Construction and demolition activities at the project site, adjacent staging areas, and staging areas at the 1550 Evans Avenue and Southeast Greenhouses sites, would be subject to the Construction Site Runoff requirements of Article 4.2 of the San Francisco Public Works Code, Section 146 (refer to Section 4.16.2.3, Local Regulations). Proposed construction activities that are covered under this regulation include site grading; excavation for construction of utilities, roadways, other infrastructure, and buildings; and demolition of existing buildings.

Pursuant to this regulation, the SFPUC or its contractor must obtain a Construction Site Runoff Control Permit. This permit is required for any project that includes any land-disturbing activities such as building demolition, clearing, grading, grubbing, filling, stockpiling, excavating, and transporting soil. The permit application must include a site-specific Erosion and Sediment Control Plan that provides a vicinity map showing the location of the site in relationship to the surrounding area's water courses, water bodies, and other significant geographic features; a site survey; suitable contours for the existing and proposed topography, area drainage, proposed construction and sequencing, and drainage channels; proposed erosion and sediment controls; dewatering controls where applicable; soil stabilization measures where applicable; maintenance controls; sampling, monitoring, and reporting schedules; and any other information deemed necessary by the SFPUC as the administering agency. The requirements also specify that the contractor must provide adequate dust controls in conformance with applicable air pollution laws and regulations (including Article 22B of the San Francisco Health Code, described in Section 4.17, Hazards and Hazardous Materials, and Section 4.8, Air Quality, of this EIR). Improvements to any existing grading, ground surface, or site drainage must also meet the requirements of Article 4.2 for new grading, drainage, and erosion control.

Under the Construction Site Runoff Control Permit requirements, the construction contractor would be required to conduct daily inspections and maintenance of all erosion and sediment controls and must provide inspection and maintenance information to the SFPUC as the administering agency. The SFPUC would also conduct periodic inspections of the project site to ensure compliance with the plan. The construction contractor would be required to notify the SFPUC as the administering agency at least two days prior to the start of construction, completed installation of erosion and sediment control measures, completion of final grading, and project completion. As the administering agency, the SFPUC could also require sampling, metering, and monitoring at its discretion.

During construction, the SFPUC or its contractors could store hazardous materials and fuels at the on-site staging areas within Quint Street and Jerrold Avenue and off-site staging areas at the Southeast Greenhouses site or 1550 Evans Avenue site. The Erosion and Sediment Control Plan for construction activities at these sites would include the appropriate BMPs to prevent stormwater contact with these materials and limit the potential for a release of hazardous materials that could affect water quality.

Implementation of the Construction Site Runoff Control Permit requirements of Article 4.2 of the San Francisco Public Works Code, Section 146, would ensure that water quality impacts related to violation of water quality standards or degradation of water quality due to discharge of construction-related stormwater runoff from the project site and staging areas at 1550 Evans Avenue and the Southeast Greenhouses site would be less than significant.

Construction-Related Stormwater Discharges to Separate Stormwater System or to Bay

Stormwater from Piers 94 and 96 and the Pier 94 Backlands drains to separate stormwater systems that are under the jurisdiction of the Port and discharge to Lower San Francisco Bay. Up to 12 acres would be used for staging in these areas. Therefore, grading and excavation for new temporary utilities for the staging areas at these piers would be also be subject to both Article 4.2 of the San Francisco Public Works Code (Section 146) and the SWRCB's Construction General Permit. Article 4.2 requires implementation of an Erosion and Sediment Control Plan for projects that disturb more than 5,000 square feet of land, and the Construction General Stormwater Permit requires implementation of a Stormwater Pollution Prevention Plan (SWPPP) for projects that disturb one or more acres of land. Article 4.2 provides that projects subject to both regulatory requirements may prepare a SWPPP in lieu of the Erosion and Sediment Control Plan.

The Construction General Stormwater Permit characterizes construction activities by the level of risk to water quality. This is determined using a combination of the sediment risk of the project and the receiving water quality risk. Projects can be characterized as Risk Level 1, Risk Level 2, or Risk Level 3, with Risk Level 1 representing the lowest risk to receiving water quality. The minimum BMPs and monitoring that must be implemented during construction are based on the risk level. The BMPs are designed to prevent pollutants from coming in contact with stormwater and to keep any erosion and stormwater pollutants from moving off-site into receiving waters. The BMPs are specified in a SWPPP that must be prepared by a Qualified SWPPP Developer and submitted to the San Francisco Bay RWQCB before construction begins. Construction activities under the project would not be characterized as Risk Level 3, the highest risk level, because Lower San Francisco Bay is not considered a sediment-sensitive water body under the Construction General Stormwater Permit, as described in Section 4.16.2.2, State Regulations. Characterization as a Risk Level 1 or 2 site would depend on the sediment risk of construction activities. Sediment risk is based on the timing of construction, including the potential for rainfall to occur, as well as other project-related information such as the slope of the site and soil erodibility.

For Risk Level 1 sites, the Construction General Stormwater Permit specifies minimum BMPs to be implemented that address good housekeeping practices (including those for managing hazardous materials used during construction); non-stormwater management, erosion, and sediment control; and run-on and runoff control. A qualified professional must inspect the required BMPs weekly when there is no rain and daily during a qualifying rainstorm. For construction activities characterized as Risk Level 2, the minimum requirements identified for Risk Level 1 apply, as do some more stringent requirements. For instance, for Risk Level 2 construction activities, erosion controls must be implemented in conjunction with sediment controls in active construction areas, and linear sediment controls such as silt fences, gravel bag berms, or fiber rolls must be used along slopes. In addition, a Qualified SWPPP Developer must prepare a rain event action plan for Risk Level 2 construction activities. This plan would identify

the designated site stormwater manager, the provider of erosion and sediment controls, and the stormwater sampling agent, as well as the types of construction activities implemented at the site during all construction phases. The plan would include suggested actions for each construction phase.

Compliance with the Construction General Stormwater Permit, including the associated permit enforcement requirements, would ensure that water quality impacts related to violation of water quality standards or degradation of water quality due to discharge of construction-related stormwater runoff to the Bay via the separate stormwater systems at Piers 94 and 96, would be less than significant.

Water Quality Effects of Groundwater Dewatering

As noted above in Section 4.16.1.8, above, shallow groundwater levels at the project site are approximately 8 to 12 feet below ground surface.[58] In addition, confined groundwater occurs within the upper layered sediments encountered below the young bay mud. While the upper layered sediments occur at depths of greater than 12 feet below ground surface at the site, groundwater levels rise to within 1 to 4 feet of the ground surface in monitoring wells completed in this zone as a result of pressure on the confined groundwater.

Most of the excavations at the project site would be completed within the artificial fill materials and young bay mud that underlie the project site. These excavations would be completed below the shallow water table. Shoring systems used in the excavations would limit the amount of groundwater flow into the excavations. Alternatively, the sidewalls of the excavations could be sloped to ensure slope stability which would allow more groundwater flow into the excavation. In either case active dewatering systems such as use of a sump pump may be required to maintain a dry working space in these excavations, but only limited dewatering would be required to maintain a dry working area within these shallower excavations. Deeper excavations (e.g., for the Anaerobic Digesters) would extend into the upper-layered sediments. As discussed in Section 4.16,1.8, groundwater within this geologic unit occurs under pressure. Therefore, these deeper excavations could require more extensive groundwater dewatering to provide a stable and dry work area and to reduce groundwater within the excavations. The volume of groundwater that could be produced during dewatering is not currently known.

Groundwater from dewatering activities could contain contaminants related to past site activities, as discussed in Section 4.17, Hazards and Hazardous Materials, as well as sediment and suspended solids. Discharge of groundwater produced during construction-related dewatering would be subject to a Batch Wastewater Discharge Permit issued in accordance with Article 4.1 of the Public Works Code, as supplemented by Order No. 158170, which regulates the quantity and quality of discharges to the combined sewer system. Accordingly, groundwater produced during the limited dewatering would be pumped to baker tanks or other containment, tested, and treated to ensure compliance with the discharge limitations of Article 4.1 of the Public Works Code and Order No. 158170. Treatment could include methods such as using settling tanks to remove sediments,

[58] Brown and Caldwell with CH2MHILL and Black & Veatch, Geotechnical Interpretive Report, February 2017.

filters to remove suspended solids, and other methods to meet chemical-specific discharge limitations. The chemical-specific treatment method used would depend on the chemicals that exceed the specified discharge limitation but could include methods such as filtration or activated carbon treatment to reduce chemical concentrations as necessary to meet permit requirements prior to discharge. Installation of meters to measure the volume of the discharge may also be required.

With discharge to the combined sewer system in accordance with regulatory requirements, water quality impacts related to a violation of water quality standards or degradation of water quality due to discharge of groundwater produced during construction-related dewatering would be less than significant**.**

Summary of Impact HY-1

Impact HY-1 describes potential water quality impacts related to stormwater runoff during construction and discharge of groundwater produced during dewatering in order to provide safe and dry work area in project excavations. These impacts would be ***less than significant*** because construction would be subject to the regulatory requirements specified in Articles 4.1 and 4.2, Section 146, of the San Francisco Public Works Code as well as the SWRCB's Construction General Permit, and implementation of the required control measures would adequately protect water quality. No mitigation is required.

Mitigation: None required.

Impact HY-2: Construction of the project would not substantially deplete groundwater supplies or interfere with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table. (Less than Significant)

As described in Impact HY-1, shallow groundwater at the project site occurs within the artificial fill materials overlying the young bay mud. Shallow groundwater levels at the project site are about 8 to 12 feet below ground surface.[59] In addition, confined groundwater occurs within the upper layered sediments encountered below the young bay mud. While the upper layered sediments occur at depths of greater than 12 feet below ground surface beneath the site, groundwater levels rise to within 1 to 4 feet of the ground surface in monitoring wells completed in this zone.

Most of the excavations at the project site would be completed within the artificial fill materials and young bay mud that underlie the project site. These excavations would be completed below the shallow water table. Active dewatering systems such as use of a sump pump may be required to maintain a dry working space in these excavations, but only limited dewatering would be required within these shallow excavations. Based on the limited dewatering required and because this dewatering would be conducted only during construction, this dewatering would not result in depletion of groundwater resources. Further, as described in Section 4.16.1.8, there are no wells that utilize groundwater from the shallow zone within 1/2 mile of the project site.

[59] Brown and Caldwell with CH2MHILL and Black & Veatch, Geotechnical Interpretive Report, February 2017.

Deeper excavations (e.g., for the Anaerobic Digesters) would extend into the upper-layered sediments, and groundwater within this geologic unit occurs under pressure. Therefore, these deeper excavations could require more extensive groundwater dewatering to provide a stable and dry work area and to reduce groundwater within the excavations. The volume of groundwater that could be produced during dewatering is not currently known.

Pumping of groundwater causes groundwater levels to decline in the area around the excavation which could interfere with the operation of nearby wells if present. However, as described in Section 4.16.1.8, there are no wells that utilize groundwater from the upper layered sediments within 1/2 mile of the project site. Because groundwater from the upper layered sediments is not used for any purposes in the vicinity of the project site, and because the duration of groundwater dewatering would be limited to the construction period, groundwater dewatering from the upper layered sediments would not result in groundwater depletion.

Construction activities would not result in an increase of impervious surfaces. Therefore, the project would not interfere with groundwater recharge, and impacts related to groundwater depletion and interference with groundwater recharge would be ***less than significant.***

Mitigation: None required.

Impact HY-3: Construction of the project would not place structures within a 100-year flood zone or expose people or structures to a significant risk of loss, injury, or death involving flooding under current conditions or future conditions resulting from sea level rise. (Less than Significant)

Project Site and Adjacent Staging Areas

The project site and adjacent staging areas (at the Southeast Greenhouses site and 1550 Evans Avenue) are not located within an existing 100-year flood zone, as shown on Figure 4.16-2. Therefore, there would be no impact related to flooding risk during construction within these areas. Impact HY-8 addresses impacts related to future flooding resulting from sea level rise that would occur during operation of the BDFP.

Staging Areas on Port Property

The Pier 94 Backlands is not within an existing 100-year flood zone and would not be subject to future flooding as a result of sea level rise as shown on Figures 4.16-2 through 4.16-5.

The near-shore areas of the Piers 94 and 96 staging areas are located within an existing 100-year flood zone, as shown on Figure 4.16-2.[60] However, these areas would be used for construction staging only and no employees would permanently work in these areas. The project would not

[60] City and County of San Francisco, San Francisco Interim Floodplain Map, SE San Francisco, November 12, 2015.

include the construction of any structures in the flood zone that could impede or redirect flood flows (or, consequently, exacerbate flood hazards).

Based on sea level rise mapping conducted by the SFPUC, a small area in the southern portion of the Pier 96 staging area could be permanently inundated by 2050, with a larger area inundated by 2100. Other portions of the Piers 94 and 96 staging areas could also temporarily flood as a result of 100-year storm surge under both scenarios as shown on Figures 4.16-3 and 4.16-4, and as a result of 100-year storm surge associated with the upper range of sea level rise estimated by the NRC as indicated on Figure 4.16-5. However, construction activities would be completed by 2023. If inundation occurred prior to this time, the SFPUC could move staging activities out of the inundation area to avoid adverse effects related to flooding.

Based on the above analysis, during construction, the project would not result in a significant risk due to flooding nor exacerbate flood hazards because the staging activities at Piers 94 and 96 would not include the placement of structures within the existing 100-year flood zone and the project would not expose structures or people to a significant risk of loss, injury, or death involving flooding. This impact would be ***less than significant*** and no mitigation is required.

Mitigation: None required.

Impact HY-4: Construction of the project would not expose people or structures to a significant risk of loss, injury, or death involving inundation by seiche or tsunami. (Less than Significant)

Project Site and Adjacent Staging Areas

As shown on Figure 4.16-6, the project site and adjacent staging areas (at the Southeast Greenhouses site and 1550 Evans Avenue) are not located within the potential tsunami inundation zone shown on Map 5 of the Community Safety Element of the *San Francisco General Plan*[61] or on statewide maps prepared by the California Emergency Management Agency.[62] Therefore, there would no impact related to the potential of seiche or tsunami inundation during construction at the project site and adjacent staging areas.

Staging Areas on Port Property

A large part of the Piers 94 and 96 staging areas would be located within a potential tsunami inundation zone as shown on Figure 4.16-6. Based on the estimated tsunami height of about -1.7 feet SFD (9.7 feet NAVD88) at Piers 94 and 96, the maximum potential depth of inundation could be about 1.5 feet as described in Section 4.16.1.7, Tsunami and Seiche. However, other than temporary trailers with restroom facilities, the project would not include the construction of any structures in this area that could be damaged in the event of a tsunami.

[61] City and County of San Francisco, *San Francisco General Plan*, Community Safety, an Element of the General Plan of the General Plan of the City and County of San Francisco, October 2012.

[62] California Emergency Management Agency, California Geological Survey, University of Southern California, Tsunami Inundation Map for Emergency Planning, San Francisco North Quadrangle/San Francisco South Quadrangle (SF Bay), June 15, 2009.

Workers would only intermittently occupy the area before and after their work shifts. In the event that the National Warning System issues a tsunami warning, the CCSF would initiate its outdoor warning system and issue emergency instructions should the San Francisco waterfront be threatened. Use of this system would allow adequate warning time to avoid the area in the event of a tsunami and for evacuation of the area should workers be present when the warning is issued.

While the SFPUC could store construction-related hazardous materials such as fuels, lubricants, paints, and adhesives at the Piers 94 and 96 staging areas, the Port would require implementation of an operations plan as part of their lease, subject to approval by the Port, that addresses the safe storage of hazardous materials. This plan would specify BMPs for hazardous materials storage to reduce the potential for a release of hazardous materials in the event of a tsunami and spill response procedures to address a release of hazardous materials if one were to occur. Implementation of appropriate BMPs would ensure that adverse water quality effects would not occur in the event of a tsunami during the construction period.

The Pier 94 Backlands is not located within a potential tsunami inundation zone.

Based on this analysis, the project would not expose structures or people to a substantial risk of loss, injury, or death involving inundation by seiche or tsunami, and this impact would be ***less than significant*** for the construction staging areas on Port property.

Mitigation: None required.

Operational Impacts

Impact HY-5: Operation of the project would not violate water quality standards or waste discharge requirements or otherwise substantially degrade water quality. (Less than Significant)

The project would replace and relocate the solids treatment facilities at the SEP with modern technologies and facilities designed to produce Class A biosolids, which have no detectable pathogens. The proposed operational improvements would modify the existing biosolids treatment process to add a thermal hydrolysis process (THP), which includes heating undigested wastewater solids with steam under pressure and rapidly depressurizing them to make them more biodegradable. After pre-treatment and digestion, the solids would be dewatered prior to loadout, and the dewatering return stream (i.e., the reject water from the dewatering process) would be returned to the existing SEP liquid processing facilities. These liquid processing facilities ultimately discharge secondary-treated effluent from the SEP to Lower San Francisco Bay via the Southeast Bay Outfall during dry weather. While the proposed change in solids treatment process under the BDFP would not substantially increase the total load of any constituents, it could potentially increase the concentration of certain constituents in the plant's final effluent if the concentration in the dewatering return stream is sufficiently high and if those constituents are not otherwise removed by primary and/or secondary liquid treatment processes used at the SEP. The constituents of particular concern are ammonia and nitrogen because they are present in the wastewater solids,

and during the solids treatment process they are concentrated in the dewatering return stream. In addition, the SEP primary and secondary liquid treatment processes are not designed to remove or transform ammonia or remove nitrogen. These constituents could substantially degrade water quality at high concentrations.

Water Quality Objectives and Effluent Limitations

The Basin Plan includes the following water quality objectives for un-ionized ammonia[63] in Lower San Francisco Bay:

- An annual median of 0.025 milligram per liter (mg/L) as nitrogen; and
- A maximum of 0.4 mg/L as nitrogen.

The effluent limitations of the Bayside NPDES Permit consider the amount of dilution the effluent will receive when discharged to Lower San Francisco Bay and are established to ensure that effluent discharges will not cause the above water quality objectives to be exceeded in the Bay. Accordingly, the dry weather ammonia effluent limitations of the Bayside NPDES Permit are an average monthly effluent limit (AMEL) of 190 mg/L and a maximum daily effluent limit (MDEL) of 290 mg/L. During wet weather, the concentrations of ammonia would be expected to be much less because of the increased volumes of stormwater in the effluent.

The SFPUC Bayside NPDES Permit does not include any effluent limitations specifically for total nitrogen. However, most nitrogen in the SEP effluent occurs in the form of ammonia. Any increase in concentration of total ammonia results in a corresponding increase in total nitrogen concentration. Increased nitrogen concentrations in wastewater effluents have the potential to increase algal blooms and consequently decrease dissolved oxygen concentrations in San Francisco Bay. These changes can affect habitat for several estuarine species, including clams, which are filter feeders.

Summary of Water Quality Analysis

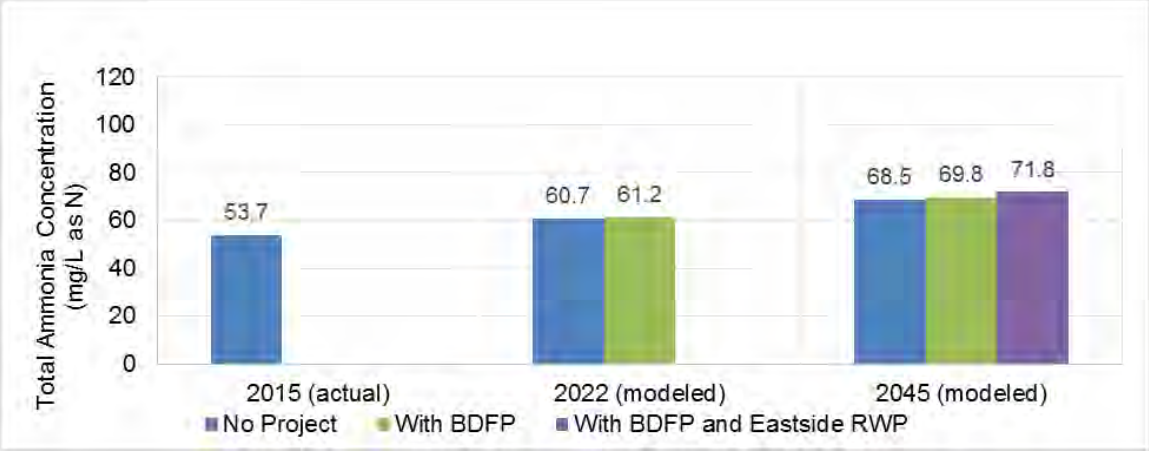
RMC Water and Environment (RMC) conducted a water quality analysis for the proposed solids treatment processes, included in this EIR as Appendix HYD and referred to below as the Water Quality Analysis. This analysis determined that the project's new THP process could increase the concentrations of both total ammonia and total nitrogen in the dewatering return stream relative to the existing digestion process.[64] The increase in total nitrogen concentrations is due almost entirely to the increase in ammonia concentration. While the dewatering return stream is typically less than 1 percent of raw plant flow (during dry weather), an increased concentration of ammonia or nitrogen in the dewatering return stream could result in an increase in the total ammonia or total nitrogen concentration in the final SEP effluent if concentrations in the dewatering return stream are very high. The water quality analysis assessed whether the

[63] Ammonia is a nutrient that contains nitrogen and hydrogen. Its chemical formula is NH_3 in the un-ionized state and NH_4^+ in the ionized form. Total ammonia is the sum of both un-ionized and ionized ammonia. Un-ionized ammonia is more toxic to fish and other aquatic life than ionized ammonia.

[64] RMC Water and Environment, Water Quality Analysis for the SEP Biosolids Digester Facilities Project, March 24, 2016.

increased ammonia and total nitrogen concentrations in the dewatering return stream would result in a violation of the Bayside NPDES Permit or otherwise substantially degrade water quality. The study also concluded that no other constituents in the dewatering stream would have a potential to exceed the Bayside NPDES Permit effluent limitations or water quality objectives for Lower San Francisco Bay, or otherwise substantially degrade water quality; for this reason, the analysis summarized below focuses on ammonia and nitrogen.

The Water Quality Analysis reported both the average and 95th percentile concentrations of ammonia and total nitrogen concentrations in the analysis. While the average is commonly used, the 95th percentile is a more conservative estimate of increases in concentration because it represents the value below which 95 percent of all concentrations would fall (with only 5 percent of the concentrations exceeding the stated value). The 95th percentile concentration is greater than the average and, for the purposes of this EIR, the discussion below conservatively analyzes impacts associated with the 95th percentile concentrations reported in the Water Quality Analysis.



The Water Quality Analysis also analyzed measured concentrations of ammonia and nitrogen in the SEP effluent between 2008 and 2015 to evaluate existing effluent quality. Between 2008 and 2015, the concentrations of both ammonia and nitrogen have shown a gradual increase due to population growth and water conservation. Despite this increase, in 2015 the 95th percentile concentration of total ammonia in the SEP effluent was 53.7 mg/L, well below the NPDES most stringent effluent limitation of 190 mg/L. The 95th percentile concentration of nitrogen in the SEP effluent in 2015 was 65.1 mg/L. The increasing trend in ammonia and nitrogen concentrations in the SEP effluent is expected to continue, whether or not the BDFP is implemented, because the volume of solids discharged to the combined sewer system has been increasing and will continue to increase over time as a result of population growth in San Francisco. At the same time, ongoing water conservation efforts in San Francisco are lowering the per capita water use for purposes such as toilet flushing, bathing, dishwashing, and clothes washing, resulting in a corresponding reduction in the volume of wastewater discharges from these activities. As a result, the increase in solids and reduction in flows have increased total ammonia and nitrogen concentrations in the final SEP effluent over time, and this increasing trend is expected to continue, regardless of project implementation.

The study presents the results of modeling conducted by the BDFP Consultant Team for the SFPUC to estimate future ammonia and nitrogen concentrations in the SEP effluent with and without the project. The estimates were completed using the BioWin computer model, a wastewater treatment process simulator that ties together biological, chemical, and physical process models. The modeling used the trends associated with the measured ammonia and nitrogen concentrations for the years 2010 to 2012 to determine the projected ammonia and nitrogen concentrations for later years (including 2015, 2022, and 2045) for the existing treatment plant. The projected concentrations accounted for future per capita ammonia and nitrogen loading (based on pre-drought conditions), future population estimates, and future water conservation. Because the measured effluent concentrations in the 2014-2015 dataset were greater than the modeled concentrations for the baseline year due to drought conditions and associated water conservation efforts in San Francisco, the water quality analysis also considered a more

conservative condition based on higher per capita ammonia and nitrogen loading rates (reflecting drought conditions) calculated from the 2014-2015 dataset. This analysis is referred to as Analysis B in Appendix HYD and the estimated concentrations from this more conservative condition are used in this evaluation.

A total of five scenarios were evaluated to determine potential impacts of the project: measured effluent quality in 2015 for the existing plant (baseline) as well as estimated effluent quality with and without the project in 2022 (representative of when the project would become operational in early 2023) and in 2045 (the planning horizon for the project). A sixth scenario evaluated the contribution of the planned Eastside Recycled Water Project at the SEP (described in Table 4.1-1 in Section 4.1) to changes in ammonia and nitrogen concentrations, and the results of this scenario are discussed in Impact C-HY-2 below, which addresses cumulative water quality impacts.

Ammonia. As shown on **Figure 4.16-7** and in **Table 4.16-3**, between 2015 and 2022, the 95th percentile ammonia concentration is expected to increase from 53.7 to 60.7 mg/L without the project. By 2045, the 95th percentile ammonia concentration is projected to increase to 68.5 mg/L without the project. With implementation of the project, 95th percentile ammonia concentration is modeled to increase to 69.8 mg/L by 2045. This concentration is well below the NPDES limitations of an AMEL of 190 mg/L and an MDEL of 290 mg/L. With project implementation, the estimated increase in the 95th percentile ammonia concentration in 2045 would be about 2 percent greater than the concentration would be without the project, as shown in Table 4.16-3. Average ammonia levels would be much less than the 95th percentile concentrations.

NOTE: The Eastside Recycled Water Project (RWP) is discussed below under Impact C-HY-2 which addresses cumulative impacts related to water quality and hydrology.

Total Nitrogen. Between 2015 and 2022, the 95th percentile total nitrogen concentrations are expected to increase from 65.1 to 73.4 mg/L without the project, as shown on **Figure 4.16-8** and in Table 4.16-3. By 2045, the 95th percentile total nitrogen concentration is projected to increase to 82.9 mg/L without the project. With implementation of the project, 95th percentile total nitrogen concentration is modeled to increase to 85.2 mg/L by 2045. This represents approximately a 3 percent increase over the 95th percentile nitrogen concentrations without the project, as shown in Table 4.16-3. Average total nitrogen levels would be much less than the 95th percentile concentrations.

NOTE: The Eastside Recycled Water Project (RWP) is discussed below under Impact C-HY-2 which addresses cumulative impacts related to water quality and hydrology.

SOURCE: RMC Water and Environment, Water Quality Analysis for the SEP Biosolids Digester Facilities Project, 2016

Figure 4.16-8
Measured 2015 and Estimated Future Total Nitrogen Effluent Concentrations

NPDES Permit Requirements

The above analysis demonstrates that with implementation of the BDFP, total ammonia concentrations would increase slightly and would remain within the effluent limitations of the existing Bayside NPDES Permit issued in 2013. Nitrogen concentrations would also increase slightly. While the permit is scheduled to be renewed in 2018, the renewed permit would be expected to continue to specify effluent limitations for the SEP that are protective of the beneficial uses of Lower San Francisco Bay and to require the SFPUC to monitor for compliance with permit requirements. Any future permit renewals would involve coordination with the San Francisco Bay RWQCB and would consider any changes in SEP operations, including BDFP implementation and any associated changes in effluent water quality, to ensure that effluent limits remain protective of beneficial uses identified in the Basin Plan.

Summary of Impact HY-5

The project would not result in ammonia concentrations in the SEP effluent that exceed the NPDES permit effluent limitations, and total nitrogen concentrations would only increase slightly. NPDES permit effluent limitations are established to ensure that discharges comply with applicable water quality standards and do not degrade water quality, as discussed in Section 4.16.2, Regulatory Framework. With expected continued compliance with NPDES permit effluent limitations and requirements during long-term project operation, impacts related to a violation of water quality standards or waste discharge requirements or degradation of water quality would be ***less than significant*** with respect to changes in SEP effluent quality, and no mitigation is required.

Mitigation: None required.

Impact HY-6: Operation of the project would not substantially deplete groundwater supplies or interfere with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table. (Less than Significant)

The project site overlies the Islais Valley Groundwater Basin. As described in Section 4.16.1, Setting, sources of recharge to this groundwater basin include rain water, irrigation return flows, and leakage from water and sewer pipes. The project site is currently covered by impervious surfaces that prevent groundwater recharge. With implementation of the BDFP, the project site would continue to be covered by impervious surfaces, and no new impervious surfaces would be constructed at the staging areas. Therefore, implementation of the project would not change groundwater recharge compared to existing conditions.

The project would not deplete groundwater resources in this basin because no long-term dewatering would be required and the project would not withdraw groundwater from this basin for any other purposes during operation.

For these reasons, impacts related to interference with groundwater recharge and depletion of groundwater resources would be ***less than significant***, and no mitigation is required.

Mitigation: None required.

Impact HY-7: Operation of the project would not exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff. (Less than Significant)

As discussed in Section 4.16.1, Setting, stormwater runoff from the SEP is directed to a 15-inch-diameter combined sewer within the SEP and to other combined sewers in Jerrold Avenue, Phelps Street, and Evans Avenue. Runoff is treated at the SEP, and treated effluent is discharged through the Southeast Bay Outfall and Quint Street outfalls. Once the BDFP is constructed, runoff from the project area would be directed to this same infrastructure. The project would result in a decrease in stormwater flows to this infrastructure because the City's Stormwater Management Ordinance and Stormwater Management Requirements and Design Guidelines would require the project to reduce the existing stormwater runoff flow rate and volume by 25 percent for a two-year, 24-hour design storm.

Chapter 2, Section 2.4.2.3, Architecture and Landscaping, describes low-impact development features proposed for the project, including street tree plantings, a green roof for the Solids Pretreatment Facility, and flow-through planters. However, infiltration rates at the project site have not yet been measured. The SFPUC assumes that infiltration would be feasible based on soil types at the project site and the depth to groundwater. If further studies demonstrate that infiltration is infeasible, the SFPUC would apply for modified compliance with the Stormwater Management Ordinance and Stormwater Management Requirements and Design Guidelines to adjust the amount by which the project must reduce the stormwater runoff volume and flow rate relative to existing conditions.

The Stormwater Control Plan required to be prepared for the project in accordance with the Stormwater Management Requirements and Design Guidelines would describe BMPs that would be implemented to achieve the specified reduction in stormwater flow rates and volumes as well as a plan for post-construction operation and maintenance of the BMPs. The plan must be reviewed and approved by the SFPUC as the administering agency to certify compliance with the Stormwater Management Requirements and Design Guidelines, and as the administering agency, the SFPUC would inspect stormwater BMPs once they are constructed to confirm that they perform as designed.

With compliance with the Stormwater Management Ordinance and Stormwater Management Requirements and Design Guidelines, project-related stormwater discharges would not exceed the capacity of the new or existing stormwater system and would not constitute an additional source of polluted runoff. This impact would be ***less than significant***, and no mitigation is required.

Mitigation: None required.

Impact HY-8: Operation of the project would not include the construction of structures that would impede flood flows within an existing 100-year flood zone or 100-year flood zones resulting from sea level rise. (Less than Significant)

As discussed in Section 4.16.1, Setting, above, the project site is not located within an existing 100-year flood hazard area (refer to Figure 4.16-2), and would remain outside of the 100-year flood zone in 2050 assuming 12 inches of sea level rise (refer to Figure 4.16-3). The site would be partially within the 100-year flood zone in 2100 with 36 inches of sea level rise (refer to Figure 4.16-4). These future flood zones are based on the NRC's projected rate of sea level rise that is considered likely based on the current understanding of global climate change. In the event of worst-case conditions, based on the NRC's upper range of sea level rise (66 inches) in combination with 100-year storm surge, the majority of the site could be subject to shallow flooding (refer to Figure 4.16-5). This extreme upper limit of sea level is based on very high GHG emissions scenarios and significant land ice melt assumptions.

The following analysis describes the potential for the project to exacerbate future flood hazards, assuming that the CCSF does not implement area-wide measures in the interim to control the intrusion of floodwaters related to sea level rise.

Potential for Project Structures to Exacerbate Future Flood Hazards

The BDFP could exacerbate the anticipated future flood hazards in the project area if it were to increase the frequency or severity of flooding or cause flooding to occur in an area that would not be subject to flooding without the project.

Proposed finished grade elevations at the project site range from approximately 0.6 to 4.3 feet SFD (12 to 15.7 feet NAVD88), with the lowest elevations occurring in the northernmost portion of the site. The anticipated flood elevation related to the projected amount of sea level rise would be 1.5 feet SFD (12.9 feet NAVD88) in 2100. Therefore, only the northernmost portion of the site would be subject to shallow flooding under this scenario. Assuming worst-case estimates of sea level rise, flood elevations could reach 4.0 feet SFD (15.4 feet NAVD88) and larger amounts of the project site could be subject to flooding. As described in Chapter 2, Section 2.4.2, Other Project Features, proposed facilities that could be affected by future flooding due to sea level rise of 36 inches would include flood-proofing features (e.g., precluding wall penetrations such as doorways below 2.5 feet SFD for structures in the northernmost portion of the project site). Project design would also incorporate adaptive features (e.g., elevation of critical elements within affected buildings) to provide resilience to potential worst-case flood levels. The project would not exacerbate future flooding conditions under either the projected or worse-case scenarios described above because the project would not include any topographic changes or the construction of new structures that would increase the extent of storm surge-related flooding relative to existing conditions. The project would not result in an increase in impervious surfaces that would restrict infiltration of floodwaters, nor would it create any topographic changes that would redirect flood flows or alter their flow rate. The site is already developed, and construction of new structures under the project would not redirect flood flows relative to existing conditions. None of the proposed features of the BDFP includes additional stormwater discharges that could contribute to the frequency or severity of flooding. Further, flood proofing of the proposed

structures and incorporation of adaptive features would ensure that future operations of the BDFP would not be adversely affected by flooding such that there could be a disruption of wastewater treatment services, or damage to the proposed facilities that could result in a release of sewage or hazardous materials that could affect water quality. Therefore, impacts related to future flooding would be ***less than significant***, and no mitigation is required.

Mitigation: None required.

Cumulative Impacts

Impact C-HY-1: The project, in combination with past, present, and probable future projects in the site vicinity, would not result in significant adverse cumulative hydrology impacts. (Less than Significant)

Hydrology impacts are related to changes in groundwater storage and flooding. The geographic scope of cumulative impacts on groundwater storage includes the Islais Valley Groundwater Basin. Impacts related to existing and future flooding and inundation by tsunami could occur along the entire San Francisco waterfront. However, only projects in close proximity and within the same flood zones could cumulatively exacerbate flood conditions; therefore, the geographic scope for cumulative flooding impacts includes the project site and near vicinity.

Groundwater

As described in Impacts HY-2 and HY-6, the project would involve only limited dewatering from the shallow groundwater zone during construction, but could require more extensive dewatering of the upper layered sediments, including dewatering required for construction of the Anaerobic Digesters. No dewatering would be required during operation. Because no wells completed within the shallow or confined groundwater are within ½ mile of the project site, temporary project-related excavation dewatering would not result in substantial adverse effects on groundwater levels.

While the Southeast Plant Headworks Replacement project would also require excavation dewatering during construction, the Headworks project would implement measures to limit the amount of dewatering needed, such as water-impermeable shoring walls, localized sump pumps, and use of working pads made with crushed rock. The other cumulative projects at the SEP may require limited dewatering during construction. However, these projects would be required to implement controls to limit the amount of dewatering required, similar to the proposed project and the Headworks project. Due to the implementation of dewatering controls and the short durations of the cumulative projects, the cumulative effects of temporary groundwater dewatering would not result in depletion of groundwater resources. While the cumulative projects at the SEP would minimally increase the amount of impervious surfaces at the SEP, this minor increase would not affect groundwater recharge in the groundwater basin. Based on these factors, cumulative impacts related to groundwater depletion and recharge would be ***less than significant***.

Flooding

As described in Impacts HY-3 and HY-4, the near-shore areas of the Piers 94 and 96 staging areas are located within an existing 100-year flood zone and a large part of these staging areas is located within a potential tsunami inundation zone. However, the project would not expose structures to risk of loss involving flooding or inundation by seiche or tsunami during construction because no permanent structures would be constructed. Therefore, the project would not contribute to any cumulative impacts related to exposing structures to risk of loss due to flooding or tsunami inundation. While the Asphalt and Concrete Recycling and Production Plant at Pier 94 and the Pier 96 Bulk Export Terminal project would introduce new site occupants within the same tsunami inundation zone, cumulative impacts related to exposing people to injury or death as a result of tsunami inundation zone would be less than significant. This is because, as for the project, in the event that the National Warning System issues a tsunami warning, the CCSF would initiate its outdoor warning system and issue emergency instructions should the San Francisco waterfront be threatened. Use of this system would allow adequate warning time to avoid the area in the event of a tsunami and for evacuation of the area should workers be present when the warning is issued.

As described in Impact HY-8, a portion of the BDFP site could be subject to shallow flooding as a result of future climate change-induced sea level rise. Past, present, and probable future development in such areas could cumulatively exacerbate future flooding conditions if the development were to increase the frequency or severity of flooding or cause flooding in areas where it would not have otherwise occurred, resulting in a substantial risk of loss, injury, or death. Cumulative projects located in the northernmost portion of the SEP such as the Southeast Plant Headworks Replacement Project, SEP Chemical System Relocation and Facilities Upgrade, SEP Primary/Secondary Clarifier Upgrades, and SEP Oxygen Generation Plant Replacement Project are also located in the same future flood zone. However, these are all projects that would be implemented by the SFPUC and would be subject to the requirements of the City's Sea Level Rise Guidance as well as the sea level rise guidance for SSIP projects (the San Francisco Design Tides and Sea Level Rise Recommendations prepared by the SFPUC).[65] Further, none of these projects would result in substantial increases in impervious surfaces that would restrict infiltration of floodwaters, nor would they create any substantial topographic changes that would redirect flood flows or alter their flow rate. The SEP is already developed, and construction of new structures under the project would not redirect flood flows relative to existing conditions. None of the proposed features of the BDFP or the cumulative projects includes additional stormwater discharges that could contribute to the frequency or severity of flooding. The SFPUC Southeast Outfall Islais Creek Crossing Replacement project, Southeast Community Facility Revitalization, and Quint Street Lead Track area are also located in the future flood zone but would not include the construction of new structures or changes in runoff patterns that could exacerbate flooding. Therefore, cumulative impacts related to future flooding would be ***less than significant***.

Mitigation: None required.

---

[65] SFPUC, *San Francisco Design Tides and Sea Level Rise Recommendations*, March 12, 2015.

Impact C-HY-2: The project, in combination with past, present, and probable future projects in the site vicinity, would not result in significant adverse cumulative water quality impacts. (Less than Significant)

Water quality impacts are related to changes in wastewater and stormwater flows to the Bayside Drainage Basin of the City's combined sewer system and changes in the SEP effluent composition. Therefore, the geographic scope of potential cumulative impacts on water quality encompasses the Bayside Drainage Basin of the combined sewer system where the project is located and Lower San Francisco Bay where the SEP effluent is discharged. As discussed above, compliance with applicable regulatory requirements designed to reduce the cumulative effects of development on water quality would ensure that the project would not result in any significant water quality impacts as a result of construction-related discharges (Impact HY-1) and operational stormwater discharges (Impact HY-7). All cumulative development in San Francisco would be subject to the same regulatory framework as described for the project for these impacts, and compliance with existing regulations would serve to ensure that any cumulative impacts on water quality as a result of the cumulative projects in combination with the BDFP would be ***less than significant***.

As discussed in Impact HY-5, operation of the project would not result in changes in effluent composition that would violate applicable water quality standards, violate the effluent limitations of the Bayside NPDES Permit, or otherwise substantially degrade water quality. The only cumulative project included in Table 4.1-1 that would also affect the composition of the SEP effluent water quality is the Eastside Recycled Water Project, which could be constructed beginning in 2026 and operational as of 2029. The Water Quality Analysis conducted for the BDFP (discussed above in Impact HY-5) considered the effects of the Eastside Recycled Water Project on effluent composition.[66] The analysis concluded, as shown on Figures 4.16-7 and 4.16-8, that with the addition of this project, 95th percentile ammonia concentrations in the SEP effluent would increase to 71.8 mg/L and 95th percentile total nitrogen concentrations would increase to 87.8 mg/L. The 95th percentile ammonia concentrations would be below the NPDES permit limitations of an AMEL of 190 mg/L and an MDEL of 290 mg/L and only approximately 2 percent higher than would occur without the project and the Eastside Recycled Water Project. The 95th percentile total nitrogen concentrations would be about 3 percent higher than would occur without the project and the Eastside Recycled Water Project. Therefore, the cumulative impact of these two projects on water quality would be ***less than significant***.

Mitigation: None required.

[66] RMC Water and Environment, Technical Memorandum: Water Quality Analysis for the SEP Biosolids Digester Facilities Project, March 2016.

4.17 Hazards and Hazardous Materials

This section describes existing conditions in the Biosolids Digester Facilities Project (BDFP or project) vicinity with respect to hazards and hazardous materials, including the hazardous materials currently used at the Southeast Water Pollution Control Plant (Southeast Plant or SEP) for biosolids treatment. It discusses the potential for the BDFP to encounter hazardous materials in soil and/or groundwater in the project vicinity, the potential to encounter naturally occurring asbestos, the potential for hazardous materials proposed for future use under the BDFP to pose a hazard to the public or the environment, potential fire hazards, the potential to interfere with an emergency plan, and potential hazards related to proximity to schools and airports. Mitigation measures are identified to avoid or reduce significant adverse impacts, as appropriate.

4.17.1 Setting

4.17.1.1 Definition of Hazardous Materials

A *hazardous material*, defined in Section 25501(n) of the California Health and Safety Code, is a material that is listed by statute or one that "because of its quantity, concentration, or physical or chemical characteristics poses a significant present or potential hazard to human health and safety or to the environment if released to the workplace or environment." Hazardous materials have been and are commonly used in commercial, agricultural, and industrial applications as well as in residential areas to a limited extent.

A waste is any material that is discarded after primary use, recycled, or inherently waste-like (such as an unused by-product of an industrial process). Title 22 of the California Code of Regulations (CCR), Division 4.5, Chapter 11 (Identification and Listing of Hazardous Waste) contains regulations for the classification of hazardous wastes.[1] A waste is considered a hazardous waste if it is toxic (causes human health effects), ignitable (has the ability to burn), corrosive (causes severe burns or damage to materials), or reactive (causes explosions or generates toxic gases) in accordance with the criteria established in Article 3 of Chapter 11. Articles 4 and 4.1 also list specific hazardous wastes and Article 5 identifies specific waste categories, including wastes considered hazardous under the federal Resource Conservation and Recovery Act (RCRA); wastes that are considered hazardous under state definitions but not under federal definitions (non-RCRA hazardous wastes); extremely hazardous wastes, classified based on their high toxicity levels or reactivity with water; hazardous wastes of concern; and special wastes. If improperly handled and if released to the soil, groundwater, or air (in the form of vapors, fumes, or dust), hazardous materials and wastes can result in public health hazards.

4.17.1.2 Existing Hazardous Materials Uses for Biosolids Processing

Chemicals used for existing biosolids handling processes at the SEP include polymers and ferric chloride (iron chloride). A polymer is a chemical that is used to promote thickening in the

[1] CCR 22 Sections 66261.1, et seq.

treatment process, and polymers are not considered hazardous materials. Common examples of polymers include polystyrene, neoprene, nylon, and silicone. Polymer use in dewatering increases solids content. The existing solids treatment facilities include seven storage tanks of polymer, with a total volume of 10,000 gallons. Ferric chloride, an iron salt, is used to control the buildup of struvite[2] in the digesters, pipes, and other equipment. This chemical is considered hazardous due to its corrosivity, and an irritant in case of skin contact, eye contact, or inhalation; the amount of tissue damage from exposure depends on length of contact. It would be toxic if ingested.[3] Ferric chloride reacts violently with metals, forming a flammable/explosive gas. A total of 16,000 gallons of ferric chloride solution is stored in aboveground tanks at the SEP.[4] In addition, a small quantity of diesel fuel (1,000 gallons) is stored for use in backup generators.

4.17.1.3 Digester Gas Management

Digester gas that is produced as a byproduct of the digestion process is comprised mostly of methane and carbon dioxide. As discussed in Chapter 2, *Project Description*, the 1.3 million cubic feet of digester gas currently produced by the biosolids treatment process is primarily used on-site to produce heat and power through the energy recovery process. Excess digester gas that cannot be used in the energy recovery process is flared. Methane, one of the primary components of digester gas, forms explosive mixtures in air. The lower explosive limit of methane is 5 percent by volume and the upper limit is 15 percent by volume. Methane is only explosive at concentrations greater than the lower explosive limit and less than the upper explosive limit.

4.17.1.4 Hazardous Materials in Soil and Groundwater

Based on the historic use of the SEP as a wastewater treatment plant and the Jerrold Avenue properties as an asphalt plant and vehicle maintenance facility, soil and/or groundwater contamination could exist at the project site. The results of regulatory agency database searches as well as environmental investigations and underground storage tank removals conducted at each site are discussed below to assess existing soil and groundwater contamination.

Regulatory Agency Database Search

On behalf of the San Francisco Planning Department, Environmental Data Resources (EDR) conducted a regulatory database search to identify permitted hazardous materials uses and environmental cases at the project site and in the vicinity.[5] The results of this database search are briefly discussed below, and a discussion of the existing soil and groundwater quality at the SEP, Central Shops, and Asphalt Plant, based on site-specific reports follows this discussion.

---

2 Struvite forms when concentrations of soluble magnesium, ammonium, and orthophosphate exceed levels that promote the formation of crystals. Struvite can build up and clog wastewater treatment equipment.

5 EDR, *Summary Radius Map Report, Biosolids Digester Facilities Project, 1800 and 1801 Jerrold Avenue, San Francisco CA 94124*, August 20, 2015.

The regulatory agency databases identify three addresses for the SEP: 750 Phelps Street and 1700 and 1701 Jerrold Avenue. The SEP was identified in multiple regulatory agency lists as summarized in **Table 4.17-1**. The SEP has historical or current underground storage tanks (USTs) as indicated by inclusion in the Active UST Facilities (UST), Hazardous Substance Storage Container (HIST UST), Facility Inventory (CA FID UST), and Statewide Environmental Evaluation and Planning System (SWEEPS UST) databases. Identification in the Leaking Underground Storage Tank (LUST) and historic Cortese databases indicates that a petroleum release may have affected soil or groundwater conditions at the SEP.

SOURCE: EDR, Summary Radius Map Report, Biosolids Digester Facilities Project, 1800 and 1801 Jerrold Avenue, San Francisco CA 94124, August 20, 2015.

Both the Central Shops and the Asphalt Plant have historical or current USTs as indicated by inclusion in the UST, HIST UST, CA FID UST, and SWEEPS UST databases. The Central Shops was also identified in the LUST and Recovered Government Archive Leaking Under Ground Storage Tank (RGA LUST) databases, indicating that a petroleum release may have affected soil or groundwater conditions at the Central Shops. In addition, there are five LUST sites within one-eighth mile of the SEP and 25 LUST sites within one-quarter mile. The relatively large number of LUST sites in the project vicinity suggests the potential for shallow groundwater contamination from nearby land uses.

The SEP is identified as a large quantity generator of hazardous wastes under the Resource Conservation and Recovery Act (RCRA-LQG). In addition, the Central Shops are identified as small

quantity generators of hazardous waste under RCRA (RCRA SQG), and the Central Shops site is identified in the RCRA Non Generator (RCRA NonGen) database, indicating that it is no longer regulated under RCRA. Both the Central Shops and the Asphalt Plant have manifested hazardous wastes for off-site disposal as indicated by inclusion in the Facility and Manifest Data (HAZNET) database. However, all of these are regulated activities related to management of hazardous wastes. Similarly, inclusion of the SEP, Central Shops, and Asphalt Plant in the Emissions Inventory Data (EMI) database indicates that all three sites have historically reported emissions of toxic and criteria air pollutants to the Bay Area Air Quality Management District (BAAQMD) as part of an emissions inventory. Inclusion of the sites in these databases is not indicative of potential soil or groundwater contamination.

The California Hazardous Material Incident Reporting System (CHMIRS) incident at 750 Phelps Street reported to the California Office of Emergency Services was recorded as a release of sewage in 2014. Further review by the SFPUC indicates that incident refers to a release of secondary treated wastewater (disinfected and dechlorinated) to Islais Creek through the Quint Street Outfall for less than three minutes during resumption of plant operation after shutdown in May 2014. This also is not indicative of potential soil and groundwater contamination.

Environmental Investigations and Underground Tank Removals

The San Francisco Public Utilities Commission (SFPUC) completed an environmental investigation of the project site in 2016. The Environmental Investigation Report provides a summary of previous investigations at the Central Shops and Asphalt Plant along with the results of sampling conducted in 2015 to evaluate soil and groundwater quality within the portion of the project site located on the existing SEP and at the Central Shops.[6] In the discussions below, the results of these environmental investigations are compared to two screening levels established by regulatory agencies responsible for the oversight of environmental site investigations and cleanups in the San Francisco Bay Area. These screening levels are conservative estimates of safe levels of a chemical that a person could be exposed to in soil or groundwater. If the concentration of a chemical in the soil or groundwater is below the screening level, then it can be assumed that the chemical would not pose a health risk to a person. The screening levels evaluated include:

- Environmental Screening Levels (ESLs) established by the Regional Water Quality Control Board – San Francisco Bay Region (RWQCB) for commercial/industrial land uses.[7]
- Screening Levels for Soil recommended by the Department of Toxic Substances Control (DTSC) (DTSC SLs) for commercial/industrial land uses.[8]

In general, the ESL is lower than the DTSC SL. Accordingly, the DTSC SL is only discussed where the concentration of a chemical exceeds the DTSC SL, but not the ESL.

8 California Department of Toxic Substances Control, Human and Ecological Risk Office (HERO), *Human Health Risk Assessment (HHRA) Note, HERO HHRA Note Number: 3, DTSC-modified Screening Levels (DTSC-SLs)*, June 2016.

The analytical results of environmental investigations at the project site and staging areas on Port of San Francisco (Port) property are also compared to federal and California hazardous waste classification criteria to evaluate disposal options for the soil. These criteria include the state Total Toxicity Limit Concentration (TTLC) and Soluble Toxicity Limit Concentration (STLC) and the federal Toxicity Characteristic Leaching Procedure (TCLP) regulatory limit. All of these criteria are described in Section 4.17.2.2, State Regulations, below.

Groundwater results are also compared to the discharge limitations provided in Article 4.1 of the San Francisco Public Works Code to evaluate whether the groundwater would be suitable for discharge to the combined sewer system. (Refer to Section 4.16, Hydrology and Water Quality, of this EIR for a description of this regulation.)

1800 Jerrold Avenue Property (Central Shops)

Vehicle repair and maintenance activities at the Central Shops property have included the storage and use of fuels, lubricants, and solvents since the 1950s. As summarized in the Environmental Investigation Report, these six USTs have been removed from the Central Shops:

- March 1994 – One 1,000-gallon waste oil tank was removed from the site.
- June 1999 – Three 6,000-gallon gasoline USTs associated with the UST complex were removed and soil samples collected from the UST excavation. The San Francisco Department of Public Health (SFDPH) issued case closure for the waste oil tank and three gasoline USTs following abandonment of the monitoring wells in 2012.
- February 2012 – Two 10,000-gallon gasoline USTs were removed.

Based on the chemical analyses performed during a 2013 environmental investigation of this site and in 2015 as part of the environmental investigation, total petroleum hydrocarbons as gasoline (TPH-gasoline), total petroleum hydrocarbons as diesel (TPH-diesel), total petroleum hydrocarbons as motor oil (TPH-motor oil), benzene, antimony, arsenic, cadmium, cobalt, copper, lead, nickel, naphthalene and benzo(a)pyrene (a semi-volatile organic compound) were reported in at least one soil sample at a concentration above the respective commercial ESL or DTSC SL. Methyl tert-butyl ether (MTBE), a gasoline additive that is known to cause cancer, was not detected in any of the soil samples. The environmental investigation report indicates that all but two of the arsenic concentrations are within background levels for Bay Area soils, and therefore do not necessarily result from site activities, rather the presence is likely due to naturally occurring arsenic in the soil.

Based on the soil analytical results, the total or soluble metal concentrations for copper, lead, and zinc exceed the respective California and federal hazardous waste criteria. Several soluble concentrations of lead exceed the federal TCLP regulatory limit. However, statistical analysis of the analytical results in accordance with United States Environmental Protection Agency (USEPA) protocol indicates that these results are outliers and are not considered representative of the entire volume of soil that would be excavated. Classification of the soil as a California hazardous waste or federal hazardous waste would be determined based on a waste profile application prepared by the SFPUC, which would be used to select the appropriate disposal site for the soil.

The concentrations of several compounds detected in groundwater exceeded their respective SFPUC batch wastewater discharge requirements specified in Article 4.1 of the San Francisco Public Works Code. These include TPH-gasoline, TPH-diesel, TPH-motor oil, and five metals (chromium, copper, lead, nickel, and zinc).

1801 Jerrold Avenue Property (Asphalt Plant)

San Francisco Public Works (SFPW) operated an asphalt plant at 1801 Jerrold Avenue that was built in 1954[9] and decommissioned in 2009.[10] According to SFDPH files, the asphalt plant used four underground concrete tanks: one 6,000-gallon and one 10,000-gallon asphalt emulsion tank, and two 10,000-gallon liquid asphalt tanks.[11] The 6,000-gallon tank may also have been used for storage of diesel fuel in the past.[12] There are no records of tank removal; therefore, these USTs are believed to remain in the ground.

Based on soil sampling in 2013 and 2014, the concentrations of several compounds in the soil exceed the respective commercial ESLs, including TPH-diesel, TPH-motor oil, several semi-volatile organic compounds (SVOCs), arsenic, copper, lead, and nickel. As with the Central Shops site, the environmental investigation report indicates that all of the arsenic concentrations are within background levels for Bay Area soils, and would therefore not necessarily result from site activities.

Based on total and soluble lead concentrations, some of the soil would be considered a California hazardous waste. TPH-diesel, TPH-motor oil, lead, nickel, and zinc concentrations would exceed their respective SFPUC batch wastewater discharge requirements.[13]

Southeast Water Pollution Control Plant

As described in Chapter 2, *Project Description*, the project site includes two areas located within the north side of the existing SEP property at 750 Phelps Street and 1700 Jerrold Avenue. Soil and groundwater within these areas are described below.

The portion of the project site referred to as the SEP Boneyard in the environmental investigation report is currently used for storage of miscellaneous equipment and compressed gases.[14] Based on the soil investigation conducted in 2015, the concentrations of several compounds in the soil—including TPH-diesel, TPH-motor oil, naphthalene, polychlorinated biphenyls (PCBs), arsenic, cadmium, cobalt, copper, lead, mercury, and nickel—exceed their respective commercial ESL or

[14] BDFP Consulting Team, Environmental Site Investigation Report for San Francisco Department of Public Health Article 22A Compliance, May 2016.

DTSC SL. MTBE was not detected in any of the soil samples. As with the Central Shops site, the environmental investigation report indicates that all of the average arsenic concentration is within background levels for Bay Area soils, and the presence is likely due to naturally occurring arsenic.

Based on total or soluble copper, lead, and zinc concentrations, some of the soil would be considered a California hazardous waste. TPH-motor oil, cadmium, copper, lead, nickel, and zinc concentrations also exceeded their respective SFPUC batch wastewater discharge requirements.[15]

The portion of the project site referred to as the SEP Maintenance Area in the environmental investigation report is currently used for various facility maintenance shops and chemical storage.[16]

Based on the soil investigation conducted in 2015, the concentrations of several compounds in the soil—including TPH-diesel, TPH-motor oil, benzo(a)pyrene, arsenic, lead, and nickel—exceed the respective ESLs. MTBE was not detected in any of the soil samples. As with the Central Shops site, the environmental investigation report indicates that all of the average arsenic concentration is within background levels for Bay Area soils, and the presence is likely due to naturally occurring arsenic. Based on soluble lead, some of the soil would be considered a California hazardous waste. In the groundwater, copper, lead, mercury, nickel, and zinc concentrations exceeded their respective SFPUC batch wastewater discharge requirements.[17]

Pier 94 Backlands and Pier 94

The 27-acre Pier 94 Backlands area was created during the 1960s and 1970s through filling of the area with dredge spoils and construction debris. Unauthorized municipal refuse was also used as fill material in a 14-acre area that partially underlies the Pier 94 Backlands and Pier 94. This area is referred to as the Pier 94 landfill. Regional water quality control boards regulate discharges of waste that could affect the quality of waters of the state, including discharges of solid waste to land, through the issuance of waste discharge requirements. Since 1987, the Pier 94 landfill has been regulated as a non-hazardous solid waste disposal site under Waste Discharge Requirements (WDRs) issued by the RWQCB.[18] **Figure 4.17-1** shows the extent of the regulated landfill. Within the regulated landfill, the fill material is covered by a soil cap. A geotechnical investigation conducted in 2012 concluded that for the most part, the existing cover meets or exceeds the cover requirements specified in Title 27 of the California Code of Regulations because the annual percolation through the existing cover would be less than would occur through a cover designed as specified in the regulations, except at three locations.[19]

SFPUC Biosolids Digester Facilities

Figure 4.17-1

Area of Regulated Landfill at Pier 94 and Pier 94 Backlands

Order No. R2-2003-0055 implements the waste discharge requirements for the landfill. In accordance with this order, groundwater beneath the landfill and surrounding bay waters has been sampled on a quarterly to semi-annual basis since 1989. Historic sampling indicates that landfill materials have not affected groundwater or surface water quality. No volatile organic compounds (VOCs) or SVOCs have been detected in groundwater or surface water, and metals concentrations are below water quality criteria. TPH-diesel has been detected at concentrations of up 6.4 milligrams per liter (mg/L) in groundwater samples from an area near an aboveground fuel tank formerly located at the aggregate processing facility. The WDRs required additional evaluation and monitoring of TPH-diesel in the groundwater.

Landfill investigations conducted in 1989 and 1990 identified several VOCs in subsurface soil gas samples from within the regulated area.[20] None of the concentrations exceed the ESL and methane was not detected in any of the soil gas samples. However, the geotechnical report for previously proposed improvements in the Pier 94 Backlands recommends that a soil gas investigation be conducted if enclosed structures or structures for human occupancy are proposed within the landfill.

The WDRs prohibit any excavation or reconfiguration within the regulated landfill without prior RWQCB approval. Under the WDRs, RWQCB would require (1) submittal of a technical report describing any proposed changes to site development that may affect the water quality, (2) maintenance of the integrity of the landfill cap, and (3) verification that water quality impacts are not occurring.[21]

On the basis of the analytical results for one soil sample collected from within the regulated landfill and an additional six samples from around the perimeter of the Pier 94 Backlands in 2012, only the concentrations of arsenic and lead in the soil exceed ESLs for commercial/industrial land uses.[22] However, as for soil samples from the project site, the arsenic concentration is within background levels for Bay Area soils, and the presence is likely due to naturally occurring arsenic. No other constituents were detected at concentrations greater than ESLs. In addition, some portions of the soil would be classified as a California hazardous waste based on total or soluble lead concentrations. Field screening during this investigation did not detect organic vapors.

1550 Evans Avenue

Based on a Phase I Environmental Site Assessment conducted in 2007[23] and a Phase II Environmental Site Assessment conducted in 2012,[24] the property at 1550 Evans Avenue was historically used for meat packing and tannery operations. The buildings associated with these uses were removed in the early 1970s. The two buildings currently present at the site were built in 1978;

one was used as an office building and the other was used as a warehouse. Hazardous building materials surveys for the buildings identified asbestos-containing materials in both buildings and lead in the ceramic tile of one building. Soil sampling conducted as part of the Phase II Environmental Assessment indicates that a small portion of the soil beneath the site would be classified as a California hazardous waste based on soluble lead concentrations, but the remainder of the soil would be non-hazardous waste. None of the constituents analyzed exceeded background levels or ESLs current at the time of the investigation.

Naturally Occurring Asbestos

In 1986, the California Air Resources Board (CARB) identified naturally occurring asbestos, which is present in many parts of California, as a toxic air contaminant (TAC). Naturally occurring asbestos is commonly associated with serpentine[25] and ultramafic[26] rock types such as serpentinite of the Franciscan Complex. Serpentinite rock is apple green, brown, reddish brown, and gray to black and has a waxy or shiny appearance. The usual appearance of serpentine is fine grain and compact, but it can be flaky or fibrous. Chrysotile asbestos (a form of asbestos from the serpentine mineral group) and amphibole asbestos (including crocidolite) are naturally occurring asbestos minerals that may present a human health hazard if they become airborne and are inhaled.

The environmental investigations for each portion of the project site on the SEP, Central Shops, and Asphalt Plant included selected analysis of the fill materials for naturally occurring asbestos.[27] The samples were analyzed by CARB Method 435 for the determination of asbestos content of serpentine aggregate, which has a detection limit of 0.25 percent asbestos. None of the soil samples analyzed contained asbestos at concentrations greater than 0.25 percent.[28] Naturally occurring asbestos was not identified in the near-surface soil samples from within the Pier 94 Backlands collected during a 2012 site investigation.[29]

4.17.1.5 Hazardous Building Materials

Hazardous materials, such as asbestos, lead, and PCBs, may also be contained in building materials and released during demolition activities. The likelihood of hazardous materials in building components can be generally assessed based on the age of the buildings, as these materials were phased out of use during the 1970s and 1980s. As shown in Table 2-12 in Chapter 2, *Project Description*, the project would demolish three Central Shops buildings constructed in 1959; Building 870 at the SEP constructed in 1952; belowground structures at the

[25] Serpentine is a naturally occurring group of minerals that can be formed when ultramafic rocks are metamorphosed during uplift to the earth's surface. Serpentinite is a rock consisting of one or more serpentine minerals. This rock type is commonly associated with ultramafic rock along earthquake faults. Small amounts of chrysotile asbestos, a fibrous form of serpentine minerals, are common in serpentinite.

[26] Ultramafic rocks are one type of igneous rock (formed at high temperatures well below the surface of the earth) that is rich in iron and magnesium.

former Asphalt Plant site constructed in 1954; and two structures located at 1550 Evans Avenue constructed in 1978. In addition, water pump stations and an electrical substation constructed in the early 1980s would be removed. Because of the age of these structures, the hazardous building materials described below are likely to be present.

Asbestos

Asbestos is a naturally occurring fibrous material that was used as a fireproofing and insulating agent in building construction materials before such uses were banned by the USEPA in the 1970s, although some use of non-friable[30] asbestos in roofing materials still exists. Asbestos can be found in such materials as ducting insulation, wallboard, shingles, ceiling tiles, floor tiles, insulation, plaster, floor backing, and many other building materials. Asbestos and asbestos-containing materials are considered both a hazardous air pollutant and a human health hazard. The risk to human health is from inhalation of airborne asbestos, which commonly occurs when asbestos-containing materials are disturbed during demolition and renovation activities.

Lead

Lead and lead compounds have been historically added to paint as pigment and to speed drying, increase durability, retain a fresh appearance, and resist moisture (which causes corrosion). The CCR defines lead-based paint as paint that contains 1.0 milligram of lead per square centimeter of paint, or 5,000 milligrams per kilogram (mg/kg) of lead.[31] In 1978, the United States Consumer Product Safety Commission set the allowable lead levels in paint used for residential purposes and public buildings at 0.06 percent by weight in a dry film of newly applied paint. The Consumer Products Safety Improvement Act of 2008 changed the limit to 0.009 percent lead. However, lead-based paint may still be used in some applications today, such as coatings used to refinish industrial or agricultural equipment; building and equipment maintenance coatings; products marketed solely for use on billboards, road signs, and similar products; touch-up coatings for agricultural equipment, lawn and garden equipment, and appliances; and catalyzed coatings marketed solely for use on radio-controlled model powered airplanes.[32]

Lead is toxic to humans and can cause a range of human health effects depending on the level of exposure. Lead dust is of special concern, because the smaller particles are more easily absorbed by the body. Common methods of paint removal, such as sanding, scraping, and burning as well as torch cutting of equipment can create excessive amounts of dust.

Lead-based paints are likely present in the buildings and structures that would be demolished.

[30] Non-friable asbestos refers to asbestos-containing materials that include asbestos fibers in a solid matrix that does not allow for them to become crumbled or reduced to powder or be easily released.
[31] CCR 17 §35033.
[32] United States Consumer Product Safety Commission, Office of Compliance, Ban of Lead-Containing Paint and Certain Consumer Products Bearing Lead-Containing Paint, 16 CFR 1303, November 2011.

Polychlorinated Biphenyls (PCBs)

PCBs are oils that were formerly placed in many types of electrical equipment, such as transformers and capacitors, primarily as electrical insulators. They may also be found in hydraulic fluid used for hoists, elevators, and other features. Years after widespread and commonplace installation, it was discovered that exposure to PCBs may cause various health effects and that PCBs are highly persistent in the environment. The USEPA has listed these substances as carcinogens. Under the Toxic Substances Control Act, the USEPA began to impose bans on PCB manufacturing and sales and on most PCB uses in 1978, but some electrical transformers in use today use oils that contain PCBs. The Toxic Substances Control Act requires incineration or an alternative destruction method for oils containing PCB concentrations greater than 50 parts per million, and requires that free liquids be drained from electrical equipment prior to disposal and that the liquids be appropriately disposed of. In California, PCB wastes are regulated as hazardous waste if the PCB concentration exceeds 50 parts per million or the soluble concentration exceeds 5 parts per million as oily liquid.

Most fluorescent light ballasts manufactured before 1978 contain PCBs. Ballasts manufactured after January 1, 1978, do not contain PCBs and should be labeled as such on the ballast. Approved disposal methods for PCB-containing ballasts depend on the condition of the ballast and the PCB content. If the PCB concentration is less than 50 parts per million and the ballast contains a small, intact, non-leaking capacitor, the ballast may be disposed of at a municipal landfill. In general, all leaking ballasts and ballasts containing PCB concentrations greater than or equal to 50 parts per million must be incinerated or destroyed by alternative methods, disposed of in a hazardous waste landfill, or decontaminated using approved methods.

Di (2-ethylhexyl) Phthalate (DEHP)

Between 1979 and the early 1990s, DEHP was used in place of PCBs as a dielectric fluid in some fluorescent light ballasts and other electrical equipment.[33] DEHP is classified as a probable human carcinogen by the United States Department of Health and Human Services and as a hazardous substance by the USEPA. Because of this, ballasts containing DEHP must be legally disposed of; ballast incineration or a combination of ballast recycling and incineration are recommended for complete destruction of DEHP.

Mercury

Spent fluorescent lamps and tubes commonly contain mercury vapors and are considered a hazardous waste in California.[34] Regulations adopted in 2004 classified all fluorescent lamps and tubes in California as a hazardous waste because they contain mercury. Because they are considered a hazardous waste, all fluorescent lamps and tubes must be recycled or taken to a universal waste handler.

[34] CCR 22 Section 66261.50.

4.17.1.6 Wildfire Hazards

Based upon fire hazard mapping by the California Department of Forestry and Fire Protection (CAL FIRE) Forest Resource Assessment Program,[35] the SEP and staging areas are not located within identified high fire hazard areas.

4.17.1.7 Schools and Day Care Facilities

There is one day care facility within one-quarter mile of the site. The Wu Yee South East Child Development Center, a children's daycare, is located at the Southeast Community Facility at 1300 Phelps Street and next to the Southeast Greenhouses.[36]

4.17.1.8 Emergency Response Plans

The City and County of San Francisco (CCSF or City) Emergency Response Plan addresses the roles and responsibilities of CCSF during all-hazards emergency response, in particular its interaction with regional, state, and federal entities and the role of the San Francisco Emergency Operations Center and City agencies.[37] The Transportation Annex of the Emergency Response Plan describes the procedures for assessment, identification of temporary alternative solutions, and restoration of damage to transportation systems, facilities and infrastructure due to an emergency incident. To provide flexibility for incident response to select appropriate routing, the plan does not specify designated emergency response or evacuation routes. The Earthquake Annex of the Emergency Response Plan provides an overview of considerations for CCSF response to a major earthquake in the San Francisco Bay Area. The primary purpose of this part of the plan is to support effective management of the initial earthquake response.

The SFPUC Wastewater Enterprise Emergency Operations Plan outlines the Wastewater Enterprise's overall emergency preparedness measures, emergency management organization, emergency operations, roles and responsibilities. Contingency plans supplement the Emergency Operations Plan and are incorporated by reference, including the Operations and Maintenance Manual that outlines detailed procedures for the operation of equipment or facilities during or in response to an emergency.[38]

The SEP Contingency Plan was developed to ensure that wastewater facilities remain in, or are rapidly returned to operation, in the event of an emergency. The plan includes emergency response operating procedures for power failures, equipment failures, treatment plant security, spills and discharges of chemicals or sewage.[39]

4.17.2 Regulatory Framework

4.17.2.1 Federal Regulations

In California, federal regulations pertaining to the use and management of hazardous materials and wastes are largely enforced through state and local regulations. Relevant state and local regulations are discussed below.

4.17.2.2 State Regulations

Asbestos-Containing Materials

Section 19827.5 of the California Health and Safety Code, adopted in January 1991, requires that local agencies not issue demolition or alteration permits until an applicant has demonstrated compliance with notification requirements under applicable federal regulations (Part 61 of Title 40 of the Code of Federal Regulations) regarding hazardous air pollutants in the Bay Area, including asbestos. The BAAQMD is vested by the California legislature with authority to regulate airborne pollutants, including asbestos, through both inspection and law enforcement, and implements the California regulatory requirements through Regulation 11, Rule 2 (Asbestos Demolition, Renovation, and Manufacturing).

In accordance with Regulation 11, Rule 2, the BAAQMD must be notified 10 days in advance of any proposed demolition or abatement work that would involve removal of asbestos-containing materials. Notification includes the names and addresses of operations and persons responsible; description and location of the structure to be demolished/altered including size, age, and prior use, and the approximate amount of friable asbestos; scheduled starting and completion dates of demolition or abatement; nature of planned work and methods to be employed; procedures to be employed to meet BAAQMD requirements; and the name and location of the waste disposal site to be used. The BAAQMD randomly inspects asbestos removal operations. In addition, the BAAQMD will inspect any removal operation that is the subject of a complaint.

Rule 11, Regulation 2 requires a survey of any building planned for demolition to identify asbestos-containing materials that may be present. If asbestos-containing materials are identified, they must be removed prior to demolition or alteration activities. During renovation, regulated asbestos-containing materials must also be removed prior to any operations that would cover the asbestos materials, making them inaccessible. During removal activities, the contractor must implement controls to ensure that there are no visible asbestos emissions to the outside air. The contractor can use methods such as wetting exposed asbestos-containing materials or providing exhaust controls to prevent asbestos emissions to the outside air. The structure being abated must also be isolated by containment barriers during removal operations, and a negative air pressure must be maintained within the containment barrier. The BAAQMD periodically inspects asbestos removal operations and will typically inspect removal operations when a complaint has been received.

Contractors who conduct asbestos-related work activities (including abatement) in buildings and structures must follow state regulations where the work would involve 100 square feet or more of asbestos-containing material.[40] Specifically, under CCR Title 8 Section 341.6, the California Occupational Safety and Health Administration (Cal/OSHA) must be notified of asbestos-related work activities to be carried out. Contractors must be licensed as an Asbestos Qualified Contractor by the Contractors Licensing Board of the State of California and registered as such with Cal/OSHA. Section 1529 regulates asbestos exposure in construction work. In addition, a one-time report of the use of carcinogens must be made to Cal/OSHA under CCR Title 8 Chapter 4 Section 5203. The owner of the property where abatement is to occur must have a Hazardous Waste Generator Number assigned by and registered with DTSC. The contractor and hauler of the material are required to file a Hazardous Waste Manifest that details the hauling of the material from the site and its disposal.

Naturally Occurring Asbestos

In 2001, the CARB adopted the Asbestos Airborne Toxic Control Measure (ATCM) for Construction, Grading, Quarrying, and Surface Mining Operations in areas of serpentine and other ultramafic rocks, which became effective in July 2002.[41] The ATCM protects public health and the environment by requiring the use of best available dust mitigation measures to prevent the off-site migration of asbestos-containing dust from road construction and maintenance activities, construction and grading operations, and quarrying and surface mining operations in areas of ultramafic rock, serpentine, or asbestos. The BAAQMD implements the Asbestos ATCM. In accordance with the Asbestos ATCM, asbestos-containing material is defined as any material that has an asbestos content of 0.25 percent or greater (California Code of Regulations Title 17, Division 3, Chapter 1, Subchapter 7.5, Section 93105[i][9]). The Asbestos ATCM does not apply to the project because no soil containing greater than 0.25 percent asbestos would be excavated or otherwise disturbed during construction at the project site or during grading to prepare the staging areas on Port property at Piers 94 and 96 and the Pier 94 Backlands.[42]

Lead in Construction Standard

Cal/OSHA's Lead in Construction Standard[43] requires project proponents to develop and implement a lead compliance plan when lead-based paint would be disturbed during construction. The plan must describe activities that could emit lead, methods for complying with the standard, safe work practices, and a plan to protect workers from exposure to lead during construction activities. Cal/OSHA requires 24-hour notification if more than 100 square feet of lead-based paint would be disturbed.

[41] CCR 17 Section 93105.
[42] Biosolids Digester Facilities Project (BDFP) Consultant Team, Environmental Site Investigation Report for San Francisco Department of Public Health Article 22A Compliance, May 2016.
[43] CCR 8 Section 1532.1

Screening Levels for Hazardous Materials in Soil or Groundwater

The RWQCB ESLs and DTSC SLs provide conservative screening levels for over 100 chemicals commonly found at sites with contaminated soil or groundwater. These screening levels are intended to help expedite the identification and evaluation of potential environmental concerns at contaminated sites for various site uses (e.g., commercial/industrial uses, residential uses, and construction workers). ESLs and DTSC SLs are not regulatory action levels or cleanup standards.

ESLs and DTSC SLs have been established for both residential and commercial/industrial land uses. Residential screening levels are the most restrictive; soil with chemical concentrations below these levels generally would not require remediation and would be suitable for unrestricted uses if disposed of off-site. Commercial/industrial screening levels are generally higher than residential screening levels because they are based on potential worker exposure to hazardous materials in the soil (and these are generally less than residential exposures).

Hazardous Waste Classification

California and Federal Hazardous Waste Criteria

In accordance with Title 22 of CCR Section 66261.20 et seq., excavated soil is classified as a hazardous waste if it exhibits the characteristics of ignitability, corrosivity, reactivity, and/or toxicity. A waste is considered toxic in accordance with CCR 22 Section 66261.24 if it contains:

- Total concentrations of certain substances at concentrations greater than the total threshold limit concentrations (TTLCs);
- Soluble concentrations greater than the soluble threshold limit concentrations (STLCs);
- Soluble concentrations of certain substances greater than federal toxicity regulatory levels using the Toxic Characteristic Leaching Procedure (TCLP); or
- Specified carcinogenic substances at a single or combined concentration of 0.001 percent.

State and federal regulations consider waste to be hazardous if the soluble concentration exceeds the federal regulatory level as determined by the TCLP. Because the TCLP involves a 20-to-1 dilution of the sample, the total concentration of a substance in the soil would need to exceed 20 times the regulatory level for the soluble concentration to exceed the regulatory level in the extract. A waste is also considered hazardous under state regulations if the soluble contaminant concentration exceeds the STLC as determined by the waste extraction test method. Because the waste extraction test analysis is performed using a 10-to-1 dilution of the sample, the total concentration of a substance would need to exceed 10 times the STLC for the soluble concentration to possibly exceed the STLC in the extract. A waste may also be classified as toxic if testing indicates toxicity greater than the specified criteria. Soil that is not classified as a hazardous waste can be accepted at a Class II or Class III designated landfill, depending on the waste acceptance criteria for the specific landfill. This soil may also be reused on-site or sent to a recycling facility for reuse at another site if it is non-hazardous and meets specific criteria. Typically, the concentrations of all chemicals should be less than RWQCB Residential ESLs for unrestricted on-site reuse or off-site recycling. On-site reuse is subject to approval by the SFDPH.

Asbestos-Containing Materials

Asbestos wastes transported off-site are considered a hazardous waste in accordance with the California Code of Regulations, Title 22, Division 4.5, Chapter 11, Article 3, Section 66261.24 if the asbestos is friable and the asbestos content is 1 percent or greater.

Lead-Based Paint

Demolition debris that is painted with intact lead-based paint may or may not be considered hazardous waste. In order for the entire item to be hazardous, the lead concentration in the paint and the painted item (i.e., door, beam, etc.) must exceed a TTLC of 1000 mg/kg of lead, STLC of 5 mg/L, or TCLP of 5 mg/L in accordance with the California Code of Regulations, Title 22, Division 4.5, Chapter 11, Section 66261.24. In most cases, the lead concentration from the intact paint alone will not exceed hazardous lead levels for both the item and the intact paint; therefore, most materials with intact lead-based paint can be disposed of through normal practices at a regularly licensed waste facility. If the paint has been separated from the building material (e.g., chemically or physically removed), then the paint waste should be evaluated independently from the building material to determine if it is hazardous and to identify the proper management practice.

Polychlorinated Biphenyls (PCBs)

In California, PCB wastes are regulated as hazardous waste under the California Code of Regulations, Title 22, Division 4.5, Chapter 11, Section 66261.24 if the PCB concentration exceeds TTLC of 50 mg/kg or the soluble concentration exceeds the STLC of 5 parts mg/L.

California Universal Waste Regulations

Universal wastes are hazardous wastes that are widely produced by households and many different types of businesses. Televisions, computers and other electronic devices as well as batteries, fluorescent lamps, mercury thermostats and other mercury-containing equipment, and other items are classified as universal wastes. California's Universal Waste Rule, included the California Code of Regulations, Title 22, Division 4.5, Chapter 11, Section 66261.9, allows individuals and businesses to transport, handle, and recycle these wastes in a manner that differs from the requirements for most hazardous wastes. The universal waste regulations contain specific requirements for universal waste handlers and transporters, as well as the destination facilities. These requirements for managing universal wastes are more relaxed than other hazardous materials management regulations and were adopted to ensure that the universal wastes are managed safely and are not disposed of in the trash.

California Fire Code

The California Fire Code, Article 80, includes specific requirements for the safe storage and handling of hazardous materials. These requirements reduce the potential for a release of hazardous materials and for mixing of incompatible chemicals, and specify the following specific design features to reduce the potential for a release of hazardous materials that could affect public health or the environment:

- Separation of incompatible materials with a non-combustible partition, or appropriate distance separation.
- Spill control in all storage, handling, and dispensing areas.
- Separate secondary containment for each chemical storage system. The secondary containment must hold the entire contents of the tank, plus the volume of water needed to supply the fire suppression system for a period of 20 minutes in the event of a catastrophic spill.

The California Fire Code, Article 79, includes specific requirements for the safe storage and handling of flammable and combustible liquids. Specific requirements address fire protection; prevention and assessment of unauthorized discharges; labeling and signage; protection from sources of ignition; specifications for piping, valving, and fittings; maintenance of aboveground tanks; requirements for storage vessels, vaults, and overfill protection; and requirements for dispensing, using, mixing, and handling of flammable and combustible liquids.

The California Fire Code, Chapter 33, specifies safety requirements to prevent fires during construction and demolition. This chapter specifies precautions that must be taken to protect against fire and procedures for management of flammable and combustible liquids as well as flammable gasses during construction. Requirements for providing a water supply for fire protection, portable fire extinguishers, and a means of egress are also addressed.

Transportation of Hazardous Materials and Wastes

The transport of hazardous materials is regulated by the California Highway Patrol under the California Vehicle Code. Specific requirements related to hazardous materials are specified in the California Code of Regulations, Title 13, Division 2, Chapter 6. These regulations specify container types, packaging requirements, and placarding requirements as well as requirements for licensing and training for truck operators and chemical handlers.

Regulatory requirements for the transport of hazardous wastes in California are specified in CCR 22 Division 4.5 Chapters 13 and 29. In accordance with these regulations, all hazardous waste transporters must have identification numbers, which are used to identify the hazardous waste handler and to track the waste from its point of origin to its final disposal disposition. This number, issued by either the USEPA or DTSC, depends on whether the waste is classified as hazardous by federal regulations or only under California regulations. Hazardous waste transporters must also comply with the California Vehicle Code, California Highway Patrol regulations (CCR Title 13). A hazardous waste manifest is required for transport of hazardous wastes. The hazardous waste manifest documents the legal transport and disposal of the waste, and is signed by the generator and transporter(s) of the waste as well as the disposal facility. California regulations specify specific cleanup actions that must be taken by a hazardous waste transporter in the event of a discharge or spill, and for the safe packaging and transport of hazardous wastes.

4.17.2.3 Local Regulations

Articles 21, 22, and 22A of the San Francisco Health Code, administered by the SFDPH, implement state and federal hazardous material and hazardous waste regulations and impose specific local requirements. These articles address the handling of hazardous materials, hazardous wastes, and facility closure as well as requirements for investigation of sites that may contain hazardous materials in the soil or groundwater. Article 22B of the San Francisco Health Code addresses dust control during construction activities. These regulatory requirements are discussed below.

San Francisco General Plan

The Community Safety Element of the *San Francisco General Plan* includes Objective 1, which requires the City to "reduce structural and non-structural hazards to life safety and minimize property damage resulting from future disasters." The Community Safety Element contains the following relevant hazardous materials policies in support of this objective:

> ***Policy 1.23*:** Enforce state and local codes that regulate the use, storage, and transportation of hazardous materials in order to prevent, contain, and effectively respond to accidental releases.
>
> ***Policy 1.24*:** Educate public about hazardous materials procedures including transport, storage, and disposal.

The Community Safety Element of the *San Francisco General Plan* also includes Objective 3, which requires the City to "establish strategies to address the immediate effects of a disaster." The Community Safety Element contains the following relevant emergency response and hazardous materials policies in support of this objective:

> ***Policy 3.1*:** After an emergency, follow the mandates of the Emergency Response Plan and Citywide Earthquake Response Plan.
>
> ***Policy 3.12*:** Address hazardous material and other spills by requiring appropriate cleanup by property owners per local, state, and federal environmental laws.

San Francisco Health Code Article 21 – Hazardous Materials

Article 21 of the San Francisco Health Code provides for safe handling of hazardous materials in the city. It requires any person or business that handles, sells, stores, or otherwise uses specified quantities of hazardous materials to keep a current certificate of registration and to implement a Hazardous Materials Business Plan (HMBP). A special permit is required for USTs. To close a facility (including USTs), a closure plan must be prepared that identifies how the need for future maintenance of the facility will be eliminated, how the threat to the environmental and public health and safety will be eliminated, and how all hazardous materials in the facility will be removed and appropriately disposed of. This article also requires that soil from the UST excavation, and possibly the groundwater, be sampled. Upon completion of closure, a final report documenting UST removal activities and any residual contamination left in place must be submitted to the City. Upon approval of this report, the City would issue a Certificate of

Completion. If a release were indicated, the site owner would be required to assess the extent of any contamination and conduct a site remediation, as needed, in compliance with the SFDPH Local Oversight Program requirements. The SFDPH could approve abandonment of the UST in place if removal were infeasible.

The project would increase the use of hazardous materials and generation of hazardous wastes at the SEP and would include the removal of USTs at the Asphalt Plant as well as closure of hazardous materials handling facilities at the Central Shops and Asphalt Plant.

San Francisco Health Code Article 22 – Hazardous Wastes

Article 22 of the San Francisco Health Code provides for safe handling of hazardous wastes in the city. It authorizes the SFDPH to implement the state hazardous waste regulations, including authority to conduct inspections and document compliance.

The project would generate hazardous wastes as a result of building demolition and excavation of soil containing hazardous materials.

San Francisco Health Code Article 22A – Site Investigation and Remediation

Article 22A of the San Francisco Health Code (also known as the Maher Ordinance) applies to any site identified within the Maher area as well as any site that is on a lot either currently or previously either zoned for or permitted for industrial use; within 150 feet of any of the elevated portions of U.S. Highway 101, Interstate 80, or Interstate 280; on a lot known or suspected by the SFDPH to contain hazardous substances in the soil and/or groundwater; or on a lot known or suspected by the SFDPH to contain or to be within 100 feet of a UST. Article 22A requires that a project sponsor evaluate the potential for site contamination and level of exposure risk associated with the project. Where such analysis reveals the presence of hazardous substances in excess of state or federal standards, the project sponsor is required to submit a site mitigation plan to the SFDPH or other appropriate state or federal agency(ies), and to remediate any site contamination in accordance with an approved site mitigation plan prior to the issuance of any building permit. For departments, boards, commissions and agencies of the CCSF such as the SFPUC that authorize construction or improvements on land under their jurisdiction where no building or grading permit is required, the ordinance requires that protocols be developed between that entity and the SFDPH that will achieve the environmental and public health and safety goals of Article 22A.

The project site is within a designated Maher area.

San Francisco Health Code Article 22B – Construction Dust Requirements

In July 2008, the City adopted amendments to San Francisco Health Code Article 22B and San Francisco Building Code Section 106.A.3.2.6, which collectively constitute the Construction Dust Control Ordinance. The ordinance requires that all site preparation work, demolition, or other construction activities within San Francisco that have the potential to create dust or to expose or disturb more than 10 cubic yards or 500 square feet of soil comply with specified dust control

measures whether or not the activity requires a permit from the Department of Building Inspection (DBI). For projects over one-half acre, the Construction Dust Control Ordinance requires that the SFPUC submit a Dust Control Plan for approval by the SFDPH. For construction on CCSF property, all agencies of the CCSF that authorize construction or improvements must adopt rules and regulations to ensure that the same dust control requirements that are set forth in the Construction Dust Control Ordinance are followed if no building, excavation, grading, foundation, or other permit needs to be obtained under the San Francisco Building Code. The Directors of the SFDPH and DBI assist the departments, boards, commission and agencies to ensure that these requirements are met.

The Construction Dust Control Ordinance requires the site owners and contractors responsible for construction activities to control construction dust on the site or implement other practices that result in equivalent dust control that are acceptable to the Director of Public Health. Dust suppression activities may include watering of all active construction areas sufficiently to prevent dust from becoming airborne; increased watering frequency may be necessary whenever wind speeds exceed 15 miles per hour. Reclaimed water must be used if required by Article 21, Section 1100 et seq. of the San Francisco Public Works Code.

The project would disturb soil throughout much of the 12.9-acre site and up to 12 acres at the staging areas located on Port property (Piers 94 and 96 and the Pier 94 Backlands).

San Francisco Building Code – Lead-Based Paint Regulations

Work that could result in disturbance of lead paint must comply with Section 3426 of the San Francisco Building Code, Work Practices for Lead-Based Paint on Pre-1979 Buildings and Steel Structures. Where there is any work that may disturb or remove lead paint on the exterior of any building built prior to 1979, Section 3426 requires specific notification[44] and work standards, and identifies prohibited work methods and penalties.

Section 3426 applies to the exterior of all buildings or steel structures on which original construction was completed prior to 1979 (which are assumed to have lead-based paint on their surfaces, unless demonstrated otherwise through laboratory analysis), and to the interior of residential buildings, hotels, and childcare centers. The ordinance contains performance standards, including establishment of containment barriers, at least as effective at protecting human health and the environment as those in the U.S. Department of Housing and Urban Development Guidelines (the most recent Guidelines for Evaluation and Control of Lead-Based Paint Hazards) and identifies prohibited practices that may not be used in disturbances or removal of lead-based paint. Any person performing work subject to the ordinance shall, to the maximum extent possible, protect the ground from contamination during exterior work; protect floors and other horizontal surfaces from work debris during interior work; and make all reasonable efforts to prevent migration of lead paint contaminants beyond containment barriers

[44] The required notices are similar to those commonly placed on residential and other buildings in San Francisco that are undergoing re-painting. These notices are generally affixed to a drape that covers all or portions of a building and are a required part of the Section 3425 notification procedure.

during the course of the work. Cleanup standards require the removal of visible work debris, including the use of a High Efficiency Particulate Air Filter vacuum following interior work.

The ordinance also includes notification requirements. Prior to the commencement of work, the responsible party must provide written notice to the Director of DBI of the address and location of the project; the scope of work, including specific location within the site; methods and tools to be used; the approximate age of the structure; anticipated job start and completion dates for the work; whether the building is residential or non-residential, owner-occupied or rental property; the dates by which the responsible party has fulfilled or will fulfill any tenant or adjacent property notification requirements; and the name, address, telephone number, and pager number of the party who will perform the work. Section 3426 contains provisions regarding inspection and sampling for compliance by DBI, as well as enforcement, and describes penalties for non-compliance with the requirements of the ordinance.

San Francisco Fire Code

The 2010 San Francisco Fire Code incorporates by reference the California Code of Regulations, Title 24, Part 9 (California Fire Code) including appendices adopted by the state. In addition, it incorporates portions of the 2009 International Fire Code that are not part of the California Fire Code.

4.17.2.4 Industry Standards

National Fire Protection Association (NFPA) Standard 820, Standard for Fire Protection in Wastewater Treatment and Collection Facilities, establishes minimum requirements to protect wastewater treatment facilities and associated collection systems against fire and explosion hazards. The standard applies to combined sewers, pumping stations, and wastewater treatment plants as well as other wastewater handling facilities. NFPA Standard 820 provides requirements specific to various wastewater treatment processes including both the liquid and solids treatment processes. General requirements are also included for fire and explosion prevention and protection, materials of construction, ventilation, and administrative controls.

4.17.3 Impacts and Mitigation Measures

4.17.3.1 Significance Criteria

The project would have a significant impact related to hazards and hazardous materials if the project were to:

- Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials;
- Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment;

- Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school;
- Be located on a site that is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, create a significant hazard to the public or the environment;
- For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, result in a safety hazard for people residing or working in the project area;
- For a project within the vicinity of a private airstrip, result in a safety hazard for people residing or working in the project area;
- Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan; or
- Expose people or structures to a significant risk of loss, injury, or death involving fire.

Due to the nature of the project, there would be no impact related to the following topics for the reasons described below:

- ***Safety Hazards from Public Airports.*** There is no public airport or public use airport within two miles of the project site. The nearest airport, San Francisco International Airport, is located approximately eight miles south of the project site. Therefore, this criterion is not applicable.
- ***Safety Hazards from Private Airstrips.*** There is no private airstrip in the project site vicinity. Therefore, this criterion is not applicable.

4.17.3.2 Approach to Analysis

Construction Impacts

Construction-related effects are impacts that could occur during construction activities. The analysis first identifies uses of and potential exposure to hazardous materials during construction, such as a release of hazardous materials used during construction activities, the potential for exposure to hazardous building materials during building demolition, the potential for exposure to hazardous materials in soil and groundwater, and use of extremely hazardous materials or emission of TACs within one-quarter mile of a school. The impact analysis assumes that all construction would be completed in compliance with applicable regulations, including BAAQMD Regulation 11, Rule 2 (Asbestos Demolition, Renovation, and Manufacturing); Section 3426 of the San Francisco Building Code; the Cal/OSHA Lead in Construction Standard; Articles 22A and 22B of the San Francisco Health Code; Articles 4.1 and 4.2 of the San Francisco Public Works Code; the General Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities, Order No. 2009-0009-DWQ; and any other relevant hazardous waste disposal laws. If the project would implement the requirements of these regulations, the impact is considered less than significant. The impact analysis regarding potential impairment of emergency response assumes implementation of the Traffic Control Plan described in Chapter 2, *Project Description*.

Operational Impacts

Operational effects of the project would be related to the routine use, transport, and disposal of hazardous materials; the emission of TACs within one-quarter mile of a school; risk of fire; and interference with emergency response. The impact analysis assumes that the use of hazardous materials and management of hazardous wastes would occur in compliance with applicable regulations, including Articles 21 and 22 of the San Francisco Health Code. The impact analysis for the emission of TACs within one-quarter mile of a school assesses whether the emissions would result in adverse health effects on the staff and students at the school. If so, the analysis assumes implementation of mitigation measures specified in Section 4.8, Air Quality. The impact analysis for interference with emergency response and fire risks assumes implementation of the SFPUC Emergency Operations Plan, the San Francisco Fire Code, and NPFA standards.

Cumulative Impacts

Section 4.1.3, Approach to Cumulative Impact Analysis and Cumulative Projects, describes the overall approach to the cumulative analysis for those topics using a list based approach and summarizes past, present, and reasonably foreseeable future cumulative projects in the vicinity of the project that could contribute to a cumulative impact; please refer to Table 4.1-1 and Figure 4.1-1 for a description and location of potential cumulative projects in the vicinity of the BDFP.

The geographic scope of potential hazards and hazardous materials impacts is restricted to the project site and immediate vicinity because related risks are relatively localized or even site-specific. Similar to the analysis for project impacts, the cumulative impact analysis assumes that construction and operation of other projects in the immediate vicinity would also be completed in compliance with applicable regulations, including BAAQMD Regulation 11, Rule 2; Cal/OSHA's Lead in Construction Standard; Articles 21, 22, 22A, and 22B of the San Francisco Health Code; Articles 4.1 and 4.2 of the San Francisco Public Works Code; the General Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities; and the San Francisco Fire Code. The analysis considers whether or not there would be a significant, adverse cumulative impact associated with project implementation in combination with past, present, and probable future projects in the immediate vicinity, and if so, whether or not the project's incremental contribution to the cumulative impact would be considerable. Both conditions must apply in order for a project's contribution to cumulative effects to be deemed cumulatively considerable (significant). If so, then mitigation measures are identified to reduce the project's contribution to the extent feasible.

4.17.3.3 Impact Evaluation

Construction and Operational Impacts

Impact HZ-1: Project construction and operation would not result in a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials. (Less than Significant)

Construction Impacts

Project construction would require the use of routine hazardous materials such as fuels, lubricants, and solvents for construction vehicles and equipment. Without adequate management, the storage and use of hazardous materials at the project site and off-site staging areas could result in the accidental release of small quantities of hazardous materials, which could result in exposures for construction workers, degradation of soils, and/or entrainment in stormwater runoff affecting the downstream environment.

As discussed under Impact HY-1 in Section 4.16, Hydrology and Water Quality, grading and excavation at the project site and any of the staging areas would be subject to Article 4.2 of the San Francisco Public Works Code (Section 146). For construction uses at the off-site staging areas at the Pier 94 Backlands, Pier 94, and Pier 96, which are not within the area serviced by the combined sewer system, the construction activities would also be subject to the State Water Resources Control Board (SWRCB) General Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities, Order No. 2009-0009-DWQ if preparation of the staging areas would disturb more than one acre of land.

Article 4.2 requires implementation of an Erosion and Sediment Control Plan for projects that disturb more than 5,000 square feet of land, and the Construction General Stormwater Permit requires implementation of a Stormwater Pollution Prevention Plan (SWPPP) for projects that disturb one or more acres of land. Article 4.2 provides that for projects subject to both regulatory requirements, the SWPPP may be prepared in lieu of the Erosion and Sediment Control Plan. These plans would include best management practices to minimize the risk of a hazardous materials release during construction activities. The best management practices would include protection measures for the temporary on-site storage of fuel and other hazardous materials used during construction, including requirements for secondary containment and berming to prevent any release from reaching an adjacent waterway or stormwater collection system. All equipment and materials storage would be routinely inspected for leaks, and records would be maintained for documenting compliance with the storage and handling of hazardous materials. As the administering agency, the SFPUC would review and approve the plans prior to implementation, and would conduct periodic inspections to ensure compliance with the plans.

Regarding transport, the project would be required to comply with the regulations of the California Highway Patrol related to the transportation of hazardous materials. With implementation of the approved controls discussed above, subject to approval and inspection by the City, and compliance with hazardous materials transportation regulations, the potential for releases of

hazardous construction materials during construction to result in a significant hazard to the public or the environment would be ***less than significant***.

Operational Impacts

As described in Chapter 2, *Project Description*, Table 2-9, operation of the project would increase the use of several chemicals at the SEP, including polymer for thickening and dewatering of biosolids, ferric chloride for struvite control, and diesel for a backup generator. The BDFP would also use relatively small quantities of sulfuric acid and potassium permanganate in the odor control systems, antiscalant and sodium hypochlorite (similar to bleach) for the Digestion Cooling Tower, sodium sulfite for the boiler system, and propane gas for turbine startup. None of these materials is considered extremely hazardous. These materials would be stored in appropriate containers with spill containment systems, within proposed buildings and handled in accordance with regulations for the safe storage and handling of hazardous materials.

The SFPUC would continue to comply with the City's hazardous materials handling requirements specified in Article 21 of the San Francisco Health Code. In accordance with this article, the SFPUC's HMBP for the SEP that is on file with the SFDPH would be revised to reflect the increased quantities of hazardous materials used. The HMBP includes chemical inventories, a program for reducing the use of hazardous materials and generation of hazardous wastes, site layouts, a program and implementation plan for training all new employees and annual training for all employees, and emergency response procedures and plans that provide for safe handling of hazardous materials, and also allows emergency responders to safely respond to a chemical emergency at the facility, if one were to occur. Any hazardous wastes produced would be managed in accordance with Articles 21 and 22 of the San Francisco Health Code.

Compliance with the San Francisco Health Code, which incorporates state and federal requirements, would minimize potential exposure of site personnel and the public to accidental releases of hazardous materials or waste and would also protect against a potential release that could cause environmental contamination. In addition, transportation of hazardous materials is well regulated by the California Highway Patrol and the California Department of Transportation, as discussed in Section 4.17.2.2, State Regulations, and operational transport of hazardous materials would be subject to these regulations. Therefore, with compliance with applicable hazardous materials regulations, the potential impacts related to the routine use, transport, and disposal of hazardous materials during operation of the BDFP would be ***less than significant***.

Mitigation: None required.

Impact HZ-2: Project construction and operation would not result in reasonably foreseeable conditions involving the release of hazardous building materials to the environment. (Less than Significant)

Construction Impacts

As described in Section 4.17.1.5, the BDFP would demolish structures that, because of their age, are likely to contain hazardous building materials, including asbestos-containing materials and lead-based paint. Electrical equipment may contain PCBs, while fluorescent light ballasts may contain PCBs or DEHP, and fluorescent light tubes would contain mercury vapors. Prior to demolition, the SFPUC would perform surveys to identify the presence of these materials in buildings to be demolished. During building demolition, workers and the public could be exposed to hazardous building materials if they were not abated prior to demolition. However, as discussed below and in Section 4.17.2, Regulatory Framework, there is a well-established regulatory framework for the abatement of hazardous building materials, and impacts related to exposure to these materials would be less than significant with compliance with regulatory requirements.

Asbestos-Containing Materials

In accordance with BAAQMD Rule 11, Regulation 2 (discussed in Section 4.17.2.2, State Regulations), the SFPUC would be required to retain a qualified contractor to conduct a survey to identify asbestos-containing materials in any building planned for demolition. If asbestos-containing materials are identified, the SFPUC would retain a qualified asbestos removal contractor certified as such by the Contractors Licensing Board of the State of California to remove the regulated materials prior to demolition activities. During removal activities, the contractor would implement controls to ensure that there are no visible asbestos emissions to the outside air. Such measures may include methods such as wetting exposed asbestos-containing materials or providing exhaust controls to prevent asbestos emissions to the outside air; and constructing a containment barrier around the building and maintaining negative air pressure within the containment barrier. The removal activities would be conducted in accordance with the state regulations contained in the California Code of Regulations, Title 8, Section 1529 and Sections 341.6 through 341.17. As the owner of the property, the SFPUC would be responsible for disposal of the asbestos-containing materials at a permitted disposal facility under the SFPUC's Hazardous Waste Generator Number. The contractor and hauler of the material would be required to file a Hazardous Waste Manifest that details the hauling of the material from the project site to the disposal site.

Implementation of the required procedures in accordance with the legal requirements described above would ensure that any potential impacts due the presence of asbestos-containing materials in any of the structures to be demolished would be ***less than significant***.

Lead-Based Paint

Disturbance of building and equipment components that include lead-based paint during demolition could result in exposure of workers and the public to lead. However, demolition activities would be subject to Section 3426 of the San Francisco Building Code and the Cal/OSHA Lead in Construction Standard (CCR 8 Section 1532.1), which are described in Section 4.17.2.2, State Regulations, and Section 4.17.2.3, Local Regulations.

Because the three Central Shops buildings were constructed in 1959, Building 870 at the SEP was constructed in 1952, the buildings at 1550 Evans were constructed in 1978, and underground structures at the former Asphalt Plant site were constructed in 1954, demolition of these structures would be subject to Section 3426 of the San Francisco Building Code. This section of the building code requires specific notifications and work standards, and identifies prohibited work methods and penalties. In accordance with this regulation, the SFPUC's contractor would be required to protect the ground from contamination and make all reasonable efforts to prevent migration of lead paint contaminants beyond containment barriers during the course of the work.

Lead-based paint continues to be used in some industrial applications. Demolition of the water pump station and electrical substation constructed at the SEP in the early 1980s along with demolition of the industrial equipment within all of the structures could encounter lead-based paint. These demolition activities would be subject to the requirements of the Lead in Construction Standard as well, which would require the SFPUC's contractor to develop and implement a lead compliance plan that describes activities that could emit lead, methods used to comply with the standard, safe work practices, and measures to protect workers from exposure to lead during construction activities.

Implementation of procedures required by Section 3426 of the San Francisco Building Code and the Lead in Construction Standard as part of the project would ensure that potential impacts of demolition of structures with lead-based paint would be ***less than significant***.

Other Hazardous Building Materials

Other hazardous building materials that could be present within the structures to be demolished include electrical transformers that could contain PCBs, fluorescent light ballasts that could contain PCBs or DEHP, and fluorescent light tubes that could contain mercury vapors, some of which would be classified as universal wastes under California law. Because electrical transformers that contain PCBs, fluorescent light ballasts that contain PCBs or DEHP, fluorescent light tubes, and any universal wastes encountered during demolition would be removed and disposed of in accordance with the established regulatory framework described in Section 4.17.2.2, State Regulations (under the heading "Hazardous Waste Classification"), impacts related to exposure to other hazardous building materials during demolition activities would be ***less than significant.***

Operational Impacts

Operation of the BDFP would not require the demolition of any structures with asbestos-containing materials or lead-based paint. Removal of any universal wastes such as fluorescent light tubes would continue to comply with applicable laws and regulations. Therefore, impacts related to encountering hazardous building materials during operation would be ***less than significant.***

Mitigation: None required.

Impact HZ-3: Project construction and operation would not release hazardous emissions or handle acutely hazardous materials, substances, or waste within one- quarter mile of an existing or proposed school. (Less than Significant)

Section 15186 of the California Environmental Quality Act (CEQA) Guidelines requires that the environmental document for projects that are located within one-quarter mile of a school address the use of extremely hazardous materials and emission of hazardous air emissions. The Wu Yee South East Child Development Center is located within the Southeast Community Facility, within one-quarter mile of the project site. The State of California defines acutely hazardous materials as extremely hazardous materials in Section 25532(i)(2) of the Health and Safety Code. Construction of the project would use only common hazardous materials such as paints, solvents, cements, adhesives, and petroleum products (such as asphalt, oil, and fuel). None of these materials is considered extremely hazardous. In addition, the project would not use any extremely hazardous materials during operation.

Hazardous air emissions include the TACs that are listed in Title 17 of the California Code of Regulations, Section 93000 (refer to Section 4.8, Air Quality). Impacts associated with TAC emissions are addressed in Impact AQ-3 in Section 4.8, Air Quality. Thus, impacts related to hazardous emissions or the use of extremely hazardous materials within one- quarter mile of a school would be ***less than significant***.

Mitigation: None required.

Impact HZ-4: The project would be located on a site that is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5; however, project construction and operation would not result in a significant hazard to the public or the environment under reasonably foreseeable conditions. (Less than Significant)

Construction Impacts

As discussed in Section 4.17.1, Setting, the SEP, Central Shops, and Asphalt Plant are included on a list of hazardous materials sites compiled by one or more government regulatory agencies. The SFPUC has conducted investigations to evaluate soil and groundwater conditions at these sites and detected several chemicals at concentrations exceeding ESLs or DTSC SLs for commercial/industrial workers. Because project construction would include the excavation of approximately 190,000 cubic yards of soil at the project site, the public could be exposed to hazardous materials in the soil as a result of airborne dust or entrainment in stormwater runoff from the project site unless proper precautions are implemented. In addition, excavation at the project site would require dewatering of groundwater encountered in the excavated areas, and groundwater sampling has indicated that the concentrations of some chemicals in the groundwater exceed the SFPUC batch wastewater discharge requirements specified in Article 4.1 of the San Francisco Public Works Code (described in Section 4.16, Hydrology and Water Quality). At some locations, concentrations of metals in soil (predominantly lead) exceed state or federal hazardous waste criteria and the soil would require disposal at appropriate permitted hazardous waste landfill.

Similarly, soil samples from the Pier 94 Backlands area contained lead at concentrations greater than the ESL, and some portions of the soil would be classified as a California hazardous waste based on total or soluble lead concentrations. At staging areas, shallow excavations would be needed for installation of water and sewer lines and demolition of the existing buildings at 1550 Evans Avenue, but the volume of soil requiring excavation has not been quantified. Due to the limited depth of excavation in the staging areas, no groundwater dewatering would be required during construction.

In addition, the public could be exposed to hazardous materials during removal of subsurface structures at the Asphalt Plant site, including the four concrete underground tanks that formerly contained asphaltic materials as well as during removal of the hazardous materials handling facilities at the Central Shops prior to building demolition. Workers could be exposed to hazardous materials in soil vapors as a result of placement of construction trailers within the regulated landfill at Pier 94 and the Pier 94 Backlands.

Without proper controls, these construction activities could expose the public or the environment to hazardous materials. However, as discussed below, there is a robust set of regulatory requirements for site investigation and cleanup, discharge of dewatering effluent, and closure of facilities that handled hazardous materials as well as for the transportation and disposal of hazardous wastes. In addition, the WDRs for the regulated landfill include specific requirements for construction within the regulated landfill. Implementation of these requirements would ensure that the excavation, handling, and disposal of soil and groundwater containing hazardous materials during construction would not result in a significant hazard to the public or the environment.

Soil Excavation

Maher Ordinance Requirements. The BDFP and staging areas are all located within a Maher area. Therefore, the project is subject to Article 22A of the San Francisco Health Code (the Maher Ordinance), which is administered and overseen by the SFDPH. The project site and staging areas are in different stages of compliance with the Maher Ordinance. Therefore, this impact analysis describes the overall requirements of the ordinance, then discusses that status of compliance for the project site, adjacent staging areas, and staging areas on Port property.

The Maher Ordinance requires the SFPUC to retain the services of a qualified professional to prepare a Phase I Environmental Site Assessment that meets the requirements of San Francisco Health Code Section 22A.6. The Phase I Environmental Site Assessment would determine the potential for hazardous materials to be present in the soil and groundwater and the level of exposure risk associated with the project. Based on that information, the SFPUC may be required to conduct soil and/or groundwater sampling and analysis. Where such analysis reveals the presence of hazardous substances in excess of state or federal standards, the SFPUC would be required to submit a site mitigation plan to SFDPH or other appropriate state or federal agency(ies), and to remediate any site contamination in accordance with an approved site mitigation plan prior to the issuance of any building permit. For departments, boards, commissions and agencies of the CCSF that authorize construction or improvements on land under their jurisdiction where no building or grading permit is required, the ordinance requires

protocols be developed between that entity and SFDPH that will achieve the environmental and public health and safety goals of Article 22A.

In accordance with these requirements, the SFPUC conducted soil and groundwater sampling to characterize the concentration of chemicals in the soil and groundwater at the project site.[45] In August 2016, the SFDPH approved the subsurface investigation report summarizing this sampling, and required SFPUC to prepare and implement a site mitigation plan, dust control plan, and health and safety plan for construction.[46] In their approval of the subsurface investigation report, the SFDPH also required submittal of a final report at the completion of the project. All of these required plans and reports would be prepared prior to construction and would be subject to review and approval by the SFDPH.

The Maher Ordinance would also require the SFPUC to conduct a Phase I Environmental Site Assessment, and possibly soil and groundwater sampling, at any off-site staging areas that would involve the excavation of more than 50 cubic yards of soil (i.e., potentially the Pier 94 Backlands or 1550 Evans Avenue). If indicated on the basis of the sampling in all areas, the SFPUC would prepare a site mitigation plan for SFDPH review and would implement the site mitigation plan during construction.

San Francisco Dust Control Ordinance. The public would also be protected against exposure to chemicals in airborne dust because the contractor would be required to implement the requirements of Article 22B of the San Francisco Health Code, San Francisco's Dust Control Ordinance. In accordance with the Dust Control Ordinance, the SFPUC's construction contractor(s) would submit a Dust Control Plan for approval by the SFDPH for construction activities at the SEP. The plan would describe dust suppression activities to prevent dust from becoming airborne, dust monitoring requirements, action levels that would require implementation of corrective actions, and corrective actions that would be implemented if action levels are exceeded or a dust complaint is received. The requirements of Article 22B are discussed in more detail in Section 4.8, Air Quality. Although construction activities at Pier 94, Pier 96, and the Pier 94 Backlands would likely disturb more than one-half acre of land, the SFPUC may obtain a waiver from the SFDPH because there are no sensitive receptors within 1,000 feet of these proposed staging areas.

Construction Site Runoff Control Requirements. Implementation of stormwater BMPs in accordance with the Erosion Control Plan prepared under Article 4.2 of the San Francisco Public Works Code, Section 147, and the SWPPP prepared for construction activities on Port property would ensure that hazardous materials are not transported off-site in stormwater during project construction. These regulatory requirements are discussed above under Impact HZ-1.

[45] BDFP Consulting Team, Environmental Site Investigation Report for San Francisco Department of Public Health Article 22A Compliance, May 2016.

[46] San Francisco Department of Public Health, Subsurface Investigation Approval, Sewer Improvement Project, Southeast Water Pollution Control Plant, Biosolids Digester Facility, 1800 & 1801 Jerrold Avenue and 750 & 1150 Phelps Street, San Francisco, CA. EHB-SAM No. -SMED: 1293. August 29, 2016.

With implementation of the regulatory requirements discussed above, soil excavation would result in a ***less-than-significant*** impact related to construction within areas of soil containing hazardous materials.

Dewatering

During BDFP construction, groundwater produced by dewatering would be discharged to the combined sewer system in compliance with Article 4.1 of the San Francisco Public Works Code, as supplemented by Order No. 158170. Section 4.16, Hydrology and Water Quality, describes these regulatory requirements. In accordance with Article 4.1, groundwater produced during the limited dewatering would be pumped to baker tanks or other containment, tested, and treated to ensure compliance with the discharge limitations of Article 4.1 of the San Francisco Public Works Code and Order No. 158170. Treatment could include methods such as using settling tanks to remove sediments, filters to remove suspended solids, and other methods to meet chemical-specific discharge limitations. The chemical-specific treatment method used would depend on the chemicals that exceed the specified discharge limitation but could include methods such as filtration or activated carbon treatment to reduce chemical concentrations as necessary to meet permit requirements prior to discharge. Impacts related to discharge of the groundwater produced during construction-related dewatering would be ***less than significant*** with compliance with the specified discharge limitations.

Closure of USTs and Hazardous Materials Handling Facilities

Construction of the BDFP would include closure of USTs at the Asphalt Plant and other hazardous materials handling facilities at the Central Shops in accordance with Article 21 of the San Francisco Health Code. This article would require a closure plan identifying how the need for future maintenance of the facility will be eliminated, how the threat to the environment and public health and safety will be eliminated, and how all hazardous materials in the facility will be removed and appropriately disposed of. For USTs, the closure plan would identify appropriate requirements for disposition of any remaining hazardous materials in the tank and the tank itself. The closure plan would be submitted to the SFDPH for approval prior to removal of the UST. Soil from the UST excavation, and possibly the groundwater, would also be sampled in accordance with Article 21. Upon completion of closure, a release or contamination report would be submitted to the SFDPH if a release were indicated on the basis of visual observations or sampling, and a final report documenting tank removal activities and any residual contamination left in place would be submitted to the SFDPH. Upon approval of this report, the SFDPH would issue a Certificate of Completion. If a release were indicated, the SFPUC would be required to submit a corrective action plan, including a community health and safety plan, to the SFDPH and the RWQCB, and remediation would be required in accordance with federal, state, and local regulations. Alternatively, the UST could be abandoned in place if removal were infeasible. Implementation of the measures required in accordance with Article 21 of the San Francisco Health Code would ensure that hazardous materials impacts associated with UST removal and closure would be ***less than significant***.

Transportation and Disposal of Hazardous Materials

The environmental investigation report estimates that the following volumes of soil would require disposal as hazardous waste:

- 4,000 cubic yards of soil from the Boneyard would be classified as a California hazardous waste. (This is the location of the proposed Biosolids Dewatering Facility.)
- 2,000 cubic yards from the Asphalt Plant would be classified as a California hazardous waste.
- 1,000 cubic yards from the Central Shops would be classified as a federal hazardous waste.
- 38,000 cubic yards from the Central Shops would be classified as a California hazardous waste.

As the generator of the hazardous wastes, the SFPUC would be required to follow state and federal regulations for manifesting wastes, using licensed waste haulers, and disposing the materials at a permitted disposal or recycling facility. These requirements are described in Section 4.17.2.2, State Regulations (under the heading "Transportation of Hazardous Materials and Wastes"). Compliance with these regulatory requirements would ensure that impacts related to disposal of hazardous wastes would be ***less than significant***.

Possible Siting of Construction Offices on a Regulated Landfill

Portions of the Pier 94 Backlands and Pier 94 are located on a listed landfill site that received unauthorized municipal debris in the 1960s and 1970s (see Figure 4.17-1). This area is regulated as a solid waste disposal site under a WDR issued by the RWQCB. During BDFP construction, temporary trailers and restroom facilities would be located at the staging areas at the Pier 94 Backlands and on Pier 94 and/or Pier 96 for approximately five years. Portions of the Pier 94 and Pier 94 Backlands staging areas include this regulated landfill. Because the future availability and configuration of staging areas at the Port are not currently known, it is possible that construction offices would be located on top of the regulated landfill area, potentially exposing building occupants to harmful landfill gases such as methane and VOCs. Compliance with WDRs would require RWQCB approval of any changes to site development, including the proposed staging area uses. The RWQCB would require additional studies to confirm the potential presence of landfill gases and any landfill gas controls needed to ensure the safe occupancy of proposed structures. With compliance with the WDR requirements, the potential adverse effects of landfill gases on construction workers at the staging area would be ***less than significant***.

Operational Impacts

As discussed in Section 4.17.1, Setting (under the heading "Environmental Investigations and Underground Tank Removals"), soil at the SEP, Asphalt Plant, and Central Shops contains several chemicals at concentrations exceeding commercial/industrial ESLs. Therefore, without proper precautions, future site workers could potentially experience adverse health effects if exposed to the soil for a sufficient period of time and off-site migration of soil from the project site could potentially cause adverse environmental effects. However, construction of the BDFP would remove much of the soil, and the construction of new structures and paved areas under the BDFP would preclude future contact with and off-site migration of any soil remaining in

place once the project is constructed. Further, operation of the project would not require additional earthmoving activities that could generate dust.

The site mitigation plan prepared in accordance with the Maher Ordinance, described above, would specify any measures the SFPUC would put in place to manage future contact with the site soil during normal operations and minimize the off-site migration of soil. The SFDPH would review the site mitigation plan and ensure that the proposed measures are protective of future site occupants and the environment. Therefore, operation of the BDFP on a listed hazardous materials site would not cause a significant hazard to the public or the environment. This impact would be ***less than significant***.

Mitigation: None required.

Impact HZ-5: Project construction and operation would not impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan. (Less than Significant)

Construction Impacts

BDFP construction would not conflict with the San Francisco Emergency Response Plan, because the plan does not designate emergency response or evacuation routes, and the project would not otherwise impair implementation of this plan. However, the project would be considered to have a significant impact on implementation of emergency response or emergency evacuation if construction activities interfered with emergency response vehicle travel or restricted access to critical facilities such as hospitals or fire stations. Project construction would close Jerrold Avenue between Phelps Street and the Caltrain tracks to through traffic for approximately five years, which could impede emergency response traffic. However, as discussed in Chapter 2, *Project Description*, the SFPUC or its contractor would prepare and implement a Traffic Control Plan that conforms to the San Francisco Municipal Transportation Agency's (SFMTA) Blue Book. The Traffic Control Plan would require coordination of construction with facility owners or administrators of police and fire stations (including all fire protection agencies), transit stations, hospitals, and schools. In accordance with the plan, facility owners or operators would be notified in advance of the timing, location, and duration of construction activities and the locations of detours and lane closures. Emergency service vehicles would be given priority for access. As a result, implementation of the Traffic Control Plan would provide adequate access such that project construction would not interfere with emergency response or evacuation activities and this impact would be ***less than significant***.

Operational Impacts

Upon completion of construction, Jerrold Avenue would be reopened to through traffic and detours around the site would no longer be needed. Quint Street would remain closed. The SEP operations would continue to conform to the SFPUC Wastewater Enterprise Emergency

Operations Plan, which would be modified to include the BDFP.[47] The Emergency Operations Plan outlines the Wastewater Enterprise's overall emergency preparedness measures, emergency management organization, emergency operations, roles, and responsibilities. Contingency plans supplement the Emergency Operations Plan and are incorporated by reference; these include the Operations and Maintenance Manual, which outlines detailed procedures for the operation of equipment or facilities during or in response to an emergency. The SEP Contingency Plan was developed to ensure that wastewater facilities remain in operation, or are rapidly returned to operation, in the event of an emergency. The plan includes emergency response operating procedures for power failures, equipment failures, treatment plant security, spills, and discharges of chemicals or sewage.[48] In addition, the SEP HMBP contains procedures for emergency response to hazardous materials incidents. The SEP Contingency Plan and HMBP would be updated, as required by law, to include the BDFP operations and to ensure that the new biosolids treatment facilities and operations would not impair implementation of the SEP emergency response plans. Because operation of the BDFP would conform to the modified SEP Contingency Plan and HMBP, this impact would be ***less than significant***.

Mitigation: None required.

Impact HZ-6: Project construction and operation would not result in a significant risk of loss, injury, or death involving fire. (Less than Significant)

Construction Impacts

As discussed in Impact HZ-1, construction activities would involve the use of flammable materials such as fuels, oils, solvents, and compressed gases for welding. If handled or stored improperly, these materials could ignite and result in fire. However, the construction contractor would comply with the California Fire Code requirements for Fire Safety during Construction and Demolition,[49] including requirements for storage of flammables, accumulation of debris, site work such as welding, and operation of motor vehicles. In addition, these regulations require the preparation of a fire prevention program in cooperation with the fire chief, training of responsible personnel in the use of fire protection equipment, maintenance of fire protection equipment and water supply for fire protection on-site, and vehicle access for firefighting on the project site. Further, as described above and in Section 4.6, Transportation and Circulation, emergency vehicles would have local access during construction for fire response. Compliance with these regulations would ensure that impacts related to the risk of fires during construction would be ***less than significant***.

47 Metcalf&Eddy/AECOM, *SFPUC Wastewater Enterprise Emergency Operations Plan*, May 2008.
48 SFPUC, Program Management Consultant, *Contingency Plan, Southeast Water Pollution Control Plant as required by NPDES Permit No. CA0037664, Regional Water Board Resolution 74-10*, August 2013.
49 California Fire Code, Chapter 33.

Operational Impacts

Project facilities would be designed and constructed in accordance with fire safety requirements set forth in the California Fire Code and industry standards. As discussed in Chapter 2, *Project Description*, the BDFP would store and use flammable materials, including a 50-foot-diameter steel digester gas storage tank, a 1,000-gallon diesel fuel storage tank for the backup generator, and two propane gas cylinders for turbine startup fuel. California Fire Code Article 79 includes specific requirements for the safe storage of flammable and combustible liquids. In addition, the NFPA develops and publishes consensus codes and standards intended to minimize the possibility and effects of fire and other risks. While not regulations, these codes and standards are industry-accepted guidelines for construction and fire protection systems. NFPA Standard 820 establishes the standard for fire protection in wastewater treatment and collection facilities, which would be applicable to the Digester Gas Storage facility. Additional relevant codes include a fuel gas code, a standard on explosion prevention systems, and standards for fire prevention during welding and other construction activities.

The project would increase the generation of digester gas, a flammable gas, from the current production rate of 1.3 million cubic feet per year to 2 million cubic feet per year by 2045. The proposed digester gas storage system would be similar to the system operated at the Oceanside Water Pollution Control Plant, which is a gasholder submerged in a steel water tank. This arrangement pressurizes the digester gas handling system and provides a buffer between the anaerobic digesters and digester gas use facilities. The tank would be equipped so that increases in digester gas pressure would automatically trigger the waste gas burners and combust the digester gas until the pressure in the system has been reduced. This storage system and all of the biosolids handling facilities would be constructed in accordance with NFPA Standard 820, which specifies ventilation requirements for wastewater treatment facilities that generate digester gas. Implementation of this standard would ensure that explosive vapors do not accumulate at dangerous levels. Implementation of these requirements and other measures to prevent and protect against fire and explosion hazards in accordance with NFPA Standard 820 would ensure that project operations would not result in a significant risk of loss, injury, or death involving fire or explosions and this impact would be ***less than significant.***

Mitigation: None required.

Cumulative Impacts

Impact C-HZ-1: The project, in combination with past, present, and probable future projects, would not substantially contribute to cumulative hazards or hazardous materials impacts. (Less than Significant)

Hazardous materials impacts related to the project could result from using hazardous materials, constructing and operating the project within soil and groundwater containing hazardous materials, and demolishing structures that contain hazardous building materials. In addition, the project could result in hazards related to emergency response impairment and fires.

Table 4.1-1 and Figure 4.1-1 summarize cumulative projects in the vicinity of the BDFP. Those projects that are at or adjacent to the SEP, involve construction, but have not yet been constructed or completed construction include the following (project sponsor is shown in parentheses following project name):

- Southeast Plant Headworks Replacement Project (SFPUC)
- SEP Existing Digester Gas Handling Improvements (SFPUC)
- SEP Building 521 Replacement/ 522 Disinfection Upgrade (SFPUC)
- SEP Power Feed and Primary Switchgear Upgrades (SFPUC)
- SEP Primary/Secondary Clarifier Upgrades (SFPUC)
- SEP Seismic Reliability and Condition Assessment Improvements (SFPUC)
- SEP Oxygen Generation Plant Replacement (SFPUC)
- SEP Repair and Replacement (R&R) Projects (SFPUC)
- Demolition of the Existing SEP Digesters and Southside Renovation Project (SFPUC)
- Eastside Recycled Water Project (SFPUC)
- Central Shops Relocation and Land Reuse (SFPUC)
- Southeast Greenhouses Demolition (SFPUC)
- Central Bayside System Improvement Project (SFPUC)
- Quint Street Lead Track (Port of San Francisco and Federal Railroad Administration)
- Peninsula Corridor Electrification Project (Caltrain Peninsula Corridor Joint Powers Board)

As shown, most of these projects are proposed by the SFPUC and would involve construction within and adjacent to the SEP property. In addition, the Pier 94 Backlands Improvement Project could involve industrial uses such as the production of biofuel.

Routine Use or Release of Hazardous Materials

As discussed above, compliance with applicable regulatory requirements would ensure that the project would not result in any significant impacts with respect to hazards or hazardous materials (Impacts HZ-1 through HZ-3). All cumulative development in San Francisco would be subject to the same regulatory framework as the project for the transport, use, and storage of hazardous materials. Compliance with these existing regulations would ensure that any cumulative impacts related to exposure to hazardous materials would be ***less than significant.***

Hazardous Emissions near Schools

As discussed in Impact HZ-3, the project would not use extremely hazardous materials so it would not contribute to any cumulative impacts related to the use of these materials. While the project would emit DPM, a TAC, cumulative impacts related to these emissions are discussed in Section 4.8, Air Quality (Impact C-AQ-2).

Interference with an Adopted Emergency Response Plan or Emergency Evacuation Plan

As discussed in Impact HZ-5, the project would not conflict with the City's Emergency Response Plan. Project construction would close Jerrold Avenue to through traffic for the five-year duration of construction. However, as discussed in Chapter 2, *Project Description*, the SFPUC or its contractor would prepare and implement a Traffic Control Plan that conforms to the SFMTA's Blue Book. The Traffic Control Plan would require coordination of construction with facility owners or administrators of police and fire stations (including all fire protection agencies), transit stations, hospitals, and schools. In accordance with the plan, facility owners or operators would be notified in advance of the timing, location, and duration of construction activities and the locations of detours and lane closures. Emergency service vehicles would be given priority for access. Implementation of the Traffic Control Plan would provide adequate access such that project construction, in combination with other construction projects, would not interfere with emergency response or evacuation activities and this cumulative impact would be ***less than significant***.

Project operations would increase truck trips by an estimated four trips per day, which is expected to have a negligible effect on local area roadways; therefore, operation of the project in combination with other cumulative projects would not cause a significant cumulative hazards impact related to the impairment of emergency response.

Risk of Fires

Construction of the project and other cumulative projects would likely use similar flammable materials, such as fuels, lubricants, and welding materials, that would contribute to a risk of fires. Because each project in the cumulative scenario would be required to comply with the San Francisco Fire Code as would the project (see Impact HZ-6), the cumulative impact of BDFP construction in combination with other planned projects would be ***less than significant***.

Project operation would result in a less-than-significant impact related to loss and damage from fires due to handling of digester gas, storage of diesel fuel, and flammable gas. The only other project in the cumulative scenario that would handle or store digester gas is the Pier 90-94 Backlands, which may include industrial uses such as biofuel production. However, this site is more than one-half mile from the BDFP and would not contribute to fire risk at the project site. Other projects may possibly store fuels and propane gas, and those projects would be subject to the San Francisco Fire Code and HMBP regulations that would reduce the potential for fires, as well as be required to provide information to the San Francisco Fire Department about the types of flammable materials stored on-site to facilitate appropriate fire response. Therefore, the cumulative impact of BDFP operation in combination with other planned projects on fire risk would be ***less than significant.***

Mitigation: None required.

4.18 Mineral Resources, Energy Resources, and Water Use

This section identifies and evaluates impacts related to mineral resources, energy resources, and water use that could result from implementation of the Biosolids Digester Facilities Project (BDFP or project). The section discusses existing energy, fuel, and water use at the Southeast Water Pollution Control Plant (Southeast Plant or SEP) and examines whether implementation of the project would result in the consumption of large amounts of energy, fuel, or water, or would use such resources in a wasteful manner. This section also addresses the project's impacts on mineral resources. Mitigation measures are identified to avoid or reduce adverse impacts, as appropriate. The project's impacts on water supply are addressed in Section 4.12, Utilities and Service Systems. The project's impacts related to energy usage as it may affect climate change, including measures to reduce greenhouse gas emissions, are discussed in Section 4.9, Greenhouse Gas Emissions.

4.18.1 Setting

4.18.1.1 California's Energy Use and Supply

Forms of energy generated or obtained within California include electricity from fossil fuel, hydroelectric, nuclear, and renewable sources; natural gas; and petroleum. California's energy system provides 71 percent of the electricity, 10 percent of the natural gas, and 38 percent of the petroleum consumed in or used for the state. The rest of the state's energy is imported, and includes electricity from the Pacific Northwest (8 percent, primarily hydroelectric) and the Southwest (21 percent, primarily coal and nuclear); natural gas purchases from Canada (22 percent), the Rocky Mountain states (23 percent), and the Southwest (42 percent); and crude oil imported from Alaska (12 percent) and foreign sources (50 percent).[1]

Electricity

Statewide Use and Supply

The production of electricity requires the consumption or conversion of energy resources such as water, wind, oil, gas, coal, solar, geothermal, and nuclear sources. Of the electricity generated in-state, 61.3 percent is generated by natural gas-fired power plants, 0.5 percent is generated by coal-fired power plants, 7.1 percent comes from large hydroelectric dams, and 8.6 percent comes from nuclear power plants. The remaining in-state total electricity production (22.5 percent) is supplied by renewable sources such as biomass, geothermal, small hydroelectricity, solar, and wind.[2]

On a per capita basis, Californians consume approximately 6,721 kilowatt-hours (kWh) of electricity annually, the lowest statewide per capita consumption in the country. In comparison,

[1] California Energy Commission, California's Major Sources of Energy, 2011.
[2] California Energy Commission, Energy Almanac – Total Electricity System Power, *2014 Total System Power in Gigawatt Hours*, data as of June 30, 2016. Available online at http://energy.ca.gov/almanac/electricity_data/system_power/2014_total_system_power.html. Accessed on January 12, 2017.

the average annual U.S. per capita consumption is 12,146 kWh.[3] However, California's overall electricity consumption is second only to that of Texas.

Use and Supply within San Francisco

In 2014, electricity consumption in San Francisco was 5.8 billion kWh.[4] This use is forecast to grow at the rate of 1.3 percent per year to approximately 8 billion kWh per year by 2030.[5]

Electricity in San Francisco is primarily provided by three sources: the Pacific Gas and Electric Company (PG&E), the San Francisco Public Utilities Commission (SFPUC) Power Enterprise, and direct access providers (i.e., purchase of electric energy directly from energy generators or other suppliers). San Francisco receives 73 percent of its electricity from PG&E,[6] which also provides natural gas and electricity to most of Northern California. The PG&E power mix for 2014 was as follows: 24 percent natural gas, 21 percent nuclear, 27 percent eligible renewables (described below), 8 percent large hydroelectric, and 21 percent unspecified power.[7] The SFPUC is the municipal power utility that provides electrical services to all City and County of San Francisco (City) facilities, services, and customers, which include the following: San Francisco International Airport; San Francisco General Hospital; San Francisco Municipal Railway; police services, fire services, retail City tenants, residences, and businesses in the San Francisco Shipyard; and Treasure Island. The SFPUC provides approximately 16 percent of San Francisco's electricity from the Hetch Hetchy Power system or local renewable sources operated by the SFPUC Power Enterprise.[8] The Hetch Hetchy Power system is composed of three hydroelectric powerhouses with a combined total hydroelectric output of nearly 400 megawatts (MW).[9] This clean energy is transmitted to San Francisco along PG&E and City-owned transmission lines that traverse California from east to west. Within San Francisco, the SFPUC also generates over 10 MW of clean, renewable energy from San Francisco's 19 solar arrays and two digester gas cogeneration facilities. (See discussion below regarding cogeneration facilities at the SEP.) The Hetch Hetchy Power system comprises 98.8 percent of the power supply from the SFPUC Power Enterprise, while in-City renewable resources comprise 1.2 percent. Direct access to electricity providers was created as a result of California restructuring its electricity industry in 1998. Fewer than 800 customers in San Francisco use direct access, but they constitute about 11 percent of the total energy usage in San Francisco.[10]

Natural Gas

Natural gas is one of the two primary fuels that drive California's energy system. It is primarily used to generate electricity and for heating and cooling buildings and water. Natural gas has become an increasingly important source of energy since the state's power plants rely on this fuel. Combined, California's residential and commercial building sectors account for more than 40 percent of the total state natural gas usage.[11] At 56,000 cubic feet (approximately 58 million British thermal units [Btu]) per year, California's per capita natural gas consumption is lower than the national per capita average of 72,000 cubic feet (74 million Btu) per year.[12] California is second only to Texas in total statewide natural gas consumption. As with electricity, California's high statewide natural gas consumption results from the state's large population and its vigorous economy. Only 10 percent of the state's natural gas needs are met by in-state production. The state's natural gas is primarily supplied from the southwest and the Rocky Mountains, as well as imports from Canada.

In 2014, approximately 220 million therms (approximately 22 trillion Btu) of natural gas were used in San Francisco.[13] PG&E operates one of the largest natural gas distribution networks in the country, including 48,850 miles of natural gas transmission and distribution pipelines.[14] In all, PG&E delivers natural gas to approximately 4.3 million customer accounts in Northern and Central California, including San Francisco.

Transportation Fuels

California's transportation sector uses nearly 40 percent of the energy consumed in the state.[15] Gasoline and diesel, both derived from petroleum (also known as crude oil), are the two most common fuels used for vehicular travel. According to the California Energy Commission (CEC), the state relies on petroleum-based fuels for 96 percent of its transportation needs. Although California refines much of its oil reserves in the state (approximately 38 percent), most of the petroleum consumed is produced out of state (approximately 10 percent from Alaska) or is supplied by foreign sources (52 percent).[16] California experienced a 12 percent decrease in production between 2004 and 2014 as a result of several factors, including declining fuel reserves and economic and regulatory factors. Statewide, Californians used approximately 2.8 billion gallons of diesel and 14.7 billion gallons of gasoline in 2014.[17,18] Per capita consumption of

[18] California State Board of Equalization, Net Taxable Gasoline Gallons, Including Aviation Gasoline.

petroleum products in transportation is expected to slow down with the increasing use of alternative fuels and improved fuel efficiency in vehicles.

Renewable and Alternative Energy

Renewable electricity generation sources provide a number of benefits. Such sources reduce the state's dependence on the use of imported fossil fuels (including natural gas), reduce the state's vulnerability to price fluctuations in energy markets, and serve to minimize greenhouse gas emissions. The CEC currently defines solar, geothermal, wind, biomass, and small-scale hydroelectric generation methods as renewable electricity sources. Compared to other utility providers in the state, PG&E's overall electricity generation portfolio contains a relatively high percentage of renewable sources. In 2014, PG&E generated 27 percent of its total electricity through renewable sources, including biomass, small hydroelectric, geothermal, and wind. Although development of renewable energy sources is generally beyond the scope of local development planning, individual development projects may include small-scale generation features, such as photovoltaics, that can be connected to, and supply supplementary electricity to, the primary power grid.

Commercially available alternative transportation fuels to gasoline and diesel include biodiesel, renewable diesel, ethanol, hydrogen, methanol, natural gas, and electricity.[19] Some of these fuels, such as natural gas, are cleaner-burning petroleum-based alternatives to gasoline and diesel. Other products, such as ethanol and renewable diesel, are non-petroleum fuels. Although some alternative fuels can be used in a traditional combustion motor, other alternatives, such as electricity, are based on alternative propulsion technologies. The California Air Resources Board is investigating a number of low-carbon fuel strategies.

In 2007, the CEC in partnership with the California Air Resources Board and other state, federal, and local agencies prepared the State Alternative Fuels Plan in accordance with Assembly Bill 1007. The plan identifies strategies to increase the use of alternative fuels to meet California's goals for reducing petroleum consumption, improving energy security, and increasing in-state production of biofuels. Subsequently, the State of California has implemented the Alternative and Renewable Fuel and Vehicle Technology Program (Assembly Bill 118). This program provides financial incentives for businesses, vehicle and technology manufacturers, workforce training partners, fleet owners, consumers, and academic institutions to develop and deploy alternative and renewable fuels and advanced transportation technologies to help attain the State's climate change policy objectives.

[19] Biodiesel is a fuel produced from biological feedstock sources including fats, oils and greases. Biodiesel is chemically different from petroleum diesel and renewable diesel (which is chemically indistinguishable from petroleum diesel). Biodiesel is usually blended with petroleum diesel, such as the B20 biodiesel grade used in City fleets.

4.18.1.2 Existing Energy Demand and Supply at the SEP

The annual electricity demand of the existing solids treatment process at the SEP is estimated at 1 MW. This electricity demand is currently supplied by a combination of the following sources: electricity generated from digester gas at the existing cogeneration facility (0.66 MW), electricity from Hetch Hetchy hydropower (0.32 MW), and natural gas purchased from the state (0.02 MW). Electricity is provided to the SEP from Hetch Hetchy Power distributed through PG&E's distribution system. A small stream of natural gas is required for the cogeneration engine, and it is currently purchased from the State Department of General Services Natural Gas Services program and delivered through PG&E pipelines. Other energy demands at the existing solids treatment facilities include about 50 gallons of diesel per year for equipment testing and fuel use.

As indicated in Table 2-8 (in Chapter 2, *Project Description)*, the SEP digesters currently produce about 1.3 million cubic feet of digester gas per day. The digester gas provides fuel for boilers and a cogeneration facility on-site. An internal combustion engine at the cogeneration facility converts the digester gas to electricity. The boilers are fueled by digester gas to supply heat. The cogeneration facility can produce about 2 MW of electricity for on-site use, providing about one-third of the overall SEP's energy needs through electricity and heating. Heat from cogeneration maintains the digesters at the necessary temperatures to biologically treat the biosolids. Currently, any excess digester gas that cannot be converted to energy is routinely combusted via waste gas burners.

4.18.1.3 Existing Water Use at the SEP

As described in Chapter 2, *Project Description*, the SEP currently uses supplies from the following three water sources for process and wash water: No. 1 water (potable water); No. 2 water (non-potable, chlorinated and filtered SEP secondary-treated effluent); and No. 3 water (non-potable, chlorinated SEP secondary-treated effluent). The type of water used in the treatment system depends on the process and required water quality. Current average water demand of potable water (No. 1 water) for the existing solids treatment process is approximately 0.04 million gallons per day (mgd), while the average total water demand (potable and non-potable) is approximately 1.3 mgd (refer to Table 2-6 in Chapter 2, *Project Description*). Currently, potable water use constitutes approximately 3 percent of the total water used for the existing solids treatment process.

4.18.1.4 Mineral Resources

Minerals are naturally occurring chemical elements or compounds, or groups of elements or compounds, that were not formed by organisms. Naturally occurring concentrations of minerals in the earth's crust are known as mineral deposits. Mineral resources are mineral deposits from which the economic extraction of a commodity (such as gold or copper) is currently potentially feasible. In addition to metallic minerals, materials used for construction (e.g., sand and aggregate), industrial and chemical processes (e.g., salt), and fuel (e.g., crude oil) are considered mineral resources in California.

In accordance with the Surface Mining and Reclamation Act (SMARA) of 1975, the California Department of Conservation, Division of Mines and Geology, currently known as the California Geological Survey, has mapped non-fuel mineral resources of the state to show where economically

significant mineral deposits are either present or likely to occur based on the best available scientific data. These resources have been mapped using the California Mineral Land Classification System, which includes the following four Mineral Resource Zones (MRZs):

- ***MRZ-1.*** Areas where adequate information indicates that no significant mineral deposits are present, or where it is judged that little likelihood exists for their presence.
- ***MRZ-2.*** Areas where adequate information indicates that significant mineral deposits are present, or where it is judged that a high likelihood exists for their presence.
- ***MRZ-3.*** Areas containing mineral deposits, the significance of which cannot be evaluated.
- ***MRZ-4.*** Areas where available information is inadequate for assignment to any other zone.

The project site and construction staging areas are mapped as MRZ-1.[20] There are no mines, mineral plants, oil, gas, or geothermal wells within the project area.[21]

4.18.2 Regulatory Framework

4.18.2.1 Federal Regulations

No federal regulations pertain to mineral resources or water use in the project area. Regulations related to energy use are described below.

National Energy Conservation Policy Act

The National Energy Conservation Policy Act serves as the underlying authority for federal energy management goals and requirements. Signed into law in 1978, it has been regularly updated and amended by subsequent laws and regulations. This act is the foundation of most federal energy requirements.

National Energy Policy Act of 2005

The National Energy Policy Act of 2005 sets equipment energy efficiency standards and seeks to reduce reliance on non-renewable energy resources and provide incentives to reduce current demand on these resources. For example, under the act, consumers and businesses can attain federal tax credits for purchasing fuel-efficient appliances and products, including hybrid vehicles; constructing energy-efficient buildings; and improving the energy efficiency of commercial buildings. Additionally, tax credits are available for the installation of qualified fuel cells, stationary microturbine power plants, and solar power equipment.

Executive Order 13423 (Strengthening Federal Environmental, Energy, and Transportation Management), signed in 2007, strengthens the key energy management goals for the federal government and sets more challenging goals than the Energy Policy Act of 2005. The energy reduction and environmental performance requirements of Executive Order 13423 were expanded upon in Executive Order 13514 (Federal Leadership in Environmental, Energy, and Economic Performance), signed in 2009.

4.18.2.2 State Regulations

California Energy Action Plan

The State of California's *2008 Energy Action Plan Update*[22] updates the *2005 Energy Action Plan II*,[23] which is the State's principal energy planning and policy document. The plan maintains the goals of the original *Energy Action Plan*, describes a coordinated implementation plan for state energy policies, and identifies specific action areas to ensure that California's energy is adequate, affordable, technologically advanced, and environmentally sound. First-priority actions to address California's increasing energy demands are to promote energy efficiency, demand response (i.e., reducing customer energy usage during peak periods to address power system reliability and support the best use of energy infrastructure), and use of renewable power sources. To the extent that these strategies are unable to satisfy increasing energy and capacity needs, the plan supports clean and efficient fossil fuel-fired generation.

Title 24 - California Energy Efficiency Standards

The Energy Efficiency Standards for Residential and Nonresidential Buildings specified in Title 24, Part 6 of the California Code of Regulations were established in 1978 in response to a legislative mandate to reduce California's energy consumption. Pursuant to state law[24], the CEC is required to adopt and implement energy efficiency standards for both residential and non-residential buildings. The CEC must also update the standards periodically to allow for consideration and possible incorporation of new energy efficiency technologies and methods. The CEC adopted its most recent update to the standards in 2013.[25] These updated standards are expected to achieve 25 percent more efficiency than previous standards for residential construction and 30 percent more for non-residential construction, offering builders better windows, insulation, lighting, ventilation systems, and other features that reduce energy consumption in homes and businesses.

California Green Building Standards Code

As described in Section 4.9, Greenhouse Gas Emissions, the 2013 California Green Building Standards Code, as specified in Title 24, Part 11 of the California Code of Regulations, specifies building standards to improve public health, safety, and general welfare by enhancing the design

22 California Energy Commission, *2008 Update Energy Action Plan*, February 2008.

and construction of buildings through the use of building concepts having a positive environmental impact and encouraging sustainable construction practices. The provisions of this code apply to the planning, design, operation, construction, replacement, use and occupancy, location, maintenance, removal, and demolition of every building or structure or any appurtenances connected or attached to such building structures throughout California.

California Water Code Chapter 1, General State Policy

Section 106.5 of the California Water Code declares the state's policy that no municipality shall acquire or hold any right to wastewater, or to use water for other than municipal purposes.

Surface Mining and Reclamation Act of 1975

SMARA of 1975 (Chapter 9, Division 2, Section 2710 et seq. of the Public Resources Code) requires the State Mining and Geology Board to adopt state policies for reclaiming mined lands and conserving mineral resources. Title 24 of the California Code of Regulations, Division 2, Chapter 8, Subchapter 1 contains these policies.

In accordance with SMARA, the State has established the California Mineral Land Classification System to help identify and protect mineral resources in areas that are subject to urban expansion or other irreversible land uses that would preclude mineral extraction. Protected mineral resources include construction materials, industrial and chemical mineral materials, metallic and rare minerals, and non-fluid mineral fuels.

4.18.2.3 Local Regulations

San Francisco General Plan

The Energy section of the Environmental Protection Element of the *San Francisco General Plan* provides the City and County of San Francisco with a comprehensive and pragmatic energy management program that helps promote a productive collaboration between municipal government and local residents by guiding both public and private decisions affecting the use of energy. San Francisco's Energy Policy was designed with four goals in mind: (l) increasing the efficiency with which energy is used locally, (2) diversifying the present balance of resource supplies to meet local energy needs, (3) fostering the economic development of energy management services and renewable energy systems, and (4) encouraging the active participation of members of the community to carry out this program. The Air Quality Element of the General Plan includes one objective pertaining to energy use, which links energy conservation and waste management to emissions reductions.

The Fresh Water section of the Environmental Protection Element of the *San Francisco General Plan* includes the following policy related to limiting wasteful use of water:

> ***Policy 6.1.*** Maintain a leak detection program to prevent the waste of fresh water.

Regarding mineral resources, the *San Francisco General Plan* does not identify any occurrences of locally important mineral resources in the project area.[26]

Sustainability Plan for City and County of San Francisco

The *Sustainability Plan for City and County of San Francisco*, adopted in 1997, contains a set of general goals and specific objectives and actions for San Francisco to ensure that the city's current energy and water use needs are met without sacrificing the ability of future generations to meet their own needs. The major energy goals expressed in the plan are to reduce overall power use by maximizing energy efficiency; to maintain an energy supply based on renewable, environmentally sound resources; to eliminate climate-changing and ozone-depleting emissions and toxic contaminants associated with energy production and use; and to base energy decisions on the goal of creating a sustainable society. The major water use goals expressed in the plan are to maximize reuse of wastewater, maximize water conservation, minimize water use and waste, and ensure a sustainable and adequate water supply.

Climate Action Plan for San Francisco, San Francisco Climate Action Strategy, and San Francisco Greenhouse Gas Reduction Strategy

Multiple San Francisco programs developed to reduce greenhouse gas emissions (discussed in detail in Section 4.9, Greenhouse Gas Emissions) contain energy conservation provisions. The *Climate Action Plan for San Francisco, Local Actions to Reduce Greenhouse Gas Emissions* outlines citywide actions to reduce GHGs in the energy, transportation, and solid waste sectors. Strategies of the Climate Action Plan include expanding residential and commercial recycling programs. The 2013 *San Francisco Climate Action Strategy* describes additional steps taken to increase energy efficiency in San Francisco.[27] The San Francisco *Strategies to Address Greenhouse Gas Emissions*[28] documents San Francisco programs designed to reduce greenhouse gas emissions; programs that address energy conservation and recycling include increasing the energy efficiency of new and existing buildings, implementing a green building strategy, adopting a zero waste strategy, and adopting a mandatory recycling and composting ordinance. Specific actions taken by the SFPUC to address climate change include managing an energy efficiency program for municipal buildings in San Francisco designed to reduce electricity use and natural gas consumption.

San Francisco Environment Code, Green Building Requirements

The San Francisco Environment Code sets green building requirements that apply to all new construction in San Francisco. As discussed in Section 4.9, Greenhouse Gas Emissions, Chapter 7 (Green Building Requirements) of the San Francisco Environment Code adopts the mandatory measures in the state green building code and requires documentation of compliance with either Leadership in Energy and Environmental Design (LEED®) or GreenPoint Rated standards. City

departments must administer their construction projects in accordance with this chapter. Chapter 7 includes requirements for municipal projects related to LEED® certification, collection of recyclable and compostable materials, construction and demolition debris management, water conservation, energy-efficient lighting, and indoor environmental quality. In accordance with these requirements, fluorescent fixtures must meet certain efficiency of lumens per watt of electricity consumed and/or be controlled by an occupancy sensor, and exterior light fixtures must include an automatic timer to prevent lights from operating during daylight hours. Water closets (e.g., toilets and urinals), shower heads, and faucets must meet certain efficiency standards to meet the water conservation requirements of this code.

San Francisco Better Roof Requirements for Renewable Energy Facilities Ordinance

As described in Section 4.9, Greenhouse Gas Emissions, this ordinance requires projects like the BDFP (i.e., newly constructed buildings of non-residential occupancy meeting criteria related to size) to install solar photovoltaic systems and/or solar thermal systems in the solar zone.[29] The minimum total solar zone area[30] for a building must also meet certain size requirements. Refer to Section 4.9.2.3 in Section 4.9 for additional information.

San Francisco Green Building Code

The San Francisco Green Building Code (Green Building Code) consists of the California Green Building Standards Code as further amended by the City and County of San Francisco. The purpose of the Green Building Code is to minimize waste of energy, water, and other resources in the construction and operation of buildings. Provisions of the Green Building Code apply to planning, design, operation, construction, use and occupancy of newly constructed buildings in San Francisco.

San Francisco Environment Code, Construction and Demolition Debris Management

The requirements described below apply to the BDFP.

The San Francisco Environment Code, Section 708, mandates the reduction and recycling of construction and demolition debris generated at City-owned facilities. This section affects all construction and demolition projects implemented by City agencies, regardless of size, and requires that contractors on City projects divert at least 75 percent of construction and demolition debris from landfill disposal. The contractor is also prohibited from sending any construction or demolition debris to a landfill without receiving approval from the San Francisco Department of the Environment (SFDE).

Chapter 14 of the Environment Code also mandates the recycling of construction and demolition debris generated from both private and City-sponsored projects in San Francisco. This chapter affects all construction projects that would generate one cubic yard or more of construction and

[29] The solar zone is located on the roof or overhang of a building, or on the roof or overhang of another structure within 250 feet of the building or on covered parking installed with the building project.
[30] California Title 24, Part 6, Section 110.10.

demolition debris and requires that all construction and demolition wastes be taken to a registered facility that is certified by the SFDE to receive these wastes. These facilities must recycle or reuse at least 65 percent of all construction waste received.

Recycling and reuse of materials (including construction and demolition debris) reduces the energy requirements associated with extraction and manufacturing of new and raw materials.

San Francisco Public Works Code, Article 21 – Restriction of Use of Potable Water for Soil Compaction and Dust Control Activities

Article 21 of the San Francisco Public Works Code prohibits the use of potable water supplies for soil compaction and dust control in conjunction with any construction or demolition project when alternatives (e.g., non-potable water) are available. (Refer to Section 4.12, Utilities and Service Systems, for additional information.)

San Francisco Water Efficient Irrigation Ordinance

The San Francisco Water Efficient Irrigation Ordinance (codified in the San Francisco Administrative Code, Chapter 63) establishes a framework for planning, designing, installing, maintaining, and managing water-efficient landscaping in new construction and rehabilitation projects. The ordinance encourages the use of climate-appropriate and local California native species, and establishes provisions for water management and the prevention of wasteful use of water in landscapes. Landscape areas affected include planted areas within buildings or structures, such as green roofs. To ensure that water is used efficiently without waste, the ordinance sets a Maximum Applied Water Allowance, using State-mandated formulas and accounting for local climatic conditions. This allowance may not be exceeded unless the landscaped area is irrigated with gray water or harvested rain water.

San Francisco Reclaimed Water Use Ordinance

As discussed in greater detail in Section 4.16, Hydrology and Water Quality, this ordinance requires property owners to install recycled water systems in certain new construction, modified, or remodel projects. The goal of the ordinance is to maximize the use of recycled water. Buildings and facilities that are within the designated recycled water use areas are required to use recycled water for all uses authorized by the State of California. Some of the common uses include irrigation, cooling, and/or toilet and urinal flushing. These systems must meet San Francisco Plumbing and Health Codes, which include specifications for pipe type, pipe separation, backflow prevention assemblies, water meters, and signage. The project site is within a designated recycled water use area,[31] and the total floor area of the proposed Solids Pretreatment Facility would be greater than 40,000 square feet. Thus, the Reclaimed Water Use Ordinance would apply to the project.

[31] SFPUC, *Recycled Water Use*. Available online at http://sfwater.org/index.aspx?page=687. Accessed on January 26, 2016.

San Francisco Non-Potable Water Ordinance

As described in Section 4.16, Hydrology and Water Quality, this ordinance allows for the collection, treatment, and use of alternative water sources for non-potable applications. In October 2013, the CCSF amended the ordinance to allow water systems consisting of two or more buildings sharing non-potable water. The CCSF also amended the ordinance in July 2015, requiring new construction to use alternative water supplies for non-potable use.

4.18.3 Impacts and Mitigation Measures

4.18.3.1 Significance Criteria

The project would have a significant impact related to mineral or energy resources or water use if it were to:

- Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state;
- Result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan; or
- Encourage activities that result in the use of large amounts of fuel, water, or energy, or use these resources in a wasteful manner.

Due to the nature of the project, there would be no impact related to the following topic(s) for the reasons described below:

- ***Result in the loss of availability of a known mineral resource or a locally important mineral resource.*** As indicated above in Section 4.18.1.4, the project site and construction staging areas do not contain substantial mineral resources or locally important mineral resource recovery sites. Consequently, the project would not change the availability of mineral resources; therefore, these significance criteria are not discussed further in this EIR.

4.18.3.2 Approach to Analysis

Consistent with Public Resources Code Section 21100(b)(3), this impact analysis evaluates the potential for the BDFP to result in a substantial increase in energy demand and/or wasteful use of fuel, water, or energy during project construction and project operations. The impact analysis is informed by Appendix F of the California Environmental Quality Act Guidelines.

Construction Impacts

The analysis uses a qualitative approach to discuss energy demand from construction activities and describes conservation measures that would minimize the use of fuel, water, and energy and ensure that they are not used in a wasteful manner.

Operational Impacts

To determine whether the project would use large amounts of energy, fuel, or water during operations, this analysis provides a quantitative overview of the energy and water that would be consumed during the operation of the project and compares it to existing energy and water use. The analysis also weighs the project's energy, fuel, and water efficiency features when considering the project's potential for wasteful consumption of these resources during long-term operations. It is assumed that, as part of the project, the SFPUC and its contractors would comply with existing laws and regulations applicable to the BDFP with respect to fuel, water, and energy use.

Cumulative Impacts

Section 4.1.3, Approach to Cumulative Impact Analysis and Cumulative Projects, describes the overall approach to the cumulative analysis for those topics using a list-based approach and summarizes reasonably foreseeable future projects in the vicinity of the project that could contribute to a cumulative impact; refer to Table 4.1-1 and Figure 4.1-1 for a description and location of potential cumulative projects in the vicinity of the BDFP.

The cumulative analysis for energy resources and water use uses a list-based approach to analyze the effects of the project in combination with other past, present, and probable future projects in the immediate vicinity. (Because the project would have no impact related to mineral resources, that topic is not addressed in the cumulative impact analysis.) Cumulative impacts during construction and operations are evaluated together because energy use during both construction and operations would be strongly influenced by State and local regulations that encourage energy, fuel, and water conservation, and would affect similar fuel, energy, and water resources. The cumulative impact analysis assumes that construction and operations of other projects in the geographical area, listed in Table 4.1-1, would be required to comply with the same regulatory requirements as the project, which would serve to avoid and reduce many impacts to less-than-significant levels on a project-by-project basis. The analysis then considers whether or not there would be a significant, adverse cumulative impact associated with project implementation in combination with past, present, and probable future projects in the geographical area, and if so, whether or not the project's incremental contribution to the cumulative impact would be considerable. Both conditions must apply in order for a project's contribution to cumulative effects to be deemed cumulatively considerable (significant). If so, then mitigation measures are identified to reduce the project's contribution to the extent feasible.

4.18.3.3 Impact Evaluation

Construction Impacts

Impact ME-1: Construction of the project would not result in the use of large amounts of fuel, water, or energy, or use these resources in a wasteful manner. (Less than Significant)

The BDFP would require construction of about 206,000 square feet of new structures. To accommodate the proposed facilities and construction staging, approximately 136,000 square feet

of existing structures would be demolished, including buildings at the 1550 Evans Avenue staging area. Construction of BDFP facilities would take place over a period of about five years, from 2018 to 2023. During this period, fuel, water, and energy would be needed for the operation of equipment and vehicles to perform a variety of demolition and construction activities. Construction activities associated with the project would require the following sources of fuel, water, and energy:

- Diesel, for demolition, grading, and construction equipment, heavy-duty delivery trucks, and demolition debris and material hauling trucks
- Gasoline, to fuel construction worker commute vehicles
- Electricity, for operation of hand tools, air compressors, welding machines, mobile project offices, and security lighting
- Water, for dust control

In addition to direct construction-related energy consumption at the project site, energy would be consumed indirectly to make the materials and components used in construction. This includes energy used for extraction of raw materials, manufacturing, and transportation associated with manufacturing. Direct energy use typically represents about one-quarter of total construction-related consumption, while indirect energy use typically represents about three-quarters of total construction-related energy consumption.[32]

Energy Use

The precise amount of construction-related energy demand cannot be predicted at this time. Although this usage would represent an irreversible consumption of finite fossil fuel energy resources, the energy consumption associated with construction would be temporary and would therefore not result in long-term depletion of local or regional energy resources. As indicated in Chapter 2, *Project Description*, all construction equipment would comply with the San Francisco Clean Construction Ordinance. Many of the requirements of the ordinance also reduce energy use by (for example) requiring use of more efficient equipment and alternative fuels (refer to Section 4.8.2.3 in Section 4.8, Air Quality, for more detail). The project would also be constructed in compliance with the Chapter 14 and Section 708 of the San Francisco Environment Code. All non-hazardous material removed from the project site and off-site staging areas, including concrete, metal, and green waste, would be recycled to the maximum extent feasible, consistent with the minimum diversion rates specified in Chapter 14 and Section 708 of the San Francisco Environment Code to reduce the amount of material disposed of in landfills. Recycling and reuse of materials would reduce the energy requirements associated with extraction and manufacturing of new and raw materials.

Therefore, project construction would not require excessive or wasteful use of energy, as fuel use would be consistent with current construction and manufacturing practices, energy standards that promote strategic planning, and building standards that reduce consumption of fossil fuels and enhance energy efficiency. Additionally, implementation of **Mitigation Measure AQ-1a**

[32] Hannon et al., *Energy and Labor in the Construction Sector, Science Magazine,* November 24, 1978.

described in Section 4.8, Air Quality, would further ensure that fuel energy consumed during construction activities would not be wasted. Excavated material would be used as backfill on-site where feasible, thereby minimizing fuel consumption associated with construction haul trucks and solid waste disposal. Because construction of the BDFP would not be expected to have a material effect on energy resources, or result in wasteful or unnecessary use of energy, energy consumption that would be associated with construction activities would be considered ***less than significant***.

Water Use

Construction activities associated with the project would use water over the entire five-year construction period. During construction, recycled water would be used for dust control on roads and streets consistent with San Francisco Public Works Code, Article 21 which would ensure that water is not used in a wasteful manner. Public Works Code, Article 21, restricts the use of potable water for soil compaction and dust control activities associated with any construction project in the City and requires that recycled water, well water, or groundwater be used. The SEP recycled water fill station on Quint Street directly adjacent to the project site provides disinfected recycled water for these uses. Therefore, project compliance with applicable ordinances would ensure that the project would not result in wasteful, inefficient, or unnecessary use of potable water during construction, and this impact would be ***less than significant***.

Mitigation: None required.

Operational Impacts

Impact ME-2: Operation of the project would not result in the use of large amounts of fuel, water, or energy, or use these resources in a wasteful manner. (Less than Significant)

Energy Use

Table 4.18-1 summarizes the existing and projected operational energy demand, and the existing and proposed energy supply sources. Current power demand for the existing solids treatment process is estimated to be 1 MW; with implementation of the BDFP, power demand is expected to increase to 4.4 MW by 2023 and 4.9 MW by 2045. The existing energy recovery facilities provide about 66 percent of the current power demand, with the remainder provided from Hetch Hetchy Power or purchased from the State. Under the project, while power demand is expected to increase, the BDFP facilities are designed to increase the power generation capabilities such that by 2023, the BDFP would supply 95 percent of its own power demands. By 2045, the BDFP would provide over 100 percent of its own power demands and the excess power would be available for use by other SEP facilities. The current use of Hetch Hetchy Power would be reduced from 0.32 to 0.2 MW by 2023, and to zero by 2045, at which point it would be used only for backup power, when necessary.

TABLE 4.18-1
EXISTING AND PROJECTED ENERGY DEMAND
AND SUPPLY FOR BIOSOLIDS PROCESSING FACILITIES

		Existing Biosolids Facilities	Proposed BDFP
Electricity			
Power Demand		1 MW (estimated)	4.4 MW (2023) 4.9 MW (2045)
Power Supply Sources[a]	Cogeneration – Digester gas	0.66 MW[b]	4.2 MW (2023) 5.2 MW (2045)
	Cogeneration – Natural Gas	0.02 MW[c]	0
	Hetch Hetchy Power through PG&E Grid	0.32 MW	0.2 MW (2023) 0 (2045)
	On-site Solar power	n/a	Unknown
TOTAL, Power Supply from All Sources		1 MW	4.4 MW (2023) 5.2 MW (2045, excess 0.3 MW to be made available to other SEP facilities)
Diesel[d]			
Diesel Demand		50 gallons/year[e]	5,250 gallons/year[f]
Diesel Supply Source		Regional diesel providers	Regional diesel providers

NOTES:

n/a = not applicable ; BDFP = Biosolids Digester Facilities Project; MW = megawatts

[a] Existing power supply based on 2014 cogeneration engine operating record.
[b] Currently, the cogeneration engine can generate up to 2 MW power. When engine output exceeds the solids treatment processdemand, the surplus power is used by liquid processes.
[c] The cogeneration engine consumes a small stream of natural gas.
[d] Includes only non-emergency use.
[e] Based on actual current use.
[f] Estimate based on the operation of a 1.5-MW standby power generator for a maximum 50 hours of operation per year at 100 percent load for maintenance and testing purposes, consistent with Bay Area Air Quality Management District (BAAQMD) permit requirements. Actual maintenance and testing hours are anticipated to be less (i.e., six hours annually).

SOURCE: San Francisco Public Utilities Commission (SFPUC), *Final BDFP Conceptual Engineering Report*, March 2016

As shown in Table 2-8 in Chapter 2, *Project Description*, the proposed BDFP facilities are projected to generate an average of 1.6 million cubic feet of digester gas per day when the BDFP becomes operational in 2023. As the total volume of solids treated by the BDFP increases over time with anticipated population growth, the amount of digester gas generated would also increase to an average of 2 million cubic feet per day by 2045. Digester gas generated by the proposed digesters would be used to produce steam (used to heat the thermal hydrolysis process [THP]) and power that would more than meet the BDFP operational power needs. The new Energy Recovery Facility would improve energy production efficiency compared to the existing facilities. The project also would include solar photovoltaics, which would supply part of the energy requirements of the SEP. Although the energy demand would increase almost five-fold with the implementation of the BDFP, long-term demand would be more than offset by additional power generated on-site, and the BDFP would eliminate use of natural gas and electricity from Hetch Hetchy hydropower for solids processing at the SEP. Excess energy produced by BDFP supply sources would be made available to other SEP facilities. The project's net increase in on-site

generation of renewable energy would also increase the availability of renewable energy from hydropower for other municipal uses; overall, this would be a beneficial energy impact.

Energy Efficiency

New equipment installed as part of the proposed new solids treatment, odor control, energy recovery, and associated facilities of the BDFP would be more energy efficient than the existing equipment it would replace. In addition, several operational features of the BDFP would increase energy recovery and conservation. By 2045, the Energy Recovery Facility would produce enough electricity and enough high quality heat (steam) for the THP and other BDFP facilities so that under normal circumstances no additional fuel or steam supply would be needed for the BDFP. Use of the THP would make the solids more readily digestible and allow for better methane production during anaerobic digestion. In addition, the turbine would have a recuperator that would maximize the turbine efficiency by using exhaust heat to pre-heat the fuel stream.

The project would be consistent with all applicable regulations pertaining to energy efficiency and conservation associated with San Francisco Environment Code, Chapter 7, regarding Green Building Requirements for City buildings and their commissioning. All lighting would meet applicable requirements of Chapter 7 of the San Francisco Environment Code, which is consistent with California Code of Regulations Title 24, Part 6. Lighting needs of project buildings would be provided by light emitting diode fixtures, and structures would be constructed to meet or exceed Title 24 requirements for energy efficiency.

Energy monitoring proposed as part of the project would improve management of energy usage, variable frequency drives would be used for energy efficiency in driven equipment, and premium efficiency motors would be specified for use. Due to the nature of non-occupied infrastructure projects such as the BDFP, LEED® certification can be difficult to obtain because energy reduction credits identified for the certification tend to be oriented toward the characteristics of energy use in occupied buildings. As part of project design, however, the SFPUC would evaluate alternative technologies to increase energy efficiency consistent with applicable performance requirements of the San Francisco Building Code Green Building Ordinance and the San Francisco Environment Code. The operational energy demands of the project would not increase reliance on non-renewable resources, and implementation of the BDFP would not result in the use of large amounts of energy in a wasteful manner.

Fuel Use

As shown in Table 4.18-1, the existing solids treatment process currently uses a minimal amount of diesel fuel for miscellaneous purposes. As part of the proposed Energy Recovery Facility improvements, the BDFP would install one 1.5-MW standby power generator to provide an alternative source of electrical power in the event that the normal electrical power source fails. While the standby power generator is intended to be used only during emergencies, it would need to be operated routinely for testing and maintenance purposes. The generator would be subject to BAAQMD permit requirements, which require annual testing and maintenance of the

engine, with a maximum of 50 hours of testing and maintenance use per year.[33] Assuming 50 hours per year of non-emergency use at 100 percent load, diesel usage for the proposed generator would be 5,250 gallons per year. This increase would not be considered excessive or wasteful use of diesel fuel as the standby generator is essential for the operational reliability of the BDFP and routine testing is a permit requirement. In addition, the unit would be required to undergo regular testing and maintenance consistent with the standards of National Fire Protection Association 110, which specifies installation, maintenance, operation, and testing requirements as they pertain to the performance of the emergency or standby power supply systems. As the proposed generator use would be consistent with BAAQMD requirements and the National Fire Protection Association standards, the increase in diesel fuel use under the BDFP would not be considered excessive or wasteful.

As described above in Impact ME-1, consistent with current City policy for the entire municipal fleet, all SFPUC diesel vehicles associated with BDFP operation would use renewable diesel. Use of renewable diesel during BDFP operations would increase the efficiency of fuel use compared to existing conditions. The number of daily truck trips required for biosolids cake hauling would increase from 7 to 10 truck trips per day under existing conditions to approximately 10 to 14 haul trips per day by 2045 (although this projected increase in haul trips is attributable to the projected increase in solids loading associated with anticipated population growth through 2045). This would incrementally increase diesel fuel use as the contractors hauling biosolids are not required to use renewable diesel and are assumed to use conventional diesel vehicles. (With the production of Class A biosolids, to the extent that market locations for biosolids were located closer than sites where biosolids are currently reused [described in Section 2.2.2 in Chapter 2, *Project Description*], diesel consumption per haul trip could be less than existing conditions.) This minimal increase would not be considered wasteful, and overall the BDFP operations would not result in the use of large amounts of fuel or use fuel in a wasteful manner. As a result, this impact would be less than significant.

Water Use

BDFP processes would increase overall water use compared to existing conditions for all water types, as shown in **Table 4.18-2**. The BDFP is being designed to maximize use of SEP recycled water and/or other non-potable water to the extent possible in its processes. Therefore, most (about 92 percent) of the project's water needs would be supplied by the No. 2 and No. 3 non-potable water systems, while about 8 percent would be associated with the No. 1 potable water system. The Water Supply Assessment prepared for the project indicates that estimated potable water (No. 1 water) demand would be 0.21 mgd, about a five-fold increase in demand compared to existing conditions.[34] However, the non-potable water would have the greatest demand increases, and to meet this demand, the project would maximize the beneficial reuse of treated effluent, which would have otherwise been discharged into the Bay.

BDFP = Biosolids Digester Facilities Project, mgd = million gallons per day

SOURCE: San Francisco Water Power Sewer, Water Supply Assessment for Biosolids Digester Facilities Project, February 16, 2017.

Nearly 100 percent of the projected increase in potable water demand is associated with processes that require water with low salinity; this would not be considered a wasteful use of potable water given the fundamental purpose of the solids treatment processes. Potable water use for solids processing could be further reduced in the future through use of disinfected tertiary-level treated recycled water.[35] The SFPUC would also design and construct all bathrooms in BDFP buildings with dual plumbing to allow for the use of recycled water if and when it becomes available in the future.

All new water closets and faucets installed under the project would comply with the San Francisco Building Code. Although LEED® standards for water conservation are oriented toward commercial, office, and residential facilities, and not non-occupied wastewater treatment buildings like the project facilities, LEED® Credit WE3.0 (30 percent reduction in indoor water use) would be the targeted goal for proposed administrative (occupied) buildings.

For outdoor water use, the project would comply with water conservation measures under the San Francisco Water Efficient Irrigation Ordinance. These requirements specify water efficiency and conservation measures for indoor and outdoor use, including establishing standards for low-flow plumbing fixtures and water efficiency standards for landscape irrigation. Irrigation water demand, which is currently met by potable water, is also assumed to be supplied by potable water under the project until the Eastside Recycled Water Project is online. The project would include mostly developed areas and use drought-tolerant plants, and irrigation water usage would comply with the Water Efficient Irrigation Ordinance. Therefore, the BDFP operations would not result in use of large amounts of potable water in a wasteful manner.

[35] The SFPUC proposes to implement the Eastside Recycled Water Project by 2030. The Eastside Recycled Water Project would produce disinfected tertiary treated recycled water for non-potable uses. Refer to Table 4.1-1 in Section 4.1 for more information on this project.

Summary of Impact ME-2

Operational energy use would not be considered wasteful since proposed BDFP facilities would increase energy generation, efficiency, and conservation and more than offset the increase in energy demand due to the project. Compliance with the requirements of the San Francisco Environment Code and other ordinances discussed above would ensure that the project would not result in inefficient, wasteful, or unnecessary use of fuel or water during operation. For these reasons, the project's operational impacts on fuel, water, and energy resources would be ***less than significant.***

Mitigation: None required.

Cumulative Impacts

Impact C-ME-1: The project, in combination with past, present, and probable future projects, would not encourage activities that result in the use of large amounts of fuel, water, or energy, or use such resources in a wasteful manner. (Less than Significant)

The geographic scope for the analysis of potential cumulative impacts related to energy, fuel, and water resources encompasses the BDFP area and the broader region, which generally would use the same fuel, water, and energy supply sources. All projects listed in Table 4.1-1 in Section 4.1, Overview, are considered in the cumulative impact analysis for both construction and operation.

Regarding construction-phase impacts related to energy and water use, all of the projects presented in Table 4.1-1 involve some level of construction. Several of the Projects (e.g., SEP Chemical Systems Relocation and Facilities Upgrade, SEP Existing Digester Roof Repairs, SEP Northside Reliability Project) have already been constructed, while 20 projects could be under construction during some portion of the five-year construction period of the BDFP. Like the project, construction of all cumulative projects would require the use of fuel and energy, and could also require the use of water. The amount of fuel, energy and water consumed during construction would vary by project. The projects identified in Table 4.1-1 are within San Francisco and would be subject to the same regulatory framework as the project for the use of fuel, water, and energy during construction.[36] These requirements include the California Green Building Standards Code, Clean Construction Ordinance (applicable to most public projects), Environment Code Chapter 14 and Section 708, and Public Works Code Article 21. Compliance with these existing regulations by the identified cumulative projects would ensure that fuel, water, or energy resources are not used wastefully during construction, and that construction of these projects would not result in a significant adverse, cumulative impact to which the BDFP project could contribute.

[36] One project, the Peninsula Corridor Electrification Project (Caltrain Peninsula Corridor Joint Powers Board), would not be subject to City policies and ordinances, but would be subject to the state regulations pertaining to energy and water conservation discussed in Section 4.18.2.2.

Regarding operations-phase impacts related to energy and water use, many of the projects listed in Table 4.1-1 involve repair and replacement of existing systems and equipment at the SEP and elsewhere (e.g., SEP Chemical System Relocation and Facilities Upgrade, SEP Existing Digesters Roof Repair, Existing Digester Gas Handling Improvements); these projects generally would not increase consumption of energy and water above existing levels. Operation of the other projects listed in Table 4.1-1 would require the use of fuel, energy or water in varying quantities. For example, similar to the BDFP, generators and other diesel-fueled equipment that could be installed as part of the cumulative projects would use fuel, but these uses are generally required by safety regulations. As indicated above, the projects identified in Table 4.1-1 are within San Francisco and would be subject to the same regulatory framework as the BDFP for the use of fuel, water, and energy during operations. At a minimum, applicable regulations would include current State standards regarding energy consumption and conservation (e.g., energy efficiency standards and green building standards in Title 24 of the California Code of Regulations). The application of local energy and water efficiency requirements would vary by project type, size, and sponsor but could include Chapter 7 of the San Francisco Environment Code or the 2013 San Francisco Green Building Code, San Francisco Better Roofs Requirements for Renewable Energy Facilities Ordinance, the San Francisco Water Efficient Irrigation Ordinance, and (if within a recycled water use area) the Reclaimed Water Use and Non-Potable Water ordinances. Compliance with applicable energy and water use regulations would ensure that the identified cumulative projects in the region would not result in wasteful use of these resources. As a result, there would not be a significant cumulative impact from the wasteful use of fuel, energy, or water to which the BDFP project could contribute. Accordingly, the cumulative effect would be ***less than significant***.

Mitigation: None required.

4.19 Agriculture and Forest Resources

This section describes existing agricultural and forest resources in the project area and the potential for implementation of the Biosolids Digester Facilities Project (BDFP or project) to adversely affect those resources. This impact analysis evaluates the potential agriculture and forest resources impacts of the project construction and operation, and identifies mitigation measures to avoid or reduce significant adverse impacts, as appropriate. Please see Section 4.14, Biological Resources, for discussion of the San Francisco Urban Forestry Ordinance as it relates to protected trees.

4.19.1 Setting

The project site and off-site staging areas are located on the eastern side of San Francisco, in the Bayview-Hunters Point neighborhood (refer to Figures 2-1 and 2-2 in Chapter 2, *Project Description*). As described in Section 4.2, Land Use, the project site and off-site staging areas are designated for public and heavy industrial uses under the City's zoning.

The California Department of Conservation, Division of Land Resource Protection, maps important farmlands throughout California. Important farmlands include Prime Farmland, Farmland of Statewide Importance, Unique Farmland, Farmland of Local Importance, and Grazing Land. There are no important farmlands mapped on the project site or off-site staging areas.[1]

Section 12220(g) of the California Public Resources Code defines forest land as "land that can support 10 percent native tree cover of any species, including hardwoods, under natural conditions, and that allows for management of one or more forest resources, including timber, aesthetics, fish and wildlife, biodiversity, water quality, recreation, and other public benefits." Timberland is land (other than land owned by the federal government and land designated by the California Department of Forestry and Fire Protection [CAL FIRE] as experimental forest land) that is available for and capable of growing a crop of trees of any commercial species used to produce lumber and other forest products. Statewide land cover mapping prepared by CAL FIRE as part of ongoing land cover monitoring classifies land cover into 13 land cover classes. The land cover maps characterize land cover at the project site and off-site staging areas as urban; therefore, there are no timber harvesting activities at the project site or off-site staging areas.[2]

[2] California Department of Forestry and Fire Protection (CAL FIRE), [Map] State of California Land Cover, Multi-Source Data Compiled in 2006, February 2011. Available online at http://frap.fire.ca.gov/data/frapgismaps/landcover2006_download. Accessed on September 8, 2015.

4.19.2 Regulatory Framework

4.19.2.1 Federal Regulations

The Farmland Protection and Policy Act requires an evaluation of the relative value of farmland including Prime Farmland, Unique Farmland, and Farmlands of Statewide or Local Importance, as follows, that could be affected by decisions sponsored in whole or part by the federal government:[3]

- ***Prime Farmland*** is land that has the best combination of physical and chemical characteristics for long-term crop production. It has the soil quality, growing season, and moisture supply needed to sustain high crop yields when appropriately treated and managed. In addition, the land must have been used for irrigated agricultural production in the last four years to qualify under this category.

- ***Unique Farmland*** is land that does not meet the criteria for Prime Farmland or Farmland of Statewide Importance but has been used for the production of the state's leading agricultural crops. This land is usually irrigated, but may include the types of non-irrigated orchards or vineyards that are found in some climatic zones of California. Unique Farmland must have been in agricultural production at some time during the four years prior to the mapping date.

- ***Farmland of Statewide Importance*** is similar to Prime Farmland, but with minor shortcomings such as greater slopes and less ability to store moisture.

- ***Farmland of Local Importance*** applies to land of importance to the local agricultural economy as determined by the county. This land is either currently producing crops or has the capability of production, but does not meet the criteria of the preceding categories.

The Farmland Protection and Policy Act would not apply to the project, since the project is not a federal government action or program.

4.19.2.2 State Regulations

The California Land Conservation Act of 1965 (commonly referred to as the Williamson Act) is the state's primary program for the conservation of private land for agricultural and open space uses. The Williamson Act provides a mechanism through which private landowners can contract with counties and cities to voluntarily restrict their land to agricultural and compatible open space uses. In return, Williamson Act contracts offer tax incentives by ensuring that land is assessed for its agricultural productivity rather than its highest and best use. Contracts typically restrict land use for a period of 10 years; however, some jurisdictions exercise the option to extend the term for up to 20 years. Contracts are automatically renewed unless the landowner files for non-renewal or petitions for cancellation.

[3] United States Department of Agriculture Natural Resources Conservation Service, Farmland Protection Policy Act. Available online at http://www.nrcs.usda.gov/wps/portal/nrcs/main/national/landuse/fppa/. Accessed on June 27, 2016.

The California Department of Conservation prepares countywide maps of lands enrolled in Williamson Act contracts and classifies them into the following categories[4]:

- ***Prime Agricultural Land.*** This category represents the state's highest quality agricultural land. Land in this category is typically used for the production of irrigated crops or to support livestock.

- ***Non-Prime Agricultural Land.*** This category represents Open Space Land of Statewide Significance as defined under the California Open Space Subvention Act. Most land in this category is being used for agricultural purposes, such as livestock grazing or non-irrigated crops, but may also include other open space uses that are compatible with agriculture and consistent with local general plans.

- ***Land in Non-Renewal.*** This category represents land under a Williamson Act contract that is being terminated at the option of the landowner or local government.

There are no agricultural lands, including Williamson Act lands, within the project site or off-site staging areas. No state regulations pertaining to forest resources apply to the project.

4.19.2.3 Local Regulations

The San Francisco Board of Supervisors established an Urban Agriculture Program in 2012 to provide institutional support for urban agriculture, including the growing of plants and raising of animals.[5] The project site and off-site staging areas are not currently used for urban agriculture (except for the Southeast Greenhouses) or planned for such use. The Southeast Greenhouses were used for urban agriculture at the time of the Notice of Publication but will be demolished in 2017 as part of a separate project; potential future uses of the site are being evaluated by the SFPUC. There are no local regulations governing agriculture or forest resources that apply to the project.

4.19.3 Impacts and Mitigation Measures

4.19.3.1 Significance Criteria

The project would have a significant impact on agriculture and forest resources if the project were to:

- Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance, as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use;

- Conflict with existing zoning for agricultural use, or a Williamson Act contract;

[4] Department of Conservation, Division of Land Resource Protection, *State of California Williamson Act Contract Land*, 2013.

[5] San Francisco Board of Supervisors, Agenda Packet 7/17/12 San Francisco Administrative Code. Available online at http://www.sfbos.org/ftp/uploadedfiles/bdsupvrs/bosagendas/materials/bag071712_120404.pdf. Accessed on June 27, 2016.

- Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code Section 12220(g)) or timberland (as defined by Public Resources Code Section 4526);
- Result in the loss of forest land or conversion of forest land to non-forest use; or
- Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland to non-agricultural use or forest land to non-forest use.

Due to the nature of the project, there would be no impact related to the following topics for the reasons described below:

- ***Conversion of Prime Farmland, Unique Farmland, or Farmland of Statewide Importance to Non-Agricultural Use.*** The project would not be on land designated as Prime Farmland, Unique Farmland, or Farmland of Statewide Importance. Therefore, this criterion is not applicable to the project.
- ***Conflict with Zoning for Agricultural Use or with a Williamson Act Contract.*** The project would not be on land used or zoned for agricultural activities. The project site and off-site staging areas are not subject to a Williamson Act contract. Therefore, this criterion is not applicable to the project.
- ***Conflict with Existing Zoning for Forest Land, Loss of Forest Land, or Conversion of Forest Land to Non-Forest Use.*** There is no forest land on the project site or off-site staging areas; thus, implementation and operation of the project would not conflict with zoning regulations for forest land, result in the loss of forest land, or result in the conversion of forest land to non-forest use. Therefore, the third and fourth criteria listed above are not applicable to the project.

4.19.3.2 Approach to Analysis

For this analysis, state and local planning documents and maps were reviewed to identify agricultural or forest resources present at the project site or construction staging areas that, because of their proximity, could be directly or indirectly affected by the project.

4.19.3.3 Impact Evaluation

Construction and Operational Impacts

Impact AG-1: The project would not involve changes in the existing environment which could result in the conversion of farmland to non-agricultural use or forest land to non-forest use. (No Impact)

As indicated in the preceding text, none of the areas affected by the project are designated as Farmland or forest land. Therefore, the project would have ***no impact*** on farmland or forest land.

Mitigation: None required.

Cumulative Impacts

Impact C-AG-1: The project, in combination with past, present, and probable future projects, would not substantially contribute to cumulative impacts on farmland or forest land. (No Impact)

Pursuant to CEQA Guidelines Section 15130(a)(1), an EIR should not discuss impacts that do not result in part from the project evaluated in the EIR. As described under Impact AG-1, the project would have no impact related to the conversion of farmland to non-agricultural use or forest land to non-forest use. Therefore, there would be ***no significant cumulative impact*** on these resources to which the project would contribute.

Mitigation: None required.

This page intentionally left blank

CHAPTER 5
Other CEQA Issues

5.1 Growth Inducing Impacts

Section 15126.2(d) of the California Environmental Quality Act (CEQA) Guidelines requires that an environmental impact report (EIR) discuss "the ways in which the proposed project could foster economic or population growth, or the construction of additional housing, either directly or indirectly, in the surrounding environment. Included in this are projects which would remove obstacles to population growth (a major expansion of a wastewater treatment plant might, for example, allow for more construction in service areas). It must not be assumed that growth in any area is necessarily beneficial, detrimental, or of little significance to the environment."

As discussed in Chapter 4, Section 4.4, Population and Housing, the Biosolids Digester Facilities Project (BDFP or project) does not involve any housing construction and therefore would not induce growth directly by constructing housing that would attract people to the area. Project construction would not extend roads or other infrastructure that could indirectly induce growth. Given the size and availability of the regional workforce, project construction would not be expected to induce demand for housing by attracting a substantial number of workers from outside the region. Nor would the project provide new permanent employment opportunities that could attract workers to the area; long-term operation of the BDFP would not increase the number of workers employed at the Southeast Water Pollution Control Plant (Southeast Plant or SEP).

The existing sewer system is already sized to serve the projected population of over 1 million residents by 2045. Both the Southeast Plant and Oceanside Plant have capacity for the projected flows expected in 2045 and the biosolids digester facilities at the SEP would be designed to treat the solids from these projected flows up to the existing capacity. Project implementation would thus maintain the existing overall capacity of the SEP. As described in Section 4.4, Population and Housing, the proposed solids treatment facilities capacity provided by the BDFP is based on projections presented in the San Francisco Public Utilities Commission (SFPUC) *Wastewater Flow and Load Projections Technical Memorandum*.[1] The flow and load projections were developed using the most recent data available from SEP and Oceanside Water Pollution Control Plant operations and the (then) most recent population and employment projections developed by the Association of Bay Area Governments (ABAG), the Bay Area's regional planning agency. ABAG projections are relied on for planning by transportation and air quality agencies, water agencies, local governments, and others,

[1] SFPUC, *Wastewater Flow and Load Projections Technical Memorandum*, Prepared for San Francisco Public Utilities Commission Sewer System Improvement Program, Updated February 2014.

and are routinely used by the San Francisco Planning Department in its land use allocations to project growth throughout the City and County of San Francisco. Use of ABAG's *Projections 2013* to project wastewater flows and loads ensures that treatment capacity provided by the SEP and the associated solids treatment improvements provided by the BDFP would be consistent with planned growth and would not provide excess capacity that could potentially accommodate unplanned growth.

Based on this analysis, the project would not have a substantial growth-inducing impact, and no mitigation is required.

5.2 Significant Unavoidable Impacts

In accordance with Section 21100(b)(2)(A) of CEQA and with Sections 15126(b) and 15126.2(b) of the CEQA Guidelines, the purpose of this section is to identify project-related environmental impacts that could not be eliminated or reduced to a less-than-significant level with implementation of all feasible mitigation measures, as identified in Chapter 4, *Environmental Setting and Impacts*. The findings in this chapter are subject to final determination by the San Francisco Planning Commission as part of its certification of the Final EIR.

5.2.1 Cultural Resources

The project would result in the demolition of Buildings A and B at the Central Shops site, which are eligible for listing in the California Register of Historical Resources and National Register of Historic Places. Demolition of Buildings A and B would destroy the physical characteristics that convey historical significance of these buildings, as detailed in Section 4.5, Cultural Resources, causing a substantial adverse change in the significance of a historical resource as defined in CEQA Guidelines Section 15064.5. This impact would be significant and unavoidable, even with implementation of Mitigation Measure M-CR-1 (Documentation of Historic Resources and Interpretive Display), which would require written and photographic documentation of Buildings A and B consistent with National Park Service Historic American Building Survey/ Historic American Engineering Record Historical Report Guidelines prior to their demolition, as well as installation of a permanent display of interpretive materials in a prominent, public setting. Implementation of this measure would reduce the severity of the impact, but not to a less-than-significant level. The project would cause a substantial adverse change in the significance of a historical resource, and the impact would be *significant and unavoidable, with mitigation.*

Furthermore, the project would result in a substantial contribution to cumulative impacts on historic architectural resources when considered in combination with past, present, and probable future projects (specifically the Demolition of the Existing SEP Digesters and Southside Renovation Project). This would be *significant and unavoidable*, even with implementation of Mitigation Measure M-CR-1 (Documentation of Historic Resources and Interpretive Display). The impact associated with the demolition of Building 870, a contributor located within the *Southeast Treatment Plant Streamline Moderne Industrial Historic District*, from implementation of the BDFP in combination with the impact associated with the proposed future demolition of all existing digesters (Buildings 630-730) and their control buildings (Buildings 620 and 680), as part of the Southside Renovation Project, would result

in a significant, adverse cumulative impact on historic architectural resources. In addition to the loss of one of the *Southeast Treatment Plant Streamline Moderne Industrial Historic District's* 22 contributory buildings, the overall implementation of the BDFP would replace the function of the existing digesters and associated control buildings, thereby allowing for demolition of the existing digesters and control buildings. Therefore, the proposed project's contribution to this cumulative impact is considered cumulatively considerable, and cumulative impacts would remain *significant and unavoidable, with mitigation*.

5.2.2 Air Quality

The project includes construction activities and equipment that would generate NOx, an ozone precursor and criteria air pollutant, above the City's significance threshold for NOx during all five construction years. For this reason, the project would violate an air quality standard, a significant impact. Implementation of Mitigation Measure M-AQ-1a (Construction Emissions Minimization) would help to reduce NOx emissions, but not to below the applicable significance threshold during the first and third construction years. Implementation of Mitigation Measure M-AQ-1b (Emission Offsets) could offset the residual NOx emissions to below significance thresholds; however, whether implementation of Mitigation Measure M-AQ-1b would fully offset excess NOx emissions cannot be confirmed for two reasons. First, the SFPUC is in the process of determining whether there are enough opportunities available for upgrading existing SFPUC facilities sufficient to achieve the needed offset to reduce this impact to below the significance threshold. Second, although implementation of emissions offsets via the mitigation offset fee would result in an agreement with a third party, the BAAQMD, that agreement depends in part on the actions of that third party, and thus is not fully within the City's control. Given these uncertainties, the residual impact of construction emissions is conservatively considered significant, and the project's impact would remain *significant and unavoidable, with mitigation*.

5.3 Areas of Known Controversy and Issues to Be Resolved

On June 24, 2015, the San Francisco Planning Department issued a Notice of Preparation (NOP) of an EIR. In accordance with Section 15082 of the CEQA Guidelines, on June 24, 2015, the Planning Department sent over 2,340 copies of the NOP to public agencies and interested parties to begin the formal CEQA scoping process for the project. Notices were sent to potentially interested parties, including various state, regional, and local agencies, as well as to owners of properties within at least 300 feet of the north and west boundaries of the SEP and to owners of properties south of the SEP to Palou Avenue and east to Third Street. The Planning Department held a scoping meeting on July 16, 2015 to solicit comments on the scope of the EIR. The NOP is included in Appendix NOP of this document.

No areas of scientific or technical controversy have been identified for this project. Public comments received on the NOP for the proposed project included the following:

- Pedestrian, bicyclist and motorist safety during construction
- Transit impacts related to construction

- Overall health impacts related to truck traffic, exposure to diesel particulates and dust, and respective mitigation measures
- Construction and operations job opportunities for the community; benefits of project to the community
- Community involvement and outreach
- Use of the facility for educational and training purposes
- Conflicts with other concurrent construction projects in vicinity; potential for cumulative impacts with other projects
- Odors
- Environmental justice[2]
- Issues related to aesthetics
- Cumulative impacts of concurrent projects
- Loss of Southeast Greenhouses
- Alternative location for project
- Use of compostable materials

[2] The U.S. Environmental Protection Agency's (USEPA) Office of Environmental Justice defines environmental justice as the fair treatment and meaningful involvement of all people regardless of race, color, national origin, or income with respect to the development, implementation, and enforcement of environmental laws, regulations, and policies. Consistent with CEQA, economic or social effects of a project are not to be treated as significant effects on the environment (CEQA Guidelines Section 15131). The EIR focuses on physical environmental effects rather than socioeconomic effects. The SFPUC is conducting a separate environmental justice analysis concurrent with the project, which can be found at the following website: http://sfwater.org/index.aspx?page=654.

CHAPTER 6
Alternatives

Sections	Tables	Figures
6.1 Overview	6-1 Comparison of Project and Alternatives	6-1 Comparison of Project Air Pollutant Emissions to No Project Alternative Emissions
6.2 Alternatives Screening and Selection	6-2 Summary of Ability of Project and Alternatives to Meet Project Objectives	6-2 Comparison of Proposed Project GHG Emissions to No Project Alternative Emissions
6.3 Alternatives Analysis	6-3 Comparison of Environmental Impacts of Project to Impacts of Alternatives	6-3 Location of Pier 94 Backlands Alternative
6.4 Alternatives Comparison and the Environmentally Superior Alternative		6-4 Conceptual Site Plan: Pier 94 Backlands Alternative
6.5 Alternatives Considered But Eliminated from Further Analysis		6-5 Potential Site and Layout for Historical Resources Relocation Alternative
		6-6 Conceptual Site Plan: SEP South/Quint Street Alternative
		6-7 Parcels Considered for Potential Alternative Sites

6.1 Overview

6.1.1 Purpose of this Chapter

As required by the California Environmental Quality Act (CEQA), this chapter presents the alternatives analysis for the Biosolids Digester Facilities Project (BDFP or project) proposed by the San Francisco Public Utilities Commission (SFPUC) to replace the solids treatment and related facilities at the existing Southeast Water Pollution Control Plant (SEP) in San Francisco. The purpose of the CEQA alternatives analysis is to identify potentially feasible alternatives that could avoid or substantially lessen the significant impacts identified for the project while still meeting most of the project objectives. This chapter describes both the methodology used to screen and select alternatives to the project for detailed CEQA analysis as well as the results of the detailed alternatives analysis. For the alternatives selected for detailed analysis, the chapter evaluates the alternatives' impacts relative to existing environmental conditions and compares the potential impacts of the alternatives with those of the project. Based on this analysis, this chapter then identifies the environmentally superior alternative. Finally, other alternatives that were considered but eliminated from detailed consideration are presented together with the reasons for their elimination.

6.1.2 CEQA Requirements for Alternatives Analysis

CEQA Guidelines Section 15126.6(a) states that an environmental impact report (EIR) must describe and evaluate a reasonable range of alternatives to the project that would feasibly attain most of the project's basic objectives but would also avoid or substantially lessen any identified significant adverse environmental effects of the project. CEQA Guidelines Section 15364 defines "feasible" as "capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors." CEQA Guidelines Section 15126.6(f)(1) states that "the factors that may be taken into account when addressing the potential feasibility of alternatives include site suitability, economic viability, availability of infrastructure, general plan consistency, other plans or regulatory limitations, jurisdictional boundaries (projects with a regionally significant impact should consider the regional context), and whether the proponent can reasonably acquire, control, or otherwise have access to the alternative site (or the site is already owned by the proponent)."

The EIR must evaluate the comparative merits of the alternatives and include sufficient information about each alternative to allow meaningful evaluation, analysis, and comparison with the project. Specifically, the CEQA Guidelines set forth the following criteria for selecting and evaluating alternatives:

- ***Range of reasonable alternatives.*** An EIR shall describe a range of reasonable alternatives to the project, or to the location of the project, that would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project, and evaluate the comparative merits of the alternatives. An EIR need not consider every conceivable alternative to a project. Rather, it must consider a reasonable range of potentially feasible alternatives that will foster informed decision-making and public participation (Section 15126.6[f]). An EIR is not required to consider alternatives that are infeasible. (Section 15126.6[a]) The specific alternative of "no project" shall also be evaluated along with its impact (Section 15126.6[e][1]).

- ***Ability to avoid or substantially reduce significant effects.*** The discussion of alternatives shall focus on alternatives to the project or its location that are capable of avoiding or substantially lessening any significant effects of the project, even if these alternatives would impede to some degree the attainment of the project objectives, or would be more costly (Section 15126.6[b]).

- ***Ability to meet project objectives.*** The range of potential alternatives shall include those that could feasibly accomplish most of the basic objectives of the project and could avoid or substantially lessen one or more of the significant effects (Section 15126.6[c]).

6.2 Alternatives Screening and Selection

Consistent with CEQA, the approach to alternatives selection focused on the following criteria for identifying the range of alternatives:

- Does the alternative reduce the severity of one or more of the project's significant adverse impacts?

- Is the alternative potentially feasible?
- Does the alternative meet most of the basic objectives of the project?
- Does the alternative foster informed decision-making and public participation?

The screening process involved three main steps: (1) review of potentially impact-reducing or impact-avoidance concepts and strategies that were previously identified either by members of the community or by the SFPUC, (2) review of significant impacts identified in the EIR, and (3) formulation of alternatives that would meet CEQA requirements. Most of the concepts and strategies previously identified by the public or the SFPUC were eliminated from consideration for CEQA purposes based on one or more of the following reasons: (1) their inability to reduce the project's significant impacts that were identified in Chapter 4 of this EIR, (2) their infeasibility, (3) their inability to meet most of the project's basic objectives, and/or (4) their potential to result in greater environmental impacts than the project. Section 6.5 describes potential alternatives and other strategies that were considered but eliminated and the reasons for their elimination.

6.2.1 Alternatives Previously Identified for the BDFP

6.2.1.1 Alternatives Identified by the Public

Residents of the Bayview-Hunters Point community and other members of the public suggested numerous alternative concepts to the project, all of which were considered as part of the alternatives screening process for this EIR.

The nine-member Southeast Digester Task Force was an advisory group representing the local Bayview-Hunters Point community and convened by the SFPUC for the purpose of reviewing and evaluating alternative concepts for replacing the SEP digesters. The Digester Task Force met regularly during 2009 and 2010 before delivering a final report, the Southeast Digester Task Force Final Report,[1] to the City and County of San Francisco (City or CCSF) that included recommendations for site options and facility layouts, among other things. The Digester Task Force evaluated 16 site options, screened out most of the sites due to their infeasibility (e.g., inadequate size, distance from the SEP, site contamination, and/or site unavailability), reconfigured the remaining sites, and ultimately recommended the following two sites:

- The proposed BDFP site, which is described in Chapter 2, *Project Description*, and evaluated in Chapter 4, *Environmental Setting and Impacts*, as the proposed project in this EIR.
- The Pier 94 Backlands site, which is described and evaluated in this EIR as a CEQA alternative in Section 6.3, below.

A variation of an alternative considered by the Task Force (the SEP South/Quint Street Alternative), the project site plus SEP South, is also described and evaluated in this EIR as a CEQA alternative in Section 6.3 below. Section 6.5, below, identifies the other options identified by the task force and describes the reasons they were eliminated from detailed analysis in the EIR.

[1] Southeast Digester Task Force for the San Francisco Public Utilities Commission, *Review of the Biosolids Digester Facility Project*, June 2, 2010.

During the scoping period for this EIR (see Chapter 1, Section 1.2, Environmental Review Process), one community member suggested the following three alternatives to the project:

- The first alternative would divert some wastewater flows from the SEP to the SFPUC Oceanside Water Pollution Control Plant but otherwise would not alter existing SEP solids processing facilities. This alternative was considered for evaluation in the EIR but ultimately rejected for reasons stated in Section 6.5, below.
- The second alternative would locate the BDFP facilities at 1550 Evans Avenue or the Pier 94 site. The 1550 Evans alternative was considered for evaluation in the EIR but ultimately rejected for reasons stated in Section 6.5, below. The Pier 94 site is described and analyzed as a CEQA alternative in Section 6.3.2, below.
- The third alternative component proposed hauling biosolids by rail instead of by truck. This alternative was considered for evaluation in the EIR but ultimately rejected for reasons stated in Section 6.5, below.

6.2.1.2 Other Alternatives Identified During Project Planning

The SFPUC has identified and examined numerous alternative concepts to address the need for and objectives of the BDFP over many years. As part of the alternatives screening process for the BDFP EIR, the SFPUC's Needs Assessment Report[2] and the Alternatives Analysis Report[3] were reviewed for possible alternatives that could meet CEQA criteria for EIR alternatives. The Needs Assessment Report identified requirements and modifications needed for the SEP biosolids facilities to meet the Sewer System Improvement Program (SSIP) levels of service goals (refer to Table 2-3 in Chapter 2, *Project Description*). The report evaluated four alternatives that could meet future needs and could achieve level of service goals, two of which advanced the recommendations of the Digester Task Force (construction of new biosolids digester facilities at either the proposed BDFP site or at the Pier 94 Backlands, described in Section 6.2.1.1, above). The remaining two alternatives were the following:

- *Maintain Existing Facilities.* This alternative, involving long-term maintenance of existing facilities, essentially represents what would reasonably be expected to occur if the BDFP is not approved, and is described and analyzed under the No Project Alternative (refer to Section 6.3.1, below).
- *Rebuild Existing Facilities in Place.* This alternative concept involves reconstruction of existing solids handling facilities in place. Section 6.5, below, describes this potential alternative and the reasons it was eliminated from detailed analysis in this EIR.

During development of the BDFP, the SFPUC evaluated processing technology, treatment train, and site layout options for the BDFP as part of the Alternatives Analysis Report. The results yielded the proposed technology (thermal hydrolysis process with mesophilic anaerobic digestion), unit processes, and site layout described in Chapter 2, *Project Description*. Section 6.5, below, describes

[2] SFPUC, *Needs Assessment Report: Southeast Water Pollution Control Plant Biosolids Digester Facilities, Draft Final*, January 2016.
[3] SFPUC, *Biosolids Digester Facilities Project Alternatives Analysis Report*, December 2014.

three of the site layout options considered for potential evaluation in the EIR and the reasons they were eliminated.

6.2.2 Strategies to Avoid Significant Impacts

The primary goal of the alternatives selection process is to identify alternatives that could substantially reduce or avoid one or more of the significant impacts attributable to the project, in accordance with CEQA Guidelines Section 15126.6(b). The following sections summarize the conclusions for significant and potentially significant impacts of the BDFP that were identified in Chapter 4, *Environmental Setting and Impacts*, of this EIR and describe strategies that were considered for inclusion in the alternatives analysis based on their ability to avoid or lessen significant or potentially significant impacts. See Chapter 4 for details regarding the impacts of the project.

6.2.2.1 Significant and Unavoidable Impacts

The project was determined to have the following significant and unavoidable impacts.

Cultural Resources

- Project implementation would cause a substantial adverse change in the significance of a historic architectural resource through the demolition of Central Shops Buildings A and B. Even with implementation of Mitigation Measure M-CR-1 (Documentation of Historical Resources and Interpretive Display), the impact would be *significant and unavoidable.* (Impact CR-1)

- The project would result in a substantial contribution to cumulative impacts on historic architectural resources because the project would demolish Building 870, a contributor to a *Southeast Treatment Plant Streamline Moderne Industrial Historic District* (historic district), and implementation of the BDFP would replace the function of the existing digesters and associated control buildings, which are contributors to the historic district, thereby allowing for a potential future project involving demolition of the existing digesters and control buildings. (Demolition of the existing digesters and control buildings is not part of the BDFP.) Loss of Building 870 (contributor within the historic district) under the project, in combination with the proposed future demolition of all existing digesters and their control buildings, would result in a significant, adverse cumulative impact on the district and therefore an adverse impact on historic architectural resources. Even with implementation of Mitigation Measure M-CR-1 (Documentation of Historical Resources and Interpretive Display), the impact would be *significant and unavoidable.* (Impact C-CR-1)

Air Quality

- Of the criteria air pollutants that would be generated during project construction, nitrogen oxide (NOx) emissions would violate an existing air quality standard, both at the project level and cumulatively. Even with implementation of Mitigation Measures M-AQ-1a (Construction Emissions Minimization) and M-AQ-1b (Emission Offsets), these impacts would be *significant and unavoidable* during two of the five years of construction. (Impacts AQ-1, C-AQ-1a)

6.2.2.2 Strategies to Avoid or Lessen Significant Unavoidable Impacts

Significant and Unavoidable Impact on Historic Architectural Resources

Strategies to avoid the project's impact on historic architectural resources (i.e., demolition of Central Shops Buildings A and B) were examined in detail in a memorandum from ESA+Orion to the San Francisco Planning Department.[4] In 2015, the San Francisco Historic Preservation Commission approved Resolution No. 0746 recommending that EIRs that identify demolition of a historic architectural resource in San Francisco include a robust alternatives evaluation. The resolution states that EIR alternatives evaluation should include, in addition to the required No Project Alternative, at least one full preservation alternative (i.e., an alternative that would fully preserve the resource) and one partial preservation alternative (i.e., an alternative that would partially preserve the resource), while taking into account the potential feasibility of the proposed alternatives and their ability to achieve the project objectives. The resolution also requests that EIRs describe these alternatives. As part of the alternatives development process for this EIR, full and partial preservation strategies were identified to meet the Historic Preservation Commission recommendations[5] as well as the CEQA requirements. In total, ten strategies to reduce or avoid impacts on historic architectural resources were considered: six "full preservation" alternatives that would avoid the impact entirely and four "partial preservation" alternatives that would lessen the severity of the impact by retaining a portion of the resource. Three full preservation alternatives identified in this process (the No Project, Pier 94 Backlands, and Historical Resources Relocation Alternatives) were selected as alternatives for detailed analysis in this EIR in Section 6.3, below. In addition, the SEP South/Quint Street Alternative (one of the site options considered by the Digester Task Force) was selected for detailed analysis in Section 6.3, below and is also considered a full preservation alternative. All of the partial preservation strategies were deemed either to be infeasible or ineffective in substantially reducing the significant and unavoidable impact on historic architectural resources. The strategies to avoid or reduce impacts on historic architectural resources that were considered but eliminated from further analysis are described in Section 6.5, below.

Cumulative Significant and Unavoidable Impact on Historic District

The project would result in a substantial contribution to cumulative impacts on historic architectural resources because the overall implementation of the BDFP would replace the function of the existing digesters and associated control buildings, which are contributors to the *Southeast Treatment Plant Streamline Moderne Industrial Historic District*, thereby allowing for future potential demolition of the existing digesters and control buildings. Phase II of the SFPUC's SSIP includes demolition of the existing SEP digesters and associated control buildings, and improvements within the south side of the SEP,[6] once the BDFP is constructed and fully operational. With the BDFP and the proposed future demolition of the existing digesters,

[5] Ibid.

[6] More information on this project, Demolition of the Existing SEP Digesters and Southside Renovation Project, can be viewed in Table 4.1-1 in Section 4.1 of this EIR.

approximately 13 of the 22 contributing structures to the historic district would be demolished, a significant, unavoidable cumulative impact.

The fundamental project objective is to "replace the existing solids treatment facilities at the SEP with new infrastructure with modern and more efficient treatment technologies to protect public health and safety and provide continued regulatory compliance." Thus, *any* alternative that would achieve this single objective would also result in a substantial contribution to cumulative impacts on historic architectural resources by replacing the function of the existing digesters and allowing for potential future demolition of the existing digesters. There is no alternative that could avoid or substantially reduce the severity of this significant and unavoidable cumulative impact on the historic district *and* meet this fundamental project objective. Therefore, with the exception of the No Project Alternative, none of the alternatives described and analyzed in Section 6.3, below, addresses this significant and unavoidable cumulative impact on the historic district.

Significant and Unavoidable Construction Air Quality Impacts

The project would result in significant and unavoidable impacts associated with criteria air pollutant emissions (specifically ozone precursors, NOx) during the first and third years of construction, both on a project and cumulative impact basis, even with implementation of maximum feasible mitigation measures for construction emissions minimization. Implementation of Mitigation Measure M-AQ-1b (Emission Offsets) could reduce these impacts to less than significant, by reducing NOx emissions to below the threshold level within the same air basin. However, these impacts are still considered significant and unavoidable because of uncertainties related to the availability of sufficient offset opportunities and reliance on an agreement with a third party (the BAAQMD).

No feasible strategy or alternative has been identified to avoid or substantially reduce the severity of these impacts beyond the mitigation measures presented in Chapter 4, Section 4.8. Consequently, only the No Project Alternative would avoid these significant and unavoidable, air quality impacts.

6.2.2.3 Significant Impacts that Can be Mitigated to Less than Significant

Project implementation would result in the following significant impacts, all of which could be mitigated to less-than-significant levels with the implementation of mitigation measures identified in Chapter 4, *Environmental Setting and Impacts*, under the respective impact evaluations.

Cultural Resources

- Ground-disturbing activities during project construction would affect known prehistoric archeological resources or could affect unidentified deeply submerged prehistoric deposits, resulting in a substantial adverse change in the significance of an archeological resource, as both a project-level impact and a cumulative impact. With implementation of Mitigation Measures M-CR-2a (Archeological Testing, Monitoring, and/or Data Recovery) and M-CR-2b (Accidental Discovery of Archeological Resources), both impacts would be *less than significant*. (Impacts CR-2 and C-CR-2)

- Project construction could disturb human remains, including those interred outside of formal cemeteries, as both a project-level impact and a cumulative impact. With implementation of Mitigation Measure M-CR-2a (Archeological Testing, Monitoring, and/or Data Recovery), both impacts would be *less than significant*. (Impacts CR-3 and C-CR-2)

Noise

- Use of concrete saws during project construction could cause a substantial temporary or periodic increase in ambient noise levels and could expose people to or generate noise levels in excess of noise level standards established in the local noise ordinance. In addition, use of the Southeast Greenhouses as a staging area could substantially exceed the ambient noise levels at nearby sensitive receptors. With implementation of Mitigation Measure M-NO-1a (Shielding of Concrete Saw Operations) and Mitigation Measure M-NO-1b (Construction Noise Control Measures at Southeast Greenhouses Staging Area), this impact would be *less than significant*. (Impact NO-1)

- Noise from project construction, combined with construction noise from cumulative projects nearby, could cause a substantial temporary or periodic increase in ambient noise levels in the project vicinity. With implementation of Mitigation Measures M-NO-1b (Construction Noise Control Measures at Southeast Greenhouses Staging Area), the project's contribution to this impact would be *less than cumulatively considerable*. (Impact C-NO-1)

Air Quality

- The NOx emissions during project construction could conflict with or obstruct implementation of the 2010 Clean Air Plan, but with implementation of Mitigation Measures M-AQ-1a (Construction Emissions Minimization) and M-AQ-1b (Emission Offsets), the project would be consistent with the 2010 Clean Air Plan, and this impact would be *less than significant with mitigation*. (Impact AQ-4)

Biological Resources

- Project construction could have a substantial adverse effect on roosting bats, as both a project-level and cumulative impact. However, with implementation of Mitigation Measure M-BI-1 (Protective Measures for Special Status Bats and Maternity Roosts), these impacts would be *less than significant*. (Impacts BI-1 and C-BI-1)

Geology, Soils and Paleontological Resources

- Project construction could destroy a unique paleontological resource, as both a project-level impact and a cumulative impact. However, with implementation of Mitigation Measure M-GE-4 (Paleontological Resources Monitoring and Mitigation Program), these impacts would be *less than significant*. (Impacts GE-4 and C-GE-2)

6.2.2.4 Strategies to Avoid or Lessen Significant Impacts that can be Mitigated to Less than Significant

Several strategies were identified to avoid or more effectively mitigate noise and air quality impacts determined to be less than significant after mitigation. These impacts are generally all associated with project construction, and strategies to avoid or more effectively mitigate such impacts include extending the construction schedule and revising the construction methods.

Extending the construction schedule could reduce the severity of air quality impacts (by reducing concurrent use of air pollutant-emitting construction equipment such that NOx emissions would be consistent with the 2010 Clean Air Plan); however, this strategy would prolong numerous other construction activity impacts (e.g., noise, traffic, air pollutant emissions) and would not reduce the total criteria air pollutant emissions; on balance, this strategy would not effectively reduce or avoid these construction-related impacts over the duration of the construction period. The severity of Impacts NO-1, C-NO-1, and AQ-4 could potentially be reduced by avoiding or reducing the use of concrete saw operations; however, this strategy could be overly cumbersome, if even feasible, and would likely extend the construction schedule, such that this strategy would not effectively reduce or avoid these construction-related noise and air quality impacts. Therefore, neither extending the construction schedule nor revising the construction methods were determined to more effectively mitigate noise and air quality impacts than the identified mitigation measures, and these strategies were eliminated from further consideration.

To avoid construction impacts related to cultural and paleontological resources, the SFPUC would need to revise the construction methods to avoid subsurface excavation, assuming the project would remain at the proposed location. This strategy is not feasible. As shown on Figure 2-8 in Chapter 2, *Project Description*, subsurface facilities are integral components of the project. Because feasible mitigation measures are available that would effectively reduce these impacts to less than significant, alternative construction methods that would avoid subsurface excavation were eliminated from further consideration and are not addressed under any of the alternatives. Another strategy that would avoid construction impacts related to cultural and paleontological resources would be to locate the new facilities at a site that does not have known or suspected buried resources. This strategy is addressed and analyzed in Section 6.3, below, under Alternative B, the Pier 94 Backlands Alternative.

Similarly, to avoid construction impacts related to effects on roosting bats, the SFPUC would need to revise the construction methods to avoid building demolition and tree removal as well as reduce construction-associated noise and vibration. This strategy is not feasible at the proposed project location because building demolition and removal of trees are necessary prerequisites for the project. Although these impacts could potentially be avoided or reduced if the project is constructed at a different location (addressed under the Pier 94 Backlands Alternative in Section 6.3, below), there is the potential that the same or other impacts on biological resources could occur at the alternative location. Section 6.3.2, below, evaluates the relative merits of the Pier 94 Backlands Alternative for its effectiveness in reducing construction effects on biological resources (including roosting bats) compared to the project. Nevertheless, because feasible mitigation measures are available that would effectively reduce these impacts to less than significant, alternative construction methods that would avoid building demolition and tree removal at the project site were eliminated from further consideration.

6.2.3 Alternatives Selected for Detailed Analysis

The screening process described above identified four alternatives to the BDFP that represent a reasonable range of alternatives and warrant further analysis as CEQA alternatives. These include the No Project Alternative plus three feasible alternatives that could avoid or substantially reduce

one or more significant impacts of the project and achieve most of the BDFP objectives, thus meeting the CEQA criteria for detailed analysis. The following four alternatives are analyzed in this chapter:

- Alternative A: No Project
- Alternative B: Pier 94 Backlands
- Alternative C: Historical Resources Relocation
- Alternative D: SEP South/Quint Street

With the exception of the No Project Alternative, the identified alternatives would meet most of the project objectives and would lessen, and in some cases avoid, significant adverse impacts that were identified for the proposed project. All four of the above alternatives would be considered full preservation alternatives and would avoid the significant and unavoidable direct impact on historic architectural resources. The No Project Alternative would avoid all significant impacts identified for the proposed project, including the project's significant and unavoidable cumulative impact on the *Southeast Treatment Plant Streamline Moderne Industrial Historic District* and the significant and unavoidable construction-related air quality impact of the proposed project; it would also avoid the significant but mitigable impacts with respect to archeological and paleontological resources, human remains, construction noise, consistency with the 2010 Clean Air Plan, and biological resources (roosting bats). In addition to the significant and unavoidable direct impact on historic architectural resources, the Pier 94 Backlands Alternative would avoid the significant but mitigable impacts related to paleontological resources. Both the Historical Resources Relocation Alternative and the SEP South/Quint Street Alternative would avoid the significant and unavoidable direct impact on historic architectural resources, but for both of these alternatives, all other significant impacts would be the same as those identified for the BDFP.

6.3 Alternatives Analysis

This section presents the detailed analysis of the impacts of the selected alternatives compared to the proposed project. For each of the four alternatives, this section presents a description of the alternative and assumptions used in analyzing that alternative, assesses the ability of the alternative to meet each of the project objectives, and analyzes the impacts of the alternative compared to those of the proposed project. The impact analysis is based on the same environmental setting and significance thresholds as presented for each resource topic in Chapter 4, *Environmental Setting and Impacts*, and uses the same approach to analysis. Except as noted, the impact analysis of the alternatives is qualitative, relative to the identified impacts of the project, and the reader is referred to Chapter 4 for the more detailed analysis. Since the alternatives are conceptual, this evaluation is based on the best available information and reasonable assumptions about how each alternative would be implemented.

Table 6-1 summarizes and compares the characteristics of the project with those of the four alternatives. **Table 6-2** summarizes the ability of the four alternatives to meet the project objectives.

TABLE 6-1
COMPARISON OF PROJECT AND ALTERNATIVES

Characteristic	Proposed Project	Alternative A: No Project	Alternative B: Pier 94 Backlands	Alternative C: Historical Resources Relocation	Alternative D: SEP South/Quint Street
Summary					
Facilities Location	Parts of SEP North near Rankin Street and near Jerrold Avenue, Central Shops site, and Asphalt Plant site (no facilities located within Quint Street)	SEP South	Pier 94 Backlands	Same as project	Portions same as project: parts of SEP North near Rankin Street and near Jerrold Avenue and Asphalt Plant site Portions different from project: Part of Central Shops site (excluding the area in and around Central Shops Buildings A and B); parts of SEP South near Quint Street; Quint Street between Jerrold Avenue and the Caltrain right-of-way
New Pipelines between SEP and New Facilities	Within SEP boundaries and project site	n/a	Approximately 4,000 feet of 10 to 12 new pipelines (between 6 and 20 inches in diameter) located within public rights-of way along Cargo Way, Mendell Street, and Evans Avenue	Same as project	Within SEP boundaries and project site, but different locations from the project Relocation of existing utilities under Quint Street may require construction outside the SEP boundaries
Facilities Acreage	Approximately 10 acres	Approximately 9 acres	Approximately 15 acres (excluding off-site pipelines)	Same as project	Approximately 16 acres
Site Acquisition and Availability	SEP available now Asphalt Plant available in 2017 Central Shops available in 2018	SEP available now	May be feasible, but site is part of the public land trust that is under State Lands Commission jurisdiction. Unknown date of availability, but if feasible would require a minimum of several years to acquire. Pipeline alignments within public rights-of-way.	Same as project	Same as project, plus would require vacating Quint Street
Additional Site Needs	n/a	n/a	Would require that land of similar size and value as the area of the Pier 94 Backlands site be identified and be placed into public trust	Pier 90 site (approximately 3 acres), potentially available in the future	Temporary sites for relocation of existing solids treatment facilities (e.g., gravity belt thickeners, centrifuge systems, sludge pipelines, biosolids dewatering, cake storage and loadout, etc.) would be needed for interim use during construction. Locations of these temporary (at least seven years) sites to be determined. Need right-of-way for relocated gas pipeline along Quint Street.
Proximity of Digesters to Residences	1,000 feet	< 100 feet	> 1,800 feet	Same as project	600 feet to Phelps Street 700 feet to Oakdale Avenue
Footprint of Aboveground Structures	Approximately 206,000 square feet	n/a	Building square footage greater than that of project due to height restriction	Same as project	Same as project
Maximum Height	65 feet	65 feet	40 feet	Same as project	Same as project
Sea Level Rise Considerations	Designed to meet 36-inch increase in sea level rise by 2100 as applicable	None	Designed to meet 36-inch increase in sea level rise by 2100 as applicable at this site	Same as project	Same as project
Staging Area Location	Pier 94 Backlands, Pier 94 and/or Pier 96, segments of Quint Street/Jerrold Avenue, Southeast Greenhouses, and/or 1550 Evans Avenue	None	Piers 94 Backlands, Pier 94 and/or Pier 96	Same as project except for possible additional staging area at Pier 90 required for relocation of historic resources	Same as project
Staging Area Acreage	Up to 12 acres	None	Approximately same as project	Same as project, except for possible additional staging area at Pier 90 required for relocation of historic resources	Same as project
Solids Treatment Facilities					
Process	Thermal Hydrolysis Process/Mesophilic Anaerobic Digestion	Mesophilic Anaerobic Digestion	Same as project	Same as project	Same as project

TABLE 6-1 (Continued)
COMPARISON OF PROJECT AND ALTERNATIVES

Characteristic	Proposed Project	Alternative A: No Project	Alternative B: Pier 94 Backlands	Alternative C: Historical Resources Relocation	Alternative D: SEP South/Quint Street
Solids Treatment Facilities (cont.)					
Biosolids Type	Class A (fewest restrictions for reuse)	Class B (limited reuse options)	Same as project	Same as project	Same as project
Biosolids Annual Production	24,000 dry tons (year 2045)	27,700 dry tons (Year 2045)	Same as project	Same as project	Same as project
Digesters	Number of digesters: 5 Size of digesters: 1.66 million gallons each Height above grade: 65 feet Diameter: 70 feet	Number of digesters: 10 (9 in active use as digesters and 1 used for biogas storage) Size of digesters: 1.8 million gallons each Height above grade: 22 feet Diameter: 100 feet	Number of digesters: 5 Size of digesters: 1.66 million gallons each Height above grade: 40 feet Diameter: 100 feet	Same as project	Same as project
Digester Gas Production	Approximately 1.6 to 2 million cubic feet per day (2023 to 2045)	Approximately 1.3 to 1.7 million cubic feet per day (2023 to 2045)	Same as project	Same as project	Same as project
Energy Recovery Facilities					
Process	• Gas Turbines • Heat Recovery Steam Generation System • Steam Boilers (backup only) • Waste gas burners	• Internal Combustion Engine • Hot Water Boilers • Waste gas burners	Same as project	Same as project	Same as project
Energy Generation, Annual Average	4.2 to 5.2 megawatts (2023 to 2045)	Up to 2 megawatts	Same as project	Same as project	Same as project
Maximum Height of Structures	55 feet (digester gas storage tank)	26 feet (boilers)	40 feet	Same as project	Same as project
Waste Gas Burners – Operations	2 units, 40 feet tall, infrequent use (only used for testing, planned maintenance, and emergencies)	2 units, 65 feet tall, routine and more frequent flaring over time (due to projected increased loadings)	Same as project	Same as project	Same as project, but closer to residences
Odor Control Facilities					
Design Parameter	Designed to limit odors from biosolids facilities to within SEP site	Odors from biosolids facilities not completely contained within existing SEP site	Designed to limit odors from biosolids facilities to within Pier 94 Backlands site	Same as project	Same as project
Solids Treatment Odor Control Facilities	One new centralized solids odor control system with biofilters, adsorption vessels, ammonia scrubbers, odor control fans, and dispersion cones to treat odors from pre-digestion processes (gravity belt thickeners, screening, pre-THP dewatering, and cake storage) and from post-digestion processes (biosolids dewatering, storage, and loadout)	Adsorption units at gravity belt thickeners, centrifuge building, and cake loadout	Same as project	Same as project	Same as project
Ancillary SEP-Related Facilities					
New Ancillary Facilities	New, redundant plant-wide operations control center for both SEP North and South (i.e., security controls, energy management systems, fire protection and alarm systems, compressed air, and plant communications); new electrical rooms, transformers, chemical storage, and diesel emergency generator	None	Additional redundant facilities would need to be built at this location, including site-specific operations control center at this site, backup power, (diesel generators), chemical storage, and fire protection. Due to the distance from the main SEP, these additional facilities would not support the rest of the SEP in the way the same facilities would with the project.	Same as project	Same as project
New Utility Connections	Not required	None	New connections needed for water supply, high voltage power (substation), sewage, natural gas, communications Increased stormwater drainage improvements needed	Same as project, plus potential utility connections to relocated historic buildings	Relocate 24-inch high pressure PG&E gas line within public right-of-way (to be determined) and other utilities within Quint Street

TABLE 6-1 (Continued)
COMPARISON OF PROJECT AND ALTERNATIVES

Characteristic	Proposed Project	Alternative A: No Project	Alternative B: Pier 94 Backlands	Alternative C: Historical Resources Relocation	Alternative D: SEP South/Quint Street
Operations and Maintenance					
Maintenance	• Routine maintenance of new facilities • Routine grit removal during normal operations (due to design, no need to take digesters offline for cleaning)	• High level of maintenance for older equipment • Digester taken out of service for more frequent routine grit removal from digesters • Repair/replacement of facilities as needed (e.g., secondary sludge thickening pumps, gravity belt thickeners, digesters, digester pumps, centrifuges and pumps, bin hoppers, gas booster station equipment, gas handling system components, electrical system)	Similar to project Due to the remote location, additional redundant facilities would need to be maintained and operated	Same as project (does not include maintenance of relocated historic resources)	Similar to project, but layout is not as efficient as proposed project. Maintenance facilities are located far from the processes they would be supporting.
Staffing	No change from existing (280 staff for entire SEP including biosolids)	Slight increase in operations and maintenance staffing compared to existing to ensure reliable operations of aging facilities (up to five additional staff)	Increase of about five staff (to be located at Pier 94 Backlands)	Same as project (does not include staffing for relocated historic resources)	Same as project
Operating Hours	24 hours per day, seven days per week	Same as project	Same as project	Same as project (does not include operations for relocated historic resources)	Same as project
Operational Haul Routes	Grit and screening, biosolids, yellow grease hauling, and chemical delivery via Rankin Street, Evans Avenue, and Cesar Chavez Street to Interstate 280 or U.S. Highway 101	Same as existing condition: grit and screening hauling via Rankin Street, Evans Avenue, and Cesar Chavez Street to Interstate 280 or U.S. Highway 101; chemical delivery, yellow grease, and biosolids loadout via Jerrold Avenue to U.S. Highway 101	• Biosolids, chemical deliveries, yellow grease loadout (to/from site): Amador Street, Illinois Street, Cesar Chavez Street, U.S. Highway 101 • Grit/screening (to/from site): Amador Street, Illinois Street, Cesar Chavez Street, Pennsylvania Street (outbound only), Interstate 280	Same as project	Same as project
Energy Demand and Supplies	By 2045, all electricity demands of the SEP solids treatment process (4.9 megawatts) would be met by electricity produced by the energy recovery facilities (5.2 megawatts), with excess energy available to other SEP facilities. Standby energy would be available for use at the SEP during routine operations, emergencies, and power outages.	Up to 2 megawatts produced by existing energy recovery facilities would partially meet SEP solids treatment process energy demands; supplemental energy from Hetch Hetchy hydropower would be required.	Energy produced at the Pier 94 Backlands site would only be used on-site; no excess energy would be available, due to higher electrical demands related to additional pumping of dilute sludge and return streams to SEP. There would be no standby energy for use at the SEP during routine operation, emergencies, and power outages.	Same as project	Same as project
Construction of New Facilities or Relocation					
Duration and Schedule	Five years, February 2018 to January 2023	No planned construction for major facilities replacement, but construction would be expected to occur sporadically as needed. The diminishing reliability of existing solids processing facilities could result in unanticipated breakdowns and equipment failure, necessitating sporadic repair and replacement construction projects in the future.	Duration approximately same as project. Start date likely delayed by several years due to site acquisition.	Approximately 7 to 13 months for disassembly and transportation (to occur prior to BDFP construction) and 18 to 24 months for reassembly and rehabilitation of Central Shops Buildings A and B at the new site (to occur concurrent with BDFP construction). Total assumed construction duration: about six years.	Duration: At least seven years due to relocation of utilities under Quint Street (water lines, gas pipeline) and construction of interim solids treatment process facilities. Start date likely delayed by several years due to need to redesign project and site acquisition needs for vacating Quint Street.
Construction Hours	Typical: Monday through Friday, 7:00 a.m. to 3:30 p.m. Work could occur until 8:00 p.m. and on Saturdays and Sundays as needed. During peak construction for up to a year, two shifts per day with the second shift lasting until 11:00 p.m. if needed.	No planned construction; see above	Similar to project	Same as project Relocation of Buildings A and B: assumed to be standard Monday through Friday, 7:00 a.m. to 3:30 p.m.	Same as project
Construction Work Force (includes both management and contractor staff)	Typical: 100 to 550 persons, depending on construction activity	No planned construction; see above	Assumed to be 10 percent larger than project	Same as project for construction of BDFP facilities Relocation of Buildings A and B: 75 construction workers	Same as project

TABLE 6-1 (Continued)
COMPARISON OF PROJECT AND ALTERNATIVES

Characteristic	Proposed Project	Alternative A: No Project	Alternative B: Pier 94 Backlands	Alternative C: Historical Resources Relocation	Alternative D: SEP South/Quint Street
Construction of New Facilities or Relocation (cont.)					
Temporary Road Closure	Jerrold Avenue between SEP entrance west of Phelps Street and Caltrain tracks	No planned construction; see above	Potential lane closures for pipeline installation	Same as project	Same as project
Temporary Relocation of Muni	Muni 23 Monterey route	No planned construction; see above	Potential rerouting of Muni Route 19 and Route 44 along Evans Avenue (three to five months)	Same as project	Same as project
Construction Haul Routes	Routing along Rankin Street, Evans Avenue, Cesar Chavez Street, Jerrold Avenue, Third Street, Cargo Way, and Amador Street to Interstate 280 or U.S. Highway 101. Haul trucks between pier staging and SEP. Construction worker shuttle between Pier 94 and SEP.	No planned construction, see above	Routing along Amador, Illinois, Cesar Chavez, and Pennsylvania Streets to Interstate 280 or U.S. Highway 101	Same as project	Same as project
Ongoing Operational Hauling from SEP During Construction	Routing along Jerrold Avenue, Phelps Street, Rankin Street, Evans Avenue, and Cesar Chavez Street	Same as existing condition	Same as existing condition	Same as project	Same as project
Demolition	Approximately 136,000 square feet of existing structures	No planned demolition	None required	Same as project Relocation of Buildings A and B: Assume existing buildings at 600 Amador Street would be demolished	Demolition of Building 871 in SEP North (same as project) No demolition of Central Shops Buildings A and B Additional demolition of SEP South Structures (780, 960 [partial], 785, 900, SS14, SS15, SS15A 770, 915A, 915B, 750, 891, 800, 880, 885, 995, 950, 860, SS17, 833, 840, 791, 832, 790, 962, 925, SS5A, SS5B, 870, 511), including below-grade structures and pipe galleries. Relocation of equipment and pipes would add extensive time and cost. Includes demolition of processes that are needed throughout construction; therefore, interim facilities need to be constructed (waste activated sludge thickening, biosolids dewatering and cake storage and loadout).
Site Preparation	Substantial excavation and subsurface construction, requiring subsurface excavation support Approximate excavation depth 20 to 30 feet, except for digesters (41 feet)	No planned construction	Similar to project. Additionally, site preparation could be more extensive because contamination exists due to existing stockpiling of concrete, soils, and debris, heavy metals, polycyclic aromatic hydrocarbons, petroleum hydrocarbons, methane; two closed hazardous sites; two active underground storage tanks (USTs).	Same as project Relocation of Buildings A and B: Standard construction methods, assumes no subsurface construction and minimal, if any, excavation	Same as project. In addition, site would require relocation of utilities under Quint Street and construction of interim treatment processes.
Construction Methods	Standard construction methods, including pile driving	No planned construction	Standard construction methods, including pile driving Cut-and-cover for pipelines connecting to the SEP; bore and jack for pipeline construction at Third Street and railroad tracks near Cargo Way to reduce disruption of transportation	Same as project Relocation of Buildings A and B: Standard construction methods but consistent with Secretary of Interior's Standards for historic structures	Same as project
Construction Dewatering	Groundwater dewatering system required to provide dry work area; volume of groundwater produced is unknown. Groundwater would be tested, pre-treated as necessary, and discharged to the combined sewer system for treatment at the SEP.	No planned construction	Groundwater dewatering needed similar to project	Same as project	Same as project

6.3.1 Alternative A: No Project

6.3.1.1 Description

As required by CEQA Guidelines Section 15126.6(e), the No Project Alternative is evaluated to allow decision-makers to compare the environmental effects of approving the project with the effects of not approving the project. The No Project Alternative, as described below, represents what would reasonably be expected to occur in the foreseeable future if the project were not to be approved. This would be considered a full preservation alternative with respect to Central Shops Buildings A and B, an identified individual historical resource. In addition, this alternative would avoid the project's significant and unavoidable cumulative impact on the *Southeast Treatment Plant Streamline Moderne Industrial Historic District*. This alternative would also avoid the significant and unavoidable construction-related air quality impact of the proposed project.

Construction

Under the No Project Alternative, the BDFP would not be constructed and the SFPUC would continue to operate and maintain the existing SEP solids treatment and energy recovery facilities indefinitely. The SFPUC has an immediate need in the vicinity of the SEP for an area of at least six acres for storage of equipment and vehicles and temporary relocation of existing uses while it undertakes scheduled repair and replacement projects at the SEP, and has already acquired jurisdiction of the Asphalt Plant site and is in the process of acquiring the Central Shops site to support this need. The SFPUC also has a longer-term, continuing need for staging to support upgrades to the SEP and sewer system as part of its SSIP. The SFPUC would not demolish Central Shops Buildings A and B under the No Project Alternative.

Digester Gas, Energy Recovery and Biosolids Production

Under the No Project Alternative, the energy recovery capacity and the biosolids quality would remain the same as under existing conditions. In the future, biosolids volumes are expected to increase due to planned population growth with a concomitant increases in digester gas volumes, but the existing energy recovery facilities (internal combustion engine, hot water boilers, and waste gas burners) would not have the capacity to capture the energy production potential of the increases in digester gas volumes. The waste gas burners would operate more frequently than under existing conditions, and there would be more frequent flaring over time due to the increased loadings.

The future annual production of biosolids is estimated to be 27,700 dry tons by 2045 under the No Project Alternative, compared to 24,000 dry tons under the project, due to the lower efficiency of the existing processes. Digester gas production would be less under the No Project Alternative (1.3 to 1.7 million cubic feet per day from 2023 to 2045 compared to 1.6 to 2.0 million cubic feet per day for the same period under the BDFP), and energy generation would be limited to up to 2.0 megawatts (MW), compared to 4.2 to 5.2 MW for the project. Because the energy recovery facilities would not be replaced, the SEP would not generate surplus energy. The amount of energy generation under the No Project Alternative would only partially meet the SEP solids treatment process energy demands and, as under existing conditions, supplemental energy from Hetch Hetchy hydropower would continue to be required (refer to Chapter 2, Table 2-8). In the future,

with the projected increase in SEP electricity demands, the SFPUC would need to increase its use of electricity from Hetch Hetchy hydropower from about 0.32 MW in 2014 up to 2.9 MW by 2045.

The biosolids produced from the solids treatment process would continue to be Class B, and would still contain detectable levels of pathogens. In the future, Class B biosolids likely will have increasingly limited reuse options. In the long term, the No Project Alternative could require transport of the biosolids over greater distances for reuse or disposal, compared to both existing conditions and the proposed project.

Odor Control

Under the No Project Alternative, the odor control systems for solids handling facilities would continue to consist of adsorption units at the gravity belt thickeners, centrifuge building, and cake loadout facilities. As described in Chapter 2, Section 2.2.2, Southeast Water Pollution Control Plant, the existing SEP odor control units are not capable of completely containing odors within the SEP fence line, and this condition would be expected to continue under this alternative.

Maintenance and Repair

Many of the existing solids treatment facilities are over 60 years old and operating well beyond their useful life. Consequently, under the No Project Alternative, the SFPUC would need to implement an increased frequency of maintenance compared to either existing or future-with-project conditions, and would need a more rigorous program to repair and replace facilities for reliable operations. For example, each of the working digesters would need to be taken out of service more frequently for grit removal procedures in order to maintain adequate operating conditions. Up to five additional permanent staff over the existing condition would be needed to accommodate the increased maintenance requirements.

In addition to increased maintenance, increased levels of repair and replacement of equipment and facilities would ultimately be required for reliable operations and continued compliance with regulatory requirements, reducing the efficiency of the current treatment process operations and maintenance and staffing resources. The Needs Assessment Report[7] for the BDFP and a 2013 condition assessment[8] that preceded it document the performance and condition of 23 separate existing structures involved in solids handling. The Needs Assessment Report found that, in addition to failing to meet the SSIP levels of service goals, many individual structures and facilities lack redundancy, are structurally inadequate (e.g., concrete structures exhibited cracking, leakage, and spalling), are seismically unreliable, do not provide adequate treatment capacity for projected 2045 flows and loads, and use equipment that (due, for example, to corrosion) require major maintenance, repair, or replacement. Structures and equipment that would be expected to require major repair and/or replacement under the No Project Alternative include the secondary sludge thickening pumps, gravity belt thickeners, digesters, digester pumps and associated equipment, centrifuges, centrifuge pumps, bin hoppers, gas booster

7 SFPUC, *Needs Assessment Report: Southeast Water Pollution Control Plant Biosolids Digester Facilities, Draft Final*, January 2016.

8 SFPUC, *Southeast Water Pollution Control Plant Condition Assessment Report (Final),* 2013.

station equipment, gas handling systems components, and the electrical system. In the future as equipment continues to age and deteriorate, the SFPUC would also need to conduct more frequent assessments to determine the integrity of the individual facilities and pieces of equipment, so that the SFPUC could take actions as appropriate to repair and/or replace individual failing facilities and equipment.

To the extent possible, the SFPUC would repair facilities to avoid complete failure. However, it is not feasible to seismically retrofit the existing digesters without completely rebuilding them,[9] so this alternative assumes that no seismic improvements to the digesters would occur.

Risk of Upset

The No Project Alternative would have the same risk of upset compared to existing conditions, but a much higher risk of upset than the proposed project. The seismic hazards at the existing solids processing facilities would persist. The existing facilities are not built to current seismic standards, nor are they designed for future sea level rise considerations. Thus, long-term continued use of the existing solids treatment facilities under the No Project Alternative would result in an increasing risk of failure and shutdown the longer this equipment is used. As described in a 2013 condition assessment, the current conditions of the solids processing facilities include inadequate and deteriorated piping and equipment supports and anchorages, soft story[10] buildings/structures, and plan irregularities.[11] If an earthquake of substantial size and in proximity to the SEP were to occur, the risk of failure of one or more digesters (in addition to other structures at the SEP) would be the same as under existing conditions, but as the digesters continue to age and deteriorate, this risk of failure would be expected to increase compared to existing conditions because the existing digesters are not seismically reinforced. With the increased level of maintenance, it is unlikely that all of the digesters and other equipment would fail at once; however, a seismic event in the SEP vicinity could have severe consequences. In such an event, potential simultaneous failure of multiple solids treatment facilities and equipment could be catastrophic and could result in large volumes of undigested sludge that would require special transport and disposal.

In addition to increased likelihood of physical damage and release during an earthquake, failure of portions of the SEP could reduce the efficacy of wastewater and solids treatment by limiting the facilities available for wastewater processing. If one or more of the digesters were to become non-operational, SEP staff would need to modify the liquid wastewater treatment processes to reduce solids production, which could affect the ability of the SEP to protect San Francisco Bay water quality. The SFPUC's ability to treat wastewater would then be compromised, with implications for public health and safety as well as regulatory permit violations.

---

9 SFPUC, *Needs Assessment Report: Southeast Water Pollution Control Plant Biosolids Digester Facilities, Draft Final*, January 2016.

10 "Soft story" buildings are so called because they have first stories that are much less rigid than the stories above. These buildings are typically susceptible to earthquake damage due to the large unreinforced openings of the ground floors and the typically wood-frame construction. Without reinforcement, these buildings generally cannot withstand lateral earthquake forces.

11 Plan irregularity expresses the extent that a building shape differs from a "regular" simple box-shaped building. Irregularities are believed to contribute to poor seismic performance and occasional failure.

If any of the major components of the biosolids facilities were to fail, the SEP would not be able to achieve Class B quality biosolids. The SFPUC would have to send the biosolids to another party for further treatment or distribution or otherwise find alternative disposal options for partially or undigested sludge.

6.3.1.2 Ability to Meet Project Objectives

The No Project Alternative would fail to meet most, if not all, of the BDFP objectives. The No Project Alternative would not replace the existing aging facilities with new modern and more efficient treatment technologies, would use equipment beyond its useful life, would not provide facilities that would reliably treat 2045 flows and loads, would not beneficially use 100 percent of the biosolids and biogas generated, would not provide redundant infrastructure for operational flexibility, would not improve seismic reliability, would not limit noticeable odors to the SEP property boundary, would not make visual improvements to the BDFP site, and would not accommodate or adapt to expected future sea level rise. Due to the uncertainties associated with future facilities and equipment failures and potential catastrophic breakdown, it is unknown if, in the long term, the No Project Alternative would maintain rate payer affordability. However, despite the continued use of outdated equipment beyond its useful life, the SFPUC would continue to maximize the efficiency of the current operations and maintenance, staffing resources, and use of existing SFPUC infrastructure, partially meeting Objective #2.

The No Project Alternative would also fail to achieve the goals of the SFPUC's SSIP by not providing a reliable, flexible system that can respond to catastrophic events; by not integrating green and grey infrastructure to manage stormwater and minimize flooding, by not providing benefits to affected communities (compared to existing conditions); by not modifying the system to adapt to climate change; and by not achieving economic and environmental sustainability through 100 percent use of biosolids and biogas.

6.3.1.3 Environmental Impacts

The No Project Alternative would avoid the significant and unavoidable impacts related to historical resources and construction-phase NOx emissions identified for the project in Chapter 4, *Environmental Setting and Impacts*. Under "normal" conditions (without breakdowns and equipment failure), the No Project Alternative would avoid all construction and operational impacts that were identified for the project, but under possible future scenarios with breakdowns and equipment failures, a wide range of impacts could occur, depending on the nature and extent of those breakdowns. As discussed below, in a few resource areas, there could be distinct environmental impacts compared to the proposed project, but in most impact areas there would either be no impacts or similar impacts to those of the proposed project.

Most Resource Areas

The No Project Alternative would avoid all construction activities and operational changes that would occur under the proposed project, and therefore it would result in *no impacts* in the following areas: Land Use, Population and Housing, Transportation and Circulation, Wind/ Shadow, Recreation, Utilities, Public Services, Biological Resources, Geology/Soils/Paleontological Resources,

Hazards, Mineral Resources, and Agricultural/Forest Resources. Although this alternative would require a slight increase in staffing for the increased maintenance requirements, the estimated increase in staffing (up to five persons) would be a negligible increase from existing staffing levels (less than two percent), with negligible effects on environmental impacts in any of the above-listed resource areas compared to existing conditions.

As described above, the No Project Alternative would have a long-term higher risk of upset than existing conditions or the proposed project. In the event of a breakdown or equipment failure, there could be sporadic repair and replacement construction projects at the SEP South, where the existing digesters are located. In such cases, construction impacts on the above-listed resource areas would be expected to be similar to those identified for the proposed project, though at a reduced scale (because repairs and replacement would occur on an as-needed basis, rather than as one all-encompassing construction project). Upon completion of any needed repairs or equipment replacement, operations are assumed to continue to be similar to existing conditions, and there would be no operational impacts in these resource areas.

Aesthetics

The No Project Alternative would avoid all construction impacts, including temporary, minor effects on visual character and light and glare impacts that would occur under the proposed project. In the event that emergency equipment repairs or replacements are required, any construction would be subject to the same SFPUC standard construction measures requiring siting construction staging away from public view where possible and directing any nighttime lighting away from residential areas. Therefore, as with the proposed project, aesthetic impacts during construction would be less than significant. With regard to operational impacts, outside of routine maintenance, this analysis presumes that there would not be any substantial improvements to the existing structures beyond basic repairs and maintenance, or if replacement were to be required, any replacement equipment is assumed to be similar in size and locations as the existing equipment. Similarly, under No Project Alternative, existing landscaping would be maintained with no substantial improvements. Thus, similar to the proposed project, the No Project Alternative would have less-than-significant long-term (operational) aesthetics impacts.

Cultural Resources

The No Project Alternative would not demolish Central Shops Buildings A and B or Building 870. It would continue use of the existing digesters and associated control buildings. This would avoid the significant and unavoidable impacts on individual historical resources (Central Shops Buildings A and B) and on the *Southeast Treatment Plant Streamline Moderne Industrial Historic District*. This alternative would also avoid the project's significant but mitigable effects on archeological resources and on human remains.

As part of an action separate from the project, the San Francisco General Services Agency is in the process of relocating the Central Shops operations and transferring the site to the SFPUC, and this process is assumed to proceed under the No Project Alternative. The SFPUC has identified the use of the Central Shops to store equipment and vehicles and temporarily relocate existing uses while it undertakes scheduled repair and replacement projects. For the purposes of this

alternatives analysis, it is assumed that the SFPUC would neither demolish nor alter this historic resource; thus, under the No Project Alternative, the resources would retain the physical characteristics that convey its historical significance and that justify its individual eligibility for inclusion in the California and National Registers. Furthermore, it is assumed that continued use of the existing digesters and associated control buildings would retain the historic integrity of the eligible historic district. Therefore, unlike the proposed project, the No Project Alternative would have no impact on historic resources.

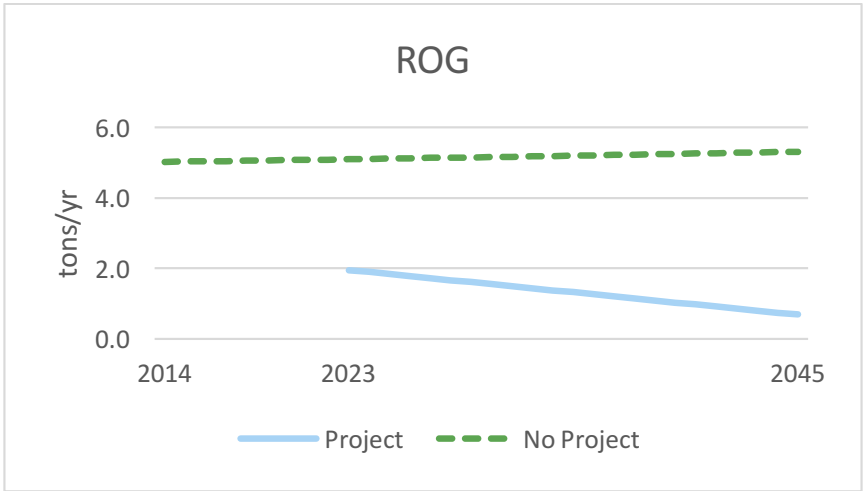
However, as described above, the No Project Alternative would have a higher risk of upset than the proposed project, and an increasingly higher risk of upset as continued, prolonged use of the existing digesters occurs. Although not an impact *per se*, the increased likelihood of physical damage to the existing digesters under this alternative could result in future catastrophic damage to these structures, which could affect the historic integrity of the historic district.

Noise and Vibration

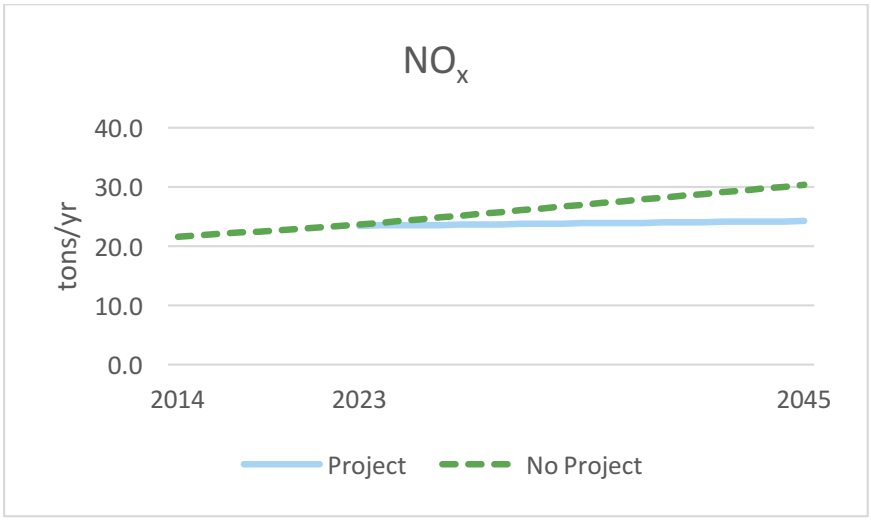
Under "normal" conditions (without breakdowns and equipment failure), the No Project Alternative would avoid all construction-related noise impacts that were identified for the project. However, major repair projects and replacement of some structures and equipment ultimately would be necessary in the future, but the magnitude and duration of the associated construction requirements cannot be predicted at this time. These repair and replacement projects likely would generate construction noise and vibration impacts similar to those of the project, but the impacts would be associated with repair/replacement of existing biosolids treatment facilities located at SEP South. The existing digesters and energy recovery facilities are closer to residential receptors to the east (less than 100 feet away) and the daycare facility (about 350 feet to the south), compared to the facilities under the project (e.g., the proposed digesters would be approximately 1,000 feet away from residential receptors and 1,500 feet away from the daycare facility). Therefore, it is possible that construction-related noise levels could occasionally be higher (and significant) at these residences and at the daycare facility, compared to levels predicted to occur under the proposed project, both on a project and cumulative level; if such construction activities were to be subject to CEQA, mitigation measures similar to those identified for the proposed project would be required to reduce the impact to less than significant. While construction noise generated during each individual repair would be shorter in duration than the project's five-year construction duration, the overall, long-term duration of ongoing repair/replacement activities under the No Project Alternative, including major repairs, could exceed well beyond five years.

Vibration impacts of the No Project Alternative could be less than those of the proposed project if ongoing repair activities were to involve less intensive construction activities, and pile-driving was avoided altogether. Construction associated with the existing digesters, would be required and could occur less than 100 feet from sensitive receptors to the east, and there could be intensive construction activities required, similar to those of the proposed project; for these reasons, vibration levels could exceed the strongly perceptible threshold for human annoyance, a potentially significant impact.

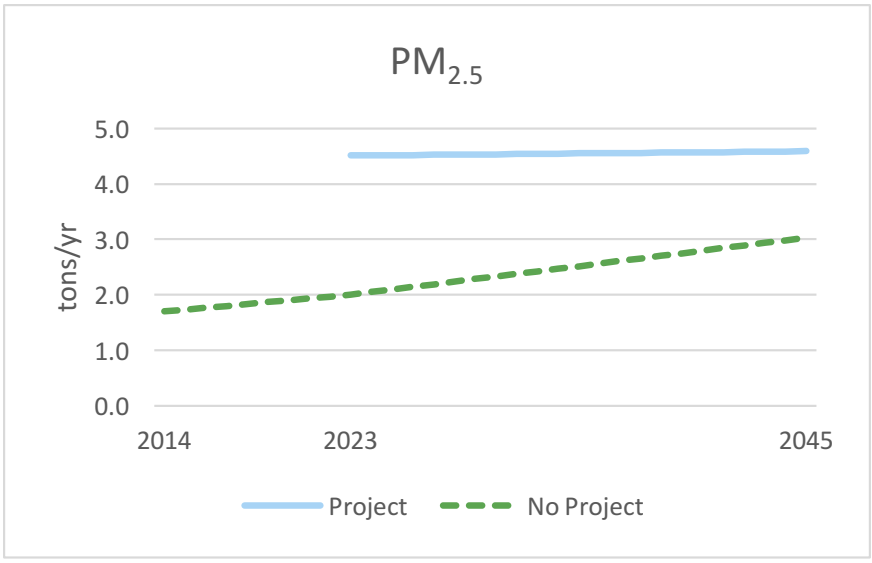
Operational noise levels under this alternative would be the same as existing conditions, and therefore there would be no impact.



Air Quality



Under normal conditions, the No Project Alternative would avoid all construction-related air quality impacts that were identified for the project. Major repair projects and replacement of some structures and equipment ultimately would be necessary in the future, but the magnitude and duration of the associated construction requirements cannot be predicted at this time. These repair and replacement projects would generate the same type of construction-phase air pollutant emissions as the proposed project, although the impacts would be associated with repair/replacement of facilities at SEP South. Daily emissions of criteria air pollutants (such as NOx from construction equipment and vehicles) as well as toxic air contaminants (e.g., diesel particulate matter [DPM] from diesel equipment and vehicles) would most likely be less under the No Project Alternative than under the project because the amount of construction would most likely be less; therefore, construction-phase air pollutant impacts for the No Project Alternative are assumed to be less than significant. If large-scale repair/replacement of structures became necessary, construction-related air pollutant emissions could still exceed significance thresholds, and if such construction activities were to be subject to CEQA, Mitigation Measures M-AQ-1a (Construction Emissions Minimization) and M-AQ-1b (Emission Offsets) could still be required.



Regarding operational air quality impacts, as indicated in Table 6-1, there will be future increases in biosolids loading (associated with planned population growth). Consequently, compared to existing conditions, there will be increased operational air pollutant emissions in the future associated with increased biosolids and digester gas processing volumes, even without implementation of the project. On behalf of the San Francisco Planning Department, Ramboll-Environ[12] conducted an analysis of future estimated operational air pollutant emissions without the project, and a comparison of criteria pollutant emissions under the No Project Alternative versus the project is presented on **Figure 6-1**. As indicated on this figure, the No Project Alternative is projected to result in higher reactive organic gas (ROG) and NOx operational emissions than the project due to the increase in digester gas that would be generated from the increased loadings and older equipment being used. However, the No Project Alternative would have lower operational emissions of particulate matter of 2.5 microns in diameter or less ($PM_{2.5}$) than the proposed project, largely due to the project's operation of turbines which have higher emission factors than the existing cogeneration engines that would be used under the No Project Alternative.[13] The increase in $PM_{2.5}$ operational emissions under the proposed project should be considered on balance with the increased energy that would be generated from digester gas production. Nevertheless, under

[12] Ramboll-Environ, April 2017**.** Memorandum, San Francisco Public Utilities Commission SFPUC Biosolids Digester Facilities Project (BDFP) No Project Alternative Air Quality.

[13] The estimated future increase in $PM_{2.5}$ associated with operation of the proposed turbines depicted on Figure 6-1 is not expected to actually occur to the degree indicated on the figure because the turbine emissions are based on a manufacturer-guarantee not-to-exceed emission factor for the proposed turbine, which is conservative. The turbine emissions should never exceed this value, and the turbines would likely operate with much lower emissions.

SOURCE: Ramboll Environ, San Francisco Public Utilities Commission (SFPUC) Biosolids Digester Facilities Project (BDFP) No Project Alternative Air Quality Analysis, April 2017.

Figure 6-1
Comparison of Project Air Pollutant Emissions to No Project Alternative Emissions

both the No Project Alternative and the proposed project, net operational criteria pollutant emissions (ROG, NOx, and $PM_{2.5}$) would remain below significance threshold levels and therefore would be less than significant.[14] With respect to toxic air contaminants and health risk, as described in Section 4.8.1.4 (in Section 4.8, Air Quality), the project site and its vicinity are located in the Air Pollutant Exposure Zone (APEZ) and Health Vulnerability zip code 94124, which indicates that the area already experiences poor air quality due to emissions from various stationary and mobile sources in the area. Existing sources of toxic air contaminant emissions from solids processing (the cogeneration engine, sludge handling process unit, the digesters, waste gas burners, dewatering facility, and hot water boilers) would continue to operate under the No Project Alternative. As shown in Figure 6 1, $PM_{2.5}$ emissions would be lower than with the proposed project, and toxic air contaminant emissions (such as DPM emissions) also would likely be less. Overall, like the project, the No Project Alternative would not expand the boundaries of the APEZ.

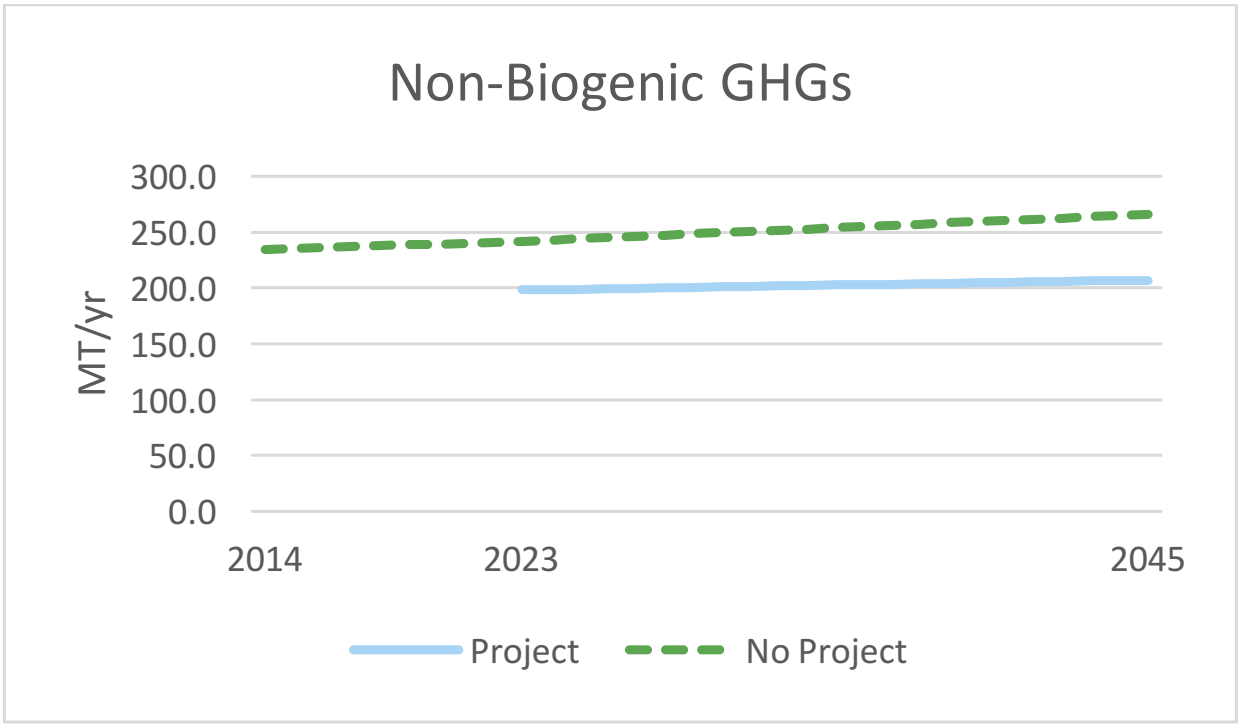
As stated above, the No Project Alternative could require transport of the biosolids over greater distances for reuse or disposal, compared to both existing conditions and the project, which could result in long-term increases in air pollutant emissions associated with the increased hauling distances. Nevertheless, this is not expected to be a substantial increase in emissions, and operational air quality impacts are assumed to be less than significant.

While this alternative would avoid the project's conflicts with the Clean Air Plan due to significant and unavoidable construction-related emissions, this alternative would not be consistent with the Clean Air Plan's Policy ECM 2, which promotes energy efficiency and renewable energy for purposes of air quality and climate protection, since the No Project Alternative would not have the ability to recover the associated increase in energy potential of 3.9 MW (refer to Chapter 2, Table 2-8) beyond the 2-MW capacity of the existing energy recovery facilities. Similarly, it is unknown whether continued reliance on existing solids treatment facilities would be consistent with Measure WR1 of the *2017 Clean Air Plan* (currently in draft form). Measure WR1 specifically calls for limiting GHGs from, and promoting the use of digester gas recovery systems at publicly owned treatment works like the SEP.

Cumulative construction-related air quality impacts would be less severe than those of the proposed project, but the impacts would not be completely avoided because repair/replacement construction activities, such as repair or replacement of existing digesters, would contribute to cumulative increases in construction-related criteria pollutant and toxic air contaminant emissions (and therefore, health impacts). Nevertheless, due to the unknown schedule for the repair/ replacement activities, it is assumed that, because construction activities would be less intensive than those for the proposed project, the contribution of construction-related air quality impacts to cumulative impacts would be less than significant.

[14] Net emissions are future No Project or future BDFP emissions minus existing emissions (that is, emissions relative to today).

Greenhouse Gas Emissions



As described above, in the future under the No Project Alternative, the SEP would have increased biosolids loading over existing conditions due to anticipated population growth, and there would be an associated increase in digester gas production. By not using the increase in energy potential available from the increase in digester gas production (and not improving biosolids reuse opportunities), the No Project Alternative would not be consistent with adopted policies intended to reduce statewide greenhouse gas (GHG) emissions, including increasing renewable portfolio standards for electricity (see Chapter 4, Section 4.9, Greenhouse Gas Emissions). Therefore, the No Project Alternative would not be consistent with policies adopted for the purpose of reducing GHG emissions, and unlike the proposed project, would have a potentially significant impact on GHG emissions. Mitigation measures such as improvements to existing or construction of new energy recovery facilities would be needed to reduce the impact to less than significant.

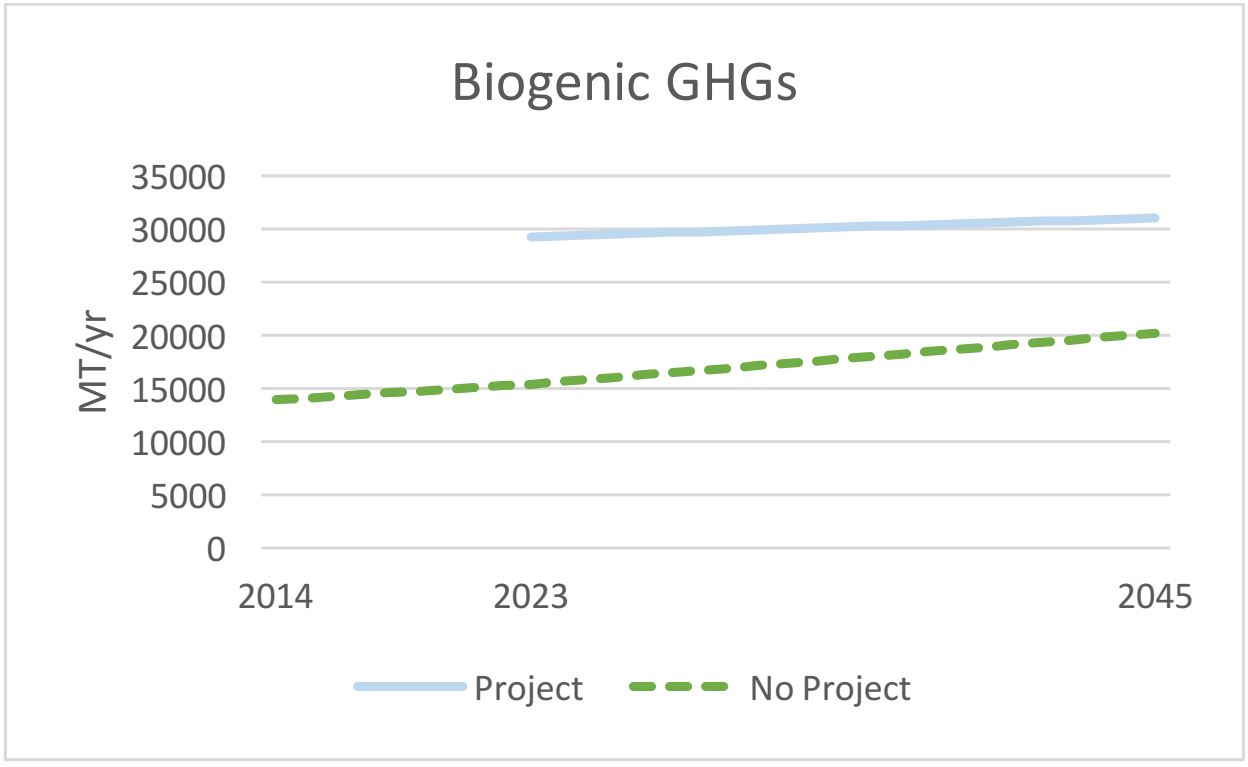


Figure 6-2 presents a comparison of biogenic and non-biogenic GHG emissions. This figure indicates that, between 2014 and 2045, operational non-biogenic and biogenic GHG emissions under the No Project Alternative and the proposed project would increase, but the rate of increase would be greater under the No Project Alternative. Under the No Project Alternative, the non-biogenic emissions would increase from 234 metric tons of carbon dioxide-equivalent ($MTCO_2E$) per year to 266 $MTCO_2E$ per year, a net increase of 32 $MTCO_2E$ per year by 2045. Under the project, non-biogenic emissions would increase slightly from 198 $MTCO_2E$ per year to 207 $MTCO_2E$ per year (9 $MTCO_2E$ per year) by 2045. While the net increase would be greater under the No Project Alternative than under the proposed project, non-biogenic emissions under this alternative as well as under the proposed project would be less than significant, well below the Bay Area Air Quality Management District (BAAQMD) guidance threshold of 10,000 $MTCO_2E$ per year for a stationary source.

Hydrology and Water Quality

Under "normal" conditions (without breakdowns and equipment failure), the No Project Alternative would have none of the impacts on hydrology or water quality that were identified for the project during either construction or operation. However, this alternative would have a much higher risk of upset than the proposed project, and long-term continued use of the existing solids treatment facilities under the No Project Alternative would result in an increasing risk of failure and shutdown the longer this equipment is used. For example, because the existing facilities are not built to current seismic standards, a seismic event in the SEP vicinity could have severe consequences. In such an event, potential simultaneous failure of multiple solids treatment facilities and equipment could be catastrophic and could result in large volumes of undigested sludge that reduce the ability of wastewater and solids treatment processes to achieve water quality objectives and discharge limits required to protect San Francisco Bay water quality.

Furthermore, even without a catastrophic event, the No Project Alternative would be expected to require major repair and replacement of some structures and equipment in the future, with associated construction activities. This analysis presumes that construction impacts on hydrology and water quality would be similar to, or less severe than, those identified for the proposed project, depending on the magnitude and extent of construction activities.

SOURCE: Ramboll-Environ, San Francisco Public Utilities Commission (SFPUC) Biosolids Digester Facilities Project (BDFP) No Project Alternative Air Quality Analysis, April 2017.

Figure 6-2
Comparison of Proposed Project GHG Emissions to No Project Alternative Emissions

As described in Chapter 4, Section 4.16, Hydrology and Water Quality, a water quality analysis conducted for the project identified changes in water quality of the SEP effluent that are expected to occur in the future due to planned population growth, independent of the proposed project. The study indicated that increased concentrations of total ammonia and nitrogen are expected to occur under the No Project Alternative. Total ammonia concentrations (95th percentile) are projected to increase from 53.7 to 68.5 milligrams per liter (mg/L_ between 2015 and 2045 (with the BDFP, the increase would be to 69.8 mg/L), which is well below the National Pollutant Discharge Elimination System (NPDES) limitation of 190 mg/L; total nitrogen concentrations (95th percentile) are projected to increase from 65.1 to 82.9 mg/L between 2015 and 2045 (with the BDFP, the increase would be to 85.2 mg/L). By comparison, the proposed project would result in a slightly greater increase in both total ammonia and nitrogen concentrations in the effluent than the No Project Alternative, but in either case, the increase would be well below the permit limitation and the impact would therefore be less than significant.

Energy

As described above, in the future under the No Project Alternative, biosolids loading at the SEP would increase compared to existing conditions due to anticipated population growth, and there would be an associated increase in digester gas production. In the future, the existing energy recovery facilities at the SEP could produce up to 2 MW (an increase of 1 MW over existing conditions), which would partially meet SEP solids treatment process energy demands. Supplemental energy from Hetch Hetchy hydropower would still be required to meet future electricity demands of 4.4 MW and 4.9 MW in 2023 and 2045, respectively (refer to Chapter 2, Table 2-8). Thus, the SFPUC would not be able to use all of the increased digester gas that would be generated due to increased loadings of biosolids associated with population growth, and the No Project Alternative would require more frequent routine flaring over time, compared to existing conditions. (Under the proposed project, no routine flaring of biogas would occur.) Although the increased use of Hetch Hetchy hydropower that would occur under this alternative would continue the use of renewable energy sources, it would not maximize use of the increase in on-site energy resources, nor would it make Hetch Hetchy renewable energy available to replace non-renewable energy demand elsewhere. In addition, the No Project Alternative would not improve biosolids reuse opportunities. Unlike the proposed project, the No Project Alternative would not maximize the energy recovery and therefore would have a potentially significant impact due to this loss of the future increase in energy potential. Construction of modern, more efficient energy recovery facilities, similar to those under the proposed project, would reduce this impact to less than significant, although construction of those facilities would result in impacts similar to those identified for the proposed project.

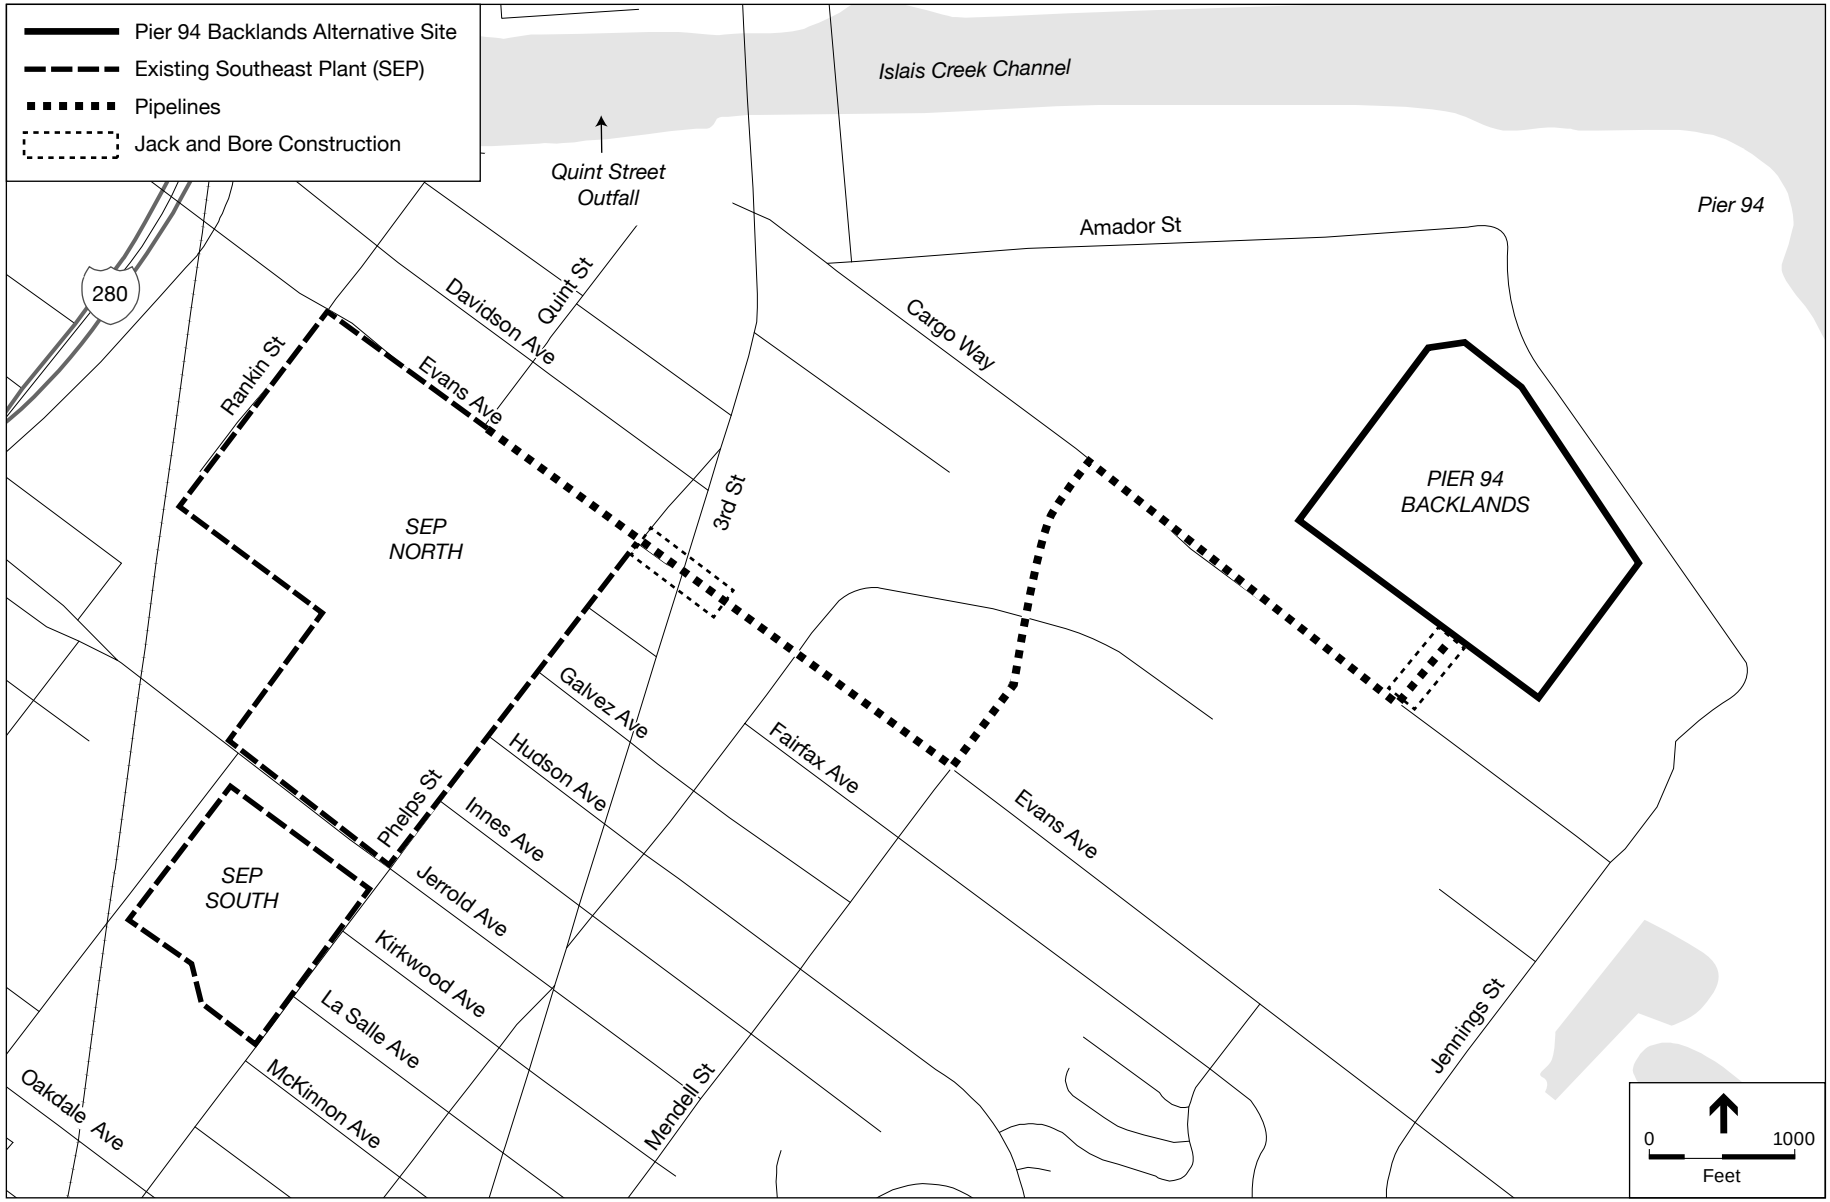
6.3.2 Alternative B: Pier 94 Backlands

6.3.2.1 Description

Alternative B, the Pier 94 Backlands Alternative, would involve constructing BDFP facilities at the Pier 94 Backlands, which is the same site as one of the potential staging areas under the proposed project. Under this alternative, no construction or demolition activities would occur at

the project site, and Central Shops Buildings A and B would be retained in place. This alternative was selected for evaluation because it would avoid a significant impact on a historical resource, was recommended by the Southeast Digester Task Force as an alternative location for biosolids processing,[15,16] and would analyze impacts at an alternative location consistent with CEQA Guidelines Section 15126.6(f)(2). This would be considered a full preservation alternative with respect to an identified individual historical resource. However, this alternative would neither reduce nor avoid the significant and unavoidable cumulative impact on the *Southeast Treatment Plant Streamline Moderne Industrial Historic District*.

This alternative is similar to an option previously developed by the SFPUC as described in Section 6.2.1.1 above. It would consist of constructing essentially the same solids handling, odor control, energy recovery and associated facilities as the proposed project but at the Pier 94 Backlands site. This alternative would also require construction and operation of multiple pipelines to convey sludge and other materials between the Pier 94 Backlands site and the SEP. Under this alternative, the SFPUC would have to acquire the Pier 94 Backlands site from the Port of San Francisco (Port), and the California State Lands Commission would have to make a public trust determination.



Site Location

Pier 94 Backlands

Figure 6-3 shows the location of the Pier 94 Backlands Alternative, and **Figure 6-4** depicts the conceptual site plan. Solids handling, energy recovery, and related facilities would be constructed on approximately 15 acres within the 27-acre Pier 94 Backlands area, located south and west of Amador Street, north of Jennings Street, and east of Cargo Way, about 0.75 mile southwest of the SEP (refer to Chapter 2, Figure 2-13). The Pier 94 Backlands is the same site as one of the staging areas for the BDFP described in Chapter 2; information on existing conditions at the Pier 94 Backlands and plans and policies applicable to its proposed use during construction are presented throughout Chapters 2, 3, and 4 of this EIR. Information relevant to its use as a permanent location for biosolids facilities as applicable to this alternative is summarized below.

Site Acquisition and Availability. The Pier 94 Backlands is owned by the City and administered by the Port.[17] Most of the Port's property including the Pier 94 Backlands consists of former tidelands held in public trust for the people of California.[18] The Public Trust Doctrine[19] holds that trust lands belong to the public and should be used in ways that connect people to the water: water-related commerce, navigation, fisheries, and other uses that require waterfront access to operate, as well as

Note: Refer to Figure 6-3 for location of pipelines between the SEP and the Pier 94 Backlands Alternative site.

development deemed to increase the public's enjoyment of and access to tidelands (e.g., habitat preservation, recreation). The State Lands Commission is responsible for ensuring compliance with the Public Trust Doctrine for properties like the Pier 94 Backlands. The Pier 94 Backlands Alternative would require approval from the State Lands Commission (and possibly approval from the state legislature) for the trust exchange agreement and approval of long-term use of Pier 94 Backlands from the Port. To secure access to the site, the SFPUC would enter a trust exchange agreement with the State Lands Commission either through negotiation or if authorized by special legislation. In the trust exchange agreement, the SFPUC would need to place into the trust land of similar size and value as the area needed for this alternative.

Site Development Considerations. The Pier 94 Backlands area consists of fill from dredge spoils and construction debris deposited during the 1960s and 1970s; unauthorized deposition of municipal refuse also occurred within part of the site and is now a regulated (closed) landfill (refer to the area shaded green on Figure 4.17-1 in Chapter 4, Section 4.17, Hazards and Hazardous Materials). Although the Pier 94 Backlands itself currently has no utility services, major utilities (e.g., water, wastewater, electrical services) are already available in the vicinity, and the Port plans to construct roads, utilities, and stormwater management facilities on the property as part of the Pier 90-94 Backlands Planning project (refer to Table 4.1-1 in Chapter 4, Section 4.1, Overview).

Pipelines Between Pier 94 Backlands and SEP

Figure 6-3 shows the alignment for the pipeline between the Pier 94 Backlands and SEP North that would be required under this alternative. As shown, the approximately 4,000-foot-long pipeline alignment would be within public rights-of-way, crossing beneath the San Francisco Bay Railroad railyard that abuts the Pier 94 Backlands, then following along Cargo Way, Mendell Street, and Evans Avenue to the SEP.

This pipeline corridor would include 10 to 12 pipelines, each ranging from 6 to 20 inches in diameter, to convey separately the following materials between the Pier 94 Backlands and SEP sites: primary sludge; waste activated sludge; primary scum; No. 2 and No. 3 water; reject liquid from thickening, screening, and dewatering; and a supervisory control and data acquisition fiber optic cable.

Components

Biosolids Treatment, Energy Recovery, and Other Facilities

As shown on Figure 6-4 and Table 6-1, the facilities and processes described for the proposed project—including biosolids treatment, energy recovery, odor control, operations and maintenance, and ancillary facilities—would be constructed and operated at the Pier 94 Backlands site. As with the proposed project, the solids treatment facilities in the Pier 94 Backlands Alternative would use a thermal hydrolysis process and anaerobic digestion to treat solids, producing Class A biosolids and biogas. Energy recovery and odor control facilities would also operate in the same manner, use the same technologies, and generate the same amount of energy as the project. The odor control facilities would be designed to limit odors from solids handling and energy recovery operations to

within the site, as with the proposed project. Overall, the areal extent of the site would be about 15 acres (compared to 10 acres for the proposed project), and the total amount of building square footage to be constructed would also be somewhat greater under the Pier 94 Backlands Alternative than under the proposed project, in part because the height of all structures would be limited to 40 feet at this site (refer to Table 2-4 in Chapter 2, *Project Description*, for the heights proposed for project facilities) and because of the additional available space. For example, the five digesters would be 15 feet shorter than under the proposed project, and therefore the diameter of the digesters under this alternative would be greater in order to provide equivalent digestion capacity.

Ancillary Facilities, Support Systems, and Utility Connections

Under this alternative, additional redundant ancillary facilities would be needed because of the remote location of the Pier 94 Backlands from the SEP. Unlike under the proposed project, certain support facilities present at the SEP, such as water, utilities, communication control systems, and chemical storage would not be available. This alternative would thus require a site-specific operations control center and dedicated security, fire protection, backup power facilities with diesel generators, and new connections for commodity utility supplies (e.g., high-voltage electric power and substation, potable water, sewer/stormwater, and natural gas).

As described in Chapter 4, Section 4.16, Hydrology and Water Quality, the Pier 94 Backlands is comprised of unpaved surfaces, and stormwater is treated through a system of landscape swales that collect, treat, and convey stormwater. The stormwater, once treated, is released to the bay through an outfall. This alternative would include the construction of a new separate stormwater system or reconfiguration of the combined sewer system to accommodate stormwater flows from the Pier 94 Backlands. In either case, the drainage system would be constructed in accordance with applicable design requirements to accommodate anticipated stormwater flows.

Other Project Features

Under this alternative, flood-proofing for the Pier 94 Backlands would be in accordance with the SFPUC's Climate Change Guidance for SSIP Projects and consistent with the anticipated future flood levels at this location (refer to Chapter 4, Section 4.16, Figures 4.16-3, 4.16-4, and 4.16-5). As with the project, architecture and landscaping would be designed consistent with the San Francisco Planning Code, the Stormwater Management Ordinance, the San Francisco Arts Commission Civic Design Review process and Public Art Program, and the *San Francisco Better Streets Plan*. The decommissioning of the existing digesters would be as described for the project (see Chapter 2, Section 2.4.2.4) but would occur at least two to three years later than with the project.

Operations and Maintenance

Performance testing, full facility commissioning, plant capacity, and operating hours for the Pier 94 Backlands Alternative would be the same as described for the proposed project. The SFPUC would conduct routine maintenance of new facilities and equipment, although there would be more facilities and equipment to maintain than under the proposed project (due to the need for site-specific dedicated operations and maintenance facilities, as well as the pipelines

between the SEP and Pier 94 Backlands). As indicated in Table 6-1, five additional staff would be needed at the Pier 94 Backlands to operate and maintain the facilities. Trucks hauling biosolids, chemical deliveries, yellow grease loadout, and grit/screening debris would use Amador, Illinois, Cesar Chavez, and Pennsylvania Streets for access to the Pier 94 Backlands site when traveling to and from U.S. Highway 101 and Interstate 280.

Similar to the proposed project, energy produced at the energy recovery facility would be used to support solids processing, but unlike the proposed project, the energy recovery facilities located at the Pier 94 Backlands site would not be available as backup power to the main plant or to support other SEP facilities.

Construction

Construction Schedule, Work Force, Hours, and Coordination

Similar to the proposed project, construction of the Pier 94 Backlands Alternative would take approximately five years. The overall construction schedules are estimated to be similar because (1) total facilities construction activities would be essentially the same and require the same amount of time (refer to Chapter 2, Table 2-10); (2) although no major demolition would be necessary, more extensive site preparation activities would be needed at the Pier 94 Backlands site, requiring about the same amount of time; and (3) construction of the additional pipelines between the SEP and Pier 94 Backlands site could occur concurrently. Pipeline construction could involve more than one location at a given time if the contractor were to mobilize multiple crews to work at different locations along the alignment. If so, the size of the construction work force for the Pier 94 Backlands Alternative would be greater than that estimated for the proposed project. For purposes of this alternatives analysis, it is assumed that the construction work force could be 10 percent greater than that estimated for the proposed project at any given time. Construction hours would be the same as for the project (generally 7:00 a.m. to 3:30 p.m. Monday through Friday, with some activities extending to 8:00 p.m. as needed. Construction could also occur on Saturdays and Sundays when needed. As with the project, prior to the start of construction, the SFPUC would hire a Southeast Area Program Construction Manager who would (among other things) oversee construction staging and traffic control planning. The SFPUC would develop a Traffic Control Plan for this alternative similar in content to that described in Chapter 2, Section 2.6, Project Construction, but also addressing traffic control needed for pipeline construction, which would entail in-street construction.

Under this alternative, construction would start at least several years later than the project due to the unknown timeline required to garner site use permissions. As described above, the site use process for the Pier 94 Backlands Alternative would require approval from the San Francisco Port Commission and approval from the State Lands Commission for public trust consistency (and possibly approval from the California legislature).

Construction Staging and Haul Routes, Lane Closures, and Temporary Relocation of Muni Routes

Staging for construction of biosolids treatment facilities under the Pier 94 Backlands Alternative would require up to 12 acres (similar to the proposed project). Staging would occur within the

Pier 94 Backlands and Piers 94/96 staging areas, similar to the proposed project. Staging for pipeline construction would occur in these areas as well as within the pipeline construction corridor.

Construction haul routes would be as indicated in Table 6-1. (Existing operational haul trips from the SEP would not be affected during construction of this alternative.) Pipeline construction would require temporary closure of travel lanes, although with the possible exception of Mendell Street, full road closures are not anticipated; San Francisco Municipal Railway (Muni) Routes 19 and 44 along Evans Avenue could require rerouting during pipeline construction in that street.[20]

Construction Methods

General construction methods would be similar to those for the proposed project (described in Chapter 2, Section 2.6) with the following exceptions: no building demolition or tree removal would be required, and the pipelines between the Pier 94 Backlands and the SEP would be installed using traditional cut and cover (trenching) and bore and jack techniques. Bore and jack construction (a form of tunneling) would be used to construct the pipelines beneath the San Francisco Bay Railroad railyard and westbound lanes of Cargo Way, and under Third Street at Evans Avenue. For purposes of this alternatives analysis, it is assumed that the depth of excavation for pipeline construction would be 10 to 30 feet, though deeper construction would occur at bore and jack locations. Pipeline construction would be constrained due to the complexity of installing multiple pipelines within streets that already contain numerous utilities (necessitating relocation of some utilities), but would be expected to be completed within the overall five-year construction schedule.

Permits and Approvals

As listed in Table 6-1, many of the permits and approvals needed for the Pier 94 Backlands Alternative would be the same as those required for the proposed project. Additional approvals needed for this alternative include approval by the State Lands Commission or state legislature for the trust exchange agreement, approval of long-term use of the Pier 94 Backlands from the Port, and approvals from the Regional Water Quality Control Board (RWQCB) related to construction within a closed landfill. In addition, the Port's Waterfront Land Use Plan would need to be amended to allow the use to occur.

6.3.2.2 Ability to Meet Project Objectives

The Pier 94 Backlands Alternative would meet most of the project's basic objectives, as shown in Table 6-2. However, this alternative would not allow for timely construction of the BDFP because of the years of delay anticipated for permission to use the Pier 94 Backlands site. This alternative would not maximize the efficiency of the current treatment process operations and maintenance, staffing resources, and use of existing SFPUC infrastructure because it could not use existing support facilities and systems at the SEP and would require construction of new essentially

[20] SFPUC, Sludge Pipeline for Remote Biosolids Center Site Alternatives, Draft, November 2009.

duplicative support facilities and systems at the Pier 94 Backlands site. Similarly, because this alternative would not result in a plant-wide operations center and standby power, it would only partially meet the objective of building critical processes with redundant infrastructure to provide reliability and operational flexibility. Lastly, the ability of this alternative to maintain rate payer affordability is unknown because of the financial uncertainties associated with site acquisition.

6.3.2.3 Environmental Impacts

Land Use

The Pier 94 Backlands is currently undeveloped and used for storage of soil and aggregate. No community is established on the Pier 94 Backlands, and the public does not use the site. Neither the Pier 94 Backlands Alternative nor any of the cumulative projects in the vicinity of the Pier 94 Backlands would include physical barriers or obstacles to circulation that would restrict existing patterns of movement. Pipelines connecting the Pier 94 Backlands site to the SEP would be located underground. Consequently, the Pier 94 Backlands Alternative would not physically divide an established community, and as with the proposed project, this impact would be less than significant.

As described in Chapter 3, *Plans and Policies*, development at the Pier 94 Backlands site is subject to policies and other provisions of the City's *San Francisco General Plan* and *Bayview Hunters Point Area Plan* and the Port's *Waterfront Land Use Plan*.[21] Unlike the project, the Pier 94 Backlands Alternative would be consistent with *San Francisco General Plan* policies related to the preservation of historical resources and Policy 7 of the Accountable Planning Initiative, due to the preservation of Central Shops Buildings A and B. However, the Pier 94 Backlands Alternative as a permanent, non-maritime use would not be consistent with Port's *Waterfront Land Use Plan*. As part of their approval processes, the San Francisco Planning Commission, the Port, and other relevant regulatory agencies would determine whether, on balance, the Pier 94 Backlands Alternative would be consistent with the plans they administer, and would identify any exceptions or revisions that might be required (e.g., revising policies to reflect removal of the property from the public trust and use of the site for wastewater treatment). Therefore, at this time, the Pier 94 Backlands Alternative would not be inconsistent with aspects of the *San Francisco General Plan* and *Bayview Hunters Point Area Plan* relevant to avoiding or mitigating an environmental effect, but the use would not be consistent with the Port's *Waterfront Land Use Plan.* Assuming that an amendment to the Port's *Waterfront Land Use Plan* would be incorporated as part of this alternative, this impact would be less than significant.

[21] For example, the *Bayview Hunters Point Area Plan* designates the Pier 94 Backlands area as Maritime Industrial, and the *Waterfront Land Use Plan* designates part of the Pier 94 Backlands area as a "Waterfront Mixed Use Opportunity Area" and identifies portions of the area as either "Existing Maritime Area" or "Maritime Expansion Area." In addition, the *San Francisco Bay Plan*, *San Francisco Bay Area Seaport Plan*, and *Waterfront Special Area Plan* designate the Pier 94 Backlands area for "port priority" use.

Aesthetics

Under the Pier 94 Backlands Alternative, new permanent structures would be constructed at the Pier 94 Backlands, but the maximum height of the structures would be limited to 40 feet. Thus, the new facilities would be similar in character and scale to nearby industrial facilities. A portion of the digesters and other structures would be visible from certain public vistas, including parts of Heron's Head Park, the India Basin Shoreline Park to the southeast, and Hilltop Park and Adam Rodgers Park to the south. However, because the facilities would all be located west of Amador Street, the facilities would not block views of the Bay from these parks nor otherwise obstruct scenic vistas. While facilities at the Pier 94 Backlands would be highly visible from the section of the Bay Trail on Cargo Way between Heron's Head Park and Illinois Street, the area is already substantially developed with industrial land uses, and existing views of the Bay from this part of the San Francisco Bay Trail are substantially blocked by sand and aggregate piles, equipment, and structures. Therefore, while the Pier 94 Backlands Alternative, alone and in combination with cumulative projects, would intensify industrial uses in this area, the new facilities would not substantially degrade the visual character of the site or surroundings, adversely affect a scenic vista, or damage scenic resources. Thus, as with the proposed project, these visual impacts would be less than significant.

Construction of this alternative would create a new source of nighttime light or glare during nighttime construction activities, but this light and glare would not substantially affect other people or properties because the closest residences to the Pier 94 Backlands site are more than 1,800 feet away. As a result, this aesthetics impact would be less than significant. As with the project, compliance with SFPUC standard construction measures would ensure that construction site and staging areas are maintained in a clean and orderly condition and nighttime lighting is directed away from residential areas and has shields to prevent light spillover effects. As with the proposed project, compliance with applicable regulations and policies (California Green Building Code Section 5.106.8 and *San Francisco Better Streets Plan* policy) would ensure that light and glare from operation of the facilities would be less than significant.

Population and Housing, Growth Inducement

Similar to the proposed project, the Pier 94 Backlands Alternative would not displace housing would not increase treatment capacity at the SEP, nor would it extend roads or infrastructure into an undeveloped area. While construction-phase employment projections could be incrementally (assumed to be 10 percent) greater under this alternative than under the proposed project, construction workers would largely be drawn from the local and regional work force and would commute (rather than relocate) to the area. Although this alternative would require an additional five employees over existing SEP (and future with-project) staffing levels, this increase would not represent substantial population growth. Thus, the Pier 94 Backlands Alternative would not induce population growth, displace housing units, create substantial demand for additional housing, or displace a substantial number of people, and population and housing and growth inducement impacts would be less than significant.

Cultural Resources

Historical Resources

There are no known historical resources at the Pier 94 Backlands. Under this alternative, Central Shops Buildings A and B would be retained in place rather than demolished. Consequently, this significant and unavoidable impact on a historical resource associated with the project would not occur.

There are no recorded historical resources within or immediately adjacent to the proposed pipeline route (Evans Street, Mendell Street, and Cargo Way). Buildings along the pipeline route are primarily modern, light industrial, industrial, or office buildings, most of which were constructed in the late 1970s to the late 1980s;[22] as such, they would not meet the minimum age threshold for eligibility for listing in the California Register. Approximately six industrial, steel-frame warehouses on the north side of Evans Street between Quint and Phelps Streets were built from 1961 to 1969 and would meet the minimum age threshold.[23] Upon further review, these buildings could be eligible for listing in the California Register if they meet criteria such as associations with historic events or important persons, or are the embodiment of a certain style of architecture. While construction of the pipelines would have no direct effects (e.g., demolition or substantial alteration) on potentially age-eligible buildings, it could have indirect effects from vibration associated with activities such as pile driving and use of large vibratory compactors. However, these buildings are mostly corrugated steel and concrete construction, which have reduced sensitivity to vibration; in addition, the one masonry building has been structurally upgraded in compliance with local ordinance requirements.[24] Should any damage occur to these buildings, the SFPUC would be required to repair the damage. In addition, if upon later investigation these buildings are determined to be historical resources, mitigation measures could be applied to reduce the potentially significant impact to less-than-significant levels.

While the Pier 94 Backlands Alternative would avoid impacts on historical resources (by retaining Central Shops Buildings A and B in place), the cumulative impacts of this alternative on historical resources would be substantially the same as those identified for the proposed project. Similar to the proposed project, this alternative would still replace the function of the existing digesters and associated buildings at the SEP, and would allow for subsequent potential demolition of many of the contributors to the *Southeast Treatment Plant Streamline Moderne Industrial Historic District* during the envisioned Southside Renovation Project. Mitigation Measure M-CR-1 (Documentation of Historical Resources and Interpretive Display) would reduce the severity of the cumulative impact but would not reduce the impacts on the historic district to a less-than-significant level. As such, the cumulative impact on historical resources due to the indirect impacts of Pier 94 Backlands Alternative in combination with the direct impact of the Demolition of the Existing SEP Digesters and Southside Renovation Project, with respect to future demolition of the existing digesters and control buildings, would be a significant and

[22] Assessor's records accessed June 10, 2016 via San Francisco Property Information Map, http://propertymap.sfplanning.org.
[23] Ibid.
[24] San Francisco Property Information Map, Building Permits for 1698 Evans Avenue. Available online, accessed July 29, 2016.

unavoidable cumulative impact, even with mitigation, and the alternative's contribution to the impact would be cumulatively considerable (i.e., significant).

Archeological Resources and Human Remains

Like the proposed project, the Pier 94 Backlands Alternative could result in a substantial adverse change in the significance of an archeological resource. Because the Pier 94 Backlands and pipeline routes are on artificial fill from land reclaimed during the 1960s, there is the potential that historic structures, such as shipwrecks or wharf remains, present within San Francisco Bay when land reclamation began, could still be extant. Remains of these historic structures could be preserved beneath the artificial fill on or beneath the original San Francisco Bay floor and could be directly affected by construction excavations that penetrate the fill. This site has low potential for the presence of middle or later period prehistoric archeological sites as the subterranean topography does not display pre-Bay conditions generally associated with elevated potential for submerged prehistoric sites, and the area has been under bay waters for several thousand years at least. However, the potential to encounter older, submerged prehistoric sites through drilling of pilings beneath the bay floor has not been assessed for this site. Implementation of Mitigation Measure M-CR-2a (Archeological Testing, Monitoring, and/or Data Recovery) and Mitigation Measure M-CR-2b (Accidental Discovery of Archeological Resources) would reduce this potentially significant impact to a less-than-significant level. With respect to cumulative impacts on archeological resources, the Pier 94 Backlands Alternative would avoid contributing to potential cumulative impacts on CA-SFR-171, but the potential remains that this alternative could contribute to cumulative impacts on both recorded and unrecorded archeological resources in the Pier 94 Backlands vicinity as well as along the pipeline route between the Pier 94 Backlands site and the SEP. However, as with the proposed project, implementation of Mitigation Measure M-CR-2a (Archeological Testing, Monitoring, and/or Data Recovery) and Mitigation Measure M-CR-2b (Accidental Discovery of Archeological Resources) would ensure that any contribution to potentially significant cumulative impacts on archeological resources would not be cumulatively considerable.

Like the proposed project, this alternative has the potential to uncover human remains that may have been buried outside of formal cemeteries. In the event that human remains are uncovered during ground-disturbing activities, Mitigation Measure M-CR-2b (Accidental Discovery of Archeological Resources) would reduce this potentially significant impact to a less-than-significant level. Therefore, with mitigation, the impact on archeological resources and human remains would be less than significant.

Transportation and Circulation

Under the Pier 94 Backlands Alternative, impacts on transportation and circulation would generally be similar to those of the proposed project, although the effects of construction and operations would predominantly occur to the east of the SEP. Table 6-1 indicates the construction- and operations-phase vehicle routes associated with this alternative, as well as the streets associated with the pipeline alignment.

Construction-Phase Transportation and Circulation Impacts

Construction-related travel demand would be incrementally greater (assumed to be 10 percent) than with the proposed project because of the increased number of vehicle trips associated with pipeline construction, although truck and worker access routes would be primarily via Cesar Chavez Street (instead of Oakdale and Jerrold Avenues). Pipeline construction would require temporary closure of travel lanes on Cargo Way and Evans Avenue and could require temporary full closure of segments of Mendell Street. Pipeline construction within Evans Avenue between Quint and Mendell Streets may require temporary rerouting of the Muni 19 Polk and 44 O'Shaughnessy routes for three to four months or more (depending on the rate of pipeline construction). Pipeline construction at Third Street would occur via bore and jack construction, and thus would not affect T Third light rail operation. Unlike the proposed project, this alternative would not require the temporary closure of Jerrold Avenue and rerouting of the Muni 22 Monterey route. Pipeline construction under this alternative could temporarily disrupt bicycle and pedestrian facilities along the route of the pipelines between the SEP and Pier 94 Backlands (such as the Class II and III lanes along Evans Avenue and the Class IV separated path along Cargo Way). As with the proposed project, the SFPUC would implement a Traffic Control Plan under this alternative that would include measures to reduce traffic congestion and temporarily relocate bus stops, and other measures to reduce potential traffic, bicycle, pedestrian, transit, and emergency vehicle access disruptions and safety hazards. Thus, similar to impacts of the project, construction-related transportation impacts of the Pier 94 Backlands Alternative would be less than significant.

Given the change in location and construction start date, construction of new biosolids facilities at the Pier 94 Backlands would minimally overlap with cumulative projects identified for the proposed project, but would likely overlap with other projects in the vicinity of Pier 94 for which schedules are currently undetermined or that are still in the planning stages.[25] As with the proposed project, a Southeast Area Program Construction Manager would be hired by the SFPUC to manage implementation of the Traffic Control Plan and lead coordination efforts between other projects in the vicinity and SEP operations throughout construction. The Southeast Area Program Construction Manager would also be responsible for coordinating with the project teams to update the San Francisco Municipal Transportation Agency (SFMTA) as needed to address local traffic, transit, bicycle, and pedestrian issues. Therefore, as with the proposed project, implementation of the Pier 94 Backlands Alternative, in combination with construction of other cumulative projects, would result in less-than-significant cumulative construction-related transportation impacts.

Operations-Phase Transportation and Circulation Impacts

Under this alternative, operation and maintenance of new facilities at Pier 94 Backlands would generally be similar to the proposed project, though with some relocation of truck trips from the SEP to the Pier 94 Backlands and a slight increase in staffing (up to five additional staff) with a commensurate increase in travel demand. The additional trips would not substantially affect

[25] These cumulative projects could include the Asphalt and Concrete Recycling and Production Plant at Pier 94, Pier 96 Bulk Export Terminal, and the Blue Greenway Project and Heron's Head Park Improvements.

transportation and circulation in the vicinity of Pier 94 and, as with the proposed project, operations-phase impacts on transportation and circulation would be less than significant.

Noise and Vibration

Under this alternative, the biosolids facilities would be located over 2,200 feet north of the closest residential receptors, and about 1,200 feet northeast of City College of San Francisco's Evans Campus (an educational facility). Construction and operational noise impacts on residential receptors would be reduced under this alternative compared to the proposed project, because both residential receptors and educational facilities would be located much farther from construction and operational noise.

Since the same construction equipment would be used under this alternative, Impact NO-1, regarding consistency with ordinance noise limits, would be the same (i.e., significant for concrete saws) under Pier 94 Backlands Alternative as it would be under the proposed project.

Construction noise impacts from use of the Southeast Greenhouses staging area would be avoided under this alternative since this staging area would no longer be needed. However, this alternative would have additional construction noise impacts associated with pipeline construction that would not occur under the proposed project. The proposed pipeline alignment would extend along the southern and eastern boundaries of the City College campus. Due to the proximity of City College to the pipeline alignment (minimum of 150 feet from the edge of Evans Avenue and 25 feet from Mendell Street), construction-related noise levels would be significantly higher near City College compared to the proposed project and would require mitigation measures such as construction equipment source and administrative controls to reduce the potentially significant impacts to less than significant. However, pipeline construction would move along the alignment and construction-related noise impacts associated with pipeline construction would be much shorter in duration than facility construction at the project site or at the Pier 94 Backlands. When all of these factors are considered, construction-related noise impacts of the Pier 94 Backlands Alternative would be potentially significant but less severe compared to the proposed project's impacts. Similarly, the less-than-significant operational noise impacts on nearby sensitive receptors that would occur under the proposed project would be avoided altogether under this alternative.

With the additional pipeline construction required under this alternative, the likelihood of vibration impacts would be greater than under the proposed project. Construction along the pipeline alignment would occur near buildings (as close as 15 feet from edges of streets), which could be subject to temporary increases in vibration. In addition, if sheet pile driving is required at bore and jack pits or along the pipeline alignment, vibration impacts on adjacent structures would be greater than would occur under the proposed project because of the structures' proximity to such activities. This alternative would likely require vibration controls to reduce these potentially significant effects to a less-than-significant level.

This alternative would avoid the significant, but mitigable, cumulative construction-related noise impact that would result from the proximity of the project to other SFPUC projects proposed at the SEP and their proximity to nearby sensitive receptors. While construction of this alternative

could overlap with construction of other cumulative projects in the Pier 94 Backlands vicinity, any cumulative noise impacts are expected to be less than significant due to the absence of sensitive receptors in the immediate vicinity of the Pier 94 Backlands. Any cumulative operational noise or vibration increases would also be expected to be less than significant for the same reason (absence of sensitive receptors). Therefore, cumulative construction-related impacts would be less severe than those of the project, and as with the proposed project, cumulative operational noise and vibration impacts are anticipated to be less than significant.

Air Quality

While this alternative would avoid air pollutant emissions associated with the proposed project's demolition activities, there would be additional emissions resulting from construction of up to 12 pipelines between the SEP and the Pier 94 Backlands site and the additional redundant ancillary facilities required under this alternative. When the component of project emissions related to demolition activities is compared to construction-related emissions typically associated with pipeline projects, it would be expected that emissions from pipeline construction would be greater than emissions from demolition activities due to the excavation, grading, and off-hauling that would be required for pipeline construction. Thus, with all other aspects of construction and operations being essentially equivalent, the Pier 94 Backlands Alternative would likely result in a net increase in construction-related criteria air pollutant and toxic air contaminant (TAC) emissions, compared to the proposed project. Construction-related criteria air pollutant emissions would be greater under this alternative and the significant and unavoidable construction-related impacts associated with NOx emissions that would occur during two years of construction under the proposed project would also be significant and unavoidable during at least two years of construction under this alternative. Despite the overall increase in construction-related TAC emissions, construction-related health risks and hazards would be less than those of the proposed project because there are few, if any, sensitive receptors located within 1,000 feet downwind of the Pier 94 Backlands site. Since the closest sensitive receptors are not located downwind of the site, construction-related health risks and hazards are expected to be lower at these locations. Likewise, the potential for nuisance odors to adversely affect downwind sensitive receptors would also be less under this alternative. However, it is noted that construction-related and operational TAC emissions and nuisance odor impacts would be less than significant under both this alternative and the proposed project.

Like the project site, the Pier 94 Backlands is located within an APEZ. As with the proposed project, construction and operation of the BDFP facilities at this site is not expected to expand the APEZ.

Although greater construction-related emissions would occur under this alternative, potentially significant impacts associated with conflicts with the 2010 Clean Air Plan would be the same as those of the proposed project and would be less than significant with mitigation.

This alternative's contribution to significant and unavoidable cumulative construction-related NOx emissions would be greater than that of the proposed project due to the added pipeline construction, and as with the proposed project, this cumulative impact would be significant and

unavoidable, even with implementation of mitigation measures like Mitigation Measures M-AQ-1a and M-AQ-1b. Although there would be a net increase in construction-related contaminant emissions and TACs, cumulative health risks and hazards would be less severe than those of the proposed project because the closest sensitive receptors are farther (1,800 feet) compared to the project and because of the absence of downwind receptors at the Pier 94 Backlands site.

Greenhouse Gas Emissions

This alternative would have the same energy capture potential (from digester gas produced) and the same increase in biosolids reuse opportunities as the project, and would be subject to the same local regulations adopted to reduce GHG emissions. Energy produced by digester gas facilities under the Pier 94 Backlands Alternative would be similar to the energy produced under the project and would result in a similar associated increase in biogenic GHG emissions, but unlike the proposed project, the energy recovery facilities located at the Pier 94 Backlands site would not be available as backup power to the main plant or to support other SEP facilities. Other SEP facilities would remain reliant upon Hetch Hetchy power, similar to existing conditions, and therefore, unlike the proposed project, GHG emissions reductions would not be realized because this renewable energy source would not be freed up for use by others. This alternative would nevertheless have a less-than-significant effect because its GHG emissions would not conflict with state, regional, or local GHG reduction plans and regulations, and would not contribute considerably to cumulative GHG emissions.

Wind and Shadow

Because the pipelines between the SEP and the Pier 94 Backlands would be underground, they would not affect wind or shadow and are not discussed further in this section.

Wind

Similar to the proposed project site, the Pier 94 Backlands does not contain any areas subject to wind comfort or wind hazard criteria established in the San Francisco Planning Code. The nearest public areas to the portion of the Pier 94 Backlands that would be developed under this alternative (shown on Figure 6-4) are Amador Street, which has no sidewalks, and Cargo Way, which includes a segment of the Bay Trail. Cargo Way is 200 feet from the Pier 94 Backlands and separated from it by the San Francisco Bay Railroad railyard. As occurs at the proposed project site, winds in the area are typically from the west/southwest and wind speeds are light. Changes in wind patterns resulting from this alternative would generally occur to the east (downwind) of the Pier 94 Backlands along Amador Street. Given existing wind conditions and the absence of downwind public areas, implementation of the Pier 94 Backlands Alternative would not alter wind in a manner that would substantially affect public areas and, as with the proposed project, this impact would be considered less than significant. Given the location and nature of cumulative projects in the vicinity of the Pier 94 Backlands, no significant cumulative impacts related to wind would be anticipated.

Shadow

Heron's Head Park is the nearest public open space to the Pier 94 Backlands. The parking lot at Heron's Head Park is about 500 feet southwest of the portion of the Pier 94 Backlands that would be developed under this alternative. None of the facilities that would be constructed at the Pier 94 Backlands would exceed 40 feet in height; thus, Section 295 of the San Francisco Planning Code would not apply. The Pier 94 Backlands Alternative could cast new shadow on bicycle routes, the Bay Trail, and sidewalks along Cargo Way during certain times of the year, although the facilities would be located over 200 feet away. New shadow, if any, would be transitory in nature and would not substantially affect the function of these pathways (which are generally not used as places for extended periods of stationary activity). The open space recreation facilities are too distant to be affected by shadows created by facilities that would be constructed at the Pier 94 Backlands under this alternative. Consequently, implementation of the Pier 94 Backlands Alternative would not create shadow in a manner that could substantially affect outdoor recreation facilities or other public areas and, as with the project, this impact would be considered less than significant. Given the location and nature of cumulative projects in the vicinity of the Pier 94 Backlands, no significant impacts related to shadow would be anticipated.

Recreation

As discussed above, recreational resources in the vicinity of Pier 94 Backlands include the Bay Trail along Cargo Way, Heron's Head Park, India Basin Shoreline Park, Hilltop Park, and Adam Rodgers Park. Similar to the proposed project, this alternative would construct neither housing nor recreational resources. The five additional workers needed to operate the solids processing facilities at the Pier 94 Backlands would create a negligible increase in existing trail and park use in the area. Construction of the pipelines from the SEP to the Pier 94 Backlands could temporarily disturb users of the Bay Trail during construction in Cargo Way; however, this disturbance would be temporary, and use of the Bay Trail is transitory. The Pier 94 Backlands Alternative would not otherwise alter existing recreational resources. Under cumulative conditions, this alternative in combination with the Blue Greenways Project, Asphalt and Concrete Recycling and Production Plant, and Pier 96 Bulk Export Terminal, could result in an incremental increase in use of recreational resources in the vicinity. However, the incremental increase in use of these resources would not result in physical degradation to the extent that construction or expansion of recreational facilities would be required. These cumulative projects would have less-than-significant incremental impacts related to recreational resources. For these reasons, similar to the proposed project, this alternative would have less-than-significant impacts related to recreational resources.

Utilities and Service Systems

Compared to the proposed project, the Pier 94 Backlands Alternative would generate more soil requiring disposal, primarily resulting from construction of the new digesters (which have a much larger diameter) and the pipelines between the Pier 94 Backlands and the SEP. Other than this construction-related increase, this alternative would generate approximately the same amount of wastewater and solid waste as the proposed project and would require the same amount of potable water. Wastewater would be conveyed to the SEP via facilities designed to

accommodate the anticipated flows. Solid waste disposal would be subject to the same regulatory requirements as the proposed project. There is currently a system of landscape swales that collect, treat, and convey stormwater through an outfall to the Bay, but this alternative would include modifications to the combined sewer system or construction of a new separate stormwater system for the conveyance of stormwater runoff. In either case, the drainage system would be constructed in accordance with applicable design requirements to accommodate anticipated stormwater flows. As with the proposed project, compliance with applicable regulatory requirements would ensure that the Pier 94 Backlands Alternative would not result in any impacts with respect to utilities or services systems. All cumulative development in San Francisco would be subject to the same regulatory framework as this alternative, and compliance with these existing regulations would serve to reduce any cumulative impacts. Therefore, all impacts related to utilities and service systems would be less than significant, as identified for the proposed project, and no mitigation would be required.

Public Services

The number of construction workers needed for the Pier 94 Backlands Alternative would be about 10 percent higher than the number needed for the proposed project, and similarly the temporary increase in demand for public services during construction would be limited to an insubstantial increment above current conditions. As with the proposed project, the SFPUC would be required to prepare a Traffic Control Plan for construction (including pipelines) (see Chapter 2, Section 2.6.1.3, Construction Coordination). The impact of construction on demand for public services and governmental facilities would thus be less than significant. The five additional workers required to staff operation of the solids processing facilities under this alternative would not substantially increase the population of permanent residents requiring public services in the area. As with the proposed project, facilities under this alternative would be constructed in compliance with all applicable fire codes and public safety standards and would be inspected by the San Francisco Fire Department. The Pier 94 Backlands site is within the same police and fire jurisdictions as the proposed project site. Operation of this alternative would have a less-than-significant effect on demand for public services and governmental facilities. For these reasons, all impacts related to public services would be less than significant, as identified for the proposed project, and no mitigation would be required.

Biological Resources

Whereas the proposed project would remove buildings/structures that could serve as roost for bats, implementation of the Pier 94 Backlands Alternative would not require removal of any structures. Thus, the potential impact on bat roosts would not occur under this alternative. As with the proposed project, implementation of SFPUC standard construction measures as well as compliance with the Construction General Stormwater Permit and the City's Construction Site Runoff Control requirements (Article 4.2, San Francisco Public Works Code, Section 146) would reduce potentially significant impacts on nesting birds to a less-than-significant level. This alternative would include removal of non-native grasslands and coyote brush to accommodate construction activities and facility construction. These activities would result in short-term ground disturbance and increased noise, and long-term foraging habitat removal, which would be potentially significant impacts on

migratory birds. As with the proposed project, implementation of SFPUC standard construction measures during project construction would reduce these effects to a less-than-significant level. Implementation of this alternative would not require the removal of any protected trees; however, if tree removal becomes necessary, it is assumed that any removal of protected trees would occur in compliance with requirements in the San Francisco Urban Forestry Ordinance. Bore and jack construction activities could result in short-term indirect impacts on industrial drainages to the north of Cargo Way, although these potential impacts are considered less than significant with the implementation of the project's Stormwater Pollution Prevention Plan (SWPPP). Like the proposed project, the Pier 94 Backlands Alternative would not significantly affect sensitive wildlife or vegetation, or wetlands, after the implementation of the aforementioned best management practices and the SFPUC standard construction measures.

Geology, Soils, and Paleontological Resources

The amount of earthwork under this alternative would be incrementally greater than under the proposed project, primarily due to construction of the pipelines between the Pier 94 Backlands and the SEP. However, impacts related to soil erosion would remain less than significant with implementation of the requirements of Article 4.1 of the San Francisco Public Works Code and the SWRCB General Construction Stormwater NPDES Permit. As with the proposed project, excavations conducted during construction would be shored in accordance with applicable regulations. Monitoring would be conducted during dewatering and pile driving, and corrective actions would be implemented if necessary to ensure that settlement would remain within acceptable levels. Similarly, facilities would be constructed in accordance with the San Francisco Building Code, the SFPUC's General Seismic Safety Requirements, and applicable engineering design standards, which would ensure that the structures could withstand seismic hazards including ground shaking and ground failures (including vibration-induced liquefaction during project construction).

While some of the facilities would be constructed within the limits of the regulated landfill in the Pier 94 Backlands and could be subject to substantial amounts of settlement, this alternative would implement the recommendations of the required site-specific geotechnical report, which would need to be prepared, to reduce the amount of settlement and/or the potential for damage due to settlement. The artificial fill and young bay mud that underlie the Pier 94 Backlands have a low potential for paleontological resources. Therefore, all impacts related to geology, soils, seismicity, and paleontology would be less than significant and no mitigation would be required.

Hydrology and Water Quality

Under the Pier 94 Backlands Alternative, the amount of earth-moving activities and construction-related groundwater dewatering would be greater than under the proposed project, due to the larger area required, the depth to groundwater, and the construction of pipelines between the Pier 94 Backlands and the SEP. However, impacts related to degradation of water quality would remain less than significant with implementation of City requirements (i.e., Articles 4.1 and 4.2 of the San Francisco Public Works Code and the SWRCB General Construction Stormwater NPDES Permit). This alternative would include the construction of a new separate stormwater system or reconfiguration of the combined sewer system to accommodate stormwater flows from the Pier

94 Backlands. Under either option, compliance with City requirements (Article 4.1 of the San Francisco Public Works Code and the City's Stormwater Design Guidelines) would preclude adverse water quality effects from discharge of stormwater. Because the proposed biosolids treatment processes would be the same under the proposed project and the Pier 94 Backlands Alternative, the changes in SEP effluent composition would also be the same (and would not adversely affect receiving water quality). While the project site would be partially within the 100-year flood zone in 2100 with 36 inches of sea level rise, the Pier 94 Backlands is not within an existing or future flood zone or within a potential tsunami inundation zone. For these reasons, as with the proposed project, all impacts related to hydrology and water quality would be less than significant under the Pier 94 Backlands Alternative.

Hazards and Hazardous Materials

There are no buildings at the Pier 94 Backlands, and there are no schools located within one-quarter mile of the Pier 94 Backlands. Construction of the new facilities at the Pier 94 Backlands would introduce a new use of hazardous materials at this site. As with the proposed project, compliance with City requirements (e.g., Article 21 of the San Francisco Public Health Code) regarding the use of hazardous materials would ensure that adverse effects would not occur. The geologic materials at the Pier 94 Backlands contain asbestos.[26] As with the proposed project, construction within these materials would be subject to the requirements of the California Air Resources Board Asbestos Air Toxics Control Measure.

As indicated above, the northern portion of the Pier 94 Backlands site would be located over a portion of a Class III regulated landfill regulated under Order No. R2-2003-0055 issued by the RWQCB.[27] Historic groundwater monitoring indicates that the landfill wastes have not adversely affected groundwater or surface water quality except in the area of a previous aboveground fuel storage tank where elevated total petroleum hydrocarbon concentrations have been identified in the groundwater.[28] However, excavation could encounter wastes within the landfill and potentially affect the integrity of the landfill cover. Although a 1988 Solid Waste Assessment Test investigation of the landfill did not detect methane, volatile organic compounds (VOCs), or hydrocarbons in the soil gas,[29] methane is a common byproduct of decomposing wastes. Therefore, following construction, building occupants could potentially be exposed to harmful landfill gases such as methane and VOCs. However, the RWQCB must approve all changes to the landfill and would require technical reports under Order No. R2-2003-0055 to address how the design of this alternative would maintain the integrity of the landfill and prevent water quality impacts. In addition, as with the proposed project, the assessment and management of site risks would be ensured through compliance with the Maher Ordinance, Article 22A of the San Francisco Health Code, regardless of the likelihood that higher volumes of contaminated soil would be encountered

[29] TR/RYCG, *Geotechnical Investigation Pier 94 Backland Improvements San Francisco, California*, July 5, 2012.

under this alternative compared to the proposed project. As with the proposed project, impacts related to interference with emergency response would be minimized through implementation of a Traffic Control Plan. Fire risks would be minimized through compliance with existing fire safety codes and industry standards. For the reasons stated above, as with the proposed project, all impacts related to hazards and hazardous materials would be less than significant.

Mineral Resources, Energy Resources, and Water Use

Similar to the proposed project, this alternative would have no impact on mineral resources because the Pier 94 Backlands does not contain substantial mineral resources or locally important mineral resource recovery sites.

Construction energy needs would be slightly higher than those of the proposed project, given that this alternative would include construction of pipelines between the Pier 94 Backlands and the SEP. However, this energy consumption would not be considered a wasteful use of energy, for the reasons explained for the proposed project; thus, this impact would be less than significant. Energy produced by digester gas facilities under this alternative would be similar to the energy produced under the proposed project and would be sufficient to provide enough power to operate the project, although this energy would not be available to SEP facilities. Thus, other SEP facilities would remain reliant upon Hetch Hetchy power (similar to existing conditions). The impact of operation of this alternative on energy, fuel, and water use would be less than significant. Cumulative impacts of this alternative would be less than significant, similar to those identified for the proposed project. This alternative would not reduce the amount of power needed from Hetch Hetchy; however, the alternative would not encourage activities that would result in the use of large amounts of these resources, or result in their use in a wasteful manner.

Agriculture and Forest Resources

Like the proposed project, the Pier 94 Backlands Alternative would not affect any land designated as Prime Farmland, Unique Farmland, or Farmland of Statewide Importance, nor would it affect any land zoned or used for either agricultural or forestry use. Therefore, there would be no impact related to agriculture or forest resources.

6.3.3 Alternative C: Historical Resources Relocation

6.3.3.1 Description

Alternative C, the Historical Resources Relocation Alternative, would consist of full construction and operation of the BDFP as proposed, plus the relocation of Central Shops Buildings A and B to a similar industrial setting in San Francisco. The relocation, rehabilitation, and reuse of Buildings A and B would be consistent with the Secretary of the Interior's Standards, and would reduce the significant and unavoidable impact on historical resources under the proposed project to a less-than-significant level. Rather than demolishing Buildings A and B, the SFPUC would dismantle these structures such that they could be relocated consistent with the Secretary of the Interior's Standards for Rehabilitation, and the character-defining features of these historical resources would

be retained.[30] Following relocation, Buildings A and B would be rehabilitated and reused. This would be considered a full preservation alternative with respect to an identified individual historical resource. However, this alternative would neither reduce nor avoid the significant and unavoidable cumulative impact on the *Southeast Treatment Plant Streamline Moderne Industrial Historic District*.

Under this alternative, construction of BDFP facilities at the proposed project site would be delayed by about one year to accommodate the disassembly and transportation and relocation of Buildings A and B; otherwise, the characteristics of the BDFP (location, components, operation, maintenance, and construction) would be the same as described in Chapter 2, *Project Description*, and are not discussed in detail in this section. The description below, instead, focuses on the relocation of Central Shops Buildings A and B.

Site Location

The relocation of Buildings A and B would require a site of about 130,000 square feet (about three acres) in area, in order to allow sufficient buffer around the buildings themselves to accommodate vehicular circulation and to retain a similar setting to their original location. The SFPUC has identified a site at Pier 90, bisected by Amador Street east of Illinois Street and Cargo Way, as a potentially feasible new location for Buildings A and B (refer to **Figure 6-5**). Buildings A and B could be relocated to two sites on either side of Amador Street (600 Amador Street and 450 Amador Street). The existing buildings at 600 Amador Street would be relocated or demolished prior to relocation of Buildings A and B. No buildings would be demolished at 450 Amador Street. The relocation site is referred to as the Pier 90 site in this document. Construction staging would occur primarily at the Pier 90 site, with additional staging at the Pier 94 Backlands if needed.

The City through the Port Commission owns the Pier 90 site. American Storage, a storage company, currently leases 600 Amador Street. Central Concrete Supply, Inc., a ready mix concrete supplier, currently leases 450 Amador Street. These two uses are typical of land uses in the surrounding area. While this site is subject to the public trust (similar to Pier 94 Backlands site discussed above), the relocation of Central Shops Buildings A and B to this site would not require State Lands Commission approval.[31]

The 600 Amador Street site is bounded to the south by the Pier 94 Backlands and the San Francisco Bay Railroad railyard; a rendering plant and concrete preparation plant are located to the east along Amador Street. Vacant grain silos stand to the east of 450 Amador Street. Islais Creek Channel borders the area to the north. Cargo Way and Third Street separate the site from warehouses and commercial uses to the west.

[30] Secretary of Interior's Standards for Rehabilitation (36 CFR 67).

[31] If the Port were to rent out the relocated buildings for a long-term use that was not consistent with the public trust, then that use would require approval by the State Lands Commission.

SOURCE: ESA+Orion; Google Earth, 2016

SFPUC Biosolids Digester Facilities

Figure 6-5

Potential Site and Layout for Historical Resources Relocation Alternative

Buildings along Amador Street near the Pier 90 site are used for industrial and maritime purposes, and include multi-story concrete grain silos, building materials storage, large metal storage tanks associated with a rendering facility, and multi-story concrete and metal structures associated with concrete processing.

The Pier 90 site is not within the Bay Conservation and Development Commission (BCDC) 100-foot shoreline band but is within a "port priority use area" (designated in the *San Francisco Bay Area Seaport Plan*). While specific future uses of Buildings A and B have not been determined, it is presumed that the future uses would be consistent with the existing use of the Central Shops, as well as with allowable uses within a port priority area such as light industrial uses.

For the purposes of this analysis, it is assumed that the City through the Port Commission would retain ownership of the Pier 90 site, and that the Port would manage land use at the site.

Components

In addition to construction of the BDFP as described in Chapter 2, *Project Description*, this alternative would relocate Buildings A and B to the Pier 90 site. The existing buildings at 600 Amador Street would be relocated or demolished prior to relocation of Buildings A and B. No buildings would be demolished at 450 Amador Street. Dismantling, transport, and storage of Buildings A and B would occur before BDFP construction begins at the SEP. Prior to reconstruction of Buildings A and B, a slab foundation would be installed at the Pier 90 site, and some utilities (such as water, sewer, and power) would be connected.

Operations and Maintenance

As discussed above, future use of Buildings A and B would likely retain an industrial use in a manner consistent with the *Port of San Francisco, Waterfront Land Use Plan* land uses. It would be speculative to presume a particular use for the relocated Buildings A and B beyond this basic consistency assumption, so the impact analysis below addresses only this basic assumption.

Construction

Construction Schedule, Work Force, and Work Hours

Construction of the BDFP facilities would occur as described in Chapter 2, *Project Description*; however, the demolition or relocation of buildings at Pier 90 and subsequent dismantling and transport of Buildings A and B to Pier 90 would occur at the beginning of the construction schedule, and would add about one year to the total construction schedule. Construction would thus occur over an approximately six-year period. For purposes of this evaluation, it is assumed that 75 construction workers (approximately half of the work force required for site preparation of the BDFP) would be needed for disassembly and transportation of Buildings A and B and site preparation at the Pier 90 site. Construction work hours are assumed to be the same as for the proposed project.

Construction Staging, Worker Parking, Truck Access, and Lane Closures

As described above, construction staging could occur at the same locations as proposed for the BDFP, as well as at the Pier 90 site. Construction worker parking would be provided at the Pier 90 site and the Pier 94 Backlands if needed. Trucks transporting Buildings A and B would travel between the existing Central Shops site and 600 Amador Street or 450 Amador Street along either the same route as the equipment deliveries and concrete trucks route identified in Figure 2-15 in Chapter 2, *Project Description*, for the BDFP (exiting the SEP on Rankin Street, then continuing to the Pier 90 site using Evans Avenue, Third Street, and Cargo Way/Amador Street), or would exit the SEP on Jerrold Avenue and then continue on to Phelps Street, Third Street, and Cargo Way/Amador Street. Additional materials brought to the Pier 90 site would be delivered via Evans Avenue, Third Street, or Illinois Street. Temporary lane closures may occur during construction.

Construction Methods

Construction methods to be used for relocating Buildings A and B have not been determined but would likely include disassembly of the structures, construction of slab on grade foundations (Pier 90 is on artificial fill placed between 1926 and 1938) and concrete perimeter walls, and reassembly of the buildings. Buildings A and B would be required to be constructed in accordance with the State Historical Building Code and the Secretary of the Interior's Standards for the Treatment of Historic Properties. Construction would require the use of similar equipment to that included in Table 2-11 in Chapter 2, *Project Description*. The total amount of earthwork under the Historical Resources Relocation Alternative would be slightly greater than under the proposed project due to construction activities required for site preparation at Pier 90.

Permits and Approvals

Relocation of Buildings A and B would require approval from the Port, as the Pier 90 site is under its jurisdiction; thus, this alternative would require all the same the permits and approvals required for the proposed project (identified in Chapter 2, Section 2.7, Intended Uses of this EIR and Required Actions and Approvals).

6.3.3.2 Ability to Meet Project Objectives

Because the Historical Resources Relocation Alternative would involve full implementation of the BDFP as proposed, this alternative would meet all of the proposed project objectives (see Table 6-2), with one possible exception. Due to the unknown time and costs to acquire a suitable relocation site for Buildings A and B, conduct site preparations, and take the precautions needed to dismantle and reconstruct Buildings A and B consistent with the Secretary of the Interior's Standards, it is unknown if this alternative would allow for rate payer affordability. The estimated one-year extension in project schedule for the dismantling and relocation would be considered within a reasonable range for the SFPUC to partially meet its objective for timely construction of the BDFP facilities.

6.3.3.3 Environmental Impacts

With a few exceptions, the Historical Resources Relocation Alternative would result in all the same impacts as those identified for the proposed project in Chapter 4, *Environmental Setting and Impacts*, plus impacts associated with construction and operation of the relocated buildings at Pier 90. The exceptions relate to the historical resource impacts and assumptions for cumulative impacts, as discussed below.

This alternative would substantially reduce the severity of impacts on historic architectural resources (Impact CR-1). Under this alternative, the project-level impact on historical architectural resources would be less than significant because Central Shops Building A and B would be relocated, rehabilitated, and reused in a similar industrial setting in San Francisco in a manner consistent with the Secretary of the Interior's Standards. However, as with the proposed project, the cumulative impact on historical architectural resources would be significant and unavoidable under the Historical Resources Relocation Alternative, even with mitigation (Mitigation Measure M-CR-1, Documentation of Historical Resources and Interpretive Display). This is because under cumulative conditions, the SFPUC would potentially demolish all of the existing digesters and their central control buildings (refer to Chapter 4, Section 4.1, Table 4.1-1), which are contributors to the eligible *Southeast Treatment Plant Streamline Moderne Industrial Historic District*, and implementation of this alternative would demolish Building 870 (a contributor to the historic district) plus replace the function of the existing digesters and allow for the future demolition of the digesters and control buildings. Therefore, similar to the proposed project, the alternative's contribution to the cumulative adverse impact on this eligible district would be cumulatively considerable, and a significant, unavoidable cumulative impact on a historic district.

With respect to the assumptions for cumulative impacts, this alternative would delay construction of facilities at the BDFP site by about one year. Some of the cumulative impacts disclosed in Chapter 4, *Environmental Setting and Impacts*, are directly related to the degree to which construction of cumulative projects would overlap with the BDFP. Consequently, some of those cumulative impacts could slightly differ under this alternative, as described below.

The impact discussions described below focus on the construction and operational impacts at the Pier 90 site and do not repeat the impacts at the project site and staging areas that would be the same under this alternative as those of the proposed project.

Land Use

Existing uses in the Pier 90 area include a storage company, concrete supplier, building materials storage and a rendering facility. With implementation of the Historical Resources Relocation Alternative, the building materials storage and a parking lot operated by the concrete supplier would be replaced by Buildings A and B. Moving the buildings to this site would not close any roads, and existing uses in the Pier 90 vicinity do not constitute an established community. Consequently, this alternative would not physically divide an established community.

Development at Pier 90 would be subject to policies and other provisions of the City's *San Francisco General Plan* and *Bayview Hunters Point Area Plan* and the Port's *Waterfront Land Use Plan*. Although specific future uses have not been identified, potential uses of Buildings A and B under this alternative (e.g., light industrial) are assumed not to conflict with the policies set forth in these plans.

Aesthetics

At Pier 90, the two relocated Central Shops buildings would constitute new permanent industrial buildings near other industrial buildings and facilities. While Central Shops Building B would be taller and more massive than the existing storage facility buildings it would replace, the character of both of the relocated buildings would be similar to the visual character of nearby industrial facilities. The relocated buildings would be partly visible from parts of Hilltop Park and Adam Rodgers Park to the south; however, the relocated Central Shops buildings would not block views of the Bay from these parks nor otherwise obstruct scenic vistas. While the relocated buildings would be highly visible from the section of the Bay Trail on Cargo Way and Illinois Street where these two streets intersect with Amador Street, the area is already substantially developed with industrial land uses, and existing views of the Bay from this part of the San Francisco Bay Trail are substantially interrupted by existing buildings and other structures that border this part of Amador Street. Therefore, while the Historical Resources Relocation Alternative, alone and in combination with cumulative projects, would intensify the industrial uses at the Pier 90 site, the relocated buildings would not degrade the visual character of their respective sites or surroundings, adversely affect a scenic vista, or damage scenic resources. Thus, these impacts would be less than significant. It is assumed that no nighttime construction would be required at the Pier 90 site, so there would be no construction-related light and glare impacts at that location. As with the proposed project, compliance with applicable regulations and policies (California Green Building Code Section 5.106.8 and *San Francisco Better Streets Plan* policy) would ensure that light and glare from operation of the relocated Buildings A and B would be less than significant.

Population and Housing, Growth Inducement

Similar to the proposed project, the Historical Resources Relocation Alternative would not displace housing, would not increase treatment capacity at the SEP, and would not extend roads or infrastructure into an undeveloped area. However, the relocation of the Central Shops buildings to Pier 90 would displace two businesses that currently lease the 450 and 600 Amador Street sites. The number of jobs associated with these businesses is small, and the employees displaced from their current employment sites would be expected to find employment at the same businesses in a different location or at other jobs in San Francisco or the surrounding area. Therefore, the displacement of the workers at these two sites would not create substantial demand for new housing or necessitate the construction of replacement housing elsewhere, and the impact of the Historical Resources Relocation Alternative related to displacement of people, while greater than that of the proposed project, would be less than significant. The construction-phase employment period for the Historical Resources Relocation Alternative would be extended by about one year and require about 75 additional construction workers to dismantle and relocate

the Central Shops buildings. This is not a substantial increase in the time and work force requirements assumed for the proposed project. As under the proposed project, construction workers would largely be drawn from the local and regional work force and would commute (rather than relocate) to the area. Therefore, the relocation component of the Historical Resources Relocation Alternative would not induce population growth, displace housing units, create substantial demand for additional housing, or displace a substantial number of people, and population and housing and growth inducement impacts would be less than significant.

Cultural Resources

Historical Resources

The Historical Resources Relocation Alternative would consist of full construction and operation of the BDFP as proposed; however, rather than demolish Central Shops Buildings A and B, this alternative would relocate these buildings to a similar industrial setting in San Francisco. The dismantlement, relocation, rehabilitation, and reuse of Buildings A and B would be consistent with the Secretary of the Interior's Standards, and the character-defining features of these resources would be retained. Therefore, this alternative would substantially reduce the severity of a significant impact on historical architectural resources. Like the proposed project, this alternative would include demolition of Building 870, which is an identified contributor to the eligible *Southeast Treatment Plant Streamline Moderne Industrial Historic District*. However, as with the proposed project, removal of Building 870 would have a less-than-significant impact on the overall significance and historic integrity of the district because the building is not individually eligible for listing, and because the removal of this one building would not substantially degrade the historical integrity of the district.

Because the dismantlement, relocation, rehabilitation, and reuse of Buildings A and B would be consistent with the Secretary of the Interior's Standards, and because the demolition of Building 870 would result in a less-than-significant impact on the historic district, the impact on historical architectural resources would be less than significant under this alternative, and no mitigation measures are necessary. However, as with the proposed project, under cumulative conditions, the SFPUC would demolish all of the existing digesters and their central control buildings (refer to Chapter 4, Section 4.1, Table 4.1-1, Project 12), which are contributors to the eligible *Southeast Treatment Plant Streamline Moderne Industrial Historic District*. Therefore, as with the proposed project, the Historical Resources Relocation Alternative's contribution to the cumulative adverse impact on this eligible historic district would be cumulatively considerable, and the cumulative impact would be significant and unavoidable, even with mitigation (Mitigation Measure M-CR-1, Documentation of Historical Resources and Interpretive Display).

Archeological Resources and Human Remains

The proposed relocation site for Buildings A and B (Pier 90, bisected by Amador Street east of Illinois Street and Cargo Way) consists of artificial fill. Historic structures present when land reclamation began, such as shipwrecks or wharf remains, could be extant and could be directly affected by construction excavations if erection of Buildings A and B entails excavation or pile driving that would penetrate the fill. Because the proposed relocation site consists of artificial fill,

there is a low potential for the presence of middle or later period prehistoric archeological sites. It is assumed that Buildings A and B would be relocated to slab on grade foundations similar to their existing foundations. This work would not require substantial excavation, and there would be a low potential to encounter older deeply buried prehistoric sites submerged by the Bay.

Nevertheless, the potential remains that site preparation activities could encounter archeological resources and human remains at the Pier 90 site, a potentially significant impact. Implementation of Mitigation Measure M-CR-2a (Archeological Testing, Monitoring, and/or Data Recovery) and Mitigation Measure M-CR-2b (Accidental Discovery of Archeological Resources) would reduce impacts on archeological resources and human remains at the proposed relocation site to a less-than-significant level. Therefore, with mitigation, the impact on archeological resources and human remains would be less than significant.

Transportation and Circulation

The same peak number of construction trucks and construction workers as the BDFP would occur for the Historical Resources Relocation Alternative, although the dates of these peaks would shift. The same temporary street closures would occur during construction, with the addition of potential temporary closures of roadways between the SEP and the Pier 90 site during transport of large pieces of Buildings A and B, but these closures would be of short duration and would represent less-than-substantial changes to current vehicle travel and circulation, based on the existing traffic volumes and the duration of closures. Temporary disruption of the bicycle and pedestrian facilities on Cargo Way and Illinois Street could also occur during relocation of Buildings A and B; however, as with the BDFP, a Traffic Control Plan containing measures to reduce transportation and circulation hazards associated with construction activities would be prepared. As with the proposed project, construction impacts of this alternative would be less than significant.

Operational haul routes of vehicles associated with SEP operations would be the same as those identified for the proposed project. For this reason, operation of the Historical Resources Relocation Alternative would result in transit, bicycle and pedestrian travel, freight rail, parking, and traffic safety hazard impacts that would be similar to those described for the proposed project.

While the dates of peak construction activity would shift by about one year under the Historical Resources Relocation Alternative, the same construction cumulative scenario as evaluated for the proposed project would apply because no additional projects in the SEP vicinity from the cumulative projects list would be under construction in 2023 to 2024. For this reason, the cumulative construction impacts of the Historical Resources Relocation Alternative on transportation and circulation would be similar to those of the proposed project.

The operational cumulative scenario for the relocation component of the Historical Resources Relocation Alternative is also the same as that analyzed for the BDFP. Similar to the BDFP, the relocation component of the Historical Resources Relocation Alternative, along with other cumulative projects in the operational cumulative scenario, would not permanently reroute public transit, bicycle, or pedestrian routes in the area, and would not include activities using freight rail.

Noise and Vibration

In addition to having the same potentially significant but mitigable construction noise impact identified for the BDFP at the BDFP site, the Historical Resources Relocation Alternative would result in construction-related noise increases in the Pier 90 area (assuming Buildings A and B are reconstructed on this alternative site). Because of the added development in the Pier 90 area, noise impacts would be slightly greater when compared to those of the proposed project; however, implementation of this alternative is not expected to result in any new significant construction-related and operational noise impacts on sensitive receptors, due to the absence of noise-sensitive receptors in the Pier 90 vicinity.

This alternative would result in the same significant cumulative construction-related noise impacts on nearby sensitive receptors when combined with other SEP projects. While construction of this alternative could overlap with construction of other cumulative projects in the Pier 90 area, any cumulative noise or vibration impacts are expected to be less than significant due to the absence of sensitive receptors in the immediate vicinity. Any cumulative operational noise or vibration increases at the Pier 90 site are also expected to be less than significant for the same reason (absence of sensitive receptors). Therefore, cumulative construction-related and operational noise and vibration impacts would be slightly greater than those of the proposed project due to the added development in the Pier 90 area, but there would be no new significant construction-related or operational cumulative noise and vibration impacts.

Air Quality

Under this alternative, criteria pollutant emissions and health risks would remain substantially the same as those of the proposed project, since the Central Shops maintenance activities were assumed to continue to occur within the air basin but at a different location (i.e., no emissions reductions were assumed due to removal of the Central Shops activities from the SEP site), even though new uses at the relocated Buildings A and B could incrementally add to long-term operational emissions. Given the size of Buildings A and B, operational emissions of a new use at this site would not be expected to be significant. (If the new use were a relocated use from another site within the same air basin, then operational emissions would be the same as those of the proposed project.) Therefore, this alternative would not substantially increase the operational emissions and health risks estimated for the proposed project.

This alternative would result in slightly more short-term criteria pollutant emissions resulting from relocation or demolition of existing facilities on the Pier 90 site and relocation of the Central Shops buildings. Depending on the timing of these activities at the Pier 90 site, these added emissions would further increase the project's exceedances of the significance threshold for NOx if the emissions occurred during Construction Years 1 or 3, and such an impact would be significant and unavoidable under the proposed project as well as under this alternative.

Despite this additional increase in construction-related criteria air pollutant and TAC emissions compared to the proposed project, the added construction-related health risks and hazards are expected to be less than significant (as with the proposed project) because there are few, if any, sensitive receptors located within 1,000 feet downwind of the Pier 90 area. Likewise, the potential

for nuisance odors to adversely affect downwind sensitive receptors would also be less than significant under this alternative.

Like the BDFP site, the Pier 90 area is located within an APEZ. As with the proposed project, implementation of the Historical Resources Relocation Alternative would not be expected to expand the APEZ.

As with the proposed project, even with somewhat greater construction-related emissions under this alternative, impacts associated with conflicts with the Clean Air Plan would be less than significant with mitigation.

This alternative's contribution to significant and unavoidable cumulative construction-related NOx emissions would be greater than that of the proposed project due to the added emissions associated with Central Shops relocation and rehabilitation as well as dismantling or demolition of buildings at the Pier 90 site, and as with the proposed project, this cumulative impact would be significant and unavoidable, even with implementation of measures like Mitigation Measures M-AQ-1a and M-AQ-1b. Cumulative impacts on health risks and hazards associated with TACs would be similar to those of the proposed project and would be less than significant.

Greenhouse Gas Emissions

This alternative would have the same energy capture potential (from digester gas produced) and the same increase in biosolids reuse opportunities as the proposed project, and would be subject to the same local regulations adopted to reduce GHG emissions. Energy produced by digester gas facilities under the Historical Resources Relocation Alternative would be the same as the energy produced under the proposed project. Overall, under this alternative, despite the minor increase in construction activities at Pier 90, impacts related to GHGs are still expected to be less than significant.

Wind and Shadow

Wind

Similar to the BDFP site, the Pier 90 site does not contain any areas subject to wind comfort or wind hazard criteria established in the San Francisco Planning Code. The nearest public areas to the portion of the Pier 90 site to which Buildings A and B would be relocated under this alternative (shown on Figure 6-5) are Amador Street, which has no sidewalks, and Illinois Street and Cargo Way, which both include a segment of the Bay Trail. The Pier 90 site is approximately 120 feet northeast of Cargo Way and approximately 120 feet east of Illinois Street. The Bayview Gateway open space is located between Third Street, Cargo Way, Illinois Street, and the Illinois Street bridge approach, which is west of the Pier 90 site. As at the BDFP site, winds in the area are typically from the west/southwest and wind speeds are light. Changes in wind patterns resulting from this alternative would be less than significant at the SEP, the same as described for the BDFP. Changes in wind patterns resulting from the relocation of Buildings A and B would generally occur to the east (downwind) of the Pier 90 site along either side of Amador Street. This alternative would reconstruct Buildings A and B, which have a maximum height of two stories.

Given existing wind conditions and the absence of public areas immediately downwind, implementation of the relocation component of the Historical Resources Relocation Alternative would not alter wind in a manner that would substantially affect public areas and, as with the proposed project, this impact would be considered less than significant. As stated above, any changes in wind patterns resulting from the relocation of Buildings A and B would generally occur to the east (downwind) of the Pier 90 site, and therefore no significant cumulative impacts related to wind would be anticipated.

Shadow

The Bayview Gateway open space is the nearest public open space to the Pier 90 site. The eastern edge of the Bayview Gateway open space is about 150 feet west of the portion of the Pier 90 site to which Building A would be relocated. Neither Building A nor Building B would exceed 40 feet in height; thus, Section 295 of the San Francisco Planning Code would not apply to the relocation of these buildings. The Historical Resources Relocation Alternative could cast new shadow on bicycle routes and the Bay Trail (approximately 150 feet west) along Illinois Street, but new shadow would be transitory in nature and would not substantially affect the function of these pathways (which are generally not used as places for extended periods of stationary activity). The open space recreation facilities are too distant to be affected by shadows created by relocated Buildings A and B. Consequently, implementation of the relocation component of the Historical Resources Relocation Alternative would not create shadow in a manner that could substantially affect outdoor recreation facilities or other public areas and, as with the proposed project, this impact would be less than significant. Given the location and nature of cumulative projects in the vicinity of the Pier 90 site, no significant impacts related to shadow would be anticipated.

Recreation

Recreational resources in the vicinity of the Pier 90 site include the Bayview Gateway open space and the Bay Trail along Illinois Street. Users of the Bay Trail along Illinois Street could be temporarily disturbed by construction activities associated with the relocation of Buildings A and B; however, this disturbance would be temporary, and use of the Bay Trail is transitory. Similar to the proposed project, relocation of Buildings A and B would not result in the physical deterioration or degradation of recreational resources.

In combination with the Blue Greenways Project, Asphalt and Concrete Recycling and Production Plant, and Pier 96 Bulk Export Terminal, use of the Bay Trail could increase due to improvements to the Bay Trail and the presence of additional employees in the area. However, the incremental increase in use of these resources would not result in substantial physical degradation. These cumulative projects would have less-than-significant incremental impacts related to recreational resources. For these reasons, similar to the proposed project, the relocation component of the Historical Resources Relocation Alternative would have less-than-significant impacts related to recreational resources.

Utilities and Service Systems

While Central Shops Buildings A and B would not be demolished under the Historical Resources Relocation Alternative, this alternative would result in a similar volume of building debris requiring disposal because the existing structures at Pier 90 would be relocated or demolished to accommodate the relocated buildings. The Historical Resources Relocation Alternative would also produce slightly more soil requiring disposal because of construction activities required for site preparation for reconstruction of Buildings A and B. Wastewater from the relocated buildings would be conveyed to the SEP via the City's combined sewer system and stormwater would drain to the existing separate storm sewer system at Pier 90. Solid waste disposal at the relocated buildings would be subject to the same regulatory requirements as the proposed project. As with the proposed project, compliance with applicable regulatory requirements would ensure that the Historical Resources Relocation Alternative would not result in any impacts with respect to utilities or services systems. All cumulative development in San Francisco would be subject to the same regulatory framework as the Historical Resources Relocation Alternative, and compliance with these existing regulations would serve to reduce any cumulative impacts.

For the reasons stated above, as with the proposed project, all impacts related to utilities and service systems would be less than significant, and no mitigation would be required.

Public Services

During the disassembly and transport of Buildings A and B, about 75 workers would be needed for the Historical Resources Relocation Alternative; this would occur prior to construction at the project site. The subsequent rehabilitation and construction of Buildings A and B at Pier 90 would occur concurrently with BDFP construction activity at the project site; therefore, the total average construction work force would be higher than the number of workers identified for the proposed project due to these extra 75 workers during this rehabilitation period. As under the proposed project, construction workers would largely be drawn from the local and regional work force and would commute (rather than relocate) to the area. Therefore, similar to the proposed project, the relocation component of the Historical Resources Relocation Alternative would not result in increased response times such that new or physically altered facilities would be required to maintain service, and the impact on public services would be less than significant.

Biological Resources

Similar to the project, the relocation component of the Historical Resources Relocation Alternative could cause impacts on nesting birds and roosting bats, as a result of demolition of existing buildings at 600 Amador Street, building re-construction, and site preparation. Direct and indirect disturbances to bats potentially roosting in underutilized industrial buildings or trees could occur from construction-associated noise or increased human activity in the area. Increased lighting, or the reconstruction of Building A and B, can also lead to the disturbance of roosting bats. Similarly, birds potentially nesting in the street trees along Amador Street in front of the proposed location of Buildings A and B could be affected by project construction activities that generate noise and visual disturbance. Construction activities that may alter the ambient noise environment or introduce short-term loud noise events include but are not limited to building

demolition and grading or ground disturbance. Noise pollution can be detrimental to wildlife, and bird populations are particularly susceptible because they rely on acoustic signals for mating, predator evasion, and communication between adults and offspring, among other behaviors.

Trees along Amador Street in front of the proposed location for Buildings A and B would be exposed to potential damage or removal during construction, similar to trees under the proposed project. Absent more specific information regarding extent of demolition and construction under the Historical Resources Relocation Alternative, this analysis conservatively assumes that any of the trees along Amador Street in front of the 450 and 600 Amador Street lots would be removed or damaged, and that damage may include mechanical damage to tree trunks and canopies, root damage resulting from grading and excavation activities, and root damage resulting from soil compaction. Similar to the project, this alternative would protect these trees through implementation of a Tree Protection Plan, described in Chapter 2, Section 2.6.5.5, Tree Removal and Protection Plan, which would be submitted to San Francisco Public Works (SFPW). The commitment to tree replacement and protection would conform with Article 16 of the San Francisco Public Works Code.

Nesting birds, roosting bats, and street trees potentially affected by the implementation of the Historical Resources Relocation Alternative would be subject to the same standard construction measures and regulatory conditions as those identified for the project. As with the project, implementation of the SFPUC's Standard Construction Measure 7 would reduce impacts on birds potentially nesting in the street trees along Amador Street in front of the proposed location of Buildings A and B to less than significant levels. Implementation of Mitigation Measure M-BI-1 (Protective Measures for Special Status Bats and Maternity Roosts) would reduce potentially significant impacts on roosting bats at the proposed Buildings A and B relocation site to a less-than-significant level. Therefore, the impacts of the Historical Resources Relocation Alternative on biological resources would be less than significant with mitigation. Cumulative projects in the vicinity of Pier 90 could also generate noise during construction and operation that could contribute potentially significant impacts on biological resources. However, with implementation of the identified mitigation measure, the remaining contribution to this cumulative impact from the relocation component of this alternative would be less than cumulatively considerable, and as with the proposed project, the cumulative impact would be less than significant with mitigation.

Geology, Soils, and Paleontological Resources

Due to construction activities required for site preparation at Pier 90, the total amount of earthwork under the Historical Resources Relocation Alternative would be slightly greater than under the project. However, impacts related to soil erosion would remain less than significant with implementation of the requirements of Article 4.1 of the San Francisco Public Works Code and the SWRCB NPDES Permit. Central Shops Buildings A and B would be retrofitted to comply with the current San Francisco Building Code and applicable engineering design standards to withstand seismic hazards including ground shaking and seismically induced ground failures such as liquefaction. This would be an improvement over existing conditions. The artificial fill and young bay mud that underlie Pier 90 have a low potential for paleontological resources.

For the reasons stated above, as with the proposed project, all potentially significant impacts related to geology, soils, seismicity, and paleontology would be less than significant with implementation of the mitigation measures required for the project.

Hydrology and Water Quality

Due to construction activities required for site preparation at Pier 90, the total amount of earthwork and construction-related groundwater dewatering under the Historical Resources Relocation Alternative would be slightly greater than under the project. However, impacts related to degradation of water quality would remain less than significant with implementation of City requirements (i.e., Articles 4.1 and 4.2 of the San Francisco Public Works Code and the SWRCB General Construction Stormwater NPDES Permit). Compliance with City requirements (Article 4.1 of the San Francisco Public Works Code and the City's Stormwater Design Guidelines) would preclude adverse water quality effects from discharge of stormwater from the relocated Buildings A and B.

Pier 90 is located adjacent to Islais Creek and could be inundated by 2050 as a result of sea level rise (refer to Chapter 4, Section 4.16, Figure 4.16-3). However, in accordance with the City's Guidance for Incorporating Sea Level Rise into Capital Planning, it is assumed that the relocated Central Shops Buildings A and B would be appropriately designed to withstand and adapt to sea level rise (see Chapter 4, Section 4.16.2, Regulatory Framework, for a description of this guidance). Because there are existing structures at the Pier 90 site that would be replaced by relocated Buildings A and B, in general, the relocated buildings would not substantially alter the direction of flood flows compared to what would occur under existing conditions, and the relocated buildings would not exacerbate future flooding conditions. Unlike the BDFP site, much of Pier 90 is located within a potential tsunami zone (refer to Chapter 4, Section 4.16, Figure 4.16-6), and relocated Building A could be located within this zone. Tsunamis are extremely rare. However, if the National Warning System issues a tsunami warning, the City would initiate its outdoor warning system and issue emergency instructions should the San Francisco waterfront be threatened. Use of this system would allow for adequate time to warn people to avoid the area in the event of a tsunami and for evacuation of the area should workers be present when the warning is issued. Although some damage to relocated Buildings A and B could occur, these buildings would be retrofitted to comply with the current San Francisco Building Code and applicable engineering design standards, which would increase the buildings' resilience to damage in the event of a tsunami. Both the sea level rise impact and the tsunami impact would be of greater magnitude than under the proposed project but would remain less than significant.

For the reasons stated above, as with the proposed project, all impacts related to hydrology and water quality would be less than significant and no mitigation would be required.

Hazards and Hazardous Materials

While Buildings A and B would not be demolished under the Historical Resources Relocation Alternative, this alternative would result in a similar volume of hazardous building materials requiring abatement and disposal because the existing structures at Pier 90 could be demolished (or relocated) to accommodate the relocated buildings. The amount of earthwork under the

Historical Resources Relocation Alternative would be slightly greater than under the proposed project due to construction activities for site preparation at Pier 90.

As with the proposed project, the assessment and management of site risks related to construction at Pier 90 would be ensured through compliance with the Maher Ordinance, Article 22A of the San Francisco Health Code, and the California Air Resources Board Asbestos Air Toxics Control Measure. Any use of hazardous materials at the relocated buildings would also be subject to the requirements of Article 21 of the San Francisco Health Code. Similarly, impacts related to interference with emergency response during construction would be minimized through implementation of a Traffic Control Plan. Fire risks would be minimized through compliance with existing fire safety codes and industry standards.

For the reasons stated above, as with the proposed project, all impacts related to hazards and hazardous materials would be less than significant.

Mineral and Energy Resources

Similar to the proposed project, this alternative would have no impact on mineral resources because the Pier 90 site and the SEP do not contain substantial mineral resources or locally important mineral resource recovery sites.

Construction energy needs would be slightly higher than those of the project, given that this alternative would include relocation of Buildings A and B. However, this energy consumption would not be considered a wasteful use of energy, for reasons similar to those explained for the project (similar construction equipment meeting local efficiency standards would be used, and the same regulations regarding recycling and water use would apply); thus, this impact would be less than significant. Additional power would be needed to supply relocated Buildings A and B, however. Operation of relocated Buildings A and B would use Pacific Gas and Electric Company (PG&E) power rather than Hetch Hetchy power, and therefore this alternative would result in an incremental increase in energy demand compared to the proposed project. The impact of operation of the relocation component of the Historical Resources Relocation Alternative on energy, fuel, and water use would be less than significant. Cumulative impacts of this alternative would also be less than significant, similar to those identified for the proposed project. This alternative would not reduce energy demand; however, the alternative would not encourage activities that would result in the use of large amounts of these resources, or result in their use in a wasteful manner.

Agriculture and Forest Resources

Like the proposed project, the relocation component of the Historical Resources Relocation Alternative would not affect any land designated as Prime Farmland, Unique Farmland, or Farmland of Statewide Importance, nor would it affect any land zoned or used for either agricultural or forestry use. Therefore, there would be no impact related to agriculture or forest resources.

6.3.4 Alternative D: SEP South/Quint Street

6.3.4.1 Description

Alternative D, the SEP South/Quint Street Alternative, would consist of full construction and operation of the same processes and facilities as the proposed project, except that the project facilities would be reconfigured and located within different portions of the SEP boundaries, the Asphalt Plant site, portions of the Central Shops site, and within the right-of-way of Quint Street between Jerrold Avenue and the Caltrain right-of way. Central Shops Buildings A and B would be retained in place. This would be considered a full preservation alternative with respect to an identified individual historical resource. However, this alternative would neither reduce nor avoid the significant and unavoidable cumulative impact on the *Southeast Treatment Plant Streamline Moderne Industrial Historic District*. This alternative was selected for evaluation because it would avoid a significant impact on a historical resource and would avoid the site acquisition challenges of Alternative B, Pier 94 Backlands, and physical difficulties associated with relocating Central Shops Buildings A and B under Alternative C above. **Figure 6-6** shows the conceptual layout of the SEP South/Quint Street Alternative.

Site Plan

Similar to the proposed project, this alternative would have digesters aligned parallel to the Caltrain right-of-way, but instead of being within the Central Shops site they would be located within the Asphalt Plant site and would extend across Quint Street into SEP South. The solids pretreatment, thermal hydrolysis process (THP), anaerobic digesters, solids odor control, biosolids dewatering facilities, and waste gas burners would all be located within SEP South, requiring demolition of about 25 existing structures/facilities that are part of the existing solids treatment process (refer to Table 6-1, above, for list of structures to be demolished). The energy recovery and gas treatment facilities would be located on the non-historic portion of the Central Shops site. Maintenance Shops 1 would be located within SEP North boundaries along Rankin Street. Maintenance Shops 2, No. 2 Water Pump Station, and iron chloride storage tanks would generally be in the same locations as under the proposed project, within SEP North along Jerrold Avenue. In total, the facilities would span about 16 acres, including the area to be preserved around Central Shops Buildings A and B.

Treatment of Historical Resources

Central Shops Buildings A and B and the immediate surrounding area would be preserved, thereby avoiding the significant impacts on this historical architectural resource that would occur with their demolition under the project. Like the proposed project, this alternative would include demolition of Building 870, which is an identified contributor to the eligible *Southeast Treatment Plant Streamline Moderne Industrial Historic District*. In addition, this alternative would include demolition of numerous structures in SEP South, within and adjacent to this eligible historic district, including at least seven structures identified as contributors. This contrasts with the proposed project, which would demolish one building within the historic district in SEP North but would not include demolition of any structures in SEP South. However, the future potential demolition of the existing

SOURCE: SFPUC; Google Maps, 2016

SFPUC Biosolids Digester Facilities

Figure 6-6

Conceptual Site Plan: SEP South/Quint Street Alternative

SEP digesters and associated control buildings is considered reasonably foreseeable as a result of the proposed project (refer to Chapter 4, Section 4.1, Table 4.1-1, Project 12).

Components

The SEP South/Quint Street Alternative would essentially include all of the same components as the proposed project. Aside from the layout of the facilities, nearly all aspects of the SEP South/Quint Street Alternative would be substantially the same as those of the proposed project, including the footprint of aboveground structures, maximum height, and staging area locations and acreage. The major differences in project components are described below.

Interim Solids Handling Facilities

Construction of the project within SEP South would require demolition of facilities needed to maintain ongoing solids treatment processes throughout the duration of construction. Therefore, this alternative would require construction of interim facilities prior to demolition of these facilities. Interim facilities (e.g., gravity belt thickeners, centrifuge systems, sludge pipelines, biosolids dewatering, cake storage and loadout, etc.) would be required for at least seven years, until construction is completed and the new facilities are fully commissioned. The locations of the sites for these temporary facilities have not yet been identified, but presumably they would be located within or near the SEP boundaries since they need to be in reasonable proximity to existing facilities and treatment processes. One potentially feasible site for interim facilities is the Southeast Greenhouses site. Regardless of their specific location, the interim facilities would include interim odor control systems, which would not be constructed to the same standards and objectives as the proposed permanent odor control system.

For the purposes of this alternative analysis, the interim facilities are assumed to be located at the Southeast Greenhouses site. Under this assumption, with interim facilities located at this site and new permanent facilities constructed on the closed Quint Street site, trucks associated with ongoing SEP operations would need to use Phelps Street for access to Jerrold Avenue during the construction period.

Quint Street

This alternative would require permanently vacating the segment of Quint Street between Jerrold Avenue and the Caltrain right-of-way for construction of both aboveground and underground structures. This differs from the proposed project, under which this same portion of Quint Street would be closed, but no permanent facilities would be constructed here and relocation of underground utilities would not be required. The SEP South/Quint Street Alternative would require relocation of existing utilities under Quint Street, including a 24-inch-diameter high pressure gas line. Relocating existing utilities such as the high pressure gas line would require construction in locations outside of the SEP boundaries.

Facilities Locations

Under this alternative, the digesters would be located at the Asphalt Plant site and on the closed Quint Street segment, placing the digesters closer to the nearest residences (600 feet to Phelps

Street and 700 feet to Oakdale Avenue) compared to the proposed project (1,000 feet). The location of the waste gas burners would also be closer to residences.

Operations and Maintenance

Overall operations and maintenance under the SEP South/Quint Street Alternative would be substantially the same as under the proposed project. However, under this alternative configuration, some of the maintenance facilities would be farther from the processes they would be supporting, and therefore there would be somewhat reduced efficiency in maintenance activities compared to the proposed project.

For the purposes of this alternative analysis, it is assumed that long-term operational grit truck routes would be the same as those identified for the proposed project (refer to Chapter 2, Figure 2-12); chemical delivery, yellow grease loadout, and biosolids truck routes would be the same as the existing route along Jerrold Avenue.

6.3.4.2 Ability to Meet Project Objectives

Because the SEP South/Quint Street Alternative would involve full implementation of the BDFP as proposed, this alternative would meet most of the project objectives (see Table 6-2). However, this alternative would not allow for the timely construction of the BDFP nor maintain rate payer affordability. The reasons for not meeting these objectives relate to the extended schedule and increased costs associated with the interim facilities and relocation of utilities under Quint Street.

This alternative would require that both aboveground structures/facilities (e.g., waste activated sludge thickening, biosolids dewatering, and cake storage and loadout) and underground components (pipe galleries, utility lines, etc.) be relocated in phases to ensure there would be no interruption of solids treatment processes. Relocation of underground pipe galleries and pipelines would be particularly complicated because many of the subsurface areas are congested and there would be minimal room to maneuver given the areas reserved for construction activities. In addition, relocating the 24-inch PG&E high pressure gas pipeline (and other utilities on Quint Street) would further complicate the construction process due to the proximity to residents to the west and potentially the lack of public right-of-way in the vicinity to accommodate these pipelines. With the need for relocating underground utilities, vacating Quint Street, and constructing/operating interim facilities, the overall construction duration and cost are anticipated to be substantially higher than what was identified for the proposed project. The construction schedule would extend at least seven years.

The location where interim facilities would be built has not been identified, but would need to be determined as soon as possible to reduce further schedule extensions beyond the minimum seven years. One possible (though not guaranteed) location would be the Southeast Greenhouses site, due to its proximity to the existing solids handling treatment facilities and the availability of space (although other nearby construction staging areas would need to be identified). While this alternative would be designed to limit noticeable odors of permanent facilities to the SEP property boundary (including locating the proposed digesters as far as possible from residents by placing the digesters in the area along the railroad tracks on the Asphalt Plant site), the interim

solids handling facilities may not have as robust odor control systems. This could exacerbate existing odor conditions during the construction period.

While the proposed facilities would be designed to meet the remaining objectives, the proposed site layout would not optimize efficiency of the treatment system or operations and maintenance compared to the proposed project. For example, the orientation of the solids pretreatment facility would not provide the most direct and unencumbered piping pathways to the proposed digesters. In addition, the waste gas burners would be located on the opposite side of the plant from the energy recovery facilities, which, in the event of an emergency that results in breakages of digester gas pipes, could result in excess digester gas that could not be flared, resulting in potential public safety hazards. Lastly, locating one of the maintenance shops away from the main solids treatment facilities would result in less efficiency during operations and maintenance of equipment.

6.3.4.3 Environmental Impacts

Land Use

Similar to the BDFP, construction of the SEP South/Quint Street Alternative would temporarily affect land uses in the vicinity of the SEP but would not physically divide an established community because temporary closure of Jerrold Avenue would separate two areas of similar industrial land use that do not constitute an established community. Operation of the SEP South/Quint Street Alternative, including interim facilities at SEP South and the Southeast Greenhouses site, also would be in areas not currently accessible by the public and would not block access between adjacent land uses, similar to the BDFP. For these reasons, the SEP South/Quint Street Alternative would have a less-than-significant effect on dividing an established community.

Conflicts with land use plans and policies adopted to avoid or mitigate an environmental effect would be reduced compared to the proposed project, because the SEP South/Quint Street Alternative would retain Central Shops Buildings A and B in place, thereby avoiding conflicts with *San Francisco General Plan* policies related to the preservation of historic resources and conflicts with Policy 7 of the Accountable Planning Initiative. However, the SEP South/Quint Street Alternative would have the same policy inconsistencies as the proposed project related to a significant and unavoidable cumulative impact on a historic district. As with the BDFP, the impact related to consistency with land use plans and policies would be considered less than significant under CEQA because policy conflicts in and of themselves do not constitute a significant effect on the physical environment.

Aesthetics

Construction and operation of this alternative would be substantially similar to the proposed project, with construction equipment and permanent facilities similar in character to those typically used at industrial sites in the area. Views of the project site would be substantially blocked by intervening structures and landscaping. Short-range views of the site would be primarily from adjacent public streets, where views would be limited and fleeting, and while the

site may be visible in longer-range views from surrounding hills, neither construction nor operations would be expected to substantially affect views from these areas within the context of the overall industrial setting. Even though construction activities would be somewhat closer to Phelps Street compared to the proposed project, this alternative would not substantially degrade the existing visual character of the site or its surroundings or damage scenic resources. The reconfigured site would not block or disrupt scenic vistas or degrade the visual character of the area. Therefore, the SEP South/Quint Street Alternative, alone and in combination with cumulative projects, would not substantially degrade the visual character of the site or surroundings, adversely affect a scenic vista, or damage scenic resources. Thus, these impacts would be less than significant.

Similar to the proposed project, this alternative would be expected to require nighttime illumination, but the SFPUC would implement standard construction measures that require nighttime lighting to be directed away from residential areas and shielded to prevent light spillover effects, and construction impact on light and glare would be less than significant. As with the proposed project, compliance with applicable regulations and policies (California Green Building Code Section 5.106.8 and Planning Commission Resolution 9212) would ensure that light and glare from facilities operation would be less than significant.

Population and Housing, Growth Inducement

Similar to the proposed project, the SEP South/Quint Street Alternative would not displace housing or employment, would not increase treatment capacity at the SEP, and would not extend roads or infrastructure into an undeveloped area. While the construction phase is expected to take about two years longer (for a total of about seven years rather than five), as under the proposed project, it is expected that construction workers would largely be drawn from the local and regional work force and would commute (rather than relocate) to the area. Therefore, the SEP South/Quint Street Alternative would not induce population growth, displace housing units, create substantial demand for additional housing, or displace a substantial number of people, and population and housing and growth inducement impacts would be less than significant.

Cultural Resources

Historical Resources

As Central Shops Buildings A and B and the immediate surrounding area would be preserved, the SEP South/Quint Street Alternative would avoid the significant impact on this historical architectural resource that would occur with their demolition under the proposed project. However, unlike the proposed project, this alternative would include demolition of at least seven structures, including Building 870, identified as contributors to the *Southeast Treatment Plant Streamline Moderne Industrial Historic District*. Thus, this alternative would result in the demolition of 31.8 percent of the contributors in the eligible district, the majority of which are associated with the implementation of the 1935 Sewer System Master Plan and continue to provide a good representation of the Streamline Moderne architectural style that characterized the SFPUC's original wastewater facilities. Therefore, the demolition of these buildings would adversely affect the integrity of the historic district. As a result, this alternative would result in a significant

impact on historical architectural resources. Mitigation measures available to reduce the severity of the impact include Mitigation Measure M-CR-1 (Documentation of Historic Resources and Interpretive Display). However, as implementation of Mitigation Measure M-CR-1 would not reduce the severity of the impact to a less-than-significant level, the impact would be significant and unavoidable with mitigation.

As with the proposed project under cumulative conditions, the SFPUC would potentially demolish all of the existing digesters and their central control buildings (refer to Chapter 4, Section 4.1, Table 4.1-1, Project 12), which are contributors to the *Southeast Treatment Plant Streamline Moderne Industrial Historic District*. Therefore, as with the proposed project, the SEP South/Quint Street Alternative's contribution to the cumulative adverse impact on this eligible district would be cumulatively considerable, and the cumulative impact would be significant and unavoidable, even with mitigation (Mitigation Measure M-CR-1, Documentation of Historical Resources and Interpretive Display).

Archeological Resources and Human Remains

Like the proposed project, the SEP South/Quint Street Alternative could cause a substantial adverse change in the significance of an archeological resource, but would include substantially more construction due to the additional need for interim facilities. Archeological investigations have identified a National Register-eligible prehistoric archeological site, CA-SFR-171, in the SEP, and potential impacts on archeological resources would be more severe than those of the proposed project because substantially more construction and excavation would occur within the site boundaries of this resource. Potential impacts on human remains would also be similar to those of the proposed project. Older prehistoric sites potentially associated with the pre-bay surface similarly could be affected by either mass excavation or the installation of piles. Additionally, there is a moderate to high potential to encounter historical archeological remains during excavation at the Southeast Greenhouses site where the interim facilities would be constructed.

For these reasons, impacts on archeological resources and human remains at the SEP would be potentially significant. Implementation of Mitigation Measure M-CR-2a (Archeological Testing, Monitoring, and/or Data Recovery) and Mitigation Measure M-CR-2b (Accidental Discovery of Archeological Resources) would reduce impacts on archeological resources and human remains to a less-than-significant level. Therefore, with mitigation, the impact on archeological resources and human remains would be less than significant.

Transportation and Circulation

The SEP South/Quint Street Alternative would rearrange the same facilities as the BDFP within SEP North and SEP South, and the total duration of construction of this alternative would be at least two years longer than that of the proposed project. The SEP South/Quint Street Alternative would also produce more soil requiring disposal as a result of constructing the interim solids handling facilities and the additional utilities location that would be required. Like the proposed project, the SEP South/Quint Street Alternative would include a project-specific construction Traffic Control Plan. Construction of interim facilities would similarly require such a plan. The

same peak numbers of construction trucks and construction workers as the proposed project would occur for the SEP South/Quint Street Alternative, although the dates of these peaks would shift. As peak construction traffic (trucks and workers), the temporary closure of Jerrold Avenue, and the Traffic Control Plan would be similar to the proposed project, effects of SEP South/Quint Street Alternative construction on traffic circulation, public transit, bicycle facilities, pedestrian travel, freight rail, parking, and traffic safety would be similar to those identified for the proposed project. While this alternative would vacate Quint Street, the effect on circulation and vehicle miles traveled (VMT) from vacating this street would be inconsequential because Quint Street was permanently closed (effectively vacated) in October 2015, preventing through vehicular and pedestrian traffic from traveling between Newcomb and Jerrold Avenues (as described in Chapter 4, Section 4.6, Transportation and Circulation).

Operations trucks would either use the same routes as existing SEP haul trucks or would use the second entrance/exit to the SEP site via Rankin Street, as described for the proposed project. As the number of haul trucks servicing the SEP South/Quint Street Alternative would be the same as for the proposed project, the SEP South/Quint Street Alternative would similarly result in an insubstantial increase in VMT. For this reason, the transportation and circulation impacts of operation of the SEP South/Quint Street Alternative would be the same as those described for the proposed project.

As with to the proposed project, construction of the SEP South/Quint Street Alternative would overlap with the Headworks Replacement Project, the Central Bayside System Improvement Project, the 1995 Evans/Forensic Services Division and Traffic Control Project, the Pier 70 Project, and the India Basin Mixed Use Development Project. Due to the later construction start date of the SEP South/Quint Street Alternative, construction would not overlap with the Power Feed and Primary Switchgear Upgrades Project, the Seismic Reliability and Conditions Assessment, the Kansas and Marin Streets Sewer Improvements, or the Mission Bay Blocks 29-32 Project; however, the SEP South/Quint Street Alternative could occur concurrently with the Peninsula Corridor Electrification Project, which may require temporary lane or road closures along Jerrold Avenue and Evans Avenue during construction. Similar to the proposed project, the SEP South/Quint Street Alternative would be required to be conducted in accordance with City requirements to ensure that construction activities are conducted safely and with the least possible interference with pedestrians, bicyclists, transit, and vehicles. All cumulative projects would also be required to comply with these requirements. Construction and operational truck trips and routes, construction staging areas, and workers would be the same as proposed for the BDFP (or, in the case of operational truck routes, would include an existing truck route for chemical delivery, yellow grease loadout, and biosolids), but construction-related traffic increases would begin and peak at later times than under the proposed project. While the projects included in the cumulative construction scenario would be somewhat different under this alternative, it is anticipated that cumulative impacts of both construction and operation of the SEP South/Quint Street Alternative would be similar to those identified for the proposed project, and would be less than significant.

Noise and Vibration

Under this alternative, project facilities would still be located generally at the BDFP site, and therefore construction-related noise impacts would be similar to those of the project, as identified in Chapter 4, Section 4.7, Noise and Vibration. As with the proposed project, construction equipment under this alternative would have the potential to generate noise that exceeds the 86 A-weighted decibel (dBA) (at 50 feet) equipment noise limit of Section 2907 of the Police Code. Use of the Southeast Greenhouses staging area could generate noise levels that exceed the City's ambient +10 dBA threshold at the daycare center to the south and some of the closest residential receptors to the east on Phelps Street. Both of these exceedances would be potentially significant, temporary noise impacts, but they would be reduced to less-than-significant levels with implementation of Mitigation Measure M-NO-1a (Shielding of Concrete Saw Operations) and Mitigation Measure M-NO-1b (Construction Noise Control Measures at Southeast Greenhouses Staging Area). In addition, due to the closer proximity to sensitive receptors, this alternative could result in other construction activities—in addition to concrete saws—exceeding the applicable equipment noise limit, and additional mitigation measures, such as construction equipment source and administrative controls, may be required. This alternative would also require more extensive demolition of existing facilities (south of Jerrold Avenue and west of the existing digesters), which could result in a longer construction duration or more equipment being operated on the site at the same time.

Impacts related to construction vibration would be slightly greater than those of the proposed project because demolition and construction activities would occur closer to nearby structures to the east and south. This is a potentially significant impact that would not occur under the proposed project, but feasible vibration control measures are available that would reduce this impact to less than significant.

With respect to operational noise, compared to the proposed project, this alternative would construct the energy recovery facilities slightly farther from the closest residences to the southeast and east, resulting in lower noise levels at these sensitive receptors. At the same time, the waste gas burners, solids pretreatment, and Solids Odor Control Facility (i.e., fans and pumps) would be constructed closer to these same receptors. The noisiest facility would be the Solids Odor Control Facility, at which operational noise levels would exceed the 60-dBA exterior (with windows open) or 45-dBA interior nighttime Section 2909(d) noise limit by as much as 7 dBA, which would be a new potentially significant impact. Since the odor control facilities (primarily fan noise) are mostly outdoors, additional noise mitigation would be required in order to reduce operational noise to below the ordinance limit. Therefore, overall construction-related and operational noise under this alternative would be greater than under the proposed project due to the more extensive demolition required as well as the potential for additional noise impacts caused by facilities being located closer to nearby sensitive receptors.

Compared to the proposed project, this alternative would have the same cumulative construction-related noise and vibration impacts resulting from the proximity to other SFPUC projects proposed at the SEP and their proximity to nearby sensitive receptors. As indicated above, this alternative's contribution to cumulative construction-related noise and vibration impacts would be slightly greater than those of the proposed project, but construction-related

cumulative noise impacts under this alternative would be the same as those of the proposed project and the same mitigation measures would be required to reduce the impacts to less than significant.

As described above, this alternative would result in potentially significant operational noise impacts because the Solids Odor Control Facility, the noisiest facility, would be located closer to sensitive receptors to the east and southeast. For the same reasons, unlike the proposed project, this alternative's contribution to cumulative operational noise impacts could be considerable, a potentially significant impact. Further analysis would be needed to determine if feasible measures are available to reduce operational noise levels to less-than-significant levels.

Air Quality

Compared to the proposed project, this alternative would result in higher construction-related criteria pollutant emissions because it would require more construction and truck trips, due to (1) greater demolition at the SEP; (2) relocation of existing infrastructure, including PG&E's 24-inch high pressure line in Quint Street; and (3) construction of interim facilities. Because construction would occur on Quint Street, routes for construction-related trucks and operational trucks (during construction) could be temporarily redirected to Phelps Street for access to the SEP and the Southeast Greenhouses site, increasing proximity of trucks to sensitive receptors to the east of Phelps Street. While the degree of increase cannot be specified, the project's construction-related criteria pollutant emissions could be reduced with implementation of Mitigation Measures M-AQ-1a (Construction Emissions Minimization) and M-AQ-1b (Emission Offsets) if feasible emission offsets were identified; however, as with the proposed project and due to the uncertain feasibility of implementing adequate emission offsets, this impact would be considered significant and unavoidable with mitigation. Additionally, there would be short-term increases in criteria air pollutants due to operation of interim facilities at the Southeast Greenhouses site.

Construction-related health risks could be greater under this alternative than under the proposed project. There would be increased health risks associated with closer proximity of construction equipment and trucks to sensitive receptors as well as increased TAC emissions (mostly as diesel particulate matter) from additional demolition activities and additional construction activities associated with interim facilities. Operationally, development of interim facilities and location of the waste gas burners substantially closer to the nearest sensitive receptors, while locating energy recovery facilities only slightly farther from these receptors under this alternative, could result in a net increase in operational health risks when compared to the proposed project, a potentially significant impact. This impact likely could be reduced with implementation of mitigation (e.g. additional emissions controls).

Even though there would be greater construction-related emissions under this alternative, conflicts with the Clean Air Plan would be the same as those of the proposed project, and this potentially significant impact would be less than significant with mitigation.

This alternative's contribution to significant and unavoidable cumulative construction-related NOx emissions would be greater than that of the proposed project due to more extensive demolition at the SEP, and as with the proposed project, this impact would be significant and

unavoidable, even with implementation of mitigation measures like Mitigation Measures M-AQ-1a and M-AQ-1b. Cumulative effects on health risks would be greater than those of the proposed project due to location of waste gas burners closer to the nearest sensitive receptors, and would be a potentially significant impact, compared to a less-than-significant impact for the proposed project; however, this impact would be less than significant with mitigation.

Greenhouse Gas Emissions

This alternative would have the same energy capture potential (from digester gas produced) and the same increase in biosolids reuse opportunities as the project, and would be subject to the same local regulations adopted to reduce GHG emissions. Energy produced by digester gas facilities under the SEP South/Quint Street Alternative would be the same as the energy produced under the project and, as with the proposed project, the energy produced would be used to power proposed solids handling facilities, with excess energy used by other facilities at the SEP. Other SEP facilities not served by the energy recovery facilities would remain reliant upon Hetch Hetchy power. Overall, this alternative is still expected to have a less-than-significant effect on GHG emissions.

Wind and Shadow

Wind

The SEP South/Quint Street Alternative would construct the BDFP facilities in areas that would affect the same publicly accessible areas as those identified for the proposed project (Jerrold Avenue). The SEP South/Quint Street Alternative site does not contain any areas subject to wind comfort or wind hazard criteria established in the San Francisco Planning Code. As with the proposed project, winds in the area are typically from the west/southwest and wind speeds are light. The orientations and profiles of the new facilities would be different from those of the proposed project. For purposes of this analysis, it is assumed that the facility/structure heights and massing would be the same as described for the proposed project. In the SEP South/Quint Street Alternative, the buildings nearest Jerrold Avenue would be the energy recovery and digester gas treatment facilities, Maintenance Shops 2, solids pretreatment and THP, biogas storage, and digestion. The largest new structure adjacent to Jerrold Avenue would be the Solids Pretreatment Facility, approximately 34,200 square feet in area and 65 feet tall. As described in Chapter 4, Section 4.10, Wind and Shadow, the tallest BDFP structures would exceed the height of existing structures within the project site but would be similar in height to some existing buildings at the SEP and to neighboring buildings that would remain. The SEP South/Quint Street Alternative structures would not be substantially taller than adjacent or nearby buildings and structures. Due to the predominant wind patterns, buildings and structures to the southwest of Jerrold Avenue (including the Solids Pretreatment Facility) would intercept wind but would not direct it to publicly accessible areas. While the energy recovery and digester gas treatment facilities would increase the slab-shaped massing facing the predominant wind direction on the northeastern side of Jerrold Avenue, potentially affecting winds at pedestrian level, the maximum height of the structure would be 65 feet, a height that is generally considered too low to result in substantial ground-level wind effects. For this reason, the SEP South/Quint Street

Alternative would not contribute to wind pattern alteration that would substantially affect public areas, and would have a less-than-significant impact.

Shadow

As noted above, the SEP South/Quint Street Alternative would construct facilities in areas that would affect the same publicly accessible areas as those identified for the proposed project (Jerrold Avenue). The SEP South/Quint Street Alternative would not cast new shadow on Palou & Phelps Mini Park or Youngblood Coleman Playground, the nearest San Francisco Recreation and Parks Department (SFRPD) properties, or any other SFRPD properties. As with the proposed project, full buildout of the SEP South/Quint Street Alternative would cast shade on Jerrold Avenue; however, this shadow would be transitory, would not affect the function of the sidewalks, and would not exceed levels commonly expected in urban areas. For these reasons, the SEP South/Quint Street Alternative would not create new shadow that would substantially affect public open spaces, and would have a less-than-significant impact.

Recreation

Similar to the proposed project, the SEP South/Quint Street Alternative would not directly affect recreational facilities because there are no such facilities within the SEP South/Quint Street Alternative site or off-site staging areas. The SEP South/Quint Street Alternative does not include new recreational facilities and would not permanently affect existing recreational resources, and does not include new residential or other uses that would generate increased demand for parks or other recreational facilities. The SEP South/Quint Street Alternative would thus have no impact related to direct or indirect physical deterioration of recreational resources.

Utilities and Service Systems

The BDFP facilities constructed under the SEP South/Quint Street Alternative would produce the same amount of wastewater, stormwater, biosolids, and solid waste as the proposed project and would require the same amount of potable water. While Central Shop Buildings A and B would not be demolished under this alternative, more building debris would require disposal because 30 structures in SEP South would be demolished to accommodate the BDFP facilities. The SEP South/Quint Street Alternative would also produce more soil requiring disposal, as a result of constructing the interim solids handling facilities and the additional utilities location that would be required. As with the proposed project, compliance with applicable regulatory requirements would ensure that the SEP South/Quint Street Alternative would not result in any impacts with respect to utilities or service systems. All cumulative development in San Francisco would be subject to the same regulatory framework, and compliance with these existing regulations would serve to avoid any significant cumulative impacts. Therefore, all impacts related to utilities and service systems would be less than significant, as with the proposed project, and no mitigation would be required.

Public Services

Compared to the proposed project, the SEP South/Quint Street Alternative would require a similarly sized work force, which is expected to be drawn from the local and regional work force

and would commute (rather than relocate) to the area. For this reason, the SEP South/Quint Street Alternative is not expected to result in increased response times such that new or physically altered facilities would be required to maintain public services, despite the extended duration of construction under the SEP South/Quint Street Alternative. As with the proposed project, any incremental increase in demand for law enforcement, fire protection, or emergency medical services during construction would be temporary, could be accommodated by existing services, and would not require construction of new or physically altered facilities to maintain service. Thus, impacts would be less than significant.

As with the proposed project, operations of the SEP South/Quint Street Alternative would not require new or physically altered public service facilities because this alternative similarly would not construct residences or increase the number of employees at the SEP. For this reason, operation of the SEP South/Quint Street Alternative would have no impact on public services.

Biological Resources

Potential impacts on biological resources— including impacts on nesting birds and roosting bats as a result of building demolition, construction, and site preparation—would be the same under this alternative as under the proposed project.

Disturbances to bats potentially roosting in underutilized industrial buildings or trees could occur from construction-associated noise or vibration, or increased human activity in the area. Increased lights or the construction of large structures can lead to the disturbance of roosting bats, which also may lead to behavioral alterations. Similarly, nesting birds could be affected by construction activities that generate noise and visual disturbance. Construction activities that may alter the ambient noise environment or introduce short-term loud noise events include but are not limited to building demolition and grading or ground disturbance. Noise pollution can be detrimental to wildlife, and bird populations are particularly susceptible because they rely on acoustic signals for mating, predator evasion, and communication between adults and offspring, among other behaviors.

Absent more specific information regarding the extent of demolition and construction under the SEP South/Quint Street Alternative, this analysis conservatively assumes that any trees within or near the footprint of the SEP South/Quint Street Alternative would be removed or damaged, with damage such as mechanical damage to tree trunks and canopies, root damage resulting from grading and excavation activities, and root damage resulting from soil compaction. However, these trees would be protected through implementation of the Tree Protection Plan described in Chapter 2, Section 2.6.5.5, Tree Removal and Protection Plan, which would be submitted to SFPW. The commitment to tree replacement and protection would conform with Article 16 of the Public Works Code.

Nesting birds, roosting bats, and street trees potentially affected by the implementation of the SEP South/Quint Street Alternative would be subject to the same standard construction measures and regulatory conditions as identified for the project. As with the proposed project, implementation of SFPUC's Standard Construction Measure 7 would reduce impacts to nesting birds to less than significant. Implementation of Mitigation Measure M-BI-1 (Protective Measures

for Special Status Bats and Maternity Roosts) would reduce potentially significant impacts on roosting bats within or near the footprint of the SEP South/Quint Street Alternative to a less-than-significant level. Therefore, with the above mitigation, impacts on biological resources would be less than significant.

Geology, Soils, and Paleontological Resources

The BDFP facilities constructed under the SEP South/Quint Street Alternative would be identical to those constructed under the proposed project, except that interim solids handling facilities would also be constructed. The amount of earthwork under this alternative would be greater because of construction of the interim biosolids handling facilities and the additional utilities relocation that would be required for this alternative. However, impacts related to soil erosion would remain less than significant with implementation of the requirements of Article 4.1 of the San Francisco Public Works Code and the SWRCB General Construction Stormwater NPDES Permit. As with the proposed project, excavations conducted during construction would be shored in accordance with applicable regulations. Monitoring would be conducted during dewatering and pile driving, and corrective actions would be implemented if necessary to ensure that settlement would remain within acceptable levels. All new facilities would be constructed in accordance with the San Francisco Building Code, the SFPUC's General Seismic Safety Requirements, and applicable engineering design standards, which would ensure that the structures could withstand seismic hazards including ground shaking and seismically induced ground failures such as liquefaction.

Under the SEP South/Quint Street Alternative, the depths of excavation would be the same as under the proposed project, and therefore the excavations under this alternative would also extend into the Pleistocene-aged upper layered sediments, which have a high paleontological sensitivity. However, as with the proposed project, implementation of Mitigation Measure M-GE-4 (Paleontological Resources Monitoring and Mitigation Program) would reduce this potentially significant impact to a less-than-significant level.

For the reasons stated above, as with the proposed project, all impacts related to geology, soils, seismicity, and paleontology would be less than significant with implementation of the mitigation measures required for the project.

Hydrology and Water Quality

The facilities constructed under the SEP South/Quint Street Alternative would produce the same amount of wastewater and stormwater as the proposed project, and there would be no change in the composition of the wastewater. The amount of earthwork and construction-related groundwater dewatering under the SEP South/Quint Street Alternative would be greater because of construction of the interim biosolids handling facilities and the additional utilities relocation that would be required under this alternative. However, impacts related to degradation of water quality would remain less than significant with implementation of City requirements (i.e., Articles 4.1 and 4.2 of the San Francisco Public Works Code and the SWRCB General Construction Stormwater NPDES Permit).

While the project includes construction of some facilities in a future flood zone (due to sea level rise), none of the facilities constructed under the SEP South/Quint Street Alternative would be constructed in such a zone. As with the proposed project, none of the facilities would be constructed within a potential tsunami inundation zone.

For the reasons stated above, as with the proposed project, all impacts related to hydrology and water quality would be less than significant and no mitigation would be required.

Hazards and Hazardous Materials

The BDFP facilities constructed under the SEP South/Quint Street Alternative would be identical to those constructed under the proposed project, except that interim solids handling facilities would also be constructed and additional utilities would require relocation. Under the SEP South/Quint Street Alternative, the BDPF facilities would use the same hazardous materials and would generate the same volume of biogas as would the proposed project. The increased soil excavation conducted under the SEP South/Quint Street Alternative for construction of the interim biosolids facilities and relocation of additional utilities would increase the potential for encountering hazardous materials in the soil and groundwater. However, as with the proposed project, the assessment and management of site risks related to construction would be ensured through compliance with the Maher Ordinance, Article 22A of the San Francisco Health Code and the California Air Resources Board Asbestos Air Toxics Control Measure. While Central Shops Buildings A and B would not be demolished under the SEP South/Quint Street Alternative, more hazardous building materials would require abatement and disposal under this alternative because 30 structures in SEP South would be demolished to accommodate the BDFP facilities. However, impacts related to hazardous building materials would be less than significant with compliance of existing regulations, including BAAQMD Rule 11, Regulation 2; Section 3426 of the San Francisco Building Code; the Lead in Construction Standard; and California Universal Waste Regulations. Similarly, impacts related to interference with emergency response during construction would be minimized through implementation of a Traffic Control Plan. Fire risks would be minimized through compliance with existing fire safety codes and industry standards.

For the reasons stated above, as with the proposed project, all impacts related to hazards and hazardous materials would be less than significant.

Mineral and Energy Resources

Similar to the proposed project, this alternative would have no impact on mineral resources because the SEP and construction staging areas do not contain substantial mineral resources or locally important mineral resource recovery sites.

Construction energy needs would be slightly higher than those of the project, given that this alternative would include the construction of interim facilities. However, this energy consumption would not be considered a wasteful use of energy, for similar reasons as those explained for the project (similar construction equipment meeting local efficiency standards would be used, and the same regulations regarding recycling and water use would apply); thus, this impact would be less than significant. Energy produced by biogas facilities under the SEP

South/Quint Street Alternative would be similar to the energy produced under the project and similarly would be available to SEP facilities. The impact of operation of the SEP South/Quint Street Alternative on energy, fuel, and water use would be less than significant. Cumulative impacts of this alternative would be less than significant, similar to those identified for the project. Similar to the proposed project, this alternative would reduce the amount of power needed from Hetch Hetchy and would not encourage activities that would result in the use of large amounts of these resources, or result in their use in a wasteful manner.

Agriculture and Forest Resources

Like the proposed project, the SEP South/Quint Street Alternative would not affect any land designated as Prime Farmland, Unique Farmland, or Farmland of Statewide Importance, nor would it affect any land zoned or used for either agricultural or forestry use. Therefore, there would be no impact related to agriculture or forest resources.

6.4 Alternatives Comparison and the Environmentally Superior Alternative

The CEQA Guidelines require the identification of an environmentally superior alternative to the proposed project (Section 15126.6[e]). If it is determined that the "no project" alternative would be the environmentally superior alternative, then the EIR shall also identify an environmentally superior alternative among the other project alternatives (Section 15126.6[3]).

Table 6-3 compares the significant impacts of the proposed project with those of Alternatives A (No Project), B (Pier 94 Backlands), C (Historical Resources Relocation), and D (SEP South/Quint Street). The table also lists impacts that would be less than significant for the proposed project but would be significant or potentially significant under one or more of the alternatives, indicating that in a few cases, an alternative would result in a significant impact that would not occur under the proposed project. Impacts not listed in this table would be less than significant (or no impact) for the proposed project and for all alternatives.

As indicated in Table 6-3, the significant and unavoidable impact on historical resources associated with the demolition of Central Shops Buildings A and B identified for the proposed project would be avoided or substantially reduced under all alternatives. However, the significant and unavoidable cumulative impact on the eligible *Southeast Treatment Plant Streamline Moderne Industrial Historic District* under the proposed project would remain significant and unavoidable under Alternatives B, C, and D (but not under Alternative A, the No Project Alternative), and this impact would be the same or more severe for these alternatives compared to the proposed project. The significant and unavoidable air quality impacts related to construction emissions of criteria air pollutants identified for the project would remain under Alternatives B, C, and D and would be more severe under these alternatives. Therefore, there is no clear distinction among Alternatives B, C, and D regarding their ability to avoid or substantially reduce the significant and unavoidable impacts of the proposed project.

This page intentionally left blank

TABLE 6-3
COMPARISON OF ENVIRONMENTAL IMPACTS OF PROJECT TO IMPACTS OF ALTERNATIVES

Environmental Resource	Proposed Project	Alternative A: No Project	Alternative B: Pier 94 Backlands	Alternative C: Historical Resources Relocation	Alternative D: SEP South/Quint Street
Cultural Resources	**Impact CR-1:** The project would cause a substantial adverse change in the significance of a historical resource as defined in CEQA Guidelines Section 15064.5, including those resources listed in Article 10 or Article 11 of the San Francisco Planning Code. (SUM)	No impact.	No impact on Central Shops Buildings A and B because they would be retained in place. However, potential impacts on other potentially eligible historic structures along the pipeline route would occur. (LSM)	Impact reduced because Central Shops Buildings A and B would be relocated and rehabilitated consistent with Secretary of the Interior's Standards. (LS)	Impact would be significant and avoidable with mitigation because, although Central Shops Buildings A and B would be retained in place, at least seven structures that are contributors to the historic district would be demolished, which would not occur under the project. (SUM)
	Impact CR-2: The project could cause a substantial adverse change in the significance of an archeological resource. (LSM)	No impact.[a]	Impact and mitigation would be similar to the project. (LSM)	Impact and mitigation would be similar to the project, at both the SEP and Pier 90 site. (LSM)	Impact and mitigation would be similar to the project. (LSM)
	Impact CR-3: The project could disturb human remains, including those interred outside of formal cemeteries. (LSM)	No impact.[a]	Impact and mitigation would be similar to the project. (LSM)	Impact and mitigation would be similar to the project, at both the SEP and Pier 90 site. (LSM).	Impact and mitigation would be similar to the project. (LSM)
	Impact C-CR-1: The project, in combination with past, present, and future projects, would substantially contribute to cumulative adverse historic architectural resources impacts. (SUM)	No impact.	Impact reduced because Central Shops Buildings A and B would be retained; however, this alternative would allow for future demolition of the existing digesters (part of the historic district), and thus the impact on the historic district and archeological resources, and associated mitigation, would be similar to the project. (SUM)	Impact reduced because Central Shops Buildings A and B would be relocated and rehabilitated; however, this alternative would allow for future demolition of the existing digesters (part of the historic district), and thus the impact on the historic district and archeological resources, and associated mitigation, would be similar to the project. (SUM)	Impact on Central Shops Buildings A and B would be avoided because these structures would be retained in place; however, Alternative D would demolish seven other structures that are contributors to the historic district. Alternative D would also allow for future demolition of the existing digesters (part of the historic district), and thus the impact on the historic district and archeological resources, and associated mitigation, would be similar to the project. (SUM)
Noise and Vibration	**Impact NO-1:** Use of concrete saws during construction of the project could cause a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project and could expose people to or generate noise levels in excess of standards in the Noise Ordinance and when the Southeast Greenhouses staging area would be used, construction activities would exceed significance thresholds at nearby sensitive receptors. (LSM)	Construction noise impacts would be less than those of the project, but would still be significant because some ongoing repair activities, such as repair of existing digesters, would be closer to the nearest residences to the east. Similar mitigation would be required. (LS or LSM)	Construction noise impacts would be significant because construction activities could disrupt classroom activities at City College of San Francisco's Evans Campus, but overall, construction-related noise increases would be less than those of the project because fewer sensitive receptors would be affected by construction noise and they would be subject to temporary noise increases for a much shorter duration. Additional mitigation would be required to address pipeline construction noise, but less mitigation would be required for construction activities at the Pier 94 Backlands site (Construction noise impacts at sensitive receptors near the Southeast Greenhouses staging area would be avoided, and less than significant). (LSM)	This impact would be greater because this alternative would result in construction noise increases at an off-site location that would occur in addition to noise at the SEP. Overall, however, construction noise impacts on sensitive receptors would be the same as those of the project since there are no sensitive receptors located in proximity to the Pier 90 site. Similar mitigation would be required. (LSM)	Construction noise impacts would be greater than those of the project because this alternative would involve more demolition activities closer to sensitive receptors and because siting interim facilities at the Southeast Greenhouses site would create greater construction-related and operational noise impacts. Additional mitigation would be required. (LSM)
	Impact NO-2: Construction of the project would not expose structures or persons to excessive groundborne vibration levels. (LS)	Vibration impacts could be less under this alternative if ongoing repair activities were to involve less intensive construction activities and pile driving activities were either reduced or avoided altogether. However, these activities could be closer to sensitive receptors to the east and construction-related vibration levels could exceed thresholds for human annoyance. Mitigation would be required. (LSM)	Potential vibration impacts on adjacent historic structures at the SEP would be avoided under this alternative. With the additional pipeline construction required, however, the likelihood of vibration impacts would be greater than under the proposed project. This alternative could pose new vibration impacts if sheet pile driving techniques were employed for pipeline construction near existing development, but this impact could be mitigated to less than significant with feasible measures (avoidable with alternative construction techniques). (LSM)	Impact would be the same as that of the project. (LS)	Impacts and mitigation would be the slightly greater than those of the project because demolition and construction activities would occur closer to nearby structures to the east and south. (LSM)

TABLE 6-3 (Continued)
COMPARISON OF ENVIRONMENTAL IMPACTS OF PROJECT TO IMPACTS OF ALTERNATIVES

Environmental Resource	Proposed Project	Alternative A: No Project	Alternative B: Pier 94 Backlands	Alternative C: Historical Resources Relocation	Alternative D: SEP South/Quint Street
Noise and Vibration (cont.)	**Impact NO-3**: Operation of the project would not result in a substantial permanent increase in ambient noise levels in the project vicinity and permanently expose persons to noise levels in excess of standards in the Noise Ordinance (Article 29 of the Police Code). (LS)	As with the proposed project, there would be no new significant operational impacts under this alternative. (No Impact)	As with the proposed project, there would be no new significant operational impacts under this alternative; there would be fewer sensitive receptors that could be affected by operational noise. (LS)	As with the proposed project, there would be no new significant operational impacts under this alternative since there would be no sensitive receptors in proximity to the new off-site facilities. (LS)	This alternative would create new significant noise impacts associated with construction and operation of interim facilities at the Southeast Greenhouses site, which is closer to receptors to the east and south than the project. In addition, under this alternative the noisiest facility, the Solids Odor Control Facility, would be located closer to sensitive receptors to the east and southeast, and operational noise increases could exceed ordinance limits. (LSM or SUM)
	Impact C-NO-1: Construction activities of the project combined with cumulative construction noise in the project vicinity would cause a substantial temporary or periodic increase in ambient noise levels in the project vicinity or result in excessive groundborne vibration levels during construction. (LSM)	Noise generated by repair activities[a] at the SEP could contribute to cumulative construction-related noise increases at the SEP if they overlap with other planned construction projects at the SEP. (LSM)	Cumulative construction-related noise impacts would be less due to absence of sensitive receptors in the Pier 94 Backlands vicinity. (LS)	Cumulative construction noise impacts and mitigation would be similar to the project since project facilities would still be located at the BDFP site. (LSM) There are no sensitive receptors in proximity to the Pier 90 site, so cumulative impacts would be less than significant at this site.	This alternative's contribution to cumulative noise impacts would be greater than that of the project since construction would be more extensive at the SEP site and closer to sensitive receptors (including construction and operation of interim facilities at the Southeast Greenhouses site. (LSM)
	Impact C-NO-2: Operation of the project when considered with other cumulative development would not cause a substantial permanent increase in ambient noise levels or result in excessive vibration in the project vicinity. (LS)	No impact.	Similar to the project. (LS)	Similar to the project. (LS)	Under this alternative, the noisiest facility, the Solids Odor Control Facility, would be located closer to sensitive receptors to the east and southeast, and operational noise increases could result in cumulatively considerable contribution to operational noise impacts. (LSM or SUM)
Air Quality	**Impact AQ-1:** The project's construction activities would not generate fugitive dust that could violate an air quality standard or contribute substantially to an existing or projected air quality violation, but project construction would generate criteria air pollutants that would violate an air quality standard and contribute substantially to an existing or projected air quality violation, and result in a cumulatively considerable net increase in criteria air pollutants. (SUM)	Less than the proposed project, but the impact would not be completely avoided due to construction-related air pollutant emissions associated with ongoing repair activities of existing facilities. (LS or LSM)	Construction-related criteria pollutant emissions would be greater overall because of the added pipeline construction, which would not be offset by reduced demolition at the BDFP site. (SUM)	Construction of this alternative would generate the same criteria pollutant emissions as the project, plus additional emissions resulting from relocation and rehabilitation of the Central Shops buildings and dismantling or demolition of buildings at Pier 90 site. (SUM)	Construction-related criteria pollutant emissions would be greater than those of the proposed project due to increased demolition, construction/operation of interim facilities, increased truck operations, and increased grading/excavation associated with relocation of existing infrastructure. (SUM)
	Impact AQ-3: Construction and operation of the project would generate toxic air contaminants, including diesel particulate matter, but would not expose sensitive receptors to substantial air pollutant concentrations or result in a cumulatively considerable net increase in health risks or hazards. (LS)	Less than the proposed project but impact would not be completely avoided because there would still be construction-related air pollutant emissions associated with ongoing repair activities of existing facilities. (LS)	Net increase in construction related emissions and TACs, however health risks could be less overall because the closest sensitive receptors are farther away (1,800 feet) compared to the project (1,000 feet), and because there are few to no sensitive receptors located downwind of the Pier 94 Backlands site. (LS)	Impact would be similar to the proposed project. (LS)	Construction and operational health risks could be greater than those of the project due to closer proximity of construction and trucks to sensitive receptors, increased TAC emissions from demolition activities and construction/demolition of interim facilities. Operational health risks could be greater because waste gas burners would be substantially closer to the nearest sensitive receptors. (LSM)
	Impact AQ-4: The project's construction-related air pollutant emissions could conflict with, or obstruct implementation of, the *2010 Clean Air Plan*. (LSM)	While this alternative would reduce the project's conflicts with the Clean Air Plan associated with construction-related emissions, this alternative would not be consistent with the Clean Air Plan's Policy ECM 2, Renewable Energy. In addition, it would result in higher future operational emissions of ozone precursors (ROG and NOx) than the proposed project. (LSM)	Although there would be greater construction-related emissions under this alternative, conflicts with the Clean Air Plan would be the same as those of the project. (LSM)	Although there would be greater construction-related emissions under this alternative, conflicts with the Clean Air Plan would be the same as those of the project. (LSM)	Although there would be greater construction-related emissions under this alternative, conflicts with the Clean Air Plan would be the same as those of the project. (LSM)

TABLE 6-3 (Continued)
COMPARISON OF ENVIRONMENTAL IMPACTS OF PROJECT TO IMPACTS OF ALTERNATIVES

Environmental Resource	Proposed Project	Alternative A: No Project	Alternative B: Pier 94 Backlands	Alternative C: Historical Resources Relocation	Alternative D: SEP South/Quint Street
Air Quality (cont.)	**Impact C-AQ-1a:** Construction of the project, in combination with other past, present, and probable future projects, would result in a cumulatively considerable net increase in criteria air pollutants and contribute to cumulative regional air quality impacts. (SUM)	Less than the proposed project but impact would not be completely avoided because repair activities, such as repair of existing digesters, would contribute to cumulative increases in construction-related criteria pollutant emissions. (LS)	This alternative's contribution to significant and unavoidable cumulative construction-related NOx emissions would be greater than the proposed project due to the added pipeline construction. (SUM)	This alternative's contribution to significant and unavoidable cumulative construction-related NOx emissions would be greater than the proposed project due to the added emissions associated with Central Shops relocation and rehabilitation as well as dismantling or demolition of buildings at the Pier 90 site. (SUM)	This alternative's contribution to significant and unavoidable cumulative construction-related NOx emissions would be greater than the proposed project due to more extensive demolition at the SEP. (SUM)
	Impact C-AQ-2: Construction and operation of the project, in combination with other past, present, and probable future projects, could generate toxic air contaminants, including diesel particulate matter, but would not expose sensitive receptors to substantial air pollutant concentrations or result in a cumulatively considerable net increase in health risks and hazards. (LS)	Less than the project, but the impact is not avoided because repair activities, such as repair of existing digesters, would contribute to cumulative increases in construction-related toxic air contaminant emissions. (LS)	Although there would be a net increase in construction-related contaminant emissions and TACs, cumulative health risks and hazards would decrease because the closest sensitive receptors would be farther away (1,800 feet) compared to the project and because downwind receptors are absent with respect to the Pier 94 Backlands site. (LS)	Impact would be similar to that of the project. (LS)	Slight net increase in health risks due to relocation of waste gas burners closer to nearest sensitive receptors, but the impact would be less than significant with mitigation. (LSM)
Greenhouse Gas Emissions	**Impact C-GG-1:** The project would generate greenhouse gas emissions, but not at levels that would result in a significant impact on the environment or conflict with any policy, plan, or regulation adopted for the purpose of reducing greenhouse gas emissions. (LS)	Unlike the project, this alternative would conflict with adopted policies intended to reduce statewide GHG emissions because it would not make use of the energy production potential of increasing biogas emissions, would not reduce non-biogenic GHG emissions, and would not improve biosolids reuse opportunities, though feasible measures are available to reduce this impact to less than significant. (LSM)	This alternative would have the same energy capture potential (from biogas produced) and the same increase in biosolids reuse opportunities as the project. However, unlike in the project, the energy recovery facilities located at the Pier 94 Backlands site would not be available as backup power to the main plant or to support other SEP facilities. (LS)	Impact would be similar to that of the project. (LS)	Impact would be similar to that of the project. (LS)
Biological Resources	**Impact BI-1:** Project construction could have a substantial adverse effect, either directly or through habitat modifications, on roosting bats, which are protected by the California Department of Fish and Wildlife. (LSM)	No impact.[a]	Impacts on bats would be avoided. (LS)	Impact and mitigation would be similar to the project. (LSM)	Impact and mitigation would be similar to the project. (LSM)
	Impact C-BI-1: The project, in combination with past, present, and probably future projects, could substantially contribute to cumulative impacts on biological resources (roosting bats). (LSM)	No impact.[a]	Impacts on bats would be avoided. (LS)	Impact and mitigation would be similar to the project. (LSM)	Impact and mitigation would be similar to the project. (LSM)
Geology, Soils, and Paleontological Resources	**Impact GE-4:** The project could directly or indirectly destroy a unique paleontological resource. (LSM)	No impact.[a]	Impact would be reduced to less than significant due to low potential for paleontological resources. (LS)	Impact and mitigation would be similar to the project. (LSM)	Impact and mitigation would be similar to the project. (LSM)
	Impact C-GE-2: The project, in combination with past, present, and probable future projects, could substantially contribute to cumulative impacts on paleontological resources. (LSM)	No impact.[a]	Impact would be reduced to less than significant due to low potential for paleontological resources. (LS)	Impact and mitigation would be similar to the project. (LSM)	Impact and mitigation would be similar to the project. (LSM)
Mineral and Energy Resources	**Impact ME-2:** Operation of the project would not result in the use of large amounts of fuel, water, or energy, or use these resources in a wasteful manner. (LS)	Unlike the proposed project, this alternative would result in a potentially significant impact because more frequent routine flaring of digester gas would be a wasteful use of a local energy resource, but feasible measures are available to reduce this impact to less than significant. (LSM)	Impact would be similar to the project. (LS)	Impact would be similar to the project. (LS)	Impact would be similar to the project. (LS)

NOTES:

[a] As described in Section 6.3.1, under the No Project Alternative, the SFPUC would need to implement a much higher level of maintenance, as well as increased levels of equipment/facility repair and replacement, compared to existing conditions. With a higher risk of upset, there could also be emergency repairs or replacements needed. Construction of such projects could adversely affect archeological resources or human remains, and could create impacts related to noise, air pollutant emissions, and transportation.

LS = Less than Significant
LSM = Less than Significant with Mitigation
SUM = Significant and Unavoidable with Mitigation
SU = Significant and Unavoidable

BDFP = Biosolids Digester Facilities Project
GHG = greenhouse gas
NOx = nitrogen oxides
ROG = reactive organic gases

SEP = Southeast Water Pollution Control Plant
TAC = toxic air contaminant

This page intentionally left blank

The identification of the environmentally superior alternative is based on the relative severity of the various significant impacts. For the purposes of this analysis, the relative severity of a significant impact considers multiple factors, including the areal extent, magnitude, duration, and frequency of the impact as well as proximity to and number of sensitive receptors.

The No Project Alternative would avoid all construction and operational impacts that were identified for the proposed project under "normal" conditions. However, due to the age and condition of the existing facilities, likely future scenarios include breakdowns and equipment failures, even with an increased level of maintenance. Under scenarios of breakdowns and equipment failures, there would be potential for a wide range of impacts, depending on the nature and extent of those breakdowns. Due to the increased level of repairs and replacement and the inevitable construction associated with those repairs/replacement, the No Project Alternative would likely result in physical environmental impacts associated with archeological resources, transportation/circulation, noise, vibration, air quality, biological resources, and paleontological resources. However, depending on the circumstances under which the repairs/replacement would occur, implementation of the mitigation measures identified in this EIR for the significant construction-related impacts of the proposed project may or may not be required; this could result in more severe impacts than those identified for the proposed project. Furthermore, because the No Project Alternative would not make use of the energy production potential of increased digester gas production (a result of planned population growth), it would conflict with policies adopted for the purpose of reducing GHG emissions and it would be a wasteful use of a local energy resource. These would be considered potentially significant impacts associated with GHG emissions and energy resources that would not occur under the proposed project, although feasible mitigation is available that could reduce these impacts to less than significant. Nevertheless, in consideration of the likelihood of persistent and prolonged environmental impacts associated with ongoing and unplanned construction activities for repairs and replacement, the No Project Alternative is not the environmentally superior alternative.

The SEP South/Quint Street Alternative would result in some impacts that are more severe and some significant impacts that would not occur under the proposed project. Even though Central Shops Buildings A and B would be retained in place, at least seven structures that are contributors to the historic district would be demolished, a significant and unavoidable impact that would not occur at the project level under the proposed project (but was identified as a cumulative impact). In addition, due to the closer proximity of sensitive receptors, health risk impacts associated with exposure to TACs would be greater than those under the proposed project, a potentially significant impact. Increased exposure to TACs due to closer proximity to sensitive receptors would occur during construction (due to construction equipment and trucks) as well as during operations (due to waste gas burners). Under this alternative, the noisiest facility, the Solids Odor Control Facility (mostly outdoors), would be located closer to sensitive receptors to the east and southeast, and operational noise increases could exceed ordinance limits, another significant direct and cumulative impact. Furthermore, the SEP South/Quint Street Alternative would add at least two years to the proposed project's five-year construction schedule, for a total of seven years. This extended construction period would extend the duration of all construction-related impacts, and specifically, air pollutant emissions, noise, and transportation impacts in the project vicinity, which, as stated above, would occur closer to sensitive receptors,

further exacerbating these impacts. Overall, although Central Shops Buildings A and B would be retained in place, avoiding a significant and unavoidable impact, the SEP South/Quint Street Alternative would result in more severe environmental impacts than the proposed project. Therefore, the SEP South/Quint Street Alternative is not the environmentally superior alternative.

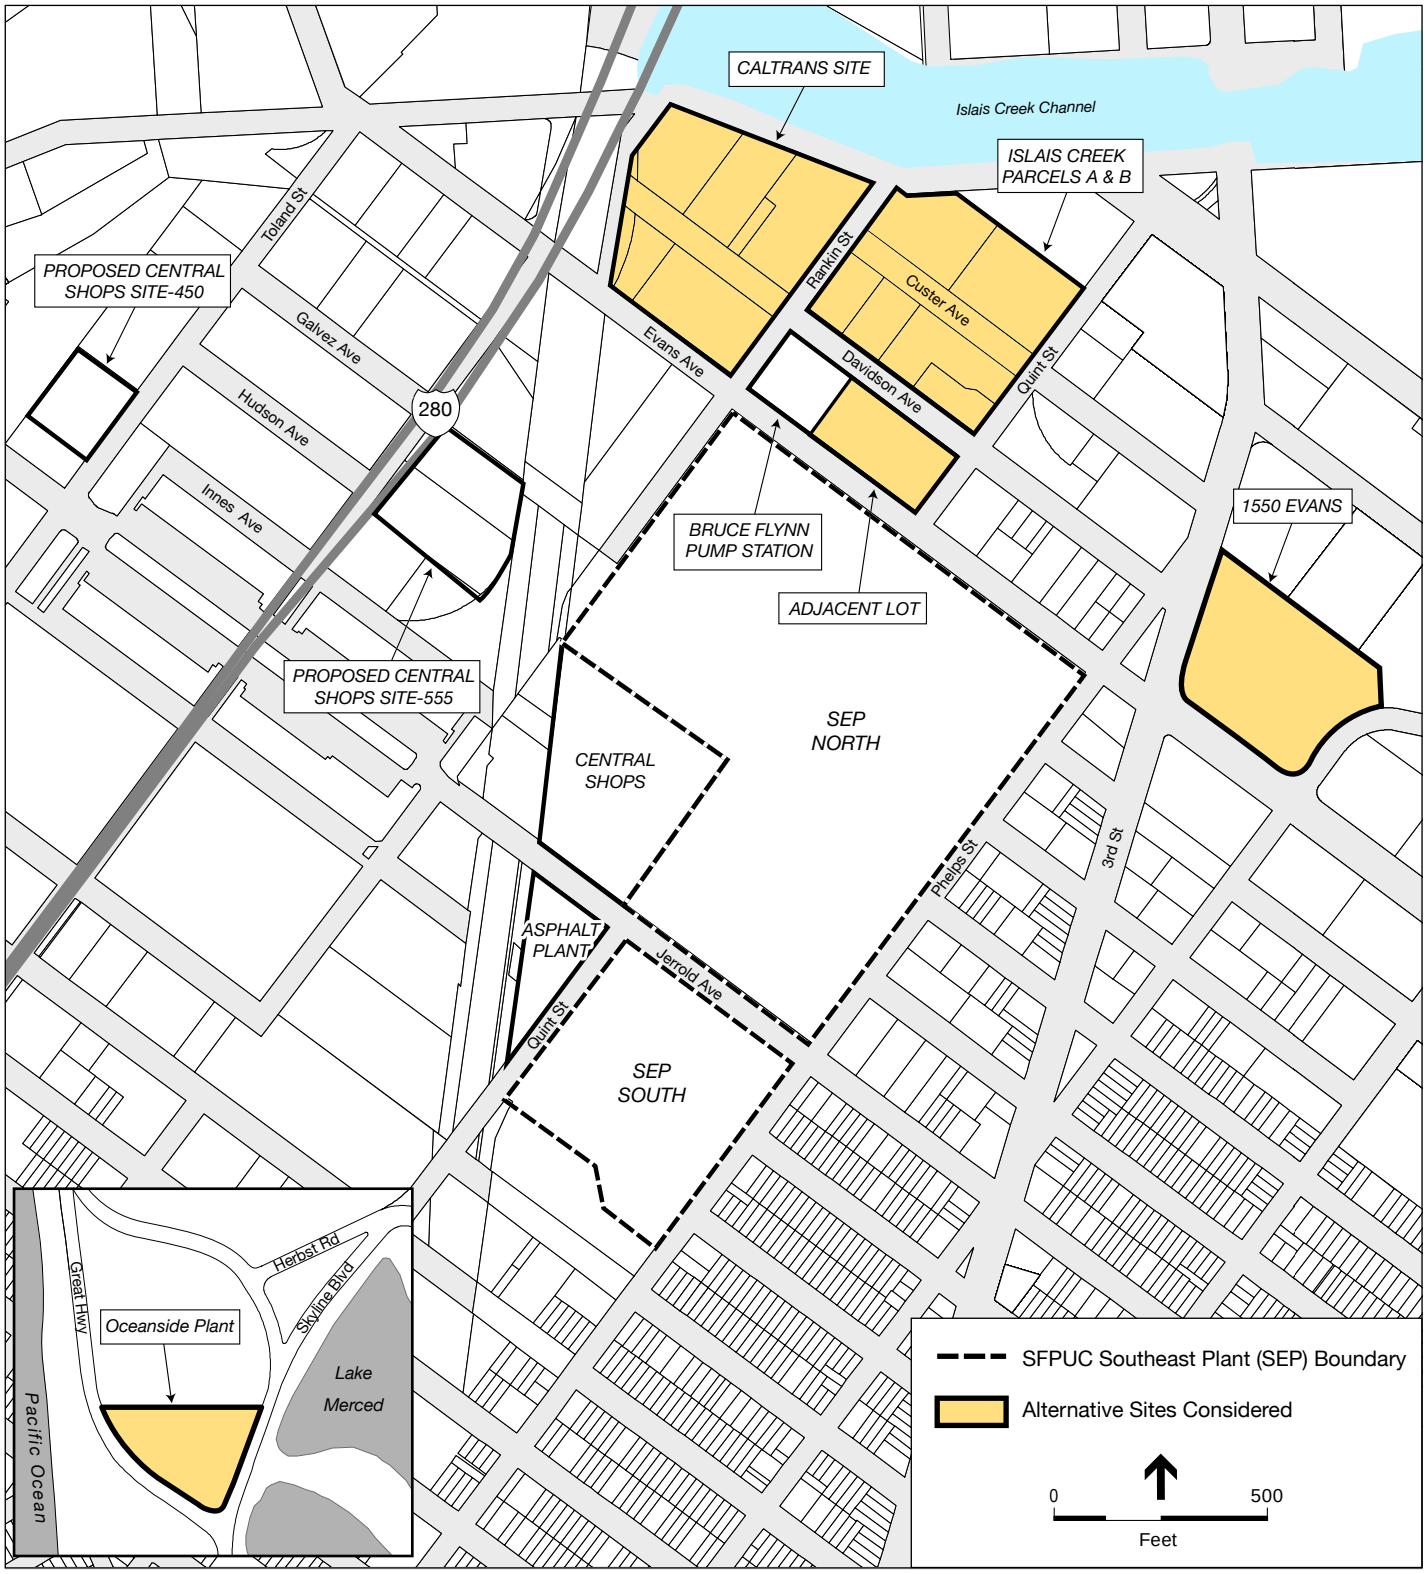
The remaining two alternatives—the Pier 94 Backlands and Historical Resources Relocation Alternatives—would both provide environmental trade-offs compared to the proposed project. Both alternatives would avoid or substantially reduce at least one significant impact of the proposed project, but both alternatives would also result in additional environmental impacts, including impacts at different locations, that would not occur under the proposed project.

The Pier 94 Backlands Alternative would avoid and substantially reduce all impacts at the BDFP site, but overall construction and operational impacts at the Pier 94 Backlands site would be comparable to those identified for the proposed project, only at a different location. This alternative would also result in construction impacts associated with the 4,000 feet of pipelines between the Pier 94 Backlands site and the SEP that would not occur under the proposed project and would affect the sensitive receptors located along the pipeline alignment that would not be affected under the proposed project (including City College campus). However, some impacts at the Pier 94 Backlands site (e.g., noise and health risk) would be less severe than what would occur under the proposed project, because of the greater distance to sensitive receptors. This alternative would avoid the cumulative construction noise impact that would occur under the proposed project. The same mitigation measures identified for the project would be required except for Mitigation Measures M-CR-1 (Documentation of Historical Resources and Interpretive Display), M-NO-1b (Construction Noise Control Measures at Southeast Greenhouses Staging Area), M-BI-1 (Protective Measures for Special Status Bats and Maternity Roosts), and M-GE-4 (Paleontological Resources Monitoring and Mitigation Program). In addition, many mitigation measures similar to those recommended for the proposed project and/or additional new mitigation measures (for construction noise) would be necessary along the 4,000-foot corridor for the pipeline construction. The overall construction schedule would be about the same as that of the proposed project (five years), but the overall area of surface disturbance for the Pier 94 Backlands Alternative would be about 15 acres plus the 4,000-foot pipeline corridor, which could disturb an additional 5 to 10 acres, depending on the width of the construction corridor. This would be a substantially greater area of disturbance than that of the project (about 10 acres).

Similarly, **the Historical Resources Relocation Alternative** would involve trade-offs. This alternative would avoid the significant and unavoidable impact associated with demolition of Central Shops Buildings A and B that would occur under the proposed project, but it would otherwise have all the same impacts as those identified for the proposed project *plus* it would result in construction and operational impacts at the off-site location where the Central Shops buildings would be relocated (assumed to be Pier 90). With the exception of Mitigation Measure M-CR-1 (Documentation of Historical Resources and Interpretive Display), all of the mitigation measures identified for the proposed project would be required for this alternative, and additional mitigation measures could be required at the relocation site. The overall construction schedule would be slightly longer than that for the proposed project, adding up to about one year, but the overall area of surface disturbance would be the same as for the proposed project

(about 10 acres) plus about 3 acres for the relocation site. Assuming that the relocation site would be at Pier 90 (or a similar location with light industrial land use), this alternative would not substantially affect any additional sensitive receptors.

In summary, either the Pier 94 Backlands Alternative or the Historical Resources Relocation Alternative would be considered environmentally superior to the proposed project because either would avoid the proposed project's significant and unavoidable impact on historical resources associated with the demolition of Central Shops Buildings A and B. However, on balance, the Historical Resources Relocation Alternative would have a slight environmental advantage over the Pier 94 Backlands Alternative as the environmentally superior alternative. This is mainly because, although operational impacts would be substantially the same for these two alternatives, the construction impacts under the Pier 94 Backlands Alternative would have a substantially greater area of disturbance and affect more sensitive resources along the 4,000-foot pipeline corridor between the SEP and Pier 94 compared to the construction impacts of the Historical Resources Relocation Alternative.



6.5 Alternatives Considered but Eliminated From Further Analysis

This section describes numerous potential alternatives that were considered for analysis in the EIR but were rejected from detailed analysis. As discussed in Section 6.2, above, the San Francisco Planning Department evaluated potential alternatives for their ability to avoid or reduce the significant adverse impacts attributable to the proposed project, their feasibility, and their ability to achieve most of the basic objectives of the project. In most cases, the Planning Department determined that the alternative concepts or locations were infeasible or unable to achieve most of the project's basic objectives, or would result in similar or more severe environmental impacts compared to those of the project. Some alternatives were rejected because they lacked distinct environmental advantages relative to the proposed project or the alternatives analyzed in Section 6.3 above.

This section presents a description of each potential alternative considered and the reasons for its elimination from further analysis, covering a total of 19 alternatives. The discussions include a brief description of the alternative, the source of the alternative concept, the effectiveness of the alternative to avoid or substantially reduce significant impacts of the proposed project, the feasibility of the alternative, and the ability to meet project objectives (using the objectives as numbered in Table 6-2, above). The alternatives considered are grouped according to the following categories: different locations, different site layouts, different preservation strategies for historical resources, and miscellaneous alternatives.

6.5.1 Alternative Site Locations

Seven alternative site locations or combinations of locations were considered, as described below. **Figure 6-7** shows the general locations of parcels considered in these alternatives.

SOURCE: Brown and Caldwell, CH2M Hill, Black and Veatch, Biosolids Digester Facilities Project Alternatives Analysis Report, December 2014; Southeast Digester Task Force, Review of the Biosolids Digester Facility Project by the Southeast Digester Task Force for the San Francisco Public Utilities Commission, Final Document, June 2, 2010.

SFPUC Biosolids Digester Facilities

Figure 6-7

Parcels Considered for Potential Alternative Sites

6.5.1.1 Project Site Plus SEP South

This alternative would develop the BDFP facilities at SEP South, Central Shops, Asphalt Plant, and Quint Street between Jerrold Avenue and the Caltrain right-of-way. This alternative would demolish all solids processing facilities at SEP South. Two facility configurations were considered. This alternative is from the Southeast Digester Task Force Report.[32]

Impact Reduction

This alternative lacks distinct environmental advantages relative to the proposed project or the SEP South/Quint Street Alternative. Compared to the BDFP, this alternative would result in greater project-level impacts on historical resources due to demolition of the historic digesters at SEP South, which are also contributors to a historic district; greater potential for impacts related to odors if the digesters were located at SEP South; and greater impacts on prehistoric archeological resources.

Feasibility

This alternative is feasible. However, it would entail greater risk to existing operations during construction, as the existing solids treatment needs to stay in operation. Also, construction at SEP South would be piecemeal (e.g., demolish/rebuild one digester at a time), so it would require more complicated construction sequencing. Temporary and/or interim facilities may also need to be built to sustain full plant operation throughout construction.

Ability to Meet Project Objectives

This alternative would meet most of the project's objectives. It would only partially meet Objective 8, because if the digesters are located at SEP South, limiting odors at the SEP property boundary would be more difficult than for the BDFP. It would not meet Objectives 11 and 12 because use of the SEP South site would require more complex construction, increasing construction duration and costs and thereby reducing rate payer affordability.

6.5.1.2 SEP South and Caltrans Site

This alternative would develop the BDFP facilities at SEP South and the Caltrans site (comprised of both privately- and Caltrans-owned parcels located north of Evans Avenue and west of Rankin Street). This alternative would demolish SEP South solids processing facilities and develop the proposed facilities at the above-referenced locations. New digesters would be constructed at SEP South. This alternative is from the Southeast Digester Task Force Report.[33]

[32] As described in the Southeast Digester Task Force Report, 2010, Site Plan Option 1a of the Digester Task Force would locate digestion processes on the current SEP South parcel; and Site Plan Option 1b of the Digester Task Force would locate digestion processes on the Central Shops site.

[33] As described in the Southeast Digester Task Force Report, 2010, the Caltrans site, comprised of eight parcel lots, is surrounded by Evans Avenue, Rankin Street, Islais Creek, and the railroad tracks.

Impact Reduction

Compared to the BDFP, this alternative would result in greater project-level impacts on historical resources due to demolition of the historic digesters at SEP South, which are also contributors to a historic district; greater impacts on prehistoric archeological resources; and greater impacts related to odors as the digesters would be located at SEP South closer to residences. The risk of damage associated with flooding would also be greater for facilities at the Caltrans site. However, this alternative would avoid demolition of Central Shops Buildings A and B and the associated significant impact on historical resources.

Feasibility

This alternative is feasible. However, site acquisitions, design, and construction would be more complicated than what is anticipated for the BDFP. Because three of the parcels on the Caltrans site are privately owned, eminent domain proceedings could be required to acquire the parcels. The 2 Rankin site (one of the parcels within the Caltrans site) is also considered as a potential site for a collection system improvement (e.g., for the Central Bayside System Improvement Project). Solids processing facilities would be developed at two sites 1,600 feet apart, reducing efficiency (e.g., due to the distance of underground connections between facilities, the need to pump sludge, the need for two set of facilities/equipment including control center, and separate odor control systems) and minimizing redundancy. Permanent closure of Davidson Avenue northwest of Rankin Street would be required. More complicated flood protection measures would also be required, as the Caltrans site is within the 100-year flood zone. Construction at SEP South would be piecemeal (e.g., demolish/rebuild one digester at a time) and would require more complicated construction sequencing. Temporary and/or interim facilities may also need to be built to sustain full plant operation throughout construction. This alternative would also entail greater risk to existing operations during construction compared to the project.

Ability to Meet Project Objectives

This alternative would meet most of the project's basic objectives. It would only partially meet Objectives 6, 8, and 10, because (1) the 1,600-foot separation of solids processing facilities would reduce reliability and operational flexibility, (2) limiting odors at the SEP property boundary would be more difficult due to locating digesters at SEP South closer to residences, and (3) locating solids processing facilities at the Caltrans site would place them within the 100-year flood zone, requiring more complex design measures in order to accommodate or adapt to expected sea level rise. It would not meet Objectives 11, and 12 because use of the SEP South site would require more complex construction, increasing construction duration and reducing rate payer affordability.

6.5.1.3 Caltrans Site, Islais Creek Parcels, and Bruce Flynn Pump Station Adjacent Lot

This alternative would develop the BDFP facilities at the combined Caltrans site, Islais Creek Parcels A and B, and Bruce Flynn Pump Station adjacent lot. This alternative is from the Southeast Digester Task Force Report.[34]

Impact Reduction

This alternative has no environmental advantages compared to the other alternatives carried forward, particularly the Pier 94 Backlands Alternative. While direct project impacts on historical resources would be avoided because Central Shops Buildings A and B would not be demolished, the risk of flooding at the sites identified for this alternative would be greater than the risk at the BDFP site. This alternative would not avoid or reduce the cumulative impact on the historic district, as it would replace the function of the existing digesters and facilitate the eventual removal of the digesters and associated structures comprising a substantial portion of a historic district.

Feasibility

This alternative is feasible. However, due to the multiple sites involved, site acquisition and construction would be more complicated than anticipated for the BDFP. Because three of the parcels within the Caltrans site are privately owned, eminent domain proceedings could be required to acquire the parcels. In addition, the 2 Rankin site (one of the parcels within the Caltrans site) is also considered as a potential site for a collection system improvement (e.g., for the Central Bayside System Improvement Project). Permanent street closures (e.g., Davidson Avenue) would be required, and underground pipe connections between facilities would be complicated by crossing multiple public rights-of-way. More complicated flood protection measures would also be required, as all of the proposed sites are within the 100-year flood zone.

Ability to Meet Project Objectives

This alternative would meet some of the basic project objectives. It would only partially meet Objectives 2, 6, 10, 11, and 12, for multiple reasons. Inclusion of multiple sites not currently owned by the SFPUC would affect timely construction of the proposed facilities and the ability to maintain ratepayer affordability. Relative to the BDFP, reliability and operational flexibility would be reduced due to the 1,600-foot distance between proposed and existing solids processing facilities. Locating the facilities at these more distant sites would not provide redundant infrastructure for existing processes. More complex design measures than what are proposed for the BDFP (such as elevating equipment and identifying access routes to the site from the SEP during flood conditions) would be required in order to accommodate or adapt to expected sea level rise.

[34] As described in the Southeast Digester Task Force Report, 2010. Parcels A and B are located adjacent to the Caltrans site, north of Davidson Avenue where existing warehouses are located. The Bruce Flynn Pump Station adjacent lot is located across from the SEP, between Rankin Street, Davidson Avenue, Evans Avenue, and Quint Street. A rail spur splits the property.

Limiting odors at the SEP property boundary would be more difficult due to the proximity of these sites to sensitive receptors.

6.5.1.4 SEP South/Asphalt Plant Site

This alternative would develop the proposed BDFP facilities at the Asphalt Plant and SEP South. This alternative would demolish all solids processing facilities at SEP South. This alternative is based on the site layout alternatives described in the Alternatives Analysis Report.[35]

Impact Reduction

While this alternative would avoid impacts on Central Shops Buildings A and B, it would result in impacts on historical resources due to potential demolition of buildings and other structures within the historic district (whereas the BDFP and other alternatives would replace this function, ultimately allowing for the future demolition of the digesters). The SEP South/Quint Street Alternative would achieve the same environmental advantages of this alternative, without demolition of the historic digesters.

Feasibility

This alternative is feasible. However, it would entail greater risk to existing operations during construction, as the existing solids treatment would need to stay in operation. Also, construction at SEP South would be piecemeal (e.g., demolish/rebuild one digester at a time), so it would require more complicated construction sequencing. This alternative would substantially disrupt existing solids operations, and temporary facilities may also be required to sustain full plant operation throughout construction.

Ability to Meet Project Objectives

This alternative would meet most of the project objectives. It would partially meet Objective 8, because it would be difficult to limit odors to the fence line. It would not meet Objectives 11 and 12, because use of the SEP South site would require more complex construction, increasing construction duration and reducing rate payer affordability compared to the BDFP.

6.5.1.5 Bruce Flynn Pump Station Adjacent Lot/Asphalt Plant/Central Shops

This alternative would develop the BDFP facilities at Bruce Flynn Pump Station adjacent lot (e.g., for biosolids dewatering), Asphalt Plant, and Central Shops. This alternative is based on the site layout alternatives described in the Alternatives Analysis Report.[36]

---

[35] Developed as part of preservation alternatives evaluation process, based on site layout alternatives described in SFPUC Biosolids Digester Facilities Project Alternatives Analysis Report, December 2014.

[36] Developed as part of preservation alternatives evaluation process, based on site layout alternatives described in SFPUC Biosolids Digester Facilities Project Alternatives Analysis Report, December 2014. Use of the Bruce Flynn Pump Station adjacent lot was considered to site unit processes that require frequent truck hauling (e.g., biosolids dewatering) or for future (post-2022) facilities.

Impact Reduction

The risk of damage from flooding would be greater under this alternative than under the BDFP due to siting at the Bruce Flynn Pump Station adjacent lot. This alternative would offer no substantial environmental benefits as compared to the BDFP, since it would result in the same or similar construction and operational impacts and therefore would not avoid or substantially reduce significant impacts of the proposed project.

Feasibility

This alternative is feasible. However, solids processing facilities would be developed at sites about 1,000 feet apart, reducing efficiency (e.g., due to the distance of underground connections between facilities, the need to pump sludge, the need for two sets of facilities/equipment including control center and separate odor control systems, etc.) and reducing operational redundancy. In addition, the Bruce Flynn Pump Station site is divided by an operating rail spur, which would complicate underground pipe connections between facilities across the rail spur.

Ability to Meet Project Objectives

This alternative would meet most of the project's basic objectives. It would not meet Objective 2 because the 1,000-foot separation of proposed facilities from other parts of the SEP and space constraints would reduce how efficiently existing SFPUC infrastructure and resources are used.

6.5.1.6 SEP South

This alternative would develop the proposed solids processing facilities at SEP South while rebuilding digesters in place (one at a time). This alternative is from the Needs Assessment Report.[37]

Impact Reduction

Compared to the BDFP, this alternative would result in different significant impacts on historical resources, because it would include demolition of the digesters at SEP South (which are contributors to a historic district) while retaining Central Shops Buildings A and B. This alternative would result in more severe impacts related to odors, as the digesters would be located at SEP South close to sensitive receptors. This alternative would also increase direct impacts on a known prehistoric resource at SEP south. The SEP South/Quint Street Alternative would better achieve the intent of this alternative by building the digesters farther from residences.

Feasibility

This alternative is feasible. Compared to the BDFP, this alternative would entail greater risk to existing operations because one digester would be out of commission at all times during construction. Construction at SEP South would be piecemeal. Temporary and/or interim facilities may also need to be built to sustain full plant operation throughout construction.

[37] As described in the Needs Assessment Report, 2016.

Ability to Meet Project Objectives

This alternative would meet some of the basic project objectives. It would not meet Objectives 1 and 3 because the same treatment process would be installed (instead of using new technology) and digester capacity would not increase to reliably treat projected 2045 flows and loads. It would partially meet Objectives 4 and 8 because it would not upgrade to Class A biosolids and instead would continue to produce Class B biosolids, and it would be difficult to achieve limiting odors at the fence line because of the proximity to residences. It would not meet Objectives 11 and 12 because use of the SEP South site would require more complex construction, increasing construction duration to about 25 years and reducing rate payer affordability compared to the BDFP.

6.5.1.7 Asphalt Plant and 1550 Evans Avenue Sites

This alternative would develop the BDFP facilities at 1550 Evans Avenue and the Asphalt Plant. This alternative is based on public comment received during the EIR scoping period.[38]

Impact Reduction

This alternative would avoid the project's significant unavoidable historical resource impacts because Central Shops Buildings A and B would be retained in place. Otherwise, this alternative would result in similar environmental impacts as the BDFP, because similar construction and operations activity would occur. The SEP South/Quint Street Alternative would better achieve the intent of this alternative.

Feasibility

This alternative is potentially feasible; however, there are other long-term uses envisioned for 1550 Evans Avenue, including replacement of the Southeast Community Facility, currently located at 1800 Oakdale Avenue, which could include an academic institution. Solids processing facilities would be developed at sites about 1,700 feet apart, increasing operational complexity (e.g., due to the amount of underground connections between facilities and the need to pump sludge) and reducing efficiency (e.g., the distance between the two sites is too far to optimize operations, as it would require two sets of facilities equipment including control center and separate odor control systems).

Ability to Meet Project Objectives

This alternative would meet most of the project's basic objectives. It would partially meet Objective 6 because, relative to the BDFP, efficiencies resulting from use of existing resources and facilities would not be maximized due to the 1,700-foot separation of solids processing facilities.

[38] As described in scoping comments from David Pilpel, adapted to include the Asphalt Plant due to space limitations at 1550 Evans Avenue.

6.5.2 Alternative Site Layouts

6.5.2.1 Digesters Adjacent to Jerrold Avenue

This alternative would develop the BDFP facilities at Central Shops, Asphalt Plant, and SEP South, with the digesters located adjacent to Jerrold Avenue. This alternative is based on the Alternatives Analysis Report.[39]

Impact Reduction

This alternative would not materially alter the impact conclusions for the BDFP, and in fact would locate the digesters closer to residences. Therefore, this alternative offers no environmental advantages and would not meet the requirements of the CEQA alternatives analysis.

Feasibility

This alternative is feasible.

Ability to Meet Project Objectives

This alternative would meet most of the project objectives. It would only partially meet Objectives 8, 11, and 12 for the following reasons: odor sources would be relatively close to the fence line, the alignment and arrangement of structures would be poor, and the alternative would require more complex construction, increasing construction duration and reducing affordability compared to the BDFP.

6.5.2.2 Digesters in Clustered Configuration

This alternative would develop BDFP facilities at Central Shops, Asphalt Plant, and SEP South, with the digesters in a layout with a more clustered configuration rather than linear layout. This alternative is based on the Alternatives Analysis Report.[40]

Impact Reduction

This alternative would not materially alter the impact conclusions for the BDFP. Therefore, this alternative offers no environmental advantages and would not meet the requirements of the CEQA alternatives analysis.

Feasibility

This alternative is feasible.

[39] As described in the BDFP Alternatives Analysis Report, 2014.
[40] As described in the BDFP Alternatives Analysis Report, 2014.

Ability to Meet Project Objectives

This alternative would meet most of the project objectives. It would only partially meet Objectives 6, 9, 11, and 12 for the following reasons: reliability and operational flexibility would be reduced due to limited consolidation and optimization of the site layout, the alignment and arrangement of structures would be poor, and the alternative would require more complex construction, increasing construction duration and reducing affordability compared to the BDFP.

6.5.2.3 Digesters in Two Rows

This alternative would develop the BDFP facilities at Central Shops, Asphalt Plant, and SEP South, with the digesters in a layout of two rows of three digesters. This alternative is based on the Alternatives Analysis Report.[41]

Impact Reduction

This alternative would not materially alter the impact conclusions for the BDFP. Therefore, this alternative offers no environmental advantages and would not meet the requirements of the CEQA alternatives analysis.

Feasibility

This alternative is feasible.

Ability to Meet Project Objectives

This alternative would meet most of the project objectives. It would only partially meet Objectives 8 and 9 because odor sources would be relatively close to the fence line and the alignment and arrangement of structures would be poor.

6.5.3 Alternative Approaches to Preserve Historical Resources

6.5.3.1 Retain Central Shops Buildings in Place

This alternative would develop the BDFP facilities as described in Chapter 2, *Project Description*, redesigned to include full preservation and reuse/repurpose of Central Shops Buildings A and B in place as part of the project. This alternative was identified in the Preservation Alternatives Memo as a full preservation alternative.[42]

Impact Reduction

This alternative would avoid significant impacts on individual historical resources by retaining the Central Shops buildings in place; however, impacts associated with construction duration

[41] As described in the BDFP Alternatives Analysis Report, 2014.
[42] Developed as part of preservation alternatives evaluation process for this EIR (FP2).

could increase. The environmental advantages of this alternative would be the same as those of the SEP South/Quint Street Alternative.

Feasibility

This alternative is infeasible for numerous reasons, including the following: (1) the location of Buildings A and B, in the middle of the BDFP site, constrains overall space available for required aboveground facilities as well as access to required underground facilities; (2) the total square footage of Buildings A and B (66,200 square feet) is inadequate for the proposed uses (requiring about 136,800 square feet); (3) the configuration would constrict operations, making them inefficient; and (4) space constraints would require use of other existing SEP areas and would interfere with ongoing SEP operations. Even if feasible, this alternative would require a complete redesign of project layout that would result in substantial project delay, and it would require disassembling and temporarily relocating Buildings A and B to construct underground project components before reconstructing them in place consistent with the Secretary of Interior's Standards.

Ability to Meet Project Objectives

Because this alternative is infeasible, it would not meet the project objectives.

6.5.3.2 Relocate Central Shops Buildings within SEP

This alternative would develop the BDFP facilities as described in Chapter 2, *Project Description*, redesigned to include relocation of Central Shops Buildings A and B within the SEP. This alternative was identified in the Preservation Alternatives Memo as a full preservation alternative.[43]

Impact Reduction

This alternative would avoid the impact of demolishing a historical resource by instead relocating the buildings elsewhere in the SEP and rehabilitating them consistent with the Secretary of Interior's Standards. If Central Shops Buildings A and B were to be relocated within the historic district, it would increase the proportion of non-contributors and thereby to a small degree reduce the integrity of the historic district. The environmental advantages of this alternative are the same as or less than those of the SEP South/Quint Street Alternative.

Feasibility

This alternative is infeasible because there is insufficient space to accommodate both Buildings A and B within the remaining SEP property. The largest open space (parking lot) within the SEP is about 57,700 square feet, which is less than the 66,200-square-foot area of the Central Shops buildings if they were put side by side without any setbacks.

[43] Developed as part of preservation alternatives evaluation process for this EIR (FP4).

Ability to Meet Project Objectives

Because this alternative is infeasible, it would not meet the project objectives.

6.5.3.3 Relocate Central Shops Buildings to SFPW Site

This alternative would develop the BDFP facilities as described in Chapter 2, *Project Description*, and relocate Central Shops Buildings A and B to the new SFPW Central Shops site opposite the Caltrain tracks and continue use at this new location. This alternative was identified in the Preservation Alternatives Memo as a full preservation alternative.[44]

Impact Reduction

This alternative would reduce historical resource impacts to a less-than-significant level by avoiding the impacts of demolition, while relocating Central Shops Buildings A and B in proximity to their original location, retaining their current use, and rehabilitating them consistent with the Secretary of the Interior's Standards. Otherwise, this alternative lacks distinct environmental advantages over Alternatives B, C, or D.

Feasibility

This alternative is infeasible, because SFPW needs to maintain an ongoing, operational Central Shops facility, such as under the current plan to complete construction of the new Central Shops facility before abandoning the old location and relocating to the new location.

Ability to Meet Project Objectives

Because this alternative is infeasible, it would not meet the project objectives.

6.5.3.4 Retain and Expand Central Shops Buildings

This alternative would develop the BDFP facilities at the Central Shops and Asphalt Plant sites, redesigned to retain both Buildings A and B in place, with expansion of the buildings (e.g. adding a second story or addition) consistent with the Secretary of the Interior's Standards. This alternative was identified in the Preservation Alternatives Memo as a partial preservation alternative.[45]

Impact Reduction

This alternative would reduce historical resources impacts due to demolition of Central Shops Buildings A and B to less-than-significant levels and lessen impacts on their integrity because adaptive modifications and reuse would be required to be consistent with the Secretary of the Interior's Standards. Otherwise, this alternative would have the same or similar impacts as the project. Alternatives B, C, and D would better achieve the environmental advantages of this alternative.

[44] Developed as part of preservation alternatives evaluation process for this EIR (FP6).
[45] Developed as part of preservation alternatives evaluation process for this EIR (PP1).

Feasibility

This alternative is infeasible. Central Shops Buildings A and B are in the middle of the BDFP site, which has little to no space to spare, making the layout of this alternative inefficient and more costly than the project. The diagonal orientation of the BDFP facilities, compared with the rectilinear orientation of Central Shops Buildings A and B, makes retaining a portion of Buildings A and B problematic from a design standpoint. Even if feasible, this alternative would require a complete redesign of project layout that would result in substantial project delay, and it would require disassembling and temporarily relocating Buildings A and B to construct underground project components.

Ability to Meet Project Objectives

Because this alternative is infeasible, it would not meet the project objectives.

6.5.3.5 Retain a Portion of Central Shops Buildings

This alternative would develop the BDFP facilities at Central Shops and Asphalt Plant, redesigned to retain a portion of both Buildings A and B in place, such as one or two exterior glass curtain walls, or a portion of both buildings. This alternative was identified in the Preservation Alternatives Memo as a partial preservation alternative.[46]

Impact Reduction

This alternative would reduce the severity of the project's impacts on historical resources, but not to a less-than-significant level, and therefore would not provide substantial environmental benefit compared to the BDFP. Alternatives C and D would better achieve the intent of this alternative.

Feasibility

This alternative is infeasible. Central Shops Buildings A and B are in the middle of the BDFP site, which has little to no space to spare, making the layout of this alternative inefficient and more costly than the project. The diagonal orientation of the BDFP facilities, compared with the rectilinear orientation of Central Shops Buildings A and B, makes retaining a portion of the Buildings A and B problematic from a design standpoint. Even if feasible, this alternative would require a complete redesign of project layout that would result in substantial project delay, and it would require disassembling and temporarily relocating Buildings A and B to construct underground project components.

Ability to Meet Project Objectives

Because this alternative is infeasible, it would not meet the project objectives.

[46] Developed as part of preservation alternatives evaluation process for this EIR (PP2).

6.5.3.6 Retain a Portion of Central Shops Building A Only

This alternative would develop the BDFP facilities at Central Shops and Asphalt Plant, demolishing Building B and part of Building A; relocate a portion of Building A to Jerrold Avenue where it could fit within the BDFP site plan; and repurpose the relocated portion of Building A. This alternative was identified in the Preservation Alternatives Memo as a partial preservation alternative.[47]

Impact Reduction

This alternative would reduce the severity of the project's impacts on historical resources, but not to a less-than-significant level, and therefore would not provide substantial environmental benefit compared to the BDFP. Alternatives C and D would better achieve the intent of this alternative.

Feasibility

This alternative is feasible, as it would be possible to retain portions of one or two walls of Building A as a wall (or screen wall) and relocate it along Jerrold Avenue and integrate it with proposed facilities (e.g., Maintenance Shops 1 or 2). This alternative would require architectural redesign to integrate the historic buildings. Relocating portions of the walls of Building A would not be consistent with the Secretary of the Interior's Standards, would add cost, and would increase construction duration.

Ability to Meet Project Objectives

This alternative would meet most of the basic objectives of the project. It would not meet Objectives 11 and 12, because the construction schedule would be more complex and consequently the alternative would be less affordable than the BDFP.

6.5.3.7 Relocate One Central Shops Building Only

This alternative would develop the BDFP facilities at Central Shops and Asphalt Plant, demolishing either Central Shops Building A or Building B and relocating the other building to a similar industrial setting in San Francisco consistent with the Secretary of the Interior's Standards. This alternative was identified in the Preservation Alternatives Memo as a partial preservation alternative.[48]

Impact Reduction

This alternative would reduce the severity of the project's impacts on historical resources, but not to a less-than-significant level, and it would not sufficiently reduce the severity of the impact to provide adequate benefits of a partial preservation alternative. Buildings A and B are considered a single historical resource, and relocation of one building without the other would not meet the needs of a partial preservation alternative. Therefore, this alternative would not provide substantial

[47] Developed as part of preservation alternatives evaluation process for this EIR (PP3).
[48] Developed as part of preservation alternatives evaluation process for this EIR (PP4).

environmental benefit compared to the BDFP. Alternatives C and D would better achieve the intent of this alternative.

Feasibility

This alternative is potentially feasible, assuming an appropriate relocation site is available.

Ability to Meet Project Objectives

This alternative would meet most of the project objectives. It would partially meet Objectives 11 and 12, because the construction schedule would be more complex and a site with a similar industrial setting would have to be found. Consequently, the alternative would be less affordable than the BDFP.

6.5.4 Miscellaneous Other Alternative Strategies

6.5.4.1 Divert Wastewater Flows to the Oceanside Water Pollution Control Plant

This alternative would continue use of existing SEP solids processing facilities and construct a tunnel to divert wastewater flows to the Oceanside Water Pollution Control Plant for treatment ("Cayuga Diversion"). Additionally, liquid wastewater treatment would still occur at the SEP. This concept was based on public comment received during the EIR scoping period.[49]

Impact Reduction

This alternative would not preclude the need for new solids facilities at the SEP and thus lacks any environmental advantages over the project. This alternative would also result in environmental impacts at different locations, including tunnel construction sites as well as at the Oceanside Water Pollution Control Plant (where THP would be needed to treat excess solids). Therefore, this alternative would not meet the requirements of the CEQA alternatives analysis.

Feasibility

At a conceptual level, this alternative is potentially feasible, but no engineering studies have been conducted to determine actual feasibility.

Ability to Meet Project Objectives

If this alternative is feasible, it is assumed that the alternative would meet the treatment capacity for projected 2045 flows and loads, achieving Objective 3, but overall this alternative would not

[49] The Cayuga Diversion was discussed preliminarily during previous sewer system master planning efforts. In order to be a mitigation or alternative for the BDFP as suggested in scoping comments from David Pilpel, the Cayuga Diversion would need to shift a portion of untreated flows from the SEP across town to the Oceanside Water Pollution Control Plant. This would be a system-wide change to the collection and treatment system. At this time, the SSIP is prioritizing improving aging infrastructure, assuring reliable operations, and maintaining regulatory compliance over system-wide changes.

meet any of the project's other objectives. It would not replace existing SEP solids handling infrastructure, maximize efficiency of current treatment resources, beneficially use 100 percent of biosolids and biogas, build redundant infrastructure, improve seismic reliability, limit odors, provide visual improvements at the SEP, or adapt to sea level rise; thus, this alternative would not meet Objectives 1, 2, 4, 5, 6, 7, 8, 9, or 10. It would also not meet Objectives 11 and 12, since construction would be delayed for a minimum of several years and would have an unknown construction duration, and costs for conducting the required studies, design, environmental review, and construction of a tunnel to the Oceanside Water Pollution Control Plant would not maintain rate payer affordability. It is assumed this alternative would continue to produce Class B biosolids and use some of the biogas generated, but this alternative would not beneficially use 100 percent of these materials.

6.5.4.2 Use Railway Instead of Trucks for Hauling Biosolids

This alternative would develop the project as described in Chapter 2, *Project Description*, but would modify long-term operational practices to haul biosolids from the SEP using railway instead of trucks. This concept was based on public comment received during the EIR scoping period.[50]

Impact Reduction

This alternative would not materially alter the impact conclusions for the BDFP. While there could be a reduction in the distance, frequency, and number of truck trips for hauling biosolids and commensurate reduction in air pollutant emissions from trucks, there would be increased handling of biosolids from truck to rail and rail to truck and increased emissions associated with rail use; the net effect on regional air quality in the air basin is unknown. There are no significant impacts related to biosolids hauling included in the proposed project that would be alleviated by this alternative. Therefore, this alternative would not meet the requirements of the CEQA alternatives analysis.

Feasibility

This alternative is potentially feasible if a rail line is available to a Class A biosolids end use destination.

Ability to Meet Project Objectives

This alternative, if feasible, would meet most of the project's basic objectives. The only exceptions would be the uncertainty associated with meeting or partially meeting Objectives 11 and 12, due to unknown implications on the construction schedule if rail spurs are needed and unknown net effects on costs that affect rate payer affordability.

[50] As described in scoping comments from David Pilpel.

2.6.5 Site Preparation 2-65
2.6.5.1 Subsurface Construction, Pile Driving, and Retaining Walls 2-65
2.6.5.2 Groundwater Dewatering 2-66
2.6.5.3 Utility Relocation 2-67
2.6.5.4 Soil Removal and Backfill 2-67
2.6.5.5 Tree Removal and Tree Protection Plan 2-68
2.6.5.6 Water Use During Construction 2-68
2.6.6 Facilities Construction 2-69
2.6.6.1 Digesters 2-69
2.6.6.2 Other Facilities 2-69
2.6.7 SFPUC Standard Construction Measures 2-69
2.7 Intended Uses of this EIR and Required Actions and Approvals 2-70
●* 2.7.1 Federal Actions and Approvals 2-70
●* 2.7.2 State Actions and Approvals 2-70
2.7.3 Regional and Local Actions and Approvals 2-70

3. Plans and Policies 3-1

3.1 Overview 3-1
3.2 Plans and Policies Relevant to the BDFP 3-2
3.2.1 CCSF Plans and Policies 3-2
3.2.1.1 San Francisco General Plan 3-2
3.2.1.2 Bayview Hunters Point Area Plan 3-3
3.2.1.3 Accountable Planning Initiative 3-3
3.2.1.4 San Francisco Bicycle Plan 3-4
3.2.1.5 Climate Action Plan 3-5
3.2.1.6 Better Streets Plan 3-6
3.2.2 SFPUC Plans and Policies 3-6
3.2.3 Other Plans 3-6
3.2.3.1 Waterfront Land Use Plan 3-7
3.2.3.2 San Francisco Bay Plan 3-7
3.2.3.3 San Francisco Bay Area Seaport Plan 3-7
3.2.3.4 San Francisco Waterfront Special Area Plan 3-8
3.2.4 Regional Plans and Policies 3-8

4. Environmental Setting and Impacts 4.1-1

4.1 Overview 4.1-1
4.1.1 Scope of Analysis 4.1-1
4.1.2 Significance Determinations 4.1-2
4.1.3 Approach to Cumulative Impact Analysis and Cumulative Projects 4.1-3
4.1.3.1 CEQA Provisions Regarding Cumulative Impacts 4.1-3
●* 4.1.3.2 Approach to Cumulative Impact Analysis in this EIR 4.1-4
4.2 Land Use 4.2-1
4.2.1 Setting 4.2-1
4.2.1.1 Existing Land Uses at the Southeast Plant and in Surrounding Areas 4.2-1
4.2.1.2 Existing Land Uses at Piers 94 and 96 Staging Areas and in Surrounding Areas 4.2-3
4.2.2 Regulatory Framework 4.2-5

4.19.2.2 State Regulations 4.19-2
4.19.2.3 Local Regulations 4.19-3
4.19.3 Impacts and Mitigation Measures 4.19-3
4.19.3.1 Significance Criteria 4.19-3
4.19.3.2 Approach to Analysis 4.19-4
4.19.3.3 Impact Evaluation 4.19-4

5. Other CEQA Issues 5-1
5.1 Growth Inducing Impacts 5-1
5.2 Significant Unavoidable Impacts 5-2
5.2.1 Cultural Resources 5-2
5.2.2 Air Quality 5-3
5.3 Areas of Known Controversy and Issues to Be Resolved 5-3

6. Alternatives 6-1
6.1 Overview 6-1
6.1.1 Purpose of this Chapter 6-1
6.1.2 CEQA Requirements for Alternatives Analysis 6-2
6.2 Alternatives Screening and Selection 6-2
6.2.1 Alternatives Previously Identified for the BDFP 6-3
6.2.1.1 Alternatives Identified by the Public 6-3
6.2.1.2 Other Alternatives Identified During Project Planning 6-4
6.2.2 Strategies to Avoid Significant Impacts 6-5
6.2.2.1 Significant and Unavoidable Impacts 6-5
6.2.2.2 Strategies to Avoid or Lessen Significant Unavoidable Impacts 6-6
6.2.2.3 Significant Impacts that Can be Mitigated to Less than Significant 6-7
6.2.2.4 Strategies to Avoid or Lessen Significant Impacts that can be Mitigated to Less than Significant 6-8
6.2.3 Alternatives Selected for Detailed Analysis 6-9
6.3 Alternatives Analysis 6-10
6.3.1 Alternative A: No Project 6-19
6.3.1.1 Description 6-19
6.3.1.2 Ability to Meet Project Objectives 6-22
6.3.1.3 Environmental Impacts 6-22
6.3.2 Alternative B: Pier 94 Backlands 6-30
6.3.2.1 Description 6-30
6.3.2.2 Ability to Meet Project Objectives 6-37
6.3.2.3 Environmental Impacts 6-38

Page

Volume 2 (continued)

6. Alternatives (continued)
6.3.3 Alternative C: Historical Resources Relocation 6-50
6.3.3.1 Description 6-50
6.3.3.2 Ability to Meet Project Objectives 6-54
6.3.3.3 Environmental Impacts 6-55
6.3.4 Alternative D: SEP South/Quint Street 6-66
6.3.4.1 Description 6-66
6.3.4.2 Ability to Meet Project Objectives 6-69
6.3.4.3 Environmental Impacts 6-70
6.4 Alternatives Comparison and the Environmentally Superior Alternative 6-81
6.5 Alternatives Considered but Eliminated From Further Analysis 6-89
6.5.1 Alternative Site Locations 6-89
6.5.1.1 Project Site Plus SEP South 6-91
6.5.1.2 SEP South and Caltrans Site 6-91
6.5.1.3 Caltrans Site, Islais Creek Parcels, and Bruce Flynn Pump Station Adjacent Lot 6-93
6.5.1.4 SEP South/Asphalt Plant Site 6-94
6.5.1.5 Bruce Flynn Pump Station Adjacent Lot/Asphalt Plant/ Central Shops 6-94
6.5.1.6 SEP South 6-95
6.5.1.7 Asphalt Plant and 1550 Evans Avenue Sites 6-96
6.5.2 Alternative Site Layouts 6-97
6.5.2.1 Digesters Adjacent to Jerrold Avenue 6-97
6.5.2.2 Digesters in Clustered Configuration 6-97
6.5.2.3 Digesters in Two Rows 6-98
6.5.3 Alternative Approaches to Preserve Historical Resources 6-98
6.5.3.1 Retain Central Shops Buildings in Place 6-98
6.5.3.2 Relocate Central Shops Buildings within SEP 6-99
6.5.3.3 Relocate Central Shops Buildings to SFPW Site 6-100
6.5.3.4 Retain and Expand Central Shops Buildings 6-100
6.5.3.5 Retain a Portion of Central Shops Buildings 6-101
6.5.3.6 Retain a Portion of Central Shops Building A Only 6-102
6.5.3.7 Relocate One Central Shops Building Only 6-102
6.5.4 Miscellaneous Other Alternative Strategies 6-103
6.5.4.1 Divert Wastewater Flows to the Oceanside Water Pollution Control Plant 6-103
6.5.4.2 Use Railway Instead of Trucks for Hauling Biosolids 6-104

7. Report Preparers 7-1
7.1 EIR Authors 7-1
7.2 Project Sponsor 7-1
7.3 EIR Consultants 7-2
7.4 EIR Contributors 7-3

Page

Volume 3 *(Responses to Comments)*

8. Introduction to Responses to Comments **8-1**
8.1 Purpose of the Responses to Comments Document 8-1
8.2 Environmental Review Process 8-2
8.2.1 Notice of Preparation and Public Scoping 8-2
8.2.2 Draft EIR Public Review 8-2
8.2.3 Responses to Comments Document and Final EIR 8-3
8.3 Document Organization 8-4

9. List of Persons Commenting **9-1**

10. Responses to Comments
10.1 Organization of Responses to Comments 10.1-1
10.2 Project Description 10.2-1
PD-1: Project Objectives 10.2-1
PD-2: Proposed Solids Treatment Process 10.2-2
PD-3: Resiliency Planning 10.2-4
10.3 Aesthetics 10.3-1
AE-1: Aesthetic Impacts 10.3-1
10.4 Cultural Resources 10.4-1
CR-1: Historical Resources 10.4-1
CR-2: Archeological Resources 10.4-4
CR-3: Tribal Cultural Resources 10.4-6
10.5 Transportation and Circulation 10.5-1
TR-1: Construction Impacts – Traffic Circulation 10.5-1
TR-2: Construction Impacts – Emergency Access 10.5-14
TR-3: Construction Impacts – Parking 10.5-16
TR-4: Cumulative Transportation Impacts 10.5-18
TR-5: Operational Transportation Impacts 10.5-29
10.6 Air Quality and Greenhouse Gas Emissions 10.6-1
AQ-1: Standard for Mitigating Construction-Related and Operational Impacts 10.6-1
AQ-2: Construction-Related Air Quality Impacts 10.6-5
AQ-3: Mitigation to Reduce Fugitive Dust 10.6-8
AQ-4: Additional Mitigation to Reduce Construction-Related NO_x and $PM_{2.5}$ Emissions 10.6-12
AQ-5: Additional Mitigation to Address Operational Criteria Air Pollutant Impacts 10.6-18
AQ-6: Odor Issues 10.6-22
AQ-7: Mitigation to Reduce GHG Impacts 10.6-24
AQ-8: Inclusion of Air Quality Technical Report and Diesel Equipment Compliance Requirements 10.6-25
10.7 Hydrology and Water Quality 10.7-1
HY-1: Sea Level Rise 10.7-1
10.8 Hazards and Hazardous Materials 10.8-1
HZ-1: Asbestos 10.8-1
HZ-2: Hazards to San Francisco Wholesale Produce Market and Community 10.8-3
10.9 Other CEQA Considerations 10.9-1
OC-1: CEQA Process 10.9-1
OC-2: Cumulative Impact Analysis 10.9-2

CHAPTER 8
Introduction to Responses to Comments

8.1 Purpose of the Responses to Comments Document

The purpose of this Responses to Comments (RTC) document is to present comments on the Draft Environmental Impact Report (Draft EIR) for the proposed Biosolids Digester Facilities Project (BDFP or project), to respond in writing to comments on environmental issues, and to revise the Draft EIR as necessary to provide additional clarity. Pursuant to the California Environmental Quality Act (CEQA) Public Resource Code Sections 21091(d)(2)(A) and (B), the San Francisco Planning Department has considered the comments received on the Draft EIR, evaluated the issues raised, and is providing written responses that address each substantive environmental issue that has been raised by the commenters. In accordance with CEQA, the responses to comments focus on clarifying the project description and addressing physical environmental issues associated with the project. In addition, this RTC document includes text changes to the Draft EIR initiated by Planning Department staff.

None of the comments received provide new information that warrants recirculation of the Draft EIR. The comments do not identify new significant impacts or a substantial increase in the severity of previously identified impacts or feasible project alternatives or mitigation measures that are considerably different from those analyzed in the Draft EIR and/or that the project sponsor has not agreed to implement.

The Draft EIR together with this RTC document constitutes the Final EIR for the project in fulfillment of CEQA requirements consistent with CEQA Guidelines Section 15132. The Final EIR has been prepared in compliance with CEQA, including the CEQA Guidelines and the San Francisco Administrative Code, Chapter 31. It is an informational document for use by (1) governmental agencies (such as the City and County of San Francisco) and the public to aid in the planning and decision-making process by disclosing the physical environmental effects of the project and identifying possible ways of reducing or avoiding the potentially significant impacts; and (2) the Planning Commission and other City and County of San Francisco (CCSF or City) entities (such as San Francisco Public Utilities Commission [SFPUC] and the Board of Supervisors) where applicable prior to their decision to approve, disapprove, or modify the project.

This RTC document provides written responses to all substantive comments received during the public review period. It contains the following: (1) a list of persons, organizations, and public agencies commenting on the Draft EIR; (2) copies of comments received on the Draft EIR; (3) written responses to those comments; and (4) revisions to the Draft EIR to clarify or correct

information in the Draft EIR. See Section 8.3, below, for a description of the overall contents and organization of the combined Draft EIR and RTC document.

8.2 Environmental Review Process

8.2.1 Notice of Preparation and Public Scoping

The Planning Department sent a Notice of Preparation (NOP) to governmental agencies, organizations, and persons interested in the proposed project on June 24, 2015 (see Appendix NOP of the Draft EIR, Volume 2). During a 30-day public scoping period that ended on July 27, 2015, the Planning Department received three written comments from agencies and interested parties identifying environmental issues that should be addressed in the EIR. The comment letters received in response to the NOP are summarized in EIR Chapter 1, Table 1-1 and are included in Appendix NOP of the Draft EIR, Volume 2. In addition, a public scoping meeting was held on July 16, 2015 in the Alex Pitcher Room at the Southeast Community Facility, 1800 Oakdale Avenue, San Francisco, California to receive oral comments on the scope of the EIR. Oral comments were received from 10 speakers and are also summarized in the Draft EIR Chapter 1, Table 1-1. The Planning Department has considered all comments made by the public and agencies during the scoping period in preparing the EIR on the project.

In addition, the Native American Heritage Commission was contacted on November 25, 2015 to determine if there were known cultural sites within or near the area affected by the BDFP.[1] A list of Native American groups and individuals interested in the project was also requested and received from the Native American Heritage Commission. All eight contacts were sent letters on December 14, 2015, requesting their input on the project. No responses were received. Follow up phone calls conducted in February and March 2016 received two responses that were considered while preparing the EIR.

8.2.2 Draft EIR Public Review

The Draft EIR on the BDFP was published on May 3, 2017 and circulated to local, state, and federal agencies and to interested organizations and individuals for their review and comment. The Planning Department held a 45-day public review period, starting on May 4, 2017 and ending on June 19, 2017. Paper copies of the Draft EIR were made available for public review at the following locations: (1) San Francisco Planning Department, 1650 Mission Street, 1st Floor, Planning Information Counter, San Francisco, California; (2) San Francisco Main Library, 100 Larkin Street, San Francisco, California; and (3) Bayview Library, 5075 Third Street, San Francisco, California. Electronic copies of the Draft EIR could be accessed through the internet on the Planning Department website, Environmental Impacts and Negative Declarations webpage at the following address: http://sf-planning.org/sfpuc-negative-declarations-eirs. On May 3, 2017, the Planning Department also distributed notices of availability of the Draft EIR to over 2,500 interested parties, published

[1] Byrd, Brian F., Philip Kaijankoski, Rebecca Allen, and Matthew Russell, Archaeological Research Design and Treatment Plan for the Biosolids Digester Facility Project, Southeast Water Pollution Control Plant, San Francisco, California. Prepared for San Francisco Public Utilities Commission, October, 2016.

notification of its availability in a newspaper of general circulation in San Francisco (the San Francisco Chronicle), and posted nine notices at the project sites.

During the public review period, the Planning Department conducted a public hearing to receive oral comments on the Draft EIR. The public hearing was held before the San Francisco Planning Commission on June 1, 2017 at San Francisco City Hall. A court reporter present at the public hearing transcribed the oral comments verbatim and prepared a written transcript. See Attachment PH of this RTC document for the public hearing transcript. During the Draft EIR public review period, the Planning Department received comments from three public agencies, seven organizations, and nine private individuals. See Chapter 9, *List of Persons Commenting*, for a complete list of persons, agencies, and organizations commenting on the Draft EIR.

8.2.3 Responses to Comments Document and Final EIR

The comments received during the public review period are the subject of this RTC document, which addresses all substantive written and oral comments on the Draft EIR. Under CEQA Guidelines Section 15201, members of the public may comment on the project. Further, CEQA Guidelines Section 15204(a) states that the focus of public review should be "on the sufficiency of the [Draft EIR] in identifying and analyzing the possible impacts on the environment and ways in which the significant effects of the project might be avoided or mitigated." In addition, "when responding to comments, lead agencies need only respond to significant environmental issues and do not need to provide all information requested by reviewers, as long as a good faith effort at full disclosure is made in the EIR." CEQA Guidelines Section 15088 specifies that the lead agency is required to respond to the comments on the major environmental issues raised in the comments received during the public review period. Therefore, this RTC document is focused on the sufficiency and adequacy of the Draft EIR in disclosing the significance of the environmental impacts of the project that was evaluated in the Draft EIR.

The Planning Department distributed this RTC document for review to the San Francisco Planning Commission, as well as to the agencies, organizations, and individuals who commented on the Draft EIR. The Planning Commission will consider the adequacy of the Final EIR—consisting of the Draft EIR and the RTC document—in complying with the requirements of CEQA. If the Planning Commission finds that the Final EIR complies with CEQA requirements, it will certify the Final EIR under CEQA.

If the Final EIR is certified, the SFPUC will then review and consider the Final EIR before making a decision to approve the proposed project. If the SFPUC decides to approve the project, it will adopt CEQA findings, including adopting or rejecting mitigation measures and alternatives to avoid or reduce significant impacts, and a mitigation monitoring and reporting program (MMRP). Consistent with CEQA Guidelines Section 15097, the purpose of the MMRP is to ensure implementation of the mitigation measures identified in the Final EIR and adopted by decision-makers to mitigate or avoid the project's significant environmental effects. CEQA also requires the adoption of findings prior to approval of a project for which a certified EIR identifies significant environmental effects (CEQA Guidelines Sections 15091 and 15092). If the EIR identifies significant adverse impacts that cannot be mitigated to less-than-significant levels and the project is approved,

the findings must reject project alternatives and include a statement of overriding considerations for those impacts (CEQA Guidelines Section 15093(b)). The SFPUC adopts the MMRP as a condition of project approval.

8.3 Document Organization

This RTC document is organized to complement the Draft EIR and follows the sequential numbering of chapters in the Draft EIR. The Draft EIR consists of Chapters S through 7 as follows:

- **Chapter S, *Summary*.** This chapter summarizes the project, identifies significant environmental impacts and mitigation measures, and describes the alternatives considered in this EIR, including the environmentally superior alternative. It also identifies areas of controversy and issues to be resolved.

- **Chapter 1, *Introduction*.** This chapter describes the purpose and organization of the EIR, as well as the environmental review process and additional public outreach efforts.

- **Chapter 2, *Project Description*.** This chapter describes the project (including project background and project objectives), summarizes project components, and provides information about project construction and operation. The chapter also lists permits and approvals relevant to the construction and operation of the BDFP.

- **Chapter 3, *Plans and Policies*.** This chapter describes applicable land use plans and policies and their relevance to the project and identifies any inconsistencies with those plans.

- **Chapter 4, *Environmental Setting and Impacts*.** This chapter is subdivided into sections for each environmental resource topic. Each section describes the environmental and regulatory setting, the criteria used to determine impact significance, and the approach to the analysis for that resource topic. It then presents analyses of potential environmental impacts as well as the project-specific mitigation measures that have been developed to address significant and potentially significant impacts. Each section also includes an evaluation of cumulative impacts with respect to that resource topic. The environmental resource topics are:

  - Land Use
  - Aesthetics
  - Population and Housing
  - Cultural Resources
  - Transportation and Circulation
  - Noise and Vibration
  - Air Quality
  - Greenhouse Gas Emissions
  - Wind and Shadow
  - Recreation
  - Utilities and Service Systems
  - Public Services
  - Biological Resources
  - Geology, Soils, and Paleontological Resources
  - Hydrology and Water Quality
  - Hazards and Hazardous Materials
  - Mineral Resources, Energy Resources, and Water Use
  - Agriculture and Forest Resources

- **Chapter 5, *Other CEQA Issues*.** This chapter discusses growth-inducing effects, identifies the significant environmental effects that cannot be avoided if the project is implemented, and describes significant irreversible impacts.

- **Chapter 6, *Alternatives*.** This chapter describes the alternatives to the project and compares their impacts to those of the project. This chapter also summarizes the alternatives that were considered but eliminated from further analysis.

- **Chapter 7, *Report Preparers*.** This chapter lists the authors of this EIR.

Technical and other supporting information for the Draft EIR is included as appendices to the Draft EIR.

This RTC document consists of Chapters 8 through 11 plus supplemental attachments, as follows:

- **Chapter 8, *Introduction to Responses to Comments*.** This chapter describes the purpose of the RTC document, the environmental review process, and the organization of the entire EIR.

- **Chapter 9, *List of Persons Commenting*.** This chapter lists the persons, agencies, and organizations that submitted comments on the Draft EIR and describes the coding and organization of comments.

- **Chapter 10, *Responses to Comments*.** This chapter presents the substantive comments received on the Draft EIR together with responses to those comments. The comments and responses in this chapter are organized by topic, covering several of the environmental topics addressed in Chapter 4 of the EIR. Similar comments on the same topic were received from multiple commenters. These comments are grouped together, and a single comprehensive response is provided.

- **Chapter 11, *Draft EIR Revisions*.** This chapter presents changes and additions to the Draft EIR. The Planning Department has made changes and additions to the Draft EIR in response to comments received on the Draft EIR and/or as necessary to clarify statements and conclusions made in the Draft EIR. In all cases, changes and additions are provided to clarify or correct content in the Draft EIR or to add information received after the release of the Draft EIR. None of the changes or additions in Chapter 11 affect the conclusions presented in the Draft EIR.

- ***Responses to Comments Attachments*.** The attachments include full copies of the written comments received on the Draft EIR (Attachment COM, Written Comments on Draft EIR, Coded) and the transcript of the public hearing held for the Draft EIR (Attachment PH, Public Hearing Transcript, Coded). Attachment COM and Attachment PH also show, in the margin of each letter or transcript, the bracketing and comment code used to identify comments and the corresponding response code.

This page intentionally left blank

CHAPTER 9
List of Persons Commenting

This Responses to Comments (RTC) document provides written responses to comments received on the Draft Environmental Impact Report (Draft EIR) during the public review period, including all written comments submitted either by letter or email and all oral comments presented at the public hearing on the Draft EIR. This chapter lists all persons who submitted comments on the Draft EIR. Persons who submitted written comments are grouped according to whether they represent a public agency, an organization, or commented as an individual, as shown in **Table 9-1**. The complete set of written and oral comments received on the Draft EIR is contained in Attachment COM, Written Comments on the Draft EIR, Coded, and Attachment PH, Public Hearing Transcript, Coded.

The commenter codes were assigned to facilitate the preparation of responses, and there is a unique commenter code for each comment letter, email, and public hearing transcript based on the name of the agency, organization, or individual submitting the comment. Comments submitted by mail, email, or orally at the public hearing (as transcribed in the official public hearing transcript) are all coded and numbered the same way. The commenter code begins with a prefix indicating whether the commenter represents a public agency (A), an organization or business (O), or an individual (I). The prefix is followed by a hyphen and an acronym or name for the agency or organization, or the individual's last name. If a commenter submitted more than one set of comments, the acronym or name is followed by a number indicating the comment set (e.g., 1, 2, 3…). Within each category (public agencies, organizations, and individuals), commenters are listed in alphabetical order by code.

As described further in Chapter 10, *Responses to Comments*, the commenter codes are used to identify individual comments on separate topics within each comment letter, email, or public hearing transcript. Each individual comment from each commenter is bracketed and numbered sequentially following the commenter code. The bracketed comments and corresponding comment codes are shown in the margins of the comments in Attachments COM and PH. There is a unique comment code for each distinct substantive comment.

CHAPTER 10
Responses to Comments

10.1 Organization of Responses to Comments

The San Francisco Planning Department, as lead agency for the California Environmental Quality Act (CEQA) environmental review process for the environmental impact report (EIR) on the Biosolids Digester Facilities Project (BDFP or project), has reviewed all letters, emails, and oral testimony presenting comments received on the Draft EIR, as listed in Chapter 9, *List of Persons Commenting*. This chapter presents all substantive comments received on the Draft EIR and responses to those comments, organized by topic. The substantive comments contained in the letters, emails, and public hearing transcript have been bracketed and numbered, and this chapter groups together comments on the same topic and provides a comprehensive response on that topic. Substantive comments are those comments that relate to the project, the adequacy or accuracy of the EIR, or the environmental review process, and do not include comments such as a description of an agency or organization's mission or a reiteration of the BDFP project description. All comments and written materials submitted during the public review period, however, are considered by the Planning Department and provided to the decision-makers for their consideration.

Attachments COM and PH contain the full text of all comments received on the BDFP Draft EIR and show the bracketing and associated comment code. Each bracketed comment is assigned a unique comment code that corresponds to the type of commenter (i.e., public agency [A], organization [O], and individual [I]); an acronym or name for the agency, organization, or individual; and the sequentially numbered, bracketed comment from that commenter. For example, the comment letter from the Bay Area Air Quality Management District is coded A-BAAQMD; the first comment in the letter is coded A-BAAQMD.1, the second comment on a different topic is coded A-BAAQMD.2, and so on.

This chapter is organized generally in the same order as the topics presented in the Draft EIR. The topics of the comments and responses included in this chapter are shown below, and the prefix of the response code[1] used to cross-reference the responses with the comment code is shown in parentheses:

10.2 Project Description (PD)
10.3 Aesthetics (AE)
10.4 Cultural Resources (CR)
10.5 Transportation and Circulation (TR)
10.6 Air Quality and Greenhouse Gas Emissions (AQ)

[1] The bracketed comments in Attachments COM and PH also include a response code beneath the comment code so that a commenter can readily locate the response to individual comments within this chapter.

10.7 Hydrology and Water Quality (HY)
10.8 Hazards and Hazardous Materials (HZ)
10.9 Other CEQA Considerations (OC)
10.10 Alternatives (AL)
10.11 General Comments (GC)

Within each section of this chapter under each topic area, similar comments are grouped together by subtopic. Subtopics are assigned a response code prefix and then numbered sequentially for each subtopic in that resource area. For example, Cultural Resources (CR) comments are listed as CR-1, CR-2, CR-3, and so on. For each subtopic, there is a list of the comments addressed showing the unique comment code that identifies the commenter and the specific comment. Following the list of comment codes for each subtopic, the comments are presented verbatim (including font styling such as bolded or italicized text). Comments with identical text have been combined.

Following each comment or group of comments on a specified subtopic, a comprehensive response is provided that addresses issues raised in the comments and clarifies or augments information in the Draft EIR as appropriate. Each response is assigned a response code that reflects the subtopic; for example, the response to the Comment CR-1 comment group is provided under Response CR-1. In some cases, where a comment addresses more than one topic, the response includes a cross-reference to other responses. As appropriate, the responses also provide clarification of the information presented in the Draft EIR and may also include revisions or additions to the Draft EIR. Revisions to the Draft EIR are shown as indented text. New or revised text is double-underlined; deleted material is shown in strikethrough (~~strikethrough~~). Chapter 11, *Draft EIR Revisions*, presents all changes and revisions to the Draft EIR, including those made as part of a response to comments.

10.2 Project Description

The comments and corresponding responses in this section relate to the topic of the Project Description, presented in Draft Environmental Impact Report (EIR) Chapter 2. For ease of reference these comments are grouped into the following issues that the comments raise:

- PD-1: Project Objectives
- PD-2: Proposed Solids Treatment Process
- PD-3: Resiliency Planning

Comment PD-1: Project Objectives

This response addresses the following comment, which is quoted below:

I-Lawrence-2.1

"Ratepayers are to spend in the neighborhood of $1.5 billion for new digesters at SEP. Work and commissioning is to be completed May 2025. Objectives for the project include "meet treatment capacity for projected 2045 flows and loads." The City is growing, and is expected to continue to grow both jobs and residents. Recently growth has been faster than past estimates; growth projections keep being revised upward. The existing digesters were built in the early 1950s, and will have lasted seventy years. The proposed digesters may be adequate for only twenty years. Given the size and cost of the project, both in dollars and in disruption, and environmentally, the objective of meeting flows and loads for only twenty years seems questionable. While per person use of water has declined, has "load" per person for purposes here? One reads that more pills, household products, and other new challenges make their way into sewage. One reads that the average person is larger than in the past. Have these trends been considered? Is it environmentally sound to plan for a twenty-year period, especially when recent experience suggests that projections might be low?" (Steve Lawrence, Email, June 14, 2017)

Response PD-1

The comment does not address the adequacy or accuracy of the EIR; rather, the comment speaks to the merits of the proposed Biosolids Digester Facilities Project (BDFP). The comment will be transmitted to City decision-makers for consideration in their deliberations on whether to approve the proposed BDFP.

Based on projections by the Association of Bay Area Governments, the San Francisco Planning Department has projected population to year 2040, but not beyond, in the *San Francisco General Plan*.[1] The SFPUC then extrapolated the 2040 projections to 2045, which is the project's planning

[1] City and County of San Francisco, *San Francisco General Plan 2014 Housing Element Part 1: Data and Needs Analysis*, adopted April 27, 2015.

horizon.[2] The growth assumptions underlying the BDFP design capacity and the methodology used to project future flows and loads are presented in the SFPUC's 2014 *Wastewater Flow and Load Projections Technical Memorandum*.[3] The SFPUC elected to plan for an approximately 20+ year period based on available planning information and a typical design life for municipal wastewater treatment plants. Consistent with industry standards, the life expectancies associated with this project are anticipated to be 15-20 years for equipment and 50 years for buildings, structures and pipelines. BDFP equipment would be maintained and/or replaced over time to extend the life of the facilities beyond 2045.

The proposed facilities can be adapted in the future to changing conditions and/or increased population growth if needed. With the project's more efficient solids treatment technologies, including the pre-digestion thermal hydrolysis process, less digester tank capacity is required to accommodate future needs compared to what would be needed if the current solids handling treatment processes were maintained. Moreover, the SFPUC designed the layout of the BDFP such that additional facilities could be installed at the Southeast Plant in the future if needed (such as additional digester capacity through additional digested sludge storage). Any additional facilities not included in the BDFP would undergo separate environmental review in the future, when designed and proposed.

Comment PD-2: Proposed Solids Treatment Process

This response addresses the following comment, which is quoted below:

A-BAAQMD.7

"We also recommend that this project consider how it might be designed to allow for addition of additional anaerobic digestion infrastructure at the SEP, given that the [California] Air Resources Board is looking toward publicly owned treatment works as co-location opportunities for food waste management as part of its "Short-lived Climate Pollutant Reduction Strategy" (March 2017). Further, to meet the requirements of SB 1383 (Lara, 2016), the City and County of San Francisco, as well as all other local jurisdictions around the State, will need to divert 50 percent of organics wastes from landfill in 2020 and 75 percent in 2025. Given the requirements of SB 32 (Pavley, 2016) to reduce greenhouse gas emissions by forty percent below 1990 levels by 2030, there is further need to assure that long-haul trucking is not required to satisfy the intention of SB 1383. As such, there is growing need to identify opportunities close to or within San Francisco and the Bay Area to compost and/or digest organic materials. Given that this facility has been permitted for biodigestion, we encourage this project to consider potential co-location during its design and buildout. Such consideration may mean designing a project that is conducive to any or all of the following: (i) the addition of more biodigester vessels at this site, (ii) the upsizing or addition of biogas storage facilities at this site, (iii) the addition of infrastructure that will enable upgrading of biogas to renewable

[2] SFPUC, *Wastewater Flow and Load Projections Technical Memorandum*, prepared for San Francisco Public Utilities Commission Sewer System Improvement Program, updated February 2014.

[3] SFPUC, *Wastewater Flow and Load Projections Technical Memorandum*, prepared for San Francisco Public Utilities Commission Sewer System Improvement Program, updated February 2014.

natural gas, and (iv) the capacity to install piping that enables produced biogas to be transported via rail tanker or pipeline." (Jean Roggenkamp, Bay Area Air Quality Management District, Letter, July 28, 2017)

Response PD-2

The BDFP as proposed would not preclude the consideration of future installation of facilities that treat food waste. As noted in **Response PD-1**, above, the SFPUC designed and located the BDFP such that additional facilities (such as additional digested sludge storage) could be installed at the Southeast Water Pollution Control Plant in the future if needed. Any additional facilities not included in the BDFP would undergo separate environmental review in the future, when designed and proposed. In any case, this comment will be transmitted to City decision-makers for consideration in their deliberations on whether to approve the proposed BDFP.

Regarding compliance with Senate Bill (SB) 1383, as described on Draft EIR page 4.12-10, in 2002 the San Francisco Board of Supervisors set goals of achieving 75 percent diversion of wastes from landfills and incineration by 2010, and zero solid waste (i.e., 100 percent diversion) by a date determined once the 50 percent diversion goal was met (Ordinance 679-02). Following adoption of Ordinance 679-02, it was determined that the goal of 50 percent landfill diversion had been met in 2001, and the San Francisco Commission on the Environment established a goal of achieving zero solid waste by 2020 in Resolution 002-03-COE (dated March 6, 2003). The City achieved 75 percent landfill diversion in 2008 through the implementation of numerous programs and efforts. The San Francisco Department of the Environment has been directed by the Board of Supervisors to develop policies and programs to achieve zero waste by methods such as increasing producer and consumer responsibility. The San Francisco Board of Supervisors adopted the Mandatory Recycling and Composting Ordinance in 2009, which requires all of San Francisco to separate recyclables, compostables, and trash to be landfilled (Draft EIR page 4.12-11). The purpose of this ordinance is to send no compostable or recyclable material to landfills, which goes beyond the requirements of SB 1383. To achieve this goal, in addition to increasing consumer and producer responsibility, the City has partnered with Recology to pilot a program to capture organics from multifamily housing mixed waste by compressing the waste to extract the organics and sending the organic materials to digestion facilities owned by East Bay Municipal Utility District in Oakland, less than 15 miles from the Recology facility.[4] Implementation of the BDFP would not adversely affect the City's compliance with SB 1383, the City's goals to divert organic waste from landfills, or the City's pilot program with Recology, nor would it encourage any long-haul trucking to satisfy SB 1383 requirements.

---

[4] San Francisco Department of the Environment, Jack Macy, personal communication with Larry Kass, ESA, August 24, 2017.

Comment PD-3: Resiliency Planning

This response addresses the following comment, which is quoted below:

I-Lawrence-1.1

"The proposed new digesters are to employ a new technology, THP. Will there be less resilience than now? San Francisco is subject to earthquake, flood or deluge, possibly tidal wave sea rise, and terror attack, any of which may change digester feedstock. Avoiding digester upset should be a priority. Digester upset, especially if extended in length, could harm San Francisco's livability and its economy. Will the new digesters (will the sewage treatment plant with them) be as resilient as what we have, or could have, and if not, what mitigations or steps are prudent?" (Steve Lawrence, Email, May 4, 2017)

Response PD-3

As required by CEQA, the Draft EIR evaluates physical environmental effects of the BDFP, including the potential for the BDFP to exacerbate existing environmental hazards.[5] As this comment does not address the adequacy or accuracy of the EIR, no further response is required under CEQA. Nonetheless, information pertaining to resiliency planning relative to the BDFP is provided below.

Resilient San Francisco defines resilience as "the capacity of individuals, communities, institutions, businesses and systems within a city to survive, adapt and grow, no matter what kinds of chronic stresses and acute shocks they experience."[6] In this case the amount of maintenance (and associated time offline) required at Southeast Water Pollution Control Plant solids processing facilities after chronic stress or a given acute shock (such as a seismic event) would reflect the facilities' resilience. The SFPUC intends for the new biosolids digester facilities to be more resilient than the existing digester system. As stated in Draft EIR Section 2.3 (page 2-19), explicit project objectives include, among others, adding infrastructure redundancy for critical processes to provide reliability and operational flexibility; improving seismic reliability; and designing and siting the new facilities to accommodate or adapt to expected sea level rise. The new facilities are designed to meet the latest building codes and seismic design requirements (see EIR Section 4.15.2.3, Draft EIR pages 4.15-14 to 4.15-17, and Impact GE-1, Draft EIR pages 4.15-20 to 4.15-21). The location of the new facilities is not in a defined flood zone or in an area known to flood (see EIR Section 4.16.1.4, Draft EIR page 4.16-5). Regardless, the new biosolids facilities would include features to address sea level rise and meet the requirements as defined by the Sea Level Rise checklist developed under the City's

[5] CEQA requires an evaluation of the project's physical environmental effects. Analysis of the effects of existing environmental conditions on a project's occupants or users is not required under CEQA, but CEQA does require an analysis of existing environmental hazards if the project might exacerbate them.

[6] City and County of San Francisco Office of Resilience and Recovery, *Resilient San Francisco: Stronger Today, Stronger Tomorrow*, April 18, 2016. Available online at http://sfgov.org/orr.

Capital Planning Committee (see EIR Section 2.4.2.2, Draft EIR pages 2-41 to 2-42, Section 4.16.2.3, Draft EIR pages 4.16-32 to 4.16-34, and Impact HY-8, Draft EIR pages 4.16-51 to 4.16-52).

As described on Draft EIR page 6-20, if the BDFP is not undertaken the SFPUC would need to implement an increased frequency of maintenance compared to either existing or future-with-project conditions, and would need a more rigorous program to repair and replace facilities for reliable operations. As described on Draft EIR page 6-21, the risk of upset of the proposed project would be lower than the risk associated with existing facilities. The existing facilities were built prior to current seismic standards, and are not designed for future sea level rise considerations. In addition, as discussed in Draft EIR Section 6.3.1.3 (starting on page 6-22), long-term continued use of the existing solids treatment facilities would result in an increasing risk of failure and shutdown the longer this equipment is used. The new digesters are designed in accordance with current engineering standards, which are developed to reduce the amount of maintenance work and offline time required for the facilities.

This page intentionally left blank

10.3 Aesthetics

The comments and corresponding responses in this section relate to the topic of aesthetics, evaluated in Draft Environmental Impact Report (EIR) Section 4.3. For ease of reference, these comments are grouped into the following issues that the comments raise:

- AE-1: Aesthetic Impacts

Comment AE-1: Aesthetic Impacts

This response addresses the following comments, which are quoted below:

O-Greenaction.3 O-Greenaction.8

"A major concern is the projected increase in truck traffic. The project estimates a thirty to fifty percent increase in truck traffic to/from the Southeast Plant, and we consider 10-14 truck trips per day to be a large number of trips, particularly for a facility that operates 24 hours a day, 7 days a week, 365 days per year. We strongly encourage the project to explore ways to reduce and mitigate the increase in truck trips, particularly given the air quality overburden and environmental justice concerns in this community. Even if the trucks are using 2010 or new engines and if they are Tier 4 for pollution control, having over a dozen trucks rumbling into and out of the plant daily increases the intensity of impacts on the community, particularly if taking place in evenings, during the night, or over the weekend. We strongly encourage SFPUC to come up with a plan to mitigate the aesthetic and health impacts of this increase in truck traffic." (Bradley Angel, Greenaction for Health and Environmental Justice, Letter, June 26, 2017)

"We observe that the project proposes using 1500 Evans/Third and the adjacent Greenhouses as staging areas. The project also plans to use Pier 94 Backlands as a staging area. On aesthetic concerns, these choices are problematic and warrant mitigation. The construction phase of this project is planned for 2018-2023. This timeframe means that the community will have five years of construction equipment and materials, as well as ongoing truck traffic, piled in a visible parking lot on the main thoroughfare into and out of the neighborhood. We strongly encourage the project not to use 1500 Evans as a staging area and, instead, to use areas internal to the plant and behind walls more efficiently. We also encourage aesthetic mitigation for any use of the Greenhouses and of Pier 94 Backlands as staging areas." (Bradley Angel, Greenaction for Health and Environmental Justice, Letter, June 26, 2017)

Response AE-1

Operational Truck Traffic Visual Effects

The commenter expresses concern about aesthetic impacts of operational truck traffic. Section 4.3.3.2, Approach to Analysis (Draft EIR pages 4.3-18 - 4.3-20) describes the methodology used to evaluate project impacts on aesthetic conditions. The project's operations-phase impact on the existing

visual character of the site and its surroundings are evaluated under Impact AE-3 (Draft EIR pages 4.3-23 – 4.3-28), and were found to be less than significant; therefore, no mitigation is required. Consistent with the Approach to Analysis presented in Section 4.3.3.2, the analysis focused on long-term changes to the visual character of the project site and vicinity associated with the removal of existing structures and vegetation, construction of new facilities, and landscaping and street improvements, and the net effect on views of the site and vicinity resulting from these changes. Although not explicitly considered in Impact AE-3, the proposed change in the number of operations-phase truck trips associated with the project does not alter the conclusions of the analysis (and thus warrant the inclusion of a mitigation measure) for the following reasons. As stated in Draft EIR Chapter 2, *Project Description*, operational truck traffic would increase by approximately 3-4 trucks per day (from between 7 and 10 to between 10 and 14 biosolids hauling trips per day once the project is complete). This increase in operational truck traffic would be even higher under the No Project Alternative due to population growth and because the proposed BDFP treatment process would further condense the resulting biosolids. As identified in Appendix TR, single-unit trucks[1] comprise approximately seven percent of the average daily weekday traffic along Jerrold Avenue. The additional operational trucks (which would be routed on Evans Avenue rather than Jerrold Avenue in the future) would not visually contrast with the area's predominant industrial and warehouse land uses and associated vehicles in the area. Trucks would pass through the project vicinity and thus would not dominate views compared to other site features nor permanently block or obscure views. Thus, visual impacts of these truck trips would be less than significant and no mitigation is required.

Staging Area Visual Effects

Regarding the comment pertaining to the staging areas, as shown in Figure 2-2 of the DEIR (page 2-4), potential staging areas include Pier 94/96, 1550 Evans, Southeast Greenhouses, as well as areas within the Southeast Water Pollution Control Plant and the project site. The San Francisco Public Utilities Commission intends to maximize the use of the project area for staging to the extent feasible, balancing space requirements for construction and worker safety, but additional off-site staging area would still be needed. As described in Draft EIR Section 4.3.3.2, the analysis in the Draft EIR evaluated the potential visual impacts of the proposed temporary use of off-site staging areas, including assessing whether the project would substantially degrade the existing visual character of the site or its surroundings or damage scenic resources. The Biosolids Digester Facilities Project (BDFP) proposes to use 1550 Evans Avenue, not 1500 Evans Avenue, as a potential construction staging area. The parking lot at 1550 Evans Avenue is currently partially obscured by an approximately 6-foot-tall brick-red fence on Newhall Street and Evans Avenue. The parking lot is visible at locations immediately adjacent to the entry and exit gates on the property. Trees along the Evans-facing fence line also obscure views of the parking lot. Project effects on visual character of the 1550 Evans Avenue site are evaluated on Draft EIR page 4.3-21; as described therein, the San Francisco Public Utilities Commission would remove some perimeter trees and other landscaping along Evans Avenue and Newhall Street and within the site to facilitate use of the site for construction staging. No trees would be removed within 30 feet of Third Street, as there is an easement for the landscaping in this portion of the site. As shown in Draft EIR Appendix BIO, most

[1] Single-unit trucks are medium or heavy trucks in which the engine, cab, drive train, and cargo area are all one base frame (chassis).

trees nearest Evans Avenue within the site would remain. Based on the EIR analysis (included in Draft EIR page 4.3-21), while removal of some trees at 1550 Evans Avenue would somewhat lessen the overall visual quality of the site, the net change in visual quality would not be substantial, given that perimeter trees that would be retained would continue to provide visual interest (as well as screening), few viewing opportunities exist in the surround areas, and activities at the site would be similar to and visually compatible with surrounding land uses. Thus, visual impacts would be less than significant and mitigation would not be required.

The Draft EIR (page 4.3-21) also evaluated the effect on visual character that would result from use of the Southeast Greenhouses site for construction staging. Use of the site for construction staging would be temporary and (given the site's existing visual character and its future appearance following removal of structures at the site as part of the Southeast Greenhouses Demolition Project [see Draft EIR p. 4.1-10 for a description of this project]) was not found to cause a significant aesthetic effect. Thus, mitigation is not required. Note, however, that temporary noise barriers that may be erected in accordance with Mitigation Measure M-NO-1b (Draft EIR page 4.7-32) could also function as a visual barrier between the construction staging at the Southeast Greenhouses site and the surrounding neighborhood.

As described in Draft EIR Section 4.3.1.2 (page 4.3-10), the Pier 94 Backlands area is currently used for storage of large piles of dredged sand and other materials. The Pier 94 Backlands is surrounded by industrial uses; a railyard obscures the view of the Pier 94 Backlands from Cargo Way. The aesthetic effects of use of Piers 94 and 96 for construction staging are evaluated on Draft EIR pages 4.3-20 and 4.3-21. The existing visual quality of the staging areas is considered moderate to low based on the industrial, utilitarian character of land uses in the area, and views of the off-site staging areas are limited by intervening structures and other features (e.g., piles of dredged sand and demolition debris). The equipment and activities associated with project construction would not affect the existing visual character of the area or scenic resources due to intervening structures and similarity with current uses of the piers. As a result, the EIR analysis concluded that the impact of project construction on the visual character and scenic resources of staging on Pier 94 Backlands would be less than significant. Thus, mitigation is not required.

10.4 Cultural Resources

The comments and corresponding responses in this section relate to the topic of cultural resources, evaluated in Draft EIR Section 4.5. For ease of reference, these comments are grouped into the following issues that the comments raise:

- CR-1: Historical Resources
- CR-2: Archeological Resources
- CR-3: Tribal Cultural Resources

Comment CR-1: Historical Resources

This response addresses the following comments, which are quoted below:

O-BayviewCP-2.1	O-BHS.1	I-Blacketer.2	I-Blacketer.3
I-Hamman-3.1	I-Hamman-3.2		

"Impacts on Individual Historic Elements - **The Central Shops** and Southeast Treatment Plant Streamline Moderne Industrial Historic District

"As noted in the EIR, the proposed project would result in the removal of the Central Shops (including Buildings A and B), a complex that is eligible for listing in the California and National Registers. (Vol 1. S-6)

"The removal of Buildings A and B at the Central Shops would cause a substantial adverse change in the significance of the historical resource because the project would demolish the physical characteristics that convey the resource's historical significance and that justify its individual eligibility for inclusion in the California and National Registers, resulting in a significant impact under CEQA Guidelines Section 15064.5." (Dan Dodt, Bayview Community Planning, Letter, June 17, 2017; Adrian Card, Bayview Historical Society, Letter, June 19, 2017)

"Recommendation

"Understanding that implementing Mitigation Measure M-CR-1 (Documentation of Historic Resources and Interpretive Display)

"'would reduce the severity of the impact…but would not reduce the severity of the impact to a less-than-significant level' and even though 'the impact would be significant and unavoidable with mitigation',

"we nevertheless recommend a combined solution for the loss of these historic resources. It is suggested that the complete and thorough **Mitigation Measure M-CR-1 be conducted, along with the implementation of Alternative C**, the Historical Resources Relocation, with the relocation of the Central Shops serving as the permanent public display and archival venue for the documentation and interpretive material. As indicated in M-CR-1:

"'the SFPUC shall provide a permanent display of interpretive materials (which may include, but are not limited to, a display of photographs, a brochure, educational website, or an exhibitive display)

….Development of the interpretive materials shall be supervised by an architectural historian or historian who meets the Secretary of the Interior's Professional Qualification Standards…shall be placed in a prominent, public setting. A proposal describing the general parameters of the interpretive materials shall be approved by Planning Department Preservation staff prior to construction completion. The substance, media and other elements of such interpretive display shall be approved by Planning Department Preservation staff prior to completion of the project.'

"And as indicated in Alternative C:

"'*The Historical Resources Relocation Alternative, would consist of full construction and operation of the BDFP as proposed, plus the relocation of Central Shops Buildings A and B to a similar industrial setting in San Francisco. The relocation, rehabilitation, and reuse of Buildings A and B would be consistent with the Secretary of the Interior's Standards, and would reduce the significant and unavoidable impact on historical resources under the proposed project to a less than- significant level. Rather than demolishing Buildings A and B, the SFPUC would dismantle these structures such that they could be relocated consistent with the Secretary of the Interior's Standards for Rehabilitation.*'" (Dan Dodt, Bayview Community Planning, Letter, June 17, 2017)

"Recommendation

"We have reviewed the proposed Mitigation Measure M-CR-1 (Documentation of Historic Resources and Interpretive Display) which 'would reduce the severity of the impact…but would not reduce the severity of the impact to a less-than-significant level' and even though 'the impact would be significant and unavoidable with mitigation', and have also noted the Alternative C mitigation option -'The Historical Resources Relocation Alternative' - and understand that this 'would consist of full construction and operation of the BDFP as proposed, plus the relocation of Central Shops Buildings A and B to a similar industrial setting in San Francisco. The relocation, rehabilitation, and reuse of Buildings A and B would be consistent with the Secretary of the Interior's Standards, and would reduce the significant and unavoidable impact on historical resources under the proposed project to a less than-significant level. Rather than demolishing Buildings A and B, the SFPUC would dismantle these structures such that they could be relocated consistent with the Secretary of the Interior's Standards for Rehabilitation.'

"We recommend a combined solution for the loss of these historic resources. It is suggested that the complete and thorough Mitigation Measure M-CR-1 be conducted, along with the implementation of Alternative C, the Historical Resources Relocation, with the relocation of the Central Shops serving as the permanent public display and archival venue for the documentation and interpretive material, and establish this location as the Bayview Architectural Resources Archive.

"As indicated in M-CR-1:

"'the SFPUC shall provide a permanent display of interpretive materials; shall be supervised by an architectural historian or historian who meets the Secretary of the Interior's Professional Qualification Standards; shall be placed in a prominent, public setting; a proposal describing the general parameters of the interpretive materials shall be approved by Planning Department Preservation staff prior to construction completion; with the substance, media and other elements of such interpretive display shall be approved by Planning Department Preservation staff prior to completion of the project.'

"And as indicated in Alternative C:

""The Historical Resources Relocation Alternative, would consist of full construction and operation of the BDFP as proposed, plus the relocation of Central Shops Buildings A and B to a similar industrial setting in San Francisco.' A port property on Pier 92 is suggested." (Adrian Card, Bayview Historical Society, Letter, June 19, 2017)

"As the party responsible for the 40 year-long restoration of a City Landmark in Bayview, I am also dismayed with the plan for wholesale destruction of the Streamline Moderne Industrial Historic District in Bayview and for the Display Greenhouse structures at McKinnon and Phelps Streets, both iconic markers in the area." (Linda K. Blacketer, Letter, June 19, 2017)

"Central Shops

"I do understand the need to locate the digesters to an area far removed from residents, and, as such, concur with the recommendations proposed to remove and relocate Central Shops A and B. I also recommend that a combined solution for the loss of these historic resources be implemented, including fulfillment of **Mitigation Measure M-CR-1 along with the implementation of Alternative C,** the Historical Resources Relocation, with the relocation of the Central Shops serving as the permanent public display and archival venue for the documentation and interpretive material." (Linda K. Blacketer, Letter, June 19, 2017)

"As an admirer of architecture, I am also dismayed with the plan for wholesale destruction of the Streamline Moderne Industrial Historic District in Bayview and for the Display Greenhouse structures at McKinnon and Phelps Streets, both iconic markers in the area and contributory to the historic district. The preservation of such buildings is crucial for the community to retain a sense of it's past and it's distinctive character." (Michael Hamman, Letter, June 19, 2017)

"Central Shops

"I do understand the need to locate the digesters to an area far removed from residents, and, as such, concur with the recommendations proposed to remove and relocate Central Shops A and B. I also recommend that a combined solution for the loss of these historic resources be implemented, including fulfillment of **Mitigation Measure M-CR-1 along with the implementation of Alternative C,** the Historical Resources Relocation, with the relocation of the Central Shops serving as the permanent public display and archival venue for the documentation and interpretive material. As I have had some experience in relocating building in my capacity as General Contractor I can attest to the fact that such a relocation would not be unduly expensive." (Michael Hamman, Letter, June 19, 2017)

Response CR-1

The comments express support for Mitigation Measure M-CR-1 (Documentation of Historic Resources and Interpretive Display, Draft EIR pages 4.5-44 – 4.5-45) and implementation of Alternative C (Historical Resources Relocation Alternative, described and evaluated starting on Draft EIR page 6-50), rather than the BDFP, and suggest that Mitigation Measure M-CR-1 and Alternative C be combined such that the interpretive display would be installed at relocated Buildings A and B.

As noted in the Draft EIR (page 6-55), Alternative C would substantially reduce the severity of impacts on historic architectural resources (Impact CR-1), but the cumulative impact on historical architectural resources would remain significant and unavoidable. The commenters' support for adoption of Alternative C and suggestion to relocate historic resources to Pier 92 are noted and will be transmitted to City and County of San Francisco (City or CCSF) decision-makers for consideration in their deliberations on whether to approve the BDFP, as proposed. As stated on Draft EIR page 6-51, the SFPUC identified a site at Pier 90 (not Pier 92) for Alternative C.

Regarding the display greenhouses, the Southeast Greenhouse Demolition project is a separate project previously approved by the SFPUC, which the Draft EIR considered in the analysis of cumulative impacts. As stated in Draft EIR Table 4.1-1 (page 4.1-10), the Southeast Greenhouse buildings, which include the display greenhouses, were constructed in 1986 and are not historic structures. Refer also to **Response OC-3** in Section 10.9 of this document.

Please note that Bayview Historical Society misidentifies the source of the quote as being on page S-6; the quote is included on Draft EIR page 4.5-43.

Comment CR-2: Archeological Resources

This response addresses the following comment, which is quoted below:

I-Matlock.3

"…Nonetheless, I wish to express my interest in the preservation of the Ohlone heritage site, CA-SFR-171. Since I have not been in a position to research the DEIR during the past 48 days, I am not prepared to address the DEIR adequately. Thus, I have enclosed some copies of the educational materials which my group, Save the Shellmounds, distributes.

"Please note, that CA-SFR-171 is a cultural treasure of the Ohlone, and that its protection ought to be of greatest importance. The Ohlone do not get to make the decisions about the preservation of their own heritage sites. The fate of shellmounds, cemeteries, village places, and other sacred sites is in the hands of property owners and politicians. The Ohlone and their heritage places have been controlled by others since the Spanish invasion of the 1770s. Destruction of these heritage places is a hate crime. Very few of the shellmounds, and other heritage places, are preserved. Once CA-SFR-171 has been destroyed, the opportunity to save this priceless monument has ended.

"Please, reconsider this project so that not only CA-SFR-171 remains intact, but also that any other shellmounds might be saved. SAVE THE SHELLMOUNDS!" (Perry Matlock, Letter, June 19, 2017)

Response CR-2

Educational materials provided by this commenter are included in Attachment COM, Written Comments on the Draft EIR, Coded.

The City recognizes the legal significance and cultural importance of CA-SFR-171, a National Register-eligible prehistoric archaeological site. The City has determined that a significant impact could result if ground-disturbing activities during project construction were to affect CA-SFR-171. The impact could be an adverse effect to the scientific significance of the resource and/or an adverse effect to its significance to associated Native American tribal groups.

The overall goal of the BDFP is to replace the existing aged and unreliable solids processing facilities at the Southeast Water Pollution Control Plant with new, modern, and efficient facilities to ensure the long-term sustainability of the Southeast Plant wastewater treatment system. Many of the existing solids treatment facilities at the wastewater treatment plant are over 60 years old, require significant maintenance, and are operating well beyond their useful life. The proposed project would adversely affect CA-SFR-171, as discussed in Impact CR-2 on Draft EIR pages 4.5-45 through 4.5-48.

The City has proposed Mitigation Measure M-CR-2a (Archeological Testing, Monitoring, and/or Data Recovery, Draft EIR pages 4.5-48 and 4.5-53). This mitigation measure formalizes the City's commitment to conduct archeological testing and monitoring (as well as data recovery, if warranted) consistent with the project's Archeological Research Design and Treatment Plan, in consultation with the City's Environmental Review Officer (ERO). This would reflect both the findings of archeological testing previously approved, planned and/or currently underway, and potential future project design changes. The measure also would require that the archeological testing and monitoring program be consistent with the City's standard protocols.

The mitigation measure also includes provisions for engaging and consulting with the Native American community, as follows:

> **Consultation with Descendant Communities**. On discovery of an archeological site associated with descendant Native Americans, the Overseas Chinese, or other potentially interested descendant group, an appropriate representative of the descendant group, the ERO, and the SFPUC shall be contacted. The representative of the descendant group shall be given the opportunity to monitor archeological field investigations of the site and to offer recommendations to the ERO and SFPUC regarding appropriate archeological treatment of the site, of recovered data from the site, and, if applicable, any interpretative treatment of the associated archeological site. A copy of the Final Archeological Resources Report shall be provided to the representative of the descendant group.

The City has determined that implementation of Mitigation Measure M-CR-2a (Archeological Testing, Monitoring, and/or Data Recovery) and Mitigation Measure M-CR-2b (Accidental Discovery of Archeological Resources, Draft EIR pages 4.5-53 through 4.5-54) would reduce potential impacts on CA-SFR-171 to a less-than-significant level. Mitigation Measure M-CR-2a would formalize the SFPUC's commitment to conduct archeological testing and monitoring (as well as data recovery, if warranted) consistent with the project's Archeological Research Design and Treatment Program, in consultation with the City's Environmental Review Officer, to reflect both the findings of archeological testing previously approved, planned and/or currently underway, and any future project design changes. The measure also would require that the archeological testing and monitoring program be consistent with the City's standard protocols. Mitigation Measure M-CR-2b would ensure that (1) work would halt if archeological resources are inadvertently discovered during project implementation, and that (2) proper procedures are followed to ensure appropriate treatment of significant archeological resources.

In addition, the San Francisco Public Utilities Commission (SFPUC) intends to seek low-interest financing from the Environmental Protection Agency (EPA) through the Water Infrastructure Finance and Innovation Act (WIFIA) and the Clean Water State Revolving Fund (SRF), which would require consultation with the State Historic Preservation Officer and other consulting parties required under Section 106 of the National Historic Preservation Act of 1966 (NHPA), as amended (see Draft EIR page 2-70). The SRF Program is partially funded by the U.S. Environmental Protection Agency and administered by the SWRCB. EPA has authorized SFPUC to initiate NHPA Section 106 consultation.[1]

The Pier 94 Backlands Alternative would avoid impacts on CA-SFR-171, but the potential remains that this alternative could contribute to cumulative impacts on unrecorded archeological resources in the Pier 94 Backlands vicinity as well as along the pipeline route between the Pier 94 Backlands site and the Southeast Plant. However, as with the proposed project, implementation of Mitigation Measure M-CR-2a and Mitigation Measure M-CR-2b would ensure that potentially significant impacts on archeological resources would be mitigated to a less-than-significant level by conducting archeological testing and monitoring as well as ensuring that work would halt if archeological resources are inadvertently discovered.

Comment CR-3: Tribal Cultural Resources

This response addresses the following comments, which are quoted below:

A-SWRCB.3 I-Matlock.1

---

[1] Letter from Andrew Sawyers, Director of Office of Wastewater Management, USEPA, to Jenan Saunders, Deputy State Historic Preservation Officer, Office of Historic Preservation, regarding Authorization for National Historic Preservation Act Section 106 Review for San Francisco Public Utilities Commission Biosoilids Digester Facilities Project, November 22, 2017.

"We have noted the statement in the footnote on page 4.5-1, that provisions for Assembly Bill No. 52 Native Americans: California Environmental Quality Act only apply to projects that have a notice of preparation (NOP) filed on or after July 1, 2015, and that the NOP for the Project was released June 24, 2015. Therefore, the Project is not subject to separate tribal cultural resources analyses." (Susan Stewart, SWRCB, Letter, June 16, 2017)

"…Initially, I must point out that the term 'midden' which is used in the DEIR to describe the Ohlone heritage site, CA-Sfr-171, is derogatory. 'Shellmound, village site, or cemetery' would be more accurate, for the word midden means 'dung hill.'" (Perry Matlock, Letter, June 19, 2017)

Response CR-3

Tribal Cultural Resources Consultation

As noted by the commenter and in the EIR, the NOP for the project was released on June 24, 2015; consequently, the project is not subject to a separate tribal cultural resources analysis pursuant to the provisions of Assembly Bill 52 (codified in Public Resources Code Sections 21074, 5097.94 et seq).

Although Public Resources Code Section 21074 does not apply, tribal consultation efforts were conducted for the project. On behalf of the San Francisco Planning Department, Far Western Anthropological Research Group (Far Western) contacted the Native American Heritage Commission (NAHC) on November 25, 2015, and requested a search of their Sacred Lands File to determine if there were known cultural sites within or near the project area. Far Western also requested a list of Native American groups and individuals for the project area. On December 14, 2015, the NAHC responded stating that no Native American cultural resources were reported from the Sacred Lands file records search. Far Western sent letters to the eight contacts on the NAHC list on December 14, 2015, requesting input on the project. No responses were received. Follow-up phone calls were completed in February and March 2016, and two responses were received. Ramona Garibay and Ann Marie Sayers both expressed their concern regarding the known prehistoric archeological site (CA-SFR-171) and stated that a Native American monitor should be present during ground disturbance.[2] As discussed above in **Response CR-2**, the City has proposed Mitigation Measure M-CR-2a (Archeological Testing, Monitoring, and/or Data Recovery, Draft EIR pages 4.5-48 and 4.5-53), formalizing the City's commitment to conduct archeological testing and monitoring (as well as data recovery, if warranted) consistent with the project's Archeological Research Design and Treatment Plan, in consultation with the City's Environmental Review Officer (ERO). The measure would require that the archeological testing and monitoring program be consistent with the City's standard protocols. The mitigation measure also includes provisions for

[2] Brian F. Byrd, Ph.D., *Archaeological Research Design and Treatment Plan for the Biosolids Digester Facilities Project, Southeast Water Pollution Control Plant, San Francisco, California*. Prepared for San Francisco Public Utilities Commission, October 2016.

engaging and consulting with the Native American community, as quoted in **Response CR-2**. The SFPUC sent letters to all eight contacts on December 4, 2017 to provide a project update.[3]

Cultural Resources Terminology

The term midden is commonly used in archeology in both the United States and elsewhere, and refers to "a large refuse heap, mound, or concentration of cultural debris associated with human occupation. The term includes such materials as discarded artifacts (e.g., broken pots and tools), food remains, shells, bones, charcoal and ashes, and may include the material in which the debris is encapsulated and modifications of this matrix. Midden debris usually contains decayed organic material, bone scrap, artifacts (broken and whole), and miscellaneous detritus. The long-term disposal of refuse can result in stratified deposits, which are useful for relative dating."[4] The terms 'shellmound', 'village site' and 'cemetery' are more specific terms used to describe certain archaeological features.

———————————

10.5 Transportation and Circulation

The comments and corresponding responses in this section relate to the topic of transportation and circulation, evaluated in Draft Environmental Impact Report (EIR) Section 4.6. For ease of reference, these comments are grouped into the following transportation-related issues that the comments raise:

- TR-1: Construction Impacts – Traffic Circulation
- TR-2: Construction Impacts – Emergency Access
- TR-3: Construction Impacts – Parking
- TR-4: Cumulative Transportation Impacts
- TR-5: Operational Transportation Impacts

Comment TR-1: Construction Impacts – Traffic Circulation

This response addresses the following comments, which are quoted below:

A-CPC-Johnson.2	O-BayviewCP-2.3	O-BayviewCP-2.10	O-BVHPCAC.1
O-BVHPCAC.7	O-BRITE.4	O-PetCamp-1.3	O-Petcamp-1.4
O-Petcamp-2.3	O-PetCamp-2.4	O-SFWPM-1.1	O-SFWPM-1.3
O-SFWPM-2.2	O-SFWPM-2.6	I-Ares.1	I-Blacketer.6
I-Harney.2	I-Karlin.2		

"I actually also was going to point out the -- both the air quality, where there was significant mitigation that was necessary. I would like the staff to further explain what alternative mitigations could have been considered and as well for the traffic and the circulation. I think specifically, when it comes to an EIR, we do look at traffic and circulation as an impact. And I think that we can take a look at what are the alternative, again, mitigations for some of the impacts that we're looking at." (Christine Johnson, Planning Commission, Public Hearing Comments, June 1, 2017)

"II. TRAFFIC, CIRCULATION and TRANSPORTATION

"In our work with the Bayview CAC and many others, we are also requesting additional review of the impact analysis with respect to traffic and circulation (Impact TR 1-5 incl.; Vol.1 s28) from the existing 'LS' -less than significant - status to the LSM condition, requiring mitigation. While the EIR indicates potential compliance with 'applicable regulations' and the incorporation of a 'traffic and control plan', no such plan is articulated or explored within the report, nor is there a suggested mitigation for alleviating the traffic and circulation impacts as outlined in the analysis.

"In addition to a request for a thorough and multi-agency review and written plan as a requirement prior to final certification of the EIR, several straightforward, feasible mitigations are proposed.

…

"Recommendations:

"1. Study and re-evaluate the conclusions drawn in the EIR regarding the significance of the traffic impacts, along with a more clearly articulated and written, multi-agency transportation and traffic plan prior to certification of the EIR."

(Dan Dodt, Bayview Community Planning, Letter, June 17, 2017; Jack Gallagher, Bayview Hunters Point Citizens Advisory Committee, Letter, June 19, 2017)

"Second, residents have historically been deeply concerned about the lack of accessibility between Bayview and Hunters Point neighborhoods with the rest of the City – we have one North/South route, and less than a handful of East/West routes (Evans, Jerrold, Oakdale, and Paul). This long-imposed exile is currently exacerbated by game-day traffic for the Giants and will be further stressed once the basketball arena opens, also around the time when BDFP construction will be in full affect. Constricting the flow of traffic on Evans and closing Jerrold means the community will effectively lose its two Northern-most E/W routes, leaving only Oakdale and Paul "unaffected". Both of which are already heavily used and Oakdale is in terrible condition and getting worse.

…

"One example from a family in our community demonstrates how these street closures could test the resiliency of an already fragile community, compromise the economic stability of families, and exacerbate delicate issues of equitable justice. This family has children at a school in Cole Valley – getting to the school requires two, 1-hour round-trips per day. They take either Evans or Jerrold to Caesar Chavez / 101. One parent takes CalTrain to San Jose for work (approximately a 1h45m door-to-door commute). The children are dropped off by 8:30 am and picked up before 6pm. For every minute they're late, it costs $5/min/child. This family has minimal resiliency in their day already and see a strong education as the most accessible path to generational economic mobility. Adding even a 5-10 minute delay in their day due to traffic as a result of these street closures (compounded by aforementioned systemic impacts) will impose a "social justice tax" of $50 - $100/per day – they have 2 kids and are already stretched thin to get to the school by 6pm. This family is not alone in their transit struggles as a direct consequence of living in the isolated Bayview neighborhood.

"BRITE calls on the SFPUC to define a construction and staging plan that does not call for Jerrold to close. Consider using existing road infrastructure within the SEP boundaries; instead of performing roadwork during Phase 1 to transform the traffic patterns through the produce market, use that time and funding to make roadway improvements within the SEP boundary to handle the construction and hazardous material traffic currently targeted for Jerrold." (Steven Tiell, Bayview Residents Improving Their Environment, Letter, May 30, 2017, and Email, May 31, 2017)

"Asking small businesses to comment on a 1400-page Draft EIR that does not even include the traffic control plan places us at a distinct disadvantage. This document is complicated, convoluted and technical, yet is still missing a critical component, the traffic control plan. Sorry.

"It's unfair to expect small businesses to be able to comment on this type of document when it is lacking such a critical component." (Mark Klaiman, PetCamp, Public Hearing Comments, June 1, 2017)

"Yet there are better alternatives available for traffic. Rather than sending trucks and buses down such a narrow street as Phelps Street, negatively impacting the small businesses that have already been negatively impacted for decades by the plant, traffic should be directed from Evans to Mendell to Jerrold or from Evans to Rankin directly into the plant.

"These routes would significantly lessen the impact on small businesses in the Bayview and should be prioritized over the Phelps Street locations. Thank you so much." (Mark Klaiman, Public Hearing Comments, June 1, 2017)

"I encourage you to investigate better alternatives then than sending all of this traffic on Phelps Street from Evans to Jerrold including routing traffic from Evans to Mendell Street to Jerrold or along Evans to Rankin and directly into the plant. In so doing the burden on small businesses in the Bayview would be significantly lessened, bicycle riders will be protected, and San Franciscans patronizing the businesses on Phelps Street will be safer." (Mark Klaiman, PetCamp, Email, June 19, 2017)

"Lastly, that small businesses are being asked to comment on the DEIR without completion of a Traffic Control Plan places small business at a significant disadvantage. The DEIR is already long and complicated; to ask small businesses to comment on such a document when it is lacking such a critical component as the Traffic Control Plan is simply untenable. The DEIR should be withdrawn from public comment until such time that the Traffic Control Plan is available." (Mark Klaiman, PetCamp, Email, June 19, 2017)

"While we understand the importance of the treatment plant's project, we have significant concerns and ask the Commission to consider that the project's description does not adequately reflect the Market's reinvestment plan nor our schedule. So long as Jerrold Avenue remains open on our site, we have challenges with the PUC's plan to use it for construction truck traffic as it severely impacts and impairs the operations of our businesses.

"The Market does not want the PUC's proposed construction truck routing to discourage, delay, or prevent the execution of our reinvestment plan, our path to needed improvements." (Michael Janis, San Francisco Wholesale Produce Market, Public Hearing Comments, June 1, 2017)

"Conclusion

"1. Project description in DEIR does not accurately reflect the Market's Reinvestment Plan or our schedule

"2. So long as Jerrold Avenue remains open on our site, we oppose the PUC's plan to use it for construction truck traffic as it severely impairs the operations and viability of our merchants

"3. The Market does not want PUC's proposed construction truck routing to discourage, delay, or prevent the execution of our Reinvestment Plan, which [is a] path to providing our merchants with new facilities" (Michael Janis, San Francisco Wholesale Produce Market, Public Hearing Comments, June 1, 2017)

"II. SFWPM Project Includes Changes to Jerrold Avenue Access

'To improve safety and security, and to enhance the efficiency of loading operations on the Market's main site, the SFWPM Project includes the eventual closure of the portion of Jerrold Avenue that bisects the Market, and the re-routing of through traffic around the Market onto Innes and Kirkwood Avenues. This change to the roadway network has always been a key part of the vision for the SFWPM Project. As of the time of this letter, SFMC anticipates that, in furtherance of the SFWPM Project, Jerrold Avenue will be unavailable to through traffic beginning in October of 2018. As such, the DEIR should be revised to include an update to the project description for the SFWPM Project that includes this anticipated timing for the rerouting of traffic around the Market. Additionally, as discussed below, the DEIR needs to consider impacts to the Market, the SFWPM Project, and the Biosolids Project that stem from the anticipated changes to the availability of the portion of Jerrold Avenue that runs through the Market.

"III. The DEIR Does Not Properly Consider And Mitigate Various Environmental Impacts

"A. Transportation and Circulation Impacts

"Transportation and circulation, in general, are significant issues in this portion of San Francisco. Due to the patchwork of PDR activities that have arisen over the years, many of the streets do not follow a typical street grid. In addition, a number of streets, including several streets around the Market, are either degraded or were never improved to current standards. The generally less-than-ideal condition and layout of the streets will be further strained by the boom of new development proposed in the neighborhood, as described in the DEIR's cumulative analysis. In particular, the DEIR identifies a total of forty (40) cumulative projects[1], twenty (20) of which are scheduled to overlap with the construction activities of the Biosolids Project, and eight (8) more of which may have some overlap depending on those projects' final construction timelines.[2]

"As described above, the SFWPM Project intends to close the portion of Jerrold Avenue that bisects the Market and begin to reconfigure and improve the surrounding roadways in or about October of 2018. In recognition of the need for greater security, and to mitigate the current operational conflicts caused by Jerrold Avenue's bisection of the main Market site, the closing of Jerrold Avenue and redirection of through traffic onto Innes and Kirkwood Avenues has always been a key component of the SFWPM Project.

"The DEIR shows that the Biosolids Project intends to use the to-be-closed portion of Jerrold Avenue through construction and operation of the facility.[3] The DEIR does not analyze what impacts the Jerrold Avenue closure would have on the Biosolids Project, and, in particular, how and where construction and operational truck traffic would be rerouted. Instead, the

transportation analysis assumes that the Biosolids Project will have continued access to Jerrold Avenue for truck off-haul, even beyond October 2018.

"Additional truck traffic from the Biosolids Project through the Market on Jerrold Avenue poses safety and operational constraint issues for all users of the Market due to the Market's intensity of loading operations on Jerrold Avenue. Currently, approximately thirty (30) produce merchants occupy warehouse space with loading docks that front on Jerrold Ave. Even under current conditions and traffic loads, this loading arrangement poses operational challenges and safety concerns. Indeed, this (in addition to food safety regulations) is one of the main reasons why the SFWPM Project envisions the eventual closure of Jerrold through the Market. The additional truck traffic caused by the Biosolids Project's use of Jerrold will exacerbate this already sub-optimal traffic coordination issue.

"For the reasons described above, the SFWPM Project intends to move as quickly as possible to close Jerrold Avenue through the Market. As such, we are keenly interested in making sure that the Biosolids Project does not depend on the Jerrold Avenue truck route in a way that would discourage, delay, or prevent the SFWPM Project from moving forward with the planned closure of Jerrold Avenue. The DEIR must address alternative routes that do not rely on Jerrold Avenue for ingress and egress to and from the Biosolids Project site.

"After the closure of Jerrold Avenue as part of the SFWPM Project, the Biosolids Project's most direct and logical alternative route, and the route for all other east-west through traffic, would be via Innes Avenue. Accordingly, the DEIR should study the Biosolids Project's potential use of Innes Avenue, rather than Jerrold Avenue. As noted above, the SFWPM Project plans include improving Innes and Kirkwood Avenues to improve general circulation through the area, both for safety and efficiency. These public improvements will benefit the neighborhood, generally, and the Biosolids Project, specifically. The Market, therefore, proposes coordinating the improvement of Innes Avenue and the creation of a new intersection connecting the improved Innes Avenue to the portion of Jerrold Avenue northeast of the SFWPM. An analysis of the coordinated design should be included in the DEIR and added to the Project Description for the Biosolids Project.

"Finally, the DEIR discusses how Evans Avenue, an east-west route parallel to Jerrold Avenue, offers one alternative travel path for the vehicles currently traveling on the section of Jerrold Avenue that will be closed during construction of the Biosolids Project.[4] The DEIR goes on to note that Evans Avenue has "sufficient capacity to accommodate diverted traffic without a substantial effect on local vehicle circulation."[5] However, this analysis leaves out any discussion of the SFPUC's Southeast Plant Headworks Replacement Project, one of the many cumulative projects in the area. That project contemplates closing at least one lane of Evans Avenue through project construction, which is estimated to occur between January 2018 and June 2024, as discussed in that project's Final Mitigated Negative Declaration. The DEIR must analyze the planned use of Evans Avenue in the context of the upcoming lane closure to determine whether there is sufficient capacity on Evans Avenue to serve as an alternative route for Jerrold Avenue traffic, given the proposed closure of travel lanes due to the SFPUC Headworks Project, as well as the planned closure of Jerrold as part of the SFWPM Project." (Michael Janis, San Francisco Wholesale Produce Market, Letter, June 19, 2017)

"In summary, the SFMC, Market, and SFWPM Project recognize the importance of the Biosolids Project to the City. However, as a vital business and adjacent site, it is important to the SFMC and Market that the Biosolids Project fits into the existing (and ever-growing and

changing) neighborhood. As such, it is our position that the DEIR is inadequate in its (1) failure to properly describe the SFWPM Project and the anticipated closure of Jerrold Avenue in connection therewith; (2) failure to consider transportation… impacts to the Market and the SFWPM Project…. We respectfully request that the DEIR be modified to address these inadequacies."

1. DEIR, p. 4.1-6 et seq., Table 4.1-1.
2. DEIR, p. 4.6-51.
3. DEIR, pp. 2-60, Figure 2-15; 2-61, Figure 2-16.
4. DEIR, p. 4.6-36.
5. DEIR, pp. 4.6-36 and 37.

(Michael Janis, San Francisco Wholesale Produce Market, Letter, June 19, 2017)

"While I support the BDFP for its potential to reduce the odors we currently experience from the existing water treatment plant, I am and have always been deeply concerned about the lack of accessibility of Bayview. In particular:

"- the existence of Caltrain tracks and lack of underpasses on all streets worsened by the permanent closure of the Quint bridge a couple of years ago: http://www.caltrain.com/projectsplans/Projects/Caltrain_Capital_Program/Quint_Street_Project.html;

"- the lack of an intake mechanism by the SFMTA to improve traffic signage, flow and pedestrian access and safety in the industrial zones that surround Bayview, making them hazardous deserts for bikers and pedestrians;

"- the lack of streets and routes of access to Bayview, being Jerrold, Evans and Third Street the only 3 routes available to Bayview residents and business to exit Bayview towards the West and North, where the most traditionally attractive features of SF are, including jobs.

"The above conditions make living in Bayview an isolating experience and an unsustainable one in view of the projected growth of the Bayview population in the next couple decades.

"I would be deeply grateful if you could please object to any additional proposed street closure, or any other measure or proposal that could reduce automotive and pedestrian accessibility of Bayview even further, including any temporary closure of Jerrold St." (Ximena Ares, Email, May 24, 2017)

"I am supporting the recommendations made by others in this regard, and outlined as follows:

"1. Study and re-evaluate the conclusions drawn in the EIR regarding the significance of the traffic impacts, along with a more clearly articulated and written, multi-agency transportation and traffic plan prior to certification of the EIR." (Linda K. Blacketer, Letter, June 19, 2017)

"Traffic Circulation-Phelps cannot handle any increase traffic and it will only get worse should Jerrold Avenue be closed to through traffic. Has access to the construction site off of **Rankin** at Evans been fully vetted? Can the site be accessed off of Oakdale with the re-opening of Quint Street in a more timely matter than what has been discussed to date? I would like to see that a thorough traffic analysis be completed taking into account these two other access options." (Chris Harney, Email, June 26, 2017)

"I understand that this is a major project that will take six years to complete and in that period significant east-west streets will need to be blocked, specifically Jerrold Ave and parts of Evans Ave.

"While you are focused on doing your best work, I hope that your plans take into account the folks who live and work in the Bayview and ensure we continue to have access to Cesar Chavez, Bayshore Blvd. and the freeways." (Sean Karlin, Email, May 24, 2017)

Response TR-1

The comments express concerns regarding the circulation impacts of the temporary closure of Jerrold Avenue during Biosolids Digester Facilities Project (BDFP) construction, including east-west access and on Phelps Street; request that the San Francisco Public Utilities Commission (SFPUC) keep Jerrold Avenue open during BDFP construction; and request consideration of alternative construction vehicle access routes or other ways to reduce traffic impacts, particularly on Phelps Street. Other comments state that a detailed Traffic Control Plan should have been included in the BDFP Draft EIR.

One comment states that the Draft EIR did not include an impact assessment of the permanent closure of Jerrold Avenue between Toland and Rankin Streets as part of the San Francisco Wholesale Produce Market (SFWPM, or produce market) Project, nor the temporary travel lane closures on Evans Avenue associated with the SFPUC's Southeast Plant Headworks Replacement Project. Cumulative impacts of the BDFP in combination with the Headworks Replacement Project and the SFWPM Project, including transportation and circulation impacts, were evaluated in the Draft EIR analysis. Refer to **Response TR-4** for responses regarding specific cumulative projects and associated street closures. Note that BDFP is not proposing any changes to the roadway configuration of Evans Avenue. This commenter (the produce market) also requests assurances from the SFPUC that BDFP construction trucks would be able to use alternative routes to the Southeast Water Pollution Control Plant (Southeast Plant or SEP) construction site when the SFWPM Project results in the permanent closure of Jerrold between Toland and Rankin Streets. In addition, the commenter requests assurances from the SFPUC that BDFP construction would not "discourage, delay, or prevent the execution of the SFWPM's reinvestment plan" or their schedule. The commenter requests coordinated design of the produce market's planned improvements to Innes Avenue. The commenter also states that the additional construction truck traffic through the produce market associated with BDFP construction would pose safety and operational constraint issues for produce market users due to the intensity of loading operations.

Other comments cite general concerns regarding lack of accessibility between the Bayview and other parts of the city due to the Caltrain tracks, closure of Quint Street, lack of overpasses, and lack of adequate procedures by the San Francisco Municipal Transportation Agency (SFMTA) to implement traffic signage and other improvements; and express objection to any additional street closures in the Bayview.

As discussed in Draft EIR Section 4.6, *Transportation and Circulation,* the Draft EIR did not identify any significant transportation and circulation impacts resulting from construction and operation of the BDFP; for this reason, no mitigation measures applicable to transportation and circulation were developed.

Temporary Jerrold Avenue Closure between the Caltrain Tracks and Phelps Street during BDFP Construction

As noted in the Draft EIR (e.g., page S-10, 2-41, and 2-55), the SFPUC is proposing the temporary closure of a segment of Jerrold Avenue to minimize conflicts and potentially hazardous conditions for pedestrians, bicyclists and general public vehicles due to construction vehicles traveling between the two construction sites north and south of Jerrold Avenue; and to construct a pipe chase[1] under Jerrold Avenue. During this time, the closed segment of Jerrold Avenue could be used as a staging/parking area. The SFPUC has now retained a Construction Manager General Contractor, who will work with the SFPUC to evaluate options to reduce the duration and/or alter the type (full or partial) of road closure while considering safety concerns and overall construction duration. (The selection of the Construction Manager General Contractor does not commit SFPUC to approving the BDFP.) In response to community concerns, the SFPUC is also hiring a Southeast Area Program Construction Manager (whose responsibilities are summarized on Draft EIR page 2-53) to plan the logistics and coordination among the various SFPUC projects to be constructed in the area. Following completion of BDFP construction, this segment of Jerrold Avenue would be reconstructed in accordance with Better Street Plan standards (see Figure 2-9 on Draft EIR page 2-40 and the discussion of long-term changes to Jerrold Avenue on page 2-39). The temporary closure of this segment of Jerrold Avenue would result in traffic using other available routes such as Evans Avenue, Oakdale Avenue and Third Street to access other roadways, including Cesar Chavez Street, Bayshore Boulevard, or the regional freeways. BDFP construction would not include any temporary travel lane or full roadway closures of Evans Avenue. As described in **Response TR-4**, the Draft EIR cumulative impact analysis considered the effects of BDFP in combination with the planned construction activities and travel lane closures on Evans Avenue associated with the Headworks Project.

The effects of the temporary closure of this segment of Jerrold Avenue and the effects of BDFP construction activities on travel on Phelps Street are described in Impact TR-1 (Draft EIR pages 4.6-35 to 4.6-46) and were determined to be less than significant. Draft EIR Figures 2-14 and 2-15 (pages 2-57 and 2-60) present the construction staging access plan for the project site and

[1] As described in the Draft EIR (page 2-41), pipe chases are covered trenches designed to carry multiple pipes (including, with respect to the pipe chase to be constructed under Jerrold Avenue, a pipeline to convey digester gas to the energy recovery and steam generation facilities).

haul routes, respectively. As described on Draft EIR page 4.6-36, the temporary closure of Jerrold Avenue to public through traffic would remove the approximately 6,800 daily vehicles currently traveling through this section and replace them with between about 35 and 50 daily eastbound (inbound) construction truck trips during the period of maximum construction truck traffic (about a five-month period), and 5 to 10 daily eastbound truck trips during the period of maximum construction workers (about a six-month period). Thus, during project construction there would be a substantial reduction in traffic volume on this segment of Jerrold Avenue. Other construction trucks are expected to access the project site via Evans Avenue and Rankin Street. As described on Draft EIR pages 4.6-36 - 4.6-38, both Oakdale Avenue and Evans Avenue have sufficient travel lane capacity to accommodate diverted traffic volumes without a substantial effect on local vehicle circulation. In addition, as discussed below, with the diversion of existing through traffic from Jerrold Avenue and with the additional BDFP construction traffic accessing the site from the west, it is not anticipated that there would be a noticeable increase in traffic congestion on Jerrold Avenue or on Phelps Street in the vicinity of Jerrold Avenue.

The comment about the economic effects of "even a 5-10 minute delay" due to the travel lane closures is noted, however, economic and social or quality of life effects of a project are generally not considered environmental impacts under CEQA unless there would be a physical impact on the environment or if such effects result in the need for the construction of new or physically altered facilities that would result in significant physical environmental effects. That is not the case here. Comments on socioeconomic or quality of life effects will be transmitted to City decision-makers for consideration in their deliberations on whether to approve the proposed BDFP. Please refer to **Response GC-2** in Section 10.11 of this document regarding comments pertaining to socioeconomic and quality of life effects. As indicated in the comment, Evans Avenue is already used by the resident with small children for access to Cesar Chavez Street/U.S. Highway 101 (Highway 101), and BDFP does not propose any closure or reduction in lane capacity of Evans Avenue. In addition, during BDFP construction, residents would also be able to use Oakdale Avenue one block south of Jerrold Avenue for access to Bayshore Boulevard and Highway 101.

Jerrold Avenue and Produce Market Operations

The addition of up to 50 BDFP-related trucks per day during the period of maximum construction truck traffic would not substantially affect traffic conditions on Jerrold Avenue or the produce market operations for the following reasons. As noted above, the temporary Jerrold Avenue closure would substantially decrease the number of vehicles (to less than 1 percent of existing) traveling on Jerrold Avenue west of Rankin Street, as vehicles other than those associated with the produce market would be detoured to other east-west streets, including Oakdale and Evans Avenues. Thus, with the 99 percent reduction in vehicles, the potential for through traffic to conflict with produce market operations would be noticeably reduced. Therefore, the use of Jerrold Avenue for BDFP construction would not severely impair produce market operations. In addition, the number of BDFP trucks traveling eastbound on Jerrold Avenue to the water pollution control plant would be low throughout the majority of the five-year BDFP construction period (i.e., outside of the peak five-month maximum construction truck demand period, there would be between 10 and 20 daily construction trucks per day for 11 months, and fewer than 10 daily construction trucks for 44 months). Lastly, these trucks would

travel primarily between 7:00 a.m. and 3:30 p.m., resulting in minimal overlap with produce market peak activities. As described in the *Final Mitigated Negative Declaration, San Francisco Wholesale Produce Market Project*[2] (page 81), market wholesale and distribution activities start around 8:00 p.m., with receiving continuing throughout the early morning. Wholesale activities increase between 3:00 a.m. and 7:00 a.m. and are largely completed by 9:00 a.m. Outbound merchant distribution activity travel takes place in the morning, with most of the trucks leaving before 9:00 a.m., and is mostly completed in the afternoon (1:00 to 4:00 p.m.) when trucks return empty from their deliveries.

Phelps Street and Construction Site Access Options

Some comments express concerns about increased traffic on Phelps Street, and others suggest the use of Rankin Street or internal roads at the water pollution control plant as alternatives to the temporary closure of Jerrold Avenue. The BDFP Draft EIR project description (on pages 2-51 to 2-70) provides detailed information on the transportation aspects of project construction. As indicated therein, the primary construction vehicle access route for construction haul trucks and deliveries to the project site would indeed be via Evans Avenue and Rankin Street; however, given the volume of construction truck traffic coupled with the constraints of routing traffic through the water pollution control plant (which must operate continuously), use of Rankin Street as the sole ingress/egress point is not considered a practical option. Draft EIR Figure 2-15 (page 2-60) presents proposed construction truck and delivery access, while Draft EIR Figure 2-16 (page 2-61) presents proposed operational truck access during project construction. These routes were developed based on current access routes to the water pollution control plant and preliminary plans for project construction, and were reviewed and vetted by City and County of San Francisco (City or CCSF) agencies involved in the project development and assessment (i.e., SFPUC, SFMTA, Planning Department). As shown on Figure 2-15, construction vehicles on Phelps Street would primarily include equipment deliveries and concrete trucks. The number of BDFP-related vehicles on Phelps Street would be greatest if the Southeast Greenhouses are used for construction staging and construction worker parking. However, primary construction truck access to the water pollution control plant would be via Evans Avenue at Rankin Street. Due to the temporary Jerrold Avenue closure, traffic volumes on Phelps Street would be generally similar to existing conditions, as the reduction in through traffic turning left or right onto Jerrold Avenue would be offset by the addition of BDFP construction-related traffic. Thus, during BDFP construction, it is not anticipated that there would be a noticeable increase in traffic volumes or congestion on Phelps Street. See **Response TR-3** regarding effects on parking and local businesses on Phelps Street.

One comment asks whether construction access via a re-opened Quint Street (in combination with Oakdale Avenue) could occur. Use of Quint Street for access to the water pollution control plant site would not be feasible, as the portion of Quint Street under the Caltrain tracks was permanently closed in October 2015 to accommodate the berm required to replace the old railroad bridge that was seismically inadequate, and to allow for a potential Caltrain station to be

[2] San Francisco Planning Department, *Final Mitigated Negative Declaration, San Francisco Wholesale Produce Market Project, Case No. 2009-1153E*, May 11, 2011, as amended July 5, 2011.

located at Oakdale Avenue in the future. The construction of the Quint-Jerrold Connector Road project (by the San Francisco County Transportation Authority) along the west side of the Caltrain tracks is not expected to be completed prior to the start of the BDFP construction (see Draft EIR page 4.1-10).

Produce Market's Proposed Permanent Closure of Jerrold Avenue between Toland and Rankin Streets

The existing produce market (Main Site) occupies approximately eight acres along Jerrold Avenue between Toland Street and Rankin Street, and is bisected north-south by the elevated Interstate 280 (I-280) freeway, which runs parallel to and above the existing Selby Street right-of-way. The Main Site possesses four primary building locations at the four quadrants defined by the intersection of Jerrold Avenue and I-280. The produce market is in the process of implementing a phased Master Plan to improve and expand the area available for its activities.

Pursuant to the *Final Mitigated Negative Declaration, San Francisco Wholesale Produce Market Project* (2011), the Master Plan would increase warehouse and office building square footage at the site from approximately 373,000 to 526,000 gross square feet, and implement street improvements (listed below) to control access to the site, better facilitate the flow of traffic around the site, and improve the existing transportation network in the project vicinity. That project includes phased implementation, with Phase I including construction of a new building at 901 Rankin Street and all of the roadway improvements identified below, demolition of a number of buildings, and rerouting of the Muni 23 Monterey bus route. Phase I was to begin in 2012 and be completed in fall 2013. Phase II (2017-2020) and Phase III (2015-2028) include construction and renovation of the Main Site. The City adopted the Final Mitigated Negative Declaration and approved a 60-year lease of the land to the produce market in 2012.[3] Approval of the lease was conditioned upon implementation of a Streetscape Plan for the Project site, as discussed in the General Plan Referral prepared for the lease.[4] Preparation of the Streetscape Plan is to be conducted in consultation with the San Francisco Planning Department and the Department of Public Works (now San Francisco Public Works).

The SFWPM Project as approved by the Planning Department includes the following circulation improvements, which the Streetscape Plan would incorporate:

- Vacation of a portion of Kirkwood Avenue east of Rankin Street on the 901 Rankin Street site.
- Vacation of the portion of Jerrold Avenue between Toland Street and Rankin Street. Vehicular traffic not related to the produce market will be rerouted to the north on an improved Innes Avenue. Produce market traffic will also use an improved Kirkwood Avenue between Toland and Rankin Streets for local access.

[3] San Francisco Board of Supervisors Resolution No. 0280-12, Ground Lease – Retention and Expansion of the San Francisco Wholesale Produce Market, passed July 17, 2012.

[4] San Francisco Planning Department, General Plan Referral, Case No. 2009.1153R, San Francisco Wholesale Produce Market Retention and Expansion Project, September 6, 2011.

- Lease of the portion of Selby Street (underneath I-280) between Innes and Kirkwood Avenues.
- Vacation of the Lettuce Lane and Milton I. Ross Lane rights-of-way, and a small portion of the Rankin Street right-of-way internal to the existing produce market.
- Dedication of portions of the land occupied by the produce market facilities to create two new intersections at Toland/Innes and Toland/Kirkwood.
- Dedication of a portion of existing produce market facilities to become a portion of the Innes Avenue right-of-way, to allow the connection of Innes Avenue to Toland Street and remove the existing Innes Avenue dead end from the existing street grid.
- Dedication of a portion of existing produce market facilities to become a portion of the Kirkwood Avenue right-of-way, to allow for the connection of Kirkwood Avenue to Toland Street and for the removal of the existing Kirkwood Avenue dead end from the existing street grid.
- Relocation of the portion of Rankin Street between Jerrold Avenue and Innes Avenue to parallel the existing and adjacent Caltrain right-of-way, and reconfiguration of the intersection of Jerrold Avenue and Rankin Street.

In addition, the produce market's planned street improvements necessitate permanent relocation of the Muni 23 Monterey bus route from Jerrold Avenue. As described in the BDFP Draft EIR (page 4.6-12), the Muni Forward 23 Monterey Muni service improvements have not yet been approved by the SFMTA board; this approval would have to occur prior to implementation of the street improvements. The SFMTA has not identified a schedule to bring this service improvement to the SFMTA board.

At this time, only the 901 Rankin Street building included as part of Phase I has been completed, and none of the proposed circulation changes (e.g., reconstruction and extension of Innes and Kirkwood Avenues) have been implemented. As described in the materials supporting Resolution 0280-12, the produce market is required to prepare and submit the Streetscape Plan associated with Phase II improvements to the City for review and approval one year prior to commencement of construction. As of late July 2017, San Francisco Public Works had not received the Streetscape Plan.[5] Because the Streetscape Plan has not yet been submitted to the City, the timing of the produce market Jerrold Avenue permanent roadway closure, as well as the roadway improvements on Innes Avenue, Kirkwood Avenue, and Rankin Street, were determined to be unknown.

As indicated above, the SFWPM Project, including the permanent closure of Jerrold Avenue between Toland and Rankin Streets, was included as a cumulative project in the BDFP Draft EIR (see, for example, Draft EIR page 4.6-58) with the produce market closure of Jerrold Avenue assumed in the future during BDFP operation (but not during BDFP construction). In its comments on the BDFP Draft EIR, the produce market has indicated that it intends to implement the Jerrold Avenue permanent roadway closure in October 2018. If that proves to be the case,

[5] J. Rivera, San Francisco Public Works, Personal Communication, July 31, 2017.

through access on Jerrold Avenue will be restricted by the produce market regardless of the BDFP. Nevertheless, the produce market's possible closure of Jerrold Avenue between Rankin and Toland Streets during BDFP construction would affect inbound trucks traveling empty to the water pollution control plant. As noted above, this includes approximately 35 to 50 daily trucks during the period of maximum construction truck traffic (for approximately five months), and 5 to 10 daily trucks during the period of maximum construction workers (for approximately six months). If inbound access to the water pollution control plant via Jerrold Avenue were not available (i.e., if the produce market permanent Jerrold Avenue roadway closure is implemented), inbound trucks would instead reach the site via alternative routes such as Cesar Chavez Street to Evans Avenue, Cesar Chavez to Third Street to Jerrold Avenue, or Bayshore Boulevard to Oakdale Avenue to Phelps Street. Because alternative access to the water pollution control plant is available for these vehicles, the use of Innes Avenue (as suggested in a comment) would not be warranted.

If the produce market closes Jerrold Avenue in October 2018 as noted by the commenter, the closure would overlap with BDFP soil excavation truck-traffic for three months (including overlap with the month of maximum construction truck traffic). After December 2018, the number of trucks accessing the water pollution control plant would be substantially lower than during soil excavation, as the demolition and excavation activities that generate the greatest number of construction haul trucks would be substantially completed. Either Cesar Chavez Street or Evans Avenue could accommodate the 50 trucks per day maximum that could no longer use Jerrold Avenue through the produce market; consequently, no substantial change to the discussion of impacts or impact determinations presented in the Draft EIR is warranted.[6] Thus, the BDFP would not discourage, delay, or prevent the produce market from moving forward with the planned closure of Jerrold Avenue between Toland and Rankin Streets or other planned produce market improvements.

The produce market also requests that the design of its planned improvements to Innes Avenue be coordinated with the BDFP, and included in the BDFP Draft EIR project description. However, as presented on Figure 2-12 (Draft EIR page 2-48), upon completion of the BDFP construction, all BDFP operational trucks (including chemical delivery, yellow grease loading, and biosolids trucks) would use Evans Avenue for access to the water pollution control plant, and would therefore not travel on Jerrold Avenue or the new roadways required to be constructed by the produce market. The produce market Innes Avenue improvements should not be part of the BDFP project description and no change to the Draft EIR is necessary. Regardless, the SFPUC will continue to coordinate with the produce market on the two projects.

[6] The level-of-service analysis conducted for the project did not identify any future potential capacity issues on Evans Avenue or Cesar Chavez Street. (Technical Memorandum Biosolids Digester Facilities Project – Case No. 2015.000644ENV, Intersection Level of Service Analysis Documentation, prepared by Adavant Consulting and LCW Consulting for Debra Dwyer [San Francisco Planning Department] and Karen Frye [San Francisco Public Utilities Commission], December 29, 2016.) In addition, both Evans Avenue and Cesar Chavez Street have multiple lanes each way, and the additional truck traffic (5 to 6 trucks per hour) would represent between 0.3 and 0.7 percent of the existing traffic on these roadways (800-900 vehicles per hour on Evans Avenue at Rankin Street, 950-2,200 vehicles per hour on Cesar Chavez Street at Bayshore Boulevard). Expected daily variations in traffic on these roadways (3 to 5 percent) are larger than the additional traffic generated by project construction once soil excavation is complete.

Traffic Control Plan

As indicated on Draft EIR page 4.6-23, the SFPUC would implement standard construction measures for the BDFP, which include implementation of a Traffic Control Plan prepared consistent with the requirements of the SFMTA's Blue Book. While a detailed Traffic Control Plan is typically prepared by the contractor prior to construction and not during environmental review (because it takes into account specific conditions on the streets that may be unknown at the time of preparation of the Draft EIR), the Draft EIR (pages 2-53 to 2-54) describes the various elements of the plan, the requirements of which would be included in the contract specifications for the project. The Traffic Control Plan would address circulation and detour routes, construction staging locations, roadside safety protocols, maintenance of bicycle and pedestrian access, and emergency vehicle access. The Traffic Control Plan would also include measures to reduce travel by construction workers in private automobiles, and a public information plan to provide residents and businesses with regularly updated information regarding project construction activities, duration, peak construction vehicle activities, and lane and full-roadway closures. In addition, given the number of planned and ongoing construction activities at the water pollution control plant, the SFPUC has issued a Request for Proposals to retain a Southeast Area Program Construction Manager to manage coordinated implementation of the Traffic Control Plans for the major projects being implemented at the water pollution control plant (including the BDFP and Headworks projects), as well as with other projects in the area. The selection of the Southeast Area Program Construction Manager does not commit SFPUC to approving the BDFP.

The Draft EIR project description (Chapter 2), including elements of the Traffic Control Plan, provides sufficient information on proposed construction activities to assess the transportation impacts of project construction (presented in Section 4.6, Transportation and Circulation, pages 4.6-1 to 4.6-61).

Comment TR-2: Construction Impacts – Emergency Access

This response addresses the following comments, which are quoted below:

O-BayviewCP-1.2 O-BayviewCP-2.5 O-BVHPCAC.3 I-Blacketer.5 I-Hamman-4.3

"It should also be noted that the sole northwest -- north-south access along Third Street at Islais Creek is a documented potential liquefaction zone. This is issue is about public safety in Bayview." (Dan Dodt, Bayview Community Planning, Public Hearing Comments, June 1, 2017)

"It should also be noted that the **sole NORTH bound** access, along Third Street @ Islais Creek, is a documented potential **liquefaction zone** and will be significantly compromised as a transportation route following a seismic event." (Dan Dodt, Bayview Community Planning,

Letter, June 17, 2017; Jack Gallagher, Bayview Hunters Point Citizens Advisory Committee, Letter, June 19, 2017)

"The only exit to the North, along Third Street, is the Islais Creek Bridge. This area is a noted potential liquefaction zone and will be significantly compromised during a seismic event. These transportation issues are life safety and quality of life issues. Please take these concerns seriously." (Linda K. Blacketer, Letter, June 19, 2017)

"The impacts to this community during an emergency especially a seismic event was not well considered. With all the main corridors into and out of the Bayview closed and the main bridge across the creek closed and the huge [increase] in [population] access into and especially out of the Bayview after an earthquake will be severely compromised. With no access how will we fight fires or evacuate the injured? This aspect must be further analyzed." (Michael Hamman, Letter, June 20, 2017)

Response TR-2

The comments raise concerns regarding vehicular access for the Bayview community during an emergency, such as following an earthquake, particularly in the northbound direction.

Transportation impacts related to emergency vehicle access during project construction are described in Impact TR-2 (Draft EIR pages 4.6-46 to 4.6-47) and were determined to be less than significant. As described on Draft EIR page 4.6-46, Jerrold Avenue would be closed to public through traffic during the five-year construction period, and the closed segment would be used for construction staging and parking. However, either emergency vehicles would be allowed access through Jerrold Avenue or a detour route would be provided, as determined through coordination with emergency service providers. Consequently, Jerrold Avenue could be available for emergency access in the event of an earthquake or other disaster. Note that there are two fire stations east of the project site (Station 49 at 1415 Evans Avenue and Station 25 at 3305 Third Street), as well as one to the west (Station 9 at 2245 Jerrold Avenue), that would continue to serve the Bayview neighborhood during emergencies.

While the impact analysis assumed the closure of Jerrold Avenue between the Caltrain tracks and the driveways west of Phelps Street for the entire five-year duration of project construction, as indicated in **Response TR-1**, SFPUC and the Construction Manager General Contractor will evaluate options to reduce the duration of the closure to the extent possible to balance the needs of construction and public safety.

Transportation impacts related to emergency vehicle access during project operations are described in Impact TR-3 (Draft EIR page 4.6-49) and were determined to be less than significant. The BDFP does not include any permanent roadway closures following completion of construction; consequently, BDFP operations would not affect emergency vehicle access into or out of the Bayview in the long term.

The commenters' concerns regarding north-south access along Third Street at Islais Creek being within a potential liquefaction zone are acknowledged; however, this condition would not be affected by either BDFP construction or operations. The Islais Creek Bridge Rehabilitation Project is described in **Response TR-4**, and would require a complete bridge closure for one to two months, during which time detour routes using Illinois Street, Evans Avenue, Cesar Chavez Street, and other north-south streets to the west, such as Potrero Avenue would be required. The construction contractor would be required to cause the least possible obstruction and inconvenience to the community, and provide travel lanes and routing for vehicular, pedestrian, and Muni riders, in a manner that would be safe and would minimize traffic congestion and delays. The City's Department of Emergency Management maintains a number of emergency plans to ensure that the City is ready to respond to a variety of threats and hazards.

Comment TR-3: Construction Impacts – Parking

This response addresses the following comments, which are quoted below:

O-PetCamp-2.2 I-Harney.3

"The businesses on Phelps Street cannot exist without easy street access and parking. Pet Camp's clients, for example, cannot take the Third Street Light Rail as is suggested in the DEIR. Pet Camp's clients must drive to Pet Camp often with multiple pets and belongings and more often than not with young children. The ability to safely drive on Phelps Street and to be able to park in close proximity to Pet Camp is essential to their continued patronage and the jobs created from such. As presented the DEIR would place Pet Camp's clients at serious risk of injury causing them to seek pet care elsewhere and thus placing both the business and the jobs it has created at serious risk as well.

"Phelps Street is a narrow street with two lanes of traffic, two lanes of parking and a bicycle route. It simply cannot sustain the proposed increase traffic while safely maintaining access to the small businesses located there. That the DEIR suggest that 5 years is only a temporary inconvenience reflects a complete lack of understanding of the burdens of running a small business. It is inconceivable that a small business could sustain itself for 5 years without clients being able to access it!" (Mark Klaiman, PetCamp, Email, June 19, 2017)

"With the proposed closure of Jerrold Avenue I do not see how one could overburden the neighborhood businesses and residents by proposing to use Phelps for construction staging/parking for this project. The local business count on this street parking for their livelihood. I would like to see a better solution for construction staging /parking for this should not be considered as a use for Phelps street which street parking should be reserved for local business and residents." (Chris Harney, Email, June 26, 2017)

Response TR-3

The comments raise concerns regarding construction-related activities affecting access on Phelps Street, particularly construction staging and parking, and the ability of visitors to park near the businesses. The response below addresses parking. As discussed under **Response TR-1** (section titled "Phelps Street and Construction Site Access Options"), due to the Jerrold Avenue closure, traffic volumes on Phelps Street during BDFP construction would be generally similar to existing conditions, as the reduction in through traffic turning left or right onto Jerrold Avenue would be offset by the addition of BDFP construction-related traffic. Refer also to **Response GC-2** in Section 10.11 of this document regarding effects on businesses.

The adequacy of parking supply relative to parking demand is no longer considered in determining the significance of project impacts under CEQA. However, the Draft EIR presents a discussion of the effect of the proposed project on parking demand and supply for informational purposes (pages 4.6-43 to 4.6-44), and evaluates whether the proposed project would result in secondary effects of people searching for available parking spaces. The secondary effects consider whether a substantial parking deficit could create hazardous conditions affecting traffic, transit, bicycles, or pedestrians and whether particular characteristics of the project or its site demonstrably render use of other modes infeasible, for example by causing significant transit delays.

As described in the Draft EIR (pages 2-55 to 2-59), BDFP construction staging and parking would occur on-site within the water pollution control plant, within the portion of Jerrold Avenue between the Caltrain tracks and Phelps Street that would be closed during project construction, and at off-site staging areas (1550 Evans Avenue, the Southeast Greenhouses, and/or Piers 94 and 96). BDFP construction staging and parking would not occur within the parking lane of Phelps Street, as stated by the commenter.

As presented on Table 4.6-15 (Draft EIR page 4.6-34), the shuttle service between the water pollution control plant and Piers 94 and 96 would only be required if the 1550 Evans Avenue site is not used as a staging area, as the maximum expected number of parked vehicles could be accommodated within the water pollution control plant and 1550 Evans Avenue sites. The worker shuttle service during BDFP construction would be required for approximately 16 months between April 2021 and July 2022. Figure 2-14 (Draft EIR page 2-57) shows the location of the proposed shuttle stop and route in the vicinity of the Southeast Plant. The BDFP construction employee shuttle bus would stop on Phelps Street at the approach to Jerrold Avenue. At this time, it is not known whether the stop would be a curb stop (the shuttle stops within the parking lane) or a pole stop (the shuttle stops within the travel lane). A curb stop would require temporary use of two to three existing parking spaces.

The SFPUC continues to conduct outreach to local businesses in the area to identify and address concerns around customer parking and access.[7]

---

[7] SFPUC, BDFP Public Outreach, e-mail from K. Frye, November 7, 2017.

Comment TR-4: Cumulative Transportation Impacts

This response addresses the following comments, which are quoted below:

O-BayviewCP-1.1	O-BayviewCP-1.3	O-BayviewCP-2.4	O-BayviewCP-2.7
O-BayviewCP-2.8	O-BayviewCP-2.10	O-BVHPCAC.2	O-BVHPCAC.5
O-BVHPCAC.7	O-SFWPM-1.2	O-SFWPM-1.4	I-Blacketer.4
I-Blacketer.6	I-Hamman-1.1	I-Hamman-4.1	I-Kelly.4

"But on the third, related to transportation, traffic, and congestion -- both construction related and local -- I'm requesting the Commission consider a reevaluation of the conclusions drawn in the EIR. As noted, there are significant cumulative traffic and circulation impacts, including the closure of Jerrold from Phelps to Rankin for a period of approximately five to six years; the current existing lane closure and narrowing along the Evans Avenue alignment beginning in August 17th for the Headworks phase - now, that's not part of this EIR, but it is currently under construction -- with construction vehicles, manpower transportation, et cetera; the construction staging along the Phelps Avenue parking and the equipment relay.

"This is a narrow street, as Mark Klaiman had indicated, and includes many PDR businesses, residences, et cetera. And please note the circulation in the graphics.

"Please also note that nearby Palou Avenue will be under construction for a $3 1/2 million streetscape improvement plan beginning this year for a couple of years.

"Other projects by the Fire Department, SFPD, DPW, and others will and are impacting the adjacent streets. When considering these traffic and circulation impacts alone, one should consider that these crucial east-west arterials, particularly Evans and Jerrold, in a closed or blocked condition, will increase traffic on an already heavily used Oakdale Avenue and Palou alignments.

"These major streets in and out of Bayview provide the daily transportation routes for those who live and work in Bayview, for parents who take their kids to school and back, for employees and employers who must get to their jobs, and, most importantly serve as an essential transportation route in the event of a natural disaster or a major event." (Dan Dodt, Bayview Community Planning, Public Hearing Comments, June 1, 2017)

"As noted in the EIR, the long-term changes include the Quint Street berm construction, which closed under the -- under the Caltrain's bridge. But what's missing is a commitment and a plan in conjunction with that closure for a bypass road along the railroad alignment. The Quint Street connector bypass should be expedited and built as part of the PUC project prior to major construction in 2018, in my opinion, and should be urged by this Commission – "(Dan Dodt, Bayview Community Planning, Public Hearing Comments, June 1, 2017)

"Noted in the report are forty (40) projects considered in the cumulative impact analysis for traffic and circulation, with 25 of these projects, or 63% of the impact to Bayview, as SSIP and/or SFPUC related. (Table 4.1-1; Vol.1 p. 4.1.6).

"Specifically, the following projects noted in the analysis will severely impact the surrounding community and neighborhoods, in our opinion, with questionable 'public safety' and 'emergency routing' possibilities due to the closure or blocking of major East/West thoroughfares in Bayview:

">Current, existing lane narrowing/access along the Evans Street beginning in August 2017 for the Headworks phase; (Table item #1). Beginning in August, 2017, this work is under pre-development now and includes hundreds of construction vehicles, manpower transportation efforts, shuttles, and staging relays due to the SSIP early phase implementation. Evans Avenue is a major East/West arterial utilized by residents, businesses and visitors including City and County employees, USPS facility employees, SFFD manpower, residents of India Basin, Hunters-Point Shipyard, and thousands of residents, businesses and nonprofits throughout the community.

">Closure of Jerrold Avenue from Phelps to Rankin Street. Specifically, as noted in the EIR, is the 5-6 year closure of Jerrold Avenue between Phelps Avenue and Rankin Street. Another major East/West arterial, Jerrold is similarly traversed by thousands of residents, business owners, employees on a daily basis. The closure of Jerrold Avenue presents a very high level of concern for all nearby businesses and residents, and will significantly and negatively impact the quality of life for those utilizing this alignment.

">Construction staging along Phelps Avenue/ parking / equipment relay. This narrow street includes many active and essential PDR businesses and nearby residences. Note the circulation graphics contained in the EIR, with additive impacts to to [*sic*] staging areas at Evans and McKinnon Avenues and with routing from 1550 Evans Avenue and Piers 92-94 for construction employees and equipment.

"Not included in the cumulative impact analysis on traffic, and not mentioned in the BSFP-EIR, yet key to understanding the need for feasible mitigation as a requirement to LSM status are:

"> **Palou Avenue** streetscape improvement project -from Barneveld to Crisp Avenues- beginning late 2017, this is an approved $10m, SFDPW/SFMTA project with significant staging, parking, re-routing and daily traffic impacts on this heavily used East/West alignment.

"> **2245 Jerrold Avenue** - Project by **SFFD** - construction of SFFD Ambulance Deployment Facility - a $27m project slated for construction in 2020. As noted in the project conceptual design documentation, "The Project site is in an intensively developed area of San Francisco's Bayview neighborhood characterized by various warehouse, distribution and light industrial uses".

"> Re-routing of the **23 Muni Bus Line to Palou Avenue.** While the BSFP-EIR indicates relocation of the 23 Monterey Muni Line from Jerrold Avenue to Palou Avenue as a temporary measure during course of construction, the Palou Streetscape project indicates the eventual and permanent relocation of the 23 to Palou Avenue following the streetscape improvements. A temporary relocation of this public transportation element to Palou Avenue from Jerrold Avenue is neither practical nor safe during concurrent major construction on both E/W alignments.

"> Other: Multiple private construction projects for residential mixed-use, PDR, commercial improvements, etc. are under review and/or are being considered for the Third Street Corridor in Bayview between Williams Avenue and Evans Avenue for 2018-2025.

"When considering these traffic and circulation impacts alone, one should consider that these crucial East/West arterials (Evans, Jerrold, Palou), in a 'closed', 'blocked' or 'under construction' condition, will increase traffic on already heavily used E/W Oakdale Avenue.

"These major East/West street alignments, in and out of Bayview, provide the daily transportation routes for tens of thousands of individuals who live and work in Bayview, for parents who take their children to school and back, for employees and employers who must get to their jobs, and, most importantly serve as essential transportation routes in the event of a natural disaster such as an earthquake, flood, fire or other impactful 'event'. (see attachments 2-60, 61)" (Dan Dodt, Bayview Community Planning, Letter, June 17, 2017; Jack Gallagher, Bayview Hunters Point Citizens Advisory Committee, Letter, June 19, 2017)

"As noted in the EIR in section 2.4.2.1 Long-Term Changes to Local Roadway Network, 'In October 2015, Quint Street between Oakdale Avenue and the Caltrain tracks was permanently closed to through traffic as part of Caltrain's Quint Street Bridge Replacement project.' Also noted in the Impact Analysis Table 4.1-1; Vol.1 p. 4.1.6-14, are **two projects which we suggest provide partial solutions for feasible mitigation on these traffic impacts.**

"Item #24 (Table 4.1.1; Vol 1. p 4.1.10) - **The Quint Connector**

"This project would construct a new 950-foot-long roadway to provide access between existing Quint Street and Jerrold Avenue. The roadway would consist of two 13-foot-wide lanes (within a 50-footwide corridor), one northbound and one southbound. Construct a new 27-foot-wide curb cut located along the San Francisco Wholesale Produce Market property (Project 25, below); and install street trees and street lighting;

"Item #25 (Table 4.1.1; Vol 1. p 4.1.10) -**City and County of San Francisco Produce Market**

"Jerrold Avenue would be reconfigured to direct through traffic around the site onto Innes and Kirkwood Avenues. Innes Avenue would be improved and portions of the project site would also be dedicated to create two new intersections where Toland Street crosses Innes and Kirkwood Avenues. Rankin Street would be relocated between Kirkwood and Innes Avenues to parallel the west side of the Caltrain right-of-way, and the intersection of Rankin Street and Jerrold Avenue would be reconfigured. All roadway improvements would be constructed under Phase 1." (Dan Dodt, Bayview Community Planning, Letter, June 17, 2017; Jack Gallagher, Bayview Hunters Point Citizens Advisory Committee, Letter, June 19, 2017)

"Construction and implementation of the Quint Connector Road, prior to major construction at the SEP, will reduce pressure on the remaining, key E/W arterial (Oakdale Avenue) and allow local traffic to be routed to the NW along the alignment - to Innes, etc. and out to Bayshore and 101N in the short, medium and long term." (Dan Dodt, Bayview Community Planning, Letter, June 17, 2017; Jack Gallagher, Bayview Hunters Point Citizens Advisory Committee, Letter, June 19, 2017)

"Recommendations:

"1. Study and re-evaluate the conclusions drawn in the EIR regarding the significance of the traffic impacts, along with a more clearly articulated and written, multi-agency transportation and traffic plan prior to certification of the EIR.

"2. Completion of the Quint Street Connector by December 31, 2018.

"The **Quint Street Connector By-Pass** roadway plan should be **expedited and built, as part of the PUC project**, prior to major construction in 2018/19, in our opinion. An inter-agency cooperative effort is essential in this regard. Leadership and guidance from the Mayor's Office, the City Administrator's Office, the District 10 Supervisor, SFDPW, SFMTA, SFPUC, SFFD, SFPD, Union Pacific and the Department of Emergency Management is highly recommended and urged.

"3. Reconsideration of the temporary relocation of Muni 23 Monterey Bus line. SFPUC, with SFMTA as lead agency, to consider the cumulative impact of the Jerrold Street closure, the streetscape improvement project on Palou Avenue, the narrowing of Evans Avenue, and the heavily impacted Oakdale Avenue arterial due to the above concurrent projects." (Dan Dodt, Bayview Community Planning, Letter, June 17, 2017; Jack Gallagher, Bayview Hunters Point Citizens Advisory Committee, Letter, June 19, 2017)

"The Market seeks improved collaboration and coordination with the PUC on the redesign of all of the full length of Jerrold Avenue and neighboring streets and intersections. Thank you." (Michael Janis, SF Wholesale Produce Market, Public Hearing Comments, June 1, 2017)

"TRAFFIC and TRANSPORTATION

"As I've been revising this documentation with many others in the community, I am also requesting additional review of the impact analysis on traffic and circulation from the existing 'LS' -less than significant - status to the LSM condition, requiring mitigation. Of the 40 projects considered in the cumulative impact analysis for traffic and circulation, 63% of these are SFPUC related. (see Table 4.1-1; Vol.1 p. 4.1.6).

"There are multiple projects affecting the area, with many occurring simultaneously with the Biosolids Digester Project. Other projects that will affect transportation in the area are not listed in the EIR. For example, in addition to the partial closing of **Evans Street** beginning in August 2017; the **closure of Jerrold Avenue from Phelps to Rankin Street for** 5-6 years; the **construction staging along Phelps Avenue**; the **Palou Avenue** streetscape improvement project -from Barneveld to Crisp Avenues; the **2245 Jerrold Avenue** - construction of SFFD Ambulance Deployment Facility; ;the re-routing of the **23 Muni Bus Line to Palou Avenue**, the temporary closure of the Illinois Street Bridge at Islais Creek, we are potentially in real trouble when desiring to enter or exit our neighborhood by vehicle. There is also the relocation of the 23 Monterey Muni Line from Jerrold Avenue to Palou Avenue as a temporary measure during course of construction, but the Palou Streetscape project indicates the eventual and permanent relocation of the 23 to Palou Avenue following the streetscape improvements. Better planning is required for the transportation elements of the project, in my opinion." (Linda K. Blacketer, Letter, June 19, 2017)

"I am also recommending that the construction of the Quint Street bypass road be completed quickly. The loss of the Quint Street roadway due to the construction of the CalTrain berm and crossing has caused innumerable delays and traffic circulation problems for may in the community. I am supporting the recommendations made by others in this regard, and outlined as follows:

"1. Study and re-evaluate the conclusions drawn in the EIR regarding the significance of the traffic impacts, along with a more clearly articulated and written, multi-agency transportation and traffic plan prior to certification of the EIR.

"2. Completion of the Quint Street Connector by December 31, 2018. The **Quint Street Connector ByPass** roadway plan should be **expedited and built, as part of the PUC project**, prior to major construction in 2018/19, in our opinion. An inter-agency cooperative effort is essential in this regard. I ask the Mayor, Mr. Kelly(SFPUC), Mr. Nuru (SFDPW), Supervisor Cohen (D10) and other respected and effective City leaders to coordinate closely and purposely to see this project completed as soon as possible.

"3. Reconsideration of the temporary relocation of Muni 23 Monterey Bus line. Work with Muni/SFMTA to reconsider the placement of the 23 Monterey Bus from Palou to another location during the construction timeframe." (Linda K. Blacketer, Letter, June 19, 2017)

"And I'm here today to talk about a serious flaw in the EIR for this project.

"Specifically, I'm referring to the cumulative analysis of the traffic problems. As Mr. Dodt so accurately portrayed, the situation in the Bayview is we have three major north-south corridors of which one is Jerrold. Jerrold they're planning to close. Evans, they're going to reduce that to one lane in each direction controlled by a flag man. And Oakdale, we don't even know how badly that's going to be torn up when they do -- the PUC does their project at Oakdale and Phelps, 1800 Oakdale.

"So imagine, if you would, that they've disrupted Van Ness, but they've also closed Gough and Franklin. That would be a catastrophe for this city. And that is the nature of this perfect storm that the PUC is going to visit on our neighborhood.

"They -- by their analysis, there are 7,000 people a day that use that route. Those 7,000 people will be severely impacted. The businesses will be placed under a hardship.

"But that 7,000 is just the beginning. They failed to take into account the major projects that are being built in India Basin. The India Basin Project is 1250 units, the Shipyard is coming online with 900 units, Hunters View hundreds more, plus the projects up and down Third Street. The traffic will increase. It's going to be a lot worse than 7,000 in five years.

"Five-year temporary closure. Allow me to put that in perspective. In five years, your children will start college, graduate from college, get married, and have their first child before anyone can go down Jerrold Avenue. It's very possible you could all become grandparents before they open Jerrold Avenue. Five years is not a temporary closure. Five years is -- for many people of a certain age, that's a lifetime, a lifetime of severe inconvenience, economic hardship.

"I urge you, please, please, do not allow them to close Jerrold Avenue. It's going to be a major impact in our neighborhood" (Michael Hamman, Public Hearing Comments, June 1, 2017)

"As I've been revising this documentation with many others in the community, I am also requesting additional review of the impact analysis on traffic and circulation. For the following reasons:

"There are multiple projects affecting the area, with many occurring simultaneously and the EIR does not consider the cumulative impact of all these projects together. Several huge projects in the area were not considered at all, including the 1200 new housing units in the Build Inc project the 900 units in the Shipyard project as well as numerous projects on Third Street such as the Chris Harney project. In addition projects by other agencies such as the closing of the Third Street "Nishkin" bridge by DPW. I request a complete inventory of all the projects expected during this project be considered." (Michael Hamman, Letter, June 20, 2017)

"In the interest of reducing traffic and congestion, I also ask the PUC to live up to their promises to the neighborhoods by building the Quint Street Connector Bypass, as soon as feasible, to re-connect Oakdale and Jerrold Avenues" (Tony Kelly, Letter, June 26, 2017)

Response TR-4

The comments raise concerns regarding cumulative transportation impacts associated with the numerous projects currently underway or planned in the vicinity of the water pollution control plant. The comments identify several specific projects and concerns related to BDFP construction, addressed below, and state that significant cumulative transportation and circulation impacts would occur during BDFP construction. Reasons stated in the comments as causing significant cumulative impacts include the characteristics of the BDFP itself or the cumulative projects; cumulative projects that were not included in Draft EIR; effects on emergency access; and the assertion that a Traffic Control Plan is required to evaluate the significance of impacts. Commenters also identify strategies to improve circulation in the neighborhood.

Note that comments indicating that the Draft EIR does not contain a Traffic Control Plan and requests for inclusion of a Traffic Control Plan are responded to under **Response TR-1 (**under the heading "Traffic Control Plan"), and **Response TR-2** provides responses to comments regarding emergency access into and out of the Bayview-Hunters Point neighborhood. Refer to **Response GC-2** in Section 10.11 of this document for a response regarding socioeconomic effects.

Overview of BDFP Draft EIR Cumulative Analysis

The cumulative transportation impact analysis is presented on Draft EIR pages 4.6-51–4.6-61, and includes analysis of cumulative impacts during project construction (Impact C-TR-1, pages 4.6-52–4.6-58) and project operations and maintenance activities (Impact C-TR-2, 4.6-58–4.6-61). The cumulative impact analysis was conducted based on the transportation significance criteria presented on Draft EIR pages 4.6-23–4.6-25, and includes assessment of impacts on vehicles miles traveled, traffic safety, public transit, bicyclists, pedestrians, and emergency vehicle access. As described there, the San Francisco Planning Commission uses the vehicle miles traveled metric instead of automobile delay to evaluate the transportation impacts of projects; consequently,

degradation of vehicular delay and level of service (LOS) are no longer considered a significant impact under CEQA and are not reported in the Draft EIR. However, discussion of cumulative traffic circulation effects is provided in the Draft EIR for informational purposes. In addition, as described above in **Response TR-3**, while the adequacy of parking is no longer considered in determining the significance of project impacts under CEQA, the Draft EIR assesses whether the proposed project would result in secondary effects that could create hazardous conditions affecting traffic, transit, bicycles, or pedestrians and whether it could result in significant delays to transit. Cumulative transportation impacts were determined to be less than significant; therefore, mitigation measures are not required.

The cumulative impact analysis considered impacts from projects that would overlap with the BDFP temporally and, with respect to affected roadways, spatially. The majority of the cumulative projects identified in the comments are included in Draft EIR Table 4.1-1 (Draft EIR pages 4.1-6–4.1-15). The cumulative analysis was developed based on the most recently available information regarding cumulative project implementation to determine potential effects, and in particular, overlap with BDFP construction activities.

The following information is provided to clarify the characteristics of the BDFP and other cumulative projects identified by commenters as potentially contributing to a cumulative impact in combination with the BDFP. This information was included in the Draft EIR cumulative impact analysis, which for transportation and circulation concluded that construction-related cumulative impacts would be less than significant.

- **BDFP Temporary Closure of Jerrold Avenue**. The analysis of the proposed temporary closure of Jerrold Avenue between the Caltrain tracks and Phelps Street as part of BDFP construction, in combination with cumulative projects in the vicinity, was included in the BDFP Draft EIR. The effects of the temporary closure of Jerrold Avenue between the Caltrain tracks and Phelps Street, and effects of BDFP construction activities on travel on Phelps Street are described in Impact TR-1 on Draft EIR pages 4.6-35–4.6-46. Both Oakdale and Evans Avenues would offer alternative travel paths for vehicles currently traveling on this section of Jerrold Avenue that would be closed, and based on the traffic analysis conducted for the project, both streets have sufficient capacity to accommodate these diverted vehicles without a substantial effect on local vehicle circulation. **Response TR-1** provides additional discussion of the temporary closure of Jerrold Avenue. As noted in **Response TR-1**, in response to the community concerns regarding the closure of Jerrold Avenue for a five-year duration, the SFPUC construction contractor would evaluate options to reduce the duration and/or alter the type (full or partial) of the temporary closure of Jerrold Avenue.

- **BDFP Construction Shuttle on Phelps Street**. The construction worker shuttle bus from BDFP off-site construction parking at Piers 94 and 96 was included as part of the transportation analysis. As described on Draft EIR page 4.6-30, when construction workers park at the Piers 94 and 96 staging areas (expected to be needed for approximately 16 months, from April 2021 to July 2022), a worker shuttle bus service would be provided between the piers and the water pollution control plant. The shuttle service would run approximately one hour before and after the project construction worker arrival and

departure hours. Table 4.6-14 (Draft EIR page 4.6-33) presents the number of daily and a.m. and p.m. peak hour shuttle trips. Construction workers who park at the Southeast Greenhouses or 1550 Evans staging areas would walk between the staging area and the water pollution control plant.

- **SFPUC Southeast Plant Headworks Replacement Project (Cumulative Project No. 1).** As described on Draft EIR page 4.6-53, the Headworks Project would remove on-street parking on both sides of Evans Avenue adjacent to the water pollution control plant and would use the parking lane on the north side of the street to maintain four travel lanes on Evans Avenue throughout the approximately five-year construction period estimated for that project. The exception would be during a five-month period when one travel lane each way (rather than the existing two travel lanes each way) would be provided for a one-block segment of Evans Avenue between Rankin and Quint Streets to allow for construction between the water pollution control plant and the Bruce Flynn Pump Station that is located to the north of Evans Avenue. The circulation impacts of two, rather than four, travel lanes on Evans Avenue for the one block segment for a five-month period are discussed on Draft EIR pages 4.6-53 to 4.6-54. While BDFP-generated vehicles traveling to and from the water pollution control plant access at Rankin Street would continue to travel on Evans Avenue during the five-month period, the Headworks Traffic Control Plan would address the travel lane reduction, including use of advance construction warning signs, identification of alternative routes, and use of flaggers, as appropriate, to maintain vehicle flow with minimal disruption. Thus, east-west access on Evans Avenue would be maintained during construction of the Headworks Project. In addition, Cesar Chavez Street and Oakdale Avenue would continue to provide east-west arterial access to and from the Bayview during Headworks Project and BDFP construction. The temporary reduction in travel lanes for the one-block segment of Evans Avenue during the five-month period would not result in significant impacts on vehicular access in the area or result in traffic safety hazards. Overall, BDFP construction, in combination with the Headworks Project and other cumulative projects would not substantially affect traffic circulation in the area, and would result in less-than-significant cumulative construction-related traffic circulation impacts.

  Neither the Headworks project nor the BDFP includes any on-street construction staging or parking on either side of Phelps Street, although the Headworks project does include an off-street construction staging area along Phelps Street, on SFPUC property, and as described in **Response TR-3**, a shuttle stop may be located near the corner of Phelps Street and Jerrold Avenue for a limited duration of construction to transport workers between staging areas within Port property and the water pollution control plant as part of the BDFP. The Headworks project will have an off-street construction staging area within the water pollution control plant boundaries at the southwest corner of the intersection of Phelps Street and Evans Avenue, but would not remove any on-street parking spaces or travel lanes on Phelps Street. The Headworks Project may require some trenching along Phelps Street to install a sewer line from the construction trailers to an adjacent sewer manhole; however, this construction would be of very limited duration.

- **Southeast Community Facility Revitalization (Cumulative Project No. 20).** The Southeast Community Facility Revitalization project at 1800 Oakdale, cited in a comment, was evaluated as a cumulative project. Following a year-long community engagement process, the SFPUC Commission approved recommendations from the Southeast Community

Facility Commission and Citizen's Advisory Committee to initiate environmental review and design to relocate the Southeast Community Facility, currently located at 1800 Oakdale, to 1550 Evans, which is also a proposed staging area for the BDFP.[8, 9] Planning and design are underway to construct new facilities at 1550 Evans by 2022.[10] Therefore, it is possible that construction at 1550 Evans could be concurrent with and/or following completion of the BDFP construction. However, regardless of the timing, if work were to occur at this location, it would not require excavation within Oakdale Avenue.

- **Quint-Jerrold Connector Road (Cumulative Project No. 24).** The Quint-Jerrold Connector Road is a San Francisco County Transportation Authority (SFCTA) project that would restore local access eliminated by the Caltrain Quint Street Bridge Replacement Project in October 2015. The connector road would essentially restore north-south access on Quint Street, including access for pedestrians and bicyclists. In addition, the connector road would provide for local vehicular circulation (Quint Street is not a major north-south arterial). The connector road would be partially constructed on transMetro right-of-way (formerly owned by Union Pacific Railroad), and the SFCTA is currently in negotiations with transMetro for use of the right-of-way.[11] Once negotiations are completed, the SFCTA is expected to proceed with the project as planned. Construction of the connector road is anticipated to take one year.

- **San Francisco Wholesale Produce Market Expansion (Cumulative Project No. 25).** The SFWPM Project, including the permanent closure of Jerrold Avenue between Toland and Rankin Streets, was included as a cumulative project in the BDFP Draft EIR (see, for example, Draft EIR page 4.6-38). Refer to **Response TR-1** for a discussion of the timing of implementation of the Jerrold Avenue closure as part of that project.

Additional Projects Suggested for Inclusion in the Cumulative Analysis

Four proposed projects cited in the comments, the Palou Avenue Streetscape Improvement Project and Quesada Bike Lane, the 2245 Jerrold Avenue Emergency Medical Services Facility, the Hunters View project, and Islais Creek Bridge Rehabilitation, were not included in the list of cumulative projects in Draft EIR Table 4.1-1 (page 4.1-6). **Table 10.9-1** in Section 10.9, Other CEQA Considerations, describes these projects.

Based on the information provided below and in Table 10.9-1, inclusion of these projects in the cumulative scenario would not alter the cumulative transportation and circulation impact significance conclusions in the EIR, as discussed below for each project.

---

8 From January through September 2016, the SFPUC initiated a broad-based stakeholder engagement process. Outreach efforts included surveys of area residents, public meetings, door-to-door campaigns and awareness surveys, and online engagement tools. (SFPUC, *Southeast Community Facility and Greenhouses: A Summary of Stakeholder Engagement and Preferences*, October 11, 2016. Available online at http://peir.sfwater.org/Modules/.aspx?documentID=10949)

9 SFPUC, Commission Resolution No. 16-0233, November 8, 2016.

10 SFPUC, Our New Home: Envisioning Our Bayview Together, 2017. Available online at http://sfwater.org/index.aspx?page=1183. Accessed on January 26, 2018. SFPUC has indicated completion of this project is anticipated in 2022.

11 Mike Tan, San Francisco County Transportation Authority, November 9, 2017.

- **Palou Avenue Streetscape Improvement Project and Quesada Avenue Bike Lane**.[12] This project includes streetscape improvements on a seven-block segment of Palou Avenue between Rankin and Jennings Streets and a new bicycle lane on Quesada Avenue between Third and Griffith Street, as described in Table 10.9-1. Traffic volumes on both streets are low, and neither component of the project involves substantial construction activity (i.e., there would be no excavation or work within the travel lanes for extended durations; see Table 10.9-1 for more details). Implementation of the project will take about one year, starting in April 2018.

- **2245 Jerrold Avenue Emergency Medical Services Facility**.[13] The Emergency Medical Services (EMS) Facility project would construct an EMS facility and a parking garage approximately 0.4 miles west of the water pollution control plant (see Table 10.9-1). The facility would replace an existing facility located on Evans Avenue between Newhall and Mendell Streets (east of the water pollution control plant). Presuming approval of the land transfer to the San Francisco Fire Department in late 2017, construction is anticipated to begin in 2018. Construction would take about 1.5 years, and would not generate a substantial amount of construction vehicle trips. The CEQA analysis conducted for this project did not identify any substantial construction or operational impacts.

- **Hunters View Project**.[14] The Hunters View Project includes revitalization of the existing Hunters View public housing site located about 0.7 miles southeast of the water pollution control plant. The project includes demolition of existing residential units and other facilities on the site, and construction of up to 800 residential units and other supporting land uses. The project is being developed in multiple phases to allow the market-rate units to come into the market such that the sale of these units would help subsidize public housing units. Phased construction also allows all existing residents to be temporarily relocated on-site during construction.[15] Phased construction of the Hunters View Project is currently underway: Phase 1 (267 units) was completed in 2013, Phase 2a (107 units) was completed in early 2017, Phase 2b (72 units) was in progress as of late 2017, and the remaining phases (up to 426 units) will be constructed between 2019 and 2023.[16] Consequently, construction vehicle trips associated with Phase 1 and Phase 2a of the Hunters View Project are included in the existing conditions in the BDFP Draft EIR. The final phase of the Hunters View Project construction activities are planned to end around the same time as the BDFP construction (i.e., around 2023), at which time Jerrold Avenue between the Caltrain tracks and Phelps Street would be reopened and reconstructed to Better Streets Plan standards.

[16] Catherine Etzel, John Stewart Company, personal communication with Karen Lancelle, ESA, August 22, 2017.

- **Islais Creek Bridge Rehabilitation Project**.[17] The Islais Creek Bridge Rehabilitation Project would rehabilitate and repair the Islais Creek Bridge, as described in Table 10.9-1, and is currently undergoing environmental review. No change to the alignment or widening of the bridge is proposed. Prior to initiation of rehabilitation work, the construction contractor would be required to submit a Traffic Control Plan to the City's Traffic Engineer for review and approval. The contractor would be required to conduct construction activities to cause the least possible obstruction and inconvenience to the community, and provide travel lanes and routing for vehicular, pedestrian, and Muni riders, in a manner that would be safe and would minimize traffic congestion and delays. The bridge rehabilitation work is anticipated to require complete bridge closure for one to two months, during which time detour routes would be required. The detour routes could include use of Illinois Street, Evans Avenue, Cesar Chavez Street, and other north-south streets to the west, such as Potrero Avenue. The Traffic Control Plan for the Islais Creek Bridge Rehabilitation Project would be required to consider the one- to two–month bridge closure with other planned construction activities in the area, including the temporary closure of Jerrold Avenue as part of the BDFP, and temporary partial closure of two lanes on Evans Avenue as part of the Headworks project. During the one- to two-month bridge closure, BDFP construction traffic using this segment of Third Street (i.e., between Cesar Chavez Street and Cargo Way), would be routed to Illinois Street (i.e., one block to the east of Third Street), and therefore, the Islais Creek Bridge Rehabilitation Project would not substantially affect the cumulative impact analysis presented in the BDFP Draft EIR. A CEQA Categorical Exemption is being prepared for the project, and it is anticipated that the Islais Creek Bridge Rehabilitation Project would not result in any substantial construction impacts.

Commenter Suggestions to Improve Circulation

Commenter suggestions to improve circulation in the vicinity of the water pollution control plant focus on how BDFP implementation could be coordinated with select nearby cumulative projects.

- **Temporary Reroute of the Muni 23 Monterey Bus Route**. As noted by a commenter, and discussed on Draft EIR page 4.6-39, the five-year closure of Jerrold Avenue between the Caltrain tracks and Phelps Street would require the temporary rerouting of the 23 Monterey bus route. Because the SFMTA's Muni Forward project identified a service improvement that would permanently relocate the bus route from Jerrold Avenue onto Palou Avenue, the BDFP included this route as a proposed route during the BDFP construction period. A commenter cited concern regarding relocating the bus route to Palou Avenue during construction of the Palou Avenue Streetscape Project, and recommended reconsideration of the reroute. As discussed above, implementation of the Palou Avenue Streetscape Improvements would not involve substantial construction activity, and temporary relocation of the bus route to Palou Avenue would not be substantially affected by the streetscape implementation activities. However, depending on sequencing and actual schedule of the Palou Avenue Improvement Project, which is currently not known, the SFMTA may identify during preparation of the BDFP Traffic Control Plan an alternate route that avoids Palou Avenue. For example, instead of traveling

17 San Francisco Planning Department, Preliminary Project Assessment, Third Street Crossing of Islais Creek, Case No. 2014.0097U, March 14, 2014; Oscar Gee, San Francisco Public Works, personal communication with Karen Lancelle, ESA, August 28, 2017.

on Industrial Street to access Palou Avenue, the 23 Monterey could continue on Oakdale Avenue between Industrial and Phelps Streets. Impacts of such an alternative alignment, if it were to be used during the BDFP project construction, would be similar to those discussed on Draft EIR page 4.6-39, and as a result would be less than significant.

- **Coordination with Produce Market.** One comment requests improved collaboration and coordination between the SFPUC and the produce market on the redesign of the full length of Jerrold Avenue and neighboring streets and intersections. This request is noted. The SFPUC will continue to meet periodically with the produce market regarding implementation of the BDFP. The SFPUC's continued collaboration with local stakeholders would seek to improve project coordination and attempt to reduce traffic conflicts but would not affect the cumulative impact analysis or conclusions contained in the BDFP Draft EIR because any physical improvements to neighboring streets and intersections not currently planned would be covered in project-level CEQA review when proposed.

- **Construction of the Quint-Jerrold Connector Road.** As noted above, SFCTA is implementing the Quint Street Connector Road project, not SFPUC. For this reason, SFPUC does not control the schedule of this project. The connector road is not expected to be completed by December 2018, as recommended in a comment. The Quint-Jerrold Connector Road would not be required for BDFP construction trucks traveling to and from the water pollution control plant, and therefore, would not need to be constructed prior to initiation of BDFP construction.

Because cumulative transportation impacts were determined to be less than significant, no mitigation would be required. Thus, while SFPUC acknowledges the commenters' suggestions to include the Quint Street Connector Road Project and the San Francisco Wholesale Produce Market Expansion Project's roadway improvements as mitigation for transportation circulation impacts, they are not warranted.

Comment TR-5: Operational Transportation Impacts

This response addresses the following comment, which is quoted below:

O-Greenaction.3

"A major concern is the projected increase in truck traffic. The project estimates a thirty to fifty percent increase in truck traffic to/from the Southeast Plant, and we consider 10-14 truck trips per day to be a large number of trips, particularly for a facility that operates 24 hours a day, 7 days a week, 365 days per year. We strongly encourage the project to explore ways to reduce and mitigate the increase in truck trips, particularly given the air quality overburden and environmental justice concerns in this community." (Bradley Angel, Greenaction for Health and Environmental Justice, Letter, June 26, 2017)

Response TR-5

As described on Draft EIR page 4.6-24, the San Francisco Planning Commission uses a vehicle miles traveled metric instead of automobile delay or intersection levels of service (e.g., resulting from an increase in vehicles on affected roadways) in significance thresholds. The effects of the BDFP on vehicle miles traveled during operations were evaluated in Draft EIR Impact TR-3, starting on Draft EIR page 4.6-47. As discussed there, the VMT generated by the additional three to four trucks per day due to projected increases in solids loads associated with anticipated population growth could be offset somewhat by the additional market reuse options available for the Class A biosolids produced by the BDFP, which could be located closer to the site. The BDFP also would not substantially alter existing traffic circulation associated with facility operations, and would reroute operational truck trips to Evans Avenue, identified as a Freight Traffic Route in the SF General Plan (see Draft EIR page 4.6-3). For these reasons, impacts of BDFP operations on vehicle miles traveled were determined to be less than significant and no mitigation would be required. Refer to **Response AQ-1** for discussion of air quality impacts resulting from BDFP operations.

———————————

10.6 Air Quality and Greenhouse Gas Emissions

The comments and corresponding responses in this section relate to the topic of air quality, evaluated in Draft Environmental Impact Report (EIR) Section 4.8. For ease of reference, these comments are grouped into the following air quality-related issues that the comments raise:

- AQ-1: Standard for Mitigating Construction-Related and Operational Impacts
- AQ-2: Construction-Related Air Quality Impacts
- AQ-3: Mitigation to Reduce Fugitive Dust
- AQ-4: Additional Mitigation to Reduce Construction-Related NO_x and $PM_{2.5}$ Emissions
- AQ-5: Additional Mitigation to Address Operational Criteria Air Pollutant Impacts
- AQ-6: Odor Issues
- AQ-7: Mitigation to Reduce GHG Impacts
- AQ-8: Inclusion of Air Quality Technical Report and Diesel Equipment Compliance Requirements

Comment AQ-1: Standard for Mitigating Construction-Related and Operational Impacts

This response addresses the following comments, which are quoted below:

A-BAAQMD.3 O-Greenaction.3 O-Greenaction.6 I-Kelly.1

"We also have identified project aspects that warrant additional review and/or clarification in the FEIR. The first of these aspects is the project's location. Two noteworthy programs have classified the location as a disadvantaged and vulnerable community that warrants heightened protection from air quality-related health risk. In San Francisco's Community Risk Reduction Plan (CRRP), this area has been designated an Air Pollution Exposure Zone (APEZ) and a Health Vulnerability zip code. At the Air District this area has been identified as an area with disproportionate air quality burden by our Community Air Risk Evaluation (CARE) program. The Air District's 2017 Clean Air Plan strives to eliminate the disparity in air quality between the eight CARE communities and the rest of the region by stabilizing and decreasing emissions around and in them. For this reason, we suggest that this project strive for "no net increase" in criteria air pollutant and toxic air contaminant emissions over existing conditions. We recommend this standard across construction and operation phases of the project. We strongly recommend that NOx and $PM_{2.5}$ emission increases associated with this project (i.e., those listed in Tables 4 and 14 of the AQTR) be reduced or offset by lower-emission equipment choices in this project, by revised operating plans or other equipment upgrades within the SEP, and/or by off-site initiatives. We recommend that any off-site mitigation occur in or immediately upwind of the communities affected by this project to assure consistency with SFPUC's environmental justice policy, the environmental justice report written for this project, and the community vulnerability concerns discussed above. We encourage more detailed equipment choices prior to finalization of the EIR to strive for no net increases in emissions and to assure consistency between the FEIR and the application for a Permit to Operate from the Air District." (Jean Roggenkamp, Bay Area Air Quality Management District [BAAQMD], Letter, July 28, 2017)

"A major concern is the projected increase in truck traffic. The project estimates a thirty to fifty percent increase in truck traffic to/from the Southeast Plant, and we consider 10-14 truck trips per day to be a large number of trips, particularly for a facility that operates 24 hours a day, 7 days a week, 365 days per year. We strongly encourage the project to explore ways to reduce and mitigate the increase in truck trips, particularly given the air quality overburden and environmental justice concerns in this community. Even if the trucks are using 2010 or new engines and if they are Tier 4 for pollution control, having over a dozen trucks rumbling into and out of the plant daily increases the intensity of impacts on the community, particularly if taking place in evenings, during the night, or over the weekend. We strongly encourage SFPUC to come up with a plan to mitigate the aesthetic and health impacts of this increase in truck traffic. Other than creating a more efficient trucking route, we see no such plan in the draft EIR." (Bradley Angel, Greenaction for Health and Environmental Justice, Letter, June 26, 2017)

"One of our significant concerns in this project is the expansion in the amount of production and combustion of biogas in the neighborhood. San Francisco has already designated the Bayview-Hunters Point neighborhood as a Health Vulnerability zip code in its Community Risk Reduction Plan. Increasing and burning 50 percent more biogas will exacerbate community health concerns, particularly given that part of the increase is in PM2.5 emissions. There is already considerable concern in the neighborhood about respiratory health and asthma rates in children. We strongly encourage SFPUC to offset any estimated increases in PM2.5 with actions that will reduce direct emissions in the Bayview-Hunters air shed. We repeat this call for any other increases in other criteria pollutant emissions associated with this project. We do not understand why SFPUC would increase the community health burden in this project instead of assiduously offsetting or reducing it." (Bradley Angel, Greenaction for Health and Environmental Justice, Letter, June 26, 2017)

"I am writing today in support of my neighbors in Bayview and their comments regarding the Biosolids Digester Facilities Project EIR, requesting additional review of the impact analysis for Air Quality (Section 4.8)." (Tony Kelly, Letter, June 26, 2017)

Response AQ-1

The comments (a) indicate that aspects of the project "warrant additional review and/or clarification" regarding the Biosolids Digester Facilities Project's (BDFP) location within an Air Pollution Exposure Zone (APEZ), a Health Vulnerability zip code, and an area identified in the Bay Area Air Quality Management District's (BAAQMD) Community Air Risk Evaluation (CARE) program; and (b) call for heightened protection from air quality-related health risks in these areas. The comments suggest that the project strive for "no net increase" in criteria air pollutant and toxic air contaminant emissions over existing conditions.

The Draft EIR describes the APEZ, Health Vulnerability designations and the CARE program on pages 4.8-11 to 4.8-12 and 4.8-63, and describes how the project is compared against thresholds specifically designed to address the increased air quality risks associated with its location in the APEZ and Health Vulnerability zip code on page 4.8-39. The Draft EIR also discusses the project's consistency with the CARE program (Draft EIR pages 4.8-63 to 4.8-64). In support of this program, the City and County of San Francisco (city) completed the San Francisco Community Risk Reduction Plan (CRRP), which included a city-wide health risk assessment (HRA). The CRRP-HRA provides the basis for the designation of APEZs in San Francisco and establishes more stringent thresholds for projects located within these zones. The APEZ and Health Vulnerability zip codes were the result of a joint effort by the city and the BAAQMD to identify areas with poor air quality and assess the cumulative exposures to air pollution throughout the city (Draft EIR page 4.8-11). Figure 4.8-2 (Draft EIR page 4.8-13) presents the APEZ and Health Vulnerability zip code boundaries in the project vicinity. Table 4.8-7 (Draft EIR page 4.8-40) presents a comparison of the thresholds applied to areas within and outside the Health Vulnerability zip codes, reflecting the increased health risks within these zip codes. Table 4.8-7 also indicates lower (more stringent, health-protective) thresholds for a project's incremental contribution to cumulative health risks when sensitive receptors are located within the APEZ. Because the project site is located within the APEZ and a Health Vulnerability zip code, the Draft EIR's impact analysis applies these lower (more stringent) thresholds. The thresholds applied in the Draft EIR analysis are equivalent to, or more stringent than, the California Environmental Quality Act (CEQA) significance thresholds that were recommended by the BAAQMD in its *Options and Justifications Report* (2009) and presented in Table 2-1 of the BAAQMD's *CEQA Air Quality Guidelines*.[1]

While the comments suggest that the project should strive to achieve no net increase in criteria air pollutant and toxic air contaminant emissions over existing conditions, application of such a threshold is not consistent with the CEQA significance thresholds implemented by the city (shown in Tables 4.8-6 and 4.8-7 on Draft EIR pages 4.8-36 and 4.8-40, which in turn are based on BAAQMD guidance), or with CEQA. As explained in CEQA Guidelines Section 15041, subdivision (a), "[a] lead agency for a project has authority to require feasible changes in any or all activities involved in the project in order to substantially lessen or avoid significant effects on the environment, consistent with applicable constitutional requirements such as the 'nexus' and 'rough proportionality' standard established by case law." (Citing *Nollan v. California Coastal Commission* (1987) 483 U.S. 825, *Dolan v. City of Tigard* (1994) 512 U.S. 374, and *Ehrlich v. City of Culver City* (1996) 12 Cal.4th 854; see also CEQA Guidelines, Section 15126.4, subd., (a)(4)(A), (B).) The rough proportionality standard means that the type and amount of mitigation must roughly correspond in size, degree, and intensity to the project impact. In other words, an agency may not impose mitigation on a project that is greater than necessary to mitigate a particular impact of the project to a less-than-significant level.

[1] Table 2-1 is presented on page 2-2 of both the May 2011 and May 2017 versions of BAAQMD's *CEQA Air Quality Guidelines*.

Comments also recommend that the project's construction-related and operational nitrogen oxides (NOx) and fine particulate matter ($PM_{2.5}$) emissions be reduced or offset by selecting lower-emission equipment for the project, by modifying operating plans or implementing other equipment upgrades at the Southeast Water Pollution Control Plant, or by off-site initiatives. For purposes of CEQA, there is no nexus (i.e., connection) to require mitigation of the project's *operational* NOx emissions or *construction-related and operational* $PM_{2.5}$ emissions because estimated operational NOx emissions and construction-related and operational $PM_{2.5}$ emissions would not exceed the city's significance thresholds and were therefore determined to be less than significant (Draft EIR pages 4.8-49 and 4.8-54). (Nonetheless, please refer to **Response AQ-5** for a discussion of expected reductions in operational NOx emissions to below existing levels, based on new information received since preparation of the Draft EIR.) Construction-related NOx emissions would, however, exceed the threshold level, and the Draft EIR recommends Mitigation Measures M-AQ-1a (Construction Emissions Minimization) and M-AQ-1b (Emission Offsets) to reduce NOx emissions. Implementation of these mitigation measures would reduce the project's construction-related NOx emissions to below the threshold levels. However, because the availability of sufficient NOx offset opportunities is uncertain and may require an agreement with a third party, the Draft EIR determined that construction-related NOx emissions during the first and third construction years may not be reduced to below threshold levels and conservatively determined this potential exceedance to be significant and unavoidable with mitigation. However, if NOx emissions offsets are achieved, then the project's construction-related NOx exceedance would be reduced to a less-than-significant level during all five construction years. Additionally, if NOx emissions offset projects are located in the vicinity of the water pollution control plant (as suggested above in Comment A-BAAQMD.3), then they would directly benefit neighbors by reducing NO_2 concentrations because NO_2, a component of NOx, can have adverse, but typically mild health effects (i.e., an increased risk of acute and chronic respiratory disease, as well as reduced visibility). Localized concentrations of NOx are not specifically considered a potential CEQA significant impact by the BAAQMD; the NOx emissions threshold is intended to limit NOx because it is a precursor to regional ozone formation, not because of its mild health effects. (See **Response AQ-4** below for more discussion of mitigation measures to reduce NOx and $PM_{2.5}$ emissions.) With respect to providing more detailed equipment choices prior to finalization of the EIR to assure consistency between the FEIR and the application for a Permit to Operate from the Air District, the air quality emissions modeling utilized conservative assumptions (see **Response AQ-5** for more explanation).

Regarding the request that San Francisco Public Utilities Commission (SFPUC) "offset any estimated increases in $PM_{2.5}$," the SFPUC completed an environmental justice analysis for the project separate from the CEQA process.[2] In accordance with SFPUC's 2009 Environmental Justice Policy, that report finds that localized $PM_{2.5}$ concentrations are disproportionately high in Bayview-Hunters Point compared to other parts of the city, and recommends that the SFPUC enact a $PM_{2.5}$

[2] Consistent with CEQA, economic or social effects of a project are not to be treated as significant effects on the environment (CEQA Guidelines Section 15131). The EIR focuses on physical environmental effects rather than socioeconomic effects. The SFPUC has completed a separate environmental justice analysis for the project: ESA, *Environmental Justice Analysis for Bayview-Hunters Point, Biosolids Digester Facilities Project and Community Benefits Program,* prepared for SFPUC, June 2017. Available online at www.sfwater.org/bdfp-ej-analysis.

offset program to reduce operational emissions from the turbines (which account for approximately 90 percent of the BDFP's estimated operational $PM_{2.5}$ emissions[3]) if source testing indicates that $PM_{2.5}$ emissions exceed 3.0 tons per year, with a goal of "no net increase" over future no-project conditions. The future no-project condition refers to the estimated condition with no modification to the water pollution control plant but accounting for population growth (and associated increases in the quantity of wastewater treated at the plant). The environmental justice report indicates that SFPUC should prioritize $PM_{2.5}$ reduction options that are located near the Southeast Plant and/or within the APEZ, followed by options located within the broader Bayview-Hunters Point neighborhood. The SFPUC will consider the recommendations of the environmental justice report separately from the CEQA process. For additional discussion of the SFPUC's environmental justice policy, and the environmental justice report prepared for this project, refer to **Response GC-4** in Section 10.11 of this document.

The comment stating that the 10 to 14 truck trips per day is a large number of trips for a facility that operates 24/7 and encouraging the SFPUC to mitigate the increase in truck trips requires clarification. As indicated in Draft EIR Table 4.6-16 (page 4.6-35), existing average daily truck trips total about 33 trucks per day including up to 10 trucks per day associated with biosolids hauling. With the project, a total of up to 36 truck trips per day would be generated, including up to 14 truck trips per day associated with biosolids hauling. This would represent a total net increase of three truck trips per day, comprised of an increase of four truck trips per day associated with biosolids hauling and a decrease of one truck trip per day associated with coarse and fine screenings hauling. This increase would be attributable to increased solids loads resulting from projected population growth by 2045 rather than the BDFP *per se*. A net increase in solids loading would occur irrespective of the BDFP.[4] As stated on Draft EIR page 4.8-37, such a small change in truck trips on local roadways would not substantially alter transportation-related criteria pollutant emissions.

Another commenter expresses support for comments by other Bayview neighbors for additional review of the air quality impact analysis. The commenter is referred to **Response AQ-2** regarding provision of more details from the impact assessment related to construction, **Response AQ-3** regarding the adequacy of fugitive dust mitigation, and **Responses AQ-4** and **AQ-5** for consideration of additional mitigation to reduce construction-related NOx and $PM_{2.5}$ emissions and operational criteria pollutant emissions.

---

3 See Table 12c of the *Air Quality Technical Report, Biosolids Digester Facilities Project Draft EIR* (AQTR). (Ramboll Environ, *Air Quality Technical Report, Biosolids Digester Facilities Project Draft EIR*, March 10, 2017. Available online at http://sfmea.sfplanning.org/SFPUC%20SEP%20Biosolids_AQTR_2017-03-10.pdf.**)**

4 As indicated in Note g in Table 2-1 (Draft EIR page 2-7), *without implementation of the BDFP* the amount of biosolids generated and the number of haul trips would actually be greater because the proposed BDFP solids treatment processes would reduce the quantity of biosolids generated compared to existing solids treatment processes.

Comment AQ-2: Construction-Related Air Quality Impacts

This response addresses the following comments, which are quoted below:

O-BayviewCP-2.9 O-BVHPCAC.6 O-SFWPM-2.3 O-SFWPM-2.6

"In addition, and as a result of the completion of this Quint connector alignment, a portion of the deteriorating air quality issues noted as 'significant and unavoidable' during the construction process may be improved as the likely impacts of congested and idling automobiles, trucks and busses on the remaining Oakdale corridor could be reduced." (Dan Dodt, Bayview Community Planning, Letter, June 17, 2017; Bayview Hunters Point Citizens Advisory Committee, Letter, June 19, 2017)

"The discussion of and mitigation related to potential air quality impacts of the Biosolids Project on the environment is inadequate in its (1) failure to consider potential impacts to the SFWPM and (2) failure to consider and mitigate for dust related impacts. The DEIR should be revised to include a more comprehensive discussion of these issues.

"The entire air quality section of the DEIR[6] only has one passing reference to the Market and/or the SFWPM Project, and even then only in a footnote.[7] As described above, the Market is the primary source for San Francisco's produce, including that served in restaurants, sold in grocery stores, and consumed by San Francisco residents. Given the potential sensitivity of these operations to air quality impacts - including emissions, dust, and odors - the DEIR should have included within its analysis a discussion of the potential impacts specific to the Market and the SFWPM Project."

[6] DEIR, pp. 4.8-1 et seq.

[7] DEIR, p. 4.8-72, fn. 116

(Michael Janis, San Francisco Wholesale Produce Market, Letter, June 19, 2017)

"[A]s a vital business and adjacent site, it is important to the SFMC and Market that the Biosolids Project fits into the existing (and ever-growing and changing) neighborhood. As such, it is our position that the DEIR is inadequate in its … failure to consider … air quality…impacts to the Market and the SFWPM Project …. We respectfully request that the DEIR be modified to address these inadequacies." (Michael Janis, San Francisco Wholesale Produce Market, Letter, June 19, 2017)

Response AQ-2

The first comment presented above suggests that a portion of the project's construction-phase significant and unavoidable air quality impact could be reduced once the "Quint connector alignment" is completed because there would be less congestion (fewer idling vehicles). Note that the San Francisco County Transportation Authority is the entity overseeing implementation of

the Quint Connector Road; the SFPUC has no authority or control over its implementation. As described on Draft EIR page 4.1-10, the Quint Connector Road is expected to be constructed from late 2018 to 2019, depending upon land acquisition.

As shown in Draft EIR Table 4.8-9 (page 4.8-47), roughly 24 percent of reactive organics (ROG), 44 percent of NOx, and 15 percent of PM of the mitigated total construction criteria air pollutant emissions result from on-road construction vehicles traveling to and from the project site. These emissions are based on estimates of total vehicle miles traveled (VMT) and assume trip lengths ranging from 0.6 miles to 65 miles (one-way). Any reduction in VMT that might result from travel via the future Quint Connector Road (assuming that project is completed before or prior to completion of BDFP construction) would represent a very small fraction of total VMT. As such, while any reduction in traffic congestion associated with completion of this connector would help to reduce construction-related on-road criteria pollutant emissions, it would have a negligible effect on the Project impact and conclusions in the DEIR would remain the same. In any case, idling emissions from off-road equipment (also shown in Table 4.8-9) would not be affected by implementation of the Quint Street Connector Road and were assumed to be limited to two minutes, in accordance with the requirements of the Clean Construction Ordinance.

The comments that the air quality analysis fails to consider impacts on the San Francisco Wholesale Produce Market (SFWPM or produce market), and therefore is inadequate, requires clarification regarding localized versus regional effects of air pollutants, as well as the approach to evaluating health risk. For the purposes of CEQA, impacts associated with the project's increases in criteria air pollutants (evaluated under Impact AQ-1, beginning on Draft EIR page 4.8-43) are regional in nature (i.e., they affect regional air quality), and most health risks associated with criteria air pollutants are not localized (i.e., they do not necessarily affect adjacent receptors directly or especially) except for particulates (PM), which are evaluated in terms of $PM_{2.5}$ concentration. However, nuisance effects of fugitive dust and health risks associated with toxic air contaminant (TAC) emissions are more localized. Impacts and mitigation related to fugitive dust are discussed below in **Response AQ-3**. The Draft EIR (page 4.8-56) evaluated the project's health risk impacts on all receptors within 1 kilometer of the project site, which includes the produce market. As required by the City and BAAQMD CEQA guidelines, health risks evaluated for the project include lifetime excess cancer risk, chronic and acute health indices HI]), and $PM_{2.5}$ concentration. Cumulative health risks evaluated include lifetime excess cancer risk and $PM_{2.5}$ concentration. These health risks are based on inhalation risk factors only (and not ingestion) due to the types of airborne TAC emissions from major pollution sources such as traffic and stationary sources. The vast majority of these TACs are designated by the California Office of Environmental Health Hazard Assessment (OEHHA), the state agency responsible for providing guidance on evaluation of exposure to chemicals, as "inhalation only" and do not have multi-pathway effects (such as those resulting from ingestion).

The health risks of the project were evaluated at 20 meter intervals (designated as "receptors") up to 1 kilometer from the site (the "study area," as shown on Draft EIR Figure 4.8-5, page 4.8-57), consistent with the CRRP-HRA conducted by the city. Several of the receptor locations evaluated cover the produce market, but the specific results at these receptors were not reported in the Draft EIR, as only sensitive receptors (i.e., residential or other high sensitivity uses such as

daycares or medical facilities)[5] were evaluated. This is consistent with BAAQMD guidance, as non-sensitive receptors are not expected to have continuous exposure for an extended period (e.g., residential exposure assumes an infant is exposed all-day, every day for the complete construction period and lives in the same location for the first 30 years of their life). In addition, only the maximum impacts at sensitive receptors are required to be reported; the maximums for each health impact at sensitive receptors are shown in Draft EIR Tables 4.8-11, 4.8-12, 4.8-14, and 4.8-15 (pages 4.8-59, 4.8-61, 4.8-73, and 4.8-75, respectively). As such, health impacts from the project for the non-sensitive, worker receptors (adult) at the produce market would be much lower than those reported in the Draft EIR.

Note that these health impacts do not provide information on the health risks associated with the ingestion of any produce which is brought to, temporarily stored at, and distributed from the site. (As discussed above, the vast majority of TACs associated with the project is deemed an "inhalation only" risk by OEHHA and would not be expected to cause adverse health effects through deposition onto, and subsequent ingestion of produce.) Note also that the produce market is located at least approximately 200 feet upwind of the project's northern property line, and its upwind location would help to further minimize exposure to health impacts. The impacts on the products at the produce market would be further mitigated by the fact that the produce appears to mainly be stored indoors, which would limit its exposure to fugitive dust and other pollutants.

Comment AQ-3: Mitigation to Reduce Fugitive Dust

This response addresses the following comments, which are quoted below:

O-SFWPM-2.4 O-SFWPM-2.6 I-Karlin.3

"Among the potential air quality impacts to the Market are dust related impacts. Indeed, fugitive dust is specifically identified as part of Impact AQ-1.[8] The DEIR purports to address these issues through references to the San Francisco Construction Dust Control Ordinance[9] and the Biosolids Project's required compliance therewith. However, no mitigation measures specific to dust control or dust impacts are imposed on the Biosolids Project, including in response to Impact AQ-1. Instead, the sole focus on the mitigation measures for air quality is on emissions, with two emissions-related mitigation measures imposed.

"Given the sensitive nature of surrounding uses, including the Market's operations, and the DEIR's admission that fugitive dust is an impact from the Biosolids Project, mitigation measures should be imposed to ensure that any such impacts are less than significant, particularly given the Market's role in maintaining the City's public health. The Biosolids Project's compliance with the San Francisco Construction Dust Control Ordinance, in and of itself, is not adequate to mitigate these impacts."

[5] Refer to Draft EIR Section 4.8.1.2 (page 4.8-3) for a definition of sensitive receptors and a description of sensitive uses near proposed Biosolids Digester Facilities Project (BDFP) facilities and staging areas.

[8] DEIR, pp. 4.8-43 and 44.

[9] DEIR, pp. 4.8-31, 32, 35, 36, 43, and 44.

(Michael Janis, San Francisco Wholesale Produce Market, Letter, June 19, 2017)

"[A]s a vital business and adjacent site, it is important to the SFMC and Market that the Biosolids Project fits into the existing (and ever-growing and changing) neighborhood. As such, it is our position that the DEIR is inadequate in its … failure to require mitigation specific to air quality … impacts. We respectfully request that the DEIR be modified to address these inadequacies." (Michael Janis, San Francisco Wholesale Produce Market, Letter, June 19, 2017)

"We also appreciate keeping the dust to a minimum and protecting our community from toxic waste while you work on our pipes." (Sean Karlin, Email, May 24, 2017)

Response AQ-3

One commenter states that there are no mitigation measures specific to dust control and that compliance with the San Francisco Construction Dust Control Ordinance, in and of itself, is not adequate to mitigate dust impacts. Another commenter is concerned with health risks associated with exposure to dust from toxic waste.

As explained in the Draft EIR (page 4.8-43), the SFPUC and project contractors responsible for construction activities at the project site would be required to comply with the San Francisco Construction Dust Control Ordinance (San Francisco Health Code Article 22B and San Francisco Building Code Section 106A.3.2.6). The city adopted the ordinance to reduce the quantity of airborne dust generated during site preparation, demolition, and overall construction work in order to protect the health of the general public and on-site workers, to minimize public nuisance complaints, and to avoid orders to stop work by the Department of Building Inspection (DBI).

The Construction Dust Control Ordinance requires that the SFPUC submit a Dust Control Plan for approval by the San Francisco Department of Public Health (SFDPH). The plan must specify how construction dust on the site will be controlled. The Draft EIR (page 4.8-43) lists over a dozen measures (reprinted below) that could be included in this plan, and these measures are consistent with recommended dust control measures included in the BAAQMD's CEQA Guidelines. The plan would describe dust monitoring requirements, action levels that would require implementation of corrective actions, and corrective actions that would be implemented if action levels are exceeded or a dust complaint is received. For the BDFP, the dust control plan may include any of the following (or equivalent) measures to accomplish the goal of minimizing visible dust, as described on Draft EIR pages 4.8-43 and 4.8-44:

- Wet down areas of disturbed soil at least three times per day using non-potable water;

- Analyze wind direction and install upwind and downwind particulate dust monitors;
- Record particulate monitoring results;
- Hire an independent third party to conduct inspections and keep a record of those inspections;
- Establish requirements for when dust-generating operations have to be shut down due to dust crossing the property boundary or if dust within the property boundary is not controlled after a specified number of minutes;
- Establish a hotline for surrounding community members to call and report visible dust problems;
- Limit the area subject to dust-generating construction activities at any one time;
- Minimize on-site storage of excavated material or waste materials;
- Install dust curtains and windbreaks on the property lines on windward and down windward sides of construction, as necessary;
- Pave or apply water or non-toxic soil stabilizers on all unpaved access roads, parking areas, and staging areas;
- Limit the amount of soil in hauling trucks to the size of the truck bed and walls and cover with a tarpaulin or other effective covers those trucks hauling soil, sand, and other loose materials;
- Establish a 15 mile-per-hour (mph) speed limit for vehicles entering and exiting construction areas;
- Sweep streets with water sweepers at the end of the day where visible soil material is present;
- Install and use wheel washers to clean truck tires if possible or otherwise brush off tires or tracks before they reenter City streets;
- Temporarily stop excavation, grading, and other construction activities when winds exceed 25 mph; and
- Hydroseed or apply soil stabilizers to previously graded areas for at least 10 calendar days; and sweep adjacent streets to reduce particulate emissions.

The produce market site is located at least approximately 200 feet upwind of the project's northern property line, and its upwind location would help to further minimize exposure to fugitive dust.

The requirements described above are mandatory for all construction projects in San Francisco. For example, San Francisco Building Code Section 106A.3.2.6 states as follows:

> "Dust control required. All applicants for a building, demolition, excavation, grading, foundation, or other permit required by this Code to construct a new building, to demolish a building, to substantially alter or to add to an existing building shall comply with the requirements for dust control and, in addition, for projects over a half acre the applicant will be required to submit a Dust Control Plan for approval by the San Francisco Health Department as set forth in Article 22B of the San Francisco Health Code."

The city's Construction Dust Control Ordinance establishes "best management practices" (BMPs), to reduce dust emissions during construction. An agency's decision to rely on BMPs to address a project's impacts has been upheld on numerous occasions under both federal and state law,[6] and the BAAQMD has acknowledged that implementation of BMPs represents sufficient insurance of avoiding significant impacts related to fugitive dust generated by construction activities.[7] Studies have demonstrated that the application of BMPs at construction sites has significantly controlled fugitive dust emissions.[8] Individual measures have been shown to reduce fugitive dust by anywhere from 30 percent to more than 90 percent. These studies support BAAQMD staff's recommendation that projects like the BDFP that implement these construction BMPs will reduce fugitive dust emissions to a less-than-significant level.[9]

The comment that BDFP compliance with existing regulations is not adequate to reduce dust impacts to a less-than-significant level is incorrect. California courts recognize that an agency may rely on compliance with existing regulations or requirements in finding a project's impacts would be less than significant.[10] In fact, reliance on compliance with the applicable regulatory framework is a common and widely accepted CEQA practice.

As stated on Draft EIR page 4.8-8, while dust can cause nuisance effects (i.e., watery eyes or irritation to the lungs, nose, and throat), adverse health effects associated with fugitive dust could occur if specific contaminants such as lead or asbestos are constituents in the soil. Such health-related impacts on the produce market and surrounding community are discussed in **Response HZ-2** in Section 10.8 of this document, and in Draft EIR Section 4.17, *Hazards and Hazardous Materials*.

Since the San Francisco Construction Dust Control Ordinance was adopted for the purpose of taking feasible available actions to reduce sources of particulate matter exposure, compliance with the regulations and procedures set forth by the Construction Dust Control Ordinance is feasible and mandatory, and would ensure that potential dust-related air quality impacts would be less than significant. For the reasons stated above, it was determined operations at the produce

City of Oakland* (2011) 195 Cal.App.4th 884 (project's compliance with existing laws and regulations provided substantial evidence that seismic impacts would be less than significant).

market would not be significantly affected by dust generated by construction activities at the project site or by dust from the off-site transport of soil and other materials.

Comment AQ-4: Additional Mitigation to Reduce Construction-Related NO_x and $PM_{2.5}$ Emissions

This response addresses the following comments, which are quoted below:

A-BAAQMD.4 A-BAAQMD.6 A-CPC-Johnson.2 I-Blacketer.1 I-Hinton.4

"To mitigate its NOx emissions during construction, the project proposes Mitigation Measure M-AQ-1a, which will require that "equipment with engines greater than or equal to 140 horsepower must meet Tier 4 final standards; [and] equipment with engines less than 140 horsepower must meet Tier 2 standards and be equipped with diesel particulate filters (DPFs)" (p. 4.8-46). We recommend or affirm the use of this mitigation approach for both municipally-owned and contractor-owned equipment in this project. We also see in the same section that "at least 80 percent of haul trucks (i.e., trucks used to remove or deliver backfill soil, excavated soil, and demolition debris) used must have 2010 or newer engines." Unless or until there is a conflicting local business enterprise requirement, we encourage the project to strive for 100 percent of all haul trucks to be 2010 engines or newer." (Jean Roggenkamp, BAAQMD, Letter, July 28, 2017)

"To mitigate NOx emissions during the five years anticipated for construction, the project proposes funding off-site efforts that reduce emissions. The DEIR anticipates an offset price of $18,030 per weighted ton. Our expectation is that the price of offsets for NOx emissions alone is around $35,000 per weighted ton and is likely to rise during the course of the project. We strongly recommend revision of this cost estimate, while also noting that this pricing correction was raised by the Air District in a comment letter on the Seawall Project (dated June 7, 2017) and the Event Center & Mixed use Development at Mission Bay (dated July 20, 2015)." (Jean Roggenkamp, BAAQMD, Letter, July 28, 2017)

"I actually also was going to point out the -- both the air quality, where there was significant mitigation that was necessary. I would like the staff to further explain what alternative mitigations could have been considered and as well for the traffic and the circulation. I think specifically, when it comes to an EIR, we do look at traffic and circulation as an impact. And I think that we can take a look at what are the alternative, again, mitigations for some of the impacts that we're looking at." (Christine Johnson, Planning Commission, Public Hearing Comments, June 1, 2017)

"For example, it is determined that the BDFP would result in **significant and unavoidable impacts** in the areas of cultural resources and air quality that would remain significant and unavoidable even with implementation of feasible mitigation measures.

"AIR QUALITY

"On the air quality issue, I am troubled that there are no serious mitigation measures proposed to offset these proposed **air quality** conditions during a construction period that 'generate levels of '**nitrogen oxide emissions that would exceed significance thresholds** during **two of the five years** of construction and that would also be a **cumulatively considerable contribution to regional air quality conditions**.' Does this indicate that we should withhold breathing for a period of 2-5 years in Bayview?

"Surely there are serious plans to offset these deplorable conditions proposed for the tens of thousands of residents, including a number of elderly citizens, many young children, and thousands of active students and working adults. 'Significant and unavoidable' are profoundly disturbing descriptors.

"I believe that a robust and thoroughly vetted air quality monitoring and reporting plan be developed and implemented as the project proceeds, with local and consistent notification regarding serious air quality deficiencies present, plans for 'sheltering in place' or other actions as required on extremely bad air days, etc. A repeat of 'failed' or 'battery-less' air quality monitors, as witnessed during the denuding of Parcel A in the Hunters-Point Shipyard some years ago, for example, will not be tolerated in Bayview or by our City leadership. I'm sure that you can appreciate these concerns regarding air quality (or the lack thereof) and the overall environmental impact of this project." (Linda Blacketer, Letter, June 19, 2017)

"I would ask that you at the very least… 3. Enroll fenceline residents in the area in a long-term health study that seeks both to understand and mitigate the detrimental health effects of the "deteriorating air quality issues" that are noted as 'significant and unavoidable' during construction. This study should continue for all fenceline residents who live near the SFPUC Sewerage treatment plant and who will be exposed to significant and unavoidable pollution from the sewerage treatment facilities." (Rosalind Hinton, Letter, June 19, 2017)

Response AQ-4

One comment encourages the project to strive for 100 percent of all haul trucks to be 2010 or newer model engines. Other comments request further explanation regarding the adequacy of proposed mitigation to address NOx impacts and of alternative mitigation measures that could be used to reduce impacts to less-than-significant levels. Commenters also propose or request additional mitigation measures for BDFP air pollutant emissions.

Engine Requirements for Haul Trucks

The SFPUC considered the requirement for 100 percent of haul trucks to be 2010 or newer and determined that it was infeasible due to San Francisco Local Business Enterprise (LBE) requirements[11] and the fact that compliance with the California Truck and Bus Regulation's final requirement (mandating fleets with heavy trucks or buses to have 100 percent 2010 or newer

[11] LBE requirements are contained in San Francisco Administrative Code Chapter 14B, *Local Business Enterprise and Non-Discrimination in Contracting Ordinance*. Available online at http://sfgov.org/cmd/14b-local-business-enterprise-ordinance. Accessed on November 15, 2017.

model engines) is not required until January 1, 2023, after project construction.[12] However, to maximize use of 2010 or newer engines in all haul trucks, the following text in Mitigation Measure M-AQ-1a(A)(2) of Draft EIR (page 4.8-49) has been revised (new text is shown in double underline and deleted text is indicated with ~~strikethrough~~):

> ***"Engine Requirements.***
>
> 2. At least 80 percent of haul trucks (i.e., trucks used to remove or deliver backfill soil, excavated soil, and demolition debris) used must have 2010 or newer engines. The SFPUC should strive to exceed this requirement when possible; if trucks with 2010 or newer engines are available in the Contractor's, or subcontractor's fleet, then those should be used for the project.
>
> The SFPUC, through its Contractors Assistance Center, will work with the BAAQMD's Strategic Incentives Division and interested, eligible truckers to pursue funding to replace vehicles or retrofit engines to comply with the lower emissions requirement, including but not limited to conducting informational presentations at the Contractors Assistance Center to notify truckers about the grants and incentives and assisting with the completion of applications to the grant programs."

Adequacy of Mitigation for NOx Emissions

This commenter also "strongly recommends" that the SFPUC provide a greater amount of funds than is required under Mitigation Measure M-AQ-1b (Emissions Offsets) to fully offset the project's construction-related NOx emissions during the first and third years of construction. Under CEQA (as explained below), a lead agency can only impose mitigation on a project applicant to the extent necessary to reduce an impact to a less-than-significant level.

As explained in CEQA Guidelines Section 15041, subdivision (a), "[a] lead agency for a project has authority to require feasible changes in any or all activities involved in the project in order to substantially lessen or avoid significant effects on the environment, consistent with applicable constitutional requirements" including the following: (1) Mitigation measures must have an "essential nexus (i.e., connection)" to a legitimate government interest (CEQA Guidelines Section 15126.4, subdivision (a)(4)(A)); and (2) mitigation measures must also bear a "rough proportionality" to the project's adverse impacts. If the mitigation measure is an ad hoc exaction, it must be "roughly proportional" to the impacts of the project (CEQA Guidelines Section 15126.4, subdivision (a)(4)(B)).

The mitigation measure is required (i.e., there is a nexus) because the project's construction-related NOx emissions exceed the City's significance thresholds. Mitigation Measure M-AQ-1b (Emission Offsets) is identified to offset the portion of the project's construction-related NOx

[12] CARB, Truck and Bus Regulation Compliance Requirement Overview, December 18, 2017. Available online at https://www.arb.ca.gov/msprog/onrdiesel/documents/FSRegSum.pdf; CARB, Truck and Bus Regulation Small Fleet Option, August 15, 2016. Available online at https://www.arb.ca.gov/msprog/onrdiesel/documents/FAQsmall.pdf.

emissions, to the extent they exceed the significance threshold for NOx, by implementing either or a combination of the following: (1) directly implementing a specific offset program (such as replacing equipment); and/or (2) paying a mitigation offset fee to fund the implementation of one or more emission reduction projects within the air basin. The BAAQMD administers the Carl Moyer Program within the San Francisco Bay Area Air Basin (SFBAAB), which establishes the cost-effectiveness criteria for funding emissions reduction projects at a not-to-exceed amount of $30,000 (adjusted to reflect annual California Consumer Price Index adjustments between 2017 and the estimated first year of exceedance) per weighted ton of reactive organic gas (ROG), NOx, and PM emissions.[13,14] The program has established guidelines and criteria for the funding of emissions reduction projects.

Here, the proportionality of the mitigation to the air quality impact is based on the existing Carl Moyer Program cost-effectiveness criteria and a 5 percent administrative fee. For any NOx emissions still exceeding the city's significance thresholds after implementation of the offset program, the SFPUC would implement the other part of this mitigation measure through payment of the offset fee, which has a clear nexus between the project's construction-related air quality impacts and the BAAQMD's authority to implement emission reduction projects as part of the Carl Moyer Program. Therefore, the offset fee would be "roughly proportional" to the construction-related air quality impacts, using the offset funding equation of no less than $30,000 per weighted ton of NOx and a 5 percent administrative fee. The amount of $30,000 will be adjusted to reflect annual California Consumer Price Index adjustments between 2017 and the estimated first year of exceedance. The following text in Mitigation Measure M-AQ-1b (2) of Draft EIR (page 4.8-51) has been revised to reflect the updated funding equation (new text is shown in double underline and deleted text is indicated with ~~strikethrough~~):

> "2. Pay a mitigation offset fee to the Bay Area Air Quality Management District's (BAAQMD) Bay Area Clean Air Foundation (Foundation) in an amount to be determined at the time of the impact. The mitigation offset fee will be no less than ~~$18,030~~ $30,000 per weighted ton of ozone precursors per year requiring emissions offsets plus an administrative fee of no less than 5 percent, to fund one or more emissions reduction projects within the SFBAAB. The $30,000 will be adjusted to reflect annual California Consumer Price Index adjustments between 2017 and the estimated first year of exceedance. This fee will be determined by the Planning Department in consultation with the SFPUC and BAAQMD and based on the type of projects available at the time of impact. This fee is intended to fund emissions reduction projects to achieve reductions of 2.3 tons per year of ozone precursors."

[13] The following equation is used to calculate the Weighted Emissions Reductions: Weighted Emissions Reductions = NOx reductions (tons/year) + ROG Reductions (tons/year) + (20 x (PM Reductions (tons/year))).

[14] At the time the Draft EIR was circulated, the mitigation offset fee specified in the Carl Moyer Program Guidelines was $18,030, but the fee amount was in the process of being increased to $30,000. This increase was approved by the California Air Resources Board on April 27, 2017 and it was included in the 2017 revisions to the guidelines dated June 20, 2017. (California Air Resources Board, *Carl Moyer Program Guidelines 2017 Revisions, Volume I, Program Overview, Program Administration and Project Criteria,* updated June 20, 2017, pp. I and 1-6. Available online at https://www.arb.ca.gov/msprog/moyer/guidelines/2017gl/2017_gl_chapter_1.pdf.)

The San Francisco Planning Department met with the BAAQMD on June 14, 2017 and discussed the BAAQMD's suggestion that a higher fee may be warranted to reduce project emissions to a less-than-significant level and found that the BAAQMD could not establish that an increased rate beyond that of the Carl Moyer Program plus a 5 percent administrative fee could meet the "rough proportionality" standard required under CEQA. The Carl Moyer fee structure was reviewed and updated by the California Air Resources Board (CARB) in April 2017 and became fully implemented on June 20, 2017.[15] The offset rate specified in the above revised Mitigation Measure M-AQ-1b (Emission Offsets) is consistent with the rate established in the Carl Moyer Program.

Consideration of Alternative Mitigation Measures

During the development of Mitigation Measures M-AQ-1a and M-AQ-1b, multiple mitigation approaches were considered. Additional mitigation strategies considered during the environmental review process included requiring the use of all Tier 4 engines in construction equipment and requiring that 100 percent of haul trucks have 2010 or newer engines. Requiring the use of all Tier 4 engines was determined to be infeasible due to the unavailability of some off-road equipment types. The infeasibility of requiring 100 percent of haul trucks to have 2010 or newer engines is described above under the heading *Engine Requirements for Haul Trucks*.

As indicated on page 6-7, the Draft EIR did not identify any feasible alternatives to avoid or substantially reduce the severity of the BDFP's significant and unavoidable construction air quality impacts beyond Mitigation Measures M-AQ-1a and M-AQ-1b. Implementation of Mitigation Measures M-AQ-1a and M-AQ-1b could indeed reduce the project's NOx impact to a less-than-significant level during all five years of project construction, but because the availability of sufficient NOx offset opportunities is uncertain and may require an agreement with a third party, this impact was determined to be *significant and unavoidable with mitigation (*Draft EIR page 4.8-48).

Need for Additional Mitigation to Address Health Risks from NOx Emissions

Several commenters express concerns over the health risks from the "significant and unavoidable" impact during two of the five years of construction due to excessive NOx emissions. The commenters request further explanation of, or suggest, additional mitigation measures, such as a robust air quality monitoring and reporting plan, notification of residents, plans for "sheltering in place" on days with extremely poor air quality, and enrolling fenceline residents in the area in a long-term health study.

As discussed in the Draft EIR, the SFPUC would implement several measures (see Mitigation Measure M-AQ-1a) to reduce NOx beyond what is already required by the Clean Construction Ordinance. These include the use of equipment that meets the following emissions controls: equipment with engines greater than or equal to 140 horsepower must meet Tier 4 final standards; equipment with engines less than 140 horsepower must meet Tier 2 standards and be equipped with diesel particulate filters; at least 80 percent of haul trucks (i.e., trucks used to

15 *Ibid.*

remove or deliver backfill soil, excavated soil, and demolition debris) used must have 2010 or newer engines; and all diesel haul trucks and off-road equipment must use renewable diesel. These emission controls would reduce total NOx emissions by approximately 75 percent beyond what is required by the Clean Construction Ordinance.

The Draft EIR (page 4.8-49) identifies Impact AQ-1 as significant and unavoidable even with the implementation of Mitigation Measures M-AQ-1a and M-AQ-1b. This finding is based upon acknowledgement that implementation of an emissions offset project would either: (1) be conducted by the BAAQMD but would therefore be dependent in part on the actions of a third party and not fully within the control of the SFPUC, or (2) be implemented by the SFPUC, but sufficient direct SFPUC offset opportunities have not been fully verified. Thus, at this time, the appropriate conclusion is that the impact is significant and unavoidable with mitigation. Note that an offset project(s) would be imposed on, and thus be binding to, the SFPUC through adoption and implementation of Mitigation Measure AQ-1b. Such a project(s) would be implemented to offset the portion of NOx emissions that would exceed the threshold level, and would be designed to fully mitigate the project's impact during the first and third construction years, as explained on Draft EIR pages 4.8-46 and 4.8-48. Therefore, it is likely that NOx emissions would ultimately be mitigated to a less-than-significant level.

While direct SFPUC offset opportunities have not been fully verified, the SFPUC has evaluated and recommends those listed below in **Table 10.6-1**. If verified and approved, these opportunities could sufficiently offset the estimated NOx exceedances during construction years 1 and 3.

TABLE 10.6-1
SFPUC-RECOMMENDED POTENTIAL OFFSET PROJECTS

Department	Offset Opportunity	Offset Amount
SFPUC	Headworks Renewable Diesel[a]	1.24 tons over 5 years
Wastewater Enterprise	Trailer Generator Emergency Light Replacement[b]	0.21 tons/year
	Southeast Community Facility Generator Replacement[c]	0.08 tons/year
City Distribution Division	2000 Maingang Truck Replacement[d]	0.42 tons/year
	2000 Maingang Truck Replacement[d]	0.42 tons/year

NOTES:

[a] The Headworks Project at the Southeast Plant would be updated to use renewable diesel in all construction years, rather than only Year 5 as originally planned.

[b] An existing emergency light powered by a generator would be replaced with calendar year 2017 equivalent equipment. Emissions offsets calculated assuming the new equipment would operate at historical or permitted levels and that engine operational hours would occur evenly over all years of equipment operation.

[c] An existing Southeast Community Facility emergency generator would be replaced with a Tier 2 engine. Emissions offsets calculated assuming the new equipment would operate at historical or permitted levels and that engine operational hours would occur evenly over all years of equipment operation.

[d] Two existing year 2000 Maingang trucks would be replaced with calendar year 2017 equivalent equipment. Emissions offsets calculated assuming the new equipment would operate at historical levels and that odometer mileage would occur evenly over all years of equipment operation.

SOURCE: Memo from Karen Frye, SFPUC, BDFP Environmental Project Manager, to Carolyn Chiu, SFPUC, BDFP Project Manager, regarding Air Quality NOx Offsets for the Biosolids Digester Facilities Project, February 12, 2018.

NOx is comprised of nitrogen dioxide (NO_2) and nitric oxide (NO) emissions. Only the NO_2 component of NOx is recognized as being capable of causing harm to people. Regarding the health impacts of NO_2 emissions, the BAAQMD CEQA significance standards do not require an evaluation of localized impacts for NO_2 emissions because the entire state is in attainment for NO_2, and non-attainment of local NO_2 ambient air standards is not expected. In fact, since 1998, there have been no non-attainment areas for NO_2 in the United States.[16] As shown in Draft EIR Table 4.8-1 (page 4.8-5), the NO_2 1-hour standard was only exceeded one time between 2011 and 2015 at the BAAQMD Monitoring Station at 10 Arkansas Street, approximately 1.5 miles from the project. Therefore, despite all of the NO_2 emissions sources in the city, including vehicle emissions and other industrial sources, the NO_2 standards are not easily exceeded.

Although localized concentrations of NO_2 are not specifically considered a potential CEQA significant impact by the BAAQMD, the BAAQMD does have a total mass emissions rate standard (in units of tons per year) for NOx, of which NO_2 is a component. This emissions standard is put in place to ensure that project emissions of NOx are considered, as NOx is a precursor to ozone (in combination with volatile organic compounds [VOC] and sunlight).

San Francisco is in non-attainment for the 1-hour ozone standard and marginal non-attainment for the 8-hour ozone standard. As discussed in Draft EIR Section 4.8.1.3 (page 4.8-4), ozone is formed downwind of where its components are formed; therefore, the health impacts of ozone are not necessarily experienced by receptors immediately adjacent to emissions of NOx. In response to the comment regarding the potential for implementing a shelter-in-place program or other emergency procedures, these programs are typically not used or warranted for NOx emissions, since health impacts from NO_2 are typically mild. While the health effects of high concentrations of NO_2 can include an increased risk of acute and chronic respiratory disease and reduced visibility, since 1998 there have been no non-attainment areas for NO_2 in the United States, as noted earlier. The standards for attainment areas are set at levels to protect public health and the environment.

Comment AQ-5: Additional Mitigation to Address Operational Criteria Air Pollutant Impacts

This response addresses the following comment, which is quoted below:

A-BAAQMD.8

"At the time of the review of this DEIR, the Air District has not yet received a permit application for an Authority to Construct for this project because the SFPUC is still designing this facility. In light of your pending equipment choices and their impacts on your emissions estimates, we recommend that SFPUC seek quotes for a selective catalytic reduction system

[16] United States Environmental Protection Agency (USEPA), Green Book Nitrogen Dioxide (1971) Area Information, 2016. Available online at https://www.epa.gov/green-book/green-book-nitrogen-dioxide-1971-area-information. Accessed on January 23, 2018.

and/or low-NOx burners to determine whether a lower NOx limit is technologically feasible and cost-effective, particularly given that the proposed NOx limit for the turbine/duct burner (i.e., 25 ppm @ 15% oxygen) is based on a BACT determination from 1999. We recommend that the facility request emission factors and guarantees from the manufacturer for each planned piece of combustion equipment as an alternative to using the emission factor of 3.2E-3 kg methane/MMBtu from Table C-2 of 40 CFR 98. We recommend that the facility determine whether the new thermal hydrolysis process will increase precursor organic compounds in the biogas." (Jean Roggenkamp, BAAQMD, Letter, July 28, 2017)

Response AQ-5

The commenter asks whether a selective catalytic reduction (SCR) system or low NOx burners are technologically feasible and cost-effective, particularly given that the proposed NOx limit for the turbine/duct burner is based on a Best Available Control Technology determination from 1999. The commenter recommends that the SFPUC request emission factors and guarantees from the manufacturer for each piece of combustion equipment instead of using the specified emission factor. The commenter also recommends that the SFPUC determine whether the new thermal hydrolysis process (THP) would increase precursor organic compounds in the biogas.

The project's power-generating equipment (turbine) would be the primary combustion equipment proposed. Other combustion equipment would include the boilers and waste gas burners, both of which would only operate when the turbine is not operating, and the emergency generator, which would operate during emergencies and for limited testing. Two rounds of evaluation were conducted to determine alternatives for the combined heat and power facilities in the SFPUC's Combined Heat and Power Alternatives Analysis, Decision Technical Memorandum, dated December 2015.[17] In the first round, three combined heat and power alternatives were evaluated and compared: an internal-combustion engine, a mid-size gas turbine, and a small gas turbine. As described in the memo, most municipal wastewater combined heat and power installations use internal-combustion engines because of their high electrical efficiency. However, the water pollution control plant has two unique drivers that may make gas turbines a more viable combined heat and power alternative: (1) the need for steam generation, and (2) the need to meet stringent air emission limits. Gas turbines have higher exhaust flows and thus a greater ease of steam generation and lower air emissions compared to internal-combustion engines. The second round evaluated hybrid alternatives to complement the gas turbine to provide 100 percent biogas utilization over the planning period. Three hybrid alternatives were evaluated: gas turbine plus microturbines, gas turbine plus small internal-combustion engine, and gas turbine plus large internal-combustion engine. Factors considered in the selection of the power-generating equipment included financial factors and non-financial factors (chemical usage and hazardous waste generation, level of operating complexity, system maturity and reliability, level of maintenance required, footprint, load variation adaptability, backup power, regulatory compliance, and adaptability to future

[17] This memorandum is presented in Appendix B of the *BDFP Conceptual Engineering Report*, (SFPUC, March 2016). The Conceptual Engineering Report is available for public review at the San Francisco Planning Department, 1650 Mission Street, Suite 400, in Case File No. 2015-000644ENV and can be made available electronically on request.

regulatory changes). The financial comparison was relatively equal among the alternatives considered. The proposed type of turbine (a recuperated turbine with a low NOx combustor) was recommended and selected primarily because of the lower air emissions and simpler operations and maintenance compared to other alternatives. The addition of selective catalytic reduction (SCR) to further reduce NOx was considered for the turbine exhaust. Based on the technical evaluation, an SCR was not included with the turbine exhaust system because it would provide minimal reduction of NOx emissions while potentially increasing $PM_{2.5}$ emissions.[18]

For the analysis in the Draft EIR, the NOx emission factors used for the turbine, microturbines, and waste gas burners are from manufacturer specifications. The NOx emission factors used for the emergency diesel engine and the boilers are based on limits of Best Available Control Technology from 2010 and 1993, respectively. Although the boiler limits are from 1993, they are the BAAQMD's BACT (Best Available Control Technology or currently accepted) limits.[19]

In response to BAAQMD's recommendation, the SFPUC obtained a NOx emission factor warranty from the turbine manufacturer.[20] The updated NOx emission factor identified in the warranty is 20 parts per million (ppm) based on proposed operational conditions, which is lower than the 25 ppm emission factor used in the Draft EIR analysis. With the updated NOx emission factor, the Project's turbine-related NOx emissions would be 4.5 tons per year lower than reported in the Draft EIR during both full operational scenarios (2023 and 2045). **Table 10.6-2** presents the project's net operational NOx emissions (project emissions minus existing [2014] emissions) for both NOx emission factors. As shown, the lower NOx emission factor results in no net increase in NOx emissions when compared to existing (2014) conditions, which also responds to the commenter's concerns regarding the project's increase in operational emissions included in Comment AQ-1.

The emission factor of 3.2E-3 kg methane/MMBtu referenced by the commenter was used to estimate methane emissions that, together with carbon dioxide (CO_2) and nitrous oxide (N_2O), comprise the total greenhouse gas (GHG) emissions from the combustion sources at the facility (turbine, microturbines, waste gas burners, and boilers). This is the method the facility is required to use to report GHG emissions to the state through the California Mandatory Reporting of Greenhouse Gas Emissions regulation (Title 17 California Code of Regulations, Sections 95100-95158).

SOURCE: Brown and Caldwell, SFPUC BDFP NOx Emissions Fact Sheet, February 12, 2018.

An increase of precursor organic compounds due to the proposed thermal hydrolysis process is not anticipated. The proposed thermal hydrolysis process is a digestion pre-treatment process that combines high temperature and high pressure followed by rapid decompression, making the solids more biodegradable and allowing for higher methane production during the subsequent anaerobic digestion process. The proposed thermal hydrolysis process could potentially result in a small increase in organic compounds in the biogas compared to the existing process; however, the biogas (along with any organics present in the biogas) is combusted in subsequent processes (e.g., turbine, boilers and/or duct burner, with waste gas burners as backup) and only the combustion products are emitted to the atmosphere. Combustion results in approximately 99 percent oxidation of the volatile organic compounds within the biogas. In addition, the precursor organics represent a *de minimis* (i.e., very minimal) fraction of the biogas, which is almost entirely methane and carbon dioxide. Lastly, the digester gas is treated to remove hydrogen sulfide, moisture, and siloxanes prior to combustion. Residual hydrogen sulfide removal would be accomplished via adsorption on an iron sponge media. Siloxane removal would be accomplished via adsorption to granular activated carbon or an alternate media, which would also likely remove the majority of the volatile organic compounds present, prior to combustion. For these reasons, higher emissions of precursor organic compounds are not anticipated compared to the existing processes.[21]

[21] Memo from Tracy Stigers, Vice President of Brown and Caldwell, BDFP Consultant Team, to Carolyn Chiu, SFPUC, regarding Draft Environmental Impact Report (EIR) Comment Response related to the thermal hydrolysis process (THP), September 21, 2017.

Comment AQ-6: Odor Issues

This response addresses the following comments, which are quoted below:

A-BAAQMD.11 O-Greenaction.1

"As a final note, we noticed a statement on p. 4.8-29 of the DEIR that" ... based on the odor complaint history, the [Air District] does not consider the SEP to be ·a significant source of odors in the area." While the number of odor complaints has not resulted in designation of the SEP as a significant source of odors and although the project will improve odor control for biosolids digestion, the entirety of the treatment works is still considered a potentially significant odor source by the Air District." (Jean Roggenkamp, BAAQMD, Letter, July 28, 2017)

"We are pleased to start by acknowledging a potential benefit to the community from this project. The replacement and relocation of the decades-old digesters has the potential to reduce odiferous volatile organic compounds (aka "odors") for people who live adjacent to the plant along Phelps Avenue. While applauding this effort, we would be remiss not to point out that the biodigesters are responsible for only some of the odor from the Southeast Plant. We remain concerned about the odors emanating from the overall plant and its impact on the community. Given that wastewater processing is expected to increase 20 percent under the 2045 scenario reviewed in the draft EIR, we are concerned that odors emanating from the primary treatment portion of the Southeast Plant will get worse, particularly for the immediate neighbors. If this project is meant to decrease odors, we strongly recommend that SFPUC consider the net odors from the overall plant in light of the expected 20 percent increase in wastewater processing by 2045. From the standpoint of odor control, it is convenient but problematic to frame this project as related to only one portion of the Southeast Plant. We encourage SFPUC to look at overall odors as part of its final EIR." (Bradley Angel, Greenaction for Health and Environmental Justice, Letter, June 26, 2017)

Response AQ-6

In the first comment above, the BAAQMD indicates that, although the number of odor complaints has not resulted in designation of the water pollution control plant as a significant source of odors and the project would improve odor control for biodigestion, the BAAQMD still considers the entire water pollution control plant a potentially significant odor source.

In response to this comment, the following text on Draft EIR page 4.8-29 has been revised (new text is shown in double underline and deleted text is indicated with ~~strikethrough~~):

> "The BAAQMD is also the agency responsible for investigating and controlling odor complaints in the area. The BAAQMD enforces odor control by helping the public document a public nuisance. Upon receipt of a complaint, the BAAQMD sends an investigator to interview the complainant and to locate the odor source if possible. The BAAQMD typically brings a public nuisance court action when there are a substantial number of confirmed odor events within a 24-hour period. An odor source with five or

more confirmed complaints per year averaged over three years is considered to have a substantial effect on receptors. As indicated above (under *Odor Incidents*), the BAAQMD has received two confirmed odor complaints regarding odor at the SEP over the six-year period from January 1, 2009 through October 22, 2015. Thus, ~~based on~~ the odor complaint history at the Southeast Water Pollution Control Plant has not resulted in its designation by the BAAQMD ~~does not consider the SEP to be~~ as a significant source of odors in the area. Nonetheless, the BAAQMD still considers the entirety of the treatment works at the water pollution control plant to be a potentially significant odor source.[52a, 52b]

[52a] Roggenkamp, Jean, Bay Area Air Quality Management District. Letter to Tim Johnson, July 28, 2017.

[52b] The term "significant" in this paragraph refers to BAAQMD's assessment of the odor source, and is not the same as impact significance as defined under CEQA.

The revisions presented above do not alter the analysis or conclusions presented in the EIR because the BDFP is designed to reduce odors compared to existing conditions. The BDFP would replace existing odor control facilities with new facilities that include technologies identified by the BAAQMD as effective in reducing odor impacts from wastewater treatment plants (as discussed on Draft EIR page 4.8-68). The BDFP would also be designed to limit noticeable odors from BDFP facilities to the Southeast Plant property boundary, quantified as the 5 D/T criterion with 99 percent compliance based on a 1-hour average (as discussed on Draft EIR page 4.8-41).

The second comment acknowledges a potential benefit to the community in terms of reducing odors from solids processing, expresses concern about odors from the overall plant, and requests that the SFPUC and the EIR consider the net effect on odors from the water pollution control plant as a whole be considered in light of a projected 20 percent increase in wastewater processing by 2045.

As indicated on Draft EIR page 2-17, one of the goals of Sewer System Improvement Program is to limit plant odors to within the treatment facility's fenceline. Consistent with this goal, the SFPUC is incorporating odor control into many of the projects planned at the water pollution control plant. Regarding primary treatment in particular, the Primary/Secondary Clarifier Upgrades project at the water pollution control plant (described on Draft EIR page 4.8-77) includes installing odor control design features (covers, ventilation system) to reduce odors emanating from those facilities. The Draft EIR (pages 4.8-76 to 4.8-80) includes an evaluation of future cumulative odor conditions in the vicinity of the water pollution control plant. Future odor conditions were assessed based on a determination of how proposed changes at the Southeast Plant (i.e., the projects listed in Table 4.1-1, Draft EIR pages 4.1-6 to 4.1-15, in combination with the BDFP) could change existing odor conditions. Factors considered included whether odor incidents had been attributed to the water pollution control plant facilities with which each project was associated, and project characteristics, including whether odor control was proposed as part of the project's design (as is the case with the BDFP). The results, presented in Table 4.8-16 (Draft EIR pages 4.8-77 and 4.8-78), indicate that none of the projects would be expected to worsen existing odor conditions and some projects are expected to improve odor conditions. In addition to the qualitative assessment described above, as described on Draft EIR page 4.8-76, dispersion modeling was conducted for the BDFP in combination with the Headworks Replacement and Primary/Secondary Clarifier Upgrades projects; both of those projects involve

modifications to and/or replacement of facilities associated with existing odor sources, which would improve odor conditions. Figure 4.8-6 (Draft EIR page 4.8-79) presents the results of the dispersion modeling in terms of predicted future cumulative odor concentrations in the vicinity of the water pollution control plant, and reflects a predicted improvement in future cumulative odor conditions in the area compared to existing conditions.

Comment AQ-7: Mitigation to Reduce GHG Impacts

This response addresses the following comment, which is quoted below:

A-BAAQMD.5

"To mitigate its greenhouse gas emissions, the project states that "all diesel haul trucks and offroad equipment must use renewable diesel" (p. 4.8-46) as part of Mitigation Measure M-AQ-1a. We recommend or affirm the use of this mitigation approach for both municipally-owned and contractor-owned equipment in this project. Further, we recommend that this standard be extended to any portable diesel engines used in this project and to the backup generator installed in this project." (Jean Roggenkamp, BAAQMD; letter, July 28, 2017)

Response AQ-7

The commenter affirms the use of renewable diesel for haul trucks and off-road equipment and recommends that the SFPUC consider the use of renewable diesel in portable diesel engines and backup generators associated with this project. The purpose of requiring use of renewable diesel in all diesel-powered haul trucks and off-road equipment in Mitigation Measure M-AQ-1a is to reduce the project's NOx emissions, although reducing GHG (and ROG and particulate matter) emissions would be an added benefit. The use of renewable diesel in haul trucks and off-road equipment as part of Mitigation Measure M-AQ-1a results in emissions reductions of 5.3%, 0.27%, 15.5% and 15.6% for NOx, ROG, PM10, and PM2.5, respectively. The GHG emissions reductions associated with the use of renewable diesel are not specifically quantified here, as renewable diesel GHG benefits are the result of the full lifecycle of the fuel, and greatly depend on the feedstock source. However, for reference, the lifecycle analysis of renewable diesel under the Low Carbon Fuel Standard showed reductions in GHGs of about 15% to 80% depending on feedstock source.[22] With implementation of this mitigation measure, all portable diesel generators (municipally-owned and contractor equipment) used in construction would be required to use renewable diesel (they are included in the reference to "off-road equipment" in this mitigation measure) and this is reflected in air quality modeling results under the mitigated condition (see Draft EIR Table 4.8-9, page 4.8-47). With respect to operational emissions, the project's criteria pollutant emissions were determined to be less than significant (see Draft EIR Table 4.8-10, page 4.8-53). Although renewable diesel was not

[22] California Environmental Protection Agency, Staff Report, Multimedia Evaluation of Renewable Diesel, May 2015, pg 9. Available online at https://www.arb.ca.gov/fuels/diesel/altdiesel/20150521RD_StaffReport.pdf.

assumed to be used in the project's backup generators in the air quality modeling effort, the SFPUC has indicated that it would be used in backup generators because SFPUC Operations obtains diesel from the city's fill stations, and all of these stations provide renewable diesel for portable and stationary generators. Therefore, the less-than-significant criteria pollutant emissions that were identified in the Draft EIR for operation of backup generators would be even lower than estimated and would result in a secondary benefit of reduced GHG emissions because renewable diesel would be used. This less-than-significant impact (Impact AQ-2) would continue to be less than significant with use of renewable diesel in backup generators.

Comment AQ-8: Inclusion of Air Quality Technical Report and Diesel Equipment Compliance Requirements

This response addresses the following comments, which are quoted below:

A-BAAQMD.1 A-BAAQMD.10

"Air District staff want to compliment the City for producing a high-quality report that thoughtfully and meticulously explores air quality concerns. We find the separate air quality technical report (AQTR) quite helpful in understanding assumptions about impacts and recommend including it or key portions of it as an appendix in the final environmental impact report (FEIR)." (Jean Roggenkamp, BAAQMD, Letter, July 28, 2017)

"The Air District also wants to assure that diesel equipment used in this project complies with applicable registration requirements. Off-road diesel-powered equipment greater than 25 horsepower must be registered in the Diesel Off-Road On-line Registration System (DOORs) Database and display an Equipment Identification Number (EIN). Portable diesel-powered equipment must be permitted by the Air District as part of the Portable Equipment Registration Program (PERP), and we encourage SFPUC to pick the lowest emission equipment available for this project." (Jean Roggenkamp, BAAQMD, Letter, July 28, 2017)

Response AQ-8

The comment regarding the quality of the report is acknowledged.

The BAAQMD's recommendation that the entire *Air Quality Technical Report, Biosolids Digester Facilities Project Draft EIR* (AQTR) or key portions of it be included as an appendix to the Final EIR is noted. In its efforts to balance CEQA requirements for clear and concise yet sufficiently detailed information about potential environmental effects of a given project, the city selects the key information from such technical analyses for inclusion in the EIR section itself. The AQTR is part of the administrative record for the EIR and, as indicated in the Draft EIR (pages 4.8-9, 4.8-34, 4.8-38, 4.8-44, 4.8-58, and 4.8-60), is available for public review at the San Francisco Planning Department.

In response to this comment, the San Francisco Planning Department has also made the AQTR available online at: http://sfmea.sfplanning.org/SFPUC%20SEP%20Biosolids_AQTR_2017-03-10.pdf.

The BAAQMD also requests assurance that diesel equipment would comply with the specified registration requirements where applicable. If the project is approved, the SFPUC would comply with all applicable registration requirements and regulations.

With respect to the BAAQMD's encouragement for the SFPUC to pick the lowest emission equipment available, the San Francisco Clean Construction Ordinance requires contractors on city public works projects (like the BDFP) to use equipment that meets or exceeds Tier 2 standards for off-road engines and operates with the most effective CARB verified diesel emission control strategy available for the engine. In addition, the ordinance prohibits the use of portable diesel engines where access to alternative sources of power is available (see Draft EIR page 4.8-32 for details). Mitigation Measure M-AQ-1a requires contractors to meet even more restrictive emissions standards, thereby requiring use of the lowest emission equipment available for most engine sizes. All off-road equipment with larger engines (greater than or equal to 140 horsepower) must meet Tier 4 Final off-road emission standards, while equipment with smaller engines (less than 140 horsepower) must meet or exceed Tier 2 off-road emission standards and be equipped with diesel particulate filters, which is equivalent to a Level 3 verified diesel emission control strategy. Revisions to Mitigation Measure M-AQ-1a presented in **Response AQ-4** would further encourage the use of the lowest emission equipment in all haul trucks. The combination of the ordinance requirements and Mitigation Measures M-AQ-1a and M-AQ-1b would encourage use of low emission equipment for the project.

10.7 Hydrology and Water Quality

The comment and corresponding response in this section relates to the topics of hydrology and water quality, evaluated in Draft Environmental Impact Report (EIR) Section 4.16. The comment addresses the topic of sea level rise.

Comment HY-1: Sea Level Rise

This response addresses the following comment, which is quoted below:

A-SWRCB.2

"In section 4.16.1.5 regarding Sea Level Rise, on page 4.16-8, it states, "The sea level at the San Francisco tidal gauge has risen approximately 0.8 inches per year since 1897, resulting in about 0.6 foot of sea level rise between that time and 2015." Please clarify if this should be corrected to 0.08 (0.076) inches per year." (Susan Stewart, State Water Resources Control Board; letter, June 16, 2017)

Response HY-1

The commenter is correct; the sea level at the San Francisco tidal gauge has risen approximately 0.08 inch per year since 1897. Accordingly, the first sentence on Draft EIR page 4.16-8 is revised as follows (deleted text is shown in strikethrough; new text in double-underline):

"…risen approximately 0.0<u>8</u> inch per year since 1897, resulting in about 0.~~6~~<u>8</u> foot of sea level rise between that time and 2015."

This page intentionally left blank

10.8 Hazards and Hazardous Materials

The comments and corresponding responses in this section relate to the topic of hazards and hazardous materials, evaluated in Draft Environmental Impact Report (EIR) Section 4.17. For ease of reference, these comments are grouped into the following issues that the comments raise:

- HZ-1: Asbestos
- HZ-2: Hazards to San Francisco Wholesale Produce Market and Community

Comment HZ-1: Asbestos

This response addresses the following comment, which is quoted below:

A-BAAQMD.9

"To assure that demolition associated with this project complies with Air District Regulation 11, Rule 2, this project may need to take multiple actions, which include but are not necessarily limited to a thorough asbestos survey by a certified asbestos consultant, removal of all regulated asbestos present, and a renovation and/demolition notification. We also observe that the SEP is within one quarter mile of the geologic ultramafic unit (JSP) on the Naturally Occurring Asbestos (NOA) geologic map of the area. Accordingly, we recommend that soil analysis be conducted to determine whether NOA is present where soil surfaces would be disturbed. Presence of NOA may trigger applicability of the Asbestos Airborne Toxic Control Measure (ATCM) for Construction, Grading, Quarrying and Surface Mining Operations (CCR Title 17 Section 93105) and require dust mitigation measures, reporting, and submission of an Asbestos Dust Mitigation Plan. Should no NOA be found, the Air District recommends that construction dust best management practices (BMP) be implemented to control any fugitive dust during the construction phases." (Jean Roggenkamp, Bay Area Air Quality Management District, Letter, July 28, 2017)

Response HZ-1

This comment refers to requirements for the evaluation and investigation of asbestos that may be present in buildings that would be demolished under the project and naturally occurring asbestos that could be encountered in the soil that is excavated. Each of these is described below.

Asbestos in Building Materials

Draft EIR Section 4.17, Hazards and Hazardous Materials, describes Bay Area Air Quality Management District (BAAQMD) Regulation 11, Rule 2 (Asbestos Demolition, Renovation, and Manufacturing). Draft EIR pages 4.17-14 and 4.17-15 describe notification requirements for demolition work that may encounter asbestos-containing materials, and requirements for asbestos surveys and abatement. As discussed in Impact HZ-2 (Draft EIR page 4.17-27), the San Francisco Public Utilities Commission (SFPUC) would implement these regulatory requirements prior to demolition of any structures. Implementation of these requirements would ensure that impacts

related to encountering asbestos in building materials would be less than significant and no mitigation is necessary.

Naturally Occurring Asbestos

As discussed in Draft EIR Section 4.15, Geology, Soils, and Paleontological Resources (beginning on page 4.15-2), the geologic materials beneath the project site within which excavation is proposed (from shallowest to deepest) include artificial fill, young bay mud, and the upper layered sediments. Because neither young bay mud nor the upper layered sediments are ultramafic rock types, they would not likely contain naturally occurring asbestos. As discussed in Draft EIR Section 4.17, Hazards and Hazardous Materials (page 4.17-10), environmental investigations for each portion of the project site (i.e., the Southeast Water Pollution Control Plant, Central Shops, and Asphalt Plant) included analysis of the fill materials for naturally occurring asbestos. The samples were analyzed using California Air Resources Board Method 435 for the determination of asbestos content of serpentine aggregate, which has a detection limit of 0.25 percent asbestos. None of the soil samples analyzed contained asbestos at concentrations greater than 0.25 percent.[1] Naturally occurring asbestos was not identified in the near-surface soil samples from within the Pier 94 Backlands collected during a 2012 site investigation.[2]

Draft EIR Section 4.17, Hazards and Hazardous Materials, describes the Asbestos Airborne Toxic Control Measure (ATCM) and its relevance to the project. As discussed on Draft EIR page 4.17-15, the Asbestos ATCM would not apply to the project because no soil containing greater than 0.25 percent asbestos would be excavated or otherwise disturbed during construction at the project site or during grading to prepare the staging areas on Port of San Francisco property at Piers 94 and 96 and the Pier 94 Backlands.[3] Regardless, the project would implement construction dust best management practices for dust control in accordance with San Francisco's Dust Control Ordinance codified in Article 22B of the San Francisco Health Code. The dust control plan prepared in accordance with this ordinance would be subject to review and approval by the San Francisco Department of Public Health as described on Draft EIR page 4.17-31.

Based on this information, additional analysis of naturally occurring asbestos is not required and the Asbestos ATCM does not apply to project-related construction activities; the EIR already addresses the appropriate requirements for dust monitoring in areas that do not contain naturally occurring asbestos.

Comment HZ-2: Hazards to San Francisco Wholesale Produce Market and Community

This response addresses the following comments, which are quoted below:

O-SFWPM-2.5 O-SFWPM-2.6 O-BRITE.5

"**C. Hazards and Hazardous Materials Impacts**

"The DEIR's inadequacies with respect to its hazards and hazardous materials analysis are similar to, and potentially even more troubling than, its air quality analysis. The DEIR does not discuss the potential impacts of hazardous materials on the Market or the SFWPM Project. This failure to consider that the Market's operations could be significantly impacted by airborne hazardous materials, including as a result of off-haul of hazardous materials, or any other hazards related to the construction and operation of the Biosolids Project is a significant inadequacy."

"The DEIR has only a limited discussion of naturally occurring asbestos, which is a known and potentially significant issue in the area. Indeed, a number of potentially hazardous materials have been discovered in the soil around the Market during its construction activities. These potentially hazardous materials are often the result of fill material of various depths, and include serpentine rock (which contains naturally occurring asbestos), as well as petroleum hydrocarbons, heavy metals, and other similar contaminants related to the past use of the area for industrial and military purposes. Despite this documented history, the DEIR devotes only two paragraphs of Chapter 4.17 to discussing naturally occurring asbestos. Even more notable is the fact that only one impact analysis addresses asbestos, and there are no mitigation measures imposed to address it. Instead, the DEIR's analysis of Impact HZ-2 relies on the Biosolids Project's compliance with various Bay Area Air Quality Management District rules and regulations. Such limited analysis of a hazardous material known to be present in the area, with no proposed mitigation, is inadequate."

"As a general matter, the DEIR's analysis of hazardous materials (as well as air quality) fails to address the SFWPM and it's sensitive, food-related operations. While it does not appear from the DEIR that there will be any off-haul of hazardous materials through Jerrold Avenue (and thus through the SFWPM itself), the close proximity of the SFWPM to the Biosolids Project, which has confirmed hazardous materials on-site, requires some discussion and evaluation of potential food-related impacts." (Michael Janis, San Francisco Wholesale Produce Market, Letter, June 19, 2017)

"[A]s a vital business and adjacent site, it is important to the SFMC and Market that the Biosolids Project fits into the existing (and ever-growing and changing) neighborhood. As such, it is our position that the DEIR is inadequate in its … failure to consider … hazardous materials impacts to the Market and the SFWPM Project, and…failure to require mitigation specific to…hazardous materials impacts. We respectfully request that the DEIR be modified to address these inadequacies." (Michael Janis, San Francisco Wholesale Produce Market, Letter, June 19, 2017)

"This is also a good opportunity to pause and consider if it's in CCSF's best interest to have the most hazardous shipments travel through the primary distribution point for all fresh produce in CCSF – this is an issue of resiliency and food security as well." (Steven Tiell, Bayview Residents Improving Their Environment, Letter, May 30, 2017, and Email, May 31, 2017)

Response HZ-2

These comments address hazards posed to the San Francisco Wholesale Produce Market (SFWPM or produce market), specifically from dust containing naturally occurring asbestos and hazardous materials. As described below, the Biosolids Digester Facilities Project (BDFP) would not pose a hazard to the produce market or the surrounding community for multiple reasons discussed in the Draft EIR.

Naturally Occurring Asbestos

As described under **Response HZ-1**, environmental investigations for each portion of the project site included analyzing the fill materials for naturally occurring asbestos. The samples were analyzed by California Air Resources Board Method 435 for the determination of asbestos content of serpentine aggregate, and none contained asbestos at concentrations greater than 0.25 percent (the detection limit of California Air Resources Board Method 435).[4] The deeper geologic units that would also be excavated include the young bay mud and upper layered sediments, neither of which is an ultramafic rock type and thus would not include naturally occurring asbestos. For these reasons, there would be no hazards associated with airborne naturally occurring asbestos, and the Asbestos ATCM would not apply to the project (see Draft EIR page 4.17-15). No further discussion of the Asbestos ATCM is necessary and no mitigation is required because the soil excavated under the project would not contain naturally occurring asbestos.

Asbestos-Containing Building Materials

As described above under **Response HZ-1**, other forms of asbestos that may be encountered during construction include asbestos-containing materials within structures to be demolished. As discussed in the analysis of Impact HZ-2 (Draft EIR page 4.17-27), the SFPUC would be legally required to implement the BAAQMD's Regulation 11, Rule 2 (Asbestos Demolition, Renovation, and Manufacturing) before demolishing any structures. This regulation includes requirements for notification for demolition work that may encounter asbestos-containing materials, as well as requirements for asbestos surveys and emissions abatement. In accordance with this regulation, the contractor would implement controls during removal activities to ensure that there are no visible asbestos emissions to the outside air. Such measures may include wetting exposed asbestos-containing materials or providing exhaust controls to prevent asbestos emissions to the outside air, and constructing a containment barrier around the building and maintaining negative air pressure within the containment barrier. Implementation of these regulatory requirements would ensure that

[4] BDFP Consulting Team, Environmental Site Investigation Report for San Francisco Department of Public Health Article 22A Compliance, May 2016.

asbestos-containing materials are safely removed from any structure prior to demolition and that asbestos would not be dispersed into the air during the pre-demolition abatement.

There is a well-established regulatory framework and permitting process in place for addressing asbestos hazards during demolition, and compliance with these requirements is mandatory. It is therefore reasonable to assume that the project would comply with these requirements. Many decisions issued by California courts have recognized that an agency may rely on compliance with existing regulations or requirements in finding that a project's impacts would be less than significant. For example, *Tracy First v. City of Tracy* (177 Cal.App.4th 1933; 2009) held that an agency could rely on project compliance with a Building Code's energy efficiency standards for conclusion that a project would not have significant energy impacts and therefore did not require mitigation. In addition, *Oakland Heritage Alliance v. City of Oakland* (195 Cal.App.4th 884; 2011) also held that a project's compliance with existing laws and regulations provided substantial evidence that seismic impacts would be less than significant.

As concluded on Draft EIR page 4.17-27, implementation of the BAAQMD's legally required Regulation 11, Rule 2 (Asbestos Demolition, Renovation, and Manufacturing) is sufficient to ensure that impacts related to encountering asbestos in building materials would be less than significant and therefore no mitigation measures would be necessary. As a result, neither the produce market nor the wider public would be affected by asbestos emissions during the abatement of asbestos-containing materials or demolition of structures. No mitigation is necessary.

Construction-Generated Dust

Draft EIR Section 4.17, Hazards and Hazardous Materials (pages 4.17-2 through 4.17-7), describes the presence of chemicals in the soil at the Southeast Water Pollution Control Plant, Asphalt Plant, and Central Shops. Regarding the commenter's statement that the soil could contain hazardous materials, environmental investigations of the Southeast Water Pollution Control Plant, Asphalt Plant, and Central Shops sites have demonstrated that the site soil contains several chemicals, including total petroleum hydrocarbons as gasoline (TPH-gasoline), total petroleum hydrocarbons as diesel (TPH-diesel), total petroleum, volatile organic compounds, semi-volatile organic compounds, polychlorinated biphenyls, and metals. However, as discussed in Impact HZ-4 (Draft EIR pages 4.17-29 through 4.17-34), compliance with the dust control plan required under Article 22A of the San Francisco Health Code (also referred to as the Maher Ordinance) and San Francisco's Dust Control Ordinance would ensure that surrounding properties, including the produce market, would not be adversely affected as a result of dust emanating from construction activities within these materials. The requirements of the dust control plan are discussed on Draft EIR pages 4.8-43, 4.8-44, and 4.17-31 and in **Response AQ-3** in Section 10.6, Air Quality and Greenhouse Gas Emissions.

The dust control plan would be subject to review and approval by the San Francisco Department of Public Health, as described on Draft EIR page 4.17-31. The SFPUC would also be required to designate a third-party inspector to conduct inspections for visible dust during construction and keep records of those inspections.

Regarding the potential for dust from off-site transport, as shown on Draft EIR Figure 2-15 (Draft EIR page 2-60), only incoming (unloaded) trucks would use Jerrold Avenue through the produce market. Outgoing (loaded) trucks would use Rankin Street, Evans Avenue, and Cesar Chavez Street for access to either U.S. Highway 101 (Highway 101) or Interstate 280, and would not pass through the produce market. Further, in accordance with the Dust Control Ordinance, the amount of soil in hauling trucks would be limited to the size of the truck bed and walls, and trucks hauling loose materials (e.g., soil and sand) would be covered with a tarpaulin or other effective cover. With implementation of these measures, there would be no significant dust generation along the haul routes associated with the hauling of waste materials from the BDFP site.

In summary, compliance with the regulations and procedures set forth by the Dust Control Ordinance would ensure that potential dust-related air quality impacts would be less than significant, and that operations at the produce market would not be affected by dust generated by construction activities at the project site or by dust from the off-site transport of soil and other materials.

Use of Hazardous Materials in Project Operations

Regarding the operational use of hazardous materials, Table 2-9 (Draft EIR page 2-50) indicates the net change in the volume of chemicals and on-site fuels needed for the BDFP, which include polymer for thickening and dewatering of biosolids, ferric chloride for struvite control, and diesel for a backup generator. The BDFP would also use relatively small quantities of sulfuric acid and potassium permangate in the odor control systems, antiscalant, and sodium hypochlorite (similar to bleach) for the Digestion Cooling Tower, sodium sulfite for the boiler system, and propane gas for turbine startup. None of these materials is considered extremely hazardous. These materials would be stored in appropriate containers with spill containment systems, within proposed buildings, and handled in accordance with regulations for the safe storage and handling of hazardous materials. Handling of these materials would be consistent with existing SFPUC safety practices.

The SFPUC would continue to comply with the City and County of San Francisco's hazardous materials handling requirements specified in Article 21 of the San Francisco Health Code (discussed on Draft EIR pages 4.17-19 to 4.17-21). In accordance with this article, the SFPUC's Hazardous Materials Business Plan (HMBP) for the Southeast Water Pollution Control Plant that is on file with the San Francisco Department of Public Health would be revised to reflect the increased quantities of hazardous materials used. The HMBP includes chemical inventories, a program for reducing the use of hazardous materials and generation of hazardous wastes, site layouts, a program and implementation plan for training all new employees and annual training for all employees, and emergency response procedures and plans that provide for safe handling of hazardous materials, and also allows emergency responders to safely respond to a chemical emergency at the facility, if one were to occur. Any hazardous wastes produced would be managed in accordance with Articles 21 and 22 of the San Francisco Health Code.

Compliance with the San Francisco Health Code, which incorporates state and federal requirements, would minimize the potential for a release of hazardous materials at the Southeast

Water Pollution Control Plant and the potential exposure of the public to accidental releases of hazardous materials or waste. Compliance would also reduce the likelihood of a potential release that could cause environmental contamination. None of these chemicals are considered extremely hazardous materials that would require more stringent risk management procedures in accordance with Article 21A of the San Francisco Health Code.

Regarding chemical deliveries to the Southeast Water Pollution Control Plant, the existing truck route for chemical deliveries includes Jerrold Avenue through the produce market as shown on Draft EIR Figure 2-12 (Draft EIR page 2-48). Under the BDFP, the chemical delivery truck route would be changed, and chemical delivery trucks would use Rankin Street, Evans Avenue, and Cesar Chavez Street for access to either Highway 101 or Interstate 280 from the new Rankin Street entrance, as also shown on Draft EIR Figure 2-12 and described on Draft EIR pages 4.6-47 and 4.6-48. The number of chemical deliveries would remain approximately the same (fewer than six per day) and the delivery trucks would not pass through the produce market.

For the reasons discussed above, the increased use of hazardous materials during operation of the BDFP would not result in additional risks of chemical exposure at the produce market, either as a result of normal storage and use or from changes in chemical deliveries.

This page intentionally left blank

10.9 Other CEQA Considerations

The comments and corresponding responses in this section relate to the California Environmental Quality Act (CEQA) process, the cumulative impact analysis and projects identified in Draft Environmental Impact Report (EIR) Section 4.1, and the State Revolving Fund (SRF) process. For ease of reference these comments are grouped into the following issues that the comments raise:

- OC-1: CEQA Process
- OC-2: Cumulative Impact Analysis
- OC-3: Cumulative Projects – Southeast Greenhouses Demolition
- OC-4: SRF Process

Regarding comments and responses pertaining to cumulative development in the project vicinity, refer also to **Response TR-4** in Section 10.5 of this document.

Comment OC-1: CEQA Process

This response addresses the following comments, which are quoted below:

I-Matlock.2 I-Hinton.5

"The 48 day comment period does not provide ample time for members of the public to study and respond to this DEIR." (Perry Matlock, Letter, June 19, 2017)

"I respectfully request also that you seriously consider the thoughtful recommendations of Dan Dodt and Bayview Community Planning." (Rosalind Hinton, Letter, June 19, 2017)

Response OC-1

When an EIR is submitted to the California State Clearinghouse for review by state agencies, which was the case for the BDFP Draft EIR, the public review period must be at least 45 days unless a shorter review period is approved by the State Clearinghouse. The 48-day BDFP comment period thus exceeds CEQA requirements for public comment periods, and is consistent with standard practice of the City and County of San Francisco.

Responses to comments provided by Dan Dodt and Bayview Community Planning are included in relevant portions of this response to comments document. **Table COM-1** (in Attachment COM) identifies the written comments received from Dan Dodt and Bayview Community Planning, and lists the topics under which responses to the comments are provided. **Table PH-1** (in Attachment PH) identifies the oral comments received from Dan Dodt and Bayview Community Planning, and lists the topics under which responses to the comments are provided.

Comment OC-2: Cumulative Impact Analysis

This response addresses the following comments, which are quoted below:

A-CPC-Johnson.3	O-Bayview CP-1.1	O-BayviewCP-2.4	O-BVHPCAC.2
I-Blacketer.4	I-Hamman-1.1	I-Hamman-4.1	

"I know that -- and I don't know -- hopefully I'm speaking slowly enough for the recorder -- that generally speaking for EIRs, we try to be very project specific. And so we'll take into account various projects. And there's actually a table in the EIR that looks at the various projects in the surrounding area to say what are we looking at when we talk about cumulative impact. But we don't get super detailed into their on-boarding plans or their phasing to look at the impacts for this particular project or any particular EIR.

"And I think that that's something we need to take a look at here. Five years is not a lifetime, but it is a long time. And I think it would be good for us to make sure we dotted all our Is and crossed our Ts when it comes to looking at how we can get this project done with the least amount of impact possible." (Christine Johnson, Planning Commission, Public Hearing Comments, June 1, 2017)

"Please also note that nearby Palou Avenue will be under construction for a $3 1/2 million streetscape improvement plan beginning this year for a couple of years. (Dan Dodt, Bayview Community Planning, Public Hearing Comments, June 1, 2017)

"Not included in the cumulative impact analysis on traffic, and not mentioned in the BSFP-EIR, yet key to understanding the need for feasible mitigation as a requirement to LSM status are:

"> **Palou Avenue** streetscape improvement project -from Barneveld to Crisp Avenues- beginning late 2017, this is an approved $10m, SFDPW/SFMTA project with significant staging, parking, rerouting and daily traffic impacts on this heavily used East/West alignment.

"> **2245 Jerrold Avenue** - Project by **SFFD** - construction of SFFD Ambulance Deployment Facility - a $27m project slated for construction in 2020. As noted in the project conceptual design documentation, "The Project site is in an intensively developed area of San Francisco's Bayview neighborhood characterized by various warehouse, distribution and light industrial uses". (Dan Dodt, Bayview Community Planning, Letter, June 17, 2017; Jack Gallagher, Bayview Hunters Point Citizens Advisory Committee, Letter, June 19, 2017)

"There are multiple projects affecting the area, with many occurring simultaneously with the Biosolids Digester Project. Other projects that will affect transportation in the area are not listed in the EIR. For example, in addition to the partial closing of **Evans Street** beginning in August 2017; the **closure of Jerrold Avenue from Phelps to Rankin Street** for 5-6 years; the **construction staging along Phelps Avenue**; the **Palou Avenue** streetscape improvement

project -from Barneveld to Crisp Avenues; the **2245 Jerrold Avenue** - construction of SFFD Ambulance Deployment Facility; ;the re-routing of the **23 Muni Bus Line to Palou Avenue**, the temporary closure of the Illinois Street Bridge at Islais Creek, we are potentially in real trouble when desiring to enter or exit our neighborhood by vehicle." (Linda K. Blacketer, Letter, June 19, 2017)

"They failed to take into account the major projects that are being built in India Basin. The India Basin Project is 1250 units, the Shipyard is coming online with 900 units, Hunters View hundreds more, plus the projects up and down Third Street." (Michael Hamman, Public Hearing Comments, June 1, 2017)

"There are multiple projects affecting the area, with many occurring simultaneously and the EIR does not consider the cumulative impact of all these projects together. Several huge projects in the area were not considered at all, including the 1200 new housing units in the Build Inc project the 900 units in the Shipyard project as well as numerous projects on Third Street such as the Chris Harney project. In addition projects by other agencies such as the closing of the Third Street "Nishkin" bridge by DPW. I request a complete inventory of all the projects expected during this project be considered." (Michael Hamman, Letter, June 20, 2017)

Response OC-2

The comment from Commissioner Johnson regarding the evaluation of cumulative project impacts is noted. Draft EIR Table 4.1-1 (beginning on page 4.1-6) describes the past, present and probable future projects that are considered in the list-based cumulative analyses; Figure 4.1-1 (Draft EIR page 4.1-17) shows their locations. Forty cumulative projects were included in Table 4.1-1, selected for inclusion based on the nature of the environmental effects examined in the Draft EIR, the location of each project, and the type of project. The cumulative analyses of the BDFP and other projects in the cumulative scenario are included within each Draft EIR topic section (Sections 4.2 through 4.19). Each topic section defines the geographic scope of the area affected by the cumulative effect, if any, and includes a reasonable analysis of the cumulative impacts of the relevant projects within the geographic scope. The analysis of cumulative impacts takes into consideration the characteristics particular to BDFP construction (e.g., the five-year construction schedule, closure of Jerrold Avenue). For example, the transportation analysis (beginning on Draft EIR page 4.6-22) quantified construction worker and truck trips for those cumulative projects with construction schedules overlapping the periods representing the greatest BDFP construction truck traffic (October 2018) and greatest BDFP construction worker traffic (May 2022); then, cumulative impacts related to seven different transportation-related impacts (e.g., traffic circulation, traffic safety, emergency access) were evaluated.

As stated in the specific Draft EIR topic sections (Sections 4.2 through 4.19), the BDFP cumulative analyses used a list-based approach, a projections approach, or a hybrid of the two as appropriate, to determine cumulative impacts of the BDFP in combination with other reasonably foreseeable projects. To better reflect the various approaches used in the individual cumulative analyses, the first paragraph on Draft EIR page 4.1-4 is revised as follows (new text is shown in double underline and deleted text is indicated with ~~strikethrough~~):

> As permitted in CEQA Guidelines Section 15130(b)(1), the analyses ~~analysis~~ in this EIR employs~~s~~ the list-based approach, a projections approach, or a hybrid of the two as appropriate~~, for defining projects to be considered in the cumulative impact analysis~~. In the list-based approach, ~~— that is,~~ the analysis is based on a list of past, present, and probable future projects that could result in related or cumulative impacts. A probable future project is defined as one that is "reasonably foreseeable," which is generally a project for which an application has been filed with the approving agency or that has approved funding. In the projections approach, projections contained in an adopted local, regional, or statewide plan, or related planning document, are summarized to describe or evaluate conditions contributing to the cumulative effect.

The second paragraph on Draft EIR page 4.1-4 is also revised to read:

> The following factors were used to determine an appropriate list of relevant projects to be considered in the list-based cumulative analyses:

The second paragraph on Draft EIR page 4.1-5 is revised to read:

> **Table 4.1-1** describes the past, present, and probable future projects that are considered in the list-based cumulative analyses (based on the factors described above), and their locations are shown on **Figure 4.1-1**.

Four proposed projects cited in the comments above were not included in list of cumulative projects in Draft EIR Table 4.1-1 (page 4.1-6). These projects include the Palou Avenue Streetscape Improvement Project and Quesada Bike Lane, the 2245 Jerrold Avenue Emergency Medical Services Facility, the Hunters View project, and Islais Creek Bridge Rehabilitation. **Table 10.9-1** describes these projects. As described in **Response TR-4** (Section 10.5), inclusion of these projects in the cumulative scenario would not alter the cumulative transportation and circulation impact significance conclusions in the EIR.

TABLE 10.9-1
ADDITIONAL PROJECTS SUGGESTED FOR INCLUSION IN CUMULATIVE IMPACT ANALYSIS

Project Name (Project Sponsor)	Project Description	Construction Dates
Palou Avenue Streetscape Improvement Project and Quesada Avenue Bike Lane (SFMTA)[a]	This project includes streetscape improvements on a seven-block segment of Palou Avenue between Rankin and Jennings Streets, about 1,000 feet from the BDFP project site. Improvements include color curb changes, removal of seven on-street parking spaces, transit stop consolidation, removal of existing shared roadway bicycle markings, and removal of one of two westbound travel lanes on the three-block segment of Palou Avenue between Newhall and Keith Streets. In addition, a new bicycle lane would be implemented on Quesada Avenue between Third and Griffith Street. Construction activities would include lane striping, signage, color curb changes, and other minor improvements, and would not include excavation or work within the travel lanes for extended durations.	April 2018-April 2019
2245 Jerrold Avenue (CCSF Fire Department)[b]	San Francisco Fire Department Station #9 is located at 2245 Jerrold Avenue. This project involves demolition of two structures south of the fire station and construction of a three-story, 30,344-gross-square-foot (gsf) EMS facility and a three-level, approximately 62,000 gsf parking structure behind the existing San Francisco Fire Department Fire Station 9 located on same block/lot. The proposed 47-foot-tall concrete parking structure would provide 121 parking spaces for various emergency vehicles as well as vehicles for trainees, employees, and visitors, and would also include an emergency generator, vehicle refueling pumps, and diesel and gasoline fuel tanks. The existing Fire Station 9 and an open shed would remain in use. This project site is about 2,270 feet west of the BDFP project site.	2018-2019 (1.5 years)
Hunters View Project (San Francisco Housing Authority and Hunters View Associates, LP)[c]	Hunters View is the first project to proceed under HOPE SF, an initiative to rebuild San Francisco public housing sites. When completed, the 22.5-acre Hunters View site will include 800 housing units, childcare facilities, a community center, playgrounds and parks, and 6,400 square feet of retail space. The site is approximately 0.7 mile southeast of the BDFP site. The project will include the demolition of all existing public housing units and other facilities on the site and result in a mixed-income community of up to 800 new residential units (with one-for-one replacement of the existing 267 public housing units). The project includes realignment of some existing streets as well as new streets and sidewalks. Up to 816 off-street parking spaces will be included at the site. Phase 1 was completed in 2013, Phase 2a was completed in early 2017, and the remaining phases would be constructed between 2019 and 2023.	Phased development: 2010 to 2023
Islais Creek Bridge Rehabilitation (San Francisco Public Works)[d]	SFPW would rehabilitate and repair the Islais Creek Bridge, located approximately 0.25-mile northeast of the Southeast Plant. The project would include repairing and replacing various components of the bridge to bring them up to current seismic and service standards and replacement and upgrades to bridge safety features; which would serve to increase the bridge's service life an additional 50 years. Without preventative replacement, repair, and seismic compliance, existing bridge wear and damage would worsen and ultimately compromise the structural integrity of the bridge. No change to the alignment or widening of the bridge is proposed. The construction contractor would be required to submit a Traffic Control Plan to the City's Traffic Engineer for review and approval.	2018-2019; bridge closure lasting 1-2 months in late 2018

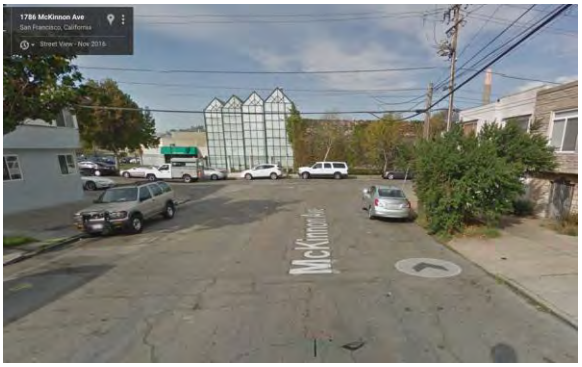
Comment OC-3: Cumulative Projects - Southeast Greenhouses Demolition

This response addresses the following comments, which are quoted below:

O-BayviewCP-2.2	O-BHS.2	O-BRITE.3	I-Blacketer.2
I-Hamman-3.1	I-Hinton.2		

"2. Impacts of Other Project Components - **Display Building**

"'The most prominent features of the greenhouses are four tall, narrow structures near the edge of the property on Phelps Street. As a separate action from the BDFP, the San Francisco Public Utilities Commission(SFPUC) plans to demolish the existing structures at the Southeast Greenhouses site (refer to Table 4.1-1 in Section 4.1). The site would be used for construction staging for the project if it becomes available prior to BDFP construction.'



"Recommendation:

"The smaller, yet taller, glassed in greenhouse 'facade' - THE DISPLAY BUILDING is a striking and important community marker at the intersection of Phelps and McKinnon Avenues. As community planners and advocates for improving the physical environment where we live, the potential for losing these smaller buildings (if contemplated in Phase 1) seems antithetical to the goals we've set for ourselves in lifting this place in Bayview.

"These buildings have been recognized as remaining in our neighborhood greening and block improvement plans for some time and fulfill the Phase2 goals for the 'Model Block' as planned in 2006-2009.

"These DISPLAY BUILDINGS are noted in the EIR and Aecom report as the 'Display' buildings, and are not contiguous to the larger greenhouses also slated for demolition in the BDFP. The Aecom Due Diligence report -2015 does not indicate an imminent seismic failure of this particular location, as was reported by the SFPUC neighborhood outreach team in May, 2017. The path of least resistance may be to simply demolish the buildings in order to make way for a construction parking lot and staging area as mapped and noted in the EIR. Demolition of these structures add to the removal of community assets, bit by bit, in our opinion. An alternate, community use, is highly recommended.

"If it is indeed determined that occupancy of building is not recommended, yet the seismic integrity is not significantly compromised, the building would provide an ideal location as a community storage hub for cots, MREs, generators, first-aid supplies, water and many other emergency items for use by emergency responders on behalf of Bayview and beyond in the event of a impactful event or natural disaster. (Dan Dodt, Bayview Community Planning, Letter, June 17, 2017)

"2. **CULTURAL RESOURCES** Impacts of Other Project Components - Display Building

"We are opposed to the demolition and removal of the green framed, display buildings along Phelps Avenue, and suggest an alternate, community serving use for these modest structures. As noted in the EIR - 'The most prominent features of the greenhouses are four tall, narrow structures near the edge of the property on Phelps Street. As a separate action from the BDFP, the San Francisco Public Utilities Commission(SFPUC) plans to demolish the existing structures at the Southeast Greenhouses site (refer to Table 4.1-1 in Section 4.1). The site would be used for construction staging for the project if it becomes available prior to BDFP construction.

"Recommendation:

"These buildings have been recognized as remaining in our neighborhood greening and block improvement plans for some time and fulfill the Phase2 goals for the 'Model Block' as planned in 2006-2009, with the initial phase completed at City cost on the Newcomb Avenue alignment. These buildings are also noted in both the EIR and Aecom report as the 'Display' buildings, and are not contiguous to the larger greenhouses also slated for demolition in the BDFP. The Aecom Due Diligence report -2015 does not indicate an imminent seismic failure of this particular location.

"Demolition of these structures to make space for a construction staging and parking lot and staging area as mapped and noted in the EIR is mis-guided and needlessly destructive, in our opinion. Demolition of these structures also add to the incremental removal of known community assets. The display buildings are valued and admired by many in the community and stand out as an 'iconic marker' despite the modest architectural character and lack of recognition as an 'historic resource'

"An alternate, rather benign and easily implemented community use is highly recommended and is outlined by the Bayview Office for Community Planning. We concur with this assessment:

"If it is determined that occupancy of building is not recommended, yet the seismic integrity is not significantly compromised, the building would provide an ideal location as a community storage hub for cots, MREs, generators, first-aid supplies, water and many other emergency items for use by emergency responders on behalf of Bayview and beyond in the event of a impactful event or natural disaster. The community could clearly benefit from such an asset in light of the other significant impacts from this phase of the SSIP project" (Adrian Card, Bayview Historical Society, Letter, June 19, 2017)

"What we hear universally from residents is best described as outrage. First, with respect to the greenhouses, it would be minimally respectful to retain the glass "exhibit gallery" buildings and façade on Phelps at the intersection with McKinnon – these structures remind the community of their pride for being pioneers in creating urban, green-collar jobs. Furthermore, the cost to retain and repair these structures is surely competitive with the costs of leased trailers for office space (the EIR-identified use of that land)." (Steven Tiell, Bayview Residents Improving Their Environment, Letter, May 30, 2017, and Email, May 31, 2017)

"Display Buildings

"While the display buildings are not technically 'historic', they nonetheless provide a much needed and moderately attractive facade with which to block the industrial elements of the Water Treatment Plant beyond. Destruction of those elements in favor of a parking lot for trucks and staging makes little sense and appears to be entirely unavoidable. I clearly understand the need to demolish the large and low slung white greenhouse items and the concrete building (the ancillary structure), but the green-framed Display Houses do not need to be eliminated in the neighborhood for purposes of construction. It also appears that the funding to repair these Display buildings is minor overall, and clearly beneficial when one considers the placement and connection to the community. Save the Display Buildings." (Linda K. Blacketer, Letter, June 19, 2017; Michael Hamman, Letter, June 19, 2017)

"I would ask that you at the very least (1) Preserve the smaller, yet taller, glassed in greenhouse 'facade' - at the intersection of Phelps and McKinnon Avenues. A "display of interpretive materials" is not a suitable replacement for the actual assets that currently exist and can be used by the community." (Rosalind Hinton, Letter, June 19, 2017)

Response OC-3

The comments express opposition to demolition of the "Display Building" (also referred to as the Display House, exhibit gallery or exhibit hall) at the Southeast Greenhouses, and recommend that the building be retained. The Southeast Greenhouses Demolition is a separate project that would remove both the greenhouses and the Display Building and is not proposed as part of the BDFP;[1] it is described on BDFP Draft EIR page 4.1-10 (Item #21 in Table 4.1-1) and evaluated as a cumulative project. Approval of the BDFP would have no effect on the Southeast Greenhouses Demolition project. The cumulative environmental effects of the Southeast Greenhouses Demolition along with the BDFP and other cumulative projects were evaluated in the Draft EIR in each topic section (Sections 4.2 through 4.19). Approval of the Southeast Greenhouses Demolition project is anticipated in early 2018.

Comment OC-4: SRF Process

This response addresses the following comments, which are quoted below:

A-SWRCB.1 A-SWRCB.4

"We understand that the Department is pursuing Clean Water State Revolving Fund (CWSRF) financing for this Project. As a funding agency and a state agency with jurisdiction by law to preserve, enhance, and restore the quality of California's water resources, the State Water

[1] In June, 2017, the Planning Department found the demolition of the buildings at the Southeast Greenhouses exempt from CEQA (San Francisco Planning Department, CEQA Categorical Exemption for SFPUC – Revised Southeast Greenhouses Demolition Project. Case Number 2017-007807ENV, June 23, 2017).

Resources Control Board (State Water Board) is providing the following information on the EIR to be prepared for the Project.

"The State Water Board, Division of Financial Assistance, is responsible for administering the CWSRF Program.

…

"The CWSRF Program is partially funded by the United States Environmental Protection Agency and requires additional "CEQA-Plus" environmental documentation and review. Three enclosures are included that further explain the CWSRF Program environmental review process and the additional federal requirements. For the complete environmental application package please visit: http://www.waterboards.ca.gov/water issues/programs/grants loans/srf/srf forms.shtml. The State Water Board is required to consult directly with agencies responsible for implementing federal environmental laws and regulations. Any environmental issues raised by federal agencies or their representatives will need to be resolved prior to the State Water Board approval of a CWSRF financing commitment for the proposed Project. For further information on the CWSRF Program, please contact Mr. Ahmad Kashkoli, at (916) 341-5855." (Susan Stewart, State Water Resources Control Board, Letter, June 16, 2017)

"Please provide us with the following documents applicable to the proposed Project following the Department's California Environmental Quality Act (CEQA) process: (1) one copy of the draft and final EIR, (2) the resolution adopting the EIR and making CEQA findings, (3) all comments received during the review period and the Department's response to those comments, (4) the adopted Mitigation Monitoring and Reporting Program (MMRP), and (5) the Notice of Determination filed with the San Francisco County Clerk and the Governor's Office of Planning and Research, State Clearinghouse. In addition, we would appreciate notices of any hearings or meetings held regarding environmental review of any projects to be funded by the State Water Board." (Susan Stewart, State Water Resources Control Board, Letter, June 16, 2017)

Response OC-4

The comments from the State Water Resources Control Board (SWRCB) regarding the Clean Water State Revolving Fund program are noted. The San Francisco Public Utilities Commission (SFPUC) intends to pursue Clean Water State Revolving Fund financing for the Biosolids Digester Facilities Project (BDFP) and will comply with the environmental documentation and review requirements of the program, and provide the SWRCB with the documents requested in these comments.

This page intentionally left blank

10.10 Alternatives

The comments and corresponding responses in this section relate to the topic of project alternatives, evaluated in Draft Environmental Impact Report (EIR) Chapter 6. For ease of reference these comments are grouped into the following issues that the comments raise:

- AL-1: Rail Transport Alternative
- AL-2: Other Comments on Alternatives

Comment AL-1: Rail Transport Alternative

This response addresses the following comments, which are quoted below:

O-Greenaction.4 I-Hamman-2.1 I-Hamman-2.2 I-Hamman-2.3 I-Kelly.3

"Other options of [operational biosolids hauling] transport should be explored, such as rail." (Bradley Angel, Greenaction for Health and Environmental Justice, Letter, June 26, 2017)

"I am a resident and business owner in the Bayview and I am writing today to request additional review of the impact analysis with respect to Air Quality (Section 4.8). The EIR divides the contributions to air quality into two categories, operations of the completed plant and thos[e] activities necessary to construct the plant. Of the activities that contribute to air quality some are impossible or difficult to mitigate successfully. However, one component does le[n]d itself to successful reduction and that is truck trips, both during construction project and trips during the operation by using rail to transport the construction material and the biosolids during operation of the plant.

"The primary pollutant generated by truck trips is NOx and the EIR projects a total of 31,123 lbs of NOx emitted in our neighborhood during the five years of construction (Section 4.8-8). In addition many tons will be emitted during the operational life of the project. Several methods of mitigation are recommended, nevertheless, *"the construction-related NOx emissions are considered significant and unavoidable with mitigation"* (4.8-49) in addition to the significant degradation of our air quality, these 71 truck trips a day will severely impact traffic and emergency access to our neighborhood (4.6-28).

"The EIR projects seventy one (71) construction truck trips a day for the duration of the project. These truck trips will also have a negative impact on traffic and emergency access. Rail transportation would ameliorate these impacts as well." (Michael Hamman, Letter, June 19, 2017)

"The use of rail transportation for hauling the biosolids during the operation of the plant was analyzed in Section 6.5.4-2. However that analysis is inadequate in several respects:

- "The analysis only considers the use of rail to haul the operation biosolids. It should consider the alternative of using rail for BOTH the operations biosolids and the

construction material. Especially the waste going to Altamont as there exists a well established process for rail transportation of that commodity. **I request this option be analyzed**.

- "The analysis assumes that all material needs to be trucked to the SFBR yard along Cargo Way. The possibility of loading directly onto rail cars at the site by constructing a loading spur off the nearby Quint Street lead needs to be analyzed. Such direct loading would achieve dramatic reduction in total truck trips. Furthermore such direct loading was once practiced at that location. **I request this option be analyzed."** (Michael Hamman, Letter, June 19, 2017)

"The use of rail transportation to transporting such bulk items has benefits beyond improving air quality.

- "Reducing truck trips will also reduce the impacts on traffic.
- "Using a rail spur will enhance the ability to organize the logistics of construction, possibly reducing the need for construction staging areas and "lay-down" space.
- "Moving freight by rail reduces greenhouse gas emissions by 75% over trucks (*"Freight Railroads Help Reduce Greenhouse Emissions"* ARR Study April 2017)
- "Utilizing the railroad infrastructure that currently exists next to the proposed project will reduce the degradation of our streets and highways caused by the tens of thousand heavy truck trips during the five year course of construction. And into the future with the operation of the new plant." (Michael Hamman, Letter, June 19, 2017)

"All that said:

"My comments are centered around the issues of truck traffic and their emissions. The EIR considers and recommends several methods of mitigation; but it goes on to say "*the construction-related NOx emissions are considered significant and unavoidable with mitigation*" (4.8-49). I must disagree – **a significant amount of the construction-related NOx emissions can be avoided** by utilizing rail transportation instead of trucks.

"Quoting my neighbor, Michael Hammann, in his EIR comments:

"'The primary pollutant generated by truck trips is NOx, and the EIR projects a total of 31,123 lbs of NOx emitted in our neighborhood during the five years of construction (Section 4.8-8)....

"'The use of rail transportation for hauling the biosolids during the operation of the plant was analyzed in Section 6.5.4-2. That analysis is inadequate in several respects:

- *"'The analysis only considers the use of rail to haul the operation biosolids. It should consider the alternative of using rail for BOTH the operations biosolids and the construction material. Especially the waste going to Altamont as there exists a well established process for rail transportation of that commodity.* ***I request this option be analyzed.***
- *"'The analysis assumes that all material needs to be trucked to the SFBR yard along Cargo Way. The possibility of loading directly onto rail cars at the site by constructing a loading spur off the nearby Quint Street lead needs to be analyzed. Such direct loading would achieve dramatic*

reduction in total truck trips. Furthermore such direct loading was once practiced at that location. ***I request this option be analyzed.'***

"I am certain that additional analysis will reach the same conclusion that other developers and contractors have found over the years – that rail transportation has less impact on air quality than truck traffic." (Tony Kelly, Letter, June 26, 2017)

Response AL-1

The comments request that the EIR evaluate hauling biosolids (during operation of the Biosolids Digester Facilities Project [BDFP]) as well as hauling construction materials via rail as alternatives in order to reduce truck trips and associated transportation and air quality impacts. The comments also request consideration of direct loading into rail cars from the project site via the Quint Street Lead rail spur.

Draft EIR Chapter 6, *Alternatives*, describes the purpose of and requirements for consideration of alternatives in an EIR, the alternatives selected for evaluation and the process by which they were selected, and alternatives that were considered but eliminated from analysis. As described in the Draft EIR (page 6-2), pursuant to the California Environmental Quality Act (CEQA) an EIR must include a range of reasonable alternatives to the project that are feasible, are capable of meeting most of the basic objectives of the project, and would avoid or substantially lessen any of the significant effects of the project. The term "feasible" as relevant to the evaluation of alternatives under CEQA is defined in California Public Resources Code Section 21061.1 as "capable of being accomplished in a successful manner within a reasonable period time, taking into account economic, environmental, social, and technological factors." Factors that may be taken into account when addressing the feasibility of alternatives include (but are not limited to) availability of infrastructure, jurisdictional boundaries, and whether the proponent can reasonably acquire, control, or otherwise have access to sites included in the alternatives.[1]

Railway Transport of Biosolids

As indicated in Draft EIR Section 6.5.4.2 (Draft EIR page 6-104), the use of the railway for hauling biosolids as part of long-term operations was considered but eliminated from further analysis. As discussed there, this option did not reduce any significant impacts or materially alter the impact conclusions for the BDFP. With implementation of the BDFP, there would be an increase of three truck trips per day on average (Draft EIR page 4.8-37). Due in part to this small increase in truck trips (among other factors discussed in Draft EIR Impact TR-3), operations-phase transportation impacts were determined to be less than significant and thus no mitigation was required (Draft EIR page 4.6-47). Similarly, such a small change in truck trips on local roadways would not substantially increase transportation-related criteria pollutant emissions or associated health risks (see Draft EIR pages 4.8-51 and 4.8-55). This information is summarized in Draft EIR Section 6.5.4.2 under the heading "Impact Reduction." As stated there, while there could be a reduction in the distance, frequency, and number of truck trips for hauling biosolids and commensurate reduction in air pollutant emissions from trucks, there would be increased handling of biosolids from truck

[1] CEQA Guidelines Section 15126.6(f)(1).

to rail and rail to truck and increased emissions associated with rail use; the net effect on regional air quality in the air basin is unknown. Consequently, while a "Rail Transport of Biosolids" alternative would meet most of the basic project objectives and was considered potentially feasible (conditioned upon the availability of a rail line between the Southeast Plant and a Class A biosolids end-use destination), it would not reduce any significant environmental impacts attributable to the project, as discussed on Draft EIR page 6-104. Use of the railway to haul biosolids lacked distinct environmental advantages relative to the proposed project or alternatives evaluated in Draft EIR Section 6.3, and was thus eliminated from further analysis.

Railway Transport of Construction Materials

Some comments suggest using rail haul for construction materials (assumed to include equipment and other construction materials as well as construction and demolition debris) in order to reduce truck trips, transportation impacts, and air quality impacts. The Draft EIR did not identify significant transportation and circulation impacts, but did identify significant construction-phase air quality impacts due to nitrogen oxide (NOx) emissions. As described on Draft EIR page 4.6-46, construction-related project impacts on transportation and circulation were determined to be less than significant due in part to implementation of a site-specific Traffic Control Plan that would establish measures to reduce traffic congestion and reduce potential traffic, bicycle, pedestrian, transit, and emergency vehicle access disruptions and safety hazards. As described in Draft EIR Section 4.8, Air Quality (beginning on page 4.8-43), NOx emissions generated during the first and third years of the five-year construction period would violate an existing air quality standard, both at the project level and cumulatively, even with implementation of maximum feasible mitigation measures for construction emissions minimization. Implementation of Mitigation Measure M-AQ-1b (Emission Offsets; Draft EIR page 4.8-50) could reduce these impacts to a less-than-significant level by reducing NOx emissions to below the threshold level within the same air basin; however, these impacts are still considered significant and unavoidable because sufficient direct offset opportunities have not been fully verified and because implementation depends on an agreement with a third party (the BAAQMD). While direct offset opportunities have not been fully verified, **Table 10.6-1** in Section 10.6, *Air Quality and Greenhouse Gas Emissions*, outlines potential mitigation projects the SFPUC has analyzed and recommended. If approved, these offset opportunities could sufficiently offset the NOx exceedances in years 1 and 3 of construction.

Two suggestions for railway transport of construction materials are made by commenters. Some comments suggest that direct rail loading of materials at the Southeast Plant be implemented. The San Francisco County Transportation Authority recently removed the rail spur adjacent to the project site's western boundary (labeled "Freight Rail Spur" on Figure 2-2, Draft EIR page 2-4) that previously connected the Southeast Plant to the San Francisco Bay Railroad line as part of the Quint Street Lead Track project (see Draft EIR page 4.1-12 for a description). Nonetheless, in response to these comments, the San Francisco Bay Railroad, which operates the San Francisco Bay Railroad Rail Yard and Transfer Facility (shown on Draft EIR Figure 4.2-2, page 4.2-4), was contacted to discuss the feasibility of using rail transport with direct loading at the Southeast Plant. A new rail spur would need to be installed in order to directly load materials from the Southeast Plant. Installation of a new rail spur would require coordination with UPRR (the land owner) as well as with the San Francisco Bay Railroad and the San Francisco County Transportation Authority. Due

to the extent of coordination required with these entities, it is unlikely that installation of a new rail spur would be feasible without delaying BDFP construction. SFPUC may pursue this option should installation of a new rail spur become practical; however, for the purposes of the BDFP EIR, the feasibility of a "Direct Loading at the Southeast Plant" alternative is uncertain.

Commenters also propose the use of rail instead of trucks to transport the portion of project construction and demolition debris destined for Altamont Landfill. This alternative would require new infrastructure at the Altamont Landfill. While railroad tracks pass near the landfill, there is no offloading infrastructure. Thus, infrastructure would have to be constructed at or near the landfill to transfer construction and demolition wastes into trucks which would then be driven the remaining distance. Constructing such facilities would require agreements with and approvals from numerous third parties, as SFPUC may need to acquire or secure access to lands owned by others or lands outside San Francisco's territorial jurisdiction to build the infrastructure. Furthermore, railway transport infrastructure at other construction materials origin and destination locations is considered unavailable (e.g., concrete trucks assumed to originate from within San Francisco) or unknown (e.g., the origin of some truck trips cannot be known at this time). Consequently, the feasibility of a Railway Transport of Construction Materials alternative is uncertain based on lack of available infrastructure and reliance on agreements with multiple third parties.

Comment AL-2: Other Comments on Alternatives

This response addresses the following comment, which is quoted below:

O-Greenaction.9

> "We would like to conclude that many of the concerns raised in this letter would be mitigated if the project moved the biosolids digestion and energy recovery to another location. We are disappointed to see that SFPUC has opted not to relocate these processes to Pier 94, given that it would more than double the distance between health-impacting operations and adjacent homes and a daycare facility. We are also concerned that this project will reduce the attractiveness of locating businesses in the area. It appears that SFPUC was able to dismiss this option by underestimating the amount of community impact that this expansion of the Southeast Plant would have on the community." (Bradley Angel, Greenaction for Health and Environmental Justice, Letter, June 26, 2017)

Response AL-2

This comment states that moving the BDFP to the Pier 94 location would reduce impacts.

The Draft EIR examines the physical environmental impacts of the BDFP, identifies feasible measures that could minimize significant adverse impacts, as required under CEQA (CEQA Guidelines Section 15126.4), and evaluates alternatives to the project. Pursuant to CEQA,

mitigation measures are not required for effects that are not found to be significant (CEQA Guidelines Section 15126.4). As described above under **Response AL-1** and in Section 6.1.2 (Draft EIR page 6-2), pursuant to CEQA an EIR must include a range of reasonable alternatives to a project that would feasibly meet most of the basic objectives of the project and would avoid or substantially lessen the significant effects of the project. Alternatives screening and selection (described on Draft EIR pages 6-2 through 6-9) focused on these factors, identifying alternatives that could reduce the severity of one or more significant impact.

The Draft EIR evaluates construction of the BDFP at the Pier 94 backlands (Draft EIR pages 6-30 through 6-50). The analysis discloses the scope and magnitude of physical environmental effects that could occur under the Pier 94 Backlands Alternative. With respect to the topics raised by the commenter (aesthetics, air quality, and general comments related to socioeconomic effects and environmental justice), under the Pier 94 Backlands Alternative, aesthetic impacts would be considered less than significant, as is the case for the proposed project, and construction-phase criteria air pollutants would be greater overall because of pipeline construction, while health risks could be lower because of the distance to sensitive receptors.[2] The discussion on Draft EIR page 6-88 summarizes the environmental trade-offs of implementing the BDFP at the Pier 94 Backlands compared to the proposed project. Refer to responses in Section 10.11 of this document regarding general comments related to socioeconomic effects and environmental justice. These comments will be transmitted to City decision-makers for consideration in their deliberations on whether to approve the proposed BDFP, select the Pier 94 Backlands Alternative, or select another of the alternatives.

---

[2] Refer to Sections 10.3, Aesthetics, 10.6, Air Quality and Greenhouse Gas Emissions, and 10.11, General Comments, for responses to the specific comments raised by the commenter, Greenaction for Health and Environmental Justice.

10.11 General Comments

The comments and corresponding responses in this section relate to project merits or other topics not evaluated in the Draft Environmental Impact Report (EIR). For ease of reference these comments are grouped into the following issues:

- GC-1: Project Merits
- GC-2: Socioeconomic and Quality-of-Life Effects
- GC-3: Community Benefits and SFPUC Relationship to the Community
- GC-4: Environmental Justice

Comment GC-1: Project Merits

This response addresses the following comments, which are quoted below:

A-BAAQMD.2 A-CPC-Johnson.1 A-CPC-Johnson.4 O-PetCamp-1.1 I-Karlin.1

"…We commend the project on the greater recovery efficiency of biosolids digestion, the planned odor control improvements, and the reduction in emissions of volatile organic compounds and associated nuisance odors in the adjacent neighborhood. We further commend this project for its planned inclusion of renewable diesel fuel to reduce diesel emissions from the project." (Jean Roggenkamp, Bay Area Air Quality Management District, Letter, June 26, 2017)

"And so I'm happy to see that finally this project is before us today or least the Draft EIR. This is something that is needed. If we're not going to move the biodigester, which I know was a movement for a little while, we at least need to have it completely upgraded to a modern-day standard. It is an environmental justice issue that we have equipment that is so completely beyond its useful life still handling 80 percent of the solids in our city, wastewater in our city. So I think that's a good thing." (Christine Johnson, Planning Commission, Public Hearing Comments, June 1, 2017)

"But I think this is a great day for the City, for the Southeast, particularly for that area. And I'm happy to see this project coming online." (Christine Johnson, Planning Commission, Public Hearing Comments, June 1, 2017)

"All of that means that, after 20 years of confronting these issues, I'm very much looking forward to improvements being made at the Southeast Plant." (Mark Klaiman, Public Hearing Comments, June 1, 2017)

"I am a member of the Bayview-Hunters Point community. I understand that significant work is being planned for the southeast water treatment plant in the near future. Of course I support maintenance and upgrades to our city's utilities, especially one as important to our health as waste removal." (Sean Karlin, Email, May 24, 2017)

Response GC-1

The comments do not address the adequacy or accuracy of the EIR; rather, the comments speak to the merits of the proposed Biosolids Digester Facilities Project (BDFP). The comments will be transmitted to City decision-makers for consideration in their deliberations on whether to approve the proposed BDFP. Refer to **Response GC-4,** below, regarding environmental justice concerns.

Comment GC-2: Socioeconomic and Quality-of-Life Effects

This response addresses the following comments, which are quoted below:

O-BayviewCP-2.6	O-BRITE.4	O-BVHPCAC.4	O-Greenaction.10
O-PetCamp-1.2	O-PetCamp-2.1	O-SFWPM-2.1	I-Hamman-1.2
I-Hamman-4.2	I-Harney.1	I-Hinton.1	I-Hinton.3

"One example from a family in our community demonstrates how these street closures could test the resiliency of an already fragile community, compromise the economic stability of families, and exacerbate delicate issues of equitable justice. This family has children at a school in Cole Valley – getting to the school requires two, 1-hour round-trips per day. They take either Evans or Jerrold to Caesar Chavez / 101. One parent takes CalTrain to San Jose for work (approximately a 1h45m door-to-door commute). The children are dropped off by 8:30 am and picked up before 6pm. For every minute they're late, it costs $5/min/child. This family has minimal resiliency in their day already and see a strong education as the most accessible path to generational economic mobility. Adding even a 5-10 minute delay in their day due to traffic as a result of these street closures (compounded by aforementioned systemic impacts) will impose a "social justice tax" of $50 - $100/per day – they have 2 kids and are already stretched thin to get to the school by 6pm. This family is not alone in their transit struggles as a direct consequence of living in the isolated Bayview neighborhood." (Steven Tiell, Bayview Residents Improving Their Environment, Letter, May 30, 2017, and Email, May 31, 2017)

"We would like to see expanded attention to the socioeconomic impacts on the neighborhood in the final EIR, considering the drag on future business operations as well as the ongoing aesthetic and reputational impacts associated with living next to a large sewage treatment plant." (Bradley Angel, Greenaction for Health and Environmental Justice, Letter, June 26, 2017)

"That said, as a small business owner, I'm very concerned that, as drafted, the EIR will preclude me from benefiting from these improvements. As drafted, the EIR places an unfair burden on those businesses which have already been unfairly burdened by the plant. Specifically, as drafted, the EIR places an unfair amount of traffic burden on construction on those businesses located on Phelps Street.

"In case you're unaware, Phelps Street is a fairly narrow street with parking on both sides of the street, two lanes of traffic, and a bicycle route. Most of the businesses on Phelps Street are both destination locations and are the types of businesses that require their clients to drive to the business and to be able to park in close proximity.

"The Draft EIR completely fails to address this issue. Suggesting that since this is only a temporary burden -- a five-year temporary burden is something that small businesses can withstand -- reflects a lack of understanding of the cash-flow needs of small businesses, as well as the overall burdens of running a small business in San Francisco." (Mark Klaiman, Public Hearing Comments, June 1, 2017)

"It is based on that past experience that I understand the crippling effect the proposed DIER will have on my business and others on Phelps Streets if a change is not made to the proposed traffic patterns.

"As an active member of the Bayview business community, I have had the privilege to serve on both the Southeast Working Group and the Digester Task Force. Like many small businesses and residents who have suffered through odors and other noxious smells emanating from the Southeast Plant, I support the efforts to reduce this problem. But as drafted, the DEIR will preclude the very businesses that have suffered from the plant to still be in business when the project is completed." (Mark Klaiman, PetCamp, Email, June 19, 2017)

"As such, the City has a strong interest in protecting its investment by ensuring that (i) the Market can continue to operate successfully during the extended construction period required for the Biosolids Project, and (ii) that the SFWPM Project is able to continue moving forward in spite of the Biosolids Project." (Michael Janis, San Francisco Wholesale Produce Market, Letter, June 19, 2017)

"The economic impact that these road closures will have on the existing local businesses was not adequately analyzed. Many of these small businesses will not survive this loss of customers. This analysis need revision." (Michael Hamman, Letter, June 20, 2017)

"I am a commercial property owner here in San Francisco and I have several properties on the block bounded by Third, Jerrold, Innes and Phelps Street which are adjacent to the Southeast Treatment Plant. My commercial tenants will be negatively impacted by the proposed project. I am hopeful that the negative impacts can be mitigated with a well thought out development plan." (Chris Harney, Email, June 26, 2017)

"I would ask that you at the very least…Undergo additional review of the impact analysis with respect to traffic and circulation (Impact TR 1-5 incl.; Vol.1 s28) from the existing 'LS' -less than significant - status to the LSM condition, requiring mitigation. Current plans will have a devastating impact both to businesses, many of whom will leave the area if they cannot conduct business day-to-day, and residents." (Rosalind Hinton, Letter, June 19, 2017)

"The overarching issues - transportation, traffic and circulation - drive the question of public safety in Bayview and the quality of life for those directly and indirectly impacted by these multiple, intersecting projects. For the record, approximately 35,000 San Francisco citizens reside in the Bayview community and neighborhoods." (Dan Dodt, Bayview Community Planning, Letter, June 17, 2017; Jack Gallagher, Bayview Hunters Point Citizens Advisory Committee, Letter, June 19, 2017)

"…and [closure of Jerrold Avenue] will seriously degrade the quality of life for just about everybody who lives here." (Michael Hamman, Public Hearing Comments, June 1, 2017)

"The SFPUC project in the Bayview is of enormous concern to me. The communities, businesses and residential, along Phelps, 3rd and Jerrold are revitalizing and much more stable than they have been in many years, but are still quite fragile. The SFPUC expansion and upgrade in the area with its vast footprint and its 20-year timeline (when you put the discreet phases together) will have a devastating impact on the residents and businesses in the area, the property values, the quality of life, and just the simple ability to conduct business and get around and through the neighborhood.

"While SFPUC makes claims that it is mitigating the impact of its construction and upgrades, the actual neighborhoods impacted by the construction will undergo a scorched earth approach that has little regard for protecting community assets where the assets and the community currently exist." (Rosalind Hinton, Letter, June 19, 2017)

Response GC-2

In accordance with the California Environmental Quality Act (CEQA), the Draft EIR evaluated the physical environmental effects of the BDFP. Economic (e.g., property values) and social or quality-of-life effects of a project are not considered environmental impacts under CEQA (Guidelines Section 15131) unless there would be a physical impact on the environment (such as impacts addressed in the Draft EIR in the air quality, traffic, and noise sections) resulting from such effects, or if such effects result in the need for the construction of new or physically altered facilities that would result in significant physical environmental impacts. Comments on socioeconomic or quality-of-life effects will be transmitted to City decision-makers for consideration in their deliberations on whether to approve the proposed BDFP.

Many of the concerns expressed in the comments above relate to transportation and circulation during BDFP construction. The Draft EIR evaluated transportation and circulation impacts of

BDFP construction and operation in Section 4.6, *Transportation and Circulation*. Readers are also referred to **Response TR-1** in Section 10.5 of this document, which directly addresses community comments related to BDFP transportation and circulation impacts, including discussing the net changes in traffic along Phelps Street and Jerrold Avenue during BDFP construction. As indicated in **Response TR-1**, implementation of the BDFP would not impede continued operation of the San Francisco Wholesale Produce Market nor impair implementation of their project.

Refer to **Response TR-3** in Section 10.5 of this document for additional discussion of BDFP effects on parking. The San Francisco Public Utilities Commission (SFPUC) has conducted public outreach on the BDFP, including presenting to various community, business, and residential groups and conducting door-to-door merchant outreach, providing opportunities to identify and attempt to address concerns around customer parking and access.[1]

The BDFP proposes improvements to the existing aesthetic conditions along Jerrold Avenue. Consistent with Sewer System Improvement Program (SSIP) and BDFP objectives, the SFPUC aims to provide visual improvements as part of the BDFP that enhance the overall aesthetics at the Southeast Plant, and improve the public edges in a manner consistent with the surrounding neighborhood (Draft EIR page 2-19). Architectural, landscaping, and street improvements included in the BDFP (described in Draft EIR Section 2.4.3, pages 2-42 to 2-46, and further illustrated in Draft EIR Figures 4.3-8 and 4.3-9, pages 4.3-24 and 4.3-25) are designed to reduce the project's long term effects on the quality of life for the surrounding neighborhood.

The BDFP would also replace the existing solids treatment system with new biosolids handling facilities at a new location farther away from Phelps Street. As described in Impact AQ-5 (Draft EIR page 4.8-66 et seq.), odors from the solids treatment facilities both inside and outside the Southeast Plant boundary are expected to improve compared to existing conditions. Refer also to **Response GC-3**, below, for discussion of community benefits and the SFPUC's relationship to the community.

In accordance with CEQA, the Draft EIR evaluated the environmental effects of the entire BDFP, including the full construction period, the transition from existing to new solids processing facilities, and operation of the project. BDFP construction is expected to take approximately five years, from 2018 through 2023 (as shown in Draft EIR Table 2-10, page 2-52). Once construction of the BDFP is complete, transition from the existing solids processing facilities to the new solids processing facilities would require about two years; this would not require additional construction activities.

---

Comment GC-3: Community Benefits and SFPUC Relationship to the Community

This response addresses the following comments, which are quoted below:

O-BRITE.1	O-BRITE.2	O-BRITE.4	O-Greenaction.5
O-Greenaction.7	I-Harney.4		

"In summary, BRITE strongly opposes the closure of Jerrold and would like to see efforts made to honor preexisting commitments to the community -- both in terms of the Jerrold street closure and a key component of the greenhouse community benefit." (Steven Tiell, Bayview Residents Improving Their Environment, Letter, May 30, 2017, and Email, May 31, 2017)

"As progress builds on the SE Wastewater Treatment facility, so does the feedback we hear from members of the community. After the publication of the draft EIR, we've heard discussion and displeasure with the call for Jerrold St to be "closed during construction". (EIR Vol 1, §2.1.1.2; §S.4.3;) Compounding this closure is the simultaneous realignment of lanes on Evans to also support this project. But there's more to this than road closures – the bigger picture is about the SFPUC's relationship with and commitments to the community and the isolation (and resilience) of Bayview.

"During the SFPUC-hosted community town hall March 18, 2017, Carolyn Chiu said, "the Jerrold Street closure would only happen late at night and would only impact the businesses at the produce market." Now, the draft EIR states the street will be completely closed during construction! This significant of a change, buried in a 500+ page, multi-volume document, further erodes what's left of the trust between the SFPUC and our community. This is a categorically unacceptable and unreasonable burden to place on our residents, especially when commitments have already been made to the community to avoid this very situation. This is the epitome of trying to pull a fast one and it is offensive to the community. Together with the seizure and demolition of the greenhouses – which were supposed to be a community benefit – the number and significance of flip-flops on commitments to the community by the SFPUC raises eyebrows among community stakeholders." (Steven Tiell, Bayview Residents Improving Their Environment, Letter, May 30, 2017, and Email, May 31, 2017)

"While the community strongly supports the BDFP project for its promise to eliminate odors beyond the fence line – odors which our community has been subject to for decades (odors that came with scaled back community benefits that were delinquent in being delivered and are now being repossessed) – the appetite for traffic disruptions of this magnitude are nil, as is the appetite for a complete demolition of the greenhouses site." (Steven Tiell, Bayview Residents Improving Their Environment, Letter, May 30, 2017, and Email, May 31, 2017)

"We understand that the location of the Southeast Plant is a geographic convenience for SFPUC. As a topographic low point it enables much of the wastewater system to be gravity fed and, therefore, more efficient to operate. Here we see a trade-off between efficiency and

equity. The Southeast Plant already processes 80 percent of the City and County's wastewater, but it does not provide what we consider a proportional amount of benefit to the neighborhood that supports it. Therefore, we want to echo calls made by the others to provide employment opportunities, both during construction and during ongoing operation, to members of the immediate community. We encourage SFPUC to hire local business enterprises (LBEs) in this project, while also encouraging SFPUC not to reduce but to enable LBEs to achieve the same environmental performance standards as required elsewhere in the project. For example, we observe that the project only requires 80 percent of haul trucks to use 2010 or newer engines. We understand that the 20 percent not required to achieve this standard are LBEs that might have older equipment. Rather than reducing the environmental standard, we would prefer that SFPUC see this project as a way for LBEs to modernize their fleets. Lowering an environmental standard and using a quota approach limits both the ongoing opportunities for an LBE and contributes to community health overburden. We hope that you consider and change your approach in the final EIR." (Bradley Angel, Greenaction for Health and Environmental Justice, Letter, June 26, 2017)

"When the Southeast Plant expanded considerably in 1982, SFPUC reached a compromise with the neighborhood that increased community resources. Specifically, it added a community education center and community greenhouses in return for its increased production. We see no such plan as part of this project, but we do see that the portion of the plant south of Jerrold Street and between Phelps and Quint Streets will be retired as part of this project. We understand that the SFPUC has chosen to treat demolition of this older equipment and plans for this site as a future project. As a consequence, the project discussed in the Draft EIR appears to take more from the neighborhood than it gives. That is, it will burden the neighborhood with five years of construction, and it will increase daily truck traffic during ongoing operation. It will increase the production and combustion of biogas immediately upwind of residences. While it strives to reduce odors from one portion of the plant, it ignores others while also making plans to increase wastewater processing. We fail to see why the community should be in favor of this project, given a lack of return for the people who will live with the inconveniences associated with this facility. We encourage you to correct this oversight in your final EIR and to engage with community members and community leaders as you do so." (Bradley Angel, Greenaction for Health and Environmental Justice, Letter, June 26, 2017)

"The BIT (Bayview Industrial Triangle) which includes Jerrold Avenue between Third and the Southeast Plant still is an area that has overhead utility lines, inadequate (non ADA) sidewalk curbs, lacking uniform street trees, no sidewalk lighting etc. Given all that is planned and knowing the hardship this multiyear build will place on local business and residents it would be nice to see real tangible community benefits being presented as part of the entire proposal." (Chris Harney, Email, June 26, 2017)

Response GC-3

Closure of Jerrold Avenue

At the SFPUC community open house held at the Bayview Opera House on March 18, 2017, Carolyn Chiu provided information on the closure of Jerrold Avenue to public through-traffic

24-hours per day during the five-year project construction period; this closure includes both daytime and nighttime, contrary to the comment above.[2] As discussed in **Responses GC-2** and **TR-1**, the transportation and circulation effects of the closure of Jerrold were evaluated in Draft EIR Section 4.6, Transportation and Circulation. As indicated in the Draft EIR (pp. 2-53 and 2-54), the Traffic Control Plan would include development of detour routes designed to minimize impacts on local street circulation and manage traffic around road closures in order to reduce the project's effects on the surrounding community. Refer to **Response TR-1** for additional discussion of this topic.

Southeast Greenhouses

As discussed in **Response OC-3**, in Section 10.9 of this document, the Southeast Greenhouses Demolition project is a separate project previously approved by the SFPUC, and is not proposed as part of the BDFP. The cumulative environmental effects of the Southeast Greenhouses Demolition along with the BDFP and other projects in the cumulative scenario were evaluated in the Draft EIR within each topic section (i.e., Draft EIR Sections 4.2 through 4.19).

To address the social and economic effects of an expansion of the Southeast Plant necessitated by amendments to the federal Clean Water Act in the 1980s, the City and the Bayview-Hunters Point community developed a plan, commonly called the "Southeast Community Mitigation Agreement" (the Community Agreement), to construct the Southeast Greenhouses and the Southeast Community Facility.[3] The Southeast Greenhouses began to operate in 1987. As part of its stated commitment to the Community Agreement, the SFPUC is launching an Interim Greenhouse Grants Program (the "Greenhouse Grant Program"). The SFPUC developed this grant program with the involvement of the local community in an effort to fulfill the SFPUC's goal of providing residents with educational and workforce development opportunities. The purpose of the Greenhouse Grant Program is to help Bayview-Hunters Point residents overcome barriers to employment through development of the skills needed to secure living-wage jobs in the horticulture and urban agriculture sectors (including aquaponics and hydroponics); agriculture-adjacent food industries (including but not limited to wholesale sales, transport and distribution, packing and manufacturing, and production and catering); and related green sectors.[4,5]

Community Engagement

The remaining comments grouped into this topic category, which discuss SFPUC's engagement with the community regarding the Southeast Plant and community benefits (discussed below), do not address the adequacy or accuracy of the EIR. The comments will be transmitted to City decision-makers for consideration in their deliberations on whether to approve the proposed BDFP.

---

2 Carolyn Chiu, SFPUC, personal communication with Tim Johnston, San Francisco Planning Department, November 7, 2017.

3 ESA, *Environmental Justice Analysis for Bayview-Hunters Point, Biosolids Digester Facilities Project and Community Benefits Program*, prepared for SFPUC, June 2017. Available online at www.sfwater.org/bdfp-ej-analysis.

4 SFPUC, Solicitation for Grant Requests, PRO.0099(G): Interim Greenhouse Grant Program. Issued November 27, 2017.

5 SFPUC, Community Grant Program, 2017. Available online at http://sfwater.org/index.aspx?page=1212. Accessed on January 25, 2018.

Separate from the CEQA process, the SFPUC has made efforts to engage the local community pursuant to multiple SFPUC programs and policies. The SFPUC has conducted approximately 50 separate public outreach efforts related to the project, beginning in 2009 and continuing to present (see Section 1.3 of the Draft EIR). In addition to outreach associated with the SSIP and BDFP planning processes, relevant efforts include the Community Benefits Program and the Southeast Community Mitigation Agreement.

The BDFP is part of the SSIP, a wastewater capital improvement program that is the culmination of several years of wastewater system planning efforts, public meetings, and SFPUC workshops. SSIP guiding principles include maximizing employment and educational opportunities, in addition to the primary goals and levels of service identified in Draft EIR Table 2-3 (page 2-17). As part of the SSIP planning process, the nine-member Southeast Digester Task Force, an advisory group representing the local Bayview-Hunters Point community, was convened by the SFPUC in 2009-2010 for the purpose of reviewing and evaluating alternative concepts for replacing the Southeast Plant digesters (see Draft EIR Section 1.3.2, page 1-7). Then, between 2014 and 2016, the Southeast Working Group, made up of a cross-section of residents, business owners, and community group leaders based near the water pollution control plant, met routinely to gain updates on SFPUC projects and provide input on SFPUC projects and other activities near the water pollution control plant (see Draft EIR Section 1.3.3, page 1-7).

Community Benefits

SFPUC adopted Resolution No. 11-0008 (Community Benefits Policy) on January 11, 2011.[6] As specified in the resolution, SFPUC defines community benefits as "those positive effects on a community that result from the SFPUC's operation and improvement of its water, wastewater and power services." Referred to as the SFPUC's "good neighbor policy," the resolution "affirms and commits to the goal of developing an inclusive and comprehensive community benefits program to better serve and foster partnership with communities in all SFPUC service areas and to ensure that public benefits are shared across all communities." The resolution commits SFPUC to develop a Community Benefits Program and to devote sufficient resources and authority to staff for stakeholder and community engagement in design and implementation of SFPUC policies and projects; workforce development; environmental programs; economic development; support for arts and culture related to SFPUC's mission; educational programs; use of land in a way that maximizes health, environmental sustainability, and innovative ideas; diversity and inclusion programs; in-kind contributions and volunteerism; and improvement in community health.

As indicated in the Draft EIR (pages S-18 and 1-4), the SFPUC has conducted a separate environmental justice analysis concurrent with the BDFP, and prepared a stand-alone report titled *Environmental Justice Analysis for Bayview-Hunters Point, Biosolids Digester Facilities Project and Community Benefits Program* (Environmental Justice report).[7] See Chapter 6 of the Environmental Justice report for more information on the SFPUC's ongoing Community Benefits Program.

[6] SFPUC, Community Benefits Policy, SFPUC Commission Resolution No.11-0008, January 11, 2011. Available online at http://sfwater.org/modules/showdocument.aspx?documentid=3687.

[7] ESA, *Environmental Justice Analysis for Bayview-Hunters Point, Biosolids Digester Facilities Project and Community Benefits Program*, prepared for SFPUC, June 2017. Available online at www.sfwater.org/bdfp-ej-analysis.

Section 6.3 of the Environmental Justice report presents information about past, current, and intended or proposed future actions under the Community Benefits Program that seek to improve local employment of San Francisco residents and provide job training, experience, and search assistance, including the following:

- ***Local Hiring Policy and Local Business Participation***. SFPUC projects are covered by the San Francisco Local Hiring Policy for Construction and have a goal of 30 percent local hiring at this time, meaning that 30 percent of total construction work hours must be worked by San Francisco residents. For apprenticeships (entry-level jobs), this goal is increased to 50 percent. As of March 2017, SFPUC is achieving a 36 percent local hiring rate for San Francisco residents and 72 percent for San Francisco apprentices, exceeding the respective goals. This program has resulted in greater numbers of local hires within Bayview-Hunters Point compared to other neighborhoods, with 30 percent of the 231 San Francisco workers and 42 percent of the 58 San Francisco apprentices coming from District 10. Construction of the BDFP would comply with the local hiring policy, and several other SFPUC projects (e.g., the Headworks Facility Project) also are planned within Bayview-Hunters Point. The City also has a mandate for local community contractors to participate. Although the goals vary per contract, the SFPUC aims to maximize local participation on every project. As of March 2017, 196 contracts valued at $108 million have been awarded to SSIP LBE contractors. Of those contracts awarded to San Francisco businesses, 41 percent of those businesses are located in Bayview-Hunters Point (District 10).

- ***Youth Internships***. SFPUC supports the Mayor's Youth Jobs Plus Initiative as a part of an overall strategy to educate and prepare job seekers in local communities to be successful SFPUC applicants. More than 1500 youth and young adults annually benefit from internships through SFPUC and other partner agencies. While the youth served by SFPUC programs live all over the city, a large number come from the southeastern portion of the City. In 2016, the SFPUC sponsored paid internships for 188 youth and young adults from Bayview-Hunters Point. Since the program's inception in 2013, SFPUC has employed between 150 and 200 young people from Bayview-Hunters Point each summer, and SFPUC is committed to continuing this program, including in 2017.

- ***Baywork***. SFPUC is a signatory of Baywork, a consortium of water and wastewater agencies dedicated to workforce development. In 2016, Baywork secured funding to complete a regional labor market research initiative with JVS, a San Francisco-based non-profit career and skills development organization with over 40 years of experience in sector-based training and job search assistance in the Bay Area. The $150,000 grant is underway and will deliver a regional map of hiring needs and training opportunities and gaps within the region. This research will map the skills, training, and certification required for careers in the water/wastewater industry that are hard to fill, like electronic maintenance technicians, and will lay the foundation for new community college and training programs to fill these gaps.

The Environmental Justice report[8] (Section 6.4) also identified recommendations for the SFPUC Community Benefits Program.

---

[8] ESA, *Environmental Justice Analysis for Bayview-Hunters Point, Biosolids Digester Facilities Project and Community Benefits Program*, prepared for SFPUC, June 2017. Available online at www.sfwater.org/bdfp-ej-analysis.

Comment GC-4: Environmental Justice

This response addresses the following comments, which are quoted below:

O-Greenaction.2 O-Greenaction.11 I-Kelly.2 I-Kelly.5

"We are extremely concerned that this project involves a 20 percent expansion of waste processing and biosolids production. This expansion may exacerbate community health burdens which are unacceptable. We must continue to point out the inequity, and object to the fact, that the Southeast Plant in Bayview Hunters Point continues to process almost all of the City's sewage and sewage from other cities.

"As you are well aware, Bayview Hunters Point (BVHP) residents bear the disproportionate burden of industrial and military base pollution in San Francisco. As you are also aware, residents suffer high rates of illnesses likely related to the many mobile and stationary pollution sources in the neighborhood. The California Environmental Protection Agency's CalEnviroScreen 3.0 has confirmed that BVHP residents are highly vulnerable to pollution due to environmental, health and socio-economic indicators - and in fact CalEnviroScreen ranks BVHP as one of the most at risk communities in the state to pollution." (Bradley Angel, Greenaction for Health and Environmental Justice, Letter, June 26, 2017)

"All decisions made by the City regarding this project must be consistent with environmental justice, be health protective, and reduce - not add - to the environmental burden in the community." (Bradley Angel, Greenaction for Health and Environmental Justice, Letter, June 26, 2017)

"I believe you will soon see a number of neighborhood groups throughout Bayview and the City come together in an official alliance for environmental justice in Southeast San Francisco; to that end, I am cc-ing these comments to some Bayview neighbors, members of the SFPUC CAC, and to Yolanda Manzone of the PUC, who is presenting a draft Environmental Justice Analysis of the project to neighborhood groups in the coming months." (Tony Kelly, Letter, June 26, 2017)

"I worked on the successful campaign for Proposition I in 2004, forcing Muni to replace their old diesel buses and improve their air quality standards. **All City agencies should take great care to minimize and mitigate their environmental impacts in this heavily-burdened neighborhood.** I look forward to the PUC acting responsibly in their construction and operation of the new Biosolids Digesters." (Tony Kelly, Letter, June 26, 2017)

Response GC-4

The comments above express concern about projected increases in the quantities of wastewater and biosolids at the Southeast Plant, the effects of the BDFP on the health of Bayview community members given existing environmental conditions, and environmental justice issues generally. The U.S. Environmental Protection Agency defines environmental justice as follows:[9]

> "The fair treatment and meaningful involvement of all people regardless of race, color, national origin, or income with respect to the development, implementation, and enforcement of environmental laws, regulations, and policies. Fair treatment means that no group of people, including racial, ethnic, or socioeconomic group should bear a disproportionate share of the negative environmental consequences resulting from industrial, municipal, and commercial operations or the execution of federal, state, local, and tribal programs and policies."

Wastewater Treatment and Biosolids Production

Regarding wastewater quantities, average dry weather wastewater flows to the Southeast Plant between 2010 and 2045 are projected to increase from 60.6 to 69.4 million gallons per day (Draft EIR Appendix HYD, page HYD-16), while biosolids production with implementation of the BDFP is projected to increase from 13,000 dry tons (2015) to 24,000 dry tons (2045; Draft EIR page 2-7). Note that wastewater influent and biosolids production are projected to increase at the treatment plant with or without implementation of the BDFP. In 2045 *without implementation of the BDFP*, the amount of biosolids generated and the number of haul trips would be greater (27,700 dry tons and 14 to 18 trips per day, respectively) because the proposed BDFP solids treatment processes would reduce the quantity of biosolids generated (and associated truck trips required for off-hauling) compared to existing solids treatment processes (see note g on Draft EIR Table 2-1, page 2-7). As discussed in Draft EIR Section 4.4, *Population and Housing*, the BDFP would not increase the plant's existing overall wastewater treatment capacity (Draft EIR page 4.4-7) and the solids treatment capacity that would be provided by the BDFP is based on current growth projections through 2040 prepared by the Association of Bay Area Governments, and extrapolated through 2045.

The water pollution control plant treats flows from a limited area of Daly City and Brisbane, representing about 2.5 percent of the total flow currently treated at the plant (refer to Draft EIR Section 2.2.2.2).

Health Impacts

The requirements of CEQA and Chapter 31 of the San Francisco Administrative Code guided preparation of the BDFP Draft EIR. In accordance with these requirements, the Draft EIR evaluates numerous effects on aspects of human health, including Air Quality (Section 4.8), Noise and Vibration (Section 4.7), and Hazards and Hazardous Materials (Section 4.17). Draft EIR Section S.5 (page S-11) summarizes all impacts identified for the project, the significance determination for each impact, and measures identified to avoid, reduce, or otherwise lessen significant impacts.

[9] United States Environmental Protection Agency (USEPA), *Final Guidance for Incorporating Environmental Justice Concerns in EPA's NEPA Compliance Analyses,* April 1998. Available online at https://www.epa.gov/sites/production/files/2015-04/documents/ej-guidance-nepa-compliance-analyses.pdf.

The Draft EIR's discussion of local health risks and hazards from airborne pollution is presented in the following sections:

- ***Section 4.8.1.4*** (Draft EIR pages 4.8-9 – 4.8-13)**.** This section describes toxic air contaminants (TACs) and other pollutants of concern and how health risk assessments are used; modeling conducted by the City and the Bay Area Air Quality Management District (BAAQMD) to identify areas of poor air quality (termed the Air Pollutant Exposure Zone [APEZ]) and Health Vulnerable locations); and the City's *Community Risk Reduction Plan.* As shown in Figure 4.8-2 (Draft EIR page 4.8-13), the BDFP site and portions of the surrounding area are within the APEZ and Health Vulnerability zip codes.

- ***Section 4.8.3.2*** (under Local Health Risks and Hazards, Draft EIR pages 4.8-38 – 4.8-40) describes the thresholds of significance and approach to evaluating health risk from air pollutants. As discussed therein, a health risk assessment was prepared for the BDFP to provide quantitative estimates of health risks (in terms of increased excess lifetime cancer and non-cancer risks as well as localized $PM_{2.5}$ concentrations) from exposures to TACs and other pollutants of concern. The analysis accounted for background (existing) concentrations and risk levels, as estimated in the San Francisco Community Risk Reduction Plan Health Risk Assessment.

- ***Impact AQ-3*** (Draft EIR pages 4.8-55 – 4.8-62) presents the results of the analysis. The Draft EIR analysis determined that project-related construction and operational emissions increases would not expand the existing APEZ, and would not exceed significance thresholds for cancer risk and $PM_{2.5}$ concentrations at sensitive receptors within 1 kilometer of the project site. In summary, the impact was found to be less than significant.

Environmental Justice

The remaining comments in this topic, which encourage the City to make decisions consistent with environmental justice principles, do not address the adequacy or accuracy of the EIR. The comments will be transmitted to City decision-makers for consideration in their deliberations on whether to approve the proposed BDFP.

Consistent with the U.S. Environmental Protection Agency's definition referenced above, the SFPUC's Environmental Justice Policy (2009)[10] defines environmental justice as the fair treatment of people of all races, cultures, and incomes and believes that no group of people should bear a disproportionate share of negative environmental consequences resulting from the operations, programs, and/or policies of the SFPUC. The policy commits the SFPUC to the goals of environmental justice to prevent, mitigate, and lessen disproportionate environmental impacts of its activities on communities in all SFPUC service areas and to insure that public benefits are shared across all communities.

As discussed in the preceding response (and identified on Draft EIR pages S-18, 1-4, and 1-5), the SFPUC has prepared an environmental justice analysis of the BDFP as a separate, yet complimentary, analysis from what is required under CEQA. The environmental justice indicators examined in the analysis were selected based upon direct input from the local community. The

[10] SFPUC, Environmental Justice Policy, SFPUC Commission Resolution No.09-0170, October 13, 2009. Available online at http://sfwater.org/modules/showdocument.aspx?documentid=3686.

results of this evaluation and analysis are contained in the *Environmental Justice Analysis for Bayview-Hunters Point, Biosolids Digester Facilities Project and Community Benefits Program* (Environmental Justice report).[11] The Environmental Justice report documents the analysis of potential environmental justice effects of the BDFP, both in terms of its potential to exacerbate or to improve upon the selected environmental justice indicators and in terms of whether it would result in new disproportionately high and adverse effects on minority and low-income communities. As discussed in the preceding response, the report also contains a discussion of ongoing and proposed Community Benefits Program activities. The report (Section 5.4) also includes recommendations to improve outcomes of BDFP implementation and outreach related to environmental justice. The SFPUC will consider the Environmental Justice Report separate from the CEQA process. For more information on the Environmental Justice report, please see the SFPUC's Land Use and Environmental Justice web page: http://sfwater.org/index.aspx?page=654.

The SFPUC has incorporated commitments to environmental improvement into the design of the BDFP. As described in Section 5.3.1 of the Environmental Justice report, the project has been designed to be as far from residential receptors as feasible within the available site at the Southeast Plant and to incorporate turbine design features that decrease emissions of air contaminants compared to the existing internal combustion engines (by selecting low-emission turbines for the project) and that enhance the dispersal of emissions (by electing to build a taller turbine exhaust stack). One of the BDFP project objectives is to limit noticeable odors from BDFP facilities to the water pollution control plant property boundary, which would improve odor conditions outside the plant compared to existing conditions (Draft EIR page 2-19). See EIR Impact AQ-5 in Section 4.8, Air Quality (Draft EIR pages 4.8-66 to 4.8-70) for additional discussion of the project's odor-related impact.

While not part of project design, EIR Mitigation Measure M-AQ-1a (Construction Emissions Minimization, Draft EIR pages 4.8-49 to 4.8-50) requires cleaner construction equipment fuel and more stringent engine efficiencies than are required by the Clean Construction Ordinance, which would reduce emissions during project construction. Also refer to EIR Impacts AQ-1, AQ-2, and AQ-3 in Section 4.8, Air Quality (Draft EIR pages 4.8-43 to 4.8-62) for discussion of dust and criteria pollutant emissions during construction; criteria pollutant emissions during project operations; and toxic air contaminant emissions during project construction and operations, respectively.

CHAPTER 11
Draft EIR Revisions

11.1 Introduction

This chapter presents revisions to the Biosolids Digester Facilities Project (BDFP or project) Draft Environmental Impact Report (EIR) that was published on May 3, 2017. These revisions include both (1) changes made to text, tables, or figures in response to comments on the Draft EIR as discussed and presented in Chapter 10, as well as (2) staff-initiated text changes to correct minor inconsistencies, to add minor information or clarification related to the project, and to provide updated information where applicable. None of the revisions or corrections in this chapter substantially change the analysis and conclusions presented in the Draft EIR.

The chapter includes all revisions by reproducing the relevant excerpt of the Draft EIR in the sequential order by the chapter, section, and page that it appears in the document. Preceding each revision is a brief explanation for the text change, either identifying the corresponding response codes, such as Response AQ-4, where the issue is discussed in Chapter 10 or indicating the reason for a staff-initiated change. Deletions in text and tables are shown in strikethrough (~~strikethrough~~) and new text is shown in underline (<u>double-underline</u>).

11.2 Changes to the Draft EIR

11.2.1 Cover, Table of Contents, Acronyms, Abbreviations, Glossary, and Summary

To maximize use of 2010 or newer engines in all haul trucks as discussed in Response AQ-4, the following text in Mitigation Measure M-AQ-1a(A)(2) in Table S-2 of the Draft EIR (page S-30) has been revised:

> ***"Engine Requirements.***
>
> 2. At least 80 percent of haul trucks (i.e., trucks used to remove or deliver backfill soil, excavated soil, and demolition debris) used must have 2010 or newer engines. <u>The SFPUC should strive to exceed this requirement when possible; if trucks with 2010 or newer engines are available in the Contractor's, or subcontractor's fleet, then those should be used for the project.</u>
>
>   <u>The SFPUC, through its Contractors Assistance Center, will work with the BAAQMD's Strategic Incentives Division and interested, eligible truckers to pursue funding to replace vehicles or retrofit engines to comply with the lower</u>

emissions requirement, including but not limited to conducting informational presentations at the Contractors Assistance Center to notify truckers about the grants and incentives and assisting with the completion of applications to the grant programs."

In response to comments, the following text in Mitigation Measure M-AQ-1b(2) in Table S-2 of the Draft EIR (page S-31) has been revised to reflect the updated funding equation:

"2. Pay a mitigation offset fee to the Bay Area Air Quality Management District's (BAAQMD) Bay Area Clean Air Foundation (Foundation) in an amount to be determined at the time of the impact. The mitigation offset fee will be no less than ~~$18,030~~$30,000 per weighted ton of ozone precursors per year requiring emissions offsets plus an administrative fee of no less than 5 percent, to fund one or more emissions reduction projects within the SFBAAB. The $30,000 will be adjusted to reflect annual California Consumer Price Index adjustments between 2017 and the estimated first year of exceedance. This fee will be determined by the Planning Department in consultation with the SFPUC and BAAQMD and based on the type of projects available at the time of impact. This fee is intended to fund emissions reduction projects to achieve reductions of 2.3 tons per year of ozone precursors."

11.2.2 Chapter 1: Introduction

No revisions were made to this chapter.

11.2.3 Chapter 2: Project Description

To reflect the SFPUC's pursuit of financing from the U.S. Environmental Protection Agency under the Water Infrastructure Finance and Innovation Act, Section 2.7.1 Federal Action and Approvals (Draft EIR page 2-70) is revised as follows as a staff-initiated change:

2.7.1 Federal Actions and Approvals

~~The project is not expected to require any federal permits or approvals.~~

- United States Environmental Protection Agency:
  - Consideration for Water Infrastructure Finance and Innovation Act loan and review of environmental review requirements that must be completed to apply for a loan

2.7.2 State Actions and Approvals

- State Historic Preservation Officer:
  - Review under Section 106 of the National Historic Preservation Act (as part of the Water Infrastructure Finance and Innovation Act and State Revolving Fund loan application process)

11.2.4 Chapter 3: Plans and Policies

No revisions were made to this chapter.

11.2.5 Chapter 4: Environmental Setting and Impacts

No revisions were made to this chapter, except for those in the following sections:

Section 4.1: Overview

As discussed in Response OC-2, the first paragraph on Draft EIR page 4.1-4 is revised as follows:

> As permitted in CEQA Guidelines Section 15130(b)(1), the analyses ~~analysis~~ in this EIR employ~~s~~ the list-based approach, a projections approach, or a hybrid of the two as appropriate~~, for defining projects to be considered in the cumulative impact analysis~~. In the list-based approach~~, — that is,~~ the analysis is based on a list of past, present, and probable future projects that could result in related or cumulative impacts. A probable future project is defined as one that is "reasonably foreseeable," which is generally a project for which an application has been filed with the approving agency or that has approved funding. In the projections approach, projections contained in an adopted local, regional, or statewide plan, or related planning document, are summarized to describe or evaluate conditions contributing to the cumulative effect.

The second paragraph on Draft EIR page 4.1-4 is also revised to read:

> The following factors were used to determine an appropriate list of relevant projects to be considered in the list-based cumulative analyses:

The second paragraph on Draft EIR page 4.1-5 is revised to read:

> **Table 4.1-1** describes the past, present, and probable future projects that are considered in the list-based cumulative analyses (based on the factors described above), and their locations are shown on **Figure 4.1-1**.

Section 4.5: Cultural Resources

To properly reflect the title of the subject report, footnotes number 8 (page 4.5-6), 49 (page 4.5-22), 70 (page 4.5-46), and 71 (page 4.5-46) in the Draft EIR are revised as follows as a staff initiated change:

> Kaijankoski, Philip, Brian F. Byrd, and Jack Meyer, ~~*DRAFT Preliminary Prehistoric Archaeological Testing Report for*~~ *FINAL A Geoarchaeological Study of the Islais Creek Estuary: A Framework for Future Project-Specific Archaeological Investigations at the Southeast Water Pollution Control Plant, San Francisco, California*. Far Western Anthropological Research Group, Inc., Davis, California. Prepared for the San Francisco Public Utilities Commission, September 2016.

Section 4.8: Air Quality

As discussed in Response AQ-6, the following text on Draft EIR page 4.8-29 has been revised:

> "The BAAQMD is also the agency responsible for investigating and controlling odor complaints in the area. The BAAQMD enforces odor control by helping the public document a public nuisance. Upon receipt of a complaint, the BAAQMD sends an investigator to interview the complainant and to locate the odor source if possible. The BAAQMD typically brings a public nuisance court action when there are a substantial number of confirmed odor events within a 24-hour period. An odor source with five or more confirmed complaints per year averaged over three years is considered to have a substantial effect on receptors. As indicated above (under *Odor Incidents*), the BAAQMD has received two confirmed odor complaints regarding odor at the SEP over the six-year period from January 1, 2009 through October 22, 2015. Thus, ~~based on~~ the odor complaint history at the Southeast Water Pollution Control Plant has not resulted in its designation by the BAAQMD ~~does not consider the SEP to be~~ as a significant source of odors in the area. Nonetheless, the BAAQMD still considers the entirety of the treatment works at the water pollution control plant to be a potentially significant odor source.[52a, 52b]
>
> [52a] Roggenkamp, Jean, Bay Area Air Quality Management District. Letter to Tim Johnson, July 28, 2017.
>
> [52b] The term "significant" in this paragraph refers to BAAQMD's assessment of the odor source, and is not the same as impact significance as defined under CEQA.

To maximize use of 2010 or newer engines in all haul trucks as discussed in Response AQ-4, the following text in Mitigation Measure M-AQ-1a(A)(2) of Draft EIR (page 4.8-49) has been revised:

> ***"Engine Requirements.***
>
> 2. At least 80 percent of haul trucks (i.e., trucks used to remove or deliver backfill soil, excavated soil, and demolition debris) used must have 2010 or newer engines. The SFPUC should strive to exceed this requirement when possible; if trucks with 2010 or newer engines are available in the Contractor's, or subcontractor's fleet, then those should be used for the project.
>
> The SFPUC, through its Contractors Assistance Center, will work with the BAAQMD's Strategic Incentives Division and interested, eligible truckers to pursue funding to replace vehicles or retrofit engines to comply with the lower emissions requirement, including but not limited to conducting informational presentations at the Contractors Assistance Center to notify truckers about the grants and incentives and assisting with the completion of applications to the grant programs."

Also in response to comments, the following text in Mitigation Measure M-AQ-1b(2) of Draft EIR (page 4.8-51) has been revised to reflect the updated funding equation:

> "2. Pay a mitigation offset fee to the Bay Area Air Quality Management District's (BAAQMD) Bay Area Clean Air Foundation (Foundation) in an amount to be determined at the time of the impact. The mitigation offset fee will be no less than

~~$18,030~~ $30,000 per weighted ton of ozone precursors per year requiring emissions offsets plus an administrative fee of no less than 5 percent, to fund one or more emissions reduction projects within the SFBAAB. The $30,000 will be adjusted to reflect annual California Consumer Price Index adjustments between 2017 and the estimated first year of exceedance. This fee will be determined by the Planning Department in consultation with the SFPUC and BAAQMD and based on the type of projects available at the time of impact. This fee is intended to fund emissions reduction projects to achieve reductions of 2.3 tons per year of ozone precursors."

Section 4.16: Hydrology and Water Quality

As discussed in Response HY-1, the first sentence on Draft EIR page 4.16-8 is revised as follows:

"…risen approximately 0.08 inch per year since 1897, resulting in about 0.~~6~~8 foot of sea level rise between that time and 2015."

11.2.6 Chapter 5: Other CEQA Issues

No revisions were made to this chapter.

11.2.7 Chapter 6: Alternatives

No revisions were made to this chapter.

11.2.8 Chapter 7: Report Preparers

No revisions were made to this chapter.

1650 Mission Street, Suite 400
San Francisco, CA 94103

RE: EIR for the Biosolids Digester Facilities Project

Dear Mr. Johnston,

Bay Area Air Quality Management District (Air District) staff have reviewed the Draft Environmental Impact Report (DEIR) for the Biosolids Digester Facilities Project. This project demolishes buildings and reorganizes a portion of San Francisco's Southeast Water Pollution Control Plant (SEP) to add new solids treatment, odor control, energy recovery, and associated facilities to its wastewater treatment capabilities. The project imagines a construction period between 2018-2023, assumes full operation of the redesigned plant by 2025, and expects its highest operating level by 2045 after a 20 percent growth in population and associated wastewater processing needed. The combination of this increase in flows and more effective biosolids digester equipment is anticipated to increase biogas production by roughly 50 percent. The project plans to burn all of this biogas in a new cogeneration facility and to use all of the generated electricity and steam on site.

Air District staff submitted comments on this DEIR on June 26, 2017. This letter clarifies comments about asbestos management and supersedes our previous letter.

Air District staff want to compliment the City for producing a high-quality report that thoughtfully and meticulously explores air quality concerns. We find the separate air quality technical report (AQTR) quite helpful in understanding assumptions about impacts and recommend including it or key portions of it as an appendix in the final environmental impact report (FEIR). We commend the project on the greater recovery efficiency of biosolids digestion, the planned odor control improvements, and the reduction in emissions of volatile organic compounds and associated nuisance odors in the adjacent neighborhood. We further commend this project for its planned inclusion of renewable diesel fuel to reduce diesel emissions from the project.

1 **AQ-8**

2 **GC-1**

We also have identified project aspects that warrant additional review and/or clarification in the FEIR. The first of these aspects is the project's location. Two noteworthy programs have classified the location as a disadvantaged and vulnerable community that warrants heightened protection from air quality-related health risk. In San Francisco's Community Risk Reduction Plan (CRRP), this area has been designated an Air Pollution Exposure Zone (APEZ) and a Health Vulnerability zip code. At the Air District this area has been identified as an area with disproportionate air quality burden by our Community Air Risk Evaluation (CARE) program. The Air District's 2017 Clean Air Plan strives to eliminate the disparity in air quality between the eight CARE communities and the rest of the region by stabilizing and decreasing emissions around and in them. For this reason, we suggest that this project strive for "no net increase" in criteria air pollutant and toxic air contaminant emissions over existing conditions. We recommend this standard across construction and operation

3 **AQ-1**

phases of the project. We strongly recommend that NOx and PM2.5 emission increases associated with this project (i.e., those listed in Tables 4 and 14 of the AQTR) be reduced or offset by lower-emission equipment choices in this project, by revised operating plans or other equipment upgrades within the SEP, and/or by off-site initiatives. We recommend that any off-site mitigation occur in or immediately upwind of the communities affected by this project to assure consistency with SFPUC's environmental justice policy, the environmental justice report written for this project, and the community vulnerability concerns discussed above. We encourage more detailed equipment choices prior to finalization of the EIR to strive for no net increases in emissions and to assure consistency between the FEIR and the application for a Permit to Operate from the Air District.

3 **AQ-1** cont.

To mitigate its NOx emissions during construction, the project proposes Mitigation Measure M-AQ-1a, which will require that "equipment with engines greater than or equal to 140 horsepower must meet Tier 4 final standards; [and] equipment with engines less than 140 horsepower must meet Tier 2 standards and be equipped with diesel particulate filters (DPFs)" (p. 4.8-46). We recommend or affirm the use of this mitigation approach for both municipally-owned and contractor-owned equipment in this project. We also see in the same section that "at least 80 percent of haul trucks (i.e., trucks used to remove or deliver backfill soil, excavated soil, and demolition debris) used must have 2010 or newer engines." Unless or until there is a conflicting local business enterprise requirement, we encourage the project to strive for 100 percent of all haul trucks to be 2010 engines or newer.

4 **AQ-4**

To mitigate its greenhouse gas emissions, the project states that "all diesel haul trucks and off-road equipment must use renewable diesel" (p. 4.8-46) as part of Mitigation Measure M-AQ-1a. We recommend or affirm the use of this mitigation approach for both municipally-owned and contractor-owned equipment in this project. Further, we recommend that this standard be extended to any portable diesel engines used in this project and to the backup generator installed in this project.

5 **AQ-7**

To mitigate NOx emissions during the five years anticipated for construction, the project proposes funding off-site efforts that reduce emissions. The DEIR anticipates an offset price of $18,030 per weighted ton. Our expectation is that the price of offsets for NOx emissions alone is around $35,000 per weighted ton and is likely to rise during the course of the project. We strongly recommend revision of this cost estimate, while also noting that this pricing correction was raised by the Air District in a comment letter on the Seawall Project (dated June 7, 2017) and the Event Center & Mixed use Development at Mission Bay (dated July 20, 2015).

6 **AQ-4**

We also recommend that this project consider how it might be designed to allow for addition of additional anaerobic digestion infrastructure at the SEP, given that the California Air Resources Board is looking toward publicly owned treatment works as co-location opportunities for food waste management as part of its "Short-lived Climate Pollutant Reduction Strategy" (March 2017). Further, to meet the requirements of SB 1383 (Lara, 2016), the City and County of San Francisco, as well as all other local jurisdictions around the State, will need to divert 50 percent of organic wastes from landfill in 2020 and 75 percent in 2025. Given the requirements of SB 32 (Pavley, 2016) to reduce greenhouse gas emissions by forty percent below 1990 levels by 2030, there is further need to assure that long-haul trucking is not required to satisfy the intention of SB 1383. As such, there is growing need to identify opportunities close to or within San Francisco and the Bay Area to compost and/or digest organic materials. Given that this facility has been permitted for biodigestion, we encourage this project to consider potential co-location during its design and buildout. Such consideration may mean designing a project that is conducive to any or all of the following: (i) the addition of more biodigester vessels at this site, (ii) the upsizing or addition of biogas storage facilities at this site, (iii) the addition of infrastructure that will enable upgrading of biogas to renewable natural gas, and (iv) the capacity to install piping that enables produced biogas to be transported via rail tanker or pipeline.

7 **PD-2**

At the time of the review of this DEIR, the Air District has not yet received a permit application for an Authority to Construct for this project because the SFPUC is still designing this facility. In light of your

8 **AQ-5**

pending equipment choices and their impacts on your emissions estimates, we recommend that SFPUC seek quotes for a selective catalytic reduction system and/or low-NOx burners to determine whether a lower NOx limit is technologically feasible and cost-effective, particularly given that the proposed NOx limit for the turbine/duct burner (i.e., 25ppm @ 15% oxygen) is based on a BACT determination from 1999. We recommend that the facility request emission factors and guarantees from the manufacturer for each planned piece of combustion equipment as an alternative to using the emission factor of 3.2E-3 kg methane/MMBtu from Table C-2 of 40 CFR 98. We recommend that the facility determine whether the new thermal hydrolysis process will increase precursor organic compounds in the biogas.

8
AQ-5
cont.

To assure that demolition associated with this project complies with Air District Regulation 11, Rule 2, this project may need to take multiple actions, which include but are not necessarily limited to a thorough asbestos survey by a certified asbestos consultant, removal of all regulated asbestos present, and a renovation and/or demolition notification. We also observe that the SEP is within one quarter mile of the geologic ultramafic unit (JSP) on the Naturally Occurring Asbestos (NOA) geologic map of the area. Accordingly, we recommend that soil analysis be conducted to determine whether NOA is present where soil surfaces would be disturbed. Presence of NOA may trigger applicability of the Asbestos Airborne Toxic Control Measure (ATCM) for Construction, Grading, Quarrying and Surface Mining Operations (CCR Title 17 Section 93105) and require dust mitigation measures, reporting, and submission of an Asbestos Dust Mitigation Plan. Should no NOA be found, the Air District recommends that construction dust best management practices (BMP) be implemented to control any fugitive dust during the construction phases.

9
HZ-1

The Air District also wants to assure that diesel equipment used in this project complies with applicable registration requirements. Off-road diesel-powered equipment greater than 25 horsepower must be registered in the Diesel Off-Road On-line Registration System (DOORs) Database and display an Equipment Identification Number (EIN). Portable diesel-powered equipment must be permitted by the Air District as part of the Portable Equipment Registration Program (PERP), and we encourage SFPUC to pick the lowest emission equipment available for this project.

10
AQ-8

As a final note, we noticed a statement on p. 4.8-29 of the DEIR that "...based on the odor complaint history, the [Air District] does not consider the SEP to be a significant source of odors in the area." While the number of odor complaints has not resulted in designation of the SEP as a significant source of odors and although the project will improve odor control for biosolids digestion, the entirety of the treatment works is still considered a potentially significant odor source by the Air District.

11
AQ-6

Air District staff is available to assist the City in addressing these comments. For more information, or if you have any questions, please contact Chad White, Senior Planner, at (415) 749-8619 or via email at cwhite@baaqmd.gov.

Sincerely,

Jean Roggenkamp

CALIFORNIA
Water Boards

EDMUND G. BROWN JR.
GOVERNOR

MATTHEW RODRIGUEZ
SECRETARY FOR
ENVIRONMENTAL PROTECTION

State Water Resources Control Board

JUN 16 2017

Timothy P. Johnson
MP, Environmental Planner
RE: Biosolids Digester Facilities Project
San Francisco Planning Department
1650 Mission Street, Suite 400
San Francisco, CA 94103

Dear Mr. Johnson:

ENVIRONMENTAL IMPACT REPORT (EIR) FOR SAN FRANCISCO PLANNING DEPARTMENT (DEPARTMENT); BIOLSOLIDS DIGESTER FACILITIES PROJECT (PROJECT); SAN FRANCISCO COUNTY; STATE CLEARINGHOUSE NO. 2015062073

We understand that the Department is pursuing Clean Water State Revolving Fund (CWSRF) financing for this Project. As a funding agency and a state agency with jurisdiction by law to preserve, enhance, and restore the quality of California's water resources, the State Water Resources Control Board (State Water Board) is providing the following information on the EIR to be prepared for the Project.

The State Water Board, Division of Financial Assistance, is responsible for administering the CWSRF Program. The primary purpose for the CWSRF Program is to implement the Clean Water Act and various state laws by providing financial assistance for wastewater treatment facilities necessary to prevent water pollution, recycle water, correct nonpoint source and storm drainage pollution problems, provide for estuary enhancement, and thereby protect and promote health, safety and welfare of the inhabitants of the state. The CWSRF Program provides low-interest funding equal to one-half of the most recent State General Obligation Bond Rates with a 30-year term. Applications are accepted and processed continuously. Please refer to the State Water Board's CWSRF website at: www.waterboards.ca.gov/water_issues/programs/grants_loans/srf/index.shtml.

The CWSRF Program is partially funded by the United States Environmental Protection Agency and requires additional "CEQA-Plus" environmental documentation and review. Three enclosures are included that further explain the CWSRF Program environmental review process and the additional federal requirements. For the complete environmental application package please visit: http://www.waterboards.ca.gov/water_issues/programs/grants_loans/srf/srf_forms.shtml. The State Water Board is required to consult directly with agencies responsible for implementing federal environmental laws and regulations. Any environmental issues raised by federal agencies or their representatives will need to be resolved prior to the State Water Board approval of a CWSRF financing commitment for the proposed Project. For further information on the CWSRF Program, please contact Mr. Ahmad Kashkoli, at (916) 341-5855.

1
OC-4

It is important to note that prior to a CWSRF financing commitment, projects are subject to provisions of the Federal Endangered Species Act (ESA), and must obtain Section 7 clearance from the United States Department of the Interior, Fish and Wildlife Service (USFWS), and/or the United States Department of Commerce National Oceanic and Atmospheric Administration, National Marine Fisheries Service (NMFS) for any potential effects to special-status species.

Please be advised that the State Water Board will consult with the USFWS, and/or the NMFS regarding all federal special-status species that the Project has the potential to impact if the Project is to be financed by the CWSRF Program. The Department will need to identify whether the Project will involve any direct effects from construction activities, or indirect effects such as growth inducement, that may affect federally listed threatened, endangered, or candidate species that are known, or have a potential to occur in the Project site, in the surrounding areas, or in the service area, and to identify applicable conservation measures to reduce such effects.

In addition, CWSRF projects must comply with federal laws pertaining to cultural resources, specifically Section 106 of the National Historic Preservation Act (Section 106 http://www.achp.gov/regs-rev04.pdf). The State Water Board has responsibility for ensuring compliance with Section 106, and must consult directly with the California State Historic Preservation Officer (SHPO). SHPO consultation is initiated when sufficient information is provided by the CWSRF applicant. If the Department decides to pursue CWSRF financing, please retain a consultant that meets the Secretary of the Interior's Professional Qualifications Standards (http://www.nps.gov/history/local-law/arch_stnds_9.htm) to prepare a Section 106 compliance report.

Note that the Department will need to identify the Area of Potential Effects (APE), including construction and staging areas, and the depth of any excavation. The APE is three-dimensional and includes all areas that may be affected by the Project. The APE includes the surface area and extends below ground to the depth of any Project excavations. The records search request should extend to a ½-mile beyond project APE. The appropriate area varies for different projects but should be drawn large enough to provide information on what types of sites may exist in the vicinity.

In addition, the Department will need to comply with Assembly Bill No. 52, (AB-52 Native Americans: California Environmental Quality Act) which requires a lead agency to begin consultation with a California Native American tribe that is traditionally and culturally affiliated with the geographic area of the proposed project (https://leginfo.legislature.ca.gov/faces/billNavClient.xhtml?bill_id=201320140AB52).

Other federal environmental requirements pertinent to the Project under the CWSRF Program include the following (for a complete list of all federal requirements please visit: http://www.waterboards.ca.gov/water_issues/programs/grants_loans/srf/docs/forms/application_environmental_package.pdf):

A. An alternative analysis discussing environmental impacts of the project in either the CEQA document (Negative Declaration, Mitigated Negative Declaration or Environmental Impact Report) or in a separate report.

B. A public hearing or meeting for adoption/certification of all projects except for those with little or no environmental impacts.

C. Compliance with the Federal Clean Air Act: (a) Provide air quality studies that may have been done for the Project; and (b) if the Project is in a nonattainment area or attainment area subject to a maintenance plan; (i) provide a summary of the estimated emissions (in tons per year) that are expected from both the construction and operation of the Project for each federal criteria pollutant in a nonattainment or maintenance area, and indicate if the nonattainment designation is moderate, serious, or severe (if applicable); (ii) if emissions are above the federal *de minimis* levels, but the Project is sized to meet only the needs of current population projections that are

used in the approved State Implementation Plan for air quality, quantitatively indicate how the proposed capacity increase was calculated using population projections.

D. Compliance with the Coastal Zone Management Act: Identify whether the Project is within a coastal zone and the status of any coordination with the California Coastal Commission.

E. Protection of Wetlands: Identify any portion of the proposed Project area that should be evaluated for wetlands or United States waters delineation by the United States Army Corps of Engineers (USACE), or requires a permit from the USACE, and identify the status of coordination with the USACE.

F. Compliance with the Farmland Protection Policy Act: Identify whether the Project will result in the conversion of farmland. State the status of farmland (Prime, Unique, or Local and Statewide Importance) in the Project area and determine if this area is under a Williamson Act Contract.

G. Compliance with the Migratory Bird Treaty Act: List any birds protected under this act that may be impacted by the Project and identify conservation measures to minimize impacts.

H. Compliance with the Flood Plain Management Act: Identify whether or not the Project is in a Flood Management Zone and include a copy of the Federal Emergency Management Agency flood zone maps for the area.

I. Compliance with the Wild and Scenic Rivers Act: Identify whether or not any Wild and Scenic Rivers would be potentially impacted by the Project and include conservation measures to minimize such impacts.

Following are specific comments on the City's draft EIR:

1. In section 4.16.1.5 regarding Sea Level Rise, on page 4.16-8, it states, "The sea level at the San Francisco tidal gauge has risen approximately 0.8 inches per year since 1897, resulting in about 0.6 foot of sea level rise between that time and 2015." Please clarify if this should be corrected to 0.08 (0.076) inches per year. 2 **HY-1**

2. We have noted the statement in the footnote on page 4.5-1, that provisions for Assembly Bill No. 52 Native Americans: California Environmental Quality Act only apply to projects that have a notice of preparation (NOP) filed on or after July 1, 2015, and that the NOP for the Project was released June 24, 2015. Therefore, the Project is not subject to separate tribal cultural resources analyses. 3 **CR-3**

Please provide us with the following documents applicable to the proposed Project following the Department's California Environmental Quality Act (CEQA) process: (1) one copy of the draft and final EIR, (2) the resolution adopting the EIR and making CEQA findings, (3) all comments received during the review period and the Department's response to those comments, (4) the adopted Mitigation Monitoring and Reporting Program (MMRP), and (5) the Notice of Determination filed with the San Francisco County Clerk and the Governor's Office of Planning and Research, State Clearinghouse. In addition, we would appreciate notices of any hearings or meetings held regarding environmental review of any projects to be funded by the State Water Board. 4 **OC-4**

Thank you for the opportunity to review the Department's draft EIR. If you have any questions or concerns, please feel free to contact me at (916) 341-5879, or by email at Susan.Stewart@waterboards.ca.gov, or contact Ahmad Kashkoli at (916) 341-5855, or by email at Ahmad.Kashkoli@waterboards.ca.gov.

Sincerely,

Susan Stewart

CLEAN WATER STATE REVOLVING FUND

California Environmental Quality Act Requirements

State Water Resources Control Board
Division of Financial Assistance

The State Water Resources Control Board (State Water Board), Division of Financial Assistance, administers the Clean Water State Revolving Fund (CWSRF) Program. The CWSRF Program is partially funded by grants from the United States Environmental Protection Agency. All applicants seeking CWSRF financing must comply with the California Environmental Quality Act (CEQA), and provide sufficient information so that the State Water Board can document compliance with federal environmental laws. The "Environmental Package" provides the forms and instructions needed to complete the environmental review requirements for CWSRF Program financing. It is available at:

http://www.waterboards.ca.gov/water_issues/programs/grants_loans/srf/srf_forms.shtml

LEAD AGENCY

The applicant is usually the "Lead Agency" and must prepare and circulate an environmental document before approving a project. Only a public agency, such as a local, regional or state government, may be the "Lead Agency" under CEQA. If a project will be completed by a non-governmental organization, "Lead Agency" responsibility goes to the first public agency providing discretionary approval for the project.

RESPONSIBLE AGENCY

The State Water Board is generally a "Responsible Agency" under CEQA. As a "Responsible Agency," the State Water Board must make findings based on information provided by the "Lead Agency" before financing a project.

ENVIRONMENTAL REVIEW

The State Water Board's environmental review of the project's compliance with both CEQA and federal cross-cutting regulations must be completed before a project can be financed by the CWSRF Program.

DOCUMENT REVIEW

Applicants are encouraged to consult with State Water Board staff early during preparation of CEQA document if considering CWSRF financing. Applicants shall also send their environmental documents to the State Water Board, Environmental Review Unit during the CEQA public review period. This way, any environmental concerns can be addressed early in the process.

REQUIRED DOCUMENTS

The Environmental Review Unit requires the documents listed below to make findings and complete its environmental review. Once the State Water Board receives all the required documents and makes its own findings, the environmental review for the project will be complete.

- ✓ Draft and Final Environmental Documents: Environmental Impact Report, Negative Declaration, and Mitigated Negative Declaration as appropriate to the project
- ✓ Resolution adopting/certifying the environmental document, making CEQA findings, and approving the project
- ✓ All comments received during the public review period and the "Lead Agency's" responses to those comments
- ✓ Adopted Mitigation Monitoring and Reporting Plan, if applicable
- ✓ Date-stamped copy of the Notice of Determination or Notice of Exemption filed with the County Clerk(s) and the Governor's Office of Planning and Research
- ✓ CWSRF Evaluation Form for Environmental Review and Federal Coordination with supporting documents

We've got the **green**...
to keep California's **water clean**.
CLEAN WATER STATE REVOLVING FUND

Contact Information: For more information related to the CWSRF Program environmental review process and requirements, please contact your State Water Board Project Manager or Mr. Ahmad Kashkoli at 916-341-5855 or Ahmad.Kashkoli@waterboards.ca.gov

REVISED: FEB. 2014

CLEAN WATER STATE REVOLVING FUND

Basic Criteria for Cultural Resources Report Preparation

State Water Resources Control Board
Division of Financial Assistance

For Section 106 Consultation with the State Historic Preservation Officer (SHPO) under the National Historic Preservation Act

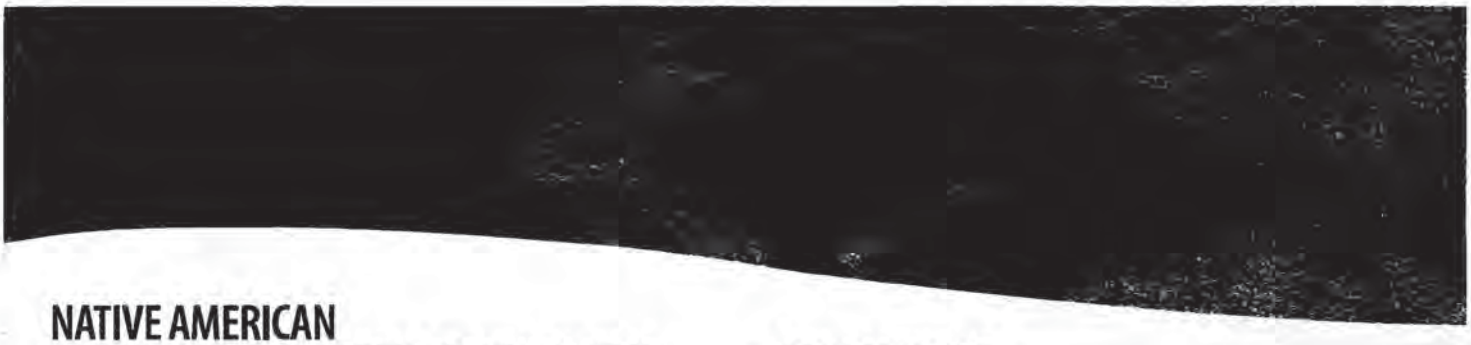
CULTURAL RESOURCES REPORT

The Cultural Resources Report must be prepared by a qualified researcher that meets the Secretary of the Interior's Professional Qualifications Standards. Please see the Professional Qualifications Standards at the following website at: ***http://www.cr.nps.gov/local-law/arch_stnds_9.htm***

The Cultural Resources Report should include one of the four "findings" listed in Section 106. These include:

"No historic properties affected"
(no properties are within the area of potential effect (APE; including below the ground).

"No effect to historic properties"
(properties may be near the APE, but the project will not have any adverse effects).



"No adverse effect to historic properties"
(the project may affect "historic properties", but the effects will not be adverse).

"Adverse effect to historic properties"
Note: Consultation with the SHPO will be required if a "no adverse effect to historic properties" or an "adverse effect to historic properties" determination is made, to develop and evaluate alternatives or modifications to the proposed project that could avoid, minimize or mitigate adverse effects on "historic properties."

RECORDS SEARCH

- A records search (less than one year old) extending to a half-mile beyond the project APE from a geographically appropriate Information Center is required. The records search should include maps that show all recorded sites and surveys in relation to the APE for the proposed project, and copies of the confidential site records included as an appendix to the Cultural Resources Report.
- The APE is three-dimensional (depth, length and width) and all areas (e.g., new construction, easements, staging areas, and access roads) directly affected by the proposed project.

NATIVE AMERICAN and INTERESTED PARTY CONSULTATION

- Native American and interested party consultation should be initiated at the planning phase of the proposed project to gather information to assist with the preparation of an adequate Cultural Resources Report.
- The Native American Heritage Commission (NAHC) must be contacted to obtain documentation of a search of the Sacred Lands Files for or near the project APE.
- All local Native American tribal organizations or individuals identified by the NAHC must be contacted by certified mail, and the letter should include a map and a description of the proposed project.
- Follow-up contact should be made by telephone and a phone log maintained to document the contacts and responses.
- Letters of inquiry seeking historical information on the project area and local vicinity should be sent to local historical societies, preservation organizations, or individual members of the public with a demonstrated interest in the proposed project.

Copies of all documents mentioned above (project description, map, phone log and letters sent to the NAHC and Native American tribal organizations or individuals and interested parties) must be included in the Cultural Resources Report.

Contact Information: For more information related to the CWSRF Program Cultural Resources and Requirments, please contact Mr. Ahmad Kashkoli at 916-341-5855 or Ahmad.Kashkoli@waterboards.ca.gov

PRECAUTIONS

A finding of ***"no known resources"*** without supporting evidence is unacceptable. The Cultural Resources Report must identify resources within the APE or demonstrate with sufficient evidence that none are present.

"The area is sensitive for buried archaeological resources," followed by a statement that ***"monitoring is recommended."*** Monitoring is not an acceptable option without good-faith effort to demonstrate that no known resource is present.

If ***"the area is already disturbed by previous construction"*** documentation is still required to demonstrate that the proposed project will not affect "historic properties." An existing road can be protecting a buried archaeological deposit or may itself be a "historic property." Additionally, previous construction may have impacted an archaeological site that has not been previously documented.

SHPO CONSULTATION LETTER

Submit a draft consultation letter prepared by the qualified researcher with the Cultural Resources Report to the State Water Resources Control Board. A draft consultation letter template is available for download on the State Water Board webpage at: ***http://www.waterboards.ca.gov/water_issues/programs/grants_loans/cwsrf_requirements.shtml***

REVISED JAN 2014

National Historic Preservation Act (NHPA)

Section 106 of the NHPA requires an analysis of the effects on "historic properties." The Section 106 process is designed to accommodate historic preservation concerns for federal actions with the potential to affect historic properties. Early consultation with appropriate government agencies, Indian tribes, and members of the public, will ensure that their views and concerns are addressed during the planning phase.

Historic properties (i.e., buildings, structures, objects, and archaeological sites 50 years or older) are properties that are included in the National Register of Historic Places or meet the criteria for the National Register.

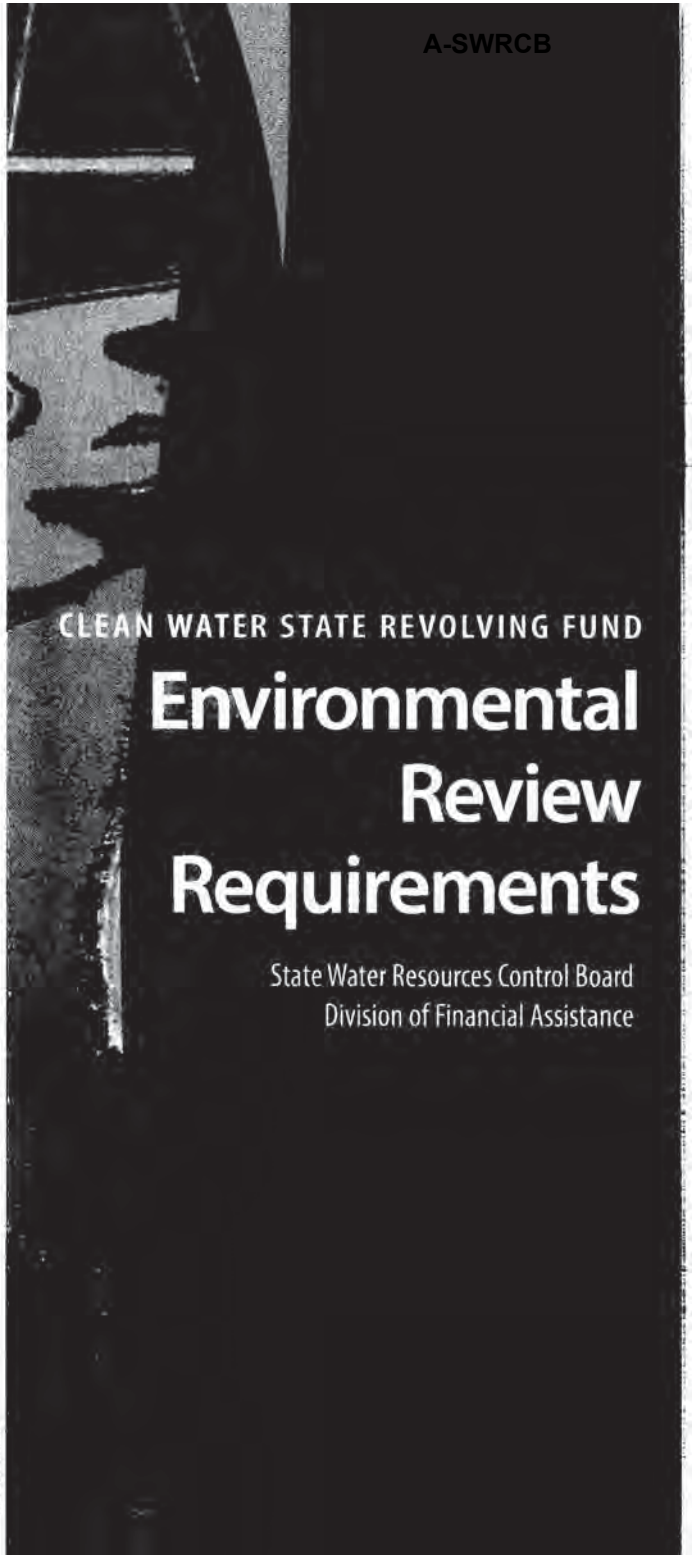
Required Documents:

✓A draft State Historic Preservation Officer consultation request letter; and

✓A cultural resources report on historic properties conducted according to the Secretary of the Interior's Standards, including:

- A clearly defined Area of Potential Effect (APE), specifying the length, width, and depth of excavation, with a map clearly illustrating the project APE;
- A records search, less than one year old, extending to a half-mile beyond the project APE;
- Written description of field methods;
- Identification and evaluation of historic properties within the project's APE; and
- Documentation of consultation with the Native American Heritage Commission and local Native American tribes.

ADDITIONAL INFORMATION



If your project has the potential to affect biological resources or historic properties, the consultation process can be lengthy. Please contact the State Water Board staff early in your planning process to discuss what additional information may be needed for your specific project.

Please contact your State Water Board Project Manager or Mr. Ahmad Kashkoli at (916) 341-5855 or *Ahmad.Kashkoli@waterboards.ca.gov* for more information related to the CWSRF Program environmental review process and requirements.

We've got the **green**...
to keep California's **water clean**.
CLEAN WATER STATE REVOLVING FUND

CALIFORNIA
Water Boards
STATE WATER RESOURCES CONTROL BOARD
REGIONAL WATER QUALITY CONTROL BOARDS

www.waterboards.ca.gov

A-SWRCB

CLEAN WATER STATE REVOLVING FUND

Environmental Review Requirements

State Water Resources Control Board
Division of Financial Assistance

REVISED FEB 2015

ENVIRONMENTAL REVIEW REQUIREMENTS

The Clean Water State Revolving Fund (CWSRF) Program is partially funded by the United States Environmental Protection Agency (EPA), and is subject to federal environmental regulations as well as the California Environmental Quality Act (CEQA). All applicants seeking CWSRF financing must comply with both CEQA and the federal cross-cutting regulations. The **"Environmental Package"** provides the forms and instructions needed to complete the environmental review requirements for CWSRF financing. The forms and instructions are available at: ***http://www.waterboards.ca.gov/water_issues/programs/grants_loans/srf/srf_forms.shtml.***

Lead Agency/Applicant

The applicant will generally act as the "Lead Agency" for environmental review. It will prepare, circulate, and consider the environmental documents prior to approving the project. It also provides the State Water Board with copies of the CEQA documents, and a completed **"Environmental Evaluation Form for Environmental Review and Federal Coordination"** ***(http://www.waterboards.ca.gov/water_issues/programs/grants_loans/srf/docs/forms/application_environmental_package.pdf)*** with supporting documents as part of the **"Environmental Package."**

Responsible Agency/State Water Board

The State Water Board acts on behalf of EPA to review and consider the environmental documents before approving financing. The State Water Board may require additional studies or documentation to make its own CEQA findings, as well as circulate CEQA documents and other environmental reports to relevant federal agencies for consultation before making a determination about the project financing.

The Applicant must address all relevant federal agencies' comments before project financing is approved.

FEDERAL CROSS-CUTTING REGULATIONS

The CWSRF Program requires consultation with relevant federal agencies on the following federal environmental regulations, if applicable to the project:

- Clean Air Act
- Coastal Barriers Resources Act
- Coastal Zone Management Act
- Endangered Species Act
- Environmental Justice
- Farmland Protection Policy Act
- Floodplain Management
- Magnuson-Stevens Fishery Conservation and Management Act
- Migratory Bird Treaty Act
- National Historic Preservation Act
- Protection of Wetlands
- Safe Drinking Water Act, Sole Source Aquifer Protection
- Wild and Scenic Rivers Act

The following is a brief overview of requirements for some of the key regulations.

Clean Air Act (CAA)

The CAA general conformity analysis only applies to projects in areas not meeting the National Ambient Air Quality Standards or subject to a maintenance plan.

If project emissions are below the federal "de minimis" levels then:

- A general conformity analysis is not required.

If project emissions are above the federal "de minimis" levels then:

- A general conformity determination for the project must be made. A general conformity determination can be made if facilities are sized to meet the needs of current population projections used in an approved State Implementation Plan for air quality.
- Using population projections, applicants must explain how the proposed capacity increase was calculated.

An air quality modeling analysis is necessary of all projects for the following criteria pollutants, regardless of attainment status:

- Carbon monoxide
- Lead
- Oxides of nitrogen
- Ozone
- Particulate matter (PM2.5 and PM10)
- Sulfur dioxide

Endangered Species Act (ESA)

The ESA requires an analysis of the effects on federally listed species. The State Water Board will determine the project's potential effects on federally listed species, and will initiate informal/formal consultation with the United States Fish and Wildlife Service (USFWS) and/or the National Marine Fisheries Service, as necessary under Section 7 of the ESA.

Required Documents:

- ✓ A species list, less than one year old, from the USFWS and the California Department of Fish and Wildlife's Natural Diversity Database;
- ✓ A biological survey conducted during the appropriate time of year;
- ✓ Maps or documents (biological reports or biological assessments, if necessary); and
- ✓ An assessment of the direct or indirect impacts to any federally listed species and/or critical habitat. If no effects are expected, explain why and provide the supporting evidence.

Re: BDFP-EIR Comment and Recommendation
Project Address: 750 Phelps Street, 1700 Jerrold Avenue, 1800 Jerrold Avenue, and 1801 Jerrold Avenue, San Francisco
Case No.: 2015-000644ENV

Dear Mr. Johnston,

Thank you for considering these comments and recommendations as you continue to evaluate the BDFP-EIR. Our recommendations are in two key areas: Cultural Resources and Traffic/Transportation and Circulation.

I. CULTURAL RESOURCES

1. Impacts on Individual Historic Elements - **The Central Shops** and Southeast Treatment Plant Streamline Moderne Industrial Historic District

1
CR-1

As noted in the EIR, the proposed project would result in the removal of the Central Shops (including Buildings A and B), a complex that is eligible for listing in the California and National Registers. (Vol 1. S-6)

"*The removal of Buildings A and B at the Central Shops would cause a substantial adverse change in the significance of the historical resource because the project would demolish the physical characteristics that convey the resource's historical significance and that justify its individual eligibility for inclusion in the California and National Registers, resulting in a significant impact under CEQA Guidelines Section 15064.5.*"

The Bayview Office for Community Planning is a non-governmental, non-public funded, community-based and independent organization of Bayview residents and business owners providing land-use and project review services, economic development planning efforts and merchant advocacy. Recommendations are presented to clients, Bayview community organizations, the San Francisco Planning Commission, Board of Permit Appeals, etc. BOCP work includes outreach to the SFPlanning Department, DBI, Bayview CAC, OCII, Resilient Bayview, the Bayview Business Alliance Project, the District 10 Supervisor's Office, and other community-based advocacy organizations and district merchants.
established on 3rd Street 2000

Recommendation

Understanding that implementing Mitigation Measure M-CR-1 (Documentation of Historic Resources and Interpretive Display)

'would reduce the severity of the impact…but would not reduce the severity of the impact to a less-than-significant level' and even though *'the impact would be significant and unavoidable with mitigation',*

we nevertheless recommend a combined solution for the loss of these historic resources. It is suggested that the complete and thorough **Mitigation Measure M-CR-1 be conducted, along with the implementation of Alternative C**, the Historical Resources Relocation, with the relocation of the Central Shops serving as the permanent public display and archival venue for the documentation and interpretive material. As indicated in M-CR-1:

" the SFPUC shall provide a permanent display of interpretive materials (which may include, but are not limited to, a display of photographs, a brochure, educational website, or an exhibitive display) ….Development of the interpretive materials shall be supervised by an architectural historian or historian who meets the Secretary of the Interior's Professional Qualification Standards…shall be placed in a prominent, public setting. A proposal describing the general parameters of the interpretive materials shall be approved by Planning Department Preservation staff prior to construction completion. The substance, media and other elements of such interpretive display shall be approved by Planning Department Preservation staff prior to completion of the project."

And as indicated in Alternative C:

"The Historical Resources Relocation Alternative, would consist of full construction and operation of the BDFP as proposed, plus the relocation of Central Shops Buildings A and B to a similar industrial setting in San Francisco. The relocation, rehabilitation, and reuse of Buildings A and B would be consistent with the Secretary of the Interior's Standards, and would reduce the significant and unavoidable impact on historical resources under the proposed project to a less than- significant level. Rather than demolishing Buildings A and B, the SFPUC would dismantle these structures such that they could be relocated consistent with the Secretary of the Interior's Standards for Rehabilitation."

established on 3rd Street 2000

2. Impacts of Other Project Components - **Display Building**

'The most prominent features of the greenhouses are four tall, narrow structures near the edge of the property on Phelps Street. As a separate action from the BDFP, the San Francisco Public Utilities Commission(SFPUC) plans to demolish the existing structures at the Southeast Greenhouses site (refer to Table 4.1-1 in Section 4.1). The site would be used for construction staging for the project if it becomes available prior to BDFP construction.

Recommendation:

The smaller, yet taller, glassed in greenhouse 'facade' - THE DISPLAY BUILDING is a striking and important community marker at the intersection of Phelps and McKinnon Avenues. As community planners and advocates for improving the physical environment where we live, the potential for losing these smaller buildings (if contemplated in Phase 1) seems antithetical to the goals we've set for ourselves in lifting this place in Bayview.

2

OC-3

These buildings have been recognized as remaining in our neighborhood greening and block improvement plans for some time and fulfill the Phase2 goals for the 'Model Block' as planned in 2006-2009.

These DISPLAY BUILDINGS are noted in the EIR and Aecom report as the 'Display' buildings, and are not contiguous to the larger greenhouses also slated for demolition in the BDFP. The Aecom Due Diligence report -2015 does not indicate an imminent seismic failure of this particular location, as was reported by the SFPUC neighborhood outreach team in May, 2017. The path of least resistance may be to simply demolish the buildings in order to make way for a construction parking lot and staging area as mapped and noted in the EIR. Demolition of these structures add to the removal of community assets, bit by bit, in our opinion.

An alternate, community use, is highly recommended.
If it is indeed determined that occupancy of building is not recommended, yet the seismic integrity is not significantly compromised, the building would provide an ideal location as a community storage hub for cots, MREs, generators, first-aid supplies, water and many other emergency items for use by emergency responders on behalf of Bayview and beyond in the event of a impactful event or natural disaster.

2
OC-3
cont.

II. TRAFFIC, CIRCULATION and TRANSPORTATION

In our work with the Bayview CAC and many others, we are also requesting additional review of the impact analysis with respect to traffic and circulation (Impact TR 1-5 incl.; Vol.1 s28) from the existing 'LS' -less than significant - status to the LSM condition, requiring mitigation. While the EIR indicates potential compliance with 'applicable regulations' and the incorporation of a 'traffic and control plan', no such plan is articulated or explored within the report, nor is there a suggested mitigation for alleviating the traffic and circulation impacts as outlined in the analysis.

In addition to a request for a thorough and multi-agency review and written plan as a requirement prior to final certification of the EIR, several straightforward, feasible mitigations are proposed.

3
TR-1

Noted in the report are forty (40) projects considered in the cumulative impact analysis for traffic and circulation, with 25 of these projects, or 63% of the impact to Bayview, as SSIP and/or SFPUC related. (Table 4.1-1; Vol.1 p. 4.1.6).

Specifically, the following projects noted in the analysis will severely impact the surrounding community and neighborhoods, in our opinion, with questionable 'public safety' and 'emergency routing' possibilities due to the closure or blocking of major East/West thoroughfares in Bayview:

4
TR-4

The Bayview Office for Community Planning is a non-governmental, non-public funded, community-based and independent organization of Bayview residents and business owners providing land-use and project review services, economic development planning efforts and merchant advocacy. Recommendations are presented to clients, Bayview community organizations, the San Francisco Planning Commission, Board of Permit Appeals, etc. BOCP work includes outreach to the SFPlanning Department, DBI, Bayview CAC, OCII, Resilient Bayview, the Bayview Business Alliance Project, the District 10 Supervisor's Office, and other community-based advocacy organizations and district merchants.
established on 3rd Street 2000

BAYVIEW
Community Planning

>**Current, existing lane narrowing/access along the Evans Street** beginning in August 2017 for the Headworks phase; (Table item #1). Beginning in August, 2017, this work is under pre-development now and includes hundreds of construction vehicles, manpower transportation efforts, shuttles, and staging relays due to the SSIP early phase implementation. Evans Avenue is a major East/West arterial utilized by residents, businesses and visitors including City and County employees, USPS facility employees, SFFD manpower, residents of India Basin, Hunters-Point Shipyard, and thousands of residents, businesses and non-profits throughout the community.

>**Closure of Jerrold Avenue from Phelps to Rankin Street.** Specifically, as noted in the EIR, is the 5-6 year closure of Jerrold Avenue between Phelps Avenue and Rankin Street. Another major East/West arterial, Jerrold is similarly traversed by thousands of residents, business owners, employees on a daily basis. The closure of Jerrold Avenue presents a very high level of concern for all nearby businesses and residents, and will significantly and negatively impact the quality of life for those utilizing this alignment.

4
TR-4
cont.

>**Construction staging along Phelps Avenue**/ parking / equipment relay. This narrow street includes many active and essential PDR businesses and nearby residences. Note the circulation graphics contained in the EIR, with additive impacts to to staging areas at Evans and McKinnon Avenues and with routing from 1550 Evans Avenue and Piers 92-94 for construction employees and equipment.

Not included in the cumulative impact analysis on traffic, and not mentioned in the BSFP-EIR, yet key to understanding the need for feasible mitigation as a requirement to LSM status are:

OC-2

> **Palou Avenue** streetscape improvement project -from Barneveld to Crisp Avenues- beginning late 2017, this is an approved $10m, SFDPW/SFMTA project with significant staging, parking, re-routing and daily traffic impacts on this heavily used East/West alignment.

The Bayview Office for Community Planning is a non-governmental, non-public funded, community-based and independent organization of Bayview residents and business owners providing land-use and project review services, economic development planning efforts and merchant advocacy. Recommendations are presented to clients, Bayview community organizations, the San Francisco Planning Commission, Board of Permit Appeals, etc. BOCP work includes outreach to the SFPlanning Department, DBI, Bayview CAC, OCII, Resilient Bayview, the Bayview Business Alliance Project, the District 10 Supervisor's Office, and other community-based advocacy organizations and district merchants.
established on 3rd Street 2000

> **2245 Jerrold Avenue** - Project by **SFFD** - construction of SFFD Ambulance Deployment Facility - a $27m project slated for construction in 2020. As noted in the project conceptual design documentation, " The Project site is in an intensively developed area of San Francisco's Bayview neighborhood characterized by various warehouse, distribution and light industrial uses".

> Re-routing of the **23 Muni Bus Line to Palou Avenue**. While the BSFP-EIR indicates relocation of the 23 Monterery Muni Line from Jerrold Avenue to Palou Avenue as a temporary measure during course of construction, the Palou Streetscape project indicates the eventual and permanent relocation of the 23 to Palou Avenue following the streetscape improvements. A temporary relocation of this public transportation element to Palou Avenue from Jerrold Avenue is neither practical nor safe during concurrent major construction on both E/W alignments.

> **Other:** Multiple private construction projects for residential mixed-use, PDR, commercial improvements, etc. are under review and/or are being considered for the Third Street Corridor in Bayview between Williams Avenue and Evans Avenue for 2018-2025.

When considering these traffic and circulation impacts alone, one should consider that these crucial East/West arterials (Evans, Jerrold, Palou), in a 'closed', 'blocked' or 'under construction' condition, will increase traffic on already heavily used E/W Oakdale Avenue.

These major East/West street alignments, in and out of Bayview, provide the daily transportation routes for tens of thousands of individuals who live and work in Bayview, for parents who take their children to school and back, for employees and employers who must get to their jobs, and, most importantly serve as essential transportation routes in the event of a natural disaster such as an earthquake, flood, fire or other impactful 'event'. (see attachments 2-60, 61)

established on 3rd Street 2000

BAYVIEW
Community Planning

It should also be noted that the **sole NORTH bound** access, along Third Street @ Islais Creek, is a documented potential **liquefaction zone** and will be significantly compromised as a transportation route following a seismic event.

5
TR-2

The overarching issues - transportation, traffic and circulation - drive the question of public safety in Bayview and the quality of life for those directly and indirectly impacted by these multiple, intersecting projects. For the record, approximately 35,000 San Francisco citizens reside in the Bayview community and neighborhoods.

6
GC-2

As noted in the EIR in section 2.4.2.1 Long-Term Changes to Local Roadway Network, "In October 2015, Quint Street between Oakdale Avenue and the Caltrain tracks was permanently closed to through traffic as part of Caltrain's Quint Street Bridge Replacement project." Also noted in the Impact Analysis table Table 4.1-1; Vol.1 p. 4.1.6-14, are **two projects which we suggest provide partial solutions for feasible mitigation on these traffic impacts.**

Item #24 (Table 4.1.1; Vol 1. p 4.1.10) - **The Quint Connector**

This project would construct a new 950-foot-long roadway to provide access between existing Quint Street and Jerrold Avenue.
The roadway would consist of two 13-foot-wide lanes (within a 50-foot-wide corridor), one northbound and one southbound.
Construct a new 27-foot-wide curb cut located along the San Francisco Wholesale Produce Market property (Project 25,below); and install street trees and street lighting;

Item #25 (Table 4.1.1; Vol 1. p 4.1.10) -

City and County of San Francisco Produce Market

Jerrold Avenue would be reconfigured to direct through traffic around the site onto Innes and Kirkwood Avenues. Innes Avenue would be improved and portions of the project site would also be dedicated to create two new intersections where Toland Street crosses Innes and Kirkwood Avenues. Rankin Street would be relocated between Kirkwood and Innes Avenues to parallel the west side of the Caltrain right-of-way, and the intersection of Rankin Street and Jerrold Avenue would be

established on 3rd Street 2000

reconfigured. All roadway improvements would be constructed under Phase 1.

7 **TR-4** cont.

Construction and implementation of the Quint Connector Road, prior to major construction at the SEP, will reduce pressure on the remaining, key E/W arterial (Oakdale Avenue) and allow local traffic to be routed to the NW along the alignment - to Innes, etc. and out to Bayshore and 101N in the short, medium and long term. In addition, and as a result of the completion of this Quint connector alignment, a portion of the deteriorating air quality issues noted as 'significant and unavoidable' during the construction process may be improved as the likely impacts of congested and idling automobiles, trucks and busses on the remaining Oakdale corridor could be reduced.

8 **TR-4**

9 **AQ-2**

Recommendations:

1. Study and re-evaluate the conclusions drawn in the EIR regarding the significance of the traffic impacts, along with a more clearly articulated and written, multi-agency transportation and traffic plan prior to certification of the EIR.

2. Completion of the Quint Street Connector by December 31, 2018.

The **Quint Street Connector ByPass** roadway plan should be **expedited and built, as part of the PUC project**, prior to major construction in 2018/19, in our opinion. An inter-agency cooperative effort is essential in this regard. Leadership and guidance from the Mayor's Office, the City Administrator's Office, the District 10 Supervisor, SFDPW, SFMTA, SFPUC, SFFD, SFPD, Union Pacific and the Department of Emergency Management is highly recommended and urged.

10 **TR-1** **TR-4**

San Francisco, CA 94103

Subject: Case No.: 2015-000644ENV Biosolids Digester Facilities Project
Environmental Impact Report Draft

Mr. Johnston,

We are submitting comments on the Draft EIR with regard to Cultural Resources. Kindly forward these items to the project review team.

1. **CULTURAL RESOURCES** Impacts on Individual Historic Elements - The Central Shops and Southeast Treatment Plant Streamline Moderne Industrial Historic District

As noted in the EIR, the proposed project would result in the removal of the Central Shops (including Buildings A and B), a complex that is eligible for listing in the California and National Registers. (Vol 1. S-6) 'The removal of Buildings A and B at the Central Shops would cause a substantial adverse change in the significance of the historical resource because the project would demolish the physical characteristics that convey the resource's historical significance and that justify its individual eligibility for inclusion in the California and National Registers, resulting in a significant impact under CEQA Guidelines Section 15064.5'

1
CR-1

Recommendation

We have reviewed the proposed Mitigation Measure M-CR-1 (Documentation of Historic Resources and Interpretive Display) which 'would reduce the severity of the impact…but would not reduce the severity of the impact to a less-than-significant level' and even though 'the impact would be significant and unavoidable with mitigation', and have also noted the Alternative C mitigation option -

1556 Revere Avenue San Francisco, California 94124
415.822.4388 www.bayviewhistory.org thebayviewhistoricalsociety@gmail.com

preservation of place

'The Historical Resources Relocation Alternative' - and understand that this 'would consist of full construction and operation of the BDFP as proposed, plus the relocation of Central Shops Buildings A and B to a similar industrial setting in San Francisco. The relocation, rehabilitation, and reuse of Buildings A and B would be consistent with the Secretary of the Interior's Standards, and would reduce the significant and unavoidable impact on historical resources under the proposed project to a less than- significant level. Rather than demolishing Buildings A and B, the SFPUC would dismantle these structures such that they could be relocated consistent with the Secretary of the Interior's Standards for Rehabilitation.'

We recommend a combined solution for the loss of these historic resources. It is suggested that the complete and thorough Mitigation Measure M-CR-1 be conducted, along with the implementation of Alternative C, the Historical Resources Relocation, with the relocation of the Central Shops serving as the permanent public display and archival venue for the documentation and interpretive material, and establish this location as the Bayview Architectural Resources Archive.

1 **CR-1** cont.

As indicated in M-CR-1:
'the SFPUC shall provide a permanent display of interpretive materials; shall be supervised by an architectural historian or historian who meets the Secretary of the Interior's Professional Qualification Standards; shall be placed in a prominent, public setting; a proposal describing the general parameters of the interpretive materials shall be approved by Planning Department Preservation staff prior to construction completion; with the substance, media and other elements of such interpretive display shall be approved by Planning Department Preservation staff prior to completion of the project.'

And as indicated in Alternative C:
"The Historical Resources Relocation Alternative, would consist of full construction and operation of the BDFP as proposed, plus the relocation of Central Shops Buildings A and B to a similar industrial setting in San Francisco. ' A port property on Pier 92 is suggested.

2. **CULTURAL RESOURCES** Impacts of Other Project Components - Display Building

We are opposed to the demolition and removal of the green framed, display buildings along Phelps Avenue, and suggest an alternate, community serving use for these modest structures. As noted in the EIR - 'The most prominent features of the greenhouses are four tall, narrow structures near the edge of the property on Phelps Street. As a separate action from the BDFP, the San Francisco Public Utilities Commission(SFPUC) plans to demolish the existing structures at the Southeast Greenhouses site (refer to Table 4.1-1 in Section 4.1). The site would be used for construction staging for the project if it becomes available prior to BDFP construction.

2 **OC-3**

1556 Revere Avenue San Francisco, California 94124
415.822.4388 www.bayviewhistory.org thebayviewhistoricalsociety@gmail.com

preservation of place

Recommendation:

These buildings have been recognized as remaining in our neighborhood greening and block improvement plans for some time and fulfill the Phase2 goals for the 'Model Block' as planned in 2006-2009, with the initial phase completed at City cost on the Newcomb Avenue alignment. These buildings are also noted in both the EIR and Aecom report as the 'Display' buildings, and are not contiguous to the larger greenhouses also slated for demolition in the BDFP. The Aecom Due Diligence report -2015 does not indicate an imminent seismic failure of this particular location.

Demolition of these structures to make space for a construction staging and parking lot and staging area as mapped and noted in the EIR is mis-guided and needlessly destructive, in our opinion. Demolition of these structures also add to the incremental removal of known community assets. The display buildings are valued and admired by many in the community and stand out as an 'iconic marker' despite the modest architectural character and lack of recognition as an 'historic resource'

2
OC-3
cont.

An alternate, rather benign and easily implemented community use is highly recommended and is outlined by the Bayview Office for Community Planning. We concur with this assessment:

If it is determined that occupancy of building is not recommended, yet the seismic integrity is not significantly compromised, the building would provide an ideal location as a community storage hub for cots, MREs, generators, first-aid supplies, water and many other emergency items for use by emergency responders on behalf of Bayview and beyond in the event of a impactful event or natural disaster. The community could clearly benefit from such an asset in light of the other significant impacts from this phase of the SSIP project

Thank you for your consideration.
Sincerely,

Adrian Card

Subject: Feedback on SEP BDFP EIR

Please find a letter from BRITE attached that should serve as a response to the recently issued EIR for the Biosolids Digester Facilities Project.

In summary, BRITE strongly opposes the closure of Jerrold and would like to see efforts made to honor pre-existing commitments to the community -- both in terms of the Jerrold street closure and a key component of the greenhouse community benefit. 1 GC-3

Thank you for accepting this input and integrating in the next iteration of the EIR.

Re: Feedback on Draft EIR for BDFP May 30, 2017

TO: Timothy Johnston, SFPUC
Monica Huggins, Administrative Assistant, SFPUC
CC: Malia Cohen, Supervisor District 10
Brittni Chicuata, Legilative Aide, Supervisor Cohen's Office
Casey Hildreth, Sr. Planner, SFMTA Livable Streets
Jack Gallagher, Bayview Hunter's Point Citizen's Advisory Committee
Carolyn Chiu, Project Manager, SFPUC
Captain Raj Vaswani, SFPD Bayview Station

The neighborhood group, BRITE (Bayview Residents Improving Their Environment), a registered 501(c)4 nonprofit, represents hundreds of residents of Bayview/Hunters Point (BVHP).

As progress builds on the SE Wastewater Treatment facility, so does the feedback we hear from members of the community. After the publication of the draft EIR, we've heard discussion and displeasure with the call for Jerrold St to be "closed during construction". (EIR Vol 1, §2.1.1.2; §S.4.3;) Compounding this closure is the simultaneous realignment of lanes on Evans to also support this project. But there's more to this than road closures – the bigger picture is about the SFPUC's relationship with and commitments to the community and the isolation (and resilience) of Bayview.

During the SFPUC-hosted community town hall March 18, 2017, Carolyn Chiu said, "the Jerrold Street closure would only happen late at night and would only impact the businesses at the produce market." Now, the draft EIR states the street will be completely closed during construction! This significant of a change, buried in a 500+ page, multi-volume document, further erodes what's left of the trust between the SFPUC and our community. This is a categorically unacceptable and unreasonable burden to place on our residents, especially when commitments have already been made to the community to avoid this very situation. This is the epitome of trying to pull a fast one and it is offensive to the community. Together with the seizure and demolition of the greenhouses – which were supposed to be a community benefit – the number and significance of flip-flops on commitments to the community by the SFPUC raises eyebrows among community stakeholders.

2
GC-3

What we hear universally from residents is best described as outrage. First, with respect to the greenhouses, it would be minimally respectful to retain the glass "exhibit gallery" buildings and façade on Phelps at the intersection with McKinnon – these structures remind the community of their pride for being pioneers in creating urban, green-collar jobs. Furthermore, the cost to retain and repair these structures is surely competitive with the costs of leased trailers for office space (the EIR-identified use of that land). Second, residents have historically been deeply concerned about the lack of accessibility between Bayview and Hunters Point neighborhoods with the rest of the City – we have one North/South route, and less than a handful of East/West routes (Evans, Jerrold, Oakdale, and Paul). This long-imposed exile is currently exacerbated by game-day traffic for the Giants and will be further stressed once the basketball arena opens, also around the time when BDFP construction will be in full affect. Constricting the flow of traffic on Evans and closing Jerrold means the community will effectively lose its

3
OC-3

4
TR-1

two Northern-most E/W routes, leaving only Oakdale and Paul "unaffected". Both of which are already heavily used and Oakdale is in terrible condition and getting worse.

4 cont.

While the community strongly supports the BDFP project for its promise to eliminate odors beyond the fence line – odors which our community has been subject to for decades (odors that came with scaled back community benefits that were delinquent in being delivered and are now being repossessed) – the appetite for traffic disruptions of this magnitude are nil, as is the appetite for a complete demolition of the greenhouses site.

GC-3

One example from a family in our community demonstrates how these street closures could test the resiliency of an already fragile community, compromise the economic stability of families, and exacerbate delicate issues of equitable justice. This family has children at a school in Cole Valley – getting to the school requires two, 1-hour round-trips per day. They take either Evans or Jerrold to Caesar Chavez / 101. One parent takes CalTrain to San Jose for work (approximately a 1h45m door-to-door commute). The children are dropped off by 8:30am and picked up before 6pm. For every minute they're late, it costs $5/min/child. This family has minimal resiliency in their day already and see a strong education as the most accessible path to generational economic mobility. Adding even a 5-10 minute delay in their day due to traffic as a result of these street closures (compounded by aforementioned systemic impacts) will impose a "social justice tax" of $50 - $100/per day – they have 2 kids and are already stretched thin to get to the school by 6pm. This family is not alone in their transit struggles as a direct consequence of living in the isolated Bayview neighborhood.

GC-2

TR-1

BRITE calls on the SFPUC to define a construction and staging plan that does not call for Jerrold to close. Consider using existing road infrastructure within the SEP boundaries; instead of performing roadwork during Phase 1 to transform the traffic patterns through the produce market, use that time and funding to make roadway improvements within the SEP boundary to handle the construction and hazardous material traffic currently targeted for Jerrold. This is also a good opportunity to pause and consider if it's in CCSF's best interest to have the most hazardous shipments travel through the primary distribution point for all fresh produce in CCSF – this is an issue of resiliency and food security as well.

Re: BDFP EIR Comments
Project Address: 750 Phelps Street, 1700 Jerrold Avenue, 1800 Jerrold Avenue, and 1801 Jerrold Avenue, San Francisco
Cross Street(s): Jerrold Avenue/Phelps Street
Block /Lot No.: 5262/009; 5281/001 Zoning District(s): P (Public Facilities); M-1 (Light Industrial); M-2 (Industrial) Plan Area: Bayview Hunters Point
Case No.: 2015-000644ENV

Dear Mr. Johnston,

The Bayview Hunters Point Citizens Advisory Committee ("CAC") provides community guidance to the Board of Supervisors, City boards, commissions and departments, including the Planning Commission and Planning Department regarding planning and development issues in Zone 2 of the Bayview Hunters Point Redevelopment Project Area.

As such, we are requesting additional review of the impact analysis with respect to traffic and circulation (Impact TR 1-5 incl.; Vol.1 s28) from the existing 'LS' -less than significant - status to the LSM condition, requiring mitigation. While the EIR indicates potential compliance with 'applicable regulations' and the incorporation of a 'traffic and control plan', no such plan is articulated or explored within the report, nor is there a suggested mitigation for alleviating the traffic and circulation impacts as outlined in the analysis. 1 TR-1

In addition to a request for a thorough and multi-agency review and written plan as a requirement prior to final certification of the EIR, several straightforward, feasible mitigations are proposed. Noted in the report are forty (40) projects considered in the cumulative impact analysis for traffic and circulation, with 25 of these projects, or 63% of the impact to Bayview, as SSIP and/or SFPUC related. (Table 4.1-1; Vol.1 p. 4.1.6). 2 TR-4

O-BVHPCAC

Specifically, the following projects noted in the analysis will severely impact the surrounding community and neighborhoods, in our opinion, with questionable 'public safety' and 'emergency routing' possibilities due to the closure or blocking of major East/West thoroughfares in Bayview:

>**Current, existing lane narrowing/access along the Evans Street** beginning in August 2017 for the Headworks phase; (Table item #1). Beginning in August, 2017, this work is under pre-development now and includes hundreds of construction vehicles, manpower transportation efforts, shuttles, and staging relays due to the SSIP early phase implementation. Evans Avenue is a major East/West arterial utilized by residents, businesses and visitors including City and County employees, USPS facility employees, SFFD manpower, and residents of India Basin, Hunters-Point Shipyard, and thousands of residents, businesses and non-profits throughout the community.

>**Closure of Jerrold Avenue from Phelps to Rankin Street.** Specifically, as noted in the EIR, is the 5-6 year closure of Jerrold Avenue between Phelps Avenue and Rankin Street. Another major East/West arterial, Jerrold is similarly traversed by thousands of residents, business owners, employees on a daily basis. The closure of Jerrold Avenue presents a very high level of concern for all nearby businesses and residents, and will significantly and negatively impact the quality of life for those utilizing this alignment.

>**Construction staging along Phelps Avenue**/ parking / equipment relay. This narrow street includes many active and essential PDR businesses and nearby residences. Note the circulation graphics contained in the EIR, with additive impacts to to staging areas at Evans and McKinnon Avenues and with routing from 1550 Evans Avenue and Piers 92-94 for construction employees and equipment.

2
TR-4
cont.

Not included in the cumulative impact analysis on traffic, and not mentioned in the BSFP-EIR, yet key to understanding the need for feasible mitigation as a requirement to LSM status are:

> **Palou Avenue** streetscape improvement project -from Barneveld to Crisp Avenues- beginning late 2017, this is an approved $10m, SFDPW/SFMTA project with significant staging, parking, re-routing and daily traffic impacts on this heavily used East/West alignment.

OC-2

> **2245 Jerrold Avenue** - Project by **SFFD** - construction of SFFD Ambulance Deployment Facility - a $27m project slated for construction in 2020. As noted in the project conceptual design documentation, "The Project site is in an intensively developed area of San Francisco's Bayview neighborhood characterized by various warehouse, distribution and light industrial uses".

> Re-routing of the **23 Muni Bus Line to Palou Avenue**. While the BSFP-EIR indicates relocation of the 23 Monterery Muni Line from Jerrold Avenue to Palou Avenue as a temporary measure during course of construction, the Palou Streetscape project indicates the eventual and permanent relocation of the 23 to Palou Avenue following the streetscape improvements. A temporary relocation of this public transportation element to Palou Avenue from Jerrold Avenue is neither practical nor safe during concurrent major construction on both E/W alignments.

2

> **Other:** Multiple private construction projects for residential mixed-use, PDR, commercial improvements, etc. are under review and/or are being considered for the Third Street Corridor in Bayview between Williams Avenue and Evans Avenue for 2018-2025.

When considering these traffic and circulation impacts alone, one should consider that these crucial East/West arterials (Evans, Jerrold, Palou), in a 'closed', 'blocked' or 'under construction' condition, will increase traffic on already heavily used E/W Oakdale Avenue.

These major East/West street alignments, in and out of Bayview, provide the daily transportation routes for tens of thousands of individuals who live and work in Bayview, for parents who take their children to school and back, for employees and employers who must get to their jobs, and, most importantly serve as essential transportation routes in the event of a natural disaster such as an earthquake, flood, fire or other impactful 'event'. (See attachments 2-60, 61)

2 **TR-4** cont.

It should also be noted that the **sole NORTH bound** access, along Third Street @ Islais Creek, is a documented potential **liquefaction zone** and will be significantly compromised as a transportation route following a seismic event.

3 **TR-2**

The overarching issues - transportation, traffic and circulation - drive the question of public safety in Bayview and the quality of life for those directly and indirectly impacted by these multiple, intersecting projects. For the record, approximately 35,000 San Francisco citizens reside in the Bayview community and neighborhoods.

4 **GC-2**

As noted in the EIR in section 2.4.2.1 Long-Term Changes to Local Roadway Network, "In October 2015, Quint Street between Oakdale Avenue and the Caltrain tracks was permanently closed to through traffic as part of Caltrain's Quint Street Bridge Replacement Project." Also noted in the Impact Analysis Table 4.1-1; Vol.1 p. 4.1.6-14, are **two projects which we suggest provide partial solutions for feasible mitigation on these traffic impacts.**

Item #24 (Table 4.1.1; Vol 1. p 4.1.10) - **The Quint Connector**
This project would construct a new 950-foot-long roadway to provide access between existing Quint Street and Jerrold Avenue. The roadway would consist of two 13-foot-wide lanes (within a 50-foot-wide corridor), one northbound and one southbound. Construct a new 27-foot-wide curb cut located along the San Francisco Wholesale Produce Market property (Project 25, below); and install street trees and street lighting;

Item #25 (Table 4.1.1; Vol 1. p 4.1.10) - **City and County of San Francisco Produce Market**
Jerrold Avenue would be reconfigured to direct through traffic around the site onto Innes and Kirkwood Avenues. Innes Avenue would be improved and portions of the project site would also be dedicated to create two new intersections where Toland Street crosses Innes and Kirkwood Avenues. Rankin Street would be relocated between Kirkwood and Innes Avenues to parallel the west side of the Caltrain right-of-way, and the intersection of Rankin Street and Jerrold Avenue would be reconfigured. All roadway improvements would be constructed under Phase 1.

5 **TR-4**

Construction and implementation of the Quint Connector Road, prior to major construction at the SEP, will reduce pressure on the remaining, key E/W arterial (Oakdale Avenue) and allow local traffic to be routed to the NW along the alignment - to Innes, etc. and out to Bayshore and 101N in the short, medium and long term. In addition, and as a result of the completion of this Quint connector alignment, a portion of the deteriorating air quality issues noted as 'significant and unavoidable' during the construction process may be improved as the likely impacts of congested and idling automobiles, trucks and busses on the remaining Oakdale corridor could be reduced.

5 TR-4 cont.

6 AQ-2

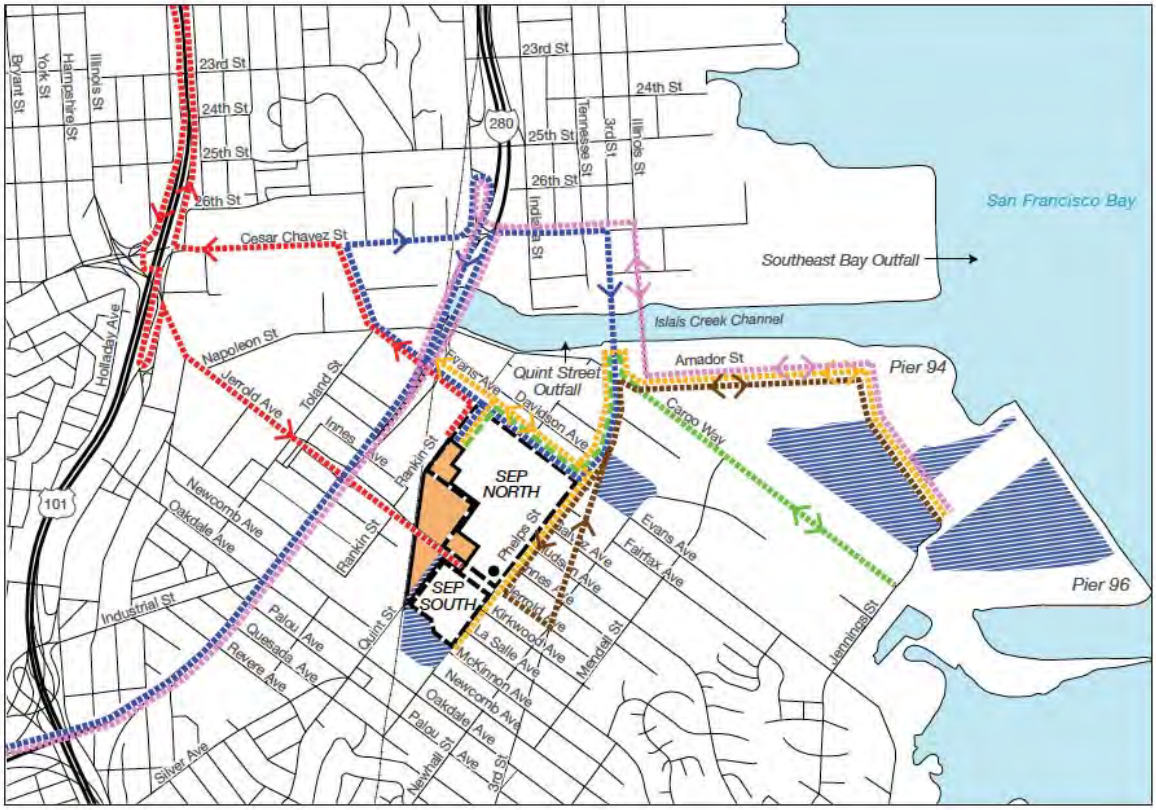
Recommendations:

1. Study and re-evaluate the conclusions drawn in the EIR regarding the significance of the traffic impacts, along with a more clearly articulated and written, multi-agency transportation and traffic plan prior to certification of the EIR.

2. Completion of the Quint Street Connector by December 31, 2018.
The **Quint Street Connector By-pass** roadway plan should be **expedited and built, as part of the PUC project**, prior to major construction in 2018/19, in our opinion. An inter-agency cooperative effort is essential in this regard.

7 TR-1 TR-4

Leadership and guidance from the Mayor's Office, the City Administrator's Office, the District 10 Supervisor, SFDPW, SFMTA, SFPUC, SFFD, SFPD, Union Pacific and the Department of Emergency Management is highly recommended and urged.



3. **Reconsideration of the temporary relocation of Muni 23 Monterey Bus line**. SFPUC, with SFMTA as lead agency, to consider the cumulative impact of the Jerrold Street closure, the streetscape improvement project on Palou Avenue, the narrowing of Evans Avenue, and the heavily impacted Oakdale Avenue arterial due to the above concurrent projects.

Thank you for considering these comments during the review process for the Bio solids Digester Facilities Project EIR.

Sincerely,

Bayview Hunters Point Citizens Advisory Committee

GREENACTION

for Health & Environmental Justice

June 26, 2017

Tim Johnston
Planning Department, City and County of San Francisco
1650 Mission Street, Ste 400
San Francisco, CA 94103

RE: Greenaction for Health and Environmental Justice Comments on Draft EIR for the Five-Year Southeast Plant Renovation

Dear Mr. Johnston,

We have reviewed the Draft Environmental Impact Report (DEIR) that discusses a five-year renovation plan at San Francisco's Southeast Water Pollution Control Plant (Southeast Plant). On behalf of our many members who are residents of Bayview-Hunters Point, we have concerns and submit the following comments about this project.

We are pleased to start by acknowledging a potential benefit to the community from this project. The replacement and relocation of the decades-old digesters has the potential to reduce odiferous volatile organic compounds (aka "odors") for people who live adjacent to the plant along Phelps Avenue. While applauding this effort, we would be remiss not to point out that the biodigesters are responsible for only some of the odor from the Southeast Plant. We remain concerned about the odors emanating from the overall plant and its impact on the community. Given that wastewater processing is expected to *increase* 20 percent under the 2045 scenario reviewed in the draft EIR, we are concerned that odors emanating from the primary treatment portion of the Southeast Plant will *get worse*, particularly for the immediate neighbors. If this project is meant to decrease odors, we strongly recommend that SFPUC consider the net odors from the overall plant in light of the expected 20 percent increase in wastewater processing by 2045. From the standpoint of odor control, it is convenient but problematic to frame this project as related to only one portion of the Southeast Plant. We encourage SFPUC to look at overall odors as part of its final EIR.

1
AQ-6

We are extremely concerned that this project involves a 20 percent expansion of waste processing and biosolids production. This expansion may exacerbate community health burdens which are unacceptable. We must continue to point out the inequity, and object to the fact, that the Southeast Plant in Bayview Hunters Point continues to process almost all of the City's sewage and sewage from other cities.

2
GC-4

559 Ellis Street, San Francisco, CA 94109 Phone: 415-447-3904 Fax 415-447-3905
Email: greenaction@greenaction.org
Website: www.greenaction.org

As you are well aware, Bayview Hunters Point (BVHP) residents bear the disproportionate burden of industrial and military base pollution in San Francisco. As you are also aware, residents suffer high rates of illnesses likely related to the many mobile and stationary pollution sources in the neighborhood. The California Environmental Protection Agency's CalEnviroScreen 3.0 has confirmed that BVHP residents are highly vulnerable to pollution due to environmental, health and socio-economic indicators – and in fact CalEnviroScreen ranks BVHP as one of the most at risk communities in the state to pollution.

2
GC-4
cont.

A major concern is the projected increase in truck traffic. The project estimates a thirty to fifty percent increase in truck traffic to/from the Southeast Plant, and we consider 10-14 truck trips per day to be a large number of trips, particularly for a facility that operates 24 hours a day, 7 days a week, 365 days per year. We strongly encourage the project to explore ways to reduce and mitigate the increase in truck trips, particularly given the air quality overburden and environmental justice concerns in this community. Even if the trucks are using 2010 or new engines and if they are Tier 4 for pollution control, having over a dozen trucks rumbling into and out of the plant daily increases the intensity of impacts on the community, particularly if taking place in evenings, during the night, or over the weekend. We strongly encourage SFPUC to come up with a plan to mitigate the aesthetic and health impacts of this increase in truck traffic. Other than creating a more efficient trucking route, we see no such plan in the draft EIR. Other options of transport should be explored, such as rail.

3
TR-5
AQ-1
AE-1

4
AL-1

We understand that the location of the Southeast Plant is a geographic convenience for SFPUC. As a topographic low point it enables much of the wastewater system to be gravity fed and, therefore, more efficient to operate. Here we see a trade-off between efficiency and equity. The Southeast Plant already processes 80 percent of the City and County's wastewater, but it does not provide what we consider a proportional amount of benefit to the neighborhood that supports it. Therefore, we want to echo calls made by the others to provide employment opportunities, both during construction and during ongoing operation, to members of the immediate community. We encourage SFPUC to hire local business enterprises (LBEs) in this project, while also encouraging SFPUC not to reduce but to enable LBEs to achieve the same environmental performance standards as required elsewhere in the project. For example, we observe that the project only requires 80 percent of haul trucks to use 2010 or newer engines. We understand that the 20 percent not required to achieve this standard are LBEs that might have older equipment. Rather than reducing the environmental standard, we would prefer that SFPUC see this project as a way for LBEs to modernize their fleets. Lowering an environmental standard and using a quota approach limits both the ongoing opportunities for an LBE and contributes to community health overburden. We hope that you consider and change your approach in the final EIR.

5
GC-3

One of our significant concerns in this project is the expansion in the amount of production and combustion of biogas in the neighborhood. San Francisco has already designated the Bayview-

6
AQ-1

Hunters Point neighborhood as a Health Vulnerability zip code in its Community Risk Reduction Plan. Increasing and burning 50 percent more biogas will exacerbate community health concerns, particularly given that part of the increase is in PM2.5 emissions. There is already considerable concern in the neighborhood about respiratory health and asthma rates in children. We strongly encourage SFPUC to offset any estimated increases in PM2.5 with actions that will reduce direct emissions in the Bayview-Hunters air shed. We repeat this call for any other increases in other criteria pollutant emissions associated with this project. We do not understand why SFPUC would increase the community health burden in this project instead of assiduously offsetting or reducing it.

6
AQ-1
cont.

When the Southeast Plant expanded considerably in 1982, SFPUC reached a compromise with the neighborhood that increased community resources. Specifically, it added a community education center and community greenhouses in return for its increased production. We see no such plan as part of this project, but we do see that the portion of the plant south of Jerrold Street and between Phelps and Quint Streets will be retired as part of this project. We understand that the SFPUC has chosen to treat demolition of this older equipment and plans for this site as a future project. As a consequence, the project discussed in the Draft EIR appears to take more from the neighborhood than it gives. That is, it will burden the neighborhood with five years of construction, and it will increase daily truck traffic during ongoing operation. It will increase the production and combustion of biogas immediately upwind of residences. While it strives to reduce odors from one portion of the plant, it ignores others while also making plans to increase wastewater processing. We fail to see why the community should be in favor of this project, given a lack of return for the people who will live with the inconveniences associated with this facility. We encourage you to correct this oversight in your final EIR and to engage with community members and community leaders as you do so.

7
GC-3

We observe that the project proposes using 1500 Evans/Third and the adjacent Greenhouses as staging areas. The project also plans to use Pier 94 Backlands as a staging area. On aesthetic concerns, these choices are problematic and warrant mitigation. The construction phase of this project is planned for 2018-2023. This timeframe means that the community will have five years of construction equipment and materials, as well as ongoing truck traffic, piled in a visible parking lot on the main thoroughfare into and out of the neighborhood. We strongly encourage the project not to use 1500 Evans as a staging area and, instead, to use areas internal to the plant and behind walls more efficiently. We also encourage aesthetic mitigation for any use of the Greenhouses and of Pier 94 Backlands as staging areas.

8
AE-1

We would like to conclude that many of the concerns raised in this letter would be mitigated if the project moved the biosolids digestion and energy recovery to another location. We are disappointed to see that SFPUC has opted not to relocate these processes to Pier 94, given that it would more than double the distance between health-impacting operations and adjacent homes

9
AL-2

and a daycare facility. We are also concerned that this project will reduce the attractiveness of locating businesses in the area. It appears that SFPUC was able to dismiss this option by underestimating the amount of community impact that this expansion of the Southeast Plant would have on the community. We would like to see expanded attention to the socioeconomic impacts on the neighborhood in the final EIR, considering the drag on future business operations as well as the ongoing aesthetic and reputational impacts associated with living next to a large sewage treatment plant.

9 cont.

10 GC-2

All decisions made by the City regarding this project must be consistent with environmental justice, be health protective, and reduce – not add – to the environmental burden in the community.

11 GC-4

Thank you for consideration of these comments.

Respectfully submitted,

Bradley Angel

To: Johnston, Timothy (PUC)
Subject: Comments on Biosolids DEIR

Dear Mr. Johnston:

I am writing to express my great concern about the Draft Environmental Impact Report (DEIR) for the Biosolids Digester Project.

For the past 20 years I have owned and operated a small business at 525 Phelps Street, Pet Camp, directly across the street from the Southeast Water Treatment Facility. Over these two decades, my business like many others, has suffered through the ebb and flow of the San Francisco economy and been subject to every increasing burdens associated with operating small business in San Francisco. In addition to those "normal" burdens, running a business in the Bayview and especially at my specific location has subjected me to extra-ordinary burdens. While many business in the Bayview suffer from the lack of infrastructure, poor streets, graffiti, and dumping; my business has also had to suffer from the storage of 500 feet of light rail track across the street from my business for several years as part of the Third Street Light Rail's construction. It is based on that past experience that I understand the crippling effect the proposed DIER will have on my business and others on Phelps Streets if a change is not made to the proposed traffic patterns.

As an active member of the Bayview business community, I have had the privilege to serve on both the Southeast Working Group and the Digester Task Force. Like many small businesses and residents who have suffered through odors and other noxious smells emanating from the Southeast Plant, I support the efforts to reduce this problem. But as drafted, the DEIR will preclude the very businesses that have suffered from the plant to still be in business when the

1
GC-2

project is completed. The businesses on Phelps Street cannot exist without easy street access and parking. Pet Camp's clients, for example, cannot take the Third Street Light Rail as is suggested in the DEIR. Pet Camp's clients must drive to Pet Camp often with multiple pets and belongings and more often than not with young children. The ability to safely drive on Phelps Street and to be able to park in close proximity to Pet Camp is essential to their continued patronage and the jobs created from such. As presented the DEIR would place Pet Camp's clients at serious risk of injury causing them to seek pet care elsewhere and thus placing both the business and the jobs it has created at serious risk as well. 1cont. 2 TR-3

Phelps Street is a narrow street with two lanes of traffic, two lanes of parking and a bicycle route. It simply cannot sustain the proposed increase traffic while safely maintaining access to the small businesses located there. That the DEIR suggest that 5 years is only a temporary inconvenience reflects a complete lack of understanding of the burdens of running a small business. It is inconceivable that a small business could sustain itself for 5 years without clients being able to access it!

I encourage you to investigate better alternatives then than sending all of this traffic on Phelps Street from Evans to Jerrold including routing traffic from Evans to Mendell Street to Jerrold or along Evans to Rankin and directly into the plant. In so doing the burden on small businesses in the Bayview would be significantly lessened, bicycle riders will be protected, and San Franciscans patronizing the businesses on Phelps Street will be safer. 3 TR-1

Lastly, that small businesses are being asked to comment on the DEIR without completion of a Traffic Control Plan places small business at a significant disadvantage. The DEIR is already long and complicated; to ask small businesses to comment on such a document when it is lacking such a critical component as the Traffic Control Plan is simply untenable. The DEIR should be withdrawn from public comment until such time that the Traffic Control Plan is available. 4 TR-1

Re: Biosolids Digester Facilities Project, Case No. 2015-000644ENV
Comments on Draft Environmental Impact Report

Dear Mr. Johnston:

On behalf of the San Francisco Market Corporation ("SFMC"), which manages the San Francisco Wholesale Produce Market (the "Market"), I submit the following comments on the Draft Environmental Impact Report ("DEIR") for the SFPUC Biosolids Digester Facilities Project ("Biosolids Project"), Planning Department Case No. 2015-000644ENV.

I. The SFWPM Is A Vital Resource for San Francisco

The Market is the largest multi-tenanted produce wholesale and distribution facility in Northern California, spanning over 20 acres and including 485,000 square feet of warehouse and logistics space. We were created in 1963 when the City and County of San Francisco (the "City") relocated independent produce merchants from downtown San Francisco and built a shared facility in the Bayview-Hunters Point neighborhood to house them.

Since then, we have grown alongside the City and its produce industry. Our merchants, many of whom have been in operation for decades, sell and distribute a wide variety of produce to food businesses across the Bay Area. Today, the Market is the linchpin of San Francisco's world-class food and restaurant scene. We've become integral to the city's culinary fabric by providing the critical, behind-the-scenes infrastructure to wholesale and distribution businesses that link farmers to restaurants, independent grocery stores, and hotels.

Our work at the Market benefits the City in a number of key ways:

- *A Healthier Bay Area*: The Market supplies food businesses throughout the Bay Area with fresh, healthy, and affordable produce.

O-SFWPM-2

- *A Culinary Destination*: The Market is central to the supply chain that makes the City a delicious place to live and visit.

- *Business Incubator*: Home to over 30 businesses, the Market provides the space, expertise, and access to produce for anyone launching or growing a food business.

- *Support for Farmers*: The Market's merchants source from local and regional farms, providing critical market access for growing farms.

- *Job Creation*: The Market employs over 650 workers via its independent merchants, providing diverse employment opportunities within the important PDR sectors.

In January 2013, the City and SFMC finalized a long-term ground lease (the "SFWPM Lease") that envisions a comprehensive, phased redevelopment and expansion of the Market's facilities and infrastructure (the "SFWPM Project"). Through the operations, improvement projects, and activities contemplated as part of the SFWPM Project, the City has made a significant ongoing investment in the success of the Market. As such, the City has a strong interest in protecting its investment by ensuring that (i) the Market can continue to operate successfully during the extended construction period required for the Biosolids Project, and (ii) that the SFWPM Project is able to continue moving forward in spite of the Biosolids Project. 1 GC-2

II. SFWPM Project Includes Changes to Jerrold Avenue Access

To improve safety and security, and to enhance the efficiency of loading operations on the Market's main site, the SFWPM Project includes the eventual closure of the portion of Jerrold Avenue that bisects the Market, and the re-routing of through traffic around the Market onto Innes and Kirkwood Avenues. This change to the roadway network has always been a key part of the vision for the SFWPM Project. As of the time of this letter, SFMC anticipates that, in furtherance of the SFWPM Project, Jerrold Avenue will be unavailable to through traffic beginning in October of 2018. As such, the DEIR should be revised to include an update to the project description for the SFWPM Project that includes this anticipated timing for the rerouting of traffic around the Market. Additionally, as discussed below, the DEIR needs to consider impacts to the Market, the SFWPM Project, and the Biosolids Project that stem from the anticipated changes to the availability of the portion of Jerrold Avenue that runs through the Market. 2 TR-1

III. The DEIR Does Not Properly Consider And Mitigate Various Environmental Impacts

A. Transportation and Circulation Impacts

Transportation and circulation, in general, are significant issues in this portion of San Francisco. Due to the patchwork of PDR activities that have arisen over the years, many of the

O-SFWPM-2

streets do not follow a typical street grid. In addition, a number of streets, including several streets around the Market, are either degraded or were never improved to current standards. The generally less-than-ideal condition and layout of the streets will be further strained by the boom of new development proposed in the neighborhood, as described in the DEIR's cumulative analysis. In particular, the DEIR identifies a total of forty (40) cumulative projects[1], twenty (20) of which are scheduled to overlap with the construction activities of the Biosolids Project, and eight (8) more of which may have some overlap depending on those projects' final construction timelines.[2]

As described above, the SFWPM Project intends to close the portion of Jerrold Avenue that bisects the Market and begin to reconfigure and improve the surrounding roadways in or about October of 2018. In recognition of the need for greater security, and to mitigate the current operational conflicts caused by Jerrold Avenue's bisection of the main Market site, the closing of Jerrold Avenue and redirection of through traffic onto Innes and Kirkwood Avenues has always been a key component of the SFWPM Project.

The DEIR shows that the Biosolids Project intends to use the to-be-closed portion of Jerrold Avenue through construction and operation of the facility.[3] The DEIR does not analyze what impacts the Jerrold Avenue closure would have on the Biosolids Project, and, in particular, how and where construction and operational truck traffic would be rerouted. Instead, the transportation analysis assumes that the Biosolids Project will have continued access to Jerrold Avenue for truck off-haul, even beyond October 2018.

Additional truck traffic from the Biosolids Project through the Market on Jerrold Avenue poses safety and operational constraint issues for all users of the Market due to the Market's intensity of loading operations on Jerrold Avenue. Currently, approximately thirty (30) produce merchants occupy warehouse space with loading docks that front on Jerrold Ave. Even under current conditions and traffic loads, this loading arrangement poses operational challenges and safety concerns. Indeed, this (in addition to food safety regulations) is one of the main reasons why the SFWPM Project envisions the eventual closure of Jerrold through the Market. The additional truck traffic caused by the Biosolids Project's use of Jerrold will exacerbate this already sub-optimal traffic coordination issue.

For the reasons described above, the SFWPM Project intends to move as quickly as possible to close Jerrold Avenue through the Market. As such, we are keenly interested in making sure that the Biosolids Project does not depend on the Jerrold Avenue truck route in a way that would discourage, delay, or prevent the SFWPM Project from moving forward with the

2
TR-1
cont.

[1] DEIR, p. 4.1-6 *et seq.*, Table 4.1-1.

[2] DEIR, p. 4.6-51.

[3] DEIR, pp. 2-60, Figure 2-15; 2-61, Figure 2-16.

O-SFWPM-2

planned closure of Jerrold Avenue. The DEIR must address alternative routes that do not rely on Jerrold Avenue for ingress and egress to and from the Biosolids Project site.

After the closure of Jerrold Avenue as part of the SFWPM Project, the Biosolids Project's most direct and logical alternative route, and the route for all other east-west through traffic, would be via Innes Avenue. Accordingly, the DEIR should study the Biosolids Project's potential use of Innes Avenue, rather than Jerrold Avenue. As noted above, the SFWPM Project plans include improving Innes and Kirkwood Avenues to improve general circulation through the area, both for safety and efficiency. These public improvements will benefit the neighborhood, generally, and the Biosolids Project, specifically. The Market, therefore, proposes coordinating the improvement of Innes Avenue and the creation of a new intersection connecting the improved Innes Avenue to the portion of Jerrold Avenue northeast of the SFWPM. An analysis of the coordinated design should be included in the DEIR and added to the Project Description for the Biosolids Project.

2
TR-1
cont.

Finally, the DEIR discusses how Evans Avenue, an east-west route parallel to Jerrold Avenue, offers one alternative travel path for the vehicles currently traveling on the section of Jerrold Avenue that will be closed during construction of the Biosolids Project.[4] The DEIR goes on to note that Evans Avenue has "sufficient capacity to accommodate diverted traffic without a substantial effect on local vehicle circulation."[5] However, this analysis leaves out any discussion of the SFPUC's Southeast Plant Headworks Replacement Project, one of the many cumulative projects in the area. That project contemplates closing at least one lane of Evans Avenue through project construction, which is estimated to occur between January 2018 and June 2024, as discussed in that project's Final Mitigated Negative Declaration. The DEIR must analyze the planned use of Evans Avenue in the context of the upcoming lane closure to determine whether there is sufficient capacity on Evans Avenue to serve as an alternative route for Jerrold Avenue traffic, given the proposed closure of travel lanes due to the SFPUC Headworks Project, as well as the planned closure of Jerrold as part of the SFWPM Project.

B. Air Quality Impacts

The discussion of and mitigation related to potential air quality impacts of the Biosolids Project on the environment is inadequate in its (1) failure to consider potential impacts to the SFWPM and (2) failure to consider and mitigate for dust related impacts. The DEIR should be revised to include a more comprehensive discussion of these issues.

3
AQ-2

The entire air quality section of the DEIR[6] only has one passing reference to the Market and/or the SFWPM Project, and even then only in a footnote[7]. As described above, the Market is

[4] DEIR, p. 4.6-36.

[5] DEIR, pp. 4.6-36 and 37.

[6] DEIR, pp. 4.8-1 *et seq.*

O-SFWPM-2

the primary source for San Francisco's produce, including that served in restaurants, sold in grocery stores, and consumed by San Francisco residents. Given the potential sensitivity of these operations to air quality impacts – including emissions, dust, and odors – the DEIR should have included within its analysis a discussion of the potential impacts specific to the Market and the SFWPM Project.

3 cont.

Among the potential air quality impacts to the Market are dust related impacts. Indeed, fugitive dust is specifically identified as part of Impact AQ-1[8]. The DEIR purports to address these issues through references to the San Francisco Construction Dust Control Ordinance[9] and the Biosolids Project's required compliance therewith. However, no mitigation measures specific to dust control or dust impacts are imposed on the Biosolids Project, including in response to Impact AQ-1. Instead, the sole focus on the mitigation measures for air quality is on emissions, with two emissions-related mitigation measures imposed.

4 **AQ-3**

Given the sensitive nature of surrounding uses, including the Market's operations, and the DEIR's admission that fugitive dust is an impact from the Biosolids Project, mitigation measures should be imposed to ensure that any such impacts are less than significant, particularly given the Market's role in maintaining the City's public health. The Biosolids Project's compliance with the San Francisco Construction Dust Control Ordinance, in and of itself, is not adequate to mitigate these impacts.

C. Hazards and Hazardous Materials Impacts

The DEIR's inadequacies with respect to its hazards and hazardous materials analysis[10] are similar to, and potentially even more troubling than, its air quality analysis. The DEIR does not discuss the potential impacts of hazardous materials on the Market or the SFWPM Project. This failure to consider that the Market's operations could be significantly impacted by airborne hazardous materials, including as a result of off-haul of hazardous materials, or any other hazards related to the construction and operation of the Biosolids Project is a significant inadequacy.

5 **HZ-2**

The DEIR has only a limited discussion of naturally occurring asbestos, which is a known and potentially significant issue in the area. Indeed, a number of potentially hazardous materials have been discovered in the soil around the Market during its construction activities. These potentially hazardous materials are often the result of fill material of various depths, and include serpentine rock (which contains naturally occurring asbestos), as well as petroleum hydrocarbons, heavy metals, and other similar contaminants related to the past use of the area for

[7] DEIR, p. 4.8-72, fn. 116.

[8] DEIR, pp. 4.8-43 and 44.

[9] DEIR, pp. 4.8-31, 32, 35, 36, 43, and 44.

[10] DEIR, pp. 4.17-1 *et seq.*

O-SFWPM-2

industrial and military purposes. Despite this documented history, the DEIR devotes only two paragraphs of Chapter 4.17 to discussing naturally occurring asbestos.[11] Even more notable is the fact that only one impact analysis addresses asbestos[12], and there are no mitigation measures imposed to address it. Instead, the DEIR's analysis of Impact HZ-2 relies on the Biosolids Project's compliance with various Bay Area Air Quality Management District rules and regulations. Such limited analysis of a hazardous material known to be present in the area, with no proposed mitigation, is inadequate.

5
HZ-2
cont.

As a general matter, the DEIR's analysis of hazardous materials (as well as air quality) fails to address the SFWPM and it's sensitive, food-related operations. While it does not appear from the DEIR that there will be any off-haul of hazardous materials through Jerrold Avenue (and thus through the SFWPM itself), the close proximity of the SFWPM to the Biosolids Project, which has confirmed hazardous materials on-site, requires some discussion and evaluation of potential food-related impacts.

IV. Conclusion

In summary, the SFMC, Market, and SFWPM Project recognize the importance of the Biosolids Project to the City. However, as a vital business and adjacent site, it is important to the SFMC and Market that the Biosolids Project fits into the existing (and ever-growing and changing) neighborhood. As such, it is our position that the DEIR is inadequate in its (1) failure to properly describe the SFWPM Project and the anticipated closure of Jerrold Avenue in connection therewith; (2) failure to consider transportation, air quality, and hazardous materials impacts to the Market and the SFWPM Project; and (3) failure to require mitigation specific to air quality and hazardous materials impacts. We respectfully request that the DEIR be modified to address these inadequacies.

Mr. Timothy Johnston
San Francisco Planning Department
1650 Mission Street, Suite 400
San Francisco, CA 94103

Subject: Case No.: 2015-000644ENV **Biosolids Digester Facilities Project**
Environmental Impact Report Draft

Dear Mr. Johnston,

In reviewing the EIR for the SSIP project, there are a number of items that concern me deeply. For example, it is determined that the BDFP would result in **significant and unavoidable impacts** in the areas of cultural resources and air quality that would remain significant and unavoidable even with implementation of feasible mitigation measures.

AIR QUALITY

On the air quality issue, I am troubled that there are no serious mitigation measures proposed to offset these proposed **air quality** conditions during a construction period that 'generate levels of '**nitrogen oxide emissions that would exceed significance thresholds** during **two of the five years** of construction and that would also be a **cumulatively considerable contribution to regional air quality conditions**.' Does this indicate that we should withhold breathing for a period of 2-5 years in Bayview?

1
AQ-4

Surely there are serious plans to offset these deplorable conditions proposed for the tens of thousands of residents, including a number of elderly citizens, many young children, and thousands of active students and working adults. 'Significant and unavoidable' are profoundly disturbing descriptors.

I believe that a robust and thoroughly vetted air quality monitoring and reporting plan be developed and implemented as the project proceeds, with local and consistent notification regarding serious air quality deficiencies present, plans for 'sheltering in place' or other

actions as required on extremely bad air days, etc. A repeat of 'failed' or 'battery-less' air quality monitors, as witnessed during the denuding of Parcel A in the Hunters-Point Shipyard some years ago, for example, will not be tolerated in Bayview or by our City leadership. I'm sure that you can appreciate these concerns regarding air quality (or the lack thereof) and the overall environmental impact of this project.

1
AQ-4
cont.

CULTURAL RESOURCES

As the party responsible for the 40 year-long restoration of a City Landmark in Bayview, I am also dismayed with the plan for wholesale destruction of the Streamline Moderne Industrial Historic District in Bayview and for the Display Greenhouse structures at McKinnon and Phelps Streets, both iconic markers in the area.

2
CR-1

Display Buildings

While the display buildings are not technically 'historic', they nonetheless provide a much needed and moderately attractive facade with which to block the industrial elements of the Water Treatment Plant beyond. Destruction of those elements in favor of a parking lot for trucks and staging makes little sense and appears to be entirely unavoidable. I clearly understand the need to demolish the large and low slung white greenhouse items and the concrete building (the ancillary structure), but the green-framed Display Houses do not need to be eliminated in the neighborhood for purposes of construction. It also appears that the funding to repair these Display buildings is minor overall, and clearly beneficial when one considers the placement and connection to the community. Save the Display Buildings.

OC-3

Central Shops

I do understand the need to locate the digesters to an area far removed from residents, and, as such, concur with the recommendations proposed to remove and relocate Central Shops A and B. I also recommend that a combined solution for the loss of these historic resources be implemented, including fulfillment of **Mitigation Measure M-CR-1 along with the implementation of Alternative C**, the Historical Resources Relocation, with the relocation of the Central Shops serving as the permanent public display and archival venue for the documentation and interpretive material.

3
CR-1

415.822.3074 linda.blacketer@gmail.com

TRAFFIC and TRANSPORTATION

As I've been revising this documentation with many others in the community, I am also requesting additional review of the impact analysis on traffic and circulation from the existing 'LS' -less than significant - status to the LSM condition, requiring mitigation. Of the 40 projects considered in the cumulative impact analysis for traffic and circulation, 63% of these are SFPUC related. (see Table 4.1-1; Vol.1 p. 4.1.6).

There are multiple projects affecting the area, with many occurring simultaneously with the Biosolids Digester Project. Other projects that will affect transportation in the area are not listed in the EIR. For example, in addition to the partial closing of **Evans Street** beginning in August 2017 ; the **closure of Jerrold Avenue from Phelps to Rankin Street for** 5-6 years; the **construction staging along Phelps Avenue**; the **Palou Avenue** streetscape improvement project -from Barneveld to Crisp Avenues; the **2245 Jerrold Avenue** - construction of SFFD Ambulance Deployment Facility; ;the re-routing of the **23 Muni Bus Line to Palou Avenue**, the temporary closure of the Illinois Street Bridge at Islais Creek, we are potentially in real trouble when desiring to enter or exit our neighborhood by vehicle. There is also the relocation of the 23 Monterery Muni Line from Jerrold Avenue to Palou Avenue as a temporary measure during course of construction, but the Palou Streetscape project indicates the eventual and permanent relocation of the 23 to Palou Avenue following the streetscape improvements. Better planning is required for the transportation elements of the project, in my opinion.

4
TR-4
OC-2

The only exit to the North, along Third Street, is the Islais Creek Bridge. This area is a noted potential **liquefaction zone** and will be significantly compromised during a seismic event. These transportation issues are life safety and quality of life issues. Please take these concerns seriously. I am also recommending that the construction of the Quint Street bypass road be completed quickly. The loss of the Quint Street roadway due to the construction of the CalTrain berm and crossing has caused innumerable delays

5
TR-2

6
TR-4

415.822.3074 linda.blacketer@gmail.com

and traffic circulation problems for may in the community. I am supporting the recommendations made by others in this regard, and outlined as follows:

1. Study and re-evaluate the conclusions drawn in the EIR regarding the significance of the traffic impacts, along with a more clearly articulated and written, multi-agency transportation and traffic plan prior to certification of the EIR.

2. Completion of the Quint Street Connector by December 31, 2018.

The **Quint Street Connector ByPass** roadway plan should be **expedited and built, as part of the PUC project**, prior to major construction in 2018/19, in our opinion. An inter-agency cooperative effort is essential in this regard. I ask the Mayor, Mr. Kelly(SFPUC), Mr. Nuru (SFDPW) , Supervisor Cohen (D10) and other respected and effective City leaders to coordinate closely and purposely to see this project completed as soon as possible.

6 cont.
TR-1
TR-4

3. **Reconsideration of the temporary relocation of Muni 23 Monterey Bus line**. Work with Muni/SFMTA to reconsider the placement of the 23 Monterey Bus from Palou to another location during the construction timeframe.

Thank you very much for reviewing these comments on Air Quality, Cultural Resources and Transportation items as outlined in the draft EIR.

Sincerely,

Linda K. Blacketer
Proprietress, The Sylvester House
San Francisco City Landmark # 61

Subject: Bayview resident Ximena Ares comment re EIR re Biosolids Digester Facilities Project (BDFP)

Dear Planner Johnson,

I'm writing to provide my comments for the EIR related to the BDFP. I'm a Bayview resident of 11 years and live 2 blocks from the BDFP site.

While I support the BDFP for its potential to reduce the odors we currently experience from the existing water treatment plant, I am and have always been deeply concerned about the lack of accessibility of Bayview. In particular:

- the existence of Caltrain tracks and lack of underpasses on all streets worsened by the permanent closure of the Quint bridge a couple of years ago: http://www.caltrain.com/projectsplans/Projects/Caltrain_Capital_Program/Quint_Street_Project.html;
- the lack of an intake mechanism by the SFMTA to improve traffic signage, flow and pedestrian access and safety in the industrial zones that surround Bayview, making them hazardous deserts for bikers and pedestrians;
- the lack of streets and routes of access to Bayview, being Jerrold, Evans and Third Street the only 3 routes available to Bayview residents and business to exit Bayview towards the West and North, where the most traditionally attractive features of SF are, including jobs.

1
TR-1

The above conditions make living in Bayview an isolating experience and an unsustainable one in view of the projected growth of the Bayview population in the next couple decades. **I would be deeply grateful if you could please object to any additional proposed street closure, or any other measure or proposal that could reduce automotive and pedestrian accessibility of Bayview even further, including any temporary closure of Jerrold St.**

I appreciate your willingness to listen and help.
'
All the best,
Ximena Ares

Quint Street Project

Subscribe to receive e-mail notifications about the Quint Street Bridge Replacement Project.

Scope & Need
Caltrain will remove the existing Quint Street Bridge which is over 100 years old and is at the end of its useful life with a new berm. The current bridge is deemed structurally deficient, does not meet existing seismic safety standards and must be replaced to ensure the safety of community members and Caltrain passengers. The new berm will be designed to allow for a potential Caltrain station to be located at Oakdale Avenue in the future.

The contract for the Quint Street Bridge Replacement project was awarded to Shimmick Construction Company, Inc. in August 2015.

Quint Street Project Construction Update

Construction of the Quint Street Project has been completed.

Closure of Quint Street between Newcomb and Jerrold Avenues began on October 5, 2015. During the closure, Caltrain has established traffic rerouting signs for pedestrians and motorists to help with traffic flow.

Construction Impacts
Work to replace the bridge with a new berm will begin in November 2015 and is expected to last 6 months. Closure of Quint Street between Jerrold Avenue and Oakdale Avenue is expected to begin on September 28, 2015 (or after). The San Francisco County Transportation Authority's Quint-Jerrold Connector Road project will follow the berm construction. The planned connector road will link Quint Street, just north of Oakdale Avenue, to Jerrold Avenue via a new road along the west side of the Caltrain tracks. More information regarding the Quint-Jerrold Connector Road project can be found at www.sfcta.org/quint.

During the closure, Caltrain will establish traffic rerouting signs for pedestrians and motorists to help with traffic flow. Please see traffic rerouting map below for details.

While a majority of the work will be completed during the day, in order to maintain rail operations, night and weekend work will be required for some construction activities.

Public Outreach & Community Engagement
In partnership with the San Francisco County Transportation Authority, Caltrain has participated in numerous community outreach events and meetings starting in 2012. Outreach activities included several open houses, multiple presentations to community groups and commissions, and multilingual notifications through email, mailings and flyers.

Caltrain will continue to engage the public in multiple venues to provide more information and collect feedback about the project.

Nearby residents and businesses will be notified via mail about upcoming construction impacts. Caltrain will continue to work with the San Francisco County Transportation Authority to build awareness about the project and its impacts.

Re: BDFP EIR Comments
Project Address: 750 Phelps Street, 1700 Jerrold Avenue, 1800 Jerrold Avenue, and 1801 Jerrold Avenue, San Francisco

Dear Mr. Johnston:

I am a resident and business owner in the Bayview and I am writing today to request additional review of the impact analysis with respect to Air Quality (Section 4.8). The EIR divides the contributions to air quality into two categories, operations of the completed plant and thos activities necessary to construct the plant. Of the activities that contribute to air quality some are impossible or difficult to mitigate successfully. However, one component does led itself to successful reduction and that is truck trips, both during construction project and trips during the operation by using rail to transport the construction material and the biosolids during operation of the plant.

The primary pollutant generated by truck trips is NOx and the EIR projects a total of 31,123 lbs of NOx emitted in our neighborhood during the five years of construction (Section 4.8-8). In addition many tons will be emitted during the operational life of the project. Several methods of mitigation are recommended, nevertheless, *"the construction-related NOx emissions are considered <u>significant and unavoidable</u> with mitigation"* (4.8-49) in addition to the significant degradation of our air quality, these 71 truck trips a day will severely impact traffic and emergency access to our neighborhood (4.6-28).

The EIR projects seventy one (71) construction truck trips a day for the duration of the project (. These truck trips will also have a negative impact on traffic and emergency access. Rail transportation would ameliorate these impacts as well.

1
AL-1

The use of rail transportation for hauling the biosolids during the operation of the plant was analyzed in Section 6.5.4-2. However that analysis is inadequate in several respects:

- The analysis only considers the use of rail to haul the operation biosolids. It should consider the alternative of using rail for BOTH the operations biosolids and the construction material. Especially the waste going to Altamont as there exists a well established process for rail transportation of that commodity. **I request this option be analyzed.**
- The analysis assumes that all material needs to be trucked to the SFBR yard along Cargo Way. The possibility of loading directly onto rail cars at the site by constructing a loading spur off the nearby Quint Street lead needs to be analyzed. Such direct loading would achieve dramatic reduction in total truck trips. Furthermore such direct loading was once practiced at that location. **I request this option be analyzed.**

2
AL-1

The use of rail transportation to transporting such bulk items has benefits beyond improving air quality.

- Reducing truck trips will also reduce the impacts on traffic.
- Using a rail spur will enhance the ability to organize the logistics of construction, possibly reducing the need for construction staging areas and “lay-down” space.
- Moving freight by rail reduces greenhouse gas emissions by 75% over trucks (*“Freight Railroads Help Reduce Greenhouse Emissions”* ARR Study April 2017)
- Utilizing the railroad infrastructure that currently exists next to the proposed project will reduce the degradation of our streets and highways caused by the tens of thousand heavy truck trips during the five year course of construction. And into the future with the operation of the new plant.

3
AL-1

Sincerely,

Michael Hamman

Re: BDFP EIR Comments
Project Address: 750 Phelps Street, 1700 Jerrold Avenue, 1800 Jerrold Avenue, and 1801 Jerrold Avenue, San Francisco

Dear Mr. Johnston:

I am a resident and business owner in the Bayview and I am writing today to request additional review of the impact analysis with respect to ***CULTURAL RESOURCES.***

As an admirer of architecture, I am also dismayed with the plan for wholesale destruction of the Streamline Moderne Industrial Historic District in Bayview and for the Display Greenhouse structures at McKinnon and Phelps Streets, both iconic markers in the area and contributory to the historic district. The preservation of such buildings is crucial for the community to retain a sense of it's past and it's distinctive character. 1 **CR-1**

Display Buildings
While the display buildings are not technically 'historic', they nonetheless provide a much needed and moderately attractive facade with which to block the industrial elements of the Water Treatment Plant beyond. Destruction of those elements in favor of a parking lot for trucks and staging makes little sense and appears to be entirely unavoidable. I clearly understand the need to demolish the large and low slung white greenhouse items and the concrete building (the ancillary structure), but the green-framed Display Houses do not need to be **OC-3**

eliminated in the neighborhood for purposes of construction. It also appears that the funding to repair these Display buildings is minor overall, and clearly beneficial when one considers the placement and connection to the community. Save the Display Buildings.

1 cont.

Central Shops

I do understand the need to locate the digesters to an area far removed from residents, and, as such, concur with the recommendations proposed to remove and relocate Central Shops A and B. I also recommend that a combined solution for the loss of these historic resources be implemented, including fulfillment of **Mitigation Measure M-CR-1 along with the implementation of Alternative C**, the Historical Resources Relocation, with the relocation of the Central Shops serving as the permanent public display and archival venue for the documentation and interpretive material. As I have had some experience in relocating building in my capacity as General Contractor I can attest to the fact that such a relocation would not be unduly expensive.

Re: BDFP EIR Comments
Project Address: 750 Phelps Street, 1700 Jerrold Avenue, 1800 Jerrold Avenue, and 1801 Jerrold Avenue, San Francisco

Dear Mr. Johnston:

I am a resident and business owner in the Bayview and I am writing today to request additional review of the impact analysis with respect to ***TRAFFIC and TRANSPORTATION***

As I've been revising this documentation with many others in the community, I am also requesting additional review of the impact analysis on traffic and circulation. For the following reasons:

- There are multiple projects affecting the area, with many occurring simultaneously and the EIR does not consider the cumulative impact of all these projects together. Several huge projects in the area were not considered at all, including the 1200 new housing units in the Build Inc project the 900 units in the Shipyard project as well as numerous projects on Third Street such as the Chris Harney project. In addition projects by other agencies such as the closing of the Third Street "Nishkin" bridge by DPW. I request a complete inventory of all the projects expected during this project be considered.

1
TR-4
OC-2

- The economic impact that these road closures will have on the existing

2
GC-2

local businesses was not adequately analyzed. Many of these small businesses will not survive this loss of customers. This analysis need revision.

2 cont.

- The impacts to this community during an emergency especially a seismic event was not well considered. With all the main corridors into and out of the Bayview closed and the main bridge across the creek closed and the huge incres in populating access into and especially out of the Bayview after an earthquake will be severly compromised. With no access how will we fight fires or evacuate the injured? This aspect must be further analyzed.

3 **TR-2**

Sincerely,

Michael Hamman

Subject: BDFP EIR

Dear Mr. Johnston,

I am a commercial property owner here in San Francisco and I have several properties on the block bounded by Third, Jerrold, Innes and Phelps Street which are adjacent to the Southeast Treatment Plant. My commercial tenants will be 1 GC-2

negatively impacted by the proposed project. I am hopeful that the negative impacts can be mitigated with a well thought out development plan. My initial concerns are as follows:

1 (cont.) **GC-2**

Traffic Circulation-Phelps cannot handle any increase traffic and it will only get worse should Jerrold Avenue be closed to through traffic. Has access to the construction site off of Rankin at Evans been fully vetted ? Can the site be accessed off of Oakdale with the re-opening of Quint Street in a more timely matter than what has been discussed to date? I would like to see that a thorough traffic analysis be completed taking into account these two other access options.

2 **TR-1**

With the proposed closure of Jerrold Avenue I do not see how one could overburden the neighborhood businesses and residents by proposing to use Phelps for construction staging/parking for this project. The local business count on this street parking for their livelihood. I would like to see a better solution for construction staging /parking for this should not be considered as a use for Phelps street which street parking should be reserved for local business and residents.

3 **TR-3**

The BIT (Bayview Industrial Triangle) which includes Jerrold Avenue between Third and the Southeast Plant still is an area that has overhead utility lines, inadequate (non ADA) sidewalk curbs, lacking uniform street trees, no sidewalk lighting etc.. Given all that is planned and knowing the hardship this multiyear build will place on local business and residents it would be nice to see real tangible community benefits being presented as part of the entire proposal.

4 **GC-3**

Your time and consideration in reviewing this proposal is much appreciated.

Re: BDFP-EIR Comment and Recommend Project Address: 750 Phelps Street, Jerrold Avenue, and 1801 Jerrold Av Case No.: 2015-000644ENV

Dear Mr. Johnson,

As a member of Resilient Bayview, I work with an impressive group of community leaders who seek to leverage resources on behalf of and with the varied communities in the Bayview.

The SFPUC project in the Bayview is of enormous concern to me. The communities, businesses and residential, along Phelps, 3rd and Jerrold are revitalizing and much more stable than they have been in many years, but are still quite fragile. The SFPUC expansion and upgrade in the area with its vast footprint and its 20-year timeline (when you put the discreet phases together) will have a devastating impact on the residents and businesses in the area, the property values, the quality of life, and just the simple ability to conduct business and get around and through the neighborhood. 1 **GC-2**

While SFPUC makes claims that it is mitigating the impact of its construction and upgrades, the actual neighborhoods impacted by the construction will undergo a scorched earth approach that has little regard for protecting community assets where the assets and the community currently exist. I would ask that you at the very least

1. Preserve the smaller, yet taller, glassed in greenhouse 'facade' - at the intersection of Phelps and McKinnon Avenues. A "display of interpretive materials" is not a suitable replacement for the actual assets that currently exist and can be used by the community. 2 **OC-3**

2. Undergo additional review of the impact analysis with respect to traffic and circulation (Impact TR 1-5 incl.; Vol.1 s28) from the existing 'LS' -less than significant - status to the LSM condition, requiring mitigation. Current plans will have a devastating impact both to businesses, many of whom will leave the area if they cannot conduct business day-to-day, and residents. 3 **GC-2**

3. Enroll fenceline residents in the area in a long-term health study that seeks both to understand and mitigate the detrimental health effects of the "deteriorating air quality 4 **AQ-4**

issues" that are noted as 'significant and unavoidable' during construction. This study should continue for all fenceline residents who live near the SFPUC Sewerage treatment plant and who will be exposed to significant and unavoidable pollution from the sewerage treatment facilities. 4 cont.

Thank you for reviewing these comments. I respectfully request also that you seriously consider the thoughtful recommendations of Dan Dodt and Bayview Community Planning. I look forward to hearing from you and hope to work with you in protecting the economic, cultural and physical assets of the Bayview as well as the health and prosperity of its residents. 5 **OC-1**

Sincerely,
Rosalind Hinton, PhD

Subject: Southeast Water Plant EIR

Hello Timothy Johnston

I am a member of the Bayview-Hunters Point community. I understand that significant work is being planned for the southeast water treatment plant in the near future. Of course I support maintenance and upgrades to our city's utilities, especially one as important to our health as waste removal. 1 **GC-1**

I understand that this is a major project that will take six years to complete and in that period significant east-west streets will need to be blocked, specifically Jerrold Ave and parts of Evans Ave.

While you are focused on doing your best work, I hope that your plans take into account the folks who live and work in the Bayview and ensure we continue to have access to Cesar Chavez, Bayshore Blvd. and the freeways. 2 **TR-1**

We also appreciate keeping the dust to a minimum and protecting our community from toxic waste while you work on our pipes. 3 **AQ-3**

I will not be able to attend next months hearing, but I did want to communicate my concerns to the planning dept.

Best of luck.

Re: Biosolids Digester Facilities Project - EIR Comments
Project Address: 750 Phelps Street, 1700 Jerrold Avenue, 1800 Jerrold Avenue, and 1801 Jerrold Avenue, San Francisco

Dear Mr. Johnston:

I am a member of the Development Committee and the Executive Committee of the Potrero Boosters Neighborhood Association; I am writing today in support of my neighbors in Bayview and their comments regarding the Biosolids Digester Facilities Project EIR, requesting additional review of the impact analysis for Air Quality (Section 4.8). 1 **AQ-1**

I realize that these comments are being sent after the published deadline for EIR comments of June 19, 2017. However, I believe the issues I am discussing here have already been raised by Bayview neighbors of the project, and I am happy to lend my voice in support of them. (I believe you will soon see a number of neighborhood groups throughout Bayview and the City come together in an official alliance for environmental justice in Southeast San Francisco; to that end, I am cc-ing these comments to some Bayview neighbors, members of the SFPUC CAC, and to Yolanda Manzone of the PUC, who is presenting a draft Environmental Justice Analysis of the project to neighborhood groups in the coming months.) 2 **GC-4**

These comments are my opinions as an individual, since the Potrero Boosters Neighborhood Association has not yet taken a position regarding the project. However, the Boosters have for many years taken strong positions in support of their neighbors, especially on development, environmental, and EIR issues; and I will be asking the Association to take a formal position along the lines expressed in this letter.

All that said:
My comments are centered around the issues of truck traffic and their emissions. The EIR considers and recommends several methods of mitigation; but it goes on to say *"the construction-related NOx emissions are considered <u>significant and unavoidable</u> with mitigation"* (4.8-49). I must disagree – **a significant amount of the construction-related NOx emissions can be avoided** by utilizing rail transportation instead of trucks. 3 **AL-1**

Quoting my neighbor, Michael Hammann, in his EIR comments:

> *"The primary pollutant generated by truck trips is NOx, and the EIR projects a total of 31,123 lbs of NOx emitted in our neighborhood during the five years of construction (Section 4.8-8). . . .*
>
> *"The use of rail transportation for hauling the biosolids during the operation of the plant was analyzed in Section 6.5.4-2. That analysis is inadequate in several respects:*
>
> - *The analysis only considers the use of rail to haul the operation biosolids. It should consider the alternative of using rail for BOTH the operations biosolids and the construction material. Especially the waste going to Altamont as there exists a well established process for rail transportation of that commodity.* ***I request this option be analyzed.***
> - *The analysis assumes that all material needs to be trucked to the SFBR yard along Cargo Way. The possibility of loading directly onto rail cars at the site by constructing a loading spur off the nearby Quint Street lead needs to be analyzed. Such direct loading would achieve dramatic reduction in total truck trips. Furthermore such direct loading was once practiced at that location.* ***I request this option be analyzed."***

I am certain that additional analysis will reach the same conclusion that other developers and contractors have found over the years – that rail transportation has less impact on air quality than truck traffic.

3
AL-1
cont.

In the interest of reducing traffic and congestion, I also ask the PUC to live up to their promises to the neighborhoods by building the Quint Street Connector Bypass, as soon as feasible, to re-connect Oakdale and Jerrold Avenues.

4
TR-4

I worked on the successful campaign for Proposition I in 2004, forcing Muni to replace their old diesel buses and improve their air quality standards. **All City agencies should take great care to minimize and mitigate their environmental impacts in this heavily-burdened neighborhood.** I look forward to the PUC acting responsibly in their construction and operation of the new Biosolids Digesters.

5
GC-4

Please feel free to contact me with any questions, etc.

Sincerely,

Tony Kelly

Subject: Biosolids digesters project of SFPUC, Case No.: 2015-000644ENV -- comment

The proposed new digesters are to employ a new technology, THP. Will there be less resilience than now? San Francisco is subject to earthquake, flood or deluge, possibly tidal wave sea rise, and terror attack, any of which may change digester feedstock. Avoiding digester upset should be a priority. Digester upset, especially if extended in length, could harm San Francisco's livability and its economy. Will the new digesters (will the sewage treatment plant with them) be as resilient as what we have, or could have, and if not, what mitigations or steps are prudent? 1 **PD-3**

Subject: Biosolids digesters, 2015-000644ENV, comment on Draft EIR

Ratepayers are to spend in the neighborhood of $1.5 billion for new digesters at SEP. Work and commissioning is to be completed May 2025. Objectives for the project include "meet treatment capacity for projected 2045 flows and loads." The City is growing, and is expected to continue to grow both jobs and residents. Recently growth has been faster than past estimates; growth projections keep being revised upward. The existing digesters were built in the early 1950s, and will have lasted seventy years. The proposed digesters may be adequate for only twenty years. Given the size and cost of the project, both in dollars and in disruption, and environmentally, the objective of meeting flows and loads for only twenty years seems questionable. While per person use of water has declined, has "load" per person for purposes here? One reads that more pills, household products, and other new challenges make their way into sewage. One reads that the average person is larger than in the past. Have these trends been considered? Is it environmentally sound to plan for a twenty-year period, especially when recent experience suggests that projections might be low?

Regarding the DEIR for the Biosolids Digester Facilities Project

Dear Timothy P. Johnston,

I was born and raised in San Francisco, and I have been a volunteer for various Native organizations for over 25 years. My focus continues to be education concerning Ohlone issues, especially the preservation of the ancient monuments and funerary places, the shellmounds. Initially, I must point out that the term "midden" which is used in the DEIR to describe the Ohlone heritage site, CA-Sfr-171, is derogatory. "Shellmound, village site, or cemetery" would be more accurate, for the word midden means "dung hill." 1 CR-3

The 48 day comment period does not provide ample time for members of the public to study and respond to this DEIR. Nonetheless, I wish to express my interest in the preservation of the Ohlone heritage site, CA-Sfr-171. Since I have not been in a position to research the DEIR during the past 48 days, I am not prepared to address the DEIR adequately. Thus, I have enclosed some copies of the educational materials which my group, Save the Shellmounds, distributes. 2 OC-1

Please note, that CA-Sfr-171 is a cultural treasure of the Ohlone, and that its protection ought to be of greatest importance. The Ohlone do not get to make the decisions about the preservation of their own heritage sites. The fate of shellmounds, cemeteries, village places, and other sacred sites is in the hands of property owners and politicians. The Ohlone and their heritage places have been controlled by others since the Spanish invasion of the 1770s. Destruction of these heritage places is a hate crime. Very few of the shellmounds, and other heritage places, are preserved. Once CA-Sfr-171 has been destroyed, the opportunity to save this priceless monument has ended. 3 CR-2

Please, reconsider this project so that not only CA-Sfr-171 remains intact, but also that any other shellmounds might be saved.

SAVE THE SHELLMOUNDS!

South City Won't Disturb Shell Mound

(5/27/1999) 5/28/99

Council rejects plan for big project near Ohlone Indian site

By Marshall Wilson
CHRONICLE STAFF WRITER

American Indians and environmentalists scored a victory yesterday when South San Francisco officials rejected a plan to build a hotel and offices next to a 5,000-year-old Ohlone settlement.

Nearly 50 people spoke for or against the proposed development, known as Terrabay III, during an often emotional four-hour hearing that began Wednesday and ended early yesterday.

Activists from throughout the Bay Area criticized a plan that would put an office building on one side of an Indian shell mound and burial site at the base of San Bruno Mountain and a restaurant and hotel on the other.

"To develop a sacred site is really wrong," said Fred Short, an American Indian from Alameda. "The mountain is sacred. To us, our people are still up there."

Those concerns were enough to persuade the City Council to reject plans for development that would flank the Indian site.

In a 4-to-0 vote, council members said they want no development north of the site but would consider development to the south, although how close or how large was left ambiguous.

Councilman John Penna, who runs a local realty company, abstains on Terrabay issues and did not cast a vote.

The council's decision was the latest chapter in a 30-year battle over the fate of San Bruno Mountain. Environmentalists have long fought any development on the mountain, which is also home to the endangered Mission Blue butterfly.

Dennis Breen, project manager for the developer, SunChase Inc. of Arizona, said plans for Terrabay's three phases already have been sharply scaled back from what was originally approved in 1982.

He said the proposed hotel, offices and restaurant would provide the city with taxes and jobs.

Moreover, the project design, he said, shows respect for the American Indian site, which would be left undisturbed.

If the council's action results in a further scaled-down project, it could have broad consequences.

As proposed, SunChase would have been obligated to contribute as much as $8.5 million for roadway improvements if the project was approved.

But less development would mean fewer SunChase dollars that would be used to relieve congestion.

In the coming weeks, city planners will meet with SunChase to determine how much development could be placed south of the Indian site.

Any revised plan would eventually need City Council approval.

Plans submitted by SunChase called for a 150-room hotel, 7,500-square-foot restaurant and 340,000-square-foot office building, with a 30-foot buffer zone around the 2.5-acre former Indian settlement.

Today, a casual observer would have trouble finding the site, situated off Highway 101 near the Brisbane border.

But American Indians and archaeologists say the mound is what is left of one of the oldest known Indian villages in the Bay Area.

"When it comes to desecrating our cemeteries, we are going to stand up and speak," Patrick Orozco of Watsonville told the council.

Orozco's and similar comments clearly had the desired effect.

Councilman Joe Fernekes said he wanted city planners and the developer to devise a plan that would leave "the Ohlone burial site alone."

Councilman Eugene Mullins first praised the project because it would put jobs along a major transit corridor.

However, he said he could not support placing development so close to a site dear to American Indians.

Although opponents outnumbered supporters, the project drew praise from trade union representatives whose members stand to gain construction jobs if a final version is approved.

South City has a long history as a blue-collar union town.

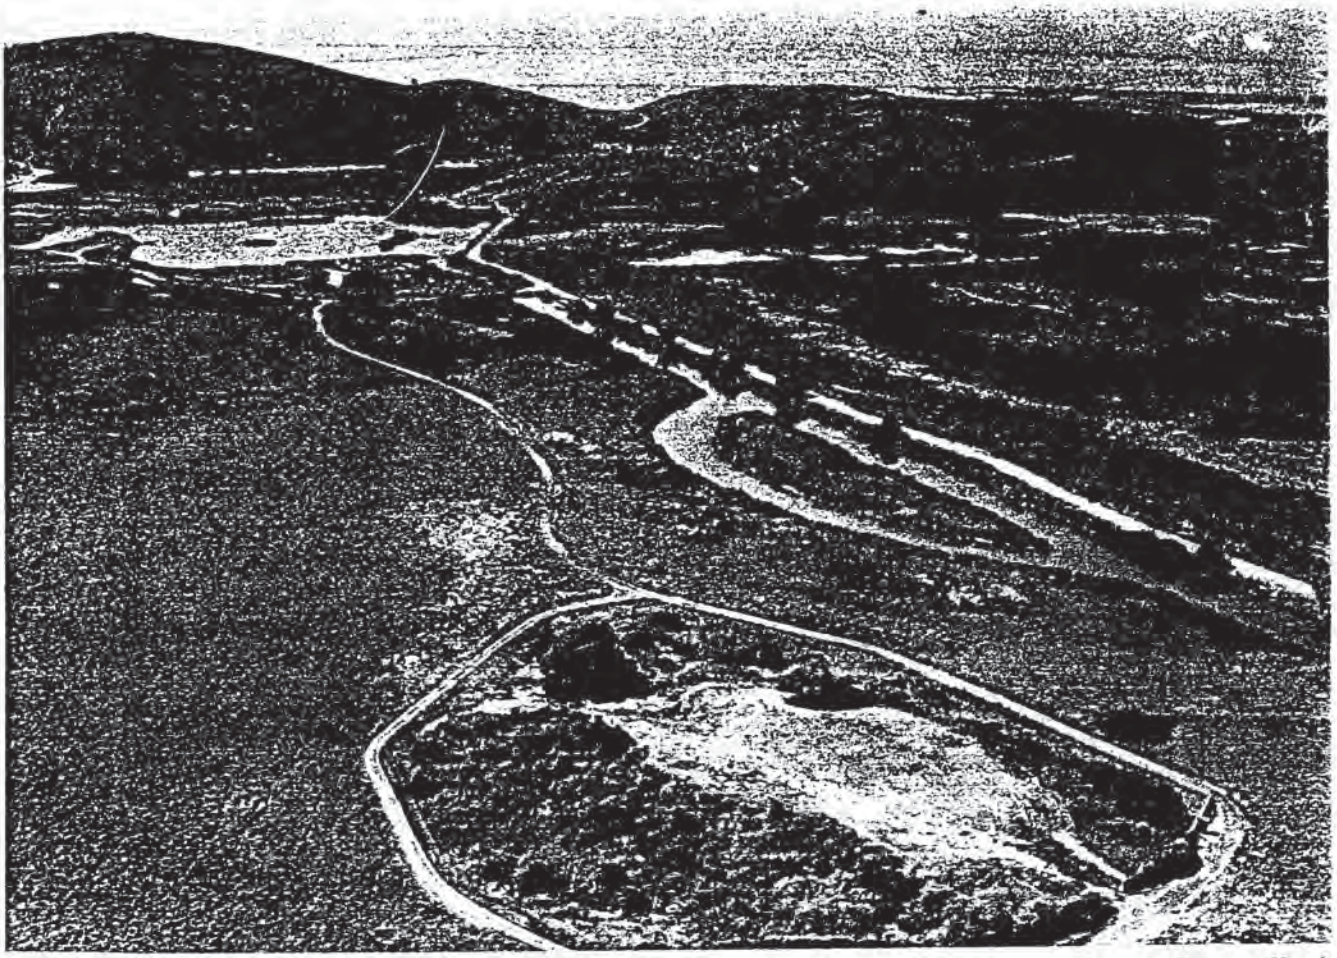
Control of Ancestral Remains

Rosemary Cambra

Recently the media has widely publicized what has been construed as a very controversial issue: the reburial of Native American ancestral remains currently held within the vaults and shelves of museums and other curational facilities. The recent decision by the Stanford University administration to consider a request made on behalf of documented Costanoan/Ohlone family members to have approximately 550 ancestral human remains reviewed for scientific merit (future research potential), proper curation and possible reburial, has sparked a storm of accusations, misinformation, and controversy in the scientific and Native American communities.

First of all it is not our intention to impede scientific inquiry relating to our heritage and ancestral remains. We are, however, concerned that the orientation of archaeological research, specifically relating to the Costanoan/Ohlone Territory, has been and is currently much undernourished. Many of our family members have reviewed the extant and generally inaccessible literature about our people (biological, prehistorical, and cultural) from the archaeological and historical records. We have determined that for the most part the archaeological community has resigned itself to removing us as living descendants from our ancestral past or what they call "the Archaeological Record." The history of anthropological thought and the development of regional models for prehistoric California is most remarkable when one views it with a native eye. We find ourselves looking at our rich ancestral past through the eyes and interpretive minds of an alien world view. Many archaeologists for purposes of continuity and from the way they were socialized within the discipline of anthropology, find it useful to pigeonhole our ancestral past into fictitious phases, facies, horizons, or other clever and catchy nomenclature. Seldom do they recognize that the human remains, along with the associated assemblage of ceremonial regalia, represent our ancestral past. What archaeologists tend to call "collections, materials or archaeological residues," we refer to as "our ancestral remains."



The history of anthropological and archaeological inquiry around the Bay Area and California was inspired by Dr. Kroeber at UC Berkeley at the turn of the century. Dr. Kroeber, in conjunction with his colleagues, attempted to "salvage" the remnant memory, culture, language, songs, and other working knowledge of their respective societies from the elders of various tribal groups before they died. Recognition of their efforts must be acknowledged even though they were somewhat purist in their world view. While some cultural anthropologists were busy interviewing the elders of the tribes, another group took an interest in the large shell mounds that dotted the San Francisco Bay shore. Interestingly, these anthropologists never tried to explain, based upon discussions with late 19th- and early 20th-century knowledgeable tribal people, how the mounds developed and specifically why so many burials were contained

Left: Norma Sanchez, Rosemary Cambra (Chairwoman of the Muwekma Indian Tribe), and Ann-Marie Sayers (Mutsun Indian Tribe).

Right: Robert Sanchez and Dolores Sanchez, Muwekma elders.

Partly excavated shellmound at Coyote Hills Regional Park, Fremont. Photo courtesy of East Bay Regional Park District. At the turn of the century there were 400 such mounds, all but a handful of which have been excavated or paved over.

therein. These early studies were focused upon the antiquity of the mound based upon volumetric shell analysis. Essentially the model developed was: take how many shellfish one individual eats per year, and extrapolate it through time based upon the overall estimated volume of shell at the site. In the late 1950s and 1960s other publications concerning the Alameda Bay Shore Mounds were published — for example the report on CA-ALA-328. In this report we are introduced to a complex stratified mound containing numerous burials. The archaeologists discuss the "ceremonial complex" at this site by the identification of the presence of charmstones, quartz crystals, red and yellow ocher, and other associated objects. What archaeologists fail to address is that these objects and "associations" are merely by-products of our ancestral "ceremonial complex," and that we performed funeral ceremonies when our people died and mourning ceremonies thereafter. The point is that the scientific community has done very little to help bridge the gap between the living descendants who trace their lineages through the missions and their pre-contact ancestral lifeways as interpreted through archaeological processes.

As a result of the recent storm of articles concerning Stanford's decision to consider the requests made by the concerned descendants, a newsletter has been published by a group of archaeologists called ACPAC, which essentially assails the decision made by Stanford University. Furthermore, there is an attempt within this newsletter to discredit our concerns as Native California Indian descendants, by reducing us to a negative image. They refer to us as nameless and faceless "activists." Similar tactics were employed by the government and media against the North Vietnamese people by reducing them to faceless "enemies" and "communists." Additionally, the ACPAC folks have determined that these few activists are bent upon destroying the collections and Indian culture by reburying ancestral remains back in the ground. We are surprised and chagrined that these supposed men of knowledge would stoop to such tactics. We don't have a Ph.D. in anthropology. We do, however, have our documented lineages that demonstrate that we are indeed descendants of the people buried within our ancestral territory.

The anthropological community, rather than reacting in such a hostile fashion, should recognize that Native American communities change through time. Change involves some loss. We no longer know how to start a fire with sticks. But how many anthropologists know how to harness a plow horse? Does their loss of "tradition" make them less Anglo? Change also brings gain, in our case the acquisition of knowledge and power. Knowledge and power were inaccessible to us during the past scores of years. Our parents' genera-

tion was socialized to accept a lower status in this society. Education and avenues to economic advancement were certainly not available to our people until the civil rights era. Rather than taking a position, based upon ignorance and misinformation, that is hostile to us, the scientific community should try to provide a forum for discussion in order to understand the dynamics of changing Native American communities. Have they forgotten their own basic curriculum? What do California anthropologists and archaeologists do these days? How does their work benefit the communities they are studying? How does their work benefit the greater society and upcoming generation of school children? We, Costanoan/Ohlone descendants, have seen much money spent on Bay Area pre-contact archaeology. However, we haven't seen the benefits passed on to the greater general public or to ourselves in the form of educational curriculum, public forums, or displays. We desire that the history of our rich heritage be known! For over ten thousand years our ancestral peoples have lived and died in California. We have been involved with local institutions and archaeologists, receiving training in current processes concerning "cultural resource management." We desire that, if there are impacts to our ancestral villages and cemeteries, and an archaeological recovery program must be formulated, then we want to be part of the decision-making process rather than being treated in the traditional "after the fact" token fashion. Furthermore, the research designs should incorporate a way to bridge the living descendants with their pre-contact past. In other words, if you are going to do archaeology, it better be good! We already know that you think we ate nuts and berries and hunted deer, but the literature is devoid of the rich culture and human qualities that were shared among us who inhabited the area of central California!

Regarding our concerns about our ancestral remains residing within the vaults at Stanford University, we want to offer the following:

1. Due to the historical nature of archaeology as a discipline within California there were no guidelines concerning the treatment of human remains as well as other curational standards until these past two decades.

2. When we were invited to review our ancestral remains housed at Stanford, we expressed that we would prefer that they be curated in a different and more sensitive fashion.

3. We inquired about what is the long- and short-term research and educational potential for these ancestral human remains now that Dr. Gerow has retired from Stanford.

4. We requested that an independent physical anthropologist be brought in as a consultant to assess the research and educational value of these ancestral human remains. Dr. Philip Walker from UC Santa Barbara was selected to do this assessment.

5. We requested that those human remains thought not to have any further research value for the scientific community be turned over to us for proper reburial.

6. And finally, if the assessment (of which we are awaiting the final results) does suggest that some of these ancestral remains do indeed have additional research potential prior to reburial, then we desire that the scientific community generate their research designs and propose their scope of work within a reasonable time frame. We desire as much as anybody else to know more about our ancestral lifeways and heritage. We want people to communicate their scientific proposals to us so that we can work with these scholars. We have proposed a partnership with the scientific community based upon mutual respect and sensitivity. We want those people who are most critical of our position to send us copies of their publications and communicate directly with us the scope of their concerns. We believe that there should be good research and this must be done in an atmosphere that is sensitive and respectful. Our ancestors were buried by their loved ones. They have patiently resided in the ground over the thousands of years. Even in death, they can still offer knowledge to the world around them. We feel that it is our duty to be the stewards of our ancestral people and heritage. We also believe that our rich history should be celebrated and not stereotyped. These bad feelings, accusations and corruption of the truth are a desecration of our traditions and a blemish on the face of academia and the scientific community. By creating a working partnership with the scholarly community, and by making intelligent and sensitive decisions concerning our ancestral past, we have the opportunity to enjoy our cultural revival and ensure the survival of our people well into the 21st century.

Rosemary Cambra is a spokesperson for the Costanoan/Ohlone Muwekma Tribe, and head of the Ohlone Families Consulting Service - San Jose.

Illustration by Scott Kimball © 1989. Courtesy of Orion (Chico State University newspaper).

Editors' Note: The success of the negotiations between Stanford University and members of the Costanoan/Ohlone community regarding the return and reburial of human remains has reverberated throughout the country. The Smithsonian Institution has since taken steps to allow the return of certain remains in its possession, and the Lowie Museum of Anthropology in Berkeley, after an initial display of reluctance, also seems ready to alter its policies.

At a recent meeting of the World Archeological Congress in Vermillion, South Dakota, the World Indigenous Congress recommended the adoption of the following:

1. Ensure that grave robbing and pot hunting done in the name of scientific inquiry, academic freedom, and professional development be ended immediately.

2. Those individuals, institutions, and governments responsible for the disinterment and curation of indigenous remains and grave goods bear the full cost of reburying same.

3. Advocate passage of enforceable laws which protect indigenous cemetaries, grave sites, and burial mounds.

4. Return all curated indigenous remains and associated sacred burial possessions to appropriate indigenous groups.

"Stand Up If You Can" Muwekma Monument

The present-day Muwekma Ohlone Tribe is comprised of all of the known surviving Native American lineages aboriginal to the San Francisco Bay region who trace their ancestry through the Missions Dolores, Santa Clara and San Jose. The aboriginal homeland of the Muwekma Tribe includes a large contiguous geographical area that historically crosscut linguistic and tribal boundaries that fell under the sphere of influence of the three missions between 1776 and 1836.

In 1906, as a result of the discovery of the 18 unratified California Indian Treaties (negotiated between 1851-1852), Charles E. Kelsey of San Jose, was named Special Agent by the Indian Service Bureau in Washington, D. C. to identify all of tribes and bands needing land. One of these tribes was the Verona Band of Alameda County residing in Pleasanton, Niles and surrounding towns near Mission San Jose. The direct ancestors of the present-day Muwekma Tribe were Federally Acknowledged as the Verona Band by the U.S. Government beginning in 1906. Since 1900, noted anthropologists and linguists such as A. L. Kroeber, E. W. Gifford, J. A. Mason, C. Hart Merriam and J. P. Harrington (between 1902 and 1934) interviewed the last fluent speakers of the languages. During this time these knowledgeable Verona Band Elders still employed the linguistic term "Muwekma" which means "The People" in the Ohlone languages spoken in the East and South San Francisco Bay.

During World War I, Muwekma men served overseas in the United States Armed Forces, and four of them (Tony Guzman, Alfred Guzman, Joseph Aleas, and Henry Nichols) are buried in the Golden Gate National Cemetery. Later, during World War II almost all of the Muwekma men served overseas in the various branches of the Armed Forces. Still landless, the Muwekma Tribe maintained their distinctive social ties and culture.

In 1984, the Muwekma Tribal government was formed and by 1989, the Tribal Council submitted a letter of intent to petition the US Government for Federal Acknowledgment. A petition was submitted at a White House meeting on January 25, 1995 and by May 24, 1996 the Bureau of Indian Affairs' Branch of Acknowledgment and Research (BAR) made a positive determination, but reluctantly acknowledged that:

> *The band was among the groups, identified as bands, under the jurisdiction of the Indian agency at Sacramento, CA. The agency dealt with the Verona Band as a group and identified it as a distinct social and political entity.*

Almost two years later, as a result of submitting more documentation, Deborah Maddox, Division Chief of Tribal Operation, issued a letter to the tribe stating that:

> *A review of the Muwekma submissions shows that there is sufficient evidence to review the petition on all seven of the mandatory criteria. The Bureau of Indian Affairs (BIA) is placing the Muwekma petition on the ready for active consideration list as of March 26, 1998.*

On December 8, 1999, the Muwekma Tribal Council filed a lawsuit against the Department of the Interior /BIA and on June 30, 2000, Federal District Judge Ricardo M. Urbina ruled in favor of the Muwekma Tribe.

Over the past 21 years, the Muwekma have politically, spiritually and culturally revitalized themselves and formed a formal tribal government in compliance with Congressional and the Department of the Interior's criteria. Presently, the Muwekma Tribe is seeking reaffirmation as a Federally Acknowledged Indian Tribe. The Muwekma have spent these past 21 years conducting research and submitting to the Branch of Acknowledgment and Research over several thousand pages of historical, anthropological and genealogical documentation as part of the petitioning process.

As a result of the vision employed by the Muwekma Tribal leadership, the Muwekma have potentially paved the way for other previously Federally Recognized tribes to follow for reaffirmation -- a court ordered Fast Track. Based upon the Federal court's decision the BIA has until July 30, 2001 to make its proposed finding and its final determination no later than March 11, 2002.

After all said and done, it will be approximately 96 years since the Verona Band was first Federally Acknowledged, and perhaps now the Muwekma Ohlone Tribe, can be treated as an **equal** in the eyes of other Federally Recognized Indian Nations. Furthermore, Muwekma's reaffirmation also sends a message to the larger dominant society, some of whom have emphatically stated and published that the "Costanoan/Ohlones are extinct" and/or that they "never have been Federally Recognized". Obviously these so-called "experts and authorities" are of the colonial mindset that continues to create policies and sow discord that seeks to erode the rights of the aboriginal inhabitants of this continent.

Aho!

3rd annual Shellmound Walk in San Francisco Bay Area

By Stephanie Hedgecoke

Indian People Organizing for Change and the Vallejo Inter-Tribal Council's Indigenous Sacred Sites Preservation Committee held the second annual Shellmound Walk from Oct. 12 to 20 in the San Francisco Bay Area. Indigenous people and their supporters walked every day for two weeks to struggle to preserve their ancient burial mounds from real estate development and other devastation.

IPOC has stated that the walk is held to say that the original people of the Bay Area are not extinct, to honor the ancestors and call attention to their ongoing struggle, and to dismiss the disinformation that has been used historically to justify the destruction of their ancient temples.

Organizers kicked off the walk with announcements at the International Indian Treaty Council's annual Oct. 12 Sunrise Ceremony at Alcatraz on Indigenous Peoples' Day and an evening potluck dinner at the Intertribal Friendship House in Oakland.

This year the Shellmound Walk traveled through the East Bay and Marin County, going through Solano Community College, Glen Cove, Pt. Richmond, El Cerrito, and UC Berkeley; then across the Bay to Sausalito, Tiburon, San Anselmo, Lagunitas, Pt. Reyes and Kule Loklo. Kule Loklo is a former Miwok village now controlled by the Golden Gate National Recreation Area, which allows the Miwoks to interpret their former home, but not reside there.

The struggle to preserve the ancient shellmounds is a struggle focused on the survival of the many Pacific Coastal peoples who were twice colonized. Spain's conquistador army and priests built the mission system by forcibly rounding up and enslaving tens of thousands. During the Gold Rush, the U.S. moved in to enforce its proclamation of Manifest Destiny—that it had a right to take the continent from the Atlantic Ocean to the Pacific.

The Bay Area shellmounds are traditional cemeteries and ancient monuments of First Nations including the Ohlones, Coast Miwok, Bay Miwok, Mutsun, Plains Miwok, Yokuts, Wappo, Patwin and several other nations. They were temples made of shells, older than the pyramids in Egypt, and originally so huge that they appear as landmarks on the original Coast Guard maps of the area. Some of them have been carbon-dated at over 5,000 years.

Native traditions of caring for what shellmound activists call "living cemeteries" were disrupted by the genocidal attacks and land thefts of the Gold Rush days, followed by the institution of capitalist private property laws.

The Spanish looted the shellmounds, but the destruction of them began with the Gold Rush. A shellmound located in what is now Aquatic Park, north of San Francisco's Ghirardelli Square, was destroyed in 1861, reported Alexander Taylor in an "Indianology Series" in the May 1861 California Farmer and Journal of Useful Science. As late as 1909 Nels Nelson counted 425 still-existing shellmounds in an archeological report of the Stevenson Street Shellmound, which was located near the corner of Market and First streets in downtown San Francisco.

West Berkley shell mound.

The destruction of the shellmounds was officially excused via misrepresentation of what they actually were. Until recently archeologists downplayed the evidence of thousands of human burials, which prove these were funerary places like the pyramids. They purposely mischaracterized them as "middens" or garbage heaps. In his 1965 "The Archeology of San Francisco," Robert Suggs wrote: "The Emeryville shellmound was, in fact, little more than a huge garbage heap. ... Burials were also made in the discarded shells and debris."

The Emeryville Shellmound was 60 feet high and more than 600 feet in diameter, covering 19 acres. It formerly held at least four historical levels of burial sites going back at least 2,500 years. Recently a shopping mall was built over what was left of the lower level, despite complaints by construction workers that they were finding hundreds of human remains. Those reports were verified by archeologists but were glossed over by the local authorities to let greedy developers make profits.

Long-time shellmound activist Perry Matlock told WW: "The heartbreaking ongoing devastation of these ancient monuments should be stopped. They should receive UNESCO World Heritage status and be returned to the Native Nations."

For updates on future events write to IPOC, POB 796, Alameda, CA 94501; call the VITC at (707) 558-8776 (www.vallejointertribalcouncil.org); or e-mail the Shellmounder News at sfbayshellmounds@yahoo.com.

Information was gathered for this report by activists with the Shellmounder News and supporters of the Muwekma Ohlone Nation. The report of the Stevenson St. Shellmound is from the Coyote Press Archives of California Pre-History, "Archeological Excavations at CA-SFR-112," Allen G. Pastron, 1909.

Ancient Burial Sites Beneath Hunters Point Lots

August 6, 1991/San Francisco Independent/

By Rachel Gordon

Underneath the empty paint cans, rusted fenders, urban wildflowers and plastic oil containers scattered over Bayview-Hunters Point's undeveloped land may lie Native American burial sites, some as old as 4,000 years.

Descendants of the Ohlones, the Native Americans who were the first known people to inhabit the Bay Area, say there are at least 11 known burial sites in the city's southeast sector.

Members of the modern-day Ohlones recently cautioned city officials not to develop the land without taking the needs and rights of the Native Americans into account.

The city recently completed a master plan for the Bayview-Hunters Point area, which calls for developing much of the vacant land, primarily for housing.

"We do not want to stop any projects," said Irene Zwierlein, chairwoman of the Amah Tribe, a sub-group of the Ohlones. "We just want to make sure that proper care is taken."

No specific development projects for the Bayview-Hunters Point officially have been proposed, and it's possible that the areas of concern to the Native Americans will not be touched.

Under state and federal law, remains of Native Americans can be unearthed, but only under the watchful eyes of state-registered Native American archaeological consultants.

"We don't care what the plan is, we just want to make sure that process is followed," said Rosemary Cambra, chairwoman of the Muwekma Tribe, another Ohlone sub-group.

Native American consultants, such as Zwierlein and Cambra, oversee reburial of their ancestors' bones at another location, preferably as close to the original site as possible.

"The idea is not to decimate the remains," said Randall Dean, an archaeology specialist for the Planning Department.

In general, the excavated remains that pre-date the arrival of Europeans to the area in the 1760s are buried in Native American cemeteries; bones of people who came into contact with the Spanish explorers and missionaries may be buried in Christian cemeteries.

The reason Zwierlein and Cambra don't fight the excavations, they said, is simple.

"Indians do not stop projects, because if we did, (the planners and developers) wouldn't tell us where the sites are or what they've found," she said. "They'd just bulldoze over our ancestors' bones."

It still is unknown whether the areas Zwierlein pointed out are actual Ohlone burial sites, but the existence of ancient Native American shell mounds in those areas is known.

Shell mounds – remains of villages and camps given their name by the vast amount of shells left behind as food refuse – often include burial sites, said archaeologist Alan Leventhal, an expert on the Ohlones who teaches at Ohlone Community College in Fremont.

"The chances of finding human remains under shell mounds is extremely high," said Leventhal. "Some of the burial sites span several thousand years."

He said an estimated 450 shell mound sites encircle the brim of the San Francisco Bay. The Ohlones first began living near the bay shore 4,500 years ago.

The Bayview-Hunters Point area is one of the richest in historic Native American use.

Three sites, Zwierlein said, are at the Hunters Point Naval Shipyard; another three are situated just west of there at the tips of Palou and Thomas avenues.

Three are close to the Executive Park office development just west of Candlestick Park; the remaining two are at the intersection of Interstate 280 and the James Lick Freeway.

A quick glance at those areas doesn't readily reveal anything to the untrained eye, but, say archaeologists, history lurks underneath the surface.

While some shell mounds – covered with earth and grasses – may protrude from the ground like a small hill, others have been flattened during past development.

"Through the early part of this century," said Leventhal, "the top portions of the mounds in many cases were leveled off for construction projects, and the top portion of the burial grounds were destroyed.

"But when the buildings were later knocked down," he said, "we've been finding that burial grounds still exist below the surface."

AIR News, Notes & Comment

Centuries of persecution: *The Ohlone tribe's land was taken from it by the Spanish, Mexican, and American governments.*

The last burial ground

Ohlone fight to save shell-mound site. By Savannah Blackwell

AT THE TURN of the century, even after their lands were seized and their culture decimated, hundreds of burial sites for the Bay Area's Native Americans—the Ohlone tribe—remained intact. As many as 600 earthen shell mounds, in which they had interred their loved ones over thousands of years, could still be found throughout the region.

But today only a few undisturbed shell mounds (so named because oyster shells are frequently found in them) have been spared the bulldozer. The few remaining mounds symbolize sacred links to the past for the descendants of the Ohlone, the tribe that thrived in the Bay Area before the arrival of the Spanish in the late 1700s. And they provide evidence of long lost villages.

"They represent the legacy of the people who were here before," says Linda Yamane, who is of Ohlone descent. Rosemary Cambra, chair of the Muwekma/Ohlone Tribe, adds, "What is significant to my people is to respect these holy sites."

Tribe members, archaeologists, a Native American advocacy group, and an environmental organization are jointly fighting to preserve one such shell mound at the base of San Bruno Mountain, in San Mateo County. The site is located on land slated for commercial development. According to archaeologists, the mound is part of what was once the area's largest Ohlone village, known by records kept by early missionaries as Urebure or Sipliskin (also known as Siplichiquin). Cambra says the mound is 10,000 years old and contains the remains of 10,000 individuals.

According to South San Francisco City Council member John Penna, in the early 1990s Miley Holman, a San Francisco State University archaeologist, found evidence of human remains at the mound while taking sample borings for the site's previous developer, W.W. Dean Associates. Dean, Penna said, never released Holman's findings to the public.

Dean had planned to build a hotel complex on land that included the mound. South San Francisco's "specific land-use plan," which dictates what kind of development may occur in the city, allows for a hotel parking lot to cover the mound. And according to Penna, SunChase G.A. California I Inc., the new developer, plans to build a parking lot and a highway interchange on the site.

At a Dec. 18 South San Francisco City Council meeting, activists urged the council to refuse SunChase's request for a 10-year extension of Dean's preexisting development agreement until the shell mound could be preserved and deeded to the Ohlone. Despite warnings that the ancient gravesite would be jeopardized, the council voted in favor of the extension. SunChase has already entered the first phase of construction of a housing development called Terrabay near the shell mound.

Penna, who wants the site to be preserved for parkland or for use by the Ohlone, was the lone dissenter. "I don't believe we're pursuing the right course here," he said at the meeting.

Representatives of SunChase have declined to spell out their plans for the site. Martin Van Duyn, South San Francisco's chief planner, told council members that approving the extension did not mean they had ceded control of how the commercial site will be laid out, because SunChase must still apply for construction permits.

Penna said that although the council did approve a resolution calling for the mound to be preserved, the resolution will not necessarily stand up. Under the development agreement, if SunChase can show that commercial construction on the site will be lucrative for the city, the council will be hard-pressed to stop it, he said.

Dennis Breen, director of development for Sterling Pacific Management Services, the manager of the property, has refused an offer to purchase about 30 acres of the land, including the mound, which was made by Parnum Alston, president of the Environmental Mitigation Exchange Company. Alston proposed turning the land over to the state or to a nonprofit group—such as the Ohlone—for protection, as well as educational and cultural use. Breen told the *Bay Guardian* SunChase planned to consult with archaeologists regarding the mound but not with members of the Ohlone tribe.

The Muwekma/Ohlone, the International Indian Treaty Council (a Native American advocacy group), and San Bruno Mountain Watch (an environmental group that has fought development on the mountain [see "Tragic Mountain," 12/11/96]) vow to keep pressuring SunChase and the city council to preserve the site.

"Putting the mound into tribal ownership is the best thing we can do to try to make up for the terrors of the past," says treaty council volunteer Perry Matlock.

Bay Area Tribe Stakes Its Claim to the Presidio

Muwekma Ohlones say they were the original San Franciscans

By Carl Nolte
Chronicle Staff Writer

A group of Native Americans who say they are descendants of the original inhabitants of San Francisco are laying claim to the Presidio.

They say they have the right of first refusal when the Army withdraws from the Presidio in 1994, a claim that could throw a monkey wrench into plans to transform the post into a spectacular new national park.

The group is the Muwekma Ohlone tribe, which has 175 members and is based in San Jose.

Their claim goes back into the dim past of the Bay Area, a time before European settlement of the Pacific Coast, and raises a number of questions about California's nearly forgotten native people, including their rights and their very identity.

"From time immemorial this land has been Ohlone," said a statement issued by the Muwekma Tribe last week. "Therefore, the original indigenous Ohlone Muwekma ... tribe, here, now lay claim to first right of use to the Presidio.

"We will exercise that right of first refusal," said tribal administrator Norma Sanchez. "We want the land to be placed in trust for the tribe."

It is the first time Native Americans have claimed what would be federal parkland since Indians occupied Alcatraz Island more than 20 years ago. They were eventually evicted by federal marshals.

The National Park Service, which had been soliciting ideas for use of the Presidio, was pleased that the Indians responded to their call for proposals but astonished when the Ohlones claimed the whole post.

"We are looking forward to a continuing discussion," said Howard Levitt, chief of interpretation for the Golden Gate National Recreation Area. It was a matter, he said, for the secretary of the interior.

In Washington, however, they were not so understanding.

"Anybody can lay claim for anything if they want to," said Bob Walker, a spokesman for the Department of the Interior in Washington. "We will proceed under federal law with plans for the National Park Service to take charge of the property."

Walker said he does not know who has the right of first refusal to federal land, but he said the government is not giving up ownership of the Presidio, only transferring it to another agency.

"I don't know if this group of people claiming to be an Indian tribe has this right," he said.

His response touched on one of the principal difficulties of the Muwekma claim: The Ohlone tribe is not officially recognized as an Indian tribe by the federal government. Official recognition implies that the tribe existed in years past, lived in a specific territory and had certain rights, which may or may not include rights to land, such as the Presidio.

Although many California

Page A13 Col. 1

From Page A11

tribes — such as the Hoopa in far Northern California — are recognized by the government, many are not, including the Ahwahneechee, the original inhabitants of Yosemite Valley, many other Indian groups in the central Sierra — and the Ohlone people, who are descendants of the first Bay Area residents.

"The Ohlone are among 32 California tribes that are seeking recognition by the federal government," said Sanchez. She said seven steps are necessary and that the Muwekma tribe is working on the case. She also said a bill to recognize the 32 tribes has been introduced in Congress.

Native Americans Claim the Presidio

The other question is that although there is no doubt that what later was called the San Francisco Peninsula was inhabited by native peoples, there could be doubt that the Muwekma Ohlone are their descendants.

Evidence of Occupation

Evidence of Indian occupation of the Presidio was gathered by University of California anthropologists in the 19th century, indicating that the area had been settled for several thousand years.

According to Richard S. Levy of American Archeological Consultants, at least 1,400 people lived in San Francisco and San Mateo counties when Europeans "discovered" California. An additional 1,200 lived in the Santa Clara Valley, and about 2,000 lived in the East Bay area. These were people now called Ohlone, who inhabited an area from the Carquinez Strait to San Benito County.

The Spanish arrived in 1769 and established a mission they named San Francisco in June 1776, and they established the Presidio in the same year. A number of local Indians were converted to Christianity by the Franciscan padres, but many more died of diseases carried by Europeans.

The padres also impressed the Indians into work gangs; a lithograph exists showing Spanish soldiers with Indian workers in the Presidio in 1816.

Migration to East Bay

When the Mexican government took over the area, the missions were disbanded and the Indians were told they were free to leave. Many of the San Francisco Indians, who were Mexican citizens and Christian, went to the East Bay, where they had relatives.

Levy thinks that their descendants are still there.

"Sure, there are people who are descendants of the San Francisco people," he said. "I know for a fact there are descendants of the Mission San Jose Indians, Mission Santa Clara and Carmel Mission people."

Bay Area Indians have kept a low profile for a number of years. After the United States occupied California, many of them claimed to be Mexicans, rather than Indians, because the U.S. policy toward Indians was much harsher than the Mexican policy.

Tribe's Proposals

The Muwekma tribe has a number of proposals for the Presidio site, including health facilities for all California tribal people, a native housing village, a social services center, a California Indian museum and a tribal government-economic center.

They have submitted no detailed plans for any of these activities. Instead, they have asserted a claim to the whole post. "We would have jurisdiction over the whole Presidio," said tribal administrator Sanchez.

Levitt said one previous example of Indian claims to government land came in the 1970s when the Chumash tribe, which lives in Santa Barbara County, claimed Anacapa Island, which became part of the Channel Islands National Park. The claim was denied by the Secretary of the Interior and later was also turned down in the courts.

Urban renewal atop sacred past

Ohlone protest Emeryville project

By Rick DelVecchio
CHRONICLE STAFF WRITER

Today's opening of a snazzy shoreline shopping center across the Bay Bridge from San Francisco marks the return to life of what had been one of the foulest industrial wastelands in the Bay Area.

But for some, it's a sad day. Underfoot at the Bay Street center in Emeryville are the remains of Ohlone Indians who occupied the site from 800 years before Christ until European contact 300 years ago.

And the dead have not gotten their due, says Perry Matlock of San Francisco, a volunteer with the International Indian Treaty Council who plans to join a handful of "shellmounders" in informational picketing today to tell shoppers about the archaeological history of the largest Indian shellmound in Northern California.

"Ohlone Indians are still alive and continue to live in the Bay Area," Matlock said. "This isn't an ancient forgotten cemetery. It's a living cemetery. Their great-great-great grandchildren are the Ohlone people who live among us."

Bay Street, a compact between the city of Emeryville and the developer Madison Marquette, has been hailed nationally as a model of urban land reclamation. The names of the tenants whose shops open today – Victoria's Secret, Williams-Sonoma, Old Navy and 20 others, with 35 more plus nine restaurants and a movie theater to come later this month and in December – signify the economic value attached to a spot once so dirty that a skull and crossbones would have been a fitting sign.

The ground at the mouth of Temescal Creek had been dumped on for more than a century. An amusement park and racetrack gave way to heavy industry in the 1920s.

In 1924, steam shovels

Reclamation plan hailed

▶ BURIAL
From Page A17

chomped away the main feature of the Ohlone epoch, a 40-foot high burial mound, to make way for a paint factory. An archaeologist slipped in between bites to recover the remains of 700 Ohlone, which are still in storage at UC Berkeley.

When industry died off in the early 1990s, city leaders took over. Emeryville's redevelopment agency stripped the ground of dirt so toxic that anyone treading it had to wear a moon suit. Then, the agency hired a developer to carry out a one-shot transformation of the entire strip, with shops, entertainment, apartments and townhouses, and a hotel all arranged in the model of a village Main Street.

The city and developers had archaeologists and American Indian advisers involved from the outset. But despite $2 million spent on archaeological work alone, the debate goes on about whether the results were appropriate or far-reaching enough for what had been the largest of 400 Indian burial sites in Northern California.

"I'm astounded any community in this day and age would knowingly destroy a 2,500-year-old site," said Sandy Sher, a member of the Emeryville historical society. "To build on the site when you know there are still bodies there and to drive piles through the bodies – it's very offensive to the Native American descendants."

No descendants of the Bay Area Ohlone band are known to exist. But Katherine Perez of Stockton, who is one-quarter Ohlone, has been designated the "most likely descendant." She has served in that role under a state law requiring land users to tread lightly on American Indian archaeological sites.

"The city was so concerned about the cost," she said. "I would have liked to have seen them comb the entire site clean, but that didn't happen and wasn't going to happen, and was too costly."

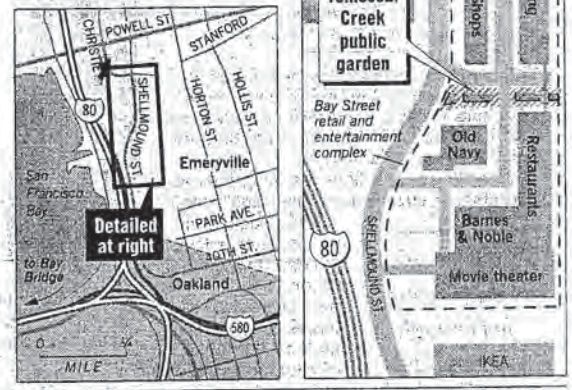
The developer is creating a public garden on both sides of concrete-walled Temescal Creek to memorialize the Ohlone story. It will include a representation of the cone-shaped mound leveled in 1924, plantings of native vegetation and meditative water sculpture.

A community room inside the center will display replicas of artifacts found during the dig, which uncovered 200 sets of remains from a buried, 8-foot-deep section of the burial mound dated at 2,800 years old.

Opening later this week will be a city-sponsored Web site telling the Ohlone story more fully while providing aids for fourth- and fifth-grade teachers.

The mounds weren't religious sites as such. They served as community cemeteries on a site that had continuous occupation for thousands of years because of its rich store of food, primarily bat rays but also salmon, shellfish, whales and grizzly bears.

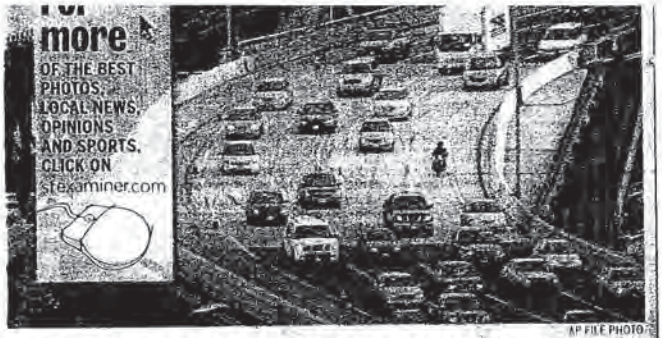
Eric Hohmann, vice president of development for Madison Marquette, defended the effort to memorialize the Ohlone story.



"The important thing to say is, when Madison Marquette came on the scene this site was nothing like a pristine, undisturbed field," he said, adding that the project never would have happened if the city had not cleaned up the site.

City Manager John Flores said the steps taken to memorialize the Ohlone story were part of an agreement with American Indian and community representatives. The agreement specified that workers disturb the site as little as possible.

E-mail Rick DelVecchio at rdelvecchio@sfchronicle.com.



Bay Street retail and entertainment complex

As a way of remembering the Ohlone Indians who once lived on the site, the new Bay Street retail and entertainment complex in Emeryville will include a public garden along Temescal Creek and a community room displaying replicas of artifacts found in an archaeological excavation.

Deadly curve: The Bay Bridge S-curve was the site of a fatal accident Nov. 9, when a truck traveling 50 mph flipped and plummeted off the road, killing the driver.

Burial ground disturbed underneath Bay Bridge

Sunday, March 14, 2010

Ohlone remains were removed from ground beneath S-curve

By John Upton
Examiner Staff Writer

The Bay Bridge's deadly S-curve was built hundreds of feet above a Muwekma Ohlone tribal burial ground, and spirits whose bodies were unearthed and placed in storage are said to be restless.

The Ohlone were the first people to inhabit the Bay Area, where their burial grounds and other sacred sites are frequently unearthed.

At least 26 Ohlone skeletons were discovered between 2002 and 2004 in a burial ground at Yerba Buena Island, which was subsequently excavated to clear a path for a new Bay Bridge east span.

The east span replacement project has suffered billions of dollars in cost overruns and a decade of construction delays that could force motorists to navigate the temporary S-curve — a dogleg where the speed limit drops from 50 mph to 40 mph — until 2014. A truck driver was allegedly traveling at 50 mph when his pear-laden truck flipped Nov. 9 off the recently installed S-curve and plummeted to the former burial ground, where he died.

The California Highway Patrol responded by aggressively policing the speed limit and Caltrans placed addition striping, signs and other features on the S-curve, helping to slash the curve's high accident rate.

Bodies unearthed at the Ohlone burial ground were treated differently depending on which government owned the land where they were discovered.

Bodies found on state-owned land were appropriately ceremonially reburied elsewhere on the island, according to tribal spokeswoman Ann Marie Sayers, who led the ceremony.

Ohlone homeland

Counties that were part of the Muwekma Ohlone until the 18th-century arrival of the Spanish Empire:

- San Francisco
- San Mateo
- Santa Clara
- Alameda
- Contra Costa
- Napa*
- Santa Cruz*
- Solano*
- San Joaquin*

** Portion of the modern county was Muwekma Ohlone homeland*

Source: Muwekma Ohlone Tribe

But skeletons found on adjacent Coast Guard land were placed in storage because the tribe, which is recognized by California, has not been recognized by the United States since the 1930s.

Remains found on Coast Guard land at Yerba Buena Island could only be legally repatriated to the Ohlone people and reburied if the U.S. Department of Interior formally recognizes the tribe, according to Coast Guard spokesman Dan Dewell. The remains are stored securely, he said.

The remains of tens of thousands of Ohlone people excavated from various places, generally on federal land and placed in storage, could be ceremonially reburied if the tribe wins federal recognition through a lawsuit filed in 2003, according to Sayers.

"It creates confusion in the energy and frequency when they're not at peace or in the spirit world," Sayers said. "There are burials that want to be reinterred — they want to go back to the spirit world. When there are accidents on the Bay Bridge, it doesn't surprise me at all."

INTERNATIONAL INDIAN TREATY COUNCIL
INFORMATION OFFICE
710 CLAYTON STREET #1 SAN FRANCISCO, CA 94117
TELEPHONE: (415) 566-0251
FAX: (415) 566-0442
EMAIL PEACE NET: IITC

April 6, 1992

To all concerned local, state and federal officials.

The International Indian Treaty Council, a Non-governmental Organization (NGO) advocating for the rights of Indigenous Peoples at the United Nations, supports the inherent land rights of all Indigenous Peoples. This "right to territory" is recognized under international law.

The IITC recognizes that the Muwekma Ohlone People of the San Francisco Bay Area have survived a bitter history which has disenfranchised them from their ancestral lands and denied them recognition as a distinct and independent People. This history includes enslavement in Mission communities in the early 1800's, forced removals and stealing of traditional lands, cultural destruction, and ongoing desecration of burial grounds and sacred sites.

As a critical aspect of their struggle to implement their basic right to self-determination, the Muwekma Ohlone People are currently seeking federal tribal recognition, along with more than 30 other California Indian Nations who have been relegated to the tragic and genocidal status of "landless Indians".

The Muwekma Ohlone have also initiated the process of regaining a portion of their traditional land base. Currently their priority is the return of the area in San Francisco known as the Presidio, soon to become unused federal land when the military pulls out. Under federal law, this land must be returned to the original "owners", the Muwekma Ohlone. This act of simple and straightforward justice, carried out at the earliest possible date, will be a significant step in reversing the policy of genocide through which many California Indian Peoples have been pushed to the brink of extinction, and California Indian Nations have become homeless in their own homelands.

The IITC strongly encourages all city, state and federal officials who have a part in the decision-making regarding the future of the Presidio to take immediate action towards its return to the Muwekma Ohlone.

The IITC also supports federal recognition for the Muwekma Ohlone Tribe as a critical step in their ability to engage in government-to government relations, and to exercise self-determination as a Sovereign People.

The IITC will continue to support the efforts of the Muwekma Ohlone People to reclaim their traditional lands, including the Presidio in San Francisco. 1992 is the year

for healing the wounds that have been inflicted upon Indigenous Peoples, but this healing will not begin until justice is done.

Respectfully,

William A. Means

William A. Means,
IITC Executive Director

SAVE THE SHELLMOUNDS!

Beneath the streets and landfill of Emeryville, San Francisco, and much of the Bay Area endure the ancient monuments and funerary places of the Muwekma Ohlone Nation, whose homeland is the San Francisco Bay Area. The Spanish invasion, beginning in the 1770s, delacerated the sovereignty, culture, religion, and language of the Muwekma Ohlone. Today, the physical legacy of the Spanish invasion includes the Mission Dolores and the Presidio's Officers' Club in San Francisco, for both structures were erected in the 1770s. However, the physical legacy of the Muwekma Ohlone has not received equal preservation nor respect. Prior to the Spanish invasion some 500 shellmounds lined the sea and bay shores of the San Francisco Bay Area. These mounds, generally consisting mostly of molluscan shells, were made by the Muwekma Ohlone for thousands of years, and act as cemeteries. Sadly, archaeologists have referred to these shellmounds as "middens." A "midden" is defined as a waste pile, for the word's origin occurs in Middle English/Norse, and means a "dung hill."

The Muwekma Ohlone term to describe a shellmound is not available or not known, for the destruction of the local language has brought much harm. Some of these shellmounds might not have functioned as cemeteries, yet in any case, they remain the cultural treasures of the Muwekma Ohlone Nation. The 1852 U.S. Coast Survey map on the right actually features two of the Muwekma Ohlone's shellmounds. The gargantuan size of these ancient monuments, perhaps wonders of the world, is attested, here. The Muwekma Ohlone continue to live amongst the now called San Francisco Bay Area, and they see these shellmounds as living cemeteries where their ancestors rest. To intentionally demolish a cemetery is universally considered a hate-crime. Unfortunately, no laws exist to prevent the erasure of Muwekma Ohlone cemeteries, the shellmounds. This is the homeland of the Muwekma Ohlone Nation. As new residents and visitors to their country, we ought to show the same respect we would expect to our far distant homelands and cemeteries.

P R O C E E D I N G S

(Commission business and other items were heard)

SECRETARY IONIN: Case No. 2015-000644ENV Biosolids Digester Facilities Project. This is a draft environmental impact report. Please note that written comments will be accepted at the Planning Department until 5:00 p.m. on June 19th, 2017.

TIM JOHNSTON: Sorry for that delay. Good afternoon, President Hillis and Members of the Commission. I'm Tim Johnston with the Environmental Planning Section of the Planning Department, and I'm the EIR coordinator for the SFPUC's proposed Biosolids Digester Facilities Project.

Also here today is Carolyn Chiu, who is the SFPUC's project manager for this project. Should the Commissioners wish, Ms. Chiu can offer a brief project overview before I continue.

VICE PRESIDENT RICHARDS: Please, yes.

TIM JOHNSTON: Okay. Carolyn?

CAROLYN CHIU: Good afternoon, Commissioners. I'm Carolyn Chiu, SFPUC Project Manager.

This Biosolids Project is the largest capital

project in the SFPUC Sewer System Improvement Program. This project addresses the aging infrastructure and outdated technologies at the Southeast Wastewater Treatment Plant. Located at the Bayview-Hunters Point area, the Southeast Plant provides 80 percent of the city's sewage and stormwater treatment; hence, it is a cornerstone in our whole wastewater infrastructure in the city.

In this project, we will be replacing the solids handling portion of this treatment plant, basically, one half of the plant as shown in the figure here on the top, outlined in yellow.

We are planning to build on a new site adjacent to the existing plant, shown in the figure on the bottom, outlined in blue. The proposed site is comprised of portions of the existing plant, the decommissioned asphalt plant, and Central Shops.

Right here is an aerial view of the existing site [indicating]. And you see on the left side is Caltrain, and then on the bottom of the blue outline, you know, south of Jerrold, is that decommissioned asphalt plant. And above Jerrold Avenue is that Central Shops I talked about.

So some key features of this Biosolids Projects, the new facility will apply the best

available technology, be more efficient in effective treatment processes, will be able to reduce the number of digesters that we need. The level of treatment will improve to allow for more options for beneficial use of our treated biosolids. Additionally, we're going to generate renewable energy that will actually sustain the new biosolids treatment facility, which is basically half the power usage of the plant. And lastly, we're going to achieve our PUC's level of service goal, which is to limit the odors within the plant fence line.

And here is a rendering of the proposed new facilities. And you'll see that the digesters, which are the five vessels on the very top of the page, are the furthest from the neighbors, adjacent to the railroad tracks. And you'll see the energy recovery being on the asphalt plant on, basically, the left side of your screen.

And with that, I'm going to give the stage back to Tim. Thank you.

TIM JOHNSTON: Thank you, Carolyn.

I would now like to state that this is a hearing to receive comments on Draft Environmental Impact Report for Case No. 2015-000644ENV, which is a -- which assesses the impacts of -- on the

environment that could result from implementation of the Biosolids Digester Facilities Project. This Draft EIR was published on May 3rd, 2017. Links to pdf to this document were provided to you via the agenda for today's hearing.

The EIR determined that this project would result in significant and unavoidable impacts in the areas of air quality and cultural resources that would remain significant and unavoidable even with implementation of feasible mitigation measures.

On May 17th, 2017, the Historic Preservation Commission held a public hearing on the Draft EIR for the Biosolids Digester Facility Project. No comments from the public were offered, but the HPC reviewed the DEIR and agreed with the application of Mitigation Measure MCR1, requiring documentation of historic resources proposed for demolition and the installation of an interpretive display of the demolished historic resources in a publicly accessible location.

In addition, the HPC did not identify any historic resources affected by the proposed project beyond those identified in the Draft EIR, and the HPC concurred with the analysis and conclusion in the Draft EIR and concluded that the DEIR was adequate as relates to historic resources.

As a reminder, staff is not here today to respond to comments on the environmental analysis. Such comments will be transcribed and responded to in writing in a responses to comments document, which will respond to all verbal and written comments received during the draft public comment period and may include revisions made to the Draft EIR as appropriate.

This is not a hearing to consider approval or disapproval of the project. That hearing will be held by the SFPUC following certification of a Final EIR which we would expect in 2018.

Comments today from the public should be directed toward the adequacy and accuracy of the information contained in the Draft EIR. Commenters are asked to speak slowly and clearly so that a court reporter can produce an accurate transcript.

Commenters should also state their name and address or fill out a comment speaker card so that they can be sent a copy of the responses to comment document when it's completed. After comment from the general public, we'll also take any comments on the Draft EIR from the Planning Commission. The public comment period for this project began on May 4th, 2017 and extends until 5:00 p.m. on June 19th.

Unless the Commission Members have any

questions, I recommend that the public hearing be opened.

VICE PRESIDENT RICHARDS: Thank you.

Opening up to general public comment. I have three speaker cards -- two speaker cards, Mark Klaiman and Michael Janis.

MARK KLAIMAN: Good afternoon. My name is Mark Klaiman. I own and operate a small business at 525 Phelps Street, directly across the street from the Southeast Plant for the last 20 years. I've been actively involved in the digester project for several years, having worked on the Southeast Working Group and the Digester Task Force.

Like many small businesses on Phelps Street, both my employees, my customers, and myself have been confronted with smells that burn your nose or make your eyes tear. Also, like many businesses in the neighborhood, I've been confronted by who knows what bubbling out of the manhole covers. All of that means that, after 20 years of confronting these issues, I'm very much looking forward to improvements being made at the Southeast Plant.

O-PetCamp-1.1
GC-1

That said, as a small business owner, I'm very concered that, as drafted, the EIR will preclude me from benefiting from these improvements. As drafted,

2
GC-2

the EIR places an unfair burden on those businesses which have already been unfairly burdened by the plant. Specifically, as drafted, the EIR places an unfair amount of traffic burden on construction on those businesses located on Phelps Street.

In case you're unaware, Phelps Street is a fairly narrow street with parking on both sides of the street, two lanes of traffic, and a bicycle route. Most of the businesses on Phelps Street are both destination locations and are the types of businesses that require their clients to drive to the business and to be able to park in close proximity.

The Draft EIR completely fails to address this issue. Suggesting that since this is only a temporary burden -- a five-year temporary burden is something that small businesses can withstand -- reflects a lack of understanding of the cash-flow needs of small businesses, as well as the overall burdens of running a small business in San Francisco.

Asking small businesses to comment on a 1400-page Draft EIR that does not even include the traffic control plan places us at a distinct disadvantage. This document is complicated, convoluted and technical, yet is still missing a critical component, the traffic control plan.

2 **GC-2** cont.

3 **TR-1**

Sorry.

It's unfair to expect small businesses to be able to comment on this type of document when it is lacking such a critical component. Yet there are better alternatives available for traffic. Rather than sending trucks and buses down such a narrow street as Phelps Street, negatively impacting the small businesses that have already been negatively impacted for decades by the plant, traffic should be directed from Evans to Mendell to Jerrold or from Evans to Rankin directly into the plant.

These routes would significantly lessen the impact on small businesses in the Bayview and should be prioritized over the Phelps Street locations. Thank you so much.

VICE PRESIDENT RICHARDS: Thank you very much.

Next speaker, please.

MICHAEL JANIS: Good afternoon, Commissioners and staff leadership of the Planning Commission. I am Michael Janis of the San Francisco Wholesale Produce Market, and we are longtime adjacent neighbors to the Treatment Plant.

The Market, partnering with the City, has operated in our Bayview-Hunters Point neighborhood since 1963. But many of our current 30 merchant

3 **TR-1** cont.

4 **TR-1**

businesses began at the original Market District that is now home to the Golden Gateway Center.

Washington Vegetable Company is a great example. In 1931, the current operator's grandfather began the company in an alleyway on Washington Street, and, along with the other merchants in 1963, moved to the Market. The Market's 30 merchant businesses and their over 650 team members bring healthy, fresh-tasting produce to San Francisco and Bay Area residents and businesses. And they do that every day from midnight until 9:00 in the morning.

The Market serves -- they partner with farmers and growers of all sizes throughout the Bay Area, California, and the world. Our merchant customers are what make San Francisco the premier food destination of the world, be it our residents -- our restaurants, our neighborhood stores, caterers, or our blossoming food makers industry.

In addition to providing critical food infrastructure to our merchant businesses, the market adds value in the city's social service network, where our food recovery program prevents fresh healthy produce from going to waste and instead feeding the hungry and vulnerable populations.

To ensure we continue to be a food source and

generate jobs, our reinvestment project -- an expansion and capital improvement program -- is in place. Our first phase was completed in 2015 with the completion of an 82,000-square-foot LEED gold building that now houses Good Eggs and Mollie Stone's Markets.

In your packet, we have shared with you an aerial of our small section of the city and highlighted all of the nearby projects that are either in construction or very much under plan. We think and we hope that you will agree that significant changes are underway in our neighborhood today and comprehensive, coordinated, and effective planning is critical for long-term residents and businesses of our community.

While we understand the importance of the treatment plant's project, we have significant concerns and ask the Commission to consider that the project's description does not adequately reflect the Market's reinvestment plan nor our schedule. So long as Jerrold Avenue remains open on our site, we have challenges with the PUC's plan to use it for construction truck traffic as it severely impacts and impairs the operations of our businesses.

The Market does not want the PUC's proposed construction truck routing to discourage, delay, or prevent the execution of our reinvestment plan, our

O-SFWPM-1.1

TR-1

path to needed improvements.

The Market seeks improved collaboration and coordination with the PUC on the redesign of all of the full length of Jerrold Avenue and neighboring streets and intersections. Thank you.

VICE PRESIDENT RICHARDS: Thank you.

Mr. Dan Dodt.

Additional speakers, if you could line up on the television side.

DAN DODT: Good afternoon, Commissioners, my name is Dan Dodt. I'm a Bayview resident for over 30 years, business owner, member of the CAC in the Bayview.

My comments are in three areas, two of which, regarding the significant unavoidable impacts related to cultural resources -- the Central Shops -- and air quality, I'll provide in written form.

But on the third, related to transportation, traffic, and congestion -- both construction related and local -- I'm requesting the Commission consider a reevaluation of the conclusions drawn in the EIR. As noted, there are significant cumulative traffic and circulation impacts, including the closure of Jerrold from Phelps to Rankin for a period of approximately five to six years; the current existing lane closure

1 cont.

2
TR-4

O-Bayview
CP-1.1
TR-4

and narrowing along the Evans Avenue alignment beginning in August 17th for the Headworks phase -- now, that's not part of this EIR, but it is currently under construction -- with construction vehicles, manpower transportation, et cetera; the construction staging along the Phelps Avenue parking and the equipment relay.

This is a narrow street, as Mark Klaiman had indicated, and includes many PDR businesses, residences, et cetera. And please note the circulation in the graphics.

Please also note that nearby Palou Avenue will be under construction for a $3 1/2 million streetscape improvement plan beginning this year for a couple of years.

Other projects by the Fire Department, SFPD, DPW, and others will and are impacting the adjacent streets. When considering these traffic and circulation impacts alone, one should consider that these crucial east-west arterials, particularly Evans and Jerrold, in a closed or blocked condition, will increase traffic on an already heavily used Oakdale Avenue and Palou alignments.

These major streets in and out of Bayview provide the daily transportation routes for those who

1 cont.

TR-4
OC-2

live and work in Bayview, for parents who take their kids to school and back, for employees and employers who must get to their jobs, and, most importantly, serve as an essential transportation route in the event of a natural disaster or a major event.

It should also be noted that the sole northwest -- north-south access along Third Street at Islais Creek is a documented potential liquefaction zone. This is issue is about public safety in Bayview.

As noted in the EIR, the long-term changes include the Quint Street berm construction, which closed under the -- under the Caltrain's bridge. But what's missing is a commitment and a plan in conjunction with that closure for a bypass road along the railroad alignment. The Quint Street connector bypass should be expedited and built as part of the PUC project prior to major construction in 2018, in my opinion, and should be urged by this Commission --

SECRETARY IONIN: Thank you, sir. Your time is up.

DAN DODT: I'm sorry. We ask to engage the leadership in this building to get that done. Thank you very much.

VICE PRESIDENT RICHARDS: Michael Hamman.

MICHAEL HAMMAN: Commissioners, my name is

1 cont.

2 **TR-2**

3 **TR-4**

Michael Hamman. I'm a resident and business owner in the Bayview. And I'm here today to talk about a serious flaw in the EIR for this project.

Specifically, I'm referring to the cumulative analysis of the traffic problems. As Mr. Dodt so accurately portrayed, the situation in the Bayview is we have three major north-south corridors of which one is Jerrold. Jerrold they're planning to close. Evans, they're going to reduce that to one lane in each direction controlled by a flag man. And Oakdale, we don't even know how badly that's going to be torn up when they do -- the PUC does their project at Oakdale and Phelps, 1800 Oakdale.

I-Hamman-1.1

TR-4

So imagine, if you would, that they've disrupted Van Ness, but they've also closed Gough and Franklin. That would be a catastrophe for this city. And that is the nature of this perfect storm that the PUC is going to visit on our neighborhood.

They -- by their analysis, there are 7,000 people a day that use that route. Those 7,000 people will be severely impacted. The businesses will be placed under a hardship.

But that 7,000 is just the beginning. They failed to take into account the major projects that are being built in India Basin. The India Basin Project is

OC-2

1250 units, the Shipyard is coming online with 900 units, Hunters View hundreds more, plus the projects up and down Third Street. The traffic will increase. It's going to be a lot worse than 7,000 in five years.

Five-year temporary closure. Allow me to put that in perspective. In five years, your children will start college, graduate from college, get married, and have their first child before anyone can go down Jerrold Avenue. It's very possible you could all become grandparents before they open Jerrold Avenue. Five years is not a temporary closure. Five years is -- for many people of a certain age, that's a lifetime, a lifetime of severe inconvenience, economic hardship.

I urge you, please, please, do not allow them to close Jerrold Avenue. It's going to be a major impact in our neighborhood, and it will seriously degrade the quality of life for just about everybody who lives here. Thank you.

VICE PRESIDENT RICHARDS: Thank you very much, Mr. Hamman.

Any additional speakers on this item?

(No response)

VICE PRESIDENT RICHARDS: Seeing none, open up for Commissioner comments.

TR-4
OC-2

1
cont.

2
GC-2

Commissioner Johnson.

COMMISSIONER JOHNSON: Let me start with something positive.

So I remember my very first meeting on the Hunter's Point Shipyard CAC. And I drove down Third Street at the time and passed by -- at the time, I didn't know what it was. But I was, "What is that smell?" And, "What is that?" And it was the early evening. The wind shifted to the southeast at the same time basically every day. And it was incredible.

And I later learned that there was a biodigester facility, one of two in San Francisco, as presented by the PUC staff today. And so I'm happy to see that finally this project is before us today or least the Draft EIR. This is something that is needed. If we're not going to move the biodigester, which I know was a movement for a little while, we at least need to have it completely upgraded to a modern-day standard. It is an environmental justice issue that we have equipment that is so completely beyond its useful life still handling 80 percent of the solids in our city, wastewater in our city. So I think that's a good thing.

A-CPC-Johnson.1
GC-1

I actually also was going to point out the -- both the air quality, where there was significant

2
TR-1
AQ-4

mitigation that was necessary. I would like the staff to further explain what alternative mitigations could have been considered and as well for the traffic and the circulation. I think specifically, when it comes to an EIR, we do look at traffic and circulation as an impact. And I think that we can take a look at what are the alternative, again, mitigations for some of the impacts that we're looking at.

I know that -- and I don't know -- hopefully I'm speaking slowly enough for the recorder -- that generally speaking for EIRs, we try to be very project specific. And so we'll take into account various projects. And there's actually a table in the EIR that looks at the various projects in the surrounding area to say what are we looking at when we talk about cumulative impact. But we don't get super detailed into their on-boarding plans or their phasing to look at the impacts for this particular project or any particular EIR.

And I think that that's something we need to take a look at here. Five years is not a lifetime, but it is a long time. And I think it would be good for us to make sure we dotted all our Is and crossed our Ts when it comes to looking at how we can get this project done with the least amount of impact possible.

2 cont.

A-CPC-Johnson.3

OC-2

But I think this is a great day for the City, for the Southeast, particularly for that area. And I'm happy to see this project coming online.

VICE PRESIDENT RICHARDS: Thank you.

Any other Commissioner comments?

(No response)

VICE PRESIDENT RICHARDS: Seeing none, this item is closed.

(Whereupon, the proceedings adjourned at 1:51 p.m.)

Dated the 19th day of November, 2017.

DEBORAH FUQUA

CSR NO. 12948

San Francisco Wholesale Produce Market
Facts & Figures

San Francisco Planning Commission Hearing
June 1, 2017

About the Market

- City partner for over 50 years
- Critical food infrastructure for city, linking local farmers to City residents
- Supplier for grocers, restaurants, caterers, food makers, and corner stores
- Small business incubator
- Improves health of Bayview residents by increasing availability of fruit and vegetables
- Social Enterprise: financially sustainable with a mission driven by achieving social good

Operations, Jobs, & Merchants

- Business day is from 11pm to 9am
- Current Jobs on Site: 650
- Merchants Currently Operating on Site: 30

Programs

- Composting: In 2004, the Market piloted composting to prove its viability to City and now composts thousands of pounds of produce per month
- Food Recovery: 329,000 pounds of blemished food diverted from compost bins and sent to food kitchens, supplying 274,000 meals

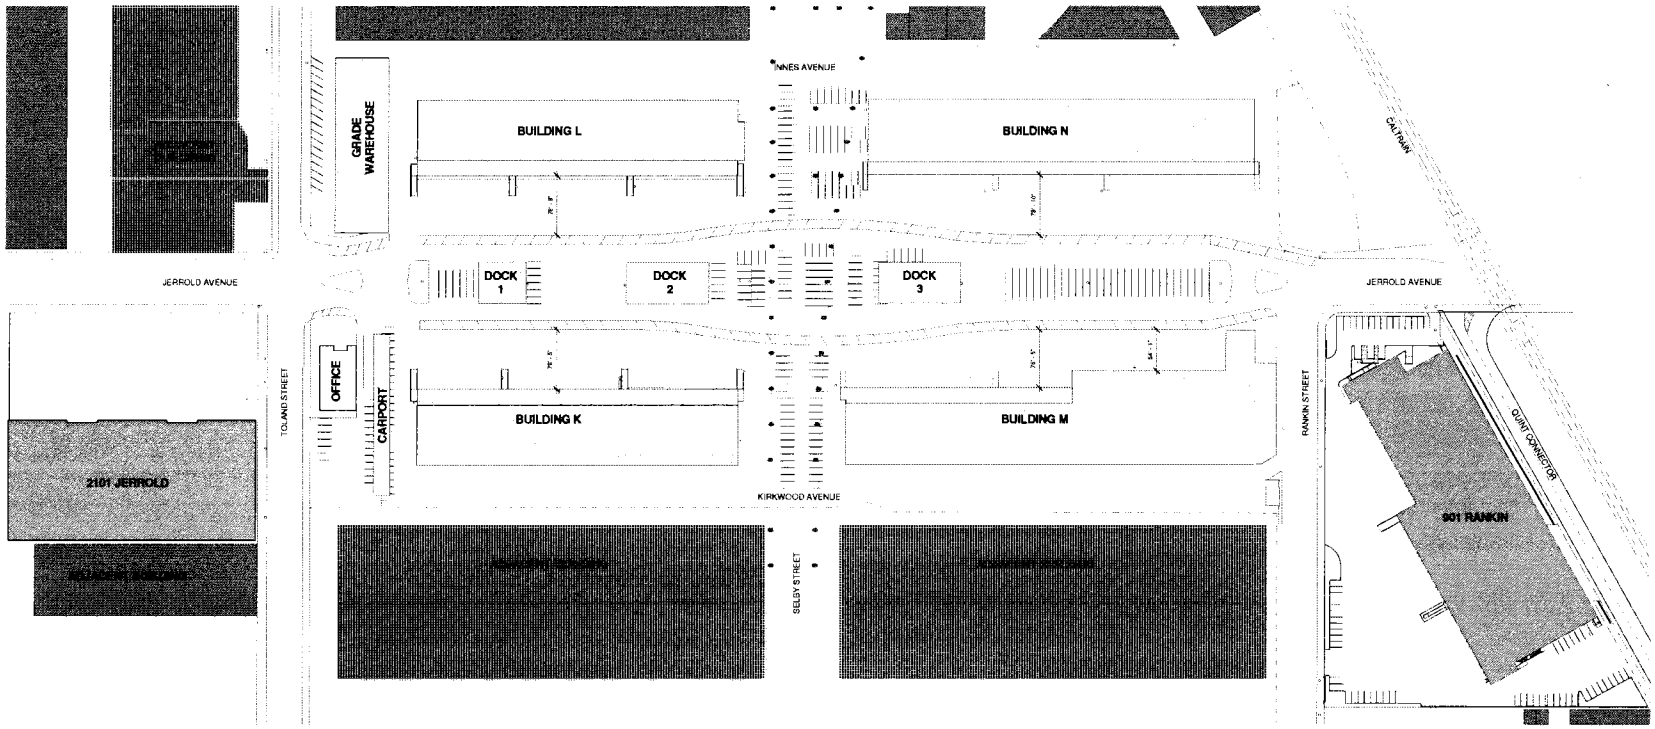
Reinvestment Plan

- 2013: Market becomes 501c3 and signs new 60-year lease with City
  - Lease requires Market to rebuild entire campus and reroute Jerrold Avenue (*see attached existing and proposed roadway configuration plan*)
  - At time of lease, no adjacent projects were envisioned (*see attached neighboring projects plan*)
- Market's board-approved Reinvestment Plan includes
  - Already-completed 901 Rankin (*see attached image*)
  - Addition of food-focused maker space
  - Designs for new campus buildings

Conclusion

1. Project description in DEIR does not accurately reflect the Market's Reinvestment Plan or our schedule
2. So long as Jerrold Avenue remains open on our site, we oppose the PUC's plan to use it for construction truck traffic as it severely impairs the operations and viability of our merchants

O-SFWPM-1.3
TR-1



3. The Market does not want PUC's proposed construction truck routing to discourage, delay, or prevent the execution of our Reinvestment Plan, which path to providing our merchants with new facilities
4. The Market seeks improved collaboration and coordination with PUC on the redesign of the full length of Jerrold Avenue and neighboring streets and intersections

SAN FRANCISCO WHOLESALE PRODUCE MARKET

FOOD RECOVERY PROGRAM

Preventing fresh, healthy produce from going to waste

The Food Recovery Program aims to eliminate all food waste from the San Francisco Wholesale Produce Market. The Food Recovery Program:

Supplies Bay Area charitable organizations with a diverse selection of healthy fruits and vegetables that go to feeding the hungry and other vulnerable populations.

Allows our merchant businesses to lower their operating costs and increase available space in their limited cold storage units.

We have a long history of diverting food from going to landfill. Our merchants were the first participants of the green bin compost program created in 1996. Today, our merchants work with our Food Recovery Coordinator to donate all of their edible, but no longer sellable, produce.

The Program is making a difference!

329,253
POUNDS OF PRODUCE RECOVERED

"I would like to thank you for the wonderful produce we have been receiving. It's a huge help, and allows us to offer a seasonal variety to our clients!"
Bayview Senior Services

"[Your] food donations help us serve high quality food to the people who rely on us."
Mother Brown's Dining Room

ABOUT THE MARKET
The San Francisco Wholesale Produce Market (the "Market") is a diverse community of merchants with the widest selection of fruits and vegetables helping Northern Californian food businesses meet their customers' unique produce needs. As San Francisco's original – and only – wholesale produce market, we are creating a thriving and sustainable food center that delivers unique value to our customers while giving back to the community and neighborhood. We allocated in the Bayview district. For more info: FoodRecovery@sfproduce.org or call: 415-550-4495 Updated 5/22/17

Project Title:	Biosolids Digester Facilities Project
Project Modification:	Biogas Utilization System
Modified Project Case No.	**2015-000644ENV-03**
Location:	Southeast Water Pollution Control Plant 750 Phelps Street, San Francisco, CA
Project Sponsor:	San Francisco Public Utilities Commission Karen Frye, (415) 554-1652, kfrye@sfwater.org
Lead Agency:	San Francisco Planning Department
Staff Contact:	Julie Moore, (628) 652-7566, Julie.Moore@sfgov.org

1.0 Background

On March 8, 2018, the San Francisco Planning Commission certified the Final Environmental Impact Report (FEIR) for the Biosolids Digester Facilities Project (Biosolids or approved project) at the Southeast Water Pollution Control Plant (Southeast Plant), located in the southeast part of San Francisco (**Figure 1**).[1] Originally built in 1952 with major upgrades in 1982 and 1996, the Southeast Plant is the City's largest wastewater treatment facility, treating approximately 80 percent of San Francisco's sewage and stormwater flows. The approved project includes the construction and operation of a new solids treatment process, odor control, energy recovery, and associated facilities to replace outdated existing facilities with more reliable, efficient, and modern technologies. Biosolids are the recyclable solid materials removed from the wastewater during the wastewater treatment process and digesters are the major facilities used in the solids treatment process.

1 San Francisco Planning Department, *Biosolids Digester Facilities Project Final Environmental Impact Report*, Planning Department Case No. 2015-000644ENV, State Clearinghouse No. 2015062073 certified March 8, 2018. Available online at: http://tinyurl.com/BDFPFEIR.

2.0 Approved Project Summary and Status

This section provides a brief overview of the project evaluated in the FEIR, the status of facilities construction, and minor modifications.

2.1 Components

The key components of the approved project include:

- Replacement and relocation of the solids processing treatment processes with new facilities
- Energy recovery facilities to reuse 100 percent of the digester gas generated by the proposed solids processing facilities to produce energy for heating and power uses at the Southeast Plant
- Odor control facilities to collect and treat odors from solids handling and energy recovery facilities
- Water systems and pump stations
- Support facilities such as buildings for operations and maintenance staff
- Various utility piping and electrical facilities
- Landscaping and architectural improvements

2.2 Status

Construction of the approved project began in early January 2020 and is in the fifth year of construction. All the buildings at the former Asphalt Plant and the Central Shops have been demolished; the majority of soil excavation and off hauling has been completed; foundations for most new facilities (including piles) have been installed; and the new biosolids digester facilities are partially constructed. The largest facilities, including the new solids pretreatment facility (Facility 600) and five new anaerobic digester tanks (Facility 610), along with the iron chloride storage tanks (Facility 913), and W2 pump station (Facility 921) have been erected with mostly internal work remaining such as, but not limited to, installing stairs and elevators, mechanical equipment, HVAC equipment, plumbing, equipment installation, and architectural finishes. The remaining buildings to be erected above ground level (the foundations, including excavation and piles are complete) are the smaller digestion cooling towers (Facility 604), thermal hydrolysis (Facility 605), solids odor control (Facility 606), steam generation (Facility 607), waste gas burners (Facility 613), and biosolids dewatering (Facility 615). Also continuing are excavation and installation of utility piping throughout the approved project area. As new facilities are completed there will be process testing, commissioning, and startup and integration with existing facilities.

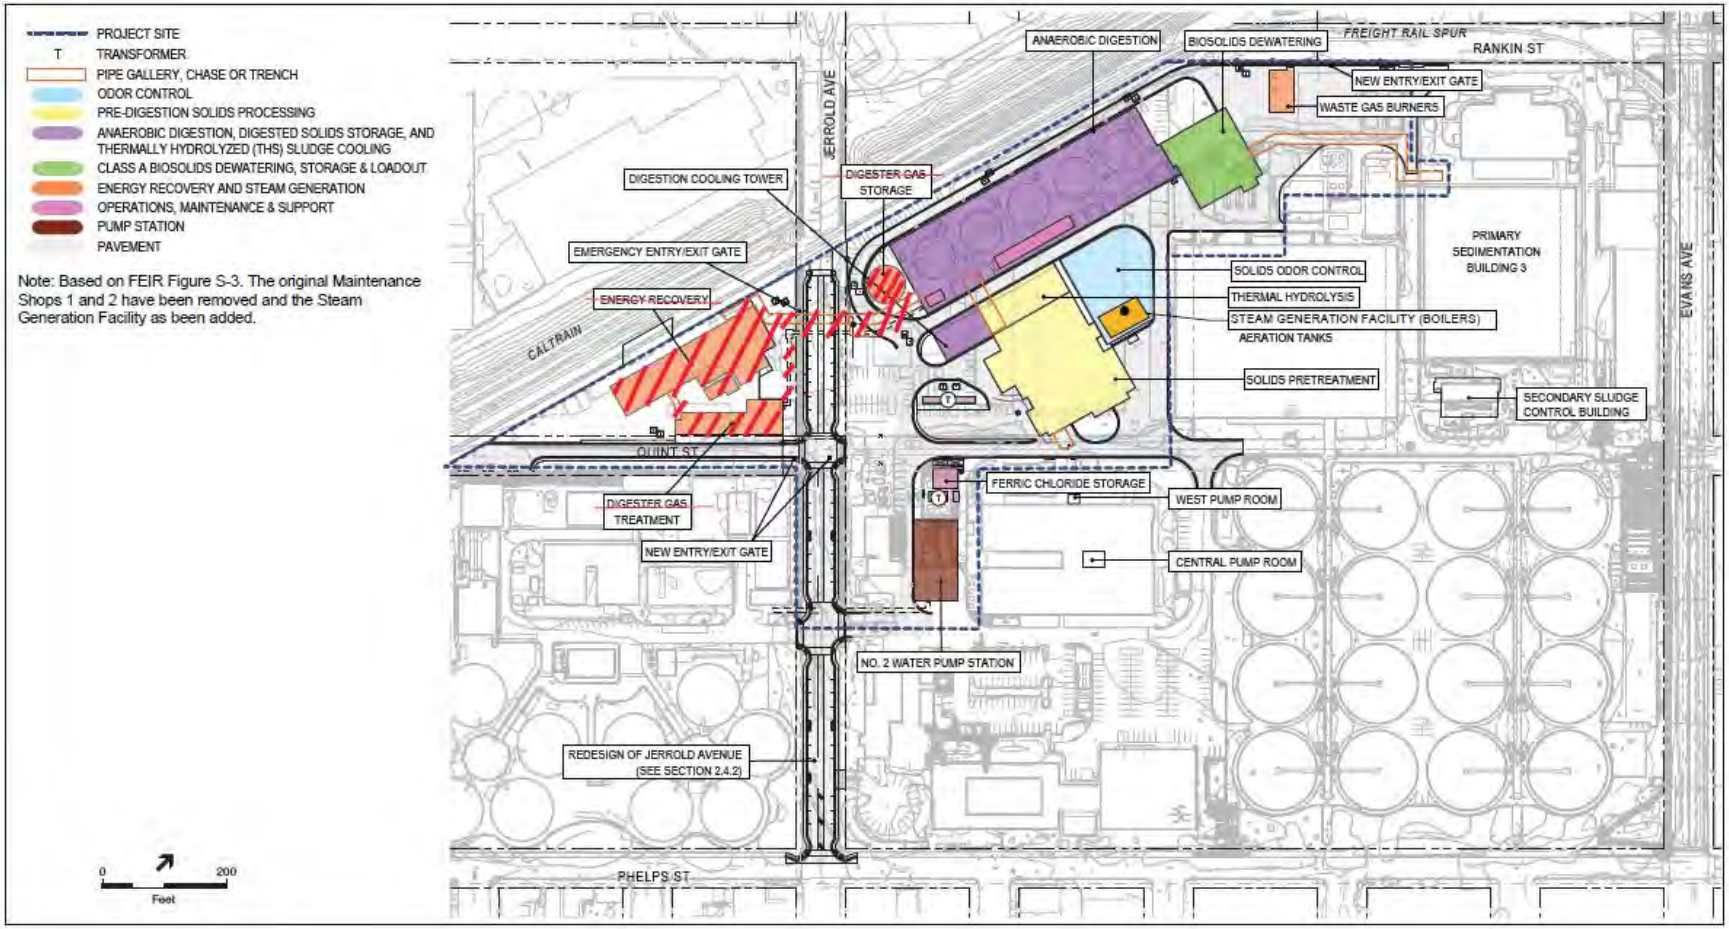
The FEIR estimated project construction would take five years from February 2018 through January 2023, followed by two and a half years of performance testing, start-up, and commissioning. However, construction of the approved project did not start until about January 2020 and construction is expected to take 1.5 years longer than previously estimated, independent of the project revisions analyzed in this addendum.

Since FEIR certification, the SFPUC has proposed a number of minor changes to the approved project such as, additional dewatering wells; geotechnical potholes and test piles; a rerouted pipeline; additional

work, staging, and parking areas (and the removal of other staging areas); alternative effective air quality mitigation; removal of Maintenance Shops 1 and 2; reducing the size of the Odor Control Building; adding a new Steam Generation Facility; and, adding an Interim Sidestream Nutrient Removal Facility to reduce nutrients (mainly nitrogen) from treated effluent to improve effluent water quality. The Planning Department determined these were minor project modifications that would clearly not alter the FEIR conclusions and documented the determinations with memoranda to the case file. These previously reviewed minor project modifications, summarized in Section 4.0 below, were each approved by the SFPUC. As such, they are now considered to be part of the approved project and are discussed in this addendum where relevant.

3.0 Proposed Modifications to the Project

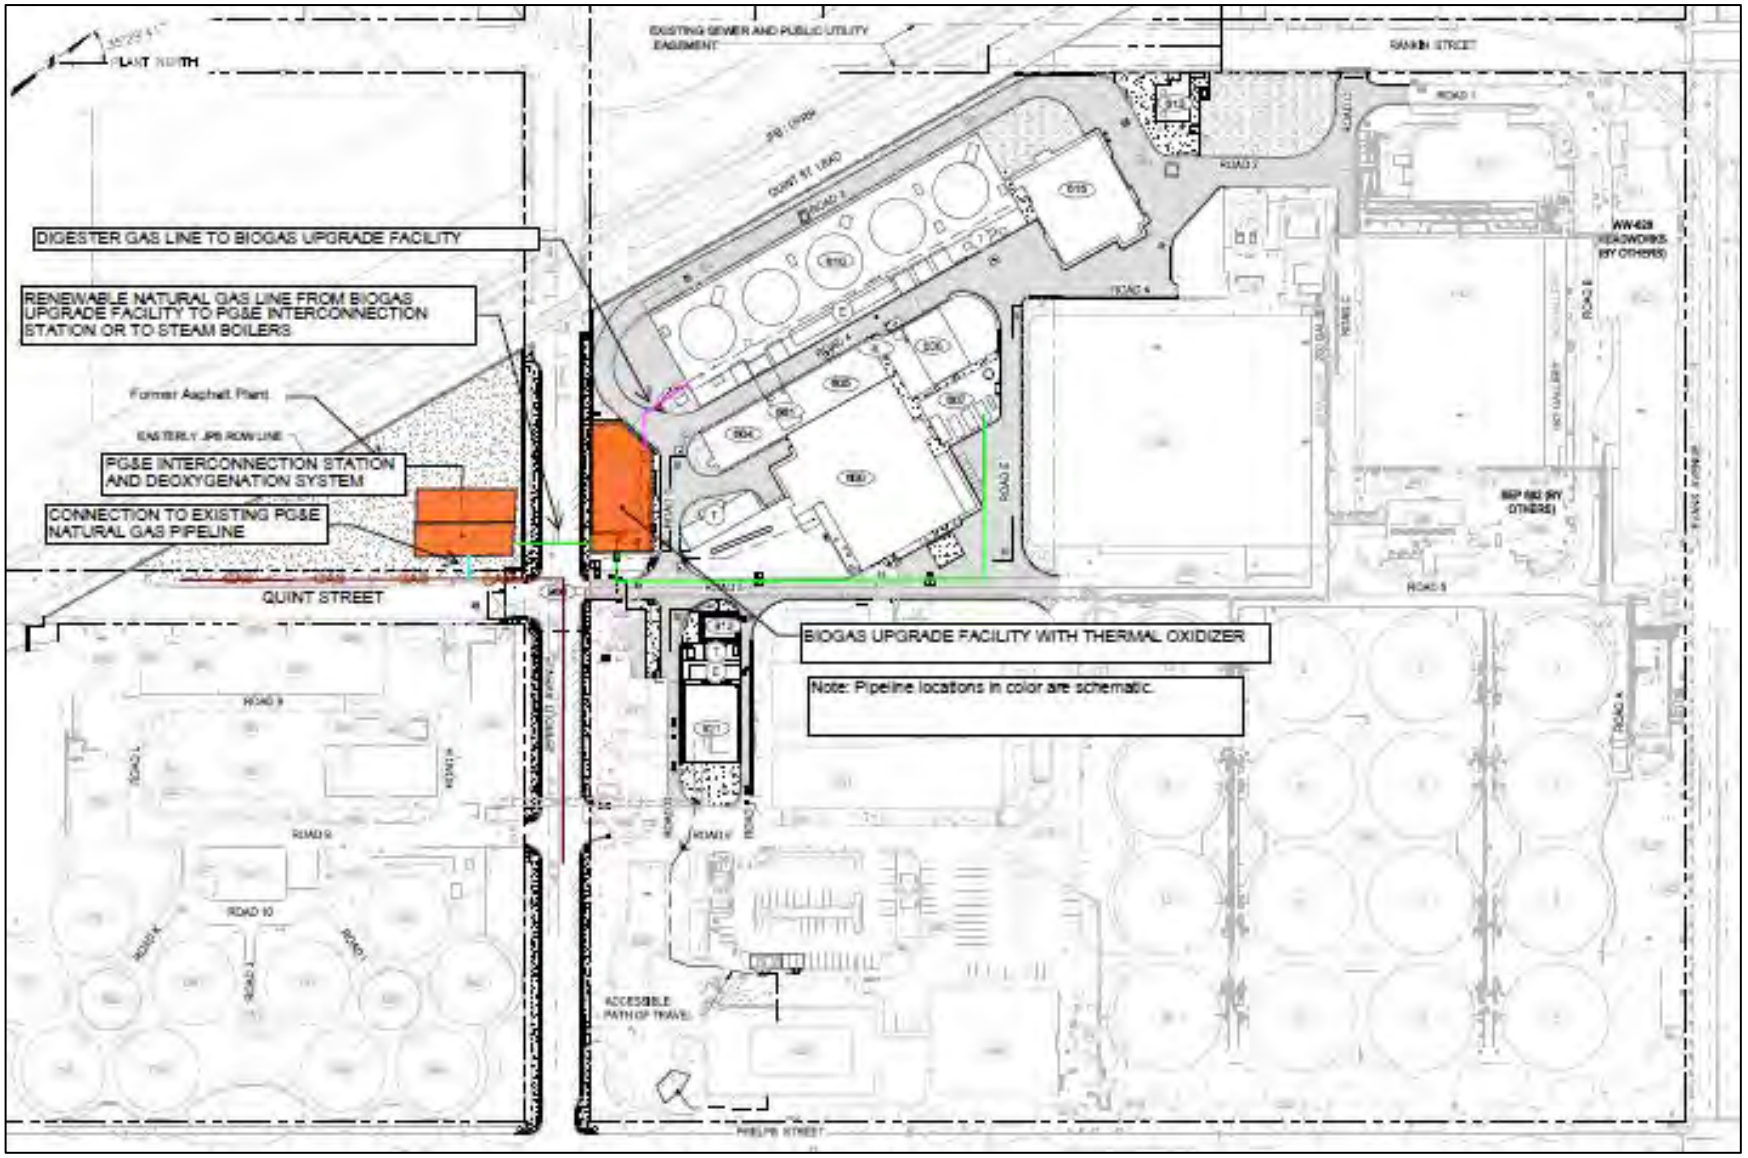
As discussed in the FEIR, a key objective of the approved project is the beneficial reuse of 100 percent of the digester gas generated by the Southeast Plant. To achieve this, the approved project included an energy recovery/cogeneration facility in which boilers and a turbine generator would burn the digester gas (or biogas) in turbines to convert it to heat, steam, and electricity that would then be used to operate the new biosolids facilities (called the "energy recovery system" in the FEIR). However, the SFPUC is now proposing to revise the approved project to convert the digester gas into pipeline-quality, renewable natural gas for injection into PG&E's existing natural gas pipeline, referred to hereafter as the "biogas utilization system." Consequently, the energy recovery system components would be removed from the approved project as shown in **Figure 2**. This alternative end-use of the digester gas would result in a smaller footprint of new facilities to be constructed and simplify Southeast Plant operations.



This addendum evaluates the environmental effects of the proposed modifications to the approved project: the construction and operation of a biogas utilization system instead of the approved energy recovery system and related changes to operational energy demand/supply.

3.1 Biogas Utilization System

The SFPUC would build and operate the proposed biogas utilization system, except for the Interconnection Station that PG&E would build and operate. The proposed biogas utilization system would convert the digester gas generated at the Southeast Plant into renewable natural gas that would become part of the greater energy market.[2] **Figure 3** shows the location of the proposed biogas utilization system components. The proposed biogas upgrade facility would be built at the location of the approved project's Maintenance Building No. 2 that was previously removed from the approved project



2 The proposed system promotes current California state goals for in-state production and distribution of renewable natural gas as documented in Assembly Bill 1900 and Senate Bill 840, and more recently in the Inflation Reduction Act.

Figure 2 Energy Recovery System Components Proposed To Be Removed from the Approved Project

Note: Cross hatching indicates energy recovery components to be removed

Figure 3 Modified Project Proposed Biogas Utilization System Components

Source: SFPUC

as documented in Minor Project Modification 10.[3] The PG&E interconnection station and deoxygenation system would be built at the location of the former digester gas treatment facility that was part of the approved project energy recovery system. The proposed biogas utilization system facilities would be within the approved project boundary, and no additional staging areas or access points would be needed. Each of the system's components are discussed below.

Table 1 provides a summary of the energy recovery system components to be removed from the approved project and the biogas utilization system components to be added. As shown, the 57-foot-tall energy recovery building, 60-foot tall by 60-foot-diameter digester gas storage tank, digester gas treatment facility, and maintenance shop building would not be constructed. Instead, the modified project would construct the Biogas Upgrade Facility with thermal oxidizer comprised of piping, tanks, and storage container-type structures approximately 15 to 45 feet tall and a PG&E Interconnection Station and Deoxygenation System with above-ground valves and piping. Because the proposed biogas utilization system would be a less complex system with less substantial components than the approved energy recovery system facilities, construction would disturb 0.3 acres less work area, excavate 5,538 cubic yards less soil, and drill 279 to 331 fewer piles.

3.1.1 Biogas Upgrade Facility

The first step of the biogas utilization system would be to convert the digester gas generated by the Southeast Plant to renewable natural gas at the proposed Biogas Upgrade Facility. The facility would be built on the north side of Jerrold Avenue within the footprint of the originally planned Maintenance Shops 2 Building. It would consist of outside equipment, including piping, valves, and tanks. The facility foundation would be either a shallow, approximately 2-foot-thick concrete pad supported by up to approximately 50, 60-foot-deep piles, or an approximately 8-foot-thick concrete pad without piles. The technology to convert the digester gas to renewable natural gas is still being evaluated and would determine the height of the equipment. The vessels (or tanks) would either be more spread out and shorter, up to about 20 feet tall, or more confined and taller, up to about 45 feet tall. Most of the digester gas would be converted to renewable natural gas, but some residual tail gas, comprised of methane and carbon dioxide, may remain. Therefore, the facility may include a thermal oxidizer unit, 15 to 45 feet tall, to abate the methane, with resulting emissions of carbon dioxide. For the purpose of this addendum analysis, the thermal oxidizer unit is assumed to be needed.

The digester gas would be piped directly from the anaerobic digesters to the proposed Biogas Upgrade Facility via a portion of the previously approved Digester Gas Line, instead of needing to be stored in a digester gas storage tank first. From the biogas upgrade facility, two approximately 4-inch-diameter pipes would be installed under Jerrold Avenue to convey the renewable natural gas to and from the proposed PG&E Interconnection Station discussed below.

3 SFPUC, Biosolids Digester Facilities Project Minor Project Modification 10 - Facilities Modifications, approved by San Francisco Planning Department on February 2, 2021.

Table 1 Proposed Modifications to Facilities

Facility	Location	Approximate Area and Excavation Depth	Height and Diameter	Piles
Remove from Approved Project				
Digester Gas Storage tank	North of Jerrold	2,827 sq. ft (0.06 acre) by 15 feet deep	60 foot tall by 60 foot diameter tank	38 piles: 3 foot diameter by 60 feet deep (none were in cultural site)[4]
Energy Recovery Building (turbines, boilers, 1.5MW emergency generator)	South of Jerrold	21,000 sq. ft. (0.48 acre) by 5 feet deep	57 foot tall building, 75 foot tall by 4 foot diameter vent stack for turbine	185 piles: 3 foot diameter by 60 feet deep (6 were in cultural site)
Digester Treatment Facility	South of Jerrold	8,568 sq. ft. (0.2 acre) by 5 feet deep	12 foot tall by 10 foot diameter outside tanks and vessels (11)	75 piles: 4 foot diameter by 60 feet deep (35 were in cultural site)
Digester Gas Line[5]	Under Jerrold, North and South of Jerrold	1440 sq. ft. (0.03 acre) [96 feet long by 15 inches wide] by 15 feet deep	N/A	9 piles: 4 foot diameter by 60 feet deep (none were in cultural site)
Pipe Chase under Jerrold from Digester Gas Storage Tank to Energy Recovery Building	Under Jerrold	1440 sq. ft. (0.03 acre) [247 feet long by 18 inches wide by 12 feet deep	N/A	24 piles: 4 foot diameter by 60 feet deep (none were in cultural site)

4 California Register- and National Register-eligible Native American archeological site CA-SFR-171. Refer to Section 5.3, Cultural Resources for discussion.

5 The portion of the originally approved digester gas line west of Jerrold would still be built to convey gas from the new digesters to the proposed biogas upgrade facility.

Facility	Location	Approximate Area and Excavation Depth	Height and Diameter	Piles
Add to Modified Project[6]				
Biogas Upgrade Facility with thermal oxidizer	North of Jerrold – replaces originally approved Maintenance Shops	9,984 sq. ft. (0.23 acre) by 2 to 8 feet[7]	15 feet to 45 feet tall outside piping and tanks, various diameters[8]	To be determined[9] Either none or up to 52 piles, 3 foot diameter by 60 feet deep (all would be in cultural site)
PG&E Interconnection Station and Deoxygenation System	South of Jerrold - replaces originally approved Digester Treatment Facility	15,000 sq. ft. (0.34 acre) by 2 feet	15 feet tall	None
Pipes from Biogas Upgrade Facility to PG&E Interconnection Station	Under Jerrold	940 sq. ft. (0.02 acre) [235 feet long by 4 feet wide] by 6 feet deep	N/A	None
Pipe from PG&E Interconnection Station to existing PG&E natural gas pipeline	Under Quint	35 sq. ft. (0.001 acre) [14 feet long by 2.5 feet wide] by 6 feet deep	N/A	None
NET		**Less 12,326 sq. ft. (0.3 acres)** **Less 5,538 cubic yards excavated**		**279 to 331 fewer piles** (11 more or 41 fewer in cultural site)

6 The exact dimensions of new facilities are to be determined upon completion of final design; the information in this table represents the range of facility dimensions.

7 A range in excavation depth is provided because the new tanks and piping could either be on a shallow concrete pad with piles or a deeper concrete pad with no piles.

8 A range in height is provided because the new tanks and piping could either be shorter and more spread out or taller and more confined.

9 Piles may or may not be needed depending on the final design of the concrete pad foundation.

Like the energy recovery system under the approved project that would have generated a small amount of solid waste associated with removing impurities in the digester gas, impurities would need to be removed from the tail gas generated at the biogas upgrade facility and also would need to be hauled to an approved landfill by several trucks every four to six months. The volume of material would be similar and involve approximately the same number of trucks as the approved project because the volume of digester gas would not change.

3.1.2 PG&E Interconnection Station and Deoxygenation System

PG&E would construct and operate a standard Interconnection Station at the former Asphalt Plant site, south of Jerrold where the originally-approved digester gas treatment facility would have been located. The Interconnection Station would test the quality of the renewable natural gas. Poor-quality renewable natural gas would be returned to the biogas upgrade facility for additional treatment. Quality renewable natural gas would be conveyed to PG&E's existing natural gas pipeline in Quint Street. The Interconnection Station would consist of skid-mounted piping and valves on a 2-foot-thick concrete pad (no piles) with equipment up to 10 feet tall. Access would occur from Jerrold Avenue and a solar panel may be installed for power. PG&E would construct and operate a short section of new pipeline from the station to its existing natural gas pipeline in Quint Street.

A Deoxygenation System may also be necessary in this area to remove oxygen to meet PG&E's renewable natural gas quality standards prior to injection. The Deoxygenation System would be adjacent to the Interconnection Station and would include tanks and storage containers up to 15 feet tall on a concrete slab.

3.2 Modified Project Construction

3.2.1 Schedule

The proposed biogas utilization system would take approximately two years to construct from about December 2024 through December 2026. The proposed biogas utilization system facilities would be constructed along with the remaining approved project facilities so that they would be operational concurrent with the other new Biosolids facilities to start immediately reusing the biogas. While the energy recovery facilities would have taken about three years to build, the biogas utilization system would take approximately two years. This decrease in construction duration is commensurate with the reduction in construction level of effort (i.e., less excavation, pile drilling, building construction, trucking, etc.). Overall, the approved project started later, and construction is projected to extend approximately one and a half years longer than estimated in the FEIR because it is taking longer to construct than initially envisioned. **Table 2** presents the revised construction schedule for the remaining facilities. The recently approved project modification to construct the Interim Sidestream Nutrient Removal Facility would also be constructed within this timeframe.

Table 2 Revised Schedule

Activity	FEIR Table 2-10 Estimated Schedule	Revised Estimated Schedule	Facilities in Construction
Biosolids Digester Facilities Construction	Feb. 2018 – Jan. 2023 (5 years)	Jan. 2020 - July 2026 (6.5 years)	• Approved project facilities (ongoing) • Approved Interim Sidestream Nutrient Removal facility (May 2024 to April 2025) • Proposed Biogas Utilization System (December 2024 to December 2026)[10] • Future anticipated proposed SEP-7 Operations, Engineering, and Maintenance Buildings[11] (February 2025 to September 2027)
Post-Construction Activities (performance testing/start-up, full facility commissioning)	Feb. 2023 - July 2025 (2.5 years)	August 2026 – Summer 2028 (2 years)	
Existing Digesters Decommissioning[12]	After 2025	After 2028	

3.2.2 Hours, Work Force, and Construction Coordination

The construction schedule days and work hours for the biogas utilization system and the remaining approved facilities during the extended construction period of the modified project would be the same as for the approved project. Construction of the biogas utilization system components would require up to approximately 20 workers at any one time, which would be within the work force estimated for the approved project. As currently, the Southeast Plant Construction Management Team would coordinate construction staging, parking, project interfaces, and traffic controls for the modified project with the other Southeast Plant maintenance and repair projects to maintain local traffic, transit, bicycle, and pedestrian access and safety.

3.2.3 Equipment, Staging, Truck and Delivery Access, Demolition, and Foundations

Construction of the proposed biogas utilization system would use the same types of equipment as the construction of the other approved project facilities. No new types of equipment would be required. Staging and worker parking for construction of the biogas utilization system would occur within the approved project boundary, inclusive of the warehouses at the corner of McKinnon and Rankin streets

10 The proposed biogas utilization system is evaluated in this addendum.

11 SFPUC has proposed new SEP-7 Operations, Engineering, and Maintenance Buildings, to replace the maintenance shops included in the originally approved project described in the FEIR. This proposed revision to the approved project is undergoing environmental analysis.

12 Per the FEIR, potential demolition of the existing digesters and the solids handling facilities would be evaluated as a separate project when future uses of the site are proposed.

previously added to the approved project for parking and staging areas under Minor Project Modification 16.[13] The same roads would be used for access and trucking as for the approved project, including Highway 101, Interstate 280, Cesar Chavez, Evans Street, Phelps Street, Rankin Street, Jerrold Avenue, and McKinnon Street.

Because the structures that were present at the proposed locations for the Biogas Upgrade Facility and the PG&E Interconnection Station and Deoxygenation System have already been demolished as part of the approved project, no demolition is required for the proposed modification. There are no trees at these locations. Construction of the proposed biogas utilization system facilities would involve removing asphalt, excavation and drilling piles to serve as building foundations by the same methods as the approved project. As shown in **Table 1**, the modified project would result in approximately 5,538 cubic yards less excavation and installation of 279 to 331 fewer piles.

3.2.4 SFPUC Standard Construction Measures

As with the approved project, SFPUC's Standard Construction Measures would be implemented during construction of the proposed biogas utilization system.

3.3 Modified Project Operations

3.3.1 Removal of the Energy Recovery System and Related Changes in Operation and Energy Demand/Supply

Without the energy recovery system, in which the digester gas would be burned in boilers and a turbine generator to provide heat, steam, and electricity to operate the new biosolids facilities, the steam boilers would need to operate full-time instead of on a stand-by basis to generate the steam needed for the solids treatment (i.e., pre-digestion solids processing using the thermal hydrolysis process). Additionally, whereas flaring would have been infrequent with the energy recovery system, the SFPUC expects that the biogas utilization system would operate 90 to 95 percent of the time with intermittent flaring, or burning off the digester gas in a smokestack, limited to 5 to 10 percent of the time.[14]

Removal of the energy recovery system would require natural gas and electricity to power the steam boilers and other approved project facilities. **Table 3** below presents the revised energy demand and supply sources with the proposed biogas utilization system in comparison to the approved project.

3.3.2 Work Force and Maintenance

Operation of the proposed biogas upgrade facility and deoxygenation system may require approximately one additional employee, resulting in two additional worker vehicle trips per day during operations. The PG&E interconnection station would operate autonomously with periodic site visits by an existing PG&E employee to inspect and maintain equipment. Therefore, with the modified project there may be one

13 SFPUC, Biosolids Digester Facilities Project Minor Project Modification 16, approved by San Francisco Planning Department May 17, 2023.

14 As discussed further in the air quality analysis below, this addendum evaluates a worst-case operating scenario of the biogas utilization system operating only 70 percent of the time and flaring 30 percent of the time.

Table 3 Estimated Energy Demand and Supplies with Project Revisions

Energy Type	Facility	FEIR Table 2-8 for Existing Facilities	FEIR Table 2-8 for Future Biosolids Facilities[15]	With Proposed Revisions
Electricity Power Demand	BDFP Solids Treatment Process	1 MW (estimated)	4.4 MW (2023) 4.9 MW (2045)	4.1 MW (2027)[16] 4.5 MW (2045)
	Interim Sidestream Nutrient Removal (MPM-17)	-	N/A – not in FEIR	0.5 MW
	Proposed Biogas Utilization System	-	N/A – not in FEIR	1.6 MW
Electricity Produced from Cogeneration (i.e., Energy Recovery System)	From Digester Gas	0.66 MW	4.2 MW (2023) 5.2 MW (2045)	0 MW
	Digester gas generation, cubic feet per day	*Approximately 1.3 million*	*Approximately 1.6 million (2023)* *Approximately 2 million (2045)*	*Approximately 1.6 million (2027)* *Approximately 2 million (2045)*
	From Natural Gas	0.02 MW	0 MW	0 MW
Electricity from Hetch Hetchy Hydropower		0.32 MW	0.2 MW (2023) 0 MW (2045)	5.2 MW (2027) 5.6 MW (2045)
Electricity from PG&E		N/A	N/A – not in FEIR	1.6 MW[17]
Diesel Use, gallons year		50 gallons/year	5,250 gallons/year	50 gallons/year
Natural Gas/Propane Gas		Minor volume to supplement steam boilers as-needed		Up to 50,000 standard cubic feet/hour (24/7)[18]

BDFP = Biosolids Digester Facilities Project; MW = megawatts; N/A = not applicable

15 Source: FEIR, see original table for information details on existing and approved project assumptions

16 Revised date due to construction delays and extended schedule

17 Because power for the biogas utilization system could be provided by the SFPUC or PG&E, it is conservatively shown as coming from PG&E in this table and as evaluated in this addendum.

18 Natural gas demand conservatively assumes steam boilers are operating full time and to process the maximum potential daily intake of sewerage and associated digester production, but the annual average digester gas production is less such that annual natural gas consumption would also be less.

new employee for operations compared to the approved project having no new employees. Maintenance frequency for the proposed biogas utilization system would be similar to the approved project, with minor repairs every few years and repairing major pieces of equipment every 20 to 30 years. Thus, there would be a negligible change in the number of truck trips or vehicle miles travelled during operation of the proposed biogas utilization system or the overall modified project.

3.3.3 Other Southeast Plant Operations

The proposed revisions would not affect the existing overall capacity of the Southeast Plant for wastewater treatment; the overall treatment methods and in turn chemical storage, use, handling and associated truck trips and routes; the amount of digester gas generated; or the amount of biosolids generated and the associated number of hauled trucks and routes. Lastly, the long-term streetscape and landscape improvements along Jerrold Avenue would still be implemented under the modified project.

3.4 Approvals

This addendum will be used to support the following public agency approvals:

- San Francisco Public Utilities Commission - Approval of the proposed biogas utilization system at a public hearing
- Bay Area Air Quality Management District – Authority to Construct and Permit to Operate

4.0 CEQA Approach

San Francisco Administrative Code section 31.19(c)(1) states that a modified project must be reevaluated, and that "If, on the basis of such reevaluation, the Environmental Review Officer determines, based on the requirements of the California Environmental Quality Act (CEQA), that no additional environmental review is necessary, this determination and the reasons therefore shall be noted in writing in the case record, and no further evaluation shall be required by this Chapter." CEQA Guidelines section 15164 provides for the use of an addendum to document the basis for a lead agency's decision not to require a subsequent FEIR for a project that is already adequately covered in a previously certified FEIR. An addendum to a certified FEIR may be prepared if some changes or additions are necessary, but none of the conditions described in section 15162 calling for the preparation of a supplemental or subsequent FEIR have occurred.

This addendum to the FEIR documents the environmental effects of the proposed modifications to the Biosolids Digester Facilities Project: the construction and operation of the biogas utilization system in lieu of the originally proposed energy recovery facilities and related changes to operational energy demand/supply. The Biosolids Digesters Facilities Project, inclusive of these proposed modifications (herein referred to as the "modified project"), is compared to the impacts of the "approved project" as disclosed in the FEIR and subsequently approved minor project modifications, and explains why the proposed modifications would not result in any new significant environmental impacts or a substantial increase in the severity of previously identified environmental impacts, and would not require the adoption of any new or considerably different mitigation measures.

Since certification of the FEIR, several changes have occurred in the approved project and the circumstances under which the approved project would be undertaken. These changes include the following: 1) minor modifications to the approved project described in the FEIR; 2) new information regarding cumulative projects proposed in the vicinity; and 3) changes in the existing conditions regarding health risks from air pollution sources due to an updated citywide health risk assessment. These changes are described further in the subsections below. As analyzed in this addendum, the modified project combined with these changed circumstances would not materially change any of the analyses or conclusions of the certified FEIR.

4.1 Approved Minor Project Modifications

As described in Section 2.2 above, since FEIR certification, the SFPUC has proposed a number of minor changes to the approved project including the following: additional dewatering wells; geotechnical potholes and test piles; a rerouted pipeline; additional work, staging, and parking areas (and the removal of other staging areas); substitution of alternative effective air quality mitigation; removal of Maintenance Shops 1 and 2; reducing the size of the Odor Control Building; adding a new Steam Generation Facility; and, adding an Interim Sidestream Nutrient Removal Facility to reduce nutrients (mainly nitrogen) from treated effluent to improve effluent water quality. The Planning Department determined that these changes were minor project modifications that would clearly not alter the FEIR conclusions and documented these determinations with memoranda to the case file. Two key previous changes related to this addendum were the removal of the Maintenance Shops Building No. 2 from the approved project (now the proposed location of the Biogas Upgrade Facility) and the addition of the Steam Generation Facility to support the solids treatment process.[19] **Table 4** summarizes the approved project inclusive of the minor project modifications to date and the proposed modifications analyzed in this addendum.

4.2 Cumulative Projects in the Site Vicinity

FEIR Section 4.1.3, Approach to Cumulative Impact Analysis and Cumulative Projects, describes potential projects in the site vicinity. FEIR Table 4.1-1 lists 40 nearby projects considered in the cumulative impact analysis, including the construction dates of those projects. Since certification of the FEIR, some of these projects have been completed and would no longer be part of the modified project cumulative scenario; others have been delayed and would now overlap with the modified project construction. In addition, new projects have been proposed both at the Southeast Plant and in the project vicinity. **Appendix A** updates the projects considered in the cumulative impact analysis for the modified project.

19 SFPUC Biosolids Digester Facilities Project Minor Project Modification 10 – Modified Facilities, Approved by San Francisco Planning Department February 2, 2021.

Table 4 Summary of Approved Project and Modified Project

Feature	Approved Project		Modified Project
	FEIR Certified Project	Previously Approved Project Changes[20]	
Southeast Plant Property Size	Approximately 47 acres	No change	No change
Southeast Plant Design Wastewater Flow Capacity	250 mgd (wet weather)	No change	No change
Digester Tanks	85 mgd (dry weather design average)	No change	No change
Solids Treatment Process	• Thickening • Screening • Pre-thermal hydrolysis • Thermal Hydrolysis Process • Anaerobic Digestion • Biosolids Dewatering	Same as certified project with addition of: • Steam Generation Facility with boilers operating full time[21] • Interim Sidestream Nutrient Removal[22]	No change
Biosolids	Classification: Class A Exceptional Quality Annual Production: 24,000 dry tons Haul Trips: 10-14 trips per day	No change	No change
Odor Control	Designed to limit odors from biosolids facilities to within revised SEP site boundaries	No change	No change
Digester Gas	Production: approximately 2 million cubic feet/day Flaring: Infrequent	No change	No change in production Flaring: Intermittent

20 Minor revisions to the original project in the FEIR as modified under Minor Project Modifications approved by Planning Department

21 SFPUC Biosolids Digester Facilities Project Minor Project Modification 10 – Modified Facilities, Approved by San Francisco Planning Department February 2, 2021

22 SFPUC Biosolids Digester Facilities Project Minor Project Modification 17 – Interim Sidestream Nutrient Removal, Approved by San Francisco Planning Department February 12, 2024

Feature	Approved Project		Modified Project
	FEIR Certified Project	Previously Approved Project Changes [20]	
Energy Recovery	Technology: • Gas Turbines • Heat Recovery Steam Generation System • Steam Boilers: Backup Only Electricity Generation (Annual Average): 4.2 to 5.2 megawatts	No change	Removed Technology: • Gas Turbines • Heat Recovery Steam Generation System • Steam Boilers: Backup Only (*see changes related to boilers in Solids Treatment Process above) Added Technology: • Biogas Upgrade Facility with Thermal Oxidizer • PG&E Interconnection Station with Deoxygenation System Electricity Generation (Annual Average): 0.0 megawatts • Power for Biogas Upgrade Facility may be from PG&E • Power for all other facilities from SFPUC Hetch Hetchy Water and Power
Southeast Plant Staffing Levels	280 staff (entire SEP including biosolids staff)	No change	One additional employee
New Operations, Maintenance, and Support Buildings/Structures	Maintenance Shops 1 (19,600 square feet) Maintenance Shops 2 (5,500 square feet) Digester Electrical Rooms Ferric Chloride Storage Transformers Maximum Height: 30 feet above grade	Same as certified project except no Maintenance Shops 1 and 2.[23]	No change

23 SFPUC Biosolids Digester Facilities Project Minor Project Modification 10 – Modified Facilities, Approved by San Francisco Planning Department February 2, 2021.

Feature	Approved Project		Modified Project
	FEIR Certified Project	Previously Approved Project Changes [20]	
Landscaping Improvements	Trees, landscaping, fencing and street improvements along Jerrold Avenue Proposed removal of 90 trees	No change	No change
BDFP Project Site	Approximately 12.9 acres	Approximately 14 acres	No change
Construction Schedule	Five years (2018-2023)	No change	Six and a half years (2020 – Summer 2026)
Construction Staging, Worker Parking	Within plant, on Quint Street, Closed portion of Jerrold Avenue, Piers 94 and 96, Southeast Greenhouses site, 1550 Evans	Same as certified project except: • No use of 1550 Evans, Piers 94/96 • Added 2000 McKinnon Avenue • Expanded staging on Jerrold Avenue to between Phelps and Rankin [24]	No change
Construction Truck and Delivery Access, Worker Access	Truck/Delivery Access to BDFP: Rankin Street, Evans Avenue, Jerrold Avenue, Cesar Chavez, Phelps Street Worker Access: Jerrold Avenue	Truck/Delivery Access to BDFP: added McKinnon Avenue Worker Access: added Quint Street, McKinnon Avenue [25]	No change
Muni Route 23 Relocation	Temporarily relocated from Jerrold Ave to Oakdale and Palou Avenues	No change	No change
Construction Equipment	Listed in FEIR	No change	No change

24 SFPUC Biosolids Digester Facilities Project Minor Project Modification 16 – McKinnon Parking Site, Approved by San Francisco Planning Department May 17, 2023

25 SFPUC Biosolids Digester Facilities Project Minor Project Modification 7 – Traffic on Jerrold, Approved by San Francisco Planning Department September 1, 2020

Feature	Approved Project		Modified Project
	FEIR Certified Project	Previously Approved Project Changes [20]	
Building Demolition	Central Shops Asphalt Plant Structures Buildings 855, 870, 925, SS5A/5B 1550 Evans Total: 136,000 square feet	Same as certified project except: • Building 870 not demolished [26]	No change
Excavation Volumes /Areas/Depths	Volume: 190,000 cubic yards Depth: 45 feet below ground surface	Same as certified project plus: Additional volume: 360 cubic yards [27]	Same as certified project except: • Volume: reduced by 5,538 cubic yards to total of 184,812 cubic yards • 279 to 331 fewer piles

28 SFPUC Biosolids Digester Facilities Project Minor Project Modification 6– Additional Work Area Changes, Approved by San Francisco Planning Department April 28, 2020

4.3 Existing Air Quality Conditions

In 2020, the City and County of San Francisco completed an update to the San Francisco Citywide Health Risk Assessment (HRA), which was previously prepared in 2014.[29] The 2020 San Francisco Citywide HRA evaluated the cancer risks and small particulate matter (PM2.5) concentrations from existing known sources of air pollution including updates to vehicle activity and emissions rates, updates to maritime emissions, emissions from Caltrain and updated stationary source emissions. The 2020 San Francisco Citywide HRA was used to update the air pollutant exposure zone that is referenced in Health Code article 38 and the Clean Construction Ordinance. The 2020 San Francisco Citywide HRA and air pollutant exposure zone updates the 2014 analysis referenced in the FEIR. This addendum air quality analysis uses the updated 2020 Citywide HRA for the existing plus project and cumulative health risk assessment. The updated background health risks show an increase in the existing background health risks since 2014 due to the changes in emissions and methodology.

4.4 Updates to CEQA Guidelines

Since FEIR certification, the CEQA Guidelines Appendix G Environmental Checklist Form has been updated to add the topics of Tribal Cultural Resources and Wildfire. Accordingly, these topics are discussed in the analysis of potential environmental effects below.

5.0 Analysis of Potential Environmental Effects

The FEIR and subsequent approved minor project modifications evaluated potential physical environmental impacts of the approved project and found that implementation of the approved project would result in project-specific significant environmental effects that could be mitigated to a less-than-significant level with implementation of mitigation measures, except for the demolition of historic buildings and NOx emissions in Years 1 and 3 of construction. A Mitigation Monitoring and Reporting Program was required for the approved project and adopted by the SFPUC on March 13, 2018,[30] and applicable mitigation measures from the approved project would be required for the modified project.

This addendum evaluates the modified project with respect to the resource topics discussed in the FEIR, with the addition of analyses for tribal cultural resources and wildfire in accordance with recent changes in the CEQA Guidelines Appendix G initial study checklist. Because the modified project is located within the approved project site and would be similar to the approved project evaluated in the FEIR, only those environmental topics with significant impacts or otherwise requiring additional analysis or new analysis are discussed in detail below. The environmental topics discussed in detail include:

- Air Quality
- Greenhouse Gas Emissions
- Noise
- Cultural Resources

29 San Francisco Department of Public Health (SF DPH), San Francisco Planning Department, and Ramboll. 2020. San Francisco Citywide Health Risk Assessment: Technical Support Documentation.

30 San Francisco Public Utilities Commission Resolution No. 18-0042, March 13, 2018.

- Tribal Cultural Resources
- Biological Resources
- Wildfire

The remaining environmental topics are addressed in less detail below or briefly in the "Other Environmental Topics" section.

5.1 Air Quality

5.1.1 Biosolids Digester Facilities Project FEIR Findings

The FEIR found that the approved project would have potentially significant impacts related to the following significance criteria regarding air quality:

- Conflict with or obstruct implementation of the applicable air quality plan
- Violate any air quality standard or contribute substantially to an existing or projected air quality violation
- Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is in non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions that exceed quantitative thresholds for ozone precursors)

The potentially significant impacts associated with the above criteria for the approved project and modified project are discussed in detail in the construction and operations sections below.

Briefly, the FEIR also evaluated several other significance criteria regarding air quality impacts and determined that the potential impacts related to these criteria would be less than significant. The FEIR found that operation of the approved project would result in the emissions of criteria air pollutants below the significance thresholds and thus would not result in any new violations of air quality standards, contribute to an existing or projected air quality violation, or result in a cumulatively considerable net increase in criteria air pollutants. The FEIR found that construction and operation of the approved project would generate toxic air contaminants, including diesel particulate matter, but would not expand the City's air pollutant exposure zone (APEZ) boundaries or create new APEZ areas or result in net excess cancer risk and PM2.5 emissions concentrations in exceedance of significance thresholds at sensitive receptors within 1 kilometer of the site. Lastly, the FEIR determined that odors from construction and operation would be less than significant because construction odors (e.g., diesel exhaust from equipment) would be temporary and variable and that odors from the operation of the approved solids treatment facilities would improve compared to existing conditions because the solids handling and digester gas handling facilities would be relocated further from sensitive receptors and facilities would include odor control features.

Construction

Construction of the project would generate emissions of fugitive dust from soil disturbance and hauling soil off-site and criteria air pollutants through construction equipment and truck emissions. The FEIR determined that because the SFPUC would be required to implement dust control measures like watering, covering truck beds hauling soil, and perimeter dust monitoring pursuant to with San Francisco

Health Code Article 22B (Dust Control Ordinance), fugitive dust emissions would have a less than significant impact on air quality.

Criteria air pollutants include nitrogen oxides (NOx), particulate matter (PM10 and PM2.5), and reactive organic gases (ROG). The FEIR estimated construction criteria air pollutant emissions and found that because the SFPUC would be required to use either newer construction equipment or equip older construction equipment with after-market emissions controls (e.g., soot filters) pursuant to San Francisco Environment Code Chapter 25 (Clean Construction Ordinance), the average daily emissions of NOx, ROG, PM10, and PM2.5 would be below applicable thresholds, except that NOx emissions would exceed thresholds in Years 1 and 3 of construction. To further reduce NO_x, emissions, the FEIR requires implementation of Mitigation Measure M-AQ-1a (Construction Emissions Minimization), which requires equipment greater than 140 horsepower to have a Tier 4 Final engine rating, 80% of trucks to be 2010 or newer, and the use of renewable diesel in all off-road equipment and haul trucks. However, the FEIR found that while this measure would further reduce NO_x emissions, NO_x emissions would still exceed the significance threshold in construction Years 1 and 3. The FEIR therefore further requires implementation of Mitigation Measure M-AQ-1b (Emission Offsets), requiring the SFPUC to offset any remaining NO_x emissions in Years 1 and 3 to below significance thresholds, such as by upgrading other equipment at the Southeast Plant or paying a mitigation offset fee to the Bay Area Air Quality Management District. Nevertheless, the FEIR determined that although these measures combined would mitigate construction-related NOx emissions to below the significance threshold levels, NOx emissions were significant and unavoidable with mitigation because implementation of the offset mitigation depends on the actions of a third party (the BAAQMD) and could not be guaranteed.

The FEIR evaluates if the project's construction-related air pollutant emissions would conflict with or obstruct implementation of the BAAQMD's 2010 Clean Air Plan. It also discusses the BAAQMD's Draft 2017 Clean Air Plan. The FEIR found that with implementation of Mitigation Measures M-AQ-1a (Construction Emissions Minimization) and M-AQ-1b 1b (Emission Offsets), the project would not hinder either plan in meeting its primary goals.

Operation

The only significant operational air quality impact was if the approved project would be consistent with the BAAQMD's 2010 Clean Air Plan. The FEIR determined that approved project would be consistent with the BAAQMD's 2010 Clean Air Plan and this impact would be less than significant with implementation of Mitigation Measures M-AQ-1a (Construction Emissions Minimization) and M-AQ-1b (Emission Offsets).

5.1.2 Modified Project

The following discussion summarizes the findings of the air quality technical analysis presented in **Appendix B.**[31]

Construction

Dust and Criteria Air Pollutants

Because the proposed biogas utilization system would have fewer and less substantive facilities than the originally-approved energy recovery facilities, the modified project would require less excavation,

[31] Ramboll, Air Quality Health Risk Assessment Update for Potential Modification to the Future End-Use of Digester Gas at the Southeast Plant Biosolids Digester Facility Project in San Francisco, California. April 10, 2024.

drilling, trucking, and overall construction activities. This would reduce potential dust emissions because there would be less ground disturbance, soil stockpiling, and soil off-hauling. Like the approved project, the SFPUC would comply with the Dust Control Ordinance to minimize dust emissions during construction.

Similarly, this reduction in construction effort would also decrease criteria air pollutant emissions because there would be fewer hours of equipment operation and less trucking. Further, the actual daily average criteria air pollutant emissions from construction of the approved project components for Years 1 through 3 were substantially less than estimated in the FEIR (See Appendix B, Table 1) because the hours of actual equipment use have been less than estimated in the FEIR, and this trend is expected to continue. For example, the FEIR estimated that with mitigation in year 3, average daily NOx emissions during construction would be approximately 55 pounds per day (lbs/day); actual average daily NOx emissions were 30 lbs/day. Therefore, it is reasonable to conclude that criteria air pollutant emissions from the modified project, with continued implementation of Mitigation Measure M-AQ-1a (Construction Emissions Minimization) requiring the use of clean equipment and newer trucks, would be less severe than estimated in the FEIR.[32] Additionally, Mitigation Measure M-AQ-1a requires the SFPUC to track actual equipment use. Therefore, as done for Years 1 through 3 to date, SFPUC would quantify actual construction emissions during future years, including construction of the proposed biogas utilization system, and if the NOx threshold is exceeded, the SFPUC would implement Mitigation Measure M-AQ-1b (Emissions Offsets) to mitigate this potentially significant impact. However, because implementation of Mitigation Measure M-AQ-1b relies on a third-party and cannot be guaranteed, like the approved project, to the extent that implementation of M-AQ-1b is required, the modified project's construction impacts on air quality would continue to be significant and unavoidable with mitigation.

The approved project will require an additional approximately 1.5 years to construct because it is taking longer to construct the approved project components than estimated at the time of the FEIR, not the addition of new components. The total hours of equipment usage has occurred as estimated, but for fewer hours per day resulting in a longer duration. As a result, potential dust emissions and criteria air pollutant emissions from construction equipment would occur over a longer time. Dust control measures would continue to be implemented pursuant to the Dust Control Ordinance to minimize dust emissions during this extension. Spreading construction of the same scope of work out over a longer time reduces the maximum average daily emissions because the same total emissions would be divided over more days.

Health Risks

As discussed above, the FEIR determined that the approved project would have a less-than-significant impact on health risks, inclusive of construction and operations. Because the modified project operations would substantially alter the end use of digester gas and related changes to operational energy demand/supply, the effects of the modified project on health risks compared to the approved project are discussed in detail here. As discussed in Appendix B, health risks correlate with construction equipment emissions, especially during the first few years of construction when heavy equipment use is most intensive, and receptors are assumed to be young children that have higher breathing rates and a greater

32 Mitigation Measure M-AQ-1a (Construction Emissions Minimization) was previously revised to require that 80% of trucks either be 2010 or new and run on renewable diesel or could be 2012 or newer and run on regular or renewable diesel, as approved under Minor Project Modification 10.

chance of contracting cancer over their lifetime due to their young exposure age. Because criteria air pollutant emissions of the modified project would decrease due to the reduction in excavation, pile driving, building construction, and trucking, the health impacts associated with modified project construction would reasonably be expected to decrease as well. Therefore, health risks related to construction emissions would remain less than significant.

As discussed above, construction of the approved project will require an additional 1.5 years because construction is taking longer than expected at the time of the FEIR, not the addition of new project components. Thus, the total air pollutant emissions analyzed in the FEIR would not increase. Therefore, the longer construction period would not increase health risks impacts.

Operation

Dust and Criteria Air Pollutants

Like the approved project facilities, the areas around the proposed biogas upgrade system, PG&E interconnection station, and deoxygenation facility would be paved upon the completion of construction and would thus not be sources of fugitive dust during operation.

Net operational criteria air pollutant emissions of the project with the proposed biogas utilization system instead of the energy recovery system were calculated by the SFPUC's Biosolids Design Consultant Team (Brown and Caldwell, CH2M Hill, Black & Veatch).[33] Because the final detailed design of the biogas upgrade facilities is still underway, the team quantified emissions based on a worst-case operating scenario, which assumes that 70 percent of the digester gas would be converted to renewable natural gas for export (injection into the PG&E pipeline), while the remaining 30 percent of digester gas would be combusted on-site by flaring. This is a conservative assumption that would yield higher, or worst case, emissions analysis because the SFPUC expects that digester gas would be converted to renewable natural gas 90 to 95 percent of the time, with flaring limited to 5 to 10 percent of the time. The analysis also includes that steam boilers at the plant would need to operate full time to produce steam for the thermal hydrolysis process instead of being generated by the energy recovery facilities. The steam boilers would use electricity and natural gas for operation.

Table 6 compares the operational emissions of the modified project and the approved project. The changes in criteria air pollutant emissions are due to changes in equipment (namely, the removal of the proposed turbines and an increase in boiler and flaring operations), as well as differing amounts and composition of the gas combusted. As shown in **Table 6**, the modified project would increase operational emissions of ROG, PM10 and PM2.5, but would decrease NOx emissions compared with the approved project. Overall, criteria air pollutant emissions would still be below significance thresholds.

Health Risks

Since some operational criteria air pollutant emissions would increase with the proposed biogas utilization system and the location of emissions sources on the project site would change, the health risk model was updated as discussed in more detail in Appendix B to quantify changes in health risks (excess lifetime cancer risks, PM2.5 concentrations, and chronic and acute noncancer health effects) from modified project operation. **Table 7** presents the health risk impacts from operation of the modified

[33] Brown and Caldwell with CH2M, Black & Veatch, and associated firms, Bay Area Air Quality Management District Authority to Construct/Permit to Operate Application for the Biosolids Digester Facilities Project, March 2021.

project compared to the approved project at the maximally exposed individual sensitive receptor or MEISR.

Table 6 Net Operational Criteria Air Pollutant Emissions with the Modified Project

Approach	Annual Emissions (Tons/Year)			
	ROG	NOx	PM_{10}	$PM_{2.5}$
Existing (2014) Total	5.0	22	1.7	1.7
FEIR Approved Project - Full Operation (2045) (Net Change to Existing)[34]	- 4.3	2.6	2.9	2.9
Proposed Modified Project - Full Operation (2045) (Net Change to Existing)[35]	-2.9	-3.2	3.8	3.8
CEQA Significance Threshold (Tons/Year)	10	10	15	10
Modified Project Emissions Above Threshold?	No	No	No	No

Table 7 Health Risk Impacts from Modified Project Operations

Source	Excess Cancer Risk (in a million)	PM2.5 Concentration (ug/m^3)	Chronic Non-Cancer Hazard Index (unitless)	Acute Hazard Index (unitless)
FEIR Approved Project Maximum Impact (operations only)[36]	0.022	0.09	0.0067	0.08 3

34 Sourced from the FEIR.

35 Brown and Caldwell with CH2M, Black & Veatch, and associated firms, Bay Area Air Quality Management District Authority to Construct/Permit to Operate Application for the Biosolids Digester Facilities Project, March 2021. Emissions are based on the worst-case operating scenario of biogas being converted to renewable natural gas 70% of the time with 8.3% methane in the tail gas and flaring 30% of the time (Operations Scenario 3 in the BAAQMD permit application). In reality, the SFPUC expects that digester gas would be converted to renewable natural gas 90 to 95% of the time with flaring limited to 5 to 10% of the time.

36 Ramboll, Air Quality Technical Report, Biosolids Digester Facilities Project Draft EIR, March 10, 2017. Refer to Table 22, Net Project Cancer Risk at MEISR (Scenario 2); Table 24, Chronic and acute Health Impacts from Project Operation at MEISR and MEI.

37 Ramboll, Air Quality Health Risk Assessment Update for Potential Modification to the Future End-Use of Digester Gas at the Southeast Plant Biosolids Digester Project in San Francisco, California. April 10, 2024. Refer to Updated Table 22, Net Project Cancer Risk at Off-site MEISR; Updated Table 24, Chronic and acute Health Impacts from Project Operation at MEISR and MEI.

As shown in **Table 7**, although some health risks would increase, all health risks associated with modified project operations would remain below the significance thresholds. While **Table 7** only presents the operational health risk impacts, the excess cancer risk threshold of 7.0 per million is inclusive of emissions from both construction and operation. In the FEIR, the Maximally Exposed Individual Sensitive Receptor (MEISR) worst-case value for excess cancer risk was less than 0.1 to 1.7 per million, well below the CEQA threshold. Given that the modified project would reduce construction-related emissions and the operational cancer risk would decrease to -0.009 per million, it is reasonable to conclude that the modified project's combined excess cancer risk from construction and operation would still be below the CEQA threshold without re-quantifying construction risk.

Cumulative

The FEIR states that the geographic scope of the cumulative impact analysis of criteria air pollutant emissions encompasses the San Francisco Bay Area Air Basin and the geographic scope of health risk encompasses existing and new emissions sources (including diesel-fueled standby emergency generators) within approximately 1 km of the project site.

Criteria Air Pollutants

For the cumulative analysis, the FEIR establishes that no single project by itself would be of such size as to result in regional non-attainment of ambient air quality standards. The project-level thresholds for criteria air pollutants are based on levels at which new sources are not anticipated to result in a cumulatively considerable net increase in non-attainment criteria air pollutants. Therefore, a separate cumulative criteria air pollutant analysis is not necessary.

Health Risks

As discussed above, construction of the modified project would be expected to reduce health risks compared to the approved project while operation would increase some health risks and decrease others. For this reason, the cumulative health risk analysis focuses only on the increased health risks from project operations and does not evaluate the health risks from construction as the impact would be lower than the approved project. The cumulative impact analysis done for this addendum (Appendix B) estimates excess lifetime cancer risks and PM2.5 concentrations at the project's MEISR that are attributable to other existing mobile and stationary sources and cumulative projects as disclosed in the FEIR within 1,000 feet of the sensitive receptor,[38] in addition to operational impacts only from the modified project. This 1,000-foot distance from the project's MEIRs is the typical radius in which cumulative health risks are analyzed, as discussed on FEIR page 4.8-71. As discussed above in the Approach to Analysis in Section 4.3, the background risks were derived from the health risks database from the 2020 Citywide Health Risk Assessment[39] rather than the previous analysis conducted in 2014 that was used for the FEIR analysis. The cumulative projects accounted for in the cumulative analysis below are only those projects where quantitative information from the FEIR was available.[40] As shown in Appendix A, there are a number of additional projects in the vicinity of the Biosolids project site that have proposed been since the FEIR

38 The analysis includes construction of newly proposed Operations, Engineering, and Maintenance buildings (SEP-7) instead of the Maintenance Shops 1 and 2 as originally proposed in the FEIR.

39 San Francisco Department of Public Health, San Francisco Planning Department, and Ramboll. San Francisco Citywide Health Risk Assessment: Technical Support Documentation, 2020

40 Ramboll, Air Quality Technical Report, Biosolids Digester Facilities Project Draft EIR, March 10, 2017. Refer to Table 17, Cumulative Projects and Schedules; Table 18, Cumulative Project Operational Emissions and Modeled Emission Rates.

certification. Lastly, quantitative health risk information that was not available for the San Francisco Gateway Project is now available and can be considered in the updated cumulative analysis. The estimated cumulative excess lifetime cancer risk from operational emissions of the modified project at the nearest resident location (maximally exposed individual sensitive receptor or MEISR) would be approximately 69 in a million, compared to 10 in a million for the approved project as analyzed in the Air Quality Technical Report prepared for the FEIR.[41] This increase is due to the difference in background risks and the receptor location and accounts for an additional cumulative project.[42] The cumulative PM2.5 concentration from modified project emissions at this location would decrease from 9.0 ug/m^3 to 8.8 ug/m^3. The chronic non-cancer hazard index at this location would increase from 0.0087 to 0.019 (unitless). **Table 8** shows the quantitative cumulative health risk impact at the Modified Project maximally exposed individual sensitive receptor. However, Table 8 does not account for additional health risks from other nearby cumulative projects listed in Appendix B for which quantitative information is not available. Nor does it account for additional health risks from the SEP-7 Operations, Engineering and Maintenance Buildings that would replace Maintenance Shops No. 1 and No. 2 that were part of the project analyzed in the FEIR. To the extent that these cumulative projects also result in PM2.5, diesel particulate matter or other toxic air contaminants within 1,000 feet of the modified project maximally exposed individual receptor, these projects would increase health risks beyond that disclosed in Table 8. It is possible that cumulative health risks could be exceeded when considering the health risk impact from these additional cumulative projects. However, the proposed project's contribution would remain the same and would be below the project-level significance thresholds. Therefore, the modified project's health risk impact, like the approved project, would be less than cumulatively considerable, a less-than-significant impact.

Conclusion

As discussed above, dust and criteria air pollutant emissions from modified project construction would decrease as compared to the approved project because the proposed revisions would entail smaller structures, less excavation and hauling. As a result, construction dust emissions from the modified project would remain less than significant with compliance with the Dust Control Ordinance. Construction criteria air pollutant emissions would be reduced with Mitigation Measure M-AQ-1a (Construction Emissions Minimization), except potentially NOx emissions. If NOx emissions are exceeded, Mitigation Measure M-AQ-1b (Emission Offsets) would also be required, but because implementing offsets depends on the actions of a third party (the Bay Area Air Quality Management District or BAAQMD), this impact would remain significant and unavoidable with mitigation like the approved project.

Modified project operation would not result in dust emissions, like the approved project. Modified project operation would reduce the annual emissions of some criteria air pollutants and increase others compared to the approved project; however, all pollutants would be below significance thresholds and thus impacts would remain less than significant. Similarly, modified project operation would reduce some health risks and increase others relative to the approved project; however, all health risks would be below significance thresholds and thus remain less than significant. The modified project would result in no

41 The Air Quality Technical Report prepared for the FEIR evaluates the maximum health risk impact of two scenarios: 1) scenario 1 evaluates the cancer risk impact from construction and operation of the approved BDFP project and 2) scenario 2 evaluates the cancer risk impact from operation of the approved BDFP project. Because scenario 1 would result in the greatest health risk impact, these results are reported in the FEIR. The results of scenario 2 are reported in the Air Quality Technical Report and compared to the modified project's operational health risks in this addendum because construction health risks would be lower than predicted in the FEIR.

42 For example, the background risk at the approved project's sensitive receptor location increased from 10 in a million to 19 in a million using the Citywide HRA.

changes regarding odors during construction and operation, which would thus remain less than significant.

Table 8 Cumulative Health Risk Impacts from Modified Project Operation

Source	Excess Cancer Risk (in a million)	PM2.5 Concentration (ug/m^3)	Chronic Non-Cancer Hazard Index (unitless)
FEIR Approved Project Operation Cumulative Health Risk Impact (existing, project, plus cumulative projects[43]	10	9.0	0.0087
Proposed Modified Project			
Proposed Modified Project Health Risks[44]	-0.009	0.17	0.015
Existing Background Health Risks (Citywide HRA Background)	57	8.5	--
Cumulative Project Health Risk Contribution[45, 46, 47]	0.12	0.083	0.0038
Modified Project Cumulative Health Risk Total	57	8.7	0.019
Cumulative Significance Thresholds for sensitive receptors in Health Vulnerable Locations within Air Pollutant Exposure Zone	90	9.0	10
Project Level Significance Thresholds	7.0	0.2	1.0
Modified Project Health Risks Exceed Significance Thresholds?	No	No	No

The modified project cumulative health risk from operations would increase, corresponding to changes in operations, background health risks, additional health risks from cumulative projects and sensitive receptor location; however, the project's contribution to cumulative health risks would remain less than significant. Further, as explained above, actual operational emissions are expected to be less than

43 As discussed in the FEIR and AQTR, Acute Non-Cancer Hazard is not assessed as a cumulative impact.

44 The Citywide HRA does not evaluate chronic hazard Index.

45 Ramboll, Air Quality Health Risk Assessment Update for Potential Modification to the Future End-Use of Digester Gas at the Southeast Plant Biosolids Digester Facility Project, April 10, 2024. Updated AQTR Table 26 – Cumulative Lifetime Excess Cancer Risk at MEISR with the Proposed Modification; Updated AQTR Table 27 – Cumulative PM2.5 Concentration at MEISR with the Proposed Modification; and Updated AQTR Table 28 – Cumulative Chronic Hazard Index at MEISR with the Proposed Modification

46 AECOM, San Francisco Gateway Project Air Quality and Health Risk Assessment Methodology Memorandum, August 2023.

47 The quantitative cumulative health risk analysis includes those projects evaluated in Ramboll's Air Quality Health Risk Assessment Update for Potential Modification to the Future End-Use of Digester Gas at the Southeast Plant Biosolids Digester Facility Project in San Francisco, California (cited above) in addition to the maximum health risk impact from the SF Gateway Project at 749 Toland Street and 2000 McKinnon Avenue, Planning Department Case no. 2015-012491ENV. The maximum exposed individual resident for the SF Gateway Project is located 440 feet south of the SF Gateway Project site on Oakdale Avenue, which is approximately two-thirds of a mile southwest of the Modified Project maximally exposed individual receptor impact. Thus, the actual health risk contribution from the SF Gateway Project at the Modified Project maximally exposed individual receptor would be much lower than presented here.

calculated, as the analysis is based upon the conservative assumption of the biogas utilization system operating 70 percent of the time, whereas it is expected to operate 90 to 95 percent of the time.

For the reasons described above, the modified project would not have any new or substantially more severe impacts related to air quality than the approved project.

5.2 Greenhouse Gases

5.2.1 Biosolids Digester Facilities Project FEIR Findings

The FEIR found that the approved project would have less-than-significant impacts related to the following significance criteria regarding greenhouse gas emissions:

- Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment; or
- Conflict with any applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases.

The FEIR discusses that because no individual project could emit greenhouse gases at a level that could result in a significant impact on global climate, greenhouse gas emissions are a cumulative impact. The FEIR evaluated the proposed project's consistency with AB 32 goals by comparing the project's net changes in non-biogenic GHG emissions to the stationary source GHG significance threshold from BAAQMD, which is 10,000 metric tons of carbon dioxide equivalent ($MTCO_2E$). The FEIR identified that construction would directly emit greenhouse gases from equipment use and vehicles and indirectly emit greenhouse gases via electricity providers for electric power. The FEIR determined that the project's annualized construction-related GHG emissions would average 894 $MTCO_2E$, which would be below BAAQMD's annual threshold for stationary sources of 10,000 $MTCO_2E$. Further, the SFPUC would be required to use renewable diesel in all municipal fleets (Executive Directive 06-02) and comply with San Francisco Environment code Chapters 7 and 14 to recycle construction waste. Therefore, the project's contribution to global GHGs from construction would be less than significant.

Regarding operation, the FEIR discussed that, by 2045, the approved project would result in a 120 percent increase in biogenic greenhouse gas emissions and an 11 percent decrease in non-biogenic greenhouse gas emissions compared to existing conditions. Biogenic emissions would mainly increase due to an increase in the production and combustion of digester gas due to population growth and the increased capture and reuse of biogas for on-site energy recovery. Meanwhile, non-biogenic emissions would decrease due to elimination of future natural gas use for energy to run processes because the originally planned energy recovery facilities would generate this energy instead. Non-biogenic emissions at full operation, estimated to be 207 $MTCO_2E$, would be well below BAAQMD's annual threshold for stationary sources of 10,000 $MTCO_2E$. The FEIR does not consider biogenic greenhouse gas emissions from the Southeast Plant to be a project impact because they would occur regardless of the project and regardless of whether the organic material decomposes in solids processing facilities at the treatment plant or at a land application site elsewhere (i.e., landfills, composting operation, etc.). The FEIR also discussed that because the approved project energy recovery facilities would generate sufficient electricity to power all the new Biosolids facilities by 2045, making more renewable energy from Hetch Hetchy hydropower available to other users, it would also indirectly reduce GHG emissions.

The FEIR also notes that the approved project would be subject to the California Air Resources Control Board's Greenhouse Gas Mandatory Reporting Regulation, just as it is now for the existing facilities. The project would also be subject to applicable City regulations adopted to reduce operational greenhouse gas emissions as identified in the San Francisco Strategies to Address Greenhouse Gas Emissions, which include but are not limited to: compliance with the City's Commuter Benefits Program, Emergency Ride Home Program, Executive Directive 06-02 requiring use of renewable diesel, Clean Construction Ordinance, bicycle parking requirements, the City's Green Building and recycling and composting ordinance requirements that would reduce greenhouse gas emissions in the City from transportation, waste, and promote energy and water efficiency. Lastly, by planting new landscaping trees per (and above) the City's Street Tree planting requirements, the approved project would help offset the effects associated with the proposed removal of about 90 trees and would serve to increase carbon sequestration. Through implementation of these actions, the FEIR determined that the project would be consistent with San Francisco's Strategies to Address Greenhouse Gas Emissions, and thus would not conflict with the AB 32 goal to reduce greenhouse gas emissions to 1990 levels by 2020.

5.2.2 Modified Project

Construction

Construction of the modified project would require less intensive construction activities (less excavation, piles, materials) and fewer truck trips which, as discussed above, would reduce equipment and exhaust emissions and related greenhouse gas emissions. Although construction of the approved project will require an additional approximately 1.5 years, it is because the project it is taking longer to build, not because of the addition of new project components and thus total greenhouse gas emissions would not increase. As a result, there would not be an increase in GHG emissions from modified project construction.

Operation

Table 9 shows the modified project greenhouse gas emissions, and the net operational greenhouse gas emissions resulting from replacing the originally-approved energy recovery facilities with the biogas utilization system. Changes in greenhouse gas emissions are also due to the changes in equipment (namely, the removal of the proposed turbines and an increase in boiler and flaring operations), as well as differing amounts and composition of the gas combusted between the FEIR scenario and the modified project. Compared to the approved project's operations as analyzed in the FEIR, biogenic emissions have decreased, non-biogenic emissions have increased, and total project GHG emissions have decreased slightly, without accounting for any greenhouse gas emissions reductions from renewable natural gas production.[48] Renewable natural gas produced by the modified project would be injected into PG&E's natural gas pipeline. By making this renewable natural gas available to customers, the renewable natural gas injection would thus replace and avert potential emissions from burning fossil fuel-derived natural gas. This calculation assumes only 70% of the digester gas is converted to renewable natural gas and exported off site; in reality, more renewable natural gas is expected to be produced and injected into the pipeline. The modified project's total greenhouse gas emissions would be 30,615 $MTCO_2E$ per year, and

48 CO_2 emissions from biogas combustion in the flares and thermal oxidizer are considered biogenic emissions by the California Air Resources Board; however, the CH_4 and N_2O emissions from these sources are considered non-biogenic emissions. Additionally, biomethane and biogas emissions from wastewater treatment facilities are exempt from compliance requirements under of the State's Cap-and-Trade Regulation, per Section 95852.2(a)(8)(B).

19,805 $MTCO_2E$ per year when accounting for averted emissions, a reduction when compared to 31,241 $MTCO_2E$ per year analyzed in the AQTR. While the modified project's non-biogenic emissions would increase to 5,005 $MTCO_2E$ per year, non-biogenic emissions would still be below the GHG significance threshold outlined by the BAAQMD, which is 10,000 $MTCO_2E$ per year for stationary sources.

Table 9 Greenhouse Gas Emissions from Modified Project Operations

	GHG Emissions ($MTCO_2e$/year)[49]		
Emissions Type	Existing 2014	EIR Project Full Operation 2045	Modified Project Full Operation
Total Biogenic Emissions	13,931	31,035	14,566
Total Non-Biogenic Emissions	234	207	16,048
Total Operational Emissions	**14,165**	**31,241**	**30,615**
Averted Emissions from Biomethane Sent to PG&E Pipeline	--	--	-10,809
Net Operational Non-Biogenic Emissions (including Averted Emissions)	**--**	**-27**	**5,005**
Total Operational Emissions (including Averted Emissions)	**14,165**	**31,241**	**19,805**

Conclusion

The modified project would reduce the construction level of effort compared to the approved project, which would reduce greenhouse gas emissions from construction. Total greenhouse gas emissions from modified project operations would also decrease relative to the approved project. When accounting for averted emissions from the renewable natural gas sent to the PG&E pipeline, the total operational greenhouse gas emissions would be even further reduced. While non-biogenic emissions would increase, emission levels would be below BAAQMD significance thresholds for greenhouse gas emissions. Moreover, like the approved project, the modified project would continue to be consistent with the various San Francisco's Strategies to Address Greenhouse Gas Emissions to reduce emissions during construction and operation, and would not conflict with local or state climate goals. Therefore, modified project construction, operation, and cumulative impacts on greenhouse gases would remain less than significant.

For the reasons described above, the modified project would not have any new or substantially more severe impacts related to greenhouse gas emissions than the approved project.

[49] Ramboll, Air Quality Health Risk Assessment Update for Potential Modification to the Future End-Use of Digester Gas at the Southeast Plant Biosolids Digester Project in San Francisco, California. April 10, 2024.

5.3 Cultural Resources

5.3.1 Biosolids Digester Facilities Project FEIR Findings

The Biosolids Digester Facilities Project FEIR found that the approved project would have potentially significant impacts related to the following significance criteria regarding cultural resources:

- Cause a substantial adverse change in the significance of a historical resource as defined in CEQA Guidelines Section 15064.5, including those resources listed in Article 10 or Article 11 of the San Francisco Planning Code
- Cause a substantial adverse change in the significance of an archeological resource pursuant to CEQA Guidelines Section 15064.5
- Disturb any human remains, including those interred outside of formal cemeteries

The potentially significant impacts associated with the above criteria for the approved project and modified project are discussed in detail below.

Historical Resources

The FEIR evaluated all buildings and structures at the Southeast Plant for eligibility to the National Register and California Register and determined that a portion of the SEP, including 26 buildings and structures (or combinations of buildings and structures) that comprise most of the southernmost block of the SEP and a portion of the block adjacent to the north, was eligible for listing in the National and California registers and National Register as a historic district named the Southeast Treatment Plant Streamline Moderne Industrial Historic District (district). The district includes 22 contributing buildings and structures that were all constructed in 1952 in the Streamline Moderne style. Four non-contributing buildings and structures were not 45 years old when the assessment was made and did share the same architectural style as the district. The evaluation found that none of the buildings or structures within the district were individually eligible for listing in the National or California Register. Additionally, the FEIR found that Buildings A and B of the Central Shops complex eligible for listing in the National and California registers as a single resource having the distinctive characteristics of a type, period, and method of construction as an important example of Industrial Modern architecture in San Francisco.

The approved project included the demolition of historic Building 870 and all the historic Central Shops buildings to build the new Maintenance Shops No. 1 and the new digester tanks at those locations. The removal of Building 870 was determined to be a less-than-significant impact for multiple reasons; however, demolition of the Central Shops buildings was determined to be a substantial adverse change in the significance of the historical resource and requires implementation of Mitigation Measure M-CR-1 (Documentation of Historic Resources and Interpretive Display). The FEIR concluded that while Mitigation Measure M-CR-1 (Documentation of Historic Resources and Interpretive Display) would reduce the severity of the impact, it would not reduce the impact to a less-than-significant level, and that the demolition of the Central Shops was a significant and unavoidable impact with mitigation.

Archeological Resources

The FEIR identified the presence of previously recorded California Register- and National Register-eligible Native American archeological site CA-SFR-171 within the approved project site, as well as the potential presence of a deeply submerged/buried prehistoric deposit. It also identified the potential for historic archeological resources related to a potential buried historic refuse deposit. The FEIR determined that

these archeological resources could be impacted by excavation and pile drilling, but that impacts would be reduced to a less-than-significant level through implementation of Mitigation Measure M-CR-2a (Archeological Testing, Monitoring, and/or Data Recovery) and Mitigation Measure M-CR-2b (Procedures for Accidental Discovery of Archeological Resources) that require the SFPUC as directed by Planning Department's archeologists to conduct additional archeological testing prior to construction and monitoring during construction, to halt work and implement proper procedures to ensure appropriate treatment of significant archeological resources discovered, and to implement data recovery and public interpretation if significant resources were found. Implementation of these measures also required consultation with Native American representatives and Native American monitoring during construction activities.

Human Remains

The FEIR discussed that although no known human burial locations had been identified within the approved project site during archeological investigations undertaken for the FEIR, the possibility that human remains could be encountered during earthmoving activities could not be discounted given construction would occur within a known Native American archeological site. The FEIR concluded that potentially significant impacts on human remains would be reduced to a less-than-significant level through implementation of Mitigation Measure CR-2a (Archeological Testing, Monitoring, and/or Data Recovery), which requires that any human remains or associated or unassociated funerary objects discovered during construction be treated in compliance with applicable local, state and federal laws, including immediate notification of the Planning Department's archeologist, the Coroner of the City and County of San Francisco (Office of the Chief Medical Examiner), and the California Native American Heritage Commission in the event of the Coroner determined that the human remains are Native American remains. The California State Native American Heritage Commission would appoint a Most Likely Descendant (Public Resources Code Section 5097.98). The Most Likely Descendant would provide recommendations to the SFPUC on the appropriate treatment of the remains.

5.3.2 Modified Project

As discussed above in the approved project status, all buildings and structures on the proposed biogas utilization system site have been demolished. The approved project no longer includes demolition of Building 870, a contributor to the historic district, as Maintenance Shop 1 was removed from the approved project in an earlier modification. The modified project would be within the footprint of the approved project.

Construction

Historical Resources

The proposed biogas utilization system, including all tanks, containers, and pipelines to convey renewable natural gas from the north to south side of Jerrold Avenue and into PG&E's existing pipeline in Quint Street would all be built outside of the Southeast Plant Historic District. Further, there are no buildings or structures in the areas where the proposed facilities would be built. Therefore, the proposed modifications would not directly impact historical resources. Mitigation Measure M-CR-1 (Documentation of Historic Resources and Interpretive Display) applicable to the Central Shops has been completed or is in process of being finalized with the Planning Department.

The FEIR discusses that vibration of 0.5 in/sec PPV or greater could indirectly damage nearby historic structures and that pile driving within 75 feet of a structure could exceed this limit. Since Building 870 would not be demolished, it could be indirectly impacted by the modified project. However, neither Building 870 nor any other historic buildings are within 75 feet; therefore, no historic building would be expected to be indirectly damaged by modified project construction. The nearest historic buildings are about 180 feet away. At this distance, vibration from the modified project would not damage these contributing historic buildings.

Archeological Resources

Construction of the modified project would reduce excavation by over 5,000 cubic yards compared to the approved project excavation and thus reduce potential impacts on archeological resources because eliminating the energy recovery building and digester gas treatment facility on the former Asphalt Plant site would reduce excavation in known Native American archeological site CA-SFR-171. The modified project would also require 279 to 331 fewer deep piles (depending upon the type of foundation needed for the biogas upgrade facility). Removal of the energy recovery facilities would eliminate 41 piles in CA-SFR-171, although the biogas upgrade facility may require up to 52 piles for a net increase in 9 piles, if piles are needed. The SFPUC has already completed testing and data recovery for CA-SFR-171 as required by Mitigation Measure M-CR-2a (Archeological Testing, Monitoring, and/or Data Recovery) based on the impacts of the approved project[50] and is currently working with the Planning Department and Native American community on a public interpretation program. Based on the chosen foundation system for the biogas upgrade facility, additional archeological investigation identified in consultation with Native American tribal representatives will be undertaken as required by Mitigation Measure M-CR-2a (Archeological Testing, Monitoring, and/or Data Recovery) to address potential impacts on CA-SFR-171 due to the modified project. The completed testing did not identify the presence of the potential historic-era refuse deposit or any other significant historical archeological resources within the project area. In any event, the biogas utilization system would not include work near the potential historic-era refuse deposit location. Like the approved project, monitoring would be required during open-cut excavations for construction of the proposed biogas utilization system facilities pursuant to M-CR-2a (Archeological Testing, Monitoring, and/or Data Recovery) and Mitigation Measure M-CR-2b (Accidental Discovery of Archeological Resources) would be implemented in the event of discoveries to minimize impacts on archeological resources from the modified project.

Human Remains

For the same reasons discussed above for archeological resources, construction of the modified project would have similar or reduced potential to affect the known archeological site wherein human remains could be present. Like the approved project, during construction of the modified project, the SFPUC would be required to conduct monitoring during excavation pursuant to M-CR-2a (Archeological Testing, Monitoring, and/or Data Recovery) and implement Mitigation Measure M-CR-2b (Accidental Discovery of Archeological Resources) in the event of discoveries to minimize impacts to human remains.

50 Far Western, December 2023. Archaeological Data Recovery Report for Site CA-SFR-171 for the Biosolids Digester Facilities Project, Southeast Water Pollution Control Plant, San Francisco, California Planning Department Case No. 2015-000644ENV Block 5262/Lot 009.

Operation

Like the approved project, the modified project operations would not impact historic or archeological resources, including human remains.

Cumulative

Historic Resources

The FEIR establishes that the geographic scope for cumulative effects on historical resources includes the Southeast Plant and the boundaries of the *Southeast Treatment Plant Streamline Moderne Industrial Historic District*. The FEIR found that the loss of Building 870 in combination with the proposed future demolition of all existing digesters (Buildings 630-730) and their control buildings (Buildings 620 and 680) as part of the Demolition of the Existing SEP Digesters and Southside Renovation Project, would result in a significant and unavoidable cumulative impact on historic architectural resources, even with implementation of Mitigation Measure M-CR-1 (Documentation of Historic Resources and Interpretive Display). Building 870 would no longer be demolished under the modified project thereby reducing cumulative impacts on the historical resource. The SFPUC has notified the Planning Department of another change to the approved project known as the SEP-7 Operations, Engineering and Maintenance buildings that is undergoing separate environmental review, which for the purpose of this addendum, is evaluated as a new cumulative project. The SEP-7 Operations, Engineering, and Maintenance Building Project would demolish Building 850, which is also a contributor to the *Southeast Treatment Plant Streamline Moderne Industrial Historic District*, but since Building 870 will not be removed, the net loss of the district's contributory buildings would remain at 13 of the original 22 contributors or 59 percent and would not result in additional cumulative impacts than those identified in the FEIR.

Of the other projects on the cumulative list at the Southeast Plant at the time of the of FEIR, only the Southeast Plant Headworks Replacement project (still under construction) remains on the updated cumulative list and the FEIR determined this project would not contribute to a cumulative impact on historic architectural resources. Several new SFPUC projects at the Southeast Plant have been added to the cumulative list, including the Primary Treatment Health and Safety Improvement project (SEP 040 and 041), HVAC and Mechanical Upgrades, and Electrical Controls Upgrade (SEP 545). The Primary Treatment Health and Safety Improvement project includes replacement of windows and vents and installation of conduit on Buildings 040, 041, and 043 all of which are contributors to the historic district. Previous environmental review for this project determined that after completion the buildings would continue to convey their historical significance such that this project in combination with the modified project would not cause an adverse cumulative impact.[51] The other two projects involve upgrades and repairs of existing equipment that would not impact historic resources.

Regardless, as found in the FEIR for the approved project, because the overall implementation of the modified project would replace the function of the existing digesters and associated control buildings, thereby allowing for demolition of the existing digesters and control buildings, the modified project's contribution to this cumulative impact would be cumulatively considerable, or significant, and the cumulative impact on the historic district would remain significant and unavoidable with mitigation.

51 San Francisco Planning Department, CEQA Categorical Exemption Form, SFPUC SEP 040/041/043 Health and Safety Improvements, Case No. 2022-011482ENV, July 12, 2023.

The only other project added to the updated cumulative list in the vicinity of the Southeast Plant with the potential to impact historic resources is the future Bayview Train Caltrain Station project. According to the San Francisco Property Information Map, there are buildings on this parcel that are old enough to be historic resources but have yet to be evaluated. This cumulative project and the modified project are near each other; however, changes at this cumulative project site would not combine with changes to historic buildings within the Southeast Plant given intervening fencing, walls, and plant facilities to result in a new significant cumulative impact.

Archeological Resources

The FEIR establishes that the geographic scope for cumulative effects on archeological resources and human remains includes the immediate vicinity of locations where the project would cause ground disturbance. The FEIR found that the approved project and cumulative projects in the project vicinity at the time of the FEIR could result in a significant cumulative impact on buried archaeological resources associated with Native American site CA-SFR-171. The only two cumulative projects remaining from the FEIR are the Southeast Plant Headworks Replacement Project and the SEP Power Feed and Primary Switchgear Upgrades. Excavation for these projects is largely completed and has not exposed significant buried archaeological resources to date. The new cumulative project, the SEP-7 Operations, Engineering and Maintenance Building Project, would also occur within the boundary of CA-SFR-171 and could likewise affect buried archeological resources in the project vicinity. As part of the implementation of Mitigation Measures M-CR-2a (Archeological Testing, Monitoring, and/or Data Recovery) for the approved project, several geoarcheological cores were collected around Building 850 and were found to contain a dense layer of redeposited shell midden. Thus, this project combined with modified project could result in a significant cumulative impact on this site. The SEP-7 Operations, Engineering, and Maintenance Building Project would also be subject to Mitigation Measures M-CR-2a (Archeological Testing, Monitoring, and/or Data Recovery) and Mitigation M-CR-2b (Accidental Discovery of Archeological Resources) and would reduce this impact to less than significant.

Overall, the modified project would reduce the extent of excavation that could affect archeological resources relative to the approved project. Additionally, removal of the energy recovery facilities would eliminate 41 piles in CA-SFR-171, but the biogas upgrade facility may require up to 52 piles for a net increase in 9 piles. Nevertheless, similar to the approved project, the modified project's contribution to cumulative impacts would not be considerable with implementation of Mitigation Measures M-CR-2a (Archeological Testing, Monitoring, and/or Data Recovery) and Mitigation M-CR-2b (Accidental Discovery of Archeological Resources).

Conclusion

As discussed above, the modified project construction and operation would have similar or reduced impacts on historic resources and archeological resources and impacts would remain less than significant with mitigation, including implementation Mitigation Measure M-CR-1 (Documentation of Historic Resources and Interpretive Display), Mitigation Measures M-CR-2a (Archeological Testing, Monitoring, and/or Data Recovery), and Mitigation M-CR-2b (Accidental Discovery of Archeological Resources). As a result, the modified project's contribution to cumulative impacts would also not be considerable.

For the reasons described above, the modified project would not have any new or substantially more severe impacts on cultural resources than the approved project.

5.4 Tribal Cultural Resources

The Biosolids Digester Facilities Project FEIR did not analyze tribal cultural resources as this topic was not yet mandated for inclusion under CEQA. As defined in Public Resources Code section 21074, a Tribal Cultural Resource is either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is: a) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k); or, b) a resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resources Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.

Construction

As discussed above, archeological site CA-SFR-171 was found eligible for the National Register of Historic Places and the California Register of Historical Resources. Based on previous consultation with local California Native American tribal representatives undertaken by the San Francisco Planning Department, all Native American archeological resources have cultural value to tribal representatives and are considered to be Tribal Cultural Resources. As such CA-SFR-171 is considered to be a Tribal Cultural Resource. As required under Mitigation Measure M-CR-2a (Archeological Testing, Monitoring, and/or Data Recovery) and discussed in the Cultural Resources section above, an archeological data recovery program has already been prepared, and Native American monitoring was undertaken as part of the effort. Native American monitoring and consultation will continue to be included as part of Mitigation Measure M-CR-2a. Cultural sensitivity training by a local Native American representative will also be included in tandem with archeological awareness and accidental discovery training for construction crews.

Additionally, as requested through prior consultation with local Native American tribal representatives, a public interpretation program is one means to memorialize the cultural value of the tribal cultural resource while also educating the public concerning Native American lifeways, both past and present. On September 1, 2021, the San Francisco Planning Department sent letters to local California Native American representatives providing information on CA-SFR-171 and asking if they would like to consult on a public interpretation program. Based on the responses received, the Planning Department and SFPUC are in the process of developing a public interpretation program with the Association of Ramaytush Ohlone, which will include both an onsite interpretative component as well as a nearby offsite component in a more publicly accessible location. Therefore, project impacts on tribal cultural resources would be less than significant with the implementation of consultation on the archeological investigations of CA-SFR-171 and public interpretation program that is currently under preparation in consultation with the Native American community as required under Mitigation Measures M-CR-2a (Archeological Testing, Monitoring, and/or Data Recovery).

Operation

Like the approved project, modified project operations would not impact archeological resources, including tribal cultural resources.

Cumulative

The cumulative impact on CA-SFR-171 as described above under cumulative archeological resources would be similar to the cumulative impact analysis on CA-SFR-171 as a tribal cultural resource. As stated, like the approved project, the modified project's contribution to cumulative impacts on tribal cultural resources would not be considerable with implementation of public interpretation program that is currently under preparation in consultation with the Native American community as required under Mitigation Measures M-CR-2a (Archeological Testing, Monitoring, and/or Data Recovery).

Conclusion

As discussed above, the modified project construction and operation would have similar or reduced impacts on archeological resources and tribal cultural resources as the approved project, and impacts would be less than significant with mitigation, including implementation of the public interpretation program that is currently under preparation in consultation with the Native American community as required under Mitigation Measures M-CR-2a (Archeological Testing, Monitoring, and/or Data Recovery). As a result, the modified project's contribution to cumulative impacts would also not be considerable.

5.5 Noise

5.5.1 Biosolids Digester Facilities Project FEIR Findings

The Biosolids Digester Facilities Project FEIR found that the approved project would have potentially significant impacts related to the following significance criteria regarding noise and vibration:

- Result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies
- Result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project

The potentially significant impacts associated with the above criteria for the approved project and modified project are discussed in detail below under Construction.

Additionally, the FEIR evaluated several other significance criteria regarding potential noise and vibrations impacts and determined that there would either be no impact or less-than-significant impacts as briefly discussed here. The approved project was found to have no impact related to being with within an airport land use plan area or in the vicinity of a private airstrip or being affected by existing noise level because there are no airports nearby and the project site is not a noise-sensitive land use. The FEIR determined that noise from construction traffic would be less than significant because a traffic control plan would establish truck routes that minimize truck traffic in residential areas and that traffic along Phelps Street where there are residences would primarily be worker vehicles accessing the Southeast Greenhouses staging area (not trucks). The FEIR determined that operational noise from the new facilities and additional truck trips would be less than significant because the estimated maximum combined noise level of 59 dBA at nearest residential receptor at 1700 Kirkwood Avenue would not exceed the minimum 60-dBA nighttime noise limit applicable under Section 2909(d) and there would only be a small change in trucking that would occur on Jerrold Avenue, Rankin Street, and Evans Street where there are no residential receptors or noise-sensitive uses. Lastly, the FEIR found that vibration from construction and operation would have a less-than-significant impact on buildings and people

because vibration would not exceed the 0.5 in/sec PPV threshold for structural damage at the nearest buildings or the 0.1 in/sec PPV threshold for human annoyance at the nearest sensitive receptor.

Construction

As discussed in the FEIR, Section 2907 of the Noise Ordinance allows construction activities between 7:00 a.m. and 8:00 p.m. but limits noise from any individual piece of construction equipment, except impact tools that are exempt, to 80 dBA at 100 feet (equivalent to 86 dBA at 50 feet). The FEIR evaluated the various types of non-impact construction equipment to be used and found that only concrete saws would exceed the 86-dBA (at 50 feet) noise limit of Section 2907, but concluded that this potentially significant impact on noise would be reduced to a less-than-significant level through implementation of the noise controls specified in Mitigation Measure M-NO-1a (Shielding of Concrete Saw Operations). The FEIR defined a substantial temporary or periodic increase in ambient noise levels as noise that would be greater than 10 dBA above ambient at sensitive receptors. The FEIR found that construction noise level would only exceed this threshold at the former Southeast Community Center daycare center[52] and the closest residential receptor at 1700 Kirkwood Avenue at the corner of Phelps Street from activities at the Southeast Greenhouses staging area. The FEIR concluded that implementation of the noise controls specified in Mitigation Measure M-NO-1b (Construction Noise Control Measures at Southeast Greenhouses Staging Area) would reduce this impact to a less-than-significant level. Noise from construction at other locations throughout the site was found to be lower than 10 dBA above ambient.

Operation

As discussed above, the FEIR found that all potential noise and vibration impacts from operation of the approved project would be less than significant.

5.5.2 Modified Project

Construction

Noise

Construction of the proposed biogas utilization system would not require the use of any new types of equipment beyond what was included in the FEIR for the approved project, and all of the equipment in the FEIR was found to comply with the noise limit of 86 decibels average (dBA) at 50 feet in San Francisco Police Code section 2907, except for the concrete saws. Like the approved project, Mitigation Measure M-NO-1a (Shielding of Concrete Saw Operations) would be required during construction of the modified project to minimize noise from concrete saws. Construction of the modified project would occur within the approved project boundary and would use the previously approved staging areas and truck routes, including the off-site vacant warehouses on McKinnon Street at the corner of Rankin for employee parking and McKinnon as a truck route. As a result, construction of the modified project would not affect additional sensitive noise receptors. The closest construction to the residential receptor at 1700 Kirkwood Avenue would be construction of the Biogas Upgrade Facility and the PG&E Interconnection Station and Deoxygenation Facility. These facilities would be built at the same locations as the originally approved Maintenance Shops No. 2 Building and the Digester Gas Treatment facility, respectively. The FEIR determined that construction of the Maintenance Shops No. 2 Building and the Digester Gas Treatment would not be greater than 10 dBA above ambient at this closest receptor. The proposed

52 The former Southeast Community Center daycare center has relocated to 1550 Evans and is thus no longer a sensitive receptor that could be affected by the proposed biogas utilization system construction. Therefore, it is not discussed further.

Biogas Upgrade Facility and the PG&E Interconnection Station and Deoxygenation Facility are smaller structures and would involve less intensive construction than the facilities analyzed in the FEIR, and thus would generate similar or less noise. As a result, it is reasonable to conclude that noise during construction of the biogas utilization system also would not increase noise at 1700 Kirkwood Avenue by greater than 10 dBA above ambient.

The Southeast Greenhouses staging area would continue to be used for offices and parking during construction of the modified project and these uses generate limited noise. With implementation of Mitigation Measure M-NO-1b (Construction Noise Control Measures at Southeast Greenhouses Staging Area), noise impacts on nearby residences during use of this staging area would remain less than significant with mitigation.

As discussed above, construction will extend an additional 1.5 years due to construction of the approved project taking longer than estimated, not the addition of new project components. As a result, while noise from construction would occur for a longer time, it would not involve new types of equipment or methods/activities that would result in different or louder noise. Therefore, with implementation of the mitigation measures described above, construction noise impacts would continue to be less than significant with mitigation throughout the extended project duration.

Vibration

Vibration from modified project construction and operation would continue to have a less-than-significant impact on buildings and people because vibration-inducing construction activities would be located at the same distances relative to nearby buildings and sensitive receptors, and less pile driving would occur.

Operation

The FEIR establishes operational noise limits of no more than 8 dBA above ambient at the nearest property line, 60 dBA at the exterior of the nearest residence at night, and 70 dBA at the exterior of the nearest residence during the day. Ambient noise at the closest residential receptor at 1700 Kirkwood Avenue is 67 dBA during the day and 58 dBA at night. The FEIR estimated that the combined noise from operating all of the new Biosolids facilities would be 59 dBA at the exterior of 1700 Kirkwood Avenue and determined that this would be less than significant because it would be below ambient noise. As shown in FEIR Table 4.7-11, under the approved project, the closest operational noise source to 1700 Kirkwood Avenue would have been the originally approved digester gas treatment facility at 47 dBA.

Estimated noise from the proposed Biogas Upgrade Facility on the north side of Jerrold would be similar to noise from the modified project's digester gas treatment facility (47 dBA) and waste burners (35 dBA), respectively, which would be 47.3 dBA when combined.[53,54] The Deoxygenation System would have similar noise levels as the Digester Gas Treatment facility or 47 dBA. Noise from the PG&E Interconnection Station would be negligible because it would consist of only piping and valves to test renewable natural gas quality and would not require pumping to return poor quality gas to the Biogas Upgrade Facility because the renewable natural gas is pressurized. Although noise from the proposed Biogas Upgrade Facility at 47.3 dBA would be slightly higher than noise from the originally approved Digester Gas

53 Noise levels provided by designer Adam Ross, P.E., Vice President, Central Valley-Tahoe Area Leader, Brown and Caldwell.

54 Noise calculations performed using online calculators at http://www.sengpielaudio.com/calculator-leveladding.htm and http://www.sengpielaudio.com/calculator-SoundAndDistance.htm

Treatment facility at 47 dBA, the Biogas Upgrade Facility would be over 65 feet further away from residential receptor at 1700 Kirkwood Avenue. To be conservative, even if noise from operation of the proposed biogas utilization system were combined with the total estimated noise level of 59 dBA from all the approved project facilities (including the Digester Gas Treatment Facility and other energy recovery facilities that would no longer be included in the modified project), the combined noise would be 59.28 dBA, which would not be a discernable increase and would not exceed the minimum 60-dBA nighttime exterior noise limit at 1700 Kirkwood Avenue. Therefore, noise from operation of the modified project would remain less than significant.

Only one additional person may be required to operate the proposed biogas utilization system, which would add a negligible amount of worker vehicle traffic. Like the approved project, several trucks would be required every four to six months to remove solid waste from the digester gas upgrade process. Truck trips to remove this solid waste would be the same as for the approved project and the FEIR determined that noise from these trucks would be less than significant. Given the minor change in operational traffic, traffic related noise during operation of the proposed biogas utilization system would also be expected to be less than significant.

Cumulative

In general, cumulative construction-related noise increases would occur if any nearby cumulative projects are constructed at the same time as the modified project and would affect the same sensitive receptors. As discussed above, the nearest sensitive receptor is the residence at 1700 Kirkwood Avenue. Among the projects identified in **Appendix A**, only the following could result in cumulative noise impacts due their location adjacent to the modified project site and construction schedule:

- Headworks Replacement Project
- Power Feed and Primary Switchgear Upgrades
- Wastewater Enterprise Repair and Replacement
- Quint-Jerrold Connector Road
- Primary Treatment Health and Safety Project
- Electrical Controls Upgrade (SEP 545)
- HVAC and Mechanical Upgrades
- Operations, Engineering and Maintenance Buildings (SEP 7)[55]

The Southeast Plant Headworks project site is located north of the modified project site and further from the sensitive receptors. As the loudest construction activities – excavation, pile driving, and building erection - have been completed, remaining construction noise from this project is expected to be lower. The Quint-Jerrold Connector Road Project would be separated physically from the modified project site by the existing railroad embankment which would buffer sensitive receptors to the east from roadway construction noise. Except for the Operations, Engineering and Maintenance Buildings, the other projects at the Southeast Plant are not expected to contribute substantially to cumulative construction-related noise impacts at the closest receptors because they would replace or upgrade existing equipment, avoid impact pile driving, and/or involve construction that would occur inside existing building enclosures.

55 The proposed Operations, Engineering and Maintenance Buildings is currently undergoing CEQA review.

The Operations, Engineering and Maintenance Buildings would replace Maintenance Shops No. 1 and No. 2 that were part of the project analyzed in the FEIR. These proposed buildings would be located to the east of the modified project site and closer to the residential receptor at 1700 Kirkwood Avenue, at a distance of approximately 250 feet. Construction of the Operations, Engineering and Maintenance buildings would overlap with the final 20 months of the modified project. The combined or cumulative impact from simultaneous construction could be potentially significant. The modified project's contribution to the cumulative impact, however, would not be considerable for several reasons: the modified project site is further from the 1700 Kirkwood Avenue receptor; the modified project will be in the final stages of construction with less noisy construction activities (more interior work and connections); and, the Operations, Engineering and Maintenance buildings construction activities of demolition, excavation, and pile driving would be expected to be noisier. Therefore, the modified project's contribution to a potential cumulative construction noise impact would be less than significant.

Conclusion

The modified project would continue to have no impact or less-than-significant impacts related to location near an airport, construction truck trips and operational noise. As discussed, modified project construction would have similar or reduced noise impacts than the approved project with implementation of Mitigation Measure M-NO-1a (Shielding of Concrete Saw Operations) and Mitigation Measure M-NO-1b (Construction Noise Control Measures at Southeast Greenhouses Staging Area). The modified project would have a less-than-cumulatively considerable contribution related to a potentially significant cumulative construction noise impact (less than significant).

For the reasons described above, the modified project would not have any new or substantially more severe noise impacts than the approved project.

5.6 Biological Resources

5.6.1 Biosolids Digester Facilities Project FEIR Findings

The Biosolids Digester Facilities Project FEIR found that the approved project would have potentially significant impacts related to the following significance criteria regarding biological resources:

- Have a substantial adverse effect, either directly or through habitat modifications, on species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or United States Fish and Wildlife Service

The potentially significant impacts associated with the above criteria for the approved project and modified project are discussed in detail below under the Construction and Operation sections.

Briefly, the FEIR also evaluated several other significance criteria regarding biological resources and determined that there would either be no impact or impacts would be less than significant. The approved project had no impact on riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Wildlife (CDFW) or U.S. Fish and Wildlife Service; migratory corridors or the use of native wildlife nursery sites; implementation of an adopted habitat conservation plan or Natural Community Conservation Plan; or operational effects on biological resources. The FEIR determined that with adherence to Article 4.2 of the San Francisco Public

Works Code (Section 146) and the State Water Resources Control Board's Construction General Stormwater Permit during grading and excavation near wetlands at the Piers 94 and 96 staging areas, the approved project would have a less-than-significant impact on wetlands. The FEIR identified that the approved project would not significantly conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance, because the design includes planting trees and other landscaping along Jerrold Avenue to replace trees requiring removal and a site-specific Tree Protection Plan would be required to protect trees that would be retained pursuant to San Francisco Public Works Code Article 16.

Construction

The FEIR found that there is no sensitive habitat or species present that could be affected by construction or operation due to its location in an urban, paved environment. The FEIR found that underutilized buildings, trees, and other structures in and near the project site and construction staging areas could serve as migratory bird nesting habitat and bat roosting sites. The FEIR determined that impacts to nesting birds would be less than significant with implementation of SFPUC's Standard Construction Measure 7 (Biological Resources) that requires pre-construction surveys and establishing no disturbance buffers for active nests, while Mitigation Measure M-BI-1 (Protective Measures for Special Status Bats and Maternity Roosts) would reduce impacts on bats to a less-than-significant level. Mitigation Measure M-BI-1 (Protective Measures for Special Status Bats and Maternity Roosts) requires pre-construction surveys, establishing no disturbance buffers for active nests and roosts, removing bat roosts under certain weather conditions when bats are more active and only in consultation with the CDFW, and installing artificial habitat to compensate for removed roosts.

Operation

The FEIR determined that because all operations would be restricted to the modernized Southeast Plant and no activities would occur within the staging areas, operation of the approved project would have no impacts on biological resources.

5.6.2 Modified Project

Construction

Construction of the proposed biogas utilization system facilities would be within the Southeast Plant and the approved project boundary where there is no sensitive habitat or species present. Buildings, trees, and other structures where the Biogas Upgrade Facility, PG&E Interconnection Station, and Deoxygenation System would be built have already been removed. As a result, it is unlikely that construction of the modified project would affect nesting birds or bat roosts. Nevertheless, like the approved project, the SFPUC would implement Standard Construction Measure 7 (Biological Resources) and Mitigation Measure M-BI-1 (Protective Measures for Special Status Bats and Maternity Roosts) during construction to ensure that nesting birds and bats would not be adversely affected. The modified project impacts on biological resources would remain less than significant with mitigation.

Operation

Because the proposed biogas utilization system would be confined to the Southeast Plant and the approved project boundary, like the approved project, the modified project would not impact biological resources during operation.

Cumulative

The FEIR establishes that the geographic scope for potential cumulative impacts on biological resources encompasses the species occurrences, habitats, and sensitive natural communities in the vicinity of the project site and off-site staging areas. Cumulative projects that would affect biological resources similar to those of the project and that could combine to result in potential cumulative impacts on biological resources include projects that would demolish or remove buildings or structures that could be used as bat roosts or result in adverse effects on nesting birds by removing trees or generating substantial noise. As the use of Piers 94/96 for construction staging is no longer proposed, the modified project would have no contribution to potential cumulative impacts on wetlands.

The modified project would not involve the demolition of any additional buildings or trees and thus would not increase the project's contribution to potential cumulative impacts. The only two cumulative projects remaining from the FEIR that could contribute to cumulative biological resources impacts are the Headworks Replacement Project and the Power Feed and Primary Switchgear Upgrades, both of which involve demolition and/or tree removal and include measures to prevent impacts to nesting birds and bats. Several new projects at the Southeast Plant have been added to the cumulative list, including the Primary Treatment Health and Safety Improvement project (SEP 040 and 041), HVAC and Mechanical Upgrades, Electrical Controls Upgrade (SEP 545), and the Operations, Engineering, and Maintenance Building Project (SEP 7), but only the last project would include building demolition and tree removal. Lastly, there are buildings and trees at the site of the future Bayview Train Caltrain Station project that may need to be removed and measures to protect birds and bats would be expected in the environmental review document. The modified project in combination with these cumulative projects could have a potentially significant cumulative impact on birds and bats. However, like the approved project, with implementation of Mitigation Measure M-BI-1 (Protective Measures for Special-status Bats and Maternity Roosts) and SFPUC Standard Construction measure 7 (Biological Resources), the modified project's contribution to potentially significant cumulative impacts would be less than cumulatively considerable, or less than significant with mitigation.

Conclusion

The modified project does not require demolition or tree removal and it is therefore unlikely that construction would affect birds or bat roosts. Nevertheless, like the approved project, the SFPUC would implement Standard Construction Measure 7 (Biological Resources) and Mitigation Measure M-BI-1 (Protective Measures for Special Status Bats and Maternity Roosts) to ensure that potential impacts would remain less than significant. Like the approved project, the modified project would not impact biological resources during operation. Although other cumulative projects in the vicinity would also have demolition and tree removal, the modified project's contribution to cumulative impacts would not be considerable (less than significant).

For the reasons described above, the modified project would not have any new or substantially more severe impacts on biological resources than the approved project.

5.7 Geology, Soils, and Paleontological Resources

5.7.1 Biosolids Digester Facilities Project FEIR Findings

The Biosolids Digester Facilities Project FEIR found that the approved project would have potentially significant impacts related to the following significance criteria regarding geology, soils, and paleontological resources:

- Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature.

The potentially significant impacts associated with the above criterion for the approved project and modified project are discussed in detail below under Construction.

Briefly, the FEIR also evaluated several other significance criteria regarding geology and soil impacts and determined that impacts would be less than significant. Impacts related to ground shaking or seismically induced ground failure, liquefaction, earthquake-induced settlement, lateral spreading, and ground settlement that could expose people or structures to the risk of loss, injury, or death would were found to be less than significant for a number of reasons: the approved project was designed in accordance with the San Francisco Building Code, ASCE/SEI 7-10, and the SFPUC's Seismic Design Requirements; incorporates engineering and design features to withstand a major earthquake; the geotechnical interpretive report concluded that there is a low potential for lateral spreading at the approved project site; and measures would be implemented to prevent ground settlement due to excavation, dewatering, and pile driving in accordance with Title 8 of the California Code of Regulations. Moreover, the FEIR discusses that the approved project would substantially improve the Southeast Plant's seismic safety because it would replace the digesters and other existing Southeast Plant solids treatment facilities that are over 60 years old and were not built to withstand a major earthquake. Lastly, the FEIR determined that the approved project would not result in substantial erosion because the SFPUC would be required to prepare and implement a site-specific erosion and sediment control plan pursuant to San Francisco Public Works Code Article 4.2.

Construction

The FEIR found that the Pleistocene-aged, upper-layered sediments underlying the approved project site have a high paleontological sensitivity, and that excavations extending into these sediments would have the potential to encounter and damage or destroy paleontological resources (fossils). The FEIR concluded that this potentially significant impact on paleontological resources would be less than significant with implementation of Mitigation Measure M-GE-4 (Paleontological Resources Monitoring and Mitigation Program), which requires that excavation activities within the upper layered sediments be monitored by a qualified paleontologist, that any substantial find be adequately curated, and establishes procedures in the event of discoveries.

Operation

The FEIR found no potentially significant impacts from operation of the approved project related to geology, soils, and paleontological resources.

5.7.2 Modified Project

Construction

Modified project impacts related to ground shaking or seismically induced ground failure, liquefaction, earthquake-induced settlement, lateral spreading, and ground settlement that could expose people or structures to the risk of loss, injury, or death would continue to be less than significant because the modified project is also designed in accordance with the San Francisco Building Code and ASCE/SEI 7-10 and the SFPUC's Seismic Design Requirements. Like the approved project, site-specific erosion and sediment control measures would continue to be implemented during construction of the modified project such that this impact would remain less than significant. Overall, construction of the modified project would reduce potential impacts on paleontological resources because it would result in less excavation and eliminate from 279 to 333 piles (depending upon foundation design) at depths where fossils could potentially be encountered. To date, no fossils have been exposed during the sampling and monitoring performed for construction of the approved project pursuant to Mitigation Measure M-GE-4 (Paleontological Resources Monitoring and Mitigation Program). This mitigation measure would also be applicable to the modified project and potential impacts on paleontological resources would remain less than significant with mitigation.

Operation

The FEIR found potential impacts related to geology, soils, and paleontological resources would be less than significant. Like the approved project, the modified project facilities would meet current engineering standards to limit damage from seismically-induced hazards like ground shaking, and settlement and liquefaction.

Cumulative

The FEIR establishes that the geographic scope of cumulative geology and soils impacts is restricted to the project site and adjacent areas because related impacts are relatively localized or even site-specific. All of the SFPUC-sponsored cumulative projects would be engineered and designed according to the most current building code requirements, the SFPUC Seismic Design Guidelines, and applicable engineering standards for seismic safety, which would minimize the potential for cumulatively considerable damage. The non-SFPUC cumulative projects would also be subject to local and state building codes. Additionally, all cumulative projects would be required to implement the requirements of Article 4.1 of the San Francisco Public Works Code that would ensure that cumulative impacts of erosion from the construction sites would be less than significant. The Operations, Engineering, and Maintenance Building Project (SEP 7) could also impact upper-layered sediments where paleontological resources could be present. It would also be subject to Mitigation Measure M-GE-4 (Paleontological Resources Monitoring and Mitigation Program). Moreover, like the approved project, the modified project's contribution to potentially significant cumulative impacts related to geology, soils, and paleontological resources would be less than cumulatively considerable with implementation of Mitigation Measure M-GE-4 (Paleontological Resources Monitoring and Mitigation Program) or less than significant.

Conclusion

The modified project would reduce impacts to paleontological resources because it would reduce the amount of excavation and number of piles required within the upper layer sediments where resources could occur. For the reasons described above, the modified project would not have any new or

substantially more severe geology, soils and paleontological resources impacts than the approved project.

5.8 Wildfire

The Biosolids Digester Facilities Project FEIR did not analyze wildfire as this topic was not yet mandated for inclusion under CEQA. CEQA Guidelines Appendix G Checklist criteria for wildfire impacts are listed below.

If located in or near state responsibility areas or lands classified as very high fire hazard severity zones, would the project:

- Substantially impair an adopted emergency response plan or emergency evacuation plans?
- Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?
- Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?
- Expose people or structure to significant risks including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?

San Francisco and bordering areas within San Mateo County do not have any state responsibility areas for fire prevention or lands that have been classified as very high fire hazard severity zones.[56] Therefore, the wildfire topic is not applicable to the project.

5.9 Other Environmental Topics with Less-Than-Significant Impacts

The FEIR found that the following topics would have less than significant impacts. The modified project would have similar or reduced impacts as the approved project for the reasons discussed below.

- **Land Use.** The existing Southeast Plant is an area designated as Public Facilities and Light Industrial in the *San Francisco General Plan*. The FEIR discuses that construction would temporarily affect land uses in the project vicinity, particularly related to closing Jerrold Avenue to public through-traffic between Phelps Street and the Caltrain right-of way to maintain a safe work area but that this would be a less-than-significant impact because the closure would be temporary; there would be detour routes; and the area affected by the closure does not clearly constitute an established community given the distinct nature of land uses on either side of this closed road segment (e.g., industrial warehouses to the west and residences and commercial uses to the east), along with the large-scale intervening industrial land uses that comprise the

56 California Department of Forestry and Fire Protection, Fire and Resource Assessment Program, San Francisco County Draft Fire Hazard Severity Zones in Local Responsibility Areas Map, October 5, 2007; San Mateo County Fire Hazard Severity Zones in State Responsibility Areas Map, November 7, 2007; and San Mateo County Very High Fire Hazard Severity Zones in Local Responsibility Areas Map, November 24, 2008, *http://www.fire.ca.gov/fire_prevention/fire_prevention_wildland_zones_maps*.

existing Southeast Plant site. Regarding operation, the FEIR determined that although the approved project would expand the Southeast Plant wastewater facilities into the Central Shops and Asphalt Plant sites, the new facilities would not divide an established community because those areas were already being used for storage and for industrial uses similar to Southeast Plant, were already not accessible to the public, and would not block access between adjacent land uses. The FEIR concluded that, on the whole, the Biosolids project would not conflict with applicable land use plans and policies, since it would advance the General Plan objective and policy concerning the location of wastewater facilities and provision of effective and efficient wastewater treatment, the streetscape improvements would be consistent with *the Better Streets Plan and* impacts on policies related to the preservation of historic resources would be mitigated.

The modified project would be constructed and operated entirely within the Southeast Plant and the approved project boundary such that, like the approved project, construction and operation would not physically divide a community. Overall, the proposed revisions would eliminate several large buildings and tanks, which would minimize changes to the landscape and replace them with fewer and less substantive facilities. Moreover, the long-term streetscape and landscape improvements along Jerrold Avenue that would enhance the safety and connectivity of Jerrold Avenue for various transportation modes (e.g., bikes, pedestrians) in the plant's vicinity would still be constructed. As discussed above, the approved project will take any additional 1.5 years to construct, which will extend the closure of Jerrold Avenue between Rankin and Phelps for safety considerations. During this time, detour routes will continue to be provided.

For these reasons, the modified project would not have any new or substantially more severe land use impacts than the approved project.

- **Aesthetics.** As stated in the FEIR, there are no scenic views or vistas in the project vicinity. The FEIR discussed that construction could affect the visual character of the area due to views of construction activities and staging areas, as well as the creation of new sources of light or glare. The FEIR determined that these impacts would be less than significant because construction equipment would be similar to other equipment and buildings already present in the area; other existing buildings at the Southeast Plant and in the general area and the 15-foot-tall Caltrain berm would block views of the site from nearby residential, commercial, and industrial properties; views from adjacent or nearby streets for passing motorists, bicyclists, pedestrians, and Caltrain passengers would be brief and quickly replaced by succeeding streetscape views as the viewer moves past the project; views from the hills would be distant and include other industrial facilities; views of the trailers would replace those of the former greenhouses; and construction equipment and activities would not create a substantial new source of light or glare because the SFPUC would implement Standard Construction Measure 8 to shield lights if used at night. Regarding operation, the FEIR found that the new Biosolids facilities would be similar to the existing Southeast Plant facilities, views of the new facilities from outside the project site would be limited by intervening structures and trees or would be fleeting views from cars or the train, and that the overall visual character of the Southeast Plant as seen from surrounding areas would remain essentially the same as the existing character, that of a major industrial facility. The FEIR discussed that the design of the new facilities would be consistent with applicable standards (such as the Industrial Area Design Guidelines, the San Francisco Arts Commission Civic Design Review process, and the *Better Streets Plan)* and that landscaping and other street

improvements included in the project would enhance the overall long-term visual quality of the area. As are result, the FEIR determined that the new permanent facilities would have a less-than-significant aesthetic impact.

The modified project would be constructed within the approved project boundary and involve similar construction equipment and methods as the approved project, such that construction would not introduce work at new locations or new equipment and methods that could result in temporary impacts on visual character.

Regarding operation, the proposed biogas utilization system would require fewer and less substantive new facilities than the approved energy recovery facilities. North of Jerrold Avenue (within the plant) the large Digester Gas Storage tank would be eliminated, while the new Biogas Upgrade Facility would be built instead of the originally approved Maintenance Shops 2. The Maintenance Shops 2 would have been 15 feet tall. The Biogas Upgrade Facility would include various equipment on a concrete pad. The equipment could be either approximately 15 feet tall, or up to approximately 45 feet tall, depending on the final design, and thus would be similar in height or taller than the originally planned maintenance building. Even if the new biogas upgrade facility equipment were taller than Maintenance Shops 2 would have been, it would be equipment at various heights (not a building) and would be seen in the foreground of the 65-foot-tall digesters that, as with the approved project, would dominate views from Jerrold Avenue overall. South of Jerrold (within the former Asphalt Plant), the 57-foot-tall Energy Recovery Building and the 22-foot-tall Digester Gas Treatment Facility would be eliminated. The PG&E Interconnection Station would be built within the footprint of the former Digester Gas Treatment Facility and be approximately 10 feet tall. The Deoxygenation Facility would be up to approximately 15 feet tall. The FEIR discussed that the Energy Recovery Building at 57 feet tall would have increased massing in the foreground that may reduce views of the distant hillside from the surrounding area. The modified project would thus reduce this impact on hillside views because the proposed facilities in this area would only be approximately 15 feet tall or shorter.

Like the approved project, the modified project facilities would be behind the Southeast Plant perimeter wall and trees would be installed along both sides of Jerrold Avenue per the planned long-term streetscape and landscape improvements along Jerrold Avenue discussed in the FEIR. These improvements would improve the public edges along the plant and enhance the visual quality of the area compared to existing conditions. The FEIR determined that, overall, the approved project would not substantially degrade the visual character of the area because the new facilities would be visually compatible with existing plant facilities, views of the new biosolids facilities at the plant to the typical motorist or pedestrian continued southeast on Jerrold Avenue would be fleeting, and views from the surrounding areas would remain that of a major industrial facility. These conditions would remain the same because the modified project would have fewer, less substantive permanent facilities within the approved project boundary.

For these reasons, the modified project would not have any new or substantially more severe aesthetic impacts than the approved project.

- **Population and Housing.** As discussed in the FEIR, the approved project does not involve any housing construction and thus would not directly induce growth by constructing housing that would attract people to the area, nor would it extend roads or other infrastructure that could

indirectly induce growth because it is located at an existing industrial site in an area that is already well-served by roads and other infrastructure. The FEIR found that given the size of the regional construction work force compared to the number of workers needed to construct that project, even during peak construction periods, construction workers would likely be drawn primarily from the local and regional construction work force and that workers who do not live in the Bayview-Hunters Point neighborhood would likely commute from elsewhere in the city or Bay Area rather than relocate from more distant cities or towns such that the approved project would not induce population growth by attracting a substantial number of workers from outside the region to relocate to the area and thus would not create demand for additional housing. The FEIR found that operation of the approved project would also have a less than significant impact on population and housing because it would not include new homes; increase the number of workers employed at the Southeast Plant; extend roads or other infrastructure into areas lacking such services that could induce substantial population growth; and would not increase existing overall Southeast Plant wastewater treatment capacity and would only provide solids treatment capacity that is consistent with the Association of Bay Area Government's growth forecasts. Thus, the project would not indirectly induce population growth.

The modified project construction and operation would have similar impacts as the approved project because the biogas utilization system facilities would be smaller and less complex than the originally proposed energy recovery facilities, fewer construction workers would be needed. While the approved project would not result in additional employees, only one new permanent employee may be needed for the modified project and could reasonably be expected to be available from the local or regional workforce. Further, like the approved project, the modified project would not change the Southeast Plant's treatment capacities.

For these reasons, the modified project would not have any new or substantially more severe impacts on population and housing than the approved project.

- **Transportation and Circulation.** The FEIR discusses that construction-related traffic comprised of trucks and workers trips to and from the approved project site and staging areas and detours and road closures could interfere with pedestrian, bicycle, or vehicle circulation; increase potential traffic hazards; and cause inadequate emergency vehicle access. The FEIR found that even during the periods of peak truck trips (406 total trips) and peak worker vehicle trips (742 total trips) the overall contribution to total traffic volumes and to increased vehicle delay would be minimal, that detour trips to two nearby parallel east-west routes (Oakdale Avenue and Evans Avenue) could be accommodated without substantial delays or out-of-way travel, the reroute of the 23 Monterey would not substantially affect accessibility to transit or transit operations, and that emergency vehicles would not be substantially affected by the temporary closure of a two-block segment of Jerrold Avenue. Regarding traffic safety hazards, as discussed in the FEIR, the approved project includes establishing a site-specific Traffic Control Plan that conforms to the SFMTA's Blue Book, which requires the implementation of construction safety measures like proper advance warning and detour signage, identification of approved construction truck routes, and coordination with public service providers like the fire department. The approved project also establishes that the SFPUC would coordinate traffic control across the various projects at the Southeast Plant that would be constructed concurrently. With these measures, the FEIR determined that construction of the approved project would have a less-than-significant

impact on transportation and circulation. Operational impacts of the approved project were also less than significant, with approximately 60 truck trips (one way) annually for hauling digester treatment waste and no additional worker trips.

The modified project would use same access routes for construction vehicles, including from Evans, Rankin, Jerrold, and McKinnon as described in the FEIR and subsequently approved minor modifications. Construction of the modified project would require fewer truck trips to deliver materials (e.g., concrete and rebar) and to off-haul spoils because the proposed biogas utilization system would be comprised of fewer and less substantial facilities than the energy recovery facilities. Just reducing soil excavation by 5,538 cubic yards alone would eliminate approximately 615 one-way truck trips (assuming 18-cubic yard trucks). Similarly, modified project construction would require fewer delivery and haul trips and construction worker vehicles per day. Therefore, construction trips on any one day could reasonably be expected to be well within the maximum daily truck and vehicle trips analyzed in the FEIR, which were found to have a less-than-significant impact on transportation and circulation. Like the approved project, the SFPUC would implement traffic control measures during construction of the modified project per the Traffic Control Plan to minimize potential traffic hazards to public vehicles, pedestrians, and bicyclists from these construction trips. Additionally, pursuant to the FEIR, the Southeast Plant program construction management team would coordinate access and truck routes with traffic from the other ongoing approved project construction to minimize impacts on the public. The approved project will require approximately 1.5 additional years to construct, which would extend the temporary closure of Jerrold Avenue and elongate the time during which traffic safety hazards from construction-related traffic in the area could occur. During this time, the same traffic safety measures will be implemented.

Operation of the proposed biogas utilization system would not require the routine import of any materials. A similar amount of spent media (solid waste) associated with removing digester gas impurities would be generated at the biogas upgrade facility as was estimated in the FEIR to be generated from operation of the energy recovery system. As a result, off-haul of this material would not require additional truck trips. Operation of the biogas upgrade system facilities may require one additional full-time person. PG&E would have limited visits to maintain the PG&E Interconnection Station. As a result, there would be a negligible increase in employee vehicle miles traveled to operate the proposed biogas utilization system. The modified project would not change the improvements to be implemented at the end of construction along Jerrold Avenue to improve pedestrian and bicycle circulation.

For these reasons, the modified project would not have any new or substantially more severe impacts on transportation and circulation than the approved project.

- **Wind and Shadow.** The FEIR determined that construction would have no impact on wind or shadow because construction equipment would be smaller than or similar in size and height to other equipment and buildings in the area such that it would not substantially alter wind patterns in the project vicinity nor be tall enough to create substantial new shadows that could affect public open spaces. Regarding the approved project's new permanent facilities, the FEIR found that the approved new project facilities, including the 65-foot-tall digesters and 57-foot-tall energy recovery building, would not alter wind patterns in a manner that substantially affects public areas. The shadow analysis conducted for the FEIR to evaluate impacts of the new

permanent facilities on the nearest recreational facilities found the project would not create new shadows that would substantially affect outdoor recreational areas, streets and sidewalks. Wind and shadow impacts were less than significant.

Construction of the proposed biogas utilization system would use the same type of construction equipment within the same approved project work areas and thus would be expected to have similar effects on wind and shadows as the approved project. Regarding permanent effects on wind patterns, the modified project would eliminate the 57-foot-tall Energy Recovery Building, the 65-foot-tall Digester Storage Tank, and 22-foot-tall Digester Gas Treatment Facility and replace them with less substantial outdoor equipment ranging from 15 to 45 feet tall on concrete pads (not buildings) through which air could flow and thus there would likely be less effects on wind patterns. The Biogas Upgrade Facility, PG&E Interconnection Station, and Deoxygenation Facility would be built within the approved project boundary at the same distance to the closest recreational facilities and would not be taller than the other approved project buildings and structures such that they would also not cast shadows on outdoor recreational areas or substantially affect streets and sidewalks.

For these reasons, the modified project would not have any new or substantially more severe impacts on wind and shadow than the approved project.

- **Recreation.** The FEIR found that construction of the approved project would have no impact on recreational facilities, either directly or indirectly, because there are no such facilities within the approved project site or the off-site staging areas and because the existing parks and trails in the vicinity at over 1,000 feet and 300 feet (Bay Trail) respectively would remain open and are sufficiently far so as not to be physically deteriorated or degraded by the project. The FEIR found that operation of the project would also have no impact on recreational facilities because it does not permanently affect existing recreational resources, it does not include new residential or other uses that would generate increased demand for parks or other recreational facilities, it would not increase existing operations staff levels at the Southeast Plant that could increase demand at existing recreational facilities near the Southeast Plant, and that ongoing demand would continue to be met by existing parks and recreational facilities.

  Construction of the modified project, like the approved project, would not include the construction or expansion of recreational facilities, or increase the use of existing neighborhood and regional parks or other recreational facilities because construction workers and possibly one additional permanent staff member would continue to be drawn from the local and regional work force such that there would not be a significant increase in population that could accelerate the physical deterioration existing recreational facilities.

  For these reasons, the modified project would not have any new or substantially more severe impacts on recreation than the approved project.

- **Utilities and Service Systems.** The FEIR evaluated several construction-related utilities and services systems topics, including wastewater discharges in excess of the treatment capacity of the Southeast Plant and associated conveyance infrastructure, landfill capacity for construction waste, and compliance with local, state and federal regulations pertaining to the disposal of solid waste. The FEIR concluded that potential impacts would be less than significant because wastewater discharges from the sanitary needs of construction workers and groundwater

dewatering could be accommodated by the Southeast Plant's existing treatment capacity, the SFPUC would be required to recycle construction and demolition debris pursuant to Section 708 and Chapter 14 of the San Francisco Environment Code to divert solid waste from landfills and that the landfills the project would use have sufficient capacity for the maximum amount of potential waste, and because by complying with the local code, the approved project would also be consistent with the California Integrated Waste Management Act of 1989 (AB 939). Regarding potential impacts due to operation, the FEIR identified that the project would increase water demand due to changes in processes and facilities (i.e., for the energy recovery facilities and the Maintenances Shops 1 and 2) and generate 820 cubic yards of solid waste (iron sponge media waste and siloxane media waste) annually from the new digester gas treatment facilities. The FEIR concluded that these operations would result in a less-than-significant impact because the City's existing water supply could sufficiently meet the additional demand and that amount of solid waste constituted a small fraction of available, permitted landfill capacity.

Construction of the modified project would involve less excavation and pile drilling and thus would likely require less groundwater dewatering. As a result, the Southeast Plant's existing treatment capacity would still be able to accommodate discharges of both wastewater from the sanitary needs of construction workers and groundwater during construction, including during the approximately additional 1.5 years of approved project construction. Since the proposed biogas utilization system facilities would be built in the footprint of other originally approved project components, the FEIR already accounts for the solid waste generated by the demolition of existing structures in those locations. Construction of the proposed biogas utilization system would reduce the amount of soil to be excavated and disposed of by over 5,000 cubic yards. Thus, construction of the modified project would not generate additional solid waste that could cause the capacity of permitted landfills to be exceeded. Like the approved project, the SFPUC would be required to divert waste from landfills during construction in accordance with the City code to recycle construction demolition and debris.

Operation of the modified project would not use more water during operation than the approved project because the Biogas Upgrade Facility, PG&E Interconnection Station, and Deoxygenation Facility would not include bathrooms and, although full time operation of the steam boilers would use more water, less water would be used elsewhere with elimination of than the energy recovery system. Operation of the proposed biogas utilization system would result in a similar amount of solid waste associated with removing digester gas and/or tailgates impurities as the originally-planned energy recovery facilities and would not affect the amount of biosolids generated. Lastly, PG&E has capacity in the existing natural gas system to receive the additional renewable natural gas within its existing facilities.

For these reasons, the modified project would not have any new or substantially more severe impacts on utilities than the approved project.

- **Public Services.** The FEIR found that construction and operation of the approved project would have a less-than-significant impact on public services because it would not result in a substantial increase in the local population as construction workers would likely be drawn primarily from the local and regional construction work force, and the new facilities would be operated by existing Southeast Plant employees. The FEIR concludes that incidents during construction that require law enforcement, fire protection, or emergency medical services would constitute an incremental

increase in demand that would be temporary, could be accommodated by existing services, and would not require construction of new or physically altered facilities to maintain services.

Construction workers for the modified project would also reasonably be expected to be drawn from the local and regional construction work force and construction would be less extensive than the approved project (i.e., less excavation, less truck trips, less drilling, less substantial buildings erected, etc.) such that the potential for incidents that could require public services would not be expected to increase. Operation of the proposed biogas utilization system may require one new permanent employee who would also be expected to be drawn from the local and regional work force.

For these reasons, the modified project would not have any new or substantially more severe impacts on public services than the approved project.

- **Hydrology and Water Quality**. The FEIR evaluates several topics related to hydrology and water quality, including that soil disturbing activities (i.e., excavation) and using hazardous materials could result in excess sediment and other pollutants being entrained in stormwater runoff and discharged into the sewer or San Francisco Bay (at off-site Pier 94-96 staging areas) without proper controls; contaminated groundwater from dewatering could be discharged into the sewer and/or Bay; groundwater level could decline from dewatering activities or increased impervious surface limiting recharge and thereby interfere with nearby wells; and people or structures could be harmed at facilities in the 100-year flood or tsunami inundation zones. The FEIR concluded that all of these impacts were less than significant because the SFPUC would prevent sediment and other pollutants from entering the sewer or the Bay per San Francisco Public Works code Article 4.2 (Construction Site Runoff Controls) and the State Water Resources Control Board Construction General Stormwater Permit; must obtain and comply with a Batch Wastewater Discharge Permit for discharging groundwater into the sewer pursuant to Public Works code Article 4.2 that regulates the quality of the water; there are no groundwater wells within 1/2 mile of the site and impervious surface would not permanently increase; and no structures would be in the flood or tsunami inundation zones. During operation, the FEIR discusses that the project could increase water quality impacts on the San Francisco Bay because the approved new thermal hydrolysis process would increase total ammonia and nitrogen concentrations in the dewatering return that is ultimately discharged as secondary-treated effluent to the Bay via the Southeast Bay Outfall during dry weather; increase impervious surface that could overwhelm the site's stormwater infrastructure; and exacerbate future flood hazards. The FEIR concludes that these impacts would be less than significant because the water quality analysis showed that the increase in ammonia and nitrogen concentrations in the Southeast Plant effluent would not exceed the SFPUC's Bayside NPDES permit effluent limitations, future flooding would not be exacerbated since the site's topography would not change, and structures that could increase the extent of storm surge-related flooding compared to existing conditions would not be installed.

  Construction of the modified project would reduce impacts on groundwater during construction because it would reduce excavation and pile drilling at depths where groundwater is present. Like the approved project, groundwater that is encountered during construction would be appropriately treated prior to discharge. Similarly, the modified project would reduce potential impacts on stormwater quality given less site disturbance and soil off-hauling. Like the approved project, the SFPUC would still be required to install erosion and sediment controls during

construction of proposed biogas utilization system facilities to prevent sediment-laden water from entering storm drains in accordance with the Construction Site Runoff Control Permit requirements of Article 4.2 of the San Francisco Public Works Code.

Operation of the proposed biogas utilization system would not affect the thermal hydrolysis process that the FEIR discusses would increase nutrient concentrations discharged from the Southeast Plant into the San Francisco Bay. Moreover, the SFPUC will be installing a new Interim Sidestream Nutrient Removal Facility at the Southeast Plant as previously approved in minor project modification 17 that would reduce nutrients, primarily nitrogen, in the Southeast Plant's discharges from the approved project by about 50 percent. Thus, future operation would have reduced water quality impacts on San Francisco Bay that the approved project.

For these reasons, the modified project would not have any new or substantially more severe impacts on hydrology and water quality than the approved project.

- **Hazards and Hazardous Materials.** The FEIR evaluates several topics related to hazards and hazardous materials, including that the approved project site and staging areas are known to contain contaminated soil and groundwater; that the project would transport, store, and use routine hazardous materials (i.e., fuels, lubricants, and solvents for construction vehicles and equipment); that the project includes and demolition of old structures that could contain hazardous building materials (i.e., asbestos and lead based paint); and that it could interfere with emergency access and start fires. The FEIR discusses that without adequate management, these conditions could adversely affect public and environmental health, such as due to spills and pollutants in airborne dust. The FEIR concludes that because the SFPUC must comply with California Highway Patrol regulations related to transportation, implement site-specific best management practices like proper storage and secondary containment to prevent spills per San Francisco Public Works Article 4.2 (Construction Site Runoff Controls) and the State Water Resources Control Board Construction General Stormwater Permit, abate building hazards pursuant to well-established regulations prior to demolition, comply with Article 22A of the San Francisco Health Code (the Maher Ordinance), implement a Traffic Control Plan that would provide adequate emergency access, comply with the California Fire Code requirements for Fire Safety during Construction and Demolition, and comply with other applicable state and federal laws, that all of these potential impacts would be less than significant. During operation, the FEIR discusses that the approved project would increase the quantity of several chemicals used at the Southeast Plant, use diesel for a backup generator, and may require periodic disposal of hazardous wastes (e.g., fluorescent light tubes), but that because the SFPUC would be required to update the Hazardous Materials Business Plan for the Southeast Plant that is on file with the San Francisco Health Department pursuant to Article 21 of the San Francisco Health Code and comply with local, state, and federal regulations for hazardous material use, storage, and disposal, these impacts would be less than significant.

  Construction of the modified project would occur entirely within the approved project area such that it would not affect, or be affected, by new sources of existing soil and/or groundwater contamination that could expose the public and environmental to new or more severe impacts. The same types of hazardous materials would be used during construction, and the SFPUC would be required to continue transporting and managing them properly in accordance with the local, state, and federal laws discussed above. The only school located within one-quarter mile of the

approved project site was the Wu Yee Southeast Child Development Center that has now relocated and thus would not be exposed to hazardous materials related incidents. The SFPUC would be required to update the project's Traffic Control Plan to address traffic during construction of the modified project while maintaining emergency access and implementing fire prevention measures. Operation of the proposed biogas utilization system would not introduce new types of chemicals than those identified in the FEIR for operation of the approved project. Like the approved project, operation of the proposed biogas utilization system would use hazardous materials in accordance with applicable laws.

For these reasons, the modified project would not have any new or substantially more severe impacts related to hazards and hazardous materials than the approved project.

- **Mineral Resources, Energy Resources, and Water Use.** The FEIR found that the project site and construction areas do not contain substantial mineral resources or locally important mineral resource recovery sites. The FEIR discussed that energy, in the form of diesel, gasoline, and electricity would be consumed directly by construction equipment as well as indirectly through the energy needed to make the materials and components used in construction. The FEIR determined that construction energy use would be less than significant because construction would be temporary and would therefore not result in long-term depletion of local or regional energy resources, would not be wasteful because efficient equipment and alternative fuels would be used per Mitigation Measure AQ-1a, and would recycle construction waste per Chapter 14 and Section 708 of the San Francisco Environment Code which would reduce energy associated with extraction and manufacturing of new and raw materials. The FEIR discussed that potable water use during construction would not be wasteful, inefficient, or unnecessary because for San Francisco Public Works Code, Article 21 requires the use of recycled water for dust control during construction. Regarding operation, the FEIR discussed that the approved project would increase energy and water use. However, the FEIR determined that the approved project energy recovery facilities would, by 2045, generate enough steam and electricity to operate the Biosolids facilities to provide this additional energy, only importing 5,250 gallons of diesel a year for the 1.5-MW standby power generator, and that the design maximizes using recycled water and/or other non-potable water to the extent possible in the new processes along with complying with the San Francisco Building Code and San Francisco Water Efficient Irrigation Ordinance such that the project's operational impacts on fuel, water, and energy resources would be less than significant.

  Construction of the modified project would not affect mineral resources because the biogas upgrade facility, PG&E interconnection station, deoxygenation system and associated piping would be built within the approved project boundary where the FEIR determined that no resources are present. Construction of the modified project would reduce energy use (fuel) relative to the approved project because it would require less construction effort (less excavation, piles, materials) and fewer truck trips. Although construction would occur for an additional approximately 1.5 years, the time increase is due to the approved project components taking longer to complete, not additional project components. Therefore, the overall energy required for construction would not increase. Moreover, like the approved project, energy consumption during construction would not be wasteful because efficient equipment would be used pursuant to the City's Clean Construction Ordinance and Mitigation Measure M-AQ-1a

(Construction Emissions Minimization) and the consumption would temporary such that it would also not result in long-term depletion of local or regional energy resources.

Operation of the modified project would not increase overall water use as discussed above. Like the approved project, design of the biogas upgrade facility, PG&E interconnection station, deoxygenation system and associated piping and surrounding areas would incorporate recycled water and/or other non-potable water to the extent possible and comply with the San Francisco Water Efficient Irrigation Ordinance. **Table 3** above provides an update on the operational energy demand with the proposed biogas utilization system. As shown, operation of the modified project would increase natural gas use because instead of the energy recovery system generating the steam needed to operate the Biosolids facilities, the steam would be generated by the steam boilers that would now need to operate full time. Diesel use would decrease because a smaller backup generator would be required (20 kw instead of 1.5 MW). Also, as shown there would be a change in electrical power demand. Under the approved project, the energy recovery facility would have generated the power needed to operate the Biosolids facilities. With the modified project, power from the electrical grid would now be needed. The SFPUC has confirmed that it generates sufficient clean hydroelectricity to provide all the power for the modified project; however, it is possible that PG&E's power may be used for the biogas utilization system components. Meanwhile, the digester gas that would be upgraded to renewable natural gas with the proposed biogas utilization system would be made available to the energy market and would offset some portion of natural gas that would have had to be extracted by others, elsewhere.

For these reasons, the modified project would not have any new or substantially more severe impacts related to mineral resources, energy, and water use than the approved project.

6.0 Conclusion

Based on the foregoing, it is concluded that the analyses conducted and the conclusions reached in the final FEIR certified by the planning commission on March 8, 2018 and adopted by the San Francisco Public Utilities Commission on December 18, 2018 remain valid. The modified project would not cause new significant impacts not identified in the FEIR, would not substantially increase the severity of the previously identified environmental impacts, and would not require new mitigation measures. No changes have occurred with respect to circumstances surrounding the modified project that would cause significant environmental impacts to which the modified project would contribute considerably, and no new information has become available that shows that the modified project would cause significant environmental impacts or a substantial increase in the severity of previously identified significant impacts. Therefore, no supplemental environmental review is required beyond this addendum.

I do hereby certify that the above determination has been made pursuant to State and local requirements.

Distribution List

APPENDIX A
CUMULATIVE PROJECTS

Appendix A Projects Considered in Cumulative Impact Analysis

Project No. in FEIR	Project Name (Project Sponsor)	Project Description	Construction Dates
1	Southeast Plant (SEP) Headworks Replacement Project (SFPUC)	The project would construct a new 250 million gallon per day, all-weather headworks facility to provide better screening and grit removal at the SEP. The project would replace two existing headworks facilities, modify the Bruce Flynn Pump Station (BFS), and construct a new odor control facility. It would provide redundant infrastructure to provide reliability and ensure operational reliability. It would also improve the seismic reliability of the headworks facility and improve odor control. The project would modify and eventually demolish the influent control structure/Southeast Lift Station. The two existing headworks buildings (SEP 011 and SEP 012) would also be demolished. The project was modified to include upgrades to the Bruce Flynn Pump station to enhance reliability in wet weather events, modify influent sewer, remove a proposed new generator and the sewer construction in Evans Avenue, Rankin Street and Davidson Avenue. The modified project would also construct a new SEP 005 Southeast Lift Station and associated piping.	Spring 2018 to Spring 2026 (Revised from January 2017 to December 2021)
6	SEP Power Feed and Primary Switchgear Upgrades (SFPUC)	The objective of the project is to increase reliability, redundancy and capacity of the electrical system at Southeast Plant (SEP) to meet Sewer System Improvement Program (SSIP) level-of-service goals by upgrading the existing power feed by PG&E and obtaining a new feed by SFPUC Power Enterprise. The project will construct an elevated building to house the new Primary Power Switch Station and substructures to provide adequate power for the existing electrical loads and new SSIP facilities, upgrade/replace aging existing substations, install power monitoring and protection system for additional reliability and efficiency, as well as provide redundant services to the nearby pump stations.	January 2024 to May 2025 (Revised from November 2017 to January 2020)
11	SEP Repair and Replacement Treatment Plant Improvement Projects (SFPUC)	In order to maintain the operational reliability of existing facilities, ongoing repair and replacement activities are conducted including replacement of equipment that has reached the end of its useful life, is no longer operational due to continuous operation in a highly corrosive environment, or does not meet current operational requirements.	Ongoing
12	Demolition of the Existing SEP Digesters and Southside Renovation Project (SFPUC)	This Phase II Sewer System Improvement Program (SSIP) project (Phase II has not yet been approved) would include demolition of the existing SEP digesters and associated control buildings, and improvements within the south side of the SEP. This project has not yet begun	After 2028 (Revised from after 2025)

Project No. in FEIR	Project Name (Project Sponsor)	Project Description	Construction Dates
		the planning phase and the SFPUC has not yet determined the specific improvements to be constructed.	
24	Quint-Jerrold Connector Road (San Francisco County Transportation Authority)[1]	This project would construct a new 950-foot-long roadway to provide access between existing Quint Street and Jerrold Avenue. The roadway would consist of two 13-foot-wide lanes (within a 50-foot-wide corridor), one northbound and one southbound. In addition, the project would construct or install several other elements along or beneath the length of the new roadway. Along the western side of the new roadway, the project would construct a new 5.5-foot-wide to 20-foot-wide sidewalk, depending on location; construct a new 27-foot-wide curb cut located along the San Francisco Wholesale Produce Market property (Project 25, below); and install street trees and street lighting. Along the eastern side of the new roadway, the project would construct a new 6.5-foot-tall reinforced concrete retaining wall. A new stop sign would be installed at the intersection of the new roadway and Jerrold Avenue. New sewer and water pipelines would be installed beneath the new roadway to provide on-site drainage and overall system reliability. The new road would support a potential new Caltrain station at Oakdale Avenue. The intersection with Jerrold Avenue also would accommodate trucks, although some movements would require wide turns. The San Francisco County Transportation Authority (SFCTA), Caltrain, and SF Public Works have coordinated project schedules to minimize the duration of the street closure.	Currently in the right-of-way acquisition phase. If successful, design would begin and construction could start in 2025. (Revised from later 2018 to 2019 depending on land acquisition)
25	San Francisco Market (formerly San Francisco Wholesale Produce Market) Expansion (City and County of San Francisco Market Corporation)[2]	This project consists of phased development to expand the existing San Francisco Wholesale Produce Market. The project would demolish the existing San Francisco Market buildings at the four quadrants of the main site, and would construct new buildings at each of the four quadrants. The project would include warehousing, office, meeting hall, and restaurant/café land uses. The new buildings would be 16 to 45 feet tall and would have a larger footprint than the existing buildings. The project and its associated roadway infrastructure would be built in about nine phases, over a period of approximately 16 years. It would start with the demolition of existing facilities at the SE Quadrant and construction of the 1900 Kirkwood Avenue building in January 2024, and would conclude with the occupancy of the 2000 Kirkwood Avenue building in June 2041. Phases 1 through 4 of the project include: Closure of Jerrold Ave between Toland and Rankin by the San Francisco Market; Demolition of the existing 455 Toland St building (NW Quadrant), and	2024 through 2041: Phases 1 through 4 would occur between 2024 and 2028

Project No. in FEIR	Project Name (Project Sponsor)	Project Description	Construction Dates
		grading for new surface parking lot; Vacation of Jerrold Ave, and other minor right-of-way areas at the Main Site; and Demolition of existing SE Quadrant Building and dock, and construction of 1900 Kirkwood Ave Building. The project would vacate Jerrold Avenue on the main site and reroute through-traffic around the main site on Innes Avenue, which will become the primary route for non-market destined traffic traveling through the area.	
27	Candlestick Point-Hunters Point Shipyard Phase I and II Development Project (Lennar Urban)[3]	This project would redevelop the 702-acre Candlestick Point-Hunters Point Shipyard area along the waterfront between south of India Basin and Candlestick Point. The project includes a mixed-use community with a wide range of residential, retail, office, research and development, civic, and community uses, and parks and recreational open space. In addition, a 300-slip marina would be constructed as would shoreline improvements to stabilize the shoreline. Phase I is already underway, including demolition of Candlestick Park Stadium. Phase II includes 6,225 units of housing (including rebuilding the Alice Griffith Public Housing), a regional retail center, a 220-room hotel, a performance venue, and 160 acres of new and revitalized open space.	Phased construction 2015 - 2035 (expect delays)
29	Pier 70 Waterfront Site (Forest City Development CA)[4]	This project consists of redevelopment of approximately 28 acres (identified as the "Waterfront Site") of the former industrial shipyard at Pier 70 and an additional 7 acres of land owned by the Port and PG&E. The site would be developed into a new mixed-use community with new commercial office development, new residential development, and a retail and arts component. New above-grade and below-grade parking and approximately 8 acres of new and expanded parks and shoreline access would be constructed. The project also includes the rehabilitation and adaptive reuse of Buildings 2, 12, and 21, which contribute to the eligible Pier 70 National Register Historic District. Overall, the project would construct a maximum of 4.2 million gross square feet in four phases over about 11 years. Two land use scenarios are under consideration, each with different amounts of commercial and residential land uses. The project would include up to 3,025 new residential units and up to 2.3 million square feet of commercial, restaurant, retail, and arts/light industrial land uses.	Phased construction 2018 - 2029 (expect delays)
30	Blue Greenway Project (Port of San Francisco)[5]	The Blue Greenway is the City's project to improve the City's southerly portion of the 500-mile, nine-county, region-wide Bay Trail, as well as the newly established Bay Area Water Trail and associated waterfront open space system. The alignment of the Blue Greenway generally follows the	Aqua Vista Park to be completed by 2025-2026

Project No. in FEIR	Project Name (Project Sponsor)	Project Description	Construction Dates
		alignment of the Bay Trail and Bay Area Water Trail from Mission Creek on the north to the County line on the south. Remaining parks: Warm Water Cove Park (in future after 2030), Pier 70 Parks (2028-2029) and Aqua Vista Park (would be completed by 2025-2026). The Port expects to complete all Blue Greenway projects within its jurisdiction by 2035.	
39	India Basin Mixed-Use Development (Build, Inc. and San Francisco Recreation and Parks Department)[6]	This project would encompass publicly and privately owned parcels, including existing streets, totaling approximately 38.8 acres at 700 Innes Avenue, 900 Innes Avenue, India Basin Shoreline Park, and India Basin Open Space locations. The project at 700 Innes Avenue would develop 17.12 acres of privately owned land plus 5.94 acres of developed and undeveloped public rights-of-way in phases; proposed uses include residential, retail, commercial, office, research and development/laboratory and clinical care space, institutional, flex space, recreational and art uses, parking, and a shoreline network of publicly accessible open space. The project at 900 Innes Avenue, India Basin Shoreline Park, and India Basin Open Space would include improvement of 14.2 acres of publicly owned parcels along the shoreline plus 1.58 acres of unimproved "paper" streets to create a publicly accessible network of new and/or improved parkland and open space. This new shoreline network would extend the Blue Greenway/Bay Trail and would provide pedestrian and bicycle connections to and along the shoreline, fronting San Francisco Bay.	On hold (Revised from 2018 – 2024)
40	San Francisco Gateway Project (Prologis, Inc.)[7]	The San Francisco Gateway Project would demolish the four existing single-story buildings at 749 Toland Street and 2000 McKinnon Avenue and construct two new multi-story buildings that would provide new production, distribution, and repair (PDR) space in the city. Each building would be approximately 97 feet tall and would have a maximum height of 115 feet, including rooftop appurtenances. The two new buildings would include PDR space, a logistics yard, vehicular circulation systems, and ground-floor retail spaces; they would total 2,160,000 gross square feet. The proposed project would convert Kirkwood Avenue (along the northern side of the project site, between Toland and Rankin streets) to a single-lane, eastbound one-way street; and convert a portion of McKinnon Avenue (along the southern side of the project site, between Toland and Selby streets) to a single-lane, westbound one-way street. Construction is anticipated to take approximately 31 months. Approximately 140,600 cubic yards of soil would	Summer 2026 through Winter 2028 (Revised from TBD)

Project No. in FEIR	Project Name (Project Sponsor)	Project Description	Construction Dates
		be excavated for the proposed project. The EIR also analyzes an expanded streetscape variant, which would improve the public right-of-way surrounding the project site.	
	Channel Force Main Intertie (SFPUC)	The existing 66-inch Channel Force Main transports wastewater from the northeastern part of San Francisco to the Southeast Treatment Plant. The Channel Force Main Intertie Project will increase reliability, provide operational flexibility, and allow for future inspections and maintenance. This project will construct a new pipeline connection and control systems along the existing force main. The project will also install control panels in the sidewalk along Cesar Chavez Street, between Indiana and Pennsylvania Streets, and replace existing air valves at two locations on Indiana Street, near the 20th and 25th street intersections.	January 2024 - December 2025
	City Distribution Division Headquarters Project (SFPUC)[8]	This project would establish a new City Distribution Division (CDD) headquarters at 2000 Marin Street that would replace the existing CDD yards located at 639 Bryant and 1990 Newcomb. The proposed CDD headquarters would consist of an administrative building, car shop, machine shop, meter shop, warehouse, fabrication shop, paint and autobody shop, auto shop, landscape shop, a parking garage, outdoor vehicle and equipment parking, outdoor storage and laydown area, outdoor space, and a fuel station.	January 2025 - December 2027
	3433 3rd Street (Equity Community Builders)[9]	The proposed project would construct an approximately 16,194 gross square-foot (sf), two-story, office and assembly building with surface parking with an approximate 9,441 sf ground floor footprint. The proposed project would include a 7,364 sf of union assembly/meeting hall, 8,830 sf of office space which includes 2,646 sf of elevators and corridors, 4,215 sf of landscaped area, and 9,372 sf of parking area. The project site is approximately 25,968 sf in area.	Under review with SF Planning
	Bay Corridor Transmission and Distribution (Phase 3 and 4) (SFPUC)	The San Francisco Public Utilities Commission Power Enterprise is building a high voltage transmission and distribution system in the Southeast portion of the city. It is intended to serve existing and future customers with large power needs. There are four phases of the project; phases 1 and 2 were completed in 2022. Phase 3 - 1535 Davidson Avenue - Power Distribution System - builds a new electrical substation at 1535 Davidson Avenue. Phase 4 - The Project proposes the following improvements in the City's Bayview District: Installation of	Phase 3 construction on-going with completion by Winter 2024. Phase 4 construction August 2024-May 2026

Project No. in FEIR	Project Name (Project Sponsor)	Project Description	Construction Dates
		a new duct bank from the intersection of Evans Avenue and Rankin Street to 2000 Marin Street. Replacement of existing 12-inch and 8-inch cast iron potable water mains with new 12-inch ductile iron pipe mains along three segments (Evans Avenue from Napoleon Street north to the existing Evans Avenue bridge near Cesar Chavez Street, Marin Street from Evans Avenue to the Marin Street terminus, and Cesar Chavez Street from Evans Avenue to Mississippi Street). This project component involves: the replacement of water main appurtenances including valves, fire hydrants, and water service; and extension and modernization of the existing emergency water system from the intersection of Evans Avenue and Marin Street to the Marin Street terminus; installation of high-pressure fire hydrants and high pressure valves. Ancillary work including ADA curb ramp upgrades, traffic signal related improvements, and restoration of traffic markings and striping.	
	Primary Treatment (SEP 040 and 041) Health and Safety Improvement project (SFPUC)	Southeast Plant (SEP) 040 and 041 are primary treatment facilities that were built in the 1950s and served as SEP's only primary treatment facility until a newer primary treatment facility (SEP 042) was constructed in the 1980s. The primary sedimentation tanks in SEP 040 and 041 provide additional operational flexibility, currently providing added capacity to SEP 042 tanks to handle wet weather flows as well as to serve as a backup during dry weather conditions when some or all tanks at SEP 042 need to be taken offline. The project proposes to sawcut the super structures of SEP 040 and 041 to expose the tanks to open air, and to cover those tanks with covers, and install a new odor control system. The project would also include the following: 1. replace and relocate utility lines; 2. Demolish, relocate, or provide an enclosure for exposed equipment (backup air compressor system, hydraulic power unit); 3. Replace electrical conduits and consolidate control centers; and, 4. Relocate outdoor storage areas.	September 2024 - September 2026 or 2027 weather dependent
	SEP HVAC and Mechanical Upgrades (SFPUC)	The SFPUC proposes to repair and replace various HVAC equipment and mechanical systems at the Southeast Plant.	December 2022 - Winter 2025
	SEP 545 Electrical Controls Upgrade (SFPUC)	The project would conduct electrical service upgrades and repairs to existing facility valve controls adjacent to the Southeast Plant, Bruce Flynn Pump Station, and Booster Pump Station (adjacent to Islais Creek) to maintain permit compliance and support operational reliability and resilience. Key project scope includes selective demolition of the existing and installation of new power feeders and	Spring 2023 - Fall 2024

Project No. in FEIR	Project Name (Project Sponsor)	Project Description	Construction Dates
		fiber optic cable between Bruce Flynn Pump Station through the new and existing duct bank to the valve vault and existing pull box; new control panel; new automatic transfer switch, input/output unit; pump station ventilation; bollards; associated conduit and wiring, miscellaneous site and vault upgrades as required.	
	1399 Marin Transit Service Operations and Maintenance Plan (SFMTA)[10]	The existing diesel hybrid fleet of approximately 88 buses will be moved from the Kirkland Transit Facility near Fisherman's Wharf to operate from the Islais Creek Transit Facility located at 1301 Cesar Chavez Street, with bus storage and repair-level maintenance occurring at the 1399 Marin facility, located across Indiana Avenue from Islais Creek facility site. Minimal improvements to the site (replacement or upgraded fencing, improved yard lighting, which likely will include some minor trenching and spot repavement of the surface yard area) are planned. No improvements are planned for the interior of the building on site.	Spring - Winter 2025
	Operations, Engineering and Maintenance Buildings (SFPUC)	SFPUC proposes to modify the approved Biosolids Digester Facilities Project to construct the Operations, Engineering and Maintenance Buildings (SEP-7) instead of Maintenance Buildings 1 and 2. The project would include demolition of SEP 850 and trailers at SEP 850. Demolition of SEP 850 includes boiler that serves SEP 930, requiring installation of local hot water solution for SEP 930. The project would replace SEP 850 and the adjacent parking lot at Jerrold and Phelps, an area just under one acre, with two new buildings, SEP 603 and SEP 914. Building SEP 603 would be a single story, 9,800 square foot, Mechanical Maintenance building for crews 402, 402, and 404 shops. Building SEP 914 would be a two-story, 28,250 square foot building, consisting of shops for Painters, Carpenters and Plumber on the ground floor and shower and locker facilities on the second floor.	February 2025 - September 2027
	Additional Newcomb Yard Improvements (SFPUC)	This program will fund interim improvements at CDD Headquarters at 1990 Newcomb Avenue that are required to address health and safety concerns and to renovate existing facilities to accommodate the division's staffing needs while a new SFWD Headquarters at 2000 Marin is designed and constructed. Interim improvements include: re-roofing the Administration, Shops and Warehouse Building; Emergency Communication Facilities at Newcomb Yard and Lake Merced Pump Station; developing approximately 4,000 square feet of new office space; renovating the Shops Building mechanical systems;	2025 - 2027

Project No. in FEIR	Project Name (Project Sponsor)	Project Description	Construction Dates
		developing Incident Command Structure facilities; developing access control systems; and street and sidewalk improvements.	
	Islais Creek Bridge Project (San Francisco Public Works)[11]	The City and County of San Francisco is proposing to replace the existing Islais Creek Bridge along Third Street in San Francisco's Bayview neighborhood. Construction of the proposed project would result in the replacement of the existing drawbridge with a fixed bridge and large ships would no longer be able access the Islais Creek channel west of the new bridge. Throughout the construction duration, there would be no access for vehicles, the T-Third Street light rail service, or pedestrians to the bridge or Third Street between Marin Street to the north and Cargo Way to the south. Vehicles would be detoured around the site to other routes. T-Third Street passengers would use bus shuttles in lieu of light rail service south of Islais Creek Bridge and the 15 Bayview Hunters Point Express and 91 Third Street/19th Avenue OWL buses would be detoured around the project site.	Spring 2026 -Spring 2028
	Bayview Train Caltrain Station (SFCTA)[12]	The San Francisco County Transportation Authority is proposing a new Caltrain Station in the Bayview community at either Oakdale (Quint Street between Oakdale and Jerrold avenues) or Evans Avenue (between Selby and Rankin streets).	Unknown

NOTES

Projects with numbers were included in the FEIR Cumulative Projects List, with locations shown on FEIR 4.1-1. Projects completed since the FEIR have been removed from the cumulative list. Projects with no numbers are new projects.

APPENDIX B
AIR QUALITY HEALTH RISK ASSESSMENT UPDATE

AIR QUALITY MEMO

Date: **April 10, 2024**

To: **Kimberly Stern, SFPUC**
Karen Lancelle, ESA
Josh Pollak, San Francisco Environmental Planning

From: **Rei Zhang**
Michael Keinath, PE

Subject: **AIR QUALITY HEALTH RISK ASSESSMENT UPDATE FOR POTENTIAL MODIFICATION TO THE FUTURE END-USE OF DIGESTER GAS AT THE SOUTHEAST PLANT BIOSOLIDS DIGESTER FACILTY PROJECT IN SAN FRANCISCO, CALIFORNIA**

As part of the environmental review effort in 2017, Ramboll conducted California Environmental Quality Act (CEQA) analyses of greenhouse gases (GHGs), criteria air pollutants (CAPs) and precursors, as well as a health risk assessment (HRA) based on exposure to toxic air contaminants (TACs), associated with the construction and operation of the San Francisco Public Utilities Commission's (SFPUC) Southeast Plant (SEP) Biosolids Digester Facility Project (BDFP or "the Project"). Analysis methodology and results were documented in an Air Quality Technical Report (AQTR), which was incorporated into the Final Environmental Impact Report (FEIR).[1,2]

In the FEIR design previously analyzed by Ramboll, the Project included the construction of energy recovery facilities, in which boilers, gas turbines, and microturbines would convert the SEP's generated digester gas to heat, steam, and electricity to operate SEP facilities. Since the certification of the FEIR, SFPUC is considering a modification to the end-use of the digester gas instead of energy recovery, which is to convert the gas to pipeline-quality renewable natural gas (RNG, also referred to as biomethane) for injection into PG&E's existing natural gas pipeline at Quint Street. Instead of constructing and operating the energy recovery components described in FEIR section 2.4.1.5, the SFPUC would construct a biogas upgrade facility where the digester gas would be converted to RNG, a deoxygenation facility, a PG&E Interconnection Facility where the RNG quality would be tested, and various pipelines connecting these facilities and them to the existing PG&E natural gas pipeline. These facilities are referred to collectively as the biogas utilization system.

The San Francisco Planning Department and SFPUC have requested an air quality analysis of this proposed modification analyzing changes to criteria air pollutant, toxic air contaminant and greenhouse gas emissions and resulting health risks. This technical memorandum presents a summary of the methodology and results, noting any details not included in the AQTR and FEIR. Tables and Figures were updated from the AQTR for the proposed modification; however, table numbering was

[1] Ramboll. 2017. Air Quality Technical Report. March. Available upon request.
[2] City and County of San Francisco. 2017. Biosolids Digester Facilities Project. May. Available at: https://ceqanet.opr.ca.gov/2015062073/2

preserved for ease of direct comparison to the AQTR.[3] Ramboll is providing this analysis of the proposed modification to support the San Francisco Planning Department's CEQA review of the modified project.

OVERVIEW OF PROPOSED CHANGES

There are several differences between the Project analyzed in the FEIR and the proposed modification. Compared to the FEIR, this proposed modification would result in less construction activity, both temporally and materially, because fewer and less substantive structures would be built in less time (see **Attachment 1**). In the FEIR, a majority of the digester gas was analyzed as being combusted on-site by the digesters, the energy recovery system turbines and boilers, flares, and other associated facilities. In the proposed modification, a majority of the digester gas would be exported off-site as RNG and the balance would be combusted on-site by the digesters, boilers, flares, and other associated facilities. Lastly, compared to the FEIR, the proposed modification's operational emission sources would be located further from residences.

IMPACTS FROM CHANGES IN CONSTRUCTION EMISSIONS

As discussed in the FEIR, construction off-road equipment, on-road vehicles, and paving and off-gassing result in the emissions of criteria air pollutants and greenhouse gases that impact air quality.

We calculated actual CAP emissions for the first two years of construction of the Project based on off-road equipment data provided by the construction contractors, which was collected and reported to demonstrate compliance with the FEIR mitigation measures, for two previously approved modifications.[4] For this analysis, we calculated actual CAP emissions for the third year of construction. Emissions of CAPs based on actual construction activity are shown in **Table A1a-c** of this report for Year 1-3, respectively. Compared to the FEIR, the emissions of all CAPs have decreased from the estimates for construction Years 1-3; this decrease is due to actual equipment use (i.e., hours of operation) being less than estimated at the time of the FEIR. Accordingly, GHG emissions from construction would reasonably be expected to decrease as well.

Construction impacts are directly correlated with ROG (reactive organic gases) that affects Acute Hazard Index, PM_{10} (particulate matter less than 10 microns) as diesel particulate matter affects Cancer Risk and Chronic non-Cancer Hazard Index, and $PM_{2.5}$. Since the construction emissions of all of the CAPs, including ROG, have decreased from those estimated in the FEIR for Years 1 through 3, and the proposed modification would result in less construction activity than if the energy recovery facilities were built and thus fewer emissions, the health impacts associated with construction of the proposed modification would reasonably be expected to decrease as well. Additionally, the initial years of construction tend to have the highest health impacts due to the exposure parameters relative to the age of sensitive receptors evaluated; therefore, reductions in these early years of construction would be expected to also disproportionally reduce risk. Therefore, Ramboll did not re-quantify the health risk impacts of construction of the modified Project as part of this analysis.

[3] Although the same existing facilities would be decommissioned with the proposed modification, the magnitude of their reduction on health impacts appears different because the project's MEISR changes with the proposed modification such that the values in the original and updated AQTR tables vary (not because of difference in activity, only because that activity is being reported at a different location).
[4] MPM-09 and MPM-13.

IMPACTS TO HEALTH RISK FROM CHANGES IN OPERATIONAL EMISSIONS

Methodology and Emissions

Operational CAP emissions with the proposed modification were estimated by the Biosolids Digester Facilities Project Consultant Team.[5] That team analyzed several operating scenarios for the new biogas utilization system. The most conservative operating scenario analyzed for emissions assumes that 70% of the digester gas would be converted to RNG for export (injection into the PG&E pipeline) while the remaining 30% of digester gas would be combusted on-site by flaring.[6] In reality, the SFPUC expects that 90% or more of the digester gas would be converted to RNG and that less than 10% would be flared; however, as 70:30 is the worst-case typical operating scenario, it is the basis for updating the operational CAP emissions and this update to health risk impacts during operations.

Ramboll re-modeled the Project operational sources at their modified locations and the existing sources at the facility. The modified locations of the Project stationary sources were provided by the SFPUC.[7] Updated **Figure 3** shows the modeled locations of the operational emissions sources, which include the flares, boilers, biogas upgrade facility, and solids odor control stack. Each stationary source was modeled as a point source, with various stack heights, temperatures, velocities, and diameters. Updated modeling parameters are shown in Updated **Table E-3**. The Project operational source parameters were provided by the BDFP consultant design team.

Ramboll evaluated excess lifetime cancer risks, $PM_{2.5}$ concentrations, and chronic and acute non-cancer health effects for Project stationary operational sources of emissions with the proposed modification. In the AQTR, operation-only risks are characterized by Scenario 2, and this is the scenario updated in this analysis for this proposed modification. Exposure assumptions for this update were consistent with AQTR Scenario 2, for risk to a resident with a 30-year exposure commencing at the time of Project operations. Cancer and non-cancer risks were calculated using the California Air Resources Board's Hot Spots Analysis & Reporting Program Air Dispersion Modeling and Risk Tool (HARP), following Bay Area Air Quality Management District (BAAQMD) 2023 CEQA guidelines and 2015 OEHHA Hot Spots Guidance.

For all TACs, Ramboll used toxicity values consistent with OEHHA-approved values found in the HARP Air Dispersion Modeling and Risk Tool (CARB 2023), shown in updated **Table 20c** for the updated TAC emissions from the modified operational sources provided by the BDFP Consultant Team.

Results

Operational Emissions

Updated **Table 12c** shows the updated Project CAP emissions for the worst-case operating scenario with the proposed modification. Compared to the Project as analyzed in the FEIR at full operation in 2045, the proposed modification would slightly increase operational emissions of ROG, PM_{10}, and $PM_{2.5}$ and decrease NOx emissions. These changes in operational CAP emissions are due to changes in

[5] Brown and Caldwell, CH2M, Black & Veatch (Biosolids Digester Facilities Project Consultant Team). 2021. Bay Area Air Quality Management District Authority to Construct/Permit to Operate Application for the Biosolids Digester Facilities Project. May.

[6] The worst-case operating scenario analyzed by the Biosolids Digester Facilities Project Consultant Team is identified as Operating Scenario 3 in the Bay Area Air Quality Management District Authority to Construct/Permit to Operate Application.

[7] The location of the biogas upgrade facility in the BAAQMD to Construct/Permit to Operate Application is out of date. The SFPUC provided the location of this proposed facility on a site plan. It would be located at the former location of Maintenance Shops 2 Building that was previously removed from the project in MPM-10. This is where we modeled this facility in the update.

equipment (namely, the removal of the proposed turbines and increase in boiler and flaring operations), as well as differing amounts and composition of the gas combusted between the FEIR scenario and the proposed modification. The FEIR compares the net Project operational CAP emissions to the CEQA significance thresholds, which are calculated as the Project's operational CAP emissions from new Project facilities minus existing emissions from existing facilities that would be decommissioned. Net operational CAP emissions from the Project with the proposed modification are shown in updated **Table 14.**

Updated **Table 13c** shows the updated Project GHG emissions, and updated **Table 15** shows the net operational GHG emissions. Changes in GHG emissions are also due to the changes in equipment (namely, the removal of the proposed turbines and increase in boiler and flaring operations), as well as differing amounts and composition of the gas combusted between the FEIR scenario and the proposed modification. Compared to the Project's full operations as analyzed in the FEIR, biogenic emissions have decreased, non-biogenic emissions have increased, and total project GHG emissions have decreased slightly, without accounting for any GHG reductions from RNG production.[8] RNG produced by the BDFP will be injected into the PG&E's natural gas pipeline. By making this renewable natural gas available to customers, the RNG injection will thus replace and avert potential emissions from burning fossil-fuel-derived natural gas. This calculation assumes only 70% of the digester gas is converted to RNG and exported off site (worst-case); in reality, more RNG is expected to be produced and injected into the pipeline. The modified project's total GHG emissions would be further reduced to 19,805 MT/year when accounting for averted emissions. The total net increase from the baseline 2014 existing conditions in non-biogenic emissions from the modified project, including averted emissions, would be approximately 5,005 MT CO_2e (metric tons of carbon dioxide equivalent)/year.

The differing amounts and composition of the gas combusted would result in different speciation and quantities of TACs between the FEIR scenario and the proposed modification. TAC emissions for the worst-case operating scenario are shown in updated **Table 16b.** Ramboll compared the existing operational TAC emissions to the proposed modification TAC emissions. While the overall TAC emissions would increase post-Project with the proposed modification, the emissions of the highest contributors to cancer risk would remain comparable or decrease compared to the existing operations.

Health Risks

Modified Project Operational Impacts

Long-term health impacts (cancer risk, chronic HI, and $PM_{2.5}$ concentrations) are evaluated at sensitive receptors (residences, schools, daycares, etc.), and the maximum impact for each is called the maximally exposed individual sensitive receptor (MEISR). The MEISR can vary for the different health endpoints (e.g., cancer risk, chronic HI). Short-term health impacts (acute HI) are evaluated for all receptors (not just sensitive receptors) since it is based on a one-hour exposure; the location of maximum impact is referred to as the MEI. Ramboll updated the health risk assessment to identify the MEISR and MEI locations for the proposed modification.

The updated Project MEISR due to changes in project operation (i.e., updated AQTR Scenario 2) was identified as the sensitive receptor location of the maximum net risk, which is calculated as the modified Project's cancer risks minus the adjusted existing SEP operational risk of sources planned for

[8] CO_2 emissions from biogas combustion in the flares and thermal oxidizer are considered biogenic emissions by the California Air Resources Board; however, the CH_4 and N_2O emissions from these sources are considered non-biogenic emissions. Additionally, biomethane (RNG) and biogas emissions from wastewater treatment facilities are exempt from compliance requirements under of the State's Cap-and-Trade Regulation, per Section 95852.2(a)(8)(B).

removal. As shown in updated **Figure 6**, with the proposed modification, this sensitive receptor would be located far from the project boundary, which is emblematic of a net reduction in excess cancer risk (i.e., there is a greater impact from removal of existing SEP operational sources than introduction of new sources as part of the proposed Project). Accounting for the removal of the existing equipment, the sensitive receptors with the largest reductions in net cancer risk would be those located the closest to the project. A breakdown of excess lifetime cancer risk at the updated MEISR from each stationary source for operations at their modified locations is shown in updated **Table 22**. The AQTR net Project cancer risk at the MEISR with the energy recovery system was 0.022 in a million, whereas it would be -0.009 for the modified Project.[9] The proposed modification operations would thus represent a reduction in operational cancer risk.

The AQTR total and net $PM_{2.5}$ concentration at the MEISR with the energy recovery system was 0.39 $\mu g/m^3$ and 0.090 $\mu g/m^3$, respectively. The Project and net total Project $PM_{2.5}$ concentration at the off-site MEISR location for modified Project operations was calculated as 0.37 $\mu g/m^3$ and 0.17 $\mu g/m^3$, respectively, as shown in updated **Table 24**. The net total $PM_{2.5}$ concentration was calculated by subtracting the $PM_{2.5}$ concentration from the Project's stationary sources that would be replaced by the new Project facilities. The net total $PM_{2.5}$ concentration for the proposed modification would thus increase.

The chronic HI at the off-site MEISR associated with modified Project operations would be 0.015, compared to the value of 0.0067 in the AQTR. The acute HI associated with the proposed modification at the MEI would be 0.22, compared to a value of 0.083 presented in the AQTR. The updated information is shown in updated **Table 24**. Overall TAC emissions have increased for the proposed modified operations; however, distances from sources to residences have also increased, leading to only a slight increase in chronic HI. Acute hazards have experienced the largest relative increases, as acute HI accounts for maximum one-hour exposure and is assessed at any receptor location.

Cumulative Impacts with Modified Project

The cumulative analysis estimates excess lifetime cancer risks and $PM_{2.5}$ concentrations that are attributable to other mobile and stationary sources within the Project vicinity, in addition to impacts from the Project. The cumulative sources analyzed remained consistent with the AQTR, and consist of additional projects in the surrounding area that will be under construction during the construction and

[9] The MEISR analyzed in the AQTR and the MEISR for the proposed modification analyzed here are not at the same location due to changes in source locations; however, it is conservative to compare maximally exposed individuals.

operation of the BDFP,[10] as well as an update of the background risks from the health risks database from the 2020 San Francisco Citywide HRA.[11,12]

The lifetime excess cancer risk from each cumulative source, as well as from modified Project operations, was summarized and summed together to get cumulative risk in the updated **Table 26**. The estimated excess lifetime cancer risk from operational emissions for a resident at the off-site MEISR location with the proposed modification using the Citywide HRA would be 57 in a million, compared to 10 in a million in the AQTR using the CRRP-HRA. This increase is due to the change in MEISR locations due to the change in the location of emissions sources, as well as the difference in background risk from the Citywide HRA (used for this analysis) and the CRRP-HRA (used in the FEIR and AQTR). For comparison purposes, the background risk at the new MEISR would have been 16 in a million if the CRRP-HRA that was used for the AQTR was used for this analysis, instead of 57 million using the updated Citywide HRA. The background risk at the MEISR for the AQTR would have been 19 in a million using the updated 2020 Citywide HRA instead of 10 in a million using the 2014 CRRP-HRA (and presented in the AQTR). In other words, the increase in cumulative impacts with the proposed modifications is attributable to the increase in background risk in San Francisco since the FEIR and AQTR, not just the project modifications alone.

The cumulative $PM_{2.5}$ concentrations are presented in updated **Table 27**; the $PM_{2.5}$ concentration at the off-site MEISR with the proposed modification with the updated Citywide HRA would be 8.7 $\mu g/m^3$ during the operational period, a slight decrease from 9.0 $\mu g/m^3$ assessed in the AQTR.

The cumulative chronic HI and acute HI are shown in updated **Table 28** and **Table 29**, respectively. The cumulative chronic HI would be 0.019 for the modified Project operations. As shown in updated **Table 29**, there are no acute health impacts included in the CRRP-HRA and the original analysis and this update do not estimate acute health impacts from other on- and off-site cumulative projects. Therefore, the cumulative acute HI is equal to the Project acute HI or 0.22. Both cumulative chronic and acute HI would slightly increase from the 0.0087 chronic HI and 0.083 acute HI in the AQTR.

Locations of all MEISRs and MEIRs discussed above are shown in updated **Figure 6**.[13] The MEISR for excess cancer risk due to the project modification is the sensitive receptor with the highest risk over a 30-year exposure time. The MEISR for Chronic HI and $PM_{2.5}$ concentrations is the sensitive receptor with the maximum annual average hazard index or concentration, respectively. The MEI for acute HI is the location where the maximum one-hour exposure occurs. Because of the different exposure

---

[10] As originally proposed in the FEIR, two new buildings (Maintenance Shops 1 and 2) were included to support operations and maintenance. Instead of Maintenance Shops 1 and 2, the SFPUC proposes to modify the approved BDFP to construct the SEP trades and maintenance buildings (designated as "SEP-7"), which would be located southeast of the approved Maintenance Shops 1 and 2 location and adjacent to but outside of the BDFP project site evaluated in the FEIR. SEP-7, separate to the biogas upgrading system addressed in this memo, is currently under development and also subject to review by the SF Planning Department.

[11] The San Francisco Planning Department evaluated citywide the cumulative cancer risks and $PM_{2.5}$ concentrations from existing known sources of air pollution in 2014 as part of the development of a Community Risk Reduction Plan (CRRP) and corresponding HRA database (CRRP-HRA) and this was used in the AQTR. Since the certification of the FEIR with the AQTR in 2018, the cumulative health risks were re-evaluated and the Citywide HRA was updated in 2020, supplanting the former CRRP-HRA. As requested by the SF Planning Department, this analysis uses the updated Citywide HRA for the cumulative risk assessment.

[12] San Francisco Department of Public Health (SFDPH), San Francisco Planning Department, and Ramboll. 2020. San Francisco Citywide Health Risk Assessment: Technical Support Documentation.

[13] The updated Project Cancer Risk MEISR due to operational emissions (AQTR Scenario 2 update) is located further away from the Project than the other identified MEISRs as the Project cancer risk is net negative. As the MEISR is determined based on the maximum net risk (Project minus existing), the sensitive receptors closer to the site have higher relative existing risk and therefore lower net risk. As the Project cancer risk is net negative, it is not shown in Figure 6.

periods and the various locations of different sources of emissions that go into each of these impacts, the location of the MEISR and MEI are not always coincident.

SUMMARY

Table 1 below summarizes actual Years 1 through 3 construction CAP emissions. Construction CAP emissions and, in turn construction GHG emissions, have decreased compared to the FEIR. As the proposed modification would require less construction activity because fewer and less substantive structures would be built than for the energy recovery system, it would result in fewer emissions. Construction impacts are directly correlated with ROG that affects Acute Hazard Index, PM_{10} as diesel particulate matter affects Cancer Risk and Chronic Non-Cancer Hazard Index, and $PM_{2.5}$. Since construction emissions would decrease from those studied in the AQTR, the health impacts from construction of the proposed modification would reasonably be expected to decrease.

Table 1: Actual Construction Criteria Air Pollutant Emissions Years 1 - 3

Criteria Air Pollutant Average Daily Emissions (lbs/day)	Year 1 (2020)		Year 2 (2021)		Year 3 (2022)		FEIR CEQA Threshold (lb/day)
	AQTR Controlled[1]	Actual Controlled[2]	AQTR Controlled[1]	Actual Controlled[2]	AQTR Controlled[1]	Actual Controlled[2]	
ROG	8.7	3.5	10	4.2	10	3.1	54
NOx	**72**	**54.2**	45	37	**55**	30	54
PM_{10}	0.7	0.3	0.7	0.3	0.63	0.14	82
$PM_{2.5}$	0.7	0.3	0.6	0.3	0.63	0.13	54

[1] Source: AQTR Table 4c.
[2] Source: See tables A1a – A1c of this report.
Bold indicates CEQA threshold exceedance. Emissions rounded to nearest whole number for comparison to FEIR CEQA threshold.

Table 2a-2b summarize the worst-case operating scenario of the biogas upgrade facility. Compared to the FEIR, operational CAP emissions of ROG, PM_{10}, and $PM_{2.5}$ would increase while NOx emissions would decrease with the proposed modification. However, all net operational CAP emissions would remain below the CEQA thresholds in the FEIR. As the modified project's net operational criteria pollutant emissions would not exceed CEQA thresholds, the modified project also would not result in a cumulatively considerable contribution to regional air quality impact.

Table 2a: Net Operational Criteria Air Pollutant Emissions with the Proposed Modification

Approach	Annual Emissions (Tons/Year)			
	ROG	NO_x	PM_{10}	$PM_{2.5}$
Existing (2014) Total[1]	5.0	22	1.7	1.7
FEIR/AQTR Scenario 2 - Full Operation (2045) Impacts (Net Change from Existing)[1]	-4.3	2.6	2.9	2.9
Modified Project Operating Scenario, Full Operation (2045) Impacts (Net Change from Existing)[2]	-2.9	-3.2	3.8	3.8
Modified Project Emissions Above Threshold?	No	No	No	No

[1] Sourced from the FEIR.
[2] Source is Brown and Caldwell. The operating scenario analyzed is 70% of the biogas being converted to RNG with 8.3% methane in the tail gas and 30% of the biogas flared on site (Operations Scenario 3 in the BAAQMD permit application). In reality, the SFPUC expects that 90% or more of the digester gas would be converted to RNG and only 10% would be flared.

Compared to the FEIR, the total net increase from the baseline 2014 existing conditions in non-biogenic emissions from the modified project, including averted emissions, would be approximately 5,005 MT CO_2e/year. However, net operational non-biogenic GHG emissions for the modified project would remain below the CEQA thresholds in the FEIR.[14]

Table 2b: Net Operational Greenhouse Gas Emissions with the Proposed Modification

Approach	Annual Non-Biogenic GHG Emissions (MT CO_2e/Year)
Existing (2014) Total[1]	234
FEIR/AQTR Scenario 2 - Full Operation (2045) Impacts (Net Change from Existing)[1]	-27
Modified Project Operating Scenario, Full Operation (2045) Impacts (Net Change from Existing)[2]	5,005
Modified Project Emissions Above Threshold?	No

[1] Sourced from the FEIR.
[2] Biomethane produced by the BDFP will be injected into the PG&E's natural gas pipeline. By making this renewable natural gas available to customers, the biomethane injection will thus avert potential emissions from burning fossil-fuel-derived natural gas.

[14] The FEIR evaluated the project's net changes in non-biogenic GHG emissions in comparison to the BAAQMD's GHG significance thresholds, which is 10,000 MTCO_2e per year for a stationary source.

Table 3 summarizes the health risk impacts of the operation of the Modified Project, and **Table 4** summarizes the cumulative health impacts of the proposed modification. Some risks would increase slightly while others would decrease. However, all risks would remain below the FEIR CEQA thresholds.

Table 3. Operational Health Risk Impacts with the Proposed Modification

Source	Excess Cancer Risk (in a million) from Operations	$PM_{2.5}$ Concentration from Operations (ug/m^3)	Chronic Non-Cancer Hazard Index from Operations (unitless)	Acute Hazard Index from Operations (unitless)
FEIR/AQTR Maximum Impact Value (Scenario 2 – operations only)	0.022	0.09	0.0067	0.083
Modified Project Operation Maximum Impact	-0.009	0.17	0.015	0.22
CEQA Threshold	7.0	0.2	1.0	1.0
Modified Project Risks Above Threshold?	N[1]	N	N	N

[1]In the AQTR, the MEISR worst-case value for excess cancer risk was <0.1 to 1.7 per million, well below the CEQA threshold. The excess cancer risk threshold of 7.0 per million is inclusive of emissions from construction and operation. Given the proposed modification would have decreased construction related and operational cancer risk, it is reasonable to conclude that the Project's combined excess cancer risk would still be below the CEQA thresholds even though construction risk was not re-quantified.

Table 4. Cumulative Operational Health Risk Impacts with the Proposed Modification, Cumulative Projects and 2020 Updated Citywide Health Risk Assessment[1]

Source	Excess Cancer Risk (in a million) from Operations	$PM_{2.5}$ Concentration from Operations (ug/m^3)	Chronic Non-Cancer Hazard Index from Operations (unitless)
AQTR Maximum Impact Value with Background using the CRRP-HRA[2] (Scenario 2 – operations only)	10	9.0	0.0087
Modified Project Operation Maximum Impact with Background using the updated Citywide HRA	57	8.7	0.019
Cumulative CEQA Threshold	90	9.0	10.0
Modified Project Risks Above Threshold?	N	N	N

[1] As discussed in the FEIR and AQTR, Acute Non-Cancer Hazard is not assessed as a cumulative impact. Cumulative impacts include risks from nearby stationary sources, major roadways, and SFPUC-sponsored projects, consistent with the AQTR and FEIR. Since the publication of the FEIR, the Gateway Draft EIR has been published; as discussed with SF Planning, operational chronic HI and $PM_{2.5}$ concentration from the Gateway project were included in the cumulative analysis.[15] Operational cancer risks were not included due to the distance between the Gateway MEIR and the modified project MEIR.

[2] "CRRP-HRA" refers to the Community Risk Reduction Plan (CRRP) and corresponding background HRA database (CRRP-HRA). "Citywide HRA" refers to the background risks updated in 2020. Refer to footnote 11 above regarding these two sources.

CLOSING

The analysis presented above provides updated construction CAP emissions analysis, operational CAP emissions, operational GHG emissions, and health risks that would occur from the Project with the proposed modification. The proposed modification would not result in any change in significance determinations of the FEIR. As discussed, this update conservatively analyses the worst-case operating scenario of the proposed biogas upgrade facility, such that in reality, emissions would be expected to be lower. It also includes the use of the Citywide HRA updated in 2020 for the cumulative health risk assessment. Citywide background health risk has increased since the FEIR (and AQTR), contributing to the increase in cumulative effects.

ATTACHMENT 1
FACILITY DETAILS

Attachment 1 - Modified Project Revisions to Facilities

Facility	Location	Approximate Area and Excavation Depth	Height and Diameter	Piles
Remove				
Digester Gas Storage tank	North of Jerrold	2,827 sq. ft (0.06 acre) by 15 feet deep	60 foot tall by 60 foot diameter tank	38 piles: 3 foot diameter by 60 feet deep
Energy Recovery Building (turbines, boilers, 1.5MW emergency generator)	South of Jerrold	21,000 sq. ft. (0.48 acre) by 5 feet deep	57 foot tall building, 75 foot tall by 4 foot diameter vent stack for turbine	185 piles: 3 foot diameter by 60 feet deep
Digester Treatment Facility	South of Jerrold	8,568 sq. ft. (0.2 acre) by 5 feet deep	12’ tall by 10’ dia. outside tanks and vessels (11)	75 piles: 4 foot diameter by 60 feet deep
Digester Gas Line[1]	Under Jerrold, North and South of Jerrold	1440 sq. ft. (0.03 acre) [96 feet long by 15 inches wide] by 15 feet deep	N/A	9 piles: 4 foot diameter by 60 feet deep
Pipe Chase under Jerrold from Digester Gas Storage Tank to Energy Recovery Building	Under Jerrold	1440 sq. ft. (0.03 acre) [247 feet long by 18 inches wide by 12 feet deep	N/A	24 piles: 4 foot diameter by 60 feet deep

1 The portion of the originally approved digester gas line west of Jerrold would still be built to convey gas from the new digesters to the added biogas upgrade facility.

Facility	Location	Approximate Area and Excavation Depth	Height and Diameter	Piles
Add[2]				
Biogas Upgrade Facility with thermal oxidizer	North of Jerrold – replaces originally approved Maintenance Shops	9,984 sq. ft. (0.23 acre) by 2 to 8 feet[3]	15 feet to 45 feet tall outside piping and tanks, various diameters[4]	To be determined[5] Either none or up to 52 piles, 3 foot diameter by 60 feet deep
PG&E Interconnection Station and Deoxygenation System	South of Jerrold - replaces originally approved Digester Treatment Facility	15,000 sq. ft. (0.34 acre) by 2 feet	15 feet tall	None
Pipes from Biogas Upgrade Facility to PG&E Interconnection Station	Under Jerrold	940 sq. ft. (0.02 acre) [235 feet long by 4 feet wide] by 6 feet deep	N/A	None
Pipe from PG&E Interconnection Station to existing PG&E natural gas pipeline	Under Quint	35 sq. ft. (0.001 acre) [14' long by 2.5 feet wide] by 6 feet deep	N/A	None
NET		**Less 12,326 sq. ft. (0.3 acres)** **Less 5,538 cubic yards excavated**		**279 to 331 fewer piles**

[2] The exact dimensions of new facilities are to be determined upon completion of final design; the information in this table represents the range of facility dimensions.

[3] A range in excavation depth is provided because the new tanks and piping could either be on a shallow concrete pad with piles or a deeper concrete pad with no piles.

4 A range in height is provided because the new tanks and piping could either be shorter and more spread out or taller and more confined.

5 Piles may or may not be needed depending on the final design of the concrete pad foundation.

TABLES

Table A1a
Actual Emissions Summary for Year 1[1]
SFPUC Biosolids Digester Facilities Project
San Francisco, California

On-Road Vehicle Emissions[2] (lbs)	551	10,355	28	27	536	10,066	30	29	-15	-289	2	2
Paving and Off-Gassing[3] (lbs)	9.6	--	--	--	9.6	--	--	--	No change from EIR assumptions; therefore, no change in emissions.			
Total Emissions (lbs)	**2,274**	**18,625**	**176**	**174**	**920**	**14,099**	**72**	**71**	**-1,354**	**-4,526**	**-104**	**-104**
Average Daily Emissions[4] (lbs/day)	8.7	72	0.7	0.7	3.5	54.2	0.3	0.3	-5.2	-17	-0.4	-0.4
BAAQMD Significance Threshold (lbs/day)	54	54	82	54	54	54	82	54	--	--	--	--
Exceeds Threshold (Y/N)	N	Y	N	N	N	Y	N	N	--	--	--	--
Excess Emissions (lbs/day)	--	18	--	--	--	0.2	--	--	--	-17	--	--
Excess Emissions Requiring Offsets[5] (tons/year)	--	2.3	--	--	--	0.0	--	--	--	-2.3	--	--

Notes:

1. Actual Year 1 emissions for off-road based on data provided by the Project's construction contractors for 2020. These emissions reflect the use of renewable diesel in off-road equipment based on the Environmental Impact Report (EIR) assumptions. These emissions were previously provided to San Francisco Envrionmental Planning in MPM-9.

2. Actual Year 1 emissions for on-road reflect the control measure that 80% of haul trucks are engine model year 2012 or newer with no renewable diesel. This varies from the control measure in the EIR that equipment be 2010 or newer with renewable diesel. This alternative control measure was approved by San Francisco Environmental Planning (Johnston, 9-30-20).

3. Paving and off-gassing emissions taken from EIR "Mitigated Scenario" without modification.

4. Average Daily Emissions calculated using the same method as the FEIR as:
([Year 1 Offroad Equipment Emissions] + [EIR Year 1 Onroad Emissions]) / 260 days/year

5. Excess emissions calculated as:
([Average Daily Emissions] - [BAAQMD Significance Threshold]) * 260 days/year * 1 ton/2000 lbs

Table A1b
Actual Emissions Summary for Year 2[1]
SFPUC Biosolids Digester Facilities Project
San Francisco, California

Notes:

1. Actual Year 3 emissions for off-road based on data provided by the Project's construction contractors for 2022. These emissions reflect the use of renewable diesel in off-road equipment based on the Environmental Impact Report (EIR) assumptions.

2. Actual Year 3 emissions for on-road reflect the control measure that 80% of haul trucks are engine model year 2012 or newer with no renewable diesel. This varies from the control measure in the EIR that equipment be 2010 or newer with renewable diesel. This alternative control measure was approved by San Francisco Environmental Planning (Johnston, 9-30-20).

3. Paving and off-gassing emissions taken from EIR "Mitigated Scenario" without modification.

4. Average Daily Emissions calculated using the same method as the FEIR as:
([Year 3 Offroad Equipment Emissions] + [EIR Year 3 Onroad Emissions]) / 260 days/year

5. Excess emissions calculated as:
([Average Daily Emissions] - [BAAQMD Significance Threshold]) * 260 days/year * 1 ton/2000 lbs

6. Prepared by Ramboll on January 26, 2024.

Updated AQTR Table 12c
Project Operational CAP Emissions for Worst Case Operational Scenario With the Proposed Modification
SFPUC Biosolids Digester Facilities Project
San Francisco, CA

	Hours of Operation per Piece of Equipment[2] (hrs/yr)	Project Emissions[1,2]			
		ROG	NO_X	PM_{10}	$PM_{2.5}$
		(tons/year)			
Steam Boiler 1	8760	0.60	2.3	0.82	0.82
Steam Boiler 2	8760	0.60	2.3	0.82	0.82
Emergency Generator[3]	100	5.5E-04	0.016	6.6E-04	6.6E-04
Standby Enclosed Flare 1	2700	0.30	9.8	2.0	2.0
Worst Case Biogas Upgrading System Abated by a Thermal Oxidizer	6060	0.59	4.4	1.8	1.8
Sludge Handling/Solids Odor Control	8760	0.054	--	--	--
Utility Provided Electricity[4]	8760	--	4.9	--	--
Total Emissions (tons/yr)	-	**2.1**	**24**	**5.5**	**5.5**
Total Emissions (lbs/day)	**-**	**12**	**130**	**30**	**30**

Notes:

1. Operational emissions for the Project with the proposed modification were calculated by the BDFP Consultant Design Team for the Project, with the exception of electricity usage. Emissions from electricity usage was calculated using California's 2022 State Electricity Profile from the Energy Information Administration (EIA).

2. Operational Scenario 3 represents the worst case operational scenario. The worst-case operating scenario analyzed by the Biosolids Digester Facilities Project Consultant Team is identified as Operating Scenario 3 in the Bay Area Air Quality Management District Authority to Construct/Permit to Operate Application. It assumes 70% of the digester gas is converted to renewable natural gas (RNG) and exported off site, 30% of the digester gas is combusted (flared) on-site, and that there is 8.3% methane in the tail gas.
3. Emergency generator emissions were calculated for a 20kW Tier 4 Interim engine, per information from the Project Sponsor. ROG emissions were calculated using NMHC conversion factors from the USEPA Conversion Factors for Hydrocarbon Emission Components document. ROG and VOC can be used interchangeably for CEQA analysis. As per BAAQMD policy, when NMHC+NOx emissions were reported together for the diesel emergency engine, the emissions were calculated as 5% NMHC and 95% NOx.
4. The BDFP is expected to use up to 1.6 MW of PG&E electricity annually.

Abbreviations:

CAP - criteria air pollutants
hrs - hours
lb - pounds
BDFP - Biosolids Digester Facilities Project
EIA - Energy Information Administration
NO_X - nitrogen oxide compounds (NO + NO_2)
PM_{10} - particulate matter less than 10 micrometers
$PM_{2.5}$ - particulate matter less than 2.5 micrometers
ROG - Reactive Organic Gas
SFPUC - San Francisco Public Utilities Commission

Updated AQTR Table 13c
Project Operational GHG Emissions
SFPUC Biosolids Digester Facilities Project
San Francisco, CA

Source or Abatement Device	Hours of Operation per Piece of Equipment[2] (hrs/yr)	Project GHG Emissions[1,2,3,4]
		MT CO_2e/yr
Biogenic GHG Emissions		
Standby Enclosed Flare 1	2,700	7,804
Worst Case Biogas Upgrading System Abated by a Thermal Oxidizer	6,060	6,762
Total Biogenic Emissions for Stationary Sources (MT CO_2e/yr)		**14,566**
Non-Biogenic GHG Emissions		
Steam Boiler 1	8,760	7,332
Steam Boiler 2	8,760	7,332
Standby Enclosed Flare 1	2,700	39
Worst Case Biogas Upgrading System Abated by a Thermal Oxidizer	6,060	34
One Emergency Diesel Engine	50	1.7
Utility Provided Electricity[5]	-	1,309
Total Non-Biogenic Emissions for Stationary Sources (MT CO_2e/yr)		**16,048**
Averted Emissions from Biomethane Sent to PG&E Pipeline[6]	**6060**	**-10,809**

Notes:

1. Operational Scenario 3 represents the worst case operational scenario. The worst-case operating scenario analyzed by the Biosolids Digester Facilities Project Consultant Team is identified as Operating Scenario 3 in the Bay Area Air Quality Management District Authority to Construct/Permit to Operate Application. It assumes 70% of the digester gas is converted to renewable natural gas (RNG) and exported off site to the PG&E pipeline, 30% of the digester gas is combusted (flared) on-site, and that there is 8.3% methane in the tail gas.
2. Hours of operation were estimated by the BDFP Consultant Design Team for the Project. Operational emissions were calculated using the same methodology and emission factors as the FEIR, as shown in the FEIR Appendix D.
3. Global warming potential values of 1 for CO_2, 21 for CH_4, and 310 for N_2O are from 40 CFR Part 98 Table A-1 (2011 version) as referenced in the California Mandatory Reporting Regulation (MRR) were used to convert emissions to metric tones of carbon dioxide equivalents (CO_2e) in accordance with 40 CFR Part 98.2.
4. CO2 emissions from biogas combustion in the flares and thermal oxidizer are considered biogenic emissions by the California Air Resources Board (ARB); however, the CH4 and N2O emissions from these sources are considered non-biogenic emissions. Additionally, biomethane and biogas emissions from wastewater treatment facilities are exempt from compliance requirements under of the Cap-and-Trade Regulation, per Section 95852.2(a)(8)(B).
5. The BDFP is expected to use up to 1.6 MW of PG&E electricity annually.
6. Biomethane produced by the BDFP will be injected into the PG&E's natural gas pipeline. By making this renewable natural gas available to customers, the biomethane injection will thus avert potential emissions from burning fossil-fuel-derived natural gas. This calculation assumes only 70% of the digester gas is converted to RNG and exported off site (worst-case); in reality, more biomethane is expected to be produced and injected into the pipeline.

Updated AQTR Table 13c
Project Operational GHG Emissions
SFPUC Biosolids Digester Facilities Project
San Francisco, CA

Abbreviations:

ARB - California Air Resources Board
BAAQMD - Bay Area Air Quality Management District
BDFP - Biosolids Digester Facilities Project
CFR - Code of Federal Regulation
CH_4 - methane
CO_2 - carbon dioxide
CO_2e - carbon dioxide equivalents
GHG - greenhouse gas
kW - kilowatt
MMBTU - one million British thermal unit
MRR - California Mandatory Reporting Regulation
MT - metric ton
MW - molecular weight
N_2O - nitrogen dioxide
RNG - Renewable Natural Gas
PG&E - Pacific Gas & Electric
scf - standard cubic feet
SFPUC - San Francisco Public Utilities Commission
yr - year

Updated AQTR Table 14
Summary of Net Project Operational CAP Emissions With the Proposed Modification
SFPUC Biosolids Digester Facilities Project
San Francisco, CA

Emissions Scenario		Project Emissions (lbs/day)[1,2]			
		ROG	NO_X	PM_{10}	$PM_{2.5}$[3]
Existing - 2014[4]	**Total**	28	118	9.3	9.3
Modified Project Operation - Worst Case Biogas Upgrading System Abated by a Thermal Oxidizer	**Total**	12	130	30	30
	Net[4]	**-16**	**12**	**21**	**21**

Emissions Scenario		Project Emissions (tons/year)[1,2]			
		ROG	NO_X	PM_{10}	$PM_{2.5}$[3]
Existing - 2014[4]	**Total**	5.0	22	1.7	1.7
Modified Project Operation - Worst Case Biogas Upgrading System Abated by a Thermal Oxidizer	**Total**	2.1	24	5.5	5.5
	Net[4]	**-2.9**	**2.1**	**3.8**	**3.8**

Notes:

1. The existing operational scenario is based on the emissions during the 2014 year of operation of the existing facility. The modified Project Operation represents worst case annual emissions, where 70% of the digester gas is upgraded to renewable natural gas (RNG) and 30% goes to a standby enclosed flare.
2. Hours of operation and operational emissions for the proposed modification were estimated by the BDFP Consultant Team for the Project.
3. Existing emissions are from AQTR Table 9.
4. The net operational emissions shown here are the existing 2014 emissions subtracted from the Project Emissions for each annual scenario.
5. Modified Project Operational emissions are from Updated AQTR Table 12c.

Abbreviations:

CAP - criteria air pollutants
PM_{10} - particulate matter less than 10 micrometers
$PM_{2.5}$ - particulate matter less than 2.5 micrometers
ROG - reactive organic gas
SFPUC - San Francisco Public Utilities Commission
USEPA - United States Environmental Protection Agency

References:

Brown and Caldwell and CH2M and Black & Veatch (BDFP Consultant Design Team). 2021. Bay Area Air Quality Management District Authority to Construct/Permit to Operate Application for the Biosolids Digester Facilities Project. March.

Updated AQTR Table 15
Summary of Net Project Operational GHG Emissions[1]
SFPUC Biosolids Digester Facilities Project
San Francisco, CA

Emissions Type	GHG Emissions ($MT CO_2e/yr$)		
	Existing 2014	**EIR Project Full Operation 2045**	**Modified Project Full Operation**
Total Biogenic Emissions	13,931	31,035	14,566
Total Non-Biogenic Emissions	234	207	16,048
Total Operational Emissions[2]	**14,165**	**31,241**	**30,615**
Averted Emissions from Biomethane Sent to PG&E Pipeline[3]	--	--	-10,809
Net Operational Non-Biogenic Emissions (including Averted Emissions)[4]	**--**	**-27**	**5,005**
Total Operational Emissions (including Averted Emissions)	**14,165**	**31,241**	**19,805**

Notes:

1. The existing operational scenario is based on the emissions during the 2014 year of operation of the existing facility.

2. Hours of operation were estimated by the BDFP Consultant Design Team for the Project. Operational GHG emissions were calculated using the same methodology and emission factors as the FEIR, as shown in the FEIR Appendix D.

3. Global warming potential values of 1 for CO2, 25 for CH4, and 298 for N2O from 40 CFR Part 98 Table A-1 as referenced in the California Mandatory Reporting Regulation (MRR) were used to convert emissions to MT CO2e in accordance with 40 CFR Part 98.2.

2. The total operational emissions are calculated by summing biogenic and non-biogenic emissions.

3. Biomethane produced by the BDFP will be injected into the PG&E's natural gas pipeline. By making this renewable natural gas available to customers, the biomethane injection will thus avert potential emissions from burning fossil-fuel-derived natural gas.

4. The net operational non-biogenic emissions are the existing 2014 non-biogenic emissions subtracted from the Project emissions, and includes averted emissions from biomethane injected into the PG&E pipeline if applicable. For the project evaluated in the EIR, this would be Project emissions minus existing 2014 emissions; for the modified Project, this calculation would be Project emissions minus existing 2014 emissions and accounts for averted emissions.

Abbreviations:

BAAQMD - Bay Area Air Quality Management District
BDFP - Biosolids Digester Facilities Project
CAPCOA - California Air Pollution Control Officers Association
CFR - Code of Federal Regulations
CH_4 - methane
CO_2 - carbon dioxide
CO_2e - carbon dioxide equivalents
GHG - Greenhouse gas
MRR - California Mandatory Reporting Regulation
MT - metric tons (1000 kilograms)
N_2O - nitrogen dioxide
SFPUC - San Francisco Public Utilities Commission
yr - year

	Polycyclic Aromatic Hydrocarbons (as B(a)P equivalent)	1151	3.9	0	0
Emergency Generator	Diesel PM	9901	1.1	5	0

Notes:

1. Values presented in this table reflect values used in this analysis for the proposed modification. If a chemical does not have a cancer potency factor, acute reference level, or chronic reference level, it was not included in the analysis.
2. The cancer potency factors, chronic reference levels, and acute reference levels were obtained from Cal/EPA 2023.
3. The acute effect for DPM is evaluated based on individual constitutes included in the speciation profile for diesel TOG, which is shown in Appendix E.
4. The chemical shown has a cancer potency factor and/or chronic reference level; however, it is not shown here because cancer risk and chronic hazard index are calculated using the cancer potency factor and chronic reference level from DPM instead of the individual chemicals in the speciation profile for diesel on-road and off-road TOG.
5. The value for Benzo(a)pyrene was selected to represent PAHs for this analysis as a conservative approach, since it has the highest cancer potency factor.

Abbreviations:

BAAQMD - Bay Area Air Quality Management District
Cal/EPA - California Environmental Protection Agency
CAS - chemical abstract services
CPF - cancer potency factor
kg - kilogram
m^3 - cubic meter
mg - milligram
PAH - polycyclic aromatic hydrocarbon
PM - particulate matter
REL - reference exposure level
SFPUC - San Francisco Public Utilities Commission
µg - microgram

Updated AQTR Table 22
Net Project Cancer Risk at MEISR With the Proposed Modification[1]
SFPUC Biosolids Digester Facilities Project
San Francisco, CA

Phase	Source	Lifetime Excess Cancer Risk[2]
		Scenario 2 (Operational Emissions Only)
		in a million
Project Construction	Off-road Construction Equipment	--
	On-road Construction Vehicles	--
	Total	**--**
Modified Project Operation	Two Boilers (One Standby)	0.0020
	Emergency Diesel Engine	0.0051
	Standby Flares	0.0041
	Worst-case Biogas Upgrading System	4.2E-04
	Solids Odor Control System	0.0018
	Total	**0.013**
Existing Operation	Waste Gas Burners (A7003 and A7004)[3]	(0.017)
	Cogeneration Engine (S10)[4]	(0.003)
	Industrial Boilers (S8201, S8202, and S8203)[5]	(0.001)
	Total	**(0.022)**
Net Project Lifetime Excess Cancer Risk[6]		**(0.009)**

Notes:

1. The proposed modified Project off-site MEISR for lifetime excess cancer risk for Scenario 2 is located at coordinates 553,200m and 4,178,680m.
2. This table presents the lifetime excess cancer risk from Project operation at the off-site MEISR locations. Scenario 2 considered exposure to operational emissions for 30 years.
3. The existing waste gas burners were not modeled for the CRRP-HRA. The toxic air contaminant (TAC) emissions for the existing waste gas burners were calculated using the emission factors used by the BDFP Consultant Team to calculate the TAC emissions for the Project waste gas burners. The $PM_{2.5}$ emissions from the existing flares were calculated using the PM_{10} emission factor from AP-42, Table 2.4-5, and total 2014 digester gas throughput to the flares, as provided by SFPUC. These emissions were used to calculate the cancer risk from the existing waste gas burners.
4. The cogeneration engine was not modeled for the CRRP-HRA. The organics emissions from the cogeneration engine are from the 2015 BAAQMD Source Emissions for the Plant (No. 568). The organics emissions were speciated based on the ARB 2015 organics speciation profile for reciprocating internal combustion engines that run on natural gas (Organic Profile 719). These emissions were used to calculate the cancer risk from the existing cogeneration engine.
5. The industrial boilers (S8201, S8202, and S8203) were modeled for the CRRP-HRA; however, the modeling was refined to account for a more realistic existing emissions baseline. The organics emissions from the boilers are from the 2015 CER, and PAHs were combined using BAAQMD Toxic Air Contaminant Trigger Levels Table 2-5-1. These emissions were used to calculate the adjusted existing cancer risk from the existing boilers. Existing risks differ from the AQTR due to the difference in MEISR location.
6. Net Project operation is the difference between the excess cancer risk from the Project and the excess cancer risk from the existing operation sources that will be replaced with the Project.

	Cogeneration Engine (S10)[6]	(0.068)	NC	NC
	Industrial Boilers (S8201, S8202, and S8203)[7]	(0.014)	NC	NC
	Total	**(0.20)**	**NC**	**NC**
Total Health Impacts from Project Operation		**0.17**	**0.015**	**0.22**

Notes:

1. This table presents the chronic and acute health impacts from the proposed Project operational sources with the proposed modification at the off-site MEISR and MEI. PM2.5 and chronic HI are for the year with the maximum impact and the acute HI is for the maximum one-hour impact. Therefore, sources of operation only show a contribution to the health impact if they are operating during the maximum year or maximum one-hour impact.
2. The Project off-site MEISR for the Project operational PM2.5 concentration with the proposed modification is located at UTM coordinates 553,880m and 4,177,240m.
3. The Project off-site MEISR for operational chronic HI with the proposed modification is located at coordinates 553,880m and 4,177,240m.
4. The Project off-site MEISR for operational acute HI with the proposed modification is located at coordinates 553,380m and 4,177,440m.
5. The existing waste gas burners were not modeled for the CRRP-HRA. The toxic air contaminant (TAC) emissions for the existing waste gas burners were calculated using the emission factors used by the BDFP Consultant Team to calculate the TAC emissions for the Project waste gas burners. The PM2.5 emissions from the existing waste gas burners were calculated using the PM10 emission factor from AP-42, Table 2.4-5, and total 2014 digester gas throughput to the waste gas burners, as provided by SFPUC.
6. The cogeneration engine was not modeled for the CRRP-HRA. The organics emissions from the cogeneration engine are from the 2015 BAAQMD Source Emissions for the Plant (No. 568). The organics emissions were speciated based on the ARB 2015 organics speciation profile for reciprocating internal combustion engines that run on natural gas (Organic Profile 719). These emissions were used to calculate the cancer risk from the existing cogeneration engine.
7. The industrial boilers (S8201, S8202, and S8203) were modeled for the CRRP-HRA; however, the modeling was refined to account for a more realistic existing emissions baseline. The organics emissions from the boilers are from the 2015 CER, and PAHs were combined using BAAQMD Toxic Air Contaminant Trigger Levels Table 2-5-1. These emissions were used to calculate the adjusted existing cancer risk from the existing boilers.

Updated AQTR Table 26
Cumulative Lifetime Excess Cancer Risk at MEISR With the Proposed Modification[1]
SFPUC Biosolids Digester Facilities Project
San Francisco, CA

Source	Lifetime Excess Cancer Risk[2,3]
	Scenario 2 (Operational Emissions Only)
	in a million
Net Project Risk[4] (Operation - Existing)	-0.009
Cumulative Projects[5]	0.12
Citywide HRA Background[6,7]	57
Total	**57**

Notes:

1. The Project MEISR for Scenario 2 with the proposed modification is located at coordinates 553,200m and 4,178,680m.

2. Excess lifetime cancer risks are estimated as the upper-bound incremental probability that an individual will develop cancer over a lifetime as a direct result of exposure to potential carcinogens. The estimated risk is expressed as a unitless probability. The cancer risk attributed to the emissions associated with the Project was calculated based on the modeled annual average pollutant concentrations, the intake factor for resident child, the Cancer Potency Factors (CPF) for all toxic pollutants emitted, and the Age Sensitivity Factors (ASF).

3. This table presents the long-term health impacts from Project operation at the off-site MEISR locations. Scenario 2 considered exposure to operational emissions for 30 years.

   Calculation: $Risk_{inh} = \Sigma Risk_{inh,i} = \Sigma C_i \times CF \times IF_{inh} \times CPF_i \times ASF$

   Where:

   $Risk_{inh}$: Cancer Risk; the incremental probability of an individual developing cancer as a result of inhalation exposure to a potential carcinogen

   $Risk_{inh,i}$: Cancer Risk for Chemical i

   C_i: Modeled Annual Average Concentration in air for Chemical i ($\mu g/m^3$)

   CF: Conversion Factor (mg/µg)

   CPF_i: Cancer Potency Factor for Chemical i (mg chemical/kg body weight-day)

   ASF: Age Sensitivity Factor

4. The adjusted cancer risk from the existing operational sources that will be replaced with the Project was subtracted from the risk from Scenario 2 to calculate net Project cancer risks for both scenarios.

5. The excess lifetime cancer risk from additional projects at the Southeast Plant (SEP) and in the surrounding area (within 1,000 meters) that will be under construction during the construction and operation of the BDFP were estimated. Since the publication of the FEIR, the Gateway Draft EIR has been published; as discussed with SF Planning, Gateway operational cancer risks were not included due to the distance between the Gateway MEIR and the modified project MEIR.

6. The background cancer risk from existing nearby stationary sources was obtained from the 2020 Citywide HRA.

Abbreviations:

ASF - Age Sensitivity Factor
BDFP - Biosolids Digester Facilities Project
CPF - cancer potency factor
CRRP - Community Risk Reduction Plan
DPF - diesel particulate filter
HRA - health risk assessment
MEISR - maximally exposed individual sensitive receptor
OEHHA - Office of Environmental Health Hazard Assessment
SEP - Southeast Plant
SFPUC - San Francisco Public Utilities Commission
m - meter

References:

OEHHA. 2015. Air Toxics Hot Spots Program Risk Assessment Guidelines. Guidance Manual for Preparation of Health Risk Assessments. February.

Updated AQTR Table 27
Cumulative $PM_{2.5}$ Concentration at MEISR With the Proposed Modification[1]
SFPUC Biosolids Digester Facilities Project
San Francisco, CA

Source	Maximum Annual $PM_{2.5}$ Concentration ($\mu g/m^3$)
	Operation
Net Project[2]	0.17
Cumulative Projects[3]	8.3E-02
Citywide HRA Background[4]	8.5
Total	**8.7**

Notes:

1. The Project off-site MEISR for the Project operational PM2.5 concentration with the proposed modification is located at UTM coordinates 553,880m and 4,177,240m.

2. The PM2.5 concentration from the existing operational sources was adjusted from the value calculated in the San Francisco Community Risk Reduction Plan (Citywide HRA) by modeling the existing operational sources in their actual locations and adding buliding downwash. These sources will be replaced with the Project; therefore, this adjusted value was subtracted from the Project concentration to calculate a net Project concentration.

3. The chronic health impacts of additional projects at the Southeast Plant (SEP) and in the surrounding area that will be under construction during the construction and operation of the BDFP were estimated. The construction of the modeled cumulative projects was assumed to occur during the both construction and operation of the Project, so the health impacts were added to both Project construction and operational impacts. Since the publication of the FEIR, the Gateway Draft EIR has been published; as discussed with SF Planning, the operational PM2.5 concentration from the Gateway project was included in the cumulative analysis.

4. The background PM2.5 concentration from existing nearby stationary sources was obtained from the Citywide HRA.

Abbreviations:

BDFP - Biosolids Digester Facilities Project

CRRP - Community Risk Reduction Plan
DPF - diesel particulate filter

HRA - health risk assessment

m - meter

m^3 - cubic meter

MEISR - maximally exposed individual sensitive receptor

PM - particulate matter

SEP - Southeast Plant

SFPUC - San Francisco Public Utilities Commission

UTM - Universal Transverse Mercator

µg - microgram

Updated AQTR Table 28
Cumulative Chronic Hazard Index at MEISR With the Proposed Modification[1]
SFPUC Biosolids Digester Facilities Project
San Francisco, CA

Source	Chronic Hazard Index[2]
	Operation
Project	0.015
Cumulative Projects[3]	0.0038
Citywide HRA Background[4]	--
Total	**0.019**

Notes:

1. The Project off-site MEISR for operational chronic HI with the proposed modification is located at coordinates 553,880m and 4,177,240m. Sources of operation only show a contribution to the health impact if they are operating during the maximum year of chronic HI impact.

2. The potential for exposure to result in adverse chronic non-cancer effects is evaluated by comparing the estimated annual average air concentration (which is equivalent to the average daily air concentration) to the non-cancer chronic Reference Exposure Level (REL) for each chemical. When calculated for a single chemical, the comparison yields a ratio termed a hazard quotient. To evaluate the potential for adverse chronic non-cancer health effects from simultaneous exposure to multiple chemicals, the hazard quotients for all chemicals are summed, yielding a hazard index (HI).

   Calculation: Chronic HI = ΣChronic HQ_i = Σ [C_i / $cREL_i$]

   Where:

   HI: Hazard Index

   HQ_i: Hazard Quotient for Chemical i

   C_i: Average Daily Air Concentration for Chemical i ($\mu g/m^3$)

   $cREL_i$: Non-cancer Chronic Reference Exposure Level for Chemical i ($\mu g/m^3$)

3. The chronic health impacts of additional SFPUC projects at the Southeast Plant (SEP) and in the surrounding area that will be under construction during the construction and operation of the BDFP were estimated. The construction of the modeled surrounding projects will occur during the construction and operation of the Project, so the health impacts were added to both Project construction and operational impacts. Since the publication of the FEIR, the Gateway Draft EIR has been published; as discussed with SF Planning, operational chronic HI from the Gateway project was included in the cumulative analysis.

4. The San Francisco Citywide HRA does not estimate cumulative chronic HI; therefore, this was not included in the cumulative chronic HI evaluation.

Abbreviations:

BDFP - Biosolids Digester Facilities Project

CRRP - Community Risk Reduction Plan

DPF - diesel particulate filter

HI - hazard index

HRA - health risk assessment

m - meter

MEISR - maximally exposed individual sensitive receptor

REL - reference exposure level

SEP - Southeast Plant

SFPUC - San Francisco Public Utilities Commission

Updated AQTR Table 29
Cumulative Acute Hazard Index at MEI With the Proposed Modification[1]
SFPUC Biosolids Digester Facilities Project
San Francisco, CA

Source	Acute Hazard Index[2]
	Operation
Project	0.22
Cumulative Projects[3]	--
Citywide HRA Background[3]	--
Total	**0.22**

Notes:

1. The Project off-site MEISR for operational acute HI with the proposed modification is located at coordinates 553,380m and 4,177,440m. The acute HI is based on a one-hour maximum air concentration so it is evaluated for all receptors as opposed to only sensitive receptors.

2. The potential for exposure to result in adverse acute effects is evaluated by comparing the estimated one-hour maximum air concentration of a chemical to the acute REL for each chemical. When calculated for a single chemical, the comparison yields an hazard quotient. To evaluate the potential for adverse acute health effects from simultaneous exposure to multiple chemicals, the hazard quotients for all chemicals are summed, yielding a hazard index.

   Calculation: Acute HI = ΣAcute HQ_i = Σ [C_i / $aREL_i$]

   Where:

   HI: Hazard Index

   HQ_i: Hazard Quotient for Chemical i

   C_i: Estimated One-Hour Maximum Air Concentration for Chemical i ($\mu g/m^3$)

   $aREL_i$: Noncancer Acute Reference Exposure Level for Chemical i ($\mu g/m^3$)

3. Since the acute HI is based on a one-hour maximum air concentration, it is not typically evaluated on a cumulative basis for CEQA analyses. The BAAQMD CEQA Guidelines do not have a cumulative threshold for acute HI; therefore, the acute HI for cumulative projects was not analyzed. Additionally, the San Francisco Community Risk Reduction Plan (Citywide HRA) does not estimate a background acute HI.

ADDENDUM 2 TO ENVIRONMENTAL IMPACT REPORT

Date of Publication of Addendum:	December 20, 2024
Date of certification of Final EIR:	March 8, 2018
EIR Case No.:	2015-000644ENV
Project Title:	Biosolids Digester Facilities Project
Project Modification:	Operations, Engineering and Maintenance Buildings
Modified Project Case No.:	2015-000644ENV-02
Project Sponsor:	San Francisco Public Utilities Commission, Kelly Yong, 415.551.4532, kyong@sfwater.org
Lead Agency:	San Francisco Planning Department
Staff Contact:	Timothy Johnston, 628.652.7536, timothy.johnston@sfgov.org

1.0 Background

On March 8, 2018, the San Francisco Planning Commission certified the Final Environmental Impact Report (FEIR) for the Biosolids Digester Facilities Project (Biosolids project or approved project) at the Southeast Water Pollution Control Plant (Southeast Plant), located in the southeast part of San Francisco (**Figure 1**).[1] Originally built in 1952 with major upgrades in 1982 and 1996, the Southeast Plant is the City and County of San Francisco's (City's) largest wastewater treatment facility, treating approximately 80 percent of San Francisco's sewage and stormwater flows. The approved project includes the construction and operation of a new solids treatment process, odor control, energy recovery, and associated facilities to replace outdated existing facilities with more reliable, efficient, and modern technologies. Biosolids are the recyclable solid materials removed from the wastewater during the wastewater treatment process and digesters are the major facility used in the solids treatment process.

[1] San Francisco Planning Department, *Biosolids Digester Facilities Project Final Environmental Impact Report*, Planning Department Case No. 2015-000644ENV, State Clearinghouse No. 2015062073 certified March 8, 2018. Available online at: http://tinyurl.com/BDFPFEIR.

Project Location

2.0 Approved Project Summary and Status

This section provides a brief overview of the project evaluated in the FEIR, the status of facilities construction, and minor modifications made to the approved project since the FEIR was certified.

2.1 Components

The key components of the approved project include the following:

- Replacement and relocation of the solids processing treatment processes with new facilities,
- Energy recovery facilities to reuse the digester gas generated by the proposed solids processing facilities,
- Odor control facilities to collect and treat odors from solids handling and energy recovery facilities,
- Water systems and pump stations,
- Support facilities such as buildings for operations and maintenance staff,
- Various utility piping and electrical facilities, and
- Landscaping and architectural improvements.

2.2 Status

Construction of the approved project began in early January 2020 and is entering the sixth year of construction. All the buildings at the former Asphalt Plant and the Central Shops have been demolished; the majority of soil excavation and off hauling has been completed; foundations for most new facilities (including piles) have been installed; and the new biosolids digester facilities are partially constructed. The largest facilities, including the new solids pretreatment facility (Facility 600) and five new anaerobic digester tanks (Facility 610), along with the iron chloride storage tanks (Facility 913), and W2 pump station (Facility 921) have been erected with mostly internal work to be completed such as, but not limited to, installing stairs and elevators, mechanical equipment, heating, ventilation, and air conditioning (HVAC) equipment, plumbing, equipment installation, and architectural finishes. The remaining buildings to be erected above ground level (the foundations, including excavation and piles are complete) are the smaller digestion cooling towers (Facility 604), thermal hydrolysis (Facility 605), solids odor control (Facility 606), steam generation (Facility 607) and biosolids dewatering (Facility 615) with forming/rebar, concrete pours, and other building activities, and that will then be followed by internal work. Also continuing are excavation and installation of utility piping throughout the approved project area. As new facilities are completed there will be process testing, commissioning, and startup and integration with existing facilities.

Since FEIR certification, the San Francisco Public Utilities Commission (SFPUC) has approved multiple minor changes to the approved project such as: additional dewatering wells; geotechnical potholes and test piles; a rerouted pipeline; additional work, staging, and parking areas (and the removal of other staging areas); alternative effective air quality mitigation; removal of Maintenance Shops 1 and 2; reducing the size of the Odor Control Building and adding new Steam Generation Facility; and adding an Interim Sidestream Nutrient Removal Facility to reduce nutrients (mainly nitrogen) from treated effluent to improve effluent water quality. The San Francisco Planning Department determined that these minor project modifications were not substantial and that they would clearly not alter the FEIR conclusions, and then documented these determinations in memoranda added to the case file. These previously reviewed minor project

modifications, summarized in Section 4.1 below, were each approved by the SFPUC after California Environmental Quality Act (CEQA) review by the San Francisco Planning Department. As such, they are now considered to be part of the approved project and are discussed in this addendum where relevant.

The approved project also includes construction and operation of the biogas utilization system instead of the originally proposed energy recovery facilities and related changes to operational energy demand and supply, that were evaluated in addendum 1 to the FEIR.[2] The San Francisco Planning Department determined that these changes would not alter the FEIR conclusions.

The approved project also includes an additional 1.5 years of construction, for a total of 6.5 years, from January 2020 through July 2026, followed by two years of performance testing, start-up, and commissioning, as described in addendum 1.

3.0 Proposed Modifications to Project

The SFPUC proposes to revise the approved project to construct an Operations, Engineering, and Maintenance building; a Mechanical Maintenance building; and a new utility enclosure at the Southeast Plant (the operations, engineering, and maintenance buildings or the "proposed modifications"). The proposed modifications would be located southeast of the originally approved location for the Maintenance Shops 1 and 2 and adjacent to, but outside of, the approved project site. The proposed modifications would support operations and maintenance activities and replace the current function of building SEP 850, and of the temporary pre-fabricated trailers (referred to as buildings "SEP 850A" and "SEP 850B"). As noted in addendum 1, the SFPUC will not demolish building SEP 870 as was planned in the original project and later modified,[3] and instead would demolish building SEP 850, the SEP 850A and SEP 850B trailers, and the adjacent surface parking lot. Activities currently performed in the existing building SEP 850 and trailers would be temporarily relocated during construction. Temporary construction staging would occur along Jerrold Avenue northwest of Phelps Street, where the road is already currently closed for construction, and within the Southeast Plant. The approved project, inclusive of these proposed modifications, is referred to as the "modified project."

3.1 Project Setting

The Southeast Plant is located at 750 Phelps Street and currently occupies approximately 50 acres bounded by Evans Avenue to the northeast, Rankin Street to the northwest, Phelps Street to the southeast, and the Caltrain railroad tracks and a freight rail spur to the west (see **Figure 2**). Jerrold Avenue bisects the Southeast Plant, dividing it into "Southeast Plant North" (i.e., facilities north of Jerrold Avenue) and "Southeast Plant South" (facilities south of Jerrold Avenue). Facilities in Southeast Plant North are currently associated with processing the liquids portion of the wastewater. Facilities in Southeast Plant South are currently associated with processing the solids portion of the wastewater and include the existing digesters, solids loadout, and energy recovery facilities; however, once construction of the approved project is

Operations, Engineering, and Maintenance Buildings

Figure 2
Southeast Plant Overview and Project Site

complete, solids processing and biogas utilization system facilities would also be located in Southeast Plant North near the Caltrain railroad tracks and the intersection of Jerrold Avenue and Quint Street.

Located within San Francisco's Bayview-Hunters Point community, the Southeast Plant is surrounded by a mix of residential, commercial, and light- and heavy-industrial uses. Residential and commercial uses are located across Phelps Street from the Southeast Plant, with the nearest residence located approximately 500 feet from the approved project site boundary, on Phelps Street and Kirkwood Avenue.

The approximately 1.2-acre site of the proposed operations, engineering and maintenance buildings includes areas located within Southeast Plant North but outside of the 14-acre approved project site. The proposed modifications would expand the project site to the southeast and increase the total size of the project site from 14 to 15.2 acres. With this expansion, the modified project site boundary would be located approximately 250 feet from the nearest residences along Phelps Street and Kirkwood Avenue.

Since approval of the project, the 23 Monterey bus line was permanently rerouted to the proposed alignment shown in FEIR Figure 4.6-3. The 23 Monterey bus no longer passes through the project vicinity on Jerrold Avenue.

3.2 Existing Facilities

The operations, engineering and maintenance buildings site currently contains existing building SEP 850, which is a one- to two-story building that is 30 feet tall at its tallest point (15 feet tall on the single-story portion), two temporary pre-fabricated trailers (SEP 850A and SEP 850B), and an adjacent surface parking lot. The proposed modifications would also require temporary use of existing building SEP 870, a one-story 20-foot-tall building, and the associated parking area for temporary shower trailers. The site also contains stormwater collection facilities that route stormwater runoff to plant influent or primary clarifiers for treatment. Approximately 35 landscape trees, including four trees that have been mapped as "significant tree"[4] consistent with article 16 of the San Francisco Public Works Code, are present within the site.[5] An existing circular parking lot at the corner of Jerrold Avenue and Phelps Street contains 16 vehicle spaces, with access from Jerrold Avenue. Access to Southeast Plant North is provided via Jerrold Avenue, past the temporary construction site security check-in, approximately 370 feet northwest of the intersection of Jerrold Avenue and Phelps Street.

3.3 Description of the Proposed Modifications

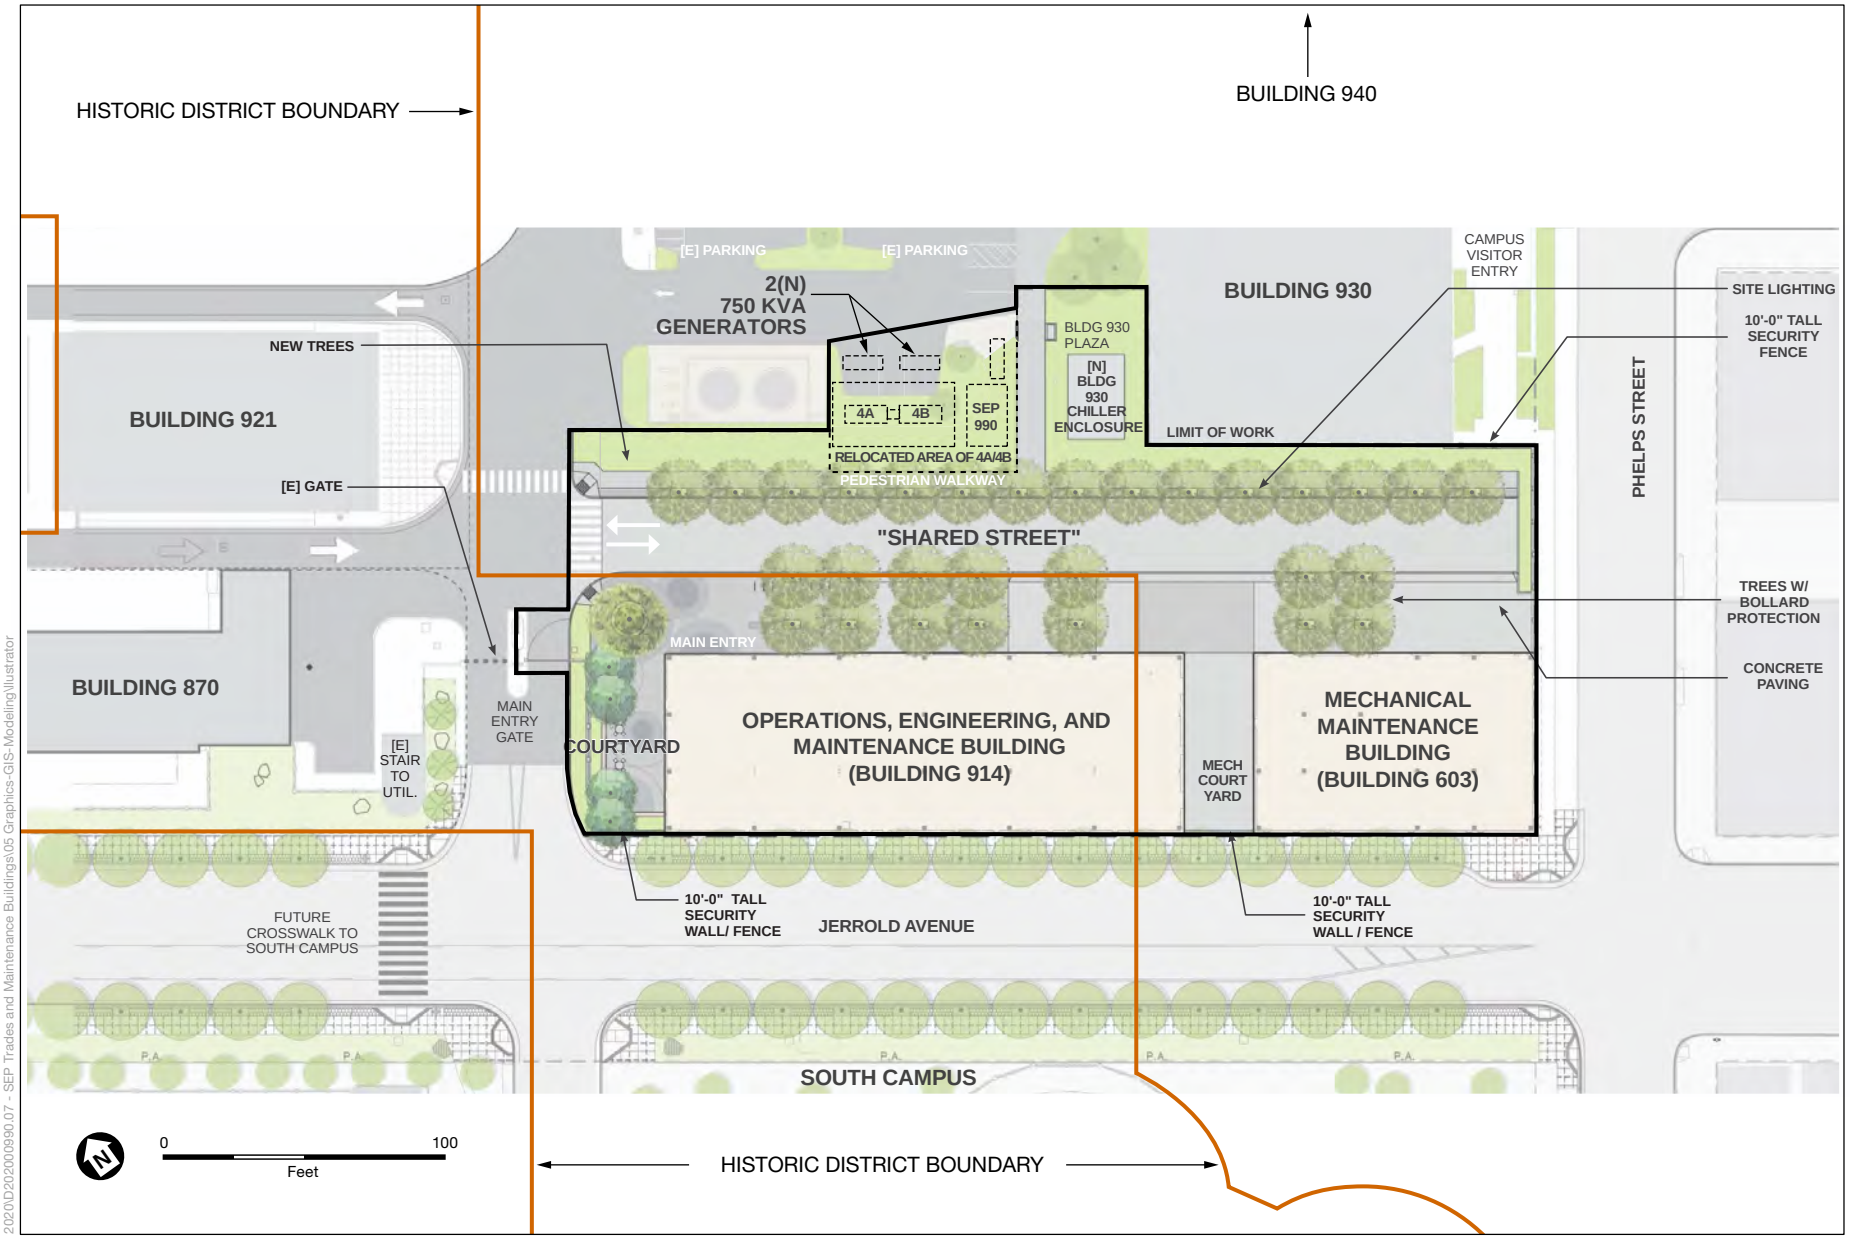
The proposed modifications to the approved project evaluated in this addendum include: demolition of the existing building SEP 850; removal of the temporary pre-fabricated trailers SEP 850A and SEP 850B and the adjacent surface parking lot; demolition of the existing emergency backup generator, an existing transformer, and related electrical equipment (SEP 990); construction of the Mechanical Maintenance building (SEP 603), the Operations, Engineering, and Maintenance building (SEP 914), and a utility enclosure for a new chiller; and installation of two new boilers located inside building SEP 930 to service both buildings SEP 930 and SEP 940. Two new emergency generators and an associated upgraded transformer

[4] A significant tree is defined in San Francisco Public Works Code Chapter 16, Section 810A as any tree that is on property under the jurisdiction of the Department of Public Works or is on privately-owned property and within ten feet of the public right-of way, which meets at least one of the following size criteria: height greater than 20 feet; canopy width greater than 15 feet; and trunk diameter at breast height (dbh) greater than 12 inches.

[5] San Francisco Planning Department, Biosolids Digester Facilities Project Final Environmental Impact Report Appendix BIO, Planning Department Case No. 2015-000644ENV, State Clearinghouse No. 2015062073 certified March 8, 2018.

and electrical panel (SEP 990) as shown on **Figures 3 and 4** would be constructed and installed for use by proposed buildings SEP 603 and SEP 914.

The proposed Mechanical Maintenance building (SEP 603) would house maintenance bays, tool storage, office space and associated maintenance equipment. The approximately 8,400-square-foot, 33-foot-tall two-story building (including mezzanine) would be located at the corner of Jerrold Avenue and Phelps Street and would be accessed from Jerrold Avenue. To be consistent with San Francisco's Green Building Code, the SFPUC would install approximately 2,500 square feet of solar panels on the roof of SEP 603.



The proposed Operations, Engineering, and Maintenance building (SEP 914) would house carpenter, plumbing, and paint shops; offices, conference rooms, and break room; tool and paint storage; showers, lockers, and a wellness room; and records storage. The approximately 35,600-square-foot, 48.5-foot-tall, three-story building would be located along Jerrold Avenue between the proposed Mechanical Maintenance building and existing access to the Southeast Plant along Jerrold Avenue, southeast of existing building SEP 870. Consistent with San Francisco's Green Building Code, approximately 4,300 square feet of solar panels would be installed on the roof of SEP 914.

The demolition of building SEP 850, shown in **Figure 5**, would require the relocation and replacement of existing utilities. The existing gas boilers and chiller serving existing buildings SEP 850, SEP 930 and SEP 940 would be relocated and replaced. SEP 914 and SEP 603 would be served by an upgraded electrical transformer, three new electric boilers and an electric chiller. SEP 930 and 940 would be served by two smaller, more efficient gas boilers. A new utility enclosure to house the new chiller, measuring approximately 600 square feet and 6 feet tall, would be installed northeast of the proposed operations, engineering and maintenance buildings and west of the existing building SEP 930. The two new boilers would be located inside building SEP 930. Additionally, an existing 500 kVA[6] emergency backup generator and existing electrical equipment (SS 4A/4B and SEP 990) would be replaced with two new 750 kVA generators and electrical equipment (SS 4A/4B and SEP 990) next to the new chiller enclosure. The two new generators would have Tier 3 control technology.

Prior to demolition, the SFPUC would temporarily relocate the building occupants and uses within buildings SEP 850, SEP 850A, and SEP 850B to 1900 Jerrold Avenue. Temporary parking would be arranged near 1900 Jerrold Avenue, or previously approved staging areas such as 2000 McKinnon Avenue and 1811 Jerrold Avenue. Temporary showers would be placed adjacent to building SEP 870 with temporary lockers staged within the interior of building SEP 870. Trenching would be required to connect the temporary trailers (in particular, shower trailers) to potable water utilities, as shown in **Figures 5 and 6**. Construction management staff for the project would be located at the existing Headworks trailers, located north of the project site within the Southeast Plant's boundary.

Other improvements proposed at the operations, engineering and maintenance buildings site include an interior road for internal employee circulation and fire truck access, fencing, interior sidewalks, outdoor seating, and site lighting. The project proposes an approximately 23-foot-wide, 333-foot-long, dead-end

[6] Kilo volt amperes, which is the apparent power or actual power drawn from a power source.

road for internal employee circulation and access and required fire apparatus access to proposed buildings SEP 914 and SEP 603. A 10-foot-tall security fence or wall would be constructed along the Jerrold Avenue and Phelps Street boundaries in front of the modified project site. Permanent lighting would be installed primarily inside of the buildings, with exterior lighting at entrances and low-level landscaping lighting for paths of travel. New landscaping including approximately 35 new trees would be planted.

The SFPUC would connect the new operations, engineering and maintenance buildings to existing and proposed utilities, including natural gas, electricity, water, and sanitary sewer lines. This would include installing electrical conduit in the existing parking lot west of building SEP 930 and replacing an existing transformer within Southeast Plant North. Future runoff from the paved areas and new structures would be routed to the existing stormwater collection facilities at the site, or to new landscaped areas designed for stormwater infiltration that may be required for the modified project to comply with applicable regulations. The existing Southeast Plant potable water distribution system would be extended to serve the facilities.

The proposed buildings have been designed to meet the code requirements for Leadership in Energy and Environmental Design (LEED) Gold through various features, including water saving fixtures, solar panels, occupancy sensors, and energy saving materials.

3.4 Modified Project Construction

Construction of the approved project is estimated to last approximately 6.5 years. Approved project construction began in 2020. Construction of the proposed modifications would extend construction by an additional year through 2027 as shown in **Table 1**.

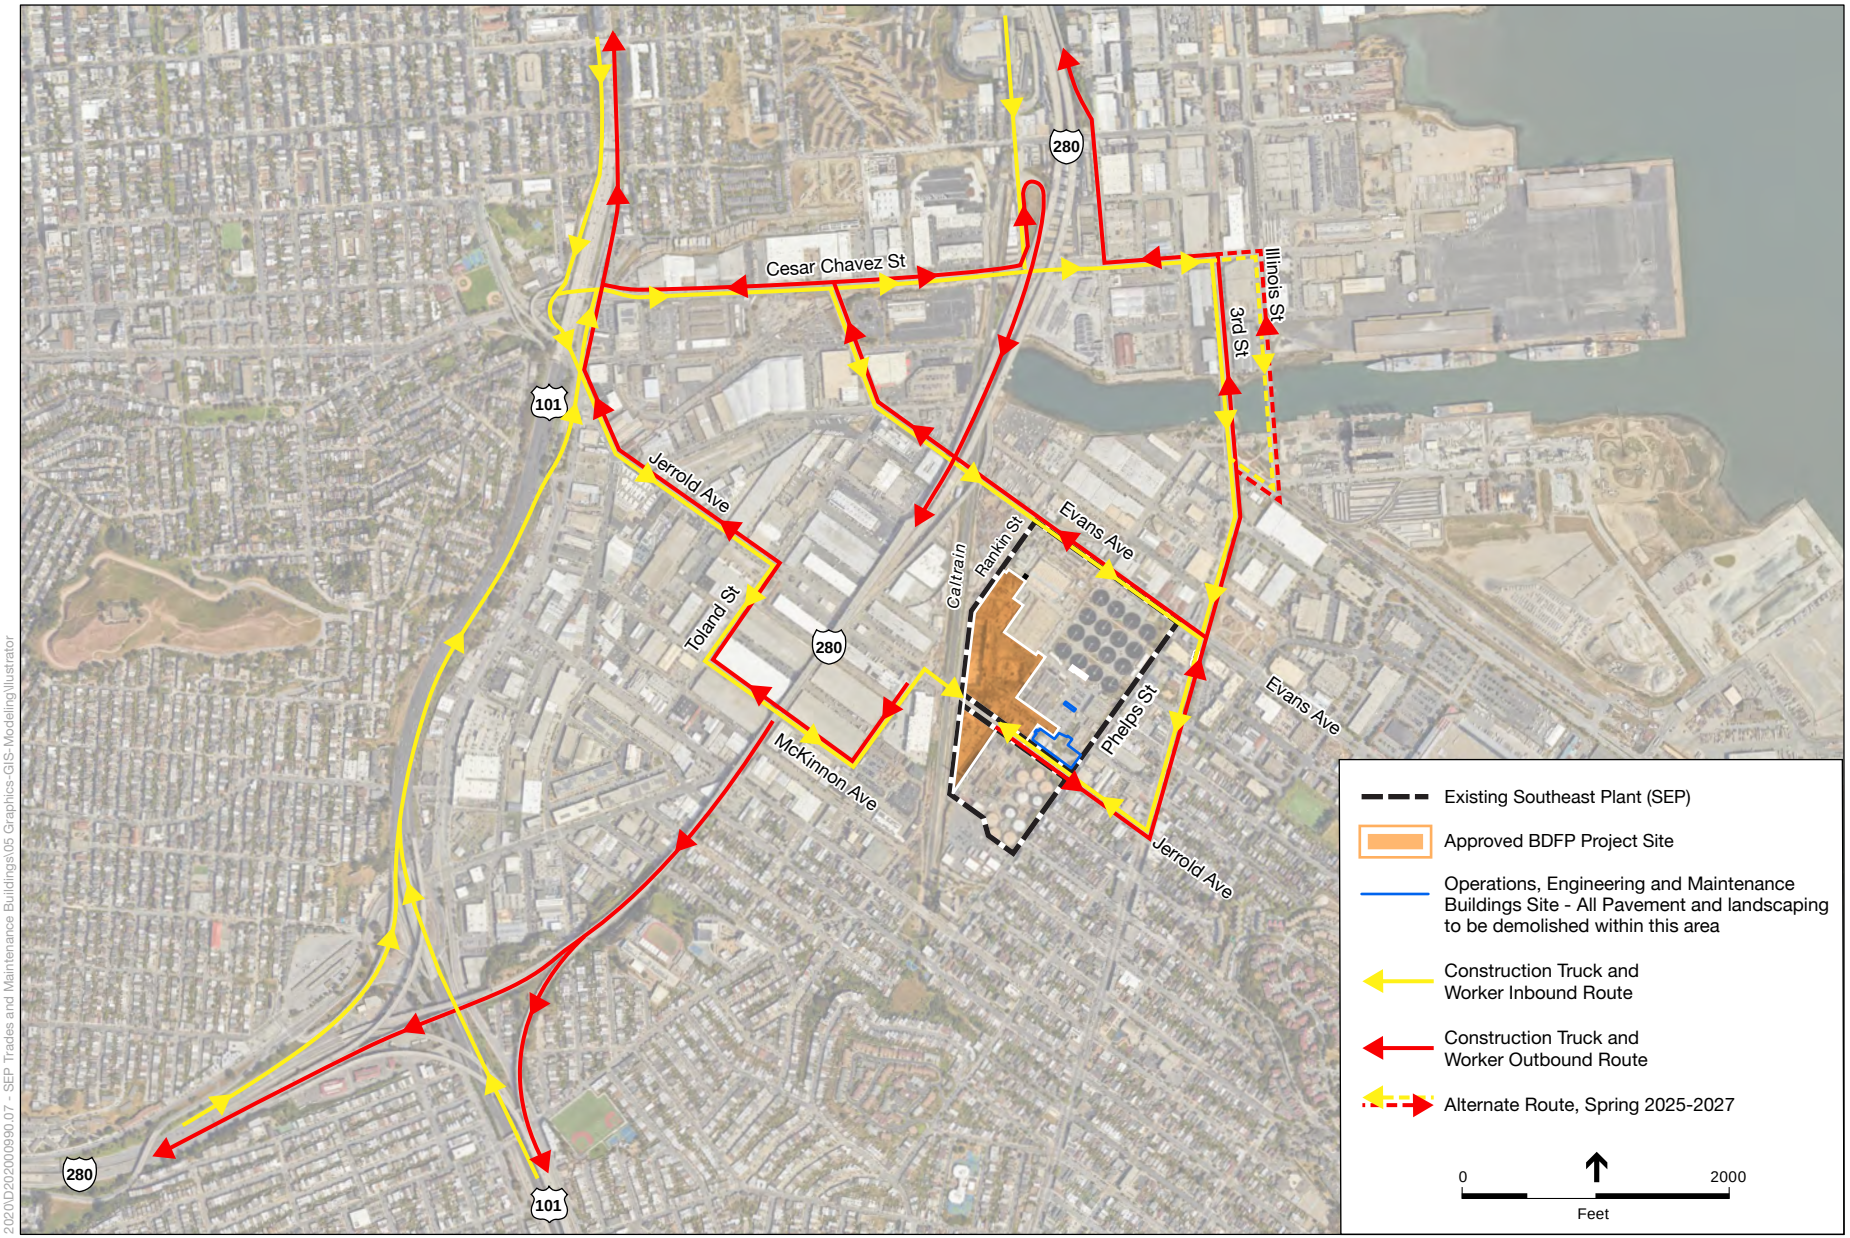
Table 1 Construction Schedule Overview

Activity	FEIR Table 2-10 Estimated Schedule	Estimated Schedule	Facilities in Construction
Biosolids Digester Facilities Construction	February 2018 – January 2023 (5 years)	January 2020 - September 2027 (approximately 7.5 years)	• Approved project facilities (ongoing) • Approved Interim Sidestream Nutrient Removal Facility (February 2025 to December 2025) • Approved Biogas Utilization System (April 2025 to January 2027) • Proposed Operations, Engineering, and Maintenance Buildings (February 2025 to September 2027)
Post-Construction Activities (performance testing/start-up, full facility commissioning)	February 2023 - July 2025 (2.5 years)	August 2026 – Summer 2028 (2 years)	None
Existing Digesters Decommissioning[7]	After 2025	After 2028	None

[7] Per the FEIR, potential demolition of the existing digesters and the solids handling facilities would be evaluated as a separate project when future uses of the site are proposed.

For most of the construction period, construction activities at the project site would occur Monday through Friday from 7 a.m. to 4:30 p.m., and at times until 8 p.m. as needed. Construction could also occur on Saturdays and Sundays when needed. Work would occur on holidays and 24 hours per day only if needed for critical facility connections, similar to the approved project.

Construction Staging, Worker Parking, Truck and Delivery Access, and Temporary Relocation of Muni Route. The approved project would require up to 12 acres of total construction staging area in addition to the project site itself. The approved project identified potential construction staging areas shown on Figure 1, along with staging within the Southeast Plant boundary and the closed portion of Jerrold Avenue to Phelps Street. The modified project would add temporary parking, in an area large enough for approximately 90 construction worker vehicles, at 2 Rankin Street (area shown in green on Figure 1).



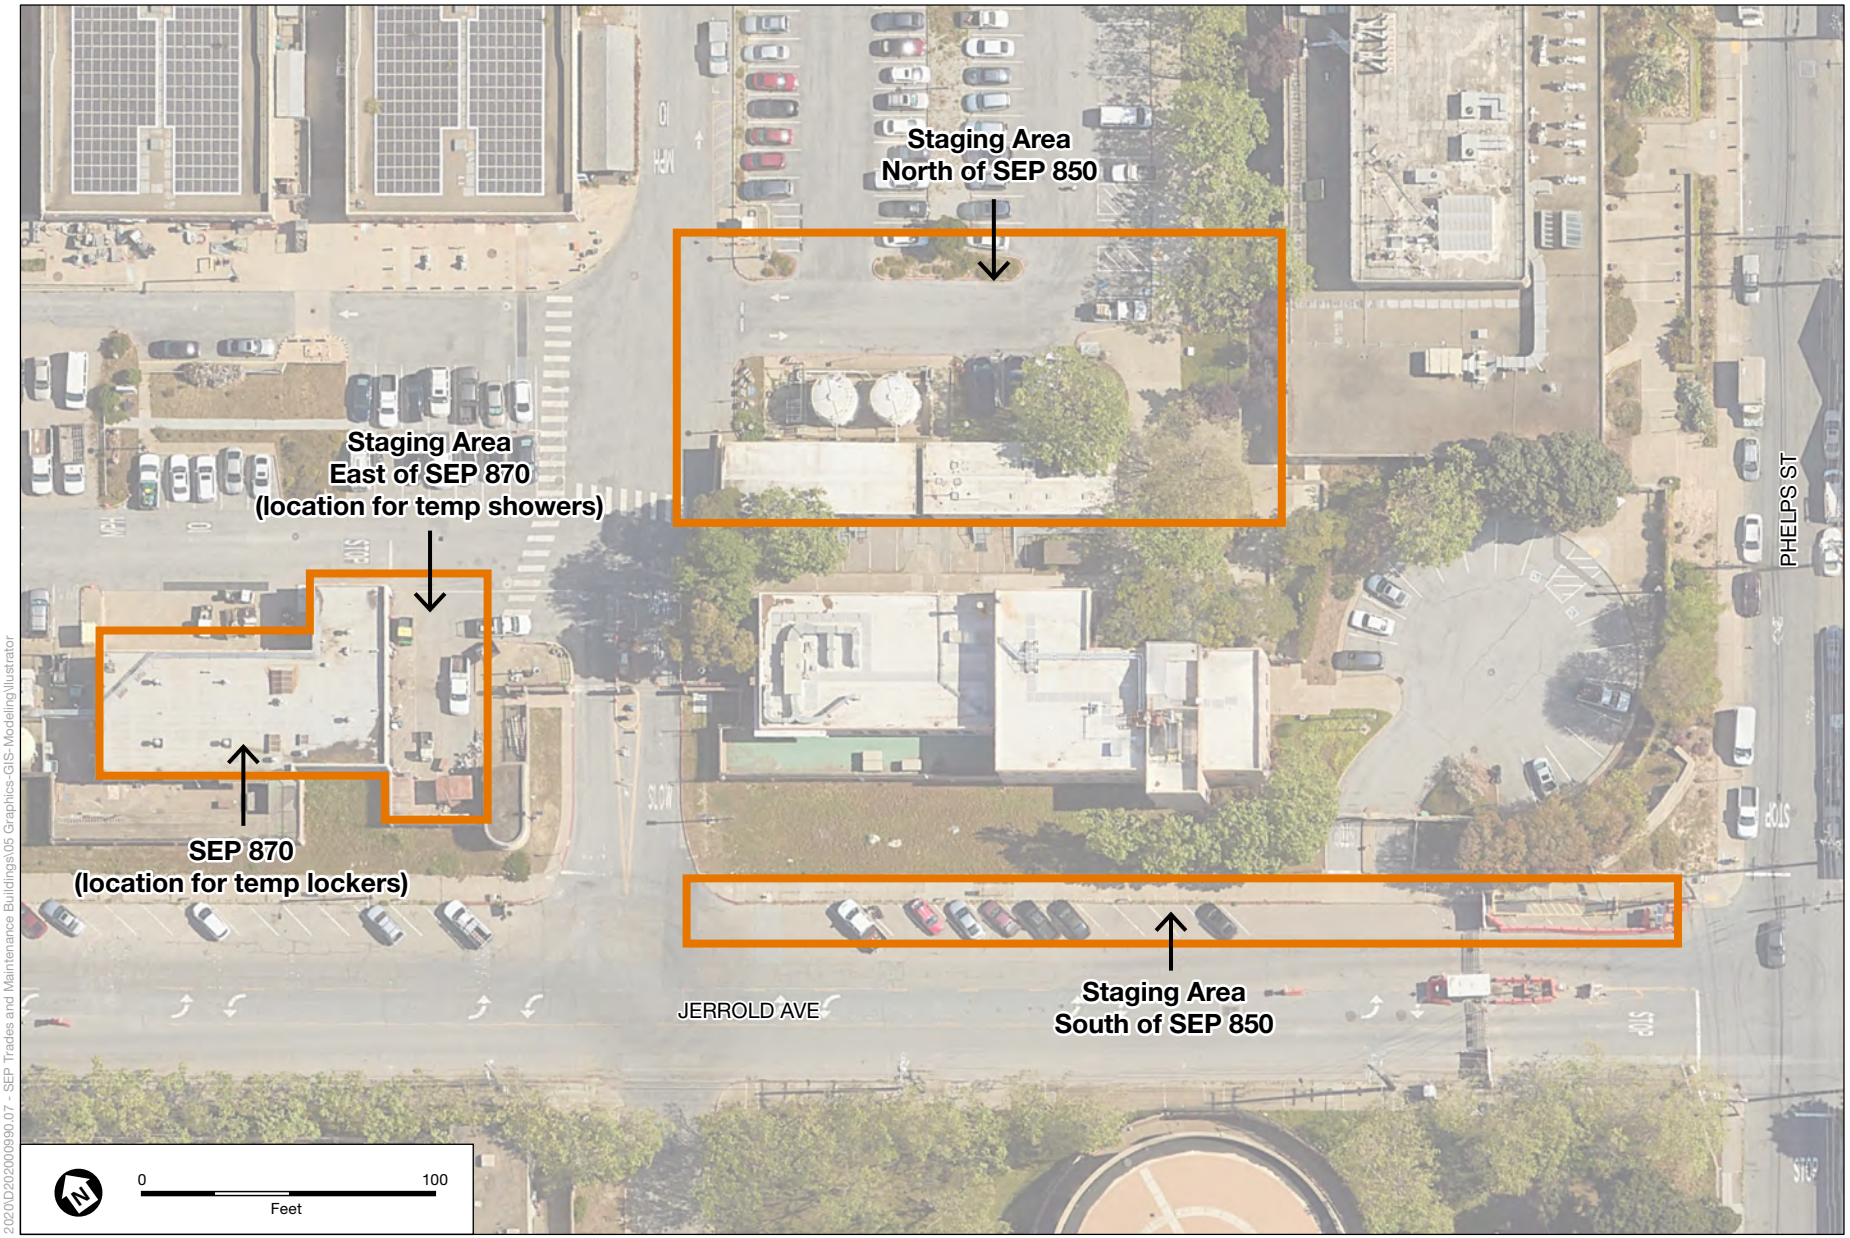
Construction trucks and workers would use the inbound and outbound routes shown on **Figure 7** to access the modified project site, instead of the routes shown in FEIR Figure 2-15. Interim truck delivery and off-haul routes for ongoing operations at the Southeast Plant would be the same as shown in FEIR Figure 2-16. Construction staging for the proposed modifications would be located within the Southeast Plant and along Jerrold Avenue as shown on **Figure 8**.

Construction Equipment. Equipment similar to that listed in the FEIR would be used during construction of the proposed modifications, as shown in **Appendix D**.

Demolition of Existing Structures. The approved project intended to demolish about 132,200 square feet of existing buildings and structures within the project site. With the proposed modifications, the SFPUC would demolish and dispose of the existing building SEP 850, two temporary pre-fabricated trailers (SEP 850A and SEP 850B), the adjacent surface parking lot, and the existing emergency generator and associated electrical equipment (SS 4A/4B, SEP 990), as shown on Figure 5. This would result in an additional 15,270 square feet of demolition, for a total of approximately 147,470 square feet of demolition for the modified project. Approximately 35 additional trees would be removed. As part of the proposed modifications, some of the existing underground utility lines from building SEP 850 to building SEP 930 would be intercepted and tied into the new buildings. Portions of existing utility lines not needed for the proposed modifications would also be capped, cut, and abandoned in place.

Site Preparation. The approved project proposed to excavate to depths of approximately 41 feet below ground surface at the digesters location within the approved project site, and several other facilities required excavation to depths of 25 to 30 feet below ground surface. Permanent secant pile wall piles were proposed to be installed to depths of 75 feet below ground surface within the approved project site, and temporary sheet piles were also proposed within the approved project site. Some utility relocation and groundwater dewatering were also proposed during construction of the approved project. With the proposed modifications, the modified project would excavate to depths of approximately 10 feet below ground surface in areas outside of the approved project site. Foundations for the new buildings would be drilled or auger cast 40- to 60-foot-deep piles below a 4-foot-deep concrete slab.

The approved project was expected to result in a total of 184,812 cubic yards of soil to be hauled offsite. The proposed modifications would excavate up to 21,455 cubic yards of soil, including potentially contaminated soil that could be removed from the site, for a total of 206,267 cubic yards of excavation for the modified project. The approved maximum excavation depths would not change. Excavated soil would be reused as backfill for the modified project as needed if it meets design specifications based on testing results;



2020\D2020000990.07 - SEP Trades and Maintenance Buildings\05 Graphics-GIS-Modeling\Illustrator

Operations, Engineering, and Maintenance Buildings

Figure 8
Staging Areas for the Operations, Trade and Maintenance Buildings

otherwise, the soil would be properly disposed of offsite in accordance with all applicable local, state, and federal regulations governing solid waste disposal. Contaminated and uncontaminated soil and demolition debris would be hauled and transferred to the same sites identified for the approved project (Recology Hay Road Landfill, Altamont Landfill, Republic Ox Mountain Landfill, or East Carbon Development Corporation Landfill in Utah).

Facility Construction. The proposed modifications would be constructed using the same standard techniques identified for most of the approved project facilities. After demolition and site grading, the SFPUC would construct the Mechanical Maintenance building (building SEP 603) and the Operations, Engineering, and Maintenance building (building SEP 914), and utility enclosure, and install the new boilers, generators and associated electrical equipment for use by proposed buildings SEP 603 and SEP 914. Once building and security fence construction is complete, the internal road and sidewalks would be placed. Landscaping would be planted as shown in the conceptual plan on Figure 3.

3.5 Modified Project Operations

The proposed operations, engineering, and maintenance buildings would support operations and maintenance activities at the Southeast Plant, including the maintenance of treatment equipment, same as described for Maintenance Shops 1 and 2 under the approved project. The buildings would provide equipment repair areas, parts storage, and staff facilities.

Operational Energy Needs. The FEIR estimated that the annual energy demand for the solids treatment process at the Southeast Plant would be approximately 4.9 megawatts in 2045, which included energy demand for associated operations, maintenance and support facilities. The annual energy demand of the approved project would be approximately 6.6 megawatts in 2045. Overall, the SFPUC would provide most of the electricity to the Southeast Plant, except for PG&E power that may be used for the biogas utilization system, as discussed in addendum 1 to the FEIR.[8] The proposed operations, engineering and maintenance buildings would be designed to comply with LEED Gold standards, would include solar panels, and would use approximately 0.60 megawatt annually (0.48 megawatt with the inclusion of the proposed rooftop solar generation). With the proposed modifications, the annual operational energy needs of the Southeast Plant would be up to 7.2 megawatts. The additional energy for the new operations, engineering, and maintenance buildings would be provided by hydroelectric power from SFPUC sources.

Other Southeast Plant Operations. As with the approved project, the modified project would not result in changes to the overall treatment capacity of the Southeast Plant. The SFPUC does not propose to increase the existing operations staff levels (about 280 people for the entire Southeast Plant) as part of the modified project. Once the modified project is operational, on-site parking for employees at the Southeast Plant would be the same as for the approved project. Operational truck routes, and chemical storage, use, and handling would be the same as described in the FEIR for the approved project. The proposed modifications would not affect the existing overall capacity of the Southeast Plant for wastewater treatment; the overall treatment methods and in turn chemical storage, use, handling and associated truck trips and routes; the amount of digester gas generated; or the amount of biosolids generated and the associated number of hauled trucks and routes. Lastly, the long-term streetscape and landscape improvements along Jerrold Avenue from the approved project would still be implemented under the modified project.

[8] San Francisco Environmental Planning, Biosolids Digester Facilities Project Addendum 1 to Environmental Impact Report, July 12, 2024.

3.6 Approvals

This addendum evaluates the potential environmental effects of the modified project described above and will be used to support the following public agency approvals:

- San Francisco Public Utilities Commission: consideration of approval of the proposed modifications at a public hearing.
- Bay Area Air Quality Management District: Authority to Construct and Permit to Operate

4.0 CEQA Approach

San Francisco Administrative Code section 31.19(C)(1) states that a modified project must be reevaluated, and that "If, on the basis of such reevaluation, the Environmental Review Officer determines, based on the requirements of CEQA, that no additional environmental review is necessary, this determination and the reasons therefore shall be noted in writing in the case record, and no further evaluation shall be required by this Chapter." CEQA Guidelines section 15164 provides for the use of an addendum to document the basis for a lead agency's decision not to require a subsequent EIR for a project that is already adequately covered in a previously certified EIR. An addendum to a certified FEIR may be prepared if some changes or additions are necessary but none of the conditions described in CEQA Guidelines section 15162 calling for the preparation of a subsequent FEIR have occurred.

This addendum to the FEIR evaluates the potential environmental effects of the proposed modifications to the Biosolids Digester Facilities Project (i.e., the construction of the operations, engineering and maintenance buildings and associated development). As defined previously, the Biosolids Digesters Facilities Project, inclusive of the proposed modifications (the "modified project"), is compared to the impacts of the "approved project" as disclosed in the FEIR (and in the subsequently approved minor project modifications and addendum 1), and explains why the modified project would not result in any new significant environmental impacts or a substantial increase in the severity of previously identified environmental impacts, and would therefore not require the adoption of any new or considerably different mitigation measures.

Since certification of the FEIR and issuance of addendum 1, the approved project and the circumstances under which the approved project would be completed have changed. These changes include the following: 1) modifications to the project described in the certified FEIR; 2) new information regarding cumulative projects proposed in the vicinity; and 3) changes in the existing conditions regarding health risks from air pollution sources due to an updated citywide health risk assessment. These changes are described further in the subsections below. As analyzed in this addendum, the modified project combined with these changed circumstances would not materially change any of the analyses or conclusions of the certified FEIR.

4.1 Approved Project Modifications

As described in Section 2.2 above, since FEIR certification, the SFPUC has approved multiple changes to the approved project, such as the following: additional dewatering wells; geotechnical potholes and test piles; a rerouted pipeline; additional work, staging, and parking areas (and the removal of other staging areas); alternative effective air quality mitigation; removal of Maintenance Shops 1 and 2; reducing the size of the Odor Control Building and adding new Steam Generation Facility; adding an Interim Sidestream Nutrient

Removal Facility to reduce nutrients (mainly nitrogen) from treated effluent to improve effluent water quality; and revising the approved energy recovery/cogeneration facility to a biogas utilization system to convert the digester gas into renewable natural gas. The San Francisco Planning Department determined that these project modifications were not substantial, given that they would clearly not alter the FEIR conclusions (as documented in memoranda to the case file and in addendum 1 to the FEIR). **Table 2** summarizes the approved project inclusive of the project modifications to date and the proposed modifications analyzed in this addendum.

Table 2 Summary of Approved Project and Modified Project

Feature	Approved Project		Modified Project
	FEIR Project[9]	Previously Approved Project Changes[10]	
Property Size of the Southeast Plant	Approximately 47 acres	No change	No change

4.2 Cumulative Projects in the Site Vicinity

FEIR Section 4.1.3, Approach to Cumulative Impact Analysis and Cumulative Projects, describes potential projects in the site vicinity. FEIR Table 4.1-1 lists 40 nearby projects considered in the FEIR cumulative impact analysis, including the construction dates of those projects. Since certification of the FEIR, some of the nearby projects have been completed and would no longer be part of the modified project cumulative scenario; others have been delayed and would now overlap with the modified project construction. In addition, new projects have been proposed both at the Southeast Plant and in the project vicinity. **Appendix A** updates the projects considered in the cumulative impact analysis for the modified project.

4.3 Existing Air Quality Conditions

In 2020, the City and County of San Francisco completed an update to the San Francisco Citywide Health Risk Assessment, which was previously prepared in 2014.[21] The 2020 assessment evaluated the cancer risks and the concentrations of particulate matter measuring 2.5 microns or less in diameter ($PM_{2.5}$) from existing known sources of air pollution including updates to vehicle activity and emissions rates, updates to maritime emissions, emissions from Caltrain and updated stationary source emissions. The 2020 assessment was used to update the air pollutant exposure zone that is referenced in San Francisco Health Code article 38 and in the Clean Construction Ordinance. The 2020 assessment and air pollutant exposure zone analysis updated the 2014 analysis that was referenced in the FEIR. This addendum analysis uses the updated 2020 Citywide Heath Risk Assessment for the existing-plus-project and cumulative health risk assessment analyses. The updated background health risks show an increase in the existing background health risks due to the changes in emissions and methodology since 2014.

4.4 Updates to CEQA Guidelines

Since FEIR certification, the CEQA Guidelines Appendix G Environmental Checklist Form has been updated to add the topics of Tribal Cultural Resources and Wildfire. Accordingly, these topics are discussed in the analysis of potential environmental effects below.

5.0 Analysis of Potential Environmental Effects

5.1 Cultural Resources

Biosolids Digester Facilities Project FEIR Findings

The Biosolids Digester Facilities Project FEIR found that the approved project would have potentially significant impacts related to the following significance criteria:

- Cause a substantial adverse change in the significance of a historical resource as defined in CEQA Guidelines Section 15064.5, including those resources listed in Article 10 or Article 11 of the San Francisco Planning Code

[21] San Francisco Department of Public Health (SF DPH), San Francisco Planning Department, and Ramboll. 2020. San Francisco Citywide Health Risk Assessment: Technical Support Documentation.

- Cause a substantial adverse change in the significance of an archeological resource pursuant to CEQA Guidelines Section 15064.5
- Disturb any human remains, including those interred outside of formal cemeteries

Historic Architectural Resources

The FEIR evaluated all buildings and structures at the Southeast Plant for eligibility for listing on the National Register of Historic Places (National Register) and the California Register of Historical Resources (California Register). The FEIR determined that a portion of the Southeast Plant, consisting of 22 buildings and structures, meets the criteria to be considered an eligible historic district and named it the Southeast Treatment Plant Streamline Moderne Industrial Historic District (as shown on FEIR Figure 4.5-2, Historic District). However, the evaluation found that none of the buildings or structures within the eligible historic district are individually significant. Additionally, the FEIR found that Buildings A and B of the Central Shops complex (outside the boundaries of, and separate from, the historic district) were individually eligible for listing on the California Register and National Register because each was an important example of Industrial Modern architecture in San Francisco.

The approved project included the demolition of all the Central Shops buildings (including Buildings A and B) to build the new digester tanks at those locations. The demolition of the Central Shops buildings was determined to be a substantial adverse change in the significance of the historical resources and required implementation of Mitigation Measure M-CR-1 (Documentation of Historic Resources and Interpretive Display). The FEIR concluded that while Mitigation Measure M-CR-1 (Documentation of Historic Resources and Interpretive Display) would reduce the severity of the impact, it would not reduce the impact to a less-than-significant level, and the demolition of the Central Shops was a significant and unavoidable impact with mitigation.

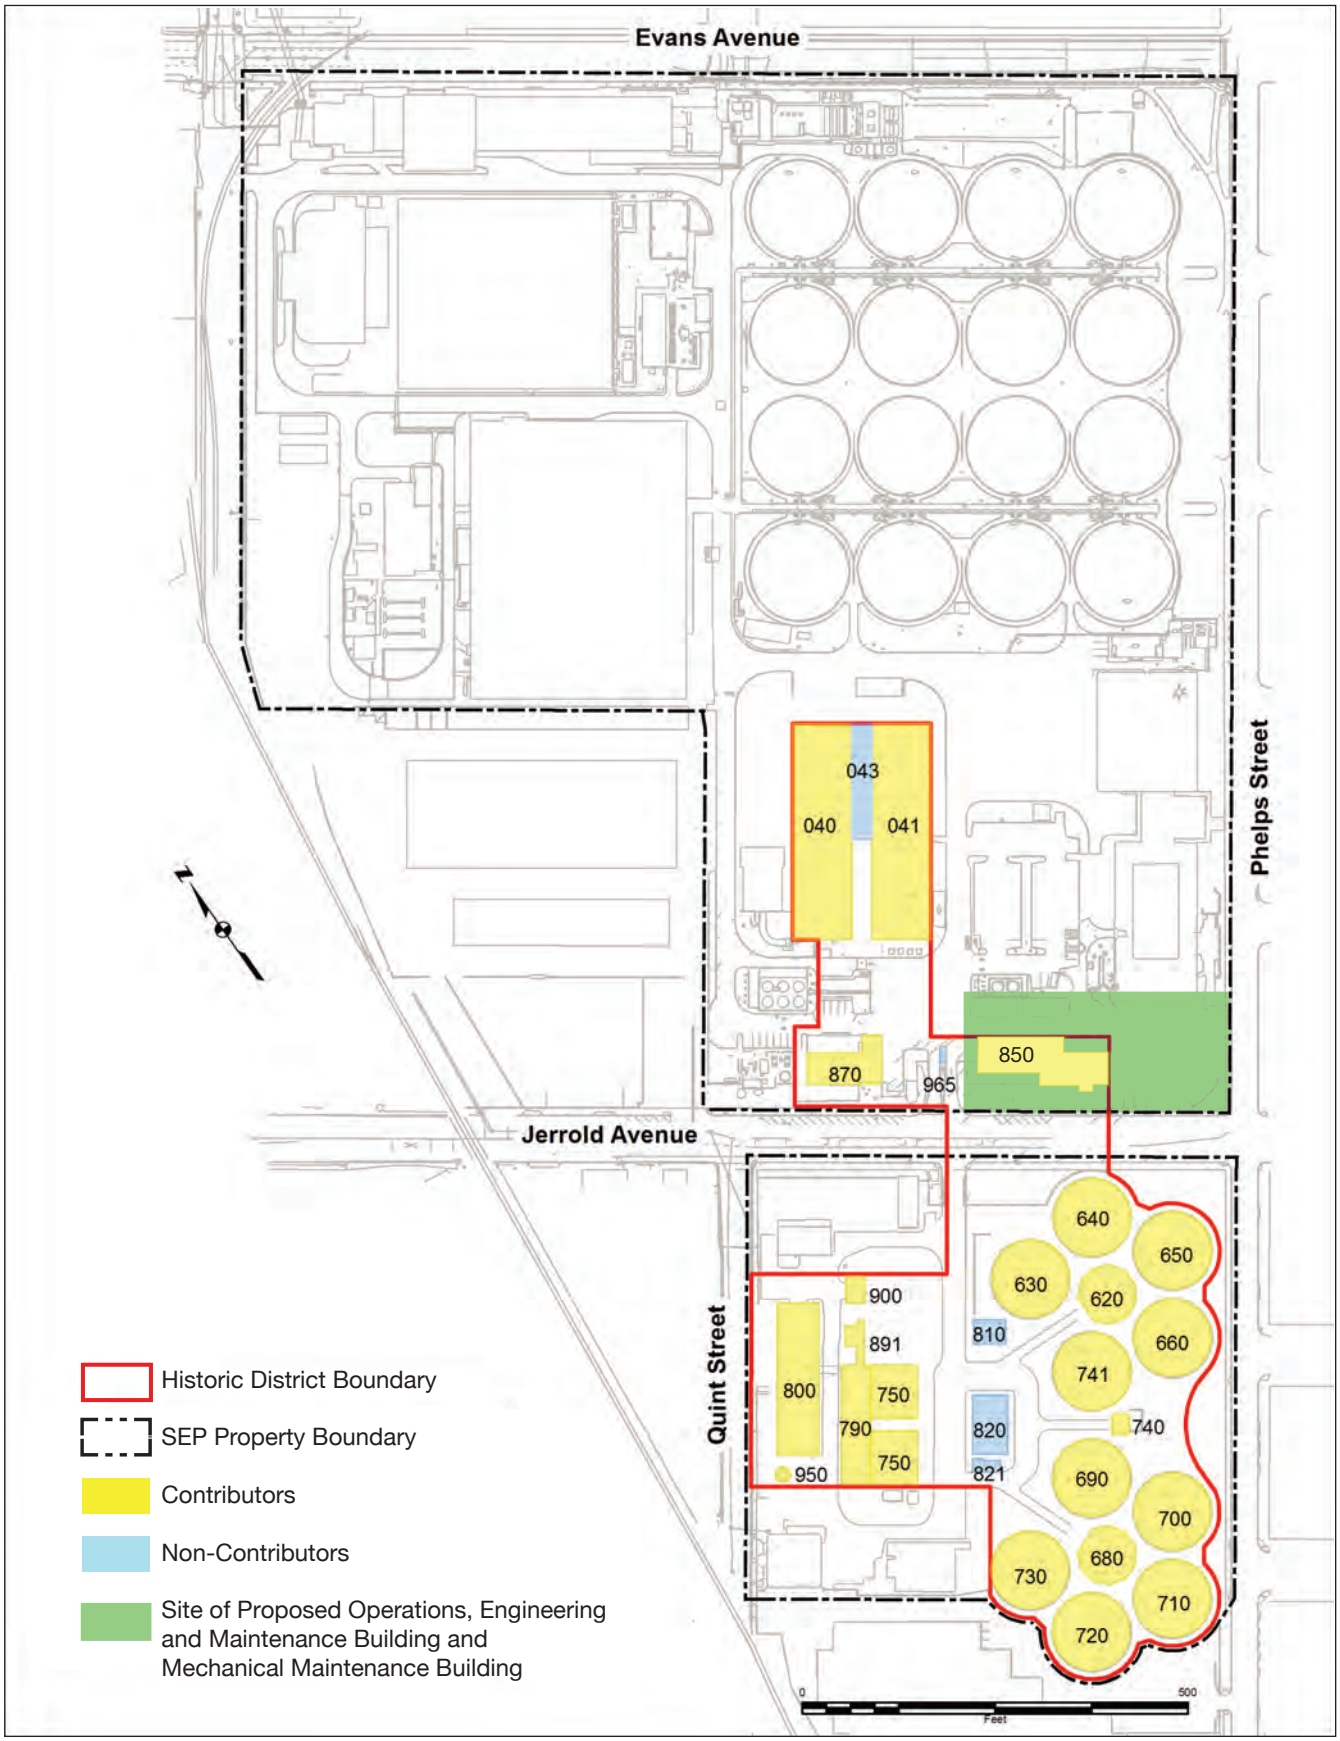
Archeological Resources

The FEIR identified the presence of previously recorded California Register- and National Register-eligible Native American archeological site CA-SFR-171 within the approved project site, including the potential presence of a deeply submerged/buried midden deposit. It also identified the potential for historic archeological resources related to a potential buried historic refuse deposit. The FEIR determined that these archeological resources could be impacted by excavation and pile drilling, but that impacts would be reduced to a less-than-significant level through implementation of Mitigation Measure M-CR-2a (Archeological Testing, Monitoring, and/or Data Recovery) and Mitigation Measure M-CR-2b (Procedures for Accidental Discovery of Archeological Resources) that require the SFPUC as directed by Planning Department's archeologists to conduct additional archeological testing prior to construction, monitoring during construction, data recovery and public interpretation if significant resources were found, and halt work and implement proper procedures to ensure appropriate treatment of significant archeological resources discovered during project implementation. Implementation of these measures also required consultation with Native American representatives and Native American monitoring during construction activities.

Human Remains

The FEIR discussed that although no known human burial locations had been identified within the approved project site during archeological investigations undertaken for the FEIR, the possibility that human remains could be encountered during earthmoving activities could not be discounted given construction would

occur within a known Native American archeological site. The FEIR concluded that potentially significant impacts on human remains would be reduced to a less-than-significant level through implementation of Mitigation Measure CR-2a (Archeological Testing, Monitoring, and/or Data Recovery), which requires that any human remains or associated or unassociated funerary objects discovered during construction be treated in compliance with applicable local, state and federal laws, including immediate notification of the Planning Department's archeologist, the Coroner of the City and County of San Francisco (Office of the Chief Medical Examiner), and the California Native American Heritage Commission in the event the Coroner determined that the human remains are Native American remains. The California State Native American Heritage Commission would appoint a Most Likely Descendant (Public Resources Code Section 5097.98). The Most Likely Descendant would provide recommendations to the SFPUC on the appropriate treatment of the remains.



Modified Project Impacts

Historic Architectural Resources

As discussed in addendum 1, building SEP 870 would not be demolished. Construction of the modified project would demolish the Operator's Building (SEP 850); two temporary, prefabricated trailers (SEP 850A and 850B); a small, paved parking lot at the north corner of Jerrold Avenue and Phelps Street, and the existing emergency generators and associated electrical equipment (SS 4A/4B, SEP 990). Of these, only building SEP 850 is a contributor to the eligible historic district, and the trailers, parking lot, generators and associated electrical equipment are located outside of the eligible historic district. Additionally, two new buildings would be constructed in the area of demolition: the two-story with mezzanine Mechanical Maintenance Building (SEP 603) and the three-story Operations, Engineering, and Maintenance Building (SEP 914). Building SEP 914 would be sited within the boundary of the eligible historic district, and building SEP 603 would be adjacent to it. **Figure 9** shows the location of the operations, engineering and maintenance buildings site relative to the historic district.

Building SEP 850 is a contributor to the eligible historic district, but it is not an individually-eligible historical resource. After demolition of building SEP 850, the remaining 21 buildings and structures that contribute to the eligible historic district would be unaffected by the modified project and would, as a whole, retain their ability to convey their significant associations with implementation of the 1935 Sewer System Master Plan and continue to be representative of the Streamline Moderne architectural style that characterized the SFPUC's original wastewater facilities.

In place of building SEP 850, the modified project would construct one new non-contributing building within the boundaries of the eligible historic district, i.e., the three-story Operations, Engineering, and Maintenance Building (SEP 914). Construction of building SEP 914 would have a less-than-significant impact on the eligible historic district, as the vast majority of the eligible historic district would remain intact. Although the number of non-contributors within the eligible historic district would increase from four to five after completion of the modified project, the district would retain a relatively high ratio of 21 contributors to five non-contributors. In addition, introduction of the proposed modifications to the eligible historic district would be a less-than-significant impact because, after 1952, the original master plan was abandoned, and buildings of different architectural types were already introduced over time and were sited based on individual project objectives, rather than on the original master plan. Further, the new building SEP 914 would be of similar scale to the existing buildings, would be inside the wall on the north side of Jerrold Avenue away from and minimally visible from the main SEP South complex where most of the contributory

2020\D202000990.07 - SEP Trades and Maintenance Buildings\05 Graphics-GIS-Modeling\Illustrator

Operations, Engineering, and Maintenance Buildings

Figure 9
Southeast Treatment Plant Streamline Moderne Industrial Historic District

buildings are located, and would be constructed on the edge of the district boundary as opposed to its center. Therefore, the modified project would not significantly impact the historic integrity of the eligible historic district.

Other new construction associated with the modified project would occur outside of the eligible historic district. All new construction would occur at least 50 feet from the other district contributors. This distance would provide a sufficient physical and visual buffer between the new buildings and the historical resource (i.e., the eligible historic district) to ensure that no other significant, indirect impacts would occur as a result of construction. For additional information, see the analysis in Section 5.4, Noise and Vibration.

Furthermore, in December 2024, planning department preservation staff determined that the modified project would not result in any new or substantially more severe impacts on the eligible historic district that were not previously disclosed in the environmental review for the approved project (**Appendix C**). As such, the removal of building SEP 850 would have a less-than-significant impact on the overall significance and historic integrity of the eligible historic district.

Archeological Resources

The FEIR identified the presence of previously recorded California Register- and National Register-eligible Native American archeological site CA-SFR-171 within the approved project site, and the proposed modifications overlap with a small area of the eastern portion of the site. Far Western Anthropological Research Group, Inc. (Far Western) conducted a geoarcheological investigation in 2021 that revealed a stratum of artificial fill that extended to depths of 14 feet to as much as 21 feet below surface in the modified project footprint. Redeposited shell midden was encountered at depths that ranged between 14 and 18 feet below surface. The midden stratum was underlain by bay and peat deposits and then by an intact layer of buried surface soil, ("A horizon"[22]) the surface of which was encountered at depths ranging between 18 and 23 feet below surface.

Grading and trenching for the modified project would be confined to the artificial fill stratum, while the proposed piles would penetrate both the redeposited midden and the buried A Horizon. The planning department's archeologists have determined that the redeposited midden did not contribute to the significance of nearby site CA-SFR-171. On this basis, construction of the modified project would not result in significant impacts on CA-SFR-171.[23] Based on the deposit's distribution as revealed through testing and data recovery, the modified project's potential for significant incremental effects to CA-SFR-171 is low.

Given the very small size and relatively limited number of samples provided by the geoarcheological cores in the modified project site, there remains the potential that pockets of intact midden or lenses of buried/submerged midden, undetected in relatively widely spaced coring in the vicinity, could be present. It is unlikely that such materials would be exposed in the proposed shallow grading and excavation. However, artifacts that could be significant diagnostically and/or human remains potentially could be brought to the surface in spoils from pile construction. Such impacts on archaeological resources would be potentially significant. However, with implementation of **Mitigation Measure M-CR-2b (Procedures for Accidental Discovery of Archeological Resources)** as presented below in full, which halts work and implements proper

[22] In developed soils, the A horizon is the shallow soil that contains organic matter (humus), indicative of the influence of air, plants and other soil organisms.

[23] Vanderslice, Allison, Email to Kelly Yong, SF Water. From Allison Vanderslice, CEQA Cultural Resources Team Manager, Environmental Planning Division. August 8, 2024.

procedures for appropriate treatment of significant archeological resources discovered, impacts would be reduced to a less-than-significant level.

Mitigation Measure M-CR-2b: Accidental Discovery of Archeological Resources

The following mitigation measure is required to avoid any potential adverse effect from the project on accidentally discovered buried or submerged historical resources as defined in CEQA Guidelines Section 15064.5(a) and (c). The project sponsor shall distribute the Planning Department archeological resource "ALERT" sheet to the project prime contractor; to any project subcontractor (including demolition, excavation, grading, foundation, pile installation, etc. firms); or utilities firm involved in soils disturbing activities within the project site. Prior to any soils disturbing activities being undertaken each contractor is responsible for ensuring that the "ALERT" sheet is circulated to all field personnel including machine operators, field crew, pile drivers, supervisory personnel, etc.

A preconstruction training shall be provided to all construction personnel by a qualified archeologist prior to their starting work on the project. The training may be provided in person or using a video and include a handout prepared by the qualified archeologist. The video and materials shall be reviewed and approved by the ERO and the SFPUC. The purpose of the training is to enable personnel to identify archeological resources that may be encountered and to instruct them on what to do if a potential discovery occurs. Images or video of expected archeological resource types and archeological testing and data recovery methods should be included in the training. As possible, video or images should utilize archeological investigations that have occurred at the project site. The training should also include general information about the known archeological resources identified within the project site.

The project sponsor shall provide the Environmental Review Officer (ERO) with a signed affidavit from the responsible parties (prime contractor, subcontractor[s], and utilities firm) to the ERO confirming that all field personnel have received copies of the Alert Sheet and have taken the preconstruction training.

Should any indication of an archeological resource be encountered during any soils disturbing activity of the project, the project Head Foreman and/or project sponsor shall immediately notify the ERO and the SFPUC and shall immediately suspend any soils disturbing activities in the vicinity of the discovery until the ERO, in coordination with the SFPUC, has determined what additional measures should be undertaken.

If the ERO determines that the find may represent an archeological resource, the project sponsor shall retain the services of an archeological consultant. The archeological consultant shall advise the ERO and the SFPUC as to whether the discovery is an archeological resource, retains sufficient integrity, and is of potential scientific/historical/cultural significance. If an archeological resource is present, the archeological consultant shall identify and evaluate the archeological resource. The archeological consultant shall make a recommendation as to what action, if any, is warranted. Based on this information, the ERO may require, if warranted, specific additional measures to be implemented by the project sponsor.

Measures might include: preservation in situ of the archeological resource; an archeological monitoring program; or an archeological testing program. If an archeological monitoring program or

archeological testing program is required, it shall be consistent with the Environmental Planning (EP) division guidelines for such programs. The ERO may also require that the project sponsor immediately implement a site security program if the archeological resource is at risk from vandalism, looting, or other damaging actions.

The project archeological consultant shall submit a Final Archeological Resources Report (FARR) to the ERO and the SFPUC that evaluates the historical significance of any discovered archeological resource and describing the archeological and historical research methods employed in the archeological monitoring/data recovery program(s) undertaken. Information that may put at risk any archeological resource shall be provided in a separate removable insert within the final report.

Copies of the Draft FARR shall be sent to the ERO for review and approval and concurrently to the SFPUC for review and comment. Once approved by the ERO, copies of the FARR shall be distributed as follows: California Archaeological Site Survey Northwest Information Center (NWIC) shall receive one (1) copy and the ERO shall receive a copy of the transmittal of the FARR to the NWIC. The Environmental Planning division of the Planning Department shall receive one bound copy, one unbound copy and one unlocked, searchable PDF copy on CD, three copies of the FARR along with copies of any formal site recordation forms (CA DPR 523 series) and/or documentation for nomination to the National Register of Historic Places/California Register of Historical Resources. In instances of high public interest or interpretive value, the ERO may require a different final report content, format, and distribution than that presented above.

Human Remains

No human burial locations have been identified during construction of the approved project to date, and none have been identified within the modified project site during archeological investigations undertaken for the approved project. However, the possibility that human remains could be encountered during earthmoving activities cannot be discounted, which would be a potentially significant impact. With implementation of Mitigation Measure M-CR-2b (Procedures for Accidental Discovery of Archeological Resources) as discussed above, which requires that any human remains or associated or unassociated funerary objects discovered during construction be treated in compliance with applicable local, state and federal laws, impacts would be reduced to a less-than-significant level.

Like the approved project, the modified project operations would not affect historic architectural or archeological resources, including human remains.

Conclusion

In summary, with implementation of Mitigation Measure M-CR-2b (Procedures for Accidental Discovery of Archeological Resources), the modified project would not result in significant impacts on cultural resources greater than those identified in the FEIR. Moreover, the modified project would not result in new significant impacts on cultural resources that were not previously identified in the FEIR; would not result in more severe impacts than those identified; and would not require new mitigation measures.

Cumulative Impacts

Historic Architectural Resources

The FEIR identified the geographic scope of cumulative effects on historic architectural resources to be the Southeast Plant and the boundaries of the eligible historic district. The FEIR determined that demolition of building SEP 870 in combination with cumulative projects including the Demolition of the Existing SEP Digesters and Southside Renovation Project would result in a significant and unavoidable cumulative impact on the eligible historic district, even with implementation of Mitigation Measure M-CR-1 (Documentation of Historic Resources and Interpretive Display), because the majority of contributory buildings would be demolished and mitigation would not abate this impact. The project's contribution was determined to be cumulatively considerable.

As discussed in Section 4.2, Cumulative Projects in the Site Vicinity, and presented in Appendix A, several new projects have been proposed at the Southeast Plant since the certification of the FEIR. The following projects could result in cumulative impacts on historic architectural resources due to their location within the eligible historic district and/or the Southeast Plant:

- *HVAC and Mechanical Upgrades* – This project would repair and replace various HVAC equipment and mechanical systems at the Southeast Plant. No changes would be made to historical resources.
- *Maintenance Building (SEP 940) Interim Improvement* – This project would modify Building 940 (located outside the eligible historic district) to include interim shop areas, HVAC improvements, and health and safety improvements.

The projects at the Southeast Plant are not expected to result in significant impacts on historic architectural resources.

As with the approved project, the modified project would contribute to a significant cumulative impact on historic architectural resources because the modified project continues to allow for the eventual demolition of the existing digesters and control building, and in combination with cumulative projects (in particular the Southside Renovation Project) would demolish 13 of the 22 contributors to the eligible historic district.[24] Because cumulative impacts on historic architectural resources would be the same as those identified in the FEIR, implementation of **Mitigation Measure M-CR-1 (Documentation of Historic Resources and Interpretive Display)** would be required but would not reduce the severity of the cumulative impact to a less-than-significant level. Adopted Mitigation Measure M-CR-1 has been modified as shown below to reflect the planning department's current professional best practice and to clarify the measure's applicability to the remaining historic resources on the site.[25] The proposed modifications do not reflect an increased impact on the historic district because overall the modified project would substitute demolition of one contributor (Building 870) with demolition of another contributor (Building 850).[26] Deletions are shown in strikethrough and additions in double underline. The cumulative impact on the eligible historic district would be significant and unavoidable with mitigation.

[24] Refer to FEIR page 4.5-56.

[25] Documentation of the Central Shops is complete.

[26] The FEIR Project included demolition of Building 870, which the approved project would no longer demolish (SFPUC Biosolids Digester Facilities Minor Project Modification 10 – Modified Facilities, reviewed by San Francisco Planning Department February 2, 2021).

Mitigation Measure M-CR-1: Documentation of Historic Resources and Interpretive Display. Prior to demolition of any individual historic resource or contributor to a historic district, the SFPUC shall submit to the planning department for review photographic and narrative documentation of the individual historic resource or district contributor. ~~retain~~ The documentation shall be funded by the SFPUC and undertaken by a qualified professional who meets the standards for history, architectural history, or architecture (as deemed appropriate by the department's preservation staff), as set forth by the Secretary of the Interior's Professional Qualification~~s~~ Standards ~~for Architectural History to prepare written and photographic documentation of the Central Shops~~ (36 Code of Federal Regulations, part 61). The documentation scope ~~effort~~ shall be reviewed and approved by the department prior to any work on the documentation. A documentation package shall consist of the required forms of documentation and shall include a summary of the historic resource and an overview of the documentation provided. Documentation of the building should include the following:

- *HABS/HALS-Like Measured Drawings* – A set of Historic American Buildings/Historic American Landscapes Survey-like (HABS/HALS-like) measured drawings that depict the existing size, scale, and dimension of the subject property. The department's preservation staff will accept the original architectural drawings or an as-built set of architectural drawings (plan, section, elevation, etc.). Copies of building plans gathered from the prior evaluations of the Biosolids Digester Facilities Project can be reused and reformatted for this effort. The department's preservation staff will assist the consultant in determining the appropriate level of measured drawings. A cover sheet may be required that describes the historic significance of the property. ~~based on the National Park Service (NPS) Historic American Building Survey (HABS)/Historic American Engineering Record (HAER) Historical Report Level II Guidelines, and NPS's policy for photographic documentation as outline in the National Register of Historic Places and National Historic Landmarks Survey Photo Policy Expansion.~~
- The written historical data for this documentation shall follow HABS/~~HAER~~HALS standards. Efforts shall be made to locate original construction drawings or plans ~~of the Central Shops~~. If located, these drawings shall be reproduced and included in the dataset. Historical information, as well as copies of building plans gathered from the prior evaluations of the SEP ~~and Central Shops~~, can be reused and reformatted for this effort.
- *HABS/HALS-Like Photographs* – Digital photographs of the interior and the exterior of the individual historic resource or district contributor. Large-format negatives are not required. The scope of the digital photographs shall be reviewed by the department's preservation staff for concurrence, and all digital photography shall be conducted according to current National Park Service standards. The photography shall be undertaken by a qualified professional with demonstrated experience in HABS photography. ~~Digital photography shall be used. The ink and paper combinations for printing photographs shall be in compliance with National Register-National Historic Landmark (NR-NHL) Photo Policy Expansion[22] and have a permanency rating of approximately 115 years. Digital photographs shall be taken as uncompressed, Tagged Image File Format (TIFF) files. Each image shall be 1,600 by 1,200 pixels at 330 pixels per inch (ppi) or larger in size, color format, and printed in black and white. The file name for each electronic image shall correspond with the index of photographs and photograph label.~~ Photograph views for the dataset shall include (a) contextual views; (b) views of each side of each building and interior views, where possible; (c) oblique views of buildings; and (d) detail views of character-

defining features. All views shall be referenced on a photographic key. This photographic key shall be on a map of the property and shall show the photograph number with an arrow to indicate the direction of the view. Historic photographs shall also be collected, reproduced, and included in the dataset.

The SFPUC shall reach out to the following repositories to determine if they would like copies of the documentation and to assess the documentation format (digital or hard copy) preferred: ~~transmit the datasets as hardcopies on archival paper and in electronic PDF format to the~~ History Room of the San Francisco Public Library, ~~the San Francisco Planning Department,~~ the archives of the San Francisco Public Utilities Commission, and to the Northwest Information Center of the California Historical Information Resource System. ~~The SFPUC shall scope the documentation measures with San Francisco Planning Department Preservation staff.~~ Preservation staff shall also review and approve the submitted documentation for adequacy.

In addition, the SFPUC shall provide a permanent display of interpretive materials (which may include, but are not limited to, a display of photographs, a brochure, educational website, or an exhibitive display) concerning the history and architectural features of the individual historic resource or district contributor~~Central Shops~~. Development of the interpretive materials shall be supervised by an architectural historian or historian who meets the Secretary of the Interior's Professional Qualification Standards. The interpretative materials shall be placed in a prominent, public setting. A proposal describing the general parameters of the interpretive materials shall be approved by Planning Department Preservation staff prior to construction completion. The substance, media, and other elements of such interpretive display shall be approved by Planning Department Preservation staff prior to completion of the project.

Archaeological Resources and Human Remains

The FEIR identified the geographic scope of cumulative effects on archeological resources and human remains to be the immediate vicinity of locations where the approved project would cause ground disturbance. It also determined that the approved project in combination with cumulative projects could result in a significant cumulative impact on buried archeological resources due to the extent of excavation required, but that with implementation of Mitigation Measures M-CR-2a and M-CR-2b the approved project's contribution to cumulative impacts would not be considerable.

As discussed in Section 4.2, Cumulative Projects in the Site Vicinity, and presented in Appendix A, the list of potential cumulative projects at the Southeast Plant has been revised since the certification of the FEIR. The following projects could result in cumulative impacts to archaeological resources and human remains due to their location within the Southeast Plant and potential for ground disturbance:

- Southeast Plant Headworks Replacement Project
- SEP Power Feed and Primary Switchgear Upgrades

The cumulative ground disturbance of the modified project and cumulative projects in the vicinity could cause potentially significant cumulative impacts on archeological resources. As with the approved project, the modified project's contribution to impacts on archeological resources and human remains could be cumulatively considerable because, as discussed above, the modified project would expand the area of ground disturbance and there remains the potential that pockets of intact midden or lenses of

buried/submerged midden, undetected in relatively widely spaced coring in the vicinity, could be present in the expanded area. However, implementation of Mitigation Measure M-CR-2b (Procedures for Accidental Discovery of Archeological Resources) as discussed previously would require implementation of legally required appropriate treatment of human remains as well as actions to follow in the event of an inadvertent discovery of archeological materials. Therefore, with implementation of Mitigation Measure M-CR-2b, the modified project's contribution to cumulative impacts would not be considerable, and the impact would be less than significant with mitigation.

Conclusion

In summary, with implementation of Mitigation Measures M-CR-1 and M-CR-2b, the modified project would not result in significant impacts on cultural resources greater than those identified in the FEIR. Moreover, the modified project would not result in new significant impacts on cultural resources that were not identified in the FEIR; would not result in more severe impacts than those identified; and would not require new mitigation measures.

5.2 Tribal Cultural Resources

The Biosolids Digester Facilities Project FEIR did not analyze tribal cultural resources as this topic was not yet mandated for inclusion under CEQA. As defined in Public Resources Code section 21074, a Tribal Cultural Resource is either a site, feature, place, or cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:

a) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k), or

b) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resources Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.

Construction

As discussed in Section 5.1, Cultural Resources, under Archaeological Resources, archeological site CA-SFR-171 was found eligible for the National Register and California Register. Based on previous consultation with local California Native American tribal representatives undertaken by the San Francisco Planning Department, all Native American archeological resources have cultural value to tribal representatives and are considered to be Tribal Cultural Resources. As such CA-SFR-171 is considered to be a Tribal Cultural Resource. As required under Mitigation Measure M-CR-2a (Archeological Testing, Monitoring, and/or Data Recovery) and discussed in the Cultural Resources section above, an archeological data recovery program has been implemented, and Native American monitoring was undertaken as part of the effort. Native American monitoring and consultation will continue throughout construction as required by Mitigation Measure M-CR-2a. Cultural sensitivity training by a local Native American representative will also be included in tandem with archeological awareness and accidental discovery training for construction crews.

Additionally, as requested through prior consultation with local Native American tribal representatives, a public interpretation program is one means to memorialize the cultural value of the tribal cultural resource

while also educating the public concerning Native American lifeways, both past and present. On September 1, 2021, the San Francisco Planning Department sent letters to local California Native American representatives providing information on CA-SFR-171 and asking if they would like to consult on a public interpretation program. Based on the responses received, the Planning Department and SFPUC are in the process of developing a public interpretation program with the Association of Ramaytush Ohlone, which will include both an onsite interpretative component as well as a nearby offsite component in a more publicly accessible location. Therefore, project impacts on tribal cultural resources would be less than significant with the implementation of tribal consultation on the archeological investigations of CA-SFR-171, and of a public interpretation program that is currently under preparation in consultation with the Native American community, as required under **Mitigation Measure M-CR-2a (Archeological Testing, Monitoring, and/or Data Recovery)**. Implementation of Mitigation Measure M-CR-2a, as presented below in full, would reduce impacts to less-than-significant levels.

> **Mitigation Measure M-CR-2a. Archeological Testing, Monitoring, and/or Data Recovery**
>
> Based on the results of the project Archeological Research Design and Treatment Plan[27] (ARDTP), legally-significant prehistoric archeological resources are present within the archeological C-APE. The following measures shall be undertaken to avoid any potentially significant adverse effects from the project on an historical resource under CEQA. The SFPUC shall retain the services of a qualified archeological consultant(s), based on standards developed by the City and County of San Francisco Environmental Review Officer (ERO). The archeological consultant(s) shall have demonstrated experience in geoarcheology and historical archeology. The archeological consultant shall implement archeological testing and other treatment as specified in the project ARDTP, as detailed below, which shall include archeological monitoring and data recovery as required pursuant to findings of ongoing testing and this measure. The archeological consultant's work shall be conducted in accordance with this measure and with the requirements of the project ARDTP at the direction of ERO or its designated representative and in coordination with the SFPUC. In instances of inconsistency between the requirement of the project ARDTP and of this archeological mitigation measure, the requirements of this archeological mitigation measure shall prevail. Project design changes after finalizing the ARDTP eliminated the portion of the C-APE that was identified in the ARDTP as sensitive for historical archeological resources. Testing as discussed below for historical archeological resources shall only be required if future design changes call for excavation in that location. If future project design changes further revise other parts of the C-APE, then testing shall only be required in archeologically sensitive areas that potentially would be adversely affected by project implementation. All plans and reports prepared by the consultant as specified herein shall be submitted directly to the ERO for review and comment and concurrently to the SFPUC for review and comment, and shall be considered draft reports, subject to revision until final approval by the ERO. Archeological monitoring and/or data recovery programs required by this measure could suspend construction of the affected area of the project for up to a maximum of four weeks. At the direction of the ERO, the suspension of construction can be extended beyond four weeks only if such a suspension is the only feasible means to reduce to a less-than-significant level potential effects on a significant archeological resource as defined in CEQA Guidelines Section 15064.5 (a) and (c).

[27] Byrd, Brian F., Philip Kaijankoski, Rebecca Allen, and Matthew Russell, Archaeological Research Design and Treatment Plan for the Biosolids Digester Facility Project, Southeast Water Pollution Control Plant, San Francisco, California. Prepared for San Francisco Public Utilities Commission, October, 2016.

Consultation with Descendant Communities. On discovery of an archeological site[28] associated with descendant Native Americans, the Overseas Chinese, or other potentially interested descendant group, an appropriate representative[29] of the descendant group, the ERO, and the SFPUC shall be contacted. The representative of the descendant group shall be given the opportunity to monitor archeological field investigations of the site and to offer recommendations to the ERO and SFPUC regarding appropriate archeological treatment of the site, of recovered data from the site, and, if applicable, any interpretative treatment of the associated archeological site. A copy of the Final Archeological Resources Report shall be provided to the representative of the descendant group.

Archeological Testing Program–Prehistoric Archeology. Depending on the results of on-going prehistoric archeological testing outlined in the project ARDTP, additional testing may be required to define site boundaries of CA-SFR-171 or other prehistoric deposits at the SEP, and to assess whether redeposited and/or reworked prehistoric archeological material identified in the project ARDTP within the C-APE has sufficient integrity to contribute to the significance of known resources at SEP. At the direction of the ERO and in coordination with SFPUC, additional testing may be rolled into a subsequent data recovery program (see below).

Archeological Testing Program–Historical Archeology. If future design changes would affect the area identified as sensitive for historical archeological resources, the archeological consultant shall implement the historical archeological testing plan outlined in the project ARDTP for potential historical archeological resources that could be adversely affected by the project. The archeological testing program shall be conducted in accordance with the approved ARDTP. The project ARDTP identifies the property types of the expected archeological resource(s) that could be adversely affected by the project, the testing method to be used, and the locations recommended for testing. The purpose of the archeological testing program will be to determine to the extent possible the presence or absence of historical archeological resources and to identify and to evaluate whether any archeological resource encountered on the site constitutes an historical resource under CEQA.

If future project design changes further alter the C-APE from what is identified in the ARDTP, then the archeological consultant shall prepare and submit to the ERO for review and approval an archeological testing plan (ATP) for both prehistoric and historical archeological resources to address any area added to the C-APE to accommodate the project design changes. The archeological testing program shall be conducted in accordance with the approved ATP. The ATP shall identify the property types of the expected archeological resource(s) that potentially could be adversely affected by the project, the testing method to be used, and the locations recommended for testing. The purpose of the archeological testing program will be to determine to the extent possible the presence or absence of archeological resources and to identify and to evaluate whether any archeological resource encountered on the site constitutes an historical resource under CEQA.

At the completion of the archeological testing program, as required, the archeological consultant shall submit a written report of the findings to the ERO and the SFPUC. If based on the archeological testing program the archeological consultant finds that significant archeological resources may be

[28] The term "archeological site" is intended here to minimally include any archeological deposit, feature, burial, or evidence of burial.

[29] An "appropriate representative" of the descendant group is here defined to mean, in the case of Native Americans, any individual listed in the current Native American Contact List for the City and County of San Francisco maintained by the California Native American Heritage Commission and in the case of the Overseas Chinese, the Chinese Historical Society of America. An appropriate representative of other descendant groups should be determined in consultation with the Department archeologist.

present, the ERO in consultation with the archeological consultant and coordination with the SFPUC shall determine if additional measures are warranted. Additional measures that may be undertaken include additional archeological testing, archeological monitoring, and/or an archeological data recovery program. No archeological data recovery shall be undertaken without the prior approval of the ERO or the Planning Department archeologist. If the ERO determines that a significant archeological resource is present and that the resource could be adversely affected by the project, at the discretion of the SFPUC either:

A) The project shall be re-designed so as to avoid any adverse effect on the significant archeological resource; or

B) An archeological data recovery program shall be implemented, unless the ERO determines that the archeological resource is of greater interpretive than research significance and that interpretive use of the resource is feasible.

Archeological Monitoring Program. Preparation of an archeological monitoring program (AMP) may be required prior to project construction depending on the results of the prehistoric and historical archeological testing programs outlined above. If the ERO in consultation with the archeological consultant determines that an archeological monitoring program shall be implemented, the archeological monitoring program shall minimally include the following provisions:

- The archeological consultant, SFPUC, and ERO shall meet and consult on the scope of the AMP reasonably prior to commencement of any project-related soils disturbing activities. The ERO in consultation with the archeological consultant shall determine what project activities shall be archeologically monitored based on the results of pre-construction archeological testing currently approved and underway or planned, and archeological sensitivity assessment based on the results of that testing;
- The archeological consultant shall advise all project contractors to be on the alert for evidence of the presence of the expected resource(s), of how to identify the evidence of the expected resource(s), and of the appropriate protocol in the event of discovery of a potential archeological resource;
- The archeological monitor(s) shall be present on the project site according to a schedule agreed upon by the archeological consultant and the ERO or until the ERO has, in consultation with project archeological consultant, otherwise determined that project construction activities could have no effects on significant archeological deposits and monitoring can conclude;
- The archeological monitor shall record and be authorized to collect soil samples and artifactual/ecofactual material as warranted for analysis;
- If an intact archeological deposit is encountered, all soils-disturbing activities in the vicinity of the deposit shall cease. The archeological monitor shall be empowered to temporarily redirect demolition/excavation/construction activities and equipment until the deposit is evaluated. The archeological consultant shall immediately notify the ERO and the SFPUC of the encountered archeological deposit. The archeological consultant shall make a reasonable effort to assess the identity, integrity, and significance of the encountered archeological deposit, and present the findings of this assessment to the ERO and the SFPUC.

Whether or not significant archeological resources are encountered, the archeological consultant shall submit a written report of the findings of the monitoring program to the ERO and the SFPUC.

Archeological Data Recovery Program. An archeological data recovery program shall be implemented in accord with an archeological data recovery plan (ADRP). The ADRP shall incorporate (1) programmatic-level procedures for deeply buried prehistoric archeological deposits; (2) site-specific procedures for identified prehistoric archeological deposits; (2) and site-specific procedures for historical archeological deposits (as warranted).

The archeological consultant, SFPUC, and ERO shall meet and consult on the scope of the ADRP prior to preparation of a draft ADRP. The archeological consultant shall submit a draft ADRP to the ERO and SFPUC. The ADRP shall identify how the proposed data recovery program will preserve the significant information the archeological resource is expected to contain. That is, the ADRP shall identify what scientific/historical research questions are applicable to the expected resource, what data classes the resource is expected to possess, and how the expected data classes would address the applicable research questions. Data recovery, in general, should be limited to the portions of the historical resource that could be adversely affected by the project. Destructive data recovery methods shall not be applied to portions of the archeological resources if non-destructive methods are practical.

The scope of the ADRP shall include the following elements:

- *Field Methods and Procedures*. Descriptions of proposed field strategies, procedures, and operations for the following elements:

    1) Programmatic-level procedures for deeply buried prehistoric archeological deposits potentially uncovered during excavation for deep foundations (e.g., driven, drilled, or augured piles).

    2) Site-specific procedures for known/identified prehistoric archeological deposits potentially affected by project excavation activities (e.g. CA-SFR-171).

    3) Site-specific procedures for historical archeological deposits (as warranted) potentially affected by project excavation activities.

- *Cataloguing and Laboratory Analysis*. Description of selected cataloguing system and artifact analysis procedures.
- *Discard and Deaccession Policy*. Description of and rationale for field and post-field discard and deaccession policies.
- *Interpretive Program*. Consideration of an on-site/off-site public interpretive program during the course of the archeological data recovery program.
- *Security Measures*. Recommended security measures to protect the archeological resource from vandalism, looting, and non-intentionally damaging activities.
- *Final Report*. Description of proposed report format and distribution of results.
- *Curation*. Description of the procedures and recommendations for the curation of any recovered data having potential research value, identification of appropriate curation facilities, and a summary of the accession policies of the curation facilities.

Human Remains and Associated or Unassociated Funerary Objects. The treatment of human remains and of associated or unassociated funerary objects discovered during any soils disturbing activity, in the context of an archeological deposit or in isolation, shall comply with applicable state and federal laws. This shall include immediate notification of the Coroner of the City and County of San Francisco and in the event of the Coroner's determination that the human remains are Native American remains, notification of the California State Native American Heritage Commission (NAHC) who shall appoint a Most Likely Descendant (MLD) (PRC Section 5097.98). PRC 5097.98 indicates that " The descendants shall complete their inspection and make their recommendation within 48 hours of their notification by the Native American Heritage Commission." The archeological consultant, SFPUC, ERO, and MLD shall have up to but not beyond six days of discovery to make all reasonable efforts to develop an agreement for the treatment of human remains and associated or unassociated funerary objects with appropriate dignity (CEQA Guidelines Section 15064.5[d]). The agreement should take into consideration the appropriate excavation, removal, recordation, analysis, custodianship, curation, and final disposition of the human remains and associated or unassociated funerary objects. Nothing in existing State regulations or in this mitigation measure compels the SFPUC and the ERO to accept recommendations of an MLD. The archeological consultant shall retain possession of any Native American human remains and associated or unassociated burial objects until completion of any scientific analyses of the human remains or objects as specified in the treatment agreement if such as agreement has been made or, otherwise, as determined by the archeological consultant and the ERO.

Final Archeological Resources Report. The archeological consultant shall submit a Draft Final Archeological Resources Report (FARR) to the ERO and SFPUC that evaluates the historical significance of any discovered archeological resource and describes the archeological and historical research methods employed in the archeological testing/monitoring/data recovery program(s) undertaken. The FARR shall include new updated DPR forms, as applicable. Information that may put at risk any archeological resource shall be provided in a separate removable insert within the final report.

Once approved by the ERO, copies of the FARR shall be distributed as follows: Northwest Information Center (NWIC) of the California Historical Resources Information System shall receive one (1) copy and the ERO shall receive a copy of the transmittal of the FARR to the NWIC. The Environmental Planning division of the Planning Department shall receive one bound, one unbound and one unlocked, searchable PDF copy on CD of the FARR along with copies of any formal site recordation forms (CA DPR 523 series) and/or documentation for nomination to the National Register of Historic Places/California Register of Historical Resources. In instances of high public interest in or the high interpretive value of the resource, the ERO may require a different final report content, format, and distribution than that presented above.

Operation

Like the approved project, modified project operations would have no impact on tribal cultural resources.

Conclusion

In summary, with implementation of Mitigation Measure M-CR-2a (Archeological Testing, Monitoring, and/or Data Recovery), construction and operation of the modified project would not result in significant impacts on tribal cultural resources and would not require new mitigation measures.

Cumulative Impacts

The same geographic scope for cumulative impacts addressed in Section 5.1, Cultural Resources, applies to tribal cultural resources, which is the immediate vicinity of locations where the approved project would cause ground disturbance. As discussed in Section 4.2, Cumulative Projects in the Site Vicinity, and presented in Appendix A, the list of potential cumulative projects at the Southeast Plant has been revised since the certification of the FEIR. The following projects could result in cumulative impacts on tribal cultural resources due to their location within the Southeast Plant and potential for ground disturbance:

- Southeast Plant Headworks Replacement Project
- SEP Power Feed and Primary Switchgear Upgrades

Excavation for these projects is largely completed and has not exposed significant buried archaeological or tribal cultural resources to date. The cumulative ground disturbance of the modified project and cumulative projects in the vicinity could cause significant cumulative impacts on tribal cultural resources because the modified project would expand the area of ground disturbance and there remains the potential that pockets of intact midden or lenses of buried/submerged midden, undetected in relatively widely spaced coring in the vicinity, could be present in the expanded area. The modified project's contribution to cumulative impacts on tribal cultural resources would not be considerable with implementation of the public interpretation program that is currently under preparation in consultation with the Native American community as required under Mitigation Measure M-CR-2a (Archeological Testing, Monitoring, and/or Data Recovery).

5.3 Transportation and Circulation

Biosolids Digester Facilities Project FEIR Findings

The FEIR found that the approved project would have less than significant impacts related to the following significance criteria regarding transportation and circulation:

- Conflict with an applicable plan, ordinance, or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation, including mass transit, non-motorized travel, and relevant components of the circulation system (including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit);
- Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment);
- Result in inadequate emergency access; or
- Conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities.

The FEIR determined that, due to location, the approved project would have no impact to change air traffic patterns. The FEIR also determined that the approved project would not permanently affect any roadways or highways included in the San Francisco Congestion Management Program, and therefore would have no impact related to conflict with an applicable congestion management program. These criteria were not addressed further in the FEIR.

Construction

The FEIR evaluated whether construction-related traffic comprised of truck and worker trips to and from the approved project site and staging areas, as well as detours and road closures could interfere with pedestrian, bicycle, or vehicle circulation; increase potential traffic hazards; or cause inadequate emergency vehicle access. The FEIR found that even during the periods of maximum truck demand (71 daily trucks and 212 daily construction workers) or maximum construction worker demand (28 daily trucks and 550 daily construction workers), the project would not result in significant impacts related to traffic circulation, interfere with pedestrian or bicycle circulation, or their accessibility to adjoining areas, that the reroute of the 23 Monterey would not substantially affect accessibility to public transit or transit operations, and that emergency vehicles would not be substantially affected by the temporary closure of a two-block segment of Jerrold Avenue. The FEIR also determined that construction related activities would not affect nearby freight rail operation or parking conditions.

Regarding traffic safety hazards, as discussed in the FEIR, the approved project includes establishing a site-specific Traffic Control Plan that conforms to the SFMTA's Blue Book, which requires the implementation of construction safety measures like proper advance warning and detour signage, identification of approved construction truck routes, and coordination with public service providers like the fire department. The approved project also establishes that the SFPUC would coordinate traffic control across the various projects at the Southeast Plant that would be constructed concurrently. With these measures in place, the FEIR determined that construction of the approved project would have a less-than-significant impact on transportation and circulation.

The FEIR did not identify any significant construction related project impacts on traffic circulation, transit, pedestrians, bicyclists, parking, and freight rail service (Impact TR-1). The FEIR also determined that emergency vehicle access in the project vicinity would not be substantially affected by project construction-related activities (Impact TR-2). As a result, the FEIR did not require any transportation mitigation measures for the construction of the approved project.

Operation

The FEIR established that the operational impacts of the approved project, with approximately less than 36 daily trucks and about 280 daily operation and maintenance workers, both similar to existing conditions, would not cause substantial additional vehicle miles traveled (VMT), substantially induce automobile travel, or cause or worsen traffic safety hazards (Impact TR-3).

The FEIR established that the operational characteristics of the approved project would be similar to existing conditions, with enhanced pedestrian and vehicle circulation conditions in the area, improved access to the site, without substantially affecting area-wide parking conditions or creating hazardous transportation conditions or significant delays affecting traffic, transit, bicycles, pedestrians, or emergency vehicles. The FEIR also determined that operation of the approved project would not cause substantial

additional VMT, substantially induce automobile travel, or affect freight rail service on the Quint Street spur tracks. Thus, the FEIR did not require any transportation mitigation measures for the approved project.

Modified Project Impacts

As described above, the SFPUC proposes to modify the approved project to construct an Operations, Engineering, and Maintenance building; a Mechanical Maintenance building; and a new utility enclosure at the Southeast Plant (i.e. the proposed modifications). As defined previously, the Biosolids Digesters Facilities Project (i.e. the approved project) together with the proposed modifications represents the modified project. In this section of the addendum, potential transportation and circulation related impacts of the modified project are compared to similar impacts of the approved project as disclosed in the FEIR (and in the subsequently approved minor project modifications plus addendum 1). Given that the period of maximum truck demand (site demolition and excavation) for the approved project occurred early in the construction schedule, the transportation and circulation analysis in this addendum considers the modified project in the context of the approved project's maximum construction worker demand (construction of superstructures), which represents a higher level of construction activity.

Freight rail car demand for hauling away unsuitable excavated soils during construction of the modified project would be the same as for the approved project. Furthermore, as with the approved project, operations and maintenance of the Southeast Plant under the modified project would not affect rail service on the Quint Street spur tracks, as disposal and deliveries of various materials to and from the site would continue to occur by truck, similar to existing conditions. Therefore, potential impacts to freight rail services are not further analyzed for the modified project.

The transportation and circulation analysis in this addendum follows the *Transportation Impact Analysis Guidelines* published by the San Francisco Planning Department in October 2019 (2019 SF Guidelines), as appropriate.

Construction

Construction of the proposed modifications (the operations, engineering, and maintenance buildings) would extend from February 2025 through July 2027 (substantial completion would occur from July through September 2027), which represents a 30-month construction period. The first two years of construction would overlap with other approved project construction activities, while the remainder represents a six-month extension of the current project construction schedule.[30] Work on the proposed modifications would not begin until February 2025, after the peak of construction workers associated with the approved project has already occurred. The period of peak construction activity on the proposed modifications would occur during a three-month overlap of construction phase 4 (Erection) and phase 5 (Architectural Finishes), starting in fall 2026. Remaining construction on the approved project during fall 2026 will be limited to work on the biogas utilization system. Fall 2026 represents a lower level of construction activity for the approved

[30] The FEIR identified a five-year construction schedule. In addendum 1 to the FEIR (biogas utilization system), the construction schedule for the project was extended one year, to December 2026, which has since been extended through January 2027; the modified project would extend that construction schedule to July 2027.

project compared to the maximum construction activity peak [31] identified in the FEIR. Prior to the start of construction of the proposed modifications, SFPUC would temporarily relocate the occupants and uses of SEP 850 and the temporary pre-fabricated trailers (SEP850A and SEP850B) to 1900 Jerrold Avenue. Temporary parking would be arranged for these workers primarily near 1900 Jerrold Avenue, or other sites already approved for use in the approved project, which would not substantially alter employee parking conditions. The workers would return to the Southeast Plant at the end of the construction period.

As with the approved project, most of the construction activities at the site would occur Monday through Friday from 7:00 a.m. to 4:30 p.m., the same days and time period as the approved project. Prior changes to the approved project extended the end date for construction staging as well as the length of the street closure along Jerrold Avenue to Phelps Street. The proposed modifications would further extend the construction schedule, including the closure of Jerrold Avenue, and add temporary construction worker vehicle parking, in an area large enough for approximately 90 construction worker vehicle parking spaces, at 2 Rankin Street (see Figure 1).

The proposed modifications would generate 13 daily trucks and 120 daily construction workers during the phase of maximum combined person and vehicle demand, which would occur at the end of the erection phase in combination with the beginning of the architectural finishes phase (a three-month period between September and November 2026). Construction trucks and worker vehicles would use the routes shown on Figure 7 of this addendum to access the site, instead of the routes shown in FEIR Figure 2-15, as approved by in a prior minor project modification.[32] The proposed routes differ from the routes in FEIR Figure 2-15 in the following ways:

- One block of Jerrold Avenue west of the Caltrain tracks would be closed to through traffic and vehicles instead take Rankin Street, McKinnon Avenue, and Toland Avenue to connect to the west
- Phelps Street would no longer be used for vehicle access

Interim truck delivery and off-haul rates for ongoing operations at the Southeast Plant would continue to be those shown in FEIR Figure 2-16.

An analysis was conducted to evaluate the travel demand during construction of the proposed modifications. **Table 3** compares the peak construction travel demand activity for the approved project to the peak construction activities of the modified project. [33] **Table 4** compares the two construction vehicle trip assignments during the a.m. and p.m. peak hours. No trip generation credit has been assumed for the proposed modifications; the travel demand analysis of the modified project prepared in support of this addendum is included as **Appendix E**.

---

[31] The period of maximum construction activity (maximum construction workers) for the approved project consisted of 28 daily trucks and 550 daily construction workers and has already occurred. The expected level of construction activity for the approved project during Fall 2026 would be two daily trucks and 20 daily construction workers.[32] SFPUC Biosolids Digester Facilities Project Minor Project Modification 7 – Traffic on Jerrold, reviewed by San Francisco Planning Department September 1, 2020

[32] SFPUC Biosolids Digester Facilities Project Minor Project Modification 7 – Traffic on Jerrold, reviewed by San Francisco Planning Department September 1, 2020

[33] The maximum level of construction activity for the modified project (September through November 2026) includes those activities related to the proposed modifications (13 daily trucks and 120 daily construction workers), together with overlapping construction activities of the approved project (i.e. construction of the biogas utilization system; two daily trucks and 20 daily construction workers); see modified project travel demand memorandum in Appendix E.

Table 3 Approved Project and Modified Project Net-New Trip Generation – Daily and Peak Hour Person and Vehicle Trips

Project Version	Daily		AM/PM Peak Hour	
	Person trips	Vehicle trips	Person trips	Vehicle trips
Approved Project (Maximum Construction Workers)[34]	1,100	742	550	351
Modified Project[35]	280	206	140	93
Modified Project compared to Approved Project	25%	28%	25%	27%

[36] See Table 15 of the modified project travel demand memorandum in Appendix E.

[37] Technical Memorandum to the SFPUC, *Traffic Estimates Results at Selected Study Locations*, Adavant Consulting, December 16, 2018 (Table 5, Maximum construction workers, Scenario 5).

[38] See travel demand memorandum for the proposed modifications in Appendix E.

project.[39] The 60 daily construction workers would park at the proposed temporary surface lot located at 2 Rankin Street, north of Evans Avenue, which would have a capacity of approximately 90 parking spaces.

For the reasons that follow, the construction activities for the modified project would not be considered intense, as they relate to the transportation network. Construction trucks and worker vehicles would use the same routes as those currently approved and followed by construction trucks and construction worker vehicles, with the addition of an optional truck route using the Illinois Street Bridge, if necessary (see Figure 7). As shown in Table 3, with the proposed modifications, the modified project would result in an additional peak of construction activity occurring about two years after the construction workers peak of the approved project, but the new peak would generally result in a lower number of truck and construction worker trips than the approved project (less than 25 to 28 percent of the daily and peak hour values estimated for the approved project). The interaction between construction activities and the adjacent transportation network would primarily occur as trucks and construction workers access the site at the intersections of Phelps Street/Jerrold Avenue and Rankin Street/Evans Avenue. Table 4 presents the number of a.m. and p.m. peak hour vehicle trips generated by the modified project during the peak construction travel demand period along Phelps Street, Jerrold Avenue and Oakdale Avenue (September through November 2026). The number of vehicle trips generated by the modified project generally would be less than those generated by the approved project. During the p.m. peak hour the number of vehicle trips generated by the modified project on Evans Avenue would be about three to five times more than those generated by the approved project, due to the presence of the proposed construction worker parking lot at 2 Rankin Street; however, the modified project increase of approximately 30 to 40 vehicles per hour would not be substantial given the existing traffic volumes on Evans Avenue (about 800 to 900 vehicles per hour).

Potentially Hazardous Conditions and Accessibility During Construction

Construction staging for the proposed modifications would occur on-site, including on the already closed portion of Jerrold Avenue to Phelps Street. The modified project would not require changes to the approved detour routes, construction truck routes, changes to emergency vehicle access, or additional sidewalk or lane closures, beyond those already established under the approved project, but would add an optional truck route using the Illinois Street Bridge as shown on Figure 7. During the new peak of construction of the modified project, vehicular and truck access to the Southeast Plant would be similar to those evaluated in the FEIR for the approved project while traffic volumes on Jerrold Avenue, Phelps Street, Evans Avenue, and other nearby roadways would be lower. As in the approved project, increased traffic due to construction activities would result in temporary higher potential for vehicle-bicycle and vehicle-pedestrian conflicts at some locations, while construction detours may be an inconvenience to some bicyclist or pedestrians.

As in the approved project, the construction contractor for the proposed modifications would be required to prepare and implement a modified Traffic Control Plan that conforms to the approved Traffic Control Plan, as well as the City of San Francisco's Regulations for Working in San Francisco Streets (the "Blue Book"). The modified Plan would include changes, if necessary, to advance warning signage, as well as scheduling and monitoring of construction vehicle movements. Prior to implementation of any changes, the modified Traffic Control Plan would be reviewed by the SFMTA and the multi-agency Interdepartmental Staff Committee on Traffic and Transportation. In addition to the regulations in the Blue Book, the contractor would be responsible for complying with all city, state, and federal codes, rules and regulations.

[39] In addendum 1 to the FEIR (biogas utilization system), the construction schedule for the project was extended 1.5 years, to June 2026; the modified project would extend that construction schedule approximately one year longer.

Construction of the proposed modifications would be conducted in compliance with a Traffic Control Plan, as well as the Blue Book regulations which require the implementation of construction safety measures with respect to bicyclists and pedestrians, such as providing alternative access routes, vehicle, bicycle and pedestrian detours with adequate signage, and transit stop relocation, if necessary. As in the approved project, implementation of the multi-agency-approved traffic control plans and compliance with construction safety regulations would ensure that construction activities are conducted safely and with the least possible interference with vehicles, pedestrians, bicyclists, and public transit, as well as reduce emergency vehicle access disruptions and safety hazards.

For these reasons, construction-related activities of the modified project would not create potentially hazardous conditions or substantially interfere with accessibility; and any such impacts would remain less than significant.

Potential Public Transit Delays During Construction

Muni's 23 Monterey bus route previously traveled through the project site along Jerrold Avenue and was permanently rerouted to Palou and Oakdale Avenues in February 2020 by SFMTA, with the objective of reducing bus travel time, improving service reliability, and increasing ridership.[40] The reroute of the 23 Monterey took place ahead of the start of the temporary multi-year closure of Jerrold Avenue, between Phelps Street and the Caltrain tracks, that was implemented as part of the construction of the approved project in January 2021. In addition to the 23 Monterey, Muni's 24 Divisadero and 44 O'Shaughnessy routes also operate on Palou Avenue, while the 19 Polk buses travel along Evans Avenue; Muni Metro T Third line operates in the median of Third Street.

All of these transit routes have been operating in the project vicinity since the start of construction of the approved project, and their alignment has not changed. No construction would occur on any of these streets as part of the modified project. Furthermore, as described above, the modified project represents a lower level of peak construction intensity compared to the approved project and, although the number of construction vehicle trips generated by the modified project on Evans Avenue where the 19 Polk route operates would be higher than those generated by the approved project, they would only represent about 5 percent of the existing total traffic volume on Evans Avenue.[41] Therefore, there would not be any transit rerouting, stop relocation, additional congestion, or transit delay as a result of the construction of the modified project.

For the above reasons, and as with the approved project, construction activities associated with the modified project would not substantially delay transit (less than significant impact).

Conclusion Regarding Construction Impacts

For the reasons described above, construction of the modified project would not result in significant impacts related to transportation and circulation greater than those identified in the FEIR. Moreover, the modified project would not result in new significant construction-related transportation and circulation

[40] SFMTA had found that providing service along Jerrold Avenue added five minutes of bus travel time (25 percent of total) through the Bayview area, while serving only 10 percent of the Bayview transit customers. See https://www.sfpublicworks.org/sites/default/files/Palou%20Avenue%20factsheet.pdf ; last accessed July 5, 2024.

[41] Traffic volume increases or decreases of about 5 percent are generally considered typical, due to daily or seasonal traffic pattern changes.

impacts that were not previously identified in the FEIR (Impacts TR-1 and TR-2), would not result in more severe impacts than those identified in the FEIR, and would therefore not require new mitigation measures.

Operations

Similar to the approved project, the modified project does not involve any changes to the transportation network that would create potentially hazardous conditions or interfere with accessibility. The modified project would not change the features of the approved project that would alter the transportation network, such as the redesign and reconstruction of the segment of Jerrold Avenue between Phelps Street and the Caltrain tracks, and implementation of a new second gate to the Southeast Plant via Rankin Street, to facilitate the movement of truck traffic to and from the Southeast Plant. After construction of the modified project is complete, Southeast Plant workers temporarily relocated to 1900 Jerrold Avenue would return to the Southeast Plant, and vehicular, transit, pedestrian and bicycle circulation in the project vicinity would be the same as under the approved project. In addition, modified project operations would not result in an increase in vehicle, pedestrian or bicycle trips compared to the approved project, as the number of operations staff (about 280 people for the entire plant) and haul and delivery trucks are expected to be the same. Consistent with the approved project, the modified project would not result in changes to the overall treatment capacity of the Southeast Plant.

Potentially Hazardous Conditions and Accessibility

Modified project operations would not result in a substantial increase in pedestrian and bicycle trips, overcrowding or an increased demand for pedestrian and bicycle facilities compared to the approved project because the number of operations staff at the Southeast Plant would not increase.

Compared to the approved project, the modified project would not change conditions for people walking, bicycling or driving, or public transit operations and emergency access routes because the modified project would not introduce new design features or change the street network compared to the approved project, therefore; driving, walking, bicycling, public transit operations and emergency vehicle access in the area would remain the same as those of the approved project.

Potential Public Transit Delay

As with the approved project, with implementation of the modified project, the existing operations staff of about 280 people for the entire Southeast Plant would not change, and therefore the modified project would not result in a need for additional transit routes or substantially increase ridership on nearby Muni bus routes (e.g., 23 Monterey, 19 Polk, 24 Divisadero) or the T Third light rail line in the project vicinity. Similar to the approved project, modified project operation would not substantially affect operations of the nearby Muni routes.

Cause Substantial Additional VMT or Substantially Induce Automobile Travel

The modified project has the same transportation network features as the approved project. In addition, the modified project operations would not increase operations staff at the Southeast Plant and would require the same number of daily haul and delivery trucks as the approved project, and therefore would not substantially increase the total VMT associated with operations-related vehicle trips (less than significant impact).

Conclusion Regarding Operations Impacts

Operation of the modified project would be similar to the approved project conditions, with no increase in the total number of employees or haul and delivery trucks at the Southeast Plant. Therefore, for the reasons described above, the modified project would not result in significant impacts related to additional vehicle miles traveled (VMT), induced automobile travel, traffic safety hazards, or public transit delays greater than those identified in the FEIR. Moreover, operation of the modified project would not result in new significant transportation and circulation impacts that were not previously identified in the FEIR (Impact TR-3), would not result in more severe impacts than those identified in the FEIR, and would not require new mitigation measures.

Cumulative Impacts

Existing and probable future projects listed in Appendix A could contribute to cumulative impacts of the modified project related to transportation and circulation. Similar lists are presented in Table 4.1-1 (Section 4.1, Overview) of the FEIR and Appendix A in addendum 1 for the approved project. The geographic scope for the analysis of cumulative transportation impacts generally includes the sidewalks, roadways and transit network adjacent to the work areas.

Approved Project Analysis

According to the FEIR, approved project construction was expected to begin in February 2018 and end in January 2023, a five-year construction duration. Actual construction started in January 2020, and the recently approved project modification that was the subject of addendum 1 to the FEIR (biogas utilization system) extended the construction schedule for the approved project by about 1.5 years, to June 2026. The FEIR established that construction-related impacts of the approved project in combination with past, present and other cumulative projects, would be less than significant, and that no mitigation measures would be required. Similarly, it also established that the cumulative impacts resulting from the approved project operation, in combination with past, present, and probable future projects, would also be less than significant, and therefore no mitigation measures would be required.

Comparison of the Modified Project to the Approved Project

Eleven of the 21 projects that could contribute to cumulative impacts of the modified project, presented in Appendix A, were also included in the 40 cumulative project list presented in Table 4.1-1 of the FEIR, including major developments such as the San Francisco Market (previously known as the SF Wholesale Produce Market) and the San Francisco Gateway projects. Those projects that are not included in the current cumulative project list have already been built, or their construction has either been cancelled or extended beyond the expected construction period of the modified project.

Construction

Within the project site vicinity, construction of the cumulative projects identified above may overlap with each other and with the modified project (through September 2027)[42]. Like the approved project, sponsors and construction managers of projects considered in the cumulative analysis would be required to coordinate with various City departments, such as the SFMTA and Public Works, comply with the SFMTA

[42] Construction of the proposed modifications would extend from February 2025 through July 2027; substantial completion (i.e. on-site testing work) would occur from July through September 2027.

"Blue Book" regulations, and construction activities affecting City streets are required to coordinate any temporary sidewalk and travel-lane closures to develop plans that would address construction-related vehicle routing, traffic control, and pedestrian and bicycle movements adjacent to the construction area.

Construction of the San Francisco Gateway project, which is located to the southwest of the project site, may overlap with construction of the modified project for a period of about 23 months, while construction of the San Francisco Market, located immediately to the west of the project site, may overlap with construction of the modified project for a period of about 30 months. Construction activities for the Quint-Jerrold Connector Road could also overlap with the construction of the modified project for about 30 months. All of these construction activities would occur on streets to the west of the Caltrain tracks, without vehicular or pedestrian access to the project site, because Jerrold Avenue would remain closed during construction of the modified project. Furthermore, all three projects were included as part of the cumulative transportation impact analysis for the approved project.

Construction of several projects sponsored by the SFPUC would take place at the Southeast Plant, or in its immediate vicinity. These include the HVAC and Mechanical Upgrades and Maintenance Building (SEP 940) Interim Improvement. Consistent with SFPUC procedures, all these projects would include development of a construction management plan including for traffic, consistent with SFMTA requirements, taking into consideration other concurrent construction projects in the area, including the proposed modifications, if approved.

Non-SFPUC cumulative projects, such as the Potrero Power Station, 1399 Marin Transit Service Operations and Maintenance Plan, and 3433 3rd Street commercial building, are all located approximately 0.5 miles or further from the project site, and therefore, their construction activities would not overlap spatially in proximity with those of the modified project.

Although the Islais Creek Bridge Project to be undertaken by Public Works is located approximately 0.6 miles from the project site, the replacement of the bridge would involve the closure of Third Street to all vehicles and people walking or bicycling for approximately 24 months (spring 2026 to spring 2028). Thus, the effects associated with the Third Street closure would temporarily affect the construction trucks and worker vehicle routes shown in Figure 7. As part of this project, Public Works would work with the SFMTA to develop a vehicle, transit, bicycle, and pedestrian detour plan where most of the vehicle traffic would be diverted to nearby streets, including Evans Avenue and Illinois Street, and the remainder would use freeways, including U.S. 101 and I-280. The Islais Creek Bridge Project environmental analysis[43] found that construction of the Islais Creek Bridge Project, which would include a SFMTA approved construction management plan, in combination with cumulative projects,[44] would not contribute to any potentially significant transportation related impacts.

Conclusion Regarding Cumulative Transportation Impacts During Construction

For the reasons described above, construction of the modified project, in combination with cumulative projects, would not create potentially hazardous conditions for people walking, bicycling, or driving, or public transit operations; or interfere with emergency access or accessibility for people walking or bicycling,

[43] Draft Environmental Impact Report Islais Creek Bridge Project, November 29, 2023; San Francisco Planning Case No. 2022-000112ENV, Draft EIR public comment period: November 30, 2023 –January 22, 2024.

[44] The nearby project list used in the cumulative analysis of the Islais Creek Project includes the approved BDFP. As described above, the number of construction vehicle trips for the modified project would be less than those of the approved project.

and cumulative transportation impacts during construction would be less than significant. Therefore, the modified project would not result in any new significant construction-related impacts in addition to those identified in the FEIR (Impact C-TR-1), would not substantially increase the severity of a significant impact identified in the FEIR, and would not require new mitigation measures.

Operation

Potentially Hazardous Conditions and Accessibility

Cumulative projects and projected citywide growth would increase the number of people walking, bicycling, driving, or riding transit on streets nearby the project site. Under cumulative conditions, there would be a projected increase in vehicles on the streets in the proximity of the project site, primarily due to the San Francisco Market and the San Francisco Gateway projects; there would be no increase in the approved project operation staff of about 280 people resulting from the modified project, and the number of haul and delivery trucks would be the same as with the approved project. The identified cumulative projects would be required to conform to the requirements of the Better Streets Plan, Transit-First Policy, and Vision Zero, and thus would adhere to planning principles that emphasize providing convenient connections and safe routes for people walking and bicycling.

The non-SFPUC cumulative projects would enhance accessibility for people walking and bicycling in the vicinity of the project site. The San Francisco Market and the San Francisco Gateway projects would construct new sidewalks adjacent to their sites and would include intersection improvements such as crosswalks and traffic controls (e.g., stop signs). In addition, the San Francisco Market project would include a new east-west vehicle, pedestrian, and bicycle connection (Innes Avenue Extension) to replace the permanent closure of Jerrold Avenue between Toland and Rankin Streets. The Quint-Jerrold Connector Road project would reestablish a connection between Oakdale and Jerrold Avenues along the west side of the Caltrain tracks. The roadway would include one travel lane each way and a new sidewalk on the west side of the roadway, enhancing circulation for vehicular, bicycle and pedestrian travel in the surrounding area.

None of the cumulative projects would include features that would substantially affect vehicle circulation in the project vicinity or impede emergency access compared to existing conditions, and the new Islais Creek bridge would result in no changes to Third Street from existing conditions, regarding the number of travel lanes, travel routes, or access for emergency vehicles. As noted above, the Quint-Jerrold Connector Road would reestablish vehicle travel between Oakdale and Jerrold Avenues. Prior to finalizing the design and dimensions of any planned transportation network changes under city jurisdiction, the fire and police departments' staff would review and approve streetscape modifications, as required through the Interdepartmental Staff Committee on Traffic and Transportation review process, so that emergency vehicle access is not impeded.

Based on the results of the transportation analyses conducted for the largest cumulative projects in the vicinity of the Southeast Plant (San Francisco Market Project[45] and San Francisco Gateway Project[46]), the planned transportation network improvements that would be constructed as part of the cumulative projects would accommodate the expected cumulative increases in vehicles, and travel or access for people walking

[45] San Francisco Market, Addendum 2 to Mitigated Negative Declaration, Final Report, July 21, 2022; San Francisco Planning Case No. 2009.1153ENV-03

[46] San Francisco Gateway Project 749 Toland Street and 2000 McKinnon Avenue, Draft EIR, August 2, 2023; San Francisco Planning Case No. 2015-012491ENV

or bicycling, and emergency vehicles would not be impeded. Therefore, the modified project, in combination with cumulative projects, would not create potentially hazardous conditions for people bicycling, walking or driving, or for transit operations, or impede access for people walking or bicycling or for emergency vehicles, and cumulative transportation impacts related to potentially hazardous conditions and accessibility would be less than significant.

Potential Public Transit Delay

As described above, there are no bus routes currently operating adjacent to the project site. The nearest Muni service includes the 19 Polk operating on Evans Avenue, approximately 0.25 miles to the north, and the 23 Monterey operating on Palou Avenue (east of Industrial Street) and Oakdale Avenue (west of Industrial Street),[47] approximately 0.25 miles to the south, and under cumulative conditions transit operations in the modified project vicinity would remain the same as under existing conditions. In addition, none of the cumulative projects include transportation features that could delay transit once they become operational (e.g., roadway lane reductions on streets with transit routes).

The San Francisco Market and the San Francisco Gateway projects would generate new vehicle trips, however, vehicles would primarily travel on streets that do not contain transit (e.g., Jerrold Avenue, Toland Street, Rankin Street, Selby Street), on streets that have limited segments with transit (e.g., Oakdale Avenue, Industrial Street), or on streets with exclusive transit right-of-way (e.g., Third Street). There would be no transit service on the Quint-Jerrold Connector Road, and the Islais Creek Bridge Project would not result in changes to the existing transportation network or transit service at the completion of construction. Operation of the modified project would result in the same number of vehicle or transit trips as the approved project, so the modified project would not result in new or more severe cumulative transit delay impacts in combination with the growth from the San Francisco Market and the San Francisco Gateway projects. There is no transit service on Jerrold Avenue adjacent to the Southeast Plant, and the increase in vehicular traffic due to the operation of the various SFPUC cumulative projects at the Southeast Plant would not be discernible from previously analyzed cumulative background traffic, because the modified project would have the same total number of employees or trucks as the approved project.[48] Therefore, none of these cumulative projects would result in transit delay. Thus, for the reasons stated above, a significant cumulative impact related to substantial transit delay would not result from implementation of the identified cumulative projects and the modified project.

Cause Substantial Additional VMT or Substantially Induce Automobile Travel

Operation of the modified project would result in the same number of vehicle trips as the approved project (i.e., the modified project would not generate additional vehicle trips) because it would not increase operations staff, and therefore the modified project would not cause additional VMT or induce automobile travel. The San Francisco Market and the San Francisco Gateway projects would cause an increase in VMT; however, both projects were included in the cumulative analysis of the approved project, and the FEIR established that that the cumulative impacts related to VMT and induced automobile travel would be less than significant. In addition, the FEIR found that cumulative impacts related to VMT and induced automobile travel due to the opening of the Quint-Jerrold Connector Road and the operation of various SFPUC projects at or in the vicinity of the Southeast Plant would also be less than significant. The Islais Creek Bridge Project

[47] Muni's 23 Monterey bus route previously traveled through the project site along Jerrold Avenue and was permanently rerouted to Palou and Oakdale Avenues in February 2020 by SFMTA, with the objective of reducing bus travel time, improving service reliability, and increasing ridership.

[48] The two projects at the Southeast Plant not included in the cumulative transportation analysis presented in the FEIR are a) SEP HVAC and Mechanical Upgrades and b) SEP 545 Electrical Controls Upgrade, which do not include changes to operational staff or vehicle demand.

is an infrastructure project that would result in no changes from existing conditions regarding the number of travel lanes, travel routes, or access to local land uses, and therefore would not cause substantial additional VMT or induce automobile travel. Thus, for the reasons stated above, a significant cumulative impact related to VMT would not result from implementation of the identified cumulative projects and the modified project.

Conclusion Regarding Cumulative Transportation Impacts During Operation

In conclusion, the modified project in combination with other cumulative projects would not result in significant cumulative impacts related to substantial additional VMT, substantially induce automobile travel, or cause or worsen traffic safety hazards, or result in public transit delays. Therefore, impacts from operation of the modified project in combination with other cumulative projects would be less than significant, and no mitigation measures would be required. Thus, operation of the modified project would not result in any new significant cumulative impacts in addition to those identified in the FEIR (Impact C-TR-2), would not substantially increase the severity of a significant cumulative impact identified in the FEIR, and would not require new mitigation measures.

5.4 Noise and Vibration

Biosolids Digester Facilities Project FEIR Findings

The FEIR found that the approved project would have potentially significant impacts related to the following significance criteria regarding noise and vibration:

- Result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies
- Result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project

The FEIR found that the approved project would have less than significant impacts related to: exposure of persons or structures to or generation of excessive groundborne vibration or groundborne noise levels or substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project. The FEIR determined the approved project would have no impact related to being within an airport land use plan area or in the vicinity of a private airstrip or being affected by existing noise level because the project site is not within an airport land use plan area or in the vicinity of a private airstrip.

Construction Noise

As discussed in the FEIR, Section 2908 of the Noise Ordinance allows construction activities between 7:00 a.m. and 8:00 p.m. and Section 2907 limits noise from any individual piece of construction equipment, except impact tools that are exempt, to 80 dBA at 100 feet (equivalent to 86 dBA at 50 feet). The FEIR evaluated the various types of non-impact construction equipment to be used and found that only concrete saws would exceed the 80 dBA noise limit of Section 2907, but concluded that this potentially significant impact on noise would be reduced to a less-than-significant level through implementation of the noise controls specified in Mitigation Measure M-NO-1a (Shielding of Concrete Saw Operations).

The FEIR defined a substantial temporary or periodic increase in ambient noise levels as noise that would be greater than 10 dBA above ambient at sensitive receptors. The FEIR found that construction noise level

would only exceed this threshold at the former Southeast Community Center daycare center[49] and the closest residential receptor at 1700 Kirkwood Avenue (at the corner of Phelps Street) from activities at the Southeast Greenhouses staging area. The FEIR concluded that implementation of the noise controls specified in Mitigation Measure M-NO-1b (Construction Noise Control Measures at Southeast Greenhouses Staging Area) would reduce this impact to a less-than-significant level. Noise from construction at other locations throughout the site was found to be lower than the applied 10 dBA above ambient threshold.

Construction Vibration

The FEIR found that vibration from construction and operation would have a less-than-significant impact on buildings and people because vibration would not exceed the 0.5 inches per second peak particle velocity (in/sec PPV) threshold for structural damage at the nearest buildings or the 0.1 in/sec PPV threshold for human annoyance at the nearest sensitive receptor.

Construction Roadway Noise

The FEIR determined that noise from construction traffic would be less than significant because a traffic control plan would establish truck routes that minimize truck traffic in residential areas and that traffic along Phelps Street where there are residences would primarily be worker vehicles accessing the Southeast Greenhouses staging area (not trucks).

Operation Noise, including Roadway Noise

The FEIR determined that operational noise from the new facilities and additional truck trips would be less than significant because the estimated maximum combined noise level of 59 dBA[50] at the nearest residential receptor at 1700 Kirkwood Avenue would not exceed the minimum noise limit applicable under Section 2909(d) and there would only be a small change in trucking that would occur on Jerrold Avenue, Rankin Street, and Evans Avenue where there are no residential receptors or noise-sensitive uses.

Modified Project

Construction Noise

Construction activities at the project site would occur Monday through Friday from 7 a.m. to 4:30 p.m., and at times until 8 p.m. as needed, consistent with the City's noise ordinance (San Francisco Police Code). Construction could also occur on Saturdays and Sundays when needed. Work would occur on holidays and 24 hours per day only if needed for critical facility connections, similar to the approved project. The proposed modifications would include demolition of building SEP 850, removal of the temporary, pre-fabricated trailers SEP 850A and SEP 850B, removal of the adjacent surface parking lot, and demolition of an existing generator (500 kilovolt-amperes), a transformer and associated electrical equipment (SS 4A/4B and SEP 990). Demolition would be followed by construction of the Mechanical Maintenance building (SEP 603) and the Operations, Engineering, and Maintenance building (SEP 914), a utility enclosure for a new chiller, and two new boilers located inside building SEP 930 to service buildings SEP 930 and SEP 940. Two new generators (750 kilovolt-amperes) would be installed for use by the new operations and maintenance buildings. In addition, an upgraded transformer and associated electrical equipment (SS 4A/4B and SEP 990)

[49] The former Southeast Community Center daycare center has relocated to 1550 Evans and is thus no longer a sensitive receptor that could be impacted by the construction of the proposed modifications. Therefore, it is not discussed further.

[50] A-weighted decibel, reported an L_{eq} in the FEIR. This represents the acoustical energy over an operational hour.

would be installed for the new operations and maintenance buildings, as well as for buildings SEP 930 and SEP 940.

Equipment similar to that listed in the FEIR would be used during construction of the proposed modifications. Like the approved project, the occasional use of a concrete saw under the modified project would generate noise in excess of the 80 dBA L_{max} threshold at 100 feet established under Section 2907 of the Police Code, which would be a significant impact. However, implementation of **Mitigation Measure M-NO-1a (Shielding of Concrete Saw Operations)**, as presented below in full, would reduce construction noise of the modified project to a less-than-significant level by requiring shielding when concrete saw operations are conducted within 100 feet of a sensitive receptor.

> **Mitigation Measure M-NO-1a: Shielding of Concrete Saw Operations**
>
> Project contractors shall erect temporary shielding when concrete saw operations are conducted within 100 feet of a sensitive receptor. Shielding shall be sufficient to reduce noise levels to 80 dBA at a distance of 100 feet (an approximate 5 dBA reduction), consistent with the noise limit specified in Section 2907 of the Noise Ordinance.

The two noisiest pieces of demolition equipment associated with the new elements of the modified project (concrete saw and tractor) would generate a combined noise level of 85 dBA, L_{eq} at 50 feet. The nearest receptor to the proposed modifications construction area would be the residence at 1700 Kirkwood Avenue, approximately 250 feet from the parking lot to be demolished, where the measured ambient daytime noise level is 61 dBA. At this distance, noise from demolition activities would be attenuated to 71 dBA. This noise level would be below the 90-dBA criterion set by the Federal Transit Administration and would also not exceed the 10-dBA-above-ambient-noise-level criterion at this receptor.[51] Therefore, noise from demolition activities associated with the modified project would be less than significant.

The noisiest construction equipment that involves drilling for pile foundations would be a tractor and a drill rig. The nearest receptor to the modified project construction area would be the residence at 1700 Kirkwood Avenue, approximately 250 feet from the modified project site. At this distance, noise from foundation construction activities would be attenuated to 68 dBA. This noise level would be below the 90- dBA criterion set by the Federal Transit Administration and would also be less than 10-dBA-above-ambient-noise-level criterion at this receptor. Therefore, noise from construction activities associated with the modified project would be less than significant. The noisiest equipment for all other phases of construction would be quieter than the equipment used for drilling pile foundations and therefore all other phases of construction would result in less than significant noise impacts.

Construction Vibration

Equipment similar to that listed in the FEIR would be used during construction of the modified project. No pile driving is proposed as part of the modified project and all piles would be installed using drilling methods. The construction equipment with the greatest potential for generating vibration would be a vibratory roller that could be used for compaction. At a distance of 250 feet (at the nearest vibration-sensitive receptor), vibration from a vibratory roller would be approximately 0.007 in/sec PPV, which would be below the human annoyance threshold of 0.1 in/sec PPV, as applied in the FEIR. Therefore, construction

[51] Ambient noise measurement at 1663 Kirkwood Avenue. Refer to FEIR Table 4.7-2, Summary of Noise Monitoring in Project Vicinity.

activities under the modified project would have a less than significant impact with respect to human annoyance from construction-related vibration.

With respect to the potential for building damage, the nearest off-site structure to the construction areas of the modified project would be across Phelps Street, approximately 50 feet from construction work areas. At this distance, vibration from a vibratory roller would be approximately 0.07 in/sec PPV, which would be below both the historic building damage threshold of 0.25 in/sec PPV and the building damage threshold of 0.5 in/sec PPV, as applied in the FEIR. The nearest onsite structure is Building 930, located approximately 20 feet northeast of the proposed internal roadway. Construction of the internal roadway could require use of a vibratory roller. At this distance, vibration from a vibratory roller would be approximately 0.29 in/sec PPV, which is below the building damage threshold of 0.5 in/sec PPV.

The nearest on-site historic structure would be Building 870 which is approximately 90 to 100 feet west of the proposed work areas. Building 870 is characterized as a contributor to the historic district. However, as stated in the FEIR, the 0.25 in/sec PPV threshold was not applied to SEP buildings because, despite their historic status, all SEP buildings have been engineered for industrial use and lack fragile construction elements, such as plastered or masonry walls that could be subject to cosmetic damage. Instead, a threshold level of 0.5 in/sec PPV is applied to SEP buildings. At a distance of 90 feet, vibration levels from operation of a vibratory roller would be 0.03 in/sec PPV. Therefore, construction activities under the modified project would have a less-than-significant impact with respect to building damage from construction-related vibration.

Construction Roadway Noise

Like the approved project, the modified project would also require construction worker trips as well as vendor trips to bring project materials to the construction site. During construction, vehicle trips would use Jerrold Avenue (west of the site), Phelps Street (north of Jerrold Avenue), Evans Avenue, Third Street, and Cesar Chavez Street for access to the Highway 101 and I-280 freeways. There are no residential uses located along these routes. Since construction-related traffic noise increases on these streets would not adversely affect any residential sensitive receptors, construction-related traffic noise increases of the modified project would be less than significant.

Operational Noise including Roadway Noise

Under the modified project, a new chiller would be located within a utility enclosure outside of and adjacent to building SEP 930. The two proposed new boilers to be located inside SEP 930 would not generate substantial noise (because they would be enclosed indoors), but the chiller could generate a sound power level of approximately 68 dB. The chiller enclosure would be approximately 320 feet away from the nearest noise-sensitive receptor (1700 Kirkwood Avenue). At this distance, the noise level from the chiller would be approximately 27 dBA, which would be well below the nighttime standard of 60 dBA (45 dBA interior) at the nearest receptor. When the chiller is considered conservatively in combination with all other operational noise sources from the modified project, the noise level would be 59 dBA (refer to FEIR Tables 4.7-10 and 4.7-11 for the project's other operational noise sources), which would still be below the nighttime standard at the nearest residence. Therefore, operational noise from stationary sources associated with the modified project would be less than significant.

Under the modified project, there would be no additional employees and no increase in vehicle trip generation. Therefore, the modified project would have no impact with respect to roadway noise during operation.

The proposed two new emergency generators would be tested for maintenance purposes during daytime hours approximately one hour per week and would replace a single emergency generator currently in use. The noise ordinance does not regulate the testing of emergency backup generators. Further, the San Francisco Planning Department considers maintenance operations of less than three generators to be a less than significant noise impact. Consequently, upgrade and replacement of the existing emergency generator with two new emergency generators would not result in a significant operational noise impact.

Conclusion

In summary, with implementation of Mitigation Measure M-NO-1a (Shielding of Concrete Saw Operations), construction of the modified project would not result in significant noise and vibration impacts greater than those identified in the FEIR. Moreover, construction and operation of the modified project would not result in new significant noise and vibration impacts that were not previously identified in the FEIR; would not result in more severe impacts than those identified; and would not require new mitigation measures.

Cumulative Impacts

The FEIR determined that cumulative construction noise from the approved project, in combination with construction noise from cumulative projects, would result in a significant cumulative impact on the nearest residential receptors (east of Phelps Street and south of Jerrold Avenue) during use of the Southeast Greenhouses Staging Area, but that implementation of Mitigation Measure M-NO-1b would reduce the approved project's contribution to less-than-cumulatively considerable (less-than-significant) levels. The FEIR did not identify other potentially significant cumulative noise and vibration impacts.

With regard to the modified project, significant cumulative construction-related noise increases could occur if any nearby cumulative projects were to be constructed at the same time as the modified project and would affect the same sensitive receptors. As discussed above, the nearest sensitive receptor is the residence at 1700 Kirkwood Avenue. Among the cumulative projects identified in Appendix A, the following could result in cumulative noise impacts due their location adjacent to the modified project site and construction schedule:

- Headworks Replacement Project
- Power Feed and Primary Switchgear Upgrades
- Repair and Replacement Treatment Plant Improvement Projects
- Quint-Jerrold Connector Road
- Electrical Controls Upgrade (SEP 545)
- HVAC and Mechanical Upgrades

The Southeast Plant Headworks project site is located north of the modified project site and farther from sensitive receptors. Because the loudest construction activities – excavation, pile driving, and building erection - have been completed, remaining construction noise from the Headworks project would be lower.

Conservatively assuming that remaining activities for the Headworks project could be as loud as the initial construction phases, which in the FEIR was estimated at up to 58 dBA (L_{eq}) at the 1700 Kirkwood Avenue sensitive receptor, the combined noise levels with the modified project would be 71 dBA (i.e., when added to the project-specific construction noise, there would be no incremental noise increase). As discussed above, this noise level (71 dBA) would be below the 90-dBA criterion set by the Federal Transit Administration and would also not exceed the 10-dBA-above-ambient-noise-level criterion at the nearest sensitive receptor. The Quint-Jerrold Connector Road Project would be physically separated from the modified project site by the existing railroad embankment which would buffer sensitive receptors to the south and east from roadway construction noise. Given this barrier separating the projects, no cumulative noise increases from these two overlapping construction projects would occur at sensitive receptors located south and east of the modified project site. The other projects at the Southeast Plant are not expected to contribute substantially to cumulative construction-related noise impacts at the closest receptors because they would replace or upgrade existing equipment, avoid impact pile driving, or involve construction that would occur inside existing building enclosures. Therefore, the modified project in combination with cumulative projects would not result in a significant cumulative construction noise impact.

With respect to cumulative operational noise, as discussed above, the noise level from the chiller associated with the modified project would be approximately 27 dB at the 1700 Kirkwood Avenue receptor by itself and 59 dBA when considered in combination with all other operational noise sources from the modified project. This contribution to the existing noise level would be nominal and would not further elevate either the existing noise level at the receptor or the noise level predicted from all elements of the other projects at the Southeast Plant (59 dBA), which would be below the applicable nighttime noise standard. Therefore, there would be no significant cumulative operational noise impact with the addition of the sources under the modified project.

In summary, the modified project would not result in new significant cumulative noise and vibration impacts that were not previously identified in the FEIR; would not result in more severe cumulative noise and vibration impacts than those identified; and would not require new noise and vibration mitigation measures.

5.5 Air Quality

Biosolids Digester Facilities Project FEIR Findings

The FEIR found that the project would have potentially significant impacts related to the following significance criteria regarding air quality:

- Conflict with or obstruct implementation of the applicable air quality plan,
- Violate any air quality standard or contribute substantially to an existing or projected air quality violation,
- Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is in non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions that exceed quantitative thresholds for ozone precursors).

The FEIR found that the project would have less than significant impacts related to exposing sensitive receptors to substantial pollutant concentrations or creating objectionable odors that affect a substantial number of people.

As discussed in Sections 2.2 and 4, construction of the approved project began in early January 2020. Since FEIR certification, the SFPUC has approved multiple minor changes to the approved project. The approved project also includes construction and operation of the biogas utilization system instead of the originally proposed energy recovery facilities and related changes to operational energy demand and supply, which was evaluated in addendum 1 to the FEIR.[52] The Planning Department determined that these changes would not alter the FEIR conclusions. The following discussion summarizes the air quality impacts of the approved project based on information from the FEIR and addendum 1 to the FEIR.

Criteria Air Pollutant Emissions

Construction

Construction of the project was found to generate emissions of fugitive dust and criteria air pollutants. The SFPUC, through its contractors, would be required to implement dust control measures in compliance with the requirements of the Construction Dust Control Ordinance, and therefore, the FEIR determined that construction-related air quality impacts due to fugitive dust would be less than significant. The SFPUC, through its contractors, is also required to implement emissions control measures in compliance with the requirements of the Clean Construction Ordinance. With these control measures, estimated average daily construction emissions of reactive organic gases (ROG) and of particulate matter measuring 10 and 2.5 microns in diameter or less (PM_{10}, and $PM_{2.5}$) were found to be below the applicable thresholds during all construction years. Emissions of nitrogen oxides (NOx), however, were found to exceed the applicable significance thresholds for two construction years (years 1 and 3). Subsequent to the certification of the FEIR and approval of the project, an updated analysis was conducted for the first three years of construction to estimate the emissions of the approved project based on the actual construction activities that occurred during those years. As documented in addendum 1 to the FEIR, the updated construction emission estimates for the first three years of construction are less than the emission estimates presented in the FEIR due to considerably fewer construction equipment hours actually used. **Table 5** presents the average daily construction criteria air pollutant emissions for the approved project. For the purposes of this analysis (addendum 2), the construction emissions presented in Table 5 for years 1 through 3 of the approved project are the updated construction emissions from addendum 1.[53] The original FEIR estimated emissions are shown in parentheses for comparison. The FEIR estimated emissions are shown in Table 5 for years 4 and 5 because the actual emissions have not been quantified for years 4 and 5.

[52] San Francisco Planning Department, Addendum 1 to Environmental Impact Report, Biosolids Digester Facilities Project, Biogas Utilization System, July 12, 2024. Available at: https://sfplanning.org/environmental-review-documents.

[53] Other minor project modifications were evaluated using worst-case conceptual analyses, which found there would not be any new or substantial changes in construction emissions or health risk effects beyond those analyzed in the FEIR.

Table 5 Average Daily Construction Criteria Air Pollutant Emissions for the Approved Project

Year	Average Daily Emissions (Pounds/Day)			
	ROG	NO_x	PM_{10}	$PM_{2.5}$
Year 1 of actual construction emissions *FEIR estimates shown in parentheses*	3.5 (8.7)	54 (**72**)	0.3 (0.7)	0.3 (0.7)
Year 2 of actual construction emissions *FEIR estimates shown in parentheses*	4.2 (10)	37 (45)	0.3 (0.7)	0.3 (0.6)
Year 3 of actual construction emissions *FEIR estimates shown in parentheses*	3.1 (10)	30 (**55**)	0.14 (0.6)	0.13 (0.6)
Year 4 (FEIR estimates)	13	40	0.5	0.5
Year 5 (FEIR estimates)	10	33	0.4	0.4

Project Emissions Above Threshold?	No	No	No	No

SOURCE: San Francisco Environmental Planning, Biosolids Digester Facilities Project Addendum 1 to Environmental Impact Report, July 12, 2024, Appendix B, Tables A 1a-A1c; Biosolids Digester Facilities Project Final EIR, Table 4.8-9

Operation

The FEIR found that full operation emissions in 2045 associated with the project would not exceed any of the significance thresholds for criteria air pollutants. The FEIR disclosed that net emissions of ROG would be reduced by approximately 4 tons, and that net emissions of NOx, PM10, and PM2.5 would each increase by approximately 3 tons per year (see **Table 6**), which would be less than the 10 or 15 tons per year significance thresholds for those pollutants. Subsequent to FEIR certification, an updated analysis was conducted for operation of the biogas utilization system instead of the originally proposed energy recovery facilities and related changes to operational energy demand and supply in addendum 1. Table 6 shows the approved project's operational criteria air pollutant emissions for the worst-case operating scenario.[54] The emissions presented in Table 6 for the approved project also reflect emissions updates that occurred after issuance of addendum 1 to reflect revised emission factors for emissions from the specific boilers and thermal oxidizer to be procured for the project.[55] The original FEIR estimated emissions are shown in parentheses for comparison. As shown in Table 6, the approved project's impacts with respect to causing new violations of air quality standards, contributing to an existing or projected air quality violation, or causing a cumulatively considerable net increase in criteria air pollutants during operations were found to be less than significant.

[54] Compared to the project as analyzed in the FEIR at full operation in 2045, the approved project has decreased emissions of ROG, NOx, PM10, and PM2.5. These changes in operation criteria air pollutant emissions are due to changes in equipment for the biogas utilization system (namely, the removal of the proposed turbines and increase in boiler and flaring operations), as well as differing amounts and composition of the gas combusted between the FEIR project scenario and the recently approved biogas utilization system.

SOURCE: Ramboll, 2024. Memorandum: Air Quality Health Risk Assessment Update for Potential Modification to the Future End-use of Digester Gas at the Southeast Plant Biosolids Digester Facility, Table 2a, October 7, 2024; Biosolids Digester Facilities Project Final EIR, Table 4.8-10.

Toxic Air Contaminants

Both construction and operation of the approved project were found to generate emissions of $PM_{2.5}$ and toxic air contaminants, including diesel particulate matter. The FEIR determined that project-related construction and operational emissions increases would not expand air pollutant exposure zone boundaries or create new air pollutant exposure zones. The project-specific health risk assessment found that the project's net construction-related and operational cancer risk as well as $PM_{2.5}$ concentrations would not exceed significance thresholds at sensitive receptors within 1 kilometer of the project site. Because the biogas utilization system would require fewer facilities and less excavation than estimated for construction of the energy recovery facilities in the FEIR, addendum 1 to the FEIR found that it was reasonable to conclude that construction-related health risk would also decrease as a result of the modifications, and therefore, the construction health risk impacts were not re-quantified as part of the analysis in addendum 1 to the FEIR. Operations-related excess cancer risk and $PM_{2.5}$ concentrations of the approved project as analyzed in addendum 1 were reduced compared to the project evaluated in the FEIR.[56] The excess cancer risk threshold of 7.0 per million is inclusive of emissions from construction and operation. Given the approved project would have decreased construction related and operational cancer risk, it is reasonable to conclude that the approved project's combined excess cancer risk would be below the values presented in the FEIR, and below CEQA thresholds, even though construction risk was not re-quantified. The analysis in addendum 1 to the FEIR determined that the approved project's impact would remain less than significant.

Consistency with Clean Air Plan

The project was found to be consistent with the adopted *2010 Clean Air Plan* and Draft *2017 Clean Air Plan* because it would not hinder either plan in meeting its primary goals. Additionally, with implementation of Mitigation Measures M-AQ-1a and M-AQ-1b, the project was found to be consistent with the *2010 Clean Air Plan*'s control measures, including mobile/stationary source measures, land use/local impact measures, and energy/climate measures, as well as the Draft *2017 Clean Air Plan's* transportation, stationary source, and

[56] Ramboll, 2024. Memorandum: Air Quality Health Risk Assessment Update for Potential Modification to the Future End-use of Digester Gas at the Southeast Plant Biosolids Digester Facility, October 7, 2024.

water control measures. Therefore, the FEIR concluded that the project would not conflict with or obstruct implementation of the *2010 Clean Air Plan,* and the impact would be less than significant with mitigation.

Odors

The FEIR determined that construction activities for the project were not expected to create objectionable odors affecting a substantial number of people. The FEIR determined that during operation, odors from the solids treatment facilities both inside and outside the boundary of the Southeast Plant were expected to improve compared to existing conditions. Based on the relocation of solids and digester gas handling facilities farther from sensitive receptors, design of proposed facilities, implementation of the proposed odor control features, and results of odor modeling, operation of the project was not expected to create objectionable odors that would affect a substantial number of people, and the impact was found to be less than significant. Addendum 1 to the FEIR found that the approved project would not affect odors.

Cumulative Impacts

The FEIR determined that the project, in combination with cumulative projects, would result in a significant cumulative impact related to criteria air pollutant emissions because the project's construction-related criteria pollutant emissions would exceed thresholds for NOx during years 1 and 3 of construction. However, as discussed above, while the FEIR concluded that the project would result in a significant and unavoidable cumulative impact with mitigation for NOx, as shown in Table 5 the approved project emissions for NOx no longer exceed the threshold for years 1 through 3.

The FEIR determined that cumulative increases in excess cancer risk from the project in combination with background risks and other development would exceed the cumulative threshold of 90 per million and 100 per million, indicating a significant cumulative impact, but that the project's contribution would not be cumulatively considerable (less than significant) because the project's combined construction-related and operational excess cancer risk would not exceed the project-level thresholds of 7.0 per million and 10 per million. Similarly, the FEIR determined that cumulative $PM_{2.5}$ increase during construction would exceed the cumulative $PM_{2.5}$ threshold of 9.0 $\mu g/m^3$, indicating a significant cumulative impact. However, the FEIR determined the project's construction-related contributions to cumulative $PM_{2.5}$ levels within the air pollution exposure zone would not exceed the project-level thresholds of 0.2 and 0.3 $\mu g/m^3$, and therefore the project's construction-related contribution to the cumulative $PM_{2.5}$ levels would not be cumulatively considerable. The FEIR did not identify other potentially significant cumulative air quality impacts. Because the biogas utilization system would require fewer facilities and less excavation than estimated for construction of the energy recovery facilities in the FEIR, addendum 1 to the FEIR found that it was reasonable to conclude that construction-related health risks (including excess cancer risk and $PM_{2.5}$ concentration) would also decrease as a result of the modifications, and therefore, the construction health risk impacts were not re-quantified as part of the analysis in addendum 1 to the FEIR. Operations-related excess cancer risk and $PM_{2.5}$ concentrations of the approved project would also be reduced compared to the project evaluated in the FEIR.[57] The excess cancer risk threshold of 7.0 per million and the project-level cumulative contribution $PM_{2.5}$ concentration threshold of 0.2 $\mu g/m^3$ are both inclusive of emissions from construction and operation. Given the approved project would have decreased construction related and operational toxic air contaminant emissions, it is reasonable to conclude that the approved project's

[57] Ramboll, 2024. Memorandum: Air Quality Health Risk Assessment Update for Potential Modification to the Future End-use of Digester Gas at the Southeast Plant Biosolids Digester Facility, October 7, 2024.

combined excess cancer risk and cumulative $PM_{2.5}$ concentration would be below the values presented in the FEIR, and below CEQA thresholds, even though construction risk was not re-quantified. Because construction risk was not re-quantified, **Tables 7 and 8** below present estimated health risk results from the FEIR.

Modified Project

Criteria Air Pollutants

Construction

The approved project included construction of Maintenance Shops 1 and 2 during the second year through fourth year of construction. For consistency with the FEIR, and for a conservative evaluation, construction of the proposed modifications in this addendum (that would replace Maintenance Shops 1 and 2) are evaluated as if they would also be constructed during the second year through fourth year of construction of the approved project, when criteria air pollutant emissions were estimated to be the highest.

Table 9 shows the modified project criteria air pollutant emissions, consisting of emissions from the proposed modifications combined with the approved project emissions. Approved project emissions reflect actual construction activities during the second and third years of construction,[58] while the FEIR emissions estimate is used for the fourth year of construction because actual emissions data is unavailable. The emissions shown in Table 9 assume compliance with FEIR Mitigation Measure M-AQ-1a (Construction Emissions Minimization), presented below. Refer to Appendix B for additional details regarding the modified project construction emissions estimates.

Table 9 shows that, with implementation of **Mitigation Measure M-AQ-1a (Construction Emissions Minimization)**, none of the emissions for years two through four of construction of the modified project would exceed a significance threshold. Construction during all three years would result in slightly higher average daily emissions of NOx, ROG, PM_{10} and $PM_{2.5}$ when compared to the approved project. However, all emissions would be below significance thresholds (less than significant with mitigation).

Implementation of Mitigation Measure M-AQ-1a (Construction Emissions Minimization), as presented below in full, would reduce impacts to less-than-significant levels by requiring the use of emissions control technologies, newer equipment, and renewable diesel.

[58] An updated criteria air pollutant emissions analysis was conducted for the first three years of the Biosolids project construction to estimate the emissions of the project based on the actual construction activities that occurred during those years (years 1 through 3).

Table 9 Modified Project Average Daily Construction Criteria Air Pollutant Emissions During Years 2-4 - Mitigated[59]

Memorandum: Air Quality Health Risk Assessment Update for Potential Modification to the Future End-use of Digester Gas at the Southeast Plant Biosolids Digester Facility, Table 1, October 7, 2024; and FEIR Table 4.8-9 for Approved Project emissions year 4.

Mitigation Measure M-AQ-1a: Construction Emissions Minimization

The SFPUC's contractors shall comply with the following:

A. Engine Requirements.

1. All off-road equipment with larger engines (greater than or equal to 140 horsepower) shall meet United States Environmental Protection Agency (USEPA) or California Air Resources Board (CARB) Tier 4 Final off-road emission standards, while equipment with smaller engines (less than 140 horsepower) shall meet or exceed Tier 2 off-road emission standards and be equipped with diesel particulate filters (DPFs), which is equivalent to a Level 3 verified diesel emission control strategy (VDECS).

[59] Years 2 through 4 are shown in this table because the approved project included construction of Maintenance Shops 1 and 2 during the second year through fourth year of construction. For consistency with the FEIR, and for a conservative evaluation, construction of the proposed modifications that would replace Maintenance Shops 1 and 2 are evaluated as if they would also be constructed during the second year through fourth year of construction of the approved project. Approved project emissions reflect actual construction activities during the second and third years; the FEIR emissions estimate is used for the fourth year of construction.

[60] Totals shown in this row may not be equal to the sum of values in rows above due to rounding.

2. At least 80 percent of haul trucks (i.e., trucks used to remove or deliver backfill soil, excavated soil, and demolition debris) used must have 2010 or newer engines. The SFPUC should strive to exceed this requirement when possible; if trucks with 2010 or newer engines are available in the Contractor's, or subcontractor's fleet, then those should be used for the project.

   The SFPUC, through its Contractors Assistance Center, will work with the BAAQMD's Strategic Incentives Division and interested, eligible truckers to pursue funding to replace vehicles or retrofit engines to comply with the lower emissions requirement, including but not limited to conducting informational presentations at the Contractors Assistance Center to notify truckers about the grants and incentives and assisting with the completion of applications to the grant programs.

3. All diesel-powered haul trucks and off-road equipment must use renewable diesel.[61]

B. Waivers.

1. Pursuant to the Clean Construction Ordinance, the SFPUC General Manager (GM) or designee may waive the alternative source of power requirement if an alternative source of power is limited or infeasible at the project site. If the SFPUC GM grants the waiver, the contractor shall submit documentation that the equipment used for on-site power generation meets the requirements of Subsection (A)(1).

2. The SFPUC GM or designee may waive the equipment requirements of Subsection (A)(1) but only under any of the following unusual circumstances: if a particular piece of off-road equipment with Tier 4 Final standards or CARB Level 3 VDECS is technically not feasible; the equipment would not produce desired emissions reduction due to expected operating modes; installation of the equipment would create a safety hazard or impaired visibility for the operator; or there is a compelling emergency need to use off-road equipment that is not retrofitted with a CARB Level 3 VDECS. If the SFPUC GM or designee grants the waiver, the contractor shall use the next cleanest piece of off-road equipment, according to the following table:

Compliance Alternative	Engine Emission Standard
1	Tier 4 Interim
2	Tier 3
3	Tier 2

NOTES: How to use the table: If the SFPUC GM or designee determines that the equipment requirements cannot be met, then the contractor shall meet Compliance Alternative 1. If the SFPUC GM or designee determines that the contractor cannot supply off-road equipment meeting Compliance Alternative 1, then the contractor shall meet Compliance Alternative 2. If the SFPUC GM or designee determines that the contractor cannot supply off-road equipment meeting Compliance Alternative 2, then the contractor shall meet Compliance Alternative 3.

Operation

Operational criteria air pollutant emissions associated with the proposed modifications would generally remain unchanged relative to the approved project because there would be no new operational emissions sources with the exception of two new emergency generators that would replace a single existing emergency generator (see below). In addition, the relocated chiller and boiler equipment would serve fewer

[61] In Minor Project Modification 8 the SFPUC proposed an alternative to the requirement to use renewable diesel in on-road haul trucks because there are no renewable diesel fueling facilities for large haul trucks near the project site. The alternative would achieve the same NOx emissions avoidance by replacing 80% of older trucks using renewable diesel with 80% of newer trucks using non-renewable diesel.

buildings with an overall reduced square footage. **Table 10** shows the net increase in operational emissions that would be associated with the modified project. As shown in Table 10, the associated operational emissions increase from the emergency generators would be under 1 ton per year and the total combined increase in criteria air pollutant operational emissions from the modified project would remain below significance thresholds.

Table 10 Modified Project Net Annual Operational Criteria Air Pollutant Emissions

Source	Maximum Annual Emissions (Tons/Year)

SOURCE: Appendix B, Table D; and Ramboll, Air Quality Health Risk Assessment Update for Potential Modification to the Future end-use of Digester Gas at the Southeast Plant Biosolids Digester Facility Project in San Francisco, California, October 7, 2024, Table 14.

Toxic Air Contaminants

Table 11 shows the total health risks for the modified project, including the operational emissions for the proposed modifications quantified in Table 10. Adding the maximum health impacts from the proposed modifications to the approved project impacts is conservative because this assumes that these maximums could occur at receptors that would also be experiencing health risks at the level of the maximally exposed individual sensitive receptor for the approved project.[63] The maximum risks at the maximally exposed individual sensitive receptor include risks from the modified project activities such as off-road construction and emergency generator testing. Moreover, the approved project maximally exposed individual sensitive receptor impact value already includes a small portion of risk accounted for from the construction of Maintenance Shops 1 and 2 (i.e., the previously approved design for the currently proposed modification, as was evaluated in the FEIR). The estimate of modified project health risks is also conservative for particulate matter and chronic non-cancer hazard index, which are calculated as maximum annual averages, as the summation assumes they would also overlap in time.

As shown in Table 11 below, with implementation of FEIR Mitigation Measure M-AQ-1a (Construction Emissions Minimization), the resulting maximum health risks at the maximally exposed individual sensitive receptor would be below CEQA thresholds.

[62] Assumes Tier 3 generators for proposed modifications.

[63] The location of the maximally exposed individual sensitive receptor for the proposed modifications is different from the location of the approved project's maximally exposed sensitive receptor.

Table 11 Modified Project Potential Theoretical Maximum Health Risk Impacts[64]

Source	Excess Cancer Risk (in a million)	$PM_{2.5}$ Concentration (ug/m^3)	Chronic Non-Cancer Hazard Index (unitless)
Proposed Modifications MEISR[65] Impact (Construction and Operations)	2.4	0.0047	0.0010

Modified Project Impact (Construction and Operation) [68]	4.2	0.04	0.02
CEQA Significance Threshold	7.0	0.2	1
Exceeds CEQA Significance Threshold	No	No	No

SOURCES: Appendix B, Table E.

Table 12 summarizes the cumulative health impacts of the modified project and compares it to the CEQA significance threshold. As discussed above, since preparation of the FEIR, citywide background health risk has increased due to changes in methodology and due to increases in nearby stationary sources and major roadway and railroad emissions sources, contributing to the increase in cumulative effects. In addition, due to the updated emissions sources the maximally exposed individual sensitive receptor location for the modified project is different from the maximally exposed individual sensitive receptor location in the FEIR. The modified project's impact would be considered cumulatively considerable if the project's contribution to the excess cancer risk exceeded the threshold of 7.0 per million (for the maximally exposed individual sensitive receptor within the air pollutant exposure zone). As shown, the modified project's construction-related and operational net increase in excess cancer risk would not exceed the 7.0 per million threshold. Therefore, the modified project's combined cancer risk would be less than significant, and no mitigation would be necessary. Although the impact would be less than significant, implementation of controls specified in Mitigation Measure M-AQ-1a (Construction Emissions Minimization) would reduce the project's less-than-significant impact by decreasing the project's net increase in cancer risk.

[64] Assumes implementation of Mitigation Measure M-AQ-1a and Tier 3 generators for proposed modifications.

[65] "MEISR" is maximally exposed individual sensitive receptor.

[66] "FEIR Construction MEISR Impact" values include the cancer risk at the MEISR identified in the FEIR from the entire project implementation, including construction and operation, minus the net reduction from decommissioning of certain existing facilities.

[67] Ramboll, Revised Air Quality Health Risk Assessment Update for Potential Modification to the Future End Use of Digester Gas at the Southeast Plant Biosolids Digester Facility Project in San Francisco, California, October 7, 2024.

[68] Total shown in this row may not be equal to the sum of values in rows above due to rounding.

Table 12 Cumulative Health Risk Impacts of the Modified Project, Cumulative Projects, and 2020 Updated Citywide Health Risk Assessment

Source	Excess Cancer Risk (in a million)	$PM_{2.5}$ Concentration (ug/m^3)	Chronic Non-Cancer Hazard Index (unitless)
FEIR Total Cumulative Health Risk (FEIR Construction MEISR Impact)[69]	111	9.2	0.009
Modified Project			
Modified Project Total Net Health Risk (Construction and Operations)[70]	4.2	0.04	0.02

Threshold for Contribution to Cumulative Impact (Project-Level Threshold)	7.0	0.5	1
Modified Project Contribution Significant?	No	No	No

SOURCE: Appendix B, Table F.

Consistency with Clean Air Plan

Impacts associated with consistency with the adopted 2010 Clean Air Plan and Draft 2017 Clean Air Plan associated with the modified project would remain unchanged relative to the approved project because construction emissions during years 2 through 4 would not exceed BAAQMD thresholds with implementation of Mitigation Measure M-AQ-1a (Construction Emissions Minimization), and the only new emissions sources would be routine testing of two new emergency generators that would replace an existing emergency generator resulting in operational emissions below thresholds.

Odors During Construction and Operation

Odor impacts associated with the modified project would remain unchanged relative to the approved project because the proposed modifications would not alter biosolids handling or treatment processes.

[69] "FEIR Construction MEISR Impact" values include the cancer risk at the MEISR identified in the FEIR from the entire project implementation, including construction and operation, minus the net reduction from decommission of certain existing facilities.

[70] The modified project total for each type of health risk is calculated as shown in Table 11 and is the sum of health risks from the proposed modifications, construction maximum health risks from the FEIR, and operations maximum health risks of the approved project (including other approved project modifications). Values shown assume implementation of Mitigation Measure M-AQ-1a and Tier 3 generators for proposed modifications.

Conclusion

With implementation of approved Mitigation Measure M-AQ-1a (Construction Emissions Minimization), the modified project would not result in new significant impacts on air quality that were not previously identified in the FEIR, would not result in more severe impacts than those identified, and would not require new mitigation measures.

5.6 Biological Resources

Biosolids Digester Facilities Project FEIR Findings

The FEIR found that the approved project would have potentially significant impacts related to the following significance criteria regarding biological resources:

- Have a substantial adverse effect, either directly or through habitat modifications, on species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or United States Fish and Wildlife Service

The FEIR found that the project would have less than significant impacts related to: federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means; and conflicting with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance. The approved project was determined to have no impacts related to riparian habitat or other sensitive natural community, interference with migratory corridors, or conflicts with an adopted habitat conservation plan. As explained in the FEIR, operational impacts on biological resources were not discussed because limited biological resources are found within and near the site, and upon completion of the project, all operations would be restricted to the expanded, modernized Southeast Plant, and no activities would occur in the staging areas.

Special-Status Species

The FEIR found that underutilized buildings, trees, and other structures in and near the project site and construction staging areas could serve as migratory bird nesting habitat and bat roosting sites. The FEIR determined that impacts to nesting birds would be less than significant with implementation of SFPUC's Standard Construction Measure 7 (Biological Resources) that requires pre-construction nesting bird surveys and establishing no-disturbance buffers for any active nests, while Mitigation Measure M-BI-1 (Protective Measures for Special Status Bats and Maternity Roosts) would reduce impacts on bats to a less-than-significant level. Mitigation Measure M-BI-1 (Protective Measures for Special Status Bats and Maternity Roosts) requires pre-construction bat surveys, establishing no disturbance buffers for active nests and roosts, removing bat roosts under certain weather conditions when bats are more active and only in consultation with the California Department of Fish and Wildlife, and installing artificial habitat to compensate for removed roosts.

Federally Protected Wetlands

The FEIR determined that with adherence to Article 4.2 of the San Francisco Public Works Code (Section 146) and the State Water Resources Control Board's Construction General Stormwater Permit during grading and

excavation near wetlands at the Piers 94 and 96 staging areas, the approved project would have a less-than-significant impact on wetlands.

Local Policies or Ordinances Protecting Biological Resources

The FEIR identified that the approved project would not significantly conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance, because the design includes planting trees and other landscaping along Jerrold Avenue to replace trees requiring removal and a site-specific Tree Protection Plan would also be required to protect trees that would be retained pursuant to San Francisco Public Works Code Article 16.

Modified Project

Construction of the proposed modifications would be within the existing Southeast Plant boundary, but outside of the approved project boundary. The disturbance footprint is currently developed with pavement, existing buildings, and landscaping which does not support or contain sensitive natural communities, aquatic features, serve as a wildlife corridor, or provide suitable habitat for special-status plants. While the proposed modifications would occur beyond the approved project boundary, operations would occur within the existing Southeast Plant and therefore for the same reasons discussed in the FEIR, operational impacts are not discussed in the impact analysis below.

Special-Status Species

Wildlife habitat within the proposed modifications disturbance footprint is limited to existing landscape trees and buildings, which could support migratory bird nests or bat maternity roosts. Like the approved project, construction of the modified project could affect birds or bats if active nests or maternity roosts are present in the trees or buildings to be removed or demolished. Construction associated noise, vibration, and visual disturbance could also affect avian or bat behavior and disturb or disrupt use of active nests or roosts in the modified project area, if present. As with the approved project, direct impacts on active bird nests or bat maternity roosts resulting from the modified project, such as disturbance that causes nest or roost abandonment, would be potentially significant. Like the approved project, the SFPUC would implement Standard Construction Measure 7 (Biological Resources) and Mitigation Measure M-BI-1 (Protective Measures for Special Status Bats and Maternity Roosts) during construction to ensure that nesting birds and bat maternity roosts would not be adversely affected. Therefore, with implementation of **Mitigation Measure M-BI-1 (Protective Measures for Special Status Bats and Maternity Roosts)** as presented below in full, the modified project impacts on nesting birds, and special-status bat maternity roosts would remain less than significant with mitigation.

> **Mitigation Measure M-BI-1: Protective Measures for Special Status Bats and Maternity Roosts**
>
> The San Francisco Public Utilities Commission (SFPUC) shall engage a qualified biologist to conduct a pre-construction survey of buildings and other structures to be demolished, vacant buildings within 100 feet of construction activities, trees to be removed, and trees located within 100 feet of construction activities to locate potential roosting habitat for special-status bats and active maternal colonies. The pre-construction surveys shall occur no more than two weeks in advance of initiation of building demolition or renovation activities on-site or initiation of construction. No activities that could disturb active roosts of special-status bats or maternal roosts shall proceed prior to the completed surveys. The pre-construction survey shall include at a minimum:

- Identification of potential direct and indirect project-related bat- disturbing activities; and
- Locations of active roosting habitat and maternal colonies.

If the pre-construction survey does not identify signs of potentially active bat roosts (e.g., guano, urine staining, dead bats, etc.) then no further action is required. If the pre-construction survey identifies signs of potentially active bat roosts, the following measures shall be implemented:

- Removal of structures and trees shall occur when bats are active, approximately between the periods of March 1 to April 15 and August 15 to October 15; outside of bat maternity roosting season (approximately April 15 to August 31); and outside of months of winter torpor (approximately October 15 to February 28). On structures where bats were observed during the pre-construction survey, exclusion devices (i.e., one-way doors) shall be installed prior to removal of the structures. Exclusion devices shall be left in place for a minimum of four nights prior to demolition of the structures.
- If removal of structures and trees during the periods when bats are active is not feasible and active bat roosts being used for maternity or hibernation purposes are found on or in the immediate vicinity of the project site where structure demolition or renovation is planned, a no-disturbance buffer of 100 feet or less if determined adequate by a qualified biologist in coordination with the California Department of Fish and Wildlife (CDFW) based on site-specific conditions shall be established around the roost sites until they are determined to be no longer active or volant by a qualified biologist.
- The qualified biologist shall be present during structure and tree disturbance if active bat roosts are present. Structures and trees with active roosts shall be removed only when no rain is occurring or is forecast to occur for three days and when daytime temperatures are at least 50 degrees Fahrenheit (˚F).
- Structures or trees containing or suspected to contain active bat roosts shall be dismantled or removed under the supervision of the qualified biologist in the evening and after bats have emerged from the roost to forage. Structures shall be partially dismantled to significantly change the roost conditions, causing bats to abandon and not return to the roost.
- If significant bat roosting habitat (e.g., maternity roosts or special-status non-maternity roost sites) is destroyed during structure or tree removal, artificial bat roosts shall be constructed in an undisturbed area in the project site vicinity away from human activity and at least 200 feet from project demolition/construction activities. The design and location of the artificial bat roost(s) shall be determined by a qualified bat biologist.
- Bat roosts that begin during construction are presumed to be unaffected, and no buffer would be necessary.

Local Policies or Ordinances Protecting Biological Resources

Construction of the proposed modifications would remove approximately 35 landscaping trees within the modified project's disturbance footprint, including four trees mapped as "significant trees" as defined in San Francisco Public Works Code Article 16.[71] The landscaping plan for the proposed modifications incorporates

[71] San Francisco Planning Department, Biosolids Digester Facilities Project Final Environmental Impact Report Appendix BIO, Planning Department Case No. 2015-000644ENV, State Clearinghouse No. 2015062073 certified March 8, 2018.

planting approximately 35 replacement trees (see Figure 3), consistent with the 1:1 replacement ratio in San Francisco Public Works Code Article 16. Like the approved project, with tree replacement consistent with Article 16 of the San Francisco Public Works Code, the modified project would not substantially conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance. Like the approved project, the location of the modified project is not in or near an Urban Bird Refuge and the building design for the proposed modifications does not contain any components that creates feature-related hazards for birds. Therefore, the modified project conforms with the Standards for Bird Safe Buildings.

Conclusion

In summary, with implementation of SFPUC Standard Construction Measure 7 and Mitigation Measure M-BI-1, construction of the modified project would not result in significant impacts on biological resources greater than those identified in the FEIR. Moreover, the modified project would not result in new significant impacts on biological resources that were not previously identified in the FEIR; would not result in more severe impacts than those identified; and would not require new mitigation measures.

Cumulative Impacts

The FEIR establishes that the geographic scope for potential cumulative impacts on biological resources encompasses the species occurrences, habitats, and sensitive natural communities in the vicinity of the project site and off-site staging areas. Cumulative projects that would affect biological resources similar to those of the modified project and that could combine to result in potential cumulative impacts on biological resources include projects that would demolish or remove buildings or structures that could be used as bat roosts or result in adverse effects on nesting birds by removing trees or generating substantial noise. As the use of Piers 94 and 96 for construction staging is no longer proposed, the modified project would have no contribution to potential cumulative impacts on wetlands.

As discussed in Section 4.2, Cumulative Projects in the Site Vicinity, and presented in Appendix A, the list of potential cumulative projects at the at the Southeast Plant has also been revised since the certification of the FEIR. The following cumulative project could involve building demolition, tree or vegetation removal, and/or noise or visual disturbance during construction:

- Islais Creek Bridge Replacement

The building and tree removal of the modified project and cumulative projects in the vicinity could cause potentially significant cumulative impacts on biological resources. However, like the approved project, the modified project would implement Mitigation Measure M-BI-1 (Protective Measures for Special-status Bats and Maternity Roosts) and SFPUC Standard Construction Measure 7 (Biological Resources). As explained above, implementation of these measures would reduce or avoid potential impacts on nesting birds, and special-status bats, and maternity roosts. Therefore, with implementation of Mitigation Measure M-BI-1 and SFPUC Standard Construction Measure 7 (Biological Resources), the modified project's contribution to cumulative impacts would not be considerable, and the impact would be less than significant with mitigation.

In summary, the modified project would not result in new significant cumulative impacts on biological resources that were not previously identified in the FEIR; would not result in new more severe impacts than those identified; and would not require new mitigation measures.

5.7 Geology, Soils, and Paleontological Resources

Biosolids Digester Facilities Project FEIR Findings

The FEIR found that the approved project would have potentially significant impacts related to the following significance criteria regarding geology, soils, and paleontological resources:

- Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature.

The approved project was determined to have less than significant impacts related to seismic ground shaking or seismically induced ground failure, erosion, or being located on a geologic unit or soil that is unstable or could become unstable as a result of the project. The approved project was determined to have no impacts related to fault rupture and landslides, loss of topsoil, expansive soil, septic tanks or alternative water systems, and changes in unique geologic features.

Paleontological Resources

The FEIR found that the Pleistocene-aged, upper-layered sediments underlying the approved project site have high paleontological sensitivity, and that excavations extending into these sediments could encounter and damage or destroy paleontological resources (fossils). The FEIR concluded that this potentially significant impact on paleontological resources would be less than significant with implementation of Mitigation Measure M-GE-4 (Paleontological Resources Monitoring and Mitigation Program), which requires that excavation activities within the upper layered sediments be monitored by a qualified paleontologist, that any substantial find be adequately curated, and establishes procedures in the event of discoveries.

Ground Shaking or Seismically Induced Ground Failure

The FEIR determined that impacts related to ground shaking or seismically induced ground failure, liquefaction, earthquake-induced settlement, lateral spreading, and ground settlement that could expose people or structures to the risk of loss, injury, or death would be less than significant because the approved project was designed in accordance with the San Francisco Building Code and ASCE/SEI 7-10 and the SFPUC's Seismic Design Requirements and the approved project incorporates engineering and design features to withstand a major earthquake. Moreover, the FEIR discussed that the approved project would substantially improve the Southeast Plant's seismic safety, because it would replace the digesters and other existing solids treatment facilities at the Southeast Plant that are over 60 years old and were not built to withstand a major earthquake.

Unstable Geologic Units

The geotechnical interpretive report concluded that there is a low potential for lateral spreading at the approved project site; and measures would be implemented to prevent ground settlement due to excavation, dewatering, and pile driving in accordance with Title 8 of the California Code of Regulations.

Soil Erosion

The FEIR determined that the approved project would not result in substantial erosion, because the SFPUC would be required to prepare and implement a site-specific erosion and sediment control plan pursuant to San Francisco Public Works Code Article 4.2.

Modified Project

To date, no fossils have been exposed during the sampling and monitoring performed for construction of the approved project pursuant to Mitigation Measure M-GE-4 (Paleontological Resources Monitoring and Mitigation Program). However, the SFPUC would continue to implement Mitigation Measure M-GE-4 during construction, same as the approved project. With implementation of Mitigation Measure M-GE-4, presented below in full, construction impacts on paleontological resources would remain less than significant with mitigation.

> **Mitigation Measure M-GE-4: Paleontological Resources Monitoring and Mitigation Program**
>
> The SFPUC shall retain the services of a qualified paleontological consultant having expertise in California paleontology to design and implement a Paleontological Resources Monitoring and Mitigation Program (PRMMP) for construction activities that would disturb the upper layered sediments that are sensitive for paleontological resources. The PRMMP shall not require monitoring in shallower excavations that do not encounter the upper layered sediments.
>
> The PRMMP shall include a description of when and where construction monitoring would be required; emergency discovery procedures; sampling and data recovery procedures; procedure for the preparation, identification, analysis, and curation of fossil specimens and data recovered; pre-construction coordination procedures; and procedures for reporting the results of the monitoring program.
>
> The PRMMP shall be consistent with the Society for Vertebrate Paleontology (SVP) Standard Guidelines for the mitigation of construction–related adverse impacts on paleontological resources and the requirements of the designated repository for any fossils collected. During construction, earth-moving activities shall be monitored by a qualified paleontological consultant having expertise in California paleontology in the areas where these activities have the potential to disturb the upper layered sediments. Monitoring need not be conducted for construction activities that would disturb only artificial fill material and/or young bay mud.
>
> The consultant's work shall be conducted in accordance with this measure and at the direction of the City's Environmental Review Officer (ERO) in coordination with the SFPUC. Plans and reports prepared by the consultant shall be submitted first and directly to the ERO for review and comment and concurrently to the SFPUC for review and comment, and shall be considered draft reports subject to revision until final approval by the ERO. Paleontological monitoring and/or data recovery programs required by this measure could suspend construction of the project in an appropriate buffer zone around a discovered paleontological resource or area determined in the PRMMP to be sensitive for paleontological resources for up to a maximum of four weeks. At the direction of the ERO and in coordination with the SFPUC, the suspension of construction may be extended beyond four weeks for a reasonable time required to implement appropriate measures in accordance with

the PRMMP only if such a suspension is the only feasible means to reduce potential effects on a significant paleontological resource as previously defined to a less-than-significant level.

Ground Shaking or Seismically Induced Ground Failure

Modified project impacts related to ground shaking or seismically induced ground failure, liquefaction, earthquake-induced settlement, lateral spreading, and ground settlement that could expose people or structures to the risk of loss, injury, or death would continue to be less than significant. This is because the modified project is also designed in accordance with the San Francisco Building Code and ASCE/SEI 7-10 and the SFPUC's Seismic Design Requirements.

Unstable Geologic Units

The modified project impacts related to unstable soils and geologic units would remain less than significant because the modified project would implement the recommendations of the geotechnical reports for each project and excavation safety requirements specified in California Code of Regulations Title 8.

Soil Erosion

Like the approved project, site-specific erosion and sediment control measures would continue to be implemented during construction of the modified project, and impacts related to soil erosion would remain less than significant.

Conclusion

In summary, with implementation of Mitigation Measure M-GE-4, construction of the modified project would not result in significant impacts related to geology and soils greater than those identified in the FEIR. Moreover, the modified project would not result in new significant impacts related to geology and soils that were not previously identified in the FEIR; would not result in more severe impacts than those identified; and would not require new mitigation measures.

Cumulative Impacts

The FEIR established that the geographic scope of cumulative impacts related to seismic hazards and erosion is restricted to the project site and adjacent areas, as these geology and soils impacts are relatively localized or even site-specific. The FEIR found that cumulative impacts related to seismic hazards, erosion, and unstable soils or geologic units would be less than significant. As discussed in the FEIR, all of the SFPUC-sponsored cumulative projects would be engineered and designed according to the most current building code requirements, the SFPUC Seismic Design Guidelines, and applicable engineering standards for seismic safety, which would reduce risks associated with seismic hazards. The non-SFPUC cumulative projects would also be subject to local and state building codes. Additionally, all cumulative projects would be required to implement the requirements of Article 4.1 of the San Francisco Public Works Code, which includes stormwater pollution prevention and erosion control requirements applicable to construction projects.

The FEIR establishes that the geographic scope for potential cumulative impacts to paleontological resources includes the Islais Creek area where the upper layered sediments and other Pleistocene-age sediments could be disturbed. As discussed in Section 4.2, Cumulative Projects in the Site Vicinity, and presented in Appendix A, the list of potential cumulative projects at the Southeast Plant has been revised

since the certification of the FEIR. The following cumulative projects could include ground disturbance in the upper layered sediments and other Pleistocene-age sediments:

- Southeast Plant Headworks Replacement Project
- Islais Creek Bridge Replacement

The modified project in combination with cumulative projects could disturb upper layered sediments or other Pleistocene-age sediments and could result in potentially significant cumulative paleontological resources impacts. However, like the approved project, implementation of Mitigation Measure M-GE-4 (Paleontological Resources Monitoring and Mitigation Program) would ensure the modified project's contribution to this cumulative impact would be less than significant with mitigation.

In summary, the modified project would not result in new significant cumulative impacts related to geology and soils that were not previously identified in the FEIR; would not result in new more severe impacts than those identified; and would not require new mitigation measures.

5.8 Wildfire

The Biosolids Digester Facilities Project FEIR did not analyze wildfire impacts, because this topic was not mandated for inclusion under CEQA until 2019, after the FEIR certification. CEQA Guidelines Appendix G Checklist criteria for wildfire impacts are listed below.

If located in or near state responsibility areas or lands classified as very high fire hazard severity zones, would the project:

- Substantially impair an adopted emergency response plan or emergency evacuation plans?
- Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?
- Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?
- Expose people or structure to significant risks including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?

The City and County of San Francisco does not have any state responsibility areas for fire prevention or lands that have been classified as very high fire hazard severity zones.[72,73,74] Therefore, the wildfire topics are not applicable to the project and are not discussed further in this addendum. Refer to Section 5.9.10, Hazards

[72] California Department of Forestry and Fire Protection (CAL FIRE), San Francisco County Fire Hazard Severity Zone (FHSZ) Maps, November 2008, https://osfm.fire.ca.gov/what-we-do/community-wildfire-preparedness-and-mitigation/fire-hazard-severity-zones/fire-hazard-severity-zones-maps, accessed February 13, 2024.

[74] CAL FIRE, San Mateo County FHSZ Map, June 15, 2023, https://34c031f8-c9fd-4018-8c5a-4159cdff6b0d-cdn-endpoint.azureedge.net/-/media/osfm-website/what-we-do/community-wildfire-preparedness-and-mitigation/fire-hazard-severity-zones/fire-hazard-severity-zones-map-2022/fire-hazard-severity-zones-maps-2022-files/fhsz_county_sra_11x17_2022_sanmateo_2.pdf, accessed April 9, 2024.

and Hazardous Materials, for a discussion of additional fire risks and emergency response or evacuation plans.

5.9 Other Environmental Topics with Less-Than-Significant Impacts

5.9.1 Land Use and Planning

The existing Southeast Plant is an area designated as Public Facilities and Light Industrial in the San Francisco General Plan. The FEIR discussed that construction would temporarily affect land uses in the project vicinity, particularly related to closing Jerrold Avenue to public through-traffic between Phelps Street and the Caltrain right-of way to maintain a safe work area; however, this would be a less-than-significant impact, because the closure would be temporary, there would be detour routes, and the area affected by the closure does not clearly constitute an established community given the distinct nature of land uses on either side of this closed road segment (e.g., industrial warehouses to the west and residences and commercial uses to the east) along with the large-scale intervening industrial land uses that comprise the existing Southeast Plant site. Regarding operation, the FEIR determined that although the approved project would expand the Southeast Plant wastewater facilities into the Central Shops and Asphalt Plant sites, the new facilities would not divide an established community because those areas were already being used for storage and for industrial uses similar to the Southeast Plant, were already not accessible to the public, and would not block access between adjacent land uses. The FEIR assessed the demolition of Building 870, a contributor to the Southeast Treatment Plant Streamline Moderne Industrial Historic District (See Section 5.1, Cultural Resources) but was subsequently removed from the project and proposed demolition plans.[75] The FEIR concluded that, on the whole, the approved project would not conflict with applicable land use plans and policies, since it would advance the General Plan objective and policy concerning the location of wastewater facilities and provision of effective and efficient wastewater treatment, and the streetscape improvements would be consistent with the Better Streets Plan; however, the project could conflict with General Plan policies related to the preservation of historic resources (impacts would be mitigated to less than significant; see Cultural Resources, Section 5.1).

While the modified project would expand the project footprint to the corner of Phelps Street and Jerrold Avenue, the modified project would be constructed and operated entirely within the Southeast Plant such that, like the approved project, construction and operation would not physically divide an established community. The modified project would demolish Building 850, a contributor to the *Southeast Treatment Plant Streamline Moderne Industrial Historic District* (See Section 5.1, Cultural Resources) to construct the operations, engineering and maintenance Buildings, which could conflict with General Plan policies related to the preservation of historic resources, but would not demolish Building 870, as mentioned above. As discussed in Section 5.1, the demolition of Building 850 would have a comparable impact on the significance of the historic district as the approved project and would be addressed through the same mitigation measure approved in the FEIR, Mitigation Measure M-CR-1, Documentation of Historic Resources and Interpretive Display.

As discussed in the FEIR, the approved project includes long-term streetscape and landscape improvements along Jerrold Avenue that would enhance the safety and connectivity of Jerrold Avenue for various

[75] SFPUC Biosolids Digester Facilities Project Minor Project Modification 10-Modified Facilities, Approved by San Francisco Planning Department February 2, 2021.

transportation modes (e.g., bikes, pedestrians) in the plant's vicinity. As discussed above in the addendum, the modified project would take approximately an additional 1 year to construct, which would extend the closure period of Jerrold Avenue between Rankin and Phelps for safety considerations. During this time, detour routes would continue to be provided.

Therefore, the modified project would not result in new significant land use impacts that were not previously identified in the FEIR; would not result in more severe land use impacts than those identified; and would not require new land use mitigation measures.

5.9.2 Aesthetics

As stated in the FEIR, there are no scenic views or vistas in the project vicinity. The FEIR discussed that construction could affect the visual character of the area due to views of construction activities and staging areas, as well as the creation of new sources of light or glare. The FEIR determined that these impacts would be less than significant because construction equipment would be similar to other equipment and buildings already present in the area; other existing buildings at the Southeast Plant and in the general area, and the 15-foot-tall Caltrain berm would block views of the site from nearby residential, commercial, and industrial properties; views from adjacent or nearby streets for passing motorists, bicyclists, pedestrians, and Caltrain passengers would be brief and quickly replaced by succeeding streetscape views as the viewer moves past the project; views from the hills would be distant and include other industrial facilities; views of construction trailers would replace those of the former greenhouses; and construction equipment and activities would not create a substantial new source of light or glare because the SFPUC would implement Standard Construction Measure 8 to shield lights if used at night. Regarding operations, the FEIR found that the new Biosolids facilities would be similar to the existing Southeast Plant facilities, views of the new facilities from outside the project site would be limited by intervening structures and trees or would be fleeting views from cars or the train, and that the overall visual character of the Southeast Plant as seen from surrounding areas would remain essentially the same as the existing character, that of a major industrial facility. The FEIR also discussed that the design of the new facilities would be consistent with applicable standards (such as the Industrial Area Design Guidelines, the San Francisco Arts Commission Civic Design Review process, and the *Better Streets Plan)* and that landscaping and other street improvements included in the project would enhance the overall long term visual quality of the area. As a result, the FEIR determined that the new permanent facilities would have less-than-significant aesthetics impacts.

The proposed modifications would expand the project construction footprint to the corner of Jerrold Avenue and Phelps Street. On-site trees visible from Jerrold Avenue and Phelps Street would also be removed and replaced to the north of the proposed buildings. Equipment associated with project construction would be the same as that described in the FEIR. As discussed in previous environmental review, views from adjacent or nearby streets for passing motorists, bicyclists, and pedestrians would be brief, and while some project construction may be discernable from hills to the south and southeast, it would be difficult to distinguish from surrounding land uses. The previously approved closure of Jerrold Avenue east of the Caltrain tracks for use as a staging area would further limit views of project construction. For these reasons, construction would not result in new or more substantial temporary impacts on visual character.

Regarding project operations, the proposed modifications would replace an existing two-story building and a parking lot visible from the adjacent streets with a three-story Operations, Engineering, and Maintenance building along Jerrold Avenue and a two-story (including mezzanine) Mechanical Maintenance building at

the corner of Phelps Street and Jerrold Avenue. The new operations, engineering and maintenance buildings would be up to 50 feet tall. As stated in the FEIR, most of the approved project's new structures would be 20 to 50 feet tall, although the digesters would be up to 65 feet tall. The proposed buildings would replace existing buildings and be of similar height as previously approved structures and would be seen in the foreground of the 65-foot-tall digesters that, as with the approved project, would dominate views from Jerrold Avenue overall.

Like the approved project, the modified project facilities would be behind the Southeast Plant perimeter wall and trees would be installed along both sides of Jerrold Avenue consistent with the planned long-term streetscape and landscape improvements along Jerrold Avenue discussed in the FEIR. These improvements would enhance the visual quality of the area compared to existing conditions. The FEIR determined that, overall, the approved project would not substantially degrade the visual character of the area because the new facilities (including the originally approved Maintenance Shops 1 and 2) would be consistent with the existing industrial zoning and visually compatible with existing plant facilities. Additionally, for the typical motorist or pedestrian heading southeast on Jerrold Avenue, views of the new biosolids facilities at the plant would be fleeting. These conditions would remain the same because the modified project proposes structures that would be visually compatible with existing plant facilities and views from the surrounding areas would remain that of a major industrial facility, at heights that are lower than the tallest approved project components evaluated in the FEIR.

Therefore, the modified project would not result in new significant aesthetics impacts that were not previously identified in the FEIR; would not result in more severe impacts than those identified; and would not require new mitigation measures.

5.9.3 Population and Housing

As discussed in the FEIR, the approved project does not involve any housing construction and thus would not directly induce growth by constructing housing that would attract people to the area, nor would it extend roads or other infrastructure that could indirectly induce growth. The FEIR found that construction workers would likely be drawn primarily from the local and regional construction work force and commute from the Bayview-Hunters Point neighborhood or from elsewhere in the city or Bay Area. Accordingly, the approved project would not induce population growth by attracting workers from outside the region. The FEIR found that operation of the approved project would also have a less than significant impact on population and housing because it would not include new homes; increase the number of workers employed at the Southeast Plant; extend roads or other infrastructure into areas lacking such services that could induce substantial population growth; and would not increase existing overall Southeast Plant wastewater treatment capacity and would only provide solids treatment capacity that is consistent with the Association of Bay Area Government's growth forecasts. Thus, the project would not indirectly induce population growth.

The construction and operation of the modified project, including the proposed modifications, would have similar less-than-significant impacts as the approved project because the maximum number of construction workers would not increase compared with the approved project. The proposed modifications are intended to provide improved facilities for existing Southeast Plant employees and no new workers are proposed as part of the modified project. Further, like the approved project, the modified project would not change the Southeast Plant's treatment capacity.

Therefore, the modified project would not result in new significant population and housing impacts that were not previously identified in the FEIR; would not result in more severe impacts than those identified; and would not require new mitigation measures.

5.9.4 Greenhouse Gas Emissions

The FEIR concluded that the approved project would have a less-than-significant impact related to the generation of greenhouse gas emissions, either directly or indirectly, and would not conflict with any applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases.

The FEIR discussed that because no individual project could emit greenhouse gases at a level that could result in a significant impact on global climate, greenhouse gas (GHG) emissions are a cumulative impact. The FEIR evaluated the proposed project's consistency with the goals of Assembly Bill 32[76] by comparing the project's net changes in non-biogenic GHG emissions to the stationary source GHG significance threshold from the Bay Area Air Quality Management District (air district), which is 10,000 metric tons of carbon dioxide equivalent (MTCO2E).

The FEIR identified that construction would directly emit GHG from equipment use and vehicles and indirectly emit GHG via electricity providers for electric power. It also determined that the approved project's annualized construction-related GHG emissions[77] would average 894 MTCO2E, which would be below the air district's annual threshold for stationary sources of 10,000 MTCO2E. Further, the SFPUC would be required to use renewable diesel in all municipal fleets (Executive Directive 06-02) and comply with San Francisco Environment Code, chapters 7 and 14, to recycle construction waste. Therefore, the FEIR concluded that the approved project's contribution to global GHGs from construction would be less than significant. Construction of the modified project would require offhaul of up to 21,455 cubic yards of excavated material over the originally anticipated approved project's construction. As noted above, the approved project's annualized construction-related GHG emissions would average 894 MTCO2E, well below the applicable threshold. Moreover, during construction between 2020 and 2023, the actual emissions from approved project construction have been lower than anticipated in the FEIR.[78] Therefore, it is reasonable to conclude that the modified project's annualized construction-related GHG emissions would be substantially less than air district's GHG significance threshold of 10,000 MTCO2E per year for stationary sources.

Regarding operations, the approved project would result in an increase in net non-biogenic emissions[79] of 5,005 MTCO2E per year in 2045 associated with future wastewater treatment demand. In 2045, an annual net total of 19,805 MTCO2E would be emitted per year when accounting for averted non-biogenic emissions (consisting of 5,005 MTCO2E per year non-biogenic emissions and 14,800 MTCO2E per year biogenic emissions). Non-biogenic emissions would be below the GHG significance threshold outlined by the air district, which is 10,000 MTCO2E per year for stationary sources. The FEIR did not consider biogenic greenhouse gas emissions from the Southeast Plant to be a project impact because they would occur regardless of the project and regardless of whether the organic material decomposes in solids processing

[76] Global Warming Solutions Act of 2006. Cal Assembly Bill. 32, Health and Safety Code Section 38500, Division 25.5.

[77] Total GHG emissions from construction activities divided by years of construction activity.

[78] San Francisco Planning Department, SFPUC Biosolids Digester Facilities Project Addendum 1 to Environmental Impact Report, July 12, 2024.

[79] Biogenic GHG emissions are emissions from biological processes involving living organisms (i.e., not related to energy production and consumption). Non-biogenic GHG emissions are emissions related to energy production and consumption.

facilities at the treatment plant or at a land application site elsewhere (such as landfills, composting operations).

The FEIR also noted that the approved project would be subject to the California Air Resources Control Board's Greenhouse Gas Mandatory Reporting Regulation, just as it is now for the existing facilities. The approved project would also be subject to applicable City regulations adopted to reduce operational greenhouse gas emissions as identified in the San Francisco Strategies to Address Greenhouse Gas Emissions, which include but are not limited to: compliance with the City's Commuter Benefits Program, Emergency Ride Home Program, Executive Directive 06-02 requiring use of renewable diesel, Clean Construction Ordinance, bicycle parking requirements, the City's Green Building and recycling and composting ordinance requirements that would reduce greenhouse gas emissions in the City from transportation, waste, and promote energy and water efficiency. Lastly, by planting new landscaping trees consistent with San Francisco's Street Tree planting requirements, the approved project would help offset the effects associated with the proposed removal of about 90 trees and would serve to increase carbon sequestration. Through implementation of these actions, the FEIR determined that the project would be consistent with San Francisco's Strategies to Address Greenhouse Gas Emissions, and thus would not conflict with the goal of Assembly Bill 32 to reduce greenhouse gas emissions to 1990 levels by 2020.

The modified project, including the operations, engineering and maintenance buildings, does not include new types of operations activities that emit greenhouse gases. As discussed in Section 3, the proposed modifications would replace two existing inefficient shared boilers with two updated and smaller, efficient boilers and install a new chiller. As discussed in **Appendix F**, the new buildings would also be LEED certified, further reducing any greenhouse gas emissions associated with the modified project.

Additionally, like the approved project, the modified project would continue to be consistent with San Francisco's Strategies to Address Greenhouse Gas Emissions to reduce emissions during construction and operation and would not conflict with local or state climate goals.

Therefore, the modified project would not result in new significant greenhouse gas emissions impacts that were not previously identified in the FEIR; would not result in more severe impacts than those identified; and would not require new mitigation measures.

5.9.5 Wind and Shadow

The FEIR determined that construction would have no impact on wind or shadow because construction equipment would be smaller than or similar in size and height to other equipment and buildings in the area. Consequently, construction equipment would not substantially alter wind patterns in the project vicinity nor be tall enough to create substantial new shadows that could affect public open spaces. Construction of the modified project would use the same type of construction equipment and contain new structures of similar height (approximately 50 feet tall) as in the approved project. Although the modified project would be outside of the approved project footprint, it would be adjacent to it and within the boundaries of the Southeast Plant and would therefore have similar, less-than-significant impacts on wind and shadow as the approved project.

Regarding the approved project's new permanent facilities, the FEIR found that the approved new project facilities would range in height from 10 feet to 65 feet above grade with most buildings between 20 and 50 feet tall, would be similar in height to some existing buildings at the Southeast Plant and to neighboring

buildings that would remain, and would not be substantially taller than adjacent or nearby buildings or structures. In addition, the FEIR indicated that based on wind analyses for other development projects in San Francisco, a building or structure that does not exceed a height of 80 feet generally has little potential to cause substantial changes to ground level wind conditions. The approved project was not found to alter wind patterns in a manner that substantially affects public areas. The shadow analysis conducted for the FEIR to evaluate the impacts of the new permanent facilities on the nearest recreational facilities found that the project would not create new shadows that would substantially affect outdoor recreational areas, streets, and sidewalks. Wind and shadow impacts were determined to be less than significant.

The approved project would no longer demolish Building SEP 870, which is approximately 30 feet tall. With the proposed modifications, the modified project would instead demolish the existing building SEP 850, which is a two-story building ranging in height from approximately 26-40 feet, and two temporary pre-fabricated trailers (SEP 850A and SEP 850B). The proposed new buildings of the modified project would replace these existing structures and be up to approximately 50 feet tall, which is similar to other approved structures at the Southeast Plant and in nearby areas.

Regarding potential wind impacts, the new operations, engineering and maintenance buildings would be up to 50 feet tall, shorter than the approved project's maximum heights of 65 feet (for the digesters), and shorter than 80 feet (the height at which wind impacts would be expected to occur). Again, as stated in the FEIR, most of the approved project's new structures would be 20 to 50 feet tall, although the digesters would be up to 65 feet tall. The digesters would be located northwest of the modified project site and existing Building SEP 870. According to the FEIR, since wind primarily comes from the west in San Francisco, the approaching wind would be intercepted by the digesters on the western boundary of the Southeast Plant site, to the west of the modified project, and therefore would not significantly impact nearby publicly accessible areas such as streets and sidewalks. As discussed in Section 5.9.6 below, there would be no impact on recreational facilities because none are present within or adjacent to the approved project or the proposed modified project. Like the approved project, the net new project shadow from the modified project would be within the original footprint that was analyzed for shadow with buildings at proposed heights of 65 feet. As stated in Section 4.10 of the FEIR, shadows on streets and sidewalks would be transitory, would not substantially affect the function of sidewalks, and would not exceed levels commonly expected in urban areas[80].

Therefore, the modified project would not result in new significant wind and shadow impacts that were not previously identified in the FEIR; would not result in more severe impacts than those identified; and would not require new mitigation measures.

5.9.6 Recreation

The FEIR found that construction of the approved project would have no impact on recreational facilities, either directly or indirectly, because there are no such facilities within the approved project site or the off-

[80] The FEIR used a "shadow fan" diagram prepared by the San Francisco Planning Department (San Francisco Planning Department, Shadow Fan, September 3, 2015) to determine whether any properties under the jurisdiction of the Recreation and Park Commission could be potentially affected by project shadow. The shadow fan is a diagram that shows the maximum extent of the shadows cast by a building throughout the year, between one hour after sunrise and one hour before sunset. The preliminary shadow fan is typically based on full buildout of the zoning envelope (the maximum three-dimensional space within which a structure can be built, based on the zoning of the relevant lot), including complete lot coverage and maximum building height (in this case, 65 feet). According to the shadow fan analysis, due to the distance between the proposed structures and the nearest recreational facilities, there would be no new shadows created by the approved project that would affect outdoor recreational areas.

site staging areas and the existing parks and trails in the vicinity at over 1,000 feet and 300 feet (Bay Trail) respectively would remain open and are sufficiently far away so as not to be physically deteriorated or degraded by the project. The FEIR found that operation of the project would also have no impact on recreational facilities because it would not permanently affect existing recreational resources, include new residential or other uses that would generate increased demand for parks or other recreational facilities, or increase existing operations staff levels at the Southeast Plant that could increase demand at existing recreational facilities near the Southeast Plant, and that ongoing demand would continue to be met by existing parks and recreational facilities.

Construction and operation of the modified project, like the approved project, would not include the construction or expansion of recreational facilities, or increase the use of existing neighborhood and regional parks or other recreational facilities, because construction workers would continue to be drawn from the local and regional work force and there would be no increase in permanent employees at the Southeast Plant such that there would not be a significant increase in population that could accelerate the physical deterioration existing recreational facilities.

Therefore, the modified project would not result in new significant recreation impacts that were not previously identified in the FEIR; would not result in more severe impacts than those identified; and would not require new mitigation measures.

5.9.7 Utilities and Service Systems

The FEIR evaluated several construction-related utilities and services systems topics, including wastewater discharges in excess of the treatment capacity of the Southeast Plant and associated conveyance infrastructure, landfill capacity for construction waste, and compliance with local, state and federal regulations pertaining to the disposal of solid waste. The FEIR concluded that potential impacts would be less than significant because wastewater discharges from the sanitary needs of construction workers and groundwater dewatering could be accommodated by the Southeast Plant's existing treatment capacity, the SFPUC would be required to recycle construction and demolition debris pursuant to Section 708 and Chapter 14 of the San Francisco Environment Code to divert solid waste from landfills, and that the landfills the project would use have sufficient capacity for the maximum amount of potential waste. By complying with the local codes, the approved project would also be consistent with the California Integrated Waste Management Act of 1989 (AB 939). Regarding potential impacts due to operations, the FEIR identified that the project would increase water demand due to changes in processes and facilities (i.e., for the energy recovery facilities and the Maintenances Shops 1 and 2) and generate 820 cubic yards of solid waste (iron sponge media waste and siloxane media waste) annually from the new digester gas treatment facilities. As discussed in addendum 1 to the FEIR, the approved project would result in similar amounts of water use and solid waste as estimated in the FEIR.[81] The FEIR and addendum concluded that these impacts would be less than significant because the City's existing water supply could sufficiently meet the additional demand and that amount of solid waste constituted a small fraction of available, permitted landfill capacity.

Construction of the modified project would involve slightly more excavation (approximately 21,455 cubic yards more than the approved project) and would demolish an additional 15,270 square feet of existing buildings and structures. The modified project could require more groundwater dewatering due to the expansion of the project footprint within the Southeast Plant. However, any additional groundwater

[81] San Francisco Planning Department, SFPUC Biosolids Digester Facilities Project Addendum 1 to Environmental Impact Report, July 12, 2024.

dewatering required for construction of the modified project could be accommodated by the Southeast Plant's existing treatment capacity and wastewater discharges from the sanitary needs of construction workers would not change from the approved project. The increase in excavation and demolition would constitute a small fraction of available, permitted landfill capacity for solid waste. Similar to the approved project, the SFPUC would be required to divert waste from landfills during construction in accordance with the City code to recycle construction demolition and debris. These changes do not constitute a new or substantially more severe significant impact on utilities and service systems than the approved project.

Operation of the modified project would not use more water during operations than the approved project, because the new facilities would be operated by existing Southeast Plant employees and the modified project does not propose an increase in staff. The modified project would not introduce new work activities or additional staff that could result in more solid waste.

Therefore, the modified project would not result in new significant utilities and service systems impacts that were not previously identified in the FEIR; would not result in more severe impacts than those identified; and would not require new mitigation measures.

5.9.8 Public Services

The FEIR found that construction and operation of the approved project would have a less-than-significant impact on public services, because it would not result in a substantial increase in the local population as construction workers would likely be drawn primarily from the local and regional construction work force, and the new facilities would be operated by existing Southeast Plant employees. Addendum 1 to the FEIR determined that one additional employee as part of the approved project would not result in a substantial increase in the local population. The FEIR also concluded that incidents during construction that require law enforcement, fire protection, or emergency medical services would constitute an incremental increase in demand that would be temporary, could be accommodated by existing services, and would not require construction of new or physically altered facilities to maintain services.

Similar to the approved project, the use of construction equipment and traffic generated by construction workers commuting to the modified project's construction sites could increase the potential for accidents in the modified project area. However, any increase in the number of accidents during construction (no new staff would be added for operation) of the modified project would not be expected to exceed the capacity of existing emergency response services, local medical facilities, or other services to the extent that new emergency response facilities would need to be constructed. As with the approved project, operation of the modified project would not increase the local population, or otherwise affect the need for fire protection, police protection, schools, parks, or other public services (the construction of which could result in impacts on the environment), given that it would not result in an increase of staff at the Southeast Plant. Therefore, no expansion of such services, causing adverse physical impacts, would occur. As with the approved project, the modified project's impact related to public services would be less than significant.

Therefore, the modified project would not result in new significant impacts related to public services that were not previously identified in the FEIR; would not result in more severe impacts than those identified; and would not require new mitigation measures.

5.9.9 Hydrology and Water Quality

The FEIR determined that the approved project would have a less than significant impact on water quality related to stormwater runoff during construction and discharge of groundwater produced during dewatering. Construction would be subject to the regulatory requirements specified in San Francisco Public Works Code Section 146, Articles 4.1 and 4.2, as well as the State Water Quality Control Board's Construction General Permit, and implementation of the required control measures would adequately protect water quality. Similarly, the modified project would be subject to the regulatory requirements specified in Articles 4.1 and 4.2, and Section 146 of the San Francisco Public Works Code and as a result, there would be less-than-significant water quality impacts related to stormwater runoff and groundwater discharge during construction.

The FEIR and minor project modifications determined that operation of the approved project would have a less-than-significant impact on water quality standards, waste discharge requirements, and water quality. The approved project's required compliance with the Bayside National Pollutant Discharge Elimination System permit during operations would also ensure that discharges comply with applicable water quality standards and do not degrade water quality. The modified project includes the same treatment technologies as the approved project[82] and therefore would still be expected to comply with the Bayside National Pollutant Discharge Elimination System permit for effluent limitations and requirements. Therefore, the modified project would have less-than-significant water quality impacts during operations.

The FEIR determined that the approved project would have a less than significant impact on groundwater supplies or recharge during construction because the project would obtain and comply with a Batch Wastewater Discharge Permit for discharging groundwater from temporary construction dewatering into the combined sewer system pursuant to San Francisco Public Works Code Article 4.2 and construction dewatering would be temporary. Similarly, groundwater dewatering for the modified project would be temporary and would be required to comply with the same Batch Wastewater Discharge Permit. As a result, like the approved project, construction of the modified project would have less-than-significant impacts on groundwater supplies and recharge.

No long-term dewatering would be required for operation of the approved project, and the approved project would not withdraw groundwater from the Islais Valley Groundwater Basin for any other purposes during operation. Similarly, the modified project would not require long-term groundwater dewatering or other use of groundwater, and would not result in an increase in impervious surfaces. As discussed in the FEIR, no wells that utilize groundwater are present within 0.5 mile of the approved project site. As a result, like the approved project, operation of the modified project would have less-than-significant impacts on groundwater supplies and recharge.

The FEIR determined that the approved project would have a less than significant impact on the exposure of people or structures to risk of loss, injury, or death involving flooding under current conditions, future conditions resulting from sea level rise, or inundation by seiche or tsunami. The FEIR found that most project components were not within an existing 100-year flood zone and were not within a potential tsunami inundation zone shown on Map 5 of the Community Safety Element of the San Francisco General Plan or on

[82] Including the interim sidestream treatment facility, which was incorporated into the approved project after FEIR certification. SFPUC Biosolids Digester Facilities Project Minor Project Modification 17 – Interim Sidestream Nutrient Removal, reviewed by San Francisco Planning Department February 12, 2024

statewide maps prepared by the California Emergency Management Agency,[83] with the exception of the Piers 94 and 96 staging areas. However, because those staging areas would be temporarily used, would not involve the placement of permanent structures within the 100-year flood zone, and would be subject to the City emergency warning system as well as an operations plan with best management practices for construction-related hazardous materials storage, the FEIR concluded that use of the staging areas would have a less than significant effect on the risk of loss, injury, or death related to flooding or inundation by seiche or tsunami. Similarly, the modified project includes construction worker vehicle parking at 2 Rankin Street, an area within the Federal Emergency Management Agency flood zone, for temporary use during construction and would not involve the placement of structures. The proposed modifications are not within mapped seiche or tsunami zones; accordingly, the modified project would result in less-than-significant impacts related to exposing people or structures to inundation from seiche, tsunami, or mudflow during operation.

The FEIR determined that the approved project would not exceed the capacity of stormwater drainage systems or provide additional sources of polluted runoff because the project would comply with the City's Stormwater Management Ordinance and Stormwater Management Requirements and Design Guidelines. The modified project would also comply with the City's Stormwater Management Ordinance and Stormwater Management Requirements and Design Guidelines, and therefore would have a less-than-significant impact on stormwater drainage systems.

In summary, the modified project would not result in new significant hydrology and water quality impacts that were not previously identified in the FEIR; would not result in more severe impacts than those identified; and would not require new mitigation measures.

5.9.10 Hazards and Hazardous Materials

The FEIR disclosed that, during construction, the approved project would transport, store, and use routine hazardous materials (i.e., fuels, lubricants, and solvents for construction vehicles and equipment). The FEIR concluded that potential impacts would be less than significant because the SFPUC must comply with California Highway Patrol regulations related to transport of hazardous materials, implement site-specific best management practices like proper storage and secondary containment to prevent spills consistent with San Francisco Public Works Article 4.2 (Construction Site Runoff Controls) and the requirements of a Construction General Stormwater Permit from the State Water Resources Control Board, and comply with other applicable state and federal laws. The same types of hazardous materials would be used during construction of the modified project, and the SFPUC would be required to continue transporting and managing the materials properly in accordance with the local, state, and federal laws, as discussed above.

During operation, the FEIR discussed that the approved project would increase the quantity of several chemicals used at the Southeast Plant, use diesel for a backup generator, and may require periodic disposal of hazardous wastes (i.e., fluorescent light tubes), but that impacts would be less than significant, because the SFPUC would be required to update the Hazardous Materials Business Plan for the Southeast Plant that is on file with the San Francisco Health Department pursuant to Article 21 of the San Francisco Health Code and also comply with local, state, and federal regulations for hazardous materials use, storage, and disposal. Operation of the modified project would not introduce new types of chemicals beyond those identified in

[83] San Francisco Planning Department, Biosolids Digester Facilities Project Final Environmental Impact Report, Planning Department Case No. 2015-000644ENV, State Clearinghouse No. 2015062073 certified March 8, 2018.

the FEIR for operation of the approved project. Like the approved project, operation of the modified project would use hazardous materials in accordance with applicable laws.

The FEIR disclosed that the approved project includes the demolition of old structures that could contain hazardous building materials (i.e., asbestos and lead based paint). The approved project would abate building hazards pursuant to well-established regulations prior to demolition, and thereby impacts related to release of hazardous building materials into the environment would be less than significant. The modified project would demolish building SEP 850, which, similar to other structures demolished as part of the approved project, is likely to contain hazardous building materials such as asbestos-containing materials and lead-based paint. In accordance with Rule 11, Regulation 2, of the Bay Area Air Quality Management District, the SFPUC would be required to retain qualified contractors to identify the presence of asbestos-containing materials and complete removal of such materials prior to building demolition using methods that prevent visible asbestos emissions. Demolition activities would also be subject to: Section 3426 of the San Francisco Building Code and to the lead-in-construction standard regulated by the Occupational Safety and Health Administration of California, which aims to reduce the risk of exposing workers and the public to hazardous levels of lead; and California Code of Regulations Title 22 Sections 66261.24 and 66261.9, requiring specific handling of wastes with PCBs or otherwise considered "universal waste" in California. The modified project would comply with the same regulations regarding abatement of asbestos-containing materials, lead-based paint, and electrical equipment that could include polychlorinated biphenyls (PCBs), DEHP[84], or mercury vapors. The modified project would have less-than-significant impacts related to the release of hazardous building materials into the environment.

The FEIR disclosed that the approved project site and staging areas are known to contain contaminated soil and groundwater. The FEIR queried regulatory databases for information about the Southeast Plant as well as surrounding areas within one-quarter mile and found that the Southeast Plant, the Central Shops, and the Asphalt Plant are included on a list of hazardous materials sites compiled by one or more government regulatory agencies. The FEIR concluded that construction of the approved project would be required to comply with Article 22A of the San Francisco Health Code (the Maher Ordinance, which regulates the handling of hazardous soils), Article 22B of the San Francisco Health Code (the San Francisco Dust Control Ordinance, which regulates dust from construction sites), San Francisco Public Works Code Section 147 (construction site runoff controls), Article 4.1 of the San Francisco Public Works Code (groundwater dewatering controls), Article 21 of the San Francisco Health Code (closure of underground storage tanks), California Code of Regulations Title 13 Division 2, Chapter 6 (handling of hazardous materials and wastes), and California Code of Regulations Title 22 Division 4.5, Chapters 13 and 29 (transport of hazardous wastes). The modified project includes ground disturbance outside of the approved project site but within the Southeast Plant. An updated review of regulatory databases found no additional hazardous materials sites within the modified project site.[85] Construction of the modified project would occur within the Southeast Plant under the same regulatory environment such that, like the approved project, it would not affect, or be

[84] Di(2-ethylhexyl) phthalate or DEHP is a manufactured chemical that was use in place of PCBs as a dielectric fluid in some fluorescent light ballasts and other electrical equipment.

[85] California Water Resources Control Board, Geotracker results for area surrounding 750 Phelps Street, San Francisco CA. https://geotracker.waterboards.ca.gov/map/?global_id=T10000016780, accessed September 19, 2024; California Department of Toxic Substances Control, Envirostor Hazardous Waste and Substances Site List (Cortese), https://www.envirostor.dtsc.ca.gov/public/search?cmd=search&reporttype=CORTESE&site_type=CSITES,FUDS&status=ACT,BKLG,COM&reporttitle=HAZARDOUS+WASTE+AND+SUBSTANCES+SITE+LIST+%28CORTESE%29, accessed September 19, 2024; California Environmental Protection Agency, Cortese List Data Sources, https://calepa.ca.gov/sitecleanup/corteselist/, accessed September 19, 2024.

affected by, existing soil and/or groundwater contamination that could expose the public and environment to new or more severe significant impacts.

The FEIR disclosed that the approved project could interfere with emergency access. Emergency access with the modified project is discussed in Section 5.3, Transportation and Circulation, above.

The FEIR concluded that the approved project would comply with the California Fire Code requirements for fire safety during construction and therefore result in less-than-significant impacts related to fire hazards. The same California Fire Code requirements would apply to the modified project, and the modified project does not include facilities or materials that would increase project fire hazards. The modified project would have less-than-significant impacts related to fire hazards.

Therefore, the modified project would not result in new significant impacts related to hazards and hazardous materials that were not previously identified in the FEIR; would not result in more severe impacts than those identified; and would not require new mitigation measures.

5.9.11 Mineral Resources, Energy Resources, and Water Use

The FEIR found that the project site and construction areas do not contain substantial mineral resources or locally important mineral resource recovery sites. Similarly, construction of the proposed modifications would not impact mineral resources, because the operations, engineering and maintenance buildings would be built within the same geologic units that the FEIR determined did not contain mineral resources.[86] Although construction of the modified project would require additional truck trips and associated energy use (for example, due to the additional 21,455 cubic yards of excavation; see Section 5.3, Transportation and Circulation), like the approved project, energy consumption during construction would not be wasteful because efficient equipment would be used pursuant to the City's Clean Construction Ordinance and Mitigation Measure M-AQ-1a (Construction Emissions Minimization) and consumption would be temporary such that it would also not result in long-term depletion of local or regional energy resources.

The FEIR discussed that energy, in the form of diesel, gasoline, and electricity would be consumed directly by construction equipment as well as indirectly through the energy needed to make the materials and components used in construction. The FEIR determined that impacts of construction energy use would be less than significant, because construction would be temporary and would therefore not result in long-term depletion of local or regional energy resources, would not be wasteful because efficient equipment and alternative fuels would be used per Mitigation Measure AQ-1a, and would recycle construction waste per Chapter 14 and Section 708 of the San Francisco Environment Code, which would reduce energy associated with extraction and manufacturing of new and raw materials.

Operation of the approved project would increase energy use (natural gas and electricity). The steam needed for digester operations would be generated by the steam boilers operating full time. However, the approved project would process digester gas into renewable natural gas offsetting a portion of natural gas that would have had to be extracted by others elsewhere. In addition, the approved project would also use the same amount of diesel for a back-up generator as conditions existing prior to project approval. The approved project would increase electricity use which would be supplied by hydroelectricity generated by

[86] Kohler-Antablin, S., *Generalized Mineral Land Classification Map of the South San Francisco Bay Production-Consumption Region*, 1996. Published by the California Department of Conservation Division of Mines and Geology.

City-owned facilities, except as identified below related to PG&E, and the SFPUC confirmed its ability to generate sufficient hydroelectricity to provide all the power for the approved project.

As part of the approved project (as reviewed by Addendum 1 to the Biosolids EIR), the developer of the biogas upgrade facility and deoxygenation system, together with PG&E, may elect to use PG&E's power for the biogas utilization system components. In this case, it would represent a small amount of overall power (approximately 1.6 megawatts out of a total of 6.6 megawatts) and, as of 2022, nearly 40 percent of PG&E's power comes from renewable resources. Therefore, the approved project's operations would not result in significant impacts due to wasteful, inefficient, or unnecessary consumption of energy resources, because sufficient clean hydroelectricity would be available to supply the approved project, any portion of energy obtained from PG&E includes renewable resources, diesel use would not increase, and the approved project would offset a portion of natural gas usage elsewhere that would otherwise have been extracted. Regarding operation, the proposed operations, engineering and maintenance buildings would be designed to comply with LEED Gold standards, would incorporate solar panels into the building design, and would use up to approximately 0.60 megawatt annually. With the modified project, the annual operational energy needs of the Southeast Plant would be approximately 7.2 megawatts in 2045. The additional operational energy needs of the new operations, engineering, and maintenance buildings would also be provided by solar and hydroelectric power from SFPUC sources, and therefore modified project operations would result in less-than-significant impacts due to wasteful, inefficient, or unnecessary consumption of energy resources.

The FEIR discussed that potable water use during construction would not be wasteful, inefficient, or unnecessary, with compliance to Article 21 of the San Francisco Public Works Code, which requires the use of recycled water for dust control during construction unless a waiver is obtained from the City Water Department.[87] While the SFPUC obtained a waiver for the use of potable water for dust control, as allowed under applicable sections of Article 21, the use of this water would protect air quality and, in turn, public health, and therefore the modified project would result in less-than-significant impacts related to wasteful, inefficient, or unnecessary use of potable water during construction. Regarding operation, the FEIR discussed that the approved project would increase energy and water use; however, the FEIR concluded that the approved project's design maximizes using recycled water and/or other non-potable water to the extent possible in the new processes along with complying with the San Francisco Building Code and the San Francisco Water Efficient Irrigation Ordinance; furthermore, as discussed in the FEIR, the water would be used for wastewater treatment. Therefore, operation of the approved project would not result in the use of large amounts of water in a wasteful manner and operational impacts related to water usage would be less than significant. Like the approved project, the modified project design would maximize the use of recycled and other non-potable water to the extent possible and comply with the San Francisco Building Code and the San Francisco Water Efficient Irrigation Ordinance such that impacts related to water use would be less than significant.

Therefore, the modified project would not result in new significant impacts related to mineral resources, energy, and water use that were not previously identified in the FEIR; would not result in more severe impacts than those identified; and would not require new mitigation measures.

[87] San Francisco Public Works Code, Article 21, Sections 1101 and 1102.

6.0 Conclusion

Based on the foregoing, the San Francisco Planning Department concludes that the analyses conducted, and the conclusions reached, in the final FEIR certified by the San Francisco Planning Commission on March 8, 2018, and adopted by the San Francisco Public Utilities Commission on December 18, 2018, as well as in determinations made for subsequent minor project modifications and in Addendum 1 to the FEIR, remain valid. The modified project would not cause new significant impacts not identified in the FEIR, would not substantially increase the severity of the previously identified environmental impacts, and would not require new mitigation measures. No changes have occurred with respect to circumstances surrounding the modified project that would cause significant environmental impacts to which the modified project would contribute considerably to cumulative impacts, and no new information has become available that shows that the modified project would cause significant environmental impacts or a substantial increase in the severity of previously identified significant impacts. Therefore, no supplemental environmental review is required beyond this addendum.

I do hereby certify that the above determination has been made pursuant to State and local requirements.

Lisa Gibson
Environmental Review Officer

APPENDIX A
CUMULATIVE PROJECTS

Appendix A Projects Considered in Cumulative Impact Analysis

Project No. in FEIR	Project Name (Project Sponsor)	Project Description	Construction Dates
1	Southeast Plant Headworks Replacement Project (SFPUC)	The project would construct a new 250 million gallon per day, all-weather headworks facility to provide better screening and grit removal at the SEP. The project would replace two existing headworks facilities, modify the Bruce Flynn Pump Station (BFS), and construct a new odor control facility. It would provide redundant infrastructure to provide reliability and ensure operational reliability. It would also improve the seismic reliability of the headworks facility and improve odor control. The project would modify and eventually demolish the influent control structure/Southeast Lift Station. The two existing headworks buildings (SEP 011 and SEP 012) would also be demolished. The project was modified to include upgrades to the Bruce Flynn Pump station to enhance reliability in wet weather events, modify influent sewer, remove a proposed new generator and the sewer construction in Evans Avenue, Rankin Street and Davidson Avenue. The modified project would also construct a new SEP 005 Southeast Lift Station and associated piping.	Spring 2018 to Spring 2026 (Revised from January 2017 to December 2021)
6	SEP Power Feed and Primary Switchgear Upgrades (SFPUC)	The objective of the project is to increase reliability, redundancy and capacity of the electrical system at Southeast Plant (SEP) to meet Sewer System Improvement Program (SSIP) level-of-service goals by upgrading the existing power feed by PG&E and obtaining a new feed by SFPUC Power Enterprise. The project will construct an elevated building to house the new Primary Power Switch Station and substructures to provide adequate power for the existing electrical loads and new SSIP facilities, upgrade/replace aging existing substations, install power monitoring and protection system for additional reliability and efficiency, as well as provide redundant services to the nearby pump stations.	January 2024 to May 2025 (Revised from November 2017 to January 2020)
11	SEP Repair and Replacement Treatment Plant Improvement Projects (SFPUC)	In order to maintain the operational reliability of existing facilities, ongoing repair and replacement activities are conducted including replacement of equipment that has reached the end of its useful life, is no longer operational due to continuous operation in a highly corrosive environment, or does not meeting current operational requirements.	Ongoing
12	Demolition of the Existing SEP Digesters and Southside Renovation Project (SFPUC)	This Phase II Sewer System Improvement Program (SSIP) project (Phase II has not yet been approved) would include demolition of the existing SEP digesters and associated control buildings, and improvements within the south side of the SEP. This project has not yet begun	After 2028 (Revised from after 2025)

Project No. in FEIR	Project Name (Project Sponsor)	Project Description	Construction Dates
		the planning phase and the SFPUC has not yet determined the specific improvements to be constructed.	
24	Quint-Jerrold Connector Road (San Francisco County Transportation Authority)[1]	This project would construct a new 950-foot-long roadway to provide access between existing Quint Street and Jerrold Avenue. The roadway would consist of two 13-foot-wide lanes (within a 50-foot-wide corridor), one northbound and one southbound. In addition, the project would construct or install several other elements along or beneath the length of the new roadway. Along the western side of the new roadway, the project would construct a new 5.5-foot-wide to 20-foot-wide sidewalk, depending on location; construct a new 27-foot-wide curb cut located along the San Francisco Wholesale Produce Market property (Project 25, below); and install street trees and street lighting. Along the eastern side of the new roadway, the project would construct a new 6.5-foot-tall reinforced concrete retaining wall. A new stop sign would be installed at the intersection of the new roadway and Jerrold Avenue. New sewer and water pipelines would be installed beneath the new roadway to provide on-site drainage and overall system reliability. The new road would support a potential new Caltrain station at Oakdale Avenue. The intersection with Jerrold Avenue also would accommodate trucks, although some movements would require wide turns. The San Francisco County Transportation Authority (SFCTA), Caltrain, and SF Public Works have coordinated project schedules to minimize the duration of the street closure.	Currently in the right-of-way acquisition phase. If successful, design would begin and construction could start in 2025. (Revised from later 2018 to 2019 depending on land acquisition)
25	San Francisco Market (formerly San Francisco Wholesale Produce Market) Expansion (City and County of San Francisco Market Corporation)[2]	This project consists of phased development to expand the existing San Francisco Wholesale Produce Market. The project would demolish the existing San Francisco Market buildings at the four quadrants of the main site, and would construct new buildings at each of the four quadrants. The project would include warehousing, office, meeting hall, and restaurant/café land uses. The new buildings would be 16 to 45 feet tall and would have a larger footprint than the existing buildings. The project and its associated roadway infrastructure would be built in about nine phases, over a period of approximately 16 years. It would start with the demolition of existing facilities at the SE Quadrant and construction of the 1900 Kirkwood Avenue building in January 2024, and would conclude with the occupancy of the 2000 Kirkwood Avenue building in June 2041. Phases 1 through 4 of the project include: Closure of Jerrold Ave between Toland and Rankin by the San Francisco Market; Demolition of the existing 455 Toland St building (NW Quadrant), and	2024 through 2041: Phases 1 through 4 would occur between 2024 and 2028

Project No. in FEIR	Project Name (Project Sponsor)	Project Description	Construction Dates
		grading for new surface parking lot; Vacation of Jerrold Ave, and other minor right-of-way areas at the Main Site; and Demolition of existing SE Quadrant Building and dock, and construction of 1900 Kirkwood Ave Building. The project would vacate Jerrold Avenue on the main site and reroute through-traffic around the main site on Innes Avenue, which will become the primary route for non-market destined traffic traveling through the area.	
27	Candlestick Point-Hunters Point Shipyard Phase I and II Development Project (Lennar Urban)[3]	This project would redevelop the 702-acre Candlestick Point-Hunters Point Shipyard area along the waterfront between south of India Basin and Candlestick Point. The project includes a mixed-use community with a wide range of residential, retail, office, research and development, civic, and community uses, and parks and recreational open space. In addition, a 300-slip marina would be constructed as would shoreline improvements to stabilize the shoreline. Phase I is already underway, including demolition of Candlestick Park Stadium. Phase II includes 6,225 units of housing (including rebuilding the Alice Griffith Public Housing), a regional retail center, a 220-room hotel, a performance venue, and 160 acres of new and revitalized open space.	Phased construction 2015 - 2035 (expect delays)
29	Pier 70 Waterfront Site (Forest City Development CA)[4]	This project consists of redevelopment of approximately 28 acres (identified as the "Waterfront Site") of the former industrial shipyard at Pier 70 and an additional 7 acres of land owned by the Port and PG&E. The site would be developed into a new mixed-use community with new commercial office development, new residential development, and a retail and arts component. New above-grade and below-grade parking and approximately 8 acres of new and expanded parks and shoreline access would be constructed. The project also includes the rehabilitation and adaptive reuse of Buildings 2, 12, and 21, which contribute to the eligible Pier 70 National Register Historic District. Overall, the project would construct a maximum of 4.2 million gross square feet in four phases over about 11 years. Two land use scenarios are under consideration, each with different amounts of commercial and residential land uses. The project would include up to 3,025 new residential units and up to 2.3 million square feet of commercial, restaurant, retail, and arts/light industrial land uses.	Phased construction 2018 - 2029 (expect delays)
30	Blue Greenway Project (Port of San Francisco)[5]	The Blue Greenway is the City's project to improve the City's southerly portion of the 500-mile, nine-county, region-wide Bay Trail, as well as the newly established Bay Area Water Trail and associated waterfront open space system. The alignment of the Blue Greenway generally follows the	Aqua Vista Park to be completed by 2025-2026

Project No. in FEIR	Project Name (Project Sponsor)	Project Description	Construction Dates
		alignment of the Bay Trail and Bay Area Water Trail from Mission Creek on the north to the County line on the south. Remaining parks: Warm Water Cove Park (in future after 2030), Pier 70 Parks (2028-2029) and Aqua Vista Park (would be completed by 2025-2026). The Port expects to complete all Blue Greenway projects within its jurisdiction by 2035.	
39	India Basin Mixed-Use Development (Build, Inc. and San Francisco Recreation and Parks Department)[6]	This project would encompass publicly and privately owned parcels, including existing streets, totaling approximately 38.8 acres at 700 Innes Avenue, 900 Innes Avenue, India Basin Shoreline Park, and India Basin Open Space locations. The project at 700 Innes Avenue would develop 17.12 acres of privately owned land plus 5.94 acres of developed and undeveloped public rights-of-way in phases; proposed uses include residential, retail, commercial, office, research and development/laboratory and clinical care space, institutional, flex space, recreational and art uses, parking, and a shoreline network of publicly accessible open space. The project at 900 Innes Avenue, India Basin Shoreline Park, and India Basin Open Space would include improvement of 14.2 acres of publicly owned parcels along the shoreline plus 1.58 acres of unimproved "paper" streets to create a publicly accessible network of new and/or improved parkland and open space. This new shoreline network would extend the Blue Greenway/Bay Trail and would provide pedestrian and bicycle connections to and along the shoreline, fronting San Francisco Bay.	On hold (Revised from 2018 – 2024)
40	San Francisco Gateway Project (Prologis, Inc.)[7]	The San Francisco Gateway Project would demolish the four existing single-story buildings at 749 Toland Street and 2000 McKinnon Avenue and construct two new multi-story buildings that would provide new production, distribution, and repair (PDR) space in the city. Each building would be approximately 97 feet tall and would have a maximum height of 115 feet, including rooftop appurtenances. The two new buildings would include PDR space, a logistics yard, vehicular circulation systems, and ground-floor retail spaces; they would total 2,160,000 gross square feet. The proposed project would convert Kirkwood Avenue (along the northern side of the project site, between Toland and Rankin streets) to a single-lane, eastbound one-way street; and convert a portion of McKinnon Avenue (along the southern side of the project site, between Toland and Selby streets) to a single-lane, westbound one-way street. Construction is anticipated to take approximately 31 months. Approximately 140,600 cubic yards of soil would	Summer 2026 through Winter 2028 (Revised from TBD)

Project No. in FEIR	Project Name (Project Sponsor)	Project Description	Construction Dates
		be excavated for the proposed project. The EIR also analyzes an expanded streetscape variant, which would improve the public right-of-way surrounding the project site.	
	Channel Force Main Intertie (SFPUC)	The existing 66-inch Channel Force Main transports wastewater from the northeastern part of San Francisco to the Southeast Treatment Plant. The Channel Force Main Intertie Project will increase reliability, provide operational flexibility, and allow for future inspections and maintenance. This project will construct a new pipeline connection and control systems along the existing force main. The project will also install control panels in the sidewalk along Cesar Chavez Street, between Indiana and Pennsylvania Streets, and replace existing air valves at two locations on Indiana Street, near the 20th Street and 25th Street intersections.	January 2024 - December 2025
	City Distribution Division Headquarters Project (SFPUC)[8]	This project would establish a new City Distribution Division (CDD) headquarters at 2000 Marin Street that would replace the existing CDD yards located at 639 Bryant and 1990 Newcomb. The proposed CDD headquarters would consist of an administrative building, car shop, machine shop, meter shop, warehouse, fabrication shop, paint and autobody shop, auto shop, landscape shop, a parking garage, outdoor vehicle and equipment parking, outdoor storage and laydown area, outdoor space, and a fuel station.	January 2025 - December 2027
	3433 3rd Street (Equity Community Builders)[9]	The proposed project would construct an approximately 16,194 gross square-foot (sf), two-story, office and assembly building with surface parking with an approximate 9,441 sf ground floor footprint. The proposed project would include a 7,364 sf of union assembly/meeting hall, 8,830 sf of office space which includes 2,646 sf of elevators and corridors, 4,215 sf of landscaped area, and 9,372 sf of parking area. The project site is approximately 25,968 sf in area.	Under review with SF Planning
	Bay Corridor Transmission and Distribution (Phase 3 and 4) (SFPUC)	The San Francisco Public Utilities Commission Power Enterprise is building a high voltage transmission and distribution system in the Southeast portion of the city. It is intended to serve existing and future customers with large power needs. There are four phases of the project; phases 1 and 2 were completed in 2022. Phase 3 - 1535 Davidson Avenue - Power Distribution System - builds a new electrical substation at 1535 Davidson Avenue. Phase 4 - The Project proposes the following improvements in the City's Bayview District: Installation of	Phase 3 construction on-going with completion by Winter 2024. Phase 4 construction August 2024-May 2026

Project No. in FEIR	Project Name (Project Sponsor)	Project Description	Construction Dates
		a new duct bank from the intersection of Evans Avenue and Rankin Street to 2000 Marin Street. Replacement of existing 12-inch and 8-inch cast iron potable water mains with new 12-inch ductile iron pipe mains along three segments (Evans Avenue from Napoleon Street north to the existing Evans Avenue bridge near Cesar Chavez Street, Marin Street from Evans Avenue to the Marin Street terminus, and Cesar Chavez Street from Evans Avenue to Mississippi Street). This project component involves: the replacement of water main appurtenances including valves, fire hydrants, and water service; and extension and modernization of the existing emergency water system from the intersection of Evans Avenue and Marin Street to the Marin Street terminus; installation of high-pressure fire hydrants and high pressure valves. Ancillary work including ADA curb ramp upgrades, traffic signal related improvements, and restoration of traffic markings and striping.	
	SEP HVAC and Mechanical Upgrades (SFPUC)	The SFPUC proposes to repair and replace various HVAC equipment and mechanical systems at the Southeast Plant.	December 2022 - Winter 2025
	SEP 545 Electrical Controls Upgrade (SFPUC)	The project would conduct electrical service upgrades and repairs to existing facility valve controls adjacent to the Southeast Plant, Bruce Flynn Pump Station, and Booster Pump Station (adjacent to Islais Creek) to maintain permit compliance and support operational reliability and resilience. Key project scope includes selective demolition of the existing and installation of new power feeders and fiber optic cable between Bruce Flynn Pump Station through the new and existing duct bank to the valve vault and existing pull box; new control panel; new automatic transfer switch, input/output unit; pump station ventilation; bollards; associated conduit and wiring, miscellaneous site and vault upgrades as required.	Spring 2023 - Fall 2024
	1399 Marin Transit Service Operations and Maintenance Plan (SFMTA)[10]	The existing diesel hybrid fleet of approximately 88 buses will be moved from the Kirkland Transit Facility near Fisherman's Wharf to operate from the Islais Creek Transit Facility located at 1301 Cesar Chavez Street, with bus storage and repair-level maintenance occurring at the 1399 Marin facility, located across Indiana Avenue from Islais Creek facility site. Minimal improvements to the site (replacement or upgraded fencing, improved yard lighting, which likely will include some minor trenching and spot repavement of the surface yard area) are planned. No improvements are planned for the interior of the building on site.	Spring - Winter 2025

Project No. in FEIR	Project Name (Project Sponsor)	Project Description	Construction Dates
	Additional Newcomb Yard Improvements (SFPUC)	This program will fund interim improvements at CDD Headquarters at 1990 Newcomb Avenue that are required to address health and safety concerns and to renovate existing facilities to accommodate the division's staffing needs while a new SFWD Headquarters at 2000 Marin is designed and constructed. Interim improvements include: re-roofing the Administration, Shops and Warehouse Building; Emergency Communication Facilities at Newcomb Yard and Lake Merced Pump Station; developing approximately 4,000 square feet of new office space; renovating the Shops Building mechanical systems; developing Incident Command Structure facilities; developing access control systems; and street and sidewalk improvements.	2025 - 2027
	Islais Creek Bridge Project (San Francisco Public Works)[11]	The City and County of San Francisco is proposing to replace the existing Islais Creek Bridge along Third Street in San Francisco's Bayview neighborhood. Construction of the proposed project would result in the replacement of the existing drawbridge with a fixed bridge and large ships would no longer be able access the Islais Creek channel west of the new bridge. Throughout the construction duration, there would be no access for vehicles, the T-Third Street light rail service, or pedestrians to the bridge or Third Street between Marin Street to the north and Cargo Way to the south. Vehicles would be detoured around the site to other routes. T-Third Street passengers would use bus shuttles in lieu of light rail service south of Islais Creek Bridge and the 15 Bayview Hunters Point Express and 91 Third Street/19th Avenue OWL buses would be detoured around the project site.	Spring 2026 -Spring 2028
	Bayview Train Caltrain Station (SFCTA)[12]	The San Francisco County Transportation Authority is proposing a new Caltrain Station in the Bayview community at either Oakdale (Quint Street between Oakdale and Jerrold avenues) or Evans Avenue (between Selby and Rankin streets).	Unknown

NOTES

Projects with numbers were included in the FEIR Cumulative Projects List, with locations shown on FEIR 4.1-1. Projects completed since the FEIR have been removed from the cumulative list. Projects with no numbers are new projects.

APPENDIX B
AIR QUALITY TECHNICAL MEMORANDUM AND HEALTH RISK ASSESSMENT UPDATE

AIR QUALITY MEMO

Date: **October 11, 2024**

To: **Tiffany Edwards, ESA**
Karen Lancelle, ESA
Josh Pollak, San Francisco Planning Department

From: **Michael Keinath, PE**
Rei Zhang

Subject: **Air Quality Health Risk Assessment Update for the Biosolids Digester Facilities Project: SEP-7 Operations, Engineering and Maintenance Buildings**

As part of the original environmental analysis effort in 2017, for the construction and operation of the San Francisco Public Utilities Commission's (SFPUC) Southeast Plant (SEP) Biosolids Digester Facilities Project (BDFP or "the Project"), Ramboll conducted California Environmental Quality Act (CEQA) analyses of greenhouse gases (GHGs), criteria air pollutants (CAPs) and precursors, as well as a health risk assessment (HRA) based on exposure to toxic air contaminants (TACs). Analysis methodology and results were documented in an Air Quality Technical Report (AQTR, 2017), which was incorporated into the Final Environmental Impact Report (FEIR).[1,2] The approved project to date includes one addendum (Addendum 1), which analyzed the potential impacts of constructing and operating a biogas utilization system at the SEP plant.

SFPUC is proposing to modify the approved BDFP to construct the SEP operations, engineering, and maintenance buildings (SEP-7), instead of the originally planned and approved Maintenance Shops 1 and 2 within the SEP along Jerrold Avenue. The SEP-7 area would be adjacent to but outside of the BDFP project site evaluated in the FEIR. SEP-7 would also replace an existing 500 kVA emergency backup generator with two new 750 kVA generators.[3] The two new generators would be at minimum Tier 3 compliant; due to the lack of specifications for the two new generators, both Tier 3 and Tier 4 Final generators were analyzed.

This memorandum analyzes the effects of this proposed modification on construction and operational emissions and health risks. GHG emissions are evaluated for SEP-7 operations only, as the BAAQMD does not identify a significance threshold for construction-related GHG emissions.

The Maintenance Shops 1 and 2 were originally analyzed in the BDFP FEIR as part of the construction and operations emissions estimation and health risk assessment. This analysis estimates SEP-7 emissions and health risk independently before adding them to the construction and operational

---

[1] Ramboll. 2017. Air Quality Technical Report. March. Available upon request.

[2] City and County of San Francisco. 2017. Biosolids Digester Facilities Project. May. Available at: https://ceqanet.opr.ca.gov/2015062073/2

[3] Project Description for the SEP-7 Maintenance and Trades Buildings Project, provided on 8/8/2024.

emissions and health risk results from the approved project,[4] which is conservative for the following reasons:

1. Actual BDFP construction emissions have been much lower than estimated in the FEIR;[5] however, this analysis adds SEP-7 to the approved project, which consists of the construction emissions and health risks previously estimated in the FEIR including the former project design of Maintenance Buildings 1 and 2, as well as the operational emissions and health risk from Addendum 1 (the biogas addendum)
2. First analyzing SEP-7 as an individual project would be conservative with regard to exposure assumptions used in the cancer risk analysis, as it would assume a resident is exposed from the third trimester, with the highest exposure numbers; whereas the SEP-7 project would not actually have construction activity in the first year of approved project construction, since that construction began in January of 2020.
3. Adding the maximum individual project health impacts from SEP-7 onto the maximally exposed individual sensitive receptors (MEISR) impacts for the approved project is also conservative since this assumes that the maximum impact from both analyses could be occurring at the same location, when the maximum impacts from each could be in different locations.

OVERVIEW OF PROPOSED CHANGES

As described in the FEIR, Maintenance Shops 1 consisted of a 30-foot-tall building with a footprint of approximately 12,600 square feet and a total floor area of 19,600 square feet. Maintenance Shops 2 consisted of a 15-foot-tall building with a total footprint and floor area of 5,500 square feet.

Instead of Maintenance Shops 1 and 2, the SFPUC proposes to modify the project to construct SEP-7, which would also consist of two buildings (SEP 603 and SEP 914). These modifications are described in more detail in the Project Description for the SEP-7 Operations, Engineering and Maintenance Buildings Project. The modification would also demolish the existing building (SEP 850), two pre-fabricated trailers (SEP 850A and 850B), and the adjacent, paved surface parking lot (a total area of approximately one acre), instead of existing building (SEP 870) as covered in the FEIR. The proposed Mechanical Maintenance building (SEP 603) would consist of an approximately 8,700-square-foot, 35-foot-tall two-story building (including mezzanine) at the corner of Jerrold Avenue and Phelps Street (accessed from Jerrold Avenue). The proposed Operations, Engineering, and Maintenance building (SEP 914) would consist of an approximately 34,600-square-foot, 50-foot-tall three-story building located along Jerrold Avenue between the proposed Mechanical Maintenance building and existing building SEP 870 (also accessed from Jerrold Avenue). Proposed staging areas would be on-site at the SEP and in front of the project site along the parking strip on Jerrold Avenue.

SEP-7 construction would also temporarily relocate SFPUC operational activities in existing Building 850 to the existing 1900 Jerrold Avenue building, within existing Building 870, and to newly constructed temporary shower trailers in the parking area adjacent to Building 870. Activities associated with connections to existing and new utilities, the construction of a utility enclosure for a

[4] The approved project consists of the FEIR and Addendum 1, which analyzed the potential impacts of constructing and operating a biogas utilization system at the SEP plant.

[5] This memorandum builds upon previous analyses done for the biogas utilization system, a previous addendum to the BDFP FEIR. For that project modification, actual construction hours to date were used to estimate emissions. Actual construction activity (horsepower hours) and thus emissions are lower than those estimated in the FEIR.

new chiller, and construction staging would be limited and are accounted for by the overall construction activity occurring with the SEP-7 project construction footprint.

The proposed SEP-7 modification represents an increase in building square footage from the original Maintenance Shops 1 and 2. Project construction would occur outside the project area analyzed in the FEIR, including construction closer to Phelps Street.

Construction Emissions Analysis

Ramboll utilized California Emission Estimator Model version 2022.1 (CalEEMod) and its equivalent methodologies to quantify construction CAP emissions for the SEP-7 project. Emissions are estimated for on-site exhaust, mobile exhaust,. and architectural coatings from six construction subphases. As described below, Ramboll updated several default assumptions to reflect Project-specific information to generate emission estimates.

The construction schedule is shown in **Table 1**. The off-road equipment list is shown in **Table 2**; off-road equipment quantities, utilization, and fuel types were provided by SFPUC. Equipment load factor and horsepower were assumed to be CalEEMod default. These parameters were used along with CAP and GHG emission factors to calculate offroad emissions. Emissions assume compliance with FEIR Mitigation Measure M-AQ-1a, which is the scenario using Tier 4 Final equipment for all equipment greater than or equal to 140 horsepower. Equipment with horsepower less than 140 horsepower were assumed to be Tier 2 equipment with a Diesel Particulate Filter (DPF). This mitigation measure also includes renewable diesel for all diesel offroad equipment and on-road haul trucks.

Construction on-road vehicle trip rates are shown in **Table 3**. All worker vehicles were assumed to be fueled by gasoline, and all vendor vehicles and haul trucks were assumed to be fueled by diesel. On-road emissions were calculated using emission factors from the California Air Resources Board's (CARB) Emission FACtor onroad emissions model (EMFAC2021). Construction emissions are also generated from architectural coatings, as shown in **Table 4**.

The control measures incorporated into the emission estimates for the controlled scenario are consistent with the engine requirements outlined in FEIR Mitigation Measure M-AQ-1a for construction emissions.[6] Summarized CAP and GHG emissions from SEP-7 construction are presented in **Table 5**.

For construction emissions, only diesel particulate matter (DPM) and $PM_{2.5}$ emissions from vendor and hauling trucks were included in the HRA. Construction worker vehicle trips were assumed to be gasoline-fueled and thus not a source of diesel particulate matter. Therefore, construction worker vehicle emissions were not included in the health risk assessment.

All construction equipment was assumed to be diesel-fueled, such that the only TAC evaluated in the health risk assessment is DPM.

Operational Emissions Analysis

Ramboll calculated emissions from the existing 500kva and the two new 750kva backup generators, as shown in **Table 6**. Generator emissions were calculated assuming 50 hours of emergency use in accordance with the San Francisco Planning Department's Air Quality and Greenhouse Gas Analysis

[6] This is the scenario using Tier 4 Final equipment for all equipment greater than or equal to 140 horsepower. Equipment with horsepower less than 140 horsepower were assumed to be Tier 2 equipment with a Diesel Particulate Filter (DPF). Emissions also include renewable diesel for all diesel offroad equipment and on-road haul trucks.

Guidelines.[7] The existing generator's emissions were calculated using emission factors from the generator specifications. Due to the lack of specifications for the two new generators, Ramboll analyzed both Tier 3 and Tier 4 Final generators and conservatively used a power factor of 1 to convert from kva to kW (apparent to actual power).[8]

Air Dispersion Modeling Methodology

Ramboll modeled the SEP-7 sources at the proposed project location, sourced from the project description, shown in **Figure 1**. The construction area was modeled as a single area emissions source, consistent with parameters used for modeling construction in the AQTR. The generators were modelled using information from the generator specification sheets (existing generator) or the BAAQMD's default generator modeling parameters[9] (proposed generators) and the locations provided by SFPUC. Construction traffic routes were not separately modeled and all on-road traffic emissions were conservatively assigned to the construction area source.[10]

Health Risk Assessment Methodology

Project construction would generate TAC emissions, specifically DPM. Per the Consolidated Table of California Office of Environmental Health Hazard Assessment (OEHHA)/CARB Approved Risk Assessment Health Values, DPM can cause cancer and non-cancer chronic health impacts; DPM has no acute toxicity value. Sources of DPM included in the HRA include: vendor truck trips, hauling truck trips, offroad equipment associated with construction, and operational emergency generator emissions.

During the previous health risk assessment associated with the BDFP FEIR, long-term health impacts (such as cancer risk, chronic HI, and $PM_{2.5}$ concentrations) from Project construction and operations were evaluated at sensitive receptors (such as residences), and the MEISR were identified.

Ramboll conducted a health risk assessment for the SEP-7 operations, engineering and maintenance buildings consistent with OEHHA's 2015 Guidance Manual for Preparation of Health Risk Assessment[11] and the 2022 BAAQMD CEQA Guidelines.[12] Following these guidance documents for assessing impacts to exposed populations from emissions resulting from a project's construction, sensitive receptors were evaluated as a fetus *in utero* at the beginning of the third trimester at the start of SEP-7 construction until the end of construction. The exposure parameters for residential receptors are presented in **Table 8**. This approach is conservative because it places the proposed SEP-7 construction activity in the earliest years of exposure, which have the highest intake factors and thus

---

[7] SF Environmental Planning. 2024. Air Quality and Greenhouse Gas Analysis Guidelines. Available at: https://sfplanning.org/air-quality

[8] While a power factor of 0.8 is typical, the use of a power factor of 1 is conservative, as emissions are calculated using emission factors in units of g/hp-hr.

[9] BAAQMD. 2023. California Environmental Quality Act Air Quality Guidelines, Appendix E: Recommended Methods For Screening and Modeling Local Risks and Hazards. April.

[10] The construction routes for SEP-7 will include previously modeled routes for the BDFP. Ramboll has previously performed analyses to determine that contributions from construction traffic are small at the MEIR, and that a worst-case screening (worst-case construction traffic) would not result in an exceedance of CEQA thresholds; see MPM 16, available upon request.

[11] OEHHA. 2015. Air Toxics Hot Spot Program. Risk Assessment Guidelines. Guidance Manual for Preparation of Health Risk Assessments. February. Available online at: https://oehha.ca.gov/media/downloads/crnr/2015guidancemanual.pdf

[12] BAAQMD. 2023. California Environmental Quality Act Air Quality Guidelines. April.

contribution to health risk impacts (i.e., as would be done if SEP-7 was a standalone project, rather than a part of the BDFP project even though the SEP-7 project would actually be built toward the end of the BDFP project). Operations were assumed to start immediately after construction, with the total exposure duration for the health risk assessment set at 30 years (2 years of construction and 28 years of generator operation). The maximum cancer risk, chronic HI, and $PM_{2.5}$ concentrations for the Tier 3 generators scenario are shown in **Table 9a** and the maximum cancer risk, chronic HI, and $PM_{2.5}$ concentrations for the Tier 4 Final generators scenario are shown in **Table 9b**. The maximum health impacts occur at different locations between the Tier 3 and Tier 4 scenarios.

As mentioned above, the SEP-7 operations, engineering and maintenance buildings are a component of the BDFP; therefore, the health risks from SEP-7 construction were then conservatively added to the previously identified MEISRs from BDFP Project construction in the FEIR, as shown also in **Table 9a** and **9b** and **Figure 2**. **Table 9** also includes the results of the cumulative risk assessment, which estimates excess lifetime cancer risks and $PM_{2.5}$ concentrations that are attributable to other mobile and stationary sources within the Project vicinity, in addition to impacts from the Project. The cumulative sources analyzed remained consistent with the AQTR, and consist of additional projects in the surrounding area that will be under construction during the construction and operation of the BDFP, as well as an update of the background risks from the health risks database from the 2020 San Francisco Citywide HRA.[13,14]

RESULTS

Construction Emissions

Table 7 and **Table A** (below) show CAP and GHG construction emissions from the proposed construction of the SEP-7 operations, engineering and maintenance buildings project.

[13] The San Francisco Planning Department evaluated citywide the cumulative cancer risks and $PM_{2.5}$ concentrations from existing known sources of air pollution in 2014 as part of the development of a Community Risk Reduction Plan (CRRP) and corresponding HRA database (CRRP-HRA) and this was used in the AQTR. Since the certification of the FEIR with the AQTR in 2018, the cumulative health risks were re-evaluated and the Citywide HRA was updated in 2020, supplanting the former CRRP-HRA. As requested by the SF Planning Department, this analysis uses the updated Citywide HRA for the cumulative risk assessment.

[14] San Francisco Department of Public Health (SFDPH), San Francisco Planning Department, and Ramboll. 2020. San Francisco Citywide Health Risk Assessment: Technical Support Documentation.

Table A: Average Daily Criteria Air Pollutant and Greenhouse Gas Construction Emissions from SEP-7 Alone

Year	ROG (lb/day)[1]	NOx (lb/day)[1]	PM_{10} (lb/day)[1]	$PM_{2.5}$ (lb/day)[1]	CO_2e (MT/year)[1]
2025 (1st year of SEP-7 construction)	0.3	11	0.07	0.07	405
2026 (2nd year of SEP-7 construction)	1.3	6.5	0.05	0.05	431
2027 (3rd year of SEP-7 construction)	2.4	8.6	0.06	0.06	216
BAAQMD Thresholds[2]	54	54	82	54	N/A
Exceed Thresholds?[2]	N	N	N	N	N/A

Notes:

1. SEP-7 emissions shown here assume compliance with FEIR Mitigation Measure M-AQ-1a and were sourced from the attached Table 5.
2. The BAAQMD construction thresholds do not include thresholds for greenhouse gases.

The Conceptual Engineering Report schedule, which was used in the FEIR, placed the construction of Maintenance Shops 1 and 2 in Years 2-4. **Table B** below therefore shows the SEP-7 emissions added to the FEIR controlled construction emissions for Years 2-4; Years 1 and 5 are the same as presented in the FEIR.

As shown in the tables, CAP emissions for the summation of BDFP and SEP-7 construction would exceed thresholds for NOx in Years 2 and 3; the BDFP Project as analyzed in the FEIR would exceed the NOx threshold in Years 1 and 3 only.

Table B: Average Daily Construction Emissions from SEP-7 Combined with BDFP FEIR Emissions Years 2-4

Year[1]	ROG (lb/day)[1]	NOx (lb/day)[1]	PM_{10} (lb/day)[1]	$PM_{2.5}$ (lb/day)[1]
1st year of SEP-7 construction plus FEIR Year 2	10	**56**	0.7	0.7
2nd year of SEP-7 construction plus FEIR Year 3	11	**62**	0.7	0.7
3rd year of SEP-7 construction plus FEIR Year 4	15	48	0.6	0.6
BAAQMD Thresholds	54	54	82	54
Exceed Thresholds?	N	Y	N	N

Notes:

1. The FEIR Conceptual Engineering Report schedule, which was used in the FEIR, placed the construction of Maintenance Shops 1 and 2 in Years 2-4, which is how the mapping between calendar year and FEIR Year was determined. Construction CAP emissions from the BDFP FEIR are sourced from Table 4c of the AQTR and are consistent with Table 4.8-9 of the FEIR. Construction CAP emissions from the SEP-7 operations, engineering and maintenance buildings are sourced from the attached Table 5 and were added to FEIR Years 2-4. **Bold** represents exceedances of the threshold.
2. BDFP and SEP-7 emissions shown here assume compliance with FEIR Mitigation Measure M-AQ-1a.

These summed emissions are conservative because the SEP-7 construction activities were added to the construction emissions from the FEIR years two through four while the construction emissions that would have occurred from the construction of Maintenance Shops 1 and 2 were not removed. In addition, as a part of separate analyses conducted for the biogas utilization system (Addendum 1, 2024), Ramboll computed actual emissions from BDFP construction for Years 1 through 3, which showed that actual construction emissions are lower than estimated in the FEIR due to fewer construction equipment hours. **Table 7b** and **Table C** show the SEP-7 emissions added to the FEIR actual construction emissions for Years 2-3, since actual construction emissions were only available for Years 1-3 and again this analysis adds SEP-7 to BDFP FEIR Years 2-4.

Table C: Average Daily Construction Emissions from SEP-7 Combined with BDFP Actual Construction Emissions

Year	ROG (lb/day)[1]	NOx (lb/day)[1]	PM_{10} (lb/day)[1]	$PM_{2.5}$ (lb/day)[1]
Year 1 of SEP-7 plus Year 2 of BDFP actual emissions	4.5	47	0.4	0.4
Year 2 of SEP-7 plus Year 3 of BDFP actual emissions	4.4	37	0.2	0.2
Year 3 of SEP-7 plus Year 4 of BDFP actual emissions[2]	N/a	N/a	N/a	N/a
BAAQMD Thresholds	54	54	82	54
Exceed Thresholds?	N	N	N	N

Notes:

1. Actual emissions for the Biosolids Digester Facility Project off-road sources were based on data provided by the Project's construction contractors for Years 1-3 (2020-2022). Construction CAP emissions from the SEP-7 project are sourced from the attached Table 5 and were added to Years 2-3. SEP-7 emissions shown here assume compliance with FEIR Mitigation Measure M-AQ-1a.
2. BDFP actual emissions for year 4 is not available as the construction is currently ongoing as of October 2024; refer to Table B above for average daily construction emissions from SEP-7 combined with BDFP FEIR year 4 construction emissions.

Operational Emissions

Table D shows SEP-7 operational emissions with both Tier 3 and Tier 4 750 kva generators, as well as the SEP-7 operational emissions combined with the biogas Addendum 1 operational emissions.

Table D: Net Annual Operational Emissions from SEP-7 Generators Combined with Approved Project Operational Emissions

Scenario	ROG (ton/year)	NOx (ton/year)	PM_{10} (ton/year)	$PM_{2.5}$ (ton/year)
Approved Project[2]	-3.4	-0.2	2.3	2.3
Net SEP-7 Operations (Tier 3 Generators)[1]	8.4E-04	0.10	0.0081	0.0070
Approved Project plus SEP-7 (Total)	-3.4	-0.1	2.3	2.3
BAAQMD Thresholds	10	10	15	10
Exceed Thresholds?	N	N	N	N

Approved Project[2]	-3.4	-0.2	2.3	2.3
Net SEP-7 Operations (Tier 4 Generators) [1]	-0.0036	0.089	3.7E-04	3.7E-04
Approved Project plus SEP-7 (Total)	-3.4	-0.1	2.3	2.3
BAAQMD Thresholds	10	10	15	10
Exceed Thresholds?	N	N	N	N

Notes:

1. Operational emissions calculated as emissions from the new generators minus the emissions of the removed generator.
2. The approved project includes the biogas Addendum 1 to the EIR.

The operational emissions from SEP-7 are negligible on a ton per year basis; when combined with the operational emissions from the approved project, the total combined emissions would remain under thresholds.

Health Risks

In the FEIR, the MEISR is identified as the sensitive receptor location of the maximum net risk: cancer risks minus the adjusted existing operational risk of existing sources at the SEP planned for removal at the completion of the overall BDFP project. In the FEIR, the net cancer risk was 1.7 in a million, the net chronic HI was 0.0036, and the $PM_{2.5}$ concentration was 0.017 ug/m^3. This risk includes contributions from BDFP construction and approved project operations.

Table 9 and **Table E** below shows the health impacts for the SEP-7 construction and operations, including for the Tier 3 and Tier 4 generators, as well as the combined value of SEP-7 plus the approved project. Adding the maximum health impacts from SEP-7 and the MEISR impacts is conservative because this assumes that these maximums could be occurring at receptors that would also be experiencing health risks at the level of the MEISR in the FEIR. In addition, the FEIR MEISR impact value shown for BDFP already includes a small portion of risk accounted for from the Maintenance Shops 1 and 2 construction as well as operations of the BDFP (as was evaluated in the FEIR). Summing SEP-7 and the FEIR health risk impacts is additionally conservative for PM and chronic HI, which are calculated as maximum annual averages, as the summation assumes they will also overlap in time.

As shown in **Table E** below, the resulting health impacts at this receptor (the MEISR) would be below CEQA thresholds in both the Tier 3 and Tier 4 scenario.

Table E: Potential Theoretical Maximum Health Risk Impacts from SEP-7 combined with Approved Project

Source	Excess Cancer Risk (in a million)[1]	$PM_{2.5}$ Concentration (ug/m^3)[3]	Chronic Non-Cancer Hazard Index (unitless)[3]
SEP-7 MEISR Impact (Construction Emissions and Tier 3 Generators)	2.4	0.0047	0.0010
FEIR Construction MEISR Impact	1.7[2]	0.017[4]	0.0036[4]
Addendum 1 MEISR Impact[5]	-0.009	0.02	0.015
Total Combined Impact	4.2	0.04	0.020
CEQA Significance Threshold	7.0	0.2	1
Exceeds CEQA Significance Threshold?	N	N	N

SEP-7 MEISR Impact (Construction Emissions and Tier 4 Generators)	1.5	0.0047	0.0010
FEIR Construction MEISR Impact	1.7[2]	0.017[4]	0.0036[4]
Addendum 1 MEISR Impact[5]	-0.009	0.02	0.015
Total Combined Impact[6]	3.3	0.04	0.020
CEQA Significance Threshold	7.0	0.2	1
Exceeds CEQA Significance Threshold?	N	N	N

Notes:

1. The cancer risk values reflect the maximum lifetime exposure to the project (construction and operations) of the mitigated scenario described in the FEIR and the approved project operations.
2. This value is from Table 4.8-11 of the FEIR and Table 22 of the AQTR. This cancer risk value includes the cancer risk at the MEISR identified in the FEIR from the entire project implementation, including construction and operation, minus the net reduction from decommission of certain existing facilities. As part of the biogas addendum, risks from BDFP operation, and therefore entire project implementation risks (construction and operation) would likely be lower than evaluated in the FEIR.
3. The values for chronic non-cancer hazard index and $PM_{2.5}$ reflect the annual maximums from any of the project years at the MEISR with the highest level of exposure as identified in the FEIR.
4. These values are from Table 23a of the AQTR and represent the mitigated scenario.
5. Addendum 1 only updated the health risks from the operation of the biogas utilization system.
6. The total combined impact value may not equal the sum of the individual components due to rounding.

Table F below summarizes the cumulative health impacts of SEP-7 plus the approved project, and compares it to the FEIR Construction MEISR impact value. The health impacts from SEP-7 at the MEISR were added onto the construction health impacts from the BDFP EIR at the BDFP MEISR and the operational health impacts from the Biogas addendum at the Addendum MEISR.

Table F: Cumulative Health Impacts from SEP-7 combined with the Approved Project , plus Cumulative Projects and the 2020 Updated Citywide Health Risk Assessment[1]

Source	Excess Cancer Risk (in a million)	$PM_{2.5}$ Concentration (ug/m^3)	Chronic Non-Cancer Hazard Index (unitless)
FEIR Construction MEISR Impact[2]	111	9.2	0.0089
SEP7 (Tier 3 Generators) Construction and Operations plus Addendum 1	4.2	0.04	0.025
Cumulative Projects	24	0.010	0.0053
Citywide HRA	106	9.5	--
Total[3]	134	9.5	0.025
Cumulative CEQA Threshold	90	9.0	10.0
Screening Risks Above Cumulative Threshold?	Y	Y	N

FEIR MEISR Impact[2]	111	9.2	0.0089
SEP7 (Tier 4 Generators) Construction and Operations plus Addendum 1	3.3	0.04	0.025
Cumulative Projects	24	0.010	0.0053
Citywide HRA	100	9.5	--
Total[3]	127	9.5	0.025
Cumulative CEQA Threshold	90	9.0	10.0
Screening Risks Above Cumulative Threshold?	Y	Y	N

Notes:

1. Cumulative impacts include risks from nearby stationary sources, major roadways, and SFPUC-sponsored projects, consistent with the AQTR and FEIR. Nearby stationary sources and major roadway impacts are estimated in the Citywide HRA. Citywide background health risk has increased since the FEIR (and AQTR), contributing to the increase in cumulative effects.
2. FEIR impacts from construction are taken from AQTR Table 26 and Table 27.
3. These values are different because the background concentrations (from the Citywide HRA) vary by location, and the SEP-7 MEISRs are at different locations for the two generator scenarios and for the biogas addendum.

This approach is conservative, as it sums the maximum risks from all project components when the maximum health impacts would occur at different locations. Citywide background health risk has also increased since the FEIR (and AQTR). The approach taken in this analysis is additionally conservative for construction emissions and health risk. As mentioned previously, in the air quality analysis done for the biogas utilization system, actual construction hours were used to estimate emissions. Actual construction activity (horsepower hours) and thus emissions were lower than the estimates in the FEIR. Additionally, the biogas utilization system would result in less construction activity than was analyzed in the FEIR, because fewer and less substantive structures would be built in less time.

CLOSING

The analysis presented above represents a conservative estimate of the CAP, GHG, and health risk emissions from the proposed modifications to the BDFP Project to implement the proposed SEP-7 project. CAP emissions for the conservative summation of BDFP and SEP-7 construction would exceed CEQA threshold for NOx in Years 2 and 3. Year 3 was already determined to be exceeded in the BDFP FEIR with mitigation. Thus, like for the approved project, NOx offsets would be required to mitigate emissions over the threshold. The theoretical worst-case health risk analysis demonstrates that the modifications would not result in exceedances of the CEQA project-level health risk thresholds. The cumulative risk assessment includes the use of the Citywide HRA updated in 2020 for the cumulative health risk assessment; increases in citywide background health risk since the FEIR leads to increases in cumulative effects.

Notes:

1. Equipment list was provided by the Project Applicant. Utilization was calculated based on work days of equipment use divided by phase length.
2. CalEEMod® equipment type and horsepower are assigned using defaults from CalEEMod® User's Guide Appendix G, Table 12.
3. Engine tier assumes compliance with the control measures outlined in the BDFP (Biosolids Digesters Facilities Project) Environmental Impact Report (EIR). Equipment with horsepower under 140 use Tier 2 engines with a diesel particulate filter (DPF), while equipment with 140 hp or more employ Tier 4 Final engines. These assumptions also include the use of renewable diesel in off-road equipment based on the Environmental Impact Report (EIR) assumptions and on-road haul trucks.

Table 4
Estimated Emissions from Construction Architectural Coating Off-Gassing
SFPUC SEP-7
San Francisco, CA

Inputs[1,2]

Parameter		Input	Units
Residential Surface Area to Floor Area Ratio		2.7	--
Non-Residential Surface Area to Floor Area Ratio		2.0	
Painted Area in Parking Structures		6%	--
Application Rate		100%	--
Reapplication Rate		10%	--
Fraction of Surface Area (Non-Parking)	Interior Surfaces	75%	--
	Exterior Shell	25%	--
Fraction of Surface Area (Parking)	Interior Surfaces	90%	--
	Exterior Shell	10%	--
Total surface for painting by acreage (in square feet) for parking lot		5%	--
Indoor Paint VOC Content		100	g/L
Exterior Paint VOC Content		150	g/L
Parking VOC Content		100	g/L

Emissions

Phase	Land Use	Square Footage[2] (square feet)	Building Surface Area Painted[2] (square feet)	Interior Area Painted[3] (square feet)	Exterior Area Painted[3] (square feet)	Architectural Coating VOC emissions (lb)
Construction	Mechanical Maintenance Building (SEP 603)	8,700	17,400	13,050	4,350	91
	Operations, Engineering, and Maintenance Building (SEP 914)	34,600	69,200	51,900	17,300	361
	Utility Shed	600	1,200	900	300	6
					Total VOC Emissions (lbs)	**458**

Notes:

[1] Inputs and assumptions are consistent with CalEEMod 2022.1 for San Francisco. Indoor and outdoor paint VOC content parameters were obtained from CalEEMod Appendix G Table G-17 Architectural Coating Emissions Factors by Air District.

[2] Building type square footage is based on information provided by the Project Sponsor. Non-residential square footage is assumed to be 2.0 times the square footage, consistent with CalEEMod Appendix C.

[3] For commercial land use types: calculated based on CalEEMod assumption that 1 gallon of paint covers 180 square feet and that building area is assumed to be 75% indoors and 25% outdoors. For parking land use types: calculated based on CalEEMod assumption that 1 gallon of paint covers 180 square feet and that building area is assumed to be 90% indoors and 10% outdoors.

Abbreviations:

CalEEMod - California Emissions Estimator Model
EF - emission factor
g - grams
L - liter
lb - pound
VOC - volatile organic compound

	Mobile Exhaust		20	162	1.4	1.3	64

Summary of Construction Emissions by Source

Year	Daily Average CAP Emissions (lb/day)[2]				GHG Emissions (MT/yr)
	ROG	NO_x	PM_{10} (Exhaust)	$PM_{2.5}$ (Exhaust)	CO_2e
2025	0.3	11	0.07	0.07	405
2026	1.3	6.5	0.05	0.05	431
2027	2.4	8.6	0.06	0.06	216
BAAQMD Thresholds	54	54	82	54	--
Exceed Thresholds?	**No**	**No**	**No**	**No**	--

Notes:

1. The emissions above include emissions from offroad equipment, emissions from worker, vendor, and hauling trucks, and off-gassing emissions from paving and architectural coating. BAAQMD construction thresholds for PM_{10} and $PM_{2.5}$ evaluate only exhaust emissions.
Emissions shown here assume compliance with EIR Mitigation Measure M-AQ-1a, which is the scenario using Tier 4 Final equipment for all equipment greater than or equal to 140 horsepower. Equipment with horsepower less than 140 horsepower were assumed to be Tier 2 equipment with a Diesel Particulate Filter (DPF). Emissions also include renewable diesel for all diesel offroad equipment and on-road haul trucks.

2. Daily average emissions are computed by dividing by the number of workdays per year.

New Tier 3	750	750	1006	50	Tier 3	0.0050	0.13	0.0050	0.0044
New Tier 4	750	750	1006	50	Tier 4 Final	0.0028	0.12	0.0011	0.0011
New Tier 4	750	750	1006	50	Tier 4 Final	0.0028	0.12	0.0011	0.0011

Net emissions from new Tier 3 Generators	8.4E-04	0.10	0.0081	0.0070
Net emissions from new Tier 4 Generators	-0.0036	0.089	3.7E-04	3.7E-04

Notes:

[1] Emissions assume 50 hours of emergency use for each generator consistent with the San Francisco Environmental Planning's Air Quality and Greenhouse Gas guidance.

[2] Emission factors for the existing (to be removed) generator are based on generator spec sheets provided by the project sponsor. Emission factors given in NOx + NMHC are assumed to be 95% NOx and 5% VOC.

[3] Emission factors for the new generators are based on CalEEMod 2022 Tier 3 and Tier 4 Final default emission factors, per information from the Project Sponsor.

Exceed Thresholds?		No	Yes	No	No

Notes:

1. Actual emissions for the Biosolids Digester Facility Project off-road sources were based on data provided by the Project's construction contractors for 2020-2022 (Years 1-3). These emissions reflect the use of renewable diesel in off-road equipment based on the Environmental Impact Report (EIR) assumptions. These actual construction emissions were previously provided to San Francisco Environmental Planning in MPM-9.
   Actual emissions for the on-road sources reflect the control measure that 80% of haul trucks are engine model year 2012 or newer with no renewable diesel. This varies from the control measure in the EIR that equipment be 2010 or newer with renewable diesel. This alternative control measure was approved by San Francisco Environmental Planning (Johnston, 9-30-20).
2. SEP-7 Emissions shown here assume compliance with EIR Mitigation Measure M-AQ-1a, which is the scenario using Tier 4 Final equipment for all equipment greater than or equal to 140 horsepower. Equipment with horsepower less than 140 horsepower were assumed to be Tier 2 equipment with a Diesel Particulate Filter (DPF). Emissions also include renewable diesel for all diesel offroad equipment and on-road haul trucks.

Table 8
Exposure Parameters
SFPUC SEP-7
San Francisco, CA

Receptor Type	Project Phase	Year	Receptor Age Group	Exposure Parameters						
				Daily Breathing Rate (DBR)[1]	Annual Exposure Duration (ED)	Fraction of Time at Home (FAH)[2]	Exposure Frequency (EF)[3]	Age Sensitivity Factor (ASF)[4]	Averaging Time (AT)	ASF-Weighted Intake Factor, Inhalation (IF_{inh})
				[L/kg-day]	[years]	[unitless]	[days/year]		[days]	[m^3/kg-day]
Resident[5]	Construction	2025	3rd Trimester	361	0.29	1.0	350	10	25,500	0.014
		2025	Age 0-<2 Years	1090	0.71	1.0	350	10	25,500	0.107
		2026	Age 0-<2 Years	1090	1.0	1.0	350	10	25,500	0.150
		2027	Age 0-<2 Years	1090	0.56	1.0	350	10	25,500	0.083
		2027	Age 2-<16 Years	572	0.44	1.0	350	3	25,500	0.010
	Operation	2027	Age 2-<16 Years	572	0.33	1.0	350	3	25,500	0.00768
		2028-2041	Age 2-<16 Years	572	13.39	1.0	350	3	25,500	0.3153
		2041-2055	Age 16-<30 Years	261	14	0.7	350	1	25,500	0.037

Notes:

1. Daily breathing rates for residential receptors and non-residential receptors are consistent with the recommended breathing rates in the BAAQMD's 2022 CEQA Guidelines, Appendix E.

2. Fraction of time spent at home is consistent with the recommended value in the BAAQMD's 2022 CEQA Guidelines, Appendix E for residential receptors.

3. Exposure frequency was determined as follows:

   Resident: reflects default residential exposure frequency from the BAAQMD's 2022 CEQA Guidelines.

4. Age sensitivity factors (ASFs) account for an "anticipated special sensitivity to carcinogens" of infants and children as recommended in the OEHHA Technical Support Document (OEHHA 2015) and current OEHHA guidance (OEHHA 2015). This approach is consistent with the cancer risk adjustment factor calculations recommended by BAAQMD.

5. A resident receptor is assumed to be exposed at the beginning of the infancy (third trimester)

Calculation:

IF_{inh} = DBR * FAH * EF * ED * CF / AT

CF = 0.001 (m^3/L)

MAF = HR / HS * DR / DS *DF

Abbreviations:

AT - averaging time
ASF - Age Sensitivity Factor
BAAQMD - Bay Area Air Quality Management District
DBR - daily breathing rate
ED - exposure duration
EF - exposure frequency
FAH - fraction of time at home
HS - number of hours of source operation per day
DS - number of days of source operation per week
IF_{inh} - intake factor
kg - kilogram
L - liter
m^3 - cubic meter
OEHHA - Office of Environmental Health Hazard Assessment
MAF - model adjustment factor
HR - number of hours per day for which long-term concentration is calculated
DR - number of days per week for which annual average concentration is calculated

Cumulative Projects[3]		24	0.010	0.0053
Citywide HRA[4]		106	9.5	--
Total		134	9.5	0.02

Notes:

1. Results are presented for construction assuming compliance with EIR Mitigation Measure M-AQ-1a.
2. This table presents the cancer risk, chronic health impacts, and PM2.5 concentration from the SEP-7 project component at the MEISR for SEP7, which are then added onto the construction health impacts from the BDFP EIR at the BDFP MEISR and the operational health impacts from the Biogas addendum. This approach is conservative, as the maximum health impacts occur at different locations.
3. The health impacts of additional SFPUC projects at the Southeast Plant (SEP) and in the surrounding area that will be under construction during the construction and operation of the BDFP were estimated for the FEIR, and retained for this analysis.
4. The background cancer risk and PM2.5 concentration from existing nearby stationary sources was obtained from the Citywide HRA at the SEP-7 MEISR location. The Citywide HRA does not estimate cumulative chronic HI; therefore, this was not included in the cumulative chronic HI evaluation.

Re:	Southeast Water Pollution Control Plant, 750 Phelps Street
Case No.	2015-000644ENV

Introduction

The proposed project takes place at the Southeast Water Pollution Control Plant (Southeast Treatment Plant), at 750 Phelps Street, and would be a modification to the previously approved Biosolids Digester Facilities project (Case number 2015-000644ENV), to replace the existing solids treatment facilities with more reliable, efficient, and modern technologies and facilities.

CEQA Historic Resources Evaluation

The Southeast Treatment Plant was previously evaluated and determined to be a historic resource eligible for listing in the National and California registers. The Southeast Treatment Plant Streamline Moderne Industrial Historic District is eligible under Criterion A/1 for its significant contributions to the completion of the 1935 Sewer System Master Plan and C/3 as an important collection of industrial buildings all designed in the Streamline Moderne architectural style. The period of significance for the district is the date of completion of the buildings within the district, 1952. There are a total of 22 contributing buildings, 5 non-contributing buildings, and one none-contributing structure (security fence), within the district boundary which is drawn to capture the area within the plant that contains the highest concentration of buildings constructed during the period of significance.

Proposed Project

The previously approved project to upgrade the Southeast Treatment Plant, known as the Biosolids Digester Facilities project, would demolish Building 870, the "Service Building," to allow for the construction of a new maintenance shop in its location. The previous project underwent CEQA review and the EIR was certified by the San Francisco Planning Commission on March 8, 2018 (Case number 2015-000644ENV). The proposed project has been revised to retain Building 870 and instead demolish a different contributing building within the Southeast Treatment Plant (Building 850, the "Operator's Building"), along with the adjacent surface parking lot, for the construction of two new buildings, a Mechanical Maintenance building (SEP 603) and an Operations, Engineering and Maintenance building (SEP 914).

Project Impacts

Planning department preservation staff reviewed the proposed project modification to determine if there were any new impacts to historic architectural resources that had not been previously disclosed. The environmental impact report (EIR) for the previously approved project did not find project-level significant impacts to historic resources due to the fact that the previously approved project would only demolish one contributing building, Building 870. The analysis in the EIR stated that while Building 870 was a contributor to the district, it was not an anchor building within the historic district and was more utilitarian in comparison with some of the other grander and architecturally detailed buildings within the historic district. Furthermore, the analysis explained that north of Jerrold Avenue, the historic district had less cohesion and contains a higher number of non-contributing buildings within the historic district boundaries. The analysis concluded that the new construction would simply be one new non-historic addition in the mix of buildings within the northern part of the historic district that already has a mixture of contributing and non-contributing buildings.

The previous EIR did however find there was a cumulative impact on the Southeast Treatment Plant Streamline Moderne Industrial Historic District caused by cumulative projects including the Demolition of the Existing SEP Digester and Southside Renovation Project that would demolish all existing digesters and their central control buildings. Implementation of *Mitigation Measure M-CR-1 (Documentation of Historic Resources and Interpretive Display)* was determined to reduce the severity of the cumulative impact but would not reduce it to a less-than-significant level. The previously approved project's contribution to this cumulative impact was cumulatively considerable (i.e. significant) and the cumulative impact on the historic district would be significant and unavoidable with mitigation.

Planning department staff have reviewed the revised project and determined that it will not have any additional impacts that were not disclosed in the previous environmental review. Building 850 is a more architecturally distinguished building than Building 870 as it was the former administration building and has a more prominent street presence along Phelps Street. While it is true that Building 850 is architecturally more distinguished than Building 870, its demolition instead of Building 870, would not result in enough of a change in the historic district composition to result in a significant and unavoidable impact at the project-level. After demolition of Building 850 the historic district will still retain 21 contributing buildings that as a whole will still communicate their significance in completion of the 1935 Sewer System Master Plan and C/3 as an important collection of industrial buildings all designed in the Streamline Moderne architectural style.

Cumulative impacts to historic resources would still be the same as those identified in the EIR, therefore it is recommended that a Mitigation Measure be implemented that documents and interprets the history of the building that will be demolished.

Mitigation Measure M-CR-1: Documentation of Historic Resources and Interpretive Display. Prior to demolition of any individual historic resource or contributor to a historic district, the SFPUC shall submit to the planning department for review photographic and narrative documentation of the individual historic resource or district contributor. ~~retain~~ The documentation shall be funded by the SFPUC and undertaken by a qualified professional who meets the standards for history, architectural history, or architecture (as deemed appropriate by the department's preservation staff), as set forth by the Secretary of the Interior's Professional Qualification~~s~~ Standards ~~for Architectural History to prepare written and photographic documentation of the Central Shops~~ (36 Code of Federal Regulations, part 61). The documentation scope ~~effort~~ shall be reviewed and approved by the department prior to any work on the documentation. A documentation package shall consist of the required forms of documentation and shall include a summary of the historic resource and an overview of the documentation provided. Documentation of the building should include the following:

- *HABS/HALS-Like Measured Drawings* – A set of Historic American Buildings/Historic American Landscapes Survey-like (HABS/HALS-like) measured drawings that depict the existing size, scale, and dimension of the subject property. The department's preservation staff will accept the original architectural drawings or an as-built set of architectural drawings (plan, section, elevation, etc.). Copies of building plans gathered from the prior evaluations of the Biosolids Digester Facilities Project can be reused and reformatted for this effort. The department's preservation staff will assist the consultant in determining the appropriate level of measured drawings. A cover sheet may be required that describes the historic significance of the property. ~~based on the National Park Service (NPS) Historic American Building Survey (HABS)/Historic American Engineering Record (HAER) Historical Report Level II Guidelines, and NPS's policy for photographic documentation as outline in the National Register of Historic Places and National Historic Landmarks Survey Photo Policy Expansion.~~
- The written historical data for this documentation shall follow HABS/~~HAER~~HALS standards. Efforts shall be made to locate original construction drawings or plans ~~of the Central Shops~~. If located, these drawings shall be reproduced and included in the dataset. Historical information, as well as copies of building plans gathered from the prior evaluations of the SEP ~~and Central Shops~~, can be reused and reformatted for this effort.
- *HABS/HALS-Like Photographs* – Digital photographs of the interior and the exterior of the individual historic resource or district contributor. Large-format negatives are not required. The scope of the digital photographs shall be reviewed by the department's preservation staff for concurrence, and all digital photography shall be conducted according to current National Park Service standards. The photography shall be undertaken by a qualified professional with demonstrated experience in HABS photography. ~~Digital photography shall be used. The ink and paper combinations for printing photographs shall be in compliance with National Register-National Historic Landmark (NR-NHL) Photo Policy Expansion[22] and have a permanency rating of approximately 115 years. Digital photographs shall be taken as uncompressed, Tagged Image~~

~~File Format (TIFF) files. Each image shall be 1,600 by 1,200 pixels at 330 pixels per inch (ppi) or larger in size, color format, and printed in black and white. The file name for each electronic image shall correspond with the index of photographs and photograph label.~~ Photograph views for the dataset shall include (a) contextual views; (b) views of each side of each building and interior views, where possible; (c) oblique views of buildings; and (d) detail views of character-defining features. All views shall be referenced on a photographic key. This photographic key shall be on a map of the property and shall show the photograph number with an arrow to indicate the direction of the view. Historic photographs shall also be collected, reproduced, and included in the dataset.

The SFPUC shall reach out to the following repositories to determine if they would like copies of the documentation and to assess the documentation format (digital or hard copy) preferred: ~~transmit the datasets as hardcopies on archival paper and in electronic PDF format to the~~ History Room of the San Francisco Public Library, ~~the San Francisco Planning Department,~~ the archives of the San Francisco Public Utilities Commission, and to the Northwest Information Center of the California Historical Information Resource System. ~~The SFPUC shall scope the documentation measures with San Francisco Planning Department Preservation staff.~~ Preservation staff shall also review and approve the submitted documentation for adequacy.

In addition, the SFPUC shall provide a permanent display of interpretive materials (which may include, but are not limited to, a display of photographs, a brochure, educational website, or an exhibitive display) concerning the history and architectural features of the individual historic resource or district contributor~~Central Shops~~. Development of the interpretive materials shall be supervised by an architectural historian or historian who meets the Secretary of the Interior's Professional Qualification Standards. The interpretative materials shall be placed in a prominent, public setting. A proposal describing the general parameters of the interpretive materials shall be approved by Planning Department Preservation staff prior to construction completion. The substance, media, and other elements of such interpretive display shall be approved by Planning Department Preservation staff prior to completion of the project.

Conclusion

Planning department staff finds the change in project scope to include the demolition of Building 850 instead of Building 870 does not affect the conclusion of the previous EIR for the project that found a project level less than significant impact to the Southeast Treatment Plant Streamline Moderne Industrial Historic District, and a significant cumulative impact to the historic district. A mitigation measure that documents and interprets the demolished building would help reduce impacts but the cumulative impact would still be significant, as previously disclosed.

APPENDIX E
TRANSPORTATION DEMAND ESTIMATE AND SUPPORTING DOCUMENTATION

Adavant Consulting

Memorandum

To: Karen Lancelle – Environmental Science Associates

From: José I. Farrán – Adavant Consulting

Date: December 18, 2024 **Revised Final Version**

Re: BDFP, Operations, Engineering and Maintenance Buildings
Travel Demand Analysis Case No.: 2015-000644ENV

This memorandum summarizes the assumptions and methodology used to develop the travel demand for the proposed modifications to the Biosolids Digester Facilities Project (BDFP) Final Environmental Impact Report (FEIR) consisting of construction of the Operations, Engineering and Maintenance building, a Mechanical Maintenance building, and a new utility enclosure at SFPUC's Southeast Plant (i.e. the proposed modifications). The proposed new buildings would be located adjacent to, but outside of, the approved project site for the BDFP project at the Southeast Plant. The BDFP (i.e. the approved project) together with the proposed modifications represents the modified project.

The analysis presented in this document estimates the travel demand (i.e. number of person and vehicle trips) associated with the modified project during both construction and operation of such facilities. The travel demand analysis for the modified project relies on the same methodology and assumptions regarding trip generation rates, mode of travel, average vehicle occupancy factors, etc., previously utilized in the CEQA analysis of the approved project[1], as applicable. The travel demand analysis for the approved project was based on standard methodology and practices used in the evaluation of transportation impacts as part of environmental review in San Francisco, which are described in detail in the *Transportation Impact Analysis Guidelines for Environmental Review* (SF Guidelines),[2] prepared by the San Francisco Planning Department (department).

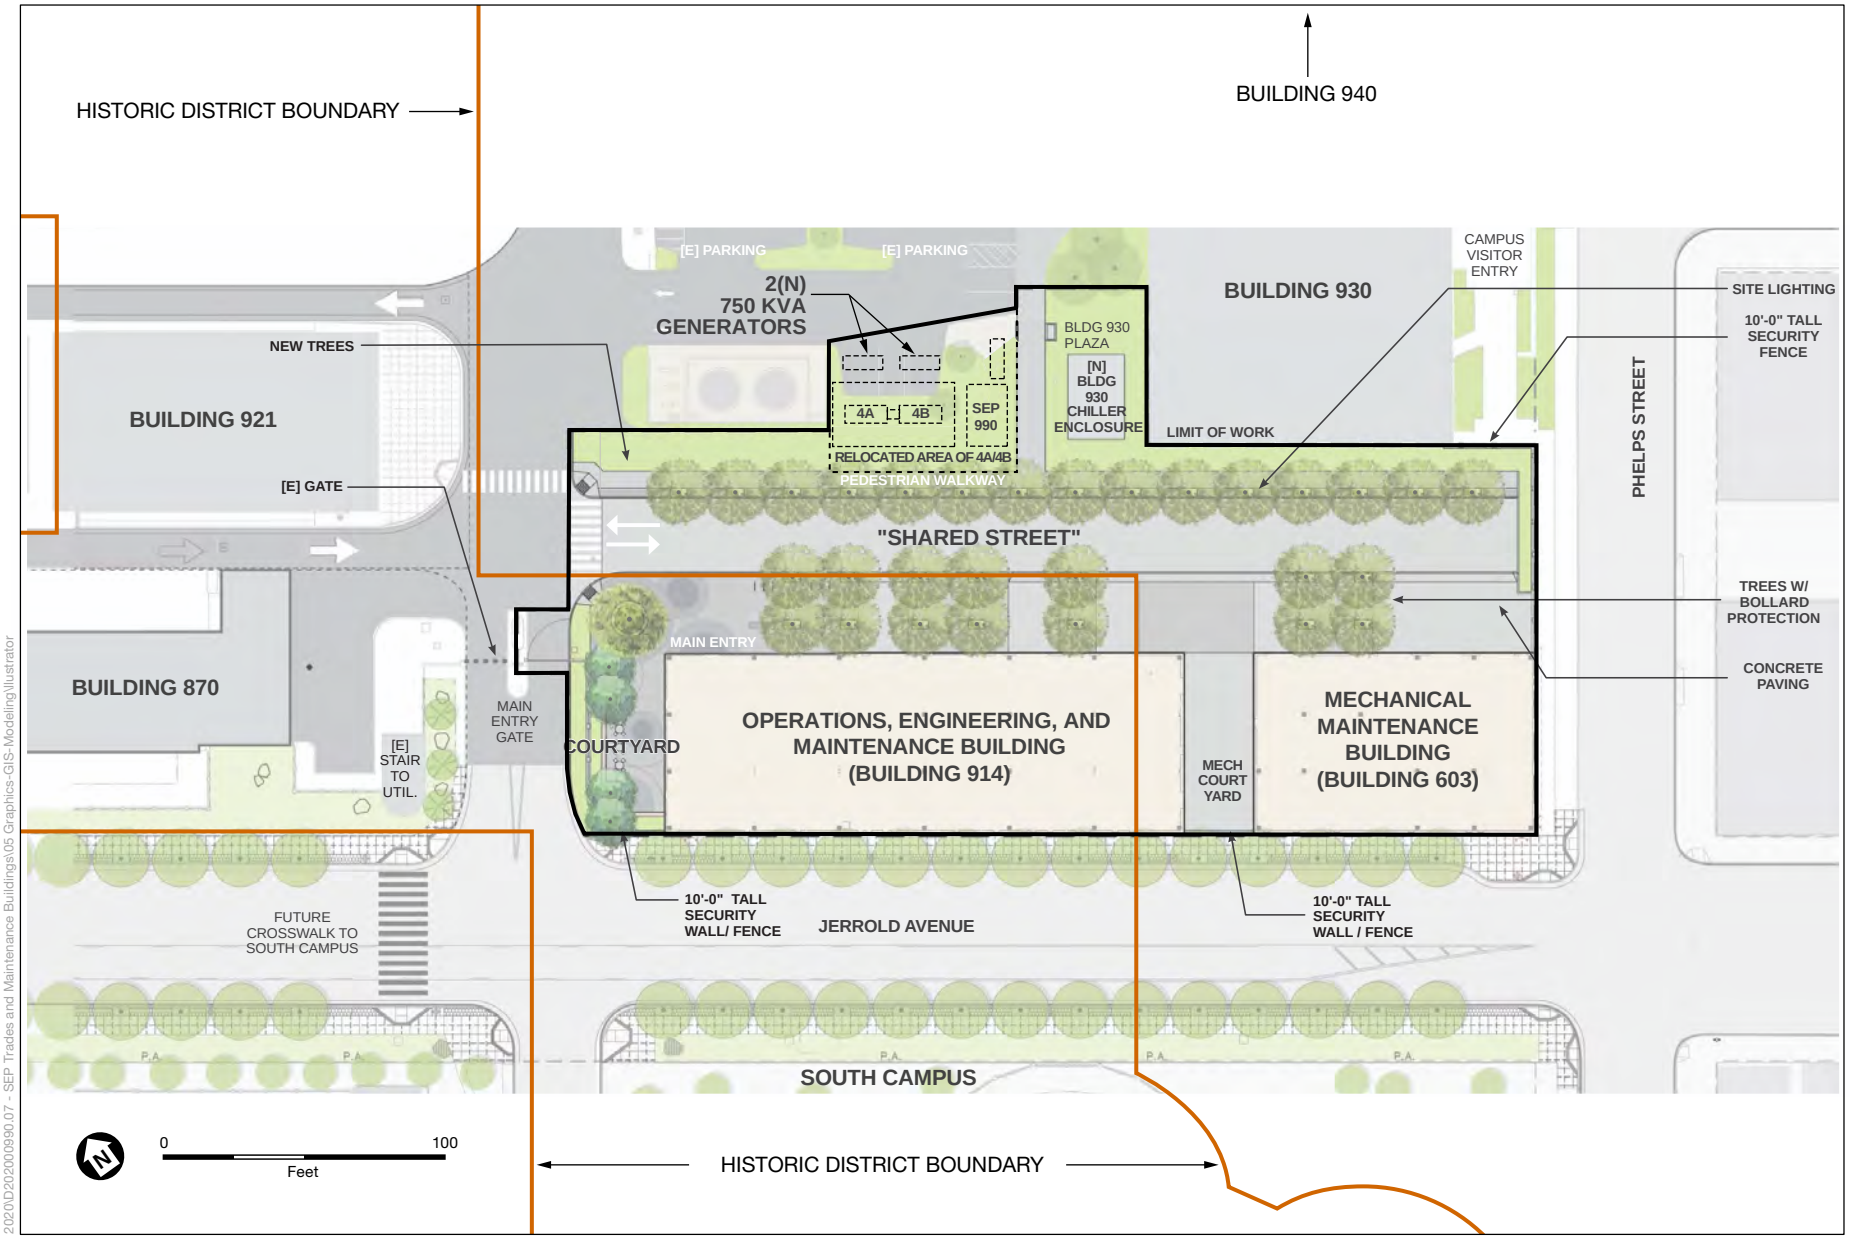
---

1 San Francisco Planning Department, *Biosolids Digester Facilities Project FEIR*. Case Number 2015-000644ENV; Final EIR Certification: March 8, 2018. Referred to in this memorandum as BDFP FEIR.

2 Consistent with the BDFP FEIR, the travel demand analysis relies primarily on the San Francisco Planning Department, *Transportation Impact Analysis Guidelines,* from October 2002, referred in this memorandum as SF Guidelines. The updated San Francisco Planning Department, *Transportation Impact Analysis Guidelines*, published in October 2019 have been consulted.

DESCRIPTION OF THE MODIFIED PROJECT

As described above, the proposed modifications in combination with the approved project define the modified project.



PROPOSED MODIFICATIONS

The proposed modifications to the approved project include: demolition of the existing building SEP 850; removal of the temporary pre-fabricated trailers SEP 850A and SEP 850B and the adjacent surface parking lot; demolition of the existing emergency backup generator, an existing transformer, and related electrical equipment (SEP 990); construction of the Mechanical Maintenance building (SEP 603), the Operations, Engineering, and Maintenance building (SEP 914), and a utility enclosure for a new chiller; and installation of two new boilers located inside building SEP 930 to service both buildings SEP 930 and SEP 940. Two new emergency generators and an associated upgraded transformer and electrical panel (SEP 990) would be constructed and installed for use by proposed buildings SEP 603 and SEP 914. **Figure 1** shows the landscape concept plan.

The proposed approximately 8,400-gross square foot (gsf) Mechanical Maintenance building (SEP 603) would house maintenance bays, tool storage, office space and associated maintenance equipment, while the proposed approximately 35,600-gsf Operations, Engineering, and Maintenance building (SEP 914) would house carpenter, plumbing, and paint shops; offices, conference rooms, and break room; tool and paint storage; showers, lockers, and a wellness room; and records storage. Prior to the start of construction, SFPUC would temporarily relocate the occupants and uses of the SEP 850 building and temporary pre-fabricated trailers (SEP 850A and SEP 850B) to be demolished at the Southeast Plant to 1900 Jerrold Avenue, at the San Francisco Market site. Temporary parking would be arranged for these workers near 1900 Jerrold Avenue, or previously approved staging areas such as 2000 McKinnon Avenue and 1811 Jerrold Avenue, which would not substantially alter employee travel patterns or parking conditions. The workers would return to the Southeast Plant at the end of the construction period.

CONSTRUCTION

In total, approximately 15,270 square feet of existing buildings and structures would be demolished for the proposed modifications, while Building SEP 870 would no longer be demolished as originally proposed in the approved BDFP project. After demolition and site grading, SFPUC would construct the Mechanical Maintenance building (building SEP 603) and the Operations, Engineering, and Maintenance building (building SEP 914). Once building and security fence construction is complete, the internal road and sidewalks would be placed.

SOURCE: Sage Consultion Engineers, Inc., 2024

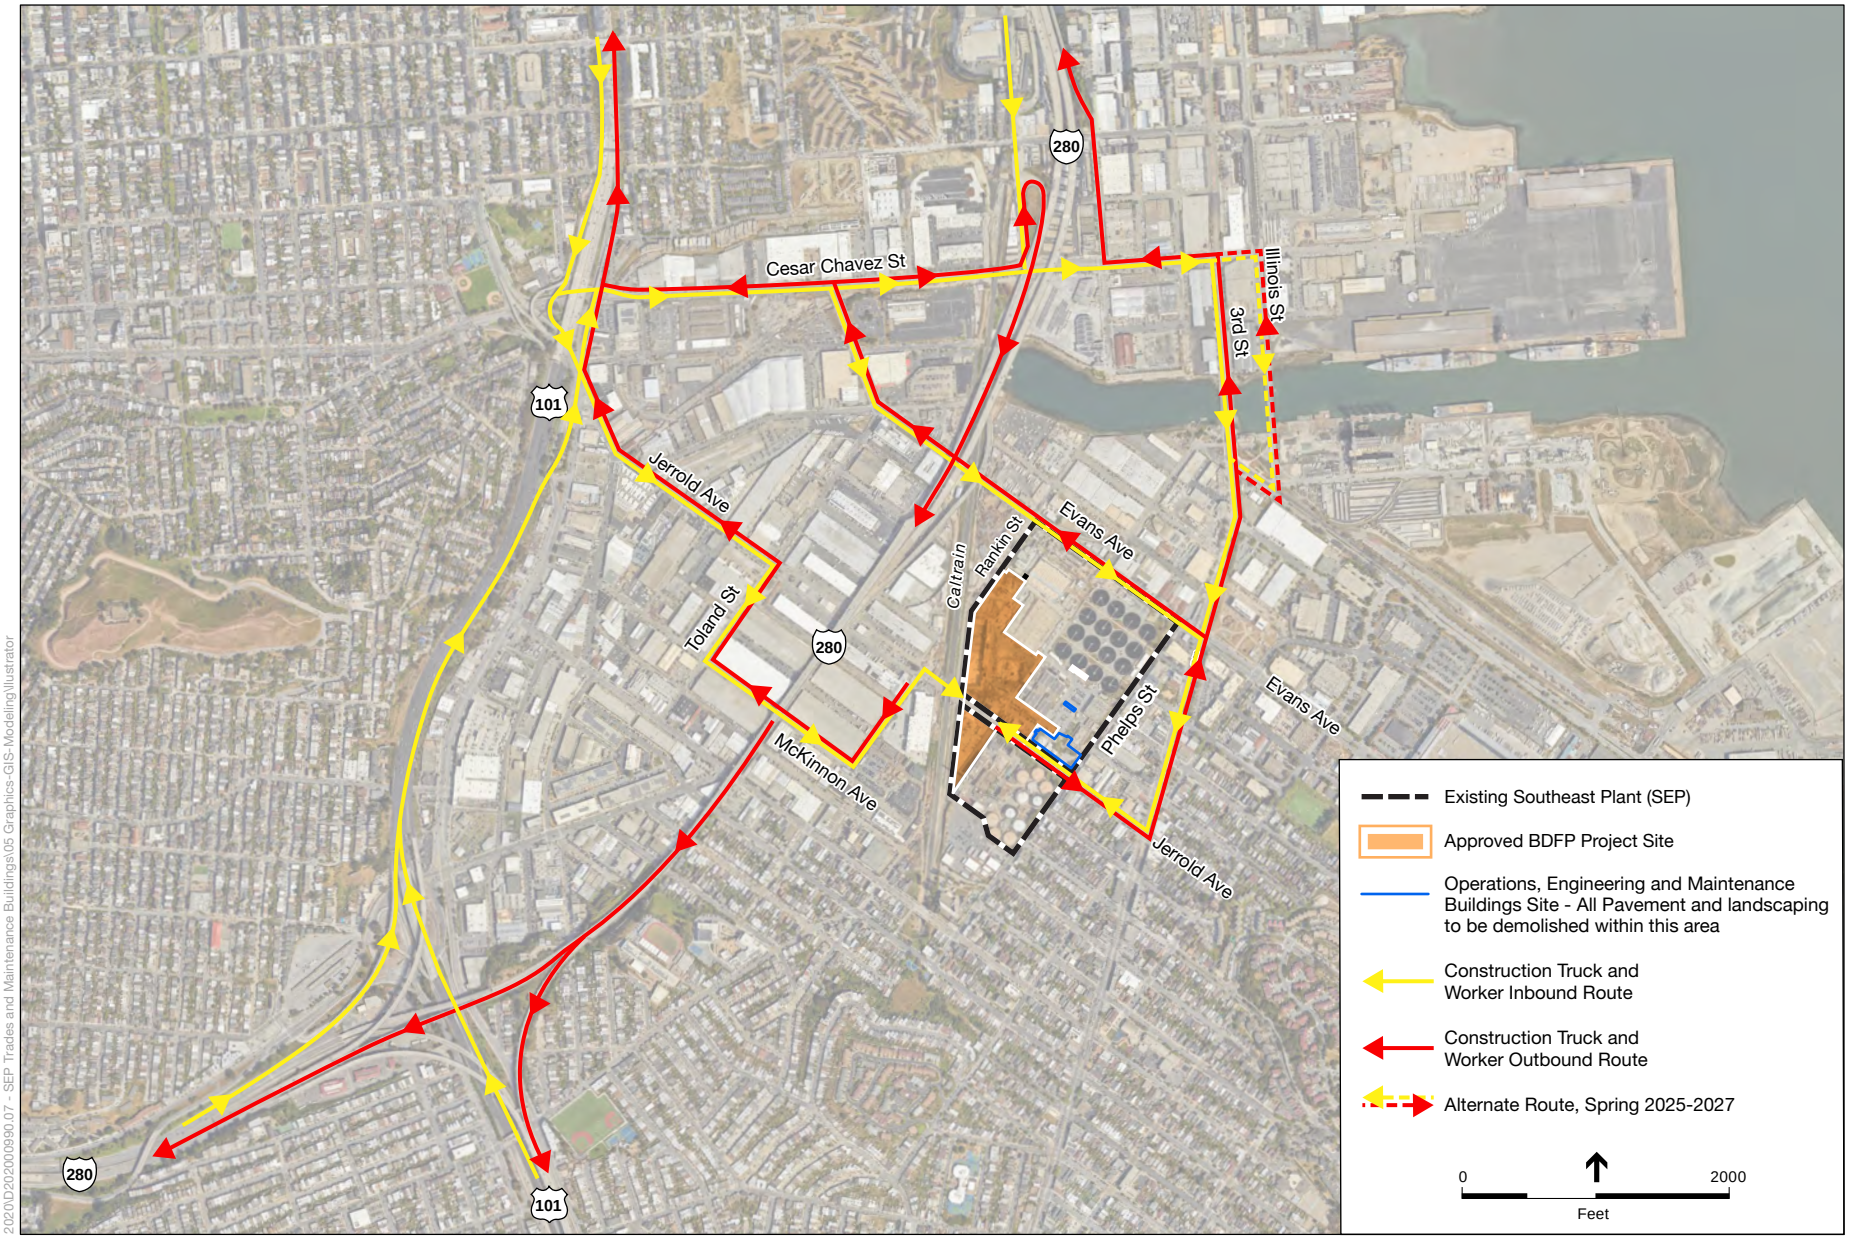
Operations, Engineering, and Maintenance Buildings

Figure 1
Landscape Concept Plan

Construction of the proposed modifications would extend from February 2025 through July 2027 as shown in Table 1 (substantial completion would occur from July through September 2027), which represents a 30-month construction period. The first two years of construction would overlap with other approved project construction activities, while the remainder represents a six-month extension of the current project construction schedule (in addendum 1 to the BDFP FEIR, for the biogas utilization system, the construction schedule for the project was extended one year to December 2026, which has since been extended through January 2027; the modified project reviewed in addendum 2 would extend that construction schedule to July 2027).

Table 1
Proposed Modifications: Construction Schedule

Construction Phase	Start Date	End Date	Duration (months)
Demolition	2/14/25	6/19/25	4
Grading and Utility Installation	6/20/25	11/24/25	5
Deep Foundations Construction	11/3/25	3/2/26	4
Erection – Superstructure, enclosure, framing, building systems, walls	12/1/25	11/20/26	12
Architectural Finishes	9/1/26	6/3/27	9
Site Work	12/22/26	7/2/27	6



Source: Environmental Science Associates – 2024.

Most of the construction activities at the site would occur Monday through Friday from 7:00 a.m. to 4:30 p.m., the same days and time period as in the approved BDFP FEIR. Prior changes to the approved project extended the end date for construction staging as well as the length of the street closure along Jerrold Avenue to Phelps Street. The proposed modifications would further extend the construction schedule, including the closure of Jerrold Avenue, and add temporary construction worker vehicle parking, in an area large enough for approximately 90 construction worker vehicle parking spaces, at 2 Rankin Street.

Construction trucks and worker vehicles would use the routes shown on Figure 2 to access the site, instead of the routes shown in BDFP FEIR Figure 2-15, as approved in a prior minor project modification (MPM) number 7. Interim truck delivery and off-haul rates for ongoing operations at the Southeast Plant would be the same as shown in BDFP FEIR Figure 2-16.

OPERATIONS

The proposed modifications would not result in changes to the overall treatment capacity of the Southeast Plant. The SFPUC does not propose to increase the existing operations staff levels (about 280 people for the entire Southeast Plant) as part of the proposed modifications. The proposed modifications would not alter the operational employee vehicular travel, on-site employee or vehicle parking, or operational truck routes described in the BDFP FEIR.

Operations, Engineering, and Maintenance Buildings

Figure 2
New Truck Haul Routes

APPROVED PROJECT: BIOGAS UTILIZATION SYSTEM

The approved project includes construction and operation of a biogas utilization system (instead of the originally proposed energy recovery facilities) and other related changes to operational energy demand and supply, that were evaluated in addendum 1 to the BDFP FEIR. The biogas utilization system represents the most substantial construction activity that would overlap with the construction of the proposed modifications, from February 2025 through July 2027 (see **Table 1**).

The biogas utilization system would convert the digester gas generated at the Southeast Plant into renewable natural gas that would become part of the greater energy market. The biogas utilization system, consisting of two new sets of structures, would be built within the project area on either side of Jerrold Avenue between Quint Street and the Caltrain tracks. The Biogas Upgrade Facility south of Jerrold Avenue would include a thermal oxidizer comprised of piping, tanks, and storage container-type structures approximately 15 to 45 feet tall. The PG&E Interconnection Station and Deoxygenation System north of Jerrold Avenue would include above-ground valves and piping.

According to the current project schedule provided by the SFPUC, construction of the biogas utilization system would take almost two years to construct, from April 2025 through January 2027, and require up to approximately 20 workers at any one time.

TRAVEL DEMAND DURING CONSTRUCTION

The travel demand forecasts for the modified project during construction are based on the same methodology and information presented in the previous CEQA analysis of the BDFP, as well as data gathered from the SF Guidelines, as appropriate. Similar to the BDFP FEIR, the travel demand analysis focuses on the construction scenario for the modified project, given that, as previously described, once the modified project becomes operational, the Southeast Plant would have the same number of operational staff and truck demand as was previously analyzed in prior CEQA documents for the approved project.

For the analysis of the construction scenario for the modified project (i.e. the proposed modifications and the biogas utilization system), the same truck trip generation rates, hourly truck travel, and truck origins and destinations developed for the transportation evaluation in the BDFP FEIR were also applied to this analysis. Similarly, other assumptions used in the travel demand analysis related to construction workers, such as mode of travel, a.m. and p.m. peak hour trip generation rates, and average vehicle occupancy rates were also derived from transportation information presented in the BDFP FEIR.

The travel demand model developed for the analysis of the modified project includes four sequential steps (trip generation, mode of travel, trip distribution, and trips assignment). The results of implementing the model are presented in the following tables, which separately identify each project component. Travel demand during construction of the modified project was estimated for weekday daily, as well as the a.m. and p.m. peak hour conditions, and includes travel by construction workers and construction trucks associated

with the proposed modifications. The detailed travel demand calculations for the modified project are presented in Appendix A.

PROPOSED MODIFICATIONS

TRIP GENERATION

Table 2 summarizes the expected construction-related trip generation (workers and trucks) to and from the project site for the proposed modifications during each of the six construction phases.

As shown in Table 2, the maximum number of daily construction workers (60) present at the site would occur during the Erection and the Architectural Finishes phases. On the other hand, the highest number of daily construction-related truck traffic (17 daily trucks) would occur during the Grading and Utility Installation phase, followed by the Demolition and Architectural Finishes phases (seven daily trucks each).

Table 2
Proposed Modifications: Construction Daily Demand by Phase

Construction Phase	Number of Construction Workers	Number of Trucks [a]				
		Off-haul	Fill	Material Deliveries	Other Trucks [b]	Total
Demolition	20	2	0	0	5	7
Grading and Utility Installation	20	4	1	1	11	17
Deep Foundations Construction	40	0	0	1	4	5
Erection – Superstructure, enclosure, framing, building systems, walls	60	0	0	3	3	6
Architectural Finishes	60	0	0	4	3	7
Site Work	30	0	2	3	1	6

Notes:
a. The number of trucks shown in the table represent the number of heavy vehicles accessing the project site on a typical day, and it is equivalent to the number of daily round trips by truck. One-way truck trips are twice the values shown in the table.
b. Water trucks, tool trucks, delivery trucks, boom lift.

Source: Environmental Science Associates – 2024.

Based on the trip generation methodology presented in the BDFP FEIR, the daily trip generation rate for construction workers is two daily person trips per worker, one inbound to the site in the morning, plus one outbound from the site in the afternoon. This assumes that construction workers would either bring their own lunch to the site or travel (generally walk) a short distance to nearby food trucks or a lunch place.

Similarly, the daily trip generation rate for construction trucks is two vehicle trips per truck, one inbound trip to drop off (loaded truck) or pick up (empty truck) materials at the

site, plus a reverse trip leaving the site. Consistent with the BDFP FEIR, the analysis assumes an 8-hour workday for all truck operations.

Table 3 summarizes the weekday daily as well as the a.m. and p.m. peak hours construction worker person trips and construction truck vehicle trips for the proposed modifications for each of the six construction phases. The highest number of person trips would occur during the Erection and Architectural Finishes construction phases (120 daily one-way person trips and 60 one-way person trips during the peak hour), while the highest construction truck demand would occur during the Grading and Utility Installation phase (34 daily one-way truck trips and 5 one-way truck trips during the peak hour).

Table 3
Proposed Modifications: Construction Worker Daily and Hourly Demand by Phase

Construction Phase	Construction Workers One-way Person-trips		Total Construction Truck One-way Vehicle-trips	
	Daily	AM/PM Peak Hour [a]	Daily	AM/PM Peak Hour [b]
Demolition	40	20	14	2
Grading and Utility Installation	40	20	34	5
Deep Foundations Construction	80	40	10	2
Erection – Superstructure, enclosure, framing, building systems, walls	120	60	12	2
Architectural Finishes	120	60	14	2
Site Work	60	30	12	2

Notes:
a. Assumes construction worker trips are all inbound in the a.m. peak hour and all outbound in the p.m. peak hour (same as in BDFP FEIR)
b. Assumes an 8-hour day for truck operations (same as in BDFP FEIR); conservatively, values have been rounded up to the nearest integer. Half of the truck trips are inbound and half are outbound to/from the project site.

Source: Adavant Consulting – 2024.

MODE OF TRAVEL

Mode split or travel mode refer to the estimated way or method people travel (e.g., walking, bicycling, etc.). The daily and hourly construction worker person trips estimated in the previous step were allocated to ways of travel to determine the number of trips by auto, transit, walking and bicycling.

The same travel characteristics presented in the BDFP FEIR for construction workers were used to establish the mode split for the proposed modifications, which assumed that most (80 percent) of the construction workers travel would be by auto, with a small portion (20 percent) traveling by public transit. Table 4 presents the estimated number of daily, and a.m./p.m. peak hour person trips for construction workers by mode of travel and construction phase; more detailed calculations are presented in Appendix A.

Table 4
Proposed Modifications: Construction Worker Daily and Hourly Person-trip Demand by Mode of Travel and Phase

Construction Phase	Number of Construction Worker One-way Person Trips by Mode of Travel					
	Daily			AM/PM Peak Hour [a]		
	Auto	Transit	Total	Auto	Transit	Total
Demolition	32	8	40	16	4	20
Grading and Utility Installation	32	8	40	16	4	20
Deep Foundations Construction	64	16	80	32	8	40
Erection – Superstructure, enclosure, framing, building systems, walls	96	24	120	48	12	60
Architectural Finishes	96	24	120	48	12	60
Site Work	48	12	60	24	6	30

Note:
a. Assumes construction worker trips are all inbound in the a.m. peak hour and all outbound in the p.m. peak hour (same as in BDFP FEIR)

Source: Adavant Consulting – 2024.

Table 5 summarizes the estimated number of daily and peak hour one-way vehicle trips generated by construction workers during each phase. These were estimated by dividing the number of person trips made by auto mode as shown in Table 4, by an average vehicle occupancy of 1.28 persons per vehicle,[3] to account for some carpooling, in accordance with the data presented in the BDFP FEIR. The table also includes the total number of daily and peak hour one-way construction truck trips, based on the data previously presented in Table 3. As shown in Table 5, the highest combined number of daily and peak hour one-way vehicle trips generated by the proposed modifications (90 and 40, respectively) correspond to the Architectural Finishes construction phase, followed by the Erection phase (88 daily one-way vehicle trips and 40 one-way vehicle trips during the peak hour).

As previously indicated in Table 1, construction activities for the Erection phase and the Architectural phase would overlap during a three-month period, between September and November 2026, which would result in the highest travel demand values during the entire construction. Therefore, the overlap of these two construction phases will be used in the transportation impact analysis to represent the travel demand of the proposed modifications.

[3] The estimated number of passengers per vehicle is dependent on the place of origin or destination of the construction worker trip, resulting in an average vehicle occupancy of 1.28 persons per vehicle; more detailed calculations are presented in Appendix A.

As shown in Table 5, the number of vehicles generated by the construction workers during all analysis periods in most cases represents the vast majority (80 to 95 percent) of all the vehicle trips generated by the proposed modifications.

Table 5
Proposed Modifications: Construction Daily and Hourly Vehicle Demand by Phase

Construction Phase	Number of One-way Vehicle Trips					
	Daily			AM/PM Peak Hour		
	Workers [a]	Trucks	Total	Workers [b]	Trucks [c]	Total
Demolition	26	14	40	13	2	15
Grading and Utility Installation	26	34	60	13	5	18
Deep Foundations Construction	50	10	60	25	2	27
Erection – Superstructure, enclosure, framing, building systems, walls [d]	**76**	**12**	**88**	**38**	**2**	**40**
Architectural Finishes [d]	**76**	**14**	**90**	**38**	**2**	**40**
Site Work	38	12	50	19	2	21

Notes:

a. The number of daily worker trips is rounded up to the next even value, given that each worker performs an even number of one-way vehicle trips (one to the site and another from the site).
b. Assumes construction worker trips are all inbound in the a.m. peak hour and all outbound in the p.m. peak hour (same as in BDFP FEIR)
c. Assumes an 8-hour day for truck operations (same as in BDFP FEIR). Half of the truck trips are inbound and half are outbound to/from the project site.
d. The combination of the Erection construction phase and the Architectural Finishes construction phase, shown in **bold**, which would overlap between September and November 2026, represent the highest combined number of daily and peak hour vehicle trips and will be used to assess the potential transportation and circulation impact analyses of the proposed modifications.

Source: Adavant Consulting – 2024.

Table 6, presents the number of inbound and outbound daily one-way vehicle trips generated by the proposed modifications, as well as the in and out split during the a.m. and p.m. peak hours during the three-month period of overlap of the Erection construction phase with the Architectural Finishes construction phase.

Table 6
Proposed Modifications
Overlap of Erection Construction Phase with Architectural Finishes Construction Phase
(September through November 2026)
Daily and Hourly Inbound and Outbound Vehicle Demand [a]

Vehicle Type	Number of One-way Vehicle Trips								
	Daily			AM Peak Hour			PM Peak Hour		
	In	Out	Total	In	Out	Total	In	Out	Total
Workers [b]	76	76	152	76	0	76	0	76	76
Trucks [c]	13	13	26	2	2	4	2	2	4
All Vehicles	89	89	178	78	2	80	2	78	80

Notes:
a. Includes construction worker vehicle and truck trips.
b. Assumes construction worker trips are all inbound in the a.m. peak hour and all outbound in the p.m. peak hour (same as in BDFP FEIR).
c. Half of the truck trips are inbound and half are outbound to/from the project site.

Source: Adavant Consulting – 2024.

TRIP DISTRIBUTION

Trip distribution refers to whether the trip is destined towards (inbound) or away from (outbound) the project site, and to either an origin for inbound trips or destination for outbound trips (e.g., another neighborhood) of the trip relative to the project site. Thus, the person and vehicle trips estimated in the previous step for each land use were distributed to various points of trip origin or destination, and inbound versus outbound directionality. The trip origins and destinations were allocated to the four San Francisco quadrants and the East Bay, North Bay, and South Bay areas.

Data from the BDFP FEIR for construction workers were used to establish the split between inbound and outbound direction, and the origins and destinations. **Table 7** summarizes the inbound and outbound construction vehicle trips for the a.m. and p.m. peak hour for the three-month period of overlap of the Erection construction phase with the Architectural Finishes construction phase by place of origin or destination; the assumed origin/destination percentage information is presented in **Appendix A**.

Table 7

TRIP ASSIGNMENT

The inbound and outbound vehicle trips generated by the proposed modifications and presented in **Table 7** were used as a basis for assigning trips to the transportation network during the a.m. and p.m. peak hours. The construction worker vehicle trips were assigned to the local streets near the project site in a similar manner to those analyzed in the BDFP FEIR, which took into account the most direct routes, the number of travel lanes on the various streets, and typical travel patterns in the area. The truck trips were assigned to the street network in accordance to the routes presented in **Figure 2**.

The results of the trip assignment process for the vehicle trips generated by the proposed modifications during the a.m. and p.m. peak hour are summarized in **Table 8** for key street segments within the study area; they are the same segments as those evaluated in the BDFP FEIR. As shown in the table, most of the vehicle trips generated by the proposed modifications, which corresponds to construction workers, would utilize Rankin Street to access the proposed worker vehicle parking to be located at 2 Rankin Street. Construction trucks would utilize Jerrold Avenue, and then continue onto Third Street to access the I-280 freeway, or vice versa.

Table 8
Proposed Modifications – Overlap of Erection Construction Phase
with Architectural Finishes Construction Phase
AM and PM Peak Hour Vehicle Trip Assignment

APPROVED PROJECT: BIOGAS UTILIZATION SYSTEM

As described above (**Table 5**), the highest level of construction-related travel demand for the proposed modifications would occur between September and November 2026, when construction activities for the Erection phase and the Architectural phase would overlap. Remaining construction on the approved project during fall 2026 would be limited to work on the biogas utilization system, requiring up to approximately 20 workers and two daily trucks[4] at any one time.

Assumptions used to estimate construction-related travel demand of the biogas utilization system analysis related to workers and trucks are consistent with those shown above for the proposed modifications, as well as transportation information presented in the BDFP FEIR.

TRIP GENERATION AND MODE OF TRAVEL

Table 9 summarizes the expected construction-related daily and peak hour person-trip generation (workers and trucks) to and from the project site during construction of the biogas utilization system, while **Table 10** presents the estimated number of daily, and

[4] The number of daily construction trucks associated with the biogas utilization system has been estimated based on an average ratio of 15 workers per truck, obtained from worker and truck data presented in the BDFP FEIR.

a.m./p.m. peak hour person trips for construction workers by mode of travel and construction phase; more detailed calculations are presented in Appendix B.

Table 9
Biogas Utilization System – Construction Daily and Peak Hour Person-trip Demand

Construction Phase	Construction Workers	Trucks [a]
Daily		
Number of workers/trucks	20	2
Person-trips	40	--
AM/PM Peak Hour [b]		
Person-trips	20	--

Notes:
a. The number of daily construction trucks associated with the biogas utilization system has been estimated based on an average ratio of 15 workers per truck, obtained from worker and truck data presented in the BDFP FEIR; it represents the number of daily round trips to the project site by truck.
b. Assumes construction worker trips are all inbound in the a.m. peak hour and all outbound in the p.m. peak hour (same as in BDFP FEIR).

Table 11 summarizes the estimated number of daily and peak hour one-way vehicle trips generated by the biogas utilization system during construction, using the same methodology previously presented in this document for the proposed modifications. The estimated number of passengers per vehicle is dependent on the place of origin or destination of the construction worker trip, resulting in an average vehicle occupancy of 1.28 persons per vehicle; more detailed calculations are presented in Appendix A.

TRIP ASSIGNMENT

The results of the trip assignment process for the vehicle trips generated by the biogas utilization system during the a.m. and p.m. peak hour are summarized in **Table 13** for the key street segments within the study area; they are the same segments as those that have been presented in **Table 8** for the proposed modifications, and previously evaluated for the approved project in the BDFP FEIR. As shown in the table, most of the construction traffic generated by the biogas utilization project would operate on Oakdale Avenue.

COMPLIANCE CHECKLIST TABLE FOR GREENHOUSE GAS ANALYSIS: TABLE 2. MUNICIPAL PROJECTS

A. GENERAL PROJECT INFORMATION:

Date:	Case No.:
November 26, 2024	2015-000644ENV-02
Project Name:	
Biosolids Digester Facilities Project - Operations, Engineering and Maintenance Buildings	
Project Address:	**Block/Lot:**
750 Phelps Street	5262/009
Standard to be met (Select one)[1]:	**Date of site permit submittal (if applicable):**
Not Applicable	
Compliance Checklist Prepared By:	**Date:**
Kelly Yong	**November 26, 2024**
Brief Project Description:	

On March 13, 2018, the San Francisco Public Utilities Commission (SFPUC) approved construction of new solids treatment, odor control, energy recovery, and associated facilities as part of improvements to the wastewater treatment facilities at the existing Southeast Water Pollution Control Plant (SEP) in San Francisco. The approved project includes the construction and operation of a new solids treatment process, odor control, energy recovery, and associated facilities to replace outdated existing facilities with more reliable, efficient, and modern technologies. As part of the planning process, the SFPUC completed a compliance checklist for greenhouse gas analysis for the project.

Since completing the compliance checklist, the SFPUC has proposed multiple minor changes to the approved project. The San Francisco Planning Department's Environmental Planning Division determined these were minor project modifications that would clearly not alter the FEIR conclusions, including related to greenhouse gas emissions, and documented the changes with memoranda to the case file.

At the time the previous compliance checklist was completed, the project included biogas recovery facilities that would generate sufficient levels of electricity to ultimately power all BDFP process facilities. Since completion of the previous compliance checklist, the SFPUC has proposed a biogas utilization system instead of the originally proposed energy recovery facilities and related changes to operational energy demand and supply. The biogas utilization system would allow SFPUC to provide renewable natural gas to PG&E through a new interconnection station and deoxygenation system.

The SFPUC proposes constructing two new buildings, an Operations, Engineering, and Maintenance building and a Mechanical

1 Refers to the standard to be met per the San Francisco Green Building Code. See http://sfdbi.org/administrative-bulletins for latest "AB-093" to determine which standard your project is required to meet, if applicable.

Maintenance building, replacing the current function of building SEP 850 and temporary prefabricated trailers. These proposed buildings would total approximately 44,000 square feet and are expected to be constructed from 2025 through 2027.

Overall project construction began in January 2020 and was expected to take approximately five years. However, construction is now estimated to take 1.5 years longer than anticipated, independent of the project revisions. Construction of the modified project, including the new buildings, will extend through 2027. As with the approved project, the modified project would not result in changes to the overall treatment capacity of the Southeast Plant. The SFPUC does not propose to increase the existing operations staff levels (about 280 people for the entire Southeast Plant) as part of the modified project.

B. COMPLIANCE CHECKLIST TABLE

Instructions: Complete the following table by determining project compliance with the identified adopted regulations and providing project-level details in the "Remarks" column which explains the selection. Projects that do not comply with an ordinance/regulation may be determined to be inconsistent with San Francisco's qualified GHG reduction strategy, although compliance with most ordinance/regulations is not optional. (See next page)

Table 2. Regulations Applicable to Municipal Projects

REGULATION	REQUIREMENT	PROJECT COMPLIANCE	SPECIFY HOW PROJECT WOULD COMPLY/NOT COMPLY OR WHY REGULATION NOT APPLICABLE
TRANSPORTATION SECTOR			
Commuter Benefits Ordinance (San Francisco Environment Code, section 427)	City employees are eligible for pre-tax commuter benefits for transit and vanpool expenses.	☒ Project Complies ☐ Not Applicable ☐ Project Does Not Comply	All City employees, including San Francisco Public Utilities Commission (SFPUC) staff, are provided commuter benefits in accordance with Environment Code Section 427.
Healthy Air and Clean Transportation Ordinance – Implementing Transit First (San Francisco Environment Code, section 403(a))	Requires all City officers, boards, commissions and department heads responsible for departments that require transportation to fulfill their official duties to reduce the municipal fleet by implementing transit-first policies by: • Maximizing the use of public transit, including taxis, vanpools, and car-sharing; • Facilitating travel by bicycle, or on foot; and, • Minimizing the use of single-occupancy motor vehicles, for travel required in the performance of public duties.	☒ Project Complies ☐ Not Applicable ☐ Project Does Not Comply	SFPUC provides to employees commuter checks, bicycle parking, carpooling and/or transit opportunities to in City off-site events to encourage transit-first policies.
Healthy Air and Clean Transportation Ordinance – Optimizing Fleet Management (San Francisco Environment Code, section 403(b))	Requires the reduction of the number of passenger vehicles and light-duty trucks in the municipal fleet. In addition, requires new purchases or leases of passenger vehicles and light-duty trucks to be the cleanest and most efficient vehicles available on the market.	☒ Project Complies ☐ Not Applicable ☐ Project Does Not Comply	Existing SFPUC fleet vehicles may be utilized for operation and maintenance activities by SFPUC staff at existing and proposed facilities.

REGULATION	REQUIREMENT	PROJECT COMPLIANCE	SPECIFY HOW PROJECT WOULD COMPLY/NOT COMPLY OR WHY REGULATION NOT APPLICABLE
Clean Construction Ordinance (San Francisco Environment Code, sections 2504-2506)	For all work performed on a major construction project located in an air pollutant exposure zone, equipment is subject to emission and idling standards. Before beginning on-site construction activities, the contractor must submit a construction emissions minimization plan to the head of the department funding the project for review and approval. After the start of construction activities, the contractor shall maintain quarterly reports at the construction site documenting compliance with the plan. For projects located outside the Air Pollutant Exposure Zone, all contracts for large City projects (longer than 20 days) are required to: • Fuel diesel vehicles with B20 biodiesel, and • Use construction equipment that meet U.S. EPA Tier 2 standards or best available control technologies for equipment over 25 horsepower.	☒ Project Complies ☐ Not Applicable ☐ Project Does Not Comply	All SFPUC contracts issued for construction of the BDFP (including the operations, engineering and maintenance buildings) will incorporate the relevant requirements into the contract specifications since project components are located within an Air Pollutant Exposure Zone, which are as follows: • Use construction equipment that meets USEPA Tier 2 standards or higher and retrofitted with the most effective Verified Diesel Emission Control Strategies (VDECS, Level 3 is currently available); • Use alternative sources of power where available and prohibit use of portable diesel engines; • Limit idling of diesel engines to two minutes, except as allowed for in applicable state regulations; and • Maintain and tune construction equipment in accordance with manufacturer specifications.
Bicycle parking, showers, and lockers for city-owned and leased properties (San Francisco Planning Code, sections 155.1-155.4 and CalGreen, section 5.106.4)	Requires bicycle facilities for City-owned and leased properties. Refer to sections 155.2 and 155.3 for requirements by use. Requires bicycle facilities for new and expanded buildings, new dwelling units, change of occupancy, increase of use intensity, and added parking capacity/area. For projects that add 10 or more tenant vehicular spaces, provide short-term and long-term bicycle parking for 5 percent of total motorized parking capacity each, or meet San Francisco Planning Code section 155, whichever is greater. May meet LEED SS 4.2.	☒ Project Complies ☐ Not Applicable ☐ Project Does Not Comply	Bicycle parking will be provided at the SEP site for use by SEP employees. The number of proposed bicycle parking spaces will be determined later in the design phase, but would be equal to at least five percent of the number of new parking spaces provided at the SEP, in accordance with section 155.2 of the San Francisco Planning Code.

REGULATION	REQUIREMENT	PROJECT COMPLIANCE	SPECIFY HOW PROJECT WOULD COMPLY/NOT COMPLY OR WHY REGULATION NOT APPLICABLE
Tenant Bicycle Parking in Existing Commercial Buildings Ordinance (San Francisco Environment Code, section 402)	The San Francisco Tenant Bicycle Parking in Existing Commercial Buildings Ordinance requires commercial property owners to: • Allow tenants to bring their bicycles to their leased space, or • Provide secure bicycle parking on-site, or • Provide no-cost off-site bike parking access for tenants within 750 feet of the building.	☐ Project Complies ☒ Not Applicable ☐ Project Does Not Comply	The project does not propose new commercial buildings. Therefore, the requirements of San Francisco Environment Code Section 402 are not applicable to the project.
Transportation Management Programs (San Francisco Planning Code, section 163)	Requires new buildings or additions over a specified size (buildings >25,000 sf or 100,000 sf depending on the use and zoning district) within certain zoning districts to implement a Transportation Management Program and provide on- site transportation management brokerage services for the life of the building.	☐ Project Complies ☒ Not Applicable ☐ Project Does Not Comply	The project will not add any new residential or office buildings over 25,000 sf within the applicable zoning districts. Therefore, the requirements of San Francisco Planning Code Section 163 are not applicable to the project.
ENERGY EFFICIENCY SECTOR			
Green Building Rating Systems (San Francisco Environment Code, chapter 7, section 704(a)(1)(A))	**Projects of 10,000 gross square feet or more** shall be certified as LEED Gold® and meet additional requirements, as specified in section 704(a)(1)(A), during the conceptual design phase, schematic design phase, all design phases and project closeout.	☒ Project Complies ☐ Not Applicable ☐ Project Does Not Comply	The modified project includes approximately 44,000 square feet of new buildings, which include the proposed Operations, Engineering, and Maintenance and Mechanical Maintenance buildings. The Operations, Engineering, and Maintenance building and Mechanical Maintenance building would be certified LEED Gold consistent with this requirement.
Green Building Rating Systems (San Francisco Environment Code, chapter 7, section 704(a)(1)(B))	**Small Projects** do not require LEED certification and LEED credit documentation is not necessary. Instead, the sponsoring City Department, in consultation with a LEED AP With Specialty, shall prepare and submit to the Department a LEED Scorecard for informational and reporting purposes as follows: • At the conclusion of the conceptual design phase, indicating the maximum LEED credits that are practicable for the project, the sponsoring City Department shall integrate the environmental attributes of these LEED credits throughout the design and construction process.	☐ Project Complies ☒ Not Applicable ☐ Project Does Not Comply	The project is not considered a “small project”. Therefore, the requirements of San Francisco Environment Code Chapter 7 Section 704(a)(1)(B) are not applicable to the project.

REGULATION	REQUIREMENT	PROJECT COMPLIANCE	SPECIFY HOW PROJECT WOULD COMPLY/NOT COMPLY OR WHY REGULATION NOT APPLICABLE
	• Upon receiving a temporary certificate of occupancy or similar indication that the project is substantively complete, indicating all LEED credits that have been or would likely be achieved.		
Energy Optimization (San Francisco Environment Code, chapter 7, section 704(b)(1))	Each Municipal Construction Project is subject to compliance with the following locally required measures: • **Electric Service To City Departments And Facilities** (Administrative Code Section 99.3). • **Better Roofs** (San Francisco Green Building Code Chapter 5, Section 5.201.1.2).	☒ Project Complies ☐ Not Applicable ☐ Project Does Not Comply	The project will meet these requirements, as applicable.
Energy Optimization (San Francisco Environment Code, chapter 7, section 704(b)(2))	**Commissioning.** For each Municipal Construction Project subject to a LEED certification requirement, the LEED Project Administrator shall submit documentation to the Department of Environment verifying that the project achieves the LEED credit Enhanced Commissioning Option 1, Path 2: Enhanced and monitoring-based commissioning.	☒ Project Complies ☐ Not Applicable ☐ Project Does Not Comply	The project will meet these requirements, as applicable.
Energy Optimization (San Francisco Environment Code, chapter 7, section 704(b)(3))	**All-Electric Building.** Each New Construction or Major Renovation that includes HVAC system replacement shall be All-Electric, except as follows: • Natural Gas or propane service and plumbing may be installed if necessary for processes or features separate from the operation of systems integral to Building functions, such as vehicle fueling and mechanic shop equipment. • Existing equipment that uses Natural Gas and serves the project area, but is outside the scope of the project, may be retained. Projects which both (i) are served by existing equipment that use Natural Gas and are outside the scope of work, and (ii) include upgrade to electric service in the project scope of work, are encouraged to include sufficient electrical service capacity to, in the future, replace existing systems that use Natural Gas with All-Electric systems.	☒ Project Complies ☐ Not Applicable ☐ Project Does Not Comply	The project would use R-410A in the variable refrigerant volume system for the HVAC units in project process treatment facilities. SEP 914 and SEP 603 would be served by an upgraded electrical transformer, three new electric boilers and an electric chiller. SEP 930 and 940, existing buildings which are served by gas boilers and chiller, would be served by two smaller, more efficient gas boilers. The modified project includes replacement of the existing 500 kilo volt amperes (kVA) emergency backup generator with two new 750 kVA generators. The two new generators would be fossil fuel powered but have Tier 3 control technology.

REGULATION	REQUIREMENT	PROJECT COMPLIANCE	SPECIFY HOW PROJECT WOULD COMPLY/NOT COMPLY OR WHY REGULATION NOT APPLICABLE
	• Emergency backup electricity generation systems may use any combination of technologies permitted under applicable law, including combustion of fossil fuels. Zero-emissions emergency backup electricity systems are encouraged, such as onsite batteries that store electricity from onsite solar photovoltaics.		
Energy Optimization (San Francisco Environment Code, chapter 7, section 704(b)(4))	**Electrification of Existing Building Systems.** • Each City Department shall conduct an inventory of gas-using equipment in their managed Buildings using a template provided by the Director, and upload the inventory results to the City and County of San Francisco's online data catalog no later than December 31, 2023. • Where a gas-using equipment or system integral to building functions is removed from a Building other than a hospital and/or new equipment is required for a Municipal Construction Project, electric equipment or system must be installed, and: o If new equipment can be supported by existing electric service capacity, no upgrade to electric service infrastructure is required by this subsection 704(b). o If new equipment requires an increase from existing electric service capacity, the upgraded electric service infrastructure must be sufficient to accommodate the new equipment, future replacement, and electrification of the Building's remaining gas-using equipment.	☒ Project Complies ☐ Not Applicable ☐ Project Does Not Comply	The project will meet these requirements.
Energy Optimization (San Francisco Environment Code, chapter 7, section 704(b)(5))	**Energy Resilience.** This provision shall apply to any Municipal Construction Project for which the initial appropriation request, either whole or partial, is submitted to the Board of Supervisors after the effective date of the ordinance in Board File No. 221223, enacting this Chapter 7 and repealing an earlier version of Chapter 7.	☒ Project Complies ☐ Not Applicable ☐ Project Does Not Comply	The modified project would replace the existing boiler and chiller and would include electrical system improvements and new photovoltaic arrays. The current design includes battery storage at both new buildings.

REGULATION	REQUIREMENT	PROJECT COMPLIANCE	SPECIFY HOW PROJECT WOULD COMPLY/NOT COMPLY OR WHY REGULATION NOT APPLICABLE
	• **Critical Community Institution:** For New Construction and Major Renovation that includes HVAC system replacement and electrical system upgrade: o Calculate the battery storage capacity and photovoltaic array size sufficient to ensure ongoing operation of the Building's Tier 1 Emergency Loads to be met by battery storage and solar resources in the event of disaster or other disruption to electrical power, using a typical operational 3-day cycle in March as a basis of design; and o Install battery storage and photovoltaics consistent with daily ongoing delivery of Tier 1 Emergency Loads and functions specified in Section 704(b)(5)(A)(i). • **All other Buildings:** For New Construction and Major Renovation, other than at Critical Community Institutions, that includes HVAC system replacement and electrical system upgrade, comply with at least one of the following: o Battery storage and photovoltaics sufficient to sustain ongoing Tier 1 Emergency Loads as specified in Section 704(b)(5)(A)(i); OR o Annual site zero net energy; OR o Design energy use intensity (EUI) 50% better than the national median site EUI; OR o For a Building with process loads that are at least 50% of the Building's total energy use, exceed requirements of ASHRAE 90.1-2019 by 10%.		
WASTE REDUCTION SECTOR			
Responsible Production and Consumption (San Francisco Environment Code, chapter 7, section 704(c)(1),	**Building Material Management.** • Each Municipal Construction Project located within the nine counties surrounding the San Francisco Bay must comply with the **Construction and Demolition Debris Recovery Ordinance** (No. 27-06) and Environment Code Chapter 14.	☒ Project Complies ☐ Not Applicable ☐ Project Does Not Comply	The project construction contracts will include these requirements.

REGULATION	REQUIREMENT	PROJECT COMPLIANCE	SPECIFY HOW PROJECT WOULD COMPLY/NOT COMPLY OR WHY REGULATION NOT APPLICABLE
chapter 14, section 1402, and chapter 19)	• For each Municipal Construction Project, the contract between the City Department and the Contractor shall require the Contractor responsible for construction and/or demolition (C&D) debris management to: o Conduct a site assessment to estimate the types of material discards that will be generated during the project, including packaging and/or shipping materials. o Write and implement a Material Reduction and Recovery Plan (MRRP) in accordance with regulations promulgated under this Chapter 7 to guide onsite material management procedures for waste prevention and material reuse and recycling. o At a minimum, source-separate for reuse or recycling concrete, metal, clean solid wood, clean and unpainted drywall, and carpet and carpet padding. Other C&D debris must either be source-separated or placed in a C&D debris box for transport to a registered facility to maximize material recovery. The Director may adjust the materials to be source-separated by regulation under Section 702(b)(2) based on the Director's assessment of infrastructure and markets available. o If needed, maintain dedicated separate bins for recyclable, compostable, and trash materials as required by Environment Code Chapter 19 **Mandatory Recycling and Composting**. • For each Tenant Improvement subject to a LEED certification requirement, the LEED Project Administrator shall submit documentation verifying that the project achieves the Interior Design + Construction – Commercial Interiors LEED credit Construction and Demolition Waste Management Option 2: Waste Prevention (1 point).		

REGULATION	REQUIREMENT	PROJECT COMPLIANCE	SPECIFY HOW PROJECT WOULD COMPLY/NOT COMPLY OR WHY REGULATION NOT APPLICABLE
Responsible Production and Consumption (San Francisco Environment Code, chapter 7, section 704(c)(2))	**Material Reuse.** City Departments are encouraged to prioritize source reduction and onsite reuse through whatever means practicable. To the extent permitted by law, City Departments shall list in the Virtual Warehouse all unwanted furniture, fixtures, equipment, computers, and supplies purchased with City and County of San Francisco funds. Before buying any new furniture, fixtures, equipment, computers, or supplies, City Departments shall check the Virtual Warehouse for available items that meet their needs.	☒ Project Complies ☐ Not Applicable ☐ Project Does Not Comply	The SFPUC will check the Virtual Warehouse before buying any new furniture or equipment in accordance with these requirements.
Responsible Production and Consumption (San Francisco Environment Code, chapter 7, section 704(c)(3), and chapter 19)	**Material Recovery.** City Departments shall ensure that all City-Owned Properties and City Leaseholds have adequate, accessible, and convenient areas for the collection, storage, and loading of 100% of recyclable, compostable, and refuse materials. Design and/or construction contract documents shall incorporate requirements of Environment Code Chapter 19 **Mandatory Recycling and Composting** City Departments shall ensure that the designed and designated areas are sufficient to accommodate containers consistent with both current methods and projected needs when zero waste goals are met, as well as allow for easy access by a collector's vehicle. • City Departments are required to recycle used fluorescent and other mercury-containing lamps, batteries, and universal waste as defined by California Code of Regulations Section 66261.9.	☒ Project Complies ☐ Not Applicable ☐ Project Does Not Comply	The project will meet these requirements.
Responsible Production and Consumption (San Francisco Environment Code, chapter 7, section 704(c)(4))	**Embodied Carbon.** • Each Municipal Construction Project of 10,000 gross square feet or more shall submit to the Department an embodied carbon reduction strategies checklist on a form provided by the Director for informational and reporting purposes as follows: o At the conclusion of the schematic design phase, as an assessment of the maximum embodied carbon reduction strategies that are practicable for the project. The sponsoring City Department shall prioritize	☒ Project Complies ☐ Not Applicable ☐ Project Does Not Comply	The project will implement these requirements for the design of the Operations, Engineering, and Maintenance building and Mechanical Maintenance building, given the criteria of 10,000 gross square feet and the nature of the project as a municipal construction. The Operations, Engineering, and Maintenance building and Mechanical Maintenance building would be certified LEED Gold consistent with these requirements. SFPUC would complete carbon reduction strategies checklist during subsequent project design.

REGULATION	REQUIREMENT	PROJECT COMPLIANCE	SPECIFY HOW PROJECT WOULD COMPLY/NOT COMPLY OR WHY REGULATION NOT APPLICABLE
	the integration of these strategies throughout the design and construction process. o Upon receiving a temporary certificate of occupancy or similar indication that the project is substantively complete, explaining the embodied carbon reduction strategies that have been successfully integrated into the design and/or construction process. • For each New Construction or Major Renovation subject to a LEED certification requirement, the LEED Project Administrator shall submit documentation verifying that the project achieves the LEED credit Building Life-Cycle Impact Reduction Option 2: Whole-Building Life-Cycle Assessment, Path 3 by addressing at least three product categories or building assembly types. For each Tenant Improvement subject to a LEED certification requirement, the LEED Project Administrator shall submit documentation verifying that the project achieves the LEED credit Interiors Life-Cycle Impact Reduction Option 1: Interior Furniture and Nonstructural Elements Reuse (1 point) or Option 3: Building Interiors Life Cycle Assessment (2 points). • For each Municipal Construction Project subject to a LEED certification requirement, the LEED Project Administrator shall submit documentation verifying that the project achieves the LEED credit Environmental Product Declarations (1 point).		
Resource Conservation Ordinance (San Francisco Environment Code, chapter 5, section 3 & Executive Directive 08-02)	This ordinance establishes a goal for each City department to (i) maximize purchases of recycled products and (ii) divert from disposal as much solid waste as possible and appoint at least one person responsible for compliance with the chapter. Each City department shall prepare a waste assessment annually. The ordinance requires janitorial contracts to consolidate Recyclable materials for pick up. Lastly, the ordinance requires departments to specify the purchase of 30 percent post-consumer recycled content for all paper products except copier and bond paper.	☒ Project Complies ☐ Not Applicable ☐ Project Does Not Comply	The project will meet these requirements. SFPUC includes the ordinance requirements in their construction contract specifications.

REGULATION	REQUIREMENT	PROJECT COMPLIANCE	SPECIFY HOW PROJECT WOULD COMPLY/NOT COMPLY OR WHY REGULATION NOT APPLICABLE
Resource Conservation Ordinance: : Non-PVC Plastics (San Francisco Environment Code, chapter 5, section 9)	This ordinance requires non-PVC plastics to be specified in city purchasing and construction projects.	☒ Project Complies ☐ Not Applicable ☐ Project Does Not Comply	The project will meet these requirements. SFPUC includes the ordinance requirements in their construction contract specifications.
Preference for Local Manufacturers and Industry/Recycled Content Materials Ordinance (San Francisco Administrative Code, section 6.4)	Ordinance requires the use of recycled content material in public works projects to the maximum extent feasible and gives preference to local manufacturers and industry.	☒ Project Complies ☐ Not Applicable ☐ Project Does Not Comply	The SFPUC will comply with this ordinance, which requires utilization of recycled content materials, rather than virgin materials, to the maximum extent feasible.
Bottled and Package Free Water Ordinance (San Francisco Environment Code, chapter 24, section 5)	No City officer, department, or agency shall use City funds to purchase bottled water for its own general use. A department may use City funds to purchase bottled water for uses specifically exempted from or allowed under chapter 24. It shall be City policy not to have drinking water systems in City offices or facilities that use plastic water bottles of any size where satisfactory alternatives exist and are feasible at the location under consideration.	☒ Project Complies ☐ Not Applicable ☐ Project Does Not Comply	The SFPUC implements these requirements.
Food Service and Packaging Waste Reduction Ordinance (San Francisco Environment Code, chapter 16, section 3)	City Departments (city contractors, lessees, and food providers) may not purchase, acquire, or use food service ware if (1) the food service ware is made, in whole or in part, from polystyrene foam, or if (2) the food service ware is not compostable or recyclable, and (3) where the food service ware is compostable and not fluorinated chemical free. In addition, they shall not purchase or acquire, any single-use straws, stirrers, splash sticks, cocktail sticks, or toothpicks made with plastic, including compostable, bio- or plant-based plastic, except as expressly provided in this Chapter 16 and/or as required by applicable State or federal laws, regulations, or guidelines.	☒ Project Complies ☐ Not Applicable ☐ Project Does Not Comply	The SFPUC implements these requirements

REGULATION	REQUIREMENT	PROJECT COMPLIANCE	SPECIFY HOW PROJECT WOULD COMPLY/NOT COMPLY OR WHY REGULATION NOT APPLICABLE
ENVIRONMENT/CONSERVATION SECTOR			
Street Tree Planting Requirements (San Francisco Public Works Code, Article 16, section 806(d) and San Francisco Planning Code, section 138.1)	Public Works Code section 806(d) requires projects that include new construction, significant alterations, new curb cuts, a new garage, or new dwelling units to plant a 24-inch box tree for every 20 feet along the property street frontage. Any street trees removed without obtaining a permit, must be replaced by street trees that are equal or greater than the total diameter of the street trees removed.	☒ Project Complies ☐ Not Applicable ☐ Project Does Not Comply	Removal and replacement of any street trees along Jerrold Avenue (publicly accessible right-of-way) will be conducted consistent with Public Works Code section 806(d), which requires planting of a minimum of one 24-inch box tree for every 20 feet of property street frontage. This requirement does not apply to trees within the SEP which is a non-DPW public right-of-way.
Human and Environmental Health (San Francisco Environment Code, chapter 7, section 704(d)(2))	**Toxics Reduction and Pollution Prevention.** • For each Municipal Construction Project subject to a LEED certification requirement, the LEED Project Administrator shall submit documentation verifying that the project achieves the LEED credit Building Product Disclosure and Optimization – Material Ingredients (1 point) using reporting methodologies that inventory content of a product's homogeneous materials to at least 1,000 ppm. • For all Municipal Construction Projects and for purchases made by or on behalf of City Departments for these projects, product categories including but not limited to furniture, countertops, door hardware, paints, ceilings, and flooring shall comply with regulations promulgated under this Chapter 7 pertaining to the following attributes, subject to verification by the Department of the Environment: o Added flame retardant chemicals; o Antimicrobial chemicals; o Fluorinated chemicals; o Volatile organic compounds (VOCs) content or emissions. o Polyvinyl chloride (PVC) content; o Recycled content and recyclability; o Sustainably grown and harvested wood; and	☒ Project Complies ☐ Not Applicable ☐ Project Does Not Comply	The project will implement this requirement for the Operations, Engineering, and Maintenance building and Mechanical Maintenance building.

REGULATION	REQUIREMENT	PROJECT COMPLIANCE	SPECIFY HOW PROJECT WOULD COMPLY/NOT COMPLY OR WHY REGULATION NOT APPLICABLE
	o Other environmental attributes, consistent with this Chapter.		
Construction Site Runoff Ordinance (Public Works Code, section 146)	Municipal construction projects that involve land-disturbing activities on 5,000 or more square feet of ground surface must implement construction site run-off best management practices in compliance with the Construction Site Runoff Ordinance (See Public Works Code section 146).	☒ Project Complies ☐ Not Applicable ☐ Project Does Not Comply	The SFPUC will develop and implement an erosion control plan in accordance with Article 4.2 of the San Francisco Public Works Code, Section 146, and construction activities will include pollution prevention and stormwater controls.
San Francisco Stormwater Management Ordinance (Public Works Code, article 4.2, section 147)	All projects creating or replacing impervious surface of 5,000 square feet or more in combined or separate sewer areas must manage stormwater on-site using low impact design. Projects must comply with the Stormwater Management Ordinance, including SFPUC Stormwater Design Guidelines, and implement Post Construction Stormwater Controls and prepare a Stormwater Control Plan. All projects creating or replacing impervious surface of between 2,500 and 5,000 square feet in separate sewer areas must implement Post Construction Stormwater Controls.	☒ Project Complies ☐ Not Applicable ☐ Project Does Not Comply	Drainage for the project will be designed in accordance with the SFPUC Article 4.2 of the San Francisco Public Works Code, Section 147, and the SFPUC's Stormwater Design Guidelines to the extent feasible.
Indoor Water Use Reduction (Green Building Code, Section 5.103.1.2)	For each Municipal Construction Project subject to a LEED certification requirement, the LEED Project Administrator shall submit documentation verifying that the project achieves the LEED credit Indoor Water Use Reduction (30% reduction minimum).	☒ Project Complies ☐ Not Applicable ☐ Project Does Not Comply	The project will implement this requirement for the Operations, Engineering, and Maintenance building and Mechanical Maintenance building.
Water Efficient Irrigation Ordinance (Administrative Code Chapter 63)	All public agency landscape rehabilitation projects, with a modified landscape area equal to or greater than 1,000 square feet and less than 2,500 square feet, shall comply with Chapter 63 and the rules and regulations adopted by the Public Utilities Commission. All public agency new construction landscape projects with a landscape area equal to or greater than 500 square feet; landscape rehabilitation projects with a modified landscape area equal to or greater than 2,500 square feet; or a project under Tier 1 with a turf limitation exceeding 25% of the	☒ Project Complies ☐ Not Applicable ☐ Project Does Not Comply	The modified project includes vegetated areas exceeding a total of 1,000 square feet and therefore qualifies as a landscape rehabilitation project. Low water use plants will be specified and the irrigation design will comply with Chapter 63.

REGULATION	REQUIREMENT	PROJECT COMPLIANCE	SPECIFY HOW PROJECT WOULD COMPLY/NOT COMPLY OR WHY REGULATION NOT APPLICABLE
	landscape area, shall comply with Chapter 63 and the rules and regulations adopted by the Public Utilities Commission.		
Water Conservation (San Francisco Environment Code, chapter 7, section 704(e))	A Municipal Construction Project located outside of the City and County of San Francisco may be subject to the following locally required measures if the project is not mandated by the local agency having jurisdiction to meet equivalent requirements: • **Construction Site Runoff Ordinance** (Public Works Code Sections 146-146.11). • **Stormwater Management Ordinance** (Public Works Code Sections 147-147.6). • **Indoor Water Use Reduction.** (Green Building Code, Section 5.103.1.2). For each Municipal Construction Project subject to a LEED certification requirement, the LEED Project Administrator shall submit documentation verifying that the project achieves the LEED credit Indoor Water Use Reduction (30% reduction minimum). • **Water Efficient Irrigation Ordinance** (Administrative Code Chapter 63).	☐ Project Complies ☒ Not Applicable ☐ Project Does Not Comply	The project would only include ground disturbance in San Francisco and would not be required to meet these requirements.
Human and Environmental Health (San Francisco Environment Code, chapter 7, section 704(d)(1))	**Indoor Air Quality.** For each Municipal Construction Project subject to a LEED certification requirement, the LEED Project Administrator shall submit documentation verifying that the project achieves the following LEED credits: • Enhanced Indoor Air Quality Strategies (1 point); • Low-Emitting Materials (5 product categories); • Construction Indoor Air Quality Management Plan (1 point); and • Indoor Air Quality Assessment Option 2: Air Testing (2 points).	☒ Project Complies ☐ Not Applicable ☐ Project Does Not Comply	The project will implement this requirement for the Operations, Engineering, and Maintenance building and Mechanical Maintenance building.

REGULATION	REQUIREMENT	PROJECT COMPLIANCE	SPECIFY HOW PROJECT WOULD COMPLY/NOT COMPLY OR WHY REGULATION NOT APPLICABLE
Environmentally Preferable Purchasing Ordinance (San Francisco Environment Code, chapter 2, section 3)	For certain common product categories, the ordinance mandates that City Departments purchase only products listed as "required" on the SFApproved.org website, which is maintained by the Department of the Environment. The items on the SFApproved.org website meet the most rigorous standards for protecting our health and environment.	☒ Project Complies ☐ Not Applicable ☐ Project Does Not Comply	Some of the products that would be needed for the project fall under the Approved Green Products List product categories, including (but not limited to): building materials, fuel, landscaping products, lighting, and paint and lacquer thinner. These products would be utilized during the project construction phase; therefore, contract specifications will include the requirement to use products from the Approved Green Products List when feasible. Any applicable products from the Approved Green Products List needed for conducting operations and maintenance activities will be utilized by SFPUC staff when feasible.
Tropical Hardwood and Virgin Redwood Ban (San Francisco Environment Code, chapter 8, section 3)	The ordinance prohibits City departments from procuring or engaging in contracts that would use the ordinance-listed tropical hardwoods and virgin redwood.	☒ Project Complies ☐ Not Applicable ☐ Project Does Not Comply	All contracts associated with construction of the project will prohibit the utilization of the ordinance-listed tropical hardwoods and virgin redwood
Wood Burning Rule (Bay Area Air District Regulation 6, Rule 3 Rule 3: Wood-Burning Devices)	Bans the construction of wood-burning devices in new buildings constructed in the Bay Area since November 1, 2016. Gas-fueled fireplaces and logs, gas inserts, and electrical fireplaces are okay.	☐ Project Complies ☒ Not Applicable ☐ Project Does Not Comply	The project will not include the installation of fireplaces, wood burning or otherwise.
Arsenic-Treated Wood Ordinance (San Francisco Environment Code, chapter 13, section 3)	For City departments, prohibits the use of arsenic-treated wood for most applications, with the exception of seawater immersion. Details can be found at SFApproved.org/wood.	☒ Project Complies ☐ Not Applicable ☐ Project Does Not Comply	Construction of the project will not use arsenic-treated wood.
Human and Environmental Health (San Francisco Environment Code, chapter 7, section 704(d)(3))	**Biodiversity and Wildlife Habitat.** Each Municipal Construction Project shall follow the City and County of San Francisco's Biodiversity Guidelines.	☒ Project Complies ☐ Not Applicable ☐ Project Does Not Comply	The project will adhere to the City's Better Roof Ordinance, the Stormwater Management Ordinance, the City's Integrated Pest Management program, and the Bird-Safe Building Ordinance. The project will utilize wildlife-friendly lighting, including downward-facing lights to reduce light pollution.

C. DETERMINATION OF COMPLIANCE WITH CITY'S GHG REDUCTION STRATEGY (TO BE FILLED OUT BY ENVIRONMENTAL PLANNING STAFF)

☒ Project Complies with San Francisco's *Strategies to Address Greenhouse Gas Emissions*

Biosolids Digester Facilities Project

California Environmental Quality Act Findings: Findings of Fact, Evaluation of Mitigation Measures and Alternatives

San Francisco Public Utilities Commission

In determining to approve the Biosolids Digester Facilities Project ("BDFP" or "Project") described in Section I, Project Description, below, the San Francisco Public Utilities Commission ("SFPUC" or "Commission") makes and adopts the following findings of fact and decisions regarding mitigation measures and alternatives, based on substantial evidence in the whole record of this proceeding and under the California Environmental Quality Act ("CEQA"), California Public Resources Code Sections 21000 et seq., particularly Sections 21081 and 21081.5, the Guidelines for Implementation of CEQA ("CEQA Guidelines"), 14 California Code of Regulations Sections 15000 et seq., particularly Sections 15091 through 15093, and Chapter 31 of the San Francisco Administrative Code.

This document is organized as follows:

Section I provides a description of the Project proposed for adoption, the environmental review process for the Project Environmental Impact Report (the "Final EIR" or "EIR"), Planning Department Case No., 2015-000644ENV, State Clearinghouse No. 2015062073, the approval actions to be taken and the location of records;

Section II identifies the impacts found not to be significant that do not require mitigation;

Section III identifies potentially significant impacts that can be avoided or reduced to less-than-significant levels through mitigation and describes the disposition of the mitigation measures;

Section IV identifies significant impacts that cannot be avoided or reduced to less-than-significant levels and describes any applicable mitigation measures as well as the disposition of the mitigation measures; and

Section V evaluates the different Project alternatives and the economic, legal, social, technological and other considerations that support approval of the Project and the rejection of alternatives, or elements thereof, analyzed.

Section VI presents a statement of overriding considerations setting forth specific reasons in support of the Commission's actions and rejection of alternatives not incorporated into the Project.

The Mitigation Monitoring and Reporting Program ("MMRP") for the mitigation measures that have been proposed for adoption is attached with these findings as Attachment B to Resolution

No. _____ . The MMRP is required by CEQA Section 21081.6 and CEQA Guidelines Section 15091. Attachment B provides a table setting forth each mitigation measure listed in the Final Environmental Impact Report for the Project ("Final EIR") that is required to reduce or avoid a significant adverse impact. Attachment B also specifies the agency responsible for implementation of each measure and establishes monitoring actions and a monitoring schedule. The full text of the mitigation measures is set forth in Attachment B.

These findings are based upon substantial evidence in the entire record before the Commission. The references set forth in these findings to certain pages or sections of the Draft Environmental Impact Report ("Draft EIR" or "DEIR") or the Responses to Comments document in the Final EIR are for ease of reference and are not intended to provide an exhaustive list of the evidence relied upon for these findings.

I. Approval of the Project

A. Project Description

By this action, the SFPUC adopts and implements the BDFP identified in the Final EIR. The Project as adopted by the Commission is described in detail in the Draft EIR at pages 2-1 through 2-69. A summary of the key components of the Project follows.

The proposed project would replace the outdated existing solids treatment facilities with more reliable, efficient, and modern technologies and facilities. Biosolids are the recyclable solid materials removed from wastewater during the treatment process, and digesters are the major facility used in the solid treatment process. Many of the existing Southeast Water Pollution Control Plant (“Southeast Plant” or “SEP”) solids treatment facilities are over 60 years old, require significant maintenance, and are operating well beyond their useful life.

The project facilities would be situated on portions of the SEP located at 750 Phelps Street and 1700 Jerrold Avenue, and two adjacent properties at 1800 Jerrold Avenue (Central Shops site) and 1801 Jerrold Avenue (Asphalt Plant site). The project site encompasses approximately 562,000 square feet (12.9 acres).

Specifically, the Project adopted by the SFPUC includes the following components:

- Replace and relocate the solids processing treatment processes with new processes and new facilities;

- Replace the 10 existing digesters (1.8-million gallons each) with five (5) digesters (1.66 million gallons each), and place the new digesters further away from residential uses;

- Upgrade the solids treatment process such that quality of the biosolids produced by the SEP would achieve Class A biosolids, which contains no detectable levels of pathogens and do not attract vectors such as flies, mosquitoes and other potential disease-carrying organisms;

- Install odor control facility to collect and treat odors from solids handling and energy recovery facilities, thereby limit odors from biosolids facilities to within revised SEP site boundaries;

- Reuse 100 percent of the digester gas generated by the proposed solids processing facilities to produce energy for heating and power uses at the SEP; increase digester gas production from 1.3 million cubic feet/day (cfd) to 2 million cfd;

- Increase the annual average electricity generation from up to 2 megawatt (MW) to up to 5.2 MW;

- Install support facilities such as buildings for operations and maintenance staff, and ancillary piping and electrical facilities; and

- Make changes to vehicular circulation and access, landscaping, and architectural improvements.

The BDFP would require construction of new structures on approximately 206,000 square feet of the project site and excavation in certain areas to a maximum depth of about 41 feet below grade. The height of new structures would be up to 65 feet above grade.[1] To accommodate the proposed facilities, a number of existing structures within the project site would be demolished. This includes the Central Shops buildings and existing SEP facilities within the SEP boundaries of the project site totaling about 136,000 square feet.

Project construction would require five years to complete, from 2018 through 2023. During the construction period, the SFPUC would operate and maintain the existing solids treatment facilities to ensure no interruption of service and ongoing compliance with applicable regulatory permits. To maintain a safe construction work area, the Project includes a temporary closure of approximately two blocks of Jerrold Avenue to public through traffic (starting at the Caltrain right-of-way and up to the SEP entrance on Jerrold Avenue west of Phelps Street) during the five-year project construction period.

Construction would require temporary use of other off-site locations for staging including construction employee parking during the five-year construction period. The BDFP would require up to 12 acres for off-site construction staging at one or more sites, in addition to areas within the project site itself. Potential staging areas include the segments of Quint Street and Jerrold Avenue that would be closed during construction, the Southeast Greenhouses site and the 1550 Evans Avenue site if they are available for use (both owned by SFPUC), and portions of Piers 94 and 96 and the Pier 94 Backlands (administered by the Port of San Francisco and available for lease).For most of the project construction period, construction activities at the project site would occur Monday through Friday from 7:00 a.m. to 3:30 p.m., with some activities extending to 8:00 p.m. as needed. Construction could also occur on Saturdays and Sundays when needed. Work would

[1] Heights listed exclude mechanical penthouses, catwalks, and similar accessory structures that qualify for exemption from the 65-foot height limit for the project site pursuant to Section 260(b) of the San Francisco Planning Code.

occur on holidays and 24 hours per day only if needed for critical facility connections. Pile driving would generally occur between 7:00 a.m. and 3:30 p.m., Monday to Friday, and at times until 8:00 p.m. consistent with the City's Noise Ordinance. During the peak of construction, a period of approximately one year, and other times during critical functions, construction would occur in two shifts per day if needed: Monday through Saturday from 7:00 a.m. to 3:30 p.m. and from 2:30 p.m. to 11:00 p.m. Nighttime work (after 8:00 p.m.) would be limited to interior facility work and outside work with minimal noise. The size of the construction work force would vary over the five-year construction period, averaging about 333 workers per day and ranging from about 133 to 550 workers per day.

Proposed long-term improvements to Jerrold Avenue would occur in accordance with San Francisco Better Streets Plan guidelines and could include traffic calming measures, curb extensions (road narrowing), sidewalk improvements, lighting, street trees, and safer pedestrian and worker crossings.

The project would also include a new entrance at Rankin Street to facilitate the movement of truck traffic to and from the proposed facilities. Two entrances (as well as emergency access gates) on either side of Jerrold Avenue and one entrance on Quint Street are also proposed. The project would include redesign of on-site vehicular circulation within the SEP boundaries to accommodate the new entrances, exits, and facility layout.

B. Project Objectives

The overall goal of the BDFP is to replace the existing aged and unreliable solids processing facilities at the SEP with new, modern, and efficient facilities to ensure the long-term sustainability of the SEP wastewater treatment system. The specific BDFP objectives are as follows:

- Replace the existing solids treatment facilities at the SEP with new infrastructure with modern and more efficient treatment technologies to protect public health and safety and provide continued regulatory compliance;
- Maximize the efficiency of the current treatment process operations and maintenance, staffing resources, and the use of existing SFPUC infrastructure;
- Reliably meet treatment capacity for projected 2045 flows and loads associated with projected population growth;
- Beneficially use 100 percent of biosolids generated;
- Beneficially use 100 percent of digester gas generated;
- Build critical processes with redundant infrastructure to provide reliability and operational flexibility;
- Improve seismic reliability;
- Limit noticeable odors from BDFP facilities to the SEP property boundary;

- Provide visual improvements that promote a cohesive architectural design and identity at the BDFP site, enhance the overall aesthetics, and improve the public edges in a manner consistent with the surrounding neighborhood and the rest of the SEP;
- Design and site new facilities to accommodate or adapt to expected sea level rise over their expected life;
- Allow for timely construction of the proposed BDFP; and
- Maintain rate payer affordability.

C. Environmental Review

Biosolids Digester Facilities Project Environmental Impact Report

In accordance with Sections 15063 and 15082 of the CEQA Guidelines, the Environmental Planning ("EP") staff of the San Francisco Planning Department, as lead agency, prepared a Notice of Preparation ("NOP") and conducted a scoping meeting for the Project EIR. The San Francisco Planning Department released the NOP on June 24, 2015, held a scoping meeting on July 16, 2015 at the Southeast Community Facility, 1800 Oakdale Avenue in San Francisco, and accepted written comments on the NOP through July 27, 2015.

EP distributed the NOP to the State Clearinghouse, and mailed notices of the availability of the NOP to over 1,540 interested parties, including property owners and tenants within 300 feet of the proposed Project. The scoping meeting was noticed in local newspapers through the San Francisco Neighborhood Newspaper Association, including El Tecolote, a Spanish/ English publication and in Sing Tao (published in Chinese). Approximately 22 people attended the meeting.

The San Francisco Planning Department received 17 verbal comments at the scoping meeting and three written comment letters/email. The comments are included in the Scoping Report in Appendix NOP of the EIR.

The San Francisco Planning Department then prepared the Draft EIR, which described the Project and the environmental setting, identified potential impacts, presented mitigation measures for impacts found to be significant or potentially significant, and evaluated Project alternatives. The Draft EIR analyzed the impacts associated with each of the key components of the Project, and identified mitigation measures applicable to reduce impacts found to be significant or potentially significant for each key component. It also included an analysis of three alternatives to the Project. In assessing construction and operational impacts of the Project, the EIR considered the impacts of the Project as well as the cumulative impacts associated with the proposed Project in combination with other past, present, and reasonably foreseeable future actions that could affect the same resources.

Each environmental issue presented in the Draft EIR was analyzed with respect to significance criteria that are based on EP guidance regarding the environmental effects to be considered

significant. EP guidance is, in turn, based on CEQA Guidelines Appendix G, with some modifications.

The Draft EIR was circulated for public comment on May 3, 2017 for a 47-day comment period, which closed at 5:00pm on June 19, 2017. The San Francisco Planning Commission held a public hearing on the Draft EIR to accept written or oral comments at San Francisco City Hall on June 1, 2017. During the public review period, the Planning Department received written comments sent through the mail, fax, or email. A court reporter was present at the public hearing, transcribed the public hearing verbatim, and prepared a written transcript.

The Planning Department then prepared the Responses to Comments document, which provided written responses to each comment received on the Draft EIR. The Responses to Comments document was published on February 23, 2018 and included copies of all of the comments received on the Draft EIR and responses to those comments. The Responses to Comments provided additional, updated information and clarification on issues raised by commenters, as well as SFPUC and Planning Department staff-initiated text changes to address Project updates. The Final EIR provided augmented and updated information presented in the Draft EIR, on the following topics: project description, aesthetics, cultural resources, transportation, air quality, cultural resources, sea level rise, hazardous materials, cumulative projects, and alternatives. Other topics covered which are not part of the CEQA process include project merits, socioeconomics, community benefits, and environmental justice. This augmentation and update of information in the Draft EIR did not constitute new information or significance that altered any of the conclusions of the EIR. The Planning Commission reviewed and considered the Final EIR, which includes the Draft EIR and the Responses to Comments document, and all of the supporting information.

In certifying the Final EIR, the Planning Commission determined that none of the factors that would necessitate recirculation of the Final EIR under CEQA Guidelines Section 15088.5 are present. Specifically, the Final EIR contains no information revealing (1) any new significant environmental impact that would result from the Project or from a new mitigation measure proposed to be implemented, (2) any substantial increase in the severity of a previously identified environmental impact, (3) any feasible Project alternative or mitigation measure considerably different from others previously analyzed that would clearly lessen the environmental impacts of the Project, but that was rejected by the Project's proponents, or (4) that the Draft EIR was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded. This Commission concurs in that determination.

The Commission finds that the Project is within the scope of the Project analyzed in the Final EIR and the Final EIR fully analyzed the Project proposed for approval. No new impacts have been identified that were not analyzed in the Final EIR.

D. Approval Actions

Under San Francisco's Administrative Code Chapter 31 procedures, the San Francisco Planning Commission certifies the Final EIR as complete and all approving bodies subject to CEQA adopt CEQA findings at the time of the approval actions. Anticipated approval actions are listed below.

1. San Francisco Public Utilities Commission

The SFPUC is taking the following actions and approvals to implement the Project:

- Adopts these CEQA findings and the attached Mitigation Monitoring and Reporting Program.
- Approves the Project, as described in these findings, and authorizes the General Manager or his designee to obtain necessary permits, consents, agreements and approvals
- Authorizes the General Manager to proceed to implement the Project and proceed with the Construction Phase

2. San Francisco Board of Supervisors Actions

- Considers any appeal of the Planning Commission's certification of the Final EIR.
- Releases appropriated funds for implementation of the Project.

3. Other – Federal, State, and Local Agencies

Implementation of the Project may involve consultation with or required approvals by other local, state, and federal regulatory agencies, including (but not limited to) the following:

- United States Environmental Protection Agency:
  - Consideration for Water Infrastructure Finance and Innovation Act loan and review of environmental review requirements that must be completed to apply for a loan
- State Water Resources Control Board:
  - Construction General Permit and Stormwater Pollution Prevention Plan, if more than one acre of land were disturbed[2]
  - Consideration for Clean Water State Revolving Fund loan and review of environmental review requirements that must be completed to apply for a loan
- State Historic Preservation Officer: Review under Section 106 of the National Historic Preservation Act (as part of the Water Infrastructure Finance and Innovation Act and State Revolving Fund loan application process)
- San Francisco Planning Commission: Certification of the BDFP Final EIR

[2] Applicable to areas that do not drain to the City's combined sewer system; therefore, not applicable to the project site but potentially applicable to the Piers 94 and 96 staging areas.

- San Francisco Public Works (SFPW): Approval of Sidewalk Changes (SFDPW Order) and Street Improvement Permit
- San Francisco Department of Public Health: Approval of Site Mitigation Plan
- San Francisco Board of Supervisors: Approval of Sidewalk Legislation (if needed)
- San Francisco Municipal Transportation Agency: Approval of On-Street Parking Legislation (if needed)
- Bay Area Air Quality Management District: Authority to Construct and Permit to Operate
- San Francisco Port Commission: Approval of use of Pier 94 and Pier 96 for construction staging

To the extent that the identified mitigation measures require consultation or approval by these other agencies, this Commission urges these agencies to assist in implementing, coordinating, or approving the mitigation measures, as appropriate to the particular measure.

E. Contents and Location of Records

The record upon which all findings and determinations related to the Project are based ("Record of Proceedings") includes the following:

- The Draft EIR and all documents referenced in or relied upon by the EIR, including technical memoranda and reports prepared by the Planning Department, the SFPUC, and the EIR consultants and subconsultants. (The references in these findings to the EIR or Final EIR include both the Draft EIR and the Comments and Responses document.)

- All information (including written evidence and testimony) provided by City staff to the SFPUC and Planning Commission relating to the EIR, the Project, and the alternatives set forth in the EIR.

- All information (including written evidence and testimony) presented to the SFPUC and the Planning Commission by the environmental consultant and sub-consultants who prepared the EIR or that was incorporated into reports presented to the SFPUC.

- All information presented at any public hearing or workshop related to the Project and the EIR.

- The Mitigation Monitoring and Reporting Program.

- All other documents available to the SFPUC and the public, comprising the administrative record pursuant to Public Resources Code Section 21167.6(e).

The Commission has relied on all of the information listed above in reaching its decision on the Project, even if not every document was formally presented to the SFPUC. Without exception, these documents fall into one of two categories. Many documents reflect prior planning or legislative decisions that the SFPUC was aware of in approving the Project. Other documents

influenced the expert advice provided to Planning Department staff or consultants, who then provided advice to the SFPUC. For these reasons, such documents form part of the underlying factual basis for the SFPUC's decisions relating to the adoption of the Project.

The public hearing transcript, a copy of all letters regarding the Draft EIR received during the public review period, the administrative record, and background documentation for the Final EIR are available at the San Francisco Planning Department, 1650 Mission Street, San Francisco. **Jonas P. Ionin**, Commission Secretary, is the Custodian of Records for the Planning Department. Materials concerning approval of the Project and adoption of these findings are contained in SFPUC files, **SFPUC Project No. CWWSIPDP01** in the Bureau of Environmental Management, San Francisco Public Utilities Commission, 525 Golden Gate Avenue, San Francisco, California 94102. The Custodian of Records is **Karen Frye.** All files have been made available to the SFPUC and the public for review in considering these findings and whether to approve the Project.

F. Findings about Significant Environmental Impacts and Mitigation Measures

The following Sections II, III, and IV set forth the SFPUC's findings about the Final EIR's determinations regarding significant environmental impacts and the mitigation measures proposed to address them. These findings provide the written analysis and conclusions of the SFPUC regarding the environmental impacts of the Project and the mitigation measures included as part of the Final EIR and adopted by the SFPUC as part of the Project. To avoid duplication and redundancy, and because the SFPUC agrees with, and hereby adopts, the conclusions in the Final EIR, these findings will not repeat the analysis and conclusions in the Final EIR but instead incorporate them by reference and rely upon them as substantial evidence supporting these findings.

In making these findings, the SFPUC has considered the opinions of SFPUC staff and experts, other agencies, and members of the public. The SFPUC finds that (i) the determination of significance thresholds is a judgment decision within the discretion of the City and County of San Francisco; (ii) the significance thresholds used in the EIR are supported by substantial evidence in the record, including the expert opinion of the EIR preparers and City staff; and (iii) the significance thresholds used in the EIR provide reasonable and appropriate means of assessing the significance of the adverse environmental effects of the Project. Thus, although, as a legal matter, the SFPUC is not bound by the significance determinations in the EIR (see Public Resources Code, Section 21082.2, subdivision (e)), the SFPUC finds them persuasive and hereby adopts them as its own.

These findings do not attempt to describe the full analysis of each environmental impact contained in the Final EIR. Instead, a full explanation of these environmental findings and conclusions can be found in the Final EIR, and these findings hereby incorporate by reference the discussion and analysis in the Final EIR supporting the determination regarding the project impact and mitigation measures designed to address those impacts. In making these findings, the SFPUC ratifies, adopts and incorporates in these findings the determinations and conclusions of

the Final EIR relating to environmental impacts and mitigation measures, except to the extent any such determinations and conclusions are specifically and expressly modified by these findings.

As set forth below, the SFPUC adopts and incorporates all of the mitigation measures set forth in the Final EIR and the attached MMRP to substantially lessen or avoid the potentially significant and significant impacts of the Project. Accordingly, in the event a mitigation measure recommended in the Final EIR has inadvertently been omitted in these findings or the MMRP, such mitigation measure is hereby adopted and incorporated in the findings below by reference. In addition, in the event the language describing a mitigation measure set forth in these findings or the MMRP fails to accurately reflect the mitigation measures in the Final EIR due to a clerical error, the language of the policies and implementation measures as set forth in the Final EIR shall control. The impact numbers and mitigation measure numbers used in these findings reflect the information contained in the Final EIR.

In Sections II, III and IV below, the same findings are made for a category of environmental impacts and mitigation measures. Rather than repeat the identical finding dozens of times to address each and every significant effect and mitigation measure, the initial finding obviates the need for such repetition because in no instance is the SFPUC rejecting the conclusions of the Final EIR or the mitigation measures recommended in the Final EIR for the Project.

II. Impacts Found Not To Be Significant and Thus Do Not Require Mitigation

Under CEQA, no mitigation measures are required for impacts that are less than significant (Public Resources Code, Section 21002; CEQA Guidelines, Sections 15126.4, subdivision (a)(3), 15091). Based on the evidence in the whole record of this proceeding, the SFPUC finds that the implementation of the Project will result in no impacts in the following areas: project-level impacts to recreation and agriculture and forest resources. These subjects are not further discussed in these findings.

The SFPUC further finds that implementation of the Project will not result in any significant impacts in the following areas and that these impact areas therefore do not require mitigation:

Land Use

- **Impact LU-1:** The project would not physically divide an established community. (DEIR Section 4.2.3.3, Page 4.2-7 to 4.2-8)

- **Impact LU-2:** The project would not conflict with land use plans and policies adopted for the purpose of avoiding or mitigating an environmental effect. (DEIR Section 4.2.3.3, Page 4.2-8)

- **Impact C-LU-1:** The project, in combination with past, present, and probable future projects, would not physically divide an established community, nor would it conflict with applicable land use plans and policies adopted for the purpose of avoiding or mitigating an environmental effect. (DEIR Section 4.2.3.3, Pages 4.2-9 to 4.2-10)

Aesthetics

- **Impact AE-1:** Project construction would not substantially degrade the existing visual character of the site or its surroundings or damage scenic resources. (DEIR Section 4.3.3.3, Pages 4.3-20 to 4.3-22)

- **Impact AE-2:** Project construction would not create a substantial new source of light or glare that could adversely affect nighttime views in the area, or could substantially impact other people or properties. (DEIR Section 4.3.3.3, Page 4.3-22)

- **Impact AE-3:** Project operation would not substantially degrade the existing visual character of the site or its surroundings or damage scenic resources. (DEIR Section 4.3.3.3, Pages 4.3-23 to 4.3-28)

- **Impact AE-4:** Project operation would not create a substantial new source of light or glare that could adversely affect day or nighttime views in the area, or substantially impact other people or properties. (DEIR Section 4.3.3.3, Pages 4.3-29 to 4.3-30)

- **Impact C-AE-1:** Implementation of the BDFP, in combination with past, present, and probable future projects in the vicinity, would not substantially degrade the existing visual character of the site or its surroundings or damage scenic resources. (DEIR Section 4.3.3.3, Pages 4.3-30 to 4.3-31)

- **Impact C-AE-2:** Implementation of the BDFP, in combination with past, present, and probable future projects in the vicinity, would not contribute considerably to substantial new sources of light or glare that could adversely affect nighttime views in the area, or could substantially impact other people or properties. (DEIR Section 4.3.3.3, Pages 4.3-31 to 4.3-32)

Population and Housing

- **Impact PH-1:** Construction of the BDFP would not directly or indirectly induce substantial population growth in the area or create demand for additional housing. (DEIR Section 4.4.3.3, Pages 4.4-6 to 4.4-7)

- **Impact PH-2:** Operation of the BDFP would not directly or indirectly induce substantial population growth in the area or create demand for additional housing. (DEIR Section 4.4.3.3, Pages 4.4-7 to 4.4-8)

- **Impact C-PH-1:** The project, in combination with past, present, and probable future projects, would not directly or indirectly induce substantial population growth or create demand for additional housing. (DEIR Section 4.4.3.3, Pages 4.4-8 to 4.4-9)

Transportation and Circulation

- **Impact TR-1:** Project construction would not result in substantial interference with pedestrian, bicycle, or vehicle circulation and accessibility to adjoining areas, and would not result in potentially hazardous conditions. (DEIR Section 4.6.3.3, Pages 4.6-35 to 4.6-46)

- **Impact TR-2:** Project construction would not result in inadequate emergency vehicle access. (DEIR Section 4.6.3.3, Pages 4.6-46 to 4.6-47)

- **Impact TR-3:** Project operations and maintenance activities would not cause substantial additional vehicle miles traveled (VMT), substantially induce automobile travel, or cause or worsen traffic safety hazards. (DEIR Section 4.6.3.3, Pages 4.6-47 to 4.6-50)

- **Impact C-TR-1:** Construction of the project, in combination with past, present, and probable future projects, would not result in significant transportation impacts. (DEIR Section 4.6.3.3, Pages 4.6-52 to 4.6-58)

- **Impact C-TR-2:** Project operations and maintenance activities, in combination with past, present, and probable future projects, would not result in significant transportation impacts. (DEIR Section 4.6.3.3, Pages 4.6-58 to 4.6-61)

Noise and Vibration

- **Impact NO-2:** Construction of the project would not expose structures or persons to excessive groundborne vibration levels. (DEIR Section 4.7.3.3, Pages 4.7-33 to 4.7-35)

- **Impact NO-3:** Operation of the project would not result in a substantial permanent increase in ambient noise levels in the project vicinity and permanently expose persons to noise levels in excess of standards in the Noise Ordinance (Article 29 of the Police Code). (DEIR Section 4.7.3.3, Pages 4.7-35 to 4.7-39)

- **Impact NO-4:** The project would not result in substantial permanent increases in traffic-related ambient noise levels in the project vicinity. (DEIR Section 4.7.3.3, Page 4.7-39)

- **Impact NO-5:** Operation of the project would not expose any people or off-site structures to excessive groundborne vibration levels. (DEIR Section 4.7.3.3, Page 4.7-40)

- **Impact C-NO-2:** Operation of the project when considered with other cumulative development would not cause a substantial permanent increase in ambient noise levels or result in excessive groundborne vibration levels in the project vicinity. (DEIR Section 4.7.3.3, Pages 4.7-44 to 4.7-46)

Air Quality

- **Impact AQ-2:** During project operations, net changes in criteria air pollutant emissions would not result in any new violations of air quality standards, contribute to an existing or projected air quality violation, or result in a cumulatively considerable net increase in criteria air pollutants. (DEIR Section 4.8.3.3, Pages 4.8-51 to 4.8-54 and Response to Comments (RTC) Section 10.6, page 10.6-20)

- **Impact AQ-3:** : Construction and operation of the project would generate toxic air contaminants, including diesel particulate matter, but would not expose sensitive receptors to substantial air pollutant concentrations or result in a cumulatively considerable net increase in health risks or hazards. (DEIR Section 4.8.3.3, Pages 4.8-55 to 4.8-62)

- **Impact AQ-5:** Construction and operation of the BDFP facilities would not create objectionable odors that would affect a substantial number of people. (DEIR Section 4.8.3.3, Pages 4.8-66 to 4.8-70)

- **Impact C-AQ-1b:** Operation of the project, in combination with other past, present, and probable future projects, would not result in a cumulatively considerable net increase in criteria air pollutants nor contribute to cumulative regional air quality impacts. (DEIR Section 4.8.3.3, Page 4.8-71)

- **Impact C-AQ-2:** Construction and operation of the project, in combination with other past, present, and probable future projects, would generate toxic air contaminants, including diesel particulate matter, but would not expose sensitive receptors to substantial air pollutant concentrations or result in a cumulatively considerable net increase in health risks and hazards. (DEIR Section 4.8.3.3, Pages 4.8-71 to 4.8-75)

- **Impact C-AQ-3:** The project, in combination with past, present, and probable future projects, would not create objectionable odors that would affect a substantial number of people. (DEIR Section 4.8.3.3, Pages 4.8-76 to 4.8-80)

Greenhouse Gas Emissions

- **Impact C-GG-1:** The project would generate greenhouse gas emissions, but not at levels that would result in a significant impact on the environment or conflict with any policy, plan, or regulation adopted for the purpose of reducing greenhouse gas emissions. (DEIR Section 4.9.3.3, Pages 4.9-15 to 4.9-21)

Wind and Shadow

- **Impact WS-1:** The project structures would not alter wind in a manner that would substantially affect public areas. (DEIR Section 4.10.3.3, Pages 4.10-7 to 4.10-8)

- **Impact WS-2:** Project structures would not create new shadow in a manner that would substantially affect outdoor recreation facilities or other public areas. (DEIR Section 4.10.3.3, Pages 4.10-8 to 4.10-9)

- **Impact C-WS-1:** The project, in combination with past, present, and probable future projects, would not substantially contribute to cumulative impacts on wind. (DEIR Section 4.10.3.3, Pages 4.10-9 to 4.10-11)

- **Impact C-WS-2:** The project, in combination with past, present, and probable future projects, would not substantially contribute to cumulative impacts on shadow. (DEIR Section 4.10.3.3, Page 4.10-11)

Utilities and Service Systems

- **Impact UT-1:** Project construction would not result in a determination by the wastewater treatment provider that would serve the project that it has inadequate capacity to serve the project's projected demand in addition to the provider's existing commitments. (DEIR Section 4.12.3.3, Pages 4.12-14 to 4.12-15)

- **Impact UT-2:** Project construction would not result in a substantial adverse effect related to landfill capacity. (DEIR Section 4.12.3.3, Pages 4.12-15 to 4.12-16)

- **Impact UT-3:** Project construction would not result in a substantial adverse effect related to compliance with federal, state, or local statutes and regulations related to solid waste. (DEIR Section 4.12.3.3, Pages 4.12-16 to 4.12-17)

- **Impact UT-4:** The City's water supply provider would have sufficient water supply available to serve project operations from existing entitlements and resources, and the project would not require new or expanded water distribution or treatment facilities. (DEIR Section 4.12.3.3, Pages 4.12-17 to 4.12-18)

- **Impact UT-5:** Project operations would be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs. (DEIR Section 4.12.3.3, Pages 4.12-18 to 4.12-19)

- **Impact UT-6:** Project operations would not result in a substantial adverse effect related to compliance with federal, state, or local statutes and regulations related to solid waste. (DEIR Section 4.12.3.3, Page 4.12-20)

- **Impact C-UT-1:** The project, in combination with past, present, and probable future projects, would not result in significant cumulative impacts on utilities and service systems. (DEIR Section 4.12.3.3, Pages 4.12-21 to 4.12-22)

Public Services

- **Impact PS-1:** Construction and operation of the BDFP would not increase demand for public services to an extent that would require new or physically altered governmental facilities in order to maintain acceptable service ratios, response times, or other performance objectives for public services. (DEIR Section 4.13.3.3, Pages 4.13-7 to 4.13-8)

- **Impact C-PS-1:** The project, in combination with past, present, and probable future projects, would not substantially contribute to cumulative impacts related to public services. (DEIR Section 4.13.3.3, Pages 4.13-8 to 4.13-9)

Biological Resources

- **Impact BI-2:** Project construction would not have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act through direct removal, filling, hydrological interruption, or other means. (DEIR Section 4.14.3.3, Page 4.14-20)

- **Impact BI-3:** Construction activities would not conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance. (DEIR Section 4.14.3.3, Page 4.14-21)

Geology and Soils

- **Impact GE-1:** The project would not expose people or structures to the risk of loss, injury, or death involving seismic ground shaking or seismically induced ground failure. (DEIR Section 4.15.3.3, Pages 4.15-20 to 4.15-21)

- **Impact GE-2:** The project would not result in substantial erosion. (DEIR Section 4.15.3.3, Page 4.15-22)

- **Impact GE-3:** The project site is not located on a geologic unit or soil that is unstable, and the site would not become unstable as a result of the project. (DEIR Section 4.15.3.3, Pages 4.15-22 to 4.15-24)

- **Impact C-GE-1:** The project, in combination with past, present, and probable future projects, would not substantially contribute to cumulative impacts on geology or soils. (DEIR Section 4.15.3.3, Pages 4.15-26 to 4.15-27)

Hydrology and Water Quality

- **Impact HY-1:** Construction of the project would not violate water quality standards or waste discharge requirements or otherwise substantially degrade water quality. (DEIR Section 4.16.3.3, Pages 4.16-37 to 4.16-41)

- **Impact HY-2:** Construction of the project would not substantially deplete groundwater supplies or interfere with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table. (DEIR Section 4.16.3.3, Pages 4.16-41 to 4.16-42)

- **Impact HY-3:** Construction of the project would not place structures within a 100-year flood zone or expose people or structures to a significant risk of loss, injury, or death involving flooding under current conditions or future conditions resulting from sea level rise. (DEIR Section 4.16.3.3, Pages 4.16-42 to 4.16-43)

- **Impact HY-4:** Construction of the project would not expose people or structures to a significant risk of loss, injury, or death involving inundation by seiche or tsunami. (DEIR Section 4.16.3.3, Pages 4.16-43 to 4.16-44)

- **Impact HY-5:** Operation of the project would not violate water quality standards or waste discharge requirements or otherwise substantially degrade water quality. (DEIR Section 4.16.3.3, Pages 4.16-44 to 4.16-49)

- **Impact HY-6:** Operation of the project would not substantially deplete groundwater supplies or interfere with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table. (DEIR Section 4.16.3.3, Pages 4.16-49 to 4.16-50)

- **Impact HY-7:** Operation of the project would not exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff. (DEIR Section 4.16.3.3, Page 4.16-50)

- **Impact HY-8:** Operation of the project would not include the construction of structures that would impede flood flows within an existing 100-year flood zone or 100-year flood zones resulting from sea level rise. (DEIR Section 4.16.3.3, Pages 4.16-51 to 4.16-52)

- **Impact C-HY-1:** The project, in combination with past, present, and probable future projects in the site vicinity, would not result in significant adverse cumulative hydrology impacts. (DEIR Section 4.16.3.3, Pages 4.16-52 to 4.16-53)

- **Impact C-HY-2:** The project, in combination with past, present, and probable future projects in the site vicinity, would not result in significant adverse cumulative water quality impacts. (DEIR Section 4.16.3.3, Page 4.16-54)

Hazards and Hazardous Materials

- **Impact HZ-1:** Project construction and operation would not result in a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials. (DEIR Section 4.17.3.3, Pages 4.17-25 to 4.17-26)

- **Impact HZ-2:** Project construction and operation would not result in reasonably foreseeable conditions involving the release of hazardous building materials to the environment. (DEIR Section 4.17.3.3, Pages 4.17-27 to 4.17-28)

- **Impact HZ-3:** Project construction and operation would not release hazardous emissions or handle acutely hazardous materials, substances, or waste within one- quarter mile of an existing or proposed school. (DEIR Section 4.17.3.3, Page 4.17-29)

- **Impact HZ-4:** The project would be located on a site that is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5; however, project construction and operation would not result in a significant hazard to the public or the environment under reasonably foreseeable conditions. (DEIR Section 4.17.3.3, Pages 4.17-29 to 4.17-34)

- **Impact HZ-5:** Project construction and operation would not impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan. (DEIR Section 4.17.3.3, Pages 4.17-34 to 4.17-35)

- **Impact HZ-6:** Project construction and operation would not result in a significant risk of loss, injury, or death involving fire. (DEIR Section 4.17.3.3, Pages 4.17-35 to 4.17-36)

- **Impact C-HZ-1:** The project, in combination with past, present, and probable future projects, would not substantially contribute to cumulative hazards or hazardous materials impacts. (DEIR Section 4.17.3.3, Pages 4.17-36 to 4.17-38)

Mineral and Energy Resources

- **Impact ME-1:** Construction of the project would not result in the use of large amounts of fuel, water, or energy, or use these resources in a wasteful manner. (DEIR Section 4.18.3.3, Pages 4.18-13 to 4.18-15)

- **Impact ME-2:** Operation of the project would not result in the use of large amounts of fuel, water, or energy, or use these resources in a wasteful manner. (DEIR Section 4.18.3.3, Pages 4.18-15 to 4.18-20)

- **Impact C-ME-1:** The project, in combination with past, present, and probable future projects, would not encourage activities that result in the use of large amounts of fuel, water, or energy, or use such resources in a wasteful manner. (DEIR Section 4.18.3.3, Pages 4.18-20 to 4.18-21)

III. Findings of Potentially Significant or Significant Impacts That Can Be Avoided or Reduced to a Less-Than-Significant Level through Mitigation and the Disposition of the Mitigation Measures

CEQA requires agencies to adopt mitigation measures that would avoid or substantially lessen a project's identified significant impacts or potentially significant impacts if such measures are feasible (unless mitigation to such levels is achieved through adoption of a project alternative). The findings in this Section III and in Section IV concern mitigation measures set forth in the EIR. These findings discuss mitigation measures as proposed in the EIR and recommended for adoption by the SFPUC, which can be implemented by the SFPUC. The mitigation measures proposed for adoption in this section and referenced following each Project impact discussed in this Section III, are the same as the mitigation measures identified in the Final EIR for the Project. The full text of each mitigation measure listed in this section is contained in the Final EIR and in Attachment B, the MMRP. Attachment B identifies the SFPUC as the agency responsible for the implementation of all mitigation measures and establishes monitoring actions and a monitoring schedule.

This Commission recognizes that some of the mitigation measures are partially within the jurisdiction of other agencies. The agencies and measures are:

- San Francisco Planning Department (Mitigation Measure M-CR-1: Documentation of Historic Resources and Interpretive Display; Mitigation Measure M-CR-2a: Archaeological Testing, Monitoring, and/or Data Recovery; Mitigation Measure M-CR-2b: Accidental Discovery of Archaeological Resources; Mitigation Measure M-AQ-1b: Emissions Offsets; Mitigation and Mitigation Measure M-GE-4: Paleontological Resources Monitoring and Mitigation Program).

- San Francisco Planning Department and Bay Area Air Quality Management District (BAAQMD) (Mitigation Measure M-AQ-1b: Emissions Offsets).

- CDFW (Mitigation Measure M-BI-1e: Protective Measures for Special Status Bats and Maternity Roosts); and

The Commission urges these remaining agencies to assist in implementing these mitigation measures and finds that these agencies can and should participate in implementing these mitigation measures.

The Commission adopts all of the mitigation measures proposed for the Project. The Commission finds that all of the mitigation measures are appropriate and feasible and that changes or alterations will be required in, or incorporated into, the Project that mitigate or avoid the significant environmental effects as identified in the Final EIR. The Commission finds that for the reasons set forth in the Final EIR and elsewhere in the record, the impacts identified in this section would be reduced to a less-than-significant level through implementation of the mitigation measures identified in this section.

Project Impacts

Cultural Resources

Impact CR-2: The project could cause a substantial adverse change in the significance of an archeological resource. (DEIR Section 4.5.3.3, Pages 4.5-45 to 4.5-54)

Implementation of Mitigation Measure M-CR-2a and Mitigation Measure M-CR-2b would reduce any impacts on known (CA-SFR-171, a National Register-eligible prehistoric archaeological site) or previously unrecorded and buried (or otherwise obscured) archaeological deposits to *less-than-significant* levels by requiring the SFPUC and its contractors to implement the Archaeological Research Design and Treatment Plan and adhere to the appropriate procedures and protocols to identify and appropriately treat possible archaeological resources discovered during construction activities.

- *Mitigation Measure M-CR-2a: Archeological Testing, Monitoring, and/or Data Recovery*

- *Mitigation Measure M-CR-2b: Accidental Discovery of Archeological Resources*

Impact CR-3: The project could disturb human remains, including those interred outside of formal cemeteries. (DEIR Section 4.5.3.3, Pages 4.5-54 to 4.5-55)

Implementation of Mitigation Measure M-CR-2a would reduce any impacts on buried human remains and associated burial items that are accidentally discovered during project construction activities to *less-than-significant* levels by requiring the SFPUC to solicit the Most Likely Descendant's recommendations and adhere to appropriate excavation, removal, recordation, analysis, custodianship, curation, and final disposition protocols.

- *Mitigation Measure M-CR-2a: Archeological Testing, Monitoring, and/or Data Recovery*

Impact C-CR-2: The project, in combination with past, present, and probable future projects, could result in cumulative adverse impacts on archeological resources and human remains. (DEIR Section 4.5.3.3, Pages 4.5-57 to 4.5-58)

See Impacts CR-2 and CR-3. Implementation of the listed mitigation measures would reduce the Project's contribution to cumulative impacts on archaeological resources and human remains encountered during construction to a *less-than-significant* level.

- *Mitigation Measure M-CR-2a: Archeological Testing, Monitoring, and/or Data Recovery*

- *Mitigation Measure M-CR-2b: Accidental Discovery of Archeological Resources*

Noise

Impact NO-1: Construction of the project could cause a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project and could expose people to or generate noise levels in excess of standards in the Noise Ordinance. (DEIR Section 4.7.3.3, Pages 4.7-22 to 4.7-33)

Implementation of Mitigation Measure M-NO-1a and M-NO-1b would reduce any noise impacts during construction to *less-than-significant* levels by requiring temporary noise control measures in proximity of sensitive receptors.

- *Mitigation Measure M-NO-1a: Shielding of Concrete Saw Operations*

- *Mitigation Measure M-NO-1b: Construction Noise Control Measures at Southeast Greenhouses Staging Area*

Impact C-NO-1: : Construction activities of the project combined with cumulative construction noise in the project vicinity could cause a substantial temporary or periodic increase in ambient noise levels in the project vicinity or result in excessive groundborne vibration levels during construction. (DEIR Section 4.7.3.3, Pages 4.7-41 to 4.7-44)

- Implementation of Mitigation Measure M-NO-1b would reduce the project's contribution to potential cumulative noise impacts to less than significant.

- *Mitigation Measure M-NO-1b: Construction Noise Control Measures at Southeast Greenhouses Staging Area*

Air Quality

Impact AQ-4: The project's construction-related air pollutant emissions could conflict with, or obstruct implementation of, the 2010 Clean Air Plan. (DEIR Section 4.8.3.3, Pages 4.8-62 to 4.8-66, RTC Section 10.6, pages 10.6-15 and 10.6-16, and RTC Section 11.2, pages 11-1 to 11-2)

Implementation of Mitigation Measure M-AQ-1a and M-AQ-1b would ensure that the project with be consistent with the 2010 Clean Air Plan's control measures, such that the project would not conflict with or obstruct the implementation of the 2010 Clean Air Plan, and the impact would be *less-than-significant*.

- *Mitigation Measure M-AQ 1a: Construction Emissions Minimization*

- *Mitigation Measure M-AQ-1b: Emission Offsets*

Biological Resources

Impact BI-1: Project construction could have a substantial adverse effect, either directly or through habitat modifications, on species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or United States Fish and Wildlife Service. (DEIR Section 4.14.3.3, Pages 4.14-16 to 4.14-20)

Implementation of Mitigation Measures M-BI-1 would reduce any potential impacts on special-status bats and maternity roosts to *less-than-significant* levels by requiring preconstruction surveys and specific avoidance or minimization measures.

- *Mitigation Measure M-BI-1: Protective Measures for Special Status Bats and Maternity Roosts*

Impact C-BI-1: The project, in combination with past, present, and probable future projects, could substantially contribute to cumulative impacts on biological resources. (DEIR Section 4.14.3.3, Pages 4.14-22 to 4.14-23)

Implementation of Mitigation Measure M-BI-1 would reduce the project's contribution to potential cumulative impacts to less than significant.

- *Mitigation Measure M-BI-1: Protective Measures for Special Status Bats and Maternity Roosts*

Geology and Soils

Impact GE-4: Project construction could result in a substantial adverse effect by directly or indirectly destroying a unique paleontological resource or site or unique geologic feature. (DEIR Section 4.15.3.3, Pages 4.15-24 to 5.15-25)

Implementation of Mitigation Measure M-GE-4, Paleontological Resources Monitoring and Mitigation Program, would reduce the Project's potential construction-related impacts on paleontological resources to *less-than-significant* levels by requiring the preparation and implementation of a Paleontological Resources Monitoring and Mitigation Program, which shall specify emergency discovery procedures to be followed in the event of a discovery.

- *Mitigation Measure M-GE-4: Paleontological Resources Monitoring and Mitigation Program*

Impact C-GE-2: The project, in combination with past, present, and probable future projects, could substantially contribute to cumulative impacts on paleontological resources. (DEIR Section 4.15.3.3, Page 4.15-27)

See Impacts GE-3. Implementation of the listed mitigation measure would reduce the Project's contribution to cumulative impacts on paleontological resources encountered during construction to a *less-than-significant* level.

- *Mitigation Measure M-GE-4: Paleontological Resources Monitoring and Mitigation Program*

IV. Significant Impacts That Cannot Be Avoided or Reduced to a Less-Than-Significant Level

Based on substantial evidence in the whole record of these proceedings, the SFPUC finds that, where feasible, changes or alterations have been required or incorporated into the Biosolids Digester Facilities Project to reduce the significant environmental impacts as identified in the Final EIR for the Project. Most Project-specific impacts will be reduced to a **less-than-significant level** with the implementation of the mitigation measures proposed in the Final EIR and set forth in the MMRP, attached hereto as Attachment B.

The SFPUC further finds, however, that the Project will contribute to the significant and unavoidable impacts, even with implementation of mitigation measures. For the impacts listed below, the effect remains **significant and unavoidable**. The SFPUC determines that the following significant impacts on the environment, as reflected in the Final EIR, are unavoidable, but under Public Resources Code Section 21081(a) (3) and (b), and CEQA Guidelines Sections 15091(a) (3), 15092(b) (2) (B), and 15093, the SFPUC determines that the impacts are acceptable due to the overriding considerations described in Section VI below. This finding is supported by substantial evidence in the record of this proceeding.

<u>Cultural Resources Impacts</u>

- **Impact CR-1: The project would cause a substantial adverse change in the significance of a historical resource as defined in CEQA Guidelines Section 15064.5, including those resources listed in Article 10 or Article 11 of the San Francisco Planning Code.** (DEIR Section 4.5.3.3, Pages 4.5-42 to 4.5-45)

- **Impact C-CR-1: The project, in combination with past, present, and probable future projects, would substantially contribute to cumulative adverse historic architectural resources impacts.** (DEIR Section 4.5.3.3, Pages 4.5-55 to 4.5-57)

The project would result in the removal of the Central Shops (including Buildings A and B), which comprise a complex that is eligible for listing in the California and National Registers. The removal of Buildings A and B at the Central Shops would cause a substantial adverse change in the significance of the historical resource because the project would demolish the physical characteristics that convey the resource's historical significance and that justify its individual eligibility for inclusion in the California and National Registers, resulting in a significant impact under CEQA Guidelines Section 15064.5. Implementing Mitigation Measure M-CR-1

(Documentation of Historic Resources and Interpretive Display) would reduce the severity of the impact. However, implementation of Mitigation Measure M-CR-1 would not reduce the severity of the impact to a less-than-significant level, and the impact would be significant and unavoidable with mitigation.

In addition, a portion of the SEP, including 26 buildings and structures that comprise most of the southernmost block of the SEP and a portion of the block adjacent to the north, qualifies as a California Register- and National Register-eligible historic district, named the *Southeast Treatment Plant Streamline Moderne Industrial Historic District* (district). The SHPO concurred with this recommendation in a letter dated October 6, 2016. Of the 26 buildings within the historic district, 22 buildings and structures were assessed as contributors to the district's significance. The impacts associated with the loss of SEP Building 870 (as part of the Project) in combination with the impact associated with the proposed future demolition of all existing digesters (Buildings 630-730) and their control buildings (Buildings 620 and 680), as part of the Demolition of the Existing SEP Digesters and Southside Renovation Project (a reasonably foreseeable future project included in the cumulative analysis), would result in a significant, adverse cumulative impact on historic architectural resources. With these two projects combined, the district would lose approximately 13 of its 22 contributors, or 59 percent of the district's contributory buildings as part of a future cumulative scenario. The material impairment of over 50 percent of the district's contributory buildings would mean that the district as a whole would no longer retain sufficient integrity to convey its associations under National Register/California Register criteria A/1 or C/3. This would be considered a significant impact. Implementation of Mitigation Measure M-CR-1 (Documentation of Historic Resources and Interpretive Display) would reduce the severity of the cumulative impact but would not reduce the impacts to the district to a less-than-significant level. As such, the cumulative impact of the project in combination with the future demolition of the existing digesters and control buildings would be a significant and unavoidable cumulative impact on historic resources, even with mitigation. The proposed future demolition of the existing digesters will be subject to CEQA environmental review.

Although the Project would result in the loss of Building 870, only one of the district's 22 contributory buildings, the overall implementation of the Project would replace the function of the existing digesters and associated control buildings, thereby allowing for demolition of the existing digesters and control buildings. Therefore, the project's contribution to this cumulative impact would be cumulatively considerable (i.e., significant), and the cumulative impact on historic districts would be ***significant and unavoidable with mitigation.***

<u>Air Quality Impacts</u>

- **Impact AQ-1: The project's construction activities would not generate fugitive dust that could violate an air quality standard or contribute substantially to an existing or projected air quality violation, but project construction would generate criteria air pollutants that would violate an air quality standard and contribute substantially to an**

existing or projected air quality violation, and result in a cumulatively considerable net increase in criteria air pollutants. (DEIR Section 4.8.3.3, Pages 4.8-43 to 4.8-51)

- **Impact C-AQ-1a: Construction of the project, in combination with other past, present, and probable future projects, would result in a cumulatively considerable net increase in criteria air pollutants and contribute to cumulative regional air quality impacts.** (DEIR Section 4.8.3.3, Pages 4.8-70 to 4.8-71)

Construction of the project would occur over approximately five years. The SFPUC, through its contractors, would be required to implement air emissions control measures in compliance with the requirements of the Clean Construction Ordinance. With these control measures, estimated average daily construction emissions of NO_x, would exceed the applicable significance thresholds. Implementation of Mitigation Measure M-AQ-1a (Construction Emissions Minimization) would help to reduce NO_x emissions, but not to below the applicable significance threshold during the first and third construction years. Implementation of Mitigation Measure M-AQ-1b (Emission Offsets) could offset the residual NO_x emissions to below significance thresholds. While use of waivers allowed under Mitigation Measure M-AQ-1a could alter the residual NOx emissions requiring offsets under Mitigation Measure M-AQ-1b, use of these waivers is not expected to occur frequently enough to alter the amount of offsets that would be required under Mitigation Measure M-AQ-1b.

While direct SFPUC offset opportunities have not been fully verified, to further mitigate these significant and unavoidable impacts, the SFPUC has evaluated and recommends potential offset projects as listed in the Response to Comments document (pg. 4.6-17) to satisfy Mitigation Measure M-AQ-1b. These offset projects include use of renewable diesel for the SFPUC Headworks Replacement Project and replacing old diesel equipment at SFPUC facilities (at the Southeast Community Facility and the City Distribution Division). These emission reductions would occur in the vicinity of the BDFP and mitigate the construction impacts on air quality in the vicinity of the Bayview-Hunters' Point neighborhood. If verified and approved, these opportunities could sufficiently offset the estimated NOx exceedances.

Although implementation of these two mitigation measures combined would mitigate NO_x emissions to below threshold levels, construction-related NO_x emissions are considered ***significant and unavoidable with mitigation*** because the offsets identified by SFPUC, described above and in the RTC, are not verified at this time, and therefore some uncertainty remains as to their ability to fully mitigate this impact..

Likewise, the Project would also be considered to result in a cumulatively considerable contribution to regional air quality impacts even with implementation of mitigation measures identified for Impact AQ-1, and the cumulative impact is also considered significant and unavoidable with mitigation for the first and third years of construction, and less than significant with mitigation for all other construction years. Because the project's criteria pollutant emissions could result in a cumulatively considerable contribution to regional air quality impacts during the first and third years of construction, the cumulative impact of construction-related criteria pollutant emissions is considered significant and unavoidable with mitigation. Therefore, the

residual impact of construction emissions was conservatively considered ***significant and unavoidable with mitigation***, even with implementation of identified mitigation measures.

V. Evaluation of Project Alternatives

This section describes the Project as well as alternatives and the reasons for approving the Project and for rejecting the alternatives as infeasible. CEQA mandates that an EIR evaluate a reasonable range of alternatives to the Project or the Project location that generally reduce or avoid potentially significant impacts of the Project. CEQA requires that every EIR also evaluate a "No Project" alternative. Alternatives provide a basis of comparison to the Project in terms of their significant impacts and their ability to meet Project objectives. This comparative analysis is used to consider reasonable, potentially feasible options for minimizing environmental consequences of the Project.

A. Alternatives Rejected and Reasons for Rejection

The Commission rejects the alternatives set forth in the Final EIR and listed below because the Commission finds that there is substantial evidence, including evidence of economic, legal, social, technological, and other considerations described in this section in addition to those described in Section VI below under CEQA Guidelines 15091(a)(3), that make such Alternatives infeasible. In making these infeasibility determinations, the Commission is aware that CEQA defines "feasibility" to mean "capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, social, legal, and technological factors." The Commission is also aware that under CEQA case law the concept of "feasibility" encompasses (i) the question of whether a particular alternative promotes the underlying goals and objectives of a project, and (ii) the question of whether an alternative is "desirable" from a policy standpoint to the extent that desirability is based on a reasonable balancing of the relevant economic, environmental, social, legal, and technological factors.

The following four alternatives are analyzed in the EIR:

- Alternative A: No Project
- Alternative B: Pier 94 Backlands
- Alternative C: Historical Resources Relocation
- Alternative D: SEP South/Quint Street

Alternative A: No Project

The No Project Alternative represents what would reasonably be expected to occur in the foreseeable future if the project were not to be approved. Under the No Project Alternative, the BDFP would not be constructed and the SFPUC would continue to operate and maintain the existing SEP solids treatment and energy recovery facilities indefinitely. The SFPUC would not demolish Central Shops Buildings A and B, an identified individual historical resource. However, because of the age and condition of the existing facilities, the SFPUC would need a more rigorous

program to repair and replace facilities, requiring up to five additional permanent staff over the existing conditions. In addition, in order to maintain reliable operations, increased levels of repair and replacement of equipment and facilities would ultimately be required.

The No Project Alternative would have the same risk of upset compared to existing conditions, but the risk of upset in the future would increase the longer the existing solids treatment facilities are in use. The risk of upset would be substantially higher than what would occur under the proposed project. The existing facilities are not built to current seismic standards, nor are they designed for future sea level rise considerations. Thus, long-term continued use of the existing solids treatment facilities under the No Project Alternative would result in an increasing risk of failure and shutdown the longer this equipment is used. A seismic event in the SEP vicinity could have severe consequences. In addition to the increased likelihood of physical damage and release during an earthquake, failure of portions of the SEP could reduce the efficacy of wastewater and solids treatment and limit the facilities available for wastewater processing. The SFPUC's ability to treat wastewater could be compromised, with implications for public health and safety as well as regulatory permit violations.

The No Project Alternative would avoid the significant and unavoidable impacts related to historical resources and construction-phase nitrogen oxide emissions identified for the proposed project. Under "normal" conditions (without breakdowns and equipment failure), the No Project Alternative would also avoid all construction and operational impacts that were identified for the project, but under possible future scenarios with breakdowns and equipment failures, there would be potential for a wide range of impacts, depending on the nature and extent of those breakdowns.

However, unlike the proposed project, the No Project Alternative would have a potentially significant impact related to greenhouse gas emissions because it would not recapture energy from increased digester gas production (and would not improve biosolids reuse opportunities). Thus, the No Project Alternative would not be consistent with adopted policies intended to reduce statewide greenhouse gas emissions. This would also be considered a wasteful use of a local energy resource, and would be a significant impact that would not occur under the proposed project. However, there are feasible mitigation measures that could reduce these impacts to less than significant.

The No Project Alternative is hereby rejected as infeasible because, although it would eliminate the Project's significant and unavoidable impacts, it would fail to meet most of the Project's objectives, and would still result in the potential for a wide range of impacts that may or may not be more severe than those identified for the project, depending on the nature and extent of breakdowns of existing equipment. Therefore, the No Project Alternative is not a feasible alternative.

Alternative B: Pier 94 Backlands

The Pier 94 Backlands Alternative would construct the BDFP facilities on approximately 15-acres within the 27-acre Pier 94 Backlands, one of the same sites as the potential staging areas under the proposed project. Under this alternative, no construction or demolition activities would

occur at the project site, and Central Shops Buildings A and B would not be demolished. This alternative was selected for evaluation because it would avoid a significant impact on a historical resource, and thus is a full preservation alternative. This alternative was also one of two sites recommended by an advisory group representing the local Bayview-Hunters Point community (the advisory group, the Southeast Digester Task Force, recommended the Central Shops site and the Pier 94 Backlands site).[3]

This alternative would also require construction and operation of multiple pipelines to convey sludge and other materials about 4,000 feet between the SEP and the Pier 94 Backlands. Under this alternative, the SFPUC would have to secure permission to use the Pier 94 Backlands site from the Port of San Francisco, and the State Lands Commission would have to make a public trust determination. To secure access to the site, the SFPUC would enter a trust exchange agreement with the State Lands Commission either through negotiation or if authorized by special legislation. In the trust exchange agreement, the SFPUC would need to place into the trust land of similar size and value as the area needed for this alternative.

The proposed facilities under this alternative would occupy a larger area than the proposed project (15 acres compared to 10 acres), and the maximum height of structures would be lower (40 feet compared to 65 feet). The distance of the digesters to the nearest residences would be greater than under the proposed project (more than 1,800 feet compared to 1,000 feet). Construction requirements at the Pier 94 Backlands site would generally be the same as those of the proposed project, but there would be additional construction required for new utilities at the site and for the pipelines construction between the Pier 94 Backlands and the SEP. Construction duration would be the same as the proposed project, but the start date for construction would be delayed by at least several years due to site acquisition and use requirements.

The Pier 94 Backlands Alternative would avoid one significant and unavoidable impact on historical resources by retaining Central Shops Buildings A and B in place, but the other significant and unavoidable impacts of this alternative on historical resources and construction-phase nitrogen oxide emissions would be the same or more severe than those of the proposed project. This alternative would have additional construction noise impacts associated with pipeline construction that would not occur under the proposed project as well as increased potential for vibration impacts along the pipeline route, although these impacts could be mitigated to less than significant with similar mitigation measures to those identified for the proposed project. The Pier 94 Backlands Alternative would result in minor differences in construction-related toxic air contaminant emissions, but like the proposed project, impacts would be less than significant. Unlike the proposed project that would have significant but mitigable impacts, impacts of this alternative on biological resources (roosting bats) and on paleontological resources would be less than significant. All other impacts would be less than significant, assuming compliance with and implementation of all federal, state, and local regulations designed to protect the environment and implementation of SFPUC standard construction measures.

[3] Southeast Digester Task Force for the San Francisco Public Utilities Commission, *Review of the Biosolids Digester Facility Project*, June 2, 2010.

The Pier 94 Backlands Alternative is hereby rejected as infeasible because, although it would eliminate the significant, unavoidable impact to Central Shops Buildings A and B, it would 1) not eliminate the other significant, unavoidable impacts to the historic district and air quality; 2) fail to meet four of the Project's objectives (related to visual improvements at the SEP, construction schedule, efficiency of existing infrastructure and resources, and rate payer affordability); 3) result in a greater area of disturbance (about 10 additional acres) compared to the project; and 4) require approval from the Stand Lands Commission (and possibly approval from state legislature) for the trust exchange agreement and approval of long-term use of Pier 94 Backlands from the Port which could increase complexity and uncertainty on the viability of this alternative). Therefore, the Pier 94 Backlands Alternative is not a feasible alternative.

Alternative C: Historical Resources Relocation

The Historical Resources Relocation Alternative is a full preservation alternative that would consist of full construction and operation of the BDFP as proposed, plus the relocation and rehabilitation of Central Shops Buildings A and B to a similar industrial setting in San Francisco. The relocation, rehabilitation, and reuse of Buildings A and B would be consistent with the Secretary of the Interior's Standards and would reduce the significant and unavoidable impact on historical resources under the proposed project to a less-than-significant level. The SFPUC has identified an approximately three-acre site at Pier 90 on Amador Street east of Illinois Street and Cargo Way as a potential new location for Buildings A and B. The Pier 90 site is within a port-priority use area, and it is assumed that future uses of Buildings A and B at this site would be consistent with the existing use of the Central Shops, as well as with allowable uses within a port-priority area. Construction requirements for this alternative would be the same as those of the proposed project, with the addition of about one year at the beginning of the construction period to dismantle and transport Buildings A and B to Pier 90 plus the site preparation and construction activities required to reconstruct and rehabilitate these buildings at the new site.

Because the Historical Resources Relocation Alternative would involve full implementation of the BDFP as proposed, this alternative would have all of the same environmental impacts as those identified for the proposed project, with the exception of avoiding the significant and unavoidable impact associated with demolition of Central Shops Buildings A and B. However, the significant and unavoidable impact of this alternative on the historic district would be the same as those of the project, and the significant and unavoidable impact associated with construction-phase nitrogen oxide emissions would be more severe than those of the proposed project because of the additional emissions resulting from relocation and rehabilitation of the Central Shops buildings. In addition, there would be impacts associated with relocation and rehabilitation of the Central Shops Buildings A and B at an off-site location, although any significant impacts could generally be mitigated to less than significant with similar mitigation measures identified for the proposed project.

The Historical Resources Relocation Alternative is hereby rejected as infeasible because, although it would eliminate the significant, unavoidable impact to Central Shops Buildings A and B, it would 1) not eliminate the other significant, unavoidable impacts to the historic district and air quality; 2) fail to meet two of the Project's objectives (related to construction schedule and

rate payer affordability), 3) result in a slightly greater area of disturbance (about 3 additional acres) compared to the project and 4) the feasibility of meeting Secretary of the Interior standards for the relocated historic resource is uncertain. Therefore, the Historical Resources Relocation Alternative is not a feasible alternative.

Alternative D: SEP South/Quint Street Alternative

The SEP South/Quint Street Alternative is a full preservation alternative that would consist of construction and operation of the same processes and facilities as the proposed project, except that the project facilities would be reconfigured and located within different portions of the SEP boundaries, the Asphalt Plant site, portions of the Central Shops site, and within the right-of-way of Quint Street between Jerrold Avenue and the Caltrain right-of way. Central Shops Buildings A and B and the immediate surrounding area would be preserved, thereby avoiding the significant impact on this historical resource that would occur with its demolition under the proposed project. Under this alternative, the digesters would be located at the Asphalt Plant site, placing the digesters closer to the nearest residences (600 feet to Phelps Street and 700 feet to Oakdale Avenue) compared to the proposed project (1,000 feet). The location of the waste gas burners would also be closer to residences.

Construction of facilities within SEP South would require demolition of existing solids treatment facilities that need to operate during construction of the new facilities. Therefore, this alternative would require construction of interim facilities (e.g., gravity belt thickeners, centrifuge systems, sludge pipelines, biosolids dewatering, cake storage and loadout, etc.) at another location prior to construction, and these interim facilities would be required to operate for at least seven years, until construction is completed and the new facilities are fully commissioned. One possible site for the interim facilities is the Southeast Greenhouses site. In addition, this alternative would require permanently vacating the segment of Quint Street between Jerrold Avenue and the Caltrain right-of way for construction of both aboveground and below ground structures. This is unlike the proposed project, under which this same portion of Quint Street would be closed to the public and incorporated into the project site, but no permanent facilities would be constructed here, and relocation of underground utilities would not be required. The SEP South/Quint Street Alternative would require relocation of existing utilities under Quint Street, including a 24-inch diameter high pressure gas line. The location and extent of relocating the existing utilities has not been identified, but could require construction in locations outside of the SEP boundaries. The construction schedule for this alternative would be at least seven years, substantially longer than the five years estimated for the proposed project, and the start date of construction would be delayed by several years.

The SEP South/Quint Street Alternative would result in most of the same impacts as the proposed project, plus several significant impacts that would not occur under the proposed project. Even though the Central Shops Buildings A and B would be retained in place, at least seven structures that are contributors to the eligible historic district would be demolished, a significant and unavoidable impact that would not occur under the proposed project. In addition, due to the closer proximity of sensitive receptors, health risk impacts associated with exposure to toxic air contaminants would be greater than those under the proposed project, a potentially significant

impact. Increased exposure to toxic air contaminants due to closer proximity to sensitive receptors would occur during construction (due to construction equipment and trucks) as well as during operations (due to waste gas burners). The extended construction period for this alternative would extend the duration of all construction-related impacts, and specifically air pollutant emissions and noise impacts, which as stated above would occur in closer proximity to sensitive receptors, further exacerbating these impacts.

The SEP South/Quint Street Alternative is hereby rejected as infeasible because, although it would eliminate the significant, unavoidable impact to Central Shops Buildings A and B, it would 1) not eliminate the other significant, unavoidable impacts to the historic district and air quality; 2) have an additional project specific significant and unavoidable impact on the historic district, 3) fail to meet two of the Project's objectives (related to construction schedule and rate payer affordability), and 4) require a longer construction duration in proximity to sensitive receptors which could generate greater health risks. Therefore, the SEP South/Quint Street Alternative is not a feasible alternative.

Environmentally Superior Alternative. Either Alternative B, Pier 94 Backlands Alternative or Alternative C, the Historical Resources Relocation Alternative would be considered environmentally superior to the proposed project because either would avoid the proposed project's significant and unavoidable impact on historical resources associated with the demolition of Central Shops Buildings A and B. However, on balance, the Historical Resources Relocation Alternative would have a slight environmental advantage over the Pier 94 Backlands Alternative as the environmentally superior alternative. This is mainly because, although operational impacts would be substantially the same for these two alternatives, the construction impacts under the Pier 94 Backlands Alternative would have a substantially greater area of disturbance and affect more sensitive resources along the 4,000-foot pipeline corridor between the SEP and Pier 94 compared to the construction impacts of the Historical Resources Relocation Alternative.

C. Alternatives Considered but not Analyzed in Detail

The Draft EIR, Section 6.5 explains the process for selecting the BDFP and the alternatives considered and evaluated in the Draft EIR. Nineteen options/alternatives considered but eliminated from detailed consideration in the EIR, together with the reasons why they were eliminated, include:

- Seven alternative site locations or combinations of locations
- Three alternative site layouts
- Seven alternative approaches to preserve historical resources
- Two alternative strategies (divert wastewater flows to Oceanside Plant and use of railways for hauling biosolids)

The Draft EIR explains that all of these alternative options or strategies were eliminated from further evaluation. Reasons for elimination include but are not limited to infeasibility, greater project-level impacts on historical resources, increased risk to existing operations, complicated site acquisition and construction, reduction in operational redundancy, and inability to meet the project objectives. Some alternatives were determined to be feasible, but they did not have any environmental advantages compared to the other alternatives carried forward for analysis. The process the SFPUC undertook to consider all of these alternatives and a detailed analysis of these alternatives considered and the reasons they have been rejected from further analysis is described in the Draft EIR, Section 6.5. The SFPUC finds each of the reasons identified provide sufficient independent grounds for rejecting these alternatives.

The SFPUC finds that the Draft EIR evaluated a reasonable range of alternatives, as required by CEQA that allows Project decision-makers and the public to evaluate and compare the potential impacts of the proposed project with alternatives designed to avoid or lessen the project's environmental effects.

VI. Statement of Overriding Considerations

Pursuant to CEQA Section 21081 and CEQA Guidelines Section 15093, the Commission hereby finds, after consideration of the Final EIR and the evidence in the record, that each of the specific overriding economic, legal, social, technological and other benefits of the Project as set forth below, independently and collectively outweighs the significant and unavoidable impacts and is an overriding consideration warranting approval of the Project. Any one of the reasons for approval cited below is sufficient to justify approval of the Project. Thus, even if a court were to conclude that not every reason is supported by substantial evidence, the Commission will stand by its determination that each individual reason is sufficient. The substantial evidence supporting the various benefits can be found in the preceding findings, which are incorporated by reference into this section, and in the documents found in the Record of Proceedings, as defined in Section I.

On the basis of the above findings and the substantial evidence in the whole record of this proceeding, the Commission specifically finds that there are significant benefits of the Project that outweigh the unavoidable significant impacts to air quality and historic resources described in Section IV, above, and therefore makes this Statement of Overriding Considerations. The Commission further finds that, as part of the process of obtaining Project approval, all significant effects on the environment from implementation of the Project have been eliminated or substantially lessened where feasible. All mitigation measures proposed in the Final EIR for the Project are adopted as part of this approval action. Furthermore, the Commission has determined that any remaining significant effects on the environment found to be unavoidable are acceptable due to the following specific overriding economic, technical, legal, social, and other considerations.

Many of the existing SEP solids treatment facilities are over 60 years old, require significant maintenance, and are operating well beyond their useful life. As specified in Section 6.3.1.1 of the EIR, the Needs Assessment Report found that, in addition to failing to meet the Sewer System Improvements Program (SSIP) levels of service goals, many individual structures and facilities lack redundancy, are structurally inadequate (e.g., concrete structures exhibited cracking, leakage, and

spalling), are seismically unreliable, do not provide adequate treatment capacity to treat the solids from the projected 2045 flows and loads, and use equipment that (due, for example, to corrosion) require major maintenance, repair, or replacement. Thus, there are important public health and welfare reasons for the Project to be implemented.

The project would meet all of the objectives of the project and provide multiple benefits, as identified below:

1. The Project would replace the existing solids treatment facilities at the SEP with new infrastructure with modern and more efficient treatment technologies to protect public health and safety and provide continued regulatory compliance.

2. The Project would be co-located with the existing SEP, to maximize the efficiency of the current treatment process operations and maintenance, staffing resources, and the use of existing SFPUC infrastructure.

3. The Project would treat the solids from projected 2045 flows and loads associated with projected population growth. The project would not change the existing overall capacity of the SEP for wastewater treatment (250 million gallons per day [mgd] wet weather flow and 85 mgd dry weather flow).

4. The Project would increase the quality of the biosolids from Class B to Class A biosolids, such that 100 percent of the biosolids could be reused. Class A biosolids contain no detectable levels of pathogens and do not attract vectors such as flies, mosquitoes, and other potential disease-carrying organisms. According to the United States Environmental Protection Agency (USEPA) Guide to Part 503 Rule, Class A biosolids that meet the USEPA's metals pollutant limits are labeled "Exceptional Quality (EQ)" biosolids and have the fewest restrictions for land applications such as soil conditioning and fertilizer. Class B biosolids are treated but still contain detectible levels of pathogens.

5. With the Project, 100 percent of the digester gas generated would be used. The energy recovery facilities would maximize digester gas utilization and energy recovery for the production of heat, steam, and electrical power. The project would generate up to 5.2 megawatt of electricity in 2045which would meet the BDFP operational power needs as well as provide power to other SEP facilities. Because digester gas would be used beneficially, less flaring by the waste gas burners would occur (limited to only testing, planned maintenance and emergencies)..

6. The Project would build critical processes with redundant infrastructure to provide reliability and operational flexibility.

7. The Project would improve seismic reliability by rebuilding the digesters and solid treatment facilities to meet the latest seismic criteria, thereby reducing the possibility of structure failure.

8. The Project would limit odors from the biosolids facilities to within revised SEP site boundaries, thus minimizing impacts to neighbors. In addition, the Project would locate the digesters farther away from residents. Currently the digesters are located south of Jerrold Avenue, adjacent to residents along Phelps Street. The proposed digesters would be located at the farthest end of the project site away from these receptors, along the Caltrain right-of-way within the Central Shops site.

9. The Project would provide visual improvements that promote a cohesive architectural design and identity at the Project site, enhance the overall aesthetics, and improve the public edges in a manner consistent with the surrounding neighborhood and the rest of the SEP. Jerrold Avenue would be redesigned as part of the Project. Proposed long-term improvements to Jerrold Avenue would occur in accordance with San Francisco Better Streets Plan guidelines and may include traffic calming measures, curb extensions (road narrowing), sidewalk improvements, lighting, street trees, and safer pedestrian and worker crossings, a benefit to the neighborhood.

10. The Project would provide new facilities that are capable of accommodating or adapting to expected sea level rise over their expected life.

11. The Project would allow for timely construction of the proposed BDFP. Project construction has the shortest construction duration (5 years) compared to the other alternatives. Thus, this project would minimize construction impacts to the public.

12. The Project has the lowest cost and least amount of uncertainties with respect to timely initiation of project construction compared to the other alternatives. Hence, this Project will best serve rate payer affordability.

While the EIR concluded that the Project would result in significant unavoidable impacts to air quality from construction NOx emissions, as described above, SFPUC has committed to implement a NOx offsets program as part of its implementation of mitigation measure M-AQ-1b as described in RTC Section 10.6, pages 10.6-16 to 10.6-17), that would in practice reduce the impact to a level comparable to less than significant. The significant and unavoidable with mitigation conclusion is due to the fact that the emissions reductions that will result from the offset program are not verified yet, and therefore some uncertainty remains. The program would require the use of renewable diesel by the SFPUC Headworks Replacement Project and replacement of old, diesel equipment with newer equipment that reduce NOx emissions. Thus, with implementation of the NOx offsets, the project would likely not increase emissions above CEQA thresholds.

Having considered these benefits, including the benefits discussed in Section I above, the Commission finds that the benefits of the Project outweigh its unavoidable adverse environmental effects, and that the adverse environmental effects are therefore acceptable.

MITIGATION MONITORING AND REPORTING PROGRAM FOR BIOSOLIDS DIGESTER FACILITIES PROJECT				
MEASURES ADOPTED AS CONDITIONS OF APPROVAL	**Implementation Responsibility**	**Mitigation Schedule**	**Monitoring/Reporting Responsibility**	**Monitoring Actions/Schedule and Verification of Compliance**
MITIGATION MEASURES FOR THE BIOSOLIDS DIGESTER FACILITIES PROJECT				
Cultural Resources (Historic Resources) Mitigation Measures				
Applicable to Central Shops site **Mitigation Measure M-CR-1. Documentation of Historic Resources and Interpretive Display** Prior to demolition, the SFPUC shall retain a professional who meets the Secretary of the Interior's Professional Qualifications Standards for Architectural History to prepare written and photographic documentation of the Central Shops. The documentation effort shall be based on the National Park Service (NPS) Historic American Building Survey (HABS)/Historic American Engineering Record (HAER) Historical Report Level II Guidelines, and NPS's policy for photographic documentation as outlined in the National Register of Historic Places and National Historic Landmarks Survey Photo Policy Expansion. The written historical data for this documentation shall follow HABS/HAER standards. Efforts shall be made to locate original construction drawings or plans of the Central Shops. If located, these drawings shall be reproduced and included in the dataset. Historical information, as well as copies of building plans gathered from the prior evaluations of the SEP and Central Shops, can be reused and reformatted for this effort. Digital photography shall be used. The ink and paper combinations for printing photographs shall be in compliance with National Register-National Historic Landmark (NR-NHL) Photo Policy Expansion[1] and have a permanency rating of approximately 115 years. Digital photographs shall be taken as uncompressed, Tagged Image File Format (TIFF) files. Each image shall be 1,600 by 1,200 pixels at 330 pixels per inch (ppi) or larger in size, color format, and printed in black and white. The file name for each electronic image shall correspond with the index of photographs and photograph label. Photograph views for the dataset shall include (a) contextual views; (b) views of each side of each building and interior views, where possible; (c) oblique views of buildings; and (d) detail views of character-defining features. All views shall be referenced on a photographic key. This photographic key shall be on a map of the property and shall show the photograph number with an arrow to indicate the direction of the view. Historic photographs shall also be collected, reproduced, and included in the dataset. The SFPUC shall transmit the datasets as hardcopies on archival paper and in electronic PDF format to the History Room of the San Francisco Public Library, the San Francisco Planning Department, the archives of the San Francisco Public Utilities Commission, and to the Northwest Information Center of the California Historical Information Resource System. The SFPUC shall scope the documentation measures with San Francisco Planning Department Preservation staff. Preservation staff shall also review and approve the submitted documentation for adequacy. In addition, the SFPUC shall provide a permanent display of interpretive materials (which may include, but are not limited to, a display of photographs, a brochure, educational website or an exhibitive display) concerning the history and architectural features of the Central Shops. Development of the interpretive materials shall be supervised by an architectural historian or historian who meets the Secretary of the Interior's Professional Qualification Standards. The interpretative materials shall be placed in a prominent, public setting. A proposal describing the general parameters of the interpretive materials shall be approved by Planning Department Preservation staff prior to construction completion. The substance, media and other elements of such interpretive display shall be approved by Planning Department Preservation staff prior to completion of the project.	1. Qualified professional to prepare written and photographic documentation of the Central Shops 2. Qualified professional to prepare interpretative display material. 3. SFPUC to install interpretative display.	1. Prior to demolition. 2. During construction. 3. Prior to completion of the project.	1. SFPUC Bureau of Environmental Management (BEM) and San Francisco (SF) Planning Department Preservation staff 2. SFPUC BEM and SF Planning Department Preservation staff 3. SFPUC BEM and SF Planning Department Preservation staff	1. Distribution of approved HABS/HAER Historic Report to specified entities. 2. SF Planning Department Preservation staff approval of interpretative display material. 3. Documentation of installed interpretive display.

MITIGATION MONITORING AND REPORTING PROGRAM FOR BIOSOLIDS DIGESTER FACILITIES PROJECT				
MEASURES ADOPTED AS CONDITIONS OF APPROVAL	**Implementation Responsibility**	**Mitigation Schedule**	**Monitoring/Reporting Responsibility**	**Monitoring Actions/Schedule and Verification of Compliance**
MITIGATION MEASURES FOR THE BIOSOLIDS DIGESTER FACILITIES PROJECT				
Cultural Resources (Archeological Resources) Mitigation Measures				
Applicable to project site **Mitigation Measure M-CR-2a. Archeological Testing, Monitoring, and/or Data Recovery** Based on the results of the project Archeological Research Design and Treatment Plan[2] (ARDTP), legally-significant prehistoric archeological resources are present within the archeological C-APE. The following measures shall be undertaken to avoid any potentially significant adverse effects from the project on an historical resource under CEQA. The SFPUC shall retain the services of a qualified archeological consultant(s), based on standards developed by the City and County of San Francisco Environmental Review Officer (ERO). The archeological consultant(s) shall have demonstrated experience in geoarcheology and historical archeology. The archeological consultant shall implement archeological testing and other treatment as specified in the project ARDTP, as detailed below, which shall include archeological monitoring and data recovery as required pursuant to findings of ongoing testing and this measure. The archeological consultant's work shall be conducted in accordance with this measure and with the requirements of the project ARDTP at the direction of ERO or its designated representative and in coordination with the SFPUC. In instances of inconsistency between the requirement of the project ARDTP and of this archeological mitigation measure, the requirements of this archeological mitigation measure shall prevail. Project design changes after finalizing the ARDTP eliminated the portion of the C-APE that was identified in the ARDTP as sensitive for historical archeological resources. Testing as discussed below for historical archeological resources shall only be required if future design changes call for excavation in that location. If future project design changes further revise other parts of the C-APE, then testing shall only be required in archeologically sensitive areas that potentially would be adversely affected by project implementation. All plans and reports prepared by the consultant as specified herein shall be submitted directly to the ERO for review and comment and concurrently to the SFPUC for review and comment, and shall be considered draft reports, subject to revision until final approval by the ERO. Archeological monitoring and/or data recovery programs required by this measure could suspend construction of the affected area of the project for up to a maximum of four weeks. At the direction of the ERO, the suspension of construction can be extended beyond four weeks only if such a suspension is the only feasible means to reduce to a less-than-significant level potential effects on a significant archeological resource as defined in CEQA Guidelines Section 15064.5 (a) and (c).	SFPUC BEM to retain qualified professional archeologist determined, in consultation with EP archaeologist, to have specialized expertise in geoarchaeology and historical archaeology	Prior to ground disturbing activities.	SFPUC Archeological consultant to prepare and submit archeological testing plan and archaeological monitoring plan to the ERO for review and approval. BEM and ERO.	Considered complete when SFPUC retains a qualified professional archeological consultant, archeological consultant's scope has been approved by the ERO, and required plans and reports have been submitted to and approved by the ERO and submits any required reports to ERO for the archeological testing plan.
Consultation with Descendant Communities. On discovery of an archeological site[3] associated with descendant Native Americans, the Overseas Chinese, or other potentially interested descendant group, an appropriate representative[4] of the descendant group, the ERO, and the SFPUC shall be contacted. The representative of the descendant group shall be given the opportunity to monitor archeological field investigations of the site and to offer recommendations to the ERO and SFPUC regarding appropriate archeological treatment of the site, of recovered data from the site, and, if applicable, any interpretative treatment of the associated archeological site. A copy of the Final Archeological Resources Report (FARR) shall be provided to the representative of the descendant group.	1. SFPUC and archeological consultant to inform descendant group and ERO on discovery of site 2. Qualified archaeological consultant to prepare FARR 3. SFPUC to provide FARR to representative of the descendant group	1. For the duration of soil-disturbing activities 2. Prior to completion of the project.	1. SFPUC BEM and ERO 2. SFPUC BEM and ERO	1 & 2. Considered complete upon documentation of consultation and submittal of FARR to descendant group(s).

[2] Byrd, Brian F., Philip Kaijankoski, Rebecca Allen, and Matthew Russell, Archaeological Research Design and Treatment Plan for the Biosolids Digester Facility Project, Southeast Water Pollution Control Plant, San Francisco, California. Prepared for San Francisco Public Utilities Commission, October, 2016.

[3] The term "archeological site" is intended here to minimally include any archeological deposit, feature, burial, or evidence of burial.

[4] An "appropriate representative" of the descendant group is here defined to mean, in the case of Native Americans, any individual listed in the current Native American Contact List for the City and County of San Francisco maintained by the California Native American Heritage Commission and in the case of the Overseas Chinese, the Chinese Historical Society of America. An appropriate representative of other descendant groups should be determined in consultation with the Department archeologist.

MITIGATION MONITORING AND REPORTING PROGRAM FOR BIOSOLIDS DIGESTER FACILITIES PROJECT				
MEASURES ADOPTED AS CONDITIONS OF APPROVAL	**Implementation Responsibility**	**Mitigation Schedule**	**Monitoring/Reporting Responsibility**	**Monitoring Actions/Schedule and Verification of Compliance**
MITIGATION MEASURES FOR THE BIOSOLIDS DIGESTER FACILITIES PROJECT				
Cultural Resources (Archeological Resources) Mitigation Measures (cont.)				
Archeological Testing Program–Prehistoric Archeology. Depending on the results of on-going prehistoric archeological testing outlined in the project ARDTP, additional testing may be required to define site boundaries of CA-SFR-171 or other prehistoric deposits at the SEP, and to assess whether redeposited and/or reworked prehistoric archeological material identified in the project ARDTP within the C-APE has sufficient integrity to contribute to the significance of known resources at SEP. At the direction of the ERO and in coordination with SFPUC, additional testing may be rolled into a subsequent data recovery program (see below).	1. Qualified archeological consultant to scope additional testing if warranted, in consultation with the ERO, and to implement that testing 2. Qualified consultant to prepare supplemental testing report if warranted and report of supplemental archaeological testing	If additional testing is warranted, it shall be carried out prior to any soil disturbing activities that, in the assessment of the project archaeologist in consultation with ERO, have the potential to disturb archaeological resources based on the results of Phase 1 and Phase 2 preconstruction archaeological testing.	SFPUC BEM and ERO	1. Considered complete upon finding by the ERO that the archaeological testing program has been adequate to identify and assess resources likely to be present and that supplemental testing is not required. 2. If supplemental testing is required, considered complete upon submittal of the supplemental archaeological testing report.
Archeological Testing Program–Historical Archeology. If future design changes would affect the area identified as sensitive for historical archeological resources, the archeological consultant shall implement the historical archeological testing plan outlined in the project ARDTP for potential historical archeological resources that could be adversely affected by the project. The archeological testing program shall be conducted in accordance with the approved ARDTP. The project ARDTP identifies the property types of the expected archeological resource(s) that could be adversely affected by the project, the testing method to be used, and the locations recommended for testing. The purpose of the archeological testing program will be to determine to the extent possible the presence or absence of historical archeological resources and to identify and to evaluate whether any archeological resource encountered on the site constitutes an historical resource under CEQA. If future project design changes further alter the C-APE from what is identified in the ARDTP, then the archeological consultant shall prepare and submit to the ERO for review and approval an archeological testing plan (ATP) for both prehistoric and historical archeological resources to address any area added to the C-APE to accommodate the project design changes. The archeological testing program shall be conducted in accordance with the approved ATP. The ATP shall identify the property types of the expected archeological resource(s) that potentially could be adversely affected by the project, the testing method to be used, and the locations recommended for testing. The purpose of the archeological testing program will be to determine to the extent possible the presence or absence of archeological resources and to identify and to evaluate whether any archeological resource encountered on the site constitutes an historical resource under CEQA.	1. If future design changes would affect sensitive historical archaeological resources outside the C-APE but within the ATP outlined in the ARDTP, a qualified archeological consultant shall implement the ATP as outlined in the ARDTP. 2. Qualified archaeological consultant to prepare, implement and report upon an updated ATP for any new areas outside the C-APE in consultation with the ERO	1. Prior to any soil disturbing activities. 2. Prior to any soil disturbing activities.	1. SFPUC BEM and ERO 2. SFPUC BEM and ERO	1. Considered complete upon approval of the ATP in the ARDTP by the ERO and finding by the ERO that the ATP has been implemented and no further testing is warranted based on testing results. 2. Considered complete upon approval of the updated ATP by the ERO, finding by the ERO that the ATP has been implemented, and submittal and approval of a supplemental archaeological testing report.
At the completion of the archeological testing program, as required, the archeological consultant shall submit a written report of the findings to the ERO and the SFPUC. If based on the archeological testing program the archeological consultant finds that significant archeological resources may be present, the ERO in consultation with the archeological consultant and coordination with the SFPUC shall determine if additional measures are warranted. Additional measures that may be undertaken include additional archeological testing, archeological monitoring, and/or an archeological data recovery program. No archeological data recovery shall be undertaken without the prior approval of the ERO or the Planning Department archeologist. If the ERO determines that a significant archeological resource is present and that the resource could be adversely affected by the project, at the discretion of the SFPUC either: A) The project shall be re-designed so as to avoid any adverse effect on the significant archeological resource; or B) An archeological data recovery program shall be implemented, unless the ERO determines that the archeological resource is of greater interpretive than research significance and that interpretive use of the resource is feasible.	1. Based on findings of approved testing report, and if impacts cannot be avoided, SFPUC BEM and qualified archeological consultant will consult with ERO, to determine, based on relationship between locations of known and suspected resources and anticipated soil disturbance, whether additional treatment is warranted, and appropriate scope of additional treatment. 2. Qualified archaeological consultant to prepare archeological data recovery program (ADRP)	1. Upon completion of the archeological testing program and ERO approval of the archaeological testing report, and prior to ground disturbing activity at the project site. 2. Upon completion of ERO consultation on scope and prior to any ground disturbing activity.	1. SFPUC BEM, qualified archaeological consultant and ERO 2. SFPUC BEM, qualified archaeologist and ERO	1. Considered complete after ERO review and approval of report(s) on ATP findings, and after concurrence by ERO on appropriate scope of ADRP. 2. Considered complete after ERO review and approval of ADRP and implementation of the ADRP and/or interpretive program.

MITIGATION MONITORING AND REPORTING PROGRAM FOR BIOSOLIDS DIGESTER FACILITIES PROJECT				
MEASURES ADOPTED AS CONDITIONS OF APPROVAL	**Implementation Responsibility**	**Mitigation Schedule**	**Monitoring/Reporting Responsibility**	**Monitoring Actions/Schedule and Verification of Compliance**
MITIGATION MEASURES FOR THE BIOSOLIDS DIGESTER FACILITIES PROJECT				
Cultural Resources (Archeological Resources) Mitigation Measures (cont.)				
Archeological Monitoring Program. Preparation of an archeological monitoring program (AMP) may be required prior to project construction depending on the results of the prehistoric and historical archeological testing programs outlined above. If the ERO in consultation with the archeological consultant determines that an archeological monitoring program shall be implemented, the archeological monitoring program shall minimally include the following provisions: • The archeological consultant, SFPUC, and ERO shall meet and consult on the scope of the AMP reasonably prior to commencement of any project-related soils disturbing activities. The ERO in consultation with the archeological consultant shall determine what project activities shall be archeologically monitored based on the results of pre-construction archeological testing currently approved and underway or planned, and archeological sensitivity assessment based on the results of that testing; • The archeological consultant shall advise all project contractors to be on the alert for evidence of the presence of the expected resource(s), of how to identify the evidence of the expected resource(s), and of the appropriate protocol in the event of discovery of a potential archeological resource; • The archeological monitor(s) shall be present on the project site according to a schedule agreed upon by the archeological consultant and the ERO or until the ERO has, in consultation with project archeological consultant, otherwise determined that project construction activities could have no effects on significant archeological deposits and monitoring can conclude; • The archeological monitor shall record and be authorized to collect soil samples and artifactual/ecofactual material as warranted for analysis; • If an intact archeological deposit is encountered, all soils-disturbing activities in the vicinity of the deposit shall cease. The archeological monitor shall be empowered to temporarily redirect demolition/excavation/construction activities and equipment until the deposit is evaluated. The archeological consultant shall immediately notify the ERO and the SFPUC of the encountered archeological deposit. The archeological consultant shall make a reasonable effort to assess the identity, integrity, and significance of the encountered archeological deposit, and present the findings of this assessment to the ERO and the SFPUC. Whether or not significant archeological resources are encountered, the archeological consultant shall submit a written report of the findings of the monitoring program to the ERO and the SFPUC.	1. Qualified archaeological consultant to prepare an AMP 2. Qualified archaeological consultant to implement the AMP, including notification of ERO of any potentially significant discoveries, and consultation with the ERO on scope of subsequent assessment and treatment 3. Qualified archaeological consultant to prepare written report of findings during construction. Monitoring results may be included in FARR.	1. AMP to be subject to approval by ERO prior to construction. Qualified archaeologist to conduct construction crew training prior to soil disturbing activities 2. During construction 3. Post-construction	1. SFPUC BEM and ERO 2. SFPUC BEM and ERO 3. SFPUC BEM and ERO	1. Considered complete on approval of AMP(s) by ERO. 2. ERO to be notified quarterly of monitoring progress including any proposed changes in monitoring schedule or intensity; notified immediately of any potentially significant discoveries; and consulted in development of proposed assessment and treatment plan in the event of a discovery 3. ERO approval of written report of monitoring findings/ FARR.
Archeological Data Recovery Program. An archeological data recovery program shall be implemented in accord with an archeological data recovery plan (ADRP). The ADRP shall incorporate (1) programmatic-level procedures for deeply buried prehistoric archeological deposits; (2) site-specific procedures for identified prehistoric archeological deposits; (2) and site-specific procedures for historical archeological deposits (as warranted). The archeological consultant, SFPUC, and ERO shall meet and consult on the scope of the ADRP prior to preparation of a draft ADRP. The archeological consultant shall submit a draft ADRP to the ERO and SFPUC. The ADRP shall identify how the proposed data recovery program will preserve the significant information the archeological resource is expected to contain. That is, the ADRP shall identify what scientific/historical research questions are applicable to the expected resource, what data classes the resource is expected to possess, and how the expected data classes would address the applicable research questions. Data recovery, in general, should be limited to the portions of the historical resource	1. Qualified archeological consultant to prepare an ADRP to address those portions of the historic resources that could be adversely affected by the project. 2. Archaeological consultant to implement the ADRP. 3. Archaeological consultant to prepare written report of findings of the data recovery program.	1. Prior to soil disturbing activities 2. Prior to and during soil-disturbing construction activities. 3. Upon completion of all soil-disturbing activities that may trigger ADRP implementation, and upon completion of all ADRP analyses.	1. SFPUC BEM and ERO 2. SFPUC BEM and ERO	1. ERO approval of the ADRP 2. ERO approval of the final archaeological report(s) documenting implementation of the ADRP and curation of resultant archaeological collections.

MITIGATION MONITORING AND REPORTING PROGRAM FOR BIOSOLIDS DIGESTER FACILITIES PROJECT				
MEASURES ADOPTED AS CONDITIONS OF APPROVAL	**Implementation Responsibility**	**Mitigation Schedule**	**Monitoring/Reporting Responsibility**	**Monitoring Actions/Schedule and Verification of Compliance**
MITIGATION MEASURES FOR THE BIOSOLIDS DIGESTER FACILITIES PROJECT				
Cultural Resources (Archeological Resources) Mitigation Measures (cont.)				
that could be adversely affected by the project. Destructive data recovery methods shall not be applied to portions of the archeological resources if non-destructive methods are practical. The scope of the ADRP shall include the following elements: • *Field Methods and Procedures.* Descriptions of proposed field strategies, procedures, and operations for the following elements: 1) Programmatic-level procedures for deeply buried prehistoric archeological deposits potentially uncovered during excavation for deep foundations (e.g., driven, drilled, or augured piles). 2) Site-specific procedures for known/identified prehistoric archeological deposits potentially affected by project excavation activities (e.g. CA-SFR-171). 3) Site-specific procedures for historical archeological deposits (as warranted) potentially affected by project excavation activities. • *Cataloguing and Laboratory Analysis.* Description of selected cataloguing system and artifact analysis procedures. • *Discard and Deaccession Policy*. Description of and rationale for field and post-field discard and deaccession policies. • *Interpretive Program.* Consideration of an on-site/off-site public interpretive program during the course of the archeological data recovery program. • *Security Measures*. Recommended security measures to protect the archeological resource from vandalism, looting, and non-intentionally damaging activities. • *Final Report*. Description of proposed report format and distribution of results. • *Curation*. Description of the procedures and recommendations for the curation of any recovered data having potential research value, identification of appropriate curation facilities, and a summary of the accession policies of the curation facilities.				
Human Remains and Associated or Unassociated Funerary Objects. The treatment of human remains and of associated or unassociated funerary objects discovered during any soils disturbing activity, in the context of an archeological deposit or in isolation, shall comply with applicable state and federal laws. This shall include immediate notification of the Coroner of the City and County of San Francisco and in the event of the Coroner's determination that the human remains are Native American remains, notification of the California State Native American Heritage Commission (NAHC) who shall appoint a Most Likely Descendant (MLD) (PRC Section 5097.98). PRC 5097.98 indicates that " The descendants shall complete their inspection and make their recommendation within 48 hours of their notification by the Native American Heritage Commission." The archeological consultant, SFPUC, ERO, and MLD shall have up to but not beyond six days of discovery to make all reasonable efforts to develop an agreement for the treatment of human remains and associated or unassociated funerary objects with appropriate dignity (CEQA Guidelines Section 15064.5[d]). The agreement should take into consideration the appropriate excavation, removal, recordation, analysis, custodianship, curation, and final disposition of the human remains and associated or unassociated funerary objects. Nothing in existing State regulations or in this mitigation measure compels the SFPUC and the ERO to accept recommendations of an MLD. The archeological consultant shall retain possession of any Native American human remains and associated or unassociated burial objects until completion of any scientific analyses of the human remains or objects as specified in the treatment agreement if such as agreement has been made or, otherwise, as determined by the archeological consultant and the ERO.	SFPUC and qualified archeological consultant, in consultation with the San Francisco Coroner, NAHC, ERO, and MLD.	In the event human remains and/or funerary objects are encountered, during soils disturbing activity; immediately, upon each such discovery	SFPUC BEM and ERO	Considered complete on notification of the San Francisco County Coroner and ERO, and if Native American remains are discovered, then notification to NAHC, and MLD, and completion of treatment agreement and/or analysis and archaeological reporting.

MITIGATION MONITORING AND REPORTING PROGRAM FOR BIOSOLIDS DIGESTER FACILITIES PROJECT				
MEASURES ADOPTED AS CONDITIONS OF APPROVAL	**Implementation Responsibility**	**Mitigation Schedule**	**Monitoring/Reporting Responsibility**	**Monitoring Actions/Schedule and Verification of Compliance**
MITIGATION MEASURES FOR THE BIOSOLIDS DIGESTER FACILITIES PROJECT				
Cultural Resources (Archeological Resources) Mitigation Measures (cont.)				
Applicable to project site **Final Archeological Resources Report.** The archeological consultant shall submit a Draft Final Archeological Resources Report (FARR) to the ERO and SFPUC that evaluates the historical significance of any discovered archeological resource and describes the archeological and historical research methods employed in the archeological testing/monitoring/data recovery program(s) undertaken. The FARR shall include new updated DPR forms, as applicable. Information that may put at risk any archeological resource shall be provided in a separate removable insert within the final report. Once approved by the ERO, copies of the FARR shall be distributed as follows: Northwest Information Center (NWIC) of the California Historical Resources Information System shall receive one (1) copy and the ERO shall receive a copy of the transmittal of the FARR to the NWIC. The Environmental Planning division of the Planning Department shall receive one bound, one unbound and one unlocked, searchable PDF copy on CD of the FARR along with copies of any formal site recordation forms (CA DPR 523 series) and/or documentation for nomination to the National Register of Historic Places/California Register of Historical Resources. In instances of high public interest in or the high interpretive value of the resource, the ERO may require a different final report content, format, and distribution than that presented above.	1. SFPUC and qualified archeological consultant to consult with ERO regarding interpretive value of identified resources and, if so, to develop an interpretive plan 2. Qualified archeological consultant to prepare the FARR and/or FARR with interpretive augmentation	1. Post-construction, upon recommendation by qualified archaeologist based on preliminary analytical results 2. Within one year of the completion of all soil disturbing activity at the project site that has potential for archaeological impacts	1. SFPUC BEM, qualified archaeologist and ERO 2. SFPUC BEM and qualified archaeologist	1. If the ERO determines that the findings have high interpretive value, completion and approval of an interpretive report or other interpretive product, to be scope in consultation between the ERO, SFPUC and the qualified archaeological consultant 2. Considered complete on submittal of FARR and approval by ERO, written confirmation the FARR has been distributed to specified entities and that any archaeological collections have been curated as specified in the ADRP.
Applicable to project site, 1550 Evans, and Piers 94 and 96 staging areas **Mitigation Measure M-CR-2b. Accidental Discovery of Archeological Resources** The following mitigation measure is required to avoid any potential adverse effect from the project on accidentally discovered buried or submerged historical resources as defined in CEQA Guidelines Section 15064.5(a) and (c). The project sponsor shall distribute the Planning Department archeological resource "ALERT" sheet to the project prime contractor; to any project subcontractor (including demolition, excavation, grading, foundation, pile installation, etc. firms); or utilities firm involved in soils disturbing activities within the project site. Prior to any soils disturbing activities being undertaken each contractor is responsible for ensuring that the "ALERT" sheet is circulated to all field personnel including, machine operators, field crew, pile drivers, supervisory personnel, etc. A preconstruction training shall be provided to all construction personnel by a qualified archeologist prior to their starting work on the project. The training may be provided in person or using a video and include a handout prepared by the qualified archeologist. The video and materials shall be reviewed and approved by the ERO and the SFPUC. The purpose of the training is to enable personnel to identify archeological resources that may be encountered and to instruct them on what to do if a potential discovery occurs. Images or video of expected archeological resource types and archeological testing and data recovery methods should be included in the training. As possible, video or images should utilize archeological investigations that have occurred at the project site. The training should also include general information about the known archeological resources identified within the project site. The project sponsor shall provide the Environmental Review Officer (ERO) with a signed affidavit from the responsible parties (prime contractor, subcontractor[s], and utilities firm) to the ERO confirming that all field personnel have received copies of the Alert Sheet and have taken the preconstruction training. Should any indication of an archeological resource be encountered during any soils disturbing activity of the project, the project Head Foreman and/or project sponsor shall immediately notify the ERO and the SFPUC and shall immediately suspend any soils disturbing activities in the vicinity of the discovery until the ERO, in coordination with the SFPUC, has determined what additional measures should be undertaken.	1. SFPUC Construction Management Bureau (CMB)/BEM to prepare training materials and conduct preconstruction training and provide signed affidavit. 2. Qualified archaeological consultant to notify the ERO and the SFPUC, immediately suspend any soils disturbing activities in the vicinity of the discovery, and consult with ERO to assess significance and identify appropriate treatment measures. 3. Qualified archaeological consultant to implement significance assessment and treatment measures 4. Qualified archaeological consultant to prepare a FARR.	1. Prior to any ground disturbing activity. 2. In the event archeological resources are encountered during soil disturbing activity 3. Upon concurrence by ERO on significance assessment and treatment measures proposed by qualified archaeologist and prior to further construction activities that would impact the resource. 4. Post construction	1. SFPUC BEM and ERO 2. SFPUC BEM and ERO 3. SFPUC BEM and ERO 4. SFPUC BEM and ERO	1. Considered complete on approval of training materials and when signed affidavit from responsible parties is received by ERO. 2. Considered complete on notification of the ERO, and completion of ERO consultation on treatment 3. Upon completion of agreed upon significance assessment/treatment of the discovery. 4. SF Planning Department approval of FARR and confirmation that FARR has been distributed to specified entities and the collection has been curated as specified in the ADRP.

MITIGATION MONITORING AND REPORTING PROGRAM FOR BIOSOLIDS DIGESTER FACILITIES PROJECT				
MEASURES ADOPTED AS CONDITIONS OF APPROVAL	**Implementation Responsibility**	**Mitigation Schedule**	**Monitoring/Reporting Responsibility**	**Monitoring Actions/Schedule and Verification of Compliance**
MITIGATION MEASURES FOR THE BIOSOLIDS DIGESTER FACILITIES PROJECT				
Cultural Resources (Archeological Resources) Mitigation Measures (cont.)				
If the ERO determines that the find may represent an archeological resource, the project sponsor shall retain the services of an archeological consultant. The archeological consultant shall advise the ERO and the SFPUC as to whether the discovery is an archeological resource, retains sufficient integrity, and is of potential scientific/historical/cultural significance. If an archeological resource is present, the archeological consultant shall identify and evaluate the archeological resource. The archeological consultant shall make a recommendation as to what action, if any, is warranted. Based on this information, the ERO may require, if warranted, specific additional measures to be implemented by the project sponsor. Measures might include: preservation in situ of the archeological resource; an archeological monitoring program; or an archeological testing program. If an archeological monitoring program or archeological testing program is required, it shall be consistent with the Environmental Planning (EP) division guidelines for such programs. The ERO may also require that the project sponsor immediately implement a site security program if the archeological resource is at risk from vandalism, looting, or other damaging actions. The project archeological consultant shall submit a Final Archeological Resources Report (FARR) to the ERO and the SFPUC that evaluates the historical significance of any discovered archeological resource and describing the archeological and historical research methods employed in the archeological monitoring/data recovery program(s) undertaken. Information that may put at risk any archeological resource shall be provided in a separate removable insert within the final report. Copies of the Draft FARR shall be sent to the ERO for review and approval and concurrently to the SFPUC for review and comment. Once approved by the ERO, copies of the FARR shall be distributed as follows: California Archaeological Site Survey Northwest Information Center (NWIC) shall receive one (1) copy and the ERO shall receive a copy of the transmittal of the FARR to the NWIC. The Environmental Planning division of the Planning Department shall receive one bound copy, one unbound copy and one unlocked, searchable PDF copy on CD three copies of the FARR along with copies of any formal site recordation forms (CA DPR 523 series) and/or documentation for nomination to the National Register of Historic Places/California Register of Historical Resources. In instances of high public interest or interpretive value, the ERO may require a different final report content, format, and distribution than that presented above.				
Noise and Vibration Mitigation Measures				
Applicable to work at Southeast Greenhouses Staging Area **Mitigation Measure M-NO-1a. Shielding of Concrete Saw Operations** Project contractors shall erect temporary shielding when concrete saw operations are conducted within 100 feet of a sensitive receptor. Shielding shall be sufficient to reduce noise levels to 80 dBA at a distance of 100 feet (an approximate 5 dBA reduction), consistent with the noise limit specified in Section 2907 of the Noise Ordinance.	Contractors to erect shielding when concrete saw operations are conducted within 100 feet of a sensitive receptor.	Prior to conducting concrete saw operations within 100 feet of a sensitive receptor.	SFPUC BEM	Documentation of compliance
Applicable to work at Southeast Greenhouses Staging Area **Mitigation Measure M-NO-1b. Construction Noise Control Measures at Southeast Greenhouses Staging Area** Project contractors shall implement noise control measures at the Southeast Greenhouses staging area, such as one of the following strategies, to ensure that construction-related noise does not exceed 77 dBA at the closest residences located across Phelps Street or 70 dBA at the daycare center (including its outdoor play area) at the Southeast Community Facility (this performance standard is based on the City's ambient +10 dBA noise limit):	Contractor to implement noise control measures; SFPUC CMB to post sign.	Prior to and during construction activities at the Southeast Greenhouses staging area.	SFPUC BEM	Documentation of compliance

MITIGATION MONITORING AND REPORTING PROGRAM FOR BIOSOLIDS DIGESTER FACILITIES PROJECT				
MEASURES ADOPTED AS CONDITIONS OF APPROVAL	**Implementation Responsibility**	**Mitigation Schedule**	**Monitoring/Reporting Responsibility**	**Monitoring Actions/Schedule and Verification of Compliance**
MITIGATION MEASURES FOR THE BIOSOLIDS DIGESTER FACILITIES PROJECT				
Noise and Vibration Mitigation Measures (cont.)				
• ***Restrict Use of Heavy Equipment***. Restrict operation of heavy equipment and trucks in the southern portion of the Southeast Greenhouses staging area within approximately 200 feet of the daycare center (including the outdoor play area) and residences across Phelps Street such that noise levels are maintained below this performance standard. • ***Temporary Noise Barrier***. Erect temporary noise barrier(s) along the southern and eastern boundaries of the Southeast Greenhouses staging area to shield the daycare facility and residences from noise generated by staging area activities necessary to achieve this performance standard. • The SFPUC shall also post a sign on-site describing permitted construction days and hours, noise complaint procedures, and a complaint hotline number (available during construction hours).				
Air Quality Mitigation Measures				
Applicable to all project locations **Mitigation Measure M-AQ-1a. Construction Emissions Minimization** The SFPUC's contractors shall comply with the following: ***A. Engine Requirements.*** 1. All off-road equipment with larger engines (greater than or equal to 140 horsepower) shall meet United States Environmental Protection Agency (USEPA) or California Air Resources Board (CARB) Tier 4 Final off-road emission standards, while equipment with smaller engines (less than 140 horsepower) shall meet or exceed Tier 2 off-road emission standards and be equipped with diesel particulate filters (DPFs), which is equivalent to a Level 3 verified diesel emission control strategy (VDECS). 2. At least 80 percent of haul trucks (i.e., trucks used to remove or deliver backfill soil, excavated soil, and demolition debris) used must have 2010 or newer engines. The SFPUC should strive to exceed this requirement when possible; if trucks with 2010 or newer engines are available in the Contractor's, or subcontractor's fleet, then those should be used for the project. The SFPUC, through its Contractors Assistance Center, will work with the BAAQMD's Strategic Incentives Division and interested, eligible truckers to pursue funding to replace vehicles or retrofit engines to comply with the lower emissions requirement, including but not limited to conducting informational presentations at the Contractors Assistance Center to notify truckers about the grants and incentives and assisting with the completion of applications to the grant programs. 3. All diesel-powered haul trucks and off-road equipment must use renewable diesel. ***B. Waivers.*** 1. Pursuant to the Clean Construction Ordinance, the SFPUC General Manager (GM) or designee may waive the alternative source of power requirement if an alternative source of power is limited or infeasible at the project site. If the SFPUC GM grants the waiver, the contractor shall submit documentation that the equipment used for on-site power generation meets the requirements of Subsection (A)(1).	SFPUC CMB and contractor.	Implement prior to and during construction activities.	SFPUC BEM.	Considered complete upon Planning Department review and approval of documentation.

MITIGATION MONITORING AND REPORTING PROGRAM FOR BIOSOLIDS DIGESTER FACILITIES PROJECT

MEASURES ADOPTED AS CONDITIONS OF APPROVAL	Implementation Responsibility	Mitigation Schedule	Monitoring/Reporting Responsibility	Monitoring Actions/Schedule and Verification of Compliance
MITIGATION MEASURES FOR THE BIOSOLIDS DIGESTER FACILITIES PROJECT				
Air Quality Mitigation Measures (cont.)				
2. The SFPUC GM or designee may waive the equipment requirements of Subsection (A)(1) but only under any of the following unusual circumstances: if a particular piece of off-road equipment with Tier 4 Final standards or CARB Level 3 VDECS is technically not feasible; the equipment would not produce desired emissions reduction due to expected operating modes; installation of the equipment would create a safety hazard or impaired visibility for the operator; or there is a compelling emergency need to use off-road equipment that is not retrofitted with a CARB Level 3 VDECS. If the SFPUC GM or designee grants the waiver, the contractor shall use the next cleanest piece of off-road equipment, according to the following table: **Compliance Alternative** / **Engine Emission Standard** 1 — Tier 4 Interim 2 — Tier 3 3 — Tier 2 NOTES: How to use the table: If the SFPUC GM or designee determines that the equipment requirements cannot be met, then the contractor shall meet Compliance Alternative 1. If the SFPUC GM or designee determines that the contractor cannot supply off-road equipment meeting Compliance Alternative 1, then the contractor shall meet Compliance Alternative 2. If the SFPUC GM or designee determines that the contractor cannot supply off-road equipment meeting Compliance Alternative 2, then the contractor shall meet Compliance Alternative 3.				
Mitigation Measure M-AQ-1b. Emission Offsets During the five-year construction period and prior to project completion, the SFPUC, with the oversight of the Planning Department, shall implement either of the following two options or a combination of both: 1. Directly implement a specific offset program (such as replace equipment) to achieve reductions of 2.3 tons per year of ozone precursors, subject to Environmental Review Officer (ERO) approval. To qualify under this mitigation measure, the specific emissions retrofit project must result in emissions reductions within the San Francisco Bay Area Air Basin (SFBAAB) that are real, surplus, quantifiable, enforceable, and would not otherwise be achieved through compliance with existing regulatory requirements or any other legal requirement. Prior to implementation of the offset project, the SFPUC must obtain Planning Department's approval of the proposed offset project by providing documentation of the estimated amount of emissions of 2.3 tons per year of ozone precursors within the SFBAAB from the emissions reduction project(s). The project sponsor shall notify the Planning Department within six months of completion of the offset project for verification. 2. Pay a mitigation offset fee to the Bay Area Air Quality Management District's (BAAQMD) Bay Area Clean Air Foundation (Foundation) in an amount to be determined at the time of the impact. The mitigation offset fee will be no less than $30,000 per weighted ton of ozone precursors per year requiring emissions offsets plus an administrative fee of no less than 5 percent, to fund one or more emissions reduction projects within the SFBAAB. The $30,000 will be adjusted to reflect annual California Consumer Price Index adjustments between 2017 and the estimated first year of exceedance. This fee will be determined by the Planning Department in consultation with the SFPUC and BAAQMD and based on the type of projects available at the time of impact. This fee is intended to fund emissions reduction projects to achieve reductions of 2.3 tons per year of ozone precursors.	SFPUC	*Offset program*: During construction and notify the Planning Department within 6 months of completion of the offset project(s). and/or *Mitigation Fee*: Pay amount determined at time of impact	*Offset program*: SFPUC and ERO *Mitigation Fee*: BAAQMD	*Offset program*: Documentation of offset projects implemented. *Mitigation Fee*: BAAQMD confirmation of receipt of payment.

MITIGATION MONITORING AND REPORTING PROGRAM FOR BIOSOLIDS DIGESTER FACILITIES PROJECT				
MEASURES ADOPTED AS CONDITIONS OF APPROVAL	**Implementation Responsibility**	**Mitigation Schedule**	**Monitoring/Reporting Responsibility**	**Monitoring Actions/Schedule and Verification of Compliance**
MITIGATION MEASURES FOR THE BIOSOLIDS DIGESTER FACILITIES PROJECT				
Air Quality Mitigation Measures (cont.)				
For this option, the SFPUC is required to enter into a Memorandum of Understanding (MOU) with the BAAQMD's Foundation. The MOU will include details regarding the funds to be paid, administrative fee and the timing of the emissions reductions project. Acceptance of this fee by the BAAQMD shall serve as an acknowledgment and commitment by the BAAQMD to: (1) implement an emissions reduction project(s) within a time frame to be determined based on the type of project(s) selected, after receipt of the mitigation fee to achieve the emission reduction objectives specified above; and (2) provide documentation to the ERO and the SFPUC describing the amount of and the project(s) funded by the mitigation fee, including the amount of emissions of NOx reduced (tons per year) within the SFBAAB from the emissions reduction project(s). If there is any remaining unspent portion of the mitigation offset fee following implementation of the emission reduction project(s), the SFPUC shall be entitled to a refund in that amount from the BAAQMD. To qualify under this mitigation measure, the specific emissions reduction project must result in emission reductions within the SFBAAB that are real, surplus, quantifiable, enforceable, and would not otherwise be achieved through compliance with existing regulatory requirements or any other legal requirement.				
Biological Resources Mitigation Measures				
Applicable to buildings and structures to be demolished, trees to be removed, and buildings/structures and trees within 100 feet of construction activity. **Mitigation Measure M-BI-1: Protective Measures for Special Status Bats and Maternity Roosts** The San Francisco Public Utilities Commission (SFPUC) shall engage a qualified biologist to conduct a pre-construction survey of buildings and other structures to be demolished, vacant buildings within 100 feet of construction activities, trees to be removed, and trees located within 100 feet of construction activities to locate potential roosting habitat for special-status bats and active maternal colonies. The pre-construction surveys shall occur no more than two weeks in advance of initiation of building demolition or renovation activities on-site or initiation of construction. No activities that could disturb active roosts of special-status bats or maternal roosts shall proceed prior to the completed surveys. The pre-construction survey shall include at a minimum: • Identification of potential direct and indirect project-related bat- disturbing activities; and • Locations of active roosting habitat and maternal colonies. If the pre-construction survey does not identify signs of potentially active bat roosts (e.g., guano, urine staining, dead bats, etc.) then no further action is required. If the pre-construction survey identifies signs of potentially active bat roosts, the following measures shall be implemented: • Removal of structures and trees shall occur when bats are active, approximately between the periods of March 1 to April 15 and August 15 to October 15; outside of bat maternity roosting season (approximately April 15 to August 31); and outside of months of winter torpor (approximately October 15 to February 28). On structures where bats were observed during the pre-construction survey, exclusion devices (i.e., one-way doors) shall be installed prior to removal of the structures. Exclusion devices shall be left in place for a minimum of four nights prior to demolition of the structures. • If removal of structures and trees during the periods when bats are active is not feasible and active bat roosts being used for maternity or hibernation purposes are found on or in the immediate vicinity of the project site where structure demolition or renovation is planned, a no-disturbance buffer of 100 feet or less if determined adequate by a qualified biologist in coordination with the California Department of Fish and Wildlife (CDFW) based on site-specific conditions shall be established around the roost sites until they are determined to be no longer active or volant by a qualified biologist.	1. Qualified biologist to conduct preconstruction surveys no more than two weeks in advance of building demolition or renovation activities onsite 2. If active bat roosts are identified, qualified biologist to implement one of the avoidance/protective measures.	1. Prior to construction Conduct pre-construction surveys no more than two weeks in advance of initiation of building demolition or renovation activities on-site or initiation of construction. 2. During construction	1. SFPUC BEM 2. SFPUC BEM	1. Documentation of surveys 2. Documentation that avoidance / protective measures were taken.

MITIGATION MONITORING AND REPORTING PROGRAM FOR BIOSOLIDS DIGESTER FACILITIES PROJECT				
MEASURES ADOPTED AS CONDITIONS OF APPROVAL	**Implementation Responsibility**	**Mitigation Schedule**	**Monitoring/Reporting Responsibility**	**Monitoring Actions/Schedule and Verification of Compliance**
MITIGATION MEASURES FOR THE BIOSOLIDS DIGESTER FACILITIES PROJECT				
Biological Resources Mitigation Measures (cont.)				
• The qualified biologist shall be present during structure and tree disturbance if active bat roosts are present. Structures and trees with active roosts shall be removed only when no rain is occurring or is forecast to occur for three days and when daytime temperatures are at least 50 degrees Fahrenheit (°F). • Structures or trees containing or suspected to contain active bat roosts shall be dismantled or removed under the supervision of the qualified biologist in the evening and after bats have emerged from the roost to forage. Structures shall be partially dismantled to significantly change the roost conditions, causing bats to abandon and not return to the roost. • If significant bat roosting habitat (e.g., maternity roosts or special-status non-maternity roost sites) is destroyed during structure or tree removal, artificial bat roosts shall be constructed in an undisturbed area in the project site vicinity away from human activity and at least 200 feet from project demolition/construction activities. The design and location of the artificial bat roost(s) shall be determined by a qualified bat biologist. • Bat roosts that begin during construction are presumed to be unaffected, and no buffer would be necessary.				
Geology and Soils Mitigation Measures				
Applicable to project site **Mitigation Measure M-GE-4: Paleontological Resources Monitoring and Mitigation Program** The SFPUC shall retain the services of a qualified paleontological consultant having expertise in California paleontology to design and implement a Paleontological Resources Monitoring and Mitigation Program (PRMMP) for construction activities that would disturb the upper layered sediments that are sensitive for paleontological resources. The PRMMP shall not require monitoring in shallower excavations that do not encounter the upper layered sediments. The PRMMP shall include a description of when and where construction monitoring would be required; emergency discovery procedures; sampling and data recovery procedures; procedure for the preparation, identification, analysis, and curation of fossil specimens and data recovered; pre-construction coordination procedures; and procedures for reporting the results of the monitoring program. The PRMMP shall be consistent with the Society for Vertebrate Paleontology (SVP) Standard Guidelines for the mitigation of construction–related adverse impacts on paleontological resources and the requirements of the designated repository for any fossils collected. During construction, earth-moving activities shall be monitored by a qualified paleontological consultant having expertise in California paleontology in the areas where these activities have the potential to disturb the upper layered sediments. Monitoring need not be conducted for construction activities that would disturb only artificial fill material and/or young bay mud. The consultant's work shall be conducted in accordance with this measure and at the direction of the City's Environmental Review Officer (ERO) in coordination with the SFPUC. Plans and reports prepared by the consultant shall be submitted first and directly to the ERO for review and comment and concurrently to the SFPUC for review and comment, and shall be considered draft reports subject to revision until final approval by the ERO. Paleontological monitoring and/or data recovery programs required by this measure could suspend construction of the project in an appropriate buffer zone around a discovered paleontological resource or area determined in the PRMMP to be sensitive for paleontological resources for up to a maximum of four weeks. At the direction of the ERO and in coordination with the SFPUC, the suspension of construction may be extended beyond four weeks for a reasonable time required to implement appropriate measures in accordance with the PRMMP only if such a suspension is the only feasible means to reduce potential effects on a significant paleontological resource as previously defined to a less-than-significant level.	1. PRMMP: qualified paleontological consultant. 2. Monitoring: Paleontological consultant and SFPUC CMB	1. PRMMP: Before the start of any ground disturbing activities. 2. Monitoring: During construction	1. SFPUC BEM and ERO 2. SFPUC BEM and ERO	1. Final PRMMP approved by ERO 2. Documentation of compliance

APPENDIX BIO

Special Status Species List and Tree Survey Results

This page intentionally left blank

APPENDIX BIO
SPECIAL-STATUS SPECIES THAT MAY OCCUR IN THE PROJECT AREA

Common Name ***Scientific Name***	**Federal Status**	**State Status**	**CNPS Listing**	**Habitat Description / Blooming Period**	**Potential to Occur in the Project Area**
Invertebrates					
San Bruno elfin butterfly *Callophrys mossii bayensis*	FE	--	--	Coastal scrub on rocky outcrops with broadleaf stonecrop (*Sedum spathulifolium*)	**Low.** No suitable habitat present. Three known populations at San Bruno Mountain, Montara, and Pacifica.
Bay checkerspot butterfly *Euphydryas editha bayensis*	FT	--	--	Serpentine grasslands.	**Absent.** No suitable habitat present.
Mission blue butterfly *Plebejus icarioides missionensis*	FE	--	--	Grassland with *Lupinus albifrons, L. Formosa*, and *L. varicolor*.	**Low.** No suitable habitat present.
Callippe silverspot butterfly *Speyeria callippe callippe*	FE	--	--	Found in native grasslands with *Viola pedunculata* as larval food plant.	**Low.** No suitable habitat present.
Monarch butterfly *Danaus plexippus*	--	*	--	Eucalyptus groves (wintering sites).	**Low.** Several records of this species in Golden Gate Park but no wintering sites known at or adjacent to project site.
Mimic tryonia (=California brackishwater snail) *Tryonia imitator*	--	*	--	Inhabits coastal lagoons, estuaries and salt marshes, from Sonoma County south to San Diego County. Found only in permanently submerged areas in a variety of sediment types; able to withstand a wide range of salinities.	**Low**. No suitable habitat present.
Reptiles					
Western pond turtle *Emys marmorata*	--	CSC	--	Ponds, marshes, rivers, streams, and irrigation ditches with aquatic vegetation. Requires basking sites and suitable upland habitat for egg-laying. Nest sites most often characterized as having gentle slopes (<15%) with little vegetation or sandy banks.	**Absent.** No suitable habitat present.
San Francisco garter snake *Thamnophis sirtalis tetrataenia*	FE	CE	--	Densely vegetated ponds near open hillsides with abundant small mammal burrows.	**Absent.** No suitable habitat present. Species is considered likely extirpated from San Francisco.
Amphibians					
California red-legged frog *Rana aurora draytonii*	FT	CSC	--	Freshwater ponds and slow streams with emergent vegetation for egg attachment.	**Absent.** No suitable habitat present.

APPENDIX BIO
SPECIAL-STATUS SPECIES THAT MAY OCCUR IN THE PROJECT AREA

Common Name ***Scientific Name***	**Federal Status**	**State Status**	**CNPS Listing**	**Habitat Description / Blooming Period**	**Potential to Occur in the Project Area**
Birds					
Western snowy plover *Charadrius alexandrines nivosus*	FT	CSC	--	Sandy beaches, salt pond levees and shores or large alkali lakes.	**Low.** Potential low-quality foraging habitat present along Pier 94 and Heron's Head Park salt marshes, but low potential for species to occur with high frequency of disturbance within proximity of project site.
Ridgway's rail *Rallus obsoletus*	FE	CE/CFP	--	Salt marsh wetlands along San Francisco Bay.	**Low.** Potential low-quality foraging habitat present along Pier 94 and Heron's Head Park salt marshes, but moderate potential for species to occur with high frequency of disturbance within proximity of project site.
California least tern *Sternula antillarum browni*	FE	CE/CFP	--	Nests along the coast from San Francisco Bay south to northern Baja California. Colonial breeder on bare or sparsely vegetated, flat substrates: sand beaches, alkali flats, landfills, or paved areas.	**Low.** May migrate and forage over project staging areas on a transient basis and forage. Nesting colony is located on Alameda Island approximately 4.5 miles east of project area.
Burrowing owl *Athene cunicularia*		CSC	--	Open, dry annual or perennial grasslands, deserts, and scrublands characterized by low-growing vegetation.	**Absent.** No suitable habitat present.
Northern harrier *Circus cyaneus*		CSC	--	Nests on ground in shrubby vegetation, usually at marsh edge. Nest built of large mound of sticks in wet areas.	**Absent.** No recorded occurrences in San Francisco Peninsula. No suitable habitat present.
White-tailed kite *Elanus leucurus*		CFP	--	Rolling foothills and valley margins with scattered oaks and river bottomlands or marshes next to deciduous woodland.	**Absent.** No suitable habitat present.
American peregrine falcon *Falco peregrinus anatum*	FD/ BCC	CFP	--	Woodlands, coastal habitats, riparian areas, coastal and inland waters, human-made structures that may be used as nest or temporary perch sites.	**Low.** No suitable habitat present.
Bank swallow *Riparia riparia* (nesting)	--	CT	--	Vertical banks and cliffs with sandy soil, near water. Nests in holes dug in cliffs and river banks.	**Low.** Could be present on a transient basis adjacent to project site.
California black rail *Laterallus jamaicensis coturniculus*	--	CT	--	Salt and brackish marshes; also in freshwater marshes at low elevations. Requires waters that do not fluctuate during the year and dense vegetation for nesting habitat.	**Low.** Potential low-quality foraging habitat present along Pier 94 and Heron's Head Park salt marshes, but low potential for species to occur with high frequency of disturbance within proximity of project site.
Salt marsh common yellowthroat *Geothlypis trichas sinuous*	--	CSC	--	Forages in various marsh, riparian and upland habitats. Nests on or near the ground in concealed locations. Requires thick, continuous cover down to water surface for foraging. Nests in tall grasses, tule patches, and willows.	**Moderate.** This species is known to breed in the freshwater marshes in the western part of the city. Potential suitable foraging habitat north of Pier 94 staging area; however, staging area setback precludes any potential impacts.

APPENDIX BIO
SPECIAL-STATUS SPECIES THAT MAY OCCUR IN THE PROJECT AREA

Common Name ***Scientific Name***	**Federal Status**	**State Status**	**CNPS Listing**	**Habitat Description / Blooming Period**	**Potential to Occur in the Project Area**
Birds (cont.)					
Alameda song sparrow *Melospiza melodia pusillula*	--	CSC	--	Salt marshes of eastern and south San Francisco Bay.	**Low.** Potential foraging habitat in salt marsh north of Pier 94 staging area. However, species only recorded in East Bay.
San Pablo song sparrow *Melospiza melodia samuelis*	--	CSC	--	Salt marshes of eastern and north San Francisco Bay.	**Low.** No suitable habitat present.
Double-crested cormorant *Phalacrocorax auritus*	--	WL, 3503.5	--	Coastal areas and inland lakes in fresh, saline, and estuarine waters.	**Moderate.** Could forage in waters near Piers 94 and 96 staging areas. Cargo crane facilities on eastern edge of Pier 96.
Cooper's hawk *Accipiter cooperii*	--	3503.5	--	Nests in riparian areas and oak woodlands, forages at woodland edges.	**Low.** Foraging is known in Lake Merced over 5 miles east of project site, though breeding remains undocumented. Large trees in project area, including eucalyptus and Monterey cypress, could support nests for this species.
Sharp-shinned hawk *Accipiter striatus*	--	3503.5	--	Nests in riparian areas and oak woodlands, forages in open areas.	**Low.** Could nest in large trees near project site.
Red-tailed hawk *Buteo jamaicensis*	--	3503.5	--	Found in nearly all habitats and elevations.	**Low.** Large trees in project area, including eucalyptus and Monterey pines, could support nests for this species.
Red-shouldered hawk *Buteo lineatus*	--	3503.5	--	Riparian woodlands with swamps and emergent wetlands.	**Low.** Large trees in project area, including eucalyptus and Monterey pines, could support nests for this species.
Caspian tern *Hydroprogne caspia*	BCC	--	--	Nests colonially on sandy estuarine shores, on levees in salt ponds, and on islands in alkali and freshwater lakes. Breeding adults often fly substantial distances to forage in lacustrine, riverine, and fresh and saline emergent wetland habitats.	**Low.** Species known to nest in Heron's Head Park, south of Pier 96 staging area; however, existing industrial activities preclude potential impacts to species as a result of the project.
Snowy egret *Egretta thula*	--	3503.5	--	Nests colonially on along margins of water bodies.	**Moderate.** Nests locally on Farm Island and Alcatraz. Only potential suitable nesting site for species would be in restored saltmarsh north of Pier 94 staging area, but lack of trees or large shrubs in this area preclude nesting habitat.
Osprey *Pandion haliaetus*	--	3503.5	--	Habitat varies greatly and usually includes adequate supply of accessible fish, shallow waters, open and elevated nest sites (10 to 60 feet in height), and artificial structures such as towers. Builds large platform stick nests near or in open waters such as lakes, estuaries, and bays.	**Low.** Could forage in shoreline vicinity.
Great blue heron	--	3503.5	--	Shallow estuaries and fresh and saline emergent wetlands.	**Low.** Could forage in shoreline vicinity.

APPENDIX BIO
SPECIAL-STATUS SPECIES THAT MAY OCCUR IN THE PROJECT AREA

Common Name ***Scientific Name***	**Federal Status**	**State Status**	**CNPS Listing**	**Habitat Description / Blooming Period**	**Potential to Occur in the Project Area**
Ardea herodias					
Mammals					
Salt-marsh harvest mouse *Reithrodontomys raviventris*	FE	CE/FP	--	Only in the saline emergent wetlands of San Francisco Bay and its tributaries. Found primarily in pickleweed (*Salicornia* spp.). Does not burrow, builds loosely organized nests. Requires higher areas for flood escape.	**Absent.** Suitable habitat not found onsite.
Pallid bat *Antrozous pallidus*	--	CSC	--	Prefers caves, crevices, hollow trees, or buildings in areas adjacent to open space for foraging. Associated with lower elevations in California. Very sensitive to disturbance of roosting sites.	**Low.** Species may migrate through area but ongoing disturbance occurring at site not suitable for pallid bat roost.
Townsend's big-eared bat *Corynorhinus townsendii*	--	CSC	--	Throughout California in a wide variety of habitats. Most common in mesic sites. Roosts in the open, hanging from walls and ceilings of rocky areas with caves or tunnels. Roosting sites limited. Extremely sensitive to human disturbance.	**Moderate.** Suitable roosting habitat is available in undisturbed portions of Central Shops and Asphalt Plant.
Western red bat *Lasiurus blossevillii*	--	CSC	--	Roosts primarily in trees, 2 to 40 feet above ground, from sea level up through mixed conifer forests.	**Low.** No suitable habitat present.
Hoary bat *Lasiurus cinereus*	--	--	--	Prefers open habitats or habitat mosaics, with access to trees for cover and open areas or habitat edges for feeding. Roosts in dense foliage of medium to large trees. Feeds primarily on moths; requires water.	**Low.** Low quality roosting habitat is available in undisturbed portions of Asphalt Plant or Central Shops. May be present on a transient basis. Nearest CNDDB occurrence is approximately 1.5 miles south of project site at Gilman Playground, although this occurrence is historical.
American badger *Taxidea taxus*	--	CSC	--	Open grasslands with loose, friable soils.	**Low.** No suitable habitat present.
Plants					
Presidio manzanita *Arctostaphylos montana* ssp. *Ravenii*	FE	CE	1B.1	Open, rocky, serpentine slopes in chaparral, coastal scrub, and coastal prairie. February – March	**Absent.** No suitable habitat present.
Presidio clarkia *Clarkia franciscana*	FE	CE	1B.1	Serpentine outcrops in coastal scrub, and valley and foothill grassland. May – July	**Absent.** No suitable habitat present.

APPENDIX BIO
SPECIAL-STATUS SPECIES THAT MAY OCCUR IN THE PROJECT AREA

Common Name ***Scientific Name***	**Federal Status**	**State Status**	**CNPS Listing**	**Habitat Description / Blooming Period**	**Potential to Occur in the Project Area**
Plants (cont.)					
Santa Cruz tarplant *Holocarpha macradenia*	FT	CE	1B.1	Coastal prairie, coastal scrub, valley and foothill grassland. June – October	**Absent.** No suitable habitat present.
San Francisco lessingia *Lessingia germanorum*	FE	CE	1B.1	Coastal scrub, sandy soils free of competing species. July – November	**Absent.** No suitable habitat present. Historically known in San Francisco.
White rayed pentachaeta *Pentachaeta bellidiflora*	FE	CE	1B.1	Open, dry, rocky slopes and grassy areas, usually on serpentine. March – May	**Absent.** No suitable habitat present.
Marin western flax *Hesperolinon congestum*	FE	CT	1B.1	Chaparral and grassland, usually on serpentine barrens. April – July	**Absent.** No suitable habitat present.
Robust spineflower *Chorizanthe robusta var. robusta*	FE	--	1B.1	Sandy or gravelly coastal dunes, coastal scrub, cismontane woodland, and maritime chaparral. April – September	**Absent.** Potentially suitable habitat present north of Pier 94 staging area but species presumed extirpated in San Francisco.
San Bruno Mountain manzanita *Arctostaphylos imbricada*	--	CE	1B.1	Chaparral and coastal scrub, usually on sandstone outcrops. February – May	**Absent.** No suitable habitat present.
San Francisco popcorn-flower *Plagiobothrys diffusus*	--	CE	1B.1	Coastal prairie, and valley and foothill grasslands. March – June	**Absent.** Known to be extirpated in San Francisco. No suitable habitat present.
California seablite *Suaeda californica*	FE	--	1B.1	Margins of coastal salt marshes and swamps. July – October	**Low.** Species restored in salt marsh north of Pier 94 staging area, but highly disturbed habitat within the project area is unlikely to support this species. Curb separating staging area from restored population would preclude impacts to this species.
Adobe sanicle *Sanicula maritima*	--	--	1B.1	Moist clay or ultramafic soil in chaparral, coastal prairie, meadows, seeps, and valley and foothill grassland. February – May	**Absent.** No suitable habitat present.
Two-fork clover *Trifolium amoenum*				Valley and foothill grassland, coastal bluff scrub. April – June	**Absent.** No suitable habitat present.
Hairless popcorn-flower *Plagiobothrys glaber*	--	--	1A	Coastal salt marshes and alkaline meadows. March – May	**Low.** Known to be extirpated in San Francisco. No suitable habitat present.

APPENDIX BIO
SPECIAL-STATUS SPECIES THAT MAY OCCUR IN THE PROJECT AREA

Common Name ***Scientific Name***	**Federal Status**	**State Status**	**CNPS Listing**	**Habitat Description / Blooming Period**	**Potential to Occur in the Project Area**
Plants (cont.)					
Kellogg's horkelia *Horkelia cuneata* ssp. *sericea*	--	--	1B.1	Coastal scrub, dunes, and openings of closed-cone coniferous forests. February – July	**Absent.** No suitable habitat present.
Rose leptosiphon *Leptosiphon rosaceus*	--	--	1B.1	Coastal bluff scrub. April – July	**Absent.** No suitable habitat present.
Oregon polemonium *Polemonium carneum*	--	--	1B.1	Coastal prairie, coastal scrub, lower montane coniferous forest. April – September	**Absent.** No suitable habitat present.
Franciscan onion *Allium peninsulare var. franciscanum*			1B.2	Cistamone woodland, valley and foothill grassland in clay soils, often on dry, serpentine hillsides. April -June	**Absent.** No suitable habitat present.
Bent-flowered fiddleneck *Amsinckia lunaris*	--	--	1B.2	Coastal bluff scrub, cismontane woodland, and valley and foothill grassland. March – June	**Absent.** No suitable habitat present.
Franciscan manzanita *Arctostaphylos franciscana*	--	--	1B.1	Open, rocky, serpentine outcrops in chaparral. February – April	**Absent.** No suitable habitat present.
Montara manzanita *Arctostaphylos montaraensis*	--	--	1B.2	Slopes and ridges in chaparral and coastal scrub. January – March	**Absent.** No suitable habitat present.
Coastal marsh milk-vetch *Arctostaphylos pycnostachyus var pycnostachyus*	--	--	1B.2	Coastal salt marshes, scrub and dunes. April – October	**Low.** Nearest occurrence recorded near Crystal Springs Reservoir over 15 miles south of project site.
Alkali milk-vetch *Astragualus tener* var. *tener*	--	--	1B.2	Alkali flats, flooded grassland, playas, and vernal pools. March – June	**Low.** No suitable habitat present; species presumed extirpated in San Francisco.
Pappose tarplant *Centromadia parryi* ssp. *parryi*	--	--	1B.2	Chaparral, coastal prairie, meadows, seeps, coastal salt marshes and swamps, and vernally mesic, often alkaline, valley and foothill grasslands. May – November	**Absent.** No suitable habitat present.

APPENDIX BIO
SPECIAL-STATUS SPECIES THAT MAY OCCUR IN THE PROJECT AREA

Common Name ***Scientific Name***	**Federal Status**	**State Status**	**CNPS Listing**	**Habitat Description / Blooming Period**	**Potential to Occur in the Project Area**
Plants (cont.)					
Franciscan thistle *Cirsium andrewsiisnowy*	--	--	1B.2	Coastal bluff scrub, coastal prairie, coastal mesic scrub, and broadleaf upland forest; sometimes on serpentine. March – July	**Absent.** No suitable habitat present.
San Francisco Bay spineflower *Chorizanthe cuspidata* var. *cuspidata*	--	--	1B.2	Coastal scrub, dunes and grassland. April – July	**Absent.** No suitable habitat present.
Point Reyes bird's-beak *Chloropyron maritimum* ssp. *palustre*	--	--	1B.2	Coastal salt marshes and swamps. June – October	**Low.** All recorded occurrences in San Francisco Peninsula are extirpated besides localized Presidio occurrence.
Round-headed Chinese-houses *Collinsia corymbosa*	--	--	1B.2	Coastal dunes and coastal prairie. April – June	**Absent.** No suitable habitat present. Only historical occurrence of species recorded in San Francisco.
Fragrant fritillary *Fritillaria liliacea*	--	--	1B.1	On clay, often serpentine-derived soils in coastal scrub, grassland, and coastal prairie. February – April	**Absent.** No suitable habitat present.
Blue coast gilia *Gilia capitata* spp. *chamissonis*	--	--	1B.1	Coastal dunes and scrub. April – July	**Absent.** No suitable habitat present.
San Francisco gumplant *Grindelia hirsutula* var. *maritime*	--	--	1B.2	On sandy or serpentine slopes of sea bluffs in coastal scrub, or valley and foothill grasslands. June – September	**Absent.** Serpentine soils necessary. No suitable habitat present.
Diablo helianthella *Helianthella castanea*	--	--	1B.2	On rocky soils in broadleaf upland forest, cismontane woodland, coastal scrub, riparian woodland, and valley and foothill grassland. March – June	**Absent.** No suitable habitat present.
Short-leaved evax *Hesperevax sparsiflora* var. *brevifolia*	--	--	1B.2	Sandy bluffs and flats in coastal scrub and coastal dunes. March – June	**Absent.** No suitable habitat present.
Arcuate bush mallow *Malacothamnus arcuatus*	--	--	1B.2	Gravelly alluvium in chaparral and cismontane woodland. April – September	**Absent.** No suitable habitat present.

APPENDIX BIO
SPECIAL-STATUS SPECIES THAT MAY OCCUR IN THE PROJECT AREA

Common Name ***Scientific Name***	**Federal Status**	**State Status**	**CNPS Listing**	**Habitat Description / Blooming Period**	**Potential to Occur in the Project Area**
Plants (cont.)					
Marsh microseris *Microseris paludosa*	--	--	1B.2	Closed-cone coniferous forest, cismontane woodland, coastal scrub, and valley and foothill grassland. August – June	**Absent.** No suitable habitat present.
Choris's popcorn-flower *Plagiobothrys chorisianus* var. *chorisianus*	--	--	1B.2	Mesic sites in chaparral, coastal scrub, and coastal prairie. March – June	**Absent.** No suitable habitat.
San Francisco campion *Silene verecunda* ssp. *verecunda*	--	--	1B.2	Mudstone, shale, or serpentine substrates in coastal scrub, coastal prairie, chaparral and valley and foothill grassland. March – June	**Absent.** No suitable habitat present.
Santa Cruz microseris *Stebbinsoseris decipiens*	--	--	1B.2	On sandstone, shale or serpentine-derived seaward-facing slopes in broadleaf upland forest, closed-cone coniferous forest, chaparral, coastal prairie, and coastal scrub. April – May	**Absent.** No suitable habitat present.
Coastal triquetrella *Triquetrella californica*	--	--	1B.2	On soil in coastal bluff and coastal scrub.	**Absent.** No suitable habitat present.
San Francisco owl's clover *Triphysaria floribunda*	--	--	1B.2	Grasslands. April – June	**Absent.** Historically occurred in San Francisco. No suitable habitat present.
Saline clover *Trifolium depauperatum var. hydrophilum*			1B.2	Marshes and swamps, valley and foothill grassland, vernal pools. Mesic, alkaline sites.	**Absent**. Suitable habitat not found onsite.
Marin knotweed *Polygonum marinense*	--	--	3.1	Marshes and swamps. April – October	**Low.** No suitable habitat present.

NOTES:
The "Potential for Effect" category is defined as follows:
High = Species is expected to occur and habitat meets species requirements.
Moderate = Habitat is only marginally suitable or is suitable but not within species geographic range.
Low = Habitat does not meet species requirements as currently understood in the scientific community.

APPENDIX BIO
SPECIAL-STATUS SPECIES THAT MAY OCCUR IN THE PROJECT AREA

STATUS CODES:

Federal:
FE = Listed as "endangered" under the Federal Endangered Species Act
FT = Listed as "threatened" under the Federal Endangered Species Act
FS = United States Forest Service Sensitive
BCC = USFWS Birds of Conservation Concern
FSC = NOAA Fisheries designated "species of concern"
FPD = Proposed delisted
FD = Delisted

CNPS:
List 1A= Plants presumed extirpated in California and either rare or extinct
List 1B= Plants rare, threatened, or endangered in California and elsewhere
List 2 = Plants rare, threatened, or endangered in California, but more common elsewhere
List 3 = Plants about which we need more information--a review list
List 4 = Plants of limited distribution--a watch list
LS = Locally Significant Species

State:
CE = Listed as "endangered" under the California Endangered Species Act
CT = Listed as "threatened" under the California Endangered Species Act
CSC = California Department of Fish and Wildlife designated "species of special concern"
CFP = California Department of Fish and Wildlife designated "fully protected"
SC = California Department of Fish and Wildlife designated "candidate threatened"
WL = California Department of Fish and Wildlife designated "watch list"
3503.5 = Eggs, Nests, and Nestlings Protected under section 3503.5 of the California Department of Fish and Game Code
* = California special animal

APPENDIX A: August 7, 2015 and July 19, 2016 Tree Survey Results, Main Project Area (Figures 1 and 2)

SFPUC SEP Biosolids Digester Facilities Project, San Francisco CA

Tree #	Common Name	Scientific Name	Diameter (inches) at 54"	Height feet (approx.)	Spread feet (approx.)	Protection Category[1]	Effect Code[2]	General Condition[3]	Comments
1	Brisbane box	*Lophostemon confertus*	10.5	34	20	SG	PE-TP	Good	
2	Bailey acacia	*Acacia baileyana*	8.5	19	18	SG	PE-TP	Good	
3	Bailey acacia	*Acacia baileyana*	7	24	16	SG	PE-TP	Good	
4	Brisbane box	*Lophostemon confertus*	7	32	12	SG	PE-TP	Good	
5	Bailey acacia	*Acacia baileyana*	6	18	15	SG	R	Fair	Trunk scar at 3'. Canopy unbalanced to south.
6	Brisbane box	*Lophostemon confertus*	7	18	8	SG	R	Poor	Topped @ 4'. Watersprouts with weak attachments from cut.
7	Brisbane box	*Lophostemon confertus*	10.5	29	18	C	PE-TP	Good	
8	Brisbane box	*Lophostemon confertus*	6	24	12	C	PE-TP	Good	
9	Brisbane box	*Lophostemon confertus*	10	17	17	C	PE-TP	Good	
10	Lombardy poplar	*Populus nigra*	6+3	14	14	C	R	Poor	Against concrete wall. Codominant stems with weak attachment.
11	Pyracantha	*Pyracantha angustifolia*	6	15	15	C	R	Poor	Against concrete wall. 40% dead canopy.
12	Pyracantha	*Pyracantha angustifolia*	5.5	17	17	C	R	Fair	Against concrete wall. 20% dead canopy.
13	Monterey pine	*Pinus radiata*	20	36	30	C	R	Fair	Pitch canker, dead branches.
14	Monterey pine	*Pinus radiata*	13	32	15	C	R	Fair	Pitch canker, dead branches.
15	Lombardy poplar	*Populus nigra*	14.5	42	12	C	R	Fair	Suppressed by neighboring trees.
16	Lombardy poplar	*Populus nigra*	27	46	20	C	R	Good	
17	Monterey pine	*Pinus radiata*	19.5	40	20	C	R	Fair	Canopy unbalanced to south
18	London plane tree	*Platanus x acerifolia*	26	54	43	C	PE-TP	Good	
19	blackwood acacia	*Acacia melanoxylon*	8.5	36	10	C	R	Poor	Thin unbalanced canopy. Bark cracked and peeling.
20	blackwood acacia	*Acacia melanoxylon*	12	42	16	C	R	Fair	Unbalanced canopy, 10% dead wood.
21	blackwood acacia	*Acacia melanoxylon*	22	47	28	C	R	Good	
22	blackwood acacia	*Acacia melanoxylon*	13	34	15	C	R	Poor	Canopy unbalanced to west
23	blackwood acacia	*Acacia melanoxylon*	15.5	46	20	C	R	Fair	Canopy unbalanced to east.
24	blackwood acacia	*Acacia melanoxylon*	11	36	16	C	R	Fair	Trunk lean 10 to west. Canopy unbalanced and thin.
25	blackwood acacia	*Acacia melanoxylon*	14	34	15	C	R	Poor	40% dead canopy. Codominant stems @ 6' with included bark.

[1] Protection category: Tree protected under San Francisco Urban Forestry Ordinance as: **ST** = **Street tree**, within public right-of-way, **SG** = **Significant tree**, a tree (1) on property under the jurisdiction of the Department of Public Works or (2) on privately owned-property with any portion of its trunk within 10 feet of the public right-of-way, and (3) that satisfies at least one of the following criteria: (a) a diameter at breast height (DBH, or 54 inches) in excess of twelve (12) inches, (b) a height in excess of twenty (20) feet, or (c) a canopy in excess of fifteen (15) feet. ,**C** = tree on **City property**.

[2] Effect code: **R** = Remove for project development, **PE-TP** = Potential effect, tree protection may be necessary.

[3] Condition: **Good** = 80-100% healthy foliage and no significant defects; **Fair** = 50-79% healthy foliage and/or minor defects; **Poor** = 5-49% healthy foliage and/or other significant defects; **Dead** = less than 5% healthy foliage.

Tree #	Common Name	Scientific Name	Diameter (inches) at 54"	Height feet (approx.)	Spread	Protection Category[1]	Effect Code[2]	General Condition[3]	Comments
26	blackwood acacia	*Acacia melanoxylon*	12.5	36	15	C	R	Fair	Canopy unbalanced to east.
27	blackwood acacia	*Acacia melanoxylon*	14	36	16	C	R	Fair	30% dead wood.
28	blackwood acacia	*Acacia melanoxylon*	15	36	20	C	R	Fair	Codominant stems @ 10' with weak attachment.
29	blackwood acacia	*Acacia melanoxylon*	12	36	12	C	R	Fair	Canopy thin with dead branches.
30	blackwood acacia	*Acacia melanoxylon*	17	36	24	C	R	Fair	Trunk scar from 2-7'.
31	blackwood acacia	*Acacia melanoxylon*	14	34	22	C	R	Fair	Lion tailed canopy.
32	blackwood acacia	*Acacia melanoxylon*	13	38	18	C	R	Fair	Canopy unbalanced to east.
33	blackwood acacia	*Acacia melanoxylon*	18	30	24	C	R	Poor	Cracked and peeling bark @10' on 2 of 4 main stems.
34	London plane tree	*Platanus x acerifolia*	25.5	42	44	SG	R	Fair	Canopy thin. Large branch removed on south side.
35	Lombardy poplar	*Populus nigra*	21	48	16	C	R	Good	
36	Lombardy poplar	*Populus nigra*	16.5	46	12	C	R	Fair	Unbalanced to northeast.
37	Lombardy poplar	*Populus nigra*	19	46	18	C	R	Good	
38	London plane tree	*Platanus x acerifolia*	8.5	23	20	SG	PE-TP	Fair	Thin canopy.
39	London plane tree	*Platanus x acerifolia*	11.5	33	20	C	R	Good	
40	London plane tree	*Platanus x acerifolia*	8	26	12	SG	R	Poor	60% dead canopy.
41	London plane tree	*Platanus x acerifolia*	13	35	25	SG	R	Fair	15% dead top.
42	blackwood acacia	*Acacia melanoxylon*	13.5	34	20	C	R	Good	
43	Lombardy poplar	*Populus nigra*	18	46	14	C	R	Good	
44	Lombardy poplar	*Populus nigra*	16	46	16	C	R	Good	
45	Lombardy poplar	*Populus nigra*	18.5	48	15	C	R	Good	
46	blackwood acacia	*Acacia melanoxylon*	17	46	22	C	R	Good	
47	Lombardy poplar	*Populus nigra*	12	40	10	C	R	Fair	Thin canopy, unbalanced to northeast.
48	Lombardy poplar	*Populus nigra*	13	42	12	C	R	Fair	Cavity at base of trunk. 30% void or decayed wood.
49	Lombardy poplar	*Populus nigra*	17	43	14	C	R	Good	
50	Monterey pine	*Pinus radiata*	39	54	56	C	**Removed** (per arborist-hazard risk)	Poor	40% dead canopy. Bark beetle pitch tubes along trunk with significant frass accumulated at tree base.
51	Monterey pine	*Pinus radiata*	45	46	52	C	**Removed** (per arborist-hazard risk)	Poor	40% dead canopy. Bark beetle pitch tubes along trunk with significant frass accumulated at tree base.

77	Victorian box	*Pittosporum undulatum*	12.5	26	18	SG	R	Fair	Against fence. Multistemed @ 4' & 6"
78	Victorian box	*Pittosporum undulatum*	9	25	19	SG	R	Fair	Against fence. Multistemed @ 4'
79	avocado	*Persea americana*	6	14	13	C	R	Poor	Against fence. 30% dead wood. Bark cracked and peeling.
80	ngaio tree	*Myoporum laetum*	17.5+16	28	28	C	PE-TP	Poor	Canopy heavily weighted to west side of trunk. 20% dead wood in canopy.
81	little-leaf fig	*Ficus microcarpa*	8.5	20	14	C	PE-TP	Fair	25° lean to west. 15 gal. container with roots now anchored in the ground.
82	Canary Island pine	*Pinus canariensis*	12	24	11	C	PE-TP	Fair	24" box with roots now anchored in the ground. Growing against brick wall.

[1] Protection category: Tree protected under San Francisco Urban Forestry Ordinance as: **ST** = **Street tree**, within public right-of-way, **SG** = **Significant tree**, a tree (1) on property under the jurisdiction of the Department of Public Works or (2) on privately owned-property with any portion of its trunk within 10 feet of the public right-of-way, and (3) that satisfies at least one of the following criteria: (a) a diameter at breast height (DBH, or 54 inches) in excess of twelve (12) inches, (b) a height in excess of twenty (20) feet, or (c) a canopy in excess of fifteen (15) feet. ,**C** = tree on **City property**.

[2] Effect code: **R** = Remove for project development, **PE-TP** = Potential effect, tree protection may be necessary.

[3] Condition: **Good** = 80-100% healthy foliage and no significant defects; **Fair** = 50-79% healthy foliage and/or minor defects; **Poor** = 5-49% healthy foliage and/or other significant defects; **Dead** = less than 5% healthy foliage.

Notes **:**

1. bgs = below existing ground surface.
2. TPHs-G = Total Petroleum Hydrocarbons (TPHs) as Gasoline by United States Environmental Protection Agency (USEPA) Method 8015 modified.
   BTEX/MTBE = Benzene, Toluene, Ethylbenzene and Xylenes; and Methyl tert-Butyl Ether by USEPA Method 8020.
   TPHs-D and TPHs-MO = TPHs as Diesel and TPHs as Motor Oil by USEPA Method 8015 modified with silica gel cleanup.
   VOCs = Volatile Organic Compounds by USEPA Method 8260.
   SVOCs = Semi-Volatile Organic Compounds by USEPA Method 8270.
   Pesticides = Organochlorine Pesticides by USEPA Method 8080 series.
   PCBs = Polychlorinated Biphenyls by USEPA Method 8080 series.
   Title-22 Metals = 17 Metals as listed in Title 22 of the California Code of Regulations by USEPA Methods 6000/7000 series.
   Sb=Antimony, As=arsenic, Ba=Barium, Be=Beryllium, Cd=Cadmium, Cr=Chromium, Cr+6=Chromium VI, and Co=Cobalt.
   Cu=Copper, Pb=Lead, Hg=Mercury, Mo=Molybdenum, Ni=Nickel, Se=Selenium, Ag=Silver, Tl=Thallium, V=Vanadium; and Zn=Zinc.
   WET = California Waste Extraction Test.
   TCLP = United States Environmental Protection Agency's Toxicity Characteristic Leaching Procedure.
   Asbestos = Asbestos analyses by Air Resources Board's Method 435.
   pH = pH analyses by USEPA Method 9040;
   TSS & TS = Total susepended solids and total solids by USEPA Method 2540;
   O&G = Oil and Grease by USEPA Method 1664;
3. - - = Not Analyzed, NR = Not Required.

Notes :

1. TPHs-G = Total Petroleum Hydrocarbons (TPHs) as Gasoline by United States Environmental Protection Agency (USEPA) Method 8015 modified.
   BTEX/MTBE = Benzene, Toluene, Ethylbenzene and Xylenes; and Methyl tert-Butyl Ether by USEPA Method 8020.
   TPHs-D and TPHs-MO = TPHs as Diesel and TPHs as Motor Oil by USEPA Method 8015 modified with silica gel cleanup.
   bgs=below existing ground surface
2. mg/Kg = milligrams per Kilogram
3. RSL - Industrial = USEPA's Regional Screening Levels under industrial scenario, May 2014.
   ESL = California Regional Water Quality Control Board - San Francisco Region's Environmental Screening Criteria as listed in Table B (ESL for shallow soils and groundwater is a NOT a current or potential source of drinking water) under commercial/residential use scenario, December 2013.
   ESLs - Table K-3 Construction Worker = ESLs for Direct Exposure Soil Screening Levels Construction/Trench Worker Exposure Scenario (Table K-3).
   CHHSLs = California Human Health Screening Levels (CHHSLs) for commercial/industrial scenario, September 2010
4. NA = Not Available; ND = Not detected at concentrations above the respective detection limit(s).
5. STLC = California Souble Threshold Limit Concentration
   TTLC = California Total Threshold Limit Concentration
   TCLP = United States Environmental Protection Agency's Toxicity Characteristic Leaching Procedure
6. ***9.7*** denotes the respective concentration above the detected limit
   120 denotes the respective concentration above the respective ESL - Commercial/Industrial value.
   Min = Minimum Concentration. Max = Maximum Concentration. Ave: Approximate Arithmetic Average Concentration (for concentration reported as below detection limit, the detection limit was employed for the average estimation.

This page intentionally left blank.

Notes :

1. VOCs = Volatile Organic Compounds by USEPA Method 8260.
   SVOCs = Semi-Volatile Organic Compounds by USEPA Method 8270.
   bgs=below existing ground surface
2. mg/Kg = milligrams per Kilogram
3. RSL - Industrial = USEPA's Regional Screening Levels under industrial scenario, May 2014.
   ESL = California Regional Water Quality Control Board - San Francisco Region's Environmental Screening Criteria as listed in Table B (ESL for shallow soils and groundwater is a NOT a current or potential source of drinking water) under commercial/residential use scenario, December 2013.
   ESLs - Table K-3 Construction Worker = ESLs for Direct Exposure Soil Screening Levels Construction/Trench Worker Exposure Scenario (Table K-3).
   CHHSLs = California Human Health Screening Levels (CHHSLs) for commercial/industrial scenario, September 2010
4. NA = Not Available; ND = Not detected at concentrations above the respective detection limit(s).
5. STLC = California Souble Threshold Limit Concentration
   TTLC = California Total Threshold Limit Concentration
   TCLP = United States Environmental Protection Agency's Toxicity Characteristic Leaching Procedure
6. ***9.7*** denotes the respective concentration above the detected limit
   120 denotes the respective concentration above the respective ESL - Commercial/Industrial value.
   Min = Minimum Concentration. Max = Maximum Concentration. Ave: Approximate Arithmetic Average Concentration (for concentration reported as below detection limit, the detection limit was employed for the average estimation).

Notes :

1. Sb = Antimony, As = Arsenic, Ba = Barium, Be = Beryllium, Cd = Cadmium, Cr = Chromium, Cr VI = Chromium VI, Co = Cobalt, Cu = Copper, Pb = Lead, Hg = Mercury, Mo = Molybdenum, Ni = Nickel, Se = Selenium, Ag = Silver, Tl = Thallium, V = Vanadium, and Zn = Zinc. WET = California Waste Extraction Test. TCLP = United States Environmental Protection Agency Toxicity Characteristic Leaching Procedure.
2. mg/Kg = milligrams per Kilogram; mg/L = milligrams per Liter; % - percent by volume.
3. RSL - Industrial = USEPA's Regional Screening Levels under industrial scenario, May 2014.
   ESL = California Regional Water Quality Control Board - San Francisco Region's Environmental Screening Criteria as listed in Table B (ESL for shallow soils and groundwater is not a current or potential source of drinking water) under commercial/industrial use scenario, December 2013.
   ESLs - Table K-3 Construction Worker = ESLs for Direct Exposure Soil Screening Levels under Construction/Trench Worker Exposure Scenario (Table K-3).
   CHHSLs = California Human Health Screening Levels (CHHSLs) for commercial/industrial scenario, September 2010
4. NA = Not Available; NR = Not required; ND = Not detected at concentrations above the respective detection limit(s); and - - = Not Analyzed (see Table 1 for explanation).
5. STLC = California Souble Threshold Limit Concentration
   TTLC = California Total Threshold Limit Concentration
   TCLP = United States Environmental Protection Agency's Toxicity Characteristic Leaching Procedure
   Shaklette and Boerngen = The estimated arithmetic mean of Western United States in Table 2 of the "Element Concentrations in Soils and Other Surficial Materials of the Conterminous United States" by Hansord T. Shacklette and Josephine G. Boerngen, U.S. Geological Survey Professional Paper 1270 and dated 1984.
   LBNL = Table 5 of the "Analysis of Background Distributions of Metals in the Soil at Lawrence Berkeley National Laboratory" by Diamond et al. and dated June 2002, Revised April 2009.
   Bradford et al. = Reported mean concentration of the "Background Concentrations of Trace and Major Elements in California Soils" by Bradford etal., Kearney Foundation of Soil Science, March 1996.
6. ***20*** denotes the respective concentration above the detected limit
   4.4 denotes the respective concentration above the respective ESL - Commercial value.
   5.9 denotes the respective concentration above the respective applicable hazardous criteria.
   Min = Minimum Concentration. Max = Maximum Concentration. Ave: Approximate Arithmetic Average Concentration (for concentration reported as below detection limit, the detection limit was employed for the average estimation.

Notes :

1. TPHs-G = Total Petroleum Hydrocarbons (TPHs) as Gasoline by United States Environmental Protection Agency (USEPA) Method 8015 modified.
   BTEX/MTBE = Benzene, Toluene, Ethylbenzene and Xylenes; and Methyl tert-Butyl Ether by USEPA Method 8020.
   TPHs-D and TPHs-MO = TPHs as Diesel and TPHs as Motor Oil by USEPA Method 8015 modified with silica gel cleanup.
   VOCs = Volatile Organic Compounds by USEPA Method 8260.
   SVOCs = Semi-Volatile Organic Compounds by USEPA Method 8270.
   Pesticides = Organochlorine Pesticides by USEPA Method 8080 series.
   PCBs = Polychlorinated Biphenyls by USEPA Method 8080 series.
2. µg/L = micrograms per Liter
3. RSL - Residential = MCL in USEPA's Regional Screening Levels under residential scenario, May 2014.
   ESL = California Regional Water Quality Control Board - San Francisco Region's Environmental Screening Criteria as listed in Table F-1b (ESL for groundwater which is not a current or potential source of drinking water), December 2013.
   SF Batch Discharge Limit = San Francisco Batch Wastewater Discharge Limit, May 18, 2012.
4. NA = Not Available; ND = Not detected at concentrations above the respective detection limit(s).
5. ***9.7*** denotes the respective concentration above the detected limit
   120 denotes the respective concentration above the respective ESL - Residential value.
   Min = Minimum Concentration. Max = Maximum Concentration. Ave: Approximate Arithmetic Average Concentration (for concentration reported as below detection limit, the detection limit was employed for the average estimation.

Notes :

1. bgs = below existing ground surface.
2. TPHs-G = Total Petroleum Hydrocarbons (TPHs) as Gasoline by United States Environmental Protection Agency (USEPA) Method 8015 modified.
   BTEX/MTBE = Benzene, Toluene, Ethylbenzene and Xylenes; and Methyl tert-Butyl Ether by USEPA Method 8020.
   TPHs-D and TPHs-MO = TPHs as Diesel and TPHs as Motor Oil by USEPA Method 8015 modified with silica gel cleanup.
   VOCs = Volatile Organic Compounds by USEPA Method 8260.
   SVOCs = Semi-Volatile Organic Compounds by USEPA Method 8270.
   Title-22 Metals = 17 Metals as listed in Title 22 of the California Code of Regulations by USEPA Methods 6000/7000 series.
   Cr=Chromium, Pb=Lead, and Ni=Nickel
   WET = California Waste Extraction Test.
   TCLP = United States Environmental Protection Agency's Toxicity Characteristic Leaching Procedure.
   Asbestos = Asbestos analyses by Air Resources Board's Method 435.
   pH = pH analyses by USEPA Method 9040.
   TSS & TS = Total susepended solids and total solids by USEPA Method 2540.
   TROG = Total Recoverable Oil and Grease by USEPA Method 1664.
3. - - = Not Analyzed, NR = Not Required.

Notes :

1. TPHs-G = Total Petroleum Hydrocarbons (TPHs) as Gasoline by United States Environmental Protection Agency (USEPA) Method 8015 modified.
   BTEX/MTBE = Benzene, Toluene, Ethylbenzene and Xylenes; and Methyl tert-Butyl Ether by USEPA Method 8020.
   TPHs-D and TPHs-MO = TPHs as Diesel and TPHs as Motor Oil by USEPA Method 8015 modified with silica gel cleanup.
   bgs=below existing ground surface
2. mg/Kg = milligrams per Kilogram
3. RSL - Industrial = USEPA's Regional Screening Levels under industrial scenario, May 2014.
   ESL = California Regional Water Quality Control Board - San Francisco Region's Environmental Screening Criteria as listed in Table B (ESL for shallow soils and groundwater is a NOT a current or potential source of drinking water) under commercial/residential use scenario, December 2013.
   ESLs - Table K-3 Construction Worker = ESLs for Direct Exposure Soil Screening Levels Construction/Trench Worker Exposure Scenario (Table K-3).
   CHHSLs = California Human Health Screening Levels (CHHSLs) for commercial/industrial scenario, September 2010
4. NA = Not Available.
5. STLC = California Souble Threshold Limit Concentration
   TTLC = California Total Threshold Limit Concentration
   TCLP = United States Environmental Protection Agency's Toxicity Characteristic Leaching Procedure
6. ***9.7*** denotes the respective concentration above the detected limit
   120 denotes the respective concentration above the respective ESL - Commercial/Industrial value.
   Min = Minimum Concentration. Max = Maximum Concentration. Ave: Approximate Arithmetic Average Concentration (for concentration reported as below detection limit, the detection limit was employed for the average estimation.

Notes :

1. VOCs = Volatile Organic Compounds by USEPA Method 8260.
   SVOCs = Semi-Volatile Organic Compounds by USEPA Method 8270.
   bgs=below existing ground surface
2. mg/Kg = milligrams per Kilogram
3. RSL - Industrial = USEPA's Regional Screening Levels under industrial scenario, May 2014.
   ESL = California Regional Water Quality Control Board - San Francisco Region's Environmental Screening Criteria as listed in Table B (ESL for shallow soils and groundwater is a NOT a current or potential source of drinking water) under commercial/residential use scenario, December 2013.
   ESLs - Table K-3 Construction Worker = ESLs for Direct Exposure Soil Screening Levels Construction/Trench Worker Exposure Scenario (Table K-3).
   CHHSLs = California Human Health Screening Levels (CHHSLs) for commercial/industrial scenario, September 2010
4. NA = Not Available; ND = Not detected at concentrations above the respective detection limit(s).
5. STLC = California Souble Threshold Limit Concentration
   TTLC = California Total Threshold Limit Concentration
   TCLP = United States Environmental Protection Agency's Toxicity Characteristic Leaching Procedure
6. ***9.7*** denotes the respective concentration above the detected limit
   120 denotes the respective concentration above the respective ESL - Commercial/Industrial value.
   Min = Minimum Concentration. Max = Maximum Concentration. Ave: Approximate Arithmetic Average Concentration (for concentration reported as below detection limit, the detection limit was employed for the average estimation.

1 Introduction

The San Francisco Public Utilities Commission (SFPUC) is proposing to construct new solids treatment, odor control, energy recovery, and associated facilities as part of the Biosolids Digester Facilities Project (BDFP or project) at the Southeast Water Pollution Control Plant (SEP) in the Bayview District of San Francisco[1]. The San Francisco Planning Department (SF Planning) is the lead agency preparing the Environmental Impact Report (EIR) in accordance with the California Environmental Quality Act (CEQA) for the SEP BDFP.

This technical memorandum (TM) was prepared for the SF Planning in support of the BDFP EIR water quality analysis. The purpose of this memorandum is to summarize RMC Water and Environment's (RMC) investigation of the potential effects of the BDFP on the water quality of the effluent discharged through the SEP outfall to San Francisco Bay. The water quality analysis discussed in this TM will evaluate how the new facilities may affect SFPUC's ability to maintain regulatory compliance with its NPDES permit (also known as Waste Discharge Requirements for SEP) (NPDES No. CA0037664, Order No. R2-2013-0029).

1.1 Project Background

The SFPUC operates and maintains the City's combined sewer system, which collects and treats the majority of San Francisco's wastewater and stormwater. Since the existing solids treatment facilities at the SEP are operating well beyond their useful life, SFPUC is proposing to construct new facilities as part of the SFPUC's Sewer System Improvement Program. The BDFP would replace the outdated existing solids treatment facilities with more reliable, efficient, modern technologies and facilities. The project would replace the existing digesters with new, state-of-the art digesters and other new facilities that produce a higher quality biosolids, capture and treat odors more effectively and maximize biogas utilization and energy recovery for the production of heat and energy.

Undigested wastewater solids, under the proposed BDFP, would be heated with steam under pressure and when the pressure is rapidly reduced, microbial cells would be ruptured and the material would disintegrate. This process would make the solids more biodegradable and when the digested sludge is dewatered, the liquid removed from the biosolids dewatering process is expected to contain higher levels of nitrogen (predominantly ammonia) compared to current 2015 concentrations for the existing processes. The liquid removed from the dewatering process would be returned to the liquid processing facilities (hereinafter known as "dewatering return stream"), hence potentially resulting in higher effluent ammonia and nitrogen levels. The new facilities are anticipated to go online in 2023 and are designed to provide solids treatment through the projected year 2045[1].

1.2 Approach

This TM provides an analysis of effects based on two criteria specified in Appendix G, Environmental Checklist of the CEQA Guidelines. The approach includes scenarios that focus on future conditions with the BDFP and without the project ("no project") to distinguish between future changes occurring due to the project and future changes that may occur without the project (e.g., changes related to population growth and water conservation). The approach to evaluating the criteria in the CEQA checklist is shown in **Table 1.**

[1] SF Planning, 2015.

Table 1: CEQA Approach Strategy

Would the Project:	Approach:
CEQA checklist item IX.a) Violate (exceed) any water quality standards or waste discharge requirements?	Determine if the following could be exceeded: 1. Basin Plan Water Quality Objectives (WQOs) 2. NPDES Permit Limitations
CEQA checklist item IX.f) Otherwise substantially degrade water quality?	Quantify the percent change (increase) in constituents of concern due to the BDFP

This approach is similar to the approach taken in environmental documentation for four other projects throughout California:

- West County Wastewater District Recycled Water Reliability Upgrade Project,
- City of Carlsbad Precise Development Plan and Desalination Plant,
- City of Pinole Water Pollution Control Plant Improvement Project, and
- City and County of San Francisco Westside Recycled Water Project.

The projects examined were selected for their similarity in projected long-term operational impacts to those projected from the BDFP, such as changes in effluent volumes, increased constituent loading, and potential effects on their facilities' ability to meet water quality standards. The analyses evaluated the changes to the water quality of the effluent discharge from existing/ambient conditions and compared it to the applicable WQOs set in the Water Quality Control Plan for Ocean Waters of California (Ocean Plan) or San Francisco Bay Basin (Region 2) Water Quality Control Plan (Basin Plan), March 2015 Basin Plan and NPDES permit limitations. If the project would not exceed these limitations and would not adversely affect beneficial uses of the receiving waters, then the impacts were considered less than significant. The results and environmental documentation for the four case studies are summarized in the Technical Memorandum *CEQA Water Quality Analysis Approaches*[2].

1.3 Constituents of Concern

The BDFP would replace the existing digesters with new, state-of-the art digesters and other new facilities, including a thermal hydrolysis process (THP) pretreatment step prior to digestion. In thermal hydrolysis, a high temperature and pressure treatment step is followed by rapid depressurization. This process increases the breakdown of cellular material and macromolecules, thereby increasing the rate of biodegradation during the subsequent digestion step and increasing the solubilization of some constituents. After digestion the biosolids are dewatered. This dewatering return stream (liquid removed during the dewatering process) is returned to the beginning of the wastewater treatment plant where it passes through primary and secondary wastewater treatment processes. The changes in THP/digestion performance may increase the concentrations of certain constituents in the dewatering stream, which may also result in concentration increases in the final effluent if those constituents are not otherwise removed by primary and/or secondary treatment.

Consequently, the constituents of concern for this analysis must be identified to assess the potential effects the BDFP may have on water quality. The discharge from SEP is regulated by the San Francisco

[2] RMC, 2015.

Bay Regional Water Quality Control Board (Regional Water Board) through the NPDES permit process. The SEP effluent, which receives dilution when discharged to Lower San Francisco Bay, is regulated for many pollutants, and there are effluent limitations for several pollutants to confirm adequate overall wastewater treatment. In addition, there are numerous parameters with applicable water quality criteria and objectives established in the Basin Plan or California Toxics Rule (CTR) to protect beneficial uses of the receiving water body (shown below in *italics*). (Some of the Basin Plan and CTR parameters also have effluent limitations based on reasonable potential.) A list of all the parameters is provided below:

- *Total Ammonia, as N*
- *126 CTR priority pollutants (metals, cyanide, organic compounds)*
- Biochemical Oxygen Demand (BOD)
- Total Suspended Solids (TSS)
- Oil and Grease
- pH
- Total Residual Chlorine
- *Acute Toxicity*
- *Chronic Toxicity*

Substantial increases in the final effluent concentrations of the above listed parameters are not expected due to the nature of both the thermal hydrolysis and SEP liquid treatment processes, and the fact that the dewatering return stream comprises a relatively small proportion of the final effluent discharge. Information on the changes to the final effluent as a result of thermal hydrolysis/digestion process, however, is limited, so some parameter investigations were performed. The following subsections discuss the process for determining which of the above water quality parameters are relevant for this water quality analysis (i.e., the constituents with concentrations that may increase in the final effluent due to the BDFP).

Ammonia and Total Nitrogen. Ammonia has been identified as a constituent with the potential to increase in the dewatering return stream because biological matter in wastewater contains substantial amounts of total nitrogen (of which ammonia is a component) and the THP pretreatment process may result in higher ammonia concentrations in the dewatering return stream than the current digestion process. Because SEP liquid treatment processes are not designed to remove or transform ammonia, any concentration increase in the dewatering return stream (which, based on existing SEP flow data, is typically less than one percent of raw plant flow) could result in a change in the concentration in the final effluent, depending on changes in the flow rate and mass loading of the dewatering stream.

Although there are neither effluent limitations nor applicable WQOs for total nitrogen, it is also of interest to evaluate total nitrogen levels because ammonia is a major component of total nitrogen in the SEP effluent. Nitrogen and ammonia are of emerging concern for the San Francisco Bay as indicated in the 2014 watershed permit[3], which requires monitoring for nutrient parameters (including ammonia and nitrogen) as well as nutrient studies.

Literature Investigation. A literature search was conducted by the SFPUC BDFP team to investigate the potential effects of THP/digestion on the water quality of the final effluent. Literature searches returned limited information. There are numerous studies dealing with the performance of thermal hydrolysis and effects on total nitrogen and biogas production, but very limited data regarding the effects on heavy metal partitioning to dewatered digested solids, and none found regarding the effects on other priority

[3] SFRWQCB, 2014b.

pollutants. In fact, only one piece of scientific literature returned relevant information, which focuses on heavy metal uptake by activated sludge[4].

The fate of heavy metals in solids processes is the result of complex interactions between metal cations and the surrounding medium. The thermal hydrolysis process has been used to improve anaerobic digestion performance and biogas production and reduce solids production. However, reducing solids production leads either to (1) an increase in the discharge of heavy metals in the environment through wastewater treatment plant effluent or (2) an increase in heavy metals concentration in the solids.

Laurent et al. studied solids characteristic modifications and their potential effects on cadmium (Cd) and copper (Cu) metal sorption by activated sludge using batch isotherms. The authors concluded that the concentrations of some heavy metals may increase in the reduced amount of residual solids whereas other heavy metals may be released in the liquid fraction of digested solids and reintroduced to the wastewater treatment process. The fate of heavy metals such as Cd and Cu should be greatly affected by solids pretreatment – Cd might be concentrated in a lower amount of waste-activated sludge whereas Cu might leak through treated effluent. It is important to note that only two metals were studied and other metals may behave differently according to their chemical properties. In this study, Cu uptake mechanisms at pH 7 were governed by precipitation whereas Cd uptake was more dependent on ion exchange interactions at the floc surface.

Because of the lack of information in the literature, a THP/digestion pilot study was performed to evaluate the effect of THP/digestion on priority pollutants.

THP/Digestion Pilot Project Assessment of Priority Pollutants. A wastewater treatment plant simulator, BioWin, has been used to predict the concentrations of ammonia and total nitrogen in SEP's final effluent (see Section 3.2). However, this process model cannot be used to accurately estimate fate and transport of priority pollutants like metals and cyanide in the final effluent. To support this water quality analysis, data from SEP's THP/digestion pilot project were used to evaluate the effect of THP/digestion on other constituents of concern. In October and November 2015, SFPUC staff collected data on metal and cyanide concentrations in the pilot dewatering return stream. Pilot concentrations and BDFP projected dewatering return stream flow rates were used to generate a conservative estimate of the anticipated project effects on the final effluent concentrations and compared to NPDES permit effluent limitations.

Organic compounds were not measured in pilot samples due to analytical limitations. The dewatering return stream contains an abundance of background organic interferences generated in the anaerobic digestion process. The high concentrations of these background interferences complicate or render infeasible the analytical methods used to analyze organic wastewater pollutants of concern, many of which are at the parts per billion (ppb, or µg/L) or lower levels. For example, organic compounds such as dioxins and furans and polychlorinated biphenyls [PCBs] are analyzed using gas chromatography with mass spectrometer and/or other detectors. Due to the heterogeneous and concentrated nature of the dewatering return stream, samples must be diluted prior to analysis to prevent the analytical instrument from being overwhelmed and damaged, but the large dilution results in an increased method detection limit above informative levels. Therefore, the data generated is of little value.

An SFPUC technical memorandum[5] summarizes the pilot THP/digestion data, including the estimated projected change in metal and cyanide concentrations for the BDFP. The estimated changes were added

[4] Laurent et al., 2011.

[5] SFPUC, 2016.

to the maximum effluent concentrations observed for the last six years to estimate whether future final effluent (i.e., with BDFP) would exceed the applicable NPDES permit effluent limitations or WQOs for Lower San Francisco Bay specified in the Basin Plan. These estimates are provided below in **Table 2.**

Table 2: Estimated Future Metal and Cyanide Concentrations due to BDFP (µg/L)

Parameter	MEC	Estimated Incremental Change from THP/digestion Pilot		Expected Final Effluent Concentration		Most Stringent NPDES Permit Limit and Most Stringent Applicable WQO		Expected Concentration Exceeds NPDES Permit Limit / WQO?	
		2022	2045	2022	2045	Limit	WQO	2022	2045
Antimony	2.94	0.000522	0.000452	2.94	2.94	--	4300	No	No

Acronyms:
MEC = Maximum Effluent Concentration observed in the SEP final effluent from October 2009 through November 2015.
µg/L = microgram per liter
WQO = Water Quality Objective

As shown in **Table 2**, the applicable limits and Basin Plan WQOs for metals and cyanide are not expected to be exceeded. Concentrations of beryllium, mercury, silver, thallium and cyanide are actually projected to be somewhat lower with implementation of the BDFP. Slight increases in other metals are not expected to result in any exceedance of effluent limits or WQOs. Because there is no evidence that the nature of the organics stream will change with the BDFP and because there is no practical method available to estimate future concentrations, these constituents were not further studied in the water quality analysis.

Conventional pollutants. The NPDES permit has effluent limitations for the following conventional pollutants: BOD, TSS, oil and grease, pH, and total residual chlorine. The thermal hydrolysis process is not expected to affect final effluent concentrations of BOD, TSS, or oil and grease because these

constituents are removed by the liquid treatment processes (e.g., primary and secondary treatment), which are expected to remain unchanged after implementation of the BDFP. Similarly, pH and residual chlorine are controlled by the liquid treatment processes, and therefore any changes in the dewatering return stream are not expected to affect these final effluent characteristics.

Toxicity. In addition to chemical constituents, the NPDES permit for the SEP establishes effluent limitations and triggers for toxicity. Compliance is determined by conducting bioassays, which measure effects on test organisms exposed to SEP effluent. The methodology for conducting the bioassays is specified in the Monitoring and Reporting Program for the NPDES permit. Ammonia is the only toxic constituent expected to potentially impact toxicity as a result of the BDFP. Even at low concentrations, ammonia can be toxic to aquatic organisms. Because the existing liquid treatment process does not remove ammonia, effects of BDFP on final effluent ammonia concentrations could also impact toxicity.

The NPDES permit for the SEP also establishes effluent limitations, which implement narrative water quality standards for toxicity. For acute toxicity, the NPDES permit specifies (page F-37) that observed acute toxicity does not constitute a violation if SFPUC demonstrates that the two following conditions apply: (1) ammonia causes acute toxicity in excess of the acute toxicity limits, and (2) ammonia in the discharge complies with the ammonia effluent limits. For chronic toxicity, the permit includes a somewhat similar statement (page E-9) noting that compliance with the chronic toxicity limit may be determined after test samples are adjusted to remove substances if SFPUC demonstrates that the substances are rapidly rendered harmless upon discharge to the receiving water.

The NPDES permit indicates that the ammonia numeric effluent limitations in the permit are based on WQOs necessary to protect aquatic life against the toxic effects of ammonia so that compliance with that effluent limitation would provide protection against toxicity in the environment. Additionally, the permit recognizes that concentrations of the toxic form of ammonia – unionized ammonia (NH_3) – in laboratory toxicity tests can be elevated due to the pH in the test and that it is rapidly converted to the relatively non-toxic ammonium ion (NH_4^+) upon discharge. For acute toxicity, ammonia is specifically identified. For chronic toxicity, the Regional Water Board recently provided flexibility for SFPUC to perform ammonia removal during chronic toxicity testing[6] based on this rationale. So, if ammonia (which is rapidly rendered harmless upon discharge to the receiving water as assured by the effluent limits) causes a failure of SEP effluent toxicity tests and the ammonia concentrations comply with the ammonia effluent limits, SFPUC would not violate the toxicity limitations in the permit and thereby would not cause an exceedance in the toxicity water quality standards.

It is not expected that total nitrogen would cause toxicity because the other components of the total nitrogen parameter (i.e., components other than ammonia, such as nitrates, nitrites, and organically-bound nitrogen) are not recognized as parameters that cause toxicity to aquatic life. Moreover, ammonia is a major component of total nitrogen in SEP effluent so if toxicity occurred due to total nitrogen, the source of toxicity is likely ammonia.

Thus, as ammonia and nitrogen have been identified as the chemical water quality constituents of concern and the permit states that toxicity caused by ammonia and/or nitrogen would not result in an exceedance of water quality standards, acute and chronic toxicity were not studied for this analysis.

Identified Constituents for Analysis. For this analysis, ammonia and total nitrogen were selected as the two constituents of concern.

2 Existing Conditions

2.1 NPDES Permit Requirements

To address CEQA checklist item IX.a, current applicable water quality standards (most in the form of WQOs) were identified. Three regulatory documents contain applicable water quality standards:

- **San Francisco Bay Basin (Region 2) Water Quality Control Plan (Basin Plan), March 2015.** The Basin Plan designates beneficial uses for water bodies in the Bay Area and their associated WQOs. The Basin Plan specifies numeric WQOs for 10 priority pollutants (including un-ionized ammonia) and narrative WQOs for toxicity and bioaccumulation.
- **California Toxics Rule (CTR) and National Toxics Rule (NTR).** The CTR and NTR specifies numeric aquatic life and human health criteria for numerous priority pollutants, including some metals and semivolatile organic compounds.

For this water quality analysis, the Basin Plan's WQO for un-ionized ammonia are pertinent because total nitrogen and total ammonia have been identified as the two main constituents of concern and no currently applicable water quality standards have been established for total nitrogen. The Basin Plan's WQO for un-ionized ammonia are as follows: an annual median of 0.025 milligram per liter (mg/L) as N and a maximum of 0.4 mg/L as N. The Regional Water Board implements this WQO to protect beneficial uses by issuing total ammonia effluent limitations in the NPDES permit. The NPDES permit specifies an average monthly effluent limit (AMEL) of 190 mg/L and a maximum daily effluent limit (MDEL) of 290 mg/L, as shown below in **Figure 1**. These limits are calculated with recognition given to the significant amount of dilution that the effluent receives in San Francisco Bay under dry weather conditions; ammonia limits only apply in dry weather conditions.

Basin Plan Water Quality Objective

Un-Ionized Ammonia WQO (mg/L as N):

Annual Median (AMEL)	0.025
Maximum, Lower San Francisco Bay (MDEL)	0.4

Implementation

NPDES Permit Limits

Total Ammonia Effluent Limitations (mg/L as N):

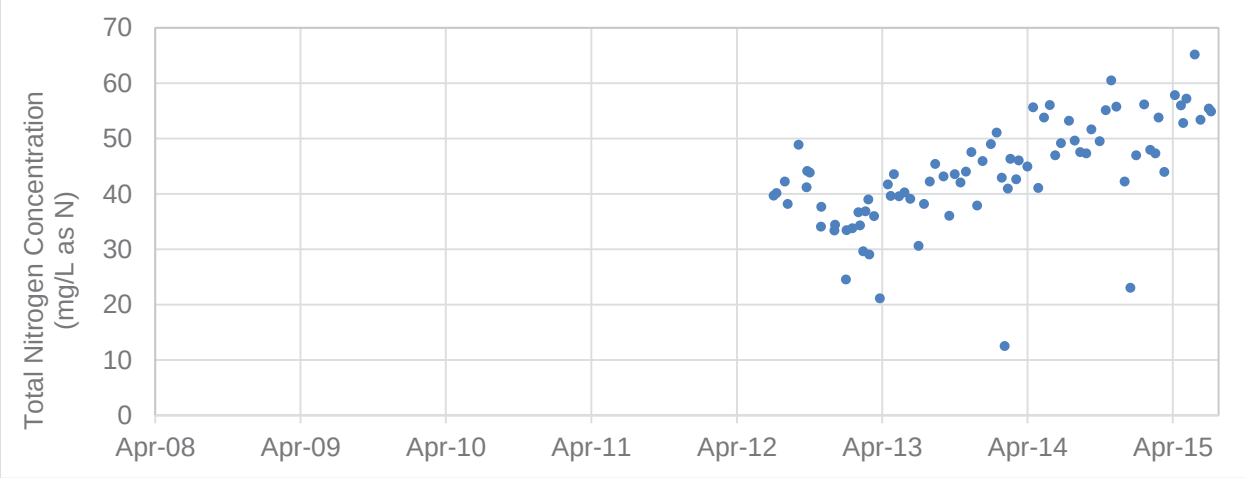
2.2 Existing SEP Effluent Water Quality

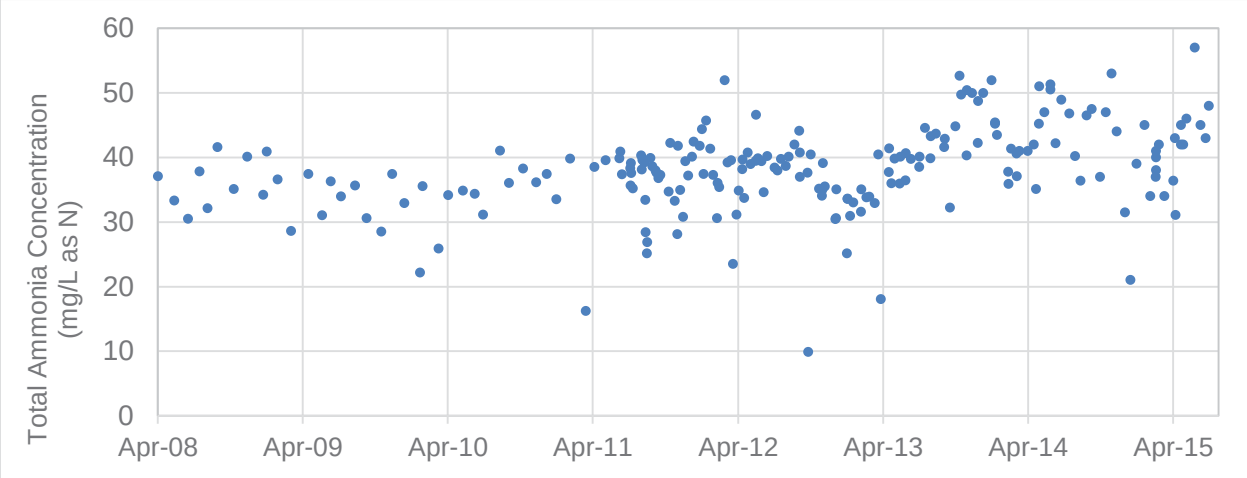
Water quality data for the SEP effluent at monitoring location EFF-001A (effluent monitoring location as defined in NPDES permit[7]) were evaluated to identify water quality trends. From April 2008 to June 2015, the SEP effluent flow rate exhibited a somewhat variable, but fairly consistent trend with an average dry weather effluent flow of about 55 million gallons per day (MGD), as shown on **Figure 2**.



[7] EFF-001A is defined as any point at the SEP between the point at which all wastes have gone through complete secondary treatment including disinfection, and the deep water outfall.

(Source: CIWQS, 2015)

Figure 2: SEP Effluent Data for EFF-001A - Flow Rate (April 2008 – July 2015)



Monthly monitoring for total nitrogen concentration in the SEP effluent began in July 2012. From July 2012 to present, total nitrogen concentration in the SEP effluent appears to increase over time, as shown in **Figure 3**. (Although nitrogen data for April 2008 through June 2012 are not available, the figure uses the same time scale as shown above to provide a consistent time frame.)

(Source: CIWQS, 2015)

Figure 3: SEP Effluent Data for EFF-001A - Total Nitrogen Concentration (July 2012 – July 2015)

From April 2008 through July 2015, the SEP effluent data for the concentration of total ammonia demonstrates a slight upward trend with a fairly variable spread, as shown in **Figure 4.**

(Source: CIWQS, 2015)

Figure 4: SEP Effluent Data for EFF-001A - Total Ammonia Concentration (April 2008 – July 2015)

As shown in **Figure 3** and **Figure 4**, both total nitrogen and total ammonia concentrations have been increasing over the past few years. It is likely that this trend is occurring due to a combination of recent population increase and water conservation[8].

As both total nitrogen and total ammonia concentrations have been exhibiting upward trends, current water quality was investigated for this analysis. Calculations for the period July 2014 through June 2015 (2014/15) show an average total nitrogen concentration of 51.0 mg/L and a 95th percentile concentration of total nitrogen of 65.1 mg/L and an average total ammonia (as N) concentration of 41.3 mg/L and a 95th percentile concentration[9] of total ammonia (as N) of 53.7 mg/L. These data are summarized in **Table 3.**

Table 3: Average and 95th Percentile Concentration Data for SEP Effluent, July 2014 – June 2015

Constituent	Average Concentration (mg/L)	95th Percentile Concentration (mg/L)
Total Nitrogen (as N)	51	65
Total Ammonia (as N)	41	54

[8] SFPUC, 2014b.

[9] The 95th percentile value is the concentration that is above 95 percent of the estimated values based on a particular distribution.

3 Water Quality Analysis Approach

3.1 Scenarios Considered

To assess potential changes in water quality from the implementation of the BDFP, existing and future scenarios were identified; the current (no project, 2015) scenario and five future scenarios were identified, as summarized in **Table 4.**

Table 4: Scenarios Considered in BDFP Water Quality Analysis

Project Condition	2015 (Baseline)	2022	2045
No Project	⊗	⊗	⊗
With BDFP		⊗	⊗
With BDFP and Eastside Recycled Water Project (RWP)			⊗

The 2015 "Baseline" scenario reflects current conditions (flow rates, concentrations, and loads) based on data available as of the publication date of the Notice of Preparation for the EIR. The baseline analysis considers one year of data spanning July 2014 through June 2015 to reflect current trends (population growth and water conservation).

The 2022 scenarios reflect anticipated conditions for the year 2022 when the BDFP is complete and online. Two scenarios are modeled to determine the water quality contribution from the BDFP. These scenarios are:

- *No Project*: this scenario accounts for anticipated population growth and water conservation through 2022.
- *With BDFP*: this scenario accounts for implementation of the BDFP and anticipated population growth and water conservation through 2022.

The 2045 scenarios represent anticipated conditions for the year 2045, the year for which project design is based. Three scenarios are included:

- *No Project*: this scenario accounts for anticipated population growth and water conservation through 2045.
- *With BDFP:* this scenario accounts for implementation of the BDFP and anticipated population growth and water conservation through 2045.
- *With BDFP and Eastside RWP*: In 2045, another potential project – the Eastside Recycled Water Project (RWP)[10] – may also affect effluent water quality. This project is currently expected to

[10] The proposed Eastside RWP may deliver high quality recycled water to a variety of customers on the east side of the City for non-drinking uses such as irrigation and toilet flushing. The Eastside RWP may produce up to 2 MGD of recycled water using a reverse osmosis process. Reverse osmosis is a physical separation process that uses a membrane to separate the solvent portion of a solution from the solute portion by applying hydrostatic pressure.

come online in the year 2030. Consequently, the Eastside RWP is considered as a project that could contribute to cumulative water quality effects as both the BDFP and Eastside RWP have the potential to increase nitrogen and ammonia in lower San Francisco Bay. To be conservative, all total nitrogen and total ammonia resulting from the Eastside RWP were assumed to be rejected in the hypothetical reverse osmosis process. That is, for the average estimated 2045 SEP effluent flow of 69.2 MGD (calculated value from the BioWin modeling input, discussed below and included as Appendix B) and a 2 MGD production of recycled water from the Eastside RWP, this analysis assumes the SEP effluent is reduced by 2 MGD, which would increase concentration of these constituents. Thus, the SEP effluent concentrations were estimated to increase by 3.0% [Calculated as (69.1 MGD-67.1 MGD)/67.1 MGD × 100%].

3.2 BioWin Modeling Data (With and Without Project)

SFPUC developed and calibrated a BioWin model for SEP. BioWin is a wastewater treatment process simulator that ties together biological, chemical, and physical process models. The BDFP Consultant Team performed minor modifications to SFPUC's model to simulate the effect of the new BDFP facilities weith THP. The model inputs are based on SEP's projected flows and loads[11], (which are based on estimated population growth and per capita loading rates calculated using 2010-2012 SEP data for the model simulation year 2010, and more recent 2014-15 SEP data for the future year scenarios of 2022, 2033, and 2045).

Modeling was conducted separately from this water quality analysis to estimate the change in effluent water quality that would be expected with implementation of the BDFP. The modeling results (included as Appendix B) comprise both projected loadings and projected concentrations (which were calculated based on these projected loadings and the projected average dry weather flow rate for a given year). As discussed in Section 1.3, the modeling has demonstrated that the only constituents with a potential to exceed NPDES permit limitations, WQOs, or otherwise degrade water quality are ammonia and nitrogen. Projected average ammonia and nitrogen concentrations in 2015, 2022, 2033, and 2045, both with and without the project, are included in **Table 5.**

[11] The SSIP Wastewater Flow and Load Projections TM (SFPUC, 2014a) summarizes wastewater projected flows which were calculated by converting projected potable water demands into wastewater generation. Projected water demands account for future water conservation, resulting in decreasing per capita flows in the future; Appendix A.

Table 5: BioWin Modeling Influent Flow Rate Input and Average Concentration Results for No Project and With BDFP Scenarios

Parameter	Unit	2010	2015 (linearly interpolated)	2022	2033	2045
No Project Scenario						
Influent Average Dry Weather Flow Rate	MGD	60.6	----	63.6	66.4	69.4
Effluent Total Nitrogen	mg/L as N	37.5	41.3	46.6	49.6	52.6
Effluent Total Ammonia	mg/L as N	34.2	37.7	42.7	45.4	48.2
With BDFP Scenario						
Influent Average Dry Weather Flow Rate	MGD	--	----	63.6	66.4	69.4
Effluent Total Nitrogen	mg/L as N	--	----	47.5	50.8	54.1
Effluent Total Ammonia	mg/L as N	--	----	43.0	46.0	49.0

3.3 Conservative Assumptions for Concentrations

As stated in the previous section, the BioWin model results were based on average data. To contrast, in the water quality analysis described in this TM, 95th percentile concentration values (lognormal distribution) were compared to the most stringent ammonia effluent limit in the permit: the AMEL of 190 mg/L. As stated in the USEPA's *Technical Support Document For Water Quality-based Toxics Control*, the 95th percentile is used because the water quality-based AMELs in the NPDES permit are calculated based on the 95th percentile of the distribution of values, and have historically been used to determine whether compliance with an AMEL would be feasible. This approach is more conservative compared to using the average values; due to the variable concentrations of total ammonia and total nitrogen observed in the 2008-2015 SEP effluent data (shown in **Figure 3** and **Figure 4**), it is necessary to take a conservative approach. The lognormal distribution is used because of its practicality. Often, environmental data sets (such as effluent concentration data) possess basic lognormal characteristics. Additionally, a lognormal approach was used in this case because using the 95th percentile values based on the lognormal distribution is more conservative than a normal distribution.

3.4 Analysis Methodology

Information regarding the future scenarios to study, modeling results, and historic effluent data were gathered to develop a strategy to evaluate the two CEQA checklist items discussed in Section 1.1. This strategy is provided above in **Table 1.**

For each of the five future scenarios described in Section 3.1, both checklist items were evaluated. To address CEQA checklist item IX.a, future 95th percentile concentrations of both total nitrogen and total ammonia were estimated to compare with the Basin Plan WQOs and NPDES permit limitations. As stated in Section 2.1, the Regional Water Boards implement the numeric un-ionized ammonia WQO by issuing effluent limits for total ammonia in the NPDES permit. Thus, future total ammonia concentrations were estimated to make this comparison. Although there are currently no defined WQOs

for nitrogen, ammonia is a major component of total nitrogen in SEP effluent, so future nitrogen concentrations were also estimated.

Two analyses were performed: one analysis (Analysis A) was based on the modeling results, and another (Analysis B) was based on both the modeling results and actual, drought-influenced data.

Analysis A. To estimate "no project" and "with BDFP" concentrations for 2022 and 2045, the ratio between the 95th percentile and average concentrations was first calculated based on the 2015 actual values (see **Table 3**). This ratio was the same for both total nitrogen and total ammonia: 1.3 (95th percentile to average value). Then the 2022 and 2045 average values from the modeling (see **Table 5**) were multiplied by this ratio to estimate corresponding 95th percentile concentrations. For the 2045 "with BDFP and Eastside RWP" scenario, the 2045 "with BDFP" scenario concentration was increased by 3.0% (as described in Section 3.1).

Analysis B. Furthermore, an additional analysis (**Analysis B**) was done to consider current drought conditions. In recent years, significant water conservation in San Francisco has been observed due to the California drought. In early 2014, the governor of California declared a drought State of Emergency and called for Californians to reduce their water usage by 20 percent[12]. In April 2015, the governor of California signed Executive Order B-29-15 requiring the State Water Resources Control Board to impose statewide restrictions to achieve 25% reduction in potable urban water usage through February 28, 2016. From June through November 2015, the City of San Francisco achieved a 15.1% water savings, almost twice SFPUC's 8% conservation requirement[13]. Significant water conservation in San Francisco has effectively caused concentrations of pollutants in the SEP influent to increase (i.e., less water is entering the wastewater collection system to dilute pollutants, resulting in increased concentrations). As stated, the SEP liquid treatment processes are not designed to remove or transform nitrogen and ammonia so a concentration increase in the influent will likely result in a concentration increase in the effluent. Accordingly, the observed 2015 SEP effluent concentrations for nitrogen and ammonia are somewhat greater than expected.

Because the SEP-observed nitrogen and ammonia concentrations in 2015 were greater than predicted from the BioWin model due to the exceptional drought, an additional analysis was performed to be even more conservative; this analysis was conducted to estimate future concentrations based on the 2015 SEP data ("actual data"), rather than the model results. In this analysis, the modeling results were first linearly interpolated to obtain 2015 concentrations (see **Table 5**). Then the percent change values between 2015 and 2022 model concentrations, and the percent change values between 2022 and 2045 model concentrations were calculated from the modeling results. Finally, the 95th percentile 2015 actual concentration data (**Table 3**) and percent change values were multiplied to estimate future 95th percentile concentrations based on actual data. As with the other analysis, for the 2045 "with BDFP and Eastside RWP" scenario, the 2045 "with BDFP" scenario concentration was increased by 3.0%.

To address CEQA checklist item IX.f, the percent change values were analyzed to determine whether the BDFP – cumulatively with the Eastside RWP – would substantially degrade water quality. As stated previously, the percent change values were estimated from the BioWin modeling results with an assumed conservative 3.0% increase in concentration for the 2045 "with BDFP and Eastside RWP" scenario.

[12] State of California, 2014.

[13] SWRCB, 2015.

4 Results & Discussion

As discussed in Section 3.4, two analyses were performed to address the two CEQA checklist items.

Using the modeling results and the calculated ratio between the 95th percentile and average concentrations (Analysis A), future concentrations for nitrogen and total ammonia were estimated for the six scenarios described in **Table 4.** As shown in the figures below, total nitrogen and total ammonia concentrations are estimated to increase regardless of whether the BDFP occurs.

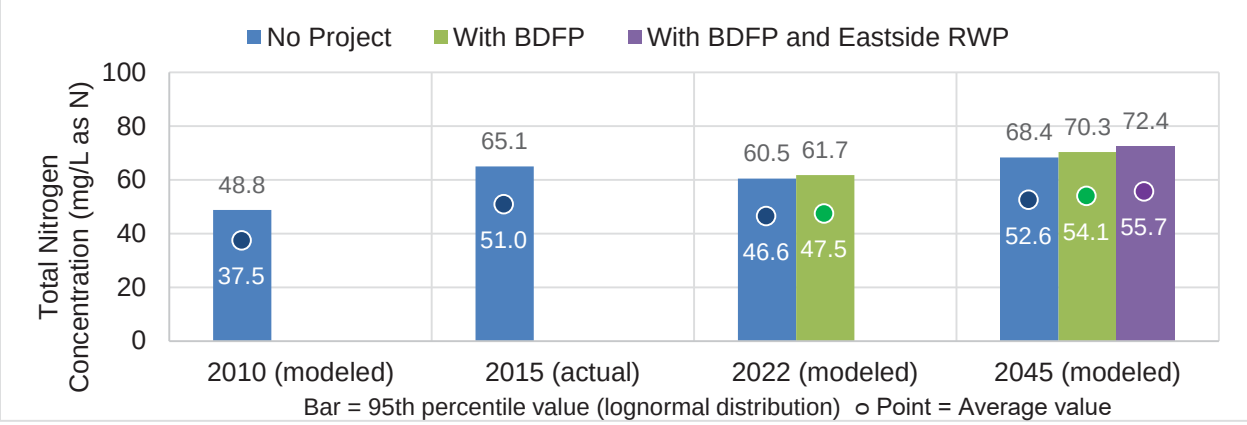


Figure 5: Current (2014/15) and Model-Estimated Total Nitrogen Effluent Concentrations, SEP (Analysis A)

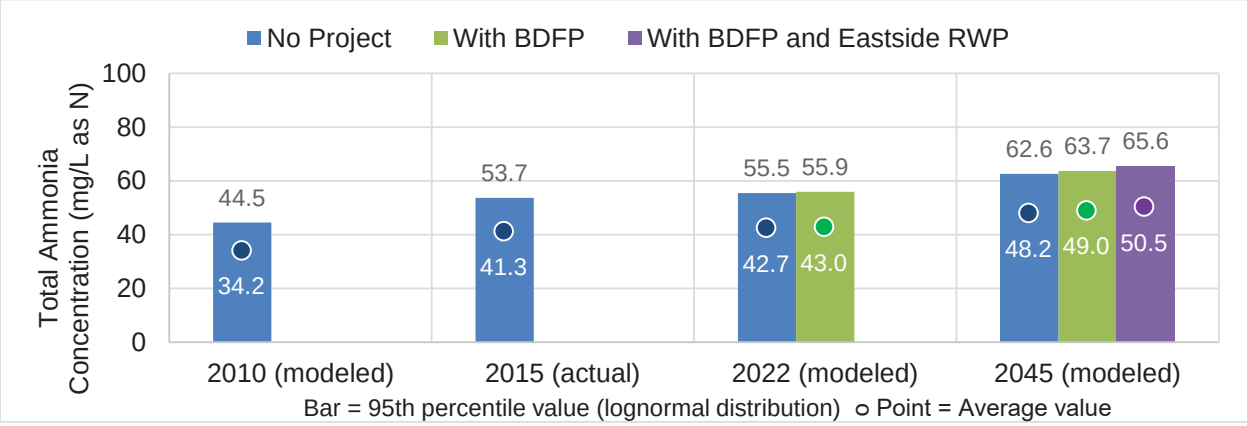

Figure 6: Current (2014/15) and Model-Estimated Total Ammonia Effluent Concentrations, SEP (Analysis A)

As part of the additional more conservative analysis (Analysis B), future concentrations for nitrogen and total ammonia were estimated for the six scenarios using the relative percent change information from the BioWin model results and 2014/15 SEP effluent data. Similar to the results shown for Analysis A, total nitrogen and ammonia concentrations would increase with or without the BDFP due to population growth as shown in **Figure 7** and **Figure 8**.

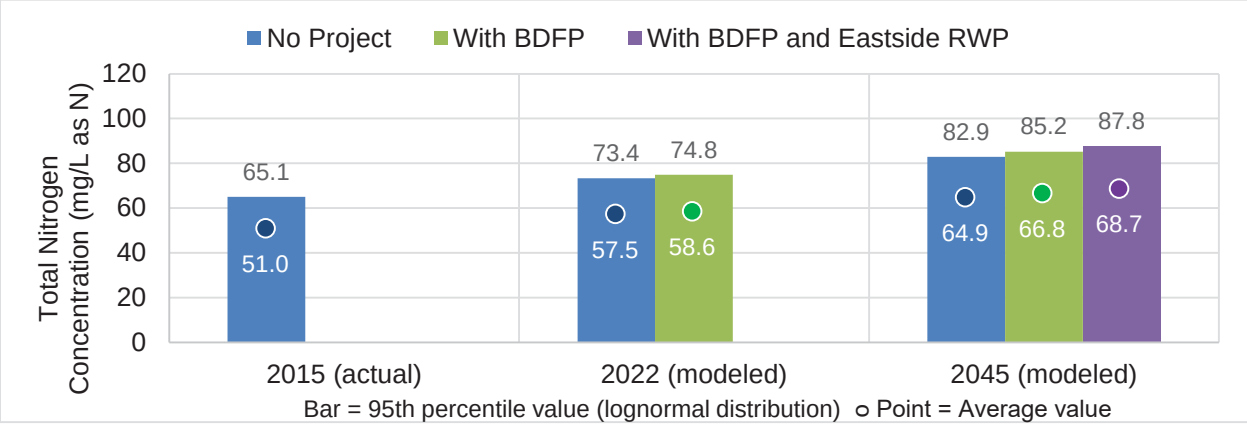

Figure 7: Current (2014/15) and Estimated Future Total Nitrogen Effluent Concentrations, SEP (Analysis B)

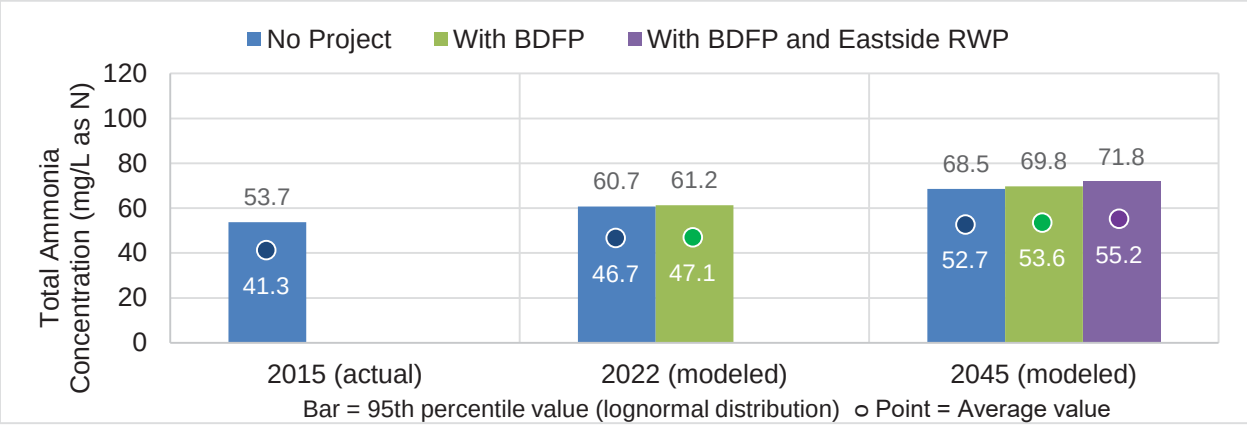

Figure 8: Current (2014/15) and Estimated Future Total Ammonia Effluent Concentrations, SEP (Analysis B)

The four figures above for both analyses indicate a slight increase between the "No Project" and "BDFP" cases for the years 2022 and 2045. For the 2045 case that includes both the BDFP and the Eastside RWP, another slight increase is estimated. Overall, results show that greater increases would occur regardless of the BDFP ("No Project" scenario), due to population growth and water conservation.

To determine whether current water quality standards may be exceeded, the total ammonia concentrations were compared to the effluent limits (as discussed in Section 2.1). As shown in both **Figure 6** and **Figure 8**, the conservatively predicted 95th percentile future values (including cumulative impacts from the Eastside RWP) are well below the NPDES permit's currently most stringent effluent limitation for total ammonia: 190 mg/L as N (AMEL). Thus, the BDFP is not expected to cause an exceedance of water quality standards or NPDES permit effluent limitations.

For the five scenarios and baseline, the estimated average concentrations as well as the percent change values discussed above are summarized in **Table 6**.

For the two 2022 scenarios -- no project and with BDFP -- it is estimated that total nitrogen concentrations may increase above the 2015 levels by about 12.8% and 15.0%, respectively. Similarly, it is estimated that ammonia concentrations may increase about 13.1% and 14.0%, respectively.

For the three 2045 scenarios -- no project, with BDFP, and with BDFP and the Eastside RWP -- it is estimated that total nitrogen concentrations may increase above the 2015 levels by about 27.4%, 31.0%, and 34.9%, respectively. Similarly, it is estimated that ammonia concentrations may increase about 27.6%, 29.9%, and 33.8%, respectively. The percent change in nitrogen and ammonia concentrations attributable to the BDFP is 3.6% and 2.3%, respectively.

The modeling indicates that the BDFP may cause a small increase in total nitrogen and ammonia concentrations. This increase, however, is small when compared to the increase projected from population increases and water conservation. Thus, the increase in concentrations of total nitrogen and total ammonia in the effluent that would be attributable to the BDFP is expected to be minor, and the BDFP would not otherwise substantially degrade water quality.

Table 6: Percent Change of Total Nitrogen and Total Ammonia Effluent Concentrations

Scenario	Total Nitrogen		Total Ammonia	
	Average (mg/L as N)	*% Change from 2015*	Average (mg/L as N)	*% Change from 2015*
2015 Linearly Interpolated from Table 5 Values				
No Project (Existing Plant)	41.3	--	37.7	--
2022 Modeled Estimate (Analysis A)				
No Project	46.6	*12.8%*	42.7	*13.1%*
With BDFP	47.5	*15.0%*	43.0	*14.0%*
Increment due to BDFP	*0.9*	***2.2%***	*0.4*	***1.0%***
2045 Modeled Estimate (Analysis A)				
No Project	52.6	*27.4%*	48.2	*27.6%*
With BDFP	54.1	*31.0%*	49.0	*29.9%*
With BDFP and Eastside RWP	55.7	*34.9%*	50.5	*33.8%*
Increment due to BDFP	*1.5*	***3.6%***	*0.9*	***2.3%***
Increment due to Eastside RWP	*1.6*	***3.9%***	*1.5*	***3.9%***
SEP NPDES Permit Effluent Limit	***N/A***	*--*	***190***	*--*

As shown, total nitrogen and ammonia effluent concentrations are expected to increase for all future cases due to decreases in per capita wastewater volumes discharged to the wastewater collection system as a result of future water conservation efforts. In addition, total nitrogen and ammonia loads would increase in the SEP influent and effluent for all future cases because of increased wastewater discharged to the collection system as a result of population growth and because SEP liquid treatment processes are not designed to remove or transform total nitrogen and ammonia. However, it is noted that these increases would occur with or without the BDFP; only slight increases in effluent mass loading and concentration are anticipated due to the BDFP. These increases would occur as a result of the slight process-related increases in ammonia and total nitrogen concentrations discussed above.

5 Conclusions

Total ammonia and total nitrogen have been identified as the two main water quality constituents of concerns for the BDFP. Modeling was conducted to estimate the quality of effluent that would be expected with implementation of the BDFP. The water quality of the effluent was projected using BioWin, a wastewater treatment process simulator that ties together biological, chemical, and physical process models. New processes that would be constructed as part of the BDFP were modeled to predict future plant performance. The model inputs accounted for population increases and water conservation in determining projected levels of constituents in effluent. Both total ammonia and total nitrogen were projected. Although the NPDES permit does not establish effluent limitations for nitrogen, since ammonia is one component of total nitrogen, it is of interest to evaluate total nitrogen levels in addition to total ammonia.

Two analyses were conducted to evaluate the changes to the water quality of the effluent discharge from existing baseline conditions compared to the applicable NPDES permit limitations. Using conservative assumptions (95th percentile values) to estimate future effluent concentrations, the concentration increases for total nitrogen and total ammonia are expected to be minimal due to the BDFP, as shown in **Table 7** below. Estimated effluent changes due to the BDFP and the Eastside RWP are comparatively less than the estimated contribution from other factors, such as population increase and water conservation (shown in **Table 7** below).

Table 7: Percent Increase in Constituents due to BDFP and Other Factors

Constituent	Projected Effluent Concentration % Increase from 2015				
	2022 Scenarios		2045 Scenario		
	No Project (Increase due to Population Increase & Water Conservation)	Increment due to BDFP	No Project (Increase due to Population Increase & Water Conservation)	Increment due to BDFP	Increment due to BDFP and Eastside RWP
Total Nitrogen	12.8%	2.2%	27.4%	3.6%	3.9%
Total Ammonia	13.1%	1.0%	27.6%	2.3%	3.9%

Even with the contribution of 1) the BDFP, 2) population increase and water conservation, and 3) a cumulative project (Eastside RWP), effluent limitations for total ammonia in the NPDES permit are not expected to be exceeded (190 mg/L) (shown in **Table 8**).

Table 8: Comparison of Estimated Future Ammonia Concentrations with Effluent Limitations

Total Ammonia Effluent Limitations (mg/L as N)		Estimated 95th Percentile Ammonia Concentration (mg/L as N)	
		2045 Case with BDFP	2045 Case with BDFP and Eastside RWP
Average Monthly Effluent Limitation (AMEL)	190	63.7 (Analysis A)	65.6 (Analysis A)
		69.8 (Analysis B)	71.8 (Analysis B)

Therefore, based on the above analysis, the BDFP would comply with the existing NPDES permit limitations and would not result in substantial changes to receiving water quality.

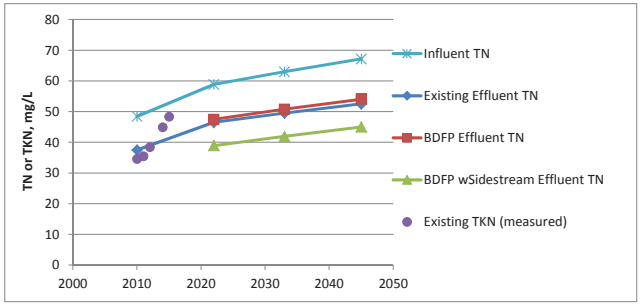
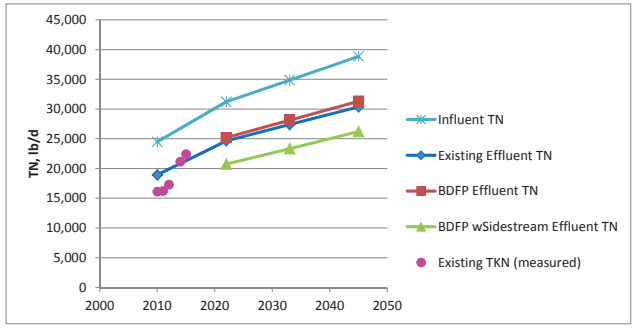
Appendix A – Projected SEP Nitrogen Concentration and Loads

Projected SEP Nitrogen Concentration and Loads

	2015 (existing condition)		2022		2033		2045	
Influent	**Conc. mg/L**	**Load lbs/day**	**Conc. mg/L**	**Load lbs/day**	**Conc. mg/L**	**Load lbs/day**	**Conc. mg/L**	**Load lbs/day**
Annual Average Flow (AAF, mgd)	64.3		73.5		76.3		79.3	
Average Dry Weather Flow (ADWF, mgd)	56.2		63.6		66.4		69.4	
COD	786	368,100	754	399,700	811	449,200	869	503,200
TKN	60.6	28,400	57.9	30,700	61.9	34,300	66.2	38,300
NH_3	47.6	22,300						
Alkalinity	210	98,400						
Effluent								
Total N	ND	ND						
TKN	48.2	22,600						
NH3	43.5	20,400						
NO2	0.2	100						
NO3	3.0	1,400						
pH	6.66							
Alkalinity	218	102,000						
Sidestream								
Flow	0.40							
TKN	1,595	5320						
NH3	1,520	5070						



1. All pollutant loads are Annual Average Loads (AAL) only, no peaking has been applied.
2. Concentrations are calculated from the AAL and ADWF for a given year.
3. 2015 flows and loads (except influent COD) are calculated from StarLIMS and DCS data from January 1, 2014 to June 30th, 2015. All 2015 influent values include the contribution of plant recycle (PR) flow.
4. Because there are far fewer sidestream TKN data than NH3, 2015 sidestream TKN load and concentration are calculated using a TKN/NH3 ratio (1.049 TKN:NH3) established from 2014 sidestream data.
5. 2022 - 2045 flows and 2015 - 2045 COD loads are projected based on *WASTEWATER FLOW AND LOAD PROJECTIONS TECHNICAL MEMORANDUM, February 2014.* 2022 - 2045 TKN loads are projected based on 2014 - 2015 data described above. 2022 - 2045 projected flows and loads do not include contribution of PR.



Appendix B – BioWin Model Simulation Results, December 2, 2015

Note: 2022 - 2045 BioWin model simulations use a revised N per capita assumption based on trend observed in measured planta data

APPENDIX NOI

Noise Supporting Information

This page intentionally left blank

TABLE 1
ESTIMATED COMBINED DAYTIME CONSTRUCTION-RELATED NOISE LEVELS AT NEARBY SENSITIVE RECEPTORS

Project Component/ Receptor Location	Construction Schedule	Reference Hourly L_{eq} in dBA @ 50 feet[a]	Minimum Distance between Receptors and Project Site Boundary	Distance Adjustment	Noise Level (L_{eq}) Adjusted for Distance	Does Combined Project Noise Exceed 90 dBA FTA Threshold at Closest Residential Receptors?	Does Combined Project Noise Exceed 100 dBA FTA Threshold at Closest Com/Indus Receptor?	Leq Day Ambient Noise Level at Receptor (7 a.m. to 8 p.m.)	Ambient+10 dBA Threshold at Closest Sensitive Receptor	Does Project Noise Increase Ambient by More than 10 dB?
Location 1. Residential receptors on east side of Phelps Street (as represented by noise levels measured at 1796 La Salle Avenue and distances measured from 1700 Kirkwood)										
1. Demolition, Site Offices Setup, Utilities Relocation Work	2018	85	750	-24	62	No	-	67	77	No
2. Piles (Drilled) and Excavation	2018-2020	85	575	-21	63	No	-	67	77	No
3. Galleries and Pipe Chases	2018, 2020	88	900	-25	63	No	-	67	77	No
4. Digesters, Pre-THP, and GBT	2018-2022	82	925	-25	57	No	-	67	77	No
5. Utilities and Roads	2020-2022	84	165	-10	74	No	-	67	77	No
6. Construction Staging Areas	2018-2023	81	70	-3	79	No	-	67	77	**Yes**
Location 1. Commercial receptors on east side of Phelps Street (as represented by noise measurements collected at 1796 La Salle Avenue)										
1. Demolition, Site Offices Setup, Utilities Relocation Work	2018	85	700	-23	62	-	No	-	-	-
2. Piles (Drilled) and Excavation	2018-2020	85	450	-19	65	-	No	-	-	-
3. Galleries and Pipe Chases	2018, 2020	88	700	-23	65	-	No	-	-	-
4. Digesters, Pre-THP, and GBT	2018-2022	82	875	-25	58	-	No	-	-	-
5. Utilities and Roads	2020-2022	84	70	-3	81	-	No	-	-	-
6. Construction Staging Areas	2018-2023	81	125	-8	74	-	No	-	-	-
Location 2. Residential receptors to the east, mid-block east of Phelps Street (1663 Kirkwood Avenue is representative receptor with possible direct lines-of-sight from upper floors)										
1. Demolition, Site Offices Setup, Utilities Relocation Work	2018	85	950	-26	60	No	-	61	71	No
2. Piles (Drilled) and Excavation	2018-2020	85	825	-24	60	No	-	61	71	No
3. Galleries and Pipe Chases	2018, 2020	88	1,150	-27	61	No	-	61	71	No
4. Digesters, Pre-THP, and GBT	2018-2022	82	1,200	-28	55	No	-	61	71	No
5. Utilities and Roads	2020-2022	84	400	-18	66	No	-	61	71	No
6. Construction Staging Areas	2018-2023	81	500	-20	61	No	-	61	71	No
Location 3. 1200 Phelps Street (Southeast Community Facility includes City College of San Francisco Training/Education Center and San Francisco State University Head Start daycare facility with playground)										
1. Demolition, Site Offices Setup, Utilities Relocation Work	2018	85	850	-25	61	No	-	60	70	No
2. Piles (Drilled) and Excavation	2018-2020	85	975	-26	59	No	-	60	70	No
3. Galleries and Pipe Chases	2018, 2020	88	1,050	-26	62	No	-	60	70	No
4. Digesters, Pre-THP, and GBT	2018-2022	82	1,500	-30	53	No	-	60	70	No
5. Utilities and Roads	2020-2022	84	700	-23	61	No	-	60	70	No
6. Construction Staging Areas	2018-2023	81	70	-3	79	No	-	60	70	**Yes**

TABLE 1 (Continued)
ESTIMATED COMBINED DAYTIME CONSTRUCTION-RELATED NOISE LEVELS AT NEARBY SENSITIVE RECEPTORS

Project Component/ Receptor Location	Construction Schedule	Reference Hourly L_{eq} in dBA @ 50 feet[a]	Minimum Distance between Receptors and Project Site Boundary	Distance Adjustment	Noise Level (L_{eq}) Adjusted for Distance	Does Combined Project Noise Exceed 90 dBA FTA Threshold at Closest Residential Receptors?	Does Combined Project Noise Exceed 100 dBA FTA Threshold at Closest Com/Indus Receptor?	Leq Day Ambient Noise Level at Receptor (7 a.m. to 8 p.m.)	Ambient+10 dBA Threshold at Closest Sensitive Receptor	Does Project Noise Increase Ambient by More than 10 dB?
Location 4. Residential receptors to the south, south of Oakdale Avenue (1901 Palou Avenue is a representative receptor, no direct line-of-sight)										
1. Demolition, Site Offices Setup, Utilities Relocation Work	2018	85	1,275	-28	57	No	-	65	75	No
2. Piles (Drilled) and Excavation	2018-2020	85	1,450	-29	55	No	-	65	75	No
3. Galleries and Pipe Chases	2018, 2020	88	1,525	-30	59	No	-	65	75	No
4. Digesters, Pre-THP, and GBT	2018-2022	82	1,975	-32	51	No	-	65	75	No
5. Utilities and Roads	2020-2022	84	1,175	-27	57	No	-	65	75	No
6. Construction Staging Areas	2018-2023	81	800	-24	57	No	-	65	75	No
Location 5. Residential receptors to the south, mid elevations to the south (2000 Revere Avenue is a representative receptor with direct line-of-sight)										
1. Demolition, Site Offices Setup, Utilities Relocation Work	2018	85	1,850	-31	54	No	-	63	73	No
2. Piles (Drilled) and Excavation	2018-2020	85	2,000	-32	53	No	-	63	73	No
3. Galleries and Pipe Chases	2018, 2020	88	2,100	-32	56	No	-	63	73	No
4. Digesters, Pre-THP, and GBT	2018-2022	82	2,250	-33	49	No	-	63	73	No
5. Utilities and Roads	2020-2022	84	1,775	-31	53	No	-	63	73	No
6. Construction Staging Areas	2018-2023	81	1,375	-29	53	No	-	63	73	No
Location 6. Residential receptors to the south, higher elevations to the south (296 Bayview Circle is a representative receptor with direct line-of-sight)										
1. Demolition, Site Offices Setup, Utilities Relocation Work	2018	85	2,150	-33	52	No	-	58	68	No
2. Piles (Drilled) and Excavation	2018-2020	85	2,200	-33	52	No	-	58	68	No
3. Galleries and Pipe Chases	2018, 2020	88	2,300	-33	55	No	-	58	68	No
4. Digesters, Pre-THP, and GBT	2018-2022	82	2,775	-35	48	No	-	58	68	No
5. Utilities and Roads	2020-2022	84	1,950	-32	52	No	-	58	68	No
6. Construction Staging Areas	2018-2023	81	1,450	-29	52	No	-	58	68	No

NOTES: dBA = A-weighted decibel; THP = Thermal Hydrolysis Process; GBT = Gravity Belt Thickener; n/a = not applicable threshold to receptor.

[a] See Table 4.7-6 for derivation of combined noise levels by construction activity, which are applied in this table to residential receptor locations.

SOURCE: Orion Environmental Associates, 2016.

TABLE 2
OPERATIONAL NOISE LEVELS FROM PROPOSED PROCESS FACILITIES

Equipment Name	Unit Process/Facility	Location	Noise Level (dBA)	Specified Distance (feet)	Reference (L_{eq}) Noise Level at 50 feet
Glycol Chiller/Chilled Water Pumps	Digester Gas (Biogas) Treatment	Outdoor	85	3	61

THP Compact System B6 x 4 Reactor (includes pulper, reactors, flash tank, pulper recirculation & reactor feed pump, digester feed pumps, control panel)	THP	Packaged Product	80	3	56
Combined Noise Level	Pre-Digestion Soilds Processing - THP	Outdoor		(2 Duty Units)	**59**

NOTES: The above listed equipment only includes the equipment that those with contribute substantially to each process facility's combined noise levels. Process facilities that would be located indoors are assigned one combined noise level at vent openings. This level is based on a maximum design interior level of 85 dBA (Leq) which meets OSHA requirements and the building/enclosure reducing interior noise levels by at least 15 dBA at vent openings (a conservative assumption since most enclosures can provide at least 25 dB reductions). In addition, noise levels are only estimated for the total number of duty units that could operate simultaneously (standby units are not included). The number of duty units is accounted for in the combined noise level.

TABLE 3 (Continued)
ESTIMATED OPERATIONAL NOISE LEVELS AT NEARBY SENSITIVE RECEPTORS

NOTES: The combined noise levels that exceed threshold levels, may not occur because this model applies very conservative assumptions. The model does not account for noise reductions from intervening buildings or topographic changes, and it assumes all noise sources for each project component are located at the closest distance between source and receptor. Noise sources within each component will actually be distributed over the entire footprint of that component and there are intervening structures that will partially or completely shield some receptors. Therefore, the combined noise level at each project facility will likely be lower than estimated. The "Exceedance" column indicates the number of decibels (dBA) by which the ordinance limit would either be exceeded or not exceeded.

[a] See Table 2 for derivation of reference noise levels.

[b] The San Francisco Noise Ordinance (Police Code Section 2909[d]) interior noise limits from fixed noise sources are 45 dBA between 10:00 p.m. and 7:00 a.m. and 55 dBA between 7:00 a.m. and 10:00 p.m. with windows open. Assuming the building would attenuate exterior noise levels by 15 dBA with the windows open (World Health Organization (WHO), *Guidelines for Community Noise, Section 4.3.1. Dwellings*, page 61, 1999. Available online at http://www.who.int/docstore/peh/noise/guidelines2.html), these interior noise limits are equivalent to exterior noise limits of 60 dBA between 10:00 p.m. and 7:00 a.m. and 70 dBA between 7:00 a.m. and 10:00 p.m. at the closest residential receptors (windows open). However, for the Southeast Community Facility (Receptor 3), there is a training/education center and Head Start daycare facility and therefore, the ordinance's 70-dBA exterior daytime limit is applied at this receptor.

[c] Noise generated by the Energy Recovery Facility and waste gas burners are both listed in Table 2. However, they would not operate simultaneously so that only the highest noise level is added into the combined noise level at specified receptor locations.

[d] The same distance is applied to all of these facilities and based on the closest location of the Pre-THP facility and receptor.

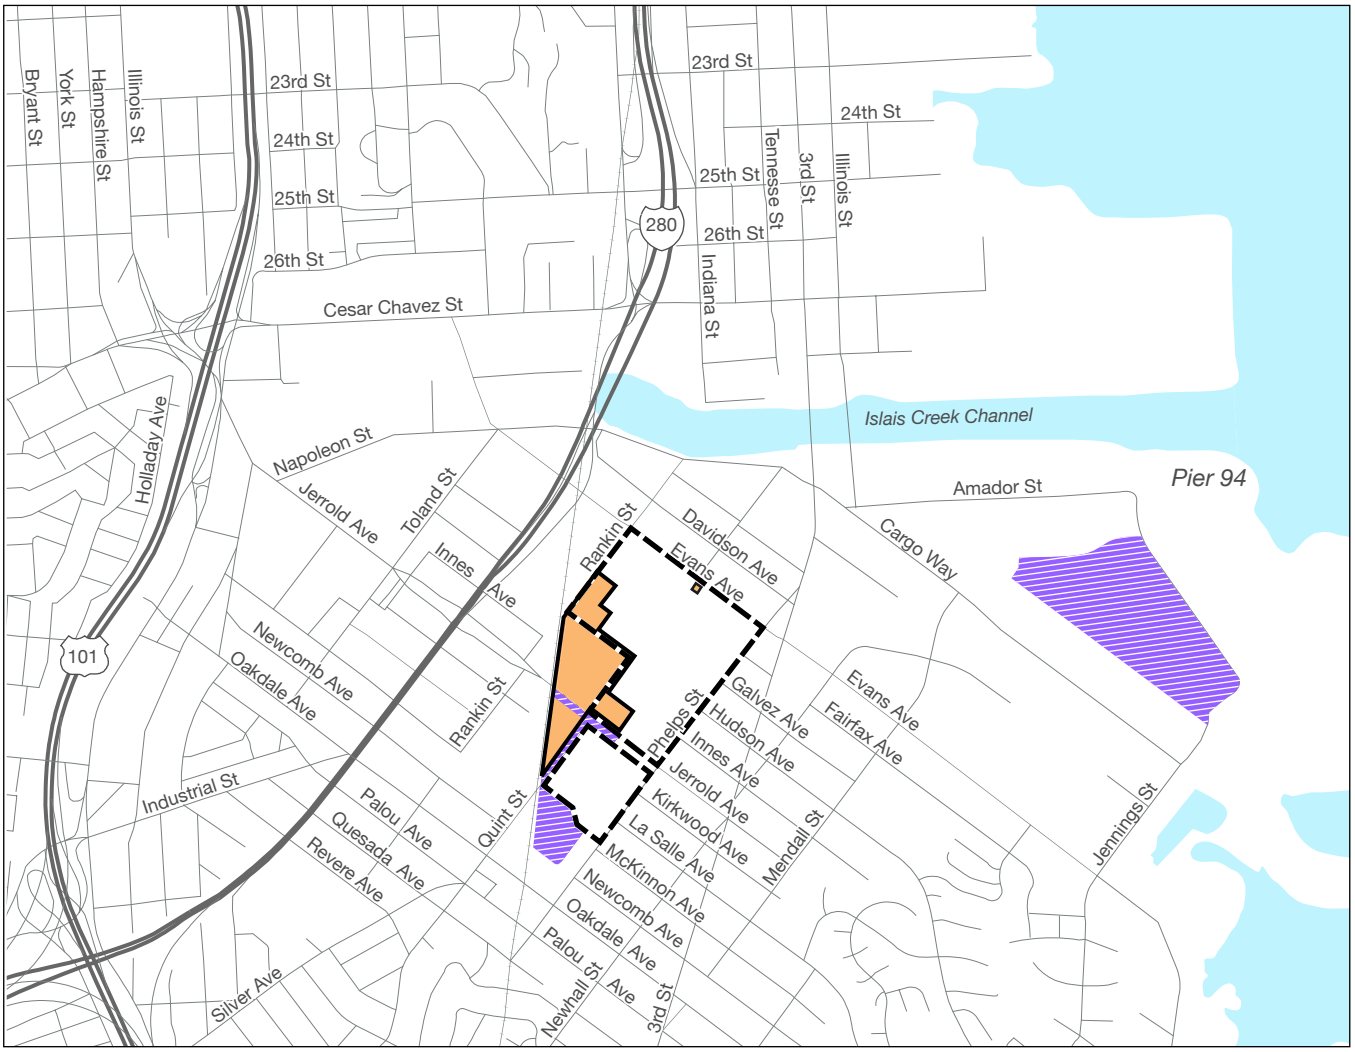
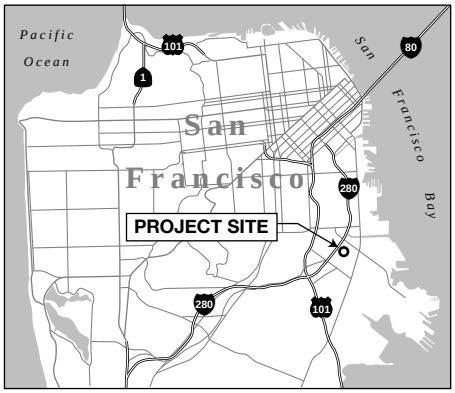
Notice of Preparation of an Environmental Impact Report and Notice of Public Scoping Meeting



Date:	June 24, 2015
Case No.:	**2015-000644ENV**
Project Title:	**Biosolids Digester Facilities Project**
Location:	750 Phelps Street, 1700 Jerrold Avenue, 1800 Jerrold Avenue and 1801 Jerrold Avenue, San Francisco
BPA Nos.:	N/A
Zoning:	P (Public Facilities); M-1 (Light Industrial); and M-2 (Industrial) 65-J Height and Bulk District
Block/Lot:	5262/009; 5281/001
Lot Size:	1,607,292 square feet; 64,394 square feet
Project Sponsor:	San Francisco Public Utilities Commission Karen Frye (415) 554-1652
Lead Agency:	San Francisco Planning Department
Staff Contact:	Steven Smith – (415) 558-6373 Steve.smith@sfgov.org



This Notice of Preparation (NOP) of an Environmental Impact Report (EIR) has been prepared by the San Francisco Planning Department in connection with the project listed above. The purpose of the EIR is to provide information about potential significant physical environmental effects of the proposed project, to identify possible ways to minimize the significant effects, and to describe and analyze possible alternatives to the proposed project in compliance with the California Environmental Quality Act (CEQA). The San Francisco Planning Department is issuing this NOP to inform the public, responsible agencies, and interested parties about the proposed project and the intent to prepare an EIR. This NOP is also available online at: http://www.sf-planning.org/puccases.

PROJECT SUMMARY

The Biosolids[1] Digester Facilities Project (the "project" or BDFP) would construct new solids treatment, odor control, energy recovery, and associated facilities at the San Francisco Public Utilities Commission's (SFPUC) Southeast Water Pollution Control Plant (SEP) located in the Bayview District of San Francisco (**Figure 1**). **Table 1** presents key features of the proposed project. The SFPUC is proposing new facilities to provide a modern and efficient solids treatment system to ensure treatment reliability, maintain regulatory compliance, protect public health and safety, meet current seismic standards, and provide advanced odor control. The BDFP would involve construction of new structures totaling approximately 200,000 square feet. To accommodate the proposed facilities, approximately 110,000 square feet of existing structures would be demolished.

[1] Biosolids are the recyclable organic product from the bacterial digestion of solids removed from wastewater.

TABLE 1
KEY FEATURES OF BIOSOLIDS DIGESTER FACILITIES PROJECT

Feature	Existing Conditions	Future with Project
SEP Size	~40 acres	~47 acres
Digesters	10 digesters – 2 million gallons each[a] Distance to Closest Residence: <100 feet	6 digesters – 1.33 million gallons each Distance to Closest Residence: ~1,000 feet
SEP Design Flow	250 million gallons per day (mgd) (wet weather)[b] 85 mgd (dry weather design average)[b]	No Change
Solids Load	182,700 lbs/day (2010); 280,000 lbs/day (2045)	No Change
Solids Treatment Process	Thickening Dewatering Anaerobic Digestion[c]	Screening Thickening Dewatering Thermal Hydrolysis[d] Anaerobic Digestion[c]
Biogas[e]	Production: ~1.3 million cubic feet per day Flaring: Routine	Production: ~2.0 million cubic feet per day Flaring: Emergency Only
Electricity Generated	2 Mega watts	5 Mega watts
Biosolids	Production: 16,360 dry tons (2010)[f] Classification: Class B[g]	Production: 24,000 dry tons (2045) Classification: Class A[g]
Daily Biosolids Haul trips (Annual Average)	7-9 per day	8-10 per day (2022-2045)[f]
Odor Control	Existing odor control does not contain odors from existing biosolids facilities to within the SEP property	Designed to limit odors from BDFP within SEP fenceline
SEP Staffing Levels (plant wide including biosolids)	280 staff	No Change

NOTES:

[a] The SEP has 10 digesters: 7 are active, 2 are used for storage, and one has been converted to a biogas storage facility.

[b] Flows at wastewater treatment plants are often expressed in terms of dry weather and wet weather since rainfall can substantially increase flows. At the SEP, during dry weather the combined sewer system flow is essentially domestic wastewater, with small contributions from industrial wastewater and urban runoff. During wet weather, the combined flow of wastewater and stormwater is governed by storm patterns and intensity.

[c] Anaerobic digestion is a method of treating wastewater solids using biological processes to inactivate bacteria and pathogens (a biological agent that causes disease or illness) and produce stabilized organic biosolids, biogas, and water.

[d] Thermal hydrolysis process (THP) provides sludge pretreatment prior to anaerobic digestion. Essentially, the sludge is heated with steam under pressure, held for a specified time in order to destroy pathogens, and then pressure is rapidly reduced to rupture microbial cells.

[e] Biogas is a byproduct of the bacterial digestion process and comprised mostly of methane and carbon dioxide.

[f] In the "no project" scenario, the production of biosolids would increase from existing conditions (2010) to 2045 due to projected future increases in wastewater flows and loads; however, production of biosolids without the project would result in approximately 27,700 dry tons compared to 24,000 dry tons with the project. Associated with the expected increase in biosolids under the "no project" scenario, the SEP daily biosolids truck trips would also increase from existing conditions (2010) to 2045, but the proposed processes under the BDFP would enable the SEP to reduce the number of biosolids truck trips compared to the projected future growth baseline.

[g] The Standards for the Use or Disposal of Sewage Sludge (Title 40 of the Code of Federal Regulations [CFR], Part 503), also known as the Part 503 rule, establish rules for biosolids application to land for different classes of biosolids. Class A biosolids contain no detectible levels of pathogens, low levels of metals, and do not attract vectors. According to the US Environmental Protection Agency Guide to Part 503 Rule, Class A biosolids are considered exceptional quality and have the fewest restrictions for land applications such as soil conditioning and fertilizer. Class B biosolids are treated but still contain detectible levels of pathogens. There are buffer requirements, public access, and crop harvesting restrictions for virtually all forms of Class B biosolids. Anticipated regulations may further restrict Class B biosolids use.

PUBLIC SCOPING PROCESS

Pursuant to the State of California Public Resources Code Section 21083.9 and CEQA Guidelines Section 15206, a public scoping meeting will be held to receive oral comments concerning the scope of the EIR. The meeting will be held on **Thursday, July 16, 2015 at 6:30 p.m.** in the Alex Pitcher Room at the **Southeast Community Facility, 1800 Oakdale Avenue, San Francisco**. The SFPUC will provide an informational open house from **5:30 to 6:30 p.m.** prior to the formal scoping meeting. To request a language interpreter or to accommodate persons with disabilities at the scoping meeting, please email or call the staff contact, Steven Smith, listed above at least 72 hours in advance of the meeting. Written comments will also be accepted at this meeting and until 5:00 p.m. on **Monday, July 27, 2015**. Written comments should be sent to Sarah B. Jones, San Francisco Planning Department, 1650 Mission Street, Suite 400, San Francisco, CA 94103; by fax to (415) 558-6409 (Attn: Sarah Jones); or by email to Sarah.B.Jones@sfgov.org.

If you work for a Responsible or Trustee agency, we need to know the views of your agency regarding the scope and content of the environmental information that are germane to your agency's statutory responsibilities in connection with the proposed project. Your agency may need the certified EIR when considering a permit or other approval for this project. Please include the name of a contact person in your agency.

Members of the public are not required to provide personal identifying information when they communicate with the Planning Commission or Department. All written or oral communications, including submitted personal contact information, may be made available to the public for inspection and copying upon request and may appear on the Department's website or in other public documents.

PROJECT BACKGROUND

The SFPUC operates and maintains the City's combined sewer system, which collects and treats wastewater and stormwater at one of three San Francisco treatment facilities: the Southeast Water Pollution Control Plant (SEP), the Oceanside Water Pollution Control Plant, or the North Point Wet-Weather Facility.[2] The system is called a "combined system" because it conveys both wastewater and stormwater in the same network of pipes. The broad components of wastewater treatment include:

- Liquid treatment processes
- Solids treatment processes
- Discharge of treated water through deepwater outfalls

The wastewater treatment operation at SEP consists of a number of sequential processes to separate and treat liquid and solids in the wastewater in compliance with all dry- and wet-weather[3] regulatory discharge requirements (see below, under "Existing Southeast Water Pollution Control Plant" for further description of the SEP). The focus of the BDFP is on the solids treatment facilities at the SEP.

[2] The North Point plant operates only during wet weather (rainstorms).

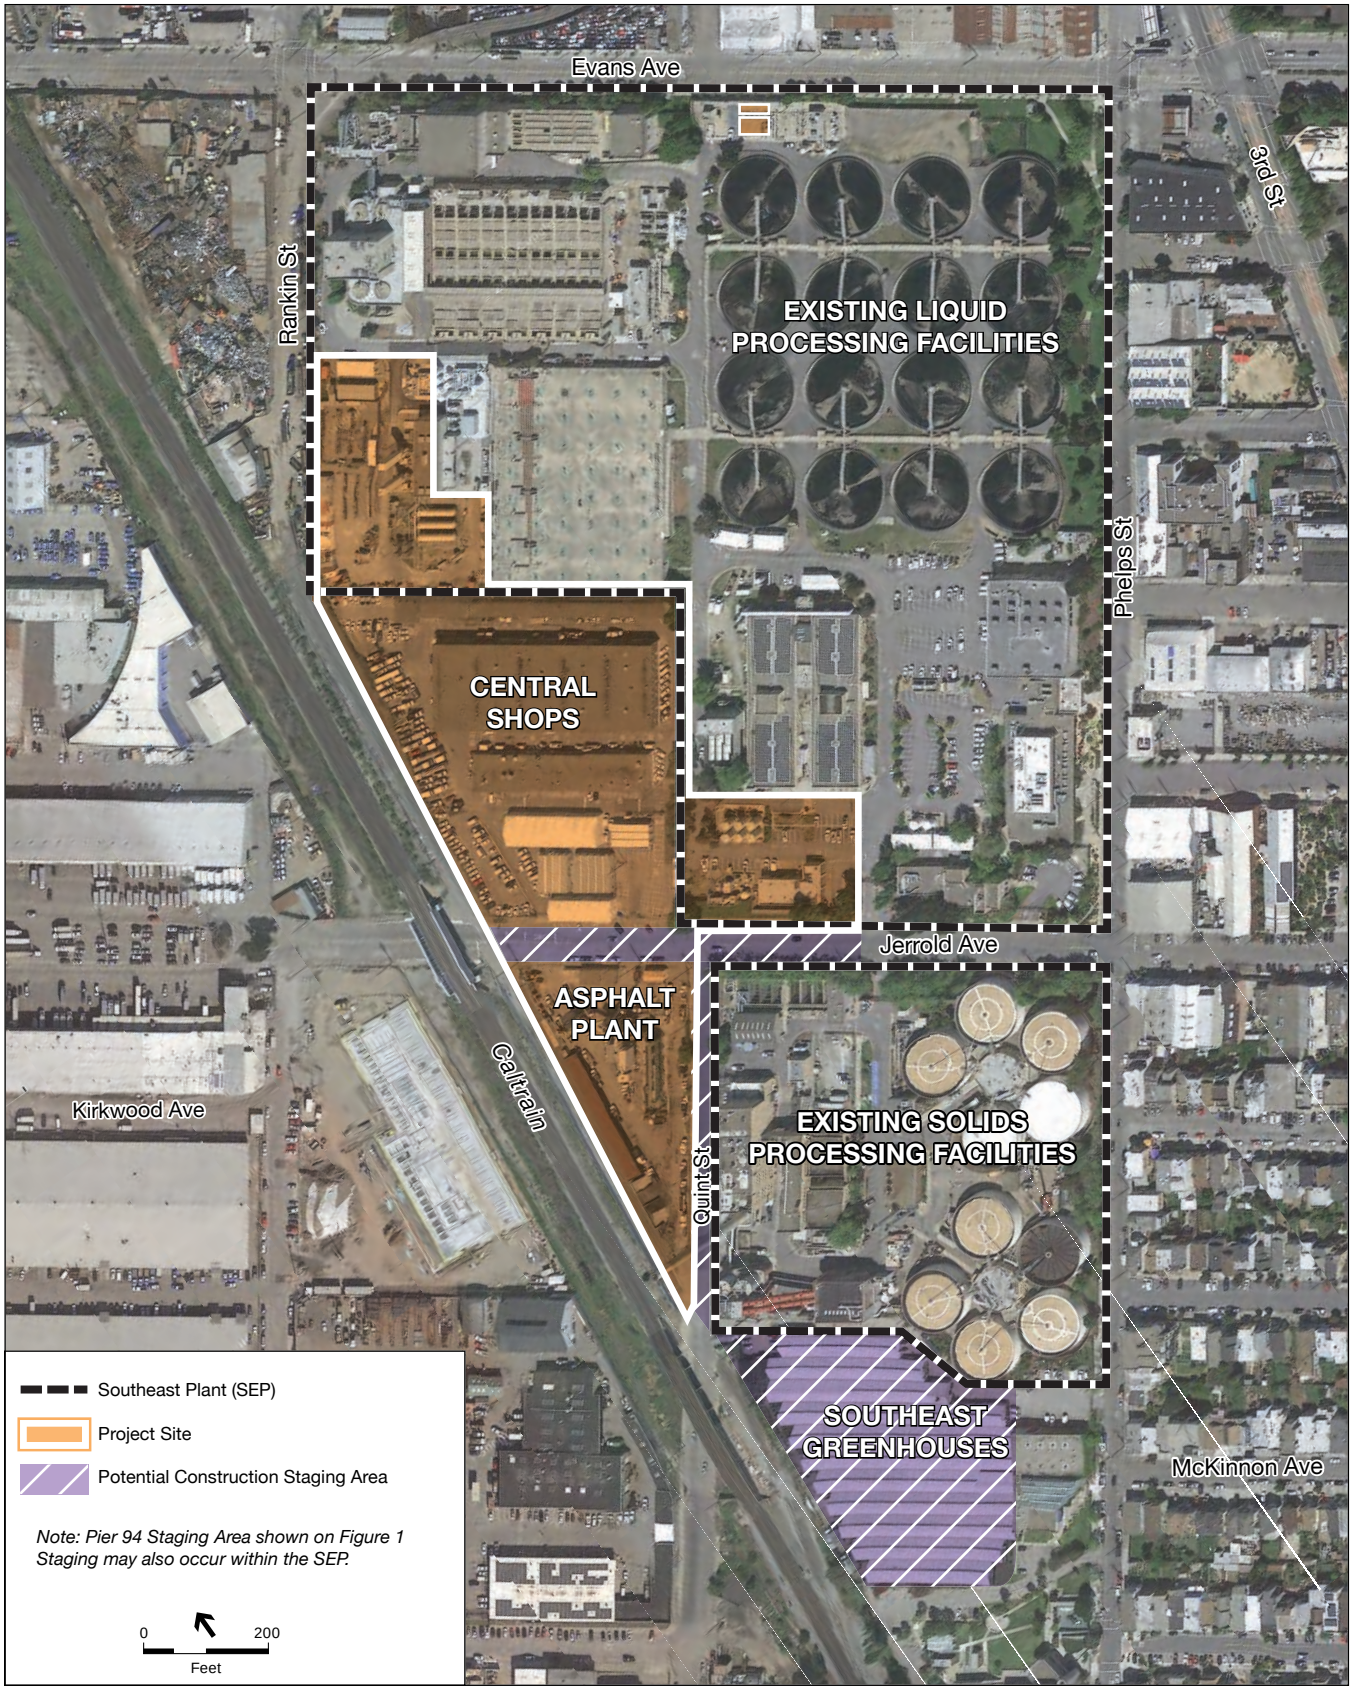
[3] Flows at wastewater treatment plants are often expressed in terms of dry weather and wet weather since rainfall can substantially increase flows. At the SEP, during dry weather the combined sewer system flow is essentially domestic wastewater, with small contributions from industrial wastewater and urban runoff. During wet weather, the combined flow of wastewater and stormwater is governed by storm patterns and intensity.

The existing solids treatment facilities at the SEP are over 60 years old and are operating well beyond their useful life. Since the SEP facilities were constructed, newer and more efficient wastewater treatment technologies have been developed. These technologies produce a higher quality and reduced volume of biosolids, capture and treat odors more effectively, and maximize biogas[4] use for production of heat and energy. Because the aging solids treatment system is prone to wear and the existing system requires significant maintenance, the SFPUC is proposing the BDFP. The proposed project is identified in the SFPUC's Sewer System Improvement Program (SSIP), a 20-year, $6.9-billion dollar citywide investment to upgrade the aging sewer infrastructure to ensure a reliable and seismically safe system.

PROJECT DESCRIPTION

Project Location

The SEP is located at 750 Phelps Street and occupies approximately 40 acres bounded by Evans Avenue to the northeast; Quint and Rankin Streets to the northwest; Phelps Street to the southeast; and the Caltrain railroad tracks and other City-owned properties to the southwest. Figure 1 shows the location of the proposed project site, including potential off-site construction staging areas. **Figure 2** shows the project site and existing SEP facilities. The SEP is located in San Francisco's Bayview-Hunters Point community (Supervisor District 10), in an area with a mix of residential and light/heavy industrial zones. Residential land uses are located directly across Phelps Street along the southeast boundary of the SEP.



Project Site

Proposed facilities would be constructed on portions of the existing SEP property and on adjacent properties at 1800 Jerrold Avenue (the Central Shops facility) and 1801 Jerrold Avenue (the decommissioned Asphalt Plant facility). These sites total approximately 415,000 square feet. The Central Shops facility site is currently owned and operated by the City of San Francisco's General Services Agency (GSA), which provides vehicle and equipment maintenance services for multiple City agencies through the Fleet Management Department. Prior to BDFP construction, Central Shops would relocate and the existing site would be transferred to SFPUC; the location of the new Central Shops site has not yet been determined. The asphalt plant site, owned by the City of San Francisco's Department of Public Works, is non-operational and will also be transferred to SFPUC prior to project construction.

As shown on Figure 2, Jerrold Avenue bisects the SEP and the project site. During the project's five-year construction period, the SFPUC would temporarily close Jerrold Avenue to public through-traffic between the existing entrance to the SEP on Jerrold Avenue between Quint Street and Phelps Street and the Caltrain right-of-way to promote a safe construction work area. Truck deliveries needed for plant operations may be permitted access to the SEP via Jerrold Avenue.

In addition, the proposed project would require temporary use of other sites during the construction period. The BDFP will require up to 12 acres of construction staging area. The SFPUC is considering use of two off-site properties, shown on Figure 1, for a majority of the construction staging. In addition, several additional staging areas within and immediately adjacent to the SEP boundary have been identified as shown on Figure 2.

[4] Biogas is a byproduct of the bacterial digestion process and comprised mostly of methane and carbon dioxide.

SFPUC Biosolids Digester Facilities

Figure 2

Biosolids Digester Facilities Project Site

Description of Project Facilities

The new facilities would be designed to provide solids treatment for projected year 2045 wastewater flows and solids loads (the project's planning horizon) in accordance with the SSIP goals (see SSIP Goals and Levels of Service in Table 3 below). The project involves the replacement and relocation of the solids treatment facilities with more efficient, modern technologies and facilities designed to produce Class A biosolids[5], which have no detectable levels of pathogens[6] and expands options for beneficial reuse of these materials. The BDFP would require construction of new structures totaling approximately 200,000 square feet. To accommodate the proposed facilities, approximately 110,000 square feet of existing structures would be demolished. There would be a transition period of two to three years during which both old and new biosolids treatment systems would operate concurrently.

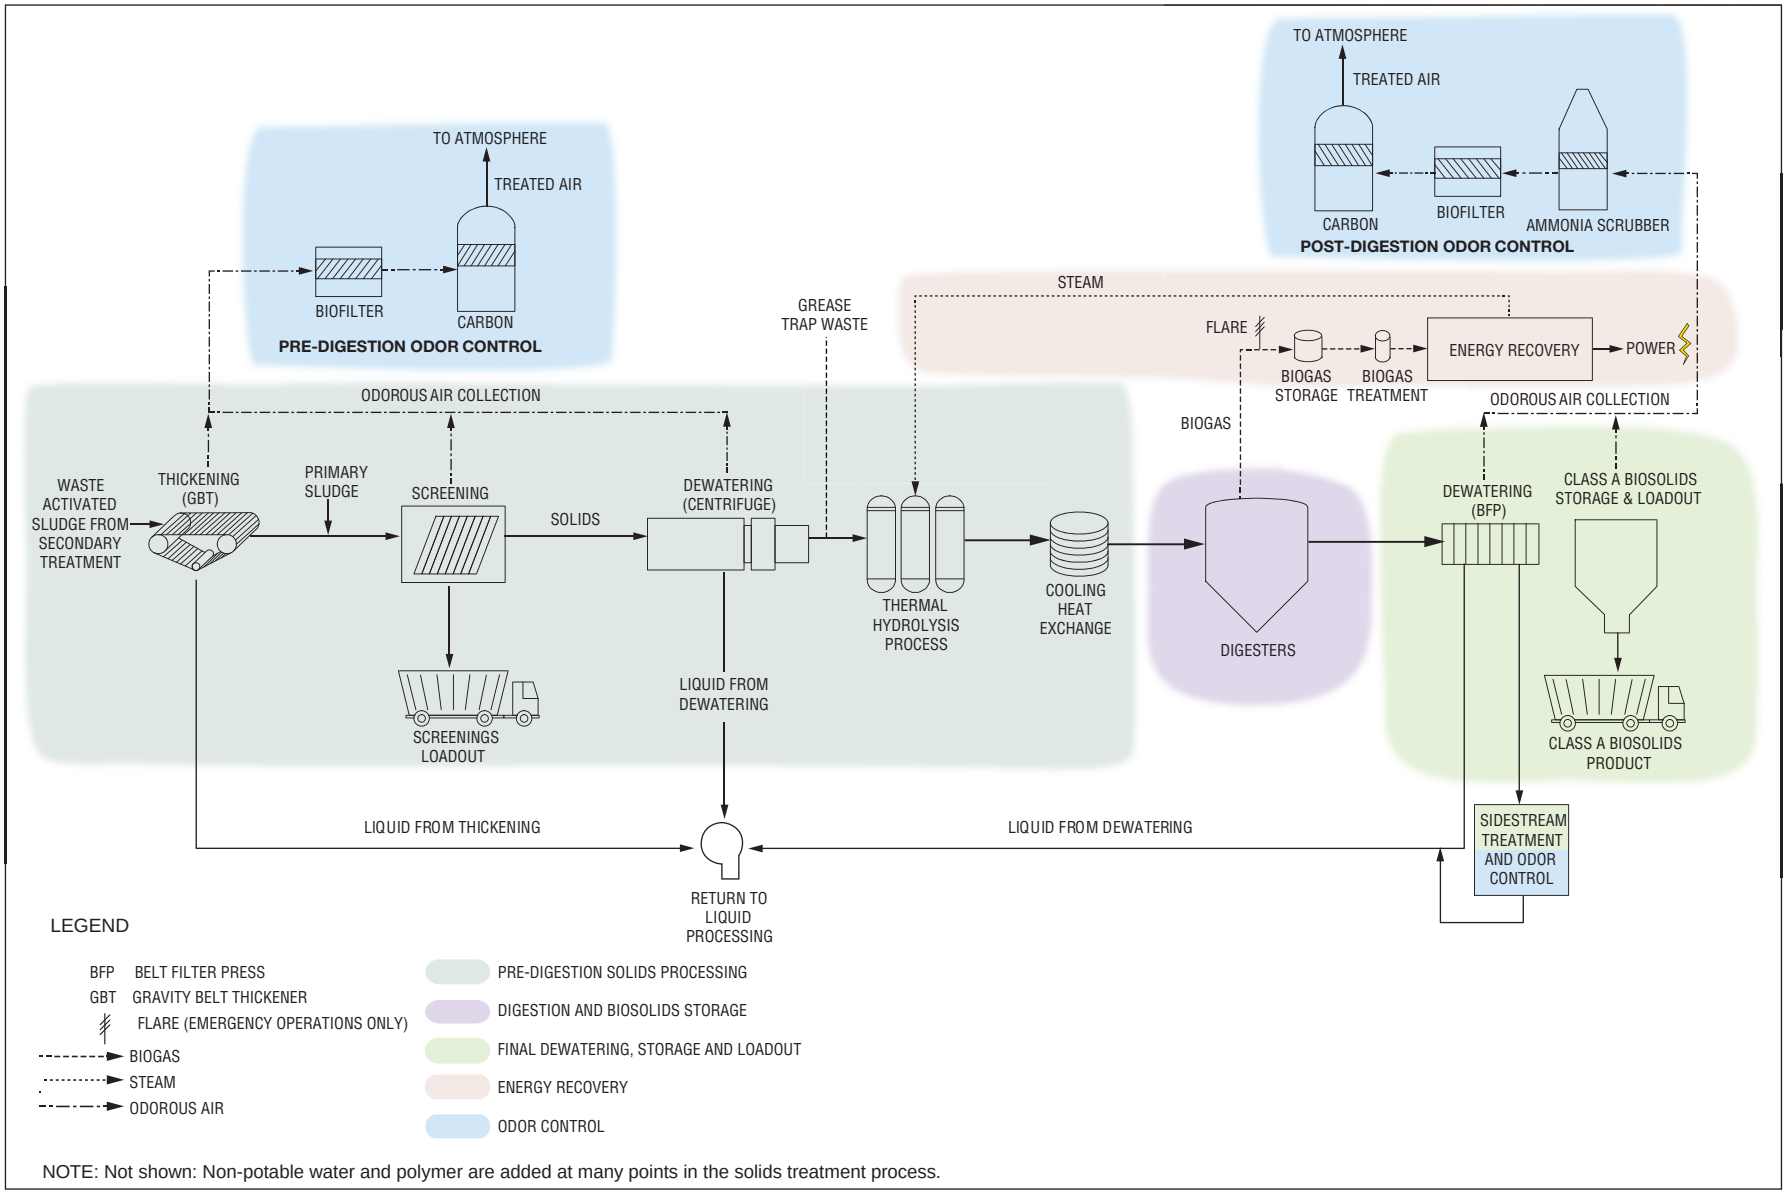
Figure 3 shows the sequence of individual processes (called "unit processes"), each of which accomplishes a specific function to prepare the solids for the next step. **Figure 4** shows the location of facilities that would house these processes within the project site, and **Table 2** shows the approximate size and height of each of the buildings or structures. The BDFP includes the following processes and associated facilities for handling and treatment of solids:

- ***Predigestion Solids Processing.*** Prior to digestion, solids would be mechanically screened, dewatered and sterilized. Processes used include screening, gravity belt thickening,[7] dewatering centrifuges, and thermal hydrolysis pretreatment (THP)[8] to sterilize the sludge and help produce Class A biosolids. The solids emerging from the THP would be cooled in a heat exchanger.

- ***Digestion and Biosolids Storage.*** In the digesters, anaerobic digestion[9] would occur, producing stabilized biosolids, biogas, and water. The digesters (a total of six tanks each 65 feet in diameter, positioned 65 feet above grade and 45 feet below grade) would be constructed in a linear layout parallel to the Caltrain right-of-way. This location is approximately 1,000 feet from the nearest residences.

- ***Final Dewatering, Storage and Load-out.*** Following digestion, digested sludge would be dewatered to produce Class A biosolids "cake" that would be trucked off-site. The final dewatering and associated Class A biosolids storage and loadout facilities would be located north of the proposed digesters, adjacent to Rankin Street.

---



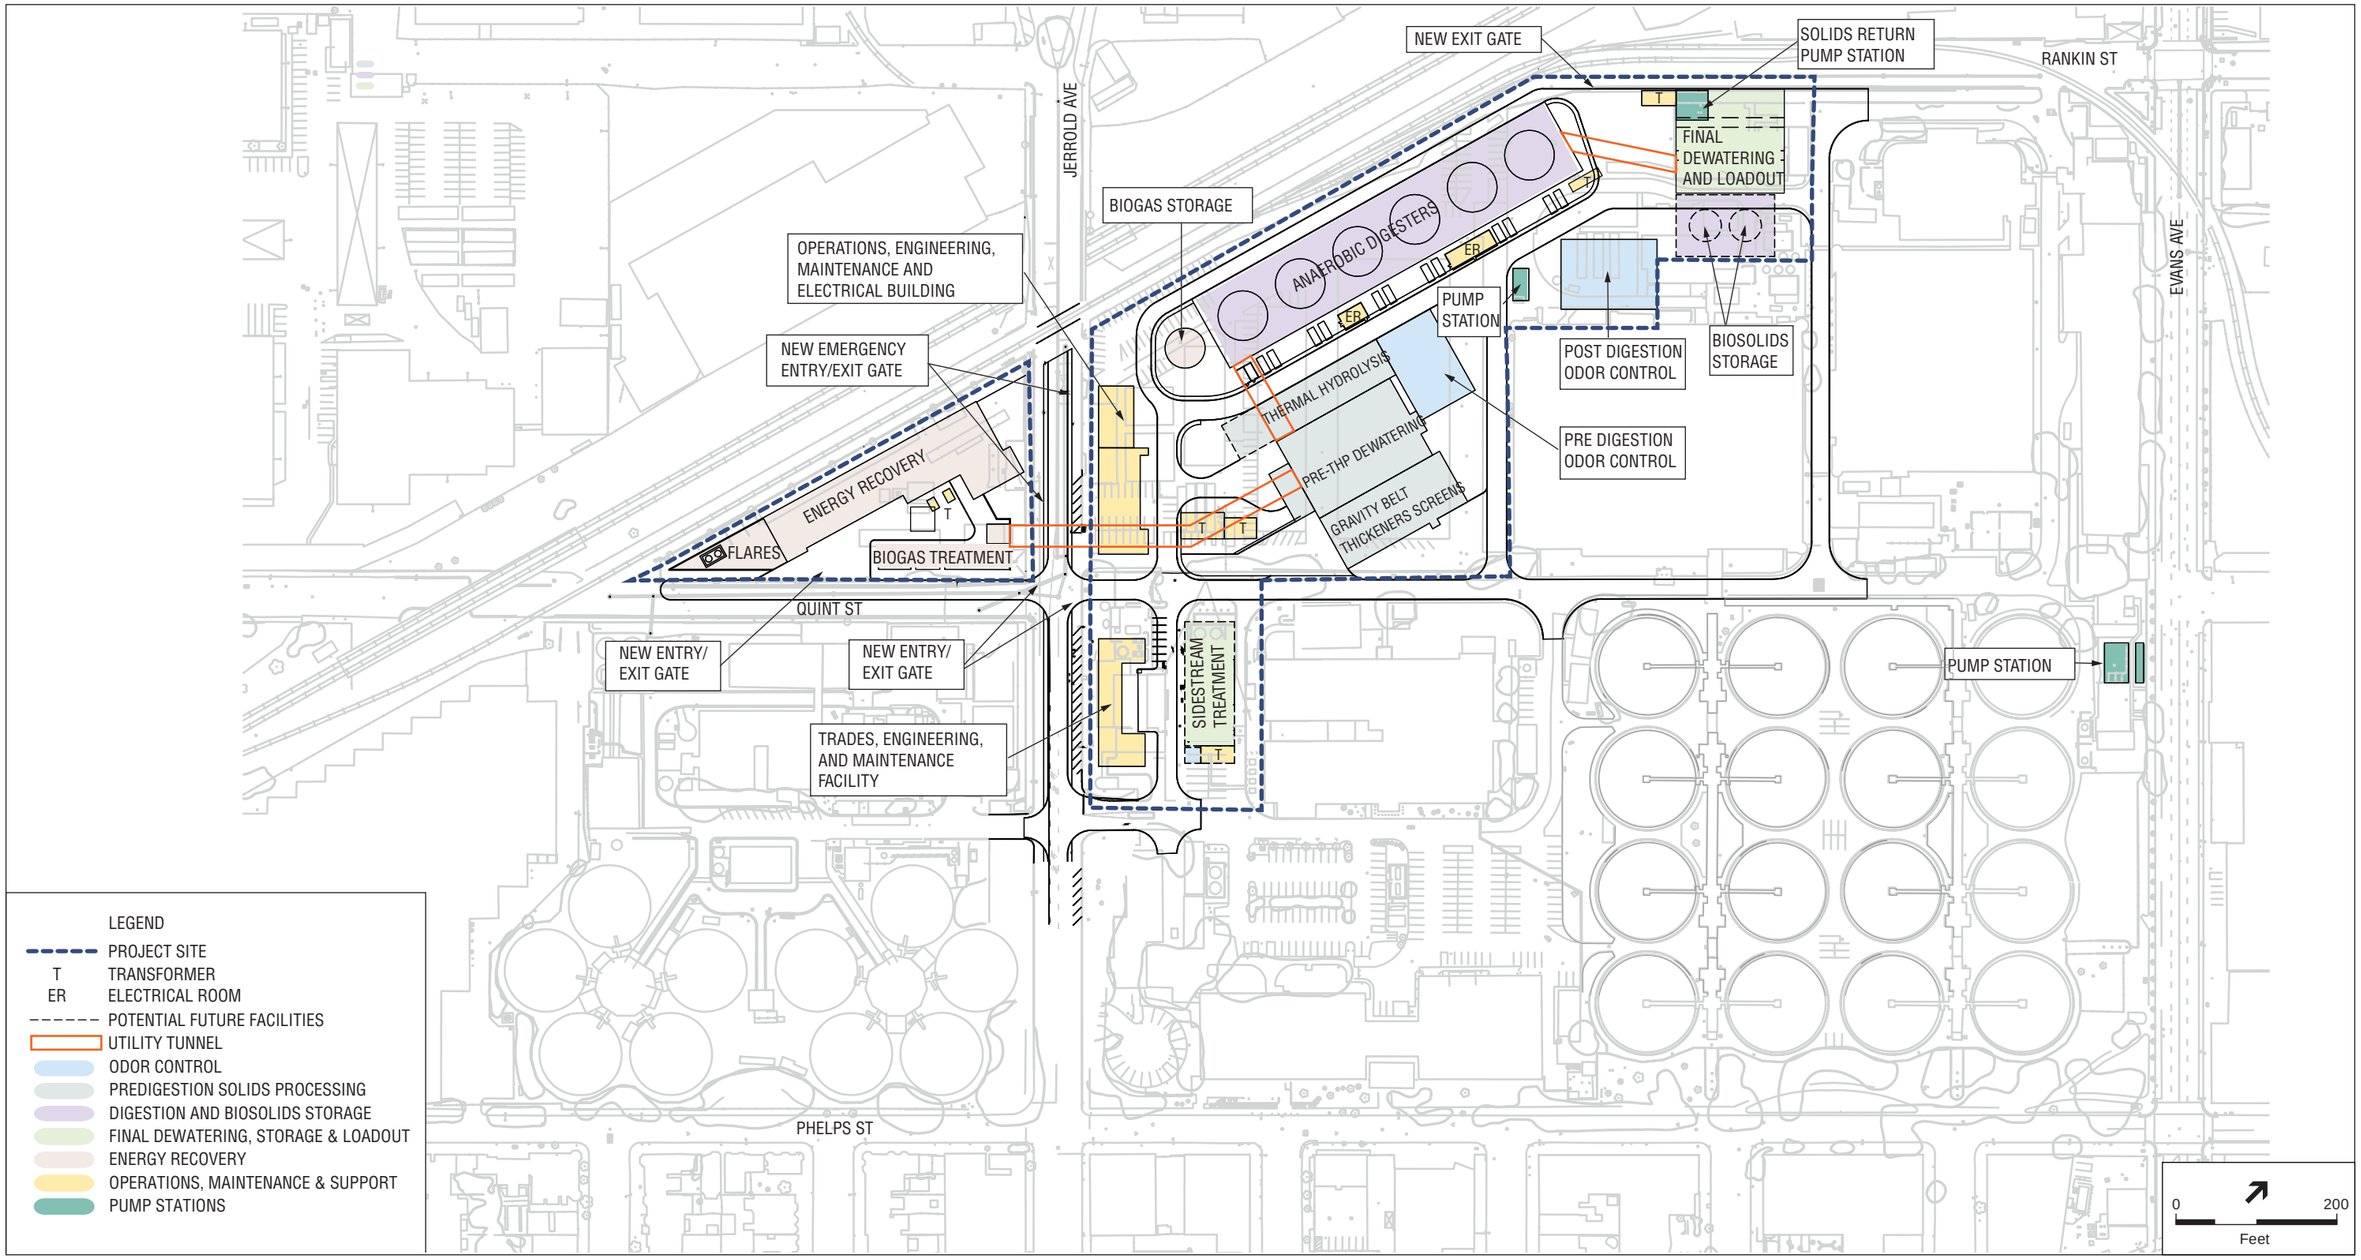
5 The Standards for the Use or Disposal of Sewage Sludge (Title 40 of the Code of Federal Regulations [CFR], Part 503), also known as the Part 503 rule, establish rules for biosolids application to land for different classes of biosolids. Class A biosolids contain no detectible levels of pathogens, low levels of metals, and do not attract vectors. According to the US Environmental Protection Agency Guide to Part 503 Rule, Class A biosolids are considered exceptional quality and have the fewest restrictions for land applications such as soil conditioning and fertilizer. Class B biosolids are treated but still contain detectible levels of pathogens. There are buffer requirements, public access, and crop harvesting restrictions for virtually all forms of Class B biosolids. Anticipated regulations may further restrict Class B biosolids use.

6 A pathogen is a biological agent that causes disease or illness.

7 Gravity Belt Thickeners are a method of condensing wastewater solids using gravity drainage of liquid through filter belt.

8 Thermal hydrolysis process (THP) provides sludge pretreatment prior to anaerobic digestion. Essentially, the sludge is heated with steam under pressure, held for a specified time in order to destroy pathogens, and then pressure is rapidly reduced to rupture microbial cells, prior to anaerobic digestion.

9 Anaerobic digestion is a method of treating wastewater solids using biological processes to inactivate bacteria and pathogens and produce stabilized organic biosolids, biogas and water.



NOTE: Not shown: Non-potable water and polymer are added at many points in the solids treatment process.

TABLE 2
PROPOSED BIOSOLIDS DIGESTER FACILITIES

Purpose	Facility	Approximate Size (Square Ft; Diameter)	Maximum Height Above Grade (feet)[f]
Pre-digestion Solids Processing	Gravity Belt Thickeners/Screens[a]	12,500	Up to 65 feet
	Pre-Thermal Hydrolysis Dewatering	20,000	Up to 65 feet
	Thermal Hydrolysis Process (THP)[b]	8,700	25
Digestion and Biosolids Storage	Anaerobic Digesters (6)	Pad: 49,800 Diameter (each): 65 feet	65
	Potential Future Biosolids Storage (2)	Pad: 9,500 Diameter (each): 45 feet	45
Final Dewatering, Storage and Loadout	Final Dewatering and Loadout	17,600	65
	Potential Future Sidestream Treatment[c]	11,200	Up to 15
Energy Recovery	Energy Recovery	22,200	45
	Biogas Treatment	4,400	At Grade
	Biogas Storage	50 feet diameter	50
	Flares (2 units)	500	20
Odor Control	Pre-digestion Odor Control	8,900	25
	Post-digestion Odor Control	10,500	25
	Sidestream Odor Control	400	15
Operations, Maintenance, and Support	Operations, Engineering, Maintenance, and Electrical Building	10,700	Up to 45
	Trades, Engineering, and Maintenance Facility	6,700	Up to 45
	Digester Electric Rooms (2 units)	2,100	10
	Transformers (6 units)	5,400	10
Water Systems and Pumping	Plant Water System[d] Pump Stations	1,500	At Grade
	Pathogen-free Water System[e]	800	At Grade
	Solids Return Pump Station	1,500	At Grade

NOTES:

[a] Gravity Belt Thickeners are a method of condensing wastewater solids using gravity drainage of liquid through filter belt.

[b] THP is a pre-treatment of solids used in combination with anaerobic digestion to produce Class A biosolids. THP processes preheat, hydrolyze, and sterilize solids. Essentially, the solids are heated with steam under pressure, held for a specified time in order to destroy pathogens, and then pressure is rapidly reduced to rupture microbial cells and allow for better methane production during anaerobic digestion.

[c] Sludge dewatering can produce "sidestream" (reject) water, which contains elevated levels of nitrogen. The proposed process would remove nitrogen from the sidestream liquid through biological processes.

[d] The "W3" system would provide W3 water, defined as non-potable chlorinated plant effluent.

[e] The "W2" system would produce W2 water, defined as non-potable chlorinated plant effluent that is also filtered.

[f] Height exemptions permitted under Planning Code Section 260(b) may exceed the 65 foot height limit.

- ***Sidestream Treatment.***[10] The final dewatering process would produce a "sidestream" (reject) liquid stream, which would contain elevated levels of ammonia. Sidestream treatment, which may be included in the project, would remove nitrogen (the primary nutrient in ammonia) from the dewatering reject stream through biological processes, and the resultant effluent would be returned to the existing SEP facilities for liquid treatment.

- ***Energy Recovery.*** One hundred percent of the biogas generated by the digesters would be used to produce both heat and power. New cogeneration facilities proposed as part of the project include low emission gas turbines that would generate up to 5.3 megawatts of electricity from the biogas produced by the digesters. The project would also include enclosed combustion flares for safe disposal of biogas in an emergency situation. Gas treatment systems would remove hydrogen sulfide, siloxanes,[11] moisture, and other volatile organic compounds from the biogas. The proposed turbines would meet or exceed Best Available Control Technology emissions standards of the San Francisco Bay Area Air Quality Management District. A heat recovery system would capture excess heat from the gas turbines and supply process steam that would be used to heat the thermal hydrolysis and digestion processes.

- ***Odor Control.*** The project includes pre-digestion and post-digestion odor control systems to collect and treat odors. Proposed odor control processes include carbon biofilters and ammonia scrubbers.[12] Odor control facilities would be designed with the goal of limiting odors to within the SEP property. A separate odor control system would be provided for the sidestream treatment process.

- ***Operations and Maintenance, Support Facilities***. The project would include structures to house operations and maintenance staff, who will manage and maintain the existing and new treatment processes. In addition, miscellaneous support facilities (e.g., electrical buildings, transformers, yard piping) would be constructed, including a utility tunnel beneath Jerrold Avenue just west of Quint Street.

- ***Water Systems and Pump Stations.*** The project would construct two water systems for use in the biosolids treatment processes that would treat SEP plant effluent. One system ("W3") would provide non-potable water for predigestion dilution and washwater requirements, and the other system ("W2") would provide pathogen-free[13] water for all processes after THP to ensure Class A biosolids requirements are met. Excess water from solids treatment processes would be returned to the existing liquid processing facilities in the SEP via a new pump station.

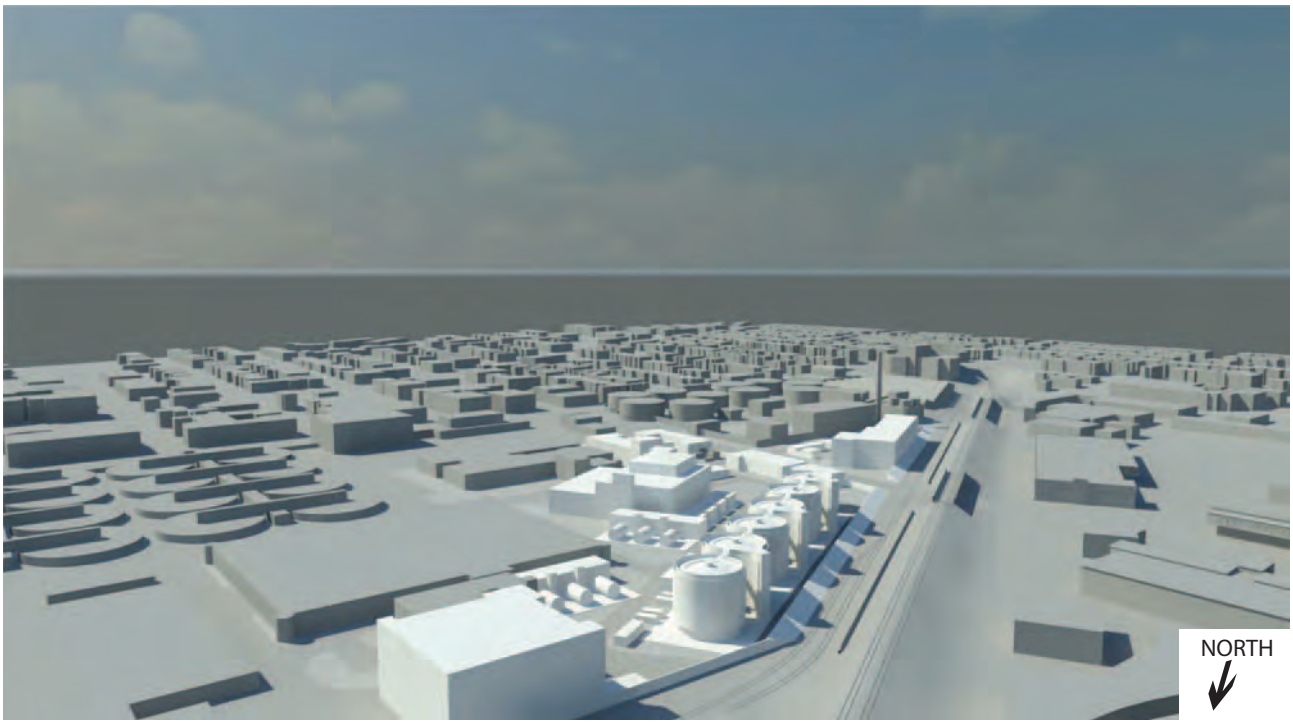

Figure 5 presents a conceptual visual representation of the general massing of the proposed project structures. Although project design is still in progress and many aspects of the project have not been finalized (e.g., the shape of the digesters), this figure provides an indication of the general physical characteristics of the BDFP.

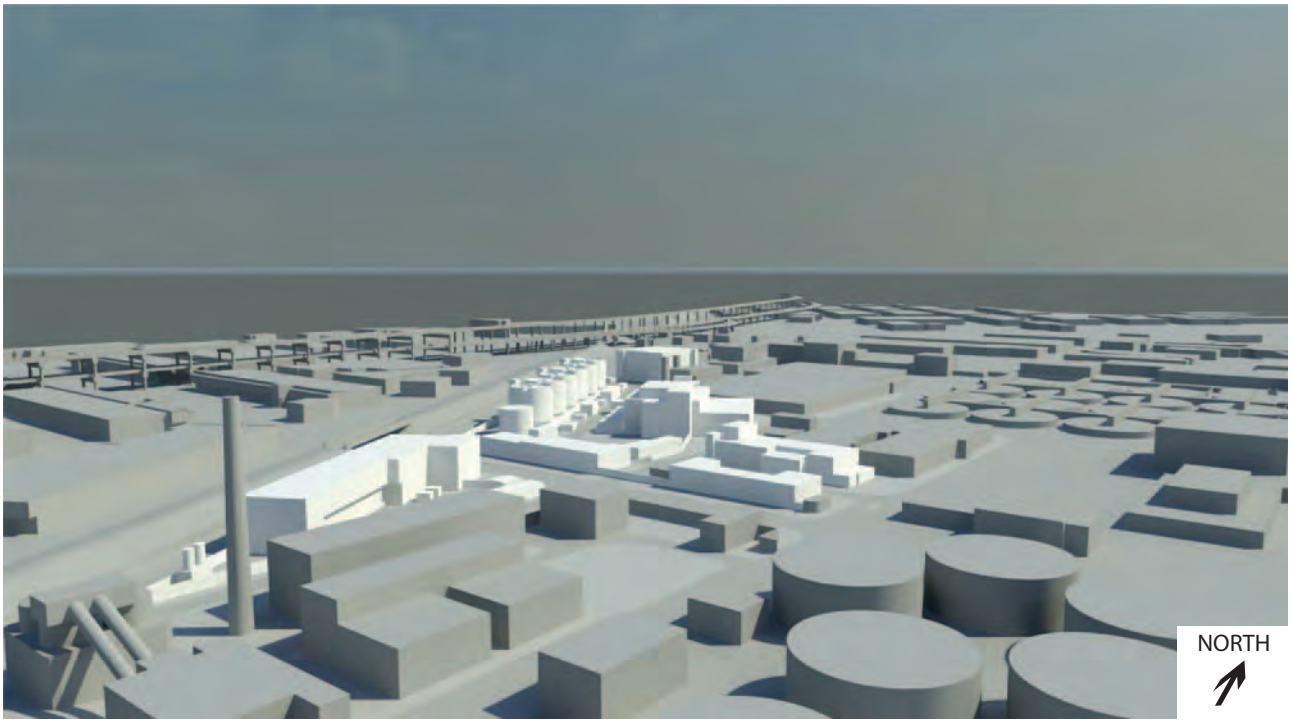
[10] The timing of implementing sidestream treatment could change. The BDFP would preserve space for a sidestream treatment facility.



[11] Siloxanes are man-made organic compounds containing silicon, oxygen and methyl groups that are commonly used in personal hygiene, health care and industrial products, and consequently are found in wastewater. Removal of siloxanes from the biogas prior to combustion extends the life of the power generating equipment and reduces maintenance requirements.

[12] Biofilters and scrubbers are pollution control devices often used to remove odors from wastewater treatment plant operations.

[13] Because the thermal hydrolysis process kills pathogens, the water used in subsequent processes must be pathogen free in order to produce Class A (i.e., pathogen free) biosolids.

Biosolids Digester Facilities Project

Figure 5

Preliminary Massing Diagrams

Other Project Features

The project would include development of a new vehicular entrance and exit from the SEP onto Rankin Street to facilitate truck deliveries and biosolids loadout, thereby relocating some truck trips away from Phelps Street and Jerrold Avenue, and shifting truck traffic away from nearby residences. Two new entrances on Jerrold Avenue (as well as emergency access gates) and one on Quint Street are also proposed (Figure 4). The project would include redesign of on-site vehicular circulation to accommodate the new entrances and exits, and the new facility layout.

Architecture and landscaping would be designed consistent with the San Francisco Planning Code, the San Francisco Arts Commission Civic Design Review process and the Public Art Program, and the Planning Department Better Streets Plan. The project would include landscaping and street improvements. Proposed improvements to Jerrold Avenue would occur in accordance with Better Street Plan guidelines, and could include traffic calming, curb extensions (road narrowing), sidewalk improvements, lighting, street trees, and safer pedestrian/worker crossings.

Street trees at the project site would be removed during construction. A tree survey would be conducted to determine the species, number, and size of trees to be removed. Preliminary estimates are that up to 50 trees would be removed. Trees removed would be replaced pursuant to Article 16 of the San Francisco Public Works Code Section 806(a) and other City requirements as applicable. Trees adjacent to construction areas that are not proposed for removal would be protected by establishing a Tree Protection Zone around any tree or group of trees to be retained.

EXISTING SOUTHEAST WATER POLLUTION CONTROL PLANT

SEP Service Area, Plant Capacity, and Existing Flows

Built originally in 1952, the SEP is the City's largest wastewater treatment facility, treating 80 percent of San Francisco's sewage and stormwater flows. In order to meet the mandates of the Federal Clean Water Act, SEP was expanded in the early 1980s to provide secondary treatment of all dry weather flows from the Bayside Watershed (generally the east side of the City), with an average design capacity of approximately 85 million gallons per day (mgd) and peak-hour design flow of 142 mgd. In 1996, the plant's wet weather capacity was increased to 250 mgd. During wet weather, the SEP provides secondary treatment to up to 150 mgd of combined sewage and stormwater, and an additional 100 mgd receives primary treatment prior to disinfection and discharge. The SEP operates 7 days a week, 24 hours a day and treats wastewater from the Bayside Watershed as well as flows from a limited area of Daly City and Brisbane (about 2.5 percent of the total flow currently treated at SEP). In 2014 the SEP produced a total of 58,100 wet tons of biosolids; the average dry weather flow for that year was approximately 58 mgd.

Existing SEP Facilities and Operations

The existing 40-acre SEP site is bisected by Jerrold Avenue, dividing it into SEP North (i.e., facilities north of Jerrold Avenue) and SEP South (facilities south of Jerrold Avenue). Facilities on SEP North are associated with processing the liquids portion of the wastewater. Facilities on SEP South (i.e., south of Jerrold Avenue) are associated with processing the solids portion of the wastewater, including the existing digesters and energy recovery facilities.

SEP provides secondary treatment using a pure oxygen activated sludge process prior to effluent disinfection. Treated plant effluent of up to 110 mgd is discharged into the San Francisco Bay through the

Pier 80 deepwater outfall. During wet weather, secondary effluent of up to 140 mgd also is discharged to the Bay through an additional outfall at the shoreline of Islais Creek (Quint Street Outfall).

The existing solids treatment process consists of: thickening to remove excess liquid; anaerobic digestion to stabilize the solids; production of biogas and biosolids; chemical conditioning and dewatering to produce a drier material; and off-hauling of the biosolids. The process produces Class B biosolids that are beneficially reused. Class B biosolids are currently trucked from the SEP to Sonoma County and Solano County during the dry season (May to October) for land application and to Hay Road Landfill (outside of Vacaville) during the wet season for beneficial reuse, including a small percentage that is composted. The digester biogas is captured on site and used to produce heat and power and/or combusted via flares. The biogas fuels a cogeneration engine that produces about 2 megawatts of electricity for on-site use. In addition, SEP also includes odor control facilities for select process areas.

PROGRAM GOALS AND PROJECT NEED

Sewer System Improvement Program Goals and Levels of Service

The BDFP is the largest and most critical project in the SFPUC's SSIP, which is a 20-year, 6.9 billion dollar citywide program to upgrade the aging sewer infrastructure to ensure a reliable and seismically safe system. Endorsed by the SFPUC Commission in August 2012, the SSIP goals and levels of service shown in **Table 3** were established to facilitate technical analysis, planning, design, and environmental review for all SSIP projects, including the BDFP.

TABLE 3
SEWER SYSTEM IMPROVEMENT PROGRAM GOALS AND LEVELS OF SERVICE

Goals	Levels of Service
Provide a compliant, reliable, resilient, and flexible system that can respond to catastrophic events	• Full compliance with state and federal regulatory requirements applicable to the treatment and disposal of sewage and stormwater. • Critical functions are built with redundant infrastructure. • Primary Treatment, with disinfection, must be online within 72 hours of a major earthquake.
Integrate green and grey infrastructure to manage stormwater and minimize flooding	• Control and manage flows from a storm of a three hour duration that delivers 1.3 inches of rain.
Provide benefits to impacted communities	• Limit odors to within the treatment facility's fence line. • Be a good neighbor. All projects will adhere to the Environmental Justice and Community Benefits policies.
Modify the system to adapt to climate change	• New infrastructure must accommodate expected sea level rise within the service life of the asset. • Existing infrastructure will be modified based on actual sea level rise.
Achieve economic and environmental sustainability	• Beneficial reuse of 100% biosolids. • Use nonpotable water sources to meet 100% of nonpotable water demands. • Beneficially use 100% of biogas generated by treatment facilities. • Stabilize lifecycle costs to achieve future economic stability.
Maintain ratepayer affordability	• Combined sewer and water bill will be less than 2.5% of average household income for a single family residence.

SOURCE: SFPUC. 2012. Sewer System Improvement Program Report, Table 9. Adopted August 28, 2012.

Project Need

The SEP digesters are over 60 years old and are operating well beyond their useful life. As indicated above, since the SEP facilities were constructed, newer and more efficient wastewater treatment technologies have emerged. Because the existing solids treatment system is prone to wear and requires significant maintenance, the SFPUC is proposing the BDFP to ensure treatment reliability, regulatory compliance and protect public health and safety.

The existing SEP appearance, odors and noise have a negative effect on the adjacent residential community. The digesters and other solids handling components are not built to current seismic standards and would not withstand the maximum credible earthquake. Furthermore, regulations are expected to become increasingly restrictive with regard to the use and land application of Class B biosolids currently generated at the SEP (Class B biosolids contain detectable levels of pathogens). For this reason, the SFPUC has proactively adopted a goal to produce Class A biosolids for additional beneficial reuse options,[14], which is an additional need for the project.

PROJECT CONSTRUCTION

Demolition, Earthwork, and Facility Construction

Overall, construction of the BDFP is anticipated to require five years (60 months). Site preparation for the BDFP would require the demolition of various structures within the project site to accommodate the proposed project facilities and associated operations. Existing structures to be demolished, including buildings at the Central Shops property, total about 110,000 square feet. Concrete, asphalt, and other demolition debris would be hauled off site for recycling or disposal as required by the San Francisco Construction and Demolition Debris Ordinance.

Following site clearing, secant retaining walls[15] would be installed to prevent groundwater intrusion and to provide a dry work area during construction. The project site would be excavated to a depth of 20 feet, and up to 48 feet at the location of the proposed digester tank structures. During the peak excavation period (roughly six months), up to 200 to 250 truck trips per day would be needed for hauling of debris, excavated soil, and backfill.

During the other four and a half years of construction, approximately 50 truck trips per day are anticipated for deliveries of equipment and materials. Construction of new project facilities would generally include: installation of foundations (using pile driving) and subsurface utility conduits, building construction, concrete placement, and interior work such as mechanical and electrical equipment installation.

Initial performance testing of the new biosolids digester facilities would be conducted for approximately six months to one year following construction completion and prior to full operation. Operation of the existing digesters would be phased out over a period of one to two years while the new facilities are brought on line and the new system is stabilized.

[14] Class A biosolids beneficial reuses include horticultural uses for products such as compost and blended soil used by landscapers, golf courses and nurseries, as well as agricultural uses as fertilizer or a fertilizer ingredient for crops that are not for human consumption.

[15] Secant pile walls are formed by constructing a series of overlapping concrete-filled drill holes surrounding the area to be excavated to avoid the intrusion of groundwater into the excavated pit.

Construction Staging

Construction staging areas would be used for construction office trailers, construction equipment and materials, and parking for construction worker vehicles. Staging areas could also be used for temporary stockpiling of demolition debris and excavated soil prior to reuse or off-site disposal. Potential construction staging areas that have been identified include the following:

- ***Within SEP.*** Various available areas within the SEP may be used during construction for laydown of equipment and materials.

- ***Within Quint Street.*** Starting in October 2015, a Caltrain project[16] will construct a berm under the Quint Street overcrossing that will result in the permanent closure of through traffic on Quint Street. This will result in a dead-end segment of Quint Street adjacent to the project site between the Caltrain railroad tracks and Jerrold Avenue. This segment of Quint Street is proposed as a staging/parking area during construction.

- ***Within Jerrold Avenue.*** The SFPUC proposes a temporary closure of approximately 1.5 blocks of Jerrold Avenue to public through-traffic (between the entrance to the SEP west of Phelps Street and the Caltrain right-of-way) during the five-year project construction period, to promote a safe construction work area. During this time, the closed segment of Jerrold Avenue may be used as a staging/parking area. Truck deliveries needed for plant operations may be permitted access to the SEP via Jerrold Avenue.

- ***Offsite location at Pier 94 Backlands*** (refer to Figure 1). Another potential offsite staging area would include a portion of the Pier 94 Backlands property owned by the Port of San Francisco located approximately 0.75 mile northeast of the SEP. This larger staging area would be used for construction office trailers, construction equipment and materials, and parking for construction worker vehicles. If selected, a shuttle service would be provided to transport construction workers between Pier 94 and the project site.

  Offsite location adjacent to SEP at the Southeast Greenhouses (refer to Figure 2). A potential offsite staging area is the 4-acre site owned by the SFPUC and currently occupied by the Southeast Greenhouses (greenhouses), located southwest of the existing digester structures.[17] The SFPUC has not yet determined potential future uses of the greenhouses site. However, if the area becomes available, the greenhouses would first be demolished and the area would be used for materials staging, parking and/or office trailers.

Existing Digesters Decommissioning

Following the successful operational performance of the new digester facilities, the existing digester tanks and solids handling facilities at SEP, located south of Quint Street and Jerrold Avenue, would be decommissioned, cleaned, and sealed. Demolition and future use of these areas would be determined in the future Phase II of the SSIP (when authorized) and are not part of the proposed project.

[16] The Caltrain Quint Street Project will permanently close Quint Street between Oakdale Avenue and the Caltrain tracks, starting in October 2015, for replacement of the existing Quint Street Bridge. http://www.caltrain.com/projectsplans/Projects/Caltrain_Capital_Program/Quint_Street_Project.html, access May 29, 2015.

[17] As part of a previously planned renovation process for the greenhouses, the SFPUC commissioned a due diligence study that recommended significant reconfiguration or demolition of the structures.

Construction Schedule

Table 4 provides the general duration of work for overall project construction. Project construction would occur for five years, from approximately summer of 2017 through summer of 2022. For most of the project construction period, construction is expected to occur Monday through Friday from 7:00 a.m. to 3:00 p.m. and Saturdays as needed, with work on Sundays and holidays and 24-hour work occurring only if needed for critical facility connections. The peak construction period in terms of vehicular traffic, when over 500 workers would be on-site, would last approximately 17 months and would be conducted in two work shifts Monday through Saturday from 7:00 a.m. to 11:00 p.m. The most intensive construction activities would occur at the Central Shops site for construction of the six digester tanks, which are the largest individual BDFP structures and require the deepest excavation (to 48 feet below ground surface); construction of ancillary facilities on other portions of the project site would be more limited in duration and intensity.

TABLE 4
CONSTRUCTION SCHEDULE AND DURATION BY ACTIVITY TYPE

Construction Activity	Expected Duration	Estimated Schedule
Site Preparation (e.g., demolition, excavation, utility relocation)	6 months	July 2017 – Jan 2018
Construction	54 months	Jan 2018 – Jun 2022
Total Biosolids Digester Facilities Construction	***60 months***	***July 2017 – Jun 2022***
Startup and Testing	12 months	Dec 2021 – Dec 2022
Process Stabilization Period (no construction)	24 months	Jun 2022 – Jun 2024
Existing Digester Decommissioning	6 months	After 2024[a]

NOTE:

[a] Potential demolition of the existing digesters and solids handling facilities to be determined in Phase II of the SSIP.

OPERATIONS

Similar to current conditions, the new facilities constructed under the BDFP would operate 24 hours per day, seven days per week. No increase in existing operations staff levels (currently about 280 staff) is anticipated. The proposed project would not increase the wastewater treatment capacity of the SEP because the existing SEP design capacity is able to handle projected loads through 2045.

Proposed changes in entrances/exit locations and to on-site circulation would alter traffic patterns associated with the SEP's operations, shifting some truck traffic off of Jerrold Avenue and onto Rankin Street. The number of daily truck trips required for biosolids processing and disposal would remain substantially similar to existing conditions.

PERMITS AND APPROVALS REQUIRED

The permits and approvals needed for the project will be confirmed during EIR preparation. Below is a preliminary identification of potential approvals needed for project construction and operation. This list is not intended to be inclusive of all permits required.

- Bay Area Air Quality Management District – Authority to Construct and Permit to Operate

- State Water Resources Control Board:
  - Construction General Permit and Stormwater Pollution Prevention Plan, if more than one acre of land were disturbed[18]
  - State Revolving Fund (SRF) Loan Program requirements (e.g., consultation regarding Section 106 of the National Historic Preservation Act)
- San Francisco Port Commission – Approval of use of Pier 94 Backlands for construction staging
- San Francisco Bay Conservation and Development Commission – Potential approval of Pier 94 Backlands for construction staging if property is within 100 feet of the Bay shoreline (most of the Port Pier 94 property is not within BCDC jurisdiction)

ENVIRONMENTAL REVIEW PROCESS

The San Francisco Planning Department is preparing an EIR to evaluate the environmental effects of the proposed project on the environment. The EIR will be prepared in compliance with CEQA (California Public Resources Code, Sections 21000 *et seq.*), the *CEQA Guidelines*, and Chapter 31 of the San Francisco Administrative Code, and will address project-specific construction and operational impacts of the BDFP. The EIR is an informational document for use by governmental agencies and the public to aid in the planning and decision-making process. The EIR will disclose the physical environmental effects of the project and identify possible ways of reducing or avoiding potentially significant impacts.

Summary of Potential Environmental Issues

The proposed project could result in potentially significant environmental effects. The Planning Department will prepare an EIR to evaluate the physical environmental effects of the proposed project. As required by CEQA, the EIR will examine potentially significant effects, identify mitigation measures, and analyze whether the proposed mitigation measures would reduce the environmental effects to a less than significant level.

The EIR will address various environmental topics, each briefly summarized below.

Land Use and Land Use Planning

The topic of Land Use and Land Use Planning will describe existing land uses on and near the project site and analyze whether the proposed project would physically divide an established community or result in land use conflicts or with land use plans adopted in the project vicinity.

Aesthetics

Project construction and operation could affect aesthetics at the project site and surrounding areas. Potential impacts to be evaluated include impacts on scenic vistas or visual character.

Population and Housing

The topic of Population and Housing will include analysis of the proposed project's potential impact related to population, employment, and housing.

[18] Applicable to areas that do not drain to the City's combined sewer system; therefore not applicable to the project site but potentially applicable to the Pier 94 Backlands staging area.

Cultural and Paleontological Resources

The EIR will assess the potential for the project to result in significant impacts to paleontological, archeological, and historical resources, including historic and prehistoric archeological deposits and historic buildings or structures ("historical resources"). The EIR will describe the historical resources and potential historical resources on the project site, assess the potential for subsurface archaeological resources to be present, and identify potential impacts of the project on these resources.

There are no known archaeological resources on the site surface. The three Central Shops buildings at 1800 Jerrold Avenue have been evaluated and two are considered historical resources under CEQA. The proposed project would demolish these buildings. The EIR will include an assessment of the significance of this impact.

The potential for effects of project-related excavation on subsurface paleontological resources (fossil plant or animal remains) also will be analyzed.

Transportation and Circulation

Once the proposed BDFP is in full operation, employee and truck trips associated with biosolids processing and disposal are expected to be substantially similar to existing conditions. During project construction, SFPUC would temporarily close Jerrold Avenue adjacent to the SEP, and also occupy a segment of Quint Street that is expected to be permanently closed to through traffic in October 2015. Project construction would generate new traffic to and from the project site, including off-site construction staging areas, and would increase transit ridership and parking and loading demand. A Transportation Impact Study will be prepared for the proposed project in accordance with the Planning Department's Transportation Guidelines for Environmental Review (October 2002). The study will include an analysis of specific transportation impacts and mitigation measures associated with the proposed facility's operations and construction-period impacts. The study will also analyze transit conditions, pedestrian and bicycle conditions, loading, and emergency access, and evaluate cumulative effects of anticipated development and changes in traffic circulation in the vicinity of the SEP. The EIR will summarize the findings of the transportation study.

Noise

The EIR will include analysis of noise compatibility standards for residential and other land uses, and discuss the long-term impacts of noise and groundborne vibration that could result from the proposed project. Short-term construction-related noise impacts also will be described, and the analysis will evaluate the potential for noise from the project to adversely affect nearby sensitive land uses.

Air Quality/Odor

The EIR will include analysis of consistency of the proposed project with applicable air quality plans and standards, the potential for the proposed project to result in emissions of criteria air pollutants and toxic air contaminants (TACs) at levels that may affect sensitive populations, as well as the potential for the project to result in sources of odors affecting a substantial number of people. The air quality analysis will include quantification of both construction-related and operational air pollutant emissions, and will evaluate potential health risk effects from emissions of TACs, including effects on residents near the project site. The air quality analysis will also include a discussion of the existing conditions at the project site, including the Air Pollutant Exposure Zone, and compliance with the Clean Construction Ordinance.

Greenhouse Gas Emissions

The topic of Greenhouse Gas Emissions will include an analysis of the proposed project's consistency with the City's Greenhouse Gas Reduction Strategy and the degree to which the proposed project's greenhouse gas emissions could result in a significant effect on the environment.

Wind and Shadow

Construction of aboveground project facilities could result in wind and shadow effects. Potential effects to be evaluated include alteration of wind in a manner that substantially affects public areas, and creation of new shadow in a manner that substantially affects outdoor recreation facilities or other public areas.

Recreation

The topic of Recreation will include an analysis of whether the proposed project could adversely affect existing parks and open spaces such that substantial physical deterioration of recreational facilities would occur or require the construction or expansion of recreational facilities.

Utilities and Service Systems

The proposed project involves improvements to the wastewater treatment system. The topic of Utilities and Service Systems will include an assessment of whether the proposed project would require the construction of new water supply and/or stormwater drainage facilities, and if so, whether that construction could result in adverse environmental effects. The analysis will also identify the potential for utility disruptions during construction. The topic will also discuss disposal of solid waste generated by the proposed project and potential effects on landfill capacity.

Public Services

The topic of Public Services will include analysis of whether existing public services (e.g., schools, police and fire protection, etc.) would be adversely affected by the proposed project during construction or operation. The analysis will determine whether project implementation would result in an inability of service providers to maintain adequate levels of service and/or a need for new or expanded facilities, the construction of which could result in adverse environmental effects.

Biological Resources

The topic of Biological Resources will include analysis of potential project effects on important biological resources or habitats, including tree removal, or the movement of any native resident or migratory bird species.

Geology, Soils, and Seismicity

The topic of Geology and Soils will include an analysis related to the susceptibility of the project site to seismic activity, liquefaction, landslides, erosion, soil stability, and consequent risks to life or property.

Hydrology and Water Quality

The topic of Hydrology and Water Quality will assess the potential for the proposed project to impact water quality standards or waste discharge requirements or result in adverse effects on groundwater. The analysis will also consider the degree to which the proposed project could affect drainage patterns or create water runoff that could affect stormwater drainage systems. Finally, the analysis will consider the potential of the project to expose people or structures to a significant risk of loss, injury or death involving flooding, including potential effects of sea level rise.

Hazards and Hazardous Materials

Studies prepared for the project site indicate the presence of contamination, including the potential for contaminated soils and groundwater. Project construction (mainly excavation) would result in the removal and cleanup of existing hazardous materials at the project site, but could temporarily expose people to those existing hazardous materials. Construction and operation of the proposed project would require the use of hazardous material, including fuels. Potential effects to be evaluated in the EIR include: creation of a significant hazard through the routine transport, use, or disposal of hazardous materials; creation of a significant hazard through upset or accident conditions involving the release of hazardous materials; emission of hazardous materials within the vicinity of a school; creation of a significant hazard associated with existing hazardous materials sites; conflict with adopted emergency response plan or evacuation plan; and exposure of people or structures to fires.

Mineral/Energy Resources

The EIR will include analysis of potential project impacts on existing mineral and energy resources.

Agriculture and Forestry Resources

The EIR will address the potential for the project to affect existing agricultural and forest resources.

Alternatives

Pursuant to CEQA, the EIR also will analyze a range of alternatives that would reduce or avoid significant environmental impacts identified in the EIR, including a No Project Alternative, as described in CEQA Guidelines Section 15126.6.

Other CEQA Considerations

The EIR will address other topics required by CEQA, including growth-inducing impacts. The EIR will also analyze significant unavoidable impacts; significant irreversible impacts; any known controversy associated with environmental effects; issues to be resolved by the decision-makers; and the potential for the project to contribute to significant cumulative effects.

FINDING

This project may have a significant effect on the environment and an Environmental Impact Report is required. This determination is based upon the criteria of the State of California Environmental Quality Act (CEQA) Guidelines, Sections 15063 (Initial Study), 15064 (Determining Significant Effect), and 15065 (Mandatory Findings of Significance), and for the reasons documented in the above project description and description of potential environmental effects.

June 24, 2015
Date

Sarah B. Jones
Environmental Review Officer

State Water Resources Control Board

JUL 2 3 2015

Mr. Steve Smith
City and County of San Francisco
1650 Mission Street, Suite 400
San Francisco, CA 94103-2479

Dear Mr. Smith:

NOTICE OF PREPARATION (NOP) FOR THE CITY AND COUNTY OF SAN FRANCISCO (CITY AND COUNTY); BIOSOLIDS DIGESTER FACILITIES PROJECT (PROJECT); SAN FRANCISCO COUNTY; STATE CLEARINGHOUSE NO. 2015062073

We understand that the City and County are pursuing Clean Water State Revolving Fund (CWSRF) financing for this Project. As a funding agency and a state agency with jurisdiction by law to preserve, enhance, and restore the quality of California's water resources, the State Water Resources Control Board (State Water Board) is providing the following information on the NOP to be prepared for the Project.

The State Water Board, Division of Financial Assistance, is responsible for administering the CWSRF Program. The primary purpose for the CWSRF Program is to implement the Clean Water Act and various state laws by providing financial assistance for wastewater treatment facilities necessary to prevent water pollution, recycle water, correct nonpoint source and storm drainage pollution problems, provide for estuary enhancement, and thereby protect and promote health, safety and welfare of the inhabitants of the state. The CWSRF Program provides low-interest funding equal to one-half of the most recent State General Obligation Bond Rates with a 30-year term. Applications are accepted and processed continuously. Please refer to the State Water Board's CWSRF website at:
www.waterboards.ca.gov/water_issues/programs/grants_loans/srf/index.shtml.

The CWSRF Program is partially funded by the United States Environmental Protection Agency and requires additional "CEQA-Plus" environmental documentation and review. Three enclosures are included that further explain the CWSRF Program environmental review process and the additional federal requirements. For the complete environmental application package, please visit:
http://www.waterboards.ca.gov/water_issues/programs/grants_loans/srf/srf_forms.shtml. The State Water Board is required to consult directly with agencies responsible for implementing federal environmental laws and regulations. Any environmental issues raised by federal agencies or their representatives will need to be resolved prior to State Water Board approval of a CWSRF financing commitment for the proposed Project. For further information on the CWSRF Program, please contact Mr. Ahmad Kashkoli, at (916) 341-5855.

It is important to note that prior to a CWSRF financing commitment, projects are subject to provisions of the Federal Endangered Species Act (ESA), and must obtain Section 7 clearance from the United States Department of the Interior, Fish and Wildlife Service (USFWS), and/or the United States Department of Commerce National Oceanic and Atmospheric Administration, National Marine Fisheries Service (NMFS) for any potential effects to special-status species.

Please be advised that the State Water Board will consult with the USFWS, and/or the NMFS regarding all federal special-status species that the Project has the potential to impact if the Project is to be financed by the CWSRF Program. The City and County will need to identify whether the Project will involve any direct effects from construction activities, or indirect effects such as growth inducement, that may affect federally listed threatened, endangered, or candidate species that are known, or have a potential to occur in the Project site, in the surrounding areas, or in the service area, and to identify applicable conservation measures to reduce such effects.

In addition, CWSRF projects must comply with federal laws pertaining to cultural resources, specifically Section 106 of the National Historic Preservation Act (Section 106). The State Water Board has responsibility for ensuring compliance with Section 106, and must consult directly with the California State Historic Preservation Officer (SHPO). SHPO consultation is initiated when sufficient information is provided by the CWSRF applicant. If the City and County decides to pursue CWSRF financing, please retain a consultant that meets the Secretary of the Interior's Professional Qualifications Standards (http://www.nps.gov/history/local-law/arch_stnds_9.htm) to prepare a Section 106 compliance report.

Note that the City and County will need to identify the Area of Potential Effects (APE), including construction and staging areas, and the depth of any excavation. The APE is three-dimensional and includes all areas that may be affected by the Project. The APE includes the surface area and extends below ground to the depth of any Project excavations. The records search request should extend to a ½-mile beyond Project APE. The appropriate area varies for different projects but should be drawn large enough to provide information on what types of sites may exist in the vicinity.

Other federal environmental requirements pertinent to the Project under the CWSRF Program include the following (for a complete list of all federal requirements please visit: http://www.waterboards.ca.gov/water_issues/programs/grants_loans/srf/docs/forms/application_environmental_package.pdf):

A. Compliance with the Federal Clean Air Act: (a) Provide air quality studies that may have been done for the Project; and (b) if the Project is in a nonattainment area or attainment area subject to a maintenance plan; (i) provide a summary of the estimated emissions (in tons per year) that are expected from both the construction and operation of the Project for each federal criteria pollutant in a nonattainment or maintenance area, and indicate if the nonattainment designation is moderate, serious, or severe (if applicable); (ii) if emissions are above the federal de minimis levels, but the Project is sized to meet only the needs of current population projections that are used in the approved State Implementation Plan for air quality, quantitatively indicate how the proposed capacity increase was calculated using population projections.

B. Compliance with the Coastal Zone Management Act: Identify whether the Project is within a coastal zone and the status of any coordination with the California Coastal Commission.

C. Protection of Wetlands: Identify any portion of the proposed Project area that should be evaluated for wetlands or United States waters delineation by the United States Army Corps of Engineers (USACE), or requires a permit from the USACE, and identify the status of coordination with the USACE.

D. Compliance with the Farmland Protection Policy Act: Identify whether the Project will result in the conversion of farmland. State the status of farmland (Prime, Unique, or Local and Statewide Importance) in the Project area and determine if this area is under a Williamson Act Contract.

E. Compliance with the Migratory Bird Treaty Act: List any birds protected under this act that may be impacted by the Project and identify conservation measures to minimize impacts.

F. Compliance with the Flood Plain Management Act: Identify whether or not the Project is in a Flood Management Zone and include a copy of the Federal Emergency Management Agency flood zone maps for the area.

G. Compliance with the Wild and Scenic Rivers Act: Identify whether or not any Wild and Scenic Rivers would be potentially impacted by the Project and include conservation measures to minimize such impacts.

Following are specific comments on the City and County's NOP:

1. In Table 2 on page 11, in addition to a column indicating Maximum Height above Grade (feet), please provide an indication of the maximum depth below grade for excavations where applicable.
2. Information presented on the depth below grade for the digester tanks is not consistent. On page 7 under Digestion and Biosolids Storage 45 feet below grade is indicated, and structures in the fourth paragraph on page 16 up to 48 foot depth is indicated at the location of the proposed digester tank; please clarify which is correct, and provide an estimate of the cubic yards of soil to be removed.
3. On page 12 regarding Figure 5, please indicate an estimated percent design in reference to the figure illustrations.
4. On page 14 regarding removal and replacement of street trees in the EIR, please discuss the types of trees that will be used in the re-vegetation effort and a timetable for re-vegetation activities. Please provide a brief description of the Tree Protection Zone and how the trees that are adjacent to construction will be protected if they are not proposed for removal. Please address compliance measures to the Migratory Bird Treaty Act in removal of tree from the project area.

Please provide us with the following documents applicable to the proposed Project following the City and County's California Environmental Quality Act (CEQA) process: (1) one copy of the draft and final EIR, (2) the resolution adopting/certifying the EIR and making CEQA findings, (3) all comments received during the review period and the City and County's response to those comments, (4) the adopted Mitigation Monitoring and Reporting Program (MMRP), and (5) the Notice of Determination filed with the San Francisco County Clerk and the Governor's Office of Planning and Research, State Clearinghouse. In addition, we would appreciate notices of any hearings or meetings held regarding environmental review of any projects to be funded by the State Water Board.

Thank you for the opportunity to review the City and County's NOP. If you have any questions or concerns, please feel free to contact me at (916) 341-5879, or by email at Susan.Stewart@waterboards.ca.gov, or contact Ahmad Kashkoli at (916) 341-5855, or by email at AKashkoli@waterboards.ca.gov.

Sincerely,

Susan L. Stewart

SFPUC Biosolids Digester Facilities Project – Notice of Preparation

Dear Mr. Smith:

Thank you for including the California Department of Transportation (Caltrans) in the environmental review process for the project referenced above. The proposed Project would construct new solids treatment, odor control, energy recovery, and associated facilities at the San Francisco Public Utilities Commission's (SFPUC's) Southeast Water Pollution Control Plant located in the Bayview District. Regional access from Interstate 280 (I-280) and U.S. Highway 101 (U.S. 101) is provided approximately one mile northeast via Cesar Chavez Street. Our comments seek to promote the State's new mission, vision, and smart mobility goals for sustainability, livability, economy, safety and health. We have reviewed the Notice of Preparation and have the following comments to offer.

Transportation Impact Study
A Transportation Impact Study, as cited in the Notice of Preparation, should provide a thorough analysis of multi-modal travel demand generated by the proposed development. We are in the process of updating our *Guide for the Preparation of Traffic Impact Studies* (TIS Guide) for consistency with SB 743, but meanwhile recommend using the Caltrans TIS Guide for determining which scenarios and methodologies to use in the analysis, available at: http://dot.ca.gov/hq/tpp/offices/ocp/igr_ceqa_files/tisguide.pdf. We encourage early collaboration, such as submitting the traffic study prior to the environmental document, to provide Caltrans an opportunity to discuss appropriate methodology and lead to better outcomes for all stakeholders.

The Transportation Impact Study should include:

1. Vicinity map, regional location map, and a site plan clearly showing project access in relation to nearby State roadways. Ingress and egress for all project components on State right-of-way

(ROW) should be clearly identified. Project driveways, construction staging, local roads and intersections, car/bike parking, and transit facilities should be mapped.

2. Project-related trip generation, distribution, and assignment including per capita use of transit, rideshare or active transportation modes and VMT reduction factors. An assessment of 2035 Cumulative and 2035 Cumulative Plus Project conditions. Calculation of cumulative traffic volumes should consider all traffic-generating developments, both existing and future that would affect study area roadways and intersections. Potential safety issues for all road users during operation and construction-periods should be identified and fully mitigated. The assumptions and methodologies used to develop this information should be detailed in the study, utilize the latest place-based research, and be supported with appropriate documentation.

3. Schematic illustration of walking, biking and auto conditions at nearby State facilities and study area roadways, trip distribution percentages and volumes as well as intersection geometrics, i.e., lane configurations, for AM and PM peak periods.

4. The project site building potential as identified in the General Plan. The project's consistency with both the Circulation Element of the General Plan and the Congestion Management Agency's Congestion Management Plan should be evaluated.

Transportation Management Plan
A Transportation Management Plan (TMP) or construction TIS may be required of the City for approval by Caltrans prior to construction where traffic restrictions and detours affect State highways. TMPs must be prepared in accordance with California *Manual on Uniform Traffic Control Devices.* Please ensure that such plans are also prepared in accordance with the transportation management plan requirements of the corresponding jurisdictions. For further TMP assistance, please contact the Office of Traffic Management Plans/Operations Strategies at 510-286-4579. TMP Information is also available at the following web address: http://www.dot.ca.gov/hq/traffops/engineering/mutcd/pdf/camutcd2014/Part6.pdf.

Transportation Permit
Project work that requires movement of oversized or excessive load vehicles on State roadways requires a transportation permit that is issued by Caltrans. To apply, a completed transportation permit application with the determined specific route(s) for the shipper to follow from origin to destination must be submitted to: Caltrans Transportation Permits Office, 1823 14th Street, Sacramento, CA 95811-7119. See the following website for more information: http://www.dot.ca.gov/hq/traffops/permits.

Hazardous Materials
All motor carriers and drivers involved in transportation of hazardous materials must comply with the requirements contained in federal and State regulations, and must apply for and obtain a

hazardous materials transportation license from the California Highway Patrol (CHP). When transporting certain types of hazardous materials including inhalation hazards, safe routing and safe stopping places are required. A route map must be carried in the vehicle. More information is available on the following CHP website: http://www.chp.ca.gov/publications/#hazmat.

Mitigation Responsibility
As the lead agency, the City and County of San Francisco is responsible for identifying and ensuring the coordinated implementation of all project mitigations. The project's fair share contribution, financing, scheduling, implementation responsibilities associated with planned improvements on Caltrans ROW should be listed, in addition to identifying viable funding sources per General Plan Guidelines.

Should you have any questions regarding this letter or require additional information, please contact Sherie George at (510) 286-5535 or by email at: sherie.george@dot.ca.gov.

Sincerely,

PATRICIA MAURICE

Subject: Biosolids Digester Facilities Project

Ms. Jones:

I am submitting comments on the Notice of Preparation of an Environmental Impact Report and Notice of Public Scoping Meeting for the Biolsolids Digester Facilities Project. Unfortunately I was unable to attend the Scoping Meeting on July 16, 2015.

For the past 18 years I have run Pet Camp, an overnight and day care facility for dogs and cats, at 525 Phelps Street. We are located directly across the street from the Southeast Treatment Facility. I am very concerned about the potential impact of massive increase in truck and other traffic associated with construction of the new digesters will have on my and other small business on Phelps Street as well as on the safety of my customers.

Pet Camp is a destination location for San Francisco's families with dogs and cats. Every day of the week, we are open 7 days a week, our customers arrive in their cars, often with children in tow, to pick up and drop off their pets. Phelps Street is a narrow street already designated as a bicycle route and is in no condition to safely handle an increase in traffic. There is no traffic calming on Phelps Street and not even a stop sign between Evans and Jerrold which results in traffic traveling at too high a rate of speed for our narrow street.

I highly encourage you to evaluate and select a route for trucks and other vehicles needed for this project that does not include the use of Phelps Street.

Respectfully,

Mark

Mitigation by San Francisco Foliage makes a difference

CREATING JOBS FOR THE COMMUNITY

- Over 50% of employees are from Bayview-Hunter's Point (zip code 94124)
- Over 80% are people of color
- San Francisco Foliage has paid over $4 million in wages to resident employees

CREATING OPPORTUNITIES FOR YOUTH

- San Francisco Foliage funds an internship program for at risk youth
- SFF hosts a Five Keys Charter School on-site in the community greenhouse
- SFF pays intern wages 100%, and all program costs
- Interns work part-time while earning credit toward a diploma or GED
- Over 30 young people interned at San Francisco Foliage since 2009
- 9 interns earned high school diplomas or GED
- Currently, 10% of SFF employees are graduates of the internship program

THE FRONT LINES OF MITIGATION

- Over 28% of San Francisco Foliage employee are student interns
- 80% of interns were from Bayview-Hunter's Point (94124)
- 40% of employees are women
- 20% of employees are LGBT

THE COMMUNITY GREENHOUSES ARE A STAGING SITE FOR LIFE

- Three different languages are spoken at SF Foliage
- On-site ESL classes are free
- We offer on-site GED prep for all employees without a HS diploma
- 25% of full time employees are enrolled in onsite educational services

A RECORD OF MITIGATION ACHIEVEMENT AND AWARDS

San Francisco Foliage is:

- A certified Local Business Entity with the City of San Francisco
- Certified by the San Francisco Human Rights Commission
- A proud recipient of the 2015 Local Business Pioneer Award from the San Francisco Housing Development Corporation

IN CONCLUSION:

- **I SEE THE GREENHOUSE AS A SITE FOR LIFE WHERE PEOPLE AND FAUNA FLOURISH. IF THE GREENHOUSE IS DEMOLISHED, the continuity of a solemn accord with the people of Bayview will be broken. I ask is this necessary?**

P R O C E E D I N G S

STEVEN SMITH: Testing, testing.

Welcome, everybody, to tonight's scoping meeting for the San Francisco PUC's Biosolids Digester Facilities Project. My name is Steven Smith. I'm with the San Francisco Planning Department, and I'm the environmental coordinator for this project. And I'll also be the moderator for tonight's scoping meeting.

Just a couple reminders, if you haven't, we would love it if you would sign in at the table by the entrance there. There are some meeting materials that you might find helpful. The Notice of Preparation has a good project description, for example.

Uhmm, and if anybody would like to speak tonight, we'd ask you fill out a speaker card. And if you don't want to speak tonight, you can of course make written comments either tonight or by July 27th is the deadline when scoping period ends.

I also want to let people know that there's a court reporter here tonight that's transcribing everything I say and anything anybody else might say for public input. And that will become part of the administrative record for the project. And I would ask

that, if people have comments, they hold off until the end of this presentation.

So after the introductions, I'll do a brief overview of the environmental review process, which hopefully will help inform your scoping comments tonight. Some staff from PUC will then present on the project description.

And then the reason why we're here is to take public comments. So that's the main portion of tonight. And then, following that, I'll have a few closing remarks to finish things up.

So, again, my name is Steven Smith. I'm with the San Francisco Planning Department. I'm the environmental review coordinator for the project. We have our consultants here tonight from ESA -- Jill Hamilton in the back there; Leslie Moulton is sitting at the table there. They're our -- we consider them an extension of our staff at the Planning Department and play a key role in the project as well.

From PUC Carolyn Chiu is the project manager. Rosanna Tse is here somewhere -- there she is. She's the project engineer.

Karen Frye is my counterpart at the PUC. She's actually not here tonight, but I did want to make note of her name. And then also Maureen Barry is the

PUC communication staff.

So I'll just talk a little bit about the environmental review process in these next few slides. And, again, my intention is to help kind of focus your comments tonight in terms of the scope of the environmental review process and explain the background of why we're here.

So the California Environmental Quality Act, or CEQA as it's usually referred to, is a state law, essentially requires the disclosure of environmental impacts prior to a public agency approving a project.

And in the City of San Francisco, the Planning Department is the lead agency for all CEQA projects. So we have the lead role in the environmental analysis required by CEQA. And in this case, the PUC is the project sponsor. So the Planning Department handles CEQA and the PUC is the sponsor of the project.

So essentially what CEQA's trying to achieve, as I mentioned, is a disclosure of environmental impacts. That's really kind of a primary objective of CEQA. Typically, in so doing, when we -- as we disclose environmental impacts and analyze them, we often find ways to avoid or reduce those impacts.

As well, the CEQA process is a good mechanism for promoting public participation, for example,

tonight and also provides a good way to communicate and cooperate with the various agencies that might be involved with the project and might have, for example, a permit that needs to be issued for the project to proceed. They rely on our analysis, and also other agencies will provide input about our analysis.

So for this project, we will be preparing an environmental impact report or an EIR. And the EIR will provide a very detailed project description of the project, a thorough analysis of all the environmental effects. We'll identify ways to reduce or avoid the significant effects that are identified. And we'll also formulate a range of alternatives that could meet most or all of the project objectives but could also potentially reduce or avoid some of the significant effects associated with the proposed project.

So as you can see, this environmental impact report will cover pretty much the full gamut of issues that are included in the CEQA guidelines. So in that regard, any input you have in terms of the scoping meeting tonight, any environmental topic that might be of concern to you, each of these issue areas will be addressed in some fashion in the EIR that will be published.

So the schedule. The notice of preparation

was issued on June 24th. So we're really just now at the beginning of the environmental review process. We're here tonight, of course, for the public scoping meeting. And I do want to note that July 27th is when the scoping period ends. So if you do decide to submit written comments, please keep that in mind. Close of business Monday, July 27th is our deadline.

Then following that, next summer we expect a Draft EIR to be published. And I would note also that's an additional opportunity for public comments. We'll circulate that Draft EIR for 45 days and solicit comments from the public and agencies.

We'll then create a responses to comments document and respond to all comments that we received, package that together with the Draft EIR, and then present that to the Planning Commission for final certification, we expect, in summer of 2017 is the current schedule.

So why we're here tonight really is to hear from you all. It's specifically on the scope of environmental review. And when I refer to the scope of environmental review, to be a little bit more clear what I'm referring to, for example, is environmental effects, you know, concerns you may have about noise, air quality, traffic, that kind of thing. You may have

ideas or thoughts about the types of alternatives to the proposed project, the way we go about analyzing the impacts, mitigation measures that could be helpful to reduce or avoid some of the impacts. So these are the general categories that are most pertinent to tonight's scoping meeting. So keep that in mind when you're making your comments.

With that, I want to turn it over to Carolyn Chiu. She's going to provide an overview of the proposed project. And then I'll come back, and we can open things up for scoping comments.

CAROLYN CHIU: Thanks, Steve.

As we mentioned at the beginning, I'm Carolyn Chiu, and I'm the project manager for the biosolids digester facility project. So this project is one of the projects in the PUC Sewer System Improvement Program, also known as the SSIP.

This is a multi-billion, 20-year program to address wastewater infrastructure -- the aging infrastructure in our wastewater system and ensure a reliable and seismically safe infrastructure from now and going forward in the future.

So here is just a map of the project location, right here. So the orange represents the proposed project site, kind of in and adjacent to the existing

southeast plant, which is outlined here in black. And the purple shaded areas is proposed staging areas at the SFPUC greenhouses and this Pier 94 backlands.

I also wanted to note, you know, at this backlands area, we are proposing off-site parking for, like, the construction worker personal vehicles, with the plan to shuttle them here, a little less than a mile to the plant during the construction phase.

So here's a kind of a closer look of that -- the project site. Once again, the orange represents the project site. This is 1800 Jerrold; this is 1801 and then obviously the parcels within the southeast plant. The purple again is the staging area. But I'd also want to point out this staging area along the -- that's also purple, the Jerrold Street, because we're proposing to temporarily close that portion of Jerrold during the construction to promote construction safety as well as public safety during the construction phase.

Also, you know, looking kind of -- this is a good place to actually talk about the southeast treatment plant. This kind of large, outlined in black, that is the existing southeast treatment plant. I think some of you know this is one of the two full-time facilities we have to treat the city's wastewater and storm water. But this treats 80 percent

of the city's -- and meets 80 percent of the city's needs. So you can see that it's really essential to our system and pretty much the backbone of our wastewater infrastructure.

So the purpose of this biosolids project we're here to talk about tonight is to basically address the existing solids processing facility, which is what is outlined here in yellow. So basically that is the half of the plant that treats the wastewater solids, meaning the solids removed from the wastewater drain.

Through this process, we break down and neutralize the solids, thus producing biosolids. So basically, biosolids is treated wastewater solids.

So why do we need this project? Why are we doing this? The existing digesters are over 60 years old. They were built in 1952. So we need this project to ensure that we have a biosolids treatment facility that's operational and reliable, seismically robust to address city future needs, regulatory requirements, and obviously we want to utilize modern efficient technologies going forward.

We also want to promote sustainability by reusing resources wherever we can, ensuring 100 percent beneficial use of biosolids and then the biogas we produce at the southeast plant. You know, the

biosolids, once treated, is a very nutrient-rich soil product, so very useful in agricultural and horticultural applications, soil amendments, compost, fertilizer.

Similarly biogas, which is a byproduct of the digestion process, is very energy rich. So it can be converted to energy or other heat sources. So it would really be a shame to waste it.

And then lastly, you know, we need to improve the odor and visual and noise quality, you know, as a part of this project, something -- at least improvements over what's there now.

So key features. You know, I talked about modern and efficient improvement technologies. Well, part of this project will include those types of technologies for screening, thickening, thermal hydrolysis, digestion, and dewatering.

Also, I mean, here's just a kind of a snapshot of some other features. There will be six digesters at 1.3 million gallons. I want you to understand that, right now, we have ten digesters at 2 million gallons each. So you can see with the technology that we're proposing, you get more -- better breakdown of the solids so that the digestion itself requires less volume.

Similarly, biosolids trucks are eight to ten per day in the new project. I want to remind people that currently we do seven to nine trucks per day. So it's not that much of a difference in the new facility.

Electricity, you know, through the biogas, we will generate five megawatts. Right now, we generate two.

And then odor control, you know, we had a goal to have no noticeable odors from this project at the fence line.

And then included were also architectural improvements within the southeast treatment plant at the new facility. And also we're looking at landscape and street improvements along Jerrold Avenue. And then we're also -- you know, a key note I also wanted to leave with is that we anticipate no change in the staffing levels at the treatment plant.

So this is a preliminary site plan. I won't go through all of it here, but I did want to point out a couple key features.

So right here at 1801 Jerrold, this is where -- at this triangle is where we're going to locate that energy recovery, where we're going to take biogas and make it into electricity for our use on the site.

Also this here is the location -- you'll see the digesters is proposed to line them up linearly, parallel to the railroad track. I want to note this is the farthest away you can get from the neighbors, probably over 1,000 feet. I think, right now, the current digesters are kind of down here, off the map; they are less than 100 feet away from the closest neighbors.

The other thing was, you know, I also wanted to point out, I talked about odors in the last slide. Here, you can't tell, but these are light blue, these two squares here. We have two distinct odor control systems to support this new facility to basically capture and treat the processed air.

One other thing, as part of our planning, we also looked at how vehicular traffic moves in and out of the plant. And one of the things we're proposing is to shift it where, you know, the main gate goes out of Rankin through Evans away from where it currently is, which is more along Jerrold and Phelps. So basically moving it away from the residents and directing it towards Evans Street, which is probably a better place to accommodate because it's more of an industrial street.

And here what I'm showing you is a kind of a

preliminary aerial layout. Once again, here are those digesters parallel to the railroad track. And just to kind of orient you, you're standing with your back to Evans Street in this picture. Although, you know, these are shown as cylindrical now, right now we have not made a decision on digester shape. And height, as shown here, are all within the zoning limits within this area at 65 feet.

And project construction. The construction duration will take five years. And we anticipate starting in July 2017. We see that there's going -- we estimate about 200,000 square feet of new construction with 100,000 square feet of demolition.

I already mentioned that we are looking at having off-site parking of personal vehicles from the construction workers be at Pier 94. But just to kind of -- but on a typical, you know, construction day, we're looking at about 50 truck trips per day for deliveries of equipment and materials to support the construction. But during peak construction, meaning during when we're hauling debris, excavated soil, there could be up to 200 to 250 trucks per day from -- for probably about six months out of that five-year period.

Construction times, work periods, typically, we're looking at Monday through Friday, 7:00 a.m. to

3:00 with an occasional Saturday. And if we had to do any kind of Sunday or holiday or 24-hour work, it would be because we had critical facility connections. And we would notify neighbors if that did happen.

And then during -- then also -- oh, and then also during peak construction, you know, when we have very intense limited-duration-type work to do, we could have two work shifts going. And that would be Monday through Saturday, 7:00 to 11:00 p.m. And it would -- and that is obviously for a short duration out of that five years.

And here is just a brief summary of the construction schedule. I mentioned that we hope to start construction in 2017. Understanding that it's a five-year period but even after construction completion is done, there is a significant period where we need to start up and test the equipment. And then, you know, two months -- or, you know, up to two years with that to have that opportunity to stabilize the new treatment process and optimize it as well. And that takes us through 2024.

STEVEN SMITH: Thank you very much, Carolyn.

So we'll open for public comments now.

Again, if anybody's interested in speaking, we do ask you submit a speaker card. A couple ground

rules here. Just, if you could state your name clearly, again, we have someone transcribing tonight, so it's good to know who's saying what. We want to be sure we're being accurate in terms of what we're noting from tonight's meeting.

UNIDENTIFIED SPEAKER: Are we able to ask questions as well?

STEVEN SMITH: Sorry, it's a one-way communication process.

Now, the comments you have and the questions you ask will be addressed in some fashion in the EIR. So that's the only question I'm going to answer tonight.

UNIDENTIFIED SPEAKER: Will they be inside the transcript?

STEVEN SMITH: Absolutely. So that I do want -- oh, I just want to note, too, of course you can submit written comments tonight and, again, up until July 27. And the last two slides I show after our public comments tonight will give the specifics regarding that. And also that information is available up at the table by the entrance there.

And two minutes is that what this slide says. We're going to say three minutes for tonight. We're not expecting a lot of speakers. So -- we're going to

give a little reorientation so we can make sure that your comments are accurately --

LESLIE MOULTON: And we'll ask that you come up to the podium. And we have a few speaker cards. You're welcome to fill them out at any time, add any comment. Okay. So Jill is in the back. If you've filled out a speaker card, we've got Jill, we've got others who will pick them up and take them forward.

Our first speaker is going to be Siri Datta Khalsa. And second one up is Ace. So if you could be getting ready to make your comments. And then Karen Pierce, in that order. Take your time. If you feel that you want to fill out a speaker card, come forward. And it's also not required that you fill out speaker card. If you feel like you want to speak, then just raise your hand, and...

Go ahead. Thank you. State your name again when you come to the podium, and then we'll take your card.

SIRI DATTA KHALSA: Hello. My name is Siri Datta Khalsa. I'm the owner of San Francisco Foliage. For the last many years, since 1989, I have been a tenant at the greenhouses here.

The greenhouses were a part of the mitigation measures that were negotiated with the community when

the facility was placed in the community.

We have tried quite diligently and persistently during that time to understand the needs of the community and to apply our efforts to a substantive mitigation. We are a small business. I would like to just read to you some of the factors that characterize our business.

Over 50 percent of our employees are from Bayview-Hunters Point; over 80 percent are people of color. We're a small business, but we have paid over $4 million in wages to residents.

I was aware -- made aware that in Bayview-Hunters Point there are some neighborhoods where youth unemployment is more than 75 percent. So we started to focus on youth employment. We offer an internship program for at-risk youth, and we partner with Five Keys Charter School. Five Keys Charter School was started -- is actually present now in the facility here.

It was started in the jails to provide educational opportunities for youth.

LESLIE MOULTON: You've got one minute.

SIRI DATTA KHALSA: We host a charter school inside the green house. We pay 100 percent of intern's wages and all program costs. Interns work part-time

while earning credit towards their diploma. Over 30 young people have interned at San Francisco Foliage since 2009. Nine interns earned their high school diplomas. Currently, 10 percent of my full-time staff were former interns.

40 percent of our employees are women. 20 percent are LGBT. Three different languages are spoken at the greenhouse: Chinese, Spanish, and English. On-site ESL classes are offered free. We offer on-site GED prep for all employees without a high school diploma. 25 percent of our full-time employees are enrolled in the educational services.

We are a certified local business entity with San Francisco. We're certified by the San Francisco Human Rights Commission. And we are a proud recipient of the 2015 Local Business Pioneer award from the San Francisco Housing Development Corporation.

In conclusion, I see the greenhouse as a site for life where people and fauna flourish. If the greenhouse is to be demolished -- and that decision has been made -- and not replaced for the duration of construction -- five to 20 years, as I understand -- the continuity of a solemn promise, a solemn accord made with the people of Bayview when the facility was first placed here will be broken.

And I simply ask is this necessary? Thank you.

LESLIE MOULTON: Thank you. Ace is next; Karen Pierce, and then Steven Tiell will be after that.

ACE WASHINGTON: Good evening, members of the audience and the City and County. My name is Ace -- better known around here as Ace on the Case.

I'm not new to this. I'm -- truth is I'm just happy to be here because I read an article in my paper of Harlan Kelly and this wastewater issue. And I come in, as soon as I walk in the door, one of your handlers -- I'm asking them is this with the City Planning Department, and they're telling me no, it's something else.

And so right then, I'm all -- I'm insulted because I ain't new to this; I'm true to this. I've been coming to these community meetings over 20-something years. So after saying that, let me say this: We here for -- on an EIR. My name is A-C-E. I'm totally shocked and saddened as an African American black Negro, however you want to clarify me, that the things that's going to be affecting and impacting our community for the next ten years, I don't see them in account here, representing or being part of these procedures. So I'm really looking for people that I

can recognize. I don't see that.

So after saying that, let me say this. Planning Commission -- this is the Planning Department, right? Is that what this department's about? Well, let me say on another parallel situation, on the planning. Because of the Planning Department is one of the issues I'm here. It goes back. It's a mystery to history on which me, as an African-American, may not even be around in the next five, ten years.

So that's why I am here and been having a platform at City Hall for a number of years since I've been involved with the outreach which has a lot to do with the Planning Department, which has a lot to do with each and every department in this city going forward on whatever five- or ten-year plan.

So I get emotional. I'm not up here because I'm -- I'm morally obligated. See, ladies and gentlemen, I'll finish with this. I represent three Cs, my children's children's childrens. So therefore, ladies and gentlemen, my name is Ace. I'm on the case. And I'm here because I am some way involved with this covering. I just thought I'd be here. And I'm just here for the procedures. Thank you much.

LESLIE MOULTON: Next up, Karen Pierce, and then

Steven Tiell, Anders & Anders.

KAREN PIERCE: Good evening. I'm Karen Pierce. I'm a native San Franciscan. I live in the 1700 block of Newcomb, which, when you drive out of the parking lot here, is right down the street.

I've lived in my house -- I bought my house 35, almost 36 years ago. So when I bought my house, this site was a wrecking yard. They were dismantling autos.

I saw -- I fought, before I moved here, with residents of this neighborhood to not allow this expansion to occur here because Bayview had more than enough burden, environmental burden already. And I didn't think that it was equitable that the expansion would occur.

There had been lots of discussion to move to the old American Can site in Potrero but Potrero Hill had more political clout than this neighborhood did. So we wound up with this, and we wound up with a benefits package that people were not completely happy with but it was something.

We have not yet received the benefit of that benefits package. This building was built with the promise that all of the space would be made available to the nonprofit organizations in the neighborhood at

either free rent or very reduced rent in acknowledgement of the needs of the neighborhood.

And thank you, sir, for your talk about the greenhouses. The greenhouses were built with the promise that an extensive training program would be developed for community residents. And that would feed those residents into jobs that included gardening jobs, which at the time were -- there were a lot of City gardeners, and they were well-paid jobs.

As soon as the building was completed, we were told the City couldn't afford it, and so we had the choice. We could allow City College to come in and rent most of the space, or they didn't know what, but they were going to have to lease it.

And we lost the Skill Center, which was in an old school building at the top of the hill, which was a facility that was serving as the one and only educational opportunity for non-skilled workers. We were promised that, if the City College moved in, the kind of programs they were going to have would take the place of the Skill Center. Okay.

So we lost the building; we lost training. We got City College to come in. The programs that they offered -- that they said they were going to offer were never offered. We did not get the training. And now

we understand that the activities that go on in this building are going to be moved down to Evans Street. And we understand that the -- the demolition of the greenhouses may mean the complete end of that. Okay.

So now we're talking about a new project. We're doing scoping. I have a list that I can read very quickly of the kinds of things that I want to be sure are looked at. But I also want to say that, in this discussion, there will be a discussion about mitigation and community benefits.

Community benefits package must acknowledge that we haven't been paid the first community benefits. We need to have PUC and the City acknowledge that and determine how we are going to get the neighborhood benefits from the first go round as well as take a look at what are the benefits that we should be getting from this because, frankly, no neighborhood wants a sewage plant. Okay?

My list: Transit. Okay? During the construction, they're going to close down Evans Street. What's going to happen to the 19 Polk? Air quality, not only the odor -- complete abatement of the odor is what we're looking for -- but dust mitigation during construction. Coordination with other construction projects because there are a number of large projects

that are not just proposed, that are moving forward, that are all right in this area that are going to impact us.

The height of the digesters is a concern. And the aesthetics of the whole place is a concern. If we have to have a sewage plant, we don't have to have it pretend to be something else, but it also should not be such an eyesore that, when we look at it, it's just one more insult. Thank you.

LESLIE MOULTON: Steven Tiell. And then we have Terry Anders and David Pilpel.

STEVEN TIELL: Good evening. Thank you, SFPUC and fellow community members. My wife and I moved here after being no-fault evicted for our third time elsewhere in San Francisco. And we were finally able to buy a home here about a month and a half ago.

A week after that, our oldest son, who's four years old, told me, "Daddy, I don't like our new home because it smells like a potty." Imagine how heartbreaking that is. And I can't really argue with him. So I'm getting engaged.

And really, you know, I hear this idea that, you know, your goal is to make the odors end at the fence line. I've had great engagement with people at the PUC -- Maureen, Rosanna, Katie, George at the

plant, Al at the PUC as well. And I'm really encouraged by the capabilities of the people that are at the table. But I really encourage you, please, don't lose sight of the community that's here.

I've lived in San Francisco for 12 years. I've consulted in cities all over the world. You know, and the social and economic justice issues that I see here have really opened my eyes to what's possible in a world class city. And I had no idea it was in my own backyard before I moved to the Bayview. And it's really astounding to me.

So the concerns that the community members are raising here today, really take to heart. You know, they're impassioned. You know, the first week we moved in, we met more neighbors than we met in four years in Bernal Heights, in five years next to Dolores Park.

The diversity is why we moved to the city to begin with. And the diversity that we saw leaving other parts of the city and why we discussed leaving the city ourselves is alive and well in Bayview. It's a community to really be cherished.

And the fact that we have this -- this -- you know, necessary piece of infrastructure for a city but really a blight on the neighborhood isn't just one item, but it's one on a whole list of things of the

social and economic justice issues that this neighborhood is enduring. And I just ask that you be cognizant of that. You really focus on this idea that, you know, people in any neighborhood in any city in any part of the world should not be subject to things like your child telling you their new neighborhood smells like a potty. It's really a horrible thing.

So thank you. And I have a lot of confidence that the PUC will rectify this issue as you move forward with the project. Thanks.

LESLIE MOULTON: Thank you.

Terry Anders. And next David Pilpel.

TERRY ANDERS: Welcome. Glad to be here. I'm Terry Anders of Anders & Anders Foundation.

When the sewage plant was built, I was part of it. It was a four-year project. Men and women in this area had first priority to jobs, the opportunity to work.

I was a steward out there with the iron workers. We had over 50 iron workers. So when we talk about the economics and what this city is about, we still need to be talking about jobs. Regardless of what and how it smells, how many people are going to be put to work?

We have the highest crime rate, and that's no

accident. So when we talk about who's going to work, every union is going to be part of this project. Historically, there's a lot of unions that keep people that look like me out of the trade.

So that's one of the benefits that we can get is an economic benefit. Every trade that's going to be part of this project should have X number of people from this neighborhood that's going to be part of the trade.

So the killings that's going on is economics. So you talking about how something smells; tell me how something looks; tell me how something feels. That people don't have the opportunity to get into a job. People don't have the opportunity to get into a trade, and they working all over this city.

How many people are in prison, stacked up like sardines? Tell me how that look. Tell me how that feels.

So when the opportunity and the economics is part of this neighborhood, we should be working. Doors open. No hesitation.

Tell me how many people is going to be making money off of this project? I want to be one of the monitors to see how many people that look like me are in these trades. That's how and why Anders & Anders

was created. I work with ex-offenders to keep them out of prison. That's what I want to hear about. What kind of financial benefits is going to happen to this neighborhood? Let me see and be part of that process.

LESLIE MOULTON: Thank you. David Pilpel. After that, we have Tracy Zhu and Andrea Tacdol.

DAVID PILPEL: Good evening. I tried to be in costume tonight.

David Pilpel, former member of the PUC Citizens Advisory Committee and 10-year member of the Wastewater Subcommittee, longtime supporter of the project.

So my concerns for purpose of scoping are as follows. The project description and setting I think should include some black cart residual material from Recology. I was formerly a supporter of -- including food waste digestion here. I understand that's now better done at their Tunnel Road site, but they are looking at capturing some of the compostable material out of the black cart. And I think the project should consider some amount of that. I think -- are we calling that high-strength waste?

Anyway. Also, on the setting, I think the EIR needs to clearly identify other PUC and in particular southeast plant projects that are happening, the

headworks and various other projects, so that a full understanding of all the related projects is included in the document.

In terms of impacts, the relocation of central shops is critical for real estate purposes. That may create its own secondary impact. Those should be identified and potentially mitigated. And, again, other southeast plant projects and potentially reorganizing certain functions on the site.

The cumulative impacts need to clearly define the area for purpose of cumulative impacts, both City and non-City projects. I suspect that will depend on the nature of the impacts but may go as far as Dog Patch, Cesar Chavez, probably over towards Bayshore and farther south.

In terms of mitigation, I understand from a meeting last week that the Palou Phelps open space area to the south of here the City could acquire. But that will cost some money. I think that's a potential mitigation, to acquire the rest of that private site for open space. I think the PUC should go back to free compost give-aways for residents, particularly those around the southeast site, probably Oceanside as well.

The PUC looked at a Cayuga diversion project several years ago to take the effluent from the Cayuga

neighborhood. I'll wrap up.

Somebody's calling me here.

(Cell phone interruption)

DAVID PILPEL: I apologize.

Anyway, the Cayuga diversion I think should be looked at again to potentially shift some flow from southeast to Oceanside. That may or may not happen within this project time span, but it should be looked at for potential mitigation.

And finally rail haul options for sludge load-out and potentially other materials, particularly outbound but also potentially inbound to the plant, since we're right contiguous with the rail line.

Finally, as to alternative locations, some of the functions could be located at 1550 Evans, already owned by the PUC, and certainly the Pier 94 backlands, which was looked at by the Digester Task Force.

I don't know that those are the best alternatives, but I think they should be looked at to some degree in this study for purpose of screening alternatives.

Thanks for your time. Look forward to the document.

LESLIE MOULTON: Tracy, followed by Andrea.

That's all the speaker cards. Anybody else?

TRACY ZHU: Hi, my name is Tracy Zhu. I'm a longtime resident of the neighborhood. I sit in the Environmental Justice seat at the SFPUC Citizen Advisory Committee.

I'm here today for a couple of reasons. This location in Bayview has a significant impact as, you know, not just having negative impacts on the neighborhood but a hub for the neighborhood as well. And so I think there's a lot to be said on how this can be -- be designed to continue attracting people from the neighborhood as well as be a destination for folks outside the neighborhood for positive uses, such as City College, other training programs.

You know, this has a huge potential for being a great engine for the city in terms of, you know, what fleshes out as being the businesses that are in the greenhouses or the types of training that we could have here in this community facility.

So in the meantime, during the construction process, there's a lot of concerns that I'd like to make sure that the EIR addresses. And I think the traffic impact is going to be significant.

And potentially shutting down Evans Street where the 19 bus runs, it's one of the only buses that takes folks from Hunters Point and out of the

neighborhood. And so that's a huge lifeline for the neighborhood. So definitely encourage some coordination with Muni in order to reduce the traffic impacts.

Second, along with traffic, the use of trucks to truck materials in and out, given the long-term operations of the biosolids, as I understand it, the Pier 94 is going to be the staging area. And so I'd really encourage you to make sure you define truck routes that minimize health impacts on the neighborhood.

And there's, you know, residential area right adjacent to this facility. So even if the trucks have to go along a route to avoid driving through the neighborhood, would be great. And as you know, going on this side of the campus on Oakdale -- yeah, Oakdale, also more residences. So any way it can go out the backside of the -- when I say "backside," I guess on the rail side of the footprint of the campus, on to Evans towards Pier 94 would be -- you know, for example. But definitely want to see some of those traffic alternatives for trucks as well as the public transportation.

And lastly, I think that -- yeah, the aesthetics can't be understated or overstated. There's

a lot of eyesore in the neighborhood that has socioeconomic impacts on the neighborhood. And so definitely encourage early and often -- early feedback from the community by going out to meeting groups to gather that information on what aesthetics is culturally appropriate for this neighborhood. Thank you.

LESLIE MOULTON: Thank you. Andrea? And after Andrea, we have Diego Sanchez and Mindy Kener.

ANDREA TACDOL: Good evening. My name is Andrea Tacdol, and I'm a resident here in the Bayview. I'm raising my two children here in the community. So the environmental and health impacts of this project are really important to me.

I know that the community faces tremendous health and environmental disparities. And so similar to Tracy, I'm very interested in these trucks that are coming into our neighborhood and the increase, especially considering there's multiple projects, huge projects here in the community.

I'd like to know what truck routes will be used to minimize their impact.

I'd also like to know what -- what considerations have been made to ensure that the construction will minimize kind of the impacts on the

community. I'm particularly interested in the lay down space for the greenhouses being so close to the community center right here and also a childcare center. Thank you.

I also would very much like to see, because there are so many EIRs happening in the community and multiple projects, what the impacts are cumulatively in our community. Two hundred trucks for one project might be -- might seem okay. But with so many other trucks or other construction happening, I want to know what those impacts are for the whole community during this time. Thank you.

LESLIE MOULTON: Thank you.

DIEGO SANCHEZ: I'm Diego Sanchez. I'm a neighbor of this facility, actually live almost immediately across the street.

I don't know if this pertains to the EIR or not, but I'm quite interested in what the process is and what the plans are for the existing biodigesters once they're undergoing the decommissioning phase. I think it was mentioned earlier by a speaker that the aesthetics are very important.

I think that in a community that's struggled with so many social justice issues over so many years that it's very important that you reach out to not only

existing community groups but to actually the neighbors across the street.

I've lived there now seven years almost across the street, and I don't think I've been reached out to directly through a flyer or any other means, except for e-mail. But it would be nice to see a flyer about how to get involved in this process and what's happening, to be kept up to date.

There are a lot of folks here that may not be connected to the Internet or e-mail or whatnot. There are some immigrant populations here who may be on the other side of that digital divide.

Also concerned about truck traffic. These trucks, I will presume, are diesel trucks. And with the particulate that they emit, it's quite concerning. I mean, we're already suffering from the odors from the plant as well as just the dust when you burn off all that gas. It does collect on our homes. So if you could be sensitive to that.

Again, I thank you for your efforts here.

LESLIE MOULTON: Thank you.

Mindy Kener.

MINDY KENER: Good evening, Planning Commission. My name is Mindy Kener. I'm a senior job developer in the Bayview for Anders & Anders Foundation.

I hear a lot about the construction jobs, and that's great. I'm hoping that you will reach out to the small community-based organizations in Bayview, not just the big boxes. We are in the trenches. We have been here for many, many years. And Downtown forgets the small folks who help people in the Bayview with their GEDs and getting into the construction union trades, which is a great idea since we have so many people without GEDs.

However, my main point this evening is, once the digesters are built, community should have those jobs. They should be first in line if they have the correct specifications, skills. We should train them in those skills.

We need them to work when they're done with the construction and have full-time benefits. I guess they're union for the digesters. So these are excellent jobs for the community. It could be from clerical to learning how to work the chemicals.

We have many training facilities. And we have many young men and women who are willing to do it.

I thank you for your time.

LESLIE MOULTON: Thank you.

Would anyone else like to speak or make comments this evening?

(No response)

STEVEN SMITH: Thank you, everybody. Very much appreciate the comments.

I want to point out up here and also as well at the table there, there's information about how to submit your written comments, whether by e-mail or in writing. So you have until July 27th close of business is the deadline to submit written comments. So -- and then a few of us will be around after I close the hearing. If there's any follow-up questions, we may be able to answer those for you tonight.

So here's my contact information. I mentioned Karen Frye is my counterpart at PUC. Again, she's not here tonight, but she can help in terms of project-description type questions. Feel free to contact me. I'm mainly the contact in terms of the CEQA process and questions you have about CEQA.

But that's it. I'm going to close the hearing. Thank everybody for coming tonight and taking your comments. Thanks.

(Whereupon, the proceedings adjourned at 7:23 o'clock p.m.)

APPENDIX SCM

Standard Construction Measures

This page intentionally left blank

SFPUC Standard Construction Measures

1. SEISMIC AND GEOTECHNICAL STUDIES: All projects will prepare a characterization of the soil types and potential for liquefaction, subsidence, landslide, fault displacement, and other geological hazards at the project site and will be engineered and designed as necessary to minimize risks to safety and reliability due to such hazards. As necessary, geotechnical investigations will be performed.

2. AIR QUALITY: All projects within San Francisco City (the City) limits will comply with the Construction Dust Control Ordinance. All projects outside the City will comply with applicable local and State dust control regulations. All projects within City limits will comply with the Clean Construction Ordinance. Projects outside City limits will comply with San Francisco or other applicable thresholds for health risks. All projects, both within and outside of City limits, will comply with either San Francisco or other applicable thresholds for construction criteria air pollutants.

To meet air quality thresholds, all projects (as necessary) will implement air quality controls to be tailored to the project, such as using high tier engines, Verified Diesel Emissions Control Strategies (VDECS) such as diesel particulate filters, customized construction schedules and procedures, and low emissions fuel.

3. WATER QUALITY: All projects will implement erosion and sedimentation controls to be tailored to the project site such as, fiber rolls and/or gravel bags around stormdrain inlets, installation of silt fences, and other such measures sufficient to prevent discharges of sediment and other pollutants to storm drains and all surface waterways, such as San Francisco Bay, the Pacific Ocean, water supply reservoirs, wetlands, swales, and streams. As required based on project location and size, a Stormwater Control Plan (in most areas of San Francisco) or a Stormwater Pollution Prevention Plan (SWPPP) (outside of San Francisco and in certain areas of San Francisco) will be prepared. If uncontaminated groundwater is encountered during excavation activities, it will be discharged in compliance with applicable water quality standards and discharge permit requirements.

4. TRAFFIC: All projects will implement traffic control measures sufficient to maintain traffic and pedestrian circulation on streets affected by construction of the project. Traffic control measures may include, but not be limited to, flaggers and/or construction warning signage of work ahead; scheduling truck trips during non-peak hours to the extent feasible; maintaining access to driveways, private roads, and off-street commercial loading facilities by using steel trench plates or other such method; and coordination with local emergency responders to maintain emergency access. For projects in San Francisco, the measures will also, at a minimum, be consistent with the requirements of San Francisco Municipal Transportation Agency (SFMTA)'s Blue Book. Any temporary rerouting of transit vehicles or relocation of transit facilities would be coordinated with the applicable transit agency, such as SFMTA Muni Operations in San Francisco. All Projects will obtain encroachment permits from the applicable jurisdiction for work in public roadways.

5. NOISE: All projects will comply with local noise ordinances regulating construction noise. The SFPUC shall undertake measures to minimize noise disruption to nearby neighbors and sensitive receptors during construction. These efforts could include using best available noise control technologies on equipment (i.e., mufflers, ducts, and acoustically attenuating shields),

locating stationary noise sources (i.e., pumps and generators) away from sensitive receptors, erecting temporary noise barriers, and other such measures.

6. HAZARDOUS MATERIALS: Where there is reason to believe that site soil or groundwater that will be disturbed may contain hazardous materials, the SFPUC shall undertake an assessment of the site in accordance with any applicable local requirements (e.g., Maher Ordinance) or using reasonable commercial standards (e.g., Phase I and Phase II assessments, as needed). If hazardous materials will be disturbed, the SFPUC shall prepare a plan and implement the plan for treating, containing or removing the hazardous materials in accordance with any applicable local, State and federal regulations so as to avoid any adverse exposure to the material during and after construction. In addition, any unidentified hazardous materials encountered during construction likewise will be characterized and appropriately treated, contained or removed to avoid any adverse exposure. Measures will also be implemented to prevent the release of hazardous materials used during construction, such as storing them pursuant to manufacturer recommendation, maintaining spill kits onsite, and containing any spills that occur to the extent safe and feasible followed by collection and disposal in accordance with applicable laws. SFPUC will report spills of reportable quantity to applicable agencies (e.g., the Governor's Office of Emergency Services).

7. BIOLOGICAL RESOURCES: All project sites and the immediately surrounding area will be screened to determine whether biological resources may be affected by construction. A qualified biologist will also carry out a survey of the project site, as appropriate, to note the general resources and identify whether habitat for special-status species and/or migratory birds, are present. In the event further investigation is necessary, the SFPUC will comply with all local, State, and federal requirements for surveys, analysis, and protection of biological resources (e.g., Migratory Bird Treaty Act, federal and State Endangered Species Acts, etc.). If necessary, measures will be implemented to protect biological resources, such as installing wildlife exclusion fencing, establishing work buffer zones, installing bird deterrents, monitoring by a qualified biologist, and other such measures. If tree removal is required, the SFPUC would comply with any applicable tree protection ordinance.

8. VISUAL AND AESTHETIC CONSIDERATIONS, PROJECT SITE: All project sites will be maintained in a clean and orderly state. Construction staging areas will be sited away from public view where possible. Nighttime lighting will be directed away from residential areas and have shields to prevent light spillover effects. Upon project completion, project sites on SFPUC-owned lands will be returned to their general pre-project condition, including re-grading of the site and re-vegetation or re-paving of disturbed areas to the extent this is consistent with SFPUC's Integrated Vegetation Management Policy. However, where encroachment has occurred on SFPUC-owned lands, the encroaching features may not be restored if inconsistent with the SFPUC policies applicable to management of its property. Project sites on non-SFPUC land will be restored to their general pre-project condition so that the owner may return them to their prior use, unless otherwise arranged with the property owner.

9. CULTURAL RESOURCES: All projects that will alter a building or structure, produce vibrations, or include soil disturbance will be screened to assess whether cultural resources are or may be present and could be affected, as detailed below.

Archeological Resources. No archeological review is required for a project that will not entail ground disturbance. Projects involving ground disturbance will undergo screening for

archeological sensitivity as described below and implement, as applicable, SFPUC's Standard Archeological Measures I (Discovery), II (Monitoring) and III (Testing/Data Recovery) per the Cultural Resources Attachments. Standard Construction Measure I will be implemented on all projects involving ground disturbance and Standard Archeological Measures II and III will be implemented based on the screening process described below for projects assessed as having the potential to encounter archeological sites and/or if an archeological discovery occurs during construction.

Projects involving ground disturbance will initially be screened to identify whether there is demonstrable evidence of prior ground disturbance in the project site to the maximum vertical and horizontal extent of the current project's planned disturbance. For projects where prior complete ground disturbance has occurred throughout areas of planned work, SFPUC will provide evidence of the previous disturbance in the Categorical Exemption application and no further archeological screening will be required.

For projects that are on previously undisturbed sites or where the depth/extent of prior ground disturbance cannot be documented, or where the planned project-related ground disturbance will extend beyond the depth/extent of prior ground disturbance, additional screening will be carried out as detailed below and shown on the attached flow chart titled "SFPUC Standard Construction Measure #9 Archeological Assessment Process". The additional screening will be conducted by the SFPUC's qualified archeologist (defined as meeting the Secretary of the Interior's Professional Qualifications Standards [36 CFR 61]) and, if a consultant, selected in consultation with the San Francisco Planning Department's Environmental Review Officer (ERO) and meeting criteria or specialization required for the resource type as identified by the ERO.

1) The SFPUC qualified archeologist will conduct an archival review for the project site, including review of Environmental Planning's (EP's) archeological GIS data and/or a records search of the California Historical Resources Information System (CHRIS) and other archival sources as appropriate. The qualified archeologist will also conduct an archeological field survey of the project site if, in the archeologist's judgment, this is warranted by site conditions. Based on the results, the archeologist will complete and submit to EP a Preliminary Archeological Checklist (PAC) (version dated 4/2015, to be amended in consultation with the ERO as needed). The PAC will include recommendations for the need for archeological testing, additional research and/or treatment measures consistent with Archeological Measures I, II, and III, to be implemented by the project to protect and/or treat significant archeological resources identified as being present within the site and potentially affected by the project.

2) The EP Archeologist (for projects within the City) or the ERO's archeological designee (for projects outside the City) will then conduct a Preliminary Archeological Review (PAR) of the PAC and other sources as warranted; concur with the PAC recommendations; and/or amend the PAC in consultation with the SFPUC archeologist or archeological consultant to require additional research, reports, or treatment measures as warranted based on his/her professional opinion.

3) The SFPUC shall implement the PAC/PAR recommendations prior to and/or during project construction consistent with Standard Archeological Measures I, II, and III, and

shall consult with the EP Archeologist in selecting an archeological consultant, as needed, to implement these measures.

4) Ground disturbing activities in archeologically sensitive areas, as identified through the above screening, will not begin until required preconstruction archeological measures of the PAC/PAR (e.g., preparation of an Archeological Monitoring Plan, Archeological Treatment Plan, and/or an Archeological Research Design and Data Recovery Plan) have been implemented.

Historic (Built Environment) Resources. For projects within the City that include activities with the potential for direct or indirect effects to historic buildings or structures, initial CEQA screening will include a review, for the project footprint and up to one parcel surrounding the footprint of CCSF's online planning map, all relevant survey data, preservation address files, and other pertinent sources for previously-identified, historically significant buildings and building and structures more than 45 years old that have not been previously evaluated. For projects outside of the City, initial CEQA screening will include a records search of EP's CCSF historical resources data, CHRIS, and other pertinent sources for historically significant or potentially significant buildings and structures older than 45 years.

For projects that would modify an existing building or structure that has been determined by EP as being a significant historical resource (i.e., appears eligible to qualify for the CRHR), or that would introduce new aboveground facilities in the vicinity of a significant historical resource, or that would affect previously unevaluated buildings or structures more than 45 years old, the SFPUC will retain a qualified architectural historian (defined as meeting the Secretary of the Interior's Professional Qualification standards and, if a consultant, also selected in consultation with the ERO) to conduct a historical resource evaluation (HRE). SFPUC will submit the project description and the HRE to the CCSF Planning Department Preservation Planner or to the ERO's-designated qualified architectural historian to assess potential effects. Where the potential for the project to have adverse effects on historic buildings or structures is identified, the CCSF Planning Department Preservation Planner or the ERO's designee will consult with SFPUC to determine if the project can be conducted as planned or if the project design can be revised to avoid the significant impact, and will comply with applicable procedures set forth in Historic Architectural Resource Measure I. If these options are not feasible, the project will need to undergo further review with EP and mitigation may be required. If so, the project would not qualify for a Categorical Exemption from CEQA review.

Where construction will take place in proximity to a building or structure identified as a significant historical resource but would not otherwise directly affect it, the SFPUC will implement protective measures, such as but not limited to, the erection of temporary construction barriers to ensure that inadvertent impacts to such buildings or structures are avoided.

6. Truck Traffic Routes and Restrictions

MAP APPROVED BY THE BOARD OF SUPERVISORS

The notation below in italics represents a recent amendment to the General Plan that has been approved by the Board of Supervisors after this map was originally adopted. The change will be added to the map during the next map update.

→ *Add a boundary area around the Hunters Point Shipyard area with a line that leads to a reference that states "See Hunters Point Redevelopment Plan."*

→ *Add a boundary area around Candlestick Point with a line that leads to a reference that states "See Candlestick Point SubArea Plan and Bayview Hunters Point Redevelopment Plan."*

RESTRICTED TRAFFIC STREETS

- Weight Restriction Over 3 Tons Transportation Code Section 501(b)
- Weight Restriction Over 9 Tons Transportation Code Section 501(c)
- Buses and Vans With 8 or More Passengers Restricted
- Buses and Vans With 8 or More Passengers Restricted (Alamo Square Neighborhoud)

BASEMAP:
Department of Public Works

RESTRICTED STREETS LAYER:
SFMTA - SUSTAINABLE STREETS

Notes:

1) Certain vehicles exempt, including vehicles with business in that block, utility vehicles, emergency vehicles, school buses, and city vehicles.
2) Transportation code restricts the parking of commercial vehicles with gross weight over 10,000 pounds on residentially zoned areas.

For further information on restricted traffic streets, go to:
www.sfgov.org and view the Municipal Codes Transportation Code

7. Travel Demand

San Francisco Superdistrict Boundaries

The boundaries of the four San Francisco Superdistricts are based on the travel analysis zones established by the Metropolitan Transportation Commission (MTC). The four Superdistricts shown in this figure are aggregations of the MTC's 1454 Regional Travel Analysis Zones (May 2002) that encompasses the nine-county San Francisco Bay Area. MTC's 1454-zone system fits within the year 2000 U.S. Census tracts.

Maximum	18	0	15	47	62	8	8	8	24	62	5	5	10	67

a. Concrete deliveries:
Cemex – 500 Amador Street, San Francisco, CA – 0.7 miles
Bode Concrete – 450 Amador Street, San Francisco, CA – 0.6 miles
Allied Redy Mix – 450 Amador Street, San Francisco, CA – 0.6 miles

b. Clean material excavated from digester complex will be used for backfill.
c. Unsuitable soil (due to geotechnical or environmental reaons) will be excavated and hauled off-site. Unsuitable soil destination will depend on soil classification. Assume that contaminated soil will be transported to a landfill in Utah and the remainder will be transported to the Altamonte Landfill outside Livermore/T
d. Due to limited information, estimates of demolition debris material is assumed to be a third lead/asbestos materials, a third recycable materials and a third un-recycable materials. Potential locations are listed based on the type of material.
e. Source of equipment has not been determined yet. Assume equipment deliveries will be distributed between the two potential staging areas identified at this time: Pier 94 and Southeast Greenhouses.
f. All quantities and truckload estimates are rough order of magnitude, based on 10% design and class 4 cost estimate. These estimates will be refined during design development.
g. Truck capacity is assumed to be 20 CY, filled to 18 CY capacity (to provide freeboard).
h. The total excavation volumes (and breakdown for hazardous and non-hazardous materials) are based on the Final Environmental Site Investigation Report for San Francisco Department of Public Health (May 2016)

Source: SF PUC, August 2016

a. BDFP estimates for people per day and office staff as shown in Draft CER Construction Staging TM. Standard working hours are assumed (8.5 hours per day, 5 days per week).
While one work shift is assumed for VMT calculations, it is possible that two work shifts could occur during the shaded period shown above (May '21 to May '22). Workshifts are 8.5 hours, which include 1/2 hour lunch.
They are as follows: 7 am - 3:30 pm (1st shift) and 2:30 pm - 11 pm (2nd shift, if needed).
b. Contractor Work Force is based on base case or mid-point of probable range (direct cost plus 15 to 25 percent design contingency).
c. Work force parking in this table is calculated based on 1.25 vehicle occupancy ratio.
d. Work force parking area is calculated based on 300 sq.ft. parking stalls and the estimated number of vehicles.
e. A minimum of 0.5 acres for on-site office trailers is required to allow enough space for the design team field staff, general contractor, major subcontractors,
full-time inspectors and meeting rooms.throughout the period. This assumes 40 people (40 cars) will be on-site throughout the period.
f. Off-site office trailers are required to accommodate additional Contractor Manager and General Contractor staff. Estimates are based on 175 people (175 cars)
The car pool ratio was not appliedto the off-site office estimate.
g. Off-site office staff parking area is calculated based on 300 sq.ft. parking stalls and the estimated number of vehicles.
h. A shuttle bus with capacity for 50 passengers is assumed during peak of construction. A smaller shuttle bus could be used at other times.
Estimate does not include off-site office staff. (Approximaty calculation)

RE: Water Supply Assessment for the Biosolids Digester Facilities Project

---

1.0 Summary

1.1 Introduction

Under the Water Supply Assessment law (Sections 10910 through 10915 of the California Water Code), urban water suppliers like the San Francisco Public Utilities Commission (SFPUC) must furnish a Water Supply Assessment (WSA) to the city or county that has jurisdiction to approve the environmental documentation for certain qualifying projects (as defined in Water Code Section 10912 (a)) subject to the California Environmental Quality Act (CEQA). The WSA process typically relies on information contained in a water supplier's Urban Water Management Plan (UWMP), and involves answering specific questions related to the estimated water demand of the proposed project. This memo serves as the WSA for the proposed Biosolids Digester Facilities Project ("proposed project"), for use in the preparation of an environmental impact report by the City and County of San Francisco Planning Department (case no. 2015-000644ENV, San Francisco Planning Department).

1.1.1 2015 Urban Water Management Plan

The SFPUC's most current UWMP is the UWMP update for 2015, which was adopted in June 2016. The water demand projections in the UWMP incorporated 2012 Land Use Allocation (LUA 2012) housing and employment growth projections from the San Francisco Planning Department.

The WSA for a qualifying project within the SFPUC's retail service area may use information from the UWMP. Therefore, ***the 2015 UWMP is incorporated via references throughout this WSA shown in bold, italicized text.*** The UWMP may be accessed at www.sfwater.org/uwmp.

1.1.2 Basis for Requiring a WSA for the Proposed Project

The proposed project has not been the subject of a previous WSA, nor has it been part of a larger project for which a WSA was completed. The proposed project qualifies for preparation of a WSA under Water Code Section 10912(a) because it would use more water than required by a 500 dwelling unit project (Water Code section 10912(a)(7)). The SFPUC previously determined that a 500 dwelling unit project would create retail water demand of 50,000 gallons per day (gpd) or 18.25 million gallons per year (gpy). The proposed project is characterized further in Section 1.2.

1.1.3 Conclusion of this WSA

In this WSA, the SFPUC concludes that there are adequate water supplies to serve the proposed project and cumulative retail water demands during normal years, single dry years, and multiple dry years over a 20-year planning horizon from 2020 through 2040. Additional information on supply sufficiency is provided in Section 4.2, Findings.

1.2 Proposed Project Description

The proposed project would construct new solids treatment, odor control, energy recovery, and associated facilities at the SFPUC's Southeast Water Pollution Control Plant (SEP) in San Francisco. Most of the existing SEP solids treatment facilities (including the digesters) are over 60 years old, were not built to withstand the maximum credible earthquake, require significant maintenance, and are operating well beyond their useful life. Newer, more efficient treatment technologies have since been developed that produce a higher quality of biosolids, capture and treat odors more effectively, and maximize biogas production for heat and energy. The proposed project would update and replace the aging SEP solids treatment system. Over the planning period for the proposed project (2045), projected increases in population will increase solids loads from about 187,000 dry pounds per day (2014) to about 280,000 dry pounds per day (2045).

The proposed project would be located on portions of the existing SEP property at 750 Phelps Street and 1700 Jerrold Avenue (Block and Lot 5262/009), and the adjacent properties at 1800 Jerrold Avenue (the Central Shops site, Block and Lot 5262/009), and 1801 Jerrold Avenue (the decommissioned Asphalt Plant site, Block and Lot 5281/001). The project site totals approximately 415,000 square feet. The project would involve the demolition of existing structures and installation of the following facilities:

- Solids Pretreatment Facility
- Thermal Hydrolysis Process (THS)
- Anaerobic Digestion
- THS Cooling Towers
- Biosolids Dewatering Facility
- Energy Recovery Facility
- Biogas Treatment
- Biogas Storage
- Waste Gas Burners
- Solids Odor Control
- Piping modifications and new pumps for existing pump stations
- Other ancillary facilities (electrical rooms, transformers, chemical storage, and diesel generator)

The proposed project would require construction of new structures totaling less than 215,000 square feet (footprint). No new staff would be needed to operate new facilities. Operation will begin as early as 2023 (startup/commissioning period).

2.0 Water Supply

This section reviews San Francisco's existing and planned water supplies.

2.1 Regional Water System

See ***Section 3.1 of the UWMP*** for descriptions of the Regional Water System (RWS) and ***Section 6.1 of the UWMP*** for water rights held by City and County of San Francisco and the SFPUC Water System Improvement Program (WSIP).

2.2 Existing Retail Supplies

Retail water supplies from the RWS are described in ***Section 6.1 of the UWMP***.

Local groundwater supplies, including the Westside Groundwater Basin, Central Groundwater Sub Basin, and Sunol Filter Gallery Subsurface Diversions, are described in ***Section 6.2.1 of the UWMP***.

Local recycled water supplies, including the Harding Park Recycled Water Project and Pacifica Recycled Water Project, are described in ***Section 6.2.1 of the UWMP***.

2.3 Planned Retail Water Supply Sources

The San Francisco Groundwater Supply Project is described in ***Section 6.2.2 of the UWMP***.

The proposed Westside and Eastside Recycled Water Projects, as well as non-potable water supplies associated with onsite water systems implemented in compliance with San Francisco's Non-potable Water Ordinance (Health Code Chapter 12C), are also described in ***Section 6.2.2 of the UWMP***.

2.4 Summary of Current and Future Retail Water Supplies

A breakdown of water supply sources for meeting SFPUC retail water demand through 2040 in normal years is provided in ***Section 6.2.5 of the UWMP***.

2.5 Dry-Year Water Supplies

A description of dry-year supplies developed under WSIP is provided in ***Section 7.2 of the UWMP***. Other water supply reliability projects and efforts that are currently underway or completed are described in ***Section 7.4 of the UWMP***. A breakdown of water supply sources for meeting SFPUC retail water demand through 2040 in multiple dry years are provided in ***Section 7.5 of the UWMP***. For a single dry year, the retail RWS allocation and, thus, the breakdown of water supply sources would be the same as those in a normal year.

3.0 Water Demand

This section reviews the climatic and demographic factors that may affect San Francisco's water use, projected retail water demands, and the demand associated with the proposed project.

3.1 Climate

San Francisco has a Mediterranean climate. Summers are cool and winters are mild with infrequent rainfall. Temperatures in the San Francisco area average 57 degrees Fahrenheit annually, ranging from the mid-40s in winter to the upper 60s in late summer. Strong onshore flow of wind in summer keeps the air cool, generating fog through September. The warmest temperatures generally occur in September and October. Rainfall in the San Francisco area averages about 22 inches per year and is generally confined to the "wet" season from late October to early May. Except for

occasional light drizzles from thick marine stratus clouds, summers are nearly completely dry. A summary of the temperature and rainfall data for the City of San Francisco is included in Table 1.

Table 1: San Francisco Climate Summary

Month	Average Maximum Temperature (°F)	Average Minimum Temperature (°F)	Average Monthly Rainfall (inches)
January	58.0	45.7	4.36
February	60.3	47.3	4.41
March	61.4	48.1	2.98
April	62.3	49.1	1.38
May	63.2	50.9	0.68
June	64.8	52.7	0.18
July	65.6	54.3	0.02
August	66.6	55.3	0.06
September	68.1	55.0	0.19
October	67.8	53.3	1.04
November	61.2	48.1	2.85
December	58.3	45.9	4.33
Annual Average	**63.3**	**50.6**	**22.45**

Source: Western Regional Climate Center (www.wrcc.dri.edu), 1981-2010 data from two San Francisco monitoring stations (Mission Dolores/SF#047772 and Richmond/SF#047767).

3.2 Projected Growth

Projections of population growth in the retail service area through 2040 are presented in ***Section 3.2.2 of the UWMP***. The corresponding LUA 2012 projections for housing and employment in San Francisco, which are incorporated into the projected retail water demands, are provided in ***Appendix E of the UWMP***.

3.3 Projected Retail Water Demands

For the 2015 UWMP, the SFPUC developed a new set of models that incorporate socioeconomic factors to project retail demands through 2040. These models incorporate the latest housing and employment projections from LUA 2012. ***See Section 4.1 of the UWMP*** for tabulated retail water demand projections through 2040 and a description of the model methodology.

3.4 Proposed Project Water Demand

Water demand estimates for the proposed project are detailed in a memo prepared by the SFPUC project team, provided in Attachment A. The proposed project is not encompassed in the San Francisco Planning Department's LUA 2012 projections as it does not result in population or employment growth. Therefore, the demand that would be generated by the proposed project is not encompassed within the San Francisco retail water demands that are presented in the 2015 UWMP.

Water demand associated with the proposed project over the 20-year planning horizon is shown in the following table.

Table 2: Water Demand Based on Project Phasing

	2020	2025	2030	2035	2040
Total Average Demand of Proposed Project (mgd)	—	0.16	0.16	0.16	0.16

mgd = million gallons per day

Notes:
The demand shown in this table is the net increase in potable water demand (BDFP demand compared to existing solids processing facilities). Operation of the proposed project would begin as early as 2023 with the startup/commissioning period.

4.0 Conclusion

4.1 Comparison of Projected Supply and Demand

Section 7.5 of the UWMP compares the SFPUC's retail water supplies and demands through 2040 during normal year, single dry-, and multiple dry-year periods. See Table 3, below, which is adapted from the UWMP (Table 7-4) with the addition of water demands attributed to the proposed project. Although water demands associated with the proposed project are not already captured in the retail demand projections presented in the UWMP, the demands are incremental and would not substantiate the need for additional supplies.

With the addition of demands associated with the proposed project, total retail demand in 2035 is projected to be 86.1 mgd, which represents a 5.2 mgd, or 6 percent, increase over the 2035 demand projected in the 2010 UWMP. The ability to meet the demand of the retail customers is in large part due to development of 10 mgd of local WSIP supplies, including conservation, groundwater, and recycled water. These supplies are anticipated to be fully implemented over the next 10 to 15 years.

Table 3 shows projected shortfalls of 0.2-1.3 mgd resulting from the proposed project. In a normal year, single dry year, or multiple dry year 1, the SFPUC may draw up to 81 mgd from the RWS, thereby increasing the total retail supply beyond the volumes shown in Table 3 and eliminating the 0.2 mgd deficit. In years 2 and 3 of a multiple dry year event, the SFPUC may draw 79.5 mgd, which is already reflected the total retail supply shown in Table 3. The resulting deficit would be easily managed through voluntary conservation or rationing.

If planned future water supply projects (i.e., San Francisco Groundwater Supply Project, Westside Recycled Water Project, Eastside Recycled Water Project, and onsite non-potable supplies) are not implemented, normal-year supplies may not be enough to meet projected retail demands. To balance any water supply deficits during normal years, the SFPUC may import additional water from the RWS beyond the retail allocation of 81 mgd, with mitigation implemented by the SFPUC and potential environmental surcharges if RWS deliveries exceed the 265 mgd interim supply limitation.

If dry-year supply projects (i.e., Calaveras Dam Replacement Project, Lower Crystal Springs Dam Improvements Project, Alameda Creek Recapture, Regional Groundwater Storage and Recovery Project, and water transfers) are not implemented, existing dry year supplies may not be enough to meet projected retail demands. To balance any water supply deficits during dry years, the SFPUC may reduce system deliveries and impose customer rationing.

Table 3: Projected Supply and Demand Comparison with Proposed Project (mgd)

		Normal Year	Single Dry Year[1]	Multiple Dry Years		
				Year 1[1]	Year 2[2]	Year 3[2]
2020	Total Retail Demand Excluding Proposed Project[3]	77.5	77.5	77.5	77.5	77.5
	Demand of Proposed Project	—	—	—	—	—
	Total Retail Demand Including Proposed Project	77.5	77.5	77.5	77.5	77.5
	Total Retail Supply[4]	77.5	77.5	77.5	77.5	77.5
	Surplus/(Deficit)	0	0	0	0	0
2025	Total Retail Demand Excluding Proposed Project[3]	79.0	79.0	79.0	79.0	79.0
	Demand of Proposed Project	0.16	0.16	0.16	0.16	0.16
	Total Retail Demand Including Proposed Project	79.2	79.2	79.9	79.2	79.2
	Total Retail Supply[4]	79.0	79.0	79.0	79.0	79.0
	Surplus/(Deficit)	(0.2)	(0.2)	(0.2)	(0.2)	(0.2)
2030	Total Retail Demand Excluding Proposed Project[3]	82.3	82.3	82.3	82.3	82.3
	Demand of Proposed Project	0.16	0.16	0.16	0.16	0.16
	Total Retail Demand Including Proposed Project	82.5	82.5	82.5	82.5	82.5
	Total Retail Supply[4]	82.3	82.3	82.3	82.3	82.3
	Surplus/(Deficit)	(0.2)	(0.2)	(0.2)	(0.2)	(0.2)
2035	Total Retail Demand Excluding Proposed Project[3]	85.9	85.9	85.9	85.9	85.9
	Demand of Proposed Project	0.16	0.16	0.16	0.16	0.16
	Total Retail Demand Including Proposed Project	86.1	86.1	86.1	86.1	86.1
	Total Retail Supply[4]	85.9	85.9	85.9	85.9	85.9
	Surplus/(Deficit)	(0.2)	(0.2)	(0.2)	(0.2)	(0.2)
2040	Total Retail Demand Excluding Proposed Project[3]	89.9	89.9	89.9	89.9	89.9
	Demand of Proposed Project	0.16	0.16	0.16	0.16	0.16
	Total Retail Demand Including Proposed Project	90.1	90.1	90.1	90.1	90.1
	Total Retail Supply[4]	89.9	89.9	89.9	88.8	88.8
	Surplus/(Deficit)	(0.2)	(0.2)	(0.2)	(1.3)	(1.3)

Notes:

1. During a single dry year and multiple dry year 1, a system-wide shortage of 10% is in effect. Under the Water Shortage Allocation Plan (WSAP), the retail supply allocation at this stage of shortage is 36.0% of available RWS supply, or 85.9 mgd. However, due to the Phased WSIP Variant, only 81 mgd of RWS supply can be delivered. RWS supply is capped at this amount.
2. During multiple dry years 2 and 3, a system-wide shortage of 20% is in effect. Under the WSAP, the retail supply allocation at this stage of shortage is 37.5% of available RWS supply, or 79.5 mgd. RWS supply is capped at this amount.
3. Total retail demands correspond to those in ***Table 4-1 of the UWMP***, and reflect both passive and active conservation, as well as water loss.
4. Total retail supplies correspond to those in ***Table 6-7 of the UWMP***. Procedures for RWS allocations and the WSAP are described in ***Section 8.3 of the UWMP***. Groundwater and recycled water are assumed to be used before RWS supplies to meet retail demand. However, if groundwater and recycled water supplies are not available, up to 81 mgd, or the corresponding capped amount in dry years, of RWS supply could be used.

The SFPUC remains committed to meeting the level of service goals and objectives outlined under WSIP. In addition, the SFPUC continues to explore other future supplies, including:

- Development of additional conservation and recycling.
- Development of additional groundwater supplies.
- Securing of additional water transfer volumes.
- Increasing Tuolumne River supply.

4.2 Findings

Regarding the availability of water supplies to serve the proposed project beginning as early as 2023, the SFPUC finds, based on the entire record before it, as follows:

- During normal years, single dry years, and multiple dry years, the SFPUC has sufficient water supplies to serve the proposed project.
- With the addition of planned retail supplies, the SFPUC has sufficient water supplies available to serve its retail customers, including the demands of the proposed project, existing customers, and foreseeable future development.

Approval of this WSA by the Commission is not equivalent to approval of the development project for which the WSA is prepared. A WSA is an informational document required to be prepared for use in the City's environmental review of a project under CEQA. It assesses the adequacy of water supplies to serve the proposed project and cumulative demand.

Furthermore, this WSA is not a "will serve" letter and does not verify the adequacy of existing distribution system capacity to serve the proposed project. A "will serve" letter and/or hydraulic analysis must be requested separately from the SFPUC City Distribution Division to verify hydraulic capacity.

If there are any questions or concerns, please contact Steve Ritchie at (415) 934-5736 or SRitchie@sfwater.org.

RE: Input to Water Supply Assessment for the Biosolids Digester Facilities Project

---

This document provides information specified in the "Project Demand Memo for Preparation of WSA." Specifically, this document responds to the input requested for Items 1b (Introduction) and 3b (Project Demand).

Project Description (Item 1b)

The Biosolids Digester Facilities Project (the "project" or BDFP) would construct new solids treatment, odor control, energy recovery, and associated facilities at the San Francisco Public Utilities Commission's (SFPUC) Southeast Water Pollution Control Plant (SEP) in San Francisco. Most of the existing SEP solids treatment facilities (including the digesters) are over 60 years old, were not built to withstand the maximum credible earthquake, require significant maintenance, and are operating well beyond their useful life. Newer, more efficient treatment technologies have since been developed that produce a higher quality and reduced volume of biosolids, capture and treat odors more effectively, and maximize biogas production for heat and energy. The proposed BDFP would update and replace the aging SEP solids treatment system. Over the planning period for the BDFP (2045), projected increases in population will increase solids loads from about 187,000 pounds per day (2014) to about 280,000 pounds per day (2045) (SFPUC, 2016)[1].

The BDFP would be located on portions of the existing SEP property at 750 Phelps Street and 1700 Jerrold Avenue (Block and Lot 5262/009), and the adjacent properties at 1800 Jerrold Avenue (the Central Shops site, Block and Lot 5262/009) and 1801 Jerrold Avenue (the decommissioned Asphalt Plant site, Block and Lot 5281/001). The project site totals approximately 415,000 square feet. The project would involve the demolition of other onsite structures and installation of the following facilities:

- Solids Pretreatment Facility
- Thermal Hydrolysis Process (THS)
- Anaerobic Digestion
- THS Cooling Towers
- Biosolids Dewatering Facility
- Energy Recovery Facility

[1] SFPUC. March.. Final Conceptual Engineer Report. 2016.

- Biogas Treatment
- Biogas Storage
- Waste Gas Burners
- Solids Odor Control
- Piping modifications and new pumps for existing pump stations
- Maintenance Shops
- Other ancillary facilities (electrical rooms, transformers, chemical storage, and diesel generator)

The BDFP would require construction of new structures totaling less than 215,000 square feet (footprint). No new staff would be needed to operate new facilities.

Currently, the SEP uses supplies from three water systems, as follows:

- No. 1 water (W1): potable water
- No. 2 water (W2): non-potable, disinfected and filtered SEP effluent
- No. 3 water (W3): non-potable, chlorinated SEP effluent

The type of water used in the treatment system under the proposed project would depend on the process and required water quality. For example, W1, the highest quality water, would be used for the cooling tower and energy recovery facilities. W2 and W3 water would be used for wash water, chemical dissolution, dilution, and to maintain moisture for the odor control facilities.

Project Demand (Item 3b)

BDFP processes would increase overall water use. However, the BDFP has been designed to maximize use of SEP recycled water and/or other non-potable water, to the extent possible in its processes. Thus, the majority of the water needs (about 92 percent) would be supplied by the No. 2 and No. 3 water systems, while only about 8 percent would be associated with the No. 1 potable water system. **Table 1** presents the existing and projected future water demand (process and non-process water [administration / maintenance only] and irrigation) for the proposed project, including for W1, W2, and W3. W2 and W3 demand are shown to demonstrate how SFPUC would minimize potable water use and reduce treated effluent that would otherwise be discharged into the Bay.

As shown in **Tables 1** and **2**, the BDFP average demand for W1 is approximately 140 gallons per minute (gpm), or approximately 205,000 gallons per day (gpd). This would result in a net increase of approximately 162,000 gpd of potable water, above the 50,000 gpd that would trigger the preparation of a WSA. Nearly 100 percent of the W1 demand is associated with process needs.

Irrigation water demand, which is currently met by potable water, is also assumed to be supplied by potable water under the proposed project due to the higher salinity levels of the existing SEP effluent. This may likely change when recycled water or other viable non-potable water source is identified. At this time however, with selection of the right palette of salt tolerant plants and

implementation of the appropriate irrigation strategies (e.g., avoid wetting leaves with recycled water, adjusting irrigation frequency to keep soils moist, leaching soils with gypsum periodically), existing recycled water that is currently produced at the SEP could likely be used. Other water sources may be available to meet the irrigation needs of the project, such as stormwater (captured during rainy events)[2] and greywater (captured from sinks). In addition, as discussed in the Final CER (SFPUC, 2016), landscape planting will reflect the strategies of the City's Water Efficient Irrigation Ordinance Requirements for Tier 2 projects and the Green Landscaping Ordinance, including consideration of irrigation with recycled water or harvested rain water, water-efficient/drought tolerant plantings, and automatic irrigation controllers equipped with climatological sensors.

Project design has not proceeded to a level in which the plant palette has been selected, associated water requirements have been evaluated, or the specific water supplies have been identified for irrigation. Thus, the values specified in **Table 2** are based on assumptions of the calculated landscape area, estimated water requirements of peak (71 gpm) irrigation, and hours of irrigation (6 hours) during the plant establishment period. Following the plant establishment period, it is expected that water demands would reduce to 10 gpm. By assuming the irrigation water needs would be supplied entirely by the use of potable water, the project is providing a conservative estimate of W1 use. As design progresses, the BDFP Team will determine the details to better gauge the water needs as well as investigate other alternatives to potable water that can be used for irrigation.

Potable water, which is necessary for certain processes that require the lowest level of salinity, could be further reduced in the future. SFPUC has identified the Eastside Recycled Water Project as a potential project that would deliver disinfected tertiary level treated recycled water to a variety of customers on the east side of the City for non-drinking uses such as irrigation and toilet flushing. Title 22 disinfected tertiary level treated recycled water provides a variety of reuse opportunities, including supply for cooling or air conditioning, toilet and urinal flushing, and irrigation (e.g., in public spaces). If available, this level of recycled water could be used to meet proposed biosolids facilities water demand (process and non-process) as well as irrigation demand. Although not yet formally in the planning stage, the Eastside Recycled Water Project may be available by 2030. In compliance with the City's Reclaimed Water Use Ordinance, SFPUC proposes that all Irrigation pipelines would be single-piped with a crossover/air gap connection such that recycled water (Title 22) could be used if and when it becomes available in the future. In addition, bathrooms in BDFP buildings would be dual plumbed for recycled water use if and when it becomes available.

[2] As discussed in the Final CER, the BDFP will comply with SFPUC's Stormwater Design Guidelines, and thus would be required to decrease runoff rate and volume using low-impact development (LID) or other green infrastructure approaches. Examples of LID measures that could be implemented include flow-through stormwater planters, and rain barrels / oversized downsprouts. The use of LID measures would offset potable water use (SFPUC, 2016). Since the publication of the Final CER, SFPUC replaced the SFPUC's Stormwater Design Guidelines with the San Francisco Stormwater Management Requirements (SMR) and Design Guidelines in 2016. The BDFP would be in compliance with the SMR.

The water demands provided in Tables 1 and 2 are for the horizon year 2045. The BDFP would be installed with the majority of the major facilities (e.g., all five proposed digesters) that would be needed during the horizon year. As such, water demand is not expected to change substantially between the start of operation (startup/commissioning period to begin as early as 2023) and the horizon year, and demand is not broken down by phases. In addition, water demand based on water year type is not provided as THP processes do not change depending on the hydrologic water type; thus a breakdown based on the hydrologic water type is also not provided.

Attachment A

Table 1: Existing and Proposed Water Demand

Facility	Potable Water (W1)		Non-potable, Chlorinated and Filtered Water (W2)		Non-potable and Chlorinated Water (W3)		Total (W1+W2+W3)	
	Max (Peak Hour) Demand), gpm	Avg Day Demand gpm	Max (Peak Hour) Demand gpm	Avg Day Demand gpm	Max (Peak Hour) Demand, gpm	Avg Day Demand gpm	Max Demand gpm	Avg Demand gpm

NOTES

[1] Peak values from SFPUC, Final CER, March 2016.

[2] Average values from SFPUC, Draft Site Logistics Plan, March 2016.

[3] Values from Brown and Caldwell (December 2016).

[4] It is assumed irrigation is intermittent and would be up to 71 gpm (or 7 gpm when a 10% diversity factor is applied for intermittent use). The irrigation demand is based on calculated landscape area, estimated water requirements of peak (71 gpm) irrigation, and hours of irrigation (6 hours) during the plant establishment period. Following the plant establishment period, it is expected that water demands would reduce to 10 gpm, but this is not reflected above in order to provide a conservative estimate..

[5] Based on an occupancy of 110 people/day. Note that there is no increase in staffing at SEP due to the project, these people will be existing staff at SEP who will move from one building to another.

[6] SFPUC staff has clarified that secondary effluent demands (W2 and W3 system water) are nonpotable demands that would otherwise be discharged into the Bay if it were not reused for proposed operations. Thus, they're not included in the determination of whether a WSA is needed.

Definitions: Max = maximum; Avg = average; gpm = gallons per minute; gpd = gallons per day; and NA = not applicable

Table 2. SFPUC SEP BDFP No. 1 Water (W1) Demands

Functional Area	Average (gpd)	Peak Hour (gpm)	Average (mgd)
Existing Demands			
Existing Biosolids Water Demands	**43,200**	**110**	**0.04**
New Biosolids Demands (2045)			
Biosolids process facilities (Cooling Tower and Boiler Makeup Water Feed)	198,720	144	0.20
Biosolids Irrigation[a]	5,760	7	0.01
Biosolids facilities fixtures (bathrooms, locker rooms) [b]	778	116	0.001
Total new biosolids demands (2045)	**205,258**	**267**	**0.21**
Net W1 Demand Increase from BDFP Project	**162,058**	**157**	**0.16**

Source: Brown and Caldwell, December 2016.

a. Based on calculated area and estimated water requirements, at 71 gpm (peak) irrigation would be accomplished in 6 hours during plant establishment. Estimates will be revisited during design. Following the plant establishment period, it is expected that water demands would reduce to 10 gpm.

b. Based on an occupancy of 110 people/day.

Definitions: gpd = gallons per day; gpm = gallons per minute; mgd = million gallons per day.

San Francisco Water Power Sewer
Services of the San Francisco Public Utilities Commission

FROM: **Jeremy Spitz, Policy and Government Affairs**

DATE: **January 16, 2025**

SUBJECT: **[Grant of Easement – Pacific Gas and Electric Company – Approximately 2,9444-square-foot permanent easement for a Natural Gas Facility exclusively serving the San Francisco Public Utilities Commission's Southeast Water Pollution Control Plant located at 1800 Jerrold Avenue – At No Cost]**

Please see attached a proposed Resolution approving and authorizing a grant of a permanent easement on SFPUC's property located at 1800 Jerrold Avenue (Assessor's Parcel Block No. 5262, Lot No. 009), consisting of an easement of approximately 2,9444-square-feet of land within SFPUC's Southeast Water Pollution Control Plant, between City and PG&E, for the purpose of replacing and relocating SFPUC's existing solids treatment facilities at its Southeast Water Pollution Control Plant with more reliable, efficient, and modern technologies and facilities, at no cost for a term effective upon approval of this Resolution and recordation of the agreement by City's Office of the Assessor Recorder, pursuant to Charter, Section 9.118, and until PG&E surrenders or abandons the easement area or the agreement is terminated; determination that the grant of the easement at no cost will serve a public purpose by delivering an increased natural gas supply to SFPUC's existing Southeast Water Pollution Control Plant and its new biosolids digesters facilities, in accordance with Section 23.30; adopting findings of consistency with the General Plan, and the eight priority policies of Planning Code, Section 101.1; and authorizing the Director of Property to execute documents, make certain modifications and take certain actions in furtherance of this Resolution, as defined herein.

The following is a list of accompanying documents:
