"Guidelines must be developed to guide the long-term efforts of architects and developers over the many years that the numerous sites within this Redevelopment Area will be under construction. A public process must guide the preparation of these Guidelines. Paramount among the issues that must be addressed in the Guidelines are: reuse of historic fabric and contextual treatment of new buildings when they are juxtaposed with older buildings. The EIR/S does not indicate whether Guidelines will be developed.

"With so little specificity regarding the Redevelopment Area in the EIR/S, what is shown as a design concept in Figure 5.16-4 on p. 5-101 and Figure 5.16-5 on p. 5-102 is misleading in this official document. These drawings were apparently developed for another project and have nothing to do with this Redevelopment Area about which so little is known. Placing these computer visualizations in this EIR/S document gives the false impression that considerable planning has gone into the guidelines for the Redevelopment Area. These drawings should be removed from the document. It should be acknowledged that so little is known at this time about the Redevelopment Area that the treatment of it in this document is inadequate even for consideration as Program EIR."

Response 4.2.13 The CEQA Guidelines acknowledge in Section 15004 that, "Choosing the precise time for CEQA compliance involves a balancing of competing factors." It goes on to say that EIRs should be prepared as early as feasible in the planning process. Because of the complexity of the multiple components of the Project, it was decided early on to do a Programmatic EIR for the Redevelopment component that would look at the impacts of two alternative redevelopment programs absent specific designs but that included massing scenarios for such analysis as shadow and wind.

Actual development proposals will come five to ten years after project adoption when the sites become available for their ultimate redevelopment. Many of the redevelopment sites are not going to be immediately available and will be used in the interim for other uses such as the continuing Caltrans retrofit project and as the Temporary Transbay Bus Terminal. In the future as the sites become available for development, additional evaluation will be done on the proposals to determine if the project falls within the envelope of impacts reviewed in this EIS/EIR and to determine if additional environmental analysis is necessary.

Page S-8 and Figure S-2 are from the Summary Chapter of the Draft EIS/EIR. Because it is a summary, there is a limit to the amount of material that can be discussed. Chapter 2 describes the two Redevelopment Alternatives in greater detail, while Chapter 4, pages 1 through 13 set out the existing conditions for land use and zoning. Chapter 5, pages 1 through 19 discuss the environmental consequences (impacts) of the changes in land use and zoning. These later chapters provide the detail that the commentor found lacking in the Summary chapter.

As part of the Draft EIS/EIR, a review was conducted to assess the Project's conformity with the following plans and polices which guide land use in the study area: (1) The San Francisco General Plan, with subsequent elements including the Urban Design Element; the Commerce and Industry Element; the Transportation Element; the Residence Element; and the Recreation and Open Space Element, and (2) Local area plans within the General Plan, including the Downtown Plan, the South of Market Plan, the Rincon Hill Plan, and the Northeastern Waterfront Plan.

Other policies were reviewed for the Project's compliance with respect to the policies and plans of adjacent San Francisco Redevelopment Agency plans. These include: (1) the Rincon Point-South Beach Redevelopment Plan, (2) the Yerba Buena Center Redevelopment Plan, and (3) the Mission Bay North Redevelopment Plan. The proposed development within the redevelopment plan area will be subject to the development restrictions of Proposition M.

As a part of this analysis, the consistency of the proposed Project was evaluated with respect to the General Plan's urban design goals and policies and policies related to specific Area Plans in and adjacent to the project area.

The proposed Project is not in conflict with policies contained in these documents. As stated in the Draft EIS/EIR (p. 2-42), the proposed Transbay redevelopment planning efforts represent a long-standing goal of the City and consist of a multi-phased planning process that includes adopting a formal redevelopment area and plan, new zoning and design guidelines for the district, and a capital improvement plan. The EIS/EIR therefore provides information on project impacts, but does not complete the plan.

Given that detailed information is not available at the present time regarding specific designs of individual buildings within the proposed redevelopment area, individual buildings cannot be evaluated with respect to the General Plan's established urban design guidelines. The Draft EIS/EIR does, however as noted above, provides a description of the environmental consequences resulting from rezoning and developing underutilized parcels and instituting new building massing requirements and height limits for the district. These effects are presented with respect to changes in views and changes in the cityscape, potential new sources of light and glare, as well as wind and shadow effects. The Design for Development document for the redevelopment area will provide new land use or zoning designations and design guidelines to control the development of the Transbay Terminal and the associated redevelopment of adjacent underutilized parcels. These design guidelines will ultimately be reviewed with respect to their consistency with the City's established urban design goals and policies and approved by both the San Francisco Redevelopment and Planning Commissions.

4.2.14 League of Women Voters of the Bay Area, Doris Maez, North San Mateo County League of Women Voters, Onnolee Trapp, South San Mateo County League of Woman Voters, Eva Alexis Bansner, President, December 5, 2002

"Land Use: (Page 2-44). The land use mix assumed is dominantly residential which would provide a desirable balance for the intense job center of San Francisco. The Full Build alternative also includes 1,184,590 square feet of office space...

- "If more office space than "Full Build" is built, consistent with current zoning, how would that affect traffic projections and air quality?"

Response 4.2.14 The environmental document evaluated two redevelopment alternatives, the Reduced Scope with no office and the Full Build with 1,184,590 sq. ft. of office use. If more office space than that evaluated in the Draft EIS/EIR were proposed, it would require additional environmental analysis and could lead to a supplemental or subsequent environmental document. Regarding air quality impacts from increased office space development, the one-hour carbon monoxide concentrations under Project conditions would range from 4.0 to 5.7 parts per million. Eight-hour carbon monoxide concentrations would range from 2.8 to 4.0 parts per million. The California Ambient Air Quality Standards for carbon monoxide is 20.0 parts per million for the one-hour period and 9.0 parts per million for the eight-hour period. Traffic would have to increase by more than twice the amount that was evaluated in the Draft EIS/EIR for carbon monoxide concentrations to exceed the State standards.

5.0 PROJECT ALTERNATIVES - PROPOSED NEW CALTRAIN ALIGNMENT AND TERMINAL LOCATIONS

5.1.1 Mark Duncan, Askmar, November 18, 2002

"Although Muni has no interest, there would be cost savings and reduced total overall environmental impact to the City of San Francisco if the depth of the trench was increased on Second Street from Townsend to Mission, to be sufficient to run Muni on an upper level, and heavy rail on a bottom level. (This would be instead of the proposed Third Street Muni underground line extension.) I would suggest that Muni could make a dogleg from Second down Mission, stopping at the Convention Center, and proceeding down Third for the remainder of the line as planned. In addition, it is my understanding that the mezzanine level of the Transbay terminal could accommodate Muni light rail trains, were this connectivity so desired, and this approach would enable this to happen."

Response 5.1.1 This alternative alignment would require several additional 90-degree turns for Muni's New Central Subway (NCS), and it would not enable the NCS to directly serve the Museum of Modern Art/Moscone Center area. Additionally, the Transbay Joint Powers Authority (TJPA) selected in March 2003 the Tunneling Option for the Caltrain Downtown Extension as the Locally Preferred Alternative. This Caltrain option would no longer be feasible for the commentor's alternative, in that it would require that both projects be constructed using cut-and-cover techniques. The cut-and-cover approach was rejected by the TJPA for a number of reasons including the more severe impacts on the community that is associated with cut-and-cover construction. Please see Response 3.2.1 through 3.2.14.

5.1.2 M. Kiesling, Regional Alliance for Transit (RAFT), December 18, 2002

"We would like to see a modified tunneled alternative studied, involving an alignment approximately 150' west of Second Street. This alignment will "further minimize impacts on historic structures, minimize the distance of mined tunneling by passing under many empty properties, and maximize the potential platform length at the Transbay Terminal."

"Specific revisions to these basic alternatives include:
- "Studying a tunneled alignment approximately 150' west of Second Street
- "Easing the Townsend-Second Street curve for higher-speed operation
- "Altering the throat of the terminal tracks for better operations."

"North of Brannan Street, the tunnel is running deep under the South Park neighborhood. Where it passes beneath the Bay Bridge approach, the opportunity exists for integrating any necessary emergency access and ventilation facilities within the bus storage facility. Between Harrison and Folsom Street, most of the tunnel is under empty properties. From Folsom Street to the intersection of Howard and Second Streets, the alignment is threaded between high rises, ending beneath a large parking lot at the intersection. Almost 60% of this "off-street" alignment is under empty lots or streets, and many of these properties are in public ownership as streets or parks.

"This alignment eliminates the need to acquire and demolish at least 3 properties along Second Street, 201, 205-15, and 217 Second Street. Additionally, since the angle of the tracks in the throat change, it should be possible to avoid 580-586 Howard Street. Three of these are significant historic buildings. This is shown in Figure 3.

"Once under Second Street, the alignment significantly benefits the operation of the terminal, in either the Second to Main or Second to Mission alternatives. The design allows the throat of the station to begin sooner, allowing longer platforms. Richard Mlynarik has provided comments showing a Second to Mission alignment. I will describe the simpler Second to Main (Terminal Basement Platforms) alignment in this document."

Response 5.1.2 In response to this comment, the co-lead agencies evaluated the proposed alternative generally running 150 feet west of Second Street. The co-lead agencies acknowledge that this alignment has several advantages, but the proposal would pass under two existing, low rise, brick buildings between Harrison and Folsom Streets. Within a portion of this block, the alignment would pass adjacent to two high-rise buildings, and the space between the two structures is only 63 feet wide – about the same width as the proposed Caltrain tunnel. It is the position of the co-lead agencies that construction of the tunnel in sandy soils below the groundwater table would pose an unacceptable risk to the foundations of existing buildings, and therefore this alternative is deemed to not be practicable. Additionally, the Second-to-Main and Second-to-Mission Caltrain Extension alternatives principally follow underneath street rights-of-way and therefore would not require the length and number of underground easements under private property (e.g., in the South Park neighborhood) and the associated risks that would be required for the commentor's proposed alignment.

5.1.3 Transportation Solutions Defense and Education Fund (TRANSDEF), David Shronbrunn, President, December 20, 2002

"TRANSDEF supports the detailed architectural comments of RAFT and Michael Kiesling. Due to the commentor's many years of involvement with the details of a Caltrain rail extension, we are confident that the alignments proposed therein deserve close study as additional alternatives to the two rail alternatives in the DEIS/R."

Response 5.1.3 Please see Response 5.1.2.

5.1.4 BayRail Alliance, Margaret Okuzumi, December 20, 2002

"Summary of our Recommendations: The downtown extension configuration must be modified to accommodate high speed rail. Pursue a modified Second-to-Mission alignment, rather than the Second-to-Main alignment, as the preferred alternative for the downtown extension.

"At the other curves (at Townsend/Second and between Second and the Terminal), we believe that it is possible to make small adjustments to the alignments to reduce their curvature while impacting fewer buildings, where these do not impact long-term operational flexibility. For example, see Figure 3, attached."

"Currently, only the Second-to-Main alignment option has platforms long enough to accommodate HSR. However, the highly curved platforms in the Second-to-Main alignment are seriously flawed and ineffectual in their intended purpose of serving the extra long trains needed for HSR. The proposed curvature would result in unacceptably long gaps between train doors and platforms.

"Reduce Impacts to Multistory and Historic Buildings: At several places along the proposed route, we see opportunities to reduce costs and community impacts by adjusting the alignments to impact fewer buildings.

"We believe that it is possible to make adjustments to the Second-to-Mission alignment which will clearly establish it as the environmentally superior alternative that results in the fewest business and residence relocations and impacts the fewest historic buildings, while fully meeting the purpose and need for the project. In addition, we note that the Mission Street rail alignment eliminates the need for a third of the tunnel by virtue of extending the train mezzanine level to the corner of Mission and Beale; that savings should be taken into account in the rail alignment alternative analysis.

Response 5.1.4 Please see Responses 3.1.2 and 5.1.2.

5.1.5 William Blackwell, Architect, November 12, 2002

"EIS/EIR Figure 2.3-1, Alternatives Considered and Withdrawn, does not include my proposal. However, if it had been considered, I suppose that the objections would be similar to those given on page 2-50 for the Essex Street stub-end alignment that you pointed out after the SPUR meeting.

"In response to those particular objections, I note the following:

"Although the train platform is not directly under the terminal building, it is nonetheless an integral part of the multi-modal transit faculty. Passenger circulation by means of moving walkways and ease of transfer from one mode to another are probably the most attractive features of my plan. Caltrain commuters have direct links not only to the bus terminal but also to BART/Muni Metro at Montgomery Street, a connection that is not even in the consultant's plan. Transfer between AC Transit, Caltrain, and BART is frictionless. Greyhound passengers or BART SFO passengers transferring with luggage have a virtually effortless transfer via the moving sidewalks. Train levels are 25 feet below the surface rather than 50 feet. The plan has one bus level at the terminal that is 20 feet above the street, not two levels that are 40 and 60 feet above the street.

"Escalator travel is reduced by 50 per cent or more. Transfer to street level taxis, buses, limousines, and private cars right at the front door of the bus terminal is a major improvement that is also not in the consultant's plan.

"The orientation of my plan does not allow for trains to pass through the station to a storage track. Instead, three storage/by-pass tracks are provided at the station that are equally accessible to the two platform tracks. One train does not block another. Caltrain at present operates with 12 stub-end platform tracks without "tail" tracks.

"These yards are within two minutes of the stub-end and would be retained in my plan. They would be underground on one level, however, as would all tracks at Fourth & King.

"My research shows that train direction can be reversed without reducing operating efficiency. See the enclosed 'Notes.'"

"Although less grandiose than the proposed, my alternative plan for Caltrain extension is an economical approach that is worthy of consideration. If the terminal design follows consistently, it would have only three levels rather that the proposed 5½ levels and its cost would come down proportionately. This plan clearly benefits the commuter – thereby encouraging transit use – meets all of the requirements of Proposition H, and provides a level of rail service that is more than adequate for the foreseeable future."

Response 5.1.5 Mr. Blackwell has given considerable thought to his proposed station and train configurations. The alternative does not, however, meet the provisions of Section 2 of Proposition H, which states in part that, "As part of the extension of Caltrain downtown, a new or rebuilt terminal shall be constructed on the present site of the Transbay Terminal serving Caltrain, regional and intercity bus lines, Muni, and high speed rail..."

Additionally, as the commentor notes, the alternative proposal would involve a stub-end train station. While stub-end stations are operated throughout the country and world, the proposed tail tracks included with the refined Caltrain options offer substantial operating flexibility, particularly given that the number of tracks and platforms provided at the site of the Transbay Terminal are constrained by the terminal's site. The commentor's proposed alternative would also have fewer tracks and platforms than either of the refined Caltrain options, thereby reducing the station's capacity and efficiency even further. Finally, the proposed alternative would place the train tracks and other transit operators more distant from each other, reducing the convenience and time involved for transfers in the proposed multi-modal facility.

5.1.6 William Blackwell, Architect, December 2, 2002

"In a letter dated April 16, 2001, to Joan Kugler, EIR Project Manager, I suggested an alternative Caltrain extension plan coupled with underground pedestrian connectors and an efficient terminal design. This alternative offered significant advantages consistent with the primary purposes listed on page 1-1.

"Subsequently, I have amended that document to incorporate results of additional research, and am enclosing a revised version as Attachment No. 1. Many of my comments on this Draft EIS/EIR are with respect to material in this attachment, which, for purposes of identification, I am referring to as the "Blackwell Alternative.

"Attachment No. 2 adds research on reversing direction of Caltrains. Attachment No. 3 is a copy of my suggested alternate plan for the bus levels that was also included in my April 16, 2001, letter to Mrs. Kugler.

"Please give the material in these attachments the same weight and careful consideration that you give the comments listed herein by page number.

"A pedestrian concourse with horizontal passenger conveyors (Blackwell Alternative) from the Transbay Terminal to Montgomery St. BART station puts commuters closer to the center of District C-3E and, in conjunction with a Second Street rail platform, presents an opportunity for sublime pedestrian circulation. Moreover, Montgomery St. has the highest number of entries and exits of the Market Street BART stations (Page 3-8). These connecting links would obviously improve access to bus and rail services for a great majority of transit riders, a primary purpose of these projects (Sec. 1.1). See also Attachment No. 1.

"Page 2-9. Needlessly re-locating the bus levels 40 feet and 60 feet above the street level does not improve public access to bus service, a primary purpose of these projects (Page 1-1).

"Page 2-11. The West Ramp alternative itself should include an alternative that combines on one level the upper and lower bus levels proposed. See Attachment No. 3, a drawing that shows the same number of bus stations, turnout lane, turning radius, etc. on one level that are proposed for two levels. Electronic signboards at the foot of the escalators would let patrons know which of the two platforms to use, and there is no loss in AC Transit flexibility. In the Blackwell Alternative, this bus level would be at the 20-foot level, the west ramp elevation would remain

essentially as is, and retail would be partially on the street level and partially on the pedestrian concourse level below the street. See Attachment No. 1 for more detail.

"Page 2-36. (a) The Blackwell Alternative deletes the need to acquire 18 parcels of land and demolish eleven buildings for the HSR curve into the Terminal.

"Page 2-47. The reasons given for not renovating the existing terminal building tend to vanish in light of the Blackwell Alternative. Caltrain and high-speed rail are cleanly separated from the terminal; removal of the east bus ramp is still feasible. The single level plan shown in Attachment No.3 could be implemented on the existing bus level. An elegant new roof could be installed over the bus platform. The lower floors plus sub-level (now garage) of the existing terminal offer ample opportunity for revenue- generating joint development. A Minna Street underground concourse link to Caltrain at Second St. and thence to BART Montgomery is a simple addition. Opportunities for major improvements in space utilization, passenger circulation, signage, security, and safety are not precluded. Renovation would require the ablest architects and engineers, but it is certainly not out of the question.

"Page 5-94. The upper elevation drawing shows that the portion of the proposed terminal that crosses over both 1st and Fremont Streets begins about 20-feet above the street level and extends to the terminal roof height of 109-feet. The existing building also begins about 20-feet above street level but is only 40-feet high. The Blackwell Alternative would also have only one level (but of improved design) crossing these streets.

"More than any other single factor, size determines the quantity of materials required for a project. The 'Blackwell Alternative' effectively changes the design of the terminal from 5½ levels to 3 levels without curtailing services. As a first approximation, this is a 45 percent reduction in size that would reduce the consumption of building materials, and the energy required to manufacture and transport the materials, by a like amount. In this case, the opportunity to conserve natural resources and energy by size reduction is very substantial and might well be evaluated in an EIS/EIR concerned with environmental impacts."

"Page 1-28. Table does not show the street vacation procedure that is required for the taking from Minna Street of a ten foot strip (510 feet long) between 1st & Second Streets. Minna Street is only 35-feet wide. This encroachment is unnecessary. Attachment No. 3 shows an alternate one-level plan that accomplishes everything needed within the 155-foot width of the existing State property."

Response 5.1.6 Please see response 5.1.5. While placing the train station away from the terminal creates more flexibility regarding the bus terminal design, the proposal results in a substantially reduced capacity and efficiency for train operations, it reduces the efficiency and convenience for transfers at the new multi-modal facility given the placement of the train station away from the terminal, and it is not consistent with the provisions of Proposition H as passed by the voters of San Francisco in 1999.

5.1.7 Duane Morris, LLP, Oliver L. Holmes, November 24, 2002

"The following comments are submitted on behalf of a consortium of architects, engineers, urban planners and others (the "Consortium") interested in the successful development of the Project. As set forth in letters dated January 29 and February 1, 2002 (Attachments A and B), the Consortium submitted an alternative proposal ("Alternative") for the Project. Although the Consortium's proposal spelled out how the Alternative could save almost a billion dollars in construction cost and considerable time in completion of the Project, the Draft Report does not

address the Alternative. As set forth below, the Draft Report's failure to evaluate this viable alternative is a breach of the federal and state environmental review requirements for the Project.

“Moreover, given the significance of the Project for San Francisco and the entire Bay Area, it is essential that all reasonable alternatives be reviewed. This is particularly important today because the unusually high cost of constructing and financing the Transbay Terminal as proposed in the Draft Report is likely to doom any prospect of completing this critical link in Bay Area transportation for many years to come.

“AC Transit Dictated Site Selection
“The present Transbay Terminal was built in the 1930's to handle commuter trains from the East Bay. The long narrow terminal with its sweeping ramp structure was designed to accommodate multi-car trains using elevated tracks for easy connection to the lower deck of the Bay Bridge. When trains were removed from the bridge in the late 1950's, AC Transit started bus service to the terminal using the same ramps and station platforms previously used by commuter trains. AC Transit and other bus lines continued to use the terminal without significant alteration, but the 1989 Loma Prieta earthquake made it clear the aging terminal had to be replaced or substantially upgraded to meet modem seismic standards.

“In the early 1990's the City and County of San Francisco and other public agencies studied several alternatives. With the help of a Citizens Advisory Committee, the Main/Beale site next to the present terminal was picked as the best location for a new terminal. On March 4, 1996 the San Francisco Board of Supervisors approved the Main/Beale site as the preferred alternative. Preliminary designs were prepared for a Main/Beale terminal but AC Transit was not happy with the initial layouts. AC Transit then sued the City contending that the Main/Beale site was not adequate for its purposes and that only the present terminal location should be considered. In order to settle this litigation, the Board of Supervisors passed a resolution in February 1999 that backed away from the Main/Beale site and urged the "City and County of San Francisco to work expeditiously with AC Transit “to retain AC Transit bus service at the current Transbay Terminal site." As a result, the Draft Report only considers rebuilding the terminal at its present location.

“Penalties for Reusing Existing Site
“Reuse of the existing site, with its long narrow footprint and extensive elevated ramp structure, creates several problems for design of the new Transbay Terminal. For example, to accommodate AC Transit and the other bus lines, the proposed terminal will be as large or larger than the current terminal (approximately 1300 feet long, 165 feet wide, and almost 100 feet tall) – the equivalent of the Empire State building laid on its side. Like the old terminal, the new terminal will stretch over three major streets (and several alleys), blocking view corridors north and south, and together with connecting ramps dominate the surrounding neighborhood as much or more than the existing terminal. To counter the enormous scale of the new terminal, the exterior is designed as a largely transparent glass cage set in a steel frame. This high tech effort to create an attractive presence for the new terminal may be successful, but is likely to be substantially more expensive than a standard building exterior.

“Furthermore, the long narrow configuration of the terminal is inherently less efficient than a more square-shaped building. First, interior corridors must be added so passenger can get from one end of the terminal to the other-in this case an entire floor (the Concourse Level) is used as a pedestrian walkway connecting the ends of the bus terminal, and a second floor below ground (the Train Mezzanine Level) serves a similar function for train passengers. Transit buildings typically have more efficient centralized circulation areas where passengers walk fewer steps to

get to their train or bus. Second, long narrow buildings are inherently less efficient because they have a much higher ratio of exterior surface to interior floor space. The proposed terminal would have a perimeter of almost 3000 feet with floors of approximately 215,000 square feet. By comparison a building which is 400 by 600 feet has a perimeter of only 2000 feet but provides 240,000 square feet of space on each floor. In this example, the proposed Transbay Terminal is approximately 60% less efficient than the more compact terminal in terms of the interior floor space created per foot of exterior wall. This of course leads to large differences in construction cost per square foot, particularly in this case where the proposed exterior wall treatment is very expensive.

"The existing site is also a difficult place to put a rail terminal. At a width of 165 feet, the new terminal will accommodate only six train platforms. Moreover, the terminal can only be accessed on tight 500-foot radius curves and does not have room for straight platforms in excess of approximately 1000 feet. This presents problems for California's High Speed Rail Authority which has requested tracks with a radius of at least 650 feet on all curves and station platforms at least 1300 feet in length. The proposed terminal site is at best a marginal fit for high-speed rail, and clearly provides no expansion space for new rail service from the East Bay and beyond. As the Draft Report indicates, in the long run the large majority of terminal patrons will be train riders, especially when rail service to the East Bay becomes available. Unfortunately, the proposed design calls for an enormous investment in facilities for bus riders and comparatively little investment for rail passengers.

"Finally, reusing the old terminal site adversely impacts the Project's development prospects. The old terminal site along Mission Street has the highest development potential because height limits in that area are 400 to 500 feet providing the greatest density and value for development. However, the proposed terminal design precludes most development along Mission Street. Instead, the Draft Report proposes a substantial change in San Francisco's zoning, moving high rise development two blocks south along Folsom Street:

"'[The Project] would change the zoning... to allow for development of greater heights- up to a maximum of 400 feet on the north side of Folsom Street – 200 feet higher than is currently permitted.' (Report, p 5-97).

"It is unclear whether the City would allow this rezoning because to do so would permanently change the character of the neighborhood along Folsom Street. Without it, however, redevelopment would generate considerably less money to pay for the terminal.

"Advantages of Main/Beale Site
"The City and the Citizens Advisory Committee originally chose the Main/Beale site because it has several important advantages. One of the most obvious is that it is a largely vacant site on which a new terminal can be quickly constructed while the old terminal stays in operation. This eliminates the need to build a temporary terminal and ramp for use while the old terminal is tom down and rebuilt, thereby saving considerable time and tens of millions of dollars in construction cost. Most important, it is an efficient site on which to locate a new terminal because of the larger, almost square blocks between Main and Beale and Folsom and Mission. At 300+ feet in width, the site can accommodate up to 10 train platforms, including two 1300-foot long platforms required by high-speed rail with no sharp curves in the approaching track. It is closer to the Embarcadero Bart/Muni Station, making an underground pedestrian connection between the terminal and Bart/Muni feasible. Because of its North/South alignment the Main/Beale site requires shorter, less costly ramps to connect buses to the Bay Bridge, and a shorter tunnel connection for Caltrain. Finally, the Main/Beale site maximizes development along Mission Street

as called for by the City's Master Plan, and retains existing zoning along Folsom Street. Further details of the Main/Beale Alternative are provided in Attachment C.

"One and a Half Billion Dollars in Savings
"The Draft Report estimates the Transbay Terminal Project will cost approximately two billion dollars to construct and another billion to finance, or three billion dollars total. The Alternative is estimated to cost somewhat more than a billion dollars to construct, and perhaps another half billion to finance for a total cost of just over one and a half billion dollars. It is easy to see where the savings are:

"1. The Alternative avoids approximately $30 million in construction cost by eliminating the temporary terminal and ramps.
"2. Permanent ramps for the Alternative design are much shorter and simpler, saving $100 to $200 million, depending on which ramp design is selected for the proposed terminal at the existing site.
"3. The Alternative terminal is much more compact, reducing exterior size while preserving usable space within the building. Moreover, because the Alternative design has a smaller impact on the neighborhood (only a pedestrian bridge crosses one major street) there is less need for an expensive facade treatment. As a result, as much as $300 million can be saved in constructing the terminal building.
"4. Caltrain's connection to the terminal is shorter and easier, reducing costs for the rail portion of the project by approximately $200 million.
"5. The Alternative design allows development of more valuable land along Mission Street, increasing the project's total revenues by some $50 million.

"Finally, financing costs for the Alternative are greatly reduced, not only because construction costs are much lower to start with, but also because revenues would be available from development and other sources to pay approximately half these costs at the time of construction. As a result the total debt to be financed would be closer to half a billion dollars under the Alternative, versus a billion and a half-dollars under the project as proposed in the Draft Report.

"Limited Funds Available
"The higher cost of the terminal proposed in the Draft Report might be ignored if funds were readily available for the Project. However, just the opposite is true. As acknowledged in the Draft Report, a final financing plan cannot be offered at this time because sufficient sources of funding cannot be identified. The Draft Report suggests that future revenue sources may develop at state and local levels, but these are dependent on factors beyond the Project's control. The Draft Report also proposes to pay approximately twenty percent of total costs through Passenger Facility Charges (PFC's) of $2 to $3 per day collected from each commuter using the terminal – a novel concept for a local transit project – which would increase by fifty percent commute costs for a typical AC Transit rider. Finally, the Draft Report suggests approximately $600 million could be borrowed from the federal government under its TIFIA loan program, but it is unclear what additional source would be used to repay the TIFIA loan. In summary, the level of available funding is adequate for the Alternative but not for the three billion dollar project proposed in the Draft Report.

"Conclusion
"AC Transit's position is that it likes the current Transbay Terminal and sees no urgent need for change, except for a seismic upgrade to be paid for by the State. If forced to move, AC Transit will only approve a new facility that meets all its demands regardless of cost – a Taj Mahal for buses. The result is an enormous white elephant that is neither functional nor financeable, which

is perhaps the outcome intended by AC Transit from the outset. Fortunately, the environmental review laws that apply to the Project do not permit AC Transit to play dog-in-the-manger and frighten away competing alternatives with lawsuits and similar behavior.

"Instead, federal and state regulations require the consideration of all viable alternatives as a precondition to project approval. We therefore request the Alternative be fully evaluated prior to completion of the final Environmental Impact Statement/Environmental Impact Report for the Project."

Response 5.1.7 Federal guidance for preparing and processing environmental and 4(f) documents (Technical Advisory T6640.8A) which was followed in preparing the Draft EIS/EIR, states that a "draft EIS must discuss a range of alternatives, including all "reasonable alternatives" under consideration and those "other alternatives" which were eliminated from detailed study (23 CFR 771.123(c))." The Draft EIS should include "a concise discussion of how and why the "reasonable alternatives" were selected for detailed study and explain why "other alternatives" were eliminated."

The CEQA Guidelines Section 15126.6 also states that "An EIR shall describe a range of reasonable alternatives to the project, or to the location of the project, which feasibly attain most of the basic objectives of the project…" The section goes on to specifically say "An EIR need not consider every conceivable alternative to a project."

Chapter 2 of the Draft EIS/EIR and Chapter 2, Volume I, of this Final EIS/EIR have sections detailing the selected "reasonable range of alternatives" and include a section entitled "Alternatives Considered and Withdrawn."

The commentor's proposed alternative is inconsistent with Proposition H passed by the San Francisco voters in 1999, which states in Section 2 that, "As part of the extension of Caltrain downtown, a new or rebuilt terminal shall be constructed on the present site of the Transbay Terminal serving Caltrain, regional and intercity bus lines, Muni, and high speed rail…"

The commentor correctly notes that the placement of a new terminal on the block between Howard, Main, Folsom and Beale Streets (known as the Main/Beale site) was studied a number of years ago. Until February 1999, that site was the City's preferred location. As noted in the Draft EIS/EIR, Chapter 2, Section 2.3, "Alternatives Considered and Withdrawn" (page 2-47), in February 1999, the San Francisco Board of Supervisors passed a resolution repealing its prior endorsement of the Main/Beale site for a new terminal and urged the retention of the bus service at the current Transbay Terminal site. The resolution urged "the City and County of San Francisco to work expeditiously with AC Transit, the Metropolitan Transportation Commission (MTC) and Caltrans to retain AC Transit regional bus service at the current Transbay Terminal site."

In addition, a cooperative agreement transferring state-owned properties to the San Francisco Redevelopment Agency and the Transbay Joint Powers Authority (TJPA) has now been signed by the City and County of San Francisco, the TJPA, and Caltrans. This agreement prohibits use of the current terminal site for private development. Finally, it should be noted that the MTC study did generate a regional consensus among the participating agencies throughout the region (Caltrans, AC Transit, Golden Gate Transit District, Muni, the City and County of San Francisco, the Peninsula Corridor Joint Power Board, and SamTrans) for a new terminal on the site of the current Transbay Terminal.

Thus the alternative proposed by the commentor would be inconsistent with Proposition H and with the stated policies of the City and County of San Francisco Board of Supervisors. It could not be implemented under the provisions of the cooperative agreement transferring state owned property to the Redevelopment Agency and TJPA, and it would be counter to the regional consensus emanating from the 2000 MTC Terminal Study.

The existing terminal site has historically demonstrated an ability to accommodate a large volume of rail passengers as well as its suitability for bus operations. Combining these two modes and the opportunity for Muni subways, while preserving the large Main/Beale parcel for development are a few of the many reasons the existing site has been selected.

The proposed terminal and the existing terminal share the same general rectangular shape that has proven capable of serving 26 million passengers in the 1940s. The new terminal will have the capacity to serve an even greater number. The rectangular shape allows for multiple points of access from the street grid which in turn provides convenience to the commuter whose origins will vary as the areas develops. The concourse level serves both as a means of circulation as well as providing floor space for joint development opportunities. The long platform features a significant benefit for passengers: the ability to access multiple buses and bus lines from a single level. This creates a much better passenger terminal than one requiring passengers to constantly check from which platform the next bus departs. This is especially significant given that several AC Transit transbay bus lines "branch-out." From an operational perspective, the terminal is well-designed and functions well operationally, with adequate independent movement and passenger facilities.

The architectural design of the terminal is in the conceptual stage, but a current architectural goal incorporates the desire to optimize natural light sources as well as provide an inviting and exciting atmosphere that visually connects with the surrounding City – hence the concept currently under review.

The co-lead agencies have refined and enhanced the train station concepts to improve train operation efficiencies and lengthen the train platforms to better accommodate longer high-speed rail and commuter trains (please see Response 3.1.2). Early in the process, the California High Speed Rail Authority worked directly with suppliers of European and Japanese high-speed trains to identify acceptable curve radii. The co-lead agencies have met the identified minimum radius requirements for the train designs contained in the Draft EIS/EIR and for the recent refinements. Moreover, California High Speed Rail Authority staff participated in the review of the two refined options and concurred with the selection of the Second-to-Main Options as the train component of the Locally Preferred Alternative.

The commentor asserts that the location proposed by the commentor would increase revenues. Without any backup financial data, it is not possible to know what assumptions or baseline financial data is being assumed. While the veracity of the stated financial savings of the Main/Beale site is not known at this time, the commentor's financial analysis fails to acknowledge the reduction in development value on one of the most, if not the most, highly valued properties in the study area – namely the Main/Beale site.

The commentor's claim that shortening the project alignment could reduce project costs by $200 million looks only at one component of project costs. Without preparing a complete cost estimate for the proposed new alignment, and particularly without evaluating potential difficulties for the proposed alignment, the estimated savings are not considered particularly meaningful.

The co-lead agencies have continued to review opportunities for reductions in Project capital costs, and the costs have been successfully reduced from the Draft EIS/EIR by $147.3 million in 2003 dollars (please see Chapter 2, sections 2.2.1.9, 2.2.2.4, and 2.2.3.5). In addition, a value engineering task will be undertaken during the design phases of the Project, as shown in Figure 5.20-8, Volume I, of this Final EIS/EIR. Correspondingly, additional funding sources are being identified and proposed funding sources solidified. This Final EIS/EIR contains a refined financial plan reflecting these activities (please see the revised Chapter 6, Volume I, of this Final EIS/EIR). In response to this comment, the co-lead agencies have revised the PFC assumptions in the financial plan as shown in Chapter 6, Volume I, of this Final EIS. The plan assumes PFCs of $0.75 for Caltrain riders, $0.25 for AC Transit riders, and $2.00 for high speed rail patrons.

The commentor is correct in that both of the proposed redevelopment alternatives call for changes to the zoning and height and bulk districts. As the City is the project sponsor for the new terminal and the redevelopment plan, the zoning changes – including changes to the height and bulk districts – would be proposed as amendments to the planning code and zoning maps. In coordination with the Redevelopment Agency and this proposed Transbay Terminal Redevelopment Project, the Planning Department is rezoning Rincon Hill and revising the existing Rincon Hill area plan and surrounding areas South of Market as part of the Eastern Neighborhood Community Planning and Downtown Neighborhoods Initiative (including urban form, height, bulk, open space, streets, etc.) These policies and rezoning will be fully coordinated with and support the Transbay redevelopment.

6.0 CONSTRUCTION IMPACTS

6.1.1 U.S. Environmental Protection Agency, Lisa B. Hanf, Manager, Federal Activities Office, December 2, 2002

"While we have not identified environmental impacts requiring substantive changes to the document, we have identified opportunities for improving the air quality mitigation measures proposed during the construction phase of the project. Our comments are listed below.

"Air Quality - Construction
"The DEIS includes several excellent mitigation measures for air quality emissions generated during construction (p. 5-179). Because air quality impacts are of increasing human health and environmental concern, EPA recommends taking steps to reduce air quality impacts to the greatest extent possible. In addition to these mitigation measures, EPA strongly recommends that the Final Environmental Impact Statement (FEIS) address the following air quality issues:

- "Identify sensitive receptors in the project area, including transit users.
- "Include mitigation measures that detail how diesel emissions will be minimized for each phase of project construction, such as the use of electrically-powered equipment or alternative fueled machinery, where feasible. Where diesel-powered equipment is necessary, keep machinery well tuned and minimize unnecessary idling.
- "Address how traffic congestion related to project construction can contribute to increased levels of carbon monoxide, especially at already congested intersections.
- "Identify additional mitigation measures that will be implemented during high winds and smog alert days."

Response 6.1.1 Sensitive receptors within 500 feet of the proposed bus storage facility are identified in the supplemental air quality analysis.[3] These sensitive receptors include residences, parks, and schools (please see air quality section in the consolidated Response 2.7.1 through 2.7.38).

Given selection by the Transbay Joint Powers Authority of the Second-to-Main, Tunneling Option for the Caltrain Downtown extension as the Locally Preferred Alternative (LPA), sensitive receptors along the Caltrain Extension alignment subject to air emission impacts during construction would primarily be located in areas for which cut-and-cover construction is proposed. This includes along Townsend Street between Seventh Street and just east of Third, along Second Street from Folsom Street north to the Terminal, and along Main Street south of the terminal to Harrison Street. Only a limited number of sensitive receptors exist in these cut-and-cover areas, including one residential parcel along Townsend, a new hotel and residential development on Second Street north of Folsom to Howard Street, and residential development north of Howard Street on the east side just north of the curve leading into the terminal.

Current conceptual designs for the Transbay Terminal include a physical separation between bus patrons' waiting areas and bus loading area, with bus loading areas located in areas with natural open air circulation. This list has been added to the Construction Air Quality Section of the Final EIS/EIR.

[3] Terry A. Hayes Associates, LLC, *Transbay Terminal Improvement Project: Bus Access and Storage Supplemental Air Quality Impact Analysis,* March 2003.

Selection of the tunneling option as the LPA also substantially reduces the vehicular traffic impacts associated with the Caltrain extension construction compared to cut-and-cover option. Use of tunneling substantially reduces the need for street closures and detour routes.

Detour routes have been selected for the remaining cut-and-cover portions of the alignment, and haul routes have been identified for removal of building demolition and excavated materials. Haul routes were selected to minimize traffic impacts from truck movements (please see Section 5.21.2, Volume I, of this Final EIS/EIR.). Removal of the tunneling materials will principally occur near the Fourth and Townsend yard, which has direct access to the I-280 Freeway. Given the tunneling approach and the selection of haul routes to minimize traffic disruption, the effects on local traffic congestion are deemed to be minimal. Correspondingly, increases in localized vehicular air emissions resulting from construction vehicles will be minimal. During construction, it is anticipated that approximately 62 one-way truck trips per hour (or 31 round trips per hour) would occur under the worst-case scenario, i.e., a cut-and-cover Second-to-Mission option with all phases occurring simultaneously. Even under this worst-case scenario, this truck traffic would not change the level of service on the affected roadways. Thus, increases in pollutant emissions from construction vehicles would be minimal. Please note that the LPA includes the Second-to-Main tunneling option, which would have 20 percent less excavated material and would therefore have fewer trucks on the roadways during construction. For additional discussion regarding truck traffic impacts during construction, please see Section 5.21.2.1, Volume I, of this Final EIS/EIR.

The following mitigation measures designed to minimize diesel emissions during construction of the proposed Project have been added to the mitigation measures previously included in Section 5.21.9 of the EIS/EIR:

As part of the contract provisions, the project contractor would be required to implement the following measures at all project construction sites:

- *Minimize use of on-site diesel construction equipment, particularly unnecessary idling.*
- *Shut off construction equipment to reduce idling when not in direct use.*
- *Where feasible, replace diesel equipment with electrically powered machinery.*
- *Locate diesel engines, motors, or equipment as far away as possible from existing residential areas.*
- *Properly tune and maintain all diesel power equipment.*
- *Suspend grading operations during first and second stage smog alerts, and during high winds, i.e., greater than 25 miles per hour.*

6.1.2 Golden Gate Bridge District, Alan R. Zahradnik, Planning Director, November 19, 2002

"EIR Comments/Construction Impacts

- "District would appreciate if traffic control plans, cited on page 5-139, could also be developed in conjunction with District staff. All short- or long-term construction detours and street closures will affect traffic conditions and GGT schedule reliability. Ultimately any prolonged effects on schedule reliability and the continued availability of bus stops near TTT have the potential to decrease the attractiveness of GGT bus service as an alternative means of transportation to and from San Francisco.
- **"**Figure 5.20-8 (page 5-161) presents an estimated construction phasing for the TTT project. It estimates construction of off-site storage facilities and access ramps during the fourth and fifth years of construction. District requests construction of the off-site storage facility be

initiated as soon as possible after this site becomes available subsequent to Caltrans' seismic retrofit project in order to address GGT permanent midday storage needs in San Francisco."

Response 6.1.2 The request by GGT to participate in the development of street traffic control plans will be communicated to the planning and design team for the new terminal for coordination with other City agencies such as the Department of Parking and Traffic and ISCOTT (Interdepartmental Staff Committee on Traffic and Transportation). The construction schedule in this Final EIS/EIR has been revised (please see Figure 5.20-8 in Volume I). The schedule reflects the availability of the off-site bus storage site based on the construction schedule of Caltrans' Bay Bridge West Approach Seismic Retrofit Project.

6.1.3 James Wittmann Dear, November 18, 2002

"Construction impacts to streets (Table 5.21-3) do not address the mid-point access for construction of the tunnel on Second Street near Brannan Street mentioned in the last paragraph on page 5-155 (5.20.2)."

Response 6.1.3 Present plans for the proposed construction site at Second and Brannan Streets involve construction of a tunnel access shaft in Second Street north of the intersection of Second with Brannan Street. Excavation for the tunnel access shaft is expected to be 60 to 65 feet wide, requiring closure to through traffic for approximately one month of Second Street between Brannan Street and Bryant Street. After the excavation is complete, the shaft would be decked to allow two lanes open on Second Street at all times. The excavation will be positioned so that excavated material from the tunnel access shaft would be loaded onto trucks stationed along the northern edge of Brannan Street. The loaded trucks would then proceed westbound along Brannan Street to their designated disposal destination. This arrangement would allow three to four lanes of traffic to remain open on Brannan Street over the duration of tunneling. Every effort would be made to keep the duration of any full street closures very short and to have the work performed, to the extent possible, on weekends.

Through use of street decking at this site, it is anticipated that at least two lanes of traffic will be open along Second Street and three to four lanes of traffic open along Brannan Street during the weekdays, although complete closure of Second Street just north of Brannan Street may occur for a one-month shaft excavation period. Table 5.21-2 in Section 5.21.2.4, Volume I, of this Final EIS/EIR presents results of detours to Third Street that would result from construction closures of Second Street during the optional cut-and-cover operations. The results projected for Second Street in the blocks between Bryant and Brannan and Brannan and Townsend show that at least LOS D would be maintained on the detour during the PM-peak period. This would be the worst case for the total closure of Second Street. With at least one lane open in each direction on Second Street, thus serving local and through traffic during the primary construction condition for the tunnel option, the projected level of service level of service at the Brannon/Second intersection would be LOS D. No left turns would be permitted at the intersection during the periods of heavy traffic, requiring partial use of the detour to Third Street discussed in Section 5.21.2.4 of the Draft EIS/EIR and in Volume I of this Final EIS/EIR. On-street parking would be prohibited on the east approach/exit of Brannan Street during hours with construction activity and on the north approach/exit of Second Street for the duration of the use of the shaft.

6.1.4 Matthew Morrison, December 17, 2002

"I am a resident of 246 Second Street in San Francisco, and would like to make some comments on the draft EIR for the Transbay Terminal/Caltrain downtown Extension/Redevelopment Project.

I have lived on Second Street for 2 years, and I believe this project will bring many benefits to the area. However, I would like to make the following comments:

- "Please be aware that although there are many businesses in the area, there are also a number of residents. Too often in the past, construction projects have been given permission to operate at night, unaware that there are people living in the area. As the project progresses, I hope you'll keep in mind that this is a mixed-use neighborhood, and that people live here...
- "I hope you'll reconsider the location of one of the staging areas from Howard and Second. That is only half a block from 246 Second Street, and the noise, especially at night, will be extremely disruptive...
- "If it is necessary to close Second Street to all traffic, I hope there will be provisions made to provide parking to the residents who will not have access to their parking garage. This will be a major inconvenience...
- "There are a number of mentions of daily cleanup (such as watering down the dust and cleaning up contraction debris). However, a construction project of this size will greatly impact the buildings nearby, and I hope there is some provision for a through power washing and or painting of 246 Second after the project is completed, as I am sure its appearance will be adversely affected by the construction dirt and debris.
- "I understand that state-of-art building techniques will be used. However, I am concerned that all the digging and impact so near our building may weaken its foundation and potentially cause some problems during an earthquake. I hope the city is fully aware of the risks and is ready to mitigate any possible problems caused by the construction to the structural integrity of 246 Second Street.

"As the project progresses, I am sure there will be a number of issues that will arise. I sincerely hope that we can work together to make this project a success and that you will be sensitive the needs and concerns of the people who make this neighborhood their home."

"In section 5.21.10.1, there is a mention of noise measurements done at our building, which recorded a reading of 57dBa. However, this measurement was taken during evening rush hour-perhaps the noisiest time of day. At night the area is much quieter, and I hope a more accurate measurement of the noise levels will be taken and used as the basis for enforcing the noise ordinance."

Response 6.1.4 The co-lead agencies are aware that the Second Street corridor and area contains a mix of land uses, including residential areas as detailed in the EIS/EIR land use Sections 4.1 and 5.1, Volume I, of this Final EIS/EIR. Construction noise varies greatly depending on the construction process, type and condition of equipment used, and layout of the construction site. Many of these factors are traditionally left to the contractor's discretion, which makes it difficult to accurately estimate levels of construction noise. Mitigation measures are outlined in Section 5.21.10.2, Volume I, of this Final EIS/EIR regarding construction noise mitigation. These measures will be made a part of the construction contracts to minimize the noise impacts during construction.

Access to parking garages and other driveways will be maintained during construction. Temporary closures of a few hours at a time to install piling, plating, and so on, will be coordinated in advance with driveway users and with provisions for emergency access.

An additional mitigation measure has been added to the Construction Air Quality, Section 5.21.9 of the Final EIS/EIR (Volume I) stating that, "Upon completion of the construction phase, buildings with visible signs of dirt and debris from the construction site shall be power washed

and/or painted (given that permission is obtained from the property owner to gain access to and wash and/or paint the property with no fee charged by the owner)."

The tunnel alignment passes close to the existing sidewalk at the referenced location. The construction of the shoring system will be designed with the objective of controlling ground deformations within tolerable limits. This type of construction is not unique to this Project. It has been used on many projects all over the world including downtown San Francisco. Technology is available that can provide adequate protection to the existing buildings, so that their structural integrity is not affected.

A series of proposed community outreach and communication procedures during construction are outlined in Section 5.20.1, including personnel strictly dedicated to construction period community outreach, an outreach office in the construction area, and dissemination of information in a timely manner regarding anticipated construction activities.

Noise measurements at 246 Second Street were used to estimate the 24-hour noise exposure using methods outlined in the Federal Transit Administration's noise analysis guidance manual. This estimating method accounts for the typical fluctuations in noise level over a day, and has been found to be accurate in estimating noise levels for an entire day.

6.1.5 Titan Management Group, Michael Alfaro, Vice President, December 12, 2002

"Construction Period Access: The Environmental Document states that if the cut and cover method of tunnel construction is utilized, there will be block-by-block closures on Second Street. A chart describing the driveways and streets temporarily blocked by construction mistakenly states that only a delivery entrance at the Clocktower would be blocked. Obviously, the Clocktower has not been provided with the detailed plans for the closure of the Second Street, but it would appear that a driveway entrance would be blocked as well. This driveway provides access to parking both in an exterior lot and in an underground interior lot. This driveway also provides emergency access/egress in the event of a fire or other emergency.

"The Environmental Document should correctly assess the impacts on the Clocktower. If the street closure will prevent access to parking, even temporarily, that impact must be fully mitigated.

"Construction Period Noise and Vibration: The Environmental Document presents a qualitative analysis of the noise impacts, and apparently concludes that the construction phase noise impacts would be significant. The mitigation measures that are proposed, however, are so vague and ambiguous as to be unenforceable. They include such things as "conduct noise monitoring," "conduct inspections and noise testing of equipment," "implement an active community liaison program." Specific quantitative noise limits should be stated for each period during the day.

"The Environmental Document states that noise waivers may be obtained to allow nighttime construction. It also states that "it is not anticipated that the construction documents would have specific limits on nighttime construction (page 5-185)." There will apparently be no limits on the use of jack hammers, hoe-rams and pile drivers before 10 p.m. This will significantly add to the nose in the area. Mitigation measures could easily be developed preventing the use of such extremely noisy equipment unless a specified standard of necessity were met.

"A meaningful noise mitigation program could do much better than this. It could set forth specific showings that must be made in order to justify nighttime construction. The proposed

mitigation measures contain none. It could set forth noise limits in the event nighttime construction is necessary. The proposed mitigation measures do not. It could prohibit the use of certain equipment at night. The proposed measures do not.

"The mitigation plans states that contractors will be required to "use equipment with effective mufflers." What is an "effective" muffler? This is so vague as to be meaningless. Additionally, there is often an electric alternative to diesel-powered equipment. There is no requirement to use electrically powered equipment when it is available.

"The Environmental Document acknowledges that construction vibration effects can damage historic buildings. It states that a study has been done showing that no damage will occur due to construction vibrations. This study is not presented, and so it is impossible to evaluate."

Response 6.1.5 The Transbay Joint Powers Authority adopted in March 2003 the tunneling option for the Caltrain Downtown Extension as the Locally Preferred Alternative for inclusion in this Final EIS/EIR. Closures of Second Street identified in the Draft EIS/EIR for the cut-and-cover Caltrain Extension option are therefore not anticipated to occur, and there would be no effects on the Clocktower's access from the selected tunneling option. Air emissions, noise and vibration, visual, safety, and other construction related impacts associated with the cut-and-cover construction option for the Caltrain Extension would not occur at the Clocktower location under the tunneling option. Moreover, the off-site bus storage facility noise walls would be constructed in advance of the construction of the permanent bus storage facility under the west approach to the Bay Bridge.

The construction noise would have to comply with the San Francisco noise ordinance. This ordinance provides limits on noise levels from construction equipment and recommends mufflers and shielding for some types of equipment. The document also states that the contractors would have to work with the Department of Public Works (that enforces the noise ordinance) to develop an acceptable approach to balancing interruption of the business and residential community, traffic disruptions, and minimizing the total duration of the construction.

Construction noise varies greatly depending on the construction process, type and condition of equipment used, and layout of the construction site. Many of these factors are traditionally left to the contractor's discretion, making it difficult to accurately estimate levels of construction noise. A number of construction noise/vibration mitigation measures are outlined in the Section 5.21.10.2, Volume I, of this Final EIS/EIR and will be incorporated into the construction contracts to minimize noise and vibration impacts during construction.

Information on damage from construction activities is presented in the construction noise and vibration section of this Final EIS/EIR, Section 5.21.10, Volume I. Typical construction processes do not generate vibration levels high enough to cause damage, even to historic buildings.

Two activities that can generate high vibration levels are pile driving and controlled detonation. Recommendations are given for both these activities in the technical report. As stated in the Final EIS/EIR, pile driving should be done no closer than 250 feet from sensitive structures.

As noted above, under the tunneling option, construction of the Caltrain tunnel in the vicinity of the Clocktower would be underground and deep, and impacts therefore would not occur on the surface, other than possible temporary vibration impacts of controlled detonation, if needed for construction in this area. Given that the proposed tunnel in the vicinity of the Clocktower is deep, vibration impacts are expected to be minimal.

Controlled detonation may be required at some locations along the tunnel alignment, but there is no way to determine whether controlled detonation would be required in the vicinity of the Clocktower. If controlled detonation is required, it can be designed to control vibrations within acceptable tolerances. Also, such operations can be timed so as to have the minimum possible impact on residents. An appropriate level of monitoring would be implemented to verify that construction vibration is maintained at tolerable levels.

Controlled detonation would be monitored and make use of the guidelines related to size of the detonation, distance, and type of structure. Information regarding these controlled detonation guidelines is included in this Final EIS/EIR, Volume I, Section 5.21.10. Controlled detonation activities would be monitored so as not to exceed these guidelines.

6.1.6 S.J. Manufacturing, Inc., Seymour Jaron, December 6, 2002

"Given the project goes ahead with the tunneling option, my concerns are primarily of business disruption on Townsend and Second Streets, length of construction time and vibration of building during tunneling. These issues are not thoroughly addressed in the draft EIR, nor is adequate attention given to the underpinning process as part of the tunneling process. I would like to see more information on mitigation of dust, traffic, noise and timeframe. I would like more information regarding when the various components of the project might actually begin in order to plan accordingly for the future."

Response 6.1.6 Section 5.21 of the EIS/EIR discusses temporary construction impacts, including air emissions (5.21.9), traffic (5.21.2), and noise/vibration (5.21.10), along with other types of construction impacts, and provides proposed mitigation measures for these impacts. Section 5.21.6, Volume I, of this Final EIS/EIR discusses impacts to businesses during construction. Section 5.21.2.5 provides a community outreach mitigation program that would be implemented during the construction phases.

The Draft EIS/EIR indicates that underpinning would be used where deemed necessary to protect existing structures from potential damage that could result from excessive ground movements. The design of the tunnelling and the excavation procedures (and construction sequence), and the design of the temporary support system will be developed with the objective of controlling ground deformations within small enough levels to avoid damage to adjacent structures. Where the risk of damage to adjacent structures is too great, special measures may be implemented such as: (1) underpinning, (2) ground improvement, and/or (3) strengthening of existing structures to mitigate the risks.

The tunnel alignment passes under a number of old and settlement-sensitive structures in the vicinity of the intersection of Second and Townsend streets. Even though the tunnel will be excavated using the stacked drift method (see Section 5.20.2, Figures 5.20-6 and 5.20-7), and even though the tunnel will be excavated in the Franciscan Rock formation, the risk of potential adverse impacts of tunneling on the existing buildings must be assessed, because the rock cover over the tunnel is rather shallow. As part of the initial studies performed in 1996, preliminary plans were developed to protect/strengthen existing structures to mitigate the risk of adverse impacts of tunneling on existing structures. Underpinning, if it is deemed necessary, is one of the options for mitigating adverse effects of tunneling on the existing buildings. Underpinning involves modification of the foundations of the building so that the superstructure loads can be transferred beyond the zone of influence of tunneling. Underpinning may include internal strengthening of the superstructure, bracing, reinforcing the existing foundations, or replacing

the existing foundations with deep foundations that are embedded outside the zone of influence of tunneling.

Other alternatives, in lieu of underpinning, involve strengthening of the rock between the building and the crown of the tunnel. Grouting in combination with inclined pin piles can be used not only to strengthen the rock but to make the rock mass over the tunnel act as a rigid beam, which would allow construction of the tunnels with no adverse effects on the buildings that are supported on shallow foundations over the tunnel.

Preliminary plans for underpinning have been developed that allow cost estimates to be made for underpinning. During the detailed design phase of the Project, underpinning plans will be developed specific to each of the buildings that may require it. It is not necessary at this stage of the Project to develop detailed underpinning plans.

These issues will be addressed on a case by case basis, along the alignment, during the detailed design phase of the Project. The methodology that is proposed for the Caltrain Downtown Extension, i.e. to design the support system to control ground deformations within tolerances, and selectivity strengthen structures that may be too weak to resist even small deformations, was successfully used for the Muni Metro Turnback project, and should be effective for the Caltrain Downtown Extension Project as well.

A revised Figure 5.20.8, Volume I, of this Final EIS/EIR shows the anticipated construction activities schedule.

6.1.7 League of Women Voters, Sarah Diefendorf and Tuesday Ray, Co-President, League of Women Voters of San Francisco, November 22, 2002

"Page 5-161, Figure 5.20-8. Construction period appears to be a little over four years. The longest activity is the construction of a cut and cover Subway Structure along Track Corridor or tunneling, which lasts 36 months. This is a long time for surrounding businesses and traffic disruption. The area will feel like a war zone.

"Page 5-167. The construction period is assumed to be two years for the Second-to-Main Cut-and-Cover Option. Is this for excavation only? (See Figure 5.20-8, which shows a 36-month period of construction.)

"Page 5-173-174. This section describes possible mitigation measures to offset the disruption to businesses and community during the construction period. These include onsite and field offices, an information line, signage, traffic management plans, street and sidewalk level decking, sidewalk design and maintenance, and construction site fencing. There is no discussion, however, of the financial impact to businesses during the construction period, and if compensation would be required for loss of business. See also 5-41.

"Page 5-182. "It is anticipated that subway construction would last for a total period of approximately three and a half to four years". This appears to conflict with the two-year period mentioned on page 5-166."

Response 6.1.7 Adoption in March 2003 by the Transbay Joint Powers Authority of the tunneling option rather than the cut-and-cover option for the Caltrain Downtown Extension component of the Locally Preferred Alternative will substantially reduce impacts during the construction phase for this Project, including impacts to local businesses. For the most part, businesses along the cut-and-cover segments (i.e., those remaining with the adopted tunnel

option) are not dependent on foot traffic for clientele, which are the types of businesses most affected by cut-and-cover construction. Affected businesses in these segments are predominantly offices, and vehicular and pedestrian access to these businesses would for the most part remain and be only temporarily disrupted during construction. The construction field office would coordinate these temporary disruptions with affected businesses. To the extent required and feasible, temporary access routes will be identified for any land use subject to potential long-term loss of access during construction. The discussion on pages 5-173 and 174 of the Draft EIS/EIR are mitigation measures that will be implemented during construction to keep the affected residents and businesses in the area of construction informed of the progress of the construction and which areas will be affected during certain time periods (Please see pages 199-200 of Volume I of this Final EIS/EIR). Thus, compensation to local businesses and residents that are not going to be acquired is not anticipated, given the efforts to assure access and minimize impacts for these businesses.

The discussion on page 5-41 of the Draft EIS/EIR regarding payments for business interruption, loss of goodwill and "nuisance" costs applies only when the property or an easement is being purchased and commercial and residential tenants and/or owner-occupants would have to be relocated by the City or Redevelopment Agency. These costs are included in the property acquisition costs estimates for the Project.

The construction schedule on Figure 5.20-8 has been refined in this Final EIS/EIR, Volume I, and text references to the construction period have been edited accordingly.

6.1.8 League of Women Voters of the Bay Area, Doris Maez, North San Mateo County League of Women Voters, Onnolee Trapp, South San Mateo County League of Woman Voters, Eva Alexis Bansner, President, December 5, 2002

"Pedestrian Access (construction): (page 5-175). '70 percent of pedestrians going to and from the terminal would have up to a four block longer walk than under the existing situation' during construction.

- "What effect is this expected to have on ridership during and after the construction period?
- "Are special mitigations for physically challenged riders needed (shuttle? attention to maintenance of curb cuts during construction?)"

Response 6.1.8 The four block walk to the temporary terminal is approximately 800 feet and is estimated to add four minutes of travel time. Frequent Muni bus connections will be available from the temporary terminal to Market Street. It is therefore anticipated that ridership may decline only slightly, if at all, during operations at the temporary terminal.

The Americans with Disabilities Act (ADA) will govern the design of the terminal and all associated permanent and temporary facilities. Demolition and construction work required to build the project will certainly require the rerouting of some pedestrian pathways, sidewalks and passages to maintain public safety. The final design and contract documents prepared for this work will include clear and thorough definition of ADA compliant surfacing, transitions, curb cuts and protection of users from contractor activities, openings, and excavations. Please also see response 2.8.3.

7.0 CAPITAL COSTS / FINANCIAL PLAN

7.1 CAPITAL COSTS/COST CONTROLS

7.1.1 San Francisco County Transportation Authority, Jose Luis Moscovich, Executive Director, December 19, 2002

"As mentioned above, we comment and pose questions in the areas of Value Engineering, Construction Phasing, Delivery Schedule, and Constructability with the aim of encouraging further exploration of cost reduction opportunities. We also provide specific comments about the proposed schedule. Our comments are as follows:

- "Since the Terminal is in the same location as the existing terminal and has practically the same footprint, was consideration given to using even a portion of the existing ramps? The southern ramp could be modified to provide access to the temporary terminal. Elevation differentials, if any, could be resolved relatively easily at this stage of design.
- "The cost summary for the Terminal, pages S-24 and 2-21, begs a few questions:
  - "The cost estimate needs to resolve some inconsistencies and include sufficient backup information to raise the level of comfort about its accuracy.
  - "The percentage allowed for soft costs, including design, insurance, mitigation and escalation is only 27% of construction costs. It is not clear whether the allowances for CM/Management, construction contingency, and management reserve are included in that percentage, since they do not appear to be accounted for elsewhere in the document. Percentage of soft costs varies from as low as 22.4% for Permanent Ramps to 53% for Bus Storage.
  - "Escalation is only to start of construction; industry practice is to escalate to mid-point of construction. Although it is possible that escalation may not be a major factor due to the early stages of project development and foreseen economic climate, and thus be absorbed by contingency reserves, the budget should address this, especially in light of the latest developments at the state level.
  - "At $22 M, the cost of the temporary terminal facility appears relatively high. This boils down to approximately $330/square foot, for what is essentially an at-grade parking lot with minimal amenities, in a lot that is already graded, paved, and in use as a bus storage facility.
  - "The cost for the temporary ramp is the same for both options even though the drawings on pages S-5 and S-6 show the temporary ramp to be much shorter for the Loop Ramp alternative. Is some of the cost of the temporary ramp for the West Ramp option being offset by the new off-ramp to be built by Caltrans?
  - "The estimate shows the Loop Ramp alternative to cost more than double ($315.8M vs. $153M) the West Ramp cost, even though the West Ramp option is double-decked and the Loop Ramp alternative is single-decked (including the West Ramp portion). Can the new Loop Ramp be combined with the new Caltrans off ramp to offset some of the costs for the Loop?
  - "The West Loop is described as having six levels, with four above ground, the Loop Ramp alternative is described as five levels, with three above ground, but the cost of both options is exactly the same. On page 2-17, figure 2.2-7 shows an elbow on the East end of the terminal (which presumably accounts for the cost differential between five and six levels), but the description of the option does not mention it or explain why this portion is necessary.

- "Page 2-11 shows the layout of the two top floors but not the other two above-ground floors or the two below ground. There is no drawing depicting the full footprint of the facility, showing the envisioned floor-by-floor space utilization plan.
- **"**Table S-I, on page S-17 indicates that the West Ramp alternative will accommodate an additional 35,000 passengers by providing 34 bus bays, but the Loop Ramp alternative will accommodate only 24,000 passengers by providing 51 bus bays, 17 bays more than West Loop. This statement needs clarification.
- "The description of the Terminal (page 2-9) mentions that 150,000 to 225,000 square foot of space will be provided on the Concourse Level for retail, entertainment, conference, educational, and cultural uses, but does not provide a conceptual breakdown between the various uses, or describe what types of tenants are envisioned overall (i.e.: supermarket, theaters, bookstores, video rental, restaurants, coffee houses, etc.). The description does not mention retail, entertainment, or other concession space on the other floors. Since retail and entertainment leases are tried-and-true revenue generators, space for these purposes should be maximized throughout the facility.

"The Cost Estimate for the Caltrain Extension is only escalated to the start of construction; industry practice is to escalate to mid-point of construction. Although it appears that there are sufficient contingency funds to absorb moderate escalation, the budget should be adjusted to reflect realistic escalation forecasts."

Response 7.1.1 Temporary ramps to the temporary terminal facility are no longer included as part of the Project (please see Response 2.6.1.) Access to the temporary bus facility will be on surface streets as shown in Figure 5.21-2, Volume I, of the Final EIS/EIR. Signal preemption for the buses will be employed where possible at intersections to speed the flow of buses to and from the temporary facility. This Final EIS/EIR reviews the impacts of this change in Section 5.21.1, (Volume I), and costs for the temporary ramp have been removed from the Project's capital costs. The existing eastern ramp will be removed as part of Caltrans' Bay Bridge West Approach Seismic Retrofit Project.

Construction costs (excluding soft costs) for the temporary terminal have been revised down from $15.5 million (as shown in the Draft EIS/EIR in year 2002 dollars) to $6.5 million in year 2003 dollars. To be conservative, this cost includes the complete repaving of the existing lots. This is based on the possibility that the temporary use will increase the loading on the existing pavement section requiring repaving. During final design, further investigation into the existing pavement will be performed leading to a final determination of what can be used and/or what will be repaved.

The conceptual terminal design has been revised to shift the terminal site to the west and eliminate the need for the facility to cross Beale Street. Please see Response 2.6.9. This has resulted in a reduced Transbay Terminal capital cost estimate. The permanent bus ramps have been reconfigured in response to this revised location for the new terminal and in response to Caltrans' comments regarding the ramp configurations in the Draft EIS/EIR. (Please see Comment and Response 2.6.1.) Capital costs for the permanent bus ramps have been revised to reflect this reconfiguration and are based on recent information for similar types of construction in the Bay Area. Construction costs (excluding soft costs) for the permanent ramps have been lowered from $125 million in year 2002 dollars (as shown in the Draft EIS/EIR for the West Ramp Alternative) to $24.4 million in 2003 dollars. The revised capital costs have been revised to reflect these changes.

Soft costs assumed in the Final EIS/EIR are now consistent between the line items and reflect the following breakdown: 25 percent construction cost contingency; 10 percent project reserve; and a 25 percent contingency that includes 10 percent for design costs, eight percent for construction management, and seven percent for owner costs.

Finally, capital costs are also now shown as year of expenditure costs by inflating the 2003 cost estimates to the actual year that the costs are anticipated to be incurred, thus providing the most accurate cost estimate that can be made at this point in the planning process.

Caltrans has awarded a construction contract for the west approach while the Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project continues the environmental process. Caltrans' design has the buses exiting the Fremont Street off-ramp at the southern end of the Essex corridor. The remainder of the Fremont Street ramp is designed to provide sufficient width and geometry to accommodate the traffic and provide for the touchdowns at Fremont and Folsom Streets. In the long-term, inclusion of bus traffic further along the Fremont Street ramp would affect traffic capacity during commute hours.

Even though the number of floors differs for the two Transbay Terminal options, the portion of the Full Loop Option in question is necessary to accommodate the bus bays required by AC Transit and the other bus operators. The program space required by both alternatives is similar and therefore costs are similar. Detailed footprint designs for the Full Loop Alternative were not developed, given that the MTC Transbay study selected a terminal design virtually equal to the West Ramp Alternative prior to development of the detailed floor plans.

Street level of the terminal will include entry lobbies with vertical circulation, Muni and Golden Gate Transit bus bays, Greyhound package handling storefront, ticketing, joint development, paratransit and taxi curb and egress as well as some back of house program space. The concourse level, one level above the street, will accommodate joint development and public space with a small amount of building plant. The mezzanine level will serve rail with ticketing, waiting areas, baggage handling, operator back of house space, the potential for a Muni Third Street connection on the west end and building plant.

Commercial space allocations in the terminal will be subject to the economics of the time, but the co-lead agencies agree that revenue-generating uses should be maximized to the extent possible within the context of the overall intended transportation purposes of the new facility. Specific allocations will be defined during the design phases when revenue generation opportunities can be established with more certainty.

Table S-I and Section 5.19.1.2, Volume I, of the Final EIS/EIR have been changed to reflect that both the Full Loop and West Ramp would have a peak hour capacity of approximately 35,000 passengers. The 24,000 figure shown in the Draft EIS/EIR for the Full Loop Alternative represented demand rather than capacity.

7.1.2 San Francisco Muni, Jose Cisneros, Deputy General Manager for Capital Planning & External Affairs, December 17, 2002

"Figure 6.6-1, Capital Financial Plan: It may be unrealistic to assume that value engineering will reduce the cost of the Transbay Terminal Project by as much as $170 million, particularly in light of the inevitable pressure to add more to the project scope during the outreach process to affected communities and neighborhoods, and as required mitigation for construction phasing, etc; Muni has always found that project scopes tend to grow, rather than shrink, as more participants join the planning and implementation process. This is true in major rail corridors and

facilities projects, such as the Third Street LRT Project, K-Line/Ocean Avenue Project, L-Line Project, to name a few. However, a value-engineering process would be useful to identify items that are proportionally high in cost relative to their benefits, perhaps resulting in some savings. In any case an ample contingency should also be included as part of the project budget.

Response 7.1.2 The co-lead agencies appreciate Muni's advice regarding the potential for value engineering cost reductions. By carefully reviewing capital cost estimates and assumptions in the Draft EIS/EIR and by revising various aspects of the Project – e.g., elimination of the temporary bus ramp (please see Response 2.6.1) and shifting of the new Terminal site to the west (please see Response 2.6.9) – the Project capital cost estimates between the Draft and Final EIS/EIR have been reduced by $143.7 million (2003 dollars). Even though an additional, more detailed value engineering effort is still assumed to be undertaken as part of the Project's design phase (please see Figure 5.20-8, Volume I, of the Final EIS/EIR), the refined financial plan, as presented in Chapter 6 of Volume I no longer includes an assumed value engineering cost reduction amount.

7.1.3 Andrew Sullivan, Rescue Muni, December 20, 2002

"Reduce Costs to the Project.

"Consider building the tail tracks in conjunction with the California High Speed Rail project. We feel a stub-end terminal will suffice until traffic increases with the commencement of High Speed Rail service.

"Consider postponing the construction of the underground pedestrian path to the Embarcadero BART station. Though we strongly support this project, we feel it can be delayed until there is more traffic at the Terminal and new funding sources can be found.

"Consider postponing the below-ground train yard at Seventh and Townsend."

Response 7.1.3 Please see Responses 2.2.5 and 3.3.6.

7.1.4 BayRail Alliance, Margaret Okuzumi, December 20, 2002

"Summary of our Recommendations:

- "Perform value engineering to identify ways to phase construction of less essential portions of the project to reduce required debt service.
- "Contain overall project cost by eliminating or postponing construction of underground tail tracks and storage yards and the underground pedestrian connection to Market Street; and by avoiding cut-and-cover construction wherever feasible."

Response 7.1.4 Please see Responses 2.2.5, 3.2.1, 3.3.6, and 7.1.2.

7.1.5 League of Women Voters, Sarah Diefendorf and Tuesday Ray, Co-President, League of Women Voters of San Francisco, November 22, 2002

"Page 5-41. "The cost estimate does not include payments associated with business interruption, loss of goodwill, and "nuisance" costs associated with the construction of the extension, including loss of property access.

"Why aren't these costs included, or at least an estimate included? These were significant costs associated with some of the Peninsula grade separation projects."

Response 7.1.5 Please see Response 6.1.7.

7.1.6 League of Women Voters of the Bay Area, Doris Maez, North San Mateo County League of Women Voters, Onnolee Trapp, South San Mateo County League of Woman Voters, Eva Alexis Bansner, President, December 5, 2002

"Business Disruption: (Pages 5-41). 'The cost estimate does not include payments associated with business interruption, loss of goodwill, and "nuisance" costs associated with the construction of the extension, including loss of property access.' Why?"

Response 7.1.6 Please see Response 6.1.7.

7.1.7 SPUR, Michael Alexander, Chair, SPUR Transbay EIS/EIR Working Group, December 20, 2002

"Similarly, the West Ramp and Loop Ramp alternatives show the same construction costs. Since the West Ramp is considerably shorter, the cost assumptions appear to be inaccurate."

Response 7.1.7 The West Ramp and Full Loop options have similar program space requirements that result in similar estimates for construction costs.

7.1.8 Ken Bukowski, Councilmember, City of Emeryville, Speaker, 11/12/02 Public Hearing

"Also I would hope that you would look at alternatives to building the expensive project before you. Maybe a lesser project would make it happen as opposed to this."

Response 7.1.8 It is expected that the decision as to whether or not to adopt and construct this Project will depend on the overall perceived benefits and anticipated costs as evaluated by the decision makers.

7.1.9 Eugene Bradley, Speaker, 11/13/02 Public Hearing

"I'm still a little bit caught up between the cut-and-cover and the tunneling. Traditionally tunneling can be very expensive and very dangerous, particularly if you're going underneath, as I understand, land, former salt, former mud that the area is now in. My concern is – is that I haven't seen any real cost controls. As much as I like this project, my own concern is – I don't want to see the cost of this project double like it has with the Bay Bridge."

Response 7.1.9 While the cost per linear foot of cut-and-cover construction is often less expensive than tunneling for most projects, the depth of excavation required, the anticipated utility relocation costs, the real estate acquisition costs, and the mitigation costs associated with cut-and cover make the overall estimated costs for the tunneling option lower than the estimated cut-and-cover costs for this Project. Cost monitoring and controls are expected to be an integral part of the implementation of this Project.

7.1.10 Jennifer Clary, President, San Francisco Tomorrow, Speaker, 11/26/02 Public Hearing

"Joan Kugler was very helpful. We met with her. She showed us documents. We dug in the boxes. I was looking for the analyses of hazardous materials. I found a 1995 analysis which had an estimate for $5 million for disposal of hazardous materials. I'm not sure yet because they haven't gotten back to me yet as to what kind of update they did for the purposes of this document. I know that they did no new soil testing. But I was hoping that based on other

projects in the area like Mission Bay and the ballpark that, that they have a better idea of the amount of soil removed and where it's going to have to disposed of, the level of toxicity in the soil."

Response 7.1.10 As noted, no additional soil exploration was performed for this study. The hazardous materials data bases were searched for new data, as noted in Section 5.15, Volume I, of the Final EIS/EIR. Section 5.21.15 of the EIS/EIR provides a listing and classification of 41 potential hazardous materials sites that may affect the Project. These sites are discussed and evaluated on a segment by segment basis in this section, and proposed mitigation is provided at the end of this section. Moreover, additional geotechnical and hazardous soil investigations are anticipated during the early stages of design.

7.2 FINANCIAL PLAN AND PROJECT DEVELOPMENT/SCHEDULE

7.2.1 San Francisco County Transportation Authority, Jose Luis Moscovich, Executive Director, December 19, 2002

"The Authority is the sponsoring agency for the project in the RTP and, as such, it has been required over the past year to submit capital and operating plans. Our main focus, therefore, in performing a review of the DEIR/DEIS, were the sections relating to costs, schedule and funding. Given the less than bright prospects for moving the City transportation funding at the state level, we tried to identify any areas where additional opportunities for cost reduction may be found. The Authority's on-call engineering services consultant, Cordoba/Zurinaga assisted us with many of the technical aspects of the review:

"With the recent developments in the State Budget, which now registers a $35 billion deficit, it has become clear that there will be schedule and funding impacts to transportation projects across California. In particular, there will be significant impacts to state sales tax-dependent sources like Prop 42, and the Governor's Traffic Congestion Relief Program (TCRP) which are tied to the General Fund. The cash problems in the State Highway Account, which date back some years now, will be further exacerbated. The Governor has already proposed nearly $2 billion in transportation program cuts, and the State Department of Transportation is even considering reneging on allocations already made by the California Transportation Commission. The schedule for this project will inevitably have to be re- examined in light of these troubled developments, as was the case for all projects included in the 2001 RTP.

"While the Authority Board has not taken a position yet, I will be proposing a strategy that advocates keeping San Francisco's key projects moving. This is indispensable if we are to compete well for funding at the federal level in this critical year of the reauthorization of TEA 21, and it is essential if we are to be ready to build these needed projects once the economy rebounds. Such a strategy will only work if we propose realistic schedules, which are scaled down to our ability to cash flow projects. A central element of that strategy will be the reauthorization of the local sales tax for transportation. The Authority is ready and eager to work with the City and County of San Francisco to ensure that such a strategy can be developed in the next few months.

"Regarding the funding assumptions in Chapter 6 (Section 6.6.3 on page 6-10), while they are generally consistent with the Authority's initial funding plan submitted to MTC, we note that Prop 42 revenues are not likely to materialize until well after 2008 (as originally anticipated) and that once they become available they will need to be prioritized by the Authority Board. It cannot be automatically assumed that all Prop 42 funds would go to a single project. The DEIR/DEIS should note in Table 6.6-1 and in Section 6.6.3 the need for an Authority policy action regarding these funds. We anticipate that the Countywide Transportation Plan, currently being prepared by the Authority will include recommendations for the use of Prop 42, as well as a specific funding amount proposed for this project out of the reauthorization of the sales tax...

"On page 5-139, the discussion of Final Design and Development of Construction Contracts, states that: "Final Design would in turn lead to determinations of construction contract packaging." Development of a Contracting Plan, with its two major components the Contracting Strategy and Contract Packaging Plan, is a task that needs to be performed before Final Design, not during or after, especially for a project of this magnitude. The Contract Packaging Plan should clearly delineate how and why the project is going to be broken down in different contracts, and the Contracting Strategy must address the delivery methods (i.e., Design-Bid-

Build, CM at-Risk, Design-Build, Fabricate-Install, Owner Supplied, etc.) for each contract. "Since these documents influence Final Design, they should be developed no later than during Schematic Design for the Extension and Design Development for the Terminal, earlier if at all possible. It is invaluable to go into Final Design with the road map that a properly developed Contracting Plan provides, with full knowledge of how the design is going to be broken down into contract packages, and how they are going to be delivered; not doing so almost invariably results in expensive and time-consuming re-packaging.

"The Construction Phasing shown on page 5-161 appears at first glance to be overly optimistic:

"The schedule indicates that construction will commence in July 2004 on the Terminal and January 2004 on the Caltrain extension, 19 months and 13 months hence, respectively. The construction of the temporary terminal and ramps is scheduled to commence 10 months from now. Considering that the DEIR/DEIS is in the review phase and design is in the conceptual stages, it is difficult to envision consultant selection, design development, final design, and contractor selection to be completed within that time frame. In addition, Real Estate acquisition would have to take place within the same time frame for construction to commence on January 2004. A reasonable duration for this work would be a minimum of two years (probably closer to three), provided a very aggressive and competent management team fast tracks the project.

"The schedule assumes that Caltrans will complete the new Fremont Street off-ramp in time for the temporary ramp to be constructed in the third quarter of 2003, which with information currently available, appears unlikely. In addition: there appear to be conflicts between the construction of the new Fremont ramp and the existing AC Transit ramp.

"The schedule provides for 36 months to construct the cut-and-cover section of the Caltrain Extension (same duration for tunnel alternative). This provides for an average production rate of approximately eight feet per day, which translates to a peak rate of sixteen feet per day for about 10 months of peak construction. Considering the section of the subway (some cuts are 100 feet deep, which have to be backfilled and compacted after the subway is constructed), construction methods, and location, the production rate, although achievable, is aggressive and requires for everything to go exactly according to plan, which is seldom the case in underground projects. In contrast the retained cut section, which is significantly easier (inside the existing yard, significantly less excavation, no street closures), is planned for the same production rate.

"The schedule provides for 39 months for demolition of the existing terminal and construction of the new terminal and permanent ramps. Based on cost, this schedule represents an average construction expenditure of approximately a million dollars per workday, peaking at two million dollars per day during the 11-month (approximate) peak construction period. In addition, demolition of the old terminal will be time-consuming due to the necessary asbestos abatement. The schedule although achievable, is unlikely and appears aggressive considering the site constraints.

"The aggressiveness of the schedule is in conflict with the availability of funds, even before considering the latest grim news from the state. The project would benefit from a more realistic schedule, where projected cash draw-downs are more in tune with the financial plan.

"Without the basis for the summary schedule provided in the document, it is difficult to fully assess its reliability. We stand ready to take a close second look as soon as a detailed schedule is provided to us."

Response 7.2.1 In response to the commentor's observations and to more current understandings regarding funding options and such related projects as the West Approach Seismic Retrofit Project, the Transbay Terminal/Caltrain Downtown Extension Project schedule has been revised in this Final EIS/EIR (please See Figure 5.20-8, Volume I). Eliminating the use of the existing bus ramps to serve the temporary terminal lessens the critical construction coordination with Caltrans' Fremont Street off-ramp project. Updates include starting the temporary terminal construction in mid-2005 with land acquisitions secured over the two years preceding start of construction. The duration to demolish the existing facility and construct the new terminal has been extended to 42 months. The revised schedule is for the adopted Locally Preferred Alternative (Please see Response 3.1.2), namely the West Ramp Transbay Terminal and Second-to-Main Tunnel Caltrain Extension.

The document has been revised to reflect that contract packaging will be determined early in the preliminary engineering phase. Please see Response 2.6.1 regarding the revised anticipated bus access to the temporary terminal.

A revised Project funding plan showing anticipated funding sources is provided in Chapter 6, Volume I, of this Final EIS/EIR.

The Project co-lead agencies agree that the financial strategy for implementing the Project must be robust. Accordingly, since the publication of the Draft EIS/EIR, the financial plan for the Project has been adjusted to reflect changes in potential funding sources. These changes include an adjustment in the project construction costs and schedule, revised tax increment revenue projections, adjustments to the net operating revenue associated with changes in the Project design, a re-evaluation of the availability of Proposition 42 funds, and the elimination of Proposition 51 funds.

The new financial plan includes other revenue sources including increased bridge tolls (Regional Measure 2 passed by Bay Area voters on March 2004), reauthorization of the San Francisco half-cent sales tax for transportation (Proposition K passed by San Francisco voters in November 2004), and a High Speed Rail Bond initiative. SB 1856, signed by the Governor in 2002, places this measure on the state ballot in November 2004.

While statewide and local sales tax revenues are currently lower than previously anticipated due to the current economic downturn, the sales tax revenue projections included in the Project financial plan are based on future conditions. In general, the revenue estimates have been provided by the public agency that will administer the sales tax, and are based on conservative assumptions about future financial conditions. In the case of the San Francisco Transportation Sales Tax Reauthorization, for example, the SFCTA conducted sensitivity analyses to project future sales tax revenues. Eighty-eight percent of the allocation to the Transbay Terminal is based on the agency's "conservative forecast" of sales tax revenues while the remaining 12 percent is based on the "medium forecast" that the agency describes as "most likely to materialize." (San Francisco County Transportation Authority, "New Transportation Expenditure Plan for San Francisco," adopted July 22, 2003, pp. 7 and 10.) None of the allocation to the Project is dependent upon the most aggressive sales tax revenue forecasts.

Given the current status of the State budget, Proposition 42 revenues to this project may not materialize. Accordingly, the revised project funding plan does not rely on Proposition 42 revenues. However, a category for "other" funding is included in the plan, and should Proposition 42 revenues become available, the amounts from other sources may be reduced.

Examples of "other" sources being pursued are federal transportation earmarks and additional local sales tax revenues.

7.2.2 San Francisco Muni, Jose Cisneros, Deputy General Manager for Capital Planning & External Affairs, December 17, 2002

"Muni has also developed some cost estimates for Muni operating and capital costs associated with the Transbay Temporary Bus Terminal, which were provided to MTC. Attachment C is a copy of the letter provided to MTC in March 2001 detailing both the capital and operating costs summarized below:

"Operating Costs: Muni estimated the additional annual operating and maintenance costs associated with the Temporary Transbay Terminal at just under $1 million in FY 2000 dollars. These costs are for added service on the 2, 5, 6, and 38/38L lines. Muni does not currently have funding in the operating budget for these increased costs, and a Transbay Terminal project-funding source will need to be identified to provide funds for Muni's operating budget while the Temporary Transbay Terminal is in operation.

"Capital Costs: Muni estimated the total capital cost for the Temporary Transbay Terminal at $5.7 million. This cost includes new trolley overhead, strain poles, and special work. It also includes the provision of a temporary street supervisor's office at the temporary bus facility and a temporary operator restroom for the 1-California trolley coach line at its terminal on Beale Street. The existing 1-line restroom on Howard Street will need to be removed when the Temporary Transbay Terminal facility is constructed. The terminal should also provide space for street supervisors and maintenance personnel to park their trucks. Muni does not currently have capital funding planned, programmed, or awarded for these costs, and a Transbay Terminal Project funding source will need to be identified to provide funds for Muni's capital costs for the Temporary Transbay Terminal.

"Section 6.6 – Funding Sources: Many of the funding sources listed in the funding plan are sources that provide funds to Muni or could provide funds to Muni, such as existing Bridge Toll funds, Bridge Toll third dollar increase, and Prop 42 funds. It is difficult to gauge from the information given if providing any of these funds to Transbay Terminal would mean that Muni would receive less funding. It would also be useful to know what funds would be used to guarantee the TIFIA loans. If any of these funds are funds that Muni could expect to receive, using them as a guarantee could affect Muni's access to the funds. It would be good to have more explanation of these issues in this section."

Response 7.2.2 Provision for the above-noted Muni improvements at the temporary terminal have been included in the capital cost estimates for the Project. The temporary terminal costs have also been revised (please see Response 7.1.1).

Section 5.21.1.2, Volume I, of this Final EIS/EIR has been revised to reflect the estimated operating and maintenance costs associated with the temporary terminal. It is anticipated that Muni operators, supervisors, and maintenance personnel would utilize the restrooms, parking, and office space that will be provided at the temporary terminal.

Although Muni may incur additional operating costs while a temporary terminal is used during the construction phase of the project, the new terminal will provide Muni additional off-street layover parking, improved passenger and driver amenities, and improved passenger transfers and connections to other transit services. Unlike other transit operators using the Transbay Terminal,

the Project financial plan does not include lease payments from Muni to defray the operating and maintenance costs of the terminal.

The planned use of capital funds for the Project from various sources would not reduce existing Muni revenues. The revised Project funding plan includes a variety of revenue sources. The regional discretionary funds for the project are identified in MTC's Regional Transit Expansion Policy (Resolution 3434), in the same manner that the Muni New Central Subway Project's funding plan is included in the RTEP. As such, these regional discretionary sources have been made available to specific projects and do not result in Muni receiving less funding. Similarly, other revenue sources, including increased bridge tolls (Regional Measure 2 passed by Bay Area voters on March 2004) and reauthorization of the San Francisco half-cent sales tax for transportation (Proposition K passed by San Francisco voters in November 2004) include expenditure plans listing specific projects, such as the Transbay Terminal and Downtown Extension Project and various Muni projects. Other potential sources such as future California High Speed Rail Bond (SB 1856) funds provide formula funds to certain transit operators, including Muni, and construction funds for high speed rail to the Transbay Terminal. These construction funds would not be available to Muni, but might be available for the Caltrain extension to the Transbay Terminal.

The funds used to repay the TIFIA loan are anticipated to include tax increment revenues from the redevelopment area, Passenger Facility Charge (PFC) revenues, and net operating income generated by leases within the terminal. These sources would be generated by and dedicated to the Project. Therefore, funds that would otherwise be allocated to Muni would not be used for the Project's debt servicing.

7.2.3 Valley Transportation Authority, James E. Pierson, Planning and Development Director, November 25, 2002

"VTA is one of the three member agencies that provide operating and capital funds for Caltrain service. In this role, we are impacted by actions that result in increased Caltrain costs. Therefore, our first several comments relate to the proposed financing plan for the project or related elements. We have the following comments:

"1. The electrification of Caltrain is a prerequisite for the Downtown Extension. Statements made on page 2-3 indicating otherwise, contending that dual mode locomotives could be procured to operate service on the downtown extension in the absence of electrification, at an additional cost of $235 million (in 2002 dollars), raises concern because:

"a. The Caltrain electrification project, which is still under environmental review, does not include dual mode locomotives as an option.

"b. No source of funds is identified for purchasing the dual mode locomotives or any associated increase in operations and maintenance costs. Given current economic conditions it is unlikely that the estimated $235 million increment to purchase these locomotives will be available from Caltrain, its member agencies or the State within the projected project development schedule.

"2. Funding and schedule assumptions regarding the electrification of Caltrain (e.g. assuming electrification between San Francisco and Gilroy will be implemented by 2006, assuming that electrification will be funded entirely with local sources) are very optimistic given the current status of the electrification project. A funding plan with committed resources has not yet been developed or endorsed for Caltrain electrification by the three Caltrain Joint Powers Board member agencies, who are each responsible for one third of the project costs. VTA, who has funding for our share of electrification in Measure A of 2000 (the extension of our current sales

tax that begins in 2006) has consistently indicated that these funds will definitely not be available prior to 2006 and it is highly unlikely that VTA funds will be available for the project prior to 2016.

"3. It appears that the project sponsors assume that the State of California-owned land required for the Transbay Terminal project, worth approximately $300 million, will be provided to the City and County of San Francisco by means of an administrative transfer at no cost to the project sponsors. The final document should address this assumption and the status of the property acquisition.

"4. The statement on page 6-6 that Caltrain anticipates operating 120 trains a day is very optimistic, given the current economy in the Bay Area. The current Caltrain service level of 76 weekday trains (a decrease from the 80 weekday trains in the previous year) is not expected to increase significantly between now and the estimated completion of the Transbay Terminal.

"5. The financial analysis in Chapter 6, particularly the funding source assumptions in Section 6.6, and as illustrated in Table 6.6-1 shows that the majority of funds needed for the project have not been secured, with most of the funding programs and the associated levels of funds not within the control of the project sponsors. The revenue assumptions are also very optimistic in terms of the amounts of funds and the schedule of their receipt. The FEIS should include a more detailed funding plan."

Response 7.2.3 A new funding plan for the Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project is provided in Chapter 6, Volume I, of this Final EIS/EIR. (Please see Response 7.2.1.) The plan acknowledges the potential need for funding of dual mode locomotives, should electrification of the Caltrain corridor not be scheduled for completion in advance of the completion of the Caltrain Downtown Extension. The extension is scheduled for completion and operation in 2011, as shown on Figure 5.20-8, Volume I, of the Final EIS/EIR.

The Peninsula Corridor Joint Powers Board (JPB) is in the process of developing the *Caltrain Strategic Plan 2004-2023.* This plan envisions three scenarios based on different funding assumptions. The three scenarios – Baseline, Enhanced, and Build-out – were presented to the Joint Powers Board at the June 2003 Board meeting. Electrification of the system is included in all three scenarios but with different timelines. Under the Baseline scenario, Electrification would be implemented by 2020; Enhanced, 2010; and Build-out as part of the California High Speed Rail Program. Implementation of a California High Speed Rail Program would require electrification of the Caltrain Corridor from San Jose to San Francisco.

As pointed out in the comment, the current Caltrain service has been reduced from 80 to 76 in 2003 due to the state of the economy. It is anticipated that this number will increase as the economy improves. By the year 2020, it is assumed that Caltrain will operate 132 trains daily instead of the 170 trains shown in the Draft EIS/EIR. Volume I of this Final EIS/EIR has been revised to reflect this assumed train service level.

The cooperative agreement that transfers state-owned lands to the Transbay Joint Powers Authority (TJPA) and the San Francisco Redevelopment Agency has been signed by the TJPA, the City and County of San Francisco, and Caltrans. The Cooperative Agreement transfers certain parcels to the City and County of San Francisco for purposes of building the Transbay Terminal project and certain other parcels including the terminal and associated ramps to the Transbay Joint Powers Authority. The Cooperative Agreement transfers the land administratively at no cost to the City and the TJPA. The agreement requires that the property itself or the sale proceeds

for the property be used to construction the Transbay Terminal Project intermodal bus and rail terminal. It will become effective following issuance by the Federal Transit Administration of a Record of Decision and signature by the California Transportation Commission.

Please see Response 7.2.1.

7.2.4 SPUR, Michael Alexander, Chair, SPUR Transbay EIS/EIR Working Group, December 20, 2002

"The key issues of financing and development raised in the EIS/EIR center on some fundamentals of the entire project's stated feasibility. As a redevelopment project, the importance of revenue from land sales gained by the removal of the eastern ramps segments and the later tax increment streams are clearly seen as essential to the viability of the project. However, no sufficient discussion is given to the pre-development financing of the project. Please explain the sources of project and construction money needed before the availability of revenues from land sales and tax increment.

"The analysis of the revenues from mixed-use development appears to be the same in both ramping alternatives. The West Ramp alternative will make available somewhat more land for mixed-use construction. More importantly, it consolidates a city block, making development options much more attractive and valuable. As a result, land sales and subsequent tax increment revenues should be significantly higher. Therefore, we believe the EIS/EIR's assumption that revenues are the same for the alternatives is inaccurate.

"Development Strategy: The EIS/EIR should clarify why the project is to be constructed all at once, and what procedures and environmental review will occur if that strategy is found to be infeasible and construction happens in stages."

Response 7.2.4 The design and planning portion of the Project is being funded via a federal grant from the Federal Transit Administration. The tax increment revenue estimates for the Full Build and Reduced Scope development scenarios in the Draft EIS/EIR incorrectly assumed the amount of land available under the Full Loop Option. As noted by the commentor, less land would be available under the Full Loop Option and less development would therefore occur. The tax increment estimates have been updated by the Redevelopment Agency for the Final EIS/EIR and are for the West Ramp Alternative, which was selected by the Transbay Joint Powers Authority as the Transbay Terminal component for the Locally Preferred Alternative. These new tax increment estimates are shown in the revised financial plan contained in Chapter 6, Volume I.

Figure 5.20-8, Volume I, shows the assumed construction schedule for which the refined financial plan in Chapter 6 was developed. Should funding not be available for the project cash flow needs, a revised schedule would need to be developed, the financial plan would need to be revised, and additional environmental review would be undertaken, if necessary. The additional environmental review would be needed if there were substantial changes to the environmental setting or impacts associated with the new schedule. The environmental review could take a number of forms, including a CEQA addendum, a federal reevaluation, or supplemental/ subsequent environmental documents.

7.2.5 Jim Haas, Speaker, 11/12/02 Public Hearing

"I want to make a comment on the larger question which relates to the money. And if you look on page 6-8, in the chart there, there is an item that is numbered number 8 which is about $600

million. The source of the funding is very vague, and includes such things as Proposition 51 which is defeated by state voters last week, and some other very problematic things. That $600 million hole is going to be hard to fill. Now, when this project came together in its present manifestation, San Francisco said in a fairly loud voice that we think this is so important that we're going to pay for a good deal of it. And therefore, I think we need to give thought, and this EIR needs to give thought to provide more local funds and cover that $600 million hole.

"The first thing I think needs to be addressed in that EIR is the current configuration of the Redevelopment District with the holes in it that deal with developed properties. This means that the increment for those six or seven holes are not going to be available for this project. There may be – let me also say that I think that we also need to consider, and this should be discussed in the EIR – is extending the district to the south to cover, particularly the two big parking lots on the south side of Folsom Street being contemplated for large numbers of housing units. That also could be a major source of tax increment for the area. And then, thirdly – I think this needs to be discussed in the EIR – that the tunneling does not in any way make it impossible for major developments to go forward. And there is one on Mission Street which I think needs to be addressed.

"Relating to the question of the demolition of buildings for the tunnel, particularly in the Historic District, again, the choice of demolishing all these historic buildings for cut-and-cover as opposed to tunneling should be fairly obvious here. The EIR does not agree that you could build over those parcels where there is no choice but that there has to be demolition. And we should have in the EIR some idea of what can be built."

Response 7.2.5 A revised Project funding plan is included in Chapter 6, Volume I, of this Final EIS/EIR. Please see Response 7.2.1. Revisions are proposed for the Redevelopment District Boundaries as discussed in Response 4.2.4.

In the area of the proposed Caltrain Extension east of Second Street, the *Draft Transbay Redevelopment Project Area Design for Development Vision* (August 2003) envisions low-rise development similar in scale and character to the existing development. If buildings are demolished due to cut-and-cover construction for the Caltrain Extension, the properties would be made available for development after the Caltrain construction is complete. The *Draft Transbay Redevelopment Project Area Design for Development Vision* (August 2003) plan envisions this area as a mixed-use historic district combining commercial and residential development. New development on vacant parcels following construction of the Caltrain extension would be a combination of privately-developed office, retail, and residential space that would be made available to existing owners and tenants as well as affordable housing projects developed with the assistance of the Redevelopment Agency. It is anticipated that the existing fine-grained parcelization will be maintained with predominantly new low-rise (6-8 story) buildings, although taller structures will be considered.

7.2.6 M. Kiesling, Regional Alliance for Transit (RAFT), December 18, 2002

"Furthermore, we strongly urge the redevelopment area be expanded to include undeveloped parcels in the center of the proposed redevelopment area, and undeveloped parcels adjacent to the terminal on the south side of Mission Street, east of Second Street. Any new development on these parcels will be greatly enhanced by the TTT project, and it seems fitting that a portion of that benefit be captured to aid the project.

Response 7.2.6 Please see Response 4.2.4.

7.2.7 League of Women Voters, Sarah Diefendorf and Tuesday Ray, Co-President, League of Women Voters of San Francisco, November 22, 2002

"Chapter 6, general. The chapter lacks a cost/benefit analysis. The financial plan depends on several presently non-existing revenue sources (bridge tolls, gas tax, etc.), uncertain sales taxes, and revenues derived from the Redevelopment Project and Scope (not building proposed office space) and Full Build. There is no discussion of the financial impacts of NOT doing Full Build. This should be a major concern for San Francisco residents, city government, and all the transportation agencies involved.

"Page 6-1 to 6-8. Capital costs are estimated to range from $1.864-$2.095B for the rebuilt Transbay Terminal and Caltrain extension. Federal funding for the project (page 6-8, Table 6.6-1) is estimated at about $600-$700M. However, as discussed before, an approved Regional Transportation Plan and Transportation Improvement Program are required for federal funding, and at the current time, a lawsuit has delayed such approval for an indefinite period of time.

"Page 6-4, Table 6.3-1. A net surplus from additional fares of $2.76 per passenger is outlined to cover the cost of operating the Caltrain extension. These estimates are based on estimated ridership of 50,000 daily weekday riders, which may be overly optimistic. Current operations costs are exceeding revenue sources because of the steep decline in sales tax revenues and drop in ridership in 2002. Sales tax revenues from San Mateo County (per MTC's RTP, page 6-8, Table 6.6-1) are expected to provide $27M of capital costs as well. Are these figures realistic in the light of the current state of the economy?"

Response 7.2.7 The Financial Plan includes not only existing but anticipated future revenue sources. This is not an unusual approach to project financial planning at the preliminary planning stages of a project, given that revenue sources can be contingent on completion of the environmental process, they may be required to be programmed into long-range funding/project plans (e.g., the Regional Transportation Plan), they may require future referenda/voter approval (e.g., state-wide, regional, or local tax initiatives/measures), and they may depend on facility user fees or on other forms on future revenue streams such as tax increment financing. It should be noted that, since circulation of the Draft EIS/EIR, Regional Measure 2 (bridge toll increase) and Proposition K (continuation of San Francisco sales tax) have been passed by the voters.

Selection by the Transbay Joint Powers Authority of the "Full Build" Option for the Redevelopment component of the Locally Preferred Alternative was in part due to the fact that the "Reduced Scope" Option would generate reduced tax increment revenues for the Project, as noted by the commentor.

Lawsuits regarding the Regional Transportation Plan do not jeopardize the processing of environmental planning documents. The Transbay Terminal/Caltrain Extension Project is still included in the approved Regional Transportation Plan for purposes of this environmental document.

The $2.76 cited in Table 6.3-1 is the <u>average</u> fare for the new passengers attracted by the proposed extension, exclusive of any passenger facility fee. The projections estimate that the incremental revenue is adequate to cover the incremental operating cost of the extension. Please note that, overall, Caltrain fare revenue has never been able to cover the Caltrain operating costs. The recession has clearly made the situation worse, all the more evident in that it has lowered the amount of subsidy available as well. The expectation that the downtown

extension would cover its incremental operating costs reflects the high number of new passengers that the extension is estimated to attract. This estimate was based on several factors, including current (2001) and future (2020) population and job forecasts, current (2001) ridership, and the expected changes in train service and fares.

Even if the year 2001 Caltrain ridership looks high from today's perspective, this analysis matched it with the employment and population data for that same time period. Future increases were likewise keyed to ABAG projections of job and population growth between 2000 and 2020. In between years, such as beginning of the extension service in 2010, were extrapolated from 2000 and 2020 data. To the extent that the current recession still has the local economy "off track" in 2010 or even 2020, then the ridership forecasts could be too optimistic, but where the Bay Area will be in its economic cycle at those times is impossible to estimate beyond the basic assumptions on jobs and population given by ABAG *Projections 2000*, the accepted and required basis of all ridership forecasts.

The commitment of $27 million of San Mateo sales tax funds in MTC's Regional Transit Expansion Policy (Resolution 3434) was made in late 2001, when sales tax revenues were beginning to decline, so some erosion of the revenue source is included in the commitment made at that time. Further, the funding plan does not assume that the $27 million escalates over time. However, sales tax revenue is experiencing some growth and is likely to continue to grow over time. This growth should minimize or eliminate the impact of the economic downturn on San Mateo's commitment of $27 million to the project.

Please also see Responses 2.2.1, 7.2.1, and 8.1.1.

7.2.8 League of Women Voters of the Bay Area, Doris Maez, North San Mateo County League of Women Voters, Onnolee Trapp, South San Mateo County League of Woman Voters, Eva Alexis Bansner, President, December 5, 2002

"We understand that the funding stream for this project is extremely complex. It would seem prudent to design the project so that, if funding falls short, some aspects could be postponed without compromising the ability to build them later, once new funding sources are found. For instance, components that will be necessary primarily for high speed trains should be planned as part of this process, even though construction may not occur until new funding for that project has been allocated...

"Costs relative to benefits – More information in Chapter 6 seem necessary to support new regional revenue sources such as bridge toll money or a possible gas tax. The Caltrain extension and Transbay Terminal was included in MTC Track 1 plans with costs per new rider that were lower than most project proposals."

"Operating Costs: (Page 5-115). As operating costs are often the hardest to raise, the cost increases for AC for the West Ramp option seem large. Can the sources of additional cost be clarified?"

"(Page 6-4, Table 6.3-1). A net surplus from additional fares of $2.76 per passenger is outlined to cover the cost of operating the Caltrain extension. Is this realistic in the light of the current state of the economy?"

Response 7.2.8 Please see Responses 7.2.7 and 8.3.1. Operating costs for AC Transit were calculated on the basis of travel time and distance assumptions and were provided by AC Transit staff.

7.2.9 BayRail Alliance, Margaret Okuzumi, December 20, 2002

"Containing Overall Project Cost: We believe that it is important to reduce the capital cost of the initial terminal construction to the lowest possible, viable amount to reduce interest expenses. Because the Transbay Terminal project will obtain substantial revenues through its Passenger Facility Fee, it makes sense to defer some elements of the project until higher passenger volumes can help pay for them.

- "We recommend that you eliminate, or postpone building, the massive, below-ground- level train yard at Seventh and Townsend Streets. The storage space it would yield does not justify its exorbitant cost. In lieu of expensive underground stub-end tracks that can only be used for storage, we recommend building additional through tracks (i.e., four tracks south of the Mission Bay station as far to Sixteenth Street) to provide both additional operating flexibility (at peak congestion times) and off-peak train storage space.
- "Future operating scenarios will result in relatively fewer trains requiring mid-day storage. Money would be better spent excavating a much smaller amount of fill to create a Caltrain tunnel at Sixteenth and Common Streets to allow for grade-separated street crossings.
- "We recommend that you engage in value engineering to determine elements of the plan, which can be constructed at a later date without sacrificing required near-term operational flexibility or incurring large "retrofit" expenses. These elements should be designed but left unconstructed. One example of this is the tail tracks, which can be constructed at a later phase and funded as the need arises, since they are not required for the level of service planned near term. However, tail tracks should be designed into the plan, and any necessary rights-of- way and easements acquired if necessary. We estimate this will save $100-$150 million in immediate construction costs, and more when debt service is included.
- "Similarly, postpone constructing the underground pedestrian connection to BART. We ask that it be included in the project design, but this connection can be built at a later date when pedestrian volumes at the terminal increase."

Response 7.2.9 Capital cost reductions that have occurred since the Draft EIS/EIR have been incorporated into the Project's financial plan contained in Chapter 6, Volume I, of this Final EIS/EIR (please see Response 7.1.1). Additional cost evaluations will occur as part of the value engineering activity to occur early in the design phases, and cost control measures have been assumed as part of the overall Project.

The co-lead agencies acknowledge the BayRail Alliance's views regarding funding priorities and its suggestions regarding Project elements that may be deferred. As noted in Response 7.2.4, a revised construction schedule and funding plan are included in the Final EIS that could and will be adjusted in the future should the need occur. At this point, the co-lead agencies are not proposing deferral of any Project elements (with the exception of the underground pedestrian connection to BART) but rather are reviewing means by which the integrated project parts could be funded over a realistic time frame with existing and anticipated future funding sources. Please see Response 2.2.5 regarding the possible deferral of the underground pedestrian connection to BART.

7.2.10 William Blackwell, Architect, December 2, 2002

"Page 6-8, Table 6.6-1. I have been told that Proposition 42 can be expected to provide at most only $100 million for these projects, not the $600+ million shown. How is this shortfall to be made up?"

Response 7.2.10 A revised Project funding plan is included in Chapter 6, Volume I, of the Final EIS/EIR. Please see Response 7.2.1.

7.2.11 Tay C. Via, Coblentz, Patch, Duffy & Bass, LLP, December 20, 2002

"Pages 5-19 - 5-32. Displacements and Relocation. What are the funding sources for the property acquisitions listed in the charts, and when do these funds become available?

"The project is only in its initial stages of identifying potential funding sources, and the vast majority of funds are as of yet unsecured, but the document does not discuss funding feasibility or timing. The entire financial and feasibility analysis is meaningless without this information, particularly since factors such as the 'midpoint of real estate costs' are central to that analysis. The financial information drives phasing and its physical impacts, which is a fundamental component of the Project Description and impacts analysis."

Response 7.2.11 A revised Project schedule (which helps determine project cash flow needs) is shown in Figure 5.20-8, Volume I, of this Final EIS/EIR. A revised financial plan, showing anticipated costs and associated revenue sources (taking into account the schedule for anticipated costs and revenues) is included in this Final EIS/EIR in Chapter 6, Volume I.

7.2.12 San Francisco Tomorrow, Jennifer Clary, President, Norman Rolfe, Transportation Chair, December 20, 2002

"Table S-5 appears to have an inaccurate entry (repeated on Table 6.6-1). The revenue generated by land sales and tax increment is the same for both the West Ramp and Loop Ramp alternative. But these two alternatives do not place the same amount of land into the Redevelopment Area – so these figures should be different for each alternative. This table (S-5, 6.6-1) also assumes a revenue stream from leverage lease transactions, with the footnote that 'Leveraged lease transactions are encouraged by the FTA as innovative financing mechanism.' Have the project sponsors considered as another 'innovative financing mechanism' the use of ground rents combined with sale of development rights, rather than land sales, to provide an inflation-proof revenue stream for the project?"

Response 7.2.12 Please see Response 7.2.4. Ground leases of the publicly-owned development parcels in the Transbay Project Area will be considered by the Redevelopment Agency as will other financing options. Currently, land sales are considered the most efficient option for treatment of the parcels given the potential to generate early funding for the overall Project. However, as the time for the development of the parcels gets closer, the state of the real estate market may reveal other options.

7.2.13 Peter Winkelstein, SPUR, Speaker, 11/26/02 Public Hearing

"There seem to be some mathematical, possible mathematical errors. For example, both of the alternatives show the same income from the sale of the abandoned Caltrans land which, of course, is impossible because in one case, there's a loop that uses a lot of the land. In the other, there isn't. Similarly, the tax increment financing is shown to be the same which again can't be the same because you can't develop as much with the loop ramp alternative."

Response 7.2.13 Please see Response 7.2.4.

7.2.14 Onnolee Trapp, League of Women Voters, Speaker, 11/13/02 Public Hearing

"And we have some concerns about the financial projections, especially if the full build is not done."

Response 7.2.14 Please see Response 7.2.7.

7.2.15 Arthur L. Meader, III, December 19, 2002

"Where is the money coming from for this 2-billion dollar project (the state budget deficit currently looks to be over $30 billion and the federal deficit is soon to follow this steep, upward curve, what with war and tax cuts)?"

Response 7.2.15 A revised Project funding plan showing anticipated funding sources is provided in Chapter 6, Volume I, of the Final EIS/EIR.

7.2.16 James M. Patrick, President, Patrick and Co., December 16, 2002

"How likely is this project to be funded given the current State of California funding crisis?"

Response 7.2.16 A revised Project funding plan showing anticipated funding sources is provided in Chapter 6, Volume I, of the Final EIS/EIR.

8.0 TRANSPORTATION/MODELING/TRAFFIC/PARKING

8.1 RIDERSHIP FORECASTS AND ASSUMED BUS AND RAIL TRANSIT SERVICES

8.1.1 Valley Transportation Authority, James E. Pierson, Planning and Development Director, November 25, 2002

"6. For the 2020 no action alternatives and project conditions, was the BART to Santa Clara extension assumed in the project network? If the BART to Santa Clara extension project was not included, how would ridership for the no project and project change if BART to Santa Clara is assumed?

"7. Please provide a description of the ridership-forecasting model that was used to produce the station-level Caltrain ridership estimates. In particular, describe consistency or inconsistency with the latest MTC regional models.

"8. In Table 3.1-14, under the 2020 Extension to the Transbay project alternative column, which land use assumptions are used for ridership estimates? Are these ridership estimates under 2020 cumulative conditions?

"9. Please provide the 2020 cumulative scenario estimates for Caltrain system ridership if not already included in Table 3.1-14.

"10. No mention of Caltrain system impacts outside of San Francisco are disclosed for either Santa Clara County or San Mateo County stations in the 2020 project or cumulative scenario conditions. For example, the document should identify project impacts such as park-and-ride space demand, platform capacity, and other impacts at existing core stations, particularly since ridership is shown to increase for virtually every station on the system. In addition, no increases beyond 170 trains are assumed for the no-project and project alternatives, yet ridership is estimated to increase substantially over levels estimated for the no-project. A description needs to be provided on the peak trainload impacts caused by the project alternative.

"11. It should be explained why ABAG Projections 1998 forecasts were used for year 2020 ridership estimates as opposed to the most recent regionally-adopted ABAG Projections 2000 forecasts."

Response 8.1.1 See response to comment 8.1.7 regarding Page 3-29, Table 3.1-15 (formerly Table 3.1-14) on BART to San Jose. Presumably, BART to Santa Clara would affect the No-Project and Project conditions about equally.

The ridership model was an incremental model originally developed for performing BART system planning by Manuel Padron & Associates. The model used incremental or pivot point techniques to account for changes in service area, level of service, and projected demographics, including proposed increases in development around the Transbay Terminal. It used 2001 conditions, including Caltrain ridership and corridor demographics, as a basis from which to estimate the effect on 2020 ridership of expanding service area with Transbay Terminal Station, increasing train levels and speeds, and changing fare structure. Because the model does not estimate transfers with other transit systems explicitly, the impacts on other transit systems were estimated from available projections by the San Mateo County model and the main MTC regional model. In contrast to the MTC regional models, the model is generally more accurate at the station level of ridership, but weaker in estimating the effects of major changes in other transit

systems. Hence, the incremental model projections were supplemented by data from the regional models for those effects. See below for a description of the expected effects on other transit systems.

The most detailed comparison of the incremental model with the MTC regional models has been with the San Mateo County model. Current "build" projections by the San Mateo County model for the Caltrain downtown extension were essentially identical to the incremental model's projected extension ridership in Table 3.1-15 (formerly Table 3.1-14) for both the total Caltrain ridership and the number of riders using the Transbay Terminal.

Additionally, the Federal Transit Administration has reviewed the ridership projection methodology and results produced for the Draft EIS/EIR and has found them to be reasonable.

The ridership forecasts in the Final EIS/EIR were modified to account for a projected level of 132 trains per day in 2020 instead of the previously analyzed 170 trains per day. The result was a decrease in daily ridership of one tenth of one percent, less than 200 daily ons and offs out of approximately 128,000 daily ons and offs projected for 2020. Because the 132-train concept would be concentrated in the peak periods with a maximum level of service while reducing service in the off-peak and evening periods, the projected ridership gain in the peak periods is projected to nearly compensate for the losses in the off-peak and evening periods, resulting in a negligible decrease in ridership compared with that presented in Table 3.1-14 of the Draft EIS/EIR. Thus the ridership numbers in this Final EIS/EIR have not been changed from those presented in the Draft EIS/EIR.

ABAG *Projections 1998* were not used in the ridership analysis. ABAG *Projections 2000* and, within San Francisco, the City and County of San Francisco (CCSF) projections for 2000 and 2020, were the basis for the ridership estimates. The current CCSF projections parallel the ABAG *Projections* and include a 2000 baseline as well as a 2020 baseline plus the anticipated effects of the Rincon Hill Rezoning, Mid-Market, SOMA, and Transbay projects. The project ridership included all of the cited projects, the 2020 cumulative condition, while the no-project ridership excluded the land use component of the Transbay Terminal project (cumulative minus Transbay Terminal).

Ridership projections were capped to avoid parking impacts in excess of those that would occur under the No-Project conditions, so no new impacts needed to be reported. Excess parking capacity at adjacent stations was assumed to be available for overflow from oversubscribed stations. Caltrain is planning a capital improvement program to expand parking to meet the long-term parking demand from expected ridership caused by improved train speeds and numbers of trains. Caltrain is also expanding and modernizing station platforms throughout its system to improve train operations and accommodate higher future ridership, particularly in San Mateo County. On a system-wide basis, the 2020 ridership is expected to grow as much from demographic change and increased service to 132 trains per day as from the downtown extension. Caltrain is preparing a long-range strategic plan that will address the station and line capacity issues resulting from this cumulative ridership growth.

Impacts of the downtown extension on other transit systems in 2020 were estimated as follows:

- BART ridership for the San Mateo County stations would decrease by 11 percent,
- SamTrans bus ridership would decrease by three percent,
- Muni ridership would decrease by four percent,
- VTA ridership would decrease by two percent, and

- No significant change was projected in ridership on Golden Gate Transit or AC Transit, although those systems might experience a slight increase due to the complementary nature of the Downtown Caltrain Extension.

Please note that these ridership losses for other transit systems result from Caltrain riders choosing to no longer transfer to these other providers or selecting the improved Caltrain service rather than the other service options to make the desired trip.

8.1.2 BART – Thomas E. Margro, General Manager, December 20, 2002

"In describing impacts on corridor transit patronage on page 5-119, the DEIR notes that the Transbay Terminal/Downtown Caltrain Extension Project would reduce future BART ridership primarily along the San Mateo County extension. However, the DEIR does not substantively analyze the potential ridership impacts on BART's transbay service, which currently handles over 140,000 trips daily. For instance, the DEIR only minimally discusses the situation on page 5-120, stating that the project 'would likely encourage transfers from Caltrain to AC Transit buses, thereby increasing AC Transit bus ridership.'

"For planning purposes, we would like the Final EIR to quantify potential system impacts on AC Transit and BART related to the improved Transbay Terminal. The Final EIR should also describe the assumed AC Transit transbay bus network and services levels used in the modeling process, as was done for SamTrans, Muni and Golden Gate Transit."

Response 8.1.2 The bus portion of the terminal is sized to meet a demand of about 6,000 peak hour transbay bus passengers by year 2020. This demand has been quantified in several studies including the 1991 San Francisco Bay Crossing Study, the 1996 Interstate 80 Corridor Analysis, the Transbay Terminal Concept Plan, and the July 2002 San Francisco Bay Crossings Study.

This latest study identified peak hour bus trips increasing from about 100 to about 160 and estimated that daily patronage in the Bay Bridge corridor would increase from about 20,000 to more than 43,000. This patronage is based on BART reaching capacity with some trips diverted to buses. The Transbay Terminal EIS/EIR used the information from the new Bay Crossing Study by reference; the Bay Crossing Study developed a complete transbay bus network for its modeling process. This Final EIS/EIR has been updated with the AC Transit information (Table 3.1-14).

Additional analyses of transfers between AC Transit and Caltrain performed in response to public comments suggested that extending Caltrain to the Transbay Terminal would not have a significant effect on the AC Transit ridership, although AC Transit might experience a slight increase in ridership due to the complementary nature of the Downtown Caltrain Extension. Likewise, no additional transfers to BART from Caltrain in downtown San Francisco were identified higher than 700 per day described in the Draft EIS/EIR. Please also see Response 2.2.1.

8.1.3 City and County of San Francisco; Traffic Engineering Division; Bond Yee, Deputy Director and City Traffic Engineer, Jack Fleck, Senior Transportation Engineer, Jerry Robbins, Transit Planner V, December 18, 2002

"Muni impacts – Assuming that the new developments do not build large parking lots, most trips to and from them will be by transit. Will there be a transit impact fee and is the fee adequate to offset service costs to Muni for the additional service required?"

Response 8.1.3 The City requires that all new office developments in the downtown C-3 zoning districts pay a transit impact fee of $5.00 per square foot to Muni before they are allowed to occupy their building. Muni over the years has accepted that fee as mitigation of transit impacts. Although the concept of charging a similar fee for retail and other land uses had been discussed, the transit impact fee is currently only applied against office use.

8.1.4 Transportation Solutions Defense and Education Fund (TRANSDEF), David Shronbrunn, President, December 20, 2002

"5-120: Because the expected most significant benefit of the Project is the synergy of bringing all the region's transit operators together at one location, it is especially important to evaluate the impact of this co-location on the ridership of each of the operators. It is not adequate to say that the Caltrain extension "would likely encourage transfers from Caltrain to AC Transit buses, thereby increasing AC Transit bus ridership." The increase in transit ridership should be evaluated for its impact on mode split, regional VMT and air emissions.

"5-135: Please explain the methodology used in developing the extraordinarily low projected Caltrain rider transfer rates to Muni Metro and BART.

"5-174: Because no additional parking or feeder transit service to Caltrain stations is assumed, it is clear that Caltrain patronage could increase significantly beyond projected levels, were these facilities to be added in the future. This is additional justification for the mitigations proposed at 3-25 above."

Response 8.1.4 Please see Responses 2.2.1, 8.1.1, and 8.1.2. The minimal nature of the expected increase in AC Transit bus ridership as a consequence of the train extension suggests that there would be no material additional change in mode split, regional VMT and air emissions beyond that reported overall in the Draft EIS/EIR. Transfers to Muni Metro and BART were based on a combination of regional model results and current data. Currently about three percent of Transbay Terminal users transfer to Muni Metro to complete their trip in the morning. The corresponding figure for transfers to BART is about two percent.

Increasing the level of parking at key stations where parking constrain ridership levels and improving transit access would generally give higher projections of increase Caltrain ridership. Caltrain is planning to expand station parking by about 3,000 spaces in the corridor under its capital improvement plan.

8.1.5 SPUR, Michael Alexander, Chair, SPUR Transbay EIS/EIR Working Group, December 20, 2002

"Page 3-29 states that Caltrain ridership would increase from about 13,000 to 29,300 daily boardings and alightings at the San Francisco terminal if the terminal station would be moved from Fourth and Townsend to the Transbay Terminal site. Is this significant increase due solely to the extension of Caltrain or also to the development of new office, retail and residential uses in the immediate vicinity of the new terminal that is considered part of the project? Also, page 5-120 states that the Caltrain extension would result in a shift in SamTrans passengers, which seems to account for 2,000 passengers or 4,000 of the daily boardings and alightings. Please clarify.

"Page 5-118 identifies a shift in mode share with the Transbay Terminal/Caltrain Downtown Extension Project for work trips between San Mateo and Santa Clara Counties and San Francisco.

Is the shift due solely to the extension of Caltrain, or is it also partially due to development in the area associated with the Redevelopment Plan component of the project? Please clarify.

"Page 5-120: Please quantify the increase in transfers between Caltrain and AC Transit and Golden Gate Transit, or explain why they aren't quantified.

"Page 5-121: The reduction in person-hours of vehicle travel by seven percent seems high. What is the reduction in travel times based on? Was the significant development in the South of Market area considered?

"Page 5-136: Would it be possible to provide access to the pedestrian tunnel from street level? If so it would serve many more people than the 108 currently identified.

"Transbay Terminal Components: How can the Loop Ramp Alternative with almost double the number of bus bays handle only 68% of the passengers of the West Ramp Alternative?"

Response 8.1.5 The changed land use also affects the projections, but this effect is minimal in these projections compared with the expansion of the catchment area of the downtown Caltrain station as a result of its shift to the Transbay Terminal, more or less the center of downtown employment. The analysis assumes that Caltrain would gain about 2,000 current SamTrans passengers, almost all from the discontinuance of express service in the US 101 corridor. That would total about 4,000 boardings and alightings out of approximately 128,000 per day. The seven percent reduction applied to travel in the US 101/Caltrain Corridor. It did not account for increased delay in San Francisco due to the multiple South of Market developments. Please see the response to Comment 8.1.1.

As part of the design to occur during later stages of the Project, access from the street to the tunnel would be considered at various locations along the route. The Draft EIS/EIR is not correct regarding the number of passengers that could be accommodated with the Full Loop Alternative. Both terminal options would accommodate projected bus movements equally well, and this reference has been changed in Volume I of this Final EIS/EIR (please see Response 7.1.1).

8.1.6 Andy Chow, Director, BayRail Alliance, Speaker, 11/12/02 Public Hearing

"Regarding the EIR, it seems to me that the ridership for Caltrain could be higher. I think that the ridership has been somewhat conservative, and a little bit too strict in terms of their assumptions of the Caltrain service levels. I think that if they can play around with what kind of service levels that there is and possibly include high-speed rail, and maybe – perhaps, there will be much greater ridership, more than enough to justify the project. Now, the project projection does justify it. But I believe there will be more. Thank you."

Response 8.1.6 The methodology used for and the findings of the Caltrain Extension ridership forecasts used in the Draft EIS/EIR were recently reviewed by the Federal Transit Administrative and found to be reasonable. Also see response to Comment 8.1.1. Ridership numbers for the California High Speed Rail system are included in this Final EIS/EIR. The source for these numbers is the California High Speed Rail Business Plan (California High Speed Rail Authority, 2000).

8.1.7 League of Women Voters, Sarah Diefendorf and Tuesday Ray, Co-President, League of Women Voters of San Francisco, November 22, 2002

"Page 1-17. Caltrain ridership data is already nearly 2 years old and reflect a period of peak ridership during a boom economy. There has been a 17% decline in weekday riders since October 2001 (Source: JPB agenda packet for 10/31/02 meeting). The mix of northbound and southbound riders has most likely changed as well.

"Page 1-19. Similarly, cited data for San Francisco employee residency and mode of work trips is quite dated, citing data from 1990 and 1995, respectively. Given the decline in Caltrain ridership since February 2001, Caltrain projections may be inaccurate.

"Page 1-24-25. Is the reduction of auto trips estimate based on the number of daily auto trips that take place before or after the Caltrain/BART connection in Millbrae is implemented? Since the base case (no project alternative) includes the BART extension to the San Francisco International Airport, the reduction should be based on the number of auto trips after the BART extension is in service, but that is not clear in the discussion. Please clarify.

"The estimated reduction in auto trips may be affected by the opening of BART service to Millbrae and the resulting connection with Caltrain, will give where northbound commuters will have the option of getting to downtown locations on BART."

"Pages 3-1 to 3-5. The discussion relating to Caltrain level of service and fare structure is dated. Current service is 76 trains on weekdays, with no service on weekends until March 2004 for construction of passing tracks and other upgrades of the signaling system, trackwork, and other improvements to allow for "Baby Bullet" express service. An average 10% fare increase took effect in July 2002. One-way fares now range from $1.50 to $7.25, and discounted midday "offpeak" fares no longer apply. Caltrain ridership is currently well under 35,000 weekday trips.

"Page 3-28. Caltrain ridership projections with 170 trains/day sound almost too optimistic. An increase to 50,000 riders/day from the current ridership figures of around 30,000 riders is even more optimistic than the stated 35,600 daily trips in February 2001.

"Page 3-29, Table 3.1-14. Why do daily Caltrain boardings at Millbrae decrease in 2020 with the downtown extension (5,948) compared to No Project (8,370)? There is no discussion of possible impact on Caltrain ridership of a BART extension to San Jose. It was noted on page 1-19 that drive-alone rate is highest (44%) from South Bay to SF, with lowest transit mode (37%) while East Bay to SF is 55% transit.

"Page 3-30, Table 3.1-15. The title of this table is misleading, since it includes trips from Redwood City to Concord and from Oakland to San Carlos, which clearly must include BART and Muni segments. It does not appear to include the addition of the Baby Bullet service."

"Page 5-118. Linked transit trips for the region increase by 10,000/day. This is good, but is really only a little over 1% of the total. The discussion on increase in Caltrain ridership is vague, and contains no discussion of cost/rider.

"Page 5-119. The predicted 9% decline in BART ridership in San Mateo County is cause for concern for county taxpayers who will be responsible for BART losses in that corridor. (See comment about page 3-29.) This sounds like it will be difficult to get beyond an operating deficit in the BART/SamTrans agreement. What is the financial equivalent? Will the expected decline in SamTrans expenses offset the BART losses?

"Page 5-135. Estimates of Caltrain and AC Transit transfers to BART and Muni based on a 2001 survey found 5% of riders would make such a transfer. However, only half of the AC riders are assumed to use the underground tunnel, which translates to 2.5% of AC Transit riders because the AC Transit loading area is aboveground. All Caltrain riders making the transfer are assumed to use the underground tunnel because the Caltrain platform is underground. Therefore, based on 10% of 50,000 daily Caltrain riders disembarking at the downtown terminal, (see page 3-6) there would be 5% of 5,000, or 250 potential roundtrip users of an underground tunnel from Caltrain to BART or Muni. Based on 15,205 daily AC Transit riders, (see page 3-15) 2.5% or 380 AC Transit riders would use the underground tunnel. In addition, 108 pedestrian trips are expected to be diverted from the Fremont and Mission Streets intersection. This appears to add up to 738 daily users of an underground tunnel. Is this correct? It would have been helpful if a table were included that adds up these estimates.

"Page 5-107. Elimination of SamTrans routes to downtown is of concern to coastside commuters. Coastside locations, such as coast towns Daly City, Pacifica, would be better served (they say) by continuation of bus service to downtown San Francisco, not by feeder to BART or Caltrain.

Response 8.1.7 Please see Responses 2.4.11 and 7.2.7. The data on the journey to work, employee residency, and mode of work trips from the 2000 U.S. Census has yet to be made available to update the referenced data. The estimated reduction of auto trips assumes the existence of the Caltrain/BART connection in Millbrae. The discussion of pages 3-1 to 3-5 regarding the current Caltrain level of service and fare structure has been updated in Volume I of this Final EIS/EIR. For the Final EIS/EIR, Caltrain ridership has been modeled to reflect 132 trains per day in the Year 2020, as shown in Caltrain's current Strategic Plan. This assumed reduction in service results in a reduction primarily of off-peak trips, given that the number of peak-period trains is maximized under the 132-train scenario.

The decrease of Caltrain boardings at the Millbrae Station reflects the anticipated effect of fewer riders transferring to and from BART at Millbrae with the advent of the downtown extension. The extension of BART to San Jose was not analyzed by this model, and ridership for the BART extension to San Jose is currently under review by FTA.

Since the current Caltrain service does not go to downtown San Francisco, the use of Muni is implicit in all trips to downtown San Francisco. Table 3.1-15 has been annotated to make explicit the use of Muni for connecting to downtown San Francisco and BART for connecting to the East Bay. The times quoted in the table did assume the addition of Baby Bullet service, but reflected the <u>average</u> trip time during the peak period, not just those on the Baby Bullet express service. The latter was assumed to take 49 minutes between San Jose and San Francisco, with four intermediate stops. Baby Bullet trip time from Palo Alto to San Francisco was assumed to be 31 minutes, with two intermediate stops. This contrasts with local service, which was assumed to require 76 and 51 minutes, respectively, for those trips in 2020. The "average" time on the train for those trips was estimated to be 62 and 40 minutes, respectively.

Page 5-118 of the Draft EIS/EIR discusses impacts to corridor transit ridership, not Caltrain per se. Please refer to Subsection 3.1.6.1 and 3.1.6.2 for a discussion of Caltrain ridership. Cost per rider is used to evaluate projects competing for funding under the FTA "New Starts" program. This Project is not pursuing New Starts funding.

The proposed Project has a multiplicity of goals, including reducing travel time for existing Caltrain passengers as well as attracting new passengers. Please note that the Federal Transit

Administration (FTA) has been phasing in a new measure of benefit for rail projects competing for "New Starts" funding. This measure, known as "user benefit," is intended to capture all aspects of benefit that a project would generate for travelers. Examples of these benefits include: a faster transit trip for existing transit users; avoidance of costly parking charges in the central business district, and the value of having an additional attractive option to driving or carpooling.

The projected decline in BART riders from the Caltrain Downtown Extension would consist primarily of Caltrain riders originally attracted to BART from Caltrain with BART's extension to Millbrae. With the downtown Caltrain extension, a portion of these former Caltrain riders are expected to switch back to Caltrain.

It is anticipated that ridership on both BART and Caltrain will be reviewed and adjustments in service levels would be made as needed to balance revenue and expenses. The BART/SamTrans Comprehensive Agreement provides for the two agencies to "work together on a regular basis to review revenue, expense and patronage data and, based thereon, to jointly determine actions to be taken to maximize ridership, minimize expense and generate net operating surpluses."

The purpose of analyzing the impact of the underground connection between the Transbay Terminal and BART was not to determine the number of people who would use the tunnel, but to determine the effect on intersection level of service in the peak 15-minute period. The conclusion in Section 5.19.6.1, Volume I, of this Final EIS/EIR has been changed to say, "A total of 108 pedestrian trips are expected to be diverted from the Fremont and Mission Street intersection during the 15-minute peak period." The section has been modified in this Final EIS/EIR to clarify the analysis.

The 108 15-minute peak period pedestrian trips diverted from the Fremont & Mission intersection were calculated by adding together people expected to use the tunnel from the following generators:

- Pedestrians generated by the redevelopment
- Pedestrians traveling to/from AC Transit, including those transferring to/from BART or Muni
- Pedestrians traveling to/from Caltrain, including those transferring to/from BART or Muni

For each group, the following factors were used to determine the number that would potentially use the underground terminal:

- Peak hour ridership on AC Transit or Caltrain in 2020, converted to peak 15-minutes
- The percentage of transfer activity between modes
- The percentage accessing each mode as pedestrians
- The percentage anticipated to otherwise use the Fremont & Mission intersection, based on the direction pedestrians travel to/from the terminal per the SFTA model
- The percentage estimated to use the underground tunnel versus streets.

At the present time, SamTrans does not anticipate elimination of routes outside of the Caltrain corridor with implementation of the Caltrain Downtown Extension. The SamTrans express bus routes considered for elimination (to which page 5-107 of the Draft EIS/EIR refers) would be in the Caltrain corridor, not on the coastside. Improving Caltrain service is independent of transit access from the coastside.

8.1.8 League of Women Voters of the Bay Area, Doris Maez, North San Mateo County League of Women Voters, Onnolee Trapp, South San Mateo County League of Woman Voters, Eva Alexis Bansner, President, December 5, 2002

"On pages 1-17, 1-19 ridership from a boom period and mode split from 1990 and 1995 are used. In Chapter 3, Caltrain level of service and fare structure does not reflect recent changes.

- "How does the recent drop in ridership with economic decline affect projections? Will ridership shifts shown on Page 3-29, Table 3.1-14 and on page 5-119 (decreased Millbrae boardings) fiscally impact SamTrans?
- "Do projections take into account BART to San Jose service?
- "Are Baby Bullet travel times included in Page 3-30, Table 3.1-15/could they be? Include note that East Bay travel times include other transit providers.

"Reduction of auto trips: (Page 1-24-25). It appears from the chart that the primary cause of projected Caltrain ridership increases is the improvement in travel time due to Caltrain improvements, with additional substantial travel time savings after the Extension. Does the estimate take into account an operating BART extension to the San Francisco International Airport? What if Caltrain is not electrified by 2006?"

Response 8.1.8 Please see Responses 7.2.3 and 8.1.7.

8.1.9 Onnolee Trapp, League of Women Voters, Speaker, 11/13/02 Public Hearing

"It's not entirely clear how many train cars could unload at one time and at what speed, what space between trains, that sort of thing, from the drawings in the book. The previous several years ago go-around had a little more explicit information, so I was looking for that this time and not finding it."

Response 8.1.9 Please see Response 3.3.1.

8.1.10 Ken Bukowski, Councilmember, City of Emeryville, Speaker, 11/12/02 Public Hearing

"Another concern is that when BART to San Francisco Airport is completed, that Caltrain will lose ridership. We have to be careful here. We want to keep the viability of this terminal so we don't lose it."

Response 8.1.10 Please see Reponses 8.1.7.

8.2 TRAFFIC IMPACTS/DESIGN

8.2.1 California Department of Transportation, Timothy C. Sable, District Branch Chief, December 20, 2002

"Traffic Operations: Page 3-35 (section 3.2.4): Regarding conversion of High Occupancy Vehicle (HOV) ramp operations from Sterling Street to Essex Street. It is not clear how this would benefit motorists unless the City has plans to provide useful HOV bypasses on city streets approaching the ramp that function at least as well as what currently exists at Sterling Street. Also, since Essex Street feeds a full lane onto the Bridge, it may be necessary to reduce this to a merge with the First Street on-ramp traffic (as it was pre-Lorna Prieta earthquake) if changed to HOV operation because of the necessity of keeping the lane full in order to maximize the capacity of the Bridge.

"Page 3-35 (section 3.2.4): "Harrison Street would be restriped to one-way westbound from First Street to Third Street". This would have a significant impact on the operation of a number of intersections, particularly at Second Street/Harrison Street and Second Street/Bryant Street. It would also remove one of the primary directions of approach to the Essex Street on-ramp. Has this modification been considered in the reported levels of service of these intersections?"

Response 8.2.1 As noted on page 3-34 of the Draft EIS/EIR, these street improvements are planned by the City and County of San Francisco and not part of the proposed Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project. The projects were assumed as part of the No-Project Alternative and included in the traffic modeling.

8.2.2 City and County of San Francisco; Traffic Engineering Division; Bond Yee, Deputy Director and City Traffic Engineer, Jack Fleck, Senior Transportation Engineer, Jerry Robbins, Transit Planner V, December 18, 2002

"Level of Service Comments: For the most part, the transit operations which this project serves will operate on grade separated facilities – AC Transit on ramps and Caltrain underground. Therefore, the traffic impacts from the Terminal itself should not be too significant. SamTrans, Golden Gate Transit, and Muni operate on surface routes, so they will be affected by traffic generated from the redevelopment project. With regard to these new developments, the City policy of not building large parking garages with new buildings should help prevent these buildings from generating large volumes of traffic. In fact, considering that most of the land to be developed is currently occupied by parking lots, the total net increase in traffic generation should be minor. Therefore, we have a question about the sentence on page 5-125, which states, 'The Terminal/Extension Project would result in a substantial increase in vehicle trips to and from new developments.' How was this calculated?

"Table 3.2-1 on page 3-34 does show numerous intersections operating at traffic LOS F, particularly on 1st Street. This congestion is due to queuing for the Bay Bridge in the PM peak. In fact the actual conditions are somewhat worse than shown on this table. Our observations show that traffic backs up on 1st Street at least to Market Street about half the time during the PM commute periods. This percentage has fluctuated since the 1989 Loma Prieta earthquake from about 30% to 70% depending on various factors including the state of the economy. This queuing condition is not likely to change, but it could get worse, e.g. the back-up could be every night. The City deploys Parking Control Officers to keep intersections open, and we have re-routed buses to help them avoid getting stuck in the queue.

"On page 5-124 the report lists 7 intersections as having adverse impacts due to the project. An additional six intersections are listed on page 5-125 as having adverse impacts under cumulative conditions. Of these 13 adversely impacted intersections, 11 are part of the Bay Bridge queue. We agree with the suggestion on page 5-126 that funding for the SFgo program could be a useful mitigation effort. The SFgo program will provide improved traveler information so that drivers will be aware of the queuing and possibly change plans to adjust to it, prior to starting their trip. In addition, SFgo will have traffic monitoring cameras that can be used to dispatch parking control officers in a timely fashion when the queue begins to form.

"The other two intersections with adverse affects – Beale/Howard and Fremont/Howard are not part of the queue. Therefore, we would like to see mitigations to improve operations here. It appears that the intersections along Fremont Street were only looked at in the PM peak hour. This street is more congested in the AM peak than the PM peak due to the Fremont Street off-ramp from the Bay Bridge, so the report probably is not looking at the worst case impacts.

Response 8.2.2 The San Francisco County Transportation Authority (SFCTA) countywide travel demand model was used to develop the travel forecasts for cumulative development and growth in the region, as well as to determine the travel demand associated with the project. The model determines the future travel demand and the origin/destination and travel mode (auto, transit, walk and bike) for each trip, and assigns those trips to the transportation network.

Although individual projects in the Transbay Terminal area may not provide enough parking to meet their demand and may displace existing parking facilities, the model assumed that parking would be available throughout the area, although the parking would have a high cost. As a result, the Model did predict an increase in the transit mode share in the future. If sufficient parking were not provided within the Transbay Terminal area, however, additional drivers may shift to transit, which would result in a reduction in the traffic volumes projected from the model and as analyzed for the project. For this and other environmental documents, the projection of vehicle trips is a function of the type and amount of various planned land uses and not directly related to parking availability so that the analysis in the EIS/EIR is by its nature conservative and comparable to other San Francisco environmental documents.

The poor weekday PM peak hour operating conditions at the intersections of Howard/Beale and Howard/Fremont in the future would be directly related to operations of the San Francisco-Oakland Bay Bridge. Currently, there is a high volume of traffic traveling on Beale Street to Howard Street to First Street to access the bridge from the downtown area. With the future development in the Transbay Terminal area, in conjunction with the general increase in traffic volumes throughout the downtown, the number of vehicles using this route is anticipated to increase by the year 2020, resulting in the levels of service indicated in the report. Due to the configuration of these intersections and the queued conditions, no feasible mitigation measures were identified. Additional, explanatory text has been added to the traffic Section 5.19.4, Volume I, of the Final EIS/EIR to acknowledge traffic congestion due to queuing for the Bay Bridge.

In general, intersection operating conditions during the weekday morning commute period are less congested than during the evening commute period. During the PM peak hour, there are severely congested conditions throughout the area, resulting from queues from the Bay Bridge on-ramps. Although there are higher volumes on some streets in the morning, such as Fremont Street leading from the Bay Bridge off-ramp to the financial district, the queued conditions are contained on the freeway and intersection operations are generally unconstrained. As a result, any congestion is local and directly related to operations at specific intersections (e.g., at the

intersection of Fremont/Howard associated with morning carpool drop-off). This EIS/EIR evaluates the PM peak conditions as being those that could have the highest potential for adversely affecting the surrounding area as a result of this Project.

8.2.3 SPUR, Michael Alexander, Chair, SPUR Transbay EIS/EIR Working Group, December 20, 2002

"Autos and Parking, Page 5-122: Why does Table 5.19-4 have Existing plus Project conditions, while the text header is Baseline plus Project? This is somewhat confusing. 2020 Baseline plus Project seems understandable and indicates that it is not a true Existing (2002) condition.

"Page 5-123: What does the shading on Table 5.19-5 represent? Some of the "adverse effect" intersections are shaded, but not all. Were some missed?

"Page 5-126: The EIS expects there to be 7 intersections with "adverse and unmitigable" traffic impacts. The only improvement proposed is that the City may request developers to contribute to the new Integrated Transportation Management System program. Since developer participation is not mandatory and this system has not yet been implemented, what evidence is there that it might ameliorate these specific traffic impacts?"

Response 8.2.3 The terminology in the text and tables of this Final EIS/EIR clarify that it is the 2020 Baseline Plus Project and 2020 Cumulative conditions that are being addressed. The shading was originally meant to designate only the intersections that degraded to Level of Service (LOS) E or F. Impacts on intersections already at LOS E or F that did not change the level of service required review by the Department of Parking and Traffic to determine if there was an adverse impact. For consistency, all adverse impacts are now shaded and so noted in Table 5.19-5, Volume I, of this Final EIS/EIR. The contribution to the proposed Integrated Transportation Management System (ITSM) cannot be required as a mitigation measure because this separate EIS/EIR is not the decision-making document for application of this system. As more projects make contributions to the ITMS, it is expected to be implemented by the City Department of Parking and Traffic.

8.3 TRANSIT IMPACTS

8.3.1 Transportation Solutions Defense and Education Fund (TRANSDEF), David Shronbrunn, President, December 20, 2002

"3-25: The high existing peak period transit capacity utilization indicates a need for mitigation for the increased passenger demand resulting from the Project. Please evaluate the impact of increased use of the Terminal on the need for additional Muni service, to maintain acceptable service standards. Note, for example, on 5-114 how the ground level loading area will operate near capacity for existing levels of transit service. Determine locations for loading for the full complement of transit service needed to adequately serve the new Terminal.

"3-26: Verify that the capacity utilization numbers in Table 3.1-13 are comparable. Describe the capacity utilization service standards for the other transit operators.

"3-28: The asserted 140% increase in 3.1.6.1 is incorrect.

"3-48: The discussion is unnecessarily complicated by the inclusion of BART patrons that did not use the Terminal in the AM. Because they are irrelevant to any useful conclusions, they should be deleted.

"5-115: Please provide an explanation for why operating costs for AC Transit will increase beyond existing levels.

"5-119: Include the Muni and other transit operator cost savings in a comprehensive analysis of Fiscal and Economic Impacts.

Response 8.3.1 Please see Response 2.6.2. For all of the transit operators in Table 3.1-13, capacity refers to the total number of seats provided for all runs during the PM peak period (typically 5:00 – 6:00 pm). These figures are based on the operator's capacity standards as identified in their Short Range Transit Plans, which are accepted by the Metropolitan Transportation Commission. MTC's acceptance of the SRTP standards by definition creates compatibility on a regional basis. Consequently, the capacity utilization numbers are comparable. To make the EIS/EIR data comparable, only passenger seats were used for analyses in terms of ridership/capacity. Section 3.1.6.1, Volume I, has been revised to note that Caltrain ridership is expected to grow by 40 percent system wide.

Both alternatives for a new Transbay Terminal include a design option of a pedestrian underpass between the Transbay Terminal and the Embarcadero Muni Metro/BART Station. The volumes of passengers transferring between the transit services at the Transbay Terminal and BART may be an important factor in evaluating the merits of the underground passageway. Consequently, this discussion has been retained in this Final EIS/EIR.

Transit operating costs are evaluated in Section 5.19.1. Operating costs for AC Transit were calculated on the basis of travel time and distance assumptions. Table 5.19-2, Volume I, has been corrected to show a comparison of existing AC Transit operations for the various design options. The estimated 40 percent increase in AC Transit costs results from the increased deadheading to the off-site bus storage facility. Please see Response 2.6.7.

8.3.2 James Dear, Speaker, 11/12/02 Public Hearing

"We are also concerned about the transit impacts for the residents in the nearby area. Document says 125 will be canceled, the 45, the 30, the 10, and all we get is a central subway. As far as I read, we're going to have a stop on Third and King, and, and then again at Moscone Center. Three blocks either way. I count four bus lines. It doesn't seem that San Francisco is friendly for the people living in the immediate area."

Response 8.3.2 This comment is referring to the proposed New Central Subway Project rather than the Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project. The commentor should forward his comments to Sue Olive, Tennis Tsa, or John Thomas at Muni.

8.3.3 League of Women Voters of the Bay Area, Doris Maez, North San Mateo County League of Women Voters, Onnolee Trapp, South San Mateo County League of Woman Voters, Eva Alexis Bansner, President, December 5, 2002

"Bus Service Suspension: (Page 5-107). Elimination of SamTrans routes to downtown is of concern to coastside commuters. Would suspension of service lengthen commutes from locations such as Pacifica?"

Response 8.3.3 The travel time on SamTrans Line DX Pacifica – San Francisco between the Linda Mar Shopping Center and the Transbay Terminal is 47 minutes. Without the Line DX, Pacifica's coastline residents could take SamTrans Line 110 from Linda Mar Shopping Center to the Daly City BART Station and make a timed transfer on the Richmond BART line to the Embarcadero BART Station. The total travel time on this alternative route would be 52 minutes, including transfer time. Please also see Response 8.1.7.

8.3.4 League of Women Voters, Sarah Diefendorf and Tuesday Ray, Co-President, League of Women Voters of San Francisco, November 22, 2002

"Page 5-115. This looks like a huge cost increase for AC Transit for the West Ramp option, which is the lowest overall cost option in all other respects. Is this increase based on the increased mileage required for offsite storage?"

Response 8.3.4 Please see Response 8.3.1.

8.3.5 William Blackwell, Architect, December 2, 2002

"Page 1-10. The one-mile "gap" will be partially erased for those Caltrain riders who transfer to BART at Millbrae.

"Page 1-11. I don't have a copy of an August 1996 ridership report by Charles River Associates, but a later report by the High-Speed Rail Authority* put the loss at 110,000 annual riders (not 200,000) if HSR is terminated at Fourth & Townsend. Assuming weekend and holiday travel at 70 per cent of normal, this loss is only 332 riders per workday. The same report places the cost of HSR extension to the Transbay Terminal site at $270 million, which would be an incredible amount to pay for a net gain of only 332 daily riders-less than one half of one per cent of the total riders.

"Simply providing long- and short-term parking spaces at Fourth & Townsend would probably increase San Francisco HSR riders by double or triple that number.

"*California High-Speed Rail Authority "Revised Staff Recommendations for VHS Route Adoption" July 14, 1999, page 14, stated that "By terminating the Peninsula VHS routing at the 4 &

Townsend Station site, about $270 million can be saved in construction costs while reducing the length of the system by less than one mile... ridership and revenue for long-distance travelers would only be slightly less than the Transbay Terminal alternative... 110,000 less riders per year which leads to $4 million less revenue per year." Total annual riders was 23.1 million at that time, and now is projected to be 36 million."

Response 8.3.5 The commentor's use of the term "partially" is correct. Riders who transfer at the Millbrae Intermodal Station would save about four minutes (with an additional cost of $2.50) compared with the current Caltrain trip. By comparison, the Transbay Terminal Station would save downtown Caltrain riders about 14 to 15 minutes.

Ridership estimates for high speed rail varied depending on whether they were at the conservative end to produce revenue projections for the business plan or higher levels for calculating environmental impacts, so there can be valid differences. The California High Speed Rail Authority notes that actual ridership could be at least twice that shown for the conservative revenue projections, and these higher estimates are used to evaluate impacts in the Tier 1 EIS/Program EIR currently under public review for the California High Speed Rail Program. In fact, the legislation (SB 1856) placing the high speed rail program on the state ballot states that the first phase shall be "Between San Francisco Transbay Terminal and Los Angeles Union Station."

Provision of parking for high-speed rail patrons could be more achievable in the Fourth and Townsend area, but the area is currently constrained by new development for the Mission Bay Development. Parking over the train yard may be achievable but would be costly. Given the City of San Francisco's "Transit First" policy, the preferred mode of arrival for high-speed rail patrons at a San Francisco high-speed rail terminal is by transit, taxi, or kiss-and-ride.

8.4 PARKING

8.4.1 Titan Management Group, Michael Alfaro, Vice President, December 12, 2002

"The Clocktower has entered into an agreement with Caltrans to lease the parking lot off Harrison Street behind Marathon Plaza. This lease will run from the completion of the Western Approach Seismic Repair until December 31, 2038.

The Environmental Document should analyze whether any of the ramp alternatives would have an impact on this lot and mitigate any impacts that may occur.

"The Clocktower has entered into an agreement with Caltrans to use the parking lot at Second and Harrison until completion of the western approach Seismic Repair. This lot is identified for future redevelopment. The timing of that redevelopment is not stated. No potential development of that site should interfere with the Clocktower's ability to use that lot in accordance with its agreement with Caltrans."

Response 8.4.1 The commentor refers to the parking lot behind the Marathon Plaza building and asks for an analysis of impacts on this parcel due to the Loop Ramp versus the West Ramp Alternative. In particular, the commentor asks about impacts on a claimed agreement between the Clocktower and Caltrans to lease this parcel until 2038. Caltrans and the Clocktower have an agreement regarding the lot at the corner of Second and Harrison Streets as a result of impacts from Caltrans' West Approach Seismic Retrofit Project. That agreement will provide parking facilities to the Clocktower during and after completion of the West Approach Project to the year 2038.

Both ramp alternatives would use approximately the same configuration near these two parking lots for bus access to the terminal and bus storage areas. (See Figures 2.2-1 and 2.2-7 in the Draft EIS/EIR). There are no differing impacts to either lot from the Loop Ramp versus the West Ramp Alternative. Even if temporary closure of the parking lot behind Marathon Plaza is required for construction of the ramps, that closure would not affect the Clocktower's agreement with Caltrans over the lot at the corner of Second and Harrison Streets.

9.0 CULTURAL/HISTORIC RESOURCES

9.1.1 Charles Edwin Chase, AIA, Executive Director, San Francisco Architectural Heritage, December 4, 2002

"New Transbay Terminal – The DEIS/DEIR does not provide for a preservation alternative for the removal of the existing Transbay Terminal Building, a contributing resources to a National Register eligible property. The two alternatives represent a total replacement of the building and ramp system, which are listed as contributing elements to National Register eligibility. We believe this is inconsistent with federal requirements, which stipulates special efforts be made to protect historic sites. We disagree that a prudent and feasible alternative cannot be designed that would minimize harm to the known historic resources.

"Caltrain Extension from Fourth & Townsend Streets to a New Terminus below the proposed New Transbay Terminal – The two extension alternatives indicate the preferred 'cut and cover' construction method and alternatively, 'tunneling' south of Folsom Street. Tunneling would reduce the adverse effect of loss of contributing resources to the San Francisco South End Historic "VI" District and Rincon Point/South Beach Historic District, and minimize the Project's impact on known contributing historic resources.

"In all cases, retention of the three structures at Howard and Second Street were determined infeasible. Significant subway construction in other major metropolitan cities including New York and Washington DC was accomplished without removal of existing buildings of greater magnitude than those within the proposed tunnel alignment.

"In addition there are several technical issues contained within the DEIS/DEIR which require we would like to call to your attention.

"Section 4.16.6 – This section references the classification of historic resources identified in Article 11 of the San Francisco Planning Code. The DEIS/DEIR lists Category II rated buildings as both significant and contributory and does not reference Category III buildings. This is inconsistent with Article 11 of the code.

"Section 5.14.3.4 –
"1. Mitigation measures are identified which include recordation. The DEIS/DEIR states: 'The mitigation measures identified above are suggested measures; actual measures will be set forth in the MOA. Although recordation eliminates one adverse effect of demolition, the loss of historical information, it does not present the tangible loss of historically significant properties." We believe this to be an inaccurate statement. Previous court decisions have stated that recordation is not a sufficient mitigation to reduce the level of effect below adverse.
"2. Page 5-91 references The Foundation for San Francisco's Architectural Heritage. The legal name of the referenced organization is San Francisco Architectural Heritage."

Response 9.1.1 Please see Section 8.6.1 of the EIS/EIR, Comment 2.9.1 from Caltrans, and Response 2.9.3. Section 8.6.1 of the EIS/EIR notes that construction of a Caltrain Downtown Extension – as directed by Proposition H passed by the San Francisco Voter in 1999 – would require demolition of the existing terminal. No reasonable alternative appears to exist for bringing Caltrain into the existing terminal. Additionally, the retrofit of the existing terminal would not allow for provision of high-speed rail service (please see Response 2.9.3), also a requirement of Proposition H and an intended purpose of this Project. Finally, as noted in Comment 2.9.1, the existing terminal still requires upgrades to meet ADA and building codes.

The subject of effects analysis for the Transbay Terminal and other historic properties and mitigation of those effects is addressed in two documents: (1) a Finding of Effect (FOE), and (2) a Memorandum of Agreement (MOA). The FOE has been prepared because the Project is expected to have an effect on one or more historic properties. This document applies the Criteria of Adverse Effect [36 CFR 800.5(a)(1) and (2)] to the historic properties identified in the survey reports and determines whether the Project will have "no adverse effect" or an "adverse effect" on those properties. The document describes the individual effects that are expected to occur to each historic property. A summary of the FOE is provided in Volume I of this Final EIS/EIR in Sections 5.14, and the FOE is incorporated into this Final EIS/EIR by reference.

The MOA, shown in Appendix G, Volume I of this Final EIS/EIR establishes what will be done to mitigate the adverse effects to historic properties as identified in the FOE. This document presents the individual components of the mitigation strategy that will be implemented to mitigate, avoid, or reduce adverse effects. Several types of mitigation are included, such as preparation of an archeological treatment plan, recordation documents, a salvage plan, interpretive displays, and educational material.

Consistent with this comment, the tunneling option for the Caltrain Downtown Extension was selected by the Transbay Joint Powers Authority in March 2003 as the Locally Preferred Alternative for purpose of this Final EIS/EIR, thereby substantially reducing the effects of the extension on historic properties (please see Response 3.2.1).

It is true that many projects have been completed successfully in other metropolitan cities by tunnelling under existing properties. The success of tunnelling depends to a great degree on the ground conditions. In the area of Second and Howard Streets, the soils are exceptionally soft and weak, and the excavations required would be very wide to provide for multiple tracks leading into the train terminal. It would be technically feasible to construct a single tunnel or perhaps twin bores under a building. However, in the vicinity of Second and Folsom Streets it is not considered practicable to open so many tunnels so close to each to accommodate the multiple tracks planned for this portion of the Project. Please also see Reponses 3.2.4.

The typographical error on page 4-48 of the Draft EIS/EIR in Section 4.16.6, Historic and Cultural Resources, has been corrected. The second to last sentence on the page now reads as follows: "Categories I and II are considered significant buildings, while Categories III and IV are designated as Contributory Buildings."

Section 5.14 has been rewritten in this Final EIS/EIR, Volume I, to note that mitigation does not "eliminate" an adverse effect, nor reduce it to "below adverse" levels. The Final EIS/EIR has been changed to use the legal name of the referenced organization as the San Francisco Architectural Heritage.

9.1.2 Mary MacDonald, President, Oakland Heritage Alliance, December 5, 2002

"The Oakland Heritage Alliance is particularly concerned about the loss of the Transbay Terminal because this National Register eligible property is a regional resource as part of the San Francisco Oakland Bay Bridge. However, Oakland Heritage Alliance recognizes that although the Transbay Terminal has served its purpose well in the past, it cannot accommodate an intermodal station which would include a below grade train station and so needs to be replaced by a new structure at the present site that would a landmark of the future. This is the ideal location for a regional transportation hub that will afford efficient transit connectivity.

"However the mitigations for the loss of this historic resource are inadequate. We urge a thorough documentation of the building itself and its role as part of transportation history. The information should be available to the public in a usable, interesting form. A prominent space should be allocated in the new building for a permanent exhibition. In fact, a Bay Area Transportation Mini-Museum could be accommodated in the terminal with this as a permanent exhibit. And the very solid comfortable oak benches, which are beloved by bus riders, should be reused in the new facility."

Response 9.1.2 Please see Response 9.1.1. A prominent space will be identified during the design phase of the terminal for an exhibit regarding historic resources.

9.1.3 League of Women Voters, Sarah Diefendorf and Tuesday Ray, Co-President, League of Women Voters of San Francisco, November 22, 2002

"Page 5-75. How will impacts on the Bay Bridge structure be mitigated, also with respect to NRHP?

"Page 5-91. Regarding mitigation of loss of historic structures: The first option of listed Relocation is extremely unlikely. Recordation, Interpretive Display, and Salvage seem practical, but how much do these options really compensate for the loss, and how is such loss calculated?"

Response 9.1.3 Please see Response 9.1.1. Please also see Response 9.1.7 regarding the feasibility for relocation of historic structures. As noted in the response, such mitigation would be very difficult.

The co-lead agencies understand that these historic structures are valuable cultural resources, and Project planning has included substantial efforts to preserve them to the extent possible, while still meeting the purpose and need of the Project. Under CEQA, the application of recordation does not reduce the impact to a less than significant level and does not in an of it self mitigate for the loss of these resources. The degree to which proposed mitigations compensate for the loss of these resources is a subjective determination, and the co-lead agencies do not feel that such a loss can be calculated, at least in a quantitative sense. The Finding of Effect (FOE) document incorporated into Volume I of this Final EIS/EIR (in Sections 5.14, 7, and 8) discusses the effects that the loss of these structures would have.

9.1.4 League of Women Voters of the Bay Area, Doris Maez, North San Mateo County League of Women Voters, Onnolee Trapp, South San Mateo County League of Woman Voters, Eva Alexis Bansner, President, December 5, 2002

"Historic Context: The consideration that the existing terminal cannot perform its original function safely is persuasive but the mitigation for loss of historic structures is too vague. 'Dynamic continuity' is a creative concept that needs more contextual specificity to be a mitigation.

- "What mitigations are likely to be included "Memorandum of Agreement"? (What is previous Redevelopment Agency practice in comparable cases?)

"Are any of the other historic buildings to be removed also seismically unsafe?"

Response 9.1.4 See response to comment 9.1.1, above, specifically regarding the preparation of an MOA. The types of mitigations in the MOA, as shown in Appendix G of Volume I of the Final EIS/EIR includes, but are not limited to: archival quality recordation of existing building and features, permanent on-site interpretive exhibit; museum exhibit;

documentary videography; salvage, and design features for the new buildings and structures. The Redevelopment Agency has used these techniques successfully in other redevelopment areas. At this stage of the Project, it is not within the scope of this EIS/EIR to evaluate the safety of existing structures under seismic conditions, as this is not germane to the building's removal. ..

9.1.5 California Department of Transportation, Timothy C. Sable, District Branch Chief, December 20, 2002

"Cultural Resources: Page 1-28 (Table 1.2-4) should be revised to include the required legislative approval under California Public Resources Code Section 5027 (see additional information below)."

"Page 2-47 (section 2.3.1.1) describes one of the alternatives, "Renovation of Existing Transbay Terminal and Associated Structures," which was considered but withdrawn. This alternative precludes underground rail, but instead would require construction of elevated rail structures for Caltrain or high-speed rail access. According to the DEIR, this alternative was withdrawn because the anticipated seismic strengthening would preclude the project goal of revenue-generating development. The fact that the Transbay Transit Terminal and the ramps are National Register-listed properties calls for a more substantive discussion regarding the possibility of preserving the properties.

"Page 5-75 (section 5.14.3.1) should address California Public Resources Code Section 5027, which states, "Any building or structure that is listed on the National Register of Historic Places and is transferred from state ownership to another public agency shall not be demolished, destroyed, or significantly altered, except for restoration to preserve or enhance its historical values, without the prior approval of the Legislature by statute. This section applies to any building or structure transferred from state ownership to another public agency after January 1, 1987."

"Section 5.14.3.5 should additionally evaluate the effects of demolition of the ramps and Transbay Transit Terminal on the San Francisco-Oakland Bay Bridge.

"Page 5-91 (section 5.14.3.5) discusses potential mitigation. Because the project would have effects on the San Francisco-Oakland Bay Bridge, any Historic American Buildings Survey/Historic American Engineering Record documentation on the Transbay Transit Terminal and ramps should be filed additionally with the Department. Additionally, if the Department no longer owns the Transbay Transit Terminal, the "Interpretive Display" would be the responsibility of the project proponents, not the Department. Opportunities for collaborating with the Department on the completion of mitigation tasks for effects to the San Francisco-Oakland Bay Bridge should be investigated."

Response 9.1.5 Please see Response 9.1.1. The Findings of Effect (FOE) has be added to Section 5.14.3.5, and Chapters 7 and 8, Volume I, of this Final EIS/EIR and includes a discussion of the effects of the demolition of the ramps and Transbay Terminal to the San Francisco-Oakland Bay Bridge as an historical resource. Table 1.2-4 and Section 5.14 have been revised for this Final EIS/EIR to reflect the required legislative approval. In accordance with California Public Resources Code Section 5027, the Transbay Terminal and terminal loop ramp, as NRHP-eligible structures that would be transferred from state (Caltrans) ownership to another public agency (the Transbay Joint Powers Authority) may not be demolished without the prior approval of the California Legislature. The California Legislature has considered the importance of proceeding with the Transbay Transit Terminal project and has granted a specific exemption to

State Law prohibiting the demolition of historic structures with the following language: "the Legislature hereby approves demolition of the Transbay Terminal building at First and Mission Streets in the City and County of San Francisco, including its associated ramps, for construction of a new terminal at the same location, designed to serve Caltrain in addition to local, regional, and intercity bus lines, and designed to accommodate high-speed passenger rail service." (AB 812, 2003)

Response 9.1.5 Assembly Bill 812 (Yee), currently pending in the state legislature, addresses this requirement. It is understood by the co-lead agencies that mitigation would be the responsibility of the Project.

9.1.6 SPUR, Michael Alexander, Chair, SPUR Transbay EIS/EIR Working Group, December 20, 2002

"Historic/ Cultural Resources (Sections 4.165.14 & 7.2)
"Section 5.14.2, Archaeological Resources, Mitigation: By stating that mitigation measures for both archaeological and architectural resources would be set forth in an MOA, the EIS/EIR is deferring the mitigation. Per CEQA Section 15126.4(a)(B): "Formulation of mitigation measures should not be deferred until some future time. However, measures may specify performance standards which would mitigate the significant effect of the project and which may be accomplished in more than one specified way." Deferring mitigation to a future MOA without setting performance standards in the EIS denies the public its opportunity to provide input on the proposed mitigation, and makes the EIS inadequate.

"Section 5.14.3.3, Redevelopment Components: The conclusion that neither of the redevelopment alternatives would have an adverse impact on historic properties does not seem correct. Since the intention of creating a redevelopment area would be to encourage and facilitate new development in the designated area, there could be an increased likelihood that historic resources located within the area would be altered or demolished. The EIS should identify protections against such impacts.

"Section 5.14.3.4, Affected Properties:

- "Please note that the 670-680 Second Street building has been altered in recent years and converted to an office building. As such, the structure no longer appears as depicted in this document. A Negative Declaration was prepared by the City of San Francisco for the alterations to this property.
- **"**Section 5.14.2 refers to mitigation for architectural resources, but its mitigations are about archaeology. There should be a separate section on mitigation of architectural resources. See our comments about adequacy in Section 5.14.2, above. Providing a list of types of measures and stating that these are merely suggestions is not adequate. It should be stated here which, if any, of these mitigation measures would have the potential to reduce impacts to a less than significant level and whether such a conclusion would be different for different buildings.
- **"**Please explain what is meant in the last sentence of Section 5.14: "... recordation eliminates one adverse effect of demolition..." Since demolition means the total loss of a building and results in a significant unavoidable impact for an historic resource under CEQA, how does recordation eliminate one adverse impact?

"Section 7.2, Unavoidable Significant Adverse Effects Under CEQA: This section should list which buildings and districts would be significantly impacted under each alternative. The lack of clarity of the Historic and Cultural Resources section makes this doubly important."

Response 9.1.6 The Draft EIS/EIR states in Section 5.14.1 that known or potential historic-era archaeological sites exist in the Project's footprint, and that there are areas with high historic archeological sensitivity. Given that the Project area is covered with urban development or pavement, it is not possible to determine the precise locations for these resources. The mitigation measure in the EIS/EIR is therefore to establish, as the Project's design progresses, a comprehensive research design and treatment plan for archeological resources prepared by a qualified consultant. The Research Design/Treatment Plan will be consistent with the Secretary of the Interior's Standards and Guidelines for Archaeological Documentation (48 FR 44734-37) and take into account the ACHP publication, Treatment of Archaeological Properties: A Handbook (ACHP 1980), and SHPO guidelines.

The Research Design/Treatment Plan will include, at a minimum:

- An Historical Context for the Area of Potential Effects for Archaeological Resources (APEAR).
- Research Context for the APEAR.
- Testing/Data Recovery Plan that will specify, at minimum:

    - The properties or portion of properties where evaluation and/or data recovery are to be carried out;
    - The properties, if any, that will be affected by the Undertaking but for which no data recovery will be carried out;
    - The manner in which inadvertent discoveries will be treated;
    - The methods to be used for data recovery, with an explanation of their relevance to the research questions/themes;
    - The methods to be used in cataloguing, analysis, data management, and dissemination of data;
    - The proposed disposition of recovered materials and records, including discard and deaccession;
    - The manner in which any human remains and associated/unassociated funerary objects, including those of Native American or Native Hawaiian origin, will be treated;
    - The security procedures to be undertaken to protect the archeological testing/data recovery site from vandalism, theft, or unintended damage;
    - The final report summarizing, describing and interpreting the results of testing/data recovery;
    - The measures to be undertaken to ensure curation of recovered data determined to have appropriate research potential.
    - Research Design/Treatment Plan Review

TJPA will submit the Research Design/Treatment Plan to all parties to the MOA for a thirty (30) calendar day review following receipt of the Plan, and will take any review comments into account, revise the Research Design/Treatment Plan accordingly, and notify any party whose comments were not incorporated into the Plan.

This is a typical approach to these types of urban projects. It has been added to this Final EIS/EIR, Volume I, in Section 5.14.2, Archaeology Resources Mitigation, and is included in the MOA (Appendix G, Volume I of the Final EIS/EIR).

The redevelopment of parcels for the proposed Transbay redevelopment plan area is limited to the publicly owned parcels and a few small private holdings within the publicly owned parcels. The public parcels do not have any historic structures on them and the small private holdings are not historic resources. The redevelopment plan does not call for redevelopment by acquiring

private parcels. If private owners are encouraged to redevelop their own properties, they would have to pursue their own environmental and historic clearances as any private development is not a part of the proposed redevelopment plan.

The building at 670-680 Second Street has been renovated since the time of its last evaluation; nevertheless, it retains its status as a contributing element of a National Register District in the OHP Historic Property Datafile for San Francisco County as updated through January 2003. A current photograph has been provided in Section 5.14, Volume I, of this Final EIS/EIR. This Final EIS/EIR now provides better distinction between the archeological and historic architecture mitigation measures.

The specific adverse effects to historic properties are identified in the Finding of Effect (FOE) document produced under Section 106. A summary of the Finding of Effect Document is provided in this Final EIS/EIR in Section 5.15, Volume I, and the FOE incorporated by reference. Unavoidable adverse effects under CEQA are shown in the CEQA Findings Chapter 7.

9.1.7 San Francisco Tomorrow, Jennifer Clary, President, Norman Rolfe, Transportation Chair, December 20, 2002

"As shown in the attached Figure 1, San Francisco Tomorrow advocates reviewing the track alignment at Second and Howard Streets for opportunities to reduce the number of historic buildings that are endangered.

"The mitigation measures on Page 5-91 should be clarified. How will the feasibility of relocation of historic buildings be determined? The comment about the scarcity of open land in San Francisco is inappropriate; the fate of an historic building should be determined not by its destination, but by the properties of the building itself. This mitigation measure needs to be corrected and clarified.

"Why isn't an option included for preserving all or part of the buildings in place? A study should be made of the possibility of saving buildings that might otherwise be demolished during construction of the Caltrain Downtown Extension by means of bracing, underpinning, or other means of support. What is the possibility of preserving at least the facade of one or more of the endangered buildings?"

Response 9.1.7 Please see Response 5.1.2. The feasibility of relocating one or more of the historic buildings will depend on the structural condition of each individual building. Until the structural and foundation plans are reviewed and evaluated, it is not possible to make a commitment that any of the existing buildings can be safely relocated. The logistics of moving buildings in the streets of downtown San Francisco would require not only an exceptionally detailed level of planning but also consideration of physical constraints that may preclude relocating the buildings to vacant lots. The presence of overhead structures such as at Howard and Fourth Street, and at Howard between First and Second Streets would make it impossible to transport the buildings beyond these physical constraints. Similarly it would not be possible to transport the buildings under I-80 to reach the vacant lots in the Mission Bay Area.

Underpinning and bracing are not considered effective means of preserving the subject buildings because of the large size of the underground opening anticipated. It is not economical or practical to construct a structural system that can have sufficient span to transfer the building loads beyond the limits of the required excavations.

It is not considered practicable to preserve the building façades in what is expected to be a very busy and congested construction site. Preservation would require moving the façades off-site, storing them for the duration of construction, and returning them to the site after completion of construction. The technical and economic feasibility of this option can be evaluated during detailed design.

Lifting the buildings off their foundations, moving them to a storage site, and then returning them to the original site can also be evaluated during detailed design. The most significant factor is to find a site that is accessible without having to pass under an existing overhead crossing such as the various Transbay Terminal connectors, I-80, and the footbridge at Fourth and Howard Streets.

9.1.8 Greg Patterson, December 18, 2002

"There are, however, some areas of the EIR that are clear and pose a threat to the history and character of the city. As it stands, many of the historical buildings on the north-west side of Howard Street at Second Street would be demolished (and possibly replaced with parking structures). Once torn down, historical buildings will not come back, and an important character and personality of the city will be lost. This is our neighborhood, and part of San Francisco's unique character will be lost through these demolitions.

"Historic Fabric. In the three historic districts that are affected by the layout of the rail lines, a number of buildings which contribute greatly to these districts would be demolished under the cut-and-cover alternative. Even under the tunneling alternative, a number of buildings at the corner of Second Street and Howard Street would be lost. The geologic study, which would reveal whether tunneling is not only possible but economically feasible, is not yet complete. It may be argued that it is not possible to support structurally a tunnel under the Second and Howard corner since the tracks here would have to cover a wider area in order to accommodate rail track-switching.

"However, an alternative route underground should be studied to see whether it is possible to alter the tunnel alternative slightly in order to save more of the historic resources at Second and Howard. See the example provided (Mlynarik) which shows a fine-tuning of the route at this corner in order to preserve more of the threatened buildings. In any case, a strategy could be developed to remove the subject buildings or parts of them. For historic integrity of the buildings in these districts, the front facades of the threatened buildings could remain propped and stabilized in place while the tunneling is going on, and reconstructed afterwards. In this scenario, only those parts of buildings which must be removed would be removed.

"The more difficult, and less desirable, solution would be to have the three contributory buildings at Second and Howard relocated during construction and then moved back. The EIR/S states that this could be done if a place were found to put the structures. The preservation of all the threatened buildings should be required to be listed as a mitigation measure for the consideration of the decision makers and sites for temporary location should be found.

"Some of the historic resources are well described (Chapter Five, pp.5-71 to 5-91) but curiously the present Transbay Terminal Building is not shown graphically or described in this section."

Response 9.1.8 The desire to preserve historic resources played an important role in the decision to select the tunneling option for the Caltrain Downtown Extension as the Locally Preferred Alternative (LPA) – please see Response 3.2.1 through 3.2.14 – which will preserve 10 historic buildings that would have been demolished under the cut-and-cover option that was not

selected for the LPA. Please see Response 3.2.4 for the reasons that the structures on Howard Street need to be demolished.

Numerous alignments have been reviewed against the train design criteria to minimize impacts to historic structures and to the community in general. Please see Section 2.3, Alternatives Considered and Withdrawn, of the EIS/EIR, Volume I, and the numerous responses to comments in this Volume II of the Final EIS/EIR regarding alternative alignments, for example.

The description of the Transbay Terminal building and ramps is included with the other resource descriptions in Chapter 4, Volume I, specifically Sections 4.16.6.1 and 4.16.6.2 of this Final EIS/EIR. Chapter 5 presents impacts to the resources described in Chapter 4, and the effects to the terminal and ramps are described in Sec. 5.14.3.4. Photographs of the existing Transbay Terminal and ramps have been added to this section.

10.0 PUBLIC OPEN SPACE/PARKS/VISUAL IMPACTS

10.1.1 San Francisco Tomorrow, Jennifer Clary, President, Norman Rolfe, Transportation Chair, December 20, 2002

"Please add a map of the Redevelopment Area that includes the size and location of the open spaces listed on Page 5-39."

Response 10.1.1 A map showing anticipated land uses, including open space under the current Draft *Transbay Redevelopment Project Area Design for Development Vision* (August 2003) is included in the Final EIS/EIR, Volume I, as Figure 2.2.27. Please see Section 2.2.4.2, Figure 2.2-26, and Appendix F of the Final EIS/EIR, Volume I, for a discussion regarding the provision of open space and parks under the redevelopment plan.

10.1.2 James M. Patrick, President, Patrick and Co., December 16, 2002

"I found no plans for any use of the properties that were acquired and demolished once the project was completed. Has any consideration been given to parks and/or public areas or will the land be sold to the highest bidder?"

Response 10.1.2 Please see Response 10.1.1. The Agency is currently developing plans for the land to be acquired for the Project. Some of it will be converted to open space after it is no longer needed for the transportation improvements. Other land will be developed as affordable housing. Still other land will be sold to developers in conformity with the Agency's *Draft Transbay Redevelopment Project Area Design for Development Vision* (August 2003) document and design guidelines. The Agency's draft August 2003 document and design guidelines will be finalized before the redevelopment plan is adopted. Please see Section 2.2.4.2, Volume I, of this Final EIS/EIR for additional discussion of the reuse of property.

10.1.3 James Wittmann Dear, November 18, 2002

"I live in the project area. The neighborhood needs parks. I am concerned that an opportunity to establish a park where my dog can play will be lost. Especially, when I read that all that is foreseen in the Redevelopment are 'two new "green" open spaces.' What does this "'green" open space' mean? (5.5.1 [p. 5-39])."

Response 10.1.3 The *Draft Transbay Redevelopment Project Area Design for Development Vision* (August 2003) document released by the San Francisco Redevelopment Agency describes proposed new open space and includes maps with proposed locations of the open space. Please see Section 2.2.4.2, Figure 2.2-26, and Appendix F of the Final EIS/EIR, Volume I.

It is important to remember that this is a downtown neighborhood and will not be able to accommodate the amount of open space that currently exists in other neighborhoods. However, the *Draft Transbay Redevelopment Project Area Design for Development Vision* (August 2003) document envisions dedicating more than one acre out of the nine acres of available public land in the proposed Project Area to open space, and the vision includes streetscape improvements including widened sidewalks that feature open space amenities, especially on Beale, Main, and Spear Streets. That is, the total effective open space would be greater that just the addition of traditional "green park space." The *Draft Transbay Redevelopment Project Area Design for Development Vision* document also includes plans for leveraging public resources for the creation of additional open space both within and adjacent to the proposed Project Area.

10.1.4 James Dear, Speaker, 11/12/02 Public Hearing

"We have an opportunity for open space, for parks. We live in a lot of concrete there. I don't see a lot of green space proposed, especially for dogs and such like that."

Response 10.1.4 Please see Response 10.1.1, 10.1.2, and 10.1.3.

10.1.5 League of Women Voters of the Bay Area, Doris Maez, North San Mateo County League of Women Voters, Onnolee Trapp, South San Mateo County League of Woman Voters, Eva Alexis Bansner, President, December 5, 2002

"Land Use: (Page 2-44). The land use mix assumed is dominantly residential which would provide a desirable balance for the intense job center of San Francisco. The Full Build alternative also includes 1,184,590 square feet of office space...

"The open space and community services assumed to suffice should be related to the amount of housing to be built. Does San Francisco have relevant standards or precedents?"

Response 10.1.5 The City of San Francisco does not have formally adopted standards pertaining to the provision of open space on a district-wide level. However, there are requirements and standards for private open space connected with housing and publicly accessible open space associated with downtown (C-3) office space. Section 139 of the City Planning Code states that office uses in the C-3 districts shall pay $2.00 per square foot to the Downtown Park Special Fund to create parks and recreational facilities in the central business district. The City's General Plan contains a Recreation and Open Space element that describes different classifications of public open spaces in San Francisco including the areas which they serve (Citywide, District, Neighborhood and Sub-neighborhood), and provides goals and policies for these service areas. Moreover, the General Plan's Downtown Area Plan contains a set of guidelines for downtown open space that details the types of open space appropriate for downtown, and includes a listing of the preferred design elements.

The Transbay Redevelopment Plan will have its own set of requirements for providing open space (please see Response 10.1.1). The San Francisco Recreation and Park Department owns and manages over 3,300 acres of open space in the City and County of San Francisco. The combined City, state, and federal property permanently dedicated to open space totals approximately 4,090 acres, or 5.5 acres per 1,000 San Francisco residents. This is about half the established standard set by the National Park and Recreation Association (NPRA), which calls for 10 acres of open space per 1,000 population in cities. Given the City's existing development patterns, high population density, and small land mass, achieving the NPRA standard will likely never be possible (personal communication as cited in Case No. 1999.233E, Recreation and Park Department, Robert McDonald, 2003). The City attempts, however, to increase the per capita supply of open space whenever possible through the creation of new plazas and opens spaces such as those included in the proposed project. Please also see Responses 10.1.1, 10.1.2, and 10.1.3

10.1.6 SPUR, Michael Alexander, Chair, SPUR Transbay EIS/EIR Working Group, December 20, 2002

"Visual & Aesthetic Issues, Summary Project Description, p. S-3: No-project alternative: There is no discussion of the need to seismically upgrade the existing Transbay Facility. Wasn't the expense of doing this one of the main reasons for rebuilding the facility?

"Section 5.16, Visual and Aesthetic Environmental Consequences and Mitigation Measures. The minimal graphic representation of the Loop Ramp Alternative makes it difficult to gauge its visual and aesthetic impacts.

"5.16.1 No-project alternative, p. 5-92, 93:
- "The existing terminal would require extensive seismic renovations. There is no discussion of the negative aesthetic impacts this could have.
- "Do continued existence of the bus ramps contribute to declining levels of maintenance and investment in surrounding properties, and therefore constitute a future negative aesthetic impact?

"5.16.2 Transbay Terminal, p. 5-93:
- "Figure 5.16.2 does not clearly show the difference between the west ramp (stacked) and the loop ramp (split) scenarios. It shows existing and stacked ramps only.
- "Model of Potential Redevelopment Sites and Scale, Fig. 5.16.3, p. 5-99: Please provide evidence of the likelihood that developers would propose high-rise projects, especially residential high-rise development, in such close proximity to one another as shown in the illustration.

"5.16.5 Changes to Scenic Views and Vistas
- "The loss of views mentioned in the report is not illustrated. Are these lost views from existing buildings, or from public spaces and streets? If the former, then it should be noted that the new development will replace these views with an equal or greater number.
- "On page 5-98, the report states that the spacing between the new towers in the redevelopment area would be greater than is typical north of Market, but the model illustrated in Fig. 5.16-3 seems to show towers spaced as close or closer than the north of Market St. condition.

"5.16.6 Change in the Cityscape: Illustrations 5.16.4 and 5.16.5 do not show the views that are "more differentiated as the stepping up of development heights towards downtown is realized. The views as illustrated are much more monolithic and undifferentiated than described, especially in Fig. 5.16-5. Better illustrations would be helpful.

"Summary Table, p.S-16, Visual/Aesthetics Impact Category:
- "No-Build Alternative: Will this alternative have additional visual impacts due to requirements that existing facilities need to be seismically upgraded?
- "Transbay Terminal Components:
  - "Because there are no supporting illustrations of the Loop Ramp Alternative, other than a site plan diagram, it is not possible to evaluate the visual/aesthetic impacts of this scheme.
  - "Based on the illustrations and text provided, it is clear there are significant differences between the two terminal alternatives. The West Ramp Alternative replaces a single-deck loop ramp with one double-decked ramp; how does this make the ramps "less visually intrusive"? How does the Loop Ramp Alternative enhance views? Views from where?"

"Chapter 2, Description of Project Alternatives: In general, the almost complete lack of illustrations of the Loop Ramp Alternative make meaningful analysis of the visual and aesthetic impacts of this scheme impossible.

"Redevelopment Components: There are two redevelopment alternatives; it seems highly unlikely that the two alternatives will have the same visual impact. Does the text in the table refer to both schemes?"

Response 10.1.6 Please see Caltrans Comment 2.9.1 and Response 9.1.1.

The West Ramp Alternative would consist of permanent stacked bus ramps that would connect the Bay Bridge to the Transbay Terminal. These ramps would be in approximately the same position as the existing Transbay Terminal ramps which run roughly parallel to Essex Street from the bridge to the terminal, but would not require any additional ramp segments on the eastern side of the terminal. Conversely, the Loop Ramp Alternative would construct a one-way loop of bus circulation with direct connections to the Bay Bridge on both the east and west sides of the terminal. The ramp segments of the Loop Ramp Alternative would run along Essex Street to the terminal and then loop around east of the terminal just past Beale Street, then follow Clementina Street westward and reconnect to the loop just north of Folsom Street. The visual nature of the Loop Ramp would be similar in its location to the current ramp structure for the existing terminal, although with new ramps leading to the facility.

In contrast to the West Ramp Alternative, which would facilitate bus circulation on a stacked ramp system, the Loop Ramp Alternative would require additional land area dedicated to ramp segments, and as discussed on page 5-2 of the Draft EIS/EIR. This alternative could "continue to be seen by some as a barrier in the district, walling off uses inside the loops from uses outside." These additional ramp segments would be visible looking into or outside of the district from Beale and Howard Streets. The West Ramp Alternative would enhance views by reducing the overall land area in the district dedicated to elevated ramp structures.

Additional seismic renovation of the existing structure would principally affect its interior. The text regarding Figure 5.16-2 has been changed for the Final EIS/EIR to note that it provides a visualization of the stacked ramps proposed under the West Ramp Alternative.

The existence of bus ramps do contribute to declining investment in the surrounding area. This was one of the key reasons for selection of the West Ramp Alternative as the Transbay Terminal component of the LPA. Under the West Ramp Alternative, some of the ramps would be removed altogether. The redevelopment plan includes significant funding for pedestrian improvements and the creation of new open space, including space underneath the west ramps to the Transbay Terminal. The space underneath these ramps could be programmed for such active uses as basketball and handball courts, as well as landscaping and public artwork.

Please see Response 4.2.5 regarding Figures 5.16-3, 5.16-4, and 5.16-5 in the Draft EIS/EIR. New development proposed as part of either the Full Build or Reduced Scope alternatives would result in the loss of some existing skyline views across the district from new buildings. Public view corridors along streets would be largely preserved by new development that would create an orderly and uniform street wall (e.g., on Folsom Street) and would require setbacks of upper-level building masses... The *Draft Transbay Redevelopment Project Area Design for Development Vision* (August 2003) document refines the building form and development program from what is presented in the Draft EIS/EIR so as to minimize impacts on important public views by reducing the number of towers, widely spacing towers, and deliberately locating them to avoid casting too much shadow on new and existing parks and streets. Further sculpting of the height proposal likely will include lowering of heights along alleyways to create an appropriate scale and allow sunlight based on the width of the street.

For clarification, the text on in the Summary of this Final EIS/EIR now reads as follows (underlining refers to new text): "Under either alternative, Folsom St. building heights would be taller than existing. Provisions for development would help protect views, preserve open space,

and enhance the pedestrian environment. Under the Full Build Alternative, buildings may be broader and shorter, with setbacks preserved. Under the Reduced Scope Alternative, buildings would be taller and more slender, preserving more of the existing views."

Certainly, the No-Project Alternative would result in visually different development within the Transbay Terminal Area. As long as the current buildings would continue to exist in the district, the visual character of the area would not necessarily improve. If there were to be development with the area, it would conform to existing zoning and not the Redevelopment Area's *Draft Transbay Redevelopment Project Area Design for Development Vision* (August 2003), rezoning, or revitalization efforts. The No Project Alternative would not establish a redevelopment area, and would thus not meet project objectives of alleviating blight and revitalizing the Transbay Area by replacing the district's existing deteriorating buildings with a coordinated redevelopment program. There is the potential that if no action is taken, buildings could continue to deteriorate and could cumulatively affect the overall image of the neighborhood, particularly if such buildings do not meet the requirements of the City's Unreinforced Masonry Building (UMB) Ordinance. The UMB Ordinance requires existing unreinforced structures (buildings containing load-bearing walls constructed of either brick, adobe, stone or mortar without steel reinforcement) to be strengthened within specific frames (through 2007), or face demolition.

The UMB Ordinance specifies time limits in which retrofitting work must occur. At present, there are approximately 500 remaining UMBs in the City, with approximately 22 UMBs identified in the study area. Of these 22 buildings, 14 have applied for a retrofit permit, and the remaining eight would most likely be demolished. If the existing buildings were to be demolished by private entities and new buildings constructed, these would be required to meet the City's design guidelines; such development, though meeting the guidelines, would likely be less coordinated or integrated across the area than under the proposed project.

In the context of the major potential construction of up to 7.6 million square feet of new development, including high-rise buildings, within nine city blocks, the visual differences from the Loop Ramp Alternative versus West Ramp Alternative would generally be minor. Additionally, views of the ramps themselves would principally be limited to adjacent streets and from the windows of upper levels of private buildings.

11.0 PUBLIC UTILITIES / SERVICES

11.1.1 San Francisco Tomorrow, Jennifer Clary, President, Norman Rolfe, Transportation Chair, December 20, 2002

"Please include information on the increased volume of sewage that would be expected at full build-out, and the corresponding increase in CSOs (combined sewer overflows) into Mission and Islais Creeks."

Response 11.1.1 The Project area is served by the San Francisco combined sewer system, that handles both sewage and stormwater runoff. The Project would meet any wastewater pre-treatment requirements of the San Francisco Public Utilities Commission as required by the San Francisco Industrial Waste Ordinance. No new sewer construction other than hook-up would be needed because the Project site is already served by existing sewer infrastructure. Furthermore, since stormwater runoff contributes greatly to the total flow and the various aspects of the Project sites are already paved, the project would a minimal effect on the total wastewater volume discharged to the combined sewer system. The Project would add a small incremental amount that most likely would not result in additional CSOs into Mission and Islais Creeks.

11.1.2 League of Women Voters, Sarah Diefendorf and Tuesday Ray, Co-President, League of Women Voters of San Francisco, November 22, 2002

"Page 4-21. Response times for Fire Department are not given. This important statistic is kept by all fire departments, and should be readily available.

"Pages 5-36 and 5-37. It is highly interesting that the increased demands for fire and police services could be met by 'reorganizing existing staff.' Does it follow that either these services are currently overstaffed or that service will be understaffed when the proposed development takes place?"

"Page 5-70. The paragraph about communications is very inconclusive. Viability of redevelopment for both offices and residences depends greatly on the availability of telephone utilities, and the statement by Pacific Bell that it would take many years to complete relocation is very unsettling.

"Page 5-106. There are concerns that dependence on only PG&E or Hetch Hetchy source of electricity seems risky both in terms of supply and cost, unless SF is willing to make a deal regarding its Hetch Hetchy power. The report vaguely hopes that deregulation will alleviate these problems."

Response 11.1.2 Additional discussion and analysis of police, fire, energy, and public utilities has been added to Sections 5.4 and 5.12, Volume I, of the Final EIS/EIR in response to this comment. The co-lead agencies will explore all avenues prior to relocating expensive utilities. Selection of the tunneling option for the Caltrain Downtown extension for the Locally Preferred Alternative will reduce necessary utility relocations, as compared to the cut-and-cover option. It should also be noted that construction of the Caltrain Downtown extension component of the project would likely take several years to complete. The information that Pacific Bell (subsequently renamed to SBC Communications, Inc.) has provided is preliminary and, as stated on page 5-70 of the Draft EIS/EIR, would require an in-depth study to determine specific construction required to relocate existing communication lines. However, there is no indication

that such relocation is not possible or would result in adverse environmental effects. Please also see Comment and Response 3.2.1.

11.1.3 League of Women Voters of the Bay Area, Doris Maez, North San Mateo County League of Women Voters, Onnolee Trapp, South San Mateo County League of Woman Voters, Eva Alexis Bansner, President, December 5, 2002

"Emergency Services: (Page 4-21). Response times for Fire Department are lacking. Will response times be affected? What is potential for loss of communications as in BART to airport project?

"Power: (Page 5-106). The implication that reliance on city or PG&E electricity is a problem to be alleviated by deregulation needs some explanation.

"Land Use: (Page 2-44). The land use mix assumed is dominantly residential which would provide a desirable balance for the intense job center of San Francisco. The Full Build alternative also includes 1,184,590 square feet of office space...

"The open space and community services assumed to suffice should be related to the amount of housing to be built. Does San Francisco have relevant standards or precedents?"

Response 11.1.3 Please see Response 11.1.2. Please see Responses 10.1.2 and 10.1.3 regarding open space. Please see Response 10.1.5 regarding community service standards.

11.1.4 Jennifer Clary, President, San Francisco Tomorrow, Speaker, 11/26/02 Public Hearing

"There are water impacts for this project. Whenever you increase the density of an area, there's increased pressure on our sewer system. We feel that needs to be weighted in this document."

Response 11.1.4 Please see Response 11.1.1 and 11.1.2.

12.0 FISCAL/ECONOMIC IMPACTS

12.1.1 Transportation Solutions Defense and Education Fund (TRANSDEF), David Shronbrunn, President, December 20, 2002

"5-49: An analysis of the tax and other economic implications of a operational Project is glaringly absent. The Project should have strikingly positive net benefits to the San Francisco and regional economies. Increases in retail sales and employment should be estimated, along with increases in the taxes reported in Table 5.6-5."

Response 12.1.1 The Project is expected to have many tax and other economic benefits to the City and County of San Francisco and the region. However, it is not practical, within the scope of this EIS/EIR to project these benefits quantitatively. Such projections would involve estimates of the economic development impacts of the project, including enhanced development opportunities, prospective positive impacts in land values, and increased tourism to San Francisco and associated spending, as just a few examples. Projections of such impacts at this stage in project planning would be speculative and, as such, are not readily quantifiable. Hence the figures reported in Table 5.6-5 conservatively look only at the readily quantifiable adverse economic effects of the project.

13.0 SAFETY AND SECURITY IMPACTS

13.1.1 James Wittmann Dear, November 18, 2002

"Car-boosting and homeless encampments are quality-of-life issues for the street. The proposed Off-Site Bus Storage Facility between Perry and Stillman and Second and Fourth Streets is under the jurisdiction of the Transbay Terminal. Will transit agency police patrol the lot, or will SFPD? Did the police union agree that by reorganizing existing staff no additional officers would be needed? I am concerned that the police will be spread thin and crime will increase on Stillman St. (5.4.2.2) and (5.4.4.2)."

Response 13.1.1 The question of who will patrol the off-site storage bus facility will be part of the lease negotiations. The Transbay Joint Powers Authority will work closely with the San Francisco Police Department (SFPD) on this matter and, if appropriate, the California Highway Patrol. SFPD recommends a security plan for development of bus and other vehicle storage on the lots fronting Stillman Street. To reduce the possibility of crime and vandalism and the ability of transient populations to gain access to the facility, the SFPD recommends that the bus storage area be fenced to provide controlled access to the parking area (personal communication, Lt. Al Pardini, San Francisco Police Planning Division, July 2, 2003). As discussed in Response 2.7.9, portions of the bus storage facility will be enclosed by a noise wall, aiding in the provision of the site's security and the security of the surrounding area.

14.0 SEISMIC IMPACTS

14.1.1 League of Women Voters, Sarah Diefendorf and Tuesday Ray, Co-President, League of Women Voters of San Francisco, November 22, 2002

"Page 5-68. "Rapid rail repair" is the recommended mitigation for seismic impacts to surface tracks, but there is no mention of mitigation for tunnel collapse at the portals, where the subway depth is in Bay mud, or prevention of damage. What would happen to a train traveling exiting from the subway at the time of seismic motion?"

"Page 5-67. Bay mud goes down 100 feet and is the worst seismic hazard for amplified ground motion."

Response 14.1.1 Bay mud and Bay mud at considerable depth are common conditions at various locations in the Bay Area. Bay mud combined with seismic activity requires greater attention by geotechnical and structural engineers than more robust soil conditions. However, the number of major infrastructure facilities built on bay mud and planned to be constructed on Bay mud demonstrates that the necessary engineering knowledge and skill is in service to provide safe and reliable facilities.

The tunnels will be designed following state-of-the-art procedures that will allow the tunnels to remain intact and minimize structural damage to repairable levels. There is considerable evidence worldwide demonstrating that tunnels generally perform better than surface structures during earthquakes. The design of the Muni Metro Turnback project in an area of deep bay mud provides an excellent precedent that can be followed, or improved upon, for designing the tunnels and portals in bay mud so that they can resist safely the seismic design forces.

Design of the tunnels and portals would be consistent with standards of practice that require protection of life and, where practical, facilities in a major seismic event. The soil type and extent will be considered in the design of all Project facilities. Use of the stacked drift tunneling approach for the tunnel portions through fractured rock is designed to eliminate the potential for tunnel collapse.

15.0 AIR QUALITY / BUS EMISSIONS AT NEW TERMINAL

15.1.1 BAAQMD, William C. Norton, Executive Officer/ APCO, November 21, 2002

"We have some concerns about the localized exposure of transit riders at the Terminal to diesel particulate emissions from buses serving the terminal... The Terminal alternatives are unique in the Bay Area because they would place a high concentration of diesel buses and their emissions in close proximity to a large number of people on a daily basis. Diesel particulate emissions have been identified as a source of Toxic Air Contaminants (TAC) and are a suspected carcinogen. To determine whether the proposed project or its alternatives would result in a significant air quality impact, we are requesting that the Final EIR evaluate the exposure of transit riders at the Terminal to diesel particulate emissions from buses. The analysis should consider the daily volume and emissions of buses on the street accessing the Terminal and the proximity of buses to transit riders. The Air District's CEQA Guidelines threshold for a significant air quality impact is breached when the probability of contracting cancer for the Maximally Exposed Individual exceeds 10 in one million. If your evaluation of the proposed project or its alternatives results in a significant air quality impact, we request that the impact be mitigated. Mitigation from exposure to diesel particulate might include measures to reduce emissions such as establishing maximum idling times, use of cleaner burning fuels, retrofitting bus fleets and use of low emission buses. Mitigation measures to reduce exposure of transit riders to diesel particulate emissions might include ventilation of bus exhaust and separation of buses from transit riders through building design or operations."

Response 15.1.1 During early conceptual design phases of the terminal alternatives, the design team recognized the potential for adverse health effects associated with diesel emissions. The West Ramp Alternative bus decks were specifically designed to separate the buses and the passengers with a glass partition and operable doors therefore minimizing exposure to bus emissions. The conceptual design calls for the doors to be open only for unloading and loading passengers, with bus patrons queuing inside the enclosed area.

15.1.2 California Department of Transportation, Timothy C. Sable, District Branch Chief, December 20, 2002

"Air Quality: Page 5-52, Section 5.7.2.2: In view of the fact that there is an existing carbon monoxide (CO) exceedence shown at First and Howard Streets, the CO microscale study must address the construction year CO levels as well as the year 2020. Higher emission levels in the build year would result in higher CO levels. As it stands now, the document does not clearly show that the project does not worsen an existing exceedence.

"Page 5-54: The reasoning regarding the PM-10 impacts of the project, while acceptable for the regional impacts, needs further analysis regarding microscale PM-10 impacts. Localized PM-10 impacts could be caused by a larger number of vehicles drawn to the facility, even though regional trips have been reduced. The Federal Register states that PM-10 methodology is not yet available for microscale PM-10 calculations. Some other qualitative reasoning for microscale impacts would be appropriate."

Response 15.1.2 As discussed in the EIS/EIR, Volume I, CO concentrations are expected to be lower in year 2020 than under existing conditions due to stringent state and federal mandates requiring lowering vehicle emissions from individual vehicles. Although traffic volumes would be higher in the future, both with and without implementation of the proposed project, increases in traffic volumes and associated emissions are expected to be offset by an increase in

cleaner-running cars on the road. Thus, CO concentrations from future traffic in the construction and build-out years are projected to be lower than existing conditions.

The supplemental air quality analysis[4] for the proposed off-site bus facility estimates PM_{10} concentrations at sensitive receptors within 500 feet of the facility. As noted in Section 5.7.3, Volume I, of the Final EIS/EIR, the incremental increase in PM_{10} concentrations would not exceed the California Ambient Air Quality Standards.

15.1.3 Transportation Solutions Defense and Education Fund (TRANSDEF), David Shronbrunn, President, December 20, 2002

"4-29: On July 23, 2002, the US Court of Appeals for the 9th Circuit issued a stay of MTC's mobile source emissions budget, pending review of a challenge to its adequacy. This triggered a second conformity lapse, which is still in place as of the date of this letter. In addition, the SIP's Negative Declaration of Environmental Impact is facing challenge in Superior Court. If successful, the SIP approval would be vacated.

"5-49: The air quality analysis must evaluate the regional emissions reductions that result from the increased use of bus transit and the corresponding decrease in auto travel.

"5-49: The air quality benefits of the Redevelopment Project must be identified here. This will occur through correction of the definition of alternatives on 5-122 (see below).

"5-121: A 20% decrease in peak hour delay is very significant. Please verify that this is reflected in the air quality analysis. It should also be highlighted as one of the benefits of the Project."

Response 15.1.3 A conformity lapse would not prohibit the completion of the environmental process for this Project. The co-lead agencies note that an intended purpose of the proposed Project is to increase transit ridership and correspondingly reduce regional vehicular emissions.

The air quality analysis in this EIS/EIR addresses regional emissions reductions that result from the increased use of public transit and the corresponding decrease in auto travel. Table 5.7-1 shows regional emissions reductions predicted as a result of the implementation of the proposed Caltrain Downtown Extension. The regional emissions reductions were based on projected increase in transit ridership and the decrease in the number of vehicle miles that would result from the increase in transit ridership.

The air quality analysis reflects traffic volumes generated by the Project's traffic analysis. When estimating pollutant concentrations from vehicular traffic, any decrease in peak hour delay would already be reflected in the air quality analysis. As discussed, pollutant concentrations would be lower in year 2020 when compared to existing conditions during peak hour conditions.

The commentor correctly notes that the proposed redevelopment component of the Project would result in the intensification of land uses in the urban core and the placement of higher intensity land uses near a regional, multimodal transit center, which could well result in an overall reduction in regional vehicular travel, and correspondingly, a reduction in regional air emissions. The 20 percent decrease in peak hour delay is reflected in the air quality analysis.

15.1.4 League of Women Voters, Sarah Diefendorf and Tuesday Ray, Co-President, League of Women Voters of San Francisco, November 22, 2002

"Pages 5-54. The discussion about the Regional Transportation Plan applies to the situation before the lawsuit mentioned under comment about page 2-3 was upheld. At the current time, the outcome is uncertain, and federal funding for all projects not already underway is frozen."

Response 15.1.4 Please see Response 15.1.3.

15.1.5 League of Women Voters of the Bay Area, Doris Maez, North San Mateo County League of Women Voters, Onnolee Trapp, South San Mateo County League of Woman Voters, Eva Alexis Bansner, President, December 5, 2002

"Land Use: (Page 2-44). The land use mix assumed is dominantly residential which would provide a desirable balance for the intense job center of San Francisco. The Full Build alternative also includes 1,184,590 square feet of office space.

- "If more office space than "Full Build" is built, consistent with current zoning, how would that affect traffic projections and air quality?"

Response 15.1.5 Please see Response 4.2.14.

16.0 HAZARDOUS MATERIALS

16.1.1 California Department of Transportation, Timothy C. Sable, District Branch Chief, December 20, 2002

"Hazardous Materials: Section 4.17 - There is no discussion of the potential for encountering asbestos and lead during building demolition. This should be included, to be consistent with the rest of the section, which discusses potential problems during construction. The project appears to be away from veins of asbestos-bearing serpentine rock. However, if this source has not already been considered, then it would be prudent to take a closer look, particularly for the Caltrain extension.

"Section 4.17.2.2 - Vehicle exhaust should also be included as a potential source of lead contamination. In areas outside the historic fill limit and industrial sites, lead contamination shows up as a surficial zone of one to two feet in depth, depending on soil type and traffic volume."

"Hazardous Materials: Section 5.21.9 - Asbestos should also be discussed in this section since there are Bay Area Air Quality Management District (BAAQMD) rules regarding asbestos removal and building demolition. The USEPA National Emission Standards for Hazardous Air Pollutants regulate asbestos during demolition and removal. BAAQMD has the delegated authority to enforce these regulations.

"Section 5.21.11 - Does State Water Resources Control Board Order No. 99-08-DWQ apply to projects in San Francisco even though storm water runoff goes to the combined sewer system? If so, a Storm Water Pollution Prevention Plan would need to be prepared for the project. Will the project depend solely on the combined system as its sediment control practice? If not, some of the management practices listed in the Air Quality section would also minimize sediment removal from the site. Secondary containment and spill contingency should also be addressed for fuels and other liquid pollutants that will be used during construction.

Response 16.1.1 Page 5-195 through 5-197 in Section 5.21.15, Construction Hazardous Materials Impacts of the Draft EIS/EIR, discuss the potential for encountering asbestos and lead during building demolition and the appropriate mitigation. Handling of fuels and other liquid pollutants during construction along with appropriate mitigation are also discussed on these pages of the Draft EIS/EIR.

Serpentine rock is known to be present in some areas of the City. The currently available geologic information is not sufficient to make a determination whether serpentine rock may be encountered along the project alignment. During construction, as part of the health and safety plan, arrangements will be made for detecting the presence of serpentine rock, and for safely disposing the rock offsite, if serpentine is encountered. Current City ordinance requires that, where hazardous wastes are found in excess of state or federal standards, the project would be required to submit a site mitigation plan (SMP) to the appropriate state or federal agency(ies) and to implement an approved SMP prior to the issuance of any building to be permitted.

PM_{10} consists of very small particles (particles that are less than 10 microns in diameter) floating in the air, including lead. The supplemental air quality analysis analyzed PM_{10} concentrations at sensitive receptor locations of the proposed bus storage facility. The analysis took into consideration vehicular traffic on nearby roadways. As discussed, PM_{10} concentrations at sensitive receptors are not anticipated to exceed the California Ambient Air Quality Standards.

Additionally, the phase-out of leaded gasoline between 1978 and 1987 due to federal and state laws reduced overall inventory of airborne lead by nearly 95 percent. Thus, lead found in PM_{10} generated by vehicle exhaust would not have a significant impact on sensitive receptors.

Water removed from the tunnels and excavations, including groundwater and storm runoff, will be temporarily stored in sedimentation tanks. If pollutants are present such as hydrocarbons, further treatment may be required on-site. However, in the past, normal practice for most construction projects in the City, including the Muni Metro Turnback project, has been to dispose water removed from tunnels and excavations (after it has been treated to remove sediment) into the City's storm water system. It is anticipated that the same procedure would be used for the Transbay Terminal/Caltrain Downtown Extension Project, too.

17.0 NOISE / VIBRATION

17.1.1 SPUR, Michael Alexander, Chair, SPUR Transbay EIS/EIR Working Group, December 20, 2002

"Sound walls: there is a mention somewhere in the report that sound walls are required. Are they required on the ramps? If so, this is a major impact that is not illustrated in the document."

Response 17.1.1 As noted in Section 5.8.6 of the Draft and Final EIS/EIR, noise barriers are deemed necessary for the portions of the perimeter of the AC Transit and Golden Gate Transit off-site mid-day bus storage facilities. Barriers are also proposed for the bus ramps within the AC Transit storage area, but not for the other ramps.

17.1.2 Titan Management Group, Michael Alfaro, Vice President, December 12, 2002

"Vibration Impacts: The Environmental Document states that "the highest levels of ambient ground-borne vibration were measured at the Clock Tower (sic) building at Bryant and Second Streets. Both exterior and interior vibration was measured. The exterior location was on the sidewalk relatively close to the street. Even at this location, the highest vibration levels were only slightly above what can be perceived by most humans." (Page 4-32).

"The vibration analysis that was performed showed that vibrations would exceed the impact threshold for residential land uses in the hallway of the Clocktower even with mitigation in the form of a resilient track system. The vibration analysis included projections for 4 additional locations in the Clocktower. Those projections show that vibrations would be very close to exceeding the impact threshold.

"The Environmental Document, however, concludes with respect to the Clocktower: "Projected vibration levels exceed the impact threshold only at the hallway site, and therefore no mitigation is indicated." In itself, this is a questionable conclusion since the hallway itself is part of the residential use.

"Moreover, vibrations are already a significant problem at the Clocktower. This is apparently because of the building's proximity to the elevated freeway structure. We are very concerned about any vibrations in addition to the ones already experienced. An analysis of the impacts of the project on the Clocktower must include an analysis of the impacts of the project in addition to the impacts already experienced. The explanation of the vibration analysis does not indicate that this has been done. The Environmental Document also indicates that there are some significant qualifications on the vibration analysis.

"In light of the qualifications on the vibration analysis and in light of the results showing that the impact threshold has been exceeded in the hallway and showing that impacts elsewhere are close to the impact threshold, the analysis that has been done should be regarded as a screening level analysis. The results indicate that a more specific and detailed analysis should be performed. Any analysis should include indicate the vibrations that would be experienced if vibrations from the train occurred at the same time as serious vibrations from the freeway.

"The Clocktower believes this analysis is legally required. Additionally, if this analysis is not performed and if there is damage to the Clocktower residents or to the building from vibrations, a failure to have performed this analysis could have profound legal consequences."

Response 17.1.2 The noise and vibration impacts from train operations in the tunnel are described in the noise and vibration Sections 4.7 and 5.8, Volume I, of this EIS/EIR. Because the train would be operating in a tunnel, there are no noise impacts to the outside environment associated with train operations.

As noted in the EIS/EIR sections, noise and vibration measurements were conducted at a number of locations in the Clocktower building. The ambient vibration levels measured at the Clocktower were at or below the level of perception for most humans (approximately 65 VdB). Existing vibration levels measured inside the Clocktower building are even lower than this. The ambient vibration measurements were conducted to provide a basis for comparison with the projected levels associated with the Project and to assess the existing vibration environment. The ambient vibration levels do not influence either the vibration criteria or the impact assessment.

The detailed vibration analysis conducted was based on the Federal Transit Administration (FTA) vibration assessment method. The FTA method only evaluates impacts for project sources of vibration, and existing vibration sources are not a part of the analysis. The vibration analysis conducted at the Clocktower meets all FTA requirements for a detailed vibration assessment. Vibration annoyance impact has been identified and mitigation has been recommended.

A five-decibel safety factor was incorporated into the calculations of vibration and the projections of impact to take into account the potential for variations in conditions that could potentially lead to higher than projected vibration levels. The 5-decibel safety factor provides a level of conservatism in the projections.

With the recommended vibration mitigation measures, the vibration levels (with a 5-decibel safety factor) are projected to be only slightly above the impact criterion. After mitigation, groundborne noise impact at 388 Townsend Street and vibration impact at the Clocktower Building would still exceed the impact threshold by one decibel. This level of impact would not constitute a substantial adverse change requiring further mitigation, in terms either of Federal Transit Administration or CEQA guidelines. The next level of mitigation that would be effective would be to install floating slab under the Caltrain alignment trackage for 600 to 800 feet on either side of each building (at an estimated construction cost of approximately $1,000 per linear foot), which would add installed costs approaching one million dollars or more per building. Such high mitigation costs would not be a prudent and reasonable expenditure to eliminate the last one decibel of impact at these two sites.

The FTA guidance manual is clear on the reasonable and feasible nature of mitigation, for both noise and vibration.

Section3.2.4 states:

"The Federal Transit Administration does not have a specific noise mitigation policy embodied in a regulation..... In conjunction with FHWA, FTA has issued a regulation implementing NEPA which sets out the agencies' general policy on environmental mitigation. There, it states that measures necessary to mitigate adverse impacts are to be incorporated into the project and, further, that such measures are eligible for Federal funding when FTA determines that ' ...the proposed mitigation represents a reasonable public expenditure after considering the impacts of the action and the benefits of the proposed mitigation measures.'"

Section 11.4 states:

"For the areas where the impact criteria may be exceeded, review potential mitigation measures and assemble a list of feasible approaches to vibration control. To be feasible, the measure, or combination of measures, must be capable of providing a significant reduction of the vibration levels, at least 5 dB, while being reasonable from the standpoint of the added cost."

It is important to note that this criterion is for human annoyance only, not damage. Damage criteria for this type of building are significantly higher than the annoyance criterion. Vibration from train operations is projected to be more than 20 VdB below the most stringent damage criterion for the most fragile types of buildings.

17.1.3 Elizabeth Carney, Nov. 26, 2002

"What are the impacts during tunnel operation: of vibration, from exhaust, from noise from the operation of the trains must be studied in detail, as the EIR fails to even recognize the hallway as a part of the residence."

Response 17.1.3 Please see Reponses 17.1.2.

17.1.4 League of Women Voters, Sarah Diefendorf and Tuesday Ray, Co-President, League of Women Voters of San Francisco, November 22, 2002

"Page 5-62. Storage yard noise will not be limited to engine noise, as this discussion seems to imply. Simply moving large pieces of equipment generates noise, as well as associated activities. To state that no mitigation will be necessary seems far-fetched. Additionally, light sources from this site may be intrusive to surrounding uses.

"Page 5-64, Table 5.8-6. Vibration impacts are worse than noise impacts, with little reduction from mitigation using resilient track system."

Response 17.1.4 The Caltrain storage facility is proposed to continue to operate at the current site of the Fourth and Townsend yard. As noted, various operations at this site generate noise, but the yard has existed at this site for nearly 100 years. Except for the continuation of train activities at the yard site, the Project would be predominantly in a tunnel. For the tunnel portions, there is virtually no noise impact from train operations.

There are only a small number of vibration and ground-borne noise impacts, but with a resilient track system, most impacts are mitigated. There are only two locations where the vibration or ground-borne noise levels are slightly above the criteria, and that is including a 5-decibel safety factor in the calculations.

18.0 EIS / EIR PROCESS

18.1.1 State Clearinghouse, State of California, Governor's Office of Planning and Research, November 19, 2002

"The State Clearinghouse submitted the above named Joint Document to selected state agencies for review. The review period closed on November 18, 2002, and no state agencies submitted comments by that date. This letter acknowledges that you have complied with the State Clearinghouse review requirements for draft environmental documents, pursuant to the California Environmental Quality Act."

Response 18.1.1 Please see Comment 18.1.2 below regarding letters received following this Clearinghouse notice.

18.1.2 State Clearinghouse, State of California, Governor's Office of Planning and Research, December 23, 2002

"The enclosed comments(s) on your Joint Document was(were) received by the State Clearinghouse after the end of the state review period, which closed on November 18, 2002. We are forwarding these comments to you because they provide information or raise issues that should be addressed in your final document.

"The California Environmental Quality Act does not require Lead Agencies to respond to late comments. However, we encourage you to incorporate these additional comments into your final environmental document and to consider them prior to taking final action on the proposed project."

Response 18.1.2 The comments received after the end of the state review period have been included in this Volumes II and III of this Final EIS/EIR, and responses to the comments received are included in this Volume II.

18.1.3 League of Women Voters, Sarah Diefendorf and Tuesday Ray, Co-President, League of Women Voters of San Francisco, November 22, 2002

Page 2-3. Electrification of Caltrain by 2006 is highly unlikely. Revenue reductions and budget shortfalls caused Santa Clara Valley Transportation Authority (VTA) to decline to fund its $2.3M share of funding the DEIR for the electrification project in FY 2002-2003. Sources of federal funding were identified, but those are frozen until a lawsuit against EPA's approval of the 2001 Regional Transportation Plan is resolved. It is very unlikely therefore that the environmental review process will be completed in 2003."

Response 18.1.3 Please see Response 7.2.3.

18.1.4 Titan Management Group, Michael Alfaro, Vice President, December 12, 2002

"We have also stated our concerns at the Public Hearing April, 2001, and in writing, requesting a study of the Effects of Emissions the many residences and businesses. Those comments are all incorporated by reference in these comments.

"We are concerned that public health and safety needs are not being met, and we are considering legal action. We feel we have been ignored in the process. The Clocktower Lofts

Owners Association is not even on the distribution list for information. Please correct that omission."

Response 18.1.4 Please see the combined Response 2.7.1 through 2.7.38, "Air Quality Assessment" Section. The Clocktower Lofts Owners Association has been added to the distribution list and has received the Final EIS/EIR, Volumes I and II. A CD version of Volume III is available upon request or is available for review by appointment at the San Francisco Planning Department, 1660 Mission Street.

18.1.5 William Blackwell, Architect, November 12, 2002

"The EIS/EIR Notice states that reasonable alternatives will be reviewed and evaluated in the EIS/EIR. Despite Joan's explanation that the wording of the notice was misleading, it is my understanding that CEQA guidelines as well as federal statutes require an appropriate response. Otherwise, why ask for citizen participation?

"EIS/EIR Figure 2.3-1, Alternatives Considered and Withdrawn, does not include my proposal. However, if it had been considered, I suppose that the objections would be similar to those given on page 2-50 for the Essex Street stub-end alignment that you pointed out after the SPUR meeting."

Response 18.1.5 Please see Responses 5.1.5 and 5.1.6.

18.1.6 William Blackwell, Architect, December 2, 2002

"Page 2-49, Alternatives Considered and Withdrawn, does not include the Blackwell Alternative described in Attachment No.1. This is a carefully researched and reasonable alternative that was submitted within the public comment period prior to commencement of this Draft EIS/EIR."

Response 18.1.6 Please see Responses 5.1.5 and 5.1.6.

18.1.7 Greg Patterson, December 18, 2002

"A complete EIR for the Redevelopment Area should be produced as a separate, later document, or possibly a Supplemental EIR, that is recirculated for public comment, when the planning has evolved and can be studied. The chart of proposed square footages mounted on a faded, microscopic, unreadable block diagram (Figure S-2 on p. S-9) makes the Redevelopment even more unknowable. Acceptance of this document's treatment of the Redevelopment Area in this EIR/S as an adequate environmental evaluation under CEQA could be readily challenged."

Response 18.1.7 CEQA Guidelines acknowledge in Section 15004 that, "Choosing the precise time for CEQA compliance involves a balancing of competing factors." It goes on to say that EIRs should be prepared as early as feasible in the planning process. Because of the complexity of the multiple components of the Project, it was decided early on to do a Programmatic EIR for the redevelopment component of the proposed Project. NEPA also authorizes use of "tiering" (Section 1508.28) for "coverage of general matters in broader environmental impacts statements ... with subsequent narrower statements or environmental analyses (... or ultimately site-specific statements)." NEPA notes that tiering is appropriate when the sequence of statements or analysis is: ... "From a program, plan, or policy environmental impact statement to a program, plan, or policy statement or analysis of lesser scope or to a site-specific statement or analysis."

The Draft EIS/EIR evaluated the impacts of two alternative redevelopment programs that did not have specific designs for each site that was a part of the programs. The Draft EIS/EIR studied massing scenarios to evaluate such potential impacts as visual, shade, shadow, and wind. For other typical areas such as traffic and air quality, the Draft EIS/EIR projected population, density, and land use mixes for the programs and analyzed the potential impacts of the projected programs.

CEQA Guidelines Section 15168 (California Code of Regulations, Title 14). A programmatic EIR has numerous benefits including:

- *Provide an occasion for a more exhaustive consideration of effects and alternatives than would be practical in an EIR on an individual action.*
- *Ensure consideration of cumulative impacts that might be slighted in a case-by-case analysis,*
- *Avoid duplicative reconsideration of basic policy considerations*
- *Allow the lead agency to consider broad policy alternatives and program wide mitigation measure at an early time when the agency has greater flexibility to deal with basic problems or cumulative impacts.*
- *Allow reduction in paperwork.*

In addition, since release of the Draft EIS/EIR, the Redevelopment Agency has released for public review the *Draft Transbay Redevelopment Project Area Design for Development Vision* (August 2003) document. Contents of this draft are summarized in Section 2.2.4.2 and Appendix F, Volume I, of the Final EIS/EIR. The draft vision and EIS/EIR sections provide more detail regarding the currently proposed redevelopment plan for the area. The co-lead agencies have analyzed these refinements and such analysis is provided in Chapter 5 of this Final EIS/EIR. The overall analysis concludes that the refinements do not raise any substantial new adverse issues or impacts, and, in accordance with CEQA guidelines 15088.5, there is no need to recirculate the Draft EIS/EIR.

It is estimated that actual development proposals for the public parcels will come five to ten years after project adoption when the sites become available for their ultimate redevelopment. Many of the public parcel redevelopment sites are not going to be immediately available and will be used in the interim for other uses such as the continuing Caltrans Retrofit Project and as the temporary transbay bus terminal. In the future, as the sites become available for development, additional evaluation on the potential for effects on the environment will be done on the proposals by the Redevelopment Agency for a particular site. If additional environmental analysis is necessary pursuant to CEQA, it will be completed by the Redevelopment Agency prior to any subsequent approval actions for the particular site or project.

18.1.8 Elizabeth Carney, Speaker, 11/26/02 Public Hearing

“Monica DuClaud had to go back to work. She asked me to speak for her. She wanted me to tell you she's quite concerned about putting the bus depot in the area of Stillman and Second Street where we all live in the Clocktower which is 461 Second Street. And that she also wanted me to mention that the complexity of tunneling, the cut-and-cover plan really requires more of our study and analysis than we in the Clocktower have had a chance to make. There's 127 families that live in that building. And we've only recently, by accident, kind of, learned that this analysis

process is going forward. As a result, we're hoping that the comment period could be extended while we take the opportunity to look and see what are the impacts on our building.

"And I wanted to tell you a small story. In the early 1900s, there was something called the Second Street Cut. The idea was that they were going to make the hill, at Rincon Hill, a little bit flatter, so it was much easier to bring wagons from Market and Mission down to the Bay. And the politicians got together and made a plan for doing that, and did so. They made a big cut in Second Street. Shortly after that happened, the houses that were on Rincon Hill fell off the hill. And that was the end of development for Rincon Hill for a very long time. So we're hoping that the planning process can have enough careful study and analysis at the beginning of the process that these kinds of futures will be something we don't repeat again. Thank you."

Response 18.1.8 At the request of the public and the Planning Commission hearing on November 26, 2002, the comment period was extended to December 20, 2002.

18.1.9 Andrew Littlefield, Speaker, 11/26/02 Public Hearing

"I'm a resident of 461 Second Street, on the board of directors of the homeowners association. We would like to request an extension in terms of the deadline associated with written responses to the EIR associated with this agenda item. Unfortunately, this EIR was only brought to our attention merely two weeks ago. It's a complex, comprehensive EIR. We would like to provide the appropriate response, particularly as today, these were a number of people very concerned with regards the impact of the diesel fumes, and the air quality inside their homes. What we'd like to request is a delay or a postponement of the deadline for written comment to January 30th, 2003."

Response 18.1.9 Please see Response 18.1.8.

18.1.10 Arthur Meader, Speaker, 11/26/02 Public Hearing

"So I would ask that you again allow us additional time for comments, and to respond what is a complex issue involving matters of science. We're not engineers. And we need to at least have an opportunity to hire people to address these issues. Thank you very much."

Response 18.1.10 Please see Response 18.1.8.

18.1.11 Elizabeth Carney, Nov. 26, 2002

"This project is complex and the issues require more time to study. Now that we, as residents, understand how complex, we need more time to consult experts and analyze these issues. We think that a better project will result in the future if we take the additional time now to take more comments from residents and businesses. Also a new draft EIR should be prepared and circulated for comment because impacts on environment (e.g., Diesel emissions) have not been presented and analyzed...

"As we have just received the 500 page EIR/EIS document, there has not been time to study, consult experts and analyze all of the effects of the proposed plan on the Clocktower Building and neighborhood. Please extend the public input comment period, it will enrich the final solution."

Response 18.1.11 The air quality effects of the Project were analyzed for the Draft EIS/EIR and the results were reported in Section 5.7 of the EIS/EIR. The analysis found that there were no violations of the more stringent California Ambient Air Quality Standards CAAQS. In response

to comments made on the air quality analysis in the draft document, additional air quality analysis[5] was performed (please see the combined Response 2.7.1 through 2.7.38, "Air Quality Analysis" and Section 5.7.3, Volume I, of the Final EIS/EIR). Results of this additional analysis also found no violations of federal or state standards and therefore no substantial adverse impacts.

The CEQA standard for requiring a new Draft EIR are set out in CEQA Guidelines Section 15088.5 (California Code of Regulation, Title 14). This section states that it would be a new significant environmental impact that cannot be mitigated or substantial changes resulting in new significant environmental effect that cannot be mitigated that would require recirculation or a subsequent or supplemental draft EIR.

Please see Response 18.1.8.

18.1.12 J. R. Capron, November 8, 2002

"I represent the owners of 25 Stillman Street and 35 Stillman Street. I am writing to request an extension of the public comment period for the Transbay Terminal DEIS/EIR. Further, I am requesting that you require a more in-depth analysis of the negative impact to the area of the proposed Bus Storage Area along Stillman and Perry Street. I am informed that several people, and possibly many more, who requested to be notified when the EIS/EIR was published, never received notification. My clients were not notified although their names were on the circulation list. They found out about it weeks later through a chance conversation with a friend. The public needs more time to respond... Because of the impending deadline for the public comment period, please respond to me in writing by November 1Fourth regarding extending the public comment period and including a more in-depth analysis of the proposed bus storage area site alternatives."

Response 18.1.12 Please see Response 18.1.8. The co-lead agencies gave the required public notice for the Draft EIS/EIR for the Project. CEQA Guidelines (California Code of Regulations Title 14) Section 15087 states that public notice of the availability of a draft environmental document be given by at least one of the following methods: (1) publication in a newspaper of general circulation in the project area; (2) posting on and off the project site; and (3) direct mailing. For this project, the City did all three and sent notices to all property owners within the project area and within 300 feet of the project boundary as required by the San Francisco Administrative Code Chapter 31.

Note: Comments 18.1.13 through 18.1.24 all concern a request for extension of the public review period on the Draft EIS/EIR. One response is provided to all of these comments, and this consolidated response can be found following Comment 18.1.24.

18.1.13 Pamela Duffy, representing 301 Mission Development, Speaker, 11/26/02 Public Hearing

"Off my agenda, but I do think with a project of this complexity, which at least as suggested has this kind of impact on a small community could withstand another couple of months for people to get comfortable with the document."

[5] Terry A. Hayes Associates, LLC, *Transbay Terminal Improvement Project: Bus Access and Storage Supplemental Air Quality Impact Analysis,* March 2003.

18.1.14 San Francisco Planning Commissioner Kevin Hughs, 11/26/02 Public Hearing

"And with respects to a request for extension, I don't see any harm. I would lean towards, you know, an additional two weeks, on, on extension; I think January 30th is a little far out, far away. But I believe that an additional two weeks would not unduly impact the Department."

18.1.15 Planning Director Gerald Green, 11/26/02 Public Hearing

"Your suggestion at this stage is to extend the written comment period for two weeks?"

18.1.16 San Francisco Planning Commissioner Kevin Hughs, 11/26/02 Public Hearing

"Correct; right."

18.1.17 Planning Director Gerald Green, 11/26/02 Public Hearing

"I'm wondering whether that is the consensus of the commission that you'd like to see additional time for written comments... I'm not sure what two weeks will generate in terms of new or additional comments, but it is, it is going to affect the timeline. But nonetheless, it's your call. You are going to have to feel comfortable that the document is adequate before you're served by it."

18.1.18 San Francisco Planning Commissioner Michael Antonini, 11/26/02 Public Hearing

"I personally would vote not to extend. I would like to see what the other commissioners feel on this item."

18.1.19 San Francisco Planning Commissioner Bill Lee, 11/26/02 Public Hearing

"I can go halfway. Extend it for one week."

18.1.20 San Francisco Planning Commissioner Sue Lee, 11/26/02 Public Hearing

"I would support a two-week extension."

18.1.21 San Francisco Planning Commissioner Kevin Hughes, 11/26/02 Public Hearing

"I would support a two-week extension."

18.1.22 Planning Director Gerald Green, 11/26/02 Public Hearing

"We're going to extend it to – what I hear the commission saying, we're going to extend it to December 20th to provide more comments. And we'll go from there."

18.1.23 San Francisco Planning Commissioner Michael Antonini, 11/26/02 Public Hearing

"Okay, very good, Director Green. So it's extended until December 20th."

18.1.24 SPUR, Jim Chappell, President, November 13, 2002

"SPUR has assembled a working group to comment on the Transbay EIR/EIS and we look forward to sending our written comments to you. We find the document to describe the impacts one of the most complex projects the city has seen. Given that the new Planning Commission has yet to schedule a hearing, SPUR requests that the comment period be extended an additional

forty five days (until after the December holiday season) so that we may thoroughly analyze and comment on the document. We believe that this additional time would be valuable for other commentors and is appropriate given the length of gestation time of the project."

Response 18.1-13 through 18.1.24 At the request of the public and the Planning Commission hearing on November 26, 2002, the comment period was extended to December 20, 2002.

18.1.25 San Francisco Tomorrow, Jennifer Clary, President, Norman Rolfe, Transportation Chair, December 20, 2002

"San Francisco Tomorrow would like to express its appreciation to the Planning Commission and to Director Gerald Green for granting an additional two weeks to prepare comments on this important and complex project. We understand that the preparing agencies are working under considerable constraints in preparation of this document, and hope that our comments will make the document more complete and easier to understand."

Response 18.1.25 Comment noted.

18.1.26 Arthur L. Meader, III, November 22, 2002

"Thanks also for the extensive advance notification. At least with projects such as the Third Street rail line I get periodic mailers, which are very helpful. I have yet to hear peep one from your office or any other agency involved in this deal."

Response 18.1.26 Comment noted.

18.1.27 Francis and Janice Mathews, December 19, 2002

"Notices and Responses: We are concerned about the lack of notice of meetings, the lack of response to our initial input at the scoping meeting and follow-up letters. Although we were on the "distribution list" for the EIR, we did not receive it and had to call to get a copy after finding out that it was available through a chance conversation with a friend.

- "If you have not already done so, please add us to your list for notices of all meetings regarding the Transbay Terminal and any other meetings that deal with the Bus Storage Site, the Second St. Caltrain connection and the Third St. rail.
- "Please send us the "Response to Comments" that addresses our letters and other letters submitted for the Transbay Terminal EIR/EIS
- "We would like our buildings to be included in the analysis of any other issues of the Transbay Terminal and related projects (i.e. Bus Storage, Second or Third St. rail projects) brought up by others regarding our neighborhood (Second St., Third St., Fourth St., Stillman St. and Perry St. as well as Howard St.)"

Response 18.1.27 The Draft EIS/EIR was sent to the distribution list as shown in the document. The co-lead agencies will forward the request to be on the mailing list for the Third Street Project to Muni. Francis and Janice Mathews are on the Project mailing list. This Volume II along with Volume I of the Final EIS/EIR has been mailed to Francis and Janice Mathews. A CD version of Volume III is available upon request or is available for review by appointment at the San Francisco Planning Department, 1660 Mission Street.

18.1.28 Elizabeth Carney, Nov. 26, 2002

"We request to be placed on the notice list for all documents, proceedings and for a copy of the 'Response to documents' when prepared."

Response 18.1.28 Elizabeth Carney is on the Project mailing list, and Volume II along with Volume I of the Final EIS/EIR has been mailed to Ms. Carney. A CD version of Volume III is available upon request or is available for review by appointment at the San Francisco Planning Department, 1660 Mission Street.

18.1.29 Bruce W. Barnes, Barnes Equipment Company, December 16, 2002

"We request advance notice for all meetings regarding the Transbay Terminal Project and any other meetings addressing the temporary and permanent bus storage facility locations and analysis."

Response 18.1.29 Bruce W. Barnes is on the Project mailing list, and Volume II along with Volume I of the Final EIS/EIR has been mailed to Mr. Barnes. A CD version of Volume III is available upon request or is available for review by appointment at the San Francisco Planning Department, 1660 Mission Street.

18.1.30 Oliver L. Holmes, Duane Morris LLP, December 6 2002

"On November 26, 2002, this office filed public comments on the above reference project with your office. This letter will serve as formal notification of a change of address for our office. Any future correspondence with regard to the Transbay Terminal Project or our public comments should be directed to my attention at: Duane Morris LLP, One Market, Spear Tower, Suite 2000 San Francisco, CA 94105-1104."

Response 18.1.30 The commentor's address has been revised on the Project's mailing list.

18.1.31 U.S. Environmental Protection Agency, Lisa B. Hanf, Manager, Federal Activities Office, December 2, 2002

"When the FEIS is completed, please send one copy to me at the address above (Mail Code: CMD-2). If you have any questions or comments, please feel free to contact me or Nova Blazej, the primary person working on this project. Nova Blazej can be reached at 415-972-3846 or *blazej.nova@epa.gov*."

Response 18.1.31 Ms. Blazej at US EPA has been sent this Volume II along with Volume I of the Final EIS/EIR. A CD version of Volume III is available upon request or is available for review by appointment at the San Francisco Planning Department, 1660 Mission Street.

19.0 EIS / EIR OVERALL CONTENT / CORRECTIONS

19.1.1 California Department of Transportation, Timothy C. Sable, District Branch Chief, December 20, 2002

"Cultural Resources: Pages 4-48 through 4-60 (section 4.16.6) and pages 5-75 through 5-77 (section 5.14.3 through 5.14.3.4), and Section 8: the DEIR text throughout these sections is inconsistent regarding the National Register of Historic Places status of the Transbay Transit Terminal, and the Bay Bridge approach and bus ramps. As of 2000, the Transbay Transit Terminal and the ramps have been "listed" on the National Register, as contributors to the San Francisco-Oakland Bay Bridge, and are no longer considered to be merely "eligible" for the National Register. Tables 4.16-1,5.14-1, and 8.4-1 also should clarity the National Register status as listed as contributors, or 1D, rather than 2 or 2S2.

"Air Quality: Page 4-29 and 5-53: The TIP information should be updated to reflect the latest TIP/RTP information.

"Right of Way (ROW): Page S-8, and Figure S-2, discussing various development levels, should mention the fact that these parcels are currently State-owned, and that the transfer of ownership is the subject of ongoing negotiations with the State, and the subject of a cooperative agreement. Additionally, approximately 1/3 of the Block #3737 will be permanently occupied by the Folsom Street leg of the Fremont Street off-ramp. This is repeated in various figures throughout Chapter 5."

"Related Projects: Chapter 1, Section 1.4, titled "OTHER RELATED PROJECTS," does not mention the upcoming San Francisco-Oakland Bay Bridge (SFOBB) West Approach Seismic Safety Project, as-year, $225 million project, which will be impacted by the proposed Transbay Transit Terminal project. Of specific concern is the impact of the Caltrain Extension's construction activities directly underneath the west approach structure with its new pile foundation system.

"Chapter 5, Section 5.21.1.1: The second paragraph should address the impacts on the staging of the SFOBB West Approach Seismic Safety Project, the Department's intention to build a temporary on-ramp during the first stage of the project to accommodate bus access to the east loop, and the Department's commitment to retrofitting the east loop of the existing Transbay Transit Terminal. The geometric and structural feasibility of this proposal is also questionable.

"Parking: Chapter 3, Section 3.3, page 3-36, paragraph 2: The Department does not manage parking lots. State-owned lots are leased to private vendors, usually through short-term leases."

Response 19.1.1 The San Francisco-Oakland Bay Bridge was listed in the Register on August 13, 2001, according to the National Park Service's National Register Information System (NRIS) and the Historic Property Data File maintained by OHP. The bridge is listed as a "structure," not as a "district" in the NRIS database, while the OHP list shows it as a 1D, or district. In both listings, the bridge does have several contributing elements, including the ramps and terminal building. The bridge and its contributing elements were identified as historic properties in the survey report. The Finding of Effect (FOE) addresses Project effects on these properties. Corrections have been made to the cultural resource sections (4.16 and 5.14) for the sake of clarity and consistency.

The Air Quality Sections 4.6.3 and 5.7.3, Volume I, of the Final EIS/EIR reflect the latest TIP/RTP information.

Page S-8 and Figure S-2 have been changed to reflect the status of the transfer of state lands and the content of the cooperative agreement for land transfer signed by Caltrans, the Transbay Joint Powers Authority, and the City and County of San Francisco.

The San Francisco-Oakland Bay Bridge (SFOBB) West Approach Seismic Retrofit Project has been added to the Related Projects Section 1.4, Volume I, of this Final EIS/EIR.

Proper design and monitoring of the west approach structure and adjacent soils will allow for the construction of a tunnel along the proposed Caltrain alignment. As part of the design of the tunnels, the project team will obtain and review available foundation plans for adjacent structures, including the pile foundations for the west approach structure. The tunnelling work will be planned and executed in a manner that it can control potential impacts on adjacent structures within acceptable tolerances. Mitigation measures, if necessary, can be developed to protect existing adjacent structures. The project will obtain the necessary permits from Caltrans to cross under the west approach.

Section 3.3, Volume I, of the Final EIS/EIR has been revised to note that Caltrans does not manage parking lots but rather leases the State-owned property to private vendors, usually through short-term leases. Please also see Response 2.6.1.

19.1.2 Golden Gate Bridge District, Alan R. Zahradnik, Planning Director, November 19, 2002

"EIR Comments/Permanent Storage for Golden Gate Transit (GGT)

- "Table S-1 (page S-17), under the Transit Operations/No-Project Alternative heading, should mention that a permanent storage facility for GGT is not provided under this scenario. Similarly, under Transit Operations/Full Loop Ramp Alternative heading, it should be mentioned that a permanent storage facility is provided for GGT.

"EIR Comments/GGT Service in San Francisco

- "Figure 1.2-4 (page 1-15) incorrectly illustrates GGT bus service on Folsom and Howard streets. Since 1997, GGT "Civic Center" service has operated on Mission Street. (Figure 3-1 on page 3-2 is correct.) With the anticipated relocation of its midday storage facility from Main and Beale streets to Eighth and Harrison, GGT is planning to resume revenue service on Folsom and Howard streets. District Planning Department staff will provide the exact routing of bus service in the South of Market area as soon as it becomes available.
- "Page 3-20 and Table 3.1-11 (page 3-22) of the DEIS/DEIR should make the following clarifications concerning GGT Basic Service in San Francisco.
  - o "GGT Basic Service generally operates every day and nearly 24 hours per day
  - o "Route 10 operates only on weekends in San Francisco; Routes 30 and 90 operate only on weekdays.
- "Figure 3.1-6 (page 3-21) does not show GGT Route 67 and Route 69 correctly. Route 69 is a ferry shuttle route that serves San Francisco Ferry Terminal and the Financial District. Route 67 is a ferry shuttle route that serves San Francisco Ferry Terminal and the Civic Center.
- "Information on page 3-20 of the DEIS/DEIR should be updated to include the current District one-way adult cash fares.

Weekday Fares	
Golden Gate Transit transbay bus	$2.65 -$5.65
Golden Gate Ferry; SF to Sausalito	$5.60
Golden Gate Ferry; SF to Larkspur	$3.25
Weekend/Holiday Fares	
Golden Gate Transit transbay bus	$2.65 -$5.65
Golden Gate Ferry; SF to Sausalito	$5.60
Golden Gate Ferry; SF to Larkspur	$5.60

- "Table 3.1-11 (page 3-22) should be revised to include the following clarifications concerning GGT bus service in San Francisco (as of September 2002):
  - "Route 90 has two (not one) southbound trips that serve the Transbay Terminal area.
  - Route 72 has headways that vary between 14 and 55 minutes (not one peak period trip).
- "Page 3-23 should not describe District sponsored Club Bus services from Napa and Sonoma County to San Francisco as "Regional Paratransit" service. These are subscription commute bus routes that serve the Transbay Terminal via bus stops on Mission Street. As of March 2001, the Napa Valley Commute Club operates one southbound and one northbound trip during the peak period. As of October 2002, the Valley of the Moon Commute Club operates two southbound and two northbound trips during the peak periods.

  "Regional Paratransit services to TTT include services correctly described on page 1-8 of the DEIS/DEIR.

- "Page 3-49 should acknowledge that most GGT buses and all Golden Gate ferries are equipped to transport bicycles.

"EIR Comments/Miscellaneous Issues

- "Page 1-25 describes membership of the Transbay Joint Powers Authority (JPA). DEIS/DEIR should acknowledge that this District is an ex-officio member of the JPA."
- "It appears the restriping of Fremont Street traffic lanes between Mission Street and Market Street, described on Page 3-35, has already been implemented. In addition, tracks for the former F-Market Muni have been removed.

"EIR Comments/West Ramp Alternative

- "Fourth paragraph of page 5-114 cites GGT 'commuter service would also be able to use the new mid- block boarding area. Golden Gate Transit's basic service... would continue to load and alight passengers along Fremont Street between Mission and Howard.' This description of GGT service is not accurate and needs to be revised. Page 5-136 describes potential GGT operations as a result of the mid-block boarding area. There doesn't appear to be consistency between GGT operations described on page 5-114 and 5-136. Nevertheless, the following describes probable GGT operations with the new mid-block boarding area and can be incorporated into the DEIR:
  - "Basic Service: Inbound GGT Basic Service buses, which operate on Mission Street, would terminate in front of TIT on Mission Street (as they do presently). The proposed TIT mid-block boarding area would be used as the first revenue stop by outbound GGT Basic Service buses.
  - "Financial District Commute Service: Inbound GGT Financial District Commute Service buses would serve TIT by the current bus stop on First Street, between Market and Mission streets, and would not likely be affected by any of the TIT alternatives. Outbound Commute Service would be affected by the location of the off-site bus storage facility and elevated ramps mentioned previously. In the event of a direct connection between the off-site

facility and Fremont Street, GGT commute buses would serve TIT with existing bus stops on Fremont Street.

Response 19.1.2 Table S-1 has been changed to note that no Project facilities would be provided under the No-Project Alternative (which includes the off-site bus storage facility). Figure 1.2-4, Volume I, of the Final EIS/EIR has been revised to correctly illustrate GGT bus service on Folsom and Howard Streets. Section 3.1.2.4, Volume I, of the Final EIS/EIR has been revised to reflect the clarifications on GGT Basic Service. Table 3.1-11 shows the service hours on GGT basic service as well as the restriction of Route 10 service to weekends only and Routes 30 and 90 on weekdays only. Figure 3.1-6, Volume I, of the Final EIS/EIR has been revised to reflect the fact that Routes 67 and 69 are no longer in service. Information regarding GGT's one-way adult cash fares has been updated for the Final EIS/EIR.

Table 3.1-11, Volume I, of the Final EIS/EIR has been revised to include the following clarifications concerning GGT bus service in San Francisco (as of September 2002):

- Route 90 has two (not one) southbound trips that serve the Transbay Terminal area.
- Route 72 has headways that vary between 14 and 55 minutes (not one peak period trip).

Section 3.1.3.2 in Volume I, of the Final EIS/EIR has been retitled, "Special Commuter Services" and the text has been changed regarding these services. The Final EIS/EIR acknowledges that most GGT buses and all Golden Gate ferries are equipped to transport bicycles.

Ex-officio members can be added to the TJPA only by following a specific procedure in the TJPA by-laws. The Mayor has appointed a member of the GGBTHD Board to the TJPA and that member represents the City. However, this seat does not make GGBTHD an ex-officio member. Section 3.2.4 has been revised to reflect the fact that the restriping on Fremont has already been implemented and the tracks removed for the F line. Section 5.19.1.1, Volume I, has been revised to accurately reflect the GGT basic and commuter service operations.

19.1.3 San Francisco Muni, Jose Cisneros, Deputy General Manager for Capital Planning & External Affairs, December 17, 2002

"Pages 1-26 and 2-4 to 2-5, and Table 2.1-1:

- "The elevated Central Freeway, US 101, connects 1-80 with Fell and Oak Streets. This will be rebuilt and retrofitted only south of Market Street. The portion north of Market Street will be torn down and replaced by the new Octavia Blvd.
- "The Third St. LRT Project Initial Operating Segment (IOS) is expected to be open for full service in 2005; an early partial opening may occur in late 2004.
- "The Central Subway is expected to be in service in 2012, not 2009.
- "The Ferry Bus Terminal was a "relocation" project in anticipation of hotel construction, not an "expansion", and was completed in Fall 2001.
- "Muni's F-Line Historic streetcar service opened for service from Castro/Market Streets along the Embarcadero to Fisherman's Wharf in March 2000, and currently carries approximately 20,000 riders per day. Muni's E-Line station improvements on the Embarcadero and King Streets for historic streetcar service between Fisherman's Wharf and Fourth/King Streets will be under construction in 2003."

"Specific Comments – Page 1-28, Table 1.2-4: The SF Parking & Traffic Commission and SF Public Transportation Commission were merged into the SF Municipal Transportation Agency (MTA), effective July 2001. MTA approval is required for municipal public transit route

realignments, surface street changes, traffic operation changes, traffic control measures, and on-street parking changes.

"Page 2-4 -Section 2.1.2 Muni Facilities and Related Bus Service: The Third St. LRT Project Initial Operating Segment (IOS) is expected to be in full revenue service in 2005. The Central Subway is expected to be in service in 2012, not 2015.

"Page 2-4 -Section 2.1.5 Roadway and Street Improvements: The elevated Central Freeway will no longer connect with Oak and Fell Streets. It will be removed north of Market Street and replaced with the new Octavia Boulevard. The reference to a new King Street access roadway at Fifth Street into Mission Bay should be clarified, as to whether or not this roadway extends only south of King Street across Mission Creek, or whether it is intended to cross the Caltrain alignment.

"Page 2-15 - Figure 2.2-6 -Transbay Terminal Off-Site Bus Storage Ramp Link: This drawing contains a faint dashed line that is labeled "Possible Future Light Rail Connection", but the line is shown to come from the east, apparently from the Bay Bridge. Clarify what this line is intended to represent.

"Pages 3-2, Figure 3-1 Transit Network in the Project Area; and 3-12, Figure 3.1-2 Muni Service at the Transbay Terminal

- "Muni service in the Project Area is not adequately represented on this map, particularly the service that currently serves the Transbay Terminal from First Street, as well as the service that continues south on First to Howard (the 1 O-line), and goes north on Fremont from Folsom (the 1 O-line). While this service is correctly depicted in Figure 3.1-2, it should also be shown in Figure 3.1.
- "The station depicted at Fourth and King Streets in the middle of King Street is the Muni Metro station named "Fourth & King/Caltrain" station, not the Caltrain Station.
- "The map in Figure 3.1, as well as others in the EIS/EIR, has a significant highway omission in the base map. It fails to show the touchdown ramps from 1-280 to/from King Street in the vicinity of Fifth Street. The primary access to and from I-280 is now via King Street.

"Section 3.1.5 - Future Rail Transit and Bus Service - Pages 3-26 through 3-28: This section should also include a discussion of potential future high-speed rail (HSR) service to the Transbay Terminal, including projections of the number of riders expected to use the terminal. HSR could add significant numbers of users to the terminal, and should be considered. In addition, this EIS/EIR should be reviewed with California High Speed Rail staff, if this has not already been done.

"Section 5.19.3.2: It is not a correct assumption that both the 30-Stockton and 45-Union would be rerouted along Mission Street after the Caltrain extension is in place. One of those lines will still continue to serve Fourth and Third Streets between Market and Townsend, and will be extended into Mission Bay. The other line will likely be terminated in the vicinity of Yerba Buena Center. It is questionable, however, if the Caltrain Extension would be the triggering event to truncate one of these lines in the Yerba Buena area. It is more likely that the construction of Phase 2 (New Central Subway) of the Third Street LRT line would be the event that would cause Muni to truncate one of these lines."

Response 19.1.3 Chapter 3, Volume I, of the Final EIS/EIR has been changed regarding the elevated Central Freeway, the Third Street Muni Metro Project Initial Operating Segment (IOS), the New Central Subway, the Ferry Bus Terminal, Muni's F-Line Historic streetcar service,

and the merger of the San Francisco Parking and Traffic Commission with the San Francisco Public Transportation Commission (MTA). The reference to a new King Street access roadway at Fifth Street into Mission Bay has been clarified regarding its extension.

The title shown for the station depicted at Fourth and King Streets in the middle of King Street has been changed on Figure 3-1, Transit Network in the Project Area. No station is shown on Figure 3.1-2. Subsection 3.1.5.8 has been added to the Final EIS/EIR, Volume I, to reflect the proposed California High Speed Rail Program. The omission of the King Street on- and off-ramps from I-280 has been corrected on all maps in the EIS/EIR. The document has been revised to reflect Muni's qualifications on rerouting the 30-Stockton and 45-Union. Volume I of the Final EIS/EIR includes a revised Figure 2.2-6.

19.1.4 City and County of San Francisco; Traffic Engineering Division; Bond Yee, Deputy Director and City Traffic Engineer, Jack Fleck, Senior Transportation Engineer, Jerry Robbins, Transit Planner V, December 18, 2002

"Casual carpools – Page 3-43. The evening casual carpool queues have been affected by the closing of Beale Street under the Bay Bridge for security purposes. I'm not sure that the description in this section is accurate any more."

Response 19.1.4 The description in the Draft EIS/EIR regarding the evening casual carpool queues is still correct.

19.1.5 Transportation Solutions Defense and Education Fund (TRANSDEF), David Shronbrunn, President, December 20, 2002

"... we are pleased to note that the quality of the DEIS/R is consistent with the quality of the project. The DEIS/R is comprehensive, thoughtful, detailed and well- edited. The preparers are to be congratulated.

"Recognizing that no document is perfect, TRANSDEF appreciates the opportunity to provide the following comments, which are keyed to page numbers: S-7 and elsewhere: The reference to Mission Boulevard appears to refer to Mission Street.

"S-27: While the Summary contains a description of the Environmentally Superior Alternative, a more extended discussion in the body of the DEIS/R would be useful.

"1-28: The Project will also need MTC and federal DOT approvals.

"2-11: It appears that the location of the lower bus level exit ramp on the drawing is incorrect, as it conflicts spatially with the entry ramp to the upper bus level.

"5-95: The Figure legend should be "stacked" not "staked."

Response 19.1.5 The Environmental Superior Alternative identified in the Draft EIS/EIR was adopted by the Transbay Joint Powers Authority as the Locally Preferred Alternative, which is described and evaluated in some detail throughout Volume I of the Final EIS/EIR. MTC has already included the Project in the Regional Transportation Plan. However, it will not be a permitting agency. The Federal Transit Administration is one of the co-lead agencies for this document.

The geometrics of the entry and exit ramps have been developed to be consistent with accepted roadway and bus facility designs. The lower level exit ramp is below the upper level entry ramp. The figure legend has been changed to "stacked."

19.1.6 SPUR, Michael Alexander, Chair, SPUR Transbay EIS/EIR Working Group, December 20, 2002

"There is no illustration 5.16-6 in the draft plan.

"Page 5-122: The methodology that the Planning Department used for determining adverse effect at the study area intersections should be up front before Table 5.19-4."

Response 19.1.6 The commentor is correct. The reference to Figure 5.16-6 has been removed from Volume I of the Final EIS/EIR. The format of this environmental document is different from other documents because it is a joint NEPA/CEQA document, satisfying the requirements of both the federal and State environmental laws. The CEQA significance thresholds for transportation can be found in Chapter 7 on pages 7-4 and 7-5. A short description of the methodology used to determine adverse effects has been inserted just before the Table 5.19-4.

19.1.7 Tay C. Via, Coblentz, Patch, Duffy & Bass, LLP, December 20, 2002

"The DEIS must be revised to include a more thorough analysis of the Second-to-Mission alignment, both to comply with NEPA and CEOA, and to properly identify for decisionmakers and the public its significant impacts.

"Transbay DEIS/DEIR Comments: The DEIS/DEIR does not meet its burden as a disclosure document because the Project Description for the Second-to-Mission alignment lacks information required by law. Impacts from that alignment, including those related to the 301 Mission Street project, [The 301 Mission Street project is a reasonably foreseeable project and the DEIS/DEIR must analyze it. See C.C.R. Title 14, Section 15130(b)(1)(B)] are absent from the document or are inadequately analyzed. This is a particularly glaring deficiency given the high burden of Alternatives analysis under NEPA for an EIS. The NEPA Alternatives analysis has been called the 'lynchpin' of an EIS, requiring 'substantial treatment' in the document. See, e.g., 40 C.F.R.§ 1502.14. The analysis also disregards substantial adverse impacts of the Second-to-Mission alignment – information that is critical to the decisionmakers' evaluation of the preferred alternative. Our specific comments on this and other issues are provided below.

"5. Pages 2-48-2-53. Alignments Considered and Withdrawn. The text describes a number of Caltrain Extension alignments that were considered and withdrawn. Among the reasons for withdrawal are operational issues based on platform location (page 2-50), potentially substantial noise, traffic, air quality and other construction impacts (page 2-51), increased capital operating costs and reduced operating efficiencies (page 2-52) and impacts of a long tunnel on the real estate above (page 2-53). The Second-to-Mission alignment shares each of these impacts, none of which is discussed in the DEIS/DEIR. Each of these impacts must be analyzed, and the Second-to-Mission alignment must be similarly rejected as infeasible.

"Also absent from this discussion is any analysis of relevant Downtown Plan policies related to land use. By way of example, see Objectives 7 (expanding housing supply Downtown) and 13-16 (urban form). The Second-to-Mission alignment is inconsistent with these policies with respect to its 301 Mission Street site impacts.

"The Land Use section purports to analyze wind and shadow impacts. Despite the enormous scope of the project, the DEIS/DEIR does not follow the City's standard format and in fact provides far less information than would normally be included in a Downtown project analysis. For example, the shadow discussion makes conclusory impacts statements, without including any quantitative information or graphics to support or explain the conclusions. The 301 Mission Street development is a foreseeable project that must be included in these analyses.

"9. Pages 5-44 -5-49. Fiscal Impacts. The statements regarding fiscal impacts are conclusory and unsupported by evidence as they relate to the Second-to-Mission alignment. The DEIS/DEIR discusses right-of-way acquisition in Tables 5.6-2 and 5.6-3. The basis for the Fiscal Impacts analysis is indecipherable, as only general reference is made to the Sedway Group, First American Real Estate Solutions, Comps Inc. and Marshall Valuation Service information. Again, how were these numbers generated? How can there be no supporting documents? The DEIS/DEIR must include specific references and background documents that support these numbers and conclusions to provide a road map for decisionmakers as to how these conclusions were reached. Those documents should also be included in the Appendix.

"11. Pages 5-69 - 5-70. Utilities. The statements regarding utilities impacts are conclusory and unsupported by evidence as they relate to the Second-to-Mission alignment. With the substantial excavation of Mission Street that would be required, clearly there would be substantial utilities impacts that are not analyzed here.

"13. Pages 5-109 - 5-137, Transit, Traffic and Parking, Including During Construction. The statements regarding transit, traffic and parking (including during construction) are conclusory and unsupported by evidence as they relate to the Second-to-Mission alignment. This section contains no analysis of transit, traffic and parking impacts associated with that alignment. Due to the vague Project Description, it is difficult to identify or assess those impacts. However, at a minimum, they include substantial disruption to Mission Street (a General Plan Transit Preferential Street) while construction occurs at that location. Construction would presumably progress block-by-block along Mission Street, over a long period of time, with no street parking during construction and significant potential for disruption of Muni operations both above and below grade. The impact of these closures would be substantial and must be discussed.

"14. Pages 5-138 - 5-187. Construction Impacts. The DEIS/DEIR is inadequate in its description of the impacts of demolition, underpinning, surface rail line and station construction and support of adjacent structures that would be required for the Second-to-Mission alignment. These topics receive scant mention on pages 5-144 and 5-148 with no impacts discussion. On page 5-166, the text states that construction traffic 'could potentially result in temporary delays.' The Table on page 5.20-8 suggests that the schedule for both alignments is the same; this analysis appears to ignore impacts from the closure of Mission Street west of Beale Street. The limited nature of the impact is unsupported by analysis, particularly with respect to street closures necessary for construction of the Second-to-Mission alignment. Why is Mission Street west of Beale Street omitted from the analysis? Impacts to this section of Mission Street (including 301 Mission Street) must be addressed in terms of driveways blocked during construction, on-street parking removal, impacts to businesses, utilities relocation and construction noise and vibration.

"Table 5.20-4 estimates the amount of excavation materials. Given the extent of excavation required under structures at the terminus of Mission Street, the numbers for the Mission Street alignment are not credible. Even if these numbers were accurate, the Second-to-Mission

alignment would involve about 10% more excavation. How is this accounted for in the financial analysis? Again, all of this information must be provided.

"15. Chapter 6. Fiscal Analysis. The DEIS/DEIR does not identify specific source documents or make those documents available to the public. For example, where is the cited but undescribed Seifel Consulting and Nancy Whelan Associates tax increment analysis? Specific information regarding that information and acquisition, relocation, resale, and mid-point of real estate costs are essential to adequate analysis, but we are advised they do not exist. The acquisition costs associated with the Second-to-Mission alignment have been significantly underestimated, as have the costs of business disruptions and tax revenue loss. On page 6-8, the tax increment assumptions remain constant for all scenarios. Clearly, there would be a substantial difference between the two alignments in light of impacts on the 301 Mission Street project. The Tables on pages 6-4 and 6-8 must both be revised to account for increased operating expenses for the two platforms and separate tracks in the Second-to-Mission alignment. Finally, the analysis does not account for the costs of acquiring City subsurface land – is the City donating this land, and, if not, what is the acquisition cost?"

Response 19.1.7 Please see Responses 3.5.2 and 3.5.3. A detailed evaluation of the Second-to-Mission Caltrain Extension Alternative is contained in the various environmental categories in Chapter 5 of the EIS/EIR. This analysis satisfies the requirement of NEPA and CEQA.

The analyses for cumulative impacts did take into account future development at the 301 Mission site as necessary for the evaluation of the environmental impacts that the Project would cause. The Second-to-Mission Caltrain Alternative would not preclude the development of the 301 Mission Street parcel; what it would perhaps mean is that the precise preferred development that the 301 Mission Street project sponsor was proposing would have to be changed to accommodate the Caltrain extension. Therefore, the environmental document for the 301 Mission Street development does include alternatives to the proposed 301 Mission Street project that accommodate both Caltrain extension alternatives.

Reasons are provided in Section 2.3, Volume I, of the Final EIS/EIR for withdrawal of various alignments, but issues and impacts associated with the Second–to-Mission option were not sufficient to warrant its withdrawal. The Second-to-Mission Caltrain extension option was not, however, selected as the Locally Preferred Alternative (please see Response 3.1.2). Section 5.12 reviews the impacts to utilities from the Project and notes the utilities under Mission Street. Text addressing these closures of Mission Street has been added to the Final EIS/EIR document.

The Caltrain operating costs are based primarily on the operating time and distance between the Fourth and Townsend Station and the Transbay Terminal. The effect of platform configuration on operating costs has not been considered at this level of conceptual design. As this is a City-sponsored project, there would be no acquisition costs for the use of City subsurface rights-of-way. The tax increment projections for the financial plan assume only the tax increment from the publicly owned parcels. The 301 Mission Street development is on a privately owned parcel and thus is not included in these projections.

Shade and shadow diagrams for the Project are available for public review by appointment in case file 2000.048E at the Planning Department at 1660 Mission Street, San Francisco. Shade and shadow effects are evaluated in Section 5.1.3, Volume I, of this Final EIS/EIR. The excavation amounts have been revised in Section 5.20, Table 5.20-4, Volume I, of the Final EIS/EIR.

The Draft EIS/EIR indicates that underpinning would be used where deemed necessary to protect existing structures from potential damage that could result from excessive ground movements. The design of the tunnelling and the excavation procedures (and construction sequence), and the design of the temporary support system will be developed with the objective of controlling ground deformations within small enough levels to avoid damage to adjacent structures. Where the risk of damage to adjacent structures is too great, special measures may be implemented such as: (1) underpinning, (2) ground improvement, and/or (3) strengthening of existing structures to mitigate the risks. These issues will be addressed on a case by case basis, along the entire alignment, during the detailed design phase of the project. The methodology that is proposed for the Caltrain Downtown Extension, i.e. to design the support system to control ground deformations within tolerances, and selectivity strengthen structures that may be too weak to resist even small deformations, was successfully used for the Muni Metro Turnback project, and should be effective for the Caltrain Downtown Extension project as well.

The fiscal impact analysis was conducted by Sedway Group as a subconsultant working on the Draft EIS/EIR. In conducting this analysis, Sedway Group used standard methods and procedures. All such analyses were conducted in a conservative manner, using commonly accessible data sources. There are two tables associated with the fiscal impact analysis – Tables 5.6-4 and 5.6-5. Please note that comments regarding Tables 5.6-2 and 5.6-3 (which include Marshall Valuation Service and Comps Inc. as data sources) are not relevant to the fiscal impact analysis (which starts with section 5.6.2.3 on page 5-44). Response 3.5.3 addresses concerns regarding these tables.

Where source materials for the fiscal impact analysis are not cited in the text or tables, the assumptions were generated by Sedway Group based upon industry standards and the firm's professional experience. The source materials are maintained in Sedway Group's files and referenced in the text and associated tables where appropriate. Summary information is provided in the text to streamline the presentation and facilitate reader comprehension.

The presentation of figures in the Draft EIS/EIR is very transparent, such that the reader can replicate the analysis using the base information presented in the text. All tax rates are cited and, where not common knowledge, sourced. Moreover, sources are generally tied to the associated data, or can be readily deduced. For example, very specific rather than general reference is made to First American Real Estate Solutions as the source for the assessed valuation of the properties for property tax estimation purposes (see footnote 6 on page 5-45). The aggregate property valuations for each alternative are clearly presented in the text. First American Real Estate Solutions is also the source for the square footage estimates by land use presented in Table 5.6-4. Industry standards were the basis for the square feet per employee estimates for each land use as well as taxable retail sales per square foot. In contrast, County Business Patterns for 1999 produced by the U.S. Bureau of the Census was the source for the base average annual wage used as a basis for estimating payroll tax revenue as cited in footnote 9 on page 5-46.

19.1.8 Titan Management Group, Michael Alfaro, Vice President, December 12, 2002

"Figure 4.1-1(b) setting forth Existing Land Uses erroneously fails to identify the parking lot at Second and Harrison or the parking lot beneath the existing Harrison Street off-ramp. That figure also identifies the Clocktower as residential, whereas it is a live/work building."

"Chapter 4.18 fails to identify the tower containing the clock on the Clocktower Building as a visual resource or as part of the visual character of the area. The Clocktower is one of the most significant and well-recognized landmarks in the area."

Response 19.1.8 Figure 4.1-1(b) has been revised to include surface parking uses on those lots. Existing land use characterizations for Figure 4.1-1(a) and 4.1-1(b) do not include a category for mixed-use. In this case, the "residential" category should be understood to include live-work uses.

19.1.9 League of Women Voters, Sarah Diefendorf and Tuesday Ray, Co-President, League of Women Voters of San Francisco, November 22, 2002

"Pages 4-14 and 4-17, Tables 4.2-1 and 4.2-4. The total number of households in Census Tract 176.02 is listed as 257 in Table 4.2-1 and as 1952 in Table 4.2-4. Which is correct?"

"Page 5-50, Table 5.7-1. This table represents some very sloppy work. It is bogus math, and seriously misrepresents the air pollution reductions. For example, 329 pounds/day of ROG equals approximately a ton a week for a 7-day week (59 tons per year), or 1650 pounds per week for a 5-day workweek (43 tons per year), NOT 51,702 tons per year. Data should be verified before inclusion.

"Page 5-112. The sentence "The West Ramp Alternative would increase the number of bus bays from 32 to 30 bays along and provide..." does not make sense."

Response 19.1.9 Both tables in Section 4.2 of the Draft EIS/EIR are correct. As shown, the tables are for different time periods. The emission reductions shown in Table 5.7-1 in the column labeled "Reduction in Emissions (tons per year)" have been corrected. The sentence on page 5-112 of the Draft EIS/EIR has been corrected to read, "The West Ramp Alternative would increase the total number of bus bays from 32 to 48, with 30 on the AC Transit level and another 18 on the upper bus level.

19.1.10 Bernie Choden, November 16, 2002

"CEQA law permits a challenge of the fiscal feasibility necessary to assure mitigation of environmental concerns. Are there sufficient economic means to pay for the necessary mitigation depending upon what is proposed? Are the mitigation concerns sufficient to deal with cumulative impacts?

"It is not only that this EIR/EIS document does not specify how to pay for mitigations, this document doesn't say what the needed mitigations are (as the document should have done in Chapters V and VI). For example, this document cites traffic impacts as immitigable and, yet, does not acknowledge the impact of unmitigated traffic impacts on the cost of doing business or living in this area. The document does not cite other economic and environmental mitigation needs of adjacent business and residential uses that now exist or would be exacerbated or be created by the project. Vaguely, this document says that there may be an examination of these issues after the approval of this document. Mitigation is an essential component of an EIR; without identification of mitigation need and mitigation measures, this document is not certifiable.

"Mitigation revenue resources appears almost solely dependent on project internal subsidies from tax increments. Tax increments, alone, are the least advantageous means of repaying public investment for this high environmental impact.

“Almost a third of redevelopment increments are directed by law to go to school districts off the top.

“Secondly, the inflationary cap on increments is 2%; that means that the value of a dollar now will be only $0.50 later given normative rates of inflation. It also means that developers receiving tax increment assistance now will be paying off that assistance 10 years from now will do so with dollars worth half as much.

“To provide adequate long-term mitigation revenues, I strongly suggest the project use of ground rents from public land ownership underlying the entire redevelopment project as the best means of paying (a) for the project, (b) mitigating environmental design and social impacts and, (c) controlling future design and development. The reasons are:

”1. Market rate development prospects remain relatively high despite a national economic downturn. Mid-level and high-end rents in the City continued to inflate above 10% last year. A ground rent of a normative 3% on the value of development would only add 0.5% to the operators' annual cost of a project, definitely too little to discourage investment in this premier market. (Regardless of what you've heard)
”2. Ground rents (G.R) remain in constant dollars unlike tax increment dollars. They will still be worth a real dollar years from now.
“3. Front-end money will come from the sale of development rights just at it would, and almost in same amount, from the sale of the title to the land.
“4. The R.A. would receive the equivalent of tax increments (possessory interest taxes) anyway in addition to GR. As a result, the R.A. (and city) would receive, initially, four times as much cash flow as from T.I. only.
“5. Further, the use of G.R. would be much more flexible than for TI, such as the ability to match it to developer incentives and operators underwriting (think non- profits).
“6. The value of G.R. would increase with value of investments. The developers would be able to go in cheap and payout when they were profitable.
“7. Contracts regarding G.R. could control the design and operations of the project as the most efficacious legal means of protecting the public investment and the future design of the terminal area. We should look to the Embarcadero Center as a good design example of how to provide residential uses within a high intensity commercial area.

“I request an economic study directed toward the means and amount of cash flow from the project needed to provide environmental mitigation. Necessarily, approval of the terminal should be contingent how the redevelopment economics shapes up, particularly regarding other city resource needs and, in particular, the provision of a high quality, high-density residential environment within and adjacent to the project. Design isn't just about how the environment looks; it is also about how it works far into the future.

“My experience with the Martin Luther Towers project in the Western Addition #1 Redevelopment Area challenges the assumption that the Redevelopment Agency can be trusted to mitigate the Terminal's environmental impact. In the MLT situation, the RA stated that it would be selective as to what project areas it would honor regarding contractual obligations between the Agency and a beneficiary should the project become deactivated. The Terminal project, therefore, requires an objective environment monitor (as in the Mission Bay Project) who can ensure enforcement of the R.A.'s public contractual obligations regarding development and mitigations.

"Summary:
"This city needs improved rail transit access, but this proposal requires the integration of rail transit design with the design of the other uses necessary to make this project:

"1. An integral, attractive and beneficial part of the city.
"2. A means to pay for the project and its environmental impact measures

"This document spends so much effort describing the transit project that, apparently, there is little space and effort applied to identifying and providing a clear list of mitigations, their costs, how to pay for mitigation, who will be responsible, and how implementation will be monitored.

"This is not, as presented, a certifiable EIR/EIS document."

Response 19.1.10 The EIS/EIR, Chapter 5, Environmental Consequences and Mitigation Measures, contains feasible mitigation measures to reduce and avoid significant effects for both project specific and cumulative adverse impacts. Under CEQA, feasible means "capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors.

The Draft and Final EIS/EIR, Chapter 7, Section 7.2, provide a list of unavoidable significant adverse effects that cannot be mitigated to a level of less-than-significant. In such a case, Section 15093 of the CEQA Guidelines states that, if the mitigations are not available to avoid or substantially lessen project impacts, the agency shall adopt a "Statement of Overriding Considerations" detailing how the economic, legal, social, technological, or other benefits of a proposed project outweigh the unavoidable adverse environmental effects. A Statement of Overriding Considerations will be part of the approval documentation at the time of project adoption.

While there may be costs from unmitigable traffic impacts of the Project on residents and businesses, there are also ongoing costs to commuters using Caltrain because of the delays and uncertainties of traveling between the current Caltrain terminus and downtown. In the future, BART capacity may constrain economic vitality within San Francisco if AC Transit does not have more terminal capacity. Additionally, provision of transit oriented development near the proposed multi-modal transit facility should provide economic benefit to those residing in the Transbay Terminal Area. The environmental document quantifies the transportation aspects of not replacing the Transbay Terminal with those of the proposed Project. It is a decision making document for balancing these needs.

The amount of the statutory pass-throughs for school districts and other taxing agencies applied to tax increment revenues is approximately 20 percent. This has already been factored into the tax increment projections in the financial plan.

A revised Project funding plan is included in Chapter 6, Volume I, of the Final EIS/EIR. The tax increment revenue in the funding plan is reported in escalated dollars to account for inflationary effects.

The anticipated costs associated with environmental mitigations are included in the Project cost estimates. In addition, the financial plan includes a contingency fund to cover unanticipated Project costs, including environmental mitigations.

Ground leases will be explored as a possible option for some of the publicly owned parcels within the proposed Project Area. However, the sale of the land provides the obvious advantage of upfront capital to help defray the cost of the new terminal and Caltrain extension. Sale of development rights will not generate as much revenue, since developers will factor in the cost of the ground lease. Also, if the public sector retains ownership of the land, the land itself would not generate any tax increment revenue. Any possessory interest tax would have to be paid by the Redevelopment Agency itself, thus negating its benefit for the proposed Project Area. Finally, ground leases would be more difficult to finance for developers and this factor would need to be offset with lower initial rents. However, there are some advantages to a ground lease, namely that the Agency could retain more control over the development.

The *Draft Transbay Redevelopment Project Area Design for Development Vision* (August 2003) document provides the Agency's plan for constructing public open space and other environmental mitigations related to the development in the Project Area (please see Responses 10.1.1, 10.1.2, and 10.1.3).

19.1.11 League of Women Voters of the Bay Area, Doris Maez, North San Mateo County League of Women Voters, Onnolee Trapp, South San Mateo County League of Woman Voters, Eva Alexis Bansner, President, December 5, 2002

"Air Quality: (Page 5-50, Table 5.7-1). Protection of air quality is a very important benefit of transit oriented development. Bad math discredits findings."

Response 19.1.11 Please see Response 19.1.9.

19.1.12 William Blackwell, Architect, November 12, 2002

"SB 1856 does specify the Transbay Terminal as the ultimate destination for HST but, according to Rod Diridon, the $9 billion bond issue is only enough for the LA to San Jose portion. In spite of the commitment to downtown San Francisco, Section 1 (e) allows the Authority to set the limits of the route without extending to San Francisco. Diridon said that an additional $2 billion is needed to bring HST up the peninsula."

Response 19.1.12 The co-lead agencies have not received any capital cost estimates regarding high-speed rail.

19.1.13 William Blackwell, Architect, December 2, 2002

"Page 2-50. The Essex St. stub-end technical analysis is erroneous on several counts. Caltrain at present operates successfully with sub-end, not "pass through" tracks. Storage/by-pass tracks can also be provided at the stub-end. Reversing train direction is routinely done now and, in any case, does not present an operating problem that would impact schedule. Most northbound and southbound trains will make station stops at both Fourth & Townsend and at the downtown terminus. See Attachment No. 2. Internal passenger circulation (with, for example, horizontal passenger conveyors) can be as clear and elegant as in the proposed, better even because the tracks do not need to be so far underground. The paragraph does not address the advantages of separating Caltrain extension form the Transbay Terminal Improvement Project.

"Page 5-93, bottom paragraph - Assuming similar sleek structural designs for the one- level ramp, the stacked ramps illustrated in Figure 5.16-2 would not be less visually obtrusive than a single ramp. (The title of the simulated drawing is confusing - should be" looking NW on Howard St. from about Second Street")

"As in Figure 6.16-2, a simulated visual comparison should be shown that illustrates the significant adverse impact of the proposed design on the views up and down on both 1st and Fremont Streets.

"Page 5-159. Table 5.20-4 shows 658,100 cubic yards of excavation materials for the terminal, but Table 5.21-1 on page 5-168 shows only 125,000 cubic yards for the terminal and a very low truck volume. Why the discrepancy? At 2,500 cubic yards per workday (180 trucks) this trainbox excavation will take about one year. The Blackwell Alternative deletes this requirement for a very deep and costly train box excavation.

"Other: Conservation of Natural Resources and Energy – This item is not included in the Draft EIS/EIR but might be significant enough to be included."

Response 19.1.13 Please see Responses 5.1.5 and 5.1.6. The commentor accurately notes that the current Caltrain Station at Fourth and Townsend is a stub-end station. It should be noted that this station currently has 12 tracks and six platforms for train storage, staging, and passenger loading and unloading as well as additional train storage areas. This number of tracks and platforms is not possible at the new terminal, nor is this number proposed under the commentor's recommended station layout. The proposed tail tracks are therefore important for train operations and staging given the more limited number of tracks and platforms for the new station. Additionally, the tail tracks allow for trains to leave the station and be stored without interfering with incoming trains, and return quickly to the platform when needed for revenue service.

The EIS/EIR provides the reasons that the stacked ramps are viewed as less visually obtrusive. Specifically the Draft EIS/EIR states in Section 5.16 that "the proposed ramps would occupy considerably less area than the existing ramps, and would be split, breaking up the mass of the ramps and allowing views between the two new ramp sections. Although the new decks would be approximately 30 feet tall, they would be less visually intrusive due to their uniform appearance and minimal supporting structures." The caption on Figure 5.16-2, Volume I, of this Final EIS/EIR has been corrected to read, "View from Howard Street near First Street Looking Southwest."

The new facility would span both First and Fremont Streets, as does the current facility. Thus no new visual intrusion would be introduced by the new facility for these streets, and visual simulations have not been prepared for these views.

The excavation amounts have been revised in Section 5.20, Volume I, of this Final EIS/EIR. Section 5.18 of Volume I reviews the Project's impacts related to energy, while Section 5.22 discusses the irreversible and irretrievable commitment of resources.

Note: Comments 19.1.14 through 19.1.18 all concern the graphics contained in the Draft EIS/EIR. One response is provided to all of these comments, and this consolidated response can be found following Comment 19.1.18.

19.1.14 San Francisco Tomorrow, Jennifer Clary, President, Norman Rolfe, Transportation Chair, December 20, 2002

"The maps in this document are difficult to read and would benefit from the addition of directional arrows. Also, relevant street names are often omitted, again making it difficult to pinpoint locations. Please consider remarking these maps to make them clearer to the reader...

"Project Description – It would be extremely helpful if this section would include a map or maps of the entire project area with the three projects delineated on those maps. The current document has no overview of the combined projects."

19.1.15 Greg Patterson, December 18, 2002

"Graphic Description of the Project. The route of the Caltrain Downtown Extension rail layout through the city (Figures 2.2-9 through 2.2-17) is shown in nine separate maps, each of which has a different compass orientation and none of which has a North arrow. One overall location map should have been shown in smaller scale as a key to the position of each of these map sections. The only guidance one has is the "match lines." Street names are absent and have to be supplied using an automobile route map from one's glove compartment. This reader had to have Figures 2.2-9 through 2.2-17 Xeroxed and then pasted together the map segments along the match lines, resulting in a snake-like collage of angled map juxtapositions that can only be folded by an original artist. While acknowledging that this project is a complex one extending over many blocks, there are better means of presentation to make it legible for readers."

19.1.16 League of Women Voters, Sarah Diefendorf and Tuesday Ray, Co-President, League of Women Voters of San Francisco, November 22, 2002

"Figures 2.2-9 to 2.2-21. The varying orientation (with respect to the north) of the reproduced maps from map to map is extremely difficult to follow. A large map that connected all the components would be very helpful.

"Page 2-45, Figure 2.2-22. This Figure and Table 4.1-1 on page 4- 10 are helpful in conceptualizing the project.

"Figures 5.2-1 to 5.2-6. The varying orientation of these maps with respect to north is difficult to follow."

19.1.17 Mary Anne Miller, San Francisco Tomorrow, Speaker, 11/26/02 Public Hearing

"We, after all, are just members of the public. So we are trying to discover, in fact, whether we can understand this project's graphics. I went to the Xerox shop. And I tried to paste together 13 drawings. And I don't even think I've got it right. Otherwise, you don't find the project described graphically. You see certain drawings in there, schematics; they don't say if it's the existing or the proposed. Some of them tell you it's one of the alternatives. But this was kind of fun to do. I recommend it to you. Go home, Xerox it, paste it together. On the match lines, I found one drawing missing. Drawing number 205 is just sort of not there. So I couldn't complete my little patchwork there. But it was helpful to do the patchwork on the effort here in order to understand what buildings will be demolished...

"We have three historic districts, one a national registered historic district... There are no graphics that will help you to take the very well-evaluated historic resources that are in Chapter 5, I believe. And you can't take them and go find them on a map. So you have to paste together another series of things, and highlight with your yellow highlighter or whatever you want to do where those buildings are to be demolished. And you have to find the street labels, the north arrows to get all this right. So the graphics are really flawed. I don't want to belabor that."

19.1.18 San Francisco Planning Commissioner Kevin Hughs, 11/26/02 Public Hearing

"I believe we should look at the graphics; the graphics do not fit, if they do not have a good working relationship with preceding, succeeding graphics, then we might review that. Certainly should include shadow impacts."

Response to Comments 19.1.14 through 19.1.18. The plan/profile maps for the proposed Caltrain Downtown extension were developed following standard Caltrain and FTA conventions for such maps, i.e., the alignment runs horizontally along the map with a profile underneath, thus producing varying directional orientations. A north arrow is provided on each of these drawings.

In response to these comments, a summary graphic of the Caltrain Downtown extension, Figure 2.2-9, has been added to Volume I of the Final EIS/EIR. This graphic shows the full Caltrain Downtown extension and the anticipated types of construction. Figure 2.2-23 shows the Caltrain Extension in the immediate Transbay Terminal area and includes revisions to the alignment made since the Draft EIS/EIR.

The anticipated "Full Build" and "Reduced Scope" redevelopment levels and locations are shown in Figure 2.2-25, while the proposed redevelopment land use contained in the *Draft Transbay Redevelopment Project Area Design for Development Vision* (August 2003) is shown on Figure 2.2-26. The Finding of Effect (FOE) contains a map showing historic structures and is available for review by appointment at the San Francisco Planning Department, 1660 Mission Street.

The city's zoning maps are available on-line and may be useful in responding to this comment by adding an overall graphic to show the various districts and properties in the project area. See "Zoning Map of the City and County of San Francisco, Sheet 1PD," at http://www.sfgov.org/planning/index.htm.

19.1.19 San Francisco Tomorrow, Jennifer Clary, President, Norman Rolfe, Transportation Chair, December 20, 2002

"The numerous studies that have been done in this area have produced an intimidating amount of information. Many reports are cited and summarized in this document. Many more reports which were key to the development of these proposals have been left out. The limitations on the size of this document may make this necessary, but the result is that more information is left out than included. We recommend therefore that the FEIR/FEIS include as an appendix a bibliography of all of the source material for these projects."

Response 19.1.19 A Bibliography has been included in Volume I of the Final EIS/EIR as Appendix E.

19.1.20 Mary Anne Miller, San Francisco Tomorrow, Speaker, 11/26/02 Public Hearing

"In trying to decide, whether – you go from one alternative to another. You have three of the National Historic Register sites that will be lost in one alternative. You have 13 in another alternative. This was told me by the planner, Joan Kugler, who is not here today. We met with her to try to get clarification on this document. It's very hard. She brought in cardboard boxes – literally two, and she had several more in her cubicle – of the background reports that had been done for this EIR. Now, you know, I said to her, 'Well, Joan, couldn't we have a bibliography so

we can ask you in the future. This project is going to take 8 years, maybe another 20 with the Redevelopment Area; couldn't we have a bibliography with only one sentence of paragraph of the EIR?'

"There's not a reference, footnotes, no bibliography. So we're just looking for -- how can the public access the information? How can you access the information to make the best possible decision?"

Response 19.1.20 Please see Response 19.1.19.

20.0 ONGOING PLANNING COORDINATION

Note: Comments 20.1.1 through 20.1.5 all concern the coordination with other agencies for the Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project. One response is provided to all of these comments, and this consolidated response can be found following Comment 2.1.5.

20.1.1 California Department of Transportation, Timothy C. Sable, District Branch Chief, December 20, 2002

"The Transbay Transit Terminal project will require much coordination between all entities involved, and we look forward to working with you on this important transportation facility."

20.1.2 BART – Thomas E. Margro, General Manager, December 20, 2002

"A well designed Transbay Terminal and Caltrain extension project could significantly enhance regional transit options. If San Francisco is to retain its prominence in the Bay Area, it is important to maximize the effectiveness of transit projects linking San Francisco with its neighbors.

"Since the proposed Transbay Terminal and Caltrain extension are intended to facilitate travel between the East Bay, San Francisco and the Peninsula, there is clearly a mutual and potentially complementary relationship between this project and BART. We are particularly interested in the interface between the Transbay Terminal and BART in Downtown San Francisco, connectivity, and facilitating long-term regional rail opportunities."

"We hope the Final EIR will provide for ongoing coordinated planning efforts among BART, the U.S. Department of Transportation, the Federal Transit Administration, the City and County of San Francisco, Caltrain, and the San Francisco Redevelopment Agency. As we develop a better understanding of future needs, we are especially interested in identifying underserved regional markets where the Transbay Terminal could provide additional capacity that complements the existing rapid transit network. In evaluating proposed services, BART would like to work with you to coordinate capacity analysis, ridership forecasting and service planning efforts... Beyond the environmental process, we would also like to work with project sponsors in the future to help design transbay services that distribute transit resources efficiently and improve access to underserved areas."

20.1.3 San Francisco Muni, Jose Cisneros, Deputy General Manager for Capital Planning & External Affairs, December 17, 2002

"Muni will be happy to work closely with the project designers as this project moves forward, and we look forward to playing an integral role in the city's efforts to implement this project."

20.1.4 California Department of Toxic Substances Control, Guenther W. Moskat, Chief, Planning and Environmental Analysis Section, October 9, 2002

"The Department of Toxic Substances Control (DTSC is in recent receipt of the environmental document identified above. Based on a preliminary review of this document, we have determined that additional review by our regional office will be required to fully assess any potential hazardous waste related impacts from the proposed project. The regional office and contact person listed below will be responsible for the review of this document in DTSC's role as a Responsible Agency under the California Environmental Quality Act (CEQA) and for providing any necessary comments to your office – Barbara Cook Site Mitigation Branch, 700 Heinz Avenue,

Suite 200, Berkeley, California 94710. If you have any questions concerning DTSC's involvement in the review of this environmental document, please contact the regional office contact person identified above."

20.1.5 Lynn Bunim, Executive Director, SBC Pacific Bell, November 19, 2002

"If you have any questions regarding this matter, or need specific information about our underground facilities, please contact Bob Pickard, our Public Works Coordinator."

Response 20.1.1 through 20.1.5 The co-lead agencies look forward to a continued working relationship with the California Department of Transportation, BART, and Muni on this Project. Ms. Cook (California Department of Toxic Substances Control) and Mr. Pickard (SBC Pacific Bell) have been added to the list of contacts for this Project.

21.0 SUPPORT FOR THE PROJECT

Note: Comments 21.1.1 through 21.1.20 all concern the support for the Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project. One response is provided to all of these comments, and this consolidated response can be found following Comment 21.1.20.

21.1.1 AC Transit – Kathleen Kelly, Deputy General Manager, Service Development, December 20, 2002

"The Transbay Terminal is an extremely important facility for AC Transit. It is our only stop in San Francisco and serves thousands of riders daily. As the demand for travel to San Francisco grows, and other transportation modes reach capacity, we expect ridership to Transbay Terminal to increase. However the current facility is badly in need of modernization so that it can function better for both bus operations: and riders. Therefore, AC Transit hopes to see a new Transbay Terminal and associated ramps constructed at the earliest possible date... As you know, AC Transit has been working on this project for many years. We look forward to completion of environmental review and early implementation of the project."

21.1.2 San Francisco County Transportation Authority, Jose Luis Moscovich, Executive Director, December 19, 2002

"As it is well known, the Authority has been a steadfast supporter of the project, and it played a key role in the negotiations leading to the inclusion of the Transbay Terminal/Caltrain Downtown Extension in the Regional Transit Expansion Policy (Resolution 3434) adopted last March by the Metropolitan Transportation Commission as part of the 2001 Regional Transportation Plan (RTP)."

21.1.3 SPUR – Michael Alexander, Chair, SPUR Transbay EIS/EIR Working Group, December 20, 2002

"SPUR has always advocated for the integration of land use and transportation. SPUR has long supported extension of Caltrain to the Transbay Terminal. As downtown expands to the south, rebuilding an obsolete hub for commuter transit, improving connections to BART, adding High-Speed Rail and surrounding the new terminal with a new mixed-use community that is friendly to pedestrians and non-motorized travel will be essential to the city's continued viability and livability... Please accept these comments with our support for the project and mutual interest in seeing this great opportunity for San Francisco realized for the broadest benefit for our city and the region."

21.1.4 Peter Winkelstein, SPUR, Speaker, 11/26/02 Public Hearing

"I'm here representing SPUR, San Francisco Planning and Urban Research Association, and the Culture and Urban Policy Committee. We are reviewing this EIR, and we'll submit written responses next week. And I just want to say today that SPUR has been involved with this project in the transbay area very actively for many years. And we support the project very strongly. We also support the preferred alternatives that Mr. Rolfe just pointed out to you. And we feel that in general, the EIR is an adequate EIR.

21.1.5 Margaret Okuzumi, BayRail Alliance, Speaker, 11/13/02 Public Hearing

"I'm speaking on behalf of BayRail Alliance. We strongly support the Transbay Terminal project. And as some of you may know, we raised a massive lobbying campaign to get the governor to transfer the land --for the state to transfer the land to make this project possible."

21.1.6 Margaret Okuzumi, BayRail Alliance, Speaker, 11/12/02 Public Hearing

"I am speaking on behalf of BayRail Alliance, a grassroots riders groups with members throughout the Bay Area, particularly concentrated along the Caltrain line from San Francisco to Gilroy. Our organization strongly supports the Transbay Terminal project, including the Caltrain Downtown Extension, and we're very pleased those projects are moving forward and making progress.

21.1.7 Andy Chow, Director, BayRail Alliance, Speaker, 11/12/02 Public Hearing

"I personally support this proposal to, for new Transbay Terminal, and a new station for Caltrain, and a new extension. This project is really unique in a way that instead of relying on City – instead of subsidizing the cities of redevelopment which unfortunately some other projects in this Bay Area are kind of like. The land use supports the project. Whatever development process came from the government, can use to expand transportation. This is what it is. This is reality in other countries, where they have intensive land use. Integration of transportation needs to happen in San Francisco. It is about time.

21.1.8 M. Kiesling, Regional Alliance for Transit (RAFT), December 18, 2002

"Over the past decade we have witnessed a wide range of official actions on the TTT. Initially, the city wished to completely remove the terminal and ramps, putting hundreds of buses on th7e congested SOMA streets. As studies began on the Caltrain extension, some quite interesting alternatives were proposed, including running train down the middle of SOMA streets and even on Market Street.

"The DEIR that has grown out of the last decade of debate is supported by RAFT. We have concerns with some details of the project, but overall the projects described meet the transportation and planning goals that RAFT has supported and lobbied for over the last decade."

21.1.9 Tom Dillon, Speaker, 11/12/02 Public Hearing

"I just think that the rebuilding of Transbay Terminal or a transit terminal will be absolutely wonderful. I think that Caltrain needs to be – speedier trains. The whole system needs to be much speedier. We live a rapid-moving world. Going around down to San Jose in a one-hour trip is just too long. I'm looking forward tremendously to the high-speed connection between Los Angeles and San Francisco, and I hope they utilize the absolutely best technology which we have."

21.1.10 Jeff Carter, Speaker, 11/13/02 Public Hearing

"I too support this project and the Caltrain downtown extension. It's been studied to death, and we need to get it done as quickly and as efficiently as possible.

21.1.11 Michael Kiesling, Speaker, 11/12/02 Public Hearing

"I've been involved in this project for quite some time also. Over the last decade, it's been refreshing in the last couple of years to see San Francisco take a role in this and conduct a professional study that's coming up with real answers and solutions into finding out how the project can be built and finished. In the past, if you followed this study, there were a lot of strange little studies that went along with this that had diesel trains running down Brannan Street or down Market Street. It's good to see the Commission and the city working to get the synergy of redevelopment in the transbay area, and bring transportation from the East Bay and peninsula together in one place. I agree with many of the previous speakers. We have an ability to clean up almost every property that has been languishing down there for a long time. The Transbay

Terminal has anguished over what has been going to happen to it for about 30 years now. Also, it's important to remember like the previous speaker said that this is probably the premiere opportunity in this Country for the fusion of land use and transportation. And we're lucky that we're able to take some of the profits coming from development, the opportunity to develop the land there to work on the terminal to show when it comes time to get the funding in line that San Francisco is making a large contribution to this project locally."

21.1.12 Andrew Sullivan, Rescue Muni, Speaker, 11/12/02 Public Hearing

"We have been in favor of this project for many years, and so we are speaking on behalf of the project largely as written in the EIR, though of course we would like to urge the project team to pursue opportunities for cost reduction where it doesn't lead to reduction in service quality.

"We think it is a very, very important project for the region at large. It serves the commuter population and makes the Caltrain more useful, but it also serves the high-speed rail service that has to terminate in Los Angeles to be useful. California high-speed rail running from the Transbay Terminal, the Grand Central Terminal for San Francisco would be much more useful if it terminated in L.A.

"We are pleased the terminal design has been put in place to lead. A lot of years went into planning Grand Central Terminal a century ago in New York City. We're still benefiting from it today. It makes sense to repeat that experience here...

"A very good job. We'd love to see this terminal get built for San Francisco with all deliberate speed.

21.1.13 Andrew Sullivan, Rescue Muni, December 20, 2002

"As strong supporters of this project, we are very excited that this project is finally moving forward after years of delay."

21.1.14 Jim Haas, Speaker, 11/12/02 Public Hearing

"I have been a member of many other committees, Transbay, CAC, and actually four prior committees to that. So I've been involved in this close to 15 years. I've seen an EIR be stopped and begin again, so it gives me great satisfaction to be here and see that it's almost at the completion stage."

21.1.15 Eugene Bradley, Speaker, 11/13/02 Public Hearing

"But for the most part, I am for this project with the concerns that I had stated. Thank you."

21.1.16 Norman Rolfe, Speaker, 11/12/02 Public Hearing

"Generally, we support these projects – want to see them go ahead. But there are some modifications we're going to suggest."

21.1.17 Adrian Brandt, Speaker, 11/13/02 Public Hearing

"I just want to speak in support of the whole project and the plan..."

21.1.18 Transportation Solutions Defense and Education Fund (TRANSDEF), David Shronbrunn, President, December 20, 2002

"TRANSDEF is very pleased with the DEIS/R for this exceptional project. The comments we raise here mostly seek full documentation of the regional benefits of the Project. We believe that the Bay Area needs to understand how beneficial this project will be."

21.1.19 Richard Mlynarik, Speaker, 11/12/02 Public Hearing

"Our organization has been involved in 16 regional transit issues, including marginally on the Transbay Terminal, for over a decade now. We're extremely pleased at the direction that process has taken. Something that needs to be borne in mind when you have people up here having a love fest about how promising the Environmental Draft Report is, this is largely the outcome of an over-two-year Metropolitan Transportation Commission happened with the cooperation of Caltrain, Caltrans and from City Redevelopment. I think that's part of the reason that we're heading in the right direction. This isn't just one document, but an outcome of a great deal of study by a great number of individuals...

"I think it's important to note we have potentially an excellent project here. I look forward to you, and the city, and other agencies working to see it come to fruition."

21.1.20 U.S. Environmental Protection Agency – Lisa B. Hanf, Manager, Federal Activities Office, December 2, 2002

"EPA is highly supportive of the project goals to reduce vehicle miles traveled, reduce vehicle emissions, and to provide expanded transportation choices. We look forward to the successful implementation of this project. In our review of the document, we found that the DEIS sufficiently addresses the environmental impacts of the proposed alternatives. EP A has rated this document LO, Lack of Objections. This rating applies to all project options."

Response 2.1.1 through 2.1.20 The co-lead agencies acknowledge the support of the Project from Ms. Kelly and AC Transit; Mr. Moscovich and the San Francisco County Transportation Authority; Mr. Alexander, Mr. Winkelstein and SPUR; Ms. Okuzumi, Mr. Chow, and the BayRail Alliance; Mr. Kiesling and RAFT; Mr. Dillon; Mr. Carter; Mr. Sullivan and Rescue Muni; Mr. Haas; Mr. Bradley; Mr. Rolfe; Mr. Brandt; David Shronbrunn and TRANSDEF; and Mr. Mlynarik. The co-lead agencies acknowledge US EPA's support of the project goals to reduce vehicle miles traveled, reduce vehicle emissions, and to provide expanded transportation choices.

Written Public Comments and Public Hearing Transcripts on the Transbay Terminal/Caltrain Downtown Extension/ Redevelopment EIS/EIR

INTRODUCTION

The Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project Draft Environmental Impact Statement/Environmental Impact Report (Draft EIS/EIR) was released for public review on October 4, 2002. Notice of availability of the Draft EIS/EIR was published in the *San Francisco Independent* newspaper and posted at the Planning Department. 550 newsletters were sent to the mailing list announcing the availability of the Draft EIS/EIR, and a letter was sent directly to property owners whose properties could be directly affected by the Project. Fifty 11"X17" posters were posted throughout the Project area, including along Second Street. Notices were sent to all property owners within 300 feet of the project boundary as required by the San Francisco Administrative Code Chapter 31.

Enclosed are the written public comments and public hearing transcripts on the Transbay Terminal/Caltrain Downtown Extension/Redevelopment Draft Environmental Impact Statement/ Environmental Impact Report.

I. Federal Agencies

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
REGION IX
75 Hawthorne Street
San Francisco, CA 94105-3901

RECEIVED
DEC 09 2002
PLANNING DEPT

December 2, 2002

Paul E. Maltzer, Environmental Review Officer
San Francisco Planning Department
1660 Mission Street, Suite 500
San Francisco, CA 94103

Dear Mr. Maltzer:

The Environmental Protection Agency (EPA) has reviewed the Draft Environmental Impact Statement (DEIS) for the **Transbay Terminal / Caltrain Downtown Extension / Redevelopment Project**, in San Francisco, California (CEQ Number: 020417, ERP Number: FTA-K54028-CA). Our review is pursuant to the National Environmental Policy Act (NEPA), Council on Environmental Quality regulations (40 CFR Parts 1500-1508) and Section 309 of the Clean Air Act.

The Federal Transit Administration (FTA), City and County of San Francisco, Peninsula Corridor Joint Powers Board, and the San Francisco Redevelopment Agency jointly propose a three-part project: 1) a new, multi-modal Transbay Terminal on the site of the existing Transbay Terminal, 2) extension of Caltrain from its current San Francisco terminus at Fourth and Townsend Streets to a new underground terminus underneath the proposed new Transbay Terminal, and 3) establishment of a Redevelopment Area Plan with related development projects, including transit-oriented development on publically owned land in the vicinity of the new Transbay Terminal. In addition to the No Action Alternative, two alternatives are under consideration for each of the major project components. A preferred alternative is not identified.

EPA is highly supportive of the project goals to reduce vehicle miles traveled, reduce vehicle emissions, and to provide expanded transportation choices. We look forward to the successful implementation of this project. In our review of the document, we found that the DEIS sufficiently addresses the environmental impacts of the proposed alternatives. EPA has rated this document **LO, *Lack of Objections*.** This rating applies to all project options. Please see the attached *Rating Factors* for a description of our rating system.

While we have not identified environmental impacts requiring substantive changes to the document, we have identified opportunities for improving the air quality mitigation measures proposed during the construction phase of the project. Our comments are listed below.

Printed on Recycled Paper

Air Quality – Construction

The DEIS includes several excellent mitigation measures for air quality emissions generated during construction (p.5-179). Because air quality impacts are of increasing human health and environmental concern, EPA recommends taking steps to reduce air quality impacts to the greatest extent possible. In addition to these mitigation measures, EPA strongly recommends that the Final Environmental Impact Statement (FEIS) address the following air quality issues:

- Identify sensitive receptors in the project area, including transit users.
- Include mitigation measures that detail how diesel emissions will be minimized for each phase of project construction, such as the use of electrically-powered equipment or alternative fueled machinery, where feasible. Where diesel-powered equipment is necessary, keep machinery well tuned and minimize unnecessary idling.
- Address how traffic congestion related to project construction can contribute to increased levels of carbon monoxide, especially at already congested intersections.
- Identify additional mitigation measures that will be implemented during high winds and smog alert days.

We appreciate the opportunity to review this DEIS. When the FEIS is completed, please send one copy to me at the address above (Mail Code: CMD-2) . If you have any questions or comments, please feel free to contact me or Nova Blazej, the primary person working on this project. Nova Blazej can be reached at 415-972-3846 or *blazej.nova@epa.gov*.

Sincerely,

Lisa B. Hanf, Manager
Federal Activities Office

Re: Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project

The Department of Toxic Substances Control (DTSC) is in receipt of the environmental document identified above. Based on a preliminary review of this document, we have determined that additional review by our regional office will be required to fully assess any potential hazardous waste related impacts from the proposed project. The regional office and contact person listed below will be responsible for the review of this document in DTSC's role as a Responsible Agency under the California Environmental Quality Act (CEQA) and for providing any necessary comments to your office:

Barbara Cook
Site Mitigation Branch
700 Heinz Avenue, Suite 200
Berkeley, California 94710

If you have any questions concerning DTSC's involvement in the review of this environmental document, please contact the regional office contact person identified above.

Sincerely,

Guenther W. Moskat, Chief
Planning and Environmental Analysis Section

Mr. Paul E. Maltzer
Environmental Review Officer
San Francisco Planning Department
1660 Mission Street, Suite 500
San Francisco, CA 94103

Dear Mr. Maltzer:

Transbay Terminal / Caltrain Downtown Extension/Redevelopment Project -
Draft Environmental Impact Report (DEIR)

Thank you for including the California Department of Transportation (Department) in the environmental review process for the above-referenced project. We have reviewed the Draft Environmental Impact Report for construction of a multi-modal Terminal on the site of the present Transbay Transit Terminal, and have the following comments to offer:

1. Seismic Condition

As the owner/operator of the Transbay Transit Terminal, the Department has participated in ongoing regional discussion regarding relinquishment of the Terminal to a Joint Powers Authority (JPA) for replacement. The Department determined that until the facility was transferred to the JPA, the Department would need to evaluate seismic risk and acceptability levels. After an evaluation by the Department's consultant, the Office of the State Architect (OSA), the Department entered into and completed various interim seismic upgrade projects from 1993 to 1999 to mitigate the most extreme seismic risks.

Between 1993 and 1999, OSA completed three seismic retrofit projects, costing approximately $15 million. Prior to commencement of any of the seismic upgrade work the building was classified approximately at risk Level V. After completion of the final phase of the seismic upgrade work, the risk level was reduced to between Level III and Level II.

2. Terminal Deficiencies

Because regional consensus pointed to the Terminal's demolition and replacement, the Department and the Metropolitan Transportation Commission (MTC) recommended that major construction deficiencies be deferred, except on a case-by-case situation. Some of the projects recently undertaken are the completed ventilation project in the West Garage, a mechanical evaluation of the elevator and escalators, and the development of a PS&E (Plans, Specifications & Cost Estimates) to remedy an Americans with Disabilities Act (ADA)-deficient restroom and drinking fountain in the center unit.

Some of the remaining major deficiencies at the Terminal include the fire sprinkler systems; the lack of ADA-accessible bus platforms and exit routes; plumbing and electrical service to meet the Uniform Building Code (UBC); and a list of general renovation work that would need to be completed if the existing Terminal were to

be designated for full service.

3. Cultural Resources

Page 1-28 (table 1.2-4) should be revised to include the required legislative approval under California Public Resources Code Section 5027 (see additional information below).

Page 2-47 (section 2.3.1.1) describes one of the alternatives, "Renovation of Existing Transbay Terminal and Associated Structures," which was considered but withdrawn. This alternative precludes underground rail, but instead would require construction of elevated rail structures for Caltrain or high-speed rail access. According to the DEIR, this alternative was withdrawn because the anticipated seismic strengthening would preclude the project goal of revenue-generating development. The fact that the Transbay Transit Terminal and the ramps are National Register-listed properties calls for a more substantive discussion regarding the possibility of preserving the properties.

Pages 4-48 through 4-60 (section 4.16.6) and pages 5-75 through 5-77 (section 5.14.3 through 5.14.3.4), and Section 8: the DEIR text throughout these sections is inconsistent regarding the National Register of Historic Places status of the Transbay Transit Terminal, and the Bay Bridge approach and bus ramps. As of 2000, the Transbay Transit Terminal and the ramps have been "listed" on the National Register, as contributors to the San Francisco-Oakland Bay Bridge, and are no longer considered to be merely "eligible" for the National Register. Tables 4.16-1, 5.14-1, and 8.4-1 also should clarify the National Register status as listed as contributors, or 1D, rather than 2 or 2S2.

Page 5-75 (section 5.14.3.1) should address California Public Resources Code Section 5027, which states, "Any building or structure that is listed on the National Register of Historic Places and is transferred from state ownership to another public agency shall not be demolished, destroyed, or significantly altered, except for restoration to preserve or enhance its historical values, without the prior approval of the Legislature by statute. This section applies to any building or structure transferred from state ownership to another public agency after January 1, 1987."

Section 5.14.3.5 should additionally evaluate the effects of demolition of the ramps and Transbay Transit Terminal on the San Francisco-Oakland Bay Bridge.

Page 5-91 (section 5.14.3.5) discusses potential mitigation. Because the project would have effects on the San Francisco-Oakland Bay Bridge, any Historic American Buildings Survey/Historic American Engineering Record documentation on the Transbay Transit Terminal and ramps should be filed additionally with the Department. Additionally, if the Department no longer owns the Transbay Transit Terminal, the "Interpretive Display" would be the responsibility of the project proponents, not the Department. Opportunities for collaborating with the Department on the completion of mitigation tasks for effects to the San Francisco-Oakland Bay Bridge should be investigated.

4. Hazardous Materials

Section 4.17 - There is no discussion of the potential for encountering asbestos and lead during building demolition. This should be included, to be consistent with the rest of the section, which discusses potential problems during construction. The project appears to be away from veins of asbestos-bearing serpentine rock. However, if this source has not already been considered, then it would be prudent to take a closer look, particularly for the Caltrain extension.

Section 4.17.2.2 - Vehicle exhaust should also be included as a potential source of lead contamination. In areas outside the historic fill limit and industrial sites, lead contamination shows up as a surficial zone of one to two feet in depth, depending on soil type and traffic volume.

Section 5.21.9 - Asbestos should also be discussed in this section since there are Bay Area Air Quality Management District (BAAQMD) rules regarding asbestos removal and building demolition. The USEPA National Emission Standards for Hazardous Air Pollutants regulate asbestos during demolition and removal. BAAQMD has the delegated authority to enforce these regulations.

Section 5.21.11 - Does State Water Resources Control Board Order No. 99-08-DWQ apply to projects in San Francisco even though storm water runoff goes to the combined sewer system? If so, a Storm Water Pollution Prevention Plan would need to be prepared for the project. Will the project depend solely on the combined system as its sediment control practice? If not, some of the management practices listed in the Air Quality section would also minimize sediment removal from the site. Secondary containment and spill contingency should also be addressed for fuels and other liquid pollutants that will be used during construction.

5. Air Quality

Page 4-29 and 5-53: The TIP information should be updated to reflect the latest TIP/RTP information.

Page 5-52, Section 5.7.2.2: In view of the fact that there is an existing carbon monoxide (CO) exceedence shown at First and Howard Streets, the CO microscale study must address the construction year CO levels as well as the year 2020. Higher emission levels in the build year would result in higher CO levels. As it stands now, the document does not clearly show that the project does not worsen an existing exceedence.

Page 5-54: The reasoning regarding the PM-10 impacts of the project, while acceptable for the regional impacts, needs further analysis regarding microscale PM-10 impacts. Localized PM-10 impacts could be caused by a larger number of vehicles drawn to the facility, even though regional trips have been reduced. The Federal Register states that PM-10 methodology is not yet available for microscale PM-10 calculations. Some other qualitative reasoning for microscale impacts would be appropriate.

6. Right of Way (ROW)

Page S-8, and Figure S-2, discussing various development levels, should mention the fact that these parcels are currently State-owned, and that the transfer of ownership is the subject of ongoing negotiations with the State, and the subject of a cooperative agreement. Additionally, approximately 1/3 of the Block #3737 will be permanently occupied by the Folsom Street leg of the Fremont Street off-ramp. This is repeated in various figures throughout Chapter 5.

7. Proposed Bus Storage

In Chapter 2, Figure 2.2-5, the feasibility of providing a parking double-deck under the I-80 structure is not clear.

The impacts of the proposed bus storage under Interstate 80 (I-80) between Stillman, Perry, 2nd and 4th Streets are not adequately addressed in the DEIR. The West Ramp Alternative displaces AC Transit and Golden Gate Transit bus storage from current locations on the Terminal East Loop and the surface lot at Main, Beale, Folsom and Howard Streets, respectively. The Project includes a direct ramp connection between the proposed storage facilities and the new Terminal. The Noise and Vibration portions, as well as the Air Quality portions of Table S-1 do not address the impacts of the proposed bus parking underneath the I-80 structure on the residences and businesses on Stillman and Perry Streets.

Storage of 200+ buses between 2nd and 4th Streets, plus a two-level automobile parking structure at 4th Street, could represent a substantial change from the existing use that would require an Air Quality Assessment from

the Regional Air Quality Board and/or Association of Bay Area Governments (ABAG) addressing the impacts of the proposed use on air quality based on the Bay Area Air Quality Assessment Model.

Also, Streets and Highways Code Section 146 "Use of Airspace for Mass Transit" requires that the Department exercise discretion in allowing only such uses that conform to established safety design standards, and are consistent with good ecological and environmental planning. Any commitment we make to the Transbay Joint Powers Authority to provide airspace for the proposed use would be subject to the Air Quality Assessment, and our approval of the parking structure development plans.

8. Related Projects

Chapter 1, Section 1.4, titled "OTHER RELATED PROJECTS," does not mention the upcoming San Francisco-Oakland Bay Bridge (SFOBB) West Approach Seismic Safety Project, a 5-year, $225 million project, which will be impacted by the proposed Transbay Transit Terminal project. Of specific concern is the impact of the Caltrain Extension's construction activities directly underneath the West Approach structure with its new pile foundation system.

Chapter 5, Section 5.21.1.1: The second paragraph should address the impacts on the staging of the SFOBB West Approach Seismic Safety Project, the Department's intention to build a temporary on-ramp during the first stage of the project to accommodate bus access to the east loop, and the Department's commitment to retrofitting the east loop of the existing Transbay Transit Terminal. The geometric and structural feasibility of this proposal is also questionable.

9. Ramps

Chapter 2, Sections 2.2.1.1 and 2.2.1.2, the feasibility of providing the bus ramp from the existing east loop ramp down to the new temporary terminal is not clear, since no profiles are shown. Additionally, the structural feasibility of "scabbing" the proposed temporary ramp to the existing east loop ramp is not discussed.

Chapter 2, Figure 2.2-6: Again, due to a lack of profiles, the spatial arrangement of how some of these structures would operate is not clear. For example, it appears that the Department's SFOBB Electrical Substation that supplies power to the entire Bridge and its Communications Center would be impacted by one of these ramps.

10. Parking

Chapter 2, Section 3.3, page 3-36, paragraph 2: The Department does not manage parking lots. State-owned lots are leased to private vendors, usually through short-term leases.

11. Traffic Operations

Page 2-12 and figure 2.2-6: "Access to this bus storage area would be via Third Street and a two-way "storage link" ramp that would connect with the Bay Bridge-Transbay Terminal bus ramps." We assume that this "storage link" will be a bus-ONLY facility that does NOT require buses to merge with auto traffic exiting the Bay Bridge on the right side Fremont off-ramp before the buses get to the terminal.

Page 3-35 (section 3.2.4): Regarding conversion of High Occupancy Vehicle (HOV) ramp operations from Sterling Street to Essex Street. It is not clear how this would benefit motorists unless the City has plans to provide useful HOV bypasses on city streets approaching the ramp that function at least as well as what currently exists at Sterling Street. Also, since Essex Street feeds a full lane onto the Bridge, it may be necessary

to reduce this to a merge with the First Street on-ramp traffic (as it was pre-Loma Prieta earthquake) if changed to HOV operation because of the necessity of keeping the lane full in order to maximize the capacity of the Bridge.

Page 3-35 (section 3.2.4): "Harrison Street would be restriped to one-way westbound from First Street to Third Street". This would have a significant impact on the operation of a number of intersections, particularly at 2nd Street/Harrison Street and 2nd Street/Bryant Street. It would also remove one of the primary directions of approach to the Essex Street on-ramp. Has this modification been considered in the reported levels of service of these intersections?

The Transbay Transit Terminal project will require much coordination between all entities involved, and we look forward to working with you on this important transportation facility. Should you require further information or have any questions regarding this letter, please call Paul Svedersky of my staff at (510) 622-1639.

Sincerely,

Timothy C. Sable

SCH#: 1995063004

Dear Joan Kugler:

The State Clearinghouse submitted the above named Joint Document to selected state agencies for review. The review period closed on November 18, 2002, and no state agencies submitted comments by that date. This letter acknowledges that you have complied with the State Clearinghouse review requirements for draft environmental documents, pursuant to the California Environmental Quality Act.

Please call the State Clearinghouse at (916) 445-0613 if you have any questions regarding the environmental review process. If you have a question about the above-named project, please refer to the ten-digit State Clearinghouse number when contacting this office.

Sincerely,

Terry Roberts

Document Details Report
State Clearinghouse Data Base

SCH# 1995063004
Project Title Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project
Lead Agency Peninsula Corridor Joint Powers Board

Type JD Joint Document

Description The proposed project has three major components: the construction of a multi-modal Terminal on the site of the present Terminal (that would be demolished) at Mission and First Streets; an underground extension of Caltrain commuter rail service from its current San Francisco terminus at Fourth and Townsend Streets to a new terminus underneath the proposed new Transbay Terminal; and establishment of a Redevelopment Area Plan with related development projects, including transit-oriented development in the vicinity of the new multi-modal Transbay Terminal. The proposed Redevelopment Area would generally be bound by Mission, Main, Spear, Folsom, Essex, I-80, Second and Minna Streets. Other subordinate components of the project include a temporary bus terminal facility at Beale and Folsom Streets to be used during construction of the new Transbay Terminal; a new, permanent off-site bus storage/layover facility; reconstructed bus ramps leading to the new Transbay Terminal; and a redesigned Caltrain storage yard.

Dear Joan Kugler:

The enclosed comment (s) on your Joint Document was (were) received by the State Clearinghouse after the end of the state review period, which closed on November 18, 2002. We are forwarding these comments to you because they provide information or raise issues that should be addressed in your final environmental document.

The California Environmental Quality Act does not require Lead Agencies to respond to late comments. However, we encourage you to incorporate these additional comments into your final environmental document and to consider them prior to taking final action on the proposed project.

Please contact the State Clearinghouse at (916) 445-0613 if you have any questions concerning the environmental review process. If you have a question regarding the above-named project, please refer to the ten-digit State Clearinghouse number (1995063004) when contacting this office.

Mr. Paul E. Maltzer
Environmental Review Officer
San Francisco Planning Department
1660 Mission Street, Suite 500
San Francisco, CA 94103

Dear Mr. Maltzer:

Transbay Terminal / Caltrain Downtown Extension/Redevelopment Project - Draft Environmental Impact Report (DEIR)

Thank you for including the California Department of Transportation (Department) in the environmental review process for the above-referenced project. We have reviewed the Draft Environmental Impact Report for construction of a multi-modal Terminal on the site of the present Transbay Transit Terminal, and have the following comments to offer:

1. Seismic Condition

As the owner/operator of the Transbay Transit Terminal, the Department has participated in ongoing regional discussion regarding relinquishment of the Terminal to a Joint Powers Authority (JPA) for replacement. The Department determined that until the facility was transferred to the JPA, the Department would need to evaluate seismic risk and acceptability levels. After an evaluation by the Department's consultant, the Office of the State Architect (OSA), the Department entered into and completed various interim seismic upgrade projects from 1993 to 1999 to mitigate the most extreme seismic risks.

Between 1993 and 1999, OSA completed three seismic retrofit projects, costing approximately $15 million. Prior to commencement of any of the seismic upgrade work the building was classified approximately at risk Level V. After completion of the final phase of the seismic upgrade work, the risk level was reduced to between Level III and Level II.

2. Terminal Deficiencies

Because regional consensus pointed to the Terminal's demolition and replacement, the Department and the Metropolitan Transportation Commission (MTC) recommended that major construction deficiencies be deferred, except on a case-by-case situation. Some of the projects recently undertaken are the completed ventilation project in the West Garage, a mechanical evaluation of the elevator and escalators, and the development of a PS&E (Plans, Specifications & Cost Estimates) to remedy an Americans with Disabilities Act (ADA)-deficient restroom and drinking fountain in the center unit.

Some of the remaining major deficiencies at the Terminal include the fire sprinkler systems; the lack of ADA-accessible bus platforms and exit routes; plumbing and electrical service to meet the Uniform Building Code (UBC); and a list of general renovation work that would need to be completed if the existing Terminal were to

be designated for full service.

3. Cultural Resources

Page 1-28 (table 1.2-4) should be revised to include the required legislative approval under California Public Resources Code Section 5027 (see additional information below).

Page 2-47 (section 2.3.1.1) describes one of the alternatives, "Renovation of Existing Transbay Terminal and Associated Structures," which was considered but withdrawn. This alternative precludes underground rail, but instead would require construction of elevated rail structures for Caltrain or high-speed rail access. According to the DEIR, this alternative was withdrawn because the anticipated seismic strengthening would preclude the project goal of revenue-generating development. The fact that the Transbay Transit Terminal and the ramps are National Register-listed properties calls for a more substantive discussion regarding the possibility of preserving the properties.

Pages 4-48 through 4-60 (section 4.16.6) and pages 5-75 through 5-77 (section 5.14.3 through 5.14.3.4), and Section 8: the DEIR text throughout these sections is inconsistent regarding the National Register of Historic Places status of the Transbay Transit Terminal, and the Bay Bridge approach and bus ramps. As of 2000, the Transbay Transit Terminal and the ramps have been "listed" on the National Register, as contributors to the San Francisco-Oakland Bay Bridge, and are no longer considered to be merely "eligible" for the National Register. Tables 4.16-1, 5.14-1, and 8.4-1 also should clarify the National Register status as listed as contributors, or 1D, rather than 2 or 2S2.

Page 5-75 (section 5.14.3.1) should address California Public Resources Code Section 5027, which states, "Any building or structure that is listed on the National Register of Historic Places and is transferred from state ownership to another public agency shall not be demolished, destroyed, or significantly altered, except for restoration to preserve or enhance its historical values, without the prior approval of the Legislature by statute. This section applies to any building or structure transferred from state ownership to another public agency after January 1, 1987."

Section 5.14.3.5 should additionally evaluate the effects of demolition of the ramps and Transbay Transit Terminal on the San Francisco-Oakland Bay Bridge.

Page 5-91 (section 5.14.3.5) discusses potential mitigation. Because the project would have effects on the San Francisco-Oakland Bay Bridge, any Historic American Buildings Survey/Historic American Engineering Record documentation on the Transbay Transit Terminal and ramps should be filed additionally with the Department. Additionally, if the Department no longer owns the Transbay Transit Terminal, the "Interpretive Display" would be the responsibility of the project proponents, not the Department. Opportunities for collaborating with the Department on the completion of mitigation tasks for effects to the San Francisco-Oakland Bay Bridge should be investigated.

4. Hazardous Materials

Section 4.17 - There is no discussion of the potential for encountering asbestos and lead during building demolition. This should be included, to be consistent with the rest of the section, which discusses potential problems during construction. The project appears to be away from veins of asbestos-bearing serpentine rock. However, if this source has not already been considered, then it would be prudent to take a closer look, particularly for the Caltrain extension.

Section 4.17.2.2 - Vehicle exhaust should also be included as a potential source of lead contamination. In areas outside the historic fill limit and industrial sites, lead contamination shows up as a surficial zone of one to two feet in depth, depending on soil type and traffic volume.

Section 5.21.9 - Asbestos should also be discussed in this section since there are Bay Area Air Quality Management District (BAAQMD) rules regarding asbestos removal and building demolition. The USEPA National Emission Standards for Hazardous Air Pollutants regulate asbestos during demolition and removal. BAAQMD has the delegated authority to enforce these regulations.

Section 5.21.11 - Does State Water Resources Control Board Order No. 99-08-DWQ apply to projects in San Francisco even though storm water runoff goes to the combined sewer system? If so, a Storm Water Pollution Prevention Plan would need to be prepared for the project. Will the project depend solely on the combined system as its sediment control practice? If not, some of the management practices listed in the Air Quality section would also minimize sediment removal from the site. Secondary containment and spill contingency should also be addressed for fuels and other liquid pollutants that will be used during construction.

5. Air Quality

Page 4-29 and 5-53: The TIP information should be updated to reflect the latest TIP/RTP information.

Page 5-52, Section 5.7.2.2: In view of the fact that there is an existing carbon monoxide (CO) exceedence shown at First and Howard Streets, the CO microscale study must address the construction year CO levels as well as the year 2020. Higher emission levels in the build year would result in higher CO levels. As it stands now, the document does not clearly show that the project does not worsen an existing exceedence.

Page 5-54: The reasoning regarding the PM-10 impacts of the project, while acceptable for the regional impacts, needs further analysis regarding microscale PM-10 impacts. Localized PM-10 impacts could be caused by a larger number of vehicles drawn to the facility, even though regional trips have been reduced. The Federal Register states that PM-10 methodology is not yet available for microscale PM-10 calculations. Some other qualitative reasoning for microscale impacts would be appropriate.

6. Right of Way (ROW)

Page S-8, and Figure S-2, discussing various development levels, should mention the fact that these parcels are currently State-owned, and that the transfer of ownership is the subject of ongoing negotiations with the State, and the subject of a cooperative agreement. Additionally, approximately 1/3 of the Block #3737 will be permanently occupied by the Folsom Street leg of the Fremont Street off-ramp. This is repeated in various figures throughout Chapter 5.

7. Proposed Bus Storage

In Chapter 2, Figure 2.2-5, the feasibility of providing a parking double-deck under the I-80 structure is not clear.

The impacts of the proposed bus storage under Interstate 80 (I-80) between Stillman, Perry, 2nd and 4th Streets are not adequately addressed in the DEIR. The West Ramp Alternative displaces AC Transit and Golden Gate Transit bus storage from current locations on the Terminal East Loop and the surface lot at Main, Beale, Folsom and Howard Streets, respectively. The Project includes a direct ramp connection between the proposed storage facilities and the new Terminal. The Noise and Vibration portions, as well as the Air Quality portions of Table S-1 do not address the impacts of the proposed bus parking underneath the I-80 structure on the residences and businesses on Stillman and Perry Streets.

Storage of 200+ buses between 2nd and 4th Streets, plus a two-level automobile parking structure at 4th Street, could represent a substantial change from the existing use that would require an Air Quality Assessment from

the Regional Air Quality Board and/or Association of Bay Area Governments (ABAG) addressing the impacts of the proposed use on air quality based on the Bay Area Air Quality Assessment Model.

Also, Streets and Highways Code Section 146 "Use of Airspace for Mass Transit" requires that the Department exercise discretion in allowing only such uses that conform to established safety design standards, and are consistent with good ecological and environmental planning. Any commitment we make to the Transbay Joint Powers Authority to provide airspace for the proposed use would be subject to the Air Quality Assessment, and our approval of the parking structure development plans.

8. Related Projects

Chapter 1, Section 1.4, titled "OTHER RELATED PROJECTS," does not mention the upcoming San Francisco-Oakland Bay Bridge (SFOBB) West Approach Seismic Safety Project, a 5-year, $225 million project, which will be impacted by the proposed Transbay Transit Terminal project. Of specific concern is the impact of the Caltrain Extension's construction activities directly underneath the West Approach structure with its new pile foundation system.

Chapter 5, Section 5.21.1.1: The second paragraph should address the impacts on the staging of the SFOBB West Approach Seismic Safety Project, the Department's intention to build a temporary on-ramp during the first stage of the project to accommodate bus access to the east loop, and the Department's commitment to retrofitting the east loop of the existing Transbay Transit Terminal. The geometric and structural feasibility of this proposal is also questionable.

9. Ramps

Chapter 2, Sections 2.2.1.1 and 2.2.1.2, the feasibility of providing the bus ramp from the existing east loop ramp down to the new temporary terminal is not clear, since no profiles are shown. Additionally, the structural feasibility of "scabbing" the proposed temporary ramp to the existing east loop ramp is not discussed.

Chapter 2, Figure 2.2-6: Again, due to a lack of profiles, the spatial arrangement of how some of these structures would operate is not clear. For example, it appears that the Department's SFOBB Electrical Substation that supplies power to the entire Bridge and its Communications Center would be impacted by one of these ramps.

10. Parking

Chapter 2, Section 3.3, page 3-36, paragraph 2: The Department does not manage parking lots. State-owned lots are leased to private vendors, usually through short-term leases.

11. Traffic Operations

Page 2-12 and figure 2.2-6: "Access to this bus storage area would be via Third Street and a two-way "storage link" ramp that would connect with the Bay Bridge-Transbay Terminal bus ramps." We assume that this "storage link" will be a bus-ONLY facility that does NOT require buses to merge with auto traffic exiting the Bay Bridge on the right side Fremont off-ramp before the buses get to the terminal.

Page 3-35 (section 3.2.4): Regarding conversion of High Occupancy Vehicle (HOV) ramp operations from Sterling Street to Essex Street. It is not clear how this would benefit motorists unless the City has plans to provide useful HOV bypasses on city streets approaching the ramp that function at least as well as what currently exists at Sterling Street. Also, since Essex Street feeds a full lane onto the Bridge, it may be necessary

to reduce this to a merge with the First Street on-ramp traffic (as it was pre-Loma Prieta earthquake) if changed to HOV operation because of the necessity of keeping the lane full in order to maximize the capacity of the Bridge.

Page 3-35 (section 3.2.4): "Harrison Street would be restriped to one-way westbound from First Street to Third Street". This would have a significant impact on the operation of a number of intersections, particularly at 2nd Street/Harrison Street and 2nd Street/Bryant Street. It would also remove one of the primary directions of approach to the Essex Street on-ramp. Has this modification been considered in the reported levels of service of these intersections?

The Transbay Transit Terminal project will require much coordination between all entities involved, and we look forward to working with you on this important transportation facility. Should you require further information or have any questions regarding this letter, please call Paul Svedersky of my staff at (510) 622-1639.

Sincerely,

Timothy C Sable

Paul Maltzer, Environmental Review Officer
San Francisco, Planning Department
1660 Mission Street, Suite 500
San Francisco, CA 94103

Subject: Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project
Draft Environmental Impact Report (DEIR)

Dear Mr. Maltzer:

The Bay Area Air Quality Management District (District) has reviewed your agency's DEIR for the Transbay Terminal Project. The project would replace the existing outdated terminal with a new multi-modal transit facility. The proposed project's Caltrain extension to the terminal, improved bus service, and transit-oriented redevelopment of the surrounding area will help to improve regional transit and thereby reduce air pollution. However, we have some concerns about the localized exposure of transit riders at the Terminal to diesel particulate emissions from buses serving the terminal. We also believe that the DEIR does not adequately address pedestrian and bicycle access between the Terminal and nearby destinations.

The Terminal alternatives are unique in the Bay Area because they would place a high concentration of diesel buses and their emissions in close proximity to a large number of people on a daily basis. Diesel particulate emissions have been designated by the California Air Resources Board as a Toxic Air Contaminant (TAC) and are a suspected carcinogen. To determine whether the proposed project or its alternatives would result in a significant air quality impact, we are requesting that the Final EIR evaluate the exposure of transit riders at the Terminal to diesel particulate emissions from buses. The analysis should consider the daily volume and emission characteristics of the bus fleet accessing the Terminal and the proximity of buses to transit riders. The Air District's CEQA Guidelines threshold for a significant air quality impact is breached when the probability of contracting cancer for the Maximally Exposed Individual exceeds 10 in one million. If your evaluation of the proposed project or its alternatives results in a significant air quality impact, we request that the impact be mitigated. Mitigation from exposure to diesel particulate might include measures to reduce emissions such as establishing maximum bus idling times, use of cleaner burning fuels, retrofitting bus fleets and use of low emission buses. Mitigation measures to reduce exposure of transit riders to diesel particulate emissions might include ventilation of bus exhaust and separation of buses from transit riders through building design or operations.

We believe that if the Terminal is to function optimally as a multi-modal facility then the design of the building and the surrounding redeveloped area must improve access

to pedestrians and bicyclists. The DEIR indicates that the future project scenarios would significantly increase the number of pedestrians on sidewalks and at intersections in the vicinity of the Terminal and result in a significant impact. The measures in the DEIR to improve pedestrian access appear insufficient to mitigate the impacts to less than significant. We request that the FEIR consider improving pedestrian access by expanding the sidewalks and narrowing street widths in the vicinity of the Terminal. The DEIR also indicates that future project scenarios would result in an almost ten-fold increase in bicyclists in the vicinity of the Terminal. To integrate bicycling with the multi-modal Terminal, we recommend that the Project link planned bicycle routes along Howard and Second Streets with the Terminal. Once inside the Terminal, bicyclists should be able to easily connect with buses and trains or have the option of on-site storage, such as a bike station.

If you have any questions regarding these comments, please contact Joseph Steinberger, Senior Environmental Planner, at (415) 749-5018.

Sincerely,

William C. Norton
Executive Officer/APCO

IV. Local Agencies

MEMORANDUM

Date: December 18, 2002

To: Joan Kugler
Planning Department

Through: Bond Yee, Deputy Director and City Traffic Engineer

From: Jack Fleck, Senior Transportation Engineer
Jerry Robbins, Transit Planner V

Subject: Transbay Terminal EIR

These are our comments on the Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project Draft EIS/EIR/Section 4(f) Evaluation dated October, 2002 (the Report).

Level of Service Comments

For the most part, the transit operations which this project serves will operate on grade separated facilities—AC Transit on ramps and Caltrain underground. Therefore, the traffic impacts from the Terminal itself should not be too significant. SamTrans, Golden Gate Transit, and Muni operate on surface routes, so they will be affected by traffic generated from the redevelopment project. With regard to these new developments, the City policy of not building large parking garages with new buildings should help prevent these buildings from generating large volumes of traffic. In fact, considering that most of the land to be developed is currently occupied by parking lots, the total net increase in traffic generation should be minor. Therefore, we have a question about the sentence on page 5-125, which states, "The Terminal/Extension Project would result in a substantial increase in vehicle trips to and from new developments. . ." How was this calculated?

Table 3.2-1 on page 3-34 does show numerous intersections operating at traffic LOS F, particularly on 1st Street. This congestion is due to queuing for the Bay Bridge in the PM peak. In fact the actual conditions are somewhat worse than shown on this table. Our observations show that traffic backs up on 1st Street at least to Market Street about half the time during the PM commute periods. This percentage has fluctuated since the 1989 Loma Prieta earthquake from about 30% to 70% depending on various factors including the state of the economy. This queuing condition is not likely to change, but it could get worse, e.g. the back-up could be every night. The City deploys Parking Control Officers to keep intersections open, and we have re-routed buses to help them avoid getting stuck in the queue.

On page 5-124 the report lists 7 intersections as having adverse impacts due to the project. An additional six intersections are listed on page 5-125 as having adverse impacts under cumulative conditions. Of these 13 adversely impacted intersections, 11 are part of the Bay Bridge queue. We agree with the suggestion on page 5-126 that funding for the SFgo program could be a useful mitigation effort. The SFgo program will provide improved traveler information so that drivers will be aware of the queuing and possibly change plans to adjust to it, prior to starting their trip. In addition, SFgo will have traffic monitoring cameras that can be used to dispatch parking control officers in a timely fashion when the queue begins to form.

The other two intersections with adverse affects—Beale/Howard and Fremont/Howard are not part of the queue. Therefore, we would like to see mitigations to improve operations here. It appears that the intersections along Fremont Street were only looked at in the PM peak hour. This street is more congested in the AM peak than the PM peak due to the Fremont Street off-ramp from the Bay Bridge, so the report probably is not looking at the worst case impacts.

It is not clear that the LOS calculations account for increased pedestrian volumes at intersections like First/Mission and Fremont/Mission. These intersections used to be much more congested in the pre-BART era when there were more pedestrians going to and from the TBT at peak hours. Does the report include the impact of increased ped crossings?

Additional comments

Muni impacts – Assuming that the new developments do not build large parking lots, most trips to and from them will be by transit. Will there be a transit impact fee and is the fee adequate to offset service costs to Muni for the additional service required?

Casual carpools - Page 3-43 – The evening casual carpool queues have been affected by the closing of Beale Street under the Bay Bridge for security purposes. I'm not sure that the description in this section is accurate any more.

Bicycles - Page 3-49– DPT is proposing to add bike lanes on Howard Street from Fremont Street to 5th Street. Bike lanes are already installed on Howard from 5th to 11th.

Page 5-138 – The plan for 105 bike storage spaces is good, but there should be a provision for additional space if needed. We do expect large increases in bike riders as bicycle facilities continue to improve in San Francicso.

Size of the terminal - Page 5-111 – "The new terminal will accommodate 35,000 rail and bus passengers during the peak hour. This is 11,000 more passengers than the 24,000 passengers projected for peak hour demand in 2020. The current peak hour passenger flow at the existing Terminal is 10,000 passengers." This raises a concern about overbuilding. Currently the Transbay Terminal is larger than it needs to be. If the new terminal is even larger, there will be a lot of empty space. Could some of that space be

used for storage of buses? Are there interim/back-up plans in case the large ridership projections do not materialize?

Caltrain - Figure 2.2-11/12 – Currently Caltrain uses Townsend Street for moving its trains during the day. This impacts the City's use of the street for bikes/parking/ sidewalks/etc. Will this use of Townsend be discontinued with the new Caltrain alignment. If so, this is a positive impact.

Subject: Comments on the Draft Environmental Impact Report/Statement and Section 4f Evaluation for the Transbay Terminal/Caltrain Downtown Extension Project

Dear Mr. Paul Maltzer:

Thank you for the opportunity to comment on the subject DEIR/DEIS. As it is well known, the Authority has been a steadfast supporter of the project, and it played a key role in the negotiations leading to the inclusion of the Transbay Terminal/Caltrain Downtown Extension in the Regional Transit Expansion Policy (Resolution 3434) adopted last March by the Metropolitan Transportation Commission as part of the 2001 Regional Transportation Plan (RTP). The Authority is the sponsoring agency for the project in the RTP and, as such, it has been required over the past year to submit capital and operating plans.

Our main focus, therefore, in performing a review of the DEIR/DEIS, were the sections relating to costs, schedule and funding. Given the less than bright prospects for transportation funding at the state level, we tried to identify any areas where additional opportunities for cost reduction may be found. The Authority's on-call engineering services consultant, Cordoba/Zurinaga assisted us with many of the technical aspects of the review.

With the recent developments in the State Budget, which now registers a $35 billion deficit, it has become clear that there will be schedule and funding impacts to transportation projects across California. In particular, there will be significant impacts to state sales tax-dependent sources like Prop 42, and the Governor's Traffic Congestion Relief Program (TCRP) which are tied to the General Fund. The cash problems in the State Highway Account, which date back some years now, will be further exacerbated. The Governor has already proposed nearly $2 billion in transportation program cuts, and the State Department of Transportation is even considering reneging on allocations already made by the California Transportation Commission. The schedule for this project will inevitable have to be re-examined in light of these troubling developments, as will be the case for all projects included in the 2001 RTP.

While the Authority Board has not taken a position yet, I will be proposing a strategy that advocates keeping San Francisco's key projects moving. This is indispensable if we are to compete well for funding at the federal level in this critical year of the reauthorization of TEA 21, and it is essential if we are to be ready to build these needed projects once the economy rebounds. Such a strategy will only work if we propose realistic schedules, which are scaled down to our ability to cash flow projects. A central element of that strategy will be the reauthorization of the local sales tax for transportation. The Authority is ready and eager to work with the City and County of San Francisco to ensure that such a strategy can be developed in the next few months.

Moving the City.

Regarding the funding assumptions in Chapter 6 (Section 6.6.3 on page 6-10), while they are generally consistent with the Authority's initial funding plan submitted to MTC, we note that Prop 42 revenues are not likely to materialize until well after 2008 (as originally anticipated) and that once they become available they will need to be prioritized by the Authority Board. It cannot be automatically assumed that all Prop 42 funds would go to a single project. The DEIR/DEIS should note in Table 6.6-1 and in Section 6.6.3 the need for an Authority policy action regarding these funds. We anticipate that the Countywide Transportation Plan, currently being prepared by the Authority will include recommendations for the use of Prop 42, as well as a specific funding amount proposed for this project out of the reauthorization of the sales tax.

As mentioned above, we comment and pose questions in the areas of Value Engineering, Construction Phasing, Delivery Schedule, and Constructability with the aim of encouraging further exploration of cost reduction opportunities. We also provide specific comments about the proposed schedule. Our comments are as follows:

1) Since the Terminal is in the same location as the existing terminal and has practically the same footprint, was consideration given to using even a portion of the existing ramps? The southern ramp could be modified to provide access to the temporary terminal. Elevation differentials, if any, could be resolved relatively easily at this stage of design.

2) The cost summary for the Terminal, pages S-24 and 2-21, begs a few questions:

   - The cost estimate needs to resolve some inconsistencies and include sufficient backup information to raise the level of comfort about its accuracy.

   - The percentage allowed for soft costs, including design, insurance, mitigation and escalation is only 27% of construction costs. It is not clear whether the allowances for CM/Management, construction contingency, and management reserve are included in that percentage, since they do not appear to be accounted for elsewhere in the document. Percentage of soft costs varies from as low as 22.4% for Permanent Ramps to 53% for Bus Storage.

   - Escalation is only to start of construction; industry practice is to escalate to mid-point of construction. Although it is possible that escalation may not be a major factor due to the early stages of project development and foreseen economic climate, and thus be absorbed by contingency reserves, the budget should address this, especially in light of the latest developments at the state level.

   - At $22 M, the cost of the temporary terminal facility appears relatively high. This boils down to approximately $330/square foot, for what is essentially an at-grade parking lot with minimal amenities, in a lot that is already graded, paved, and in use as a bus storage facility.

   - The cost for the temporary ramp is the same for both options even though the drawings on pages S-5 and S-6 show the temporary ramp to be much shorter for the Loop Ramp alternative. Is some of the cost of the temporary ramp for the West Ramp option being offset by the new off-ramp to be built by Caltrans?

   - The estimate shows the Loop Ramp alternative to cost more than double ($315.8M vs. $153M) the West Ramp cost, even though the West Ramp option is double-decked and the Loop Ramp alternative is single-decked (including the West Ramp portion). Can the new Loop Ramp be combined with the new Caltrans off ramp to offset some of the costs for the Loop?

   - The West Loop is described as having six levels, with four above ground, the Loop Ramp alternative is described as five levels, with three above ground, but the cost of both options is

exactly the same. On page 2-17, figure 2.2-7 shows an elbow on the East end of the terminal (which presumably accounts for the cost differential between five and six levels), but the description of the option does not mention it or explain why this portion is necessary.

3) Page 2-11 shows the layout of the two top floors but not the other two above-ground floors or the two below ground. There is no drawing depicting the full footprint of the facility, showing the envisioned floor-by-floor space utilization plan.

4) Table S-1, on page S-17 indicates that the West Ramp alternative will accommodate an additional 35,000 passengers by providing 34 bus bays, but the Loop Ramp alternative will accommodate only 24,000 passengers by providing 51 bus bays, 17 bays more than West Loop. This statement needs clarification.

5) The description of the Terminal (page 2-9) mentions that 150,000 to 225,000 square foot of space will be provided on the Concourse Level for retail, entertainment, conference, educational, and cultural uses, but does not provide a conceptual breakdown between the various uses, or describe what types of tenants are envisioned overall (i.e.: supermarket, theaters, bookstores, video rental, restaurants, coffee houses, etc.). The description does not mention retail, entertainment, or other concession space on the other floors. Since retail and entertainment leases are tried-and-true revenue generators, space for these purposes should be maximized throughout the facility.

6) Once the facility is completed, and with the inclusion of high-speed rail service, the terminal will serve significantly more long-distance and non-commuter passengers. Although most passengers will take advantage of the multiple transit connections available at the site and others will walk, it is expected that a portion of them will be served by private transportation. It is not clear from the information offered what provisions are contemplated, if any, for bicycles, taxi stands, or private vehicle pick-up and drop-off areas, as well as short-term waiting areas (The entry-level drawing on page 2-10 only shows buses). Is it to be understood that private vehicles picking up passengers are going to wait in a holding pattern driving around the terminal? If so, what provisions are being made to handle the traffic?

7) It appears that the design of the Terminal does not provide for the future development of a Muni Metro station. Since the current plan for the Geary Corridor calls for a station at the Transbay Terminal, the design should accommodate its inclusion, or at least not foreclose on its future development.

8) On page 5-94 the design concept shows a very attractive but complicated roofline. Considering that tall buildings will surround the terminal, and that as a result the perspective view of the building as shown on Figure 5-16.1 is not probable, has consideration been given to a more easily constructible (and therefore less expensive) roof that provides some of the same functionality? Furthermore, has the potential for additional development above the terminal itself, for retail or other uses, been seriously considered?

9) Also on page 5-94, the bottom drawing shows what appear to be cars and other vehicles in two underground levels adjacent and to the left of the Caltrain station with a large (approx. 170 feet) three-level atrium space above it. There is no mention of this space in the project description, although apparently it is also shown on the plan on page 2-10. Is it part of the Terminal or is it a representation of the adjoining private sector development envisioned for that space?

10) On page 2-37, the description of the Caltrain tunneling option states, "...tunneling appears to be feasible only for that portion of the alignments between Townsend Street and Folsom Boulevard". The section between Folsom and the Terminal, as well as the tail tracks out to Main Street can also be tunneled if soil stabilization methods such as grouting are used for the sand and mud sections.

The Muni Metro Turnback project demonstrated that tunneling could be performed successfully in unstable soils next to the bay. The advantages of tunneling are many:

- Reduced utility conflicts, and reduced likelihood of disruption to services (see page 5-152, first paragraph)
- Minimized disruption to businesses and the general public (see impacts of cut-and-cover on neighborhoods and businesses on page S-20)
- Reduced noise levels
- Minimized need for street closures
- Minimized need for street reconstruction
- Reduced amount of haul-truck trips and associated traffic congestion, dust, and mud by significantly reducing the amount of excavation and backfill (see page 5-167)
- Reduced number of buildings that have to be purchased for demolition purposes only

Given the potential benefits of tunneling, including the possibility of cost reductions, maximizing its use should be considered further.

11) The Cost Estimate for the Caltrain Extension is only escalated to the start of construction; industry practice is to escalate to mid-point of construction. Although it appears that there are sufficient contingency funds to absorb moderate escalation, the budget should be adjusted to reflect realistic escalation forecasts.

12) On page 5-139, the discussion of Final Design and Development of Construction Contracts, states that: "Final Design would in turn lead to determinations of construction contract packaging". Development of a Contracting Plan, with its two major components the Contracting Strategy and Contract Packaging Plan, is a task that needs to be performed before Final Design, not during or after, especially for a project of this magnitude. The Contract Packaging Plan should clearly delineate how and why the project is going to be broken down in different contracts, and the Contracting Strategy must address the delivery methods (i.e.: Design-Bid-Build, CM at-Risk, Design-Build, Fabricate-Install, Owner Supplied, etc.) for each contract. Since these documents influence Final Design, they should be developed no later than during Schematic Design for the Extension and Design Development for the Terminal, earlier if at all possible. It is invaluable to go into Final Design with the road map that a properly developed Contracting Plan provides, with full knowledge of how the design is going to be broken down into contract packages, and how they are going to be delivered; not doing so almost invariably results in expensive and time-consuming re-packaging.

13) The Construction Phasing shown on page 5-161 appears at first glance to be overly optimistic:

- The schedule indicates that construction will commence in July 2004 on the Terminal and January 2004 on the Caltrain extension, 19 months and 13 months hence, respectively. The construction of the temporary terminal and ramps is scheduled to commence 10 months from now. Considering that the DEIR/DEIS is in the review phase and design is in the conceptual stages, it is difficult to envision consultant selection, design development, final design, and contractor selection to be completed within that time frame. In addition, Real Estate acquisition would have to take place within the same time frame for construction to commence on January 2004. A reasonable duration for this work would be a minimum of two years (probably closer to three), provided a very aggressive and competent management team fast tracks the project.
- The schedule assumes that Caltrans will complete the new Fremont Street off-ramp in time for the temporary ramp to be constructed in the third quarter of 2003, which with information

currently available, appears unlikely. In addition, there appear to be conflicts between the construction of the new Fremont ramp and the existing AC Transit ramp.

- The schedule provides for 36 months to construct the cut-and-cover section of the Caltrain Extension (same duration for tunnel alternative). This provides for an average production rate of approximately eight feet per day, which translates to a peak rate of sixteen feet per day for about 10 months of peak construction. Considering the section of the subway (some cuts are 100 feet deep, which have to be backfilled and compacted after the subway is constructed), construction methods, and location, the production rate, although achievable, is aggressive and requires for everything to go exactly according to plan, which is seldom the case in underground projects. In contrast the retained cut section, which is significantly easier (inside the existing yard, significantly less excavation, no street closures), is planned for the same production rate.

- The schedule provides for 39 months for demolition of the existing terminal and construction of the new terminal and permanent ramps. Based on cost, this schedule represents an average construction expenditure of approximately a million dollars per workday, peaking at two million dollars per day during the 11-month (approximate) peak construction period. In addition, demolition of the old terminal will be time-consuming due to the necessary asbestos abatement. The schedule although achievable, is unlikely and appears aggressive considering the site constraints.

- The aggressiveness of the schedule is in conflict with the availability of funds, even before considering the latest grim news from the state. The project would benefit from a more realistic schedule, where projected cash draw-downs are more in tune with the financial plan.

Without the basis for the summary schedule provided in the document, it is difficult to fully assess its reliability. We stand ready to take a close second look as soon as a detailed schedule is provided to us.

15) On page 6-8 of the Financial Analysis, Table 6.6-1 has a line item for Value Engineering, which reduces the overall cost of the project by 10 percent. There is no mention of the timing of the Value Engineering efforts. In order to derive the most benefit of Value Engineering, it needs to take place now, and the budgets revised accordingly, before design proceeds any further. If design is allowed to proceed without revising the budgets, costly redesign fees will be incurred, spending funds that could otherwise be used for scope items.

The rest of the document appears to be thorough and well-researched. I would like to thank the Planning Department for its role in generating a major environmental document like this, under budget and schedule constraints. Should there be questions about the funding-related issues in this letter, please contact Maria Lombardo at 522.4802. Engineering questions will be addressed by Paul Ward, who is reachable at 522.4808.

Sincerely,

José Luis Moscovich

Re: Transbay Terminal Draft Environmental Impact Statement/Environmental Impact Report (EIS/EIR) comment on the EIS/EIR for Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project

Transbay Terminal is an extremely important facility for AC Transit. It is our only stop in San Francisco and serves thousands of riders daily. As the demand for travel to San Francisco grows, and other transportation modes reach capacity, we expect ridership to Transbay Terminal to increase. However the current facility is badly in need of modernization so that it can function better for both bus operations and riders. Therefore, AC Transit hopes to see a new Transbay Terminal and associated ramps constructed at the earliest possible date.

AC Transit supports the Environmentally Superior Alternative identified on Page S-27 of the EIS/EIR--the West Ramp Transbay Terminal, Second to Main, Tunneling Option, Full Build. We believe that the West Ramp alternative strikes an appropriate balance between the needs of bus circulation and the potential for redevelopment in the surrounding area. AC Transit supports redevelopment in the Terminal area as a way to generate both financing for the Terminal and ridership on our service.

We are aware that some property owners and residents in the Second St.& I-80 area have raised concerns about the bus storage planned under the freeway there. They have raised concerns about both air quality and traffic impacts. AC Transit sees this bus storage site as a critical and integral part of the project that should not be changed. By providing dedicated ramps from the bus storage site to the Terminal, AC Transit can quickly and reliably move buses from one to the other. If our buses had to operate from another storage site to the Terminal, which required the use of often congested Downtown San Francisco streets, this would substantially increase our running time and operating cost.

We also believe that the air quality and traffic concerns are misplaced. The air quality concern is based on an obsolete image of highly polluting diesel buses. Modern clean diesel buses eliminate all but a small fraction of former emissions. In addition, the buses would only be running at the storage site for a few minutes per day. The number of cars that currently use the site is larger than the projected number of buses, so that the existing cars also have air quality impacts. The bus storage facility and ramps could actually improve traffic in the area. The storage sites are currently used as parking lots for automobiles,

which access the lots via city streets. By creating dedicated ramps and removing on street trips, traffic congestion could actually ease.

In reviewing the draft EIS/EIR, the Planning Committee of AC Transit's Board of Directors raised some concerns. One concern was that the Purpose and Need statement contained on page S-1 did not make any mention of improvements for passengers. We propose that the following language be added to the listing of needs addressed by the project: "Improve the Terminal as a place for passengers and the public to use and enjoy."

They also discussed the potential pedestrian tunnel connecting the Terminal and BART/Muni Metro at Market St. Our view is that this tunnel would help improve the Terminal as a multi-modal transit hub. However, AC Transit is more concerned with building the Terminal and bus facilities in a timely fashion. Therefore, we would suggest that the tunnel to Market St. be built if and only if there are sufficient funds available to complete both the basic project and the pedestrian tunnel. If funds are insufficient, Transbay Terminal could be designed and built in a way that allows the tunnel to be constructed at a later date.

As you know, AC Transit has been working on this project for many years. We look forward to completion of environmental review and early implementation of the project.

9TH DISTRICT

Thank you for the opportunity to comment on the Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project Draft Environmental Impact Report (DEIR).

As the operator of a rail network that extends into four counties, BART supports improved regional transit mobility. Last year, BART spearheaded a regional planning effort involving the Metropolitan Transportation Commission (MTC) and transit operators from throughout the region. BART staff and directors have also investigated opportunities to expand service with transit modes other than traditional BART technology. A well-designed Transbay Terminal and Caltrain extension project could significantly enhance regional transit options. If San Francisco is to retain its prominence in the Bay Area, it is important to maximize the effectiveness of transit projects linking San Francisco with its neighbors.

Since the proposed Transbay Terminal and Caltrain extension are intended to facilitate travel between the East Bay, San Francisco and the Peninsula, there is clearly a mutual and potentially complementary relationship between this project and BART. We are particularly interested in the interface between the Transbay Terminal and BART in Downtown San Francisco, connectivity, and facilitating long-term regional rail opportunities. Please consider the following comments:

- Pedestrian Connection to Embarcadero BART/Muni Metro
  The current surface connection between the Transbay Terminal and the Embarcadero BART/Muni Metro Station, which is described as "convenient" on page 1-16, is actually quite challenging. The description should be revised to illustrate the physical inconvenience of this connection more accurately, specifically referencing the distance, number of street crossings and elevation changes required to transfer between systems.

  Pages 2-36, 2-37 and 5-118 reference a pedestrian tunnel underneath Fremont Street to connect the Transbay Terminal with the Embarcadero BART/Muni Metro Station. If designed appropriately, such a connection could facilitate transfers between regional systems by removing conflicts between surface traffic and transit patrons, shortening transfer times, and reducing elevation changes. BART has recommended this connection in our Embarcadero Station Access Plan, released earlier this year.

We are concerned that the pedestrian linkage is not sufficiently described or analyzed in the DEIR. Page 5-119 states that only 700 transfers per day are estimated to occur between BART and Caltrain in Downtown San Francisco (only 2% of Caltrain riders, as indicated on page 5-135). Given the existing traffic volumes on the Bay Bridge and Highway 101 corridors, we believe this may be an underestimate and would like the Final EIR to provide a justification for this number. In addition, the EIR should be revised to describe the connection's "footprint" (including the width, height and depth of the proposed tunnel) and include a diagram illustrating its configuration. Besides reducing street-activating foot traffic, underground passageways may pose security concerns if they are underutilized and poorly designed. The EIR should discuss security-enhancing features such as retail activity, clear sightlines and cameras, and patron amenities. Additionally, the EIR should include and analyze a moving sidewalk option to shorten transfer times, reduce the frequency of missed connections, and improve convenience for senior citizens, people with disabilities, and patrons with luggage.

We recognize that funding may not be sufficient initially for an underground passageway. Consequently, a clearly-defined aboveground connection should be added as an alternative and analyzed in the Final EIR.

- Impacts on Current Transit Patronage

In describing impacts on corridor transit patronage on page 5-119, the DEIR notes that the Transbay Terminal/Downtown Caltrain Extension Project would reduce future BART ridership primarily along the San Mateo County extension. However, the DEIR does not substantively analyze the potential ridership impacts on BART's transbay service, which currently handles over 140,000 trips daily. For instance, the DEIR only minimally discusses the situation on page 5-120, stating that the project "would likely encourage transfers from Caltrain to AC Transit buses, thereby increasing AC Transit bus ridership".

For planning purposes, we would like the Final EIR to quantify potential system impacts on AC Transit and BART related to the improved Transbay Terminal. The Final EIR should also describe the assumed AC Transit transbay bus network and services levels used in the modeling process, as was done for SamTrans, Muni and Golden Gate Transit. Beyond the environmental process, we would also like to work with project sponsors in the future to help design transbay services that distribute transit resources efficiently and improve access to underserved areas.

- Connectivity with Other Rail Services

Page 2-4 references Muni's future Third Street Light Rail/Central Subway project. It is our understanding that the light rail line is planned to cross the Caltrain alignment in the vicinity of the existing Caltrain terminal at 4th and King, but that there are multiple options being considered for that area. Please indicate in the Final EIR both in text and on a map how the light rail line will interface with the relocated 4th/King Caltrain Station. For safety and security reasons and to minimize transfer times, it would be preferable if the stations were located adjacent to each other so that patrons do not have to cross streets or walk long distances unnecessarily.

- Future Rail Options

The Proposed Project includes expanded layover facilities for transbay buses within the reconfigured Transbay Terminal, with the potential for an additional transbay rail connection over the long-term. Implicit is an assumption that buses will be relied upon to accommodate most of the ridership growth in the transbay corridor, with rail options to be considered in

the future should funding materialize. Buses can add capacity immediately at a relatively low cost and are a key component of the transit network. However, growth is ultimately limited by roadway congestion and seating. The DEIR should more extensively consider the opportunities and limitations of different modes both in the transbay corridor and in the sizing and design of the terminal itself.

BART and the recent MTC Bay Crossings Study recognize that additional transbay rail capacity may be necessary in the future to accommodate ridership growth. As described on page 2-36, both the Second-to-Main and Second-to-Mission Caltrain Extension alternatives "could also be extended as a separate, independent project at some time in the future, to a San Francisco-to-Oakland cross-bay alignment for commuter rail and/or high speed trains". The DEIR should be revised to show how either alternative would be able to facilitate a second Transbay crossing. In particular, the Final EIR needs to clarify how the Second-to-Main alternative, which is oriented towards the South Beach district, could be extended across the bay.

In addition to the Transbay corridor, there are opportunities for rail expansion within San Francisco and elsewhere. For example, rapid transit along the Geary corridor has been contemplated for many decades. Potentially such a service could be linked with a future transbay rail crossing via the Transbay Terminal, which would increase transbay capacity and improve links between the East Bay and the northern half of San Francisco. However, it appears that the Transbay Terminal facility has not been designed for future rail service outside of the Peninsula and East Bay corridors. Regardless of current funding limitations, long-term expansion should not be precluded by the facility design. The DEIR should be revised to show how future rail projects, particularly in the Geary corridor, could interface with the Transbay Terminal facility.

We hope the Final EIR will provide for ongoing coordinated planning efforts among BART, the U.S. Department of Transportation, the Federal Transit Administration, the City and County of San Francisco, Caltrain, and the San Francisco Redevelopment Agency. As we develop a better understanding of future needs, we are especially interested in identifying underserved regional markets where the Transbay Terminal could provide additional capacity that complements the existing rapid transit network. In evaluating proposed services, BART would like to work with you to coordinate capacity analysis, ridership forecasting and service planning efforts.

Thank you again for the opportunity to comment on the DEIR for the Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project. We look forward to working in partnership with to improve regional transit opportunities.

Sincerely,

Thomas E. Margro
General Manager

November 19, 2002

GOLDEN GATE BRIDGE
HIGHWAY & TRANSPORTATION DISTRICT

Mr. Paul E. Maltzer
Environmental Review Officer
San Francisco Planning Department
1660 Mission Street, Suite 500
San Francisco, CA 94103

Dear Mr. Maltzer:

Re: **Draft Environmental Impact Statement/Draft Environmental Impact Report (DEIS/DEIR) for the Transbay Transit Terminal/Caltrain Downtown Extension Project/Redevelopment Project**

Golden Gate Bridge, Highway and Transportation District (District) has reviewed the above-referenced document and offers the following comments as they pertain to District transit services near the Transbay Transit Terminal (TTT) area.

General Comment

- District concurs with the primary objectives of the Transbay Terminal/Caltrain Downtown Extension/ Redevelopment Project (Project) to improve public access to bus and rail services, modernize the Transbay Terminal, and reduce non-transit vehicle usage.

EIR Comments/Permanent Storage for Golden Gate Transit (GGT)

- DEIS/DEIR (pages S-1 and 1-1) describes the many transit benefits achieved by this Project. Equally important, however, is the project's inclusion of a permanent storage/layover facility for regional bus operators. This facility will continue to allow GGT to provide level of service and schedule reliability for its customers. Although passenger amenities are important for the general public, the ability for GGT to maintain level of service and schedule reliability are critical to the attractiveness and success of GGT bus service in San Francisco. Page 1-2 should also acknowledge the operational benefits provided for regional bus operators by this Project.

- A permanent midday storage facility is very critical to the retention of successful GGT bus service in San Francisco. District recommends that the bus storage and bus access ramps proposed by this Project be identified as a priority transit improvement that could be advanced independently in the event the Project is delayed.

- Table S-1 of DEIS/DEIR (page S-10) states that mitigation of displaced public parking by bus parking will be accommodated with a "parking deck" under the freeway between 3rd Street and 4th Street. This table should clarify that bus parking at grade level is the higher priority and public parking could co-exist onsite on a deck.

- Table S-1 (page S-17), under the Transit Operations/No-Project Alternative heading, should mention that a permanent storage facility for GGT is not provided under this scenario. Similarly, under Transit Operations/Full Loop Ramp Alternative heading, it should be mentioned that a permanent storage facility is provided for GGT.

1011 ANDERSEN DRIVE • SAN RAFAEL, CA 94901-5381 • USA

EIR Comments/Bus Access Ramps

- Figures 2.2-5 and 2.2-6 (pages 2-14 and 2-15) present the proposed off-site bus storage facility for GGT and AC Transit, and the direct access bus ramps connecting the off-site storage facility with TTT and Fremont Street. Although District appreciates incorporation by this Project of a permanent storage facility that it has sought since 1972 (i.e., when GGT began transbay bus service from Marin and Sonoma counties into San Francisco), there are some issues the DEIS/DEIR does not appear to address.

  1) The GGT off-site facility between 3rd Street and 4th Street is not shown to be directly connected to the ramp system proposed to TTT. The lack of a direct ramp from the GGT bus storage area makes this off-site facility completely vulnerable to weekday evening traffic congestion on 3rd Street. District strongly suggests that the feasibility of a direct ramp, as provided for the AC Transit off-street storage facility, be further investigated.

  2) The direct access ramp to Folsom Street is labeled on Figure 2.2-6 as a "possible future" connection. District strongly suggests that any potential lack of this connection as part of the Project is a serious shortfall. The absence of a direct connection between the off-site storage facility and Fremont Street would make GGT bus services in San Francisco totally dependent on evening peak period traffic conditions on surface streets. Potential congestion will decrease GGT schedule reliability and would likely require GGT to acquire a new staging facility near TTT.

EIR Comments/Street-Level Facility

- Figure 2.2-2 (page 2-10) presents proposed street-level facilities for GGT and San Francisco Municipal Railway (MUNI). A single 13-foot lane for bus boarding, although adequate from passenger and bus loading viewpoints, may prove problematic from an operating perspective should a bus become disabled in the 13-foot lane and a by-pass lane is not provided. To mitigate this operational concern, District recommends the DEIS/DEIR mention either a drop-off area for bus passengers at either the near side of the street-level facility on Beale Street or in front of the new TTT on Mission Street.

EIR Comments/Temporary Bus Terminal

- Page 2-20 discusses the proposed temporary bus terminal. It states GGT "would be allocated three bays on the curb." DEIS/DEIR should clearly state whether these bays are located on the Beale Street contraflow lane between Howard and Folsom streets.

EIR Comments/GGT Storage at 8th and Harrison Streets

- Page 2-18 correctly states that the current GGT midday storage facility, which presently occupies the site of the proposed temporary terminal, requires "a new site . . . to be identified." GGT is presently in the process of relocating its midday storage facility from the Main/Beale site to a leased lot at 8th Street and Harrison Street. This relocation should be accomplished in March 2003.

EIR Comments/GGT Service in San Francisco

- Figure 1.2-4 (page 1-15) incorrectly illustrates GGT bus service on Folsom and Howard streets. Since 1997, GGT "Civic Center" service has operated on Mission Street. (Figure 3-1 on page 3-2 is correct.) With the anticipated relocation of its midday storage facility from Main and Beale streets to 8th and Harrison, GGT is planning to resume revenue service on Folsom and Howard streets. District Planning Department staff will provide the exact routing of bus service in the South of Market area as soon as it becomes available.

- Page 3-20 and Table 3.1-11 (page 3-22) of the DEIS/DEIR should make the following clarifications concerning GGT Basic Service in San Francisco.

  1) GGT Basic Service generally operates every day and nearly 24 hours per day.

  2) Route 10 operates only on weekends in San Francisco; Routes 30 and 90 operate only on weekdays.

- Figure 3.1-6 (page 3-21) does not show GGT Route 67 and Route 69 correctly. Route 69 is a ferry shuttle route that serves San Francisco Ferry Terminal and the Financial District. Route 67 is a ferry shuttle route that serves San Francisco Ferry Terminal and the Civic Center.

- Information on page 3-20 of the DEIS/DEIR should be updated to include the current District one-way adult cash fares.

Weekday Fares	
Golden Gate Transit transbay bus	$2.65 - $5.65
Golden Gate Ferry; SF to Sausalito	$5.60
Golden Gate Ferry; SF to Larkspur	$3.25
Weekend/Holiday Fares	
Golden Gate Transit transbay bus	$2.65 - $5.65
Golden Gate Ferry; SF to Sausalito	$5.60
Golden Gate Ferry; SF to Larkspur	$5.60

- Table 3.1-11 (page 3-22) should be revised to include the following clarifications concerning GGT bus service in San Francisco (as of September 2002):

  1) Route 90 has two (not one) southbound trips that serve the Transbay Terminal area.

  2) Route 72 has headways that vary between 14 and 55 minutes (not one peak period trip).

- Page 3-23 should not describe District sponsored Club Bus services from Napa and Sonoma County to San Francisco as "Regional Paratransit" service. These are subscription commute bus routes that serve the Transbay Terminal via bus stops on Mission Street. As of March 2001, the Napa Valley Commute Club operates one southbound and one northbound trip during the peak period. As of October 2002, the Valley of the Moon Commute Club operates two southbound and two northbound trips during the peak periods.

  Regional Paratransit services to TTT include services correctly described on page 1-8 of the DEIS/DEIR.

- Page 3-49 should acknowledge that most GGT buses and all Golden Gate ferries are equipped to transport bicycles.

EIR Comments/Paratransit and Taxi Services

- DEIS/DEIR should mention that a new TTT should be designed to provide a street level paratransit transfer location adjoining the primary taxi zones as well as the ground level terminal facilities between Fremont Street and First Street. Enclosed is an October 24, 2000 letter from the Partnership Transit Coordination Committee to Metropolitan Transportation Commission (MTC) pertaining to many design-

related issues. It is offered for your information.

- There is very little information in the DEIS/DEIR pertaining to taxi service to and from the new TTT. This issue may be critical from street level activity, terminal space allocation, and traffic congestion viewpoints. Since taxi service may potentially become a significant mode of access to and from TTT with the introduction of high-speed rail service (albeit a separate future project), District recommends that taxi service to and from TTT be discussed in the DEIS/DEIR.

EIR Comments/Ferry Building

- Page 4-52 attributes the decline in use of the Ferry Building "to almost nothing" as being a result of electric trains over the Bay Bridge. The DEIS/DEIR should recognize that the decrease in ferry transportation described only reflects travel to and from the East Bay. Overall decline in ferry transportation to the Ferry Building is primarily attributed to construction of the Bay Bridge (for East Bay communities) and the Golden Gate Bridge (for North Bay communities).

  The DEIS/DEIR should acknowledge the current growth in ferry transportation at the Ferry Building and its status as a regional transportation facility.

EIR Comments/Miscellaneous Issues

- Page 1-25 describes membership of the Transbay Joint Powers Authority (JPA). DEIS/DEIR should acknowledge that the this District is an ex-officio member of the JPA.

- It appears the restriping of Fremont Street traffic lanes between Mission Street and Market Street, described on Page 3-35, has already been implemented. In addition, tracks for the former F-Market Muni have been removed.

EIR Comments/TTT Alternatives

- Page 5-2 describes Impacts Common to Both Transbay Terminal Alternatives. It states how GGT and AC Transit buses would be stored on a lot on Harrison Street between Second and Fourth Streets. It is not clear whether the lot described is referring to the proposed off-site storage facility bounded by 2nd, Perry, 4th and Stillman streets. It is also not clear, based on description of the Loop Ramp Alternative (see pages 2-14 and 2-15) whether an off-site facility will be provided for GGT.

- Table 5.19-1 (page 5-110) summarizes the two TTT and No Project Alternatives in terms of bus operational differences. It compares bus storage locations, travel times, and travel distances for the alternatives. This table raises the following questions as they pertain to GGT bus operations.

  Bus Storage: This table indicates bus storage for the Full Loop Alternative will occur on the on-site ramps and off-site storage lot. Please specifically identify where storage would occur for GGT buses.

  Travel Distances: Estimated travel distances are provided for AC Transit. Travel distances for GGT buses should also be provided.

  Travel Times: Estimated travel times are presented for AC Transit operations. Estimated travel times for GGT operations should also be presented.

EIR Comments/West Ramp Alternative

- Page 5-111 clearly describes how AC Transit would operate between the off-site storage facility and TTT. It states, "AC Transit buses would operate independently of local traffic between the Bay Bridge, the storage area, and the Transbay Terminal. Direct connections would be provided on elevated ramps. . .." Other than reference to the storage facility for GGT buses, no reference is made to how GGT buses would operate between the off-site storage facility and the beginning of revenue service on Fremont Street. As part of consensus building and planning efforts with MTC, there was considerable discussion of providing GGT buses with ramps that would also permit buses to operate independently of local traffic. District staff had understood that ramps connecting the off-site storage facility and Fremont Street would be provided. These ramps would assure GGT level of service and schedule reliability and potentially reduce operating costs. This is also true in light of traffic-related impacts discussed in Chapter 5 of this document (see comments below).

- Page 5-111 does not clearly describe features of the West Ramp Alternative for GGT bus operations. It cites Muni and Golden Gate Transit bus operations, patron entry, ticketing, and joint development. DEIS/DEIR should clearly identify features and specify the benefits for GGT of this TTT Alternative.

- Page 5-113 notes "a direct connection between the Terminal and the surface streets was determined to be unnecessary for bus operations." District staff has repeatedly mentioned during consensus building and planning process with MTC that the current street access to TTT and access from Second Street south of Harrison Street via the elevated ramps requires an additional two miles of deadhead travel for GGT. District requested that a design option consider direct access from city streets to the terminal be investigated at the outset of this project. For example, District staff suggested a contraflow lane be considered on the Fremont Street off-ramp as a potential low-cost design option.

- Second paragraph of page 5-114 cites "any significant expansions in Muni or GGT capacity would require the staging of buses at an alternate location." How much expansion by Muni or GGT would trigger this additional staging? Where would this additional staging be located?

- Fourth paragraph of page 5-114 cites GGT "commuter service would also be able to use the new mid-block boarding area. Golden Gate Transit's basic service . . . would continue to load and alight passengers along Fremont Street between Mission and Howard." This description of GGT service is not accurate and needs to be revised. Page 5-136 describes potential GGT operations as a result of the mid-block boarding area. There doesn't appear to be consistency between GGT operations described on page 5-114 and 5-136. Nevertheless, the following describes probable GGT operations with the new mid-block boarding area and can be incorporated into the DEIR:

  Basic Service: Inbound GGT Basic Service buses, which operate on Mission Street, would terminate in front of TTT on Mission Street (as they do presently). The proposed TTT mid-block boarding area would be used as the first revenue stop by outbound GGT Basic Service buses.

  Financial District Commute Service: Inbound GGT Financial District Commute Service buses would serve TTT by the current bus stop on First Street, between Market and Mission streets, and would not likely be affected by any of the TTT alternatives. Outbound Commute Service would be affected by the location of the off-site bus storage facility and elevated ramps mentioned previously. In the event of a direct connection between the off-site facility and Fremont Street, GGT commute buses would serve TTT with existing bus stops on Fremont Street.

- Page 5-116 makes reference to a change in GGT operating costs following construction of the off-site

storage facility. EIR should refer to upcoming relocation of GGT's midday storage to the 8th and Harrison Street site (effective March 2003) to determine the new site's affect on GGT operating costs

EIR Comments/Loop Ramp Alternative

- Page 2-18 of the DEIS/DEIR describes bus storage for the Loop Ramp Alternative to occur on the (elevated) bus ramps for TTT. DEIS/DEIR does not specifically mention whether bus storage for GGT is provided, although Figure 2.2-7 (page 2-17) indicates "Additional Bus Storage (under Bay Bridge Approach)." The description of this TTT alternative does not clearly indicate whether a permanent midday storage facility is provided for GGT. Absence of a midday storage facility for GGT, for any TTT alternative, is a serious shortfall and does not adequately address the needs of GGT bus services in San Francisco. Similarly, direct access ramps connecting an off-site facility and Fremont Street need to be accommodated.

- Page 5-116 cites this TTT Alternative would feature "street level bus service for Muni and Golden Gate Transit . . . in the block east of Beale Street (as opposed to the mid-block crossing between Fremont and Beale as proposed in the West Loop Alternative')." The DEIS/DEIR does not provide any further description of this street-level arrangement. How many berths will GGT be provided? Where would this street level bus service be located? How will GGT bus operations (e.g., access between a midday storage facility and the beginning of revenue service) be affected?

- Page 5-117 cites "both AC Transit and Golden Gate Transit would be available beneath the western approach of the Bay Bridge at Second Street." How does the space, layout, and the ability to provide a direct ramp between the midday storage site and Fremont Street (i.e., a route of travel that is independent of local street traffic) vary for GGT buses compared to the West Ramp Alternative?

- No reference is made on page 5-117 concerning GGT operating costs with this TTT Alternative. EIR should refer to upcoming relocation of GGT's midday storage to the 8th and Harrison Street site (effective March 2003) to determine the new storage facility's affect on GGT operating cost.

EIR Comments/Operating Costs

- Page 5-120 presents an estimated $312,000 annual increase in GGT operating costs attributed to the relocation of the midday storage function from the current lot at Main/Beale to the new off-site storage facility beneath I-80. This cost estimate assumes GGT midday storage at the current Main and Beale lot. GGT will be relocating its midday storage operation to a lot on 8th and Harrison streets in March 2003. GGT operating cost impacts relative to the relocation to a the proposed storage facility should assume the 8th and Harrison site as the existing condition.

EIR Comments/Traffic Impacts

- Page 5-126 states the project "would result in adverse (traffic) impacts" and "mitigation measures for the seven (impacted) intersections have not been proposed, and the impacts associated with the Project would be considered adverse and unmitigatible . . . ." District recommends full consideration of direct ramps between GGT off-site storage facility and Fremont Street to eliminate circulation of GGT bus traffic on local streets during the evening peak period when traffic conditions surrounding the TTT area operate under extreme levels of congestion.

- According to Table 5.19-5 (page 5-123) Harrison Street and Second Street currently operate at LOS E (delay of 44.9 seconds and v/c capacity at 1.11). Given the close proximity of this intersection to the proposed GGT off-site storage facility, District believes that GGT will be highly susceptible to traffic

queuing on Third Street. District, therefore, urges consideration of a direct ramp connecting the storage facility with the Fremont Street off-ramp.

- Similarly, Table 5.19-5 (page 5-123) cites poor traffic levels-of-service throughout the TTT area under existing and projected 2020 conditions. GGT needs direct ramps between the off-site storage facility and Fremont Street. Lack of these ramps would require a street level staging area near the TTT area.

EIR Comments/Pedestrian Impacts

- Page 3-44 of the DEIS/DEIR provides an accurate portrayal of sidewalk conditions at GGT bus stops on Fremont and Mission streets near TTT. It accurately describes potential conflicts between queuing bus passengers and sidewalk pedestrians on sidewalks that are narrow and furnished with street furniture that effectively reduces pedestrian space. The DEIS/DEIR also highlights the benefits for both queuing bus passengers and sidewalk pedestrians of the Fremont Street overhang of the existing 350 Mission Street building. District strongly advocates the use of overhangs for new buildings constructed in San Francisco with adjoining bus stops to reduce sidewalk obstacles.

- The DEIS/DEIR also discusses the general lack of curb space for GGT buses on Fremont Street. For this reason, GGT Routes 2, 4, and 8 completely bypass the TTT area. District supports expansion of GGT curb space near TTT to enhance bus passenger queuing space and facilitate consolidated bus operations.

- Page 5-131 summarizes pedestrian levels-of-service in the TTT study area. The poor levels-of-service at the Mission and Fremont street intersection highlight the need to make improvements at the street level for bus queuing passengers and sidewalk pedestrians.

- Since a mid-block pedestrian analysis for the sidewalks on Fremont Street between Market and Mission, and between Mission and Howard streets, was not performed, the EIR does not address levels of sidewalk congestion that could be exacerbated for 2020 Baseline Plus Project conditions.

- Page 5-136 recommends potential mitigating measures to enhance pedestrian flow near TTT. District supports these strategies, not only for TTT area but for all new buildings built in San Francisco.

EIR Comments/Construction Impacts

- District would appreciate if traffic control plans, cited on page 5-139, could also be developed in conjunction with District staff. All short- or long-term construction detours and street closures will affect traffic conditions and GGT schedule reliability. Ultimately any prolonged effects on schedule reliability and the continued availability of bus stops near TTT have the potential to decrease the attractiveness of GGT bus service as an alternative means of transportation to and from San Francisco.

- Figure 5.20-8 (page 5-161) presents an estimated construction phasing for the TTT project. It estimates construction of off-site storage facilities and access ramps during the fourth and fifth years of construction. District requests construction of the off-site storage facility be initiated as soon as possible after this site becomes available subsequent to Caltrans' seismic retrofit project in order to address GGT permanent midday storage needs in San Francisco.

- Figure 5.21-1 (page 5-163) illustrates and page 5-165 discusses access to the temporary TTT at the site currently occupied by GGT's midday storage facility. District appreciates efforts by this project to accommodate GGT bus service during construction of a new TTT.

1) Figure 5.21-1 and page 5-165 appear to only accommodate GGT's outbound service since no inbound GGT stops are indicated. District's inbound Basic Service bus stops are required on Mission Street, either between Fremont Street and First Street (as in current conditions) or, if not available, between Beale Street and Fremont Street (shown in Figure 5.21-1 as a San Mateo County/Muni bus stop). District desires to serve both the existing TTT and temporary TTT to facilitate transfers with other regional transit operators.

2) For GGT outbound stops, this figure shows a GGT layover on Folsom Street, a Beale Street bus stop (far side Folsom), and a Fremont Street bus stop (far side Mission). GGT currently has three bus stops on Fremont Street (near side Mission). These bus stops either have to be maintained during project construction or otherwise accommodated near the existing terminal.

District staff appreciates the opportunity to comment on the DEIS/DEIR for this project. Please call Principal Planner Maurice Palumbo at (415) 925-0160 if you have questions.

Very truly yours,

Alan R. Zahradnik
Planning Director

Mr. Jose Campos
Planning Supervisor
San Francisco Redevelopment Agency
770 Golden Gate Avenue
San Francisco, CA 94102

Dear Mssrs. Maltzer and Campos:

With this letter, Muni is submitting comments on the Draft EIS/EIR for the Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project. We are pleased to see this project moving forward, as it is a very important project for the future of transportation in San Francisco and for the entire Bay Area. This project is critical as a major regional linkage, and will improve transit services for a wide variety of riders. Muni will be happy to work closely with the project designers as this project moves forward, and we look forward to playing an integral role in the city's efforts to implement this project.

Muni has participated for several years in the planning of the proposed new Transbay Terminal, including in the Metropolitan Transportation Commission planning efforts and in charettes led by Simon Martin Winkelstein and Morris (SMWM), as a consultant to MTC. We also interacted extensively with John Eddy at Arup during the MTC planning effort, and developed concepts that should be brought into this EIR/EIS process.

Muni has reviewed the Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project Draft EIS/EIR, and we have the following comments:

General Comments:

Muni, with 750,000 rides per weekday, is the largest transit operator in the Bay Area and seventh largest in the U.S. Muni's two largest transit corridors are Market and Mission Streets, both of which feed into Transbay Terminal. Muni currently serves the Transbay Terminal with a number of motor coach (MC) and trolley coach (TC) routes, and Muni is by far the highest volume carrier at street level at this facility, both in terms of riders and in terms of number of vehicles.

Muni is concerned that the Transbay Terminal EIS/EIR does not fully address Muni's current and future needs for Muni service to the Transbay Terminal, including serving current riders, a future Geary light rail line, new customers arriving on Caltrain and other heavy rail services, and new residents and employees in the Transbay Terminal Redevelopment Area. We are concerned that the space allocated to Muni in this document is the minimum level needed for current operations, and does not allow for any of the capacity expansions to our service that can reasonably be foreseen. One good example of this is that, although Muni's surface light rail tracks were recently removed from in front of the existing Transbay Terminal, Muni needs the flexibility to be able to serve the new Transbay Terminal with historic streetcar

lines in the future, such as the F and/or E-lines. Muni would like to discuss these issues with you in more detail and to work closely with you to make sure that Muni's needs are met.

Our other main concern is that Muni has done a significant amount of work on a future Geary light rail subway connecting to Transbay Terminal, which is not referenced in this document. Muni worked with the consultants and staff on the January 2001 MTC study to ensure that provisions for future Geary light rail subway would be included in the new facility, including protection of right–of-way, provision for terminal space in the facility, and other aspects needed to integrate a future Geary LRT line into the facility. We recommend that the work done for the 2001 MTC study be reviewed in this light, and appropriate modifications be made to this document to reflect that work, so that the concepts developed at that time can be developed and expanded in the CER and PE phases of the Transbay Terminal project. Our primary concern is that subway access under Folsom (or Howard) be maintained for the Geary LRT branch off of the Central Subway between Third Street and the Transbay Terminal, and that terminal space for the line be reserved. We want to ensure that neither the Caltrain extension nor the Geary LRT subway project proceed with design assumptions that would preclude the other project from proceeding, particularly at locations where the alignments meet and/or cross. Again, we would be happy to meet to discuss the Geary LRT project in greater detail.

Specific Comments:

Page 1-28 – Table 1.2-4:

The SF Parking & Traffic Commission and SF Public Transportation Commission were merged into the SF Municipal Transportation Agency (MTA), effective July 2001. MTA approval is required for municipal public transit route realignments, surface street changes, traffic operation changes, traffic control measures, and on-street parking changes.

Pages 1-26 and 2-4 to 2-5, and Table 2.1-1:

- The elevated Central Freeway, US 101, connects I-80 with Fell and Oak Streets. This will be rebuilt and retrofitted only south of Market Street. The portion north of Market Street will be torn down and replaced by the new Octavia Blvd.
- The Third St. LRT Project Initial Operating Segment (IOS) is expected to be open for full service in 2005; an early partial opening may occur in late 2004.
- The Central Subway is expected to be in service in 2012, not 2009.
- The Ferry Bus Terminal was a "relocation" project in anticipation of hotel construction, not an "expansion", and was completed in Fall 2001.
- Muni's F-Line Historic streetcar service opened for service from Castro/Market Streets along the Embarcadero to Fisherman's Wharf in March 2000, and currently carries approximately 20,000 riders per day. Muni's E-Line station improvements on the Embarcadero and King Streets for historic streetcar service between Fisherman's Wharf and 4th/King Streets will be under construction in 2003.

Chapter 2 – Description of the Project Alternatives

This section should include descriptions of the future Geary light rail subway and its interface with the Transbay Terminal and the Caltrain alignment. There should be a new section that describes the route that the subway would take from a junction with the Central Subway at Third & Folsom (existing design concept), or possibly from Third & Howard, then under Folsom or Howard to Transbay Terminal. This section should describe how the subway would be related to the Caltrain underground alignment and any other underground features and how the station would be integrated into the Transbay Terminal. Muni's proposal for all of these features was presented to the MTC project team in 2000. Attachment A is a map from the Executive Summary of the project report that indicates two conceptual alignments for the Transbay Terminal branch off of the Central Subway. Although the alignments shown do not reflect our

precise preferred alignment, they do indicate that this issue was known at the time the report was issued in January 2001. Attachment B is more detailed information on the Geary project, from the April 1995 Geary Corridor System Planning Study.

Page 2-4 – Section 2.1.2 Muni Facilities and Related Bus Service

The Third St. LRT Project Initial Operating Segment (IOS) is expected to be in full revenue service in 2005. The Central Subway is expected to be in service in 2012, not 2015.

Page 2-4 – Section 2.1.5 Roadway and Street Improvements

The elevated Central Freeway will no longer connect with Oak and Fell Streets. It will be removed north of Market Street and replaced with the new Octavia Boulevard. The reference to a new King Street access roadway at Fifth Street into Mission Bay should be clarified, as to whether or not this roadway extends only south of King Street across Mission Creek, or whether it is intended to cross the Caltrain alignment.

Page 2-6 - Section 2.2 Project Components

Include a description of the future Geary LRT line as an additional component of the project.

Page 2-7 – Section 2.2.1 Transbay Terminal Alternatives

Include a description of the future Geary LRT line as an additional component of the project.

Page 2-8 – Figure 2.2-1 - Transbay Terminal West Ramp Alternative Map

The location of the future Geary LRT line should be indicated on this map.

Page 2-9 – Section 2.2.1.1 - Transbay Terminal West Ramp Alternative

In the discussion on the floor plan, note that space for a Geary LRT subway station would need to be accommodated in the design.

Page 2-10 - Figure 2.2-2: Muni & Golden Gate Transit Street-Level Facilities

The area designated for Muni and Golden Gate Transit to share street-level facilities in the blocks between Fremont and Beale and between Mission and Howard is the minimum space necessary to accommodate current operations, and does not allow for growth and expansion in the future. While the size and capacity of the overall area may initially be adequate, the number of lanes for Muni, the island configuration and the storage areas need to be able to accommodate future capacity expansion and provide flexibility for growth in the future. Muni needs at least five (5) separate lanes inbound (not four, as shown in Figure 2.2-2), with three (3) boarding islands, which can be shorter than the islands shown. Also, Muni needs layover areas. These needs were identified and communicated in meetings regarding Muni and the Transbay Terminal in the period 1999-2001. The following information was communicated to MTC planners in memos and meetings (including 3/24/00), and summarizes Muni's needs for street-level facilities:

TRANSBAY TERMINAL PLANNING: MUNI OPERATING REQUIREMENTS

Alternative 2: Muni in new street between Fremont-Beale/ Mission-Howard:

- Accommodate current Muni lines: 5, 6, 38, 38L, and possibly two other lines (e.g., 2, 3);
- Have the capability to bring in Muni historic streetcar rail lines (E and/or F);
- Provide space for bus stops and layover areas;
- Provide space on Mission Street for Muni lines: 14, 14L (14L terminates in Transbay Terminal street-level facility on Saturdays);
- Provide space on First & Fremont Streets for bus stops for Muni's 10-lines;
- Provide space inside Transbay Terminal upstairs for Muni 108-Line, and provide access to on-street terminals from freeway ramps if terminal is not open 24 hours a day, 7 days a week;
- Provide for future flexibility and growth;
- Also accommodate at least two other Muni Lines: 1 & 41, in Muni terminal area or on Beale St.; and
- Difficult to achieve MUNI needs if area is shared with Golden Gate Transit.

Minimum Requirements for Muni:

➢ The Transbay Terminal should provide convenient and safe transfer activity between Muni and the other primary terminal operator; AC Transit.

➢ The approach to the Transbay Terminal and exit from the terminal by motor coaches and trolley coaches should be at least as safe and efficient as the present condition. Traffic patterns in and around the terminal must efficiently accommodate at least the current level of activity, and should provide for capacity expansion.

➢ The terminal should accommodate at least the minimum number of vehicles on the lines shown below. The type and size of the vehicle, the number of coaches on each line that will need to lay over at any one time at the terminal, and the number of trips per hour at the peak are shown following the line designation *(note: Muni lines, vehicle sizes and numbers of coaches may change over time)*:

- 38-Geary, Motor Coach (MC), 60' (3 coaches at a time, 20 trips per hour);
- 38-Geary Limited, MC 60' (2 coaches at a time, 16 trips per hour);
- 5-Fulton, Trolley Coach (TC), 40' (2 coaches, 13 trips/hr);
- 6-Parnassus, TC 40' (2 coaches, 11 trips/hr);
- 2-Sutter, MC 40' (1 coach, 8 trips/hr), may be converted to TC in the future;
- Provide space on First & Fremont Streets for bus stops for Muni's 10-line;
- Provide space inside Transbay Terminal upstairs for Muni's 108-Line, and provide access to on-street terminals from freeway ramps if terminal is not open 24 hours a day, 7 days a week;
- 1-California, 40' or 60' TC (2 coaches, 12 trips/hr) – either inside street-level facility at Fremont & Beale, or on the street on Beale; and
- 41-Union 40' TC (2 coaches, 10 trips/hr) – either inside street-level facility at Fremont & Beale, or on the street on Beale.

➢ Each line needs an independent storage lane that can accommodate the number of coaches needing to lay over at any one time.

➢ At least two 6" high boarding islands, at least 40' by 8' each for each lane.

➢ Safe areas to exit passengers, which includes an 8'x 6' area to deploy wheelchair lifts.

➢ An area to park a supervisor's automobile and a revenue or maintenance truck.

- Muni operator restrooms (separate restrooms for men and women).
- A space in the terminal with direct access to the Bay Bridge to accommodate the layover and passenger loading for Muni's 108-line Treasure Island service (assume 1 bus every 20 minutes). Also, when the terminal is closed (e.g., in the middle of the night) and the 108-Line is still running to Treasure Island, provide a location for the 108-line to load and for a convenient route from the street-level facility at the terminal to the Bay Bridge.
- A covered area or shelter for waiting passengers in close proximity to passenger boarding areas. Assume up to 40 passengers at any one time.
- The Muni loading and layover areas should be flat, with the loading areas easily accessible for disabled passengers.
- The Muni areas should accommodate expansion of up to 2 additional lines, or 4 buses at any one time and 24 per hour.

Page 2-15 – Figure 2.2-6 - Transbay Terminal Off-Site Bus Storage Ramp Link

This drawing contains a faint dashed line that is labeled "Possible Future Light Rail Connection", but the line is shown to come from the east, apparently from the Bay Bridge. Clarify what this line is intended to represent.

Page 2-16 – Section 2.2.1.2 - Transbay Terminal Loop Ramp Alternative

In the discussion on the floor plan, note that space for a Geary LRT subway station would need to be accommodated in the design.

Page 2-17 – Figure 2.2-7 - Transbay Terminal Loop Ramp Alternative Map

The location of the future Geary LRT line should be indicated on this map.

Page 2-18 – Section 2.2.1.3 - Transbay Terminal Construction

This section should include a description of how provisions for the Geary LRT subway would be made in advance of the actual construction of the subway. It is likely that the new Transbay Terminal would be built before the Geary subway, so it would be important to ensure that an appropriate "box" be built at the time the terminal is constructed to reserve space for the subway and station.

Page 2-19, Figure 2.2-8: Layout of Temporary Bus Terminal:

The Temporary Bus Terminal will need to include provisions for trolley wire on the streets adjacent to the Temporary Bus Terminal, not just in it. This would also include a new boarding island on Beale Street near Howard for the 1-California trolley coach line. These, along with other Muni issues, were discussed with MTC consultants in 1999-2001:

The following is a summary of how bus lines will be routed during the operation of the Temporary Transbay Terminal facility (2003-2006?) at Howard/Beale/Folsom/Main. This is subject to revisions as the design develops, and we will need to work with the project engineers to ensure that appropriate routings are available to us:

Trolley Bus Routes:

- **5-Fulton/ 6-Parnassus**: Continue inbound (IB) on eastbound (EB) Market to Beale, southbound (SB) Beale, left to EB Howard, right into terminal loop at Main (SB contra-flow lane), drop-off passengers at terminal drop-off just south of Howard, continue around loop to layover on westbound (WB) Folsom between Main and Beale (5-line uses first position, 6-line second position). Resume outbound trip with right onto northbound (NB) Beale contra-flow lane, pick-up passengers on Beale south of Howard, left onto WB Howard (protected signal phase), right onto northbound (NB) Fremont, resume existing outbound (OB) route.

- **1-California** - Existing IB route on SB Beale to switch mid-block between Mission and Howard, switch onto left-side curb diamond lane, drop passengers and layover at new boarding island on Beale, NS Howard. Pick-up passengers at island and resume OB trip by making a left onto EB Howard, left onto NB Main, continue on current OB route.

- **41-Union** – Existing IB route on SB Beale, left onto EB Howard, left onto NB Main. Drop off passengers and layover at existing layover location on East Side of Main FS Howard. Pick-up passengers and leave layover, resume existing routing on NB Main.

- **Turnbacks** – ensure that the following turnbacks for trolley coaches would be available:
  - Turnback 14-Mission coaches from IB to OB via right on SB Beale from EB Mission, right on Howard, right on NB Fremont, left on WB Mission.
  - Route 14-Mission coaches into terminal via right on SB Beale from EB Mission, left on Howard, right into terminal, around terminal loop to left on WB Howard, right on NB Fremont, left on WB Mission.
  - Pull-ins on 1, 5, 6, and 41-lines that will by-pass the terminal - use right-hand mid-block switch on SB Beale between Mission and Howard, drop-off passengers NS Howard, right onto WB Howard, normal route back to Presidio or Potrero divisions.

Motor Coach Routes

- **38/38L/2** – Continue IB route on EB Market to Beale. Right on SB Beale to Howard, left on EB Howard, drop-off passengers on the south side of Howard between Beale and Main, right onto main (contra-flow lane), layover at curbside at curb lane on SB Main St. (contra-flow lane). Resume outbound trip with right onto NB Beale, left onto WB Howard (protected phase), right onto NB Fremont, resume existing OB routing onto WB Market.

Muni has also developed some cost estimates for Muni operating and capital costs associated with the Transbay Temporary Bus Terminal, which were provided to MTC. Attachment C is a copy of the letter provided to MTC in March 2001 detailing both the capital and operating costs summarized below:

Operating Costs: Muni estimated the additional annual operating and maintenance costs associated with the Temporary Transbay Terminal at just under $1 million in FY 2000 dollars. These costs are for added service on the 2, 5, 6, and 38/38L lines. Muni does not currently have funding in the operating budget for these increased costs, and a Transbay Terminal project-funding source will need to be identified to provide funds for Muni's operating budget while the Temporary Transbay Terminal is in operation.

Capital Costs: Muni estimated the total capital cost for the Temporary Transbay Terminal at $5.7 million. This cost includes new trolley overhead, strain poles, and special work. It also includes the provision of a temporary street supervisor's office at the temporary bus facility and a temporary operator restroom for the 1-California trolley coach line at its terminal on Beale Street. The existing 1-line restroom on Howard Street will need to be removed when the Temporary Transbay Terminal facility is constructed. The terminal should also provide space for street supervisors and maintenance personnel to park their trucks. Muni does not currently have capital funding planned, programmed, or awarded for these costs, and a Transbay Terminal Project

funding source will need to be identified to provide funds for Muni's capital costs for the Temporary Transbay Terminal.

Page 2-28 and 2-29 – Figure 2.2-15 and 2.2-16 – Plan & Profile Drawings

The location of the future Geary LRT line should be indicated on these drawings.

Page 2-32 and 2-33 – Figure 2.2-19 and 2.2-20 – Plan & Profile Drawings

The location of the future Geary LRT line should be indicated on these drawings.

Pages 3-2, Figure 3-1 Transit Network in the Project Area; and 3-12, Figure 3.1-2 Muni Service at the Transbay Terminal

- Muni service in the Project Area is not adequately represented on this map, particularly the service that currently serves the Transbay Terminal from First Street, as well as the service that continues south on First to Howard (the 10-line), and goes north on Fremont from Folsom (the 10-line). While this service is correctly depicted in Figure 3.1-2, it should also be shown in Figure 3.1.
- The station depicted at 4th and King Streets in the middle of King Street is the Muni Metro station named "4th & King/Caltrain" station, not the Caltrain Station.
- The map in Figure 3.1, as well as others in the EIS/EIR, has a significant highway omission in the base map. It fails to show the touchdown ramps from I-280 to/from King Street in the vicinity of Fifth Street. The primary access to and from I-280 is now via King Street.

Section 3.1.5 – Future Rail Transit and Bus Service – Pages 3-26 through 3-28

This section should include a major Geary rail or bus project as a possible future transit project in the study area. Muni performed a Geary Corridor Planning study in 1994 and 1995, and we have attached excerpts from the Final Report showing the project recommendations and alternatives for terminal configurations (Attachment B). The Geary study recommended moving forward to a Major Investment Study (MIS) and EIS/EIR with three alternatives:

- Light Rail, all-surface configuration (to Transbay Terminal on a street alignment basically the same as discussed for the E and F-lines in these comments).
- Light Rail, surface configuration west of Laguna, subway east of Laguna
- Trolley Coach, surface configuration west of Laguna, subway east of Laguna

The Geary alternatives with subway configurations contained several proposed downtown routings for the subway. The most likely alternative is for the Geary line to use the Central Subway in the downtown area through the Union Square area and then into South-of-Market, with a branch off of the Central Subway at 3rd Street & Folsom (or Howard) for the Geary line, proceeding easterly under Folsom (or Howard) Street to Beale, directly behind the Transbay Terminal. One of the alternatives also included the Central Subway branch coming to the surface on either Folsom or Howard.

At the time the study was performed, Muni's governing board, the Public Transportation Commission (PTC), accepted the report and elected not to move forward to an MIS and EIS/EIR until a viable financial plan could be developed. The PTC also elected not to select a preferred mode and alignment.

A Geary project is one of the four corridors listed in the San Francisco County Transportation Authority's "Four Corridor Plan", and is also included in Muni's recent publication "A Vision for Rapid Transit in San

Francisco", and has been included in Muni's Short Range Transit Plan. Given the proximity to the Transbay Terminal, it should be mentioned in this section.

In 2002, as part of the Muni publication "A Vision for Rapid Transit in San Francisco", MUNI developed a service plan for a Bus Rapid Transit (BRT) Service on Geary, which would significantly reconfigure and speed service on the Geary corridor, from Transbay Terminal to Ocean Beach. This change would increase ridership on the corridor by approximately 5,000 people a day, and would include increased service from the Transbay Terminal. The Geary BRT corridor will be included in an amendment to Muni's SRTP/CIP, and would be operational before any new rail service in the corridor.

This section should also include a discussion of potential future high-speed rail (HSR) service to the Transbay Terminal, including projections of the number of riders expected to use the terminal. HSR could add significant numbers of users to the terminal, and should be considered. In addition, this EIS/EIR should be reviewed with California High Speed Rail staff, if this has not already been done.

Page 3-27 - Section 3.1.5.3 and 3.1.5.4 – Muni Third Street Light Rail and Muni Central Subway

Muni's Third Street Light Rail project has two phases. Phase 1 is the Initial Operating Segment (IOS), and is referenced in Section 3.1.5.3. Phase 2 is the New Central Subway (NCS), and is referenced in Section 3.1.5.4. These two sections should be combined into one section labeled "Third Street Light Rail Project", with discussion of the two phases as two phases of the same project. Also, it is important to note that the New Central Subway alignment in the South of Market area under Third Street will be built complete with the junction connections for the Geary subway branch to Transbay Terminal.

Section 5.19.3.2:

It is not a correct assumption that both the 30-Stockton and 45-Union would be rerouted along Mission Street after the Caltrain extension is in place. One of those lines will still continue to serve 4th and 3rd Streets between Market and Townsend, and will be extended into Mission Bay. The other line will likely be terminated in the vicinity of Yerba Buena Center. It is questionable, however, if the Caltrain Extension would be the triggering event to truncate one of these lines in the Yerba Buena area. It is more likely that the construction of Phase 2 (New Central Subway) of the 3rd Street LRT line would be the event that would cause Muni to truncate one of these lines.

Figure 6.6-1, Capital Financial Plan:

It may be unrealistic to assume that value engineering will reduce the cost of the Transbay Terminal Project by as much as $170 million, particularly in light of the inevitable pressure to add more to the project scope during the outreach process to affected communities and neighborhoods, and as required mitigation for construction phasing, etc. Muni has always found that project scopes tend to grow, rather than shrink, as more participants join the planning and implementation process. This is true in major rail corridors and facilities projects, such as the Third Street LRT Project, K-Line/Ocean Avenue Project, L-Line Project, to name a few. However, a value-engineering process would be useful to identify items that are proportionally high in cost relative to their benefits, perhaps resulting in some savings. In any case an ample contingency should also be included as part of the project budget.

Section 6.6 – Funding Sources

Many of the funding sources listed in the funding plan are sources that provide funds to Muni or could provide funds to Muni, such as existing Bridge Toll funds, Bridge Toll third dollar increase, and Prop 42 funds. It is difficult to gauge from the information given if providing any of these funds to Transbay Terminal would mean that Muni would receive less funding. It would also be useful to know what funds

would be used to guarantee the TIFIA loans. If any of these funds are funds that Muni could expect to receive, using them as a guarantee could affect Muni's access to the funds. It would be good to have more explanation of these issues in this section.

If you have any questions, please contact Kerstin Magary, Senior Project Manager, at (415) 554-1789, fax: (415) 554-3453.

Sincerely,

José Cisneros
Deputy General Manager for Capital Planning & External Affairs

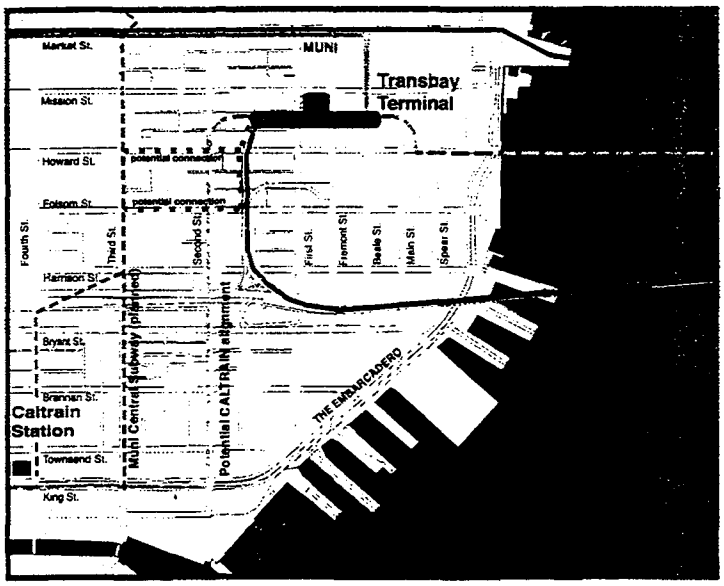
File: Transbay Terminal

 Attachment A

Favoring transit in a regional framework

improved connections among public transit services.

Located in downtown San Francisco, the new Transbay Terminal will be the indispensable component of a strategy to solve these problems by providing efficiently linked and greatly expanded bus and rail capacity, more convenient access to transit, and a new celebratory building that is delightful and easy to use—an appropriate new gateway to and from San Francisco. Simultaneously, the terminal will serve as the link between trains using the Caltrain Peninsula lines and trains serving the East Bay, making possible, for the first time, direct rail trips between San Francisco and the great interior of the state. After two years of work by the thirty-member Transbay Panel, under the leadership of MTC, the City of San Francisco, AC Transit, Caltrans and Caltrain, an informed, transit-based, site-appropriate decision has been made with the multi-agency constituent support required to inspire and sustain action. Building upon this resolve, the lead consultants to the Transbay Panel, SMWM, Richard Rogers Partnership, and Ove Arup & Partners have developed an exciting concept that realizes the Panel's vision for a remarkable new regional transportation hub, a building designed to encourage and accommodate new transit ridership, and a memorable public structure that celebrates the energy of arrival in a great American city.



A MULTI-MODAL TERMINAL FOR THE BEYOND

As a truly regional facility, the new Transbay to modern ways of working and lifestyles th Area to become a unified economic and cult ing the various modes of municipal, regiona transportation, the new terminal will bring t ciency to public transit throughout the regic izes the free exchange of ideas and informat

IV. CONCLUSIONS AND RECOMMENDATIONS

Based upon the results of the Geary Corridor System Planning Study as summarized in Section III above, and as an outgrowth of the ongoing Citywide Fixed Guideway Plan, we have the following conclusions and recommendations:

A. Need for Major Improvement of Geary Corridor Public Transit System. Because of:

- the very high public use of Geary Corridor buses despite the loss of time, reliability and comfort caused by their having to travel in mixed flow traffic lanes;

- the likelihood that the traffic and other adverse conditions which already make Geary Corridor bus travel a relatively frustrating and uncomfortable experience will worsen with time as the San Francisco Bay Region grows; and

- the preference of most of the people attending the 10 public meetings for a major investment which would result in a significant improvement in the reliability and general quality of Geary Corridor transit services

Recommendation No. 1: that subject to the availability of funds, the City move ahead with a major capital investment to improve the Geary Corridor public transit service and that this improvement include significant reduction in public transit trip times as well as significant improvement in public transit reliability and patron comfort.

B. Advancement into the Next Stage. As an outgrowth of comments received during the Public Participation Program, and based upon intensive screening by representatives of the San Francisco Transportation Authority, the City Departments of Parking and Traffic and City Planning, and MUNI as well as by representatives of the Bay Area Rapid Transit District and the Consultant team, the seven options described above were reduced in number and combined into the following four alternatives:

Table 11

1. Alternative 1 TSM

This alternative consists of two variations; namely the No- Build Alternative and the Transportation Systems Management (TSM) Alternative.

Under a "no-build" alternative, nothing would be done other than to increase the level of existing bus service to keep up with increased patronage. Local policy makers usually want to see what the a no-build condition would cost to help them evaluate the feasibility of the more costly solutions.

Under a TSM alternative as defined in federal guidelines, the existing system would improved through relatively low cost means to render it as efficient and effective as possible. The federal government uses the TSM alternative rather than the no-build alternative as a standard against which to evaluate the feasibility of the more costly "build" alternatives. The federal government wants to see what can be done cheaply before they commit themselves to help pay for more expensive solutions.

There are many gradations of TSM improvement. Virtually anything that can be done to the existing bus service that would speed it up, make it more reliable or safer or more comfortable or easier to understand and use would qualify as a TSM improvement.

TSM improvements affecting the Geary bus lines could include any or all of the following:

- Pre-emption of Traffic Signals: would give transit vehicles priority over other vehicles at crossing points; (opportunities to improve service limited due to heavy cross traffic on many north/south streets).

- Proof-of-Payment System: would feature ticket- dispensing machines on loading islands or nearby sidewalks; would eliminate need for patrons entering Geary buses to pass by operator to pay a fare or show a transfer; would utilize roving inspectors to cite individuals caught without proper proof-of-payment. A proof-of-payment system would offer the significant advantage of speeding up loading by enabling patrons to enter the vehicle by any door at any time.

- Computer-Controlled Traffic Signal System: would have the capability of altering the general traffic signaling system as appropriate to react to predetermined bus priority criteria and varying traffic conditions.

- Gradual replacement of vehicles with low floor vehicles; would speed up loading.

The TSM, as defined for the purposes of this study, involved only the pre-empting of certain traffic signals. As indicated in Figure 13, and in more detail in Table 5A, the TSM Alternative is estimated to cost $33.0 million in 1994 dollars,

primarily to cover the cost of the additional buses needed to carry the additional patronage anticipated because of demographic changes.

2. Alternative 2 Subway Surface Light Rail (with three east end routing options; namely Geary Alternatives 2A and 2B, and an alternative developed as part of the Citywide Fixed Guideway Study featuring a terminal at the foot of Pine or Bush Street).

As described in Section II H, this alternative, under any of the three east end options, features light rail vehicles running in mixed flow traffic from the west end of Geary to 39th Avenue, then in a surface median to Laguna, then in subway to Taylor. From Taylor, the options vary. Options 1 and 2 are Geary Corridor alternatives 2A and 2B. They are described in Section II H and shown in Figure 12B. Option 3 is the Citywide Fixed Guideway Study option. It is also shown in Figure 12B.

> Option 1 (Geary Corridor Alternative 2A) would route light rail vehicles on the surface of Market Street. In terms of routing, this option is regarded as doing the best job of taking people where they want to go (given that the employment centroid of downtown San Francisco is located at the intersection of Market and Sansome Streets).
>
> To ensure that rail vehicles could travel expeditiously along the surface of Market Street, it would be necessary to take certain steps to limit the access of private automobiles to lower Market Street (such as preventing southbound Stockton Street automobiles from turning left onto Market).
>
> Option 2 (Geary Corridor Alternative 2B) would route light rail vehicles under Third and Howard to a subway terminal station at Howard and Beale. Under this option, Geary Corridor travelers wishing to reach lower Market Street destinations would have a choice of transferring to a Market Street bus, or walking (partly on mezzanine level moving sidewalks) from Third Street to the Montgomery MUNI/Metro Station, or walking back to Market Street from Howard Street. This option would improve service to the south of Market area.
>
> Option 3 (Citywide Fixed Guideway Study Alternative, with terminal at the foot of Pine or Bush Street) would provide direct access from the Geary Line to the Montgomery Street Station and to Financial District destinations.

As indicated in Figure 13, and in more detail in Tables 5B and 5C, the cost of this package is estimated to range in cost from $654.1 million to $899.8 million in 1994 dollars, depending upon which east end option is selected.

3. Alternative 3 Subway Surface Electric Trolley Bus

As described in Section II H, this alternative features electric trolley buses running in mixed flow traffic from the west end of Geary to 37th Avenue, then in

a surface median to either Laguna (under Alternative 3B) or Taylor (under Alternative 3C), then in subway under Geary, Third and Howard to separate eastbound and westbound portals on Howard, then on the surface of Howard to a terminal at or east of Beale Street.

As indicated in Figure 13, and in more detail in Tables 5E and 5F, the cost of this package is estimated to range in cost from $484.8 million to $686.7 million in 1994 dollars, depending upon whether Geary Corridor Alternative 3C or 3B is selected.

As can be seen from Figure 11, the electric bus alternatives are cheaper to operate and maintain than the light rail alternatives. In addition, because of lower utility relocation costs, the absence of track work, shorter and fewer stations, cheaper vehicles, and a shorter tunnel, the electric trolley bus alternatives are substantially less expensive to develop than the equivalent light rail alternatives. However, trolley coach options have received almost no public support.

Electric Trolley Bus Alternative 3C would be substantially less costly to design and construct than Electric Trolley Bus Alternative 3B; however it would require surface running through the congested section of Geary between Gough and Taylor, with heavy cross traffic interference at Franklin, Van Ness, Polk, Larkin and Hyde.

4. Alternative All-Surface Light Rail

As described in Section II H, this alternative features light rail vehicles running in mixed flow traffic from the westerly terminal to 39th Avenue, then in a surface median to Gough, then in traffic to the east end of the line at either the Transbay Terminal or the foot of Market Street. (A variant of Alternative 4 would be to operate using electric trolley buses rather than light rail.)

As indicated in Figure 13, and in more detail in Table 5G, this alternative (assuming light rail operation) is estimated to cost $333.9 million in 1994 dollars, significantly less than any of the subway/surface alternatives.

To ensure that rail vehicles could travel expeditiously along the surface of Market Street, it would be necessary to take certain steps to limit the access of private automobiles to lower Market Street (such as preventing southbound Stockton Street automobiles from turning left onto Market).

One major concern with the all-surface rail alternative is that to provide expeditious and reliable transit service along the surface of Geary between Gough and Market, it will be necessary to make a series of far reaching street changes including shifting the entrance of the Union Square Garage from Geary to Post, diverting cars from Geary at several points (thus changing the Market-to-Gough section of Geary from an arterial to a local street), and converting Post from an eastbound arterial to a westbound arterial. Yet without significant street changes, the quality of rail service along the Market-to-Gough

section would be insufficient to justify the cost of developing a surface light rail alternative.

Recommendation No. 2: that on behalf of meeting the objectives of Recommendation 1, the four packages described above be advanced into the next (Major Investment Study) phase of the federal implementation and funding process.

C. Patronage Forecasting. Projecting public transit patronage in San Francisco has been hampered for many years by the limited applicability of the Metropolitan Transportation Commission's (MTC's) forecasting model to this city.

At various times, various city departments have called for San Francisco either to work with MTC to better adapt the MTC model to San Francisco, or to develop a separate City of San Francisco model.

In any event, an accurate means of forecasting future public transit patronage is badly needed as a tool for evaluating the various public transit fixed guideway systems currently under consideration.

Recommendation No. 3: that a sophisticated patronage forecasting model that can be accurately applied to San Francisco County be developed forthwith.

D. Costing Methodology. Each year MUNI submits a Section 15 Report to the Federal Transportation Administration delineating MUNI's annual operating and maintenance (O&M) costs. MUNI's 1993 costs as set forth in the latest Section 15 Report formed the basis of the Geary Corridor O&M cost estimates. During the course of the Geary study a concern arose over the accuracy of the Section 15 Reports.

Recommendation No. 4: that MUNI conduct an independent analysis of the Section 15 Report and make methodology adjustments as appropriate.

E. The BART Regional Alternative. Pursuant to a resolution adopted by the BART Board of Directors on July 14, 1994, the effect of a regional BART Geary regional line on four of the proposed Geary Corridor MUNI lines was evaluated. The results of this BART-sponsored effort were set forth in a separate report entitled "The BART Regional Alternative: Its Effect on MUNI". Based upon the results of the BART study, it was concluded that:

- constructing a Geary branch of the BART system from Market Street, through the Geary Corridor to approximately Seventh Avenue, where BART would

leave the Geary Corridor, would be insufficient to meet the needs of many Geary Corridor travelers, and therefore would not preclude the need for a separate MUNI fixed guideway system designed to improve Geary Corridor transit services;

- regional rail lines linking Northbay counties to San Mateo County and the Eastbay counties could create significant travel opportunities for public transit users and are therefore deserving of further study; and

- additional data and analysis are needed to fully identify the routing, feasibility, and patronage which could be generated by providing additional regional rail transit services in the Westbay and Northbay Counties.

Recommendation No. 5: that if BART is interested in improving regional transit connections on the north and west sides of San Francisco Bay, that it initiate a more definitive study designed to find the best way of extending its system, or otherwise serving the areas not now adequately served by BART.

Memorandum

To: Rod Mc Millan

From: Walt Streeter

Date: March 13, 2001 By Fax (510) 817-3299 and US Mail

Re: Estimates for Operating and Capital Costs Associated with Changes to Muni Tracks, Overhead, and Operator Facilities at the Interim Transbay Bus Terminal and the 1-California Terminal on Beale Street

---

The purpose of this memo is to provide the Metropolitan Transportation Commission with additional estimates of the Muni operating and capital costs associated with the Interim Transbay Bus Terminal

Operating Costs: We estimate the additional annual operating and maintenance costs associated with the Interim Bus Terminal at just under $1 million in FY 2000 dollars. These costs are for added service on the 2, 5, 6, and 38/38L lines per the attached memo from John Katz.

Capital Costs: We estimate the total capital cost associated with the interim terminal at $5.7 million. This cost includes new trolley overhead, strain poles, and special work. It also includes the provision of a temporary street supervisor's office at the interim bus facility and a temporary operator's restroom for the 1-Calfornia trolley coach line at its terminal on Beale Street. The existing 1-line restroom on Howard Street will need to be removed when the Interim Transbay Bus Facility is constructed. The terminal should also provide space for street supervisors and maintenance personnel to park their trucks.

The capital cost estimate, per the attached memo from Bill Neilson, should replace the previous capital cost estimate. It is a conceptual cost estimate that will be refined when the facilities are further developed.

Thank you for MTC's and the Transbay Terminal consulting firm's help in accommodating Muni operating requirements. Please let us know if you need further information on the cost estimates or Muni operations.

RE: **Interim Transbay Terminal - Operating Costs**

Following is an estimate of the increase in MUNI's operating costs to serve the interim Transbay Terminal between Beale / Main/ Folsom/ Howard. The estimate, as calculated below, results in an annual increase in MUNI's operating and maintenance costs of just under $1,000,000 a year in FY 2000 dollars.

In computing the costs the key variable is the additional round trip time required to service the interim terminal compared to the existing facility at First and Mission. The computation of that time was arrived at doing real time drive-through simulations from the common point of both terminal loops, which is inbound at Market and First, outbound at the Fremont and Market boarding island.

Based on these simulations and average traffic conditions (mid-day on a weekday), the additional round-trip time required to go to the interim terminal location was **250 seconds (or 4 minutes, 10 seconds).** For purposes of this calculation the time will be rounded off to 4 minutes. This time calculation assumed no stops between First and Market and the interim terminal, no special traffic pre-emptions at intersections not directly at the new terminal, and the completion of the construction project on First St. between Market and Howard. Also the contra-flow lanes in the interim terminal could not be exactly simulated, but a time was estimated for these movements based on drive-throughs of the same blocks in their current allowed directions (without stoplights).

Further Assumptions

- The effected lines are the 5-Fulton, 6-Parnassus, 2-Clement, 38/38L-Geary
- Trip times for the 1-California and 41-Union will not be effected
- Current schedules and layover times are assumed
- FY 2000 costs are assumed

Methodology

The methodology used in this calculation is based on the total hourly costs to MUNI of operating a vehicle in the effected mode (excluding administrative costs). MUNI's experience is that in the long run this is the most accurate estimate of actual increased or decreased operating costs for route changes. Therefore no attempt was made to calculate the impacts by line on the total number of vehicle runs that would be needed. However, it is fairly clear that additional vehicles will be needed on the 38-Geary and 5-Fulton to maintain current peak headways on those lines.

Calculation

Line	Increase in round trips / yr. x 4min/ 60	= hrs./year	x	mode cost/hr	= cost/yr
38/38L Geary	87, 847 x 4 /60	= 5, 856	x	(60'MC)$88	=$515,328
5-Fulton	5, 904 x 4/ 60	= 2, 393	x	(40'TC) $83	=$198,619
6-Parnassus	1, 245 x 4/ 60	= 2, 083	x	(40'TC) $83	=$172,889
2-Clement	16, 307 x 4/ 60	= 1,087	x	(40'MC) $80	=$ 86,960
		Total annual incremental costs			**= $973,796**

If the interim terminal would be in operation for three years, the total increase in MUNI's operating and maintenance costs would be $2,921,388.

When MUNI's terminal operation moves to the proposed new terminal between Beale and Fremont south-of-Mission a very rough estimate of the increased costs (compared to the existing configuration) would be 35% of this figure, or about $340,828 annually.

Attention: Paul E. Maltzer, Environmental Review Officer

Subject: Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project

Dear Mr. Maltzer:

Santa Clara Valley Transportation Authority (VTA) staff have reviewed the DEIS/DEIR for the Transbay Terminal/Caltrain Downtown Extension/ Redevelopment Project. The project would be located in Downtown San Francisco and has three major components:

- A new, multi-modal Transbay Terminal on the site of the present Transbay Terminal,
- Extension of Caltrain from its current San Francisco terminus at Fourth and Townsend Street to a new underground terminus underneath the proposed new Transbay Terminal
- Establishment of a Redevelopment Area Plan with related development projects, including transit-oriented development on publicly owned land in the vicinity of the new Transbay Terminal.

VTA is one of the three member agencies that provide operating and capital funds for Caltrain service. In this role, we are impacted by actions that result in increased Caltrain costs. Therefore, our first several comments relate to the proposed financing plan for the project or related elements. We have the following comments:

1. The electrification of Caltrain is a prerequisite for the Downtown Extension. Statements made on page 2-3 indicating otherwise, contending that dual mode locomotives could be procured to operate service on the downtown extension in the absence of electrification, at an additional cost of $235 million (in 2002 dollars), raise concern because:
    a. The Caltrain electrification project, which is still under environmental review, does not include dual mode locomotives as an option.
    b. No source of funds is identified for purchasing the dual mode locomotives or any associated increase in operations and maintenance costs. Given current economic conditions it is unlikely that the estimated $235 million increment to purchase these locomotives will be available from Caltrain, its member agencies or the State within the projected project development schedule.

3331 North First Street · San Jose, CA 95134-1906 · Administration 408.321.5555 · Customer Service 408.321.2300

2. Funding and schedule assumptions regarding the electrification of Caltrain (e.g. assuming electrification between San Francisco and Gilroy will be implemented by 2006, assuming that electrification will be funded entirely with local sources) are very optimistic given the current status of the electrification project. A funding plan with committed resources has not yet been developed or endorsed for Caltrain electrification by the three Caltrain Joint Powers Board member agencies, who are each responsible for one third of the project costs. VTA, who has funding for our share of electrification in Measure A of 2000 (the extension of our current sales tax that begins in 2006) has consistently indicated that these funds will definitely not be available prior to 2006 and it is highly unlikely that VTA funds will be available for the project prior to 2016.

3. It appears that the project sponsors assume that the State of California-owned land required for the Transbay Terminal project, worth approximately $300 million, will be provided to the City and County of San Francisco by means of an administrative transfer at no cost to the project sponsors. The final document should address this assumption and the status of the property acquisition.

4. The statement on page 6-6 that Caltrain anticipates operating 120 trains a day is very optimistic, given the current economy in the Bay Area. The current Caltrain service level of 76 weekday trains (a decrease from the 80 weekday trains in the previous year) is not expected to increase significantly between now and the estimated completion of the Transbay Terminal.

5. The financial analysis in Chapter 6, particularly the funding source assumptions in Section 6.6 and as illustrated in Table 6.6-1, shows that the majority of funds needed for the project have not been secured, with most of the funding programs and the associated levels of funds not within the control of the project sponsors. The revenue assumptions are also very optimistic in terms of the amounts of funds and the schedule of their receipt. The FEIS should include a more detailed funding plan.

6. For the 2020 no action alternatives and project conditions, was the BART to Santa Clara extension assumed in the project network? If the BART to Santa Clara extension project was not included, how would ridership for the no project and project change if BART to Santa Clara is assumed?

7. Please provide a description of the ridership-forecasting model that was used to produce the station-level CALTRAIN ridership estimates. In particular, describe consistency or inconsistency with the latest MTC regional models.

8. In Table 3.1-14, under the 2020 Extension to the Transbay project alternative column, which land use assumptions are used for ridership estimates? Are these ridership estimates under 2020 cumulative conditions?

9. Please provide the 2020 cumulative scenario estimates for Caltrain system ridership if not already included in Table 3.1-14.

10. No mention of CALTRAIN system impacts outside of San Francisco are disclosed for either Santa Clara County or San Mateo County stations in the 2020 project or cumulative scenario conditions. For example, the document should identify project impacts such as park-and-ride space demand, platform capacity, and other impacts at existing core stations, particularly since ridership is shown to increase for virtually every station on the system. In addition, no increases beyond 170 trains are assumed for the no-project and project alternatives, yet ridership is estimated to increase substantially over levels estimated for the no-project. A description needs to be provided on the peak trainload impacts caused by the project alternative.

11. It should be explained why ABAG Projections 1998 forecasts were used for year 2020 ridership estimates as opposed to the most recent regionally-adopted ABAG Projections 2000 forecasts.

We appreciate the opportunity to review this project. If you have any questions, please call Somruthai Michelutti of my staff at (408) 321-5785.

Sincerely,

James E. Pierson

Dear Mr. Malter:

BayRail Alliance, a rail transit riders' group consisting mostly of Caltrain riders, wishes to submit the following comments on the draft Transbay Terminal EIS/EIR. We are strong supporters of the Transbay Terminal project, and we feel that it is one of the most exciting public transportation and land use projects in the United States. However, we have specific concerns about the proposed plans that we ask you to consider.

Summary of our Recommendations:

Build a new terminal and rail extension that can accommodate the next fifty years of growth for rail and bus transit in the Bay Area and California.

- The downtown extension configuration must be modified to accommodate high speed rail. Pursue a modified 2nd-to-Mission alignment, rather than the 2nd-to-Main alignment, as the preferred alternative for the downtown extension. Platform and track design must be modified to include more and longer platforms, with fewer path conflicts, to provide for efficient and successful operation of high speed rail on shared tracks with local service.

- It is imperative to grade separate the two street crossings in the Mission Bay area (16th Street and Common Street) as part of the DTX project, as these grade separations will become difficult, if not impossible to construct, once the extension becomes operational.

- Track configuration can be improved. The number of platforms should be increased and path conflicts reduced. Track alignments should be improved to lessen tight curvatures, while impacting fewer buildings.

- Perform value engineering to identify ways to phase construction of less essential portions of the project to reduce required debt service.

- Contain overall project cost by eliminating or postponing construction of underground tail tracks and storage yards and the underground pedestrian connection to Market Street; and by avoiding cut-and-cover construction wherever feasible.

- We strongly support the full build, West Ramp alternatives and bus storage facility location.

Rail Platforms and High Speed Rail

While platform lengths presented in the DEIS/DEIR are substantially longer than what is required for conventional commuter trains, they do not provide sufficient capacity for HSR. In Europe and Japan, it is common to run HSR trains that are 14 or 16 cars long (400m/1312ft design standard), and even with this extra length, there has been a movement toward double-decked trains to provide sufficient seating capacity.

Currently, only the 2nd-to-Main alignment option has platforms long enough to accommodate HSR. However, the highly curved platforms in the 2nd-to-Main alignment are seriously flawed and ineffectual in their intended purpose of serving the extra long trains needed for HSR. The proposed curvature would result in unacceptably long gaps between train doors and platforms.

We ask you to examine other options for providing optimum platform length for high speed rail. We believe the 2nd-to-Mission alignment can be improved substantially to achieve this goal. Richard Mlynarik and Michael Kiesling have outlined a design alternative that will permit longer platforms (see attached Figure 1). We also believe that the number of platforms can be increased. For example, see Figure 2, attached.

Long platforms have the advantage of providing storage space for two conventional trains end-to-end until tail tracks are constructed at a later phase.

Improve Track Configuration

We also believe it is possible to add tracks and platforms relatively inexpensively at the stations to increase efficiency of operations. Keeping in mind the long service life of the terminal and future needs, we ask that you modify the design to provide as many operating tracks and platforms as will fit on the site to be installed. For example, see the attached designs by Richard Mlynarik.

We have concerns about the flexibility of operations allowed by track approaches into the platforms. For example, in figures 2-2.15 and 2-16 of the DEIR, the four northernmost tracks feed into a single approach track. This greatly constrains train movement into or out of the station. We ask that you redesign track approaches to reduce such path conflicts, and we believe an improved design is possible.

While extensive modeling of bus capacity performed as part of the MTC Transbay Terminal Improvement Program, informed the design of the bus terminal configuration, it doesn't appear that there has been any capacity modeling done for rail operations into the terminal. We believe such modeling will show the need for a more flexible approach-track configuration.

Reduce Impacts to Multistory and Historic Buildings

At several places along the proposed route, we see opportunities to reduce costs and community impacts by adjusting the alignments to impact fewer buildings.

For example, the proposed curvature of the tunneled track alignment near 7th and Townsend is the same as that of the existing surface tracks which currently forces trains to a crawl. This curve needs to be made less sharp to permit speedier train movement. At the other curves (at Townsend/2nd and between 2nd and the Terminal), we believe that it is possible to make small adjustments to the alignments to reduce their curvature while impacting fewer buildings, where these do not impact long-term operational flexibility.

For example, see Figure 3, attached

Grade Separations

16th Street and Common Street

We feel that it is of paramount importance to extend the scope of the study a few blocks south, and to include a grade separation at 16th Street. To serve future Mission Bay developments, MUNI is contractually obligated to operate the 30-Stockton trolley bus at sub-5 minute headways across the Caltrain line via Sixteenth Street and to operate the 45-Union trolley at sub 10-minute headways across the Common Street crossing. This will pose substantial technical problems with the crossing of trolley and Caltrain overhead wires, and traffic delays will become completely unacceptable as Caltrain service levels increase.

The downtown extension must allow 16th Street to be grade separated, and it would be most desirable to complete this at the same time as the rest of the project. It may not be possible to do so later and even if it were possible, will be much more costly and disruptive to Caltrain service.

Common Street

We also feel it is desirable to grade-separate Common Street. We are aware that grade separation was deemed infeasible in an earlier study, and that the CPUC approved an at-grade crossing at Common Street in an earlier decision (across 2 tracks and a Union Pacific siding). Nevertheless, it is highly unlikely that the CPUC would grant approval for a grade crossing across four active tracks. For example, the CPUC recently expressed strong opposition to Caltrain's request to construct an at-grade crossing across four active tracks at Sunnyvale Avenue in Sunnyvale.

By beginning the tunnel for the Caltrain downtown extension at a more southerly location, it should be possible to grade-separate Common Street.

We suggest cost savings below that will offset the cost of constructing these grade separations.

Containing Overall Project Cost

We believe that it is important to reduce the capital cost of the initial terminal construction to the lowest possible, viable amount to reduce interest expenses. Because the Transbay Terminal project will obtain substantial revenues through its Passenger Facility Fee, it makes sense to defer some elements of the project until higher passenger volumes can help pay for them.

- We recommend that you eliminate, or postpone building, the massive, below-ground-level train yard at Seventh and Townsend Streets. The storage space it would yield does not justify its exorbitant cost. In lieu of expensive underground stub-end tracks that can only be used for storage, we recommend building additional through tracks (i.e., four tracks south of the Mission Bay station as far to Sixteenth Street) to provide both additional operating flexibility (at peak congestion times) and off-peak train storage space.

  Future operating scenarios will result in relatively fewer trains requiring mid-day storage. Money would be better spent excavating a much smaller amount of fill to create a Caltrain tunnel at Sixteenth and Common Streets to allow for grade-separated street crossings.

- We recommend that you engage in value engineering to determine elements of the plan, which can be constructed at a later date without sacrificing required near-term operational flexibility or incurring large "retrofit" expenses. These elements should be designed but left unconstructed.

  One example of this is the tail tracks, which can be constructed at a later phase and funded as the need arises, since they are not required for the level of service planned near term. However, tail tracks should be designed into the plan, and any necessary rights-of-way and easements acquired if necessary. We estimate this will save $100-$150 million in immediate construction costs, and more when debt service is included.

- Similarly, postpone constructing the underground pedestrian connection to BART. We ask that it be included in the project design, but this connection can be built at a later date when pedestrian volumes at the terminal increase.

- Cut-and-cover construction should be avoided where it would directly displace multi-story structures or busy roadways such as Second Street; otherwise it can be employed in some locations to reduce costs. We support tunneling, which the DEIR/DEIS indicates will be cheaper and faster than cut-and-cover construction, and which will minimize neighborhood disruption and opposition to the project.

Bicycle Accommodation

The projected number of bike parking spaces required at the Transbay Terminal, 105, is extremely low. The Palo Alto Caltrain station, for example, has approximately 400 class 1

bike parking spaces (open-air racks), 3 dozen class 2 spaces (bike lockers) and 90 class 3 spaces (bike parking spaces monitored by staff).

On-board bicycle accommodations will be limited to 32 spaces with the new Baby Bullet cars even as demand grows. Bicycle-riding Caltrain patrons have long complained about the problem of "bumping", or being unable to board a train that is already full of bikes. The problem has been exacerbated by lack of secure bike parking at stations.

It is much easier to provide additional bicycle facilities at the station than to expand on-board bicycle capacity. It is highly desirable to encourage bicycling in lieu of driving to the station, to reduce automobile congestion in the vicinity of the station. It is also as much as ten times cheaper to provide bike parking than automobile parking.

The Nakano train station in Tokyo has a staffed bike parking garage which accommodates over 3600 bikes in a double-decker, two-story structure, and it is regularly 80% full. Over 55 train stations in Japan have bike parking facilities which have capacity for more than 2000 bikes. Similarly, many train stations in Europe have bike parking facilities which accommodate from 300 to 3000 bikes, depending on passenger volume at the station. For example, Munster station has bike parking for 3,000 bikes; Rheine, 1500; Oldenburg, 1500; Bremen, 500; and Hannover, 350. (see Figure 4)

The world-class, high-volume Transbay Terminal is sure to see much greater bicyclist patronage than the smaller Palo Alto station does today. We ask that you greatly increase the amount of bike parking at the Transbay Terminal, and include provisions for a staffed bikestation.

Transbay Terminal Bus and TOD Components

We support the Full Build alternative to take advantage of this transit-rich, prime location. This project provides one of the most phenomenal opportunities for transit-oriented development in the country, and its potential should not go to waste. The affordable housing component will be a significant boost to San Francisco as well.

We also request that the redevelopment area be extended beyond the present boundaries to include additional parcels that will obviously benefit from the project. This includes

- The block between First, Second, Mission and Minna. It is immediately adjacent to the terminal, contains a large number of fragmented parcels, and is ripe for development.

- The Cornerstone project and 524 Howard, which are holes within the redevelopment area within the present terminal bus ramps on which construction has not proceeded. Should redevelopment take place on these parcels in the future, it will be in no small part due to the appeal and utility of the Transbay Terminal facility, and so it is appropriate for these to contribute to the overall redevelopment plan.

On the bus side, we support the West Ramp alternative because it provides adequate capacity and a well-thought-out operating plan while increasing the amount of land available for

transit-oriented development. We also support the bus storage area under I-80 as it elegantly meets bus operational needs and it will improve a blighted area.

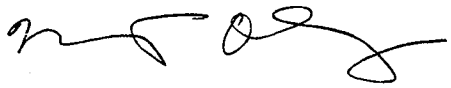
Comments on "Environmentally Superior Alternative"

We take issue with the description of the "Environmentally Superior Alternative" on page S-27 of the report, which obscures the differences between the 2nd-to-Main Caltrain alignment and the 2nd-to-Mission alignment. We concur that the Full Build, West Ramp, Tunneling options are superior to the Reduced Scope, Loop Ramp, Cut-and-Cover options; however we believe that the characterization of the 2nd-to-Main alignment as "fully meet[ing] the purpose and need for the project" is false because we don't believe it provides sufficient accommodation for HSR. The purported benefits of the 2nd-to-Main alignment are marginal compared to the 2nd-to-Mission alignment as proposed in the DEIR/DEIS.

We believe that it is possible to make adjustments to the 2nd-to-Mission alignment which will clearly establish it as the environmentally superior alternative that results in the fewest business and residence relocations and impacts the fewest historic buildings, while fully meeting the purpose and need for the project. In addition, we note that the Mission Street rail alignment eliminates the need for a third of the tunnel by virtue of extending the train mezzanine level to the corner of Mission and Beale; that savings should be taken into account in the rail alignment alternative analysis.

Thank you for your consideration of these comments.

Sincerely,



Margaret Okuzumi

EIR Project Manager
San Francisco Planning Department
1660 Mission Street, Suite 500
San Francisco, CA 94103-2414

Re: Comment on DEIS/EIR for San Francisco Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project (City Project No. 2000.048E)

Dear Ms. Kugler;

The League of Women Voters of the Bay Area, an inter-League organization of twenty-one local Leagues in the nine Bay Area counties has long advocated for this project because of its importance for regional transit connectivity.

Several LWVBA goals are in alignment with the opening Statement of Purpose and Need (S-1), notably:

- Improve public access to bus and rail services
- Enhance connectivity between Caltrain and other major transit systems
- Reduce non-transit vehicle usage
- Improve regional air quality by reducing auto emissions
- Facilitate transit use by developing both market-rate and affordable housing next to a major transit hub
- Provide a multi-modal transit facility that meets future transit needs

We are in favor of the West Loop Alternative. In addition to increased land available for development, its configuration provides better access for bus riders because the buses encircle a single platform.

A pedestrian tunnel or other seamless enclosed pedestrian connection between the Transbay Terminal and BART is absolutely essential to make this a regional multi-modal transit facility. It is a necessary link in the regional transit network, and is critically important for physically challenged persons. It is not just a rainy day convenience.

We are pleased that the three projects are considered as a whole and not separately evaluated for environmental impacts. However, we would like some key assumptions in the October 2002 DEIS/DEIR for the Transbay Terminal/ Caltrain Downtown Extension/Redevelopment Project clarified:

Ridership: On pages 1-17, 1-19 ridership from a boom period and mode split from 1990 and 1995 are used. In Chapter 3, Caltrain level of service and fare structure does not reflect recent changes.

- How does the recent drop in ridership with economic decline affect projections?
- Will ridership shifts shown on Page 3-29, Table 3.1-14 and on page 5-119 (decreased Millbrae boardings) fiscally impact Samtrans?
- Do projections take into account BART to San Jose service?
- Are Baby Bullet travel times included in Page 3-30, Table 3.1-15/could they be? Include note that East Bay travel times include other transit providers.

Reduction of auto trips: (Page 1-24-25) It appears from the chart that the primary cause of projected Caltrans ridership increases is the improvement in travel time due to Caltrain improvements, with additional substantial travel time savings after the Extension.

- Does the estimate should take into account an operating BART extension to the San Francisco International Airport?
- What if Caltrain is not electrified by 2006?

Air Quality: (Page 5-50, Table 5.7-1). Protection of air quality is a very important benefit of transit oriented development. Bad math discredits findings.

Land Use: (Page 2-44). The land use mix assumed is dominantly residential which would provide a desirable balance for the intense job center of San Francisco. The Full Build alternative also includes 1,184,590 square feet of office space.

- If the Reduced Scope without office is built, are tax revenues to pay for additional services affected?
- If more office space than "Full Build" is built, consistent with current zoning, how would that affect traffic projections and air quality?
- The open space and community services assumed to suffice should be related to the amount of housing to be built. Does San Francisco have relevant standards or precedents?.

Emergency Services: (Page 4-21). Response times for Fire Department are lacking.

- Will response times be affected?
- What is potential for loss of communications as in BART to airport project?

Business Disruption: (Pages 5-41). "The cost estimate does not include payments associated with business interruption, loss of goodwill, and "nuisance" costs associated with the construction of the extension, including loss of property access."

- Why?

Bus Service Suspension: (Page 5-107). Elimination of SamTrans routes to downtown is of concern to coastside commuters.

- Would suspension of service lengthen commutes from locations such as Pacifica?

Historic Context: The consideration that the existing terminal cannot perform its original function safely is persuasive but the mitigation for loss of historic structures is too vague. "Dynamic continuity" is a creative concept that needs more contextual specificity to be a mitigation.

- What mitigations are likely to be included "Memorandum of Agreement"? (What is previous Redevelopment Agency practice in comparable cases?)
- Are any of the other historic buildings to be removed also seismically unsafe?

Power: (Page 5-106). The implication that reliance on city or PG&E electricity is a problem to be alleviated by deregulation needs some explanation.

Pedestrian Access (construction): (Page 5-175). "70 percent of pedestrians going to and from the terminal would have up to a four block longer walk than under the existing situation" during construction.

- What effect is this expected to have on ridership during and after the construction period?
- Are special mitigations for physically challenged riders needed (shuttle? attention to maintenance of curb cuts during construction?)

Pedestrian Access (post construction) (Page 5-135). The underground connection from the terminal to BART seems important to provide transit linkage, to serve physically challenged riders, to relieve sidewalk congestion and exposure to wind, rain, and traffic mishaps. While restricted vehicle access is a corollary of intense transit-oriented development, poor Pedestrian Levels of Service would seem to suggest more specific mitigations.

- Is connection to buildings with commercial offerings either below grade or from bus level skyway possible?
- Would the linkage save on total trip times, attracting more transit ridership?
- Could a table be provided summing potential users (bus, Caltrain, high speed rail passengers...)

Operating Costs: (Page 5-115). As operating costs are often the hardest to raise, the cost increases for AC for the West Ramp option seem large.

- Can the sources of additional cost be clarified?
- (Page 6-4, Table 6.3-1). A net surplus from additional fares of $2.76 per passenger is outlined to cover the cost of operating the Caltrain extension.
- Is this realistic in the light of the current state of the economy?

Costs relative to benefits More information in Chapter 6 seems necessary to support new regional revenue sources such as bridge toll money or a possible gas tax. The Caltrain extension and Transbay Terminal was included in MTC Track 1 plans with costs per new rider that were lower than most project proposals.

- How does the Great Expectations plan in the DEIR/EIS compare with that MTC analyzed?
- Which terminal and tail configuration is the most amenable to grade separated pedestrian linkage and rail service expansion ?

We greatly appreciate the opportunity to comment on this project and hope to be involved in its fruition.

Sincerely,

Doris Maez

Re: Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project DEIS/DEIR dated October 2002

Dear Mr. Maltzer:

The League of Women Voters of San Francisco concur with the analysis of the League of Women Voters of North and South San Mateo County in regards to this report. A copy of this analysis is provided as an appendix to this letter.

Our hope is that this analysis provided by these Leagues will be taken into consideration when the final environmental report is completed.

Sincerely,

Sarah Diefendorf,
Co-President, League of Women Voters of San Francisco

Tuesday Ray,
Co-President, League of Women Voters of San Francisco

RECYCLED PAPER

APPENDIX

Analysis of Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project DEIS/DEIR dated October 2002

Introductory remarks:

We are pleased that the three projects are considered as a whole, and not separately evaluated for environmental impacts. However, there are still significant details lacking in specifics. Parts of the document are dated and need to be made current. A significant error in air pollution reductions must be corrected. There are numerous syntax and spelling errors in the text. Financial impacts to businesses during the construction period are not considered sufficiently. The financial chapter lacks a cost/-benefit analysis. There is very little discussion of the impacts of the construction and use of the temporary bus terminal and the ramps to it. There is also no discussion of impacts of off-site bus storage. Impacts on historic structures may be the biggest negative impact. Does the willingness/necessity to take down the existing Transbay Terminal compensate for the other losses?

Page 1-17. Caltrain ridership data is already nearly 2 years old and reflect a period of peak ridership during a boom economy. There has been a 17% decline in weekday riders since October 2001. (Source: JPB agenda packet for 10/31/02 meeting) The mix of northbound and southbound riders has most likely changed as well.

Page 1-19. Similarly, cited data for San Francisco employee residency and mode of work trips is quite dated, citing data from 1990 and 1995, respectively. Given the decline in Caltrain ridership since February 2001, Caltrain projections may be inaccurate.

Page 1-24-25. Is the reduction of auto trips estimate based on the number of daily auto trips that take place before or after the Caltrain/BART connection in Millbrae is implemented? Since the base case (no project alternative) includes the BART extension to the San Francisco International Airport, the reduction should be based on the number of auto trips after the BART extension is in service, but that is not clear in the discussion.
Please clarify.
The estimated reduction in auto trips may be affected by the opening of BART service to Millbrae and the resulting connection with Caltrain, will give where northbound commuters will have the option of getting to downtown locations on BART.

Page 2-3. Electrification of Caltrain by 2006 is highly unlikely. Revenue reductions and budget shortfalls caused Santa Clara Valley

Transportation Authority (VTA) to decline to fund its $2.3M share of funding the DEIR for the electrification project in FY 2002-2003. Sources of federal funding were identified, but those are frozen until a lawsuit against EPA's approval of the 2001 Regional Transportation Plan is resolved. It is very unlikely therefore that the environmental review process will be completed in 2003.

Figures 2.2-9 to 2.2-21. The varying orientation (with respect to the north) of the reproduced maps from map to map is extremely difficult to follow. A large map that connected all the components would be very helpful.

Page 2-44, Table 2.2-7. There is a huge amount of office space (1,184,590 sq ft) being added to a part of the city in the Full Build alternative that already is mostly office, and the surrounding areas are expected to be developed mostly as offices. There is no discussion of the financial impact of NOT building the office space. Although proposed office space is considerably less than residential space, office space will bring many more people into the area, mostly by transit. Tax revenues for office space will be different than for residential space, so there will be multiple impact differences between the Full Build and Reduced Scope. If I were a San Francisco resident, I would want more discussion of this aspect.

Page 2-45, Figure 2.2-22. This Figure and Table 4.1-1 on page 4-10 are helpful in conceptualizing the project.

Pages 3-1 to 3-5. The discussion relating to Caltrain level of service and fare structure is dated. Current service is 76 trains on weekdays, with no service on weekends until March 2004 for construction of passing tracks and other upgrades of the signaling system, trackwork, and other improvements to allow for "Baby Bullet" express service. An average 10% fare increase took effect in July 2002. One-way fares now range from $1.50 to $7.25, and discounted midday "offpeak" fares no longer apply. Caltrain ridership is currently well under 35,000 weekday trips.

Page 3-28. Caltrain ridership projections with 170 trains/day sound almost too optimistic. An increase to 50,000 riders/day from the current ridership figures of around 30,000 riders is even more optimistic than the stated 35,600 daily trips in February 2001.

Page 3-29, Table 3.1-14. Why do daily Caltrain boardings at Millbrae decrease in 2020 with the downtown extension (5,948) compared to No Project (8,370)? There is no discussion of possible impact on Caltrain ridership of a BART extension to San Jose. It was noted on page 1-19 that drive-alone rate is highest

(44%) from South Bay to SF, with lowest transit mode (37%) while East Bay to SF is 55% transit.

Page 3-30, Table 3.1-15. The title of this table is misleading, since it includes trips from Redwood City to Concord and from Oakland to San Carlos, which clearly must include BART and MUNI segments. It does not appear to include the addition of the Baby Bullet service.

Pages 4-14 and 4-17, Tables 4.2-1 and 4.2-4. The total number of households in Census Tract 176.02 is listed as 257 in Table 4.2-1 and as 1952 in Table 4.2-4. Which is correct?

Page 4-21. Response times for Fire Department are not given. This important statistic is kept by all fire departments, and should be readily available.

Figures 5.2-1 to 5.2-6. The varying orientation of these maps with respect to north is difficult to follow.

Pages 5-36 and 5-37. It is highly interesting that the increased demands for fire and police services could be met by "reorganizing existing staff". Does it follow that either these services are currently overstaffed or that service will be understaffed when the proposed development takes place?

Page 5-41. "The cost estimate does not include payments associated with business interruption, loss of goodwill, and "nuisance" costs associated with the construction of the extension, including loss of property access."
Why aren't these costs included, or at least an estimate included? These were significant costs associated with some of the Peninsula grade separation projects.

Page 5-50, Table 5.7-1. This table represents some very sloppy work. It is bogus math, and seriously misrepresents the air pollution reductions. For example, 329 pounds/day of ROG equals approximately a ton a week for a 7-day week (59 tons per year), or 1650 pounds per week for a 5-day workweek (43 tons per year), NOT 51,702 tons per year. Data should be verified before inclusion.

Pages 5-54. The discussion about the Regional Transportation Plan applies to the situation before the lawsuit mentioned under comment about page 2-3 was upheld. At the current time, the outcome is uncertain, and federal funding for all projects not already underway is frozen.

Page 5-62. Storage yard noise will not be limited to engine noise, as this discussion seems to imply. Simply moving large pieces of equipment generates noise, as well as associated

activities. To state that no mitigation will be necessary seems far-fetched. Additionally, light sources from this site may be intrusive to surrounding uses.

Page 5-64, Table 5.8-6. Vibration impacts are worse than noise impacts, with little reduction from mitigation using resilient track system.

Page 5-67. Bay mud goes down 100 feet and is the worst seismic hazard for amplified ground motion.

Page 5-68. "Rapid rail repair" is the recommended mitigation for seismic impacts to surface tracks, but there is no mention of mitigation for tunnel collapse at the portals, where the subway depth is in Bay mud, or prevention of damage. What would happen to a train traveling exiting from the subway at the time of seismic motion?

Page 5-70. The paragraph about communications is very inconclusive. Viability of redevelopment for both offices and residences depends greatly on the availability of telephone utilities, and the statement by Pacific Bell that it would take many years to complete relocation is very unsettling.

Page 5-75. How will impacts on the Bay Bridge structure be mitigated, also with respect to NRHP?

Page 5-91. Regarding mitigation of loss of historic structures: The first option of listed Relocation is extremely unlikely. Recordation, Interpretive Display, and Salvage seem practical, but how much do these options really compensate for the loss, and how is such loss calculated?

Page 5-106. There are concerns that dependence on only PG&E or Hetch Hetchy source of electricity seems risky both in terms of supply and cost, unless SF is willing to make a deal regarding its Hetch Hetchy power. The report vaguely hopes that deregulation will alleviate these problems.

Page 5-107. Elimination of SamTrans routes to downtown is of concern to coastside commuters. Coastside locations, such as coast towns Daly City, Pacifica, would be better served (they say) by continuation of bus service to downtown San Francisco, not by feeder to BART or Caltrain.

Page 5-112. The sentence "The West Ramp Alternative would increase the number of bus bays from 32 to 30 bays along and provide..." does not make sense.

Page 5-115. This looks like a huge cost increase for AC Transit for the West Ramp option, which is the lowest overall cost option in all other respects. Is this increase based on the increased mileage required for offsite storage?

Page 5-118. Linked transit trips for the region increase by 10,000/day. This is good, but is really only a little over 1% of the total. The discussion on increase in Caltrain ridership is vague, and contains no discussion of cost/rider.

Page 5-119. The predicted 9% decline in BART ridership in San Mateo County is cause for concern for county taxpayers who will be responsible for BART losses in that corridor. (See comment about page 3-29.) This sounds like it will be difficult to get beyond an operating deficit in the BART/SamTrans agreement. What is the financial equivalent? Will the expected decline in SamTrans expenses offset the BART losses?

Page 5-126-136. Cumulative impacts at seven intersections would be considered adverse and unmitigable. Pedestrian congestion also results in LOS F for eleven corners and two crosswalks. These are serious impacts, and consideration should be given to how streets are used by private cars, commercial vehicles, etc. and to alternatives that limit commercial traffic to nonpeak times.

Page 5-135. Estimates of Caltrain and AC Transit transfers to BART and MUNI based on a 2001 survey found 5% of riders would make such a transfer. However, only half of the AC riders are assumed to use the underground tunnel, which translates to 2.5% of AC Transit riders because the AC Transit loading area is aboveground. All Caltrain riders making the transfer are assumed to use the underground tunnel because the Caltrain platform is underground. Therefore, based on 10% of 50,000 daily Caltrain riders disembarking at the downtown terminal, (see page 3-6) there would be 5% of 5,000, or 250 potential roundtrip users of an underground tunnel from Caltrain to BART or MUNI. Based on 15,205 daily AC Transit riders, (see page 3-15) 2.5% or 380 AC Transit riders would use the underground tunnel. In addition, 108 pedestrian trips are expected to be diverted from the Fremont and Mission Streets intersection. This appears to add up to 738 daily users of an underground tunnel. Is this correct? It would have been helpful if a table were included that adds up these estimates.

We are concerned about transit connectivity after construction is completed. The document states that construction of a pedestrian tunnel connecting the TBT to BART is more likely in one configuration than the other. The (perhaps unintended) message seems to be that this connection might easily be dispensed with, especially if financing is short. This is a necessary link in the regional transit network, and is critically important for

physically challenged persons. It is not just a rainy day convenience.

Page 5-161, Figure 5.20-8. Construction period appears to be a little over four years. The longest activity is the construction of a cut and cover Subway Structure along Track Corridor or tunneling, which lasts 36 months. This is a long time for surrounding businesses and traffic disruption. The area will feel like a war zone.

Page 5-167. The construction period is assumed to be two years for the Second-to-Main Cut-and-Cover Option. Is this for excavation only? (See Figure 5.20-8, which shows a 36-month period of construction.)

Page 5-173-174. This section describes possible mitigation measures to offset the disruption to businesses and community during the construction period. These include onsite and field offices, an information line, signage, traffic management plans, street and sidewalk level decking, sidewalk design and maintenance, and construction site fencing. There is no discussion, however, of the financial impact to businesses during the construction period, and if compensation would be required for loss of business. See also 5-41.

Page 5-175. "70 percent of pedestrians going to and from the terminal would have up to a four block longer walk than under the existing situation." This is a severe impact, and may affect transit ridership during the construction period. Some form of mitigation for physically challenged persons is in order. It is important that curb cuts and other features designed to accommodate persons with limited mobility be retained during the construction period. Perhaps some form of shuttle similar to that used in airport terminals would be helpful in mitigating the impacts on less mobile transit users.

Page 5-182. "It is anticipated that subway construction would last for a total period of approximately three and a half to four years". This appears to conflict with the two-year period mentioned on page 5-166.

Page 6-1 to 6-8. Capital costs are estimated to range from $1.864-$2.095B for the rebuilt Transbay Terminal and Caltrain extension. Federal funding for the project (page 6-8, Table 6,6-1) is estimated at about $600-$700M. However, as discussed before, an approved Regional Transportation Plan and Transportation Improvement Program are required for federal funding, and at the current time, a lawsuit has delayed such approval for an indefinite period of time.

Page 6-4, Table 6.3-1. A net surplus from additional fares of $2.76 per passenger is outlined to cover the cost of operating the Caltrain extension.

These estimates are based on estimated ridership of 50,000 daily weekday riders, which may be overly optimistic. Current operations costs are exceeding revenue sources because of the steep decline in sales tax revenues and drop in ridership in 2002. Sales tax revenues from San Mateo County (per MTC's RTP, page 6-8, Table 6.6-1) are expected to provide $27M of capital costs as well. Are these figures realistic in the light of the current state of the economy?

Chapter 6, general. The chapter lacks a cost/benefit analysis. The financial plan depends on several presently non-existing revenue sources (bridge tolls, gas tax, etc.), uncertain sales taxes, and revenues derived from the Redevelopment Project and Scope (not building proposed office space) and Full Build. There is no discussion of the financial impacts of NOT doing Full Build. This should be a major concern for San Francisco residents, city government, and all the transportation agencies involved.

We endorse the inclusion of considerable residential space in the Redevelopment project surrounding the TBT, and the commitment to the affordable housing component.

Re: Comments on EIS/EIR for San Francisco Transbay Terminal/Caltrain Downtown Extension Project (City Project No. 2000.048E)

Dear Ms. Kugler;

The Oakland Heritage Alliance is particularly concerned about the loss of the Transbay Terminal because this National Register eligible property is a regional resource as part of the San Francisco / Oakland Bay Bridge.

However, Oakland Heritage Alliance recognizes that although the Transbay Terminal has served its purpose well in the past, it cannot accommodate an intermodal station which would include a below grade train station and so needs to be replaced by a new structure at the present site that would a landmark of the future. This is the ideal location for a regional transportation hub that will afford efficient transit connectivity.

However the mitigations for the loss of this historic resource are inadequate. We urge a thorough documentation of the building itself and its role as part of transportation history. The information should be available to the public in a usable, interesting form. A prominent space should be allocated in the new building for a permanent exhibition. In fact, a Bay Area Transportation Mini-Museum could be accommodated in the terminal with this as a permanent exhibit. And the very solid comfortable oak benches, which are beloved by bus riders, should be reused in the new facility.

Sincerely,

Mary MacDonald

Re: Partnership Transit Coordination Committee (PTCC) Accessibility Committee - Comments on Paratransit and Access Provisions of Transbay Terminal Improvement Plan

At the September 11, 2000 meeting of the PTCC Accessibility Committee, Rod McMillan, MTC staff, gave an informative presentation on the status of the Transbay Terminal (TBT) Improvement Plan, the regional effort to replace the existing San Francisco Transbay Transit terminal with a new, state-of-the-art building and multi-modal center. On October 10, 2000, a subcommittee of the Accessibility Committee met with Mr. McMillan to further review the conceptual plan and report back to the full Committee. As a result of this review, can advise MTC that it supports the plan and would like to compliment the design that was ultimately developed as well as the consultants' obvious hard work. The Accessibility Committee would also like to forward to MTC and the Bay Area Toll Authority (BATA) the following comments and recommendations regarding the plan which were adopted by the Accessibility Committee at its October 23, 2000 meeting:

1. TBT should be designed to provide a street level paratransit transfer location adjoining the primary taxis zone as well as the ground level terminal facilities between Fremont and First Street. The location should enable paratransit vehicles to approach from all directions, facilitate connections between paratransit van and taxi service, and minimize the distance between terminal facilities and transfer location for disabled passengers. Referring to the current concept design, a location on the north side of Natoma Street between First and Fremont St. west of the proposed mid-block cross-walk appears to meet this criteria. Less vehicle traffic on Natoma Street would minimize conflicts with other vehicles and minimize potential hazards to transferring passengers. Because as many as four paratransit providers may use the transfer location, the location should be approximately 100 ft. long, sufficient to accommodate up to three vans or small buses.

2. The facilities adjoining the transfer location should be in keeping with adopted regional criteria for paratransit transfer locations. According to these criteria, the facilities should:
    - be clean, safe, sheltered, well-lit and provide seating; provide accessible telephones and restrooms near the location;
    - be open during comparable hours to the paratransit service, with ample activity and people nearby.
    - be clearly marked with the adopted regional transfer location sign.

    In accordance with these criteria, the terminal building should be designed so that restroom, escalator, elevator, telephone, seating, ticketing, and staffed facilities are located as close as feasible to the paratransit transfer site.

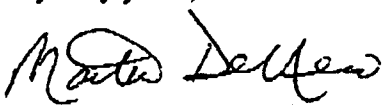
3. As a new state-of-the-art transportation center, TBT presents a unique opportunity to create a state-of-the-art accessible facility. Innovative accessible features and concepts should be incorporation into the design where ever possible. These include:
    - minimizing distance, slope, and travel requirements between accessible features within the facility;
    - providing restrooms and telephones on every floor; providing elevators and escalators between all floors and within each section of the proposed three section TBT building. (Accessibility Committee understands that space is constrained in the portion of TBT containing the ground floor MUNI/Golden Gate Transit bus-bays. However, Accessibility Committee believes an elevator connecting these bays to all other transit levels is a necessity for mobility impaired customers.)
    - orientation surfacing as well as warning tiles (easily recognized by color, contrast, texture and sound) to assist visually impaired passengers with navigation through out the building;
    - crosswalks and paths of travel clearly signed or marked and indicated by a central tactile guideline;
    - providing tactile orientation maps at every building entrance;
    - clear paths of travel, free of street furniture and other architectural obstructions between entrances and boarding areas;
    - providing braille signage and information to indicate bus poles, ticket machines, rest rooms, elevators, and other essential landmarks;
    - using "talking" or auditory signs in addition to visual signs;
    - provide the means to make visual as well as audible public service announcements through-out the station;
    - windscreens where needed;
    - other concepts as needed.

    Accessibility Committee is in the process of preparing a list of accessible design guidelines (to be forwarded to you under separate cover) that will include specific criteria for such components as bus bays, cross walks, pathways, bus pole and sign locations.

4. An accessibility professional who is expert in the ADA Accessibility Guidelines (ADAAG) and California Title 24 requirements must be part of the design team as the project moves forward. This project provides an opportunity to design and build a state of the art accessible transit facility that incorporate the principals of universal design to insure that the terminal is user-friendly and accessible to all transit customers. This opportunity can be realized by:
   - including an accessible transit professional on the design team;
   - including passengers with disabilities in the public review process to obtain feedback on the design of TBT;
   - inviting the PTCC Accessibility Committee to provide input and review and comment on the plan.

Please contact me at (408) 321-7040 if you have any questions or require additional information. PTCC Accessibility Committee looks forward to working with MTC staff and representatives of the Bay Area Toll Authority Transbay Panel to help make TBT the best and most usable transportation facility possible for all of its customers.

Very truly yours,



Martin DeNero, Chair
PTCC Accessibility Committee

Re: Transbay Terminal / Caltrain Extension DEIR Comments

RAFT, the Regional Alliance For Transit, was formed over a decade ago to support the enhancement and improvement of the Transbay Transit Terminal (TTT) for AC Transit Transbay service, and to fight various proposals to tear the building down. These comments represent a decade of experience and effort from the members of our group to lead this project to where it is today.

Over the past decade we have witnessed a wide range of official actions on the TTT. Initially, the city wished to completely remove the terminal and ramps, putting hundreds of buses on the congested SOMA streets. As studies began on the Caltrain extension, some quite interesting alternatives were proposed, including running train down the middle of SOMA streets and even on Market Street.

The DEIR that has grown out of the last decade of debate is supported by RAFT. We have concerns with some details of the project, but overall the projects described meet the transportation and planning goals that RAFT has supported and lobbied for over the last decade.

Our specific comments support the detailed comments made by others, specifically those of Richard Mlynarik, Michael Kiesling, and Norman Rolfe.

The bus portion of the project is a well-researched design, and is the result of a decade of work. We support the West Ramp Alternative. As part of this we STRONGLY support the dedicated off-site bus storage facility between Perry and Stillman Streets, beneath the Bay Bridge approach structure. An issue of contention with the previous designs for the terminal was the lack of adequate bus storage. RAFT fought long and hard to ensure that any new terminal would be operationally equal-to or better than the existing terminal. The proposed location, under the freeway, is close to the terminal

and maximizes the use of this already impacted public land. We support designing the bus storage facility to mitigate the concerns of its neighbors, and suggest that with proper landscaping and architectural treatment, the neighbors will find the facility a compliment to their neighborhood, and a great improvement over the existing public parking lot. Additionally, concerns about possible bus diesel exhaust will probably be well-mitigated through the advancement of bus propulsion technology by the time the facility is operational.

The Caltrain extension component is good, but further revision is needed in the trackwork and alignment. We would like to point out the proposed high-speed rail platforms in the Second to Main alternative are completely un-workable, due to the gap between the curved platform and standard high-speed rail cars. Generally, we support the fully tunneled option, leading to a Second to Mission terminal, with no underground connection to BART. We would like to see a modified tunneled alternative studied, involving an alignment approximately 150' west of Second Street. This alignment will further minimize impacts on historic structures, minimize the distance of mined tunneling by passing under many empty properties, and maximize the potential platform length at the Transbay Terminal.

Specific revisions to these basic alternatives include:

- grade separations at both 16th and Common Streets
- easing of the 7th Street curve for higher-speed operation
- consideration of a long-term storage facility south of the project area
- elimination of a storage yard in the Mission Bay area
- addition of a third and fourth track in the Mission Bay area (which can be used for temporary storage)
- altering the tunneled alignment to further reduce the impact on buildings along the alignment
- studying a tunneled alignment approximately 150' west of Second Street
- easing the Townsend-Second Street curve for higher-speed operation
- altering the throat of the terminal tracks for better operation
- altering the rigid design of the terminal trackwork and platforms to maximize the number and length of platforms
- consideration of phasing the construction of the tailtracks until the facility is operational and producing a pfc revenue stream, in order to reduce the proposed debt service
- a good pedestrian connection to a Market Street subway (MUNI/BART) is important, but recommend that other options besides a costly and sterile underground corridor be considered

- consideration of improvements to Ecker Alley, including a new, accessible entrance to the Montgomery subway station, to provide a high-quality, off-street pedestrian connection to Market Street

- continued coordination with the operating plans of the proposed statewide high-speed rail project is necessary to avoid costly design errors and enhance possible shared-use of facilities, especially in the area of maintenance and storage

The redevelopment portion of the project is an excellent example the synergy of land use and transportation. We fully support the Full Build redevelopment alternative. There is no more appropriate place in California, and very few in the country, for this intensity of development. It has been the policy of the City of San Francisco since the 1980's to encourage this type of development between Mission Street and the Bay Bridge. The emphasis on housing only enhances the benefit of the proposed redevelopment. Furthermore, we strongly urge the redevelopment area be expanded to include undeveloped parcels in the center of the proposed redevelopment area, and undeveloped parcels adjacent to the terminal on the south side of Mission Street, east of Second Street. Any new development on these parcels will be greatly enhanced by the TTT project, and it seems fitting that a portion of that benefit be captured to aid the project.

RAFT urges this project to move forward, with further refinement and revision to the items we've mentioned above.

Sincerely

M. Kiesling
for RAFT

Re: **Comments on Transbay Terminal / Caltrain Downtown Extension EIR**

Dear Mr. Malter:

Rescue Muni, a transit riders group in San Francisco, respectfully submits the comments below on the DRAFT EIS/EIR for the Transbay Terminal/Caltrain Downtown Extension project. As strong supporters of this project, we are very excited that this project is finally moving forward after years of delay.

Rescue Muni supports the following Alternatives to the project:

1) Caltrain Extension Alignment – 2nd to Mission.
2) Ramp Configuration – West Ramp Only.
3) Land Use – Full Build Out
4) Subway Construction Method – Tunneling (as oppose to cut-and-cover).

Caltrain Extension Alignment – 2nd to Mission.
We feel this alignment is superior for the following reasons:

- Will allow for platforms with less sharp turning radii than the 2nd & Main alignment. **We believe the 2nd and Main alignment will not accommodate CA High Speed Rail because the platform radii are too sharp, creating large gaps between the train cars and the platform. We believe this is unacceptable.**
- Will be a shorter distance to the Bay for a future extension of conventional rail to East Bay.

Ramp Configuration – West Ramp Only

- We support the West Ramp option versus a full loop ramp because it will free up much more space for Transit-Oriented Development around the site.

Land Use – Full Build Out

- We generally support as much Transit-Oriented Development around the site as possible to help increase ridership at the transit facility, and also to improve the project's ability to pay for itself.

Subway Construction Method – Tunneling

- We support the tunneling method of excavation versus cut-and-cover. According to the DEIR/DEIS this will be less disruptive and less expensive.

Additional Rescue Muni Comments:

Grade Separate 16th Street and Common St.

- With a significant increase in rail service in the near future, especially with the commencement of the Baby Bullet service, we believe that the crossings at 16th Street and Common Street must be grade separated now, rather than later. Muni is planning to re-route bus service all the way down 16th Street with frequent headways. We feel it would be very difficult operationally to have to electric systems intersecting one another at this grade crossing as well as potentially dangerous. We also feel Common Street should be grade separated as it is in the Mission Bay Area, which will soon have high levels of automobile traffic.

Bike Storage

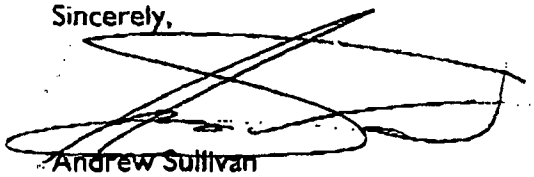
- Significantly increase bike storage at the new terminal over the 105 spaces planned. We suggest 1000 spaces.

Reduce Costs to the Project

- Consider building the tail tracks in conjunction with the California High Speed Rail project. We feel a stub-end terminal will suffice until traffic increases with the commencement of High Speed Rail service.
- Consider postponing the construction of the underground pedestrian path to the Embarcadero BART station. Though we strongly support this project, we feel it can be delayed until there is more traffic at the Terminal and new funding sources can be found.
- Consider postponing the below-ground train yard at Seventh and Townsend.

Thank you for the opportunity to make comments on this crucial transportation project.

Sincerely,



Andrew Sullivan

Dear Mr. Maltzer:

San Francisco Architectural Heritage submits the following comments on the above referenced DEIS/DEIR:

New Transbay Terminal

The DEIS/DEIR does not provide for a preservation alternative for the removal of the existing Transbay Terminal Building, a contributing resources to a National Register eligible property. The two alternatives represent a total replacement of the building and ramp system, which are listed as contributing elements to National Register eligibility.

We believe this is inconsistent with federal requirements, which stipulates special efforts be made to protect historic sites. We disagree that a prudent and feasible alternative cannot be designed that would minimize harm to the known historic resources.

Caltrain Extension from Fourth & Townsend Streets to a New Terminus below the proposed New Transbay Terminal

The two extension alternatives indicate the preferred 'cut and cover' construction method and alternatively, 'tunneling' south of Folsom Street. Tunneling would reduce the adverse effect of loss of contributing resources to the San Francisco South End Historic District and Rincon Point/South Beach Historic District, and minimize the project's impact on known contributing historic resources.

In all cases, retention of the three structures at Howard and Second Street were determined infeasible. Significant subway construction in other major metropolitan cities including New York and Washington DC was accomplished without removal of existing buildings of greater magnitude than those within the proposed tunnel alignment.

In addition there are several technical issues contained within the DEIS/DEIR which require we would like to call to your attention.

Section 4.16.6
This section references the classification of historic resources identified in Article 11 of the San Francisco Planning Code. The DEIS/DEIR lists Category II rated buildings as both significant and contributory and does not reference Category III buildings. This is inconsistent with Article 11 of the code.

Section 5.14.3.4

1. Mitigation measures are identified which include recordation. The DEIS/DEIR states: "The mitigation measures identified above are suggested measures; actual measures will be set for thin the MOA. Although recordation eliminates one adverse effect of demolition, the loss of historical information, it does not present the tangible loss of historically significant properties." We believe this to be an inaccurate statement. Previous court decisions have stated that recordation is not a sufficient mitigation to reduce the level of effect below adverse.

2. Page 5-91 references The Foundation for San Francisco's Architectural Heritage. The legal name of the referenced organization is San Francisco Architectural Heritage.

PROMOTING THE BICYCLE FOR EVERYDAY TRANSPORTATION

December 5, 2002

Paul Maltzer
Environmental Review Officer
SF Planning Department
1660 Mission Street, Ste. 500
San Francisco, CA 94103

Dear Mr. Maltzer,

I am writing on behalf of the San Francisco Bicycle Coalition (SFBC) in response to the Draft EIS/EIR for evaluation of the Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project.

The SFBC is a nonprofit advocacy group promoting bicycling for everyday transportation. In addition to our 4,000 members, we also work on behalf of the estimated 30,000 regular bike commuters in San Francisco. The SFBC has been a supporter of this project, in general.

The SFBC has serious concerns about the severe underestimation of bicycle parking spaces recommended in the proposed project. The proposed 105 bike parking spaces in the new Transbay Terminal is inadequate. The project should provide at least 300 indoor bike parking spaces, which meet the city's legal requirements for new commercial buildings (Section 155.4 of the S.F. Planning Code).

Bicycle parking at transit centers in the Bay Area have proved immensely successful and popular in the past few years. The Berkeley BART bicycle station regularly reaches capacity at its 75-space bike parking station. The Palo Alto Caltrain bike station regularly parks 60 bikes per day.

The S.F. Embarcadero BART bike station, planned to open in early 2003, is expected to hold 150 bicycles. And Caltrain's planned bike station at the S.F. Fourth & King site, projected to start operation in Fall 2003, will hold at least 100 bikes. Given the central location and high regional transit ridership expectancy for the new Transbay Terminal, it will clearly call for significantly more bike parking spaces than the more constrained transit stations listed prior.

STAFF • Dave Snyder EXECUTIVE DIR. • Leah Shahum PROGRAM DIR. • Elizabeth Creely DEVELOPMENT DIR. • Mary Brown MEMBERSHIP DIR. • Nancy Botkin OFFICE MANAGER
BOARD OF DIRECTORS • Dale Danley • Charles Higgins • Robin Levitt • Jose Najar • James M. Robinson • Brian Smith
Maggie Robbins PRESIDENT • Kate Bickert SECRETARY • Chris Fenster TREASURER

Simply considering the bicycle ridership levels in San Francisco and, specifically, on Caltrain proves the wisdom of increasing the number of Transbay Terminal bike spots. In San Francisco, an estimated 30,000 residents bike regularly for transportation, according to a 1998 David Binder Research Poll. This number is expected to have risen in the past four years, and does not even include non-SF residents traveling to the city via combined means of transit and bikes.

That multi-modal commute choice of bikes and transit is increasingly popular in the Bay Area, as evidenced by the fact that 6% of Caltrain's riders bring their bikes on the trains, a figure that is actually over capacity.

While most transit systems in the Bay Area accommodate bicycles at some level— including AC Transit, SamTrans, Golden Gate Transit, BART, and Caltrain — there is clearly a capacity problem, as evidenced by the regular overflow of bikes on Caltrain. In addition, the buses hold only up to two bicycles each. As space on transit is limited, indoor, secure bicycle parking must be provided at as many transit stations — particularly regional ones — as possible.

We formally request that the Transbay Terminal project increase its bike parking units to 300 to be located indoors in a secure, visible, easily reached location.

In addition, a change should be made in the EIR to reflect that a stretch of Howard St. does now have bike lanes between 5th and 11th Streets. The SF Department of Parking and Traffic is currently considering a proposal to extend those bike lanes eastward to Fremont Street. Bike lanes on Howard Street will only increase the ease and frequency of bike trips to and from the Transbay Terminal.

Thank you for your consideration of this request.

Sincerely,

Leah Shahum

re: Draft EIS/EIR, Transbay Terminal/Caltrain Downtown Extension/Redevelopment project

Dear Mr. Maltzer:

San Francisco Tomorrow would like to express its appreciation to the Planning Commission and to Director Gerald Green for granting an additional two weeks to prepare comments on this important and complex project. We understand that the preparing agencies are working under considerable constraints in preparation of this document, and hope that our comments will make the document more complete and easier to understand.

General

The numerous studies that have been done in this area have produced an intimidating amount of information. Many reports are cited and summarized in this document. Many more reports which were key to the development of these proposals have been left out. The limitations on the size of this document may make this necessary, but the result is that more information is left out than included.. We recommend therefore that the FEIR/FEIS include as an appendix a bibliography of all of the source material for these projects.

The maps in this document are difficult to read and would benefit from the addition of directional arrows. Also, relevant street names are often omitted, again making it difficult to pinpoint locations. Please consider remarking these maps to make them clearer to the reader.

We understand that the funding stream for this project is extremely complex. It would seem prudent to design the project so that, if funding falls short, some aspects could be postponed without compromising the ability to build them later, once new funding sources are found. For instance, components that will be necessary primarily for high speed trains should be planned as part of this process, even though construction may not occur until new funding for that project has been allocated.

Financial Analysis

Project Estimated Capital Costs and Funding Sources. Table S-5 appears to have an inaccurate entry (repeated on Table 6.6-1). The revenue generated by land sales and tax increment is the same for both the West Ramp and Loop Ramp alternative. But these two alternatives do not place the same amount of land into the Redevelopment Area - so these figures should be different for each alternative.

This table (S-5, 6.6-1) also assumes a revenue stream from leverage lease transactions, with the footnote that "Leveraged lease transactions are encouraged by the FTA as innovative financing mechanism." Have the project sponsors considered as another "innovative financing mechanism" the use of ground rents combined with sale of development rights, rather than land sales, to provide an inflation-proof revenue stream for the project?

Environmentally Superior Alternatives

We question the combination of alternatives that on page S-27 are identified as the "environmentally superior alternative". We suggest that this document recommend and justify the environmentally superior alternative for each component separately.. For example, the 2nd-to-Main platform alternative does not qualify as an environmentally superior alternative because it does not fully meet the purpose and need for the project. The platforms in this alternative are not long enough to accommodate high-speed trains As the accommodation of high-speed trains is a specific goal of the project as approved by the voters (see Purpose and Need), the 2nd-to-Main alternative cannot be considered environmentally superior to the 2nd-to-Mission alternative. For the record, here are San Francisco Tomorrow's preferred alternatives:

1. West Ramp Transbay Terminal. This reduces the amount of land required for the ramps, allowing more opportunities for residential development.
2. Second-to-Mission, modified (see Figure 1, Note 6). In addition to its superiority for the accommodation of high speed rail, this alternative would appear to be cost-effective than the Second-to-Main alternative.
3. Tunneling Option. The tunneling option will result in less taking of property and less construction impacts on surface traffic and commerce. Proposition H recommends tunneling wherever feasible to minimize disruptions and relocations in the neighborhood. .

4. Full Build Out. With careful planning and urban design and by minimizing the parking requirements, this area can be a model for building a dense but livable urban environment.

Purpose and Need

In recounting the history of recent planning efforts in and around the Transbay Terminal, it is important that this document cite the voter initiative of November 1999 that instituted the current process. Two sections are particularly relevant to this document;

> Section 2. "As part of the extension of Caltrain downtown, a new or rebuilt terminal shall be constructed on the present site of the Transbay Transit Terminal serving Caltrain, regional and intercity bus lines, MUNI, and high speed rail, and having a convenient connection to BART and MUNI Metro..."
>
> Section 9. "The mayor, the Board of Supervisors, and all relevant city officers and agencies are hereby forbidden from taking any actions that would conflict with the extension of Caltrain to downtown San Francisco, including, but not limited to, pursuing any uses that conflict with Section 2; or undertaking any other land use or development efforts that would conflict with the intent of this legislation."

This mandate must be followed in implementing this project. In the case of this document, it should be the guide for determining the environmentally superior project.

Project Description

It would be extremely helpful if this section would include a map or maps of the entire project area with the three projects delineated on those maps. The current document has no overview of the combined projects.

The Redevelopment Area shows zero space allocated to parking. This doesn't seem realistic, so it must be an oversight. Please include this information in the project description. We trust that any parking provided will be minimal, and unbundled from the residential component. After all, one result of these projects will be the creation of perhaps the most transit-friendly neighborhood in the country. Including parking, especially at anything approaching a 1:1 ratio, would make a mockery of the project and make the creation of a desirable dense urban environment next to impossible.

Modification of Alternatives

It is critical to grade separate Sixteenth Street and Common Street as part of the Downtown Extension rail construction. The Caltrain line must be completely grade separated eventually in order to accommodate greatly increased levels of service and high speed trains. If it is not done as an integral part of Downtown Extension construction, it could be difficult if not impossible to do so in the future, given the existence and design of the ramps leading underground on Townsend Street. It should be noted that because Caltrain traffic levels are now at the lowest levels they'll ever be, single-tracking and line closures necessary to undertake this will be least disruptive if done now. It should be possible to accomplish this without closing the line altogether.

Therefore, an alternative that would place the Caltrain tracks underground from just north of the north portal of Tunnel Number One must be studied. This would eliminate grade crossings at Sixteenth Street and Common Street and make the right of way better suited for future high speed trains. It will also avoid the crossing of Cal-Train's 25,000 volt catenary wires and Muni's 600 volt trolley wires on 16th Street. Although this problem has been solved many times and in many places, it would be best to avoid it.

An alternative in which the proposed underground storage tracks would not be built, but instead be replaced by surface storage tracks in the same location should be studied. Having these tracks on the surface would improve working conditions for cleaning and light maintenance of the rolling stock. They would be accessed via a ramp from the underground line as shown in Figure 1. Development of air rights over the surface tracks could be considered as another revenue source for the project.

Please see the attached Figure 1 for an illustration of the recommended additional undergrounding of the Caltrain Downtown Extension and minor changes in its routing that would result in less taking of property than the alignments shown in the DEIS/DEIR.

San Francisco Tomorrow suggests an alternative platform arrangement that is similar to the 2nd to Mission alternative, but will better accommodate high speed trains (Figure 1). We find the 2nd-to-Main alternative to be seriously flawed, as the straight portion of the platforms will be only 900 feet long, too short for high speed trains. In addition, using the curved platforms in this alternative presents dangerous conditions to passengers (see Figure 2) as the distance between the platform and the train can be significant, ranging up to two feet.

Our modified 2nd-to-Mission alternative has the secondary benefit of reducing the length required for the underground pedestrian connection to Market Street. In addition, this alternative would simplify and improve the circulation patterns for train riders.

Land Use Impacts

It is very difficult to analyze the redevelopment project based upon the data given. We understand that the analysis of Urban Design is not required for this document, but one purpose of this review should be to suggest guidelines and components to be included in the Urban Design Plan for the Redevelopment area. We ask that the following points be included or clarified in that process - and that the Urban Design Plan for the project be completed and widely circulated prior to its adoption concurrent with the redevelopment plan.

1. Pedestrian enhancement should be a key component of the Urban Design Plan. This includes designing those elements that make circulation easier - wide sidewalks, corner bulbs - as well as determining the type of street wall that will be prevalent in the area.
2. Does this plan envision recreating the system of alleys found elsewhere in SOMA, but which were lost when the freeway ramps were built? This document would seem to indicate that this is not the case, but we think it could have many advantages, including breaking up the large blocks, and providing quieter pedestrian thoroughfares.
3. When will the height and bulk changes listed in Table 5.1-1 (page 5-5) be enacted? We suggest that the process await the preparation of the Urban Design Plan, which we understand is being undertaken now. Since several blocks of the Reduced Scope alternative actually feature taller height limits than the Full Build alternative, a plan could feasibly be adopted that uses a combination of height and bulk from the two alternatives to create the final Full Build alternative.
4. The Urban Design Guidelines for this project need to include guidelines for reuse of historic fabric and contextual treatment of new buildings when they are juxtaposed with older buildings. The Redevelopment Plan should incorporate the historic preservation components of the General Plan, including Article 11 of the Planning Code.
5. The new open spaces identified for the redevelopment area must be identified on a map somewhere in this document. Also, assumptions need to be made about the type and intensity of use that would be encouraged or expected at each location, and Design Guidelines developed to suit.
6. If 1:1 parking is provided for the new residences in this new neighborhood, six to eight floors of parking will be needed for each building. This is a problematic design element. To avoid this problem, parking should be retailed separately from the residential units, and any

parking provided must be placed below ground level. Also, as noted above, parking should be provided at a ratio considerably less than 1:1.

Shadows
Can you identify on a map the three new open spaces that will be created in the Redevelopment Area, and list the shadow impacts on these areas?

Wind Impacts
Can you identify on a map the three new open spaces that will be created in the Redevelopment Area, and list the wind impacts on these areas?

Displacements and Relocation
The tunneling method for the Caltrain extension is clearly preferable to the cut-and-cover alternative from the viewpoint of preserving historic structures and minimizing local disruptions. Proposition H also specifies that tunneling be incorporated to the greatest extent possible to minimize relocation of existing homes and businesses

As shown in the attached Figure 1, San Francisco Tomorrow advocates reviewing the track alignment at 2nd and Howard Streets for opportunities to reduce the number of historic buildings that are endangered.

Parklands
Please add a map of the Redevelopment Area that includes the size and location of the open spaces listed on Page 5-39.

Water Resources
Please include information on the increased volume of sewage that would be expected at full build-out, and the corresponding increase in CSOs (combined sewer overflows) into Mission and Islais Creeks.

Historic Resources
The mitigation measures on Page 5-91 should be clarified. How will the feasibility of relocation of historic buildings be determined? The comment about the scarcity of open land in San Francisco is inappropriate; the fate of an historic building should be determined not by its destination, but by the properties of the building itself. This mitigation measure needs to be corrected and clarified.

Why isn't an option included for preserving all or part of the buildings in place? A study should be made of the possibility of saving buildings that might otherwise be demolished during construction of the Caltrain Downtown Extension by means of bracing, underpinning, or other means of support. What is the possibility of preserving at least the facade of one or more of the endangered buildings?

Bus
The bus portions of the Transbay Terminal analysis appear good. The capacity is adequate, but not excessive, and the operating plan is well thought out. However, a signal will probably needed mid-block on Fremont Street between Mission and Howard Streets to expedite Muni and Golden Gate Transit buses exiting the terminal.

Parking
There is no mention of any parking whatsoever for the Redevelopment Area. Figure S-2 and 2.2-22 both give square footages for Hotel, Office, Retail, and Residential uses in this area, but no mention is made of parking. What assumptions were made for the purpose of review in this document? How would a significant reduction in the parking assumptions reduce the adverse traffic impacts determined by this document?

Thank you for your attention to these comments. Please feel free to contact us if you have any questions about our input.

Sincerely,

Jennifer Clary, President
(415) 585-9489

Norman Rolfe, Transportation Chair
(415) 775-9167

attachments:

Figure 1
Notes to Figure 1
Figure 2

Notes to Figure 1

Note 1. Study adding third track in this section of the line. This would be a continuation of the third track proposed each side of this section. This would allow greater operational flexibility , increase the capacity of the line, and reduce the possibility of delays to trains entering or leaving the terminal

Note 2. Study possibility of reducing taking of property by use of different curve radii or compound curve.

Note 3. San Francisco Tomorrow recommends that the feasibility and superiority of grade separation at the 16th Street and Common Street crossings be studied. In this alternative, tracks would pass under 16th and Common Streets (it may be necessary to raise 16th Street to clear underground tracks).

Note 4. Caltrain goes underground from just north of the north portal of Tunnel Number One. Ramp down to underground trackage at 3% grade.

Note 5. This is a refinement of the alternative that should be studied in the final design. We recommend additional studies to determine whether changes can be made in the Second and Howard Street turn that could preserve one or more of the historic buildings in the area that are proposed for demolition in the DEIR/DEIS.

Note 6. Second to Mission Modified Alternative offers the only possibility to construct platforms long enough for high speed rail. This would create platforms that are from 1180 to 1245 feet in length, the longest possible for this project. The European standard is for 1312 foot platforms. .

Note 7. If necessary to conserve capital funds, the tail tracks here could be a separately funded second stage. They will become necessary when service is greatly expanded in the future.

Note 8. Bifurcated platform arrangement of the DEIS/DEIR shown for comparison. The additional diagonal platforms shown here have many footprint and circulation advantages. It is recommended that diagonal platforms only as shown on this drawing be constructed. The Diagonal platforms have the advantage of better circulation - the entrances and exits would be in one general location.

Note 9. We recommend obtaining an easement through the currently vacant lot at 524 Howard Street where a project has been approved, but construction has not yet begun. This would allow a more flexible track design, such as we show in our

Dear Ms. Kugler,

Re: Extension of comment period for Transbay EIR/EIS

SPUR has assembled a working group to comment on the Transbay EIR/EIS and we look forward to sending our written comments to you. We find the document to describe the impacts one of the most complex projects the city has seen. Given that the new Planning Commission has yet to schedule a hearing, SPUR requests that the comment period be extended an additional forty five days (until after the December holiday season) so that we may thoroughly analyze and comment on the document. We believe that this additional time would be valuable for other commenters and is appropriate given the length of gestation time of the project.

Sincerley,

Jim Chappell

Introduction and preferences

SPUR has always advocated for the integration of land use and transportation. SPUR has long supported extension of Caltrain to the Transbay Terminal. As downtown expands to the south, rebuilding an obsolete hub for commuter transit, improving connections to BART, adding High-Speed Rail and surrounding the new terminal with a new mixed-use community that is friendly to pedestrians and non-motorized travel will be essential to the city's continued viability and livability.

Toward these ends, our preferred set of options for this project are:

- West Ramp alternative
- Tunneling option
- Creation of High Speed Rail facilities
- Pedestrian connection to BART
- Selection of a mixed-use development package scaled financially to the cost of the terminal, with proper consideration for urban design issues. This indicates the Full Build option
- We are unable to express a preference on the tail track options, because the information presented is incomplete.

Our internal discussions and analysis of this project have raised a number of questions, reflected in these comments. Financial concerns are more general, while comments on technical issues may be quite specific. Because this is a compilation of individual reviews, please excuse stylistic differences and occasional redundancies.

William Blackwell is a SPUR member and a contributor to SPUR's discussion on the EIR/EIS. He has submitted his own comments. A number of them are consistent with SPUR's preferences, particularly if construction needs to occur in stages. Rather than repeat them, SPUR urges that they be carefully considered and responded to.

Please accept these comments with our support for the project and mutual interest in seeing this great opportunity for San Francisco realized for the broadest benefit for our city and the region.

Thank you for your consideration.

Michael Alexander
Chair, SPUR Transbay Working Group
SPUR representative to Transbay CAC

Transit

Rail

Page S-6 and Sections 2.2.2.1 and 2.2.2.2 Tail Track Options

The Second-to-Main option takes fewer buildings and less land and costs less than Second-to-Mission. But the EIS/EIR does not explain how the tail track options differ in their operational characteristics, so it is not possible to evaluate whether the Second-to-Mission design has overriding advantages. Which is better:

- Three center platforms, or two center platforms and two side platforms?
- Two tracks splitting into six tracks, or one track splitting to four terminal tracks, with two other tracks being extended as tail tracks?

On page 2-35, Section 2.2.2 says that two tracks enter the Transbay Terminal, but Section 2.2.2.2 says that Second-to-Mission's "... southernmost track would branch into four tracks... [and]... The two northernmost tracks would continue on an angle to Mission Boulevard *[sic]*..." Thus, the Second-to-Mission option appears to have three tracks entering the terminal. Please clarify.

Section 2.2.2.4

Both tail track options allow extension of high speed rail to the Eastbay, but such extensions would start from different locations and directions. SPUR believes that the Eastbay extension will eventually happen. Please clarify if one alignment (and if so, which one) offers significant engineering, construction, cost or operational advantages over the other.

Page 3-29

states that Caltrain ridership would increase from about 13,000 to 29,300 daily boardings and alightings at the San Francisco terminal if the terminal station would be moved from Fourth and Townsend to the Transbay Terminal site. Is this significant increase due solely to the extension of Caltrain or also to the development of new office, retail and residential uses in the immediate vicinity of the new terminal that is considered part of the project? Also, page 5-120 states that the Caltrain extension would result in a shift in SamTrans passengers, which seems to account for 2,000 passengers or 4,000 of the daily boardings and alightings. Please clarify.

Page 5-118

identifies a shift in mode share with the Transbay Terminal/Caltrain Downtown Extension Project for work trips between San Mateo and Santa Clara Counties and San Francisco. Is the shift due solely to the extension of Caltrain, or is it also partially due to development in the area associated with the Redevelopment Plan component of the project? Please clarify.

Bus

Page 2-7. Bus Storage: Section 2.2.1.1: West Ramp Alternative

AC Transit Bus Storage is listed as between 42 and 53 buses, plus Golden Gate Transit Storage. No number is given for the Golden Gate Transit Storage portion of the project. In Section 2.2.1.2, Loop Ramp Alternative description, bus storage is identified as being 120 on the ramp and up to 53 in a storage yard. If the entire bus storage need can be accommodated in the storage yard as shown in the West Ramp Alternative, then what is the rationale for choosing the Loop Ramp

Alternative to provide storage? Conversely, in the Loop Ramp Alternative what is the need for a bus storage yard if the ramp will provide over twice the storage of the West Ramp Alternative?

It would be helpful to provide a chart showing the projected storage needs of the various operators.

Page 2-9

The text indicates that Golden Gate Transit *basic service* will be located in the new mid-block terminal, while page 5-114 indicates that Golden Gate Transit *commuter service* would use the new mid-block boarding area. Which one is correct, and how do the services differ?

Please explain why Golden Gate Transit commuter service buses continue to be staged at the curb. Why were they not included in the new Terminal regardless of where the midday layover occurs?

Street improvements included as part of the new Terminal should be described in Chapter 2. There are discussions in Chapter 5 that indicate that street improvements would be made. For example:

- It is unclear if there is a bus lane on Beale Street or on Fremont Street. Discussion of Muni bus travel times (on page 5-113) indicates that "assuming the implementation of a diamond (bus only) lane on Beale Street..." Would there be a bus lane? How would it be configured? What would be the impact on traffic operations?
- Similarly, what would the roadway striping be on Fremont Street? Would the existing bus lane be eliminated? Relocated?
- Page 5-136 indicates that there would be a new mid-block signal on Fremont Street between Mission and Howard Street south of the overpass. What would happen with the existing signal? Has an operations analysis of the buses entering and exiting the terminal been conducted? Why hasn't it been included in Chapter 3 or 5?
- Page 5-136 indicates that a pedestrian mitigation measure should be to ensure that "the Transbay Terminal design increases corner and sidewalk widths at the four intersections immediately surrounding the terminal". Shouldn't this level of terminal design already have been completed? What would happen to the existing travel lanes and curb parking/bus stops? Why haven't these been included as part of the project and their effects analyzed?

Page 2-12

states that with the new terminal that SamTrans would terminate on Mission Street between Fremont and Beale Street, and that SamTrans buses would load on Fremont Street immediately south of the terminal. Would the Mission Street curb between Fremont and Beale Street become the new layover location for SamTrans buses? How much of the curb would be affected? No analysis of the impact of this on parking and traffic operations is presented in Chapter 3.

Page 3-44

identifies current operations of the Golden Gate Transit buses, including the problems with pedestrians queuing for the bus blocking pedestrian flows on Fremont Street. Given the significant increase in street level activity from development in the area, why haven't Golden Gate Transit operations been entirely shifted to the new Transbay Terminal? Why hasn't a plan for street level loading of Muni, SamTrans and Golden Gate Transit buses been developed and illustrated? How much of the street curbs during the AM and PM peak hours be dedicated to idling buses? How and where will future increases in Golden Gate Transit service be accommodated? The impact of operations that remain at street level should be fully discussed.

Page 5-113

states "assuming the implementation of a diamond (bus only) lane on Beale Street between Market Street and through the terminal's designated Muni loading area..." which implies an HOV lane on Beale Street. How would this look? Also, would there be an HOV lane on Fremont Street? Would the existing mid-block signal that facilitates buses exiting from the hump to access traffic flow be removed, or be moved?

Page 5-120.

Please quantify the increase in transfers between Caltrain and AC Transit and Golden Gate Transit, or explain why they aren't quantified.

Section 5.1.1.1 Impacts common to both alternatives

"Additional impacts would occur due to off-site staging and parking requirements for both AC Transit and Golden Gate Transit. Buses would be stored at a lot on Harrison Street." Please clarify how the impacts of the Loop Ramp alternative (Sec. 2.2.1.2), a facility that will hold up to 173 buses, will be the same as for the West Ramp Alternative (Sec.2.2.1.1), a facility that holds only 53. The West Ramp and the Loop Ramp alternatives are quite different, with significantly different impacts on land area where bus storage is concerned.

Table 5.19-1 Operational Differences between Transbay Terminal Alternatives

The numbers in the table don't add up. Some examples:

- Bay Bridge to Terminal: Based on the illustrations in Figure 2.2-1 and 2.2-7, please explain how the West Ramp alternative requires an additional 1,100' of travel distance, the equivalent of 2.5 city blocks, between the Bay Bridge and the Terminal, if the Terminal is in the same location as the existing terminal. The actual travel distance should be less, since the first bus bays are up to 1100' feet *closer* than other alternatives, given the actual travel paths involved. If the number reflects looping within the facility before arrival for the West Ramp, then the distance from the Terminal to the Bay Bridge should be called out separately, since the West Ramp Alternative will have a shorter travel time for this leg.
- Bay Bridge to Terminal to Storage Area: How can this number be the same as for Bay Bridge to Terminal? Since the Loop Ramp and West Ramp alternatives include bus storage in the same yard, as indicated in Section 2.2.1.2, then why aren't the travel distances the same?
- Storage Area to Terminal to Bay Bridge: Same as above.
- Travel Times: the travel times do not match travel distances.
- Travel time from Bay Bridge to Terminal
    - Existing Terminal is 216 seconds for travel distance of 6500'
    - West Ramp is 317 seconds for travel distance of 7600'
    - Loop Ramp is 227 seconds for travel distance of 6500'
    - Why is the travel time greater for the Loop Ramp vs. existing, if the distance is the same?
- Travel Time from Storage Area to Terminal To Bay Bridge
    - Existing Terminal is N/A. Buses are currently stored on the ramp, and not in the facility. (See p. 5-114, Bus Storage Areas) Why is this not reflected in the table?
    - West Ramp is 329 seconds for travel distance of 7600', a difference of + 12 seconds over the same distance listed for Bay Bridge to terminal. Reversed, the same travel time is 334 seconds, a 17 second increase for the same route in reverse.

- Loop Ramp: why is travel time 13 seconds more than the same distance given for Bay Bridge to Terminal? Why does the same trip in reverse take 3 seconds less? why the discrepancy between this and the West Ramp alternative?

- Please review the remaining travel times and distances for similar problems.
- Ramp to Terminal: if the Loop Ramp Alternative replicates the same configuration and function as the existing condition, why is there no travel time listed here?
- Notes: Note 1 of the table says that "no deadheading or off-site staging is currently involved with AC Transit operations". P. 5-114 says that currently AC Transit buses are stored on the access ramps and not in the terminal. If the current facility and the Loop Ramp alternative both use the access ramp for bus storage, how can one not require "deadheading or off-site staging" when the other does?

Table 5.19-2

- AC Transit operating costs. Given the errors listed above, the numbers here don't seem to add up. If the terminals are all in basically the same place, then the numbers should be closer than shown. Given the information presented, we question that operating costs could be so much higher for the West ramp than for the existing situation.
- P. 5-117 says that table 5.19.2 shows that the Loop Ramp Alternative requires a 78% *increase* in operations and maintenance costs, and then characterizes this as "not significantly higher...than under the current situation." Please clarify how such an increase is not significant.

Pedestrians

- The Second-to-Main and Second-to-Mission Caltrain Extension Alternatives both include a design option for a pedestrian connection underneath Fremont Street to the BART Embarcadero Station (S-7, also 5-118). However, only 0.16% of people walked, 4.63% took BART, and 0.23% took Muni rail to get to the Transbay Terminal in the morning (3-46). Also, while 78% of TBT patrons walked from the Terminal to their destinations in SF in the mornings, only 1.7% of them use BART and 2.96% of them use Muni rail. Please explain how the pedestrian tunnel to BART/Muni would significantly promote linked transit ridership and stem pedestrian reductions in the TBT area.
- Special Pedestrian Conditions concerning casual carpool and Golden Gate Transit queues are mentioned (3-43); however, there are no mitigation measures proposed for these conditions.
- The EIS makes no mention of current or future obstacles to pedestrians with disabilities, or how the TBT intends to comply with the Americans with Disabilities Act.

Page 5-136

- The text indicates that there would be a new traffic signal on Fremont Street between Mission and Howard Street. Would the new signal be in addition to the existing mid-block signal? What would a "full stop" phase be? Since the only vehicular movement at the mid-block crosswalk is westbound, and since buses exit the surface terminal downstream of the proposed new mid-block signal, a signal similar to the one that currently exists north of the terminal should be sufficient to accommodate pedestrians and vehicular traffic.

- The EIR/EIS does not include operational analysis of the access and egress from the surface level of the new Terminal.

Page 5-136.
Would it be possible to provide access to the pedestrian tunnel from street level? If so it would serve many more people than the 108 currently identified.

Bicycles

The EIS adequately covers the issues of bike lanes, bike ridership, and bike storage. However, it also needs to identify short-term bike parking at the TBT or on the sidewalks around it as a way to promote bike ridership and lessen automobile impacts.

Autos and Parking

Page 5-121.
The reduction in person-hours of vehicle travel by seven percent seems high. What is the reduction in travel times based on? Was the significant development in the South of Market area considered?

Page 5-122.
The methodology that the Planning Department used for determining adverse effect at the study area intersections should be up front before Table 5.19-4.

Page 5-122.
Why does Table 5.19-4 have Existing plus Project conditions, while the text header is Baseline plus Project? This is somewhat confusing. 2020 Baseline plus Project seems understandable and indicates that it is not a true Existing (2002) condition.

Page 5-123.
What does the shading on Table 5.19-5 represent? Some of the "adverse effect" intersections are shaded, but not all. Were some missed?

Page 5-126.
The EIS expects there to be 7 intersections with "adverse and unmitigable" traffic impacts. The only improvement proposed is that the City may request developers to contribute to the new Integrated Transportation Management System program. Since developer participation is not mandatory and this system has not yet been implemented, what evidence is there that it might ameliorate these specific traffic impacts?

Development Strategy

The EIS/EIR should clarify why the project is to be constructed all at once, and what procedures and environmental review will occur if that strategy is found to be infeasible and construction happens in stages.

William Blackwell is a SPUR member and a contributor to SPUR's discussion on the EIR/EIS. He has submitted his own comments. A number of them are consistent with SPUR's preferences,

particularly if construction needs to occur in stages. Rather than repeat them, SPUR urges that they be carefully considered and responded to.

Economics

The key issues of financing and development raised in the EIS/EIR center on some fundamentals of the entire project's stated feasibility. As a redevelopment project, the importance of revenue from land sales gained by the removal of the Eastern ramps segments and the later tax increment streams are clearly seen as essential to the viability of the project. However, no sufficient discussion is given to the pre-development financing of the project. Please explain the sources of project and construction money needed before the availability of revenues from land sales and tax increment.

The analysis of the revenues from mixed-use development appear to be the same in both ramping alternatives. The West Ramp alternative will make available somewhat more land for mixed-use construction. More importantly, it consolidates a city block, making development options much more attractive and valuable. As a result, land sales and subsequent tax increment revenues should be significantly higher. Therefore, we believe the EIS/EIR's assumption that revenues are the same for the alternatives is inaccurate.

Similarly, the West Ramp and Loop Ramp alternatives show the same construction costs. Since the West Ramp is considerably shorter, the cost assumptions appear to be inaccurate.

Construction Issues

SPUR is concerned about the impacts of the Cut-and-Cover Option to historic architectural resources and existing business operations. Dramatic change to SOMA in the last decade has included the loss or alteration of many historic structures that play a significant role in giving our city its unique character. Many of the buildings that would be demolished under Cut-and-Cover are contributors to historic districts, making their value greater than as individual pieces of architecture.

The impacts of cut-and-cover when BART/Muni was built under Market St. raises additional concerns. Existing businesses suffered for years from construction limits on public access, and many businesses failed.

SPUR therefore supports the Tunneling option and strongly encourages efforts to minimize adverse impacts to historic structures and districts, and existing businesses.

Design

Historic/ Cultural Resources (Sections 4.16 5.14 & 7.2)

Section 5.14.2, Archaeological Resources: Mitigation

- By stating that mitigation measures for both archaeological and architectural resources would be set forth in an MOA, the EIS/EIR is deferring the mitigation. Per CEQA Section 15126.4(a)(B): "Formulation of mitigation measures should not be deferred until some future time. However, measures may specify performance standards which would mitigate the significant effect of the project and which may be accomplished in more than one specified way." Deferring mitigation to a future MOA without setting performance standards in the EIS denies the public its opportunity to provide input on the proposed mitigation, and makes the EIS inadequate.

Section 5.14.3.3, Redevelopment Components

- The conclusion that neither of the redevelopment alternatives would have an adverse impact on historic properties does not seem correct. Since the intention of creating a redevelopment area would be to encourage and facilitate new development in the designated area, there could be an increased likelihood that historic resources located within the area would be altered or demolished. The EIS should identify protections against such impacts.

Section 5.14.3.4, Affected Properties

- Please note that the 670-680 Second Street building has been altered in recent years and converted to an office building. As such, the structure no longer appears as depicted in this document. A Negative Declaration was prepared by the City of San Francisco for the alterations to this property.

- Section 5.14.2 refers to mitigation for architectural resources, but its mitigations are about archaeology. There should be a separate section on mitigation of architectural resources. See our comments about adequacy in Section 5.14.2, above. Providing a list of types of measures and stating that these are merely suggestions is not adequate. It should be stated here which, if any, of these mitigation measures would have the potential to reduce impacts to a less than significant level and whether such a conclusion would be different for different buildings.

- Please explain what is meant in the last sentence of Section 5.14: "...recordation eliminates one adverse effect of demolition..." Since demolition means the total loss of a building and results in a significant unavoidable impact for an historic resource under CEQA, how does recordation eliminate one adverse impact?

Section 7.2, Unavoidable Significant Adverse Effects Under CEQA

This section should list which buildings and districts would be significantly impacted under each alternative. The lack of clarity of the Historic and Cultural Resources section makes this doubly important.

Visual & Aesthetic Issues

Summary Project Description, p. s-3: No-project alternative

- There is no discussion of the need to seismically upgrade the existing Transbay Facility. Wasn't the expense of doing this one of the main reasons for rebuilding the facility?

Summary Table, p.s-16, Visual/Aesthetics Impact Category:

- No-Build Alternative:
  - Will this alternative have additional visual impacts due to requirements that existing facilities need to be seismically upgraded?
- Transbay Terminal Components:
  - Because there are no supporting illustrations of the Loop Ramp Alternative, other than a site plan diagram, it is not possible to evaluate the visual/aesthetic impacts of this scheme.
  - Based on the illustrations and text provided, it is clear there are significant differences between the two terminal alternatives. The West Ramp Alternative replaces a single-deck loop ramp with one double-decked ramp; how does this

make the ramps "less visually intrusive"? How does the Loop Ramp Alternative enhance views? Views from where?

- Caltrain Extension:
  - The Tunneling option would have significantly fewer aesthetic impacts on the area than the Cut-and-Cover option. In addition, what is the likelihood that new construction will be of the same scale as that which is demolished?
  - What are the mitigation measures proposed for the Caltrain extension? It seems that the Tunnel option is the way to mitigate the aesthetic impacts of the extension.
- Redevelopment Components:
  - There are two redevelopment alternatives; it seems highly unlikely that the two alternatives will have the same visual impact. Does the text in the table refer to both schemes?

Summary Table, p.s-17, Transit Operations Category:

- No-Build Alternative:
  - What are the impacts on operations if portions of the facility must be closed for seismic upgrading?
- Transbay Terminal Components:
  - How can the Loop Ramp Alternative with almost double the number of bus bays handle only 68% of the passengers of the West Ramp Alternative?
  - What is the mitigation proposed for off-site bus storage?

Chapter 2, Description of Project Alternatives

- In general, the almost complete lack of illustrations of the Loop Ramp Alternative make meaningful analysis of the visual and aesthetic impacts of this scheme impossible.
- Levels of Redevelopment, p. 2.43
  - How does the full build/reduced scope development scenarios relate to the two terminal proposals? The Loop Ramp Alternative has less land available for redevelopment and the land will be under greater constraints than the West Ramp Alternative. Thus the EIS/EIR is inaccurate in not comparing development levels for each ramp alternative.
  - It would be useful to know what the proposed development levels mean in terms of FAR, building height, building separation, and relationship to height and bulk limits of the planning code. Do the development levels spelled out deviate significantly from what is permitted under current zoning?
  - There are significant differences between the development envisioned in Table 2.2-22 and the illustrative model shown in Fig. 5-16.3. Please clarify.
- Levels of Redevelopment, Figure 2.2-22:
  - Some of the development levels seems highly unlikely when compared to parcelization, adjacent land uses, etc. For instance:
  - Block #3718: it is difficult to imagine that the shape of the parcel as drawn will support the level of development illustrated.

Section 5.16. Visual and Aesthetic Environmental Consequences and Mitigation Measures

- The minimal graphic representation of the Loop Ramp Alternative make it difficult to gauge its visual and aesthetic impacts.

- 5.16.1 No-project alternative, p. 5-92, 93
  - The existing terminal would require extensive seismic renovations. There is no discussion of the negative aesthetic impacts this could have.
  - Do continued existence of the bus ramps contribute to declining levels of maintenance and investment in surrounding properties, and therefore constitute a future negative aesthetic impact?

- 5.16.2 Transbay Terminal, p. 5-93
  - Figure 5.16.2 does not clearly show the difference between the west ramp (stacked) and the loop ramp (split) scenarios. It shows existing and stacked ramps only.
  - Model of Potential Redevelopment Sites and Scale, Fig. 5.16.3, p. 5-99: Please provide evidence of the likelihood that developers would propose high-rise projects, especially residential high-rise development, in such close proximity to one another as shown in the illustration.
- 5.16.3 Caltrain Downtown Extension
  - The cut and cover option will have significant visual and aesthetic impacts in both the near and short term. Operations will cause disruptions to the surrounding businesses and store frontages by making access for customers and employees difficult for extended periods of time. When this occurred on Market and Mission Streets during the construction of BART, many businesses failed or moved away, resulting in long-term deterioration to the urban fabric, and therefore producing significant negative visual and aesthetic impacts. Similar impacts could and should be expected in the project area under this option.
- 5.16.5 Changes to Scenic Views and Vistas
  - The loss of views mentioned in the report is not illustrated. Are these lost views from existing buildings, or from public spaces and streets? If the former, then it should be noted that the new development will replace these views with an equal or greater number.
  - On page 5-98, the report states that the spacing between the new towers in the redevelopment area would be greater than is typical North of Market, but the model illustrated in Fig. 5.16-3 sseems to show towers spaced as close or closer than the north of Market St. condition.
- 5.16.6 Change in the Cityscape
  - There is no Illustration 5.16-6 in the draft plan
  - Illustrations 5.16.4 and 5.16.5 do not show the views that are "more differentiated as the stepping up of development heights towards downtown is realized" The views as illustrated are much more monolithic and undifferentiated than described, espceally in Fig. 5.16-5. Better illustrations would be helpful.
- Other:
  - Sound walls: there is a mention somewhere in the report that sound walls are required. Are they required on the ramps? If so, this is a major impact that is not illustrated in the document.

Subject: Transbay Terminal EIR Comments

Dear Mr. Maltzer:

We are dismayed to learn that the new Transbay Terminal / Caltrain Extension EIR does not include the alternative of rehabilitating the existing Transbay Terminal for use as a joint rail and bus terminal for Peninsula trains, high speed rail, and Transbay buses. We believe that this alternative should be seriously considered for the following reasons:

1. The extraordinarily high cost of removing and then replacing the existing facility. Replacement costs are much higher than re-configuring the existing facility. Property acquisition would be entirely eliminated by re-configuring the existing facility.

2. The estimated cost of rehabilitating the Transbay Terminal in the 2001 MTC Transbay Terminal Improvement Plan Study was only $275 million. Since the existing terminal was built and operated as an interurban railway terminal from 1939 to 1956, the additional cost of rehabilitating the terminal for use by trains of the same weight should be minimal.

3. A rehabilitated and reconfigured transbay terminal will serve future needs for more than a quarter of a century. The capacity of the existing terminal is well in excess of any prospective needs for the next 30 years or more. For example, the capacity of Lane 3 which formerly accommodated Tracks 5 and 6 would be 300 rail commuter cars per hour assuming 2 minutes for loading or unloading and one minute for entrance and one minute for exiting. Since Caltrain operates only about 40 cars per hour maximum at present, even a very conservative capacity estimate of 200 cars per hour with 10 car trains would be more than adequate for any for seeable increase in rail commuting from the Peninsula. Lane 2 has room for 15 bus loading zones. Assuming 1.5 seconds loading time per passenger with fare pre-payment, a loading time of 1.5 minutes for 60 passengers, and a consequent minimum headway per zone of 5 minutes, a capacity of 180 buses per hour from the east bay could be accommodated in Lane 2.

Currently, AC Transit operates only about 80 buses per hour during the peak hour. Similarly, Tracks 1 and 2 in Lane 1 could easily handle all of the high speed trains that one could ever hope to see. Other bus operators, such as Golden Gate Transit, can be easily accommodated in Lane 2 with AC Transit for the foreseeable future. Greyhound which now operates 5 to 10 coaches per hour in Lane 1, could easily be relocated to the ground level such as Natoma Street behind the terminal where Amtrak formerly boarded passengers.

San Francisco County

TRAC, active since 1984, is a non-profit consumer lobby advocating improved passenger train service in California.

4. We believe that the reasons given in the EIR for not considering the rehabilitation of the existing Transbay Terminal for rail and bus use to be without foundation or justification. Most, if not all, rail passenger cars in the United States can operate around a 250 foot radius curve. The 870 foot long platforms can accommodate 10 car trains which is more than long enough for any foreseeable demands. The design capacity of the terminal and loop is 75 tons per car which is adequate for most commute rail cars, high speed rail cars, and high speed locomotives. Talgo, which now operates trains in the Northwest, has informed us that their new high speed Talgo 350 Km. trains can with minor modifications negotiate curves of less than 250 feet. There cars also weigh less than 37 tons per truck with passengers as do the French TGVs. With reuse of the terminal for trains and buses as described above, there is no need for an additional bus deck, so no major seismic work is required. The claim that obtrusive bracing would be needed for rail was based on the erroneous assumption that an additional deck would be needed for buses above the existing building.

5. Re-use of the existing Transbay Terminal would not require acquisition of additional property. This is a major cost savings and a major environmental advantage.

6. Proposition H of 1999 mandates fiscal prudence. Conserving public resources through reuse is the least-cost alternative. The two alternatives considered in the EIR require the installation of a much more massive 2 or 3 level structure over both 1st Street and Fremont Street than the existing single level structure. This installation presents obvious environmental impacts which have not been adequately addressed by the report.

7. San Francisco Proposition H of 1999 mandates that the City select the most economical alternative for extending Caltrain to the Transbay Terminal that provides rapid and efficient service. Since a loop terminal does not require inbound trains to cross outbound tracks, or outbound trains to cross in front of inbound trains, or require crews to reverse trains, as with a stub end terminal, a loop terminal can be expected to operate with fewer and shorter delays.

We would also like to recommend that a direct tunnel connecting Tunnel #1 on the Caltrain line with the throat to the Transbay Terminal Loop between Harrison and Folsom be considered. A direct routing would be about 1.25 miles long, require no property takings, and allow much higher speeds south of Harrison Street. In the course of the preparation of the report, reuse of existing facilities was ruled out because of the supposedly high cost, but now appears to be the most feasible option as new construction options assumed by the report now have a cost in the billions of dollars. This is as much true on the Bay Bridge as it is with the Transbay Terminal. Adaptive reuse of both facilities for rail should be studied in detail before any final decision is made on the configuration of a new TBT.

Whichever option is chosen, we believe a rail terminal on the second level with access to the Bay Bridge should be studied carefully as part of the project. After completion of the new east span, there is no reason to demolish the old span. The east span could be retrofitted for rail (plus bicycles and pedestrians) and connected to the existing west span. The rails-on-the-bridge study concluded that adding rail to the west span would cost less than $1.5 billion, but this alternative was ruled out because of the supposedly high cost. In light of the tunnel alternatives, which soar to $12 billion as estimated by the MTC, rehabilitation of the Transbay terminal is the most feasible option.

Rail on the Bay Bridge and a second level Transbay Terminal rail facility should be evaluated and compared with the other options in detail before any final decision is made on the configuration of a new TBT.

Sincerely,

Richard F. Tolmach

Re: Transbay Terminal DEIS/R

Dear Mr. Maltzer:

Transportation Solutions Defense and Education Fund (TRANSDEF) is a non-profit organization dedicated to improving regional planning for transportation, land use and air quality for the Bay Area. The Transbay Terminal / Caltrain Downtown Extension/ Redevelopment Project is the most significant project to come forward during our ten years of advocacy. It embodies all the most positive aspects of Smart Growth and the regional approach we have been advocating. We support the project wholeheartedly. In addition, we are pleased to note that the quality of the DEIS/R is consistent with the quality of the project. The DEIS/R is comprehensive, thoughtful, detailed and well-edited. The preparers are to be congratulated.

TRANSDEF supports the detailed architectural comments of RAFT and Michael Kiesling. Due to the commentors' many years of involvement with the details of a Caltrain rail extension, we are confident that the alignments proposed therein deserve close study as additional alternatives to the two rail alternatives in the DEIS/R.

Recognizing that no document is perfect, TRANSDEF appreciates the opportunity to provide the following comments, which are keyed to page numbers:

S-7 and elsewhere: The reference to Mission Boulevard appears to refer to Mission Street.

S-27: While the Summary contains a description of the Environmentally Superior Alternative, a more extended discussion in the body of the DEIS/R would be useful.

1-28: The Project will also need MTC and federal DOT approvals.

2-11: It appears that the location of the lower bus level exit ramp on the drawing is incorrect, as it conflicts spatially with the entry ramp to the upper bus level.

3-25: The high existing peak period transit capacity utilization indicates a need for mitigation for the increased passenger demand resulting from the Project. Please evaluate the impact of increased use of the Terminal on the need for additional Muni service, to maintain acceptable service standards. Note, for example, on 5-114 how the ground level loading area will operate near capacity for existing levels of transit service. Determine locations for loading for the full complement of transit service needed to adequately serve the new Terminal.

3-26: Verify that the capacity utilization numbers in Table 3.1-13 are comparable. Describe the capacity utilization service standards for the other transit operators.

3-28: The asserted 140% increase in 3.1.6.1 is incorrect.

3-48: The discussion is unnecessarily complicated by the inclusion of BART patrons that did not use the Terminal in the AM. Because they are irrelevant to any useful conclusions, they should be deleted.

4-29: On July 23, 2002, the US Court of Appeals for the 9th Circuit issued a stay of MTC's mobile source emissions budget, pending review of a challenge to its adequacy. This triggered a second conformity lapse, which is still in place as of the date of this letter. In addition, the SIP's Negative Declaration of Environmental Impact is facing challenge in Superior Court. If successful, the SIP approval would be vacated.

5-9: The Land Use analysis of the Redevelopment Project fails to evaluate the Project's regional land use benefits, which include preserving suburban open space (see 5-122).

5-49: An analysis of the tax and other economic implications of a operational Project is glaringly absent. The Project should have strikingly positive net benefits to the San Francisco and regional economies. Increases in retail sales and employment should be estimated, along with increases in the taxes reported in Table 5.6-5.

5-49: The air quality analysis must evaluate the regional emissions reductions that result from the increased use of bus transit and the corresponding decrease in auto travel.

5-49: The air quality benefits of the Redevelopment Project must be identified here. This will occur through correction of the definition of alternatives on 5-122 (see below).

5-95: The Figure legend should be "stacked" not 'staked.'

5-115: Please provide an explanation for why operating costs for AC Transit will increase beyond existing levels.

5-119: Include the Muni and other transit operator cost savings in a comprehensive analysis of Fiscal and Economic Impacts.

5-120: Because the expected most significant benefit of the Project is the synergy of bringing all the region's transit operators together at one location, it is especially important to evaluate the impact of this co-location on the ridership of each of the operators. It is not adequate to say that the Caltrain extension "would likely encourage transfers from Caltrain to AC Transit buses, thereby increasing AC Transit bus ridership." The increase in transit ridership should be evaluated for its impact on mode split, regional VMT and air emissions.

5-121: A 20% decrease in peak hour delay is very significant. Please verify that this is reflected in the air quality analysis. It should also be highlighted as one of the benefits of the Project.

5-122: The land use intensities of the three alternatives listed here are not comparable, making comparisons of impacts invalid. The total development for each of the alternatives be at the ABAG Projections level. Suburban development on the fringes of the Bay Area must be correspondingly decreased. The work done for the Regional Agencies Smart Growth Strategies/Regional Liveability Project Smart Growth Alternative should be very helpful here. We suggest consulting ABAG for guidance as to where to reduce projected suburban development, because they are assembling the Projections for the Smart Growth Alternative. These alternatives then need to be plugged in when re-running the emissions and travel demand models (see 5-49 and 5-120) and looking at open space consumed by suburban development (see 5-9).

5-126: Provide additional mitigations for adverse impacts at seven intersections: (1) reduce maximum parking ratios permissible in the Project area, (2) require provision of City Car Share-type service for new development in the Project area and (3) increase local transit service to the Project Area. The best way to avoid congestion is to discourage driving and provide convenient transit. Without parking, the Project Area will not be a destination for autos.

5-135: Please explain the methodology used in developing the extraordinarily low projected Caltrain rider transfer rates to Muni Metro and BART.

5-138: Please explain the methodology used in developing the surprisingly low projected need for bike storage.

5-174: Because no additional parking or feeder transit service to Caltrain stations is assumed, it is clear that Caltrain patronage could increase significantly beyond projected levels, were these facilities to be added in the future. This is additional justification for the mitigations proposed at 3-25 above.

Several issues arose that we believe should be discussed in the FEIS/R:

- It appears that the upper bus level of the West Ramp Alternative uses only half of the space available. It would be desirable for the building to have the structural capacity to build out the other half, if demand for it should develop in the future.

- If the rail lines are extended to the East Bay in the future, the tail track function would be lost. Should the right-of-way for replacement tail tracks be identified and protected?

TRANSDEF is very pleased with the DEIS/R for this exceptional project. The comments we raise here mostly seek full documentation of the regional benefits of the Project. We believe that the Bay Area needs to understand how beneficial this project will be. In addition, we have identified the need for further mitigation of the Project's impacts. Thank you for this opportunity to comment on the DEIS/R. Should any questions arise as a result of these comments, please contact us at the address on the letterhead.

Sincerely,

David Schonbrunn

RE: Draft Environmental Impact Statement/ Draft Environmental Impact Report/Section 4(F) Evaluation (DEIS/DEIR) For The Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project ("Transbay Project")

Dear Mr. Maltzer:

We represent Mission Street Development Partners, LLC, the 301 Mission Street project sponsor. The project site is on the south side of Mission Street between Fremont and Beale Streets, Assessor's Block 3719, Lots 1 and 17. We write to affirm the DEIS/DEIR's conclusion regarding the Environmentally Superior Alternative (including the Second-to-Main alignment) and to request that this Alternative be selected as the Locally Preferred Alternative.

Both the Second-to-Mission and Second-to-Main alignments can accommodate a potential cross-bay high speed rail connection in the future. However, the Second-to-Mission alignment has numerous adverse impacts in comparison to the Second-to-Main alignment, including substantial and prolonged excavation and closure of Mission Street and unresolvable conflicts with the 301 Mission Street project, a development with substantial public benefits, including generation of tax increment necessary to support the Transbay Project. It is also significantly more costly, due to more extensive excavation, Mission Street disruptions, property acquisitions, and loss of tax increment. None of this is reflected in the document. The DEIS must be revised to include a more thorough analysis of the Second-to-Mission alignment, both to comply with NEPA and CEQA, and to properly identify for decisionmakers and the public its significant impacts.

INTRODUCTION AND SUMMARY OF COMMENTS

By way of background, the 301 Mission Street project is a substantial mixed use development, including 320 dwelling units, commercial spaces, sizable publicly accessible open space and other features designed to activate and enliven Mission Street. It is currently undergoing environmental review, and we anticipate that the Draft Environmental Impact Report ("DEIR") will be published at the beginning of the year. As part of the DEIR process, the City and Caltrain representatives shared conceptual plans for the Transbay Project with the project sponsor and their technical consultants in an effort to evaluate the impact of the Transbay Project on the 301 Mission project. The consultants analyzed the conceptual plans and developed several DEIR project Alternatives. Technical memoranda summarizing the Alternatives are attached as Exhibit A. Those Alternatives consider the feasibility of accommodating both the Transbay Terminal and the Caltrain Extension. Based on this analysis, the project sponsor believes that the 301 Mission Street project could likely be modified in a feasible manner to accommodate the Terminal portion of the Transbay Project and the Second-to-Main alignment. This accommodation would involve a partial acquisition of the 301 Mission Street project site, significant construction coordination and additional construction costs.

The technical analysis for the 301 Mission Street DEIR concludes that the Second-to-Mission alignment cannot feasibly be accommodated. The DEIR analyzes both building above the alignment and on a "remainder" area outside of the alignment. As discussed in Exhibit A, those Alternatives are infeasible for a variety of technical, urban design, cost, timing and other reasons. The DEIS/DEIR fails to identify, yet alone analyze, these impacts of the Second-to-Mission alignment on 301 Mission Street.

The DEIS/DEIR Second-to-Mission financial data is also unsupported. The economic data in the document is based on studies developed for the 1997 Caltrain DEIS/DEIR, which did not include the extension alignments. As a result, there is no evidence — not a single document — in the public record supporting the cost estimates for the Second-to-Mission alignment. Exhibit A establishes some of the 301 Mission Street technical consultants' preliminary cost estimates of the alignment as it relates to 301 Mission Street, but the DEIS/DEIR itself is devoid of any meaningful cost data for 301 Mission Street or any other aspect of the Second-to-Mission alignment.

TRANSBAY DEIS/DEIR COMMENTS

The DEIS/DEIR does not meet its burden as a disclosure document because the Project Description for the Second-to-Mission alignment lacks information required by

law. Impacts from that alignment, including those related to the 301 Mission Street project,[1] are absent from the document or are inadequately analyzed. This is a particularly glaring deficiency given the high burden of Alternatives analysis under NEPA for an EIS. The NEPA Alternatives analysis has been called the "lynchpin" of an EIS, requiring "substantial treatment" in the document. See, e.g., 40 C.F.R. § 1502.14. The analysis also disregards substantial adverse impacts of the Second-to-Mission alignment — information that is critical to the decisionmakers' evaluation of the preferred alternative. Our specific comments on this and other issues are provided below.

1. Page S-27, Environmentally Superior Alternative. We concur with the document's conclusion regarding the Environmentally Superior Alternative, particularly as it relates to the Second-to-Main component. However, the list of benefits is incomplete. The Second-to-Main alignment significantly reduces operating expenditures and costs (including acquisition costs), increases tax revenue (including from tax increment), minimizes disruptions to Mission Street (a major thoroughfare and General Plan Transit Preferential Street), substantially reduces excavation and related construction truck trips (and related traffic and air quality impacts), retains the 301 Mission Street development, is more compatible with surrounding development and generally results in reduced impacts in the areas of land use, displacement and relocation, socioeconomic, fiscal, noise and vibration, utilities, visual/aesthetic and transportation impacts, all as discussed below in comments 6-15 and in Exhibit A. Please revise the list to include these additional benefits of the Second-to-Main alignment.

2. Page 1-1, Purpose and Need for Transportation Improvements. The 301 Mission Street Project is consistent with and assists the Transbay Project in fulfilling several of the "primary purposes" and "associated needs" cited on page 1-1. This must be noted in the text so that the public and decisionmakers are advised that the Second-to-Main alignment accommodates the 301 Mission Street project, preserving its associated benefits, while the Second-to-Mission alignment does not.

The primary benefits of the 301 Mission Street project are as follows. The 301 Mission Street project proposes a substantial mixed-use development of approximately 320 residential units, 120 hotel units, 130,560 gsf of office use, 9,400 gsf of restaurant/retail use, 6,400 gsf of publicly accessible atrium space and 4,340 gsf of ground-floor lobbies. It would make a positive contribution to the Downtown skyline through innovative design and building form, including a graceful, slender tower

[1] The 301 Mission Street project is a reasonably foreseeable project and the DEIS/DEIR must analyze it. See C.C.R. Title 14, Section 15130(b)(1)(B).

articulated through elements such as a podium and central atrium. The project would also provide an active and pedestrian-friendly ground-floor environment, with attractive open spaces and retail uses; contribute significant resources to the City through generation of various fees and taxes (including but not limited to affordable housing, open space, transit, art, schools and child care fees and property, transient occupancy and parking taxes); generate substantial new employment opportunities in a variety of job classifications, including entry-level jobs; and support the City's efforts to redevelop the Transbay Terminal by providing an immediately adjacent, high-quality project generating substantial tax increment. This increment is critical to the Transbay Project, which has a significant funding gap under every development scenario analyzed in the DEIS/DEIR.

3. Pages 2-21 — 2-37, Project Description for Caltrain Extension Alternatives. The Project Description fails to perform its essential function as a disclosure document because it lacks sufficient detail for the Second-to-Mission alignment. For example, the document does not describe the impacts related to Mission Street generally, the loss of the 301 Mission Street project, and the limited reuse opportunities available for that site. The latter two are described in Exhibit A. The Project Description also omits operational considerations, such as the expense resulting from two platforms and separate tracks under the Second-to-Mission alignment. For these reasons, it is impossible to adequately analyze the impacts of the Second-to-Mission alignment. However, based upon the project sponsor's understanding of the alignment, we have provided additional impacts information below. We request that both the Project Description and impacts analyses be substantially revised to incorporate these comments and to provide the full level of analysis mandated by NEPA and CEQA.

4. Pages 2-38 — 2-41, Cost Estimates. These cost estimates are fatally flawed in that they refer only generically to source information (usually simply by consultant and year), rather than citing any memoranda or analyses. This is a problem throughout the DEIS/DEIR. We have requested the underlying background documents supporting the DEIS/DEIR Tables, but are advised that no such information exists and that the numbers have simply been updated from earlier reports prepared in connection with the 1997 DEIS/DEIR. However, because the Second Street alignments were not included in the 1997 document, there is no original data to be "updated." Accordingly, there appears to be no evidence in support of these numbers. If such evidence exists, it must be identified and should be made part of the DEIS/DEIR Appendix. Specifically, the text lacks support regarding the right-of-way acquisition, relocation and resale figures and "mid-point estimate for real estate." It is inconceivable that the Second-to-Mission alignment under the cut-and-cover and tunneling options would result in only a $32.6 and $31.2 million additional net cost, respectively, as compared to the Second-to-Main alignment. As established in Exhibit A, there is no feasible 301 Mission Street

project Alternative based on the Second-to-Mission alignment. The acquisition cost of 301 Mission Street alone would far exceed the additional net cost cited in the DIES/DEIR. Extremely limited reuse opportunities for 301 Mission Street and complexities of construction work in Mission Street under the Second-to-Mission alignment would substantially increase the net cost differential far beyond the DEIS/DEIR estimate.

5. Pages 2-48-2-53, Alignments Considered and Withdrawn. The text describes a number of Caltrain Extension alignments that were considered and withdrawn. Among the reasons for withdrawal are operational issues based on platform location (page 2-50), potentially substantial noise, traffic, air quality and other construction impacts (page 2-51), increased capital operating costs and reduced operating efficiencies (page 2-52) and impacts of a long tunnel on the real estate above (page 2-53). The Second-to-Mission alignment shares each of these impacts, none of which is discussed in the DEIS/DEIR. Each of these impacts must be analyzed, and the Second-to-Mission alignment must be similarly rejected as infeasible.

6. Pages 5-3 — 5-4, Land Use Impacts. The statements regarding land use impacts are conclusory and unsupported by evidence as they relate to the Second-to-Mission Street alignment. This section ignores facts about that project that are a matter of public record — the sole reference to 301 Mission Street is a one paragraph statement on page 5-4. In fact, the Second-to-Mission alignment would pose a substantial land use conflict with the 301 Mission Street development. As discussed in Exhibit A, the Second-to-Mission alignment renders the 301 Mission Street project infeasible, and severely restricts reuse of the site. The consultants have determined from documents not otherwise even described in the DEIS/DEIR that the alignment involves construction of a forty-five foot deep (or possibly deeper) tunnel which would traverse directly through the 301 Mission Street property. It is obvious that the location of the tunnel and its physical configuration would significantly alter both the remaining below grade and above grade buildable area on the property. The train tunnel and the pedestrian mezzanine connecting the bus terminals will take about 2/3 of the entire site.

If the 301 Mission Street project does not move forward, the City would not enjoy the various benefits of the project, discussed above, and most importantly its 320 dwelling units, significantly enhanced street-level experience, and substantial tax increment, which is a critical funding element of the Transbay Project. The DEIS/DEIR contains no discussion of the environment that would remain along this important segment of the Mission Street corridor, nor of how loss of development opportunity at this site impacts the value or reuse potential of surrounding properties. The loss of this project is a foreseeable and significant land use impact of the Second-to-Mission alignment that must be identified and discussed.

Also absent from this discussion is any analysis of relevant Downtown Plan policies related to land use. By way of example, see Objectives 7 (expanding housing supply Downtown) and 13-16 (urban form). The Second-to-Mission alignment is inconsistent with these policies with respect to its 301 Mission Street site impacts.

The Land Use section purports to analyze wind and shadow impacts. Despite the enormous scope of the project, the DEIS/DEIR does not follow the City's standard format and in fact provides far less information than would normally be included in a Downtown project analysis. For example, the shadow discussion makes conclusory impacts statements, without including any quantitative information or graphics to support or explain the conclusions. The 301 Mission Street development is a foreseeable project that must be included in these analyses.

7. Pages 5-19 — 5-32, Displacements and Relocation. What are the funding sources for the property acquisitions listed in the charts, and when do these funds become available? Why doesn't the displacement section mention the loss of approximately 320 housing units under the Second-to-Mission alignment?

8. Pages 5-31 — 5-32, Socioeconomic Impacts. The statements regarding socioeconomic impacts are conclusory and unsupported by evidence as they relate to the Second-to-Mission alignment. The loss of the 301 Mission Street project and the limited reuse opportunity as a result of the Second-to-Mission alignment is a socioeconomic impact. As discussed above, that project will generate substantial employment opportunities, fees and taxes that would be eliminated under the Second-to-Mission alignment. The analysis must also include the socioeconomic impacts of businesses disruptions along Mission Street during the lengthy Second-to-Mission alignment construction period.

9. Pages 5-44 — 5-49, Fiscal Impacts. The statements regarding fiscal impacts are conclusory and unsupported by evidence as they relate to the Second-to-Mission alignment. The DEIS/DEIR discusses right-of-way acquisition in Tables 5.6-2 and 5.6-3. The basis for the Fiscal Impacts analysis is indecipherable, as only general reference is made to the Sedway Group, First American Real Estate Solutions, Comps Inc. and Marshall Valuation Service information. Again, how were these numbers generated? How can there be no supporting documents? The DEIS/DEIR must include specific references and background documents that support these numbers and conclusions to provide a road map for decisionmakers as to how these conclusions were reached. Those documents should also be included in the Appendix. The cost of the Second-to-Mission alignment is clearly understated in light of the substantially greater acquisition costs, and the limits to reuse of the property. Specifically, on page 5-45, footnote 7 references a $50 million total valuation for the 301 Mission Street property. How is this reflected in the acquisition estimate tables? What is the basis for

this determination? This is inaccurate in that it represents only a partial value for the 301 Mission Street site. Tables 5.6-1 — 5.6-3 misrepresent the difference in acquisition costs between the two alignments, which is shown as only approximately $10 million.

The estimates for payroll tax and retail sales tax losses are also underestimated. How is the limited reuse of the 301 Mission Street site reflected? There appears to be no analysis of that impact. Presumably Mission Street would be closed in phases over a significant period of time to accommodate the Second-to-Mission alignment. What is the phasing plan? This in turn would have substantial impacts on businesses along Mission Street. These are not even mentioned in the DEIS/DEIR. Also, what is the engineering solution to tunneling beneath the Muni turnaround and the historic Agriculture Building at the terminus of Mission Street — how has that cost been addressed in the Second-to-Mission alignment analysis? What are the timeframes and associated costs for each of these? Is it even feasible? How does grade change of this tunneling impact high speed rail? The DEIS/DEIR fails as a disclosure document without this crucial information that speaks to the fundamental feasibility and impacts of the project. Under both CEQA and NEPA, the perfunctory description of the Second-to-Mission alignment and impacts is a fatal flaw, and the document must be revised to include the requested information.

10. Pages 5-55 — 5-65, Noise and Vibration. The statements regarding noise and vibration impacts are conclusory and unsupported by evidence as they relate to the Second-to-Mission alignment. The Second-to-Mission alignment involves a long tunnel which impacts the developability of real estate above the alignment, as discussed in Exhibit A. The Noise and Vibration discussion makes no reference to impacts of the Second-to-Mission Street alignment on 301 Mission Street or other properties along Mission Street, nor does it identify measures (and their associated costs and timing of implementation) that might be necessary to reduce vibration to acceptable levels.

11. Pages 5-69 — 5-70, Utilities. The statements regarding utilities impacts are conclusory and unsupported by evidence as they relate to the Second-to-Mission alignment. With the substantial excavation of Mission Street that would be required, clearly there would be substantial utilities impacts that are not analyzed here.

12. Page 5-96, Visual/Aesthetic Changes. The statements regarding visual/aesthetic changes are conclusory and unsupported by evidence as they relate to the Second-to-Mission alignment. The analysis of visual/aesthetic changes makes no reference to the significant adverse changes associated with the Second-to-Mission alignment. As discussed above (see in particular Downtown Plan policies 13-16) and in Exhibit A, the loss of the 301 Mission Street project and limited reuse opportunities would result in a substantially changed visual environment, both in terms of the street-

level environment and the Downtown skyline. The 301 Mission Street project must be included in the photomontages as a reasonably foreseeable project.

13. Pages 5-109 — 5-137, Transit, Traffic and Parking, Including During Construction. The statements regarding transit, traffic and parking (including during construction) are conclusory and unsupported by evidence as they relate to the Second-to-Mission alignment. This section contains no analysis of transit, traffic and parking impacts associated with that alignment. Due to the vague Project Description, it is difficult to identify or assess those impacts. However, at a minimum, they include substantial disruption to Mission Street (a General Plan Transit Preferential Street) while construction occurs at that location. Construction would presumably progress block-by-block along Mission Street, over a long period of time, with no street parking during construction and significant potential for disruption of MUNI operations both above and below grade. The impact of these closures would be substantial and must be discussed.

14. Pages 5-138 — 5-187, Construction Impacts. The DEIS/DEIR is inadequate in its description of the impacts of demolition, underpinning, surface rail line and station construction and support of adjacent structures that would be required for the Second-to-Mission alignment. These topics receive scant mention on pages 5-144 and 5-148 with no impacts discussion. On page 5-166, the text states that construction traffic "could potentially result in temporary delays." The Table on page 5.20-8 suggests that the schedule for both alignments is the same; this analysis appears to ignore impacts from the closure of Mission Street west of Beale Street. The limited nature of the impact is unsupported by analysis, particularly with respect to street closures necessary for construction of the Second-to-Mission alignment. Why is Mission Street west of Beale Street omitted from the analysis? Impacts to this section of Mission Street (including 301 Mission Street) must be addressed in terms of driveways blocked during construction, on-street parking removal, impacts to businesses, utilities relocation and construction noise and vibration.

Table 5.20-4 estimates the amount of excavation materials. Given the extent of excavation required under structures at the terminus of Mission Street, the numbers for the Mission Street alignment are not credible. Even if these numbers were accurate, the Second-to-Mission alignment would involve about 10% more excavation. How is this accounted for in the financial analysis? Again, all of this information must be provided.

15. Chapter 6, Fiscal Analysis. The DEIS/DEIR does not identify specific source documents or make those documents available to the public. For example, where is the cited but undescribed Seifel Consulting and Nancy Whelan Associates tax increment analysis? Specific information regarding that information and acquisition,

relocation, resale, and mid-point of real estate costs are essential to adequate analysis, but we are advised they do not exist. The acquisition costs associated with the Second-to-Mission alignment have been significantly underestimated, as have the costs of business disruptions and tax revenue loss. On page 6-8, the tax increment assumptions remain constant for all scenarios. Clearly, there would be a substantial difference between the two alignments in light of impacts on the 301 Mission Street project. The Tables on pages 6-4 and 6-8 must both be revised to account for increased operating expenses for the two platforms and separate tracks in the Second-to-Mission alignment. Finally, the analysis does not account for the costs of acquiring City subsurface land — is the City donating this land and, if not, what is the acquisition cost?

The project is only in its initial stages of identifying potential funding sources, and the vast majority of funds are as of yet unsecured, but the document does not discuss funding feasibility or timing. The entire financial and feasibility analysis is meaningless without this information, particularly since factors such as the "midpoint of real estate costs" are central to that analysis. The financial information drives phasing and its physical impacts, which is a fundamental component of the Project Description and impacts analysis.

In conclusion, we reiterate our concurrence in the DEIS/DEIR's determination regarding the Environmentally Superior Alternative, which includes the Second-to-Main alignment. While both alignments preserve the opportunity for a future cross bay high speed rail connection in the future, only the Second-to-Main alignment preserves the 301 Mission project and its contributions to the Transbay project. By contrast, the Second-to-Mission project results in numerous adverse impacts, including the loss of the 301 Mission Street project and its associated benefits, without any identified advantages . Accordingly, we request selection of the Environmentally Superior Alternative as the Locally Preferred Alternative.

Thank you for your consideration.

Very truly yours,

Tay C. Via

EXHIBIT A

EXECUTIVE SUMMARY OF 301 MISSION STREET PROJECT TRANSBAY/CALTRAIN EXTENSION ALTERNATIVES

1. **Analysis of Project with Modifications to Accommodate Conceptual Plan for Transbay Terminal.** (Alternative E, Technical Letter Nos. 1, 2.) Feasible.

   - Basic Project Description: Modifies project to reflect preliminary conceptual plan for a new Transbay Terminal only, assuming Second-to-Main alignment (Plan DTX-ALT1B-40 dated 7/21/02, 7/29/02). Involves acquisition of a southerly portion of project site to accommodate Transbay Terminal access tunnel.

   - Engineering Approach: 45' deep tunnel would encroach approximately 5' into 301 Mission Street site. Requires replacement of temporary piles with new approximately 18-24" thick foundation wall constructed as part of the 301 Mission Street project. Assumes isolation of the tunnel from the 301 Mission Street structure with load-bearing wall of the 301 Mission Street project cantilevering beyond newly-positioned foundation wall.

   - Project Impacts: Loss of approximately 3'6" along the 275' length of site, or 4,000 gross square feet over below-grade levels. Elimination of about 30-40 subterranean parking stalls and approximately 500 square feet each of storage and mechanical space.

   - Increased Costs: Approximately $400,000-600,000, plus additional transactional and coordination costs, in addition to loss of site area and related program space.

   - Conclusion: Provided that cost and construction issues can be adequately addressed, appears feasible from construction and program perspective.

2. **Analysis of Project Reconfigured to Accommodate the Second-to-Mission Street Caltrain Extension.**

   (a) **Analysis of Tunnel 45' Below Grade, Column-Free.** (Variant F1, Technical Letter Nos. 1 and 2.) Infeasible.

   - Basic Project Description: Based on preliminary conceptual plan No. DTX-ALT2B-40, 8/1/02. Bottom of tunnel 45' below grade, top at grade, all column-free zone.

   - Engineering Approach: 301 Mission Street preserves path for future Caltrain terminal; building supported on very deep concrete transfer girder above grade at top of future tunnel roof and pedestrian mezzanine. Transfer girder of about 30' thick, with approximately 76 piles on both

east and west sides. Site cannot accommodate this number of piles, even assuming encroachment into sidewalk area.

- Program Impacts: Above-grade, 30' mat replaces first two floors of project program, including atrium and associated publicly-accessible open space, retail/restaurant and residential/hotel lobbies. Lobbies relocated to third floor, with two escalators and four additional elevators required for access. Structural mat eliminates main vehicular and pedestrian drop-off and loading areas, relocated to Beale Street. Reduced program: 400 to about 100 parking spaces, 11,300 gsf to 2,000 gsf open space at the ground floor, and 10,000 gsf to 4,500 gsf restaurant/retail.

- Urban Design Issues: Ground floor-activating features eliminated and replaced with structural mat reading as a blank concrete three-story wall from street; physical and visual barrier along Fremont and Mission Streets; only remaining program at ground floor is office lobby and partial ground floor retail, with remaining ground floor area dedicated to loading, vehicle ramps and mechanical shafts.

- Increased Costs: About $35,750,000-$43,250,000, plus incremental transaction and coordination costs. See Technical Letters No. 3 and 4.

- Conclusion: Infeasible due to impacts on program, urban design, timing and cost.

Notes:

- Could also be revised to include construction of Caltrain tunnel as part of 301 Mission Street project's scope. Involves same feasibility issues as Variant F1, additional costs of tunnel construction, plus final construction drawings for tunnel and funding required by first quarter of 2003.

- If assume reduced development program (roughly one-half of the proposed project), Variant remains infeasible. Mat is reduced, but still 15' above grade, creating same conflicts as Variant F1, and eliminating about 400,000 gross square feet of program, including roughly 130 units of housing and 100 hotel rooms.

(b) Analysis of Reduced Development, "Remainder" Site. (Variant F2, Technical Letter Nos. 1 and 2.) Infeasible.

- Basic Project Description: Assumes site is reduced to only about 17,000 gross square feet "remainder" portion of the 301 Mission Street site (outside of the Caltrain alignment) available as building site, with balance used for vehicular access and landscaping only. Entails loss of approximately 2/3 of site.

- Program Impacts: Buildable area reduced from about 900,498 to 300,000 gross square feet. Due to relocation of ground floor functions, loss of the 6,400 gsf central atrium, 7,200 gsf garden terrace, 4,500 gross square feet retail use and reduction in residential and hotel public lobby spaces. Substantial portions of residential and hotel elements also eliminated in light of over 600,000 gsf (almost 2/3) reduction in buildable area.

- Urban Design Issues: Similar to Variant F1.

- Conclusion: Infeasible due to substantial reduction in program (and associated costs), timing and conflicts with urban design policies as described for Variant F1.

(c) **Analysis of Revised Caltrain Plan (lower tunnel; potential column zones).** (Variant F3, Technical Letter Nos. 3 and 4.) Infeasible.

- Basic Project Description: Based upon revised plans Nos. C/01-C/03 dated November 4, 2002, modified to (i) show lower tunnel floor (64') with top of tunnel 18' below grade and (ii) identify certain areas where columns placed to support 301 Mission Street project's superstructure.

- Engineering Approach: Support 301 Mission Street superstructure on 10' concrete mat reinforced with structural beams and conventional reinforcement, with isolation of below grade structure from tunnel. Conventional load-resisting system consisting of 3-5' diameter columns at about 15' on center.

- Program Impacts: Below-grade program impacts result in loss of about 1/3 of gsf available for parking and building services and other support space. Reconfiguration results in loss of about 243 stalls, leaving only 157 stalls for 320 residential units, and no spaces for visitors and commercial uses (loss of about 60% of the parking spaces). About 84,712 square feet of mechanical and building services requires above-grade relocation. This absorbs eight floors or about 64 units (20% of the project's total). Lost units potentially added to office tower, but building loses efficiency as the elevator core enlarges significantly, with substantial duplication of mechanical systems. Therefore, assume replacement of lost units with about six floors of new office space, increasing height of office tower from 126' to 209'. Loading facilities also configured to provide access to elevator core for residential tower's loading facilities from third floor of office building, with service corridor traversing public atrium.

- Urban Design Issues: Requires servicing residential tower through office elevator; sound and vibration concerns from above-grade mechanical equipment; and numerous design and operational challenges to Caltrain. Service corridor runs between residential and office buildings traversing public atrium, disrupting skylight views. Project's expression and

connection to street disrupted by louvers required to screen mechanical functions. Louvers replace vision glass, an important element of the design/visual continuity. Additional office floors dramatically change scale and daylight in atrium and outdoor space.

- Increased Costs: About $29,500,000-$34,250,000 plus incremental transaction and coordination costs. See Technical Letters No. 3 and 4.

- Conclusion: Infeasible for a variety of functional, urban design, timing and cost issues.

Subject: Evaluation of Caltrain Alternates for the Downtown Terminal Expansion
301 Mission Street, San Francisco, CA

Dear Glenn:

We are pleased to submit this preliminary evaluation report summarizing the results of an impact study we performed analyzing the proposed Caltrain downtown terminal expansion and the high-rise building project at 301 Mission Street. The drawings containing the parameters for the proposed Caltrain terminal expansion were prepared and submitted for our review by Computer Design Solutions. There are two configurations, both of which require acquisition of a portion of the project site. As discussed below, based upon the plans provided by the Transbay Terminal Consultants, Alternate I could be accommodated, but at an increased cost to the 301 Mission Street project. Alternate II is infeasible based upon the timing, technical and economic factors identified in our analysis.

Alternate I:

Alternate I relates to the new Transbay Terminal. Drawing DTX-ALT1B-40, dated 7/31/02, shows a plan view of this alternate. A cross section through this scheme is shown on Section AA dated 7/29/02. This plan comprises a proposed new tunnel (45 ft. deep) to be constructed under Mission Street, running parallel to the south lot line of the 301 Mission street property. The temporary shoring wall of the Caltrain tunnel structure, as shown in Section AA, is located approximately 5 feet from the property line of the subject 301 Mission building project. We propose that the temporary piles indicated on Section AA be eliminated in lieu of a new 18- to 24-inch thick foundation wall that would be constructed as a part of the 301 Mission Street project. The Caltrain tunnel wall will need to be isolated from this foundation wall so that the lateral pressure imposed by 310 Mission street project structure is not transferred to the Caltrain structure. We estimate that an isolation joint filled with a compressible material of approximately 8- to 12-inches in width will be required between the two walls. In addition to being designed to support the 301 Mission Street superstructure, this foundation wall system would also be required to be designed to resist all anticipated loads associated with the construction of the Caltrain tunnel.

The above-grade structure for the 301 Mission Street project is comprised of a two-story load-bearing wall situated at the property line that will need to be supported by the ground floor structural slab, which would cantilever out beyond the newly-positioned foundation wall. This condition will require the installation of a continuous corbel along the top of the foundation wall to provide adequate and continuous support for the superstructure.

Based upon the above noted constraints, we estimate that the approximate additional cost to design and construct the foundation wall to resist any anticipated Caltrain tunnel construction loads and to design and construct the corbel on the top of this wall to support the cantilevered ground floor slab will be range from $400,000 to $600,000. Of course, this would also involve agreements and coordination between the parties that would result in additional expense. We emphasize that this is a preliminary conceptual cost estimate based upon the plans provided, and that the final cost of construction may vary significantly from this estimate. Furthermore, any modifications to those plans would also increase this cost.

Alternate II:

Alternate II is the Second-to-Mission Street Caltrain extension. Drawing DTX-ALT2B-40, dated 8/1/02, shows a plan view of this alternate. This alternative would also involve agreements and coordination between the parties that would result in additional expense. There are several ways to analyze the impacts of this alternative.

Alternate IIA would require that 301 Mission Street project provide the necessary clearances to accommodate a 90-foot wide tunnel (train track and two platforms) under the high rise structure's base. Figure 1 shows the site plan with building footprint overlaid on the proposed Caltrain tunnel.

This proposed alternate will require that the entire 301 Mission building be supported on a very deep concrete transfer girder (concrete mat or a structural steel grillage system) spanning across the Caltrain tunnel. Section AA shows that the top of the tunnel roof (including the mezzanine structure) is located approximately at grade. Therefore, the entire depth of this transfer girder will be above grade. A layer of compressible material of up to 3-feet in thickness will be required to be installed between the underside of the transfer girder foundation mat and the Caltrain tunnel roof in order to isolate the Caltrain structure from the building. Due to site geometry constraints imposed by the proposed Alternate II Caltrain alignment, this deep transfer girder can only be supported on the east and west ends of the project site. No supports can be provided along the north and south direction of the mat as the tunnel continues beyond the project site.

As part of our evaluation of proposed Alternate II, we have performed preliminary structural analyses to establish design parameters for the transfer girder support system that would both span the Caltrain tunnel and provide requisite support for the 301 Mission building's superstructure. For the purposes of this analysis, we modeled a concrete mat foundation to act as the transfer girder. The intent was to determine equivalent stiffness and strength of the transfer girder system required to span across the Caltrain tunnel and resist loads imposed by the superstructure. The final material, type and configuration of this transfer girder will be selected based upon contractibility and design requirements.

End support area for the Mat
Max. 3 ' piers = 46

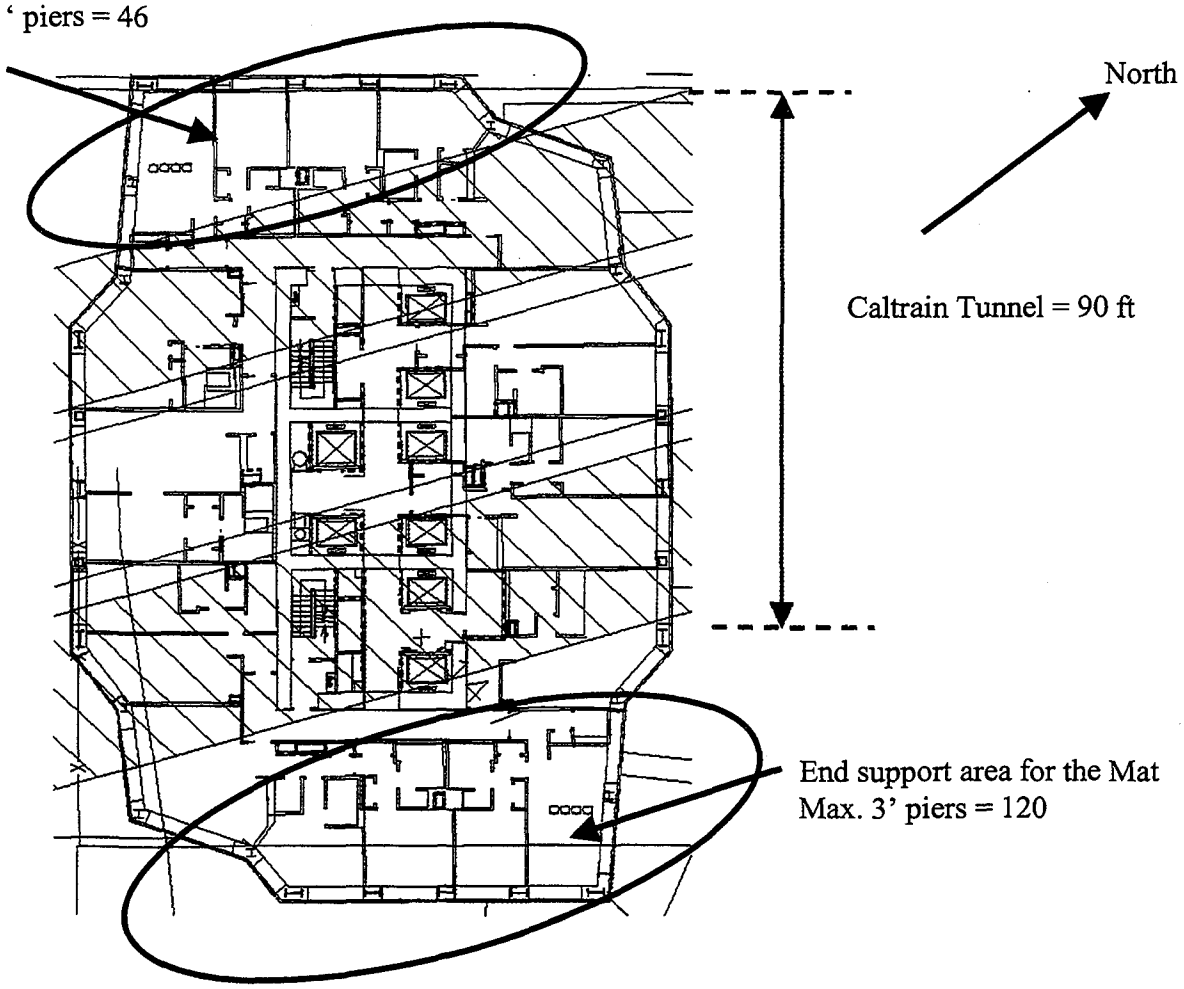

Figure 1: Building Foot Print Overlaid with Caltrain Tunnel

Figure 2 shows a schematic of a finite element structural model that was developed to represent a thick reinforced-concrete mat supported along its edges in one direction. The edge support conditions were approximately modeled in order to capture reasonable estimates for the reactions (e.g. tension, compression). The building core was modeled as line loads in order to capture the transfer of seismic lateral load moments from the building's superstructure to the mat. The non-seismic gravity column system was modeled by evenly distributing the building's gravity loads across the mat. Based on these estimated seismic overturning and gravity loads, the vertical deflections of the mat and internal flexural stresses were then computed.

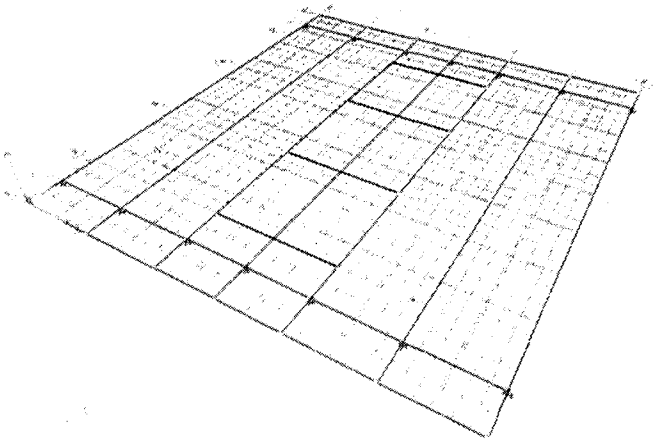

Figure 2: Finite Element model of the Foundation Mat Slab

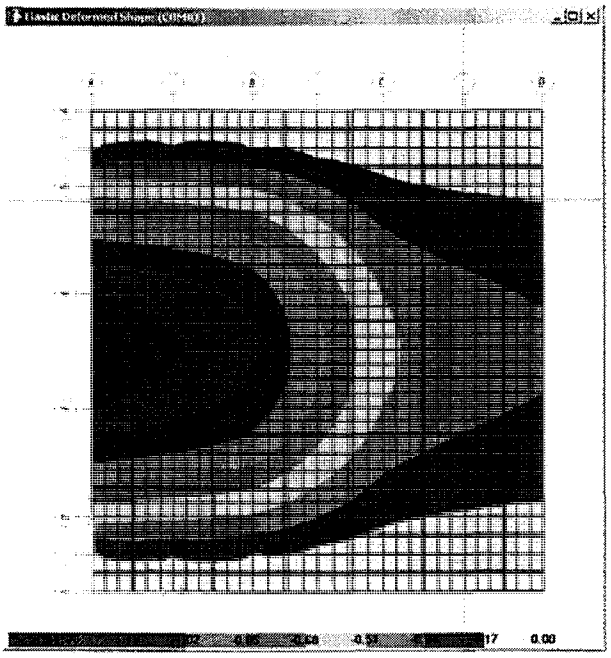

Figure 3: Deformations for 15 ft. thick Mat

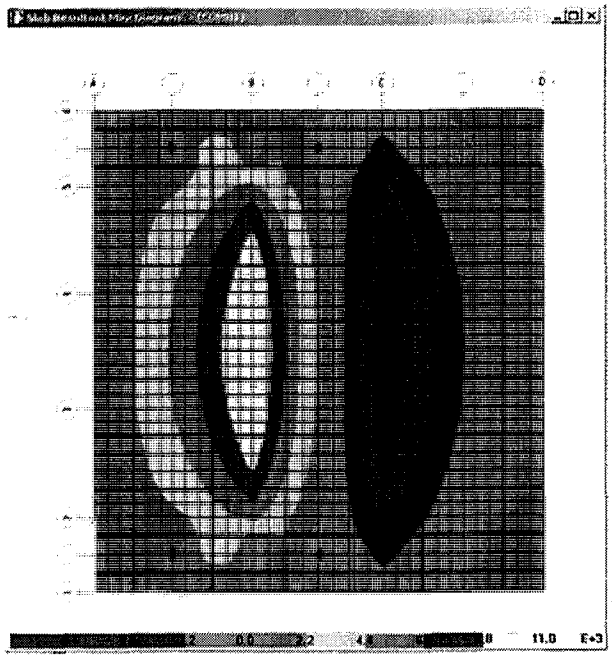

Figure 4: Flexural Stresses for 15 ft. thick mat

Figures 3 and 4 show deformations and flexural stresses for a proposed 15-foot thick transfer girder mat. As the mat deforms, it causes rotation at the base of the high-rise tower, which in turn results in a lateral deflection at the top of the 630-foot tall tower.

Tables 1 and 2 present a summary of the deformations, stresses and tower tip deflection for three different mat thicknesses (8 ft., 15 ft., and 30 ft.). Table 1 shows that the tower tip deflection for an 8-foot thick mat is approximately 53 inches, for a 15-ft. thick mat is 12.4 inches, and for a 30-ft. thick mat is approximately 3.6 inches. Therefore, to reasonably limit the tower tip deflection due to foundation rocking, stiffness and strength required for the transfer girder needs to be equivalent to a concrete mat of approximately 30-feet thick.

Table 1: (Parallel to Mission Street) X- direction

Mat Thick. (ft)	Vertical Differential Displacement (in.)	Tower Tip Displacement (in.)	Mxx (kip-ft/ft)	End Reaction Kips	No of Piers Required
8	4.40	53.31	10740	60109	43
15	1.02	12.36	11630	65520	46
30	0.30	3.63	12807	78625	56

Table 2: (Perpendicular to Mission Street) X- direction

Mat Thick. (ft)	Vertical Differential Displacement (in.)	Tower Tip Displacement (in.)	Mxx (kip-ft/ft)	End Reaction Kips	No of Piers Required
8	0.65	10.64	6000	88022	62
15	0.19	3.11	11000	94137	67
30	0.08	1.37	16800	107242	76

The number of piles required to support the foundation mat along each of its two sides are shown in Table 1 and 2. For calculational purposes, we have assumed that a number of individual 3-foot diameter drilled piers (each 120-ft. long) will be required to provide sufficient tension and compression capacity. A total of approximately 76 drilled piers will be required to support each side (east and west) of the 30-foot thick mat. Based upon the geometry constraints illustrated in Figure 1, however, a maximum of only 46 piers can be installed along the west side of the tunnel (this includes encroaching into the sidewalk area outside of the property line). If all the piers were installed within the property lines of the project, a total of 18 drilled piers can be installed along the west side of the tunnel. Therefore, all 76 piers cannot be installed on the west side of the tunnel even after encroaching into the sidewalk area outside the property line.

In summary, there is not sufficient physical space within the confines of the 301 Mission Street project site to install required number of required drilled piers to support the foundation mat spanning across the Caltrain tunnel.

A brief summary of our findings is presented below.

1. The stiffness and strength of the transfer girder system for supporting the building's superstructure and for minimizing tower tip deflections due to foundation rocking are required to be equivalent to approximately a 30 feet thick concrete mat. A transfer element of this required thickness will essentially eliminate the first floor of the building and all proposed floors below grade. The cost of constructing such a mat will be significantly higher than the cost of the basic foundation system that would have been required in the absence of the Caltrain tunnel.

2. The large number of drilled piers required to be installed at the ends of the foundation will necessitate going outside of the bounds of the existing building property line. However, after utilizing the space under the sidewalk on the west side of the tunnel, there is still not sufficient room to physically install the required number of piles.

3. With a 30-foot thick mat, the seismic deflection at the top of the tower resulting from foundation mat overturning is about 3.6 inches. This deflection needs to be added to the overall seismic deflections of the building superstructure. To incorporate these deformations, the conventional structural systems being considered (either reinforced concrete shear wall core or steel braced frame core) may not be sufficiently stiff and strong within reasonable member sizes to allow for proper architectural planning and to achieve the desired building functions, especially around the building core. Therefore, these systems will need to be supplemented by non-conventional lateral load-resisting methods such as base-isolation or active damping devices. This will result in a significant additional cost to the 301 Mission building project. We estimate that this additional cost will be in the range of 25% to 35% of the base structural cost.

Based upon the above noted constraints in the design and construction of the foundation system, we estimate the additional costs for the construction to be as follows:

Drilled piers (152 piers, 120 ft. long) = $4 to $6 Million
30 ft. thick transfer girder mat slab = $5 to $7 Million

Total additional cost of foundation system = $9 to $13 Million.

Please note that these costs are based upon preliminary conceptual estimate and the actual costs may vary significantly from this estimate. Based upon the results of the preliminary analysis described above, it appears that it is neither physically nor economically possible to provide for a sufficiently thick transfer element to support the building superstructure

and to span across the Caltrain tunnel. This conclusion is based on the large number of drilled piers that will be required to support the proposed tower structure, coupled with the fact that the structural solution will then need to be augmented with non-conventional solutions, and the additional costs for incorporating this Caltrain Alternate II in the design will be significant. Beyond the cost issues, this Alternate II is infeasible because the required number of piles cannot be accommodated on-site, even assuming the use of the adjacent sidewalk.

Alternate II B:

This alternate assumes the following:

1. The proposed building will be same as the Alternate IIA.

2. The foundation system will be same as the Alternate IIA and the Caltrain tunnel will be isolated from the building structure.

3. The 301 Mission Street project sponsor not only provides the necessary clearances but also will construct the Caltrain tunnel under the project.

This alternate requires that Caltrain's plans are finalized and approved before the construction of the project can begin. This alternate also requires that the tunnel excavation and construction of the tunnel structure be completed prior to the start of building construction. Based upon our review of the plans and understanding of the construction schedule, these requirements are infeasible. It also involves the same issues as Alternate IIA.

Alternate II C:

This alternate assumes a substantially reduced 301 Mission Street project:

1. The proposed building height will be reduced to half of its originally intended height, or to approximately 300 ft.

2. The foundation system concept will be same as that proposed for Alternate II, and assumes that the Caltrain tunnel will be isolated from the building structure.

Based upon our preliminary analyses, the foundation system required to support the truncated building and to span over the Caltrain tunnel will be similar in concept to the system discussed in Alternate IIA. However, the depth of the transfer foundation mat can be reduced to approximately 15 feet and the total number of piles required to support the transfer foundation mat will also be reduced to approximately 50 on each side of the tunnel. As described in Alternate IIA, a maximum of 46 piers can be installed (this

includes encroaching into the sidewalk area outside of the property line) in the physical space on the west side of the tunnel. If all the piers were installed within the property lines of the project, a total of 18 drilled piers can be installed along the west side of the tunnel. Therefore, all 50 piers cannot be installed on the west side of the tunnel even after encroaching into the sidewalk area outside the property line. All other parameters of design and construction would remain same as in Alternate II. The estimated additional cost (preliminary conceptual cost estimate) of this foundation system will be approximately $6 to $7 million. We understand this would significantly impact the project program. In addition, as with Alternate IIA, the required number of piles could not be accommodated on the site even using the area under the adjacent sidewalks.

Alternate II D:

This alternate assumes the following:

1. The proposed building will be moved to the "remainder" parcel (Lot 1) that is free from Caltrain development.

By relocating the building to Lot 1, the building's structural foundation system will be substantially removed from the Caltrain tunnel, with the exception of a small area in the west corner that is situated over the tunnel. We believe that the structural design for this alternate will be impacted very little by the proposed Caltrain tunnel location.

We hope that the above noted preliminary analyses provide the necessary information that you desire. If you require any further information or clarification regarding the above, please contact us at your convenience.

Sincerely,

DeSimone Consulting Engineers, P.L.L.C.

Subject: Evaluation of Caltrain Alternate 2 for the Downtown Terminal Expansion
301 Mission Street Project, San Francisco, California

Reference: Preliminary Evaluation Report - Alternatives for the Downtown Terminal Expansion, Issued by DeSimone Consulting Engineers, September 10, 2002

Dear Glenn:

We are pleased to submit this preliminary evaluation report summarizing the results of a study we performed related to the potential impact of the proposed Caltrain downtown terminal expansion on the planned high-rise building project at 301 Mission Street. Subsequent to the issuance of the above-referenced report and a meeting with the City and Caltrain to present and discuss the findings, Caltrain has made extensive modifications to the underground structure layout both in terms of lowering the tunnel floor and allowing for placement of columns to support the building's superstructure within selected regions of the tunnel. DeSimone Consulting Engineers (DCE) received the following drawings from Caltrain showing these modifications.

Reference Drawings:

Downtown Terminal Expansion - Alternate 2, Proposed Millennium Partners Section:
Drawing No. C101: Aerial view of the site with proposed Caltrain tunnel
Drawing No. C102: Aerial view of the site with tunnel and longitudinal profile
Drawing No. C103: Cross-section across the tunnel and mezzanine showing "No-Column" zone

From a review of these drawings, the following key changes were made to the Caltrain tunnel layout (Alternate 2) as compared to the earlier plans received on July 31, 2002:

1. The bottom of the tunnel floor has been lowered by 19 feet. It is now shown at 64 feet below grade as compared to 45 feet below grade previously.
2. The top of the mezzanine level has been lowered to 18 feet below grade. Previously, the top of the mezzanine roof slab was shown to be at grade. The height of the mezzanine is shown as 20 feet including the roof slab thickness (5-feet thick); whereas, previously it was shown as 15 feet (including the roof slab). Note that for analysis purposes, we have assumed that the mezzanine

roof slab could be incorporated into our design as a part of the building's foundation mat.

3. Provisions were made by Caltrain to allow interior columns to be added through the tunnel structure in certain zones in order to support the building's superstructure.

Summary of DCE Report Dated September 10, 2002

Since early August, DeSimone Consulting Engineers (DCE) have been providing support to both Millennium Partners and Gary Edward Handel + Associates (GEHA) to evaluate the potential structural engineering impacts of two proposed Caltrain terminal expansion alignments on the planned 301 Mission Street building project. Caltrain Alternate 1 passes adjacent to (and slightly encroaching upon) the 301 Mission Street site, and Alternate 2 passes underneath a portion of the site, directly under the planned location for the core of the proposed building tower.

It was concluded that Alternate 1 could be accommodated, but at an increased cost to the 301 Mission Street project. Alternate 2 was judged to be infeasible, based upon the timing, technical and economic factors identified in our analysis. Alternate 2 was found to be infeasible in part due to the stringent constraint required by Caltrain that the building structure span across the entire width of the tunnel (in excess of 90 feet) without any provisions for support of the building superstructure either by or through the Caltrain structure. This resulted in a structural design solution that required the entire superstructure to be supported by a very thick structural mat that would act as transfer element to distribute the gravity as well as lateral forces across a 90-foot wide span to a deep foundation system on either side of the tunnel. Such a solution would result in significant structural, programmatic and cost implications for the project, and was therefore judged to be impractical.

On October 21, we participated in a meeting with Caltrain and the City of San Francisco to present and discuss these results. As a result of this meeting, Caltrain has modified its criteria from what is described in their initial conceptual plan and the Transbay Draft Environmental Impact Statement, and have now provided us with a revised Alternate 2 alignment that is both lowered by 19 feet and delineates specific allowable zones within the proposed tunnel where columns may be placed for support of the building tower.

Analysis Methodology and Summary of Results

A three-dimensional linear model using the ETABS computer program was developed that comprised a complete model for the superstructure as well as the below grade structure. Figure 1 shows the computer model for the entire building. Figure 2 shows a partial 3-D model of the below-grade structure. Figure 3 shows the foundation plan layout indicating both column and shear wall sizes and locations with respect to the Caltrain tunnel.

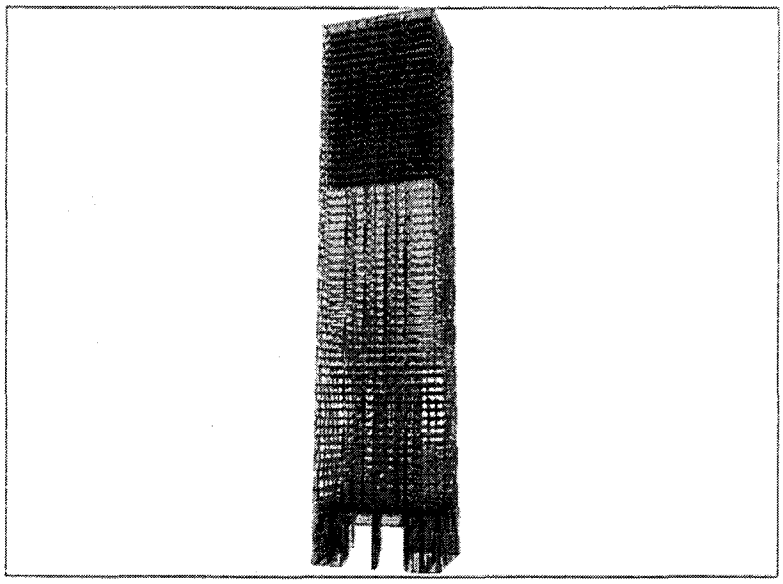

Figure 1: 3-D model of Building

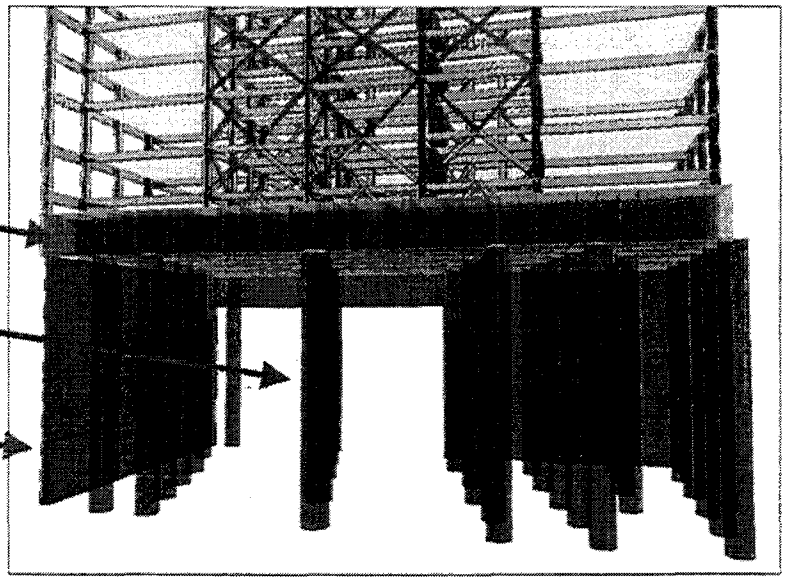

Figure 2: 3-D model of below-grade structure

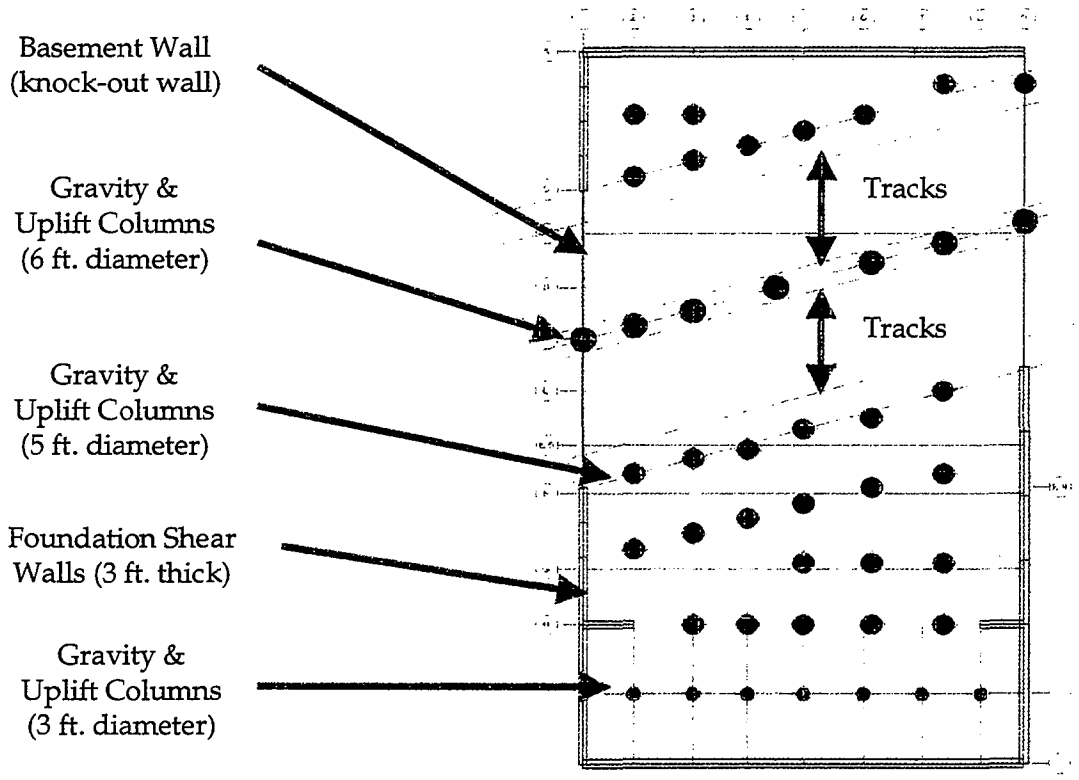

Figure 3: Foundation Plan Layout

The proposed strategy for developing a revised foundation plan for the 301 Mission Street tower comprises supporting the superstructure of the building on a thick concrete mat reinforced with structural steel beams as well as with conventional reinforcement. The concrete mat would then be supported by series of columns below as shown in Figures 2 and 3. The concrete mat acts as transfer girder in bending to transfer the superstructure's gravity and lateral tension/ compression loads to the columns below. The concrete mat also acts as a thick shear plate transferring the superstructure's shear loads to the perimeter concrete shear wall.

It was assumed that the below-grade structure supporting the building would be isolated from the Caltrain structure in order to ensure that the supporting structural system would not impose lateral loads or deformations on the Caltrain structure. As such, a 3 to 4-inch wide isolation joint will need to be provided around all columns and shear walls. Therefore, for analysis purposes, the columns and shear walls supporting the concrete mat were considered to be isolated from the Caltrain structure. As a result, the clear height (i.e. no lateral support) of these elements from the bottom of the concrete mat to the top of the pile caps is assumed to be approximately 46 feet.

The column and shear wall layout of the below-grade structure as shown in Figure 3 does not match up with the layout of the moment frames and braced frames of the superstructure. This condition is defined as a vertical and lateral discontinuity, and according the Code, all structural elements below such discontinuity shall be designed by multiplying the design loads by the "Omega" factor, which in this case will be 2.8. Therefore, the design forces for both the concrete mat and the foundation structure below this mat will need to be increased by 280% to conform to this Code requirement.

The deformations in the superstructure were also monitored to determine the relative increase in story drifts due to the foundation flexibility. The foundation flexibility resulted in an increase in story drift of approximately 20%. Therefore, the superstructure would have to be strengthened over that of the base design (without the Caltrain tunnel) to accommodate this additional flexibility. Based upon the analysis, the superstructure of the building can be stiffened by using a conventional dual lateral load-resisting system. However, this will result in an increased structural cost to the project. We estimate that this additional cost will be in the range of 10 to 15% of the base structural cost, or about $3,500,000 - $5,250,000.

Using the above methodology, the member sizes of the key structural foundation support elements were determined and are as shown in Figures 2 and 3. The members were sized based upon both strength and stiffness requirements, and as a result, a three (3) foot-thick perimeter foundation shear wall is required to resist the shear loads and provide sufficient stiffness. The shear wall would in turn be supported by a drilled pier foundation below the Caltrain track elevation. The columns situated between the tracks are required to resist the highest load due to the location of braced frame core above, as well as to support the largest unsupported span of the concrete mat. These columns are required to be approximately 6 feet in diameter, located at approximately 15 to 17 feet on center. Similarly, the remaining columns within the tunnel are required to be approximately 5-feet in diameter, with the columns on south side of the tunnel required to be 3-feet in diameter. These columns would probably be designed as composite elements comprised of heavy structural steel shapes encased in concrete in order to optimize their size and spacing.

The concrete mat would be approximately 10-feet thick, and would be comprised of both structural steel and high strength concrete working in composite action. The structural steel shapes would serve to increase the stiffness as well as to improve the constructibility of the thick mat. As mentioned previously, it was assumed that the underside of the concrete mat could serve as the ceiling of the Caltrain mezzanine structure. In the event that Caltrain prefers to have an independently supported mezzanine roof structure, this structure will need to be isolated from the bottom of the foundation mat. In this event, we estimate that a vertical isolation of between 5-to-8 inches will suffice.

Project Programming Impacts

The extensive modifications to the Caltrain tunnel layout plans noted above would result in lowering the mezzanine level to 23 feet below the street level and the train track level to 61 feet below the street level. While this element has not been analyzed or designed, it presents significant challenges for passenger access to the train level from the street and will require a series of escalators, elevators and stairs at steep angles due to the limited horizontal distance available. These escalators, elevators and stairs will also require large openings in the concrete mat of the building which will need to be significantly reinforced and may also need to be thickened at areas around these openings. This will result in additional cost, as well as architectural programming issues, for the 301 Mission Street project.

As noted above, the columns supporting the concrete mat and the superstructure range in size from 3 to 6 feet in diameter with the majority of these columns being of 5 foot diameter. These columns are spaced at approximately 15 feet-on-center. Therefore, the size, location and spacing of these columns within the Caltrain structure present significant security and passenger traffic challenges that Caltrain will need to consider in their program.

Design and Construction Sequence Constraints

There are a number of ways in which the construction of the structural system, including the Caltrain tunnel, could be sequenced. However, it would be particularly impractical and costly to construct the system in a way that would require Caltrain to bore through to create the tunnel after the building project had been completed. Therefore, we assume that prior to construction of the 301 Mission Street superstructure, it would be required to excavate to the bottom of the track elevation (-61 feet), and to provide shoring retention, pier foundations, columns, and shear walls. In addition, concrete knock-out panels at the ends of the tunnel right would need to be provided.

This proposed strategy would require that the conceptual tunnel layout plans made available to the project design team by Caltrain be verified and developed into final drawings and approved by the various agencies that are involved in a very short period of time so that the 301 Mission Street project schedule is not adversely impacted. It would be imperative that these final drawings by Caltrain be made available to the project design team before the project design is further developed into final construction documents. Based upon the 301 Mission Street project schedule and current state of the Caltrain drawings, this would not be possible without delay to the project. This will also require extensive coordination and agreements between the parties that will result in additional cost and schedule impacts. Furthermore, after the 301 Mission Street project design is completed, any material modifications to Caltrain's plans would likely result in significant costs and scheduling delays for the project as they may require redesign of part or all of the project.

Based upon the above noted constraints in the design and construction of the foundation system, we estimate the additional hard cost for the construction will be in the range of $12 to $15 million, which includes tunnel improvements of about $6 to $7 million. The total incremental structural costs of this Alternative as compared to the proposed project are about $15,500,000 to $20,250,000, taking into account both the dual lateral load-resisting system and the foundation costs. Incremental structural costs of Alternative II analyzed in our September 10, 2002 letter as compared to the proposed project are about $9-13 million for foundation work, plus about $8,750,000-$12,250,000 for the load-resisting system, for a total of about $17,750,000 to $25,250,000 in increased structural costs. The costs for Alternative II would increase by an additional $6-$7 million if the tunnel improvements are also assumed. Please note that these costs are based upon a preliminary conceptual estimate and the actual costs may vary significantly from this estimate. This preliminary cost estimate represents bare construction costs only and does not include soft costs or costs associated with delay in project completion due to construction of the structural foundation system presented in this report. These and other associated costs would be incurred in the near future as part of the 301 Mission Street project, but would be the responsibility of the Transbay project. We are unaware of any funding source to cover these costs.

We trust that the above-noted preliminary analyses will provide the necessary information you desire. If you require any further information or clarification regarding the above, please do not hesitate to contact us.

Sincerely,

DeSimone Consulting Engineers, P.L.L.C.

Re: 301 Mission Street

Dear Mark:

We have reviewed the two alternatives for the proposed Caltrain "Downtown Terminal Extension" as it relates to the 301 Mission Street Project. As per your request we have evaluated each alternative with respect to the architectural design and programming of the project as it is currently designed. I have also attached a letter from DeSimone Consulting Engineers, P.L.L.C., which raises additional cost and feasibility issues.

Alternate I: drawing DTX-ALT1B-40 dated 7-31-02 and Section A-A dated 7-29-02.
This alternative relates to the new Transbay Terminal and involves acquisition of a southernly portion of the site. The plans indicate that the construction of a forty-five (45 ft.) deep tunnel wall would run parallel and approximately five (5 ft.) within the south lot line of the 301 Mission Street (the project) property. The encroachment of this wall would affect the current diagonal parking stalls along the south wall and perhaps the vehicular passageway/loading dock at ground level. We feel that a redesign for this area of the garage is realistic and that we can make the adjustments to accommodate the design of Caltrain tunnel, at an increased cost provided that the plans are accurate and that there are no major revisions. For the purpose of this analysis we have made the following assumptions: (Refer to figure 1 on page 2 for illustration).

1. As indicated in drawing Section A-A the outside face of the Caltrain foundation wall is aligned 2'-0" over the property line of the project, which we have assumed as a starting point for construction purposes (see figure 1).
2. The temporary piles indicated on Section A-A could be eliminated in lieu of utilizing the project's foundation wall to construct the Caltrain tunnel wall up against.
3. An 8" to 12"construction separation joint would be placed between the outside face of the proposed Caltrain tunnel wall and the foundation wall of the project to mitigate movement between the two structures.
4. The thickness of foundation wall for the project would be approximately 18" to 24".
5. The total dimension width lost within the garage would be 3'-6" over the length of the site which is 275'-0". Approximately 4000 sq. ft. of floor area would be lost over the four levels below grade (Levels B1-B2-B3-B4).
6. The ground level slab will be cantilever over the project's foundation wall towards the property line. This will enable the project to maintain the existing design along the vehicular passageway and loading dock areas.

Given the assumptions described above in Alternative I approximately 30 to 40 parking stalls would be lost throughout the parking garage and approximately 500 sq. ft. of storage and 500 sq. ft. of mechanical space would be lost on Level B1. With respect to the vehicular passageway and loading dock at the ground level, no changes or alterations will be required assuming that cantilever at the ground slab is acceptable.

735 Market Street, 2nd Floor San Francisco CA 94103 tel: 415 495 5881 fax: 415 495 3620 e-mail: gehesf@gehe.com

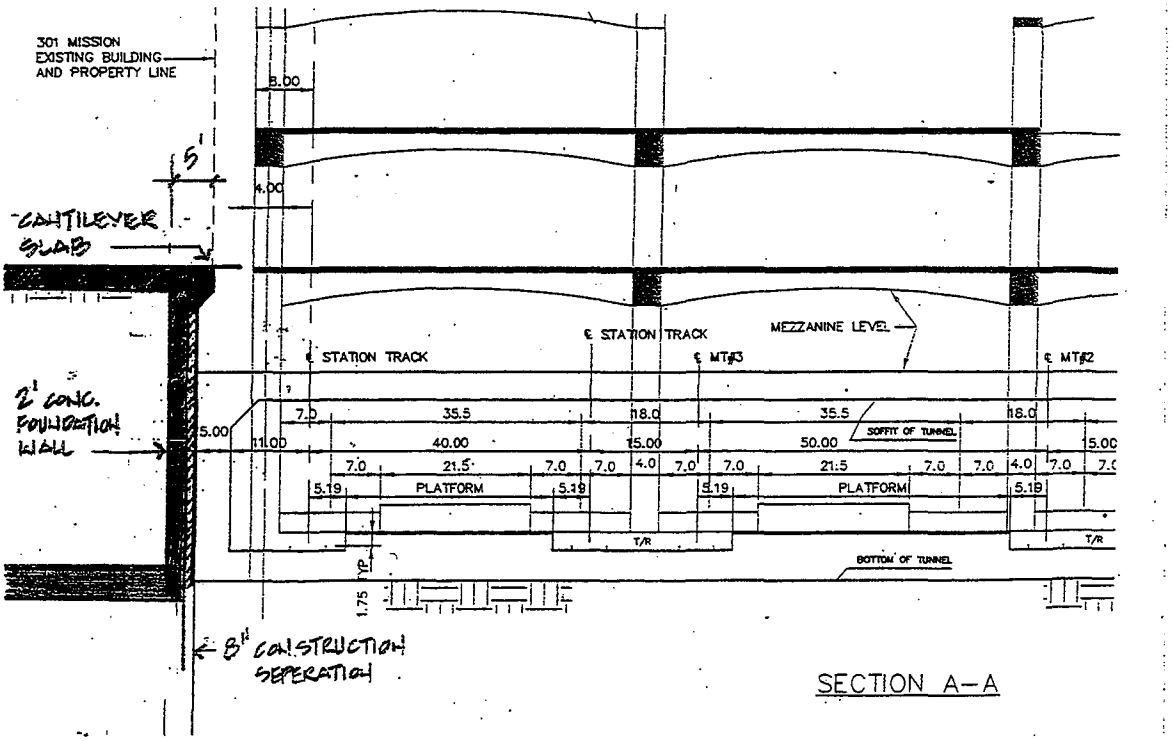

Figure 1

Alternate II: drawing DTX-ALT2B-40 dated 7-31-02.
Alternative II is the Second Street-to-Mission Street Caltrain extension alternative. There are several ways to analyze the impact of the alternative.
The plans indicate that the construction of a forty-five (45 ft.) deep tunnel would traverse directly through the 301 Mission Street property. The location of the tunnel and its physical configuration would significantly alter the remaining below grade buildable area on the property and would cause a redesign of various portions of the project. Judging from these drawings we have assumed that the train tunnel and the pedestrian mezzanine connecting to the bus terminals will make up approximately 2/3 of the entire site. The remaining 1/3 of the site (approximately 17,000 sq. ft.) would be free of any Caltrain construction and could be utilized for the below grade services of 301 Mission Street (see figure 2).

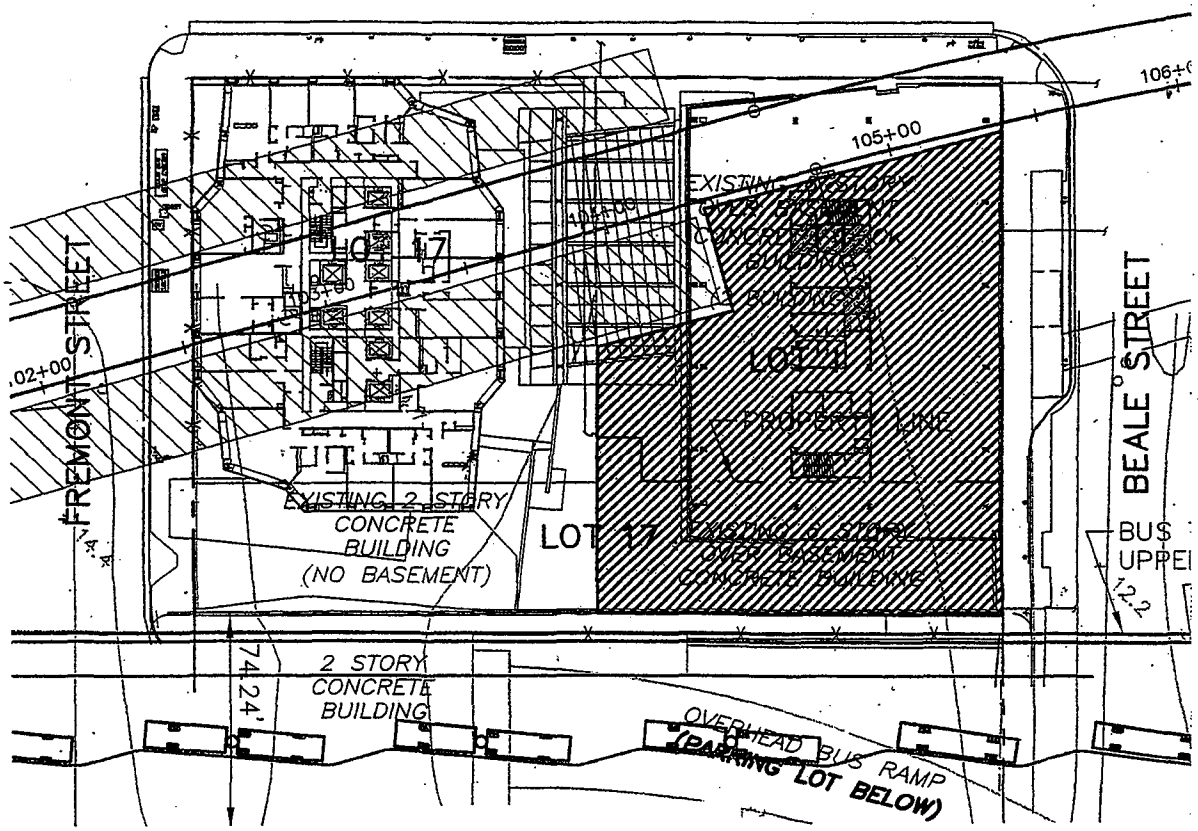

Figure 2

Alternative II A is assuming that the 301 Mission Street project provides the necessary clearances to accommodate the Caltrain tunnel under its base. Given the schedule for 301 Mission Street, it would be necessary to confirm the required clearances now. Above the mezzanine level of the tunnel a 30' deep structural mat would span the width of the tunnel (approximately 90') and piles will be located at the northern and southern outer edges of the mat for the vertical support. Under this scenario the 30' structural mat would extend above the existing grade of the street and the first two floors within the tower footprint would be completely eliminated (see figure 3). This scheme will also eliminate the main vehicular and pedestrian drop-off Porte Cohere area and the vehicular parking and loading access point from Fremont Street. We also anticipate that the structural mat would have to extend beyond the site in order to facilitate the appropriate number of piles to support the building. According to the D C E report, even with use of the public sidewalk area, the required piles need to support the mat could not be accommodated on such a small area of site. This solution will have tremendous design implications, which make it infeasible for the following reasons:

1. A 30' structural mat eliminates the first two floors of the tower footprint replacing the ground floor and second floor retail and the atriums open space areas. The residential and hotel lobbies will have to be relocated to the third floor. Access to these lobbies will replace the public atrium on that floor as well. This approach will take up approximately 2500 sq. ft. of dedicated atrium open space as well as add a significant amount of cost for additional elevators and escalators in order to shuttle hotels guests and residents up to a third floor lobby.

We can assume that two escalators and four elevators, at a minimum, would be added to the project. The functions designated to the second and third floors of the tower will also need to be relocated or eliminated due to relocating the ground floor functions above the structural mat. Relocating the second and third floor functions to higher floors within the tower will also eliminate 20 hotel units.

2. Approximately 4500 sq. ft.of restaurant and retail space at the ground floor will be eliminated below the tower footprint due to the placement of the structural mat.
3. The vehicular access to the site from Fremont Street for passenger car and loading vehicles will be eliminated due to the configuration of structural mat. In addition, the access to the parking garage ramp, the loading dock and the Porte Cohere, which is the primary pedestrian drop off for the project, will all be eliminated. As a result pedestrians, vehicles and service vehicles would need to access and egress the site from Beale Street. This resolution will significantly affect the ground floor reducing retail, public open space, and the central atrium. Additionally this resolution would create numerous constraints for locating the office elevator core in an area that would functionally be desirable for servicing pedestrians and deliveries.
4. Presently the mechanical and electrical distribution design to the residential tower is routed below grade from various mechanical rooms within the garage. Our design also incorporates a dedicated service corridor for deliveries to be routed to the central elevator cores of the tower from a below grade service elevator adjacent to the loading dock. Due to the location of the Caltrain tunnel and physical constraints of the structural mat, all mechanical and electrical distribution would need to occur outside the footprint of the tower, reducing yet more additional valuable square footage at the ground and second floor. Approximately 1500 sq. ft. of dedicated shaft area will be needed on the ground and second floor to route the mechanical and electrical distribution from below grade up and over the structural mat at the third floor. Additionally, a dedicated service elevator and corridor will need to be added to the design of the atrium to services the residential tower. A total of about 4000 sq. ft. of ground and second floor program area will be replaced by these services.
5. As per the changes to the below grade design the project will significantly be affected by the site constraints and reduce buildable area that is free of any Caltrain construction. Under the current design 123,000 sq. ft. is devoted to parking, 25,000 sq. ft. to ramps and drive aisle, 40,000 sq. ft. to mechanical rooms, and 10,000 sq. ft. to elevator cores, stairs and shafts. Assuming that a vehicular parking ramp from the ground floor to B1 can be accommodated and that an elevator core can be centrally located within the 17,000 sq. ft. parcel, and mechanical rooms can be arranged in some cohesive order, the remaining area that could be dedicated to parking would be significantly reduced and inefficient for a project of this size. Per floor, about 2000 sq. ft. is dedicated to garage exhaust fan room, 2500 sq. ft. for a vehicular ramp, 3000 sq. ft. for mechanical rooms and 2000 sq. ft. for elevator core and stairs. The remaining area dedicated to parking stalls and drive aisles would be approximately 7500 sq. ft., which would allow for roughly 25 parking stalls per floor; totaling approximately 100 cars over four floors verses 400 per our existing design.
6. From an Urban Design standpoint, this alternative would conflict with policies set forth in the downtown plan. The encroachment of the structural mat would prohibit any ground floor activity to occur below the residential tower, and eliminate all ground floor activities and visually create a physical barrier effectively a concrete wall along Fremont and Mission Street. Outdoor public space along Fremont Street and Mission Street would also be eliminated from the open space design.

   As a result of this alternative, the only remaining program at the ground floor that can be salvaged from the existing design would be the office lobby and partial ground floor retail at Mission and Beale Street. The remaining ground floor area would be dedicated to loading, vehicular ramps and mechanical shafts. The second floor of the tower will also be encroached by the structural mat and would not have any program space.

   The central atrium will not exist in its present design. Adding numerous elevators to the project to reroute pedestrians and deliveries to the third would also absorb a significant amount of the floor area (approx. 2500 sq .ft.) The remaining area that could be dedicated to public open space on the ground floor would be approximately 2000 sq. ft. versus 11,300 sq. ft., which our current design indicates.

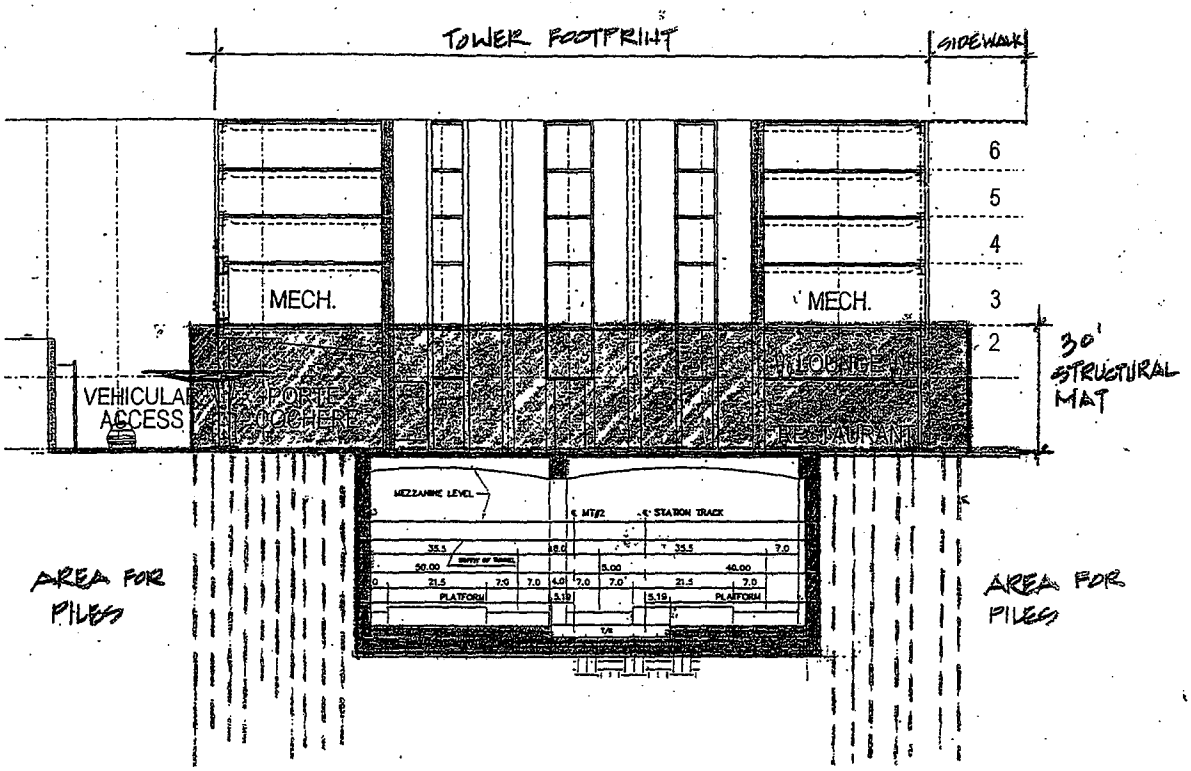

Figure 3

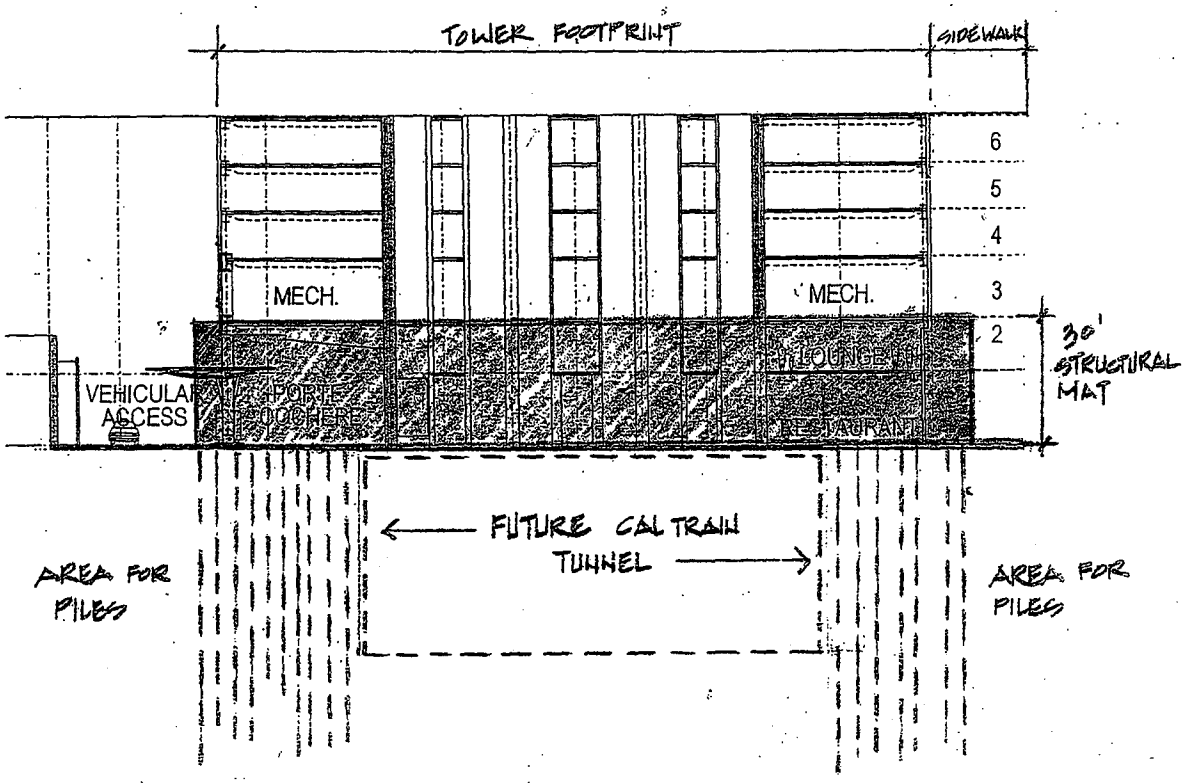

Figure 4

Alternative IIB is assuming that the Caltrain tunnel is constructed as part of the initial 301 Mission Street development. Assuming the configuration of the tunnel is as per drawing DTX-ALT2B-40, the structural foundation system for the project will be as described above in Alternative IIA. A 30' deep structural mat extending above grade supported by numerous piles at both ends of the mat will be constructed as the primary structural foundation system for the tower (see figure 4). As in Alternative IIA the problematic issues with this alternative regarding pedestrian and vehicular access, program reduction, etc., (see comments above) will be identical for Alternative IIB plus additional construction cost and timing issues, making this alternative also infeasible.

Alternative IIC is assuming that the height of the tower is reduced by ½. According to DeSimone Consulting Engineers the thickness of the structural mat could then be reduced to 15' in thickness. The engineers have concluded that, as in Alternative IIA, the required piles cannot be accommodated on the site. Although the thickness is reduced, this alternative is substantially similar to Alternative IIA in its program and urban design impacts. Similar to alternatives IIA and IIB described above the configuration of the mat in this alternative will also interfere with ground floor functions, i.e. residential and hotel lobbies, vehicular access and loading access. In addition to the programmatic issues that this solution creates at the ground floor and below grade, reducing the tower by ½ its height will also eliminate over 400,000 sq. ft. of program, most or all of which would be residential units, depending on the revised program mix. (See figure 5).

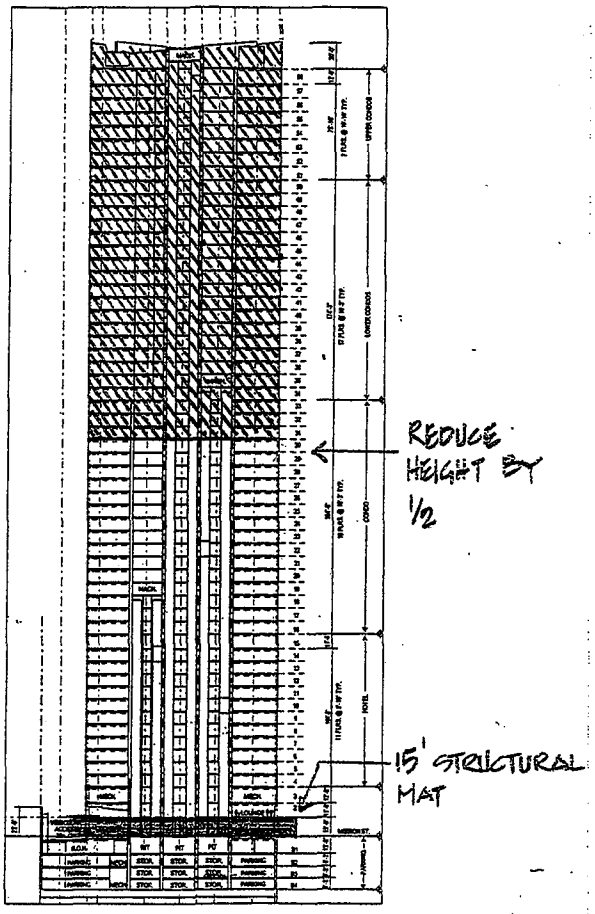

Figure 5

Alternative IID is assuming that the tower location for the project is shifted onto the area of land outside of the Caltrain tunnel. Assuming that the tunnel and pedestrian mezzanine takes up approximately 2/3 of the site, approximately 17,000 sq. ft. of land would remain free of any Caltrain construction (reference figure 2 for buildable area). This area of land would be utilized for construction of the foundation system to support the superstructure of the tower's footprint. This is of course based only on the Conceptual Plan, and additional reductions in the footprint could be necessary to accommodate CalTrains' program. As a result of this condition the project would be infeasible as follows:

1. The location in which the remaining buildable area is located is zoned for a maximum height of 400' (versus 550'), which is the zoning allowable for the current tower location. Assuming that a similar tower floor plan is designed for this location the maximum area of FAR that could be achieved on this parcel of land is approximately 306,000 sq. ft. versus 907,498 sq. ft., which is allowed. This assumes that a project of this size would support a TDR transfer bringing the FAR to 18:1; without the transfer, the square footage would be considerably less.
2. Reducing the height of the project will also have significant impacts on the project presence along the city skyline and would not be in keeping with the Downtown Plan and Planning Department policies regarding density and design at this location. The goals set forth in the Downtown Plan encourage towers of this stature to have a sense of slenderness and add visual interests to the termination of the building and emphasize that added height would improve the appearance of the skyline when viewed from a distance. Furthermore, from a development standpoint a reduction in the height of the residential tower would have a significant impact on potential views and will reduce the value of the overall project.
3. Reducing the buildable area of the project will also have a significant impact on the ground floor functions such as the residential lobbies, loading dock areas, vehicular and parking ramp access. The central atrium would be completely eliminated from the design and retail spaces at the ground floor would be very minimal. The area required to program all the ground floor functions, i.e., the residential lobby, loading dock, vehicular parking ramp, mechanical shaft and back of the house offices for a project of this size is approximately 20,000 sq. ft. This does not include areas dedicated to public open space. Due to the constraints of the reduced site (17,000 sq. ft.) this alternative cannot accommodate these functions. Furthermore, parking below grade will be dramatically impacted due to the irregularity of the site, and the limited amount of parking area that can be dedicated to stalls.

   Elevator shafts, mechanical room, electrical vaults room, and garage ramps will require approximately 8,000 sq. ft. per floor of program area. This allows only 9,000 sq. ft. for parking stalls which is equivalent to 28 stalls per floor, for a total of 112 cars if four levels were constructed. However it is unlikely that four floors would be constructed, given the high cost of excavation and small number of cars each floor could accommodate.
4. With regards to the projects urban identity and public features it will be extremely difficult to accommodate the current design or a similar concept on the reconfigured site. Assuming that the project is built as a residential building all public open space areas would be eliminated from the design and most likely the residential open space component will be designed within the units as balconies and as a dedicated roof top garden. The loading dock, the vehicular ramp and the residential lobby will primarily consume the ground floor. Due to the site constraints, retail spaces, restaurants and interior open space components that add significantly to the urban character of the street and reflect the intention of the Downtown Plan will not be accommodated in this alternative.

Based on our preliminary analysis for Alternative II, we believe that the four variations of this alternative to be infeasible. Given the constraints of the site in conjunction with the project's existing program, the physical character and program would be completely altered and a redesign of the project would need to occur. Even with a redesign, cost, site constraints and other technical considerations would make the current program, or even a substantially similar one, infeasible..

If you have any further questions, please do not hesitate to contact us.

Sincerely

Glenn G. Rescalvo, AIA

Re: **Evaluation of Caltrain Alternative 2 for the Downtown Terminal Expansion**
301 Mission Street

Dear Mark:

We have reviewed the revised alternative plan for the proposed Caltrain "Downtown Terminal Extension" (Alternate 2) as it relates to the 301 Mission Street Project. This alternative, which represents the Second Street to Mission Street Caltrain extension, is a revision to the "original Alternative 2" which Caltrain presented to us in mid-October of 2002. It entails drawings C101, C102 and C103 dated November 4, 2002. Per your request we have evaluated this alternative with respect to the architectural design and programming of the project as it is currently designed.

As discussed in the attached DeSimone Consulting Engineers' letter, the revised plan includes a lower tunnel floor and allows for placement of columns to support the building's superstructure. Under this Alternative, only 1/3 of the below-grade area would be available for parking and building support functions. While the entire site above grade is assumed to be available for the development program, the program and design are altered significantly as compared to the project in order to accommodate the relocation of below-grade functions. The following discusses the impact to the building's vertical circulation servicing, parking, support functions, and their subsequent affect on floor area ratios (F.A.R.), residential unit count, office areas, costs and Caltrain pedestrian circulation.

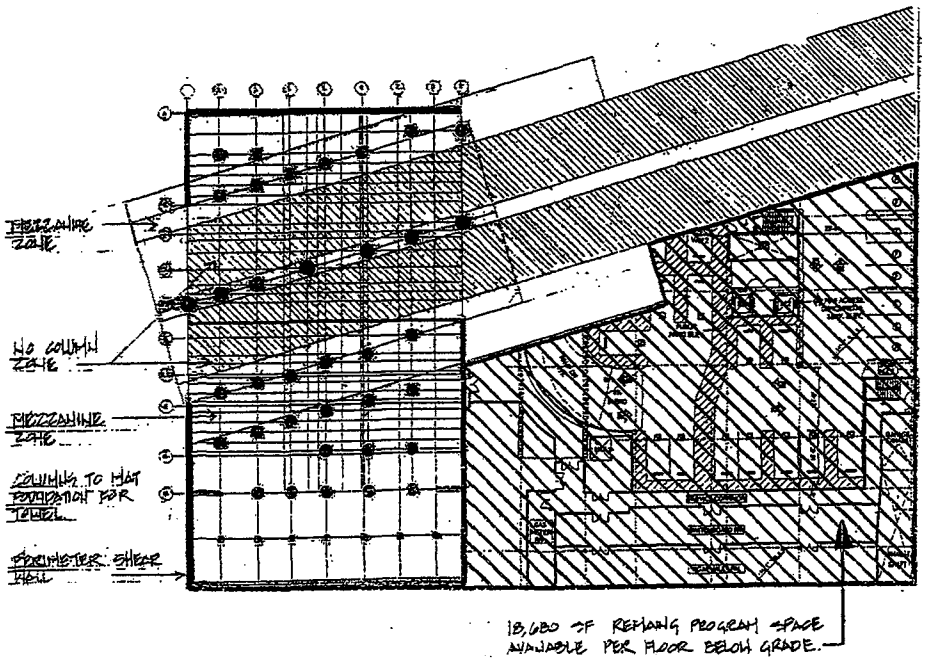

Figure 1

Residential Tower Elevator Core Servicing

Per the analysis in DiSimone's letter, the top of the tower's residential foundation slab would be placed eight feet beneath the residential tower's grade level. Thus access from the loading facilities, currently below grade would no longer be feasible and access to the elevator core from the loading facilities would need to relocate above grade, on the third floor of the office building. A service corridor would then need to traverse the public atrium and connect with the residential tower core. This enclosed corridor would ruin the purity of the current design. Upon entering the public atrium, pedestrians' views upward towards the skylight roof would be disrupted by the enclosed crossing above (Fig. 2 & 3). This resolution is also problematic from a servicing standpoint, as this entails servicing the residential tower and hotel by means of the office service elevator to reach the residential tower. This is operationally challenging, inefficient and creates numerous security concerns.

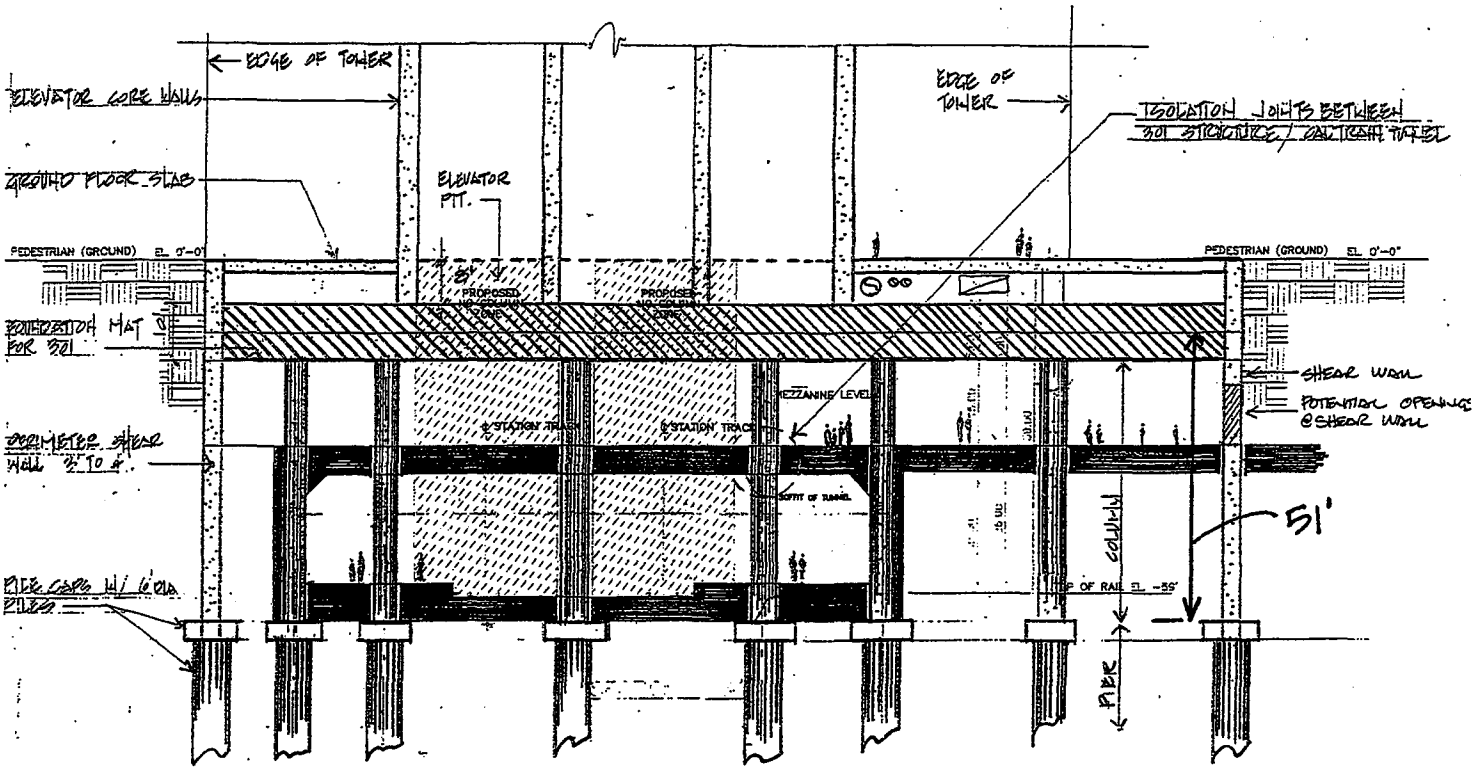

Figure 2

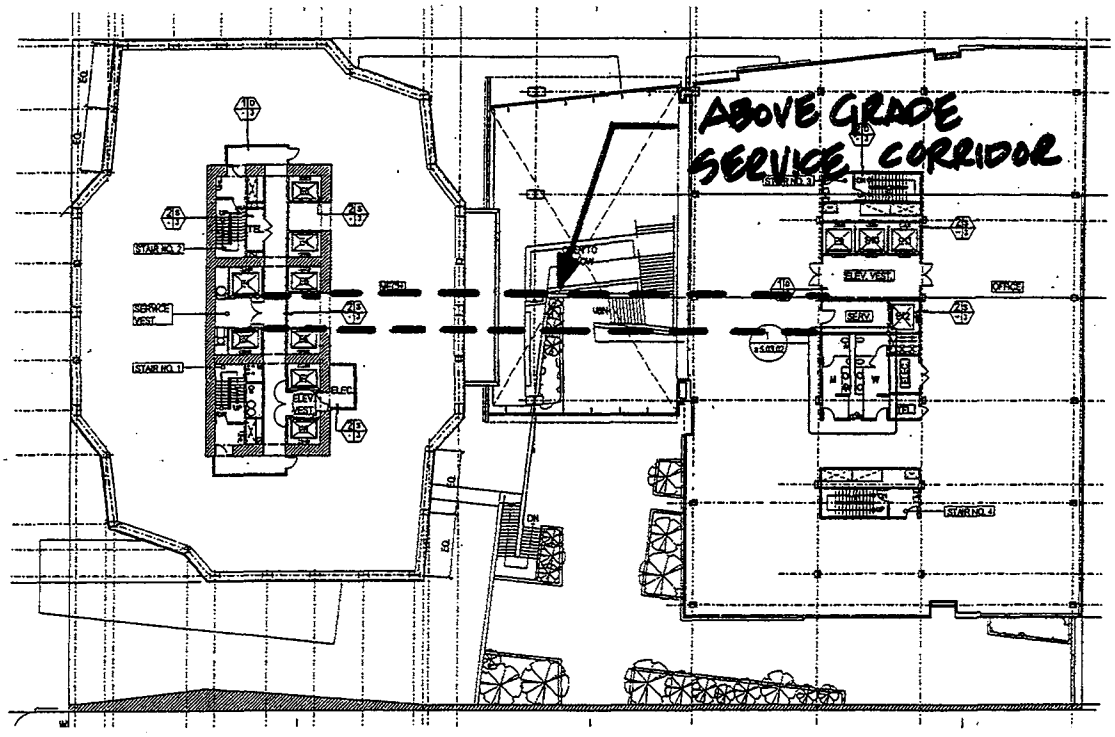

Figure 3

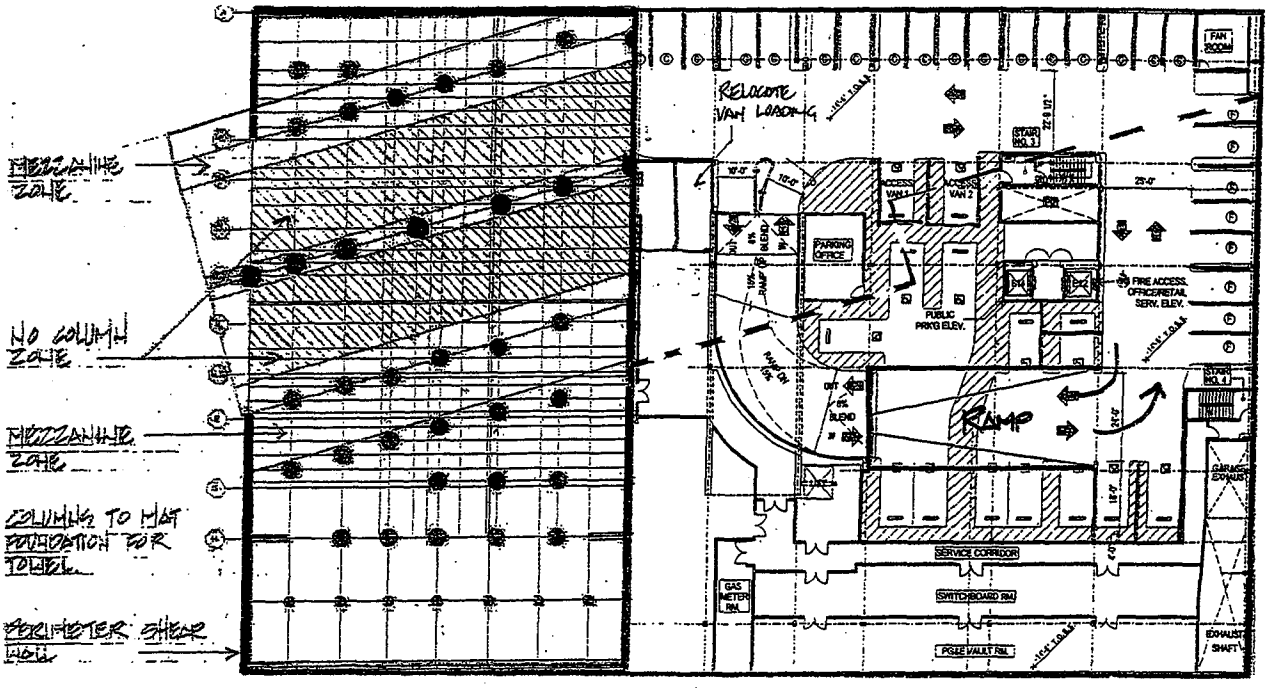
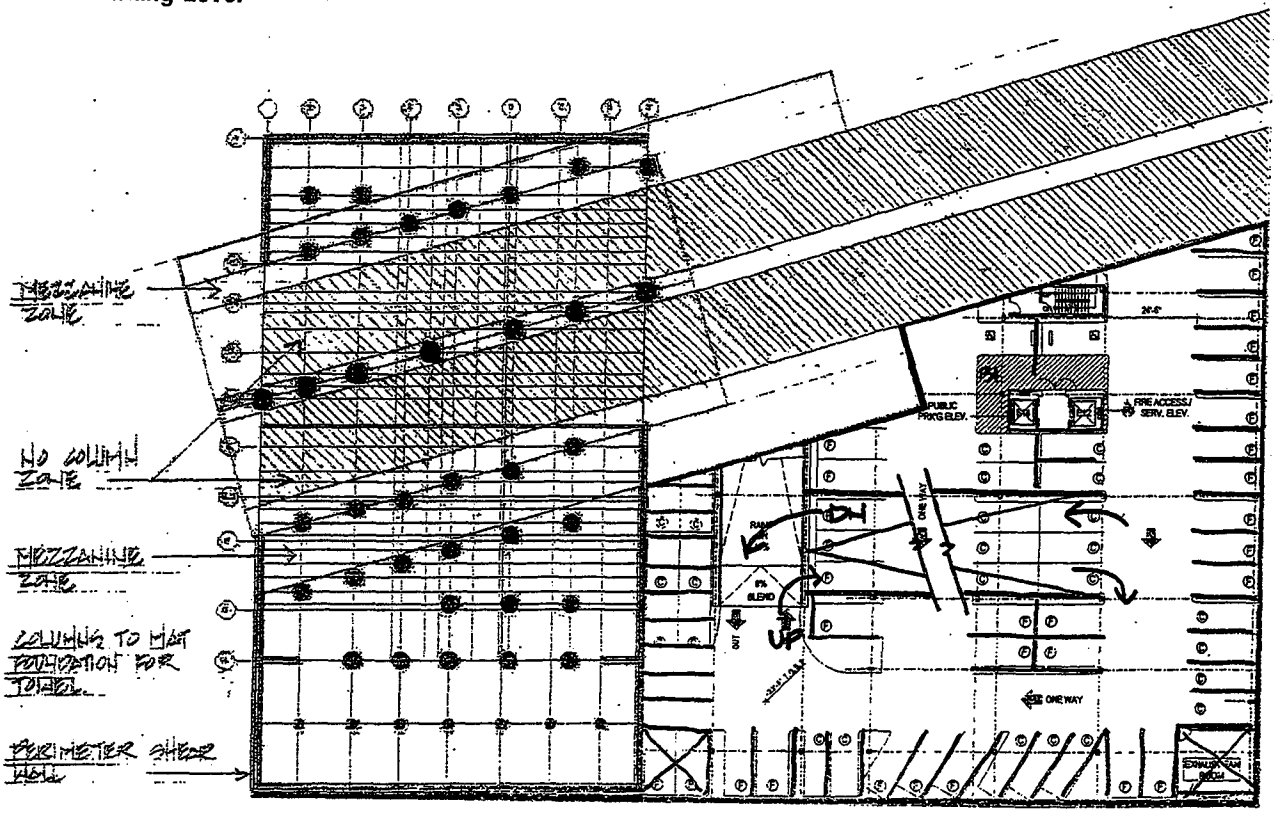
Parking Impact

Below grade Levels B1, B2, B3 and B4 would all be significantly reduced by the incorporation of the Caltrain alternative and subsequently would need to be completely redesigned. As noted on figure 4, the remaining 18,680 square feet of area would need to be devoted only to parking ramps and stalls. Given the awkwardness of the layout, maneuvering and efficiency of parking will result in a loss of 243 stalls leaving the project with only 157 stalls for 320 residential units, and no spaces for visitors and commercial uses. In addition to the loss of 60% of the parking stalls, building support functions would need to be located elsewhere within the project as discussed next.

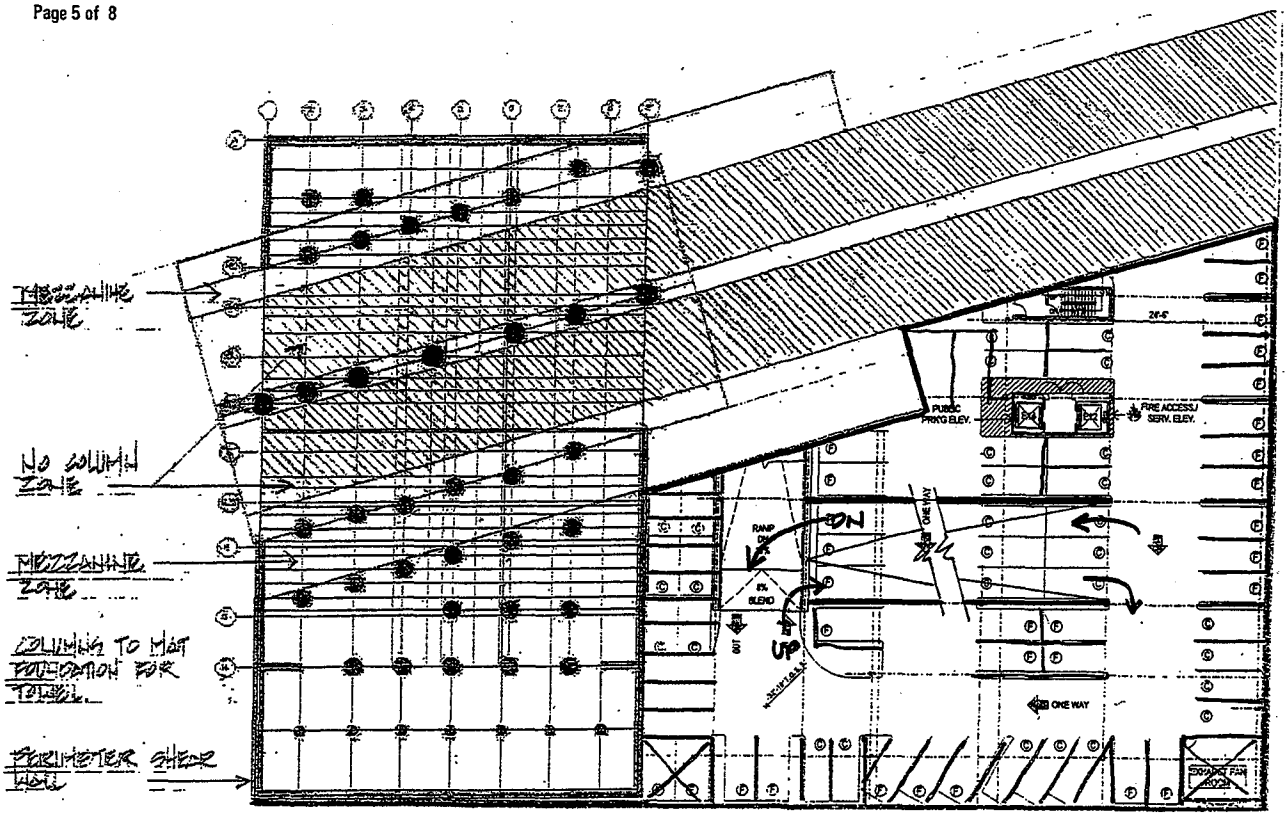


B1 Parking Level

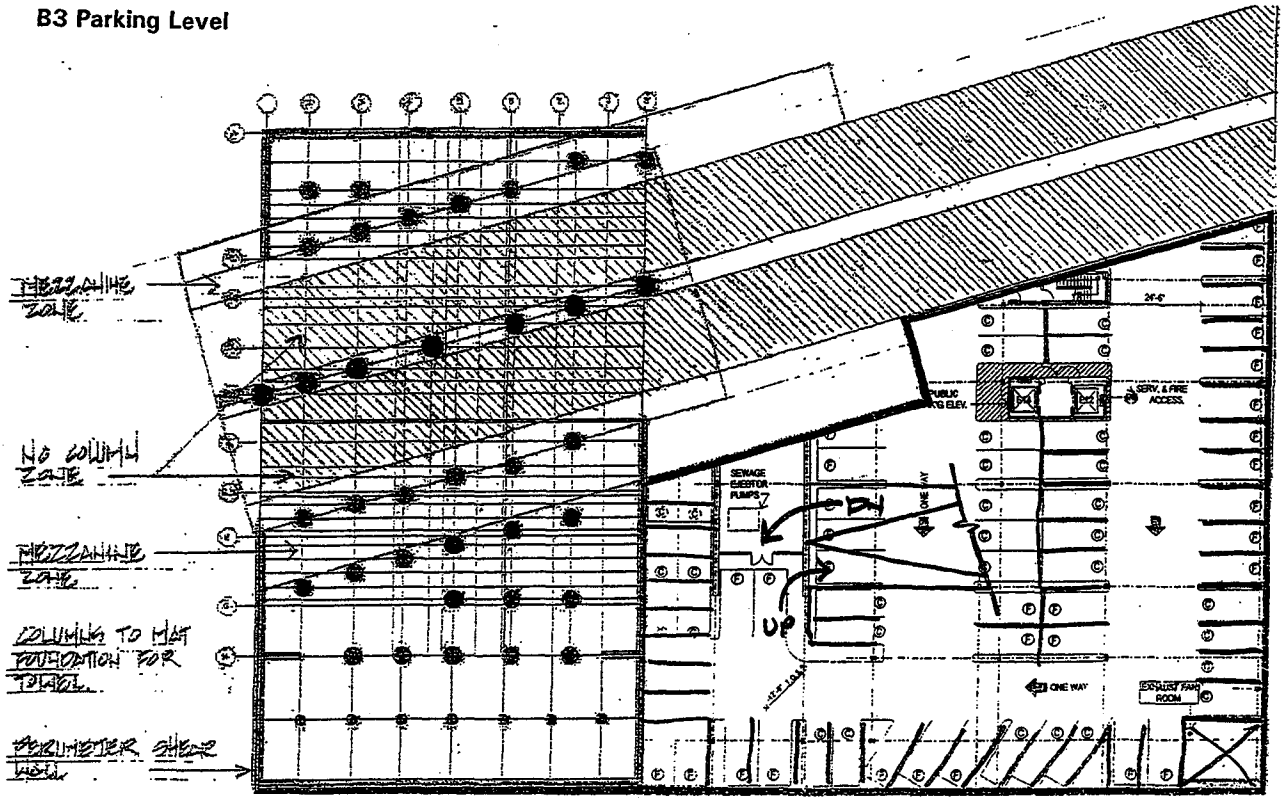


B2 Parking Level

Figure 4



B3 Parking Level



B4 Parking Level

Figure 4 continued

Relocation of Building Support Functions

For this evaluation, building support functions consist of two categories: 2- story mechanical spaces, and 1-story support spaces (utility, electrical, plumbing and storage). Caltrain's new alternative necessitates relocation of these services to tower floors above grade, and as a result valuable F.A.R. square footage will need to be recaptured else where on the site.

The 2-story mechanical spaces currently located directly beneath the residential tower footprint are strategically located to efficiently feed up into the tower. 23,725 square feet (net) of double height mechanical space would need to be relocated into the tower, for a total of 47,450 square feet. The other 1-story service areas comprise 37,262 square feet, for an overall total of 84,712 square feet of relocated space. This would absorb eight floors, equivalent to 64 units.

To address the displaced square footage from the residential tower, the area could be relocated to the office tower. This would increase the office tower 6 floors, from, 9 floors to 15 floors (Fig. 5), and increase the height of the office tower 83 feet, from 126 feet to 209 feet. Please note, the 84,714 represents net square feet associated with the support functions that would replace 8 floors of F.A.R. from the residential tower, totaling about 103,050 gross square feet, and equivalent to 6.3 current office floors, rounded here to 6 floors.

While it is possible to relocate the lost housing to the office tower, we do not recommend this given the scale of the building. The building would lose efficiency as the elevator and service core would enlarge noticeably and there would be substantial duplication of mechanical systems. Again this arrangement would be operationally challenged, inefficient and increase security concerns.

Given the steel structure above grade, sound and vibration transmittance of the mechanical equipment would be of great concern. This problem would require substantial study and result in additional costs.

Regarding aesthetics and urban design, the project's expression and connection to the street would be disrupted. With four to five lower tower floors allocated to mechanical functions, louvers would replace vision glass. The glass is an important element of the design's visual continuity and the concept of a graceful, slender glass tower. The additional 6 stories on the office tower would dramatically change the scale and daylight quality in the public atrium and outdoor space.

BASEMENT

Figure 5

Cost Issues

Given the greater complexity of the foundation system, the need to incorporate additional sound and vibration mitigation components, and the addition of 6 floors to the office tower, we anticipate the incremental construction cost will be in the range of $29,500,000 to $34,250,000. These numbers include the $15,500,000 to $20,250,000 preliminary estimate within DeSimone Consulting Engineers' letter, another $2,000,000 to mitigate sound and vibration transference, architectural and engineering design costs of approximately $2,000,000, and $10,000,000 for the additional office floors. This is above and beyond what it would have cost to do the same residential F.A.R. Alternative II analyzed in our September 19, 2002 letter would total about $35,750,000 - $43,250,000 in incremental costs as compared to the proposed project, assuming a similar approach to replacing lost developable area with office space. This total assumes the structural cost for Alternative II outlined in the December 4, 2002 DeSimone Consulting Engineers letter and an additional $4,000,000 for costs of circulation related to the "sky lobby", and would be further increased by $6,000,000 to $7,000,000 if tunnel costs are assumed. Please note these costs are very preliminary.

Caltrain Pedestrian Circulation

Since a residential tower above the Caltrains would necessitate a dense grid of columns (3 to 6-foot diameters) as they penetrate Caltrain's platforms and mezzanine beneath the project, pedestrian circulation at the platform would be circuitous and difficult to monitor for security. Making the transition upward from the mezzanine to the Transbay Terminal would also be indirect as the vertical transition would need to occur west of the 301 Mission Street Project, given the 10-foot thick tunnel roof/tower foundation projected in the DeSimone letter. As this Caltrain alternative also lowers the platform 15 feet from the prior iteration, the added vertical climb or descent, expected of the commuters could further inconvenience them creating operational concerns. These issues, together with train access issues resulting from the tunnel grade change, would need to be addressed by Caltrain.

Summary

The new Caltrain Alternative 2 significantly impacts the current design for 301 Mission Street, necessitating major revisions to the building's functional, aesthetic, urban design character, and costs. The subsequent redesign would lose 20% of its residential units, increase the amount of office space 79%, and reduce the number of parking spaces 60%. Building servicing would be less efficient. Building esthetic and urban design are compromised since mechanical relocation above grade results in louvers replacing substantial vision glass, disrupting the project's slender glass tower concept and conveying a less inviting expression to the street. The project's public atrium and open space would dramatically change in scale and daylight quality as 6 floors are added to the office tower to recapture F.A.R. Additional construction and design costs are anticipated to be in the range of $29.5 to $34.25 million. Although the Transbay space has not been designed, from the perspective of the Caltrain users, the labyrinth of large columns penetrating the pedestrian areas would likely result in circuitous pathways, a deep climb and other operational issues.

Please do not hesitate to contact us should you wish to discuss this further.

Sincerely,

PLANNING DEPT

December 6, 2002

To Whom It May Concern,

I am submitting this letter in response to invitation for public comment on the Transbay Terminal/Caltrain Downtown Extension Redevelopment Project Draft Environmental Impact Report. I am a lease holder as well as an owner respectively, of two buildings directly involved in the report as being in the path of the Caltrain Extension. Therefore, my concerns lie primarily with the construction of the extension itself.

I would like to state foremost that I am in favor of mass transit improvements in general, and the redevelopment project specifically. I would like to add my support for the tunneling option recommended by the report, as opposed to the cut-and-cover option, which may require acquisition and demolition of property. I would like to know more about how this choice will be made and within what time frame.

Given the project goes ahead with the tunneling option, my concerns are primarily of business disruption on Townsend and Second Streets, length of construction time and vibration of building during tunneling. These issues are not thoroughly addressed in the draft EIR, nor is adequate attention given to the underpinning process as part of the tunneling process. I would like to see more information on mitigation of dust, traffic, noise and timeframe. I would like more information regarding when the various components of the project might actually begin in order to plan accordingly for the future.

Respectfully,

Seymour Jaron

Re: Cal Train Extension Draft Environmental Impact Report (DEIR) Comments

Dear Mr. Maltzer:

Bob Pickard, SBC Pacific Bell Public Works Coordinator and I thank you for the opportunity to comment on the DEIR for your project. SBC-Pacific Bell supports your effort to improve mass transit in San Francisco. We also welcome the chance to help you in the planning stages of the project so that the project can be completed quickly, economically, and with minimal disruption.

The DEIR briefly mentions utilities, but does not portray the magnitude of the telecom facilities that both parallel and cross the proposed path of the CalTrain extension. SBC-Pacific Bell and several other telecom carriers have significant infrastructure along the route, including conduit and vaults that are as deep as 30 feet below grade. In one block, we have nearly one hundred ducts in three different structures. Several other carriers have structure on the same block, as do all the other non-telecom utilities. We will be happy to meet with your staff to provide you with specific details about our structures that we are not at liberty to make public.

We believe that by using the tunnel method of construction, the project could reduce the time, expense, and risk involved with either supporting or relocating the utilities that serve this vital portion of San Francisco

More than 30,000 SBC Pacific Bell customers suffered major service interruptions on several occasions as a result of the Bay Area Rapid Transit (BART) District's recent construction of the extension to San Francisco Airport. BART used open-cut construction methods. The risk of such a scenario in downtown San Francisco should not be acceptable to either the City or any of the telecommunications companies.

There are two other construction issues that we want to note. The water table along the route is within several feet of the surface at the route's low points, and would present a significant challenge to open-cut construction. Another factor to consider is the presence of foundation tieback cables in the street placed by recently constructed buildings. These cables are not identified on any City documents; therefore, a high risk exists that many of them might be cut during open-cut construction project. Ultimately, delays would result, as well as extra expense.

Like other major downtown employers with thousands of employees working in five major buildings and three field work centers near the proposed construction path, we are also concerned about the disruption, noise, environmental impacts, access restrictions, and quality of work-life issues that open-cut construction would present. Once again, using tunnel construction would avoid these issues for all downtown business workers.

While we welcome the improvements for public transit and the upgrades to the neighborhood and terminal that your project offers. We simply ask that you utilize the least disruptive methods of construction, namely tunnel construction so that our infrastructure and our service to downtown customers can remain intact

If you have any questions regarding this matter, or need specific information about our underground facilities, please contact Bob Pickard, our Public Works Coordinator, on (415) 542-9095.

Sincerely,

Lynn Bunim

December 12, 2002

Dear Ms. Kugler.

These comments are submitted on the Transbay Terminal/ Caltrain Downtown Extension/ Redevelopment Project DEIS, DEIR and Draft Section 4(f) Evaluation (the "Environmental Document") on behalf of the Clocktower Lofts Owners Association.

- The Clocktower is an historic building in a historic area.
- The Clocktower is a live/work building providing housing for 127 families including small children.
- The Clocktower is already an area in city with mitigations for the Giants Stadium. Second Street is designated as a pedestrian walkway; Third and Fourth Streets are the bus bridges.
- This area is already subject to extensive disruption during Cal Trans bridge and approach demolition and rebuilding for next 5 years.
- The Clocktower relies on open windows for ventilation as do many of its Stillman Street neighbors.

Bus Storage Facilities

One of the project elements is development of bus storage facilities. 42 or 53 AC Transit Buses would be stored between Second and Third Streets at Stillman, facing our building. 140 Golden Gate Transit buses would be stored between Third and Fourth.

These bus yards would concentrate noise and diesel emissions in a semi-enclosed area near high density residences and businesses.

The Environmental Document is obligated to consider the environmental impacts of the project, including all its components. The Environmental Document does contain a discussion of air quality impacts. It appropriately includes a microscale air quality assessment. The microscale analysis, however, was limited to an assessment of the concentrations of carbon monoxide.

The California Air Resources Board has identified diesel emissions as a carcinogen. In recognition of the health risks to children from diesel exhaust, the ARB has just taken action to prohibit idling of school buses within 100 feet of a school building, see http://www.arb.ca.gov/newsrel/nr121202.htm.

The buses utilizing the storage facilities contemplated by this project will undoubtedly be a source of diesel emissions. These emissions could be a significant health risk because of the number of buses involved. The Environmental Document acknowledges that bus engines will be warmed up in these storage areas (page 5-63). The emissions in these storage areas will be more concentrated than they would be in an open area because of the semi-enclosed covering of the freeway structure. In addition to presenting possible health hazards to residents in the surrounding areas, the relative enclosed nature and lack of significant airflow in this area may present substantial health hazards to the bus drivers and associated mass transit employees.

There are numerous residences located in this area that house sensitive populations, including children. There is a residence for the elderly adjacent to this area.

An analysis of the environmental impacts of this project should include an identification of the residences near the bus storage facility, the sensitive populations that would be affected, and an analysis of the potential exposures to diesel exhaust, including a worst case analysis and a cumulative impact analysis.

Diesel engines are also notorious sources of noise. The noise will also be greater because it will be partially contained by the freeway structure. The Environmental Document contains only a four line qualitative discussion of the bus storage facility noise impacts (page 5-63). There is no quantitative analysis presented.

The Environmental Document proposes construction of a sound wall on the south side of the storage areas to mitigate the noise impacts. This appears to be based on a recognition that the noise impacts would be regarded as significant though that is not explicitly stated. There is no analysis of how effective the sound wall would be. A sound wall may not be effective since it would be expected that noise would reflect off the bottom of the freeway structure and escape over the top of a sound wall. A sound wall on the south side of the storage areas will not mitigate the noise impacts on the Clocktower at all.

There are accepted methodologies for conducting a quantitative noise analysis of the operation of these storage facilities. Such an analysis should be performed and presented. If there are significant impacts, they should be acknowledged and mitigated. There should also be an analysis of the effectiveness of any proposed mitigation measures.

Vibration Impacts

The Environmental Document states that "the highest levels of ambient ground-borne vibration were measured at the Clock Tower (sic) building at Bryant and Second Streets. Both exterior and interior vibration was measured. The exterior location was on the sidewalk relatively close to the street. Even at this location, the highest vibration levels were only slightly above what can be perceived by most humans." (Page 4-32)

The vibration analysis that was performed showed that vibrations would exceed the FTA impact threshold for residential land uses in the hallway of the Clocktower even with mitigation in the form of a resilient track system. The vibration analysis included projections for 4 additional locations in the Clocktower. Those projections show that vibrations would be very close to exceeding the impact threshold.

The Environmental Document, however, concludes with respect to the Clocktower: "Projected vibration levels exceed the impact threshold only at the hallway site, and therefore no mitigation is indicated." In itself, this is a questionable conclusion since the hallway itself is part of the residential use.

Moreover, vibrations are already a significant problem at the Clocktower. This is apparently because of the building's proximity to the elevated freeway structure. We are very concerned about any vibrations in addition to the ones already experienced. An analysis of the impacts of the project on the Clocktower must include an analysis of the impacts of the project in addition to the impacts already experienced. The explanation of the vibration analysis does not indicate that this has been done.

The Environmental Document also indicates that there are some significant qualifications on the vibration analysis.

In light of the qualifications on the vibration analysis and in light of the results showing that the impact threshold has been exceeded in the hallway and showing that impacts elsewhere are close to the impact threshold, the analysis that has been done should be regarded as a screening level analysis. The results indicate that a more specific and detailed analysis should be performed. Any analysis should include indicate the vibrations that would be experienced if vibrations from the train occurred at the same time as serious vibrations from the freeway.

The Clocktower believes this analysis is legally required. Additionally, if this analysis is not performed and if there is damage to the Clocktower residents or to the building from vibrations, a failure to have performed this analysis could have profound legal consequences.

Construction Period Access

The Environmental Document states that if the cut and cover method of tunnel construction is utilized, there will be block-by-block closures on Second Street. A chart describing the driveways and streets temporarily blocked by construction mistakenly states that only a delivery entrance at the Clocktower would be blocked. Obviously, the Clocktower has not been provided with the detailed plans for the closure of the Second Street, but it would appear that a driveway entrance would be blocked as well. This driveway provides access to parking both in an exterior lot and in an underground interior lot. This driveway also provides emergency access/egress in the event of a fire or other emergency.

The Environmental Document should correctly assess the impacts on the Clocktower. If the street closure will prevent access to parking, even temporarily, that impact must be fully mitigated.

Construction Period Noise and Vibration

The Environmental Document presents a qualitative analysis of the noise impacts, and apparently concludes that the construction phase noise impacts would be significant. The mitigation measures that are proposed, however, are so vague and ambiguous as to be unenforceable. They include such things as "conduct noise monitoring," "conduct inspections and noise testing of equipment," "implement an active community liaison program." Specific quantitative noise limits should be stated for each period during the day.

The Environmental Document states that noise waivers may be obtained to allow nighttime construction. It also states that "it is not anticipated that the construction documents would have specific limits on nighttime construction. (page 5-185)." There will apparently be no limits on the use of jack hammers, hoe-rams and pile drivers before 10 p.m. This will significantly add to the nose in the area. Mitigation measures could easily be developed preventing the use of such extremely noisy equipment unless a specified standard of necessity were met.

A meaningful noise mitigation program could do much better than this. It could set forth specific showings that must be made in order to justify nighttime construction. The proposed mitigation measures contain none. It could set forth noise limits in the event nighttime construction is necessary. The proposed mitigation measures do not. It could prohibit the use of certain equipment at night. The proposed measures do not.

The mitigation plans states that contractors will be required to "use equipment with effective mufflers." What is an "effective" muffler? This is so vague as to be meaningless. Additionally, there is often an electric alternative to diesel-powered equipment. There is no requirement to use electrically powered equipment when it is available.

The Environmental Document acknowledges that construction vibration effects can damage historic buildings. It states that a study has been done showing that no damage will occur due to construction vibrations. This study is not presented, and so it is impossible to evaluate.

Additional Comments

All in all, the noise, disruption, and other impacts of the cut and cover tunnel construction alternative are so severe that it should be abandoned as a project alternative.

The Clocktower has entered into an agreement with Caltrans to lease the parking lot off Harrison Street behind Marathon Plaza. This lease will run from the completion of the Western Approach Seismic Repair until December 31, 2038. The Environmental Document should analyze whether any of the ramp alternatives would have an impact on this lot and mitigate any impacts that may occur.

The Clocktower has entered into an agreement with Caltrans to use the parking lot at Second and Harrison until completion of the Western Approach Seismic Repair. This lot is identified for future redevelopment. The timing of that redevelopment is not stated. No potential development of that site should interfere with the Clocktower's ability to use that lot in accordance with its agreement with Caltrans.

Figure 4.1-1(b) setting forth Existing Land Uses erroneously fails to identify the parking lot at Second and Harrison or the parking lot beneath the existing Harrison Street off-ramp. That figure also identifies the Clocktower as residential, whereas it is a live/work building.

Chapter 4.18 fails to identify the tower containing the clock on the Clocktower Building as a visual resource or as part of the visual character of the area. The Clocktower is one of the most significant and well-recognized landmarks in the area.

We have also stated our concerns at the Public Hearing April, 2001, and in writing, requesting a study of the Effects of Emissions the many residences and businesses. Those comments are all incorporated by reference in these comments.

We are concerned that public health and safety needs are not being met, and we are considering legal action. We feel we have been ignored in the process. The Clocktower Lofts Owners Association is not even on the distribution list for information. Please correct that omission.

Yours very truly,

Michael Altaro

Re: Caltrain - Transbay Terminal DEIR Comments

In 1992 I circulated the first version of my plan for extending Caltrain to a re-built Transbay Transit Terminal (TTT). The result of over five years of research and design, it suggested that a tunnel could be dug under Rincon Hill to bring trains from Mission Bay to the Transbay Terminal. Over the next decade, I refined the design to meet the changing technical and political situation. My comments come from my decade-plus involvement with the project.

The bus and terminal building project, described in the DEIR, is an excellent design. This portion of the project was often the most contentious, as initially the City of San Francisco proposed removal of the bus facility. The current design can be further improved by shifting the footprint of the facility to the west, to occupy the area of the failed residential highrise project to the immediate west of the TTT. This would allow the above-ground portion of the TTT to keep to the west of Beale Street, removing the need to bridge that street.

The bus storage facility is crucial to the operation of the terminal. The location proposed for bus storage, beneath the west approach to the Bay Bridge, between Fourth and Second Streets, connected to the terminal by grade-separated ramps, is the best alternative available. The storage facility will be an improvement over the unimproved parking lots that currently occupy the land under the freeway. Proper landscaping and design will make an aesthetic improvement to the neighborhood. The maintenance and security of the facility will improve the safety of the neighborhood. The continuing evolution of bus propulsion technology, the switch to cleaner fuels, will result in fewer pollutants in the neighborhood, not more.

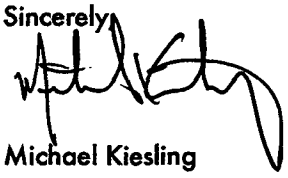
The terminal capacity and operations described in the DEIR meet all the objectives that I worked for over the past years. I support the West Ramp Alternative as the preferred alternative.

Redevelopment is key to this project, from both a urban design and funding perspective. I support the Full Build Alternative, and would like to see it expanded to other properties in the immediate terminal area that have not yet been redeveloped, and any properties north of Harrison Street that might be needed for construction of the Caltrain extension. It would also help the neighborhood if the need for the diagonal exit ramp leading to the intersection of Fremont and Folsom Streets could be re-assessed, as it reduces the development potential for the area by splitting a large lot and creating a dangerous 5-leg intersection.

Finally, provision for an extension of Essex Street should be made beneath the highway ramp as far as First Street. By providing a second approach to the bridge from First, traffic on upper First Street, past Folsom, can possibly be limited to carpools, removing the queued afternoon traffic out of the redeveloping residential neighborhood.

Good luck with the project. I look forward to reading how you plan to incorporate these suggestions into the final EIR, and seeing them implemented in the construction of the project.

Sincerely,



Michael Kiesling

A pdf of this letter and all drawings is available at:

www.arch21.org/tttdeir.pdf

or as html at:

www.arch21.org/TTTDEIR.htm

The remainder of my comments concern the Caltrain component of the project. This portion of the project needs much greater refinement, as part of it is currently un-workable as designed.

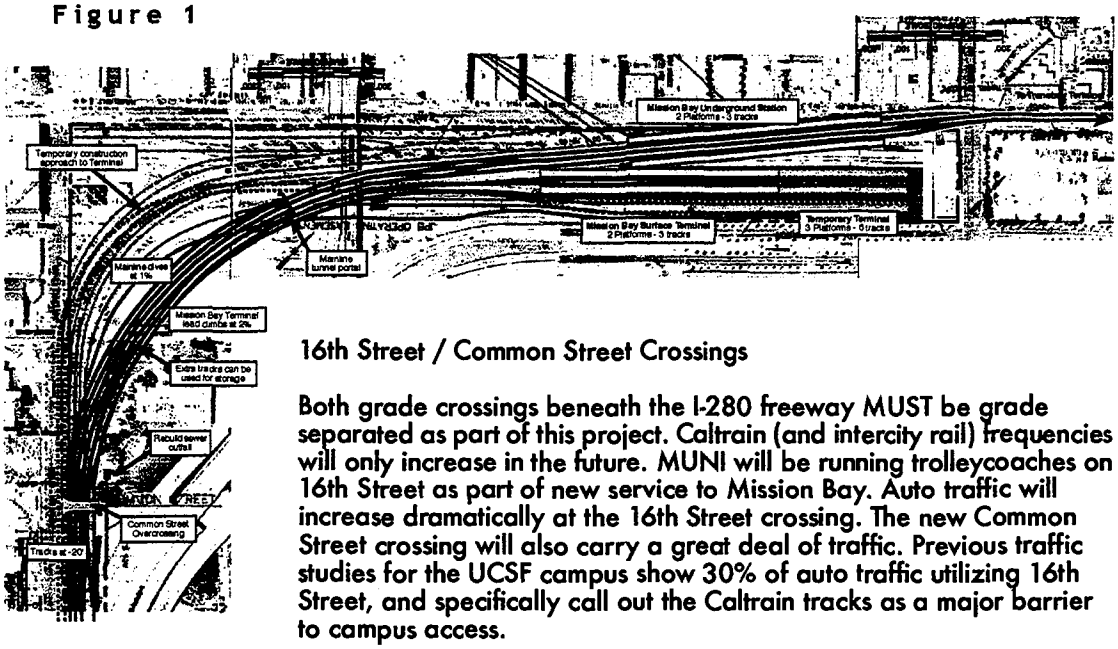
I STRONGLY support the Fully Tunneled Option under any alignment. This project cannot rip down blocks of buildings in the South Beach/Rincon Hill neighborhood. I also suggest that the alignment be "fine-tuned" to minimize the impact of construction on existing buildings. In the attached Figures 2 and 3, I've outlined a new alignment about 150' to the west of Second Street that has a smaller impact on the built environment.

The following comments are made geographically, starting south of the project area and working towards the TTT.

Fill Disposal & Storage/Light Maintenance Area

This project will generate a great deal of fill with no identified location to dispose of it. The Caltrain ROW between Palou and Cesar Chavez Streets runs along a 20' embankment. This embankment can be enlarged with suitable spoils from the tunneling and excavation of the rail extension and terminal project to create space for storage tracks and a minor maintenance facility. This can replace the function of the yard near the current Fourth and King terminal, and allow for fill disposal very close in to the project area, greatly reducing hauling costs.

Figure 1



16th Street / Common Street Crossings

Both grade crossings beneath the I-280 freeway MUST be grade separated as part of this project. Caltrain (and intercity rail) frequencies will only increase in the future. MUNI will be running trolleycoaches on 16th Street as part of new service to Mission Bay. Auto traffic will increase dramatically at the 16th Street crossing. The new Common Street crossing will also carry a great deal of traffic. Previous traffic studies for the UCSF campus show 30% of auto traffic utilizing 16th Street, and specifically call out the Caltrain tracks as a major barrier to campus access.

By beginning to descend into an open cut soon after crossing under Mariposa Street, both 16th and Common Streets can be grade separated. The height of the I-280 viaduct is great enough so that the cross streets can be raised some to help with the separation. Additionally, there is

enough distance to allow the yard lead for the permanent Mission Bay surface station to climb back to the surface after passing under Common Street. The Mission Creek outfall will need to be rebuilt, but this is not a fatal flaw to the grade separation. These issues are illustrated in the attached Figure 1.

Seventh Street Curve

Existing and future rail operations will be greatly improved by increasing the radius (and thereby the design speed) of the Seventh Street curve. Today, with the terminal at Fourth Street, there is little operational advantage to increasing the speed of the curve. But, under future conditions, many trains, especially intercity and express trains, will not be stopping in the Mission Bay area. Leaving the Seventh Street curve as a major speed constraint will degrade the operations of the mainline.

An equitable solution should be easy to reach with Catellus (the owner of the property at Mission Bay) to move the PCJBC operating easement to allow for the improvement of the curve. (See Figure 1) The property on the inside of the curve, which would be impacted by re-alignment of the curve, is hemmed in by the existing (and future tracks), the Sixth Street off-ramp from I-280, and the Mission Creek pumping plant. Moving the tracks to reduce the area of this parcel INCREASES the area of the outer parcel, which fronts on Townsend and Seventh Street, facing the edge of the Showplace Square neighborhood.

Temporary Terminal During Construction

Obviously, Caltrain will require to continue operation into San Francisco while the extension is under construction. Utilization of roughly one-half (6 tracks) of the existing terminal should provide sufficient capacity for daily operations. Figure 1 shows a suggested arrangement of the temporary and permanent facilities in the Mission Bay area.

The first phase of construction would reconfigure the south 6 tracks of the existing station and construct a small portion of the sub-surface mainline in the area that the temporary lead tracks for the terminal will cross the mainline, approximately under the Sixth Street overcrossing. A temporary shoo-fly would also be constructed from Mariposa Street to King Street west of the existing tracks, in the ROW of Seventh Street. Seventh Street is wide enough to accommodate two tracks plus two traffic lanes.

Once the first phase is complete, trains would run on the shoo-fly from Mariposa Street into the Seventh Street ROW, curve towards the terminal at King Street, passing over the new mainline at about Sixth Street, and then into the southern six tracks at the existing terminal. Excavation and construction of the sub-surface Mission Bay station and depressed mainline from Mariposa Street north would commence, including construction of the 16th and Common Street overcrossings. A permanent lead to the surface station at Mission Bay would also be built to the south of the mainline.

Once the downtown extension is operational, the 6-track surface terminal would be reduced to a 3-track, 2 platform terminal. I am suggesting that it be set back from both Fourth and King Streets, to allow development of the property on the street frontage to improve the activity in the neighborhood. This shields the trains from the surrounding development, mitigating the concerns over leaving a surface rail operation in the area.

Mission Bay Sub-Surface Station

The sub-surface Mission Bay station should be constructed with at least three tracks, allowing trains to pass through with trains stopped at each platform. The station should also be deep enough to allow a mezzanine at the east end of the station so the platforms don't have to connect directly with the street. This station will still see heavy ridership after the extension opens, and a good pedestrian flow is crucial to the operation of the station.

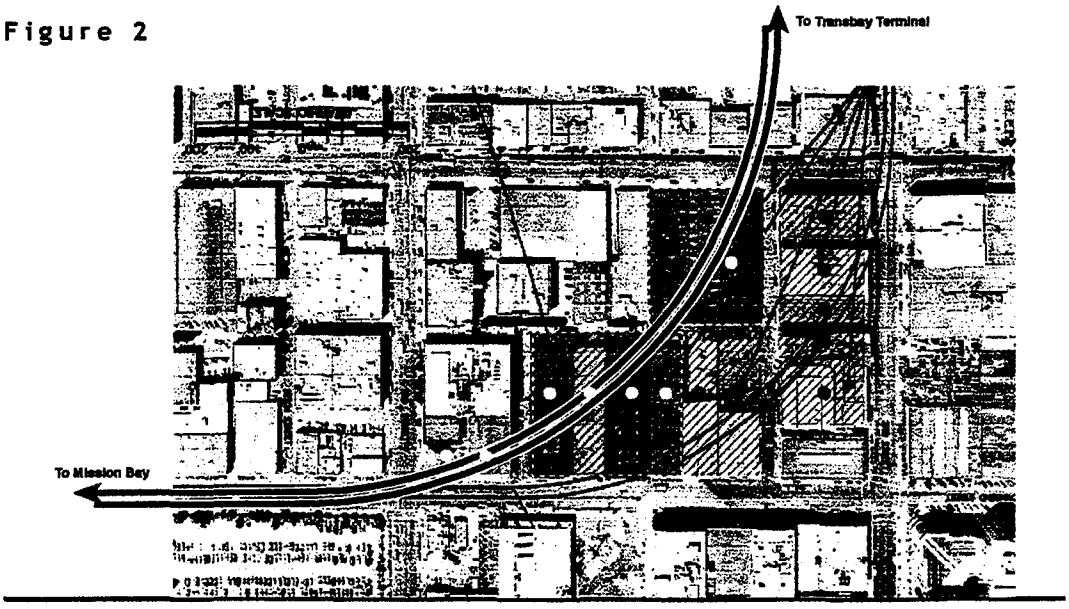
West of Second Street Alignment

Key to the entire Caltrain extension project is the minimization of construction disruption to the neighborhoods it will be passing under. In my 1992 proposal, I pointed out that the alignment passed under Rincon Hill, and therefore could be tunneled under the hill. Digging a cut and cover tunnel along Second Street not only requires acquisition of many historic and expensive properties, many recently renovated, but also the excavation and shoring of a 100' deep trench for four blocks along Second Street. A bored tunnel is the only realistic way to build the extension.

For the past decade, I've refined my designs for the project, altering the alignment in many ways. In the recent years, as the specific requirements for high speed rail have become clear, forcing the alignment from Essex Street to Second Street, I've identified a new alignment west of Second Street that should further reduce impacts on developed properties and improve the alignment into the terminal to allow for the maximum platform length.

Starting in the Mission Bay area, shown on Figure 2, the alignment begins to turn to the north just west of Third Street. It passes directly beneath the first two buildings on the north side of Townsend Street, then the public ROW of Clarance Place, and then beneath the mid- to rear-portions of 166-168, 162-164, 148-154, and a very small portion of the rear of 144-146 Townsend Street. The ground-level above this alignment is slightly higher throughout, resulting in a deeper tunnel, further minimizing potential impacts on the structures at ground level.

Figure 2

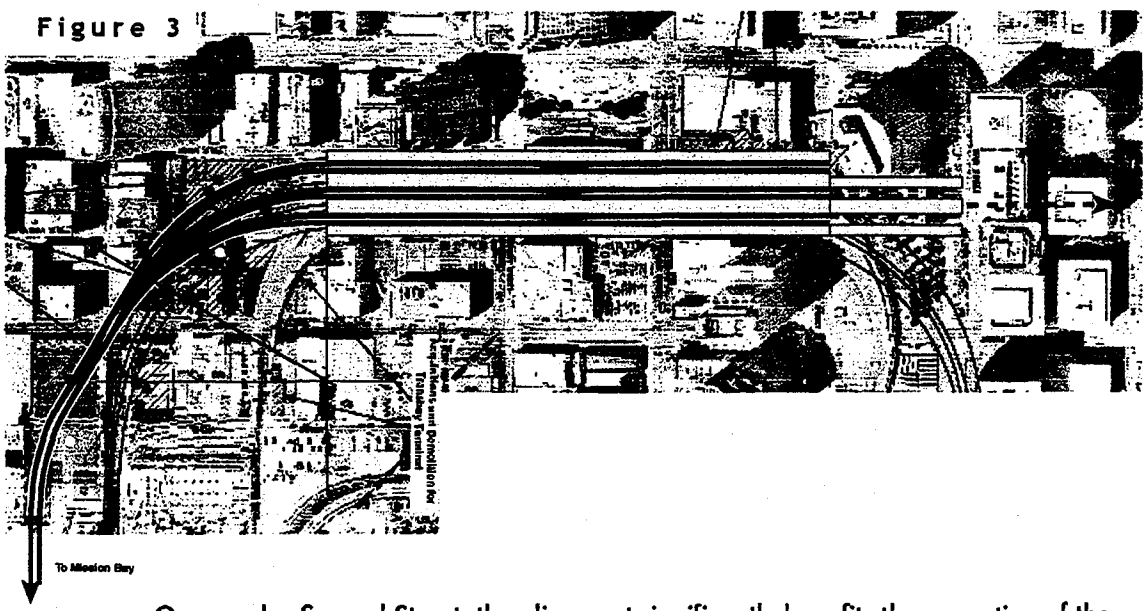


Once under the historic buildings along Townsend Street, the tunnel runs beneath a large surface parking facility, utilized by Pacific Bell. If necessary, this large property could be utilized for the tunnel heading, allowing tunneling to proceed in two directions, north to the terminal, and south towards the Mission Bay station. The current use of the property, parking and one-story garage, can easily and inexpensively be relocated to a nearby parcel during construction. Access to the tunnel heading on Brannan Street keeps large haul trucks out of the more congested streets near Mission Bay and the ballpark. (Please note- In the DEIR drawings, Brannan is mis-spelled as Brennan.)

North of Brannan Street, the tunnel is running deep under the South Park neighborhood. Where it passes beneath the Bay Bridge approach, the opportunity exists for integrating any necessary emergency access and ventilation facilities within the bus storage facility. Between Harrison and Folsom Street, most of the tunnel is under empty properties. From Folsom Street to the intersection of Howard and Second Streets, the alignment is threaded between highrises, ending beneath a large parking lot at the intersection. Almost 60% of this "off-street" alignment is under empty lots or streets, and many of these properties are in public ownership as streets or parks.

This alignment eliminates the need to acquire and demolish at least 3 properties along Second Street, 201, 205-15, and 217 Second Street. Additionally, since the angle of the tracks in the throat change, it should be possible to avoid 580-586 Howard Street. Three of these are significant historic buildings. This is shown in Figure 3.

Figure 3

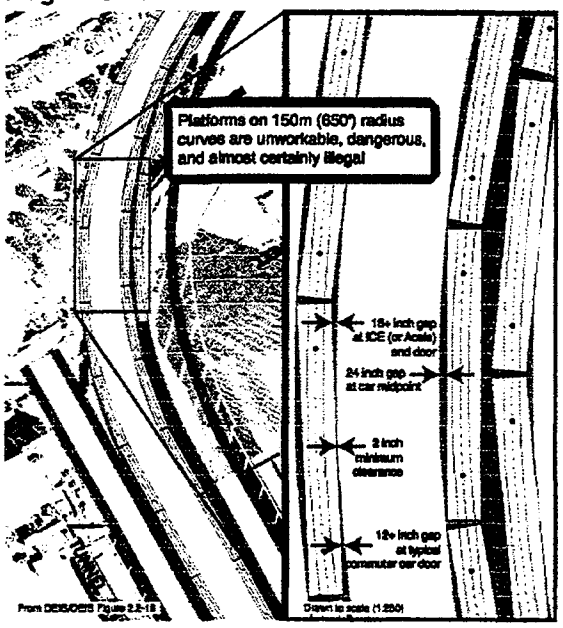


Once under Second Street, the alignment significantly benefits the operation of the terminal, in either the Second to Main or Second to Mission alternatives. The design allows the throat of the station to begin sooner, allowing longer platforms. Richard Mlynarik has provided comments showing a Second to Mission alignment. I will describe the simpler Second to Main (Terminal Basement Platforms) alignment in this document.

Terminal Basement Platforms

The proposed high-speed rail platforms described in the Second to Main alternative in the DEIR are completely un-workable, due to the gap between the curved platform and standard high-speed rail cars. See Figure 4. This should drop this terminal configuration from consideration, due to its inability to accommodate standard high speed rail train consists, or even standard commuter trains.

Figure 4



by Richard Mlynarik

I do not support the inclusion of tailtracks as part of this project. With platforms well over 1000' possible in the basement of the rebuilt TTT, and the provision for four of the platforms to extend to 1,450' with minimal effort, crossovers can be added at the midpoint of each pair of platform tracks to allow a pair of Caltrain consists to independently access each platform. The tailtrack is pulled into the body of the station.

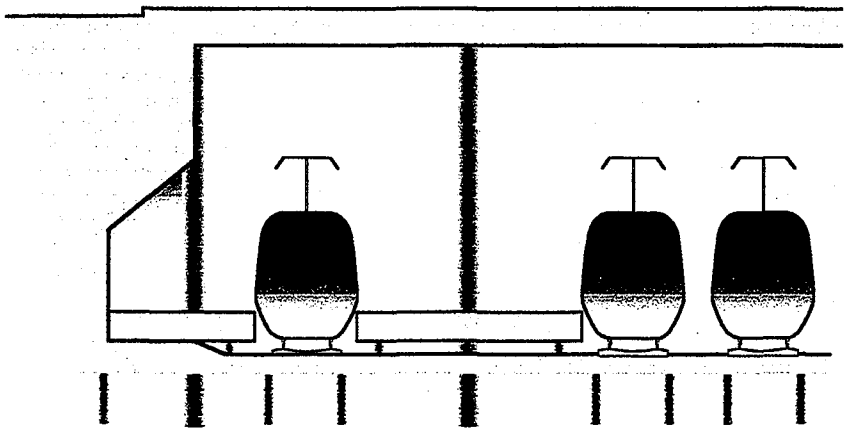
Recent MTC studies have placed the cost of a new Transbay rail tube between $2.75 and $7.25 billion. Preliminary estimates from the High Speed Rail Authority peg the cost of constructing a new high-speed line from the South Bay to Oakland at about $2 billion. It seems clear that Oakland (and the entire East Bay) would be better served with their own line, rather than an expensive transbay connection to the San Francisco line. If it does become necessary to invest in a new transbay rail link, the added cost to tunnel through the pilings of the buildings between Main Street and the Embarcadero will add very little to the overall cost of a multi-billion dollar project.

Additional transbay commute capacity can be achieved through expansion of the transbay bus service, an integral part of this project, and the growth of the ferry network. AC Transbay service today is a fraction of what it was in the 1970's, so simple expansion to previous levels can add significant capacity. Finally, the expansion of the regional ferry system will take place mainly in the Bay Bridge corridor.

For all of the reasons cited above, the platform configuration shown in Figure 3 should be substituted for the current Second-Main Alternative. The design allows for 1,150' platforms in alignment with the terminal, extending to Beale Street. The four tracks on the south side of the terminal can be extended another 300' (for a total of 1,450' - today's European High Speed practice) with minor modifications to the rear extension of the Pacific Gateway building on Mission, between Beale and Main Streets.

Another alteration to the proposed platform design is to change the arrangement of tracks and platforms from 3 platforms / 6 tracks, to 4 platforms / 6 tracks. This allows crossovers to be placed on all track pairs to allow 2 500' train consists to share the same platform. This increases capacity in the station and replaces the function of the discarded tailtracks. The side platforms, serving only one track each, would be narrower, and could be excavated alongside the station box, to limit the total amount of excavation. See Figure 5.

Figure 5



Section through terminal showing side platform

Connection to Market Street

I do not support an underground connection to Market Street, although I do urge surface improvements to both sidewalks along Beale, Fremont and First Streets, and installation of a mid-block pedestrian signal at the intersection of Ecker and Mission Street. Ecker Street has been improved as a pedestrian way between Mission and Market Streets, leading to the Montgomery Street (MUNI/BART) station. The intersections of Stevenson and Jessie with Ecker should also be modified to raise the Ecker crossing to slow traffic on Stevenson and Jessie. As a further improvement, the possibility of adding an entrance to the Montgomery Street station near Ecker on Market Street should be assessed.

Urban Design Suggestions

As the project progresses in design, there are a few items that should be explored. The un-built phase of the Foundry Square project immediately south of the TTT on Howard Street, between First and Fremont, should be integrated into the TTT with mid-block pedestrian access through their building from their planned open space at the corner of the project. The proposed project to the north of the terminal at 301 Mission (between Fremont and Beale) should also be integrated with the project, providing pedestrian access to the mezzanine levels of the terminal. Additionally, auto and truck access to the underground parking should be developed jointly with the TTT development so that only one delivery/parking access point is need for the combined projects. This is key, as MUNI will be running many routes on Beale and Fremont Streets to access their new terminal beneath the TTT. Extra driveways will cause conflicts with the MUNI, other transit, and autos around the terminal.

Reference: Transbay Terminal Project - Proposed Bus Storage Parking Facility
Stillman/Perry Street - 2nd to 4th
Our Letter of July 5, 2001

Dear Ms. Kugler and Mr.Malzer;

I have spoken at the public hearings on April 4, 2001, November 12, 2002 and November 26, 2002 in opposition to the *proposed permanent location of the A C/Golden Gate Transit Bus Storage Facility* on Stillman/Perry Street.

I have reviewed the report titled Draft Environmental Impact Statement/Draft Environmental Impact Report and Draft Section 4(f) Evaluation concerning the impact analysis performed for the Bus Storage portion of the proposed project.

The report does not address the impact on our neighborhood that will be caused by placing a Bus Storage Facility for approximately 200 buses within this two (2) block area. The draft report is grossly inadequate as it pertains to the impact that diesel fumes and circulating buses will have on the Stillman/Perry Street neighborhood.

1. The report is silent on the pollution and health hazards that will be caused by the increase in diesel emissions in the neighborhood. Diesel exhaust fumes are listed by the EPA as toxic and likely to cause lung cancer in humans. The EPA has found diesel exhaust triggers asthma and other respiratory problems.

2. The report is silent on the traffic impact to the one way street and neighborhood. The report does not address bus circulation on Stillman Street. Figure 2.2-5 on page 2-14 shows the one way direction on Stillman Street being changed. Do all the Golden Gate transit buses enter Stillman from 3rd Street ? Bus circulation and the impact within the Stillman / Perry neighborhood is not addressed.

3. The Draft EIR does not address the impact of the increase in the noise level resulting from the proposed Bus Storage Facility in the center of the Stillman / Perry Street neighborhood. The report (Section 5.8.6 & 5.8.7) mentions increased noise from the Bus Storage Facility as pertaining to only one (1) Building in the neighborhood. The noise levels are not quantified. What happened to the other forty (40) Buildings that make up the immediate neighborhood surrounding the proposed Bus Storage Facility ?

4. The loss of approximately 800 parking spaces to the businesses and residents has not been mitigated by 300 parking spaces in the proposed parking deck at 4th and Stillman.

5. None of the issues and resulting impacts raised in my certified letter to Ms. Joan Kugler dated July 5, 2001 have been addressed in the Draft EIR report. We have had no response to our letter. Not even a phone call.

6. Our Neighborhood will be impacted for the next 5-7 years as the West Approach is rebuilt. Cal Trans has made public assurances in several open meetings that the parking would be returned under the West Approach at the conclusion of the project.

The extent of the impact on our neighborhood depends on which ramp alternative is selected for further study and analysis. The Loop Ramp Alternative would provide for the storage of 120 buses on the eastern open air bus ramps. This alternative along with finding a more suitable ***permanent Bus Storage Facility now*** for the Golden Gate Transit buses would eliminate the need for Stillman/Perry Street neighborhood Bus Storage Facility under the West approach.

The Draft EIR Report presents an analysis and modeling criteria (Section 5.7) for the carbon monoxide (CO) levels on 8 intersections downtown. The Draft EIR makes no mention of any analysis or modeling for the elevated levels of carbon monoxide (CO) that will be present over the ambient conditions due to diesel bus circulation, idling and warmup in the eight (8) acre site in the middle of our neighborhood. A bus storage facility will have a significant carbon monoxide (CO) level impact within the Stillman / Perry Street neighborhood that must be addressed. Many of these Buildings and residences in this two (2) block area use operable windows for code required ventilation and air changes in the structures.

The proposed location of the ***temporary*** Golden Gate Transit Bus Storage Facility during construction of the Transbay Terminal project is not identified in the Draft EIR The temporary Golden Gate Bus Storage yard should be built as the permanent facility at the *front end* of the project in an open air location that will not impact residents and businesses with increase diesel emissions and toxic carbon monoxide. This would also eliminate the cost of a new temporary storage facility for Golden Gate Transit.

169 Stillman Street for 18 years has seved as a private day school for up to 40 children. We are currently negotiating a new lease with a private Charter School. Locating an enclosed Bus Storage Facility across the street from our Building and circulating buses up and down the street is condemning the legal highest and best use of our Building. The State of California has banned idling buses near schools. The California Air Resources Board passed this measure on Thursday, December 12, 2002.

Your planning efforts and analysis should be directed at locating a suitable open air facility for ***all*** bus storage that can not be accommodated on the open air elevated ramps or in the new terminal design. You should be able to accommodate all buses on the open air ramps, open air lots or design adequate storage space within the proposed Transbay Terminal. Trying to circulate and store 200 plus buses in a storage area with a lid on top and surrounded by business and residents is like trying to drive square pegs in round holes, they do not fit.

We request advance notice for all meetings regarding the Transbay Terminal Project and any other meetings addressing the temporary and permanent bus storage facility locations and analysis.

I again request that you consider the alternative locations that have been presented to date and explore other suitable open air sites away from residences, schools and business. The buses that need to access the terminal should be stored in the terminal or on the open ramps and lots.

If the Stillman / Perry neighborhood continues to be proposed for the Bus Storage Facility, extensive analysis must be included in future reports with regards to air quality, noise and noise. With respect to air quality it is imperative that your analysis and modeling address levels of carbon monoxide (CO) exposure to children as well as adults as their are families in addition to a school site located in this two (2) block area.

I have attached a copy of my July 5, 2001 letter for your ready reference. We look forward to hearing from you regarding alternative locations for the proposed bus storage facility in the event the project move forward.

Sincerely,
Barnes Equipment Company

Reference: Transbay Terminal Project - Proposed Bus Storage Parking
Stillman Street - 2nd to 4th

Dear Ms. Kugler;

We are the Owners of the property at 169 Stillman Street in San Francisco. I spoke with you briefly after the presentation at City Hall on the evening of April 4, 2001 regarding one component of the proposed project that we are troubled by in our Neighborhood. That element is the proposed bus storage and parking facility location!

The last several years our Neighborhood has been bracing for the *temporary loss* of the two (2) public parking lots under the west approach structure to the Bay Bridge between 2nd and 4th located on land owned by the State of California. The Neighborhood (owners, tenants and residents) depend on the two (2) lots for public parking. When the Cal Trans seismic retrofit project of the west approach was disclosed to the Neighborhood 5 years ago, we were advised of the *temporary loss* of the parking during portions of the seismic retrofit and reconstruction work currently scheduled to start in the Fall of 2001. The public parking was scheduled to be returned to the Neighborhood when the project was completed. *Cal Trans promised this in a public meeting.*

The bus storage and parking component of the Trans Bay Terminal project ("Project") currently being circulated for comment and consideration has targeted the public parking area under the west approach to be used for Golden Gate Transit and AC Transit bus storage and holdover facility to service the Project. Apparently no other areas were considered which may be more appropriate for bus storage and parking than underneath an elevated structure fronted on two sides by a narrow a right of way consisting of one way streets, sidewalk, limited parking, and loading zones for our Neighborhood.

Some of the very apparent problems we foresee based on the limited details provided to date are the following;

1. The existing west approach overhead roadway structure over the proposed bus facility is heavily concentrated with large concrete abutments and columns closely spaced to support the west approach structure overhead. The lot configuration and circulation for buses is very inefficient. A tour of the numerous bus transit storage facilities in the Bay Area will demonstrate how inefficient and problematic it would be to place buses idling underneath a confined overhead structure full of bridge piers and columns.

2. The Neighborhood already has already been impacted by a heavy concentration of vehicle emissions from the west approach roadway. The existing emissions in the air at the elevated roadway level impacts the upper floors of the Buildings along Stillman and Perry with operable windows at the freeway level. It also impacts HVAC systems for these Buildings that must circulate outdoor air from roof top levels where emission are discharged from the vehicles on elevated roadways. Adding approximately 230 buses under the elevated roadway will add a significant new element of emissions and air quality problems to our Neighborhood. It will be a significant burden and impact on the businesses and residences that directly front the street level of Stillman and Perry.

3. The proposed bus storage area is bounded on the North by Perry Street with a only 35' right of way and on the South by Stillman Street with a 35'- 40' right of way with extensive encroachment into the right of way from the west approach concrete columns and abutments that line the North side of Stillman Street.

4. The businesses and residents along Stillman Street will be severely impacted by buses circulating on the existing very narrow one way street (20-22' in width from the sidewalk to the exist concrete bridge columns encroaching the right of way) in front of the Buildings on Stillman between 3rd and 4th Street. It will not be possible to unload delivery vehicles or park in the very limited street right-of-way parking if buses are circulated up and down Stillman Street and Perry Street. There will be new grid lock on the Streets that are already *choked or closed* when deliveries are made.

5. Some existing Building occupancies have City Building Code occupancy classifications that require *a minimum* of 20' clear roadways (without sidewalk, encroachment, loading zones or parking spaces) for emergency vehicles. Buses circulating up and down Stillman Street will significantly impact the traffic, loading, unloading and emergency vehicle access. It is not uncommon for portions of the street to be blocked and closed while deliveries and pickups are made with large trucks and trailers that serve the businesses and residents on the Streets.

6. The Neighborhood is already forced to endure what is currently scheduled to be 5-6 years of disruptive heavy construction work. Many of the businesses and residences on Stillman Street are within 20' of the elevated west approach roadway that will be demolished and rebuilt. Now, we are being informed that after we endure 5-6 years of disruption, the only public parking in the Neighborhood will be taken, and in its place a permanent disruption is planned - circulating and storing some 230 buses in a confined area bound by a limited right-of-way along two one way streets that are already heavily impacted.

7. The 140 Golden Gate transit buses proposed to be stored between 3rd and 4th street will have to cross 5 lanes on 3rd street to access the proposed ramps in the proposed storage area between 2nd and 3rd. This lot already has low clearance because of the existing grades and the elevated roadway. The plan for a possible Muni Central Subway in the 3rd street corridor is another obstacle. It will take years to relocate utilities and place underground structures below grade for a Central Subway up the 3rd street corridor. Buses circulating and leaving a storage area between 3rd and 4th will have to cross 3rd street to access the proposed stacked bus ramps planned to serve the Project. It is difficult to imagine the construction of a Subway project in the middle of the two proposed bus storage facilities.

It is also difficult to imagine the impact the proposed bus storage facility will have on the Neighborhood with 230 buses running and circulating in and out of the two (2) confined lots between Stillman, Perry Street, Second and Fourth Streets. The proposal to operate 230 buses out of this confined area can't be justified to the Neighborhood, nor can the additional noise, traffic and air quality impact be mitigated. Bus transit and storage facilities are planned and designed with open air storage areas without columns, roof tops and other obstruction that hinder circulation and trap emissions from idling diesel engines.

Buses idling and circulating around and under the existing west approach structure designed to support an interstate freeway rather than store buses is a poor option to spend tax payers money studying. There are existing residential units on Stillman street and more new units currently under construction.

Our Neighborhood is currently preparing for the west bay approach reconstruction project that is finally scheduled to start this fall. We would all like to see a light at the end of the reconstruction project for the Neighborhood. Our Neighborhood wants the parking back that we were promised, we do not want it turned into a bus yard full of idling diesel buses circulating in and out of the Neighborhood to the proposed Transbay Terminal.

I recently received a copy of a letter addressed to you from by Mr. Francis Mathews regarding the bus storage impact in the Neighborhood. The five alternative locations mentioned in the letter appears to be a good place for the project team to start scoping for the proposed bus storage facility element of the Project. I am sure the project team could find many additional suitable sites for the bus facility that would not have the significant impact on a Neighborhood that is already severely impacted by noise, vehicle emissions, a planned multi year major construction project, and restricted right of way and access at Street level. These sites should all be addressed in your Draft EIR as additional alternatives to study from your scoping process.

We look forward to hearing from you regarding alternative locations for the proposed bus storage facility.

Sincerely,
Barnes Equipment Company

Bruce W. Barnes

Re: Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project

Dear Mr. Maltzer:

I am writing concerning the draft EIS/EIR for the above projects (hereafter "EIS"). My wife and I have lived on Folsom Street since 1992 and I am a member of the Transbay CAC.

The comments which follow relate solely to the Redevelopment Project portion of the EIS.

The EIS should contain as an additional alternative a proposal for development within or close to the existing height and bulk limits which prevail in the neighborhood of Folsom Street, namely 200-250 feet in height. The two alternatives presented involving buildings 350-400 feet high are far higher than what presently exists and is allowed. One or more alternatives closer to what presently exists would provide the public and the decision makers with a clearer understanding of what is proposed and its impact.

The EIS also needs to more fully take into account the combined impact of other projects and plans for the larger South of Market area involved, including the proposed rezoning of Rincon Hill, the two proposed projects for 300 Spear Street and 201 Folsom Street, the Cruise Ship facility, Mission Bay and the Ball Park.

For example, although the EIS recognizes that more fire suppression personnel may be required, it does not quantify the need or discuss the financial implications of it. With the other proposed 35-40 story towers on the South Side of Folsom Street the need will be obviously even greater. These combined needs, financing, etc. need to be discussed.

Similarly, the combined impact of the other projects with this Redeveopment Project needs to be taken into account in the discussion of such issues as traffic, parking, wind, shadows,

air quality and visual impact. As to visual impact, it is particularly important that the other projects also be considered in that what is proposed for both sides of Folsom Street is greatly out of proportion to what presently exists and is allowed. What is proposed by these various projects combined, including the Redevelopment Project, would drastically alter the character, views and light of the existing and still developing residential community along and close by Folsom Street. The impact of such a drastic change needs to be thoroughly explored in the EIS.

I also note what would appear to be inconsistencies between Table 5.1-1 and Figures 5.1-2 and 5.1-3. In Table 5.1-1 the Height/Bulk District shown for Block 3739 for both the Full Build and the Reduced Scope Alternatives is 350-S. Figure 5.1-2, for the same block for the Full Build Alternative, shows 400-S for one part of the block and 350-S for the remainder. Figure 5.1-3 for the same block for the Reduced Scope Alternative shows 350/400-U. Similarly, for Blocks 3736, 3737 and 3738, Table 5.1-1 shows 400-S for the Reduced Scope Alternative while Figure 5.1-3 shows 350/400-U.

The EIS also needs to consider how the needs of the combined project areas for schools, parks, supermarkets and other amenities will be met. With the Planning Department projecting 7750 more residential units than would otherwise be built under its proposed rezoning for the Rincon Hill Mixed Use District, plus over more than 5000 residential units approved for Mission Bay in addition to the 3400 to 4700 more units projected as a result of the present project, an additional population of at least 20,000 people more than would otherwise be expected would be living in this rather small area. The EIS needs to address how the needs of such a large population for parks, schools, retail and other amenities will be met.

As the South of Market area is already where most all of the new housing in the City has recently been constructed and will continue to be constructed (e.g. Mission Bay), to allow an even greater percentage of the overall new construction for the City to occur there will adversely affect the quality of life for those who now or hereafter live and work in the area. The much higher density resulting from these projects should be specifically contrasted with the density of other residential areas of San Francisco to provide a meaningful discussion of what is proposed. The type of units to be offered and the anticipated price range need to be included in the EIS so that it can be determined whether there is a realistic need for such units in San Francisco. The large number of units presently available (e.g. Bridge View Towers, Yerba Buena Lofts), as well as those already approved or under construction (e.g. Mission Bay, 333 First Street, 325 Fremont Street, 200 Brannan) should also be factored into this evaluation.

Over the past ten years a vibrant residential community has developed and continues to develop in the area along and nearby Folsom Street. The neighborhood is not a "clean slate" for someone to experiment on with a design considered appropriate for a theoretical or abstract urban neighborhood. The building of downtown-sized office buildings in this area which are out

of proportion to the buildings presently in the area would destroy its intended and existing character. The EIS needs to present a full and fair disclosure and discussion of the many issues raised by this and the other projects mentioned previously so as to enable the public and the various governmental agencies involved to determine whether what is proposed is in the best interests of the neighborhood and the City.

I can be contacted at the above address or by telephone at 415/781-5088 (work) or 415/882-7871 (home).

Very truly yours,

Reed H. Bement

Re: Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project
Draft EIS/EIR dated October 2002
Comments (Environmental Issues) due December 6, 2002

Dear Mr. Maltzer:

I am pleased to submit the following comments on the subject document and appreciate the opportunity to do so.

In a letter dated April 16, 2001, to Joan Kugler, EIR Project Manager, I suggested an alternative Caltrain extension plan coupled with underground pedestrian connectors and an efficient terminal design. This alternative offered significant advantages consistent with the primary purposes listed on page 1-1.

Subsequently, I have amended that document to incorporate results of additional research, and am enclosing a revised version as Attachment No. 1. Many of my comments on this Draft EIS/EIR are with respect to material in this attachment, which, for purposes of identification, I am referring to as the "Blackwell Alternative".

Attachment No. 2 adds research on reversing direction of Caltrains. Attachment No. 3 is a copy of my suggested alternate plan for the bus levels that was also included in my April 16, 2001, letter to Mrs. Kugler.

Please give the material in these attachments the same weight and careful consideration that you give the comments listed herein by page number.

COMMENTS

Page 1-10. The one-mile "gap" will be partially erased for those Caltrain riders who transfer to BART at Millbrae.

Page 1-11. I don't have a copy of an August 1996 ridership report by Charles River Associates, but a later report by the High-Speed Rail Authority* put the loss at 110,000 annual riders (not 200,000) if HSR is terminated at 4th & Townsend. Assuming weekend and holiday travel at 70 per cent of normal, this loss is only 332 riders per workday. The same report places the cost of HSR extension to the Transbay Terminal

site at $270 million, which would be an incredible amount to pay for a net gain of only 332 daily riders—less than one half of one per cent of the total riders.

Simply providing long- and short-term parking spaces at 4th & Townsend would probably increase San Francisco HSR riders by double or triple that number.

* California High-Speed Rail Authority "Revised Staff Recommendations for VHS Route Adoption" July 14, 1999, page 14, stated that "By terminating the Peninsula VHS routing at the 4th & Townsend Station site, about $270 million can be saved in construction costs while reducing the length of the system by less than one mile...ridership and revenue for long-distance travelers would only be slightly less than the Transbay Terminal alternative ...110,000 less riders per year which leads to $4 million less revenue per year." Total annual riders was 23.1 million at that time, and now is projected to be 36 million.

Page 1-28. Table does not show the street vacation procedure that is required for the taking from Minna Street of a ten foot strip (510 feet long) between 1st & 2nd Streets. Minna Street is only 35-feet wide. This encroachment is unnecessary. Attachment No. 3 shows an alternate one-level plan that accomplishes everything needed within the155-foot width of the existing State property.

Page 2-3. (a) Electrification of Caltrain is currently funded only to 4th & Townsend. (b) Electrification need not necessarily be in place prior to implementation of Caltrain extension. Push-pull electric locomotives have been used in the past to move diesel-powered trains through tunnels in urban areas, notably at Pennsylvania Station in NYC.

Page 2-6. The diagram shows an underground connection to BART as a design option. The summary on page S-7 says this pedestrian connection would be to the Embarcadero Station, rather than to Montgomery Street. There is only one short paragraph in EIS/EIR (Page 5-118) and the choice of BART stations is not discussed. The BART connection is evidently not in the cost estimate.

A pedestrian concourse with horizontal passenger conveyors (Blackwell Alternative) from the Transbay Terminal to Montgomery St. BART station puts commuters closer to the center of District C-3E and, in conjunction with a 2nd Street rail platform, presents an opportunity for sublime pedestrian circulation. Moreover, Montgomery St. has the highest number of entries and exits of the Market Street BART stations (Page 3-8). These connecting links would obviously improve access to bus and rail services for a great majority of transit riders, a primary purpose of these projects (Sec. 1.1). See also Attachment No. 1.

Page 2-9. Needlessly re-locating the bus levels 40 feet and 60 feet above the street level does not improve public access to bus service, a primary purpose of these projects (Page 1-1).

Page 2-11. The West Ramp alternative itself should include an alternative that combines on one level the upper and lower bus levels proposed. See Attachment No. 3, a drawing that shows the same number of bus stations, turnout lane, turning radius, etc. on one level that are proposed for two levels. Electronic signboards at the foot of the escalators would let patrons know which of the two platforms to use, and there is

no loss in AC Transit flexibility. In the Blackwell Alternative, this bus level would be at the 20-foot level, the west ramp elevation would remain essentially as is, and retail would be partially on the street level and partially on the pedestrian concourse level below the street. See Attachment No.1 for more detail.

Page 2-35. (a) The grade crossing planned at Common Street will prevent use of these tracks by HSR. (b) The six platform tracks on the surface cannot be used for trains continuing to the downtown terminus – such as non-electrified trains, for example. See page 2-3 (b) comment re electrification. (c) The platforms for the surface tracks are not long enough for special event trains. Caltrain has said that 1,000 feet is needed.

Page 2-36. (a) The Blackwell Alternative deletes the need to acquire 18 parcels of land and demolish eleven buildings for the HSR curve into the Terminal.

Page 2-46, Redevelopment Scenarios. BART, MUNI, Caltrain, and AC Transit stations, when fully inter-connected, will provide San Francisco with a regional commuter transit facility of unparalleled convenience in the heart of the downtown. Current market conditions not withstanding, the buildable parcels within a ten-minute walking distance of the Caltrain terminus, the Transbay Terminal, BART/MUNI Montgomery and Embarcadero Stations, and even the Ferry Building would ideally be predominantly office space. Office space development within close proximity would give maximum reinforcement to the investment in a regional transit facility. Ten minutes, incidentally, equates to a walking distance of one-half mile at 3 mph, a dimension that should be adjusted for topography.

The predominantly residential component proposed for both scenarios of the redevelopment activity is appealing because it addresses housing needs, but it has several disadvantages: (1) It displaces office space as outlined above, contributing to downtown sprawl. (2) It brings a new layer of pedestrian and vehicle traffic to an already congested downtown— moving vans, delivery trucks, more taxi and private cars, and on the sidewalks, more seniors, joggers, small children, baby carriages, and pets.

Housing that will enable more people to live near where they work is an urgent necessity, but there are many parts of the City with residential amenities already in place—schools, shopping, parks and playgrounds—that are far better suited for residential development than is the heart of the downtown. These neighborhoods need only improved transportation to be close to the downtown area.

Page 2-47. The reasons given for not renovating the existing terminal building tend to vanish in light of the Blackwell Alternative. Caltrain and high-speed rail are cleanly separated from the terminal; removal of the east bus ramp is still feasible. The single level plan shown in Attachment No. 3 could be implemented on the existing bus level. An elegant new roof could be installed over the bus platform. The lower floors plus sub-level (now garage) of the existing terminal offer ample opportunity for revenue-generating joint development. A Minna Street underground concourse link to Caltrain at 2nd St. and thence to BART Montgomery, is a simple addition. Opportunities for major improvements in space utilization, passenger circulation, signage, security, and safety are not precluded. Renovation would require the ablest architects and engineers, but it is certainly not out of the question.

Page 2-49, Alternatives Considered and Withdrawn, does not include the Blackwell Alternative described in Attachment No. 1. This is a carefully researched and reasonable alternative that was submitted within the public comment period prior to commencement of this Draft EIS/EIR.

Page 2-50. The Essex St. stub-end technical analysis is erroneous on several counts. Caltrain at present operates successfully with sub-end, not "pass through" tracks. Storage/by-pass tracks can also be provided at the stub-end. Reversing train direction is routinely done now and, in any case, does not present an operating problem that would impact schedule. Most northbound and southbound trains will make station stops at both 4th & Townsend and at the downtown terminus. See Attachment No. 2. Internal passenger circulation (with, for example, horizontal passenger conveyors) can be as clear and elegant as in the proposed, better even because the tracks do not need to be so far underground. The paragraph does not address the advantages of separating Caltrain extension form the Transbay Terminal Improvement Project.

Page 3-31 (bottom) - Setting the south boundary of the traffic study area at Bryant Street excludes 16th Street (as well as the extension of Common Street) from consideration in this EIS/EIR. Unless these streets are closed to vehicular traffic or grade separation is provided, there can be no high-speed rail service to downtown San Francisco.

Common Street might be closed but Sixteenth Street between 3rd & 7th Streets is classified as a major arterial. The balance to the Misson Street BART Station is classified as a secondary arterial. MUNI ultimately plans a surface light rail line on 16th Street. It is unlikely that this street can be closed. If an underpass is provided, access to 7th will be curtailed and there will be other traffic impacts. On the other hand, if all of the tracks are undergrounded before reaching 16th Street, the plans for the surface tracks at 4th & Townsend (page 2-25 and 2-26) no longer apply. There would also be a conflict with the major sewer collector on piles (shown in the profile drawing on page 2-24) to be resolved.

Page 5-93, bottom paragraph - Assuming similar sleek structural designs for the one-level ramp, the stacked ramps illustrated in Figure 5.16-2 would <u>not</u> be less visually obtrusive than a single ramp. (The title of the simulated drawing is confusing – should be" looking NW on Howard St. from about 2nd Street")

Page 5-94. The upper elevation drawing shows that the portion of the proposed terminal that crosses over both 1st and Fremont Streets begins about 20-feet above the street level and extends to the terminal roof height of 109-feet. The existing building also begins about 20-feet above street level but is only 40-feet high. The Blackwell Alternative would also have only one level (but of improved design) crossing these streets. As in Figure 6.16-2, a simulated visual comparison should be shown that illustrates the significant adverse impact of the proposed design on the views up and down on both 1st and Fremont Streets.

Page 5-118. Pedestrian tunnel if under Fremont Street would be to the BART Embarcadero Station rather than Montgomery Street. See comment, page 2-6. These spacious pedestrian tunnels with moving walkways would greatly <u>enhance public access to bus and rail services</u>, a primary purpose of these projects. See the detail

drawing of the underground pedestrian intersection at 2nd & Minna included with Attachment No.1.

Page 5-159. Table 5.20-4 shows 658,100 cubic yards of excavation materials for the terminal, but Table 5.21-1 on page 5-168 shows only 125,000 cubic yards for the terminal and a very low truck volume. Why the discrepancy? At 2,500 cubic yards per workday (180 trucks) this trainbox excavation will take about one year. The Blackwell Alternative deletes this requirement for a very deep and costly trainbox excavation.

Page 6-8, Table 6.6-1. I have been told that Proposition 42 can be expected to provide at most only $100 million for these projects, not the $600 ± million shown. How is this shortfall to be made up?

OTHER: Conservation of Natural Resources and Energy

This item is not included in the Draft EIS/EIR but might be significant enough to be included.

More than any other single factor, size determines the quantity of materials required for a project. The "Blackwell Alternative" effectively changes the design of the terminal from 5-1/2 levels to 3 levels without curtailing services. As a first approximation, this is a 45 per cent reduction in size that would reduce the consumption of building materials, and the energy required to manufacture and transport the materials, by a like amount. In this case, the opportunity to conserve natural resources and energy by size reduction is very substantial and might well be evaluated in an EIS/EIR concerned with environmental impacts.

Please call if you have any questions.

Sincerely,

William Blackwell

William Blackwell

Enclosures: Attachments (3)

The "Blackwell" Alternative

The Transbay Terminal plan approved by the Executive Committee of the Transbay Panel includes an underground six-track, three-platform rail terminal 50 feet below the surface for Caltrain and high-speed rail. Trains enter and leave by way of a two-track tunnel from 4th & Townsend that proceeds north under Second Street and then makes a wide turn into an underground train box. Tail tracks may be added beyond the terminal to store and stage trains. Until the time when tracks are extended to a new transbay tube, all of these tracks are stub end tracks. A design option is included for possible future pedestrian connection to the BART/Muni Metro Embarcadero Station, but funding is not provided for this option.

A two-track, one-platform rail terminus at 2nd and Minna Streets, in conjunction with underground pedestrian concourses connecting to BART at Montgomery Street and to an efficient station at the Transbay Terminal (TBT), is an attractive alternative to the approved plan. It is an arrangement that enhances connectivity and reduces cost.

Horizontal passenger conveyors (people movers) on the train platform and in the underground concourses, in effect, "shorten" the travel distances between all three of the major transit elements. Proximity of TBT and Caltrain to the BART/Muni Metro Montgomery Street Station, rather than to the Embarcadero Station, is a major bonus for commuters employed in the financial district. From the point of view of virtually all transit users, this is a beneficial arrangement. It also greatly simplifies construction. See drawing on page 7.

PRINCIPAL ADVANTAGES

- Enhances connectivity between Caltrain and other major transit systems.
- Reduces travel time and adds convenience for both bus and train riders.
- Reduces the combined cost of TBT and Caltrain extension.
- Meets the requirements of San Francisco Proposition H. The present plan does not.
- Allows Caltrain extension to proceed independently of TBT, which has several problems that could delay construction, possibly for years; conversely, allows TBT to be constructed without waiting for Caltrain Extension.

DISCUSSION

1. Does a two-track platform on Second Street have enough capacity for the level of train service contemplated, now and in the foreseeable future?

Two stub-end tracks and a wide passenger platform can be constructed underground within the Second Street R.O.W. The platform can accommodate horizontal passenger conveyors down the center that will effectively shorten walking distance—especially

important if quarter-mile long platforms are needed for HSR. There are no existing underground utilities under Second Street that restrict construction.

With an average dwell time of two minutes—the time allotted for high-speed rail stops at intermediate stations—and another 60 seconds for trains to enter and leave the station, two stub-end platform tracks can accommodate 40 trains per hour. Keep in mind that trains now travel backwards as easily as forward.

Caltrain:

Caltrain currently runs 76 trains in and out of 4th & Townsend every weekday, but never more than 8 per hour even at the height of the morning commute, according to the timetable effective August 26, 2002. For the horizon year of 2020, the Caltrain operating scenario in the Draft EIS/EIR assumes 170 trains a day but never more than 12 trains per hour during a.m. and p.m. peaks. Curiously, the number of trains per day increases by 124 per cent but the peak hour increase is only 50 per cent.

A platform with a capacity for 40 trains per hour will accommodate five times the current Caltrain peak and three times the year 2020 forecast peak.

At present, Caltrain commuter trains are only five cars in length. A 750-foot long platform at the downtown extension can easily accommodate 8-car trains. With 8-car trains, a two-track platform has a capacity that is eight times the current peak hour Caltrain activity!

In addition to two mainline tracks, Second Street is wide enough for three storage/by-pass tracks that provide operational flexibility at the stub-end. The concept would also retain intact (although underground) tracks at 4th & Townsend for train storage, staging, and light servicing that is within two minutes of the stub-end. The Long Island Railroad successfully operates 452 trains a day in and out of Pennsylvania Station in NYC using storage yards that are remote but within two minutes.

High-Speed Rail:

Unless 16th Street is closed to cross traffic, which seems unlikely because of its importance to Mission Bay, or grade separation is provided, there can be no high-speed rail service to San Francisco.

The final report of the Intercity High-Speed Rail Commission, December 1966, stated that "to attain the safety record of high-speed trains in other countries, California's system must be entirely fenced and grade separated (no rail/roadway intersections)." The June 2000 final business plan of the California High-Speed Rail Authority said, "The system will be completely grade separated, with no potential for conflict with pedestrian or vehicular traffic."

Assuming, however, that an engineering solution is found that permits grade separation at 16th Street, the year 2020 timetable for high-speed rail shows 132 trains per day in and out of San Francisco – but never more than 10 trains per hour. Thirty-six of the 132 trains provide service to Sacramento by way of Los Banos and Fresno.

Ten trains per hour could be on the high side. Dan Leavitt, Deputy Director of the California High Speed Rail Authority, said that because of traffic and other concerns, only express trains might continue to the Transbay Terminal, the remainder terminating at 4th & Townsend. Alternatively, some trains slated for San Francisco might be routed from San Jose up the East Bay side to Oakland and eventually to Sacramento by an improved Capital Corridor route.

Two stub-end platform tracks provide nearly twice the capacity needed for the combined peak hour service projected for Caltrain and HSR in the horizon year of 2020.

Reductions in dwell time could increase the capacity of a two-track platform by 50 per cent or more. Caltrain dwell time at intermediate stations is currently less then 2 minutes but BART dwell time is less then 30 seconds! Unlike Caltrain, BART cars have only one level and station platforms are at the height of the car floors—there are no steps to impede passenger flow— and several sets of entrance and exits doors are provided in each car.

The inescapable conclusion is that the rail plan developed by MTC consultants is far more elaborate then needed to meet present and future downtown rail requirements.

Adding more platform tracks allows longer dwell times but does not increase the maximum throughput of a station. No matter how many platform tracks are provided, the throughput will be governed by the maximum feasible in a two-track tunnel, never likely to exceed 60 trains per hour, the limit with BART's new advanced automatic train control system.

The MTC consultant's report states that the rebuilt Transbay Terminal has the capacity for 300,000 daily train/bus passengers. This is 4 times the number of riders projected for the year 2020 and would require 4 times the number of trains and buses. The number of bus bays cannot possibly be quadrupled nor can the number of train platform tracks. Even if the terminal had the capacity for this number of train platforms and bus bays, there is not the street and sidewalk capacity for 300,000 daily riders nor is there isn't enough land available anywhere near the terminal to build 45 million square feet or so of additional office space needed for this number of new commuters. At present, the whole of the financial district has only 44 million square feet of office space.

2. BART/Muni Metro Connection

Proposition H requires the terminal design to "yield the highest possible transit use by residents and commuters." It also requires that the terminal design "afford senior citizens, persons with disabilities, and other commuters with the most convenient connections between regional bus lines, Muni, Caltrain, and BART."

The most convenient connection from TBT to BART/Muni Metro is an underground concourse with moving sidewalks to the Montgomery Street Station, a trip that will take the average commuter slightly over five minutes on the people mover. The same trip

over surface sidewalks and three street crossings takes from 7.5 to 9 minutes – longer for persons slowed by luggage, small children, age, disability, or inclement weather.

If Caltrain terminates at 2nd & Minna Streets, approximately at the mid-point of this underground concourses linking TBT and BART, train access will be very convenient for commuters going either to the financial district or to the terminal. It will take just over 2 minutes to go from the train platform to the BART / Muni mezzanine level at 2nd & Market, and about 3 minutes to reach the center of the Transbay Terminal.

Commuters are almost always in a hurry. Even on a perfect weather day, many will choose the underground concourse because it saves time.

High-speed rail passengers and BART SFO passengers with luggage will most assuredly prefer a people mover to interconnect between TBT buses, BART/Muni, HSR, and Caltrain.

Although the Embarcadero BART/Muni Metro Station is closer to the Transbay Terminal and Ferry Building, the Montgomery Street Station at 2nd & Market is closer to the heart of the financial district, which has two-thirds of all office space in San Francisco. In fact, early studies for Caltrain extension scored location options based on relative proximity to 2nd & Market. The underground route from the TBT via 2nd & Minna to Montgomery & Market Streets is ideal for connecting with Caltrain.

Morning BART trains from the East Bay discharge riders at both Embarcadero and Montgomery Stations, which means there will be at least standing room for westbound passengers to board at Montgomery Station. Because it is near the end of the line, Muni-Metro will also have room for passengers in both directions.

The underground concourses can be a lively aspect of the terminal, featuring retail stores and restaurants that have "breakthroughs" to shops and stores on the street level. Underground satellite restaurants have been hailed as the most successful feature of the recent remodeling of Grand Central Station in New York City.

3. COST

Prop H requires the design to "result in the lowest feasible combined costs for construction of the bus terminal and the Caltrain station, without sacrificing the aesthetic qualities of the terminal and station and their interface with surrounding development."

Ending Caltrain at 2nd & Minna results in a lower combined cost than the proposed design. The shorter rail route is also shallower, deletes one curve under buildings, can be constructed in part with cut and cover, deletes the huge excavation and shell needed for the trainbox under the terminal, and deletes the tail tracks.

Deleting the curve alone deletes the acquisition and demolition costs of 18 parcels of land with 11 buildings [Draft EIS/EIR page 2-36.]

If the terminal design were revised consistent with the Caltrain extension and underground concourse in this proposal, it would have only three levels rather than the

proposed 5-1/2 levels, and its staggering $1 billion cost would come down roughly in proportion.

An underground concourse with horizontal passenger conveyors to BART/Muni Metro is not included in the TBT plan, although the concept is clearly mandated by Proposition H. If this feature had been included, added cost of the conveyors would be nil.

The 2nd Street rail concept is entirely underground and can have no possible adverse effect on aesthetic quality.

A larger issue is the very low cost/benefit ratio of the Caltrain Extension Project when compared with other transportation projects. See the table on page 13.

Cost of the extension project is now $849 million. Electrification of Caltrain at $602 million and Phase 1 of the Caltrain Express Project (Baby Bullet) at $127 million are separate and additional JPB projects. The grand total is $1.58 billion.

The Caltrain ridership forecast in the Draft EIS/EIR is for 29,307 train riders per weekday at the Transbay Terminal in the year 2020. This number equates to roughly 15,000 commuters per day who will directly benefit from the expenditure.

Caltrain extension, incidentally, is not necessarily dependent on electrification of the entire Caltrain system, a project that might best be delayed until it can be done jointly with high-speed rail. For air quality reasons, New York City prohibited steam and diesel powered locomotives within city limits. Until all commuter rail systems converted to electric, Penn Station successfully used supplemental electric locomotives to move trains underground in and out of the city.

A related consideration is BART extension to SFO, that will enable Caltrain passengers to transfer to BART at Millbrae and reach downtown destinations near any of the four BART station locations on Market Street. The new Millbrae Station is designed for cross-platform transfer between BART and Caltrain.

The BART fare from Millbrae to Montgomery Street Station will be $4.70. The trip will take 32 minutes plus the time to transfer. BART makes 11 intermediate stops.

Only 75¢ will be added to the train fare for peninsula commuters who elect to remain on Caltrain to 4th & Townsend. The Caltrain ride from Millbrae to 4th & Townsend takes 29 minutes with 5 intermediate stops. Most commuters must then add transfer time, $1 Muni fare, and at least 10 minutes more travel time to reach downtown destinations.

4. Supplemental Notes

a) For the foreseeable future, the northern California terminus of HSR likely will be at the San Jose Diridon Station rather than in San Francisco. Senate Bill 1856, authorizes a $9 billion general obligation bond for the November 2004 ballot, which is enough to construct high-speed rail from Los Angeles to San Jose (by way of Fresno and Los Banos) but is not enough to continue HSR to San Francisco. Rod Diridon has stated that an additional $2 billion is needed to reach San Francisco. Thus, for a period of unknown

duration, San Francisco bound HSR passengers will transfer to the Caltrain "Baby Bullet" at San Jose, which puts added importance on the extension of Caltrain to the downtown financial district of San Francisco. The Baby Bullet trip from San Jose to 4th & Townsend is expected to take 55 minutes or less.

Without the possibility of a new transbay tube, San Jose has a strategic advantage over San Francisco for the location of the HSR terminus that may be difficult for San Francisco to overcome.

b) Even with a downtown extension, Caltrain plans to retain a station stop at 4th & Townsend Moreover, the 4th & Townsend site has major advantages for HSR—notably much more space, better traffic access, lower cost, and reduced travel time. Unlike Caltrain, HSR has space requirements for ancillary activities such as postal and freight, car rental, passengers with luggage requiring auto and taxi service, etc. The provision of long- and short-term parking at 4th & Townsend would be a major enhancement for HSR in competition with air travel and for Caltrain reverse commuters. San Jose and Oakland airports each provide about 5,000 parking spaces for air travelers. A like number can be provided at 4th & Townsend but would be impossible to provide at the Transbay Terminal site, even if desirable.

The City of San Francisco has an opportunity for two great facilities— a grand train station with all the amenities at 4th & Townsend and a downtown multi-modal facility providing commuters with unparalleled public transit convenience.

c) Financing: In 1999 the City Controller's statement on Proposition H stated that "as a member of the Joint Powers Board, the City of San Francisco would be responsible for one third of the cost of capital improvements." At that time, the cost of the capital improvements was $621 million for the extension and $254 million for Caltrain electrification. The cost of rebuilding the Transbay Terminal was not included.

These Caltrain extension costs are now at $849 million and $602 million respectively. San Francisco's obligation under Proposition H has increased from $292 million to $484 million in just three years.

The Controller assumed that this funding would be by state and federal governments and by regional transportation agencies, and not from General Fund monies. However, the Controller said that the Caltrain Extension Project "would compete with other transportation projects, and funding this project may mean that other transportation projects important to the City would not be funded." Thus, there is added incentive for the San Francisco County Transportation Authority to ensure that San Francisco gets the highest value for each transportation dollar spent on these projects.

MAP NO. 1

COMPARATIVE PROJECT COST PER DAILY USER

Note	Project	Approx. Cost (millions)	Number of daily users*	Cost per Daily User	Multiple to equal TBT
a	TRANSBAY TERMINAL, bus only	$ 1,052	20,000	$ 52,600	0.0
b	Caltrain Extension	$ 849	15,000	$ 56,600	0.9
c	BART Extension to SFO	$ 1,500	46,600	$ 32,189	1.6
d	SFO New International Terminal	$ 840	32,877	$ 25,550	2.1
e	Bay Bridge - East Span	$ 2,620	228,500	$ 11,466	4.6
f	Pacific Bell Park	$ 300	42,000	$ 7,143	7.4
g	Penn Station Remodel	$ 800	250,000	$ 3,200	16.4
h	Grand Central Station Remodel	$ 391	250,000	$ 1,564	33.6

NOTES:

a Total project development cost dated 1/26/01 is $1,052,302,227; includes temporary facilities. MTC year 2020 daily bus ridership is 35,000 -- equates to about 20,000 daily commuters*

b Cost is Caltrain extension as of Dec 19, 2001 (MTC Draft RTEP). Year 2020 daily Caltrain riders is 29,307 (Draft EIS/EIR October 2002), which equates to about 15,000 commuters. Caltrain electrification ($600 million) is not included.

c $1.5B cost and ridership of 68,000 per day (Vicky Wills BART PIO 3/14/01.); Assume 25,200 are air passengers and remainder are daily commuters, total user per day = 46,600.

d SFO Fact Sheet 7/2000, 12 million international passengers in year 2006 = 32,877 per day

e 282,000 vehicles per day (Year 2000) at avg. 1.62 persons per vehicle (Caltrans 1991); divided by 2 = approx. 228,500 commuters; cost of $2.62 B is as of April 5, 2001.

f Cost and number of seats 1/24/99 - SF Examiner

g NY Times, 12/10/2000 - 300,000 train + 200,000 subway passengers = 250,000 commuters Only 7.4% are Amtrak, others are commute lines. 750 trains per day, 21 platform tracks.

h NY Times, 8/2/1998 - Cost includes $110 million for network of u/g passageways 550 commuter trains per day on 45 platform tracks.

* For weekday commuter systems such as Caltrain, riders per day divided by two equals approx. number of daily commuters. In the case of AC Transit, however, car-pooling in the a.m. changes number of daily users to about 60% of total AC Transit cross-bay ridership. AC Transit accounts for about two-thirds of total daily bus ridership. Hence, estimate of 20,000 commuters for bus-only terminal with 35,000 riders per day as shown in table on page 3, MTC consultants brochure, January 2001.

Reversing Train Direction

The success of the "Blackwell Alternative" to extend Caltrain to 2nd & Minna, where there is room for only two platform tracks, depends on short turnaround times. If short turnaround times are feasible, a two-track station may be all that is needed for the level of downtown service contemplated by both Caltrain and the California High-Speed Rail System.

According to trainmen at 4th & Townsend, northbound Caltrains are typically in the "pusher" mode, i.e., with the locomotive at the rear and the operating engineer in a cab car at the front. Commuter trains have five cars and are less than 500 feet in length including the locomotive. Special event trains are longer. At present, trains with more than eight cars require two locomotives. All Caltrain cars are bi-level, which increases seating capacity but also increases the time needed to load and off-load at stations.

When operating outside of yard limits, an operating engineer must be at the front of the train. When operating within yard limits, however, only a conductor is required at the front.

The trainman said that it takes between five and ten minutes to reverse the direction of a train. The operating engineer must relocate from the locomotive at one end of the train to the control cab at the opposite end, or visa versa. The operator is then required to test the controls before the train leaves the yard.

The time needed depends mainly on train length. At 3 mph, it takes about two minutes for an operator to walk the length of a five-car train and three minutes to walk the length of an eight-car train. The time to test the compressed air system in particular also varies according to the number of cars in the train and is roughly equal to the walking time. Thus, the five-minute turnaround time is for the shortest trains and the 10-minute time is for the longest.

HOWEVER, if a train is operating within yard limits, it can reverse direction without shifting operator location or testing the controls. A train can proceed in a reverse direction as soon as a crewman turns on the headlights at the front end. The trainman who gave me this information said he believed that stub-end tracks such as I propose — even if a mile or more in length — would qualify as within yard limits since public access is only at the boarding platforms and there are no grade crossings en route. If so, crew transfer and testing could always take place at the 4th & Townsend yards.

In the morning, operator transfer and control tests would take place at 4th & Townsend before the train leaves the yard for the journey south. There would be ample track storage space at 4th & Townsend and scheduling would not be impacted. In the afternoon, operator transfer could take place at 4th & Townsend before the train proceeds to the downtown terminus for the evening commute.

During off-peak hours, operator transfer could also take place at the downtown station by utilizing the storage/bypass tracks. Platform tracks would not be tied up, and train arrival and departure schedules would not be impacted.

In either case, the quick turnaround needed for a 2nd & Minna Station with only two platform tracks is evidently feasible.

To illustrate further, northbound trains arriving in the pusher mode during the morning commute would discharge some passengers at 4th & Townsend and then continue underground to the 2nd St. stub-end, off-load and load, and return to 4th & Townsend. At this point, reverse commuters that boarded at the downtown station would experience a delay while train crews change ends for the southbound trip. However, fully 90 per cent of reverse commuters live in parts of the City that are more accessible to 4th & Townsend than to a downtown location. These commuters will board at 4th & Townsend and would not be delayed. The evening commute would have a reverse scenario.

The diagram on page 3 is based on MTC data and shows the city wide reverse-commute pattern as it was in 1990.

This tilt in favor of 4th & Townsend for the reverse commuter would be further enhanced if additional short-term and long-term parking were provided at 4th & Townsend. Unlike Transbay, the 4th & Townsend site can accommodate several levels of parking conveniently located directly above train platforms. These parking spaces would unquestionably enhance ridership for both Caltrain and high-speed rail.

One other option is worth consideration. Although diesel exhaust poses an air-quality problem in downtown San Francisco, it may not be necessary to electrify the entire 77-mile Caltrain system before tracks can be extended underground to the downtown. I have been told that electric "push-pull" locomotives have been used successfully at Penn Station in NYC and elsewhere to power diesel trains for trips comparable to the round trip between 4th & Townsend and the stub-end at 2nd & Minna. Coupling and de-coupling of the electric locomotive can be accomplished quickly, and a crew shift is not required.

Dave Mansen
Parsons Transportation Group
120 Howard Street, Suite 850
San Francisco CA 94105

Dear Dave:

Enclosed for your consideration is an updated version of the material previously sent on the Caltrain Extension Project. Please use this copy when making your review.

The EIS/EIR Notice states that reasonable alternatives will be reviewed and evaluated in the EIS/EIR. Despite Joan's explanation that the wording of the notice was misleading, it is my understanding that CEQA guidelines as well as federal statutes require an appropriate response. Otherwise, why ask for citizen participation?

EIS/EIR Figure 2.3-1, Alternatives Considered and Withdrawn, does not include my proposal. However, if it had been considered, I suppose that the objections would be similar to those given on page 2-50 for the Essex Street stub-end alignment that you pointed out after the SPUR meeting.

In response to those particular objections, I note the following:

Although the train platform is not directly under the terminal building, it is nonetheless an integral part of the multi-modal transit facilty. Passenger circulation by means of moving walkway and ease of transfer from one mode to another are probably the most attractive features of my plan. Caltrain commuters have direct links not only to the bus terminal but also to BART/MUNI Metro at Montgomery Street, a connection that is not even in the consultant's plan. Transfer between AC Transit, Caltrain, and BART is frictionless. Greyhound passengers or BART SFO passengers transferring with luggage have a virtually effortless transfer via the moving sidewalks. Train levels are 25 feet below the surface rather than 50 feet. The plan has one bus level at the terminal that is 20 feet above the street, not two levels that are 40 and 60 feet above the street. Escalator travel is reduced by 50 per cent or more. Transfer to street level taxis, buses, limousines, and private cars right at the front door of the bus terminal is a major improvement that is also not in the consultant's plan.

The orientation of my plan does not allow for trains to pass through the station to a storage track. Instead, three storage/by-pass tracks are provided at the station that are equally accessible to the two platform tracks. One train does not block another. Caltrain at present operates with 12 stub-end platform tracks without "tail" tracks. These yards are within two minutes of the stub-end and would be retained in my plan. They would be underground on one level, however, as would all tracks at 4th & King.

My research shows that train direction can be reversed without reducing operating efficiency. See the enclosed "Notes."

On other items, Joan Kugler insisted that an underground connection to BART is in the TBT project. It is not in the cost estimate, however, and otherwise ignored in the EIS/EIR. I think the underground concourses with moving walkways connecting BART, Caltrain, and TBT are the links that make a multi-modal facility.

I am also bothered about developing a very costly terminal design that accommodates HST without at the same time showing how it is possible for HST to enter San Francisco. I recall that Maria Ayerdi was adamant that Proposition H includes HST. As you noted, the grade crossing at 16th St. prohibits HST.

I found on page 2-24 the sewage treatment plant and underground collector pipe you mentioned, and now understand why the track slope begins where it does. I assumed that tracks would come in underground beginning at the tunnel entry near 23rd St., 16th St. would remain open, and the entire Caltrain yards at 4th & King would be one level below grade, an arrangement ideal for a fine terminal at street level. The 4th & King site with a spur connection to TBT has the potential for a great station, with the downtown multi-modal commuter transit complex as an indispensable adjunct. From the 4th & King site, a new transbay tube could eventually provide straightforward continuation for HST to Sacramento and a second East Bay commuter rail line.

Even without HST, the 16th Street grade crossing is a problem. I put a stopwatch on the train crossings one morning. If the increase in peak hour trains is in proportion to the projected increase in Caltrain ridership, the railroad crossing gates at 16th Street will block cross traffic about 60 per cent of the time! How would motorists accept that?

SB 1856 does specify the Transbay Terminal as the ultimate destination for HST but, according to Rod Diridon, the $9 billion bond issue is only enough for the LA to San Jose portion. In spite of the commitment to downtown San Francisco, Section 1 (e) allows the Authority to set the limits of the route without extending to San Francisco. Diridon said that an additional $2 billion is needed to bring HST up the peninsula. Incidentally, I noticed Caltrain electrification is funded only to 4th & King.

Although less grandiose than the proposed, my alternative plan for Caltrain extension is an economical approach that is worthy of consideration. If the terminal design follows consistently, it would have only three levels rather that the proposed 5-1/2 levels and its cost would come down proportionately. This plan clearly benefits the commuter—thereby encouraging transit use—meets all of the requirements of Proposition H, and provides a level of rail service that is more than adequate for the foreseeable future.

I look forward to your comments.

Sincerely,

William Blackwell

William Blackwell

Jim Chappell, SPUR

SPUR, Friday Nov 8, 2002

My question is for Mrs. Kugler.

Eighteen months ago, after the EIS/EIR kick-off meeting at City Hall, I sent written comments to you that included an alternative plan for the extension of Caltrain.

This plan enhances connectivity and reduces cost without detracting from the concept of a major multi-modal transit facility in the heart of downtown San Francisco.

There may even be a precedent at Pennsylvania Station in NYC for the operating scenario that I propose, which, at the least, demonstrates that the concept is feasible.

The official EIR notice said that "any ... reasonable alternatives that emerge" would be reviewed and evaluated in the EIS/EIR. In fact, I have been told that this is a legal requirement.

Hence, my question has two parts:

Why wasn't my alternative reviewed and evaluated in this draft?

What expectation do I have that it will be properly reviewed and evaluated from this point forward?

MAP NO. 1

SUMMARY

The Transbay Terminal plan approved by the Executive Committee of the Transbay Panel includes an underground six-track, three-platform rail terminal 50 feet below the surface for Caltrain and high-speed rail. Trains enter and leave by way of a two-track tunnel from 4th & King that proceeds north under Second Street and then makes a wide radius turn into an underground train box. Tail tracks may be added beyond the terminal to store and stage trains. Until the time when tracks are extended to a new transbay tube, all of these tracks are stub-end tracks. An option is included for possible future pedestrian connection to the BART/Muni Metro Embarcadero Station, but no funding is provided for this option.

A two-track, one-platform rail terminus at Second and Minna is an alternative arrangement that enhances connectivity and reduces cost. Horizontal passenger conveyors (people movers) link the train platform to the Transbay Terminal and to the BART/Muni Metro Montgomery Street Station. From the point of view of a transit user, it is a very efficient arrangement. It also simplifies construction.

MAJOR ADVANTAGES

- Enhances connectivity between Caltrain and other major transit systems.
- Reduces travel time and adds convenience for both bus and train riders.
- Reduces the combined cost of TBT and Caltrain extension.
- Meets the requirements of San Francisco Proposition H. The present plan does not.
- Allows Caltrain extension to proceed independently of TBT, which has several problems that could delay construction, possibly for years; conversely, allows TBT to be constructed without waiting for Caltrain Extension.

DISCUSSION

1. Does a two-track platform on Second Street have enough capacity for the level of train service contemplated, now and in the foreseeable future?

The Second Street R.O.W. can accommodate two stub-end tracks and a very wide passenger platform. There is ample room for horizontal passenger conveyors down the center of the platform that will effectively reduce walking time. There are no existing underground utilities under Second Street that restrict construction.

With an average dwell time of two minutes—the time allotted for high-speed rail stops at intermediate stations—and another 60 seconds for trains to enter and leave the station, two stub-end platform tracks can accommodate 40 trains per hour. Keep in mind that trains now travel backwards as easily as forward.

Caltrain:

According to the timetable effective August 26, 2002, Caltrain runs 76 trains in and out at Fourth & King every weekday, but never more than eight per hour even at the height of the morning commute. A platform with a capacity for 40 trains per hour can accommodate five times this current peak.

Moreover, at present Caltrain commuter trains are only five cars in length. A 750-foot long platform at the downtown extension can easily accommodate eight car trains. With eight-car trains, a two-track platform has a capacity that is eight times the current peak hour Caltrain activity!

In addition to two mainline tracks, Second Street is wide enough for three storage/by-pass tracks that provide operational flexibility at the stub-end. The concept retains intact (although underground) 12 to 15 tracks at 4th & King for train storage, staging, and light servicing that are within two minutes of the stub-end. Pennsylvania Station in NYC has operated for 50 years or more with storage yards that are remote but within two minutes. Caltrain, of course, has stub-end platform tracks at 4th & King. Tailing tracks are not provided.

High-speed Rail:

Unless 16th Street is closed to cross traffic, which seems unlikely because of its importance to Mission Bay, or the tracks are under grounded before reaching 16th Street, there can be no high-speed rail service to San Francisco.

> The final report of the Intercity High-Speed Rail Commission, December 1966, said that "to attain the safety record of high-speed trains in other countries, California's system must be entirely fenced and grade separated (no rail/roadway intersections)." The June 2000 final business plan of the California High-Speed Rail Authority said, "The system will be completely grade separated, with no potential for conflict with pedestrian or vehicular traffic."

Assuming, however, that the 16th Street grade crossing problem is resolved, the timetable for high-speed rail in the year 2020 shows 132 trains per day in and out of San Francisco – but never more than 10 trains per hour. Thirty-six of the 132 daily trains are between San Francsico and Sacramento. The HST peak period does not correspond to the Caltrain peak period.

Ten trains per hour might well be on the high side. Dan Leavitt, Deputy Director of the High Speed Rail Authority, said that because of traffic and other concerns, only express trains might continue to the Transbay Terminal, the remainder terminating at Fourth & King. Alternatively, some trains slated for San Francisco might be routed from San Jose up the East Bay side to Oakland and eventually to Sacramento by an improved Capital Corridor route. As it stands, it is cheaper and faster to go by car (88 miles) than to make the 282-mile trip to Sacramento via high-speed train. Greyhound bus from San Francisco to Sacramento beats the time of local high-speed trains and at one-third the fare.

Conclusion

Two platform tracks with a capacity of 40 trains per hour permits a five-fold increase in Caltrain peak-hour service and has ample track capacity for high-speed rail well beyond the year 2020.

Moreover, reductions in dwell time could increase the capacity of a two-track platform from 40 up to 60 trains per hour. Caltrain dwell time at intermediate stations is currently less then 2 minutes but BART dwell time is less then 30 seconds! This is because there are no steps to impede passenger flow - BART cars have only one level and station platforms are at the height of the car floors – and because several sets of entrance and exits doors are provided in each car.

The inescapable conclusion is that the rail plan developed by MTC consultants is more elaborate then needed to meet present and future downtown rail requirements.

Adding more platform tracks does allow longer dwell times but does not increase the maximum throughput of a station. No matter how many platform tracks are provided, the maximum number of trains per hour in and out of any downtown terminal arrangement will be governed by the maximum feasible in a two-track tunnel, never likely to exceed 60 trains per hour with current technology.

The consultant's report said that the rebuilt Transbay Terminal would have the capacity for 300,000 train/bus passengers. This is four times the number of trains and buses projected for the year 2020, and, thus, questionable. The number of bus bays cannot be quadrupled nor can the number of train platform tracks. But even if the terminal had the capacity for this number of train platforms and bus bays, there is not enough land available anywhere near the terminal site for the 45 million square feet or so of additional downtown office space needed for this number of new commuters. The whole of the financial district has only 44 million square feet of office space.

2. BART/Muni Metro Connection

Proposition H requires the terminal design to "yield the highest possible transit use by residents and commuters." It also requires that the terminal design "afford senior citizens, persons with disabilities, and other commuters with the most convenient connections between regional bus lines, MUNI, Caltrain, and BART."

The most convenient connection from TBT to BART/Muni Metro is an underground concourse with moving sidewalk to the Montgomery Street Station, a trip that will take the average commuter slightly over five minutes on the people mover. The same trip over surface sidewalks and three street crossings takes from 7.5 to 9 minutes – longer for persons slowed by luggage, small children, age, disability, or inclement weather.

If Caltrain terminates more or less at the mid-point of this underground connector, commuter trains will be most conveniently located for passengers going either to the financial district or to the terminal. It will take just over 2 minutes to go from the train

platform to the BART /Muni mezzanine level at Second & Market, and about 3 minutes to reach the center of the Transbay Terminal.

Commuters are almost always in a hurry. Even on a perfect weather day, many will choose the underground concourse because it saves time.

High-speed rail passengers and BART SFO passengers with luggage will most assuredly prefer a people mover to interconnect between TBT buses, BART/MUNI, HSR, and Caltrain.

Although the Embarcadero BART/Muni Metro Station is closer to the Transbay Terminal and Ferry Building, the Montgomery Street Station at 2nd & Market is closer to the heart of the financial district, which has two-thirds of all office space in San Francisco. In fact, early studies for Caltrain extension scored location options based on relative proximity to 2nd & Market. Moreover, the underground route from the TBT to Montgomery Station is ideal for connecting with Caltrain on Second Street.

Morning BART trains from the East Bay discharge riders at both Embarcadero and Montgomery Stations, which means there will be at least standing room for westbound passengers to board at Montgomery Station. Because it is near the end of the line, Muni-Metro will also have room for passengers in both directions.

The underground concourses, incidentally, can be a lively feature of the terminal. It naturally follows that some retail shopping and restaurants would be at this level with "breakthroughs" to the street level. Critics have described the underground 'satellite' restaurants as the most successful feature of the recent remodeling of Grand Central Station in New York City.

3. COST

Prop H requires the design to "result in the lowest feasible combined costs for construction of the bus terminal and the Caltrain station, without sacrificing the aesthetic qualities of the terminal and station and their interface with surrounding development."

If otherwise feasible, ending the Caltrain portion at 2nd & Minna results in a lower combined cost than the proposed design. There are some trade-offs, but the shorter rail route is also shallower, deletes one curve under buildings, can be constructed in part with cut and cover, deletes the huge excavation and shell needed for the trainbox under the terminal, and deletes the tail tracks.

Moreover, if the terminal design were revised consistent with the underground concourse concept I propose it would have only three levels rather than the proposed 5 1/2 levels and its staggering one billion-dollar cost would come down roughly in proportion.

An underground concourse with horizontal passenger conveyors to BART/Muni Metro is not included in the TBT plan, although I think it is clearly mandated by Prop H. If this feature had been included, added cost due to the conveyors would be nil.

The 2nd St rail concept is entirely underground and can have no possible adverse effect on aesthetic quality. In theory, the current TBT design could remain unchanged, except, of course, the underground trainbox would be deleted.

The larger issue is the very low cost/benefit ratio of the Caltrain Extension Project when compared with other transportation projects. See the attached table.

Cost of the extension project is now $849 million — $450 million per mile! Electrification of Caltrain at $602 million and Phase 1 of the Caltrain Express Project (Baby Bullet) at $127 million are separate and additional JPB projects.

The Caltrain ridership forecast in the Draft EIS/EIR is 29,307 train riders at the Transbay Terminal in the year 2020. This number equates to roughly 15,000 commuters who will benefit.

Caltrain extension, incidentally, is not dependent on electrification of the entire Caltrain system, a project that might best be delayed until it can be done jointly with high-speed rail. For air quality reasons, New York City prohibited first steam, and then diesel powered locomotives within the city. Until the time when all commuter rail systems converted to electric, Penn Station successfully employed supplemental electric locomotives to move trains underground in and out of the City.

A related consideration is BART extension to SFO, that when open will enable Caltrain passengers to transfer to BART at Millbrae and reach downtown destinations near any of the four BART station locations on Market Street. One Caltrain/BART platform at the new Millbrae Station will provide for cross-platform transfers.

The fare from Millbrae to Montgomery Street Station on BART will be $4.70, whereas remaining on Caltrain to 4th & King adds only $0.75 to the fare. The trip on BART will take 32 minutes plus the time to transfer. BART makes 11 intermediate stops. The trip on Caltrain from Millbrae to the 4th & King station takes 29 minutes with 5 intermediate stops. A timetable and fare schedule has not yet been published for the Caltrain Baby Bullet.

4. Supplemental Notes

a) It seems likely that, for the foreseeable future, the northern terminus of the California high-speed rail system will be at the San Jose Diridon Station rather than at a station in San Francisco. Senate Bill 1856, authorizes a $9 billion general obligation bond for the November 2004 ballot, which is enough to construct high-speed rail from LA to San Jose (by way of Fresno and Los Banos) but not enough to continue HSR to San Francisco. Rod Diridon said an additional $2 billion is needed to reach San Francisco. For an interim period, San Francisco bound HSR passengers will transfer to the Caltrain "Baby Bullet" at San Jose, which puts added importance on the extension of Caltrain to the

downtown financial district of San Francisco. The Baby Bullet trip from San Jose to 4th & King is expected to take 55 minutes or less.

Without the possibility of a new transbay tube, San Jose has a strategic advantage over San Francisco for the location of the high-speed rail terminus that may be difficult for San Francisco to overcome.

b) Even with a downtown extension, Caltrain plans to retain a station stop at 4th & King. Moreover, the 4th & King site has major advantages for high-speed rail—notably more space, better traffic access, lower cost, and reduced travel time. Unlike Caltrain, HSR has space requirements for ancillary activities such as postal and freight, car rental, passengers with luggage requiring auto and taxi service, etc. Although controversial, the provision of long- and short-term parking would be a major enhancement for both HST in competition with air travel and for Caltrain reverse commuters. San Jose and Oakland airports each provide about 5,000 parking spaces for air travelers. A like number can be provided at 4th & King but is probably impossible to provide at the Transbay Terminal site, even if desirable.

The City of San Francisco has an opportunity for two great facilities — a grand train station with all the amenities at 4th & King supplemented by a downtown multi-modal facility providing commuters with unparalleled public transit convenience.

c) Financing: In 1999 the City Controller's statement on Proposition H said that "as a member of the Joint Powers Board, the City of San Francisco would be responsible for one third of the cost of capital improvements." At that time, the cost of the capital improvements was $621 million for the extension and $254 million for Caltrain electrification. The cost of rebuilding the Transbay Terminal was not included.

These costs are now at $849 million and $602 million respectably. In other words, San Francisco's obligation under Proposition H has increased from $292 million to $484 million in just three years. The Controller assumed that this funding would be by state and federal governments and by regional transportation agencies, and not from General Fund monies. However, the Controller said that the Caltrain Extension Project "would compete with other transportation projects and funding this project may mean that other transportation projects important to the City would not be funded." Thus, there is added incentive to see that San Francisco gets full value for the money spent on this important project.

PROJECT COST vs. NUMBER OF DAILY USERS

Note	Project	Approx. Cost (millions)	Number of daily users*	Cost per Daily User	Multiple to equal TBT
a	TRANSBAY TERMINAL, bus only	$ 1,052	20,000	$ 52,600	0.0
b	Transbay Terminal, bus + train	$ 1,885	40,000	$ 47,125	1.1
c	BART Extension to SFO	$ 1,500	46,600	$ 32,189	1.6
d	SFO New International Terminal	$ 840	32,877	$ 25,550	2.1
e	Bay Bridge - East Span	$ 2,620	228,500	$ 11,466	4.6
f	Pacific Bell Park	$ 300	42,000	$ 7,143	7.4
g	Penn Station Remodel	$ 800	250,000	$ 3,200	16.4
h	Grand Central Station Remodel	$ 391	250,000	$ 1,564	33.6

NOTES:

a Total project development cost dated 1/26/01 is $1,052,302,227; includes temporary facilities. MTC year 2020 daily bus ridership is 35,000 -- equates to about 20,000 daily commuters*

b Cost is Caltrain extension and rebuilt Transbay Terminal as of Dec 19, 2001 (MTC Draft RTEP). Year 2020 daily transit ridership for bus and train is given as 75,000 (MTC brochure Jan 2001) which equates to roughly 40,000 daily commuters. Caltrain electrification ($600 million) is not included.

c $1.5B cost and ridership of 68,000 per day, Vicky Wills BART PIO 3/14/01; assume 25,200 are air passengers and remainder are daily commuters, total user per day = 46,600.

d SFO Fact Sheet 7/2000, 12 million international passengers in year 2006 = 32,877 per day

e 282,000 vehicles per day (Year 2000) at avg. 1.62 persons per vehicle (Caltrans 1991); divided by 2 = approx. 228,500 commuters; cost of $2.62 B as of April 5, 2001.

f Cost and number of seats 1/24/99 - SF Examiner

g NY Times, 12/10/2000 - 300,000 train + 200,000 subway passengers = 250,000 commuters Only 7.4% are Amtrak, others are commute lines. 750 trains per day, 21 platform tracks.

h NY Times, 8/2/1998 - Cost includes $110 million for network of u/g passageways 550 trains per day on 45 platform tracks.

* For weekday commuter systems such as Caltrain, riders per day divided by two equals approx. number of daily commuters. In the case of AC Transit, however, car-pooling in the a.m. changes number of daily users to about 60% of total AC Transit cross-bay ridership. AC Transit accounts for about two-thirds of total daily bus ridership. Hence, estimate of 20,000 commuters for bus-only terminal with 35,000 riders per day, and 40,000 commuters for terminal with Caltrain extension (75,000 riders per day).

SECTION 2. As part of the extension of Caltrain downtown, a new or rebuilt terminal shall be constructed on the present site of the Transbay Transit Terminal serving Caltrain, regional ~~and~~ intercity bus lines, MUNI, and high speed rail, and having a convenient connection to BART and MUNI Metro. Said terminal shall be so designed and constructed as to: (a) yield the highest possible transit use by residents and commuters; (b) afford senior citizens, persons with disabilities, and other commuters with the most convenient connections between regional bus lines, MUNI, Caltrain, and BART; (c) produce the highest density of foot traffic, in conjunction with foot traffic from the Caltrain station, to accommodate mixed use retail development; (d) provide the lowest possible operating costs for MUNI and regional public bus lines; and (e) result in the lowest feasible combined costs for construction of the bus terminal and the Caltrain station, without sacrificing the aesthetic qualities of the terminal and station and their interface with surrounding development.

Notes after 8/15/02 visit to the 4th & King Caltrain Depot:

The success of my proposal to extend Caltrain to 2nd & Minna, where there is room for only two platform tracks, depends on short turnaround times. If short turnaround times are feasible, a two-track station may be all that is needed for the level of downtown service contemplated by both Caltrain and the California High-Speed Rail System.

According to trainmen at 4th & King, northbound Caltrains are typically in the "pusher" mode, i.e., with the locomotive at the rear and the operating engineer in a cab car at the front. Commuter trains have five cars and are just less than 500 feet in length including the locomotive. Special event trains are longer. At present, trains with more than eight cars require two locomotives. All Caltrain cars are bi-level, which increases seating capacity but also increases the time needed to load and off-load at stations.

When operating outside of yard limits, an operating engineer must be at the front of the train. When operating within yard limits, however, only a conductor is required at the front.

The trainman said that it takes between five and ten minutes to reverse the direction of a train. The operating engineer must relocate from the locomotive at one end of the train to the control cab at the opposite end, or visa versa. The operator is then required to test the controls before the train leaves the yard.

The time needed chiefly depends on train length. At 3 mph, it takes about two minutes for the operator to walk the length of a five-car train and 3 minutes to walk the length of an eight-car train. The time to test the compressed air system in particular also varies according to the number of cars in the train and is roughly equal to the walking time. Thus, the five-minute turnaround time is for the shortest trains and the 10-minute time is for the longest.

HOWEVER, if a train is operating within yard limits, it can reverse direction without shifting crews or testing the controls. A conductor simply turns on the headlights and the train can reverse direction. The trainman who gave me this information said he believed that stub-end tracks such as I propose — even if a mile or more in length — would qualify as within yard limits since public access is only at the platforms and there are no grade crossings en route. If so, crew transfer and testing could always take place at the 4th & King yards.

In the morning, operator transfer and control tests would take place at 4th & King before the train leaves the yard for the journey south, but there is plenty of track storage space at 4th & King and scheduling would not be impacted. In the afternoon, operator transfer could take place at 4th & King before the train proceeds to the downtown station for the evening commute.

Alternatively, operator transfer can take place at the stub end station by utilizing the storage/bypass tracks. Platform tracks would not be tied up, and train arrival and departure schedules would not be impacted.

In either case, the quick turnaround needed for a 2nd & Minna Station with only two platform tracks is evidently feasible.

To illustrate further, northbound trains arriving in the pusher mode during the morning commute would discharge some passengers at 4th & King and then continue underground to the 2nd St. stub-end, off-load and load, and return to 4th & King. At this point, reverse commuters that boarded at the downtown station would experience a delay while train crews change ends for the southbound trip. However, fully 90 per cent of reverse commuters live in parts of the City that are more accessible to 4th & King than to a downtown location. These commuters will board at 4th & King and would not be delayed. The evening commute would have a reverse scenario.

The attached diagram based on MTC data shows the city wide reverse-commute pattern as it was in 1990.

This tilt in favor of 4th & King for the reverse commuter would be further enhanced if additional short-term and long-term parking were provided. Unlike Transbay, the 4th & King site can accommodate several levels of parking conveniently located above train platforms. These spaces would unquestionably enhance ridership for both Caltrain and high-speed rail.

One other option is worth consideration. Although diesel exhaust poses an air-quality problem in downtown San Francisco, it may not be necessary to electrify the entire 77-mile Caltrain system before tracks can be extended underground to the downtown. Electric "push-pull" locomotives have been used successfully at Penn Station in NYC and elsewhere to power diesel trains for trips comparable to the round trip between 4th & King and the stub-end at 2nd & Minna. Coupling and de-coupling of the electric locomotive is accomplished quickly, and a crew shift is not required.

PROPERTY MANAGEMENT

December 3, 2002

Paul E. Maltzer
Environmental Review Officer
San Francisco Planning Department
1660 Mission Street, Suite 500
San Francisco, CA 94103

RECEIVED
DEC 05 2002
PLANNING DEPT

RE: Transbay Terminal EIR

Dear Mr. Maltzer,

This letter is written on behalf of Bryant St. Associates, the owners of property located at 55 Stillman St., San Francisco.

I have reviewed the Draft EIR and find it lacking in assessing the impact of the proposed permanent relocation of bus storage during the day to an area between Stillman and Perry Streets, from 2nd St. to 4th St., San Francisco.

In determining the impact of this aspect of the Transbay Terminal Plan, the EIR fails to reference proposals currently under study by the City Planning Department to rezone much of the SOMA area, particularly the areas adjacent to the proposed bus storage yard. Part of the rezoning is to include residential uses.

If the City is actually looking to encourage housing in these areas, then the impacts of a permanent bus storage yard on such housing should be discussed. As an alternative to the proposed bus storage location referenced above, the document should consider alternative locations which would not impact potential housing contemplated by the rezoning.

The EIR should also consider whether daytime storage for AC Transit and/or Golden Gate Transit should be accommodated at all. Currently Samtrans, which provides routes which interface with Transbay Terminal, does not store buses near Transbay during the day. Perhaps a lesser cost alternative, and possibly a lesser impact-generating alternative, would be for AC buses to travel back to the East Bay after their morning runs, where such buses could be re-utilized more effectively during the day for East Bay transit riders. A similar analysis should be looked at for Golden Gate Transit buses, where such buses could be re-used during the day to serve San Francisco-Marin transit demand.

If the project removes the existing ramp structure, with its own attendant impacts, to generate an impact in a different location, then the general impact is not mitigated, just shifted to a new location. A re-assessment of the desirability of accommodation of daytime bus storage for commuters should be in order.

Thank you for your consideration.

RE: Urgent information regarding your upcoming meeting on November 12th for the Transbay Terminal Project.

Dear Mr. Maltzer and San Francisco Planning Commissioners:

I represent the owners of 25 Stillman Street and 35 Stillman Street. I am writing to request an extension of the public comment period for the Transbay Terminal DEIS/EIR. Further, I am requesting that you require a more in-depth analysis of the negative impact to the area of the proposed Bus Storage Area along Stillman and Perry Streets. Both of these requests should be granted for the following reasons:

- My clients and others in the Stillman/Perry Street neighborhood publicly voiced their concern regarding this bus storage proposal at the DEIS/EIR Scoping Meeting on April 4th, 2001, during the tape-recorded session for public comment. Notwithstanding this fact, Stillman and Perry Street buildings are not even mentioned in the report.

- Many people also followed up these comments with letters, again asking that the DEIS/EIR include analysis of noise, air quality, and traffic. Instead of covering these issues, there was only one small paragraph in the entire DEIS/EIR which mentioned the noise impact on the Second St. Clocktower building. There are many other residential and commercial buildings in the area, including a large, low-income project on 3rd and Perry, that would be even more severely impacted and they were not

included in the mitigation measure identified in the DEIS/EIR. We request that a quantitative analysis of noise impacts from the bus storage yard be prepared for the sensitive receptors adjacent to the proposed bus storage area, and that the mitigation measure be expanded as necessary.

- There is no analysis in the air quality section of the impact of diesel emissions on nearby residences adjacent to the bus yard. In fact, there is no mention of any change in diesel emissions. While there may not be any increase in regional emissions because the new Terminal might not increase the number of buses or distance traveled, there will be changes in the locations of diesel emissions with the new bus storage yard. Most emissions from diesel engines are relatively heavy particulates that are local problems. We request that a quantitative analysis be carried out of the impacts of additional diesel emissions using the methodology developed by the California Air Resources Board in their publication entitled "Risk Reduction Plan to Reduce Particulate Matter Emissions from Diesel-Fueled Engines and Vehicles" in Appendix VII (published in 2000).

- The west approach span of the Bay Bridge is a lid to the proposed storage area that is boxed in between Stillman & Perry. This configuration would force the toxic diesel fumes into the many residence and offices of this densely populated neighborhood. Most if not all of the buildings in this two-block area rely exclusively on open windows/external air for their ventilation.

- I am informed that several people, and possibly many more, who requested to be notified when the EIS/EIR was published, never received notification. My clients were not notified although their names were on the circulation list. They found out about it weeks later through a chance conversation with a friend. The public needs more time to respond.

- The area currently has to deal with the negative impact of the Bay Bridge at its doorstep. Further, those along Stillman and Perry will have to live with the 5-8 year demolition and rebuilding of the west approach of the Bay Bridge. They may also have to tolerate their main exit artery (2nd St.) being torn up for the proposed rail system. Any tenant or owner who sticks it out during this extended construction period (potentially a decade or more) shouldn't be asked to tolerate permanent health and noise hazards that this storage area would impose. If you put in a permanent, 2-block diesel bus storage area, you are effectively condemning the buildings in this two-block area.

I am enclosing some recent studies showing the toxic effects of diesel exhaust. I strongly urge that you make a site visit to the area and meet with the residents/tenants to more fully understand the impact of this proposal. Once you have done this I think you will agree that other sites would be more suitable for the bus storage area.

Because of the impending deadline for the public comment period, please respond to me in writing by November 14th regarding extending the public comment period and including a more in-depth analysis of the proposed bus storage area and site alternatives.

Thank you for your prompt attention to this important matter.

Very truly yours,

John R. Capron

EPA: Diesel Fuel Exhaust Likely to Cause Cancer
03 Sep 2002 19:40 GMT

WASHINGTON (Reuters) - U.S. environmental regulators in a new report on Tuesday formally classified for the first time diesel exhaust from trucks and buses as likely to cause cancer in humans.

Green groups are seizing on the new report from the Environmental Protection Agency as proof the Bush administration needs to crack down on polluting diesel fuel emissions.

"This will underscore that diesel exhaust is a health hazard and should be controlled," said Frank O'Donnell at the Clean Air Trust, who called the report "the most in-depth health assessment to date" on diesel fumes.

Environmental groups are worried the Bush administration will roll back clean air regulations for diesel fuel.

The EPA in early 2001 issued standards to reduce diesel emissions from trucks and buses by more than 90 percent.

The administration said it backed those rules, but later said it might permit diesel engine makers to trade emission-reduction credits instead of producing cleaner trucks and buses.

The EPA is considering similar clean diesel standards for construction and farm equipment.

In addition to concluding that diesel fumes likely cause lung cancer, the EPA found diesel exhaust triggers asthma and other respiratory problems.

The agency said its report is based on exposure from diesel engines built prior to the mid 1990s. As new diesel engines with cleaner exhaust emissions replace existing engines, the report's conclusions will have to updated, it said.

Diesel Fumes Mean Cancer for Thousands of Americans

By Cat Lazaroff

WASHINGTON, DC, March 15, 2000 (ENS) - More than 125,000 Americans may get cancer from breathing diesel fumes from buses, trucks and other diesel engines, says a new analysis by state and local clean air regulators. The officials are calling on the U.S. Environmental Protection Agency, which is planning to release new restrictions on sulfur in diesel fuel within two months, to take strong action to address this health risk.

Diesel vehicles are among the prime sources of the pollution that leads to smog (Two photos courtesy EPA)

The analysis, by the State and Territorial Air Pollution Program Administrators and Association of Local Air Pollution Control Officials (STAPPA and ALAPCO), comes as the oil industry seeks to kill a proposed EPA plan to clean up diesel buses, trucks and diesel fuel. The EPA proposal is still under review by the White House Office of Management and Budget.

Calling diesel emissions an important health hazard, the EPA has announced it will release a new rule by the end of April requiring sharp cuts in the amount of sulfur allowed in diesel fuel.

Diesel engines are significant contributors to air pollution. The hazardous mixture that comprises diesel exhaust contains hundreds of different chemical compounds that wreak havoc on air quality, playing a role in ozone formation, particulate matter, regional haze and acid rain.

Diesel exhaust contains more than 40 chemicals that are listed by

the EPA as toxic air contaminants, known or probably human carcinogens, reproductive toxins or endocrine disrupters.

Vehicle exhaust also contributes to acid rain, and can lead to illness in humans

"There is no pollution more disgusting than the thick, noxious, suffocating smoke that billows from trucks and buses," said Becker. "But even worse, these fumes are putting us at risk of cancer - risk that can be almost completely eliminated with modern pollution controls."

Last fall, the South Coast Air Quality Management District, which sets air standards for the Los Angeles, California region, released a report analyzing the cancer risk in the region from exposure to diesel particulates. The agency concluded that mobile sources are responsible for about 90 percent of the cancer risk in the area, and that 70 percent of the total cancer risk is attributable to diesel particulates.

That study prompted STAPPA and ALAPCO - the national associations of state and local air quality control officers in the states and territories and more than 165 metropolitan areas across the country - to extend the evaluation to other cities nationwide.

Among their results: Over a lifetime of exposure to diesel fumes, an estimated 119,570 people in metropolitan areas, and an additional 5,540 in suburban and rural areas, will develop cancer. Large cities, including Los Angeles, New York City and Chicago, Illinois, could see thousands of cancer cases each.

STAPPA and ALAPCO want the EPA to require trucks to operate as cleanly as current laws mandate
(Photo courtesy Daimler Chrysler Corp.)

STAPPA and ALAPCO have joined major health and environmental groups in urging EPA to issue tough new diesel standards. Among their recommendations, the groups said EPA should set an extremely strict national limit on the amount of sulfur in diesel fuel - capping sulfur at less than 15 parts per million - by no later than mid-2006. The groups also want an intermediate cap of 30 parts per million to take effect by 2004.

The EPA has not yet released any specific numbers that will be included in its new sulfur rule.

Sulfur is a poison for diesel pollution control devices, much as lead was a poison to catalytic converters in the 1970s. The groups noted that California recently set a diesel sulfur cap of 15 parts per million for urban buses that continue to use diesel fuel. The groups said the national standards should apply not only to truck and bus fuel, but also to fuel used in "nonroad" diesel engines, such as construction equipment.

Oil refiners warn that the technology does not yet exist to produce fuel clean enough to meet the groups' requirements. Developing such fuel would be prohibitively expensive and could drive some refiners out of business, warned the American Petroleum Institute (API), a trade group. But API and other groups have volunteered to reduce sulfur by 90 percent from its current cap of 500 parts per million, bringing the sulfur content of diesel down to 50 parts per million. That reduction could add five or six cents to the price of a gallon of diesel fuel, said API spokesperson Edward Murphy.

Oil refiners say dramatic cuts in sulfur could prove prohibitively costly (Photo courtesy North Atlantic Co.)

Officials from the National Petrochemical Refiners Association (NPRA) and Petroleum Marketers Association of America sent a letter Tuesday to EPA Administrator Carol Browner warning that sharp sulfur reductions could result in dramatic cost increases and an unreliable supply of diesel fuel and related products.

"EPA's proposal for diesel sulfur is likely to reduce the supply of diesel fuel as well as heating oil and even gasoline," the letter said. "It is our understanding that the EPA proposal calls for a reduction of the onroad diesel sulfur cap from 500 parts per million (ppm) to 15 ppm in 2006. The proposed cap and timeframe are in excess of what is feasible or advisable from either an energy supply or environmental standpoint."

STAPPA and ALAPCO also want the EPA to set tough standards for diesel soot and smog-forming nitrogen oxide emissions from new trucks and buses by 2007. Emissions could be reduced by at least 90 percent through use of low-sulfur fuel and advanced exhaust emission controls, they noted.

STAPPA and ALAPCO want emissions reductions for construction equipment as well

(Photo courtesy Nebraska Machinery Co.)

Equivalent emission standards should be set for construction equipment and other big nonroad diesel engines, the groups advised.

Big diesel trucks, buses and nonroad engines should be required to operate as cleanly in use as they are supposed to, the groups said. The groups noted that for more than a decade, seven of the biggest diesel engine makers installed illegal "cheater" devices on well over a million trucks, allowing them to pollute more on the road than in pre-sale tests. These same engine makers are now trying to weaken the Consent Decrees that were reached last year with EPA and the Justice Department to settle these environmental violations.

The Clinton administration is taking actions to reduce pollution from trucks and other large vehicles. The Department of Energy (DOE) announced earlier this month it will partner with the heavy duty vehicle industry in a $30 million to $50 million research project to develop cleaner and more fuel efficient trucks. Over the next five years, the joint research effort will help researchers develop more energy efficient trucks, ranging from pickup trucks/sport utility vehicles to eighteen wheelers. Seven teams from the industry will join the DOE to develop clean energy technologies that will make trucks cleaner, more fuel efficient, and promote the use of alternative fuels.

"The research partnerships between the federal government and the private sector are critical to reducing America's reliance on imported oil, maintaining economic viability of our industries, and improving air quality," said Energy Secretary Bill Richardson. "With projections indicating that trucks will use twice as much fuel as cars by 2020, it is critical that we look to improve fuel efficiency and clean energy technologies."

About $5 million will be awarded this fiscal year. Three teams will develop hybrid propulsion systems utilizing a natural gas engine an electric powertrain for buses and urban duty trucks, such as delivery vans and heavy-duty vehicles. The teams will match DOE funding dollar for dollar. Four other research teams from industry will develop advanced components to reduce the fuel consumption and emissions from truck diesel engines. Because these projects are considered more risky, these teams will spend $3 for every dollar granted by DOE.

Becker noted that dozens of human epidemiological studies have found a link between diesel soot and lung cancer. STAPPA/ALAPCO's nationwide cancer projection "is an extremely conservative figure," using a method similar to that used by regulators in California to estimate diesel-related cancers there, he noted.

"In fact, the actual number of cancers could easily be ten times higher," Becker said, adding that "the important thing to keep in mind is that we are facing a cancer risk - a risk we cannot avoid

unless EPA takes decisive action."

Joan Kugler
AICP, EIR Project Manager
San Francisco Planning Department
1660 Mission Stree, Suite 500
San Francisco, CA 94103-2414

Dear Ms. Kugler,

I have become aware of a plan to use the Stillman Street parking lots between 2nd and 4th Streets for bus storage. This is not a good idea. This is a heavily populated area 24 hours a day, especially during working hours when all of the adjacent buildings are full of working tenants and residents.

I have been a tenant at 35 Stillman since 1991, when this neighborhood was next to nowhere. I've seen the dot com boom come and go, experience the snarling foot and car traffic of Giants games, and expect the Bridge retrofit to cause a major disruption sometime soon.

Idling buses should not be added to the mix! Please consider the alternatives.

Thank you,

Steve Caramia

To: Joan Kugler
AICP, EIR Project Manager
San Francisco Planning Department
1660 Mission Street, Suite 500
San Francisco, CA 94103

Dear Ms. Kugler,

While we are all in favor of efficient and effective public transportation, the concerns of the 127 families at the Clocktower Lofts (Second St. at Bryant) have not been adequately taken into account in the development of the Trans Bay Terminal Plans, specifically the development of the bus storage and maintenance area indicated in the Draft EIR/ EIS and the construction and operation of the trains and tunnels.

This project is complex and the issues require more time to study. Now that we, as residents, understand how complex, we need more time to consult experts and analyze these issues. We think that a better project will result in the future if we take the additional time now to take more comments from residents and businesses. Also a new draft EIR should be prepared and circulated for comment because impacts on environment (eg. Diesel emissions) have not been presented and analyzed.

TransBay Tunnel and CalTrain Extension
Other Solutions Can Be Found
Bus rapid transit could replace the rail system proposed here at much lower cost.

There are many impacts during the construction and operation of the CalTrain extension tunnel. What are those construction impacts? What is the damage to the building that might result and how can those risks be managed? Is there blasting? Would the construction structurally undermine the building? While we believe the Clocktower is on rock, the geological studies contained and reported in the EIR conflict with other reports on hand regarding the quality of the rock, with more sand and sandstone than reported. This is a 127 family work / live loft building, with requirements for access and functioning during work hours and in the evening and night. The construction plans do not take this into account.

What are the impacts during tunnel operation: of vibration, from exhaust, from noise from the operation of the trains must be studied in detail, as the EIR fails to even recognize the hallway as a part of the residence.

Bus Storage and Maintenance
Located between Second and Fourth Streets at Stillman, facing our building, the bus yard would be an atheistic issue and concentrate congestion, vibration, noise and diesel emissions in an enclosed area not appropriate for the high density residences and businesses.

EIR Not Responsive to Residents
We already expressed our concerns at the Public Hearing April, 2001, and in writing, requesting a study of the Effects of Emissions on the many residences and businesses. We are concerned that public safety needs are not being met and we are considering legal action. Until now, we have been nearly ignored in the process, we are not on the distribution list for information, nor is the Clocktower—an historic building—listed in the EIR/ EIS roster of buildings of historic merit. Where we do appear in the EIR, the sound wall

mitigation is directed to the wrong side of the property. (The Clocktower is on the East side of the property in question).

Other Locations Can Be Found
The function of day storage of AC Transit Buses, and Golden Gate Transit Buses can be contained within the TransBay terminal and adjoining buildings. For example, as David Baker and Associates Architects have recommended, it could be the first level of a multi- level residential development such as the Spear or Folsom projects. Adjoining the terminal project itself, its location there or at an alternative location would be more appropriate than in the middle of a dense residential and small business area–this is not an empty vacant area of abandoned lots.

Other possible locations could be explored, such as:
Widen the area now used for this bus storage and leave it where it is
Caltrans paint yard at Bryant and Main (Build double deck with bus storage below)
4th and King
Port Property- vacant piers
Ground level of property being developed adjacent to Transbay Terminal- such as 201 Spear and 300 Folsom.

When contemplating the new locations. given the carcinogenic classification of Diesel particulate, staging of buses should be inside, allowing the filtering of ventilation. New models of buses which use of particle traps, new clean burning diesel buses (or vegetable oil technologies) or electricity can be utilized.

Combination of Impacts: Existing Planning Already Puts Hardship Burdens on Neighborhood Families and Small Businesses
In the San Francisco Planning Document for the new Giants Stadium EIR and "Pacific Bell Park Transportation Management Plan", April, 1999, the area in question for the proposed bus yard is already part of the parking plan and mitigations to accommodate the needs of the Giants and neighborhood during games. In the same document the Second Street area has been designated a walking and bicycle zone, not a bus bridge. Many mitigations have been made already to accommodate the Giants plans. Please do not add additional burdens on this neighborhood. Parking is already very difficult here for small business and residents alike.

The Transportation Management Plan notes " An important objective of the Pacific Bell Park parking plan is the program to protect residential parking supplies in neighborhoods nearby the ballpark. The San Francisco Redevelopment Agency Rincon Point-South Beach Citizens Advisory Committee (CAC) has indicated that residents and businesses...are very concerned about not being severely impacted by baseball traffic or parking..."

The planned demolition and rebuilding of this area for the Bay Bridge approach will eliminate approximately 1,000 spaces of the parking and add construction for upwards of five to ten years. Please do not add additional burdens on this neighborhood's small business and families.

Traffic Congestion already High
The pressures on Second Street, Third and Fourth Street and around the Bay Bridge approaches during the evening rush hour are already very intense for this neighborhood. Contemplating a heavier use by adding buses to exit on these streets seems unlikely to succeed.

Health Issues and Public Safety Need to Be Addressed
Diesel fumes are carcinogenic and funnel directly into the building in the current plan. Fumes will accumulate under the low bridge approach and funnel directly into the first level of the building. New CalTrans designs will make it worse with the first deck even closer to the building. No on seems aware of the air pollution issues from the EIR team. Have there been visits made looking at this issue? A study of Air Pollution Emissions should be made, especially with respect to diesel emissions.

The Clocktower has 127 families, including small children for whom diesel fumes are especially dangerous. Stillman Street is also a high density residential and small business population. Both we and our neighbors rely on open windows for ventilation.

Noise and vibrations from buses will adversely affect occupants. Safety to pedestrians needs to be enhanced in the walk down Second Street.

The Clocktower is an historic building in an historic area. Every effort should be made to have aesthetic approaches to these problems. As we have just received the 500 page EIR/ EIS document, there has not been time to study, consult experts and analyze all of the effects of the proposed plan on the Clocktower Building and neighborhood. Please extend the public input comment period, it will enrich the final solution. We and the Clocktower join all the comments submitted by everyone else regarding the TransBay Terminal. We request to be placed on the notice list for all documents, proceedings and for a copy of the "Response to documents" when prepared.

I enclose a petition signed by residents.

Thank you for your attention to our concerns.

Sincerely,

Elizabeth Carney
George Carciani

Redevelopment Authority

A Petition Against the Proposed Transbay Terminal AC / Golden Gate Transit Storage Area

We, the undersigned, do not want the parking lots on Stillman between 2nd St. and 4th St. to be used for AC / Golden Gate Transit bus storage for the following reasons:

1. The Bay Bridge retrofit project is scheduled to have a major impact on our neighborhood for over 5 years (for most of us, right at our front door step). We should not be subjected to additional noise, pollution and inconvenience which this bus storage would impose.
2. The structure of the bridge approach over the Stillman St. parking lots creates a "tunnel" effect, which would further compound the impact of the bus exhaust on the air quality in the area. This not only affects pedestrians, but also impacts the many buildings in the area that use open windows as their only form of air circulation.
3. Since this lot is close to the Giant's stadium, it is used extensively for overflow parking during the day and evenings.
4. There is a real need for parking in this area -- not only for the commercial buildings - but also for the large number of live/work lofts in the area.

A Petition Against the Proposed Transbay Terminal AC / Golden Gate Transit Storage Area

We, the undersigned, do not want the parking lots on Stillman between 2nd St. and 4th St. to be used for AC / Golden Gate Transit bus storage for the following reasons:

1. The Bay Bridge retrofit project is scheduled to have a major impact on our neighborhood for over 5 years (for most of us, right at our front door step). We should not be subjected to additional noise, pollution and inconvenience which this bus storage would impose.
2. The structure of the bridge approach over the Stillman St. parking lots creates a "tunnel" effect, which would further compound the impact of the bus exhaust on the air quality in the area. This not only affects pedestrians, but also impacts the many buildings in the area that use open windows as their only form of air circulation.
3. Since this lot is close to the Giant's stadium, it is used extensively for overflow parking during the day and evenings.
4. There is a real need for parking in this area -- not only for the commercial buildings - but also for the large number of live/work lofts in the area.

1990

Dear Joan Kugler:

I am writing this letter to you to implore you to reconsider using the Stillman Street parking Lots between 2nd and 4th streets as bus storage. Stillman street residents and businesses will already be severely affected by the rebuilding of the bridge approach, do we also need to be subjected to reduced air quality by bus emissions?
If you visit our little neighborhood of businesses and homes you will see that the parking lots are a closed environment. The freeway overhead closes in the lots that are closely bordered on each side by buildings. These buildings house our businesses and our families. This is not an industrial park, this is a neighborhood.
Please help us to continue the growth of our area, not contribute to its demise.
I am sure that you can find a great alternative area in a place that would not be as negatively affected as our street. May I suggest 4th and King, or the Pier across from Bayside, or Port property, or how about under some of the property being built adjacent to the Transbay Terminal?

Thank you,

Myron Chadowitz

COMMENTS REGARDING THE TRANSBAY TERMINAL EIR/EIS

To: Joan Kugler, EIS/EIR Coordinator, City Planning Dept., San Francisco
From: Bernie Choden
(85 Cleary Ct., # 11, S.F., 94109 @ 415-9297714/fax:15).
Nov. 16, 2002

CEQA law permits a challenge of the fiscal feasibility necessary to assure mitigation of environmental concerns. **Are there sufficient economic means to pay for the necessary mitigation depending upon what is proposed? Are the mitigation concerns sufficient to deal with cumulative impacts?**

It is not only that this EIR/EIS document does not specify how to pay for mitigations, this document doesn't say what the needed mitigations are (as the document should have done in Chapters V and VI). For example, this document cites traffic impacts as immitigable and, yet, does not acknowledge the impact of unmitigated traffic impacts on the cost of doing business or living in this area. The document does not cite other economic and environmental mitigation needs of adjacent business and residential uses that now exit or would be exacerbated or be created by the project. Vaguely, this document says that there may be an examination of these issues after the approval of this document. **Mitigation is an essential component of an EIR; without identification of mitigation need and mitigation measures, this document is not certifiable.**

Mitigation revenue resources appears almost solely dependent on project internal subsidies from tax increments. Tax increments, alone, are the least advantageous means of repaying public investment for this high environmental impact.

> Almost a third of redevelopment increments are directed by law to go to school districts off the top. Secondly, the inflationary cap on increments is 2%; that means that the value of a dollar now will be only $0.50 later given normative rates of inflation. It also means that developers receiving tax increment assistance now will be paying off that assistance 10 years from now will do so with dollars worth half as much.

To provide adequate long-term mitigation revenues, I strongly suggest the project use of ground rents from public land ownership underlying the entire redevelopment project as the best means of paying (a) for the project, (b) mitigating environmental design and social impacts and, (c) controlling future design and development. The reasons are:

1. **Market rate development prospects remain relatively high despite a national economic downturn.** Mid-level and high-end rents in the City continued to inflate above 10% last year. A ground rent of a normative 3% on the value of development would only add) 0.5% to the operators' annual cost of a project, definitely too little to discourage investment in this premier market. (Regardless of what you've heard)
2. **Ground rents (G.R) remain in constant dollars unlike tax increment dollars.** They will still be worth a real dollar years from now.

3. **Front-end money** will come from the sale of development rights just at it would, and almost in same amount, from the sale of the title to the land.
4. The R.A. would receive the equivalent of tax increments (possessory interest taxes) anyway in addition to GR. As a result, the R.A. (and city) would receive, initially, **four times** as much cash flow as from T.I. only.
5. Further, **the use of G.R. would be much more flexible than for T.I.** such as the ability to match it to developer incentives and operators underwriting (think non-profits).
6. **The value of G.R. would increase with value of investments.** The developers would be able to go in cheap and pay out when they were profitable.
7. **Contracts regarding G.R. could control the design and operations of the project as a the most efficacious legal means of protecting the public investment and the future design of the terminal area.**. We should look to the Embarcadero Center as a good design example of how to provide residential uses within a high intensity commercial area.

I request an economic study directed toward the means and amount of cash flow from the project needed to provide environmental mitigation. Necessarily, approval of the terminal should be contingent how the redevelopment economics shapes up, particularly regarding other city resource needs and, in particular, the provision of a high quality, high-density residential environment within and adjacent to the project. **Design isn't just about how the environment looks; it is also about how it works far into the future.**

My experience with the Martin Luther Towers project in the Western Addition # 1 Redevelopment Area challenges the assumption that the Redevelopment Agency can be trusted to mitigate the Terminal's environmental impact. In the MLT situation, the RA stated that it would be selective as to what project areas it would honor regarding contractual obligations between the Agency and a beneficiary should the project become deactivated. **The Terminal project, therefore, requires an objective environment monitor (as in the Mission Bay Project) who can ensure enforcement of the R.A.'s public contractual obligations regarding development and mitigations.**

Summary:

This city needs improved rail transit access, but this proposal requires the integration of rail transit design with the design of the other uses necessary to make this project:

1. An integral, attractive and beneficial part of the city.
2. A means to pay for the project and its environmental impact measures

This document spends so much effort describing the transit project that, apparently, there is little space and effort applied to identifying and providing a clear list of mitigations, their costs, how to pay for mitigation, who will be responsible, and how implementation will be monitored. **This is not, as presented, a certifiable EIR/EIS document.**

SUBJECT: DEIS/DEIR/Section 4(F) Evaluation for the Transbay Terminal/ Caltrain Extension/Redevelopment Project

Dear Sir,

I live in the project area. The neighborhood needs parks. I am concerned that an opportunity to establish a park where my dog can play will be lost. Especially, when I read that all that is foreseen in the Redevelopment are 'two new "green" open spaces'. What does this '"green" open space' mean? (5.5.1 (p.5-39))

Car-boosting and homeless encampments are quality-of-life issues for the street. The proposed Off-Site Bus Storage Facility between Perry and Stillman and Second and Fourth Streets is under the jurisdiction of the Transbay Terminal. Will transit agency police patrol the lot, or will SFPD? Did the police union agree that by reorganizing existing staff no additional officers would be needed? I am concerned that the police will be spread thin and crime will increase on Stillman St. (5.4.2.2) and (5.4.4.2).

Since the Off-Site Bus Storage Facility is proposed right across the street, I read that section carefully. There is no Air Quality analysis of the bus storage lot (5.7.2). With all those buses idling underneath the freeway with nowhere for the air to go, I think it is fair to ask about Carbon Monoxide "pooling" on Stillman Street. The building in which I live is mixed-use. Five of the six units are residential and rely on open windows for cooling and ventilation. Diesel fumes and particulate impacts of the proposed bus storage lot are not addressed in the report (Table 5.7-3); therefore, the project does not conform with 40 CFR Part 93 especially section 116 (5.7.3).

I am pleased that noise mitigation is proposed for the bus storage facility. My concern is that the report mentions my neighbors in the Clock Tower without reference to other residential buildings on Stillman Street and a low-income residence on Perry, Yerba Buena Commons (5.8.7). Will noise mitigation apply only for those who live in the Clock Tower?

The report does not specify that the access ramp from the storage lot to the Terminal will be grade separated at Second Street but it does state at-grade mid-block crossing of Third Street (5.19.1.1, page 5-114 and 5-115). If the all buses in the two-block long storage lot cross Second Street and Third Street mid-block at-grade in order to return to the Terminal during the afternoon rush hour, I think that that will have an impact on vehicular traffic on Second Street. It is not addressed (Table 5.19-5) or (5.19.4.3). Third Street is defined out of the project area.

Why not locate the bus storage above the new terminal as they do at the Port Authority of the Hudson bus station in New York City? If it has to be across the street, I am looking to ensure the most beneficial impact.

The tunneling option for the Caltrain Extension is better for the area because it destroys fewer historic buildings in the neighborhood (Table 5.14-1) and has less construction impact on our street (5.20).

Construction impacts to streets (Table 5.21-3) does not address the mid-point access for construction of the tunnel on Second Street near Brannan Street mentioned in the last paragraph on page 5-155 (5.20.2).

Visual and aesthetic impact is hard to quantify. If we can try to improve the project keeping in mind its overall sculptural qualities and incorporating ornamentation and variation of form with the fabric of the district architecture, I hope that this will last another seventy-five years. The ramps need to be more than just 'less visually intrusive due to their uniform appearance and minimal supporting structures' (5.16.2 page 5-93). That sounds like a causeway to me. The sound-walls of the proposed off-site bus storage facility likewise must be architecturally related to the street. Overall, the Redevelopment District needs to have a variety of heights, mass, texture, and style. Please not another Embarcadero Center One, Two, Three, Four!

Thank you,

James Wittmann Dear

joan.kugler@sfgov.org

Dear Ms. Kugler:

This letter provides my comments in regards to the draft environmental impact statement for the proposed TransBay terminal, Caltrain extension, and redevelopment.

(1) Although Muni has no interest, there would be cost savings and reduced total overall environmental impact to the City of San Francisco if the depth of the trench was increased on 2nd Street from Townsend to Mission, to be sufficient to run Muni on an upper level, and heavy rail on a bottom level. (This would be instead of the proposed 3rd Street Muni underground line extension.) I would suggest that Muni could make a dogleg from 2nd down Mission, stopping at the Convention Center, and proceeding down 3rd for the remainder of the line as planned. In addition, it is my understanding that the mezzanine level of the TransBay terminal could accommodate Muni light rail trains, were this connectivity so desired, and this approach would enable this to happen.

(2) While some have questioned if six platforms offer adequate capacity, my suspicion is that the combination of tail tracks at the TransBay terminal and sidings at 4th and Townsend, can be sufficient with efficient operations. However, loading and handling of luggage for passengers traveling to SFO and on future high-speed rail service may cause capacity problems due to excessive dwell times. (As a side note, it appears that the terminal does not have any special provision for passenger luggage, i.e. it appears to assume everyone uses carry-on luggage.)

(3) Obtaining the maximum density in the immediate areas around the TransBay terminal makes good sense from a planning viewpoint. It also improves the economics and feasibility of the terminal, and reduces potential taxpayer liabilities.

(4) There exists a question in my mind as to whether there is sufficient redundancy and capacity in the efficient and compact TransBay design to accommodate accidents and equipment failures without undue delays.

Sincerely,

Mark Duncan

William Lee 558-6177 – needs our number

Dear Mr. Maltzer,

As the owners of 25 Stillman St., 35 Stillman St., 470 Third St. and 585 Howard St, we ask that you read and respond to our concerns regarding the Transbay Terminal Project EIR/EIS.

- The Stillman St. site is unsuitable for bus storage because it is a highly populated area with hundreds of residences, and many high-density office buildings in this two-block site.
- Most if not all of these buildings have operative windows and employ external air as their sole source of ventilation. The diesel exhaust, noise and additional traffic impact of a bus storage site is inappropriate and dangerous in our highly populated neighborhood.
- The "San Francisco Planning Department SoMa Community Planning Process Rezoning Alternative" Draft Packet dated Nov. 19, 2002, shows that the plan for this neighborhood is to encourage an even higher percentage of residential and office use. Putting a bus storage site in the middle of this would not be a compatible use for this area.
- As there are families and a school site in this 2-block area, a much more extensive analysis of air quality, sound, vibration and traffic would have to be implemented. Please note that the State has now banned idling buses near schools. The California Air Resources Board passed this measure on Thursday, December 12th, 2002. Before expending a lot of money to do these extensive studies, I hope you instead determine, with the additional information that you have before you, that alternative sites should be considered instead.
- Traffic to and from the proposed bus storage would have a significant impact on the already burdened Third Street and Fourth Street corridors.

Alternative location for the Bus Storage Facility.

- Those buses that don't need frequent access to the Transbay Terminal should be stored in a more industrial area, away from residences and high-density office use. Alternatively, they should be put into circulation in Marin, the East Bay and San Francisco to make a more frequent and efficient bus service (see paragraph below on "Bus Rapid Transit").
- The buses that do need access to the Terminal should be stored in or closer to the Terminal. One option would be to use the 2 lots on both sides of Howard St. at Beale under the bus ramp. There is substantially more height clearance at this location and it is much closer to the Transbay Terminal.
- Alternatively, the bus storage could be designed into one of the adjacent re-development projects or into the Terminal itself.
- Traffic in the South of Market area would be much less impacted by a bus storage site closer to the terminal.

Bus Rapid Transit:
Both the "cut & cover" and the "tunneling" options for the Caltrain extension would be disruptive to our neighborhoods. Please do an analysis of a "Bus Rapid Transit" alternative.

- This would be more cost effective and less disruptive.
- It could utilize more of the "idle" buses during off peak times by setting up a system that would be fast, easy and encourage increased ridership. This would decrease the amount of space you would need for bus storage, and thus could incorporate the smaller storage site into the Transbay Terminal development site.

To quote Stuart Cohen of the Transportation and Land Use Coalition (San Francisco Magazine, Dec. 02) "Together, AC Transit and Muni already carry close to 60 percent of the transit riders in the Bay Area, and both bus companies say they could add a whole lot more with a few innovations. In the cities, they would introduce what's known as "bus rapid transit" on major arteries....These buses would operate like trains, traveling in their own lanes, with the ability to trip traffic signals so that they don't get stuck at lights. The buses would make fewer stops, and the bus shelters would be more like train stations, with protection from the rain and signs that give real-time projections about when the next bus is arriving. Throughout the cities, buses would be frequent and fast (even during off-peak times).....especially in neighborhoods where people don't have cars. .....Along two major corridors in Los Angeles, where "bus rapid transit" is a top funding priority, installing such a system has reduced bus riders' commute times by 25% and increased ridership by close to 40% (See :Trains vs Buses: The L.A. Lesson.")

Notices and Responses:
We are concerned about the lack of notice of meetings, the lack of response to our initial input at the scoping meeting and follow-up letters. Although we were on the "distribution list" for the EIR, we did not receive it and had to call to get a copy after finding out that it was available through a chance conversation with a friend.

- If you have not already done so, please add us to your list for notices of <u>all</u> meetings regarding the Transbay Terminal and any other meetings that deal with the Bus Storage Site, the 2nd St. Caltrain connection and the 3rd St. rail.
- Please send us the "Response to Comments" that addresses our letters and other letters submitted for the Transbay Terminal EIR/EIS.
- We would like our buildings to be included in the analysis of any other issues of the Transbay Terminal and related projects (i.e. Bus Storage, 2nd or 3rd St. rail projects)brought up by others regarding our neighborhood (2nd St., 3rd St., 4th St., Stillman St. and Perry St. as well as Howard St.)
- My husband spoke at the initial Scoping meeting in April 2001 and we reiterated our concerns in two subsequent letters (May 18, 2001 & Sept. 30th, 2002 – see attached) and at the Planning Commission meeting in November 2002. Our attorney, John Capron, also submitted a letter (attached) in November, 2002. Those comments are all incorporated by reference in these comments.

Sincerely,

Francis and Janice Mathews

Subject: CalTrain/Transbay Terminal Connection.

Dear Ms. Kugler,

We are writing to express our concern over a proposal linked to the above mentioned project, requiring the closing of the Stillman Street parking lots between 2nd and 4th Streets. We understand that an EIR is underway and we would like the report to address the following:

Air Quality-the proposed bus parking lot is located under the concrete west approach to the Bay Bridge with residential and commercial buildings fronting both sides of the parking lot. Diesel fumes from idling buses would be trapped in this tunnel-like environment polluting the air that ventilates through the adjacent buildings. The Planning Department approved numerous live-work projects on Stillman Street; Clocktower lofts, 21 Stillman, etc combined with several existing apartment buildings, the bus parking lot certainly is not harmonious to our environment.

Recently we visited the Golden Gate Transit and Sam-Trans bus parking lots and were alarmed to find the buses idling with diesel fumes spewing out long before exiting the parking lots.

Our neighborhood will be severely impacted by the demolition and re-building of the Bay Bridge west approach as well as the potential construction of the 3rd Street Muni Line--- we should not be subjected to additional, ongoing noise and pollution from the bus storage.

Alternatives: We recommend the following alternative locations be considered for the bus storage:

1- CALTRANS paint yard on Bryant and Main, a two-story structure would allow for the maintenance yard and courtyard on top, and bus storage below.
2- Treasure Island
3- 4th and King Streets
4- Pier/Port property across from Bayside Village
5- Incorporated with the development, lower levels of adjacent parcels to the Transbay Terminal

Sincerely,

Francis Mathews

Subject: Cal/Train/Transbay Terminal Connection Follow-up

Dear Ms. Kugler:

This letter is to follow up our letter dated May 18, 2001 regarding a proposal which would require the closing of the Stillman Street parking lots between 2nd and 4th Streets. We are seeking full disclosure on your EIR with regards to air quality and to address our increased concern regarding new national reports, particularly one from the National Institute for Occupational Safety and Health (NIOSH) regarding the CARGINOGENIC EFFECTS OF EXPOSURE TO DIESEL EXHAUST. The information in this report as well as others contend that exposure to diesel fumes should be reduced to the lowest feasible limits. We have also discovered that diesel exhaust contains more than 40 chemicals that are listed by the EPA as toxic air contaminants, known or probably human carginogens, reproductive toxins or endocrine disrupters. If the diesel fumes from the idling buses were sustained over any period of time, they would be potentially very dangerous to all residents and commercial tenants of our neighborhood. These are health risks that we cannot accept. We cannot allow a known carginogen to be introduced into an environment where we live and work every day.

We sincerely hope that you will explore every alternative to this proposal and take our concern very seriously. We are willing to work with you to find a viable solution and have already recommended several alternative locations which much less environmental impact.

Sincerely,

Francis Mathews

EPA: Diesel Fuel Exhaust Likely to Cause Cancer
03 Sep 2002 19:40 GMT

WASHINGTON (Reuters) - U.S. environmental regulators in a new report on Tuesday formally classified for the first time diesel exhaust from trucks and buses as likely to cause cancer in humans.

Green groups are seizing on the new report from the Environmental Protection Agency as proof the Bush administration needs to crack down on polluting diesel fuel emissions.

"This will underscore that diesel exhaust is a health hazard and should be controlled," said Frank O'Donnell at the Clean Air Trust, who called the report "the most in-depth health assessment to date" on diesel fumes.

Environmental groups are worried the Bush administration will roll back clean air regulations for diesel fuel.

The EPA in early 2001 issued standards to reduce diesel emissions from trucks and buses by more than 90 percent.

The administration said it backed those rules, but later said it might permit diesel engine makers to trade emission-reduction credits instead of producing cleaner trucks and buses.

The EPA is considering similar clean diesel standards for construction and farm equipment.

In addition to concluding that diesel fumes likely cause lung cancer, the EPA found diesel exhaust triggers asthma and other respiratory problems.

The agency said its report is based on exposure from diesel engines built prior to the mid 1990s. As new diesel engines with cleaner exhaust emissions replace existing engines, the report's conclusions will have to updated, it said.

NIOSH ISSUES CANCER ALERT FOR DIESEL EXHAUST FUMES

One reason why people often oppose a new facility is increased truck traffic. Trucks are big and noisy and subject to accidents, and when accidents occur involving trucks, there's a high likelihood of fatalities.

However, the federal government has recently concluded officially that there is another good reason to be concerned about increased truck traffic in your neighborhood: five separate studies in the last 3 years have shown that diesel exhaust certainly causes cancer in laboratory animals, and two studies of railroad workers show that it causes cancer in humans as well. As a result of this determination, the National Institute for Occupational Safety and Health (NIOSH) has issued a special publication, CARCINOGENIC EFFECTS OF EXPOSURE TO DIESEL EXHAUST, offering this recommendation: "As prudent public health policy, employers should assess the conditions under which workers may be exposed to diesel exhaust and reduce exposures to the lowest feasible limits." Citizens may reasonably ask: if NIOSH believes workers should not be exposed to diesel exhaust because of the cancer hazard, can health officials in other parts of government believe that the general public should continue to be exposed to diesel exhaust? Taken in this light, risk assessments that discuss only the traffic hazards associated with a facility are missing the major point: diesel trucks can evidently kill innocent people even if no traffic accidents occur.

Diesel engines are more efficient than gasoline engines; they produce more horsepower per gallon of fuel, and they use a less-refined (thus cheaper and more plentiful) fuel. When diesel fuel burns in an engine's combustion chamber, the resulting exhaust contains gases and particles (soot). The gases include nitric oxide, nitrogen dioxide, oxides of sulfur, and hydrocarbons (e.g., ethylene, formaldehyde, methane, benzene, phenol, 1,3 butadiene, acrolein, and polynuclear aromatic hydrocarbons [PAHs], several of which are known carcinogens). Of the particles in diesel exhaust, 95% are less than 1 micron in diameter and thus they are respirable, which is to say they are easily taken into the deepest portions of the human lung where they may lodge forever. The core of each particle is made up of pure carbon, but as many as 18,000 different chemicals from the gaseous portion of the exhaust may be adsorbed (attached) onto the carbon core, and thus diesel exhaust can carry a whole host of exotic, toxic and carcinogenic chemicals into the deepest portions of your lung-down in the region where the transfer of gas occurs to put oxygen into your blood stream and to take carbon dioxide out.

As recently as 1986, NIOSH concluded that diesel exhaust did not cause cancer in laboratory animals. However, in the period 1986-1988, five long-term animal studies, and two epidemiologic studies of humans, all concluded that exposure to diesel exhaust causes lung cancer. As a result, NIOSH reversed itself and in August, 1988, issued a special "current intelligence bulletin" to

Environment

Diesel Fumes Mean Cancer for Thousands of Americans

By Cat Lazaroff

WASHINGTON, DC, March 15, 2000 (ENS) - More than 125,000 Americans may get cancer from breathing diesel fumes from buses, trucks and other diesel engines, says a new analysis by state and local clean air regulators. The officials are calling on the U.S. Environmental Protection Agency, which is planning to release new restrictions on sulfur in diesel fuel within two months, to take strong action to address this health risk.

Diesel vehicles are among the prime sources of the pollution that leads to smog (Two photos courtesy EPA)

The analysis, by the State and Territorial Air Pollution Program Administrators and Association of Local Air Pollution Control Officials (STAPPA and ALAPCO), comes as the oil industry seeks to kill a proposed EPA plan to clean up diesel buses, trucks and diesel fuel. The EPA proposal is still under review by the White House Office of Management and Budget.

Calling diesel emissions an important health hazard, the EPA has announced it will release a new rule by the end of April requiring sharp cuts in the amount of sulfur allowed in diesel fuel.

Diesel engines are significant contributors to air pollution. The hazardous mixture that comprises diesel exhaust contains hundreds of different chemical compounds that wreak havoc on air quality, playing a role in ozone formation, particulate matter, regional haze and acid rain.

Diesel exhaust contains more than 40 chemicals that are listed by

the EPA as toxic air contaminants, known or probably human carcinogens, reproductive toxins or endocrine disrupters.

Vehicle exhaust also contributes to acid rain, and can lead to illness in humans

"There is no pollution more disgusting than the thick, noxious, suffocating smoke that billows from trucks and buses," said Becker. "But even worse, these fumes are putting us at risk of cancer - risk that can be almost completely eliminated with modern pollution controls."

Last fall, the South Coast Air Quality Management District, which sets air standards for the Los Angeles, California region, released a report analyzing the cancer risk in the region from exposure to diesel particulates. The agency concluded that mobile sources are responsible for about 90 percent of the cancer risk in the area, and that 70 percent of the total cancer risk is attributable to diesel particulates.

That study prompted STAPPA and ALAPCO - the national associations of state and local air quality control officers in the states and territories and more than 165 metropolitan areas across the country - to extend the evaluation to other cities nationwide.

Among their results: Over a lifetime of exposure to diesel fumes, an estimated 119,570 people in metropolitan areas, and an additional 5,540 in suburban and rural areas, will develop cancer. Large cities, including Los Angeles, New York City and Chicago, Illinois, could see thousands of cancer cases each.

STAPPA and ALAPCO want the EPA to require trucks to operate as cleanly as current laws mandate
(Photo courtesy Daimler Chrysler Corp.)

STAPPA and ALAPCO have joined major health and environmental groups in urging EPA to issue tough new diesel standards. Among their recommendations, the groups said EPA should set an extremely strict national limit on the amount of sulfur in diesel fuel - capping sulfur at less than 15 parts per million - by no later than mid-2006. The groups also want an intermediate cap of 30 parts per million to take effect by 2004.

The EPA has not yet released any specific numbers that will be included in its new sulfur rule.

Sulfur is a poison for diesel pollution control devices, much as lead was a poison to catalytic converters in the 1970s. The groups noted that California recently set a diesel sulfur cap of 15 parts per million for urban buses that continue to use diesel fuel. The groups said the national standards should apply not only to truck and bus fuel, but also to fuel used in "nonroad" diesel engines, such as construction equipment.

Oil refiners warn that the technology does not yet exist to produce fuel clean enough to meet the groups' requirements. Developing such fuel would be prohibitively expensive and could drive some refiners out of business, warned the American Petroleum Institute (API), a trade group. But API and other groups have volunteered to reduce sulfur by 90 percent from its current cap of 500 parts per million, bringing the sulfur content of diesel down to 50 parts per million. That reduction could add five or six cents to the price of a gallon of diesel fuel, said API spokesperson Edward Murphy.

Oil refiners say dramatic cuts in sulfur could prove prohibitively costly (Photo courtesy North Atlantic Co.)

Officials from the National Petrochemical Refiners Association (NPRA) and Petroleum Marketers Association of America sent a letter Tuesday to EPA Administrator Carol Browner warning that sharp sulfur reductions could result in dramatic cost increases and an unreliable supply of diesel fuel and related products.

"EPA's proposal for diesel sulfur is likely to reduce the supply of diesel fuel as well as heating oil and even gasoline," the letter said. "It is our understanding that the EPA proposal calls for a reduction of the onroad diesel sulfur cap from 500 parts per million (ppm) to 15 ppm in 2006. The proposed cap and timeframe are in excess of what is feasible or advisable from either an energy supply or environmental standpoint."

STAPPA and ALAPCO also want the EPA to set tough standards for diesel soot and smog-forming nitrogen oxide emissions from new trucks and buses by 2007. Emissions could be reduced by at least 90 percent through use of low-sulfur fuel and advanced exhaust emission controls, they noted.

STAPPA and ALAPCO want emissions reductions for construction equipment as well

(Photo courtesy Nebraska Machinery Co.)

Equivalent emission standards should be set for construction equipment and other big nonroad diesel engines, the groups advised.

Big diesel trucks, buses and nonroad engines should be required to operate as cleanly in use as they are supposed to, the groups said. The groups noted that for more than a decade, seven of the biggest diesel engine makers installed illegal "cheater" devices on well over a million trucks, allowing them to pollute more on the road than in pre-sale tests. These same engine makers are now trying to weaken the Consent Decrees that were reached last year with EPA and the Justice Department to settle these environmental violations.

The Clinton administration is taking actions to reduce pollution from trucks and other large vehicles. The Department of Energy (DOE) announced earlier this month it will partner with the heavy duty vehicle industry in a $30 million to $50 million research project to develop cleaner and more fuel efficient trucks. Over the next five years, the joint research effort will help researchers develop more energy efficient trucks, ranging from pickup trucks/sport utility vehicles to eighteen wheelers. Seven teams from the industry will join the DOE to develop clean energy technologies that will make trucks cleaner, more fuel efficient, and promote the use of alternative fuels.

"The research partnerships between the federal government and the private sector are critical to reducing America's reliance on imported oil, maintaining economic viability of our industries, and improving air quality," said Energy Secretary Bill Richardson. "With projections indicating that trucks will use twice as much fuel as cars by 2020, it is critical that we look to improve fuel efficiency and clean energy technologies."

About $5 million will be awarded this fiscal year. Three teams will develop hybrid propulsion systems utilizing a natural gas engine an electric powertrain for buses and urban duty trucks, such as delivery vans and heavy-duty vehicles. The teams will match DOE funding dollar for dollar. Four other research teams from industry will develop advanced components to reduce the fuel consumption and emissions from truck diesel engines. Because these projects are considered more risky, these teams will spend $3 for every dollar granted by DOE.

Becker noted that dozens of human epidemiological studies have found a link between diesel soot and lung cancer. STAPPA/ALAPCO's nationwide cancer projection "is an extremely conservative figure," using a method similar to that used by regulators in California to estimate diesel-related cancers there, he noted.

"In fact, the actual number of cancers could easily be ten times higher," Becker said, adding that "the important thing to keep in mind is that we are facing a cancer risk - a risk we cannot avoid

unless EPA takes decisive action."

Re: Stillman and Perry Streets, proposed bus storage, and the EIR.

Dear Ms. Kugler,

I am hand delivering this letter, along with copies of our previous correspondence dated May 18, 2001 and September 30, 2002, and copies of studies which show significant impact and danger from diesel fumes. The EIR did not address this very important issue. We are already exposed to pollution of all kinds from the traffic on the approach to the Bay Bridge; buses idling and coming and going to and from a rather enclosed storage area under this unventilated approach would escalate the air and noise pollution to unacceptable levels. I am hoping that this will get your attention and that we will be able to halt all further forward motion on this proposal

I was quite dismayed to discover that not only did we not receive a copy of the EIR as requested, but in reviewing a Stillman Street neighbor's copy, Stillman and Perry Streets were completely absent, with the exception of a brief mention of noise pollution from the proposed bus storage. We raised these issues at the April 4, 2001, Scoping Meeting. Why weren't these issues evaluated in the EIR?

Although we are concerned with noise pollution, we are also greatly concerned with the impact of diesel fumes on air quality, the dissolution of all parking between 2nd and 4th Streets in the established lots. I think it is important to note, these parking lots were listed in the Pac Bell Ballpark EIR as important to that facility. Also the greatest concentration of commercial development, hence parking demand, is on Second Street. In conclusion we are concerned and suspicious of the desire to push through this proposal without exhausting other alternatives.

We have distributed petitions to our concerned friends and neighbors and these shall be returned to you as soon as all signatures are in. Letters are also forthcoming.

We look forward to seeing you at City Hall on November 12th.

Sincerely,

Francis Mathews

Re: Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project

Dear Ms. Kugler:

I am a resident at the Clocktower at 461 2nd Street, San Francisco, California. I have reviewed as best I can the EIR on the Transbay Terminal/Caltrain/Redevelopment project and offer the following comments.

I disagree strongly with the suggestion of a bus storage facility across the street from the Clocktower. Literally, it seems, hundreds of buses may be stored there. The EIR does not adequately address the issue of pollution (noise, fumes, particulate matter) that will result from these buses being stuffed under the freeway ramps in that area. Clocktower residents are not the only people living in the area: there are residences on Stillman and Harrison Streets, I believe, that would be affected as well.

Even more woefully inadequate is the discussion of resulting traffic problems which can be expected from ferrying buses to and from the new transbay terminal. Several of the intersections in the area are already "worse case scenario" at peak traffic times (see the EIR for the Giants' stadium and the EIR for some proposed high rises also in this same general area). I can tell you from firsthand experience that peak traffic times go well beyond typical rush hour scenarios now, including weekends. There are "horn concertos" many nights of the week already.

Other options for the buses would be much more appropriate. I suggest housing them at the transbay terminal itself or at some other location closer to the terminal (I know you don't want to take up space where other high rise buildings are likely to be proposed in the near future and that the honchos at Charles Schwab, Gap, etc. don't want the buses in their neck of their woods either–better to squeeze'em in with hapless homeowners).

Regarding the analysis of expected noise and vibration from running a huge tunnel right down Second Street, literally feet away from the Clocktower building, the EIR seems so far off base as to be from the world of science fiction and junk science. So unacceptable noise in the hallway is not the equivalent of unacceptable noise in the house? Even though this is all in the same building, it doesn't matter?

I'm sure you are aware of the fact that the Clocktower is already at Ground Zero for another huge construction project, viz., the re-do of the western approach to the Bay Bridge. Exactly where is the study showing what the cumulation of that and the proposed mega-project now before you (and the proposed three- and four-hundred foot towers just blocks away) will be? What happens when each EIR says such-and-such intersections are already at maximum traffic degradations but makes little or no reference to the combination of all these proposals?

Discussion in the EIR is totally lacking about what happens to access to the Clocktower garage when our block of Second Street is "closed" (this is not a "delivery entrance," as mentioned in the report).

A few other comments, even though outside the purview of the EIR:

Where is the money coming from for this 2-billion dollar project (the state budget deficit currently looks to be over $30 billion and the federal deficit is soon to follow this steep, upward curve, what with war and tax cuts)?

How many people does Caltrain actually move and do the projections for increased ridership, even if to be believed, justify a project of this magnitude now?

I believe the EIR needs substantial work yet.

Very truly yours,

ARTHUR L. MEADER, III

San Francisco, CA 94103

Dear Ms. Kugler:

I am a resident at the Clocktower, near ground zero for the proposed TransBay terminal bus storage facility (2nd and Stillman Streets). To put it nicely, you've picked a lousy location, pretty much guaranteed to pour lots of diesel fumes and particulate matter into people's homes, not to mention the accompanying noise that can be expected. Someone's brain was not in gear when this plan was developed or have you not ever seen the chaotic traffic mess present in the area nearly every night (weekends not excluded but not quite as bad). If you want real problems, I suggest adding lots and lots of buses to the mix per your idea.

There should be plenty of areas actually closer to the Bay and to the proposed terminal where the buses can be housed. Let me guess: the Powers That Be didn't want these pollution-spillers in their backyard(s) so why not foist them off on hapless residents in the area (there are residents on Stillman and other parts of Second Street as well as Clocktower people that will be affected). I say why not nestle these babies right next to the Gap headquarters or under the Charles Schwab building. You won't convince me that those locations aren't as practical or more so than your apparent choice.

Thanks also for the extensive advance notification. At least with projects such as the Third Street rail line I get periodic mailers,which are very helpful. I have yet to hear peep one from your office or any other agency involved in this deal.

Please reconsider this ill-advised proposal.

Very truly yours,

ARTHUR L. MEADER, III

Hand Delivery
Paul E. Maltzer
Environmental Review Officer
San Francisco Planning Department
1660 Mission Street, Suite 500
San Francisco, CA 94103-2414

RE: Public Comment on Draft Environmental Impact Statement / Environment Impact Report for Transbay Terminal / Caltrain Extension / Redevelopment Project

Dear Mr. Maltzer:

This letter responds to Caltrain's letter of October 4, 2002, which (1) transmitted a copy of the Draft Environmental Impact Statement/Environmental Impact Report ("Draft Report") for the above referenced Transbay Terminal Project ("Project"), and (2) requested public comments on the Draft Report be directed to your attention. The following comments are submitted on behalf of a consortium of architects, engineers, urban planners and others (the "Consortium") interested in the successful development of the Project. As set forth in letters dated January 29 and February 1, 2002 (Attachments A and B), the Consortium submitted an alternative proposal ("Alternative") for the Project. Although the Consortium's proposal spelled out how the Alternative could save almost a billion dollars in construction cost and considerable time in completion of the Project, the Draft Report does not address the Alternative. As set forth below, the Draft Report's failure to evaluate this viable alternative is a breach of the federal and state environmental review requirements for the Project. Moreover, given the significance of the Project for San Francisco and the entire Bay Area, it is essential that all reasonable alternatives be reviewed. This is particularly important today because the unusually high cost of constructing and financing the Transbay Terminal as proposed in the Draft Report is likely to doom any prospect of completing this critical link in Bay Area transportation for many years to come.

AC Transit Dictated Site Selection

The present Transbay Terminal was built in the 1930's to handle commuter trains from the East Bay. The long narrow terminal with its sweeping ramp structure was designed to accommodate multi-car trains using elevated tracks for easy connection to the lower deck of the Bay Bridge. When trains were removed from the bridge in the late 1950's, AC Transit started bus service to the terminal using the same ramps and station platforms previously used by

commuter trains. AC Transit and other bus lines continued to use the terminal without significant alteration, but the 1989 Loma Prieta earthquake made it clear the aging terminal had to be replaced or substantially upgraded to meet modern seismic standards.

In the early 1990's the City and County of San Francisco and other public agencies studied several alternatives. With the help of a Citizens Advisory Committee, the Main/Beale site next to the present terminal was picked as the best location for a new terminal. On March 4, 1996 the San Francisco Board of Supervisors approved the Main/Beale site as the preferred alternative. Preliminary designs were prepared for a Main/Beale terminal but AC Transit was not happy with the initial layouts. AC Transit then sued the City contending that the Main/Beale site was not adequate for its purposes and that only the present terminal location should be considered. In order to settle this litigation, the Board of Supervisors passed a resolution in February 1999 that backed away from the Main/Beale site and urged the "City and County of San Francisco to work expeditiously with AC Transit...to retain AC Transit bus service at the current Transbay Terminal site." As a result, the Draft Report only considers rebuilding the terminal at its present location.

Penalties for Reusing Existing Site

Reuse of the existing site, with its long narrow footprint and extensive elevated ramp structure, creates several problems for design of the new Transbay Terminal. For example, to accommodate AC Transit and the other bus lines, the proposed terminal will be as large or larger than the current terminal (approximately 1300 feet long, 165 feet wide, and almost 100 feet tall) - the equivalent of the Empire State building laid on its side. Like the old terminal, the new terminal will stretch over three major streets (and several alleys), blocking view corridors north and south, and together with connecting ramps dominate the surrounding neighborhood as much or more than the existing terminal. To counter the enormous scale of the new terminal, the exterior is designed as a largely transparent glass cage set in a steel frame. This high tech effort to create an attractive presence for the new terminal may be successful, but is likely to be substantially more expensive than a standard building exterior.

Furthermore, the long narrow configuration of the terminal is inherently less efficient than a more square-shaped building. First, interior corridors must be added so passenger can get from one end of the terminal to the other –in this case an entire floor (the Concourse Level) is used as a pedestrian walkway connecting the ends of the bus terminal, and a second floor below ground (the Train Mezzanine Level) serves a similar function for train passengers. Transit buildings typically have more efficient centralized circulation areas where passengers walk fewer steps to get to their train or bus. Second, long narrow buildings are inherently less efficient because they have a much higher ratio of exterior surface to interior floor space. The proposed terminal would have a perimeter of almost 3000 feet with floors of approximately 215,000 square feet. By comparison a building which is 400 by 600 feet has a perimeter of only 2000

feet but provides 240,000 square feet of space on each floor. In this example, the proposed Transbay Terminal is approximately 60% less efficient than the more compact terminal in terms of the interior floor space created per foot of exterior wall. This of course leads to large differences in construction cost per square foot, particularly in this case where the proposed exterior wall treatment is very expensive.

The existing site is also a difficult place to put a rail terminal. At a width of 165 feet, the new terminal will accommodate only six train platforms. Moreover, the terminal can only be accessed on tight 500-foot radius curves and does not have room for straight platforms in excess of approximately 1000 feet. This presents problems for California's High Speed Rail Authority which has requested tracks with a radius of at least 650 feet on all curves and station platforms at least 1300 feet in length. The proposed terminal site is at best a marginal fit for high-speed rail, and clearly provides no expansion space for new rail service from the East Bay and beyond. As the Draft Report indicates, in the long run the large majority of terminal patrons will be train riders, especially when rail service to the East Bay becomes available. Unfortunately, the proposed design calls for an enormous investment in facilities for bus riders and comparatively little investment for rail passengers.

Finally, reusing the old terminal site adversely impacts the Project's development prospects. The old terminal site along Mission street has the highest development potential because height limits in that area are 400 to 500 feet providing the greatest density and value for development. However, the proposed terminal design precludes most development along Mission Street. Instead, the Draft Report proposes a substantial change in San Francisco's zoning, moving high rise development two blocks south along Folsom Street:

> "[The Project] would change the zoning ... to allow for development of greater heights – up to a maximum of 400 feet on the north side of Folsom Street – 200 feet higher than is currently permitted." (Report, p 5-97).

It is unclear whether the City would allow this rezoning because to do so would permanently change the character of the neighborhood along Folsom Street. Without it, however, redevelopment would generate considerably less money to pay for the terminal.

Advantages of Main/Beale Site

The City and the Citizens Advisory Committee originally chose the Main/Beale site because it has several important advantages. One of the most obvious is that it is a largely vacant site on which a new terminal can be quickly constructed while the old terminal stays in operation. This eliminates the need to build a temporary terminal and ramp for use while the old terminal is torn down and rebuilt, thereby saving considerable time and tens of millions of dollars in construction cost. Most important, it is an efficient site on which to locate a new

terminal because of the larger, almost square blocks between Main and Beale and Folsom and Mission. At 300+ feet in width, the site can accommodate up to 10 train platforms, including two 1300-foot long platforms required by high-speed rail with no sharp curves in the approaching track. It is closer to the Embarcadero Bart/Muni Station, making an underground pedestrian connection between the terminal and Bart/Muni feasible. Because of its North/South alignment the Main/Beale site requires shorter, less costly ramps to connect buses to the Bay Bridge, and a shorter tunnel connection for Caltrain. Finally, the Main/Beale site maximizes development along Mission Street as called for by the City's Master Plan, and retains existing zoning along Folsom Street. Further details of the Main/Beale Alternative are provided in Attachment C.

One and a Half Billion Dollars in Savings

The Draft Report estimates the Transbay Terminal Project will cost approximately two billion dollars to construct and another billion to finance, or three billion dollars total. The Alternative is estimated to cost somewhat more than a billion dollars to construct, and perhaps another half billion to finance for a total cost of just over one and a half billion dollars. It is easy to see where the savings are:

1. The Alternative avoids approximately $30 million in construction cost by eliminating the temporary terminal and ramps.

2. Permanent ramps for the Alternative design are much shorter and simpler, saving $100 to $200 million, depending on which ramp design is selected for the proposed terminal at the existing site.

3. The Alternative terminal is much more compact, reducing exterior size while preserving usable space within the building. Moreover, because the Alternative design has a smaller impact on the neighborhood (only a pedestrian bridge crosses one major street) there is less need for an expensive façade treatment. As a result, as much as $300 million can be saved in constructing the terminal building.

4. Caltrain's connection to the terminal is shorter and easier, reducing costs for the rail portion of the project by approximately $200 million.

5. The Alternative design allows development of more valuable land along Mission Street, increasing the project's total revenues by some $50 million.

Finally, financing costs for the Alternative are greatly reduced, not only because construction costs are much lower to start with, but also because revenues would be available from development and other sources to pay approximately half these costs at the time of construction. As a result the total debt to be financed would be closer to half a billion dollars

under the Alternative, versus a billion and a half-dollars under the project as proposed in the Draft Report.

Limited Funds Available

The higher cost of the terminal proposed in the Draft Report might be ignored if funds were readily available for the Project. However, just the opposite is true. As acknowledged in the Draft Report, a final financing plan cannot be offered at this time because sufficient sources of funding cannot be identified. The Draft Report suggests that future revenue sources may develop at state and local levels, but these are dependent on factors beyond the Project's control. The Draft Report also proposes to pay approximately twenty percent of total costs through Passenger Facility Charges (PFC's) of $2 to $3 per day collected from each commuter using the terminal - a novel concept for a local transit project - which would increase by fifty percent commute costs for a typical AC Transit rider. Finally, the Draft Report suggests approximately $600 million could be borrowed from the federal government under its TIFIA loan program, but it is unclear what additional source would be used to repay the TIFIA loan. In summary, the level of available funding is adequate for the Alternative but not for the three billion dollar project proposed in the Draft Report.

Conclusion

AC Transit's position is that it likes the current Transbay Terminal and sees no urgent need for change, except for a seismic upgrade to be paid for by the State. If forced to move, AC Transit will only approve a new facility that meets all its demands regardless of cost - a Taj Mahal for buses. The result is an enormous white elephant that is neither functional nor financeable, which is perhaps the outcome intended by AC Transit from the outset. Fortunately, the environmental review laws that apply to the Project do not permit AC Transit to play dog-in-the-manger and frighten away competing alternatives with lawsuits and similar behavior. Instead, federal and state regulations require the consideration of all viable alternatives as a precondition to project approval. We therefore request the Alternative be fully evaluated prior to completion of the final Environmental Impact Statement/Environmental Impact Report for the Project.

Sincerely,

Oliver L. Holmes

246 Second Street #902
San Francisco, CA 94105

RECEIVED
DEC 2002
PLANNING DEPT

Paul Maltzer, EIR officer
SF Planning Dept.
1660 Mission Street #500
San Francisco, 94103-2414

Mr. Maltzer,

I am a resident of 246 Second Street in San Francisco, and would like to make some comments on then draft EIR for the Transbay Terminal/CalTrain downtown Extension/Redevelopment Project.

I have lived on Second Street for 2 years, and I believe this project will bring many benefits to the area. However, I would like to make the following comments:

- Please be aware that although there are many businesses in the area, there are also a number of residents. Too often in the past, construction projects have been given permission to operate at night, unaware that there are people living in the area. As the project progresses, I hope you'll keep in mind that this is a mixed-use neighborhood, and that people live here.

- I am concerned at the large number of buildings that will be demolished for this project. One of the attractive aspects of the SOMA area is the number of historic and interesting buildings built on a human scale. I am particularly thinking of Second Street between Mission and Folsom. I hope we can keep the demolition to a minimum, as I'm afraid that if these building are destroyed, they will be replaced by large, ungainly, and uninteresting buildings whose only purpose is to maximize the profit for the developer.

- I hope the possibility of tunneling is explored as much as possible, as I believe it will significantly lessen the impact to the neighborhood.

- I hope you'll reconsider the location of one of the staging areas from Howard and Second. That is only half a block from 246 Second Street, and the noise, especially at night, will be extremely disruptive.

- In section 5.21.10.1, there is a mention of noise measurements done at our building, which recorded a reading of 57dBa. However, this measurement was taken during evening rush hour—perhaps the noisiest time of day. At night the area is much quieter, and I hope a more accurate measurement of the noise levels will be taken and used as the basis for enforcing the noise ordinance.

- Figure 5.2-3 illustrates (by red shading) buildings scheduled to be demolished by the construction. This figure seems to indicate many more buildings slated for demolition than is indicated in the text. I hope that can be minimized.

- If it is necessary to close Second street to all traffic, I hope there will be provisions made to provide parking to the residents who will not have access to their parking garage. This will be a major inconvience.

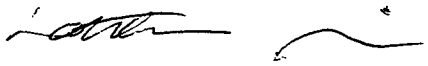
- There are a number of mentions of daily cleanup (such as watering down the dust and cleaning up contraction debris). However, a construction project of this size will greatly impact the buildings nearby, and I hope there is some provision for a through power washing and or painting of 246 Second after the project is completed, as I am sure its appearance will be adversely affected by the construction dirt and debris.

- I understand that state-of-art building techniques will be used. However, I am concerned that all the digging and impact so near our building may weaken its foundation and potentially cause some problems during an earthquake. I hope the city is fully aware of the

risks and is ready to mitigate any possible problems caused by the construction to the structural integrity of 246 Second Street.

As the project progresses, I am sure there will be a number of issues that will arise. I sincerely hope that we can work together to make this project a success and that you will be sensitive the needs and concerns of the people who make this neighborhood their home.

Sincerely,



Matthew Morrison

Mr. Paul Meltzer
San Francisco Planning Dept.
1660 Mission St. Suite 500
San Francisco, CA. 94103

Subject: public comment, Transbay Terminal reconstruction

Dear Mr. Meltzer:

I am writing in response to the proposed redesign of the Transbay Terminal for use as a combined commuter rail and high-speed rail station. While the overall design is beautiful and efficient, I am very concerned about the rail capacity limits imposed by the unusually small number of tracks proposed (six) within or beneath the terminal. If you look at any major multi-modal rail station, in the USA or in Europe, you will see a much greater number of tracks to accommodate the frequent service required of such a facility. Even in San Francisco today, the existing Caltrain terminal has ten tracks, just to handle one commuter rail line and a few special trains. Major terminals that handle high-speed and commuter rail traffic, such as Washington Union Station and Paris Montparnasse Station, have *two or three times* as many tracks that are in heavy use from early in the morning until late at night. I do not see how the current proposed Transbay Terminal design could accommodate the kind of frequent arrivals and departures expected when the high-speed rail service begins.

The potential for congestion is increased by the fact that the proposed tracks will be underground. Mechanical breakdowns or accidents, no matter how slight, are likely to shut down tunnels and create serious disruptions. For example: anyone who has lived in San Francisco for more than a few years can tell you what a major error it was to build a two-track "stub-end" underground terminal at the Embarcadero Muni Metro station. Every weekday trains would back up in the tunnels, creating massive delays. When a breakdown occurred, the entire system was gravely affected. This problem was only solved when, 17 years later, a multi-track turnaround was constructed beneath the Embarcadero roadway. No one wants to see such an expensive error repeated in the new Transbay Terminal. I hope you agree.

Sincerely yours,

Patrick Moyroud

PAUL E. MALTZER, ENVIRONMENTAL REVIEW OFFICER
SAN FRANCISCO PLANNING DEPARTMENT
1660 MISSION STREET. SUITE 500
SAN FRANCISCO, CALIFORNIA 94103

Ref: DRAFT ENVIRONMENTAL IMPACT STATEMENT/DRAFT ENVIRONNMENTAL IMPACT REPORT/SECTION 4(F) EVALUATION (DEIS/DEIR) FOR THE TRANSBAY TERMINAL/CALTRAIN DOWNTOWN EXTENSION/REDEVELOPMENT PROJECT

Dear Sir:

The following are comments I ask the Environmental Review Officer to look at and respond to concerning the subject EIR:

1. **The CalTrain Extension (Section 5.2) calls for an analysis of a two switch or three switch approach into the new Transbay Terminal. The Three Switch approach requires the taking of considerably more property and much more cut and fill. This alternative seems to be a poor one and will cost considerably more. Why is it being considered as a viable alternative?**

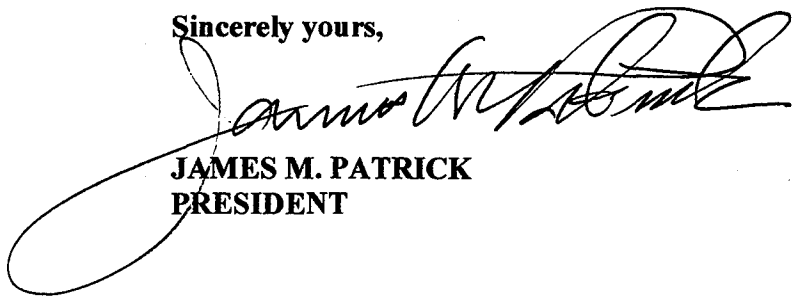
2. **The CalTrain Extension (Section 5.2) calls for the taking of 90 Natoma Street, Block 3721 number 47 for both the two and three switch alternatives. The taking of 90 Natoma appears to be not necessary relative to the Two Switch approach. Are we being too aggressive in our assumptions here?**

3. **I found no plans for any use of the properties that were acquired and demolished once the project was completed. Has any consideration been given to parks and/or public areas or will the land be sold to the highest bidder?**

4. **How likely is this project to be funded given the current State of California funding crisis?**

Thank your for your consideration.

Sincerely yours,



JAMES M. PATRICK
PRESIDENT

Paul Maltzer, EIR officer
SF Planning Dept.
1660 Mission Street #500
San Francisco, 94103-2414

RECEIVED
DEC 18 2002
PLANNING DEPT

Dear Mr. Maltzer & SF Planning Dept.,

I am a resident and owner at 246 2nd Street. I am writing to voice important concerns about the Transbay Terminal Project.

I am not opposed to improving the Transbay Terminal. What needs to be heard loud and clear, however, is that the proposed project area and changes (as well as the construction process itself) will affect not just business, but the increasing number of currently overlooked San Francisco residents in that same area. Also critical is the character, historical buildings, and quality of life for this growing residential area.

There are many areas of the EIR that are not clear, and it doesn't specify or limit the kind of development and changes in several cases. This is very concerning, given the potential change to the entire development area, and the influence and political power of large developers whose interests are not necessarily in line with those of the city or its residents.

There are, however, some areas of the EIR that are clear and pose a threat to the history and character of the city. As it stands, many of the historical buildings on the north-west side of Howard Street at 2nd street would be demolished (and possibly replaced with parking structures). Once torn down, historical buildings will not come back, and an important character and personality of the city will be lost. This is our neighborhood, and part of San Francisco's unique character will be lost through these demolitions. Similarly, once built, the Transbay Terminal will stay for many years, so should be designed with the long-term character of the city in mind.

There must be designs and development plans that will only enhance the city, rather than hurt its historical buildings, character and residential neighborhoods.

Sincerely,
A concerned resident and 5th generation San Franciscan,

Greg Patterson

p.s. Please find more detailed comments attached.

Urban Design. The publication of this EIR/S is premature in a number of areas. Only the Caltrain Extension project is sufficiently realized and well developed at this time to warrant publication and comment in this EIR/S. However, impacts associated with the design of the Terminal and the design of the many buildings that will be constructed in the proposed Redevelopment Area which surrounds it are difficult to analyze since there is so little information available at this time.

The Terminal design shown is apparently just a schematic possibility and not a real design. Urban Design impacts are impossible to assess since the schematic shown was developed specifically for preliminary study and the architecture shown is apparently conjectural. Have Guidelines been developed to assist the eventual project architect? Will there be a signature style of architecture for the Terminal that is in any way similar to what is suggested by the sketches in Figure 5.16-1?

Redevelopment Area zoning and height and bulk limits would be widely different in the Full Build and the Reduced Scope scenarios making the impacts difficult to determine (see p. S-8 and Figure S-2 opposite). Furthermore, in a Redevelopment Area, the zoning and height-and-bulk limits can all be superseded. Since the Redevelopment Area has not yet been instituted, so even the boundaries of it as stated in the EIR/S might not be fixed. The City's Master Plan and Urban Design Plan are barely acknowledged in this document.

Guidelines must be developed to guide the long-term efforts of architects and developers over the many years that the numerous sites within this Redevelopment Area will be under construction. A public process must guide the preparation of these Guidelines. Paramount among the issues that must be addressed in the Guidelines are: reuse of historic fabric and contextual treatment of new buildings when they are juxtaposed with older buildings. The EIR/S does not indicate whether Guidelines will be developed.

With so little specificity regarding the Redevelopment Area in the EIR/S, what is shown as a design concept in Figure 5.16-4 on p. 5-101 and Figure 5.16-5 on p. 5-102 is misleading in this official document. These drawings were apparently developed for another project and have nothing to do with this Redevelopment Area about which so little is known. Placing these computer visualizations in this EIR/S document gives the false impression that considerable planning has gone into the guidelines for the Redevelopment Area. These drawings should be removed from the document. It should be acknowledged that so little is known at this time about the Redevelopment Area that the treatment of it in this document is inadequate even for consideration as Program EIR. A complete EIR for the Redevelopment Area should be produced as a separate, later document, or possibly a Supplemental EIR, that is recirculated for public comment, when the planning has evolved and can be studied. The chart of proposed square footages mounted on a faded, microscopic, unreadable block diagram (Figure S-2 on p. S-9) makes the Redevelopment even more unknowable. Acceptance of this document's treatment of the Redevelopment Area in this EIR/S as an adequate environmental evaluation under CEQA could be readily challenged.

Historic Fabric. In the three historic districts that are affected by the layout of the rail lines, **a number of buildings which contribute greatly to these districts would be demolished under the cut-and-cover alternative.** Even under the tunneling alternative, **a number of buildings at the corner of Second Street and Howard Street would be lost**. The geologic study, which would reveal whether tunneling is not only possible but economically feasible, is not yet complete. It may be argued that it is not possible to support structurally a tunnel under the Second and Howard corner since the tracks here would have to cover a wider area in order to accommodate rail track-switching.

However, an alternative route underground should be studied to see whether it is possible to alter the tunnel alternative slightly in order to save more of the historic resources at Second and Howard. See the example provided (Mylnarik) which shows a fine-tuning of the route at this corner in order to preserve more of the threatened buildings. In any case, a strategy could be developed to remove the subject buildings or parts of them. For historic integrity of the buildings in these districts, the front facades of the threatened buildings could remain propped and stabilized in place while the tunneling is going on, and reconstructed afterwards. In this scenario, only those parts of buildings which must be removed would be removed.

The more difficult, and less desirable, solution would be to have the three contributory buildings at Second and Howard relocated during construction and then moved back. The EIR/S states that this could be done if a place were found to put the structures. The preservation of all the threatened buildings should be required to be listed as a mitigation measure for the consideration of the decision makers and sites for temporary location should be found.

Some of the historic resources are well described (Chapter Five, pp.5-71 to 5-91) but curiously the present TransbayTerminal Building is not shown graphically or described in this section.

Graphic Description of the Project. The route of the Caltrain Downtown Extension rail layout through the city (Figures 2.2-9 through 2.2-17) is shown in nine separate maps, each of which has a different compass orientation and none of which has a North arrow. One overall location map should have been shown in smaller scale as a key to the position of each of these map sections. The only guidance one has is the "match lines". Street names are absent and have to be supplied using an automobile route map from one's glove compartment. This reader had to have Figures 2.2-9 through 2.2-17 xeroxed and then pasted together the map segments along the match lines, resulting in a snake-like collage of angled map juxtapositions that can only be folded by an origami artist. While acknowledging that this project is a complex one extending over many blocks, there are better means of presentation to make it legible for readers.

Comments re:
Transbay Terminal/Caltrain Extension/Redevelopment Draft EIS/EIR

Paul Maltzer, Environmental Review Officer
San Francisco Planning Department
1660 Mission Street, Suite 500
San Francisco, CA 94103-2414

Dear Mr. Maltzer,

The Draft EIS/EIR provides a comprehensive view of the project, project alternatives, why it is needed, its overall potential scope, impacts, benefits and costs. The initiating item, as made clear in the document, was the seismic problems of the existing Transbay Terminal and need to replace it with an earthquate-safe terminal. I commend staff of all agencies involved in this project for recognizing, early-on, the opportunity this provided to expand the project scope to include both redevelopment of the surrounding area and extension of Caltrain into a new terminal be built to accommodate its operation.

The need to replace the current terminal is clear and the opportunity to redevelop the surrounding area should be done where feasible, under either of the "Build" alternatives. However, I believe the Caltrain extension into the terminal should be eliminated from the planning process for the following reasons:

(1) such proposed extension, estimated to cost in the $800 million range, is far too costly for the potential ridership gain involved.

(2) the severe funding difficulties in the current economic environment, likely to continue indefinitely, will work against the Caltrain extension proposal and probably keep it from being funded, especially considering its weak economic features and more financially-attractive and cost-effective aspects of competing projects. The current official state budget shortfall, more than $34 billion, will result in severe state funding cutbacks for proposed transportation projects and there are Federal cutbacks to also be considered. Therefore, the Caltrain extension component should be dropped so the terminal replacement and area redevelopment aspects of the proposal would not be hindered by failure to secure funding for the Caltrain extension component.

(3) other potentially greater cost-effective approaches benefiting both Caltrain and MUNI Metro riders are either available now, or potentially available, and they can be implemented more quickly and should be developed.

(4) the extension puts all the burden to seek funding and build the Caltrain extension on the project partners (San Francisco Planning Department, the San Francisco Redevelopment Agency, and the Peninsula Rail Joint Powers Board), though it will be designed to allow High Speed Rail trains reach downtown San Francisco. This "piggy-backing" on these three agencies' efforts to reach downtown San Francisco, without itself seeking, obtaining and constructing its own downtown access, is unfair and unethical, and works to divert costs that otherwise should be borne by the California High Speed Rail Authority. (In fact, its own web site, regarding funding and building the system, assumes 15% of the right-of-way is in public ownership and *"will be provided to the system at no cost. This cost avoidance amounts to between $373.5 and $499 million".*) High speed rail should bear its own construction costs.

What is the funding situation of current Caltrain and MuniMetro projects?

(1) Regarding Caltrain, the DEIS/DEIR notes that Caltrain electrification is based on the assumption that the line will be electrified and new electric powered rolling stock will be purchased. It notes that should electrification not proceed, dual-mode diesel-electric locomotives would need to be purchased and the cost, estimated to be $235 million, added to the Downtown Extension component of the Transbay Terminal project. Peninsula Corridor Joint Powers Board draft minutes, for the October 31, 2002 meeting, notes that the funding availability is what is driving the electrification project and without money, there is no way the project could move ahead. In that event, I do not believe spending $235 million for the alternative approach, buying dual-mode engines, is either wise or feasible. I certainly do not believe it should be made a part of the Transbay Terminal project scope and its cost borne by the overall project.

(2) Regarding the MuniMetro, state money, if not cut due to the budget shortfall, should allow the design phase of the northern (Central Subway) portion of the 3rd Street light rail line to be completed. However, there is no funding for its construction, estimated, in 1997, to cost $750 million. In current dollars, the figure would be even higher.

What can be done? In place the highly-cost-ineffective Caltrain downtown extension proposal, there are some cost-effective approaches that should be investigated, and design proposals and cost estimates prepared for. The costs for some are almost negligible, compared with the proposed $800 million cost range for the Caltrain extension. I recommend the following be studied:

(1) Construct a covered pedestrian bridge over (or a pedestrian tunnel under) the westbound King Street traffic lanes, to provide a direct connection between the existing Caltrain 4th and King Street terminal and the MuniMetro 4th Street station. This would not only allow riders to go from one system to the other without needing to wait at red traffic lights at that intersection to turn green but also provide protect them from inclement weathe. It should attract additional riders to Caltrain and the MuniMetro extension along the Embarcadero and into the Market Street subway.

(2) Give MuniMetro trains on the surface extension to the 4th Street station complete traffic signal pre-emtion capability, i.e., have all signals turn green along the route whenever a MuniMetro train approaches in either direction. This will speed up the time it takes for riders to get from Market Street to the Caltrain terminal. It should attract yet more riders to Caltrain and the MuniMetro extension along the Embarcadero and into the Market Street subway.

(3) Increase the frequency of MuniMetro trains between the Market Street subway and the Embarcadero and the Caltrain terminal, as warranted by increased ridership.

(4) Develop a joint design of the Central Subway portion of the 3rd Street light rail line to include Caltrain single level electric trains, that could run directly into it from the peninsula. Multiple use of this subway would result in shared costs between Muni and the JPB, resulting in lower costs for both agencies and make it easier to secure funding to build it, as it would become a more cost-effective project with the multiple use I propose. Caltrain would need to be equipped with new single-level diesel-electric motive unit (D/EMU) equipment compatible with the tunnel infrastructure. Being standard gauge, it could possible share common trackage with the MuniMetro trains, or it could be built with separate tracks on its own level, as part of a single construction project. This would be similar to the Market Street Subway, where the two levels housing MuniMetro and BART tracks, and common stations and mezzanines, were built in a single cost-effective project. The new Caltrain D/EMU equipment would run using overhead electric line when in the Central Subway, and would run using the on-board diesel engines (generating electricity to power the wheel motors) when on the existing Caltrain right-of-way between San Francisco and San Jose. Should that line get electrified, this equipment would then get power from the overhead electric line and continue to be used. This would be a more cost-effective solution, when compared with the DEIR/EIS proposal to buy a new set of electric engines for Caltrains, needed to access the Transbay Terminal, costing $235 million. With joint use of the Central Subway and enhanced attractiveness of the MuniMetro surface extension into the Market Street subway, Caltrain riders will have two cost-effective ways to get downtown.

Sincerely,

Michael Rothenberg

Joan Kugler
AICP, EIR Project Manager
San Francisco Planning Development
1660 Mission Street, Suite 500
San Francisco, CA 94103-2414

Dear Joan:

I am writing to express my strong opposition to the proposed bus storage in parking lots between 2nd and 4th streets running along Stillman Street.

The diminished air quality and increased noise that would come as a result of bus storage would render this area uninhabitable for businesses and residential tenants alike.

Sincerely,

Art Wagner

November 22, 2002

Paul Maltzer, Environmental Review Officer
San Francisco Planning Department
1660 Mission St Ste 500
San Francisco CA 94103

Sir, these are my comments for the DEIS/DEIR for the Transbay Terminal & Caltrain Downtown Extension Redevelopment Project.

Para S.7. Concur, except that I prefer the Second to Mission option; and the Market to Mission pedestrian tunnel build or no build should be in the Superior Alternative statement. This tunnel should be built as part of the initial construction.

Para 2.2.2 and page 2-26, 2-27. The two track segment between station 41 and station 70 must be widened to three or four tracks to match the design on both ends of this segment. This intentional choke point imposes permanent severe operational limitations and prevents any flexibility to adapt to mechanical or other breakdowns. This creates congestion that completely negates any capacity improvements in the terminal or the first ten miles south. The benefit of the four track Townsend Street station cannot be exploited since the crossovers at station 44 do not provide adequate signal separation to expedite a following outbound train. On the inbound route, reducing the 4th track at station 40 is an impractical design, since any train waiting at the platform will foul the overtaking movement.

Page 2-33. By adjusting platform spacing, the two platforms angled toward Mission could be fully functional island platforms serving two tracks each and providing needed separation of Caltrain Regional Rail from Amtrak and HSR (High Speed Rail) trains. Since the ticketing, loading, provisioning, and pre trip servicing requirements are different between short and long distance trains, separate platform areas, and their comparable passenger mezzanines above, would encourage smooth passenger flow within the terminal.

The 2nd to Mission option affords a direct high speed connection to any projected new transbay tunnel for HSR and Capital Corridor trains to Oakland, Sacramento, and east. While a new tunnel could connect to the Main Street option, it entails sharp curves and extended low speed approaches that negate the benefits of HSR.

Page 3-23. The California rail plan envisions conventional long distance passenger trains between San Francisco and Los Angeles under the Amtrak California brand by the end of 2004. It is logical that these trains would originate and terminate from the Transbay Terminal after it opens.

Page 5-113. If a diamond lane is established on both Beale and Fremont, surface rail connection should be provided from Market Street for E and F line tripper service at the Transbay Terminal. This would share use of 600 volt trolley with Muni lines 5 and 6. The incorporation of heritage trolley service at the Transbay Terminal provides both a historic link and practical direct connection to the Waterfront for both daily commuters and off peak tourists.

Page 5-118. This tunnel would be a catalyst not only for the one block Fremont Street corridor between the Transbay Terminal and Market Street, but then the area adjoining the perimeter of the Embarcadero station mezzanine concourse. A comfortable climate controlled passageway from work to transit would extend from First and Folsom to Market and Drumm. The pedestrian count for this tunnel underestimates the potential uses and benefits for the redevelopment area.

Thank you for your consideration.

Re: Caltrans & Transbay Terminal Project / Objection To Proposed Bus Storage At Stillman Street Area Between Second & Fourth Streets

Dear Planning Commission:

This letter is a follow-up to my oral objection on the referenced subject at the Planning Commission's 11/26/02 hearing.

I am the Managing General Partner and majority owner of a commercial building at 51 through 53 Stillman Street in San Francisco. My partners and I have owned this building since 1977 and have watched the neighborhood develop into a true mixed-use area where millions upon millions of dollars have recently been invested in both upgrading existing buildings as well as new development into retail, residential and commercial uses. The new proposed rezoning plans all call for more residential use in this area which seems consistent with the general location and overall quality of living this area offers.

Obviously, the permanent parking of hundreds of buses in the middle of this mixed –use area has significant negative impact on it and is totally incompatible with its current and proposed future uses due to noise, health-safety issues, traffic, parking, and other reasons already stated by other owners.

One can argue back and forth as to just how damaging the exhaust fumes are to the local residents and tenants but no one can seriously argue that the relocation of the buses to this area does not seriously diminish the quality of life for the tenants and residents as well as negatively impacting property values. To illustrate my point please imagine this bus storage facility was being relocated in front of your place of residence. What would be the day to day impact on your quality of life? If you own your residence how do you expect it would affect the long-term value of your home?

The impact is so negative that those affected have no choice but to oppose this relocation by any and every means they have, including litigation.

Clearly, the developers of the new projects making the bus relocation necessary have or, should have the burden of finding a lower impact site for the buses. Their responsibility for the impact of their project on other property owners seems clear and is similar to well established shaping or view-blocking issues where the party causing the negative impact is responsible to compensate the affected parties.

My suggestion is to urge any approval of the subject project's be conditioned upon the new project's developers finding a less dense, more suitable and less controversial site for their buses to be relocated on.

Staying with the current site is a lose-lose situation for everybody. The City loses property tax values, one of its' most successful mixed-use areas as well as excellent future residential sites where residents can truly walk to most work places. The locals lose their quality of life and investment value. Lastly, the developers of the sites surrounding the Transbay Project are likely to be delayed needlessly as those opposed to this bus relocation fight it. Why put unnecessary obstacles on a project that appears to be good for the City? Doesn't it make sense to help the project by eliminating this serious flaw as soon as possible?

Thank you for your consideration.

Sincerely,

George Yamas

PRESIDENT SEXTON: I would like to clarify any confusion regarding the location of today's public hearing on the TransBay Draft EIS/EIR. When the Draft EIS/EIR was released on October 4th and the initial plans for the public hearing were being made, it was assumed that as is customary, there would be a joint public hearing between the Redevelopment Agency and the Planning Commission. However, as a new Planning Commission has just been confirmed by the Board of Supervisors, the Planning Commission will be scheduling a separate public hearing on the Transbay Draft EIS/EIR. The public will be notified of the Planning Commission's public hearing when the date is set.

For the public's information, the public comment period that was scheduled to end on November 25th will be extended to allow the public hearing by the newly seating Planning Commission and the public will be notified of the new closing date for public comment.

Notices have been placed on the bulletin board of the Legislative Chambers, and a staff person has been placed near the entrance to direct interested members of the public to this meeting room. I apologize for any inconvenience to the public. Thank you.

SECRETARY TANJUAQUIO: Madam President and commissioners, the next order of business is the hearing on the Transbay Terminal, Caltrain extension, Draft Environmental Impact

BARKLEY Court Reporters

Statement report. Madam Director.

MARCIA ROSEN: Thank you, Mr. Secretary. EIS CalTrans -- Caltrain extension. A senior planner, David Habert, will give a presentation on this item. And then as you know, the main purpose of this item is to hear public testimony.

DAVID HABERT: Good afternoon, President Sexton, Vice President Palamountain, members of the Commission, and Director Rosen. This is an assisted hearing device. Helps assist me in hearing you so I can hear you correctly. That's out of the way. Before we start the hearing on the Draft EIS/EIR, there are two points I would like to make. Again, just to echo President Sexton's statement that there was a confusion over the room, signs have been posted. There are people directing folks up to this room for the hearing. Second of all, this is the first of three public hearings on the Draft EIS/EIR. The second will be held tomorrow -- that's November 13th -- down in San Carlos, 1250 San Carlos Avenue, the headquarters of Caltrain and SamTrans, then a subsequent public hearing that the Planning Commission will hold. That has not been scheduled yet. Everyone will be notified when that is scheduled. I'd like to also point out, um, there are several people who have been instrumental in helping to get this together. Maria Ayerdi from the Terminal Joint Powers Authority. Joan Kubler from the Planning Department. Paul Maltzer from the

Planning Department. From the City Attorney's office, John Cooper. David Mansen.

MICHELLE SEXTON: Can you stand up so the commissioners will know --

DAVID HABERT: Yes, the scores of people whom -- will you stand up please -- who have helped put this together. It's been a very good effort in terms of the City family working together.

MICHELLE SEXTON: For the commissioners, can you identify the individuals.

DAVID HABERT: Yes, John Cooper.

BERTHA ONTIVEROS: From the City Attorney's Office.

MICHELLE SEXTON: Which office?

DAVID HABERT: I'm sorry. Paul Maltzer, Department of City Planning. Joan Kubler, Department of City Planning, Maria Ayerdi, CalTrans -- Caltrain. Sorry. David Mansen, who is the Transportation Group -- who is the consultant heading the team doing the EIS --

SHARON KYLE: Sharon Kyle.

DARSHAN SINGH: I didn't hear you.

SHARON KYLE: Sharon Kyle from Moore Iacofano and Goltsman.

DAVID HABERT: Okay. Again, um, the purpose of this meeting is solely to hear public comment on the adequacy and accuracy of the Draft Environmental Impact Statement/ Environmental Impact Report. The draft was issued on

BARKLEY Court Reporters

October 4th pursuant to -- we're within the 45-day review period of the Draft EIR/EIS. Again, the 45-day review period would have ended on November the 25th. However, as a new Planning Commission has just been installed, and will have their first meeting later this week, the public review period will be extended to accommodate the Planning Commission here. Once the Planning Commission releases the date for the public hearing, you and the public will be notified of the date. You may also keep abreast of the items with respect to the Draft EIS/EIR by contacting the Planning website which is http colon slash www dot sfc dot www dot sfgov dot org slash sfra slash planning. The Redevelopment which is the same as Planning is http colon slash www dot sfc dot www dot sfgov dot org slash tjpa.

Upon closing of the review period, staff will respond to all comments in writing. The draft with modifications and the responses to all of the comments will constitute the final Environmental Impact Statement/Report. Finalization and certification of the EIS/EIR is expected for the middle of 2003.

At this point, I would like to turn the floor back to the Commission to receive public testimony on the adequacy and accurateness of the Environmental Draft Impact Statement and so forth.

MICHELLE SEXTON: Yes.

SECRETARY TANJUAQUIO: I have speaker cards. The first speaker is Norman Rolfe, followed by Jim Haas. Mr. Rolfe?

NORMAN ROLFE: Good evening. I'm Norman Rolfe of San Francisco. We are in the process of preparing our comments and suggestions on possible changes in the rulings, and construction, and so forth and so on. I'll just hit some highlights of what I see coming down the line.

And, uh, generally, we support these projects, want to see them go ahead. But there are some modifications we're going to suggest. One thing we want to do is draw the attention of the agency to Proposition H in November 9 which says we shall not approve projects which might interfere with Caltrain, or the terminal, or so forth, including high-speed rail in the future. One of the things that should be done is that the attraction should actually go underground starting from the north end of Tunnel Number 1. Starting at 16th, the tracks would go underneath. This is going to be necessary in the future when this high-speed rail gets here, as we hope it will. That can be financed by not installing some of the ground storage tracks they have in the city. Those could be surface tracks. It's really critical that that be done.

And we also suggest the study authors engage in extensive ground evaluation engineering because of the sort of things that have been mentioned or will be mentioned,

BARKLEY Court Reporters

that they should be encouraged to examine and minimize effects on surrounding properties. That is, I believe -- we hope these drawings illustrate this, that they could reduce the taking of property by some little, slight changes, slight changes of right-of-way, and so forth and so on. And the terminal itself, might be possible to defer certain parts of it, certain aspects in the future, and get the thing going a little easier that way.

I believe that is, uh, all I will have to say at the moment. As I have said, we will hopefully produce quite an extensive little report for our suggestions so how some of these impacts can be mitigated a little better. Thank you.

SECRETARY TANJUAQUIO: Mr. Haas, followed by Jan Johnston.

JIM HAAS: Madam President, commissioners, I'm Jim Haas. I have been a member of many other committees, TransBay, CAC, and actually four prior committees to that. So I've been involved in this close to 15 years. I've seen an EIR be stopped and begin again, so it gives me great satisfaction to be here and see that it's almost at the completion stage. I went through it. It's a very dense document. And I'm sure that people having specific focuses on particular issues will have some comments on its accuracy and completion.

I want to make a comment on the larger question which relates to the money. And if you look on page 6 dash 8, in

BARKLEY Court Reporters

the chart there, there is a item that is numbered number 8 which is about $600 million. The source of the funding is very vague, and includes such things as Proposition 51 which is defeated by state voters last week, and some other very problematic things. That $600 million hole is going to be hard to fill.

Now, when this project, um, uh, came together in its present manifestation, San Francisco said in a fairly loud voice that we think this is so important that we're going to pay for a good deal of it. And therefore, I think we need to give thought, and this EIR needs to give thought to provide more local funds and cover that $600 million hole.

The first thing I think needs to be addressed in that EIR is the current configuration of the Redevelopment District with the holes in it that deal with developed properties. This means, that means that the increment for those six or seven holes are not going to be available for this project. There may be, um -- let me also say that I think that we also need to consider, and this should be discussed in the EIR -- is extending the district to the south to cover, particularly the two big parking lots on the south side of Folsom Street being contemplated for large numbers of housing units. That also could be a major source of tax increment for the area. And then, thirdly, I think -- this needs to be discussed in the EIR -- we're on the

BARKLEY Court Reporters

three-minute rule -- that the tunneling does not in any way make it impossible for major developments to go forward. And there is one on Mission Street which I think needs to be addressed specifically, for that matter, relating to the question of the demolition of buildings for the tunnel, particularly in the Historic District. Again, the choice of demolishing all these historic buildings for cut-and-cover as opposed to tunneling should be fairly obvious here. The EIR does not agree that you could build over those parcels where there is no choice but that there has to be demolition. And we should have in the EIR some idea of what can be built.

SECRETARY TANJUAQUIO: Jan Johnston, followed by Francis Mathews. Please state your name.

JAN JOHNSTON: Jan Johnston. I'm speaking on behalf of the management of 88 Perry Street in Yerba Buena Gardens which is a fairly new project with about 260 low-income apartments at 3rd and Perry. It's adjacent to the proposed bus storage where the diesel buses would be stored for the Golden Gate and AC Transit. And the concerns which were not addressed that we could see in the study is that, um, this building has operative windows, relies exclusively on the outside air for ventilation. And it is, you know, directly next to this proposed bus storage site. So we would like to have, um, studies done on the effects, the carcinogenic effects of

BARKLEY Court Reporters

diesel fumes. I know there are studies now on that.

Also, there's concerns about noise, and also traffic issues with the buses, especially on 3rd and 4th Streets. So pretty much, we're asking that you consider an alternative site closer to the Transbay Terminal. Thank you.

SECRETARY TANJUAQUIO: Francis Mathews. Followed by Margaret Okuzumi.

FRANCIS MATHEWS: I'm Francis Mathews. And um, we, I manage several properties along Stillman Street which like the previous speaker is adjacent to the new bus storage area that's proposed for the new Transbay Terminal. We weren't given a lot of advance notice, that we have letters that will be going out that will be more specific. But you know, our properties, you know, um, are both residential and commercial. They're lower-rise buildings with operative windows for ventilation. The EIR didn't address any of the added impacts of the, the diesel bus fumes, or the additional noise that would be associated with parking several hundred buses right next to, um, our properties.

This neighborhood is going to be severely impacted over the next 10 years during the seismic upgrade of the west approach to the Bay Bridge and followed, at the same time bringing the Third Street Rail Project down through the neighborhood and -- possibly the, you know, bringing a

BARKLEY Court Reporters

high-speed rail down Second Street. And we are in favor of the Transbay Terminal. We just feel that, um, um, um, we've been -- we are going to be severely impacted by all these other projects, and to, you know, wait all that out just to push the, um, bus storage facility down on our backs is unreasonable. We'd like to see, um, other alternatives investigated, including, um, in some of the redevelopment projects, restoring the buses down the lower level with those, widening the existing ramps where AC Transit buses are currently stored, or looking into other areas in mission Bay for the buses. So that, that sums it up. Thank you for your attention.

SECRETARY TANJUAQUIO: Ms. Okuzumi, followed by Ken Bukowski, and then Andrew Sullivan.

MARGARET OKUZUMI: Margaret Okuzumi speaking on behalf of Bayview Alliance, a grassroots riders groups with members throughout the Bay Area, particularly concentrated along the Caltrain line from San Francisco to Gilroy. Our organization strongly supports the Transbay Terminal project, including the CalTrain Downtown Extension, and we're very pleased those projects are moving forward and making progress. We're still reviewing the EIR, and hope to ask some of our questions tomorrow during open house.

Just some initial comments for the record, one is that we ask that the, the area encompassed by the EIR be extended

BARKLEY Court Reporters

to include 16th Street and a possible upgrade separation there. We think this is important for the future operations and efficiency of the train service through that area and also a degree of separation.

We also think of the some of the impacts of the building might possibly be adjusted to reduce impacts, and to realize a cost savings to be used to grade separate those areas which have a great potential for conflicts with Muni service and proposed future Muni service, especially along 16th Street.

Um, just a note that the, the projected bicycle parking figure at a Transbay Terminal seems pretty low. It's listed as 105. I'm sure that the San Francisco Bicycle Coalition might have some more input on this. I know the Palo Alto bike station is currently parking 60 bikes a day. And ridership at that station is lower than projected at the Transbay Terminal, especially 20 years from now.

So I think that Norman Rolfe, who spoke first, made a lot of comments that we agree with. So we would ask you to consider, I won't repeat all his comments. And we'll be submitting comments before the end of the period.

SECRETARY TANJUAQUIO: Mr. Bukowski.

KEN BUKOWSKI: I'm a councilmember from the City of Emeryville; followed this project the last 10 years or so. I want to make a couple of points about the proposal

BARKLEY Court Reporters

currently out there to take out the bus ramps. It's really in the East Bay, sued CalTrans on account of taking down the ramp. A settlement was entered into where they were going to take the ramp down and proposed to put it back. It doesn't make sense to put it back without it being part of the new project. Somebody should look into that. We want to make sure that the terminal has viability.

Another concern is that when B.A.R.T. to San Francisco Airport is completed, that CalTrans will lose ridership. We have to be careful here. We want to keep the viability of this terminal so we don't lose it. Also I would hope that you would look at alternatives to building the expensive project before you. Maybe a lesser project was make it happen as opposed to this.

I'm going to submit detailed comments.

SECRETARY TANJUAQUIO: Mr. Sullivan, followed by Richard Mlynarik.

ANDREW SULLIVAN: I'm With Rescue Muni, the San Francisco Train Riders Association. We have been in favor of this project for many years, and so we are speaking on behalf of the project largely as written in the EIR, though of course we would like to urge the project team to pursue opportunities for cost reduction where it doesn't lead to reduction in service quality. We think it is a very, very important project for the region at large. Not only does it

serve the commuter population and make the Caltrain service more useful, but it also serves the high-speed rail service that has to terminate in Los Angeles to be useful. California high-speed rail running from the Transbay Terminal, the Grand Central Terminal for San Francisco would be much more useful if it terminated in L.A.

We are pleased the terminal design has been put in place to lead to that ultimate project. A lot of years went into planning Grand Central Terminal a century ago in New York City. We're still benefiting from it today. It makes sense to repeat that experience here. A few specifics here that we'd like to make recommendations on. We know there's a choice among underground alignments for the service. We favor the Mission service that leads to a potential transbay tube. If rail will go across the Bay -- it could happen at some point, and we think it should -- we think through a new tube is the way to go that connects high-speed rail here to high-speed rail in the East Bay via high-capacity infrastructure. That makes sense because of, we don't think it's necessary to keep that terminal loop nor the buses, as long as the buses can maintain the same level of service which appears to be the case in the design as we've looked at it here. You can take that bus loop down, and use the land to fund the project, and reduce the cost to taxpayers which in this time of economic uncertainty is particularly

appropriate. Plan for rail across the Bay in a not-too-distant future when high-speed rail is being extended beyond the initial network.

Couple of initial suggestions. We favor an underground connection to Muni Embarcadero station. It's important, much like in Europe where we have connection to SBahn and UBahn to the underground connection. It needs to be considered as part of the ultimate plan so users can stay out of the weather. This doesn't refer to the proposed Folsom alignment. We don't think that's necessary. A Pine Street alignment would make no sense. These are largely details. A very good job. We'd love to see this terminal get built for San Francisco with all deliberate speed.

SECRETARY TANJUAQUIO: Mr. Mlynarik.

RICHARD MLYNARIK: Our organization has been involved in regional transit issues, including marginally on the Transbay Terminal, for over a decade now. We're extremely pleased at the direction that process has taken. Something that needs to be borne in mind when you have people up here having a lovefest about how promising the Environmental Draft Report is, this is largely the outcome of an over-two-year Metropolitan Transportation Commission happened with the cooperation of Caltrain, CalTrans and from City Redevelopment. I think that's part of the reason that we're heading in the right direction. This isn't just one

document, but an outcome of a great deal of study by a great number of individuals.

I'd like to include in my comments many things said already. Mr. Rolfe who spoke first said things about the -- separating the Caltrain alignment at 16th Street so we don't have to come in and dig in freshly-dug tunnels once separation becomes necessary. For specific issues, alternatives in the Environmental Impact Report as written, I believe the Mission Street alignment is superior because it has more capability of accommodating high-speed rail service in the future.

I think it's imperative the full development program be carried out. This is a premiere site to have transit-oriented development anywhere this side of New York City. It would be an abdication of San Francisco's responsibilities in the region and nationally to put up three- or four-story buildings. I think it's important to note this really is an integrated project. Transbay Terminal for bus service, Caltrain extension is what links them together. It's redevelopment which helps it work and helps the redevelopment work. So I think that's quite clear. This is documented. I encourage you to think of it this way.

I will also be making more detailed comment in the future of a more technical nature. I think it's important

BARKLEY Court Reporters

to note we have potentially an excellent project here. I look forward to you, and the city, and original agencies working to see it come to fruition.

MICHELLE SEXTON: Just for the people who have entered the hearing room, if you'd like to speak on this item, number 4(d) on the agenda, you can fill out a public speaking card and hand it to the secretary. If you could please speak into a microphone.

MICHAEL KIESLING: Good evening. Michael Kiesling of San Francisco. I've been involved in this project for quite some time also. Over the last decade, it's been refreshing in the last couple of years to see San Francisco take a role in this and conduct a professional study that's coming up with real answers and solutions into finding out how the project can be built and finished. In the past, if you followed this study, there were a lot of strange little studies that went along with this that had diesel trains running down Brannan Street or down Market Street. It's good to see the Commission and the city working to get the synergy of redevelopment in the transbay area, and bring transportation from the East Bay and Peninsula together in one place.

I will also be making comments. I agree with many of the previous speakers. We have an ability to clean up almost every property that has been languishing down there

for a long time. The Transbay Terminal has anguished over what has been going to happen to it for about 30 years now. Also, it's important to remember like the previous speaker said that this is probably the premiere opportunity in this country for the fusion of land use and transportation. And we're lucky that we're able to take some of the profits coming from development, the opportunity to develop the land there to work on the terminal to show when it comes time to get the funding in line that, um, San Francisco is making a large contribution to this project locally. That's about it. Thank you. Have a good evening.

SECRETARY TANJUAQUIO: Last card I have is from James, I believe it's Dean.

JAMES DEAR: My name is James Dear. I speak on behalf of homeowners at 21 Stone Street. We're concerned about the fumes from the storage unit. I mean the bus storage unit at the proposed site between Second Street and Fourth Street, concerned about the traffic impact on Second Street if buses are going to be grade separated, going to go on a rim across or above Second Street, then again between the storage, Third and Fourth Street, if we're going to cross that grade or be above Third Street. It's a very heavy-use street, Third Street.

Also concerned about the transit impacts for the residents in the nearby area. Document says 125 will be

BARKLEY Court Reporters

canceled, the 45, the 30, the 10, and all we get is a central subway. As far as I read, we're going to have a stop on Third and King, and, and then again at Moscone Center. Three blocks either way. I count four bus lines. It doesn't seem that San Francisco is friendly for the people living in the immediate area. We have an opportunity for open space, for parks. We live in a lot of concrete there. I don't see a lot of green space proposed, especially for dogs and such like that.

SECRETARY TANJUAQUIO: The next card I have is from Bruce Barnes. Mr. Barnes.

BRUCE BARNES: Good evening. I'm from 169 Stillman Street between 3rd and 4th Streets. My primary concern this evening is the proposed bus storage transit facility that's being proposed between 3rd and 4th in the area of Stillman. We've gone on the record with a letter quite some time back regarding some of the issues we'd like to see addressed specifically with regards of the bus storage facility and its impact on the neighborhood. I think that -- in reviewing the EIR report, I only saw a brief paragraph that considered the impact on the neighborhood. I'd like to see more time on some impact we perceive on diesel fumes, health effect on the neighborhoods. We have a lot of businesses, now housing going in that area. Our building is -- right now, we're in negotiating for a charter school, 15-20 feet

BARKLEY Court Reporters

away from where the bus storage facility is being proposed. I'd like you to reconsider the location. There are a lot of areas that would better serve that type of facility, especially with not having a lid over the top of it like the current freeway is. Thank you.

SECRETARY TANJUAQUIO: Andy Chow.

ANDY CHOW: Hi. I'm Andy Chow. IÆm director of BayRail Alliance. Basically, I personally support this, this this proposal to, for new Transbay Terminal, and a new station for Caltrain, and a new extension. This project is really unique in a way that instead of relying on City -- instead of subsidizing the cities of redevelopment which unfortunately some other projects in this Bay Area are kind of like. The land use supports the project. Whatever development process came from the government, can use to expand transportation. This is what it is. This is reality in other countries, where they have intensive land use. Integration of transportation needs to happen in San Francisco. It is about time.

Regarding the EIR, it seems to me that the ridership for Caltrain could be higher. I think that the ridership has been somewhat conservative, and a little bit too strict in terms of their, uh, assumptions of the Caltrain service levels. I think that if they can play around with what kind of service levels that there is and possibly include

BARKLEY Court Reporters

high-speed rail, and maybe -- perhaps, there will be much greater ridership, more than enough to justify the project. Now, the project projection does justify it. But I believe there will be more. Thank you.

SECRETARY TANJUAQUIO: That's all the cards I have, Madam President.

MICHELLE SEXTON: Is there anyone in the public who wishes to address, could you come up, please.

TOM DILLON: Hi. My name is Tom Dillon. I just think that the rebuilding of Transbay Terminal or a transit terminal will be absolutely wonderful. I think that CalTrain needs to be -- speedier trains. The whole system needs to be much speedier. We live a rapid-moving world. Going around down to San Jose in a one-hour trip is just too long. I'm looking forward tremendously to the high-speed connection between Los Angeles and San Francisco, and I hope they utilize the absolutely best technology which we have. I'm a resident in the United States, employed by NASA. Thanks a lot.

MICHELLE SEXTON: Thank you. Public comment on this matter's closed. Any more comment? Not seeing any more comment. Public comment on this matter's closed. Thank you.

BARKLEY Court Reporters

DEPOSITION OFFICER'S CERTIFICATE

STATE OF CALIFORNIA }
} ss.
COUNTY OF CONTRA COSTA }

I, Cathryn Bauer, hereby certify:

I am a duly qualified Certified Shorthand Reporter in the State of California, holder of Certificate Number CSR 12676, issued by the Court Reporters Board of California and which is in full force and effect. (Bus. & Prof. § 8016.)

I am not financially interested in this action and am not a relative or employee of any attorney of the parties, or of any of the parties. (Civ. Proc. § 2025 (k)(1).)

I am authorized to administer oaths or affirmations pursuant to California Code of Civil Procedure, Section 2093(b) and prior to being examined, the deponent was first duly sworn by me. (Civ. Proc. § 2025(r)(1).)

I am the deposition officer that stenographically recorded the testimony in the foregoing deposition and the foregoing transcript is a true record of the testimony given. (Civ. Proc. § 2025(r)(1).)

I have not and shall not offer or provide any services or products to any party's attorney or third party who is financing all or part of the action without first offering same to all parties or their attorneys attending the deposition and making same available at the same time to all parties or their attorneys. (Civ. Proc. § 2025(k)(2).)

I shall not provide any service or product consisting of the deposition officer's notations or comments regarding the demeanor of any witness, attorney, or party present at the deposition to any party or any party's attorney or third party who is financing all or part of the action, nor shall I collect any personal identifying information about the witness as a service or product to be provided to any party or third party who is financing all or part of the action. (Civ. Proc. § 2025(k)(3).)

SAN CARLOS, CALIFORNIA, WEDNESDAY, NOVEMBER 13, 2002

7:07 P.M.

---oOo---

MS. PANG: Good evening, and welcome to the second public hearing for the Transbay Terminal/Caltrain Downtown Extension and Redevelopment Project.

I hope you had a chance to stop by across the hall there at the open house and chat with the team members about the various components of the project and their impact on the environment.

My name is Marie Pang. I'm staff to the Caltrain JPB, and I'll be facilitating the hearing tonight.

For the record, this is the official public hearing on the Draft Environmental Impact Statement/Environmental Impact Report for this project. Throughout this evening, we'll be referring to this document as the Draft EIS/EIR.

The Draft EIS/EIR was released for public review on October 4th, and the public comment period is scheduled to end on November 25th.

This hearing is being conducted on behalf of the project co-lead agencies: the City and County of San Francisco, the San Francisco Redevelopment Agency, the Caltrain Joint Powers Board, and the federal lead

agency, the Federal Transit Administration. This hearing is being recorded by a court reporter.

After a brief presentation by staff, we want to devote the rest of the evening to hear from you. Please be sure to fill out one of those speaker forms. If you haven't done so, please raise your hand, and Sharon will give you one.

The purpose of this -- Sharon?

The purpose of this hearing is to receive your comments. No responses will be given tonight. However, they will be addressed in the Final EIS/EIR and will become part of the administrative record for the project.

You can also submit your comments in writing to Paul Maltzer, environmental review officer for the City and County of San Francisco. His address is in the newsletter that's on the table back there. Written comments will also be responded to in the Final EIS/EIR.

At this time, I would like to turn the meeting over to Maria Ayerdi, executive director of the Transbay Joint Powers Authority. And many of you also know her as a director on the Caltrain Joint Powers Board, and she's also the project director for this project.

Maria.

MS. AYERDI: Thank you, Marie.

Good evening, everybody. Thank you very much for coming here tonight. It's a pleasure to have you. We're very excited about this project.

As you know, it includes the building of a new Grand Central Station in downtown San Francisco. We have partnered up with San Mateo County and Santa Clara County here, the Joint Powers Board, to help build a new facility and extend Caltrain into it.

It's an exciting project, because not only will it be a transit hub for buses and rail, but it also will be designed to accommodate future high-speed rail operation.

As you know, the senate -- or the legislature and the governor passed Senate Bill 1856. It goes to the voters in 2004; and if it passes, the first segment that will be built will be from Los Angeles Union Station into the San Francisco Transbay Terminal.

Eventually there's a possibility for the trains to continue on to the East Bay via an underwater tube under the bay and connect to the capitol corridor. So some day you'll be able to take the train from Los Angeles into the terminal for a two-and-a-half-hour ride and connect on to Sacramento and the rest of the country. So we're very excited about it.

The project also includes the development of

the surrounding land, approximately 4,700 new residential units, retail, indus- -- commercial and entertainment opportunities also abound.

So what I'd like to do is introduce Joan Kugler who's here with us tonight. She's our senior environmental officer from the Department of City Planning on this project; Darrell Maxey, Caltrain; he's the chief engineer.

We also have Sharon Kyle with us in the back here today. She's our MIG public outreach consultant. I see Paul Maltzer in the back there from the Department of City Planning for the City and County of San Francisco. You will address your comments to him. We have Dave Mansen, our consultant in charge of the environmental document from Parsons Transportation Group. I also see Gui Shearin in the back there.

And if I miss anyone, I -- I'm sorry. But thank you all for being here, and we look forward to hearing your comments. And I will now turn it over to Joan Kugler.

MS. KUGLER: Okay. We have a short presentation that gives you a broad generalized overview of the project, and so that's what I would like to do.

As Maria and Marie said, that the EIS/EIR is being circulated. It went out October 4th. And the

close of the public review period will be -- is now scheduled for November 25th.

This EIR -- EIS/EIR is just the latest of a lot of study that has gone into the terminal and for looking at SamTrans, Caltrans, AC Transit. All these agencies have had input into our work.

The Transbay Terminal is one block south of Market Street in downtown San Francisco. As you would come in over the bridge from the East Bay, you see downtown San Francisco, and the purple is where the new Transbay Terminal would be. It is at the site of the existing Transbay Terminal.

We've got three major project components for this in the environmental document. There's a Transbay Terminal replacement, the extension of Caltrain 1.3 miles from its existing terminus to the new Transbay Terminal, and a redevelopment plan to do transit-oriented development on the public lands around the terminal.

Our objectives are to provide a new terminal which would be a multi-modal facility to extend Caltrain and to establish the Redevelopment Plan.

First part is the Transbay Terminal itself. We have -- We are -- In the environmental document, we looked at two potential alternatives: the west ramp and

the loop ramp alternatives.

The proposed -- This particular slide shows what the west ramp alternative would look like. The new terminal would be in yellow where -- at the site of the existing terminal. Because it will be on the site of the existing terminal, we will need to put in a temporary terminal for buses and -- to use during the time that the new terminal is under construction. That's shown in yellow.

Caltrain would come up Seventh Street and then swing into the basement of the new terminal, and the bus -- new bus ramps from the freeway would link up the freeway and the new terminal.

There would be a need for additional bus storage, and we have allocated two sections underneath the freeway between Second and Fourth Streets. And that's those two areas there.

The MTC study that was completed in January of 2001 came up with a concept for a new terminal, and this shows one of their conceptual drawings for a multi-level terminal with a conceptual capital cost for the conceptual terminal being about a billion dollars.

In section view, we would have the train level in the lower basement. Then there would be a train mezzanine, which would be a cueing area and ticketing

area.

Additional ticketing would be at the ground level along with Muni transit, and there would also be some retail and other uses.

The concourse level would be a level where people would start to get up to the bus areas, additional ticketing, additional ability to have retail and/or cultural space.

The AC Transit level would be where most of the AC buses would come in, and passengers would board or exit. And then other buses and paratransit would be at the topmost level.

We have carried a optional pedestrian connection from the Transbay Terminal to BART and Muni Metro, and that is one block away on Market Street.

The other -- next project component is the Caltrain downtown extension. As -- We have two potential alternatives that we're looking at: Second-to-Main and Second-to-Mission.

Okay. If you look at this area, No. 5 is the existing Caltrain station. The underground alignment would go down Townsend S- -- go east on Townsend Street and then come -- turn into Second Street, go north until it swung into -- to the Transbay Terminal, which is No. 1 on this map.

In both alternatives, that segment is exactly the same. The differences come in where the tail track would be. Number 3 is the Second-to-Mission alternative, and No. 4 is the Second-to-Main.

There will also be some work that will need to be done in the Caltrain yard and in the existing Caltrain area. Go down Townsend Street, turn the corner, swing up Second Street. Go up Second Street until you reach the area where the new terminal will be. And then you see in the red is the Second-to-Mission, and the yellow is the Second-to-Main alternative.

Transbay Terminal is an extremely important transportation connection from the freeway from the East Bay to San Francisco. Autos can come off the freeway and be right there by the terminal. AC Transit and Greyhound. You see here the two-commuter rail.

Muni will continue to serve the area as well, we mentioned, the potential connection betw- -- to the BART and Muni and then, of course, Samtrans and Golden Gate Transit. So all those elements come together at that one hub.

The third project -- major project component is the Redevelopment Plan. We're also looking at two alternatives for this. One would be what we call the Full Build alternative, which has about 7.6 million

square feet, 4,000 -- approximately 4,700 dwelling units, and then the Reduced Scope alternative, which has approximately 4,700 square feet and would have 3,400 units, dwelling units.

We're looking at the development of the publicly owned land, which is shown in red. Both of the alternatives will be within that blue boundary, which would be the new Redevelopment Plan area.

MTC study looked at both the existing area around the Transbay Terminal and then what could be in the future with the new terminal. They had the 7.6 million square -- square feet is included in hotel, and -- plus -- which would be right by the terminal, plus other buildings that would be along Folsom and, I guess, Main.

Okay. Cost estimate. We worked out -- In Chapter 6, we have cost estimates for all the alternatives, but when -- we put this slide together as a indicator of what one of the alternatives could cost.

This is the west ramp terminal option with the Second-to-Main tunnel in a tunnel configuration and the Second-to-Main alternative for Caltrain. To re- -- The cost estimate is approximately one point three point -- 1 billion 3.1 million dollars to rebuild the terminal, and $786 million for the downtown extension.

Because we would be looking at loan, we would need debt service, which would add to the cost; and then we're hoping to do value engineering and perhaps come down with a reduction in cost. So the grand total would be 2 billion 668.6.

The funding plan shows where we have located the probable funds for the downtown extension: local sales tax; federal moneys: We talked about -- TIFIA, which is Transit Integration Facilities Act, and that's a loan program; other federal moneys; state; and then there's a number of local measures that could be used.

So looking at a pie chart, federal funds would be approximately 21 percent, state funds 15 percent, and local funds would actually be 64 percent because the bridge toll funds and other local funds would add up to that.

In the environmental process, we had scoping meetings in April 2001. There was a scoping meeting right here in this room. We reevaluated the alternatives according to the public comments that we had gotten. We did some engineering to further refine the project components; and then, of course, we went into the environmental evaluation phase and prepared the Draft EIS/EIR, which has been circulating for the last month.

Long-term environmental impacts would be displacements. Both terminal alternatives would displace two nonresidential uses, and the downtown extension alternatives range from 23 to 60 residential units, 40 to 58 businesses.

There would be noise and vibration impacts from bus storage east of Second Street. We're talking about mitigation with a sound wall. Vibration impacts were also found which would be mitigated with track fasteners or tie systems that would be resilient.

The redevelopment component would eliminate approximately 1,950 off-street parking spaces. However, we are adding a parking garage at Fourth and -- Street, and also the project is expected to encourage a great increase in transit use.

During the construction phase, which is a temporary phase, there will be some need to close block by block Seventh Street with detours.

The tunneling option would also require detour plans and parking removal for at least one block. And then for the temporary terminal, we would need to do contra-flow lanes and remove some parking and traffic lanes on Beale, Folsom, and Main Street.

Again, during the construction phase, parking would be removed on sections of Townsend, Second and

Third Street as would the tunneling option also would remove some parking, much more limited amount.

Construction noise and vibration could affect nearby residents and workers, and we have a set of mitigation measures which will reduce that impact.

We did come and find unavoidable adverse impacts. The No. 1 was demolition of buildings that are either eligible or on the National Register of Historic Places. Both options would require the demolition of the current terminal and loop ramp, which are contributing elements to the Bay Bridge.

If cut-and-cover is the selected construction methodology, that would require the demolition of 13 buildings that are eligible for the National Register. Tunneling reduces that by ten buildings but still would require the demolition of three eligible buildings.

We found traffic congestion which exceeded our thresholds of significance at these seven intersections [indicating].

Our environmental schedule is to -- we released the document on October 4th. Last night we had a hearing in front of the Redevelopment Commission. Tonight is the Joint Powers Board public hearing. The San Francisco Planning Department Planning Commission

will also have a hearing.

Due to a change in the way the Planning Commission members are appointed, we haven't had a Planning Commission since last June. So their first meeting is actually tomorrow; and at that point, they will set the rest of their calendar, and we will have a date to put instead of "TBD," which stands for to be determined.

The close of the comment comm- -- public comment period is scheduled for November 25th. If the Planning Commission schedules their hearing after the 25th, we would hold open the public comment period. But I would suggest to everyone who will be writing additional comments in -- in addition to what they say tonight to think about getting their comments in by November 25th.

Project milestones. In 2000 -- In April of 2001, the Transbay Joint Powers Authority was formed.

The Transbay Terminal project was listed in the Regional Transportation Plan in 2002. We've gotten the Draft EIS/EIR and circulating.

The next step after the close of the public comment period will be to select what we term a locally preferred alternative for purposes of doing the Final EIS. And that in the federal process, we need to come

up with one alternative in each of the three components so that we can prepare a Final EIS. In late spring, early summer, we hope to have EIR certification and an EIS Record of Decision.

Groundbreaking for the temporary terminal will be scheduled in the latter portion of 2004.

And the Transbay Terminal would be completed 2008, 2009.

So thank you very much for your attention. We really wanted to hear from you tonight, and so I hope that you'll fill out a speaker card and give us your comments on the Draft EIS/EIR. Thank you.

MS. PANG: Okay. Is there anybody who hasn't filled out one yet who wishes to?

Thank you.

MR. LYSYY: [Unintelligible.] Why do you want to . . . so much?

MS. PANG: Excuse me. I'm sorry. Would you mind filling out a card so that, you know, we can pick it up and you can speak. Sharon will give you a card, and you can --

MR. LYSYY: [Unintelligible.]

MS. PANG: Yes, and you'll get a turn, okay? Thank you. When you finish filling that out, could you give it to Sharon and -- yeah. There are other people

who wish to speak, and they will take a turn.

MR. LYSYY: [Unintelligible] . . . come?

MS. PANG: Yes, please, yes.

Okay. Now --

MR. LYSYY: I'm sorry.

MS. PANG: Yes.

We now come to the most important part of the evening. As Joan said, we want to hear from you; and so everyone who filled in a card will get a chance to speak tonight.

I have Patrick Moore here.

When you come to the podium, please spell your name for the court reporter. Patrick? Are you here?

MR. MOORE: My name is Patrick Moore, P-a-t-r-i-c-k, last name M-o-o-r-e.

The question -- The concern I have is that talking to Darrell before the meeting, it looks like that the tunnel envelope going from the Fourth and King station to -- onto just short of the Transbay Terminal would be constricted to two to three tracks.

Considering that Caltrain is planning on spending a lot of money to four-track their entire system and considering also that this section of track will probably be a fairly slow section, it seems like there needs to be better planning for at least four

tracks and, you know, maybe trying to fit five in somehow, although I don't know how you can do it.

But constricting ourselves -- yourselves down to two tracks in a section where it would be very difficult to add other tracks seems to be a real bad idea, especially considering the probability of having to make deadhead moves along that same section of track.

MS. PANG: Thank you.

The next speaker is Adrian Brandt.

MR. BRANDT: Adrian Brandt is spelled A-d-r-i-a-n, B-r-a-n-d-t.

I just want to speak in support of the whole project and the plan. But what I am concerned about is that you really only have one chance to do it right the first time, and I'm sort of taking a slightly different tack than the prior speaker is that I'm worried about having enough tracks in the facility itself to accommodate sort of the future demand that I would expect to see with Caltrain and high-speed rail in the same facility.

And I -- There's a -- I've seen drawings that are more creative than those in the two official alternatives that seem to shoehorn a lot more tracks and platforms by using a little bit more creative alignments, and I would really like to have this body do

all that it can to explore what it would take to do something along those lines.

I mean, maybe not that exact thing, but in the spirit of that, I -- I'd like to see, you know, more than two long platforms for high-speed rail, you know, like this other drawing I'm referring that I've seen on the -- on the World Wide Web has four tracks. The platforms aren't, you know, straight and narrow, but they -- they -- it's a much -- it seems like a much more creative plan.

And I'd like to see a little bit more creativity in trying to get this thing as -- as -- get the capacity up to the maximum possible from the start, because once it's built, there's really extreme pain involved in ever trying to do that, so -- in the future.

So I just want to see that explored a lot more aggressively. That's the key comment. Thanks.

MS. PANG: Thank you.

Next we have Eugene Bradley.

MR. BRADLEY: Yes. My name is Eugene Bradley. First name is spelled E-u-g-e-n-e. Last name is spelled B-r-a-d-l-e-y.

Speaking as somebody who has used major terminals before in New York City with Grand Central Station, with Penn Station; looking at this project, my

concern is -- is that you do not have enough train tracks to accommodate not only any future high-speed rail, but also Caltrains' current expansion plans. You're going to need, from what I can see, at least eight tracks or more in order to accommodate Caltrains as well as high-speed rail.

My other concern is: I'm still a little bit caught up between the cut-and-cover and the tunneling. Traditionally tunneling can be very expensive and very dangerous, particularly you're going underneath, as I understand, land, former salt, former mud that the area is now in.

My concern is -- is that I haven't seen any real cost controls. As much as I like this project, my own concern is: I don't want to see the cost of this project double like it has with the Bay Bridge.

But for the most part, I am for this project with the concerns that I had stated. Thank you.

MS. PANG: Thank you.

Margaret Okuzumi.

MS. OKUZUMI: Good evening. Margaret Okuzumi, M-a-r-g-a-r-e-t, O-k-u-z-u-m, as in Mary, -i. And I'm speaking on behalf of Bayrail Alliance.

We strongly support the Transbay Terminal project. And as some of you may know, we raised a

massive lobbying campaign to get the governor to transfer the land -- for the state to transfer the land to make this project possible.

And my board -- it is -- has still -- we're still compiling our comments on this whole project. So we will be submitting written comments before the close of the comment period.

But there are a couple of concerns I do want to lift up. Again, we strongly support this project. One is that we ask that the scope of the EIR be extended southward to encompass 16th Street and the grade separation there. Muni has frequent service along that street, and we foresee a lot of conflicts if a grade separation is not included there.

Also in the -- this Draft EIR, the -- it talks about how the CPUC has approved a grade crossing at Common Street. I wonder if that would include approval for four tracks across Common Street, because based on what I've seen of their -- what they've been willing to approve in Santa Clara County, it just -- I'm presuming that that approval was based on -- on two tracks, not four.

So I'm concerned that that would need to be grade separated also. So I'd like for some more information on that.

Also, the amount of bicycle storage at the terminal seems a bit low. I mentioned last night that the Palo Alto Bike Station is currently parking 60 bicycles a day, and their patronage is not as high as -- as Fourth and King right now, especially projecting out 20 years into the future, and it seems low.

Overall, I think as far as the alternatives are concerned, the west ramp alternative looks like it has -- you know, it's a superior ramp alternative because it allows for more redevelopment. Just aesthetically also it's better. And so I think we would support that.

There are some concerns about whether the Second-to-Main alternative does a good job of accommodating high-speed rail. So we'll have better questions about that.

And then as far -- let's see. Oh. And then we support the full build, you know, that provides the most return to the project. It makes the most sense. We have this incredible nexus of public transit and land use, and we need to keep that very strong for this project.

So I think -- well, I think that's -- you know, so there's some comments to chew on for now, and we'll

be submitting more. Thank you.

MS. PANG: Thank you, Margaret.

Jeff Carter?

MR. CARTER: Thank you and good evening. My name is Jeff Carter; that's J-e-f-f, C-a-r-t-e-r. I too support this project and the Caltrain downtown extension. It's been studied to death, and we need to get it done as quickly and as efficiently as possible.

I haven't had a lot of time to read the report because October has been extremely busy for me with World Series and Halloween. So I'd like to, you know, take a little time to read more into the -- the document.

But as previous speakers have said, the project needs to provide enough capacity to support high-speed rail, projected increase in Caltrain service, inner city Amtrak service and all -- you know, whatever else, you know, we can -- we have.

Also, I would support the idea of the Mission Street alignment so that there is the possibility of a future transbay tube in -- parallel to the existing BART transbay tube so we can turn San Francisco into a true world-class transit system with a, i.e., Grand Central Station in San Francisco.

Other concerns I would have is to decrease the

radius as much as possible of the curves so that the trains could, you know, go as quickly as possible through the project. You know, you look at the maps, and there are some very sharp curves which do restrict the speeds of the trains; and, you know, getting the speeds up there as much as possible is going to attract more people to the -- to the train.

So that concludes my comments. Thank you very much.

MS. PANG: Thank you.

Onnolee Trapp?

MS. TRAPP: Onnolee Trapp, O-n-n-o-l-e-e, T-r-a-p-p. I'm with the Legal Women Voters, and we will be submitting written comments before the deadline from the whole Bay Area league.

And we have some concerns about the financial projections, especially if the full build is not done.

We also have some questions about the platform configurations for the train. It's not entirely clear how many train cars could unload at one time and at what speed, what space between trains, that sort of thing, from the drawings in the book. The previous several years ago go-around had a little more explicit information, so I was looking for that this time and not finding it.

We are very happy to see that part of the project does include housing, especially affordable housing, but we will make more comments later.

MS. PANG: Peter Sheerin, Sheerin. Sorry. Probably mispronounced.

MR. SHEERIN: No. That was -- That's correct. The last name is spelled S-h-e-e-r-i-n. And I've got basically four or five comments.

I'd like to reiterate the concern that several other speakers have made about the number of tracks. I feel that four -- at least four tracks is critical to supporting the local trains, express trains and long-distance. And, you know, if you've got all three of those, maybe you need five or six to support that and deadheading. But at least four seem to meet the minimum that you need to be able to load both local and express trains in both incoming and outgoing directions.

And I think the whole project should be built as close as possible to Market Street because that's where you've got the greatest number of people commuting through, and the transit corridor is all right there with the surface rail and the Muni and the BART.

And if you live further away, even with an underground terminal, the further away you make it from Market Street, the longer that transit time is and the

longer people's overall commute is. And you really need to make sure that connections are short, simple, easy, and direct as possible.

I'm also concerned that there don't seem to be any plans with the Ferry Building or the Ferry terminals; and it seems to me that by -- I don't know if it's possible, but by shifting it a block east, it might be possible to make another underground connection to the Ferry terminals or overhead pedestrian passways to make it possible to have more direct connections possibly even with a small people mover.

But I think that's very important that you get people an easy way to get from the Ferry Terminal to the integrated terminal.

And I'm also concerned that some of the sketches I've seen here of multiple levels on the platform separates the ground level from the train and bus terminals by two or more levels, and that seems to me like that will also make it more difficult and cumbersome for people to make connections. You have to deal with elevators and escalators and staircases.

And in that case, it seems to me if you could -- maybe it's not possible to do on one level, but eliminate the intermediate mezzanine level if at all possible so that the -- again, the travel time is

decreased.

And that's basically it. Thank you for your time.

MS. PANG: All right. Thank you.

Is there anybody else who wish to speak?

Sir?

MR. ATTENDEE: Want to speak?

MS. PANG: Would you like to speak?

MR. LYSYY: Yes, yes, yes. I finish.

MS. PANG: Oh, you may speak if you like.

MR. LYSYY: Yeah.

MS. PANG: Yeah. And you can also submit it in writing.

MR. LYSYY: Yeah, sure. I still don't understand: Why do you want to --?

MS. PANG: Please come to the podium, yes, please, so that we can all hear you.

MR. LYSYY: I'm sorry. I still don't understand: Why do you want to -- to put -- to put the train -- to put the train to buses?

MS. PANG: Yes. Excuse me. Can you just stop for a minute? Could you say your name to --

MR. LYSYY: My name.

MS. PANG: -- the court reporter?

MR. LYSYY: My name, yeah.

MS. PANG: -- court reporter?

I'm sorry. I'm sorry. I forgot. My name is Yevgeniy Lysyy of Sunnyvale.

THE REPORTER: Please -- please spell your name, sir.

MR. LYSYY: Sure. Y-e-v-g, like a George, -e-n-i-y.

THE REPORTER: Thank you.

MS. PANG: Thank you.

MR. LYSYY: I'm sorry. I'm sorry.

MS. PANG: Thank you.

MR. LYSYY: Question is: Why do you want to put -- exactly to put a train to buses instead of for -- why can't just buses go to the train station, the train station? What's the reason for this project?

MS. PANG: Wait. I'm sorry. We're not going to respond to comments tonight, but we will respond to your comment in the Final EIS, okay? Thank you.

MR. LYSYY: Because I don't understand what's the reason for this project. Problems now some are prejudiced over existing?

MS. PANG: Yes.

MR. LYSYY: Sure. Yes, I believe, yes. But there's -- there are much more important problems in the United States and by people in the Bay Area, in

particular, the transportation field.

Caltrain, I admire Cal- -- admire Caltrain. It's -- it's very -- very smart way and like for stupid European multiple units.

But one train in half an hour, it does not very good service. Trains would be -- Trains could be short just for two cars but around every 10 to 15 minutes. Free to commute cut costs. Must be twice as big, yes.

MS. PANG: Yes. Okay. Thank you, yes.

MR. LYSYY: There -- there must be a rapid transit across the bay. There is a bus, but it's also goes rarely, once a half an hour, and it's slow. It goes on city streets. It's convenient for people of Palo Alto and Union City but not for people of Sunnyvale on Amtrak, not the rapid transit. The Dumbarton train could be such transit. But why do you wait for a long time?

MS. PANG: Thank you very much for your comments.

MR. LYSYY: Then Altamont train is a -- Capitol trains are also -- they are one train in the -- more than one hour. It's stupid. It's commuter trains, it's called.

Then there is another one from San Mateo to Cupertino. It's 18 miles across the way. It could be

a -- like BART in this area, but now there's no passenger service at all.

So there are -- I mean, I'm from Russia, and the Russian off -- often call Americans "practical impractical Americans." And so what do we see? So-called practical Americans? I about to spend huge money. There is -- there is a reason. There is a reason for this project.

MS. PANG: Yes.

MR. LYSYY: Yes. But there are much more important -- important project. And I could show you picture, for instance.

MS. PANG: Well, thank you very much, sir. I do have your written comments.

MR. LYSYY: This picture [indicating] shows train -- train coming off. Train -- train comes every few minutes. Most -- most pleasant -- most pleasant subway here.

But some use ground transportation. You see many cars, buses, street cars there; and so trust me, all -- three or four trains must go train station to over here. And trust me, all the stuff, it's all been problems. This all structures. Facility over bus, about from here [indicating] 1,000 --

MS. PANG: Sir, I must ask that you -- excuse

me.

MR. LYSYY: -- from here to here.

MS. PANG: I must ask --

MR. LYSYY: And it's also --

MS. PANG: -- that you -- can you please confine your comment to just this project for this evening? That's the reason why we're here, and --

MR. LYSYY: I'm sorry.

MS. PANG: -- I -- yeah. I've heard your comments, and we thank you very much.

MR. LYSYY: I'm sorry. I have no comments to this project.

MS. PANG: Oh, all right. Thank you very much.

Is there anybody else who wish to speak?

MR. SHEERIN: Yeah. Can I add some additional comments?

MS. PANG: Sure. And please restate --

MR. SHEERIN: This is --

MS. PANG: -- your name.

MR. SHEERIN: -- Peter Sheerin again, last name S-h-e-e-r-i-n. And I just have a few additional comments.

In looking at the diagrams and listening to the last speaker, it occurred to me I don't see any large seating areas in this cross section of the terminal, and

that's been one of the -- I think, the biggest problems with the existing Caltrain terminal and much of the stations along the way.

It's -- There are a few benches, but not very many. And so if you've got a trainload of people waiting for the next train, they all have to stand; and that's not very inducive to con- -- convincing more people to mass transit and a train three quarters of your way to commute.

It's, you know -- especially like the end of the day: Tired people want to sit down, and you ought to need to let them do that on a train or in large seating areas, such as are found in other train terminals throughout Europe and the US.

And partially I'd like to address the last speaker's comments on why he doesn't think this project is necessary.

But to encourage people to take mass transit in greater numbers and more frequently, you need to make the connections as few as possible and as easy as possible; and the current location of the train station is not conductive to that, and not all of these designs are conductive to that.

You need to make the station layout have as few levels as possible, be as easy to get through, lots of

seating, easy connections to both trains, buses, the mass transit on Market Street, and the Ferry Terminal.

MS. PANG: Okay. Thank you.

MR. SHEERIN: Thank you.

MS. PANG: Anybody else?

Okay. Since we have no more speakers, this will conclude the public comment part of this hearing.

And now I just want to recap what Joan said about the next steps.

After the -- Following the close of the comment period and after considering all the public comments received and the information in the Draft EIS/EIR, the local lead agencies will select the locally preferred alternative from amongst the alternatives and design variations presented in the Draft EIS/EIR. The locally preferred alternative will then be evaluated in the Final EIS.

Upon completion of that EIS, each local agency, as Joan said, will cer- -- will certify the Final EIS to adopt the project. And then the Federal Transit Administration will approve the Final EIS/EIR and issue what we call a Record of Decision. And this will complete the environmental review process for the project. Okay.

This concludes the public hearing. Thank you

very much for taking your valuable time to come here tonight and to share your views about the project. Good night.

(Off record at 7:52 p.m., 11/13/02.)

BARKLEY
Court Reporters

MICHAEL ANTONINI: If I could have everyone to have a seat, please, we'll get started on our next item momentarily.

We're officially back in session again. I ask Mr. Ionin to call the next item.

SECRETARY IONIN: The item is Case Number 2000.048E, Transbay Terminal Caltrain Downtown Extension Redevelopment Project, public hearing of the Draft Environmental Impact Statement, Draft Environmental Impact Report.

MICHAEL ANTONINI: Thank you. I see Mr. Cooper at the microphone. He wants to begin with a staff presentation on this item.

RICK COOPER: Good afternoon, commissioners; I am Rick Cooper, staff from the Environmental Analysis Section of the Planning Department.

The item before you is Case No. 2000.048E, a Draft Environmental Impact Statement/Environmental Impact Report on the Transbay Terminal/Caltrain Downtown Extension/Redevelopment Plan. This is a joint environmental document and was prepared to satisfy the requirements of both the National Environmental Policy Act (NEPA) and the California Environmental Quality Act (CEQA).

Today's action is a public hearing on the adequacy and accuracy of the information in the Draft EIS/EIR for the project. There will be no decision today to approve or disapprove the project. We are here today to receive comments

BARKLEY Court Reporters

from the public and yourselves regarding the Draft EIS/EIR as a part of the environmental process as required by both the federal and state environmental laws.

The three major components of the project are the construction of a new multimodal Terminal at First and Mission Streets; an underground extension of Caltrain to a new terminus in the basement of the proposed new Terminal; and establishment of a Redevelopment Area Plan with related transit-oriented development projects. Other subordinate components of the project include a temporary bus terminal facility at Main, Beale and Folsom Streets to be used during construction of the new Transbay Terminal; a new, permanent, off-site bus storage/layover facility; reconstructed bus ramps leading to the new Transbay Terminal; and a redesigned Caltrain storage yard.

The draft document was advertised and released for public review and comment beginning October 4, 2002. Two public hearings have already been held -- the first on November 12, 2002 in front of the San Francisco Redevelopment Agency, and the second in San Carlos on November 13 for Caltrain -- the Peninsula Corridor Joint Powers Board. The period for written comments on this joint environmental document has been extended. The period during which staff will accept written comments will be extended from the previously noticed date of November 25th to Friday December 6th at close of business.

We have a court reporter here today who will be recording

BARKLEY Court Reporters

these proceedings. I ask you to speak slowly and clearly so that an accurate record can be made. Staff will take all the comments on the environmental documents and will be responding to all comments, both those received in writing, and those from the three public hearings, and get back to you with the comments and responses, hopefully by late spring or early summer. This environmental process will be completed before any decisions on the proposal for the new Transbay Terminal, the extension of Caltrain, and the creation of a Redevelopment Plan area will be made by the three co-lead agencies.

This concludes my presentation on this matter. And unless the commission members have any questions, I would respectfully suggest that the public hearing on this Supplement to the Draft EIR be opened.

Again, I would like to emphasize as did Director Green that we are taking comments on the adequacy and accuracy of the environmental document, and not on the rest of the project. Thank you.

MICHAEL ANTONINI: Commissioners, do you have any questions?

WILLIAM LEE: One question. If we meet the SEQA regulations, I assume we also meet the NEPA regulations since SEQA is more restricted than NEPA?

RICK COOPER: I believe that's correct, that generally, the SEQA requirements are greater.

WILLIAM LEE: Is there any federal property on the site?

BARKLEY
Court Reporters

Because if there isn't, there's really no need to consider NEPA because we're already doing SEQA.

LAWRENCE B. BADINER: There's federal money involved. So we have to.

WILLIAM LEE: I don't know why we have to talk about NEPA. But there's federal money at stake, so it makes sense.

MICHAEL ANTONINI: Thank you, Mr. Cooper. Any other questions from commissioners? Okay. I think I'm going to officially open public comment. And we're going to limit comment to five minutes per speaker as we did with the earlier item. And as Mr. Green mentioned, our comments are on the adequacy of the Environmental Impact Report that is before us. So our first speaker is Luis Belmonte. Is that correct?

LUIS BELMONTE: Close enough. You're not the first person to mispronounce it. Luis Belmonte. I am one of the developers and one of the owners of the Yerba Buena Commons, 257-unit SRO project at the corner of Third and Perry Streets. And despite all of the rotten things said about SROs today, I think we have a fine place for people to live: 220 square feet of housing including a kitchen and bathroom, and for $600 a month, you get a furnished unit with utilities and cable television. It's safe, it's clean, and it's affordable. Our income threshold is approximately $22,000 a year, 40 per cent of the median.

BARKLEY Court Reporters

I have 257 residents who live immediately adjacent to the place that the EIR proposes to put all the buses, and I think that's an inappropriate place to put the buses. And I think that that impact should be looked into as part of this EIR. We get enough noise and pollution from the freeway. And from proposed freeway relocation, I think that this adds unnecessarily to the burden. And given, uh, uh, all of the cant that surrounds affordable housing, we actually have some here that was produced. And we shouldn't denigrate the lifestyle of the people who are living there by putting all the buses in the world right next to them. Thank you.

MICHAEL ANTONINI: Thank you. Next speaker is Monica DuClaud.

ELIZABETH CARNEY: My name is Elizabeth Carney. Monica had to go back to work. She asked me to speak for her. She wanted me to tell you she's quite concerned about putting the bus depot in the area of Stillman and Second Street where we all live in the Clock Tower which is 461 Second Street. And that she also wanted me to mention that the complexity of tunneling, the cut-and-cover plan really requires, uh, more of our study and analysis than we in the Clock Tower have had a chance to make.

There's 127 families that live in that building. And we've only recently, by accident, kind of, learned that this analysis process is going forward. As a result, we're

BARKLEY
Court Reporters

hoping that, um, that comment period could be extended while we, uh, take the opportunity to look and see what are the impacts on our building.

And I wanted to tell you a small story. In the early 1900s, there was something called the Second Street Cut. The idea was that they were going to make the hill, at Rincon Hill, a little bit flatter, so it was much easier to bring wagons from Market and Mission down to the Bay. And the politicians got together and made a plan for doing that, and did so. They made a big cut in Second Street. Shortly after that happened, the houses that were on Rincon Hill fell off the hill. And that was the end of development for Rincon Hill for a very long time. So we're hoping that the planning process can have enough, um, um -- careful study and analysis at the beginning of the process that these kinds of futures will be something we don't repeat again. Thank you.

MICHAEL ANTONINI: Thank you. Our next speaker is Roger Brandon. He's going to be followed by Jan Johnston Matthews.

ROGER BRANDON: Members of the Commission, my name is Roger Brandon. I'm here about the proposal to move the downtown Caltrain terminal from its present location at Fourth and Townsend Streets to First and Mission Streets, going underground on Second Street, having two levels underground

BARKLEY Court Reporters

at First and Mission Streets. It is expensive to locate a railroad underground.

This project raises many other questions. How many trains will be waiting underground to unload at First and Mission Streets during the morning rush hour? It would be easier to find some other way to get into the downtown business district. If you're familiar with the, the train system, you know there could be 10 trains arriving in an hour, and several trains leaving in an hour. This proposal does not seem feasible. Many people do not realize that we already have a good connection with downtown transportation lines for incoming rail passengers. All they have to do is a cross to street to Fourth and Townsend Streets and board a Muni Metro line which will connect them with a transbay rail system.

We have a transbay connecting system in places. For good reason, San Francisco voters rejected the proposal on the San Francisco ballot one year ago. It is not necessary. It is impractical. This is another waste of money, spending money for the sake of spending money. The present terminal location at 4th and Townsend Streets is better for the city, and we should reject this underground terminal. We had better find some practical-minded fiscal managers for the city who do not want to put up a new building every time we find a surplus in the accounting. We find that the EIR

BARKLEY
Court Reporters

overlooks many, many obvious problems and that the proposal, it is a, not realistic, not a good idea. And the voters, the voters decided against it a year ago on the ballot. Their good decision should not, should not be overturned. Thank you.

MICHAEL ANTONINI: Thank you. Our next speaker, Jan Johnston Matthews, please, followed by Ted Pollak.

JAN JOHNSTON MATTHEWS: Hi, my name is Jan Johnston Matthews. I wish to comment on the proposed terminal for bus storage. I don't feel that there was adequate environmental studies done on this site. In fact, although we spoke at the initial scoping meeting over a year ago about our concerns, Stillman and Perry Streets weren't addressed in the EIR.

This proposed site is a high-density area with hundreds of residents, low-income housing as well as office buildings. Many of these buildings use exterior air as their sole source of ventilation, mostly opening windows. So since Perry and Stillman Street is narrow, they're close to these lots. You've got the overpass close to this area, creating a lid effect which would exacerbate the noise and the toxic diesel emissions from the bus storage site, not only as they're entering and leaving, but as they sit there and idle to warm up. And I can go into more details in a letter.

BARKLEY
Court Reporters

This storage would also impact traffic and safety issues in our community. I request again that you analyze alternative sites for buses that -- bus lines that need to access the Transbay Terminal. Incorporate their storage areas in or around the Transbay Terminal more closely to the Transbay Terminal site vs. blocks and blocks away. For those buses that don't need access to the terminal, store them, either at their existing sites, or in an industrial area that doesn't have a high density, residential and commercial usage that this area has.

In the SOMA community planning process, rezoning alternatives that was distributed and discussed at the November 19th meeting, it shows that this area, Stillman and Perry between Second and Fourth, is one of the areas being encouraged to be more residential. Would you allow a company to build, or a person to come and build a facility that have the emissions, the noise, and the diesel, and everything else that this bus storage site would? You know, impact, how it would impact our neighborhood.

So please consider that in your report, that this is a community, not just an area underneath the approach to the Bay Bridge. We already have to deal with the teardown and building of this rail at our doorsteps, and possibly the Third Street Rail, and the Second Street tunnel or tube. If you put a bus storage site in front of your doorsteps. It's

BARKLEY
Court Reporters

like the nail in the coffin. There goes our community. So please, I ask that you do more detailed study on this, and also analyze alternative sites for the bus storage. Thank you.

MICHAEL ANTONINI: Thank you. Our next speaker is Ted Pollak, followed by Elizabeth Carney who actually already spoke, unless she's going to speak again on her own, I suppose.

TED POLLAK: My name is Ted Pollak, a resident of 461 Second Street, the Clock Tower Building. I am very concerned about the proposed bus parking facility under the freeway there for a number of reasons including noise, traffic and more importantly, the effects of the diesel fumes. If I may read a paragraph out of the Chronicle today concerning diesel, "Diesel exhaust from all sorts of vehicles, mostly trucks and buses, accounts for 70 per cent of the cancer that's from air pollution in California. The state estimates..." -- this is a number from the state. Environmental working groups and advocacy groups are using the same formula as the state which estimates that emissions account for 90 per cent of San Francisco's cancer risk. To put potentially 100 diesel buses in an area where children and people live and work is, uh, something that needs to be addressed. And I don't think it's adequately addressed in the EIR. Thank you.

MICHAEL ANTONINI: Thank you. Elizabeth Carney, and Bruce Barnes. And I would expect different comments --

ELIZABETH CARNEY: I spoke for Monica DuClaud. I'm sorry.

GERALD GREEN: Excuse me. Everybody must be treated equally. Everybody gets five minutes. You can submit your comments in writing. But we can't allow people to speak twice.

ELIZABETH CARNEY: For I was speaking for somebody else. I wasn't speaking for myself.

GERALD GREEN: Normally, you are allowed to speak one time. It has been the practice of the Commission to do so. Commissioners, if it's your desire to allow her to speak, go ahead. But in future, I would encourage you to keep track of speakers. If she spoke on behalf of someone else, normally, the Commission would not allow that. But if it is your desire, go ahead let her speak. She should also recognize that her friend could provide comments in writing, as well.

MICHAEL ANTONINI: I think I will allow you to speak. But I will ask you to keep your comments, not to echo the same comments that were spoken when you spoke on behalf of your friend. You may proceed.

ELIZABETH CARNEY: I promise I won't tell the same story. Thank you for the opportunity to speak. There are a number of us from the Clock Tower and from the neighborhood. A

BARKLEY Court Reporters

show of hands, who's here about this issue.

GERALD GREEN: Again, those people will be given a chance to speak.

ELIZABETH CARNEY: Some of them won't be. And I also have 30 people on a petition that I will submit that are also, um, neighbors and residents of the 127 families of the Clock Tower that are concerned about this issue. As I said, I hope that we'll have the chance to have the comment period extended because with respect to the tunnel construction, it's a very complex issue. Noise, vibration, air impacts. And we'd really like the opportunity to study this further so we can also assure that there won't be damage to this historical building.

The main thing that I wanted to speak to you about was that it seemed to me that the EIR does not deal with diesel emissions at all in the current draft. And it is my understanding that EPA is, has mentioned there's 40 toxicogenic air contaminants within diesel fuel. So I would hope that this omission could be replaced with an opportunity to study and analyze this further. The 127 families that live at Clock Tower all rely on air ventilation from windows. And the way that the bridge approach works, if the diesel buses were sited where it's proposed, that air would tunnel, um, along, underneath that approach and directly into our building which is open, and

BARKLEY
Court Reporters

then directly into the units. So I would hope that the EIR study group could come and actually look at the site regarding this because there's nothing in the study so far that, um, that deals with this aspect at all.

The neighborhood has been going through other mitigations, The Giants Stadium has been a huge adjustment with the mitigations that were included in that transportation plan. It doesn't mention in the EIR that this neighborhood is, um, at all a part of other studies, but, um -- the earthquake project that CalTrans is working on also will take away parking during this construction and make chaos. This also is not mentioned in the EIR, that there are additional burdens that the neighborhood will be experiencing.

Finally, the traffic around the approach to the Bay Bridge is often, as you probably know, at a standstill. We have a hard time coming in and out of our building. And to consider that adding more buses to that mix, we don't think will be a very viable solution. The traffic is not addressed in the EIR, as well. So, um, thank you very much for the opportunity.

MICHAEL ANTONINI: Our next speaker is Bruce Barnes, to be followed by Norman Rolfe.

BRUCE BARNES: Is there a screen?

MICHAEL ANTONINI: Yeah.

GERALD GREEN: So you should go ahead and start speaking.

BRUCE BARNES: Good afternoon, Commissioners. My name is

BARKLEY
Court Reporters

Bruce Barnes. I'm here speaking on solely with regard today on the, um, the bus, the temporary bus storage facility that is being proposed for the area bounded by Stillman Street, Perry Street, Second, and Fourth. It's a little hard to tell from this diagram; it's basically the area where the west approach of the Bay Bridge is, all the elevated ramps are -- it's used by CalTrans, surface parking operated by lot operators. There's about 700 parking spaces that serves the neighborhood and a lot of other areas.

My main concern is these diesel emission fumes and the health hazards in regards to the diesel emission fumes. I spoke at the earlier hearings, and I also wrote a registered letter in July of 2001. That letter specifically identified emissions as a major concern of the neighborhood, diesel emissions. At the time, I wasn't aware of the, um, finding with regard to cancer, and things that have recently been, uh, disclosed. And I found an EIR that -- my concerns that I addressed to the managers doing that project, they were not even addressed in the EIR report. It's silent in regards to diesel fumes in our neighborhood, and the impact of parking these buses underneath the west approach, it's been described here as basically a lid on the top of that area. Air quality is a problem down there. In our neighborhood, emissions is a problem. You know, you can go out on the rooftop of our two-story building that's 25 feet

BARKLEY
Court Reporters

away from the west approach. When there's no traffic, there's no sense of smell. When there's traffic, a lot of traffic sitting there idling and backed up, there's a whole different sense of smell.

I think that other, alternative sites ought to be explored. The question came up earlier in the prior EIR that was being reviewed as to where the AC buses were going to be stored. Right now, as I read the report, they have not found a temporary home for the Golden Gate buses. But they're to be stored permanently -- based on this report, I shouldn't say permanently. Um, they're going to be housed during the day between Second, Fourth, excuse me, Third, Perry and Stillman. And the AC buses are supposed to be stored between Third and Second. There's roughly, roughly about 190 buses in the EIR report. I think more came out. But I think there will -- some buses are going to be stored on ramps, depending upon what alternative is finally decided on, how the, the loops are going to be done, and the ramps are going to go into the new facility.

Our neighborhood's been bracing for the last two to three years for the start of the reconstruction of the, um, overhead structure. Basically, five to six lanes are going to be rebuilt right in our front doors over the next roughly seven years. I understand the project -- the bids were received last week. It's ready to be awarded. You know,

BARKLEY Court Reporters

this neighborhood, we're losing parking, we're losing our street for periods of time during this construction. And, um, when we get all done, we'd like to see something back that we were promised which is adequate parking. And now that we're being faced with inheriting all the buses. We would like to see that the Commission really do their job on this EIR, and really look at alternative sites, especially when a site hasn't been identified for Golden Gate, where their buses will be stored while they build this facility. Maybe a bus storage facility should be designed early and built somewhere else that could not just be used in the interim, but could be permanent and a facility more conducive to -- maybe an open-air facility, and the emissions wouldn't be as much. The impact wouldn't be as much as on other places.

I currently have a school in my building, 18 of the last 22 years. We're in the process now of negotiating a lease with a new charter school for about 60 kids. Our building would be across from what looks like to be the entrance to the bus --

MICHAEL ANTONINI: Thank you, Mr. Barnes. Mr. Rolfe, Norman Rolfe, to be followed by Andrew Littlefield.

NORMAN ROLFE: I'm Norman Rolfe. I'm the transportation chair for San Francisco Tomorrow. We're in the process of working up our comments on this. It's going to be quite

BARKLEY
Court Reporters

extensive. I'll hit a few highlights here as to what will be in it with the transportation aspects, though this may address other aspects.

And one of the things, as far as alternatives to the study are adopted, the tunneling alternative for the Caltrain downtown extension should be the preferred alternative. That's the one where there will be the least disruption and taking of property. I'll address that in a minute. It's very important that, that, that separation between 16th Street -- 16th -- start over. It's 16th Street. Can you hear me now? Again, very important to create, separate to accommodate the greatly increased number of transit that's anticipated in the future. Therefore, there should be an additional alternative study that has the Caltrain underground, just north of the north portal tunnel number one and then continue underground from there. There should be further study given to minor changes in routing. When we send our written comments in, we will enclose a drawing illustrating this additional underground and possible other small, little changes in route to reduce if amount of property taken.

Now as for the terminal itself, the second Commission alternative should be the preferred alternative. The reason for that, this is the one that allows platforms wide enough to accommodate high speed trains in the future. Our

BARKLEY
Court Reporters

proposal for track arrangement is different than that one shown in the EIR. Once again, we'll have a drawing in the packet to illustrate that. We feel that this track arrangement will create a better operating environment and less impact than proposed in the EIR. The second alternative will not permit platforms long enough to permit high-speed trains. That should not be, should not be pursued. And the western bus alternative, that's the one which is not in the loop, should be preferred because that would offer the best potential for development, and also it will probably result in a superior urban environment. And at this point, I think I'll wind up for it now, as you can see, there's quite a bit more in this. You will receive a multipage letter which will address other things besides the transportation aspects.

MICHAEL ANTONINI: Thank you. Mr. Littlefield, Andrew Littlefield, to be followed by Peter Winkenstein (sic).

ANDREW LITTLEFIELD: My name is Andy Littlefield.

MICHAEL ANTONINI: Bring the mike up a little more.

ANDREW LITTLEFIELD: Hi. My name's Andrew Littlefield. I'm a resident of 461 Second Street, on the board of directors of the homeowners association.

We would like to request an extension in terms of the deadline associated with written responses to the EIR associated with this agenda item. Unfortunately, this EIR

BARKLEY Court Reporters

was only brought to our attention merely two weeks ago. It's a complex, comprehensive EIR. We would like to provide the appropriate response, particularly as today, they were a number of people very concerned with regards the impact of the diesel fumes, and the air quality inside their homes. What we'd like to request is a delay or a postponement of the deadline for written comment to January 30th, 2003. Thank you.

MICHAEL ANTONINI: Thank you. Our next speaker is Peter Winkelstein, to be followed by Arthur Meader.

PETER WINKELSTEIN: My name is Peter Winkelstein. I'm here representing SPUR, San Francisco Planning and Urban Research Association, and the Culture and Urban Policy Committee. We are reviewing this EIR, and we'll submit written responses next week.

And I just want to say today that SPUR has been involved with this project in the transbay area very actively for many years. And we support the project very strongly. We also support the preferred alternatives that Mr. Rolfe just pointed out to you. And, uh, we feel that in general, the EIR is an adequate EIR.

There are a few things in the financing which we have concerns about. And, uh, there seem to be some mathematical, possible mathematical errors. For example, both of the alternatives show the same income from the sale

BARKLEY Court Reporters

of the abandoned CalTrans land which, of course, is impossible because in one case, there's a loop that uses a lot of the land. In the other, there isn't. Similarly, the tax increment financing is shown to be the same which again can't be the same because you can't develop as much with the loop ramp alternative. We will submit the rest of our comments next week. And I thank you for your time.

MICHAEL ANTONINI: Thank you, sir. Our next speaker is Arthur Meader, to be followed by Mary Anne Miller.

ARTHUR MEADER: Good afternoon, ladies and gentlemen. I too live at the Clock Tower, Second and Bryant Streets. I'm would like to reiterate the other comments. I feel like this is a stealth report. I have no idea how much money is involved in these projects, but it's a heck of a lot of money. And I think we should be afforded some time to respond to some of the issues, particularly, to reiterate, concerning traffic, diesel, and wind issues around that area.

I know from personal experience that the traffic in that area is a nightmare. And that's quite a bit of the time. To add, I don't know how many buses into that mix will only make things worse. There have to be some better and more viable alternatives. Running closer to downtown, I think that's certainly possible.

The issue about air quality cannot be overstressed.

BARKLEY
Court Reporters

Diesel pollutants are serious matters. And I do not believe that this report adequately addresses that at all. With regard to the Caltrain issue, and this may be somewhat of an editorial comment, there is a system in place now that I think the city already has spent a lot of money on, basically the N-Judah line which connects perfectly well with Caltrain at Fourth and Townsend. It's a great system. It works very well. I see absolutely no need for the disruption for God knows how long of Second Street or any other street to run an underground train so people from the Peninsula can get to work five minutes faster than they did already.

So I would ask that you again allow us additional time for comments, and to respond what is a complex issue involving matters of science. We're not engineers. And we need to have at least have an opportunity to hire people to address these issues. Thank you very much.

MICHAEL ANTONINI: Thank you, sir. Our next speaker, Mary Anne Miller, to be followed by Pamela Duffy.

MARY ANNE MILLER: Mary Anne Miller, adding to the San Francisco Tomorrow comments. But we'll have your letter to you by the end of next week. My assignment was to do the urban design issue and also preservation issues, just the adequacy of the document the friendliness of it to the public. We, after all, are just members of the public.

BARKLEY
Court Reporters

So we are trying to discover, in fact, whether we can understand this project's graphics. I went to the Xerox shop. And I tried to paste together 13 drawings. And I don't even think I've got it right. Otherwise, you don't find the project described graphically. You see certain drawings in there, schematics; they don't say if it's the existing or the proposed. Some of them tell you it's one of the alternatives. But this was kind of fun to do. I recommend it to you. Go home, Xerox it, paste it together. On the match lines, I found one drawing missing. Drawing number 205 is just sort of not there. So I couldn't complete my little patchwork there. But it was helpful to do the patchwork on the effort here in order to understand what buildings will be demolished.

We have three historic districts, one a national registered historic district. San Francisco Tomorrow's very concerned about urban design and the overall impacts of this project on a part of the city that ought to be friendly to pedestrians. It surely is an opportunity for housing, retail, commercial as well as, of course, for this wonderful new terminal. There are no graphics that will help you to take the very well-evaluated historic resources that are in Chapter 5, I believe. And you can't take them and go find them on a map. So you have to paste together another series of things, and highlight with your yellow highlighter or

BARKLEY
Court Reporters

whatever you want to do where those buildings are to be demolished. And you have to find the street labels, the north arrows to get all this right. So the graphics are really flawed. I don't want to belabor that. In trying to decide, whether -- you go from one alternative to another. You have three of the National Historic Register sites that will be lost in one alternative. You have 13 in another alternative.

This was told me by the planner, Joan Kubler, who is not here today. We met with her to try to get clarification on this document. It's very hard. She brought in cardboard boxes --literally two, and she had several more in her cubicle -- of the background reports that had been done for this EIR. Now, you know, I said to her, "Well, Joan, couldn't we have a bibliography so we can ask you in the future. This project is going to take 8 years, maybe another 20 with the Redevelopment Area; couldn't we have a bibliography with only one sentence of paragraph of the EIR? There's not a reference, footnotes, no bibliography. So we're just looking for -- how can the public access the information? How can you access the information to make the best possible decision?

San Francisco Tomorrow has this project, I mean, on a level of the approval as its highest priority. We need to do something about transit, transportation, regional

BARKLEY
Court Reporters

transportation, etc. But urban design, you figure, well, maybe the Redevelopment Agency is going to solve all your problems with urban design. However, you want to look for information in documents, really evaluating, as it says three projects, the Transbay Terminal, the Caltrain Extension, the Redevelopment Area.

Let me take you to two pages in the whole document, pages 242 and 243, and they don't tell you much. They do talk about the Redevelopment Area a little bit. They say there's a full-build alternative and reduced-scope alternative. Then you go to the next two pages. You have a couple of fairly good graphics. You have a chart, anyway -- you can't really read it from this. But there's a chart there on 244, and then there's one over here -- which I find the most, it's an attempt at being informative. Here's the outline of the Redevelopment Area. But of course, it's so faded you nearly can't see it. All you can see is turquoise squares accompanied by areas that tell you how many housing units, how much this, and how much that. This is not an urban design evaluation. I don't know how I find out whether this is a good project or not. I looked in the back and saw a graphic. I was very hopeful when I saw it. Then I saw it's a computer simulation, here, this isn't coming to you. MICHAEL ANTONINI: Thank you, Ms. Miller.

MARY ANNE MILLER: All right. It's not adequate. If it

BARKLEY
Court Reporters

were built that way, it would be a horror. And I think Redevelopment agreed with me when I talked with them on the phone.

MICHAEL ANTONINI: Thank you. Pamela Duffy, then Jennifer Jennifer Clary.

PAMELA DUFFY: Good afternoon, commissioners. My name is Pamela Duffy. I'm with Coblentz, Patch, Duffy and Bass. We represent the owners of 301 Mission Street which is probably probably adjacent to the transbay terminal to the east. We will, as will many others, have a detailed comment letter to submit before the closing of the comment period.

Off my agenda, but I do think with a project of this complexity, which at least as suggested has this kind of impact on a small community could withstand another couple of months for people to get comfortable with the document.

Fundamentally, we believe that our exciting, 320-unit housing project which is currently undergoing Planning Department review at 301 Mission Street, and the equally exciting and in fact essential Transbay Terminal may go forward in harmony.

COURT REPORTER: Please slow down for the record.

PAMELA DUFFY: You sound like my mom.

COURT REPORTER: Sorry, maÆam, itÆs my job to make the record.

PAMELA DUFFY: Fundamentally, we believe our housing project which is currently undergoing Planning Department review is adequate.

BARKLEY Court Reporters

An adequate Transbay Terminal is moving forward. But we believe the Transbay EIS/EIR could be more sufficient, particularly with regard to the impact from the second to mission alternative and acting as a disclosure document for you and other decisionmakers. That alternative from Second to Mission cuts a broad, 45-foot deep swath across our site, and also contemplates doing the same tunnels all the way down Mission Street.

I know that only from deduction. It actually doesn't discuss the cumulative impacts at all of that alternative. It neglects several important areas and doesn't adequately address economic impact, including the loss of the vital tax increment associated with 301 Mission Street which ironically is included in part of the economic feasibility analysis for the Redevelopment Project Area.

It fails -- in so failing to discuss the economic impacts of the Second to Mission alternative, it begs the question of what the economic feasibility of that alternative itself is. It proposes massive excavation the length of Mission Street, the cumulative impacts of which are ignored. There is no discussion of the hazardous materials effects, noise, air quality, or vibration effects on the properties adjacent to Mission Street once it runs on down.

The real focus ought to be the scientific information

BARKLEY
Court Reporters

that's in the EIR about these alternatives, particularly the Second to Mission alternative. The graphics and the scientific engineering analysis is so vague as to make the feasibility of the Second to Mission alternative very doubtful. This is the reason we believe the EIS/EIR so radically understates the impacts of this 45-foot tunnel that starts out across the vast majority of 301 Mission, and then proceeds down Mission Street.

Fortunately, there is an alternative in the EIR/EIS, that is listed as the environmental preferred alternative and to which SPUR referred earlier. That alternative reduces the operating costs, eliminates two platforms, reduces acquisition costs, increases the tax increment, minimizes disruption on Mission Street, a traffic-preferential street, reduces excavation and the related air-quality effects, and is clearly far more compatible with surrounding economic opportunities. It generally reduces the impacts on land use, not very well covered in this EIS, displacement, socioeconomic fiscal noise vibration, existence of utilities. It also eliminates conflict with existing transportation and transit systems that would occur as the result of tunneling down Mission Street.

Frankly, when the EIS/EIR so clearly such a preferable alternative -- in fact, in the draft, reaches such

BARKLEY Court Reporters

conclusion -- we should pursue it. But if there's a suggestion, a preferred alternative positive Second to Mission Street, the EIR is woefully inadequate. As Commissioner Lee inquired about, the standards and alternatives are different from the California Environmental Quality Act and require a high degree of analysis for alternatives which the EIS/EIR does not present.

COURT REPORTER: Could I get the name of your organization again, ma'am?

PAMELA DUFFY: This is great. It's Coblentz, Patch, Duffy, and Bass. And I'll give you my card. Thank you.

MICHAEL ANTONINI: Thank you. Speaker Jennifer Clary, and if there's anyone else after that, we'll take them after that.

JENNIFER CLARY: I promise to take much less than five minutes. My name is Jennifer Clary. I'm president of San Francisco Tomorrow. As you can infer by the number of people here today, we're very, very interested in this project and this document. Norm Rolfe wanted to correct an earlier speaker, and to remind you that Proposition H in November 1999 passed with almost 80 per cent of the vote and designated an extension to Caltrain and a new Transbay Terminal, and continued urban design comments.

Also, Mary Anne was continuing with the urban design comments. One of the difficulties is the extent to which decisions are going to be made based on this EIR. We

BARKLEY
Court Reporters

understand it's a Redevelopment Area. This is a program-level EIR, but rezoning will still occur based on this. Currently, there's nowhere for the design plan, no picture in the document saying where the EPA says is and what it will look like. There's no shade diagrams. You don't understand what the shadow impacts are going to be in the area. There's no urban design plan yet. We understand Redevelopment is behind and that they'll engage someone soon. But we feel there has to be a process in the EIR to have that completed. Either you incorporate a requirement for it in the EIR with some specific requirements, or you recirculate the EIR later, once you have the urban design component completed.

Really quickly, there are water impacts for this project. Whenever you increase the density of an area, there's increased pressure on our sewer system. We feel that needs to be weighted in this document. Also, we're very -- Joan Kugler was very helpful. We met with her. She showed us documents. We dug in the boxes. I was looking for the analyses of hazardous materials. I found a 1995 analysis which had an estimate for $5 million for disposal of hazardous materials. I'm not sure yet because they haven't gotten back to me yet as to what kind of update they did for the purposes of this document. I know that they did no new soil testing. But I was hoping that based on other,

BARKLEY
Court Reporters

um -- projects in the area like Mission Bay and the ballpark that, that they have a better idea of the amount of soil removed and where it's going to have to disposed of, the level of toxicity in the soil. You'll get a lot of writing. Thank you.

MICHAEL ANTONINI: I think we had one more gentleman who wished to speak. Come forward, sir, and state your name.

GEORGE YAMAS: My name is George Yamas, Y-A-M-A-S. I'm the owner of a building on Stillman, and have been for 25 years. I wanted to basically support the people that feel it is not a compatible use to put the buses storage there for the obvious reasons, some of which we already heard; regard residential commercial usage etc.

I'd also like to point out to you that it seems to me that the developers that will be developing the project along with the Transbay Terminal have a responsibility to find a less dense, a less controversial, uh, place to store those buses as part of the project. And, um, there's no denying that putting that storage at that location is going to interfere with the quality of life of a lot of residents, a lot of tenants. And the diminish the value of people's property. That seems like an unfair transfer of wealth and sense from the developers to, to the local people. They've been supporting that for a long, long time in that area.

The other thing I'd like to point out is that all the

BARKLEY
Court Reporters

proposals I've seen are stressing more residential construction in that area. It seems to me that's a very incompatible use, to encourage more residential use, then people can get sick with the diesel fumes, the traffic and safety issues, etc., involved with parking some buses there, thank you.

MICHAEL ANTONINI: Thank you. And I would ask if any other people wish to comment publicly on this item, please come forward now.

Saying that, I'm going to close public comment on item number seven on today's calendar, the Transbay Terminal Caltrain Downtown Extension Redevelopment Project. And I'd like to ask my fellow commissioners if they have any comments in regards to that at this time. Commissioner Bill Lee.

WILLIAM LEE: I think the, um, the issue regarding diesel is a major issue, and as you may be aware, the Board of Supes has requested Muni within the next four months convert all the buses to natural gas. But I think there's a misconception by the public that diesel is in itself a carcinogenic. Diesel is a mix of exhaust from oils that are burned. Some of it could be carcinogenic. Some of it could not be.

We talk about carcinogens. A lot of people have a misnomer. Quite a few of the things you eat and wear are

BARKLEY Court Reporters

carcinogenic. The question is, how potent is the carcinogen? I would ask the Planning Commission to work with the Bay Area Air Quality Management District and include in your report their reviews on diesel. If they don't have the information, go to EPA, and they will provide you with updated information regarding the diesel issue. I think the public also has a misunderstanding that under Bay Area quality management district standards included here. You should look at the particular matter, the standard. These are particular matters you're looking at with regards to diesel exhaust. That's particle size. If it's between one and ten microns, that is the size you breathe in and out. If it's larger, the likelihood of you breathing it in is small because it's too heavy and will fall out. Plus in your nose and mouth, it wouldn't go deep into your lungs. If it's less than one micron, you would breathe it in and it will go out again.

I think the public, we would be well served to educate the public regarding diesel. If there's any way for the Planning Department to do that, we would appreciate it.

GERALD GREEN: That might assist us in developing some response to this. In trying to form some response to this, your desire is to, that this document includes something educational in terms of what the standard is?

WILLIAM LEE: That is correct. So the public may read the

BARKLEY Court Reporters

document -- we used to have a cancer of the week. When they had it the last time was when they used, tested on bacteria, called the Ames Test. 90 per cent of the stuff was carcinogenic. The public believes if it's carcinogenic, you get it. But we should worry about mutagens which carry them to the next generation.

What I'm concerned about, everybody is using this as an issue about carcinogens. I think the risk management documents are out there by EPA and other regulatory agencies that will be very helpful in explaining the risks regarding diesel. Commissioner Hughes?

KEVIN HUGHES: Well, I believe that a environmental impact report that is adequate and accurate as it relates to this project should contain with respect to, to diesel emissions some study of what speed and wind direction as it relates to the freeway overpass. Um, I believe we should look at the graphics; the graphics do not fit, if they do not have a good working relationship with preceding, succeeding graphics, then we might review that. Certainly should include shadow impacts.

And with respects to a request for extension, I don't see any harm. I would lean towards, you know, an additional two weeks, on, on extension, I think January 30th is a little far out, far away. But I believe that, um, an additional two weeks would not unduly impact the Department.

BARKLEY
Court Reporters

GERALD GREEN: No. It's not going to affect the Department. It might affect others. Your suggestion at this stage is to extend the written comment period for two weeks?

KEVIN HUGHES: Correct; right.

MICHAEL ANTONINI: Okay. Thank you, Commissioner Hughes. Any other comments from commissioners?

I just wanted to add, one thing I noticed in here, that deals with this diesel question. And there is allusions in the report to the possible inclusion of a, a tube to allow trains to run in other directions, perhaps under the Bay towards the East Bay as part of the project. I think that's very farsighted. Certainly, wherever possible, I would encourage projects like this, to you know, try to do electrification and wherever we can stay away from diesel. In reality, that is, most of the buses that come in from AC Transit and from the Marin buses are diesel or are going to be, at least above-ground-type things, in the foreseeable future. So I'm going to close comment on this item now. And the only thing that remains on our agenda is opening up public comment, unless you had some remarks.

GERALD GREEN: No, I heard. And I'm wondering whether that is the consensus of the commission that you'd like to see additional time for written comments. Other than that, we received a substantial amount of comments that we were going to get to work on. I'm not sure what two weeks will

BARKLEY Court Reporters

generate in terms of new or additional comments, but it is, it is going to affect the timeline. But nonetheless, it's your call. You are going to have to feel comfortable that the document is adequate before you're served by it.

MICHAEL ANTONINI: Director Green, do we need a motion to vote on this item?

GERALD GREEN: I think that if it's a consensus of the Commission, that that is probably enough.

MICHAEL ANTONINI: I don't know. Maybe we can poll the Commission.

LAWRENCE B. BADINER: Go ahead.

MICHAEL ANTONINI: I personally would vote not to extend. I would like to see what the other commissioners feel on this item.

BILL LEE: I can go halfway. Extend it for one week.

MICHAEL ANTONINI: Commissioner Sue Lee.

SUE LEE: I would support a two-week extension.

MICHAEL ANTONINI: Commissioner Hughes.

KEVIN HUGHES: I would support a two-week extension.

MICHAEL ANTONINI: We have two votes for two weeks.

SECRETARY IONIN: I just talked to the City Attorney --

GERALD GREEN: We're going to extend it to -- what I hear the commission saying, we're going to extend it to December 20th to provide more comments. And we'll go from there.

MICHAEL ANTONINI: Okay, very good, Director Green. So it's

BARKLEY Court Reporters

extended until December 20th.

DEPOSITION OFFICER'S CERTIFICATE

STATE OF CALIFORNIA }
} ss.
COUNTY OF CONTRA COSTA }

I, Cathryn Bauer, hereby certify:

I am a duly qualified Certified Shorthand Reporter in the State of California, holder of Certificate Number CSR 12676, issued by the Court Reporters Board of California and which is in full force and effect. (Bus. & Prof. § 8016.)

I am not financially interested in this action and am not a relative or employee of any attorney of the parties, or of any of the parties. (Civ. Proc. § 2025 (k)(1).)

I am authorized to administer oaths or affirmations pursuant to California Code of Civil Procedure, Section 2093(b) and prior to being examined, the deponent was first duly sworn by me. (Civ. Proc. § 2025(r)(1).)

I am the deposition officer that stenographically recorded the testimony in the foregoing deposition and the foregoing transcript is a true record of the testimony given. (Civ. Proc. § 2025(r)(1).)

I have not and shall not offer or provide any services or products to any party's attorney or third party who is financing all or part of the action without first offering same to all parties or their attorneys attending the deposition and making same available at the same time to all parties or their attorneys. (Civ. Proc. § 2025(k)(2).)

I shall not provide any service or product consisting of the deposition officer's notations or comments regarding the demeanor of any witness, attorney, or party present at the deposition to any party or any party's attorney or third party who is financing all or part of the action, nor shall I collect any personal identifying information about the witness as a service or product to be provided to any party or third party who is financing all or part of the action. (Civ. Proc. § 2025(k)(3).)

APPENDIX
Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project EIS/EIR Transportation Assessment of Change to Traffic Flow associated with the proposed Refined Locally Preferred Alternative, Technical Memorandum, Luba C. Wyznyckyj, February 22, 2006

1 INTRODUCTION

This addendum to the Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project Final Environmental Impact Statement/ Environmental Impact Report (Final EIS/EIR) (SCH #95063004), which was certified in April 2004 and was reaffirmed by the Board of Supervisors on June 15, 2004, has been prepared pursuant to Section 15164 of the California Environmental Quality Act (CEQA) guidelines. The addendum provides an analysis of the environmental impacts that may result from proposed changes to the approved Locally Preferred Alternative (LPA) described and analyzed in the Final EIS/EIR. Each topical area previously examined in the Final EIS/EIR is reviewed and analyzed below with regard to proposed changes to the Transbay Transit Center (TC) Building design and reconstruction. The proposed changes, which are refinements to the LPA (herein identified as the Refined Project), are described in the following subsection.

This addendum addresses the question of whether the proposed changes to the Project would trigger the need for subsequent environmental review pursuant to Public Resources Code 21166 and Section 15162(a) of the CEQA guidelines. The Final EIS/EIR evaluated the following natural resources and urban systems: Land Use/Wind/Shadow, Displacements and Relocations, Socio-economics, Community Facilities and Services/Safety and Security, Parklands/Schools/Religious Institutions, Air Quality, Noise and Vibration, Geology and Seismology, Water Resources and Floodplains, Utilities, Historic and Cultural Resources, Hazardous Materials, Visual and Aesthetics, Transit/Traffic/Parking, and Construction Methods and Impacts. Analysis of cumulative impacts is interwoven in the discussion provided for each topic area. An analysis of each of these topics for the Refined Project is provided below under the Evaluation of Environmental Impacts subsection.

2 DESCRIPTION OF REFINED PROJECT

The Transbay Transit Center (TC) Building component of the LPA consists of a new, multi-modal transit center.[1] The Refined Project consists of the following changes to the conceptual design and construction for the TC Building component of the LPA:

- Reduction in the building height and size;
- Consolidation of bus operations on the AC Transit level;
- Relocating Greyhound operations to the Train Mezzanine level;
- Elimination of one level of bus ramp;
- Improvements in public access and pedestrian circulation at the Ground level;
- Two-phase (Phase 1 and Phase 2) construction process;
- Use of a temporary Greyhound boarding area prior to construction of the permanent boarding facility in Phase 2; and
- Use of a reduced number of piles (caissons) for construction of the Transbay Transit Center Building.

[1] A more detailed description of the Refined Project is provided in the Recommended Program Implementation Strategy, Transbay Joint Powers Authority, February 10, 2006, and the Final Massing Study for the Transit Center Building, Transbay Joint Powers Authority, February 16, 2006.

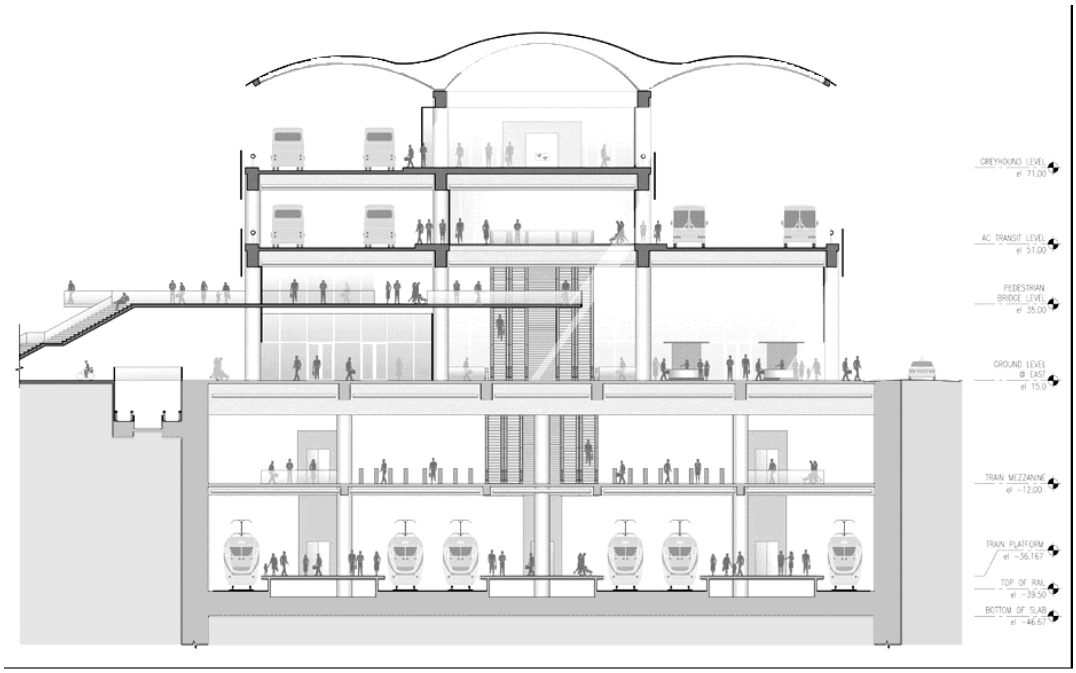
2.1 Modifications to the Transbay Transit Center Building and Bus Ramp Design

The Transbay Transit Center (TTC) Building would retain the footprint established in the Final EIS/EIR – extending from the west side of Beale Street across Fremont and First Streets to and including the parcels acquired by the Transbay Joint Powers Board (TJPA) at 80 Natoma – but would be reduced in height and size. The reduction in height would be accomplished by removing the top bus level originally planned to serve Greyhound and other miscellaneous bus carriers (Figure 2.1). The specific reduction in the 109-foot roof height and approximately 156 feet to the top of the cone-shaped roof elements presented in the Final EIS/EIR would be determined in final design. Although the TC Building would be extended 100 lineal feet on the west end from what was proposed in the Final EIS/EIR, the total square footage contained within the TC Building would be reduced from approximately 1.1 million gross square feet to approximately 1.0 million gross square feet because of reductions in floor space on the Concourse and Ground level as described below.

The AC Transit (AC) level would then become the building's top level, which would be reduced in width from 165 feet to 155 feet, but would maintain the same number of bus bays and circulation pattern planned as part of the LPA. By eliminating one bus level, the bus ramp linking the TC Building with I-80 (Bay Bridge) could be confined to a single-level structure replacing the two-level, stacked ramp concept described for the LPA. The single-level ramp would be approximately 40 feet above street level and approximately 20 feet lower than the top of the stacked ramp. The suburban and charter bus operations displaced from the upper level would be relocated on the AC level. Greyhound would move to a permanent boarding area on the Train Mezzanine level when the passenger train station is completed in Phase 2.

Located directly below the AC level, the Concourse level would be reduced in area from that described for the LPA. The Refined Project would concentrate retail uses in the central portion of the building above the main public lobby and at the west end of the TC Building on the Ground level and on the Concourse level, creating two-level retail spaces. The reduction in retail space on the Concourse level would allow a more spacious lobby and improved circulation between the Ground level and the Concourse (Figure 2.1).

The Concourse level and Ground level would be reduced in width from 165 feet to approximately 110 feet, allowing adjacent public sidewalks to be widened and more sunlight to penetrate into the center of the TC Building. The actual widths will be established during final design. Space resulting from the redesigned Concourse and Ground levels would be allotted for office lease space, flexible support space, and community use space. In addition, the Ground level would be redesigned to take advantage of the enlarged lobby and expanded exterior sidewalks created by cantilevering the AC level over the main public entryway for the TC Building. Pedestrian access to and from the north side of the Ground level would be from a redesigned public plaza or enclosed winter garden space facing Mission Street. The south side of the Ground level (along Natoma Street) would be configured to accommodate taxi and paratransit drop-offs and pick-ups and to improve pedestrian access to and from the TC Building. A second public lobby area is located on the western side of the TC Building between Minna and Natoma Streets with entrances from First Street. An additional public access point would be provided from the Bus Plaza between Beale and Fremont Streets.



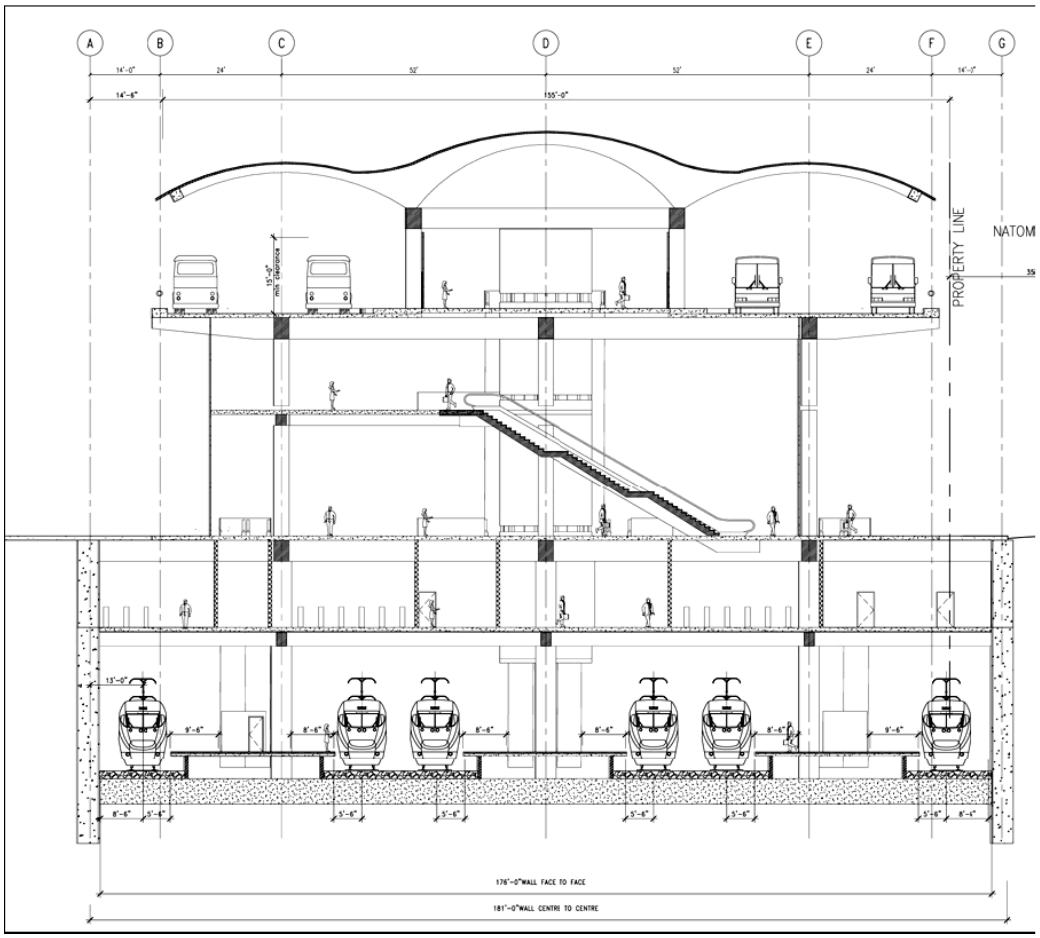


Figure 2.1, Refined LPA

2.1.1 Phased Construction and Refined Construction Methods

All components of the LPA were to be constructed simultaneously in one phase. In the Refined Project, construction activities would be accomplished in two phases. Phase 1 would complete the above-grade (bus operations) portion of the TC Building and provide the structural supports, including drilled caissons and permanent perimeter shoring walls, to allow excavation and completion of the underground train station and mezzanine level in Phase 2 (Figure 2.2, Figure 2.3) Approximately 125 caissons would be used to support the above-grade TC Building, substituting for the nearly 1,000 piers assumed in the original (LPA) construction procedures. In addition, structural steel would replace concrete as the main support element to lighten the structure and to reduce costs.

2.1.2 Temporary Terminal

As described in the Final EIS/EIR (pg. 5-184), the LPA would require construction of a Temporary Terminal that would be used by bus operators during construction of the new Transbay Transit Center. The Temporary Terminal is proposed to be located on two blocks. Under the LPA, the core of the Temporary Terminal would be constructed on the block defined by Main/Beale/Folsom/Howard Streets and would serve primarily AC Transit operations. The curbside areas would serve Muni, Samtrans, and Golden Gate Transit. Greyhound passengers would board and alight at an adjacent terminal across Beale Street between Folsom and Howard Streets. Under the Refined Project, the Temporary Terminal would be used during Phase 1 construction and may be continued for use by Greyhound if Option 2, described below, were selected as the Greyhound interim boarding area prior to Phase 2 construction.

2.1.3 Greyhound Temporary and Permanent Boarding Areas

The two-phase construction schedule would delay Greyhound's move to a permanent boarding area on the Train Mezzanine level until Phase 2 construction is completed. The Refined Project would, therefore, require Greyhound to operate at an interim boarding location until Phase 2 is finished. Three temporary locations are being considered for the Greyhound interim boarding location: 1) the AC level of the Terminal; 2) the Temporary Terminal; or 3) the western end of the TC Building on the Ground level. These options are described below.

2.1.3.1 Option 1: Temporarily Relocating Greyhound to the AC Level

Relocating Greyhound operations to the AC Transit level in Phase 1 is the preferred option if sufficient capacity is available to accommodate AC Transit, Greyhound, and other bus operators using the Transbay Transit Center. An operational and capacity analysis will be conducted to confirm this assumption. Access to and from the TC Building would still be via the bus ramp connecting with I-80 or through bus storage link ramps linking the TC Building with the bus storage area at Third Street and Stillman Street, as described in the Final EIS/EIR.

2.1.3.2 Option 2: Remaining for an Extended Period at the Temporary Terminal until Phase 2 is Complete.

Greyhound operations at the Temporary Terminal could be located on the block bounded by Folsom, Beale and Fremont Streets, as described in the Final EIS/EIR (pg. 5-184), and would remain there until Greyhound's permanent boarding area in the Terminal Train Mezzanine level is finished. Alternatively, Greyhound could be temporarily located on the block bounded by

Folsom, Main, Beale and Howard Streets where AC Transit and other bus carriers would operate until Phase 1 is completed (Figure 2.4 illustrates these alternative locations). A customer waiting and ticket area would be constructed for Greyhound in the center of the block. This structure would either be torn down when Greyhound moves to its permanent boarding area within the TC Building or reused as a park pavilion for the planned park in the middle of this block. To make room for Greyhound operations on this block, some AC Transit buses would move across the street to the block bounded by Folsom, Beale and Fremont Streets.

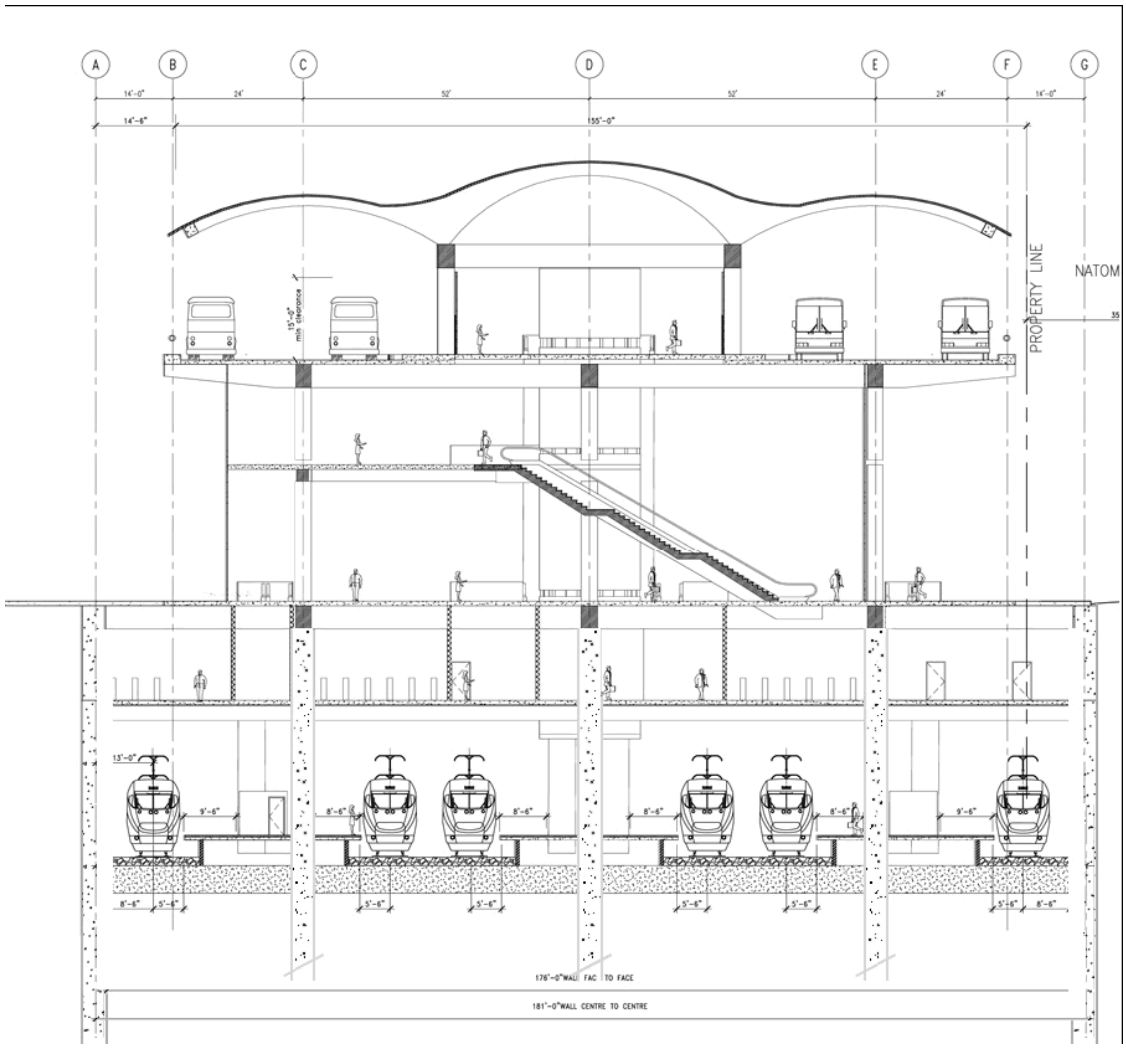

Figure 2.2, Phase 1 – Above-Grade Building

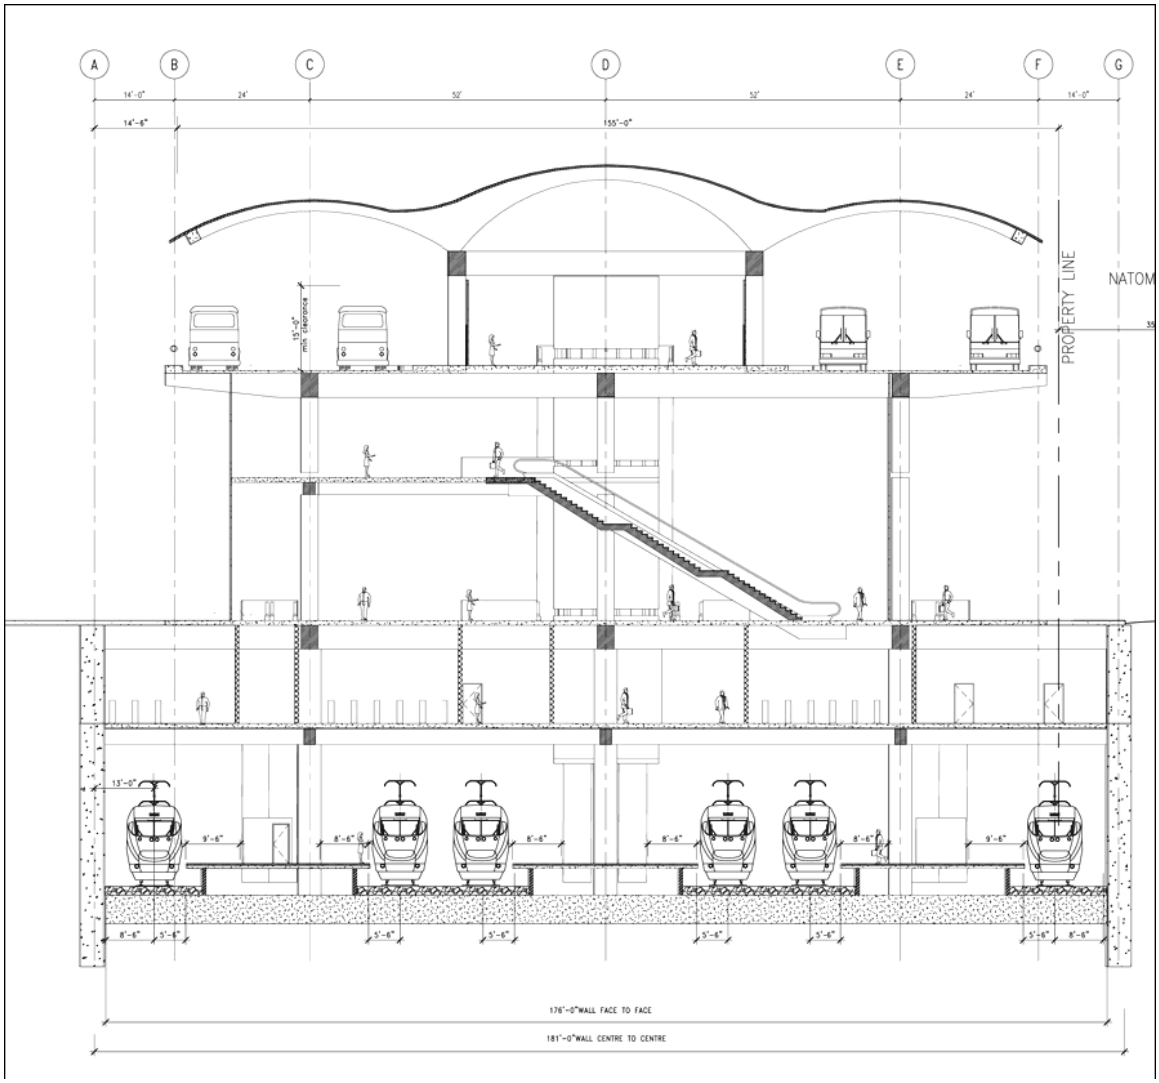

Figure 2.3, Phase 2 - Excavated Train Station

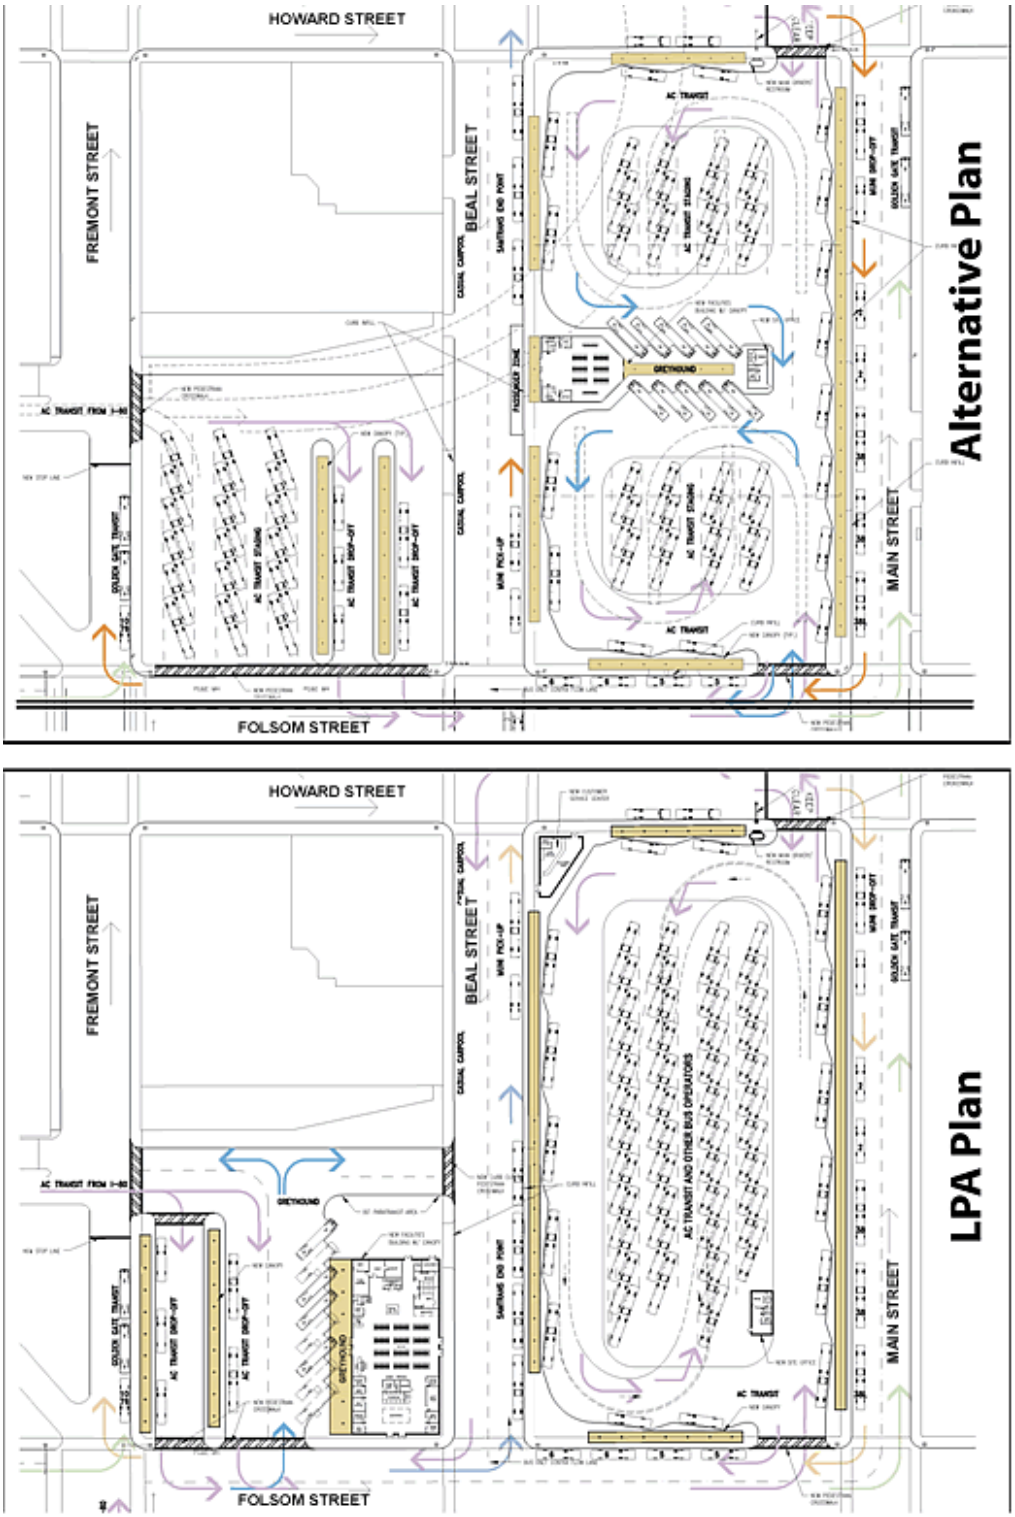

Figure 2.4, Greyhound at the Temporary Terminal - Interim Location

In Option 2, buses traveling from the I-80 off-ramp at Fremont Street could either enter the two blocks of the Temporary Terminal from Folsom Street or enter the block between Fremont and Beale Streets directly from the Fremont Street off-ramp by crossing Fremont Street at the foot of the ramp (Figure 2.4, Greyhound at the Temporary Terminal – Interim Location: LPA PLAN). Northbound through-traffic on Fremont Street would be controlled by a stoplight or stop sign at the foot of the Fremont Street off-ramp to ensure safe movement of buses into the Temporary Terminal. As indicated in Figure 2.4, Greyhound at the Temporary Terminal – Interim Location: Alternative Plan, the street segments of Beale Street between Folsom and Howard Streets, and Main Street between Folsom and Howard Streets, would be converted to two-way traffic operation to allow bus loading zones and curbside public access at the Temporary Terminal. The contra-flow bus-only lane established on Folsom Street extending from Main Street to Essex Street and passing adjacent to the Temporary Terminal would remain as described in the LPA. These elements of the project design would allow bus circulation and bus stops to be placed on all four sides of the Temporary Terminal. Circulation patterns established for the Temporary Terminal would be modified for two-way operation consistent with Design for Development guidelines in the Transbay Redevelopment Plan.

2.1.3.3 Option 3: Temporarily Relocating Greyhound to the Western End of the Transit Center on the Ground Level.

Relocating Greyhound operations to the western end of the Terminal at street level would require creation of a dedicated boarding area on Natoma Street as indicated in Figure 2.5. Natoma Street operates as a one-way eastbound alley. Buses would enter Natoma Street from westbound Howard Street via a new driveway, and would leave Natoma Street and enter First Street southbound at a signal-free intersection. In this option, buses would travel to the I-80 on-ramp via First Street and from the I-80 off-ramp via Fremont and Howard Streets. Selection of Option 3 would require that proposed Ground level retail and pedestrian sidewalk improvements at the western end of the TC Building would be deferred until Phase 2.

After Phase 2 construction is completed, Greyhound would relocate to a permanent boarding area on the Train Mezzanine level of the TC Building. A two-way bus driveway ramp would be constructed on Howard Street 250 feet east of the intersection with Second Street to allow Greyhound buses to enter the underground boarding area (Figure 2.6). The two-way ramp, used exclusively by Greyhound, would be aligned directly below or adjacent to the overhead bus ramp that provides access at the AC Transit level, passing under Natoma Street before entering the TC Building. Greyhound customer service, public waiting and ticketing area would be located on the Ground level, one level above the boarding area. Stairs, escalators, and an elevator would provide access from the Ground level waiting area to the Greyhound boarding area below.

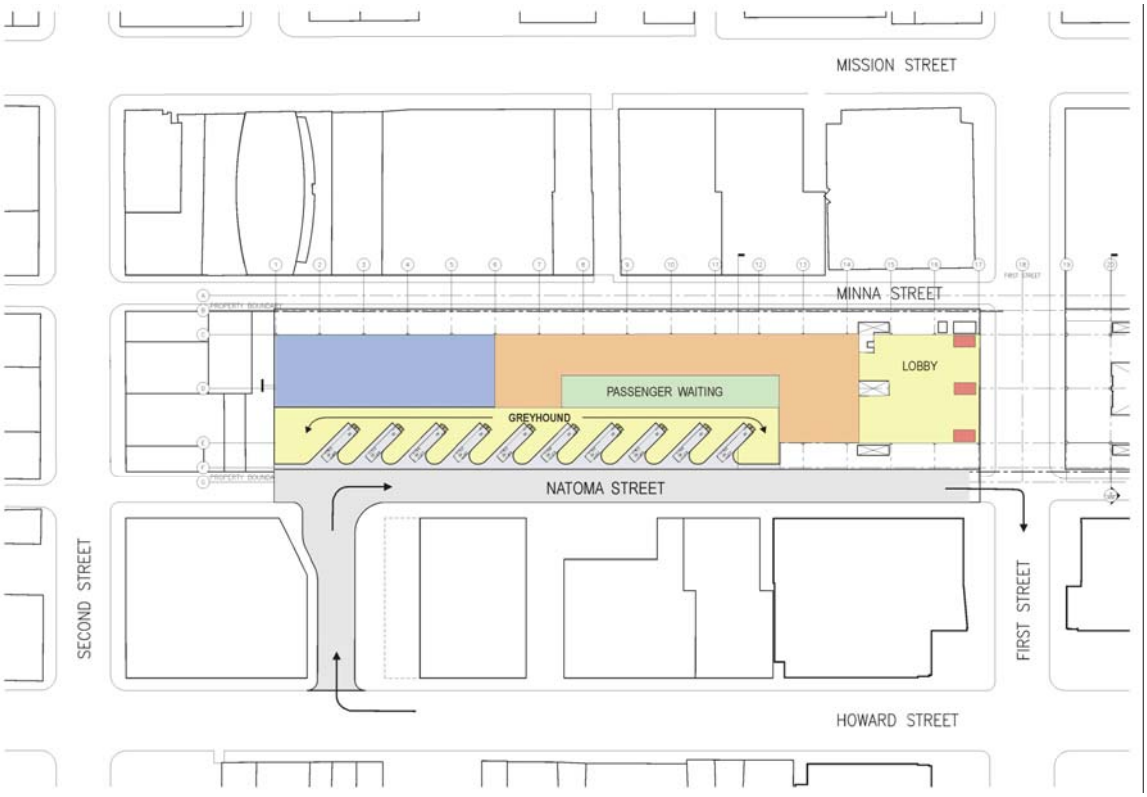

Figure 2.5, Greyhound at the West End of the Transit Center Building- Interim Location

Figure 2.6, Greyhound Permanent Boarding Area Plan and Connector Ramp

3 EVALUATION OF ENVIRONMENTAL IMPACTS DUE TO THE PROPOSED CHANGES IN THE PROJECT

3.1 Land Use/Wind/Shadow

The Refined Project would continue to provide the beneficial land use impacts described in the Final EIS/EIR (pg. 5-2), including an intensification of land uses, freeing land for development, and enhanced pedestrian circulation in the area. The beneficial impacts would extend to creating a more vibrant and cohesive neighborhood, which is consistent with the San Francisco Planning Department and Redevelopment Agency plans, policies, and guidelines for the area (Final EIS/EIR pg. 5-12 and 5-13). Although the Refined Project would reduce the height of the TC Building, the decrease in height is not sufficient to reduce shadow and wind impacts identified for the LPA, because multiple high-rise buildings would be built on the surrounding blocks under both the LPA and the Refined Project.

3.2 Displacements and Relocations

The Final EIS/EIR (pg. 5-25, Figure 5.2-3) identified 564 Howard Street as property to be acquired for construction of the TC Building and associated bus ramps, however, that property was inadvertently omitted from Table 5.2-1 (pg. 5-22) and Table 5.2-5 (pg. 5-33). The displacements and relocations required for the Transbay Transit Center Building component of the LPA are discussed in the Final EIS/EIR on pages 5-22 to 5-26. The modified TC Building and associated bus ramps would continue to require the acquisition of the property at 564 Howard Street; therefore, the text of the Final EIS/EIR is hereby corrected in this addendum as shown in Table 3.2 below.

Table 3.2, Property Acquisitions for the Transbay Transit Center Refined Project

Block	Lot	Address
Full Acquisitions		
3721	19	564 Howard Street
3721	45A	70 Natoma Street
3721	46	78-80 Natoma Street
3721	53	81 Minna Street
3721	54	65 Minna Street
3736	74	57 Tehama Street
3736	88	60 Tehama Street
3739	2	Vacant Lot on Main Street
3739	6	272 Main Street
3739	4 and 7	200 Folsom Street
Partial Acquisitions		
3721	16	546 Howard Street (northeast corner)
3719	17	101-129 Fremont Street (southern portion of the parcel)

The building located at 564 Howard Street, which was constructed in 1907, has been modified substantially over the years. Regarding this building, the San Francisco Planning Department determined the following:

In 1996 the California Office of Historic Preservation assigned 562-564 Howard Street a 6Y National Register (NR) Code (Determined ineligible for NR by consensus through Section 106 process-not evaluated for California Register (CR) or Local Listing) in 1996. According to the Planning Department's CEQA Review Procedures for Historic Resources the property is considered to be Category C, "Property Determined to not be historical resources." As a result of this categorization the subject property does not qualify for California Register or Local Listing.[2]

The building at 564 Howard Street is not located in a Historic District nor is it eligible to be listed as a National Historic Resource.[3] There is currently one business, a professional office, in 564 Howard that would be displaced under both the LPA and the Refined Project. No other uses occupy the building. Because 564 Howard Street was inadvertently omitted from Table 5.2-5 on pg. 5-33 of the Final EIS/EIR, the number of offices displaced by either the LPA as reported in the Final EIS/EIR, which would remain unchanged under the Refined Project, is hereby corrected to be 10 rather than nine. The mitigation measures identified for displacement and relocation in the Final EIS/EIR (pg. 5-34), which have been adopted and incorporated into the Project, also would reduce this displacement to a less-than-significant level.

3.3 Socio-economics

While economic and social changes resulting from a project impact are not considered significant effects on the environment pursuant to CEQA, the following update of the discussion in the Final EIS/EIR is provided for informational purposes. The Final EIS/EIR (pg. 5-35) identified potential beneficial socio-economic impacts because of the increased activity and economic vitality generated by the LPA. Although retail uses in the TC Building would be somewhat reduced under the Refined Project, the overall beneficial socio-economic effects of the entire project, including the extensive development proposed under the Transbay Redevelopment Plan, would remain.

3.4 Community Facilities and Services/Safety and Security

The community facility and service impacts identified in the Final EIS/EIR (pg. 5-37 to 5-42) resulting from increased activity and uses in the Transbay Transit Center Redevelopment Area would not be substantially altered for the Refined Project, although the Refined Project includes a somewhat smaller Transit Center Building facility than the LPA. Design guidelines for lighting, pedestrian walkways, and corridor sight lines incorporated into the Transbay Transit Center design to enhance Safety and Security (Final EIS/EIR, pg. 5-122) would also be applicable to the Refined Project. The Final EIS/EIR found that no additional staff or public service capacity would be required to respond to emergencies in the study area. Since the Refined Project would somewhat reduce the scale and uses of the reconstructed TC Building and maintain the remainder of the LPA components, no new public facility, community service, or safety and security impacts would be expected under the Refined Project.

[2] Mark Luellen, Preservation Coordinator, San Francisco Planning Department, January 6, 2006

[3] Historic Architectural Survey Report for the Transbay Terminal/Caltrain Downtown Extension Project, JRP Consulting Services, Davis, California, October 25, 2001.

3.5 Parklands/Schools/Religious Institutions

The Final EIS/EIR (pg. 5-44 and 5-45) concluded that no long-term adverse impacts on parklands, schools, and religious institutions would occur in the study area. The Refined Project, which incorporates a lower Transit Center Building, would not alter this finding. If Greyhound remains at the Temporary Terminal until Phase 2 construction is completed, establishment of the park proposed for the midblock area on the Temporary Terminal site between Main and Beale Streets, which is a benefit of the LPA, would occur later in time. This would be a temporary and less than significant impact.

3.6 Air Quality

Although the Transit Center Building would be reduced in size and the Downtown Extension would be phased such that construction of the underground rail extension and station would occur after the bus terminal and ramps are completed, the level of transit service and future patronage at the Transit Center would remain as described for the LPA in the Final EIS/EIR (pg. 5-54). As a result, transit's share of the regional mode split and the reduction in vehicle miles traveled would remain the same under the Refined Project. Therefore, the Refined Project would accrue the same air quality benefits over the 20-year planning period as the LPA, and would not create any new or increased impacts on air quality. Like the LPA, the Refined Project would conform with State Implementation Plan goals.

3.7 Noise and Vibration

The Final EIS/EIR (pg. 5-74) found no long-term noise impacts associated with the LPA except at the Bus Storage areas. Potential vibration impacts from underground train operations were identified (Final EIS/EIR pg. 5-75 and 5-76). Mitigation measures adopted and incorporated into the LPA would reduce the impacts due to vibration to a less-than-significant level. Under the Refined Project, the project components generating noise and vibration impacts would remain, and the adopted mitigation measures would have the same effectiveness in reducing impacts to a less-than-significant level.[4] No new long-term noise and vibration impacts would be created by the proposed refinements to the Transbay Transit Center design.

3.8 Geology and Seismology

Under the Refined Project, the modified structural design and construction methods for the Transit Center Building would be effective in minimizing risk from seismic events and geologic conditions in the construction area, particularly during the excavation and construction of the underground train station during Phase 2.[5] No geologic or seismic impacts would occur due to the proposed refinements to the Transbay Transit Center design.

3.9 Water Resources and Floodplains

No long-term impacts on Water Resources or Floodplains were identified in the Final EIS/EIR (pg. 5-80 and 5-81) for the Project. The Refined Project, which is the same as the LPA except for the size and construction phasing of the Transbay Transit Center, would not change this conclusion.

[4] Hugh Saurenman, ATS Consulting, Phone Conversation, February 22, 2006.
[5] Loring Wylie, Degenkolb Engineers, Phone Conversation, February 22, 2006.

3.10 Utilities

The Final EIS/EIR (pg. 5-81) concluded that the LPA would not substantially increase the demand for energy or water, thereby requiring expansion of power or water facilities. A smaller Transbay Transit Center facility with reduced retail space may slightly reduce the overall water and energy consumption due to the LPA. Construction of the Refined Project would affect sewer, water, and communications lines in the same manner as disclosed in the Final EIS/EIR (pg. 5-81 to 5-83) for the LPA because the construction envelope would be the same. Phasing may delay, but not reduce, the utility impacts associated with construction of the rail extension. As indicated in the Final EIS/EIR, pg. 5-82, LPA construction activities will require utilities to be avoided, relocated, and/or supported to prevent damage to utility systems and to minimize disruption and degradation of utility service to local customers. Coordination efforts with affected utility providers will focus on identifying potential conflicts, planning utility reroutes, and formulating strategies for overcoming problems that may arise. These procedures apply to the Refined Project as well. No new or substantially increased significant impacts on utilities would occur due to the change in the Transbay Transit Center design.

3.11 Historic and Cultural Resources

The construction of the LPA may uncover archaeological resources. The Refined Project would be constructed within the same footprint and Area of Potential Effect (APE) as the LPA, and would have the same possibility of unearthing these resources. The procedures for recovering buried resources identified in the Memorandum of Understanding among the co-lead agencies, State Historic Preservation Officer (SHPO), and the Department of the Interior would also apply to the Refined Project (refer to pg. 5-86 to 5-89 of the Final EIS/EIR). The historic structures that would be demolished to construct the LPA and identified in the Final EIS/EIR (pg. 5-92 to 5-107) include the existing Transbay Terminal and Bay Bridge Connector ramps, which have been designated as National Historic Resources. Although the Refined Project would reduce the size of the Transit Center Building, construction of the Refined Project also would require demolition of these historic resources because the APE and construction envelope for the TC Building would be the same as for the LPA. For both the LPA and the Refined Project, the demolition of historic resources would result in significant and unavoidable impacts.

3.12 Hazardous Materials

Hazardous materials would be used to fuel and clean train equipment located in the Caltrain storage yard near Fourth and Townsend Streets (Final EIS/EIR, pg. 5-111). In addition, demolition of existing buildings and construction of new facilities may expose construction workers to hazardous materials. Handling of these hazardous materials would be in conformance with California OSHA (Occupational Safety and Health Administration) and local (Maher Ordinance) guidelines and procedures. The potential to encounter hazardous materials would be the same for the Refined Project and the LPA. By following appropriate procedures, impacts from hazardous materials would be reduced to a less-than-significant level.

3.13 Visual and Aesthetics

The visual changes associated with the LPA, such as the demolition of the existing Transbay Terminal and bus ramps, would also occur under the Refined Project. The design of the reconstructed Transit Center would be contemporary and a point of visual interest. Under both the LPA and the Revised Project, the ramps would be reduced in scale and, as such, would be less visually intrusive than what currently exists. In addition, under both the LPA and the Refined Project, the Transbay Redevelopment Plan would alter the visual landscape by allowing substantial mid-rise and high-rise development in the study area and creating parks and pedestrian walkways where none currently exist. The Final EIS/EIR (pg. 5-120) concludes that although the proposed new development would alter the aesthetic nature of the area, the added visual features are common to a built-up urban area and, by following the Redevelopment Area's Design for Development guidelines, they could enhance the visual quality of the study area, which would be a beneficial impact. The Refined Project would maintain these changes to the visual and aesthetic landscape, producing the same visual and aesthetic benefits. In addition, the Refined Project would improve the visual and aesthetic quality of the LPA by: 1) reducing the size and height of the Transit Center Building; 2) narrowing the width of the Concourse and Ground level to allow expansion of the sidewalks and public plaza area as well as greater penetration of sunlight into the interior space; and 3) eliminating the second level of the bus ramps connecting to I-80.

3.14 Energy

The Final EIS/EIR (pg. 5-126) found that the increased energy consumption required for the new Transbay Transit Center, underground rail facilities, expanded transit operation, and the increased uses under Transbay Redevelopment Plan would be somewhat offset by the diminished auto use and by the sustainable design elements incorporated into the Project. As a result, the Final EIS/EIR (pg. 5-126) concluded that no energy mitigation measures would be required. The Refined Project would also entail the same energy requirements and offsets, which would be further diminished by the reduced size of the Transit Center Building and the reduction in retail uses inside the Transit Center Building. Therefore, the conclusion that no energy mitigation measures would be required for the LPA would also apply to the Refined Project.

3.15 Transit/Traffic/Parking

The Final EIS/EIR (pg. 5-142 and 5-143) found that cumulative, adverse and unmitigated traffic impacts would occur at seven intersections in the study area. Under the Refined Project, these significant and unavoidable traffic impacts would be unchanged because most of the projected traffic volume in the study area would result from the level of development proposed in the Transbay Redevelopment Project. Mitigation measures adopted and incorporated into the Project, such as having developers of Redevelopment Area properties contribute to the City's new Integrated Management System program and Intelligent Transportation System infrastructure components, would apply to the Refined Project as well.

Upon project completion, cumulative pedestrian volumes would be the same for the LPA and Refined Project, and mitigation measures adopted and incorporated into the LPA (Final EIS/EIR, pg. 5-157) that would alleviate pedestrian impacts would apply to the Refined Project. The Refined Project would improve pedestrian circulation compared to the LPA because it would create expanded sidewalks and improve public access to and public spaces within the

Transit Center. There would be no change in parking supply due to the proposed refinements to the Transbay Transit Center design. In any event, this is not considered a significant impact under the City's applicable transportation policies.

Under the Refined Project, Greyhound would have a permanent boarding area established in the Train Mezzanine level of the new Transit Center. The underground Train Mezzanine and Station area would not be completed until Phase 2. As a result, Greyhound would need an interim boarding location. Three options for the interim boarding area are included in the Refined Project. Two of the proposed interim boarding options - the Temporary Terminal (Option 2) and Natoma Street along the West End of the Transit Center (Option 3) - would produce eight additional peak hour bus trips on City streets that do not occur under the LPA. Temporarily relocating Greyhound to the AC Transit level in Phase 1 (Option 1) would not produce any additional trips on City streets since Greyhound would use the Transit Center bus ramps to access I-80. The traffic analysis for the Temporary Terminal (Option 2 in the Refined Project) presented on page 5-184 through page 5-186 in the Final EIS/EIR indicated that intersections located between the Temporary Terminal and the Bay Bridge on-ramps would operate satisfactorily except at First/Folsom and Essex/Harrison Streets, which are projected to operate at Level of Service (LOS) F with or without bus trips from the Temporary Terminal. The Final EIS/EIR concluded that bus trips operating from the Temporary Terminal and passing through First/Folsom and Essex/Harrison would not create a cumulatively considerable contribution to the intersections' congestion. This conclusion would apply to the Refined Project as well. The eight additional Greyhound trips passing through these intersections in Options 2 and 3 would occur after operations for the other bus carriers at the Temporary Terminal have ceased and have been relocated to the Terminal at the end of Phase 1, thereby removing these bus trips from congested intersections.[6]

After Phase 2 is completed, Greyhound would access its permanent boarding area in the Terminal via a new driveway located on Howard Street 250 feet east of Second Street and used exclusively by Greyhound buses. An analysis of Greyhound operation along Howard Street found that the addition of eight peak hour inbound and outbound Greyhound trips during the afternoon peak would not affect the movement of traffic along Howard Street nor substantially affect operations (projected to operate at LOS D under 2020 cumulative conditions) at the intersection of Second/Howard Streets.[7] In addition, the analysis found that Greyhound buses turning into and out of the Transit Center Building via the access driveway would not result in significant impacts to bicyclists using a bicycle lane on the north side of Howard Street because the number of Greyhound trips entering and exiting the Transit Center would be minimal. As a result, no new or substantially increased significant impacts on transit, traffic, or parking would occur due to the change in Transit Center design.

3.16 Construction Methods and Impacts

As stated in the Refined Project description, Transit Center construction would occur in two phases. The extended construction period would require mitigation measures identified in the Final EIS/EIR (pg. 5-184 to pg. 5-222), which have been adopted and incorporated into the LPA,

[6] Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project EIS/EIR Transportation Assessment of Change to Traffic Flow associated with the proposed Refined Locally Preferred Alternative, Technical Memorandum, Luba C. Wyznyckyj, February 22, 2006.
[7] ibid

to be applied over a longer period of time under the Refined Project. They would remain effective in mitigating construction impacts to a less-than-significant level.

To lighten the Transit Center structure and reduce costs, the Refined Project would employ alternative construction techniques for the building's foundation and structural support system. Instead of using a grid of 1,000 piles to provide the support structure for the Transit Center, approximately 125 caissons would be required. The caissons would be drilled during the first phase of construction. Any residual construction-related noise and vibration impacts on above-ground Transit Center uses, which would have resumed operation in the new Transit Center during Phase 2 construction, would be effectively mitigated as indicated in the Final EIS/EIR (pg. 5-206 to 5-214).[8] Permanent perimeter shoring walls used to support subsequent excavation and build-out of the underground train station would be installed in Phase 1. As indicated in Geology and Seismology above, the refined structural support system would minimize risk from seismic events or geologic impacts during both phases of construction.

Hauling of excavation materials, as well as delivery and staging of construction materials, would occur as indicated in the Final EIS/EIR, with the train station construction occurring in tandem with the construction of the underground rail alignment from Fourth and Townsend Streets. By phasing rail construction, project staging areas and hauling routes would need to be maintained for a longer period of time under the Refined Project. This could delay development of the parcels used for construction staging, which is a benefit of the LPA, until Phase 2 construction is completed. Mitigation measures that require identifying truck routes and temporary street detours (Final EIS/EIR pg. 5-192 to 5-200), which were previously adopted and incorporated into the LPA, would mitigate hauling and construction-related access and circulation impacts to a less-than-significant level and would also apply to the Refined Project.

4 ENVIRONMENTAL FINDINGS

Based on the above information and analysis, the proposed revisions to the LPA (Refined Project) would not trigger the need for subsequent environmental review pursuant to Public Resources Code section 21166 and Section 15162 of CEQA Guidelines. The proposed changes in the Refined Project would not require major revisions of the Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project Final Environmental Impact Statement/ Environmental Impact Report (FEIS/EIR) due to new or substantially increased significant environmental effects; no substantial changes have occurred with respect to the circumstances under which the Refined Project would be undertaken that would require major revisions of the FEIS/EIR due to new or substantially increased significant effects; and there has been no discovery of new information of substantial importance that would trigger or require major revisions of the FEIS/EIR due to new or substantially increased significant effects. In addition to the benefits that would be provided by the approved Project, the proposed Refined Project would provide the following environmentally beneficial effects:

- Reduced height and size of the building
- Reduced height and visual intrusion of the connecting bus ramp with I-80
- Expanded adjacent sidewalks and public access, including improved access for taxi and paratransit services
- Greater penetration of sunlight into the interior of the Transit Center Building

[8] Hugh Saurenman, ATS Consulting, Phone Conversation, February 22, 2006.

- Increased customer service and public waiting areas in the western end of the Transit Center Building

Re: Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project EIS/EIR
Transportation Assessment of Changes to Traffic Flow associated with the proposed Refined Locally Preferred Alternative

---

1. INTRODUCTION

This memorandum presents an assessment of the changes to vehicular traffic flow associated with the Refined Locally Preferred Alternative (RLPA) under consideration for adoption by the Transbay Joint Powers Authority (TJPA), within the context of the transportation analysis conducted for the *Transbay Terminal/Caltrain Downtown Extension/ Redevelopment Project Final EIS/EIR*, March 2004 (Case No. 2000.048E). The Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project is referred to in this memorandum as the "Transbay Project". The changes include elimination of the top level of the planned Transbay Transit Center building (TC Building). Greyhound bus operations would be relocated to a permanent location at the west end of the below-grade Train Mezzanine level of the TC Building. Other paratransit and private bus operators planned to use the top level of the TC Building would be relocated to the AC Transit level and share space with AC Transit.

The transportation analysis in the *Final EIS/EIR* assumed that the Greyhound and miscellaneous bus operators would be located on the top level of the TC Building and would have direct access to the building from elevated bus ramps connecting with I-80. Access to the bus ramps from surface streets would be via the Bus Storage Facility Link Ramp at the new bus storage area, located at Third Street and Stillman Street. These ramps would be used by Greyhound, paratransit and private operators' buses traveling to and from U.S. 101 northbound and southbound via I-80, which would require travel via the I-80 ramps and surface streets.

The TJPA is also considering adopting a program implementation strategy that would phase construction of the TC Building in two major phases. Phase 1 would include the above-grade portion of the TC Building. Construction of the below-grade portion of the TC Building that would house the Train Station and Greyhound bus operations area would occur in Phase 2. Until the completion of Phase 2 construction, Greyhound would continue operations at a temporary location.

This memorandum assesses the potential impacts of the relocation of the Greyhound operations for Phase 1 conditions, during which time only the above-grade bus terminal structure is constructed and occupied, and for Phase 2 conditions, when the above-grade terminal and below-grade rail terminal are both constructed and occupied.

Upon completion of Phase 2, Greyhound would move to the permanent boarding area located to the west end of the train mezzanine level, below the ground floor public customer service waiting and ticketing areas (See attached drawings A100 Refined LPA Illustrative Site Plan, and A101 Refined LPA Train Platform and Mezzanine Level Plans).

2. PROJECTED GREYHOUND BUS ACTIVITY

Projections of Greyhound activity during the weekday PM peak hour was based on *New Transbay Terminal Building Program Update, Section 6.0 Space Needs and Functional Requirements*. During the PM peak hour, there are projected to be a total of 111 inbound and 333 outbound passenger trips, results in a total of 444 passenger trips to and from the terminal. Assuming an average of 40 passengers per bus, there would be a maximum of 8 inbound and 8 outbound bus trips entering and exiting the terminal during the weekday PM peak hour.

3. PHASE 1 GREYHOUND OPERATIONS

The *Final EIS/EIR* assumed that the Temporary Terminal would be in operation for approximately five years while the new TC Building is under construction. When the new TC Building begins operation is was assumed that all bus operations at the Temporary Terminal would relocate to the TC Building, and the Temporary Terminal would be demolished.

Under the RLPA currently under consideration, following construction of Phase 1 all bus operators would relocate to the TC Building, with the possible exception of Greyhound. Under Phase 1 of the RLPA three location options are being considered for temporary Greyhound operations until a permanent location for Greyhound is constructed in Phase 2, including:

A) Greyhound Remaining for an extended period at the Temporary Terminal,
B) Relocating Greyhound to the AC Transit level in Phase 1 with scheduled sharing of bus berths with AC Transit, and
C) Relocating Greyhound to the western end of Phase 1 of the new TC Building at the ground floor level.

3.1 Relocating to the AC Transit Level

Relocating Greyhound operations to the AC Transit level in Phase 1 would not result in substantial changes to Greyhound bus operations or access as proposed in the *Final EIS/EIR*. Access to and from the Transbay Terminal Center building would still be via the ramps connecting with I-80 or through Bus Storage Link Ramps through the bus storage area at Third Street and Stillman Street, as anticipated in the certified *Final EIS/EIR*.

3.2 Remaining for an Extended Period at the Temporary Terminal until Phase 2 is complete

The *Final EIS/EIR* included a discussion of the construction impacts associated with the Transbay Project, which included the analysis the impact of the temporary terminal operations on the intersections in the vicinity of the temporary terminal. This analysis assumed that all buses using the existing Transbay Terminal would use local streets to gain access to their specified temporary terminals.

Two options for location of Greyhound operations at the Temporary Terminal are under consideration. Drawing A132 shows the option that would locate the Greyhound operations on Assessors Block 3738, bounded by Folsom, Beale and Fremont Streets, referenced in Figure 2.2.8 of the *Final EIS/EIR*. Drawing A142 shows another option currently under study that would locate Greyhound on Assessors Block 3739, bounded by Folsom, Main, Beale and Howard streets. To make room for Greyhound on this block, some AC Transit buses would move across the street to the block bounded by Folsom, Beale and Fremont Streets.

Drawing A413 shows an enlarged partial site plan of the concept shown in Drawing A142, with Greyhound operations on the center of Assessors Block 3739, with passenger access on Beale Street. Location of Greyhound as shown in Drawing A413 would be preferred if Greyhound would need to continue operations at the Temporary Terminal until Phase 2 is complete.

The street segment of Beale Street between Folsom and Howard Streets, and Main Street between Folsom and Howard Streets, would be converted to two-way traffic to allow bus loading zones and curbside public access at the Temporary Terminal. The contra-flow bus-only lane established on Folsom Street extending from Main Street to Essex Street and passing adjacent to the Temporary Terminal would remain as originally planned in the *Final EIS/EIR*. The contra-flow bus-only lanes would allow bus circulation and passenger bus stops on all four sides of the Temporary Terminal.

Access to the temporary terminal would be through Folsom and Howard streets for the option shown in Drawing A413, and from Folsom, Fremont and Beale streets for the option shown in Drawing A132. The analysis in the *Final EIS/EIR* assumed the provision of a westbound contra-flow lane on Folsom Street to serve primarily AC Transit and Greyhound buses traveling from the Temporary Terminal to the eastbound I-80 on-ramps at First and Essex streets. The intersection analyses for PM peak hour operations indicated that, in general, intersection operating conditions with the temporary terminal operations would be acceptable, except at the intersections of First/Folsom and Essex/Harrison which would operate at LOS F without and with the bus trips. It was determined that the traffic generated by the temporary terminal operations would not represent a considerable contribution to operations under existing conditions, and that there would be no significant traffic impacts at these intersections.

If Greyhound operations were to remain at the temporary terminal currently proposed for Greyhound operations for an extended period, the 8 inbound and 8 outbound bus trips during the PM peak hour would not substantially affect traffic operations. The number of Greyhound bus trips would be substantially fewer than the total number of bus trips analyzed in the *Final*

EIS/EIR for temporary terminal operations, and therefore the conclusion that there would be no severe traffic impacts would remain.

3.3 Temporarily Relocating Greyhound to the Western End of the Terminal at the Ground Floor Level

Under this option, Greyhound temporary operations during Phase 1 would be relocated to a dedicated curb area on Natoma Street as shown in Drawing A213. Natoma Street operates as a one-way eastbound alley, and buses would access Natoma Street from westbound Howard Street via a new driveway, and would leave Natoma Street to access First Street southbound at an unsignalized intersection. In this option, buses would travel to the I-80 on-ramp via First Street, and from the I-80 off-ramp via Fremont and Howard Streets.

As indicated above, the addition of 8 inbound and 8 outbound bus trips to the surface streets is not anticipated to contribute to significant worsening of operating conditions at nearby study intersections. It is likely that Greyhound buses would travel through intersections that would operate poorly (e.g., the intersection of First/Folsom Street to access I-80 eastbound), but the vehicle contribution would be minimal and the bus operations would not adversely affect traffic operating conditions.

4. PHASE 2 GREYHOUND OPERATIONS

The transportation analysis included in the *Final EIS/EIR* was conducted for future year 2020 conditions. As indicated in the *Final EIS/EIR*, the San Francisco County Transportation Authority (SFCTA) countywide travel demand forecasting model (SFCTA Model) was used to develop the travel forecasts for development and growth through the year 2020 in the region, as well as to determine the travel demand to and from the South of Market area (area roughly bounded by The Embarcadero, Market Street, South Van Ness Avenue and King Street).

The traffic impact analysis for the Transbay Project analyzed 27 study intersections in the South of Market area. Under 2020 Baseline plus Project and 2020 Cumulative conditions, the Transbay Project's contribution was considered significant at seven of the 27 study intersections. While improvements at individual intersections may reduce localized congestion somewhat, they may not mitigate operating conditions to less than significant levels. As a result of constraints at downstream intersections and the I-80/U.S. 101 on-ramps and mainline, mitigation measures for the seven intersections were not proposed and the impacts associated with the Transbay Project were considered significant and unavoidable.

Table 1 presents the year 2020 Cumulative operating conditions at intersections in the immediate vicinity of the Transbay Transit Center, and indicates whether that Transbay Project was determined to contribute to the significant adverse impacts at intersections operating at LOS E or LOS F conditions. Of the 13 study intersections in the vicinity of the Transbay Transit Center (and through which Greyhound buses may travel), 9 intersections would operate at LOS E or LOS F conditions, and the Transbay Project was determined to contribute to significant cumulative impacts at 4 of the 9 intersections.

Table 1
2020 Cumulative Conditions – Weekday PM Peak Hour
Intersection Operating Conditions and Project Impact Determinations

Study Intersection	Avg Delay per Vehicle / LOS	Project Impact Determination
Second/Mission	31.6 / D	–
First/Mission	> 60 / F	Significant Impact
Fremont/Mission	30.5 / D	–
Second/Howard	27.3 / D	–
First/Howard	> 60 / F	Significant Impact
Fremont/Howard	42.4 / E	Significant Impact
Second/Folsom	> 60 / F	Significant Impact
First/Folsom	> 60 / F	Not a Significant Impact
Fremont/Folsom	26.8 / D	–
Second/Harrison	> 60 / F	Not a Significant Impact
Essex/Harrison	> 60 / F	Not a Significant Impact
First/Harrison	> 60 / F	Not a Significant Impact
Fremont/Harrison	> 60 / F	Not a Significant Impact

Source: *Transbay Terminal/Caltrain Downtown Extension/ Redevelopment Project Final EIS/EIR,* March 2004 (Tables 5.19-3 and 5.19-4).

Under proposed Phase 2 operations, Greyhound buses would use surface streets to travel between the terminal at the train mezzanine level and either I-80 or U.S. 101, and would travel though some intersections identified above that would operate at LOS E or LOS F, and to which the Transbay Project was determined to contribute to significant impacts. The distribution of buses using I-80 versus U.S. 101 is not known. Buses accessing the driveway on Howard Street would travel from either the I-80 westbound off-ramp at Fremont Street, or from the I-80 eastbound (U.S. 101 northbound) off-ramp at the intersection of Fourth/Bryant. Buses traveling to the site from the different freeway off-ramps would use different streets, however, all inbound buses would travel through the intersection of Fremont/Howard which would operate at LOS E under 2020 Cumulative conditions, and which the Transbay Project would adversely impact. The addition of up to 8 bus tips through these intersections during the PM peak hour would not substantially change the results of the intersection LOS analysis in the *Final EIS/EIR*.

Howard Street between First and Second Streets contains four westbound travel lanes, and the intersection of Howard/Second is projected to operate at LOS D during the 2020 Cumulative weekday PM peak hour conditions. As noted above, up to 8 inbound bus trips would travel westbound on Howard Street and turn right into the driveway connecting to the below-grade Greyhound operations area within the TC Building. The arrival of 8 buses during the PM peak hour would not result in substantial queuing into the driveway, as this driveway would only serve Greyhound buses.

Buses leaving the terminal would be required to turn right onto Howard Street westbound. The driveway would be located about 250 feet east of the intersection of Second/Howard, which

would provide a sufficient merge distance for buses continuing westbound on Howard Street or turning left onto Second Street southbound. The addition of up to 8 outbound bus trips during the PM peak hour would not substantially affect operations at the intersection of Second/Howard (projected to operate at LOS D under 2020 Cumulative conditions), and would not substantially increase traffic volumes at intersections operating at LOS E or F under the 2020 Cumulative conditions.

It should be noted that a bicycle lane is located on the north side of Howard Street, and the new driveway access would increase the potential for conflicts between bicyclists and buses. The driveway would only serve Greyhound operations, which would therefore limit the potential for increased conflicts, and Greyhound operations on Howard Street would not result in significant impacts to bicyclists.

Second Addendum to the
Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project
Final Environmental Impact Statement/Environmental Impact Report
(SCH #95063004)

In April 2004, the Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project FEIS/EIR (SCH #95063004) was certified by the City and County of San Francisco, the Peninsula Corridor Joint Powers Board, and the San Francisco Redevelopment Agency. A first addendum to the FEIS/EIR (dated May 25, 2006) was adopted by the TJPA Board on June 2, 2006 pursuant to the Section 15164 of the Guidelines implementing the California Environmental Quality Act (CEQA), Public Resources Code sections 21000 *et seq.*[2] This document constitutes the second addendum to the FEIS/EIR pursuant to the Guidelines, Section 15164.

The proposed Refined LPA (RLPA) for the Caltrain Downtown Extension (DTX) Project (hereinafter, "DTX RLPA") (shown in Figure 1 attached hereto) consists of the following changes to the LPA:

- Two track lead on the surface and below ground leading to the DTX tunnel system to just before the Fourth and Townsend Streets underground station;
- Three tracks beginning at the Fourth and Townsend Streets underground station and continuing to the throat section approaching the Transbay Transit Center where the three track system splays out to six tracks to accommodate the six platform berthing locations within the station;
- At-grade rail car storage within the existing Caltrain rail storage yard rather than underground storage, which would reduce the amount of underground construction associated with the project and would not significantly change the existing use of the rail storage area;
- Design provisions to allow for a future connection to the cut and cover tunnel on Townsend Street that will facilitate construction of future system capacity for both Caltrain and High Speed Rail (HSR), and will be capable of accommodating the construction of a future Townsend Street/Embarcadero/Main Street loop with minimal disruption to ongoing rail service; and
- Delay in construction of the tail tracks, pending the outcome of future planning studies related to accommodating HSR and optimizing concurrent Caltrain and HSR operations, which would reduce the amount of underground construction within the project footprint analyzed in the FEIS/EIR at this time.

All of the changes proposed in the DTX RLPA would consist of a reduction in the size of various elements of the DTX project or rearrangement of uses within the project area previously analyzed in the FEIS/EIR, and would not change the magnitude of the environmental impacts disclosed in the FEIS/EIR. As described in the FEIR/EIS, Table 5.20-3, Pg 5-163, the approved LPA includes cut and cover construction along Townsend Street between Fourth and Fifth Streets up to Second Street.

[2] The CEQA Guidelines are found at California Code of Regulations, title 14, sections 15000 *et seq.*

Therefore, the DTX RLPA would not require major revisions to the FEIS/EIR due to new or substantially increased significant environmental effects. Furthermore, there have been no substantial changes with respect to the circumstances under which the DTX RLPA would be undertaken that would require major revisions of the FEIS/EIR due to new or substantially increased significant environmental effects; and there has been no discovery of new information of substantial importance that would trigger or require major revisions to the FEIS/EIR due to new or substantially increased significant environmental effects. Therefore, no subsequent or supplemental environmental impact report is required prior to approval of the DTX RLPA.

Figure 1: Refined Locally Preferred Alternative (RLPA)

Third Addendum to the Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project Final Environmental Impact Statement/Environmental Impact Report (SCH #95063004)

INTRODUCTION

In April 2004, the Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project FEIS/EIR (SCH #95063004) was certified by the City and County of San Francisco, the Peninsula Corridor Joint Powers Board, and the San Francisco Redevelopment Agency.

1. A first addendum to the FEIS/EIR (dated May 25, 2006) was adopted by the TJPA Board on June 2, 2006, pursuant to Section 15164 of the Guidelines implementing the California Environmental Quality Act (CEQA), Public Resources Code sections 21000 *et seq*., describing modifications to the Transbay Transit Center design and construction staging and revisions to the Temporary Terminal site plan.
2. A second addendum to the FEIS/EIR, pursuant to the Guidelines, Section 15164, describing refinements to the Locally Preferred Alternative (hereinafter, RLPA) for the Caltrain Downtown Extension Project (DTX), including design provisions that are capable of allowing construction of a future Townsend/Embarcadero/Main loop track and delay in the timing of construction of tail tracks on Main Street pending the outcome of future rail planning studies to accommodate California High-Speed Rail. The second addendum was adopted by the TJPA Board on April 19, 2007.

DESCRIPTION OF THIRD ADDENDUM

This third addendum to the FEIS/EIR describes modifications to the acquisition of one private property identified in the Final EIS/EIR for acquisition. The property is required for construction staging and is identified in Figure 1.

546 Howard Street (Block 3721, Lot 16)**:**

The property at 546 Howard Street, identified on page 5-22 of the Final EIS/EIR for partial acquisition, will be needed in its entirety for construction staging. As a result, the entire property would be acquired.

The property at 546 Howard is currently an undeveloped lot used for surface parking. The acquisition of the entire lot would remove more surface parking than would the partial property acquisition. The San Francisco Planning Code section 161(c), however, does not require the provision of off-street parking for any use in the downtown, in light of the compact and congested nature of the area. Moreover, the removal of surface parking is not considered a significant physical impact on the environment under CEQA. The full acquisition would not substantially change the severity or significance of the environmental

impacts disclosed in the Final EIS/EIR. Therefore, the acquisition of 546 Howard in its entirety would not require major revisions to the Final EIS/EIR due to new or substantially increased significant environmental effects because of substantial changes in the project, substantial changes with respect to the circumstances under which the RLPA would be undertaken, or significant new information.

The 546 Howard property is located immediately adjacent to the existing bus ramp connecting the Transbay Terminal building to the Bay Bridge. At the time that the FEIS/EIR was prepared, there was a one-story building on the property, which has since been demolished by the owner. The demolition permit was filed on November 9, 2001 (Permit Application No. 200111092798), a permit was issued on August 5, 2004, and final inspection of the demolition was approved on September 29, 2004. The FEIS/EIR Table 5.2-1 and Figure 5.2-3 identify the parcel for partial acquisition, stated as a "(f)ew feet from northeast corner of building." The partial acquisition was needed to support work in demolishing the existing bus ramp and for construction of the new facilities. Construction planning indicates that the full parcel is needed during demolition for placement of contractor equipment, such as cranes, to remove the structural members of the existing bus ramps. Following demolition of the existing bus ramp, the parcel is needed to serve as field offices, lay down areas and other construction-related staging uses required for construction of the new Transbay Transit Center.

Conclusion

The removal of surface parking that will occur with the acquisition of 546 Howard Street is not considered a significant environmental impact. The acquisition of this property would not substantially change the severity or significance of the environmental impacts disclosed in the FEIS/EIR.

Therefore, the acquisition of property described in this addendum would not require major revisions to the FEIS/EIR due to new or substantially increased significant environmental effects. Furthermore, there have been no substantial changes with respect to the circumstances under which these property acquisitions would be undertaken that would require major revisions of the FEIS/EIR due to new or substantially increased significant environmental effects; and there has been no discovery of new information of substantial importance that would trigger or require major revisions to the FEIS/EIR due to new or substantially increased significant environmental effects. Therefore, no subsequent or supplemental environmental impact report is required pursuant to CEQA Guidelines sections 15162 and 15163 prior to approval of the acquisition of property as described in this addendum.

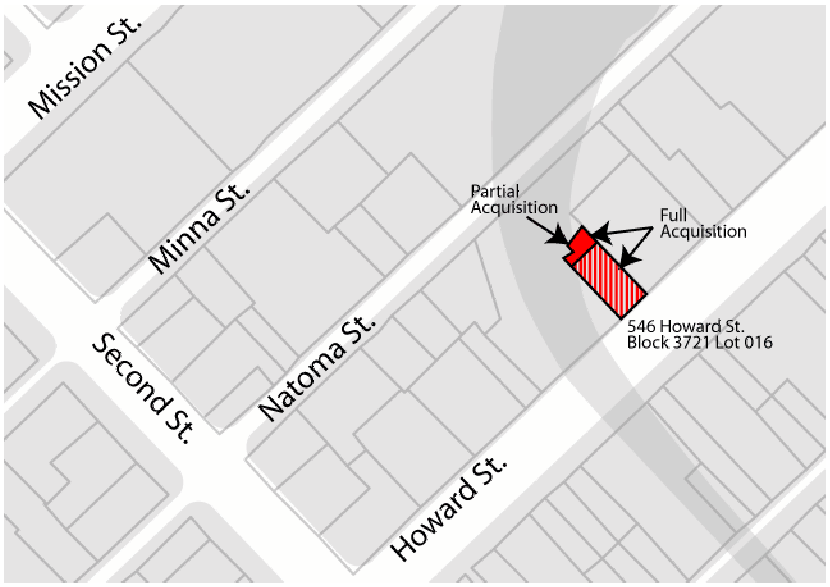

Figure 1 Location of 546 Howard Street, San Francisco, CA

Fourth Addendum to the Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project Final Environmental Impact Statement/Environmental Impact Report (SCH #95063004)

INTRODUCTION

In April 2004, the Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project FEIS/EIR (SCH #95063004) was certified by the City and County of San Francisco, the Peninsula Corridor Joint Powers Board, and the San Francisco Redevelopment Agency.

Pursuant to Section 15164 of the guidelines implementing the California Environmental Quality Act (CEQA), the following addenda to the FEIS/EIR have been prepared.

- A first addendum to the FEIS/EIR identified modifications to the Transbay Transit Center design and construction staging and revisions to the Temporary Terminal site plan. The first addendum was adopted by the Transbay Joint Powers Authority (TJPA) Board of Directors on June 2, 2006.

- A second addendum revised the Locally Preferred Alternative for the Caltrain Downtown Extension Project (DTX), including design revisions to allow future construction of a Townsend/Embarcadero/Main Loop and to allow a delay in construction of tail tracks on Main Street pending the outcome of future rail planning studies to accommodate California High-Speed Rail. The second addendum was adopted by the TJPA Board on April 17, 2007.

- A third addendum amended the list of properties identified for full acquisition to include 546 Howard Street, which was identified in the FEIS/EIR for partial acquisition. The third addendum was adopted by the TJPA Board on January 17, 2008.

This document constitutes the fourth addendum to the FEIS/EIR.

SUMMARY DESCRIPTION OF FOURTH ADDENDUM

The fourth addendum describes proposed modifications to the Temporary Terminal (referred to as the Revised Temporary Terminal). As indicated on page 2-21 of the FEIS/EIR, the Temporary Terminal is an interim surface facility that would replace the Transbay Terminal during its demolition and reconstruction. Beginning in 2009, all buses currently serving the Transbay Terminal would use the Temporary Terminal until the new building and bus ramps are reconstructed. As indicated in the FEIS/EIR, the structures will be removed as soon as bus operations are relocated to the Transit Center, and the land can be developed for multistory residential buildings and a park.

Although the purpose and function of the Temporary Terminal remains as stated in the FEIS/EIR, pursuant to the proposed project revisions, the configuration of the terminal, boarding platforms and waiting areas, bus staging areas, and street design has changed. Instead of being located on two adjacent blocks, the Revised Temporary Terminal will be confined to one block, bounded by Howard, Main, Folsom, and Beale streets. The Revised Temporary Terminal will contain AC Transit and Greyhound operations in separate operating areas and facilities (**Figure 1**).

The consolidated operation of buses onto one block requires the reconfiguration of the bus operating areas and circulation patterns described in the FEIS/EIR (pages 2-21 and 5-184). In the revised scenario, AC Transit uses a center boarding facility that contains a 1,030-square-foot office building and a 700-square-foot security office in a landscaped plaza in the northern portion of the block. The temporary structures, which would be demolished when the Temporary Terminal ceases operation, have shallow foundations and minimal (14-foot) heights. The AC Transit area contains 18 bus bays, 17 designated for AC Transit and 1 for WestCAT. The bus bays are sheltered by overhead canopies. Appropriate signage, ticketing kiosks, transit information, bike racks, restrooms, and waste receptacles accompany the boarding areas. Newly established utility lines that serve the bus facilities connect with existing lines along and under the surrounding streets. A two-way circulation area for buses surrounds the center boarding facility. Three specially designated walkways connect the perimeter of the block with the center boarding facility. As indicated in the FEIS/EIR, all pedestrian access and passenger facilities meet the requirements of the Americans with Disabilities Act. Landscaping is included at key points along the block perimeter.

The south end of the block bordering Folsom Street contains Greyhound operating facilities including an 8,550–square-foot office structure with ticketing, waiting area, restroom, baggage, and trash facilities. Similar to the AC Transit facilities, the temporary structure has a low elevation (16 feet) and shallow foundations, and is serviced by utility lines extending from the street right-of-way. Greyhound uses 8 bus bays sheltered by 28-foot canvas canopies. An exclusive 190-foot-long passenger pick-up and drop-off lane is located in front of the Greyhound building off Folsom Street.

Access to the AC Transit and Greyhound boarding areas is provided mid-block along Beale Street (refer to **Figure 1**). All buses exit on Folsom Street on the east end of the block adjacent to a staging area for SamTrans buses. SamTrans also has staging areas along the north side of Folsom Street between Beale and Essex streets; these staging areas are shared with the Caltrans bike shuttle.

Boarding areas on the curbside of the surrounding blocks have also been modified from those described in the FEIS/EIR (page 2-21). In the revised scenario, SamTrans and Golden Gate Transit have separate staging areas on the east side of Main Street (refer to **Figure 1**). They share a boarding area, including a passenger shelter on the sidewalk, along Main near Howard Street. Across the street, Muni has a staging area and a boarding island that separates two lanes of northbound traffic from a bus lane on the west side of the street. Additional stops for Golden Gate Transit are located on the north side of Howard Street at Fremont Street and for Muni along Howard Street in front of the Temporary Terminal. Muni is also allotted stops along the east side of Main Street north of Howard Street and the west side of Beale Street, and a boarding island on Beale Street just south of Howard Street. Muni shares the west side of Beale Street with carpool pick-up. Paratransit services are designated along the south curb on Howard Street.

The proposed project revisions would add bus lanes on Howard Street (eastbound direction) and would modify bus lanes on Beale Street to allow travel in both southbound and northbound directions between Howard and Folsom streets. Immediately north of Howard Street, Beale Street is redesigned to accommodate two bus lanes on the east side of the street and one lane on the west side with traffic confined to the two center lanes. The reconfigured bus lanes facilitate bus turning movements onto Howard and circulation into the bus lane on Beale Street south of Howard Street.

As indicated in the FEIS/EIR (page 2-23), buses coming off the Bay Bridge use the Harrison Street off-ramp to access the Temporary Terminal via Fremont Street, Folsom Street, and the bus lane on the east side of Beale Street. Fremont Street south of Folsom Street includes a PM peak tow-away lane on the east side of the street to allow AC Transit bus staging. Additionally, Folsom Street has a left turn pocket for Golden Gate and SamTrans bus movements onto Fremont Street. For outbound buses traveling between the Temporary Terminal and the Bay Bridge, buses depart the terminal on Folsom Street and use the Folsom Street westbound bus lane to reach Essex Street. Along Essex Street, buses continue in the southbound bus lane to reach the Bay Bridge on-ramp (refer to **Figure 1**). Bus lanes operating against the flow of traffic on these streets are in designated contra-flow lanes.

Additional modifications in the revised scenario include a PM peak bus staging area for AC Transit in one eastbound lane of Folsom Street between Fremont and Beale streets, and signal modifications along Folsom Street at First, Fremont, Beale, and Main streets and along Howard at Beale and Main streets to facilitate bus movement. **Table 1** compares the street and bus travel lane modifications for the Temporary Terminal described in the FEIS/EIR with those in the revised scenario.

Table 1, Comparison of Travel Lane Configurations – FEIS/EIR versus Revised Temporary Terminal Analysis

		FEIS/EIR (a)		Revised Temporary Terminal (b)	
	Existing (1)	Eastbound/ Northbound (eb/nb)	Westbound/ Southbound (wb/sb)	Eastbound/ Northbound (eb/nb)	Westbound/Southbound (wb/sb)

ENVIRONMENTAL ISSUES

Land Use, Wind, and Shadow

The Revised Temporary Terminal provides the beneficial land use impacts described in the FEIS/EIR (pg. 5-2), including the intensification of land uses, the freeing of land for development, and enhanced pedestrian circulation. Confining the Temporary Terminal to one block rather than two allows earlier development of the unused block according to guidelines specified in the Redevelopment Plan (FEIS/EIR pg. 2-44), and included in the analysis of the Redevelopment Plan in Section 5.1.1.3 of the FEIS/EIR, pg 5-5.

Development of the block where the Temporary Terminal is located will occur as described in the Redevelopment Plan. The small, temporary structures housing AC Transit and Greyhound offices and passenger facilities are low-lying structures that would not alter the wind and shadow analysis in the FEIS/EIR (pg 5-13 and 5-18).

Displacements and Relocations

The acquisition of 272 Main Street to construct the Temporary Terminal would remain as indicated on pg 5-22 and 5-33 of the FEIS/EIR. No other properties would be acquired for the Temporary Terminal.

Socio-economics

The beneficial socio-economic impacts resulting from the increased activity and economic vitality generated by the project would remain as described in the FEIS/EIR (pg. 5-35).

Community Facilities and Services/Safety and Security

The Revised Temporary Terminal includes specially designated pedestrian walkways and lighting standards that enhance and integrate pedestrian circulation onto one block. The Safety and Security guidelines in the FEIS/EIR (pg. 5-122) remain applicable to the Terminal facilities constructed on one block. Consolidation of the Terminal facilities does not alter the findings in the FEIS/EIR that no additional staff or public service capacity is required to respond to emergencies in the area.

Parklands/Schools/Religious Institutions

The Revised Temporary Terminal does not alter the finding in the FEIS/EIR (pg. 5-44 and 5-45) that no long-term adverse impact would occur to parks, schools, and religious institutions, as none of these types of facilities is located on or adjacent to the Temporary Terminal site. The parkland designated for the mid-block area of the site in the Redevelopment Plan would be constructed after bus operations are moved to the Transit Center and development of the block occurs.

Air Quality

The consolidation of Temporary Terminal facilities onto one block is not expected to alter the mode split of regional vehicle-miles traveled as forecasted in the FEIS/EIR (pg. 5-54). As a result, the air quality benefits identified in the FEIS/EIR occur for the Revised Temporary Terminal as well. Temporary Terminal construction activities that generate dust or construction equipment emissions are reduced to a less-than-significant level employing the mitigations described in the FEIS/EIR.

Noise and Vibration
The FEIS/EIR (pg. 5-74) found no long-term adverse noise impacts associated with the Transbay Transit Center or bus operations, including the Temporary Terminal. This conclusion remains unchanged for the Revised Temporary Terminal because there are no changes in the location or nature of Temporary Terminal operations. Noise and vibration impacts generated by construction activities are reduced by the mitigation measures identified in the FEIS/EIR.

Geology and Seismology
The low-lying temporary structures on the Temporary Terminal site are designed according to the San Francisco Building Codes that make construction of these facilities effective in minimizing risk from earthquakes and geologic conditions. As a result, no seismic or geologic impacts associated with the construction and operation of the Revised Temporary Terminal are expected.

Water Resources and Floodplains
No long-term adverse impacts on water resources and floodplains were identified in the FEIS/EIR. Consolidating the Temporary Terminal onto one block does not change the risk of impact to water resources or floodplains from that described in the FEIS/EIR (pg. 5-80).

Utilities and Energy
The Revised Temporary Terminal would be served by connecting to existing utility lines that traverse the perimeter of the site. Fewer connections are required to serve the terminal on one block instead of two. However, the reduction in utility service connections, relative to the entire project, is negligible and does not alter the need for new utility service connections or energy use as indicated in the FEIS/EIR (pg. 5-81 and 5-126). As a result, the findings on utilities and energy in the FEIS/EIR are the same for the Revised Temporary Terminal, including no substantial increase in the demand for energy or water by the project.

Historic and Cultural Resources
The construction of the Revised Temporary Terminal may uncover archaeological resources. The consolidated footprint confines the possible discovery of artifacts to one block rather than two. The same procedures for recovery identified in the FEIS/EIR (pg. 5-86 to 5-89) apply to the Revised Temporary Terminal. In addition, the Revised Temporary Terminal, like the originally approved plan for the Temporary Terminal, would continue to require removal of the loop bus ramp leading into the existing Transbay Terminal. The bus ramp is designated as a National Historic Resource and, as indicated in the FEIS/EIR (pg.5-90), its removal is considered an adverse impact.

Hazardous Materials
If hazardous materials are encountered during construction of the Revised Temporary Terminal, they will be handled as indicated in the FEIS/EIR (pg. 5-111), i.e., in conformance with California Occupational Safety and Health Administration and local ordinance procedures. The potential to encounter hazardous materials is slightly reduced by the consolidated footprint of the Revised Temporary Terminal.

Visual and Aesthetic
The Revised Temporary Terminal incorporates landscape treatments on the AC Transit center area and around the perimeter of the block along the pedestrian realm, which is a beneficial impact. The low-lying structures, less than 18 feet tall, are confined to one block and do not alter the visual context produced by the towering buildings surrounding the site. As stated in the

summary of this addendum and in the FEIS/EIR, the structures will be removed as soon as bus operations are relocated to the Transit Center, and the land can be developed for multistory residential buildings and a park.

Transportation

Traffic

Temporary Terminal in the FEIS/EIR. The FEIS/EIR analyzed the impacts of Temporary Terminal operations at seven study intersections (Folsom/Main, Folsom/Beale, Folsom/Fremont, Folsom/First, Folsom/Essex, Harrison/Fremont, and Harrison/Essex). The operations of these intersections were analyzed for weekday PM peak hour conditions for 2006, the year that the Temporary Terminal was anticipated to begin operations. The operating conditions were analyzed without and with the Temporary Terminal. The San Francisco Planning Department examines the level of service (LOS) to determine impact. If intersections operate at LOS E or F (representing adverse traffic operations), additional analysis of the volume contribution of the project compared with cumulative traffic volumes without the project is conducted to determine whether the project would contribute considerably to the cumulative traffic increase (FEIS/EIR, pg. 5-140).

The analysis was conducted using a VISSUM micro-simulation traffic operations model. The analysis indicated that without and with the terminal, two intersections (**Folsom/First** and **Harrison/Essex**) would operate at unacceptable level of service (LOS) conditions (i.e., LOS E or LOS F). The contribution of the Temporary Terminal to the poor operating conditions at these intersections was determined to be less-than-significant; therefore, Temporary Terminal operations were determined to not result in any significant traffic impacts.

Revised Temporary Terminal. The operation of the Revised Temporary Terminal and the potential impact to adjacent streets associated with lane configuration to provide exclusive bus lanes between the Temporary Terminal and the Bay Bridge was analyzed using a VISSUM micro-simulation traffic operations model (Fehr and Peers, Transbay Terminal – Temporary Terminal Transportation Operations Report, March 2008). The model analyzed weekday PM peak hour conditions at 25 study intersections in the vicinity of the Temporary Terminal. Table 2 presents the analysis of 11 critical intersections, including a comparison of the weekday PM peak hour LOS at seven intersections studied in the FEIS/EIR and also analyzed for the Revised Temporary Terminal. Four additional intersections that are expected to operate at LOS E under the revised scenario are also included.

The intersections of Folsom/Main, Folsom/Beale, Folsom/Fremont, and Harrison/Fremont would operate at LOS D or better with the Revised Temporary Terminal.

Operations at the intersections of Howard/Beale and Folsom/Essex with the reconfiguration of roadways and Revised Temporary Terminal operations would improve from LOS E conditions without the terminal to LOS D conditions with the terminal. As a result, the Revised Temporary Terminal would not result in project-specific impacts to traffic operations at these six intersections.

Table 2, Comparison of Intersection LOS Weekday PM Peak Hour Conditions – FEIS/EIR versus Revised Temporary Terminal Analysis

Intersection	FEIS/EIR			2007 Revised Temporary Terminal (3)		FEIS/EIR versus Revised Temporary Terminal
	Existing (1)	EIR Temporary Terminal (2)				
	2001	2006	with Terminal	2007	with Terminal	Impact Determination
Howard/Beale	C			**E**	D	no impact
Howard/First	D			**E (70)**	**E (70)**	no impact
Folsom/Main	B	B	D	B	A	no impact
Folsom/Beale	B	B	B	B	B	no impact
Folsom/Fremont	B	B	B	B	C	no impact
Folsom/First	**F**	**F**	**F**	**E (59)**	**E (64)**	no significant contribution
Folsom/Essex			C	**E**	D	no impact
Harrison/Fremont	D	B	B	D	D	no impact
Harrison/First	**F**			**E (64)**	**E (63)**	no impact
Harrison/Essex	**F**	**F**	**F**	**E (70)**	**E (77)**	no significant contribution
Harrison/Second	**E**			**E (76)**	**E (76)**	no impact

LOS (delay in seconds per vehicle), **BOLD** letters represent intersections operating at LOS E and LOS F, City significance criteria for congested conditions.
Source:
(1) FEIS/EIR Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project, June 2004, Table 3.2-1
(2) FEIS/EIR Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project, June 2004, Table 5.21-1
(3) Transportation Operations Report Transbay Terminal Temporary Terminal Project, March 2008

Under the revised scenario, the intersections of Howard/First, Harrison/First, and Harrison/Second would operate at LOS E conditions both without and with the Revised Temporary Terminal. As a result, the contribution of the Revised Temporary Terminal to the LOS E operating conditions would not be considered significant, and the Revised Temporary Terminal would not result in any project-specific impacts to intersection operations.

The intersections of Folsom/First and Harrison/Essex would also operate at LOS E conditions both without and with the Revised Temporary Terminal.

- At the intersection of Folsom/First, the traffic volume served under both without and with the Revised Temporary Terminal would be less than the existing demand; however, the volumes served would be similar for both conditions (within 1 percent of the total volume served).
- At the intersection of Harrison/Essex, under existing conditions (without the Temporary Terminal), the volume served in the VISSUM microsimulation model is more than the demand. The volume served under existing conditions would be less than without the terminal volume served, but very close to the existing demand (within 2 percent of the total intersection demand volumes).

An examination of the traffic volumes at the intersections of Folsom/First and Harrison/Essex, without and with the Revised Temporary Terminal, indicates that the difference in volume between operations without the terminal and operations with the terminal would be minimal, would not change the LOS, and would be within the daily variation in traffic volumes. Therefore, the project contribution to the LOS E conditions would not be considered significant, and the Revised Temporary Terminal would not result in any project-specific impacts to vehicle operations at these intersections.

Transit

The study of bus operations along the streets surrounding the terminal and within the terminal using a VISSUM micro-simulation traffic operations model concludes that the Revised Temporary Terminal traffic and bus lane configuration and consolidation of passenger boarding and waiting facilities does not impede bus operations (Fehr and Peers, March 2008). The terminal would accommodate the existing service levels provided in the existing Transbay Terminal. Sufficient capacity exists to accommodate peak period staging and the boarding of buses, although occasional delays may occur for buses that must wait for space to become available in the boarding area.

Pedestrian

The pedestrian environment at the Revised Temporary Terminal site will be enhanced by designated walkways connecting the perimeter of the block with the center boarding facilities. Landscaping and redesigned sidewalks will also improve the pedestrian realm. Consolidating transit operations onto one block will provide pedestrians moving between bus boarding areas with a safer and more conducive environment for accessing transit, a beneficial impact.

Parking

As indicated in the FEIS/EIR, curbside parking would be removed around the perimeter of the Temporary Terminal. The removal of curbside parking would not change under the revised scenario. As the FEIS/EIR concluded, the minor reduction in the downtown parking supply is not considered a significant impact under the City's applicable transportation policies.

In summary, the reconfiguration of the street system to support the Revised Temporary Terminal conditions and the Temporary Terminal bus operations would not result in significant traffic, transit, pedestrian, or parking impacts.

ENVIRONMENTAL FINDINGS

Based on the above information and analysis, the proposed revisions to the Temporary Terminal will not trigger the need for subsequent environmental review pursuant to Public Resources Code Section 21166 and Section 15162 of the CEQA guidelines. The proposed changes to the Temporary Terminal described in this addendum would not change the magnitude of the environmental impacts disclosed in the FEIS/EIR, but would provide the following environmental benefits.

- Reduced area required for Temporary Terminal operations and the availability of the unused portion of the site for planned development to support the financing of the project earlier than envisioned in the FEIS/EIR
- Reduced risk of uncovering hazardous materials or archaeological artifacts during construction of the Temporary Terminal, due to the consolidation of bus operation to one instead of two blocks
- Reduced utilities and public service infrastructure to support Temporary Terminal operation
- Improved bus circulation and access to the Bay Bridge through additional bus lanes and bi-directional lanes to facilitate bus movement to and from the Bay Bridge ramps
- Improved intersection operation from LOS E conditions without the Temporary Terminal to LOS D conditions with the Temporary Terminal at the intersections of Howard/Beale and Folsom/Essex, due to the reconfiguration of roadways and consolidation of bus operations
- Improved pedestrian realm created by designated and well-lighted walkways, landscaped and redesigned sidewalk areas, and more safe and convenient transfers between bus boarding areas
- Improved waiting areas and public facilities at the AC Transit and Greyhound boarding areas

The revisions to the Temporary Terminal described in this addendum would not require major revisions to the FEIS/EIR due to new or substantially increased significant environmental effects. Furthermore, there have been no substantial changes with respect to the circumstances under which these modifications would be undertaken that would require major revisions of the FEIS/EIR due to new or substantially increased significant environmental effects; and there has been no discovery of new information of substantial importance that would trigger or require major revisions to the FEIS/EIR due to new or substantially increased significant environmental effects. Therefore, no subsequent or supplemental environmental impact report is required prior to approval of the revisions to the Temporary Terminal configuration and design as described in this addendum.

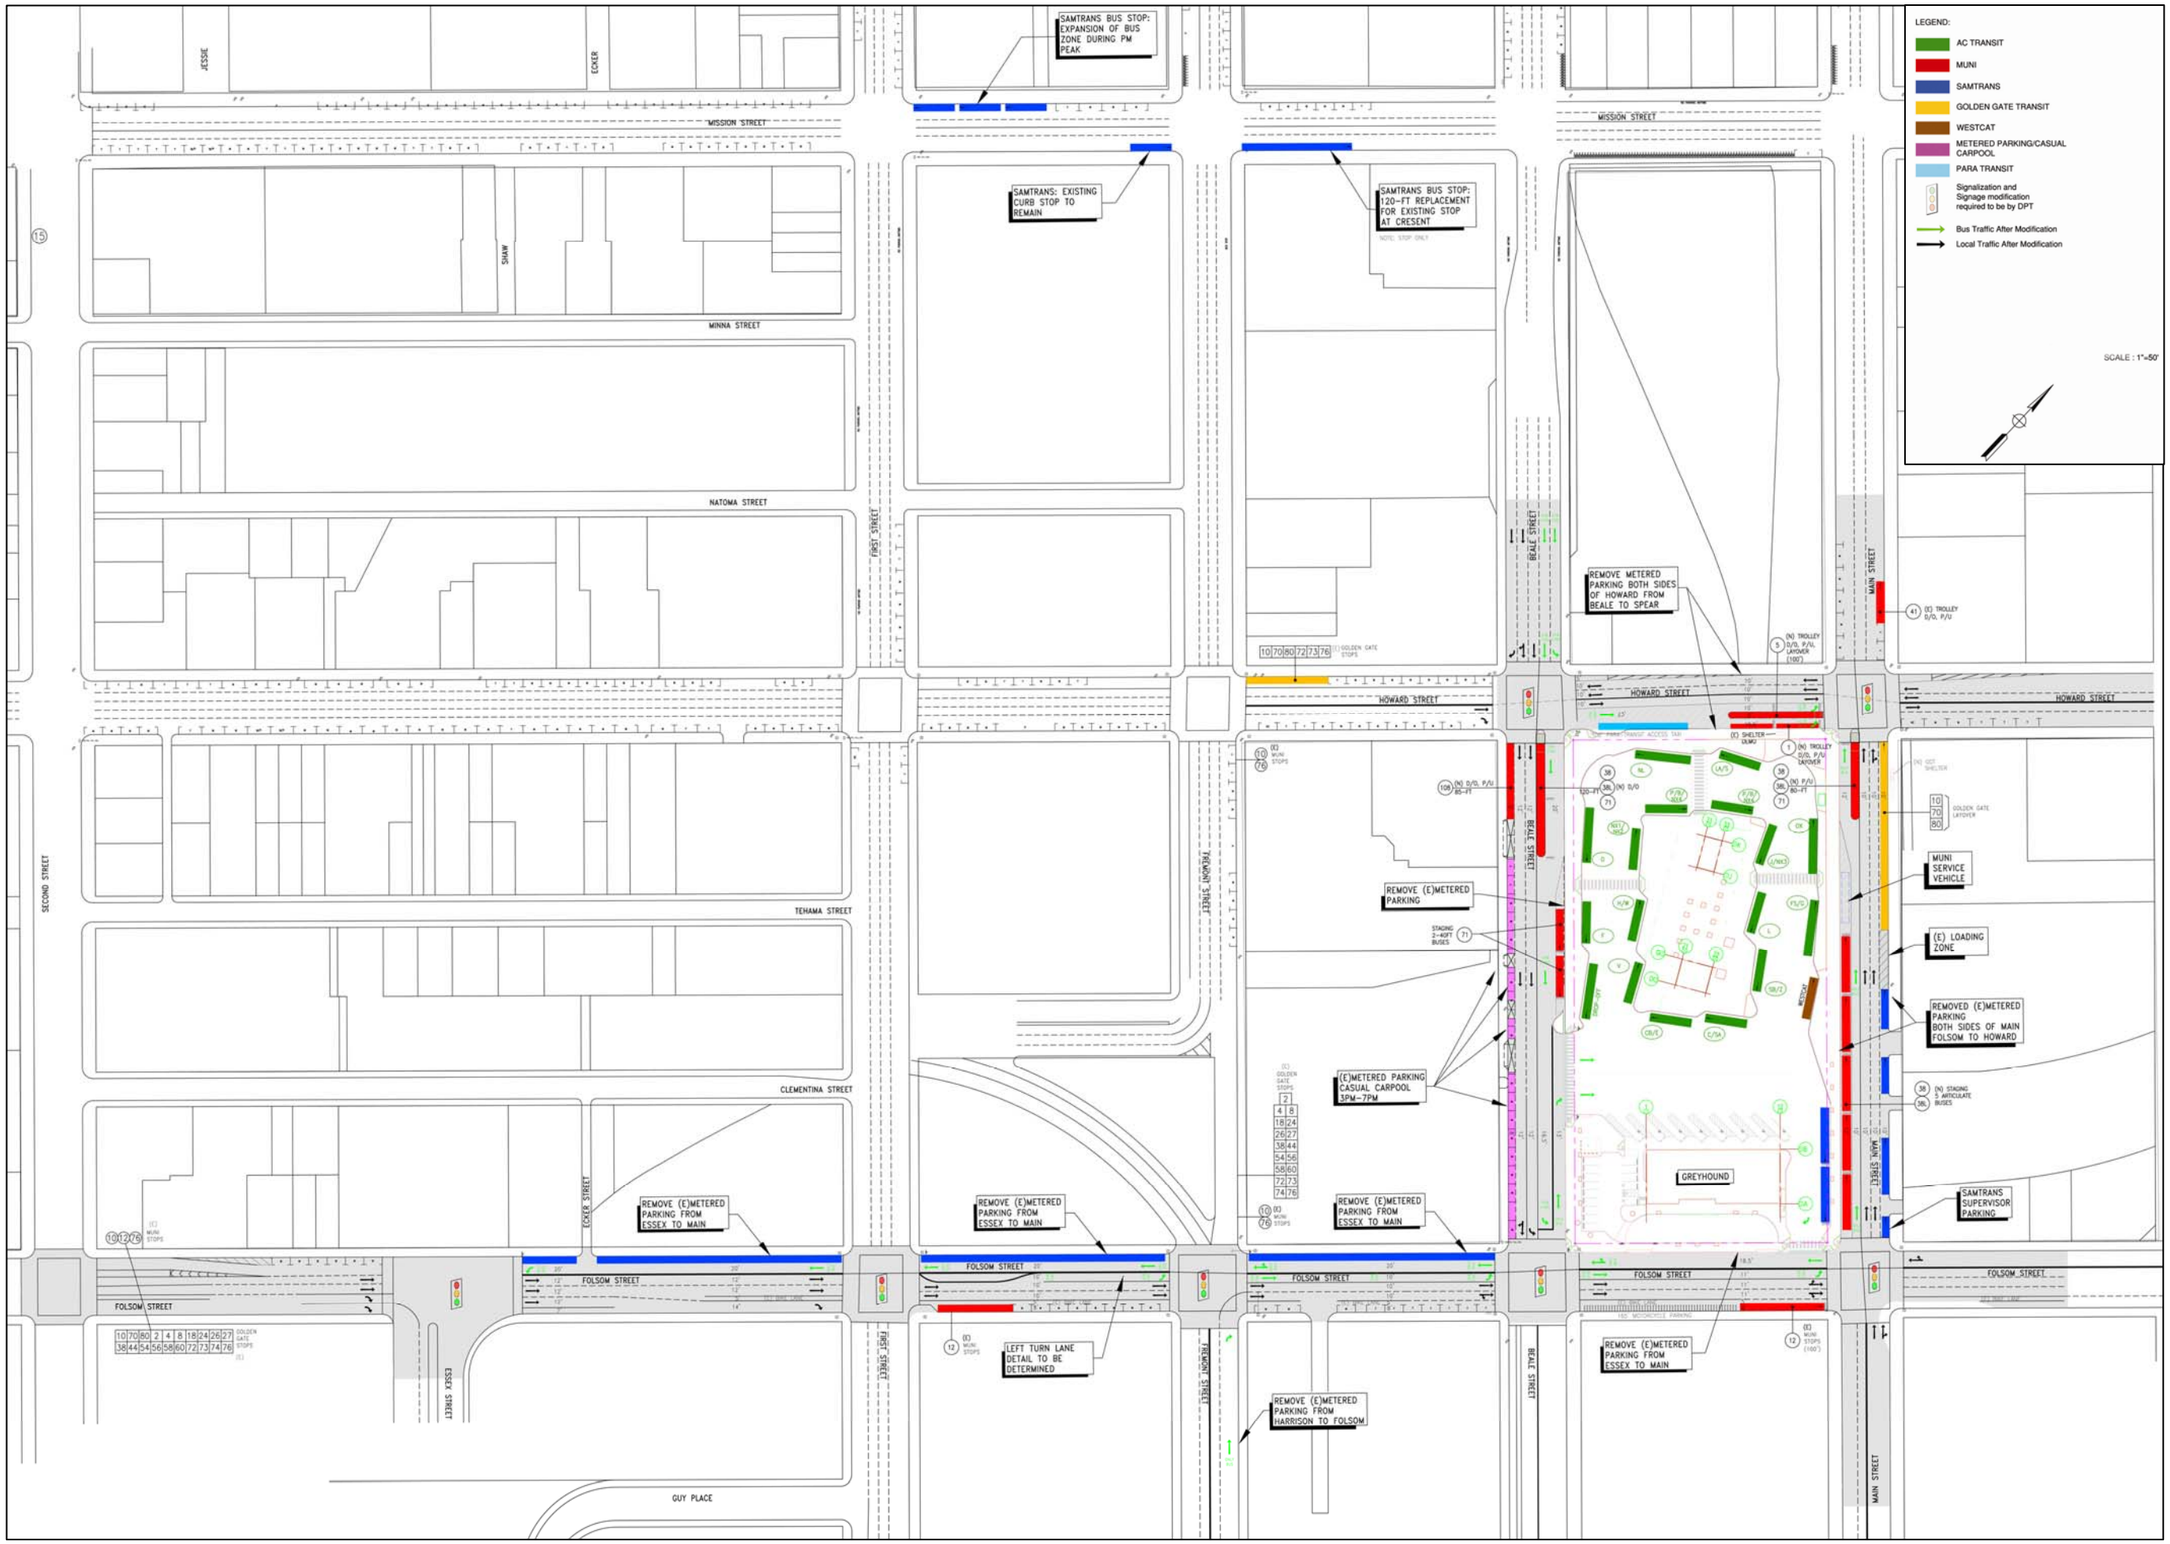

Figure 1, Revised Temporary Terminal Configuration and Off-site Traffic Circulation and Lane Configuration Plan

THIS STAFF REPORT COVERS CALENDAR ITEM NO.: 11
FOR THE MEETING OF: April 9, 2009

TRANSBAY JOINT POWERS AUTHORITY

BRIEF DESCRIPTION:

Requesting that the Board: (1) adopt a Fifth Addendum to the Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project FEIS/EIR for public right-of-way vacations for the Transit Center and its design modifications; and (2) authorize the Executive Director to submit a public right-of-way vacation application to the City and County of San Francisco to vacate those areas required for the Transit Center, including the design modifications.

REPORT:

Transit Center Design Modifications

In 2004, the TJPA Board of Directors approved the Transbay Program Locally Preferred Alternative. The Locally Preferred Alternative included, among other things, the new Transit Center and associated structures, such as bus ramps connecting I-80 to the Transit Center, the train box, bus deck bridges, and utility relocations (collectively, the "Transit Center"). Based on the results of the Design Competition and refinement of the design of the Transit Center, certain modifications to the Transit Center design have occurred, specifically (1) the addition of above-ground outer wall basket structures, and (2) the possible addition of a pedestrian bridge over Beale Street (the "Design Modifications").

Public ROW and Vacations

The Transit Center, including the Design Modifications, will need to occupy portions of the public ROW. Public streets and sidewalks are owned by the City and County of San Francisco as a public right of way ("ROW"). The public ROW includes those areas above and below public streets and sidewalks.

In particular, the Transit Center will need to occupy the following:

- Air space for the Transit Center outer wall basket structures over Minna, Natoma, and Beale Streets.
- Air space for the proposed pedestrian bridge over Beale Street.
- Air space for the Transit Center bus deck bridges over First and Fremont Streets.
- Below ground for the train boxes under Minna, Natoma, First, and Fremont Streets.
- Air space for the bus ramps connecting the Transit Center to I-80 where the bus ramps cross over Natoma, Howard, Tehama, Clementina, Folsom, First and Harrison Streets.

The TJPA must apply to the City to vacate the public ROW in those areas that need to be occupied by the Transit Center. The City has agreed that the TJPA's vacation application can roughly describe some of the areas to be vacated, with the understanding that final dimensions will be captured in legal descriptions when the Transit Center design has progressed further. Staff estimates that the City fee for review of the TJPA's vacation application will be up to $33,103.

The proposed vacations would result in the vacated areas no longer being designated for public ROW or street uses. After vacation, the City would convey the property to the TJPA. The vacated areas would no longer be owned by the City and used as a public ROW, but instead would constitute new parcels owned by the TJPA in fee title and occupied by the Transit Center.

Fifth Addendum

In April 2004, the City and County of San Francisco, the Peninsula Corridor Joint Powers Board, and the San Francisco Redevelopment Agency certified the Final EIS/EIR (SCH #95063004) for the Transbay Program under the California Environmental Quality Act (CEQA). The Final EIS/EIR analyzed the potentially significant environmental impacts of the Program's Locally Preferred Alternative. The impacts associated with the Locally Preferred Alternative that were previously analyzed in the Final EIS/EIR are not a part of the Fifth Addendum.

The TJPA developed a CEQA environmental checklist to address whether the Design Modifications that require public ROW vacation would trigger the need for subsequent environmental review pursuant to Public Resources Code 21166 and Sections 15162 and 15163 of the CEQA guidelines. The Fifth Addendum presents the findings of the environmental checklist.

Based on the Fifth Addendum, the Design Modifications will not trigger the need for subsequent environmental review pursuant to Public Resources Code Section 21166 and Sections 15162 and 15163 of the CEQA guidelines. The ROW vacations for the Transit Center and its Design Modifications, would not require major revisions to the FEIS/EIR due to new or substantially increased significant environmental effects. Furthermore, there have been no substantial changes with respect to the circumstances under which the ROW vacations would be undertaken that would require major revisions of the FEIS/EIR due to new or substantially increased significant environmental effects; and there has been no discovery of new information of substantial importance that would trigger or require major revisions to the FEIS/EIR due to new or substantially increased significant environmental effects. Therefore, no subsequent or supplemental environmental impact report is required prior to submission and approval of the ROW vacations.

RECOMMENDATION:

The Staff recommends that the Board approve the resolution adopting the Fifth Addendum to the Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project FEIS/EIR for public right-of-way vacations for the Transit Center and its design modifications, and authorize the Executive Director to submit a public ROW vacation application to the City and County of San Francisco to vacate those areas required for the Transit Center and associated structures.

ENCLOSURES:

1. Fifth Addendum to the Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project Final Environmental Impact Statement/Environmental Impact Report for certain Transit Center design modifications that require public right of way vacation.

2. Resolution

TRANSBAY JOINT POWERS AUTHORITY
BOARD OF DIRECTORS

Resolution No. _____

WHEREAS, In April 2004, the City and County of San Francisco, the Peninsula Corridor Joint Powers Board, and the San Francisco Redevelopment Agency certified the Transbay Termianl/Caltrain Downtown Extension/Redevelopment Project Final Environmental Impact Statement/Environmental Impact Report (“Final EIS/EIR”) (SCH # 95063004) for the Transbay Transit Center Program ("Program"); and

WHEREAS, The Final EIS/EIR analyzed the Program's Locally Preferred Alternative. The Locally Preferred Alternative included, among other things, the new Transit Center and associated structures, such as bus ramps connecting I-80 to the Transit Center, the train box, the Transit Center bus deck bridges, and utility relocations (collectively, the "Transit Center"); and

WHEREAS, The TJPA proposes certain modifications to the design for the Transit Center that would include outer wall basket structures and the possibility of a pedestrian bridge over Beale Street (the "Design Modifications"); and

WHEREAS, The Design Modifications would encroach on the public right-of-way and would require the City and County of San Francisco to vacate portions of the public right of way; and

WHEREAS, The TJPA has prepared a Fifth Addendum to the Final EIS/EIR, which contains an analysis of the environmental impacts that may result from the Design Modifications that require public right of way vacations; and

WHEREAS, The Board has reviewed the information in the Fifth Addendum to the Final EIS/EIR, a copy of which is attached hereto as Exhibit A, which concludes that no further environmental review is required for the public right-of-way vacations for the Transit Center and its design modifications; now, therefore, be it

RESOLVED, That the TJPA Board: (1) determines that the Fifth Addendum to the Final EIS/EIR for public right-of-way vacations for the Transit Center and its design modifications, Exhibit A hereto, reflects the independent judgment of the TJPA; (2) adopts the Fifth Addendum to the FEIS/EIR; and (3) authorizes the Executive Director to submit a public right-of-way vacation application to the City and County of San Francisco to vacate those areas required for the Transit Center.

I hereby certify that the foregoing resolution was adopted by the Transbay Joint Powers Authority Board of Directors at its meeting of April 9, 2009.

_____
Secretary, Transbay Joint Powers Authority

Fifth Addendum to the
Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project
Final Environmental Impact Statement/Environmental Impact Report
(SCH #95063004)

I. INTRODUCTION

In April 2004, the Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project Final Environmental Impact Statement/Environmental Impact Report (FEIS/EIR) (SCH #95063004) was certified by the City and County of San Francisco (the City), the Peninsula Corridor Joint Powers Board, and the San Francisco Redevelopment Agency.

Pursuant to Section 15164 of the Guidelines implementing the California Environmental Quality Act (CEQA), the following addenda to the FEIS/EIR have been prepared.

- A first addendum to the FEIS/EIR identified modifications to the Transbay Transit Center design and construction staging and revisions to the Temporary Terminal site plan. The first addendum was adopted by the Transbay Joint Powers Authority (TJPA) Board of Directors on June 2, 2006.

- A second addendum revised the Locally Preferred Alternative for the Caltrain Downtown Extension Project (DTX), including design provisions to allow future construction of a Townsend/Embarcadero/Main Loop and the delay in construction of tail tracks on Main Street pending the outcome of future rail planning studies to accommodate California High-Speed Rail. The second addendum was adopted by the TJPA Board on April 17, 2007.

- A third addendum amended the list of properties identified for full acquisition to include 546 Howard Street, which was identified in the FEIS/EIR for partial acquisition. The third addendum was adopted by the TJPA Board on January 17, 2008.

- A fourth addendum revised configuration, boarding platforms and waiting areas, bus staging areas, and street design associated with the Temporary Terminal. The fourth addendum was adopted by the TJPA Board on October 17, 2008.

II. SUMMARY DESCRIPTION OF FIFTH ADDENDUM

The Transbay Transit Center (TTC or Transit Center) is designed to occupy portions of the public right-of-way (ROW). Accordingly, the TJPA will apply to the City and County of San Francisco to vacate the public ROW in those areas. The impacts associated with most of the TTC structures that require public ROW vacation were previously analyzed in the FEIS/EIR. *See* Section III. Accordingly, analysis of these structures will not be a part of this addendum. However, minor changes to the building design, specifically (1) exterior façade of the upper levels and (2) a pedestrian bridge over Beale Street, were not analyzed in prior environmental documents. Accordingly, a

CEQA environmental checklist was developed to address the question of whether these proposed changes to the project would trigger the need for subsequent environmental review pursuant to Public Resources Code section 21166 and sections 15162 and 15163 of the CEQA guidelines. This addendum presents the findings of the environmental checklist.

III. PRIOR ENVIRONMENTAL REVIEW

The FEIS/EIR evaluated the following natural resources and urban systems: Land Use/Wind/Shadow, Displacements and Relocations, Socio-economics, Community Facilities and Services/Safety and Security, Parklands/Schools/Religious Institutions, Air Quality, Noise and Vibration, Geology and Seismology, Water Resources and Floodplains, Utilities, Historic and Cultural Resources, Hazardous Materials, Visual and Aesthetics, Transit/Traffic/Parking, and Construction Methods and Impacts. Analysis of cumulative impacts was included in the discussion for each topic area.

A. Bus Ramp Overpasses

Pages 2-16 through 2-21, and 5-161 of the FEIS/EIR addressed the potential impacts associated with the bus ramps connecting the terminal, bus storage areas, and I-80. Addendum No. 1 to the FEIS/EIR found that by eliminating one bus level, the bus ramp linking the TTC with I-80 could be confined to a single-level structure replacing the two-level, stacked ramp concept described for the Locally Preferred Alternative (LPA). The addendum identified the ramp as a single-level ramp approximately 40 feet above street level and approximately 20 feet lower than the top of the stacked ramp. Thus, the current ramp configuration design consists of a single level connector between I-80 and the TTC.

B. Train Box

The FEIS/EIR evaluated the potential environmental impacts associated with the terminal, including the train box, which was identified as a component of the project. The FEIS/EIR evaluated a train box with space to accommodate six tracks for platform berthing locations at the TTC. The train box remains in the location identified in previous environmental documents.

C. Transit Center Bridges Over First and Fremont

Chapter 2, and pages 5-112, 5-161, and 5-208 of the FEIS/EIR addressed the environmental impacts associated with the Transit Center bus deck bridges over First and Fremont.

D. Utility Relocation

Pages 5-81, 5-83, 5-216, and 5-164 of the FEIS/EIR addressed the potential environmental impacts associated with the relocation of utilities that will be required during construction of the TTC.

IV. DESIGN MODIFICATIONS

A. Basket Structures

Modifications to the Transit Center Design evaluated in this addendum include a structural shell that would undulate in a convex and concave shape, suspended from a series of "Y" columns in a curtain wall fashion (the basket structure or the baskets). This basket structure would be attached to the superstructure on the side of the proposed TTC. The structure would be suspended above the sidewalk on levels two and three, leaving the first level open for pedestrian circulation allowing for a continuous sidewalk thoroughfare underneath the TTC. The basket structure would begin approximately 18 feet above the sidewalk and gradually curve up to a height of approximately 87 feet and out to a maximum horizontal reach of approximately 16 feet from the property line. The new curved structural design is more organic in appearance than the original design, with a shape that resembles a webbed basket. This changes the original window fenestration to an exterior skin consisting mostly of transparent panels that would fill in the webbed basket with a square-grid pattern. This will allow for more daylight to filter through the building, providing a translucent appearance.

B. Beale Street Pedestrian Bridge

This addendum also evaluates the potential addition of a pedestrian bridge spanning from the east side of Beale Street to the upper levels of the Transit Center on the west side of Beale Street. The TTC pedestrian bridge over Beale Street would connect to land currently owned by Caltrans that would be developed as part of the Redevelopment Plan for the area, as described in Chapter 2 of the FEIS/EIR. The pedestrian bridge would allow for pedestrian crossover approximately 65 feet above the street, and would still allow for continuing traffic and pedestrian circulation along Beale Street. The pedestrian bridge crossing Beale Street would not impact previously proposed vertical circulation for the TTC (*See* FEIS/EIR pp. 2-14 and 2-21). The Final EIS/EIR did not evaluate the impact of crossing Beale Street with a pedestrian bridge; however, impacts associated with this crossing would be similar to or less than the impacts associated with the bridge structure for the TTC bus deck bridge crossing over Fremont and First Streets (*See* FEIS/EIR p. 5-112 [analyzing visual and aesthetic impacts of the Transbay Terminal]). The pedestrian bridge would be at most 30 feet wide, which is approximately one-quarter to one half the width of the TTC and bus deck bridges.

Construction of the basket structures and Beale Street pedestrian bridge would occur simultaneously with, and as a part of, construction of the Transit Center. The Beale Street bridge and basket structures would be designed to the same construction standards identified in the FEIS/EIR for the TTC.

V. PUBLIC RIGHT-OF-WAY VACATIONS

Public streets and sidewalks are owned by the City and County of San Francisco as a public right-of-way (ROW). The public ROW includes the areas above and below public streets and sidewalks. The TTC would occupy portions of the public ROW above ground, starting at approximately 18 feet, where the building, ramps, and bridges hang

over the street, and below ground where the proposed train box extends below the street. *See* Figure 1. In addition, bus ramps that connect I-80 to the Transit Center would occupy the public ROW approximately 40 feet above city streets. Because the TTC would occupy portions of the public ROW, the TJPA will apply to the City to vacate the public ROW in those areas. The proposed public ROW vacations would result in the vacated areas no longer being designated for public ROW or street uses. After vacation, the City would convey the property to the TJPA. The vacated areas would no longer be owned by the City and used as a public ROW, but instead would constitute property owned by the TJPA in fee title and occupied by the TTC. The surface level streets would remain City property for continued use as public ROWs. Traffic and pedestrian flows would only temporarily be impeded during construction, as previously evaluated in the FEIS/EIR. Pedestrian circulation will be enhanced after construction to allow for continuous passage on the street levels. In addition, during construction of the Transit Center, underground utility lines in the public ROW would need to be relocated.

The following above and below street-level vacations are necessary to allow for the TTC as now proposed:

- First Street between Minna and Natoma Streets
- Fremont Street between Minna and Natoma Streets
- Beale Street between Minna and Natoma Streets
- Minna Street between Second and First Streets
- Natoma Street between First and Second Streets
- Bus ramp overpasses at Natoma, Howard, Tehama, Clementina, Folsom and Harrison Streets

Appendix 1 shows the area of the proposed vacations, which are described in more detail below.

A. First Street Between Minna and Natoma Streets

The project's rail station box requires the full-width of the public ROW along First Street between Minna and Natoma Streets for approximately 186 horizontal feet beginning at a depth of approximately 4'-9" below grade and extending downward vertically. During construction, utilities would be relocated on an interim basis with utilities configured in their final location over the train box at a depth no greater than approximately 4'-5" vertically.

The air space required for project's bridge structure over First Street would be approximately 18' above grade and extend to approximately 87 vertical feet to the top level of the proposed TTC, which is the roof park. The bridge would become part of a continuous platform for the Bus Deck with an extension horizontally from west of First Street to the eastside of Beale Street. The above ground vacation area on First Street between Minna and Natoma Streets would measure approximately 180 horizontal feet.

B. Fremont Street Between Minna and Natoma Streets

The project's rail station box requires the full-width of the public ROW along Fremont Street between Minna and Natoma Streets for approximately 186 horizontal feet

beginning at a maximum depth of 4'-9" below grade and extending downward vertically. During construction, utilities would be relocated on an interim basis with utilities configured in their final location over the train box at a depth no greater than 4'-5."

The air space required for the TTC's bridge structure would be approximately 18' above grade and extend vertically skyward for approximately 87 feet to the top level of the proposed TTC, which is the roof park. The bridge over Fremont Street would become part of a continuous platform for the Bus Deck from west of First Street to the eastside of Beale Street. The above ground vacation area on Fremont Street between Minna and Natoma Streets would measure approximately 180 horizontal feet.

C. Beale Street Between Minna and Natoma Streets

The project's rail station box requires the full-width of the public ROW along Beale Street between Minna and Natoma Streets beginning at a maximum depth of 4'-9" vertically below grade and extending downward to the base of the train box. Vacation would include approximately 188 horizontal feet on the western side of Beale Street and approximately 220 horizontal feet on the eastern side of Beale Street. During construction, utilities would be relocated on an interim basis with utilities configured in their final location over the train box at a depth of approximately 4'-5."

The air space required for project's proposed Beale Street pedestrian bridge structure and baskets would begin approximately 18' above grade and extend vertically skyward up to approximately 87 feet to the top level of the proposed TTC. The above ground vacation area on Beale Street between Minna and Natoma Streets would measure at approximately 180 horizontal feet.

D. Minna Street between Second and First Streets

The project's train box would require vacation of the southern half of the public ROW from 1'-6" below grade and extending downward, beginning at the TTC property line and extending approximately 16 horizontal feet to the north along Minna Street between Second and First Streets. Utilities in the southern half of the ROW would be relocated to the northern half.

The air space required for the basket structure would be approximately 18' above grade, continuing skyward vertically up to approximately 87 feet to the top level of the proposed TTC. The basket structure would extend approximately 16 horizontal feet north of the property line over Minna Street.

E. Natoma Street between First and Fremont Streets

Beginning at the TTC property line and extending approximately 15 feet horizontally to the south along Natoma Street between First and Fremont Streets, the project's train box would require the north-half of the public ROW from 1'-6" below grade and extend downward vertically. Utilities in the north half of the ROW would be relocated to the southern half.

The air space required for the basket structure would be approximately 18 feet above grade, continuing skyward vertically for approximately 87 feet to the top level of the proposed TTC. The basket structure would extend approximately 16 horizontal feet south of the property line over Natoma Street.

F. Eastern Section of Natoma Street between First and Second Streets

From the property boundary at First Street and running westward horizontally along Natoma Street, the TTC would occupy approximately 171 horizontal feet of ROW below and above grade. Beginning at a distance of 1'-6," the below ground train box would require approximately 10' of the north-half of the public ROW as measured horizontally from the Transit Center's property boundary. Utilities in the northern half of the ROW would be relocated to the southern half of the ROW.

The air space required for the basket structure would be approximately 18' above grade, continuing skyward vertically up to approximately 87 feet to the top level of the proposed TTC. The basket structure would extend approximately 16 horizontal feet south of the property line over Natoma Street.

G. Western Section of Natoma Street between First and Second Streets

The project's train box would require the full-width of the public ROW along Natoma Street beginning 1'-6" below grade and extending vertically downward. The areas that would be affected would begin at approximately 59' east of the property boundary on the eastern side of intersection of Second and Natoma Streets and would continue horizontally to approximately 171' east of the western property boundary at the intersection of First and Natoma Streets. Utilities would be relocated outside of this approximately 596 horizontal-foot section of Natoma Street.

The air space required for the basket structure would be 18' above grade, continuing skyward up to approximately 87 feet to the top level of the proposed TTC, extending horizontally approximately 16' south of the property line.

H. Bus ramp overpasses at Natoma, Howard, Tehama, Clementina, Folsom, First and Harrison Streets

The bus ramps connecting I-80 to the TTC will cross; 1) Harrison Street between Essex and Second streets; 2) Folsom Street between Essex and Second Streets; 3) Clementina Street between Ecker and Second Streets; 4) Tehama Street between First and Second Streets; 4) Howard Street between First and Second Streets; 5) First Street between Clementina and Tehama Streets and 5) Natoma Street between First and Second Streets. The air space required to be vacated for the project's bus ramps would begin approximately 18' above grade and extend vertically to the sky. Horizontally, the bus ramps require vacation of the full-width of the public ROW at the crossings and extend lengthwise for approximately 95 feet. On First Street the vacation will extend lengthwise for approximately 30 feet.

VI. ENVIRONMENTAL ISSUES

As discussed previously, most of the TTC structures that require public ROW vacation were previously analyzed in the FEIS/EIR. This addendum focuses on the following Transit Center design changes that require public ROW vacation: (1) the addition of exterior façade wall basket structures and (2) the addition of a pedestrian bridge over Beale Street.

A. Land Use, Wind, and Shadow

Public ROW vacation would allow for the beneficial land use impacts described in the FEIS/EIR (pp. 5-2 and 5-3), including the intensification of land uses, the freeing of land for development, and enhanced pedestrian circulation. All streets identified in this addendum were previously evaluated for shadow impacts with the exception of the pedestrian bridge over Beale Street. The Beale Street bridge would cast a shadow smaller in extent and similar in duration to that described in the FEIS/EIR for Fremont and First Streets (FEIS/EIR pp. 5-19 to 5-21). Because the bridge would not be located near existing open space under the jurisdiction of the San Francisco Recreation and Park Commission, it would not cast shadows on City-owned open spaces (*See* FEIS/EIR and Addendum No. 1). Modifications to terminal design would comply with City Planning Code Section 148 for the reduction of ground-level wind currents as specified on page 5-18 of the FEIS/EIR. The design of the basket structure would conform to required building and planning standards. The Redevelopment Plan described and evaluated in the FEIS/EIR included future development of the block immediately to the east of the terminal along Beale Street. The extension of a pedestrian bridge over Beale Street would not limit or constrain the uses in the area and would be compatible with future development as evaluated by the Redevelopment Plan for the area. Pedestrian circulation will be maintained along the street.

The City's General Plan Urban Design Element Policy 2.8 creates a presumption against vacating street areas. Policy 2.9 lists criteria under which a vacation may occur. Under Policy 2.9(B), vacations for the baskets and pedestrian bridge may be considered favorably. The basket structures enhance the visual appeal of the TTC and will enhance the character of the TTC as a visual focal point for the Transbay Redevelopment Project area. The baskets also further the public values of streets; they do not interfere with adequate light and air to pedestrians below the baskets, and provide views to the outside for people within the TTC. The bridge over Beale Street is a small-scale pedestrian crossing. It will span from one side of Beale street to the other, and be at most 30 feet wide, and likely less. The bridge is necessary for public access to and from the Transit Center. It will connect to a proposed building on the east side of Beale, which would provide for egress from the underground train box levels of the TTC. Pedestrian access to the retail and park levels of the TTC would be facilitated by providing a means to cross Beale Street. Additional access to the rooftop park will encourage use of the park.

Vacation for the baskets and pedestrian bridge are also consistent with the criteria listed in Urban Design Element Policy 2.9(A). Because the design modifications will only occupy air space, they will not eliminate street space, disrupt vehicular or pedestrian circulation, or interfere with the rights of access to private property. Further, because the

pedestrian bridge will improve access to the 5.4 acre park atop the TTC, it will enhance public recreation activities and open space. The impacts on the scale and character of the surrounding development will be similar to the visual and aesthetic impacts discussed for the TTC in the FEIS/EIR, pages 5-112-121. The basket structures will begin approximately 18 feet above the streets and the pedestrian bridge will be located approximately 65 feet above the street. This is sufficient clearance to allow emergency vehicles to access the streets. Overhead trolley lines currently exist on Beale Street. The TJPA is working with the MTA to permanently relocate those utilities and will reimburse the MTA for relocation costs. The basket structures and pedestrian bridge do not add to the height of the building. Although the basket structures increase the width of the Transit Center, they add visual interest and appeal to the building design.

There is not a significant view along Beale Street that would be obstructed or diminished by the pedestrian bridge. Currently, the view looking southwest along Beale Street from the corner of Mission and Beale Streets is impeded by the existing Transbay Terminal bus ramps. Beyond the bus ramps is the Harrison Street and I-80 freeway crossings over Beale. Existing buildings obstruct the view from Beale Street to Rincon Hill. The view northwest from Howard and Beale Streets similarly is impeded by the existing bus ramps. Beyond the bus ramp is a view of highrise buildings. Similarly, the views looking up and down Minna and Natoma Streets consist of industrial and highrise buildings. There is no existing view to the San Francisco Bay along these streets.

The TTC pedestrian bridge over Beale Street would connect the TTC to property currently owned by Caltrans that would be developed as part of the Redevelopment Plan for the area, as described in Chapter 2 of the FEIS/EIR. The property along the east side of Beale would be transferred from Caltrans to the TJPA according to a Cooperative Agreement.[1] The property is zoned for public use. Future use of the property is planned to be for a building to accommodate egress stairs from the below-ground train box levels of the TTC and mechanical equipment to support the TTC. (*See* FEIS/EIR Addendum No. 1 p. 10 and Recommended Program Implementation Strategy, Transbay Joint Powers Authority, Feb. 10, 2006 (showing building on east of Beale)).

Under Urban Design Element Policy 2.10, release of street areas is permitted in the least extensive and least permanent manner appropriate. Here, only air rights are sought to be vacated for the proposed basket structures and pedestrian bridge, and surface streets would remain public ROW. Although the TJPA seeks to have the vacated properties conveyed in fee simple, this is appropriate given the long-term and public use of the property for the TTC.

The basket structures and pedestrian bridge are consistent with other General Plan Urban Design Policies. Existing street patterns will not be disrupted. The basket structures would add a design element that makes the TTC a more prominent center of activity. They will assist in distinctively identifying the TTC, making it easily understood and

[1] State of California Department of Transportation District Agreement No. 4-1984-C (effective date July 11, 2003), City and County of San Francisco Resolution No. 441-03 (approved July 11, 2003), and Transbay Joint Powers Authority Board of Directors Resolution No. 03-004 (approved May 30, 2003).

remembered as a transit stop. The basket structures would not interfere with views downward to the proposed park from higher surrounding view points. See Section M, below, for additional discussion of the visual and aesthetic impacts of the basket structure. The pedestrian bridge would create a continuous design connection between the rooftop park and the adjacent property, providing additional access the park from the outside in addition to access from inside the TTC. The bridge will also provide an additional point from which to view the rooftop park and downtown.

The pedestrian bridge may have some adverse impacts, however these would not be significant. As discussed above, the pedestrian bridge's shadow impacts on the street will not be significant. The bridge will slightly clutter the air space surrounding the TTC and rooftop park. The existing conditions along this stretch of Beale Street, however, includes several overhead crossings. The existing bus ramps for the Transbay Terminal currently cross Beale Street in two locations, north and south of Howard Street. South of that, Harrison Street crosses over Beale. I-80 crosses over Beale Street south of Harrison Street. The existing bus ramps will be demolished during construction of the TTC. The proposed pedestrian bridge will allow for a lighter, more visually pleasing design than the existing bus ramps. In addition, the pedestrian bridge would be located approximately 65 feet above the street. Thus, pedestrians would still have relatively expansive views through the street beneath the bridge.

B. Displacements and Relocations

The proposed public ROW vacations necessary for the basket structure and bridge over Beale Street would not divide an established community or conflict with applicable land uses plans, policies, or regulations, but would allow a portion of the building to overhang (but not obstruct) the sidewalk on Minna, Natoma, and Beale Streets. The City currently owns all property to be conveyed to the TJPA following the public ROW vacations. As noted above, property along the east side of Beale would be transferred from Caltrans to the TJPA according to a Cooperative Agreement.[2] The new design of the basket structure would continue along the entire side of the TTC connecting several blocks together in a cohesive fashion. The pedestrian bridge would also provide pedestrian circulation vertically and horizontally connecting the blocks and improving land use compatibility.

C. Socio-economics

The beneficial socio-economic impacts resulting from the increased activity and economic vitality generated by the project would remain as described in the FEIS/EIR (p. 5-35).

D. Community Facilities and Services/Safety and Security

The public ROW vacation process during TTC construction would comply with FEIS/EIR mitigation, which includes, but is not limited, to a combination of construction contract specifications, drawings, and provisions, as well as public affairs and a public construction coordination programs (FEIS/EIR pp. 5-198 to 200). The vacation has been

[2] State of California Department of Transportation District Agreement No. 4-1984-C effective date July 11, 2003, City and County of San Francisco Resolution No. 441-03 approved July 11, 2003, and Transbay Joint Powers Authority Board of Directors Resolution No. 03-004 signed May 30, 2003.

designed to reduce impacts to area businesses and property owners, and so that project mitigation would best meet community needs. Construction within the vacated areas would comply with the Safety and Security guidelines in the FEIS/EIR (pp. 5-122 and 5-225). The additional construction activities, which represent a small portion of the entire TTC construction effort, would not require additional staff or public service capacity to respond to emergencies in the area.

E. Parklands/Schools/Religious Institutions

Public ROW vacations would not alter the finding in the FEIS/EIR (pp. 5-44, 5-45, and 5-204) that the project would not produce adverse impacts to parks, schools, and religious institutions, since none of these uses are located in the immediate vicinity of the vacations identified. The project includes additional park space that can be accessed by the public.

F. Air Quality

Construction of the Beale Street pedestrian bridge and the basket structures would result in no change to potential air quality impacts previously evaluated in the FEIS/EIR. As stated on page 5-205 of the FEIS/EIR, there are no quantitative emissions thresholds for construction activities, which are by their nature temporary and occur over a large area, potentially affecting different receptors at different times. The project would comply with the Bay Area Air Quality Management District's (BAAQMD) approach to the analysis of construction impacts through the implementation of control measures. The public ROW vacations and construction of the Beale Street bridge would comply with measures listed on pages 5-205 and 5-206 of the Final EIS/EIR, which includes but is not limited to watering all active construction areas at least twice daily; covering all trucks hauling soil, sand, and other loose materials or requiring all trucks to maintain at least two feet of freeboard; and sweeping daily (with water sweepers) all paved access roads, parking areas and staging areas at construction sites.

G. Noise and Vibration

Construction of the baskets and Beale Street bridge would not result in new significant or substantially increased operational impacts to noise or vibration levels. Construction would be conducted in compliance with previously adopted FEIS/EIR Mitigation Measures NoiC 1 to NoiC 6, which would reduce impacts to less than significant.

H. Geology and Seismology

The TTC has been designed with pile supported foundations sufficient to support all functions (FEIS/EIR pp. 5-79 to 5-80, 5-225). The new basket-like curtain wall structure would be designed to connect into the existing superstructure intended to support the TTC. The design elements would be evaluated along with the entire structure to conform to required code standards for seismicity. Structural components of the project would be designed and constructed to resist strong ground motions approximating the maximum anticipated earthquake (0.5g) (FEIS/EIR p. 5-80). As identified in the FEIS/EIR, supports would serve to minimize settlement and lateral displacement resulting from seismic shaking (FEIS/EIR p. 5-80). The Beale Street bridge would be designed to the same construction standards identified in the FEIS/EIR for the TTC. Therefore no additional

significant impacts are anticipated due to geology or soils than those previously evaluated.

I. Water Resources and Floodplains

No long-term adverse impacts on water resources and floodplains were identified in the FEIS/EIR. The limited area affected by construction activities for the Beale Street bridge would not change the risk of impact to water resources or floodplains from that described in the FEIS/EIR (p. 5-80).

J. Utilities and Energy

As discussed in the FEIS/EIR, the Transbay Terminal/Caltrain Downtown Extension/ Redevelopment Project would result in an increase in demand for and use of water and energy, but not in excess of amounts expected and provided for in the area (FEIS/EIR p. 5-81). The Beale Street bridge and basket construction activities would require minor amounts of water and energy, as compared to the project, and operation would not require additional sources beyond those previously evaluated in the project's environmental documents. As identified on page 2-11 of the FEIS/EIR, design of the terminal would incorporate sustainable features that would allow the building to use site-specific wind, daylight and shading to reduce the building's energy needs. The basket structures would allow for the passage of more light through the TTC. The use of more translucent materials would provide transparency during the day and at night. The additional light that would filter into the space during the day would reduce energy needs.

K. Historic and Cultural Resources

The public ROW vacation above ground would occur in air space above street level and would not impact historical resources in the area. The new design of the elevation consisting of a basket-like structure will provide a modern style of architecture that is not currently represented in the area. However, the TTC design modifications do not significantly change the impacts already analyzed in the FEIS/EIR as the features described in this addendum would remain visually cohesive with the area, and analysis of impacts to historic districts and resources, as evaluated on pages 5-112, 5-116, and 5-117, would be consistent with current design proposals. The transparency of the design would allow for views through the space reducing the visual obstruction of existing historic architecture in the vicinity, a beneficial effect. Historic properties are not located on the east side of Beale Street where the pedestrian bridge would extend over Beale Street. Although, below ground construction associated with public ROW vacation and construction of the Beale Street bridge may not result in new or more severe impacts to cultural resources, it has the potential to impact unknown cultural resources. TTC construction activities would comply with previously adopted mitigation as indicated in the Memorandum of Agreement between the local and federal lead agencies and the State Historic Preservation Officer (FEIS/EIR Appendix G), and potential impacts would be less than significant (FEIS/EIR pp. 5-86 to 5-90, 5-216, and Appendix G).

L. Hazardous Materials

If hazardous materials are encountered during utility relocation for public ROW vacation, they would be handled as indicated in the FEIS/EIR (pp. 5-222 to 5-224).

M. Visual and Aesthetic

Design of the TTC elevation now proposes an organic basket-like structure with an undulating appearance that alternates between concave and convex curves, suspended over the side walk. This specific design feature would provide more visual interest along the street and would not result in a more severe impact to the existing visual character of the site than previously evaluated in the FEIS/EIR.

The new curved design of the basket structure would be constructed of materials allowing for better transparency when compared to the design originally analyzed in the FEIS/EIR. This will allow for the passage of daylight into the space on the concourse and bus levels during the daytime and the illumination of inside light onto the street during the nighttime when the TTC is operating. The new design would enhance views into the TTC space from the street so that functions and activities would be identifiable and easier to locate. The transparency of the structure would also allow for more continuous views outward for users of the TTC. The basket structure would be suspended over the sidewalk creating an overhead covering, providing a translucent quality that would allow for light to filter down to the street level.

View corridors along the street would be interrupted at First and Fremont Streets where bridge portions would cross over the streets. This would alter the public view at the ground level to some extent; however, the structure would frame views down the street and views to the north and south are still possible. The view obstruction looking upward from the street would not be substantial, and this impact would not be considered significant. Additionally, the new transparent design would allow for some views through the structure. The new design would enhance the pedestrian visual experience at the roof park and bridge levels over the street. Views at this height would be provided in multiple directions that are not currently achievable from the street level.

The design modification impacts from above ground light and glare would be within the envelope of those previously evaluated by the FEIS/EIR as the materials and equipment to be used are anticipated to be similar to those previously analyzed. Construction-related light and glare would be consistent with FEIS/EIR findings that construction would generate additional night lighting but not in amount unusual for a transportation hub in a developed urban area (FEIS/EIR p. 5-120). Short-term visual changes as a result of temporary construction activities are common and accepted elements in the redevelopment area; therefore mitigation is not required (FEIS/EIR p. 5-224). However, as addressed in the FEIS/EIR, TJPA would require project contractors to ensure that at night artificial lightings would be directed to minimize “spill over” light or glare effects.

Once the project is complete, the new TTC design modifications would allow for the passage of more light through the TTC. The use of translucent materials would provide transparency during the day and at night. During the nighttime, the lighting on the

interior would provide some illumination that would also filter onto the street. This would provide a level of light similar to street lamps. Lighting would be designed to limit glare and reflectance upon surfaces to reduce any potential negative effect to users in the vicinity.

See Section A, above, for additional discussion of visual and aesthetic impacts of the pedestrian bridge over Beale Street.

N. Transportation

Construction activities would not impact area traffic with the exception of altering lane configuration during utility relocating or construction of the bridge over Beale Street. The FEIS/EIR previously identified Natoma Street between First and Second Streets; Minna Street between First and Second Streets; and First, Fremont, and Beale Streets between Howard and Mission Streets for street closures during construction (FEIS/EIR pp. 5-160 to 5-161). The construction in vacated areas would comply with FEIS/EIR mitigation which includes, but is not limited to a combination of construction contract specification, drawings, and provisions, as well as public affairs programs. Public ROW vacation would not result in new or additional impacts to transportation as previously identified by the FEIS/EIR.

VII. ENVIRONMENTAL FINDINGS

Based on the above information and analysis, the proposed public ROW vacations for the Transit Center and its design modifications will not trigger the need for subsequent environmental review pursuant to Public Resources Code section 21166 and sections 15162 and 15163 of the CEQA guidelines. The proposed public ROW vacations described in this addendum would not require major revisions to the FEIS/EIR due to new or substantially increased significant environmental effects. Furthermore, there have been no substantial changes with respect to the circumstances under which the public ROW vacations would be undertaken that would require major revisions of the FEIS/EIR due to new or substantially increased significant environmental effects; and there has been no discovery of new information of substantial importance that would trigger or require major revisions to the FEIS/EIR due to new or substantially increased significant environmental effects. Therefore, no subsequent or supplemental environmental impact report is required prior to approval of the public ROW vacations for the Transit Center and its design modifications as described in this addendum.

Sixth Addendum to the
Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project
Final Environmental Impact Statement/Environmental Impact Report
(SCH #95063004)

I. INTRODUCTION

In April 2004, the Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project (Transbay Program) Final Environmental Impact Statement/Environmental Impact Report (2004 FEIS/EIR) (SCH #95063004) was certified by the City and County of San Francisco, the Peninsula Corridor Joint Powers Board, and the San Francisco Redevelopment Agency. As used herein, "FEIS/EIR" includes all subsequently approved addenda, which have been prepared pursuant to Section 15164 of the Guidelines implementing the California Environmental Quality Act (CEQA), and are listed below:

- A first addendum to the 2004 FEIS/EIR evaluated modifications to the Transbay Transit Center design and construction staging, and revisions to the Temporary Terminal site plan. The First Addendum was adopted by the Transbay Joint Powers Authority (TJPA) Board of Directors on June 2, 2006.

- A second addendum evaluated modifications to the Locally Preferred Alternative for the Caltrain Downtown Extension Project, including design provisions to allow future construction of a Townsend/Embarcadero/Main Loop, and the delay in construction of tail tracks on Main Street pending the outcome of future rail planning studies to accommodate California High-Speed Rail. The Second Addendum was adopted by the TJPA Board on April 17, 2007.

- A third addendum evaluated adding 546 Howard Street, which was identified in the 2004 FEIS/EIR for partial acquisition, to the list of properties identified for full acquisition. The Third Addendum was adopted by the TJPA Board on January 17, 2008.

- A fourth addendum evaluated the configuration, boarding platforms and waiting areas, bus staging areas, and street design associated with the Temporary Terminal. The Fourth Addendum was adopted by the TJPA Board on October 17, 2008.

- A fifth addendum evaluated the building design for the Transbay Transit Center, specifically, (1) the exterior façade of the upper levels and (2) a pedestrian bridge over Beale Street. The Fifth Addendum was adopted by the TJPA Board on April 9, 2009.

II. SUMMARY DESCRIPTION OF SIXTH ADDENDUM

At the time of certification of the 2004 FEIS/EIR, some design components of the Transbay Program were evaluated at a program level, because project specifics could not be identified in advance of project-level design. Subsequent to certification of the 2004 FEIS/EIR, engineering was initiated for the bus ramps connecting the Bay Bridge (Interstate 80 [I-80]) and the Transbay Terminal (now referred to as the Transit Center). The proposed design includes three new refinements. The first is a cable-stayed ramp connecting the bus ramps with the Transit Center.

The second is the widening of the bus exit off the Fremont Street ramp from westbound I-80; the bus exit is used exclusively for buses to exit I-80 and access the proposed bus ramps leading to the Transit Center. Additionally, since certification of the FEIS/EIR, the footprint for the bus ramp component has been modified to meet the project's design and performance criteria, which is the third refinement. Figure 1 shows the footprint of the proposed refinements to the design for the bus ramp component.

III. PROPOSED BUS RAMP DESIGN REFINEMENTS

This Sixth Addendum evaluates the potential impacts associated with proposed refinements to the design and configuration of the bus ramp component of the Transbay Program, identified by the following three elements.

A. Cable-Stayed Ramp Accessing the Transit Center

The proposed bus ramps linking the Transit Center with I-80 would be a single-level structure, as identified and evaluated in the First Addendum. The First Addendum identified the bus ramps as a single-level ramp approximately 40 feet above street level, and approximately 20 feet lower than the top of the stacked bus ramp component identified in the 2004 FEIS/EIR.

Since certification of the 2004 FEIS/EIR and adoption of the First Addendum, a cable-stayed ramp has been designed to connect the bus ramps to the southwestern end of the Transit Center (see Figure 2). The cable-stayed ramp is the portion of the bus ramps that begins just south of Howard Street and runs northwest to cross over Natoma Street. There would be approximately 32 feet of clearance between Howard Street and the underside of the bus ramps, and approximately 29 feet of clearance between Natoma Street and the underside of the bus ramps.

The cable-stayed ramp would have a tower approximately 90 feet above the bus deck and approximately 127 feet above the ground surface (see Figure 3). The ramp would be supported by 16 cables (eight supporting each side of the tower), each approximately 12 inches in diameter. The cable-stayed ramp, including a steel deck connecting to the Transit Center, would be approximately 330 feet long.

B. Fremont Street Ramp Modifications

The existing bus exit off the Fremont Street ramp is a 12-foot-wide, single-lane exit ramp designed by Caltrans and built in 2008 as part of the West Approach Seismic Safety Project, a portion of the San Francisco-Oakland Bay Bridge Project. The bus exit is intended to provide the transition from I-80 to the bus ramps leading to the Transit Center. As part of the proposed refinements, the Fremont Street ramp would be widened by up to approximately 12 feet (see Figure 2).

In 2006, the San Francisco Redevelopment Commission approved the Transbay Streetscape and Open Space Concept Plan. This plan identified areas under the bus ramps that could potentially be used as recreational hardcourts or pedestrian mews. The area afforded by column spacing and overhead clearances under the Fremont Street ramp could be used for such purposes.

C. Bus Ramp Footprint

The proposed bus ramps would be in generally the same position as the previous ramp on the western side of the Transit Center site and would parallel Essex Street, as identified in the FEIS/EIR. Following adoption of the First Addendum, one previously planned bus level of the Transit Center was eliminated. As a result, the bus ramps linking the building with I-80 would be a single-level structure rather than the two-level, stacked-ramp concept described for the Locally Preferred Alternative in the 2004 FEIS/EIR. See Figure 4, Previously Approved and Proposed Design of the Bus Ramp Component, which shows the bus ramp locations in the 2004 FEIS/EIR and the First Addendum as compared to the proposed refined design. The pink line in Figure 4 represents previously approved bus ramp areas, the light blue line represents proposed design areas, and the purple line shows the overlap between the two designs.

The proposed footprint is substantially similar to the previously approved design, with the exception of the eastbound I-80 on- and off-ramps, which now encircle the Sterling Street Substation. The eastbound I-80 on- and off-ramps would overlay or be adjacent to an existing ramp structure, and are similar to what was evaluated in the FEIS/EIR.

IV. ENVIRONMENTAL ISSUES

The FEIS/EIR evaluated the following natural resources and urban systems categories: Land Use/Wind/Shadow, Displacements and Relocations, Socio-economics, Community Facilities and Services/Safety and Security, Parklands/Schools/Religious Institutions, Air Quality, Noise and Vibration, Geology and Seismology, Water Resources and Floodplains, Utilities, Historic and Cultural Resources, Hazardous Materials, Visual and Aesthetics, Transit/Traffic/Parking, and Construction Methods and Impacts.

In the preparation of this Sixth Addendum, it has been determined that the modifications to the Transbay Program ramp component would have the potential to affect two of these environmental categories. This Addendum analyzes the potential environmental impacts in the following environmental categories: (A) Historic and Cultural Resources and (B) Visual and Aesthetic Resources.

A. Historic and Cultural Resources

a. Cable-Stayed Ramp Accessing the Transit Center

Construction and operation of the proposed cable-stayed ramp would not result in impacts to new or previously unevaluated historic or cultural resources. The structure would be located in the previously evaluated Area of Potential Effect (APE) for the Transbay Program.

b. Fremont Street Ramp Modifications

The Fremont Street ramp is not a historic resource because it was constructed in 2008 as part of the San Francisco-Oakland Bay Bridge West Approach Seismic Safety Project to replace the

original Fremont Street ramp.[1] As part its analysis, documented in a memorandum entitled, *San Francisco Transbay Terminal Bus Ramp Documentation and Analysis* (Appendix 1 hereto) JRP Historical Consulting, LLC, found that because the Fremont Street ramp is a component of the Transbay Program, for which Section 106 consultation was completed in accordance with the Memorandum of Agreement between the Federal Transit Administration and the California State Historic Preservation Officer Regarding the Transbay Terminal/Caltrain Downtown Extension/ Redevelopment Project in San Francisco, California, no additional compliance would be necessary under Section 106 or CEQA.

c. Bus Ramp Footprint

The proposed refined design for the bus ramps would result in the ramp passing closer to the Sterling Street Substation than the configuration identified in the FEIS/EIR. This building possesses a high degree of integrity and is eligible for listing on the NRHP as a contributing element of the Bay Bridge, which itself is listed. However, the substation is included in the NRHP not for its specific history, aesthetic or architectural characteristics, or setting, but rather as a contributing element to the Bay Bridge. None of the important contributing elements to its eligibility would be diminished by construction of the bus ramps; therefore, a constructive use[2] would not occur. The proposed design refinements would not demolish or damage the substation (William Self Associates, 2010) (Appendix 2).

Impacts to the previously existing Transbay Terminal Bus Ramp were considered to be significant and unavoidable in the FEIS/EIR, even with mitigation (page 7-6 to 7-7 of the 2004 FEIS/EIR). The final bus ramp location would not result in new or substantially more severe significant impacts to historic and cultural resources beyond those previously evaluated in the FEIS/EIR.

B. Visual and Aesthetic Resources

a. Cable-Stayed Ramp Accessing the Transit Center

The proposed cable-stayed ramp is designed to minimize visual impacts in the area. The cables connecting the ramp to the tower would likely be a neutral color such as light grey and would connect to a single, slender tower. The tower would be approximately 90 feet above the bus deck and approximately 127 feet above the ground surface (see Figure 3). The cables would be spaced to allow views through the structure. The tower would exceed the height of the Transit Center by approximately 43.5 feet, but would be located in an area that is already developed with taller buildings. As identified in the FEIS/EIR, the physical character of the area is a combination of low-, mid-, and high-rise buildings, ranging from early twentieth-century historic structures and districts to new single and clustered office towers (page 4-67 of the 2004 FEIS/EIR).

[1] The original Fremont Ramp, Bridge #34 0116F, was a contributing element of the Bay Bridge property; however, it was removed in its entirety in April 2004 by the West Approach Seismic Safety Project, and replaced with Bridge #34 0127S. Detailed discussion of the project and the removal of the Fremont Ramp is included in Alec Melkonian's *San Francisco-Oakland Bay Bridge West Approach Seismic Retrofit Project* (District 4 Graphic Services, 2009).
[2] A constructive use occurs when a project's proximity impacts are such that the features or attributes that qualify a resource for listing on the NRHP are substantially diminished (see Appendix 2).

Additionally, under the proposed Transit Center District Plan, additional tall buildings would be constructed in the area. Currently, the area adjacent to the proposed cable-stayed ramp is zoned for buildings up to 450 feet. The public draft of the Transit Center District Plan (November 2009) proposed zoning heights ranging from 350 to 750 feet in the immediate vicinity of the proposed cable-stayed ramp.

The cable-stayed ramp would be consistent with the FEIS/EIR, because it was determined that the overall character of the Transbay Program area would change from a low-rise area dominated by early twentieth-century industrial buildings interspersed with surface parking lots to a more dense urban area of newer mid- and high-rise buildings with over 80-foot-high bases (page 5-116 of the 2004 FEIS/EIR). The tower would extend beyond the height of the Transit Center, but would be designed to be visually consistent with surrounding taller buildings in this urban environment, and would enhance the visual design in the area. Therefore, the cable-stayed ramp would not result in new or additional impacts to visual or aesthetic resources beyond those previously evaluated in the FEIS/EIR.

b. Fremont Street Ramp Modifications

The modifications to the Fremont Street ramp would result in the widening of an existing freeway ramp to connect the bus ramps and the Transit Center. As identified in the FEIS/EIR, blocks and streets in the project area are punctuated by vehicular overpasses from the highway, the Bay Bridge, related off-ramps, and bus ramps. The Fremont Street ramp modifications would be consistent with the existing ramps in the area and the proposed bus ramps. The widening of the Fremont Street ramp bus exit would not result in new or more visually intrusive features; therefore, the widening of the Fremont Street ramp bus exit would not result in new or additional impacts to visual or aesthetic resources beyond what were previously evaluated in the FEIS/EIR.

c. Bus Ramp Footprint

Following adoption of the First Addendum, one previously planned bus level of the Transit Center was eliminated. As a result, the bus ramps linking the building with I-80 would be confined to a single-level structure. The First Addendum concluded that the bus ramp component would be less visually intrusive than the former ramps, and no other impacts were identified as a result of the bus ramp configuration (pages 15 and 17 of the First Addendum).

The proposed refined bus ramp location would not result in new or additional impacts to visual or aesthetic resources beyond those previously evaluated in the FEIS/EIR.

V. CONCLUSION

All significant impacts associated with the bus ramps were previously evaluated in the FEIS/EIR. The proposed design refinements to the Fremont Street ramp and bus ramps, including the bus ramp footprint and cable-stayed ramp, are similar to previous design components evaluated in the FEIS/EIR, and no new or substantially more severe significant impacts have been identified or are anticipated to be identified, nor would these elements substantially change the severity or significance of the environmental impacts disclosed in the FEIS/EIR.

Therefore, the modifications to the Fremont Street ramp, design of the components of the bus ramps, and the footprint for the bus ramps described in this Addendum would not require major revisions to the FEIS/EIR due to new or substantially increased significant environmental effects. Furthermore, there have been no substantial changes with respect to the circumstances under which these design refinements would be undertaken that would require major revisions of the FEIS/EIR due to new or substantially increased significant environmental effects; and there has been no discovery of new information of substantial importance that would trigger or require major revisions to the FEIS/EIR due to new or substantially increased significant environmental effects. Therefore, no subsequent or supplemental environmental impact report is required pursuant to CEQA Guidelines Sections 15162 and 15163 prior to approval of the design refinements as described in this Addendum.

Memorandum

Re: Fremont Ramp Modifications Project and San Francisco Transbay Terminal Bus Ramp Documentation and Analysis
Date: June 28, 2011
To: Denise Heick, URS
From: Meta Bunse and Polly Allen, JRP Historical Consulting, LLC

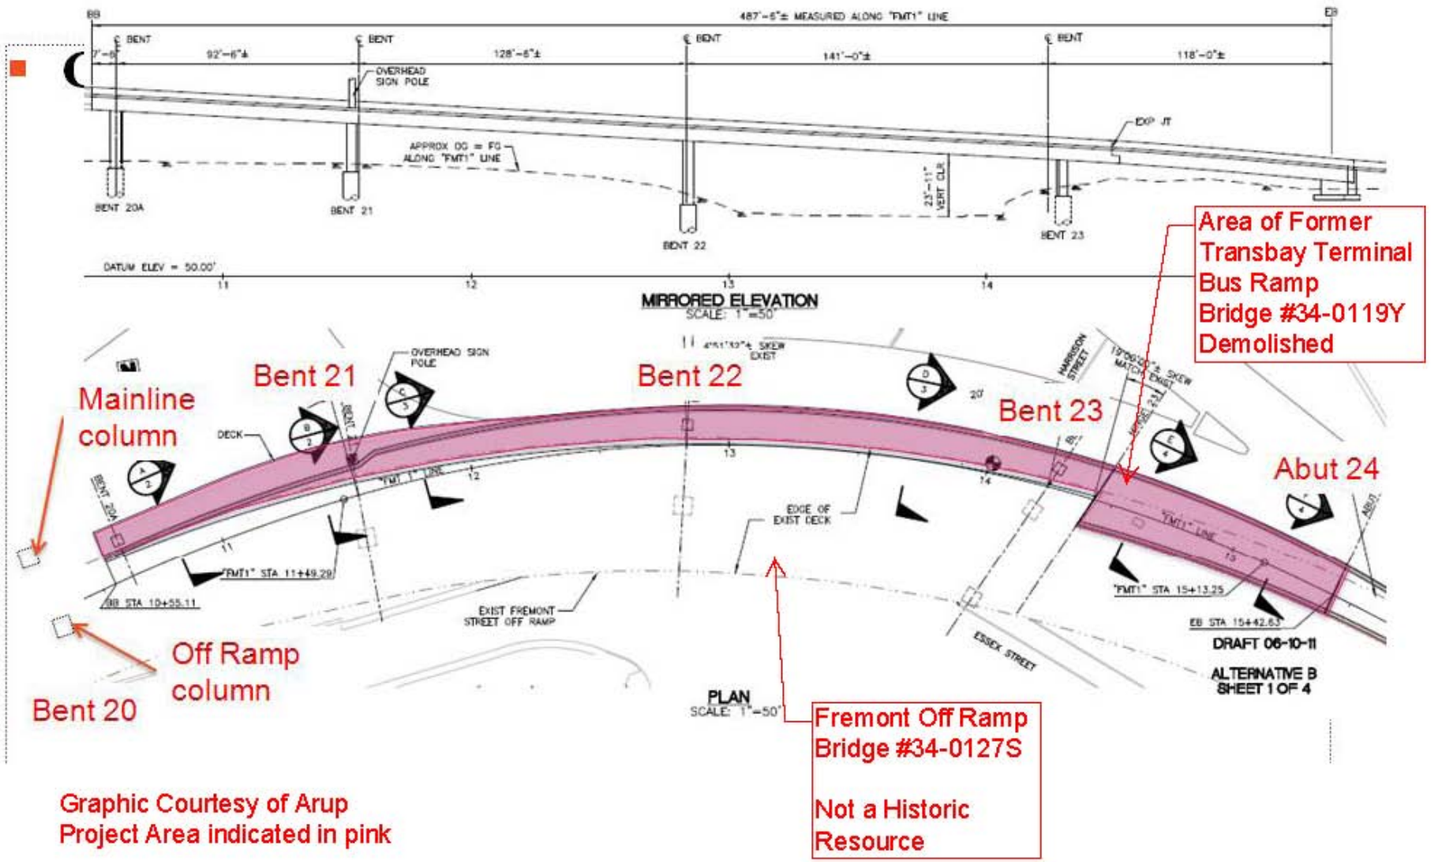
This memorandum is in support of the Transbay Transit Center Program Fremont Ramp Modifications Project (Project), and addresses the developmental history and historic status of the former Transbay Transit Terminal Bus Ramp, portions of which were within the proposed project area. The Program proposes to widen the Fremont Street Off-Ramp (Bridge # 34 0127S), a concrete box girder bridge constructed in 2008. The Transbay Transit Center Program requires the alteration of portions of the former Transbay Terminal Bus Ramp (Bridge # 34 0119Y), a decommissioned and largely demolished structure associated with the San Francisco-Oakland Bay Bridge. See **Figure 1** for project location details.

The former Transbay Terminal Bus Ramp was a historic resource under both Section 106 of the National Historic Preservation Act and the California Environmental Quality Act (CEQA) as it applies to historic resources. The ramp was a contributing element of the San Francisco-Oakland Bay Bridge National Register Property (**Appendix A**). The extant Fremont Street Off-Ramp, however, is not an historic resource because it was constructed in 2008 as part of the San Francisco-Oakland Bay Bridge West Approach Seismic Retrofit Project to replace the demolished original Bay Bridge exit ramp (Bridge # 34 0116F). Because some subsurface footings of the original exit ramp may remain under the current Fremont Off-Ramp, this memorandum presents the Program actions and Section 106 and CEQA compliance activities undertaken to address the original ramps and any remaining footings.[1]

The memo is organized into three sections and includes a description of the former historic resource (Transbay Terminal Bus Ramp), a summary of the former resource's current Section 106 and CEQA status, and conclusions regarding compliance requirements. The memo concludes that the Transbay Transit Center Program has already satisfactorily fulfilled its Section 106 and CEQA responsibilities related to the former historic resource and that no further compliance actions are necessary under the current Project.

---

[1] The Transbay Terminal Bus Ramp is listed in the most recent Office of Historic Preservation Data File for San Francisco County (10-05-10). The original Fremont Ramp, Bridge # 34 0116F, was also a contributing element of the Bay Bridge property; however, it was removed in April 2004 by the West Approach Seismic Retrofit Project and replaced with Bridge # 34 0127S. Detailed discussion of the project and the removal of the Fremont Ramp are included in Alec Melkonian's *San Francisco-Oakland Bay Bridge West Approach Seismic Retrofit Project* (District 4 Graphic Services, 2009).



Graphic Courtesy of Arup
Project Area indicated in pink

Description of Former Historic Resource

The project area includes a now-demolished, historic resource: the Transbay Terminal Bus Ramp. The structure was designed to carry interurban trains between the lower deck of the San Francisco-Oakland Bay Bridge and the Transbay Terminal and was subsequently adapted for use by buses in the midcentury period.

The property was a contributing element of the San Francisco-Oakland Bay Bridge National Register Property, which was listed on the National Register on August 13, 2001 (NRIS # 00000525). In its entirety, the Bay Bridge property included 15 contributing components: eight distinct bridge/ramp elements, the Yerba Buena Tunnel, four rail substations, the Transbay Transit Terminal Building, and a firehouse (see **Appendix A**). The property was listed under Criteria A and C in the area of engineering and transportation, for its influence on transportation development in California and the Bay Area, and for its engineering and design.

As designed in 1936, the Transbay Terminal Bus Ramp was 3,439 feet long and consisted of multiple concrete T-Beam spans with steel plate girder spans at local street overcrossings. The portion of the bus ramp in the project area is depicted below with a red arrow in **Photograph 1**.

Photograph 1: Overview of Transbay Terminal Bus Ramp, 1985
San Francisco-Oakland Bay Bridge HAER

Originally, the structure followed a generally circular loop to and from the Transbay Terminal Building on Mission Street; however, this original ramp has been demolished in recent years. Areas of the ramp were demolished in 2004 as part of the West Approach Seismic Retrofit Project and subsequent portions, including the portion of the ramp that passed through the project area, have recently been demolished under the ongoing Transbay Transit Center Program. **Photograph 2** indicates the location where the ramp passed through the project area with a red arrow. The 2008 Fremont Street exit ramp, in the foreground of the photograph, is not an historic property. Footings associated with the original Fremont Off-Ramp may remain beneath the new ramp, but they are remnants of a former contributing element to the Bay Bridge Property.

Photograph 2: Portion of the former Transbay Terminal Bus Ramp that passed through the Project Area prior it its demolition. Fremont Street exit ram in foreground remains and is not historic. Camera facing southwest, JRP April 2011.

Summary of Section 106 and CEQA Status

As discussed in the previous sections, the project area for the proposed Fremont Ramp Modifications Project contained a historic property, the previously existing Transbay Terminal Bus Ramp, which was a resource under Section 106 and CEQA and was a contributor to the National Register of Historic Properties (NRHP)-listed Bay Bridge. A March 2004 Environmental Impact Statement/ Environmental Impact Report (EIS/EIR) for the Transbay Transit Center Program previously identified the property, as well as others, as historic properties/historic resources that would be adversely affected/impacted by the Transbay Transit

Center Project. After this identification was made, the property was subject to Section 106 analysis that culminated in the signing of a Memorandum of Agreement (MOA) for the project in June 2004 (**Appendix B**).[2] This MOA, *Memorandum of Agreement between the Federal Transit Administration, and the California State Historic Preservation Officer Regarding the Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project in San Francisco County, California*, identifies the project's adverse effects on historic resources and details stipulations that govern the compliance responsibilities of all project activities.

Stipulation II of the MOA details mitigation responsibilities related to all affected contributing elements of the Bay Bridge, including the Transbay Terminal Ramp. The sole responsibility relating to this contributing component of the bridge was documentation, as detailed below:

> Prior to the start of any work that would have an adverse effect on components of the Bay Bridge that are historic properties, TJPA [Transbay Joint Powers Authority] will request SHPO [State Historic Preservation Officer] to determine whether these components, including the Transbay Terminal and associated ramps have been adequately recorded in existing documents. If SHPO determines that collectively, such documents, which include the Department's past recordation of a series of remodeling and seismic retrofit projects that have occurred since 1993, adequately document the Transbay Terminal and ramps then no further documentation will be necessary…Upon a written determination by SHPO that all documentation prescribed hereunder is satisfactory, TJPA will provide copies of this documentation to SHPO and the Department Headquarters Library, with xerographic copies to the History Center at the San Francisco Public Library, San Francisco Architectural Heritage, the Oakland History Room of the Oakland Public Library, the Oakland Museum of California, the Western Railway Museum, and Department District 4 Office…If SHPO does not respond within 45 days of receipt of each submittal of documentation prescribed herein, TJPA may assume that SHPO has determined that said documentation is adequate and may proceed with that aspect of the Undertaking that will adversely affect the historic properties documented hereunder.

TJPA submitted the specified documentation to SHPO on October 10, 2008 (**Appendix C**). SHPO did not respond within 45 days of the submittal, and therefore under the MOA, TJPA could assume SHPO concurrence that the submitted documentation was adequate. Signed concurrence was also received on June 2, 2009, by Deputy State Historic Preservation Officer Stephen D. Mikesell. Following SHPO concurrence, TJPA provided copies of the documentation to the repositories specified in the MOA. According to the TJPA's Mitigation Monitoring and

[2] *Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project in the City and County of San Francisco Final Environmental Impact Statement/Environmental Impact Report and Section 4(f) Evaluation* , by the U.S. Department of Transportation, Federal Transit Administration (FTA), City and County of San Francisco, Peninsula Corridor Joint Powers Board, and San Francisco Redevelopment Agency, March 2004.

Reporting Program, the submittal of this documentation occurred during the preliminary engineering and final design phase of the project (**Appendix D**).[3]

As such, pre-construction compliance responsibilities regarding the proposed Transbay Terminal Ramp, including any extant footings associated with the ramp, appear to have been completed by the Transbay Transit Center Program. While pre-construction compliance responsibilities have been met, the TJPA Mitigation Monitoring and Reporting Program also includes post-construction compliance – specifically, that within 180 days of completion of the Transit Center Project, TJPA, in consultation with FTA and SHPO, will re-evaluate the Bay Bridge for NRHP eligibility (see **Appendix D**).

Conclusions

The purpose of this memo was to address the developmental history and historic status of the former Transbay Transit Terminal Bus Ramp and the Transbay Transit Center Program's Fremont Ramp Modifications Project. The memo concludes that the former bus ramp, including any remaining subsurface footings associated with the ramp, was a historic property/historic resource, because it was a contributor to the NRHP-listed Bay Bridge. It appears that this property has been satisfactorily mitigated by the Transbay Transit Center Program under both Section 106 and CEQA thus far. As a component of the Transbay Transit Center Program, the Fremont Ramp Modifications Project does not appear to hold further compliance responsibilities in relation to the resource under Section 106 or CEQA. Please refer to the appendices referenced in this document for more supporting detail.

RE: SAN FRANCISCO—OAKLAND BAY BRIDGE
OAKLAND, ALAMEDA COUNTY, CALIFORNIA
SAN FRANCISCO, SAN FRANCISCO COUNTY, CALIFORNIA

On August 13, 2001, the property listed above was placed on the National Register of Historic Places. On that date, this property was also placed on the California Register of Historical Resources, pursuant to Section 5024.1(d) of the Public Resources Code.

Placement on the National Register affords a property the honor of inclusion in the nation's official list of cultural resources worthy of preservation and provides a degree of protection from adverse effects resulting from federally funded or licensed projects. Registration provides a number of incentives for preservation of historic properties, including special building codes to facilitate the restoration of historic structures, and certain tax advantages.

There are no restrictions placed upon a private property owner with regard to normal use, maintenance, or sale of a property listed in the National Register. However, a project that may cause substantial adverse changes in the significance of a registered property may require compliance with local ordinances or the California Environmental Quality Act. In addition, registered properties damaged due to a natural disaster may be subject to the provisions of Section 5028 of the Public Resources Code regarding demolition or significant alterations, if imminent threat to life safety does not exist.

If you have questions or require further information, please contact the Registration Unit at (916) 653-6624.

Sincerely,

Dr. Knox Mellon
State Historic Preservation Officer

Description

The San Francisco-Oakland Bay Bridge, or simply the Bay Bridge, is one of the most impressive engineering structures in the United States. Approximately five miles in total length, the Bay Bridge carries two levels of traffic over the San Francisco Bay, connecting the cities of San Francisco and Oakland, California. The Bay Bridge serves both as the terminus of an interstate highway and as the linchpin for the transportation network of the San Francisco Bay Area, one of the nation's largest metropolitan regions. The Bay Bridge is also among the world's most complex bridges in that it incorporates a variety of different bridge types connected to form a single structure. The West Bay Crossing, or West Span, consists of two back-to-back suspension spans, one anchored at Yerba Buena Island, one in San Francisco, and each is anchored to a massive center pier, Pier W-4. The East Bay Crossing, or East Span, is comprised of a series of trusses and girder spans. The Yerba Buena Island Tunnel links the west spans and the east spans. The bridge then connects to an existing roadway system at each end. The Bay Bridge has undergone extensive alteration since its construction in 1936, but still retains much of its historic and structural integrity.[1]

The Bay Bridge was the longest bridge in the world when it was built in 1936. The bridges, viaducts, and tunnel total about 5 miles, of which approximately 4 miles are over water. In 1936, the State of California claimed the bridge was 8 1/4 miles long, a figure that included a mass transit elevated loop in San Francisco and long approaches on the East Bay. The distance from the San Francisco Viaduct to the anchorage is 3,707 feet. The distance from the San Francisco anchorage to the Yerba Buena Island anchorage is 9,528 feet, or 1.8 miles. The distance on the island is 1,663 feet, which includes a tunnel and viaducts. The distance from the

[1] Stephen Mikesell, John Nelson, Dan Peterson, and Mark Ketchum. Historic American Engineering Record, San Francisco-Oakland Bay Bridge (Oakland-San Francisco Bay Bridge), Addendum to: Oakland-San Francisco Bay Bridge. May 1, 1999. 7, 13.

island to the Oakland Toll Plaza is 20,942 feet, about 4 miles, some of which is on fill.[2]

As originally designed, the double-decked bridge carried two-way automobile traffic on the top deck and truck and interurban trolleys on the lower level. There were six lanes on the top deck, three in each direction. The lower deck carried two trolley tracks in addition to truck lanes. The complex mix of truck, trolley, and automobile traffic required a large number of different on-and off-ramps on both approaches. In the late 1950s and early 1960s, the bridge and approaches were modified to carry mixed car/truck traffic on each deck and remove the electric railway system. The upper deck was designed to carry westbound traffic and the lower deck east bound traffic. This required strengthening the upper deck to accommodate the weight of trucks. The lower deck required new concrete slabs where the rails were removed, as well as the removal of a series of center columns at Yerba Buena Island. A lower roadway deck was added to the San Francisco viaducts to connect to the freeway system.[3]

The San Francisco Bay and Yerba Buena Island define the physical and cultural setting for the Bay Bridge. When it was built, the bridge began and ended in major harbor areas- the bustling San Francisco harbor and the Port of Oakland, which was then just emerging as a major harbor facility. Each setting has changed dramatically since completion of the bridge in 1936. In San Francisco, the waterfront near the anchorage for the bridge was a busy harbor facility at the time the bridge was built. Since 1936, however, commercial tonnage in the port area of San Francisco has declined dramatically and the waterfront has been reused for a variety of commercial and residential purposes. Conversely, the Port of Oakland has grown into the third largest port facility on the West Coast, specializing in handling containerized cargo. The waterfront south of the bridge is lined with massive cranes and other harbor structures as well as major rail and highway connections, many of which have been built and rebuilt since the 1950s. Situated midway between San Francisco and Oakland is Yerba Buena Island. A natural island, Yerba Buena was used as a station for the U.S. Navy beginning in 1900. While the Bay Bridge was under construction, the Army Corps of Engineers was creating a new island, called Treasure Island, on shoals north of Yerba Buena Island to serve as a site for the 1939 World's Fair. In 1940, Treasure Island was also taken over by the Navy, and both Treasure Island and Yerba Buena Island were used together as the Treasure

[2] Mikesell, et al., 13.
[3] Mikesell, et al., 13-14.

Island Naval Station between 1940 and the closure of the station in 1998. Today, Yerba Buena Island includes relatively few buildings and has a park-like feel, particularly since the Navy has vacated the island.[4]

All permanent structures of the bridge were built of steel and/or reinforced concrete. Reinforced concrete was used for foundations, short-span structures in the San Francisco Approach and the Island Crossing, and for roadway slabs of the long-span steel structures. Steel was used for all main superstructure components of the West Bay Crossing and East Bay Crossing. Five types of steel were used: carbon steel, nickel steel and silicon steel for major structural components, as well as special heat-treated eyebars for special application in the East Bay Crossing trusses, and cold-drawn wire for the cables of the West Bay Crossing. All connections of structural plate steel were made with rivets and bolts. Rivets were the norm-bolts used only at special locations where the riveting was not feasible. The upper deck was designed for automobile traffic, with six ton vehicles in six lanes (9'-8" wide each), plus a ten ton truck in any one lane. The lower deck was designed for three lanes (10'-4" wide each) of 30 ton trucks, and two lines (27' wide space) for 70-ton Interurban electric rail cars. Wind loads were taken at 30 pound per square foot, typical for bridges of that era. Earthquakes were considered by designing for a load of 10 percent of the weight of the bridge, acting laterally.[5]

The individual components of the Bay Bridge have been previously determined eligible for the National Register of Historic Places. The individual elements that collectively comprise the Bay Bridge are as follows:

1. Bridge # 34-118R, the San Francisco Approaches or Lower Deck On-Ramp is comprised of continuous concrete box girders, simple span composite rolled steel stringers, and haunched concrete girders with transverse floor beams, all carried on concrete bents on spread pile footings. It originally served two-way truck traffic on the lower deck. It now serves eastbound traffic on the lower deck. It was functionally revised in 1958 following removal of interurban railroad tracks from the bridge's lower deck and conversion of the lower deck to eastbound-only traffic flow. Only a portion of bridge 34-118R is part of the original Bay Bridge construction. The original portion extends from Rincon Hill (in the area bounded by First, Second, Harrison, and Bryant Streets) to the San Francisco cable

[4] Mikesell, et al., 12-13.
[5] Mikesell, et al., 14.

anchorage. The lower deck structure southwest of Rincon Hill was constructed in the 1950s to connect the bridge to the new freeway.[6]

2. Bridge #34-118L, the Upper Deck San Francisco Approaches or Center Ramps are comprised of continuous spans with suspension span in between, rigid frame connection between superstructure and bents. The superstructure is haunched concrete T-beams with transverse floor beams, and cellular structure at cable anchorage and abutment, carried on a substructure of reinforced concrete bents on pile and spread footings. Its 56 spans total 3,850 feet long.[7] It originally served two-way automobile traffic on the upper deck. It now serves westbound traffic on the upper deck.

3. Bridge #34-117S, the Upper Deck San Francisco Approaches or South Off-Ramp, is comprised of spans of two T-beam longitudinal girders with transverse floor beams on one-and two-column bents and open end diaphragm abutment, all on spread footings. Its 23 spans total 1035.2 feet long.[8] It was originally an upper deck on-ramp for eastbound automobile traffic. It is now an off-ramp for upper deck westbound traffic.

4. Bridge #34-116F, the Upper Deck San Francisco Approaches or North Connector (Westbound 80/Northbound 480), are comprised of a superstructure of T-girder and composite steel girder spans, carried on a substructure of reinforced concrete wall piers, two-column bents, reinforced concrete abutment with reinforced concrete wingwalls, reinforced concrete retaining walls, all on spread footings. Its 40 spans total 1843.2 feet long.[9] It was originally a westbound off-ramp from the upper deck, and continues to serve this purpose.

5. Bridge #34-03, West Bay Spans, is comprised of steel Warren truss approach spans carrying a double deck and supported by steel bents on concrete footings, and a double-deck suspension bridge consisting of twin bridges placed end-to-end with steel towers supported on concrete footings and caissons, and with a center concrete anchorage and two concrete end anchorages. Its 9 spans total 10,303 feet long.[10]

[8] Ibid.
[9] Ibid.
[10] Ibid.

6. Bridge #34-04, Yerba Buena Tunnel, consists of two double-deck, cast-in-place, reinforced concrete T-beam viaducts with continuous spans, on spread footings, separated by a double-deck concrete arch tunnel. It is 1,791 feet long.[11]

7. Bridge #33-25, East Bay Spans, consists of double-deck steel truss and cantilever truss spans, steel girder spans, and concrete T-beam spans, on steel and concrete piers, concrete footings, concrete caissons, and timber piles. Its 52 spans total 11,327 feet long.[12]

8. Bridge #34-119Y consists of multiple concrete T-beam spans, with steel plate girder spans at local street overcrossings. It is 3439 feet long. It originally carried interurban trains between the lower deck of the bridge and the Transbay Terminal. It now serves the same purpose for busses rather than trains.

9. Bridge #34-120Y is a concrete box girder span crossing over Harrison Street. Its single span is 165 feet long. It originally carried interurban trains over Harrison Street, heading to and from the Transbay Terminal. It now serves the same purpose for busses rather than trains.

10. The Transbay Transit Terminal Building is an 870-foot long flat slab with a 230-foot central pavilion. It is located at the San Francisco end of the bridge. The construction is reinforced concrete, faced with California granite. It is extremely simple in design and without ornament except for aluminum trim. Its most extravagant features are the seven handsome two-story windows which extend across the front of the building. In composition, the building is an enframed pavilion with end bays, wings, and a base. Inside, it consists of a basement garage, street level waiting room, a mezzanine, and originally tracks on a third level. The tracks were removed when the interurban trains were replaced with buses after 1958.[13]

11. Key System Electrical Substation-San Francisco. This building, at Second and Harrison Streets in San Francisco, is adjacent to the ramp that originally carried Key System trains from the Bay Bridge west approach ramps to the Transbay

[11] Snyder, 2.
[12] Ibid.
[13] John Snyder, Transbay Transit Terminal, Architectural Inventory/ Evaluation Form, California Department of Transportation, Sacramento, 1983.

Terminal. The one story building is a rectangular concrete box, approximately 87-feet long (east to west) by 41 feet wide and 26 feet high. It has doors on three sides but no windows, with small ventilation louvers comprising the only other fenestration. The exterior walls have two parallel indentations near the top, a subtle decorative feature that relates the building visually to the concrete columns of the adjacent Bay Bridge west approach. There is a smaller building of similar design on Yerba Buena Island, which also served as an electrical substation for the bridge railway. Both substations served to provide power for the Key System trains that ran on the bridge.[14]

12. Key System Electrical Substation-Yerba Buena Island. It is located east of the tunnel's east portal, between the Bay Bridge and the westbound on-ramp to the bridge. This one story building is a rectangular concrete box, approximately 50 feet long (east to west) by 36 feet wide. It has an entrance on the south side, but no fenestration on the other three walls. The exterior walls have an indentation near the top, forming a narrow ledge around the perimeter of the building. There is a second indentation where the roof slab meets the walls. This minor design feature relates the building visually to the concrete piers of the Bay Bridge, and was integral to the functioning of the bridge's trains.[15]

13. S.F.O.B.B. Firehouse (Caltrans Garage) – Yerba Buena Island. The Firehouse is east of the tunnel's east portal, between the east viaduct of the Bay Bridge and the westbound on-ramp to the Bay Bridge. This one story, concrete building has a flat roof and is approximately 63 feet long (east to west) by 31 feet wide. The east façade is entirely open to provide access to the two vehicle bays. The wooden doors that originally covered this opening have been removed. The windows are multi-pane metal sash and there are two exterior doors on the south elevation. The building was made approximately 13 feet longer in the mid-1960s, with an addition to the west end. This building once housed fire trucks that serviced the bridge; it also held a locker room and office.[16]

[14] Andrew Hope, Sterling Street Substation, Primary Record, California Department of Transportation, Oakland, 1995.
[15] Andrew Hope, Y.B.I. Electrical Substation, Primary Record, California Department of Transportation, Oakland, 1995.
[16] Andrew Hope, Caltrans Garage, Primary Record, California Department of Transportation, Oakland, 1995.

14. Bay Bridge Substation (Caltrans substation) – Oakland. The substation is located at the end of the narrow peninsula that extends into San Francisco Bay from the Bay Bridge toll plaza. This building is approximately 90 feet long by 42 feet wide, with a small (22' x 10') extension at the left side of the south façade, giving the building an "L" shape. The concrete walls, which are 24 feet in height, have a slightly projecting base and pilasters, with a simple cornice of vaguely classical styling. These walls are not load bearing--the flat roof is supported by steel beams on interior steel columns. There is a metal roll-up door in the center of the east facade which is ten feet wide. This door was installed in the early 1960s, replacing the original paired, side-hinged doors. The smaller door on the east façade was also installed in a new opening at that time. There is a narrow passageway extending from the west wall, connecting this building to the older Key System Substation fifteen feet to the west. Originally constructed to provide power for the bridge's trains, the building is now used primarily for storage.[17]

15. Key Pier Substation – Oakland. The substation is located at the end of the narrow peninsula that extends into San Francisco Bay from the Bay Bridge toll plaza. This concrete building is approximately 42 feet wide by 32 feet deep, with a slightly projecting base and pilasters. It was constructed in 1926. The large doorway in the center of the south façade originally had paired, side-hinged doors, but now has a metal roll-up door. There are rows of small windows, each consisting of a six-pane fixed sash in a metal frame, at the top of the north and south facades. There are also narrow ventilation louvers at the tops of all four walls, just below the eaves. The hipped roof is clad in standing-seam sheet metal and is topped by a raised, central skylight which repeats the hipped roof form. The interior is a single, large room with an open mezzanine along the east and north walls. The roof is supported by steel trusses, which are supported in turn by concrete walls. A narrow passageway connects the east wall of this building to the larger electrical substation that was built fifteen feet to the east in the late 1930s. "This electrical substation was built as part of the Key System, which provided streetcar service throughout Oakland and other East Bay communities, with connecting ferry service to San Francisco. Originally named the San Francisco, Oakland & San Jose Railway, the system was organized in 1902 by Francis M. 'Borax' Smith, through the consolidation of existing streetcar lines. Smith built a long pier extending into the bay nearly to Yerba Buena Island, where streetcar passengers transferred to San Francisco-bound ferries. The

[17] Andrew Hope, Bay Bridge Oakland Substation, Primary Record, California Department of Transportation, Oakland, 1998.

railway was officially named the Key System after a reorganization in 1923, taking its name from the shape of the pier."[18]

The following element is considered to be non-contributing:

1. P. G. & E. Substation – Oakland. This building is approximately 42 feet by 26 feet, with a small (18' x 12') extension at the east end of the north wall, giving the building an "L" shape. The building closely resembles the larger Caltrans substation located just 70 feet to the east, with concrete walls having a slightly projecting base and pilasters, and a simple cornice of vaguely classical styling. A larger opening in the west wall is now filled in, and the building has no windows. There is a small fenced-in area on the south side of the building, containing electrical equipment.[19]

[18] Andrew Hope, Key Pier Substation, Primary Record, California Department of Transportation, Oakland, 1998.

Statement of Significance

The San Francisco-Oakland Bay Bridge qualifies for placement on the National Register under Criterion A for its significant influence on transportation in California and directly in the Bay Area. The San Francisco-Oakland Bay Bridge's multi-modal design is a perfect example of the mindset many commuters had during the 1930s. While many Bay Area commuters enjoyed driving their automobile into the city, many still used public transportation. Though the Bay Bridge no longer directly accommodates public transit, in the form of interurban rail lines, Bay Area commuters still use automobiles and public transportation in nearly equal numbers. Today the San Francisco-Oakland Bay Bridge continues to play a significant role in transportation as it serves as a major freeway connector for many who travel to and from the Bay Area. Everyday, 274,000 automobiles utilize the bridge.[20]

The San Francisco-Oakland Bay Bridge also qualifies for placement on the National Register under Criterion C for its engineering design. The building of a 5-mile bridge over water in 1936 was a major feat in itself, but poor foundation conditions required the engineers to be creative in their plans. Because of the conditions of the underlying ground foundation and the ingenuity of the engineers, the bridge consists of three different bridges and a tunnel. This ingenuity allowed the engineers to not only design a safe structure but to also design a structure that would break world records. The suspension section of the bridge, with its six spans, is the country's longest suspension bridge. Its longest individual spans are 2310' which makes them the sixth longest in the U.S. The 1400' cantilever span was the longest in the U.S. at the time of its construction but has since been surpassed by the Commodore John Barry Bridge in Chester Pennsylvania (1644') and the Greater New Orleans Bridge (1576'). Its piers are the deepest in the world.

Narrative Statement of Significance

Criterion A: Transportation

The San Francisco-Oakland Bay Bridge stands today as one of the most important and widely used bridges in the United States and the world. Over 274,000

[20] Stephen Mikesell, John Nelson, Dan Peterson, and Mark Ketchum. Historic American Engineering Record, San Francisco-Oakland Bay Bridge (Oakland-San Francisco Bay Bridge), Addendum to: Oakland-San Francisco Bay Bridge. May 1, 1999. 238.

automobiles, trucks and buses use the Bay Bridge daily, a figure rarely matched or surpassed anywhere. The Bay Bridge connects two major population centers in one of the busiest metropolitan regions in the country. Further, the Bay Bridge serves as a major freeway connector for the region's massive transportation network, though this role has evolved over time and was not the bridge's original purpose.
The need for the Bay Bridge became apparent during the 1920s when the number of automobile registrations and population increased. California, in the 1920s, was the forerunner in the nation leading the way for automobile use.

> Its use is credited to contributing greatly to the economic prosperity of that decade and transformed virtually every aspect of transportation in California and the nation, and had profound impacts as well on settlement patterns, patterns of retail sales, and a host of other aspects of community development. Automobile sales increased nationally, automobile manufacturers regarded California as the "bottomless pit" market for their products.[21]

The Bay Area during the 1920s and the 1930s provides a perfect example of how automobiles transformed an urban environment. Population density in San Francisco had increased, with the search on for new places to live. The advantage to owning an automobile was that it granted people increased mobility. Now, Bay Area residents could move into suburban neighborhoods without the fear of losing their city-based jobs. Even though interurban rail lines remained the primary commuter mode in the Bay Area in 1930, those lines were rapidly losing their share of the market to automobiles, despite the long ferry rides and high tolls associated with transbay automobile commuting.

As Bay Area transportation patterns evolved during the 1920s, the region's transportation network had to change to meet new demands. Traffic congestion was not an uncommon phenomenon to the people of the Bay Area. State and local transportation agencies attempted to relieve this congestion by constructing new and improved highways linking both East Bay cities with Oakland and Peninsula cities with San Francisco. However, the

[21] "The crucial place of California in this regard is highlighted in James L. Flick, The Car Culture. Cambridge: MIT Press, 1975. Flick credits automobile sales for the prosperity of the 1920s and points to declining sales during the late 1920s for contributing to the depth of the Great Depression." As cited in Mikesell, et al., 239.

Bay Bridge became necessary as a link between San Francisco and Oakland, as ferries could no longer accommodate the increased traffic on the waterways. The San Francisco-Oakland Bay Bridge was in many ways like the other bridges being proposed at the time, in that seventy-five percent of its lane capacity would be designated for automobile use. However, what made the San Francisco-Oakland Bay Bridge unique among other bridge designs was that it also included lanes for mass transit use. The multi-modal design was vital to the engineers because they wanted everyone to be able to use this bridge. Further, the multi-modal design accurately reflected how Bay Area residents relied equally on automobiles and public mass transit for their commuting needs.[22]

The proposal for the San Francisco-Oakland Bay Bridge received almost universal support from both citizens and civic leaders. Most everyone recognized the importance and the necessity of having a bridge connecting these two city centers. It was no surprise then that the bridge proposal was passed and the loan of $70 million from the federal government was granted.[23]

The San Francisco-Oakland Bay Bridge was completed in three years and just a little bit ahead of schedule. Several factors led to the bridge's relatively swift construction. First, many politicians pushed for a timely completion date in order to satisfy certain political commitments that had been made. One of these commitments included the employment of thousands of people hit hard by the Great Depression. Secondly, the bridge's engineers wanted to finish early to prevent accumulation of interest onto the principal of their loan. When the San Francisco-Oakland Bay Bridge finally opened it served double and then triple the anticipated traffic. No one could have foreseen the success the San Francisco-Oakland Bay Bridge experienced.[24]

Speculations as to what sparked the success of the San Francisco-Oakland Bay Bridge are numerous. The first reason attributed to the success of the San Francisco-Oakland Bay Bridge became evident when the region hosted the World's Fair on Treasure Island in 1939-1940. Although one could access Treasure Island by water transportation, the San Francisco-Oakland

[22] Mikesell, et al., 239.
[23] Mikesell, et al., 10.
[24] Mikesell, et al., 8-9.

Bay Bridge proved to be a much more convenient and efficient method of getting to the island and the fair. Another reason for the success of the bridge was the entry of the United States into World War II in 1941. The United States' participation in the war transformed the Bay Area into a key contributor to the war effort. The San Francisco-Oakland Bay Bridge facilitated the movement of personnel and supplies from port to port. Finally, the Bay Bridge succeeded due to the significant increase in the population of the Bay Area during the post-war years.[25] The San Francisco-Oakland Bay Bridge once again served as a highly effective connector between these two metropolitan areas. One can only wonder what the Bay Area would look like if it did not have the San Francisco-Oakland Bay Bridge to accommodate the wartime and post-war growth of the area.

By 1963, the Bay Bridge had also evolved into a vital freeway connector for the Bay Area. This was not the original purpose of the Bay Bridge, as its designers assumed that most people would be traversing the bridge on interurban rail lines or buses. However, the failure of the interurban rail lines and the increased popularity of automobiles eventually led to the Bay Bridge becoming exclusively an automobile-truck bridge in 1963. Once again, the Bay Bridge reflected the changing reality of the Bay Area transportation network.

Criterion C: Engineering

In 1955 the American Society of Civil Engineers chose the San Francisco-Oakland Bay Bridge as one of the Seven Wonders in the United States. It was the only highway-related structure in the group.[26] The San Francisco-Oakland Bay Bridge broke many records when it was built, though this was not the original intention of the engineers. Nevertheless, the San Francisco-Oakland Bay Bridge excelled in its length, the depth of its piers, the total length of the suspension span, the length of its cantilever span, and in the great amounts of concrete, steel, wood, and other materials used in its construction. These remarkable feats only add to the bridge's importance.[27]

[25] Mikesell, et al., 9.
[26] Mikesell, et al., 242.
[27] Ibid.

The particular goal the engineers wanted to accomplish was to construct a double-deck, multi-modal structure between Oakland and San Francisco. They were able to accomplish this goal within a short amount of time and below their estimated budget. One aspect that contributes to the significance of the San Francisco-Oakland Bay Bridge is that "it was designed in a period of two years and built within three years."[28] One reason for the great haste in building the bridge was the desire to satisfy the promises the engineers and architects made to the governor, the legislature, and political leaders in the Bay Area. When campaigning for support of the San Francisco-Oakland Bay Bridge, C.H. Purcell, chief engineer of the bridge made promises to those who could further his cause. No doubt he wanted to make good on his promises. Another reason for the swiftness in constructing the San Francisco-Oakland Bay Bridge was to commence bringing in revenue from the tolls to cut down on the interest payments of the loan. Still another reason cited for the speed in which the San Francisco-Oakland Bay Bridge was built was the need to provide jobs. One of the promises made to politicians for their support in the bridge proposal was to provide jobs for those who were experiencing difficult times because of the Great Depression. The urgency of the approval for the plans of the bridge was in part to employ the Depression-ravaged citizens of California.[29]

The impressive length of the San Francisco-Oakland Bay Bridge also demonstrates significance in engineering. By today's standards, the San Francisco-Oakland Bay Bridge demonstrates a certain level of ingenuity from the perspective of the engineers. To fully appreciate this ingenuity, one must look at the design of the bridge through the eyes of the engineers who overcame difficulties, such as poor foundation conditions, without the benefit of modern day technology. The use of a double-suspension span would not have been necessary except for the length the bridge had to cross from Yerba Buena Island to San Francisco.[30] This double-suspension type of bridge was considered so unusual at that time that it could be considered as the first of its kind.[31]

---

[28] Ibid.
[29] Mikesell, et al., 242-243.
[30] Mikesell, et al., 243.
[31] "United States Steel, "San Francisco Oakland Bay Bridge," 1936, illustrates the only known predecessor to the double-suspension bridge design, an 1841 bridge in Prague, Czechoslovakia across the River Moldau; 19." As cited in Mikesell, et al., 244.

As previously noted, the engineers were not trying to build an impressive bridge; they were designing a means to cross the four-mile bay between San Francisco and Oakland. However, this is not to say that there was no desire to accomplish something daring. Some engineers advocated the use of a single-suspension span for the San Francisco-Oakland Bay Bridge for two reasons. "The first being that it would provide the best possible water way for shipping and second, it would undoubtedly create a bridge which architecturally and spectacularly would appeal to the civic pride in both cities."[32] The eventual design for the bridge was the double-suspension span because the engineers did not want to stray too far from known technologies.[33]

Why did the engineers then break world records if that was not their intention? The main reason for having to utilize the technology that they did was the poor foundation conditions of the ground that the bridge was to be built on. The depth of the piers is not attributed to the great length of the San Francisco-Oakland Bay Bridge, but actually to the seabed conditions. The length did have something to do with the piers, but only in the factors that some of them would have to be built on a poor foundation. "The deepest East Bay and West Bay piers are roughly the same depth but for different reasons. On the West Bay, the depth was defined as the depth to bedrock. The East Bay piers were sunk to a level where the hardest clay could be found. Pier E-3 reached the greatest depth by accident; the caisson continued to sink uncontrollably and gained an extra 10 feet on that basis.

"The use of multiple bridge types and the fact that the East Bay Crossing is different from the West Bay, also came from the result of the poor foundation conditions. The West Bay crossing was designed as a suspension bridge to minimize the number of piers it would have to use. When the engineers realized that the piers on the East Bay could not be taken to bedrock, they eliminated the idea of suspension bridge from that side of the island. The decision of using multiple bridge types would minimize the weight of both the substructure and superstructure.

---

[32] "Daniel Moran and Proctor to Woodruff, November 9, 1931, Board of Consulting Engineers, Moran and Proctor, 200.5, California State Archives." As cited in Mikesell, et al., 244.
[33] Mikesell, et al., 244.

"In the final analysis the Bay Bridge is a very complex structure because it was also a very bold undertaking. All of the important elements of it, from the deep piers to the multiple bridge types to double-suspension bridge to the great length, were solutions to the problems posed by this daring crossing. These elements were compromises that the state engineers and consulting engineers developed as they worked to solve the problem. That the solution worked well is a testament to the talent of the people involved in that process."[34]

Boundary Description

The boundaries of the Bay Bridge consist of the named structures listed in the nomination beginning at 5th Street in San Francisco and ending just beyond where the bridge touches down on the Oakland side and becomes a roadway on grade. That easternmost point is 1100 feet from the shoreline. At various places the boundary expands to embrace the footprint of the buildings listed in the nomination, including the Transbay Terminal and the Key System Electrical Substation in San Francisco, the Key System Electrical Substation and S.F.O.B.B. Firehouse on Yerba Buena Island, and the Bay Bridge Substation, Key Pier Substation, and P.G. & E. Substation in Oakland. The UTM references for these buildings are as follows:

Transbay Transit Terminal – San Francisco
Zone 10, Easting: 553260, Northing: 4182450

Key System Electrical Substation – San Francisco
Zone 10, Easting: 553490, Northing: 4181890

Key System Electrical Substation – Yerba Buena Island
Zone 10, Easting: 556050, Northing: 4185840

S.F.O.B.B. Firehouse (Caltrans Garage) – Yerba Buena Island
Zone 10, Easting: 556070, Northing: 4185860

Key Pier Substation – Oakland
Zone 10, Easting: 559110, Northing: 4185970

P.G. & E. Substation – Oakland
Zone 10, Easting: 559090, Northing: 4185950

Bay Bridge Substation – Oakland
Zone 10, Easting: 559130, Northing: 4185980

Boundary Justification

The boundaries encompass the historic bridge structures and appurtenant buildings. The boundaries at the eastern end of the bridge have been drawn to exclude the newer and heavily modified non-contributing buildings at and near the Oakland Toll Plaza.

San Carlos, CA 94070

Re: Section 106 Memorandum of Agreement for the Transbay Terminal/Caltrain Extension Redevelopment Project, City and County of San Francisco

Dear Ms. Pang:

Enclosed herewith is the fully executed Section 106 Memorandum of Agreement for the subject FTA undertaking. I appreciate the cooperation of all parties in bringing this consultation to a successful conclusion. I look forward to the inauguration of the consultation prescribed by stipulation IV. of the agreement.

Please direct any questions about this matter to Hans Kreutzberg of my staff.

Sincerely,

Stephen D. Mikesell
Acting State Historic Preservation Officer

Enclosure

Memorandum of Agreement

Between the

Federal Transit Administration, and the California State Historic Preservation Officer

Regarding the

Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project in San Francisco County, California

WHEREAS, the Federal Transit Administration (FTA) may assist the Transbay Joint Powers Authority (TJPA), the City and County of San Francisco (CCSF), the Peninsula Corridor Joint Powers Board (JPB), and the San Francisco Redevelopment Agency (SFRA) with construction of a new multi-modal Terminal (Terminal) on the site of the present Transbay Transit Terminal (TTT), extension of the Peninsula Corridor Service (Caltrain) from its current San Francisco terminus at Fourth and Townsend Streets to a new underground terminus beneath the new Terminal, and establishment of a Redevelopment Area Plan with related development projects, including transit-oriented development on publicly-owned land in the vicinity of the new multi-modal Terminal (Undertaking); and

WHEREAS, on March 28, 2003, TJPA selected a Locally Preferred Alternative (LPA) for the Undertaking that includes the West Ramp Transbay Terminal Alternative, Full Build Redevelopment Alternative, and Second-to-Main Tunneling Alternative; and

WHEREAS, TJPA, as a Responsible Agency, intends to become the project sponsor, a grantee for federal grant receipt purposes, and the recipient of any FTA assistance for the Undertaking; and

WHEREAS, the California Department of Transportation (Department) has indicated that it will transfer to TJPA title to the historic property known as the TTT, which is a component of the San Francisco – Oakland Bay Bridge (Bay Bridge), a multi-component structure that is listed on the National Register of Historic Places (NRHP), and that such transfer of title will occur after the Department has received satisfactory proof that FTA has issued a Record of Decision pursuant to NEPA for construction of the Undertaking; and

WHEREAS, FTA, in consultation with the California State Historic Preservation Officer (SHPO), has determined that the Undertaking will adversely affect properties listed or eligible for listing in the NRHP (historic properties), including components of the Bay Bridge and the Second and Howard Streets Historic District, and may affect archaeological properties that have not yet been identified; and

WHEREAS, the Bay Bridge East Span Seismic Safety Project in San Francisco and Alameda counties is a separate undertaking from the subject Undertaking; and

WHEREAS, FTA has consulted with SHPO in accordance with 36 CFR Part 800, regulations implementing Section 106 of the National Historic Preservation Act (16 U.S.C. 470f), and has notified the Advisory Council on Historic Preservation (ACHP) of the adverse effect finding pursuant to 36 CFR §800.6 (a) (1); and

WHEREAS, FTA, TJPA, CCSF, JPB, SFRA have consulted with the Department; the City of Oakland, the San Francisco Architectural Heritage; the San Francisco Planning & Urban Research Association (SPUR); the National Park Service (Western Regional Office); the National Trust for Historic

Preservation; the American Institute of Architects Preservation Committee; San Francisco Beautiful; Transbay Citizens' Advisory Committee; the Oakland Heritage Alliance; the San Francisco Landmarks Preservation Advisory Board; and San Francisco Tomorrow, regarding the Undertaking and its effects on historic properties, and have taken all comments received from these parties into account;

NOW, THEREFORE, FTA and SHPO agree that if the Undertaking proceeds with FTA assistance, the Undertaking shall be implemented in accordance with the following stipulations in order to take into account the effects of the Undertaking on historic properties, and further agree that these stipulations shall govern the Undertaking and all of its parts until this Memorandum of Agreement (MOA) expires or is terminated.

STIPULATIONS

If FTA provides funding assistance or a loan guarantee for the Undertaking, FTA will ensure that the following stipulations, which are applicable to the Locally Preferred Alternative (LPA), are implemented:

I. Professional Standards

A. Professional Qualifications

All activities regarding history, historic preservation, historic architecture, architectural history, historic and prehistoric archaeology, that are carried out pursuant to this MOA will be carried out by or under the direct supervision of persons meeting, at a minimum, the Secretary of the Interior's professional qualifications standards (48 FR 44738-9) (PQS) in these disciplines. However, nothing in this stipulation may be interpreted to preclude any signatory or any agent or contractor thereof from using the properly supervised services of persons who do not meet the PQS.

B. Historic Preservation Standards

All activities regarding history, historic preservation, historic architecture, architectural history, historic and prehistoric archaeology that are carried out pursuant to this MOA shall reasonably conform to the Secretary of Interior's Standards and Guidelines for Archaeology and Historic Preservation (48 FR 44716-44740) as well as to applicable standards and guidelines established by SHPO.

C. Curation and Curation Standards.

FTA and TJPA shall ensure that, to the extent permitted under §§ 5097.98 and 5097.991. of the California Public Resources Code, materials and records resulting from any archaeological treatment or data recovery that may be carried out pursuant to this MOA, are curated in accordance with 36 CFR Part 79.

II. Mitigation of Effects on Components of the San Francisco-Oakland Bay Bridge (Bay Bridge)

A. Salvage

TJPA, in consultation with the Department, will identify elements of the existing TTT that may be suitable for salvage and interpretive use by museums. Within two years following execution of this MOA by FTA and SHPO, TJPA will offer any elements identified as suitable for salvage and interpretive use to San Francisco Architectural Heritage, the California State

Railroad Museum, Sacramento, the Western Railway Museum, the Oakland Museum, and any other interested parties. Interested parties must accept these elements at least 90 days prior to demolition of the TTT. TJPA will remove any elements selected in a manner that minimizes damage and will deliver them with legal title to the recipient. Items not accepted by interested parties for salvage or interpretive use within the time frame specified herein will receive no further consideration under this MOA.

B. Permanent Interpretive Exhibit at the Terminal

TJPA will direct the design and engineering team for the Undertaking to integrate into the design of the new Terminal a dedicated space for an interpretive exhibit. The interpretive exhibit will include at a minimum, but is not necessarily limited to: plaques or markers, a mural or other depiction of the historic TTT, ramps, or Key System, or other interpretive material.

TJPA will consult with the Department regarding the availability of historical documentary materials for the creation of the permanent interpretive display of the history of the original TTT and its association with the San Francisco-Oakland Bay Bridge.

The Department will assist TJPA in planning the scope and content of the proposed interpretive exhibit. In addition, TJPA will invite the Oakland Heritage Alliance, San Francisco Architectural Heritage, the California State Railroad Museum, and the Western Railway Museum to participate. TJPA, while retaining responsibility for the development of the exhibit, will consider, jointly with the Department, the participating invitees' recommendations when finalizing the exhibit design. TJPA will produce, install, and maintain the exhibit.

TJPA will also consult with the City of Oakland about its possible interest in having a similar interpretive exhibit in the East Bay. If agreement is reached prior to completion of final design of the Terminal, TJPA will provide and deliver exhibit materials to a venue that is mutually satisfactory to TJPA and the City of Oakland.

C. Oakland Museum of California Exhibit

TJPA will consult with the Department and the Oakland Museum about contributing to the Department's exhibit and the production of an interpretive video at the Oakland Museum relating to the history and engineering of the major historic state bridges of the San Francisco Bay Area. TJPA will propose contributions to such an exhibit and video that would be related to the history of the TTT, bus ramp loop structures, and the Key System. Items contributed by TJPA to such an exhibit may include photographs, drawings, videotape, models, oral histories, and salvaged components from the TTT. In addition, TJPA will assist the Oakland Museum by contributing up to $50,000 toward the cost of preparing and presenting the exhibit and preparing an exhibit catalog or related museum publication in conjunction with the exhibit, in a manner and to an extent that is mutually satisfactory to TJPA, the Department, and the Oakland Museum. A separate agreement will outline the negotiated financial contributions.

TJPA will work with the Oakland Museum and assist in the preparation of an exhibit and interpretive video if consultation results in agreement between TJPA and the Oakland Museum prior to demolition of the existing TTT.

D. Documentation

Prior to the start of any work that would have an adverse effect on components of the Bay Bridge that are historic properties, TJPA will request SHPO to determine whether these components, including the TTT and associated ramps, have been adequately recorded in existing documents. If SHPO determines that collectively, such documents, which include the Department's past recordation of a series of remodeling and seismic retrofit projects that have occurred since 1993, adequately document the TTT and ramps, then no further documentation will be necessary. In addition, TJPA, assisted by the Department, will seek to obtain the original drawings of the TTT by architect T. Pflueger. If SHPO determines that existing documentation is adequate, then TJPA will compile such documentation into a comprehensive record. Components to be included in the review of past documentation are:

- 425 Mission Transbay Transit Terminal (APN 3719-003, 3720-001, 3721-006),
- Upper Deck San Francisco Approaches or North Connector, Bridge #34-116F,
- Upper Deck San Francisco Approaches or Center Ramps, Bridge #34-118L,
- San Francisco Approaches or Lower Deck On-Ramp, Bridge #34-118R,
- Transbay Terminal Loop ramp, Bridge #34-119Y, and
- Harrison Street over-crossing, Bridge #34-120Y.

If SHPO determines that existing documentation does not constitute adequate recordation of the Bay Bridge components addressed hereunder, then TJPA and SHPO will consult further and SHPO will determine what level and type of additional documentation is necessary. Upon a written determination by SHPO that all documentation prescribed hereunder is satisfactory, TJPA will provide copies of this documentation to SHPO and the Department Headquarters Library, with xerographic copies to the History Center at the San Francisco Public Library, San Francisco Architectural Heritage, the Oakland History Room of the Oakland Public Library, the Oakland Museum of California, the Western Railway Museum, and Department District 4 Office. Thereafter, TJPA may proceed with that aspect of the Undertaking that will adversely affect the historic properties documented hereunder.

If SHPO does not respond within 45 days of receipt of each submittal of documentation prescribed herein, TJPA may assume that SHPO has determined that said documentation is adequate and may proceed with that aspect of the Undertaking that will adversely affect the historic properties documented hereunder.

III. Mitigation of Effects on Second and Howard Streets Historic District and Protective Measures for Rincon Point/South Beach Historic Warehouse Industrial District

A. Protective Measures

TJPA, in consultation with the owners of historic properties immediately adjoining the construction sites. will develop and implement measures to protect the contributing elements of the Second and Howard Streets Historic District and the Rincon Point/South Beach Historic Warehouse Industrial District from damage by any aspect of the Undertaking. Such measures will include, but are not necessarily limited to, those identified in Appendix A to this MOA. The protective measures herein stipulated will be developed and implemented by TJPA prior to the commencement of any aspect of the Undertaking that could have an adverse effect on historic properties immediately adjoining the construction sites herein identified. In addition, TJPA will monitor the effectiveness of the protective measures herein stipulated and will supplement or modify these measures as and where necessary in order to ensure that they are effective. The historic properties covered by the terms of this paragraph are shown in the following table.

Affected Historic Properties During construction				
Address/ Assessors Parcel Number	**NRHP Status**	**Contributing *Element of***	**Const. Date**	**Type of Impact**
589-591 Howard Street / 3736-098	*1D*	Second & Howard District & New Montgomery/ Second Street	*1906*	*Cut-and-cover construction nearby*
163 Second Street / 3721-048	*1D*		*1907*	
166-78 Townsend Street / 3788-012	*3D*	*Rincon Point/South Beach District & South End District.*	*1910 [1] 1888[2]*	*Cut-and cover Construction nearby. Need construction easement*
640 Second Street / 3788-002	*2S2*	Rincon Point/South Beach District & South End District.	*1926*	Tunnel under or near property
650 Second Street / 3788-049 *through 3788-073*	*2S2*		1922	
670-680 Second Street / 3788-043, 3788-044	*2S2 (670), 3D (680)*		1913	
301-321 Brannan Street / 3788-037	3D		1909	
130 Townsend Street / 3788-008	3D		1910 [1] 1895-6 [2]	
136 Townsend Street / 3788-009	3D		1902 [1] 1913 [2]	
144-46 Townsend Street / 3788-009A	3D		1922	
148-54 Townsend Street / 3788-010	3D		1922	
162-164 Townsend Street / 3788-*081*	3D		1919	

Notes: National Register Status Codes are as follows:
1 *Listed on the NRHP*
2S1 Determined eligible for listing by the Keeper of the Register
2S2 Determined eligible for listing by consensus of the SHPO and a federal agency.
1D Listed on National Register as a contributor to a district or multi-resource property
2D2 Determined eligible as a contributor by consensus determination
3D Appears eligible as a contributor to a fully documented district

Source: JRP Historical Consulting, Parsons Transportation Group, 2001.

B. Documentation

TJPA will take the effect of the Undertaking on the three historic properties listed below into account by recording these properties in accordance with the terms herein set forth. These properties are:

- 191 2nd Street, (APN: 3721-022),
- 580-586 Howard Street, (APN: 3721-092 through 3721-106), and
- 165-173 2nd Street, (APN: 3721-025).

Prior to taking any action that could adversely affect these properties, TJPA will consult SHPO and SHPO will determine the type and level of recordation that is necessary for these properties. Upon a written determination by SHPO that all documentation prescribed hereunder is complete and satisfactory, TJPA will submit a copy of this documentation to SHPO, with xerographic copies to the History Center at the San Francisco Public Library, San Francisco Architectural Heritage, and the Oakland History Room of the Oakland Public Library. Thereafter, TJPA may proceed with that aspect of the Undertaking that will adversely affect the historic properties documented hereunder.

If SHPO does not respond within 45 days of receipt of each submittal of documentation for prescribed herein, TJPA may assume that SHPO has determined that said documentation is adequate and may proceed with that aspect of the Undertaking that will adversely affect the historic properties documented hereunder.

C. Repair of Inadvertent Damage

TJPA will ensure that any damage to contributing elements of the Second and Howard Streets Historic District and the Rincon Point/South Beach Historic Warehouse Industrial District resulting from the Undertaking will be repaired by TJPA in accordance with the Secretary of the Interior's Standards for Rehabilitation. The condition of the contributing elements will be photographed by TJPA prior to the start of the Undertaking to establish the baseline condition for assessing any damage. To document these existing conditions, TJPA will consult with property owner(s) about the appropriate level of photographic documentation of building interiors and exteriors. A copy of this photographic documentation will be provided to the property owner(s), and will be retained on file by TJPA. If repair of inadvertent damage resulting from the Undertaking is necessary, TJPA will submit repair plans and specifications to SHPO for review and comment to ensure that the work conforms to the Secretary of the Interior's Standards for Rehabilitation. TJPA and SHPO will consult to establish a mutually satisfactory time frame for the SHPO's review. TJPA will carry out any repairs required hereunder in accordance with the comments of SHPO.

IV. Consideration of Potential Effects on and Prospective Development and Implementation of a Treatment Plan for Archaeological Properties

A. Consultation

Within 45 days following execution of this MOA by FTA and SHPO, FTA, SHPO, TJPA, JPB and CCSF will consult to initiate the process of determining how archaeological properties that may be affected by the Undertaking will be identified, whether and how the NRHP eligibility of such properties may be addressed, and whether and how the Undertaking's effects, if any, on those archaeological properties that may be considered historic properties for purposes of this MOA, may be taken into account. FTA and TJPA shall invite Caltrans to participate in this consultation. The time frame for this consultation shall be determined by the consulting parties through consensus. The consultation herein prescribed will at a minimum be informed by, and take into account, the following documents:

1. Attachment 6, "Standard Treatment of Archaeological Sites: Data Recovery Plan", of the "Programmatic Agreement among the Federal Highway Administration, the Advisory Council on Historic Preservation, the California State Historic Preservation Office, and the California Department of Transportation Regarding Compliance with Section 106 of the National Historic Preservation Act, as it pertains to the Administration of the Federal Aid Highway Program in California."

2. "Archaeological Research Design and Treatment Plan for SF-480 Terminal Separation Rebuild (Praetzellis and Praetzellis, 1993)" and "The San Francisco-Oakland Bay Bridge, West Approach Replacement: Archaeological Research Design and Treatment Plan (Ziesing, 2000)".

3. "Revised Historical Archaeology Research Design for the Central Freeway Replacement Project (Thad M. Van Bueren, Mary Praetzellis, Adrian Praetzellis, Frank Lortie, Brian Ramos, Meg Scantlebury and Judy D. Tordoff)."

B. Treatment Plan

If the consulting parties agree that a plan for treatment of archaeological properties (Treatment Plan) should be prepared, then TJPA will prepare a Treatment Plan that provides for the identification, evaluation and treatment of archaeological properties that may be affected by the Undertaking. The Treatment Plan shall conform to the requirements of item 1., above, of this stipulation, take into account the information contained in items 2. and 3., above, of this stipulation, and conform to any other standards, documentation, or guidance that the consulting parties may specify. If the consulting parties agree that the Treatment Plan will address historic archaeological properties as well as prehistoric archaeological properties, then with respect to consideration of historic archaeological properties, TJPA shall ensure that appropriately qualified historians prepare a historic context(s) that will be used by an interdisciplinary team consisting at a minimum, of historians and historic archaeologists, to:

1. Identify any significant research themes and topics that relate to the historic period(s) addressed by the historic context(s);

2. Determine what types of historic archaeological properties, if any, may usefully and significantly contribute to research themes and topics deemed by the historic context(s) study to be important;

3. Identify the specific components and constituents (features, artifacts, etc.), if any, of historic archaeological property types that can factually and directly, rather than speculatively, contribute data important to our understanding of significant historic research themes and topics;

4. Determine the amount (sample size, etc.) of archaeological excavation and related activity that is needed to provide the range and type of factual data that will contribute to our understanding of significant historic research themes and topics.

Upon completion, TJPA, on behalf of FTA, will submit the draft Treatment Plan to the other consulting parties for review and comment. The consulting parties shall have 45 days from receipt of the draft Treatment Plan to comment in writing to FTA and TJPA. Failure of the consulting parties to respond within this time frame shall not preclude FTA and TJPA from finalizing the draft Treatment Plan to their satisfaction. Before finalizing the draft Treatment Plan, FTA and TJPA will provide the consulting parties with written documentation indicating whether and how the draft Treatment Plan will be modified. Unless any consulting party

objects to this documentation in writing to FTA and TJPA within 15 days following receipt, FTA and TJPA may finalize the draft Treatment Plan as they deem appropriate, and proceed to implement the final Treatment Plan. If FTA and TJPA propose to modify the final Treatment Plan, TJPA, on behalf of FTA, will notify the consulting parties concurrently in writing about the proposed modifications. The consulting parties will have 15 days from receipt of notification to comment in writing to FTA and TJPA. Failure of the consulting parties to respond within this time frame shall not preclude FTA and TJPA from modifying the final Treatment Plan to their satisfaction. Before modifying the final Treatment Plan, FTA and TJPA will provide the consulting parties with written documentation indicating whether and how the final Treatment Plan will be modified. Unless any consulting party objects to this documentation in writing to FTA and TJPA within 15 days following receipt, FTA and TJPA may modify the final Treatment Plan as they deem appropriate, and proceed to implement the modified final Treatment Plan.

C. Treatment Plan Reporting Requirements

1. If pursuant to section B., above, of this stipulation, a Treatment Plan has been implemented, then within two years after FTA, in consultation with TJPA, has determined that all fieldwork required by the Treatment Plan has been completed, FTA will ensure that TJPA prepares a draft technical report that documents the results of implementing the Treatment Plan and distributes this draft technical report to the other MOA signatories for review. The reviewing parties will be afforded 60 days following receipt of the draft technical report to submit any written comments to FTA and TJPA. Failure of the reviewing parties to respond within this time frame shall not preclude FTA from authorizing TJPA to revise to the draft technical report as FTA and TJPA may deem appropriate. FTA will provide the reviewing parties with written documentation indicating whether and how the draft technical report will be modified in accordance with any reviewing party comments. Unless the reviewing parties object to this documentation in writing to FTA and TJPA within 30 days following receipt, FTA and TJPA may modify the draft technical report as they may deem appropriate. Thereafter, FTA and TJPA may issue the technical report in final form and distribute this document in accordance with paragraph C.2 of this stipulation.

2. Copies of the final technical report documenting the results of Treatment Plan implementation will be distributed by TJPA to the other signatory parties, to any consulting Native American Tribe if prehistoric, protohistoric or ethnographic period archaeological properties were located and addressed under the Treatment Plan, and to the appropriate California Historical Resources Information Survey (CHRIS) Regional Information Center, subject to the terms of stipulation IV.E.

3. FTA will ensure that TJPA prepares a written draft document that communicates in lay terms the results of Treatment Plan implementation to members of the interested public. TJPA will distribute this written draft document for review and comment concurrently with and in the same manner as that prescribed for the draft written technical report prescribed by paragraph C.1. of this stipulation. If the draft document prescribed hereunder is a publication such as a report or brochure, then such publication shall upon completion be distributed by TJPA to the other signatory parties, to any consulting Native American Tribe as applicable, and to any other entity that the signatory parties and, as applicable, any consulting Native American Tribe, through consultation may deem appropriate, subject to the terms of Stipulation IV.E.

4. TJPA will prepare a written annual report describing the status of its efforts to comply with the terms of stipulations II. – IV., inclusive, of this MOA. The annual report will be prepared following the end of each fiscal year (July 1 to June 30) that this MOA is in effect

and will be distributed by TJPA to all MOA signatories by July 30 of each year until FTA and the SHPO through consultation determine that the requirements of stipulations II. - IV., inclusive, of this MOA have been satisfactorily completed.

D. Treatment Plan Not Developed -- Addressing Discoveries

If the consulting parties agree that a plan for treatment of archaeological properties will not be prepared, then any archaeological properties discovered during implementation of any aspect of the Undertaking will be addressed by TJPA pursuant to 36 CFR § 800.13(b)(3).

E. Confidentiality

The signatories to this MOA acknowledge that historic properties covered by this MOA are subject to the provisions of § 304 of the National Historic Preservation Act of 1966, as amended, and § 6254.10 of the California Government Code (Public Records Act), relating to the disclosure of archaeological site information and, having so acknowledged, will ensure that all actions and documentation prescribed by this MOA are consistent with § 304 of the National Historic Preservation Act of 1966, as amended, and § 6254.10 of the California Government Code.

F. Treatment of Human Remains of Native American Origin

The parties to this MOA agree that Native American burials and related items discovered during implementation of the terms of the MOA and of the Undertaking will be treated in accordance with the requirements of § 7050.5(b) of the California Health and Safety Code. If, pursuant to § 7050.5(c) of the California Health and Safety Code, the county coroner/medical examiner determines that the human remains are, or may be of Native American origin, then the discovery shall be treated in accordance with the provisions of § 5097.98(a)-(d) of the California Public Resources Code. TJPA will ensure that to the extent permitted by applicable law and regulation, the views of any consulting Native American Tribe and the Most Likely Descendant(s) are taken into consideration when decisions are made about the disposition of other Native American archaeological materials and records.

V. Resolving Objections

A. Should any party to this MOA object at any time to the manner in which the terms of this MOA are implemented, or to any action carried out or proposed with respect to implementation of the MOA (other than the Undertaking itself) or to any documentation prepared in accordance with and subject to the terms of this MOA, FTA shall immediately notify the other parties to this MOA of the objection and consult with the objecting party and the other parties to the MOA for no more than 21 days to resolve the objection. FTA shall reasonably determine when this consultation will commence. If the objection is resolved through such consultation, the action in dispute may proceed in accordance with the terms of that resolution. If, after initiating such consultation, FTA determines that the objection cannot be resolved through consultation, then FTA shall forward all documentation relevant to the objection to the ACHP, including FTA's proposed response to the objection, with the expectation that the ACHP will, within thirty (30) days after receipt of such documentation:

1. Advise FTA that the ACHP concurs in FTA's proposed response to the objection, whereupon FTA will respond to the objection accordingly; or

2. Provide FTA with recommendations, which FTA will take into account in reaching a final decision regarding its response to the objection; or

3. Notify FTA that the objection will be referred for comment pursuant to 36 CFR § 800.7(a)(4), and proceed to refer the objection and comment. FTA shall take the resulting comments into account in accordance with 36 CFR 800.7(c)(4) and Section 110(1) of the National Historic Preservation Act.

B. Should the ACHP not exercise one of the foregoing options within 30 days after receipt of all pertinent documentation, FTA may assume the ACHP's concurrence in its proposed response to the objection.

C. FTA shall take into account any ACHP recommendation or comment provided in accordance with this stipulation with reference only to the subject of the objection. FTA's responsibility to carry out all other actions under this MOA that are not the subject of the objection will remain unchanged.

D. FTA shall provide all other parties to this MOA, any consulting Native American Tribe, and the ACHP when the ACHP has issued comments hereunder, with a copy of its final written decision regarding any objection addressed pursuant to this stipulation.

E. FTA may authorize any action subject to objection under this stipulation to proceed after the objection has been resolved in accordance with the terms of this stipulation.

F. At any time during implementation of the measures stipulated in this MOA, should an objection pertaining to such implementation be raised by a member of the public, FTA shall notify the parties to the MOA, and any Native American Tribe, in writing of the objection and take the objection into consideration. FTA shall consult with the objecting party and, if the objecting party so requests, with any of the other MOA signatories and any consulting Native American Tribe, for no more than 30 days. Within 10 days following closure of this consultation period, FTA will render a decision regarding the objection and notify all consulting parties of its decision in writing. In reaching its decision, FTA will take into account any comments from the consulting parties regarding the objection, including the objecting party. FTA's decision regarding the resolution of the objection will be final. FTA may authorize any action subject to objection under this paragraph to proceed after the objection has been resolved in accordance with the terms of this paragraph.

G. Disputes pertaining to the National Register eligibility of properties covered by this MOA will be addressed by FTA in accordance with 36 CFR § 800.4(c)(2).

VI. Amendments

Any party to this MOA, or any consulting Native American Tribe, may propose that this MOA be amended, whereupon the parties to this MOA and, as applicable, any consulting Native American Tribe, will consult to consider such amendment. The amendment process shall comply with 36 CFR §§ 800.6(c)(1) and 800.6(c)(7). The time frame for such consultation shall be determined by FTA, in consultation with SHPO and TJPA. This MOA may be amended only upon the written agreement of the signatory parties. If it is not amended, this MOA may be terminated by either signatory party in accordance with Stipulation VII.

VII. Termination

A. If this MOA is not amended as provided for in Stipulation VI., or if either signatory party proposes termination of this MOA for other reasons, the signatory party proposing termination shall in writing, notify the other parties to this MOA and any consulting Native American Tribe,

explain the reasons for proposing termination, and consult with the other parties and any consulting Native American Tribe to seek alternatives to termination. The time frame for such consultation shall be determined by FTA, in consultation with SHPO and TJPA. Such consultation shall not be required if FTA proposes termination because the Undertaking no longer meets the definition set forth in 36 CFR § 800.16(y).

B. Should such consultation result in an agreement on an alternative to termination, then the parties and any consulting Native American Tribe shall proceed in accordance with the terms of that agreement.

C. Should such consultation fail, the signatory party proposing termination may terminate this MOA by promptly notifying the other parties to this MOA and any consulting Native American Tribe in writing. Termination hereunder shall render this MOA without further force or effect.

D. If this MOA is terminated hereunder, and if FTA determines that the Undertaking will nonetheless proceed, then FTA shall proceed in accordance with 36 CFR § 800.6 to develop a new MOA.

VIII. Duration of the MOA

A. Unless terminated pursuant to Stipulation VII., or unless it is superseded by an amended MOA, this MOA will be in effect following execution by SHPO until FTA, in consultation with the other parties and any consulting Native American Tribe, determines that all of its stipulations have been satisfactorily fulfilled. This MOA will terminate and have no further force or effect on the day that FTA notifies the other parties and any consulting Native American Tribe in writing of its determination that all stipulations of this MOA have been satisfactorily fulfilled.

B. The terms of this MOA shall be satisfactorily fulfilled within 12 years following the date of execution by SHPO. If FTA determines that this requirement cannot be met, the parties to this MOA and any consulting Native American Tribe will consult to reconsider its terms. Reconsideration may include continuation of the MOA as originally executed, amendment or termination. In the event of termination, FTA will comply with Stipulation VII.D. if it determines that the Undertaking will proceed notwithstanding termination of this MOA.

C. If the Undertaking has not been implemented within 12 years following execution of this MOA by the SHPO, this MOA shall automatically terminate and have no further force or effect. In such event, FTA shall notify the other parties and any consulting Native American Tribe in writing and, if it chooses to continue with the Undertaking, shall reinitiate review of the Undertaking in accordance with 36 CFR Part 800.

IX. EFFECTIVE DATE

This MOA will take effect on the date that it has been executed by SHPO.

Execution of this MOA by FTA and SHPO, its transmittal by FTA to the ACHP in accordance with 36 CFR § 800.6(b)(1)(iv), and subsequent implementation of its terms, shall evidence, pursuant to 36 CFR § 800.6(c), that this MOA is an agreement with the ACHP for purposes of Section 110(1) of the National Historic Preservation Act, and shall further evidence that FTA has afforded the ACHP an opportunity to comment on the Undertaking and its effects on historic properties, and that FTA has taken into account the effects of the Undertaking on historic properties.

Appendix A: Protective Measures:

Following are mitigation measures to be implemented to protect properties eligible for on in the National Register of Historic Places. The measures described would be implemented by a combination of construction contract specifications, drawings, and provisions, as well as public affairs programs. TJPA and JPB staff would be assigned to work directly with the public to provide project information and to resolve construction-related problems. The TJPA and JPB will work with community residents, elected officials, local businesses, and community organizations to tailor the mitigation program to best meet community needs. Contractors will be monitored to assure that mitigation measures are met.

I. Preconstruction Activities

- **Undertake building data survey.** A pre-construction structural survey would be completed to determine the integrity of existing buildings adjacent to and over the proposed extension. This survey would be used to finalize detailed construction techniques along the alignment and as the baseline for monitoring construction impacts during and following construction. During construction, the TJPA and JPB would monitor adjacent buildings for movement and, if movement is detected, take immediate action to control the movement.

- **Complete detailed geotechnical investigation.** During final design, additional sampling (drilling and core samples) and analyses of subsurface soil/rock conditions would be used to detail and finalize the excavation and its support system to be used in the retained cut, cut-and-cover and tunnel portions of the extension. Current data, including subsurface sampling conducted in 1995 and 1996 for the 1997 Caltrain DEIS/DEIR have been used to identify the proposed construction techniques presented in the following sections, which form the basis for the impact analysis that follows in Section 5.21.

II. General Construction Measures

- **Provide signage.** The TJPA and JPB would work with establishments affected by construction activities. Appropriate signage would be developed and displayed to direct both pedestrian and vehicular traffic to businesses via alternate routes.

- **Install level deck.** Decking at the under-street cut-and-cover sections would be installed flush with the existing street or sidewalk levels.

- **Provide for efficient sidewalk design and maintenance.** Wherever feasible, sidewalks would be maintained at the existing width during construction. Where a sidewalk must be temporarily narrowed during construction (e.g., deck installation), it would be restored to its original width during the majority of construction period. In some places this may require placing the temporary sidewalk actually on the deck. Each sidewalk design should be of good quality and approved by the Resident Engineer prior to construction. Handicapped access would be maintained during construction where feasible.

III. Soils/Geology

- **Underpin existing buildings, where deemed necessary, to protect existing structures from potential damage that could result from excessive ground movements during construction.** The design of the tunneling and the excavation procedures (and construction sequence), and the design of the temporary support system will be developed with the objective of controlling ground deformations within small enough levels to avoid damage to adjacent structures.

Where the risk of damage to adjacent structures is too great, special measures may be implemented such as: (1) underpinning, (2) ground improvement, and/or (3) strengthening of existing structures to mitigate the risks.

The cut-and-cover alignment passes near settlement-sensitive structures in the vicinity of the intersection of Second and Townsend streets, including buildings in the Rincon Point / South Beach Historic Warehouse – Industrial District (i.e., 166-178, 180, , and 350-360 Townsend Street).

The tunnel alignment passes under a number of old and settlement-sensitive structures in the vicinity of the intersection of Second and Townsend streets, including buildings in the Rincon Point / South Beach Historic Warehouse – Industrial District (i.e., 130, 136, 144-146, 148-154, and 162-164 "Townsend Street; 634, 640, 650, and 670-680 Second Street; and 301-321 Brannan Street).

Even though the tunnel will be excavated using the stacked drift method, and even though the tunnel will be excavated in the Franciscan Rock formation, the risk of potential adverse impacts of tunneling on the existing buildings must be assessed, because the rock cover over the tunnel is rather shallow.

As part of the initial studies performed in 1996, preliminary plans were developed to protect/strengthen existing structures to mitigate the risk of adverse impacts of tunneling on existing structures. Underpinning, if it is deemed necessary, is one of the options for mitigating adverse effects of tunneling on the existing buildings. Underpinning involves modification of the foundations of the building so that the superstructure loads can be transferred beyond the zone of influence of tunneling. Underpinning may include internal strengthening of the superstructure, bracing, reinforcing the existing foundations, or replacing the existing foundations with deep foundations that are embedded outside the zone of influence of tunneling.

Other alternatives, in lieu of underpinning, involve strengthening of the rock between the building and the crown of the tunnel. Grouting in combination with inclined pin piles can be used not only to strengthen the rock but to make the rock mass over the tunnel act as a rigid beam, which would allow construction of the tunnels with no adverse effects on the buildings that are supported on shallow foundations over the tunnel.

Preliminary plans for underpinning have been developed that allow cost estimates to be made for underpinning. During the detailed design phase of the Project, underpinning plans will be developed specific to each of the buildings that may require it. It is not necessary at this stage of the Project to develop detailed underpinning plans.

These issues will be addressed on a case by case basis, along the alignment, during the detailed design phase of the Project. The methodology that is proposed for the Caltrain Downtown Extension, i.e. to design the support system to control ground deformations within tolerances, and selectivity strengthen structures that may be too weak to resist even small deformations, was successfully used for the Muni Metro Turnback project, and should be effective for the Caltrain Downtown Extension Project as well.

- Assure proper design and construction of pile supported foundations for structures to control potential settlement of the surface. Stability of excavations resultant impacts on adjacent structures can be controlled within tolerable limits by proper design and implementation of the excavation shoring systems.

IV. Air Emissions

- Upon completion of the construction phase, buildings with visible signs of dirt and debris from the construction site shall be power washed and/or painted (given that permission is obtained from the property owner to gain access to and wash the property with no fee charged by the owner).

V. Vibration

- **Limit or prohibit use of construction techniques that create high vibration levels.** At a minimum, processes such as pile driving would be prohibited at distances less than 250 feet from residences.

- **Restrict procedures that contractors can use in vibration sensitive areas.** It is often possible to employ alternative techniques that create lower vibration levels. For example, unrestricted pile driving is one activity that has considerable potential for causing annoying vibration. Using the cast-in-drilled-hole piling method instead will eliminate most potential for vibration impact from the piling.

- Require vibration monitoring during vibration intensive activities.

- Restrict the hours of vibration intensive activities such as pile driving to weekdays during daytime hours.

- Investigate alternative construction methods and practices to reduce the impacts in coordination with the construction contractor if resident annoyance from vibration becomes a problem.

- Include specific limits, practices and monitoring and reporting procedures for the use of controlled detonation. Controlled detonation may be required during tunnel construction through rock for both the cut-and-cover and stacked-drift construction methods, subject to additional geotechnical investigations and other considerations that would be determined during the final design and construction phases of the project. Any use of controlled detonation would be closely controlled and monitored to avoid damage to existing structures. Specific limits, practices, and monitoring and reporting procedures would be included within the contract documents to ensure that such construction methods, if used, would not exceed safety criteria.

- **Use high-resilience track fasteners or a resiliently supported tie system** for the Caltrain downtown extension for areas projected to exceed vibration criteria.

TJPA Transbay Transit Terminal Historic Resource Recordation Submission

TJPA
TRANSBAY JOINT POWERS AUTHORITY
Maria Ayerdi • Executive Director

October 10, 2008

Mr. Stephen D. Mikesell
Deputy State Historic Preservation Officer
Office of Historic Preservation
P.O. Box 942896
Sacramento, CA 95296-0001

Subject: Transbay Transit Terminal Historic Resource Recordation Submission

Dear Mr. Mikesell:

Enclosed is documentation on the Transbay Transit Terminal, as required by the June 2004 Memorandum of Agreement (MOA) for the Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project in San Francisco, California, which was signed between the California State Historic Preservation Officer (SHPO), the Federal Transit Administration, and concurring signatories of the Transbay Joint Powers Authority (TJPA), the City and County of San Francisco, the Peninsula Corridor Joint Powers Board, and the California Department of Transportation (Caltrans).

This submittal fulfills MOA Stipulation II.D, Documentation, which requires the TJPA to collect past documentation of the Transbay Terminal to determine if the building has been adequately recorded prior to undertaking any work that will have an adverse effect on this historic property. The documentation in the accompanying submittal was compiled consistent with Historic American Buildings Survey/Historic American Engineering Record (HABS/HAER) Level 1 standards to demonstrate that the Transbay Terminal has been adequately recorded. The historic and contemporary documents included represent the original conditions and subsequent changes since the Terminal was constructed in 1939. The overview includes a summary of the drawings, photographs and written materials. Detailed lists of the drawings and photographs are also included for easy reference to the contents in this package.

In accordance with the MOA, the TJPA is to provide your office with a 45-day review period and requests your written comments, if any, by **Wednesday, November 26, 2008**. If SHPO determines that this submittal is adequate, or SHPO does not respond within 45 days, the TJPA may proceed with the demolition of the Transbay Terminal and ramps and provide copies of this documentation to the repositories identified in the MOA. If SHPO determines that this submittal does not constitute adequate recordation of the Terminal, then the TJPA and SHPO will consult further about what level and type of additional documentation is necessary.

This submission is concerned with the Transbay Terminal building only. Documentation for the following bridge elements listed in the MOA were submitted in 1999 to the SHPO by Caltrans as part of the Historic American Engineering Record (HAER project CA-32) for the San Francisco-Oakland Bay Bridge: the Transbay Terminal Loop ramp (Caltrans Bridge #34-119Y), the North Connector (Caltrans Bridge #34-116F), the Center Ramps (Caltrans Bridge #34-118L), the Lower Deck On-Ramp (Caltrans Bridge #34-118R), and the Harrison Street Over-crossing (Caltrans Bridge #34-120Y).

Separately, the TJPA is drafting an amendment to the MOA that acknowledges modifications to the schedule for the Transbay Transit Center Program that have occurred since execution of the MOA in 2004 and will share a draft of the proposed amendment with your office shortly.

We appreciate your consideration of this matter. If this submittal is determined by SHPO to be adequate recordation of the Transbay Terminal, please sign below and return this letter.

Sincerely,

Robert Beck
Senior Program Manager
Transbay Joint Powers Authority

J. Oishi, Program Coordinator, PMPC
A. Lau, Transit Center Project Manager, PMPC
S. Stratton, State Historic Preservation Office (pdf on CD)
L. Rogers, FTA Regional Administrator (pdf on CD)
B. Wycko, Environmental Review Officer, City and County of San Francisco (pdf on CD)
I. McAvoy, Chief Development Officer, Peninsula Corridor Joint Powers Board (pdf on CD)
J. Richards, Deputy District Director, Office of Environmental Planning & Engineering, Caltrans (pdf on CD)

Enclosure: - *Historic Resource Recordation Documentation for the Transbay Transit Terminal, 425 Mission Street, San Francisco, CA* prepared by the Transbay Joint Powers Authority, *October 10, 2008* (hardcopy and CD)
- *Historic American Engineering Record, San Francisco Oakland Bay Bridge HAER No. CA-32* submitted by Caltrans in 1999 to SHPO (pdf on CD)

The State Historic Preservation Officer finds that the submittal provided by the Transbay Joint Powers Authority dated October 10, 2008, is adequate recordation of the Transbay Terminal and, in combination with HAER project CA-32 submitted by Caltrans in 1999, adequately fulfills the requirements of MOA Stipulation II.D.

Appendix D

Excerpt of TJPA Mitigation Monitoring and Reporting Program

MITIGATION MEASURE	Responsibility for Implementation	Mitigation Schedule	Monitoring Responsibility	Monitoring Actions/Schedule
CH 9 – Request that SHPO, prior to the start of any work that would have an adverse effect on components of the Bay Bridge that are historic properties, determine whether these components, including the TTT and associated ramps, have been adequately recorded in existing documents. If SHPO determines that, collectively, such documents, which include the Department's past recordation of a series of remodeling and seismic retrofit project that have occurred since 1993, adequately document the TTT and ramps, then no further documentation will be necessary.	TJPA	During preliminary engineering and final design	TJPA	TJPA will consult with the SHPO regarding adequacy of prior recordation efforts.
Seek, with the assistance of the Department, to obtain the original drawings of the TTT by architect T. Pflueger.				TJPA will work with Department to seek original drawings of the Transbay Transit Terminal.
If SHPO determines that existing documentation is adequate, compile such documentation into a comprehensive record. Components to be included in the review of past documentation are: • 425 Mission Transbay Transit Terminal (APN 3719-003, 3720-001, 3721-006); • Upper Deck San Francisco Approaches or North Connector, Bridge #34-116F; • Upper Deck San Francisco Approaches or Center Ramps, Bridge #34-118L; • San Francisco Approaches or Lower Deck On-Ramp, Bridge #34-118R; • Transbay Terminal Loop ramp, Bridge #34-119Y; and • Harrison Street over-crossing Bridge #34-120Y.				If SHPO determines that existing documentation is adequate, compile such documentation into a comprehensive record.
Consult further with SHPO, if SHPO determines that existing documentation does not constitute adequate recordation of the Bay Bridge components addressed hereunder. SHPO will determine what level and type of additional documentation is necessary.				If SHPO determines that existing documentation does not constitute adequate recordation of the Bay Bridge components, then TJPA and SHPO will consult further and SHPO will determine what level and type of additional documentation is necessary.
Provide xerographic copies of this documentation to the SHPO and the Department Headquarters Library, upon a written				

MITIGATION MEASURE	Responsibility for Implementation	Mitigation Schedule	Monitoring Responsibility	Monitoring Actions/Schedule
determination by SHPO that all documentation prescribed hereunder is satisfactory, to the History Center at the San Francisco Public Library, San Francisco Architectural Heritage, the Oakland History Room of the Oakland Public Library, the Oakland Museum of California, the Western Railway Museum, and Department District 4 Office. Thereafter, TJPA may proceed with that aspect of the Project that will adversely affect the historic properties documented hereunder.				If no response from SHPO within 45 days of receipt of each submittal of documentation, TJPA may assume that said documentation is adequate and may proceed with the project. TJPA will ensure that these records are accepted by SHPO prior to demolition of the TTT and provide copies of the documentation to designated agencies. Then, TJPA will proceed with the aspect of the project that will adversely affect the historic properties documented.
CH 10 – Within 180 days after FTA determines that the Project has been completed, TJPA, in consultation with FTA and SHPO, will re-revaluate the Bay Bridge, a property listed on the NRHP, and determine whether the National Register nomination should be amended or whether the bridge no longer qualifies for listing and should be removed from the National Register. As appropriate, TJPA will prepare and submit to the FTA and SHPO either an amended nomination or petition for removal, to be processed according to the procedures set forth in 36 CFR Part 60 (60.14 and 60.15).	TJPA	Within 180 days after FTA determines that the Project has been completed	TJPA	As appropriate, TJPA will prepare and submit to the FTA and SHPO either an amended nomination or petition for removal, to be processed according to the procedures set forth in 36 CFR part 60 (60.14 and 60.15). TJPA will coordinate these efforts with the CCSF Planning Department.
CH 11 – Develop and implement measures, in consultation with the owners of historic properties immediately adjoining the construction sites, to protect the contributing elements of the Second and Howard Streets Historic District and the Rincon Point/South Beach Historic Warehouse Industrial District from damage by any aspect of the Project. Such measures will include, but are not necessarily limited to those identified in the MOA. The protective measures herein stipulated will be developed and implemented by TJPA prior to the commencement of any aspect	TJPA	During preliminary engineering, final design, and construction	TJPA	TJPA will contact owners of record of historic properties that will be affected (but that will not be acquired and demolished) by the Project. TJPA will provide and review this mitigation monitoring program with the owners via correspondence and/or public and face-to-face meetings. TJPA will coordinate these efforts with the CCSF Planning Department prior to commencement of any aspect of the

Appendix 2

William Self Associates Memorandum
Sterling Street Substation, Bus Ramps and Constructive Use

WSA

ARCHAEOLOGY AND HISTORIC PRESERVATION

MEMORANDUM

TO: Joyce Oishi **DATE: October 7, 2010**

FROM: Jim Allan

SUBJECT: Sterling Street Substation, Bus Ramps and Constructive Use

The Sterling Street Substation was constructed as an electrical substation for the Key System trains that originally crossed the San Francisco Oakland-Bay Bridge from Oakland to the Transbay Terminal in San Francisco and was a vital component of the Bay Bridge. Although trains no longer run on the bridge, the building retains its original use as an electrical substation and its association with the historic bridge. The building possesses a high degree of integrity and is eligible for listing on the National Register of Historic Places (NRHP) as a contributing element of the Bay Bridge (HAER No. CA-228).

The Bay Bridge itself is listed on the National Register under criteria A (it is associated with events that have made a significant contribution to the broad patterns of our history) and C (it embodies the distinctive characteristics of a type, period or method of construction . . .). While the substation is a contributing component of the Bay Bridge and as such is eligible for listing, its eligibility is based on its functional relationship and spatial proximity to the bridge (rather than its architectural significance, environmental setting, etc.), neither of which would be affected by the construction of the proposed bus ramps.

A constructive use occurs when a project's proximity impacts are such that the features or attributes that qualify a resource for listing on the NRHP are substantially diminished (Caltrans SER Vol. 1, Chpt. 20). FHWA has also determined that a constructive use may occur when the proximity of a proposed project substantially impairs aesthetic features or attributes of an eligible resource, where such features or attributes are considered important contributing elements to the value of the resource (Caltrans SER Vol. 1, Chpt. 20). FHWA has also specifically determined that a constructive use does not occur when the combined proximity impacts do not substantially impair the characteristics that qualify the property for [listing in the NRHP] (Caltrans SER Vol. 1, Chpt. 20.).

Since the substation is included in the NRHP as a contributing element to the Bay Bridge, rather than on its specific history, aesthetic or architectural characteristics, or its setting, it does not possess important contributing elements to its eligibility that would be diminished by construction of the bus ramps, and therefore a constructive use would not occur.

1.0 INTRODUCTION

1.1 DOCUMENT ORGANIZATION

This Addendum is organized into five sections as follows:

Introduction: This section provides introductory information such as background and purpose, summary findings, the project title, and the lead agency for the proposed project.

Project Description: This section provides a detailed description of the project setting, related projects, and the proposed project, including project characteristics, project objectives, and environmental review requirements.

Addendum Checklist and Environmental Impact Analysis: This section contains the completed Addendum Checklist. Each environmental issue identified in the Addendum Checklist contains an assessment and discussion of impacts associated with each subject area. When the evaluation identifies potentially significant effects, as identified in the Checklist, mitigation measures are provided to reduce such impacts to less-than-significant levels.

References: This section provides data sources used in the review of environmental impacts and the conclusions reached in the Addendum.

List of Preparers: This section provides a list of GGBHTD personnel and other team members who participated in the preparation of the Addendum.

1.2 BACKGROUND AND PURPOSE

In April 2004, the Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project (Transbay Program) Final Environmental Impact Statement/Environmental Impact Report (2004 FEIS/EIR) (SCH #95063004) was certified by the City and County of San Francisco, the Peninsula Corridor Joint Powers Board, and the San Francisco Redevelopment Agency. To date, the Transbay Terminal Joint Powers Authority, as lead agency for the Transbay Terminal portion of the project, has adopted six addenda to the original document. As used herein, "FEIS/EIR" includes all subsequently approved addenda.

This Seventh Addendum is being considered by the Golden Gate Bridge, Highway and Transportation District ("GGBHTD"), which is the lead agency for the development of the Mid-Day Bus Storage lot on the block bounded by Third, Fourth, Stillman and Perry Streets in San Francisco. Subsequent to certification of the 2004 FEIS /EIR, additional planning was initiated related to the details of the Mid-day Bus Parking Facility. This Addendum has been prepared pursuant to Section 15164 of the California Environmental Quality Act (CEQA) Guidelines (Title 14, California Code of Regulations, Section 15000 et seq.), which provides that the lead agency or responsible agency shall prepare an addendum to a previously certified environmental impact report (EIR) if some changes or additions are necessary but none of the changes or additions increase the level of environmental impacts to an extent requiring the preparation of a subsequent EIR (See CEQA Guideline 15162).

The replacement of the Transbay Terminal with the new Transbay Transit Center and the redevelopment of the surrounding area required that Golden Gate Transit relocate its previous San Francisco Mid-day Bus Parking

Facility—located on the block bounded by Main Street, Beale Street, Howard Street, and Folsom Street— to a new site. The proposed project site is located under the elevated portion of Interstate 80 (West Approach of the San Francisco-Oakland Bay Bridge) on the block bounded by Third Street, Fourth Street, Perry Street, and Stillman Street. Since the proposed project site could not be occupied until after the seismic retrofit of the West Approach was completed, Golden Gate Transit's Mid-day Bus Parking Facility was temporarily relocated to the current location at Eighth Street and Harrison Street. The proposed project evaluated herein consists of moving the Golden Gate Transit Mid-day Bus Parking Facility from the temporary location at Eighth Street and Harrison Street to the project site. The use of the proposed project site was examined in the FEIS/EIR, but several changes and refinements to the project are proposed. The purpose of this document is to evaluate the potential impacts associated with the proposed changes and refinements to the bus lot component of the project studied in the FEIS/EIR. This Addendum provides an accurate and objective discussion of environmental effects of the changes to the proposed project and is intended to inform decision makers, agencies, and the public.

1.3 SUMMARY FINDINGS

This Seventh Addendum is focused on the environmental topics that could show a potential change in the level of impact under the revised proposed project, namely air quality, greenhouse gas (GHG) emissions, noise, and transportation and traffic. As a result of the analysis conducted in this Seventh Addendum, it has been determined that all of these potential impacts would be classified as Less Than Significant or No Impact. All potentially significant impacts associated with the bus storage lot were previously evaluated in the FEIS/EIR. The proposed refinements to the bus storage lot are similar to previous design components evaluated in the FEIS/EIR, and no new or substantially more severe significant impacts have been identified or are anticipated to be identified, nor would these elements substantially change the severity or significance of the environmental impacts disclosed in the FEIS/EIR.

Therefore, the modifications described in this Addendum would not require major revisions to the FEIS/EIR due to new or substantially increased significant environmental effects. Furthermore, there have been no substantial changes with respect to the circumstances under which these design refinements would be undertaken that would require major revisions of the FEIS/EIR due to new or substantially increased significant environmental effects; and there has been no discovery of new information of substantial importance that would trigger or require major revisions to the FEIS/EIR due to new or substantially increased significant environmental effects. Therefore, no subsequent or supplemental environmental impact reports are required pursuant to CEQA Guidelines Sections 15162.

1.4 PROJECT INFORMATION

Project Title: Golden Gate Transit Mid-day Bus Parking Facility Relocation

Project Location: Third Street and Perry Street in San Francisco, CA

Lead Agency: GGBHTD

Project Sponsor: GGBHTD

GGBHTD Contact Person: Daniel Ng, PE, Senior Civil Engineer (415) 923-2323

This page intentionally left blank.

2.0 PROJECT DESCRIPTION

2.1 PROJECT SETTING

2.1.1 Project Location

The existing Golden Gate Transit Mid-day Bus Parking Facility is currently located at Eighth Street and Harrison Street, at the southeast corner of the block generally bounded by Eighth Street, Ninth Street (specifically, Gordon Street), Folsom Street (specifically, Ringold Street), and Harrison Street.

The proposed Golden Gate Transit Mid-day Bus Parking Facility would be located on the block generally bounded by Third Street, Fourth Street, Perry Street, and Stillman Street.

2.1.2 Description of Project Site and Existing Land Uses

The project site is located on the block bounded by Third Street, Fourth Street, Perry Street, and Stillman Street, underneath the elevated Interstate 80 (I-80) freeway (West Approach of the San Francisco–Oakland Bay Bridge or West Approach). The site is paved and fenced and is currently being used for daily vehicle parking. The project site is illustrated in Figure 2-1.

2.1.3 Description of the Surrounding Area

The project site is located within the South of Market (SoMa) area of Downtown San Francisco, and is bounded, in general, by major arterial roadways on all four sides (Third Street, Fourth Street, Harrison Street, and Bryant Street) that serve key roles in carrying traffic into and out of Downtown San Francisco and to and from nearby destination uses such as Caltrain's San Francisco terminal at Fourth Street / King Street, AT&T Park, and the Mission Bay area. An all-access interchange to I-80 is provided in close proximity to the site on the block bounded by Fourth Street, Fifth Street, Harrison Street, and Bryant Street. The southern tunnel portal of the under-construction Central Subway will be located along Fourth Street between Perry Street and Stillman Street.

Land uses in the vicinity of the project site consist primarily of light industrial and residential uses, but also include office and retail uses. The project site is bounded by two one-way streets (one-way westbound Perry Street to the north and one-way eastbound Stillman Street to the south) that provide on-street parking, mid-block circulation for vehicles attempting to access Third Street or Fourth Street (a one-way couplet), and parking / loading facility access for abutting parcels.

2.2 PROJECT OBJECTIVES

GGBHTD owns, maintains, and operates all "Golden Gate Transit" bus services in San Francisco. Existing Golden Gate Transit operations in San Francisco consist of two types of services: "Basic Bus" services operate seven days a week, during both peak and off-peak periods, while "Commute Bus" services operate during weekday peak periods, inbound into Downtown San Francisco in the mornings and outbound from Downtown San Francisco towards Marin and Sonoma Counties in the evenings. Existing Golden Gate Transit service in San Francisco is summarized in Table 2-1.

Notes:
[a] Mondays through Fridays, except holidays.
[b] Saturdays, Sundays, and holidays.
Source: GGBHTD, 2012a.

Basic Bus services (Routes 10, 70, 80, 101 and 101X) operate to and from Downtown San Francisco via Van Ness Avenue and Mission Street, with route alignment and stop locations in Downtown San Francisco as illustrated in Figure 2-2. In the inbound direction, all Basic Bus services travel eastbound along Mission Street to the Temporary Transbay Terminal (on the block bounded by Howard Street, Folsom Street, Main Street, and Beale Street) before turning onto westbound Howard Street towards the existing Mid-day Bus Parking Facility (located at Eighth Street and Harrison Street), with the exception of one weekday (i.e., Mondays through Fridays, except holidays) run and one weekend (i.e., Saturdays, Sundays, and holidays) run on Route 70, which continue south on Eighth Street past Mission Street directly to the current Mid-day Bus Parking Facility.

Commute Bus services can be classified into one of two different groups based on their general route to and from Downtown San Francisco:

- Via the Financial District (Routes 2, 4, 8, 18, 24, 27, 38, 44, 54, 56, 58, 72 / 72X, 74, 76, and 97); and,
- Via Civic Center (Routes 92 and 93).

All Financial District Commute Bus services travel along Doyle Drive, Richardson Avenue, Lombard Street, Van Ness Avenue, Beach Street / North Point Street, The Embarcadero, and Battery Street / Sansome Street. The exceptions are Route 97 and the first inbound trip on Route 27, which have the following route alignment east of Lombard Street: southbound Van Ness Avenue and eastbound Broadway Street to Battery Street and the Financial District. All Financial District Commute Bus services terminate at Eighth Street / Folsom Street in the inbound direction and begin at Seventh Street / Folsom Street in the outbound direction. Route alignment and stop locations are illustrated in Figure 2-3.

For Civic Center Commute Bus services, Route 92 travels along Doyle Drive, Park Presidio Boulevard, Geary Boulevard, Webster Street, and Golden Gate Avenue / McAllister Street, while Route 93 travels along Van Ness Avenue similar to the Basic Bus services, but without serving stops along Mission Street east of the Civic Center area. In other words, Route 92 and Route 93 share the same route in the Civic Center area, but Route 92 takes Park Presidio Boulevard, Geary Boulevard, Webster Street, and Golden Gate Avenue / McAllister Street to and from the Golden Gate Bridge, while Route 93 takes Doyle Drive, Richardson Avenue, Lombard Street, and Van Ness Avenue. All Civic Center Commute Bus services terminate at Eighth Street / Folsom Street in the inbound direction and begin at Seventh Street / Market Street in the outbound direction. Route alignment and stop locations are illustrated in Figure 2-4.

Golden Gate Transit's current Mid-day Bus Parking Facility (Division 4) is located on the block generally bounded by Eighth Street, Ninth Street (specifically, Gordon Street), Folsom Street (specifically, Ringold Street), and Harrison Street. The parking facility can accommodate approximately 150 buses, and is currently used by all of Golden Gate Transit's San Francisco services, seven days a week and 24 hours a day, although its primary function is to provide mid-day parking for Commute Bus services, eliminating the need to deadhead to and from Golden Gate Transit's other yards in San Rafael (Division 1), Novato (Division 2), and Santa Rosa (Division 3) after the weekday morning peak period and before the weekday evening peak period.

Figure 2-4: Existing Golden Gate Transit Routes (Civic Center Commute Bus Services)

Source: AECOM, 2013.

The replacement of the Transbay Terminal with the new Transbay Transit Center and the redevelopment of the surrounding area required that Golden Gate Transit relocate it's previous San Francisco Mid-day Bus Parking Facility—located on the block bounded by Main Street, Beale Street, Howard Street, and Folsom Street— to a new site. The proposed project site is located under the elevated portion of Interstate 80 (West Approach of the San Francisco-Oakland Bay Bridge) on the block bounded by Third Street, Fourth Street, Perry Street, and Stillman Street. Since the proposed project site could not be occupied until after the seismic retrofit of the West Approach was completed, Golden Gate Transit's Mid-day Bus Parking Facility was temporarily relocated to the current location at Eighth Street and Harrison Street. The proposed project consists of moving the Golden Gate Transit Mid-day Bus Parking Facility from the temporary location at Eighth Street and Harrison Street to the project site.

Likewise, AC Transit, which originally stored its commuter buses on the elevated loop connecting the Transbay Terminal with I-80, would be provided with a separate Mid-day Bus Parking Facility on the opposite side of Third Street from Golden Gate Transit's Mid-day Bus Parking Facility. A dedicated bus ramp would be provided from the new AC Transit facility, connecting into the primary bus approach structure into the Transbay Transit Center, allowing AC Transit buses to directly access their platforms inside the Transbay Transit Center. A separate connecter ramp was proposed in the *2004 FEIS / EIR* to connect this approach structure with the existing I-80 off-ramp touching down midblock at Fremont Street between Howard Street and Folsom Street, allowing Golden Gate Transit buses departing the new parking facility to use the AC Transit ramp to bypass surface streets to access Fremont Street.

The *2004 FEIS / EIR* evaluated mid-day bus parking facilities for Golden Gate Transit and AC Transit underneath the I-80 (West Approach) on the two blocks bounded by Perry Street, Stillman Street, Second Street, and Fourth Street. AC Transit would occupy the block between Second Street and Third Street, while Golden Gate Transit would occupy the block between Third Street and Fourth Street. As part of the proposed project, the bus storage functions currently performed for Golden Gate Transit's Commute Bus services by the current parking facility at Eighth Street / Harrison Street would be relocated to this new parking facility. The *2004 FEIS / EIR* estimated that this new parking facility would have the capacity to accommodate up to 140 buses and restricted use of the facility to weekdays only, between 7:00 AM and 7:00 PM. As a result, the facility would be used to support Commute Bus operations, which would only use the new ramp and ramp connector in the outbound direction (i.e., primarily during the weekday evening peak periods).

In addition to the new Mid-day Bus Parking Facility, the Transbay Transit Center project also involves construction of a new street-level passenger terminal (the "Transbay Transit Center Bus Plaza") for bus services on the block bounded by Minna Street, Natoma Street, Beale Street, and Fremont Street, serving primarily San Francisco Municipal Railway (Muni) and Golden Gate Transit services. This facility would provide a total of four platforms, three to be used by Muni bus services and one reserved for Golden Gate Transit bus services. This fourth platform would be used by Golden Gate Transit's Basic Bus services.

2.3 PROJECT CHARACTERISTICS

2.3.1 Proposed Uses and Service

Since the publication of the *2004 FEIS / EIR*, the following changes to the proposed project have been identified:

- The District has determined that the capacity of the new facility, originally estimated at 140 buses, is actually substantially lower, due to the column reconfiguration implemented as part of the seismic retrofit of the Bay Bridge's west approach, the requirement to construct a sound wall on portions of the south and east sides of the site as shown in the *2004 FEIS / EIR*, and the limited ability to maneuver buses in the parking area and through the ingress and egress points. The anticipated capacity of the new facility is now estimated to be 73 buses, based on conceptual engineering drawings.

- The District has reconfigured the placement of the sound wall without narrowing the public right-of-way on Stillman Street, restricting bus ingress and egress to and from the new parking facility to Perry Street only.

- The District has proposed to have its weekday evening Commute Bus services depart the new parking facility using surface streets instead of the new dedicated ramp structures connecting the AC Transit Mid-day Bus Parking Facility with Fremont Street between Howard Street and Folsom Street. No changes are proposed to inbound Commute Bus services (the planned ramp structures were never designed to allow bus traffic from surface streets to directly enter the Mid-day Bus Parking Facility) or to Basic Bus services (these services would use the Transbay Transit Center Bus Plaza, and were never envisioned to use the planned ramp structures).

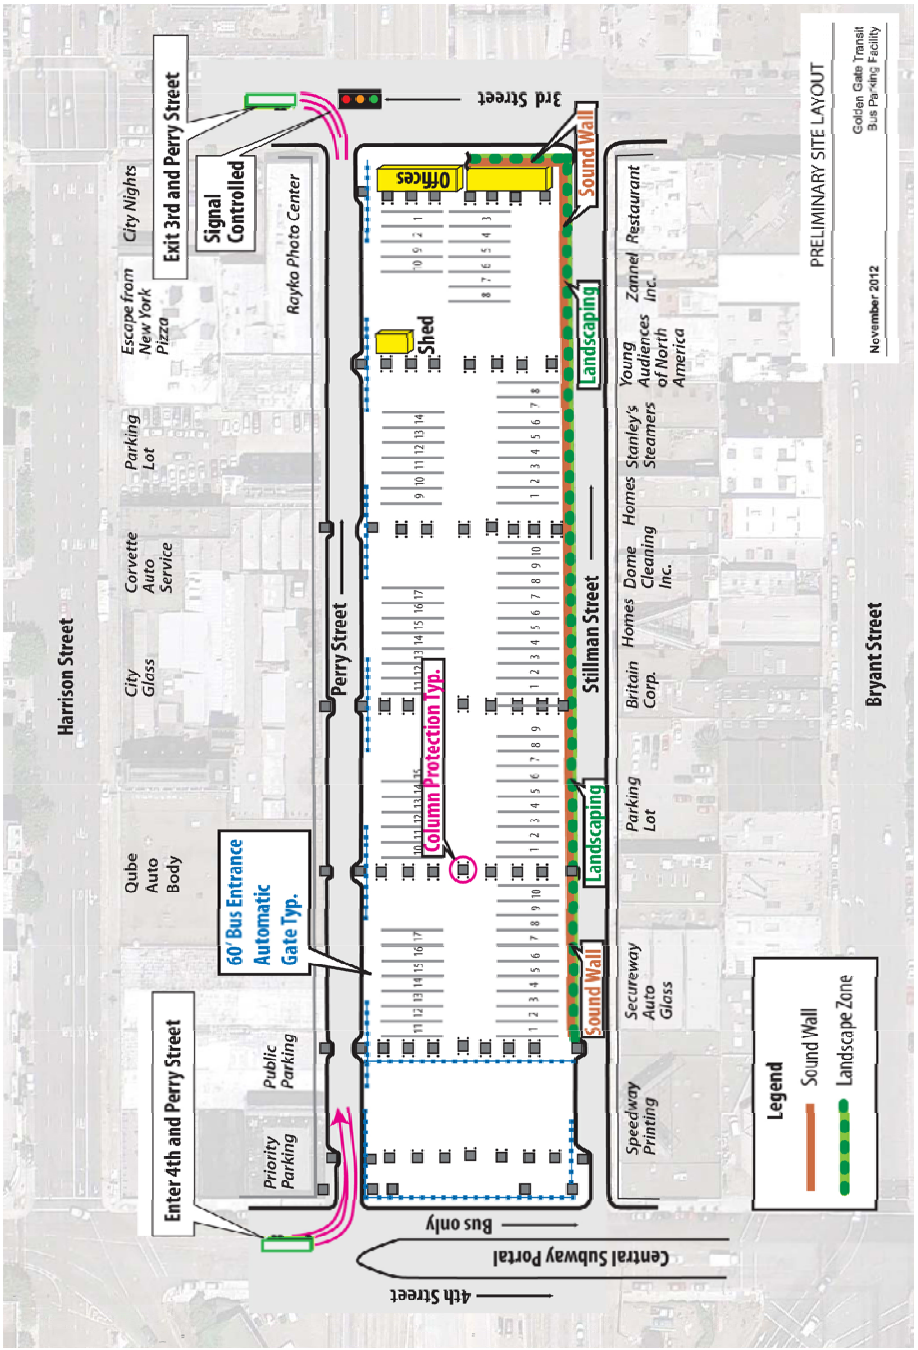
- The District has determined that the location of the signal at Third Street should be located at the intersection of Third Street / Perry Street and will include a midblock pedestrian crossing across Third Street on the south leg of the intersection.

- The District has determined that the removal of all on-street metered parking spaces along the reconfigured eastbound Perry Street is necessary due to curb modifications to enable bus ingress and egress.

The realignment of outbound Commute Bus routes onto surface streets—as opposed to grade-separated ramps—requires an evaluation of the effect of additional bus traffic to intersections not originally analyzed in the *2004 FEIS / EIR*. This proposed realignment of Golden Gate Transit's Commute Bus services onto surface streets is hereafter referred to as the "proposed project".

The project site plan, illustrating the conceptual engineering design for the Mid-day Bus Parking Facility, is illustrated in Figure 2-5.

Figure 2-5: Project Site Plan



Source: URS, 2012.

2.3.2 Proposed Weekday PM Bus Pull-Outs

As described previously, the proposed project involves the realignment of Golden Gate Transit's Commute Bus services departing the new Mid-day Bus Parking Facility during the weekday PM peak period onto surface streets.

Information on weekday PM peak period Commute Bus pull-outs from the existing Mid-day Bus Parking Facility was obtained from GGBHTD, and is summarized in Table 2-2 for 15-minute increments. As shown in Table 2-2, the maximum number of pull-outs during any four consecutive 15-minute periods is 42 trips.

Table 2-2: Weekday PM Peak Period Commute Bus Pull-Outs

Time Period	Pull-Outs	Running Hourly Total
16:01 – 16:15	9	
16:16 – 16:30	12	
16:31 – 16:45	6	
16:46 – 17:00	15	42
17:01 – 17:15	9	42
17:16 – 17:30	11	41
17:31 – 17:45	4	39
17:46 – 18:00	7	31

Source: GGBHTD, 2012b.

2.3.3 Proposed Route Realignment

The relocation of Golden Gate Transit's Mid-day Bus Parking Facility, together with the realignment of Commute Bus services onto surface streets, would necessitate changes to Commute Bus routes and stops through the SOMA area. In particular, route segments along Howard Street and Folsom Street west of Fourth Street would be discontinued, together with the existing Golden Gate Transit stop at Fourth Street / Howard Street. New Commute Bus stops would be established in the inbound direction at Fourth Street / Folsom Street (a far-side stop shared with an existing Muni stop) and Third Street / Harrison Street (a new far-side stop). The changes to bus routes and stops are illustrated in Figures 2-6, 2-7, and 2-8.

2.4 DISCRETIONARY ACTION AND APPROVALS

GGBHTD is the lead agency for this Addendum, which will be used as a decision-making tool to take action on the proposed project. GGBHTD is responsible for approval and implementation of the proposed project.

Other regulatory agencies and local jurisdictions that may require discretionary approvals in order to operate the proposed project include the San Francisco Municipal Transportation Agency (SFMTA).

2.5 CUMULATIVE PROJECTS

Section 15063(b) of the State CEQA Guidelines states that a CEQA analysis must consider the environmental effects of a proposed project individually, as well as cumulative impacts to which the project may contribute. Cumulative impacts are two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts of the proposed project (State CEQA Guidelines Section 15355). Cumulative impacts are analyzed by considering a list of past, present, and probable future projects that may result in direct or cumulative impacts.

The cumulative impacts including past, proposed (i.e., those projects with pending applications), recently approved, under construction, or reasonably foreseeable projects considered in combination with the proposed project are evaluated in this Addendum, and are addressed in Section 3.0, Addendum Checklist and Environmental Impact Analysis.

There are several projects considered in conjunction with the proposed project in the cumulative impact analyses:

- *Transbay Terminal / Caltrain Downtown Extension / Redevelopment Project:* This project involves the demolition of the Transbay Terminal and replacement with a new multi-modal transit hub integrating local, regional, and intercity bus services (Muni, SamTrans, AC Transit, WestCAT, Golden Gate Transit, and Greyhound); Caltrain's Downtown Extension from its current terminus at Fourth Street / King Street; and intercity high-speed rail. In addition, this project also includes a major land use component (the "Transbay Redevelopment Project") in the redevelopment of multiple parcels along the alignment of the elevated loop originally connecting the Transbay Terminal with I-80, used by AC Transit, WestCat, Greyhound, and Muni before the demolition of the terminal building, as well as associated roadway and streetscape changes described under the Transbay Streetscape and Open Space Plan. The new terminal is scheduled to be completed in 2017.

- *Transit Center District Plan and Transit Tower:* This project involves zoning changes (including changes to land use, height, bulk, and density), roadway and streetscape changes (including new transit-only lanes, new traffic signals, lane reductions, two-way conversions, new crosswalks and bulb-outs, new bicycle lanes, changes to on-street parking and loading, and other features), and changes to off-street parking requirements in the immediate vicinity surrounding the Transbay Transit Center. This project also involves construction of the Transit Tower, a mixed-use skyscraper adjacent to the new Transbay Transit Center, as well as zoning changes specifically designed to address proposed developments at the following "opportunity sites":

    - 41 Tehama Street (Block 3736, Lots 074-078A);
    - 181 Fremont Street (Block 3719, Lots 010-011);
    - 50 First Street (Block 3708, Lots 006-007, 009-012, 055);
    - 350 Mission Street (Block 3710, Lot 017);
    - 201 Second Street (Block 3736, Lots 094-098);
    - Parcel F (560 Howard Street) (Block 3721, Lot 015A);
    - Transit Tower (Parcel T) (Block 3720, Lot 001);
    - Golden Gate University (536 Mission Street) (Block 3708, Lot 098);
    - 222 Second Street (Block 3735, Lot 063);
    - Palace Hotel (2 New Montgomery Street) (Block 3707, Lot 052 (southwest corner));

- 524 Howard Street (Block 3721, Lots 013-015);
- 543 Howard Street (Block 3736, Lot 111);
- Parcel M (201 Mission Street) (Block 3718, Lot 027 (northern portion));
- Marine Firemen's Union (240 Second Street) (Block 3735, Lot 055);
- 176 Second Street (Block 3722, Lot 017);
- 661-667 Howard Street (Block 3735, Lots 039-040); and,
- 648-660 Howard Street (Block 3722, Lots 011-012, 014, 023-024, 026).

The San Francisco Planning Commission certified the Final Environmental Impact Report and adopted the Transit Center District Plan in May 2012.

Other relevant projects currently moving through environmental review under CEQA include the following:

- *San Francisco Bicycle Plan*: This project describes a package of citywide bikeway improvements, several of which have already been implemented. Two projects—the Second Street Bicycle Lanes Project (Modified Option 1) and the Howard Street Bicycle Lane Project—are located in the vicinity of the project site and were therefore accounted for in the cumulative analysis.

- *Rincon Hill Streetscape Master Plan*: This project would extend two-way traffic along Folsom Street from Main Street to Fremont Street and along Spear Street from Folsom Street to Harrison Street. Portions of the two-way conversion along Folsom Street have already been partially completed under roadway changes initiated under the Temporary Transbay Terminal, but the two-way conversion along Spear Street has yet to be implemented.

- *Transit Effectiveness Project:* This project would institute a series of substantial changes to Muni's service to streamline operations, including changes to frequencies, service hours, route alignments, and vehicle capacities. Some elements of the project have already been completed independently, but the bulk of the recommended capital investments, such as new overhead lines, have yet to be implemented.

- *Central Subway:* This project would extend Muni's T Third Street light rail line from Fourth Street / King Street into Union Square and Chinatown. Construction is already underway, and the new extension is expected to open for revenue service in 2019.

- *Expanded Water Emergency Transportation Authority (WETA) ferry service on San Francisco Bay:* This project involves an expansion of San Francisco Bay ferry services and would involve new routes connecting San Francisco with points in the South Bay and East Bay. Some routes have recently been implemented, but the bulk of the service expansion has yet to be implemented.

As the cumulative analysis is based primarily on work conducted for the *Transit Center District Plan and Transit Tower Draft Environmental Impact Report* Planning Department Case Number 2007.0558E and 2008.0789E and SCH #2008072073), which used the San Francisco County Transportation Authority (SFCTA) travel demand model to generate cumulative traffic and transit ridership forecasts, any development growth contained in the model is also assumed in the cumulative analysis for the proposed project. This includes general background growth in the City and region, as well as growth attributable to specific projects such as the *Market / Octavia Better Neighborhoods Plan* and *Treasure Island Redevelopment Plan*.

3.0 ADDENDUM CHECKLIST AND ENVIRONMENTAL IMPACT ANALYSIS

The environmental factors checked below (☒) would be potentially affected by this project and were, therefore, analyzed as part of this Addendum on the following pages.

☐	Aesthetics	☒	Greenhouse Gas Emissions	☐	Population/Housing
☐	Agriculture and Forestry Resources	☐	Hazards and Hazardous Materials	☐	Public Services
☒	Air Quality	☐	Hydrology and Water Quality	☐	Recreation
☐	Biological Resources	☐	Land Use/Planning	☒	Transportation/Traffic
☐	Cultural Resources	☐	Mineral Resources	☐	Utilities/Service Systems
☐	Geology/Soils	☒	Noise	☐	Mandatory Findings of Significance

EVALUATION OF ENVIRONMENTAL IMPACTS

3.1 AIR QUALITY

Issue	Potentially Significant Impact	Less-Than-Significant Impact with Mitigation Incorporated	Less-Than-Significant Impact	No Impact
Where available, the significance criteria established by the applicable air quality management or air pollution control district may be relied upon to make the following determinations. Would the project:				
a) Conflict with or obstruct implementation of the applicable air quality plan?	☐	☐	☒	☐
b) Violate any air quality standard or contribute substantially to an existing or projected air quality violation?	☐	☐	☒	☐
c) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions that exceed quantitative thresholds for ozone precursors)?	☐	☐	☒	☐
d) Expose sensitive receptors to substantial pollutant concentrations?	☐	☐	☒	☐

e) Create objectionable odors affecting a substantial number of people?	☐	☐	☒	☐

Existing Conditions

Criteria Air Pollutant Emissions

The federal and the State governments have established National Ambient Air Quality Standards (NAAQS) and California Ambient Air Quality Standards (CAAQS) respectively for six criteria pollutants: ground-level ozone, carbon monoxide (CO), nitrogen dioxide (NO_2), sulfur dioxide (SO_2), particulate matter (PM), and lead. Ozone is considered a regional pollutant, since ozone impacts air quality on a regional scale (BAAQMD, 1999). Carbon monoxide tends to accumulate in the air locally, forming CO "hotspots" (BAAQMD, 1999). PM is considered both a localized pollutant and a regional pollutant. Most of the criteria pollutants are directly emitted, but ground-level ozone—also known as smog—is a secondary pollutant produced by the photochemical reaction of sunlight with volatile organic compounds, including non-methane organic gases (NMOG) and oxides of nitrogen (NO_x) that have been released into the atmosphere from the combustion of fossil fuels.

The primary pollutants of concern within the San Francisco Bay Area Air Basin (SFBAAB) are ozone and particulate matter with a diameter of 10 microns or less (PM_{10}), as well as "fine" particulate matter with a diameter of 2.5 microns or less ($PM_{2.5}$). This is because the SFBAAB is currently classified as non-attainment for the California one-hour and eight-hour ozone standards and also the national eight-hour ozone standard. The SFBAAB is also in non-attainment for the California annual arithmetic mean and 24-hour standards for PM_{10} as well as the California annual arithmetic mean and national 24-hour standards for $PM_{2.5}$. Emissions and ambient concentrations of CO have decreased dramatically in the SFBAAB with the introduction of the catalytic converter in 1975. No exceedances of the CAAQS or NAAQS for CO have been recorded at nearby monitoring stations since 1991. SFBAAB is currently designated as an attainment area for the CAAQS and NAAQS for CO; however, elevated localized concentrations of CO still warrant consideration in the environmental review process. Occurrences of localized CO concentrations (hotspots), are often associated with heavy traffic congestion, which most frequently occur at signalized intersections of high-volume roadways (BAAQMD, 2012).

Toxic Air Contaminants

Some air pollutants are identified as toxic air contaminants (TACs) because of their potential to increase the risk of developing cancer or because of their acute or chronic health risks due to long-term exposure. Individual TACs vary greatly in the health risk they present. For TACs that cause cancer, a unit risk factor can be developed to evaluate cancer risk. For non-cancer health risks, a similar factor called a hazard index (HI) is used to evaluate risk. The HI is calculated by summing the hazard quotients for substances that affect the same target organ or organ system (e.g., respiratory system). The hazard quotient is the ratio of potential exposure to the substance and the level at which no adverse health effects are expected. An HI of less than one indicates no adverse health effects are expected because of exposure and an HI greater than 1 indicates adverse health effects are possible.

Regulatory Framework

Clean Air Act

The federal Clean Air Act (CAA), originally enacted in 1963 and amended several times thereafter (including the 1990 amendments), establishes the current framework for air pollution control in the United States. The CAA directs the U.S. Environmental Protection Agency (EPA) to establish ambient air standards for six pollutants: ozone, CO, lead, NO_2, PM, and SO_2. The standards are divided into primary and secondary standards; the former are set to protect human health within an adequate margin of safety and the latter to protect environmental values, such as plant and animal life.

Currently, the primary legislation that governs federal air quality regulations is the Clean Air Act Amendments of 1990 (CAAA). The CAAA delegates primary responsibility for clean air to EPA. EPA develops rules and regulations to preserve and improve air quality, as well as delegating specific responsibilities to state and local agencies.

The CAA requires states to submit a state implementation plan (SIP) for areas in nonattainment for federal standards. The SIP, which is reviewed and approved by EPA, must demonstrate how the federal standards will be achieved. Failing to submit a plan or secure approval could lead to denial of federal funding. In cases where the SIP is submitted by the state but fails to demonstrate achievement of the standards, EPA is directed to prepare a federal implementation plan for that state.

Ozone Attainment Plan

The Bay Area Air Quality Management District (BAAQMD) and California Air Resources Board (CARB) have been working with EPA to develop plans and approaches to address air quality issues in the SFAAB. These efforts have resulted in the 2001 Ozone Attainment Plan, which is the SFBAAB's portion of California's SIP to achieve the national ozone standard. On April 15, 2004, EPA identified areas that did not meet the national eight-hour ozone standard. The Bay Area was designated as a non-attainment area for the 8-hour ozone standard, and was classified as "marginal" based on the five classes of non-attainment areas for ozone, ranging (low to high) from marginal to extreme.

California Ambient Air Quality Standards

CARB and local air districts are tasked with the responsibility for achieving the California Ambient Air Quality Standards (CAAQS), which are more stringent than the national ambient air quality standards, through district-level air quality management plans that will be incorporated into the SIP. In California, EPA has delegated authority to prepare SIPs to CARB, which, in turn, has delegated that authority to individual air districts (for San Francisco, the BAAQMD).

CARB establishes CAAQS, maintains oversight authority in air quality planning, develops programs for reducing emissions from motor vehicles, develops air emission inventories, collects air quality and meteorological data, and approves SIPs.

Responsibilities of air districts include overseeing stationary source emissions, approving permits, maintaining emissions inventories, maintaining air quality stations, overseeing agricultural burning permits, and reviewing air quality-related sections of CEQA environmental review documents .

California Clean Air Act

The California Clean Air Act of 1988 (CCAA) substantially added to the authority and responsibilities of air districts. The CCAA designates air districts as lead air quality planning agencies, requires air districts to prepare air quality plans, and grants air districts authority to implement transportation control measures. The CCAA focuses on attainment of the state ambient air quality standards, which are generally more stringent than the comparable federal standards.

The CCAA requires designation of attainment and non-attainment areas with respect to CAAQS. The CCAA also requires that local and regional air districts expeditiously adopt and prepare an air quality attainment plan if the district violates CAAQS for CO, SO_2, NO_2, or ozone. These clean air plans are specifically designed to attain these standards and must be designed to achieve an annual five (5) percent reduction in district-wide emissions of each nonattainment pollutant or its precursors. Where an air district is unable to achieve a five (5) percent annual reduction, the adoption of "all feasible measures" on an expeditious schedule is acceptable as an alternative strategy (Health and Safety Code Section 40914[b][2]). No locally prepared attainment plans are required for areas that violate the state PM_{10} standards.

The CCAA requires that the State air quality standards be met as expeditiously as practicable but, unlike the federal CAA, does not set precise attainment deadlines. Instead, for areas that will require more time to achieve the standards the CCAA established increasingly stringent requirements. Currently, the SFBAAB is in non-attainment for the California one-hour and eight-hour ozone standards. The SFBAAB is also in non-attainment for the California annual arithmetic mean and 24-hour standards for PM_{10}, as well as the California annual arithmetic mean standard for $PM_{2.5}$.

California Air Resources Board Fleet Rule for Transit Agencies

The Transit Fleet Vehicle and Urban Bus Requirements under the Fleet Rule for Transit Agencies, Title 13 California Code of Regulations, Section 2023 first went into effect in 2000. The Fleet Rule for Transit Agencies is CARB's effort to reduce both criteria pollutant emissions and exposure to TACs from urban buses and transit fleet vehicles. The requirements for urban buses differ from the requirements for transit fleet vehicles. The regulation affects both public transit operators and heavy-duty engine manufacturers. Transit agencies must annually report detailed information on their fleets to CARB and meet increasingly stringent fleet average emission requirements for both PM and NO_x through phase-in years. The reductions in fleet average emissions can be obtained through the use of alternative fuels (e.g. compressed natural gas, propane, ethanol, methanol, gasoline (when used in hybrid electric buses), hydrogen, electricity, fuel cells, or advanced technologies that do not rely on diesel fuel) and / or through the installment of engine retrofits (e.g. diesel particulate filters), engine repowers, or vehicle replacements (CARB, 2013).

Bay Area 2010 Clean Air Plan

BAAQMD adopted the Bay Area *2010 Clean Air Plan* in cooperation with the Metropolitan Transportation Commission (MTC) and the Association of Bay Area Governments (ABAG) to set forth a plan to achieve compliance with the state one-hour air quality standard for ozone as expeditiously as practicable. A clean air plan is a comprehensive strategy to reduce air pollution from both stationary sources, such as factories and refineries, and mobile sources, such as cars, trucks, ships, diesel locomotives, and construction equipment. The goal of a clean air plan is to reduce air pollution in order to attain air quality standards and protect public health. The plan outlines strategies to reduce ozone precursors, as well as PM, TACs, and GHG emissions, in order to improve public health and protect the environment and climate.

BAAQMD CEQA Guidelines

The purpose of the BAAQMD *CEQA Air Quality Guidelines* is to assist lead agencies in evaluating air quality impacts of projects and plans proposed in the SFBAAB. Land development plans and projects have the potential to generate harmful air pollutants that degrade air quality and increase local exposure. The *CEQA Air Quality Guidelines* contain instructions on how to evaluate, measure, and mitigate air quality impacts generated from land development, construction, and operation activities, focusing on criteria air pollutant, GHG, TAC, and odor emissions generated from plans or projects.

The BAAQMD *CEQA Air Quality Guidelines* is an advisory document that provides lead agencies, consultants, and project applicants with uniform procedures for addressing air quality in environmental documents. In May 2010, BAAQMD updated its CEQA Guidelines with new quantitative thresholds for construction and operational-related criteria air pollutants and precursors, TACs, and GHGs. However, in March 2012, the Alameda County Superior Court issued a judgment finding that the changes to the BAAQMD *CEQA Air Quality Guidelines* qualify as a project under CEQA and that BAAQMD has not complied with CEQA as part of the adoption process. Therefore, at the time of this writing, BAAQMD is not recommending use of the updated 2010 *CEQA Air Quality Guidelines* thresholds to evaluate air quality impacts. As a result, the thresholds of significance in the BAAQMD's 1999 *CEQA Guidelines* must be relied upon to determine the significance of the proposed project's air quality impacts in the interim.

Impact Discussion

3.1a. Less-Than-Significant Impact. A significant impact may occur if the project is not consistent with the applicable air quality management plan (AQMP) or would in some way represent a substantial hindrance to employing the policies or obtaining the goals of that plan.

The *2010 Clean Air Plan* developed by BAAQMD is a roadmap showing how the region will continue to make progress toward meeting the California one-hour ozone standard as expeditiously as practicable, and how the region will reduce transport of ozone and ozone precursors to neighboring air basins (BAAQMD, 2010).

The proposed project involves the modification of existing bus routes and the relocation and operation of an existing bus lot that would result in a decrease of total criteria air pollutant emissions, including ozone precursors NO_x and reactive organic gases (ROG). This is because the length of the existing Commute Bus and Basic Bus services would actually be reduced and several bus stops would be removed, thus reducing bus engine running

time and idling time, respectively. Therefore, the proposed project would reduce mobile source emissions in the region while continuing to provide public transit services for commuters, which would comply with BAAQMD's core goals to reduce mobile source emissions. By continuing the operation of Commute Bus and Basic Bus services, commuters would still have the option of deferring a single-occupancy vehicle commute and shifting to public transit. These actions would reduce ozone precursor emissions along with other criteria air pollutants associated with vehicle emissions (e.g., carbon monoxide, PM_{10}, $PM_{2.5}$). By complying with BAAQMD's rules and regulations regarding ozone precursor emissions, the proposed project would be compliant with the *2010 Clean Air Plan*.

To address reductions of PM, on November 16, 2005 the BAAQMD adopted the Particulate Matter Implementation Schedule in compliance with Senate Bill (SB) 656, which is meant to reduce public exposure to PM_{10} and fine particulate matter ($PM_{2.5}$), as well as to make progress towards attainment standards. As stated in the above paragraph, the proposed project would result in a reduction of criteria pollutants, including PM emissions, and would thus be compliant with the Particulate Matter Implementation Schedule. Reducing the number of bus routes and the number of transit stops would help reduce regional PM emissions resulting from running emissions and exhaust emissions, respectively. Thus, the proposed project would also contribute to BAAQMD's plans to reduce regional PM emissions.

Considering the information discussed above for ozone precursors and PM emissions, implementation of the proposed project would not conflict with an applicable air quality plan and thus would have a less than significant impact for this criterion. See Section 3.1b for a quantitative comparison of emissions from the baseline and proposed project.

3.1b. Less-Than-Significant Impact. A project may have a significant impact if project-related emissions would exceed federal, State, or regional standards or thresholds, or if project-related emissions would substantially contribute to an existing or projected air quality violation. As described earlier, BAAQMD is not currently recommending use of the updated 2010 *CEQA Air Quality Guidelines* thresholds to evaluate air quality impacts. As a result, the thresholds of significance in the 1999 *CEQA Guidelines* must be relied upon to determine the significance of the proposed project's air quality impacts in the interim.

It is important to note that Golden Gate Transit's existing bus services already generate some level of emissions. As the Proposed Project involves the relocation of the Mid-day Bus Parking Facility and associated reroutes to bus services, the air quality and GHG emissions analysis focuses on the geographical area where the bus routes will change. These route changes would be confined to several streets in the South of Market (SoMa) District of San Francisco, and can be captured by defining an analysis area bounded by Market Street to the north, Stillman Street to the south, Main Street to the east, and Ninth Street to the west. Figures 2-4a – 2-4c provide maps capturing the existing and new routes in this area.

Since the bus routes outside of this area will remain the same, only the existing and future vehicle-miles traveled (VMT) from the bus routes within this zone need to be evaluated to determine if the proposed project's air quality emissions are a significant impact. Table 3-1 provides the existing and proposed VMT for Commute Bus and Basic Bus services, based on the existing Golden Gate Transit service in San Francisco (Table 2-1) and approximate route distances estimated using aerial images of the analysis area. Table 3-2 shows the resulting net change in daily and annual criteria pollutant emissions as a result of the proposed project.

Table 3-1: Route Distances within Analysis Area

Route	Route Distance within Analysis Area (mi)[a]			
	Existing		Proposed	
	Inbound	Outbound	Inbound	Outbound
Basic Bus Services				
Via Mission	3.20	3.35	1.55	1.30
Direct to facility[b]	0.50		1.55	1.30
Commute Bus Services				
Financial District routes	1.70	2.00	1.15	1.05
Civic Center routes	1.20	0.90	1.25	1.30

Notes:
[a] Distances rounded to the nearest 0.05 miles.
[b] Currently, one inbound run on Route 70 each day skips all Mission Street stops and heads directly to the existing Mid-day Bus Parking Facility after crossing Market Street via Eighth Street. With the Proposed Project, this inbound run would be rerouted to serve the Mission Street stops and the new Transbay Transit Center Bus Plaza along the same route as the other Basic Bus services.

Table 3-2: Net Change in Criteria Pollutant Emissions

Emissions Source	Net Change in Criteria Pollutant Emissions					
	Absolute Change (lbs / day or tons / year)					Percentage Change
	ROG	CO	NO_x	PM_{10}	$PM_{2.5}$	
Daily Emissions						
Basic Bus Services	(0.39)	(1.43)	(4.62)	(0.10)	(0.09)	(57%)
Commute Bus Services	(0.32)	(1.20)	(3.86)	(0.08)	(0.08)	(37%)
Total	**(1.27)**	**(4.71)**	**(15.19)**	**(0.32)**	**(0.30)**	**(46%)**
Annual Emissions						
Basic Bus Services	(0.07)	(0.26)	(0.84)	(0.02)	(0.04)	(57%)
Commute Bus Services	(0.04)	(0.16)	(0.50)	(0.01)	(0.02)	(37%)
Total	**(0.21)**	**(0.80)**	**(2.57)**	**(0.05)**	**(0.06)**	**(47%)**

Source: AECOM, 2013a.

As shown in Table 3-2, the VMT reductions associated with the project are expected to reduce total daily and annual emissions of criteria pollutants related to bus travel within the SoMa District by approximately 50 percent for each criteria pollutant.

In addition to reduced bus VMT, a total of five bus stops would also be removed due to the bus rerouting for the relocation of the bus storage lot. The removal of these bus stops would further decrease air emissions beyond the values summarized in Table 3-2 by reducing the amount of deceleration, acceleration, and idling activities associated with serving bus stops, activities that typically result in higher emission rates compared with same-speed travel.

3.1c. Less-Than-Significant Impact. A project found to individually have significant air impacts would also be considered to have significant cumulative impacts.

As discussed in Section 3.1b and shown in Table 3-2, project implementation would not result in long-term operational ROG, CO, NO_x, PM_{10}, or $PM_{2.5}$ emissions that would result in or contribute substantially to an air quality violation. Operational emissions from the proposed project would actually be reduced from the baseline operational scenario and would not be considered significant under BAAQMD thresholds, and, therefore, impacts would be less than significant on a project-level basis.

In addition, for any project that does not individually have significant operational air quality impacts, the determination of a significant cumulative impact should be based on an evaluation of the consistency of the project with the local general plan and of the general plan with the regional air quality plan. As noted above under Section 3.1a, the proposed project would be consistent with local air quality planning efforts and would not require an amendment to the existing *San Francisco General Plan*. As such, the project's long-term operational activities and emissions would be considered consistent with local planning efforts and less than significant on a project-level, and thus would not be cumulatively considerable.

3.1d. Less-Than-Significant Impact. A significant impact may occur where a project would generate substantial pollutant concentrations that would adversely affect sensitive receptors.

The most recent air quality analysis for the project—the Supplemental Air Quality Impact Analysis performed for the *2004 FEIS / EIR*—concluded that the relocation would not result in a substantial adverse change in concentrations of CO, NO_x, sulfur oxides (SO_x), or PM_{10} (Terry A. Hayes Associates, 2003). The proposed project would involve the use of diesel transit buses that were already in operation when the last air quality impact analysis was performed. Since the Supplemental Air Quality Impact Analysis was performed, however, CARB's Fleet Rule for Transit Agencies has imposed more stringent PM and NO_x standards for transit and urban bus fleets, including the buses operated by GGBHTD (CARB, 2013). As a result of these lowered fleet averages for PM and NO_x, the expected pollutant concentrations associated with the proposed project are expected to be reduced further beyond what was reported in the Supplemental Air Quality Impact Analysis for the *2004 FEIS / EIR*.

The overall changes to the bus routes proposed by the project would be minor and would actually reduce the total bus VMT within the SoMa District. For each individual route, the total distance would be equal or less to the current distance, and the new routes would generally be realigned only a few blocks away from their current routes. Nevertheless, an evaluation of the new routes was performed to determine if sensitive receptors (e.g. residential areas, parks, schools or senior centers, etc.) are located along those new routes.

The re-route for Basic Bus services reduces a substantial amount of its route from the SOMA District, as illustrated in Figure 2-6. There is only a small addition to the route where buses would turn right from southbound Beale Street to serve the new Transbay Transit Center Bus Plaza and then make a right onto northbound Fremont Street, where the buses would rejoin the existing route. No nearby sensitive receptors were found along the added route segment.

Likewise, routes for Financial District and Civic Center Commute Bus services would also shrink substantially. For Financial District Commute Bus services, there is only a small addition to the route where buses would turn left onto southbound Fourth Street and then travel approximately two and one-half blocks to make a left onto Perry Street and into the new Mid-day Bus Parking Facility, as illustrated in Figure 2-7. The buses would then exit onto northbound Third Street, traveling approximately one and one-half blocks before turning right onto eastbound Folsom Street to rejoin the existing route alignment. An existing day care center was identified at the corner of Fourth Street and Folsom Street, but subsequent research indicates that this center was established in 1970. The center is situated only one-and-a-half blocks from the existing route for Golden Gate Transit buses, but no indication of health risk was mentioned in the original addendum to the *2004 FEIS / EIR*.

The Civic Center Commute Bus services are the only services expected to see an expansion in geographical scope, as indicated in Figure 2-8. The new route segments proposed for these services are already part of existing routes for both Basic Bus and Financial District Commute Bus services. Because of this route overlap, there would be no new exposure of TAC or $PM_{2.5}$ emissions to receptors.

These observations of reductions in total bus VMT and overlapping route segments between the existing and proposed routes show that the proposed project will either maintain or reduce the pollutant concentration exposure for sensitive receptors, indicating a less-than-significant impact for local community risk and hazard impacts.

Although the updated significance thresholds in the 2010 BAAQMD *CEQA Air Quality Guidelines* cannot be directly used in determinations regarding the significance of an individual project's air quality impacts, the CO screening methodology provides a conservative indication of whether the implementation of the proposed project would result in CO emissions that exceed the significance thresholds.

According to the 2010 *CEQA Air Quality Guidelines*, the proposed project would result in a less-than-significant impact to localized CO concentrations if the following screening criteria are met:

1. The proposed project is consistent with an applicable congestion management program established by the county congestion management agency for designated roads or highways, regional transportation plan, and local congestion management agency plans.

2. The project traffic would not increase traffic volumes at affected intersections to more than 44,000 vehicles per hour.

3. The project traffic would not increase traffic volumes at affected intersections to more than 24,000 vehicles per hour where vertical and/or horizontal mixing is substantially limited (e.g., tunnel, parking garage, bridge underpass, natural or urban street canyon, below-grade roadway).

For Screening Criteria 1, the proposed project is consistent with the *2011 Congestion Management Program* established by the San Francisco County Transportation Authority (SFCTA, 2011). For Screening Criteria 2 and Screening Criteria 3, Existing plus Project Conditions traffic volumes at the three affected intersections would remain well below the indicated volume thresholds in the BAAQMD CO screening methodology. Thus, the proposed project would not result in operational conditions that could generate an exceedance of the CO CAAQS or NAAQS. More information on the traffic study can be found in Section 3.4.

3.1e. Less-Than-Significant Impact. A significant impact could occur if construction or operation of the proposed project would generate objectionable odors that would adversely affect sensitive receptors.

The occurrence and severity of odor impacts depends on numerous factors, including the nature, frequency, and intensity of the source; wind speed and direction; and the presence of sensitive receptors. Although offensive odors rarely cause any physical harm, they can be unpleasant and a nuisance, leading to citizen complaints.

The proposed project would involve the use of diesel transit buses that were already in operation when the most recent air quality impact analysis was performed (for the *2004 FEIS / EIR*). The continued operation of these buses would not result in an increase in generation of any odors because total emissions and operational time from the proposed project would decrease from baseline conditions. In addition, there is an overlap in the existing and proposed routes through the SoMa District, such that buses would not travel and generate potential odors in new areas that would result in exposure to new receptors. Thus, project implementation would not create objectionable odors affecting a substantial number of people and the project would have a less-than-significant impact related to odor generation.

3.2 GREENHOUSE GAS EMISSIONS

Issue	Potentially Significant Impact	Less-Than-Significant Impact with Mitigation Incorporated	Less-Than-Significant Impact	No Impact
Would the project result in:				
a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	☐	☐	☒	☐
b) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?	☐	☐	☒	☐

Existing Conditions

Greenhouse Gas Emissions and Climate Change

Activities such as fossil-fuel combustion, deforestation, and other human activity and changes in land use result in the accumulation of greenhouse gas (GHG) emissions—carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), ozone (O_3), and certain human-made hydrofluorocarbons (HFCs) and perfluorocarbons (PFCs)—in Earth's atmosphere. An increase in atmospheric GHGs alters Earth's radiation budget and, therefore, results in an increase in Earth's average surface temperature, a phenomenon commonly referred to as global warming.

The International Panel on Climate Change (IPCC) states that recently recorded increases in Earth's average surface temperature are the result of increased concentrations of GHGs in the atmosphere (IPCC, 2007). The IPCC's best estimates are that the average global temperature increase between 2000 and 2100 could range from 0.6 degrees Celsius (°C), assuming no increase in GHG emissions above 2000 levels, to 4.0°C, assuming a substantial increase in GHG emissions (IPCC, 2007). Global warming is expected, in turn, to affect weather patterns, average sea level, ocean acidification, chemical reaction rates, and precipitation rates, among other things, in a manner commonly referred to as climate change. Climate change is a global problem, and GHGs are global pollutants, unlike criteria air pollutants (such as ozone precursors) and toxic air contaminants (TACs), which are pollutants of regional and local concern.

Regulatory Framework

Massachusetts v. EPA

Twelve U.S. states and cities (including California), in conjunction with several environmental organizations, sued to force the U.S. Environmental Protection Agency (EPA) to regulate GHGs as a pollutant pursuant to the Clean Air Act (CAA) in *Massachusetts v. Environmental Protection Agency et al.* (U.S. Supreme Court No. 05-1120. Argued November 29, 2006—Decided April 2, 2007). The Supreme Court ruled that the plaintiffs had standing to sue, that GHGs fit within the CAA's definition of a pollutant, and that EPA's reasons for not regulating GHGs were insufficiently grounded in the CAA. Despite the Supreme Court ruling, there are no promulgated federal regulations to date limiting GHG emissions.

SB 97 (Chapter 185, Statutes of 2007)

Senate Bill 97 requires that the California Office of Planning and Research (OPR) prepare guidelines to submit to the California Resources Agency regarding feasible mitigation of GHG emissions or the effects of GHG emissions as required by the California Environmental Quality Act (CEQA). The Resources Agency is required to certify and adopt these revisions to the State CEQA Guidelines by January 1, 2010. The Guidelines will apply retroactively to any incomplete environmental impact report, negative declaration, mitigated negative declaration, or other related document.

Assembly Bill 32 (Chapter 488, Statutes of 2006)

The California Global Warming Solutions Act of 2006, widely known as Assembly Bill (AB) 32, requires the California Air Resources Board (CARB) to develop and enforce regulations for the reporting and verification of statewide GHG emissions. CARB is directed to set a GHG emission limit, based on 1990 levels, to be achieved by 2020. The bill sets a timeline for adopting a scoping plan for achieving GHG reductions in a technologically and economically feasible manner.

The heart of the bill is the requirement that statewide GHG emissions must be reduced to 1990 levels by the year 2020. California needs to reduce GHG emissions by approximately 25 percent below business-as-usual predictions of year 2020 GHG emissions to achieve this goal. The bill requires CARB to adopt rules and regulations in an open public process to achieve the maximum technologically feasible and cost-effective GHG reductions.

CARB proposed "Early Action Measures" in three groups, and together these measures will make a substantial contribution to the overall 2020 statewide GHG emissions reduction goal of approximately 174 million metric tons of carbon dioxide equivalent gases. These measures are summarized as follows:

- *Group 1*: Three new GHG-only regulations are proposed to meet the narrow legal definition of "discrete early action GHG reduction measures": a low-carbon fuel standard, reduction of refrigerant losses from motor vehicle air conditioning system maintenance, and increased CH_4 capture from landfills. These regulations are expected to take effect by January 1, 2010.

- *Group 2:* CARB is initiating work on 23 other GHG emission-reducing measures between 2007 and 2009, with rulemaking to occur as soon as possible, where applicable. These GHG measures relate to the following sectors: agriculture, commercial, education, energy efficiency, fire suppression, forestry, oil and gas, and transportation.

- *Group 3:* CARB is initiating work on ten conventional air pollution controls aimed at criteria and toxic air pollutants, but with concurrent climate co-benefits through reductions in CO_2 or non-Kyoto pollutants (i.e., diesel particulate matter, other light-absorbing compounds, and / or ozone precursors) that contribute to global warming.

Some proposed measures will require new legislation to implement, some will require subsidies, some are already developed, and some will require additional effort to evaluate and quantify. It should be noted that none of the measures from Group 1 would apply to the proposed project. Applicable early action measures that are ultimately adopted from Group 2 and Group 3 may become effective during implementation of the proposed project and the proposed project may be subject to these requirements, depending on their timing.

Bay Area Air Quality Management District Climate Protection Program

The Bay Area Air Quality Management District (BAAQMD) established a climate protection program to reduce pollutants that contribute to global climate change and affect air quality in the San Francisco Bay Area Air Basin (SFBAAB). The climate protection program includes measures that promote energy efficiency, reduce vehicle miles traveled, and develop alternative sources of energy, all of which assist in reducing emissions of GHGs and in reducing air pollutants that affect the health of residents. BAAQMD also seeks to support current climate protection programs in the region and to stimulate additional efforts through public education and outreach, technical assistance to local governments and other interested parties, and promotion of collaborative efforts among stakeholders.

City and County of San Francisco's Greenhouse Gas Reduction Strategy

The City and County of San Francisco (City) has a history of environmental protection policies and programs aimed at improving the quality of life for residents and reducing impacts on the environment. The following plans, policies, and legislation demonstrate San Francisco's continued commitment to environmental protection. They include measures relevant that would decrease the amount of GHG emitted into the atmosphere and thus decrease San Francisco's overall contribution to climate change. These programs are collectively referred to as San Francisco's GHG Reduction Strategy.

- *Transit First Policy:* In 1973, the City instituted the Transit First Policy, which added Article 8A, Section 8A.115 to the City Charter with the goal of reducing San Francisco's reliance on freeways and meeting transportation needs by emphasizing mass transportation. The Transit First Policy gives priority to public transit investments; adopts street capacity and parking policies to discourage increased automobile traffic; and encourages the use of transit, bicycling, and walking instead of single-occupant vehicles.

- *San Francisco Climate Action Plan:* In February 2002, the San Francisco Board of Supervisors passed the Greenhouse Gas Emissions Reduction Resolution (Number 158-02) that set a goal for the City to reduce GHG emissions to 20 percent below 1990 levels by the year 2012 (SFDE, 2004). In September 2004, the San Francisco Department of the Environment (SFDE) and San Francisco Public Utilities Commission published the *Climate Action Plan for San Francisco: Local Actions to Reduce Greenhouse Gas Emissions*. This climate action plan provides the context of climate change in San Francisco and examines strategies to meet the 20 percent GHG emissions reduction target. Although the Board of Supervisors has not formally committed the City to perform the actions addressed in the plan, and many of the actions require further development and commitment of resources, the plan serves as a blueprint for GHG emissions reductions, and several actions have been implemented or are now in progress.

- *San Francisco Municipal Transportation Agency's Zero Emissions 2020 Plan:* The Zero Emissions 2020 Plan focuses on the purchase of cleaner-emissions transit buses, including hybrid diesel-electric buses. Under this plan, hybrid buses will replace the oldest diesel buses, some dating back to 1988. The hybrid buses emit 95 percent less particulate matter (soot) than the buses they replace, produce 40 percent less NO_x, and reduce GHGs by 30 percent.

- *Greenhouse Gas Reduction Ordinance:* In May 2008, the City adopted an ordinance amending the San Francisco Environment Code to establish GHG emissions targets and departmental action plans, to authorize the SFDE to coordinate efforts to meet these targets, and to make environmental findings. The ordinance establishes the following GHG emissions reduction limits for San Francisco and the target dates by which to achieve them:

    - Determine 1990 City GHG emissions by 2008, the baseline level with reference to which target reductions are set;
    - Reduce GHG emissions by 25 percent below 1990 levels by 2017;
    - Reduce GHG emissions by 40 percent below 1990 levels by 2025; and,
    - Reduce GHG emissions by 80 percent below 1990 levels by 2050.

    The ordinance also specifies requirements for City departments to prepare climate action plans that assess GHG emissions associated with their activities and activities regulated by them, report the results of those assessments to the SFDE, and prepare recommendations to reduce emissions. In particular, the San Francisco Planning Department is required to (1) update and amend the City's applicable General Plan elements to include the emissions reduction limits set forth in this ordinance and policies to achieve those targets; (2) consider a project's impact on the City's GHG emissions reduction limits specified in this ordinance as part of its review under CEQA; and (3) work with other City departments to enhance the Transit First Policy to encourage a shift to sustainable modes of transportation, thereby reducing emissions and helping to achieve the targets set forth by the ordinance.

Impact Discussion

3.7a-b. Less-Than-Significant Impact. A significant impact would occur if the proposed project's GHG emissions would result in a substantial contribution to global climate change.

Operational GHG emissions are typically generated by both mobile sources and area sources associated with operation of a particular project. Area-source GHG emissions include natural gas combustion for space and water heating, lighting, maintenance of landscaping and grounds, waste disposal, and other sources. The two potential area-source GHG emissions that would be generated by the proposed project would be the maintenance of landscaping (i.e., water consumption) and electricity consumption associated with the new facility.

The new Mid-day Bus Parking Facility would include a building that would require electricity for lighting. Similar to the reduced parking capacity, the new building would also be smaller than the building at the existing facility. Thus, it is anticipated that electricity-related GHG emissions for lighting would decrease with implementation of the proposed project.

Although mobile-source GHG emissions would be generated by project-related bus trips, the total number of Golden Gate Transit bus trips and vehicle-miles traveled (VMT) would be reduced compared to existing conditions. The project would, therefore, result in a net decrease in mobile-source GHG emissions.

As a result, the proposed project would result in a net decrease in operational GHG emissions compared with Existing Conditions. Table 3-3 summarizes the estimated net change in operational emissions associated with bus routes and operation of the building facilities. Details on the baseline and project scenario determinations as well as the calculation methodologies are contained within the Air Quality / Greenhouse Gas Emissions Technical Study Memorandum found in Appendix A (see Appendix A) (AECOM, 2013a).

Table 3-3: Net Change in GHG Emissions

Emissions Source	Net Change in GHG emissions (carbon dioxide equivalent, CO_2e)	
	Absolute Change (metric tons / year)	**Percentage Change**
Basic Bus Services	(158.05)	(57%)
Commute Bus Services	(93.96)	(37%)
Modular Office	(51.93)	(89%)
Parking Lot	(4.38)	(14%)
Total	**(308.32)**	**(49%)**

Source: AECOM, 2013a.

As shown in Table 3-3, the proposed project would result in a net decrease in GHG emissions from mobile and area sources, as well as overall project-related GHG emissions. Therefore, although a quantitative GHG threshold has not been established by BAAQMD, CARB, or another applicable regulatory agency, it is reasonable to conclude that, because the proposed project would result in an individual (i.e., on an emission source basis) and overall net decrease in GHG emissions, it would not generate a significant amount of GHG emissions that would represent a substantial contribution to climate change.

As one component of the Transbay Transit Center, the proposed project is also part of a regional effort to reduce mobile source emissions consistent with the regional climate action plan and the statewide AB 32 Scoping Plan's GHG reduction goals. Specifically, the project and other elements of the Transbay Transit Center would improve public transit, consistent with the transportation component of San Francisco's *Climate Action Plan* (i.e., Part A. Public Transit). The transportation component of the *Climate Action Plan* calls for expanding and improving local and regional transit service and interconnections, increasing the user-friendliness of public transit, and other actions to encourage use of public transit and reduce vehicle emissions in the region, which are also the goals of the future Transbay Transit Center. Therefore, the proposed project can also be considered consistent with the transportation component of the *Climate Action Plan*. As a result, the project would have a less-than-significant impact on greenhouse gas emissions.

3.3 NOISE

Issue	Potentially Significant Impact	Less-Than-Significant Impact with Mitigation Incorporated	Less-Than-Significant Impact	No Impact
Would the project result in:				
a) Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	☐	☐	☒	☐
b) Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?	☐	☐	☒	☐
c) A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?	☐	☐	☐	☒
d) A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?	☐	☐	☐	☒
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within 2 miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?	☐	☐	☐	☒
f) For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?	☐	☐	☐	☒

Existing Conditions

Acoustics Background and Terminology

Sound is mechanical energy transmitted by pressure waves in a compressible medium such as air. Noise can be defined as unwanted sound. Sound is characterized by various parameters that include the rate of oscillation of sound waves (frequency), the speed of propagation, and the pressure level or energy content (amplitude). In particular, the sound pressure level is the most common descriptor used to characterize the loudness of an ambient sound level. The decibel (dB) scale is used to quantify sound intensity. Because sound pressure can vary enormously within the range of human hearing, the logarithmic decibel scale is used to keep sound intensity numbers at a convenient and manageable level.

The human ear is not equally sensitive to all frequencies in the entire spectrum, so noise measurements are weighted more heavily for frequencies to which humans are sensitive in a process called "A-weighting." Since humans are less sensitive to low frequency sound than to high frequency sound, A-weighted sound levels de-emphasize low frequency sound energy to better represent how humans hear.

Different types of measurements are used to characterize the time-varying nature of sound. These measurements include the equivalent sound level (L_{eq}), the minimum and maximum sound levels (L_{min} and L_{max}), percentile-exceeded sound levels (L_n), the day-night sound level (L_{dn}), and the community noise equivalent level (CNEL). Below are brief definitions of terminology used in this section:

Sound. A vibratory disturbance created by a vibrating object, which, when transmitted by pressure waves through a medium such as air, is capable of being detected by a receiving mechanism, such as the human ear or a microphone.

Noise. Sound that is loud, unpleasant, unexpected, or otherwise undesirable.

Ambient Noise. The composite of noise from all sources near and far in a given environment exclusive of particular noise sources to be measured.

Decibel (dB). A unitless measure of sound on a logarithmic scale, which indicates the squared ratio of sound pressure amplitude to a reference sound pressure amplitude. The reference pressure is 20 micropascals.

A-Weighted Decibel (dBA). An overall frequency-weighted sound level in decibels which approximates the frequency response of the human ear.

Equivalent Sound Level (L_{eq}). The average of sound energy occurring over a specified period. In effect, L_{eq} is the steady-state sound level that in a stated period would contain the same acoustical energy as the time-varying sound that actually occurs during the same period.

Day-Night Sound Level (L_{dn}). The energy average of the A-weighted sound levels occurring during a 24-hour period, with 10 dB added to the A-weighted sound levels occurring during the period from 10:00 PM to 7:00 AM (nighttime).

Community Noise Equivalent Level (CNEL). The energy average of the A-weighted sound levels occurring during a 24-hour period with 5 dB added to the A-weighted sound levels occurring during the period from 7:00 PM to 10:00 PM and 10 dB added to the A-weighted sound levels occurring during the period from 10:00 PM to 7:00 AM.

L_{dn} and CNEL values rarely differ by more than 1 dB. As a matter of practice, L_{dn} and CNEL values are considered to be equivalent and are treated as such in this assessment. In general, human sound perception is such that a change in sound level of 3 dB is just noticeable, a change of 5 dB is clearly noticeable, and a change of 10 dB is perceived as doubling or halving sound level.

For a point source of sound such as a stationary compressor, sound generally attenuates at a rate of 6 dB per doubling of distance. For a line source of sound such as free flowing traffic on a freeway, sound generally attenuates at a rate of 3 dB per doubling of distance. Atmospheric conditions including wind, temperature gradients, and humidity can change how sound propagates over distance and can affect the level of sound received at a given location. The degree to which the ground surface absorbs acoustical energy also affects sound propagation. Sound that travels over an acoustically absorptive surface such as grass attenuates at a greater rate than sound that travel over a hard surface such as pavement. The increased attenuation of an absorptive surface is typically in the range of 1 to 2 dB per doubling of distance. Barriers such as building and topography that block the line of site between a source and receiver also increase the attenuation of sound over distance.

Auditory and non-auditory effects can result from excessive or chronic exposure to elevated noise levels. Auditory effects of noise on people can include temporary or permanent hearing loss. Non-auditory effects of exposure to elevated noise levels include sleep disturbance, speech interference, and physiological effects, such as annoyance. Land use compatibility standards for noise are typically based on research related to these auditory effects.

Ambient Noise and Noise-Sensitivity of Land Uses

Noise-sensitive land uses are those locations where noise can interfere with primary activities. These uses include places where people sleep, such as residences and hospitals. Other noise-sensitive uses include schools, libraries, places of worship, and areas of recreation during hours of normal human use. Vibration-sensitive uses are similar to noise-sensitive uses, but are in large part limited to residential uses, historical structures, and vibration–sensitive technical facilities (i.e., biomedical research).

The proposed project is located in downtown San Francisco, an urban environment consisting primarily of residential, commercial, and mixed-use developments. Noise-sensitive land uses in the project vicinity are primarily residential, with the closest residences located within 50 feet of proposed bus routes and within 100 feet of the proposed Mid-day Bus Parking Facility.

Existing (ambient) noise levels in the vicinity of the closest residential receivers to the project bus parking facility were measured to be in the range of 70-79 dB hourly L_{eq} (81 dB L_{dn}). This noise exposure was dominated by local traffic on Third Street and the elevated I-80 (West Approach) freeway. Measured noise exposure near building setbacks along roadway segments in the project vicinity ranged from 64-71 dB L_{eq}, with maximum levels as high as 88 dB (L_{max}). In terms of the day-night average noise level (L_{dn}), existing traffic noise levels at typical building

setbacks and exterior receiver locations in the project vicinity were modeled to be in the range of approximately 60-75 dB.

Regulatory Framework

Federal Transit Administration (FTA)

The Federal Transit Administration (FTA) has developed a methodology and significance criteria to evaluate noise impacts from surface transportation modes (i.e., passenger cars, trucks, buses, and rail), detailed in *Transit Noise and Vibration Impact Assessment* ("*FTA Guidelines*") (May 2006). The incremental noise level increase criteria included within the *FTA Guidelines* are based on studies of annoyance in communities affected by transportation noise, prepared by the U.S. Environmental Protection Agency (EPA). These criteria are summarized in Table 3-4.

Table 3-4: FTA Impact Criteria for Noise-Sensitive Uses

Existing Day-Night Noise Level (L_{dn}) (dBA)	Allowable Noise Level Increase (dB)	
	Residences and Buildings Where People Normally Sleep[a]	Institutional Land Uses with Primarily Daytime and Evening Uses[b]
45	8	12
50	5	9
55	3	6
60	2	5
65	1	3
70	1	3
75	0	1
80	0	0

Notes:
[a] This category includes residences, hospitals, and hotels where a nighttime sensitivity to noise is assumed to be of utmost importance.
[b] This category includes schools, libraries, theaters, and churches where it is important to avoid interference with activities such as speech, meditation, and concentration on reading material.
Source: FTA, 2006.

The scientific rationale for the choice of these criteria is explained in the *FTA Guidelines*. Starting from the EPA's definition of minimal noise impact as a 5 dB change from an established protective ambient level, the FTA extended the EPA's incremental impact criteria to higher baseline ambient levels. As baseline ambient levels increase, the allowable noise level increase is reduced to limit community annoyance. For example, in residential areas with a baseline ambient noise level of 50 dBA L_{dn}, a 5 dB increase in noise levels would be acceptable, while at 70 dBA L_{dn}, only a 1 dB increase would be allowed.

The FTA has also developed guidelines for assessing the significance of ground-borne vibration produced by transportation sources and construction activity. Vibration impact criteria are summarized in Table 3-5.

Table 3-5: FTA Impact Criteria for Ground-borne Vibration (General Assessment)

Land Use Category	Impact Levels (VdB, relative to 1 µin / sec)		
	Frequent Events[a]	Occasional Events[b]	Infrequent Events[c]
Category 1 Buildings where vibration would interfere with interior operations[d]	65	65	65
Category 2 Residences and buildings where people normally sleep	72	75	80
Category 3 Institutional land uses with primarily daytime uses	75	78	83

Notes:
[a] Defined as more than 70 vibration events of the same source per day.
[b] Defined as between 30 and 70 vibration events of the same source per day.
[c] Defined as fewer than 30 vibration events of the same source per day.
[d] This criterion limit is based on levels that are acceptable for most moderately sensitive equipment such as optical microscopes.
Source: FTA, 2006.

These vibration criteria are related to ground-borne vibration levels that are expected to result in human annoyance, and are based on root mean square (RMS) velocity levels expressed in VdB. FTA experience with community response to ground-borne vibration indicates that when there are only a few train or bus events per day, higher vibration levels are needed to evoke the same community response that would be expected from more frequent events generating a similar level of vibration. The FTA criteria take this phenomenon into account by distinguishing between projects with "frequent" and "infrequent" events, where frequent is defined as more than 70 events per day.

To address the potential for structural damage to fragile buildings, Section 12.2.2 of the *FTA Guidelines* also recommends vibration impact thresholds of 0.2 in / sec peak particle velocity (PPV) (approximately 100 VdB) for fragile buildings and 0.12 in / sec PPV (approximately 95 VdB) for extremely fragile buildings. In this case, the FTA's general assessment criteria listed in Table 3-5 are more restrictive, and will therefore be used to assess proposed project impacts in this report.

Title 24

Title 24, Part 6, Division T25, Chapter 1, Subchapter 1, Article 4, Sections T25–28 of the California Code of Regulations establish building standards applicable to all dwellings throughout the state. The Code provides acoustical regulations requiring both exterior-to-interior sound insulation and sound and impact isolation between adjacent spaces of various occupied units. Title 24 regulations state that interior noise levels generated by exterior noise sources shall not exceed 45 dB L_{dn}, with windows closed, in any habitable room for general residential uses. Generally, the inclusion of noise-insulating windows and sound isolation materials in the project design are means of demonstrating compliance with this interior noise level standard.

San Francisco General Plan

The *San Francisco General Plan* provides long-term guidance and policies for maintaining and improving the quality of life and the man-made and natural resources of the community. In particular, the Environmental Protection Element of the *San Francisco General Plan* is concerned primarily with avoiding or mitigating the adverse effects of transportation noise, and contains the following objectives and policies relevant to this analysis:

Objective 11: Promote land uses that are compatible with various transportation noise levels.

Policy 11.1 Discourage new uses in areas in which the noise level exceeds the noise compatibility guidelines for that use.

Policy 11.3 Locate new noise-generating development so that the noise impact is reduced.

The "Land Use Compatibility Chart for Community Noise" included in Policy 11.1 establishes the compatibility of different land use types within a range of ambient noise levels.

For residential uses:

- Noise exposure is considered "satisfactory, with no special noise insulation requirements" where the L_{dn} is 60 dBA or less.
- "New construction or development should be undertaken only after a detailed analysis of noise reduction requirements is made and needed noise insulation features included in the design" where the L_{dn} is between 60 dBA and 70 dBA.
- "New construction or development should generally be discouraged" where the L_{dn} is above 65 dBA.

For other noise-sensitive uses (i.e., schools, libraries, churches, hospitals, nursing homes):

- Noise exposure is considered "satisfactory, with no special noise insulation requirements" where the L_{dn} is 65 dBA or less.
- "New construction or development should be undertaken only after a detailed analysis of noise reduction requirements is made and needed noise insulation features included in the design" where the L_{dn} is between 62 dBA and 70 dBA.

"New construction or development should generally not be undertaken" where the L_{dn} is above 65 dBA.

San Francisco Noise Ordinance

The *San Francisco Noise Ordinance* (Article 29, *San Francisco Police Code*, Section 2900) specifically recognizes that adverse effects on a community can arise from noise sources such as transportation, construction, mechanical equipment, entertainment, and human and animal behavior. In particular, the *San Francisco Noise Ordinance* makes the following declaration:

> It shall be the policy of San Francisco to maintain noise levels in areas with existing healthful and acceptable levels of noise and to reduce noise levels, through all practicable means, in those areas of San Francisco where noise levels are above acceptable levels as defined by the World Health Organization's *Guidelines on Community Noise*.

Section 2909 of the *San Francisco Noise Ordinance* limits noise from a fixed source (e.g., an idling bus in the proposed Mid-day Bus Parking Facility) from causing the noise level measured inside any sleeping or living room

in any dwelling unit located on residential property to 45 dBA between the hours of 10:00 PM to 7:00 AM or 55 dBA between the hours of 7:00 AM to 10:00 PM with windows open except where building ventilation is achieved through mechanical systems that allow windows to remain closed. It is assumed that these noise level limits are represented by the hourly L_{eq} descriptor (hourly average level).

Impact Discussion

3.3a. Less-Than-Significant Impact. A significant impact may occur if project-related noise levels exceed the applicable standards of the City of San Francisco or other agencies.

Measured exterior noise exposure at a residential receiver location in the vicinity of the proposed new Mid-day Bus Parking Facility, on the southeast corner of Third Street and Stillman Street, was approximately 81 dBA L_{dn}. This noise exposure was dominated by local traffic on Third Street and the elevated I-80 freeway. Modeled traffic noise exposure under the existing (ambient) condition ranged from 60.2 dBA L_{dn} to 75.3 dBA L_{dn} for affected receivers in the project vicinity, with most levels exceeding 65 dBA L_{dn}. Therefore, for most noise-sensitive uses in the project vicinity, existing noise exposure currently exceeds the City's applicable 60 dBA L_{dn} or 65 dBA L_{dn} "satisfactory" land use compatibility limits.

Modeled existing plus project traffic noise levels also ranged from approximately 60.2 dBA L_{dn} to 75.3 dBA L_{dn}, with no more than a 0.2 dB increase in traffic noise level due to the project at affected roadways / receivers. The addition of the project itself would not be expected to cause noise exposure in excess of the City's noise compatibility standards. Therefore, this impact is considered less than significant.

More detailed information regarding acoustical measurements, modeling, analysis, and impact assessment are contained within the Noise / Vibration Technical Study Memorandum found in Appendix B (see Appendix B) (AECOM, 2013b).

3.3b. Less-Than-Significant Impact. A significant impact may occur if the project would produce excessive ground-borne vibration levels at acoustically sensitive uses.

The proposed project would not include sources of substantial ground-borne vibration. The passing of a project-related bus on local streets would not be expected to produce vibration levels in excess of 65 VdB at a distance of 50 feet, and, thus, would likely be imperceptible to most receivers. Since residential receivers in the vicinity of the project bus routes would generally be more than 50 feet from passing project buses, the vibration produced by these operations would not likely be perceptible. Additionally, project-related daily operations at the Mid-day Bus Parking Facility would not be expected to introduce substantial sources of ground-borne vibration. Therefore, this impact is considered less than significant.

3.3c. Less-Than-Significant Impact. A significant impact may occur if the project would permanently increase noise exposure relative to the ambient noise condition.

As presented in Impact 3.3a above, the proposed project is not expected to increase traffic noise exposure by more than 0.2 dB (L_{dn}) relative to the existing traffic noise condition. This is not a significant increase based on the applied FTA impact threshold (see Table 3-4 above). Project-related noise produced by bus operations within the Mid-day Bus Parking Facility would be shielded from neighboring residences by the 12-foot high sound wall

(proposed as part of the previously approved 2004 FEIS / EIR) that would be constructed along Stillman Street and part of Third Street. Resulting noise exposure is expected to be well below ambient levels and is not expected to produce a significant increase in noise levels relative to the existing condition. Therefore, this impact is considered less than significant.

3.3d. No Impact. A significant impact may occur if the project would temporary or periodically increase noise exposure relative to the ambient noise condition.

The proposed project would not include any new construction or any other temporary source of noise that was not addressed in the original FEIS / EIR. Thus, implementation of the proposed project would not result in significant, temporary increases in noise exposure relative to the ambient condition. There would be no impact. Permanent increases in noise exposure from the proposed project are discussed under Impact 3.3c above.

3.3e & f. No Impact. A significant impact may occur if the people residing or working in the project area would be exposed to excessive aircraft noise levels.

The proposed project is not located within an area covered by an airport land use plan or within two miles of a public airport, public use airport, or private airport. Noise exposure in the project area is dominated by local traffic operations. Thus, implementation of the proposed project would not result in airport noise impacts on people residing or working within the project area. There would be no impact.

3.4 TRANSPORTATION AND TRAFFIC

Issue	Potentially Significant Impact	Less-Than-Significant Impact with Mitigation Incorporated	Less-Than-Significant Impact	No Impact
Would the project:				
a) Cause an increase in traffic that is substantial in relation to the existing traffic load and capacity of the street system (i.e., result in a substantial increase in either the number of vehicle trips, the volume to capacity ratio on roads, or congestion at intersections)?	☐	☐	☒	☐
b) Exceed, either individually or cumulatively, a level of service standard established by the county congestion management agency for designated roads or highways?	☐	☐	☒	☐
c) Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?	☐	☐	☐	☒
d) Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e. g. farm equipment)?	☐	☐	☐	☒

e) Result in inadequate emergency access?	☐	☐	☒	☐
f) Conflict with adopted policies supporting alternative transportation (e.g., bus turnouts, bicycle racks)?	☐	☐	☐	☒
g) Result in inadequate parking capacity?*	☐	☐	☐	☒

* Not in CEQA Appendix G.

Existing Conditions

Existing intersection Level of Service (LOS) was evaluated using the 2000 *Highway Capacity Manual* (HCM) methodology at selected study intersections where there is a potential that the proposed project may result in substantial effects to transportation and circulation. The LOS methodology is a qualitative description of the performance of an intersection based on average delay per vehicle. For signalized intersections, the HCM methodology determines the capacity of each lane group approaching the intersection and calculates an average delay (in seconds per vehicle) for each of the various movements at the intersection. A combined weighted average delay and LOS are then presented for the intersection. For unsignalized intersections, the average delay and LOS for the worst stop-controlled approach at the intersection are presented. Adjustments are typically made to the capacity of each intersection to account for various factors that reduce the ability of the streets to accommodate vehicles (such as the "downtown" nature of the area, number of pedestrians, bus stops, vehicle types, lane widths, grades, on-street parking, and queues).

Intersection LOS ranges from LOS A, which indicates free flow or excellent conditions with short delays, to LOS F, which indicates congested or overloaded conditions with extremely long delays. LOS definitions for signalized and unsignalized intersections are described in Table 3-6. In San Francisco, LOS A through LOS D are considered excellent to satisfactory service levels, and LOS E and LOS F represent unacceptable service levels.

Table 3-6: Intersection Level of Service Definitions

LOS	Description	Average Delay (seconds / vehicle)	
		Signalized Intersections	**Unsignalized Intersections**
A	Little or no delay	$\leq$ 10.0	$\leq$ 10.0
B	Short traffic delay	> 10.0 and $\leq$ 20.0	> 10.0 and $\leq$ 15.0
C	Average traffic delay	> 20.0 and $\leq$ 35.0	> 15.0 and $\leq$ 25.0
D	Long traffic delay	> 35.0 and $\leq$ 55.0	> 25.0 and $\leq$ 35.0
E	Very long traffic delay	> 55.0 and $\leq$ 80.0	> 35.0 and $\leq$ 50.0
F	Extreme traffic delay	> 80.0	> 50.0

Source: Transportation Research Board, 2000.

It should be noted that delay for intersections operating at LOS F is typically reported as "greater than 80.0 seconds" for signalized intersections and "greater than 50.0 seconds" for unsignalized intersections, as 80.0 seconds and 50.0 seconds are generally considered the limits of the meaningful range for the analysis methodology for signalized and unsignalized intersections. In these situations, the volume-to-capacity (v/c) ratio is also presented to facilitate comparison between scenarios.

Intersection LOS was analyzed at the following three (3) study intersections using Trafficware's Synchro 8 software package:

1. Third Street / Perry Street;
2. Third Street / Harrison Street; and,
3. Third Street / Folsom Street.

Consistent with typical intersection analyses as described in the San Francisco Planning Department's *Transportation Impact Analysis Guidelines for Environmental Review* (October 2002), operations at the study intersections were analyzed for the weekday PM peak hour, defined as the four consecutive 15-minute periods during the weekday PM peak period (4:00 PM to 6:00 PM) exhibiting the highest overall traffic volumes. These three intersections were selected because they are expected to show the highest increase in total traffic volumes during the weekday PM peak period as a result of the proposed project.

Intersection turning movement counts at the three study intersections were collected on Tuesday, October 9, 2012. Traffic signal timing plans were obtained from the San Francisco Municipal Transportation Agency (SFMTA). Existing lane geometries (including peak period tow-away restrictions and transit-only lanes) were gathered from field observations. Observations of roadway operations found that the transit-only lanes on Third Street were used primarily by transit vehicles only. Existing Conditions weekday PM peak hour intersection lane geometry and traffic volumes are illustrated in Figure 3-1. Existing Conditions weekday PM peak hour intersection LOS is summarized in Table 3-7.

Table 3-7: Existing Conditions – Weekday PM Peak Hour Intersection Level of Service

Intersection	Existing Conditions		
	Traffic Control	**LOS**	**Delay (seconds / vehicle)**
1 Third Street / Perry Street	One-way stop		
Westbound Perry Street		C	15.9
Intersection average		A	0.1
2 Third Street / Harrison Street	Signal	B	16.9
3 Third Street / Folsom Street	Signal	C	22.1

Source: AECOM, 2013c.

Figure 3-1: Existing Conditions Intersection Lane Geometry and Traffic Volumes

Source: AECOM, 2013.

In order to facilitate comparison with the Existing plus Project Conditions analysis, delay and LOS at Third Street / Perry Street are reported for the stop-controlled approach (westbound Perry Street) and the intersection as a whole. Likewise, at Third Street / Harrison Street and Third Street / Folsom Street, delays associated with transit vehicles in the Third Street transit-only lane have been omitted from the analysis. As shown in Table 3-7, all three study intersections currently operate at acceptable LOS (LOS D or better) during the weekday PM peak hour.

Regulatory Framework

San Francisco Transportation/Traffic-related policies

The San Francisco Planning Department uses the following significance criterion for the determination of intersection-related impacts associated with a proposed project:

- The operational impact on signalized intersections is considered significant when project-related traffic causes the intersection level of service to deteriorate from LOS D or better to LOS E or LOS F, or from LOS E to LOS F. The operational impacts on unsignalized intersections are considered potentially significant if project-related traffic causes the level of service at the worst approach to deteriorate from LOS D or better to LOS E or LOS F and the California Manual on Uniform Traffic Control Devices (California MUTCD) signal warrants would be met, or would cause California MUTCD signal warrants to be met when the worst approach is already operating at LOS E or LOS F. The project may result in significant adverse impacts at intersections that operate at LOS E or LOS F under existing conditions depending upon the magnitude of the project's contribution to the worsening of the average delay per vehicle. In addition, the project would have a significant adverse impact if it would cause major traffic hazards or contribute considerably to cumulative traffic increases that would cause deterioration in levels of service to unacceptable levels.

Impact Discussion

3.16a. Less-Than-Significant Impact. A significant impact may occur if the project would cause an increase in traffic that is substantial in relation to the existing traffic load and capacity of the street system or if adopted San Francisco thresholds for a significant project impact are exceeded for roadways and intersections that would carry project-generated traffic.

Existing plus Project Conditions

Golden Gate Transit Commute Bus pull-outs from the existing Mid-day Bus Parking Facility during the weekday PM peak hour were added to traffic volumes on the affected turning movements at the three study intersections. As described previously, the proposed project would also involve geometry and signalization changes at the Third Street / Perry Street intersection, which were also accounted for in the Existing plus Project Conditions analysis. In particular, the change in directionality of Perry Street would result in outlet traffic from the segment of Perry Street between Third Street and Fourth Street using the Third Street / Perry Street intersection instead of the Fourth Street / Perry Street intersection. Although the actual volume of traffic currently using this segment of Perry Street is minimal, it provides secondary parking / loading access for several parcels with primary entrances along Harrison Street. As a result, a nominal volume of non-bus traffic was assumed for the eastbound approach at the Third Street / Perry Street intersection.

Consistent with the *Golden Gate Transit San Francisco Mid-Day Bus Parking Facility Draft Preliminary Design Evaluation Report* (November 6, 2012) prepared by URS and associated analysis work conducted by Fehr & Peers, the analysis assumes a three-phase signal (northbound Third Street, eastbound Perry Street, and westbound Perry Street), with the new pedestrian phase across Third Street operating with both Perry Street phases.

The resulting weekday PM peak hour intersection lane geometry and traffic volumes are illustrated in Figure 3-2. The resulting Existing plus Project Conditions weekday PM peak hour intersection LOS is summarized in Table 3-8.

Table 3-8: Existing plus Project Conditions – Weekday PM Peak Hour Intersection Level of Service

Intersection	Existing Conditions			Existing plus Project Conditions		
	Traffic Control	**LOS**	**Delay (seconds / vehicle)**	**Traffic Control**	**LOS**	**Delay (seconds / vehicle)**
1 Third Street / Perry Street	OWSC			Signal		
Westbound Perry Street		C	15.9		C	29.0
Eastbound Perry Street					C	21.0
Intersection average		A	0.1		A	7.8
2 Third Street / Harrison Street	Signal	B	16.9	Signal	B	16.9
3 Third Street / Folsom Street	Signal	C	22.1	Signal	C	22.3

Notes:
OWSC = One-way stop control
Source: AECOM, 2013c.

As shown in Table 3-8, the proposed project would have a negligible effect on overall traffic operations at the Third Street / Harrison Street and Third Street / Folsom Street intersections. The introduction of a new traffic signal (and associated traffic volumes) and signalized crosswalk across Third Street at the Third Street / Perry Street intersection would slightly degrade intersection average delay compared to Existing Conditions, but the intersection as a whole would still operate at LOS A while facilitating bus egress out of the new Golden Gate Transit Mid-day Bus Parking Facility and pedestrian connectivity across Third Street.

Figure 3-2: Existing plus Project Conditions Intersection Lane Geometry and Traffic Volumes

Source: AECOM, 2013.

Cumulative (2030) Conditions

The Cumulative (2030) Conditions analysis is based on technical work conducted for the *Transit Center District Plan and Transit Tower Draft Environmental Impact Report* (EIR) (Planning Department Case Number 2007.0558E and 2008.0789E; SCH #2008072073)—hereafter referred to as the "Transit Center District Plan EIR")—published by the San Francisco Planning Department on September 28, 2011. Use of the *Transit Center District Plan EIR* technical work ensures that the analysis of Cumulative (2030) Conditions considers both background growth in the city and region (such as buildout of the *Market / Octavia Plan*, the Eastern Neighborhoods rezoning, and the *Treasure Island Redevelopment Plan*) and growth attributable to specific parcels in and around the Transit Center District Plan area. The *Transit Center District Plan EIR* technical work also assumes various changes to the transportation network—such as the *Rincon Hill Streetscape Master Plan*, the Central Subway, and the Transit Effectiveness Project—that would likely affect traffic patterns and volumes in and around the project site.

Additional modifications to the *Transit Center District Plan EIR* technical work were made as needed to account for intersections not explicitly studied in the EIR and specific elements of the proposed project (such as the rerouted bus traffic) that represent departures from the original assumptions contained in the *Transit Center District Plan EIR* analysis.

Cumulative (2030) Conditions weekday PM peak hour intersection lane geometry and traffic volumes are illustrated in Figure 3-3. The resulting Cumulative (2030) Conditions weekday PM peak hour intersection LOS is summarized in Table 3-9.

Table 3-9: Cumulative (2030) Conditions – Weekday PM Peak Hour Intersection Level of Service

Intersection	Existing plus Project Conditions		Cumulative (2030) Conditions		
	LOS	Delay (seconds / vehicle)	LOS	Delay (seconds / vehicle)	v/c
1 Third Street / Perry Street	A	7.8	A	6.8	
2 Third Street / Harrison Street	B	16.9	**F**	**> 80.0**	**1.26**
3 Third Street / Folsom Street	C	22.1	**F**	**> 80.0**	**1.16**

Notes:
Bold indicates unacceptable conditions (LOS E or LOS F).
Source: AECOM, 2013c.

It should be noted that explicit forecasts were not calculated for bus traffic in the transit-only lanes along Third Street, as the actual bus volumes are uncertain and highly dependent on Muni service plans following the opening of the Central Subway. Omission of transit-only traffic has no effect on the analysis results, as this bus traffic is segregated from the general travel lanes considered in the intersection LOS analysis. Bus traffic not in transit-only lanes (e.g., along Harrison Street or Folsom Street) was assumed to exhibit growth rates similar to those for general traffic. As the current level of bus traffic not using transit-only lanes is minimal, the effect of the growth rate assumptions for this traffic on overall intersection performance are mostly negligible.

Figure 3-3: Cumulative (2030) Conditions Intersection Lane Geometry and Traffic Volumes

Source: AECOM, 2013.

As shown in Table 3-9, the Third Street / Perry Street intersection would continue to operate at LOS A under Cumulative (2030) Conditions, but the Third Street / Harrison Street and Third Street / Folsom Street intersections would degrade to LOS F, with v/c ratios over 1.00.

Consistent with San Francisco Planning Department standard methodologies, a review of the proposed project's contribution to intersection critical movements at these two intersections was conducted to determine if the proposed project would represent a significant contribution to the failing conditions. The proposed project's contribution to critical movement volumes at these locations is summarized in Table 3-10.

Table 3-10: Cumulative (2030) Conditions – Project Contribution to Intersections

Intersection	Critical Movement	Project Contribution to Critical Movement
2 Third Street / Harrison Street	NBT	0.0%
	WBT	0.0%
3 Third Street / Folsom Street	NBT	0.0%
	EBL	0.0%

Source: AECOM, 2013c.

As shown in Table 3-10, the proposed project would not contribute traffic to any of the critical movements at the two study intersections failing under Cumulative (2030) Conditions. In particular, project-generated traffic at the Third Street / Harrison Street intersection would be confined to the transit-only lane along Third Street and would have a negligible effect on traffic operations in the adjacent northbound travel lanes. At the Third Street / Folsom Street intersection, the proposed project would add traffic to the northbound right-turn movement, which is not expected to be an intersection critical movement. Therefore, this would be a less-than-significant impact.

3.16b. Less-Than-Significant Impact. A significant impact may occur where adopted Caltrans, San Francisco County Transportation Authority (SFCTA), and Metropolitan Transportation Commission (MTC) thresholds for a significant project impact are exceeded.

The proposed project primarily involves changes to the alignment of existing bus routes on city streets, and is not expected to result in any new operational vehicle trips beyond existing traffic, nor add traffic to Caltrans facilities such as freeway mainlines or ramps.

While the proposed project would reroute bus traffic onto Third Street, which is designated as part of the local Congestion Management Program (CMP) roadway network by the SFCTA, the existing routes already direct bus traffic onto Folsom Street, which is also part of the CMP-designated roadway network. As a result, the proposed project only involves the rerouting of bus traffic from one CMP-designated roadway segment to another CMP-designated roadway segment. Given this consideration, the overall effects of the proposed project on the CMP-designated roadway network are expected to be minimal, and no additional project-related effects are expected beyond those already considered in the analysis of LOS at the three affected study intersections along Third Street. Therefore, this would be a less-than-significant impact.

3.16c. No Impact. A significant impact would occur if the proposed project would result in a change in air traffic patterns.

The proposed project would not include any aviation-related uses and would, therefore, not result in a change in air traffic patterns. Thus, no impact would occur.

3.16d. No Impact. A significant impact would occur if the proposed project includes new roadway design or introduces new land use or project features into an area with specific transportation requirements and characteristics that have not been previously experienced in that area, or if project access or other features were designed in such a way as to create hazardous conditions.

The proposed project would involve a reversal of the directionality of Perry Street from one-way westbound traffic to one-way eastbound traffic and the installation of a new traffic signal at the Third Street / Perry Street intersection to facilitate bus egress out of the new Mid-day Bus Parking Facility. Access would still be available to parcels along Perry Street, and no features of the proposed project are expected to create hazardous conditions. Thus, no impact would occur.

3.16e. Less-Than-Significant Impact. A significant impact would occur if the project design does not provide emergency access meeting the requirements of the San Francisco Fire Department or in any other way threatens the ability of emergency vehicles to access and serve the project site or adjacent uses.

The proposed project would involve a reversal of the directionality of Perry Street from one-way westbound traffic to one-way eastbound traffic, but emergency access would still be available to parcels along Perry Street. Therefore, the proposed project would have a less-than-significant impact on emergency access.

3.16f. No Impact. A significant impact may occur if the proposed project were to conflict with adopted policies or involve modification of existing alterative transportation facilities located on- or off-site.

As a transit-related project, the proposed project would encourage alternative transportation by facilitating Golden Gate Transit Commute Bus operations in Downtown San Francisco. The proposed traffic signal at the Third Street / Perry Street intersection would also include a signalized crosswalk across Third Street, enhancing pedestrian connectivity across a high-volume roadway in a dense, urban environment. The proposed project would add new bus traffic to existing transit-only lanes along Third Street, but this, in and of itself, would not represent a conflict with adopted policies, plans, or programs supporting alternative transportation. Use of the transit-only lanes by Golden Gate Transit Commute Bus services would actually encourage alternative transportation by increasing the average speed and reducing the average travel times of these services. Therefore, no impacts to adopted policies, plans, or programs supporting alternative transportation would occur.

3.16g. No Impact. A significant impact may occur if the proposed project resulted in inadequate parking capacity.

Since the proposed project would not result in new habitable or employment-related land uses, the proposed project would not be required to provide new parking spaces. Therefore, no parking deficiency is anticipated, and there would be no impact related to parking capacity.

Memorandum

To	Daniel Ng, PE Golden Gate Bridge, Highway and Transportation District	Pages	8
CC	John Eberle, PE Maurice Palumbo, PE		
Subject	Transbay Terminal EIR / EIS Addendum: Golden Gate Transit San Francisco Mid-Day Bus Parking Facility – Air Quality and Greenhouse Gases		
From	Jeffrey Chan, PTP Todd Haurin, LEED AP		
Date	January 6, 2013		

This memorandum summarizes the existing and future-year conditions technical analysis relating to air quality and greenhouse gases for Golden Gate Transit's new San Francisco Mid-day Bus Parking Facility Relocation Project. The analysis efforts described in this memorandum will be incorporated into an addendum to the Final Transbay Terminal / Caltrain Downtown Extension / Redevelopment Project Environmental Impact Statement / Environmental Impact Report (SCH #95063004) ("Transbay EIS / EIR"), originally published in March 2004.[1]

Methodology

In order to reflect the subtle air quality and climate impacts from the changes associated with the reroute of Golden Gate Transit "Commute Bus" and "Basic Bus" services from the current Mid-Day Bus Parking Facility located at Eighth Street / Harrison Street to the proposed facility at Third Street / Perry Street, a sophisticated multi-phase emissions estimation model, such as the California Emissions Estimator Model (CalEEMod) or URBEMIS is not required. In addition, URBEMIS is no longer being updated and references an out-of-date version of the EMission FACtors (EMFAC) model. Although the Bay Area Air Quality Management District (BAAQMD) California Environmental Quality Act Air Quality Guidelines (May 2012) recommend using CalEEMod or URBEMIS, it also permits the use of hand calculations, especially since these analytic tools can be burdensome and overly complex for a comparatively straightforward analysis.

The emissions required to be calculated for this exercise include the Scope 1 emissions (i.e., the direct emissions from mobile or stationary sources) of criteria pollutants and greenhouse gases (GHGs) from the Commute Bus and Basic Bus services and Scope 2 GHG emissions (i.e., the indirect emissions from purchased electricity) from the built structures and street lighting for the existing and new bus parking facilities. A qualitative assessment of toxic air contaminants (TACs) was also conducted.

The criteria pollutant and GHG emissions have been calculated using a spreadsheet containing diesel urban bus emission factors taken from EMFAC2011[2], the latest installment of the widely accepted EMFAC model

---

(1) Under the proposed project, the Golden Gate Transit "Basic Bus" services would operate in the fashion considered in the Transbay EIS/EIR.

(2) EMFAC2011 can be accessed at http://www.arb.ca.gov/msei/modeling.htm.

designed by the California Air Resources Board (CARB) to provide emissions estimations for various types of on-road vehicles. EMFAC is continuously updated to reflect changing conditions, such as newer vehicle model years and stricter vehicle emissions regulations. As EMFAC2011 does not provide trace GHG emission factors of methane (CH_4) and nitrous oxide (N_2O) for vehicles or for Scope 2 GHG emissions from purchased electricity, trace mobile GHG emission factors were referenced from CARB's Local Government Operations Protocol (LGOP).[3]

Annual electricity use from the buildings and exterior lighting at the existing and new parking facility sites was estimated using data from the California Commercial End-Use Survey (CEUS), prepared by the California Energy Commission (CEC), for operations located in the Pacific Gas & Electric (PG&E) service territory. Scope 2 GHG emissions from this estimated annual electricity usage were calculated using the local PG&E grid emission factor for carbon dioxide (CO_2).[4] As PG&E does not provide trace GHG emission factors for CH_4 and N_2O from its electricity production, the trace GHG emission factors from the California state grid were referenced from CARB's LGOP.

Emissions Sources

The proposed relocation of the Mid-day Bus Parking Facility would result in route changes for Golden Gate Transit Commute Bus and Basic Bus services. The operation of the new Mid-Day Bus Parking Facility and associated diesel-fueled buses carrying passengers will result in direct emissions of criteria pollutants and both direct and indirect emissions of GHGs from purchased electricity.

It is important to note that Golden Gate Transit's existing bus services already generate some level of emissions. As the Proposed Project involves the relocation of the Mid-Day Bus Parking Facility and associated reroutes to bus services, the air quality and GHG emissions analysis focuses on the geographical area where the bus routes will change. As described in Transbay Terminal EIR / EIS Addendum: Golden Gate Transit San Francisco Mid-Day Bus Parking Facility – Transportation and Circulation (dated December 19, 2012) (hereafter referred to as the "Transportation and Circulation Technical Memorandum"), the route changes would be confined to several streets in the South of Market (SoMa) District of San Francisco, and can be captured by defining an analysis area bounded by Market Street to the north, Stillman Street to the south, Main Street to the east, and Ninth Street to the west.

Vehicle miles traveled (VMT) within the analysis area for the baseline and Proposed Project scenarios were determined by examining the distances of the current and proposed routes for each bus line. Table 1 summarizes existing Golden Gate Transit service (i.e., scheduled trips) in San Francisco, while Table 2 summarizes the changes to route distances within the analysis area bounded by Market Street, Stillman Street, Main Street and Ninth Street. Approximate route distances were obtained using aerial images of the analysis area.

---

[3] In cases where users may need to estimate a project's GHG emissions manually, BAAQMD recommends using CARB's most current LGOP as appropriate for guidance. The LGOP can be accessed at http://www.arb.ca.gov/cc/protocols/localgov/pubs/lgo_protocol_v1_1_2010-05-03.pdf.

[4] Taken from the California Public Utilities Commission (CPUC) GHG Calculator forecast for 2013, worksheet tab "CO2 Allocations," cell AH37. The spreadsheet can be accessed at http://www.pge.com/includes/docs/pdfs/shared/environment/calculator/pge_ghg_emission_factor_info_sheet.pdf.

Table 2: Route Distances within Analysis Area

Service	Route Distance within Analysis Area (mi)			
	Existing		Proposed	
	Inbound	Outbound	Inbound	Outbound
Basic Bus Services				
Via Mission	3.20	3.35	1.55	1.30
Direct to facility[1]	0.50	--	1.55	1.30
Commute Bus Services				
Financial District routes	1.70	2.00	1.15	1.05
Civic Center routes	1.20	0.90	1.25	1.30

Source: AECOM, 2012.

Notes:
Distances rounded to the nearest 0.05 miles.

(1) Currently, one inbound run on Route 70 each day skips all Mission Street stops and heads directly to the existing Mid-Day Bus Parking Facility after crossing Market Street via Eighth Street. With the Proposed Project, this inbound run would be rerouted to serve the Mission Street stops and the new Transbay Transit Center Bus Plaza along the same route as the other Basic Bus services.

It is anticipated that the Project would comprise the following emissions sources:

- Existing fleet of Golden Gate Transit diesel buses, with a gross vehicle weight rating (GVWR) of over 14,000 pounds;
- One new modular office and shed at the new Mid-day Bus Parking Facility (Scope 2 GHG emissions only); and,
- New exterior lighting for the new Mid-day Bus Parking Facility (Scope 2 GHG emissions only).

It should be noted that the Proposed Project consists solely of operations at the new Mid-day Bus Parking Facility and associated changes to bus routes, and there would be no changes to overall level of service (i.e., number of trips). As such, the changes in VMT within the analysis area are assumed to represent the entirety of the Proposed Project's impacts related to bus-generated emissions. While there may be minor changes to dwell times at some stops as a result of the addition or elimination of some stops as part of the bus reroutes, total dwell-time emissions are expected to be similar to or lower than existing levels, as the Proposed Project would not affect overall ridership demand. While passengers would redistribute to other stops, the overall number of passengers would remain the same, such that dwell time would likely remain similar to existing conditions. In addition, emissions from bus acceleration and deceleration would likely decrease due to a reduction in the total number of stops. As a result, emissions related to dwell time as stops was omitted from this analysis.

It was also determined that the speed limit along Howard Street and Folsom Street within the analysis area is approximately 25 miles per hour (mph).[5] This was essential in assigning EMFAC emission factors based on speed.

---

(5) Speed limits on some SOMA streets lowered to 25 MPH <http://sfappeal.com/news/2012/06/speed-limits-on-some-soma-streets-lowered-to-25-mph.php>, SF Appeal (June 7, 2012). Accessed January 3, 2013.

In order to calculate Scope 2 GHG emissions, the following data was required to simulate the operation of the existing and new bus parking facilities:

1. Type and size (ft^2) of the structures located (or to be located) on each site;
2. Type of energy inputs that the structures use (or will use) (e.g., electricity and / or natural gas); and,
3. Size of each site (ft^2).

Data on these analysis inputs was provided primarily by Golden Gate Transit, supplemented by measurements of the dimensions of the existing Mid-day Bus Parking Facility site using aerial images. The annual energy consumption from the structures and exterior lighting on both sites was estimated by multiplying the surface area of the structures and sites into the annual electric energy intensity ($kWh/ft^2/year$) based on representative data from the CEUS (for all end users, for small office buildings less than 30,000 ft^2 and exterior lighting located in the PG&E service area).

Criteria Pollutant and GHG Emission Calculations

Since vehicles emit criteria pollutants at different rates based on speed, the EMFAC emission rates for the criteria pollutants were taken at 5 mph intervals from 0 mph to 25 mph and averaged to calculate a single emission factor for each pollutant. This blended average was used to better simulate diesel buses traveling at various speeds along the existing and proposed routes. Carbon dioxide emissions do not vary based on speed, so a single emission factor for urban buses was taken from EMFAC. Emissions factors based on speed for CH_4 and N_2O were not available from EMFAC and thus were taken from the LGOP for heavy-duty highway vehicles on a grams per mile (g/mi) basis.

The total daily bus VMT for existing and proposed routes (based on the information contained in Table 1 and Table 2) were multiplied into their respective emission factors based on mileage to derive the daily emissions for criteria pollutants and GHG emissions. For daily emissions, a weighted average was calculated for Basic Bus services, as the total number of trips is different for weekday and weekend schedules. In order to estimate annual emissions, the daily emissions were multiplied by 365 days / year for Basic Bus services and by 260 days / year (five days per week, 52 weeks per year) for Commute Bus services.

In order to estimate Scope 2 GHG emissions from the electricity use at the existing and new sites, the annual energy consumption values (derived from the CEC CEUS) were multiplied into the 2013 forecasted PG&E grid electricity emission factor for CO_2. As described earlier, utility-specific CH_4 and N_2O trace GHG emission factors were not available, so the California grid averages from CARB's LGOP were taken for these two gases.

The surface areas for the existing and new sites were then multiplied into the annual electric energy intensity for exterior lighting for miscellaneous uses located in the PG&E service area to calculate the annual energy consumption from lighting. The same calculation procedures and emission factors were used to estimate GHG emissions from the structures on the existing and new sites.

Results and Significance Determination

Due to a legal judgment currently awaiting appeal, BAAQMD is not recommending use of its quantified significance thresholds for air pollutants of concern in its updated California Environmental Quality Act Air Quality Guidelines (May 2010) ("BAAQMD CEQA Guidelines"). As a result, the currently applicable BAAQMD CEQA air quality significance thresholds are based on the previous version of the BAAQMD CEQA Guidelines released in December 1999.

The BAAQMD CEQA Guidelines is an advisory document that provides lead agencies, consultants, and project applicants with uniform procedures for addressing air quality in environmental documents. In May 2010, BAAQMD updated the CEQA Guidelines with new quantitative thresholds for construction and operational-related criteria air pollutants and precursors, toxic air contaminants (TACs), and GHGs. However, in March 2012, the Alameda County Superior Court issued a judgment finding that the changes to the BAAQMD CEQA Guidelines qualify as a project under CEQA and that BAAQMD has not complied with CEQA as part of the adoption process. Therefore, at the time of this writing, BAAQMD is not recommending use of the updated 2010 CEQA Guidelines thresholds to evaluate air quality impacts. As a result, the thresholds of significance in the 1999 CEQA Guidelines must be relied upon to determine the significance of the Proposed Project's air quality impacts in the interim.

Criteria Pollutant Emissions

Determination of whether or not the Proposed Project would result in air quality impacts requires a comparison of daily and annual emissions of criteria pollutants based on the VMT calculations for the baseline and Project scenarios (i.e., existing and proposed bus routes, respectively). The resulting net change in daily and annual criteria pollutant emissions as a result of the Project is summarized in Table 3.

Table 3: Net Change in Criteria Pollutant Emissions

Emissions Source	Net Change in Criteria Pollutant Emissions					
	Absolute Change (lbs / day or tons / year)					Percentage Change
	ROG	CO	NO_x	PM_{10}	$PM_{2.5}$	
Daily Emissions						
Basic Bus Services	(0.39)	(1.43)	(4.62)	(0.10)	(0.09)	(57%)
Commute Bus Services	(0.32)	(1.20)	(3.86)	(0.08)	(0.08)	(37%)
Total	(1.27)	(4.71)	(15.19)	(0.32)	(0.30)	(46%)
Annual Emissions						
Basic Bus Services	(0.07)	(0.26)	(0.84)	(0.02)	(0.04)	(57%)
Commute Bus Services	(0.04)	(0.16)	(0.50)	(0.01)	(0.02)	(37%)
Total	(0.21)	(0.80)	(2.57)	(0.05)	(0.06)	(47%)

Source: AECOM, 2012.

Notes:
ROG = reactive organic gases
CO = carbon monoxide
NOx = nitrous oxides
PM_{10} = coarse particulate matter (diameter less than 10 µm)
$PM_{2.5}$ = fine particulate matter (diameter less than 2.5 µm)

As shown in Table 3, the Project would reduce daily and annual criteria pollutant emissions from bus VMT within the analysis area under the baseline scenario by almost 50% for each pollutant as result of the proposed route changes. It should be noted that the Proposed Project would result in not only reduced VMT, but also a net reduction in the total number of bus stops, further reducing air emissions beyond the values summarized in Table 3, as described earlier.

Localized Impacts

The BAAQMD has prepared a screening methodology for determining project-related carbon monoxide (CO) concentrations using worst-case conditions. According to this methodology, projects would have a less-than-significant effect if they are consistent with an applicable congestion management program and would not increase traffic volumes at intersections handling more than 44,000 vehicles per hour (with certain exceptions for tunnels, parking garages, and other areas where mixing of air is limited).

As described in the Transportation and Circulation Technical Memorandum, cumulative traffic volumes at the affected intersections are well below those set for the CO screening methodology in the 2012 BAAQMD CEQA Guidelines, establishing that the Proposed Project would result in a less-than-significant impact to localized concentrations.

The BAAQMD has also prepared methods to determine whether there are local community risk and hazard impacts from projects for both new sources and new receptors. The two pollutants of concern in this analysis are emissions of TACs and fine particulate matter ($PM_{2.5}$). It is important to note, however, that the buses are existing sources—as a result, this qualitative analysis focuses on determining whether or not there are receptors near the proposed routes. The overall changes to the bus routes are minor, and will generally shrink the geographical scope of the existing routes and orient them along new alignments only a few blocks away from their original routes. Nevertheless, an observational TAC analysis was performed to determine if sensitive receptors (e.g. residential areas, parks, schools, senior centers, etc.) were present near the new routes, presenting a potential hazard to human health.

As indicated in the Transportation and Circulation Technical Memorandum, the routes for Basic Bus services in the analysis area would shrink substantially. There is only a small addition to the route where buses will turn right from southbound Beale Street to serve the new Transbay Transit Center Bus Plaza and then make a right onto northbound Fremont Street, where the buses will rejoin the existing route. No nearby sensitive receptors were identified along the added route segment.

Likewise, routes for Financial District and Civic Center Commute Bus services would also shrink substantially. For Financial District Commute Bus services, there is only a small addition to the route where buses will turn left onto southbound Fourth Street and then travel approximately two and one-half blocks to make a left onto Perry Street and into the new Mid-day Bus Parking Facility. The buses will then exit onto northbound Third Street, traveling approximately one and one-half blocks before turning right onto eastbound Folsom Street to rejoin the existing route alignment. An existing day care center was identified at the corner of Fourth Street and Folsom Street, but subsequent research indicates that this center was established in 1970. The center is situated only one-and-a-half blocks from the existing route for Golden Gate Transit buses, but no indication of health risk was mentioned in the original addendum to the Transbay EIS / EIR, published in 2004.

The Civic Center Commute Bus services are the only services expected to see an expansion in geographical scope, as indicated in the Transportation and Circulation Technical Memorandum. The new route segments proposed for these services are already part of existing routes for both Basic Bus and Financial District Commute Bus services. Because of this route overlap, there would be no new exposure of TAC or $PM_{2.5}$ emissions to receptors.

These observations of reductions in total bus VMT and overlapping route segments between the existing and proposed routes show that the Proposed Project will either maintain or reduce the pollutant concentration exposure for sensitive receptors, indicating a less-than-significant impact for local community risk and hazard impacts.

In addition to low cumulative traffic volumes, reduced bus VMT, and overlapping route segments between the existing and proposed routes, the Proposed Project will result in a net decrease in the number of bus stops from the existing routes. Therefore, the Proposed Project can be safely considered a less-than-significant impact based on the air quality checklist in Appendix G of the CEQA Guidelines.

Climate Change Impacts

As explained previously, BAAQMD is not currently recommending use of the updated 2010 CEQA Guidelines thresholds to evaluate air quality impacts, instead directing lead agencies, consultants, and project applicants to use the thresholds of significance in the 1999 BAAQMD CEQA Guidelines. However, since the 1999 CEQA Guidelines lack GHG emissions thresholds and guidance, discretion lies within the lead agency to determine a project's climate change impacts. In order to determine the significance of any potential climate change impacts generated by the Proposed Project, the net change in GHG emissions was evaluated, as summarized in Table 4.

Table 4 shows that total GHG emissions are expected to decrease by 49 percent from the baseline as result of the Proposed Project. As a result, the Proposed Project is not expected to have an adverse contribution to significant cumulative impacts related to global climate change as found in the Greenhouse Gas Emissions Checklist in Appendix G of the CEQA Guidelines.

Table 4: Net Change in GHG Emissions

Emissions Source	Net Change in GHG Emissions	
	Carbon Dioxide Equivalent (CO_2e) (metric tons / year)	Percentage Change
Basic Bus Services	(158.05)	(57%)
Commute Bus Services	(93.96)	(37%)
Modular Office	(51.93)	(89%)
Exterior Lighting	(4.38)	(14%)
Total	(308.32)	(49%)

Source: AECOM, 2012.

Conclusion

Based on the above analysis, the Proposed Project is expected to result in less-than-significant impacts to air quality and GHG emissions.

Memorandum

To	Daniel Ng, PE Golden Gate Bridge, Highway and Transportation District	Pages	15
CC	John Eberle, PE Maurice Palumbo, PE		
Subject	Transbay Terminal EIR / EIS Addendum: Golden Gate Transit San Francisco Mid-Day Bus Parking Facility – Noise and Vibration		
From	Jeffrey Chan, PTP Issa Mahmodi, A.M. ASCE		
Date	March 1, 2013		

This memorandum summarizes the existing and future-year conditions technical analyses relating to noise and vibration for Golden Gate Transit's new San Francisco Mid-day Bus Parking Facility. The analysis efforts described in this memorandum will be incorporated into an addendum to the Final Transbay Terminal / Caltrain Downtown Extension / Redevelopment Project Environmental Impact Statement / Environmental Impact Report (SCH #95063004) ("Transbay EIS / EIR"), originally published in March 2004.

As part of the replacement of the Transbay Terminal with the new Transbay Transit Center and the redevelopment of the surrounding area (the "Transbay Redevelopment Project"), Golden Gate Transit's previous San Francisco Mid-day Bus Parking Facility—located on the block bounded by Main Street, Beale Street, Howard Street, and Folsom Street—was proposed for relocation to the Project site, on the block bounded by Third Street, Fourth Street, Perry Street, and Stillman Street (under the Bay Bridge). However, in order to facilitate demolition of the Transbay Terminal and construction of the new Transbay Transit Center as well as the retrofit of the West Approach of the San Francisco–Oakland Bay Bridge, Golden Gate Transit's Mid-day Bus Parking Facility was temporarily relocated to its current location at Eighth Street and Harrison Street, freeing up space to construct the Temporary Transit Terminal for use by AC Transit, WestCAT, and Greyhound services while work proceeded on the future terminal building.

The Proposed Project represents the process of moving the Golden Gate Transit Mid-day Bus Parking Facility from its temporary location at Eighth Street and Harrison Street to the last planned location at the Project site. The proposed parking facility move is expected to yield a reduction in bus-related noise exposure in the vicinity of Eighth Street and Harrison Street, and an increase in bus-related noise exposure in the vicinity of the Project site. The effects of the proposed parking facility move, with respect to noise exposure, are studied in the following.

Applicable Impact Criteria

Federal Transit Administration

The Federal Transit Administration (FTA) has developed a methodology and significance criteria to evaluate noise impacts from surface transportation modes (i.e., passenger cars, trucks, buses, and rail), detailed in Transit Noise and Vibration Impact Assessment ("FTA Guidelines") (May 2006). The incremental noise level increase criteria included within the FTA Guidelines are based on studies of annoyance in communities

affected by transportation noise prepared by the United States Environmental Protection Agency (EPA), and are summarized in Table 1.

Table 1: FTA Impact Criteria for Noise-Sensitive Uses

Existing Day-Night Noise Level (L_{dn}) (dBA)	Allowable Noise Level Increase (dB)	
	Residences and Buildings Where People Normally Sleep[1]	Institutional Land Uses with Primarily Daytime and Evening Uses[2]
45	8	12
50	5	9
55	3	6
60	2	5
65	1	3
70	1	3
75	0	1
80	0	0

Source: Transit Noise and Vibration Impact Assessment, Federal Transit Administration, 2006.
Notes:
(1) This category includes residences, hospitals, and hotels where a nighttime sensitivity to noise is assumed to be of utmost importance.
(2) This category includes schools, libraries, theaters, and churches where it is important to avoid interference with activities such as speech, meditation, and concentration on reading material.

The scientific rationale for the choice of these criteria is explained in the FTA Guidelines. Starting from the EPA's definition of minimal noise impact as a 5 dB change from an established protective ambient level, the FTA extended the EPA's incremental impact criteria to higher baseline ambient levels. As baseline ambient levels increase, the allowable noise level increase is reduced to limit community annoyance (e.g., in residential areas with a baseline ambient noise level of 50 dBA L_{dn}, a 5 dB increase in noise levels would be acceptable, while at 70 dBA L_{dn}, only a 1 dB increase would be allowed).

The FTA has also developed guidelines for assessing the significance of ground-borne vibration produced by transportation sources and construction activity. Vibration impact criteria are summarized in Table 2.

These vibration criteria are related to ground-borne vibration levels that are expected to result in human annoyance, and are based on root mean square (RMS) velocity levels expressed in VdB. FTA experience with community response to ground-borne vibration indicates that when there are only a few train or bus events per day, higher vibration levels are needed to evoke the same community response that would be expected from more frequent events generating a similar level of vibration. The FTA criteria take this phenomenon into account by distinguishing between projects with "frequent" and "infrequent" events, where frequent is defined as more than 70 events per day.

To address the potential for structural damage to fragile buildings, Section 12.2.2 of the FTA Guidelines also recommends vibration impact thresholds of 0.2 in/sec peak particle velocity (PPV) (approximately 100 VdB) for fragile buildings and 0.12 in/sec PPV (approximately 95 VdB) for extremely fragile buildings. In this case, the FTA's general assessment criteria listed in Table 2 are more restrictive, and will therefore be used to assess Project effects in this analysis.

Table 2: FTA Impact Criteria for Ground-borne Vibration (General Assessment)

Land Use Category	Impact Levels (VdB; relative to 1 µin/sec)		
	Frequent Events[1]	Occasional Events[2]	Infrequent Events[3]
Category 1 Buildings where vibration would interfere with interior operations	65 [4]	65 [4]	65 [4]
Category 2 Residences and buildings where people normally sleep	72	75	80
Category 3 Institutional land uses with primarily daytime uses	75	78	83

Source: Transit Noise and Vibration Impact Assessment, Federal Transit Administration, 2006.

Notes:

(1) Defined as more than 70 vibration events of the same source per day.

(2) Defined as between 30 and 70 vibration events of the same source per day.

(3) Defined as fewer than 30 vibration events of the same source per day.

(3) This criterion limit is based on levels that are acceptable for most moderately sensitive equipment such as optical microscopes.

San Francisco General Plan

The San Francisco General Plan provides long-term guidance and policies for maintaining and improving the quality of life and the man-made and natural resources of the community. In particular, the Environmental Protection Element of the San Francisco General Plan is concerned primarily with avoiding or mitigating the adverse effects of transportation noise, and contains the following objectives and policies relevant to this analysis:

Objective 11: Promote land uses that are compatible with various transportation noise levels.

Policy 11.1 Discourage new uses in areas in which the noise level exceeds the noise compatibility guidelines for that use.

Policy 11.3 Locate new noise-generating development so that the noise impact is reduced.

The "Land Use Compatibility Chart for Community Noise" included in Policy 11.1 establishes the compatibility of different land use types within a range of ambient noise levels.

For residential uses:

- Noise exposure is considered "satisfactory, with no special noise insulation requirements" where the L_{dn} is 60 dBA or less.
- "New construction or development should be undertaken only after a detailed analysis of noise reduction requirements is made and needed noise insulation features included in the design" where the L_{dn} is between 60 dBA and 70 dBA.
- "New construction or development should generally be discouraged" where the L_{dn} is above 65 dBA.

For other noise-sensitive uses (i.e., schools, libraries, churches, hospitals, nursing homes):

- Noise exposure is considered "satisfactory, with no special noise insulation requirements" where the L_{dn} is 65 dBA or less.

- "New construction or development should be undertaken only after a detailed analysis of noise reduction requirements is made and needed noise insulation features included in the design" where the L_{dn} is between 62 dBA and 70 dBA.

- "New construction or development should generally not be undertaken" where the L_{dn} is above 65 dBA.

The Land Use Compatibility Chart for Community Noise is illustrated in Figure 1.

San Francisco Noise Ordinance

The San Francisco Noise Ordinance (Article 29, San Francisco Police Code, Section 2900) specifically recognizes that adverse effects on a community can arise from noise sources such as transportation, construction, mechanical equipment, entertainment, and human and animal behavior. In particular, the San Francisco Noise Ordinance makes the following declaration:

> It shall be the policy of San Francisco to maintain noise levels in areas with existing healthful and acceptable levels of noise and to reduce noise levels, through all practicable means, in those areas of San Francisco where noise levels are above acceptable levels as defined by the World Health Organization's Guidelines on Community Noise.

Section 2909 of the San Francisco Noise Ordinance limits noise from a fixed source[(1)] from causing the noise level measured inside any sleeping or living room in any dwelling unit located on residential property to 45 dBA between the hours of 10:00 PM to 7:00 AM or 55 dBA between the hours of 7:00 AM to 10:00 PM with windows open except where building ventilation is achieved through mechanical systems that allow windows to remain closed. It is assumed that these noise level limits are represented by the hourly L_{eq} descriptor (hourly average level).

Noise Level Measurements

AECOM performed ambient noise level measurements near existing noise-sensitive uses in the vicinity of the proposed Mid-Day Bus Parking Facility and along the proposed bus routes on Monday, January 7, 2013 and Tuesday, January 8, 2013.

---

(1) By definition, the San Francisco Noise Ordinance (Section 2901(e)) states that "fixed source" refers to a machine or device capable of creating a noise level at the property upon which it is regularly located, including but not limited to industrial and commercial process machinery and equipment, pumps, fans, air-conditioning apparatus, or refrigeration machines. In this case, stationary, idling buses within the Project site are considered fixed (or stationary) noise sources.

Land Use Compatibility Chart for Community Noise

Figure 1

Measurement Equipment

Two sound level meters—Larson-Davis Laboratories (LDL) Model 820, Class 1 (Precision) sound level meters (serial number (SN) 820A1176 and SN 820A1298)—were used to measure ambient noise levels in the study area. The meters were programmed to record A-weighted sound levels using a "slow" response and calibrated immediately before use with LDL Model CAL200 calibrators (SN 2876 and SN 1176).

Short-Term Noise Level Measurements

Short-term (15-minute) noise level measurements and concurrent traffic counts were conducted at roadway segments affected by the proposed bus routes. These measurements were completed on the two survey days, between 10:00 AM and 6:00 PM when traffic was free-flowing. Two of these measurements and counts were used to "calibrate" the Federal Highway Administration (FHWA) Traffic Noise Model (TNM) Version 2.5, which was used to predict traffic noise levels in the Project vicinity. The short-term noise level measurement locations are shown in Figure 2.

For the traffic counts, vehicles were classified as automobiles, medium-duty trucks, motorcycles, and buses. An automobile was defined as a vehicle with two axles and four tires, primarily designed to carry passengers—small vans and light trucks were included in this category. Medium-duty trucks were defined as all cargo vehicles with two axles and six tires, while heavy-duty trucks were defined as all vehicles with three or more axles. Observed traffic speeds on the studied roadways ranged from 25 miles per hour (mph) to 35 mph.

Long-Term Noise Level Measurements

Long-term (24-hour) noise level measurements were taken in the vicinity of the Project site, at the residential property on the southeast corner of the Third Street / Stillman Street intersection. The measurement equipment was positioned on the third-floor fire escape, more than five feet removed from the residential building façade, a location representative of the closest noise-sensitive receivers to the Mid-Day Bus Parking Facility. The long-term measurement location is illustrated in Figure 2.

Measurement Results

The primary source of noise in the study area is traffic on local roadways, including traffic on the Bay Bridge (Interstate 80). Because of the constant traffic flow on the roadways, the short-term measurement intervals were sufficient to characterize hourly traffic noise levels. The results of the short-term and long-term noise measurements are summarized in Table 3 and Table 4, respectively.

As shown in Table 3, average noise levels (L_{eq}) measured along the existing and proposed Golden Gate Transit bus routes range from 64 dBA to 71 dBA. These levels are typical of a dense urban environment, particularly areas near major highways and arterials.

Day-night average sound levels (L_{dn}) were calculated based on the measured hourly L_{eq} noise level data. The L_{dn} is the 24-hour L_{eq} with a 10 dB "penalty" applied to noise levels during the noise-sensitive nighttime hours (10:00 PM to 7:00 AM). As shown in Table 4, the calculated L_{dn} at the long-term measurement site was 81 dBA. Similarly, hourly equivalent noise levels (hourly L_{eq}) ranged from 70 dBA to 79 dBA at this location during the measurement session. These levels are also typical of dense urban areas, similar to the results of the short-term noise level measurements.

Noise and Vibration Analyses

Traffic Noise

As mentioned above, all traffic noise modeling completed for this study utilized the FHWA's TNM, a computer model based on two FHWA reports: FHWA-PD-96-009 and FHWA-PD-96-010 (FHWA 2004). Key inputs to the TNM include the locations of roadways; vehicle volumes, speeds, and types; shielding features (e.g., topography and buildings); ground types; and receptor locations. Three-dimensional representations of these inputs were developed using available computer-aided design drawings, aerial photography, and topographic contours.

Model Calibration

The purpose of model calibration is to "fine-tune" the prediction model to actual site conditions that are not adequately accounted for by the model. Calibration is performed by algebraically adding a constant, or K-factor, to the noise level calculated in TNM 2.5. The magnitude of K-factors initially is determined by the difference between measured and modeled noise levels at specific points. Calibration factors may be positive or negative. Additional factors may be applied, based on the experience and judgment of the noise analyst performing the analysis. Two short-term noise level measurement locations (Site ST-01 and Site ST-02) were used for model calibration. These calibration results are summarized in Table 5.

As shown in Table 5, the results of the traffic noise modeling relative to the measured conditions show an accuracy of 2 dB. As FHWA policy for modeling using TNM 2.5 states that "no adjustments should be made for differences less than 3 dB" (FHWA 2004), no calibration offsets or adjustments were applied.

Model Results

TNM was used to estimate the subtle changes in traffic noise levels associated with the proposed Golden Gate Transit Mid-Day Bus Parking Facility. In this case, the facility would be moved from its current location

at Eighth Street and Harrison Street to the new location at Third Street and Perry Street, resulting in slight changes to bus routes in the vicinity of the site and introducing new bus-related traffic noise.

Traffic noise levels were calculated for Existing Conditions and Existing plus Project Conditions. Weekday PM peak hour turning movement counts at selected intersections along the proposed bus routes (oldest counts dating from 2007 and 2008) were multiplied by a factor of ten to estimate the average daily traffic (ADT) volumes needed to assess noise exposure in terms of the 24-hour noise level metric (L_{dn}). The calculated ADT volumes were inputted into TNM to calculate day-night average noise levels at selected receiver points along the proposed bus routes through the Project area, illustrated in Figure 3.

Receivers were modeled at a height of five feet above the ground (roadway) elevation at exterior locations. Vehicle mixes on all study area roadways were assumed to be the same as those counted during the short-term noise level measurement surveys.

Predicted noise levels for Existing Conditions and Existing plus Project Conditions at all receiver locations are shown in Table 6.

It should be noted that receivers R-02, R-17, R-20, R-27, R-28, R-33, R-35, R-37, R-43, R-46, R-51, R-52, and R-54 were modeled in the second rows of the buildings to predict the noise levels at noise sensitive areas behind the buildings. As shown in Table 6, the noise levels at these second-row receivers range from 26 dBA L_{dn} to 59 dBA L_{dn} under Existing Conditions, while predicted L_{dn} noise levels at noise-sensitive areas directly exposed to existing traffic are predicted to range from 64 dBA L_{dn} to 75 dBA L_{dn}.

Comparing the existing predicted noise levels to the applicable noise exposure criteria from the San Francisco General Plan (Objective 11), the existing noise levels in most areas within the Project vicinity already exceed the standard of 60 dBA L_{dn} for residential uses and 65 dBA L_{dn} for other noise-sensitive uses. However, the expected increase in traffic noise exposure attributable to the Project—no more than 0.2 dB, as shown in Table 6—would not be substantial in relation to the applicable San Francisco General Plan criteria of 60 dBA L_{dn} and 65 dBA L_{dn} or to the FTA noise level increase criteria summarized in Table 1.

Noise at the Mid-Day Bus Parking Facility

The proposed Mid-Day Bus Parking Facility, located underneath the West Approach of the San Francisco–Oakland Bay Bridge on the block bounded by Third Street, Fourth Street, Perry Street, and Stillman Street, will be used to store Commute Bus buses during the weekday midday period, eliminating the need for buses to deadhead to and from Golden Gate Transit's other yards in the North Bay. Buses at the Mid-Day Bus Parking Facility would generate noise when idling (i.e., engines powered but not in motion), but this noise exposure would be mitigated by the proposed twelve-foot-tall sound wall on the Stillman Street and Third Street sides of the Project site. This sound wall is expected to adequately mitigate facility noise exposure (including idling buses) at the closest neighboring residences on Stillman Street, resulting in noise levels well below measured daytime ambient levels in the Project area.

As required by the Transbay EIS / EIR, the proposed sound wall would incorporate acoustical absorption in order to mitigate reflected sound energy from buses, local traffic, and other community noise sources. Without this sound absorption component of the barrier, reflected sound would likely substantially increase noise exposure relative to the ambient condition, adversely affecting noise-sensitive uses on Stillman Street.

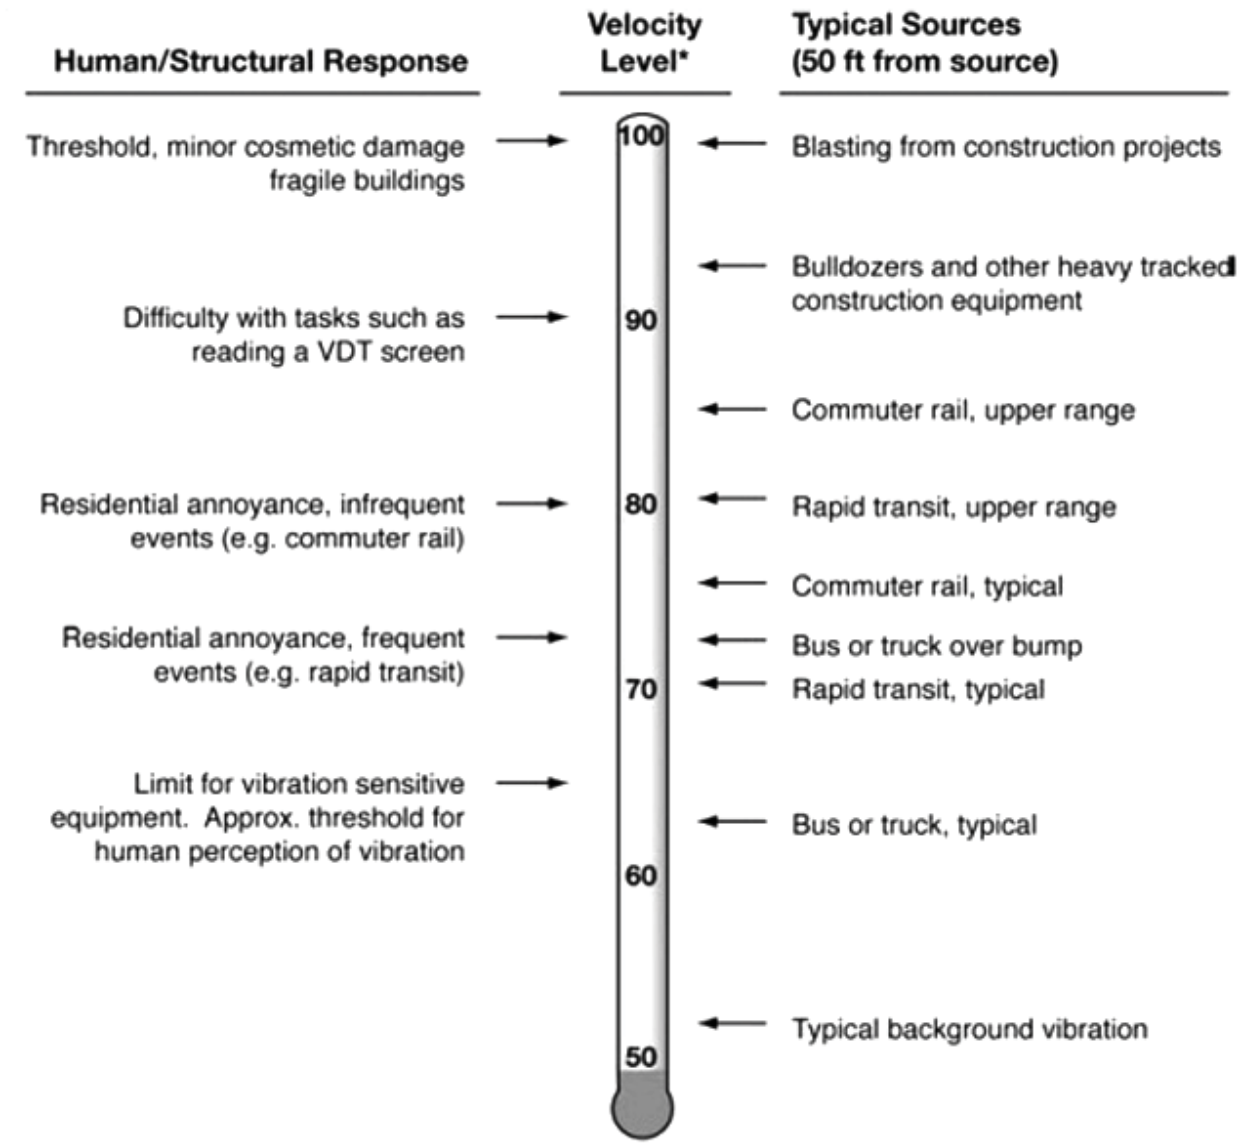
Vibration from Passing Buses

Ground-borne vibration can be a serious concern for nearby neighbors of a transit system, causing buildings to shake and rumbling sounds to be heard indoors. Ground-borne vibration associated with vehicle movements is usually the result of uneven interactions between the wheel and the road or rail surfaces. Examples of such interactions (and subsequent vibrations) include train wheels over a jointed rail, an untrue rail car wheel with "flats", and motor vehicle wheels hitting a pothole or manhole cover.

Unlike noise, which travels in air, transit vibration typically travels along the surface of the ground. Depending on the geological properties of the surrounding ground and the type of building structure exposed to transit vibration, vibration propagation may be more or less efficient. Buildings with a solid foundation set in bedrock are "coupled" more efficiently to the surrounding ground and experience relatively higher vibration levels than those buildings located in sandier soil.

Vibration induced by vehicle pass-bys can generally be discussed in terms of displacement, velocity, or acceleration. However, human responses and responses by monitoring instruments and other objects are more accurately described with velocity. Therefore, the vibration velocity level is used to assess vibration effects. To describe the human response to vibration, the average vibration amplitude, or RMS velocity, is used, expressed in terms of inches per second (in/sec) or decibels (VdB). All VdB vibration levels are referenced to 1 µin/sec.

Typical ground-borne vibration levels from transit and other common sources are shown in Figure 4.



** RMS Vibration Velocity Level in VdB relative to 10^{-6} inches/second*

SF General Plan Land Use Compatibility Chart.ai

Typical Ground-borne Vibration Levels from Transportation and Construction
Figure 4

In general, the vibration threshold of human perceptibility is approximately 65 VdB, as shown in Figure 4. Vibration levels in the range of 70 to 75 VdB are often noticeable but acceptable. Beyond 80 VdB, vibration levels are often considered unacceptable by building occupants, as described in the FTA Guidelines.

The Project would not include significant stationary sources of ground-borne vibration, such as heavy equipment operations, but operational ground-borne vibration in the Project vicinity would be generated by vehicular travel on local roadways and access streets. However, the rubber tires and suspension systems of buses provide vibration isolation, attenuating the vibration forces such that the resulting ground vibration is almost always below the threshold of human perception. In particular, the typical ground-borne vibration produced by a passing bus or truck is generally less than 65 VdB at 50 feet, and would, therefore, be imperceptible to sensitive receptors near the proposed routes, as the distance from the nearest sensitive receptor to the routes would be more than 50 feet, and associated vibration levels at these receivers would be less than the 65 VdB "human perceptibility" criterion.

In general, it is unusual for buses to cause ground-borne noise or vibration issues. When buses cause effects such as rattling of windows, the source is almost always airborne noise. In addition, even when vibration from vehicular traffic is perceptible, the cause can generally be traced to irregularities in the roadway surface such as potholes, bumps, misaligned expansion joints, or other discontinuities in the road surface. Removal of these discontinuities (e.g., smoothing bumps or filling in potholes) will usually solve vibration issues.

Summary and Conclusions

To satisfy the City's noise compatibility criteria for uses adjacent to the proposed bus routes, exterior noise exposure at the identified noise-sensitive uses should not exceed 60 dB L_{dn} for residential uses and 65 dB L_{dn} for schools, places of worship, and other non-residential uses that would be considered noise-sensitive. In general, noise exposure along the proposed routes currently exceeds the City's noise exposure limits, but noise levels with the Project as predicted by TNM would not represent a substantial increase above Existing Conditions. Noise from idling buses at the Project site would be mitigated by the proposed sound wall, which would reduce noise exposure well below the measured daytime ambient levels in the Project area.

Vibration levels associated with passing buses on the proposed bus routes would also not be expected to exceed the applied FTA criterion of 65 VdB at the closest residential or noise-sensitive receptors, as the buses would have sufficient vibration isolation such that ground-borne vibration would be imperceptible to these receptors. Any perceived vibration can generally be traced to discontinuities in the road surface, which can be repaired to reduce the vibration to levels below human perception.

As a result, the Project's effects related to noise and vibration are expected to be negligible.

Memorandum

To	Daniel Ng, PE Golden Gate Bridge, Highway and Transportation District	Pages	21
CC	John Eberle, PE Maurice Palumbo, PE		
Subject	Transbay Terminal EIR / EIS Addendum: Golden Gate Transit San Francisco Mid-Day Bus Parking Facility – Transportation and Circulation (Final)		
From	Jeffrey Chan, PTP Anthony Mangonon		
Date	January 16, 2013		

This memorandum summarizes the existing and future-year conditions technical analysis relating to transportation and circulation for Golden Gate Transit's new San Francisco Mid-day Bus Parking Facility. The analysis efforts described in this memorandum will be incorporated into a seventh addendum to the Final Transbay Terminal / Caltrain Downtown Extension / Redevelopment Project Environmental Impact Statement / Environmental Impact Report (SCH #95063004) ("Transbay EIS / EIR"), originally published in March 2004.

Existing Golden Gate Transit Operations

Bus Routes

The Golden Gate Bridge, Highway and Transportation District ("District") owns, maintains, and operates all Golden Gate Transit bus services in San Francisco. Existing Golden Gate Transit operations in San Francisco consist of two types of services: "Basic Bus" services operate seven days a week, during both peak and off-peak periods, while "Commute Bus" services operate during weekday peak periods inbound into Downtown San Francisco in the mornings and outbound from Downtown San Francisco towards Marin and Sonoma Counties in the evenings. Existing Golden Gate Transit service in San Francisco is summarized in Table 1.

Basic Bus services (Routes 10, 70, 80, 101 and 101X) operate to and from Downtown San Francisco via Van Ness Avenue and Mission Street, with route alignment and stop locations in Downtown San Francisco as illustrated in Figure 1a. In the inbound direction, all Basic Bus services travel eastbound along Mission Street to the Temporary Transbay Terminal (on the block bounded by Howard Street, Folsom Street, Main Street, and Beale Street) before turning onto westbound Howard Street towards the existing Mid-day Bus Parking Facility (located at Eighth Street and Harrison Street), with the exception of one weekday (i.e., Mondays through Fridays, except holidays) run and one weekend (i.e., Saturdays, Sundays, and holidays) run on Route 70, which continue south on Eighth Street past Mission Street directly to the current Mid-day Bus Parking Facility.

Existing Bus Routes.ai

Existing Bus Routes: Basic Bus Services

Figure 1a

Existing Financial District Routes.ai

Existing Bus Routes: Financial District Commute Bus Services

Figure 1b

Existing Civic Center Routes.ai

Existing Bus Routes: Civic Center Commute Bus Services

Figure 1c

Commute Bus services can be classified into one of two different groups based on their general route to and from Downtown San Francisco:

- Via the Financial District (Routes 2, 4, 8, 18, 24, 27, 38, 44, 54, 56, 58, 72 / 72X, 74, 76, and 97); and,
- Via Civic Center (Routes 92 and 93).

All Financial District Commute Bus services travel along Doyle Drive, Richardson Avenue, Lombard Street, Van Ness Avenue, Beach Street / North Point Street, The Embarcadero, and Battery Street / Sansome Street. The exceptions are Route 97 and the first inbound trip on Route 27, which have the following route alignment east of Lombard Street: southbound Van Ness Avenue and eastbound Broadway Street to Battery Street and the Financial District. All Financial District Commute Bus services terminate at Eighth Street / Folsom Street in the inbound direction and begin at Seventh Street / Folsom Street in the outbound direction. Route alignment and stop locations are illustrated in Figure 1b.

For Civic Center Commute Bus services, Route 92 travels along Doyle Drive, Park Presidio Boulevard, Geary Boulevard, Webster Street, and Golden Gate Avenue / McAllister Street, while Route 93 travels along Van Ness Avenue similar to the Basic Bus services, but without serving stops along Mission Street east of the Civic Center area. In other words, Route 92 and Route 93 share the same route in the Civic Center area, but Route 92 takes Park Presidio Boulevard, Geary Boulevard, Webster Street, and Golden Gate Avenue / McAllister Street to and from the Golden Gate Bridge, while Route 93 takes Doyle Drive, Richardson Avenue, Lombard Street, and Van Ness Avenue. All Civic Center Commute Bus services terminate at Eighth Street / Folsom Street in the inbound direction and begin at Seventh Street / Market Street in the outbound direction. Route alignment and stop locations are illustrated in Figure 1c.

Mid-Day Bus Parking

Golden Gate Transit's current Mid-day Bus Parking Facility (Division 4) is located on the block generally bounded by Eighth Street, Ninth Street (specifically, Gordon Street), Folsom Street (specifically, Ringold Street), and Harrison Street. The parking facility can accommodate approximately 150 buses, and is currently used by all of Golden Gate Transit's San Francisco services, seven days a week and 24 hours a day, although it's primary function is to provide mid-day parking for Commute Bus services, eliminating the need to deadhead to and from Golden Gate Transit's other yards in San Rafael (Division 1), Novato (Division 2), and Santa Rosa (Division 3) after the weekday morning peak period and before the weekday evening peak period.

Future Golden Gate Transit Operations

As part of the replacement of the Transbay Terminal with the new Transbay Transit Center and the redevelopment of the surrounding area (the "Transbay Redevelopment Project"), Golden Gate Transit's previous San Francisco Mid-day Bus Parking Facility—located on the block bounded by Main Street, Beale Street, Howard Street, and Folsom Street—was proposed for relocation to the Project site, on the block bounded by Third Street, Fourth Street, Perry Street, and Stillman Street. However, in order to facilitate demolition of the Transbay Terminal and construction of the new Transbay Transit Center as well as the retrofit of the West Approach of the San Francisco–Oakland Bay Bridge, Golden Gate Transit's Mid-day Bus Parking Facility was temporarily relocated to the current location at Eighth Street and Harrison Street, freeing up space to construct the Temporary Transit Terminal for use by AC Transit, WestCAT, and Greyhound services while work proceeded on the future terminal building. The Proposed Project represents

the process of moving the Golden Gate Transit Mid-day Bus Parking Facility from the temporary location at Eighth Street and Harrison Street to the last planned location at the Project site.

Likewise, AC Transit, which originally stored its commuter buses on the elevated loop connecting the Transbay Terminal with I-80, would be provided with a separate Mid-day Bus Parking Facility on the opposite side of Third Street from Golden Gate Transit's Mid-day Bus Parking Facility. A dedicated bus ramp would be provided from the new AC Transit facility, connecting into the primary bus approach structure into the Transbay Transit Center, allowing AC Transit buses to directly access their platforms inside the Transbay Transit Center. A separate connecter ramp was proposed in the Transbay EIS / EIR to connect this approach structure with the existing I-80 off-ramp touching down midblock at Fremont Street between Howard Street and Folsom Street, allowing Golden Gate Transit buses departing the new parking facility to use the AC Transit ramp to bypass surface streets to access Fremont Street.

The Transbay EIS / EIR evaluated mid-day bus parking facilities for Golden Gate Transit and AC Transit underneath the Bay Bridge's west approach on the two blocks bounded by Perry Street, Stillman Street, Second Street, and Fourth Street. AC Transit would occupy the half of the site between Second Street and Third Street, while Golden Gate Transit would occupy the remaining half between Third Street and Fourth Street. As part of these changes, the functions currently performed for Golden Gate Transit's Commute Bus services by the current parking facility at Eighth Street / Harrison Street would be relocated to this new parking facility. The Transbay EIS / EIR estimated that this new parking facility would have the capacity to accommodate up to 140 buses and restricted use of the facility to weekdays only, between 7:00 AM and 6:00 PM. As a result, the facility would be used primarily to support Commute Bus operations, which would only use the new ramp and ramp connector in the outbound direction (i.e., primarily during the weekday evening peak periods).

In addition to the new Mid-day Bus Parking Facility, the Transbay Transit Center project also involves construction of a new street-level passenger terminal (the "Transbay Transit Center Bus Plaza") for bus services on the block bounded by Minna Street, Natoma Street, Beale Street, and Fremont Street, serving primarily Muni and Golden Gate Transit services. This facility would provide a total of four platforms, three to be used by San Francisco Municipal Railway (Muni) bus services and one reserved for Golden Gate Transit bus services. This fourth platform would be used by Golden Gate Transit's Basic Bus services.

Project Description

Since the publication of the Transbay EIS / EIR, however, the following changes have taken place:

- The District has determined that the capacity of the new facility, originally estimated at 140 buses, is actually substantially lower, due to the column reconfiguration implemented as part of the seismic retrofit of the Bay Bridge's west approach, the requirement to construct a sound wall on portions of the south and east sides of the site as shown in the Transbay EIS / EIR, and the limited ability to maneuver buses into, within, and off the site. The anticipated capacity of the new facility is now estimated to be 73 buses, based on conceptual engineering drawings currently being developed.

- The District has reconfigured the sound wall without narrowing the public right-of-way on Stillman Street, restricting bus ingress and egress to and from the new parking facility to Perry Street only.

- The District has proposed to have its weekday evening Commute Bus services depart the new parking facility using surface streets instead of the new dedicated ramp structures connecting the AC Transit Mid-day Bus Parking Facility with Fremont Street between Howard Street and Folsom Street. No changes are proposed to inbound Commute Bus services (the planned ramp structures were never designed to allow bus traffic from surface streets to directly enter the Mid-day Bus Parking Facility) or to Basic Bus services (these services would use the Transbay Transit Center Bus Plaza, and were never envisioned to use the planned ramp structures).

The realignment of outbound Commute Bus routes onto surface streets—as opposed to grade-separated ramps—requires an evaluation of the effect of additional bus traffic to intersections not originally analyzed in the Transbay EIS / EIR. This proposed realignment of Golden Gate Transit's Commute Bus services onto surface streets is hereafter referred to as the "Project".

In addition, several design features related to the new Mid-day Bus Parking Facility, but not explicitly related to the realignment of Golden Gate Transit's Commute Bus services, have also been assumed as part of the "Project" in the technical analysis:

- Reconfiguration of Perry Street from one-way westbound traffic to one-way eastbound traffic between Third Street and Fourth Street;

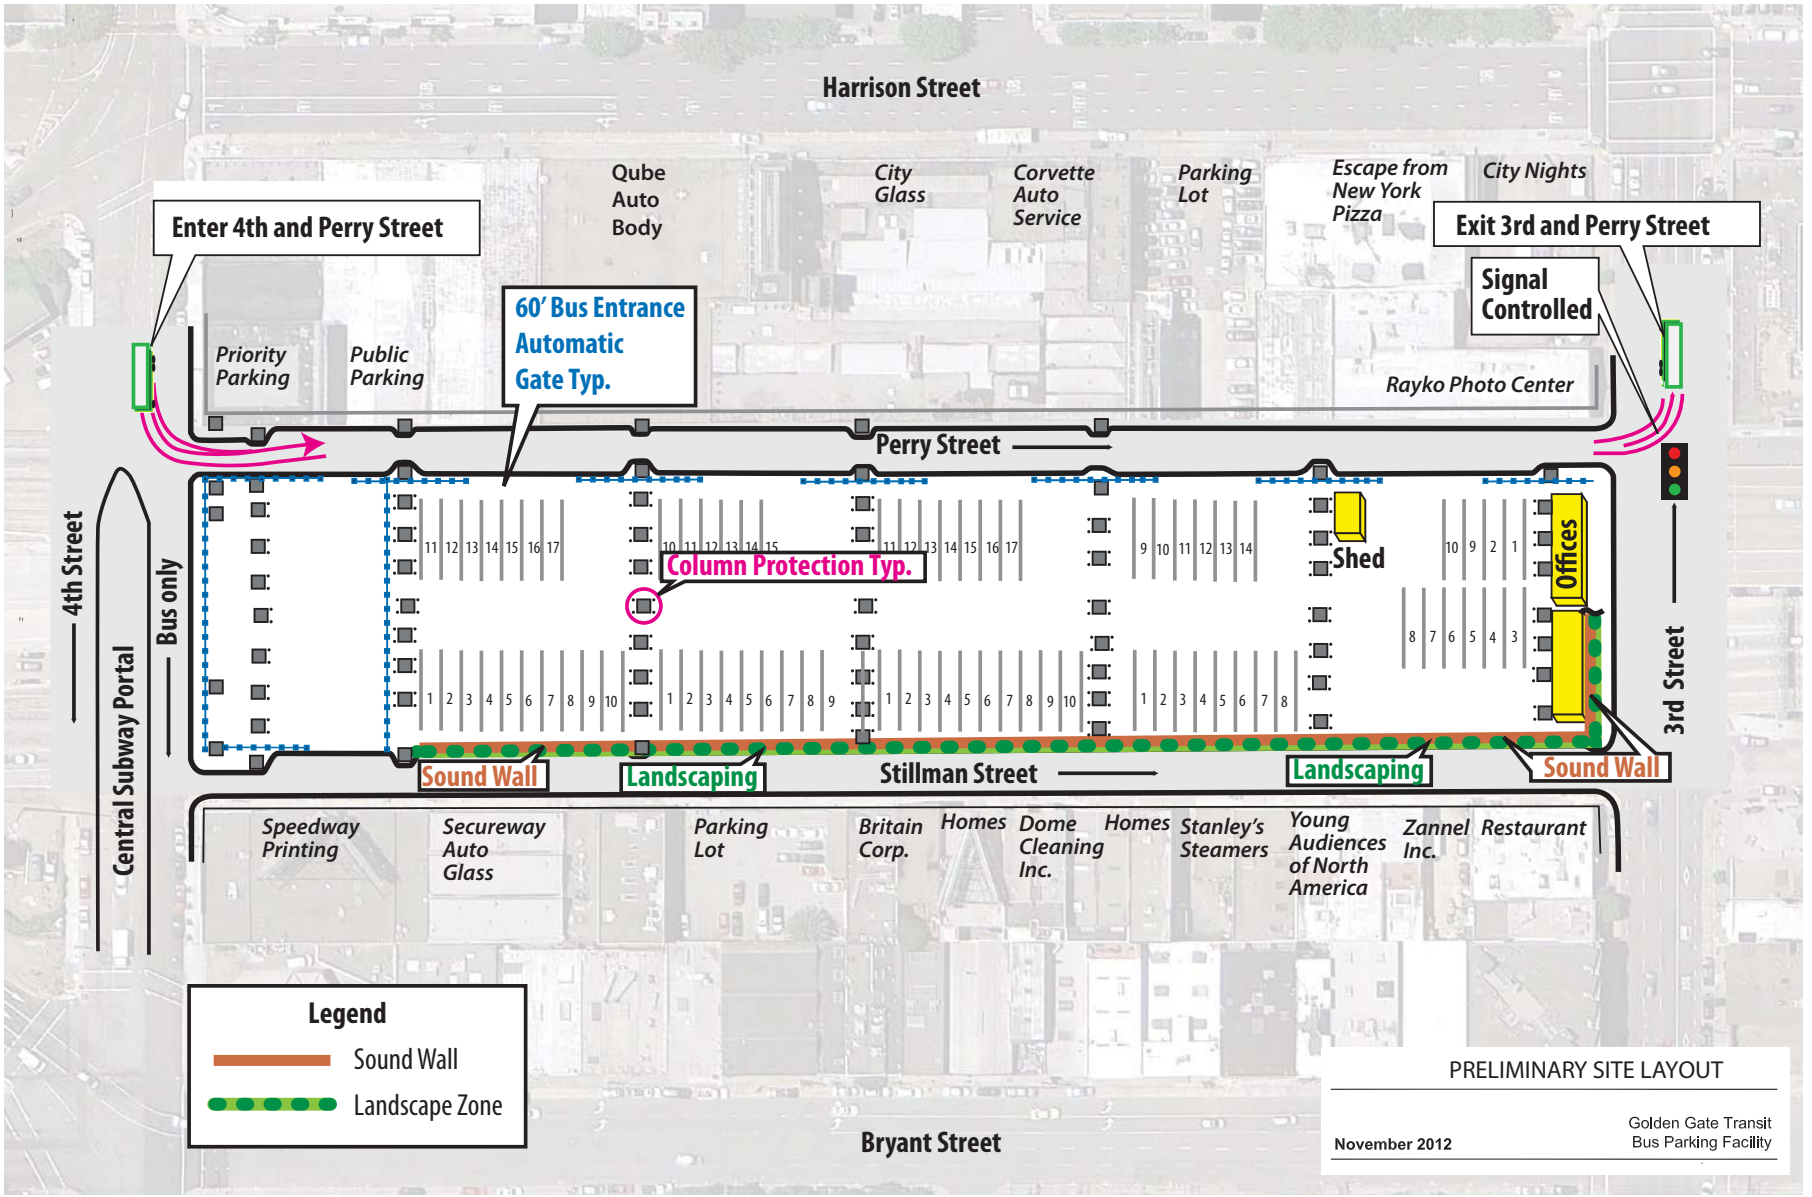
- Signalization of the Third Street / Perry Street intersection, including a midblock pedestrian crossing across Third Street on the south leg of the intersection; and,

- Removal of all on-street metered parking spaces along Perry Street due to curb modifications to enable bus ingress and egress.

The Project site plan, illustrating the conceptual engineering design for the new Mid-day Bus Parking Facility, is illustrated in Figure 2.

Analysis Methodology

Intersection Level of Service (LOS) was evaluated using the 2000 Highway Capacity Manual (HCM) methodology at selected study intersections where there is a potential that the Project may result in substantial effects to transportation and circulation. The LOS methodology is a qualitative description of the performance of an intersection based on average delay per vehicle. For signalized intersections, the HCM methodology determines the capacity of each lane group approaching the intersection and calculates an average delay (in seconds per vehicle) for each of the various movements at the intersection. A combined weighted average delay and LOS are then presented for the intersection. For unsignalized intersections, the average delay and LOS for the worst stop-controlled approach at the intersection are presented. Adjustments are typically made to the capacity of each intersection to account for various factors that reduce the ability of the streets to accommodate vehicles (such as the "downtown" nature of the area, number of pedestrians, bus stops, vehicle types, lane widths, grades, on-street parking, and queues).



Project Site Plan.ai

Project Site Plan
Figure 2

Intersection LOS ranges from LOS A, which indicates free flow or excellent conditions with short delays, to LOS F, which indicates congested or overloaded conditions with extremely long delays. LOS definitions for signalized and unsignalized intersections are described in Table 2. In San Francisco, LOS A through LOS D are considered excellent to satisfactory service levels, and LOS E and LOS F represent unacceptable service levels.

Table 2: Intersection Level of Service Definitions

LOS	Description	Average Delay (seconds / vehicle)	
		Signalized Intersections	Unsignalized Intersections
A	Little or no delay	$\leq$ 10.0	$\leq$ 10.0
B	Short traffic delay	> 10.0 and $\leq$ 20.0	> 10.0 and $\leq$ 15.0
C	Average traffic delay	> 20.0 and $\leq$ 35.0	> 15.0 and $\leq$ 25.0
D	Long traffic delay	> 35.0 and $\leq$ 55.0	> 25.0 and $\leq$ 35.0
E	Very long traffic delay	> 55.0 and $\leq$ 80.0	> 35.0 and $\leq$ 50.0
F	Extreme traffic delay	> 80.0	> 50.0

Source: Highway Capacity Manual, Transportation Research Board, 2000.

It should be noted that delay for intersections operating at LOS F is typically reported as "greater than 80.0 seconds" for signalized intersections and "greater than 50.0 seconds" for unsignalized intersections, as 80.0 seconds and 50.0 seconds are generally considered the limits of the meaningful range for the analysis methodology for signalized and unsignalized intersections. In these situations, the volume-to-capacity (v/c) ratio is also presented to facilitate comparison between scenarios.

Intersection LOS was analyzed at the following three (3) study intersections using Trafficware's Synchro 8 software package:

1. Third Street / Perry Street;
2. Third Street / Harrison Street; and,
3. Third Street / Folsom Street.

Consistent with typical intersection analyses as described in the San Francisco Planning Department's Transportation Impact Analysis Guidelines for Environmental Review (October 2002), operations at the study intersections were analyzed for the weekday PM peak hour, defined as the four consecutive 15-minute periods during the weekday PM peak period (4:00 PM to 6:00 PM) exhibiting the highest overall traffic volumes. These three intersections were selected because they are expected to show the highest increase in total traffic volumes during the weekday PM peak period as a result of the Project.

The intersection LOS analysis considers the following scenarios:

- Existing Conditions
  Existing conditions as of 2012.

- Existing plus Project Conditions
  Existing conditions as of 2012, plus the Project.

- Cumulative (2030) Conditions
  Future conditions in 2030, assuming background development growth in the city and region.

Existing Conditions

Intersection turning movement counts at the three study intersections were collected on Tuesday, October 9, 2012. Traffic signal timing plans were obtained from the San Francisco Municipal Transportation Agency (SFMTA). Existing lane geometries (including peak period tow-away restrictions and transit-only lanes) were gathered from field observations. Observations of roadway operations found that the transit-only lanes on Third Street were used primarily by transit vehicles only. Existing Conditions weekday PM peak hour intersection lane geometry and traffic volumes are illustrated in Figure 3. Existing Conditions weekday PM peak hour intersection LOS is summarized in Table 3.

In order to facilitate comparison with the Existing plus Project Conditions analysis, delay and LOS at Third Street / Perry Street are reported for the stop-controlled approach (westbound Perry Street) and the intersection as a whole. Likewise, at Third Street / Harrison Street and Third Street / Folsom Street, delays associated with transit vehicles in the Third Street transit-only lane have been omitted from the analysis. As shown in Table 3, all three study intersections currently operate at acceptable LOS (LOS D or better) during the weekday PM peak hour.

Table 3: Existing Conditions – Weekday PM Peak Hour Intersection Level of Service

Intersection		Existing Conditions		
		Traffic Control	LOS	Delay (seconds / vehicle)
1	Third Street / Perry Street	One-way stop		
	Westbound Perry Street		C	15.9
	Intersection average		A	0.1
2	Third Street / Harrison Street	Signal	B	16.9
3	Third Street / Folsom Street	Signal	C	22.1

Source: AECOM, 2012.

Existing plus Project Conditions

The relocation of Golden Gate Transit's Mid-day Bus Parking Facility, together with the realignment of Commute Bus services onto surface streets, would necessitate changes to Commute Bus routes and stops through the SOMA area. In particular, route segments along Howard Street and Folsom Street west of Fourth Street would be discontinued, together with the existing Golden Gate Transit stop at Fourth Street / Howard Street. New Commute Bus stops would be established in the inbound direction at Fourth Street / Folsom Street (a far-side stop shared with an existing Muni stop) and Third Street / Harrison Street (a new far-side stop). The changes to bus routes and stops are illustrated in Figure 4a, Figure 4b, and Figure 4c.

Information on weekday PM peak period Commute Bus pull-outs from the existing Mid-day Bus Parking Facility was obtained from Golden Gate Transit, and is summarized in Table 4 for 15-minute increments. As shown in Table 4, the maximum number of pull-outs during any four consecutive 15-minute periods is 42 trips.

These Project trips were added to traffic volumes on the affected turning movements at the three study intersections. As described previously, the Project would also involve geometry and signalization changes at the Third Street / Perry Street intersection, which were also accounted for in the Existing plus Project Conditions analysis. In particular, the change in directionality of Perry Street would result in outlet traffic from the segment of Perry Street between Third Street and Fourth Street using the Third Street / Perry Street intersection instead of the Fourth Street / Perry Street intersection. Although the actual volume of traffic currently using this segment of Perry Street is minimal, it provides secondary parking / loading access for several parcels with primary entrances along Harrison Street. As a result, a nominal volume of non-bus traffic was assumed for the eastbound approach at the Third Street / Perry Street intersection. Consistent with the Golden Gate Transit San Francisco Mid-day Bus Parking Facility Draft Preliminary Design Evaluation Report (November 6, 2012) prepared by URS and associated analysis work conducted by Fehr & Peers, the analysis assumes a three-phase signal (northbound Third Street, eastbound Perry Street, and westbound Perry Street), with the new pedestrian phase operating with both Perry Street phases.

The resulting weekday PM peak hour intersection lane geometry and traffic volumes are illustrated in Figure 5. The Existing plus Project Conditions weekday PM peak hour intersection LOS is summarized in Table 5.

Table 5: Existing plus Project Conditions – Weekday PM Peak Hour Intersection Level of Service

Intersection		Existing Conditions			Existing plus Project Conditions		
		Traffic Control	LOS	Delay (seconds / vehicle)	Traffic Control	LOS	Delay (seconds / vehicle)
1	Third Street / Perry Street	OWSC			Signal		
	Westbound Perry Street		C	15.9		C	29.0
	Eastbound Perry Street					C	21.0
	Intersection average		A	0.1		A	7.8
2	Third Street / Harrison Street	Signal	B	16.9	Signal	B	16.9
3	Third Street / Folsom Street	Signal	C	22.1	Signal	C	22.3

Notes:
OWSC = One-way stop control

Existing + Project Volumes PM.ai

Existing Plus Project Conditions Lane Geometry and Traffic Volumes
Weekday PM Peak Hour

Figure 5

As shown in Table 5, the Project would have a negligible effect on overall traffic operations at the Third Street / Harrison Street and Third Street / Folsom Street intersections. The introduction of a new traffic signal (and associated traffic volumes) and signalized crosswalk across Third Street at the Third Street / Perry Street intersection would slightly degrade intersection average delay compared to Existing Conditions, but the intersection as a whole would still operate at LOS A while facilitating bus egress out of the new Golden Gate Transit Mid-day Bus Parking Facility and pedestrian connectivity across Third Street.

Cumulative (2030) Conditions

The Cumulative (2030) Conditions analysis is based on technical work conducted for the Transit Center District Plan and Transit Tower Draft Environmental Impact Report (EIR) (hereafter referred to as the "Transit Center District Plan EIR"), Planning Department Case Number 2007.0558E and 2008.0789E and State Clearinghouse Number 2008072073, published by the San Francisco Planning Department on September 28, 2011. Use of the Transit Center District Plan EIR technical work ensures that the analysis of Cumulative (2030) Conditions considers both background growth in the city and region (such as buildout of the Market / Octavia Plan, the Eastern Neighborhoods rezoning, and the Treasure Island Redevelopment Plan) and growth attributable to specific parcels in and around the Transit Center District Plan plan area. The Transit Center District Plan EIR technical work also assumes various changes to the transportation network—such as the Rincon Hill Streetscape Master Plan, the Central Subway, and the Transit Effectiveness Project—that would likely affect traffic patterns and volumes in and around the Project site.

Additional modifications to the Transit Center District Plan EIR technical work were made as needed to account for intersections not explicitly studied in the EIR and specific elements of the Project (such as the rerouted bus traffic) that represent departures from the original assumptions contained in the Transit Center District Plan EIR analysis.

Cumulative (2030) Conditions weekday PM peak hour intersection lane geometry and traffic volumes are illustrated in Figure 6. It should be noted that explicit forecasts were not calculated for bus traffic in the transit-only lanes along Third Street, as the actual bus volumes are uncertain and highly dependent on Muni service plans following the opening of the Central Subway. Omission of transit-only traffic has no effect on the analysis results, as this bus traffic is segregated from the general travel lanes considered in the intersection LOS analysis. Bus traffic not in transit-only lanes (e.g., along Harrison Street or Folsom Street) was assumed to exhibit growth rates similar to those for general traffic. As the current level of bus traffic not using transit-only lanes is minimal, the effect of the growth rate assumptions for this traffic on overall intersection performance are mostly negligible.

The resulting Cumulative (2030) Conditions weekday PM peak hour intersection LOS is summarized in Table 6.

As shown in Table 6, the Third Street / Perry Street intersection would continue to operate at LOS A under Cumulative (2030) Conditions, but the Third Street / Harrison Street and Third Street / Folsom Street intersections would degrade to LOS F, with v/c ratios over 1.00.

Cumulative Volumes PM.ai

Cumulative (2030) Conditions Lane Geometry and Traffic Volumes

Weekday PM Peak Hour

Figure 6

Table 6: Cumulative (2030) Conditions – Weekday PM Peak Hour Intersection Level of Service

Intersection		Existing plus Project Conditions		Cumulative (2030) Conditions		
		LOS	Delay (seconds / vehicle)	LOS	Delay (seconds / vehicle)	v/c
1	Third Street / Perry Street	A	7.8	A	6.8	
2	Third Street / Harrison Street	B	16.9	F	> 80.0	1.26
3	Third Street / Folsom Street	C	22.1	F	> 80.0	1.16

Source: AECOM, 2012.

Notes:
Bold indicates unacceptable conditions (LOS E or LOS F).

Consistent with San Francisco Planning Department standard methodologies, a review of the Project's contribution to intersection critical movements at these two intersections was conducted to determine if the Project would represent a significant contribution to the failing conditions. The Project's contribution to critical movement volumes at these locations is summarized in Table 7.

Table 7: Cumulative (2030) Conditions – Project Contribution to Intersections

Intersection		Critical Movement	Project Contribution to Critical Movement
2	Third Street / Harrison Street	NBT	0.0%
		WBT	0.0%
3	Third Street / Folsom Street	NBT	0.0%
		EBL	0.0%

Source: AECOM, 2012.

As shown in Table 7, the Project would not contribute traffic to any of the critical movements at the two study intersections failing under Cumulative (2030) Conditions. In particular, Project-generated traffic at the Third Street / Harrison Street intersection would be confined to the transit-only lane along Third Street and would have a negligible effect on traffic operations in the adjacent northbound travel lanes. At the Third Street / Folsom Street intersection, the Project would add traffic to the northbound right-turn movement, which is not expected to be an intersection critical movement.

Summary and Conclusions

In order to assess the potential transportation and circulation effects of the proposed relocation of Golden Gate Transit's Mid-day Bus Parking Facility to its final location, a quantitative analysis of weekday PM peak hour intersection LOS was conducted at three study locations (Third Street / Perry Street, Third Street / Harrison Street, and Third Street / Folsom Street) along the proposed route of Commute Bus services.

The analysis of Existing plus Project Conditions determined that the Project would have a negligible effect on overall traffic operations at the Third Street / Harrison Street and Third Street / Folsom Street intersections, while the Third Street / Perry Street would operate at LOS A after signalization and addition of Project-generated bus traffic.

Under Cumulative (2030) Conditions, the Third Street / Harrison Street and Third Street / Folsom Street intersections are expected to operate at LOS F, but the Project would not contribute traffic to any of the critical movements at these two locations.

As a result, the Project's effects on overall transportation and circulation under both Existing plus Project Conditions and Cumulative (2030) Conditions are expected to be negligible.

REMARKS

The San Francisco Office of Community Investment and Infrastructure (OCII), also known as the Successor Agency to the Redevelopment Agency of the City and County of San Francisco, proposes an amendment to the Transbay Redevelopment Plan to increase the maximum height from 300 feet to 400 feet on the Transbay Block 1 site, which consists of lots 027, 029, 030, 031, and 032 on Assessor's block 3740, located at 100-160 Folsom Street and 289 Main Street in the Transbay Redevelopment Project Area (the "Proposed Plan Amendment"). Also, OCII owns Lot 27, a 33,782 square foot parcel, and seeks to develop, with the private owner of the adjacent lots, approximately 391 residential units (40 percent of which will be permanently affordable units) in a tower and podium building by means of an Owner Participation/Development and Disposition Agreement ("OP/DDA"). As described below, the proposed project qualifies as a residential project on an infill site within a transit priority area under Section 21099 (d) (1) of the California Public Resources Code and is hereinafter referred to as the "Proposed Project" or the "Block 1 Transit-Oriented Infill Project." The project site is bounded by Main Street to the west, Folsom Street to the south, Spear Street to the east, and an existing office building (221 Main Street) to the north, and is located across Main Street from the Temporary Transbay Terminal, and approximately one-and-one-half blocks north of the Bay Bridge (Interstate 80). Curb cuts are present along all three of the site's street frontages (Main, Folsom, and Spear Streets), and a Muni bus stop is proposed in front of the project site on Main Street. The site measures approximately 53,876 square feet (sf) in area, and is currently occupied by parking lots and two single-story commercial buildings serving as offices for nearby construction projects. The site consists of one publicly-owned lot (lot 027 on Assessor's block 3740), a remnant of the former Embarcadero Freeway right-of-way owned by OCII, which is to be merged with four adjacent lots (lots 029, 030, 031 and 032 of Assessor's block 3740), owned by Tishman Speyer, to effectuate the joint

development of Block 1.

The Proposed Project includes demolition of all existing structures on the project site and construction of a new 559,030-sf building containing 391 dwelling units (116 one-bedroom units, 220 two-bedroom units, 37 three-bedroom units, and 18 penthouse units), 9,126 sf of ground floor retail space, 334 off-street parking spaces located underground within three basement levels accessed from a ramp off Spear Street, 150 bicycle parking spaces and two loading spaces, and a -22,297 sf of open space including a roof deck, courtyards and residential porches and balconies. Clementina Street would be extended through the project site to provide loading and bicycle access, with connections to Main and Spear Streets. The tallest part of the Proposed Project, the tower section, located at the eastern (Spear Street) side of the site, would measure approximately 400 feet in height (39 stories), with rooftop mechanical enclosures and circulation penthouses reaching up to approximately 425 feet in height. The western portion of the site would contain a podium building ranging in height from approximately 50 feet at the northern (Clementina Street) edge of the site to approximately 85 feet at the western (Main Street) edge of the site. The central core of the site would contain open space, surrounded by the tower and podium buildings. At the ground floor, the Main, Folsom, and Spear Street frontages would contain retail space and residential lobbies. The Clementina Street frontage would contain residential townhouse units and access to mechanical utility rooms.

The Proposed Project qualifies as a transit-oriented infill project under Section 21099 of the California Public Resources Code because it meets the definition of a project on an "infill site" in a "transit priority area." The Block 1 Transit-Oriented Infill Project is located within a fully urbanized area of the South of Market neighborhood. The site is within three blocks of the multimodal Transbay Transit Center, currently under construction and funded by a locally-administered State Transportation Improvement Program. It is also located one block from the Folsom Street and The Embarcadero Station of the Muni Metro system, frequently serviced by the Muni N-Judah and Muni T-Third light rail lines.

Background

A Final Environmental Impact Statement/Environmental Impact Report (EIS/EIR) for the Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project, Planning Department case number 2000.048E and State Clearinghouse number 95063004, was certified on April 22, 2004 at a joint hearing of the San Francisco Planning Commission and the Transbay Joint Powers Board ("the EIS/EIR Project").[1] The EIS/EIR Project consisted of: 1) proposed alternative designs

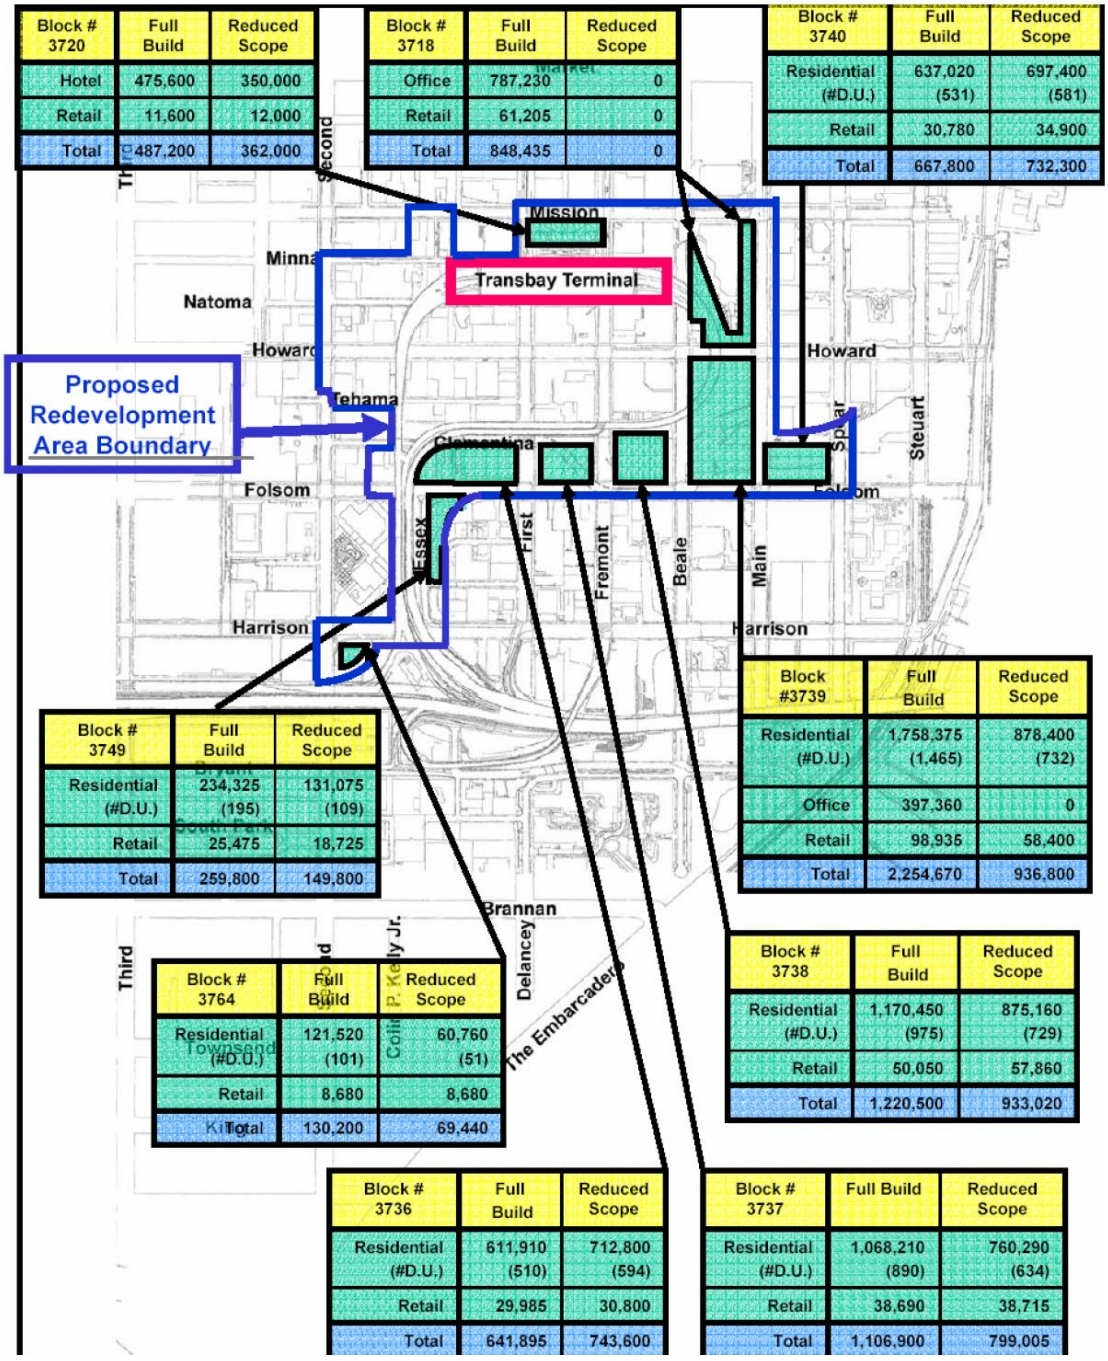
[1] U.S. Department of Transportation Federal Transit Administration and the City and County of San Francisco, Peninsula Corridor Joint Powers Board and San Francisco Redevelopment Agency, *Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project Final Environmental Impact Statement/Environmental Impact Report and Section 4(f) Evaluation*, March 2004. This document is available for review upon request from the Planning Department, 1650 Mission Street, Suite 400 as part of Case Number 2000.048E.

for the new Transbay Terminal, 2) the underground extension of the Caltrain commuter rail system 1.3 miles from its current terminus at 4th and King Streets into Downtown San Francisco, and 3) several land use redevelopment alternatives as part of the Transbay Redevelopment Plan. The Transbay Redevelopment Plan sets forth land use and zoning standards and public street and streetscape improvements on blocks to the south of the Transbay Terminal and would provide additional office, retail/hotel, and residential (including affordable housing) development in the Plan area. OCII, as the Successor Agency to the Redevelopment Agency of the City and County of San Francisco, under the Transbay Redevelopment Plan, has land use and California Environmental Quality Act (CEQA) review authority of the Transbay Redevelopment Project Area.

Development of lots 027, 029, 030, 031, and 032 on Assessor's block 3740 (the site of the Block 1 Transit-Oriented Infill Project, collectively referred to as "Block 1" for the purposes of the Transbay Redevelopment Plan), was included in the Transbay Redevelopment Plan and EIS/EIR analysis. The EIS/EIR analyzed development on Block 1 of up to 637,020 gsf of residential space (531 dwelling units) and 30,780 sf of retail space under the Full Build Alternative, and up to 697,400 gsf of residential space (581 dwelling units) and 34,900 gsf of retail space under the Reduced Scope Alternative.[2] The EIS/EIR studied the two alternatives as representations of the range of reasonable development that could occur, rather than specific development proposals. Figure 1 shows the location of the Block 1 (Assessor's Block 3740) in the Transbay Redevelopment Project Area and the development levels assumed for each of the redevelopment sites.

[2] The Reduced Scope Alternative includes less overall development throughout the Redevelopment Plan area than the Full Build Alternative. However, some individual sites, including Block 1, were anticipated to have more intensive development under the Reduced Scope Alternative than under the Full Build Alternative.

Figure 1: Development Levels Analyzed in the EIS/EIR[3]



[3] This image is sourced from the EIR/EIS. The "Proposed Redevelopment Boundary" is the adopted Transbay Redevelopment Project Area.

As part of the Redevelopment Plan, the building height limit on the Block 1 site was changed from 200 feet to 300 feet.[4] The 300-foot height limit for Block 1 was included within the Draft Transbay Redevelopment Project Area Design for Development Vision released for public review in August 2003. This document was reviewed in connection with the Final EIS/EIR and determined not to introduce any new adverse impacts beyond those identified in the Draft EIS/EIR Full Build Alternative. (EIR/EIS Summary pg. S-10/Chapter 5, pg. 5-11). The *Development Controls and Design Guidelines* added further specificity to the proposed massing on the site, calling for townhomes up to 50 feet in height on the northwestern portion of the site, a podium up to 65 feet in height on the southern portion of the site, a podium up to 85 feet in height on the southwestern portion of the site, a tower up to 300 feet in height on the eastern portion of the site, and open space in the central core of the site.[5]

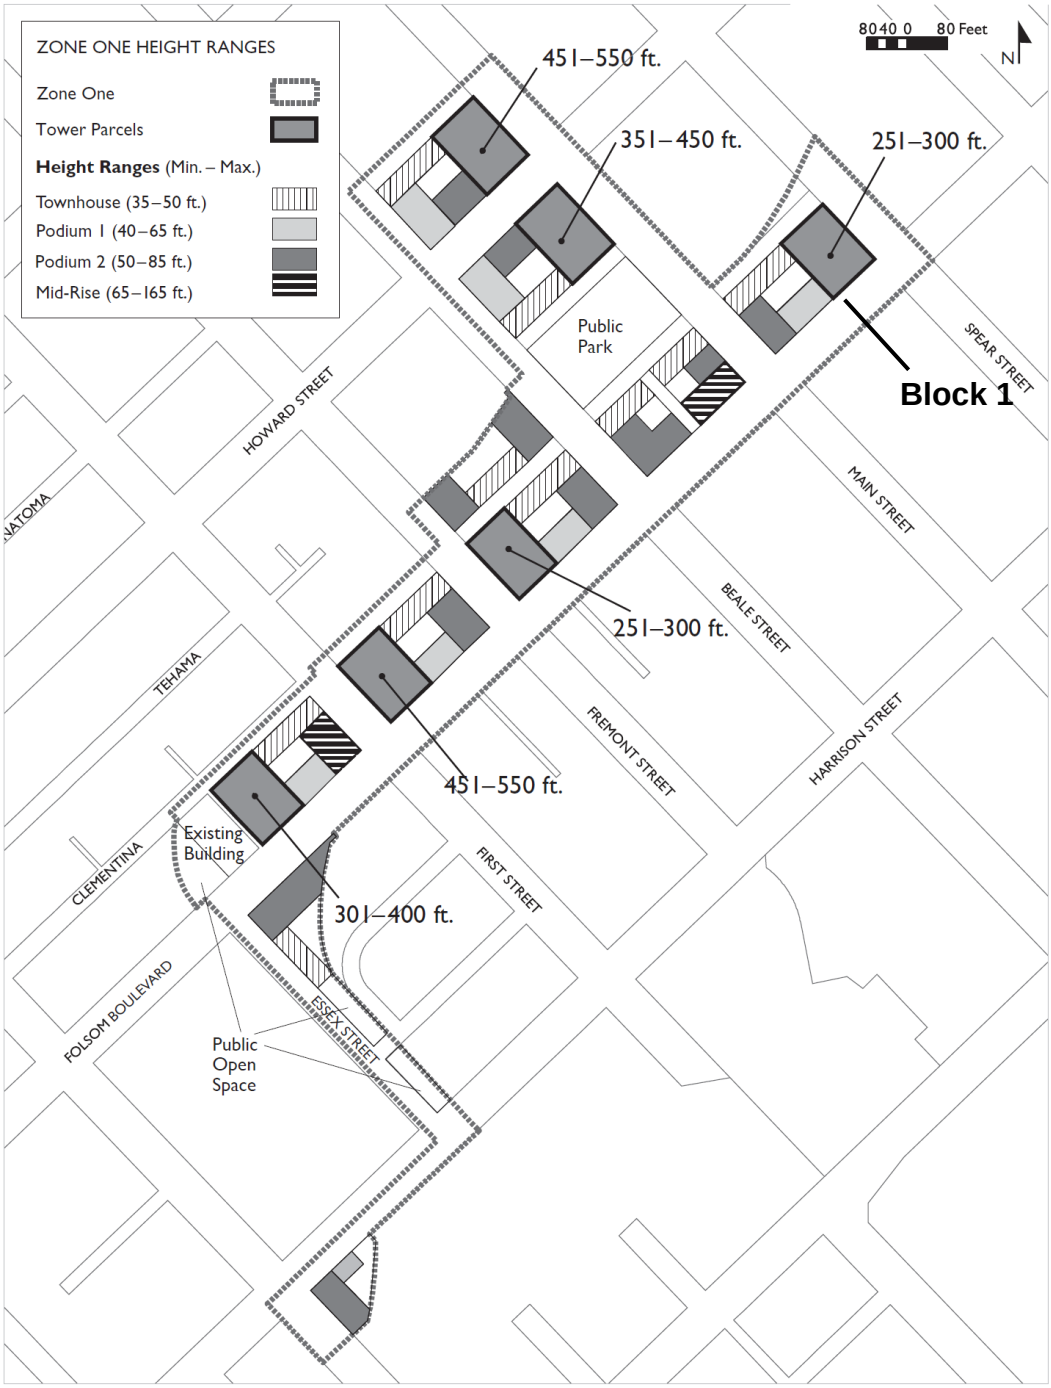
[5] San Francisco Redevelopment Agency, *Development Controls and Design Guidelines for the Transbay Redevelopment Project*, January 25, 2005. Available online at: http://sfocii.org/sites/default/files/ftp/uploadedfiles/Projects/TB%20Dev%20Controls%20&%20Design%20Guidelines.pdf (Accessed December 7, 2015).

Figure 2: Redevelopment Plan Height Limits Analyzed in the EIS/EIR



A minor discrepancy exists in the EIS/EIR regarding the height analyzed on the Block 1 site. Table 5.1-1 in the Redevelopment Land Use Impacts section indicates a 250-foot proposed height limit on the site. This table was based on an earlier version of the Draft Redevelopment Plan, and was included in the EIS/EIR in error. The actual height limit analyzed in the EIS/EIR for the Block 1 site was 300 feet, as confirmed by the Development Controls and Design Guidelines, the Urban Form Program[6] in Appendix F of the EIS/EIR, and by the shadow and wind analysis model.[7] All analysis and conclusions in the EIS/EIR were based on an assumption of a tower at least 300 feet in height at the eastern end of the Block 1 site with podium buildings up to 85 feet in height on other parts of the site.

The EIS/EIR characterized the anticipated development in the Redevelopment Area as transit-oriented land uses in the vicinity of the Transbay Terminal that would provide a mix of residential and commercial space. The land use plan studied in the EIS/EIR identified a development program for the Block 1 site consisting of primarily residential uses with ground floor retail and services.

Proposed Revisions to the EIS/EIR Project

The Block 1 Transit-Oriented Infill Project site differs from the development described in the EIS/EIR in that a 400-foot-tall tower is now proposed at the eastern edge of the Block 1 site instead of a previously-cleared 300-foot-tall tower. The non-tower components of the Proposed Project would conform to the existing Redevelopment Plan height and massing limits studied in the EIS/EIR. Despite the increased tower height, the currently-proposed land use program would be smaller and would consist of 140 fewer dwelling units and less square footage than the Full Build Alternative program studied in the EIS/EIR, despite the increased tower height. Table 1, below, compares the Proposed Project to the assumptions studied for the EIS/EIR Project.

[6] The Block 1 site is referred to as "Block 9" in the Urban Form Program, Appendix F of the EIS/EIR.

[7] Environmental Science Associates, *Transbay Redevelopment Plan EIR: Building Heights Analyzed in Shadow and Wind Analysis for Block 1*, October 28, 2015, on the basis of files developed in conjunction with the original EIR analysis, circa 2000. In an effort to provide a conservative analysis, the shadow and wind model assumed two towers on the Block 1 site: a 350-foot-tall tower at the eastern edge of the site and a 400-foot-tall tower at the western edge of the site. A single-tower, 300-foot-tall height limit was ultimately approved as part of the Redevelopment Plan.

Table 1: Comparison of the Proposed Project to the Redevelopment Plan Program for Block 1

Project Feature	Redevelopment Plan and EIS/EIR Full Build Alternative[8]	Proposed Project
Demolition	All Existing Buildings and Parking Lots on Site	All Existing Buildings and Parking Lots on Site
Total Square Footage	Up to 667,800 gsf	559,030 gsf
Land Use Types	Residential, Retail	Residential, Retail
Number of Residential Units	Up to 531 units	391 units
Retail Square Footage	Up to 30,780 gsf	9,126 gsf
Tower Height – Eastern Portion of the Site	Up to 300 feet	400 feet*
Podium Height – Northwestern Portion of the Site	Up to 50 feet (Townhomes)	48 feet (Townhomes)
Podium Height – Southern Portion of the Site	Up to 65 feet	65 feet
Podium Height – Southwestern Portion of the Site	Up to 85 feet	85 feet
Central Core of the Site	Open Space	Open Space

* indicates nonconformance with the Redevelopment Plan and the EIS/EIR analysis

As shown in Table 1, all features of the Proposed Project would conform to the Redevelopment Plan land use program studied in the EIS/EIR, with the exception of the tower height. At 400 feet tall, the Proposed Project's tower would be 100 feet taller than the 300-foot height limit established in the Redevelopment Plan and analyzed in the EIS/EIR. OCII is therefore seeking an amendment to the Redevelopment Plan. Subsequently, OCII will seek an amendment to the Development Controls and Design Guidelines to increase the height limit on the Block 1 site from 300 feet to 400 feet and the approval of an OP/DDA and Schematic Design of the Block 1 Transit-Oriented Infill Project.

[8] The Reduced Scope Alternative includes less overall development throughout the Redevelopment Plan area than the Full Build Alternative. However, some individual sites, including Block 1, were anticipated to have more intensive development under the Reduced Scope Alternative than under the Full Build Alternative. The Full Build Alternative land use program for Block 1 is used in this table in an effort to provide a conservative analysis, as any proposed project on the Block 1 site that is consistent with the Full Build Alternative would also be consistent with the Reduced Scope Alternative.

Analysis of Potential Environmental Effects

CEQA Guidelines Section 15164 provides for the use of an addendum to document the basis for a lead agency's decision not to require a Subsequent or Supplemental EIR for a project that is already adequately covered in an existing certified EIR. The lead agency's decision to use an addendum must be supported by substantial evidence that the conditions that would trigger the preparation of a Subsequent EIR, as provided in CEQA Guidelines Section 15162, are not present. This Addendum documents the assessment and determination that the modified project is within the scope of the Final EIS/EIR and no additional environmental review is required.

The change proposed in the project will not require major revisions of the EIS/EIR. The total square footage of the Proposed Project, including the square footage of retail uses and the number of dwelling units, does not exceed the assumptions studied in the EIS/EIR Project and the Proposed Project will not cause new significant impacts not identified in the EIS/EIR. In addition, no new mitigation measures will be necessary to reduce significant impacts. No changes have occurred with respect to circumstances surrounding the project that will cause significant environmental impact to which the Proposed Project will contribute considerably; and no new information has become available that shows the Proposed Project will cause significant environmental impacts not previously discussed in the EIS/EIR, that significant effects previously examined will be substantially more severe than shown in the EIS/EIR, or that mitigation measures or alternatives previously found infeasible are feasible, or that new mitigation measures or alternatives considerably different from those in the EIS/EIR would substantially reduce significant impacts.

As discussed in the "Proposed Revisions to the Project" section above, the only substantive modification to the proposed project that was not previously studied in the EIS/EIR is the proposed tower height limit change from 300 feet to 400 feet. Moreover, as a Transit-Oriented Infill Project, neither aesthetic nor parking impacts are considered significant impacts on the environment. Therefore, the only CEQA topics requiring additional evaluation are those for which impacts could worsen due to additional building height. These topics include wind and shadow. These two CEQA topics, in addition to aesthetics and transportation, are discussed in further detail in the subsections below. Although the Proposed Project would not generate more trips than anticipated in the EIS/EIR, transportation is analyzed in further detail to allow full discussion of design-specific site circulation issues.

All other features of the Proposed Project, including demolition, land use types, building square footage, retail square footage, and number of dwelling units, would be consistent with the maximum development for Block 1 analyzed in the EIS/EIR. CEQA topics that are evaluated based on those features would not require further analysis because no new or more severe significant impacts beyond those studied in the EIS/EIR could occur and no new mitigation measures would be required. Therefore, the Proposed Project revisions require no further analysis of the following CEQA topics:

- Land Use
- Population and Housing
- Cultural Resources
- Noise
- Air Quality
- Greenhouse Gas Emissions
- Recreation
- Utilities and Service Systems
- Public Services
- Biological Resources
- Geology and Soils
- Hydrology and Water Quality
- Hazards/Hazardous Materials
- Mineral/Energy Resources
- Agricultural and Forest Resources
- Construction Impacts

Prior addenda to the EIS/EIR have generally covered changes to the transportation infrastructure related to the Transbay Terminal/Caltrain Downtown Extension portions of the EIS/EIR, and were administered by the Transbay Joint Powers Authority ("TJPA") and the Golden Gate Bridge Highway and Transportation District.

In addition, a recent draft environmental review document also analyzed transportation infrastructure related to the Transbay Terminal/Caltrain Downtown Extension. On December 28, 2015, the Federal Transit Administration, in conjunction with the Federal Railroad Administration and the TJPA, published a Draft Supplemental Environmental Impact Statement/Environmental Impact Report to EIS/EIR ("Draft SEIS/SEIR") to evaluate refinements to the Caltrain Downtown Rail Extension ("DTX") component of the Transbay Program, as well as other transportation improvements and development opportunities associated with the Transbay Program. The Draft SEIS/SEIR does not contain information that would alter the determination not to require a Subsequent or Supplemental EIR in connection with the Proposed Plan Amendment and Proposed Project, pursuant to CEQA Guidelines Section 15164.

The project evaluated in the Draft SEIS/EIR (the "Draft SEIS/EIR Project") includes refinements to the DTX component of the Transbay Program; some additional transportation improvements within the Transbay Program area; and potential new development opportunities including:

(1) adding two floors (approximately 45,000 gsf) above the proposed intercity bus facility located between Maine and Beale Streets north of Howard Street, for a total structure of 4-stories above grade, which may contain office or residential development; and

(2) development of approximately 76,000 square feet of new development adjacent to the vent structure at either of the optional locations at Third and Townsend Streets, which may include a mix of uses.

The Draft SEIS/EIR Project does not propose modifications at or adjacent to the Block 1 site, or to the Redevelopment Plan component of the Transbay Program.

Overall land use impacts from the Draft SEIS/EIR Project analyzed in the Draft SEIS/EIR would be minimal, and none of the proposed components would conflict with any applicable land use, policy, or regulation in the Program area. (Draft SEIS/EIR, p.3.3-18.) The potential above-grade development opportunities analyzed under the Draft SEIS/EIR are compatible with the development intensity and uses of nearby land uses. (Id.) The proposed above-grade development would have no shadow impact on any parks under the jurisdiction of the San Francisco Recreation and Park Department. (Draft SEIS/EIR, p. 3.3-20–21.) The Draft SEIS/EIR notes that the proposed intercity bus facility discussed under the Draft SEIS/EIR would occupy the roof level of the Transit Center, and would therefore be located adjacent to the proposed City Park. However, this facility would be only slightly higher than the elevation of City Park (approximately 5 feet) (Id.) and therefore would not cast shadow onto the park that would alter the analysis conducted for the Proposed Plan Amendment and the Block 1 Transit-Oriented Infill Project.

Aesthetics

The Visual and Aesthetics analysis in the EIS/EIR anticipated that the Redevelopment Plan would cause a relatively large increase in the number and size of buildings in the Redevelopment Project Area. The EIS/EIR also found that public views within and across the Redevelopment Project Area would generally be limited by new development. The EIS/EIR found that new buildings and vehicles would also produce additional glare, though it would not be expected to result in a substantial visual change. Visual simulations were prepared for the EIS/EIR based on the 2003 *Draft Transbay Redevelopment Project Area Design for Development Vision*, and the EIS/EIR noted that actual development proposals would undergo individual environmental review for aesthetics in subsequent steps of the redevelopment process if necessary. The EIS/EIR specifically contemplated that the northern side of Folsom Street between First and Spear Streets would undergo the most visible aesthetic change in the district, as it would be "developed with a mix of uses in structures that could range in height from 350 to 400 feet." (5-117). The EIS/EIR determined that, although the proposed new development would alter the existing aesthetic nature of the area, the visual features that would be introduced by the project are commonly accepted in urban areas and would not substantially degrade the existing visual quality, obstruct publicly accessible views, or generate obtrusive light or glare. For those reasons, no significant impacts were found, and no mitigation measures were proposed.

The modified project will not involve substantial changes which would require major revisions of the EIS/EIR due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant impacts. The only substantive modification to the Proposed Project is the proposed Block 1 tower height limit change from 300 to 400 feet. The Proposed Project would not alter the overall land uses or development concept proposed for Block 1 under the Transbay Redevelopment Plan analyzed in the EIS/EIR. Further, the total square footage of the Proposed Project, including the square footage of retail uses and the number of dwelling units, does not exceed the maximum development assumptions for the Block 1 site studied in the EIS/EIR. In addition, no substantial changes have occurred with respect to circumstances surrounding the project that will cause significant environmental impact to which the Proposed Project will contribute considerably; and no new information has become available that shows the Proposed Project will cause significant environmental impacts not previously discussed in the EIS/EIR, that significant effects previously examined will be substantially more severe than shown in the EIS/EIR, or that mitigation measures or alternatives previously found infeasible are feasible, or that new mitigation measures or alternatives considerably different from those in the EIS/EIR would substantially reduce significant impacts.

The Proposed Plan Amendment and the Proposed Project would increase the height of the Block 1 tower from 300 feet to 400 feet. The 400-foot height matches the height of towers constructed within the immediate vicinity of Block 1 yet would be the sole tower on Block 1, providing ample tower separation from nearby towers. Between Block 1 and the Embarcadero waterfront are Rincon Park and the block containing the Gap Building at Folsom Street between Spear Street and the Embarcadero roadway. The Gap Building's architecture provides a tower element height of approximately 290 feet and a podium base height of approximately 90 feet. This results in an aesthetically-pleasing stepping-down of the skyline from the Proposed Project to the waterfront. In addition, considering the approved building heights within the districts to the north, the west and the south of Block 1, which include approved height ranges between 400 and 1000 feet, the Proposed Project's height will blend appropriately into the San Francisco skyline as planned.

On September 27, 2013, Governor Brown signed Senate Bill (SB) 743, which became effective on January 1, 2014. SB 743 added Section 21099 to the Public Resources Code and eliminated the analysis of aesthetics and parking impacts for certain urban infill projects under CEQA. The Proposed Project meets the definition of a mixed-use project on an infill site within a transit priority area as specified by Section 21099.[9] Accordingly, this EIS/EIR Addendum does not contain a separate discussion of the topic of aesthetics, which can no longer be considered in determining the significance of the Proposed Project's physical environmental effects under CEQA. Therefore, the proposed height increase could not result in significant aesthetics impacts under CEQA, and no mitigation measures would be necessary.

[9] San Francisco Planning Department, *Transit-Oriented Infill Project Eligibility Checklist, Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project – Block 1 (100-160 Folsom Street/289 Main Street),* December 3, 2015. This document is available for review at the Planning Department, 1650 Mission Street, 4th Floor, as part of Case File No. 2014-000953GEN.

Transportation

As noted at the beginning of the Analysis of Potential Environmental Effects section, the Proposed Project would not exceed the EIS/EIR assumptions for, retail square footage, and number of dwelling units anticipated for the Block 1 site. Therefore, the Proposed Project would not generate more person trips or vehicle trips than previously analyzed, and would not cause traffic to worsen to a greater degree than reported in the EIS/EIR, as explained further in the Traffic section below.

Transportation Impact Studies prepared by the San Francisco Planning Department for CEQA purposes estimate future cumulative traffic volumes based on cumulative development and growth identified by the San Francisco County Transportation Authority's SF-CHAMP travel demand model. The SF-CHAMP model uses zoning as part of the basis for its growth calculations. SF-CHAMP data prepared after adoption of the Transbay Redevelopment Plan takes into account the revised zoning for the Transbay Redevelopment Area, including the Zone One TB DTR (Transbay Downtown Residential) Use District and 50/85/300-TB Height and Bulk District established for the Block 1 site. Therefore, CEQA Transportation Impact Studies prepared after adoption of the Transbay Redevelopment Plan include the potential growth enabled by the plan in their cumulative analysis.

OCII has reviewed a conceptual site layout provided by the project sponsor in connection with the Proposed Project, which illustrates how pedestrians, bicycles, cars, and delivery vehicles would access the proposed building.

This conceptual site layout contains no new information which would generate significant effects not discussed in the EIS/EIR, nor alter analysis contained in the EIS/EIR regarding transportation mitigation measures or alternatives pursuant to Section 15162(a)(3) of the CEQA Guidelines. However, since this level of conceptual project detail was not available when the EIS/EIR was prepared, the subsections below contain remarks about site circulation and any potential for conflicts between modes.

<u>Traffic</u>
The EIS/EIR evaluated four traffic scenarios: 1) existing conditions, 2) year 2020 with no project, 3) year 2020 plus project (the Transbay Terminal and Redevelopment Plan), and 4) a year 2020 cumulative scenario that included concurrent and reasonably foreseeable projects. The EIS/EIR analysis showed that background traffic volumes would grow over time, and that traffic delays would lengthen at nearly all 27 intersections studied even if the Redevelopment Plan was not implemented. The EIS/EIR identified significant traffic impacts at the following seven intersections, under the year 2020 plus project and the year 2020 cumulative scenarios:

- 1st Street and Market Street
- 1st Street and Mission Street

- 1st Street and Howard Street
- Fremont Street and Howard Street
- Beale Street and Howard Street
- 2nd Street and Folsom Street
- 2nd Street and Bryant Street

The EIS/EIR stated that improvements at individual intersections and implementation of an integrated transportation management system could somewhat reduce localized congestion, but may not fully mitigate the increase in traffic congestion resulting from the Transbay Terminal and Redevelopment Plan to a less than significant level. The EIS/EIR therefore concluded that the significant traffic impacts would be unavoidable. No mitigation measures applicable to individual development projects were identified.

Vehicle trip volumes for proposed development projects are calculated using commercial square footage and dwelling unit counts. Since the Proposed Project would have less retail square footage and fewer dwelling units than analyzed for the Block 1 site in the EIS/EIR, as shown in Table 1 above, the Proposed Project would generate fewer vehicle trips than studied in the EIS/EIR analysis.[10] Therefore, the Proposed Project's contribution to the significant unavoidable traffic impacts identified in the EIS/EIR would not be worse than previously reported, and no new mitigation measures would be required. While existing and future conditions have changed since the original analysis, the contribution of a smaller project to traffic congestion is no worse than for the project as originally conceived.

Transit

Transit ridership forecasts were performed for the EIS/EIR, which predicted that transit ridership would increase over time. It also identified the potential for transit usage to increase with implementation of the Redevelopment Plan. Along with the Redevelopment Plan, the project analyzed in the EIS/EIR included the new Transbay Terminal and the downtown extension of Caltrain. Ridership generated by the Redevelopment Plan was estimated using year 2020 forecasts based on the San Francisco County Transportation Authority's transportation model outputs. The EIS/EIR predicted that the project would cause linked transit trips[11] to increase by about 10,000 per day throughout the region. Since the project would enhance transit connectivity and capacity, the EIS/EIR found no significant transit impacts, and no mitigation measures were identified.

[10] Kittelson & Associates, Inc., *Transbay Block 1 Transportation Assessment – Results of Preliminary Transportation Significance Evaluation (Updated),* August 11, 2015. This document is available for review at the Planning Department, 1650 Mission Street, 4th Floor, as part of Case File No. 2014-000953GEN.

[11] A linked trip consists of a full one-way transit trip, including transfers. For example, a bus trip involving two transfers would count as a single linked trip, or three unlinked trips.

The Proposed Project on the Block 1 parcel would not modify the transit infrastructure or service in the area, and would not preclude the proposed future addition of a Muni bus stop on Main Street adjacent to the project site. The Proposed Project would conform to the density of commercial and residential uses identified for the Block 1 parcel in the EIS/EIR, so it would not generate additional transit ridership beyond what was forecasted in the EIS/EIR analysis. Therefore, the Proposed Project would not result in new or more severe significant transit impacts, and no new mitigation measures would be required.

Pedestrians

The EIS/EIR modeled peak period walking trips with and without the Transbay Terminal and Redevelopment Plan in place. Baseline pedestrian surveys were taken, and future year 2020 volumes were projected based on the level of transit, retail, commercial, and other activity anticipated in the area. Pedestrian volumes were anticipated to increase regardless of whether the project is implemented. The EIS/EIR predicted that the volume of pedestrians in the area during the PM peak hour would increase by approximately 141,000 by the year 2020, though only about 9,000 of those trips would be attributable to the project (including the Redevelopment Plan). The EIS/EIR found that the 9,000 additional trips would not be a considerable contribution to the overall increase in pedestrian trips, and determined that the project would not have a significant pedestrian impact. No pedestrian mitigation measures were identified. The Proposed Project would conform to the residential and commercial densities assumed for Block 1 in the EIS/EIR, so it would not generate more pedestrian trips than previously analyzed.

A Site Access and Circulation Review Memorandum[12] was prepared for the Proposed Project to examine the potential for hazards and conflicts between modes, including pedestrians. Pedestrian access to the Proposed Project would be provided on all four of the building's street frontages. The project would also include streetscape improvements, such as street trees, loading areas, and pedestrian amenities consistent with San Francisco's Better Streets Plan. The proposed truck access route to the site would require trucks to cross sidewalks at the intersections of Clementina Street with Main and Spear Streets. To facilitate pedestrian crossings at these intersections, the segment of Clementina Street to be constructed on the project site would be designed as a raised roadway at sidewalk height. This configuration would encourage vehicles to travel at reduced speeds and be more aware of pedestrian crossings. A stop sign would also be installed on Clementina Street's eastbound approach toward Spear Street, which would further reduce the potential for conflicts between trucks and pedestrians. No substantial modal conflicts involving pedestrians are anticipated, and the Proposed Project would not result in any new or more severe significant pedestrian impacts.

Bicycles

[12] Kittelson & Associates, Inc., *Transbay Block 1 Transportation Assessment – Site Access and Circulation Review (Final),* October 13, 2015. This document is available for review at the Planning Department, 1650 Mission Street, 4th Floor, as part of Case File No. 2014-000953GEN.

The EIS/EIR analyzed bicycle traffic growth using field surveys and estimated year 2020 bicycle trip volumes. Year 2020 volumes were based on the San Francisco County Transportation Authority's transportation model outputs. The EIS/EIR estimated that the new Transbay Terminal and Redevelopment Plan could add up to 425 bicycle trips at the intersections studied during the peak 15-minute window, compared to a total of 45 bicycles counted in 2001. The EIS/EIR noted that there is no standard for determining bicycle level of service. Bicycle trips generated by proposed development are calculated using commercial square footage and residential unit counts. Given that the Proposed Project would have less retail square footage and fewer residential units than analyzed for Block 1 in the EIS/EIR, this analysis assumes that it would not generate more bicycle trips than previously analyzed.

The Site Access and Circulation Review Memorandum prepared for the Proposed Project examines the potential for hazards and conflicts between modes. The Proposed Project would not include curb cuts (driveways) that intersect bicycle lanes, thereby avoiding conflicts between bicycles traveling on the street and vehicles exiting project driveways. Access to the project's bicycle parking area would be located on a street with low vehicle and truck volumes (Clementina Street) that would function primarily as an alleyway, which would facilitate bicycle access to the site. Bicycles would need to pass the loading dock entrance/exit, so an audible and visual warning device would be included at the loading dock to alert bicyclists of oncoming vehicle and avoid conflicts. The Proposed Project would conform to the commercial and residential density envisioned in the Redevelopment Plan, and therefore would create no more bicycle trips than analyzed in the EIS/EIR. The Proposed Project would not cause new bicycle hazards or conflicts with other modes. No new significant impacts related to bicycles would result from the Proposed Project and no mitigation measures would be required.

Loading

The EIS/EIR did not identify any significant impacts related to passenger or commercial loading associated with the Redevelopment Plan. Since the Proposed Project would have less square footage and fewer residential units than assumed in the EIS/EIR, it would not result in any further increase in loading trips. The Proposed Project would have an off-street loading dock fronting Clementina Street, and all trucks would need to enter from northbound Main Street and exit to southbound Spear Street. Trucks traveling into and out of the loading dock would cross four pedestrian facilities: the sidewalk along the east side of Main Street, the sidewalk along the west side of Spear Street, the mid-block crosswalk on Clementina Street, and the sidewalk on the south side of Clementina Street. Although Project-related loading vehicles would only represent a portion of the total vehicular activity on the alleyway, the generally low speeds of truck movements may temporarily impede pedestrian circulation, but would not result in significant impacts such as hazards. In addition, trucks may temporarily block the right-hand travel lane on northbound Main Street or the garage exit to Spear Street while waiting for pedestrians to clear the sidewalks, similar to other vehicles attempting to turn onto or off of Clementina Street. These site circulation features of the Proposed Project would not cause hazards or substantial conflicts between modes, and would not result in significant impacts.

Emergency Access

The EIS/EIR did not find any significant impacts related to emergency vehicle access to the individual development parcels identified in the Redevelopment Plan. The Proposed Project would not include vehicular lane removal on any streets, or the introduction of physical impediments to emergency vehicle access. The building would be accessible from frontages along four streets (Folsom, Main, Spear, and Clementina Streets), and would be designed to meet Building Code standards for egress and emergency vehicle access. Since the Proposed Project would conform to the development density specified in the Redevelopment Plan, it would not result in demand for emergency services beyond levels assumed in the EIS/EIR. Therefore, no significant impacts pertaining to emergency vehicle access would occur, and no mitigation measures would be required.

Parking

As noted in the Aesthetics section above, SB 743 added Section 21099 to the Public Resources Code and eliminated the analysis of aesthetics and parking impacts for certain urban infill projects under CEQA. The Proposed Project meets the definition of a mixed-use project on an infill site within a transit priority area as specified by Section 21099.[13] Accordingly, parking deficits can no longer be considered in determining the significance of the Proposed Project's physical environmental effects under CEQA. Therefore, the Proposed Project would not result in significant impacts related to parking deficits, and no mitigation measures would be necessary.

The EIS/EIR stated that approximately 14 percent of the parking in the Redevelopment Area (1,950 spaces) would be removed as a result of the Full Build Alternative, some of which are located on the Block 1 site. The EIS/EIR also noted that some of the parking would be replaced in new buildings constructed on the Redevelopment Plan sites. The available parking spaces in the area were filled to approximately 85 percent capacity on weekdays at the time of EIS/EIR preparation. The EIS/EIR anticipated that a reduction in parking spaces would constrain parking availability, forcing some drivers to park farther away from their destinations or use other modes of transportation. The displacement of parking spaces is generally not considered a physical environmental effect, but is a social effect and an inconvenience to drivers who must seek alternate parking. Accordingly, the EIS/EIR did not identify any significant impacts related to parking.

Site Circulation

The Site Access and Circulation Review Memorandum prepared for the Proposed Project examines the potential for hazards and conflicts caused by vehicles entering and exiting the Proposed Project's parking garage ramp along Spear Street. The memorandum found that vehicles attempting to enter the garage from northbound Spear Street would have to wait for a

[13] San Francisco Planning Department, *Transit-Oriented Infill Project Eligibility Checklist, Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project – Block 1 (100-160 Folsom Street/289 Main Street),* December 3, 2015. This document is available for review at the Planning Department, 1650 Mission Street, 4th Floor, as part of Case File No. 2014-000953GEN.

gap in southbound traffic to complete a left turn. However, given that volumes along Spear Street are anticipated to be relatively low, vehicles waiting to enter the garage are not expected to affect northbound street operations.[14] Additionally, the Proposed Project's parking demand would not exceed the amount reported in the EIS/EIR because the commercial square footage and number of residential units would be less than the totals assumed in the Redevelopment Plan, as shown in Table 1 above. In any event, parking impacts of a transit-oriented infill project are not considered significant impacts on the environment. Cal. Public Resources Code § 21099 (d) (1). Therefore, no significant site circulation impacts associated with vehicles accessing the on-site parking facilities would occur.

Wind

A wind tunnel test was performed for the EIS/EIR, which included the proposed Transbay Terminal and conservative assumptions for the buildings that would be constructed in accordance with the land use program on the redevelopment parcels, including Block 1. Though the land use program ultimately adopted for the Block 1 site as part of the Redevelopment Plan included a maximum tower height limit of 300 feet, the wind tunnel test analyzed two potential towers on the Block 1 site: a 400-foot-tall tower at the western edge of the site and a 350-foot tall tower at the eastern edge of the site. These assumptions were sufficient to capture the maximum impacts of the ultimately-approved 300-foot tower height limit, as the wind speeds generated by the smaller 300-foot tower would be slower than those generated by a 350-foot or 400-foot tower in the same location. Wind speeds were modeled at 69 locations throughout the Redevelopment Area, as summarized in Table 2 below. The Full Build Alternative modeling resulted in nine locations that exceeded the comfort criterion (ground level wind speeds in excess of 11 mph) and one location that exceeded to hazard criterion (ground level wind speeds in excess of 26 mph). The Reduced Scope Alternative modeling resulted in seven locations that exceeded the comfort criterion and one location that exceeded the hazard criterion. None of the comfort criterion or hazard criterion exceedances were located on Block 1 or adjacent blocks. For the purposes of CEQA, only exceedances of the hazard criterion are considered significant impacts.

[14] The Transit Center District Plan Final EIR reported that the existing southbound PM peak hour traffic volume on Spear Street is 481 vehicles, which would rise to 701 vehicles by the year 2030.

Table 2: Comparison of the Proposed Project's Wind Impacts to the EIS/EIR Wind Analysis

Wind Study Scenario	Number of Test Points Studied	Comfort Criterion (11 mph) Exceedances – Less than Significant Impacts	Hazard Criterion (26 mph) Exceedances – Significant Impacts
EIS/EIR: Full Build Alternative	69	9	1
EIS/EIR: Reduced Scope Alternative	69	7	1
Current Existing Conditions	24	None	None
Existing Conditions Plus Proposed Project	24	None	None
Cumulative Conditions Plus Proposed Project	24	1	None

To address the modeled hazard criterion exceedances, the EIS/EIR included a mitigation measure requiring wind tunnel testing to be performed for all subsequent individual development projects proposed within the Redevelopment Area. If any exceedances of the hazard criterion occur, design modifications or other mitigation measures would be required to mitigate or eliminate the exceedances.

Accordingly, a wind tunnel test was performed for the Proposed Project. The test modeled the proposed massing with the 400-foot-tall tower.[15] Three scenarios were examined: 1) existing conditions, 2) existing conditions plus the Proposed Project, and 3) cumulative conditions plus the Proposed Project. The cumulative conditions included all buildings from the existing conditions scenario plus nearby approved and reasonably foreseeable projects, such as high-rise developments studied in the EIS/EIR and the EIR prepared for the nearby Transit Center District Plan. As shown in Table 2, wind speeds were modeled at 24 test points on and near the project site. Test points were selected to sample an area that is larger than the area within which wind speeds may be adversely affected by the Proposed Project. No exceedances of the comfort criterion were found for the existing conditions or existing-plus-project scenarios, and one exceedance was found for the cumulative conditions scenario near the northeast corner of Folsom and Beale Streets. No exceedances of the hazard criterion were found under any of the scenarios, therefore no design modification of the Proposed Project in accordance with the EIS/EIR wind mitigation measure would be required. Based on the above analysis, no significant wind impacts would occur as a result of the Proposed Project, including the proposed height limit increase to 400 feet. No new mitigation measures would be required.

[15] Environmental Science Associates, *Potential Wind Conditions – Transbay Redevelopment Area, Block 1 – 160 Folsom Street,* April 9, 2015. This document is available for review at the Planning Department, 1650 Mission Street, 4th Floor, as part of Case File No. 2014-000953GEN.

Shadow

The EIS/EIR included a shadow analysis performed in accordance with CEQA and Planning Code Section 295. The methodology analyzes the potential shadow impacts of Proposed Project on public parks and open spaces as a percentage of theoretical annual available sunlight (TAAS) consumed. TAAS is a measure of the square-foot-hours of sunlight that would theoretically be available at a given park or open space during a typical year, assuming that it is sunny during all daylight hours. The first hour of the day after sunrise and the last hour before sunset are excluded from TAAS calculations. Though the land use program ultimately adopted for the Block 1 site as part of the Redevelopment Plan included a maximum tower height limit of 300 feet, the shadow study analyzed two potential towers on the Block 1 site: a 400-foot-tall tower at the western edge of the site and a 350-foot tall tower at the eastern edge of the site. These assumptions were sufficient to capture the maximum impacts of the ultimately-approved 300-foot tower height limit, as the shadow cast by the smaller 300-foot tower would be less than that of a 350-foot or 400-foot tower in the same location. The EIS/EIR shadow analysis found that the Transbay Terminal and the Redevelopment Plan would not cast shadow on any parks or open spaces subject to Section 295.[16] Other public parks and open spaces not subject to Section 295 were still evaluated for potential impacts under CEQA. In San Francisco, a significant shadow impact would occur under CEQA if a proposed project would create new shadow in a manner that substantially affects outdoor recreation facilities or other public areas. The EIS/EIR indicated that some public accessible open spaces would see a diminution in sunlight during certain periods of the day and year, but that additional shading would not amount to a significant impact requiring mitigation measures. The EIS/EIR required all subsequent development projects in the Redevelopment Area to perform a shadow analysis. Specific to the Block 1 site, the EIS/EIR found that the tower proposed at the corner of Folsom and Spear Streets could shade the southern portion of Rincon Park in the late afternoon.

In accordance with the requirements of the EIS/EIR, a shadow analysis was prepared for the Proposed Project.[17] The shadow analysis includes a 300-foot-tall tower and a 400-foot-tall tower scenario for the Block 1 site, in order to measure the difference in shadow that would be caused by the proposed tower height change from 300 feet to 400 feet. All other features of the project (townhouse and podium buildings) would fit within the massing envelope assumed in the EIS/EIR, as shown in Table 1, and therefore would not result in any additional shadow beyond what was previously studied. Accordingly, this section focuses only on new shadow that would be cast by the part of the Proposed Project that is between the 300-foot and 400-foot levels. Reasonably foreseeable projects were included in the analysis of cumulative shadow conditions, including forthcoming Transit Center District Plan and other Transbay Redevelopment Plan

[16] Section 295 of the Planning Code only applies to public parks and open spaces that are under the jurisdiction of the San Francisco Recreation and Park Commission.

[17] Prevision Design, *CEQA Evaluation of Shadow Impacts for 160 Folsom Street/Transbay Block 1, San Francisco, CA*, October 14, 2015. This document is available for review at the Planning Department, 1650 Mission Street, 4th Floor, as part of Case File No. 2014-000953GEN.

projects. Projects that would subsume (lessen) shadow cast by the Proposed Project were not included in the cumulative analysis unless they were already substantially under construction and completion was imminent. The shadow analysis found that the Proposed Project could cast new shadow on the following parks and open spaces. None are subject to Section 295 of the Planning Code, but were still evaluated for potential impacts under CEQA.

- Rincon Park – located along the Embarcadero at Folsom Street
- Transbay Park (future)[18] – bounded by Beale, Clementina, Main, and Tehama Streets
- Spear Street Terrace – located on Spear Street south of Howard Street
- Howard/Fremont Plaza – located near Howard and Fremont Streets
- Main Street Plaza – located near Howard and Main Streets
- Transbay Terminal Park (future) – on the roof of the new Transbay Terminal

The results of the shadow analysis are shown in Table 3 below, which shows the amount of new shadow the proposed 100 foot height increase would add to each park or open space. The additional shading at each park and open space caused by the proposed tower height increase from 300 feet to 400 feet would be less than one half of one percent (0.5%) of the TAAS (ranging from 0.00% to 0.49% of TAAS). Table 4 shows how much shadow the proposed 100-foot height increase would add on the days when shadows would be the largest, and how many more days per year shadow would occur at each park. As shown, the maximum shadow size at any park would grow by less than one percent due to the proposed height increase, and the additional shadow duration on the maximum days would range from 18 to 45 minutes.

[18] Future parks were included in an effort to provide a conservative analysis, though shadow impacts on future parks are not typically considered significant.

Table 3: Comparison of the Proposed Project's Shadow Impacts on Theoretically Available Annual Sunlight (TAAS) Due to Height Increase from 300 Feet to 400 Feet

	Rincon Park	Transbay Park (future)	Spear Street Terrace	Howard/Fremont Plaza	Main Street Plaza	Transbay Terminal Park (future)
Existing Conditions						
Size (acres)	3.23	1.31	0.73	0.20	0.11	3.97
Shadow due to Existing Structures	23.51%	30.22%	75.36%	70.57%	61.43%	26.32%
Existing Conditions Plus Proposed Project						
Potential Shadow Added by 300′ Tower (already covered by EIS/EIR)	0.39%	2.37%	0.94%	0.10%	0.10%	0.003%
Potential Shadow Added by 400′ Tower (modified project)	0.72%	2.42%	1.43%	0.22%	0.29%	0.026%
New Shadow due to Height Increase from 300′ to 400′ (shadow due to modification)	**0.34%**	**0.03%**	**0.49%**	**0.12%**	**0.19%**	**0.02%**
Cumulative Conditions Plus Proposed Project						
Potential Shadow Added by 300′ Tower and Cumulative Projects (already covered by EIS/EIR)	2.09%	12.57%	1.23%	11.50%	5.75%	20.21%
Potential Shadow Added by 400′ Tower and Cumulative Projects (modified project)	2.42%	12.62%	1.72%	11.62%	5.94%	20.21%
New Shadow due to Height Increase from 300′ to 400′ (shadow due to modification)	**0.33%**	**0.05%**	**0.49%**	**0.12%**	**0.19%**	**0.00%**

All shadow amounts are shown as a percentage of TAAS.

Table 4: Additional Shadow Size and Duration at Periods of Maximum Shadow Due to Height Increase from 300 Feet to 400 Feet

	Rincon Park	Transbay Park (Future)	Spear Street Terrace	Howard/ Fremont Plaza	Main Street Plaza	Transbay Terminal Park (Future)
Additional Days Per Year When New Shadow Would Occur (Any Size)	28	None	28	43	None	70
Day(s) of Maximum Shadow	Feb 23 & Oct 18	June 21	Feb 23 & Oct 18	May 10 & Aug 2	May 10 & Aug 2	Apr 5 & Sep 6
Additional Percentage of Park/Open Space Square Footage Shaded on Day of Maximum Shadow	0.65%	0.28%	0.75%	0.30%	0.41%	0.21%
Additional Duration of Shadow on Day of Maximum Shadow	45 mins	18 mins	18 mins	18 mins	44 mins	18 mins

Qualitative descriptions of the areas that would be shaded by the proposed tower height increase from 300 feet to 400 feet (shadow cast by the portion of the proposed building between the 300-foot and 400-foot levels) are provided below:

- Rincon Park: New shading from the proposed height increase on Rincon Park would occur on a small portion of the San Francisco Bay Trail near the center of the park and over existing restaurant structures during mid- to late-afternoon. The proposed height increase would result in some new shadow for 28 days of the year. The new shadow would last approximately 45 minutes on days when shadows would be the largest, between February 23rd and October 18th. Based on park use observations, usage was varied throughout the day with mornings and afternoons having less activity than midday periods.
- Transbay Park (Future): New shading from the proposed height increase would occur in early-morning in July, August, and early May, and would depart the park before 10 am. The proposed sculptured topography feature and the intersecting paved pathways would be the areas principally affected by new shadow. Due to the dense pattern of tree planting proposed along the park's periphery, the perceived impact of new shading may be somewhat diminished. As Transbay Park has not yet been constructed, no park usage observations could be conducted. The proposed 100-foot height increase would result in

approximately 18 minutes of additional shade duration on the summer solstice, when shadows would be the largest.

- Spear Street Terrace: New shading from the proposed height increase on Spear Street Terrace would fall primarily in the northeast corner of the open space during mid- to late-afternoon between August and May. The proposed 100-foot height increase would result in some new shadow for 28 days of the year. The new shadow would last approcimately 18 minutes on days when shadows would be the largest, February 23rd and October 18th Use observations revealed that the number of users during a given 30-minute period ranged from zero on the weekend to 28 during weekday midday periods. On weekdays, visitors were observed using seating areas to eat and make phone calls.
- Howard/Fremont Plaza: New shading from the proposed height increase would primarily shade the eastern part of the plaza during morning hours. The proposed 100-foot height increase would result in some new shadow for 43 days of the year. The new shadow would last approximately 18 minutes on days when the shadows would be the largest, May 10th and August 2nd. Plaza use observations revealed that the number of users during a given 30-minute period ranged from zero on the weekend to 20 during weekday midday periods. Visitors on weekdays tended to use the plaza as informal meeting space. No visitors were present during weekend observation times.
- Main Street Plaza: New shading from the proposed height increase would shade the southeast corner of the plaza during morning hours. The proposed 100-foot height increase would result in approximately 44 minutes of additional shade duration on days when shadows would be the largest, May 10th and August 2nd. Plaza use observations revealed that the number of users during a given 30-minute period ranged from zero on the weekend to 44 during weekday midday periods. Visitors were observed using the plaza as a place to rest or eat lunch.
- Transbay Terminal Park (Future): The areas affected by new shadow from the proposed height increase would be at the eastern end of the parkand a portion of the central park during early morning in the spring and fall. Less than five percent of the park area would be shaded at the time of maximum impacts. The proposed 100-foot height increase would result in some new shadow for 70 days of the year. The new shadow would last approximately 18 minutes on days when shadows would be the largest – april 5th and September 6th. Though plans for the park are not finalized, the shaded area would likely contain benches, pathways, or passive recreation features. As Transbay Terminal Park has not yet been constructed, no park usage observations could be conducted.

As discussed above, the new shadow created by the proposed 100-foot height increase would consume less than one-half of one percent of TAAS at any of the six affected parks and open spaces. On the day(s) of maximum shading, less than one percent of each park's square footage would receive additional shading at the time when shadows are the largest. Shadows (of any size) would last from 18 to 45 minutes longer on the day of maximum shading, and the increase

in shadow duration would be smaller on other days of the year. Based on site visits, all of the affected parks were observed to have low to moderate usage. Activities in the affected portions of the parks and open spaces consisted primarily of passive activities, such as eating lunch, resting, and making phone calls. Areas that would be newly shaded would, in most cases, be located at the edges of the affected parks and open spaces. Given the limited increase in shadow size and duration, the proposed height increase from 300 to 400 feet would not create new shadow in a manner that substantially affects outdoor recreation facilities or other public areas. Therefore, the Proposed Project changes would not result in any new or more severe significant impacts compared to those identified in the EIS/EIR, and no new mitigation measures would be required.

Conclusion

Based on the foregoing, it is concluded that the analyses conducted and the conclusions reached in the Final EIS/EIR certified on April 22, 2004 remain valid. The proposed revisions to the project would not cause new significant impacts not identified in the EIS/EIR, nor would the project cause significant impacts previously identified in the EIS/EIR to become substantially more severe. No new mitigation measures would be necessary to reduce significant impacts. No changes have occurred with respect to circumstances surrounding the Proposed Project that would cause significant environmental impacts to which the project would contribute considerably, and no new information has become available that shows that the project would cause significant environmental impacts. Therefore, no supplemental environmental review is required beyond this Addendum.

CONCLUSION

Based on the further analysis provided below, it is concluded that the analyses conducted and the conclusions reached in the final EIS/EIR certified on April 22, 2004, remain valid. The proposed revisions to land use controls established by the Redevelopment Plan for the Transbay Redevelopment Project Area and the Development Controls and Design Guidelines for the Transbay Redevelopment Project, and accompanying development of Transbay Block 4 would not cause new significant impacts that were not identified in the EIS/EIR, nor would the Proposed Project cause significant impacts that were previously identified in the EIS/EIR to become substantially more severe. No new mitigation measures would be necessary to reduce significant impacts. No changes have occurred with respect to circumstances surrounding the Proposed Project that would cause significant environmental impacts to which the Proposed Project would contribute considerably, and no new information has become available that shows that the Proposed Project would cause significant environmental impacts. Therefore, no supplemental environmental review is required beyond this addendum.

I do hereby certify that the above determination has been made pursuant to state and local requirements.

Date of Determination

REMARKS

The Successor Agency to the Redevelopment Agency of the City and County of San Francisco (commonly referred to as the Office of Community Investment and Infrastructure or "OCII"), proposes to approve a residential development project on Block 4 of the Transbay Redevelopment Project Area and a new segment of Tehama Street, which includes the following actions (collectively, the Proposed Project): (1) authorize and recommend for approval to the Board of Supervisors of the City and County of San Francisco (City) an amendment to the Redevelopment Plan for the Transbay Redevelopment Project Area (Redevelopment Plan) to increase the maximum height on Transbay Block 4 from 450 feet to 513 feet and increase the maximum floor plate sizes on Block 4 from 7,500 square feet to 13,500 square feet for buildings between 85 feet and 250 feet in height and from 13,000 square feet to 15,200 square feet for buildings between 500 feet and 550 feet in height but limited to the portion of such buildings that is between 85 feet and 122 feet in height; (2) an amendment to the Development Controls and Design Guidelines for the Transbay Redevelopment Project Area (DCDG) to make conforming and related modifications to certain height and bulk restrictions, setback requirements, and other development controls; and (3) authorization of a Disposition and Development Agreement (DDA) and approval of a Schematic Design governing development of the residential development project on Block 4 and a new segment of Tehama Street. As shown in Figure 1, the Project Site consists of Assessor's Block 3739 Lot 010 (Block 4) and Lot 011 (new Tehama Street).

A. PROJECT DESCRIPTION

As shown in Figure 2, the proposed residential development on Transbay Block 4 is a mixed-use development consisting of a Tower Project, a Mid-Rise Project, a Podium that includes the Shared Parking Garage and Public Open Space (each as further described below), and associated streetscape improvements that includes a new segment of Tehama Street. Overall, the Proposed Project would include approximately 955,259 gross square feet[1] (gsf), including approximately 839,341 gsf of residential space and approximately 8,389 gsf of ground-floor retail space. The proposed buildings at the Project Site, as depicted in Figure 3 and Figure 4, would include the following:

- The Tower Project would combine a proposed 513-foot-tall, 47-story mixed-use residential high-rise tower at the corner of Howard Street and Main Street with an adjacent 71-foot-tall, six-story townhouse building, facing Tehama Street. The top of the mechanical enclosure would extend up to 39 feet above the roof of the tower; therefore, the tallest point on the Tower Project would be up to 552 feet above grade. The proposed program at the Tower Project would include ground-floor retail spaces fronting Howard Street, 324 apartment units, 20 townhouse units, and 135 condominium units, along with amenity spaces.
- The Mid-Rise Project would include a 163-foot-tall, 16-story mixed-use residential mid-rise building, facing Howard Street and Beale Street. The top of the mechanical enclosure would extend up to 16 feet above the roof; therefore, the total height of the Mid-Rise Project would be up to 179 feet when the mechanical penthouse is included. The Mid-Rise Project would include 202 apartment units, community rooms, laundry rooms, and other indoor amenities, along with

[1] The total gsf includes residential gsf and retail gsf as well as approximately 107,529 gsf for major utilities, underground parking, and loading and related back-of-house areas on the ground floor.

roof terraces. The ground-floor area of the Mid-Rise Project would include retail space along Howard and Tehama streets.

- The Podium building would consist of a Shared Parking Garage located on three basement levels that would include major utilities, trash areas, tenant storage areas, and parking for users of the Proposed Project. Vehicular parking would consist of approximately 224 physically marked stalls providing parking for up to 275 vehicles (including two car-share vehicles), through a combination of valet parking and vehicle stackers. The Proposed Project would provide a minimum of 556 class I combined bicycle parking spaces within the basement levels of the proposed garage, also serviced by valet staff. In addition, the Podium building would consist of an up to a 20-foot high single-story above ground, connected to and shared by both the Tower Project and the Mid-Rise Project and the basement levels below the entire Proposed Project. The Podium would house utility rooms and related back-of-house services, loading dock, ground-floor valet parking drop-offs, one parking space, and drive aisles and driveway ramps. The roof of the Podium would contain a minimum of 4,250 square feet of Public Open Space, which would be connected by a stairway and a stepped terrace open space connections to Howard and Tehama streets (respectively) at ground level.

Vehicular access to the Project Site would be provided from a new 24-foot-wide curb cut and two-way driveway at Main Street. Off-street commercial loading would occur within the loading dock, which would be accessible from a new 24-foot-wide curb cut on Beale Street. Approximately 340 linear feet of curb would be designated for commercial or passenger loading (i.e., 120 feet on Howard Street, 40 feet on Main Street, 180 feet on Tehama Street). This amount of curb space would equate to 17 passenger loading spaces (assuming 20 feet per space) or about 10 commercial loading spaces (assuming 30 to 35 feet per space). Passenger loading would be in effect 24 hours per day, seven days per week. Commercial loading would be in effect Monday through Saturday from 7 a.m. to 4 p.m., consistent with commercial loading zones in the area. The specific allocation of curb space between passenger and commercial loading has not been defined, and all color curb changes would be subject to review and approval by the San Francisco Municipal Transportation Agency (SFMTA).

Streetscape modifications adjacent to the Project Site would be consistent with the *Transbay Redevelopment Project Area Design for Development* (Design for Development) document published in October 2003 and described and defined in the Redevelopment Plan. The Design for Development provides a development framework for the Transbay Redevelopment Project Area as well as specific design recommendations that apply to all development in the area, including the Proposed Project. For Tehama Street, the Project Sponsor would be responsible for implementing all of the streetscape improvements described below. For Beale Street, Howard Street, and Main Street, the Project Sponsor would be responsible for implementing the streetscape improvements between the property line and the curb; the City would implement the streetscape improvements beyond the curb. Proposed modifications to streets adjacent to the Project Site are as follows:

- **Tehama Street.** The Proposed Project would make Tehama Street a new midblock alley (i.e., a 40-foot right-of-way) between Beale Street and Main Street. The Tehama Street roadway would be approximately 21 feet wide and have one westbound vehicle travel lane, approximately 14 feet wide. A total of nine passenger or commercial loading spaces (about 180 feet long), including two accessible spaces with curb ramps, would be provided on the north side of the street. Raised crosswalks would be provided at the Beale Street and Main Street intersections, connecting the Project Site with the south-adjacent (future) Transbay Block 3 Park. A 12-foot-wide sidewalk with an 8.5 feet clear walkway and curbside tree zone would be constructed on the north side of the street, and a 7-foot-wide sidewalk would be constructed on the south side of the street. A bulb-out would be constructed at the northeast corner of the Tehama Street/Beale Street intersection, increasing the sidewalk width to 19 feet (from 12 feet) and reducing the Tehama Street crossing distance from 21 feet to 14 feet.
- **Beale Street.** Vehicle travel lanes would be reduced from three southbound travel lanes (two mixed-flow lanes and one bus-only lane) to two southbound mixed-flow lanes. A curbside casual carpool lane would be provided on the west side of the street, along with a 6-foot-wide southbound bicycle lane and a 2-foot, 6-inch buffer to separate the bicycle lane from the travel lane. Under the Design for Development program, the east sidewalk would be widened from 10 feet to 30 feet and include a 9-foot-wide clear path of travel adjacent to the building, a 17-foot-wide landscaped area, and a 4-foot-wide hardscaped area along the east curb. A 24-foot-wide curb cut would be constructed to provide vehicle access to the proposed off-street loading dock. However, the City has approved the Active Beale Project, which, instead, would consist of a 12-foot-wide two-way bicycle track and an 8-foot buffer and would be constructed by the City to separate the bicycle lanes from the travel lanes. The Project Sponsor would be responsible for constructing the east sidewalk, which would be widened from 10 feet to 17 feet, 6 inches near the Howard Street intersection and include a 9-foot-wide clear path of travel adjacent to the building; a 6-foot, 6 inch-wide landscaped area; and a 2-foot-wide hardscaped area along the east curb.
- **Howard Street.** Vehicle travel lanes would be reduced from four travel lanes (two westbound mixed-flow lanes, one eastbound mixed-flow lane, and one eastbound bus-only left-turn lane) to two travel lanes (one westbound mixed-flow lane and one eastbound mixed-flow lane), with an eastbound left-turn lane at Main Street. A 12-foot-wide, two-way protected cycle track (class I) would be constructed on the south side of the street, and the existing class III lanes (sharrows) would be removed. Six passenger or commercial loading spaces (about 120 feet long) would be marked on the Project Site frontage, and five passenger or commercial loading spaces (about

100 feet long) would be marked on the opposite (north) side of Howard Street, near the intersection with Beale Street. The existing 12-foot-wide sidewalk with new trees on curbside zone and the 16-foot-wide sidewalk on the north side would be maintained on the street.

- **Main Street.** Vehicle travel lanes would be reduced from three northbound travel lanes (two mixed-flow lanes and one bus-only lane) to two northbound mixed-flow lanes. A northbound 6-foot-wide curbside bicycle lane, with a 2-foot, 6-inch buffer to separate it from the travel lanes, would be provided on the east side of the street. On the west side of the street, two passenger or commercial loading spaces would be marked in an approximately 40-foot-long bulb-in on the Project Site frontage north of the proposed garage driveway. Under the Design for Development program, the west sidewalk would be widened from 15 feet to 30 feet and include a 9-foot-wide clear path of travel adjacent to the Tower Project and two configurations for landscaped and hardscaped areas. North of the driveway, the landscaped area would be reduced to 12.5 feet in width, and the hardscaped area would be reduced to 2.5 feet in width at the loading cut-in. South of the garage driveway would be a 17-foot-wide landscaped area and a 4-foot-wide hardscaped area along the curb. A 24-foot-wide curb cut would be constructed to provide vehicular access to the proposed valet parking in the below-grade garage. The City is studying the design of a new one-way protected bicycle lane on the east side of Main Street, which, if approved, would reduce the sidewalk expansion at the Project Site from the proposed 30 feet to 25 feet, 6 inches.

Detailed construction plans have not been finalized. However, based on preliminary plans, it is anticipated that construction activities would take up to approximately 48 months to complete. Work is expected to occur Monday through Friday from 7 a.m. to 8 p.m. On occasion, construction may also take place on Saturdays from 8 a.m. to 4 p.m. on an as-needed basis and subject to compliance with the San Francisco Noise Ordinance and Department of Building Inspection permit provisions. Construction staging would occur primarily within the confines of the Project Site but occasionally use portions of the public right-of-way along Howard, Main, and Beale streets. Travel-lane, parking-lane, and sidewalk closures would most likely be needed. During periods of travel-lane and sidewalk closures, wayfinding signs and pedestrian protection would be erected, as appropriate, in accordance with the public works code and the blue book.[2]

The Proposed Project described above would require amendments to the Transbay Redevelopment Plan and DCDG, as follows:

Redevelopment Plan Amendments

No.	*Topic*	*Plan Standards*	*Proposed Changes*
1	Tower Maximum Height	Maximum height on Block 4 is 450 feet	Increase maximum height to 513 feet on Block 4
2	Increase Bulk Limit on Tower (maximum floor plate area)	Maximum floor plate area is 13,000 square feet (sf) for the portions of a 513-foot-tall Tower higher than 85 feet	Increase maximum floor plate area on Block 4 to 15,200 sf for buildings over 500 feet tall, but limited to the portion of said

[2] San Francisco Municipal Transportation Agency, *Regulations for Working in San Francisco Streets*, 8th edition, revised October 202, https://www.sfmta.com/sites/default/files/reports-and-documents/2022/05/blue_book_8th_ed_accessible_rev_5-2022_v3.7.4.pdf, accessed June 14, 2022.

			buildings between 85 feet and 122 feet in height
3	Increase Bulk Limit on Mid-Rise Project (maximum floor plate area)	Maximum floor plate area of 7,500 sf for buildings with heights in the range of 85 feet to 250 feet (height of Mid-Rise Project)	Increase maximum floor plate area to 13,500 sf for buildings on Block 4 with heights in the range of 85 feet to 250 feet

Overall Block 4 DCDG Amendments

No.	*Topic*	*DCDG Standards*	*Proposed Changes*
1	Parcel, Setback, & Height Maps	Proposed Project is not compliant with restrictions on Parcel Map 3, Setback Map 4, and Height Map 5	Add alternative to parcel, setback, and height maps to match the Proposed Project
2	Construction over Open Space Parcel	Construction over Open Space Parcel allowed on only one block fronting Folsom Street to accommodate expansion of a ground-floor commercial use, with open space on roof	Allow construction over Open Space Parcel on Block 4 to accommodate ground-floor parking and drive aisles, with open space on roof
3	Townhouse Frontage	Required on Main and Beale streets on Block 4	Eliminate requirement for Townhouse frontages on Main and Beale streets
4	Setbacks on Beale, Howard, Main, and Tehama Streets	Six-foot to 10-foot setbacks required	Eliminate setback requirement on Beale and Howard streets, reduce setback length on Main Street frontage to coincide with Townhouse building, and remove setback requirement on Mid-Rise Project's Tehama Street frontage
5	Off-street Parking on Ground Floor	Off-street parking not allowed on ground floor	Permit off-street handicapped parking and temporary valet parking on the ground floor of Block 4

Tower Project DCDG Amendments

No.	*Topic*	*DCDG Standards*	*Proposed Changes*
6	Tower Building Maximum Height	Maximum height is 450 feet on Block 4	Increase maximum height of Tower Parcel to 513 feet on Block 4
7	Tower Building Maximum Screening Height	Maximum of 10% of building height, or 51 feet, for a 513-foot-tall Tower	Maximum of 39 feet of screening above Tower roofline—must adequately screen mechanical equipment

8	Townhouse Parcel Height	Maximum height of Townhouse Parcels is 50 feet	Increase maximum height of Townhouse Parcel to 71 feet on Block 4
9	Townhouse Maximum Number of Floors	Maximum of four floors	Increase to maximum of six floors for Townhouses on Block 4
10	Maximum Plan Dimension	Maximum plan dimension of 130 feet for buildings with heights between 501 and 550 feet	Increase maximum plan dimension to 150 feet for buildings with heights between 501 and 550 feet on Block 4
11	Maximum Floor Plate Aspect Ratio	Maximum 1:1.2 for buildings with heights between 501 and 550 feet	Increase to 1:1.46
12	Maximum Floor Plate Area	Maximum 13,000 sf above 85 feet for buildings with heights between 501 feet and 550 feet	Increase maximum floor plate area on Block 4 to 15,200 sf for the portions of a Tower over 500 feet tall between 85 feet and 122 feet in height
13	Townhouse Width	Maximum of 30-foot-wide Townhouse modules between unit demising walls	Apply to architectural expression of façade/modulation on Block 4

Mid-Rise Project DCDG Amendments

No.	*Topic*	*DCDG Standards*	*Proposed Changes*
14	Block 4 Podium 1 Parcel Height	Maximum of 65 feet	Increase height to maximum 163 feet, redesignate as Mid-Rise Parcel
15	Block 4 Podium 2 Parcel Height	Maximum of 85 feet	Increase height to maximum 115 feet, redesignate as Mid-Rise Parcel
16	Maximum Plan Dimension	Maximum plan dimension of 100 feet for buildings with heights in the range of 85 feet to 250 feet	Increase maximum plan dimension for buildings with heights in the range of 85 feet to 250 feet on Block 4 to 147 feet
17	Maximum Floor Plate Aspect Ratio	Maximum 1:1.6 for buildings with heights in the range of 85 feet to 250 feet	Increase to 1:1.7 for buildings with heights in the range of 85 feet to 250 feet on Block 4
18	Maximum Floor Plate Area	Maximum 7,500 sf for buildings heights in the range of 85 feet to 250 feet	Increase maximum floor plate area to 13,500 sf for buildings with heights in the range of 85 feet to 250 feet on Block 4
19	Mid-rise Parcel Designation	Designated previously as Townhouse Parcel	Redesignate about 75-foot-long portion of Townhouse Parcel to the Block 4 Mid-Rise Parcel

20	Mid-rise Parcel Height at Tehama & Beale	Maximum height of Townhouse Parcel is 50 feet	Portion of Townhouse Parcel redesignated as Mid-Rise Parcel includes maximum height increase to 68 feet

BACKGROUND

A final environmental impact statement/environmental impact report for the Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project (EIS/EIR Project),[3] San Francisco Planning Department (Planning Department) case number 2000.048E and State Clearinghouse number 95063004, was certified on April 22, 2004, at a joint hearing of the San Francisco Planning Commission and the Transbay Joint Powers Board. The EIS/EIR Project consisted of (1) alternative designs for the new Transbay Terminal; (2) an underground extension to the Caltrain commuter rail system, extending 1.3 miles from its current terminus at Fourth and King streets to downtown San Francisco; and (3) several land use redevelopment alternatives as part of the Transbay Redevelopment Plan. The Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project EIS/EIR has been supplemented with eight addenda issued by the co-lead agencies and/or the responsible agencies administering the EIS/EIR Project.

The Transbay Redevelopment Plan sets forth land use and zoning standards as well as public street and streetscape improvements south of the Transbay Terminal, providing additional office, retail/hotel, and residential development, including affordable housing, in the area. Under the Transbay Redevelopment Plan, OCII, as the successor agency to the Redevelopment Agency of the City, has land use authority over Zone One of the Transbay Redevelopment Plan/Redevelopment Project Area and is the California Environmental Quality Act (CEQA) lead agency for approval actions under the Redevelopment Plan.

Development of Assessor's Block 3739 was included in the Transbay Redevelopment Plan and EIS/EIR analysis. Table 1, below, provides an overview of the development on Assessor's Block 3739 analyzed in the EIS/EIR under the Full Build Alternative and the Reduced Scope Alternative as well as the proposed development on Block 4 under the Proposed Project. The EIS/EIR studied the two alternatives as representations of the range of reasonable development that could occur. As shown in Table 1, the EIS/EIR analyzed development on Assessor's Block 3739 of up to 1,758,375 gsf of residential space (1,465 dwelling units), 397,360 gsf of office space, and 98,935 gsf of retail space under the Full Build Alternative and up to 878,400 gsf of residential space (732 dwelling units) and 58,400 gsf of retail space under the Reduced Scope Alternative.

[3] U.S. Department of Transportation, Federal Transit Administration, City and County of San Francisco, Peninsula Corridor Joint Powers Board, and San Francisco Redevelopment Agency, *Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project Final Environmental Impact Statement/Environmental Impact Report and Section 4(f) Evaluation*, March 2004. Available: <https://tjpa.org/documents/final-eiseir>. Accessed September 2, 2020.

Table 1. Overview of EIS/EIR Full Build Alternative and Reduced Scope Alternative Assumptions Compared to Proposed Project

Square Footage	EIS/EIR Full Build Alternative Assumptions for Assessor's Block 3739	EIS/EIR Reduced Scope Alternative Assumptions for Assessor's Block 3739	Proposed Project
Residential (number of d.u.)	1,758,375 gsf (1,465 d.u.)	878,400 gsf (732 d.u.)	839,341 gsf (681 d.u.)
Office	397,360 gsf	0 gsf	0 gsf
Retail	98,935 gsf	58,400 gsf	8,389 gsf
Total	***2,254,670 gsf***	***936,800 gsf***	***847,730 gsf***[a]

Source: Hines, 2022.

Note:

[a.] The total includes residential gsf and retail gsf, plus areas such as lobbies and other shared spaces. The total does not include the area for underground parking, major utilities, or loading on the ground floor. Accounting for all of the aforementioned areas, the Proposed Project would construct a total of approximately 955,259 gsf.

d.u. = dwelling unit; gsf = gross square feet

The DCDG added further specificity to the proposed bulk/massing on the Project Site by calling for townhouses up to 50 feet in height on the southwestern portion of the Project Site; a mid-rise building[4] up to 65 feet in height on the northwestern portion of the Project Site; a mid-rise building up to 85 feet in height on the northern portion of the Project Site; and a tower up to 450 feet in height on the eastern portion of the Project Site, with open space in the central core of the Project Site.[5]

The EIS/EIR characterized the anticipated development in the Transbay Redevelopment Project Area as transit-oriented land uses in the vicinity of the Transbay Terminal, providing a mix of residential and commercial space. The land use plan studied in the EIS/EIR identified a development program for the Block 4 site, consisting of primarily residential uses, with some office and ground-floor retail uses and services.

B. PROPOSED REVISIONS TO THE EIS/EIR PROJECT

The Transbay Redevelopment Plan divided Assessor's Block 3739 into three separate areas: Block 2 (fronting Folsom Street),[6] Block 3 (proposed to include a public park), and Block 4 (fronting Howard Street).

4 DCDG nomenclature refers to these mid-rise buildings as "podium" buildings, but for sake of clarity they are referred to herein as "mid-rise" buildings, as distinguished from the actual Podium building in the Proposed Project.

5 San Francisco Redevelopment Agency, *Development Controls and Design Guidelines for the Transbay Redevelopment Project*, January 25, 2005 (as amended), https://sfocii.org/sites/default/files/20180906_TB_DCDG_Revision.pdf, accessed June 6, 2022.

6 A Request for Proposals (RFP) was released by OCII in August 2020 for the development of mixed-use affordable family and senior rental housing units at Transbay Block 2.

The Project Site, and the focus of this EIR addendum, includes Block 4 and a new segment of Tehama Street immediately adjacent to the southeast.

The Proposed Project differs from the development described in the EIS/EIR in that a 513-foot-tall tower with slightly larger massing at heights between 85 to 122 feet (the Tower Project) is now proposed at the eastern edge of Block 4 instead of the previously analyzed 450-foot-tall tower, and permits larger maximum floor plates (up to 15,200 square feet) that portion of the tower between 85 feet and 122 feet in height. In addition, the mid-rise components of the Proposed Project would be taller than the height and have greater bulk/massing than the limits studied in the EIS/EIR. Table 2, below, compares the development on Assessor's Block 3739 analyzed in the EIS/EIR under the Full Build Alternative to the proposed development on Block 4 under the Proposed Project.

Table 2. Detailed Comparison of EIS/EIR Full Build Alternative Assumptions to Proposed Project

Features	EIS/EIR Full Build Alternative Assumptions for Assessor's Block 3739	Proposed Project
Demolition	All existing structures and parking lots on the site.	All existing structures and parking lots on the site.
Land Use Types	Residential, retail, office	Residential, retail
Total Square Footage	2,254,670 gsf[a]	847,730 gsf[b]
Residential Square Footage	1,758,375 gsf	839,341 gsf
Number of d.u.[b]	1,465 d.u.[a]	681 d.u.
Retail Square Footage	98,935 gsf[a]	8,389 gsf
Tower Height	Up to 450 feet	513 feet*
Townhouse Height	Up to 50 feet	71 feet*
Podium Height (northwest)	Up to 65 feet	163 feet*
Podium Height (north)	Up to 85 feet	115 feet*

Source: Hines, 2022.

Notes:

a. Includes Full Build Alternative for all of Assessor's Block 3739.

b. The total includes residential gsf and retail gsf, plus areas such as lobbies and other shared spaces. The total does not include the area for underground parking, major utilities, or loading on the ground floor. Accounting for all of the aforementioned areas, the Proposed Project would construct a total of approximately 955,259 gsf.

* Indicates non-conformance with the Transbay Redevelopment Plan and the EIS/EIR analysis. Refer to the lists of required amendments to the Transbay Redevelopment Plan and DCDG in Section A, Project Description.

d.u. = dwelling unit; gsf = gross square feet

As shown in Table 2, all features of the Proposed Project would conform to the Redevelopment Plan land use program studied in the EIS/EIR, with the exception of the building heights and bulk/massing. At 513 feet tall, the Proposed Project's tower would be 63 feet taller than the 450-foot height limit established in the Transbay Redevelopment Plan and analyzed in the EIS/EIR. In addition, the increased townhouse and

podium (mid-rise) heights would be 21 to 98 feet taller than the respective height limits. OCII is therefore seeking amendments to the Transbay Redevelopment Plan and DCDG together with its authorization of a DDA and approval of a Schematic Design for the Block 4 Project.

As discussed above, the Transbay Redevelopment Plan divided Assessor's Block 3739 into three separate areas: Block 2 (fronting Folsom Street), Block 3 (proposed to include a public park), and Block 4 (fronting Howard Street). The Proposed Project would not include any potential development on Block 2. The EIS/EIR assumed a maximum buildout on an assessor's block level as the basis for the impact conclusions. To understand the maximum buildout on Assessor's Block 3739 and whether the Proposed Project would fall within the development assumptions for Assessor's Block 3739 in the EIS/EIR, the Proposed Project and the potential development on Block 2 need to be considered together. Table 3, below, provides an overview of the development on Assessor's Block 3739 analyzed in the EIS/EIR under the Full Build Alternative, the proposed development on Block 4 under the Proposed Project, and the potential development on Block 2. As shown in Table 3, the total proposed development on Blocks 2 and 4 would be within the parameters analyzed in the EIS/EIR under the Full Build Alternative for residential, office, and retail square footage; total square footage; and total number of dwelling units. Therefore, this EIR addendum will focus on the proposed increases in heights and bulk/massing at Block 4 compared to the heights and bulk/massing analyzed in the EIS/EIR.

Table 3. Overview of EIS/EIR Full Build Alternative Assumptions Compared to Block 2 and Proposed Project

Square Footage	EIS/EIR Full Build Alternative Assumptions for Assessor's Block 3739	Block 2 (Potential)[a]	Block 4 (Proposed Project)	Total Proposed Development at Blocks 2 and 4
Residential (number of d.u.)	1,758,375 gsf (1,465 d.u.)	239,200 gsf (341 d.u.)	839,341 gsf (681 d.u.)	1,078,541 gsf (1,022 d.u.)
Office	397,360 gsf	0 gsf	0 gsf	0 gsf
Retail	98,935 gsf	12,800 gsf[b]	8,389 gsf	21,189 gsf
Total[c]	***2,254,670 gsf***	***252,000 gsf***	***847,730 gsf***	***1,099,730 gsf***

Sources: Hines, 2022; OCII, 2022.

Notes:

a. Development includes potential buildout at Block 2, but the project at Block 2 is not analyzed in this EIR addendum.

b. The retail square footage includes the proposed childcare uses at Block 2.

c. The total includes residential gsf and retail gsf, plus areas such as lobbies and other shared spaces. The total does not include the area for underground parking, major utilities, or loading on the ground floor. Accounting for all of the aforementioned areas, the Proposed Project would construct a total of approximately 955,259 gsf.

d.u. = dwelling unit; gsf = gross square feet

C. REQUIRED PROJECT APPROVALS

As shown in Table 2, all features of the Proposed Project would conform to the Redevelopment Plan land use program studied in the EIS/EIR, with the exception of building heights and bulk/massing. At 513 feet tall, the Proposed Project's tower would be 63 feet taller than the 450-foot height limit established in the Redevelopment Plan and analyzed in the EIS/EIR. In addition, the townhouse and podium heights would be 21 to 98 feet taller than the respective height limits. OCII is therefore seeking an amendment to the Redevelopment Plan and DCDG to increase the height limit on the Block 4 site from 450 feet to 513 feet and approval of a DDA and a Schematic Design for the Proposed Project.

The following approvals are required for the Proposed Project:

OCII Commission

- Redevelopment Plan Amendment
- Report to Board of Supervisors on Redevelopment Plan Amendment
- DCDG Amendment
- DDA
- Schematic Design

Planning Commission

- General Plan Amendment
- Zoning Map Amendment
- General Plan Consistency Findings - Report and Recommendation to Board of Supervisors

Board of Supervisors

- General Plan Amendment
- Zoning Map Amendment
- Redevelopment Plan Amendment
- Property Disposition Report/Findings

D. ANALYSIS OF POTENTIAL ENVIRONMENTAL EFFECTS

CEQA Guidelines Section 15164 provides that the lead agency shall prepare an addendum to a previously certified EIR if some changes or additions are necessary but none of the conditions requiring a subsequent or supplemental EIR have occurred. The lead agency's decision to use an addendum must be supported by substantial evidence that the conditions that would trigger preparation of a subsequent EIR, as provided in CEQA Guidelines Section 15162, are not present. The following analysis of environmental effects provides the basis for that determination.

No new or more severe significant impacts beyond those studied in the EIS/EIR would occur, as discussed in Section D, Analysis of Potential Environmental Effects, and the preliminary checklist. Thus, as discussed in Section B, Proposed Revisions to the EIS/EIR Project, the only substantive modifications

to the Proposed Project that were not previously studied in the EIS/EIR are the height change from 450 feet to 513 feet and the change to bulk/massing. Therefore, the only CEQA topics that require additional evaluation are those for which impacts could worsen because of the additional building height: wind and shadow. Wind and shadow studies for the Proposed Project are included as part of the addendum to the EIS/EIR. Moreover, as a transit-oriented infill project, neither aesthetic nor parking impacts are considered significant impacts on the environment.[7] Although not required under CEQA, aesthetics is discussed below. In addition, although the Proposed Project would not generate more trips than anticipated in the EIS/EIR, transportation is analyzed in detail below to allow a full discussion of design-specific site circulation issues. A transportation study for the Proposed Project is included as part of the addendum to the EIS/EIR. Based on the aforementioned reasons, aesthetics, transportation, wind, and shadow are discussed in the subsections below. All other features of the Proposed Project, including demolition, land use types, building square footage, retail square footage, and the number of dwelling units, would be consistent with the maximum development for Assessor's Block 3739 as analyzed in the EIS/EIR. CEQA topics that were evaluated with respect to those features would not require further analysis because no new or more severe significant impacts beyond those studied in the EIS/EIR would occur, and no new mitigation measures would be required.

Based on the analysis in the preliminary checklist, no further analysis is required for the following CEQA topics:

- Agricultural and Forest Resources
- Air Quality
- Biological Resources
- Cultural Resources
- Energy
- Geology and Soils
- Greenhouse Gas Emissions
- Hazards and Hazardous Materials
- Hydrology and Water Quality
- Land Use and Planning
- Mineral Resources
- Population and Housing
- Public Services
- Recreation
- Tribal Cultural Resources
- Utilities and Service Systems

The prior addenda to the EIS/EIR generally covered changes to the transportation infrastructure related to the Transbay Terminal/Caltrain downtown rail extension (DTX) portions of the EIS/EIR and were administered by the Transbay Joint Powers Authority (TJPA) and the Golden Gate Bridge Highway and Transportation District. In addition, an environmental review document also analyzed transportation infrastructure related to the Transbay Program Phase 2 (i.e., the Transbay Terminal/Caltrain DTX as well as other transportation improvements and development opportunities associated with the Transbay Program).[8] In November 2018, the Federal Transit Administration, in conjunction with the Federal Railroad Administration and the TJPA, published the Final Supplemental Environmental Impact Statement/ Environmental Impact Report (SEIS/SEIR) to evaluate refinements to the Caltrain DTX component of the

[7] The Proposed Project meets the definition of a mixed-use project on an infill site within a transit priority area, as specified by CEQA section 21099.

[8] The Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project is referred to as the Transbay Program in the SEIS/SEIR.

Transbay Program. On July 22, 2019, the Federal Transit Administration issued an Amended Record of Decision for the Transbay Program's Final Supplemental EIS/EIR; this document amends the 2005 Record of Decision for the Transbay Program and covers the required environmental analysis of refinements to the DTX and other transportation improvements in the vicinity of the Transit Center. The SEIS/SEIR does not contain information that would alter the determination not to require a subsequent or supplemental EIR in connection with the proposed plan amendment and the Proposed Project, pursuant to CEQA Guidelines section 15164. The project evaluated in the SEIS/SEIR includes refinements to the DTX component of the Transbay Program, some additional transportation improvements in the Transbay Redevelopment Area, and potential new development opportunities. However, the draft SEIS/SEIR project does not propose modifications at or adjacent to Block 4 or changes to the Transbay Redevelopment Plan component of the Transbay Program.

Overall land use impacts from the project analyzed in the draft SEIS/SEIR would be minimal, and none of the proposed components would conflict with any applicable land use, policy, or regulation in the Transbay Program area. The potential above-grade development opportunities analyzed under the draft SEIS/SEIR would be compatible with the development intensity and uses nearby. The proposed above-grade development would have no shadow impact on any parks under the jurisdiction of the San Francisco Recreation and Park Department (draft SEIS/SEIR, p. 3.3-20 and 3.3-21.) The draft SEIS/SEIR notes that the proposed intercity bus facility would occupy the roof level of the Transit Center and, therefore, would be adjacent to the proposed City park (now the existing Salesforce Park). However, the elevation of this facility would be only slightly higher than the elevation of the park (approximately 5 feet) and, therefore, would not cast shadow onto the park that would alter the analysis conducted for the proposed plan amendment and the Proposed Project.

As discussed in this EIR addendum, the changes in the Proposed Project would not require major revisions to the EIS/EIR. The number of dwelling units and the total square footage of the Proposed Project, including the square footage of retail uses, would not exceed the assumptions studied in the EIS/EIR Project. In addition, the Proposed Project would not cause new significant impacts not identified in the EIS/EIR. Therefore, no new mitigation measures are necessary to reduce significant impacts. No changes have occurred with respect to circumstances surrounding the Proposed Project that would cause significant environmental impacts to which the Proposed Project would contribute considerably. No new information has become available that shows that the Proposed Project would cause significant environmental impacts that were not previously discussed in the EIS/EIR, that previously examined significant effects would be substantially more severe than shown in the EIS/EIR, that mitigation measures or alternatives that were previously found infeasible are feasible, or that new mitigation measures or alternatives that are considerably different from those in the EIS/EIR would substantially reduce significant impacts.

AESTHETICS

Transbay EIS/EIR

The visual and aesthetics analysis in the EIS/EIR anticipated that the Redevelopment Plan would cause a relatively large increase in the number and size of buildings in the Transbay Redevelopment Project Area. The EIS/EIR also found that public views within and across the Transbay Redevelopment Project Area would generally be limited by new development. The EIS/EIR found that new buildings and vehicles would produce

additional glare, although it would not be expected to result in a substantial visual change. Visual simulations were prepared for the EIS/EIR, based on the 2003 *Transbay Redevelopment Project Area Design for Development Vision (*also known as the Design for Development). The EIS/EIR noted that actual development proposals would undergo individual environmental review for aesthetics in subsequent steps of the redevelopment process, if necessary. The EIS/EIR determined that, although the proposed new development would alter the existing aesthetic nature of the area, the visual features that would be introduced by the Proposed Project are commonly accepted in urban areas and would not substantially degrade the existing visual quality, obstruct publicly accessible views, or generate obtrusive light or glare. For those reasons, no significant impacts were identified, and no mitigation measures were proposed.

Proposed Project and Cumulative Conditions

The Proposed Project meets the definition of a mixed-use project on an infill site within a transit priority area, as specified by CEQA section 21099.[9] Accordingly, this EIR addendum does not contain an in-depth discussion of the topic of aesthetics, which, pursuant to section 21099, cannot be considered in determining the significance of the physical environmental effects of such projects under CEQA. Therefore, the proposed height increase could not result in significant aesthetic impacts under CEQA, and no mitigation measures are necessary.

The Proposed Project would increase the height of the Tower Project from 450 feet to 513 feet. The 513-foot height would match the height of towers constructed in the immediate vicinity of Block 4. However, the tower would be the sole tower on Block 4, providing ample separation from nearby towers. Between Block 4 and the waterfront are Rincon Park, The Embarcadero, and two to three blocks that contain high-rise buildings with podiums and towers. Directly across Howard Street, north of the Project Site, is a newly constructed tower with a roof height of 550 feet. Buildings to the north, between the Project Site and the waterfront, generally step down in height. In addition, considering the approved building heights within districts north, west, and the south of Block 4, which include approved heights between 400 and 1,000 feet, the Proposed Project's height would blend appropriately into the San Francisco skyline, as planned (Figure 5).

TRANSPORTATION

As noted above, the Proposed Project would not exceed the EIS/EIR assumptions for retail, residential, and total square footage, as well as the number of dwelling units, at the Block 4 site. Therefore, the Proposed Project would not generate more person trips or vehicle trips than previously analyzed and would not cause traffic to worsen to a greater degree than reported in the EIS/EIR, as explained further below.

Transportation impact studies prepared by the Planning Department for CEQA purposes estimate future cumulative traffic volumes, based on cumulative development and growth identified by the San Francisco County Transportation Authority's (SFCTA's) SF-CHAMP travel demand model. The SF-CHAMP model uses zoning as part of the basis for its growth calculations. SF-CHAMP data prepared after adoption of the Transbay Redevelopment Plan takes into account the revised zoning for the Transbay Redevelopment

[9] San Francisco Planning Department. September 29, 2020. *Eligibility Checklist: CEQA Section 21099 Modernization of Transportation Analysis.* Record No. 2018-015785ENV, 200 Folsom Street/200-272 Main Street. This document is available for review at the San Francisco Planning Department, 49 South Van Ness Avenue, Suite 1400, as part of Case File No. 2018-015785ENV.

Area, including the Zone One TB DTR (Transbay Downtown Residential) Use District and 50/85/450-TB Height and Bulk District established for the Block 4 site. Therefore, CEQA transportation impact studies prepared after adoption of the Transbay Redevelopment Plan include the potential growth enabled by the plan in their cumulative analyses.

A transportation circulation study was prepared for the Proposed Project,[10] as summarized below and included in Appendix A. The transportation circulation study assumed 683 dwelling units and 8,282 gsf of ground-floor retail space. Subsequent to the preparation of the transportation circulation study, the Proposed Project was revised to include 681 dwelling units and 8,389 gsf of ground-floor retail space. These minor revisions to the Proposed Project were evaluated (refer to Appendix A) and it was determined that there are no changes required to the conclusions in the transportation circulation study.[11]

The transportation study area includes all aspects of the transportation network in the vicinity of the block bounded by Howard Street to the north, a new midblock alley section of Tehama Street (and Folsom Street) to the south, Main Street to the east, and Beale Street to the west. The transportation study area consists of travel corridors and facilities such as transit routes and stations, bicycle routes and amenities, pedestrian sidewalks and crossings, and the overall vehicular roadway network that residents, employees, and visitors would use in traveling to and from the Project Site.

The following scenarios were evaluated to identify potential transportation impacts of the Proposed Project:

- **Existing Conditions.** Existing land use and transportation conditions on the block (refer to Appendix A for a summary of existing conditions).
- **Existing-plus-Project Conditions.** Existing land use and transportation conditions with the addition of the Proposed Project. This scenario includes changes to the transportation network since the analysis for the Transbay EIS/EIR was conducted and identifies if these modifications would affect the conclusions of the Transbay EIS/EIR.
- **Cumulative Conditions.** Land use and transportation conditions, considering background growth and development, reasonably foreseeable changes to the transportation network, and incremental growth and development. This scenario includes a review of currently planned cumulative development and streetscape projects and identifies if these modifications would affect the conclusions of the Transbay EIS/EIR.

Source: Redevelopment Plan for the Transbay Redevelopment Project Area, 2016.

Figure 5
Maximum Heights in Transbay Redevelopment Area (Zone One)

The assessment in the transportation circulation study, summarized below, documents the land use and transportation network changes as a result of the Proposed Project and their effects on circulation on transportation modes in the study area. The Proposed Project as well as cumulative conditions are reviewed for impacts related to vehicle miles traveled (VMT), driving hazards, pedestrians, bicyclists, public transit, emergency access, and loading. For each transportation-related topic, an assessment is conducted to determine whether the change in Block 4 would result in changes to the transportation-related findings in the Transbay EIS/EIR. The 2020 impact analysis uses the data and guidance within the Planning Department's 2019 *Transportation Impact Analysis Guidelines* (TIA Guidelines). OCII acknowledges and accepts the use of the TIA Guidelines for the analysis of the Proposed Project's transportation impacts.

Proposed Project Trip Generation

Trip generation refers to the number of estimated trips people would take to and from the Project Site, regardless of the way they travel. Table 4, below, presents the person-trip rates and estimates the number of daily and PM Peak-Hour person trips by land use. Proposed Project person trips were assigned to travel modes (automobile, taxi/transportation network company [TNC], transit, walking, bicycling), based on the mode shares presented in the TIA Guidelines for the Proposed Project's district (district 2, South of Market [SoMa]) and placetype (placetype 1, urban high density). Table 5, below, provides the estimated percentage and number of PM Peak-Hour Proposed Project trips by mode. Table 6, below, presents Proposed Project vehicle trip generation estimates by direction (inbound and outbound).

Table 4. Person-Trip Generation Rates and Estimates by Land Use for the Proposed Project

Land Use	Daily Rate	PM Peak-Hour Percentage, Daily	Daily Person Trips	PM Peak-Hour Person Trips
Residential (1,156 bedrooms)	5/bedroom	8.9%	5,202	459
Restaurant Composite (8,282 gsf)[a]	600/1,000 gsf	13.5%	4,969	670

Sources: 2019 TIA Guidelines; Kittelson, 2020.

Notes:

a. The retail tenants are not known at this time. For conservative purposes with respect to estimating the maximum adverse effect on trip generation, a "composite rate" restaurant is assumed. In addition, the retail area has been increased slightly as part of the conservative scenario.

Table 5. Person-Trip Generation Estimates by Mode and Land Use for the Proposed Project

Mode	Mode Share		Weekday PM Peak-Hour Person Trips		
	Residential	Restaurant Composite	Residential	Restaurant Composite	Total
Auto	25%	11%	115	76	**191**
Taxi/Transportation Network Company	6%	5%	28	31	**59**
Transit	28%	25%	129	170	**299**
Walking	38%	55%	174	368	**542**
Bicycling	3%	4%	13	25	**38**
Total	100%	100%	459	670	1,129
Sources: 2019 TIA Guidelines; Kittelson, 2020.					

Table 6. Proposed Project Vehicle Trip Generation Estimates by Land Use

Land Use	Weekday PM Peak-Hour Vehicle Trips		
	Inbound	Outbound	Total
Residential	60	17	77
Restaurant Composite	14	34	48
Total Private Vehicle Trips	**74**	**51**	**125**
Taxi/TNC	35	35	70
Total Private Vehicle and Taxi/Transportation Network Company Trips	109	86	195
Sources: 2019 TIA Guidelines; Kittelson, 2020.			

As shown in Table 4 and Table 5, the Proposed Project would generate a total of 1,129 person trips (459 generated by the residential component and 670 generated by the restaurant component) during the weekday PM Peak Hour. Of these 1,129 total person trips, 542 would be people walking to and from the site, 299 would be people taking transit, 191 would be automobile person trips, 59 would be taxi/TNC trips, and 38 trips would be made by bicycle. As shown in Table 6, the 191 automobile person trips would result in a total of 125 vehicle trips (77 generated by the residential component and 48 generated by the restaurant component) during the weekday PM Peak Hour. Of these 125 vehicle trips, 74 would be traveling inbound to the Project Site, and 51 would be departing the Project Site. The 59 taxi/TNC person trips would result in a total of 70 taxi/TNC vehicle trips, 35 inbound and 35 outbound. The taxi/TNC vehicle trip generation accounts for trips to and from the Project Site.

Vehicle Miles Traveled

Transbay EIS/EIR

The Transbay EIS/EIR evaluated four traffic scenarios: 1) existing conditions, 2) year 2020 with no project, 3) year 2020 plus project (the Transbay Terminal and Transbay Redevelopment Plan), and 4) a

2020 cumulative scenario that included concurrent and reasonably foreseeable projects. The EIS/EIR analysis showed that background traffic volumes would grow over time and traffic delays would lengthen at nearly all 27 intersections studied, even without implementation of the Transbay Redevelopment Plan. The EIS/EIR identified significant traffic impacts at seven intersections under the 2020 plus-project and the 2020 cumulative scenarios.

The EIS/EIR stated that improvements at individual intersections and implementation of an integrated transportation management system could somewhat reduce localized congestion but may not fully mitigate the impact of increased traffic congestion resulting from the Transbay Terminal and Transbay Redevelopment Plan to a less-than-significant level. The EIS/EIR therefore concluded that the significant traffic impacts would be unavoidable. No mitigation measures applicable to individual development projects were identified.

Existing-plus-Project Conditions

Since preparation of the Transbay EIS/EIR, the Office of Planning and Research and the Natural Resources Agency issued new CEQA Guidelines for analyzing transportation impacts. By July 1, 2020, all CEQA lead agencies must analyze a project's transportation impacts using VMT rather than congestion levels at intersections. On March 3, 2016, the San Francisco Planning Commission adopted the Office of Planning and Research's recommendation to use the "vehicle miles traveled" (VMT) metric instead of automobile delay to evaluate the transportation impacts of projects (Resolution 19579). On October 15, 2019, the OCII Commission adopted, by Resolution No. 25-2019, criteria for determining the significance of transportation impacts based on VMT.[12] A VMT-based approach was used to prepare the transportation analysis for this EIR addendum, which is consistent with Section 21099 of the Public Resources Code, Section 15064.3 of the CEQA Guidelines, the Governor's Office of Planning and Research publication *Technical Advisory on Evaluating Transportation Impacts Under CEQA* (December 2018), and the Planning Department's publication *Transportation Impact Analysis Guidelines* (February 2019).

Consistent with CEQA Guidelines at the time, the Transbay EIS/EIR included an evaluation of automobile delay (vehicle level of service [LOS]), as summarized above; it did not include an evaluation of VMT. As a result, VMT is not specifically addressed in the Transbay EIS/EIR, and no relevant mitigation measures were identified. For the purposes of CEQA, the Proposed Project would not result in significant impacts related to automobile delay (vehicle LOS). No mitigation measures are necessary, and automobile delay is not discussed further in this document (for additional information, refer to Appendix A).

VMT per person (or per capita) is a measurement of the amount and distance that a resident, employee, or visitor drives; it also accounts for the number of passengers within a vehicle. Many interdependent factors affect the amount and distance a person might drive. In particular, the built environment affects how many places a person can access within a given distance or time, and at a given cost, using different ways to travel (e.g., private vehicle, public transit, bicycling, walking, etc.). Typically, low-density development located at great distances from other land uses, and in areas with few options for ways to travel, provides less access than a location with high density, a mix of land uses, and numerous ways

[12] Commission on Community Investment and Infrastructure, Resolution No. 25-2019, October 15, 2019.

to travel. Therefore, low-density development typically generates higher VMT rates than a similarly sized development in an urban area.

Given these behavior travel factors, on average, persons living or working in San Francisco have lower VMT rates than persons living or working elsewhere in the nine-county San Francisco Bay Area region. On a more granular level, persons living or working in some areas of San Francisco have, on average, lower VMT rates per person than persons living or working elsewhere in San Francisco. The City establishes different VMT rates per capita geographically through transportation analysis zones (TAZs).

The SFCTA uses SF-CHAMP to estimate VMT by private automobiles and taxis for different TAZs. The model estimates daily VMT for residential, office, and retail land use types. For residential and office uses, the SFCTA uses tour-based analysis. A tour-based analysis examines the entire chain of trips over the course of a day, not just trips to and from a site. For retail uses, the SFCTA uses trip-based analysis. A trip-based analysis counts VMT from individual trips to and from a site (as opposed to an entire chain of trips). A trip-based approach, as opposed to a tour-based approach, is necessary for retail sites because a tour is likely to consist of trips that stop at multiple locations; therefore, summarizing tour VMT to each location would over-estimate VMT.[13,14,15]

The Project Site is in TAZ 764. Existing average daily VMT per capita in TAZ 764 is below regional average daily VMT per capita, as follows:

- For residential uses, the existing average household daily VMT per capita is 3.2, which is about 81 percent below the existing regional average household daily VMT per capita of 17.2.
- For the retail uses, the average daily VMT per retail employee is 9.2, which is about 32 percent below the existing regional average daily retail VMT per employee of 14.8.

Given the Project Site is in an area where existing VMT is more than 15 percent below the existing regional average, the Proposed Project's residential and retail uses would not cause substantial additional VMT. Furthermore, because of its location within 0.5 mile of an existing major transit stop, the Project Site meets the "proximity to transit stations" screening criterion, which also indicates that the Proposed Project's uses would not cause substantial additional VMT. The Proposed Project would not include features that would substantially induce automobile travel (e.g., additional roadway capacity). For these reasons, VMT-related impacts for the Proposed Project would be less than significant.

---

[13] To state another way, a tour-based assessment of VMT at a retail site would consider VMT for all trips in the tour for any tour with a stop at the retail site. If a single tour stops at two retail locations, for example, a coffee shop on the way to work and a restaurant on the way back home, then both retail locations would be allotted the total tour VMT. A trip-based approach allows us to apportion all retail-related VMT to retail sites without double counting.

[14] Retail travel is not explicitly captured in the San Francisco chained activity modeling process; rather, there is a generic "other" purpose, which includes retail shopping, medical appointments, visiting friends or family, and all other non-work, non-school tours. The retail efficiency metric captures all of the "other" travel generated by Bay Area households. The denominator of employment, including retail; cultural, institutional, and educational; medical employment; school enrollment; and number of households, represents the size, or attraction, of the zone for this type of "other" travel.

[15] San Francisco Planning Department, *Executive Summary: Resolution Modifying Transportation Impact Analysis,* Appendix F, Attachment A, March 3, 2016.

Cumulative Conditions

Cumulative average daily VMT per capita in TAZ 764 is below regional average daily VMT per capita, as follows:

- For the residential uses, the cumulative average household daily VMT per capita is 2.4, which is about 85 percent below the cumulative regional average household daily VMT per capita of 16.1.
- For the retail uses, the cumulative average daily VMT per retail employee is 8.3, which is about 42 percent below the cumulative regional average daily retail VMT per employee of 14.5.[16]

As with the existing-plus-project analysis, the Project Site meets the "proximity to transit stations" screening criterion and is in an area where cumulative VMT would be more than 15 percent below the cumulative regional average. The Proposed Project's residential and retail uses would not cause substantial additional VMT. Therefore, no significant cumulative VMT impacts would occur.

Driving Hazards

Transbay EIS/EIR

This section provides a qualitative assessment of the effect of the Proposed Project on conditions for people driving. It considers whether the Proposed Project could create potentially hazardous conditions for people driving or result in new or substantially more severe transportation impacts than those identified in the Transbay EIS/EIR. However, driving hazards were not specifically addressed in the Transbay EIS/EIR. Therefore, no relevant mitigation measures were identified in the Transbay EIS/EIR.

Existing-plus-Project Conditions

The Proposed Project would consist of parking for up to 275 vehicles (including two car share vehicles) within 224 physical stalls and additional space provided by car stackers, , all serviced exclusively by valet staff, which would be accessible via a 24-foot-wide curb cut and a two-way driveway along Main Street. The garage driveway would provide entry and exit lanes on the left-hand side; the directionality would be reversed from a typical orientation so that inbound and outbound left turns would not overlap. The reversed directionality would reduce the potential for conflicts while entering or exiting the driveway. During the PM Peak Hour, demand from the Proposed Project would generate 74 inbound and 51 outbound vehicle trips. Outbound vehicle trips would be naturally metered by the rate at which valet operations occur. The proposed staging area would accommodate inbound valet trips onsite rather than in the public right-of-way or along the driveway. Inbound drivers would make the left turn from the leftmost travel lane. Outbound drivers would have a generally unobstructed view of northbound traffic as they turn left onto Main Street.

The Project Site would also include a 24-foot-wide curb cut along its Beale Street frontage to provide freight access to the proposed off-street loading dock, which would include two 10-foot-wide loading bays. The Proposed Project would generate a demand for four freight and delivery service-vehicle loading spaces

[16] Retail travel is not explicitly captured in the San Francisco chained activity modeling process; rather, there is a generic "other" purpose, which includes retail shopping, medical appointments, visiting friends or family, and all other non-work, non-school tours. The retail efficiency metric captures all of the "other" travel generated by Bay Area households. The denominator of employment, including retail; cultural, institutional, and educational; medical employment; school enrollment; and number of households, represents the size, or attraction, of the zone for this type of "other" travel.

during the peak hour and two spaces during the average hour. The proposed supply of on- and off-street freight loading spaces would meet expected peak-hour demand. To access the loading dock, trucks would need to reverse into the loading dock, which may temporarily block one or both vehicle travel lanes on Beale Street while they maneuver. Freight and delivery service vehicles would be traveling at speeds of less than 5 miles per hour (mph) as they maneuver into/out of the loading dock. Given the signalized intersection spacing and the observed vehicle speed and progression along the corridor, people driving would also be traveling at relatively slow speeds. They would have clear sight lines and be able to see and react to downstream truck activity. For these reasons, the curb cut would constitute a temporary obstruction for through traffic but would not cause potentially hazardous conditions for people driving.

The proposed extension of Tehama Street to allow one-way (westbound) travel between Main and Beale streets would provide improved multi-modal and vehicle circulation in the study area. Raised crosswalks along Tehama Street at Main and Beale streets would reduce the speed of vehicles while entering and exiting Tehama Street and minimize the potential for conflicts.

Given the traffic volume and site design, the Proposed Project would not result in vehicle queuing or circulation issues that would create potentially hazardous conditions for people driving. Furthermore, the Proposed Project would decrease residential, retail, and office space, compared to the EIS/EIR Full Build Alternative assumptions for the Project Site, resulting in a net reduction in the number of vehicle trips as well as anticipated commercial loading activity. As such, the potential for hazardous conditions for people driving would be less than that analyzed in the Transbay EIS/EIR. Impacts of the Proposed Project would be less than significant, and no mitigation measures are required.

Implementation of Improvement Measure I-TR-1 and Improvement Measure I-TR-2 is recommended to further reduce these less-than-significant impacts.[17]

Improvement Measure I-TR-1: Driveway and Loading Operations Plan (DLOP). The property owner shall implement the following measures to reduce potential conflicts related to driveway operations, including loading activities and people walking, biking, and driving:

- *Trash/Recycling/Compost Collection Design and Management.* The property owner shall provide convenient off-street trash, recycling, and compost storage room(s) for the Proposed Project and a procedure for collection. The transportation coordinator or building manager shall implement these procedures.
- *Color Curb Application.* The property owner shall submit documentation to the Environmental Review Officer to confirm that he or she applied to the SFMTA for on-street color curb zones.
- *Attendant.* The transportation coordinator shall ensure that building management employs a loading dock attendant(s) for the Proposed Project's off-street loading dock. The loading dock attendant shall be stationed at the loading dock driveway to direct vehicles while entering and exiting the loading dock, avoid any safety-related conflicts with public right-of-way users, and ensure proper allocation of freight and delivery service vehicles to available spaces. The loading dock shall be attended during business operating hours, which are anticipated to be 8 a.m. to 10 p.m. every day.

[17] The analysis herein assumes implementation of these improvement measures as conditions of Proposed Project approval, and the Project Sponsor has agreed to them.

- *Driveway Operational Safety.* The transportation coordinator shall provide notifications and information to users of the Project Site regarding driveway operational safety, including the maximum vehicle size and height for the loading dock. The loading dock would be limited to use by vehicles shorter than 30 feet; vehicles longer than 30 feet would be directed to on-street loading zones.
- *Signage/Warning Devices.* The property owner shall install "FULL" signage near the off-street loading dock entrance. The transportation coordinator shall indicate "FULL" if the off-street facility is fully occupied or if the coordinator anticipates it will be occupied by a forthcoming delivery (i.e., in the next 10 minutes). The property owner shall also install signage at the off-street facility to alert drivers to people walking or bicycling who may be behind a vehicle or in a driver's blind spot during access or egress. The property owner shall also install audible warning devices at locations where the off-street facility interfaces with the public right-of-way to alert other public right-of-way users of vehicles entering or exiting the off-street facility.
- *Large Truck Access.* The property owner shall identify convenient on-street loading spaces (i.e., within 250 feet of the site) that could accommodate large trucks (i.e., trucks longer than 30 feet), which the off-street loading facility cannot accommodate. The property owner shall also identify procedures for reserving these spaces from the SFMTA as well as procedures for guiding large trucks to the spaces. The transportation coordinator shall implement these procedures.

The property owner shall prepare a DLOP that documents the Proposed Project's compliance with the measures described above. The details of the DLOP shall be developed in coordination with the Planning Department and the SFMTA and reviewed and approved by the Environmental Review Officer, or designee, of the Planning Department and the Sustainable Streets Director, or designee, of the SFMTA. The final DLOP shall be included as a condition of approval for the Proposed Project. The transportation coordinator shall provide oversight and be responsible for implementation of the DLOP for the Proposed Project. The plan shall be evaluated by a qualified transportation professional, as retained by the Project Sponsor, upon building occupancy and once a year going forward until such time when the SFMTA determines that the evaluation is no longer necessary or could be done at less frequent intervals. The content of the evaluation report shall be determined by SFMTA, in consultation with the Planning Department, and include an assessment of on-street loading conditions, including actual loading demand; observations regarding loading operations; and an assessment of how the Proposed Project meets the requirements. If ongoing conflicts are occurring, based on the assessment, the evaluation report shall put forth additional measures to address conflicts associated with loading operations. The evaluation report shall be reviewed by SFMTA, which shall make the final determination regarding whether ongoing conflicts are occurring. In the event that ongoing conflicts are occurring, the above requirements may be altered (e.g., the hours and days when the loading dock attendant is stationed onsite).

Improvement Measure I-TR-2: Queue Abatement. The property owner, or designee, shall prevent vehicle queues by using proactive abatement methods. A vehicle queue is defined as one or more vehicles waiting to access the Proposed Project's off-street facility and blocking any portion of any public right-of-way for a combined two minutes during the peak consecutive 60 minutes for the adjacent public right-of-way or a combined 15 minutes between the hours of 6 a.m. and 10 p.m. for at least three 24-hour periods in any consecutive seven-day period. The proactive abatement methods shall depend on the characteristics of the Proposed Project's off-street facility, the characteristics of the

street to which the off-street facility connects, and the associated land uses. The proactive abatement methods may include, but are not limited to, installation of "FULL" signs, with active management by parking attendants; use of additional valet parking attendants or other space-efficient parking techniques; and implementation of transportation demand management strategies.

If the planning director, or designee, suspects that a recurring queue is present, the Planning Department shall notify the property owner in writing. Upon request, the owner/operator shall hire a qualified transportation consultant to evaluate conditions at the site for no less than seven days. The consultant shall prepare a monitoring report, which shall be submitted to the Planning Department for review. If the Planning Department determines that a recurring queue does exist, the facility owner/operator shall have 90 days from the date of the written determination to the queue.

Implementation of Improvement Measure I-TR-1 would reduce a less-than-significant impact through active management of the loading dock by an attendant; this would increase driver awareness of other public right-of-way users and reduce the potential for delivery vehicles to double park and obstruct vehicle travel lanes, thereby minimizing potentially hazardous conditions for people driving. Implementation of Improvement Measure I-TR-2 would ensure that vehicle queues related to the Proposed Project would not propagate along the public right-of-way.

Cumulative Conditions

Under cumulative conditions, traffic associated with people walking, bicycling, or driving on the surrounding street network would increase as a result of the Proposed Project, other development projects within the study area, and background growth elsewhere in the city and region. This would generally be expected to lead to an increase in the potential for conflicts between people driving and people walking, bicycling, and public transit operations. However, a general increase in traffic in and of itself would not be considered a potentially hazardous condition.

Under cumulative conditions, with implementation of the Active Beale Street Project, the on-street bicycle lane (class II) along Beale Street would be replaced with a two-way separated bicycle lane (class IV) on the east side of the street; a protected intersection corner would be constructed on the southeast corner of the Howard Street/Beale Street intersection. This shift in bicycle lane location, as well as construction of a concrete island, would increase the offset of the left-turn vehicle movement from Howard Street to Beale Street, potentially slowing turning vehicles and increasing protection for bicyclists at this location. The effects of the Active Beale Street Project and the South Downtown Design + Activation (Soda) plan will be subject to separate study and environmental review.

The Proposed Project would make Tehama Street a new midblock alley between Beale and Main streets; it would also construct a loading dock driveway on Beale Street between Howard Street and Tehama Street. Vehicles accessing the loading dock and vehicles exiting Tehama Street onto Beale Street would turn across the bicycle lane. These vehicle turning movements are not expected to create potentially hazardous conditions for drivers because drivers would generally have unobstructed sight lines and/or adequate sight distance to see approaching vehicles. The presence of the raised crosswalk across Tehama Street would slow vehicles on the intersection approach. Implementation of Improvement Measure I-TR-1 would reduce potential conflicts between freight and delivery service vehicles and people driving by requiring a visual warning device that would alert other right-of-way users when the loading dock is in use, employing a loading dock attendant to manage traffic flow, and requiring vehicles exceeding 30 feet in length to load in on-street zones on Howard Street, Main Street, or Tehama Street rather than in the loading dock.

For these reasons, the Proposed Project in combination with cumulative projects would not create potentially hazardous conditions for people driving. Therefore, there would be a less-than-significant cumulative impact related to driving hazards.

Pedestrians

Transbay EIS/EIR

An assessment of pedestrian conditions in the area surrounding the Transbay Terminal was included in the Transbay EIS/EIR. The evaluation considered pedestrian LOS at five intersections (crosswalks and corners); sidewalk widths, with qualitative analysis of on-sidewalk conditions throughout the study area; and the origin/destination of pedestrian traffic. The evaluation accounted for an increase in pedestrians due to the new Transbay Terminal and Caltrain extension as well as the Transbay Redevelopment Plan. Changes in pedestrian volumes were developed by using output from SF-CHAMP and rerouting pedestrians to and from the Transbay Terminal facility.

The Transbay EIS/EIR found 11 corners and two crosswalks that would operate at LOS F for pedestrians, including all four corners and the north crosswalk at Howard Street and Fremont Street. The crosswalks and corners at the study intersections closest to the Project Site (i.e., Mission Street/Fremont Street and Folsom Street/Beale Street) were found to operate better than LOS F. The Transbay EIS/EIR noted that the EIS/EIR Project itself did not cause the LOS F conditions, concluding that the 9,000 additional walking trips generated by the Transbay Terminal and Transbay Redevelopment Plan by 2020 would not be a considerable contribution to the overall increase in the number of pedestrian trips and determining that the Transbay Redevelopment Plan would not have a significant pedestrian impact. No mitigation measures to address pedestrian impacts were identified.

The Transbay EIS/EIR suggested improvement measures that included wide sidewalks, building setbacks in future construction, enhanced crosswalks with countdown signals, warning lights, and signalized crossings.

Existing-plus-Project Conditions

Access for people walking would be provided on all four of the Proposed Project's street frontages, with an apartment and condominium entry on Howard Street and Main Street, respectively; lobby access for the Mid-Rise Project and the townhouses on Tehama Street; and two retail entrances on Beale Street. The Proposed Project would revise the conditions identified in the DCDG to remove setback requirements along Beale, Howard, Main, and Tehama streets.[18,19] The Proposed Project would include streetscape improvements, such as widened sidewalks, landscaping and street trees, commercial and passenger loading areas, and bicycle facilities, consistent with the Design for Development. The Proposed Project would also provide an internal courtyard on the building's second level that would occupy the inner portion of the Project Site. The courtyard would be accessible from stairs on Howard Street and Tehama Street.

---

[18] The DCDG define a *setback* as the open space provided between the property line and the primary built structure, creating an expanded area along the sidewalk and providing a transition between the street and private use on the property. Setbacks may be required to be dedicated for public use or remain as a private space between the public right-of-way and the building mass.

[19] The DCDG (p. 16) identified a setback requirement of 6 to 8 feet along Tehama Street and a setback of 8 to 10 feet along Beale, Main, and Howard streets.

In accessing the Project Site, people walking would cross curb cuts at the proposed garage entry on Main Street and at the loading dock along Beale Street. The sidewalk design would allow exiting vehicles to cross the path of people walking without obstructing their path of travel while waiting to turn onto Main Street. Conversely, inbound vehicles would be able to turn from Main Street into the driveway, with adequate separation between the traveled way and walking paths along the sidewalk. Valet operations would include an adequate short-term staging area to prevent queue spillback into pedestrian travel paths. People driving would generally have unobstructed sight lines and/or adequate sight distance and would not create potentially hazardous conditions related to vehicle entry or exit. Implementation of Improvement Measure I-TR-2 would reduce the potential for conflicts between vehicles accessing the proposed garage and people walking by ensuring that queues would not spill back onto the public right-of-way.

Trucks would access the site using Fremont Street and Howard Street, the nearest truck routes. Trucks accessing the loading docks would cross the proposed 30-foot-wide sidewalk along Beale Street. Some minor conflicts may arise between people walking and trucks backing into the loading docks, most likely in the form of a short delay until the 30-foot-wide sidewalk is unobstructed. Implementation of Improvement Measure I-TR-1 would reduce the potential for conflicts between freight and delivery service vehicles and people walking.

The proposed sidewalk widening and widths along the Project Site frontages would allow an adequate public right-of-way that would accommodate furnishing, throughway, and frontage zones with the removal of building setback requirements on the adjacent streets. The construction of raised crosswalks along Tehama Street at Beale Street and Main Street would help manage vehicle speeds along Tehama Street and reduce speeds as vehicles enter and exit Tehama Street, thereby minimizing the potential for conflicts between vehicles and people walking.

The Proposed Project would generate 841 walking trips (including 299 walking trips to transit) during the PM Peak Hour. Although travel demand analysis does not include assigning walking trips to specific routes, a substantial proportion of these walking trips could be expected to be at the north crosswalk or any of the four corners at the Howard Street and Fremont Street intersection, an area where the Transbay EIS/EIR identified pedestrian LOS impacts. However, a net reduction in the anticipated number of daily and weekday PM Peak-Hour walking trips is expected with the currently proposed land use program on Block 4 relative to the analysis in the Transbay EIS/EIR. Furthermore, the current 2019 TIA Guidelines no longer consider pedestrian crowding to be an impact.

The Proposed Project would not create any potentially hazardous conditions for people walking or interfere with accessibility of people walking to and from the Project Site and adjoining areas. Furthermore, the Proposed Project would decrease the proposed residential, retail, and office space, compared to the EIS/EIR Full Build Alternative assumptions for the Project Site, resulting in a net reduction in Proposed Project–generated trips. As such, the Proposed Project would not result in any new or more severe significant impacts on walking/accessibility compared with those identified in the Transbay EIS/EIR, and no mitigation measures are necessary.

Cumulative Conditions

Under cumulative conditions, traffic from people walking, bicycling, and driving on the surrounding street network would increase as a result of the Proposed Project, other development projects within the study area, and background growth elsewhere in the city and region. However, a general increase in traffic in and of itself would not be considered a potentially hazardous condition. Under cumulative conditions, land use

development within the Transbay Redevelopment Area would conform to the requirements of the Design for Development document, which was created to incorporate public improvements, including sidewalk widening, pedestrian-oriented alleyways, and public plazas, and account for the increased demand for pedestrian and bicycle facilities with the new Transbay Terminal and the new development throughout the Transbay Redevelopment Area.

Although not required, implementation of Improvement Measure I-TR-1 would reduce potential conflicts between freight and delivery service vehicles and people walking. Implementation of Improvement Measure I-TR-2 would reduce the potential for conflicts between vehicles accessing the proposed garage and people walking on Main Street. For these reasons, the Proposed Project in combination with cumulative projects would not create potentially hazardous conditions for people walking. Therefore, there would be a less-than-significant cumulative impact related to walking/accessibility.

Bicycles

Transbay EIS/EIR

A qualitative evaluation of bicycle conditions, particularly, the anticipated increase in bicycle activity with the EIS/EIR Project, was conducted as part of the Transbay EIS/EIR. Increases in bicycle volumes were developed using output from SF-CHAMP. This included additional riders from the Transbay Terminal, Caltrain extension, and the Transbay Redevelopment Plan. The Transbay EIS/EIR estimated that the Transbay Terminal and Transbay Redevelopment Plan could add up to 425 bicycle trips at the five intersections studied during the peak 15-minute window, compared to a total of 45 people bicycling in 2001. The Transbay EIS/EIR noted that there is no standard for determining bicycle LOS and concluded that the increase in bicycle volumes could be accommodated on area streets. No bicycling mitigation measures were identified.

Existing-plus-Project Conditions

The Proposed Project would add an on-street bicycle lane (class II) along the west side of Beale Street as well as the east side of Main Street, which would connect to a bicycle lane (class II) along Folsom Street. The Proposed Project would also provide a separated bicycle lane (class IV) along Howard Street that would connect the bicycle lanes along Beale Street and Main Street. The bicycle infrastructure proposed as part of the Proposed Project would provide dedicated space for bicyclists within the study area, which would reduce the potential for conflicts.

The Project Site would be near several roads that are on the City's Vision Zero High-Injury Network, including Fremont Street, one block southwest of the Project Site, and Folsom Street, west of Beale Street. Folsom Street is a bicycle route that connects inbound bicycle traffic from other parts of the city to the Project Site with continuous bicycle lanes (class II) east of Essex Street through to The Embarcadero. The Proposed Project's provision of connecting bicycle facilities on Beale and Main streets would reduce the potential conflicts for people bicycling to and from this portion of the high-injury network. People bicycling to the Project Site would be unlikely to use Fremont Street for access; they would most likely favor Main Street and Beale Street, which front the Project Site.

Vehicle and truck (i.e., commercial loading) traffic traveling to and from the Project Site would access the driveway and loading dock on Main Street and Beale Street, respectively. Both of these Proposed Project driveways would be on the left side of the street; bicycle facilities would be provided on the right side of each street, thereby limiting conflicts between the two modes at the vehicle access points. Implementation of Improvement Measure I-TR-1 would reduce the potential for conflicts between freight

and delivery service vehicles and people bicycling by requiring a visual warning device that would alert people bicycling when the loading dock is in use, employing a loading dock attendant to manage traffic flow, and requiring vehicles exceeding 30 feet in length to load in on-street zones on Howard, Main, or Tehama streets rather than in the loading dock.

Onsite class I bicycle parking would be provided in the Proposed Project's garage, which would require people bicycling to make a left turn from the proposed right-side bicycle lane (class II) on Main Street and cross two northbound vehicle lanes or dismount at Folsom Street or Howard Street and access the driveway from the sidewalk. All such maneuvers would be made from dedicated bicycle infrastructure. Within the Proposed Project driveway, people bicycling would share the ramp with motor vehicles and navigate the valet staging area. The vehicle speeds on the ramp and within the valet operations area would not pose potentially hazardous conditions. Because class II bicycle parking would be provided along the public right-of-way near each building entrance, people bicycling would access that parking by dismounting and walking on the sidewalk to the appropriate location. Implementation of Improvement Measure I-TR-2 would reduce the potential for conflicts between vehicles accessing the Proposed Project garage and people bicycling by ensuring that queues would not spill back onto the public right-of-way.

The Proposed Project's bicycle parking supply (556 class I spaces) was compared to the Design for Development requirements. That document requires the following:

- A minimum of 12 secure (i.e., class I) bicycle parking spaces in any garage, regardless of development intensity. This would result in 12 required class I spaces for the Proposed Project.
- One additional class I bicycle parking space for every four residential units. This would result in an additional 171 class I spaces for the Proposed Project.
- For non-residential uses, one additional bicycle parking space for every 10 off-street automobile parking spaces provided. None of the proposed vehicle parking would be provided for retail use; therefore, no additional class I bicycle parking would be required.

The total class I bicycle parking requirement for the Proposed Project would be 183 spaces based on the Design for Development document. The Proposed Project would exceed the class I bicycle parking requirement and provide three times the number of spaces required.

The Proposed Project would conform to the commercial and residential density envisioned in the Transbay Redevelopment Plan and would not create potentially hazardous conditions for people bicycling. Furthermore, the Proposed Project would decrease the proposed residential, retail, and office space, compared to the EIS/EIR Full Build Alternative assumptions for the Project Site, resulting in a net reduction in Proposed Project–generated. As such, the Proposed Project would not result in new or more severe impacts related to people bicycling than those identified in the Transbay EIS/EIR, and no mitigation measures are necessary.

Cumulative Conditions

Under cumulative conditions, traffic from people walking, bicycling, and driving on the surrounding street network would increase as a result of the Proposed Project, other development projects within the study area, and background growth elsewhere in the city and region. However, a general increase in traffic in and of itself would not be considered a potentially hazardous condition.

Under cumulative conditions, land use development within the Transbay Redevelopment Area would conform to the requirements of the Design for Development document, which was created to incorporate public improvements, including sidewalk widening, pedestrian-oriented alleyways, and public plazas, and account for the increased demand for pedestrian and bicycle facilities with the new Transbay Terminal and the new development throughout the Transbay Redevelopment Area.

With implementation of the Active Beale Street Project, the on-street bicycle lane (class II) along Beale Street would be replaced with a two-way separated bicycle lane (class IV) on the east side of the street, and a protected corner would be constructed at the southeast corner of the Howard Street/Beale Street intersection. As currently planned, the introduction of a separated two-way facility on Beale Street would improve bicycle circulation by providing more separation between people biking and people driving, a more direct north/south connection, and more options for travel between east/west bicycle facilities on Howard and Folsom streets. Although the effects of the Active Beale Street Project and the Soda plan will be subject to separate study and environmental review, it is anticipated that people biking through the Howard Street/Beale Street intersection would be provided more separation from motor vehicles compared with the existing-plus-project condition as a result of inclusion of a more substantial corner safety island.

The east side bicycle lane would introduce the potential for conflicts between people bicycling and trucks accessing the Proposed Project's loading dock. Truck drivers accessing the loading dock would be required to cross over a future two-way bicycle track, with people bicycling in both directions along the east side of Beale Street between Howard and Folsom streets, that would connect to a proposed bicycle lane on Howard Street. While trucks are reversing into the loading dock, drivers' ability to see people bicycling along Beale Street may be limited. Implementation of Improvement Measure I-TR-1 would reduce the potential for conflicts between freight and delivery service vehicles and people bicycling by requiring a visual warning device that would alert other right-of-way users when the loading dock is in use, employing a loading dock attendant to manage traffic flow, and requiring vehicles exceeding 30 feet in length to load in on-street zones on Howard, Main, or Tehama streets rather than in the loading dock.

The combination of the visual warning device provided at the loading dock to alert drivers and people bicycling and the low truck speeds needed to complete the turning maneuvers into and out of the loading dock would minimize potential hazards for people bicycling. In addition, coordination with the SFMTA, as part of the Proposed Project review process and as part of the Active Beale Street Project, would further reduce the potential for conflicts and minimize hazards for people bicycling. Implementation of Improvement Measure I-TR-2 would reduce the potential for conflicts between vehicles accessing the garage and people bicycling on Main Street by ensuring that queues would not spill back onto the public right-of-way.

For these reasons, the Proposed Project in combination with cumulative projects would not create potentially hazardous conditions for people bicycling. Therefore, there would be a less-than-significant cumulative impact related to bicycling.

Public Transit

Transbay EIS/EIR

For transit, the Transbay EIS/EIR focused on changes in operations for the bus lines that would serve the new Transbay Terminal, the capacity of the terminal facility, and changes in ridership with the extension

of Caltrain. With respect to the Transbay Redevelopment Plan component of the EIS/EIR Project, no quantitative analysis was conducted. In general, it was decided that new development as part of the Transbay Redevelopment Plan would result in increased transit usage, which would help defray the cost of the new transit facilities. The Transbay EIS/EIR estimated that Assessor's Block 3739 (Transbay Blocks 2, 3, and 4) would cause linked transit trips to increase by about 10,000 per day throughout the region. Because the projects at Assessor's Block 3739 would enhance transit connectivity, the Transbay EIS/EIR found no significant transit impacts, and no mitigation measures were identified.

Existing-plus-Project Conditions

The Proposed Project does not include any transit network features, such as modifications to transit service, operations, or amenities. There are no design features that would cause substantial delay for local or regional transit lines operating along streets fronting the Project Site.

Implementation of Improvement Measure I-TR-1 would reduce the potential for conflicts between freight and delivery service vehicles and transit by requiring a visual warning device that would alert transit vehicle drivers when the loading dock is in use, employing a loading dock attendant to manage traffic flow, and requiring vehicles exceeding 30 feet in length to load in on-street zones on Howard, Main or Tehama streets rather than in the loading dock. Implementation of Improvement Measure I-TR-2 would reduce the potential for conflicts between vehicles accessing the garage and transit vehicles on Main Street by ensuring that queues would not spill back onto the public right-of-way. Furthermore, the Proposed Project would decrease the residential, retail, and office space, compared to the EIS/EIR Full Build Alternative assumptions for the Project Site, resulting in a net reduction in Proposed Project–generated trips. As such, the Proposed Project would not result in new or more severe impacts related to transit than those identified in the Transbay EIS/EIR, and no mitigation measures are necessary.

Cumulative Conditions

Under cumulative conditions, there would be a general increase in the number of people riding transit as a result of the Proposed Project, other development projects within the study area, and background growth elsewhere in the city and region. Consistent with the Transbay EIS/EIR assessment, increases in transit ridership are a benefit rather than a potential impact, and the land use and transportation changes assumed to occur as part of cumulative conditions would not create potentially hazardous conditions for transit operations. Furthermore, implementation of Improvement Measure I-TR-1 would reduce the potential for conflicts between freight and delivery service vehicles and transit by requiring a visual warning device that would alert transit vehicle drivers when the loading dock is in use, employing a loading dock attendant to manage traffic flow, and requiring vehicles exceeding 30 feet in length to load in on-street zones on Howard, Main, or Tehama streets rather than in the loading dock. Implementation of Improvement Measure I-TR-2 would reduce the potential for conflicts between vehicles accessing the garage and transit vehicles on Main Street by ensuring that queues would not spill back onto the public right-of-way. In addition, the Proposed Project would decrease the residential, retail, and office space, compared to the EIS/EIR Full Build Alternative assumptions for the Project Site, resulting in a net reduction in Proposed Project–generated trips. As such, the Proposed Project in combination with cumulative projects would result in a less-than-significant cumulative impact related to public transit.

Emergency Access

Transbay EIS/EIR

The Transbay EIS/EIR did not find any significant impacts related to emergency vehicle access to the individual development parcels identified in the Transbay Redevelopment Plan. No mitigation measures to address impacts on emergency vehicle access were identified.

Existing-plus-Project Conditions

The Proposed Project would not include the introduction of physical impediments to emergency vehicle access. Rather, the Proposed Project's extension of Tehama Street could enhance emergency vehicle access. Consistent with the Design for Development, the Proposed Project would include lane restriping to reduce the total lane count. The number of lanes would be reduced from four to two along Howard Street, three to two along Main Street, and three to two along Beale Street. These changes would constitute a reduction in total number of vehicle travel lanes. Some of the reallocation would not serve general mixed-flow traffic but would still provide for emergency vehicle access needs. On Main Street, a portion of the cross-section reallocation would be dedicated to an on-street bike lane (class II), which would still be available roadway space and help serve emergency vehicle access needs. On Beale Street, the curbside casual carpool lane could also be used to serve emergency vehicle needs.

Buildings would be accessible from frontages along four streets (Howard, Tehama, Main, and Beale streets) and designed to meet building code standards for egress and emergency vehicle access. The streetscape designs are being evaluated in consultation with the SFMTA and the San Francisco Fire Department to determine emergency vehicle access needs.

Implementation of Improvement Measure I-TR-1 would reduce the potential for conflicts between freight and delivery service vehicles and emergency access by employing a loading dock attendant to manage traffic flow. Implementation of Improvement Measure I-TR-2 would reduce the potential for conflicts between vehicles accessing the garage and emergency vehicles on Main Street by ensuring that queues would not spill back onto the public right-of-way. Furthermore, the Proposed Project would conform to the development density specified in the Transbay Redevelopment Plan and decrease the residential, retail, and office space, compared to the EIS/EIR Full Build Alternative assumptions for the Project Site, resulting in a net reduction in Proposed Project–generated trips and a reduction in demand for emergency services. As such, the Proposed Project would not result in new or more severe impacts related to emergency vehicle access, and no mitigation measures are necessary.

Cumulative Conditions

Under cumulative conditions, traffic from people walking, bicycling, and driving on the surrounding street network would increase as a result of the Proposed Project, other development projects within the study area, and background growth elsewhere in the city and region. However, a general increase in traffic in and of itself would not be considered a potentially hazardous condition.

Under cumulative conditions, with implementation of the Active Beale Street Project, the on-street bicycle lane (class II) along Beale Street would be replaced with a two-way separated bicycle lane (class IV) on the east side of the street, and a protected intersection corner would be constructed on the southeast corner of the Howard Street/Beale Street intersection. As currently planned, this shift in bicycle lane location would not reduce roadway capacity or prohibit emergency vehicle access. The proposed streetscape designs are being evaluated in consultation with the SFMTA and the San Francisco Fire Department to assess

emergency vehicle access needs, including design detail recommendations, and ensure that emergency vehicle access can be maintained with the proposed bicycle lane and corner safety islands on Beale and Howard streets.

Although there would be a general increase in vehicle traffic from cumulative development projects, prior to finalizing the design and dimensions of any proposed transportation network changes, fire department and police department personnel would review and approve the streetscape modifications, as required, to ensure emergency vehicle access is acceptable. As a result, cumulative development and transportation projects are not expected to inhibit emergency access to the Project Site or materially affect emergency vehicle response. Implementation of Improvement Measure I-TR-1 would reduce the potential for conflicts between freight and delivery service vehicles and emergency access by employing a loading dock attendant to manage traffic flow. Implementation of Improvement Measure I-TR-2 would reduce the potential for conflicts between vehicles accessing the garage and emergency vehicles on Main Street by ensuring that queues would not spill back onto the public right-of-way. For these reasons, the Proposed Project in combination with cumulative projects would result in a less-than-significant cumulative impact related to emergency access.

Loading

Transbay EIS/EIR

The Transbay EIS/EIR did not identify any significant impacts related to commercial or passenger loading associated with the Transbay Redevelopment Plan. No mitigation measures to address impacts on commercial or passenger loading were identified.

Existing-plus-Project Conditions

The Proposed Project would include an off-street loading dock along Beale Street, with two spaces serving SU-30 trucks and smaller from a 24-foot-wide curb cut and driveway. Additional proposed locations for commercial and passenger loading include the nine spaces along Tehama Street, including two accessible spaces with curb ramps; two spaces along Main Street north of the garage driveway; and six spaces along the Project Site side of Howard Street. Loading/unloading zones would be located near building entrances.

Commercial (Freight and Delivery Service) Loading. Based on the travel demand estimates, the Proposed Project would generate demand for four commercial loading spaces in the midday peak hour of commercial loading. The analysis assumes that deliveries would occur primarily from standard box trucks, which are between 30 and 35 feet in length. That demand would be met by the combination of the off-street loading dock (two spaces) and the on-street loading spaces to be provided (340 linear feet of curb along Tehama, Main, and Howard streets on the Project Site frontage). The number of commercial versus passenger loading spaces has not yet been determined and would be subject to SFMTA review and approval. Commercial loading activity would be generated primarily by the retail land uses fronting Howard, Beale, and Main streets; therefore, the spaces along those streets nearest the retail building entrances would be the appropriate locations for designated commercial loading spaces.

This analysis assumes that at least 100 linear feet of the 340 total linear feet would be designated for commercial loading, and the peak commercial loading demand for four freight loading spaces would be met. Furthermore, implementation of Improvement Measure I-TR-1 would reduce the potential for conflicts between freight and delivery service vehicles and transit by employing a loading dock attendant to manage traffic flow and requiring vehicles exceeding 30 feet in length to load in on-street zones on

Howard, Main, or Tehama streets rather than in the loading dock. Furthermore, the Proposed Project would decrease the proposed residential, retail, and office space, compared to the EIS/EIR Full Build Alternative assumptions for the Project Site, resulting in a net reduction in Proposed Project–generated trips. As such, the Proposed Project would not result in any new or substantially more severe significant impacts with respect to commercial loading, and no mitigation measures are necessary.

Passenger Loading. Based on the travel demand estimates, the Proposed Project would generate demand for two passenger loading spaces (approximately 40 linear feet) during any one minute during the peak 15 minutes of the average peak period (one space, or 20 linear feet, of demand associated with both the residential and restaurant use). The proposed 340 total linear feet of passenger and commercial loading supply (approximately 17 spaces) along Tehama (180 linear feet), Main (40 linear feet), and Howard (120 linear feet) streets would serve this level of demand. Although the distribution of commercial versus passenger loading supply along these streets has not yet been determined, 17 spaces (340 linear feet) would adequately serve both needs. The nine spaces (180 linear feet) proposed on the north side of Tehama Street would be located along a one-way westbound street that would be extended as part of the Proposed Project. Two of these nine loading spaces would be accessible spaces with curb ramps. The two spaces along the west side of Main Street would be located within a 40-foot-long bulb-in, thereby minimizing the potential for conflicts with other road users and modes. The six spaces (120 linear feet) proposed on Howard Street would be provided along the south side of the roadway, in front of the Proposed Project.

The supply and siting of on-street loading spaces would meet passenger loading needs at the most convenient location and avoid any significant impacts. Furthermore, the Proposed Project would decrease the residential, retail, and office space, compared to the EIS/EIR Full Build Alternative assumptions for the Project Site, resulting in a net reduction in Proposed Project–generated trips and passenger loading demand. The Proposed Project would not result in any new or substantially more severe significant impacts with respect to passenger loading, and no mitigation measures are necessary.

Cumulative Conditions

Under cumulative conditions, freight and passenger loading activity on the surrounding street network would increase as a result of development projects within the study area. Commercial loading demand is typically hyperlocal, confined to the block faces of the buildings being served. Freight and passenger loading demand generated by cumulative development projects would not be anticipated to use the on-site freight loading dock or on-street freight and passenger loading spaces. However, if cumulative loading demand does increase on the block with the Proposed Project, the supply of on-street loading spaces (up to 17 total spaces, or 340 linear feet) would be enough to support increases in demand under cumulative conditions.

Under cumulative conditions, the on-street bicycle lane (class II) along Beale Street would be replaced with a two-way separated bicycle lane (class IV) on the east side of the street. As currently planned, the introduction of vertical separation between the bicycle lane and the vehicle travel lane would limit the ability of trucks to conveniently complete turning movements into and out of the loading dock. The effects of the Active Beale Street Project and Soda plan will be subject to separate study and environmental review. Further coordination with the SFMTA, as part of this review process and as part of the Active Beale Street Project, will include design detail recommendations to reduce the potential for conflicts and minimize potential hazards associated with commercial loading activities.

Implementation of Improvement Measure I-TR-1 would reduce the potential for conflicts between freight and delivery service vehicles and transit by employing a loading dock attendant to manage traffic flow and requiring vehicles exceeding 30 feet in length to load in on-street zones on Howard, Main, or Tehama streets rather than in the loading dock. The Proposed Project would decrease the residential, retail, and office space, compared to the EIS/EIR Full Build Alternative assumptions for the Project Site, resulting in a net reduction in Proposed Project–generated trips. For these reasons, the Proposed Project in combination with cumulative projects would have less-than-significant cumulative impacts related to loading.

WIND

Transbay EIS/EIR

A wind tunnel test was performed for the Transbay EIS/EIR, using conservative assumptions for the buildings that would be constructed in accordance with the land use program on the redevelopment parcels, including Block 4. The land use program ultimately adopted for the Block 4 site as part of the Transbay Redevelopment Plan included a maximum tower height of 450 feet, which was included in the wind tunnel test. Wind speeds were modeled at 69 locations throughout the Transbay Redevelopment Area, including four locations at the Project Site. The full build alternative modeling resulted in nine locations exceeding the comfort criterion (ground-level speeds in excess of 11 mph) and one location exceeding the hazard criterion (ground-level wind speeds in excess of 26 mph). The Reduced Scope Alternative modeling resulted in seven locations exceeding the comfort criterion and one location exceeding the hazard criterion. None of the comfort criterion or hazard criterion exceedances were located on Block 4 or adjacent blocks. For the purposes of CEQA, only exceedances of the hazard criterion are considered significant impacts.

To address the modeled hazard criterion exceedances, the Transbay EIS/EIR included a mitigation measure that required wind tunnel testing to be performed for all subsequent individual development projects proposed within the Transbay Redevelopment Area. If any exceedances of the hazard criterion occurred, design modifications or other mitigation measures would be required to mitigate or eliminate the exceedances.

Proposed Project and Cumulative Conditions

A wind tunnel test was performed for the Proposed Project, with conclusions outlined in the wind tunnel report summarized below and included in Appendix B.[20] The test modeled the proposed massing with a 550-foot tower (511 feet plus 39 feet for screening of mechanical equipment) with a 175-foot-tall podium and a 65-foot-tall townhouse building.[21] Three scenarios were examined:

(1) Existing Conditions

(2) Existing Conditions plus Proposed Project

(3) Cumulative Conditions plus Proposed Project

---

[20] CPP, Inc., *Pedestrian-Level Winds Report: Wind Tunnel Tests for Transbay Block 4*, July 14, 2020.

[21] Regarding the "massing changes" to the Proposed Project, the massing itself has not changed relative to the massing evaluated in CPP's assessment; the methodology for measuring building height has since changed resulting in minor shifts in height (all less than 5 feet) to the proposed buildings.

The cumulative conditions included buildings that are not yet approved or completed that have been added to the Proposed Project configuration, such as high-rise developments studied in the Transbay EIS/EIR. As shown in Table 7, below, wind speeds were modeled at 48 to 50 test points on and near the Project Site. Test points were selected to sample an area that is larger than the area within which wind speeds may be adversely affected by the Proposed Project. The measurement points were chosen to determine the degree of pedestrian comfort or discomfort at locations where relatively severe conditions are frequently found, such as at building corners, near entrances, on adjacent sidewalks with heavy pedestrian traffic, and in open plaza areas. All measurements were made without landscaping in place; therefore, the results may be considered representative of worst-case conditions, as required by the Planning Department. The addition of landscaping features is likely to reduce wind speeds in some locations.

The wind tunnel test assumed the Proposed Project would include a 550-foot tower (511 feet plus 39 feet for screening of mechanical equipment) with a 175-foot-tall podium and a 65-foot-tall townhouse building. Subsequent to the preparation of the wind tunnel test, the methodology used to measure the building heights was clarified, the cumulative conditions changed to include additional developments, and revisions to the massing of the potential development at Block 2. These minor clarifications and revisions to the cumulative conditions were evaluated (refer to Appendix B) and it was determined that there are no changes required to the conclusions in the wind tunnel test.[22]

Table 7. Overview of Wind Comfort and Hazard Criterion Exceedances for the EIS/EIR Full Build Alternative and Reduced Scope Alternative Compared to Proposed Project

Wind Study Scenario	Number of Test Points Studied	Comfort Criterion Exceedances	Hazard Criterion Exceedances
EIS/EIR[a]			
Full Build Alternative	69	9	1
Reduced Scope Alternative	69	7	1
Proposed Project[b]			
Existing Configuration Conditions	48	14	none
Project Configuration Conditions	50	16	none
Cumulative Configuration Conditions	50	6	none

Wind Comfort

The EIS/EIR included analysis of the [Project] based on pedestrian comfort criteria established in Planning Code section 148, *Reduction of Ground-level Wind Currents in C-3 Districts*, , which call for equivalent wind speeds of 7 mph in public seating areas and 11 mph in areas of substantial pedestrian use not to be exceeded more than 10 percent of the time year-round between 7 a.m. and 6 p.m. The comfort criteria are not used to determine whether a proposed project would result in a significant wind impact under CEQA. The following discussion is provided for informational purposes only.

Exceedances of the comfort criteria were found at 14 locations under existing conditions. With implementation of the Proposed Project, exceedances of the comfort criteria would increase with the addition of two locations, for a total of 16 locations, but decrease to six locations under cumulative conditions. All locations along Folsom Street, between Main Street and Spear Street, exceed the comfort criteria in the existing configuration. The addition of the Proposed Project would not change the comfort rating at these locations; however, the cumulative configuration provides shelter for some of these locations and eliminates eight comfort exceedances compared with the existing configuration.

Wind Hazards

The EIS/EIR established the wind hazard criterion, as stated in the planning code, as the threshold of significance for environmental impact associated with wind. The criterion is based on wind speeds that are averaged hourly. When based on one-minute averages, as is the case for the comfort criteria, this criterion is increased to 36 mph.[23] The test results for hazardous winds prepared for the Proposed Project used the one-minute average of 36 mph for the wind hazard criterion. No exceedances of the hazard criterion were found under existing conditions, with the Proposed Project, or under the cumulative scenarios. Therefore, no design modification of the Proposed Project, in accordance with the Transbay EIS/EIR wind mitigation measure, would be required. The wind impacts of the Proposed Project would be less than significant.

Based on the analysis in the wind report for the Proposed Project, although the height of the proposed tower would increase compared to what was analyzed in the Transbay EIS/EIR, no significant wind impacts would occur. No new mitigation measures are necessary.

SHADOW

Transbay EIS/EIR

The EIS/EIR included a shadow analysis performed in accordance with CEQA and Planning Code section 295. The methodology analyzes the potential shadow impacts of the Proposed Project on public parks and open spaces as a percentage of theoretical annual available sunlight (TAAS) consumed. TAAS is a measure of the square-foot-hours (sfh) of sunlight that would theoretically be available at a given park or open space during a typical year, assuming that it is sunny during all daylight hours. The first hour of the day after sunrise and the last hour before sunset are excluded from TAAS calculations.

[23] Arens, E., D. Ballanti, C. Bennett, S. Guldman, and B. White, *Developing the San Francisco Wind Ordinance and Its Guidelines for Compliance,* 1989, in *Building and Environment*, Volume 24, No. 4, pp. 297–303.

The EIS/EIR shadow analysis found that the Transbay Terminal and development under the Transbay Redevelopment Plan would not cast shadow on any parks or open spaces subject to section 295.[24] Other public parks and open spaces not subject to section 295 were also evaluated for potential impacts under CEQA. In San Francisco, a significant shadow impact would occur under CEQA if a project were to create new shadow in a manner that would substantially affect outdoor recreation facilities or other public areas.[25] The EIS/EIR indicated that some publicly accessible open spaces would see a reduction in sunlight during certain periods of the day and year, but that additional shading would not amount to a significant impact requiring mitigation measures. The EIS/EIR required all subsequent development projects in the Transbay Redevelopment Area to undergo a shadow analysis.

Proposed Project and Cumulative Conditions

In accordance with the requirements of the EIS/EIR, a shadow analysis was prepared for the Proposed Project (Appendix C).[26] Throughout the analysis, a comparison is made between three shadow-casting scenarios:

- *Existing Conditions:* The shadows cast by existing and anticipated structures in the San Francisco downtown area.
- *DCDG-Compliant Massing:* The additional shadows, relative to existing conditions, that would be cast by Block 4 development that would comply with the current Transbay Redevelopment Plan, the Transbay Design for Development, and the DCDG massing controls previously approved for the site under Transbay Redevelopment Plan legislation. This scenario is consistent with the scenario analyzed in the EIS/EIR.
- *Proposed Project:* The additional shadows, relative to existing conditions, that would be cast by the Proposed Project.

An initial shadow fan analysis prepared for the Proposed Project identified two existing publicly owned open spaces that might be affected by the Proposed Project. These are the recently opened Salesforce Park and the diamond-shaped Rincon Park, which lies between The Embarcadero and the Bayfront Trail. In addition, the analysis included an evaluation of potential shadow on seven smaller, neighboring privately

[24] Section 295 of the planning code applies only to public parks and open spaces that are under the jurisdiction of the San Francisco Recreation and Park Commission.

[25] Prior to 2019, the CEQA significance criterion for shadow was similar to the criterion used under Planning Code Section 295 to determine if net new project shadow would have an adverse impact on the use of any property under the jurisdiction of the San Francisco Recreation and Park Commission. The Section 295 criterion includes the consideration of the quantity of net new project shadow (i.e., the number of square-foot-hours of shadow expressed as a percentage of the total amount of annual sunlight on the affected park[s]). In 2019, the San Francisco Planning Department revised the CEQA significance criterion for shadow to focus less on the quantitative aspect of analyzing shadow impacts under Section 295. Under the revised CEQA significance criterion, a project would result in a significant shadow impact if it would create new shadow that would substantially and adversely affect the use and enjoyment of publicly accessible open spaces. OCII acknowledges and accepts the use of the revised CEQA significance criterion for the analysis of the Proposed Project's shadow impact. For consistency with prior addenda to the EIS/EIR, quantitative information regarding the Proposed Project's shadow is included in this analysis.

[26] Fastcast. 2022. *Shadow Analysis Report – Block 4 San Francisco, CA*. June 2022.

owned public open spaces (POPOS),[27] including Spear Street Terrace, Howard Fremont Plaza, Main Street Plaza, 201 Mission, Salesforce Plaza, Urban Park, and 50 Beale Plaza. The future Block 3 publicly owned open space, Transbay Block 3 Park, is also discussed for informational purposes.

For each of the 10 identified open spaces, a baseline value was calculated that represents the highest theoretical amount of sunlight that each of these open spaces would receive if there were no structures casting shadows on them. This baseline maximum value is referred to as the TAAS, expressed in sfh of sunlight. The TAAS is calculated by multiplying the area of the park/open space by the total number of annual hours that fall between one hour after sunrise and one hour before sunset. Comparing the existing shadow, future shadow, and TAAS values to each other (all expressed in sfh) provides a quantitative summary of key shadow impacts. Table 8 and Table 9, below, summarize the TAAS (shown as a percentage), comparing shadows from existing buildings, existing buildings plus the DCDG-Compliant Massing, and the Proposed Project.

The shadow analysis for the Proposed Project included qualitative impacts on the affected spaces, based on (1) the nature of existing shadow profiles, (2) size and duration of existing versus potential new shadows, and (3) whether or not the identified new shadows could be considered adverse to the quality of observed and established usage. These observations follow the prescribed method in CEQA for characterizing environmental impacts associated with increased shading. These include the shadow characteristics (size, duration, and location of new shadows) as well as the relative importance of sunlight for the identified activity (time of day and year and location for new shadows versus observed open space use).

This section analyzes the net increase of shadows from the Proposed Project (maximum building height at the Project Site at 513 feet) compared to both the DCDG-Compliant Massing scenario (maximum building height at the Project Site at 450 feet, i.e. the scenario analyzed in the EIS/EIR) and, for informational purposes, existing conditions.

Table 8. Shadows on Affected Publicly Owned Open Spaces

	Salesforce Park	**Rincon Park**	**Transbay Block 3 Park (Future)**
Total Shadow from Existing Buildings	49.27%	30.61%	47.46%
Existing Buildings plus DCDG-Compliant Massing			
Total Shadow from Existing Buildings plus DCDG-Compliant Massing	49.29%	30.67%	47.47%
Increase Due to DCDG-Compliant Massing Using Existing Baseline	0.02%	0.06%	0.01%
Existing Buildings + Proposed Project			

[27] The San Francisco General Plan Recreation and Open Space Element characterizes privately owned public open spaces in the denser neighborhoods of the city as "…a critical strategy to promote livability and provide much-needed spaces for relaxation, enjoyment of greenery, and socializing with others." Although these spaces are not subject to the provisions of section 295 of the planning code, the recreation and open space element is clear in that protecting sunlight access to these spaces, especially in the areas and times of highest use, should be a high priority for City officials and private groups.

Total Shadow from Existing Buildings plus Proposed Project	49.30%	30.74%	47.51%
Increase Due to Proposed Project Using Existing Baseline	0.03%	0.13%	0.05%

Salesforce Park

Salesforce Park is a 208,072-square-foot (4.78-acre) publicly accessible park located on the roof of the Salesforce Transit Center. The 1,400-foot-long elevated park features a variety of activities and amenities, including gardens, trails, open grass areas, children's play areas, an outdoor amphitheater, as well as space for a future restaurant. The children's play areas are in the central and southwestern portions of the park, and the outdoor amphitheater is in the southwest portion of the park. Salesforce Park is used extensively throughout the day during the week. It is not as busy but still experiences substantial use on weekends.

The DCDG-Compliant Massing would contribute 125,414 sfh (0.02 percent) of new shading approximately four months of the year (mid-April to mid-August). The daily duration of net new shadow on the park under this scenario would range from less than 1 minute to a maximum of 51 minutes, with the average daily duration being about 33 minutes. In comparison, the Proposed Project would contribute 199,311 sfh (0.03 percent) new shading approximately eight months of the year (early January to early March, mid-April to mid-August, and early October to early December). The daily duration of net new Proposed Project shadow would range from less than 1 minute to a maximum of 1 hour and 16 minutes, with the average daily duration being about 44 minutes.

Both the DCDG-Compliant Massing and the Proposed Project would shadow Salesforce Park in the morning, affecting some areas with fixed seating in the northeastern end of the park. Shadow from both scenarios would move off the park around 8:45 a.m. to 9:00 a.m. and would not occur during the middle of the day when many nearby office workers might use the park during their lunch breaks.

The building height increase due to the Proposed Project would result in a net increase in shadow of 0.03 percent compared to existing conditions, and a net increase of 0.01 percent compared to the DCDG-Compliant Massing analyzed in the EIS/EIR. Given the limited duration of shadow and the limited area of the park that would be affected, shadow from the Proposed Project would not substantially and adversely affect the public's use and enjoyment of the park. Therefore, the Proposed Project's shadow impact on Salesforce Park would be less than significant, and no mitigation measures are necessary.

Rincon Park

Rincon Park is an urban diamond-shaped waterfront open space sited between the Embarcadero and the Bay Front Trail just south of the western Bay Bridge anchorage. The park features inviting expanses of lawn, canted and oriented to provide maximum views to the bay. The lawns are edged with a series of low seat walls. Tucked within and between the seat walls are shrub and perennial plantings native to California and coastal areas. Dominating the mounded landform is the Cupid's Span sculpture. Rincon Park is heavily used throughout the day both during the week and on weekends. The park is used for passive recreation (e.g., smoking, informal socializing, eating during lunch breaks, sunbathing). Although the park does not feature any active recreation facilities, cyclists and runners often pass through the park; the eastern boundary of the park abuts the San Francisco Bay Trail.

The DCDG-Compliant Massing would contribute 279,239 sfh (0.06 percent) of new shading approximately 9 months of the year (mid-April to early May, early August to mid-August, and late August to early April). The daily duration of net new shadow on the park under this scenario would range from less than 1 minute to a maximum of 1 hour, with an average daily duration of about 33 minutes. By comparison, the Proposed Project would contribute 607,662 sfh (0.13 percent) of new shading 10 months of the year, between early August and early May. The daily duration of net new shadow from the Proposed Project on the park would range from less than 1 minute to a maximum of 1 hour and 15 minutes, with an average duration of about 43 minutes.

Both the DCDG-Compliant Massing and the Proposed Project would shadow the park in the afternoon and early evening. Compared to shadow from the DCDG-Compliant Massing, shadow from the Proposed Project would be very similar in time of occurrence, duration, and location. Like the DCDG-Compliant Massing, the Proposed Project would not cast net new shadow on the park before 2:30 p.m. on any day of the year. Shadow from the Proposed Project would not occur during the morning and early afternoon when the park is heavily used. Shadow from the Proposed Project would occur during the afternoon and early evening when much of the park is already shadowed by existing buildings and activity levels within the park have decreased substantially.

The building height increase due to the Proposed Project would result in a net increase of 0.13 percent compared to existing conditions, and 0.07 percent compared to the DCDG-Compliant Massing analyzed in the EIS/EIR. The additional shadow from the Proposed Project is not expected to substantially and adversely affect the public's use and enjoyment of the park. Therefore, Proposed Project's shadow impact on Rincon Park would be less than significant, and no mitigation measures are necessary.

Spear Street Terrace (POPOS)

Spear Street Terrace is a 31,716-square-foot (0.73-acre) publicly accessible private open space in the Financial District of San Francisco (Assessor's Block 3741/Lot 032). The plaza is northwest of 2 Folsom Street; the "panhandle" portion is between a parking structure to the northeast and the 201 Spear Street building to the southwest. Access to the plaza is via Steuart Street to the northeast and Spear Street to the southwest as well as a narrower "panhandle" pedestrian passageway from Howard Street to the northwest. Spear Street Terrace is used primarily for passive activity by nearby office workers and as a pedestrian passage between Spear, Howard, and Steuart streets. The plaza experiences its maximum use around lunchtime.

The DCDG-Compliant Massing would contribute 185,116 sfh (0.16 percent) of new shading approximately 4.5 months of the year (late February to early May and early August to mid-October). The daily duration of net new shadow on the park under this scenario would range from less than 1 minute to a maximum of 1 hour and 15 minutes, with the average daily duration being about 50 minutes. By comparison, the Proposed Project would contribute 371,002 sfh (0.31 percent) of new shading approximately six months of the year (early February to early May and early August to early November. With the Proposed Project, the daily duration of net new shadow on the park would range from less than 1 minute to a maximum of 1 hour and 15 minutes, with the average daily duration being about 49 minutes.

Both the DCDG-Compliant Massing and the Proposed Project would shadow the plaza in the afternoon. Shadow from the Proposed Project would occur on the plaza for more days of the year (early February to early May and early August to early November) than shadow from the DCDG-Compliant Massing (late February to early May and early August to mid-October). From mid-August until early October, the Proposed Project would cast a larger shadow on the southwest (Spear Street) entrance to the plaza than the DCDG-

Compliant Massing. Shadow from the Proposed Project would not reach the plaza before 2:45 p.m. and would not occur during the plaza's period of maximum use (11:00 a.m. to 1:00 p.m. for nearby workers' lunch breaks).

The building height increase due to the Proposed Project would result in a net increase of 0.31 percent compared to existing conditions, and 0.15 percent compared to the DCDG-Compliant Massing analyzed in the EIS/EIR. Net new shadow from the Proposed Project would not substantially and adversely affect the public's use and enjoyment of the park. The Proposed Project's shadow impact on Spear Street Terrace would be less than significant, and no mitigation measures are necessary.

Howard/Fremont Plaza (POPOS)

Howard Fremont plaza is an 8,724-square-foot (0.20-acre) urban open space located in the Financial District of San Francisco on Assessor's Blocks 3738/Lots 016 and 017. The T-shaped open space is framed by high rises on the northwest and east and the 50-foot-tall 342 Howard Street Tower Project at the corner of Howard Street and Fremont Street. Howard Fremont Plaza attracts a high number of visitors during lunchtime, including many nearby office workers.

The DCDG-Compliant Massing would contribute 19,471 sfh (0.06 percent) of new shading approximately 4.5 months of the year (early April to mid-April, late April to mid-August, and late August to early September). The daily duration of net new shadow on the park under this scenario would range from 1 minute to a maximum of 30 minutes, with the average daily duration being about 21 minutes. In comparison, the Proposed Project would contribute 117,410 sfh (0.36 percent) of new shading approximately five months of the year (early April to early September). With the Proposed Project, the daily duration of net new shadow on the park would range from 1 minute to a maximum of 1 hour and 45 minutes, with the average daily duration being about 1 hour and 6 minutes.

Both the DCDG-Compliant Massing and the Proposed Project would shadow the southeast (Howard Street) entrance of the plaza during the morning from mid-April until late August. From early May until early August, shadow from the Proposed Project would occur for a longer duration each day than shadow from the DCDG-Compliant Massing (an average of 90 minutes compared to an average of 15 to 30 minutes). Shadow from the Proposed Project would move off the plaza by 9:15 a.m. and would not occur during the plaza's period of maximum use (11:00 a.m. to 1:00 p.m. for nearby workers' lunch breaks).

The building height increase due to the Proposed Project would result in a net increase of 0.36 percent compared to existing conditions, and 0.30 percent compared to the DCDG-Compliant Massing analyzed in the EIS/EIR. Net new shadow from the Proposed Project would not substantially and adversely affect the public's use and enjoyment of the park. The Proposed Project's shadow impact on Howard/Fremont Plaza would be less than significant, and no mitigation measures are necessary.

Main Street Plaza (POPOS)

Main Street Plaza has 4,657 square feet (0.11 acre) of publicly accessible urban open space in the Financial District of San Francisco on Assessor's Block 3740/Lots 033 and 034. The Main Street entry of the plaza, which benefits from a sunny exposure, has two concrete benches, three planters that double as seating along the edges, and modest landscaping. At the eastern edge of the plaza is an expansive fenced play lot for children. Main Street Plaza is used primarily for passive activity by nearby office workers and as a pedestrian passage between Main and Spear streets. The plaza experiences its maximum use around lunchtime.

The DCDG-Compliant Massing would contribute 554,982 sfh (3.20 percent) of new shading during all 12 months of the year. The daily duration of net new shadow on the park under this scenario would range from less than 1 minute to a maximum of 2 hours and 15 minutes, with the average daily duration being about 1 hour and 8 minutes. In comparison, the Proposed Project would contribute 700,136 sfh (4.04 percent) of new shading during all 12 months of the year. With the Proposed Project, the daily duration of net new shadow on the park would range from less than 1 minute to a maximum of 2 hours and 30 minutes, with the average daily duration being about 1 hour and 21 minutes.

Both the DCDG-Compliant Massing and the Proposed Project would shadow the southwest (Main Street) entrance of the plaza during the afternoon throughout the year. From late September until mid-March, shadow from the Proposed Project would reach the plaza about 15 to 30 minutes earlier than shadow from the DCDG-Compliant Massing, but this would occur after 2:00 p.m. Therefore, shadow from the Proposed Project would not occur during the plaza's period of maximum use (11:00 a.m. to 1:00 p.m. for nearby workers' lunch breaks).

The building height increase due to the Proposed Project would result in a net increase of 4.04 percent compared to existing conditions, and 0.84 percent compared to the DCDG-Compliant Massing analyzed in the EIS/EIR. Net new shadow from the Proposed Project would not substantially and adversely affect the public's use and enjoyment of the park. The Proposed Project's shadow impact on Main Street Plaza would be less than significant, and no mitigation measures are necessary.

201 Mission (POPOS)

The 0.31-acre parcel at 201 Mission is a lunch and break space with a surplus of movable seating and dining, buffered from Beale Street by dense planting. The open space at 201 Mission Street is presumed to be used primarily for passive activity by nearby office workers.[28] Given its proximity to high rise office buildings, the open space likely experiences its heaviest use around lunchtime.

The DCDG-Compliant Massing would contribute 825,497 sfh (1.63 percent) of new shading more than 11 months of the year, from late December to mid-December. The daily duration of net new shadow on the park under this scenario would range from less than one minute to a maximum of 6 hours and 45 minutes, with the average daily duration being about 3 hours and 41 minutes. In comparison, the Proposed Project would contribute 948,754 sfh (1.88 percent) of new shading almost nine months of the year, from early January to mid-May and from late July to early December. With the Proposed Project, the daily duration of net new shadow on the park would range from less than one minute to a maximum of 1 hour and 45 minutes, with the average daily duration being about 1 hour and 9 minutes.

Both the DCDG-Compliant Massing and the Proposed Project would shadow the open space in the morning before 9:15 a.m., with shadow from the Proposed Project lasting about 30 minutes longer per day from mid-November until late January. Shadow from the Proposed Project would not occur during the open space's presumed period of maximum use (11:00 a.m. to 1:00 p.m. for nearby workers' lunch breaks).

The building height increase due to the Proposed Project would result in a net increase of 1.88 percent compared to existing conditions, and 0.25 percent compared to the DCDG-Compliant Massing analyzed in the EIS/EIR. Net new shadow from the Proposed Project would not substantially and adversely affect the

[28] Due to an indefinite citywide shelter-in-place order effective March 17, 2020, observations of this open space were not possible at the time that this analysis was prepared.

public's use and enjoyment of the park. The Proposed Project's shadow impact on the 201 Mission open space would be less than significant, and no mitigation measures are necessary.

Salesforce Plaza (POPOS)

Salesforce Plaza, an open hardscape area at the southern corner of Mission and Fremont streets, is framed by Salesforce Tower to the southwest and Salesforce Transit Center to the southeast. Salesforce Plaza is used primarily by pedestrians while en route to Salesforce Transit Center or the high-rise office buildings and businesses in the area. It is also the location of the cable car that ferries pedestrians to the elevated Salesforce Park. The plaza contains a small amount of fixed seating and landscaping in the northern corner of the site, adjacent to the cable car. The use of the plaza for purposes other than pedestrian access to and from the Salesforce Transit Center and Salesforce Park is presumed to be minimal.[29]

The DCDG-Compliant Massing would contribute 7,031 sfh (0.01 percent) of new shading about 9 months of the year, from late January to early March and-mid-March to late September. The daily duration of net new shadow on the park under this scenario would range from less than 1 minute to a maximum of 1 hour and 45 minutes, with the average daily duration being about 53 minutes. In comparison, the Proposed Project would contribute 13,803 sfh (0.02 percent) of new shading about three months of the year, between mid-April and late May as well as mid-July to mid-August. With the Proposed Project, the daily duration of net new shadow on the park would range from less than 1 minute to a maximum of 1 30 minutes, with the average daily duration being about 24 minutes.

Both the DCDG-Compliant Massing and the Proposed Project would shadow the northern third of the plaza in the morning, with shadow from the Proposed Project covering an additional area along the eastern edge of the plaza. Shadow from the Proposed Project would occur on the plaza for fewer days of the year (mid-April to late May and mid-July to mid-August) than shadow from the DCDG-Compliant Massing (late January to early March and mid-March to late September).

The building height increase due to the Proposed Project would result in a net increase of 0.02 percent compared to existing conditions, and 0.01 percent compared to the DCDG-Compliant Massing analyzed in the EIS/EIR. Shadow from the Proposed Project is not anticipated to substantially and adversely affect the use of the plaza for pedestrian access. The Proposed Project's shadow impact on Salesforce Plaza would be less than significant, and no mitigation measures are necessary.

Urban Park (POPOS)

Urban Park, located on the western corner of Howard Street and Main Street, is a new open space, seemingly inspired by traditional Japanese raked-gravel gardens. Based on its design, the park is expected to be used primarily for passive activity by nearby residents and workers.[30]

The DCDG-Compliant Massing would contribute 8,810,597 sfh (11.09 percent) of new shading to Urban Park. New shading would be introduced at the plaza every day of the year. The daily duration of net new shadow on the park under this scenario would range from less than 1 minute to a maximum of 4 hours and 45 minutes, with the average daily duration being about 3 hours and 58 minutes. In

[29] Due to an indefinite citywide shelter-in-place order effective March 17, 2020, observations of this open space were not possible at the time that this analysis was prepared.

[30] Due to an indefinite citywide shelter-in-place order, effective March 17, 2020, observations of this open space were not possible when this analysis was prepared.

comparison, the Proposed Project would contribute 9,501,966 sfh (11.97 percent) of new shading. New shading would be introduced at the plaza every day of the year. With the Proposed Project, the daily duration of net new shadow on the park would range from less than 1 minute to a maximum of 5 hours and 30 minutes, with the average daily duration being about 4 hours and 15 minutes.

Both the DCDG-Compliant Massing and the Proposed Project would shadow the park from the early morning until the early afternoon throughout the year. Compared to shadow from the DCDG-Compliant Massing, shadow from the Proposed Project would be very similar in time of occurrence, duration, and location.

The building height increase due to the Proposed Project would result in a net increase of 0.88 percent compared to the DCDG-Compliant Massing analyzed in the EIS/EIR. Park users who prefer sunlight to shadow would be affected by the net new shadow and most likely would not use the park during the morning and early afternoon. Such individuals would be able to visit other parks and open spaces in the neighborhood that receive more sunlight. This would be the case under both the DCDG-Compliant Massing and the Proposed Project. Since the shadow from the Proposed Project would be very similar in time of occurrence, duration, and location to the shadow from the DCDG-Compliant Massing, the Proposed Project would not result in a more severe shadow impact on Urban Park when compared to the DCDG-Compliant Massing.

50 Beale Street Plaza (POPOS)

This large, square-shaped urban park opens onto Beale Street on its east side. Surrounded on three sides by towers and heavily landscaped with bushes and mature trees, the park generally stays shady. There is ample bench seating but no movable seating. Although crisscrossed by office workers heading to the nearby towers or cutting through the block, the park is generally empty in the evening and on weekends. Based on its design, the park is presumed to be used primarily for passive activity or as a mid-block pedestrian passage by nearby office workers and residents. Given its proximity to high rise office buildings, the park likely experiences its heaviest use around lunchtime.[31]

The DCDG-Compliant Massing would contribute 57,097 sfh (0.08 percent) of new shading about 3 months of the year, from early February to mid-March as well as late September to early November. The daily duration of net new shadow on the park under this scenario would range from less than 1 minute to a maximum of 45 minutes, with the average daily duration being about 30 minutes. In comparison, the Proposed Project would contribute 69,967 sfh (0.10 percent) of new shading approximately 4 months of the year, from early February to mid-March, mid-September to early November, and early December to early January. With the Proposed Project, the daily duration of net new shadow on the park would range from less than 1 minute to a maximum of 45 minutes, with the average daily duration being about 27 minutes.

Like the DCDG-Compliant Massing, the Proposed Project would not cast net new shadow on the plaza after 9:45 a.m. on any day of the year. Therefore, shadow from the Proposed Project would not occur during the plaza's presumed period of maximum use (11:00 a.m. to 1:00 p.m. for nearby workers' lunch breaks).

The building height increase due to the Proposed Project would result in a net increase of 0.10 percent compared to existing conditions, and 0.02 percent compared to the DCDG-Compliant Massing analyzed in

[31] Due to an indefinite citywide shelter-in-place order, effective March 17, 2020, observations of this open space were not possible when this analysis was prepared.

the EIS/EIR. Net new shadow from the Proposed Project would not substantially and adversely affect the public's use and enjoyment of the plaza. The Proposed Project's shadow impact on 50 Beale Street Plaza would be less than significant, and no mitigation measures are necessary.

Future Transbay Block 3 Park

The following discussion is provided for informational purposes only. Since Transbay Block 3 Park is not an existing park, shadow from the Proposed Project could not result in an impact under CEQA.

Transbay Block 3 Park is a proposed 47,885-square-foot (1.10-acre) public park in the Financial District of San Francisco, on portions of Assessor's Block 3739/Lots 002, 006, and 008 (Transbay Block 3). The future park space will occupy land that was used as the temporary Transbay Terminal while the Salesforce Transit Center was being built. The design and programming of this park are still under development and have not yet been finalized.

The DCDG-Compliant Massing would contribute 9,441 sfh (0.01 percent) of new shading approximately four months of the year. The daily duration of net new shadow on the park under this scenario would range from less than 1 minute to a maximum of 1 hour and 30 minutes, with the average daily duration being about 43 minutes. In comparison, the Proposed Project would contribute 81,454 sfh (0.05 percent) of new shading approximately 7 months of the year. With the Proposed Project, the daily duration of net new shadow on the park would range from less than 1 minute to a maximum of 1 hour and 45 minutes, with the average daily duration being about 57 minutes. The building height increase due to the Proposed Project would result in a net increase of 0.04 percent compared to the DCDG-Compliant Massing analyzed in the EIS/EIR.

Both the DCDG-Compliant Massing and the Proposed Project would shadow the northern (Tehama Street) edge of the future park during the late afternoon and early evening. Shadow from the Proposed Project would occur on the future park for more days of the year (mid-March until early October) than shadow from the DCDG-Compliant Massing (mid-March until mid-April, late May until mid-July, late August until early October). Given the limited area along the northern edge of the future park that would be affected, it is anticipated that shadow from the Proposed Project would not substantially and adversely affect the public's use and enjoyment of the future park.

COMMISSION ON COMMUNITY INVESTMENT AND INFRASTRUCTURE

RESOLUTION NO. 02-2021
Adopted January 19, 2021

CONDITIONALLY APPROVING A VARIATION TO THE TRANSBAY REDEVELOPMENT PLAN'S ON-SITE AFFORDABLE HOUSING REQUIREMENT AS IT APPLIES TO THE MIXED-USE PROJECT AT 542-550 HOWARD STREET, SUBJECT TO APPROVAL BY THE BOARD OF SUPERVISORS OF THE CITY AND COUNTY OF SAN FRANCISCO IN ITS CAPACITY AS LEGISLATIVE BODY FOR THE SUCCESSOR AGENCY TO THE SAN FRANCISCO REDEVELOPMENT AGENCY, AND AUTHORIZING THE PAYMENT OF AN AFFORDABLE HOUSING FEE TO FULFILL THE PROJECT'S AFFORDABLE HOUSING OBLIGATION; PROVIDING NOTICE THAT THIS APPROVAL IS WITHIN THE SCOPE OF THE TRANSIT CENTER DISTRICT PLAN PROJECT APPROVED UNDER THE TRANSIT CENTER DISTRICT PLAN FINAL ENVIRONMENTAL IMPACT REPORT ("FEIR"), A PROGRAM EIR, AND IS ADEQUATELY DESCRIBED IN THE FEIR FOR THE PURPOSES OF THE CALIFORNIA ENVIRONMENTAL QUALITY ACT; AND ADOPTING ENVIRONMENTAL REVIEW FINDINGS; TRANSBAY REDEVELOPMENT PROJECT AREA

WHEREAS, The California Legislature in 2003 enacted Assembly Bill 812 ("AB 812") authorizing the demolition of the historic Transbay Terminal building and the construction of the new Transbay Transit Center (the "TTC") (Stat. 2003, Chapter 99, codified at § 5027.1 of the Cal. Public Resources Code). AB 812 also mandated that 25 percent of the residential units developed in the area around the TTC "shall be available at affordable housing cost to, and occupied by, persons and families whose incomes do not exceed 60 percent of the area median income, and that at least an additional 10 percent of all dwelling units developed within the project area shall be available at affordable housing cost to, and occupied by, persons and families whose incomes do not exceed 120 percent of the area median income" if the City and County of San Francisco ("City") adopted a redevelopment plan providing for the financing of the TTC (the "Transbay Affordable Housing Obligation"); and,

WHEREAS, The Board of Supervisors of the City and County of San Francisco ("Board of Supervisors") approved a Redevelopment Plan for the approximately 40 acre Transbay Redevelopment Project Area ("Project Area") by Ordinance No. 124-05, adopted on June 21, 2005 and by Ordinance No. 99-06, adopted on May 9, 2006 ("Redevelopment Plan"). The Redevelopment Plan established a program for the Redevelopment Agency of the City and County of San Francisco ("Former Agency") to redevelop and revitalize the blighted Project Area; it also provided for the financing of the TTC and thus triggered the Transbay Affordable Housing Obligation; and,

WHEREAS, The 2005 Report to the Board of Supervisors on the Redevelopment Plan ("Report") estimated that the Transbay Affordable Housing Obligation would require the development of 1200 affordable units. Report at p. VI-14 (Jan. 2005). The Report also stated: "The affordable housing in the Project Area will include approximately

388 inclusionary units, or units built within market-rate housing projects... The affordable housing will also include approximately 795 units in stand-alone, 100 percent affordable projects." Report at page VIII-7; and,

WHEREAS, The Redevelopment Plan established, under Cal. Health and Safety Code § 33333, the land use controls for the Project Area, required development to conform to those land use controls, and divided the Project Area into two land use zones: Zone One and Zone Two. The Redevelopment Plan required the Former Agency to exercise land use authority in Zone One and authorized it to delegate to the San Francisco Planning Department ("Planning Department") the land use controls of the San Francisco Planning Code ("Planning Code"), as amended from time to time, in Zone Two; and,

WHEREAS, On May 3, 2005, the Former Agency and the Planning Department entered into a Delegation Agreement whereby the Planning Department assumed land use authority in Zone Two of the Project Area subject to certain conditions and procedures, including the requirement that the Planning Department's approval of projects shall be consistent with the Redevelopment Plan ("Delegation Agreement"); and,

WHEREAS, In 2012, the City adopted the Transit Center District Plan, which covers the entirety of the Project Area north of Folsom Street, including Zone 2 of the Redevelopment Plan wherein the Planning Department has land use authority; and,

WHEREAS, To fulfill the Transbay Affordable Housing Obligation, both the Redevelopment Plan and the Planning Code require that all housing developments within the Project Area contain on-site affordable housing. Redevelopment Plan, § 4.9.3 (a minimum of 15 percent); Planning Code, § 249.28 (b) (6) (incorporating the higher inclusionary requirements of Planning Code § 415.6, namely a minimum of 20 percent) (together the "On-Site Requirement"). Neither the Redevelopment Plan nor the Planning Code authorizes off-site affordable housing construction or an "in-lieu" fee payment as an alternative to the On-Site Requirement in the Project Area; and,

WHEREAS, The Redevelopment Plan provides a procedure and standards by which certain of its requirements and the provisions of the Planning Code may be waived or modified. Section 3.5.5 of the Redevelopment Plan states: "The Agency Commission, in its sole discretion, may grant a variation from the Plan, the Development Controls and Design Guidelines, or the Planning Code where enforcement would otherwise result in practical difficulties for development creating undue hardship for the property owner and constitute an unreasonable limitation beyond the intent of the Plan, the Design for Development or the Development Controls and Design Guidelines... Variations to the Plan or the Development Controls and Design Guidelines shall only be granted because of unique physical constraints or other extraordinary circumstances applicable to the property. The granting [of] a variation must be in harmony with the Plan, the Design for Development and the Development Controls and Design Guidelines and shall not be materially detrimental to the public welfare or materially injurious to neighboring property or improvements in the vicinity... In granting any variation,

the Agency Commission shall specify the character and extent thereof, and shall also prescribe any such conditions as are necessary to secure the goals of the Plan, the Design for Development and the Development Controls and Design Guidelines;" and,

WHEREAS, On February 1, 2012, state law dissolved the Former Agency. Cal. Health & Safety Code §§ 34170 et seq. (the "Redevelopment Dissolution Law."); and,

WHEREAS, Under the Redevelopment Dissolution Law, all of the Former Agency's assets (other than certain housing assets) and obligations were transferred to the Successor Agency to the Former Agency, also known as the Office of Community Investment and Infrastructure ("Successor Agency" or "OCII"). Some of the Former Agency's housing assets were transferred to the Mayor's Office of Housing and Community Development ("MOHCD"), acting as the housing successor; and,

WHEREAS, To implement the Redevelopment Dissolution Law, the Board of Supervisors adopted Resolution No. 11-12 (Jan. 26, 2012) and Ordinance No. 215-12 (Oct. 4, 2012), which granted land use authority over the Former Agency's Major Approved Development Projects, including the Transbay Redevelopment Project, to the Successor Agency and its Commission. The Delegation Agreement, however, remains in effect and the Planning Department continues to exercise land use authority under the Planning Code over development in Zone Two; and,

WHEREAS, On April 15, 2013, the California Department of Finance ("DOF") determined finally and conclusively that the Successor Agency has enforceable obligations under Redevelopment Dissolution Law to complete certain development in the Project Area, including the Transbay Affordable Housing Obligation; Letter, S. Szalay, DOF Local Government Consultant, to T. Bohee, Successor Agency Executive Director (April 15, 2012 [sic]); and,

WHEREAS, In furtherance of its land use authority under the Delegation Agreement, Redevelopment Plan, and Transit Center District Plan, the Planning Commission approved, by Resolutions 20613 and 20614, and Motions 20615, 20616, 20617, 20618 (Jan. 9, 2020) a project at 542-550 Howard Street (Assessor's Parcel Block No. 3721, Lots 016, 135, 136, and 138, also known as Transbay Parcel F, located in Zone 2 of the Redevelopment Plan on the north side of Howard Street, between 1st and 2nd Streets in the Project Area. (the "Project Site"). Subsequently, on June 5, 2020, the Zoning Administrator issued a variance decision. (Together the Planning Commission approvals and the Zoning Administrator decision are referred to as the "Approvals"). The Approvals approved a project that would include a new 61-story mixed use building reaching a height of approximately 750 feet (approximately 800 feet including rooftop screen/mechanical equipment), and including 165 dwelling units, 189 hotel rooms, 275,674 gross square feet of office use floor area, approximately 9,000 square feet of retail space, approximately 20,000 square feet of open space, 178 Class 1 and 34 Class 2 bicycle parking spaces, and four below-grade levels to accommodate up to 183 vehicle parking spaces for the residential, hotel, and office uses (the "Project"). The Project also includes a bridge to the future elevated park situated on top of the TTC; and,

WHEREAS, To comply with the On-Site Requirement, the Approvals require the Project to include approximately 33 inclusionary below-market-rate units that are affordable to income-eligible households. All of the Project's approximately 165 residential units are located on the highest 17 floors of the building. The residential units will be for-sale units with homeowners' association ("HOA") assessments that the Project's developer estimates will exceed $2500 per month; and,

WHEREAS, On June 28, 2018, OCII received a request from Developer for a variation from the On-Site Requirement whereby the Developer would construct off-site affordable units instead of providing on-site inclusionary units. Letter, Parcel F Owner LLC, to N. Sesay (June 28, 2018) (the "Original Variation Request"). OCII did not act on the Original Variation Request pending additional negotiations with the Developer. On December 17, 2020, OCII received an amended and restated request in which the Developer proposed that the obligation to provide on-site BMR units for the Project be fulfilled instead by paying to OCII an amount equal to one hundred fifty percent (150%) of the inclusionary housing fee (the "Affordable Housing Fee") that Section 415.5 of the Planning Code would otherwise require if the Project were not subject to the On-Site Requirement. Letter, Parcel F Owner LLC to S. Oerth, OCII (Dec. 17, 2020) ("Revised Variation Request"), attached as Exhibit B to the Commission Memorandum related to this Resolution; and,

WHEREAS, In the Revised Variation Request, the Developer explained that the Project was unique in that it will include a mix of hotel, offices, and residential units in the same high-rise building, its residential units are located on the upper 17 floors of an approximately 61-story tower, it provides desirable public amenities such as a public pedestrian way connecting Howard Street to the Transbay Transit Center, a pedestrian bridge providing public access to the Transit Center's new rooftop park, and its HOA dues will be in excess of $2500 per month. The Revised Variation Request concludes that the application of the On-Site Requirement to the Project creates practical difficulties that would prevent the administration of a successful affordable housing program because the HOA may raise fees at any time without regard to the effect on the BMR units resulting in it simply not being feasible for a BMR unit owner to be protected, over time, and thus creates an undue hardship for the Developer, the HOA, the MOHCD, and future owners of the BMR units; and,

WHEREAS, The Revised Variation Request proposes that the Successor Agency grant a variation on the condition that the Developer pay the Affordable Housing Fee, which is significantly higher than the fee that Section 415.5 of the Planning Code would require if the Project was located outside of the Project Area and not subject to the On-Site Requirement. Payment of the Affordable Housing Fee for OCII's development of affordable housing within the Project Area ensures that the variation's removal of on-site affordable units does not adversely affect the Successor Agency's compliance with the Transbay Affordable Housing Obligation; and,

WHEREAS, The following facts support a finding that the On-Site Requirement imposes practical difficulties for the Project creating undue hardships for the owners of the inclusionary below-market-rate units ("BMR Owners") and MOHCD, as the housing successor responsible for enforcing the long-term affordability restrictions on the units:

1) HOA fees pay for the costs of operating and maintaining the common areas and facilities of a luxury condominium project, including in this case the shared use of luxury hotel amenities in the lower hotel floors of the Project, such as a spa and fitness center, and generally must be allocated equally among all of the units subject to the assessment, Cal. Code Reg., title 10, § 2792.16(a). HOA fees may not be adjusted based on the below-market-rate ("BMR") status of the unit or the income level of the homeowner. If HOA fees increase, BMR Owners will generally be required to pay the same amount of increases in regular assessments and of special assessments as other owners.

2) The Successor Agency's Limited Equity Homeownership Program ("LEHP") ensures that income-eligible households are able to afford, at initial occupancy, all of the housing costs, but does not cover increases in HOA dues that occur over time. Initially, the LEHP will decrease the cost of the BMR unit itself to ensure that income-eligible applicants are able to meet all of the monthly costs, including HOA fees. Moreover, the Successor Agency nor MOHCD (which ultimately assumes authority over the BMR unit as a transferred housing asset) does not have a program for assisting owners in BMR units when increases in regular monthly HOA fees occur.

3) Members of homeowner associations may approve increases in HOA fees without the support of the BMR Owners because BMR Owners, particularly in a development with inclusionary units, typically constitute a small minority of the total HOA membership. Increases less than 20 percent of the regular assessment may occur without a vote of the HOA; increases exceeding 20 percent require a majority vote of members in favor. Cal. Civil Code § 5605 (b). In addition, a homeowner association may impose special assessments to cover the costs of capital expenditures for repairs and other purposes. *Id.*

4) When HOA fees increase or special assessments are imposed, BMR Owners whose incomes have not increased comparably may have difficulty making the higher monthly payments for HOA fees. *See e.g.* Carol Lloyd, *Owners' Dues Keep Going Up*, S.F. Chronicle, Aug. 5, 2007, *available at:* http://www.sfgate.com/default/article/Owners-dues-keep-going-up-2526988.php. The result is that housing costs may become unaffordable and some BMR Owners will face the hardship of having to sell their unit at the reduced prices required under the limited equity programs of the Successor Agency and MOHCD.

5) If the BMR Owner is forced to sell the inclusionary unit because of the high HOA fees, the cost of the restricted affordable unit, which will now include the high HOA fees, will be assumed by either the subsequent income-eligible buyer or by MOHCD, as the housing successor required to comply with the affordability restrictions. In either case, the high HOA dues will have caused an additional hardship, and it is not feasible for a BMR Owner to be protected, over time, from increases in regular and special HOA assessments; and,

WHEREAS, The hardship imposed by the On-Site Requirement constitutes an unreasonable limitation beyond the intent of the Redevelopment Plan to create affordable housing for the longest feasible time, as required under the Transbay Affordable Housing Obligation; and,

WHEREAS, The following facts support a finding that extraordinary circumstances apply to the Project:

1) The Project is unique in that it is a mixed-use building with its residential units located on the upper 17 floors of a 61-story tower. Of the high-rise developments recently approved or proposed in the Project Area, the Project will be the first building in San Francisco to include a mix of hotel, offices, and residential units in the same high-rise building. As noted above, the construction of affordable housing units at the top of a high-rise creates practical difficulties for maintaining the affordability of the units.

2) The Developer will pay OCII approximately $45 - 47 million, which is an amount equal to one hundred fifty percent (150%) of the inclusionary housing fee that Section 415.5 of the Planning Code would otherwise require if the Project was located outside of the Project Area and not subject to the On-Site Requirement.. *See* San Francisco Planning Code, §§ 415.1 et seq; and,

WHEREAS, OCII's use of the Affordable Housing Fee for affordable housing in the Project Area ensures that the variation will not be materially detrimental to the public welfare and is necessary to comply with Transbay Affordable Housing Obligation; and,

WHEREAS, Approval of the Revised Variation Request would be subject to approval by the Board of Supervisors, in its capacity as legislative body for the Successor Agency, because it constitutes a material change to a Successor Agency affordable housing program, Ordinance No. 215-12, §6(a) (providing that "the Successor Agency Commission shall not modify the Major Approved Development Projects or the Retained Housing Obligations in any manner that would . . . materially change the obligations to provide affordable housing without obtaining the approval of the Board of Supervisors...."); and,

WHEREAS, The San Francisco Planning Commission and Board of Supervisors will consider approving a development agreement that would be consistent with this Resolution by providing relief from the on-site affordable housing requirement in Section 249.28 of the Planning Code, and would require the Developer to pay the Affordable Housing Fee (based on the 2021 San Francisco Citywide Development Impact Fee Register) to OCII for affordable housing in the Project Area to further the Successor Agency's obligation to fulfill the Transbay Affordable Housing Obligation (the "Development Agreement"). The proposed Development Agreement would also provide that the Developer may pay the Affordable Housing Fee on the earlier to occur of: (a) issuance of the temporary certificate of occupancy associated with the residential portions of the Project; or (b) on the date that is two years after the effective date of the Project's Development Agreement between the City and the Parcel F Owner LLC (but only if the "first construction document," as defined in Section 401 of the Planning Code and Section 107A.13.1 of the Building

Code, has been issued for the Project). In addition, the proposed Development Agreement would require the Developer to provide OCII, prior to payment of the Affordable Housing Fee, with an irrevocable letter of credit for the full amount of the fee if the Developer and OCII reach agreement on a project at Transbay Block 4; and,

WHEREAS, On May 24, 2012, the San Francisco Planning Commission, as lead agency under the California Environmental Quality Act ("CEQA"), certified the FEIR, which analyzed the development of land under the Transit Center District Plan, including the development of the Project on the Project site. The Transit Center District is located approximately between Folsom and Market Streets, and between New Montgomery Street and the Embarcadero and includes Zone 2 of the Redevelopment Plan wherein the Planning Commission has land use authority under the Delegation Agreement. The FEIR is available for review at the Planning Department's website at: http://sfmea.sfplanning.org/2007.0558E_FEIR1.pdf, http://sfmea.sfplanning.org/2007.0558E_FEIR2.pdf,and, http://sfmea.sfplanning.org/2007.0558E_FEIR3.pdf; and,

WHEREAS, Prior to the Approvals for the Project, the Planning Department determined that the Project was eligible for review under CEQA Guideline § 15183 and issued a Certificate of Determination for a Community Plan Evaluation on August 27, 2019 (the "CPE"), determining the following: the Project would not result in effects on the environment that are peculiar to the Project or the Project site or that were not identified as significant effects in the FEIR; the Project would not result in potentially significant off-site or cumulative impacts that were not identified in the FEIR; the Project would not result in significant effects, which, as a result of substantial new information that was not known at the time the FEIR was certified, would be more severe than were already analyzed and disclosed in the FEIR; and the Project sponsor will undertake feasible mitigation measures specified in the FEIR to mitigate project-related significant impacts; and,

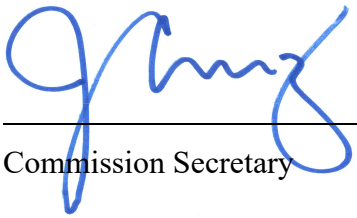
WHEREAS, A copy of the CPE is on file with the Commission Secretary and are incorporated herein by reference; now, therefore, be it

RESOLVED, That the Commission determines that its approval of the Revised Variation Request is not subject to further environmental review pursuant to CEQA Guidelines Section 15183 for the following reasons: the Project, irrespective of whether it provides affordable housing units off-site or the Affordable Housing Fee, would have the same density and would not result in effects on the environment that are peculiar to the Project or the Project site that were not identified as significant effects in the FEIR; the Project and the Variation Request would not result in potentially significant off-site or cumulative impacts that were not identified in the FEIR; the Project and the Variation Request would not result in significant effects, which, as a result of substantial new information that was not known at the time the FEIR was certified, would be more severe than were already analyzed and disclosed in the FEIR; and the Project sponsor will undertake feasible mitigation measures specified in the FEIR to mitigate project-related significant impacts; and, be it further

RESOLVED, That the Commission hereby approves a variation to the Redevelopment Plan's On-Site Requirement for the Project at 543-550 Howard Street that relieves the Developer from complying with the On-Site Requirements ,but that requires the Developer to pay OCII an amount equal to one hundred fifty percent (150%) of the inclusionary housing fee that Section 415.5 of the Planning Code would otherwise require if the Project were not subject to the On-Site Requirement, subject to approval by the Board of Supervisors, acting in its capacity as the legislative body for the Successor Agency; and, be it further

RESOLVED, The Commission on Community Investment and Infrastructure authorizes the Executive Director to take appropriate and necessary actions to effectuate the purpose of this resolution.

I hereby certify that the foregoing resolution was adopted by the Commission at its meeting of January 19, 2021.



Commission Secretary

COMMISSION ON COMMUNITY INVESTMENT AND INFRASTRUCTURE

RESOLUTION NO. 18 – 2022
Adopted June 21, 2022

ADOPTING ENVIRONMENTAL REVIEW FINDINGS PURSUANT TO THE CALIFORNIA ENVIRONMENTAL QUALITY ACT RELATED TO THE APPROVAL OF AMENDMENTS TO THE REDEVELOPMENT PLAN FOR THE TRANSBAY REDEVELOPMENT PROJECT AREA AND DEVELOPMENT CONTROLS AND DESIGN GUIDELINES FOR THE TRANSBAY REDEVELOPMENT PROJECT, A DISPOSITION AND DEVELOPMENT AGREEMENT FOR BLOCK 4 AND ADJACENT TEHAMA STREET RIGHT OF WAY WITHIN ZONE ONE OF THE TRANSBAY REDEVELOPMENT PROJECT AREA, THE SCHEMATIC DESIGN FOR THE DEVELOPMENT OF BLOCK 4, AND RELATED ACTIONS, SUCH ACTIVITIES BEING WITHIN THE SCOPE OF, AND ADEQUATELY DESCRIBED WITHIN, THE PREVIOUSLY APPROVED TRANSBAY TERMINAL/CALTRAIN DOWNTOWN EXTENSION/ REDEVELOPMENT PROJECT FINAL ENVIRONMENTAL IMPACT STATEMENT/ENVIRONMENTAL IMPACT REPORT A PROGRAM ENVIRONMENTAL IMPACT REPORT; TRANSBAY REDEVELOPMENT PROJECT AREA

WHEREAS, In furtherance of the objectives of the California Community Redevelopment Law (Health and Safety Code, section 33000 et seq. the "Community Redevelopment Law"), the Redevelopment Agency of the City and County of San Francisco ("Former Agency") undertook programs for the redevelopment of blighted areas in the City and County of San Francisco ("City"), including the Transbay Redevelopment Project Area ("Project Area"); and,

WHEREAS, The Board of Supervisors of the City and County of San Francisco ("Board of Supervisors") approved the Redevelopment Plan for the Transbay Redevelopment Project Area by Ordinance No. 124-05 (June 21, 2005) and by Ordinance No. 99-06 (May 9, 2006), as amended by Ordinance No. 84-15 (June 18, 2015) and Ordinance No. 62-16 (April 28, 2016) ("Redevelopment Plan"); and,

WHEREAS, The Redevelopment Plan establishes the land use controls for the Project Area and divides the Project Area into two subareas: Zone One, in which the Redevelopment Plan and Development Controls and Design Guidelines for the Transbay Redevelopment Project (as currently amended, the "Development Controls") regulate land uses, and Zone Two, in which the San Francisco Planning Code regulates land uses. Zone One is intended to be developed with predominantly residential uses. The Successor Agency solely administers and enforces land use entitlements for property and projects in Zone One and has delegated its authority over projects that do not require Successor Agency action in Zone Two to the San Francisco Planning Department pursuant to that certain Delegation Agreement between the Former Agency and the Planning Department for the Transbay Redevelopment Project Area (May 3, 2005); and,

WHEREAS, On June 15, 2004, the Board of Supervisors affirmed, by Motion No. 04-67, the certification under the California Environmental Quality Act (California Public Resources Code Sections 21000 et seq., and the CEQA Guidelines (14 California Code of Regulations Sections 15000 et seq. ("CEQA Guidelines," and collectively

"CEQA")) of the Final Environmental Impact Statement/Environmental Impact Report ("Final Environmental Document") for the Transbay Terminal/Caltrain Downtown Extension/ Redevelopment Project ("Project"), which included the Redevelopment Plan. Subsequently, the Board of Supervisors adopted, by Resolution No. 612-04 (October 7, 2004), findings that various actions related to the Project complied with CEQA and the Former Agency Commission adopted, by Resolution No. 11-2005 (January 25, 2005), findings and a statement of overriding considerations and a mitigation monitoring and reporting program, adopted in accordance with CEQA. Subsequent to the adoption of the Final Environmental Document and the findings, the Former Agency or the Successor Agency have approved and incorporated eight addenda into the analysis of the Final Environmental Document (as incorporated, the "FEIS/EIR") and made requisite findings under CEQA (findings referenced in this recital collectively referred to as the "CEQA Findings"). OCII staff has made the FEIS/EIR, addenda, and related documents available to the Commission and the public, and these files are part of the record before the Commission; and,

WHEREAS, On February 1, 2012, state law dissolved all redevelopment agencies including the Former Agency and required the transfer of certain of the Former Agency's assets and obligations to the Successor Agency to the Redevelopment Agency of the City and County of San Francisco ("Successor Agency"), commonly known as the Office of Community Investment and Infrastructure ("OCII") (Cal. Health & Safety Code §§ 34170 et seq., "Redevelopment Dissolution Law"). On June 27, 2012, the Redevelopment Dissolution Law was amended to clarify that successor agencies are separate public entities from the city or county that had originally established a redevelopment agency and they succeed to the organizational status of the former redevelopment agency to complete any work related to an approved enforceable obligation, Cal. Health & Safety Code § 34173 (g); and,

WHEREAS, The Board of Supervisors, acting as the legislative body of the Successor Agency, adopted Ordinance No. 215-12 (Oct. 4, 2012), which, among other matters: (a) acknowledged and confirmed that the Successor Agency is a separate legal entity from the City, and (b) established this Successor Agency Commission ("Commission") and delegated to it the authority to (i) act in place of the Former Agency Commission to, among other matters, implement, modify, enforce and complete the Redevelopment Agency's enforceable obligations, (ii) approve all contracts and actions related to the assets transferred to or retained by the Successor Agency, including, without limitation, the authority to exercise land use, development, and design approval, and to approve amendments to redevelopment plans as allowed under the Community Redevelopment Law, as amended by the Redevelopment Dissolution Law, and (iii) take any action Redevelopment Dissolution Law requires or authorizes on behalf of the Successor Agency and any other action that this Commission deems appropriate, consistent with Redevelopment Dissolution Law, to comply with such obligations; and,

WHEREAS, The Successor Agency now proposes to take actions related to Transbay Block 4 and the adjacent Tehama Street right of way within Zone 1 of the Project Area, an approximately 56,375 square-foot area generally located at 200 Main Street, bounded by Howard, Main and Beale Streets and extending approximately 205 feet southeast from Howard Street (Assessor's Block 3739 Lot 010 ("Block 4") and Lot 011 ("Tehama Parcel", and collectively the "Site")). These actions consist of: (1) amendments to the Redevelopment Plan and the Development Controls, (2) authorization to enter into a disposition and development agreement with F4 Transbay Partners LLC, a Delaware limited liability company ("Developer") and Transbay Block 4 Housing Partnership, L.P., a California limited partnership, governing the sale and development of the Site with a 47-story tower with six-story townhome adjunct, a 16-story mid-rise building, and one-story podium with

underground facilities, which comprises 681 total residential units, including 155 market-rate condominium units in the upper portion of the tower and townhome adjunct, 324 rental units in the lower portion of the tower (including 105 below market rate units affordable to moderate income households), and 202 rental units in the mid-rise building (including 201 units affordable to low- to moderate-income households), ground floor retail, open space, streetscape and Tehama right of way improvements, and underground parking (collectively the "Block 4 Project"), (3) conditional approval of the Schematic Design for the development of the Site, (4) related actions of responsible agencies (collectively, items 1 through 4 are the "Proposed Actions"); and,

WHEREAS, The Successor Agency, as lead agency and in consultation with the San Francisco Planning Department, has prepared Addendum No. 9 to the FEIS/EIR, dated June 13, 2022 ("Addendum," see Exhibit A). The Addendum evaluates the potential environmental effects associated with approval of the Proposed Actions; and,

WHEREAS, In preparing the Addendum, the Successor Agency used a vehicle-miles-travelled or "VMT"-based approach for analyzing transportation impacts, as directed by Commission Resolution No. 25-2019 (October 15, 2019), which adopted criteria for determining the significance of transportation impacts based on VMT consistent with the Governor's Office of Planning and Research publication Technical Advisory on Evaluating Transportation Impacts Under CEQA (December 2018) as appropriately modified by discussion of VMT-based significance criteria and methodology for vehicle trips in the San Francisco Planning Department publication Transportation Impact Analysis Guidelines (February 2019), which the Commission found to be in conformance with the requirements of CEQA Section 21099 and CEQA Guidelines 15064.3; and,

WHEREAS, The Addendum recommends implementation of Improvement Measure I-TR-1 (Driveway and Loading Operations Plan (DLOP)) and Improvement Measure I-TR-2: (Queue Abatement) (full text included in Exhibit A), which as explained further in the Addendum are not necessary for the reduction of impacts of the Proposed Actions to less-than-significant levels, but will further minimize transportation impacts of the Proposed Actions, and Developer has agreed that the will be implemented under the requirements of the DDA; and,

WHEREAS, The Successor Agency prepared the Addendum in compliance with CEQA and the Addendum reflects the independent judgment and analysis of the Successor Agency, and the Successor Agency concludes that the Proposed Actions are within the scope of impacts analyzed in the FEIS/EIR and will not result in any new significant impacts or a substantial increase in the severity of previously identified significant effects that alter the conclusions reached in the FEIS/EIR for the reasons stated in the Addendum; and,

WHEREAS, In making the necessary findings for the Proposed Actions, the Successor Agency considered and reviewed the FEIS/EIR and prepared necessary documents in support of the Addendum, which documents it has made available for review by the Commission and the public, and these files are part of the record before the Commission. Copies of the Addendum and supporting documentation are on file with the Commission Secretary and incorporated in this Resolution by this reference; and,

WHEREAS, Based on the analysis in the Addendum, the Successor Agency concludes that the analyses conducted and the conclusions reached in the FEIS/EIR remain valid and the Proposed Actions will not cause new significant impacts not identified in the FEIS/EIR or substantially increase the severity of previously identified significant impacts, and no new mitigation measures will be necessary to reduce significant

impacts. Further, as described in the Addendum, no changes have occurred, with respect to either the development or the circumstances surrounding the development contemplated in FEIS/EIR, that will require major revisions of the FEIS/EIR due to the involvement of new significant effects or a substantial increase in the severity of previously identified significant effects, and no new information has become available that shows that the Block 4 Project will cause new or more severe significant environmental impacts. Therefore, no subsequent or supplemental environmental review is required under CEQA beyond the Addendum to approve the Proposed Actions, the Block 4 Project and other actions necessary for the Block 4 Project; now therefore be it,

RESOLVED, That the Commission has reviewed and considered the FEIS/EIR and associated CEQA Findings as modified by the Addendum and related findings previously adopted by the Former Agency Commission and the Commission, including the statements of overriding considerations and mitigation monitoring and reporting programs, the Addendum including the findings as set forth in the Addendum and the supporting documentation in the Successor Agency's files related to the Addendum. The Commission adopts the findings made in the Addendum; and, be it further

RESOLVED, That the Commission finds and determines that the Project as modified by the Proposed Actions is within the scope of the Project analyzed in the FEIS/EIR (as modified by the Addendum) and requires no further environmental review pursuant to CEQA and the CEQA Guidelines Sections 15168, 15180, 15162, and 15163 for the following reasons:

(1) implementation of the Proposed Actions does not require major revisions to the FEIS/EIR due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant impacts; and,

(2) no substantial changes have occurred with respect to the circumstances under which the projects analyzed in the FEIS/EIR will be undertaken that would require major revisions to the FEIS/EIR due to the involvement of new significant environmental effects, or a substantial increase in the severity of effects identified in the FEIS/EIR; and,

(3) no new information of substantial importance to the projects analyzed in the FEIS/EIR has become available, which would indicate that (i) the Project as modified by the Proposed Actions will have significant effects not discussed in the FEIS/EIR; (ii) significant environmental effects will be substantially more severe; (iii) mitigation measures or alternatives found not feasible, which would reduce one or more significant effects, have become feasible; or (iv) mitigation measures or alternatives, which are considerably different from those in the FEIS/EIR, will substantially reduce one or more significant effects on the environment that would change the conclusions set forth in the FEIS/EIR.

I hereby certify that the foregoing resolution was adopted by the Successor Agency Commission at its meeting of June 21, 2022.

Commission Secretary

EXHIBIT A: Ninth Addendum to the FEIS/EIR

Addendum to Environmental Impact Report

Date:	June 13, 2022
Case No.:	2018-015785ENV
Project Title:	Transbay Block 4 Redevelopment Project
EIR Case No.:	Case No. 2000.048E
State Clearinghouse No.:	95063004, certified April 22, 2004
Project Sponsor:	Allie Stein, Hines; allie.stein@hines.com (415.399.6257)
Agency Contact:	José Campos, Office of Community Investment and Infrastructure, jose.campos@sfgov.org (415.749.2554)
Staff Contact:	Michael Li, San Francisco Planning Department, michael.j.li@sfgov.org (628.652.7538)

CONCLUSION

Based on the further analysis provided below, it is concluded that the analyses conducted and the conclusions reached in the final EIS/EIR certified on April 22, 2004, remain valid. The proposed revisions to land use controls established by the Redevelopment Plan for the Transbay Redevelopment Project Area and the Development Controls and Design Guidelines for the Transbay Redevelopment Project, and accompanying development of Transbay Block 4 would not cause new significant impacts that were not identified in the EIS/EIR, nor would the Proposed Project cause significant impacts that were previously identified in the EIS/EIR to become substantially more severe. No new mitigation measures would be necessary to reduce significant impacts. No changes have occurred with respect to circumstances surrounding the Proposed Project that would cause significant environmental impacts to which the Proposed Project would contribute considerably, and no new information has become available that shows that the Proposed Project would cause significant environmental impacts. Therefore, no supplemental environmental review is required beyond this addendum.

I do hereby certify that the above determination has been made pursuant to state and local requirements.

José Campos

Manager of Planning and Design Review

Office of Community Investment and Infrastructure

June 13, 2022

Date of Determination

REMARKS

The Successor Agency to the Redevelopment Agency of the City and County of San Francisco (commonly referred to as the Office of Community Investment and Infrastructure or "OCII"), proposes to approve a residential development project on Block 4 of the Transbay Redevelopment Project Area and a new segment of Tehama Street, which includes the following actions (collectively, the Proposed Project): (1) authorize and recommend for approval to the Board of Supervisors of the City and County of San Francisco (City) an amendment to the Redevelopment Plan for the Transbay Redevelopment Project Area (Redevelopment Plan) to increase the maximum height on Transbay Block 4 from 450 feet to 513 feet and increase the maximum floor plate sizes on Block 4 from 7,500 square feet to 13,500 square feet for buildings between 85 feet and 250 feet in height and from 13,000 square feet to 15,200 square feet for buildings between 500 feet and 550 feet in height but limited to the portion of such buildings that is between 85 feet and 122 feet in height; (2) an amendment to the Development Controls and Design Guidelines for the Transbay Redevelopment Project Area (DCDG) to make conforming and related modifications to certain height and bulk restrictions, setback requirements, and other development controls; and (3) authorization of a Disposition and Development Agreement (DDA) and approval of a Schematic Design governing development of the residential development project on Block 4 and a new segment of Tehama Street. As shown in Figure 1, the Project Site consists of Assessor's Block 3739 Lot 010 (Block 4) and Lot 011 (new Tehama Street).

A. PROJECT DESCRIPTION

As shown in Figure 2, the proposed residential development on Transbay Block 4 is a mixed-use development consisting of a Tower Project, a Mid-Rise Project, a Podium that includes the Shared Parking Garage and Public Open Space (each as further described below), and associated streetscape improvements that includes a new segment of Tehama Street. Overall, the Proposed Project would include approximately 955,259 gross square feet[1] (gsf), including approximately 839,341 gsf of residential space and approximately 8,389 gsf of ground-floor retail space. The proposed buildings at the Project Site, as depicted in Figure 3 and Figure 4, would include the following:

- The Tower Project would combine a proposed 513-foot-tall, 47-story mixed-use residential high-rise tower at the corner of Howard Street and Main Street with an adjacent 71-foot-tall, six-story townhouse building, facing Tehama Street. The top of the mechanical enclosure would extend up to 39 feet above the roof of the tower; therefore, the tallest point on the Tower Project would be up to 552 feet above grade. The proposed program at the Tower Project would include ground-floor retail spaces fronting Howard Street, 324 apartment units, 20 townhouse units, and 135 condominium units, along with amenity spaces.
- The Mid-Rise Project would include a 163-foot-tall, 16-story mixed-use residential mid-rise building, facing Howard Street and Beale Street. The top of the mechanical enclosure would extend up to 16 feet above the roof; therefore, the total height of the Mid-Rise Project would be up to 179 feet when the mechanical penthouse is included. The Mid-Rise Project would include 202 apartment units, community rooms, laundry rooms, and other indoor amenities, along with

[1] The total gsf includes residential gsf and retail gsf as well as approximately 107,529 gsf for major utilities, underground parking, and loading and related back-of-house areas on the ground floor.

roof terraces. The ground-floor area of the Mid-Rise Project would include retail space along Howard and Tehama streets.

- The Podium building would consist of a Shared Parking Garage located on three basement levels that would include major utilities, trash areas, tenant storage areas, and parking for users of the Proposed Project. Vehicular parking would consist of approximately 224 physically marked stalls providing parking for up to 275 vehicles (including two car-share vehicles), through a combination of valet parking and vehicle stackers. The Proposed Project would provide a minimum of 556 class I combined bicycle parking spaces within the basement levels of the proposed garage, also serviced by valet staff. In addition, the Podium building would consist of an up to a 20-foot high single-story above ground, connected to and shared by both the Tower Project and the Mid-Rise Project and the basement levels below the entire Proposed Project. The Podium would house utility rooms and related back-of-house services, loading dock, ground-floor valet parking drop-offs, one parking space, and drive aisles and driveway ramps. The roof of the Podium would contain a minimum of 4,250 square feet of Public Open Space, which would be connected by a stairway and a stepped terrace open space connections to Howard and Tehama streets (respectively) at ground level.

Vehicular access to the Project Site would be provided from a new 24-foot-wide curb cut and two-way driveway at Main Street. Off-street commercial loading would occur within the loading dock, which would be accessible from a new 24-foot-wide curb cut on Beale Street. Approximately 340 linear feet of curb would be designated for commercial or passenger loading (i.e., 120 feet on Howard Street, 40 feet on Main Street, 180 feet on Tehama Street). This amount of curb space would equate to 17 passenger loading spaces (assuming 20 feet per space) or about 10 commercial loading spaces (assuming 30 to 35 feet per space). Passenger loading would be in effect 24 hours per day, seven days per week. Commercial loading would be in effect Monday through Saturday from 7 a.m. to 4 p.m., consistent with commercial loading zones in the area. The specific allocation of curb space between passenger and commercial loading has not been defined, and all color curb changes would be subject to review and approval by the San Francisco Municipal Transportation Agency (SFMTA).

Proposed Elevations - Howard Street (North) & Beale Street (West)

Streetscape modifications adjacent to the Project Site would be consistent with the *Transbay Redevelopment Project Area Design for Development* (Design for Development) document published in October 2003 and described and defined in the Redevelopment Plan. The Design for Development provides a development framework for the Transbay Redevelopment Project Area as well as specific design recommendations that apply to all development in the area, including the Proposed Project. For Tehama Street, the Project Sponsor would be responsible for implementing all of the streetscape improvements described below. For Beale Street, Howard Street, and Main Street, the Project Sponsor would be responsible for implementing the streetscape improvements between the property line and the curb; the City would implement the streetscape improvements beyond the curb. Proposed modifications to streets adjacent to the Project Site are as follows:

- **Tehama Street.** The Proposed Project would make Tehama Street a new midblock alley (i.e., a 40-foot right-of-way) between Beale Street and Main Street. The Tehama Street roadway would be approximately 21 feet wide and have one westbound vehicle travel lane, approximately 14 feet wide. A total of nine passenger or commercial loading spaces (about 180 feet long), including two accessible spaces with curb ramps, would be provided on the north side of the street. Raised crosswalks would be provided at the Beale Street and Main Street intersections, connecting the Project Site with the south-adjacent (future) Transbay Block 3 Park. A 12-foot-wide sidewalk with an 8.5 feet clear walkway and curbside tree zone would be constructed on the north side of the street, and a 7-foot-wide sidewalk would be constructed on the south side of the street. A bulb-out would be constructed at the northeast corner of the Tehama Street/Beale Street intersection, increasing the sidewalk width to 19 feet (from 12 feet) and reducing the Tehama Street crossing distance from 21 feet to 14 feet.
- **Beale Street.** Vehicle travel lanes would be reduced from three southbound travel lanes (two mixed-flow lanes and one bus-only lane) to two southbound mixed-flow lanes. A curbside casual carpool lane would be provided on the west side of the street, along with a 6-foot-wide southbound bicycle lane and a 2-foot, 6-inch buffer to separate the bicycle lane from the travel lane. Under the Design for Development program, the east sidewalk would be widened from 10 feet to 30 feet and include a 9-foot-wide clear path of travel adjacent to the building, a 17-foot-wide landscaped area, and a 4-foot-wide hardscaped area along the east curb. A 24-foot-wide curb cut would be constructed to provide vehicle access to the proposed off-street loading dock. However, the City has approved the Active Beale Project, which, instead, would consist of a 12-foot-wide two-way bicycle track and an 8-foot buffer and would be constructed by the City to separate the bicycle lanes from the travel lanes. The Project Sponsor would be responsible for constructing the east sidewalk, which would be widened from 10 feet to 17 feet, 6 inches near the Howard Street intersection and include a 9-foot-wide clear path of travel adjacent to the building; a 6-foot, 6 inch-wide landscaped area; and a 2-foot-wide hardscaped area along the east curb.
- **Howard Street.** Vehicle travel lanes would be reduced from four travel lanes (two westbound mixed-flow lanes, one eastbound mixed-flow lane, and one eastbound bus-only left-turn lane) to two travel lanes (one westbound mixed-flow lane and one eastbound mixed-flow lane), with an eastbound left-turn lane at Main Street. A 12-foot-wide, two-way protected cycle track (class I) would be constructed on the south side of the street, and the existing class III lanes (sharrows) would be removed. Six passenger or commercial loading spaces (about 120 feet long) would be marked on the Project Site frontage, and five passenger or commercial loading spaces (about

100 feet long) would be marked on the opposite (north) side of Howard Street, near the intersection with Beale Street. The existing 12-foot-wide sidewalk with new trees on curbside zone and the 16-foot-wide sidewalk on the north side would be maintained on the street.

- **Main Street.** Vehicle travel lanes would be reduced from three northbound travel lanes (two mixed-flow lanes and one bus-only lane) to two northbound mixed-flow lanes. A northbound 6-foot-wide curbside bicycle lane, with a 2-foot, 6-inch buffer to separate it from the travel lanes, would be provided on the east side of the street. On the west side of the street, two passenger or commercial loading spaces would be marked in an approximately 40-foot-long bulb-in on the Project Site frontage north of the proposed garage driveway. Under the Design for Development program, the west sidewalk would be widened from 15 feet to 30 feet and include a 9-foot-wide clear path of travel adjacent to the Tower Project and two configurations for landscaped and hardscaped areas. North of the driveway, the landscaped area would be reduced to 12.5 feet in width, and the hardscaped area would be reduced to 2.5 feet in width at the loading cut-in. South of the garage driveway would be a 17-foot-wide landscaped area and a 4-foot-wide hardscaped area along the curb. A 24-foot-wide curb cut would be constructed to provide vehicular access to the proposed valet parking in the below-grade garage. The City is studying the design of a new one-way protected bicycle lane on the east side of Main Street, which, if approved, would reduce the sidewalk expansion at the Project Site from the proposed 30 feet to 25 feet, 6 inches.

Detailed construction plans have not been finalized. However, based on preliminary plans, it is anticipated that construction activities would take up to approximately 48 months to complete. Work is expected to occur Monday through Friday from 7 a.m. to 8 p.m. On occasion, construction may also take place on Saturdays from 8 a.m. to 4 p.m. on an as-needed basis and subject to compliance with the San Francisco Noise Ordinance and Department of Building Inspection permit provisions. Construction staging would occur primarily within the confines of the Project Site but occasionally use portions of the public right-of-way along Howard, Main, and Beale streets. Travel-lane, parking-lane, and sidewalk closures would most likely be needed. During periods of travel-lane and sidewalk closures, wayfinding signs and pedestrian protection would be erected, as appropriate, in accordance with the public works code and the blue book.[2]

The Proposed Project described above would require amendments to the Transbay Redevelopment Plan and DCDG, as follows:

Redevelopment Plan Amendments

No.	*Topic*	*Plan Standards*	*Proposed Changes*
1	Tower Maximum Height	Maximum height on Block 4 is 450 feet	Increase maximum height to 513 feet on Block 4
2	Increase Bulk Limit on Tower (maximum floor plate area)	Maximum floor plate area is 13,000 square feet (sf) for the portions of a 513-foot-tall Tower higher than 85 feet	Increase maximum floor plate area on Block 4 to 15,200 sf for buildings over 500 feet tall, but limited to the portion of said

[2] San Francisco Municipal Transportation Agency, *Regulations for Working in San Francisco Streets*, 8th edition, revised October 202, https://www.sfmta.com/sites/default/files/reports-and-documents/2022/05/blue_book_8th_ed_accessible_rev_5-2022_v3.7.4.pdf, accessed June 14, 2022.

			buildings between 85 feet and 122 feet in height
3	Increase Bulk Limit on Mid-Rise Project (maximum floor plate area)	Maximum floor plate area of 7,500 sf for buildings with heights in the range of 85 feet to 250 feet (height of Mid-Rise Project)	Increase maximum floor plate area to 13,500 sf for buildings on Block 4 with heights in the range of 85 feet to 250 feet

Overall Block 4 DCDG Amendments

No.	*Topic*	*DCDG Standards*	*Proposed Changes*
1	Parcel, Setback, & Height Maps	Proposed Project is not compliant with restrictions on Parcel Map 3, Setback Map 4, and Height Map 5	Add alternative to parcel, setback, and height maps to match the Proposed Project
2	Construction over Open Space Parcel	Construction over Open Space Parcel allowed on only one block fronting Folsom Street to accommodate expansion of a ground-floor commercial use, with open space on roof	Allow construction over Open Space Parcel on Block 4 to accommodate ground-floor parking and drive aisles, with open space on roof
3	Townhouse Frontage	Required on Main and Beale streets on Block 4	Eliminate requirement for Townhouse frontages on Main and Beale streets
4	Setbacks on Beale, Howard, Main, and Tehama Streets	Six-foot to 10-foot setbacks required	Eliminate setback requirement on Beale and Howard streets, reduce setback length on Main Street frontage to coincide with Townhouse building, and remove setback requirement on Mid-Rise Project's Tehama Street frontage
5	Off-street Parking on Ground Floor	Off-street parking not allowed on ground floor	Permit off-street handicapped parking and temporary valet parking on the ground floor of Block 4

Tower Project DCDG Amendments

No.	*Topic*	*DCDG Standards*	*Proposed Changes*
6	Tower Building Maximum Height	Maximum height is 450 feet on Block 4	Increase maximum height of Tower Parcel to 513 feet on Block 4
7	Tower Building Maximum Screening Height	Maximum of 10% of building height, or 51 feet, for a 513-foot-tall Tower	Maximum of 39 feet of screening above Tower roofline—must adequately screen mechanical equipment

8	Townhouse Parcel Height	Maximum height of Townhouse Parcels is 50 feet	Increase maximum height of Townhouse Parcel to 71 feet on Block 4
9	Townhouse Maximum Number of Floors	Maximum of four floors	Increase to maximum of six floors for Townhouses on Block 4
10	Maximum Plan Dimension	Maximum plan dimension of 130 feet for buildings with heights between 501 and 550 feet	Increase maximum plan dimension to 150 feet for buildings with heights between 501 and 550 feet on Block 4
11	Maximum Floor Plate Aspect Ratio	Maximum 1:1.2 for buildings with heights between 501 and 550 feet	Increase to 1:1.46
12	Maximum Floor Plate Area	Maximum 13,000 sf above 85 feet for buildings with heights between 501 feet and 550 feet	Increase maximum floor plate area on Block 4 to 15,200 sf for the portions of a Tower over 500 feet tall between 85 feet and 122 feet in height
13	Townhouse Width	Maximum of 30-foot-wide Townhouse modules between unit demising walls	Apply to architectural expression of façade/modulation on Block 4

Mid-Rise Project DCDG Amendments

No.	*Topic*	*DCDG Standards*	*Proposed Changes*
14	Block 4 Podium 1 Parcel Height	Maximum of 65 feet	Increase height to maximum 163 feet, redesignate as Mid-Rise Parcel
15	Block 4 Podium 2 Parcel Height	Maximum of 85 feet	Increase height to maximum 115 feet, redesignate as Mid-Rise Parcel
16	Maximum Plan Dimension	Maximum plan dimension of 100 feet for buildings with heights in the range of 85 feet to 250 feet	Increase maximum plan dimension for buildings with heights in the range of 85 feet to 250 feet on Block 4 to 147 feet
17	Maximum Floor Plate Aspect Ratio	Maximum 1:1.6 for buildings with heights in the range of 85 feet to 250 feet	Increase to 1:1.7 for buildings with heights in the range of 85 feet to 250 feet on Block 4
18	Maximum Floor Plate Area	Maximum 7,500 sf for buildings heights in the range of 85 feet to 250 feet	Increase maximum floor plate area to 13,500 sf for buildings with heights in the range of 85 feet to 250 feet on Block 4
19	Mid-rise Parcel Designation	Designated previously as Townhouse Parcel	Redesignate about 75-foot-long portion of Townhouse Parcel to the Block 4 Mid-Rise Parcel

20	Mid-rise Parcel Height at Tehama & Beale	Maximum height of Townhouse Parcel is 50 feet	Portion of Townhouse Parcel redesignated as Mid-Rise Parcel includes maximum height increase to 68 feet

BACKGROUND

A final environmental impact statement/environmental impact report for the Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project (EIS/EIR Project),[3] San Francisco Planning Department (Planning Department) case number 2000.048E and State Clearinghouse number 95063004, was certified on April 22, 2004, at a joint hearing of the San Francisco Planning Commission and the Transbay Joint Powers Board. The EIS/EIR Project consisted of (1) alternative designs for the new Transbay Terminal; (2) an underground extension to the Caltrain commuter rail system, extending 1.3 miles from its current terminus at Fourth and King streets to downtown San Francisco; and (3) several land use redevelopment alternatives as part of the Transbay Redevelopment Plan. The Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project EIS/EIR has been supplemented with eight addenda issued by the co-lead agencies and/or the responsible agencies administering the EIS/EIR Project.

The Transbay Redevelopment Plan sets forth land use and zoning standards as well as public street and streetscape improvements south of the Transbay Terminal, providing additional office, retail/hotel, and residential development, including affordable housing, in the area. Under the Transbay Redevelopment Plan, OCII, as the successor agency to the Redevelopment Agency of the City, has land use authority over Zone One of the Transbay Redevelopment Plan/Redevelopment Project Area and is the California Environmental Quality Act (CEQA) lead agency for approval actions under the Redevelopment Plan.

Development of Assessor's Block 3739 was included in the Transbay Redevelopment Plan and EIS/EIR analysis. Table 1, below, provides an overview of the development on Assessor's Block 3739 analyzed in the EIS/EIR under the Full Build Alternative and the Reduced Scope Alternative as well as the proposed development on Block 4 under the Proposed Project. The EIS/EIR studied the two alternatives as representations of the range of reasonable development that could occur. As shown in Table 1, the EIS/EIR analyzed development on Assessor's Block 3739 of up to 1,758,375 gsf of residential space (1,465 dwelling units), 397,360 gsf of office space, and 98,935 gsf of retail space under the Full Build Alternative and up to 878,400 gsf of residential space (732 dwelling units) and 58,400 gsf of retail space under the Reduced Scope Alternative.

Available: <https://tjpa.org/documents/final-eiseir>. Accessed September 2, 2020.

Table 1. Overview of EIS/EIR Full Build Alternative and Reduced Scope Alternative Assumptions Compared to Proposed Project

Square Footage	EIS/EIR Full Build Alternative Assumptions for Assessor's Block 3739	EIS/EIR Reduced Scope Alternative Assumptions for Assessor's Block 3739	Proposed Project
Residential (number of d.u.)	1,758,375 gsf (1,465 d.u.)	878,400 gsf (732 d.u.)	839,341 gsf (681 d.u.)
Office	397,360 gsf	0 gsf	0 gsf
Retail	98,935 gsf	58,400 gsf	8,389 gsf
Total	***2,254,670 gsf***	***936,800 gsf***	***847,730 gsf***[a]

Source: Hines, 2022.

Note:

[a.] The total includes residential gsf and retail gsf, plus areas such as lobbies and other shared spaces. The total does not include the area for underground parking, major utilities, or loading on the ground floor. Accounting for all of the aforementioned areas, the Proposed Project would construct a total of approximately 955,259 gsf.

d.u. = dwelling unit; gsf = gross square feet

The DCDG added further specificity to the proposed bulk/massing on the Project Site by calling for townhouses up to 50 feet in height on the southwestern portion of the Project Site; a mid-rise building[4] up to 65 feet in height on the northwestern portion of the Project Site; a mid-rise building up to 85 feet in height on the northern portion of the Project Site; and a tower up to 450 feet in height on the eastern portion of the Project Site, with open space in the central core of the Project Site.[5]

The EIS/EIR characterized the anticipated development in the Transbay Redevelopment Project Area as transit-oriented land uses in the vicinity of the Transbay Terminal, providing a mix of residential and commercial space. The land use plan studied in the EIS/EIR identified a development program for the Block 4 site, consisting of primarily residential uses, with some office and ground-floor retail uses and services.

B. PROPOSED REVISIONS TO THE EIS/EIR PROJECT

The Transbay Redevelopment Plan divided Assessor's Block 3739 into three separate areas: Block 2 (fronting Folsom Street),[6] Block 3 (proposed to include a public park), and Block 4 (fronting Howard Street).

4 DCDG nomenclature refers to these mid-rise buildings as "podium" buildings, but for sake of clarity they are referred to herein as "mid-rise" buildings, as distinguished from the actual Podium building in the Proposed Project.

5 San Francisco Redevelopment Agency, *Development Controls and Design Guidelines for the Transbay Redevelopment Project*, January 25, 2005 (as amended), https://sfocii.org/sites/default/files/20180906_TB_DCDG_Revision.pdf, accessed June 6, 2022.

6 A Request for Proposals (RFP) was released by OCII in August 2020 for the development of mixed-use affordable family and senior rental housing units at Transbay Block 2.

The Project Site, and the focus of this EIR addendum, includes Block 4 and a new segment of Tehama Street immediately adjacent to the southeast.

The Proposed Project differs from the development described in the EIS/EIR in that a 513-foot-tall tower with slightly larger massing at heights between 85 to 122 feet (the Tower Project) is now proposed at the eastern edge of Block 4 instead of the previously analyzed 450-foot-tall tower, and permits larger maximum floor plates (up to 15,200 square feet) that portion of the tower between 85 feet and 122 feet in height. In addition, the mid-rise components of the Proposed Project would be taller than the height and have greater bulk/massing than the limits studied in the EIS/EIR. Table 2, below, compares the development on Assessor's Block 3739 analyzed in the EIS/EIR under the Full Build Alternative to the proposed development on Block 4 under the Proposed Project.

Table 2. Detailed Comparison of EIS/EIR Full Build Alternative Assumptions to Proposed Project

Features	EIS/EIR Full Build Alternative Assumptions for Assessor's Block 3739	Proposed Project
Demolition	All existing structures and parking lots on the site.	All existing structures and parking lots on the site.
Land Use Types	Residential, retail, office	Residential, retail
Total Square Footage	2,254,670 gsf[a]	847,730 gsf[b]
Residential Square Footage	1,758,375 gsf	839,341 gsf
Number of d.u.[b]	1,465 d.u.[a]	681 d.u.
Retail Square Footage	98,935 gsf[a]	8,389 gsf
Tower Height	Up to 450 feet	513 feet*
Townhouse Height	Up to 50 feet	71 feet*
Podium Height (northwest)	Up to 65 feet	163 feet*
Podium Height (north)	Up to 85 feet	115 feet*

Source: Hines, 2022.

Notes:

a. Includes Full Build Alternative for all of Assessor's Block 3739.

b. The total includes residential gsf and retail gsf, plus areas such as lobbies and other shared spaces. The total does not include the area for underground parking, major utilities, or loading on the ground floor. Accounting for all of the aforementioned areas, the Proposed Project would construct a total of approximately 955,259 gsf.

* Indicates non-conformance with the Transbay Redevelopment Plan and the EIS/EIR analysis. Refer to the lists of required amendments to the Transbay Redevelopment Plan and DCDG in Section A, Project Description.

d.u. = dwelling unit; gsf = gross square feet

As shown in Table 2, all features of the Proposed Project would conform to the Redevelopment Plan land use program studied in the EIS/EIR, with the exception of the building heights and bulk/massing. At 513 feet tall, the Proposed Project's tower would be 63 feet taller than the 450-foot height limit established in the Transbay Redevelopment Plan and analyzed in the EIS/EIR. In addition, the increased townhouse and

podium (mid-rise) heights would be 21 to 98 feet taller than the respective height limits. OCII is therefore seeking amendments to the Transbay Redevelopment Plan and DCDG together with its authorization of a DDA and approval of a Schematic Design for the Block 4 Project.

As discussed above, the Transbay Redevelopment Plan divided Assessor's Block 3739 into three separate areas: Block 2 (fronting Folsom Street), Block 3 (proposed to include a public park), and Block 4 (fronting Howard Street). The Proposed Project would not include any potential development on Block 2. The EIS/EIR assumed a maximum buildout on an assessor's block level as the basis for the impact conclusions. To understand the maximum buildout on Assessor's Block 3739 and whether the Proposed Project would fall within the development assumptions for Assessor's Block 3739 in the EIS/EIR, the Proposed Project and the potential development on Block 2 need to be considered together. Table 3, below, provides an overview of the development on Assessor's Block 3739 analyzed in the EIS/EIR under the Full Build Alternative, the proposed development on Block 4 under the Proposed Project, and the potential development on Block 2. As shown in Table 3, the total proposed development on Blocks 2 and 4 would be within the parameters analyzed in the EIS/EIR under the Full Build Alternative for residential, office, and retail square footage; total square footage; and total number of dwelling units. Therefore, this EIR addendum will focus on the proposed increases in heights and bulk/massing at Block 4 compared to the heights and bulk/massing analyzed in the EIS/EIR.

Table 3. Overview of EIS/EIR Full Build Alternative Assumptions Compared to Block 2 and Proposed Project

Square Footage	EIS/EIR Full Build Alternative Assumptions for Assessor's Block 3739	Block 2 (Potential)[a]	Block 4 (Proposed Project)	Total Proposed Development at Blocks 2 and 4
Residential (number of d.u.)	1,758,375 gsf (1,465 d.u.)	239,200 gsf (341 d.u.)	839,341 gsf (681 d.u.)	1,078,541 gsf (1,022 d.u.)
Office	397,360 gsf	0 gsf	0 gsf	0 gsf
Retail	98,935 gsf	12,800 gsf[b]	8,389 gsf	21,189 gsf
Total[c]	***2,254,670 gsf***	***252,000 gsf***	***847,730 gsf***	***1,099,730 gsf***

Sources: Hines, 2022; OCII, 2022.

Notes:

a. Development includes potential buildout at Block 2, but the project at Block 2 is not analyzed in this EIR addendum.

b. The retail square footage includes the proposed childcare uses at Block 2.

c. The total includes residential gsf and retail gsf, plus areas such as lobbies and other shared spaces. The total does not include the area for underground parking, major utilities, or loading on the ground floor. Accounting for all of the aforementioned areas, the Proposed Project would construct a total of approximately 955,259 gsf.

d.u. = dwelling unit; gsf = gross square feet

C. REQUIRED PROJECT APPROVALS

As shown in Table 2, all features of the Proposed Project would conform to the Redevelopment Plan land use program studied in the EIS/EIR, with the exception of building heights and bulk/massing. At 513 feet tall, the Proposed Project's tower would be 63 feet taller than the 450-foot height limit established in the Redevelopment Plan and analyzed in the EIS/EIR. In addition, the townhouse and podium heights would be 21 to 98 feet taller than the respective height limits. OCII is therefore seeking an amendment to the Redevelopment Plan and DCDG to increase the height limit on the Block 4 site from 450 feet to 513 feet and approval of a DDA and a Schematic Design for the Proposed Project.

The following approvals are required for the Proposed Project:

OCII Commission

- Redevelopment Plan Amendment
- Report to Board of Supervisors on Redevelopment Plan Amendment
- DCDG Amendment
- DDA
- Schematic Design

Planning Commission

- General Plan Amendment
- Zoning Map Amendment
- General Plan Consistency Findings - Report and Recommendation to Board of Supervisors

Board of Supervisors

- General Plan Amendment
- Zoning Map Amendment
- Redevelopment Plan Amendment
- Property Disposition Report/Findings

D. ANALYSIS OF POTENTIAL ENVIRONMENTAL EFFECTS

CEQA Guidelines Section 15164 provides that the lead agency shall prepare an addendum to a previously certified EIR if some changes or additions are necessary but none of the conditions requiring a subsequent or supplemental EIR have occurred. The lead agency's decision to use an addendum must be supported by substantial evidence that the conditions that would trigger preparation of a subsequent EIR, as provided in CEQA Guidelines Section 15162, are not present. The following analysis of environmental effects provides the basis for that determination.

No new or more severe significant impacts beyond those studied in the EIS/EIR would occur, as discussed in Section D, Analysis of Potential Environmental Effects, and the preliminary checklist. Thus, as discussed in Section B, Proposed Revisions to the EIS/EIR Project, the only substantive modifications

to the Proposed Project that were not previously studied in the EIS/EIR are the height change from 450 feet to 513 feet and the change to bulk/massing. Therefore, the only CEQA topics that require additional evaluation are those for which impacts could worsen because of the additional building height: wind and shadow. Wind and shadow studies for the Proposed Project are included as part of the addendum to the EIS/EIR. Moreover, as a transit-oriented infill project, neither aesthetic nor parking impacts are considered significant impacts on the environment.[7] Although not required under CEQA, aesthetics is discussed below. In addition, although the Proposed Project would not generate more trips than anticipated in the EIS/EIR, transportation is analyzed in detail below to allow a full discussion of design-specific site circulation issues. A transportation study for the Proposed Project is included as part of the addendum to the EIS/EIR. Based on the aforementioned reasons, aesthetics, transportation, wind, and shadow are discussed in the subsections below. All other features of the Proposed Project, including demolition, land use types, building square footage, retail square footage, and the number of dwelling units, would be consistent with the maximum development for Assessor's Block 3739 as analyzed in the EIS/EIR. CEQA topics that were evaluated with respect to those features would not require further analysis because no new or more severe significant impacts beyond those studied in the EIS/EIR would occur, and no new mitigation measures would be required.

Based on the analysis in the preliminary checklist, no further analysis is required for the following CEQA topics:

- Agricultural and Forest Resources
- Air Quality
- Biological Resources
- Cultural Resources
- Energy
- Geology and Soils
- Greenhouse Gas Emissions
- Hazards and Hazardous Materials
- Hydrology and Water Quality
- Land Use and Planning
- Mineral Resources
- Population and Housing
- Public Services
- Recreation
- Tribal Cultural Resources
- Utilities and Service Systems

The prior addenda to the EIS/EIR generally covered changes to the transportation infrastructure related to the Transbay Terminal/Caltrain downtown rail extension (DTX) portions of the EIS/EIR and were administered by the Transbay Joint Powers Authority (TJPA) and the Golden Gate Bridge Highway and Transportation District. In addition, an environmental review document also analyzed transportation infrastructure related to the Transbay Program Phase 2 (i.e., the Transbay Terminal/Caltrain DTX as well as other transportation improvements and development opportunities associated with the Transbay Program).[8] In November 2018, the Federal Transit Administration, in conjunction with the Federal Railroad Administration and the TJPA, published the Final Supplemental Environmental Impact Statement/ Environmental Impact Report (SEIS/SEIR) to evaluate refinements to the Caltrain DTX component of the

[7] The Proposed Project meets the definition of a mixed-use project on an infill site within a transit priority area, as specified by CEQA section 21099.

[8] The Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project is referred to as the Transbay Program in the SEIS/SEIR.

Transbay Program. On July 22, 2019, the Federal Transit Administration issued an Amended Record of Decision for the Transbay Program's Final Supplemental EIS/EIR; this document amends the 2005 Record of Decision for the Transbay Program and covers the required environmental analysis of refinements to the DTX and other transportation improvements in the vicinity of the Transit Center. The SEIS/SEIR does not contain information that would alter the determination not to require a subsequent or supplemental EIR in connection with the proposed plan amendment and the Proposed Project, pursuant to CEQA Guidelines section 15164. The project evaluated in the SEIS/SEIR includes refinements to the DTX component of the Transbay Program, some additional transportation improvements in the Transbay Redevelopment Area, and potential new development opportunities. However, the draft SEIS/SEIR project does not propose modifications at or adjacent to Block 4 or changes to the Transbay Redevelopment Plan component of the Transbay Program.

Overall land use impacts from the project analyzed in the draft SEIS/SEIR would be minimal, and none of the proposed components would conflict with any applicable land use, policy, or regulation in the Transbay Program area. The potential above-grade development opportunities analyzed under the draft SEIS/SEIR would be compatible with the development intensity and uses nearby. The proposed above-grade development would have no shadow impact on any parks under the jurisdiction of the San Francisco Recreation and Park Department (draft SEIS/SEIR, p. 3.3-20 and 3.3-21.) The draft SEIS/SEIR notes that the proposed intercity bus facility would occupy the roof level of the Transit Center and, therefore, would be adjacent to the proposed City park (now the existing Salesforce Park). However, the elevation of this facility would be only slightly higher than the elevation of the park (approximately 5 feet) and, therefore, would not cast shadow onto the park that would alter the analysis conducted for the proposed plan amendment and the Proposed Project.

As discussed in this EIR addendum, the changes in the Proposed Project would not require major revisions to the EIS/EIR. The number of dwelling units and the total square footage of the Proposed Project, including the square footage of retail uses, would not exceed the assumptions studied in the EIS/EIR Project. In addition, the Proposed Project would not cause new significant impacts not identified in the EIS/EIR. Therefore, no new mitigation measures are necessary to reduce significant impacts. No changes have occurred with respect to circumstances surrounding the Proposed Project that would cause significant environmental impacts to which the Proposed Project would contribute considerably. No new information has become available that shows that the Proposed Project would cause significant environmental impacts that were not previously discussed in the EIS/EIR, that previously examined significant effects would be substantially more severe than shown in the EIS/EIR, that mitigation measures or alternatives that were previously found infeasible are feasible, or that new mitigation measures or alternatives that are considerably different from those in the EIS/EIR would substantially reduce significant impacts.

AESTHETICS

Transbay EIS/EIR

The visual and aesthetics analysis in the EIS/EIR anticipated that the Redevelopment Plan would cause a relatively large increase in the number and size of buildings in the Transbay Redevelopment Project Area. The EIS/EIR also found that public views within and across the Transbay Redevelopment Project Area would generally be limited by new development. The EIS/EIR found that new buildings and vehicles would produce

additional glare, although it would not be expected to result in a substantial visual change. Visual simulations were prepared for the EIS/EIR, based on the 2003 *Transbay Redevelopment Project Area Design for Development Vision (*also known as the Design for Development). The EIS/EIR noted that actual development proposals would undergo individual environmental review for aesthetics in subsequent steps of the redevelopment process, if necessary. The EIS/EIR determined that, although the proposed new development would alter the existing aesthetic nature of the area, the visual features that would be introduced by the Proposed Project are commonly accepted in urban areas and would not substantially degrade the existing visual quality, obstruct publicly accessible views, or generate obtrusive light or glare. For those reasons, no significant impacts were identified, and no mitigation measures were proposed.

Proposed Project and Cumulative Conditions

The Proposed Project meets the definition of a mixed-use project on an infill site within a transit priority area, as specified by CEQA section 21099.[9] Accordingly, this EIR addendum does not contain an in-depth discussion of the topic of aesthetics, which, pursuant to section 21099, cannot be considered in determining the significance of the physical environmental effects of such projects under CEQA. Therefore, the proposed height increase could not result in significant aesthetic impacts under CEQA, and no mitigation measures are necessary.

The Proposed Project would increase the height of the Tower Project from 450 feet to 513 feet. The 513-foot height would match the height of towers constructed in the immediate vicinity of Block 4. However, the tower would be the sole tower on Block 4, providing ample separation from nearby towers. Between Block 4 and the waterfront are Rincon Park, The Embarcadero, and two to three blocks that contain high-rise buildings with podiums and towers. Directly across Howard Street, north of the Project Site, is a newly constructed tower with a roof height of 550 feet. Buildings to the north, between the Project Site and the waterfront, generally step down in height. In addition, considering the approved building heights within districts north, west, and the south of Block 4, which include approved heights between 400 and 1,000 feet, the Proposed Project's height would blend appropriately into the San Francisco skyline, as planned (Figure 5).

TRANSPORTATION

As noted above, the Proposed Project would not exceed the EIS/EIR assumptions for retail, residential, and total square footage, as well as the number of dwelling units, at the Block 4 site. Therefore, the Proposed Project would not generate more person trips or vehicle trips than previously analyzed and would not cause traffic to worsen to a greater degree than reported in the EIS/EIR, as explained further below.

Transportation impact studies prepared by the Planning Department for CEQA purposes estimate future cumulative traffic volumes, based on cumulative development and growth identified by the San Francisco County Transportation Authority's (SFCTA's) SF-CHAMP travel demand model. The SF-CHAMP model uses zoning as part of the basis for its growth calculations. SF-CHAMP data prepared after adoption of the Transbay Redevelopment Plan takes into account the revised zoning for the Transbay Redevelopment

[9] San Francisco Planning Department. September 29, 2020. *Eligibility Checklist: CEQA Section 21099 Modernization of Transportation Analysis.* Record No. 2018-015785ENV, 200 Folsom Street/200-272 Main Street. This document is available for review at the San Francisco Planning Department, 49 South Van Ness Avenue, Suite 1400, as part of Case File No. 2018-015785ENV.

Area, including the Zone One TB DTR (Transbay Downtown Residential) Use District and 50/85/450-TB Height and Bulk District established for the Block 4 site. Therefore, CEQA transportation impact studies prepared after adoption of the Transbay Redevelopment Plan include the potential growth enabled by the plan in their cumulative analyses.

A transportation circulation study was prepared for the Proposed Project,[10] as summarized below and included in Appendix A. The transportation circulation study assumed 683 dwelling units and 8,282 gsf of ground-floor retail space. Subsequent to the preparation of the transportation circulation study, the Proposed Project was revised to include 681 dwelling units and 8,389 gsf of ground-floor retail space. These minor revisions to the Proposed Project were evaluated (refer to Appendix A) and it was determined that there are no changes required to the conclusions in the transportation circulation study.[11]

The transportation study area includes all aspects of the transportation network in the vicinity of the block bounded by Howard Street to the north, a new midblock alley section of Tehama Street (and Folsom Street) to the south, Main Street to the east, and Beale Street to the west. The transportation study area consists of travel corridors and facilities such as transit routes and stations, bicycle routes and amenities, pedestrian sidewalks and crossings, and the overall vehicular roadway network that residents, employees, and visitors would use in traveling to and from the Project Site.

The following scenarios were evaluated to identify potential transportation impacts of the Proposed Project:

- **Existing Conditions.** Existing land use and transportation conditions on the block (refer to Appendix A for a summary of existing conditions).
- **Existing-plus-Project Conditions.** Existing land use and transportation conditions with the addition of the Proposed Project. This scenario includes changes to the transportation network since the analysis for the Transbay EIS/EIR was conducted and identifies if these modifications would affect the conclusions of the Transbay EIS/EIR.
- **Cumulative Conditions.** Land use and transportation conditions, considering background growth and development, reasonably foreseeable changes to the transportation network, and incremental growth and development. This scenario includes a review of currently planned cumulative development and streetscape projects and identifies if these modifications would affect the conclusions of the Transbay EIS/EIR.

Figure 5
Maximum Heights in Transbay Redevelopment Area (Zone One)

The assessment in the transportation circulation study, summarized below, documents the land use and transportation network changes as a result of the Proposed Project and their effects on circulation on transportation modes in the study area. The Proposed Project as well as cumulative conditions are reviewed for impacts related to vehicle miles traveled (VMT), driving hazards, pedestrians, bicyclists, public transit, emergency access, and loading. For each transportation-related topic, an assessment is conducted to determine whether the change in Block 4 would result in changes to the transportation-related findings in the Transbay EIS/EIR. The 2020 impact analysis uses the data and guidance within the Planning Department's 2019 *Transportation Impact Analysis Guidelines* (TIA Guidelines). OCII acknowledges and accepts the use of the TIA Guidelines for the analysis of the Proposed Project's transportation impacts.

Proposed Project Trip Generation

Trip generation refers to the number of estimated trips people would take to and from the Project Site, regardless of the way they travel. Table 4, below, presents the person-trip rates and estimates the number of daily and PM Peak-Hour person trips by land use. Proposed Project person trips were assigned to travel modes (automobile, taxi/transportation network company [TNC], transit, walking, bicycling), based on the mode shares presented in the TIA Guidelines for the Proposed Project's district (district 2, South of Market [SoMa]) and placetype (placetype 1, urban high density). Table 5, below, provides the estimated percentage and number of PM Peak-Hour Proposed Project trips by mode. Table 6, below, presents Proposed Project vehicle trip generation estimates by direction (inbound and outbound).

Table 4. Person-Trip Generation Rates and Estimates by Land Use for the Proposed Project

Land Use	Daily Rate	PM Peak-Hour Percentage, Daily	Daily Person Trips	PM Peak-Hour Person Trips
Residential (1,156 bedrooms)	5/bedroom	8.9%	5,202	459
Restaurant Composite (8,282 gsf)[a]	600/1,000 gsf	13.5%	4,969	670

Sources: 2019 TIA Guidelines; Kittelson, 2020.

Notes:

a. The retail tenants are not known at this time. For conservative purposes with respect to estimating the maximum adverse effect on trip generation, a "composite rate" restaurant is assumed. In addition, the retail area has been increased slightly as part of the conservative scenario.

Table 5. Person-Trip Generation Estimates by Mode and Land Use for the Proposed Project

Mode	Mode Share		Weekday PM Peak-Hour Person Trips		
	Residential	Restaurant Composite	Residential	Restaurant Composite	Total
Auto	25%	11%	115	76	**191**
Taxi/Transportation Network Company	6%	5%	28	31	**59**
Transit	28%	25%	129	170	**299**
Walking	38%	55%	174	368	**542**
Bicycling	3%	4%	13	25	**38**
Total	100%	100%	459	670	1,129
Sources: 2019 TIA Guidelines; Kittelson, 2020.					

Table 6. Proposed Project Vehicle Trip Generation Estimates by Land Use

Land Use	Weekday PM Peak-Hour Vehicle Trips		
	Inbound	Outbound	Total
Residential	60	17	77
Restaurant Composite	14	34	48
Total Private Vehicle Trips	**74**	**51**	**125**
Taxi/TNC	35	35	70
Total Private Vehicle and Taxi/Transportation Network Company Trips	109	86	195
Sources: 2019 TIA Guidelines; Kittelson, 2020.			

As shown in Table 4 and Table 5, the Proposed Project would generate a total of 1,129 person trips (459 generated by the residential component and 670 generated by the restaurant component) during the weekday PM Peak Hour. Of these 1,129 total person trips, 542 would be people walking to and from the site, 299 would be people taking transit, 191 would be automobile person trips, 59 would be taxi/TNC trips, and 38 trips would be made by bicycle. As shown in Table 6, the 191 automobile person trips would result in a total of 125 vehicle trips (77 generated by the residential component and 48 generated by the restaurant component) during the weekday PM Peak Hour. Of these 125 vehicle trips, 74 would be traveling inbound to the Project Site, and 51 would be departing the Project Site. The 59 taxi/TNC person trips would result in a total of 70 taxi/TNC vehicle trips, 35 inbound and 35 outbound. The taxi/TNC vehicle trip generation accounts for trips to and from the Project Site.

Vehicle Miles Traveled

Transbay EIS/EIR

The Transbay EIS/EIR evaluated four traffic scenarios: 1) existing conditions, 2) year 2020 with no project, 3) year 2020 plus project (the Transbay Terminal and Transbay Redevelopment Plan), and 4) a

2020 cumulative scenario that included concurrent and reasonably foreseeable projects. The EIS/EIR analysis showed that background traffic volumes would grow over time and traffic delays would lengthen at nearly all 27 intersections studied, even without implementation of the Transbay Redevelopment Plan. The EIS/EIR identified significant traffic impacts at seven intersections under the 2020 plus-project and the 2020 cumulative scenarios.

The EIS/EIR stated that improvements at individual intersections and implementation of an integrated transportation management system could somewhat reduce localized congestion but may not fully mitigate the impact of increased traffic congestion resulting from the Transbay Terminal and Transbay Redevelopment Plan to a less-than-significant level. The EIS/EIR therefore concluded that the significant traffic impacts would be unavoidable. No mitigation measures applicable to individual development projects were identified.

Existing-plus-Project Conditions

Since preparation of the Transbay EIS/EIR, the Office of Planning and Research and the Natural Resources Agency issued new CEQA Guidelines for analyzing transportation impacts. By July 1, 2020, all CEQA lead agencies must analyze a project's transportation impacts using VMT rather than congestion levels at intersections. On March 3, 2016, the San Francisco Planning Commission adopted the Office of Planning and Research's recommendation to use the "vehicle miles traveled" (VMT) metric instead of automobile delay to evaluate the transportation impacts of projects (Resolution 19579). On October 15, 2019, the OCII Commission adopted, by Resolution No. 25-2019, criteria for determining the significance of transportation impacts based on VMT.[12] A VMT-based approach was used to prepare the transportation analysis for this EIR addendum, which is consistent with Section 21099 of the Public Resources Code, Section 15064.3 of the CEQA Guidelines, the Governor's Office of Planning and Research publication *Technical Advisory on Evaluating Transportation Impacts Under CEQA* (December 2018), and the Planning Department's publication *Transportation Impact Analysis Guidelines* (February 2019).

Consistent with CEQA Guidelines at the time, the Transbay EIS/EIR included an evaluation of automobile delay (vehicle level of service [LOS]), as summarized above; it did not include an evaluation of VMT. As a result, VMT is not specifically addressed in the Transbay EIS/EIR, and no relevant mitigation measures were identified. For the purposes of CEQA, the Proposed Project would not result in significant impacts related to automobile delay (vehicle LOS). No mitigation measures are necessary, and automobile delay is not discussed further in this document (for additional information, refer to Appendix A).

VMT per person (or per capita) is a measurement of the amount and distance that a resident, employee, or visitor drives; it also accounts for the number of passengers within a vehicle. Many interdependent factors affect the amount and distance a person might drive. In particular, the built environment affects how many places a person can access within a given distance or time, and at a given cost, using different ways to travel (e.g., private vehicle, public transit, bicycling, walking, etc.). Typically, low-density development located at great distances from other land uses, and in areas with few options for ways to travel, provides less access than a location with high density, a mix of land uses, and numerous ways

[12] Commission on Community Investment and Infrastructure, Resolution No. 25-2019, October 15, 2019.

to travel. Therefore, low-density development typically generates higher VMT rates than a similarly sized development in an urban area.

Given these behavior travel factors, on average, persons living or working in San Francisco have lower VMT rates than persons living or working elsewhere in the nine-county San Francisco Bay Area region. On a more granular level, persons living or working in some areas of San Francisco have, on average, lower VMT rates per person than persons living or working elsewhere in San Francisco. The City establishes different VMT rates per capita geographically through transportation analysis zones (TAZs).

The SFCTA uses SF-CHAMP to estimate VMT by private automobiles and taxis for different TAZs. The model estimates daily VMT for residential, office, and retail land use types. For residential and office uses, the SFCTA uses tour-based analysis. A tour-based analysis examines the entire chain of trips over the course of a day, not just trips to and from a site. For retail uses, the SFCTA uses trip-based analysis. A trip-based analysis counts VMT from individual trips to and from a site (as opposed to an entire chain of trips). A trip-based approach, as opposed to a tour-based approach, is necessary for retail sites because a tour is likely to consist of trips that stop at multiple locations; therefore, summarizing tour VMT to each location would over-estimate VMT.[13,14,15]

The Project Site is in TAZ 764. Existing average daily VMT per capita in TAZ 764 is below regional average daily VMT per capita, as follows:

- For residential uses, the existing average household daily VMT per capita is 3.2, which is about 81 percent below the existing regional average household daily VMT per capita of 17.2.
- For the retail uses, the average daily VMT per retail employee is 9.2, which is about 32 percent below the existing regional average daily retail VMT per employee of 14.8.

Given the Project Site is in an area where existing VMT is more than 15 percent below the existing regional average, the Proposed Project's residential and retail uses would not cause substantial additional VMT. Furthermore, because of its location within 0.5 mile of an existing major transit stop, the Project Site meets the "proximity to transit stations" screening criterion, which also indicates that the Proposed Project's uses would not cause substantial additional VMT. The Proposed Project would not include features that would substantially induce automobile travel (e.g., additional roadway capacity). For these reasons, VMT-related impacts for the Proposed Project would be less than significant.

---

[13] To state another way, a tour-based assessment of VMT at a retail site would consider VMT for all trips in the tour for any tour with a stop at the retail site. If a single tour stops at two retail locations, for example, a coffee shop on the way to work and a restaurant on the way back home, then both retail locations would be allotted the total tour VMT. A trip-based approach allows us to apportion all retail-related VMT to retail sites without double counting.

[14] Retail travel is not explicitly captured in the San Francisco chained activity modeling process; rather, there is a generic "other" purpose, which includes retail shopping, medical appointments, visiting friends or family, and all other non-work, non-school tours. The retail efficiency metric captures all of the "other" travel generated by Bay Area households. The denominator of employment, including retail; cultural, institutional, and educational; medical employment; school enrollment; and number of households, represents the size, or attraction, of the zone for this type of "other" travel.

[15] San Francisco Planning Department, *Executive Summary: Resolution Modifying Transportation Impact Analysis,* Appendix F, Attachment A, March 3, 2016.

Cumulative Conditions

Cumulative average daily VMT per capita in TAZ 764 is below regional average daily VMT per capita, as follows:

- For the residential uses, the cumulative average household daily VMT per capita is 2.4, which is about 85 percent below the cumulative regional average household daily VMT per capita of 16.1.
- For the retail uses, the cumulative average daily VMT per retail employee is 8.3, which is about 42 percent below the cumulative regional average daily retail VMT per employee of 14.5.[16]

As with the existing-plus-project analysis, the Project Site meets the "proximity to transit stations" screening criterion and is in an area where cumulative VMT would be more than 15 percent below the cumulative regional average. The Proposed Project's residential and retail uses would not cause substantial additional VMT. Therefore, no significant cumulative VMT impacts would occur.

Driving Hazards

Transbay EIS/EIR

This section provides a qualitative assessment of the effect of the Proposed Project on conditions for people driving. It considers whether the Proposed Project could create potentially hazardous conditions for people driving or result in new or substantially more severe transportation impacts than those identified in the Transbay EIS/EIR. However, driving hazards were not specifically addressed in the Transbay EIS/EIR. Therefore, no relevant mitigation measures were identified in the Transbay EIS/EIR.

Existing-plus-Project Conditions

The Proposed Project would consist of parking for up to 275 vehicles (including two car share vehicles) within 224 physical stalls and additional space provided by car stackers, , all serviced exclusively by valet staff, which would be accessible via a 24-foot-wide curb cut and a two-way driveway along Main Street. The garage driveway would provide entry and exit lanes on the left-hand side; the directionality would be reversed from a typical orientation so that inbound and outbound left turns would not overlap. The reversed directionality would reduce the potential for conflicts while entering or exiting the driveway. During the PM Peak Hour, demand from the Proposed Project would generate 74 inbound and 51 outbound vehicle trips. Outbound vehicle trips would be naturally metered by the rate at which valet operations occur. The proposed staging area would accommodate inbound valet trips onsite rather than in the public right-of-way or along the driveway. Inbound drivers would make the left turn from the leftmost travel lane. Outbound drivers would have a generally unobstructed view of northbound traffic as they turn left onto Main Street.

The Project Site would also include a 24-foot-wide curb cut along its Beale Street frontage to provide freight access to the proposed off-street loading dock, which would include two 10-foot-wide loading bays. The Proposed Project would generate a demand for four freight and delivery service-vehicle loading spaces

[16] Retail travel is not explicitly captured in the San Francisco chained activity modeling process; rather, there is a generic "other" purpose, which includes retail shopping, medical appointments, visiting friends or family, and all other non-work, non-school tours. The retail efficiency metric captures all of the "other" travel generated by Bay Area households. The denominator of employment, including retail; cultural, institutional, and educational; medical employment; school enrollment; and number of households, represents the size, or attraction, of the zone for this type of "other" travel.

during the peak hour and two spaces during the average hour. The proposed supply of on- and off-street freight loading spaces would meet expected peak-hour demand. To access the loading dock, trucks would need to reverse into the loading dock, which may temporarily block one or both vehicle travel lanes on Beale Street while they maneuver. Freight and delivery service vehicles would be traveling at speeds of less than 5 miles per hour (mph) as they maneuver into/out of the loading dock. Given the signalized intersection spacing and the observed vehicle speed and progression along the corridor, people driving would also be traveling at relatively slow speeds. They would have clear sight lines and be able to see and react to downstream truck activity. For these reasons, the curb cut would constitute a temporary obstruction for through traffic but would not cause potentially hazardous conditions for people driving.

The proposed extension of Tehama Street to allow one-way (westbound) travel between Main and Beale streets would provide improved multi-modal and vehicle circulation in the study area. Raised crosswalks along Tehama Street at Main and Beale streets would reduce the speed of vehicles while entering and exiting Tehama Street and minimize the potential for conflicts.

Given the traffic volume and site design, the Proposed Project would not result in vehicle queuing or circulation issues that would create potentially hazardous conditions for people driving. Furthermore, the Proposed Project would decrease residential, retail, and office space, compared to the EIS/EIR Full Build Alternative assumptions for the Project Site, resulting in a net reduction in the number of vehicle trips as well as anticipated commercial loading activity. As such, the potential for hazardous conditions for people driving would be less than that analyzed in the Transbay EIS/EIR. Impacts of the Proposed Project would be less than significant, and no mitigation measures are required.

Implementation of Improvement Measure I-TR-1 and Improvement Measure I-TR-2 is recommended to further reduce these less-than-significant impacts.[17]

Improvement Measure I-TR-1: Driveway and Loading Operations Plan (DLOP). The property owner shall implement the following measures to reduce potential conflicts related to driveway operations, including loading activities and people walking, biking, and driving:

- *Trash/Recycling/Compost Collection Design and Management.* The property owner shall provide convenient off-street trash, recycling, and compost storage room(s) for the Proposed Project and a procedure for collection. The transportation coordinator or building manager shall implement these procedures.
- *Color Curb Application.* The property owner shall submit documentation to the Environmental Review Officer to confirm that he or she applied to the SFMTA for on-street color curb zones.
- *Attendant.* The transportation coordinator shall ensure that building management employs a loading dock attendant(s) for the Proposed Project's off-street loading dock. The loading dock attendant shall be stationed at the loading dock driveway to direct vehicles while entering and exiting the loading dock, avoid any safety-related conflicts with public right-of-way users, and ensure proper allocation of freight and delivery service vehicles to available spaces. The loading dock shall be attended during business operating hours, which are anticipated to be 8 a.m. to 10 p.m. every day.

[17] The analysis herein assumes implementation of these improvement measures as conditions of Proposed Project approval, and the Project Sponsor has agreed to them.

- *Driveway Operational Safety.* The transportation coordinator shall provide notifications and information to users of the Project Site regarding driveway operational safety, including the maximum vehicle size and height for the loading dock. The loading dock would be limited to use by vehicles shorter than 30 feet; vehicles longer than 30 feet would be directed to on-street loading zones.
- *Signage/Warning Devices.* The property owner shall install "FULL" signage near the off-street loading dock entrance. The transportation coordinator shall indicate "FULL" if the off-street facility is fully occupied or if the coordinator anticipates it will be occupied by a forthcoming delivery (i.e., in the next 10 minutes). The property owner shall also install signage at the off-street facility to alert drivers to people walking or bicycling who may be behind a vehicle or in a driver's blind spot during access or egress. The property owner shall also install audible warning devices at locations where the off-street facility interfaces with the public right-of-way to alert other public right-of-way users of vehicles entering or exiting the off-street facility.
- *Large Truck Access.* The property owner shall identify convenient on-street loading spaces (i.e., within 250 feet of the site) that could accommodate large trucks (i.e., trucks longer than 30 feet), which the off-street loading facility cannot accommodate. The property owner shall also identify procedures for reserving these spaces from the SFMTA as well as procedures for guiding large trucks to the spaces. The transportation coordinator shall implement these procedures.

The property owner shall prepare a DLOP that documents the Proposed Project's compliance with the measures described above. The details of the DLOP shall be developed in coordination with the Planning Department and the SFMTA and reviewed and approved by the Environmental Review Officer, or designee, of the Planning Department and the Sustainable Streets Director, or designee, of the SFMTA. The final DLOP shall be included as a condition of approval for the Proposed Project. The transportation coordinator shall provide oversight and be responsible for implementation of the DLOP for the Proposed Project. The plan shall be evaluated by a qualified transportation professional, as retained by the Project Sponsor, upon building occupancy and once a year going forward until such time when the SFMTA determines that the evaluation is no longer necessary or could be done at less frequent intervals. The content of the evaluation report shall be determined by SFMTA, in consultation with the Planning Department, and include an assessment of on-street loading conditions, including actual loading demand; observations regarding loading operations; and an assessment of how the Proposed Project meets the requirements. If ongoing conflicts are occurring, based on the assessment, the evaluation report shall put forth additional measures to address conflicts associated with loading operations. The evaluation report shall be reviewed by SFMTA, which shall make the final determination regarding whether ongoing conflicts are occurring. In the event that ongoing conflicts are occurring, the above requirements may be altered (e.g., the hours and days when the loading dock attendant is stationed onsite).

Improvement Measure I-TR-2: Queue Abatement. The property owner, or designee, shall prevent vehicle queues by using proactive abatement methods. A vehicle queue is defined as one or more vehicles waiting to access the Proposed Project's off-street facility and blocking any portion of any public right-of-way for a combined two minutes during the peak consecutive 60 minutes for the adjacent public right-of-way or a combined 15 minutes between the hours of 6 a.m. and 10 p.m. for at least three 24-hour periods in any consecutive seven-day period. The proactive abatement methods shall depend on the characteristics of the Proposed Project's off-street facility, the characteristics of the

street to which the off-street facility connects, and the associated land uses. The proactive abatement methods may include, but are not limited to, installation of "FULL" signs, with active management by parking attendants; use of additional valet parking attendants or other space-efficient parking techniques; and implementation of transportation demand management strategies.

If the planning director, or designee, suspects that a recurring queue is present, the Planning Department shall notify the property owner in writing. Upon request, the owner/operator shall hire a qualified transportation consultant to evaluate conditions at the site for no less than seven days. The consultant shall prepare a monitoring report, which shall be submitted to the Planning Department for review. If the Planning Department determines that a recurring queue does exist, the facility owner/operator shall have 90 days from the date of the written determination to the queue.

Implementation of Improvement Measure I-TR-1 would reduce a less-than-significant impact through active management of the loading dock by an attendant; this would increase driver awareness of other public right-of-way users and reduce the potential for delivery vehicles to double park and obstruct vehicle travel lanes, thereby minimizing potentially hazardous conditions for people driving. Implementation of Improvement Measure I-TR-2 would ensure that vehicle queues related to the Proposed Project would not propagate along the public right-of-way.

Cumulative Conditions

Under cumulative conditions, traffic associated with people walking, bicycling, or driving on the surrounding street network would increase as a result of the Proposed Project, other development projects within the study area, and background growth elsewhere in the city and region. This would generally be expected to lead to an increase in the potential for conflicts between people driving and people walking, bicycling, and public transit operations. However, a general increase in traffic in and of itself would not be considered a potentially hazardous condition.

Under cumulative conditions, with implementation of the Active Beale Street Project, the on-street bicycle lane (class II) along Beale Street would be replaced with a two-way separated bicycle lane (class IV) on the east side of the street; a protected intersection corner would be constructed on the southeast corner of the Howard Street/Beale Street intersection. This shift in bicycle lane location, as well as construction of a concrete island, would increase the offset of the left-turn vehicle movement from Howard Street to Beale Street, potentially slowing turning vehicles and increasing protection for bicyclists at this location. The effects of the Active Beale Street Project and the South Downtown Design + Activation (Soda) plan will be subject to separate study and environmental review.

The Proposed Project would make Tehama Street a new midblock alley between Beale and Main streets; it would also construct a loading dock driveway on Beale Street between Howard Street and Tehama Street. Vehicles accessing the loading dock and vehicles exiting Tehama Street onto Beale Street would turn across the bicycle lane. These vehicle turning movements are not expected to create potentially hazardous conditions for drivers because drivers would generally have unobstructed sight lines and/or adequate sight distance to see approaching vehicles. The presence of the raised crosswalk across Tehama Street would slow vehicles on the intersection approach. Implementation of Improvement Measure I-TR-1 would reduce potential conflicts between freight and delivery service vehicles and people driving by requiring a visual warning device that would alert other right-of-way users when the loading dock is in use, employing a loading dock attendant to manage traffic flow, and requiring vehicles exceeding 30 feet in length to load in on-street zones on Howard Street, Main Street, or Tehama Street rather than in the loading dock.

For these reasons, the Proposed Project in combination with cumulative projects would not create potentially hazardous conditions for people driving. Therefore, there would be a less-than-significant cumulative impact related to driving hazards.

Pedestrians

Transbay EIS/EIR

An assessment of pedestrian conditions in the area surrounding the Transbay Terminal was included in the Transbay EIS/EIR. The evaluation considered pedestrian LOS at five intersections (crosswalks and corners); sidewalk widths, with qualitative analysis of on-sidewalk conditions throughout the study area; and the origin/destination of pedestrian traffic. The evaluation accounted for an increase in pedestrians due to the new Transbay Terminal and Caltrain extension as well as the Transbay Redevelopment Plan. Changes in pedestrian volumes were developed by using output from SF-CHAMP and rerouting pedestrians to and from the Transbay Terminal facility.

The Transbay EIS/EIR found 11 corners and two crosswalks that would operate at LOS F for pedestrians, including all four corners and the north crosswalk at Howard Street and Fremont Street. The crosswalks and corners at the study intersections closest to the Project Site (i.e., Mission Street/Fremont Street and Folsom Street/Beale Street) were found to operate better than LOS F. The Transbay EIS/EIR noted that the EIS/EIR Project itself did not cause the LOS F conditions, concluding that the 9,000 additional walking trips generated by the Transbay Terminal and Transbay Redevelopment Plan by 2020 would not be a considerable contribution to the overall increase in the number of pedestrian trips and determining that the Transbay Redevelopment Plan would not have a significant pedestrian impact. No mitigation measures to address pedestrian impacts were identified.

The Transbay EIS/EIR suggested improvement measures that included wide sidewalks, building setbacks in future construction, enhanced crosswalks with countdown signals, warning lights, and signalized crossings.

Existing-plus-Project Conditions

Access for people walking would be provided on all four of the Proposed Project's street frontages, with an apartment and condominium entry on Howard Street and Main Street, respectively; lobby access for the Mid-Rise Project and the townhouses on Tehama Street; and two retail entrances on Beale Street. The Proposed Project would revise the conditions identified in the DCDG to remove setback requirements along Beale, Howard, Main, and Tehama streets.[18,19] The Proposed Project would include streetscape improvements, such as widened sidewalks, landscaping and street trees, commercial and passenger loading areas, and bicycle facilities, consistent with the Design for Development. The Proposed Project would also provide an internal courtyard on the building's second level that would occupy the inner portion of the Project Site. The courtyard would be accessible from stairs on Howard Street and Tehama Street.

---

[18] The DCDG define a *setback* as the open space provided between the property line and the primary built structure, creating an expanded area along the sidewalk and providing a transition between the street and private use on the property. Setbacks may be required to be dedicated for public use or remain as a private space between the public right-of-way and the building mass.

[19] The DCDG (p. 16) identified a setback requirement of 6 to 8 feet along Tehama Street and a setback of 8 to 10 feet along Beale, Main, and Howard streets.

In accessing the Project Site, people walking would cross curb cuts at the proposed garage entry on Main Street and at the loading dock along Beale Street. The sidewalk design would allow exiting vehicles to cross the path of people walking without obstructing their path of travel while waiting to turn onto Main Street. Conversely, inbound vehicles would be able to turn from Main Street into the driveway, with adequate separation between the traveled way and walking paths along the sidewalk. Valet operations would include an adequate short-term staging area to prevent queue spillback into pedestrian travel paths. People driving would generally have unobstructed sight lines and/or adequate sight distance and would not create potentially hazardous conditions related to vehicle entry or exit. Implementation of Improvement Measure I-TR-2 would reduce the potential for conflicts between vehicles accessing the proposed garage and people walking by ensuring that queues would not spill back onto the public right-of-way.

Trucks would access the site using Fremont Street and Howard Street, the nearest truck routes. Trucks accessing the loading docks would cross the proposed 30-foot-wide sidewalk along Beale Street. Some minor conflicts may arise between people walking and trucks backing into the loading docks, most likely in the form of a short delay until the 30-foot-wide sidewalk is unobstructed. Implementation of Improvement Measure I-TR-1 would reduce the potential for conflicts between freight and delivery service vehicles and people walking.

The proposed sidewalk widening and widths along the Project Site frontages would allow an adequate public right-of-way that would accommodate furnishing, throughway, and frontage zones with the removal of building setback requirements on the adjacent streets. The construction of raised crosswalks along Tehama Street at Beale Street and Main Street would help manage vehicle speeds along Tehama Street and reduce speeds as vehicles enter and exit Tehama Street, thereby minimizing the potential for conflicts between vehicles and people walking.

The Proposed Project would generate 841 walking trips (including 299 walking trips to transit) during the PM Peak Hour. Although travel demand analysis does not include assigning walking trips to specific routes, a substantial proportion of these walking trips could be expected to be at the north crosswalk or any of the four corners at the Howard Street and Fremont Street intersection, an area where the Transbay EIS/EIR identified pedestrian LOS impacts. However, a net reduction in the anticipated number of daily and weekday PM Peak-Hour walking trips is expected with the currently proposed land use program on Block 4 relative to the analysis in the Transbay EIS/EIR. Furthermore, the current 2019 TIA Guidelines no longer consider pedestrian crowding to be an impact.

The Proposed Project would not create any potentially hazardous conditions for people walking or interfere with accessibility of people walking to and from the Project Site and adjoining areas. Furthermore, the Proposed Project would decrease the proposed residential, retail, and office space, compared to the EIS/EIR Full Build Alternative assumptions for the Project Site, resulting in a net reduction in Proposed Project–generated trips. As such, the Proposed Project would not result in any new or more severe significant impacts on walking/accessibility compared with those identified in the Transbay EIS/EIR, and no mitigation measures are necessary.

Cumulative Conditions

Under cumulative conditions, traffic from people walking, bicycling, and driving on the surrounding street network would increase as a result of the Proposed Project, other development projects within the study area, and background growth elsewhere in the city and region. However, a general increase in traffic in and of itself would not be considered a potentially hazardous condition. Under cumulative conditions, land use

development within the Transbay Redevelopment Area would conform to the requirements of the Design for Development document, which was created to incorporate public improvements, including sidewalk widening, pedestrian-oriented alleyways, and public plazas, and account for the increased demand for pedestrian and bicycle facilities with the new Transbay Terminal and the new development throughout the Transbay Redevelopment Area.

Although not required, implementation of Improvement Measure I-TR-1 would reduce potential conflicts between freight and delivery service vehicles and people walking. Implementation of Improvement Measure I-TR-2 would reduce the potential for conflicts between vehicles accessing the proposed garage and people walking on Main Street. For these reasons, the Proposed Project in combination with cumulative projects would not create potentially hazardous conditions for people walking. Therefore, there would be a less-than-significant cumulative impact related to walking/accessibility.

Bicycles

Transbay EIS/EIR

A qualitative evaluation of bicycle conditions, particularly, the anticipated increase in bicycle activity with the EIS/EIR Project, was conducted as part of the Transbay EIS/EIR. Increases in bicycle volumes were developed using output from SF-CHAMP. This included additional riders from the Transbay Terminal, Caltrain extension, and the Transbay Redevelopment Plan. The Transbay EIS/EIR estimated that the Transbay Terminal and Transbay Redevelopment Plan could add up to 425 bicycle trips at the five intersections studied during the peak 15-minute window, compared to a total of 45 people bicycling in 2001. The Transbay EIS/EIR noted that there is no standard for determining bicycle LOS and concluded that the increase in bicycle volumes could be accommodated on area streets. No bicycling mitigation measures were identified.

Existing-plus-Project Conditions

The Proposed Project would add an on-street bicycle lane (class II) along the west side of Beale Street as well as the east side of Main Street, which would connect to a bicycle lane (class II) along Folsom Street. The Proposed Project would also provide a separated bicycle lane (class IV) along Howard Street that would connect the bicycle lanes along Beale Street and Main Street. The bicycle infrastructure proposed as part of the Proposed Project would provide dedicated space for bicyclists within the study area, which would reduce the potential for conflicts.

The Project Site would be near several roads that are on the City's Vision Zero High-Injury Network, including Fremont Street, one block southwest of the Project Site, and Folsom Street, west of Beale Street. Folsom Street is a bicycle route that connects inbound bicycle traffic from other parts of the city to the Project Site with continuous bicycle lanes (class II) east of Essex Street through to The Embarcadero. The Proposed Project's provision of connecting bicycle facilities on Beale and Main streets would reduce the potential conflicts for people bicycling to and from this portion of the high-injury network. People bicycling to the Project Site would be unlikely to use Fremont Street for access; they would most likely favor Main Street and Beale Street, which front the Project Site.

Vehicle and truck (i.e., commercial loading) traffic traveling to and from the Project Site would access the driveway and loading dock on Main Street and Beale Street, respectively. Both of these Proposed Project driveways would be on the left side of the street; bicycle facilities would be provided on the right side of each street, thereby limiting conflicts between the two modes at the vehicle access points. Implementation of Improvement Measure I-TR-1 would reduce the potential for conflicts between freight

and delivery service vehicles and people bicycling by requiring a visual warning device that would alert people bicycling when the loading dock is in use, employing a loading dock attendant to manage traffic flow, and requiring vehicles exceeding 30 feet in length to load in on-street zones on Howard, Main, or Tehama streets rather than in the loading dock.

Onsite class I bicycle parking would be provided in the Proposed Project's garage, which would require people bicycling to make a left turn from the proposed right-side bicycle lane (class II) on Main Street and cross two northbound vehicle lanes or dismount at Folsom Street or Howard Street and access the driveway from the sidewalk. All such maneuvers would be made from dedicated bicycle infrastructure. Within the Proposed Project driveway, people bicycling would share the ramp with motor vehicles and navigate the valet staging area. The vehicle speeds on the ramp and within the valet operations area would not pose potentially hazardous conditions. Because class II bicycle parking would be provided along the public right-of-way near each building entrance, people bicycling would access that parking by dismounting and walking on the sidewalk to the appropriate location. Implementation of Improvement Measure I-TR-2 would reduce the potential for conflicts between vehicles accessing the Proposed Project garage and people bicycling by ensuring that queues would not spill back onto the public right-of-way.

The Proposed Project's bicycle parking supply (556 class I spaces) was compared to the Design for Development requirements. That document requires the following:

- A minimum of 12 secure (i.e., class I) bicycle parking spaces in any garage, regardless of development intensity. This would result in 12 required class I spaces for the Proposed Project.
- One additional class I bicycle parking space for every four residential units. This would result in an additional 171 class I spaces for the Proposed Project.
- For non-residential uses, one additional bicycle parking space for every 10 off-street automobile parking spaces provided. None of the proposed vehicle parking would be provided for retail use; therefore, no additional class I bicycle parking would be required.

The total class I bicycle parking requirement for the Proposed Project would be 183 spaces based on the Design for Development document. The Proposed Project would exceed the class I bicycle parking requirement and provide three times the number of spaces required.

The Proposed Project would conform to the commercial and residential density envisioned in the Transbay Redevelopment Plan and would not create potentially hazardous conditions for people bicycling. Furthermore, the Proposed Project would decrease the proposed residential, retail, and office space, compared to the EIS/EIR Full Build Alternative assumptions for the Project Site, resulting in a net reduction in Proposed Project–generated. As such, the Proposed Project would not result in new or more severe impacts related to people bicycling than those identified in the Transbay EIS/EIR, and no mitigation measures are necessary.

Cumulative Conditions

Under cumulative conditions, traffic from people walking, bicycling, and driving on the surrounding street network would increase as a result of the Proposed Project, other development projects within the study area, and background growth elsewhere in the city and region. However, a general increase in traffic in and of itself would not be considered a potentially hazardous condition.

Under cumulative conditions, land use development within the Transbay Redevelopment Area would conform to the requirements of the Design for Development document, which was created to incorporate public improvements, including sidewalk widening, pedestrian-oriented alleyways, and public plazas, and account for the increased demand for pedestrian and bicycle facilities with the new Transbay Terminal and the new development throughout the Transbay Redevelopment Area.

With implementation of the Active Beale Street Project, the on-street bicycle lane (class II) along Beale Street would be replaced with a two-way separated bicycle lane (class IV) on the east side of the street, and a protected corner would be constructed at the southeast corner of the Howard Street/Beale Street intersection. As currently planned, the introduction of a separated two-way facility on Beale Street would improve bicycle circulation by providing more separation between people biking and people driving, a more direct north/south connection, and more options for travel between east/west bicycle facilities on Howard and Folsom streets. Although the effects of the Active Beale Street Project and the Soda plan will be subject to separate study and environmental review, it is anticipated that people biking through the Howard Street/Beale Street intersection would be provided more separation from motor vehicles compared with the existing-plus-project condition as a result of inclusion of a more substantial corner safety island.

The east side bicycle lane would introduce the potential for conflicts between people bicycling and trucks accessing the Proposed Project's loading dock. Truck drivers accessing the loading dock would be required to cross over a future two-way bicycle track, with people bicycling in both directions along the east side of Beale Street between Howard and Folsom streets, that would connect to a proposed bicycle lane on Howard Street. While trucks are reversing into the loading dock, drivers' ability to see people bicycling along Beale Street may be limited. Implementation of Improvement Measure I-TR-1 would reduce the potential for conflicts between freight and delivery service vehicles and people bicycling by requiring a visual warning device that would alert other right-of-way users when the loading dock is in use, employing a loading dock attendant to manage traffic flow, and requiring vehicles exceeding 30 feet in length to load in on-street zones on Howard, Main, or Tehama streets rather than in the loading dock.

The combination of the visual warning device provided at the loading dock to alert drivers and people bicycling and the low truck speeds needed to complete the turning maneuvers into and out of the loading dock would minimize potential hazards for people bicycling. In addition, coordination with the SFMTA, as part of the Proposed Project review process and as part of the Active Beale Street Project, would further reduce the potential for conflicts and minimize hazards for people bicycling. Implementation of Improvement Measure I-TR-2 would reduce the potential for conflicts between vehicles accessing the garage and people bicycling on Main Street by ensuring that queues would not spill back onto the public right-of-way.

For these reasons, the Proposed Project in combination with cumulative projects would not create potentially hazardous conditions for people bicycling. Therefore, there would be a less-than-significant cumulative impact related to bicycling.

Public Transit

Transbay EIS/EIR

For transit, the Transbay EIS/EIR focused on changes in operations for the bus lines that would serve the new Transbay Terminal, the capacity of the terminal facility, and changes in ridership with the extension

of Caltrain. With respect to the Transbay Redevelopment Plan component of the EIS/EIR Project, no quantitative analysis was conducted. In general, it was decided that new development as part of the Transbay Redevelopment Plan would result in increased transit usage, which would help defray the cost of the new transit facilities. The Transbay EIS/EIR estimated that Assessor's Block 3739 (Transbay Blocks 2, 3, and 4) would cause linked transit trips to increase by about 10,000 per day throughout the region. Because the projects at Assessor's Block 3739 would enhance transit connectivity, the Transbay EIS/EIR found no significant transit impacts, and no mitigation measures were identified.

Existing-plus-Project Conditions

The Proposed Project does not include any transit network features, such as modifications to transit service, operations, or amenities. There are no design features that would cause substantial delay for local or regional transit lines operating along streets fronting the Project Site.

Implementation of Improvement Measure I-TR-1 would reduce the potential for conflicts between freight and delivery service vehicles and transit by requiring a visual warning device that would alert transit vehicle drivers when the loading dock is in use, employing a loading dock attendant to manage traffic flow, and requiring vehicles exceeding 30 feet in length to load in on-street zones on Howard, Main or Tehama streets rather than in the loading dock. Implementation of Improvement Measure I-TR-2 would reduce the potential for conflicts between vehicles accessing the garage and transit vehicles on Main Street by ensuring that queues would not spill back onto the public right-of-way. Furthermore, the Proposed Project would decrease the residential, retail, and office space, compared to the EIS/EIR Full Build Alternative assumptions for the Project Site, resulting in a net reduction in Proposed Project–generated trips. As such, the Proposed Project would not result in new or more severe impacts related to transit than those identified in the Transbay EIS/EIR, and no mitigation measures are necessary.

Cumulative Conditions

Under cumulative conditions, there would be a general increase in the number of people riding transit as a result of the Proposed Project, other development projects within the study area, and background growth elsewhere in the city and region. Consistent with the Transbay EIS/EIR assessment, increases in transit ridership are a benefit rather than a potential impact, and the land use and transportation changes assumed to occur as part of cumulative conditions would not create potentially hazardous conditions for transit operations. Furthermore, implementation of Improvement Measure I-TR-1 would reduce the potential for conflicts between freight and delivery service vehicles and transit by requiring a visual warning device that would alert transit vehicle drivers when the loading dock is in use, employing a loading dock attendant to manage traffic flow, and requiring vehicles exceeding 30 feet in length to load in on-street zones on Howard, Main, or Tehama streets rather than in the loading dock. Implementation of Improvement Measure I-TR-2 would reduce the potential for conflicts between vehicles accessing the garage and transit vehicles on Main Street by ensuring that queues would not spill back onto the public right-of-way. In addition, the Proposed Project would decrease the residential, retail, and office space, compared to the EIS/EIR Full Build Alternative assumptions for the Project Site, resulting in a net reduction in Proposed Project–generated trips. As such, the Proposed Project in combination with cumulative projects would result in a less-than-significant cumulative impact related to public transit.

Emergency Access

Transbay EIS/EIR

The Transbay EIS/EIR did not find any significant impacts related to emergency vehicle access to the individual development parcels identified in the Transbay Redevelopment Plan. No mitigation measures to address impacts on emergency vehicle access were identified.

Existing-plus-Project Conditions

The Proposed Project would not include the introduction of physical impediments to emergency vehicle access. Rather, the Proposed Project's extension of Tehama Street could enhance emergency vehicle access. Consistent with the Design for Development, the Proposed Project would include lane restriping to reduce the total lane count. The number of lanes would be reduced from four to two along Howard Street, three to two along Main Street, and three to two along Beale Street. These changes would constitute a reduction in total number of vehicle travel lanes. Some of the reallocation would not serve general mixed-flow traffic but would still provide for emergency vehicle access needs. On Main Street, a portion of the cross-section reallocation would be dedicated to an on-street bike lane (class II), which would still be available roadway space and help serve emergency vehicle access needs. On Beale Street, the curbside casual carpool lane could also be used to serve emergency vehicle needs.

Buildings would be accessible from frontages along four streets (Howard, Tehama, Main, and Beale streets) and designed to meet building code standards for egress and emergency vehicle access. The streetscape designs are being evaluated in consultation with the SFMTA and the San Francisco Fire Department to determine emergency vehicle access needs.

Implementation of Improvement Measure I-TR-1 would reduce the potential for conflicts between freight and delivery service vehicles and emergency access by employing a loading dock attendant to manage traffic flow. Implementation of Improvement Measure I-TR-2 would reduce the potential for conflicts between vehicles accessing the garage and emergency vehicles on Main Street by ensuring that queues would not spill back onto the public right-of-way. Furthermore, the Proposed Project would conform to the development density specified in the Transbay Redevelopment Plan and decrease the residential, retail, and office space, compared to the EIS/EIR Full Build Alternative assumptions for the Project Site, resulting in a net reduction in Proposed Project–generated trips and a reduction in demand for emergency services. As such, the Proposed Project would not result in new or more severe impacts related to emergency vehicle access, and no mitigation measures are necessary.

Cumulative Conditions

Under cumulative conditions, traffic from people walking, bicycling, and driving on the surrounding street network would increase as a result of the Proposed Project, other development projects within the study area, and background growth elsewhere in the city and region. However, a general increase in traffic in and of itself would not be considered a potentially hazardous condition.

Under cumulative conditions, with implementation of the Active Beale Street Project, the on-street bicycle lane (class II) along Beale Street would be replaced with a two-way separated bicycle lane (class IV) on the east side of the street, and a protected intersection corner would be constructed on the southeast corner of the Howard Street/Beale Street intersection. As currently planned, this shift in bicycle lane location would not reduce roadway capacity or prohibit emergency vehicle access. The proposed streetscape designs are being evaluated in consultation with the SFMTA and the San Francisco Fire Department to assess

emergency vehicle access needs, including design detail recommendations, and ensure that emergency vehicle access can be maintained with the proposed bicycle lane and corner safety islands on Beale and Howard streets.

Although there would be a general increase in vehicle traffic from cumulative development projects, prior to finalizing the design and dimensions of any proposed transportation network changes, fire department and police department personnel would review and approve the streetscape modifications, as required, to ensure emergency vehicle access is acceptable. As a result, cumulative development and transportation projects are not expected to inhibit emergency access to the Project Site or materially affect emergency vehicle response. Implementation of Improvement Measure I-TR-1 would reduce the potential for conflicts between freight and delivery service vehicles and emergency access by employing a loading dock attendant to manage traffic flow. Implementation of Improvement Measure I-TR-2 would reduce the potential for conflicts between vehicles accessing the garage and emergency vehicles on Main Street by ensuring that queues would not spill back onto the public right-of-way. For these reasons, the Proposed Project in combination with cumulative projects would result in a less-than-significant cumulative impact related to emergency access.

Loading

Transbay EIS/EIR

The Transbay EIS/EIR did not identify any significant impacts related to commercial or passenger loading associated with the Transbay Redevelopment Plan. No mitigation measures to address impacts on commercial or passenger loading were identified.

Existing-plus-Project Conditions

The Proposed Project would include an off-street loading dock along Beale Street, with two spaces serving SU-30 trucks and smaller from a 24-foot-wide curb cut and driveway. Additional proposed locations for commercial and passenger loading include the nine spaces along Tehama Street, including two accessible spaces with curb ramps; two spaces along Main Street north of the garage driveway; and six spaces along the Project Site side of Howard Street. Loading/unloading zones would be located near building entrances.

Commercial (Freight and Delivery Service) Loading. Based on the travel demand estimates, the Proposed Project would generate demand for four commercial loading spaces in the midday peak hour of commercial loading. The analysis assumes that deliveries would occur primarily from standard box trucks, which are between 30 and 35 feet in length. That demand would be met by the combination of the off-street loading dock (two spaces) and the on-street loading spaces to be provided (340 linear feet of curb along Tehama, Main, and Howard streets on the Project Site frontage). The number of commercial versus passenger loading spaces has not yet been determined and would be subject to SFMTA review and approval. Commercial loading activity would be generated primarily by the retail land uses fronting Howard, Beale, and Main streets; therefore, the spaces along those streets nearest the retail building entrances would be the appropriate locations for designated commercial loading spaces.

This analysis assumes that at least 100 linear feet of the 340 total linear feet would be designated for commercial loading, and the peak commercial loading demand for four freight loading spaces would be met. Furthermore, implementation of Improvement Measure I-TR-1 would reduce the potential for conflicts between freight and delivery service vehicles and transit by employing a loading dock attendant to manage traffic flow and requiring vehicles exceeding 30 feet in length to load in on-street zones on

Howard, Main, or Tehama streets rather than in the loading dock. Furthermore, the Proposed Project would decrease the proposed residential, retail, and office space, compared to the EIS/EIR Full Build Alternative assumptions for the Project Site, resulting in a net reduction in Proposed Project–generated trips. As such, the Proposed Project would not result in any new or substantially more severe significant impacts with respect to commercial loading, and no mitigation measures are necessary.

Passenger Loading. Based on the travel demand estimates, the Proposed Project would generate demand for two passenger loading spaces (approximately 40 linear feet) during any one minute during the peak 15 minutes of the average peak period (one space, or 20 linear feet, of demand associated with both the residential and restaurant use). The proposed 340 total linear feet of passenger and commercial loading supply (approximately 17 spaces) along Tehama (180 linear feet), Main (40 linear feet), and Howard (120 linear feet) streets would serve this level of demand. Although the distribution of commercial versus passenger loading supply along these streets has not yet been determined, 17 spaces (340 linear feet) would adequately serve both needs. The nine spaces (180 linear feet) proposed on the north side of Tehama Street would be located along a one-way westbound street that would be extended as part of the Proposed Project. Two of these nine loading spaces would be accessible spaces with curb ramps. The two spaces along the west side of Main Street would be located within a 40-foot-long bulb-in, thereby minimizing the potential for conflicts with other road users and modes. The six spaces (120 linear feet) proposed on Howard Street would be provided along the south side of the roadway, in front of the Proposed Project.

The supply and siting of on-street loading spaces would meet passenger loading needs at the most convenient location and avoid any significant impacts. Furthermore, the Proposed Project would decrease the residential, retail, and office space, compared to the EIS/EIR Full Build Alternative assumptions for the Project Site, resulting in a net reduction in Proposed Project–generated trips and passenger loading demand. The Proposed Project would not result in any new or substantially more severe significant impacts with respect to passenger loading, and no mitigation measures are necessary.

Cumulative Conditions

Under cumulative conditions, freight and passenger loading activity on the surrounding street network would increase as a result of development projects within the study area. Commercial loading demand is typically hyperlocal, confined to the block faces of the buildings being served. Freight and passenger loading demand generated by cumulative development projects would not be anticipated to use the on-site freight loading dock or on-street freight and passenger loading spaces. However, if cumulative loading demand does increase on the block with the Proposed Project, the supply of on-street loading spaces (up to 17 total spaces, or 340 linear feet) would be enough to support increases in demand under cumulative conditions.

Under cumulative conditions, the on-street bicycle lane (class II) along Beale Street would be replaced with a two-way separated bicycle lane (class IV) on the east side of the street. As currently planned, the introduction of vertical separation between the bicycle lane and the vehicle travel lane would limit the ability of trucks to conveniently complete turning movements into and out of the loading dock. The effects of the Active Beale Street Project and Soda plan will be subject to separate study and environmental review. Further coordination with the SFMTA, as part of this review process and as part of the Active Beale Street Project, will include design detail recommendations to reduce the potential for conflicts and minimize potential hazards associated with commercial loading activities.

Implementation of Improvement Measure I-TR-1 would reduce the potential for conflicts between freight and delivery service vehicles and transit by employing a loading dock attendant to manage traffic flow and requiring vehicles exceeding 30 feet in length to load in on-street zones on Howard, Main, or Tehama streets rather than in the loading dock. The Proposed Project would decrease the residential, retail, and office space, compared to the EIS/EIR Full Build Alternative assumptions for the Project Site, resulting in a net reduction in Proposed Project–generated trips. For these reasons, the Proposed Project in combination with cumulative projects would have less-than-significant cumulative impacts related to loading.

WIND

Transbay EIS/EIR

A wind tunnel test was performed for the Transbay EIS/EIR, using conservative assumptions for the buildings that would be constructed in accordance with the land use program on the redevelopment parcels, including Block 4. The land use program ultimately adopted for the Block 4 site as part of the Transbay Redevelopment Plan included a maximum tower height of 450 feet, which was included in the wind tunnel test. Wind speeds were modeled at 69 locations throughout the Transbay Redevelopment Area, including four locations at the Project Site. The full build alternative modeling resulted in nine locations exceeding the comfort criterion (ground-level speeds in excess of 11 mph) and one location exceeding the hazard criterion (ground-level wind speeds in excess of 26 mph). The Reduced Scope Alternative modeling resulted in seven locations exceeding the comfort criterion and one location exceeding the hazard criterion. None of the comfort criterion or hazard criterion exceedances were located on Block 4 or adjacent blocks. For the purposes of CEQA, only exceedances of the hazard criterion are considered significant impacts.

To address the modeled hazard criterion exceedances, the Transbay EIS/EIR included a mitigation measure that required wind tunnel testing to be performed for all subsequent individual development projects proposed within the Transbay Redevelopment Area. If any exceedances of the hazard criterion occurred, design modifications or other mitigation measures would be required to mitigate or eliminate the exceedances.

Proposed Project and Cumulative Conditions

A wind tunnel test was performed for the Proposed Project, with conclusions outlined in the wind tunnel report summarized below and included in Appendix B.[20] The test modeled the proposed massing with a 550-foot tower (511 feet plus 39 feet for screening of mechanical equipment) with a 175-foot-tall podium and a 65-foot-tall townhouse building.[21] Three scenarios were examined:

(1) Existing Conditions

(2) Existing Conditions plus Proposed Project

(3) Cumulative Conditions plus Proposed Project

---

[20] CPP, Inc., *Pedestrian-Level Winds Report: Wind Tunnel Tests for Transbay Block 4*, July 14, 2020.

[21] Regarding the "massing changes" to the Proposed Project, the massing itself has not changed relative to the massing evaluated in CPP's assessment; the methodology for measuring building height has since changed resulting in minor shifts in height (all less than 5 feet) to the proposed buildings.

The cumulative conditions included buildings that are not yet approved or completed that have been added to the Proposed Project configuration, such as high-rise developments studied in the Transbay EIS/EIR. As shown in Table 7, below, wind speeds were modeled at 48 to 50 test points on and near the Project Site. Test points were selected to sample an area that is larger than the area within which wind speeds may be adversely affected by the Proposed Project. The measurement points were chosen to determine the degree of pedestrian comfort or discomfort at locations where relatively severe conditions are frequently found, such as at building corners, near entrances, on adjacent sidewalks with heavy pedestrian traffic, and in open plaza areas. All measurements were made without landscaping in place; therefore, the results may be considered representative of worst-case conditions, as required by the Planning Department. The addition of landscaping features is likely to reduce wind speeds in some locations.

The wind tunnel test assumed the Proposed Project would include a 550-foot tower (511 feet plus 39 feet for screening of mechanical equipment) with a 175-foot-tall podium and a 65-foot-tall townhouse building. Subsequent to the preparation of the wind tunnel test, the methodology used to measure the building heights was clarified, the cumulative conditions changed to include additional developments, and revisions to the massing of the potential development at Block 2. These minor clarifications and revisions to the cumulative conditions were evaluated (refer to Appendix B) and it was determined that there are no changes required to the conclusions in the wind tunnel test.[22]

Table 7. Overview of Wind Comfort and Hazard Criterion Exceedances for the EIS/EIR Full Build Alternative and Reduced Scope Alternative Compared to Proposed Project

Wind Study Scenario	Number of Test Points Studied	Comfort Criterion Exceedances	Hazard Criterion Exceedances
EIS/EIR[a]			
Full Build Alternative	69	9	1
Reduced Scope Alternative	69	7	1
Proposed Project[b]			
Existing Configuration Conditions	48	14	none
Project Configuration Conditions	50	16	none
Cumulative Configuration Conditions	50	6	none

Wind Comfort

The EIS/EIR included analysis of the [Project] based on pedestrian comfort criteria established in Planning Code section 148, *Reduction of Ground-level Wind Currents in C-3 Districts*, , which call for equivalent wind speeds of 7 mph in public seating areas and 11 mph in areas of substantial pedestrian use not to be exceeded more than 10 percent of the time year-round between 7 a.m. and 6 p.m. The comfort criteria are not used to determine whether a proposed project would result in a significant wind impact under CEQA. The following discussion is provided for informational purposes only.

Exceedances of the comfort criteria were found at 14 locations under existing conditions. With implementation of the Proposed Project, exceedances of the comfort criteria would increase with the addition of two locations, for a total of 16 locations, but decrease to six locations under cumulative conditions. All locations along Folsom Street, between Main Street and Spear Street, exceed the comfort criteria in the existing configuration. The addition of the Proposed Project would not change the comfort rating at these locations; however, the cumulative configuration provides shelter for some of these locations and eliminates eight comfort exceedances compared with the existing configuration.

Wind Hazards

The EIS/EIR established the wind hazard criterion, as stated in the planning code, as the threshold of significance for environmental impact associated with wind. The criterion is based on wind speeds that are averaged hourly. When based on one-minute averages, as is the case for the comfort criteria, this criterion is increased to 36 mph.[23] The test results for hazardous winds prepared for the Proposed Project used the one-minute average of 36 mph for the wind hazard criterion. No exceedances of the hazard criterion were found under existing conditions, with the Proposed Project, or under the cumulative scenarios. Therefore, no design modification of the Proposed Project, in accordance with the Transbay EIS/EIR wind mitigation measure, would be required. The wind impacts of the Proposed Project would be less than significant.

Based on the analysis in the wind report for the Proposed Project, although the height of the proposed tower would increase compared to what was analyzed in the Transbay EIS/EIR, no significant wind impacts would occur. No new mitigation measures are necessary.

SHADOW

Transbay EIS/EIR

The EIS/EIR included a shadow analysis performed in accordance with CEQA and Planning Code section 295. The methodology analyzes the potential shadow impacts of the Proposed Project on public parks and open spaces as a percentage of theoretical annual available sunlight (TAAS) consumed. TAAS is a measure of the square-foot-hours (sfh) of sunlight that would theoretically be available at a given park or open space during a typical year, assuming that it is sunny during all daylight hours. The first hour of the day after sunrise and the last hour before sunset are excluded from TAAS calculations.

[23] Arens, E., D. Ballanti, C. Bennett, S. Guldman, and B. White, *Developing the San Francisco Wind Ordinance and Its Guidelines for Compliance,* 1989, in *Building and Environment*, Volume 24, No. 4, pp. 297–303.

The EIS/EIR shadow analysis found that the Transbay Terminal and development under the Transbay Redevelopment Plan would not cast shadow on any parks or open spaces subject to section 295.[24] Other public parks and open spaces not subject to section 295 were also evaluated for potential impacts under CEQA. In San Francisco, a significant shadow impact would occur under CEQA if a project were to create new shadow in a manner that would substantially affect outdoor recreation facilities or other public areas.[25] The EIS/EIR indicated that some publicly accessible open spaces would see a reduction in sunlight during certain periods of the day and year, but that additional shading would not amount to a significant impact requiring mitigation measures. The EIS/EIR required all subsequent development projects in the Transbay Redevelopment Area to undergo a shadow analysis.

Proposed Project and Cumulative Conditions

In accordance with the requirements of the EIS/EIR, a shadow analysis was prepared for the Proposed Project (Appendix C).[26] Throughout the analysis, a comparison is made between three shadow-casting scenarios:

- *Existing Conditions:* The shadows cast by existing and anticipated structures in the San Francisco downtown area.
- *DCDG-Compliant Massing:* The additional shadows, relative to existing conditions, that would be cast by Block 4 development that would comply with the current Transbay Redevelopment Plan, the Transbay Design for Development, and the DCDG massing controls previously approved for the site under Transbay Redevelopment Plan legislation. This scenario is consistent with the scenario analyzed in the EIS/EIR.
- *Proposed Project:* The additional shadows, relative to existing conditions, that would be cast by the Proposed Project.

An initial shadow fan analysis prepared for the Proposed Project identified two existing publicly owned open spaces that might be affected by the Proposed Project. These are the recently opened Salesforce Park and the diamond-shaped Rincon Park, which lies between The Embarcadero and the Bayfront Trail. In addition, the analysis included an evaluation of potential shadow on seven smaller, neighboring privately

[24] Section 295 of the planning code applies only to public parks and open spaces that are under the jurisdiction of the San Francisco Recreation and Park Commission.

[25] Prior to 2019, the CEQA significance criterion for shadow was similar to the criterion used under Planning Code Section 295 to determine if net new project shadow would have an adverse impact on the use of any property under the jurisdiction of the San Francisco Recreation and Park Commission. The Section 295 criterion includes the consideration of the quantity of net new project shadow (i.e., the number of square-foot-hours of shadow expressed as a percentage of the total amount of annual sunlight on the affected park[s]). In 2019, the San Francisco Planning Department revised the CEQA significance criterion for shadow to focus less on the quantitative aspect of analyzing shadow impacts under Section 295. Under the revised CEQA significance criterion, a project would result in a significant shadow impact if it would create new shadow that would substantially and adversely affect the use and enjoyment of publicly accessible open spaces. OCII acknowledges and accepts the use of the revised CEQA significance criterion for the analysis of the Proposed Project's shadow impact. For consistency with prior addenda to the EIS/EIR, quantitative information regarding the Proposed Project's shadow is included in this analysis.

[26] Fastcast. 2022. *Shadow Analysis Report – Block 4 San Francisco, CA*. June 2022.

owned public open spaces (POPOS),[27] including Spear Street Terrace, Howard Fremont Plaza, Main Street Plaza, 201 Mission, Salesforce Plaza, Urban Park, and 50 Beale Plaza. The future Block 3 publicly owned open space, Transbay Block 3 Park, is also discussed for informational purposes.

For each of the 10 identified open spaces, a baseline value was calculated that represents the highest theoretical amount of sunlight that each of these open spaces would receive if there were no structures casting shadows on them. This baseline maximum value is referred to as the TAAS, expressed in sfh of sunlight. The TAAS is calculated by multiplying the area of the park/open space by the total number of annual hours that fall between one hour after sunrise and one hour before sunset. Comparing the existing shadow, future shadow, and TAAS values to each other (all expressed in sfh) provides a quantitative summary of key shadow impacts. Table 8 and Table 9, below, summarize the TAAS (shown as a percentage), comparing shadows from existing buildings, existing buildings plus the DCDG-Compliant Massing, and the Proposed Project.

The shadow analysis for the Proposed Project included qualitative impacts on the affected spaces, based on (1) the nature of existing shadow profiles, (2) size and duration of existing versus potential new shadows, and (3) whether or not the identified new shadows could be considered adverse to the quality of observed and established usage. These observations follow the prescribed method in CEQA for characterizing environmental impacts associated with increased shading. These include the shadow characteristics (size, duration, and location of new shadows) as well as the relative importance of sunlight for the identified activity (time of day and year and location for new shadows versus observed open space use).

This section analyzes the net increase of shadows from the Proposed Project (maximum building height at the Project Site at 513 feet) compared to both the DCDG-Compliant Massing scenario (maximum building height at the Project Site at 450 feet, i.e. the scenario analyzed in the EIS/EIR) and, for informational purposes, existing conditions.

Table 8. Shadows on Affected Publicly Owned Open Spaces

	Salesforce Park	**Rincon Park**	**Transbay Block 3 Park (Future)**
Total Shadow from Existing Buildings	49.27%	30.61%	47.46%
Existing Buildings plus DCDG-Compliant Massing

Existing Buildings + Proposed Project			

[27] The San Francisco General Plan Recreation and Open Space Element characterizes privately owned public open spaces in the denser neighborhoods of the city as "…a critical strategy to promote livability and provide much-needed spaces for relaxation, enjoyment of greenery, and socializing with others." Although these spaces are not subject to the provisions of section 295 of the planning code, the recreation and open space element is clear in that protecting sunlight access to these spaces, especially in the areas and times of highest use, should be a high priority for City officials and private groups.

Salesforce Park

Salesforce Park is a 208,072-square-foot (4.78-acre) publicly accessible park located on the roof of the Salesforce Transit Center. The 1,400-foot-long elevated park features a variety of activities and amenities, including gardens, trails, open grass areas, children's play areas, an outdoor amphitheater, as well as space for a future restaurant. The children's play areas are in the central and southwestern portions of the park, and the outdoor amphitheater is in the southwest portion of the park. Salesforce Park is used extensively throughout the day during the week. It is not as busy but still experiences substantial use on weekends.

The DCDG-Compliant Massing would contribute 125,414 sfh (0.02 percent) of new shading approximately four months of the year (mid-April to mid-August). The daily duration of net new shadow on the park under this scenario would range from less than 1 minute to a maximum of 51 minutes, with the average daily duration being about 33 minutes. In comparison, the Proposed Project would contribute 199,311 sfh (0.03 percent) new shading approximately eight months of the year (early January to early March, mid-April to mid-August, and early October to early December). The daily duration of net new Proposed Project shadow would range from less than 1 minute to a maximum of 1 hour and 16 minutes, with the average daily duration being about 44 minutes.

Both the DCDG-Compliant Massing and the Proposed Project would shadow Salesforce Park in the morning, affecting some areas with fixed seating in the northeastern end of the park. Shadow from both scenarios would move off the park around 8:45 a.m. to 9:00 a.m. and would not occur during the middle of the day when many nearby office workers might use the park during their lunch breaks.

The building height increase due to the Proposed Project would result in a net increase in shadow of 0.03 percent compared to existing conditions, and a net increase of 0.01 percent compared to the DCDG-Compliant Massing analyzed in the EIS/EIR. Given the limited duration of shadow and the limited area of the park that would be affected, shadow from the Proposed Project would not substantially and adversely affect the public's use and enjoyment of the park. Therefore, the Proposed Project's shadow impact on Salesforce Park would be less than significant, and no mitigation measures are necessary.

Rincon Park

Rincon Park is an urban diamond-shaped waterfront open space sited between the Embarcadero and the Bay Front Trail just south of the western Bay Bridge anchorage. The park features inviting expanses of lawn, canted and oriented to provide maximum views to the bay. The lawns are edged with a series of low seat walls. Tucked within and between the seat walls are shrub and perennial plantings native to California and coastal areas. Dominating the mounded landform is the Cupid's Span sculpture. Rincon Park is heavily used throughout the day both during the week and on weekends. The park is used for passive recreation (e.g., smoking, informal socializing, eating during lunch breaks, sunbathing). Although the park does not feature any active recreation facilities, cyclists and runners often pass through the park; the eastern boundary of the park abuts the San Francisco Bay Trail.

The DCDG-Compliant Massing would contribute 279,239 sfh (0.06 percent) of new shading approximately 9 months of the year (mid-April to early May, early August to mid-August, and late August to early April). The daily duration of net new shadow on the park under this scenario would range from less than 1 minute to a maximum of 1 hour, with an average daily duration of about 33 minutes. By comparison, the Proposed Project would contribute 607,662 sfh (0.13 percent) of new shading 10 months of the year, between early August and early May. The daily duration of net new shadow from the Proposed Project on the park would range from less than 1 minute to a maximum of 1 hour and 15 minutes, with an average duration of about 43 minutes.

Both the DCDG-Compliant Massing and the Proposed Project would shadow the park in the afternoon and early evening. Compared to shadow from the DCDG-Compliant Massing, shadow from the Proposed Project would be very similar in time of occurrence, duration, and location. Like the DCDG-Compliant Massing, the Proposed Project would not cast net new shadow on the park before 2:30 p.m. on any day of the year. Shadow from the Proposed Project would not occur during the morning and early afternoon when the park is heavily used. Shadow from the Proposed Project would occur during the afternoon and early evening when much of the park is already shadowed by existing buildings and activity levels within the park have decreased substantially.

The building height increase due to the Proposed Project would result in a net increase of 0.13 percent compared to existing conditions, and 0.07 percent compared to the DCDG-Compliant Massing analyzed in the EIS/EIR. The additional shadow from the Proposed Project is not expected to substantially and adversely affect the public's use and enjoyment of the park. Therefore, Proposed Project's shadow impact on Rincon Park would be less than significant, and no mitigation measures are necessary.

Spear Street Terrace (POPOS)

Spear Street Terrace is a 31,716-square-foot (0.73-acre) publicly accessible private open space in the Financial District of San Francisco (Assessor's Block 3741/Lot 032). The plaza is northwest of 2 Folsom Street; the "panhandle" portion is between a parking structure to the northeast and the 201 Spear Street building to the southwest. Access to the plaza is via Steuart Street to the northeast and Spear Street to the southwest as well as a narrower "panhandle" pedestrian passageway from Howard Street to the northwest. Spear Street Terrace is used primarily for passive activity by nearby office workers and as a pedestrian passage between Spear, Howard, and Steuart streets. The plaza experiences its maximum use around lunchtime.

The DCDG-Compliant Massing would contribute 185,116 sfh (0.16 percent) of new shading approximately 4.5 months of the year (late February to early May and early August to mid-October). The daily duration of net new shadow on the park under this scenario would range from less than 1 minute to a maximum of 1 hour and 15 minutes, with the average daily duration being about 50 minutes. By comparison, the Proposed Project would contribute 371,002 sfh (0.31 percent) of new shading approximately six months of the year (early February to early May and early August to early November. With the Proposed Project, the daily duration of net new shadow on the park would range from less than 1 minute to a maximum of 1 hour and 15 minutes, with the average daily duration being about 49 minutes.

Both the DCDG-Compliant Massing and the Proposed Project would shadow the plaza in the afternoon. Shadow from the Proposed Project would occur on the plaza for more days of the year (early February to early May and early August to early November) than shadow from the DCDG-Compliant Massing (late February to early May and early August to mid-October). From mid-August until early October, the Proposed Project would cast a larger shadow on the southwest (Spear Street) entrance to the plaza than the DCDG-

Compliant Massing. Shadow from the Proposed Project would not reach the plaza before 2:45 p.m. and would not occur during the plaza's period of maximum use (11:00 a.m. to 1:00 p.m. for nearby workers' lunch breaks).

The building height increase due to the Proposed Project would result in a net increase of 0.31 percent compared to existing conditions, and 0.15 percent compared to the DCDG-Compliant Massing analyzed in the EIS/EIR. Net new shadow from the Proposed Project would not substantially and adversely affect the public's use and enjoyment of the park. The Proposed Project's shadow impact on Spear Street Terrace would be less than significant, and no mitigation measures are necessary.

Howard/Fremont Plaza (POPOS)

Howard Fremont plaza is an 8,724-square-foot (0.20-acre) urban open space located in the Financial District of San Francisco on Assessor's Blocks 3738/Lots 016 and 017. The T-shaped open space is framed by high rises on the northwest and east and the 50-foot-tall 342 Howard Street Tower Project at the corner of Howard Street and Fremont Street. Howard Fremont Plaza attracts a high number of visitors during lunchtime, including many nearby office workers.

The DCDG-Compliant Massing would contribute 19,471 sfh (0.06 percent) of new shading approximately 4.5 months of the year (early April to mid-April, late April to mid-August, and late August to early September). The daily duration of net new shadow on the park under this scenario would range from 1 minute to a maximum of 30 minutes, with the average daily duration being about 21 minutes. In comparison, the Proposed Project would contribute 117,410 sfh (0.36 percent) of new shading approximately five months of the year (early April to early September). With the Proposed Project, the daily duration of net new shadow on the park would range from 1 minute to a maximum of 1 hour and 45 minutes, with the average daily duration being about 1 hour and 6 minutes.

Both the DCDG-Compliant Massing and the Proposed Project would shadow the southeast (Howard Street) entrance of the plaza during the morning from mid-April until late August. From early May until early August, shadow from the Proposed Project would occur for a longer duration each day than shadow from the DCDG-Compliant Massing (an average of 90 minutes compared to an average of 15 to 30 minutes). Shadow from the Proposed Project would move off the plaza by 9:15 a.m. and would not occur during the plaza's period of maximum use (11:00 a.m. to 1:00 p.m. for nearby workers' lunch breaks).

The building height increase due to the Proposed Project would result in a net increase of 0.36 percent compared to existing conditions, and 0.30 percent compared to the DCDG-Compliant Massing analyzed in the EIS/EIR. Net new shadow from the Proposed Project would not substantially and adversely affect the public's use and enjoyment of the park. The Proposed Project's shadow impact on Howard/Fremont Plaza would be less than significant, and no mitigation measures are necessary.

Main Street Plaza (POPOS)

Main Street Plaza has 4,657 square feet (0.11 acre) of publicly accessible urban open space in the Financial District of San Francisco on Assessor's Block 3740/Lots 033 and 034. The Main Street entry of the plaza, which benefits from a sunny exposure, has two concrete benches, three planters that double as seating along the edges, and modest landscaping. At the eastern edge of the plaza is an expansive fenced play lot for children. Main Street Plaza is used primarily for passive activity by nearby office workers and as a pedestrian passage between Main and Spear streets. The plaza experiences its maximum use around lunchtime.

The DCDG-Compliant Massing would contribute 554,982 sfh (3.20 percent) of new shading during all 12 months of the year. The daily duration of net new shadow on the park under this scenario would range from less than 1 minute to a maximum of 2 hours and 15 minutes, with the average daily duration being about 1 hour and 8 minutes. In comparison, the Proposed Project would contribute 700,136 sfh (4.04 percent) of new shading during all 12 months of the year. With the Proposed Project, the daily duration of net new shadow on the park would range from less than 1 minute to a maximum of 2 hours and 30 minutes, with the average daily duration being about 1 hour and 21 minutes.

Both the DCDG-Compliant Massing and the Proposed Project would shadow the southwest (Main Street) entrance of the plaza during the afternoon throughout the year. From late September until mid-March, shadow from the Proposed Project would reach the plaza about 15 to 30 minutes earlier than shadow from the DCDG-Compliant Massing, but this would occur after 2:00 p.m. Therefore, shadow from the Proposed Project would not occur during the plaza's period of maximum use (11:00 a.m. to 1:00 p.m. for nearby workers' lunch breaks).

The building height increase due to the Proposed Project would result in a net increase of 4.04 percent compared to existing conditions, and 0.84 percent compared to the DCDG-Compliant Massing analyzed in the EIS/EIR. Net new shadow from the Proposed Project would not substantially and adversely affect the public's use and enjoyment of the park. The Proposed Project's shadow impact on Main Street Plaza would be less than significant, and no mitigation measures are necessary.

201 Mission (POPOS)

The 0.31-acre parcel at 201 Mission is a lunch and break space with a surplus of movable seating and dining, buffered from Beale Street by dense planting. The open space at 201 Mission Street is presumed to be used primarily for passive activity by nearby office workers.[28] Given its proximity to high rise office buildings, the open space likely experiences its heaviest use around lunchtime.

The DCDG-Compliant Massing would contribute 825,497 sfh (1.63 percent) of new shading more than 11 months of the year, from late December to mid-December. The daily duration of net new shadow on the park under this scenario would range from less than one minute to a maximum of 6 hours and 45 minutes, with the average daily duration being about 3 hours and 41 minutes. In comparison, the Proposed Project would contribute 948,754 sfh (1.88 percent) of new shading almost nine months of the year, from early January to mid-May and from late July to early December. With the Proposed Project, the daily duration of net new shadow on the park would range from less than one minute to a maximum of 1 hour and 45 minutes, with the average daily duration being about 1 hour and 9 minutes.

Both the DCDG-Compliant Massing and the Proposed Project would shadow the open space in the morning before 9:15 a.m., with shadow from the Proposed Project lasting about 30 minutes longer per day from mid-November until late January. Shadow from the Proposed Project would not occur during the open space's presumed period of maximum use (11:00 a.m. to 1:00 p.m. for nearby workers' lunch breaks).

The building height increase due to the Proposed Project would result in a net increase of 1.88 percent compared to existing conditions, and 0.25 percent compared to the DCDG-Compliant Massing analyzed in the EIS/EIR. Net new shadow from the Proposed Project would not substantially and adversely affect the

[28] Due to an indefinite citywide shelter-in-place order effective March 17, 2020, observations of this open space were not possible at the time that this analysis was prepared.

public's use and enjoyment of the park. The Proposed Project's shadow impact on the 201 Mission open space would be less than significant, and no mitigation measures are necessary.

Salesforce Plaza (POPOS)

Salesforce Plaza, an open hardscape area at the southern corner of Mission and Fremont streets, is framed by Salesforce Tower to the southwest and Salesforce Transit Center to the southeast. Salesforce Plaza is used primarily by pedestrians while en route to Salesforce Transit Center or the high-rise office buildings and businesses in the area. It is also the location of the cable car that ferries pedestrians to the elevated Salesforce Park. The plaza contains a small amount of fixed seating and landscaping in the northern corner of the site, adjacent to the cable car. The use of the plaza for purposes other than pedestrian access to and from the Salesforce Transit Center and Salesforce Park is presumed to be minimal.[29]

The DCDG-Compliant Massing would contribute 7,031 sfh (0.01 percent) of new shading about 9 months of the year, from late January to early March and-mid-March to late September. The daily duration of net new shadow on the park under this scenario would range from less than 1 minute to a maximum of 1 hour and 45 minutes, with the average daily duration being about 53 minutes. In comparison, the Proposed Project would contribute 13,803 sfh (0.02 percent) of new shading about three months of the year, between mid-April and late May as well as mid-July to mid-August. With the Proposed Project, the daily duration of net new shadow on the park would range from less than 1 minute to a maximum of 1 30 minutes, with the average daily duration being about 24 minutes.

Both the DCDG-Compliant Massing and the Proposed Project would shadow the northern third of the plaza in the morning, with shadow from the Proposed Project covering an additional area along the eastern edge of the plaza. Shadow from the Proposed Project would occur on the plaza for fewer days of the year (mid-April to late May and mid-July to mid-August) than shadow from the DCDG-Compliant Massing (late January to early March and mid-March to late September).

The building height increase due to the Proposed Project would result in a net increase of 0.02 percent compared to existing conditions, and 0.01 percent compared to the DCDG-Compliant Massing analyzed in the EIS/EIR. Shadow from the Proposed Project is not anticipated to substantially and adversely affect the use of the plaza for pedestrian access. The Proposed Project's shadow impact on Salesforce Plaza would be less than significant, and no mitigation measures are necessary.

Urban Park (POPOS)

Urban Park, located on the western corner of Howard Street and Main Street, is a new open space, seemingly inspired by traditional Japanese raked-gravel gardens. Based on its design, the park is expected to be used primarily for passive activity by nearby residents and workers.[30]

The DCDG-Compliant Massing would contribute 8,810,597 sfh (11.09 percent) of new shading to Urban Park. New shading would be introduced at the plaza every day of the year. The daily duration of net new shadow on the park under this scenario would range from less than 1 minute to a maximum of 4 hours and 45 minutes, with the average daily duration being about 3 hours and 58 minutes. In

[29] Due to an indefinite citywide shelter-in-place order effective March 17, 2020, observations of this open space were not possible at the time that this analysis was prepared.

[30] Due to an indefinite citywide shelter-in-place order, effective March 17, 2020, observations of this open space were not possible when this analysis was prepared.

comparison, the Proposed Project would contribute 9,501,966 sfh (11.97 percent) of new shading. New shading would be introduced at the plaza every day of the year. With the Proposed Project, the daily duration of net new shadow on the park would range from less than 1 minute to a maximum of 5 hours and 30 minutes, with the average daily duration being about 4 hours and 15 minutes.

Both the DCDG-Compliant Massing and the Proposed Project would shadow the park from the early morning until the early afternoon throughout the year. Compared to shadow from the DCDG-Compliant Massing, shadow from the Proposed Project would be very similar in time of occurrence, duration, and location.

The building height increase due to the Proposed Project would result in a net increase of 0.88 percent compared to the DCDG-Compliant Massing analyzed in the EIS/EIR. Park users who prefer sunlight to shadow would be affected by the net new shadow and most likely would not use the park during the morning and early afternoon. Such individuals would be able to visit other parks and open spaces in the neighborhood that receive more sunlight. This would be the case under both the DCDG-Compliant Massing and the Proposed Project. Since the shadow from the Proposed Project would be very similar in time of occurrence, duration, and location to the shadow from the DCDG-Compliant Massing, the Proposed Project would not result in a more severe shadow impact on Urban Park when compared to the DCDG-Compliant Massing.

50 Beale Street Plaza (POPOS)

This large, square-shaped urban park opens onto Beale Street on its east side. Surrounded on three sides by towers and heavily landscaped with bushes and mature trees, the park generally stays shady. There is ample bench seating but no movable seating. Although crisscrossed by office workers heading to the nearby towers or cutting through the block, the park is generally empty in the evening and on weekends. Based on its design, the park is presumed to be used primarily for passive activity or as a mid-block pedestrian passage by nearby office workers and residents. Given its proximity to high rise office buildings, the park likely experiences its heaviest use around lunchtime.[31]

The DCDG-Compliant Massing would contribute 57,097 sfh (0.08 percent) of new shading about 3 months of the year, from early February to mid-March as well as late September to early November. The daily duration of net new shadow on the park under this scenario would range from less than 1 minute to a maximum of 45 minutes, with the average daily duration being about 30 minutes. In comparison, the Proposed Project would contribute 69,967 sfh (0.10 percent) of new shading approximately 4 months of the year, from early February to mid-March, mid-September to early November, and early December to early January. With the Proposed Project, the daily duration of net new shadow on the park would range from less than 1 minute to a maximum of 45 minutes, with the average daily duration being about 27 minutes.

Like the DCDG-Compliant Massing, the Proposed Project would not cast net new shadow on the plaza after 9:45 a.m. on any day of the year. Therefore, shadow from the Proposed Project would not occur during the plaza's presumed period of maximum use (11:00 a.m. to 1:00 p.m. for nearby workers' lunch breaks).

The building height increase due to the Proposed Project would result in a net increase of 0.10 percent compared to existing conditions, and 0.02 percent compared to the DCDG-Compliant Massing analyzed in

[31] Due to an indefinite citywide shelter-in-place order, effective March 17, 2020, observations of this open space were not possible when this analysis was prepared.

the EIS/EIR. Net new shadow from the Proposed Project would not substantially and adversely affect the public's use and enjoyment of the plaza. The Proposed Project's shadow impact on 50 Beale Street Plaza would be less than significant, and no mitigation measures are necessary.

Future Transbay Block 3 Park

The following discussion is provided for informational purposes only. Since Transbay Block 3 Park is not an existing park, shadow from the Proposed Project could not result in an impact under CEQA.

Transbay Block 3 Park is a proposed 47,885-square-foot (1.10-acre) public park in the Financial District of San Francisco, on portions of Assessor's Block 3739/Lots 002, 006, and 008 (Transbay Block 3). The future park space will occupy land that was used as the temporary Transbay Terminal while the Salesforce Transit Center was being built. The design and programming of this park are still under development and have not yet been finalized.

The DCDG-Compliant Massing would contribute 9,441 sfh (0.01 percent) of new shading approximately four months of the year. The daily duration of net new shadow on the park under this scenario would range from less than 1 minute to a maximum of 1 hour and 30 minutes, with the average daily duration being about 43 minutes. In comparison, the Proposed Project would contribute 81,454 sfh (0.05 percent) of new shading approximately 7 months of the year. With the Proposed Project, the daily duration of net new shadow on the park would range from less than 1 minute to a maximum of 1 hour and 45 minutes, with the average daily duration being about 57 minutes. The building height increase due to the Proposed Project would result in a net increase of 0.04 percent compared to the DCDG-Compliant Massing analyzed in the EIS/EIR.

Both the DCDG-Compliant Massing and the Proposed Project would shadow the northern (Tehama Street) edge of the future park during the late afternoon and early evening. Shadow from the Proposed Project would occur on the future park for more days of the year (mid-March until early October) than shadow from the DCDG-Compliant Massing (mid-March until mid-April, late May until mid-July, late August until early October). Given the limited area along the northern edge of the future park that would be affected, it is anticipated that shadow from the Proposed Project would not substantially and adversely affect the public's use and enjoyment of the future park.

Board of Supervisors Resolution No. 612-04 (October 7, 2004)
San Francisco Redevelopment Agency Commission Resolution No. 11-2005 (January 25, 2005)

COMMISSION ON COMMUNITY INVESTMENT AND INFRASTRUCTURE

RESOLUTION NO. 19 – 2022
Adopted June 21, 2022

APPROVING THE REPORT TO THE BOARD OF SUPERVISORS ON THE AMENDMENT TO THE REDEVELOPMENT PLAN FOR THE TRANSBAY REDEVELOPMENT PROJECT AREA IN CONNECTION WITH THE DEVELOPMENT OF A MIXED-USE RESIDENTIAL PROJECT ON BLOCK 4 OF ZONE ONE OF THE TRANSBAY REDEVELOPMENT PROJECT AREA; AND AUTHORIZING TRANSMITTAL OF THE REPORT TO THE BOARD OF SUPERVISORS; TRANSBAY REDEVELOPMENT PROJECT AREA

WHEREAS, In furtherance of the objectives of the California Community Redevelopment Law (Health and Safety Code, section 33000 et seq. the "Community Redevelopment Law" or "CRL"), the Redevelopment Agency of the City and County of San Francisco ("Former Agency") undertook programs for the redevelopment of blighted areas in the City and County of San Francisco ("City"), including the Transbay Redevelopment Project Area ("Project Area"); and,

WHEREAS, The Board of Supervisors of the City and County of San Francisco ("Board of Supervisors") approved the Redevelopment Plan for the Transbay Redevelopment Project Area ("Project Area") by Ordinance No. 124-05 (June 21, 2005) and by Ordinance No. 99-06 (May 9, 2006), as amended by Ordinance No. 84-15 (June 18, 2015) and Ordinance No. 62-16 (April 28, 2016) ("Redevelopment Plan"); and,

WHEREAS, On February 1, 2012, the State of California dissolved all redevelopment agencies including the Former Agency and required the transfer of certain of the Former Agency's assets and obligations to the Successor Agency to the Redevelopment Agency of the City and County of San Francisco ("Successor Agency"), commonly known as the Office of Community Investment and Infrastructure ("OCII") (Cal. Health & Safety Code §§ 34170 et seq., "Redevelopment Dissolution Law"). On June 27, 2012, the Redevelopment Dissolution Law was amended to clarify that successor agencies are separate public entities from the city or county that had originally established a redevelopment agency and they succeed to the organizational status of the former redevelopment agency to complete any work related to an approved enforceable obligation, Cal. Health & Safety Code § 34173 (g); and,

WHEREAS, The Board of Supervisors, acting as the legislative body of the Successor Agency, adopted Ordinance No. 215-12 (Oct. 4, 2012), which, among other matters: (a) acknowledged and confirmed that the Successor Agency is a separate legal entity from the City, and (b) established this Successor Agency Commission ("Commission") and delegated to it the authority to (i) implement, modify, enforce and complete the Former Agency's enforceable obligations; (ii) approve all contracts and actions related to the assets transferred to or retained by OCII, including, without limitation, the authority to exercise land use, development, and design approval, consistent with the applicable enforceable obligations; and (iii) take any action that the Redevelopment Dissolution Law requires or authorizes on behalf of the Successor Agency and any other action that the Commission deems appropriate, consistent with the Redevelopment Dissolution Law, to comply with such obligations; and,

WHEREAS, The authority of the Commission includes authority to grant approvals under land use controls for the Project Area specified in the Redevelopment Plan and to recommend amendments to the Redevelopment Plan, subject to Board of Supervisors' approval, as provided under the CRL; and,

WHEREAS, The Successor Agency now proposes to take certain actions related to Transbay Block 4 and the adjacent future Tehama Street right of way within Zone One of the Project Area (Assessor's Block 3739 Lot 010 and Lot 011, respectively), an approximately 56,375 square-foot area generally located at 200 Main Street, bounded by Howard, Main and Beale Streets and extending approximately 205 feet southeast from Howard Street. Specifically, the Successor Agency proposes an amendment to the Redevelopment Plan ("Plan Amendment") that would increase the maximum height limit for development on Block 4 from 450 feet to 513 feet and increase the maximum building floor plate sizes applicable to Block 4: (a) from 7,500 square feet to 13,500 square feet for buildings 85 feet to 250 feet in height, and (b) from 13,000 square feet to 15,200 square feet for buildings over 500 feet in height but limited to that portion of the building that is between 85 feet and 122 feet in height; and,

WHEREAS, The Plan Amendment is consistent with the Redevelopment Plan objectives to provide flexibility in the development of the Project Area, to respond readily and appropriately to market conditions, to strengthen the economic base of the Project Area and to promote development of affordable housing within the Project Area; and,

WHEREAS, On May 12, 2022, Transbay Citizens Advisory Committee ("CAC") considered the Plan Amendment and recommended its approval to the Commission and the Board of Supervisors; and,

WHEREAS, In accordance with Sections 33352 and 33457.1 of the CRL, the Successor Agency has prepared the Report to the Board of Supervisors on the Plan Amendment ("Report to the Board") that contains only the information required by Health and Safety Code Section 33352 that is warranted by the scope of the Plan Amendment; and,

WHEREAS, On June 21, 2022, the Commission adopted Resolution No. 18-2022 by which the Commission determined that the Final Environmental Impact Statement/ Environmental Impact Report for the Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project (the "FEIS/EIR" as defined in said resolution), together with further analysis provided in Addendum No. 9 to the FEIS/EIR (the "Addendum" as defined in said resolution), remains adequate, accurate, and objective and in compliance with the California Environmental Quality Act (California Public Resources Code Sections 21000 et seq., "CEQA") and the CEQA Guidelines (14 California Code of Regulations Sections 15000 et seq.) for purposes of evaluating the potential environmental effects of the Proposed Actions (including the Plan Amendment) and the Project; and,

WHEREAS, The environmental effects of the Plan Amendment have been analyzed in the environmental documents as described in Commission Resolution No. 18-2022. Copies of the FEIS/EIR and Addendum No. 9 are on file with the Commission Secretary; now therefore be it

RESOLVED, That in Resolution No. 18-2022, the Commission adopted findings that various actions, including the Development Controls Amendment, were in compliance with CEQA and the CEQA Guidelines, said findings, which are on file with the Commission Secretary, being in furtherance of the actions contemplated in this Resolution and made part of this Resolution by reference herein; and, be it further

RESOLVED, That for the purposes of compliance with CEQA and the CEQA Guidelines, the hereby adopts the findings and determinations set out in Resolution 18-2022, adopted concurrently herewith, that the Plan Amendment is within the scope of the project analyzed by the FEIS/EIR and Addendum No. 9; and, be it further

RESOLVED, That the Commission hereby approves the Report to the Board of Supervisors attached to this Resolution as Exhibit A; and, be it further

RESOLVED, That the Executive Director is hereby authorized to transmit said Report to the Board of Supervisors as required under CRL Section 33457.1 for its background information in considering the proposed Plan Amendment.

I hereby certify that the foregoing resolution was adopted by the Successor Agency Commission at its meeting of June 21, 2022.

Commission Secretary

EXHIBIT A: Report to the Board of Supervisors on the Amendment to the Redevelopment Plan for the Transbay Project Area

REPORT TO THE BOARD OF SUPERVISORS ON THE AMENDMENT TO THE REDEVELOPMENT PLAN FOR THE TRANSBAY REDEVELOPMENT PROJECT AREA

INTRODUCTION

The Board of Supervisors of the City and County of San Francisco ("Board of Supervisors") established the Transbay Redevelopment Project Area ("Project Area") and approved a Redevelopment Plan for the Project Area by Ordinance No. 124-05 (June 21, 2005) and by Ordinance No. 99-06 (May 9, 2006), as amended by Ordinance No. 84-15 (June 18, 2015) and Ordinance No. 62-16 (April 28, 2016) ("Redevelopment Plan").

The Redevelopment Plan establishes the land use controls for the Project Area and divides the Project Area into two subareas: (1) Zone One, in which the Redevelopment Plan and the Development Controls and Design Guidelines for the Transbay Redevelopment Project (as currently amended, the "Development Controls") define and regulate land uses, and (2) Zone Two, in which the San Francisco Planning Code applies.

On June 21, 2022, the Successor Agency Commission ("Commission") held a public hearing to approve and recommend to the Board of Supervisors an amendment to the Redevelopment Plan in conjunction with proposed development of Transbay Block 4 and adjacent future Tehama Street public right of way, an approximately 56,375 square-foot area generally located at 200 Main Street, bounded by Howard, Main and Beale Streets and extending approximately 205 feet southeast from Howard Street (Assessor's Block 3739 Lot 010 ("Block 4") and Lot 011 ("Tehama ROW"), and collectively the "Site"). The proposed amendment ("Plan Amendment") would modify the Redevelopment Plan as follows: increase the maximum height limit for development on Block 4 from 450 feet to 513 feet and increase the maximum building floor plate sizes applicable to Block 4: (a) from 7,500 square feet to 13,500 square feet for buildings 85 feet to 250 feet in height, and (b) from 13,000 square feet to 15,200 square feet for buildings over 500 feet in height but limited to that portion of the building that is between 85 feet and 122 feet in height. In all other respects, the land use controls of the Redevelopment Plan would remain in effect.

Pursuant to Section 33352 of the California Community Redevelopment Law (Health and Safety Code Section 33000 et seq., "CRL"), the Successor Agency to the Redevelopment Agency of the City and County of San Francisco (commonly known as the Office of Community Investment and Infrastructure or "OCII") prepared this report to the Board of Supervisors to assist its review of the Plan Amendment and, should it determine to approve said amendment, provide a basis for necessary findings under the CRL.

The Plan Amendment would help achieve the Redevelopment Plan goals and objectives, including among others, (a) strengthen the community's supply of housing and affordable housing with the deepest levels of affordability; (b) ensure that high-rise buildings reflect high quality architectural and urban design standards, (c) create a mixture of housing types and sizes to attract a diverse residential population, including families and people of all income levels; (d) maximize housing development on the former Caltrans-owned properties according to the Development Controls to

provide financial support to the Salesforce Transit Center and Caltrain Downtown Extension through tax increment and land sale revenue.

The increased height and bulk limitations will allow for a larger mixed-income residential tower and a 100 percent affordable housing mid-rise building on Block 4. This will increase the total number of residential units to be constructed on the Site, including a high percentage of the total as below-market-rate units, and will continue to provide for a tower that complements the downtown skyline while supporting OCII's affordable housing mandate for the Project Area.

SCOPE OF THIS REPORT

This Plan Amendment is a minor plan amendment. [1] Under CRL Section 33352, a Plan Amendment submitted to the legislative body for approval must be accompanied by a report containing following information:

- The reason for the Plan Amendment;
- The proposed method of financing the redevelopment of the Project Area as applicable to the Plan Amendment;
- The report and recommendation of the San Francisco Planning Commission;
- The report on the environmental review required by Section 21151 of the Public Resources Code as applicable to the Plan Amendment; and
- A neighborhood impact report.

In approving the Redevelopment Plan in 2005 and 2006, the former Redevelopment Agency of the City and County of San Francisco ("Former Agency") and the Board of Supervisors relied on information about the conditions of physical and economic blight within the Project Area, the need for tax increment financing to carry out redevelopment in the Project Area, and other factors justifying the establishment of the Project Area. The Plan Amendment does not alter the blight and financial determinations made at the time the Project Area was originally adopted, but rather provides an effective approach for alleviating blight and promoting the financial feasibility of the Redevelopment Plan.

The Plan Amendment does not contemplate changes in the specific goals, objectives or expenditures of OCII for the Project Area.

---

[1] Generally, minor plan amendments are those that do not propose to (a) include a tax allocation provision into a redevelopment plan which does not uses tax increment financing; (b) add new territory to the project area of a redevelopment plan that uses tax increment financing; or (c) extend the time limits for meeting housing obligations or payments to taxing entities.

Furthermore, the Plan Amendment does not trigger the need for a Project Area Committee under CRL Section 33385 because it does not provide for the acquisition of, or the authorization of public projects on, property occupied by low- and moderate-income persons.

THE REASON FOR THE PLAN AMENDMENT (CRL Section 33352(a))

The purpose of the Plan Amendment is to facilitate, on Block 4 of the Project Area, the development of a residential tower extending to a maximum height of 513 feet with a larger building base, and a larger mid-rise building, which would be consistent with the following Redevelopment Plan goals and objectives:

- Strengthen the community's supply of housing by assisting, to the extent economically feasible, in the construction and rehabilitation of affordable housing with the deepest levels of affordability, including the development of supportive housing for the homeless. Section 2.1.

- Ensure that high-rise buildings reflect high quality architectural and urban design standards. Section 2.2.

- Create a mixture of housing types and sizes to attract a diverse residential population, including families and people of all income levels. Section 2.2.

- Develop high-density housing to capitalize on the transit-oriented opportunities within the Project Area and provide a large number of housing units close to downtown San Francisco. Section 2.2.

The Plan Amendment also allows the feasible development of sufficient residential units to satisfy affordable housing requirements under State law for total residential units within the Project Area. Specifically, in 2003, the State adopted California Public Resources Code Section 5027.1, which requires that any redevelopment plan adopted to finance, in whole or in part, the demolition of the Transbay Terminal building and the construction of a new terminal, including its associated vehicle ramps, shall ensure that at least 25% of all dwelling units developed within the Project Area shall be available at affordable housing cost to, and occupied by, persons and families whose incomes do not exceed 60% of the area median income, and that at least an additional 10% of all dwelling units developed within the Project Area shall be available at affordable housing cost to, and occupied by, persons and families whose incomes do not exceed 120% of the area median income, for a total 35% affordable housing obligation ("Transbay Affordable Housing Obligation").

In the process of negotiating the proposed development on Block 4, it became apparent to OCII staff that development of Block 4 would likely require larger buildings to feasibly provide sufficient residential units to satisfy the Transbay Affordable Housing Obligation. Thus, OCII staff, together with representatives of Hines, the managing partner of F4 Transbay Partners LLC, a Delaware limited liability company (the "Developer") proposed the development a project that, with an increase in the maximum allowable height and increases in bulk for towers and mid-rise buildings on Block 4, could feasibly deliver 45% of the units to be provided as affordable to households earning between 40% and 120% of Area Median Income ("AMI").

On June 21, 2022, the Commission authorized the execution of a disposition and development agreement with the Developer and Transbay Block 4 Housing Partnership, L.P., a California

limited partnership ("Affordable Developer"), for the sale of the Block 4 and conveyance the Tehama ROW to the Developer and construction of a residential development project on the Site.

The DDA authorizes construction of 681 residential units, including 45% or 306 units of affordable to low- or moderate-income households to satisfy the current requirements of the Transbay Affordable Housing Obligation. Overall the Block 4 DDA residential development (or "Project") contemplates (a) one residential tower 513 feet in height at the roof of the last occupiable floor (plus a rooftop mechanical screening/parapet element of a maximum 39 feet in height), including an attached wing up to 71 feet in height, collectively containing 155 for-sale residential condominium units, 219 market-rate rental residential units and no fewer than 105 rental units affordable to households earning from 100 to 120 percent of AMI, approximately 1,960 square feet of neighborhood retail uses, amenities spaces, 2,200 square feet of open spaces, and related facilities; (b) an affordable residential building 163 feet in height at the roof of the last occupiable floor (plus a rooftop mechanical screening/parapet element of a maximum 16 feet in height) containing 201 rental units (and one manager's unit) affordable to households earning from 40 to 100 percent of AMI, with, approximately 3,200 square feet of neighborhood retail uses, amenities, 3,200 square feet of open spaces, and related facilities, (c) an approximately 66,496 square foot underground shared parking garage accommodating up to 275 private vehicles valet-parked and/or parked via stackers, two car share spaces and a parking for a minimum of 556 bicycles; (d) a minimum of 4,250 square feet of public open space and streetscape improvements within and surrounding the Site and including the extension of Tehama Street on the Tehama ROW.

Community Identity and Built Form

The Redevelopment Plan implements the transformation of former freeway land into a new high-rise residential district in the South of Market neighborhood. Through public workshops and meetings, in collaboration with the Transbay Citizens Advisory Committee, land in the Project Area formerly containing portions of the Embarcadero Freeway, its ramps and Terminal Separator Structure, was envisioned as a transit-oriented residential district as documented in the Transbay Redevelopment Project Area Design for Development completed in October 2003 (“Design for Development”). The Design for Development informed the creation of the Redevelopment Plan and the Development Controls, both adopted in 2005, and called for Zone One of the Project Area to become a complementary and exciting addition to the downtown skyline, designed as a grouping of slender residential towers that would visually extend the Downtown high-rise office skyline.

Since completion of the Design for Development and adoption of the Redevelopment Plan and Development Controls, height limits were increased with the adoption of the Transit Center District Plan in 2012. As a result, buildings between approximately 700 and 1000 feet in height have been constructed, including the Salesforce Tower (formerly the Transbay Terminal Tower), between Mission and Howard Streets, and 181 Fremont Street, at Fremont and Howard Streets. An affiliate of the Developer recently received approvals for construction of an 850-foot mixed-use tower on Transbay Parcel F in Zone Two, at 542-550 Howard, between First and Second Streets.

Within Zone One, two towers have recently been completed, consistent with the Redevelopment Plan and Development Controls, at heights higher than the 513 feet proposed for Block 4. Park Tower on Transbay Block 5, located at Howard and Beale Streets immediately across Howard

Street to the north of Block 4, is a 550-foot tall office building. The Avery residential building on Transbay Block 8, located at Folsom and Fremont Streets two blocks to the southwest of Block 4, is a 550-foot tall residential tower. The Plan Amendment will increase the tower height on Block 4 to 513 feet and will produce a "stepping up" effect of building heights from Block 3 Transbay Park north to the higher heights of buildings proposed and constructed in the Transit Center District Area Plan and Zone Two of the Project Area.

The Plan Amendment will also permit specific increases to maximum bulk on Block 4, with a corresponding increase in developable residential floor area on Block 4. The increase in the maximum floor plate areas will affect the lower portion of the tower and expand the maximum floor plate of the mid-rise building. The Plan Amendment will expand the floor plate of the tower base at between 85 feet and 122 feet in height, that will provide a proportional tapering of the Tower massing. The expansion of the mid-rise floor plate will result in that building being similar in size to nearby mid-rise buildings immediately surrounding Block 4.

Housing Opportunities

The Redevelopment Plan's Planning Goals and Objectives on housing opportunities include among others, the creation of a mixture of housing types and sizes to attract a diverse residential population, including families and people of all income levels, and to develop high-density housing to capitalize on the transit-oriented opportunities within the Project Area and to provide a large number of housing units close to downtown San Francisco. Zone One is a mixed-use, high-density residential district with no maximum residential density for living units.

A 450-foot tower on Block 4, as allowed under the existing Redevelopment Plan, and podium developments at 65 feet and 85 feet, as allowed under the existing Development Controls, would result in approximately 490 total residential units. The Plan Amendment would permit a taller tower on Block 4, providing for an increase in the number of dwelling units and affordable dwelling units in the tower. The Project, as currently proposed, would increase the total number of residential units by 191 units to a total of 681, and 306 will be affordable pursuant to the terms of the Block 4 DDA. Thus, the Plan Amendment would further the attainment of the Redevelopment Plan Goals and Objectives of creating high density, mixed-income housing, and make a significant contribution to achieving the Transbay Affordable Housing Obligation.

PROPOSED METHOD OF FINANCING/ECONOMIC FEASIBILITY OF AMENDMENT (CRL Section 33352(e))

The Plan Amendment does not propose new capital expenditures by OCII, involve any new indebtedness or financial obligation of the OCII, or change OCII's overall method of financing the redevelopment of the Project Area. The change in height and bulk restrictions applicable to Block 4 is intended to maximize developable square feet and increase dwelling unit count, which would generate more property taxes and consequently more tax increments than the existing conditions.

In addition, OCII will be provide to the Developer an affordable housing loan of Forty-Six Million Seven Hundred Forty-Nine Thousand Nine Hundred Twenty-Eight and 46/100 Dollars ($46,749,928.46) to partially finance the construction of the mid-rise 100% affordable rental building ("Successor Agency Loan"). These funds will be initially provided to OCII by an affiliate

of the Developer pursuant to a separate agreement with the City for Developer's development of a separate residential project within Zone 2 of the Redevelopment Plan. Thus, the Successor Agency Loan is being provided at no cost to OCII. The Successor Agency Loan will have a simple interest rate from zero to 3% (to be determined based on financial feasibility) for a 57-year term. Payments of principal and interest on the Successor Agency Loan will be payable by the mid-rise project only to the extent that annual surplus cash from the mid-rise project remains from collection of rent after payment of expenses, fees, permanent loan debt service, and replenishment of reserves, as needed. There are no mandatory or scheduled payments, except for repayment at maturity, including any unpaid principal or accrued interest; provided however, that repayment does not necessarily occur at maturity since such loans may be restructured or forgiven by public funders (San Francisco Mayor's Office of Housing and Community Development/OCII) during the life of the project to ensure ongoing affordability and financial feasibility, typically concurrent with low-income housing tax credit resyndication.

PLANNING COMMISSION REPORT AND RECOMMENDATIONS ON CONFORMANCE TO THE GENERAL PLAN (CRL Section 33352(h))

The Commission has referred the Plan Amendment to the Planning Commission for its report and recommendation on the Plan Amendment and its conformance with the General Plan.

The San Francisco Planning Department ("Planning Department") has determined that an amendment to the San Francisco General Plan ("General Plan") would be required.

Notice of the Planning Commission hearing on the amendment to the General Plan will be given in accordance with the Rules and Regulations of the Planning Commission. The Planning Commission's resolution regarding its report and recommendation on the Redevelopment Plan Amendment and its conformity of the amendment to the General Plan will be incorporated in a supplemental Report to the Board of Supervisors.

The Planning Commission's report and recommendation will be provided to the Board of Supervisors together with this Report to permit the Board to consider adopting an ordinance amending the Redevelopment Plan.

ENVIRONMENTAL REVIEW (CRL Section 33352(k))

In April 2004, the Final Environmental Impact Statement/Environmental Impact Report ("FEIS/EIR") for the Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project was certified by the Former Redevelopment Agency and the Board of Supervisors. OCII, as the Successor Agency to the Former Redevelopment Agency, has land use and California Environmental Quality Act ("CEQA") review authority of the Project Area. The maximum height limit analyzed in the FEIS/EIR for the Block 4 site was 450 feet.

CEQA Guidelines Section 15164 provides for the use of an addendum to document the basis for a lead agency's decision not to require a Subsequent or Supplemental EIR for a project that is already adequately covered in an existing certified EIR. The lead agency's decision to use an addendum must be supported by substantial evidence that the conditions that would trigger the preparation of a Subsequent EIR, as provided in CEQA Guidelines Section 15162, are not present. An addendum

documents the assessment and determination that the modified project is within the scope of the FEIS/EIR and no additional environmental review is required.

The Plan Amendment increases certain height and bulk limitations that result in an increase in the number of residential units than what otherwise be feasible with the smaller building heights and massing allowed under the Redevelopment Plan and the Development Controls. Nonetheless, the proposed number of units on Block 4 falls below the number of units analyzed on the Site under the FEIS/EIR. The modifications to building heights and bulk controls under both the Redevelopment Plan and the Development Controls do require an additional evaluation of which impacts could worsen due to additional building height and bulk. These topics include wind and shadow. All other features of the Block 4 development, including demolition, land use types, building square footage, retail square footage, and number of dwelling units, would be consistent with the Redevelopment Plan and the FEIS/EIR. The Addendum presents an update to the FEIS/EIR's transportation study and applies the utilization of the Vehicle Miles Traveled ("VMT") methodology for transportation effects, as the VMT methodology did not exist at the time of the publication of the FEIS/EIR, and it is now the sole methodology allowed to be used in accordance with state law.

Accordingly, OCII, in consultation with the Planning Department, prepared the ninth addendum to the FEIS/EIR dated June 13, 2022, focusing on transportation, wind and shadow ("Addendum"). The shadow study that was conducted as part of the Addendum process focused its analysis of potential shadow impacts generated by the proposed development on Block 4 onto three parks located within the shadow fan of Block 4: Transbay Park Block 3, Rincon Park and Salesforce Park. The shadow analysis found that the Block 4 development would not cast shadow on any parks or open spaces subject to Section 295 of the San Francisco Planning Code.[2] The maximum shadow size at any park would grow by less than one percent due to the proposed height and bulk increases. The additional shadow duration on the maximum days would range from 15 minutes to 1 hour and 15 minutes due to the proposed height and bulk increase. Activities in the affected portions of the parks and open spaces consisted primarily of passive activities, such as eating lunch, resting, and making phone calls. Areas that would be newly shaded would, in most cases, be located at the edges of the affected parks and open spaces. Given the limited increase in shadow size and duration, the proposed height and bulk increases on Block 4 would not create new shadow in a manner that substantially affects outdoor recreation facilities or other public areas.

The Addendum determined the Plan Amendment and Project would not cause new significant impacts not identified in the FEIS/EIR, nor would the Project cause significant impacts previously identified in the FEIS/EIR to become substantially more severe. No new mitigation measures would be necessary to reduce significant impacts. No changes have occurred with respect to circumstances surrounding the proposed Project that would cause significant environmental impacts to which the Project would contribute considerably, and no new information has become available that shows that the Project would cause significant environmental impacts. Therefore, the analyses conducted and the conclusions reached in the Final FEIS/EIR certified on April 22, 2004 remain valid and no supplemental environmental review is required beyond this Addendum.

[2] Section 295 of the Planning Code only applies to public parks and open spaces that are under the jurisdiction of the San Francisco Recreation and Park Commission.

NEIGHBORHOOD IMPACT REPORT (CRL Section 33352(m))

At the time of Redevelopment Plan adoption, the Project Area did not contain low- or moderate-income housing. Since then, OCII has started implementing the affordable housing requirements under the Transbay Affordable Housing Obligation. Based on residential projects complete, under construction, approved and in process, the number of housing units currently anticipated to be built in the Project Area is approximately 4,200 units, of which 1,470 (or 35 percent) will be affordable. The means of financing the low- and moderate-income housing units are developer-subsidized below-market-rate inclusionary units, tax increment financing, revenue from the sales of public properties within the Project Area, and development fees.

Currently, seven affordable housing developments in Zone One of the Project Area have been completed and are now occupied. The Rene Cazenave development (120 affordable units) is now occupied by formerly homeless households at 25 Essex Street. Other completed and occupied affordable housing development include Block 1 (391 units including 156 affordable units), Block 6/7 podium building (70 affordable units), Block 6 tower (409 market rate units), Block 7 (120 affordable units), Block 8 (546 total units including 150 affordable units), and Block 9 (545 total units including 109 affordable units). In process and planned future projects within Zone 1 are Blocks 2, 4 and 12 which collectively provide for approximately 705 affordable units.

The Plan Amendment, by facilitating a greater density of development at a site designated for residential use, will increase the supply of housing and affordable housing in the Project Area. The Plan Amendment does not adversely affect the physical and social quality of the neighborhood. The Plan Amendment will not cause the destruction or removal of housing units from the low- and moderate-income housing market and will not cause the displacement of low- or moderate-income.

COMMISSION ON COMMUNITY INVESTMENT AND INFRASTRUCTURE

RESOLUTION NO. 20 – 2022
Adopted June 21, 2022

APPROVING AN AMENDMENT TO THE REDEVELOPMENT PLAN FOR THE TRANSBAY REDEVELOPMENT PROJECT AREA IN CONNECTION WITH THE DEVELOPMENT OF A MIXED-USE RESIDENTIAL PROJECT ON BLOCK 4 OF ZONE ONE OF THE TRANSBAY REDEVELOPMENT PROJECT AREA; REFERRING THE PLAN AMENDMENT TO THE PLANNING COMMISSION FOR ITS REPORT AND RECOMMENDATION TO THE BOARD OF SUPERVISORS; RECOMMENDING THE PLAN AMENDMENT TO THE BOARD OF SUPERVISORS FOR ADOPTION; TRANSBAY REDEVELOPMENT PROJECT AREA

WHEREAS, In furtherance of the objectives of the California Community Redevelopment Law (Health and Safety Code, section 33000 et seq. the "CRL"), the Redevelopment Agency of the City and County of San Francisco ("Former Agency") undertook programs for the redevelopment of blighted areas in the City and County of San Francisco ("City"), including the Transbay Redevelopment Project Area ("Project Area"); and,

WHEREAS, The Board of Supervisors of the City and County of San Francisco ("Board of Supervisors") approved the Redevelopment Plan for the Transbay Redevelopment Project Area by Ordinance No. 124-05 (June 21, 2005) and by Ordinance No. 99-06 (May 9, 2006), as amended by Ordinance No. 84-15 (June 18, 2015) and Ordinance No. 62-16 (April 28, 2016) ("Redevelopment Plan"); and,

WHEREAS, The Redevelopment Plan establishes the land use controls for the Project Area and divides the Project Area into two subareas: Zone One, in which the Redevelopment Plan and the Development Controls and Design Guidelines for the Transbay Redevelopment Project (as currently amended, the "Development Controls") define and regulate land uses, and Zone Two, in which the San Francisco Planning Code applies. Zone One is intended to be developed with predominantly residential uses. The Successor Agency solely administers and enforces land use entitlements for property and projects in Zone One and has delegated its authority over projects that do not require Successor Agency action in Zone Two to the San Francisco Planning Department pursuant to that certain Delegation Agreement between the Former Agency and the Planning Department for the Transbay Redevelopment Project Area (May 3, 2005); and,

WHEREAS, On February 1, 2012, the State of California dissolved all redevelopment agencies including the Former Agency and required the transfer of certain of the Former Agency's assets and obligations to the Successor Agency to the Redevelopment Agency of the City and County of San Francisco ("Successor Agency"), commonly known as the Office of Community Investment and Infrastructure ("OCII") (Cal. Health & Safety Code §§ 34170 et seq., "Redevelopment Dissolution Law"). On June 27, 2012, the Redevelopment Dissolution Law was amended to clarify that successor agencies are separate public entities from the city or county that had originally established a redevelopment agency and they succeed to the organizational status of the former redevelopment agency to complete any work related to an approved enforceable obligation, Cal. Health & Safety Code § 34173 (g); and,

WHEREAS, The Board of Supervisors, acting as the legislative body of the Successor Agency, adopted Ordinance No. 215-12 (Oct. 4, 2012), which, among other matters: (a) acknowledged and confirmed that the Successor Agency is a separate legal entity from the City, and (b) established this Successor Agency Commission ("Commission") and delegated to it the authority to (i) implement, modify, enforce and complete the Former Agency's enforceable obligations; (ii) approve all contracts and actions related to the assets transferred to or retained by OCII, including, without limitation, the authority to exercise land use, development, and design approval, consistent with the applicable enforceable obligations; and (iii) take any action that the Redevelopment Dissolution Law requires or authorizes on behalf of the Successor Agency and any other action that the Commission deems appropriate, consistent with the Redevelopment Dissolution Law, to comply with such obligations; and,

WHEREAS, The authority of the Commission includes authority to grant approvals under land use controls for the Project Area specified in the Redevelopment Plan and to recommend amendments to the Redevelopment Plan, subject to Board of Supervisors' approval, as provided under the CRL; and,

WHEREAS, The Successor Agency now proposes to take actions related to Transbay Block 4 and the adjacent future Tehama Street right of way within Zone One of the Project Area, an approximately 56,375 square-foot area generally located at 200 Main Street, bounded by Howard, Main and Beale Streets and extending approximately 205 feet southeast from Howard Street (Assessor's Block 3739 Lot 010 ("Block 4") and Lot 011 ("Tehama Parcel", and collectively the "Site")); and

WHEREAS, The Redevelopment Plan specifies the land use of Block 4 as "Transbay Downtown Residential" and provides for a maximum height limit of 450 feet and maximum floor plate sizes of (i) 7,500 square feet for buildings between 85 and 350 feet in height, (ii) 13,000 square feet for buildings over 500 feet in height, and sets an overall maximum floor plate size of 13,000 square feet for all buildings within Zone One of the Project Area; and,

WHEREAS, OCII staff negotiated the terms of a Disposition and Development Agreement ("DDA") with the F4 Transbay Partners LLC, a Delaware limited liability company and Transbay Block 4 Housing Partnership, L.P., a California limited partnership ("Developer") for the sale of the Block 4 and conveyance the Tehama Parcel to Developer and authorization of construction of the improvements on the Site and Tehama Parcel. The DDA would authorize development of a mixed-use residential development project ("Project") generally consisting of (a) a residential tower 552 feet in height (513 feet at the roof of the last occupiable floor plus a rooftop mechanical screening/parapet element of a maximum 39 feet in height), including an attached wing up to 71 feet in height, collectively containing 155 for-sale residential condominium units, 219 market-rate rental residential units and no fewer than 105 rental units affordable to households earning from 100 to 120 percent of area median income, neighborhood retail uses, amenities spaces, open spaces and related supporting spaces; (b) an affordable residential building 179 feet in height (163 feet at the roof of the last occupiable floor, and a rooftop mechanical screening/parapet element of a maximum 16 feet in height) containing 201 rental units affordable to households earning from 40 to 100 percent of area median income (and one managers unit), with supporting facilities, amenities, open spaces and neighborhood retail, (c) an approximately 66,496 square foot underground shared parking garage accommodating up to 275 private vehicles valet-parked and/or parked via stackers, two car share spaces and a parking for a minimum of 556 bicycles; (d) open space and streetscape improvements within and surrounding the Site and including the extension of Tehama Street on the Tehama Parcel; and,

WHEREAS, Developer has requested the Plan Amendment to allow the Project to be constructed in accordance with the design proposed by the Developer and described in detail in the DDA. Specifically, the Plan Amendment would increase the maximum height limit for development on Block 4 from 450 feet to 513 feet and increase the maximum building floor plate sizes applicable to Block 4: (a) from 7,500 square feet to 13,500 square feet for buildings 85 feet to 250 feet in height, and (b) from 13,000 square feet to 15,200 square feet for buildings over 500 feet in height but limited to that portion of the building that is between 85 feet and 122 feet in height; and,

WHEREAS, In addition to the Plan Amendment, Developer has requested that the Successor Agency take a series of actions related to the Site, consisting of: (1) approval of necessary amendments to the Development Controls for the Project, (2) authorization to enter into the DDA governing the sale and development of the Site with the Project, (3) conditional approval of Schematic Designs for the development of the Site, and (4) recommendations of related actions to agencies responsible therefor, including but not limited to the General Plan Amendment (defined below), Zoning Map Amendment (defined below), Plan Amendment, and approval of the sale of the Site by the Board of Supervisors of the City and County of San Francisco for the purpose of compliance with Section 33433 of the California Health and Safety Code (collectively, items 1 through 4 and the Plan Amendment are the "Proposed Actions"); and

WHEREAS, In addition to the Proposed Actions, Developer has applied to the San Francisco Planning Department requesting amendments to (i) the height classification for Block 4 in the Transit Center District Plan, a Sub Area Plan of the Downtown Plan (the "General Plan Amendment") and (ii) the height classification for Block 4 in the Planning Code's Height Map (the "Zoning Map Amendment"). The General Plan Amendment and the Zoning Map Amendment will provide for consistency between the General Plan, Planning Code, Redevelopment Plan, and Development Controls, and will allow the Project to be constructed in accordance with the design proposed by the Developer and described in detail in the DDA. The General Plan Amendment and Zoning Map Amendment must be reviewed and approved by the San Francisco Planning Commission and the San Francisco Board of Supervisors as a condition to the effectiveness of this Resolution and the DDA approved hereunder; and,

WHEREAS, OCII is recommending the Plan Amendment to achieve the goals and objectives set forth in the Redevelopment Plan, including among others, the creation of a community identity and built form that ensure that high-rise buildings reflect high quality architectural and urban design standards, and the creation of housing opportunities that provide a mixture of housing types and sizes to attract a diverse residential population, including families and people of all income levels. A 513-foot tower on Block 4 would complement the downtown skyline, and together with specified increases in maximum floor plate area, would permit a more efficient design that allows for the production of a greater number of total housing units and a greater number of affordable housing units, as described in further detail in the Commission Memorandum provided together with this resolution and incorporated herein by this reference; and,

WHEREAS, Sections 33450-33458 of the CRL set forth a process to amend a redevelopment plan. This process includes a publicly noticed, environmental review to the extent required, adoption of the after the public hearing, referral of the amendment to the planning commission, a publicly noticed hearing of the legislative body, and legislative body consideration after its hearing. CRL Section 33352 further requires the preparation of a report to the legislative body regarding the plan to provide relevant background information in support of the need, purpose and impacts of the plan amendment; and,

WHEREAS, Pursuant to Sections 33352 and 33457.1 of the CRL, the OCII staff has prepared the Report to the Board of Supervisors on the Amendment to the Redevelopment Plan for the Transbay Redevelopment Project Area ("Report to the Board of Supervisors"), which the Commission has approved by Resolution No. 19-2022; and,

WHEREAS, On June 21, 2022, the Commission opened a public hearing on the adoption of the Plan Amendment, notice of which was duly and regularly published in a newspaper of general circulation in the City and County of San Francisco once a week for three successive weeks beginning 21 days prior to the date of the hearing, and a copy of the notice and affidavit of publication are on file with OCII; and,

WHEREAS, Copies of the notice of public hearing were mailed by first-class mail to the last known address of each assessee of land in the Project Area as shown on the last equalized assessment roll of the City; and,

WHEREAS, Copies of the notice of public hearing were mailed by first-class mail to all residential and business occupants in the Project Area; and,

WHEREAS, Copies of the notice of public hearing were mailed, by certified mail, return receipt requested, to the governing body of each taxing agency that receives taxes from property in the Project Area; and,

WHEREAS, The Commission has provided an opportunity for all persons to be heard and has considered all evidence and testimony presented for or against any and all aspects of the Plan Amendment; and,

WHEREAS, On June 21, 2022, the Commission adopted Resolution No. 18-2022 by which the Commission determined that the Final Environmental Impact Statement/ Environmental Impact Report for the Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project (the "FEIS/EIR" as defined in said resolution), together with further analysis provided in Addendum No. 9 to the FEIS/EIR (the "Addendum" as defined in said resolution), remains adequate, accurate, and objective and in compliance with the California Environmental Quality Act (California Public Resources Code Sections 21000 et seq., and the CEQA Guidelines (14 California Code of Regulations Sections 15000 et seq., collectively "CEQA") for purposes of evaluating the potential environmental effects of the Proposed Actions (including the Plan Amendment) and the Project; and,

WHEREAS, The environmental effects of the Plan Amendment have been analyzed in the environmental documents as described in Commission Resolution No. 18-2022. Copies of the FEIS/EIR and Addendum No. 9 are on file with the Commission Secretary;

WHEREAS OCII staff has reviewed the Plan Amendment, and, in accordance with its Commission Memorandum and supporting information provided to the Commission and incorporated herein by reference, finds it acceptable and recommends approval thereof, now therefore, be it

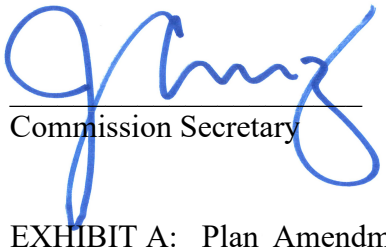
RESOLVED, That in Resolution No. 18-2022, the Commission adopted findings that the Proposed Actions, including the Plan Amendment, are in compliance with CEQA, said findings, which are on file with the Commission Secretary, being in furtherance of the actions contemplated in this Resolution and made part of this Resolution by reference herein; and, be it further

RESOLVED, That for the purposes of compliance with CEQA, the Commission hereby adopts the findings and determinations set out in Resolution 18-2022 that the Plan Amendment is within the scope of the project analyzed by the FEIS/EIR and Addendum No. 9; and, be it further

RESOLVED, That the Commission refers the Plan Amendment to the San Francisco Planning Commission for its report and recommendation on the Plan Amendment and its conformance with the General Plan, and, be it further

RESOLVED, That the Commission approves the Plan Amendment as consistent with the goals and objectives of the Redevelopment Plan and recommends the Plan Amendment to the Board of Supervisors for its approval.

I hereby certify that the foregoing resolution was adopted by the Successor Agency Commission at its meeting of June 21, 2022.



Commission Secretary

EXHIBIT A: Plan Amendment to the Redevelopment Plan for the Transbay Redevelopment Project Area

Exhibit A. Redevelopment Plan Amendment

Changed text shown in red. Additions shown in bold and underline, deletions shown in strikeout and underline

3.5.2 Height and Size of Buildings

The Zone One Plan Map and the table and text below illustrate the heights and floor plate sizes permitted for residential buildings in Zone One.

Maximum Floor Plates for Residential Buildings

Building Height (feet)	*Maximum Floor Plate Size (square feet)*
85 – 250	7,500 [2]
251 – 300	10,000
301 – 350	10,500
351 - 400	11,000
401 – 450	11,500
451 – 500	12,000
501 – 550	13,000 [3]

For residential towers above 500 feet in total height, the average floor plate size of the portion of the tower above 350 feet must not exceed 12,000 square feet. Below 85 feet, no bulk controls will apply.

The bulk controls for residential buildings prescribed in this section have been carefully considered in relation to the objectives and policies for Zone One of the Project Area. The maximum average floor plate size above 350 feet for residential towers with heights of 501-550 feet has been written to conform to the San Francisco Downtown Area Plan. There may be some exceptional cases in which the maximum average floor plate above 350 feet for residential towers with heights of 501-550 feet could be permitted to be exceeded. The Successor Agency Commission may approve exceptions to this control provided that the project sponsors demonstrate that all of the design guidelines for residential towers in the Development Controls and Design Guidelines are incorporated into the tower design. ~~In no case shall~~ **Except as otherwise provided herein**, residential tower floor plates **shall not** exceed 13,000 square feet.

For general office buildings in Zone One, the maximum floor plate sizes shall be consistent with the bulk limits permitted by Sections 270 (Bulk Limits: Measurement) and 272 (Bulk Limits: Special Exceptions in C-3 Districts) of the San Francisco Planning Code, as amended from time to time, for the C-3-O District (Downtown Office).

---

[2] On Transbay Block 4, a Maximum Floor Plate Size of 13,500 square feet is permitted.

[3] On Transbay Block 4, a Maximum Floor Plate Size of 15,200 square feet is permitted for portions of buildings between 85 feet and 122 feet in height.

Transbay Redevelopment Project Area

COMMISSION ON COMMUNITY INVESTMENT AND INFRASTRUCTURE

RESOLUTION NO. 22 – 2022
Adopted June 21, 2022

AUTHORIZING, AT A PUBLIC HEARING UNDER SECTION 33431 OF THE HEALTH AND SAFETY CODE, A DISPOSITION AND DEVELOPMENT AGREEMENT WITH F4 TRANSBAY PARTNERS LLC, A DELAWARE LIMITED LIABILITY COMPANY AND TRANSBAY BLOCK 4 HOUSING PARTNERSHIP, L.P., A CALIFORNIA LIMITED PARTNERSHIP, FOR THE PURCHASE OF BLOCK 4 OF ZONE ONE OF THE TRANSBAY REDEVELOPMENT PROJECT AREA (BLOCK 4) AND ADJACENT FUTURE TEHAMA STREET RIGHT OF WAY, AND DEVELOPMENT OF APPROXIMATELY 681 RESIDENTIAL UNITS INCLUDING 306 UNITS AFFORDABLE TO LOW- OR MODERATE-INCOME HOUSEHOLDS, GROUND FLOOR RETAIL, OPEN SPACE, STREETSCAPE IMPROVEMENTS AND UNDERGROUND PARKING; AND ADOPTING ENVIRONMENTAL REVIEW FINDINGS PURSUANT TO THE CALIFORNIA ENVIRONMENTAL QUALITY ACT; TRANSBAY REDEVELOPMENT PROJECT AREA

WHEREAS, In furtherance of the objectives of the California Community Redevelopment Law (Health and Safety Code, section 33000 et seq. the "Community Redevelopment Law"), the Redevelopment Agency of the City and County of San Francisco ("Former Agency") undertook programs for the redevelopment of blighted areas in the City and County of San Francisco ("City"), including the Transbay Redevelopment Project Area ("Project Area"); and,

WHEREAS, The Board of Supervisors of the City and County of San Francisco ("Board of Supervisors") approved the Redevelopment Plan for the Transbay Redevelopment Project Area by Ordinance No. 124-05 (June 21, 2005) and by Ordinance No. 99-06 (May 9, 2006), as amended by Ordinance No. 84-15 (June 18, 2015) and Ordinance No. 62-16 (April 28, 2016) ("Redevelopment Plan"); and,

WHEREAS, The Redevelopment Plan establishes the land use controls that Successor Agency applies in the Project Area. The Redevelopment Plan divides the Project Area into two subareas: Zone One in which the Redevelopment Plan and the Development Controls and Design Guidelines for the Transbay Redevelopment Project ("Development Controls") define and regulate land uses, and Zone Two in which the San Francisco Planning Code applies. The Successor Agency solely administers and enforces land use entitlements for property and projects in Zone One and has delegated its authority over projects that do not require Successor Agency action in Zone Two to the San Francisco Planning Department pursuant to that certain Delegation Agreement between the Former Agency and the Planning Department for the Transbay Redevelopment Project Area (May 3, 2005); and,

WHEREAS, On August 4, 2006, and in furtherance of the Redevelopment Plan, the Former Agency caused a Declaration of Restrictions affecting all of the Project Area to be recorded in the Official Records, as Document No. 2006-I224839 (the "Project Area Declaration of Restrictions"); and,

WHEREAS, Per the Redevelopment Plan and the Transbay Redevelopment Project Tax Increment and Sales Proceeds Pledge Agreement ("Pledge Agreement") between the Former Agency, the Transbay Joint Powers Authority ("TJPA"), and the City, land sale and net tax increment revenue generated by the parcels in the Project Area that are currently or formerly owned by the State of California ("State") has been pledged to the TJPA to help pay the cost of building the Transbay Transit Center. The State-Owned Parcels (as defined in the Pledge Agreement) include portions or the entirety of the development sites on Transbay Blocks 2 through 9, 11, and 12, and Parcels F, M, and T; and,

WHEREAS, California Public Resources Code Section 5027.1 requires that any redevelopment plan adopted to finance, in whole or in part, the demolition of the Transbay Terminal building and the construction of a new terminal, including its associated vehicle ramps, shall ensure that at least 25% of all dwelling units developed within the project area shall be available at affordable housing cost to, and occupied by, persons and families whose incomes do not exceed 60% of the area median income, and that at least an additional 10% of all dwelling units developed within the project area shall be available at affordable housing cost to, and occupied by, persons and families whose incomes do not exceed 120% of the area median income. Application of this project area objective may require that particular publicly owned parcels will have to be developed with a greater percentage of affordable housing units than 35% ("Transbay Affordable Housing Obligation"); and,

WHEREAS, In 2003, the TJPA, the City, and the State, acting by and through its Department of Transportation ("Caltrans"), entered into a Cooperative Agreement, which sets forth the process for the transfer of the State-Owned Parcels to the City and the TJPA ("Cooperative Agreement"). In 2005, the TJPA and the Former Agency entered into the Transbay Redevelopment Project Implementation Agreement ("Implementation Agreement") which requires the Former Agency to prepare and sell the formerly State-Owned Parcels and to implement the Redevelopment Plan, including, among other things, the construction and funding of new infrastructure improvements (such as parks and streetscapes) and compliance with the Transbay Affordable Housing Obligation. Subsequently, in 2008, the TJPA, the City and the Former Agency entered into an Option Agreement for the Purchase and Sale of Real Property ("2008 Option Agreement"), which describes the process for the transfer of certain of these parcels to the Former Agency to facilitate the sale of the parcels and provide the TJPA with the Gross Sales Proceeds for funding of the Transbay Transit Center. The 2008 Option Agreement defines Gross Sales Proceeds as the final purchase price based on "consideration of Transbay Redevelopment Plan development restrictions, environmental contamination, legally required affordable housing, and other conditions which reasonably effect [sic] the fair market value."; and,

WHEREAS, On February 1, 2012, the State of California dissolved all redevelopment agencies including the Former Agency and required the transfer of certain of the Former Agency's assets and obligations to the Successor Agency to the Redevelopment Agency of the City and County of San Francisco ("Successor Agency"), commonly known as the Office of Community Investment and Infrastructure ("OCII"). Cal. Health & Safety Code §§ 34170 et seq. ("Redevelopment Dissolution Law"). On June 27, 2012, the Redevelopment Dissolution Law was amended to clarify that successor agencies are separate public entities from the city or county that had originally established a redevelopment agency and they succeed to the organizational status of the former redevelopment agency to complete any work

related to an approved enforceable obligation. Cal. Health & Safety Code § 34173 (g); and,

WHEREAS, The Board of Supervisors, acting as the legislative body of the Successor Agency, adopted Ordinance No. 215-12 (Oct. 4, 2012), which, among other matters: (a) acknowledged and confirmed that the Successor Agency is a separate legal entity from the City, and (b) established this Successor Agency Commission ("Commission") and delegated to it the authority to (i) implement, modify, enforce and complete the Former Redevelopment Agency's enforceable obligations; (ii) approve all contracts and actions related to the assets transferred to or retained by OCII, including, without limitation, the authority to exercise land use, development, and design approval, consistent with the applicable enforceable obligations; and (iii) take any action that the Redevelopment Dissolution Law requires or authorizes on behalf of the Successor Agency and any other action that the Commission deems appropriate, consistent with the Redevelopment Dissolution Law, to comply with such obligations; and,

WHEREAS, On April 15, 2013, the California Department of Finance ("DOF") finally and conclusively determined, under Cal. Health & Safety Code § 34177.5(i), that the Pledge Agreement, Implementation Agreement, and Transbay Affordable Housing Obligation are continuing enforceable obligations of the Successor Agency under the Redevelopment Dissolution Law; and,

WHEREAS, The Transportation Infrastructure Finance and Innovation Act ("TIFIA") Loan Agreement between the TJPA, as borrower, and the United States Department of Transportation, as lender, dated January 1, 2010 (as amended, "TIFIA Loan"), and the TJPA's subsequent tax allocation bond issuance to refinance the TIFIA Loan and finance costs associated with construction and design of the Transbay Program (collectively, the "TJPA Bonds"), pledge (or may in the future pledge) certain property tax increment revenue attributable to certain former state-owned parcels ("Net Tax Increment"), including Block 4 (as defined below), in the Redevelopment Plan as security for the payment of the TJPA Bonds; and,

WHEREAS, Redevelopment Dissolution Law authorizes successor agencies to enter into new agreements if they are "in compliance with an enforceable obligation that existed prior to June 28, 2011." Cal. Health & Safety Code § 34177.5(a). This resolution authorizes the execution of a disposition and development agreement providing for the transfer of certain Successor Agency property to a third party, the development of market-rate and affordable housing, and the payment of proceeds to the TJPA, as part of Successor Agency's compliance with the pre-existing enforceable obligations under the Implementation Agreement and the Transbay Affordable Housing Obligation. DOF has confirmed that "any sale, transfer, or conveyance of property related to [the Transbay Final and Conclusive Determination] is authorized." Email from Justyn Howard, Assistant Program Budget Manager, DOF, to Tiffany Bohee, Executive Director, Successor Agency (Sep. 10, 2013, 09:17 am), attached to the DDA (defined below) as Attachment 2; and,

WHEREAS, Redevelopment Dissolution Law requires successor agencies to prepare a long range property management plan ("PMP") to dispose of its properties (Cal Health & Safety Code § 34191.5). The PMP must include an inventory of all successor agency properties, with information about date of acquisition, purpose of acquisition, parcel data, current value, revenue generation, environmental contamination, potential for transit-oriented development, and previous development proposals for each property. The PMP must also categorize each

property by one of four permissible uses: (1) retention for governmental use; (2) retention for future development; (3) disposition; or (4) use of the property to fulfill an enforceable obligation. OCII's PMP includes disposition plans for certain assets that OCII has retained to fulfill enforceable obligations, but that are proposed for transfer or sale. Accordingly, OCII's PMP categorizes a portion of Block 4 as follows: "Acquire and sell at market value to third-party developers pursuant to the Transbay Implementation Agreement," and, with respect to future ownership of certain other portions of Block 4, "Acquire and retain to fulfill Transbay enforceable obligations (i.e., to ensure these parcels are developed into affordable housing to meet the state-mandated 35% affordable housing requirement in Transbay)." The PMP was approved by Oversight Board Resolution Nos. 12-2013 (adopted November 25, 2013) and 14-2015 (adopted November 23, 2015), and finally approved by DOF in late 2015; and,

WHEREAS, The TJPA is responsible for implementing the Transbay Transit Center Program, which includes, among other things, (i) on the site of the former Transbay Terminal, the construction of a new Transit Center building ("Transit Center"), (ii) a rail tunnel and rail systems to extend Caltrain service from Fourth and King Streets to the Transit Center and to accommodate California High Speed Rail trains in the future, (iii) a new underground Fourth and Townsend Street Caltrain Station, (iv) modifications to the existing surface station at Fourth and King Streets, (v) a temporary bus terminal operated until the completion and occupancy of the Transit Center ("Temporary Terminal"), (vi) a bus ramp connecting the Bay Bridge to the Transit Center, and (vii) permanent bus storage facilities; and,

WHEREAS, Under the Cooperative Agreement, the TJPA acquired State-Owned Parcels O, O', and O" (collectively, former Lot 008 of Assessor's Block 3739) subject to a power of termination vested in Caltrans ("Caltrans Power of Termination"). These parcels comprise the majority of the city block bounded by Beale, Howard, Main, and Folsom Streets in San Francisco, California, which the TJPA used to operate the Temporary Terminal. The property described in Attachment 2 to the DDA (defined below), being Lot 10 of Assessor's Block 3739 and constituting approximately the northern third of the Temporary Terminal site, is identified as Block 4 under the Redevelopment Plan (and referred to herein as "Block 4" or the "Site"), which will be developed pursuant to the DDA (defined below) together with the property more particularly described in Attachment 3 to the DDA (defined below), being Lot 10 of Assessor's Block 3739 constituting the future public right of way immediately adjacent to the south of the Site (the "Tehama Parcel"). In 2015, the TJPA secured a loan for Transit Center construction with a lien on Block 4 and other property. Subsequently, the loan was repaid and Caltrans relinquished the Caltrans Power of Termination as it encumbered Block 4, pursuant to that certain document recorded on January 22, 2015 in the Official Records as document no. 2015-K010430-00; and,

WHEREAS, Under the 2008 Option Agreement, Successor Agency (as the successor to the Former Agency) has the exclusive and irrevocable option to acquire the entirety of Block 4 from the TJPA and/or to approve a transfer of Block 4 to a developer consistent with the terms of the 2008 Option Agreement. On January 15, 2021, the TJPA conveyed Block 4 and the Tehama Parcel to the Successor Agency in accordance with the 2008 Option Agreement; and,

WHEREAS, F4 Transbay Partners LLC, a Delaware limited liability company ("Developer") entered into an Agreement of Purchase and Sale for Real Estate dated March 3, 2016 with the TJPA ("Parcel F PSA") to acquire a formerly State-Owned Parcel in Zone Two of the Project Area (herein referred to as "Parcel F"). The Parcel F PSA was contingent on approval by the Commission and the Board of Supervisors of an option to purchase Block 4. Developer requested that the Successor Agency enter into a sole source option agreement for the purchase of Block 4 based, in part, on the Developer's qualifications and its proposal to develop Block 4 with a high level of affordable housing that met or exceeded 45 percent of the total number of residential units on the site; and,

WHEREAS, Pursuant to 65864 *et seq*. of the California Government Code, Developer has entered into a development agreement with the City for the development of Parcel F with a 61-story mixed-use building consisting of, among other things, 165 owned dwelling units, 189 hotel rooms, and approximately 276,000 square feet of office use floor area. Under the that certain Development Agreement by and between the City and Parcel F Owner, LLC Relative to the Development Known as 542-550 Howard Street (Transbay Parcel F) Development Project, dated September 30, 2021 and adopted by the Planning Commission (Resolution No. 2084 dated January 28, 2021) and Board of Supervisors (Ordinance No. 42-21 dated March 23, 2021) ("Development Agreement"), the Developer is required, upon the satisfaction of certain conditions, to pay an Affordable Housing Fee (as that term is defined in the Development Agreement) to the Successor Agency to fund the Successor Agency's obligation to fulfill the Transbay Affordable Housing Obligation. The Parties to the Development Agreement intend that the Affordable Housing Fee be used to subsidize the construction of the Mid-Rise Affordable Project (defined below); and,

WHEREAS, On June 22, 2016, Successor Agency, as optionor, and Developer, as optionee, entered into an Agreement for Option to Purchase Block 4 that was authorized by the Commission on April 19, 2016 (Commission Resolution No. 18-2016) and approved, under Cal. Health and Safety Code Section 33433 , by the Board of Supervisors on May 27, 2016 (Board Resolution No. 195-16), as evidenced by that certain Memorandum of Option Agreements recorded June 22, 2016, in the Official Records of the City as Document No. 2016-K277787-00, as amended by that First Amendment to Agreement for Option to Purchase Block 4, dated for reference purposes as of September 16, 2019 and authorized by the Commission on September 18, 2018 (Resolution No. 38-2018), and approved by the TJPA Board on August 8, 2019 (Resolution No. 021-2019), and as further amended by that Second Amendment to Agreement for Option to Purchase Block 4, dated for reference purposes as of December 15, 2020 and authorized by the Commission on the same date by Resolution No. 42-2020 and approved by the TJPA Board on January 14, 2021, by Resolution No. 004-2021, as further amended by that Third Amendment to Agreement for Option to Purchase Block 4, dated for reference purposes as of July 1, 2021 and authorized by the Commission on June 15, 2021, by Resolution No. 23-2021 and approved by the TJPA Board on July 22, 2021, by Resolution No. 022-2021, and as further amended by that Fourth Amendment to Agreement for Option to Purchase Block 4, dated for reference purposes as of October 1, 2021 and authorized by the Commission on September 21, 2021, by Resolution No. 31-2021 and approved by the TJPA Board on October 14, 2021, by Resolution No. 033-2021 (together as amended "Block 4 Option Agreement"); and,

WHEREAS, The Block 4 Option Agreement provides, among other things, that the Developer will "include, at no cost to OCII, the TJPA, or the City, at least forty five percent (45%) below-market-rate ("BMR") units on Block 4 plus . . . the transfer of affordable units required on Parcel F by the Redevelopment Plan and Planning Code in effect as of the date of this Agreement onto Block 4 ("Buyer's Inclusionary Obligation")." It also provides that OCII will have sole and absolute discretion to determine the total number and type of affordable units to be constructed on Block 4, as well as all other terms in this Agreement, except for the Block 4 sales price, which is determined by the amount or methodology established in the Option Agreement. The Block 4 Option Agreement includes a term sheet providing base terms for negotiation of this Agreement. Under the 2008 Option Agreement and Pledge Agreement with the TJPA, the Successor Agency transmits any proceeds from the sale of Block 4 to the TJPA for the construction of the Transit Terminal Project, as defined in the Pledge Agreement; and,

WHEREAS, Based on the Block 4 Option Agreement, OCII staff negotiated the terms of a disposition and development agreement ("DDA," attached hereto as Exhibit A) with the Developer and Transbay Block 4 Housing Partnership, L.P., a California limited partnership, for the sale of the Block 4 and conveyance of the land immediately adjacent to the Site ("Tehama Parcel") to Developer and construction of a residential development project with associated improvements on the Site and Tehama Parcel. The DDA provides for a purchase price of $6,000,000 and a residential development project ("Project") generally consisting of (a) a residential tower 552 feet in height (513 feet at the roof of the last occupiable floor plus a rooftop mechanical screening/parapet element of a maximum 39 feet in height), including an attached wing up to 71 feet in height, collectively containing 155 for-sale residential condominium units, 219 market-rate rental residential units and no fewer than 105 rental units affordable to households earning from 100 to 120 percent of area median income, neighborhood retail uses, amenities spaces, open spaces and related supporting spaces; (b) an affordable residential building a maximum of 179 feet in height (163 feet at the roof of the last occupiable floor, and a rooftop mechanical screening/parapet element of a maximum 16 feet in height) containing 201 rental units (and one managers unit) affordable to households earning from 40 to 100 percent of area median income, with supporting facilities, amenities, open spaces and neighborhood retail, (c) an approximately 66,496 square foot underground shared parking garage accommodating up to 275 private vehicles valet-parked and/or parked via stackers, two car share spaces and a parking for a minimum of 556 bicycles; (d) open space and streetscape improvements within and surrounding the Site and including the extension of Tehama Street on the Tehama Parcel; and,

WHEREAS, In accordance with Section 2.1(b) of the Block 4 Option Agreement, Successor Agency and Developer respectively prepared appraisals of the Site as conditioned and regulated under the Plan Amendment (defined below) and proposed DDA, and a Neutral Appraiser chosen in accordance with Section 2.1(b)(vi) of the Block 4 Option Agreement has identified the most reasonable purchase price for the Site as being Six Million Dollars ($6,000,000), which, with the concurrence of TJPA, constitutes the Purchase Price under the Block 4 Option Agreement and has been incorporated into the DDA as the purchase price for the Site; and

WHEREAS, Developer has requested amendments to the Redevelopment Plan (the "Plan Amendment") and the Development Controls (the "Development Controls Amendment") to allow the Project to be constructed in accordance with the design proposed by the Developer and described in detail in the DDA. The Plan

Amendment and the Development Controls Amendment increase certain height and bulk limits and amend other development standards on Block 4. The Plan Amendment must be transmitted to the San Francisco Planning Commission for its review and recommendation and to the San Francisco Board of Supervisors for its review and approval, the effectiveness of such approval by the Board of Supervisors being a condition to the effectiveness of this Resolution and the DDA approved hereunder; and,

WHEREAS, In connection with the review and approval of the Project, Developer has requested that the Successor Agency take a series of actions related to Block 4 and the Tehama Parcel, consisting of: (1) approval of the Plan Amendment, (2) approval of the amendments to the Development Controls, (3) this Resolution authorizing OCII to enter into the DDA, (4) conditional approval of Schematic Designs for the development of the Site, and (5) recommendations of related actions to agencies responsible therefor, including but not limited to the General Plan Amendment (defined below), Zoning Map Amendment (defined below), Plan Amendment, and approval of the sale of the Site by the Board of Supervisors of the City and County of San Francisco for the purpose of compliance with Section 4.7.2 of the Redevelopment Plan, which applies Section 33433 of the California Health and Safety Code to this Site (collectively, items 1 through 5 together with related actions of responsible agencies enumerated in the Addendum (defined below) are the "Proposed Actions"); and,

WHEREAS, Developer has applied to the San Francisco Planning Department requesting amendments to (i) the height classification for Block 4 in the Transit Center District Plan, a Sub Area Plan of the Downtown Plan (the "General Plan Amendment") and (ii) the height classification for Block 4 in the Planning Code's Height Map (the "Zoning Map Amendment"). The General Plan Amendment and the Zoning Map Amendment will provide for consistency between the General Plan, Planning Code, and the Redevelopment Plan and Development Controls (as amended), and will allow the Project to be constructed in accordance with the design proposed by the Developer and described in detail in the DDA. The General Plan Amendment and Zoning Map Amendment must be reviewed and approved by the San Francisco Planning Commission and the San Francisco Board of Supervisors, the effectiveness of such approval being a condition to the effectiveness of this Resolution and the DDA approved hereunder; and,

WHEREAS, On June 21, 2022, the Commission adopted Resolution No. __-2022 by which the Commission determined that the Final Environmental Impact Statement/ Environmental Impact Report for the Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project (the "FEIS/EIR" as defined in said resolution), together with further analysis provided in Addendum No. 9 to the FEIS/EIR (the "Addendum" as defined in said resolution), remains adequate, accurate, and objective and in compliance with the California Environmental Quality Act (California Public Resources Code Sections 21000 et seq., and the CEQA Guidelines (14 California Code of Regulations Sections 15000 et seq., collectively "CEQA") for purposes of evaluating the potential environmental effects of the Proposed Actions (including approval of the DDA and construction of the Project thereunder); and,

WHEREAS, The environmental effects of the DDA and development of the Project thereunder have been analyzed in the environmental documents as described in Commission Resolution No. 18-2022. Copies of the FEIS/EIR and Addendum No. 9 are on file with the Commission Secretary; and,

WHEREAS, OCII staff has reviewed the DDA and, in accordance with its Commission Memorandum and supporting information provided to the Commission and incorporated herein by reference, finds it acceptable and recommends approval thereof; now therefore be it

RESOLVED, That in Resolution No. 18-2022, the Commission adopted findings that the Proposed Actions, including the DDA and construction of the Project thereunder, are in compliance with CEQA, said findings, which are on file with the Commission Secretary, being in furtherance of the actions contemplated in this Resolution and made part of this Resolution by reference herein; and, be it further

RESOLVED, That for the purposes of compliance with CEQA, the Commission hereby adopts the findings and determinations set out in Resolution No. 18-2022, adopted concurrently herewith, that the DDA and construction of the Project thereunder is within the scope of the project analyzed by the FEIS/EIR and Addendum No. 9; and, be it further

RESOLVED, That concurrently with adopting this Resolution, the Commission has, pursuant to Cal. Health and Safety Code Section 33431, held a public hearing to consider its proposal to enter into the DDA for the sale of property within the Project Area without public bidding therefore, and be it further

RESOLVED, The Commission hereby authorizes the Executive Director to (i) execute the DDA with F4 Transbay Partners LLC, a Delaware limited liability company and Transbay Block 4 Housing Partnership, L.P., a California limited partnership, substantially in the form approved by the Successor Agency's General Counsel and attached as Exhibit A, and (ii) enter into any and all ancillary documents or take any additional actions necessary to consummate the transaction with respect to the Project as described in the DDA and this Resolution; provided that the effectiveness of the DDA is subject to the effectiveness of the General Plan Amendment, Zoning Map Amendment, and Plan Amendment and approval of the sale of the Site by the Board of Supervisors of the City and County of San Francisco for the purpose of compliance with Cal. Health and Safety Code Section 33433.

I hereby certify that the foregoing resolution was adopted by the Successor Agency Commission at its meeting of June 21, 2022.

Commission Secretary

EXHIBIT A: DISPOSITION AND DEVELOPMENT AGREEMENT – (Transbay Block 4)

Free Recording Requested Pursuant to Government Code Section 27383 and 27388.1 at the Request of the Successor Agency to the Redevelopment Agency of the City and County of San Francisco

WHEN RECORDED, MAIL TO:

Successor Agency to the Redevelopment Agency of the
City and County of San Francisco
One South Van Ness Avenue, Fifth Floor
San Francisco, CA 94103

DISPOSITION AND DEVELOPMENT AGREEMENT

THIS DISPOSITION AND DEVELOPMENT AGREEMENT (the "**Agreement**") is entered into as of October _____, 2022 and is effective as of the Effective Date (as defined below), by and between the SUCCESSOR AGENCY TO THE REDEVELOPMENT AGENCY OF THE CITY AND COUNTY OF SAN FRANCISCO, a public body organized and existing under the laws of the State of California, commonly known as the Office of Community Investment and Infrastructure ("**Successor Agency**"), F4 TRANSBAY PARTNERS LLC, a Delaware limited liability company ("**Developer**"), and TRANSBAY BLOCK 4 HOUSING PARTNERSHIP, L.P., a California limited partnership ("**Affordable Developer**") (collectively, the "**Parties**"). Developer and Affordable Developer are referred to from time to time herein as "**Developers**." The Parties agree as follows:

RECITALS

A. In furtherance of the objectives of the Community Redevelopment Law of the State of California, the Redevelopment Agency of the City and County of San Francisco (the "**Former Agency**") undertook a program to redevelop and revitalize blighted areas in San Francisco and in connection therewith adopted a redevelopment project area known as the Transbay Redevelopment Project Area (the "**Project Area**").

B. The Board of Supervisors of the City and County of San Francisco ("**Board of Supervisors**") approved a Redevelopment Plan for the Project Area by Ordinance No. 124-05, adopted on June 21, 2005, and by Ordinance No. 99-06, adopted on May 9, 2006, filed in the Office of the Recorder of the City and County of San Francisco ("**Official Records**") as Document No. 2006-I224836, as amended by Ordinance No. 84-15 (June 18, 2015) as Document No. 2015-K135871, and as amended by Ordinance No. 62-16 (April 19, 2016), as Document No. 2016-K333253, and as it may be amended from time to time (the "**Redevelopment Plan**").

C. The Redevelopment Plan establishes the land use controls that Successor Agency applies in the Project Area. The Redevelopment Plan divides the Project Area into two subareas: Zone One in which the Redevelopment Plan and the Development Controls and Design Guidelines for the Transbay Redevelopment Project (2005) ("**Development Controls**" or "**DCDG**") define land uses, and Zone Two in which the San Francisco Planning Code applies. Successor Agency solely administers and enforces land use entitlements for property and projects in Zone One and has delegated its authority over projects that do not require Successor Agency action in Zone Two to the San Francisco Planning Department pursuant to that certain Delegation Agreement between the Former Agency and the Planning Department for the Transbay Redevelopment Project Area (May 3, 2005).

D. On August 4, 2006, and in furtherance of the Redevelopment Plan, the Former Agency caused a Declaration of Restrictions affecting all of the Project Area to be recorded in the Official Records, as Document No. 2006-I224839 (the "**Project Area Declaration of Restrictions**").

E. Per the Redevelopment Plan and the Transbay Redevelopment Project Tax Increment and Sales Proceeds Pledge Agreement ("**Pledge Agreement**") between the Former Agency, the Transbay Joint Powers Authority ("**TJPA**"), and the City and County of San Francisco (the "**City**"), land sale and net tax increment revenue generated by the parcels in the Project Area that are currently or formerly owned by the State of California ("**State**") has been pledged to the TJPA to help pay the cost of building the Transbay Transit Center. The State-Owned Parcels (as defined in the Pledge Agreement) include portions or the entirety of the development sites on Blocks 2 through 9, 11, and 12, and Parcels F, M, and T.

F. California Public Resources Code Section 5027.1 requires that any redevelopment plan

adopted to finance, in whole or in part, the demolition of the Transbay Terminal building and the construction of a new terminal, including its associated vehicle ramps, shall ensure that at least 25% of all dwelling units developed within the project area shall be available at affordable housing cost to, and occupied by, persons and families whose incomes do not exceed 60% of the area median income, and that at least an additional 10% of all dwelling units developed within the project area shall be available at affordable housing cost to, and occupied by, persons and families whose incomes do not exceed 120% of the area median income. Application of this project area objective may require that particular publicly owned parcels will have to be developed with a greater percentage of affordable housing units than 35% ("**Transbay Affordable Housing Obligation**").

G. In 2003, the TJPA, the City, and the State, acting by and through its Department of Transportation ("**Caltrans**"), entered into a Cooperative Agreement, which sets forth the process for the transfer of the State-Owned Parcels to the City and the TJPA ("**Cooperative Agreement**"). In 2005, the TJPA and the Former Agency entered into the Transbay Redevelopment Project Implementation Agreement ("**Implementation Agreement**") which requires the Former Agency to prepare and sell the formerly State-Owned Parcels and to implement the Redevelopment Plan, including, among other things, the construction and funding of new infrastructure improvements (such as parks and streetscapes) and compliance with the Transbay Affordable Housing Obligation. Subsequently, in 2008, the TJPA, the City and the Former Agency entered into an Option Agreement for the Purchase and Sale of Real Property ("**2008 Option Agreement**"), which describes the process for the transfer of certain of these parcels to the Former Agency to facilitate the sale of the parcels and provide the TJPA with the Gross Sales Proceeds for funding of the Transbay Transit Center. The 2008 Option Agreement defines Gross Sales Proceeds as the final purchase price based on "consideration of Transbay Redevelopment Plan development restrictions, environmental contamination, legally required affordable housing, and other conditions which reasonably effect [sic] the fair market value." 2008 Option Agreement, § 6.1 at page 7.

H. On February 1, 2012, the State of California dissolved all redevelopment agencies, including the Former Agency, by operation of law pursuant to California Health and Safety Code Sections 34170 et seq. ("**Redevelopment Dissolution Law**"). Under the authority of the Redevelopment Dissolution Law and under San Francisco Ordinance No. 215-12 (Oct. 4, 2012) (establishing the Successor Agency Commission ("**Commission**") and delegating to it state authority under the Redevelopment Dissolution Law), the Successor Agency is administering the enforceable obligations of the Former Agency.

I. On April 15, 2013, the California Department of Finance ("**DOF**") finally and conclusively determined, under Cal. Health & Safety Code § 34177.5 (i), that the Pledge Agreement, Implementation Agreement, and Transbay Affordable Housing Obligation are continuing enforceable obligations of the Successor Agency under the Redevelopment Dissolution Law. A copy of DOF's Transbay Final and Conclusive Determination is attached as Attachment 1.

J. The Transportation Infrastructure Finance and Innovation Act ("**TIFIA**") Loan Agreement between the TJPA, as borrower, and the United States Department of Transportation, as lender, dated January 1, 2010 (as amended, "**TIFIA Loan**"), and the TJPA's subsequent tax allocation bond issuance to refinance the TIFIA Loan and finance costs associated with construction and design of the Transbay Program (collectively, the "**TJPA Bonds**"), pledge (or may in the future pledge) certain property tax increment revenue attributable to certain former state-owned parcels ("**Net Tax Increment**"), including Block 4 (as defined below), in the Redevelopment Plan as security for the payment of the TJPA Bonds.

K. Redevelopment Dissolution Law authorizes successor agencies to enter into new agreements if they are "in compliance with an enforceable obligation that existed prior to June 28, 2011." Cal. Health & Safety Code § 34177.5(a). This Agreement, providing for the transfer of certain Successor

Agency property to a third party, the development of market-rate and affordable housing, and the payment of proceeds to the TJPA, is part of Successor Agency's compliance with the pre-existing enforceable obligations under the Implementation Agreement and the Transbay Affordable Housing Obligation. DOF has confirmed that "any sale, transfer, or conveyance of property related to [the Transbay Final and Conclusive Determination] is authorized." Email from Justyn Howard, Assistant Program Budget Manager, DOF, to Tiffany Bohee, Executive Director, Successor Agency (Sep. 10, 2013, 09:17 am), attached as Attachment 2.

L. The TJPA is responsible for implementing the Transbay Transit Center Program, which includes, among other things, (i) on the site of the former Transbay Terminal, the construction of a new Transit Center building ("**Transit Center**"), (ii) a rail tunnel and rail systems to extend Caltrain service from Fourth and King Streets to the Transit Center and to accommodate California High Speed Rail trains in the future, (iii) a new underground Fourth and Townsend Street Caltrain Station, (iv) modifications to the existing surface station at Fourth and King Streets, (v) a temporary bus terminal operated until the completion and occupancy of the Transit Center ("**Temporary Terminal**"), (vi) a bus ramp connecting the Bay Bridge to the Transit Center, and (vii) permanent bus storage facilities.

M. Under the Cooperative Agreement, the TJPA acquired State-Owned Parcels O, O', and O" (collectively, former Lot 008 of Assessor's Block 3739) subject to a power of termination vested in Caltrans ("**Caltrans Power of Termination**"). These parcels comprise the majority of the city block bounded by Beale, Howard, Main, and Folsom Streets in San Francisco, California, which the TJPA used to operate the Temporary Terminal. The property described in Attachment 2 hereto, being approximately the northern third of the Temporary Terminal site, is identified as Block 4 under the Redevelopment Plan (and referred to herein as "**Block 4**" or the "**Site**"), which will be developed hereunder together with the future public right of way immediately adjacent to the south of the Site (the "**Tehama Parcel**", which is more particularly described in Attachment 3). In 2015, the TJPA secured a loan for Transit Center construction with a lien on Block 4 and other property. Subsequently, the loan was repaid and Caltrans relinquished the Caltrans Power of Termination as it encumbered Block 4, pursuant to that certain document recorded on January 22, 2015 in the Official Records as document no. 2015-K010430-00.

N. Under the 2008 Option Agreement, Successor Agency (as the successor to the Former Agency) has the exclusive and irrevocable option to acquire the entirety of Block 4 from the TJPA. Successor Agency has discretion, consistent with the terms of the 2008 Option Agreement, to approve a transfer of Block 4 to a developer. Development of Block 4 must comply with the Redevelopment Plan, the Development Controls, and the enforceable obligations covered by the Transbay Final and Conclusive Determination. The Redevelopment Plan and the Development Controls require residential development on Block 4 once it is no longer needed for the Temporary Terminal.

O. The Developer, F4 Transbay Partners, LLC, consists of Hines Urban F4, LLC, as managing member, and Broad Street Principal Investments, LLC and Affiliates, as member. Hines Urban F4, LLC, consists of Hines and Affiliates as managing member, and Urban Pacific Development, LLC, as member.

P. The Developer entered into an Agreement of Purchase and Sale for Real Estate dated March 3, 2016 with the TJPA ("**Parcel F PSA**") to acquire a formerly State-Owned Parcel in Zone Two of the Project Area (herein referred to as "**Parcel F**"). The Parcel F PSA was contingent on approval by the Commission and the Board of Supervisors of an option to purchase Block 4. Developer requested that the Successor Agency enter into a sole source option agreement for the purchase of Block 4 based, in part, in the Developer's qualifications and its proposal to develop Block 4 with a high amount of affordable housing that met or exceeded 45 percent of the total number of residential units on the site.

Q. Pursuant to 65864 *et seq*. of the California Government Code, Developer has entered into a development agreement with the City for the development of Parcel F with a 61-story mixed-use building consisting of, among other things, 165 owned dwelling units, 189 hotel rooms, and approximately 276,000 square feet of office use floor area. Under the that certain Development Agreement by and between the City and Parcel F Owner, LLC Relative to the Development Known as 542-550 Howard Street (Transbay Parcel F) Development Project, dated September 30, 2021 and adopted by the Planning Commission (Resolution No. 2084 dated January 28, 2021) and Board of Supervisors (Ordinance No. 42-21 dated March 23, 2021), the Developer is required, upon the satisfaction of certain conditions, to pay an Affordable Housing Fee (as that term is defined in the development agreement) to the Successor Agency to fund the Successor Agency's obligation to fulfill the Transbay Affordable Housing Obligation. The Parties intend that the Affordable Housing Fee be used to subsidize the construction of the Mid-Rise Affordable Project.

R. On June 22, 2016, Successor Agency, as optionor, and Developer, as optionee, entered into an Agreement for Option to Purchase Block 4 that was authorized by the Commission on April 19, 2016 (Commission Resolution No. 18-2016) and approved, under Section 33433 of the Health and Safety Code, by the Board of Supervisors on May 27, 2016 (Board Resolution No. 195-16), as evidenced by that certain Memorandum of Option Agreements recorded June 22, 2016 in the Official Records of the City as Document No. 2016-K277787-00, as amended by that First Amendment to Agreement for Option to Purchase Block 4, dated for reference purposes as of September 16, 2019, that was authorized by the Commission on September 18, 2018 (Resolution No. 38-2018) and approved by the TJPA Board on August 8, 2019 (Resolution No. 021-2019) and as further amended by that Second Amendment to Agreement for Option to Purchase Block 4, dated for reference purposes as of December 15, 2020, that was authorized by the Commission on the same date by Resolution No. 42-2020 and approved by the TJPA Board on January 14, 2021 by Resolution No. 004-2021, as further amended by that Third Amendment to Agreement for Option to Purchase Block 4, dated for reference purposes as of July 1, 2021, that was authorized by the Commission on June 15, 2021 by Resolution No. 23-2021 and approved by the TJPA Board on July 22, 2021 by Resolution No. 022-2021, and as further amended by that Fourth Amendment to Agreement for Option to Purchase Block 4, dated for reference purposes as of October 1, 2021, that was authorized by the Commission on September 21, 2021 by Resolution No. 31-2021 and approved by the TJPA Board on October 14, 2021 by Resolution No. 033-2021 (together as amended "**Block 4 Option Agreement**").

S. The Block 4 Option Agreement provides, among other things, that the Developer will "include, at no cost to OCII, the TJPA, or the City, at least forty five percent (45%) below-market-rate ("**BMR**") units on Block 4 plus . . . the transfer of affordable units required on Parcel F by the Redevelopment Plan and Planning Code in effect as of the date of this Agreement onto Block 4 ("**Buyer's Inclusionary Obligation**")." [Block 4 Option Agreement at p. 5]. It also provides that OCII will have sole and absolute discretion to determine the total number and type of affordable units to be constructed on Block 4, as well as all other terms in this Agreement, except for the Block 4 sales price, which is determined by the amount or methodology established in the Option Agreement. The Block 4 Option Agreement includes a term sheet providing base terms for negotiation of this Agreement. Under the 2008 Option Agreement and Pledge Agreement with the TJPA, the Successor Agency transmits any proceeds from the sale of Block 4 to the TJPA for the Transit Center construction.

T. The Developer requested an amendment to the Redevelopment Plan Exhibit 4: Zone One Plan Map, to increase the maximum overall height limit on Block 4 from 450 feet to 513 feet and to increase the maximum building floor plate sizes applicable to Block 4:(a) from 7,500 square feet to13,500 square feet for buildings 85 feet to 250 feet in height, and (b) from 13,000 square feet to 15,200 square feet for buildings over 500 feet in height but limited to that portion of the building that is between 85 feet and 122 feet in height ("**Plan Amendment**"), together with an amendment to the Development Controls to, among other matters, reflect the Plan Amendment as well as to increase the maximum Townhouse, Podium 1 and Podium 2 height ranges on Block 4 from 50, 65 and 85 feet, respectively, to 71, 163 and 115 feet

("**Development Controls Amendment**"). The Commission approved the Plan Amendment by Resolution No. X-2022 (_____, 2022), and the Development Controls Amendment by Resolution No. XX-2022 (_____, 2022). On _____, 2022, the City's Planning Commission determined by Motion No. XXXXX that the Plan Amendment conforms to the San Francisco General Plan. On _____, 2022, the Board of Supervisors adopted Ordinance No. XXX-22 approving the Plan Amendment. The Plan Amendment and Development Controls Amendment become effective 90 days after enactment of the ordinance approving the Plan Amendment. Cal. Health & Safety Code § 33378(b)(2) and 33450. All references hereinafter to the Redevelopment Plan shall mean the Redevelopment Plan as amended by the Plan Amendment, and references to the Development Controls shall mean the Development Controls as amended by the Development Controls Amendment.

U. The scope of development for both the Site and the Tehama Parcel is fully described in Attachment 4 ("**Scope of Development**"). This generally includes the following improvements, each as more particularly described in the Scope of Development: (a) an approximately 155-unit market-rate residential condominium component consisting of approximately 135 for-sale residential condominium units and 20 adjacent condominium townhouses (the "**Tower Market-Rate Condominium Project**") (together, the residential condominium units and the condominium townhouses in the Tower Market-Rate Condominium Project are referred to as the "**Residential Condominium Units**"); (b) a residential rental component consisting of approximately 219 market-rate rental residential units and no fewer than 105 rental units affordable to households earning from 100 to 120 percent of area median income, (the "**Tower Mixed-Income Rental Project**", and together with the Tower Market-Rate Condominium Project, the "**Tower Project**"); (c) an affordable housing component consisting of no fewer than 202 rental units (including one manager's unit and 201 rental Affordable Housing Units) within a mid-rise building adjacent to the tower, affordable to households earning from 40 to 100 percent of area median income ("**Mid-Rise Affordable Project**") (together, the BMR units in the Tower Mixed-Income Rental Project and in the Mid-Rise Affordable Project are referred to as the "**Affordable Housing Units**"); (d) Streetscape Improvements surrounding the Site and including the extension of Tehama Street on the Tehama Parcel; (e) approximately 8,389 square feet of ground-floor retail space along Main, Howard, Tehama and Beale Streets (the "**Commercial Units**"), including approximately 6,431 square feet located on the ground floor of the Mid-Rise Affordable Project reserved for Community Commercial Space; (f) approximately 5,850 square feet of Public Open Space and 11,016 square feet of Project Open Space ; (g) an approximately 66,496 square foot underground "**Shared Parking Garage**" accommodating up to 275 private vehicles valet-parked and/or parked via stackers and a minimum of 556 secured bicycle parking spaces. Items (a) through (g), as further described in the Scope of Development, are collectively referred to as the "**Improvements.**"

V. Pursuant to that certain Transfer Map dated May 2021 and recorded July 1, 2021 in the Official Records of the City as Document No. 2021105647, Successor Agency has assembled the Site and the Tehama Parcel for conveyance.

W. On January 12, 2021, TJPA transferred that portion of the Temporary Terminal site constituting the Site and the Tehama Parcel to Successor Agency pursuant to the 2008 Option Agreement and the Agreement for Purchase and Sale between the TJPA and Successor Agency (August 18, 2020), and the Parties intend the that the Site and the Tehama Parcel will be transferred from Successor Agency to Developer on or before the Outside Date for Close of Escrow in accordance with this Agreement. The Parties intend that the Developer will seek permanent subdivision of Block 4 and the Tehama Parcel generally as follows: (i) an airspace parcel for the Mid-Rise Affordable Project that may include the commercial space dedicated to Public Benefit and Community Serving Commercial uses ("**Affordable Air Rights Parcel,**" or if separated from the Affordable Air Rights Parcel pursuant to Section 9.09(b), the "Commercial Subdivision" as defined therein), (ii) the Tehama Parcel (which will be subject to an offer of dedication in fee together with the public improvements thereon to the City); and (iii) the remainder of the Site, which Developer intends to subdivide generally consistent with the Development Program depicted

in Attachment 5, "**Development Program**". These foregoing subdivision actions are collectively defined as the "**Permanent Subdivision of the Site**." Concurrent with recordation of the final subdivision map reflecting the Permanent Subdivision of the Site, the Parties intend that the Developer will convey the Affordable Air Rights Parcel back to the Successor Agency as described in Section 2.04(g) below.

X. In connection with the conveyance of the Affordable Air Rights Parcel to the Successor Agency as described above, the Successor Agency intends to enter into a lease of the Affordable Air Rights Parcel with the Affordable Developer (the "**Air Rights Lease**"). When construction of the Improvements located within the Affordable Air Rights Parcel is complete and the Successor Agency has issued a Certificate of Completion with respect to such Improvements, the Successor Agency will assign the title to the Affordable Air Rights Parcel and the lessor's interest in the Air Rights Lease to the Mayor's Office of Housing and Community Development ("**MOHCD**"), as the housing successor under Redevelopment Dissolution Law.

Y. In connection with the construction of the Tehama Parcel and as may be further made a condition of approval of the Permanent Subdivision of the Site, the Successor Agency intends that the Developer will enter into a public improvement agreement ("**PIA**") with the City for the purpose of constructing the required infrastructure and conveying a public street that meets the City's standard for acceptance.

Z. Together with its amendment to the Redevelopment Plan for the Project, the City's Board of Supervisors adopted findings consistent with Health & Safety Code Section 33433 (as applicable under Section 4.7.2 of the Redevelopment Plan) that the Purchase Price established by this Agreement is not less than the "fair market value" or "fair reuse value" for Block 4, pursuant to Resolution No. [XX] enacted [_____], 2022.

AA. This Agreement contemplates a sole source sale of the Site to Developer and the Successor Agency has complied with the procedural requirements for notice and public hearing required by Section 33431 of the Health and Safety Code;

BB. Furthermore, the proposed sale is consistent with the disposition plan for the Site that was included in Successor Agency's Property Management Plan ("**PMP**"), which was prepared in accordance with the requirements of Redevelopment Dissolution Law. The PMP was approved by Oversight Board Resolution Nos. 12-2013 (adopted November 25, 2013) and 14-2015 (adopted November 23, 2015), and finally approved by DOF on December 7, 2015.

CC. The parties wish to enter into this Agreement to complete the sale of the Site and conveyance of the Tehama Parcel to Developer and authorize construction of the Improvements on the Site and Tehama Parcel.

ARTICLE 1 - CONTRACT TERMS

1.01 Purchase Price

(a) The purchase price for the Site shall be SIX MILLION AND 00/100 DOLLARS ($6,000,000.00) (the "**Purchase Price**").

(b) The Developer shall deposit the Purchase Price, in cash or immediately available funds, into Escrow on the date established by the Parties for the Close of Escrow in the escrow instructions delivered by the parties pursuant to Section 2.03, but in any event no later than the Outside Date for Close of Escrow. The Purchase Price shall be paid to an account designated by the TJPA in one lump sum

simultaneously with transfer of title to the entire Site and Tehama Parcel to Developer. If Developer is not able to pay the Purchase Price as required in this Section 1.01(b), an additional TWELVE THOUSAND AND 00/100 ($12,000.00) shall be added to the Purchase Price for each calendar day of delay until the Close of Escrow (the "**Additional Purchase Payment**").

1.02 Good Faith Deposit

Within ten (10) days after the Effective Date of this Agreement, Developer shall deposit into Escrow a good faith deposit in the amount of TWO MILLION AND 00/100 DOLLARS ($2,000,000.00) (the "**Good Faith Deposit**") in cash or immediately available funds. The Good Faith Deposit shall be in addition to, and not be credited toward, the Purchase Price. If the Parties close on the purchase-sale of the Site and conveyance of the Tehama Parcel and Developer achieves Commencement of Substantial Construction, as defined in Section 4.08(b), Successor Agency shall refund the Good Faith Deposit to Developer, less any amounts due under Section 12.01 for then past-due and unpaid Successor Agency Costs. None of the $600,000.00 deposit paid under the Block 4 Option Agreement or any other amounts paid by Developer during the term of the Block 4 Option Agreement for the costs of Successor Agency shall be credited against the Good Faith Deposit or otherwise refunded.

1.03 Redevelopment Plan and Project Area Declaration of Restrictions

Development on the Site and Tehama Parcel is subject to all the terms and conditions of the Redevelopment Plan and the Project Area Declaration of Restrictions. The Site and Tehama Parcel are located within Zone One as described in the Redevelopment Plan and the Development Controls, both of which determine the land use designation and controls for the Site and Tehama Parcel.

1.04 Term of this Agreement

The term of this Agreement will begin on the Effective Date and continue until the earlier of termination in accordance with its terms or Successor Agency's issuance and recordation of a Certificate of Completion as provided in Section 4.13 (the "**Term**"), subject to the surviving provisions set forth in Section 5.12.

1.05 Affordable Developer

The Affordable Developer is Transbay Block 4 Housing Partnership, L.P, a limited partnership made up of Mercy Housing California, a California nonprofit (as managing general partner), F4 Transbay Partners LLC, a Delaware limited liability company (as administrative general partner), and a Low-Income Housing Tax Credit investor limited partner.

ARTICLE 2 - CONVEYANCE TERMS

2.01 Purchase and Development

Subject to all of the terms, covenants and conditions of this Agreement, and Community Redevelopment Law as amended by Redevelopment Dissolution Law, Successor Agency agrees to sell and convey the Site to Developer for the Purchase Price and convey the Tehama Parcel in accordance with this Agreement, and Developer agrees to purchase the Site from Successor Agency and pay the Purchase Price to Successor Agency in accordance with the provisions of Section 1.01(a) above and accept the Tehama Parcel and perform all applicable obligations thereto in accordance with this Agreement. In accordance with this Agreement, from and after the Close of Escrow, Developer shall diligently pursue and prosecute

the development, construction, maintenance and operation of the Improvements on the Site and the Tehama Parcel, subject to applicable laws.

2.02 Tehama Parcel

Developer acknowledges and covenants that the Tehama Parcel is being conveyed to Developer solely for the purposes of enabling Developer to complete its obligations to construct all Improvements specified for the Tehama Parcel in the Scope of Development, and that fee title to the Tehama Parcel, including all Improvements constructed thereon in accordance with this Agreement, shall be offered to the City via the Permanent Subdivision of the Site in accordance with all applicable provisions of the City's Subdivision Code and Subdivision Regulations. Except as consistent with this Section 2.02 and Section 5.06, Developer may not convey, in whole or in part, the Tehama Parcel and may not subject the Tehama Parcel to any lien or encumbrance except those approved in advance by the Successor Agency in its sole discretion.

2.03 Escrow

(a) Open, Close of Escrow. Developer shall establish an escrow with Chicago Title Company or such other reputable title company doing business in the City and County of San Francisco as may be selected by Developer and approved by Successor Agency ("**Title Company**") and shall notify Successor Agency in writing upon establishing such escrow ("**Escrow**"). At least fifteen (15) business days prior to the date the Parties' intend for Close of Escrow, but in any event no later than 15 business days prior to the Outside Date for Close of Escrow, Successor Agency and Developer each shall provide escrow instructions to the Title Company as shall be necessary and consistent with this Agreement governing Close of Escrow; at the same time, providing copies to each other. The "**Close of Escrow**" is defined as the consummation of the sale completed herein in accordance with the escrow instructions provided by Developer and Successor Agency. Except to the extent this Agreement provides otherwise, at least one (1) business day prior to the date the Parties intend for Close of Escrow, but in any event no later than one (1) business day prior to the Outside Date for Close of Escrow, the Parties shall each deposit into Escrow all documents and instruments that such party is obligated to deposit into Escrow in accordance with this Agreement.

(b) Outside Date for Close of Escrow. Close of Escrow (including all transactions contemplated therein) shall be completed no later than the "**Outside Date for Close of Escrow**" specified in the Schedule of Performance. The Outside Date for Close of Escrow shall not be extended except (i) for the failure to fulfill one or more of the conditions precedent in Section 2.07 (except failure to fulfill Section 2.07(b)(iv), which is subject to Section 8.08(b)) on or prior to the Outside Date for Close of Escrow where such failure is beyond the control of the Party responsible for the satisfaction of such condition; or (ii) as otherwise provided in this Agreement. In the event the Outside Date for Close of Escrow is extended as provided in this subsection 2.03(b)(i), Developer may request that Successor Agency approve, subject to its reasonable discretion, an extension of any remaining applicable dates set forth in the Schedule of Performance (and, if applicable, Schedule of Important Project Dates) that are not calculated or measured from the Close of Escrow or Outside Date for Close of Escrow.

(c) Title, Escrow and Closing Costs. Developer shall pay to the Title Company or the appropriate payee thereof all title report costs; title insurance premiums and endorsement charges as requested by Developer; recording fees; and any escrow fees in connection with the conveyances contemplated under this Agreement.

2.04 Title

(a) The escrow instructions shall provide that upon the Close of Escrow the Title Company shall provide and deliver to Developer an owner's title insurance policy ("**Title Policy**") (which at Developer's option may be an ALTA owner's policy) issued by the Title Company in an amount reasonably designated by Developer, at the sole cost and expense of Developer, insuring that fee simple title to the Site and the Tehama Parcel is vested in Developer, without any liens, encumbrances, or other matters affecting title except for the title conditions set forth in Attachment 8 ("**Approved Title Conditions**").

(b) Developer shall be entitled to request that the Title Company provide such endorsements (or amendments) to the Title Policy as Developer may reasonably require, provided that the same shall (a) be at no cost to Successor Agency, (b) impose no material or non-customary additional liability on Successor Agency, and (c) not cause a delay in the Close of Escrow.

(c) Developer shall bear all cost and responsibility for any required compliance with applicable laws related to the acquisition of the Site and Tehama Parcel, including, but not limited to, the Subdivision Map Act, the Destroyed Land Records Relief Act, and all other federal, state, and local laws applicable to the development of the Site and Tehama Parcel.

(d) If Developer elects to secure an ALTA owner's policy, Successor Agency shall cooperate with Developer to secure such policy by providing surveys and engineering studies in its possession or control, if any, at no cost to Successor Agency and without warranty of any kind, which relate to or affect the condition of title. The responsibility of Successor Agency assumed by this paragraph is limited to providing such surveys and engineering studies, if any. Developer shall be responsible for securing any other surveys and engineering studies at its sole cost and expense. Successor Agency shall also execute an Owner's Affidavit in the form set forth on Attachment 9, or in such commercially reasonable form required by the Title Company.

(e) Upon satisfaction of all conditions precedent established by this Agreement and the parties' escrow instructions, Successor Agency shall convey to Developer fee simple title to the Site and Tehama Parcel by Grant Deed, in substantially the form attached hereto as Attachment 10 ("**Grant Deed**"), free and clear of any liens, encumbrances and other matters affecting title except for the Approved Title Conditions. Developer shall provide Successor Agency with an executed and acknowledged Developer's Quitclaim Deed. Successor Agency and Developer shall work in good faith to obtain whatever additional assurances are necessary from any City department or agency, including the Department of Public Works and the City Surveyor, to enable Successor Agency to convey marketable and insurable title to the Site and Tehama Parcel.

(f) Concurrently with the recordation of the Grant Deed, the parties shall cause the recordation of a declaration of site restrictions in substantially the form of Attachment 11 (the "**Declaration of Site Restrictions**"), which shall include, among other things, the affordability and eligibility restrictions described in Section 5.05 below and such Declaration of Site Restrictions shall unless otherwise permitted by OCII (1) be in a first lien position and (2) not be subordinated to any lien or other encumbrance during the term of such restrictions.

(g) Following the Close of Escrow, Developer shall control and pursue the Permanent Subdivision of the Site in accordance with the requirements of this Agreement. Concurrently with recordation of a final subdivision map reflecting the Permanent Subdivision of the Site, Developer shall convey the Affordable Air Rights Parcel to Successor Agency free of encumbrances except those encumbrances required for the construction of the Improvements and those encumbrances previously

approved in writing by the Successor Agency. Prior to or after the conveyance of the Affordable Air Rights Parcel, as determined by the Successor Agency: (i) Successor Agency and Affordable Developer shall execute the Air Rights Lease, substantially in the form attached hereto as Attachment 12, and (ii) pursuant to Section 9.11 of this Agreement, the Parties shall cause to be executed and recorded covenants, conditions and restrictions and the REA (as defined in Section 9.11 below); provided, however, that Permanent Subdivision of the Site, the conveyance of the Affordable Air Rights Parcel and the execution of the Air Rights Lease, and the execution and recordation of the REA shall occur prior to or on the date of the closing of Developer's construction financing for the Improvements.

2.05 Taxes and Assessments

Ad valorem taxes and assessments levied, assessed or imposed from and after Close of Escrow shall be the responsibility of Developer.

2.06 Access and Entry by Developers to the Site and Tehama Parcel/Permit to Enter

(a) The Successor Agency represents and warrants to Developer that it has furnished to Developer copies of all existing surveys, environmental reports, inspection reports, and any other writings or data pertaining to the physical condition of the Site which are in the Successor Agency's possession or control. The Successor Agency shall assist Developer in obtaining any such reports or data in the possession and control of the TJPA.

(b) Prior to obtaining the fee title interest in the Site at Close of Escrow, Developers and their representatives shall, subject to the terms of the "**Permit to Enter**" attached to this Agreement as Attachment 13 have the right of access to and entry upon the Site, from time to time and at all reasonable times, for the purpose of obtaining data and making surveys and tests, including site tests and soil borings, necessary to carry out the purposes of this Agreement.

2.07 Conditions Precedent to Close of Escrow

(a) Conditions to Developer's Obligation to Close. The following are conditions to Developer's obligations to close Escrow (the "**Developer Conditions**"), to the extent not expressly waived by Developer:

(i) There shall not be an uncured Event of Default (as defined in Sections 8.01 and 8.02 as applicable) by Successor Agency;

(ii) Successor Agency shall have timely performed all obligations set forth in the Schedule of Performance that are required to be performed by Successor Agency prior to the Close of Escrow;

(iii) The Title Company shall be irrevocably committed to issuing the Title Policy to Developer, subject only to the Approved Title Conditions and in a form reasonably acceptable to Developer in accordance with Section 2.04;

(iv) Successor Agency shall have delivered, or caused to be delivered, to Developer and the Title Company all instructions and documents to be delivered by Successor Agency at Close of Escrow pursuant to the terms and provisions hereof;

(v) Successor Agency shall have executed, acknowledged and deposited with the Title Company the Grant Deed in substantially the form of Attachment 10;

(vi) The Commission shall have approved the Plan Amendment, Development Controls Amendment, this Agreement and "**Schematic Design Documents**" (as those documents are defined in the DRDAP);

(vii) The Board of Supervisors shall have held the public hearing and approved the Plan Amendment and the sale of the Site under California Health & Safety Code Section 33433; and

(viii) There shall be no litigation filed or threatened (excluding any litigation initiated by Developers or by an entity under Developers' control, and excluding litigation that challenges the validity or enforcement of Transbay Transit Center Community Facilities District 2014-1) that affects title to the Site, arises out of or relates to the physical condition of the Site, affects or may affect Developer's ability to finance the purchase of the Site, affects or may affect the ability to finance, build or market the Improvements, challenges the actions of Successor Agency or TJPA relating to the Site or this Agreement, or challenges or otherwise relates to the Developers' right to occupy the Site.

(b) Conditions to Successor Agency's Obligation to Close Escrow. The following are conditions to Successor Agency's obligation to close Escrow ("**Successor Agency Conditions**") to the extent not expressly waived by Successor Agency:

(i) Developer shall have deposited the Purchase Price in Escrow pursuant to Section 1.01 and instructed the Title Company to consummate the Escrow;

(ii) If an Event of Default by Affordable Developer then exists, and if Successor Agency has elected to cause a substitute to replace the Affordable Developer, then such replacement process must be in process and proceeding in accordance with Section 8.04;

(iii) Subject to the provisions of this Agreement, Developer shall have fully performed all obligations set forth in the Schedule of Performance that are required to be performed prior to the Outside Date for Close of Escrow;

(iv) Successor Agency shall have received and approved all items referred to in Section 2.08, and financing for the Improvements in the form and amount approved by Successor Agency under Section 2.08 shall close prior to or concurrently with the Close of Escrow;

(v) Developer shall have furnished certificates of insurance or duplicate originals of insurance policies as required by this Agreement;

(vi) There shall not be an Event of Default by Developer;

(vii) Developer shall have delivered to Successor Agency and the Title Company all instructions and documents to be delivered at Close of Escrow pursuant to the terms and provisions hereof;

(viii) Developer shall have deposited with the Title Company (i) a duly executed and acknowledged Declaration of Site Restrictions, substantially in the form of Attachment 11; (ii) Developer's Quitclaim Deed, substantially in the form of Attachment 14; and (iii) the PIA, duly executed by Developer, in a form to be mutually agreed upon by Developer and City;

(ix) Developer shall have deposited with the Title Company a duly executed and acknowledged "Unanimous Approval of Annexation to a Community Facilities District and Related

Matters" form in favor of annexing the Site into the CFD to be dated by the Title Company following recordation of the Grant Deed; and

(x) Developers shall have provided Successor Agency with a final development budget, table of sources and uses, and a 20-year operating budget for the Mid-Rise Affordable Project in accordance with Section 9.05(a).

(c) Conditions Precedent to Lease of Affordable Air Rights Parcel to Affordable Developer. The conditions precedent to Successor Agency's and Affordable Developer's obligation to enter into a lease of the Affordable Air Rights Parcel are as set forth here and in the Air Rights Lease;

(i) The Board of Supervisors shall have held the public hearing and approved the lease of the Affordable Air Rights Parcel under California Health & Safety Code Section 33433.

(d) Notwithstanding anything in this Agreement to the contrary, if the Outside Date for Close of Escrow is extended pursuant to Section 2.03(b)(i) for more than twelve (12) consecutive months, then either Successor Agency or Developer, by written notice to the other, may terminate this Agreement, whereupon the Good Faith Deposit (less those amounts to be withheld as provided in Section 1.02) shall promptly be returned to Developer and the Parties shall have no further liabilities or obligations under this Agreement arising or accruing following such termination.

2.08 Submission of Evidence of Financing and Project Commitments

No later than the dates specified in the Schedule of Performance for submission of the Evidence of Financing and Project Commitments, Developer shall submit to Successor Agency for review and approval (collectively, the "**Evidence of Financing and Project Commitments**"):

(a) A statement setting forth a budget for the total estimated construction cost of the Improvements, allocated between the Tower Market-Rate Condominium Project, the Tower Mixed-Income Rental Project, and the Mid-Rise Affordable Project, with the construction hard costs prepared by, or with the assistance of, a licensed, bondable general contractor (the "**Budget**");

(b) A financing plan listing all sources and uses of funds set forth in the Budget, in a form satisfactory to Successor Agency (the "**Financing Plan**");

(c) An operating budget for the Mid-Rise Affordable Project prepared by the Affordable Developer and agreed to by the Developer, detailing anticipated rent and other project income, and operating expenses including funds for resident services staffing and deposits to reserve accounts, for year one of the Mid-Rise Affordable Project and projected annually for the first twenty years of operation;

(d) A letter from a Bona Fide Institutional Lender, as defined in Article 13, describing a bona fide commitment or commitments for financing the construction costs of the Improvements, including verification of Developer's construction completion guaranty (the "**Financing Commitment**"). The Financing Commitment shall be certified by Developer to be a true and correct copy or copies thereof; additional commitments of funding to cover the difference between the mortgage amount and the Budget, in the form of evidence of funds dedicated to the Developer's compliance with the obligations under this Agreement from the holder of such funds, or in another form reasonably satisfactory to Successor Agency; and, if required by the interim construction financing, commitments for permanent financing shall be provided, also certified by Developer to be true and correct copies thereof. Developer covenants to use diligent, good faith efforts to perform any and all conditions to funding thereof;

(e) Final authorization of funding from all governmental agencies providing financing for the construction of the Improvements, including, allocation letters from the California Tax Credit Allocation Committee and California Debt Limit Allocation Committee, and if applicable, a fully executed loan agreement with Successor Agency governing the Successor Agency Loan and/or an award letter from the California Department of Housing and Community Development;

(f) A construction contract, with a bondable general contractor reasonably satisfactory to Successor Agency, for the construction of the Improvements in accordance with the estimated costs set forth in the Budget (the "**Construction Contract**"). Developer will provide a Construction Contract for Successor Agency's review that may redact confidential, proprietary and trade secret information.

(g) Developer shall submit to the Successor Agency for review and approval by the TJPA a certificate from Developer certifying that funds are or are anticipated to be available to be drawn by Developer and that such funds are or are anticipated to be adequate to pay the costs of planning, design, engineering, procurement, permitting, construction, installation and equipping of the development of Improvements for the intended uses and purposes under this Agreement.

(h) Successor Agency will notify Developer in writing of its approval or disapproval of any of the foregoing documents within twenty-one (21) business days after submission of such documents to Successor Agency, including written reasons for disapproval. Successor Agency shall not unreasonably withhold such approval. Failure of Successor Agency to notify Developer of its approval or disapproval of a document or submission within said periods of time shall entitle Developer to a time extension for the approval of such document or submission until the later of (i) the date of approval by Successor Agency, or (ii) fifteen (15) days after Successor Agency provides written reasons for a disapproval. In no event will Successor Agency's failure to respond be deemed to be an approval.

(i) In the event Successor Agency disapproves of a document or submission required in this Section 2.08, Developer and Successor Agency shall cooperate to review such document or submission. Developer shall be entitled to a reasonable number of re-submissions of such document or submission for approval, to be resubmitted within fifteen (15) days after Successor Agency provides written reasons for a disapproval. If Developer is diligently pursuing the correction or resolution of a deficiency in such document or submission, Developer shall be entitled to a reasonable time extension of such 15-day period, which, collectively shall be no longer than 180 days. All applicable dates set forth in the Schedule of Performance (and, if applicable, the Schedule of Important Project Dates) shall automatically be extended by the same number of days incurred in undertaking such review.

2.09 Conveyance of Title to the Site and Tehama Parcel and Delivery of Possession

Subject to the provisions of Section 2.08, and provided that (i) Developer is not then in default under the terms of this Agreement, (ii) Successor Agency Conditions and the Developer Conditions have been satisfied or expressly waived by the Close of Escrow, and (iii) Developer has paid all sums then due hereunder, then Successor Agency shall convey to Developer, and Developer shall accept the conveyance of, the fee simple interest in the Site and Tehama Parcel, subject to the Approved Title Conditions and the reconveyance to the Successor Agency of the Affordable Air Rights Parcel under Section 2.04(g) and the obligation to construct on the Tehama Parcel the public improvements and offer same for acceptance by City under Section 9.05.

ARTICLE 3 - SITE CONDITION; HAZARDOUS MATERIALS INDEMNIFICATION; "AS IS" PURCHASE

3.01 Prior to Conveyance/Site and Tehama Parcel "As Is"

(a) Successor Agency shall convey the Site and Tehama Parcel in their present, "AS IS" condition, free of any liens, leases, encumbrances, or other matters affecting title except for the Approved Title Conditions, and shall not prepare the Site or Tehama Parcel for any purpose whatsoever prior to conveyance to Developer. So long as there is no material adverse change in the condition of the Site or Tehama Parcel after the Effective Date, Developer agrees to accept the Site and Tehama Parcel in "AS IS" condition at the Close of Escrow in the Approved Title Condition.

(b) Developer acknowledges that neither Successor Agency nor the TJPA has made any representation or warranty, express or implied, with respect to the Site or Tehama Parcel, and it is agreed that Successor Agency and the TJPA make no representations, warranties or covenants, express or implied, as to its physical condition; as to the condition of any improvements; as to the suitability or fitness of the land; as to any Environmental Law, or otherwise affecting the use, value, occupancy or enjoyment of the Site or the Tehama Parcel; or as to any other matter whatsoever; it being expressly understood that the Site and Tehama Parcel are being conveyed in an "AS IS" condition. The provisions of this Section 3.01, as with the other provisions of this Agreement, shall survive the Close of Escrow and shall not merge into the Grant Deed delivered to Developer at Close of Escrow.

(c) Developer has been given the opportunity to investigate the Site and Tehama Parcel fully, using experts of its own choosing, as described in Section 2.06.

(d) After Close of Escrow, Developer, at its sole cost and expense, shall comply with all provisions of Environmental Law applicable to the Site and Tehama Parcel, and Successor Agency, the TJPA, and their respective members, officers, agents and employees shall have no responsibility or liability with respect thereto.

(e) Any costs associated with the security, maintenance/repair, and demolition of any existing structures or other improvements on the Site or Tehama Parcel are the sole and absolute responsibility of Developer.

(f) DEVELOPER ACKNOWLEDGES AND AGREES THAT, EXCEPT TO THE EXTENT OTHERWISE EXPRESSLY PROVIDED HEREIN, SUCCESSOR AGENCY IS CONVEYING AND DEVELOPER IS ACCEPTING THE SITE AND TEHAMA PARCEL ON AN "AS IS WITH ALL FAULTS" BASIS SUBJECT TO ALL APPLICABLE LAWS, RULES AND ORDINANCES, INCLUDING WITHOUT LIMITATION, ANY ZONING ORDINANCES, OR OTHER REGULATIONS GOVERNING THE USE, OCCUPANCY OR POSSESSION OF THE SITE AND TEHAMA PARCEL. DEVELOPER REPRESENTS AND WARRANTS THAT DEVELOPER IS RELYING SOLELY ON ITS INDEPENDENT INVESTIGATION AND NOT ON ANY REPRESENTATIONS OR WARRANTIES OF ANY KIND WHATSOEVER, EXPRESS OR IMPLIED, FROM SUCCESSOR AGENCY, THE TJPA, OR THEIR AGENTS AS TO ANY MATTERS CONCERNING THE SITE OR TEHAMA PARCEL, ITS SUITABILITY FOR DEVELOPER'S INTENDED USES OR ANY OF THE SITE CONDITIONS. SUCCESSOR AGENCY DOES NOT GUARANTEE THE LEGAL, PHYSICAL, GEOLOGICAL, ENVIRONMENTAL OR OTHER CONDITIONS OF THE SITE OR TEHAMA PARCEL, NOR DOES IT ASSUME ANY RESPONSIBILITY FOR THE COMPLIANCE OF THE SITE OR TEHAMA PARCEL OR THEIR USE WITH ANY STATUTE, RESOLUTION OR REGULATION. DEVELOPER AGREES THAT NEITHER SUCCESSOR AGENCY, THE TJPA NOR ANY OF SUCCESSOR AGENCY'S OR TJPA'S AGENTS HAVE MADE, AND SUCCESSOR AGENCY

DISCLAIMS, ANY REPRESENTATIONS OR WARRANTIES, EXPRESS OR IMPLIED, WITH RESPECT TO THE CONDITIONS OF THE SITE OR THE TEHAMA PARCEL.

SUCCESSOR AGENCY: _____ DEVELOPER: _____

3.02 Hazardous Materials Indemnification

(a) Developer shall indemnify, defend and hold Successor Agency, the TJPA and their respective members, officers, agents and employees (individually, "**Hazardous Materials Indemnified Party**" and collectively, "**Hazardous Materials Indemnified Parties**") harmless from and against any losses, costs, claims, damages, liabilities, and causes of action of any nature whatsoever (including, without limitation, the reasonable fees and disbursements of counsel and engineering consultants) incurred by or asserted against any Hazardous Materials Indemnified Party in connection with, arising out of, in response to, or in any manner relating to (A) Developer's or Affordable Developer's (as applicable) violation of any Environmental Law, or (B) any Release or threatened Release of a Hazardous Substance, or any condition of pollution, contamination or Hazardous Substance-related nuisance on, under or from the Site or Tehama Parcel, occurring after the Close of Escrow, except where such violation, Release or threatened Release, or condition was at any time caused by the gross negligence or intentional misconduct of the Hazardous Materials Indemnified Party seeking indemnification.

(b) The indemnification obligations by Developer with respect to violations of Environmental Law pursuant to clause (A) above shall, for each Developer, only apply to its own violation of Environmental Law, and the obligations with respect to Release or threatened Release of Hazardous Substances pursuant to clause (B) above shall be joint and several prior to Permanent Subdivision of the Site and, thereafter, shall apply with respect to each Developer (and/or its successor after a Transfer of one or more Portion(s)) only as to its ownership parcel(s).

(c) For purposes of this Section 3.02, the term "**Hazardous Substance**" shall have the meaning set forth in the Comprehensive Environmental Response, Compensation and Liability Act of 1980, as amended as of the date of this Agreement, 42 U.S.C. §9601(14), and in addition shall include, without limitation, petroleum (including crude oil or any fraction thereof) and petroleum products, asbestos, asbestos-containing materials, polychlorinated biphenyls ("**PCBs**"), PCB-containing materials, all hazardous substances identified in the California Health & Safety Code §§25316 and 25281(d), all chemicals listed pursuant to the California Health & Safety Code §25249.8, and any substance deemed a hazardous substance, hazardous material, hazardous waste, or contaminant under Environmental Law. The foregoing definition shall not include substances that occur naturally on the Sited. The term "**Environmental Law**" shall include all federal, state and local laws, regulations and ordinances governing hazardous waste, wastewater discharges, drinking water, air emissions, Hazardous Substance releases or reporting requirements, Hazardous Substance use or storage, and employee or community right-to-know requirements related to the work being performed under this Agreement.

(d) For purposes of this Section 3.02, the term "**Release**" shall mean any spilling, leaking, pumping, pouring, emitting, emptying, discharging, injecting, escaping, leaching, dumping, or disposing into the environment (including the abandonment or discharging of barrels, containers, and other closed receptacles containing any Hazardous Substance).

3.03 Risk of Loss

After Close of Escrow, all risk of loss with respect to any improvements on the Site or the Tehama Parcel shall be borne by Developer; provided that Successor Agency shall assign to Developer at

Close of Escrow any unexpended insurance proceeds and any uncollected claims and rights under insurance policies covering such loss, if any.

3.04 Release

Effective from and after the Close of Escrow, Developer and Affordable Developer hereby waives, releases, acquits, and forever discharge Successor Agency and the TJPA to the maximum extent permitted by law, of and from any and all claims, actions, causes of action, demands, rights, liabilities, damages, losses, costs, expenses, or compensation whatsoever, direct or indirect, known or unknown, foreseen or unforeseen, that it now has because of or in any way growing out or connected with this Agreement and either the Site or the Tehama Parcel, including, without limitation, the condition of the Site or Tehama Parcel (including any such claim which arose prior to the Close of Escrow, but is discovered thereafter), except (i) matters arising from Successor Agency's or TJPA's fraud or intentional misrepresentation, (ii) any breach of this Agreement by Successor Agency prior to the Close of Escrow, or (iii) any breach of Successor Agency's post-Closing obligations under this Agreement.

DEVELOPER AND AFFORDABLE DEVELOPER BOTH EXPRESSLY WAIVES ITS RIGHTS GRANTED UNDER CALIFORNIA CIVIL CODE § 1542, AND ANY OTHER PROVISION OF LAW, THAT PROVIDES AS FOLLOWS:

A GENERAL RELEASE DOES NOT EXTEND TO CLAIMS THAT THE DEVELOPER, AFFORDABLE DEVELOPER OR RELEASING PARTY DOES NOT KNOW OR EXPECT TO EXIST IN ITS FAVOR AT THE TIME OF EXECUTING THE RELEASE, AND THAT IF KNOWN TO IT WOULD HAVE MATERIALLY AFFECTED ITS AGREEMENT TO RELEASE SUCCESSOR AGENCY AND THE TJPA.

BY PLACING ITS INITIALS BELOW, DEVELOPER AND AFFORDABLE DEVELOPER SPECIFICALLY ACKNOWLEDGE AND CONFIRM THE VALIDITY OF THE RELEASES MADE ABOVE AND THE FACT THAT BOTH DEVELOPER AND AFFORDABLE DEVELOPER WERE REPRESENTED BY COUNSEL WHO EXPLAINED, AT THE TIME THIS AGREEMENT WAS MADE, THE CONSEQUENCES OF THE ABOVE RELEASES.

SUCCESSOR AGENCY:_____ DEVELOPER:_____ AFFORDABLE DEVELOPER:_____

ARTICLE 4 - CONSTRUCTION OF IMPROVEMENTS

4.01 Developer's General Development Obligation.

Developer shall bear all cost and responsibility for compliance with all applicable laws related to the development of the Site and Tehama Parcel in accordance with this Agreement, including without limitation the Subdivision Map Act, the Destroyed Land Records Relief Act, the City Building Code and Fire Code, the Redevelopment Requirements, the Project Approval Documents approved by Successor Agency, or such similar documents as reasonably required by the City, as applicable, and all other federal, state, and local laws, including all laws relating to accessibility for persons with disabilities, applicable to the development of either the Site or Tehama Parcel.

4.02 The Improvements

The Improvements are as defined in Recital U.

4.03 Developer's Construction Obligations

(a) Developer (in consultation with the Affordable Developer) shall direct the development process for the Improvements in the manner described in this paragraph, including but not limited to: forming and hiring the design and construction teams in compliance with applicable laws, rules, regulations and Successor Agency policies; providing the design team with the Development Component Diagram as shown on Attachment 5, and other information and timely decisions to facilitate creation of a design responsive to the requirements of this Agreement, causing the securing of all necessary public approvals and permits; providing clarification to the general contractor and prime contractors regarding construction scope to facilitate construction in conformance with the Project Approval Documents (as defined in Article 13); approving and processing necessary or owner-initiated changes to the work; administering the draw process to pay consultants and contractors in a timely and well-documented manner; coordinating with pertinent public agencies throughout design and construction to secure required approvals, including certificates of occupancy; monitoring the progress of design and construction of the Improvements; and monitoring and facilitating the leasing and property management activities of the Project (defined in Section 4.13(c)).

(b) Developer (in consultation with the Affordable Developer) shall diligently commence and thereafter carry out the construction of the Improvements to Completion of Construction (defined in Section 4.13) within the times and in the manner set forth in this Agreement, including without limitation the Schedule of Performance and Scope of Development and Project Approval Documents. In addition, Developer shall use commercially reasonable efforts to perform those actions listed in the Schedule of Important Project Dates on or before the dates provided in this Agreement (said dates being restated in the Schedule of Important Project Dates for convenience), or, with respect to those actions without dates provided in this Agreement, within the time listed in the Schedule of Important Project Dates. Notwithstanding anything in this Agreement to the contrary, the Parties agree that Developer's inability to perform an action listed in the Schedule of Important Project Dates within the associated period stated (or reprinted in) the Schedule of Important Project Dates shall not be a Developer default under this Agreement, provided that Developer has used commercially reasonable efforts required in the previous sentence and further provided that Developer continues to use commercially reasonable efforts to achieve said action or actions until such time as the Parties may mutually agree.

(c) Developer (in consultation with the Affordable Developer) shall construct, or cause to be constructed, the Improvements in accordance with Section 4.03(a) above and all applicable local, state and federal laws and regulations, including without limitation all laws relating to accessibility for persons with disabilities, the San Francisco Building Code, San Francisco Administrative Bulletin AB-093 (Implementation of Green Building Regulations), the Redevelopment Requirements, Mitigation Measures, and the Project Approval Documents (as that term is defined in the Design Review and Document Approval Procedures ("**DRDAP**," Attachment 15)) or such similar documents as reasonably required by the City, as applicable. Improvements shall be constructed to at least a Leadership in Energy and Environmental Design ("**LEED**") Silver (50 LEED Points) or 75 GreenPoint Rated points standard, as required by the City of San Francisco Green Building Code and the Development Controls.

(d) Sixty (60) days prior to the Construction Commencement Date, Developer shall submit to Successor Agency for its review and approval an active community liaison program for keeping neighborhood residents informed about construction of the Improvements.

(e) Developer shall comply with all City construction noise ordinances and regulations including, but not limited to, the following:

(i) San Francisco Police Code Article 29 "Regulation of Noise"; and

(ii) DBI's "Night Noise Permit Issuance Policy and Procedure".

(f) Developer shall be responsible for securing sufficient funding to construct the Mid-Rise Affordable Project and for constructing all portions of the Improvements necessary to allow for the commencement and completion of construction of the Mid-Rise Affordable Project in accordance with the Schedule of Performance. Other than providing the Successor Agency Loan, neither the Successor Agency nor MOHCD shall be responsible for any costs associated with the Mid-Rise Affordable Project. Developer shall be responsible for completion of the Mid-Rise Affordable Project.

4.04 Compliance with Redevelopment Requirements

The Project Approval Documents shall be in compliance with: (i) this Agreement, including, without limitation, the Scope of Development and (ii) the Redevelopment Plan, the Project Area Declaration of Restrictions, the Development Controls, the Transbay Redevelopment Project Area Design for Development ("D for D"), the Streetscape Plan, and the DRDAP (Attachment 15). The Redevelopment Plan, the Project Area Declaration of Restrictions, the Declaration of Site Restrictions, the Development Controls, the D for D, the Streetscape Plan, the DRDAP, and this Agreement, including the Scope of Development, are sometimes for convenience referred to as "**Redevelopment Requirements**."

4.05 Preparation of Project Approval Documents/Approval of Architect

(a) The Project Approval Documents shall be prepared by or signed by an architect (or architects) licensed to practice architecture in and by the State of California. A California-licensed architect shall coordinate the work of any associated design professions, including engineers and landscape architects. In any event:

(i) A California-licensed architect shall review all construction and certify that all construction has been built based on the design standards in the drawings and specifications as submitted by the architect and as included in the Project Approval Documents; and

(ii) A California-licensed structural and civil engineer shall review and certify all final foundation and grading design to be in substantial conformity with Project Approval Documents.

(b) The architect(s) for the Improvements shall certify that the Improvements have been designed in accordance with all local, state and federal laws and regulations relating to accessibility for persons with disabilities.

4.06 Submission of Project Approval Documents

Developer (in consultation with the Affordable Developer), shall prepare and submit Project Approval Documents to Successor Agency for review and approval in accordance with the Scope of Development, the DRDAP and the Schedule of Important Project Dates or Schedule of Performance (as applicable).

4.07 Scope of Successor Agency Review/Approval of Developer's Construction

(a) Successor Agency's review and approval of Project Approval Documents is limited to (i) a determination of their compliance with (A) the Redevelopment Requirements, and (B) the mitigation measures referred to in Section 9.02; (ii) urban design issues, including implementation of the Successor Agency's urban design objectives; and (iii) architectural design (excluding the interiors of market rate units) including, but not limited to, landscape design, including materials, plantings selection and

irrigation, site planning, the adequacy of utilities for servicing the Site, exterior and public area signs and public art work, if any. Successor Agency shall act reasonably and in good faith in its review and approval process.

(b) No Successor Agency review is made or approval given as to the compliance of the Project Approval Documents with any building codes and standards, including building engineering and structural design, or compliance with building codes or regulations, or any other applicable local, state or federal law or regulation relating to construction standards or requirements, including, without limitation, compliance with any local, state or federal law or regulation related to the suitability of the Improvements for use by persons with disabilities.

4.08 Construction Commencement

(a) Developer agrees, and the Grant Deed shall contain covenants, to commence construction of the Improvements (the date of commencement, the "**Construction Commencement Date**") on or before the Construction Commencement Outside Date specified in the Schedule of Performance and carry the development of the Improvements diligently to completion within the times specified in the Schedule of Performance. Developer shall evidence its compliance with this obligation by specifying to its general contractor a date for the general contractor to fully commence of work on the Improvements, established in a notice to proceed issued to the general contractor by Developer and/or its architect (which notice shall be simultaneously provided to OCII) and which notice shall not be modified prior to the Construction Commencement Date.

(b) For the purposes of this Agreement, the "**Commencement of Substantial Construction**" means the later to occur of the following: (i) date of issuance by the City's Department of Building Inspection ("**DBI**") of the foundation addendum to the site permit for the Project; and (ii) the date upon which Developer closes on construction financing for both the Tower Project and Mid-Rise Affordable Project as evidenced by executed and recorded deeds of trust or other documentation as Successor Agency may reasonably request.

(c) The Schedule of Performance is intended, and Developer hereby covenants, to facilitate the completion of the construction of the Improvements in a single phase.

4.09 Cost of Developer Construction

The cost of developing the Site and Tehama Parcel and construction of all Improvements thereon shall be borne solely by Developer, except as otherwise provided in this Agreement.

4.10 Issuance of Building Permit

(a) It is the intent of Developer to use the site permit process, as described in the DRDAP. Developer shall have the sole responsibility for obtaining all necessary site permits, associated addenda, and any other required building permits and shall make application for such permits directly to DBI. When applicable, Successor Agency shall reasonably and expeditiously cooperate with Developer in its efforts to obtain such permits, at no cost or expense to Successor Agency. Prior to commencing construction of any portion of the Improvements, Developer shall have each obtained the requisite site permit and associated addenda. From and after the date of its submission of any such application, Developer shall diligently prosecute such application.

(b) Developer and Affordable Developer are advised that DBI forwards all site and building permits to Successor Agency, when applicable, for Successor Agency approval of compliance with

Redevelopment Requirements. Successor Agency review of the site permit, associated addenda, or building permit does not include any review of compliance thereof with the requirements and standards referred to in Section 4.07(b) above, and Successor Agency shall have no obligations or responsibilities for such compliance. Successor Agency evidences its approval by signing such permit and returning the permit to DBI for issuance directly to Developer or Affordable Developer, as applicable. Approval of a site permit, associated addenda, or any other building permit, however, is not approval of compliance with all Redevelopment Requirements necessary for such a permit.

4.11 Delay of Construction Tax Increment Fee

(a) If the Completion of Construction (as defined in Section 4.13 below) does not occur by the date specified in the Schedule of Performance, then Developer shall pay to the TJPA a "**Delay of Construction Tax Increment Fee**" that is intended to fully recompense the increment of ad valorem property taxes lost due to Developer's failure to achieve Completion of Construction as so required.

(b) The Delay of Construction Tax Increment Fee shall be the amount of ad valorem property tax that would be due had the Developer timely completed the Project ("**Estimated Tax**"), less the amount of property tax actually due. To establish the amount of the Delay of Construction Tax Increment Fee, the Parties shall commence an appraisal and estimation process to establish both fair market value of the Site and Improvements, the ad valorem tax rate applicable to the Site and Improvements on the date specified in the Schedule of Performance for Completion of Construction, and the resulting amount of additional tax that would have been due had the Developer timely completed the Project, pro-rated to account for any partial tax year (the "**Estimation Process**"). The Estimation Process shall be as follows:

(i) Each Party shall, at its own expense, designate a licensed MAI Appraiser or other certified real estate professional with at least ten (10) years' experience in the sale and purchase of comparable commercial properties in the San Francisco market. If either party fails to designate its expert within twenty-one (21) days after Successor Agency delivers written notice pursuant to Section 4.11(d) below, then the expert selected by the other Party shall act alone and his/her determination shall be binding.

(ii) The two (2) experts selected by the Parties (the "**Party Experts**") shall each select a similarly qualified, independent appraiser or other expert whose expenses shall be shared equally by Developer and Successor Agency (the "**Neutral Expert**"). If the Neutral Expert cannot be agreed to by the Parties, then the American Arbitration Association, or any successor organization, shall select the Neutral Expert in accordance with its rules and procedures and subject to California law regarding the selection of arbitrators. The Parties shall jointly share the fees charged by the American Arbitration Association.

(iii) Each of the Party Experts shall within thirty (30) days after appointment and after soliciting, accepting and reviewing such information and documentation as each may deem necessary and appropriate, including that reasonably submitted by either Party, prepare a statement of what it considers to be the Estimated Tax based on its determination of the fair market value of the Site and Improvements if Developer achieved Completion of Construction by the date specified in the Schedule of Performance. Their determinations shall be prepared for property tax purposes according to California property tax law and the Property Tax Rules published by the California State Board of Equalization.

(iv) Once the two (2) Party Experts reach their conclusions, then the Neutral Expert shall select the determination of the Estimated Tax that he or she determinates to be most accurate, and the amount so calculated shall be used to calculate the amount of the Delay of Construction Tax immediately due and payable by Developer under this Section 4.11.

(c) Any costs incurred by Successor Agency pursuant to this Section 4.11 shall be reimbursed by the Developer pursuant to Section 12.01.

(d) Successor Agency may initiate, at any time after Developer has failed to meet the requirement in the Schedule of Performance for the Completion of Construction, the Estimation Process upon 21 days of notice to Developer; provided, however, that Successor Agency shall not initiate the Estimation Process more than once in a twelve-month period.

(e) Within 30 days after determination of the amount of the Delay of Construction Tax Increment Fee, Developer shall pay the fee directly to the TJPA. The TJPA shall remit to the Successor Agency 20% of the Delay of Construction Tax Increment Fee for Successor Agency's use in fulfilling its obligations under the Implementation Agreement and the Transbay Affordable Housing Obligation and shall retain the remainder for TJPA's use in fulfilling its obligations under the Pledge Agreement. Developer shall not receive a credit of any kind with the Assessor-Recorder for any payments made pursuant to this Section 4.11.

4.12 Construction Signs and Barriers

Developer, working with the Affordable Developer, shall provide appropriate construction barriers and construction signs and post the signs on the Site during the period of construction. The size, design and location of such signs and the composition and appearance of any non-moveable construction barriers shall be submitted to Successor Agency for approval before installation, which approval shall not be unreasonably withheld and shall otherwise comply with applicable laws.

4.13 Certificate of Completion

(a) Developer may request in writing that Successor Agency issue a Certificate of Completion, in the form of Attachment 16 hereto (the "**Certificate of Completion**"), recognizing that Developer has met the development obligations of this Agreement. In submitting such requests to Successor Agency for a Certificate of Completion, Developer shall provide: (i) DBI's Certificate of Final Completion and Occupancy ("**CFCO**") for the Improvements and (ii) a certification from Developer that it has satisfied in all material respects all obligations that are required to be satisfied under this Agreement for issuance by Successor Agency of the Certificate of Completion. Developer's certification shall include the following supporting documentation: (1) certification from Developer's architect that the Improvements have been constructed in accordance with the Project Approval Documents and in compliance with all applicable local, state and federal laws and regulations (including all laws relating to accessibility for persons with disabilities); (2) written determinations by the City of completion of streetscape or other public infrastructure improvements required under this Agreement, including a Determination of Completeness ("**DOC**") for improvements permitted by DPW and the City's acceptance, through action by the Board of Supervisors, of public improvements, including the public street constructed on the Tehama Parcel; and (3) any information necessary to determine compliance with Successor Agency Equal Opportunity Program, as described in Article 10 and Attachment 17, including Small Business Enterprise utilization reports, final certified payroll reports from Developer's construction contractors and subcontractors, construction workforce requirements, and the executed First Source Hiring Agreement between Developer and the Office of Economic and Workforce Development – CityBuild. Notwithstanding anything to the contrary contained herein, Successor Agency may, in its sole discretion, issue a Certificate of Completion for the Mid-Rise Affordable Project in accordance with the Air Rights Lease, notwithstanding the fact that the Tower Project may not be completed at that time.

(b) Upon receipt of such request, Successor Agency shall review the request and notify Developer within fifteen (15) days of receipt of the request of Successor Agency's determination of whether

or not it will issue the Certificate of Completion for the Improvements covered by the request. Any notice from Successor Agency stating that it will not issue the Certificate of Completion shall specify the reasons therefor following which Developer may seek to satisfy any unfulfilled obligations and again submit a request for the Certificate of Completion. Successor Agency's determination shall be based on Developer's compliance with the requirements of this Agreement that must be complied with to the date of the issuance of the Final CFCO for the Improvements.

(c) Upon Successor Agency's determination that Developer is in compliance with this Agreement, including, without limitation, Sections 5.05 and 9.04 below and upon Successor Agency's receipt of the documentation required of Developer in Section 4.13(a), Successor Agency shall promptly issue to Developer, in recordable form, a duly executed Certificate of Completion in the form of Attachment 16. So issued, the Certificate of Completion shall be a conclusive determination that (i) the Improvements have been constructed in accordance with this Agreement; and (ii) the full performance of the agreements and covenants contained in this Agreement and in the Grant Deed with respect to the obligations of Developer, and its successors and assigns, except for those provisions covered by Section 4.13(d), below, and those provisions that survive termination of this Agreement as provided in Section 5.12. "**Completion of Construction**" shall mean the date on which Successor Agency issues the Certificate of Completion, and after that date, the Improvements so constructed and certified pursuant to an executed Certificate of Completion are referred to as the "**Project**".

(d) Successor Agency's issuance and recordation of any Certificate of Completion does not relieve Developer or any other person or entity from any City requirements or conditions to occupancy of such Improvements, which requirements or conditions shall be complied with separately.

4.14 Right to Reconstruct the Improvements in the Event of Casualty

In the event that the Improvements are destroyed by casualty prior to the issuance of the Certificate of Completion, the Developer or Affordable Developer, as applicable, shall have the right to rebuild the applicable Improvements substantially in conformity with this Agreement and the approved Project Approval Documents, subject to changes necessary to comply with the applicable building code, and the Redevelopment Requirements or other local requirements then in effect for the Site.

4.15 Access to Site – Successor Agency

Successor Agency, the TJPA, the City, and their respective representatives will have the right to enter upon the Site and/or the Tehama Parcel during normal business hours with 48 hours' prior notice to Developer, at no cost or expense to Successor Agency, the TJPA or the City, during the period of construction of the Improvements to the extent necessary to carry out the purposes of this Agreement, including inspecting the work of construction of the Improvements. Developer will have the right to have an employee, agent or other representative of Developer accompany Successor Agency, the TJPA, the City, and their representatives at all times while they are present on the Site and/or the Tehama Parcel. Successor Agency, the TJPA, the City, and their respective representatives will exercise due care in entering upon and/or inspecting the Site and/or the Tehama Parcel and will perform all entry and inspection in a professional manner and so as to preclude any damage to the Site or Improvements, or any disruption to the work of construction of the Improvements. Successor Agency, the TJPA, the City and their respective representatives will abide by any reasonable safety and security measures Developer or its general contractor imposes.

4.16 Off-Site Infrastructure and Improvements Damage

In addition to the indemnification provisions contained in Section 11.01 of this Agreement, Developer further agrees to repair fully and/or replace to the reasonable satisfaction of Successor Agency, any damage to the off-site infrastructure and improvements within the Project Area existing as of the date of the Construction Commencement Date, including without limitation streets, sidewalks, curbs, gutters, drainage ditches, fences and utility lines lying within or adjacent to the Site, directly or indirectly resulting from work performed by or for Developer. Developer or its respective general contractor, before commencement of any work outside of the Site or Tehama Parcel, shall secure this obligation with a $1,000,000 bond or insurance in form reasonably acceptable to Successor Agency, or other security reasonably acceptable to Successor Agency, such as a personal guaranty. Developer's liability under this provision shall not be limited to the amount of the bond or insurance.

4.17 Insurance Requirements

Without in any way limiting Developer's or Affordable Developer's indemnification obligations under this Agreement, and subject to approval by Successor Agency of the insurers and policy forms, each of the Developer and Affordable Developer shall obtain and maintain, or shall contractually require others to maintain, throughout the Term, the minimum insurance coverage as set forth in Attachment 18.

ARTICLE 5 - COVENANTS AND RESTRICTIONS

5.01 Covenants

Developer expressly covenants and agrees for itself, its successors and assigns and all persons claiming under or through it, that as to the Site and Tehama Parcel and any Improvements constructed or to be constructed, the Project, or alterations or changes thereto, and in addition to any other term, covenant and condition of this Agreement, Developer and all such successors and assigns and all persons claiming under or through it, shall use, devote, operate and maintain the Site, Tehama Parcel and the Improvements, the Project, and every part thereof, only and in accordance with the provisions of this Agreement, including but not limited to Article 5 (subject to the provisions of Section 5.11 of this Agreement). The provisions hereof are contained in the Grant Deed, and/or Declaration of Site Restrictions. This provision shall only apply after the Close of Escrow and in the event Successor Agency exercises the Successor Agency Power of Termination and regains title to the Site, this provision shall be of no further force or effect.

5.02 General Restrictions

The Project shall be devoted only to the uses permitted by (i) the Redevelopment Plan and its Plan Documents (as defined in the Redevelopment Plan), (ii) the Project Area Declaration of Restrictions, (iii) this Agreement, (iv) the Declaration of Site Restrictions, (v) the Commercial Space Declaration (Attachment 28), and (vi) Affordability Requirements to be documented in the Air Rights Lease and a Declaration of Affordability Restrictions for each of the Mid-Rise Affordable Project (Attachment 19B) and the Tower Mixed-Income Rental Project (Attachment 19A) setting forth the affordability restrictions as described in Section 9.04(b) of this Agreement for the life of the Project. In the event Successor Agency exercises the Successor Agency Power of Termination and regains title to the Site, subsections (iii) and (iv) of this Section 5.02 shall be of no further force or effect.

5.03 Restrictions Before Completion

Prior to the Completion of Construction, the Site and the Tehama Parcel shall be used only for construction of the Improvements in accordance with this Agreement, including, but not limited to the Scope of Development. This provision shall only apply after the Close of Escrow and in the event Successor Agency exercises the Successor Agency Power of Termination and regains title to the Site pursuant to Section 8.03(a), this provision shall be of no further force or effect.

5.04 Nondiscrimination

(a) There shall be no discrimination against or segregation of any person or group of persons on account of age, race, color, creed, sex, sexual orientation, gender identity, marital or domestic partner status, disabilities (including AIDS or HIV status), religion, national origin or ancestry by Developer or any occupant or user of the Site in the sale, lease, rental, sublease, transfer, use, occupancy, tenure or enjoyment of the Site, or any part thereof, and Developer itself (or any person or entity claiming under or through it) shall not establish or permit any such practice or practices of discrimination or segregation with reference to the selection, location, number, use or occupancy of the Site or any part thereof, nor shall Developers or any occupant or user of the Site or any transferee, successor, assign or holder of any interest in the Site or any person or entity claiming under or through such transferee, successor, assign or holder, establish or permit any such practice or practices of discrimination or segregation, including, without limitation, with reference to the selection, location, number, use or occupancy of tenants, lessees, subtenants, sublessees, vendees or others of the Site or Improvements.

(b) Developer, for itself and or any person or entity claiming under or through it, further agrees and covenants that there shall be no discrimination against or segregation of, any person or group of persons on account of any basis listed in subdivision (a) or (d) of Section 12955 of the California Government Code, as those bases are defined in Sections 12926,12926.1, subdivision (m) and paragraph (1) of subdivision (p) of Section 12955, and Section 12955.2 of the California Government Code, in the sale, lease, sublease, transfer, use, occupancy, tenure, or enjoyment of the Site nor shall Developer or any person claiming under or through him or her, establish or permit any practice or practices of discrimination or segregation with reference to the selection, location, number, use or occupancy of tenants, lessees, subtenants, sublessees, or vendees in the premises herein conveyed.

(c) Notwithstanding the above, Developer shall not be in default of its obligations under this Section 5.04 where there is a judicial action or arbitration involving a bona fide dispute over whether Developer is engaged in discriminatory practices and Developer promptly acts to satisfy any judgment or award against Developer.

(d) The covenants of this Section 5.04 shall run with the land, and any transferee, successor, assign, or holder of any interest in the Site, or any occupant or user thereof, whether by contract, lease, rental, sublease, license, deed, mortgage or otherwise, and whether or not any written instrument or oral agreement contains the foregoing prohibitions against discrimination, shall be bound hereby and shall not violate in whole or in part, directly or indirectly, the nondiscrimination requirements set forth above; provided, however, in the event Successor Agency exercises the Successor Agency Power of Termination and regains title to the Site, this provision shall be of no further force or effect; provided, further, that nothing herein shall invalidate any applicable non-discrimination law.

(e) Elimination of Discriminatory Restrictions. Developers agree to take and to permit Successor Agency to take all steps legally necessary or appropriate to remove restrictions against the Site and Tehama Parcel, if any, that would violate any of the non-discrimination provisions of this Section, whether the restrictions are enforceable or not.

5.05 Restrictions on Affordable Housing Units

(a) The Affordable Housing Units shall remain subject to the affordability requirements specified in the Declaration of Affordability Restrictions for the life of the Project. For the purposes of this Agreement, "life of the Project" shall mean the time during which the Project, including any future modification thereto, remains in existence.

(b) For the life of the Project, neither Developer, Affordable Developer, nor any successor or assign may make or permit any material alteration, modification, addition and/or substitution of or to the location of the Affordable Housing Units without the express prior written consent of Successor Agency or its designee granted or withheld in its reasonable discretion and upon any terms and conditions Successor Agency or its designee reasonably requires.

(c) Developer shall also comply with the requirements in Section 9.04 related to the Affordable Housing Units for so long as Developer must comply with Sections 5.05(a) and (b).

5.06 No Mortgages

Until Developer has achieved the Commencement of Substantial Construction, there shall be no mortgage, encumbrance or liens on any portion of the Site and/or the Tehama Parcel, except for mortgages and deeds of trust related to the purchase of or construction on the Site and/or the Tehama Parcel or otherwise approved by Successor Agency in its reasonable discretion; provided, however, in the event Successor Agency exercises the Successor Agency Power of Termination and regains title to the Site, this provision shall be of no further force or effect.

5.07 No Changes Without Approval

For the period during which the Redevelopment Plan and Project Area Declaration of Restrictions are in effect, neither Developer nor any successor or assign may make or permit any change in the uses permitted on the Site or any Change in the Improvements (as defined below) without the express prior written consent of the Successor Agency to any proposed change in uses or any Change in the Improvements (defined below), which consent may be made subject to terms and/or conditions reasonably required by the Successor Agency; provided, however, in the event Successor Agency exercises the Successor Agency Power of Termination and regains title to the Site, this provision shall be of no further force or effect. "**Change in the Improvements**" is defined as any alteration, modification, addition and/or substitution of or to the Site or the Improvements that materially affects: (a) the density of development; (b) the extent and nature of the open space on the Site; (c) any public access to or through the Site and the Improvements; (d) the exterior design; (e) the exterior materials; and (f) the exterior color. For the purposes of this Section, "**exterior**" also includes the roof of the Improvements.

5.08 Transfer Payment Covenant

The Transfer Payment Covenant and Notice (Attachment 20) shall run with the land, and any transferee, successor, assign, or holder of any interest in a Residential Condominium Unit, shall be bound thereby and shall not violate in whole or in part, directly or indirectly, the requirements set forth therein.

5.09 Determination of Assessed Value

(a) Developer shall not (until the TJPA Bonds Final Maturity Date, as defined below) object to the assessed value of Block 4 by the Assessor-Recorder, but shall have the right to contest the

assessed valuation by the Assessor-Recorder in the event of a market downturn, where such contest is made solely on the basis of such market downturn; provided, however, that Successor Agency shall not object to or otherwise interfere with Developers' application for the welfare exemption as to the Mid-Rise Affordable Project and the BMR units in accordance with the California Revenue and Taxation Code Section 214(g) and the California State Board of Equalization Property Tax Rules.

(b) Developer shall (until the TJPA Bonds Final Maturity Date, as defined below) (i) provide information in its possession or reasonably accessible to Developer that the Assessor-Recorder, Successor Agency, or TJPA reasonably requests relating to the assessment of the value of new construction in progress, completed new construction, revenues from the sale and/or leasing of any portion of new development, applications for welfare tax exemption, and other relevant information pertinent to the assessment of Block 4 (or any portion thereof) or Developer's compliance with its obligations under this Section 5.09; and (ii) give the Successor Agency and the TJPA written notice of any planned changes in development ownership or management, contact information, or modifications to the original legal parcel boundaries (including parcel subdivision, air rights or condominium formation) at least 60 days in advance of any proposed change.

(c) The "**TJPA Bonds Final Maturity Date**" shall mean October 1, 2049, as such date shall be automatically extended in the event of subsequent financing that results in redemption of the TJPA Bonds, in part or in full, where such subsequent financing does not increase any obligation, requirement, or liability of Developer hereunder.

5.10 Casualty

Developer shall (until the TJPA Bonds Final Maturity Date) apply fire and casualty property insurance proceeds to the restoration of the development of the Site and the Improvements thereon if, in the reasonable judgment of the Successor Agency, the funds available to Developer in the event of all or partial destruction of the development are sufficient to restore the development to substantially its prior use and condition.

5.11 Effect, Duration and Enforcement of Covenants

(a) It is intended and agreed, and the Grant Deed and/or Declaration of Site Restrictions shall expressly provide, that the covenants provided in this Article 5 shall be covenants running with the land as and to the extent set forth in the Grant Deed and/or the Declarations of Site Restrictions and that they shall be, in any event and without regard to technical classification or designation, legal or otherwise, and except only as otherwise specifically provided in this Agreement itself, to the fullest extent permitted by law and equity,

(i) binding for the benefit and in favor of Successor Agency, as beneficiary, as to all covenants set forth in this Article 5; the City and the owner of any other land or of any interest in any land in the Project Area (as long as such land remains subject to the land use requirements and restrictions of the Redevelopment Plan and the Project Area Declaration of Restrictions), as beneficiary, as to the covenants provided in Sections 5.02 and 5.04; and their respective successors and assigns, and

(ii) binding against Developer, its successors and assigns to or of the Site and any Improvements thereon or any part thereof or any interest therein, and any party in possession or occupancy of the Site or the Improvements thereon or any part thereof. It is further intended and agreed that the covenants provided in this Article 5 shall remain in effect respectively as set forth herein, and the covenants in Section 5.02 shall remain in effect for the respective duration of the Redevelopment Plan and the Project Area Declaration of Restrictions; provided, however, that such agreements and covenants shall

be binding on Developer, its successors in interest or assigns, and each party in possession or occupancy, respectively, only for such period as that party shall have title to or an interest in or possession or occupancy of the Site or part thereof. In the event Successor Agency exercises the Successor Agency Power of Termination and regains title to the Site, such agreements and covenants shall be of no further force or effect, except to the extent that they are restatements of applicable law, including the Redevelopment Plan and Related Plan Documents (as defined in the Redevelopment Plan).

(b) In amplification, and not in restriction, of the provisions of the preceding Sections, it is intended and agreed that Successor Agency, the TJPA and the City and their respective successors and assigns, as to the covenants provided in this Article 5 of which they are stated to be beneficiaries, shall be beneficiaries both for and in their own right and also for the purposes of protecting the interest of the community and other parties, public or private, and without regard to whether Successor Agency or the City has at any time been, remains, or is an owner of any land or interest therein to which, or in favor of which, such covenants relate. Successor Agency, the TJPA and the City and their respective successors and assigns shall have the right, in the event of any of such covenants of which they are stated to be beneficiaries, to exercise all the rights and remedies, and to maintain any actions at law or suits in equity or other proper proceedings, to enforce the curing of such breach of such covenants to which it or any other beneficiaries of such covenants may be entitled including, without limitation, restraining orders, injunctions and/or specific enforcement, judicial or administrative. These rights and remedies are in addition to, and not in derogation of, the rights and remedies of Successor Agency set forth in this Agreement.

(c) The conveyance of the Site by Successor Agency to Developer is made and accepted upon the express covenants contained in this Article 5 as set forth herein, which, except only as otherwise specifically provided in this Agreement itself, shall survive the Certificate of Completion and shall be provided for in the Grant Deed and/or the Declaration of Site Restrictions and the Transfer Payment Covenant; provided that in the event Successor Agency exercises the Successor Agency Power of Termination and regains title to the Site pursuant to Section 8.03(a), all such agreements and covenants contained in this Article 5 shall be of no further force or effect, except to the extent that they are restatements of applicable law, including the Redevelopment Plan and Plan Documents (as defined in the Redevelopment Plan).

(d) The conveyance of the Tehama Parcel by Successor Agency to Developer is made and accepted upon the covenants contained in Section 2.02. Developer acknowledges that Section 2.02 constitutes a material inducement to the Successor Agency to enter into this Agreement, and failure to complete the applicable Improvements on the Tehama Parcel as required in this Agreement or failure to offer the Tehama Parcel to the City as provided in this Agreement shall be a material breach of this Agreement.

(e) Developer shall be entitled to notice and shall have the right to cure any breach or violation of all or any of the foregoing in accordance with Article 8.

5.12 Provisions Surviving Termination

The following provisions (together with any definitions or other general provisions necessary to implement the following provisions) shall survive Successor Agency's issuance and recordation of the Certificate of Completion, and shall also be incorporated into the Declaration of Site Restrictions (Attachment 11), and/or the Grant Deed, as applicable (Attachment 10):

(a) All requirements contained in Sections 3.01(a), (b) and (d) of this Agreement;

(b) All requirements contained in Sections 3.02, 3.03 and 3.04 of this Agreement until the expiration of such requirements as set forth therein;

(c) All requirements pertaining to Professional Liability and Builder's Risk in Attachment 18 of this Agreement until the expiration of such requirements as set forth therein;

(d) All requirements contained in Section 5.02 of this Agreement until the expiration of the Redevelopment Plan and the Declaration of Site Restrictions;

(e) All requirements contained in Section 5.04 of this Agreement;

(f) All requirements contained in Section 5.05 of this Agreement until the expiration of such requirements as set forth therein;

(g) All requirements contained in Section 5.07 of this Agreement until the expiration of the Redevelopment Plan and the Declaration of Site Restrictions;

(h) All requirements contained in Section 5.08 of this Agreement;

(i) All requirements contained in Section 5.09 of this Agreement, until the TJPA Bonds Final Maturity Date;

(j) All such requirements contained in Section 5.10 of this Agreement, until the TJPA Bonds Final Maturity Date;

(k) All requirements contained in Section 9.04 of this Agreement until the expiration of those requirements set forth in Section 5.05 of this Agreement;

(l) All requirements contained in Section 9.06(b) of this Agreement;

(m) All requirements contained in Section 9.07, but only for the life of the Project;

(n) All requirements contained in Section 9.08 of this Agreement, but only for the life of the Project;

(o) All requirements contained in Section 9.09 of this Agreement, but only for the life of the Project;

(p) All requirements and provisions contained in Section 9.10 of this Agreement for the life of each Condominium Unit; and

(q) All requirements contained in Sections 11.01 and 11.02 of this Agreement until the expiration of such requirements as set forth therein.

ARTICLE 6 - ANTI-SPECULATION, ASSIGNMENT, AND TRANSFER PROVISIONS

6.01 Representation as to Developer

Developer represents and agrees that its purchase of the Site and its other undertakings pursuant to this Agreement shall be used for the purpose of redevelopment of the Site and not for speculation in land holding.

6.02 Prohibition Against Transfer of the Site, the Improvements and the Agreement

(a) Subject to the terms of Article 7, which permits Mortgages to encumber the Project and the transfers described in Section 2.04(g), before the issuance by Successor Agency of the Certificate of Completion, neither Developer nor Affordable Developer shall make or create or suffer to be made or created any total or partial sale, conveyance, mortgage, encumbrance, lien, assignment, option to acquire, any trust or power, or transfer in any other mode or form, of this Agreement, the Site or the Improvements thereon, or any part thereof, or interest therein, or permit any significant change in the ownership of the Developer or Affordable Developer to occur or contract or agree to do any of the same (collectively a "**Transfer**") without the prior written approval of Successor Agency (the "**Successor Agency Approval**"), which shall not be unreasonably withheld. For avoidance of doubt, (i) this Section 6.02 shall not act to prevent Developer from retaining one or more Developer Affiliates (as defined below) to perform certain construction, development and other project management services with respect to the Improvements or the Project, which may include performance of certain of Developer's obligations under this Agreement on Developer's behalf, and (ii) the prohibitions on transfer in this Section 6.02 shall be of no further force or effect after the issuance of the Certificate of Completion, and (iii) the prohibitions on transfer in this Section 6.02 shall not prohibit the sale of individual Residential Condominium Units within the Tower Market-Rate Condominium Project. For purposes hereof, a "**Developer Affiliate**" shall mean any entity controlling, controlled by, or under common control with Developer (and 'control' and its correlative terms 'controlling', 'controlled by' or 'under common control with' mean the possession, direct or indirect, of the power to direct or cause the direction of the management and policies of Developer, whether through the ownership of voting securities, by contract or otherwise);

(b) Notwithstanding the general prohibition in Section 6.02(a) above, and subject to the requirements of Section 6.03:

(i) Should Developer or any equity investor(s) in or lender(s) to Developer or its owner(s) remove or cause the removal of the Hines Urban F4, LLC from Developer, said party shall, immediately concurrent with such removal, propose a replacement entity that (a) has experience developing and completing projects of similar size and scope to the Improvements (including its affordable housing component) in California; (b) possesses a good business character and reputation; and which, upon the Successor Agency's reasonable concurrence that such entity meets the foregoing qualifications, shall assume the rights and obligations of the Hines/Urban entity (including, without limitation, the control or management of the day-to-day operation of development activities with respect to the Improvements) ("**Qualified Replacement Development Manager**");

(ii) Developer may, without Successor Agency approval:

(A) effectuate any Transfer of all of the rights and obligations of Developer hereunder to another entity so long as the Hines Urban F4, LLC (or a Qualified Replacement Development Manager previously approved pursuant to this Section 6.02(b)) controls or manages the day-to-day operation of such transferee entity's development activities with respect to the Improvements;

(B) effectuate any Transfer of any direct or indirect interest in Developer, provided the Hines Urban F4, LLC (or a Qualified Replacement Development Manager previously approved under this Section 6.02(b)) controls or manages the day-to-day operation of Developer's development activities with respect to the Improvements.

(iii) Developer or Affordable Developer (or its successor) may effectuate a Transfer that is permitted under the Air Rights Lease;

(iv) Developer may effectuate the encumbrance of the Site and Improvements with recorded documents, including, without limitation, easements, stormwater maintenance agreements, reciprocal easement agreements and parcel or subdivision maps, except where Successor Agency review and approval of such is included in this Agreement, if in connection with the construction of the Improvements and/or permanent financing for the Project;

(v) Developer may effectuate the encumbrance of the Site and Improvements with one or more regulatory agreements, restrictive covenants, or land use restriction agreements in connection with the bond financing, tax credits, and affordability restrictions.

6.03 Assumption by Transferee

Notwithstanding anything to the contrary contained in Section 6.02 or elsewhere in this Agreement, no Transfer of the rights and obligations of Developer hereunder that is either allowed by Section 6.02 without Successor Agency approval or that is made with Successor Agency approval shall be valid until such transferee shall assume in writing the obligations of the Developer from and after the date of such Transfer and agree to be bound by the terms and provisions hereof in a form approved by Successor Agency in its reasonable discretion. The transferee shall thereafter be solely responsible for the obligations and liabilities of Developer under this Agreement or any document entered into in connection with this Agreement, and Successor Agency shall release and forever discharge such assignor from any obligations and liabilities with respect to any other portions of the Improvements, the Project or Site under this Agreement or any document entered into in connection with this Agreement, subject to the Successor Agency's review and approval, in its reasonable discretion, of the assignment document with respect to such obligations and liabilities.

Provided further, that Developer agrees that any leases for any portion of the Improvements entered into prior to Commencement of Substantial Construction will include a provision that allows for the termination of the lease by the Successor Agency subsequent to its exercise, prior to the Commencement of Substantial Construction, of the Successor Agency Power of Termination and subject to any notice requirements (not to exceed 30 days) under the lease.

6.04 Effect of Violation

In the absence of specific written approval by Successor Agency, and except to the extent set forth in this Agreement, no Transfer shall be deemed to relieve Developer or any other party from any obligations under this Agreement prior to the Transfer, or deprive Successor Agency of any of its rights and remedies under this Agreement or the Grant Deed.

ARTICLE 7 - MORTGAGE FINANCING: RIGHTS OF MORTGAGEES

7.01 Mortgagee

For purposes of this Agreement, the "**Mortgagee**" shall singly and collectively include the following: (a) a mortgagee or beneficiary under a mortgage or a deed of trust concerning all or any portion of the Site (a "**Mortgage**"), and (b) any insurer or guarantor of any obligation or condition secured by a Mortgage concerning all or any portion of the Site. Subject to the terms and conditions set forth in this Article 7, Developer shall be entitled to grant one or more Mortgages on all or any portion of the Site.

7.02 Required Provisions of Any Mortgage

Developer agrees to have any Mortgage provide that such Mortgage is subject to all of the terms and provisions of this Agreement. Any Mortgage shall provide that the Mortgagee of such Mortgage shall give notice to Successor Agency in writing by registered or certified mail of the occurrence of any default by Developer, as applicable, under the Mortgage, and that Successor Agency shall be given notice at the time any Mortgagee initiates any Mortgage foreclosure action. In the event of any such default, Successor Agency shall have the right to cure such default, provided that Developer, as applicable, is given not less than fifteen (15) days' prior notice of Successor Agency's intention to cure such default. If Successor Agency shall elect to cure such default, Developer shall pay the cost thereof to Successor Agency upon demand, together with the interest thereon at the maximum interest rate permitted by law, unless (i) Developer cures such default within such 15-day period, or (ii) if curing the default requires more than fifteen (15) days and Developer shall have commenced cure within such fifteen (15) days after such notice, Developer shall have (A) cured such default within forty-five (45) days or such greater time period as may be allowed by Mortgagee after commencing compliance, or (B) obtained from the Mortgagee a written extension of time in which to cure such default.

7.03 Address and Acknowledgment of Mortgagee

No Mortgagee shall be entitled to exercise the rights set forth in this Article 7 unless and until written notice of the name and address of the Mortgagee shall have been given to Successor Agency, notwithstanding any other form of notice, actual or constructive. Successor Agency shall, upon written request, promptly acknowledge receipt of the name and address of the Mortgagee and confirm to such party that such party is or would be, upon closing of its financing or its acquisition of an existing Mortgage, a Mortgagee entitled to all rights under this Article 7 and a Bona Fide Institutional Lender, provided that Successor Agency receives reasonable proof of the foregoing. Such acknowledgment shall, if requested, be in recordable form and may be recorded at Developer's expense. After reviewing the proof of the status of any prospective mortgagee, if Successor Agency reasonably determines that any such acknowledgment requested by Developer or such prospective mortgagee or assignee would be inaccurate, then Successor Agency shall promptly notify Developer and the prospective Mortgagee or assignee of such determination. Such notice shall specify the reasonable basis for Successor Agency's determination. If Successor Agency has received notice of any Mortgagee, then such notice shall automatically bind Successor Agency's successors and assigns.

7.04 Mortgagee's Right to Cure

If Developer creates a Mortgage on the Site in compliance with the provisions of this Article 7, then so long as any such Mortgage shall remain unsatisfied of record, the following provisions shall apply:

(a) Successor Agency, upon serving Developer or Affordable Developer, as applicable, any notice of default or any other notice under the provisions of or with respect to this Agreement, shall also serve a copy of such notice upon any Mortgagee at the address provided to Successor Agency pursuant to this Agreement, and no notice hereunder by Successor Agency to either of the Developers shall affect any rights of a Mortgagee unless and until a copy thereof has been so served on such Mortgagee provided that Mortgagee has complied with Section 7.03 above.

(b) Any Mortgagee shall have the right to remedy, or cause to be remedied, any Default of Developer or Affordable Developer, within the later to occur of (i) one hundred twenty (120) days following the date of Mortgagee's receipt of the notice referred to in Section 7.04(a) above, or (ii) one hundred twenty (120) days after the expiration of the period provided herein for Developer or Affordable

Developer to remedy or cure such default, and Successor Agency shall accept such performance by or at the insistence of the Mortgagee as if the same had been timely made by Developer or Affordable Developer.

(c) Any notice or other communication which Successor Agency shall desire or is required to give to or serve upon the Mortgagee shall be in writing and shall be served in the manner set forth in Section 12.03, addressed to the Mortgagee at the address provided for in this Agreement.

(d) Any notice or other communication which Mortgagee shall give to or serve upon Successor Agency shall be deemed to have been duly given or served if sent in the manner and at Successor Agency's address as set forth in Section 12.03, or at such other address as shall be designated by Successor Agency by notice in writing given to the Mortgagee in like manner.

7.05 Application of Agreement to Mortgagee's Remedies

Except as provided in Section 7.02, no provision of this Agreement shall limit the right of any Mortgagee to foreclose or otherwise enforce any mortgage, deed of trust or other encumbrance upon the Site, nor the right of any Mortgagee to pursue any remedies for the enforcement of any pledge or lien upon the Site; provided, however, that in the event of a foreclosure sale under any such mortgage, deed of trust or other lien or encumbrance or sale pursuant to any power of sale contained in any such mortgage or deed of trust, or other lien or encumbrance, the purchaser or purchasers and their successors and assigns and the Site shall be, and shall continue to be, subject to all of the conditions, restrictions and covenants herein provided for, but not any past due obligations of Developer or Affordable Developer, as applicable, for which the applicable Developer or Developers shall remain liable. In no event shall any Mortgagee be in default of any such future obligations provided for in this Agreement until at least one hundred twenty (120) days after the date of the transfer of title to the Site or the applicable equity collateral, as the case may be, plus any cure periods provided for hereunder.

7.06 No Obligation to Construct Improvements or Pay Money Damages

No Mortgagee, including without limitation any Mortgagee who obtains title to the Site or any part thereof as a result of foreclosure proceedings or action in lieu thereof (but not including any other party who thereafter obtains title to the Site or any part thereof from or through such Mortgagee or any purchaser at a foreclosure sale other than the Mortgagee), shall in any way be obligated by the provisions of the Agreement to either pay money damages or other consideration to Successor Agency, or to construct or complete the Improvements, nor shall any covenant or any other provision in the Redevelopment Plan, the Project Area Declaration of Restrictions, or any other document, instrument or plat whatsoever be construed to so obligate any Mortgagee; provided, however, that nothing in this Agreement shall be construed to permit or authorize any Mortgagee to devote the Site or any part thereof to any uses, or to construct any improvements thereon, other than those uses or improvements provided or authorized in Section 5.02.

7.07 Accommodation of Mortgagee and Mortgagees Protections

Successor Agency is obligated to act reasonably in all dealings with Mortgagees, to make reasonable accommodations with respect to the interests of Mortgagees, and to agree to reasonable amendments to this Agreement as reasonably requested by a prospective mortgagee or mezzanine lender, and to execute any estoppels or similar documents reasonably requested by any Mortgagee or prospective mortgagee or mezzanine lender.

7.08 Mortgagees of Affordable Air Space Parcel

For purposes of the Affordable Air Rights Parcel, the provisions of this Article 7 may be supplanted in the sole discretion of the Executive Director of the Successor Agency and replaced by the provisions of the Air Rights Lease.

ARTICLE 8 - DEFAULTS AND REMEDIES

8.01 Developer Default

The occurrence of any one of the events or circumstances listed as items (a) through (l) below shall constitute an "**Event of Default**" by Developer under this Agreement thirty (30) days after Developer's receipt of written notice from the Successor Agency of the alleged default (unless an alternative cure period is otherwise set forth below), or in the case of a default not susceptible of cure within thirty (30) days, Developer fails to promptly commence to cure such default and thereafter diligently to prosecute such cure to completion within a reasonable time, unless a different cure period is specified. Notwithstanding anything to the contrary in this Agreement, for the avoidance of doubt, no Event of Default by Affordable Developer, as included in Section 8.02, shall authorize or permit the Successor Agency to exercise any remedies against Developer (separate from any remedies applicable to an Event of Default of Developer) or excuse Successor Agency from performing its obligation to convey the Site to Developer as and when required by this Agreement (except as provided in Section 2.07(b)(ii)), and Developer shall have no obligations or liabilities for an Event of Default that is solely by Affordable Developer.

(a) Developer suffers or permits a Transfer to occur in a manner inconsistent with the provisions of Sections 2.02 or 6.02, or Developer allows any other person or entity (except Developer's authorized representatives or as otherwise contemplated by this Agreement or approved in writing by the Successor Agency) to occupy or use all or any part of the Site or the Tehama Parcel in violation of the provisions of this Agreement;

(b) After the Close of Escrow, Developer fails to pay real estate taxes or assessments on the Site or the Tehama Parcel prior to delinquency or places any mortgages, encumbrances or liens upon the Site, the Tehama Parcel or the Improvements on either, or any part thereof, in violation of this Agreement;

(c) Developer fails to achieve any milestone on or before the applicable time set forth in the Schedule of Performance, fails to diligently prosecute the construction of the Improvements to Completion of Construction on or before the applicable time(s) set forth in the Schedule of Performance or abandons or suspends construction of the Improvements for more than ten (10) consecutive days; and any such failure, abandonment or suspension continues for a period of thirty (30) days following the date of written notice thereof from Successor Agency. For the avoidance of doubt, the excusable delay provisions of Sections 8.08(a) and 8.08(b) are applicable to potential defaults under this Section 8.01(c);

(d) Developer defaults under any other agreement between Successor Agency and Developer and fails to cure the same in the manner provided under such other agreement, and such default shall not have been cured within thirty (30) days following the date of written demand to cure by Successor Agency to Developer, provided that Successor Agency's remedies for a default under the other agreement between Successor Agency and Developer shall be limited to the remedies respectively set forth therein;

(e) Developer fails to pay any amount required to be paid hereunder;

(f) Developer does not accept conveyance of the Site in violation of this Agreement upon tender by Successor Agency pursuant to this Agreement, or Developer fails to close escrow by the Outside Date for Close of Escrow for any reason other than failure of Developer Conditions or as otherwise provided herein, and such failure shall not have been cured within five (5) business days following the date of written demand to cure by Successor Agency to Developer;

(g) Developer is in default under Successor Agency's Equal Opportunity Program, Attachment 17; provided, however, Successor Agency's remedies for any default under Successor Agency's Equal Opportunity Program shall be only as set forth in Successor Agency's Equal Opportunity Program, Attachment 17;

(h) Developer fails to obtain a site permit with associated addenda, and all other necessary permits for the Improvements to be constructed on the Site and the Tehama Parcel within the periods of time specified in this Agreement, including the Schedule of Performance, as applicable;

(i) Developer does not submit all material Project Approval Documents as required by this Agreement within the periods of time respectively provided therefor in the Schedule of Performance, as applicable;

(j) After the Close of Escrow, Developer defaults in the performance of or violates any covenant, or any part thereof, set forth in Sections 2.02 or 4.04, the then-effective provisions of Article 5 or Article 9, the Declaration of Site Restrictions, Declaration of Affordability Restrictions, Commercial Space Restrictions or in the Grant Deed;

(k) Developer fails to perform under any other agreements or obligations on Developer's part to be performed under this Agreement and such failure or breach continues for the period of time for any cure or the expiration of any grace period specified in this Agreement therefor, or if no such time or grace period is specified, within thirty (30) days after the date of written demand by Successor Agency to Developer to perform such agreement or obligation or cure such breach, or in the case of a default not susceptible of cure within thirty (30) days, Developer fails promptly to commence to cure such default and thereafter diligently to prosecute such cure to completion within a reasonable time-including, without limitation, any obligations set forth in Sections 8.01(i) and 8.01(j);

(l) A material breach of any representation or warranty made by Developer.

8.02 Affordable Developer Default

The occurrence of any one of the following events or circumstances shall constitute an "**Event of Default**" by Affordable Developer under this Agreement thirty (30) days after Affordable Developer's receipt of written notice from the Successor Agency of the alleged default and opportunity to cure (unless an alternative cure period is otherwise set forth below), or in the case of a default not susceptible of cure within thirty (30) days, Affordable Developer fails promptly to commence to cure such default and thereafter diligently to prosecute such cure to completion within a reasonable time, unless a different cure period is specified; provided, however, that no such matter shall constitute an Event of Default to the extent that, within thirty (30) days following its receipt of written notice from the Successor Agency that an Event of Default under this Section 8.02 exists, Developer proposes a substitute Affordable Developer to the Successor Agency for its approval, which approval shall not be unreasonably withheld, delayed or conditioned, and, within thirty (30) days following Successor Agency's approval, the substitute Affordable Developer agrees in writing to be bound by the terms of this Agreement from and after the date of substitution; provided, however, that Developer shall be obligated to commence the cure of any Affordable Developer Event of Default that (i) constitutes an emergency that threatens public health or safety, or (ii) if left uncured,

would threaten the ability of any replacement Affordable Developer to perform its obligations under this Agreement. Notwithstanding anything to the contrary in this Agreement, for the avoidance of doubt, no Event of Default, as included in Section 8.01, by Developer shall authorize or permit the Successor Agency to exercise any remedies against Affordable Developer (separate from any remedies applicable to an Event of Default of Affordable Developer), and Affordable Developer shall have no obligations or liabilities for an Event of Default that is solely by Developer.

(a) Affordable Developer suffers or permits a Transfer to occur that is not expressly allowed under or consented to pursuant to Article 6; or Affordable Developer allows any other person or entity (except Affordable Developer's authorized representatives or as otherwise contemplated by this Agreement or approved in writing by the Successor Agency) to occupy or use all or any part of the Affordable Air Rights Parcel in violation of the provisions of this Agreement;

(b) Affordable Developer does not execute the Air Rights Lease and accept the leasehold interest of the Affordable Air Rights Parcel as and when required by, and subject to all terms and conditions of, this Agreement upon tender by Successor Agency pursuant to this Agreement, and such failure continues for a period of five (5) business days following the date of written notice from Successor Agency;

(c) Affordable Developer is in default under the Successor Agency's Equal Opportunity Program, Attachment 17; provided, however, that any rights to cure and Successor Agency's remedies for any default under the Successor Agency's Equal Opportunity Program shall be only as set forth in the Successor Agency's Equal Opportunity Program, Attachment 17;

(d) Affordable Developer defaults in the performance of or violates any covenant, or any part thereof, set forth in Article 5 but only to the extent such covenants apply to Affordable Developer and the Mid-Rise Affordable Project. The language of this paragraph shall not be construed to limit the right of the Affordable Developer to contest, under the terms of this Agreement, the allegation of default in the performance or violation of any covenant, or any part thereof, set forth in Article 5.

(e) Affordable Developer fails to perform any other agreements or obligations on Affordable Developer's part to be performed under this Agreement, other than Affordable Developer's failure to perform a condition to Close of Escrow under Section 2.07, or a material breach of any representation or warranty made by Affordable Developer.

(f) A material breach of any representation or warranty made by Affordable Developer.

Notwithstanding the foregoing, any act or omission by Affordable Developer that would otherwise constitute an Event of Default under this Section 8.02 that is a direct result of or solely attributable to an act or omission by Developer shall not be an Event of Default by Affordable Developer, and Affordable Developer shall have no liability therefor.

8.03 Remedies of Successor Agency upon the Occurrence of an Event of Default by Developer

Upon the occurrence of an Event of Default by the Developer, the Successor Agency shall have the remedies set forth below.

(a) Termination of Agreement/Retention of Good Faith Deposit

(i) Prior to Close of Escrow. Upon the occurrence of an Event of Default by Developer prior to Close of Escrow, Successor Agency may, in its sole option and as its sole and exclusive remedy, terminate this Agreement and in such case, Developer shall forfeit any right to reimbursement of the Good Faith Deposit and Successor Agency shall be entitled to receive and retain the Good Faith Deposit. For the sake of clarification, Section 8.03(c) shall not be applicable with respect to an Event of Default by Developer prior to Close of Escrow.

(ii) Prior to Commencement of Substantial Construction. Upon occurrence of an Event of Default by Developer after Close of Escrow but prior to Commencement of Substantial Construction, Successor Agency may, in its sole option, terminate this Agreement; in such case, Developer shall forfeit any right to reimbursement of the Good Faith Deposit and Successor Agency shall be entitled to receive and retain the Good Faith Deposit. In addition, Successor Agency shall have the right, under the Grant Deed and subject to the terms of this Agreement, to record a reversionary quitclaim deed, substantially in the form of Attachment 14 hereto ("**Developer's Quitclaim Deed**"), re-enter and take possession of the Site and the Tehama Parcel, and to terminate (and revest in Successor Agency) the right, title, or interest conveyed by the Grant Deed to Developer, at no cost to Successor Agency (collectively, the "**Successor Agency Power of Termination**"); provided, however, Successor Agency shall provide Developer and Title Company with at least three (3) business days prior written notice of its intention to instruct the Title Company to record Developer's Quitclaim Deed (which notice shall be in addition to any other notice provided under Section 8.01 above). If Successor Agency exercises the Successor Agency Power of Termination, then (i) Developer shall have no further right, title or interest in or to the Site and the Tehama Parcel and (ii) Successor Agency may record Developer's Quitclaim Deed and proceed with developing the Site and the Tehama Parcel in accordance with its obligations under the Implementation Agreement and the Transbay Affordable Housing Obligation.

THE PARTIES AGREE THAT SUCCESSOR AGENCY'S ACTUAL DAMAGES, IN THE EVENT OF DEFAULT BY DEVELOPER PRIOR TO COMMENCEMENT OF SUBSTANTIAL CONSTRUCTION, WOULD BE EXTREMELY DIFFICULT OR IMPRACTICABLE TO DETERMINE. THEREFORE, BY PLACING THEIR INITIALS BELOW, THE PARTIES ACKNOWLEDGE THAT THE AMOUNT DESCRIBED IN THIS SECTION HAS BEEN AGREED UPON, AFTER NEGOTIATION, AS THE PARTIES' REASONABLE ESTIMATE OF SUCCESSOR AGENCY'S DAMAGES AND AS A REMEDY AGAINST DEVELOPER, AT LAW OR IN EQUITY, IN THE EVENT OF DEFAULT COVERED BY THIS SECTION ON THE PART OF DEVELOPER. RETENTION OF SUCH AMOUNT BY SUCCESSOR AGENCY SHALL CONSTITUTE LIQUIDATED DAMAGES TO SUCCESSOR AGENCY PURSUANT TO CALIFORNIA CIVIL CODE SECTIONS 1671, 1676 AND 1677.

SUCCESSOR AGENCY: _____ DEVELOPER: _____

If Successor Agency receives and retains the Good Faith Deposit as liquidated damages, exercises the Successor Agency Power of Termination, and receives title to the Site and the Tehama Parcel, free and clear of any obligation to convey the same to Developer, then Successor Agency shall not have the remedy of specific performance.

(b) Specific Performance. Except as provided above in Section 8.03(a) and solely with respect to the rights of Successor Agency after Commencement of Substantial Construction, Successor Agency shall have the right to institute an action for specific performance of the terms of this Agreement or of the Grant Deed to construct the Improvements.

(c) Additional Remedies. Successor Agency shall be entitled to exercise all other remedies at law or in equity, including, without limitation, (i) those provided in the Grant Deed (Attachment 10) and elsewhere in violation of the covenants described in Article 5; (ii) the Delay of Construction Tax Increment Fee described in Section 4.11; (iii) the Delay of Construction CBD Fee described in Section 9.03(a); (iv) the Delay of Construction CFD Fee described in Section 9.03(b); (v) the remedies set forth in the Equal Opportunity Program (Attachment 17); and (vi) the remedies set forth in the Prevailing Wage Provisions.

(d) Retention of Affordable Housing Fee. Termination of this Agreement for any reason prior to the execution of a loan agreement governing the distribution of the Successor Agency Loan shall not affect the Successor Agency's right under the Parcel F development agreement to receive and retain the Affordable Housing Fee to meet the Transbay Affordable Housing Obligation whether on the Site or elsewhere. After the execution of a loan agreement governing the Successor Agency Loan, the provisions of the loan agreement shall determine the Successor Agency's rights concerning the Affordable Housing Fee.

8.04 Remedies of Successor Agency Upon the Occurrence of an Event of Default by the Affordable Developer

Any Event of Default by the Affordable Developer under this Agreement will be considered an Event of Default under any agreements related to the development of the Improvements between the Affordable Developer and the Successor Agency or MOHCD (the "**Associated Documents**"). Accordingly, upon the occurrence of an Event of Default by the Affordable Developer, Successor Agency will be able to exercise all remedies provided for in the Associated Documents. Additionally, upon the occurrence of an uncured Event of Default by the Affordable Developer, and provided Developer has elected not to propose and engage a replacement Affordable Developer in accordance with the provisions of Section 8.02, the Successor Agency may propose a substitute affordable developer. Notwithstanding such approval rights, the Developer must work with the Successor Agency to identify and approve a substitute affordable developer upon the occurrence of an uncured Event of Default by the Affordable Developer in a timely manner so as not to affect the construction schedule and result in a Developer Event of Default.

8.05 Successor Agency Default

The occurrence of any one of the following events or circumstances shall constitute an Event of Default by Successor Agency under this Agreement:

(a) Successor Agency fails to convey the Site to Developer in violation of this Agreement, pursuant to Section 2.09, and such failure continues for a period of ten (10) days following the date of written notice thereof from Developer;

(b) Successor Agency fails to convey the leasehold interest in the Affordable Air Rights Parcel to Affordable Developer as and when required, and on the terms and conditions of, this Agreement, and such failure continues for a period of ten (10) days following the date of written notice thereof from the Affordable Developer; or

(c) Successor Agency fails to perform any other agreements or obligations on Successor Agency's part to be performed under this Agreement, and such failure continues for the period of time for any cure or the expiration of any grace period specified in this Agreement therefor, or if no such time or grace period is specified, within thirty (30) days after the date of written demand by Developer to Successor Agency to perform such agreement or obligation, or, in the case of a default not susceptible of

cure within thirty (30) days, Successor Agency fails promptly to commence to cure such default and thereafter diligently to prosecute such cure to completion within a reasonable time.

8.06 Remedies of Developer and Affordable Developer

For an Event of Default by Successor Agency hereunder, Developer and Affordable Developer shall have the following remedies:

(a) Limitation on Damages. Successor Agency shall not be liable to Developer or Affordable Developer for damages caused by any default by Successor Agency, including general, special, or consequential damages, or to expend money to cure a default by Successor Agency, except as provided in subparagraph (e) below, subject to the limitations contained in subparagraph (d) below.

(b) Right of Termination. For an Event of Default by Successor Agency prior to Close of Escrow, in addition to its other remedies at law and in equity, Developer shall have the right to terminate this Agreement and obtain a prompt return of the Good Faith Deposit, less those amounts to be withheld as provided in Section 1.02.

(c) Other Remedies. Subject to subparagraphs (a), (b) and (d), Developers shall be entitled to exercise all other remedies at law and in equity.

(d) Non-liability of Successor Agency Members, Officials and Employees. No member, official or employee of Successor Agency, the TJPA or City shall be personally liable to Developer or Affordable Developer, or any successor in interest, for any default by Successor Agency, TJPA or City or for any amount which may become due to Developer or successor in interest under the terms of this Agreement.

(e) Successor Agency Liability. If Escrow fails to close due to a failure of a Developer Condition, the Good Faith Deposit shall be returned to Developer, but Successor Agency shall have no liability for money except as provided in this Section 8.06(e).

8.07 Rights and Remedies Cumulative

Except with respect to rights and remedies expressly declared to be exclusive in this Agreement, the rights and remedies of the Parties to this Agreement, whether provided by law, in equity or by this Agreement, shall be cumulative, and the exercise by either party of any one or more of such rights or remedies shall not preclude the exercise by such Parties of any other or further rights or remedies for the same or any other default or breach by the other party. No waiver made by either party with respect to the performance, or manner or time thereof, of any obligation of the other party or any condition to its own obligation under this Agreement shall be effective beyond the particular obligation of the other party or condition to its own obligation expressly waived and to the extent thereof, or a waiver in respect to any other rights of the party making the waiver or any other obligations of the other party.

8.08 Force Majeure/Extensions of Time

(a) Force Majeure

(i) In the event of Force Majeure (defined below), neither Successor Agency nor Developer, as the case may be, nor any successor in interest ("**Delayed Party**", as applicable) shall be considered in breach of or default in any obligation or satisfaction of a condition, and provided that the Delayed Party continues to diligently pursue the resumption or completion of construction or other

milestone, as applicable, and otherwise complies with the applicable requirements of this Section 8.08, all applicable dates set forth in the Schedule of Performance and Schedule of Important Project Dates shall automatically be extended for any period of Force Majeure; provided, however, Force Majeure shall apply only if the Delayed Party seeking the benefit of the provisions of this Section has notified the other party in writing no later than ten (10) business days (or 30 calendar days if notice is provided after the Close of Escrow) after learning of the enforced delay, stating the cause or causes thereof and providing an explanation of the delay and evidence of the basis for delay reasonably requested sufficient for the other Party to verify the delay. "**Force Majeure**" for purposes of this Agreement means events that cause enforced delays in the Delayed Party's performance of its obligations under this Agreement due to one or more of the following causes, to the extent the cause is beyond the Delayed Party's reasonable control: acts of God or of a public enemy, acts of governmental entities (but not those of Successor Agency with regard to its own acts) including delays in the issuance of any permits required for construction of any of the Improvements, fires, casualties, floods, earthquakes, epidemics, pandemics, quarantine restrictions, freight embargoes, inability to obtain supplies or materials or reasonably acceptable substitute supplies or materials (provided that Developer has ordered such materials on a timely basis), unusually severe weather, unanticipated geotechnical conditions, archeological finds on the Site or the Tehama Parcel that, pursuant to the Mitigation Measures, require delay in construction activity, substantial interruption of work because of labor disputes, administrative appeals, litigation and arbitration (provided that in each such case that the Delayed Party proceeds with commercially reasonable due diligence to resolve any dispute that is the subject of such action), changes in laws, codes or ordinances or in the interpretation thereof, delays of subcontractors due to any of these causes.

(ii) If the delay caused by Force Majeure prior to Close of Escrow extends for more than twelve consecutive (12) months (or such longer period consistent with Section 8.08(b) below), then either Successor Agency or Developer, by written notice to the other, may terminate this Agreement, whereupon the Good Faith Deposit (less those amounts to be withheld as provided in Section 1.02) shall promptly be returned to Developer and the Parties shall have no further liabilities or obligations under this Agreement arising or accruing following such termination.

(b) Inability to Obtain Financing

(i) If Developer is unable, through no fault of its own, to obtain (x) financing on Commercially Reasonable Terms (as defined below) or (y) bond or equivalent financing with respect to the Mid-Rise Affordable Project as a result of the Mid-Rise Affordable Project's scoring under the then-applicable scoring system used by CDLAC or its successor, provided that the availability of such bond or equivalent financing is based on a competitive process (in contrast to an over-the-counter application) at the time Developer seeks such financing; then Developer may request that Successor Agency extend the Outside Date for Close of Escrow for up to six (6) months (the "**First Extended Closing Date**") to provide Developer additional time to seek such financing or substitute financing. If Developer is unable to obtain financing described in clauses (x) and (y) immediately above sixty (60) days prior to the First Extended Closing Date, then Developer may request that Successor Agency extend the Outside Date for Close of Escrow for up to an additional six (6) months from the First Extended Closing Date, for a total of twelve (12) months to provide Developer additional time to seek such financing or substitute financing. Upon an extension of the Outside Date for Close of Escrow pursuant to this subsection (i), all applicable dates set forth in the Schedule of Performance and Schedule of Important Project Dates shall automatically be extended for an equivalent period of time. Upon requesting an extension under this Section 8.08(b)(i) and as a condition to the continued validity of the extension, Developer covenants to diligently pursue specified or substitute financing for the entire period of any extension granted hereunder.

(ii) Developer shall provide, for all requests for extensions of the Outside Date for Close of Escrow under this subsection, objective and independent evidence that it is unable, through no

fault of its own, to obtain the financing described in clauses (x) or (y) of Section 8.08(b), as applicable. Developer's extension request are subject to Successor Agency's approval in its reasonable discretion.

(iii) At the request of Developer, during any period of extension of the Outside Date for Close of Escrow pursuant to Section 8.08(b)(i), Successor Agency and Developer shall negotiate, in good faith, changes to the Budget and Scope of Development to reduce Improvements costs and to improve the financeability of the Improvements (*i.e.*, to value engineer the Improvements).

(c) "**Commercially Reasonable Terms**" shall mean, without limitation, (i) non-recourse (except as against the Site and assuming acceptance of standard terms typically required by an institutional lender), (ii) loan-to-cost equal to 65%, and (iii) maximum interest rate of LIBOR + 325 BPS or the equivalent rate associated with SOFR (Secured Overnight Financing Rate) from a reputable construction lender.

(d) Extensions by the Successor Agency Executive Director. If Developer has been unable to perform an obligation listed in the Schedule of Performance on or prior to date that is ten (10) business days prior to the applicable date stated in the Schedule of Performance despite Developer's reasonable and diligent efforts to perform such obligation, then Developer may notify Successor Agency of Developer's impending Event of Default for a failure to meet a date stated in the Schedule of Performance and may request an extension of the applicable date in the Schedule of Performance. Such request shall specify the number of days of extension requested, provided that extensions shall be requested in not less than 60-day increments and shall not exceed an aggregate of six (6) months for a particular date in the Schedule of Performance. Not later than five (5) business days after receipt of such notice, Successor Agency shall approve or disapprove such request, which shall not be unreasonably withheld or conditioned. Additionally, the Successor Agency Executive Director may extend the time for Developers' performance of any term, covenant or conditions of this Agreement or permit the curing of any default upon such terms and conditions as the Successor Agency Executive Director determines appropriate, from time to time, without the necessity for further Commission action, so long as the cumulative extensions of any particular item do not exceed a total of twelve (12) months after the dates established in the original, unextended Schedule of Performance (or, if applicable, Schedule of Important Project Dates). Notwithstanding the fact that Sections 8.08(a)(i) or (ii) above are not satisfied, the Successor Agency Executive Director may, upon approval by the Commission, extend the time for Developers' performance of any term, covenant or conditions of this Agreement or permit the curing of any default upon such terms and conditions as Successor Agency Executive Director determines appropriate, from time to time; provided, however, that any such waiver or extension or permissive curing of any particular default shall not release any of Developers' obligations nor constitute a waiver of Successor Agency's rights with respect to any other term, covenant or condition of this Agreement or any other default in, or breach of, this Agreement.

8.09 Other Rights and Remedies

The rights and remedies provided to Successor Agency and Developer in this Article 8 are in addition to and not in derogation of other rights and remedies found in this Agreement and in the Grant Deed, but not set forth in this Article 8, but in no event shall (i) Successor Agency have any liability for money or to expend money except as provided in Section 8.06(e).

8.10 General

(a) Subject to the limitations thereon contained in this Agreement, either party may institute legal action to cure, correct or remedy any default, or to obtain any other remedy consistent with the terms of this Agreement. Such legal actions shall be instituted in the Superior Court of the City and

County of San Francisco, State of California, and any other appropriate court in that City and County or, if appropriate, in the Federal District Court in San Francisco, California.

(b) In the event that any legal action is commenced by Developer against Successor Agency, service of process on Successor Agency shall be made by any legal service upon the Executive Director of Successor Agency, or its counsel, or in such other manner as may be provided by law. In the event that any legal action is commenced by Successor Agency against either Developer, service of process on Developer, as applicable, shall be made by personal service at the address provided for Section 12.03 or at such other address as shall have been given to Successor Agency by either of the Developers pursuant to Section 12.03 of this Agreement, or in any other manner as may be provided by law, and shall be valid whether made within or without the State of California.

ARTICLE 9 - SPECIAL TERMS, COVENANTS AND CONDITIONS

9.01 Timing of Completion; Mid-Rise Affordable Project.

No Residential Condominium Unit shall be eligible for, and the Developer shall not request that the City issue, a Temporary Certificate of Occupancy ("**Temporary C of O**") if such Temporary C of O would be issued prior to the City's issuance of the Temporary C of O for the Mid-Rise Affordable Project.

9.02 Mitigation Measures

Developer agrees that the construction and subsequent operation of all or any part of the Improvements shall be implemented, and otherwise be in accordance with all applicable mitigation measures set forth in the Mitigation Monitoring and Reporting Program ("**MMRP**") set forth in the Addendum to the Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project Final Environmental Impact Statement/Environmental Impact Report dated June 13, 2022 and included as Attachment 21. Prior to the Construction Commencement Date, Developer shall submit a mitigation plan that identifies responsible parties for complying with the requirements of the MMRP and a point of contact responsible for monitoring compliance with the MMRP. After start of construction activities, Developer shall submit quarterly reports to Successor Agency staff documenting compliance with the MMRP. Prior to receiving the CFCO, the applicant shall submit to Successor Agency staff a final report summarizing compliance with the MMRP during construction, including the start and end dates and duration of each construction phase, and all other specific information required in the MMRP. Developers shall provide to the entity, or entities, specified in Attachment 21, any required reports detailing the mitigation measures implemented by Developers and/or their contractors at the Site during demolition and construction of the Improvements until Completion of Construction of the Improvements, and through operation of the Improvements as applicable. These mitigation measures shall be incorporated by Developers into any appropriate contract for the construction or operation of the Improvements.

9.03 Established Districts.

(a) Community Benefit District.

(i) The Site and the Improvements are subject to the East Cut Community Benefit District ("**CBD**"), which was authorized by the Board of Supervisors on July 31, 2015 by Resolution No. 299-15. The CBD will help fund activities and improvements such as community services and maintenance of public improvements in the Transbay Center District to benefit the properties in the CBD, including maintenance of the rooftop park on the Transit Center, for a period of fifteen (15) years.

(ii) If the Completion of Construction does not occur by the dates specified in the Schedule of Performance (as such dates may be extended for Force Majeure), then Developer shall pay the Delay of Construction CBD Fee (as defined below). The "**Delay of Construction CBD Fee**" shall be an amount equal to the estimated CBD assessment amount that otherwise would have been due to the Assessor-Recorder if construction had completed by the dates specified in the Schedule of Performance (as so extended). For the purpose of this Section 9.03(b)(ii)(a)(ii), the "**amount that otherwise would have been due**" shall be the amount that would have been due under the assessments set forth in the Greater Rincon Hill Community Benefit District Management Plan dated July 2015 ("**District Management Plan**"), calculated as if the Improvements were subject to the District Management Plan from, and after, the date of Completion of Construction specified in the Schedule of Performance until the Improvements are subject to the District Management Plan.

(iii) If Developer has the right to vote in the future on renewal of the CBD, or on an amendment to the District Management Plan that would require Developer to pay an increased assessment for the Site and the Improvements that does not exceed the "Fair Share of Costs" (as defined below) attributable to the Site and the Improvements then Developer shall cast its ballot in favor of the CBD. "Fair Share of Costs" shall be as required in Proposition 218, meaning a portion of the costs described in Section 9.03(a)(i) that reflects a fair and equitable allocation of such costs amongst properties within the zone of special benefit of the public improvements in the Transbay District.

(iv) Developer shall pay the Delay of Construction CBD Fee to the TJPA. Developer shall not receive a credit of any kind with the Assessor-Recorder for any payments made pursuant to this Section 9.03(a).

(v) Developer waives and releases any and all rights, claims, losses, injuries, costs, damages, or causes of action that it may have now or in the future to challenge the initial assessment rates of the CBD, provided that the CBD does not require Developer to pay an initial assessment that exceeds the rates stated in Section 9.03(a)(ii). This waiver and release is a general release. Developer is aware of California Civil Code Section 1542, which reads as follows:

> A GENERAL RELEASE DOES NOT EXTEND TO CLAIMS THAT THE CREDITOR OR RELEASING PARTY DOES NOT KNOW OR SUSPECT TO EXIST IN HIS OR HER FAVOR AT THE TIME OF EXECUTING THE RELEASE, AND THAT IF KNOWN BY HIM OR HER WOULD HAVE MATERIALLY AFFECTED HIS OR HER SETTLEMENT WITH THE DEBTOR OR RELEASED PARTY.
>
> TO GIVE FULL FORCE AND EFFECT TO THE ABOVE GENERAL RELEASE, DEVELOPER HEREBY EXPRESSLY, KNOWINGLY, AND VOLUNTARILY WAIVES ALL THE RIGHTS AND BENEFITS OF SECTION 1542 AND ANY OTHER SIMILAR LAW OF ANY JURISDICTION. BY PLACING ITS INITIALS BELOW, DEVELOPER SPECIFICALLY ACKNOWLEDGES AND CONFIRMS THE VALIDITY OF THE RELEASES MADE ABOVE AND THE FACT THAT DEVELOPER WAS REPRESENTED BY COUNSEL WHO EXPLAINED, AT THE TIME THIS AGREEMENT WAS MADE, THE CONSEQUENCES OF THE ABOVE RELEASES.
>
> _____
> Developer acknowledges the above general release.

(b) Mello-Roos Community Facilities District.

(i) The Improvements (other than the Mid-Rise Affordable Project) are subject to the provisions of the City and County of San Francisco Community Facilities District No. 2014-1 (Transbay Transit Center) ("**CFD**"), as described in the CFD Rate and Method of Apportionment ("**RMA**") attached hereto as Attachment 22. The CFD will help pay the costs of constructing the new Transbay Transit Center, the Downtown Rail Extension, and other infrastructure in the Transit Center District area.

(ii) Prior to and as a condition of Close of Escrow, Developer shall deposit with the Title Company a duly executed and acknowledged "Unanimous Approval of Annexation to a Community Facilities District and Related Matters" form in favor of annexing the Site into the CFD to be dated by the Title Company following recordation of the Grant Deed.

(iii) If the Completion of Construction does not occur by the dates specified in the Schedule of Performance (as such dates may be extended for Force Majeure), then Developer shall pay the Delay of Construction CFD Fee (as defined below). The "**Delay of Construction CFD Fee**" shall be an amount equal to the CFD special tax amount that otherwise would have been due to the Assessor-Recorder if construction had completed by the dates specified in the Schedule of Performance (as so extended) less any special CFD tax amounts actually assessed and paid by Developer. For the purpose of this Section 9.03(b)(iii), the "**amount that otherwise would have been due**" shall be the amount that would have been due under the special tax rates set forth in the RMA, calculated as if the applicable Improvements were subject to the RMA from, and after, the date of Completion of Construction specified in the Schedule of Performance until such Improvements are subject to the CFD.

(iv) Developer shall pay the Delay of Construction CFD Fee to the TJPA. Developer shall not receive a credit of any kind with the Assessor-Recorder for any payments made pursuant to this Section 9.03(b).

(v) Developer waives and releases any rights it may have now or in the future to challenge the legal validity of the CFD or any part of the CFD. This waiver and release is a general release. Developer is aware of California Civil Code Section 1542, which reads as follows:

> A GENERAL RELEASE DOES NOT EXTEND TO CLAIMS THAT THE CREDITOR OR RELEASING PARTY DOES NOT KNOW OR SUSPECT TO EXIST IN HIS OR HER FAVOR AT THE TIME OF EXECUTING THE RELEASE, AND THAT IF KNOWN BY HIM OR HER WOULD HAVE MATERIALLY AFFECTED HIS OR HER SETTLEMENT WITH THE DEBTOR OR RELEASED PARTY.
>
> TO GIVE FULL FORCE AND EFFECT TO THE ABOVE GENERAL RELEASE, DEVELOPER HEREBY EXPRESSLY, KNOWINGLY, AND VOLUNTARILY WAIVES ALL THE RIGHTS AND BENEFITS OF SECTION 1542 AND ANY OTHER SIMILAR LAW OF ANY JURISDICTION. BY PLACING ITS INITIALS BELOW, DEVELOPER SPECIFICALLY ACKNOWLEDGES AND CONFIRMS THE VALIDITY OF THE RELEASES MADE ABOVE AND THE FACT THAT DEVELOPER WAS REPRESENTED BY COUNSEL WHO EXPLAINED, AT THE TIME THIS AGREEMENT WAS MADE, THE CONSEQUENCES OF THE ABOVE RELEASES.

_____
Developer acknowledges the above general release

9.04 Affordable Housing Requirements

In addition to the requirements of Section 5.05, the following requirements shall specifically apply to the Affordable Housing Units:

(a) Affordable Housing in Project

The Project shall include no fewer than one hundred five (105) BMR units in the Tower Mixed-Income Rental Project, and no fewer than two hundred two (202) units (including one unrestricted manager's unit) in the Mid-Rise Affordable Project. The Affordable Housing Units will remain as affordable units at the initial level of affordability for the life of the Project consistent with Section 9.04(b) 9.04(b) and will be restricted by a recorded declaration in substantially the form of Attachment 19A (the "Declaration of Affordability Restrictions (Tower)") or Attachment 19B (the "**Declaration of Affordability Restrictions (Mid-Rise)**"), as applicable (and collectively or individually, as applicable, referred to herein as the "**Declaration of Affordability Restrictions**"). These Declarations shall (1) be in a first lien position and (2) not be subordinated to any lien or other encumbrance during the term of such restrictions.

(b) Level of Affordability

(i) Mid-Rise Affordable Project. With the exception of one (1) unrestricted manager's unit, all of the residential units in the Mid-Rise Affordable Project shall be BMR units and shall have a distribution of income restrictions such that the cumulative average income restrictions required of all units shall be at a level affordable to households earning on average, at initial occupancy, seventy-three percent (73%) or less of the Area Median Income as published annually by MOHCD for the City and County of San Francisco, derived in part from the income limits and median income determined by HUD for the HUD Metro Fair Market Rent Area that contains San Francisco, adjusted only for household size, but not high housing cost area ("**AMI**"). To achieve this average:

- 20 units or approximately ten percent (10%) shall be affordable to households earning no more than forty percent (40%) of AMI;
- 9 units or approximately four percent (4%) shall be affordable to households earning no more than forty-five percent (45%) of AMI (eight units at this income level must be one-bedroom units);
- 10 units or approximately five percent (5%) shall be affordable households earning no more than fifty percent (50%) of AMI (eight units at this income level must be one-bedroom units);
- 33 units or approximately sixteen percent (16%) shall be affordable to households earning no more than sixty percent (60%) of AMI;
- 39 units or approximately nineteen percent (19%) shall be affordable to households earning no more than seventy percent (70%) of AMI;
- 47 units or approximately twenty-three percent (23%) shall be affordable to households earning no more than eighty percent (80%) of AMI;
- 38 units or approximately nineteen percent (19%) shall be affordable to households earning no more than ninety percent (90%) of AMI;

- 5 units or approximately two percent (2%) shall be affordable to households earning no more than one hundred percent (100%) of AMI; provided, however, that in no event shall this tier of units exceed the then-applicable equivalent of 80% AMI, as published by the California Tax Credit Allocation Committee ("TCAC").

Notwithstanding the foregoing, Successor Agency shall allow for adjustments to the above AMI levels if either: (1) a market study provided by the Affordable Developer at the time a funding application is submitted to TCAC and/or at the start of the marketing and lease up period shows that the Mid-Rise Affordable Project rents are not at least ten percent (10%) below the then-market rate effective rents; or (2) the Mid-Rise Affordable Project's construction lender or tax credit investor requires changes due to the tax credit income averaging rules and regulations.

(ii) Tower Mixed-Income Rental Project. At least one hundred five (105) of the residential units within the Tower Mixed-Income Rental Project will be BMR units restricted for affordability at the following AMIs:

- 21 units or approximately twenty percent (20%) shall be affordable to households earning no more than one hundred percent (100%) of AMI;

- 22 units or approximately twenty percent (20%) shall be affordable to households earning no more than one hundred ten percent (110%) of AMI;

- 62 units or approximately sixty percent (60%) shall be affordable to households earning no more than one hundred twenty percent (120%) of AMI.

(iii) The affordability levels of the Mid-Rise Affordable Project units as set forth in this Section 9.04(b) shall be distributed among the unit types detailed in Section 9.04(c) below as proposed by Developer, provided that Successor Agency or its designee shall approve such distribution in its reasonable discretion. Successor Agency or its designee shall approve any material changes to this distribution, and shall not unreasonably withhold approval of changes necessary to comply with tax credit requirements in connection with project financing.

(c) Unit Size, Mix and Location

(i) Affordable Housing Unit Minimum Size. The Affordable Housing Units shall not be less than 400 net square feet for a studio unit, 525 net square feet for a one-bedroom unit, 800 net square feet for a two-bedroom unit, and 1,000 net square feet for a three-bedroom unit.

(ii) Mid-Rise Affordable Housing Unit Mix. Affordable Housing Units in the Mid-Rise Affordable Project shall include a mix of ten percent (10%) three-bedroom units, forty-three percent (43%) two-bedroom units, and thirty-seven percent (37%) one-bedroom units, and ten percent (10%) studio units.

(iii) Tower Mixed-Income Rental Project Affordable Housing Unit Mix. Affordable Housing Units in the Tower Mixed-Income Rental Project shall include a mix of eleven percent (11%) three-bedroom units, thirty-three percent (33%) two-bedroom units, forty-five percent (45%) one-bedroom units, and eleven percent (11%) studio units.

(iv) Tower Mixed-Income Rental Project Distribution. Affordable Housing Units in the Tower Mixed-Income Rental Project shall be distributed on Floors 2-20 (the lower two thirds of the Tower Mixed-Income Rental Project) of the Tower, explicitly as shown in Attachment 23. Successor Agency or its designee shall approve any changes to this distribution in writing.

(d) Comparability and Quality of Units

(i) Average Size and Appliance Comparability; Tower Mixed-Income Rental Project. The average size of Affordable Housing Units in the Tower Mixed-Income Rental Project shall be at least eighty percent (80%) of the average size of the same unit types in market-rate units in the Tower Mixed-Income Rental Project. The specific units and their square footages in satisfaction of this requirement are shown in Attachments 19a and 23. The categories of appliances installed in the Affordable Housing Units in the Tower Mixed-Income Rental Project shall match the categories of appliances installed in the market-rate units. For example, if the market-rate rental units have washer/dryer hook-ups, dishwashers, and refrigerators, then the Tower Project Affordable Housing Units shall have washer/dryer hook-ups, dishwashers, and refrigerators. In no event, however, must the appliances in the Affordable Housing Units be of the same or comparable brands as the appliances in the market-rate units.

(ii) Comparability of Interior Features; Affordable Housing Units. The interior features of the Affordable Housing Units in the Project need not be the same as or equivalent to those in the market-rate units, provided that they are of high quality, durable and are consistent with the then-current standards for new housing, and shall be as specified in Attachment 24, Comparability of Affordable Project Units, which details agreed-upon finishes and specifications for the Affordable Housing Units and which may be modified only by prior written approval by Successor Agency or its designee.

(e) Parking

(i) Required Parking Allocations. Parking for no less than one vehicle per every four units (or fraction thereof) within the Mid-Rise Affordable Project shall be made available to tenants of the Mid-Rise Affordable Project. Any vehicle parking made available to occupants of the Tower Mixed-Income Rental Project shall be made available to the tenants of the Affordable Housing Units at the same vehicle-to-unit ratio made available to the market-rate units in the Tower Mixed-Income Rental Project, as more particularly described in the Inclusionary Manual. Vehicle parking designated for Affordable Housing Units must remain designated for use by Affordable Housing Unit tenants for the life of the Project, subject to the limited exception pursuant to Section 9.04(e)(ii) below.

(ii) Affordable Housing Unit Parking Space Leasing and Rates. Parking shall be made available to residents of the Affordable Housing Units consistent with the Inclusionary Manual, as amended from time to time. The current rates are outlined below. Initial rates and thereafter parking pricing for subsequent re-rental shall adhere to the Inclusionary Manual. Increases following leasing of parking spaces to tenants of the Affordable Housing Units shall be according to the Inclusionary Manual. For the avoidance of doubt, except as expressly provided in the REA with respect to cost sharing, Affordable Housing Developer shall have no responsibility for the parking garage structure operation or maintenance and shall have no right to any revenue therefrom.

(i) For Affordable Housing Units designated at 80% AMI and below, the lesser of $100 per month or 80% of the Project's average monthly parking rate for market rate vehicle parking;

(ii) For Affordable Housing Units designated at 81% to 110% AMI, the lesser of $175 or 80% of the Project's average monthly parking rate for market rate vehicle parking;

(iii) For Affordable Housing Units designated at 111% -120% AMI, the lesser of $250 or 80% of the Project's average monthly parking rate for market rate vehicle parking.

(iii) Developer will follow procedures established in the Inclusionary Manual for offering and pricing leased parking to residents of Affordable Housing Units. Following initial lease-up, and if vehicle parking designated for Affordable Housing Units remain available and there are no Affordable Housing Unit tenants on a waitlist for vehicle parking, Developer may follow procedures established in the Inclusionary Manual to seek approval from MOHCD to lease vehicle parking rights at market rate on a month to-month basis until an Affordable Housing Unit tenant requests vehicle parking designated for use by tenants of Affordable Housing Units.

(f) Marketing and Occupancy Preferences

(i) The initial and subsequent leasing of all Affordable Housing Units will be subject to the marketing obligations described in Attachment 25, Marketing Obligations, which include occupancy preferences for, among others, Certificate of Preference ("**COP**") holders, Displaced Tenants, Neighborhood Residents, and other targeted populations; provided, however, that such preferences shall not be required to be provided to the extent that granting such preferences will cause the Mid-Rise Affordable Project or the Tower Mixed-Income Rental Project to be in violation of the Fair Housing Act, the requirements of the tax exempt bond law and regulations, the tax credit laws and regulations, and/or regulations for funding through the California Department of Housing and Community Development.

(ii) Certificate of Preference Program Targeting. Developer has prepared a strategy to maximize the number and success of COP holders in securing housing within the Affordable Housing Units ("**COP Enhanced Outreach Strategies**") attached hereto as Attachment 26. Developer shall incorporate the strategies described in Attachment 26 into the early outreach plans for the Mid-Rise Affordable Project and the Tower Mixed-Income Rental Project, as described in Section 9.04(f)(iii) below.

(iii) Early Outreach Plan. No later than thirty (30) days after the Commencement of Substantial Construction, Developer shall deliver for Successor Agency and MOHCD's review and approval early outreach plans for initial marketing of the Affordable Housing Units consistent with Attachment 25 and an early outreach plan for COP holders, inclusive of the strategies described in Attachment 26 (COP Enhanced Outreach Strategies). Developer shall provide a plan for the units in the Mid-Rise Affordable Project and a separate plan for BMR units within the Tower. Developer shall not start the outreach activities until the Successor Agency provides approval of the Early Outreach Plans.

(iv) Marketing Plans. At least nine (9) months prior to first Temporary C of O for a residential unit in the Mid-Rise Affordable Project and the Tower Mixed-Income Rental Project, respectively, Developer shall submit to Successor Agency and MOHCD for their review and approval marketing plans, including written tenant selection plans, for the initial and ongoing leasing of all Affordable Housing Units in accordance with Attachment 25. Developer shall provide a plan for the units in the Mid-Rise Affordable Project and a separate plan for BMR units within the Tower.

(g) Resident Services for the Mid-Rise Affordable Project. The following will be provided for residents within the Mid-Rise Affordable Project:

(i) The Mid-Rise Affordable Project shall be staffed at a ratio of one (1) full time resident services staff member for every one hundred (100) units.

(ii) The services staff will routinely evaluate and provide services that respond to the needs of resident households, including the unique needs of individuals, working families, families

with children, and seniors. Staff will help connect residents to existing services in the neighborhood, at nearby properties operated by the Affordable Developer or their affiliates, and throughout the City, as needed. Funding for services staff shall be provided through the operating budget of the Mid-Rise Affordable Project. The Developer and Affordable Developer will provide a complete resident services plan, that includes services staffing as well as other programs and positions, pursuant to the Schedule of Important Project Dates.

9.05 Mid-Rise Affordable Project Financing.

(a) Deliveries and Compliance. (i) The Developer and Affordable Developer will provide a draft and final development budget, table of sources and uses, and a 20-year operating budget for the Mid-Rise Affordable Project to Successor Agency prior to the Close of Escrow and as reasonably requested by Successor Agency staff to evaluate applications for state and local funding; (ii) Financing for the Mid-Rise Affordable Project must comply with the then-current MOHCD Underwriting Guidelines for multi-family housing projects.

(b) Successor Agency Loan. Upon the closing of Developer's construction financing (meaning closing of all financing evidenced pursuant to Section 2.08), and provided the Developer has paid the Affordable Housing Fee to Successor Agency and obtained all necessary approvals for the disbursement thereof, the Successor Agency shall provide the entirety of the Affordable Housing Fee through one affordable housing loan between the Successor Agency and the Affordable Developer ("**Successor Agency Loan**") to provide a subsidy of up to Forty Six Million Seven Hundred Forty Nine Thousand Nine Hundred Twenty Eight and 46/100 Dollars ($46,749,928.46) and subject to approval by the Citywide Affordable Housing Loan Committee.

(c) Additional Affordable Housing Subsidy. In addition to the Purchase Price, the Developer shall provide any additional subsidy required to complete the Mid-Rise Affordable Project and maintain its affordability in compliance with Section 9.04(b) above, after all non-Successor Agency funding sources available for affordable housing have been secured by the Affordable Developer. Other than the Successor Agency Loan, there will be no additional subsidy from the Successor Agency or MOHCD; neither the Successor Agency nor MOHCD shall be responsible for any cost over-runs associated with the Mid-Rise Affordable Project. Developers shall cooperate with the Successor Agency to seek Citywide Affordable Housing Loan Committee and Commission approval of the financing plan and the Successor Agency Loan, and shall attend any hearings related to these approvals.

(d) Tax Exempt Bond Financing. If the Developer and Affordable Developer utilize a bond financing structure for the Mid-Rise Affordable Project, bonds must be issued through MOHCD's Multifamily Securities Program. The Developer, with the assistance of the Affordable Developer, will work with Successor Agency staff to submit an application to the California Debt Limit Allocation Committee ("**CDLAC**") for an allocation of tax-exempt bond funding. Successor Agency shall take all actions necessary on its part with respect to preparing and filing the application for the allocation of tax-exempt bonds so that Developer shall at all times be in compliance with the Schedule of Performance. After an allocation is granted by CDLAC, MOHCD will have approximately 180-days from such allocation to issue the tax-exempt bonds. During the period after the allocation of bond volume cap and prior to the expiration of the approximate 180-day period, Developer, Affordable Developer, and Successor Agency staff will work with the Developer and Affordable Developer's counsel, Bond Counsel, a Financial Advisor, and the City Attorney to prepare bond documents which include: a City Regulatory Agreement; Indenture Agreement; and, a Borrower Loan Agreement in "substantially final form." The Board of Supervisors acting for and on behalf of the City, acting through MOHCD, shall adopt an inducement/reimbursement resolution and timely publish notice of and conduct a TEFRA Hearing approving the issuance of the tax exempt bonds and thereafter the City shall issue the bonds. Regardless of the financing structure, the Mid-

Rise Affordable Project will be subject to an affordability restriction, through the recording of a Declaration of Affordability Restriction, that will require the Affordable Housing Units within the Mid-Rise Affordable Project to remain as BMR units at the initial level of affordability (subject to the terms therein) for the life of the Project.

9.06 Streetscape Improvements

(a) Developer shall complete or cause to be completed the design and construction of the Streetscape Improvements, in compliance with the Redevelopment Requirements and all applicable State laws and City ordinances and regulations. Any costs incurred to complete the Streetscape Improvements, including the cost of relocating utilities, shall be the sole responsibility of Developer. As provided in Section 2.02, Developer's obligation under this Section 9.06, and as may be further made a condition of approval of the Permanent Subdivision of the Site, shall include the obligation to construct and thereafter to convey to the City all public improvements on or in the Tehama Parcel as described in the Scope of Development (the "**Tehama Street Public Improvements**"), and fee title to the Tehama Parcel. Developer shall be solely responsible for the costs of constructing the Tehama Street Public Improvements.

(b) For the life of the Project, Developer shall maintain or cause to be maintained the Streetscape Improvements in compliance with the Redevelopment Requirements and all applicable laws of the State of California and the Ordinances and Regulations of the City and County of San Francisco, with the exception of the Tehama Street Public Improvements which shall be maintained by the City as City right of way after the City's acceptance thereof.

9.07 Open Space and Amenities

(a) Developer shall complete or cause to be completed the design and construction of the Public Open Space, Project Open Space and Amenities in accordance with the requirements of this Agreement including the Scope of Development.

(b) Developer shall maintain (or cause to be maintained) the Public Open Space and shall make it available to members of the public for the life of the Project. Prior to and as a condition of its receipt of Certification of Completion, Developer shall ensure compliance with this obligation by executing and recording in the Official Records a declaration encumbering the Site substantially in the form of Attachment 29 (Form of Declaration of Open Space Restrictions and Covenant to Maintain).

(c) Developer shall maintain, or cause to be maintained, the Project Open Space and Amenities, and make them available to residents of the Project, each in accordance with the requirements of the Scope of Development, the Redevelopment Requirements, laws of the State of California and the Ordinances and Regulations of the City and County of San Francisco, and shall include said requirements in the REA or other recorded covenants, conditions and restrictions with respect to the Project.

(d) Ongoing operation and maintenance costs of the Public Open Space, Project Open Space and Amenities may be allocated between the Tower Market-Rate Condominium Project, the Tower Mixed-Income Rental Project and the Mid-Rise Affordable Project as described in Section 9.11, subject to approval by DRE.

(e) Storage spaces shall be unbundled from any specific condominium or rental unit, available at at-cost rates to all condominium and rental residents on a 24-hour and seven day per week basis, and offered on a proportional basis in terms of number of spaces between the market-rate and Affordable Housing Units. Storage spaces assigned to tenants of Affordable Housing Units shall be monitored by MOHCD consistent with the Inclusionary Manual, including but not limited to (i) ensuring that at-cost rates

for tenants of Affordable Housing Units dot not exceed the amounts specified in the Inclusionary Manual, and (ii) requiring that the Developer maintain a waitlist of tenants of Affordable Housing Units interested in storage spaces depending on availability.

9.08 Shared Parking Garage

(a) Developer shall complete or cause to be completed the design and construction of the Shared Parking Garage, an approximately 66,496 square foot underground garage. The Parties agree that all parking within the Shared Parking Garage shall be unbundled and that the Shared Parking Garage shall accommodate no more than 275 private vehicles valet-parked and/or parked via stackers, which shall include a minimum of two accessible car share vehicles (unless no car share operator exists in the San Francisco market), and a minimum of 556 secured bicycle parking spaces. The Developer shall operate and maintain (or cause to be operated and maintained) the Shared Parking Garage, consistent with the REA.

(b) The Developer shall be responsible for all costs associated with the design, construction, and operation of the Shared Parking Garage.

(c) Parking shall be unbundled, and shall be no more than one vehicle per residential unit (except to the extent additional spaces are made available pursuant to 9.04(e)(iii)), in accordance with the following criteria:

(i) One vehicle for every unit in the Tower Market-Rate Condominium Project;

(ii) One vehicle for every four units in the Mid-Rise Affordable Project; and

(iii) The remaining vehicle parking allocated proportionally between market-rate and Affordable Housing Units in the Tower Mixed-Income Rental Project.

(d) Bicycle spaces shall be allocated proportionately between the market-rate and the Affordable Housing Units in the Tower Project and Mid-Rise Affordable Project and shall be made available to tenants of Affordable Housing Units free of charge.

(e) The garage door shall remain open during the normal business hours, then operable via call button and/or key-fob after hours. No commuter parking shall be allowed.

9.09 Public Benefit and Community Serving Commercial Uses

(a) All of the ground floor commercial square footage within the Mid-Rise Affordable Project shall be leased, subject to Successor Agency approval, to users that qualify as a "**Community Serving Commercial Use**" or a "**Public Benefit Use**," as those terms are defined in the Mayor's Office of Housing and Community Development Commercial Space Underwriting Guidelines (Feb. 2, 2018) (Attachment 27), as amended from time to time, or that meet a comparable standard if MOHCD no longer publishes Commercial Space Underwriting Guidelines ("**Community Commercial Space**"). Qualifying uses under the MOHCD Commercial Guidelines include the following:

(i) "Community Serving Commercial Use" means a land use, typically retail or other sales and services use, that provides a direct benefit to the community, e.g. a food market with affordable and healthy produce and other goods, community banking, or other neighborhood serving uses that have a demonstrated benefit to the residents of the Project; and

(ii) "Public Benefit Use" means a land use, typically programs or services, that primarily benefits low-income persons, is implemented by one or more 501(c)(3) public benefit corporations, and has been identified by the City or community as a priority use. Examples include, but are not limited to, childcare centers, adult day health centers, nonprofit office space, public libraries, supportive services for the residents of the affordable housing development, health clinics that serve the local community at no or low cost, arts-related spaces that provide programs, and classes and/or exhibition spaces available to community members at no or low cost.

(b) The Community Commercial Space will be integrated into the Mid-Rise Affordable Project under the ownership of the Affordable Developer (or by affiliate of Affordable Developer or master lease structure from Affordable Developer to an affiliate of Mercy Housing California as the master tenant). Alternatively, Affordable Developer may seek to obtain a commercial space subdivision (the "**Commercial Subdivision**") to create a separate legal parcel for the Community Commercial Space, which would be transferred and owned by an affiliate of Mercy Housing California (the "**Commercial Subdivision Owner**"). Prior to establishing either a master lease or a Commercial Subdivision, Affordable Developer will seek Successor Agency approval of the applicable structure. Affordable Developer (or its affiliate or master tenant) or the Commercial Subdivision Owner, as applicable, will be responsible for operating and leasing the Community Commercial Space in accordance with the restrictions specified in this Section 9.09. Revenue generated from the leasing of the Community Commercial Space will be used to pay Community Commercial Space expenses including operating and leasing expenses, service approved debt (if applicable), fund expenses related to shared common operating expenses as established in the REA and/or common area maintenance agreements. Net revenue generated from the leasing of the Community Commercial Space, regardless of the structure (integration with the Mid-Rise Affordable Project, Commercial Subdivision, or master lease), will be used to fund reserves for future capital/tenant improvements for the benefit of the Community Commercial Space. If there is no subdivision, revenue and expenses related to the Community Commercial Space will be incorporated into the operating budget of the Mid-Rise Affordable Project. If the Mid-Rise Affordable Project includes financing from the California Department of Housing and Community Development ("**HCD**") and there is no subdivision, the Community Commercial Space within the Mid-Rise Affordable Project shall be subject to HCD requirements regarding commercial income.

(c) Declaration of Restrictions. Prior to commencement of the marketing process, if the Community Commercial Space is a separate commercial condominium then the Community Commercial Space will be restricted by a recorded Declaration in substantially the form of Attachment 28 (the "**Declaration of Restrictions for Community Commercial Space**"). The Declaration shall (1) be in a first lien position and (2) not be subordinated to any lien or other encumbrance during the term of such restrictions.

(d) Warm Shell Conditions. Developer shall provide the Community Commercial Space in "**Warm Shell**" condition as defined by the MOHCD Commercial Space Underwriting Guidelines (Attachment 27) as amended from time to time by MOHCD, by the date of temporary certificate of occupancy for the Mid-Rise Affordable Project.

9.10 Transfer Payment

(a) Subject to any applicable requirements of the California Department of Real Estate and California Civil Code section 1098, and prior to the sale of the first Residential Condominium Unit, Developer shall (i) record a declaration and notice applicable to all Condominium Units ("**Transfer Payment Covenant and Notice**") in the form of Attachment 20, requiring that the transfer of each Residential Condominium Unit shall be subject to a transfer payment equal to 0.5 percent of the market-

rate transfer price (the "**Transfer Payment**") (ii) demonstrate, to OCII's satisfaction, that the Transfer Payment Covenant and Notice is noticed and documented in satisfaction of applicable DRE regulations.

(b) Following the initial sale of the Residential Condominium Units by the Developer, each subsequent transfer of a Residential Condominium Unit shall be subject to the Transfer Payment, to be made prior to or commensurate with each and every subsequent transfer of each Residential Condominium Unit.

(c) The Transfer Payment funds shall be used by Successor Agency or its designee for maintenance and replacement costs of publicly accessible open space constructed adjacent to the Project. Developer and its successors and the future owners of all the Project shall have no right to challenge the appropriateness or the amount of any expenditure so long as it is used for maintenance uses.

(d) The provisions of this Section 9.10 shall survive the expiration or termination of this Agreement, and shall constitute covenants and benefits running with the land pursuant to applicable law, including but not limited to California Civil Code Section 1468. The Transfer Payment shall be disclosed in the DRE disclosure packages for the Project.

9.11 Review of Condominium Association Documents.

(a) Developer shall not submit any of the following to California Department of Real Estate ("**DRE**") for review and approval without providing Successor Agency an opportunity to review and approve: (i) reciprocal easement agreements, (ii) covenants, conditions and restrictions, (iii) Preliminary Public Report Applications; (iv) Conditional Public Report Applications; (v) Final Public report Applications; (vi) Bylaws and Articles of Incorporation, and (vii) budgets for the Master Association and Market-Rate Association, Master Budget. Prior to submitting revisions to any of the above for DRE approval, Developer shall submit same to Successor Agency for its review and approval for consistency with this Agreement. To the extent permitted by DRE, Developer shall list Successor Agency as an interested party to receive all correspondence to the materials submitted to subsections (i) through (iv) above. If not permitted by DRE, then Developer shall, within five (5) business days of receipt, provide to Successor Agency a complete copy of any and all correspondence received from DRE concerning the foregoing listed materials.

(b) Prior to the closing of Developer's construction financing for the Mid-Rise Affordable Project or effective date of the Air Rights Lease, whichever is sooner, Developers shall cause to be executed and recorded covenants, conditions and restrictions and reciprocal easements (collectively, the "**Reciprocal Easement Agreement**" or "**REA**") in forms prepared by Developers and approved by the Successor Agency in its reasonable discretion.

(c) OCII, in its capacity as owner of the Affordable Air Rights Parcel, shall be a consent signatory to the REA and shall be provided an opportunity to review and approve the REA as described herein.

(d) The REA shall address, among other things, the following:

(i) Use restrictions and access to open space, amenities, and common areas;

(ii) Maintenance obligations related to the Shared Parking Garage, Streetscape Improvements, Public Open Space, Project Open Space, common areas, and Amenities, among other things;

(iii) Shared expenses for shared maintenance areas between each component of the Project. Among others, expense allocations shall specifically describe Tower Mixed-Income Rental Project and, Tower Market-Rate Condominium Project, and Mid-Rise Affordable Project responsibility and expense sharing for property taxes and insurance for shared maintenance areas, which, for the Mid-Rise Affordable Project, shall escalate at a constant annual rate and which shall not include any future tax reassessments (whether due to a transfer of the Tower Mixed-Income Rental Project or Tower Market-Rate Condominium Project or otherwise), all as further set forth in the Reciprocal Easement Agreement;

(iv) If any Community Commercial Space does not directly connect to the rear or "back-of-house" corridor of the applicable building for direct access to certain services provided through the rear or "back-of-house" corridor of such building to other Commercial Units, such as trash collection or curb delivery service, the means for the provision of such services to that Community Commercial Space, at no additional cost to the affected Community Commercial Space;

(v) Easements;

(vi) The allocation of vehicle spaces within the Shared Parking Garage;

(vii) Membership in the owners' association and association assessments;

(viii) A methodology to reach agreement about any shared expense increases other than inflationary increases among the Mid-Rise Affordable Project ownership, Tower Mixed-Income Rental Project ownership, and the Tower Market-Rate Condominium Project ownership association; and

(ix) Transfer Payment requirements, among other things.

9.12 Liquidated Damages.

The Delay in Construction Tax Increment Fee, Delay in Construction CBD Fee, and Delay in Construction CFD Fee (collectively "**Delay Fees**") shall be paid, if due, as liquidated damages to compensate the TJPA and Successor Agency. The Parties agree that, considering all the circumstances on the date of this Agreement, the actual damages suffered by the TJPA and Successor Agency in the event that Completion of Construction fails to timely occur would be difficult or impracticable to determine, and that the Delay Fees are a reasonable estimate of the damages that the TJPA and Successor Agency would incur in such event.

9.13 TJPA Third Party Beneficiary.

The TJPA is an intended third party beneficiary of Sections 4.11, 9.03(a)(ii) and (iv), and 9.03(b)(iii) and (iv) (and those Sections only) with the right to enforce the terms and provisions of those Sections (and those Sections only).

ARTICLE 10 - SUCCESSOR AGENCY EQUAL OPPORTUNITY PROGRAM

Developers will comply with Successor Agency's Equal Opportunity Program, as described in this Article 10 and in Attachment 17, and will submit all documents required pursuant to the policies included in Attachment 17 ("**Equal Opportunity Program**") in accordance with the timeframes specified therein.

10.01 Non-Discrimination

Non-Discrimination in Benefits. Developers do not as of the date of this Agreement and will not during the term of this Agreement, in any of their operations in San Francisco or with respect to their operations under this Agreement (i.e., providing services related to the Development project) elsewhere in the United States discriminate in the provision of bereavement leave, family medical leave, health benefits, membership or membership discounts, moving expenses, pension and retirement benefits or travel benefits (collectively "**Core Benefits**") as well as any benefits other than the Core Benefits between employees with domestic partners and employees with spouses, and/or between the domestic partners and spouses of such employees, where the domestic partnership had been registered with a governmental entity pursuant to state or local law authorizing such registration, subject to the conditions set forth in Successor Agency's Non-Discrimination in Contracts and Benefits Policy, adopted September 9, 1997, as amended February 4, 1998 and as set forth in Attachment 17.

10.02 Compliance with Minimum Compensation Policy and Health Care Accountability Policy

(a) Successor Agency finds that it has a significant proprietary interest in the Site that is being transferred to Developer, pursuant to this Agreement. Developers will comply with the applicable provisions of Successor Agency's Minimum Compensation Policy ("**MCP**"), Attachment 17, and Health Care Accountability Policy ("**HCAP**"), Attachment 17, adopted by Agency Resolution No. 168-2001 on September 25, 2001, as these policies may be amended from time to time (jointly, "**Policies**"). The requirements of the Policies include the following:

(i) the payment of the "Minimum Compensation" specified in MCP Section 3 to all "Covered Employees," as defined under MCP Section 2.7, who work on the Improvements, who are employed by Developer or any of its subcontractors who enter into an "Included Subcontract" (as defined in Attachment 17).

(ii) the payment of one of the health care benefit options described in HCAP Section 3 as to all "Covered Employees," as defined under HCAP Section 2.7, who work on the Project, who are employed by Developer or any of its subcontractors who enter into an "Included Subcontract" (as defined in Attachment 17).

10.03 Small Business Enterprise and Workforce Agreements

(a) Developers and Successor Agency acknowledge that the Improvements and the Project will create employment opportunities at all levels, including opportunities for qualified economically disadvantaged small business enterprises, qualified economically disadvantaged Project Area residents and San Francisco residents. In recognition of these opportunities, Developer shall develop and implement the Small Business Enterprise Agreement described in Attachment 17, and the Construction Workforce Agreement described in Attachment 17.

(i) Successor Agency shall rely on the Office of Economic and Workforce Development - CityBuild ("**CityBuild**") to implement the Construction Workforce Agreement described in Attachment 17, the First Source Hiring Agreement described in Attachment 17, and the Trainee Hiring Goal in the Small Business Enterprise Agreement described in Attachment 17; accordingly, within thirty (30) days after the Effective Date of this Agreement, Developer shall execute an agreement with CityBuild to fund CityBuild's staff costs for such services, up to a maximum of Two Hundred Fourteen Thousand Nine Hundred Fifty Dollars ($214,950) of staff costs for every Five Hundred Million Dollars ($500,000,000) in total Project costs.

10.04 Prevailing Wages (Labor Standards)

(a) Developers agree to pay or cause to be paid prevailing rates of wages in accordance with the requirements set forth in Attachment 17 for construction work done at the Site and Tehama Parcel prior to the issuance of the City's Final Certificate of Occupancy.

10.05 SBE Mentoring and Capacity Building Program

(a) Developer shall finance and, in consultation with the Successor Agency and the Developer's General Contractor, implement a Mentoring and Capacity Building Program ("**Mentoring Program**") specific to the Scope of Development. The program will provide SBE's with directed coaching, educational input, and mentoring from industry experts complementary to the Successor Agency's existing SBE Policy goals in order to build small business capacity. Specific efforts will be made to break up scopes of work to enhance SBE participation.

(b) Program initiatives will consist of:

(i) Providing One Hundred Thousand Dollars ($100,000) to the Successor Agency for the purpose of conducting a study on the availability, capacity and needs assessment of local SBE contractors to perform on large construction projects, such as the Project. Developer shall provide payment to the Successor Agency or its designee within thirty (30) days after the Effective Date of this Agreement. The Successor Agency will endeavor to complete the study within nine months of the Effective Date of this Agreement, after which the study's findings will be used to inform the Successor Agency, Developers, and Developers' general contractor about their ability to meet the Successor Agency's SBE goal, the level of SBE participation if less than fifty percent, and the means to obtain SBE participation;

(ii) Providing financial assistance by Developer of Twenty-Five Thousand Dollars ($25,000) per year for three (3) years to the City's Contractor Development Program, or an existing training/ technical assistance program acceptable to the Successor Agency, to assist local SBE contractors to compete and perform work on the Improvements. The Developer shall provide payment for the initial year within thirty (30) days after the Effective Date of this Agreement and annually thereafter;

(iii) Implementation by Developer of a General Contractor selection criteria to ensure General Contractor participation in the City's Mentor-Protégé program (https://sfgov.org/cmd/cmd-mentor-protege-program-1), or an equivalent program acceptable to the Successor Agency. The Developer shall provide the selection criteria to the Successor Agency for its review and acknowledgement prior to the Developer's efforts to solicit a General Contractor;

(iv) Developer shall encourage first-tier non-SBE subcontractors to participate in the City's Mentor-Protégé program or similar teaming relationships with SBEs; and

(v) Developer shall work cooperatively with the Successor Agency and ensure best faith efforts are exercised by the General Contractor and its first-tier subcontractors to break up scopes of work for lower-tier small business participation.

ARTICLE 11 - INDEMNITY

11.01 Developer Indemnification

Developer shall indemnify, defend, and hold harmless the Successor Agency, the City, the TJPA and their respective members, officers, agents and employees ("**Indemnified Parties**") from and

against any losses, costs, claims, damages, liabilities and causes of action (including reasonable attorney's fees and court costs) arising out of this Agreement, including with respect to any challenge to the entitlement of Developer to undertake the program described in the Scope of Development, or in any way related to the death of or injury to any person or damage to any property occurring on or adjacent to the Site and directly or indirectly caused by any acts done thereon or any acts or omissions of Developer and their agents, employees or contractors; provided, however, that the foregoing indemnity shall not apply to any losses, costs, claims, damages, liabilities or causes of action (including reasonable attorneys' fees and court costs) to the extent the same arise out of (i) the gross negligence or willful misconduct of the Indemnified Party seeking to be indemnified, or (ii) the breach under this Agreement of an obligation of the Indemnified Party seeking to be indemnified, provided that the Successor Agency may require that the Developer defend the Indemnitee Parties against claims pursuant to this Section until it is established that such claims are not subject to this indemnity requirement so long as provided, the Indemnified Party (or Parties) shall reimburse the Developer such defense costs in proportion to the degree of the negligence or fault of such Indemnified Party (or Parties).

11.02 Affordable Developer Indemnification

Affordable Developer shall indemnify, defend, and hold harmless the Indemnified Parties from and against any losses, costs, claims, damages, liabilities and causes of action (including reasonable attorney's fees and court costs) arising out Affordable Developer's obligations under this Agreement or in any way related to the death of or injury to any person or damage to any property occurring on or adjacent to the Site and directly or indirectly caused by any acts done thereon or any acts or omissions of Affordable Developer and their agents, employees or contractors; provided, however, that the foregoing indemnity shall not apply to any losses, costs, claims, damages, liabilities or causes of action (including reasonable attorneys' fees and court costs) to the extent the same arise out of (i) the gross negligence or willful misconduct of the Indemnified Party seeking to be indemnified, or (ii) the breach under this Agreement of an obligation of the Indemnified Party seeking to be indemnified, provided that the Successor Agency may require that the Affordable Developer defend the Indemnitee Parties against claims pursuant to this Section until it is established that such claims are not subject to this indemnity requirement (so long as provided, the Indemnified Party (or Parties) shall reimburse the Affordable Developer such defense costs in proportion to the degree of the negligence or fault of such Indemnified Party (or Parties).

11.03 Survival

The obligation of Developer, Affordable Developer, or both, under this Article 11 shall survive Successor Agency's recordation of the Certificate of Completion as to any acts or omissions occurring prior to such recordation.

ARTICLE 12 - GENERAL PROVISIONS

12.01 Successor Agency Costs

The Developer shall be responsible for paying any costs associated with this transaction and the Improvements until the Certificate of Completion, as defined in Section 4.13, is recorded, either directly or through reimbursement of any related Successor Agency costs, including, but not limited to, Successor Agency's legal counsel to represent Successor Agency, staffing costs, and third party costs including, but not limited to, title report costs, title insurance premiums and endorsement charges, escrow fees, surveys, environmental review, parcel mapping, lot line adjustments, quiet title actions, permits, inspections, and costs on all matters related to the negotiation and implementation of this Agreement ("**Successor Agency Costs**"). The Successor Agency shall submit quarterly invoices for such costs and Developer shall reimburse Successor Agency for its costs within forty-five (45) days of receiving Successor

Agency invoices. If the Developer fails to pay such invoices with such forty-five (45) day period, then such event will be considered an Event of Default under this Agreement.

12.02 Provisions with Respect to Time Generally

All references in this Agreement to time limitations, including those in the Schedule of Performance and Schedule of Important Project Dates, shall mean such time limitations as they may be extended pursuant to the terms of this Agreement.

12.03 Notices

Any notice, demand or other communication required or permitted to be given under this Agreement by either party to the other party shall be sufficiently given or delivered if transmitted by (i) certified United States mail, postage prepaid, (ii) personal delivery, or (iii) nationally recognized private courier services, in every case addressed as follows:

If to Successor Agency:	Successor Agency to the Redevelopment Agency of the City and County of San Francisco One South Van Ness Avenue, Fifth Floor San Francisco, California 94103 Attention: Executive Director
With copy to:	San Francisco Mayor's Office of Housing and Community Development One South Van Ness Avenue, Fifth Floor San Francisco, California 94103 Attention: Director
If to Affordable Developer:	Mercy Housing California 1256 Market Street San Francisco, CA 94102 Telephone: (415) 355-7100
If to Developer:	F4 Transbay Partners, LLC c/o Hines 101 California Street, Suite 1000 San Francisco, CA 94111 Attn: Cameron Falconer Telephone: (415) 982-6200
With copies to:	Charles J. Higley Farella Braun & Martel LLP Russ Building 235 Montgomery Street 17th Floor San Francisco, CA 94104 Telephone: (415) 954-4902

Any such notice, demand or other communication transmitted by certified United States mail, postage prepaid, shall be deemed to have been received seventy-two (72) hours after mailing (unless

it is never delivered), and any notice, demand or other communication transmitted by personal delivery, or nationally recognized private courier service shall be deemed to have been given when received by the recipient. Any party may change its address for notices under this Section 12.03 by written notice given to the other party in accordance with the provisions hereof.

12.04 Time of Performance

(a) All dates for performance (including cure) shall expire at 5:00 p.m. (San Francisco, California time) on the performance or cure date.

(b) A performance date which falls on a Saturday, Sunday or Successor Agency or national holiday is automatically extended to the next day which is not a Saturday, Sunday or Successor Agency or national holiday.

(c) Unless otherwise specified, whenever an action is required in response to a submission, request or other communication, the responding party shall respond within fifteen (15) business days.

(d) Time is of the essence with respect to each provision of this Agreement, including each milestone set forth in this Agreement, but subject to all express extension, notice and cure rights in this Agreement.

12.05 Attachments/Recitals

All attachments and recitals to this Agreement are hereby incorporated herein and made a part hereof as if set forth in full.

12.06 Non-Merger in Deed

None of the provisions of this Agreement are intended to, or shall be, merged by reason of any deed transferring title to the Site from Successor Agency to Developer or any successor in interest, and any such deed shall not be deemed to affect or impair the provisions and covenants of this Agreement.

12.07 Headings

Any titles of the several parts and sections of this Agreement are inserted for convenience of reference only and shall be disregarded in construing or interpreting any of its provisions. The terms "Paragraph" and "Section" may be used interchangeably.

12.08 Successors and Assigns

This Agreement shall be binding upon and, subject to the provisions of Article 6, shall inure to the benefit of, the successors and assigns of Successor Agency, Developer, Affordable Developer, and any Mortgagee and where the term "Developer", "Affordable Developer", "Successor Agency" or "Mortgagee" is used in this Agreement, it shall mean and include their respective successors and assigns, including as to any Mortgagee, any transferee of such Mortgagee or any successor or assign of such transferee, whether or not the terms "successors and assigns" are used in conjunction therewith, except where the Agreement expressly provides that successors and assigns are not so included.

12.09 Counterparts/Formal Amendment Required

(a) This Agreement may be executed in counterparts, each of which shall be deemed to be an original, and all such counterparts shall constitute one and the same instrument.

(b) This Agreement integrates all of the terms and conditions mentioned herein or incidental hereto and supersedes all negotiations or previous agreements between the parties with respect to all or any part of the subject matter hereof.

(c) Any modifications or waiver of any provisions of this Agreement or any amendment thereto shall be done in accordance with the provisions of this Agreement, and shall be made in writing and signed by a person or persons having authority to do so, on behalf of both Successor Agency and Developer.

12.10 Authority of Parties

Successor Agency and Developer each represent and warrant to the other party that this Agreement and all documents and delivered at Close of Escrow: (a) are, or at the time of Close of Escrow will be, duly authorized, executed and delivered by that party; (b) are, or at the time of Close of Escrow will be, legal, valid and binding obligations of that party; and (c) do not, and at the time of Close of Escrow will not, violate any provision of any agreement or judicial order to which that party is a party or to which that party is subject. Notwithstanding anything to the contrary in this Agreement, the foregoing representations and warranties and any and all other representations and warranties of the parties contained herein or in other agreements or documents executed by the parties in connection herewith, shall survive the Close of Escrow.

12.11 Governing Law

This Agreement shall be governed by, and construed and enforced in accordance with, the laws of the State of California.

12.12 Recordation

Title Company shall cause this Agreement to be recorded in the Official Records at Close of Escrow.

12.13 Estoppels

At the request of any party, the other Parties, within ten (10) days following such request, shall execute and deliver to the requesting Party a written statement in which such other Parties shall certify that this Agreement is in full force and effect; that this Agreement has not been modified or amended (or stating all such modifications and amendments); that no Party is in default under this Agreement (or setting forth any such defaults); that there are not then existing set-offs or defenses against the enforcement of any right or remedy of any Party, or any duty or obligation of the certifying Parties (or setting forth any such set-offs or defenses); and as to such other matters relating to this Agreement as the requesting Party shall reasonably request.

12.14 Attorneys' Fees

In the event that any Party brings a legal action to enforce rights under this Agreement against any other Party, the prevailing Party in any such proceeding will be entitled to recover its reasonable attorneys' fees and costs of the proceeding.

12.15 Further Assurances

Each party agrees to execute and deliver to the other party such additional documents and instruments as the other party reasonably may request in order to fully carry out the purposes and intent of this Agreement.

12.16 No Personal Liability

(a) No member, official or employee of Successor Agency or the City shall be personally liable to Developer or any successor in interest in the event of any default or breach by Successor Agency or for any amount which may become due to Developer or successor or on any obligations under the terms of this Agreement.

(b) No officer, director, member, employee, agent or shareholder of Developer or Affordable Developer shall be personally liable for the performance of Developer's obligations under this Agreement, and neither Successor Agency nor any of its successors and assigns shall seek recourse for enforcement or satisfaction of this Agreement against any general or limited partner, officer, director, member, employee, agent or shareholder of Developer or Affordable Developer. No personal judgment shall be sought or obtained against any of the foregoing in connection with this Agreement. Neither Developer, Affordable Developer nor any of the foregoing parties shall in any circumstance be liable for any consequential damages of any kind or nature.

12.17 Effective Date

The effective date of this Agreement (the "**Effective Date**") and the parties' rights and obligations hereunder shall be the date on which the Plan Amendment becomes effective. Successor Agency shall insert such date into the appropriate locations in this Agreement, but the failure to do so shall not in any way affect the enforceability of this Agreement.

ARTICLE 13 - REFERENCES AND DEFINITIONS

Terms are defined in this Article 13 or have the meanings given them when first defined.

2008 Option Agreement is defined in Recital G.

Additional Purchase Payment is defined in Section 1.01(b).

Affordable Air Rights Parcel is defined in Recital W.

Affordable Developer is defined in Preamble.

Affordable Housing Fee means the $46,749,928.46 to be paid by Developer to the Successor Agency upon the satisfaction of certain conditions specified in the Parcel F development agreement approved by City Ordinance No. 0042-21, to fund the Successor Agency's obligation to fulfill the Transbay Affordable Housing Obligation.

Affordable Housing Units means income-restricted units in the Tower Mixed-Income Rental Project and the Mid-Rise Affordable Project and is defined in Recital U.

Agreement means this Disposition and Development Agreement.

Amenities mean those things described in items I.A.1.d, I.A.2.f and g, I.B.4 and I.B.5 in Attachment 4 (Scope of Development).

AMI is defined in Section 9.04(b)(i).

Air Rights Lease is defined in Recital X and the form is attached at Attachment 12.

Amount that otherwise would have been due is defined in Section 9.03(b)(ii)9.03(a)9.03(a)(ii) and Section 9.03(b)(iii).

Approved Title Conditions is defined in Section 2.04(a) and specified in Attachment 8, Approved Title Conditions.

Associated Documents is defined in Section 8.04.

Block 4 is defined in Recital M.

Block 4 Option Agreement is defined in Recital R.

BMR means below market rate and is defined in Recital S.

Board of Supervisors means the Board of Supervisors of the City and County of San Francisco and is defined in Recital B.

Bona Fide Institutional Lender means any one or more of, a bank, savings and loan association or savings bank, commercial bank, pension fund, real estate investment trust, investment bank, insurance company, trust company, equity fund, commercial credit corporation, pension plan, pension fund or pension advisory firm or governmental agency, in each case, who customarily makes loans of the type contemplated for the construction of the Improvements and/or permanent financing for the Project and who have in place standard construction disbursement and monitoring systems reasonably satisfactory to Successor Agency.

Budget is defined in Section 2.08(a).

Buyer's Inclusionary Obligation is defined in Recital S.

CDLAC means the California Debt Limit Allocation Committee and is defined in Section 9.05(d).

Caltrans is the California Department of Transportation and is defined in Recital G.

Caltrans Power of Termination is defined in Recital M.

CBD means the Greater Rincon Hill Community Benefit District authorized by the Board of Supervisors on July 31, 2015 by Resolution No. 299-15 and is defined in Section 9.03(a).

CFCO means DBI's Final Certificate of Occupancy for the Improvements and is defined in Section 4.13(a).

CFD means the City and County of San Francisco Transbay Center District Plan Mello-Roos Community Facilities District No. 2014-1 and is defined in Section 9.03(b)(i).

Certificate of Completion is defined in Section 4.13.

Change in the Improvements is defined in Section 5.07.

City means the City and County of San Francisco and is defined in Recital E.

CityBuild means the Office of Economic and Workforce Development – CityBuild and is defined in Section 10.03(a)(i).

Close of Escrow means the consummation of the sale of property contemplated herein in accordance with escrow instructions provided by Developer and Successor Agency and is defined in Section 2.03(a).

Commencement of Substantial Construction is defined in Section 4.08(b).

Commercial Subdivision is defined in Section 9.09(b).

Commercial Subdivision Owner is defined in Section 9.09(b).

Commercial Units have the meaning set out in Recital U.

Commercially Reasonable Terms is defined in Section 8.08(c).

Commission means the Successor Agency Commission, commonly known as the Commission on Community Investment and Infrastructure, the legislative body of the Successor Agency and is defined in Recital H.

Community Commercial Space is defined in Section 9.09(a).

Community Serving Commercial Use is defined in Section 9.09(a) and the MOHCD Commercial Space Underwriting Guidelines Attachment 27.

Completion of Construction means the date on which Successor Agency issues the Certificate of Completion and is defined in Section 4.13(c).

Construction Commencement Date is defined in Section 4.08(a).

Construction Contract is defined in Section 2.08(f).

Cooperative Agreement is defined in Recital G.

COP means Certificate of Preference and is defined in Section 9.04(f)(i).

COP Enhanced Outreach Strategies is defined in 9.04(f)(ii) and Attachment 26.

Core Benefits is defined in Section 10.01.

DBI means the City's Department of Building Inspection and is defined in Section 4.08(b).

DCDG is defined in Recital C.

Declaration of Affordability Restrictions is defined in Section 9.04(a), and collectively or individually, as applicable, references the Declaration of Affordability Restrictions (Tower) in the form attached as Attachment 19A and the Declaration of Affordability Restrictions (Mid-Rise) in the form attached as Attachment 19B.

Declaration of Restrictions for Community Commercial Space is defined in Section 9.09(c).

Declaration of Site Restrictions is defined in Section 2.04(f) and substantially in the form of Attachment 11.

Delay Fees is defined in Section 9.12.

Delayed Party is defined in Section 8.08(a)(i).

Delay of Construction CBD Fee is defined in Section 9.03(a)(ii).

Delay of Construction CFD Fee is defined in Section 9.03(b)(iii)

Delay of Construction Tax Increment Fee is defined in Section 4.11(a).

Developer means F4 Transbay Partners LLC, a Delaware limited liability company.

Developers means both Developer and Affordable Developer.

Developer Affiliate is defined in Section 6.02(a).

Developer Conditions are defined in Section 2.07(a).

Developer's Quitclaim Deed is defined in Section 8.03(a)(ii).

Development Controls is defined in Recital C.

Development Controls Amendment is defined in Recital T.

Development Program is attached as Attachment 5 and defined in Recital W.

District Management Plan is defined in Section 9.03(a)(ii).

DOC (or **Determination of Completeness**) is defined in Section 4.13(a).

DOF means the State of California Department of Finance and is defined in Recital I.

DRDAP means the Design Review and Document Approvals as defined in Section 4.03(c) and set forth in Attachment 15.

DRE means the California Department of Real Estate and is defined in Section 9.11(a).

Effective Date is defined in Section 12.17.

Environmental Law is defined in Section 3.02(c).

Equal Opportunity Program is defined in Article 10 and set forth in Attachment 17.

Escrow is defined in Section 2.02.

Estimated Tax is defined in Section 4.11(b).

Estimation Process is defined in Section 4.11(b).

Event of Default is defined in Section 8.01 (with respect to Developer) and Section 8.02 (with respect to Affordable Developer).

Evidence of Financing and Project Commitments is defined in Section 2.08.

Exterior is defined in Section 5.07.

Financing Commitment is defined in Section 2.08(d).

Financing Plan is defined in Section 2.08(b).

First Extended Closing Date is defined in Section 8.08(b)(i).

Force Majeure is defined in Section 8.08(a)(i).

Former Agency means the Redevelopment Agency of the City and County of San Francisco and is defined in Recital A.

Good Faith Deposit is defined in Section 1.02.

Grant Deed is defined in Section 2.04(e), the form of which is shown in Attachment 10.

Hazardous Substance is defined in Section 3.02(c).

Hazardous Materials Indemnified Party(ies) is defined in Section 3.02(a).

HCAP means the Health Care Accountability Policy as defined in Section 10.02(a) and set forth in Attachment 17.

HCD is defined in Section 9.09(b).

Implementation Agreement means the Transbay Redevelopment Project Implementation Agreement as further defined in Recital G.

Improvements are generally described in Recital U and more particularly defined by Attachment 4, Scope of Development.

Inclusionary Manual means the MOHCD Inclusionary Affordable Housing Program Monitoring and Procedures Manual, as amended from time to time (or, if in the future the Inclusionary Manual is no longer published, an equivalent policy document).

Indemnified Parties is defined in Section 11.01.

LEED is defined in Recital W.

MCP means Minimum Compensation Policy as defined in Section 10.02(a) and set forth in Attachment 17.

Mentoring Program is defined in Section 10.05(a).

Mercy is the Affordable Developer.

Mid-Rise Affordable Project is generally described in Recital U and more particularly defined in Attachment 4, Scope of Development.

MMRP is defined in Section 9.02.

MOHCD means the Mayor's Office of Housing and Community Development and is defined in Recital X.

Mortgage is defined in Section **Error! Reference source not found.**.

Mortgagee is defined in Section **Error! Reference source not found.**.

Net Tax Increment is defined in Recital J.

Neutral Expert is defined in Section 4.11(b)(ii).

Official Records means the Office of the Recorder of the City and County of San Francisco and is defined in Recital B.

Outside Date for Close of Escrow is defined in Section 2.03(b) and specified in Attachment 7, Schedule of Performance.

Parcel F is defined in Recital P.

Parcel F PSA is defined in Recital P.

Parties means the Successor Agency, the Developer, and the Affordable Developer.

Party Experts is defined in Section 4.11(b)(ii).

PCBs is defined in Section 3.02(c).

Permanent Subdivision of the Site is defined in Recital W.

Permit to Enter is defined in Section 2.06(b).

PIA means public improvement agreement and is defined in Recital Y.

Plan Amendment is defined in Recital T.

Pledge Agreement is defined in Recital E.

PMP means the Successor Agency's Long-Range Property Management Plan and is defined in Recital BB.

Policies means the MCP and HCAP and is defined in Section 10.02(a).

Project is defined in Section 4.13(c).

Project Approval Documents are defined in Attachment 15, DRDAP.

Project Area is defined in Recital A and means the Transbay Redevelopment Project Area.

Project Area Declaration of Restrictions is defined in Recital D.

Project Open Space means all portions of open space provided within the Tower Project or the Mid-Rise Affordable Project.

Public Benefit Use is defined in Section 9.09(a) and the MOHCD Commercial Space Underwriting Guidelines Attachment 27.

Public Open Space is defined in Attachment 4, Scope of Development Section I.D.

Purchase Price is defined in Section 1.01(a).

Qualified Replacement Development Manager is defined in Section 6.02(b)(i).

Reciprocal Easement Agreement or **REA** is defined in Section 9.11(b).

Redevelopment Dissolution Law means AB 26 and AB 1414, as amended from time to time, and is defined in Recital H.

Redevelopment Plan is defined in Recital B.

Redevelopment Requirements are defined in Section 4.04.

Regulatory Agency is defined in Section 4.11.

Release is defined in Section 3.01(d).

Residential Condominium Unit means an individual residential condominium unit or townhouse created within the Tower Market-Rate Condominium Project.

RMA means the CFD Rate and Method of Apportionment as defined in Section 9.03(b)(i) and set forth in Attachment 22.

Schedule of Important Project Dates is attached as Attachment 6. Whenever used in this Agreement, "Schedule of Important Project Dates" shall mean the date(s) specified in the Schedule of Important Project Dates attached hereto as of the Effective Date *plus* any applicable extensions provided in accordance with the provisions of this Agreement (per Section 12.02).

Schedule of Performance is attached as Attachment 7. Whenever used in this Agreement, 'Schedule of Performance' shall mean the date(s) specified in the Schedule of Performance attached hereto as of the Effective Date *plus* any applicable extensions provided in accordance with the provisions of this Agreement (per Section 12.02).

Schematic Design Documents is defined in Section 2.07(a)(vi)

Scope of Development is defined in Recital U and attached as Attachment 4.

Shared Parking Garage has the meaning set out in Recital U

Site is defined in Recital M.

Site Legal Description is attached as Attachment 2.

State means the State of California and is defined in Recital E.

Streetscape Improvements are defined in the Scope of Development.

Streetscape Plan means the Transbay Redevelopment Project Area Streetscape and Open Space Concept Plan.

Successor Agency means the Successor Agency to the Redevelopment Agency of the City and County of San Francisco, a public body organized and existing under the laws of the State of California.

Successor Agency Approval is defined in Section 6.02(a).

Successor Agency Conditions are defined in Section 2.07(b).

Successor Agency Costs is defined in Section 12.01.

Successor Agency Loan is defined in Section 9.05(b).

Successor Agency Power of Termination is defined in Section 8.03(a)(ii).

TIFIA is defined in Recital J.

TIFIA Loan is defined in Recital J.

TJPA means the Transbay Joint Powers Authority and is defined in Recital E.

TJPA Bonds is defined in Recital J.

TJPA Bonds Final Maturity Date is defined in Section 5.09(c).

Tehama Parcel is defined in Recital M**.**

Tehama Street Public Improvements is defined in Section 9.06(a)

Temporary C of O is defined in Section 9.01.

Temporary Terminal is defined in Recital L.

Term is defined in Section 1.04.

Title Company is defined in Section 2.02.

Title Policy is defined in Section 2.04.

Tehama Street Public Improvements is defined in Section 9.06(a).

Tower Market-Rate Condominium Project is generally described in Recital U and more particularly defined in Attachment 4, Scope of Development.

Tower Mixed-Income Rental Project is generally described in Recital U and more particularly defined in Attachment 4, Scope of Development.

Tower Project means the Tower Market-Rate Condominium Project and the Tower Mixed-Income Rental Project.

Townhouses are defined in Attachment 4, Scope of Development.

Transbay Affordable Housing Obligation is defined in Recital F.

Transbay Final and Conclusive Determination is attached as Attachment 1.

Transfer is defined in Section 6.02(a).

Transfer Payment is defined in Section 9.10(a).

Transfer Payment Covenant and Notice is defined in Section 9.10(a).

Transit Center is defined in Recital L.

Warm Shell is defined in Attachment 27.

IN WITNESS WHEREOF, the Parties have executed this Agreement as of the date first set forth above.

Authorized by Successor Agency Resolution No. ___-2022, adopted _____, 2022.

California Health and Safety Code 33433 Report

Transbay Block 4
July 7, 2022

INTRODUCTION

The Board of Supervisors of the City and County of San Francisco ("Board of Supervisors") established the Transbay Redevelopment Project Area ("Project Area") and approved a Redevelopment Plan for the Project Area by Ordinance No. 124-05 (June 21, 2005) and by Ordinance No. 99-06 (May 9, 2006), as amended by Ordinance No. 84-15 (June 18, 2015) and Ordinance No. 62-16 (April 28, 2016) ("Redevelopment Plan"). In 2008, the former Redevelopment Agency of the City and County of San Francisco ("Former Agency"), the City and County of San Francisco ("City"), and the Transbay Joint Powers Authority ("TJPA") entered into an Option Agreement for the Purchase and Sale of Real Property within the Project Area in furtherance of the goals and objectives of the Redevelopment Plan ("2008 Option Agreement").

In January 2021, the Successor Agency to the Redevelopment Agency of the City and County of San Francisco[1] (commonly known as the Office of Community Investment and Infrastructure or "OCII") acquired certain lands under the 2008 Option Agreement to be conveyed to a private developer for future development purposes. Prior to any such conveyance, Redevelopment Plan Section 4.7.2 (incorporating the requirements of Section 33433 of the Community Redevelopment Law (California Health and Safety Code Section 33000 et seq.)) ("Section 33433"), requires OCII to obtain the approval of the Board of Supervisors. As part of any such approval, the Board of Supervisors must make findings, by resolution after a public hearing, that the consideration for such property constitutes fair market or fair reuse value in light of the covenants, conditions and development costs associated with the sale.

In accordance with these requirements, OCII submits this report ("Report") concerning the sale of Transbay Block 4 and conveyance of adjacent future Tehama Street right of way within Zone One of the Project Area, collectively an approximately 56,375 square-foot area generally located at 200 Main Street, bounded by Howard, Main and Beale Streets and extending approximately 205 feet southeast from Howard Street (Assessor's Block 3739 Lot 010 ("Block 4") and Lot 011 ("Tehama ROW", and collectively the "Site").

On June 21, 2022, the Successor Agency Commission ("Commission") approved certain entitlements including amendments to the Redevelopment Plan and the Development Controls and Design Guidelines for the Transbay Redevelopment Project and a Disposition and Development Agreement ("Block 4 DDA") with F4 Transbay Partners LLC, a Delaware limited

[1] As successor to the Former Agency under Cal. Health & Safety Code §§ 34170 et seq. ("Redevelopment Dissolution Law") and Ordinance No. 215-12 (Oct. 4, 2012) of the Board of Supervisors creating the Successor Agency Commission and delegating to it the authority to carry out activities consistent with the Redevelopment Dissolution Law.

liability company (“Developer”) and Transbay Block 4 Housing Partnership, L.P., a California limited partnership ("Affordable Developer"), for the sale of the Site at a purchase price of Six Million Dollars ($6,000,000) and development of the Site with approximately 681 residential units consisting of: (1) a 513-foot tower containing 479 residential units (composed of 155 for-sale residential condominium units, 219 market-rate rental residential units and no fewer than 105 affordable rental units); (2) an up to 165-foot mid-rise building containing 202 affordable rental units constructed within an air-space parcel owned by OCII and leased to the Affordable Developer; and (3) associated ground floor retail, open spaces, streetscape improvements and underground parking. Prior to the effectiveness of the Block 4 DDA, the Board of Supervisors must approve the amendment to the Redevelopment Plan and a resolution making findings consistent with Section 33433 and approving the fee title and air-space lease conveyances contemplated by the Block 4 DDA.

BACKGROUND

Redevelopment Plan and Transbay Affordable Housing Obligation

In 2003, the State adopted California Public Resources Code Section 5027.1, which requires that any redevelopment plan adopted to finance, in whole or in part, the demolition of the Transbay Terminal building and the construction of a new terminal, including its associated vehicle ramps, shall ensure that at least 25% of all dwelling units developed within the project area shall be available at affordable housing cost to, and occupied by, persons and families whose incomes do not exceed 60% of the area median income, and that at least an additional 10% of all dwelling units developed within the project area shall be available at affordable housing cost to, and occupied by, persons and families whose incomes do not exceed 120% of the area median income, for a total 35% affordable housing obligation (“Transbay Affordable Housing Obligation”).

Also in 2003, the TJPA, the City, and the State, acting by and through its Department of Transportation, entered into a Cooperative Agreement (“Cooperative Agreement”) establishing the process for transfer of parcels owned by the State within the future Project Area ("State-Owned Parcels") to the City and the TJPA. In 2005, together with the adoption of the Redevelopment Plan, the TJPA and the Former Agency entered into the Transbay Redevelopment Project Implementation Agreement (“Implementation Agreement”) which requires the Former Agency to prepare and sell the formerly State-Owned Parcels (once transferred to the City or TJPA) and to implement the Redevelopment Plan, including, among other things, the construction and funding of new infrastructure improvements (such as parks and streetscapes) and compliance with the Transbay Affordable Housing Obligation. Application of the Transbay Affordable Housing Obligation may require that particular publicly owned parcels will have to be developed with a greater percentage of affordable housing units than 35%.

Per the Redevelopment Plan and the Transbay Redevelopment Project Tax Increment and Sales Proceeds Pledge Agreement (“Pledge Agreement”) between the Former Agency, the TJPA and the City, land sale and net tax increment revenue generated by sale and development of the State-Owned Parcels has been pledged to the TJPA to help pay the cost of building the Transbay Transit Center. The State-Owned Parcels include the entirety of the Site.

On February 1, 2012, the Redevelopment Dissolution Law dissolved all redevelopment agencies including the Former Agency and required the transfer of certain of the Former Agency's assets and obligations to OCII. Redevelopment Dissolution Law authorizes successor agencies to enter

into new agreements if they are “in compliance with an enforceable obligation that existed prior to June 28, 2011.” Cal. Health & Safety Code § 34177.5(a). On April 15, 2013, the California Department of Finance (“DOF”) finally and conclusively determined, under Redevelopment Dissolution Law, that the Pledge Agreement, Implementation Agreement, and Transbay Affordable Housing Obligation are continuing enforceable obligations of OCII (the "Transbay Final and Conclusive Determination"). The Block 4 DDA provides for (1) the sale of certain OCII property to a third party for the development of market-rate and affordable housing and the payment of proceeds to the TJPA; (2) creation of an OCII-owned air-space parcel within Block 4 to be leased to the Affordable Developer for construction of the 100% affordable residential building under the Block 4 DDA, each as part of Successor Agency’s compliance with enforceable obligations under the Implementation Agreement and the Transbay Affordable Housing Obligation. DOF has confirmed that any sale, transfer, or conveyance of property related to the Transbay Final and Conclusive Determination is authorized. Therefore, OCII is authorized under Redevelopment Dissolution Law to convey the Site in accordance with the Block 4 DDA, subject to the requirements of Redevelopment Plan Section 4.7.2.

Block 4

The Site: The entirety of the Site was a State-Owned Parcel, first transferred by the State to TJPA and ultimately from TJPA to OCII for development in accordance with the Redevelopment Plan. It is located within Zone One of the Project Area, on the northern portion of the block that houses the former Transbay Temporary Terminal. While an address has not yet been established for the Site, it is generally located at 200 Main Street (Assessor’s Block 3739, Lots 010 (Block 4) and 011 (Tehama ROW)). Block 4 will be bounded by Howard Street to the north, Main Street to the east, Beale Street to the west, and the newly created portion of Tehama Street facing the future public park on Block 3 to the south.

The Block 4 Project: Per the Development Controls (as amended), Block 4 is planned for residential development in a tower with an attached wing of low-rise townhouses, along with a mid-rise building situated around shared open space atop a shared parking structure, and the Tehama ROW will be a publicly-owned right of way. The Block 4 development would include both market-rate and affordable units, the latter up to at least the amount needed to ensure that OCII meets the Transbay Affordable Housing Obligation.

Under the Block 4 DDA, Developer proposes a mixed-income rental and ownership development project on Block 4, including 681 residential units with 45% of the units affordable to households earning between 40% and 120% of Area Median Income (“AMI”). Specifically, the Block 4 DDA includes: (a) a residential tower 513 feet in height at the roof of the last occupiable floor plus a rooftop mechanical screening/parapet element of a maximum 39 feet in height, including an attached townhouse wing up to 71 feet in height, collectively containing 479 residential units, composed of 155 for-sale market-rate residential condominium units, 219 market-rate rental residential units and no fewer than 105 rental units affordable to households earning from 100% to 120% AMI, together with approximately 1,960 square feet of neighborhood retail uses, amenities spaces, approximately 2,200 square feet of open spaces and related uses; (b) an affordable residential building of varying heights between 68 feet and up to 163 feet at the roof of the last occupiable floor, and a rooftop mechanical screening/parapet element of a maximum 16 feet in height containing 201 rental units (and one managers unit) affordable to households earning from 40% to 100% AMI, together with approximately 6,400 square feet of neighborhood retail uses, residential amenities spaces, approximately 3,200 square feet of open spaces and

related uses, to be constructed within an air-space parcel ("Air Rights Parcel") created by Developer under the DDA and owned by OCII, leased to the Affordable Developer pursuant to an affordable housing air-space lease ("Air Rights Lease"), (c) an approximately 66,496 square foot underground shared parking garage accommodating up to 275 private vehicles valet-parked and/or parked via stackers, two car share spaces and parking for a minimum of 556 bicycles, with vehicle spaces assigned to the residents of the affordable residential building on a 1:4 space/unit ratio; (d) a minimum of 4,250 square feet of public open space and streetscape improvements within and surrounding the Site and including the extension and dedication to the City of Tehama Street on the Tehama ROW (collectively, the “Block 4 Project”).

The Block 4 DDA provides that OCII will provide a low-interest (up to 3%) residual receipts loan of approximately $46.7 million to subsidize the 100% affordable residential building. The Developer would be responsible for all further subsidy to construct at least 45% of the units as affordable units.

33433 REPORT COMPONENTS

The following sections present the information required to be provided to the Board of Supervisors under Redevelopment Plan Section 4.2.7 (incorporating the requirements of Health and Safety Code Section 33433). The bolded and italicized text is excerpted from Section 33433.

(a)(2)(A) A copy of the proposed sale or lease.

A copy of the Block 4 DDA, which includes the Air Rights Lease Attachment 12, is included with this Report as Exhibit A. Both the Block 4 DDA and the Report have been submitted to the Clerk of the Board of Supervisors and made available for public inspection on _____, 2022, in advance of _____, 2022, the date of the first publication of the notice for the Board of Supervisors public hearing (scheduled for _____, 2022) to consider approval of the Report.

(a)(2)(B)(i) The cost of the agreement to the agency, including land acquisition costs, clearance costs, relocation costs, the costs of any improvements to be provided by the agency, plus the expected interest on any loans or bonds to finance the agreements.

In January 2021, the TJPA transferred the Site to OCII at no cost pursuant to the 2008 Option Agreement. All Site clearance costs will be paid by the Developer. There are no relocation costs. The Agency will provide no improvements for the Block 4 Project. OCII will provide to the Affordable Developer an affordable housing loan of $46,749,928.46 to partially finance the construction of the mid-rise 100% affordable rental building ("Successor Agency Loan"). These funds will be initially provided to OCII by an affiliate of the Developer pursuant to a separate agreement with the City for Developer's development of a separate residential project within Zone 2 of the Redevelopment Plan. Thus, the Successor Agency Loan is being provided at no cost to OCII.

The Successor Agency Loan will have a simple interest rate from zero to 3% (to be determined based on financial feasibility) for a 57-year term. Payments of principal and interest on the Successor Agency Loan will be payable by the mid-rise affordable project only to the extent that annual surplus cash from the mid-rise affordable project remains from collection of rent after payment of expenses, fees, permanent loan debt service, and replenishment of reserves, as needed. There are no mandatory or scheduled payments, except for repayment at maturity,

including any unpaid principal or accrued interest; provided however, that repayment does not necessarily occur at maturity since such loans may be restructured or forgiven by public funders (MOHCD/OCII) during the life of the project to ensure ongoing affordability and financial feasibility, typically concurrent with low-income housing tax credit resyndication.

(a)(2)(B)(ii) The estimated value of the interest to be conveyed or leased, determined at the highest and best uses permitted under the plan.

Block 4 Parcel. The property interest to be conveyed under the DDA is fee simple title to the Site. The highest and best use of the Site under the Redevelopment Plan is residential use for Block 4 and public street right of way for the Tehama ROW. As determined by OCII's consulting real estate economist Keyser Marston Associates ("KMA"), the estimated highest and best use value of the Site is $6,000,000. A memorandum summarizing the highest and best use value calculated by KMA is included with this Report as Exhibit B.

Air Rights Parcel. The property interest to be conveyed under the Air Rights Lease is a ground-leasehold interest in the Air Rights Parcel for the purposes of constructing a residential building, the highest and best use of the Air Rights Parcel under the Redevelopment Plan. As determined by KMA, the value of the Air-Rights Parcel is included in the $6,000,000 valuation of Block 4, because the Developer is required under the DDA to complete the mid-rise affordable project together with the remainder of the Block 4 Project. Thus, the mid-rise affordable project does not contribute value and, in fact, requires the Developer to provide permanent gap funding of at least $36.7 million. Based on this assessment, there is no additional value attributable to the Air Rights Parcel, and the nominal annual ground lease rent would be appropriate consideration.

(a)(2)(B)(iii) The estimated value of the interest to be conveyed or leased, determined at the use and with the conditions, covenants, and development costs required by the sale or lease. The purchase price or present value of the lease payments which the lessor will be required to make during the term of the lease. If the sale price or total rental amount is less than the fair market value of the interest to be conveyed or leased, determined at the highest and best use consistent with the redevelopment plan, then the agency shall provide as part of the summary an explanation of the reasons for the difference.

Block 4 Parcel. The fair reuse value for the Site is $6,000,000 based on the conditions, covenants, and development costs required by the Transbay Affordable Housing Obligation, the Redevelopment Plan and the Block 4 DDA, as further detailed in the KMA memorandum.

Air Rights Parcel. As discussed above, the fair reuse value of the Air Rights Parcel is included in the $6,000,000 valuation of Block 4, based on the conditions, covenants, and development costs required by the Transbay Affordable Housing Obligation, the Redevelopment Plan, Block 4 DDA and the Air Rights Lease.

(a)(2)(B)(iv) An explanation of why the sale or lease of the property will assist in the elimination of blight, with reference to all supporting facts and materials relied upon in making this explanation.

Block 4 was formerly occupied by a portion of the Embarcadero Freeway, which was demolished after the 1989 Loma Prieta Earthquake. After the freeway was demolished, Block 4 was a surface parking lot operated by the State of California until the Temporary Transbay Transit Terminal was

constructed to provide temporary bus terminal facilities during the construction of the Transbay Transit Center. Since the fall of 2021, the site has been temporarily activated with an array of neighborhood and community-serving uses. The activation will terminate prior to OCII's sale of the land on which the Block 4 Project is located. In 2005, the Former Agency prepared as part of the adoption materials for the Board of Supervisors the Report on the Redevelopment Plan for the Transbay Redevelopment Project ("Report on the Redevelopment Plan"). The section of the Report on the Redevelopment Plan titled "Underutilized Areas and Vacant Lots" on Page V-8 states, "Given the Project Area's density and location in the Financial District, surface parking lots do not maximize the economic and development potential of the lot or area." Block 4 is identified as an "Underutilized Area" on Figure V-3 in the Report on the Redevelopment Plan. As a defunct transit terminal, Block 4 remains an underutilized area. The development of Block 4 will assist in the elimination of blight by converting a large, underutilized site into a major mixed income residential development. Additionally, the development of Block 4 will assist in the elimination of blight by providing housing opportunities for low and moderate income households, a population whose housing needs are underserved.

DISPOSITION AND DEVELOPMENT AGREEMENT

THIS DISPOSITION AND DEVELOPMENT AGREEMENT (the "**Agreement**") is entered into as of October _____, 2022 and is effective as of the Effective Date (as defined below), by and between the SUCCESSOR AGENCY TO THE REDEVELOPMENT AGENCY OF THE CITY AND COUNTY OF SAN FRANCISCO, a public body organized and existing under the laws of the State of California, commonly known as the Office of Community Investment and Infrastructure ("**Successor Agency**"), F4 TRANSBAY PARTNERS LLC, a Delaware limited liability company ("**Developer**"), and TRANSBAY BLOCK 4 HOUSING PARTNERSHIP, L.P., a California limited partnership ("**Affordable Developer**") (collectively, the "**Parties**"). Developer and Affordable Developer are referred to from time to time herein as "**Developers**." The Parties agree as follows:

RECITALS

A. In furtherance of the objectives of the Community Redevelopment Law of the State of California, the Redevelopment Agency of the City and County of San Francisco (the "**Former Agency**") undertook a program to redevelop and revitalize blighted areas in San Francisco and in connection therewith adopted a redevelopment project area known as the Transbay Redevelopment Project Area (the "**Project Area**").

B. The Board of Supervisors of the City and County of San Francisco ("**Board of Supervisors**") approved a Redevelopment Plan for the Project Area by Ordinance No. 124-05, adopted on June 21, 2005, and by Ordinance No. 99-06, adopted on May 9, 2006, filed in the Office of the Recorder of the City and County of San Francisco ("**Official Records**") as Document No. 2006-I224836, as amended by Ordinance No. 84-15 (June 18, 2015) as Document No. 2015-K135871, and as amended by Ordinance No. 62-16 (April 19, 2016), as Document No. 2016-K333253, and as it may be amended from time to time (the "**Redevelopment Plan**").

C. The Redevelopment Plan establishes the land use controls that Successor Agency applies in the Project Area. The Redevelopment Plan divides the Project Area into two subareas: Zone One in which the Redevelopment Plan and the Development Controls and Design Guidelines for the Transbay Redevelopment Project (2005) ("**Development Controls**" or "**DCDG**") define land uses, and Zone Two in which the San Francisco Planning Code applies. Successor Agency solely administers and enforces land use entitlements for property and projects in Zone One and has delegated its authority over projects that do not require Successor Agency action in Zone Two to the San Francisco Planning Department pursuant to that certain Delegation Agreement between the Former Agency and the Planning Department for the Transbay Redevelopment Project Area (May 3, 2005).

D. On August 4, 2006, and in furtherance of the Redevelopment Plan, the Former Agency caused a Declaration of Restrictions affecting all of the Project Area to be recorded in the Official Records, as Document No. 2006-I224839 (the "**Project Area Declaration of Restrictions**").

E. Per the Redevelopment Plan and the Transbay Redevelopment Project Tax Increment and Sales Proceeds Pledge Agreement ("**Pledge Agreement**") between the Former Agency, the Transbay Joint Powers Authority ("**TJPA**"), and the City and County of San Francisco (the "**City**"), land sale and net tax increment revenue generated by the parcels in the Project Area that are currently or formerly owned by the State of California ("**State**") has been pledged to the TJPA to help pay the cost of building the Transbay Transit Center. The State-Owned Parcels (as defined in the Pledge Agreement) include portions or the entirety of the development sites on Blocks 2 through 9, 11, and 12, and Parcels F, M, and T.

F. California Public Resources Code Section 5027.1 requires that any redevelopment plan

adopted to finance, in whole or in part, the demolition of the Transbay Terminal building and the construction of a new terminal, including its associated vehicle ramps, shall ensure that at least 25% of all dwelling units developed within the project area shall be available at affordable housing cost to, and occupied by, persons and families whose incomes do not exceed 60% of the area median income, and that at least an additional 10% of all dwelling units developed within the project area shall be available at affordable housing cost to, and occupied by, persons and families whose incomes do not exceed 120% of the area median income. Application of this project area objective may require that particular publicly owned parcels will have to be developed with a greater percentage of affordable housing units than 35% ("**Transbay Affordable Housing Obligation**").

G. In 2003, the TJPA, the City, and the State, acting by and through its Department of Transportation ("**Caltrans**"), entered into a Cooperative Agreement, which sets forth the process for the transfer of the State-Owned Parcels to the City and the TJPA ("**Cooperative Agreement**"). In 2005, the TJPA and the Former Agency entered into the Transbay Redevelopment Project Implementation Agreement ("**Implementation Agreement**") which requires the Former Agency to prepare and sell the formerly State-Owned Parcels and to implement the Redevelopment Plan, including, among other things, the construction and funding of new infrastructure improvements (such as parks and streetscapes) and compliance with the Transbay Affordable Housing Obligation. Subsequently, in 2008, the TJPA, the City and the Former Agency entered into an Option Agreement for the Purchase and Sale of Real Property ("**2008 Option Agreement**"), which describes the process for the transfer of certain of these parcels to the Former Agency to facilitate the sale of the parcels and provide the TJPA with the Gross Sales Proceeds for funding of the Transbay Transit Center. The 2008 Option Agreement defines Gross Sales Proceeds as the final purchase price based on "consideration of Transbay Redevelopment Plan development restrictions, environmental contamination, legally required affordable housing, and other conditions which reasonably effect [sic] the fair market value." 2008 Option Agreement, § 6.1 at page 7.

H. On February 1, 2012, the State of California dissolved all redevelopment agencies, including the Former Agency, by operation of law pursuant to California Health and Safety Code Sections 34170 et seq. ("**Redevelopment Dissolution Law**"). Under the authority of the Redevelopment Dissolution Law and under San Francisco Ordinance No. 215-12 (Oct. 4, 2012) (establishing the Successor Agency Commission ("**Commission**") and delegating to it state authority under the Redevelopment Dissolution Law), the Successor Agency is administering the enforceable obligations of the Former Agency.

I. On April 15, 2013, the California Department of Finance ("**DOF**") finally and conclusively determined, under Cal. Health & Safety Code § 34177.5 (i), that the Pledge Agreement, Implementation Agreement, and Transbay Affordable Housing Obligation are continuing enforceable obligations of the Successor Agency under the Redevelopment Dissolution Law. A copy of DOF's Transbay Final and Conclusive Determination is attached as Attachment 1.

J. The Transportation Infrastructure Finance and Innovation Act ("**TIFIA**") Loan Agreement between the TJPA, as borrower, and the United States Department of Transportation, as lender, dated January 1, 2010 (as amended, "**TIFIA Loan**"), and the TJPA's subsequent tax allocation bond issuance to refinance the TIFIA Loan and finance costs associated with construction and design of the Transbay Program (collectively, the "**TJPA Bonds**"), pledge (or may in the future pledge) certain property tax increment revenue attributable to certain former state-owned parcels ("**Net Tax Increment**"), including Block 4 (as defined below), in the Redevelopment Plan as security for the payment of the TJPA Bonds.

K. Redevelopment Dissolution Law authorizes successor agencies to enter into new agreements if they are "in compliance with an enforceable obligation that existed prior to June 28, 2011." Cal. Health & Safety Code § 34177.5(a). This Agreement, providing for the transfer of certain Successor

Agency property to a third party, the development of market-rate and affordable housing, and the payment of proceeds to the TJPA, is part of Successor Agency's compliance with the pre-existing enforceable obligations under the Implementation Agreement and the Transbay Affordable Housing Obligation. DOF has confirmed that "any sale, transfer, or conveyance of property related to [the Transbay Final and Conclusive Determination] is authorized." Email from Justyn Howard, Assistant Program Budget Manager, DOF, to Tiffany Bohee, Executive Director, Successor Agency (Sep. 10, 2013, 09:17 am), attached as Attachment 2.

L. The TJPA is responsible for implementing the Transbay Transit Center Program, which includes, among other things, (i) on the site of the former Transbay Terminal, the construction of a new Transit Center building ("**Transit Center**"), (ii) a rail tunnel and rail systems to extend Caltrain service from Fourth and King Streets to the Transit Center and to accommodate California High Speed Rail trains in the future, (iii) a new underground Fourth and Townsend Street Caltrain Station, (iv) modifications to the existing surface station at Fourth and King Streets, (v) a temporary bus terminal operated until the completion and occupancy of the Transit Center ("**Temporary Terminal**"), (vi) a bus ramp connecting the Bay Bridge to the Transit Center, and (vii) permanent bus storage facilities.

M. Under the Cooperative Agreement, the TJPA acquired State-Owned Parcels O, O', and O" (collectively, former Lot 008 of Assessor's Block 3739) subject to a power of termination vested in Caltrans ("**Caltrans Power of Termination**"). These parcels comprise the majority of the city block bounded by Beale, Howard, Main, and Folsom Streets in San Francisco, California, which the TJPA used to operate the Temporary Terminal. The property described in Attachment 2 hereto, being approximately the northern third of the Temporary Terminal site, is identified as Block 4 under the Redevelopment Plan (and referred to herein as "**Block 4**" or the "**Site**"), which will be developed hereunder together with the future public right of way immediately adjacent to the south of the Site (the "**Tehama Parcel**", which is more particularly described in Attachment 3). In 2015, the TJPA secured a loan for Transit Center construction with a lien on Block 4 and other property. Subsequently, the loan was repaid and Caltrans relinquished the Caltrans Power of Termination as it encumbered Block 4, pursuant to that certain document recorded on January 22, 2015 in the Official Records as document no. 2015-K010430-00.

N. Under the 2008 Option Agreement, Successor Agency (as the successor to the Former Agency) has the exclusive and irrevocable option to acquire the entirety of Block 4 from the TJPA. Successor Agency has discretion, consistent with the terms of the 2008 Option Agreement, to approve a transfer of Block 4 to a developer. Development of Block 4 must comply with the Redevelopment Plan, the Development Controls, and the enforceable obligations covered by the Transbay Final and Conclusive Determination. The Redevelopment Plan and the Development Controls require residential development on Block 4 once it is no longer needed for the Temporary Terminal.

O. The Developer, F4 Transbay Partners, LLC, consists of Hines Urban F4, LLC, as managing member, and Broad Street Principal Investments, LLC and Affiliates, as member. Hines Urban F4, LLC, consists of Hines and Affiliates as managing member, and Urban Pacific Development, LLC, as member.

P. The Developer entered into an Agreement of Purchase and Sale for Real Estate dated March 3, 2016 with the TJPA ("**Parcel F PSA**") to acquire a formerly State-Owned Parcel in Zone Two of the Project Area (herein referred to as "**Parcel F**"). The Parcel F PSA was contingent on approval by the Commission and the Board of Supervisors of an option to purchase Block 4. Developer requested that the Successor Agency enter into a sole source option agreement for the purchase of Block 4 based, in part, in the Developer's qualifications and its proposal to develop Block 4 with a high amount of affordable housing that met or exceeded 45 percent of the total number of residential units on the site.

Q. Pursuant to 65864 *et seq*. of the California Government Code, Developer has entered into a development agreement with the City for the development of Parcel F with a 61-story mixed-use building consisting of, among other things, 165 owned dwelling units, 189 hotel rooms, and approximately 276,000 square feet of office use floor area. Under the that certain Development Agreement by and between the City and Parcel F Owner, LLC Relative to the Development Known as 542-550 Howard Street (Transbay Parcel F) Development Project, dated September 30, 2021 and adopted by the Planning Commission (Resolution No. 2084 dated January 28, 2021) and Board of Supervisors (Ordinance No. 42-21 dated March 23, 2021), the Developer is required, upon the satisfaction of certain conditions, to pay an Affordable Housing Fee (as that term is defined in the development agreement) to the Successor Agency to fund the Successor Agency's obligation to fulfill the Transbay Affordable Housing Obligation. The Parties intend that the Affordable Housing Fee be used to subsidize the construction of the Mid-Rise Affordable Project.

R. On June 22, 2016, Successor Agency, as optionor, and Developer, as optionee, entered into an Agreement for Option to Purchase Block 4 that was authorized by the Commission on April 19, 2016 (Commission Resolution No. 18-2016) and approved, under Section 33433 of the Health and Safety Code, by the Board of Supervisors on May 27, 2016 (Board Resolution No. 195-16), as evidenced by that certain Memorandum of Option Agreements recorded June 22, 2016 in the Official Records of the City as Document No. 2016-K277787-00, as amended by that First Amendment to Agreement for Option to Purchase Block 4, dated for reference purposes as of September 16, 2019, that was authorized by the Commission on September 18, 2018 (Resolution No. 38-2018) and approved by the TJPA Board on August 8, 2019 (Resolution No. 021-2019) and as further amended by that Second Amendment to Agreement for Option to Purchase Block 4, dated for reference purposes as of December 15, 2020, that was authorized by the Commission on the same date by Resolution No. 42-2020 and approved by the TJPA Board on January 14, 2021 by Resolution No. 004-2021, as further amended by that Third Amendment to Agreement for Option to Purchase Block 4, dated for reference purposes as of July 1, 2021, that was authorized by the Commission on June 15, 2021 by Resolution No. 23-2021 and approved by the TJPA Board on July 22, 2021 by Resolution No. 022-2021, and as further amended by that Fourth Amendment to Agreement for Option to Purchase Block 4, dated for reference purposes as of October 1, 2021, that was authorized by the Commission on September 21, 2021 by Resolution No. 31-2021 and approved by the TJPA Board on October 14, 2021 by Resolution No. 033-2021 (together as amended "**Block 4 Option Agreement**").

S. The Block 4 Option Agreement provides, among other things, that the Developer will "include, at no cost to OCII, the TJPA, or the City, at least forty five percent (45%) below-market-rate ("**BMR**") units on Block 4 plus . . . the transfer of affordable units required on Parcel F by the Redevelopment Plan and Planning Code in effect as of the date of this Agreement onto Block 4 ("**Buyer's Inclusionary Obligation**")." [Block 4 Option Agreement at p. 5]. It also provides that OCII will have sole and absolute discretion to determine the total number and type of affordable units to be constructed on Block 4, as well as all other terms in this Agreement, except for the Block 4 sales price, which is determined by the amount or methodology established in the Option Agreement. The Block 4 Option Agreement includes a term sheet providing base terms for negotiation of this Agreement. Under the 2008 Option Agreement and Pledge Agreement with the TJPA, the Successor Agency transmits any proceeds from the sale of Block 4 to the TJPA for the Transit Center construction.

T. The Developer requested an amendment to the Redevelopment Plan Exhibit 4: Zone One Plan Map, to increase the maximum overall height limit on Block 4 from 450 feet to 513 feet and to increase the maximum building floor plate sizes applicable to Block 4:(a) from 7,500 square feet to13,500 square feet for buildings 85 feet to 250 feet in height, and (b) from 13,000 square feet to 15,200 square feet for buildings over 500 feet in height but limited to that portion of the building that is between 85 feet and 122 feet in height ("**Plan Amendment**"), together with an amendment to the Development Controls to, among other matters, reflect the Plan Amendment as well as to increase the maximum Townhouse, Podium 1 and Podium 2 height ranges on Block 4 from 50, 65 and 85 feet, respectively, to 71, 163 and 115 feet

("**Development Controls Amendment**"). The Commission approved the Plan Amendment by Resolution No. X-2022 (_____, 2022), and the Development Controls Amendment by Resolution No. XX-2022 (_____, 2022). On _____, 2022, the City's Planning Commission determined by Motion No. XXXXX that the Plan Amendment conforms to the San Francisco General Plan. On _____, 2022, the Board of Supervisors adopted Ordinance No. XXX-22 approving the Plan Amendment. The Plan Amendment and Development Controls Amendment become effective 90 days after enactment of the ordinance approving the Plan Amendment. Cal. Health & Safety Code § 33378(b)(2) and 33450. All references hereinafter to the Redevelopment Plan shall mean the Redevelopment Plan as amended by the Plan Amendment, and references to the Development Controls shall mean the Development Controls as amended by the Development Controls Amendment.

U. The scope of development for both the Site and the Tehama Parcel is fully described in Attachment 4 ("**Scope of Development**"). This generally includes the following improvements, each as more particularly described in the Scope of Development: (a) an approximately 155-unit market-rate residential condominium component consisting of approximately 135 for-sale residential condominium units and 20 adjacent condominium townhouses (the "**Tower Market-Rate Condominium Project**") (together, the residential condominium units and the condominium townhouses in the Tower Market-Rate Condominium Project are referred to as the "**Residential Condominium Units**"); (b) a residential rental component consisting of approximately 219 market-rate rental residential units and no fewer than 105 rental units affordable to households earning from 100 to 120 percent of area median income, (the "**Tower Mixed-Income Rental Project**", and together with the Tower Market-Rate Condominium Project, the "**Tower Project**"); (c) an affordable housing component consisting of no fewer than 202 rental units (including one manager's unit and 201 rental Affordable Housing Units) within a mid-rise building adjacent to the tower, affordable to households earning from 40 to 100 percent of area median income ("**Mid-Rise Affordable Project**") (together, the BMR units in the Tower Mixed-Income Rental Project and in the Mid-Rise Affordable Project are referred to as the "**Affordable Housing Units**"); (d) Streetscape Improvements surrounding the Site and including the extension of Tehama Street on the Tehama Parcel; (e) approximately 8,389 square feet of ground-floor retail space along Main, Howard, Tehama and Beale Streets (the "**Commercial Units**"), including approximately 6,431 square feet located on the ground floor of the Mid-Rise Affordable Project reserved for Community Commercial Space; (f) approximately 5,850 square feet of Public Open Space and 11,016 square feet of Project Open Space ; (g) an approximately 66,496 square foot underground "**Shared Parking Garage**" accommodating up to 275 private vehicles valet-parked and/or parked via stackers and a minimum of 556 secured bicycle parking spaces. Items (a) through (g), as further described in the Scope of Development, are collectively referred to as the "**Improvements.**"

V. Pursuant to that certain Transfer Map dated May 2021 and recorded July 1, 2021 in the Official Records of the City as Document No. 2021105647, Successor Agency has assembled the Site and the Tehama Parcel for conveyance.

W. On January 12, 2021, TJPA transferred that portion of the Temporary Terminal site constituting the Site and the Tehama Parcel to Successor Agency pursuant to the 2008 Option Agreement and the Agreement for Purchase and Sale between the TJPA and Successor Agency (August 18, 2020), and the Parties intend the that the Site and the Tehama Parcel will be transferred from Successor Agency to Developer on or before the Outside Date for Close of Escrow in accordance with this Agreement. The Parties intend that the Developer will seek permanent subdivision of Block 4 and the Tehama Parcel generally as follows: (i) an airspace parcel for the Mid-Rise Affordable Project that may include the commercial space dedicated to Public Benefit and Community Serving Commercial uses ("**Affordable Air Rights Parcel,**" or if separated from the Affordable Air Rights Parcel pursuant to Section 9.09(b), the "Commercial Subdivision" as defined therein), (ii) the Tehama Parcel (which will be subject to an offer of dedication in fee together with the public improvements thereon to the City); and (iii) the remainder of the Site, which Developer intends to subdivide generally consistent with the Development Program depicted

in Attachment 5, "**Development Program**". These foregoing subdivision actions are collectively defined as the "**Permanent Subdivision of the Site**." Concurrent with recordation of the final subdivision map reflecting the Permanent Subdivision of the Site, the Parties intend that the Developer will convey the Affordable Air Rights Parcel back to the Successor Agency as described in Section 2.04(g) below.

X. In connection with the conveyance of the Affordable Air Rights Parcel to the Successor Agency as described above, the Successor Agency intends to enter into a lease of the Affordable Air Rights Parcel with the Affordable Developer (the "**Air Rights Lease**"). When construction of the Improvements located within the Affordable Air Rights Parcel is complete and the Successor Agency has issued a Certificate of Completion with respect to such Improvements, the Successor Agency will assign the title to the Affordable Air Rights Parcel and the lessor's interest in the Air Rights Lease to the Mayor's Office of Housing and Community Development ("**MOHCD**"), as the housing successor under Redevelopment Dissolution Law.

Y. In connection with the construction of the Tehama Parcel and as may be further made a condition of approval of the Permanent Subdivision of the Site, the Successor Agency intends that the Developer will enter into a public improvement agreement ("**PIA**") with the City for the purpose of constructing the required infrastructure and conveying a public street that meets the City's standard for acceptance.

Z. Together with its amendment to the Redevelopment Plan for the Project, the City's Board of Supervisors adopted findings consistent with Health & Safety Code Section 33433 (as applicable under Section 4.7.2 of the Redevelopment Plan) that the Purchase Price established by this Agreement is not less than the "fair market value" or "fair reuse value" for Block 4, pursuant to Resolution No. [XX] enacted [_____], 2022.

AA. This Agreement contemplates a sole source sale of the Site to Developer and the Successor Agency has complied with the procedural requirements for notice and public hearing required by Section 33431 of the Health and Safety Code;

BB. Furthermore, the proposed sale is consistent with the disposition plan for the Site that was included in Successor Agency's Property Management Plan ("**PMP**"), which was prepared in accordance with the requirements of Redevelopment Dissolution Law. The PMP was approved by Oversight Board Resolution Nos. 12-2013 (adopted November 25, 2013) and 14-2015 (adopted November 23, 2015), and finally approved by DOF on December 7, 2015.

CC. The parties wish to enter into this Agreement to complete the sale of the Site and conveyance of the Tehama Parcel to Developer and authorize construction of the Improvements on the Site and Tehama Parcel.

ARTICLE 1 - CONTRACT TERMS

1.01 Purchase Price

(a) The purchase price for the Site shall be SIX MILLION AND 00/100 DOLLARS ($6,000,000.00) (the "**Purchase Price**").

(b) The Developer shall deposit the Purchase Price, in cash or immediately available funds, into Escrow on the date established by the Parties for the Close of Escrow in the escrow instructions delivered by the parties pursuant to Section 2.03, but in any event no later than the Outside Date for Close of Escrow. The Purchase Price shall be paid to an account designated by the TJPA in one lump sum

simultaneously with transfer of title to the entire Site and Tehama Parcel to Developer. If Developer is not able to pay the Purchase Price as required in this Section 1.01(b), an additional TWELVE THOUSAND AND 00/100 ($12,000.00) shall be added to the Purchase Price for each calendar day of delay until the Close of Escrow (the "**Additional Purchase Payment**").

1.02 Good Faith Deposit

Within ten (10) days after the Effective Date of this Agreement, Developer shall deposit into Escrow a good faith deposit in the amount of TWO MILLION AND 00/100 DOLLARS ($2,000,000.00) (the "**Good Faith Deposit**") in cash or immediately available funds. The Good Faith Deposit shall be in addition to, and not be credited toward, the Purchase Price. If the Parties close on the purchase-sale of the Site and conveyance of the Tehama Parcel and Developer achieves Commencement of Substantial Construction, as defined in Section 4.08(b), Successor Agency shall refund the Good Faith Deposit to Developer, less any amounts due under Section 12.01 for then past-due and unpaid Successor Agency Costs. None of the $600,000.00 deposit paid under the Block 4 Option Agreement or any other amounts paid by Developer during the term of the Block 4 Option Agreement for the costs of Successor Agency shall be credited against the Good Faith Deposit or otherwise refunded.

1.03 Redevelopment Plan and Project Area Declaration of Restrictions

Development on the Site and Tehama Parcel is subject to all the terms and conditions of the Redevelopment Plan and the Project Area Declaration of Restrictions. The Site and Tehama Parcel are located within Zone One as described in the Redevelopment Plan and the Development Controls, both of which determine the land use designation and controls for the Site and Tehama Parcel.

1.04 Term of this Agreement

The term of this Agreement will begin on the Effective Date and continue until the earlier of termination in accordance with its terms or Successor Agency's issuance and recordation of a Certificate of Completion as provided in Section 4.13 (the "**Term**"), subject to the surviving provisions set forth in Section 5.12.

1.05 Affordable Developer

The Affordable Developer is Transbay Block 4 Housing Partnership, L.P, a limited partnership made up of Mercy Housing California, a California nonprofit (as managing general partner), F4 Transbay Partners LLC, a Delaware limited liability company (as administrative general partner), and a Low-Income Housing Tax Credit investor limited partner.

ARTICLE 2 - CONVEYANCE TERMS

2.01 Purchase and Development

Subject to all of the terms, covenants and conditions of this Agreement, and Community Redevelopment Law as amended by Redevelopment Dissolution Law, Successor Agency agrees to sell and convey the Site to Developer for the Purchase Price and convey the Tehama Parcel in accordance with this Agreement, and Developer agrees to purchase the Site from Successor Agency and pay the Purchase Price to Successor Agency in accordance with the provisions of Section 1.01(a) above and accept the Tehama Parcel and perform all applicable obligations thereto in accordance with this Agreement. In accordance with this Agreement, from and after the Close of Escrow, Developer shall diligently pursue and prosecute

the development, construction, maintenance and operation of the Improvements on the Site and the Tehama Parcel, subject to applicable laws.

2.02 Tehama Parcel

Developer acknowledges and covenants that the Tehama Parcel is being conveyed to Developer solely for the purposes of enabling Developer to complete its obligations to construct all Improvements specified for the Tehama Parcel in the Scope of Development, and that fee title to the Tehama Parcel, including all Improvements constructed thereon in accordance with this Agreement, shall be offered to the City via the Permanent Subdivision of the Site in accordance with all applicable provisions of the City's Subdivision Code and Subdivision Regulations. Except as consistent with this Section 2.02 and Section 5.06, Developer may not convey, in whole or in part, the Tehama Parcel and may not subject the Tehama Parcel to any lien or encumbrance except those approved in advance by the Successor Agency in its sole discretion.

2.03 Escrow

(a) Open, Close of Escrow. Developer shall establish an escrow with Chicago Title Company or such other reputable title company doing business in the City and County of San Francisco as may be selected by Developer and approved by Successor Agency ("**Title Company**") and shall notify Successor Agency in writing upon establishing such escrow ("**Escrow**"). At least fifteen (15) business days prior to the date the Parties' intend for Close of Escrow, but in any event no later than 15 business days prior to the Outside Date for Close of Escrow, Successor Agency and Developer each shall provide escrow instructions to the Title Company as shall be necessary and consistent with this Agreement governing Close of Escrow; at the same time, providing copies to each other. The "**Close of Escrow**" is defined as the consummation of the sale completed herein in accordance with the escrow instructions provided by Developer and Successor Agency. Except to the extent this Agreement provides otherwise, at least one (1) business day prior to the date the Parties intend for Close of Escrow, but in any event no later than one (1) business day prior to the Outside Date for Close of Escrow, the Parties shall each deposit into Escrow all documents and instruments that such party is obligated to deposit into Escrow in accordance with this Agreement.

(b) Outside Date for Close of Escrow. Close of Escrow (including all transactions contemplated therein) shall be completed no later than the "**Outside Date for Close of Escrow**" specified in the Schedule of Performance. The Outside Date for Close of Escrow shall not be extended except (i) for the failure to fulfill one or more of the conditions precedent in Section 2.07 (except failure to fulfill Section 2.07(b)(iv), which is subject to Section 8.08(b)) on or prior to the Outside Date for Close of Escrow where such failure is beyond the control of the Party responsible for the satisfaction of such condition; or (ii) as otherwise provided in this Agreement. In the event the Outside Date for Close of Escrow is extended as provided in this subsection 2.03(b)(i), Developer may request that Successor Agency approve, subject to its reasonable discretion, an extension of any remaining applicable dates set forth in the Schedule of Performance (and, if applicable, Schedule of Important Project Dates) that are not calculated or measured from the Close of Escrow or Outside Date for Close of Escrow.

(c) Title, Escrow and Closing Costs. Developer shall pay to the Title Company or the appropriate payee thereof all title report costs; title insurance premiums and endorsement charges as requested by Developer; recording fees; and any escrow fees in connection with the conveyances contemplated under this Agreement.

2.04 Title

(a) The escrow instructions shall provide that upon the Close of Escrow the Title Company shall provide and deliver to Developer an owner's title insurance policy ("**Title Policy**") (which at Developer's option may be an ALTA owner's policy) issued by the Title Company in an amount reasonably designated by Developer, at the sole cost and expense of Developer, insuring that fee simple title to the Site and the Tehama Parcel is vested in Developer, without any liens, encumbrances, or other matters affecting title except for the title conditions set forth in Attachment 8 ("**Approved Title Conditions**").

(b) Developer shall be entitled to request that the Title Company provide such endorsements (or amendments) to the Title Policy as Developer may reasonably require, provided that the same shall (a) be at no cost to Successor Agency, (b) impose no material or non-customary additional liability on Successor Agency, and (c) not cause a delay in the Close of Escrow.

(c) Developer shall bear all cost and responsibility for any required compliance with applicable laws related to the acquisition of the Site and Tehama Parcel, including, but not limited to, the Subdivision Map Act, the Destroyed Land Records Relief Act, and all other federal, state, and local laws applicable to the development of the Site and Tehama Parcel.

(d) If Developer elects to secure an ALTA owner's policy, Successor Agency shall cooperate with Developer to secure such policy by providing surveys and engineering studies in its possession or control, if any, at no cost to Successor Agency and without warranty of any kind, which relate to or affect the condition of title. The responsibility of Successor Agency assumed by this paragraph is limited to providing such surveys and engineering studies, if any. Developer shall be responsible for securing any other surveys and engineering studies at its sole cost and expense. Successor Agency shall also execute an Owner's Affidavit in the form set forth on Attachment 9, or in such commercially reasonable form required by the Title Company.

(e) Upon satisfaction of all conditions precedent established by this Agreement and the parties' escrow instructions, Successor Agency shall convey to Developer fee simple title to the Site and Tehama Parcel by Grant Deed, in substantially the form attached hereto as Attachment 10 ("**Grant Deed**"), free and clear of any liens, encumbrances and other matters affecting title except for the Approved Title Conditions. Developer shall provide Successor Agency with an executed and acknowledged Developer's Quitclaim Deed. Successor Agency and Developer shall work in good faith to obtain whatever additional assurances are necessary from any City department or agency, including the Department of Public Works and the City Surveyor, to enable Successor Agency to convey marketable and insurable title to the Site and Tehama Parcel.

(f) Concurrently with the recordation of the Grant Deed, the parties shall cause the recordation of a declaration of site restrictions in substantially the form of Attachment 11 (the "**Declaration of Site Restrictions**"), which shall include, among other things, the affordability and eligibility restrictions described in Section 5.05 below and such Declaration of Site Restrictions shall unless otherwise permitted by OCII (1) be in a first lien position and (2) not be subordinated to any lien or other encumbrance during the term of such restrictions.

(g) Following the Close of Escrow, Developer shall control and pursue the Permanent Subdivision of the Site in accordance with the requirements of this Agreement. Concurrently with recordation of a final subdivision map reflecting the Permanent Subdivision of the Site, Developer shall convey the Affordable Air Rights Parcel to Successor Agency free of encumbrances except those encumbrances required for the construction of the Improvements and those encumbrances previously

approved in writing by the Successor Agency. Prior to or after the conveyance of the Affordable Air Rights Parcel, as determined by the Successor Agency: (i) Successor Agency and Affordable Developer shall execute the Air Rights Lease, substantially in the form attached hereto as Attachment 12, and (ii) pursuant to Section 9.11 of this Agreement, the Parties shall cause to be executed and recorded covenants, conditions and restrictions and the REA (as defined in Section 9.11 below); provided, however, that Permanent Subdivision of the Site, the conveyance of the Affordable Air Rights Parcel and the execution of the Air Rights Lease, and the execution and recordation of the REA shall occur prior to or on the date of the closing of Developer's construction financing for the Improvements.

2.05 Taxes and Assessments

Ad valorem taxes and assessments levied, assessed or imposed from and after Close of Escrow shall be the responsibility of Developer.

2.06 Access and Entry by Developers to the Site and Tehama Parcel/Permit to Enter

(a) The Successor Agency represents and warrants to Developer that it has furnished to Developer copies of all existing surveys, environmental reports, inspection reports, and any other writings or data pertaining to the physical condition of the Site which are in the Successor Agency's possession or control. The Successor Agency shall assist Developer in obtaining any such reports or data in the possession and control of the TJPA.

(b) Prior to obtaining the fee title interest in the Site at Close of Escrow, Developers and their representatives shall, subject to the terms of the "**Permit to Enter**" attached to this Agreement as Attachment 13 have the right of access to and entry upon the Site, from time to time and at all reasonable times, for the purpose of obtaining data and making surveys and tests, including site tests and soil borings, necessary to carry out the purposes of this Agreement.

2.07 Conditions Precedent to Close of Escrow

(a) Conditions to Developer's Obligation to Close. The following are conditions to Developer's obligations to close Escrow (the "**Developer Conditions**"), to the extent not expressly waived by Developer:

(i) There shall not be an uncured Event of Default (as defined in Sections 8.01 and 8.02 as applicable) by Successor Agency;

(ii) Successor Agency shall have timely performed all obligations set forth in the Schedule of Performance that are required to be performed by Successor Agency prior to the Close of Escrow;

(iii) The Title Company shall be irrevocably committed to issuing the Title Policy to Developer, subject only to the Approved Title Conditions and in a form reasonably acceptable to Developer in accordance with Section 2.04;

(iv) Successor Agency shall have delivered, or caused to be delivered, to Developer and the Title Company all instructions and documents to be delivered by Successor Agency at Close of Escrow pursuant to the terms and provisions hereof;

(v) Successor Agency shall have executed, acknowledged and deposited with the Title Company the Grant Deed in substantially the form of Attachment 10;

(vi) The Commission shall have approved the Plan Amendment, Development Controls Amendment, this Agreement and "**Schematic Design Documents**" (as those documents are defined in the DRDAP);

(vii) The Board of Supervisors shall have held the public hearing and approved the Plan Amendment and the sale of the Site under California Health & Safety Code Section 33433; and

(viii) There shall be no litigation filed or threatened (excluding any litigation initiated by Developers or by an entity under Developers' control, and excluding litigation that challenges the validity or enforcement of Transbay Transit Center Community Facilities District 2014-1) that affects title to the Site, arises out of or relates to the physical condition of the Site, affects or may affect Developer's ability to finance the purchase of the Site, affects or may affect the ability to finance, build or market the Improvements, challenges the actions of Successor Agency or TJPA relating to the Site or this Agreement, or challenges or otherwise relates to the Developers' right to occupy the Site.

(b) Conditions to Successor Agency's Obligation to Close Escrow. The following are conditions to Successor Agency's obligation to close Escrow ("**Successor Agency Conditions**") to the extent not expressly waived by Successor Agency:

(i) Developer shall have deposited the Purchase Price in Escrow pursuant to Section 1.01 and instructed the Title Company to consummate the Escrow;

(ii) If an Event of Default by Affordable Developer then exists, and if Successor Agency has elected to cause a substitute to replace the Affordable Developer, then such replacement process must be in process and proceeding in accordance with Section 8.04;

(iii) Subject to the provisions of this Agreement, Developer shall have fully performed all obligations set forth in the Schedule of Performance that are required to be performed prior to the Outside Date for Close of Escrow;

(iv) Successor Agency shall have received and approved all items referred to in Section 2.08, and financing for the Improvements in the form and amount approved by Successor Agency under Section 2.08 shall close prior to or concurrently with the Close of Escrow;

(v) Developer shall have furnished certificates of insurance or duplicate originals of insurance policies as required by this Agreement;

(vi) There shall not be an Event of Default by Developer;

(vii) Developer shall have delivered to Successor Agency and the Title Company all instructions and documents to be delivered at Close of Escrow pursuant to the terms and provisions hereof;

(viii) Developer shall have deposited with the Title Company (i) a duly executed and acknowledged Declaration of Site Restrictions, substantially in the form of Attachment 11; (ii) Developer's Quitclaim Deed, substantially in the form of Attachment 14; and (iii) the PIA, duly executed by Developer, in a form to be mutually agreed upon by Developer and City;

(ix) Developer shall have deposited with the Title Company a duly executed and acknowledged "Unanimous Approval of Annexation to a Community Facilities District and Related

Matters" form in favor of annexing the Site into the CFD to be dated by the Title Company following recordation of the Grant Deed; and

(x) Developers shall have provided Successor Agency with a final development budget, table of sources and uses, and a 20-year operating budget for the Mid-Rise Affordable Project in accordance with Section 9.05(a).

(c) Conditions Precedent to Lease of Affordable Air Rights Parcel to Affordable Developer. The conditions precedent to Successor Agency's and Affordable Developer's obligation to enter into a lease of the Affordable Air Rights Parcel are as set forth here and in the Air Rights Lease;

(i) The Board of Supervisors shall have held the public hearing and approved the lease of the Affordable Air Rights Parcel under California Health & Safety Code Section 33433.

(d) Notwithstanding anything in this Agreement to the contrary, if the Outside Date for Close of Escrow is extended pursuant to Section 2.03(b)(i) for more than twelve (12) consecutive months, then either Successor Agency or Developer, by written notice to the other, may terminate this Agreement, whereupon the Good Faith Deposit (less those amounts to be withheld as provided in Section 1.02) shall promptly be returned to Developer and the Parties shall have no further liabilities or obligations under this Agreement arising or accruing following such termination.

2.08 Submission of Evidence of Financing and Project Commitments

No later than the dates specified in the Schedule of Performance for submission of the Evidence of Financing and Project Commitments, Developer shall submit to Successor Agency for review and approval (collectively, the "**Evidence of Financing and Project Commitments**"):

(a) A statement setting forth a budget for the total estimated construction cost of the Improvements, allocated between the Tower Market-Rate Condominium Project, the Tower Mixed-Income Rental Project, and the Mid-Rise Affordable Project, with the construction hard costs prepared by, or with the assistance of, a licensed, bondable general contractor (the "**Budget**");

(b) A financing plan listing all sources and uses of funds set forth in the Budget, in a form satisfactory to Successor Agency (the "**Financing Plan**");

(c) An operating budget for the Mid-Rise Affordable Project prepared by the Affordable Developer and agreed to by the Developer, detailing anticipated rent and other project income, and operating expenses including funds for resident services staffing and deposits to reserve accounts, for year one of the Mid-Rise Affordable Project and projected annually for the first twenty years of operation;

(d) A letter from a Bona Fide Institutional Lender, as defined in Article 13, describing a bona fide commitment or commitments for financing the construction costs of the Improvements, including verification of Developer's construction completion guaranty (the "**Financing Commitment**"). The Financing Commitment shall be certified by Developer to be a true and correct copy or copies thereof; additional commitments of funding to cover the difference between the mortgage amount and the Budget, in the form of evidence of funds dedicated to the Developer's compliance with the obligations under this Agreement from the holder of such funds, or in another form reasonably satisfactory to Successor Agency; and, if required by the interim construction financing, commitments for permanent financing shall be provided, also certified by Developer to be true and correct copies thereof. Developer covenants to use diligent, good faith efforts to perform any and all conditions to funding thereof;

(e) Final authorization of funding from all governmental agencies providing financing for the construction of the Improvements, including, allocation letters from the California Tax Credit Allocation Committee and California Debt Limit Allocation Committee, and if applicable, a fully executed loan agreement with Successor Agency governing the Successor Agency Loan and/or an award letter from the California Department of Housing and Community Development;

(f) A construction contract, with a bondable general contractor reasonably satisfactory to Successor Agency, for the construction of the Improvements in accordance with the estimated costs set forth in the Budget (the "**Construction Contract**"). Developer will provide a Construction Contract for Successor Agency's review that may redact confidential, proprietary and trade secret information.

(g) Developer shall submit to the Successor Agency for review and approval by the TJPA a certificate from Developer certifying that funds are or are anticipated to be available to be drawn by Developer and that such funds are or are anticipated to be adequate to pay the costs of planning, design, engineering, procurement, permitting, construction, installation and equipping of the development of Improvements for the intended uses and purposes under this Agreement.

(h) Successor Agency will notify Developer in writing of its approval or disapproval of any of the foregoing documents within twenty-one (21) business days after submission of such documents to Successor Agency, including written reasons for disapproval. Successor Agency shall not unreasonably withhold such approval. Failure of Successor Agency to notify Developer of its approval or disapproval of a document or submission within said periods of time shall entitle Developer to a time extension for the approval of such document or submission until the later of (i) the date of approval by Successor Agency, or (ii) fifteen (15) days after Successor Agency provides written reasons for a disapproval. In no event will Successor Agency's failure to respond be deemed to be an approval.

(i) In the event Successor Agency disapproves of a document or submission required in this Section 2.08, Developer and Successor Agency shall cooperate to review such document or submission. Developer shall be entitled to a reasonable number of re-submissions of such document or submission for approval, to be resubmitted within fifteen (15) days after Successor Agency provides written reasons for a disapproval. If Developer is diligently pursuing the correction or resolution of a deficiency in such document or submission, Developer shall be entitled to a reasonable time extension of such 15-day period, which, collectively shall be no longer than 180 days. All applicable dates set forth in the Schedule of Performance (and, if applicable, the Schedule of Important Project Dates) shall automatically be extended by the same number of days incurred in undertaking such review.

2.09 Conveyance of Title to the Site and Tehama Parcel and Delivery of Possession

Subject to the provisions of Section 2.08, and provided that (i) Developer is not then in default under the terms of this Agreement, (ii) Successor Agency Conditions and the Developer Conditions have been satisfied or expressly waived by the Close of Escrow, and (iii) Developer has paid all sums then due hereunder, then Successor Agency shall convey to Developer, and Developer shall accept the conveyance of, the fee simple interest in the Site and Tehama Parcel, subject to the Approved Title Conditions and the reconveyance to the Successor Agency of the Affordable Air Rights Parcel under Section 2.04(g) and the obligation to construct on the Tehama Parcel the public improvements and offer same for acceptance by City under Section 9.05.

ARTICLE 3 - SITE CONDITION; HAZARDOUS MATERIALS INDEMNIFICATION; "AS IS" PURCHASE

3.01 Prior to Conveyance/Site and Tehama Parcel "As Is"

(a) Successor Agency shall convey the Site and Tehama Parcel in their present, "AS IS" condition, free of any liens, leases, encumbrances, or other matters affecting title except for the Approved Title Conditions, and shall not prepare the Site or Tehama Parcel for any purpose whatsoever prior to conveyance to Developer. So long as there is no material adverse change in the condition of the Site or Tehama Parcel after the Effective Date, Developer agrees to accept the Site and Tehama Parcel in "AS IS" condition at the Close of Escrow in the Approved Title Condition.

(b) Developer acknowledges that neither Successor Agency nor the TJPA has made any representation or warranty, express or implied, with respect to the Site or Tehama Parcel, and it is agreed that Successor Agency and the TJPA make no representations, warranties or covenants, express or implied, as to its physical condition; as to the condition of any improvements; as to the suitability or fitness of the land; as to any Environmental Law, or otherwise affecting the use, value, occupancy or enjoyment of the Site or the Tehama Parcel; or as to any other matter whatsoever; it being expressly understood that the Site and Tehama Parcel are being conveyed in an "AS IS" condition. The provisions of this Section 3.01, as with the other provisions of this Agreement, shall survive the Close of Escrow and shall not merge into the Grant Deed delivered to Developer at Close of Escrow.

(c) Developer has been given the opportunity to investigate the Site and Tehama Parcel fully, using experts of its own choosing, as described in Section 2.06.

(d) After Close of Escrow, Developer, at its sole cost and expense, shall comply with all provisions of Environmental Law applicable to the Site and Tehama Parcel, and Successor Agency, the TJPA, and their respective members, officers, agents and employees shall have no responsibility or liability with respect thereto.

(e) Any costs associated with the security, maintenance/repair, and demolition of any existing structures or other improvements on the Site or Tehama Parcel are the sole and absolute responsibility of Developer.

(f) DEVELOPER ACKNOWLEDGES AND AGREES THAT, EXCEPT TO THE EXTENT OTHERWISE EXPRESSLY PROVIDED HEREIN, SUCCESSOR AGENCY IS CONVEYING AND DEVELOPER IS ACCEPTING THE SITE AND TEHAMA PARCEL ON AN "AS IS WITH ALL FAULTS" BASIS SUBJECT TO ALL APPLICABLE LAWS, RULES AND ORDINANCES, INCLUDING WITHOUT LIMITATION, ANY ZONING ORDINANCES, OR OTHER REGULATIONS GOVERNING THE USE, OCCUPANCY OR POSSESSION OF THE SITE AND TEHAMA PARCEL. DEVELOPER REPRESENTS AND WARRANTS THAT DEVELOPER IS RELYING SOLELY ON ITS INDEPENDENT INVESTIGATION AND NOT ON ANY REPRESENTATIONS OR WARRANTIES OF ANY KIND WHATSOEVER, EXPRESS OR IMPLIED, FROM SUCCESSOR AGENCY, THE TJPA, OR THEIR AGENTS AS TO ANY MATTERS CONCERNING THE SITE OR TEHAMA PARCEL, ITS SUITABILITY FOR DEVELOPER'S INTENDED USES OR ANY OF THE SITE CONDITIONS. SUCCESSOR AGENCY DOES NOT GUARANTEE THE LEGAL, PHYSICAL, GEOLOGICAL, ENVIRONMENTAL OR OTHER CONDITIONS OF THE SITE OR TEHAMA PARCEL, NOR DOES IT ASSUME ANY RESPONSIBILITY FOR THE COMPLIANCE OF THE SITE OR TEHAMA PARCEL OR THEIR USE WITH ANY STATUTE, RESOLUTION OR REGULATION. DEVELOPER AGREES THAT NEITHER SUCCESSOR AGENCY, THE TJPA NOR ANY OF SUCCESSOR AGENCY'S OR TJPA'S AGENTS HAVE MADE, AND SUCCESSOR AGENCY

DISCLAIMS, ANY REPRESENTATIONS OR WARRANTIES, EXPRESS OR IMPLIED, WITH RESPECT TO THE CONDITIONS OF THE SITE OR THE TEHAMA PARCEL.

SUCCESSOR AGENCY: _____ DEVELOPER: _____

3.02 Hazardous Materials Indemnification

(a) Developer shall indemnify, defend and hold Successor Agency, the TJPA and their respective members, officers, agents and employees (individually, "**Hazardous Materials Indemnified Party**" and collectively, "**Hazardous Materials Indemnified Parties**") harmless from and against any losses, costs, claims, damages, liabilities, and causes of action of any nature whatsoever (including, without limitation, the reasonable fees and disbursements of counsel and engineering consultants) incurred by or asserted against any Hazardous Materials Indemnified Party in connection with, arising out of, in response to, or in any manner relating to (A) Developer's or Affordable Developer's (as applicable) violation of any Environmental Law, or (B) any Release or threatened Release of a Hazardous Substance, or any condition of pollution, contamination or Hazardous Substance-related nuisance on, under or from the Site or Tehama Parcel, occurring after the Close of Escrow, except where such violation, Release or threatened Release, or condition was at any time caused by the gross negligence or intentional misconduct of the Hazardous Materials Indemnified Party seeking indemnification.

(b) The indemnification obligations by Developer with respect to violations of Environmental Law pursuant to clause (A) above shall, for each Developer, only apply to its own violation of Environmental Law, and the obligations with respect to Release or threatened Release of Hazardous Substances pursuant to clause (B) above shall be joint and several prior to Permanent Subdivision of the Site and, thereafter, shall apply with respect to each Developer (and/or its successor after a Transfer of one or more Portion(s)) only as to its ownership parcel(s).

(c) For purposes of this Section 3.02, the term "**Hazardous Substance**" shall have the meaning set forth in the Comprehensive Environmental Response, Compensation and Liability Act of 1980, as amended as of the date of this Agreement, 42 U.S.C. §9601(14), and in addition shall include, without limitation, petroleum (including crude oil or any fraction thereof) and petroleum products, asbestos, asbestos-containing materials, polychlorinated biphenyls ("**PCBs**"), PCB-containing materials, all hazardous substances identified in the California Health & Safety Code §§25316 and 25281(d), all chemicals listed pursuant to the California Health & Safety Code §25249.8, and any substance deemed a hazardous substance, hazardous material, hazardous waste, or contaminant under Environmental Law. The foregoing definition shall not include substances that occur naturally on the Sited. The term "**Environmental Law**" shall include all federal, state and local laws, regulations and ordinances governing hazardous waste, wastewater discharges, drinking water, air emissions, Hazardous Substance releases or reporting requirements, Hazardous Substance use or storage, and employee or community right-to-know requirements related to the work being performed under this Agreement.

(d) For purposes of this Section 3.02, the term "**Release**" shall mean any spilling, leaking, pumping, pouring, emitting, emptying, discharging, injecting, escaping, leaching, dumping, or disposing into the environment (including the abandonment or discharging of barrels, containers, and other closed receptacles containing any Hazardous Substance).

3.03 Risk of Loss

After Close of Escrow, all risk of loss with respect to any improvements on the Site or the Tehama Parcel shall be borne by Developer; provided that Successor Agency shall assign to Developer at

Close of Escrow any unexpended insurance proceeds and any uncollected claims and rights under insurance policies covering such loss, if any.

3.04 Release

Effective from and after the Close of Escrow, Developer and Affordable Developer hereby waives, releases, acquits, and forever discharge Successor Agency and the TJPA to the maximum extent permitted by law, of and from any and all claims, actions, causes of action, demands, rights, liabilities, damages, losses, costs, expenses, or compensation whatsoever, direct or indirect, known or unknown, foreseen or unforeseen, that it now has because of or in any way growing out or connected with this Agreement and either the Site or the Tehama Parcel, including, without limitation, the condition of the Site or Tehama Parcel (including any such claim which arose prior to the Close of Escrow, but is discovered thereafter), except (i) matters arising from Successor Agency's or TJPA's fraud or intentional misrepresentation, (ii) any breach of this Agreement by Successor Agency prior to the Close of Escrow, or (iii) any breach of Successor Agency's post-Closing obligations under this Agreement.

DEVELOPER AND AFFORDABLE DEVELOPER BOTH EXPRESSLY WAIVES ITS RIGHTS GRANTED UNDER CALIFORNIA CIVIL CODE § 1542, AND ANY OTHER PROVISION OF LAW, THAT PROVIDES AS FOLLOWS:

A GENERAL RELEASE DOES NOT EXTEND TO CLAIMS THAT THE DEVELOPER, AFFORDABLE DEVELOPER OR RELEASING PARTY DOES NOT KNOW OR EXPECT TO EXIST IN ITS FAVOR AT THE TIME OF EXECUTING THE RELEASE, AND THAT IF KNOWN TO IT WOULD HAVE MATERIALLY AFFECTED ITS AGREEMENT TO RELEASE SUCCESSOR AGENCY AND THE TJPA.

BY PLACING ITS INITIALS BELOW, DEVELOPER AND AFFORDABLE DEVELOPER SPECIFICALLY ACKNOWLEDGE AND CONFIRM THE VALIDITY OF THE RELEASES MADE ABOVE AND THE FACT THAT BOTH DEVELOPER AND AFFORDABLE DEVELOPER WERE REPRESENTED BY COUNSEL WHO EXPLAINED, AT THE TIME THIS AGREEMENT WAS MADE, THE CONSEQUENCES OF THE ABOVE RELEASES.

SUCCESSOR AGENCY:_____ DEVELOPER:_____ AFFORDABLE DEVELOPER:_____

ARTICLE 4 - CONSTRUCTION OF IMPROVEMENTS

4.01 Developer's General Development Obligation.

Developer shall bear all cost and responsibility for compliance with all applicable laws related to the development of the Site and Tehama Parcel in accordance with this Agreement, including without limitation the Subdivision Map Act, the Destroyed Land Records Relief Act, the City Building Code and Fire Code, the Redevelopment Requirements, the Project Approval Documents approved by Successor Agency, or such similar documents as reasonably required by the City, as applicable, and all other federal, state, and local laws, including all laws relating to accessibility for persons with disabilities, applicable to the development of either the Site or Tehama Parcel.

4.02 The Improvements

The Improvements are as defined in Recital U.

4.03 Developer's Construction Obligations

(a) Developer (in consultation with the Affordable Developer) shall direct the development process for the Improvements in the manner described in this paragraph, including but not limited to: forming and hiring the design and construction teams in compliance with applicable laws, rules, regulations and Successor Agency policies; providing the design team with the Development Component Diagram as shown on Attachment 5, and other information and timely decisions to facilitate creation of a design responsive to the requirements of this Agreement, causing the securing of all necessary public approvals and permits; providing clarification to the general contractor and prime contractors regarding construction scope to facilitate construction in conformance with the Project Approval Documents (as defined in Article 13); approving and processing necessary or owner-initiated changes to the work; administering the draw process to pay consultants and contractors in a timely and well-documented manner; coordinating with pertinent public agencies throughout design and construction to secure required approvals, including certificates of occupancy; monitoring the progress of design and construction of the Improvements; and monitoring and facilitating the leasing and property management activities of the Project (defined in Section 4.13(c)).

(b) Developer (in consultation with the Affordable Developer) shall diligently commence and thereafter carry out the construction of the Improvements to Completion of Construction (defined in Section 4.13) within the times and in the manner set forth in this Agreement, including without limitation the Schedule of Performance and Scope of Development and Project Approval Documents. In addition, Developer shall use commercially reasonable efforts to perform those actions listed in the Schedule of Important Project Dates on or before the dates provided in this Agreement (said dates being restated in the Schedule of Important Project Dates for convenience), or, with respect to those actions without dates provided in this Agreement, within the time listed in the Schedule of Important Project Dates. Notwithstanding anything in this Agreement to the contrary, the Parties agree that Developer's inability to perform an action listed in the Schedule of Important Project Dates within the associated period stated (or reprinted in) the Schedule of Important Project Dates shall not be a Developer default under this Agreement, provided that Developer has used commercially reasonable efforts required in the previous sentence and further provided that Developer continues to use commercially reasonable efforts to achieve said action or actions until such time as the Parties may mutually agree.

(c) Developer (in consultation with the Affordable Developer) shall construct, or cause to be constructed, the Improvements in accordance with Section 4.03(a) above and all applicable local, state and federal laws and regulations, including without limitation all laws relating to accessibility for persons with disabilities, the San Francisco Building Code, San Francisco Administrative Bulletin AB-093 (Implementation of Green Building Regulations), the Redevelopment Requirements, Mitigation Measures, and the Project Approval Documents (as that term is defined in the Design Review and Document Approval Procedures ("**DRDAP**," Attachment 15)) or such similar documents as reasonably required by the City, as applicable. Improvements shall be constructed to at least a Leadership in Energy and Environmental Design ("**LEED**") Silver (50 LEED Points) or 75 GreenPoint Rated points standard, as required by the City of San Francisco Green Building Code and the Development Controls.

(d) Sixty (60) days prior to the Construction Commencement Date, Developer shall submit to Successor Agency for its review and approval an active community liaison program for keeping neighborhood residents informed about construction of the Improvements.

(e) Developer shall comply with all City construction noise ordinances and regulations including, but not limited to, the following:

(i) San Francisco Police Code Article 29 "Regulation of Noise"; and

(ii) DBI's "Night Noise Permit Issuance Policy and Procedure".

(f) Developer shall be responsible for securing sufficient funding to construct the Mid-Rise Affordable Project and for constructing all portions of the Improvements necessary to allow for the commencement and completion of construction of the Mid-Rise Affordable Project in accordance with the Schedule of Performance. Other than providing the Successor Agency Loan, neither the Successor Agency nor MOHCD shall be responsible for any costs associated with the Mid-Rise Affordable Project. Developer shall be responsible for completion of the Mid-Rise Affordable Project.

4.04 Compliance with Redevelopment Requirements

The Project Approval Documents shall be in compliance with: (i) this Agreement, including, without limitation, the Scope of Development and (ii) the Redevelopment Plan, the Project Area Declaration of Restrictions, the Development Controls, the Transbay Redevelopment Project Area Design for Development ("D for D"), the Streetscape Plan, and the DRDAP (Attachment 15). The Redevelopment Plan, the Project Area Declaration of Restrictions, the Declaration of Site Restrictions, the Development Controls, the D for D, the Streetscape Plan, the DRDAP, and this Agreement, including the Scope of Development, are sometimes for convenience referred to as "**Redevelopment Requirements**."

4.05 Preparation of Project Approval Documents/Approval of Architect

(a) The Project Approval Documents shall be prepared by or signed by an architect (or architects) licensed to practice architecture in and by the State of California. A California-licensed architect shall coordinate the work of any associated design professions, including engineers and landscape architects. In any event:

(i) A California-licensed architect shall review all construction and certify that all construction has been built based on the design standards in the drawings and specifications as submitted by the architect and as included in the Project Approval Documents; and

(ii) A California-licensed structural and civil engineer shall review and certify all final foundation and grading design to be in substantial conformity with Project Approval Documents.

(b) The architect(s) for the Improvements shall certify that the Improvements have been designed in accordance with all local, state and federal laws and regulations relating to accessibility for persons with disabilities.

4.06 Submission of Project Approval Documents

Developer (in consultation with the Affordable Developer), shall prepare and submit Project Approval Documents to Successor Agency for review and approval in accordance with the Scope of Development, the DRDAP and the Schedule of Important Project Dates or Schedule of Performance (as applicable).

4.07 Scope of Successor Agency Review/Approval of Developer's Construction

(a) Successor Agency's review and approval of Project Approval Documents is limited to (i) a determination of their compliance with (A) the Redevelopment Requirements, and (B) the mitigation measures referred to in Section 9.02; (ii) urban design issues, including implementation of the Successor Agency's urban design objectives; and (iii) architectural design (excluding the interiors of market rate units) including, but not limited to, landscape design, including materials, plantings selection and

irrigation, site planning, the adequacy of utilities for servicing the Site, exterior and public area signs and public art work, if any. Successor Agency shall act reasonably and in good faith in its review and approval process.

(b) No Successor Agency review is made or approval given as to the compliance of the Project Approval Documents with any building codes and standards, including building engineering and structural design, or compliance with building codes or regulations, or any other applicable local, state or federal law or regulation relating to construction standards or requirements, including, without limitation, compliance with any local, state or federal law or regulation related to the suitability of the Improvements for use by persons with disabilities.

4.08 Construction Commencement

(a) Developer agrees, and the Grant Deed shall contain covenants, to commence construction of the Improvements (the date of commencement, the "**Construction Commencement Date**") on or before the Construction Commencement Outside Date specified in the Schedule of Performance and carry the development of the Improvements diligently to completion within the times specified in the Schedule of Performance. Developer shall evidence its compliance with this obligation by specifying to its general contractor a date for the general contractor to fully commence of work on the Improvements, established in a notice to proceed issued to the general contractor by Developer and/or its architect (which notice shall be simultaneously provided to OCII) and which notice shall not be modified prior to the Construction Commencement Date.

(b) For the purposes of this Agreement, the "**Commencement of Substantial Construction**" means the later to occur of the following: (i) date of issuance by the City's Department of Building Inspection ("**DBI**") of the foundation addendum to the site permit for the Project; and (ii) the date upon which Developer closes on construction financing for both the Tower Project and Mid-Rise Affordable Project as evidenced by executed and recorded deeds of trust or other documentation as Successor Agency may reasonably request.

(c) The Schedule of Performance is intended, and Developer hereby covenants, to facilitate the completion of the construction of the Improvements in a single phase.

4.09 Cost of Developer Construction

The cost of developing the Site and Tehama Parcel and construction of all Improvements thereon shall be borne solely by Developer, except as otherwise provided in this Agreement.

4.10 Issuance of Building Permit

(a) It is the intent of Developer to use the site permit process, as described in the DRDAP. Developer shall have the sole responsibility for obtaining all necessary site permits, associated addenda, and any other required building permits and shall make application for such permits directly to DBI. When applicable, Successor Agency shall reasonably and expeditiously cooperate with Developer in its efforts to obtain such permits, at no cost or expense to Successor Agency. Prior to commencing construction of any portion of the Improvements, Developer shall have each obtained the requisite site permit and associated addenda. From and after the date of its submission of any such application, Developer shall diligently prosecute such application.

(b) Developer and Affordable Developer are advised that DBI forwards all site and building permits to Successor Agency, when applicable, for Successor Agency approval of compliance with

Redevelopment Requirements. Successor Agency review of the site permit, associated addenda, or building permit does not include any review of compliance thereof with the requirements and standards referred to in Section 4.07(b) above, and Successor Agency shall have no obligations or responsibilities for such compliance. Successor Agency evidences its approval by signing such permit and returning the permit to DBI for issuance directly to Developer or Affordable Developer, as applicable. Approval of a site permit, associated addenda, or any other building permit, however, is not approval of compliance with all Redevelopment Requirements necessary for such a permit.

4.11 Delay of Construction Tax Increment Fee

(a) If the Completion of Construction (as defined in Section 4.13 below) does not occur by the date specified in the Schedule of Performance, then Developer shall pay to the TJPA a "**Delay of Construction Tax Increment Fee**" that is intended to fully recompense the increment of ad valorem property taxes lost due to Developer's failure to achieve Completion of Construction as so required.

(b) The Delay of Construction Tax Increment Fee shall be the amount of ad valorem property tax that would be due had the Developer timely completed the Project ("**Estimated Tax**"), less the amount of property tax actually due. To establish the amount of the Delay of Construction Tax Increment Fee, the Parties shall commence an appraisal and estimation process to establish both fair market value of the Site and Improvements, the ad valorem tax rate applicable to the Site and Improvements on the date specified in the Schedule of Performance for Completion of Construction, and the resulting amount of additional tax that would have been due had the Developer timely completed the Project, pro-rated to account for any partial tax year (the "**Estimation Process**"). The Estimation Process shall be as follows:

(i) Each Party shall, at its own expense, designate a licensed MAI Appraiser or other certified real estate professional with at least ten (10) years' experience in the sale and purchase of comparable commercial properties in the San Francisco market. If either party fails to designate its expert within twenty-one (21) days after Successor Agency delivers written notice pursuant to Section 4.11(d) below, then the expert selected by the other Party shall act alone and his/her determination shall be binding.

(ii) The two (2) experts selected by the Parties (the "**Party Experts**") shall each select a similarly qualified, independent appraiser or other expert whose expenses shall be shared equally by Developer and Successor Agency (the "**Neutral Expert**"). If the Neutral Expert cannot be agreed to by the Parties, then the American Arbitration Association, or any successor organization, shall select the Neutral Expert in accordance with its rules and procedures and subject to California law regarding the selection of arbitrators. The Parties shall jointly share the fees charged by the American Arbitration Association.

(iii) Each of the Party Experts shall within thirty (30) days after appointment and after soliciting, accepting and reviewing such information and documentation as each may deem necessary and appropriate, including that reasonably submitted by either Party, prepare a statement of what it considers to be the Estimated Tax based on its determination of the fair market value of the Site and Improvements if Developer achieved Completion of Construction by the date specified in the Schedule of Performance. Their determinations shall be prepared for property tax purposes according to California property tax law and the Property Tax Rules published by the California State Board of Equalization.

(iv) Once the two (2) Party Experts reach their conclusions, then the Neutral Expert shall select the determination of the Estimated Tax that he or she determinates to be most accurate, and the amount so calculated shall be used to calculate the amount of the Delay of Construction Tax immediately due and payable by Developer under this Section 4.11.

(c) Any costs incurred by Successor Agency pursuant to this Section 4.11 shall be reimbursed by the Developer pursuant to Section 12.01.

(d) Successor Agency may initiate, at any time after Developer has failed to meet the requirement in the Schedule of Performance for the Completion of Construction, the Estimation Process upon 21 days of notice to Developer; provided, however, that Successor Agency shall not initiate the Estimation Process more than once in a twelve-month period.

(e) Within 30 days after determination of the amount of the Delay of Construction Tax Increment Fee, Developer shall pay the fee directly to the TJPA. The TJPA shall remit to the Successor Agency 20% of the Delay of Construction Tax Increment Fee for Successor Agency's use in fulfilling its obligations under the Implementation Agreement and the Transbay Affordable Housing Obligation and shall retain the remainder for TJPA's use in fulfilling its obligations under the Pledge Agreement. Developer shall not receive a credit of any kind with the Assessor-Recorder for any payments made pursuant to this Section 4.11.

4.12 Construction Signs and Barriers

Developer, working with the Affordable Developer, shall provide appropriate construction barriers and construction signs and post the signs on the Site during the period of construction. The size, design and location of such signs and the composition and appearance of any non-moveable construction barriers shall be submitted to Successor Agency for approval before installation, which approval shall not be unreasonably withheld and shall otherwise comply with applicable laws.

4.13 Certificate of Completion

(a) Developer may request in writing that Successor Agency issue a Certificate of Completion, in the form of Attachment 16 hereto (the "**Certificate of Completion**"), recognizing that Developer has met the development obligations of this Agreement. In submitting such requests to Successor Agency for a Certificate of Completion, Developer shall provide: (i) DBI's Certificate of Final Completion and Occupancy ("**CFCO**") for the Improvements and (ii) a certification from Developer that it has satisfied in all material respects all obligations that are required to be satisfied under this Agreement for issuance by Successor Agency of the Certificate of Completion. Developer's certification shall include the following supporting documentation: (1) certification from Developer's architect that the Improvements have been constructed in accordance with the Project Approval Documents and in compliance with all applicable local, state and federal laws and regulations (including all laws relating to accessibility for persons with disabilities); (2) written determinations by the City of completion of streetscape or other public infrastructure improvements required under this Agreement, including a Determination of Completeness ("**DOC**") for improvements permitted by DPW and the City's acceptance, through action by the Board of Supervisors, of public improvements, including the public street constructed on the Tehama Parcel; and (3) any information necessary to determine compliance with Successor Agency Equal Opportunity Program, as described in Article 10 and Attachment 17, including Small Business Enterprise utilization reports, final certified payroll reports from Developer's construction contractors and subcontractors, construction workforce requirements, and the executed First Source Hiring Agreement between Developer and the Office of Economic and Workforce Development – CityBuild. Notwithstanding anything to the contrary contained herein, Successor Agency may, in its sole discretion, issue a Certificate of Completion for the Mid-Rise Affordable Project in accordance with the Air Rights Lease, notwithstanding the fact that the Tower Project may not be completed at that time.

(b) Upon receipt of such request, Successor Agency shall review the request and notify Developer within fifteen (15) days of receipt of the request of Successor Agency's determination of whether

or not it will issue the Certificate of Completion for the Improvements covered by the request. Any notice from Successor Agency stating that it will not issue the Certificate of Completion shall specify the reasons therefor following which Developer may seek to satisfy any unfulfilled obligations and again submit a request for the Certificate of Completion. Successor Agency's determination shall be based on Developer's compliance with the requirements of this Agreement that must be complied with to the date of the issuance of the Final CFCO for the Improvements.

(c) Upon Successor Agency's determination that Developer is in compliance with this Agreement, including, without limitation, Sections 5.05 and 9.04 below and upon Successor Agency's receipt of the documentation required of Developer in Section 4.13(a), Successor Agency shall promptly issue to Developer, in recordable form, a duly executed Certificate of Completion in the form of Attachment 16. So issued, the Certificate of Completion shall be a conclusive determination that (i) the Improvements have been constructed in accordance with this Agreement; and (ii) the full performance of the agreements and covenants contained in this Agreement and in the Grant Deed with respect to the obligations of Developer, and its successors and assigns, except for those provisions covered by Section 4.13(d), below, and those provisions that survive termination of this Agreement as provided in Section 5.12. "**Completion of Construction**" shall mean the date on which Successor Agency issues the Certificate of Completion, and after that date, the Improvements so constructed and certified pursuant to an executed Certificate of Completion are referred to as the "**Project**".

(d) Successor Agency's issuance and recordation of any Certificate of Completion does not relieve Developer or any other person or entity from any City requirements or conditions to occupancy of such Improvements, which requirements or conditions shall be complied with separately.

4.14 Right to Reconstruct the Improvements in the Event of Casualty

In the event that the Improvements are destroyed by casualty prior to the issuance of the Certificate of Completion, the Developer or Affordable Developer, as applicable, shall have the right to rebuild the applicable Improvements substantially in conformity with this Agreement and the approved Project Approval Documents, subject to changes necessary to comply with the applicable building code, and the Redevelopment Requirements or other local requirements then in effect for the Site.

4.15 Access to Site – Successor Agency

Successor Agency, the TJPA, the City, and their respective representatives will have the right to enter upon the Site and/or the Tehama Parcel during normal business hours with 48 hours' prior notice to Developer, at no cost or expense to Successor Agency, the TJPA or the City, during the period of construction of the Improvements to the extent necessary to carry out the purposes of this Agreement, including inspecting the work of construction of the Improvements. Developer will have the right to have an employee, agent or other representative of Developer accompany Successor Agency, the TJPA, the City, and their representatives at all times while they are present on the Site and/or the Tehama Parcel. Successor Agency, the TJPA, the City, and their respective representatives will exercise due care in entering upon and/or inspecting the Site and/or the Tehama Parcel and will perform all entry and inspection in a professional manner and so as to preclude any damage to the Site or Improvements, or any disruption to the work of construction of the Improvements. Successor Agency, the TJPA, the City and their respective representatives will abide by any reasonable safety and security measures Developer or its general contractor imposes.

4.16 Off-Site Infrastructure and Improvements Damage

In addition to the indemnification provisions contained in Section 11.01 of this Agreement, Developer further agrees to repair fully and/or replace to the reasonable satisfaction of Successor Agency, any damage to the off-site infrastructure and improvements within the Project Area existing as of the date of the Construction Commencement Date, including without limitation streets, sidewalks, curbs, gutters, drainage ditches, fences and utility lines lying within or adjacent to the Site, directly or indirectly resulting from work performed by or for Developer. Developer or its respective general contractor, before commencement of any work outside of the Site or Tehama Parcel, shall secure this obligation with a $1,000,000 bond or insurance in form reasonably acceptable to Successor Agency, or other security reasonably acceptable to Successor Agency, such as a personal guaranty. Developer's liability under this provision shall not be limited to the amount of the bond or insurance.

4.17 Insurance Requirements

Without in any way limiting Developer's or Affordable Developer's indemnification obligations under this Agreement, and subject to approval by Successor Agency of the insurers and policy forms, each of the Developer and Affordable Developer shall obtain and maintain, or shall contractually require others to maintain, throughout the Term, the minimum insurance coverage as set forth in Attachment 18.

ARTICLE 5 - COVENANTS AND RESTRICTIONS

5.01 Covenants

Developer expressly covenants and agrees for itself, its successors and assigns and all persons claiming under or through it, that as to the Site and Tehama Parcel and any Improvements constructed or to be constructed, the Project, or alterations or changes thereto, and in addition to any other term, covenant and condition of this Agreement, Developer and all such successors and assigns and all persons claiming under or through it, shall use, devote, operate and maintain the Site, Tehama Parcel and the Improvements, the Project, and every part thereof, only and in accordance with the provisions of this Agreement, including but not limited to Article 5 (subject to the provisions of Section 5.11 of this Agreement). The provisions hereof are contained in the Grant Deed, and/or Declaration of Site Restrictions. This provision shall only apply after the Close of Escrow and in the event Successor Agency exercises the Successor Agency Power of Termination and regains title to the Site, this provision shall be of no further force or effect.

5.02 General Restrictions

The Project shall be devoted only to the uses permitted by (i) the Redevelopment Plan and its Plan Documents (as defined in the Redevelopment Plan), (ii) the Project Area Declaration of Restrictions, (iii) this Agreement, (iv) the Declaration of Site Restrictions, (v) the Commercial Space Declaration (Attachment 28), and (vi) Affordability Requirements to be documented in the Air Rights Lease and a Declaration of Affordability Restrictions for each of the Mid-Rise Affordable Project (Attachment 19B) and the Tower Mixed-Income Rental Project (Attachment 19A) setting forth the affordability restrictions as described in Section 9.04(b) of this Agreement for the life of the Project. In the event Successor Agency exercises the Successor Agency Power of Termination and regains title to the Site, subsections (iii) and (iv) of this Section 5.02 shall be of no further force or effect.

5.03 Restrictions Before Completion

Prior to the Completion of Construction, the Site and the Tehama Parcel shall be used only for construction of the Improvements in accordance with this Agreement, including, but not limited to the Scope of Development. This provision shall only apply after the Close of Escrow and in the event Successor Agency exercises the Successor Agency Power of Termination and regains title to the Site pursuant to Section 8.03(a), this provision shall be of no further force or effect.

5.04 Nondiscrimination

(a) There shall be no discrimination against or segregation of any person or group of persons on account of age, race, color, creed, sex, sexual orientation, gender identity, marital or domestic partner status, disabilities (including AIDS or HIV status), religion, national origin or ancestry by Developer or any occupant or user of the Site in the sale, lease, rental, sublease, transfer, use, occupancy, tenure or enjoyment of the Site, or any part thereof, and Developer itself (or any person or entity claiming under or through it) shall not establish or permit any such practice or practices of discrimination or segregation with reference to the selection, location, number, use or occupancy of the Site or any part thereof, nor shall Developers or any occupant or user of the Site or any transferee, successor, assign or holder of any interest in the Site or any person or entity claiming under or through such transferee, successor, assign or holder, establish or permit any such practice or practices of discrimination or segregation, including, without limitation, with reference to the selection, location, number, use or occupancy of tenants, lessees, subtenants, sublessees, vendees or others of the Site or Improvements.

(b) Developer, for itself and or any person or entity claiming under or through it, further agrees and covenants that there shall be no discrimination against or segregation of, any person or group of persons on account of any basis listed in subdivision (a) or (d) of Section 12955 of the California Government Code, as those bases are defined in Sections 12926,12926.1, subdivision (m) and paragraph (1) of subdivision (p) of Section 12955, and Section 12955.2 of the California Government Code, in the sale, lease, sublease, transfer, use, occupancy, tenure, or enjoyment of the Site nor shall Developer or any person claiming under or through him or her, establish or permit any practice or practices of discrimination or segregation with reference to the selection, location, number, use or occupancy of tenants, lessees, subtenants, sublessees, or vendees in the premises herein conveyed.

(c) Notwithstanding the above, Developer shall not be in default of its obligations under this Section 5.04 where there is a judicial action or arbitration involving a bona fide dispute over whether Developer is engaged in discriminatory practices and Developer promptly acts to satisfy any judgment or award against Developer.

(d) The covenants of this Section 5.04 shall run with the land, and any transferee, successor, assign, or holder of any interest in the Site, or any occupant or user thereof, whether by contract, lease, rental, sublease, license, deed, mortgage or otherwise, and whether or not any written instrument or oral agreement contains the foregoing prohibitions against discrimination, shall be bound hereby and shall not violate in whole or in part, directly or indirectly, the nondiscrimination requirements set forth above; provided, however, in the event Successor Agency exercises the Successor Agency Power of Termination and regains title to the Site, this provision shall be of no further force or effect; provided, further, that nothing herein shall invalidate any applicable non-discrimination law.

(e) Elimination of Discriminatory Restrictions. Developers agree to take and to permit Successor Agency to take all steps legally necessary or appropriate to remove restrictions against the Site and Tehama Parcel, if any, that would violate any of the non-discrimination provisions of this Section, whether the restrictions are enforceable or not.

5.05 Restrictions on Affordable Housing Units

(a) The Affordable Housing Units shall remain subject to the affordability requirements specified in the Declaration of Affordability Restrictions for the life of the Project. For the purposes of this Agreement, "life of the Project" shall mean the time during which the Project, including any future modification thereto, remains in existence.

(b) For the life of the Project, neither Developer, Affordable Developer, nor any successor or assign may make or permit any material alteration, modification, addition and/or substitution of or to the location of the Affordable Housing Units without the express prior written consent of Successor Agency or its designee granted or withheld in its reasonable discretion and upon any terms and conditions Successor Agency or its designee reasonably requires.

(c) Developer shall also comply with the requirements in Section 9.04 related to the Affordable Housing Units for so long as Developer must comply with Sections 5.05(a) and (b).

5.06 No Mortgages

Until Developer has achieved the Commencement of Substantial Construction, there shall be no mortgage, encumbrance or liens on any portion of the Site and/or the Tehama Parcel, except for mortgages and deeds of trust related to the purchase of or construction on the Site and/or the Tehama Parcel or otherwise approved by Successor Agency in its reasonable discretion; provided, however, in the event Successor Agency exercises the Successor Agency Power of Termination and regains title to the Site, this provision shall be of no further force or effect.

5.07 No Changes Without Approval

For the period during which the Redevelopment Plan and Project Area Declaration of Restrictions are in effect, neither Developer nor any successor or assign may make or permit any change in the uses permitted on the Site or any Change in the Improvements (as defined below) without the express prior written consent of the Successor Agency to any proposed change in uses or any Change in the Improvements (defined below), which consent may be made subject to terms and/or conditions reasonably required by the Successor Agency; provided, however, in the event Successor Agency exercises the Successor Agency Power of Termination and regains title to the Site, this provision shall be of no further force or effect. "**Change in the Improvements**" is defined as any alteration, modification, addition and/or substitution of or to the Site or the Improvements that materially affects: (a) the density of development; (b) the extent and nature of the open space on the Site; (c) any public access to or through the Site and the Improvements; (d) the exterior design; (e) the exterior materials; and (f) the exterior color. For the purposes of this Section, "**exterior**" also includes the roof of the Improvements.

5.08 Transfer Payment Covenant

The Transfer Payment Covenant and Notice (Attachment 20) shall run with the land, and any transferee, successor, assign, or holder of any interest in a Residential Condominium Unit, shall be bound thereby and shall not violate in whole or in part, directly or indirectly, the requirements set forth therein.

5.09 Determination of Assessed Value

(a) Developer shall not (until the TJPA Bonds Final Maturity Date, as defined below) object to the assessed value of Block 4 by the Assessor-Recorder, but shall have the right to contest the

assessed valuation by the Assessor-Recorder in the event of a market downturn, where such contest is made solely on the basis of such market downturn; provided, however, that Successor Agency shall not object to or otherwise interfere with Developers' application for the welfare exemption as to the Mid-Rise Affordable Project and the BMR units in accordance with the California Revenue and Taxation Code Section 214(g) and the California State Board of Equalization Property Tax Rules.

(b) Developer shall (until the TJPA Bonds Final Maturity Date, as defined below) (i) provide information in its possession or reasonably accessible to Developer that the Assessor-Recorder, Successor Agency, or TJPA reasonably requests relating to the assessment of the value of new construction in progress, completed new construction, revenues from the sale and/or leasing of any portion of new development, applications for welfare tax exemption, and other relevant information pertinent to the assessment of Block 4 (or any portion thereof) or Developer's compliance with its obligations under this Section 5.09; and (ii) give the Successor Agency and the TJPA written notice of any planned changes in development ownership or management, contact information, or modifications to the original legal parcel boundaries (including parcel subdivision, air rights or condominium formation) at least 60 days in advance of any proposed change.

(c) The "**TJPA Bonds Final Maturity Date**" shall mean October 1, 2049, as such date shall be automatically extended in the event of subsequent financing that results in redemption of the TJPA Bonds, in part or in full, where such subsequent financing does not increase any obligation, requirement, or liability of Developer hereunder.

5.10 Casualty

Developer shall (until the TJPA Bonds Final Maturity Date) apply fire and casualty property insurance proceeds to the restoration of the development of the Site and the Improvements thereon if, in the reasonable judgment of the Successor Agency, the funds available to Developer in the event of all or partial destruction of the development are sufficient to restore the development to substantially its prior use and condition.

5.11 Effect, Duration and Enforcement of Covenants

(a) It is intended and agreed, and the Grant Deed and/or Declaration of Site Restrictions shall expressly provide, that the covenants provided in this Article 5 shall be covenants running with the land as and to the extent set forth in the Grant Deed and/or the Declarations of Site Restrictions and that they shall be, in any event and without regard to technical classification or designation, legal or otherwise, and except only as otherwise specifically provided in this Agreement itself, to the fullest extent permitted by law and equity,

(i) binding for the benefit and in favor of Successor Agency, as beneficiary, as to all covenants set forth in this Article 5; the City and the owner of any other land or of any interest in any land in the Project Area (as long as such land remains subject to the land use requirements and restrictions of the Redevelopment Plan and the Project Area Declaration of Restrictions), as beneficiary, as to the covenants provided in Sections 5.02 and 5.04; and their respective successors and assigns, and

(ii) binding against Developer, its successors and assigns to or of the Site and any Improvements thereon or any part thereof or any interest therein, and any party in possession or occupancy of the Site or the Improvements thereon or any part thereof. It is further intended and agreed that the covenants provided in this Article 5 shall remain in effect respectively as set forth herein, and the covenants in Section 5.02 shall remain in effect for the respective duration of the Redevelopment Plan and the Project Area Declaration of Restrictions; provided, however, that such agreements and covenants shall

be binding on Developer, its successors in interest or assigns, and each party in possession or occupancy, respectively, only for such period as that party shall have title to or an interest in or possession or occupancy of the Site or part thereof. In the event Successor Agency exercises the Successor Agency Power of Termination and regains title to the Site, such agreements and covenants shall be of no further force or effect, except to the extent that they are restatements of applicable law, including the Redevelopment Plan and Related Plan Documents (as defined in the Redevelopment Plan).

(b) In amplification, and not in restriction, of the provisions of the preceding Sections, it is intended and agreed that Successor Agency, the TJPA and the City and their respective successors and assigns, as to the covenants provided in this Article 5 of which they are stated to be beneficiaries, shall be beneficiaries both for and in their own right and also for the purposes of protecting the interest of the community and other parties, public or private, and without regard to whether Successor Agency or the City has at any time been, remains, or is an owner of any land or interest therein to which, or in favor of which, such covenants relate. Successor Agency, the TJPA and the City and their respective successors and assigns shall have the right, in the event of any of such covenants of which they are stated to be beneficiaries, to exercise all the rights and remedies, and to maintain any actions at law or suits in equity or other proper proceedings, to enforce the curing of such breach of such covenants to which it or any other beneficiaries of such covenants may be entitled including, without limitation, restraining orders, injunctions and/or specific enforcement, judicial or administrative. These rights and remedies are in addition to, and not in derogation of, the rights and remedies of Successor Agency set forth in this Agreement.

(c) The conveyance of the Site by Successor Agency to Developer is made and accepted upon the express covenants contained in this Article 5 as set forth herein, which, except only as otherwise specifically provided in this Agreement itself, shall survive the Certificate of Completion and shall be provided for in the Grant Deed and/or the Declaration of Site Restrictions and the Transfer Payment Covenant; provided that in the event Successor Agency exercises the Successor Agency Power of Termination and regains title to the Site pursuant to Section 8.03(a), all such agreements and covenants contained in this Article 5 shall be of no further force or effect, except to the extent that they are restatements of applicable law, including the Redevelopment Plan and Plan Documents (as defined in the Redevelopment Plan).

(d) The conveyance of the Tehama Parcel by Successor Agency to Developer is made and accepted upon the covenants contained in Section 2.02. Developer acknowledges that Section 2.02 constitutes a material inducement to the Successor Agency to enter into this Agreement, and failure to complete the applicable Improvements on the Tehama Parcel as required in this Agreement or failure to offer the Tehama Parcel to the City as provided in this Agreement shall be a material breach of this Agreement.

(e) Developer shall be entitled to notice and shall have the right to cure any breach or violation of all or any of the foregoing in accordance with Article 8.

5.12 Provisions Surviving Termination

The following provisions (together with any definitions or other general provisions necessary to implement the following provisions) shall survive Successor Agency's issuance and recordation of the Certificate of Completion, and shall also be incorporated into the Declaration of Site Restrictions (Attachment 11), and/or the Grant Deed, as applicable (Attachment 10):

(a) All requirements contained in Sections 3.01(a), (b) and (d) of this Agreement;

(b) All requirements contained in Sections 3.02, 3.03 and 3.04 of this Agreement until the expiration of such requirements as set forth therein;

(c) All requirements pertaining to Professional Liability and Builder's Risk in Attachment 18 of this Agreement until the expiration of such requirements as set forth therein;

(d) All requirements contained in Section 5.02 of this Agreement until the expiration of the Redevelopment Plan and the Declaration of Site Restrictions;

(e) All requirements contained in Section 5.04 of this Agreement;

(f) All requirements contained in Section 5.05 of this Agreement until the expiration of such requirements as set forth therein;

(g) All requirements contained in Section 5.07 of this Agreement until the expiration of the Redevelopment Plan and the Declaration of Site Restrictions;

(h) All requirements contained in Section 5.08 of this Agreement;

(i) All requirements contained in Section 5.09 of this Agreement, until the TJPA Bonds Final Maturity Date;

(j) All such requirements contained in Section 5.10 of this Agreement, until the TJPA Bonds Final Maturity Date;

(k) All requirements contained in Section 9.04 of this Agreement until the expiration of those requirements set forth in Section 5.05 of this Agreement;

(l) All requirements contained in Section 9.06(b) of this Agreement;

(m) All requirements contained in Section 9.07, but only for the life of the Project;

(n) All requirements contained in Section 9.08 of this Agreement, but only for the life of the Project;

(o) All requirements contained in Section 9.09 of this Agreement, but only for the life of the Project;

(p) All requirements and provisions contained in Section 9.10 of this Agreement for the life of each Condominium Unit; and

(q) All requirements contained in Sections 11.01 and 11.02 of this Agreement until the expiration of such requirements as set forth therein.

ARTICLE 6 - ANTI-SPECULATION, ASSIGNMENT, AND TRANSFER PROVISIONS

6.01 Representation as to Developer

Developer represents and agrees that its purchase of the Site and its other undertakings pursuant to this Agreement shall be used for the purpose of redevelopment of the Site and not for speculation in land holding.

6.02 Prohibition Against Transfer of the Site, the Improvements and the Agreement

(a) Subject to the terms of Article 7, which permits Mortgages to encumber the Project and the transfers described in Section 2.04(g), before the issuance by Successor Agency of the Certificate of Completion, neither Developer nor Affordable Developer shall make or create or suffer to be made or created any total or partial sale, conveyance, mortgage, encumbrance, lien, assignment, option to acquire, any trust or power, or transfer in any other mode or form, of this Agreement, the Site or the Improvements thereon, or any part thereof, or interest therein, or permit any significant change in the ownership of the Developer or Affordable Developer to occur or contract or agree to do any of the same (collectively a "**Transfer**") without the prior written approval of Successor Agency (the "**Successor Agency Approval**"), which shall not be unreasonably withheld. For avoidance of doubt, (i) this Section 6.02 shall not act to prevent Developer from retaining one or more Developer Affiliates (as defined below) to perform certain construction, development and other project management services with respect to the Improvements or the Project, which may include performance of certain of Developer's obligations under this Agreement on Developer's behalf, and (ii) the prohibitions on transfer in this Section 6.02 shall be of no further force or effect after the issuance of the Certificate of Completion, and (iii) the prohibitions on transfer in this Section 6.02 shall not prohibit the sale of individual Residential Condominium Units within the Tower Market-Rate Condominium Project. For purposes hereof, a "**Developer Affiliate**" shall mean any entity controlling, controlled by, or under common control with Developer (and 'control' and its correlative terms 'controlling', 'controlled by' or 'under common control with' mean the possession, direct or indirect, of the power to direct or cause the direction of the management and policies of Developer, whether through the ownership of voting securities, by contract or otherwise);

(b) Notwithstanding the general prohibition in Section 6.02(a) above, and subject to the requirements of Section 6.03:

(i) Should Developer or any equity investor(s) in or lender(s) to Developer or its owner(s) remove or cause the removal of the Hines Urban F4, LLC from Developer, said party shall, immediately concurrent with such removal, propose a replacement entity that (a) has experience developing and completing projects of similar size and scope to the Improvements (including its affordable housing component) in California; (b) possesses a good business character and reputation; and which, upon the Successor Agency's reasonable concurrence that such entity meets the foregoing qualifications, shall assume the rights and obligations of the Hines/Urban entity (including, without limitation, the control or management of the day-to-day operation of development activities with respect to the Improvements) ("**Qualified Replacement Development Manager**");

(ii) Developer may, without Successor Agency approval:

(A) effectuate any Transfer of all of the rights and obligations of Developer hereunder to another entity so long as the Hines Urban F4, LLC (or a Qualified Replacement Development Manager previously approved pursuant to this Section 6.02(b)) controls or manages the day-to-day operation of such transferee entity's development activities with respect to the Improvements;

(B) effectuate any Transfer of any direct or indirect interest in Developer, provided the Hines Urban F4, LLC (or a Qualified Replacement Development Manager previously approved under this Section 6.02(b)) controls or manages the day-to-day operation of Developer's development activities with respect to the Improvements.

(iii) Developer or Affordable Developer (or its successor) may effectuate a Transfer that is permitted under the Air Rights Lease;

(iv) Developer may effectuate the encumbrance of the Site and Improvements with recorded documents, including, without limitation, easements, stormwater maintenance agreements, reciprocal easement agreements and parcel or subdivision maps, except where Successor Agency review and approval of such is included in this Agreement, if in connection with the construction of the Improvements and/or permanent financing for the Project;

(v) Developer may effectuate the encumbrance of the Site and Improvements with one or more regulatory agreements, restrictive covenants, or land use restriction agreements in connection with the bond financing, tax credits, and affordability restrictions.

6.03 Assumption by Transferee

Notwithstanding anything to the contrary contained in Section 6.02 or elsewhere in this Agreement, no Transfer of the rights and obligations of Developer hereunder that is either allowed by Section 6.02 without Successor Agency approval or that is made with Successor Agency approval shall be valid until such transferee shall assume in writing the obligations of the Developer from and after the date of such Transfer and agree to be bound by the terms and provisions hereof in a form approved by Successor Agency in its reasonable discretion. The transferee shall thereafter be solely responsible for the obligations and liabilities of Developer under this Agreement or any document entered into in connection with this Agreement, and Successor Agency shall release and forever discharge such assignor from any obligations and liabilities with respect to any other portions of the Improvements, the Project or Site under this Agreement or any document entered into in connection with this Agreement, subject to the Successor Agency's review and approval, in its reasonable discretion, of the assignment document with respect to such obligations and liabilities.

Provided further, that Developer agrees that any leases for any portion of the Improvements entered into prior to Commencement of Substantial Construction will include a provision that allows for the termination of the lease by the Successor Agency subsequent to its exercise, prior to the Commencement of Substantial Construction, of the Successor Agency Power of Termination and subject to any notice requirements (not to exceed 30 days) under the lease.

6.04 Effect of Violation

In the absence of specific written approval by Successor Agency, and except to the extent set forth in this Agreement, no Transfer shall be deemed to relieve Developer or any other party from any obligations under this Agreement prior to the Transfer, or deprive Successor Agency of any of its rights and remedies under this Agreement or the Grant Deed.

ARTICLE 7 - MORTGAGE FINANCING: RIGHTS OF MORTGAGEES

7.01 Mortgagee

For purposes of this Agreement, the "**Mortgagee**" shall singly and collectively include the following: (a) a mortgagee or beneficiary under a mortgage or a deed of trust concerning all or any portion of the Site (a "**Mortgage**"), and (b) any insurer or guarantor of any obligation or condition secured by a Mortgage concerning all or any portion of the Site. Subject to the terms and conditions set forth in this Article 7, Developer shall be entitled to grant one or more Mortgages on all or any portion of the Site.

7.02 Required Provisions of Any Mortgage

Developer agrees to have any Mortgage provide that such Mortgage is subject to all of the terms and provisions of this Agreement. Any Mortgage shall provide that the Mortgagee of such Mortgage shall give notice to Successor Agency in writing by registered or certified mail of the occurrence of any default by Developer, as applicable, under the Mortgage, and that Successor Agency shall be given notice at the time any Mortgagee initiates any Mortgage foreclosure action. In the event of any such default, Successor Agency shall have the right to cure such default, provided that Developer, as applicable, is given not less than fifteen (15) days' prior notice of Successor Agency's intention to cure such default. If Successor Agency shall elect to cure such default, Developer shall pay the cost thereof to Successor Agency upon demand, together with the interest thereon at the maximum interest rate permitted by law, unless (i) Developer cures such default within such 15-day period, or (ii) if curing the default requires more than fifteen (15) days and Developer shall have commenced cure within such fifteen (15) days after such notice, Developer shall have (A) cured such default within forty-five (45) days or such greater time period as may be allowed by Mortgagee after commencing compliance, or (B) obtained from the Mortgagee a written extension of time in which to cure such default.

7.03 Address and Acknowledgment of Mortgagee

No Mortgagee shall be entitled to exercise the rights set forth in this Article 7 unless and until written notice of the name and address of the Mortgagee shall have been given to Successor Agency, notwithstanding any other form of notice, actual or constructive. Successor Agency shall, upon written request, promptly acknowledge receipt of the name and address of the Mortgagee and confirm to such party that such party is or would be, upon closing of its financing or its acquisition of an existing Mortgage, a Mortgagee entitled to all rights under this Article 7 and a Bona Fide Institutional Lender, provided that Successor Agency receives reasonable proof of the foregoing. Such acknowledgment shall, if requested, be in recordable form and may be recorded at Developer's expense. After reviewing the proof of the status of any prospective mortgagee, if Successor Agency reasonably determines that any such acknowledgment requested by Developer or such prospective mortgagee or assignee would be inaccurate, then Successor Agency shall promptly notify Developer and the prospective Mortgagee or assignee of such determination. Such notice shall specify the reasonable basis for Successor Agency's determination. If Successor Agency has received notice of any Mortgagee, then such notice shall automatically bind Successor Agency's successors and assigns.

7.04 Mortgagee's Right to Cure

If Developer creates a Mortgage on the Site in compliance with the provisions of this Article 7, then so long as any such Mortgage shall remain unsatisfied of record, the following provisions shall apply:

(a) Successor Agency, upon serving Developer or Affordable Developer, as applicable, any notice of default or any other notice under the provisions of or with respect to this Agreement, shall also serve a copy of such notice upon any Mortgagee at the address provided to Successor Agency pursuant to this Agreement, and no notice hereunder by Successor Agency to either of the Developers shall affect any rights of a Mortgagee unless and until a copy thereof has been so served on such Mortgagee provided that Mortgagee has complied with Section 7.03 above.

(b) Any Mortgagee shall have the right to remedy, or cause to be remedied, any Default of Developer or Affordable Developer, within the later to occur of (i) one hundred twenty (120) days following the date of Mortgagee's receipt of the notice referred to in Section 7.04(a) above, or (ii) one hundred twenty (120) days after the expiration of the period provided herein for Developer or Affordable

Developer to remedy or cure such default, and Successor Agency shall accept such performance by or at the insistence of the Mortgagee as if the same had been timely made by Developer or Affordable Developer.

(c) Any notice or other communication which Successor Agency shall desire or is required to give to or serve upon the Mortgagee shall be in writing and shall be served in the manner set forth in Section 12.03, addressed to the Mortgagee at the address provided for in this Agreement.

(d) Any notice or other communication which Mortgagee shall give to or serve upon Successor Agency shall be deemed to have been duly given or served if sent in the manner and at Successor Agency's address as set forth in Section 12.03, or at such other address as shall be designated by Successor Agency by notice in writing given to the Mortgagee in like manner.

7.05 Application of Agreement to Mortgagee's Remedies

Except as provided in Section 7.02, no provision of this Agreement shall limit the right of any Mortgagee to foreclose or otherwise enforce any mortgage, deed of trust or other encumbrance upon the Site, nor the right of any Mortgagee to pursue any remedies for the enforcement of any pledge or lien upon the Site; provided, however, that in the event of a foreclosure sale under any such mortgage, deed of trust or other lien or encumbrance or sale pursuant to any power of sale contained in any such mortgage or deed of trust, or other lien or encumbrance, the purchaser or purchasers and their successors and assigns and the Site shall be, and shall continue to be, subject to all of the conditions, restrictions and covenants herein provided for, but not any past due obligations of Developer or Affordable Developer, as applicable, for which the applicable Developer or Developers shall remain liable. In no event shall any Mortgagee be in default of any such future obligations provided for in this Agreement until at least one hundred twenty (120) days after the date of the transfer of title to the Site or the applicable equity collateral, as the case may be, plus any cure periods provided for hereunder.

7.06 No Obligation to Construct Improvements or Pay Money Damages

No Mortgagee, including without limitation any Mortgagee who obtains title to the Site or any part thereof as a result of foreclosure proceedings or action in lieu thereof (but not including any other party who thereafter obtains title to the Site or any part thereof from or through such Mortgagee or any purchaser at a foreclosure sale other than the Mortgagee), shall in any way be obligated by the provisions of the Agreement to either pay money damages or other consideration to Successor Agency, or to construct or complete the Improvements, nor shall any covenant or any other provision in the Redevelopment Plan, the Project Area Declaration of Restrictions, or any other document, instrument or plat whatsoever be construed to so obligate any Mortgagee; provided, however, that nothing in this Agreement shall be construed to permit or authorize any Mortgagee to devote the Site or any part thereof to any uses, or to construct any improvements thereon, other than those uses or improvements provided or authorized in Section 5.02.

7.07 Accommodation of Mortgagee and Mortgagees Protections

Successor Agency is obligated to act reasonably in all dealings with Mortgagees, to make reasonable accommodations with respect to the interests of Mortgagees, and to agree to reasonable amendments to this Agreement as reasonably requested by a prospective mortgagee or mezzanine lender, and to execute any estoppels or similar documents reasonably requested by any Mortgagee or prospective mortgagee or mezzanine lender.

7.08 Mortgagees of Affordable Air Space Parcel

For purposes of the Affordable Air Rights Parcel, the provisions of this Article 7 may be supplanted in the sole discretion of the Executive Director of the Successor Agency and replaced by the provisions of the Air Rights Lease.

ARTICLE 8 - DEFAULTS AND REMEDIES

8.01 Developer Default

The occurrence of any one of the events or circumstances listed as items (a) through (l) below shall constitute an "**Event of Default**" by Developer under this Agreement thirty (30) days after Developer's receipt of written notice from the Successor Agency of the alleged default (unless an alternative cure period is otherwise set forth below), or in the case of a default not susceptible of cure within thirty (30) days, Developer fails to promptly commence to cure such default and thereafter diligently to prosecute such cure to completion within a reasonable time, unless a different cure period is specified. Notwithstanding anything to the contrary in this Agreement, for the avoidance of doubt, no Event of Default by Affordable Developer, as included in Section 8.02, shall authorize or permit the Successor Agency to exercise any remedies against Developer (separate from any remedies applicable to an Event of Default of Developer) or excuse Successor Agency from performing its obligation to convey the Site to Developer as and when required by this Agreement (except as provided in Section 2.07(b)(ii)), and Developer shall have no obligations or liabilities for an Event of Default that is solely by Affordable Developer.

(a) Developer suffers or permits a Transfer to occur in a manner inconsistent with the provisions of Sections 2.02 or 6.02, or Developer allows any other person or entity (except Developer's authorized representatives or as otherwise contemplated by this Agreement or approved in writing by the Successor Agency) to occupy or use all or any part of the Site or the Tehama Parcel in violation of the provisions of this Agreement;

(b) After the Close of Escrow, Developer fails to pay real estate taxes or assessments on the Site or the Tehama Parcel prior to delinquency or places any mortgages, encumbrances or liens upon the Site, the Tehama Parcel or the Improvements on either, or any part thereof, in violation of this Agreement;

(c) Developer fails to achieve any milestone on or before the applicable time set forth in the Schedule of Performance, fails to diligently prosecute the construction of the Improvements to Completion of Construction on or before the applicable time(s) set forth in the Schedule of Performance or abandons or suspends construction of the Improvements for more than ten (10) consecutive days; and any such failure, abandonment or suspension continues for a period of thirty (30) days following the date of written notice thereof from Successor Agency. For the avoidance of doubt, the excusable delay provisions of Sections 8.08(a) and 8.08(b) are applicable to potential defaults under this Section 8.01(c);

(d) Developer defaults under any other agreement between Successor Agency and Developer and fails to cure the same in the manner provided under such other agreement, and such default shall not have been cured within thirty (30) days following the date of written demand to cure by Successor Agency to Developer, provided that Successor Agency's remedies for a default under the other agreement between Successor Agency and Developer shall be limited to the remedies respectively set forth therein;

(e) Developer fails to pay any amount required to be paid hereunder;

(f) Developer does not accept conveyance of the Site in violation of this Agreement upon tender by Successor Agency pursuant to this Agreement, or Developer fails to close escrow by the Outside Date for Close of Escrow for any reason other than failure of Developer Conditions or as otherwise provided herein, and such failure shall not have been cured within five (5) business days following the date of written demand to cure by Successor Agency to Developer;

(g) Developer is in default under Successor Agency's Equal Opportunity Program, Attachment 17; provided, however, Successor Agency's remedies for any default under Successor Agency's Equal Opportunity Program shall be only as set forth in Successor Agency's Equal Opportunity Program, Attachment 17;

(h) Developer fails to obtain a site permit with associated addenda, and all other necessary permits for the Improvements to be constructed on the Site and the Tehama Parcel within the periods of time specified in this Agreement, including the Schedule of Performance, as applicable;

(i) Developer does not submit all material Project Approval Documents as required by this Agreement within the periods of time respectively provided therefor in the Schedule of Performance, as applicable;

(j) After the Close of Escrow, Developer defaults in the performance of or violates any covenant, or any part thereof, set forth in Sections 2.02 or 4.04, the then-effective provisions of Article 5 or Article 9, the Declaration of Site Restrictions, Declaration of Affordability Restrictions, Commercial Space Restrictions or in the Grant Deed;

(k) Developer fails to perform under any other agreements or obligations on Developer's part to be performed under this Agreement and such failure or breach continues for the period of time for any cure or the expiration of any grace period specified in this Agreement therefor, or if no such time or grace period is specified, within thirty (30) days after the date of written demand by Successor Agency to Developer to perform such agreement or obligation or cure such breach, or in the case of a default not susceptible of cure within thirty (30) days, Developer fails promptly to commence to cure such default and thereafter diligently to prosecute such cure to completion within a reasonable time-including, without limitation, any obligations set forth in Sections 8.01(i) and 8.01(j);

(l) A material breach of any representation or warranty made by Developer.

8.02 Affordable Developer Default

The occurrence of any one of the following events or circumstances shall constitute an "**Event of Default**" by Affordable Developer under this Agreement thirty (30) days after Affordable Developer's receipt of written notice from the Successor Agency of the alleged default and opportunity to cure (unless an alternative cure period is otherwise set forth below), or in the case of a default not susceptible of cure within thirty (30) days, Affordable Developer fails promptly to commence to cure such default and thereafter diligently to prosecute such cure to completion within a reasonable time, unless a different cure period is specified; provided, however, that no such matter shall constitute an Event of Default to the extent that, within thirty (30) days following its receipt of written notice from the Successor Agency that an Event of Default under this Section 8.02 exists, Developer proposes a substitute Affordable Developer to the Successor Agency for its approval, which approval shall not be unreasonably withheld, delayed or conditioned, and, within thirty (30) days following Successor Agency's approval, the substitute Affordable Developer agrees in writing to be bound by the terms of this Agreement from and after the date of substitution; provided, however, that Developer shall be obligated to commence the cure of any Affordable Developer Event of Default that (i) constitutes an emergency that threatens public health or safety, or (ii) if left uncured,

would threaten the ability of any replacement Affordable Developer to perform its obligations under this Agreement. Notwithstanding anything to the contrary in this Agreement, for the avoidance of doubt, no Event of Default, as included in Section 8.01, by Developer shall authorize or permit the Successor Agency to exercise any remedies against Affordable Developer (separate from any remedies applicable to an Event of Default of Affordable Developer), and Affordable Developer shall have no obligations or liabilities for an Event of Default that is solely by Developer.

(a) Affordable Developer suffers or permits a Transfer to occur that is not expressly allowed under or consented to pursuant to Article 6; or Affordable Developer allows any other person or entity (except Affordable Developer's authorized representatives or as otherwise contemplated by this Agreement or approved in writing by the Successor Agency) to occupy or use all or any part of the Affordable Air Rights Parcel in violation of the provisions of this Agreement;

(b) Affordable Developer does not execute the Air Rights Lease and accept the leasehold interest of the Affordable Air Rights Parcel as and when required by, and subject to all terms and conditions of, this Agreement upon tender by Successor Agency pursuant to this Agreement, and such failure continues for a period of five (5) business days following the date of written notice from Successor Agency;

(c) Affordable Developer is in default under the Successor Agency's Equal Opportunity Program, Attachment 17; provided, however, that any rights to cure and Successor Agency's remedies for any default under the Successor Agency's Equal Opportunity Program shall be only as set forth in the Successor Agency's Equal Opportunity Program, Attachment 17;

(d) Affordable Developer defaults in the performance of or violates any covenant, or any part thereof, set forth in Article 5 but only to the extent such covenants apply to Affordable Developer and the Mid-Rise Affordable Project. The language of this paragraph shall not be construed to limit the right of the Affordable Developer to contest, under the terms of this Agreement, the allegation of default in the performance or violation of any covenant, or any part thereof, set forth in Article 5.

(e) Affordable Developer fails to perform any other agreements or obligations on Affordable Developer's part to be performed under this Agreement, other than Affordable Developer's failure to perform a condition to Close of Escrow under Section 2.07, or a material breach of any representation or warranty made by Affordable Developer.

(f) A material breach of any representation or warranty made by Affordable Developer.

Notwithstanding the foregoing, any act or omission by Affordable Developer that would otherwise constitute an Event of Default under this Section 8.02 that is a direct result of or solely attributable to an act or omission by Developer shall not be an Event of Default by Affordable Developer, and Affordable Developer shall have no liability therefor.

8.03 Remedies of Successor Agency upon the Occurrence of an Event of Default by Developer

Upon the occurrence of an Event of Default by the Developer, the Successor Agency shall have the remedies set forth below.

(a) Termination of Agreement/Retention of Good Faith Deposit

(i) Prior to Close of Escrow. Upon the occurrence of an Event of Default by Developer prior to Close of Escrow, Successor Agency may, in its sole option and as its sole and exclusive remedy, terminate this Agreement and in such case, Developer shall forfeit any right to reimbursement of the Good Faith Deposit and Successor Agency shall be entitled to receive and retain the Good Faith Deposit. For the sake of clarification, Section 8.03(c) shall not be applicable with respect to an Event of Default by Developer prior to Close of Escrow.

(ii) Prior to Commencement of Substantial Construction. Upon occurrence of an Event of Default by Developer after Close of Escrow but prior to Commencement of Substantial Construction, Successor Agency may, in its sole option, terminate this Agreement; in such case, Developer shall forfeit any right to reimbursement of the Good Faith Deposit and Successor Agency shall be entitled to receive and retain the Good Faith Deposit. In addition, Successor Agency shall have the right, under the Grant Deed and subject to the terms of this Agreement, to record a reversionary quitclaim deed, substantially in the form of Attachment 14 hereto ("**Developer's Quitclaim Deed**"), re-enter and take possession of the Site and the Tehama Parcel, and to terminate (and revest in Successor Agency) the right, title, or interest conveyed by the Grant Deed to Developer, at no cost to Successor Agency (collectively, the "**Successor Agency Power of Termination**"); provided, however, Successor Agency shall provide Developer and Title Company with at least three (3) business days prior written notice of its intention to instruct the Title Company to record Developer's Quitclaim Deed (which notice shall be in addition to any other notice provided under Section 8.01 above). If Successor Agency exercises the Successor Agency Power of Termination, then (i) Developer shall have no further right, title or interest in or to the Site and the Tehama Parcel and (ii) Successor Agency may record Developer's Quitclaim Deed and proceed with developing the Site and the Tehama Parcel in accordance with its obligations under the Implementation Agreement and the Transbay Affordable Housing Obligation.

THE PARTIES AGREE THAT SUCCESSOR AGENCY'S ACTUAL DAMAGES, IN THE EVENT OF DEFAULT BY DEVELOPER PRIOR TO COMMENCEMENT OF SUBSTANTIAL CONSTRUCTION, WOULD BE EXTREMELY DIFFICULT OR IMPRACTICABLE TO DETERMINE. THEREFORE, BY PLACING THEIR INITIALS BELOW, THE PARTIES ACKNOWLEDGE THAT THE AMOUNT DESCRIBED IN THIS SECTION HAS BEEN AGREED UPON, AFTER NEGOTIATION, AS THE PARTIES' REASONABLE ESTIMATE OF SUCCESSOR AGENCY'S DAMAGES AND AS A REMEDY AGAINST DEVELOPER, AT LAW OR IN EQUITY, IN THE EVENT OF DEFAULT COVERED BY THIS SECTION ON THE PART OF DEVELOPER. RETENTION OF SUCH AMOUNT BY SUCCESSOR AGENCY SHALL CONSTITUTE LIQUIDATED DAMAGES TO SUCCESSOR AGENCY PURSUANT TO CALIFORNIA CIVIL CODE SECTIONS 1671, 1676 AND 1677.

SUCCESSOR AGENCY: _____ DEVELOPER: _____

If Successor Agency receives and retains the Good Faith Deposit as liquidated damages, exercises the Successor Agency Power of Termination, and receives title to the Site and the Tehama Parcel, free and clear of any obligation to convey the same to Developer, then Successor Agency shall not have the remedy of specific performance.

(b) Specific Performance. Except as provided above in Section 8.03(a) and solely with respect to the rights of Successor Agency after Commencement of Substantial Construction, Successor Agency shall have the right to institute an action for specific performance of the terms of this Agreement or of the Grant Deed to construct the Improvements.

(c) Additional Remedies. Successor Agency shall be entitled to exercise all other remedies at law or in equity, including, without limitation, (i) those provided in the Grant Deed (Attachment 10) and elsewhere in violation of the covenants described in Article 5; (ii) the Delay of Construction Tax Increment Fee described in Section 4.11; (iii) the Delay of Construction CBD Fee described in Section 9.03(a); (iv) the Delay of Construction CFD Fee described in Section 9.03(b); (v) the remedies set forth in the Equal Opportunity Program (Attachment 17); and (vi) the remedies set forth in the Prevailing Wage Provisions.

(d) Retention of Affordable Housing Fee. Termination of this Agreement for any reason prior to the execution of a loan agreement governing the distribution of the Successor Agency Loan shall not affect the Successor Agency's right under the Parcel F development agreement to receive and retain the Affordable Housing Fee to meet the Transbay Affordable Housing Obligation whether on the Site or elsewhere. After the execution of a loan agreement governing the Successor Agency Loan, the provisions of the loan agreement shall determine the Successor Agency's rights concerning the Affordable Housing Fee.

8.04 Remedies of Successor Agency Upon the Occurrence of an Event of Default by the Affordable Developer

Any Event of Default by the Affordable Developer under this Agreement will be considered an Event of Default under any agreements related to the development of the Improvements between the Affordable Developer and the Successor Agency or MOHCD (the "**Associated Documents**"). Accordingly, upon the occurrence of an Event of Default by the Affordable Developer, Successor Agency will be able to exercise all remedies provided for in the Associated Documents. Additionally, upon the occurrence of an uncured Event of Default by the Affordable Developer, and provided Developer has elected not to propose and engage a replacement Affordable Developer in accordance with the provisions of Section 8.02, the Successor Agency may propose a substitute affordable developer. Notwithstanding such approval rights, the Developer must work with the Successor Agency to identify and approve a substitute affordable developer upon the occurrence of an uncured Event of Default by the Affordable Developer in a timely manner so as not to affect the construction schedule and result in a Developer Event of Default.

8.05 Successor Agency Default

The occurrence of any one of the following events or circumstances shall constitute an Event of Default by Successor Agency under this Agreement:

(a) Successor Agency fails to convey the Site to Developer in violation of this Agreement, pursuant to Section 2.09, and such failure continues for a period of ten (10) days following the date of written notice thereof from Developer;

(b) Successor Agency fails to convey the leasehold interest in the Affordable Air Rights Parcel to Affordable Developer as and when required, and on the terms and conditions of, this Agreement, and such failure continues for a period of ten (10) days following the date of written notice thereof from the Affordable Developer; or

(c) Successor Agency fails to perform any other agreements or obligations on Successor Agency's part to be performed under this Agreement, and such failure continues for the period of time for any cure or the expiration of any grace period specified in this Agreement therefor, or if no such time or grace period is specified, within thirty (30) days after the date of written demand by Developer to Successor Agency to perform such agreement or obligation, or, in the case of a default not susceptible of

cure within thirty (30) days, Successor Agency fails promptly to commence to cure such default and thereafter diligently to prosecute such cure to completion within a reasonable time.

8.06 Remedies of Developer and Affordable Developer

For an Event of Default by Successor Agency hereunder, Developer and Affordable Developer shall have the following remedies:

(a) Limitation on Damages. Successor Agency shall not be liable to Developer or Affordable Developer for damages caused by any default by Successor Agency, including general, special, or consequential damages, or to expend money to cure a default by Successor Agency, except as provided in subparagraph (e) below, subject to the limitations contained in subparagraph (d) below.

(b) Right of Termination. For an Event of Default by Successor Agency prior to Close of Escrow, in addition to its other remedies at law and in equity, Developer shall have the right to terminate this Agreement and obtain a prompt return of the Good Faith Deposit, less those amounts to be withheld as provided in Section 1.02.

(c) Other Remedies. Subject to subparagraphs (a), (b) and (d), Developers shall be entitled to exercise all other remedies at law and in equity.

(d) Non-liability of Successor Agency Members, Officials and Employees. No member, official or employee of Successor Agency, the TJPA or City shall be personally liable to Developer or Affordable Developer, or any successor in interest, for any default by Successor Agency, TJPA or City or for any amount which may become due to Developer or successor in interest under the terms of this Agreement.

(e) Successor Agency Liability. If Escrow fails to close due to a failure of a Developer Condition, the Good Faith Deposit shall be returned to Developer, but Successor Agency shall have no liability for money except as provided in this Section 8.06(e).

8.07 Rights and Remedies Cumulative

Except with respect to rights and remedies expressly declared to be exclusive in this Agreement, the rights and remedies of the Parties to this Agreement, whether provided by law, in equity or by this Agreement, shall be cumulative, and the exercise by either party of any one or more of such rights or remedies shall not preclude the exercise by such Parties of any other or further rights or remedies for the same or any other default or breach by the other party. No waiver made by either party with respect to the performance, or manner or time thereof, of any obligation of the other party or any condition to its own obligation under this Agreement shall be effective beyond the particular obligation of the other party or condition to its own obligation expressly waived and to the extent thereof, or a waiver in respect to any other rights of the party making the waiver or any other obligations of the other party.

8.08 Force Majeure/Extensions of Time

(a) Force Majeure

(i) In the event of Force Majeure (defined below), neither Successor Agency nor Developer, as the case may be, nor any successor in interest ("**Delayed Party**", as applicable) shall be considered in breach of or default in any obligation or satisfaction of a condition, and provided that the Delayed Party continues to diligently pursue the resumption or completion of construction or other

milestone, as applicable, and otherwise complies with the applicable requirements of this Section 8.08, all applicable dates set forth in the Schedule of Performance and Schedule of Important Project Dates shall automatically be extended for any period of Force Majeure; provided, however, Force Majeure shall apply only if the Delayed Party seeking the benefit of the provisions of this Section has notified the other party in writing no later than ten (10) business days (or 30 calendar days if notice is provided after the Close of Escrow) after learning of the enforced delay, stating the cause or causes thereof and providing an explanation of the delay and evidence of the basis for delay reasonably requested sufficient for the other Party to verify the delay. "**Force Majeure**" for purposes of this Agreement means events that cause enforced delays in the Delayed Party's performance of its obligations under this Agreement due to one or more of the following causes, to the extent the cause is beyond the Delayed Party's reasonable control: acts of God or of a public enemy, acts of governmental entities (but not those of Successor Agency with regard to its own acts) including delays in the issuance of any permits required for construction of any of the Improvements, fires, casualties, floods, earthquakes, epidemics, pandemics, quarantine restrictions, freight embargoes, inability to obtain supplies or materials or reasonably acceptable substitute supplies or materials (provided that Developer has ordered such materials on a timely basis), unusually severe weather, unanticipated geotechnical conditions, archeological finds on the Site or the Tehama Parcel that, pursuant to the Mitigation Measures, require delay in construction activity, substantial interruption of work because of labor disputes, administrative appeals, litigation and arbitration (provided that in each such case that the Delayed Party proceeds with commercially reasonable due diligence to resolve any dispute that is the subject of such action), changes in laws, codes or ordinances or in the interpretation thereof, delays of subcontractors due to any of these causes.

(ii) If the delay caused by Force Majeure prior to Close of Escrow extends for more than twelve consecutive (12) months (or such longer period consistent with Section 8.08(b) below), then either Successor Agency or Developer, by written notice to the other, may terminate this Agreement, whereupon the Good Faith Deposit (less those amounts to be withheld as provided in Section 1.02) shall promptly be returned to Developer and the Parties shall have no further liabilities or obligations under this Agreement arising or accruing following such termination.

(b) Inability to Obtain Financing

(i) If Developer is unable, through no fault of its own, to obtain (x) financing on Commercially Reasonable Terms (as defined below) or (y) bond or equivalent financing with respect to the Mid-Rise Affordable Project as a result of the Mid-Rise Affordable Project's scoring under the then-applicable scoring system used by CDLAC or its successor, provided that the availability of such bond or equivalent financing is based on a competitive process (in contrast to an over-the-counter application) at the time Developer seeks such financing; then Developer may request that Successor Agency extend the Outside Date for Close of Escrow for up to six (6) months (the "**First Extended Closing Date**") to provide Developer additional time to seek such financing or substitute financing. If Developer is unable to obtain financing described in clauses (x) and (y) immediately above sixty (60) days prior to the First Extended Closing Date, then Developer may request that Successor Agency extend the Outside Date for Close of Escrow for up to an additional six (6) months from the First Extended Closing Date, for a total of twelve (12) months to provide Developer additional time to seek such financing or substitute financing. Upon an extension of the Outside Date for Close of Escrow pursuant to this subsection (i), all applicable dates set forth in the Schedule of Performance and Schedule of Important Project Dates shall automatically be extended for an equivalent period of time. Upon requesting an extension under this Section 8.08(b)(i) and as a condition to the continued validity of the extension, Developer covenants to diligently pursue specified or substitute financing for the entire period of any extension granted hereunder.

(ii) Developer shall provide, for all requests for extensions of the Outside Date for Close of Escrow under this subsection, objective and independent evidence that it is unable, through no

fault of its own, to obtain the financing described in clauses (x) or (y) of Section 8.08(b), as applicable. Developer's extension request are subject to Successor Agency's approval in its reasonable discretion.

(iii) At the request of Developer, during any period of extension of the Outside Date for Close of Escrow pursuant to Section 8.08(b)(i), Successor Agency and Developer shall negotiate, in good faith, changes to the Budget and Scope of Development to reduce Improvements costs and to improve the financeability of the Improvements (*i.e.*, to value engineer the Improvements).

(c) "**Commercially Reasonable Terms**" shall mean, without limitation, (i) non-recourse (except as against the Site and assuming acceptance of standard terms typically required by an institutional lender), (ii) loan-to-cost equal to 65%, and (iii) maximum interest rate of LIBOR + 325 BPS or the equivalent rate associated with SOFR (Secured Overnight Financing Rate) from a reputable construction lender.

(d) Extensions by the Successor Agency Executive Director. If Developer has been unable to perform an obligation listed in the Schedule of Performance on or prior to date that is ten (10) business days prior to the applicable date stated in the Schedule of Performance despite Developer's reasonable and diligent efforts to perform such obligation, then Developer may notify Successor Agency of Developer's impending Event of Default for a failure to meet a date stated in the Schedule of Performance and may request an extension of the applicable date in the Schedule of Performance. Such request shall specify the number of days of extension requested, provided that extensions shall be requested in not less than 60-day increments and shall not exceed an aggregate of six (6) months for a particular date in the Schedule of Performance. Not later than five (5) business days after receipt of such notice, Successor Agency shall approve or disapprove such request, which shall not be unreasonably withheld or conditioned. Additionally, the Successor Agency Executive Director may extend the time for Developers' performance of any term, covenant or conditions of this Agreement or permit the curing of any default upon such terms and conditions as the Successor Agency Executive Director determines appropriate, from time to time, without the necessity for further Commission action, so long as the cumulative extensions of any particular item do not exceed a total of twelve (12) months after the dates established in the original, unextended Schedule of Performance (or, if applicable, Schedule of Important Project Dates). Notwithstanding the fact that Sections 8.08(a)(i) or (ii) above are not satisfied, the Successor Agency Executive Director may, upon approval by the Commission, extend the time for Developers' performance of any term, covenant or conditions of this Agreement or permit the curing of any default upon such terms and conditions as Successor Agency Executive Director determines appropriate, from time to time; provided, however, that any such waiver or extension or permissive curing of any particular default shall not release any of Developers' obligations nor constitute a waiver of Successor Agency's rights with respect to any other term, covenant or condition of this Agreement or any other default in, or breach of, this Agreement.

8.09 Other Rights and Remedies

The rights and remedies provided to Successor Agency and Developer in this Article 8 are in addition to and not in derogation of other rights and remedies found in this Agreement and in the Grant Deed, but not set forth in this Article 8, but in no event shall (i) Successor Agency have any liability for money or to expend money except as provided in Section 8.06(e).

8.10 General

(a) Subject to the limitations thereon contained in this Agreement, either party may institute legal action to cure, correct or remedy any default, or to obtain any other remedy consistent with the terms of this Agreement. Such legal actions shall be instituted in the Superior Court of the City and

County of San Francisco, State of California, and any other appropriate court in that City and County or, if appropriate, in the Federal District Court in San Francisco, California.

(b) In the event that any legal action is commenced by Developer against Successor Agency, service of process on Successor Agency shall be made by any legal service upon the Executive Director of Successor Agency, or its counsel, or in such other manner as may be provided by law. In the event that any legal action is commenced by Successor Agency against either Developer, service of process on Developer, as applicable, shall be made by personal service at the address provided for Section 12.03 or at such other address as shall have been given to Successor Agency by either of the Developers pursuant to Section 12.03 of this Agreement, or in any other manner as may be provided by law, and shall be valid whether made within or without the State of California.

ARTICLE 9 - SPECIAL TERMS, COVENANTS AND CONDITIONS

9.01 Timing of Completion; Mid-Rise Affordable Project.

No Residential Condominium Unit shall be eligible for, and the Developer shall not request that the City issue, a Temporary Certificate of Occupancy ("**Temporary C of O**") if such Temporary C of O would be issued prior to the City's issuance of the Temporary C of O for the Mid-Rise Affordable Project.

9.02 Mitigation Measures

Developer agrees that the construction and subsequent operation of all or any part of the Improvements shall be implemented, and otherwise be in accordance with all applicable mitigation measures set forth in the Mitigation Monitoring and Reporting Program ("**MMRP**") set forth in the Addendum to the Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project Final Environmental Impact Statement/Environmental Impact Report dated June 13, 2022 and included as Attachment 21. Prior to the Construction Commencement Date, Developer shall submit a mitigation plan that identifies responsible parties for complying with the requirements of the MMRP and a point of contact responsible for monitoring compliance with the MMRP. After start of construction activities, Developer shall submit quarterly reports to Successor Agency staff documenting compliance with the MMRP. Prior to receiving the CFCO, the applicant shall submit to Successor Agency staff a final report summarizing compliance with the MMRP during construction, including the start and end dates and duration of each construction phase, and all other specific information required in the MMRP. Developers shall provide to the entity, or entities, specified in Attachment 21, any required reports detailing the mitigation measures implemented by Developers and/or their contractors at the Site during demolition and construction of the Improvements until Completion of Construction of the Improvements, and through operation of the Improvements as applicable. These mitigation measures shall be incorporated by Developers into any appropriate contract for the construction or operation of the Improvements.

9.03 Established Districts.

(a) Community Benefit District.

(i) The Site and the Improvements are subject to the East Cut Community Benefit District ("**CBD**"), which was authorized by the Board of Supervisors on July 31, 2015 by Resolution No. 299-15. The CBD will help fund activities and improvements such as community services and maintenance of public improvements in the Transbay Center District to benefit the properties in the CBD, including maintenance of the rooftop park on the Transit Center, for a period of fifteen (15) years.

(ii) If the Completion of Construction does not occur by the dates specified in the Schedule of Performance (as such dates may be extended for Force Majeure), then Developer shall pay the Delay of Construction CBD Fee (as defined below). The "**Delay of Construction CBD Fee**" shall be an amount equal to the estimated CBD assessment amount that otherwise would have been due to the Assessor-Recorder if construction had completed by the dates specified in the Schedule of Performance (as so extended). For the purpose of this Section 9.03(b)(ii)(a)(ii), the "**amount that otherwise would have been due**" shall be the amount that would have been due under the assessments set forth in the Greater Rincon Hill Community Benefit District Management Plan dated July 2015 ("**District Management Plan**"), calculated as if the Improvements were subject to the District Management Plan from, and after, the date of Completion of Construction specified in the Schedule of Performance until the Improvements are subject to the District Management Plan.

(iii) If Developer has the right to vote in the future on renewal of the CBD, or on an amendment to the District Management Plan that would require Developer to pay an increased assessment for the Site and the Improvements that does not exceed the "Fair Share of Costs" (as defined below) attributable to the Site and the Improvements then Developer shall cast its ballot in favor of the CBD. "Fair Share of Costs" shall be as required in Proposition 218, meaning a portion of the costs described in Section 9.03(a)(i) that reflects a fair and equitable allocation of such costs amongst properties within the zone of special benefit of the public improvements in the Transbay District.

(iv) Developer shall pay the Delay of Construction CBD Fee to the TJPA. Developer shall not receive a credit of any kind with the Assessor-Recorder for any payments made pursuant to this Section 9.03(a).

(v) Developer waives and releases any and all rights, claims, losses, injuries, costs, damages, or causes of action that it may have now or in the future to challenge the initial assessment rates of the CBD, provided that the CBD does not require Developer to pay an initial assessment that exceeds the rates stated in Section 9.03(a)(ii). This waiver and release is a general release. Developer is aware of California Civil Code Section 1542, which reads as follows:

> A GENERAL RELEASE DOES NOT EXTEND TO CLAIMS THAT THE CREDITOR OR RELEASING PARTY DOES NOT KNOW OR SUSPECT TO EXIST IN HIS OR HER FAVOR AT THE TIME OF EXECUTING THE RELEASE, AND THAT IF KNOWN BY HIM OR HER WOULD HAVE MATERIALLY AFFECTED HIS OR HER SETTLEMENT WITH THE DEBTOR OR RELEASED PARTY.
>
> TO GIVE FULL FORCE AND EFFECT TO THE ABOVE GENERAL RELEASE, DEVELOPER HEREBY EXPRESSLY, KNOWINGLY, AND VOLUNTARILY WAIVES ALL THE RIGHTS AND BENEFITS OF SECTION 1542 AND ANY OTHER SIMILAR LAW OF ANY JURISDICTION. BY PLACING ITS INITIALS BELOW, DEVELOPER SPECIFICALLY ACKNOWLEDGES AND CONFIRMS THE VALIDITY OF THE RELEASES MADE ABOVE AND THE FACT THAT DEVELOPER WAS REPRESENTED BY COUNSEL WHO EXPLAINED, AT THE TIME THIS AGREEMENT WAS MADE, THE CONSEQUENCES OF THE ABOVE RELEASES.
>
> _____
> Developer acknowledges the above general release.

(b) Mello-Roos Community Facilities District.

(i) The Improvements (other than the Mid-Rise Affordable Project) are subject to the provisions of the City and County of San Francisco Community Facilities District No. 2014-1 (Transbay Transit Center) ("**CFD**"), as described in the CFD Rate and Method of Apportionment ("**RMA**") attached hereto as Attachment 22. The CFD will help pay the costs of constructing the new Transbay Transit Center, the Downtown Rail Extension, and other infrastructure in the Transit Center District area.

(ii) Prior to and as a condition of Close of Escrow, Developer shall deposit with the Title Company a duly executed and acknowledged "Unanimous Approval of Annexation to a Community Facilities District and Related Matters" form in favor of annexing the Site into the CFD to be dated by the Title Company following recordation of the Grant Deed.

(iii) If the Completion of Construction does not occur by the dates specified in the Schedule of Performance (as such dates may be extended for Force Majeure), then Developer shall pay the Delay of Construction CFD Fee (as defined below). The "**Delay of Construction CFD Fee**" shall be an amount equal to the CFD special tax amount that otherwise would have been due to the Assessor-Recorder if construction had completed by the dates specified in the Schedule of Performance (as so extended) less any special CFD tax amounts actually assessed and paid by Developer. For the purpose of this Section 9.03(b)(iii), the "**amount that otherwise would have been due**" shall be the amount that would have been due under the special tax rates set forth in the RMA, calculated as if the applicable Improvements were subject to the RMA from, and after, the date of Completion of Construction specified in the Schedule of Performance until such Improvements are subject to the CFD.

(iv) Developer shall pay the Delay of Construction CFD Fee to the TJPA. Developer shall not receive a credit of any kind with the Assessor-Recorder for any payments made pursuant to this Section 9.03(b).

(v) Developer waives and releases any rights it may have now or in the future to challenge the legal validity of the CFD or any part of the CFD. This waiver and release is a general release. Developer is aware of California Civil Code Section 1542, which reads as follows:

> A GENERAL RELEASE DOES NOT EXTEND TO CLAIMS THAT THE CREDITOR OR RELEASING PARTY DOES NOT KNOW OR SUSPECT TO EXIST IN HIS OR HER FAVOR AT THE TIME OF EXECUTING THE RELEASE, AND THAT IF KNOWN BY HIM OR HER WOULD HAVE MATERIALLY AFFECTED HIS OR HER SETTLEMENT WITH THE DEBTOR OR RELEASED PARTY.
>

BY PLACING ITS INITIALS BELOW, DEVELOPER SPECIFICALLY ACKNOWLEDGES AND CONFIRMS THE VALIDITY OF THE RELEASES MADE ABOVE AND THE FACT THAT DEVELOPER WAS REPRESENTED BY COUNSEL WHO EXPLAINED, AT THE TIME THIS AGREEMENT WAS MADE, THE CONSEQUENCES OF THE ABOVE RELEASES.

_____
Developer acknowledges the above general release

9.04 Affordable Housing Requirements

In addition to the requirements of Section 5.05, the following requirements shall specifically apply to the Affordable Housing Units:

(a) Affordable Housing in Project

The Project shall include no fewer than one hundred five (105) BMR units in the Tower Mixed-Income Rental Project, and no fewer than two hundred two (202) units (including one unrestricted manager's unit) in the Mid-Rise Affordable Project. The Affordable Housing Units will remain as affordable units at the initial level of affordability for the life of the Project consistent with Section 9.04(b) 9.04(b) and will be restricted by a recorded declaration in substantially the form of Attachment 19A (the "Declaration of Affordability Restrictions (Tower)") or Attachment 19B (the "**Declaration of Affordability Restrictions (Mid-Rise)**"), as applicable (and collectively or individually, as applicable, referred to herein as the "**Declaration of Affordability Restrictions**"). These Declarations shall (1) be in a first lien position and (2) not be subordinated to any lien or other encumbrance during the term of such restrictions.

(b) Level of Affordability

(i) Mid-Rise Affordable Project. With the exception of one (1) unrestricted manager's unit, all of the residential units in the Mid-Rise Affordable Project shall be BMR units and shall have a distribution of income restrictions such that the cumulative average income restrictions required of all units shall be at a level affordable to households earning on average, at initial occupancy, seventy-three percent (73%) or less of the Area Median Income as published annually by MOHCD for the City and County of San Francisco, derived in part from the income limits and median income determined by HUD for the HUD Metro Fair Market Rent Area that contains San Francisco, adjusted only for household size, but not high housing cost area ("**AMI**"). To achieve this average:

- 20 units or approximately ten percent (10%) shall be affordable to households earning no more than forty percent (40%) of AMI;
- 9 units or approximately four percent (4%) shall be affordable to households earning no more than forty-five percent (45%) of AMI (eight units at this income level must be one-bedroom units);
- 10 units or approximately five percent (5%) shall be affordable households earning no more than fifty percent (50%) of AMI (eight units at this income level must be one-bedroom units);
- 33 units or approximately sixteen percent (16%) shall be affordable to households earning no more than sixty percent (60%) of AMI;
- 39 units or approximately nineteen percent (19%) shall be affordable to households earning no more than seventy percent (70%) of AMI;
- 47 units or approximately twenty-three percent (23%) shall be affordable to households earning no more than eighty percent (80%) of AMI;
- 38 units or approximately nineteen percent (19%) shall be affordable to households earning no more than ninety percent (90%) of AMI;

- 5 units or approximately two percent (2%) shall be affordable to households earning no more than one hundred percent (100%) of AMI; provided, however, that in no event shall this tier of units exceed the then-applicable equivalent of 80% AMI, as published by the California Tax Credit Allocation Committee ("TCAC").

Notwithstanding the foregoing, Successor Agency shall allow for adjustments to the above AMI levels if either: (1) a market study provided by the Affordable Developer at the time a funding application is submitted to TCAC and/or at the start of the marketing and lease up period shows that the Mid-Rise Affordable Project rents are not at least ten percent (10%) below the then-market rate effective rents; or (2) the Mid-Rise Affordable Project's construction lender or tax credit investor requires changes due to the tax credit income averaging rules and regulations.

(ii) Tower Mixed-Income Rental Project. At least one hundred five (105) of the residential units within the Tower Mixed-Income Rental Project will be BMR units restricted for affordability at the following AMIs:

- 21 units or approximately twenty percent (20%) shall be affordable to households earning no more than one hundred percent (100%) of AMI;

- 22 units or approximately twenty percent (20%) shall be affordable to households earning no more than one hundred ten percent (110%) of AMI;

- 62 units or approximately sixty percent (60%) shall be affordable to households earning no more than one hundred twenty percent (120%) of AMI.

(iii) The affordability levels of the Mid-Rise Affordable Project units as set forth in this Section 9.04(b) shall be distributed among the unit types detailed in Section 9.04(c) below as proposed by Developer, provided that Successor Agency or its designee shall approve such distribution in its reasonable discretion. Successor Agency or its designee shall approve any material changes to this distribution, and shall not unreasonably withhold approval of changes necessary to comply with tax credit requirements in connection with project financing.

(c) Unit Size, Mix and Location

(i) Affordable Housing Unit Minimum Size. The Affordable Housing Units shall not be less than 400 net square feet for a studio unit, 525 net square feet for a one-bedroom unit, 800 net square feet for a two-bedroom unit, and 1,000 net square feet for a three-bedroom unit.

(ii) Mid-Rise Affordable Housing Unit Mix. Affordable Housing Units in the Mid-Rise Affordable Project shall include a mix of ten percent (10%) three-bedroom units, forty-three percent (43%) two-bedroom units, and thirty-seven percent (37%) one-bedroom units, and ten percent (10%) studio units.

(iii) Tower Mixed-Income Rental Project Affordable Housing Unit Mix. Affordable Housing Units in the Tower Mixed-Income Rental Project shall include a mix of eleven percent (11%) three-bedroom units, thirty-three percent (33%) two-bedroom units, forty-five percent (45%) one-bedroom units, and eleven percent (11%) studio units.

(iv) Tower Mixed-Income Rental Project Distribution. Affordable Housing Units in the Tower Mixed-Income Rental Project shall be distributed on Floors 2-20 (the lower two thirds of the Tower Mixed-Income Rental Project) of the Tower, explicitly as shown in Attachment 23. Successor Agency or its designee shall approve any changes to this distribution in writing.

(d) Comparability and Quality of Units

(i) Average Size and Appliance Comparability; Tower Mixed-Income Rental Project. The average size of Affordable Housing Units in the Tower Mixed-Income Rental Project shall be at least eighty percent (80%) of the average size of the same unit types in market-rate units in the Tower Mixed-Income Rental Project. The specific units and their square footages in satisfaction of this requirement are shown in Attachments 19a and 23. The categories of appliances installed in the Affordable Housing Units in the Tower Mixed-Income Rental Project shall match the categories of appliances installed in the market-rate units. For example, if the market-rate rental units have washer/dryer hook-ups, dishwashers, and refrigerators, then the Tower Project Affordable Housing Units shall have washer/dryer hook-ups, dishwashers, and refrigerators. In no event, however, must the appliances in the Affordable Housing Units be of the same or comparable brands as the appliances in the market-rate units.

(ii) Comparability of Interior Features; Affordable Housing Units. The interior features of the Affordable Housing Units in the Project need not be the same as or equivalent to those in the market-rate units, provided that they are of high quality, durable and are consistent with the then-current standards for new housing, and shall be as specified in Attachment 24, Comparability of Affordable Project Units, which details agreed-upon finishes and specifications for the Affordable Housing Units and which may be modified only by prior written approval by Successor Agency or its designee.

(e) Parking

(i) Required Parking Allocations. Parking for no less than one vehicle per every four units (or fraction thereof) within the Mid-Rise Affordable Project shall be made available to tenants of the Mid-Rise Affordable Project. Any vehicle parking made available to occupants of the Tower Mixed-Income Rental Project shall be made available to the tenants of the Affordable Housing Units at the same vehicle-to-unit ratio made available to the market-rate units in the Tower Mixed-Income Rental Project, as more particularly described in the Inclusionary Manual. Vehicle parking designated for Affordable Housing Units must remain designated for use by Affordable Housing Unit tenants for the life of the Project, subject to the limited exception pursuant to Section 9.04(e)(ii) below.

(ii) Affordable Housing Unit Parking Space Leasing and Rates. Parking shall be made available to residents of the Affordable Housing Units consistent with the Inclusionary Manual, as amended from time to time. The current rates are outlined below. Initial rates and thereafter parking pricing for subsequent re-rental shall adhere to the Inclusionary Manual. Increases following leasing of parking spaces to tenants of the Affordable Housing Units shall be according to the Inclusionary Manual. For the avoidance of doubt, except as expressly provided in the REA with respect to cost sharing, Affordable Housing Developer shall have no responsibility for the parking garage structure operation or maintenance and shall have no right to any revenue therefrom.

(i) For Affordable Housing Units designated at 80% AMI and below, the lesser of $100 per month or 80% of the Project's average monthly parking rate for market rate vehicle parking;

(ii) For Affordable Housing Units designated at 81% to 110% AMI, the lesser of $175 or 80% of the Project's average monthly parking rate for market rate vehicle parking;

(iii) For Affordable Housing Units designated at 111% -120% AMI, the lesser of $250 or 80% of the Project's average monthly parking rate for market rate vehicle parking.

(iii) Developer will follow procedures established in the Inclusionary Manual for offering and pricing leased parking to residents of Affordable Housing Units. Following initial lease-up, and if vehicle parking designated for Affordable Housing Units remain available and there are no Affordable Housing Unit tenants on a waitlist for vehicle parking, Developer may follow procedures established in the Inclusionary Manual to seek approval from MOHCD to lease vehicle parking rights at market rate on a month to-month basis until an Affordable Housing Unit tenant requests vehicle parking designated for use by tenants of Affordable Housing Units.

(f) Marketing and Occupancy Preferences

(i) The initial and subsequent leasing of all Affordable Housing Units will be subject to the marketing obligations described in Attachment 25, Marketing Obligations, which include occupancy preferences for, among others, Certificate of Preference ("**COP**") holders, Displaced Tenants, Neighborhood Residents, and other targeted populations; provided, however, that such preferences shall not be required to be provided to the extent that granting such preferences will cause the Mid-Rise Affordable Project or the Tower Mixed-Income Rental Project to be in violation of the Fair Housing Act, the requirements of the tax exempt bond law and regulations, the tax credit laws and regulations, and/or regulations for funding through the California Department of Housing and Community Development.

(ii) Certificate of Preference Program Targeting. Developer has prepared a strategy to maximize the number and success of COP holders in securing housing within the Affordable Housing Units ("**COP Enhanced Outreach Strategies**") attached hereto as Attachment 26. Developer shall incorporate the strategies described in Attachment 26 into the early outreach plans for the Mid-Rise Affordable Project and the Tower Mixed-Income Rental Project, as described in Section 9.04(f)(iii) below.

(iii) Early Outreach Plan. No later than thirty (30) days after the Commencement of Substantial Construction, Developer shall deliver for Successor Agency and MOHCD's review and approval early outreach plans for initial marketing of the Affordable Housing Units consistent with Attachment 25 and an early outreach plan for COP holders, inclusive of the strategies described in Attachment 26 (COP Enhanced Outreach Strategies). Developer shall provide a plan for the units in the Mid-Rise Affordable Project and a separate plan for BMR units within the Tower. Developer shall not start the outreach activities until the Successor Agency provides approval of the Early Outreach Plans.

(iv) Marketing Plans. At least nine (9) months prior to first Temporary C of O for a residential unit in the Mid-Rise Affordable Project and the Tower Mixed-Income Rental Project, respectively, Developer shall submit to Successor Agency and MOHCD for their review and approval marketing plans, including written tenant selection plans, for the initial and ongoing leasing of all Affordable Housing Units in accordance with Attachment 25. Developer shall provide a plan for the units in the Mid-Rise Affordable Project and a separate plan for BMR units within the Tower.

(g) Resident Services for the Mid-Rise Affordable Project. The following will be provided for residents within the Mid-Rise Affordable Project:

(i) The Mid-Rise Affordable Project shall be staffed at a ratio of one (1) full time resident services staff member for every one hundred (100) units.

(ii) The services staff will routinely evaluate and provide services that respond to the needs of resident households, including the unique needs of individuals, working families, families

with children, and seniors. Staff will help connect residents to existing services in the neighborhood, at nearby properties operated by the Affordable Developer or their affiliates, and throughout the City, as needed. Funding for services staff shall be provided through the operating budget of the Mid-Rise Affordable Project. The Developer and Affordable Developer will provide a complete resident services plan, that includes services staffing as well as other programs and positions, pursuant to the Schedule of Important Project Dates.

9.05 Mid-Rise Affordable Project Financing.

(a) Deliveries and Compliance. (i) The Developer and Affordable Developer will provide a draft and final development budget, table of sources and uses, and a 20-year operating budget for the Mid-Rise Affordable Project to Successor Agency prior to the Close of Escrow and as reasonably requested by Successor Agency staff to evaluate applications for state and local funding; (ii) Financing for the Mid-Rise Affordable Project must comply with the then-current MOHCD Underwriting Guidelines for multi-family housing projects.

(b) Successor Agency Loan. Upon the closing of Developer's construction financing (meaning closing of all financing evidenced pursuant to Section 2.08), and provided the Developer has paid the Affordable Housing Fee to Successor Agency and obtained all necessary approvals for the disbursement thereof, the Successor Agency shall provide the entirety of the Affordable Housing Fee through one affordable housing loan between the Successor Agency and the Affordable Developer ("**Successor Agency Loan**") to provide a subsidy of up to Forty Six Million Seven Hundred Forty Nine Thousand Nine Hundred Twenty Eight and 46/100 Dollars ($46,749,928.46) and subject to approval by the Citywide Affordable Housing Loan Committee.

(c) Additional Affordable Housing Subsidy. In addition to the Purchase Price, the Developer shall provide any additional subsidy required to complete the Mid-Rise Affordable Project and maintain its affordability in compliance with Section 9.04(b) above, after all non-Successor Agency funding sources available for affordable housing have been secured by the Affordable Developer. Other than the Successor Agency Loan, there will be no additional subsidy from the Successor Agency or MOHCD; neither the Successor Agency nor MOHCD shall be responsible for any cost over-runs associated with the Mid-Rise Affordable Project. Developers shall cooperate with the Successor Agency to seek Citywide Affordable Housing Loan Committee and Commission approval of the financing plan and the Successor Agency Loan, and shall attend any hearings related to these approvals.

(d) Tax Exempt Bond Financing. If the Developer and Affordable Developer utilize a bond financing structure for the Mid-Rise Affordable Project, bonds must be issued through MOHCD's Multifamily Securities Program. The Developer, with the assistance of the Affordable Developer, will work with Successor Agency staff to submit an application to the California Debt Limit Allocation Committee ("**CDLAC**") for an allocation of tax-exempt bond funding. Successor Agency shall take all actions necessary on its part with respect to preparing and filing the application for the allocation of tax-exempt bonds so that Developer shall at all times be in compliance with the Schedule of Performance. After an allocation is granted by CDLAC, MOHCD will have approximately 180-days from such allocation to issue the tax-exempt bonds. During the period after the allocation of bond volume cap and prior to the expiration of the approximate 180-day period, Developer, Affordable Developer, and Successor Agency staff will work with the Developer and Affordable Developer's counsel, Bond Counsel, a Financial Advisor, and the City Attorney to prepare bond documents which include: a City Regulatory Agreement; Indenture Agreement; and, a Borrower Loan Agreement in "substantially final form." The Board of Supervisors acting for and on behalf of the City, acting through MOHCD, shall adopt an inducement/reimbursement resolution and timely publish notice of and conduct a TEFRA Hearing approving the issuance of the tax exempt bonds and thereafter the City shall issue the bonds. Regardless of the financing structure, the Mid-

Rise Affordable Project will be subject to an affordability restriction, through the recording of a Declaration of Affordability Restriction, that will require the Affordable Housing Units within the Mid-Rise Affordable Project to remain as BMR units at the initial level of affordability (subject to the terms therein) for the life of the Project.

9.06 Streetscape Improvements

(a) Developer shall complete or cause to be completed the design and construction of the Streetscape Improvements, in compliance with the Redevelopment Requirements and all applicable State laws and City ordinances and regulations. Any costs incurred to complete the Streetscape Improvements, including the cost of relocating utilities, shall be the sole responsibility of Developer. As provided in Section 2.02, Developer's obligation under this Section 9.06, and as may be further made a condition of approval of the Permanent Subdivision of the Site, shall include the obligation to construct and thereafter to convey to the City all public improvements on or in the Tehama Parcel as described in the Scope of Development (the "**Tehama Street Public Improvements**"), and fee title to the Tehama Parcel. Developer shall be solely responsible for the costs of constructing the Tehama Street Public Improvements.

(b) For the life of the Project, Developer shall maintain or cause to be maintained the Streetscape Improvements in compliance with the Redevelopment Requirements and all applicable laws of the State of California and the Ordinances and Regulations of the City and County of San Francisco, with the exception of the Tehama Street Public Improvements which shall be maintained by the City as City right of way after the City's acceptance thereof.

9.07 Open Space and Amenities

(a) Developer shall complete or cause to be completed the design and construction of the Public Open Space, Project Open Space and Amenities in accordance with the requirements of this Agreement including the Scope of Development.

(b) Developer shall maintain (or cause to be maintained) the Public Open Space and shall make it available to members of the public for the life of the Project. Prior to and as a condition of its receipt of Certification of Completion, Developer shall ensure compliance with this obligation by executing and recording in the Official Records a declaration encumbering the Site substantially in the form of Attachment 29 (Form of Declaration of Open Space Restrictions and Covenant to Maintain).

(c) Developer shall maintain, or cause to be maintained, the Project Open Space and Amenities, and make them available to residents of the Project, each in accordance with the requirements of the Scope of Development, the Redevelopment Requirements, laws of the State of California and the Ordinances and Regulations of the City and County of San Francisco, and shall include said requirements in the REA or other recorded covenants, conditions and restrictions with respect to the Project.

(d) Ongoing operation and maintenance costs of the Public Open Space, Project Open Space and Amenities may be allocated between the Tower Market-Rate Condominium Project, the Tower Mixed-Income Rental Project and the Mid-Rise Affordable Project as described in Section 9.11, subject to approval by DRE.

(e) Storage spaces shall be unbundled from any specific condominium or rental unit, available at at-cost rates to all condominium and rental residents on a 24-hour and seven day per week basis, and offered on a proportional basis in terms of number of spaces between the market-rate and Affordable Housing Units. Storage spaces assigned to tenants of Affordable Housing Units shall be monitored by MOHCD consistent with the Inclusionary Manual, including but not limited to (i) ensuring that at-cost rates

for tenants of Affordable Housing Units dot not exceed the amounts specified in the Inclusionary Manual, and (ii) requiring that the Developer maintain a waitlist of tenants of Affordable Housing Units interested in storage spaces depending on availability.

9.08 Shared Parking Garage

(a) Developer shall complete or cause to be completed the design and construction of the Shared Parking Garage, an approximately 66,496 square foot underground garage. The Parties agree that all parking within the Shared Parking Garage shall be unbundled and that the Shared Parking Garage shall accommodate no more than 275 private vehicles valet-parked and/or parked via stackers, which shall include a minimum of two accessible car share vehicles (unless no car share operator exists in the San Francisco market), and a minimum of 556 secured bicycle parking spaces. The Developer shall operate and maintain (or cause to be operated and maintained) the Shared Parking Garage, consistent with the REA.

(b) The Developer shall be responsible for all costs associated with the design, construction, and operation of the Shared Parking Garage.

(c) Parking shall be unbundled, and shall be no more than one vehicle per residential unit (except to the extent additional spaces are made available pursuant to 9.04(e)(iii)), in accordance with the following criteria:

(i) One vehicle for every unit in the Tower Market-Rate Condominium Project;

(ii) One vehicle for every four units in the Mid-Rise Affordable Project; and

(iii) The remaining vehicle parking allocated proportionally between market-rate and Affordable Housing Units in the Tower Mixed-Income Rental Project.

(d) Bicycle spaces shall be allocated proportionately between the market-rate and the Affordable Housing Units in the Tower Project and Mid-Rise Affordable Project and shall be made available to tenants of Affordable Housing Units free of charge.

(e) The garage door shall remain open during the normal business hours, then operable via call button and/or key-fob after hours. No commuter parking shall be allowed.

9.09 Public Benefit and Community Serving Commercial Uses

(a) All of the ground floor commercial square footage within the Mid-Rise Affordable Project shall be leased, subject to Successor Agency approval, to users that qualify as a "**Community Serving Commercial Use**" or a "**Public Benefit Use**," as those terms are defined in the Mayor's Office of Housing and Community Development Commercial Space Underwriting Guidelines (Feb. 2, 2018) (Attachment 27), as amended from time to time, or that meet a comparable standard if MOHCD no longer publishes Commercial Space Underwriting Guidelines ("**Community Commercial Space**"). Qualifying uses under the MOHCD Commercial Guidelines include the following:

(i) "Community Serving Commercial Use" means a land use, typically retail or other sales and services use, that provides a direct benefit to the community, e.g. a food market with affordable and healthy produce and other goods, community banking, or other neighborhood serving uses that have a demonstrated benefit to the residents of the Project; and

(ii) "Public Benefit Use" means a land use, typically programs or services, that primarily benefits low-income persons, is implemented by one or more 501(c)(3) public benefit corporations, and has been identified by the City or community as a priority use. Examples include, but are not limited to, childcare centers, adult day health centers, nonprofit office space, public libraries, supportive services for the residents of the affordable housing development, health clinics that serve the local community at no or low cost, arts-related spaces that provide programs, and classes and/or exhibition spaces available to community members at no or low cost.

(b) The Community Commercial Space will be integrated into the Mid-Rise Affordable Project under the ownership of the Affordable Developer (or by affiliate of Affordable Developer or master lease structure from Affordable Developer to an affiliate of Mercy Housing California as the master tenant). Alternatively, Affordable Developer may seek to obtain a commercial space subdivision (the "**Commercial Subdivision**") to create a separate legal parcel for the Community Commercial Space, which would be transferred and owned by an affiliate of Mercy Housing California (the "**Commercial Subdivision Owner**"). Prior to establishing either a master lease or a Commercial Subdivision, Affordable Developer will seek Successor Agency approval of the applicable structure. Affordable Developer (or its affiliate or master tenant) or the Commercial Subdivision Owner, as applicable, will be responsible for operating and leasing the Community Commercial Space in accordance with the restrictions specified in this Section 9.09. Revenue generated from the leasing of the Community Commercial Space will be used to pay Community Commercial Space expenses including operating and leasing expenses, service approved debt (if applicable), fund expenses related to shared common operating expenses as established in the REA and/or common area maintenance agreements. Net revenue generated from the leasing of the Community Commercial Space, regardless of the structure (integration with the Mid-Rise Affordable Project, Commercial Subdivision, or master lease), will be used to fund reserves for future capital/tenant improvements for the benefit of the Community Commercial Space. If there is no subdivision, revenue and expenses related to the Community Commercial Space will be incorporated into the operating budget of the Mid-Rise Affordable Project. If the Mid-Rise Affordable Project includes financing from the California Department of Housing and Community Development ("**HCD**") and there is no subdivision, the Community Commercial Space within the Mid-Rise Affordable Project shall be subject to HCD requirements regarding commercial income.

(c) Declaration of Restrictions. Prior to commencement of the marketing process, if the Community Commercial Space is a separate commercial condominium then the Community Commercial Space will be restricted by a recorded Declaration in substantially the form of Attachment 28 (the "**Declaration of Restrictions for Community Commercial Space**"). The Declaration shall (1) be in a first lien position and (2) not be subordinated to any lien or other encumbrance during the term of such restrictions.

(d) Warm Shell Conditions. Developer shall provide the Community Commercial Space in "**Warm Shell**" condition as defined by the MOHCD Commercial Space Underwriting Guidelines (Attachment 27) as amended from time to time by MOHCD, by the date of temporary certificate of occupancy for the Mid-Rise Affordable Project.

9.10 Transfer Payment

(a) Subject to any applicable requirements of the California Department of Real Estate and California Civil Code section 1098, and prior to the sale of the first Residential Condominium Unit, Developer shall (i) record a declaration and notice applicable to all Condominium Units ("**Transfer Payment Covenant and Notice**") in the form of Attachment 20, requiring that the transfer of each Residential Condominium Unit shall be subject to a transfer payment equal to 0.5 percent of the market-

rate transfer price (the "**Transfer Payment**") (ii) demonstrate, to OCII's satisfaction, that the Transfer Payment Covenant and Notice is noticed and documented in satisfaction of applicable DRE regulations.

(b) Following the initial sale of the Residential Condominium Units by the Developer, each subsequent transfer of a Residential Condominium Unit shall be subject to the Transfer Payment, to be made prior to or commensurate with each and every subsequent transfer of each Residential Condominium Unit.

(c) The Transfer Payment funds shall be used by Successor Agency or its designee for maintenance and replacement costs of publicly accessible open space constructed adjacent to the Project. Developer and its successors and the future owners of all the Project shall have no right to challenge the appropriateness or the amount of any expenditure so long as it is used for maintenance uses.

(d) The provisions of this Section 9.10 shall survive the expiration or termination of this Agreement, and shall constitute covenants and benefits running with the land pursuant to applicable law, including but not limited to California Civil Code Section 1468. The Transfer Payment shall be disclosed in the DRE disclosure packages for the Project.

9.11 Review of Condominium Association Documents.

(a) Developer shall not submit any of the following to California Department of Real Estate ("**DRE**") for review and approval without providing Successor Agency an opportunity to review and approve: (i) reciprocal easement agreements, (ii) covenants, conditions and restrictions, (iii) Preliminary Public Report Applications; (iv) Conditional Public Report Applications; (v) Final Public report Applications; (vi) Bylaws and Articles of Incorporation, and (vii) budgets for the Master Association and Market-Rate Association, Master Budget. Prior to submitting revisions to any of the above for DRE approval, Developer shall submit same to Successor Agency for its review and approval for consistency with this Agreement. To the extent permitted by DRE, Developer shall list Successor Agency as an interested party to receive all correspondence to the materials submitted to subsections (i) through (iv) above. If not permitted by DRE, then Developer shall, within five (5) business days of receipt, provide to Successor Agency a complete copy of any and all correspondence received from DRE concerning the foregoing listed materials.

(b) Prior to the closing of Developer's construction financing for the Mid-Rise Affordable Project or effective date of the Air Rights Lease, whichever is sooner, Developers shall cause to be executed and recorded covenants, conditions and restrictions and reciprocal easements (collectively, the "**Reciprocal Easement Agreement**" or "**REA**") in forms prepared by Developers and approved by the Successor Agency in its reasonable discretion.

(c) OCII, in its capacity as owner of the Affordable Air Rights Parcel, shall be a consent signatory to the REA and shall be provided an opportunity to review and approve the REA as described herein.

(d) The REA shall address, among other things, the following:

(i) Use restrictions and access to open space, amenities, and common areas;

(ii) Maintenance obligations related to the Shared Parking Garage, Streetscape Improvements, Public Open Space, Project Open Space, common areas, and Amenities, among other things;

(iii) Shared expenses for shared maintenance areas between each component of the Project. Among others, expense allocations shall specifically describe Tower Mixed-Income Rental Project and, Tower Market-Rate Condominium Project, and Mid-Rise Affordable Project responsibility and expense sharing for property taxes and insurance for shared maintenance areas, which, for the Mid-Rise Affordable Project, shall escalate at a constant annual rate and which shall not include any future tax reassessments (whether due to a transfer of the Tower Mixed-Income Rental Project or Tower Market-Rate Condominium Project or otherwise), all as further set forth in the Reciprocal Easement Agreement;

(iv) If any Community Commercial Space does not directly connect to the rear or "back-of-house" corridor of the applicable building for direct access to certain services provided through the rear or "back-of-house" corridor of such building to other Commercial Units, such as trash collection or curb delivery service, the means for the provision of such services to that Community Commercial Space, at no additional cost to the affected Community Commercial Space;

(v) Easements;

(vi) The allocation of vehicle spaces within the Shared Parking Garage;

(vii) Membership in the owners' association and association assessments;

(viii) A methodology to reach agreement about any shared expense increases other than inflationary increases among the Mid-Rise Affordable Project ownership, Tower Mixed-Income Rental Project ownership, and the Tower Market-Rate Condominium Project ownership association; and

(ix) Transfer Payment requirements, among other things.

9.12 Liquidated Damages.

The Delay in Construction Tax Increment Fee, Delay in Construction CBD Fee, and Delay in Construction CFD Fee (collectively "**Delay Fees**") shall be paid, if due, as liquidated damages to compensate the TJPA and Successor Agency. The Parties agree that, considering all the circumstances on the date of this Agreement, the actual damages suffered by the TJPA and Successor Agency in the event that Completion of Construction fails to timely occur would be difficult or impracticable to determine, and that the Delay Fees are a reasonable estimate of the damages that the TJPA and Successor Agency would incur in such event.

9.13 TJPA Third Party Beneficiary.

The TJPA is an intended third party beneficiary of Sections 4.11, 9.03(a)(ii) and (iv), and 9.03(b)(iii) and (iv) (and those Sections only) with the right to enforce the terms and provisions of those Sections (and those Sections only).

ARTICLE 10 - SUCCESSOR AGENCY EQUAL OPPORTUNITY PROGRAM

Developers will comply with Successor Agency's Equal Opportunity Program, as described in this Article 10 and in Attachment 17, and will submit all documents required pursuant to the policies included in Attachment 17 ("**Equal Opportunity Program**") in accordance with the timeframes specified therein.

10.01 Non-Discrimination

Non-Discrimination in Benefits. Developers do not as of the date of this Agreement and will not during the term of this Agreement, in any of their operations in San Francisco or with respect to their operations under this Agreement (i.e., providing services related to the Development project) elsewhere in the United States discriminate in the provision of bereavement leave, family medical leave, health benefits, membership or membership discounts, moving expenses, pension and retirement benefits or travel benefits (collectively "**Core Benefits**") as well as any benefits other than the Core Benefits between employees with domestic partners and employees with spouses, and/or between the domestic partners and spouses of such employees, where the domestic partnership had been registered with a governmental entity pursuant to state or local law authorizing such registration, subject to the conditions set forth in Successor Agency's Non-Discrimination in Contracts and Benefits Policy, adopted September 9, 1997, as amended February 4, 1998 and as set forth in Attachment 17.

10.02 Compliance with Minimum Compensation Policy and Health Care Accountability Policy

(a) Successor Agency finds that it has a significant proprietary interest in the Site that is being transferred to Developer, pursuant to this Agreement. Developers will comply with the applicable provisions of Successor Agency's Minimum Compensation Policy ("**MCP**"), Attachment 17, and Health Care Accountability Policy ("**HCAP**"), Attachment 17, adopted by Agency Resolution No. 168-2001 on September 25, 2001, as these policies may be amended from time to time (jointly, "**Policies**"). The requirements of the Policies include the following:

(i) the payment of the "Minimum Compensation" specified in MCP Section 3 to all "Covered Employees," as defined under MCP Section 2.7, who work on the Improvements, who are employed by Developer or any of its subcontractors who enter into an "Included Subcontract" (as defined in Attachment 17).

(ii) the payment of one of the health care benefit options described in HCAP Section 3 as to all "Covered Employees," as defined under HCAP Section 2.7, who work on the Project, who are employed by Developer or any of its subcontractors who enter into an "Included Subcontract" (as defined in Attachment 17).

10.03 Small Business Enterprise and Workforce Agreements

(a) Developers and Successor Agency acknowledge that the Improvements and the Project will create employment opportunities at all levels, including opportunities for qualified economically disadvantaged small business enterprises, qualified economically disadvantaged Project Area residents and San Francisco residents. In recognition of these opportunities, Developer shall develop and implement the Small Business Enterprise Agreement described in Attachment 17, and the Construction Workforce Agreement described in Attachment 17.

(i) Successor Agency shall rely on the Office of Economic and Workforce Development - CityBuild ("**CityBuild**") to implement the Construction Workforce Agreement described in Attachment 17, the First Source Hiring Agreement described in Attachment 17, and the Trainee Hiring Goal in the Small Business Enterprise Agreement described in Attachment 17; accordingly, within thirty (30) days after the Effective Date of this Agreement, Developer shall execute an agreement with CityBuild to fund CityBuild's staff costs for such services, up to a maximum of Two Hundred Fourteen Thousand Nine Hundred Fifty Dollars ($214,950) of staff costs for every Five Hundred Million Dollars ($500,000,000) in total Project costs.

10.04 Prevailing Wages (Labor Standards)

(a) Developers agree to pay or cause to be paid prevailing rates of wages in accordance with the requirements set forth in Attachment 17 for construction work done at the Site and Tehama Parcel prior to the issuance of the City's Final Certificate of Occupancy.

10.05 SBE Mentoring and Capacity Building Program

(a) Developer shall finance and, in consultation with the Successor Agency and the Developer's General Contractor, implement a Mentoring and Capacity Building Program ("**Mentoring Program**") specific to the Scope of Development. The program will provide SBE's with directed coaching, educational input, and mentoring from industry experts complementary to the Successor Agency's existing SBE Policy goals in order to build small business capacity. Specific efforts will be made to break up scopes of work to enhance SBE participation.

(b) Program initiatives will consist of:

(i) Providing One Hundred Thousand Dollars ($100,000) to the Successor Agency for the purpose of conducting a study on the availability, capacity and needs assessment of local SBE contractors to perform on large construction projects, such as the Project. Developer shall provide payment to the Successor Agency or its designee within thirty (30) days after the Effective Date of this Agreement. The Successor Agency will endeavor to complete the study within nine months of the Effective Date of this Agreement, after which the study's findings will be used to inform the Successor Agency, Developers, and Developers' general contractor about their ability to meet the Successor Agency's SBE goal, the level of SBE participation if less than fifty percent, and the means to obtain SBE participation;

(ii) Providing financial assistance by Developer of Twenty-Five Thousand Dollars ($25,000) per year for three (3) years to the City's Contractor Development Program, or an existing training/ technical assistance program acceptable to the Successor Agency, to assist local SBE contractors to compete and perform work on the Improvements. The Developer shall provide payment for the initial year within thirty (30) days after the Effective Date of this Agreement and annually thereafter;

(iii) Implementation by Developer of a General Contractor selection criteria to ensure General Contractor participation in the City's Mentor-Protégé program (https://sfgov.org/cmd/cmd-mentor-protege-program-1), or an equivalent program acceptable to the Successor Agency. The Developer shall provide the selection criteria to the Successor Agency for its review and acknowledgement prior to the Developer's efforts to solicit a General Contractor;

(iv) Developer shall encourage first-tier non-SBE subcontractors to participate in the City's Mentor-Protégé program or similar teaming relationships with SBEs; and

(v) Developer shall work cooperatively with the Successor Agency and ensure best faith efforts are exercised by the General Contractor and its first-tier subcontractors to break up scopes of work for lower-tier small business participation.

ARTICLE 11 - INDEMNITY

11.01 Developer Indemnification

Developer shall indemnify, defend, and hold harmless the Successor Agency, the City, the TJPA and their respective members, officers, agents and employees ("**Indemnified Parties**") from and

against any losses, costs, claims, damages, liabilities and causes of action (including reasonable attorney's fees and court costs) arising out of this Agreement, including with respect to any challenge to the entitlement of Developer to undertake the program described in the Scope of Development, or in any way related to the death of or injury to any person or damage to any property occurring on or adjacent to the Site and directly or indirectly caused by any acts done thereon or any acts or omissions of Developer and their agents, employees or contractors; provided, however, that the foregoing indemnity shall not apply to any losses, costs, claims, damages, liabilities or causes of action (including reasonable attorneys' fees and court costs) to the extent the same arise out of (i) the gross negligence or willful misconduct of the Indemnified Party seeking to be indemnified, or (ii) the breach under this Agreement of an obligation of the Indemnified Party seeking to be indemnified, provided that the Successor Agency may require that the Developer defend the Indemnitee Parties against claims pursuant to this Section until it is established that such claims are not subject to this indemnity requirement so long as provided, the Indemnified Party (or Parties) shall reimburse the Developer such defense costs in proportion to the degree of the negligence or fault of such Indemnified Party (or Parties).

11.02 Affordable Developer Indemnification

Affordable Developer shall indemnify, defend, and hold harmless the Indemnified Parties from and against any losses, costs, claims, damages, liabilities and causes of action (including reasonable attorney's fees and court costs) arising out Affordable Developer's obligations under this Agreement or in any way related to the death of or injury to any person or damage to any property occurring on or adjacent to the Site and directly or indirectly caused by any acts done thereon or any acts or omissions of Affordable Developer and their agents, employees or contractors; provided, however, that the foregoing indemnity shall not apply to any losses, costs, claims, damages, liabilities or causes of action (including reasonable attorneys' fees and court costs) to the extent the same arise out of (i) the gross negligence or willful misconduct of the Indemnified Party seeking to be indemnified, or (ii) the breach under this Agreement of an obligation of the Indemnified Party seeking to be indemnified, provided that the Successor Agency may require that the Affordable Developer defend the Indemnitee Parties against claims pursuant to this Section until it is established that such claims are not subject to this indemnity requirement (so long as provided, the Indemnified Party (or Parties) shall reimburse the Affordable Developer such defense costs in proportion to the degree of the negligence or fault of such Indemnified Party (or Parties).

11.03 Survival

The obligation of Developer, Affordable Developer, or both, under this Article 11 shall survive Successor Agency's recordation of the Certificate of Completion as to any acts or omissions occurring prior to such recordation.

ARTICLE 12 - GENERAL PROVISIONS

12.01 Successor Agency Costs

The Developer shall be responsible for paying any costs associated with this transaction and the Improvements until the Certificate of Completion, as defined in Section 4.13, is recorded, either directly or through reimbursement of any related Successor Agency costs, including, but not limited to, Successor Agency's legal counsel to represent Successor Agency, staffing costs, and third party costs including, but not limited to, title report costs, title insurance premiums and endorsement charges, escrow fees, surveys, environmental review, parcel mapping, lot line adjustments, quiet title actions, permits, inspections, and costs on all matters related to the negotiation and implementation of this Agreement ("**Successor Agency Costs**"). The Successor Agency shall submit quarterly invoices for such costs and Developer shall reimburse Successor Agency for its costs within forty-five (45) days of receiving Successor

Agency invoices. If the Developer fails to pay such invoices with such forty-five (45) day period, then such event will be considered an Event of Default under this Agreement.

12.02 Provisions with Respect to Time Generally

All references in this Agreement to time limitations, including those in the Schedule of Performance and Schedule of Important Project Dates, shall mean such time limitations as they may be extended pursuant to the terms of this Agreement.

12.03 Notices

Any notice, demand or other communication required or permitted to be given under this Agreement by either party to the other party shall be sufficiently given or delivered if transmitted by (i) certified United States mail, postage prepaid, (ii) personal delivery, or (iii) nationally recognized private courier services, in every case addressed as follows:

If to Successor Agency:	Successor Agency to the Redevelopment Agency of the City and County of San Francisco One South Van Ness Avenue, Fifth Floor San Francisco, California 94103 Attention: Executive Director
With copy to:	San Francisco Mayor's Office of Housing and Community Development One South Van Ness Avenue, Fifth Floor San Francisco, California 94103 Attention: Director
If to Affordable Developer:	Mercy Housing California 1256 Market Street San Francisco, CA 94102 Telephone: (415) 355-7100
If to Developer:	F4 Transbay Partners, LLC c/o Hines 101 California Street, Suite 1000 San Francisco, CA 94111 Attn: Cameron Falconer Telephone: (415) 982-6200
With copies to:	Charles J. Higley Farella Braun & Martel LLP Russ Building 235 Montgomery Street 17th Floor San Francisco, CA 94104 Telephone: (415) 954-4902

Any such notice, demand or other communication transmitted by certified United States mail, postage prepaid, shall be deemed to have been received seventy-two (72) hours after mailing (unless

it is never delivered), and any notice, demand or other communication transmitted by personal delivery, or nationally recognized private courier service shall be deemed to have been given when received by the recipient. Any party may change its address for notices under this Section 12.03 by written notice given to the other party in accordance with the provisions hereof.

12.04 Time of Performance

(a) All dates for performance (including cure) shall expire at 5:00 p.m. (San Francisco, California time) on the performance or cure date.

(b) A performance date which falls on a Saturday, Sunday or Successor Agency or national holiday is automatically extended to the next day which is not a Saturday, Sunday or Successor Agency or national holiday.

(c) Unless otherwise specified, whenever an action is required in response to a submission, request or other communication, the responding party shall respond within fifteen (15) business days.

(d) Time is of the essence with respect to each provision of this Agreement, including each milestone set forth in this Agreement, but subject to all express extension, notice and cure rights in this Agreement.

12.05 Attachments/Recitals

All attachments and recitals to this Agreement are hereby incorporated herein and made a part hereof as if set forth in full.

12.06 Non-Merger in Deed

None of the provisions of this Agreement are intended to, or shall be, merged by reason of any deed transferring title to the Site from Successor Agency to Developer or any successor in interest, and any such deed shall not be deemed to affect or impair the provisions and covenants of this Agreement.

12.07 Headings

Any titles of the several parts and sections of this Agreement are inserted for convenience of reference only and shall be disregarded in construing or interpreting any of its provisions. The terms "Paragraph" and "Section" may be used interchangeably.

12.08 Successors and Assigns

This Agreement shall be binding upon and, subject to the provisions of Article 6, shall inure to the benefit of, the successors and assigns of Successor Agency, Developer, Affordable Developer, and any Mortgagee and where the term "Developer", "Affordable Developer", "Successor Agency" or "Mortgagee" is used in this Agreement, it shall mean and include their respective successors and assigns, including as to any Mortgagee, any transferee of such Mortgagee or any successor or assign of such transferee, whether or not the terms "successors and assigns" are used in conjunction therewith, except where the Agreement expressly provides that successors and assigns are not so included.

12.09 Counterparts/Formal Amendment Required

(a) This Agreement may be executed in counterparts, each of which shall be deemed to be an original, and all such counterparts shall constitute one and the same instrument.

(b) This Agreement integrates all of the terms and conditions mentioned herein or incidental hereto and supersedes all negotiations or previous agreements between the parties with respect to all or any part of the subject matter hereof.

(c) Any modifications or waiver of any provisions of this Agreement or any amendment thereto shall be done in accordance with the provisions of this Agreement, and shall be made in writing and signed by a person or persons having authority to do so, on behalf of both Successor Agency and Developer.

12.10 Authority of Parties

Successor Agency and Developer each represent and warrant to the other party that this Agreement and all documents and delivered at Close of Escrow: (a) are, or at the time of Close of Escrow will be, duly authorized, executed and delivered by that party; (b) are, or at the time of Close of Escrow will be, legal, valid and binding obligations of that party; and (c) do not, and at the time of Close of Escrow will not, violate any provision of any agreement or judicial order to which that party is a party or to which that party is subject. Notwithstanding anything to the contrary in this Agreement, the foregoing representations and warranties and any and all other representations and warranties of the parties contained herein or in other agreements or documents executed by the parties in connection herewith, shall survive the Close of Escrow.

12.11 Governing Law

This Agreement shall be governed by, and construed and enforced in accordance with, the laws of the State of California.

12.12 Recordation

Title Company shall cause this Agreement to be recorded in the Official Records at Close of Escrow.

12.13 Estoppels

At the request of any party, the other Parties, within ten (10) days following such request, shall execute and deliver to the requesting Party a written statement in which such other Parties shall certify that this Agreement is in full force and effect; that this Agreement has not been modified or amended (or stating all such modifications and amendments); that no Party is in default under this Agreement (or setting forth any such defaults); that there are not then existing set-offs or defenses against the enforcement of any right or remedy of any Party, or any duty or obligation of the certifying Parties (or setting forth any such set-offs or defenses); and as to such other matters relating to this Agreement as the requesting Party shall reasonably request.

12.14 Attorneys' Fees

In the event that any Party brings a legal action to enforce rights under this Agreement against any other Party, the prevailing Party in any such proceeding will be entitled to recover its reasonable attorneys' fees and costs of the proceeding.

12.15 Further Assurances

Each party agrees to execute and deliver to the other party such additional documents and instruments as the other party reasonably may request in order to fully carry out the purposes and intent of this Agreement.

12.16 No Personal Liability

(a) No member, official or employee of Successor Agency or the City shall be personally liable to Developer or any successor in interest in the event of any default or breach by Successor Agency or for any amount which may become due to Developer or successor or on any obligations under the terms of this Agreement.

(b) No officer, director, member, employee, agent or shareholder of Developer or Affordable Developer shall be personally liable for the performance of Developer's obligations under this Agreement, and neither Successor Agency nor any of its successors and assigns shall seek recourse for enforcement or satisfaction of this Agreement against any general or limited partner, officer, director, member, employee, agent or shareholder of Developer or Affordable Developer. No personal judgment shall be sought or obtained against any of the foregoing in connection with this Agreement. Neither Developer, Affordable Developer nor any of the foregoing parties shall in any circumstance be liable for any consequential damages of any kind or nature.

12.17 Effective Date

The effective date of this Agreement (the "**Effective Date**") and the parties' rights and obligations hereunder shall be the date on which the Plan Amendment becomes effective. Successor Agency shall insert such date into the appropriate locations in this Agreement, but the failure to do so shall not in any way affect the enforceability of this Agreement.

ARTICLE 13 - REFERENCES AND DEFINITIONS

Terms are defined in this Article 13 or have the meanings given them when first defined.

2008 Option Agreement is defined in Recital G.

Additional Purchase Payment is defined in Section 1.01(b).

Affordable Air Rights Parcel is defined in Recital W.

Affordable Developer is defined in Preamble.

Affordable Housing Fee means the $46,749,928.46 to be paid by Developer to the Successor Agency upon the satisfaction of certain conditions specified in the Parcel F development agreement approved by City Ordinance No. 0042-21, to fund the Successor Agency's obligation to fulfill the Transbay Affordable Housing Obligation.

Affordable Housing Units means income-restricted units in the Tower Mixed-Income Rental Project and the Mid-Rise Affordable Project and is defined in Recital U.

Agreement means this Disposition and Development Agreement.

Amenities mean those things described in items I.A.1.d, I.A.2.f and g, I.B.4 and I.B.5 in Attachment 4 (Scope of Development).

AMI is defined in Section 9.04(b)(i).

Air Rights Lease is defined in Recital X and the form is attached at Attachment 12.

Amount that otherwise would have been due is defined in Section 9.03(b)(ii)9.03(a)9.03(a)(ii) and Section 9.03(b)(iii).

Approved Title Conditions is defined in Section 2.04(a) and specified in Attachment 8, Approved Title Conditions.

Associated Documents is defined in Section 8.04.

Block 4 is defined in Recital M.

Block 4 Option Agreement is defined in Recital R.

BMR means below market rate and is defined in Recital S.

Board of Supervisors means the Board of Supervisors of the City and County of San Francisco and is defined in Recital B.

Bona Fide Institutional Lender means any one or more of, a bank, savings and loan association or savings bank, commercial bank, pension fund, real estate investment trust, investment bank, insurance company, trust company, equity fund, commercial credit corporation, pension plan, pension fund or pension advisory firm or governmental agency, in each case, who customarily makes loans of the type contemplated for the construction of the Improvements and/or permanent financing for the Project and who have in place standard construction disbursement and monitoring systems reasonably satisfactory to Successor Agency.

Budget is defined in Section 2.08(a).

Buyer's Inclusionary Obligation is defined in Recital S.

CDLAC means the California Debt Limit Allocation Committee and is defined in Section 9.05(d).

Caltrans is the California Department of Transportation and is defined in Recital G.

Caltrans Power of Termination is defined in Recital M.

CBD means the Greater Rincon Hill Community Benefit District authorized by the Board of Supervisors on July 31, 2015 by Resolution No. 299-15 and is defined in Section 9.03(a).

CFCO means DBI's Final Certificate of Occupancy for the Improvements and is defined in Section 4.13(a).

CFD means the City and County of San Francisco Transbay Center District Plan Mello-Roos Community Facilities District No. 2014-1 and is defined in Section 9.03(b)(i).

Certificate of Completion is defined in Section 4.13.

Change in the Improvements is defined in Section 5.07.

City means the City and County of San Francisco and is defined in Recital E.

CityBuild means the Office of Economic and Workforce Development – CityBuild and is defined in Section 10.03(a)(i).

Close of Escrow means the consummation of the sale of property contemplated herein in accordance with escrow instructions provided by Developer and Successor Agency and is defined in Section 2.03(a).

Commencement of Substantial Construction is defined in Section 4.08(b).

Commercial Subdivision is defined in Section 9.09(b).

Commercial Subdivision Owner is defined in Section 9.09(b).

Commercial Units have the meaning set out in Recital U.

Commercially Reasonable Terms is defined in Section 8.08(c).

Commission means the Successor Agency Commission, commonly known as the Commission on Community Investment and Infrastructure, the legislative body of the Successor Agency and is defined in Recital H.

Community Commercial Space is defined in Section 9.09(a).

Community Serving Commercial Use is defined in Section 9.09(a) and the MOHCD Commercial Space Underwriting Guidelines Attachment 27.

Completion of Construction means the date on which Successor Agency issues the Certificate of Completion and is defined in Section 4.13(c).

Construction Commencement Date is defined in Section 4.08(a).

Construction Contract is defined in Section 2.08(f).

Cooperative Agreement is defined in Recital G.

COP means Certificate of Preference and is defined in Section 9.04(f)(i).

COP Enhanced Outreach Strategies is defined in 9.04(f)(ii) and Attachment 26.

Core Benefits is defined in Section 10.01.

DBI means the City's Department of Building Inspection and is defined in Section 4.08(b).

DCDG is defined in Recital C.

Declaration of Affordability Restrictions is defined in Section 9.04(a), and collectively or individually, as applicable, references the Declaration of Affordability Restrictions (Tower) in the form attached as Attachment 19A and the Declaration of Affordability Restrictions (Mid-Rise) in the form attached as Attachment 19B.

Declaration of Restrictions for Community Commercial Space is defined in Section 9.09(c).

Declaration of Site Restrictions is defined in Section 2.04(f) and substantially in the form of Attachment 11.

Delay Fees is defined in Section 9.12.

Delayed Party is defined in Section 8.08(a)(i).

Delay of Construction CBD Fee is defined in Section 9.03(a)(ii).

Delay of Construction CFD Fee is defined in Section 9.03(b)(iii)

Delay of Construction Tax Increment Fee is defined in Section 4.11(a).

Developer means F4 Transbay Partners LLC, a Delaware limited liability company.

Developers means both Developer and Affordable Developer.

Developer Affiliate is defined in Section 6.02(a).

Developer Conditions are defined in Section 2.07(a).

Developer's Quitclaim Deed is defined in Section 8.03(a)(ii).

Development Controls is defined in Recital C.

Development Controls Amendment is defined in Recital T.

Development Program is attached as Attachment 5 and defined in Recital W.

District Management Plan is defined in Section 9.03(a)(ii).

DOC (or **Determination of Completeness**) is defined in Section 4.13(a).

DOF means the State of California Department of Finance and is defined in Recital I.

DRDAP means the Design Review and Document Approvals as defined in Section 4.03(c) and set forth in Attachment 15.

DRE means the California Department of Real Estate and is defined in Section 9.11(a).

Effective Date is defined in Section 12.17.

Environmental Law is defined in Section 3.02(c).

Equal Opportunity Program is defined in Article 10 and set forth in Attachment 17.

Escrow is defined in Section 2.02.

Estimated Tax is defined in Section 4.11(b).

Estimation Process is defined in Section 4.11(b).

Event of Default is defined in Section 8.01 (with respect to Developer) and Section 8.02 (with respect to Affordable Developer).

Evidence of Financing and Project Commitments is defined in Section 2.08.

Exterior is defined in Section 5.07.

Financing Commitment is defined in Section 2.08(d).

Financing Plan is defined in Section 2.08(b).

First Extended Closing Date is defined in Section 8.08(b)(i).

Force Majeure is defined in Section 8.08(a)(i).

Former Agency means the Redevelopment Agency of the City and County of San Francisco and is defined in Recital A.

Good Faith Deposit is defined in Section 1.02.

Grant Deed is defined in Section 2.04(e), the form of which is shown in Attachment 10.

Hazardous Substance is defined in Section 3.02(c).

Hazardous Materials Indemnified Party(ies) is defined in Section 3.02(a).

HCAP means the Health Care Accountability Policy as defined in Section 10.02(a) and set forth in Attachment 17.

HCD is defined in Section 9.09(b).

Implementation Agreement means the Transbay Redevelopment Project Implementation Agreement as further defined in Recital G.

Improvements are generally described in Recital U and more particularly defined by Attachment 4, Scope of Development.

Inclusionary Manual means the MOHCD Inclusionary Affordable Housing Program Monitoring and Procedures Manual, as amended from time to time (or, if in the future the Inclusionary Manual is no longer published, an equivalent policy document).

Indemnified Parties is defined in Section 11.01.

LEED is defined in Recital W.

MCP means Minimum Compensation Policy as defined in Section 10.02(a) and set forth in Attachment 17.

Mentoring Program is defined in Section 10.05(a).

Mercy is the Affordable Developer.

Mid-Rise Affordable Project is generally described in Recital U and more particularly defined in Attachment 4, Scope of Development.

MMRP is defined in Section 9.02.

MOHCD means the Mayor's Office of Housing and Community Development and is defined in Recital X.

Mortgage is defined in Section **Error! Reference source not found.**.

Mortgagee is defined in Section **Error! Reference source not found.**.

Net Tax Increment is defined in Recital J.

Neutral Expert is defined in Section 4.11(b)(ii).

Official Records means the Office of the Recorder of the City and County of San Francisco and is defined in Recital B.

Outside Date for Close of Escrow is defined in Section 2.03(b) and specified in Attachment 7, Schedule of Performance.

Parcel F is defined in Recital P.

Parcel F PSA is defined in Recital P.

Parties means the Successor Agency, the Developer, and the Affordable Developer.

Party Experts is defined in Section 4.11(b)(ii).

PCBs is defined in Section 3.02(c).

Permanent Subdivision of the Site is defined in Recital W.

Permit to Enter is defined in Section 2.06(b).

PIA means public improvement agreement and is defined in Recital Y.

Plan Amendment is defined in Recital T.

Pledge Agreement is defined in Recital E.

PMP means the Successor Agency's Long-Range Property Management Plan and is defined in Recital BB.

Policies means the MCP and HCAP and is defined in Section 10.02(a).

Project is defined in Section 4.13(c).

Project Approval Documents are defined in Attachment 15, DRDAP.

Project Area is defined in Recital A and means the Transbay Redevelopment Project Area.

Project Area Declaration of Restrictions is defined in Recital D.

Project Open Space means all portions of open space provided within the Tower Project or the Mid-Rise Affordable Project.

Public Benefit Use is defined in Section 9.09(a) and the MOHCD Commercial Space Underwriting Guidelines Attachment 27.

Public Open Space is defined in Attachment 4, Scope of Development Section I.D.

Purchase Price is defined in Section 1.01(a).

Qualified Replacement Development Manager is defined in Section 6.02(b)(i).

Reciprocal Easement Agreement or **REA** is defined in Section 9.11(b).

Redevelopment Dissolution Law means AB 26 and AB 1414, as amended from time to time, and is defined in Recital H.

Redevelopment Plan is defined in Recital B.

Redevelopment Requirements are defined in Section 4.04.

Regulatory Agency is defined in Section 4.11.

Release is defined in Section 3.01(d).

Residential Condominium Unit means an individual residential condominium unit or townhouse created within the Tower Market-Rate Condominium Project.

RMA means the CFD Rate and Method of Apportionment as defined in Section 9.03(b)(i) and set forth in Attachment 22.

Schedule of Important Project Dates is attached as Attachment 6. Whenever used in this Agreement, "Schedule of Important Project Dates" shall mean the date(s) specified in the Schedule of Important Project Dates attached hereto as of the Effective Date *plus* any applicable extensions provided in accordance with the provisions of this Agreement (per Section 12.02).

Schedule of Performance is attached as Attachment 7. Whenever used in this Agreement, 'Schedule of Performance' shall mean the date(s) specified in the Schedule of Performance attached hereto as of the Effective Date *plus* any applicable extensions provided in accordance with the provisions of this Agreement (per Section 12.02).

Schematic Design Documents is defined in Section 2.07(a)(vi)

Scope of Development is defined in Recital U and attached as Attachment 4.

Shared Parking Garage has the meaning set out in Recital U

Site is defined in Recital M.

Site Legal Description is attached as Attachment 2.

State means the State of California and is defined in Recital E.

Streetscape Improvements are defined in the Scope of Development.

Streetscape Plan means the Transbay Redevelopment Project Area Streetscape and Open Space Concept Plan.

Successor Agency means the Successor Agency to the Redevelopment Agency of the City and County of San Francisco, a public body organized and existing under the laws of the State of California.

Successor Agency Approval is defined in Section 6.02(a).

Successor Agency Conditions are defined in Section 2.07(b).

Successor Agency Costs is defined in Section 12.01.

Successor Agency Loan is defined in Section 9.05(b).

Successor Agency Power of Termination is defined in Section 8.03(a)(ii).

TIFIA is defined in Recital J.

TIFIA Loan is defined in Recital J.

TJPA means the Transbay Joint Powers Authority and is defined in Recital E.

TJPA Bonds is defined in Recital J.

TJPA Bonds Final Maturity Date is defined in Section 5.09(c).

Tehama Parcel is defined in Recital M**.**

Tehama Street Public Improvements is defined in Section 9.06(a)

Temporary C of O is defined in Section 9.01.

Temporary Terminal is defined in Recital L.

Term is defined in Section 1.04.

Title Company is defined in Section 2.02.

Title Policy is defined in Section 2.04.

Tehama Street Public Improvements is defined in Section 9.06(a).

Tower Market-Rate Condominium Project is generally described in Recital U and more particularly defined in Attachment 4, Scope of Development.

Tower Mixed-Income Rental Project is generally described in Recital U and more particularly defined in Attachment 4, Scope of Development.

Tower Project means the Tower Market-Rate Condominium Project and the Tower Mixed-Income Rental Project.

Townhouses are defined in Attachment 4, Scope of Development.

Transbay Affordable Housing Obligation is defined in Recital F.

Transbay Final and Conclusive Determination is attached as Attachment 1.

Transfer is defined in Section 6.02(a).

Transfer Payment is defined in Section 9.10(a).

Transfer Payment Covenant and Notice is defined in Section 9.10(a).

Transit Center is defined in Recital L.

Warm Shell is defined in Attachment 27.

IN WITNESS WHEREOF, the Parties have executed this Agreement as of the date first set forth above.

Authorized by Successor Agency Resolution No. ___-2022, adopted _____, 2022.

To: Marie Munson, Senior Development Specialist
Office of Community Investment and Infrastructure
Successor Agency to the Redevelopment Agency of the City and County of San Francisco

From: Keyser Marston Associates, Inc.

Date: July 6, 2022

Subject: Transbay Block 4: Section 33433 Land Consideration

Keyser Marston Associates, Inc. (KMA) has prepared this memorandum for the Office of Community Investment and Infrastructure as Successor Agency to the Redevelopment Agency of the City and County of San Francisco (OCII, or Successor Agency) with respect to the consideration being paid to OCII for Transbay Block 4 under section 33433 of the California Health and Safety Code[1]. Section 33433 requires the Successor Agency to prepare a report that contains the following:

- The estimated value of the interest to be conveyed or leased, determined at the highest and best uses permitted under the redevelopment plan.
- The estimated value of the interests to be conveyed or leased, determined at the use and with the conditions, covenants, and development costs required by the sale or lease, i.e., the fair reuse value of the site.
- The purchase price or sum of the lease payments that the lessor will be required to make during the term of the lease. If the sale price or total rental amount is less than the fair market value of the interest to be conveyed or leased, determined at the highest and best use consistent with the redevelopment plan, then the Successor Agency shall provide as part of the summary an explanation of the reasons for the difference.

[1] While the subject property was not acquired, directly or indirectly, with tax increment moneys, Section 4.7.2 of the Redevelopment Plan requires, for lands acquired under the 2008 Option Agreement between the Former Redevelopment Agency and the TJPA, an analysis and approval by the Board of Supervisors in accordance with the standards of Health and Safety Code Section 33433.

Section 33433 requires that the resolution approving the sale or lease contain one of the following findings:

1. The consideration is not less than the fair market value at its highest and best use in accordance with the redevelopment plan; or
2. The consideration is not less than the fair reuse value at the use and with the covenants and conditions and development costs authorized by the sale or lease.

Background

The Block 4 development site (site) is an approximately 56,375 square foot parcel in the Transbay Redevelopment Project Area bounded by Howard, Beale, and Main Streets, and extending approximately 205 feet southeast from Howard Street. It is identified by the San Francisco County Assessor as Lot 010 and Lot 011 of Block 3739. The development site is owned by the Successor Agency and will be sold to the Developer (F4 Transbay Partners LLC) as a "sole source sale." The Developer consists of Hines Urban F4, LLC, as managing member, the Broad Street Principal Investments, LLC and Affiliates as member.

Proposed Development Project

The development program for Block 4 is required to comply with the Redevelopment Plan, the Transbay Development Controls and Design Guidelines, and the terms of a Disposition and Development Agreement (DDA) to be approved by the Successor Agency Commission. In accordance, with these requirements, the Developer is proposing to develop a two-building project atop a ground floor and subterranean podium, constituting approximately 954,431 gross square feet of residential uses with ground-floor commercial and two levels of subterranean parking. The project includes a total of 681 residential units divided between a mixed income tower containing a mix of market rate and affordable units and a midrise building dedicated to affordable housing. The tower will contain both rental and ownership units, with 105 deed-restricted rental units affordable to households earning between 100% and 120% of the Area Median Income, 219 market rate rental units, 135 market rate condos, and 20 market rate townhouses. The midrise affordable project will be constructed within an air space parcel created by Developer and conveyed to OCII, to then be ground leased to the affordable developer for construction of the project, which will contain 201 units affordable to households earning between 40% to 100% of the Area Median Income and one unrestricted manager unit. In total, 45% of the project's units will be deed-restricted affordable housing units. The project will also include 8,389 square feet of ground floor commercial space, Public Open Space, Project Open Space, and a shared parking garage, providing up to 275 vehicle spaces and 556 spaces for bicycles. As part of the

project, the Developer will extend Tehama Street eastward of Beale Street to Main Street.

The Developer is responsible for securing financing and completing the proposed project. The only financial assistance to be provided to the project by the Successor Agency is the provision of a soft loan of $46.7 million to fund a portion of the mid-rise affordable housing component. The Developer will provide the funds to OCII to fulfill affordable housing obligations for its development of Parcel F.

As proposed, the development site will be transferred to the Developer. The Developer will then subdivide the properties into at least three parcels, including: (i) an airspace parcel for the mid-rise affordable project ("Air Rights Parcel"); (ii) the portion to be developed as the future Tehama Street right of way ("Tehama Parcel"); and (iii) the remainder of the development site on which to construct the balance of the project. The affordable Air Rights Parcel will be conveyed to OCII, who will then ground lease the parcel to the Affordable Housing Developer[2]. After the Developer improves the Tehama Parcel, the Parcel will be dedicated to the City.

Appraisal Process and Instructions

In accordance with the terms of an amended Option Agreement that was originally executed in 2016, the Developer elected for the purchase price of the development site to be based on an arbitration process in which the buyer and seller each procure appraisals and if the two are not within 10%, a third appraiser is selected to determine which appraisal better represents the fair market value of the site according to jointly established joint appraisal instructions. The Developer retained the appraisal firm of Runde & Partners, Inc. (Runde) and OCII retained the appraisal firm of R. Blum and +Associates (Blum).

This structure provided the parties with the flexibility to negotiate the terms of the DDA (other than the purchase price), including the precise affordable housing and other Developer requirements, and the purchase price would reflect the specific negotiated requirements. The joint appraisal instructions provided detailed direction to the two appraisers regarding the development program, project financing sources (including sources and funding amounts for the mid-rise affordable housing project), project development costs, extraordinary assumptions, and appraisal standards. Of particular note are the following instructions:

[2] The Affordable Developer is Transbay Block 4 Housing Partnership, L.P, a limited partnership made up of Mercy Housing California (managing general partner), F4 Transbay partners LLC (administrative general partner), and a Low-Income Housing Tax Credit investor limited partner.

1. The appraisal should consider the highest and best land valuation for the proposed program that is reflected in the DDA;

2. The appraisal shall include land residual analysis as one approach to derive the site's market value based on the restricted uses, project design and development costs for the defined project as of September 29, 2023.

3. Twenty-five of the Tower's affordable rental units that are included to satisfy the Developer's affordable housing obligation for a separate project on Parcel F shall be treated as market-rate units for valuation purposes.

Runde and Blum completed their appraisals and their opinion of the prospective market value of the fee simple interest in the development site varied by more than 10%, with Runde concluding a value of $6 million and Blum concluding a value of a negative $16 million. In accordance with the terms of the Option Agreement, a neutral appraiser, Gary DeWeese, MAI, was then retained for the purpose to select one or the other of the two appraisals as the most reasonable purchase price for the development site. Mr. DeWeese has selected Runde's final valuation conclusion of $6 million as the most reasonable purchase price for the subject development site.

Findings and Conclusions

1. *Fair reuse value of Block 4* – The independent appraiser selected the appraisal prepared by Runde as yielding the most reasonable purchase price for the development site. The Runde appraisal determined that the fair market value of the Block 4 development site, subject to the programming requirements outlined in the Appraisal Instructions, Option Agreement, and DDA, as of September 29, 2023, is $6,000,000. This appraised value represents the fair reuse value of Block 4, assuming the development of the entire project, including the mid-rise affordable housing project, in accordance the terms and conditions contained in the DDA.

2. *Fair market value at highest and best use* – The appraisal prepared by Runde determined that the site's development potential is defined by the DDA and that no other use is permitted for the site. The appraisal determined that the site's highest and best use is either constructing the project in 2023 at the close of escrow or delaying construction of the project until the uncertainties created by Covid-19 subside. Given this conclusion, the appraiser has determined that the site's fair market value at its highest and best use is equivalent to the site's fair reuse value, which is $6 million.

3. *Consideration to be received relative to Block 4's fair market value at highest and best use* – The Developer of Block 4 will pay a purchase price of $6 million for the development site. This purchase price is equal to the site's fair market value at highest and best use and the site's fair reuse value as established by the appraisal process contained in the DDA.

4. *Value of Air Rights Parcel for Mid-Rise Affordable Housing Project* – The appraisal prepared by Runde included an evaluation of the value of the mid-rise affordable housing project as part of the evaluation of Block 4 because the Developer is required to complete the mid-rise affordable component, per the DDA. The Runde appraisal determined that: "The Stand-alone 100% affordable component does not contribute value and, in fact, requires the Developer to provide gap funding at over $27 million." Based on this assessment, there is no additional value attributable to the air rights parcel, and a nominal annual ground lease rent would be appropriate consideration.

5. *Public benefits to be funded by Block 4 Developer* – In addition to purchasing the Block 4 development site for $6 million and completing the 681-unit project, with 45% of the units being affordable to Very Low to Moderate income households, the Block 4 Developer is required per the DDA to make substantial financial contributions, as follows:

    - Implement the OCII's Small Business Enterprise (SBE) policies, which the Block 4 Developer has estimated will cost $19.7 million. The specific policies include:
        - Developer to fund approximately $400,000 of City staff costs to implement First Source Hiring, Trainee Hiring, and Small Business Enterprise programs;
        - Developer to fund and implement a Mentoring and Capacity Building Program to provide SBE"s with direct coaching, educational input, and mentoring from industry experts to build small business capacity;
        - Developer to fund $100,000 to the Successor Agency for the purpose of conducting a study on the availability, capacity and needs of local SBE contractors to perform on large construction projects;
        - Developer to provide$75,000 of funding for the City's Contractor Development Program;
        - Developer to ensure that the project's General Contractor participates in the City's Mentor-Protégé program;

  - Developer shall encourage first-tier non-SBE contractors to participate in the City's Mentor-Protégé program;
  - Developer shall work cooperatively with the Successor Agency and ensure best faith efforts are exercised by the General Contractor and its first-tier subcontractors to break up scopes of work for lower-tier small business participation;
  - Developer to pay or cause to be paid prevailing rates of wages for construction work done at the development site and the Tehama Parcel;

- Provide gap financing for the mid-rise affordable housing project, which is estimated to total $28 million during the construction period and increase to $36 million after the construction loan is paid-off;

- Design and construct the Tehama Street Public Improvements at no cost to the City and convey fee title to the Tehama Parcel to the City and County of San Francisco;

- Design, and construct all public open space and project open space and amenities identified in the DDA, including the Howard Plaza, Courtyard, and all portions of open space provided within the tower project or the mid-rise affordable project;

- Provide for the long-term maintenance of the constructed open space;

- Establish a transfer fee of 0.5% of the price of each market rate condominium at resale to be used solely for the maintenance of the publicly accessible open space adjacent to the Project, and require that all subsequent resales be subject to the same 0.5% transfer fee;

- Reserve approximately 6,400 square feet of ground floor retail space for community serving or public benefit uses.

In summary, the $6 million purchase price to be paid by the Developer for the Block 4 development site, including the Air rights Parcel to be created and leased to the Affordable Developer, represents the site's fair market value and fair reuse value given the terms and conditions of the DDA and the specific development program that will be built on the subject site. Therefore, the purchase price is in full compliance with the requirements of Health and Safety Code Section 33433.

Re: Transmittal of Planning Department Case Number 2018-015785GPR GPA MAP
Transbay Block 4 – 200 Main Street – General Plan Amendment, Zoning Map Amendment, General Plan Consistency Findings for Transbay Redevelopment Plan Amendments
Board File No. 220836 (Map Amendment)

Planning Commission Recommendation: **Approval**

Dear Ms. Calvillo and Supervisor Dorsey,

On July 28, 2022, the Planning Commission conducted a duly noticed public hearing at a regularly scheduled meeting to consider several actions that would enable a Project at 200 Main Street, otherwise referred to as Transbay Block 4. The Transbay Block 4 Project includes a 681-unit project of which 306 units (45%) would be affordable. Block 4 is within Zone 1 of the Transbay Redevelopment Project Area, for which the Office of Community Investment and Infrastructure (OCII) has general jurisdiction over approval of development projects.

The Ordinances on which the Commission acted are as follows:

1. General Plan Amendments -- Recommending to the Board of Supervisors approval of General Plan Amendments by amending Figure 1 of the TCDP by changing the height limit on Transbay Block 4 from 450 feet to 513 feet. Staff is also recommending two additional amendments to bring the TCDP into alignment with other previously implemented policy changes subsequent to adoption of that plan. These proposed amendments include: (1) amending Figure 1 by changing the allowed height on Transbay Block 1 from 50/85/300 feet to 400 feet[1]; and (2) amending Policy 4.36 to reflect changes in bike routing on Fremont Street and Beale Street. This was initiated by he Planning Commission on June 23 by Resolution No. 21133.

2. Zoning Map Amendment -- Recommending to the Board of Supervisors approval of Planning Code Map Amendments by amending Planning Code Height and Bulk Map No. HT-01 by changing the Height and Bulk Designation on Block 4 from 50/85/450-TB to 513-TB. This was initiated by Supervisor Dorsey on July 12, 2022.

Relatedly, the Commission made General Plan Consistency Findings for proposed Amendments to the Transbay Redevelopment Plan, which is also now before the Board of Supervisors pursuant to a transmittal provided by OCII.

3. Transbay Redevelopment Plan Amendment -- Making General Plan Consistency findings that find the Redevelopment Plan Amendment to be consistent with the General Plan and Planning Code Section 101.1. The proposed Redevelopment Plan Amendment – like the amendments to Figure 1 and Planning Code Height Map No. HT-01 -- would change the height limit on Transbay Block 4 from 450 feet to 513 feet. In addition to the height increase, the Redevelopment Plan Amendment allows greater bulk by increasing the floor plate limits for the tower portion of the Project from 13,000 square feet to 15,200 square feet for the lower portion of the tower (between heights of 85 feet and 122 feet); and increases the floor plate limit for the mid-rise portion of the Project from 7,500 to 13,500 square feet for portions of the building(s) above 85 feet in height.

Please find attached documents relating to the actions of the Commission. If you have any questions or require further information, please do not hesitate to contact me.

Sincerely,

Aaron D. Starr
Manager of Legislative Affairs

Planning Commission Resolutions No. 21152, 21153 and 21154
Planning Department Executive Summary

[Zoning Map - Transbay Block 4 Redevelopment Project]

Ordinance amending the Zoning Map of the Planning Code to facilitate development of the Transbay Block 4 Redevelopment Project (located on the south side of Howard Street between Beale and Main Sreets) by increasing height limits; adopting findings under the California Environmental Quality Act; making findings of consistency with the General Plan, and the eight priority policies of Planning Code, Section 101.1; and making public necessity, convenience, and general welfare findings under Planning Code, Section 302.

NOTE: **Unchanged Code text and uncodified text** are in plain Arial font.
Additions to Codes are in *single-underline italics Times New Roman font*.
Deletions to Codes are in ~~*strikethrough italics Times New Roman font*~~.
Board amendment additions are in double-underlined Arial font.
Board amendment deletions are in ~~strikethrough Arial font~~.
Asterisks (* * * *) indicate the omission of unchanged Code subsections or parts of tables.

Be it ordained by the People of the City and County of San Francisco:

Section 1. General Findings.

(a) The proposed project on Block 4 of the Transbay Redevelopment Project Area (Assessor's Parcel Block No. 3739, Lot 010) (the "Project") consists of a multi-part, mixed-use, mixed income residential development. Transbay Block 4 is an approximately 45,375 square foot site along the south side of Howard Street between Beale Street and Main Street. The tower portion of the Project would extend to a height of 513 feet.

(b) The Project is within Zone One of the Redevelopment Plan for the Transbay Redevelopment Project Area ("Redevelopment Plan"). Within Zone One, the land use regulations of the Redevelopment Plan are applicable.

(c) This ordinance is related to two companion ordinances: (1) an amendment to the Redevelopment Plan that would increase the height limit for Block 4 from 450 feet to 513 feet to accommodate the proposed Project (the "Plan Amendment"); and (2) an amendment to the Transit Center District Plan, a Sub-Area Plan of the Downtown Plan, to modify the Transit Center District height map to accommodate the proposed Project (the "General Plan Amendment"). The companion ordinances are on file with the Clerk of the Board of Supervisors in File Nos. _____ and _____, respectively.

(d) This ordinance would amend the Zoning Map to conform the Zoning Map with the height limit specified in the Redevelopment Plan Amendment and the General Plan Amendment.

Section 2. Environmental and Planning Code Findings.

(a) On April 22, 2004, after a duly noticed joint public hearing with the Peninsula Corridor Joint Powers Board (the "JPB"), in Motion No. 16773, the Planning Commission certified as adequate and complete the final Environmental Impact Statement/Environmental Impact Report ("EIS/EIR") for the Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project (Planning Department Case No. 2000.048E) in accordance with the California Environmental Quality Act (California Public Resources Code Sections 21000 et seq.), the CEQA Guidelines (Cal. Code of Regulations Title 14, sections 15000 et seq.), and Chapter 31 of the San Francisco Administrative Code. Said Motion is on file with the Clerk of the Board of Supervisors in File No. 041079 and is incorporated herein by reference.

(b) On April 20, 2004, in Resolution No. 45-2004, the former San Francisco Redevelopment Agency ("Former Agency"), at a duly noticed public hearing, also certified the

Final EIR and made findings similar to those of the Commission and JPB in regard to CEQA and the CEQA Guidelines.

(c) In Resolution No. 612-04, effective October 7, 2004, the Board of Supervisors adopted findings that various actions related to the Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project complied with CEQA. Said Resolution and the CEQA Findings are on file with the Clerk of the Board of Supervisors in File No. 041079 and are incorporated herein by reference.

(d) Subsequent to the State of California's dissolution of the Former Agency and the transfer of certain of the Former Agency's assets and obligations to the Successor Agency to the Redevelopment Agency of the City and County of San Francisco ("Successor Agency," commonly known as the Office of Community Investment and Infrastructure), the Board of Supervisors, acting as the legislative body of the Successor Agency, established the Successor Agency Commission ("OCII Commission") and delegated to it the authority to approve all actions related to the Successor Agency's assets, including the authority to exercise land use and development approval.

(e) The Successor Agency, as lead agency under CEQA and in consultation with the Planning Department, prepared Addendum No. 9 to the FEIS/EIR, dated June 13, 2022 ("Addendum"). The Addendum evaluates the environmental effects of the Project.

(f) On June 21, 2022, after a duly noticed public hearing, the OCII Commission considered various approvals related to the Project, and by Resolution No. 18-2022, determined that: the Project would not cause new significant impacts that were not identified in the EIS/EIR; the Project would not cause significant impacts that were previously identified in the EIS/EIR to become substantially more severe; no new mitigation measures would be necessary to reduce significant impacts; no changes have occurred with respect to circumstances surrounding the Project that would cause significant environmental impacts to

which the Project would contribute considerably; and no new information has become available that shows that the Project would cause significant environmental impacts. For these reasons, no supplemental environmental review is required. This determination is on file with the Clerk of the Board of Supervisors in File No. _____ and is incorporated herein by reference.

(g) Also on June 21, 2022, the OCII Commission, by Resolution Nos. 19-2022 and 20-2022, referred the Plan Amendment to the Planning Commission for its report and recommendation on the Plan Amendment and its conformance to the General Plan; found and determined that the Plan Amendment is within the scope of the project analyzed by the EIS/EIR and the Addendum; approved the Plan Amendment; and recommended the Plan Amendment to the Board of Supervisors for its approval. Copies of the Plan Amendment and OCII Commission Resolution Nos. 18-2022, 19-2022, and 20-2022 are on file with the Clerk of the Board of Supervisors in File No. _____, and are incorporated herein by reference.

(h) The Board of Supervisors, acting in its capacity as a responsible agency under CEQA, has reviewed and considered the EIS/EIR and the Addendum, and hereby adopts the CEQA findings set forth in Successor Agency Commission Resolution Nos. 18-2022, 19-2022, and 20-2022 and Planning Commission Motion No. _____ and hereby incorporates such findings by reference as though fully set forth in this ordinance.

(i) On _____, the Planning Commission, in Resolution No. _____, adopted findings that the actions contemplated in this ordinance are consistent, on balance, with the City's General Plan and eight priority policies of Planning Code Section 101.1. The Board adopts these findings as its own. A copy of said Resolution is on file with the Clerk of the Board of Supervisors in File No. _____, and is incorporated herein by reference.

(j) On _____, the Planning Commission, in Resolution No. _____, adopted findings that the actions contemplated in this ordinance will serve the public

necessity, convenience, and welfare. The Board adopts these findings as its own. A copy of said Resolution is on file with the Clerk of the Board of Supervisors in File No. _____, and is incorporated herein by reference.

Section 3. The Planning Code is hereby amended by amending Height and Bulk District Map HT01 of the Zoning Map as follows:

Assessor's Block	Lot	Height and Bulk District to be Superseded	Height and Bulk District to be Hereby Approved
3739	010	50/85/450-TB	513-TB

Section 4. Effective Date. This ordinance shall become effective 30 days after enactment. Enactment occurs when the Mayor signs the ordinance, the Mayor returns the ordinance unsigned or does not sign the ordinance within ten days of receiving it, or the Board of Supervisors overrides the Mayor's veto of the ordinance.

LEGISLATIVE DIGEST

[Zoning Map - Transbay Block 4 Redevelopment Project]

Ordinance amending the Zoning Map of the Planning Code to facilitate development of the Transbay Block 4 Redevelopment Project (located on the south side of Howard Street between Beale and Main Sreets) by increasing height limits; adopting findings under the California Environmental Quality Act; making findings of consistency with the General Plan, and the eight priority policies of Planning Code, Section 101.1; and making public necessity, convenience, and general welfare findings under Planning Code, Section 302.

Existing Law

The Planning Code and Zoning Map limit the height and bulk of buildings in the City.

Amendments to Current Law

This legislation would increase the height limit applicable to Assessor's Block 3739, Lot 010 to accommodate development of the Transbay Block 4 development project.

Background Information

The Transbay Block 4 development project is a proposed mixed-use residential development project generally consisting of a 513-foot tall residential tower, a townhouse adjunct, a 163-foot tall affordable residential building, an underground shared parking facility, and public open space and streetscape improvements within and surrounding the site. This ordinance is related to two companion ordinances that would also facilitate development of the Transbay Block 4 development project: (1) an amendment to the Transbay Redevelopment Plan that would increase the height limit for the project site from 450 feet to 513 feet; and (2) an amendment to the Transit Center District Plan, a Sub-Area Plan of the Downtown Plan, to similarly modify the Transit Center District height map.

n:\legana\as2022\2100136\01613457.docx

[General Plan Amendments - Transbay Block 4 Redevelopment Project]

Ordinance amending the General Plan to revise the Transit Center District Plan, a Sub-Area Plan of the Downtown Plan, to facilitate development of the Transbay Block 4 Redevelopment Project by revising height limits and bicycle network policy; adopting findings under the California Environmental Quality Act; making findings of consistency with the General Plan, and the eight priority policies of Planning Code, Section 101.1; and making public necessity, convenience, and general welfare findings under Planning Code, Section 340.

Deletions to Codes are in ~~*strikethrough italics Times New Roman font*~~.
Board amendment additions are in double-underlined Arial font.
Board amendment deletions are in ~~strikethrough Arial font~~.
Asterisks (* * * *) indicate the omission of unchanged Code subsections or parts of tables.

Be it ordained by the People of the City and County of San Francisco:

Section 1. Environmental Findings.

(a) On April 22, 2004, in Motion No. 16773, the Planning Commission certified as adequate and complete the final environmental impact statement/environmental impact report ("EIS/EIR") for the Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project (Planning Department Case No. 2000.048E) in accordance with the California Environmental Quality Act (California Public Resources Code Sections 21000 et seq.) and Administrative Code Chapter 31. Said Motion is on file with the Clerk of the Board of Supervisors in File No. _____ and is incorporated herein by reference.

(b) On _____ __, 2004, in Motion No. _____, the Planning Commission adopted findings under the California Environmental Quality Act ("CEQA Findings") related to the Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project. The Board adopts these CEQA Findings as its own. Said Motion and the CEQA Findings are on file with the Clerk of the Board of Supervisors in File No. _____ and are incorporated herein by reference.

(c) The Successor Agency to the Redevelopment Agency of the City and County of San Francisco, also known as the Office of Community Investment and Infrastructure ("OCII"), proposes to amend the Redevelopment Plan for the Transbay Redevelopment Project Area (Redevelopment Plan) to facilitate a multi-part, mixed-use development project on Block 4 of the Transbay Redevelopment Project Area ("Transbay Block 4 Development Project," or "Project"). The Transbay Block 4 Development Project would require an increase of the height limit applicable to the Project site, along with other development controls provided in the Transit Center District Plan, the Redevelopment Plan, and the Development Controls and Design Guidelines ("DCDG") for the Transbay Redevelopment Project. Other Transit Center District Plan amendments presented below are needed to align with other policy revisions associated with the Project.

(d) On June __, 2022, the Planning Department determined that: the Project would not cause new significant impacts that were not identified in the EIS/EIR, nor would the Project cause significant impacts that were previously identified in the EIS/EIR to become substantially more severe; no new mitigation measures would be necessary to reduce significant impacts; no changes have occurred with respect to circumstances surrounding the Project that would cause significant environmental impacts to which the Project would contribute considerably; and no new information has become available that shows that the Project would cause significant environmental impacts. For these reasons, the Planning

Department determined that no supplemental environmental review is required. This determination is on file with the Clerk of the Board of Supervisors in File No. _____ and is incorporated herein by reference.

(d) This ordinance is companion legislation to other ordinances relating to the Project, including Zoning Map amendments. The companion ordinances are on file with the Clerk of the Board of Supervisors in File Nos. _____ and _____, respectively.

Section 2. General Plan and Planning Code Section 340 Findings.

(a) Section 4.105 of the Charter provides that the Planning Commission shall periodically recommend to the Board of Supervisors, for approval or rejection, proposed amendments to the General Plan.

(b) Planning Code Section 340 provides that the Planning Commission may initiate an amendment to the General Plan by a resolution of intention, which refers to, and incorporates by reference, the proposed General Plan amendments. Section 340 further provides that the Planning Commission shall adopt the proposed General Plan amendments after a public hearing if it finds from the facts presented that the public necessity, convenience, and general welfare require the proposed amendment or any part thereof. If adopted by the Commission in whole or in part, the proposed amendments shall be presented to the Board of Supervisors, which may approve or reject the amendments by a majority vote.

(c) After a duly noticed public hearing on _____, 2022, in Motion No. _____, the Planning Commission initiated amendments to the General Plan. Said Motion is on file with the Clerk of the Board of Supervisors in File No. _____ and incorporated herein by reference.

(d) On _____, the Planning Commission, in Resolution No. _____, adopted findings regarding the City's General Plan, the eight priority policies of Planning Code

Section 101.1, and Planning Code Section 340. A copy of said Resolution is on file with the Clerk of the Board of Supervisors in File No. _____ and is incorporated herein by reference.

(e) Section 4.105 of the City Charter further provides that if the Board of Supervisors fails to act within 90 days of receipt of the proposed General Plan amendments, then the amendments shall be deemed approved.

(f) The Board of Supervisors finds that the General Plan amendments are, on balance, in conformity with the General Plan, as it is proposed for amendment by this ordinance, and the eight priority policies of Planning Code Section 101.1 for the reasons set forth in Planning Commission Resolution No. _____. The Board hereby adopts these Planning Commission findings as its own.

(g) The Board of Supervisors finds, pursuant to Planning Code Section 340, that the General Plan amendments set forth in this ordinance and in documents on file with the Clerk of the Board in File No. _____ will serve the public necessity, convenience, and general welfare for the reasons set forth in Planning Commission Resolution No. _____. The Board hereby adopts these Planning Commission findings as its own.

Section 3. The General Plan is hereby amended by revising the Transit Center District Plan, as follows:

* * * *

Figure 1. Proposed Height Limits: Revise the indicated height limit for the Transbay Block 4 site from 450 feet to 513 feet. Revise the indicated height limit for the Transbay Block 1 site from 50/85/300 feet to 400 feet.

* * * *

Policy 4.36

Expand the Bicycle Network in the area.

Create dedicated *north-south* bicycle facilities on ~~*the following streets:*~~*any possible combination of the Transit Center's north-south streets, which could include Main, Beale, and Fremont Streets.*

~~*Fremont Street (northbound)*~~
~~*Beale Street (southbound)*~~
~~*Main Street (northbound)*~~

* * * *

Section 4. Effective Date. This ordinance shall become effective 30 days after enactment. Enactment occurs when the Mayor signs the ordinance, the Mayor returns the ordinance unsigned or does not sign the ordinance within ten days of receiving it, or the Board of Supervisors overrides the Mayor's veto of the ordinance.

PLANNING COMMISSION RESOLUTION NO. 21152

HEARING DATE: JULY 28, 2022

Project Name:	Transbay Block 4 – 200 Main Street - Zoning Map Amendments
Case Number:	2018-015785MAP
Initiated by:	Planning Commission
Staff Contact:	Mat Snyder, Citywide Planning Mathew.snyder@sfgov.org, (628) 652-7460
Reviewed by:	Joshua Switzky, Land Use & Community Planning Program Manager, Citywide Planning Joshua.switzky@sfgov.org, (628) 652-7464

RESOLUTION RECOMMENDING THAT THE BOARD OF SUPERVISORS APPROVE AMENDMENTS TO PLANNING CODE HEIGHT AND BULK MAP HT-01 BY REDESIGNATING TRANSBAY BLOCK 4, ASSESSOR'S BLOCK 3739, LOT 010 FROM 50/85/450-TB TO 513-TB; ADOPTING FINDINGS, INCLUDING ENVIRONMENTAL FINDINGS, PLANNING CODE SECTION 302 FINDINGS, AND FINDINGS OF CONSISTENCY WITH THE GENERAL PLAN AND PLANNING CODE SECTION 101.1.

WHEREAS, on July 12, 2022, Supervisor Matt Dorsey introduced an ordinance (Board File 220836) for Zoning Code Map Amendments by amending Planning Code Height and Bulk Map HT-01, for the Assessor's Block and Lot as listed above; and

WHEREAS, pursuant to Planning Code Section 302(b), on July 12, 2022, the San Francisco Board of Supervisors initiated these Planning Code Map Amendments; and,

WHEREAS, the proposed amendments to Height and Bulk Map HT-01 would enable the Transbay Block 4 Project as described below; Transbay Block 4 is bordered by Howard Street on the north, Main Street on the east, Beale Street on the east and a proposed new portion on Tehama Street on the south in Zone One of the Transbay Redevelopment Project Area, and is comprised of Assessor Block 3739, Lot 10; and,

WHEREAS, the Board of Supervisors of the City and County of San Francisco ("Board of Supervisors") approved the Redevelopment Plan for the Transbay Redevelopment Project Area ("Redevelopment Plan") by Ordinance No. 124-05 (June 21, 2005) and by Ordinance No. 99-06 (May 9, 2006), as amended by Ordinance No. 84-15 (June 18, 2015) and Ordinance No. 62-16 (April 28, 2016); and,

WHEREAS, the Redevelopment Plan establishes the land use controls for the Project Area and divides the Project Area into two subareas: Zone One, in which the Redevelopment Plan and Development Controls and Design

Guidelines for the Transbay Redevelopment Project ("DCDG") regulate land uses, and Zone Two, in which the San Francisco Planning Code regulates land uses. Zone One is intended to be developed with predominantly residential uses. The Successor Agency to the San Francisco Redevelopment Agency, commonly referred to as the Office of Community Investment and Infrastructure ("OCII") solely administers and enforces land use entitlements for property and projects in Zone One and has delegated its authority over projects that do not require OCII action in Zone Two to the San Francisco Planning Department pursuant to that certain Delegation Agreement between the Former Agency and the Planning Department for the Transbay Redevelopment Project Area; and,

WHEREAS, a major focus of the Redevelopment Plan is to redevelop 10 acres of former highway access ramp properties owned by the State of California to generate funding for the Transbay Joint Powers Authority ("TJPA") to construct what is now the Salesforce Transit Center (the "Transit Center"). OCII's role is to complete the enforceable obligations that the Department of Finance has finally and conclusively approved under Redevelopment Dissolution Law. These enforceable obligations include the Implementation Agreement between TJPA and the Former Agency, which requires OCII to facilitate the sale and development of certain State-Owned Parcels to third parties, to implement the Redevelopment Plan, and to comply with California Assembly Bill 812, codified in Section 5027.1 of the California Public Resources Code ("AB 812"), which requires that 35% of all new residential units in the Project Area be affordable to low- and moderate-income households;
and,

WHEREAS, in February 2012, the State of California dissolved all redevelopment agencies pursuant to California Health and Safety Code Sections 34170 et seq. ("Redevelopment Dissolution Law"), and under Ordinance No. 215-12 (Oct. 4, 2012), the Board of Supervisors established and delegated its authority under the Redevelopment Dissolution Law to the Successor Agency Commission and the Successor Agency to the Redevelopment Agency of the City and County of San Francisco (commonly referred to as the Commission on Community Investment and Infrastructure, or "CCII" and the Office of Community Investment and Infrastructure or "OCII," respectively); and,

WHEREAS, in April 2016, the CCII the Successor Commission to the Redevelopment Agency Commission approved an Agreement for Option to Purchase Transbay Block 4 ("Options Agreement") with F4 Transbay Partners LLC, a Delaware limited liability company ("Project Sponsor"). At the time, the Project Sponsor sought to acquire Transbay Parcel F from TJPA and required as a condition of that purchase that OCII enter into the Option Agreement so that the Developer could fulfill the affordable housing obligations of Parcel F through the development of Block 4.; and,

WHEREAS, in September 2018, CCII approved a non-binding Term Sheet outlining the mixed-use, mixed-income development program for Block 4 (the "Project") along with the First Amendment to the Option Agreement. The 2018 Term Sheet served as the basis for negotiation of the Disposition and Development Agreement ("DDA") and development of the Schematic Design; and,

WHEREAS, between September 2018 and September 2021, OCII negotiated with the Project Sponsor in determining the parameters for the Transbay Block 4 Schematic Design and the DDA. Objectives for OCII in their negotiations with the Project Sponsor included, in part, ensuring a maximum number of affordable units such that, at full buildout, at least 35% of the units within Transbay Project Area would be affordable; ensuring project feasibility; and maintaining the general land use and urban design principles of the vision established by the

Design for Development ("D4D"). To meet these objectives, OCII determined that the building envelope then proscribed by the Redevelopment Plan (and as reflected in the height maps within the Transit Center District Area Plan of the General Plan and Planning Code Height and Bulk Map HT-01), and the DCDG would need to be amended to allow greater development potential. As described above, an amendment to the Redevelopment Plan requires the Commission adopt findings of consistency with the General Plan and Planning Code Section 101.1. Amendments to the General Plan and the Planning Code Height Map require legislation requiring Commission action. However, the DCDG is under the sole jurisdiction of OCII and CCII; the Planning Department and Commission have no role in administering this document, including review of approval of any amendments to it; and,

WHEREAS, through the negotiations described above, OCII and the Project Sponsor agreed upon a Project Description for the Project: The Block 4 Project would include a 47-story tower with 6-story townhouse adjunct, a 16-story mid-rise building, and a single-story shared podium with shared underground facilities. The Project would provide 681 total residential units, of which 45% would be affordable. The 681 units would include 155 market-rate condominium units in the upper portion of the tower and townhouse adjunct, 324 rental units in the lower portion of the tower (including 219 market rate units and 105 below market rate units affordable to moderate income households) (the "Tower Project"), as well as 202 rental units in a 100% affordable project in the mid-rise building (including one unrestricted manager's unit) (the "Mid-Rise Project"). In addition, the Project includes ground floor retail (a portion of which is restricted for community-serving uses), public and private open space, the construction of Tehama Street (which will be conveyed to the City upon completion), streetscape improvements, and underground utility rooms, auto and bicycle parking; and,

WHEREAS, Planning Code Height and Bulk Map HT-01 specifies a 50/85/450-TB Height designation for the subject site limiting the maximum height of the site to 450-feet; the Planning Code refers to the Redevelopment Plan for further specifications of the "TB" Height and Bulk designation. The proposed Map Amendment would provide for a maximum height limit of 513 feet for Block 4; and

WHEREAS, related conforming amendments to the Redevelopment Plan, and amendments to Figure 1, "Proposed Height Limits" to the Transit Center District Area Plan ("TCDP") of the General Plan, both of which also limit the site to 450 feet in height. At their July 28, 2022 Hearing, the Planning Commission approved the Planning General Plan Amendments to the TCDP and found the proposed Redevelopment Plan Amendments consistent with the General Plan; and

WHEREAS, OCII maintains land use and California Environmental Quality Act ("CEQA") review authority of the Transbay Redevelopment Project Area, including the site of the proposed amendment (Block 4)' and,

WHEREAS, on June 21, 2022 at a public hearing the CCII adopted Resolution Nos. 18-2022, 20-2022, 21-2022, 22-2022, and 23-2022, which (1) made CEQA findings confirming the analysis and conclusion of Addendum of the Final Environmental Impact Statement/Environmental Impact Report for the Transbay Terminal/Caltrain Downtown Extension/ Redevelopment Project ("Final Environmental Document") as further described below , (2) approved the Redevelopment Plan Amendments and referred it to the Planning Commission, (3) approved the amendments to the DCDG, (4) approved the DDA for the Project, and (5) conditionally approved the Schematic Design for the Project; and,

WHEREAS, on June 15, 2004, the Board of Supervisors affirmed, by Motion No. 04-67, the certification under the California Environmental Quality Act (California Public Resources Code Sections 21000 et seq., and the CEQA Guidelines (14 California Code of Regulations Sections 15000 et seq. ("CEQA Guidelines," and collectively "CEQA")) of the Final Environmental Document, which included the Redevelopment Plan. Subsequently, the Board of Supervisors adopted, by Resolution No. 612-04 (October 7, 2004), findings that various actions related to the Project complied with CEQA and the Former Agency Commission adopted, by Resolution No. 11-2005 (January 25, 2005), findings and a statement of overriding considerations and a mitigation monitoring and reporting program, adopted in accordance with CEQA. Subsequent to the adoption of the Final Environmental Document and the findings, the Former Agency or the Successor Agency or other responsible agencies under CEQA/NEPA have approved and incorporated eight addenda into the analysis of the Final Environmental Document (as incorporated, the "FEIS/EIR") and made requisite findings under CEQA (findings referenced in this recital collectively referred to as the "CEQA Findings"). OCII staff has made the FEIS/EIR, (including the addenda), and related documents available to the Commission and the public, and these files are part of the record before the Commission; and,

WHEREAS, OCII, as lead agency and in consultation with the San Francisco Planning Department, has prepared Addendum No. 9 to the FEIS/EIR (the "Addendum"), dated June 13, 2022 (link). The Addendum evaluates the potential environmental effects associated with approval of the Redevelopment Plan Amendments and related action ("Proposed Actions"); and,

WHEREAS, OCII prepared the Addendum in compliance with CEQA and the Addendum reflects the independent judgment and analysis of OCII, and the OCII concludes that the Proposed Actions are within the scope of impacts analyzed in the FEIS/EIR and will not result in any new significant impacts or a substantial increase in the severity of previously identified significant effects that alter the conclusions reached in the FEIS/EIR for the reasons stated in the Addendum; and,

WHEREAS, based on the analysis in the Addendum, by Motion No. 18-2022, the CCII concluded that the analyses conducted and the conclusions reached in the FEIS/EIR remain valid and the Proposed Actions will not cause new significant impacts not identified in the FEIS/EIR or substantially increase the severity of previously identified significant impacts, and no new mitigation measures will be necessary to reduce significant impacts. Further, as described in the Addendum, no changes have occurred, with respect to either the development or the circumstances surrounding the development contemplated in FEIS/EIR, that will require major revisions of the FEIS/EIR due to the involvement of new significant effects or a substantial increase in the severity of previously identified significant effects, and no new information has become available that shows that the Block 4 Project will cause new or more severe significant environmental impacts. Therefore, no subsequent or supplemental environmental review is required under CEQA beyond the Addendum to approve the Proposed Actions, the Block 4 Project and other actions necessary for the Block 4 Project;

A draft ordinance, attached hereto as Exhibit A, would amend Planning Code Height and Bulk Map HT-01 for Assessor's Block 3739, Lot 010 from a 50/85/450-TB designation to a 513-TB designation.

NOW THEREFORE BE IT RESOLVED, that the Planning Commission hereby finds that the Planning Code Text Amendments and Zoning Map Amendments promote the public welfare, convenience and necessity for the following reasons:

- The Proposed Zoning Map Amendment would enable a project that would add 681 of much needed residential dwelling units to San Francisco's housing stock. Moreover, 45% will be affordable to households with incomes that range between 40% to 120% of AMI with a broad mix of unit types.
- Though the actions required by the Planning Commission, CCII, and the Board of Supervisors would increase the allowed building envelope in multiple ways, OCII staff has worked carefully with the Project Sponsor and Planning staff to assure these increases are well considered to still meet the general urban design principles of the Transbay Redevelopment Plan, Design for Development, and DCDG. The tower will still be shorter than towers immediately to the north, thereby working within the Downtown urban design vision to create a Downtown "mound" at the Transit Center Tower (Salesforce Tower) location and tapering down toward Folsom Street and the waterfront, and other taller portions of the Project would be proportional to the tower portion. Additionally, the design of the ground plane and its interaction with the public realm are of high quality and will assure the Project fits in with its immediate context.
- The Proposed Zoning Map Amendment would enable a project that includes improvements to Beale, Howard and Main Streets, helping fulfill the public realm vision for Transbay. Beale and Main Streets are envisioned as pedestrian dominated "living streets". The Project will also include constructing a new portion of Tehama Street on the south, which will be designed to feel like a linear plaza that provides a border between the Project and a new park to the south. The Project also includes a central publicly-accessible courtyard that will feature a grand stair from Tehama Street. The open space and public realm improvements will be well-integrated and enhance the public realm and open space network of Transbay and Downtown in general.
- The Proposed Zoning Map Amendment would not create significant shadow impacts as described in Addendum No. 9 and in the draft Planning Commission Motion regarding the Redevelopment Plan Amendment;
- The Proposed Zoning Map Amendment would enable a project that would enable a project that includes 681 units (of which 306 will be affordable) will be located in Downtown San Francisco, which has excellent access to transit and other non-vehicular modes of transportation. Transbay is also rich in other amenities, including multiple parks, that make this location particularly well suited for high density residential development.

AND BE IT FURTHER RESOLVED, that the Commission finds the India Basin Planning Code Amendments are in conformity with the General Plan and Planning Code Section 101.1 as set forth in Motion No.21154 and

AND BE IT FURTHER RESOLVED, that the Commission has reviewed and considered the CEQA Findings and statement of overriding considerations that the Successor Agency previously adopted, and reviewed and considered the CEQA Findings contained in the Addendum, which the Successor Agency adopted in Resolution No. 18-2022, and hereby adopts these additional CEQA Findings as its own. The Commission finds that the conclusions reached in the FEIS/EIR remain valid and the Proposed Actions will not cause new significant impacts not identified in the FEIS/EIR or substantially increase the severity of previously identified significant impacts, and no new mitigation measures will be necessary to reduce significant impacts. Further, as described in the

Addendum, no changes have occurred, with respect to either the development or the circumstances surrounding the development contemplated in FEIS/EIR, that will require major revisions of the FEIS/EIR due to the involvement of new significant effects or a substantial increase in the severity of previously identified significant effects, and no new information has become available that shows that the Project will cause new or more severe significant environmental impacts. Therefore, no subsequent or supplemental environmental review is required under CEQA beyond the Addendum to approve the Proposed Actions, the Project and other actions necessary for the Project; and

AND BE IT FURTHER RESOLVED, that pursuant to Planning Code Section 302, the Planning Commission Adopts a Resolution to Recommend to the Board of Supervisors to approve the Draft Ordinance.

I hereby certify that the foregoing Resolution was ADOPTED by the San Francisco Planning Commission on July 28, 2022.

PLANNING COMMISSION RESOLUTION NO. 21153

HEARING DATE: JULY 28, 2022

Project Name:	Transbay Block 4 – 200 Main Street - Amendments to the Transit Center District Sub Area Plan
Case Number:	2018-015785GPA
Initiated by:	Planning Commission
Staff Contact:	Mat Snyder, Citywide Planning Mathew.snyder@sfgov.org, (628) 652-7460
Reviewed by:	Joshua Switzky, Land Use & Community Planning Program Manager, Citywide Planning Joshua.switzky@sfgov.org, (628) 652-7464

RESOLUTION RECOMMENDING THAT THE BOARD OF SUPERVISORS APPROVE AMENDMENTS TO THE TRANSIT CENTER DISTRICT AREA PLAN (TCDP), A SUB-AREA OF THE DOWNTOWN PLAN, BY AMENDING TCDP FIGURE 1 BY CHANGING THE HEIGHT LIMIT ON TRANSBAY BLOCK 4 FROM 450 FEET TO 513 FEET, AND THE HEIGHT LIMIT ON TRANSBAY BLOCK 1 FROM 50/85/300 TO 400 FEET, AND AMENDING POLICY 4.36 REGARDING BIKE ROUTING; ADOPTING FINDINGS, INCLUDING ENVIRONMENTAL FINDINGS, PLANNING CODE SECTION 340 FINDINGS, AND FINDINGS OF CONSISTENCY WITH THE GENERAL PLAN AND PLANNING CODE SECTION 101.1.

WHEREAS, section 4.105 of the Charter of the City and County of San Francisco provides to the Planning Commission the opportunity to periodically recommend General Plan Amendments to the Board of Supervisors; and

WHEREAS, pursuant to Planning Code Section 340(C), the Planning Commission ("Commission") initiated a General Plan Amendment in association with the Transbay Block 4 project, per Planning Commission Resolution No. 21133, on June 23, 2022.

WHEREAS, the proposed amendments to the TDCP would, in part, enable the Transbay Block 4 Project as described below; Transbay Block 4 is bordered by Howard Street on the north, Main Street on the east, Beale Street on the east and a proposed new portion on Tehama Street on the south in Zone One of the Transbay Redevelopment Project Area, and is comprised of Assessor Block 3739, Lot 10; and,

WHEREAS, the Board of Supervisors of the City and County of San Francisco ("Board of Supervisors") approved the Redevelopment Plan for the Transbay Redevelopment Project Area ("Redevelopment Plan") by Ordinance No. 124-05 (June 21, 2005) and by Ordinance No. 99- 06 (May 9, 2006), as amended by Ordinance No. 84-15 (June 18, 2015) and Ordinance No. 62-16 (April 28, 2016); and,

WHEREAS, the Redevelopment Plan establishes the land use controls for the Project Area and divides the Project Area into two subareas: Zone One, in which the Redevelopment Plan and Development Controls and Design Guidelines for the Transbay Redevelopment Project ("DCDG") regulate land uses, and Zone Two, in which the San Francisco Planning Code regulates land uses. Zone One is intended to be developed with predominantly residential uses. The Successor Agency to the San Francisco Redevelopment Agency, commonly referred to as the Office of Community Investment and Infrastructure ("OCII") solely administers and enforces land use entitlements for property and projects in Zone One and has delegated its authority over projects that do not require OCII action in Zone Two to the San Francisco Planning Department pursuant to that certain Delegation Agreement between the Former Agency and the Planning Department for the Transbay Redevelopment Project Area; and,

WHEREAS, a major focus of the Redevelopment Plan is to redevelop 10 acres of former highway access ramp properties owned by the State of California to generate funding for the Transbay Joint Powers Authority ("TJPA") to construct what is now the Salesforce Transit Center (the "Transit Center"). OCII's role is to complete the enforceable obligations that the Department of Finance has finally and conclusively approved under Redevelopment Dissolution Law. These enforceable obligations include the Implementation Agreement between TJPA and the Former Agency, which requires OCII to facilitate the sale and development of certain State-Owned Parcels to third parties, to implement the Redevelopment Plan, and to comply with California Assembly Bill 812, codified in Section 5027.1 of the California Public Resources Code ("AB 812"), which requires that 35% of all new residential units in the Project Area be affordable to low- and moderate-income households; and,

WHEREAS, in February 2012, the State of California dissolved all redevelopment agencies pursuant to California Health and Safety Code Sections 34170 et seq. ("Redevelopment Dissolution Law"), and under Ordinance No. 215-12 (Oct. 4, 2012), the Board of Supervisors established and delegated its authority under the Redevelopment Dissolution Law to the Successor Agency Commission and the Successor Agency to the Redevelopment Agency of the City and County of San Francisco (commonly referred to as the Commission on Community Investment and Infrastructure, or "CCII," and the Office of Community Investment and Infrastructure or "OCII," respectively); and,

WHEREAS, in April 2016, the CCII the Successor Commission to the Redevelopment Agency Commission approved an Agreement for Option to Purchase Transbay Block 4 ("Options Agreement") with F4 Transbay Partners LLC, a Delaware limited liability company ("Project Sponsor"). At the time, the Project Sponsor sought to acquire Transbay Parcel F from TJPA and required as a condition of that purchase that OCII enter into the Option Agreement so that the Developer could fulfill the affordable housing obligations of Parcel F through the development of Block 4.; and,

WHEREAS, in September 2018, CCII approved a non-binding Term Sheet outlining the mixed-use, mixed-income development program for Block 4 (the "Project") along with the First Amendment to the Option Agreement. The 2018 Term Sheet served as the basis for negotiation of the Disposition and Development Agreement ("DDA") and development of the Schematic Design; and,

WHEREAS, between September 2018 and September 2021, OCII negotiated with the Project Sponsor in determining the parameters for the Transbay Block 4 Schematic Design and the DDA. Objectives for OCII in their negotiations with the Project Sponsor included, in part, ensuring a maximum number of affordable units such that, at full buildout, at least 35% of the units within Transbay Project Area would be affordable; ensuring project

feasibility; and maintaining the general land use and urban design principles of the vision established by the Design for Development ("D4D"). To meet these objectives, OCII determined that the building envelope then proscribed by the Redevelopment Plan (and as reflected in the height maps within the Transit Center District Area Plan of the General Plan and Planning Code Height and Bulk Map HT-01), and the DCDG would need to be amended to allow greater development potential. As described above, an amendment to the Redevelopment Plan requires the Commission adopt findings of consistency with the General Plan and Planning Code Section 101.1. Amendments to the General Plan and the Planning Code Height Map require legislation requiring Commission action. However, the DCDG is under the sole jurisdiction of OCII and CCII; the Planning Department and Commission have no role in administering this document, including review of approval of any amendments to it; and,

WHEREAS, through the negotiations described above, OCII and the Project Sponsor agreed upon a Project Description for the Project: The Block 4 Project would include a 47-story tower with 6-story townhouse adjunct, a 16-story mid-rise building, and a single-story shared podium with shared underground facilities. The Project would provide 681 total residential units, of which 45% would be affordable. The 681 units would include 155 market-rate condominium units in the upper portion of the tower and townhouse adjunct, 324 rental units in the lower portion of the tower (including 219 market rate units and 105 below market rate units affordable to moderate income households) (the "Tower Project"), as well as 202 rental units in a 100% affordable project in the mid-rise building (including one unrestricted manager's unit) (the "Mid-Rise Project"). In addition, the Project includes ground floor retail (a portion of which is restricted for community-serving uses), public and private open space, the construction of Tehama Street (which will be conveyed to the City upon completion), streetscape improvements, and underground utility rooms, auto and bicycle parking; and,

WHEREAS, Transit Center District Plan Figure 1, "Proposed Height Limits" currently limits Transbay Block 4 to 450 feet. Figure 1 also limits Transbay Block 1 to 300 feet in height. TCDP Policy 4.36 specifies certain bike routing on Main, Beale and Fremont Streets. The proposed TDCP Amendments would change the height designation for Block to 513 feet, would change the height designation for Transbay Block 1 to 400 feet, and would provide more flexibility in determining bike routing on Main, Beale and Fremont Streets; and

WHEREAS, separately, the allowed maximum height increase also requires amendments to the Redevelopment Plan, and amendments Planning Code Height and Bulk Map HT-01, both of which also limit the Project site to 450 feet in height. At their July 28, 2022 Hearing, the Planning Commission approved the Zoning Map Amendment and found the proposed Redevelopment Plan Amendments consistent with the General Plan and Planning Code section 101.1; and

WHEREAS, OCII maintains land use and California Environmental Quality Act ("CEQA") review authority of the Transbay Redevelopment Project Area, including the site of the proposed amendment (Block 4)' and,

WHEREAS, on June 21, 2022 at a public hearing the CCII adopted Resolution Nos. 18-2022, 20-2022, 21-2022, 22-2022, and 23-2022, which (1) made CEQA findings confirming the analysis and conclusion of Addendum of the Final Environmental Impact Statement/Environmental Impact Report for the Transbay Terminal/Caltrain Downtown Extension/ Redevelopment Project ("Final Environmental Document") as further described below , (2) approved the Plan Amendment and referred it to the Planning Commission, (3) approved the amendments to the

DCDG, (4) approved the DDA for the Project, and (5) conditionally approved the Schematic Design for the Project; and,

WHEREAS, on June 15, 2004, the Board of Supervisors affirmed, by Motion No. 04-67, the certification under the California Environmental Quality Act (California Public Resources Code Sections 21000 et seq., and the CEQA Guidelines (14 California Code of Regulations Sections 15000 et seq. ("CEQA Guidelines," and collectively "CEQA")) of the Final Environmental Document, which included the Redevelopment Plan. Subsequently, the Board of Supervisors adopted, by Resolution No. 612-04 (October 7, 2004), findings that various actions related to the Project complied with CEQA and the Former Agency Commission adopted, by Resolution No. 11-2005 (January 25, 2005), findings and a statement of overriding considerations and a mitigation monitoring and reporting program, adopted in accordance with CEQA. Subsequent to the adoption of the Final Environmental Document and the findings, the Former Agency, the Successor Agency or other responsible agencies under CEQA/NEPA have approved and incorporated eight addenda into the analysis of the Final Environmental Document (as incorporated, the "FEIS/EIR") and made requisite findings under CEQA (findings referenced in this recital collectively referred to as the "CEQA Findings"). OCII staff has made the FEIS/EIR (including the addenda), and related documents available to the Commission and the public, and these files are part of the record before the Commission; and,

WHEREAS, OCII, as lead agency and in consultation with the San Francisco Planning Department, has prepared Addendum No. 9 to the FEIS/EIR (the "Addendum"), dated June 13, 2022 (link). The Addendum evaluates the potential environmental effects associated with approval of the Redevelopment Plan Amendments and related actions ("Proposed Actions"); and,

WHEREAS, OCII prepared the Addendum in compliance with CEQA and the Addendum reflects the independent judgment and analysis of OCII, and the OCII concludes that the Proposed Actions are within the scope of impacts analyzed in the FEIS/EIR and will not result in any new significant impacts or a substantial increase in the severity of previously identified significant effects that alter the conclusions reached in the FEIS/EIR for the reasons stated in the Addendum; and,

WHEREAS, based on the analysis in the Addendum, by Motion No. 18-2022, the CCII concluded that the analyses conducted and the conclusions reached in the FEIS/EIR remain valid and the Proposed Actions will not cause new significant impacts not identified in the FEIS/EIR or substantially increase the severity of previously identified significant impacts, and no new mitigation measures will be necessary to reduce significant impacts. Further, as described in the Addendum, no changes have occurred, with respect to either the development or the circumstances surrounding the development contemplated in FEIS/EIR, that will require major revisions of the FEIS/EIR due to the involvement of new significant effects or a substantial increase in the severity of previously identified significant effects, and no new information has become available that shows that the Block 4 Project will cause new or more severe significant environmental impacts. Therefore, no subsequent or supplemental environmental review is required under CEQA beyond the Addendum to approve the Proposed Actions, the Block 4 Project and other actions necessary for the Block 4 Project;

Whereas, a draft ordinance, attached hereto as Exhibit A, That pursuant to Planning Code Section 340, the Planning Commission Adopts a Resolution to Recommend to the Board of Supervisors to approve the Draft Ordinance.

NOW THEREFORE BE IT RESOLVED, that the Commission has reviewed and considered the CEQA Findings and statement of overriding considerations that the Successor Agency previously adopted, and reviewed and considered the CEQA Findings contained in the Addendum, which the Successor Agency adopted in Resolution No. 18-2022, and hereby adopts these additional CEQA Findings as its own. The Commission finds that the conclusions reached in the FEIS/EIR remain valid and the Proposed Actions will not cause new significant impacts not identified in the FEIS/EIR or substantially increase the severity of previously identified significant impacts, and no new mitigation measures will be necessary to reduce significant impacts. Further, as described in the Addendum, no changes have occurred, with respect to either the development or the circumstances surrounding the development contemplated in FEIS/EIR, that will require major revisions of the FEIS/EIR due to the involvement of new significant effects or a substantial increase in the severity of previously identified significant effects, and no new information has become available that shows that the Project will cause new or more severe significant environmental impacts. Therefore, no subsequent or supplemental environmental review is required under CEQA beyond the Addendum to approve the Proposed Actions, the Project and other actions necessary for the Project; and

BE IT FURTHER RESOLVED, that pursuant to Planning Code Section 340, the Planning Commission Adopts a Resolution to Recommend to the Board of Supervisors to approve the Draft Ordinance.

I hereby certify that the foregoing Resolution was ADOPTED by the San Francisco Planning Commission on July 28, 2022.

PLANNING COMMISSION MOTION NO. 21154

HEARING DATE: JULY 28, 2022

Project Name:	Transbay Block 4 – 200 Main Street – Amendment to the Transbay Redevelopment Plan
Case Number:	2018-015785GPR
Initiated by:	Planning Commission
Staff Contact:	Mat Snyder, Citywide Planning Mathew.snyder@sfgov.org, (628) 652-7460
Reviewed by:	Joshua Switzky, Land Use & Community Planning Program Manager, Citywide Planning Joshua.switzky@sfgov.org, (628) 652-7464

ADOPTING ENVIRONMENTAL FINDINGS PURSUANT TO THE CALIFORNIA ENVIRONMENTAL QUALITY ACT AND RECOMMENDING APPROVAL OF THE AMENDMENT TO THE REDEVELOPMENT PLAN FOR THE TRANSBAY REDEVELOPMENT PROJECT AREA TO INCREASE THE MAXIMUM HEIGHT LIMIT FROM 400 FEET TO 513 FEET, AND TO INCREASE THE ALLOWED BULK ON BLOCK 4 OF ZONE 1 OF THE TRANSBAY REDEVELOPMENT PROJECT AREA, ADOPTING GENERAL PLAN AND PLANNING CODE SECTION 101.1 FINDINGS, AND RECOMMENDING THE TRANSBAY REDEVELOPMENT PLAN AMENDMENT TO THE BOARD OF SUPERVISORS FOR APPROVAL.

WHEREAS, the Board of Supervisors of the City and County of San Francisco ("Board of Supervisors") approved the Redevelopment Plan for the Transbay Redevelopment Project Area ("Redevelopment Plan") by Ordinance No. 124-05 (June 21, 2005) and by Ordinance No. 99- 06 (May 9, 2006), as amended by Ordinance No. 84-15 (June 18, 2015) and Ordinance No. 62-16 (April 28, 2016); and,

WHEREAS, the Redevelopment Plan establishes the land use controls for the Project Area and divides the Project Area into two subareas: Zone One, in which the Redevelopment Plan and Development Controls and Design Guidelines for the Transbay Redevelopment Project ("DCDG") regulate land uses, and Zone Two, in which the San Francisco Planning Code regulates land uses. Zone One is intended to be developed with predominantly residential uses. The Successor Agency to the San Francisco Redevelopment Agency, commonly referred to as the Office of Community Investment and Infrastructure ("OCII") solely administers and enforces land use entitlements for property and projects in Zone One and has delegated its authority over projects that do not require OCII action in Zone Two to the San Francisco Planning Department pursuant to that certain Delegation Agreement between the Former Agency and the Planning Department for the Transbay Redevelopment Project Area; and,

WHEREAS, a major focus of the Redevelopment Plan is to redevelop 10 acres of former highway access ramp properties owned by the State of California (the "State-Owned Parcels") to generate funding for the Transbay Joint Powers Authority ("TJPA") to construct what is now the Salesforce Transit Center (the "Transit Center"). OCII's role is to complete the enforceable obligations that the Department of Finance has finally and conclusively approved under Redevelopment Dissolution Law. These enforceable obligations include the Implementation Agreement

between TJPA and the Former Agency, which requires OCII to facilitate the sale and development of certain State-Owned Parcels to third parties, to implement the Redevelopment Plan, and to comply with California Assembly Bill 812, codified in Section 5027.1 of the California Public Resources Code ("AB 812"), which requires that 35% of all new residential units in the Project Area be affordable to low- and moderate-income households; and,

WHEREAS, Section 4.105 of the City Charter and 2A.53 of Administrative Code require General Plan referrals to the Planning Commission ("Commission") for certain matters, including determination as to whether a Redevelopment Plan amendment is in conformity with the General Plan prior to consideration by the Board of Supervisors. Similarly, Section 33346 of the California Health and Safety Code regarding California Redevelopment Law, the Redevelopment Plan must be submitted to the Planning Commission for its report and recommendation concerning the proposed plan amendments; and,

WHEREAS, on July 20, 2020, the Planning Department received a General Plan Referral application to amend the Redevelopment Plan for the Transbay Redevelopment Project Area ("Plan Amendment") to increase the maximum height limit for Block 4 from 400 feet to 513 feet, and to increase the maximum floor plate limits within different portions of the building envelope within the same block; and,

WHEREAS, Transbay Block 4 is bordered by Howard Street on the north, Main Street on the east, Beale Street on the west and a proposed new segment of Tehama Street on the south in Zone One of the Transbay Redevelopment Project Area, and is comprised of Assessor Block 3739, Lot 10; and,

WHEREAS, in February 2012, the State of California dissolved all redevelopment agencies pursuant to California Health and Safety Code Sections 34170 et seq. ("Redevelopment Dissolution Law"), and under Ordinance No. 215-12 (Oct. 4, 2012), the Board of Supervisors established and delegated its authority under the Redevelopment Dissolution Law to the Successor Agency Commission and the Successor Agency to the Redevelopment Agency of the City and County of San Francisco (commonly referred to as the Commission on Community Investment and Infrastructure, or "CCII," and the Office of Community Investment and Infrastructure or "OCII," respectively); and,

WHEREAS, in April 2016, the CCII approved an Agreement for Option to Purchase Transbay Block 4 ("Option Agreement") with F4 Transbay Partners LLC, a Delaware limited liability company ("Project Sponsor"). At the time, the Project Sponsor sought to acquire Transbay Parcel F from TJPA and required as a condition of that purchase that OCII enter into the Option Agreement so that the Developer could fulfill the affordable housing obligations of Parcel F through the development of Block 4; and,

WHEREAS, in September 2018, CCII approved a non-binding Term Sheet outlining the mixed-use, mixed-income development program for Block 4 (the "Project") along with the First Amendment to the Option Agreement. The 2018 Term Sheet served as the basis for negotiation of the Disposition and Development Agreement ("DDA") and development of the Schematic Design; and,

WHEREAS, between September 2018 and September 2021, OCII negotiated with the Project Sponsor in determining the parameters for the Transbay Block 4 Schematic Design and the DDA. Objectives for OCII in their negotiations with the Project Sponsor included, in part, ensuring a maximum number of affordable units such that, at full buildout, at least 35% of the units within Transbay Project Area would be affordable; ensuring project

feasibility; and maintaining the general land use and urban design principles of the vision established by the Design for Development ("D4D"). To meet these objectives, OCII determined that the building envelope then proscribed by the Redevelopment Plan (and as reflected in the height maps within the Transit Center District Area Plan of the General Plan and Planning Code Height and Bulk Map HT-01), and the DCDG would need to be amended to allow greater development potential. As described above, an amendment to the Redevelopment Plan requires the Commission adopt findings of consistency with the General Plan and Planning Code Section 101.1. Amendments to the General Plan and the Planning Code Height Map require legislation requiring Commission action. However, the DCDG is under the sole jurisdiction of OCII and CCII; the Planning Department and Commission have no role in administering this document, including review of approval of any amendments to it; and,

WHEREAS, through the negotiations described above, OCII and the Project Sponsor agreed upon a Project Description for the Project: The Project would include a 47-story tower with 6-story townhouse adjunct, a 16-story mid-rise building, and a single-story shared podium with shared underground facilities. The Project would provide 681 total residential units, of which 45% would be affordable. The 681 units would include 155 market-rate condominium units in the upper portion of the tower and townhouse adjunct, 324 rental units in the lower portion of the tower (including 219 market rate units and 105 below market rate units affordable to moderate income households) (the "Tower Project"), as well as 202 rental units in a 100% affordable project in the mid-rise building (including one unrestricted manager's unit) (the "Mid-Rise Project"). In addition, the Project includes ground floor retail (a portion of which is restricted for community-serving uses), public and private open space, the construction of Tehama Street (which will be conveyed to the City upon completion), streetscape improvements, and underground utility rooms, auto and bicycle parking; and,

WHEREAS, the Transbay Redevelopment Plan specifies a 450-foot maximum height limit on Block 4 and limits the floor plates of the Tower Project to 13,000 square feet ("sf") above 85-feet, and limits the floor plates of the Mid-Rise Project between build heights of 85 feet and 250 feet to 7,500 sf. The proposed Plan Amendment would provide for a maximum height limit of 513 feet, a maximum floor plate size of 13,500 sf between heights of 85-feet and 250-feet for the Mid-Rise Project, and a maximum floor plate size of 15,300 sf at the lower portion of the tower (85 feet to 122 feet) for the Tower Project; these proposed Redevelopment Plan controls would only apply to Block 4 and no other portion of the Plan Area. Similarly, the DCDG contained several controls that needed to be amended to enable the Project including, in part, allowing additional heights at other portions of the site, allowing the public open space to be constructed above grade, allowing temporary parking and valet operations on the ground floor, eliminating or revising setback and townhouse location requirements on the Beale, Howard, and Main Street frontages, revising floor plate ratio requirements, and revising some modulation requirements; and

WHEREAS, related conforming amendments to the Transit Center District Area Plan of the General Plan (Figure 1 – "Proposed Height Limits"), and Planning Code Height and Bulk Map HT-01 are necessary to reflect the proposed maximum height increase in the Redevelopment Plan Amendment. On June 23, 2022, the Commission adopted Motion No. 21133 initiating the General Plan Amendments. On July 12, 2022, Supervisor Dorsey introduced legislation to amend Planning Code Height and Bulk Map HT-01 and referred the legislation to the Planning Commission for their action. At their July 28, 2022 Hearing, the Planning Commission approved the General Plan Amendment and Zoning Map Amendment; and

WHEREAS, OCII maintains land use and California Environmental Quality Act ("CEQA") review authority of the Transbay Redevelopment Project Area, including the site of the proposed amendment (Block 4) and,

WHEREAS, on June 21, 2022 at a public hearing the CCII adopted Resolution Nos. 18-2022, 20-2022, 21-2022, 22-2022, and 23-2022, which (1) made CEQA findings confirming the analysis and conclusion of Addendum of the Final Environmental Impact Statement/Environmental Impact Report for the Transbay Terminal/Caltrain Downtown Extension/ Redevelopment Project ("Final Environmental Document") as further described below , (2) approved the Plan Amendment and referred it to the Planning Commission, (3) approved the amendments to the DCDG, (4) approved the DDA for the Project, and (5) conditionally approved the Schematic Design for the Project; and,

WHEREAS, on June 15, 2004, the Board of Supervisors affirmed, by Motion No. 04-67, the certification under the California Environmental Quality Act (California Public Resources Code Sections 21000 et seq., and the CEQA Guidelines (14 California Code of Regulations Sections 15000 et seq. ("CEQA Guidelines," and collectively "CEQA")) of the Final Environmental Document, which included the Redevelopment Plan. Subsequently, the Board of Supervisors adopted, by Resolution No. 612-04 (October 7, 2004), findings that various actions related to the Project complied with CEQA and the Former Agency Commission adopted, by Resolution No. 11-2005 (January 25, 2005), findings and a statement of overriding considerations and a mitigation monitoring and reporting program, adopted in accordance with CEQA. Subsequent to the adoption of the Final Environmental Document and the findings, the Former Agency, the Successor Agency or other responsible agencies under CEQA/NEPA have approved and incorporated eight addenda into the analysis of the Final Environmental Document (as incorporated, the "FEIS/EIR") and made requisite findings under CEQA (findings referenced in this recital collectively referred to as the "CEQA Findings"). OCII staff has made the FEIS/EIR (including the addenda), and related documents available to the Commission and the public, and these files are part of the record before the Commission; and,

WHEREAS, OCII, as lead agency and in consultation with the San Francisco Planning Department, has prepared Addendum No. 9 to the FEIS/EIR (the "Addendum"), dated June 13, 2022 (link). The Addendum evaluates the potential environmental effects associated with approval of the Redevelopment Plan Amendment and related actions ("Proposed Actions"); and,

WHEREAS, OCII prepared the Addendum in compliance with CEQA and the Addendum reflects the independent judgment and analysis of OCII, and the OCII concludes that the Redevelopment Plan Amendment and related actions "Proposed Actions" are within the scope of impacts analyzed in the FEIS/EIR and will not result in any new significant impacts or a substantial increase in the severity of previously identified significant effects that alter the conclusions reached in the FEIS/EIR for the reasons stated in the Addendum; and,

WHEREAS, based on the analysis in the Addendum, by Motion No. 18-2022, the CCII concluded that the analyses conducted and the conclusions reached in the FEIS/EIR remain valid and the Proposed Actions will not cause new significant impacts not identified in the FEIS/EIR or substantially increase the severity of previously identified significant impacts, and no new mitigation measures will be necessary to reduce significant impacts. Further, as described in the Addendum, no changes have occurred, with respect to either the development or the circumstances surrounding the development contemplated in FEIS/EIR, that will require major revisions of the

FEIS/EIR due to the involvement of new significant effects or a substantial increase in the severity of previously identified significant effects, and no new information has become available that shows that the Project will cause new or more severe significant environmental impacts. Therefore, no subsequent or supplemental environmental review is required under CEQA beyond the Addendum to approve the Proposed Actions, the Project and other actions necessary for the Project;

FINDINGS

Staff analyzed the proposed Redevelopment Plan Amendment with regards to conformity to the General Plan as described below.

DOWNTOWN PLAN

OBJECTIVE 9
PROVIDE QUALITY OPEN SPACE IN SUFFICIENT QUANTITY AND VARIETY TO MEET THE NEEDS OF DOWNTOWN WORKERS, RESIDENTS, AND VISITORS.

POLICY 9.1
Require usable indoor and outdoor open space, accessible to the public, as part of new downtown development.

OBJECTIVE 10
ASSURE THAT OPEN SPACES ARE ACCESSIBLE AND USABLE.

POLICY 10.3
Keep open space facilities available to the public.

The Redevelopment Plan Amendment will enable development of the proposed Project, which is an amenity rich 681-unit development with 45% affordability. The Project will feature 12,500 square feet of open space for the residents and the public including 6,000 square feet central ungated courtyard that will be open to the public. The central open space will be accessible by a grand exterior stair from the new segment of Tehama Street, which in turn, will border a new planned public park to its south. Separately, the Project would also entail building out new streetscape portions of Beale and Main Streets, which are envisioned as pedestrian-dominated living streets. The on-site publicly accessible open space will thereby be integrated and connected to the Transbay and Downtown public realm networks.

OBJECTIVE 13
CREATE AN URBAN FORM FOR DOWNTOWN THAT ENHANCES SAN FRANCISCO'S STATURE AS ONE OF THE WORLD'S MOST VISUALLY ATTRACTIVE CITIES.

POLICY 13.1
Relate the height of buildings to important attributes of the city pattern and to the height and character of existing and proposed development.

The Transbay Redevelopment Project Area Design for Development, completed in 2003, envisions transforming an area formerly containing the Embarcadero Freeway, its remaps and Terminal Separator Structure into a transit-oriented residential district in the heart of downtown. The DCDG for this area, adopted in 2005, called for Zone One to "become a complementary and exciting addition to the downtown skyline, designed as designed as a grouping of slender towers that would visually extend the Downtown high-rise office skyline."

The proposed Redevelopment Plan Amendment would allow a 513-foot residential tower on Block 4, an additional 63 feet above what is currently allowed on the site; the proposed Redevelopment Plan Amendment would also allow buildings with larger floor plates than currently allowed on portions of the site. The increased bulk and heights have been designed so that taken together, the different components of the overall Block 4 development continue to be proportional to each other while enabling a significant increase in unit count overall and affordable unit count more specifically.

The Downtown Plan, the Transit Center District Plan, and the Urban Design Element all call for a tapering of tower heights from the location of the Transit Center Tower down toward Folsom Street and the waterfront, with towers heights tapering upward south of Folsom toward Rincon Hill. The additional height of Block 4 to allow 513-feet would be shorter than the 550-foot tower immediately north and other towers further north thereby respecting this urban design goal.

Policy 13.2
Foster sculpturing of building form to create less overpowering buildings and more interesting building tops, particularly the tops of towers.

POLICY 13.3
Create visually interesting terminations to building towers.

OBJECTIVE 15
CREATE A BUILDING FORM THAT IS VISUALLY INTERESTING AND HARMONIZES WITH SURROUNDING BUILDINGS.

The proposed Project will feature a 513-foot tower with a 49-foot mechanical penthouse. The proposed design control amendments have been carefully tailored to assure that height of the Project's tower and penthouse work within the envisioned tapering of towers from Mission Street to Folsom Street – that is that the overall tower height continues to read as being shorter than the towers to the north. The penthouse is designed as an extension of one of the tower masses thereby accentuating the tower's verticality and not creating a separate element that could otherwise call undo attention to itself.

The proposed amendments to the design controls (both with the Redevelopment Plan and the DCDG) have been carefully considered so that additional height and bulk across the site both horizontally and vertically work together proportionally. For example, floor plate limits for the tower have been increased so that they podium portion of tower is at a higher height proportional to the proposed new tower height.

OBJECTIVE 16

CREATE AND MAINTAIN ATTRACTIVE, INTERESTING URBAN STREETSCAPES

As noted above, the proposed Project includes streetscape improvements to all bordering streets accordance with the Transbay Streetscape Master Plan.

POLICY 16.2
Provide setbacks above a building base to maintain the continuity of the predominant streetwalls along the street.
Setbacks will be provided along the newly created portion of Tehama Street to provide residential stoops to the townhouse units and a portion of Main Street. Setbacks will not be provided for the remainder portion of Main Street, Beale Street and Howard Street consistent with other buildings along those streets.

TRANSIT CENTER DISTRICT PLAN: A SUB-AREA PLAN OF THE DOWNTOWN PLAN

OBJECTIVE 2.1
MAXIMIZE BUILDING ENVELOPE AND DENSITY IN THE PLAN AREA WITHIN THE BOUNDS OF URBAN FORM AND LIVABILITY OBJECTIVES OF THE

OBJECTIVE 2.2
CREATE AN ELEGANT DOWNTOWN SKYLINE, BUILDING ON EXISTING POLICY TO CRAFT A DISTINCT DOWNTOWN "HILL" FORM, WITH ITS APEX AT THE TRANSIT CENTER, AND TAPERING IN ALL DIRECTIONS.

OBJECTIVE 2.4
PROVIDE DISTINCT TRANSITIONS TO ADJACENT NEIGHBORHOODS AND TO TOPOGRAPHIC AND MAN-MADE FEATURES OF THE CITYSCAPE TO ENSURE THE SKYLINE ENHANCES, AND DOES NOT DETRACT FROM, IMPORTANT PUBLIC VIEWS THROUGHOUT THE CITY AND REGION.

POLICY 2.5
Transition heights down to adjacent areas, with particularly attention on the transitions to the southwest and west in the lower scale South of Market areas and to the waterfront to the east.

As noted above, while the proposed Redevelopment Plan Amendment would increase the height and bulk of the Project at Block 4, the additional height and bulk have been carefully considered to assure that the skyline conforms to Downtown "hill" and Folsom Street "saddle" urban form.

OBJECTIVE 2.9
PROVIDE BUILDING ARTICULATION ABOVE A BUILDING BASE TO MAINTAIN OR CREATE A DISTINCTIVE STREETWALL COMPATIBLE WITH THE STREET'S WIDTH AND CHARACTER.

OBJECTIVE 2.11
PURSUE BUILDING SETBACKS TO AUGMENT A SIDEWALK WIDENING PROGRAM ON STREET FRONTAGES WHERE SIGNIFICANT CONTIGUOUS STRETCHES OF PARCELS ARE LIKELY TO BE REDEVELOPED.

OBJECTIVE 2.12

ENSURE THAT DEVELOPMENT IS PEDESTRIAN-ORIENTED, FOSTERING A VITAL AND ACTIVE STREET LIFE.

Policy 2.15

Establish a pedestrian zone below a building height of 20 to 25 feet through the use of façade treatments, such as building projections, changes in materials, setbacks, or other such architectural articulation.

The Redevelopment Plan Amendment along with other design control amendments proposed by Project facilitate a high-quality interface with the pedestrian realm at the ground plane. While building heights along all frontages would be taller than under existing controls, they would be in keeping with nearby buildings. Special attention has been paid to uses and building design at the ground level. The Project would align the new block of Tehama with fronting townhouse units featuring stoops and planting. Also, along Tehama would be a grand stair with seating terraces that would lead to the Project's publicly accessible mid-block open space one story above grade. Retail uses and lobby entries would be featured along Howard, Beale and Main Streets. As noted above the Project Sponsor would improve Beale, Howard and Main Street pursuant to the Transbay Streetscape and Open Space Concept Plan. Most significantly, an extension of Tehama Street would be constructed to the south of the Project. Tehama's design would feature low curbs and special pedestrian-oriented design treatment of the street through raised crosswalk creating a sense of a linear plaza.

URBAN DESIGN ELEMENT

OBJECTIVE 3

MODERATION OF MAJOR NEW DEVELOPMENT TO COMPLEMENT THE CITY PATTERN, THE RESOURCES TO BE CONSERVED, AND THE NEIGHBORHOOD ENVIRONMENT

Fundamental Principles for Major New Development

1. The relationship of a building's size and shape to its visibility in the cityscape, to important natural features and to existing development determines whether it will have a pleasing or a disruptive effect on the image and character of the city.

The Urban Design Element along with the Downtown Area Plan and the Transit Center District Area Plan call for a tapering of building heights from a central Downtown location (Salesforce Tower) and tapering in each direction. Although the additional 63-feet height would bring the proposed Project closer to the height of tower immediately to the north (Block 5), the differentiation of the two is still significant enough to maintain the tapering of building heights.

RECREATION AND OPEN SPACE ELEMENT

POLICY 1.9

Preserve sunlight in public open spaces.

The proposed Redevelopment Plan Amendment would allow a taller residential tower to be built on the site of Block 4. The additional height and building envelope area that would be allowed under the proposed Plan Amendment would not create any net new shadow on a park under the jurisdiction of Department of Recreation and Parks that are subject to Planning Code Section 295. Shadow analysis conducted as a part of the addendum identified two existing parks and one proposed new park that are not subject to Planning Code Section 295 and seven privately

owned publicly open spaces ("POPOS") onto which the proposed Project could cast net new shadow. In all cases, the additional duration and area of shadow created by the Project compared to a project that would be compliant to current standards was found to be insignificant in terms of duration, area, and the overall impact of quality to the open space; the net new shadow from the proposed Project would not substantially and adversely affect the public's use and enjoyment of the respective open space.

HOUSING ELEMENT

OBJECTIVE 1

IDENTIFY AND MAKE AVAILABLE FOR DEVELOPMENT ADEQUATE SITES TO MEET THE CITY'S HOUSING NEEDS, ESPECIALLY PERMANENTLY AFFORDABLE HOUSING.

POLICY 1.10

Support new housing projects, especially affordable housing, where households can easily rely on public transportation, walking and bicycling for the majority of daily trips.

OBJECTIVE 12

BALANCE HOUSING GROWTH WITH ADEQUATE INFRASTRUCTURE THAT SERVES THE CITY'S GROWING POPULATION.

POLICY 12.1

Encourage new housing that relies on transit use and environmentally sustainable patterns of movement.

The proposed Redevelopment Plan Amendment would allow 63 additional feet in height to the tower, along with increased floor plate sizes at two locations within the site. Similarly, amendments to the DCDG allow additional height and building area at other locations at the site. OCII staff indicates that the additional building envelope allowed by the subject Redevelopment Plan Amendment along with the DCDG Amendment would enable 126 additional units on the site. The new configuration of allowable building area also enables a standalone 100% affordable housing project that will include 201 affordable units at a variety of bedroom sizes made available to households ranging from 40% to 100% AMI. The Redevelopment Plan Amendment will further enable a project that will provide 105 affordable units within the Tower Project for moderate income households ranging from 100% to 120% AMI.

The proposed height increase is suitable for this area of Downtown first because of the convenient access to public transit and the Project's various heights still fit within the D4D's urban design vision for Transbay and Downtown. The proximity to a variety of transit options within the city and to the Bay Area would allow for sustainable development.

Also, the location is suitable for the proposed height due to the dense context of the neighborhood. The residential neighborhoods near Downtown and in Rincon Hill include dense tall residential towers. After the Transbay Redevelopment Plan was enacted in 2006 additional towers were built in the Rincon Hill or are currently under construction in the Transit Center area. This neighborhood context provides flexibility for additional height on Block 4 within the confines of maintaining a cohesive skyline as discussed in the previous section.

OBJECTIVE 7

SECURE FUNDING AND RESOURCES FOR PERMANENTLY AFFORDABLE HOUSING, INCLUDING INNOVATIVE PROGRAMS THAT ARE NOT SOLELY RELIANT ON TRADITIONAL MECHANISMS OR CAPITAL.

POLICY 7.5
Encourage the production of affordable housing through process and zoning accommodations, and prioritize affordable housing in the review and approval processes.

The Redevelopment Plan Amendment would enable a Project that would include 45% affordable units. Based on building to date in the Plan Area and OCII development projections, the affordable units within the proposed Project will contribute to ensuring that at least 35% of all new residential units within the Plan Area will be restricted for affordability as required by State Law.

OBJECTIVE 11
SUPPORT AND RESPECT THE DIVERSE AND DISTINCT CHARACTER OF SAN FRANCISCO'S NEIGHBORHOODS.

POLICY 11.4
Continue to utilize zoning districts which conform to a generalized residential land use and density plan and the General Plan.

Zoning changes in the City occur through a community planning process for a neighborhood or sub-set of a neighborhood. The proposed Redevelopment Plan Amendment was discussed with the OCII's Transbay Citizen's Advisory Committee ("CAC") and other means in the community. In May 2022, the Transbay CAC approved the Project, which included the proposed height increase. Staff finds the proposed height change to serve the public good through additional affordable housing units and transit-oriented development.

Eight Priority Policies of Planning Code Section 101.1

The subject project is found to be consistent with the Eight Priority Policies of Planning Code Section 101.1 in that:

1. That existing neighborhood-serving retail uses be preserved and enhanced and future opportunities for resident employment in and ownership of such businesses enhanced.

   The proposed Redevelopment Plan Amendment will not result in change in neighborhood-serving retail businesses. The Project will include street level retail to enhance the neighborhood commercial environment and the residential units in the project will provide more customers for neighborhood retail.
2. That existing housing and neighborhood character be conserved and protected in order to preserve the cultural and economic diversity of our neighborhood.

   The proposed Redevelopment Plan Amendment will not affect existing housing and will help add to the City's housing stock. The proposed residential tower project will transform former Embarcadero Freeway land into 681 dwelling units of which 45% will be Below Market Rate Units affordable to households with income at various levels of AMI.

3. That the City's supply of affordable housing be preserved and enhanced.

   The proposed Redevelopment Plan Amendment would increase the supply of affordable housing in San Francisco. OCII has indicated that the additional height and other building envelope increases will enable 126 additional units. Moreover, the additional height and bulk of the Project allowed by the Redevelopment Plan Amendment and the resulting increased residential development area is essential to the feasibility of the Project with 45% affordability. The Project's affordable units will contribute to meeting the requirement of having 35% of new residential units within the Plan Area restricted for affordability.

4. That commuter traffic not impede MUNI transit service or overburden our streets or neighborhood parking.

   The Redevelopment Plan Amendment and Project would not impede MUNI transit service or overburden our streets or neighborhood parking; rather it would create additional residential units in this transit rich neighborhood. Parking requirements would be set by limits of the Redevelopment Plan. The proposed parking ratio is under the prescribed ratio of 0.5 space/unit in the adjacent Downtown C-3 Zoning District. The limited parking and easy access to transit and other non-vehicular modes of transportation would help enable residents to get around without having to use private vehicles.

5. That a diverse economic base be maintained by protecting our industrial and service sectors from displacement due to commercial office development, and that future opportunities for residential employment and ownership in these sectors be enhanced.

   The proposed Redevelopment Plan Amendment would not result in displacing existing industrial and service uses or change the existing economic base in this area. The site of Block 4 was most recently used as a temporary bus terminal, for which the surface lot is no longer needed.

6. That the City achieves the greatest possible preparedness to protect against injury and loss of life in an earthquake.

   The proposed Redevelopment Plan Amendment will not affect the City's preparedness to protect against injury and loss of life in an earthquake. The proposed Project would be built to the current building code and seismic standards and otherwise will not affect the City's preparedness.

7. That landmarks and historic buildings be preserved.

   The site of Project does not include any landmark or historic building and the proposed Redevelopment Plan Amendment will not affect the landmarks and historic buildings.

8. That our parks and open space and their access to sunlight and vistas be protected from development.

   The proposed Redevelopment Plan Amendment would allow a taller residential tower to be built on the site of Block 4. The additional height and building envelope area that would be allowed under the proposed

Redevelopment Plan Amendment would not create any net new shadow on a park under the jurisdiction of Department of Recreation and Parks and that are subject to Planning Code Section 295. Shadow analysis conducted as a part of Addendum No. 9 identified two existing parks and one proposed new park that are not subject to Planning Code Section 295 and seven privately owned publicly open spaces ("POPOS") onto which the proposed Project could cast net new shadow. In all cases, the additional duration and area of shadow created by the Project compared to a project that would be compliant to current standards was found to be insignificant in terms of duration, area, and the overall impact of quality to the open space; the net new shadow from the proposed Project would not substantially and adversely affect the public's use and enjoyment of the respective open space.

NOW THEREFORE BE IT MOVED, that the Commission has reviewed and considered the CEQA Findings and statement of overriding considerations that the Successor Agency previously adopted and reviewed and considered the CEQA Findings contained in the Addendum, which the Successor Agency adopted in Resolution No. 18-2022, and hereby adopts these additional CEQA Findings as its own. The Commission finds that the conclusions reached in the FEIS/EIR remain valid and the Proposed Actions will not cause new significant impacts not identified in the FEIS/EIR or substantially increase the severity of previously identified significant impacts, and no new mitigation measures will be necessary to reduce significant impacts. Further, as described in the Addendum, no changes have occurred, with respect to either the development or the circumstances surrounding the development contemplated in FEIS/EIR, that will require major revisions of the FEIS/EIR due to the involvement of new significant effects or a substantial increase in the severity of previously identified significant effects, and no new information has become available that shows that the Project will cause new or more severe significant environmental impacts. Therefore, no subsequent or supplemental environmental review is required under CEQA beyond the Addendum to approve the Proposed Actions, the Project and other actions necessary for the Project; and

BE IT FURTHER MOVED, That the Commission hereby finds the proposed amendment to the Transbay Redevelopment Plan, as described above, to be on balance consistent with the General Plan as proposed for amendment, including, but not limited to the Housing Element, Urban Design, Recreation and Open Space Element, Transit Center District Plan, and is consistent with the eight Priority Policies in City Planning Code Section 101.1 for reasons set forth in this motion, and recommend to the Board of Supervisors approval of the Plan Amendment.

I hereby certify that the foregoing Motion was adopted by the Commission at its meeting on July 28, 2022.

EXECUTIVE SUMMARY
TRANSBAY BLOCK 4 GENERAL PLAN,ZONING MAP, AND REDEVELOPMENT PLAN AMENDMENTS

HEARING DATE: JULY 28, 2022

Project Name:	Transbay Block 4 – 200 Main Street – Amendments to the Transit Center District Area Plan, Planning Code Height and Bulk Map HT-01 and the Transbay Redevelopment Plan
Case Number:	2018-015785GPR GPA MAP
Initiated by:	Planning Commission
Staff Contact:	Mat Snyder, Citywide Planning Mathew.snyder@sfgov.org, (628) 652-7460
Reviewed by:	Joshua Switzky, Land Use & Community Planning Program Manager, Citywide Planning Joshua.switzky@sfgov.org, (628) 652-7464

Recommendation:	Find Redevelopment Plan Amendment in General Conformity with the General Plan and Planning Code Section 101.1; Recommend Approval to the Board of Supervisors the Amendments to the General Plan and Planning Code Height and Bulk Map

Project Description

The Office of Community Investment and Infrastructure ("OCII") is proposing to amend the Redevelopment Plan for the Transbay Redevelopment Project Area ("Redevelopment Plan") to facilitate a mixed-use residential development project on Block 4 of the Transbay Redevelopment Project Area ("Project") located at 200 Main Street, Assessor's Block 3739, Lot 010 ("Project Site"). The amendment includes increasing the height limit for the Project Site, which will also require conforming amendments to Figure 1 – "Proposed Height Limits" of the Transit Center District Plan ("TCDP"), a Sub-Area Plan of the Downtown Area Plan, and to Planning Code Height and Bulk Map HT-01.

Block 4 is the northern portion of the former Temporary Transbay Terminal site bounded by Howard, Folsom, Main and Beale Streets. For redevelopment purposes, the Redevelopment Plan delineates this area as Blocks 2, 3, and 4, separated by new extension of Clementina Street and Tehama Street across the site. Block 4 is bounded by Howard Street to the north, Beale and Main Streets to the west and east, respectively, and the planned new segment of Tehama Street to the south.

The Block 4 Project is proposed to include a 47-story tower with 6-story townhouse adjunct, a 16-story mid-rise building, and a single-story shared podium with shared underground facilities. The Project will provide 681 total residential units, of which 45% would be affordable. The 681 units would include 155 market-rate condominium units in the upper portion of the tower and townhouse adjunct, 324 rental units in the lower portion of the tower (including 219 market rate units and 105 below market rate units affordable to moderate income households) (the "Tower Project"), as well as 202 rental units in a 100% affordable project in the mid-rise building (including one unrestricted manager's unit) (the "Mid-Rise Project"). In addition, the Project includes ground floor retail (a portion of which is restricted for community-serving uses), public and private open space, the construction of Tehama Street (which will be conveyed to the City upon completion), streetscape improvements, and underground utility rooms, auto and bicycle parking.

Details of the Project's programming is provided below:

Block 4 Project Summary	
Residential Units	681 total units, 306 (45%) restricted for affordability
Tower/townhouse condominiums	135 market rate condominium units located on floors 28 to 47 of the tower; and 20 units in floors 1 to 6 of the townhouses along Tehama
Tower Market rate rental units	219 rental units located on floors 2 to 27 of the tower, in the following sizes: 123 one-bedrooms 96 two-bedrooms
Tower BMR units	105 affordable rental units located on floors 2 to 20 of the tower, including 21 units at 100% AMI, 22 units at 110% AMI, and 62 units at 120% AMI in the following sizes: 12 studios 47 one-bedrooms 34 two-bedrooms 12 three-bedrooms
Mid-Rise Affordable Units	201 affordable rental units and one unrestricted manager's unit located on floors 2 to 16 of the mid-rise, with tiered AMIs at 40%, 45%, 50%, 60% 70%, 80%, 90%, and 100% in the following sizes: 20 studios 75 one-bedrooms 86 two-bedrooms 21 three bedrooms
Commercial space	8,389 square feet of commercial/retail space, 6,431 of which is restricted for community-serving uses
Resident amenity spaces	Tower 35th floor amenity space, with programming to be determined, accessible to condominium unit residents only Tower 12th floor amenity including solarium spaces and an outdoor terrace, accessible to residents throughout the Project Tower 2nd floor amenity space including a fitness amenity, club room and adjacent terrace, cooking accessories and seating, accessible to residents throughout the Project

	Mid-Rise 2nd floor community room with kitchen and resident lounge, accessible to residents of the Mid-Rise Affordable Project Mid-Rise 7th and 12th floor outdoor terraces, accessible to residents of the Mid-Rise Affordable Project and Tower Mixed-Income Rental Project (note: may be limited to Mid-Rise Affordable Project residents due to Low Income Housing Tax Credit regulations)
Open space	12,584 total square feet of open space, including a central raised courtyard providing approximately 8,330 square feet of ungated publicly accessible open space, (accessible via contiguous stairs from Howard Street and Tehama Street and elevators from inside of buildings) and terraced seating area with views to the future Transbay Park along Tehama Street
Streetscape improvements	Improvements include widened sidewalks and bulb-outs, street trees and other plantings, public seating, streetlights, and bicycle racks
Tehama Street	Construction of a new segment of Tehama Street between Beale and Main Streets for vehicular access, as designed by the Transbay Block 3 Park design team from the Department of Public Works. Ownership of the Tehama Parcel and Tehama Street improvements will be granted back to the City for acceptance after completion.
Parking	Parking for up to 275 vehicles in an underground garage parking facility with valet services; the garage includes 224 physical spaces with the use of stackers, including 2 car-share spaces, remaining capacity may be possible with enhanced valet operations
Bicycle parking	Class I secured spaces for 556 bicycles in two below-grade bike rooms

The approval of the Project itself will not be before the Planning Commission, as it is in Zone One of the Redevelopment Area under the jurisdiction of the Successor Agency Commission (commonly referred to as the Commission on Community Investment and Infrastructure or "CCII").

Required Planning Commission Actions

The three actions before the Planning Commission that relate to the Project described above are as follows:

1. General Plan Amendments -- Recommending to the Board of Supervisors approval of General Plan Amendments by amending Figure 1 of the TCDP by changing the height limit on Transbay Block 4 from 450 feet to 513 feet. Staff is also recommending two additional amendments to bring the TCDP into alignment with other previously implemented policy changes subsequent to adoption of that plan. These proposed amendments include: (1) amending Figure 1 by changing the allowed height on Transbay Block 1 from 50/85/300 feet to 400 feet[1]; and (2) amending Policy 4.36 to reflect changes in bike routing on Fremont Street and Beale Street.

[1] In 2016, the Commission, CCII, and the Board of Supervisors took serval actions to increase the height of Block 1 from 300 feet to 400 feet by amending the Redevelopment Plan and Map 5 of the Downtown Area Plan, but not Figure 1 of the TCDP. The Ordinance would correct that omission.

2. Zoning Map Amendment -- Recommending to the Board of Supervisors approval of Planning Code Map Amendments by amending Planning Code Height and Bulk Map No. HT-01 by changing the Height and Bulk Designation on Block 4 from 50/85/450-TB to 513-TB.

3. Transbay Redevelopment Plan Amendment -- Making General Plan Consistency findings that find the Redevelopment Plan Amendment to be consistent with the General Plan and Planning Code Section 101.1. The proposed Redevelopment Plan Amendment – like the amendments to Figure 1 and Planning Code Height Map No. HT-01 -- would change the height limit on Transbay Block 4 from 450 feet to 513 feet. In addition to the height increase, the Redevelopment Plan Amendment allows greater bulk by increasing the floor plate limits for the tower portion of the Project from 13,000 square feet to 15,200 square feet for the lower portion of the tower (between heights of 85 feet and 122 feet); and increases the floor plate limit for the mid-rise portion of the Project from 7,500 to 13,500 square feet for portions of the building(s) above 85 feet in height.

Required Actions by the CCII and Board of Supervisors

In addition to the actions required by the Planning Commission, the Project requires the following actions by the CCII and the Board of Supervisors. At their June 21, 2022 regular meeting, the CCII approved the Project as described below:

1. CEQA Findings. By Resolution 18-2022, CCII adopted findings that confirm the analysis and conclusion of Addendum No. 9 to the Transbay FEIR. These CEQA findings will be incorporated into all Board of Supervisors actions for the Project.

2. Amendments to the Redevelopment Plan. By Resolution 20-2022, CCII approved the Redevelopment Plan Amendment and referred it to both the Planning Commission and the Board of Supervisors for their action.

3. Amendment to the Transbay Development Controls and Design Guidelines ("DCDG"). By Resolution 21-2022, CCII approved an amendment to the DCDG. The DCDG provides most of the development controls for Transbay Zone One essentially acting as its Planning Code. Board of Supervisors action is not required for this.

4. Disposition and Development Agreement ("DDA"). By Resolution 22-2022, CCII approved the DDA, which establishes the rights and obligations of OCII and the Project Sponsor governing the sale of the subject site, and development and operation of the Project, including the affordable housing requirements and the requirement to set aside at least 6,431 square feet of the retail space for community use.

5. Schematic Design. By Resolution 23-2022, CCII conditionally approved the actual proposed schematic design for Block 4; the Block 4 schematic design set is provided in this packet for informational purposes. Board of Supervisors action is not required for this.

Background

Transbay Project Area

The Redevelopment Plan for the Transbay Project Area ("Project Area") was first approved in 2005 and subsequently amended twice in 2015 and 2016. The Project Area is divided in two zones: Zone One falls under the jurisdiction of OCII with its development requirements controlled by the DCDG; Zone Two falls under the jurisdiction of the Planning Department with its development requirements controlled by the Planning Code. Zone One is largely comprised of parcels created by the demolition of the previous freeway ramps that had been owned by the State of California ("Zone One Parcels"). A major focus of the Redevelopment Plan is to redevelop the Zone One Parcels to generate funding for the Transbay Joint Point Powers Authority ("TJPA") to construct the Transit Center program, which includes the Transbay (Salesforce) Transit Center, the Caltrain Downtown Extension (DTX), and related improvements. OCII is responsible for implementing the Redevelopment Plan; its duties include facilitating the sale and development of the Zone One Parcels to third parties, ensuring that at least 35% of all new residential units in the Project Area be affordable to low- and moderate-income households (required by California Resource Code Section 5027.1, also referred to as AB 812), and implementing other aspects of the Redevelopment Plan, including the overseeing the design and construction of new streetscape and open space improvements in the Project Area.

Block 4 Relationship to Parcel F

Parcel F (542-550 Howard Street) is another formerly State-owned parcel, located in Zone Two (under Planning Department jurisdiction). Unlike Zone One parcels, such as Block 4, that were and are under control of OCII for disposition and development, Parcel F was under the ownership of the TJPA. In early 2016 the TJPA entered into an agreement with the same Project Sponsor as Block 4 to purchase Parcel F, contingent on CCII approval of an Option Agreement for the Sponsor's purchase of Block 4. On January 28, 2021, the Planning Commission took several actions approving a development on Parcel F, including approving a Development Agreement (Resolution No 20841), which among other things, enabled the Project Sponsor to satisfy its affordable housing requirement pursuant to Planning Code Section 415 by paying an in-lieu fee instead of providing below-market rate units on site as required by Planning Code Section 249.28 for development projects within Zone Two. The DA set the in-lieu fee at 150% of what would be otherwise be charged elsewhere in the City for a similar project under Planning Code Section 415.5. The DA stipulated that the fee would be administered by OCII to create affordable units within the Project Area, thereby helping to ensure that at least 35% of new units within the Project Area are affordable to low- and moderate-income households as required by the State law cited above. Planning Commission Resolution 20841 stipulates that the in-lieu fee revenue generated by Parcel F could be used to increase the number of affordable units created on Block 4.

Block 4 - Proposed Increase in Development Capacity

OCII staff negotiated with the Project Sponsor through an Option Agreement in the programming and design of Block 4. Objectives for the Block 4's programming and design include maximizing the number of affordable units possible while assuring the Project is feasible and meets the design intent of the Redevelopment Plan, the Transbay Design for Development, and DCDG. In developing the program for Block 4, OCII staff has set a target of 45% affordable units across the Site in various unit types and affordability levels as described above. OCII staff

has stated that the proposed affordable units at Block 4 will contribute to meeting or exceeding the 35% affordability requirement for the Project Area. However, to achieve 45% affordability and ensure the Project is feasible, OCII staff determined that it is necessary to enable greater development capacity at the site than allowed by the adopted Redevelopment Plan and DCDG. To enable this greater development capacity, development controls provided in the Redevelopment Plan and the DCDG, and restated in the General Plan (TCDP Figure 1 – Proposed Height Limits) and Planning Code (Height and Bulk Map HT-01), would need to be amended to change the controls for (1) height, (2) bulk (floor plate square footage, plan dimension, and floor plate aspect ratio), (3) setbacks, (4) townhouse frontage location and modulation, and (5) location of open space, among other development controls.

OCII staff has indicated through an initial analysis that the proposed increase in development capacity would facilitate an additional 126 units overall on the site and bring the proposed heights and massing consistent with the adjacent high-rise buildings in TCDP and Rincon Hill neighborhoods

Issues and Other Considerations

- Public Comment & Outreach. On May 12, 2022, the Transbay Citizens Advisory Committee ("CAC") voted unanimously to recommend that the OCII Commission approve (1) the amendment to the Redevelopment Plan, (2) the amendment to the DCDG, (3) the terms of the DDA, and (4) the Schematic Design for Block 4. According to OCII staff, CAC members were pleased to see the Project moving forward and were complimentary of the proposed design. In addition to the Transbay CAC and public hearings, the Project Sponsor presented the Project to the Bay Area Council on May 26, 2022, the San Francisco Housing Action Coalition on June 15, and has reached out to other organizations including the East Cut Community Benefit District to schedule presentations.
- CCII Approval. On June 21, 2022, CCII took several actions, described above, approving the Project.
- Development Control Amendments. Amendments to both the Redevelopment Plan and the DCDG included allowing a greater building envelope by increasing heights along all frontages of the site, allowing greater bulk at the lower portion of the tower and at the upper portions of the mid-rise affordable component, eliminating setbacks along Beale, Howard, and most of Main, allowing the publicly accessible open space be provided above grade, allowing parking operations at the ground level, reducing townhouse location requirements, among others.

Basis for Recommendation

- The proposed Project will add 681 of much needed residential dwelling units to San Francisco's housing stock. Moreover, 45% will be affordable to households with incomes that range between 40% to 120% of AMI with a broad mix of unit types.

- Though the actions required by the Planning Commission, CCII, and the Board of Supervisors would increase the allowed building envelope in multiple ways, OCII staff has worked carefully with the Project Sponsor and Planning staff to assure these increases are well considered to still meet the general urban design principles of the Transbay Redevelopment Plan, Design for Development, and DCDG. The tower will still be shorter than towers immediately to the north, thereby working within the Downtown urban design

vision to create a Downtown "mound" at the Transit Center Tower (Salesforce Tower) location and tapering down toward Folsom Street and the waterfront, and other taller portions of the Project would be proportional to the tower portion. Additionally, the design of the ground plane and its interaction with the public realm are of high quality and will assure the Project fits in with its immediate context.

- The Project includes improvements to Beale, Howard and Main Streets, helping fulfill the public realm vision for Transbay. Beale and Main Streets are envisioned as pedestrian dominated "living streets". The Project will also include constructing a new portion of Tehama Street on the south, which will be designed to feel like a linear plaza that provides a border between the Project and a new park to the south. The Project also includes a central publicly-accessible courtyard that will feature a grand stair from Tehama Street. The open space and public realm improvements will be well-integrated and enhance the public realm and open space network of Transbay and Downtown in general.

- The Project will not create significant shadow impacts as described in Addendum No. 9 and in the draft Planning Commission Motion regarding the Redevelopment Plan Amendment;

- The 681 units (of which 306 will be affordable) will be located in Downtown San Francisco, which has excellent access to transit and other non-vehicular modes of transportation. Transbay is also rich in other amenities, including multiple parks, that make this location particularly well suited for high density residential development.

- The subject Project, and associated required Commission actions, are, on balance, consistent with the General Plan and Planning Code Section 101.1; findings of consistency are described in the Draft Motion regarding the Redevelopment Plan amendments.

Environmental Review

On June 13, OCII and the Planning Department published Addendum No. 9 to the Final Environmental Impact Statement/Environmental Impact Report for the Transbay Terminal/Caltrain Downtown Extension/ Redevelopment Project, which analyzed the Project and associated Board of Supervisors, CCII, and Planning Commission actions needed for the Project. On June 21, 2022, the CCII adopted Resolution No. 18-2022, which adopted CEQA findings associated with Addendum No. 9 confirming its adequacy under CEQA. Addendum No. 9, along with the original FEIR can be found at this link: Transbay Environmental Documents.

Recommendation:	Find Redevelopment Plan Amendment in General Conformity with the General Plan and Planning Code Section 101.1; and Recommend Approval to the Board of Supervisors the Amendments to the General Plan and Planning Code Height and Bulk Map

Print Form

Introduction Form

By a Member of the Board of Supervisors or Mayor

Time stamp
or meeting date

I hereby submit the following item for introduction (select only one):

- [x] 1. For reference to Committee. (An Ordinance, Resolution, Motion or Charter Amendment).
- [ ] 2. Request for next printed agenda Without Reference to Committee.
- [ ] 3. Request for hearing on a subject matter at Committee.
- [ ] 4. Request for letter beginning :"Supervisor _____ inquiries"
- [ ] 5. City Attorney Request.
- [ ] 6. Call File No. _____ from Committee.
- [ ] 7. Budget Analyst request (attached written motion).
- [ ] 8. Substitute Legislation File No. _____
- [ ] 9. Reactivate File No. _____
- [ ] 10. Topic submitted for Mayoral Appearance before the BOS on _____

Please check the appropriate boxes. The proposed legislation should be forwarded to the following:

- [ ] Small Business Commission
- [ ] Youth Commission
- [ ] Ethics Commission
- [ ] Planning Commission
- [ ] Building Inspection Commission

Note: For the Imperative Agenda (a resolution not on the printed agenda), use the Imperative Form.

Dorsey

Subject:

Redevelopment Plan Amendment - Transbay Redevelopment Project Area - Zone One, Block 4]

The text is listed:

Ordinance approving an amendment to the Transbay Redevelopment Plan to increase height and bulk limits on Block 4 of Zone One of the Transbay Redevelopment Project Area (Assessor's Block No. 3739, Lot No. 010, located on the south side of Howard Street between Beale and Main Streets), by increasing the maximum height limit for tower buildings from 450 feet to 513 feet, and increasing certain maximum floor plate sizes; making findings under the California Environmental Quality Act; making findings under the California Community Redevlopment Law; and making findings of consistency with the General Plan, and the eight priority policies of Planning Code, Section 101.1.

Signature of Sponsoring Supervisor: Matt Dorsey
