I'm glad that the EIR is coming out now, at least there's an effort right now because it ties in with Supervisor Mirkarimi's three-option plan, which I think a lot of the people here thought we were going to discuss tonight. But it works -- it ties in anyway with the Natural Areas Management Plan, and I'm very glad to see, and I want to repeat that I think the most important part of this -- well, I'd like to say that the environmental people that are here tonight and the golf people that are here tonight really need to get together and work to solve our common problems, which I think is painfully evident now, is the lagoon is dysfunctional. And that's where the efforts really need to go. If we can solve the lagoon problems, that in itself will improve the habitat and will improve the golf course, and it will solve some of Pacifica's flooding problems down at that end. So I think that's where the main focus should be. And certainly it fits in here because that certainly would improve the natural area and, you know, improve California natives and all those kinds of things you're working on.

And I'd also like to say that -- one man was saying that the drainage coming in down off the road -- ever since they put in Sharp Park Road, I guess about 1985, the drainage has just been ripping through that golf course and

they're just dumping it in there. I think it is a great idea to look at how to divert some of that water coming off Sharp Park Road. It's just a big spillway right now, and Highway 1 and all that -- and I think that could be done without damaging the creek.

We don't want to just turn the whole thing into an underground pipeline. So the creek is very viable. It's working fine for that watershed that's there, but the drainage coming off the road is really something, and it's causing silt problems and of course flooding.

So I hope that also if you look at -- there's an overflow pipe at Horse Stable Pond that used to function, and now it's silted in, and with the tules and -- the whole thing is dysfunctional. But there is an overflow pipe there. It used to work so that we didn't have to pump. It used to just flow.

Anyway, thanks a lot for coming down. People in Pacifica appreciate being involved. Thank you.

MR. BOCK: Thanks for your comments.

Kathleen Manning followed by Cliff Smethers.

MS. MANNING: Hi, thank you. I'm from the -- Kathleen Manning from the Pacifica Historical Society. And we have a long history in Pacifica of caring for the environment and for protecting and really cherishing the environment. The history the last -- since the city was

founded in '59, we've done tons of things to keep the hills green and to do wonderful things.

Now, the historical society is very proud of the wonderful golf course we have here. Looking at the historical and cultural part of the environment, it is a famous golf course, and we've heard from people all over the world that have said, "Please keep that golf course. Keep the Alister MacKenzie golf course." And we've heard from different societies, and it's been very, very interesting to see the number of people that care about that.

And also I wanted to mention that the clubhouse was done by the Willis Polk firm. So those are some of our reasons that we care about that part of the environment.

Thank you.

MR. BOCK: Great. Our next speaker will be Mitch Monroe followed by Chuck Egiziano. So we'll have Chuck Egiziano.

MR. EGIZIANO: Hi. My name is Chuck Egiziano, and I'm a retiree in Pacifica, and I love the golf course. And if you -- if it disappears, I guess I'd have to leave Pacifica. I want to thank the people trying to preserve the frogs and the snakes on behalf -- excuse me -- on behalf of all the bird life out there because they sure make a feast out of all the little frogs as soon as they start coming out. And the hawks and ravens and seagulls really enjoy

them full life.

I had a question is -- and you said that this is really not the Parks and Recs end of the spectrum, that is Parks and Recs motivated by dollars in this whole scenario in considering changing the golf course, the size of it or limiting it, and the -- I guess eventually we'll get around to that.

And the second question I had is, is there any consideration if the Parks and Rec is not interested in maintaining an 18-hole course in Pacifica, would they consider selling it or doing a long-term lease to the city of Pacifica so we could have some economics in the town of Pacifica? We don't have a lot of money being generated in this little town, so that's basically all I wanted to ask.

MR. BOCK: Thank you.

Our next speaker is Jack Rauch followed by Suzanne Valente. Suzanne is the last speaker card I have. So if anyone else is interested in speaking, please turn in your cards now.

MR. RAUCH: My name is Jack Rauch, and I am a resident of Pacifica and also a San Francisco archer. I want to thank you very much for coming here and explaining this to us today the way this process is going to go. I'm encouraged by the fact that recreation is a focal point for discovery.

I want to remind everybody that the land at Sharp Park was donated to the city -- to San Francisco for recreational purposes by the Murphy family and others, and I think it should continue that way. I look forward to the report.

I'm also encouraged by the fact that you've retained an outside firm to do the study. I'm very much concerned about the pressures put on people by environmental groups, many of whom don't know what they're talking about. I find it quite distressing when I read things in the newspaper that are simply not true. So I welcome Tetra Tech and the studies that you're -- that you're doing. Again, I want to reiterate that this is recreational land, and I think it should continue in that vein.

Thank you very much.

MR. BOCK: Next up will be Suzanne Valente followed by Robine Runneals.

MS. VALENTE: Good evening. There is a widespread perception that the Natural Areas Program is spinning out of control and it has overreached far beyond its goal of preserving the remnants of natural vegetation still left standing at SF park lands, and now engaging in a campaign of restoration ecology in which overwhelmingly human modified or created landscapes are being removed to allow for the recreation of -- re-creation of natural ones, or more

accurately, a small from thereof. The Natural Areas Program has its place, and it needs to be kept in that place. It cannot be allowed to trump the clear preferences of the vast majority of park land users in San Francisco.

That's not my rhetoric. That's the rhetoric of Arthur M. Shapiro, professor of evolution, ecology, and entomology from the center of population biology at U.C. Davis. He -- I think he echos the thoughts of many people in this audience and outside this room, but we just don't have the credentials to say it. But what I can say tonight is that I think that the NAP proposal for Sharp Park as well the other park locations intends to make major changes in the ecosystems, sometimes with no apparent benefit to wildlife and perhaps detriment to important wildlife.

Additionally, the NAP park proposal ignores the serious public safety issues that should be addressed, especially at Sharp Park. And EIR, if it intends to conform to the precautionary principles, which was adopted in 2003 by the City of San Francisco, must cover the public safety issues for humans at every park in detail, as well as provide substantial, reliable, scientific evidence to justify the proposed ecosystem changes.

Closure of the park or the entire golf course to create a natural areas wetlands restoration to benefit the

red-legged frog and San Francisco garter snake is the latest proposal under consideration by SFRPD. This is pointless. U.S. Fish and Wildlife did not designate Sharp Park as a critical habitat for the red-legged frog or SF garter snake. Therefore, by the U.S. Fish and Wildlife's own definition, whatever happens to either species in this area will have no impact upon the ultimate survival or failure of the species. There is no legal imperative for expansion of the habitat to benefit these two species.

Environmental attorneys explained that there is critical habitat and everything else. So Sharp Park has the same requirements as a habitat as your home's driveway does. The NAP report acknowledges that the quality of the habitat at Laguna Salada, Horse Stable Pond, and the adjacent wetlands remains excellent. Make the minor alterations biologists recommend and leave the rest of Sharp Park alone.

The plan for Sharp Park is the worst of any of the SF park system. It is clearly in violation of the mission statement. Uhm, they do not take into consideration public safety, which includes West Nile Virus and the need to control mosquitoes and the recent ruling by the court indicates that they no longer can spray pesticides to control adult mosquitoes. They can only drop larvicide. Clearly we cannot ensure that the public be will be safe if you expand the wetlands.

Thank you.

MR. BOCK: Our next speaker is Rabine Runneals, followed by Mike Pacelli.

MS. RUNNEALS: My name is Robine Runneals from West Shore Park here in Pacifica, and I'd like to thank you for coming down and doing this here in town. A lot of meetings in San Francisco, a lot of people have been attending. So thank you for bringing it here.

And West Sharp Park and that golf course and Palmetto Avenue, that is the center of our city. So this is very important to all of us. Thank you.

Things that I'd like you to please consider in the EIR or CEQA is flooding impact -- flooding impact including out into the neighborhood and proposed methods to prevent flooding in all three of the scenarios.

Mosquito impact. If there is more fresh water -- well, if there's more fresh water, they're going to come, and how that will be controlled.

How would views from the surrounding residences be impacted by the three scenarios, views into the park as well as our views to the beach and the ocean.

Impact of the decrease of golfers visiting West Sharp Park and the area, and the potential economic impact to the city of Pacifica and the impact of a loss of a public golf course serving northern San Mateo County's

recreation needs as well that of San Francisco's. And the impact of the loss of a golf course, which is a historical attraction to city of Pacifica also, and how that would affect and tie into the city of Pacifica's current efforts to take the Palmetto Avenue business district and emphasize upon the historic characteristics of that neighborhood and develop that into Pacifica's historical district, which is a current plan is being developed in Pacifica here.

And all of the historical references that Pacifica is attempting to draw upon for the work done in this neighborhood is all linked to the golf course and everything that the city had in that neighborhood, which is the original downtown, prior to the city's incorporation.

Thank you.

MR. BOCK: Next we'll have Mike Pacelli followed by Mitch Monroe.

MR. PACELLI: Mike Pacelli, Pacifica resident.

I'd like to consider the impacts of the storm drainage system off Sharp Park Road, you know, the golf course area, the possible partnerships with the City of Pacifica on the golf course, the economic impacts of both golf and other recreational uses into the city of Pacifica and consideration of the berm, the conditions of the berm that are there right now.

MR. BOCK: Next we'll have Mitch Monroe followed

by Allan Eisenberg.

MR. MONROE: Hello, my name's Mitch Monroe. I'm here to support off-road cycling in the other areas of Sharp Park, particularly up to the archery range, also up there beyond the archery range where it connects up to -- up beyond the ridge. That used to be a fun trail coming off of there up through the archery range.

One of your -- one of your proposals in your plan -- I can't remember which part -- that says trails would be created in previously inaccessible areas. I think it's important to link that lower area, like, particularly the archery range and also where the shooting range is, that you guys clean that up, up to the upper ridges so that you can access the southern parts of Pacifica.

I also think it's important to keep GGNRA out of Sharp Park because they seem to be taking over all the city open spaces and kind of going over them with a fine tooth comb and sanitizing everything and turning everything into, you know, basically paved fire roads, and it's getting pretty boring out there.

You guys talked about volunteerism, the stewardship was part of this plan, and a group I represent is called SF Urban Riders and we've merged with Craig Dawson Mt. Sutro, and we logged over 500 collected hours -- man hours of volunteerism. And we plan to do a lot more. So if

you guys do end up getting a project up there and want to open up a multi-use trail that's bicycle lane, I think you'll have a lot of manpower to help get that done, and you won't have to pay for labor.

That's all I got. Thanks.

MR. BOCK: Thank you for your comments.

Allan Eisenberg followed by the Steve Sinai.

MR. EISENBERG: Hello. My name's Allan Eisenberg. I live in San Francisco. I belong to the Sharp Park golf club by choice, obviously.

In your presentation you talked about the socioeconomic issues that go to every park and facilities with -- throughout the general population to use. I'd like to point out that Sharp Park is -- is a community golf course. As a community, you can go down there almost any evening and find fellows who want to talk over there, constantly enjoying themselves with their friends, which is something that does not exist at the other two courses that are run by the City of San Francisco, 18-hole courses, which would be Harding and Lincoln.

Also Sharp Park offers the opportunity for high school teams to play golf. They cannot play golf at Harding because it's cost prohibitive. So from the socioeconomic standpoint, I think it is important that it be kept as it is for the general community.

Thank you.

MR. BOCK: Up next is Steve Sinai followed by Ellen Edelson, which is currently the last speaker card that I have. So if you haven't gotten a chance yet, please fill out a card.

MR. SINAI: Hi, everyone.

Two questions or things I'd like to look at. One's already mentioned, which is take a look at how much the golf course contributes to Pacifica's economy versus how much the (unintelligible) how much that contributes to Pacifica's economy.

Second, if you could do some kind of study on populations of San Francisco garter snake, red-legged frog. I'm hearing from the group that wants to shut down the golf course that Sharp Park is basically the only habitat for the two animals. I just can't believe that, but nobody really seems to know. So take a look at throughout San Mateo County and see what the different habitats are and how the dropping of the population of the frog, what the causes might be. Appreciate that.

Thanks.

MR. BOCK: Next up is Ellen Edelson.

MS. EDELSON: Ellen Edelson from San Francisco, and I'm with the (unintelligible). And I hate speaking in front of a group. Makes me nervous.

But I do favor the idea of restoring Sharp Park and restoring the -- I'm too nervous -- but city water corridor as well, and how it connects with other green spaces in the area. I would like to ask we consider the impact of leaving as many trees as you're suggesting leaving, see what that impact would be. That we would -- 95 percent is an awful lot of trees in my view.

I would like to encourage consideration of the trails and the impact that the trails have on hiking, which is increasing in importance by many studies of recreational activities, whereas other activities have gone down on the list. But consider the use of hiking and environmental education that would have on the students -- on the students and other people out there to see the bigger picture, to see where humans fit into the larger frame of things. I think we're very egocentric in our use of the land, and we need to use space for (unintelligible).

MR. BOCK: Thank you. That's our last speaker for the evening. So unless there's anyone else who is interested in speaking, I'll encourage you to take advantage of -- in roughly two weeks between now and the end of the public comment period that's May 26th, you're welcome to turn in any written comments you had tonight, send in a letter. We'll keep this period open until the 26th and use those comments to help frame the environmental analysis we

do in the EIR, which public review we anticipate in the fall of this year.

Thank you, everyone, for coming out, and have a good night.

---oOo---

CERTIFICATE

I, the undersigned, a Certified Shorthand Reporter for the state of California, hereby certify that the foregoing proceedings were reported by me, a disinterested person, and were thereafter transcribed under my direction into typewriting; that the foregoing is a full, complete, and true record of said proceedings.

Executed this 27th day of May, 2009.

S.f. Planning Dept
Natural Areas Management Plan
1650 Mission St, Suite 400
SF, CA 94103

Dear Mr. Wycko:

I am writing concerning the SNRAMP as it relates to the steep sand covered areas of the Rock Outcropping at 14th Ave between Ortega and Pacheco Sts. I cannot attend the meeting on on May 12. Therefore I take this opportunity to express concern regarding the very unstable nature of these areas. I have no objection to modifying a different flora in this area, however as a long-term resident of the neighborhood I wish to inform you that any significant denuding of areas in preparation for this will likely have a disastrous effect on sand retention.

Also, the City does a very poor job of clearing sand in the roadway below, and this causes a traffic hazard on a narrow stretch of 14th Ave that cannot accommodate crossing traffic as is, despite being a two-way street.

If you wish to change the plants on the steep portions, it should be done very slowly over a number of years, verifying that new plants are in fact being established. Please do not allow areas more than a few feet across to be denuded of existing plants each year

Thank you.

Lydia Cassorla

Re: Natural Areas Management Plan EIR
"Scoping Meetings," May 12 and 14, 2009
Case No. 2005.1912E
Sharp Park Golf Course

Dear Mr. Wycko,

On behalf of the San Francisco Public Golf Alliance (the "Golf Alliance"), and in response to the Planning Department's Notice of Preparation of an Environmental Impact Report, dated April 22, 2009, I submit the following comments and questions relating to Sharp Park, and in particular to the Sharp Park Golf Course.

Some, but not all of my questions will relate to an Ordinance, adopted by the San Francisco Board of Supervisors on May 5, 2009 (the "Ordinance"), amending Article 3 of the San Francisco Park Code by adding Section 3.20, to read as follows:

> Sec. 3.20 SHARP PARK. (a) No later than July 31, 2009, the Recreation and Park Department shall develop a plan, schedule and budget for restoring the habitat for the California red-legged from (rana draytonii) and the San Francisco garter snake (Thamnophis sirtalis tetrataenia) in conformance with the Endangered Species Act, 16 U.S.C. 1531, et seq., and all other regulatory requirements; and

for transferring Sharp Park to, or developing a joint management agreement with the Golden Gate National Recreation Area, and the City of Pacifica and/or the County of San Mateo, in accordance with the deed granting Sharp Park to the City and County of San Francisco and San Francisco Administrative Code Section 23.41. The Department shall base such restoration plans on the best scientific information available, and shall include alternatives that (1) retain or redesign the golf course and (2) eliminate the golf course.
(b) No later than August 31, 2009, the Department shall provide to the Clerk of the Board of Supervisors a report detailing the steps taken, and the progress made, to achieve the goals set forth in subsection (a), above."

**QUESTIONS**

**1. Question Relating to the Ordinance and Possible Alternative Use Plans For the Sharp Park Golf Course.**

1.1. To the extent that the Ordinance, adopted by the San Francisco Board of Supervisors on May 5, 2009, would result in a "plan" to "eliminate the golf course" at Sharp Park, will the Tetra-Tech Environmental Impact Report that was publicly noticed by the Planning Department's April 22, 2009 Notice of Preparation afford the environmental impact review required by CEQA?

1.2. Will any "plan" to "eliminate the golf course" that the Recreation and Park Department comes up with be subject to an EIR under CEQA? If so, when will such environmental review occur?

1.3. To the extent that the Ordinance, adopted by the San Francisco Board of Supervisors on May 5, 2009, would result in a "plan" to "redesign... the golf course" at Sharp Park, will the Tetra-Tech Environmental Impact Report that was publicly noticed by the Planning Department's April 22, 2009

Notice of Preparation afford the environmental impact review required by CEQA?

1.4. Will any "plan" to "redesign... the golf course" that the Recreation and Park Department comes up with be subject to an EIR under CEQA? If so, when will this occur?

1.5. Which governmental entity or entities have permit-granting authority for any change of use at the Sharp Park Golf Course: City of San Francisco, City of Pacifica, County of San Mateo, California Coastal Zone Commission, Army Corps of Engineers, California Fish and Game, U.S. Department of the Interior, and/or other entities? For each governmental entity with permit-granting authority over the property, please state which permits are within which entity's authority.

**2. Questions Relating to golf course irrigation and its effects on the ponds and associated wetlands.**

2.1. To what extent are Laguna Salada and Horse Stable Pond, and their associated wetlands, created and/or recharged and/or enhanced by irrigation at the Sharp Park Golf Course?

2.2. Over the past five (5) years, what have been the amounts of irrigation water (measured in gallons) used each month by the Golf Course?

2.3. How much of the Golf Course irrigation water, measured in gallons, and measured month-by-month over the past five (5) years, enters the ponds and their associated wetlands?

2.4. What would be the effect on the habitat of the California Red-legged Frog at Laguna Salada, and/or Horse Stable Pond, and/or their associated wetlands, of complete cessation of irrigation at the Golf Course? Does the effect differ as between low-rainfall months and high-rainfall months, and

if so, what are the effects in the different months?

2.5. What would be the effect on the habitat of the California Red-legged Frog at Laguna Salada, and/or Horse Stable Pond, and/or their associated wetlands, of reduction of irrigation at the Golf Course? Would the effect differ as between low-rainfall months and high-rainfall months, and if so, what would be the effects in the different months?

2.6. What would be the effect on the habitat of the San Francisco Garter Snake at Laguna Salada, and/or Horse Stable Pond, and/or their associated wetlands, of complete cessation of irrigation at the Golf Course? Would the effect differ as between low-rainfall months and high-rainfall months, and if so, what would be the effects in the different months?

2.7. What would be the effect on the habitat of the San Francisco Garter Snake at Laguna Salada, and/or Horse Stable Pond, and/or their associated wetlands, of reduction of irrigation at the Golf Course? Would the effect differ as between low-rainfall months and high-rainfall months, and if so, what would be the effects in the different months?

2.8. What would be the effect of complete cessation of irrigation at the Golf Course on the salinity of the water in Laguna Salada, and/or Horse Stable Pond, and/or their associated wetlands?

2.9. What would be the effect of reduction of irrigation at the Golf Course on the salinity of the water in Laguna Salada, and/or Horse Stable Pond, and/or their associated wetlands? Would the effect differ as between low-rainfall months and high-rainfall months, and if so, what would be the effects in the different months?

**3. Questions relating to the Seawall.**

3.1. Does the groundwater generated by irrigation at the Golf Course have any effect on the hydrostatic pressures affecting the seawall? If so, what is that effect? And if so, what would be the effects on the strength and/or integrity of the seawall of (a) complete cessation of irrigation at the Golf Course, or alternately (b) reduction in the amount of irrigation at the golf course? Would these effects differ as between low-rainfall months and high-rainfall months, and if so, what would be the effects in the different months?

3.2. Is the habitat for the California Red-legged Frog in and around Laguna Salada and/or Horse Stable Pond and/or their related wetlands affected by the continued existence of the seawall? If so, how?

3.3. What is the current structural condition of the seawall? What is its useful life expectancy? At what point will it need to be repaired or replaced in order to protect the current freshwater habitat of the California Red-legged Frog in and around Laguna Salada and/or Horse Stable Pond and/or their related wetlands?

**4. Questions Relating to Potential Flooding, Disease, and Other Effects Of Alternative Uses at the Golf Course.**

4.1. Would the creation of new freshwater ponds in place of existing fairway areas at the Golf Course result in increased flood-endangerment to residents of the neighborhoods north and/or south of the Golf Course, in the event of storm surges that overtop the seawall, as has happened in the past?

4.2. Would replacement of golf fairways at Sharp Park west of Highway 1 by newly-created freshwater ponds and wetlands result in increased breeding areas for mosquitoes? If so, what measures would

be necessary to protect residential neighbors north and south of the Golf Course from West Nile Virus?

4.3. As of May, 2009, what aerial spraying for mosquito larva and adult mosquito control is permitted by law, and what aerial spraying for mosquito larva and adult mosquito control is actually performed at Sharp Park; describe generally the seasons and times of this spraying. Are other measures besides aerial spraying used for mosquito and mosquito larva control at Sharp Park, and if so, please describe them. What is the effect of such mosquito and mosquito larva control on the red-legged frog population at Laguna Salada and Horse Stable Pond? What is the effect of such mosquito and mosquito larva control on residential neighbors of the Sharp Park Golf Course?

4.4. Would closure of the Golf Course, and regrading of some or all of the fairways and greens to the west of Highway 1 to create new freshwater ponds and wetlands (as has been proposed by some advocates of "habitat restoration"), disturb the current habitat for the California Red-legged Frog and/or San Francisco Garter Snake at Laguna Salada, and/or Horse Shoe Pond, and/or their currently-existing associated wetlands? Would such work require "take permits" from California Fish & Game and/or the U.S. Fish & Wildlife Service? What are the prospects that these entities would grant any such "take permits" that may be required.

4.5. Without the groundwater generated by irrigation at the Golf Course, what would be the source of water for the proposed newly-created freshwater ponds and wetlands at Sharp Park west of Highway 1?

**5. Question Relating to Recycled Water Project.**

5.1. It is our understanding that San Francisco has near-term future plans to replace its current freshwater irrigation of the Golf Course with

recycled water to be purchased by the City from the City of Pacifica's Calera Creek Water Recycling Plant. In the event the Golf Course were to be closed or reduced in size pursuant Recreation and Park Department plans pursuant to the Ordinance, would the City of San Francisco follow-through on its plans to purchase the recycled water? Would San Francisco have anyplace else to use that amount of recycled water in the Pacifica area? Would recycled water from the Calera Creek Water Recycling Plant be used as the water source for expanded freshwater ponds and wetlands to enhance habitat for the Red-legged Frog and San Francisco Garter Snake under an alternate-use plan for Sharp Park developed by the City of San Francisco? If not recycled water, then what would be the water source for expanded freshwater ponds at Sharp Park, in the event the golf course irrigation were to be discontinued or reduced?

**6. Comment and Question Relating to Effects On Cultural and Recreational Resources.**

6.1. The Initial Study of Significant Natural Resource Areas Management Plan, at page 71, states the EIR will not discuss impacts on significant architectural resources. It is the position of the San Francisco Public Golf Alliance that Sharp Park Golf Course is a significant historic architectural resource because of its age (opened in 1932), and the fact that it is one of the very few municipal golf courses designed by the preeminent golf architect Alister Mackenzie, whose adopted home was the San Francisco Bay Area. This golf course gives public course golfers the opportunity to experience and appreciate landscape architectural genius at a reasonable price in a beautiful natural setting. The golf course is accessible as well, visually, to neighbors and strollers. Moreover, there are ways to increase the public access to the golf course, by boardwalks and/or viewing platforms, that would further increase public access to the site without interfering with either the golf or the protected

species habitat. The Mackenzie heritage of this classic golf course is a point that should be addressed in the EIR.

6.2. The Sharp Park Golf Course provides public recreation and healthful outdoor exercise to over 50,000 paying customers annually, youth sports opportunities to high school team golfers, and other public recreational benefits. What would be the effect of loss of this recreational facility on its current users? How far would current users have to drive to find comparably-priced, comparable-quality golf recreational opportunities? For what percentage of current Sharp Park Golf Course users would closure of the golf course mean the end of their ability to play golf?

Thank you for your attention to these matters.

Very truly yours,

Richard Harris

To San Francisco Planning Department: Planning Case No. 2005.1912E

I spoke at the Scoping Meeting at the San Francisco County Fair Building on May 12, but I don't speak well at public meetings and wasn't able to articulate my thoughts. I ask that these written comments supersede my verbal remarks.

The City's Natural Areas Program (NAP) is responsible for 31 natural areas, but many of those areas have been severely compromised by conflicting uses. The City has made political compromises in some areas, such as Bernal Heights, and do not enforce laws in any of the 31 areas. Nevertheless, the EIR should weigh the values of restoring the areas for maximum biodiversity enhancement, and the effects of this enhancement on citizens of the city, who have little chance to be exposed to our biological riches. This review should look at the whole issue of off-leash in our natural lands. Currently 90% of dog-play-areas are on natural lands, a shocking state of affairs. Regardless of the City's ability to enforce laws, all our natural areas—ie, the remnants of the original landscape--should be evaluated for their natural assets.

For prioritization purposes the NAP divided its lands into management areas: MA-1, -2, -3. All three categories have the potential to be restored to diverse richness. One Commissioner has proposed divorcing MA-3 areas from the NAP and charge another entity with their management. This makes no sense at all. These lands are interwoven with MA-1 and MA-2 areas in a jigsaw-puzzle pattern and separating MA-3s would create administrative confusion. There is nothing to argue in favor of doing this and everything to be said against it. Fragmenting the natural lands only adds to the burdens of this already overburdened, insufficiently funded, program.

Tree plantations, such as on Mt Davidson, Glen Canyon, Lake Merced, Pine Lake, Sharp Park, Dorothy Erskine Park,and Bayview Hill have proliferated well beyond their original plantings and have had severe negative impacts on the City's biodiversity and biological health. Plan proposals for thinning are politically-motivated and absurdly low and should be reconsidered. The term "weed" as used by those engaged in ecological restoration, does not distinguish between plant life form: It can apply to a tiny annual plant as well as to trees and anything in between. Certain trees—in this case primarily the Tasmanian blue gum, *Eucalyptus globulus*—have aggressively spread beyond the original plantings and have had devastating impacts on our natural heritage. Those impacts should be analyzed, and the analysis should include the possibility of removing all of the weed trees.

There are a surfeit of trails, some of which should be closed. New trails should not be built where native plants exist, for the reason that soil disturbance is very

damaging. When soil is disturbed weeds move in to pre-empt the space, and it becomes forever after a weed patch.

Sharp Park golf course should be analyzed to ensure that the plans are scientifically-based and that they ultimately select the alternative that will ensure that the San Francisco garter snake and California red-legged frog recover. The golf alternatives should include analysis of the environmental impacts of no golf, golf, and a modified golf course.

Jake Sigg, Chair
Conservation Committee

What are ENV. IMPACTS OF:
- Leaving 95% of INVASIVE trees in Natural areas?
- ~~[illegible]~~ - 90% of off-Leash dog areas in Natural areas?
- Cutting new trails through Sensitive Natural areas?

Management Plan has already been heavily COMPROMISED

What are ENV. IMPACTS OF a NO Management Plan alternative?

Re: Natural Areas SFRPD - Planning for Restoration Comments for Meeting Thurs May 14, 2209

My comments will focus with reference to my experience in Oak Woodlands - GG Park Natural Area.
I suggest that EIR of NAP management Plan take seriously the boots on the ground experience of local habitat restoration volunteers.
The removal of trees and dog issue seem to be big deals in the agenda.
My view is that Oak Woodlands are about 3 % of GG P and represent a fraction of what remains of original coast scrub/Oak Woodland habitat that predates the Park.
Our experience with tree canopy ( blue gum eucs' and monterey pine/cypress and ) and varieties of invasive tree species indicates that Natural Areas mandate to protect these remnant habitats trumps the often misguided attempts to " protect " trees.
In fact , in the Oak Woodlands, as far as I know , very few if any of the large canopy trees have been cut ( altho they are very problematic in some place and should be thinned ) , BUT a lot of the invasive ' monocultural ' shrubs and trees have been cut to enable healthy growth of original natural habitat and in fact we plant native shrubs and trees to restore aesthetic and habitat balance.
We also have cut the invasive monoculture to reduce the danger of fire ( we have had fires in the OW caused by vagrant campers ) and also to clear overgrown areas that provide cover for illegal camping and trash accumulation. The overlapping GG P jurisdiction ( RPD - GG P management is not always on board due bureaucratic squabbling ) has had a mixed record in coping with this issue.
This indicates to me that Natural Areas must have the clear authority to regulate the core of the natural area AND adjacent ' supporting ' zones, i.e. MA-1 , MA-2 , MA-3.
Therefore, I think that this ' tri - level ' natural area designation could be a recipe for undermining the mandate of Natural Areas to regulate, restore and steward these places based on science, factual evidence and, really, common sense.
In regard to dogs - as of now everyone is free to use such restored places as Oak Woodlands Coon Hollow - but if it becomes obvious that dogs digging, pooping and peeing in this place force out everybody else then Natural Areas and the majority community must have the right to require limits to dog play.
It doesn't rain for 5 months and eventually ( even if dog doo is picked up ) the place begins to smell like a dog toilet.
Overall, the Natural Areas mandate to restore and steward the tiny remnants of our ' original' natural habitats in this regional urban environment require some sacrifice on the part of narrow interests that don't put natural habitat front and center.
I think it is quite obvious that we continue to lose planetary biodiversity and our hands are not clean on this score - we must do better.

Concerns for Sharp Park Golf Course. May 14, 2009

To whom it may concern,

I'd like to address what I feel should be the alternatives for your scoping efforts.

I think the no project alternative should be followed by two or three alternatives with various degrees of mitigation, ESHA restoration and educational panels along existing trails retaining all 18 holes of the Sharp Park golf course in some form or fashion.

There are currently plenty of access trails that can support educational displays leading up to and including Mori Point that make moot the need to reclaim large area's of the golf course to facilitate this worthy need.

The alternatives should have and include restoration/repair elements to safe guard against egg sacks being laid in temporary wetlands that are known to dry before tadpoles can develop into adults. The seasonal ponds should be mitigated to alleviate this unfortunate natural behavior if deemed necessary.

I think the golf course can be mitigated, retaining all 18 holes in some form and that restoration(s), as yet to be identified and agreed to by agencies such as the US Fish and Wildlife Service and the California Coastal Commission will insure the existing ESHA(s) will be best able to support listed species.

In closing I see no need to have an alternative with less than 18 holes, that has trustee agency approved mitigations and some sort of educational element such as properly placed panels along existing trails. Thank you for your attention to this matter.

Yours,

Todd M. Bray

The Endangered Species Act identifies 'critical habitat' of 'threatened or endangered species' as the focus of requiring compliance to conservation efforts. The Dept of the Interior, Fish & Wildlife Service lists the criteria for determining what is 'critical habitat' and what is excluded. From this set of criteria the DOI identifies 2 units of critical habitat zones w/in San Mateo Co: approx 37,000 acres in the Cahill Ridge area south of Pacifica & another similar sized acreage in Pescadero. None of these units include SP. In fact, characteristics of Sharp Park, such as its relatively small size with respect to acreage, its location w/in a developed urban area, qualifying it to be excluded from being a 'critical habitat'.

In his opening statements in the Apr 30 meeting, Supervisor Mirkarimi stated that the driver for introducing the ordinance to restore Sharp Park is to protect SF from the liability it incurs by not protecting the threatened or endangered species. Given that Sharp Park is not listed as a critical habitat for the threatened or endangered species, what would be the basis of a liability concern with respect to compliance to ESA conservation requirements?

**COMMENTS UPON THE SCOPE OF THE EIR FOR SFRPD'S NAP**
**(as submitted by Dr. Suzanne Valente, a resident of Pacifica; May 14, 2009 )**

The NAP proposal for Sharp Park as well as the other park locations intends to make major changes in the ecosystems with no apparent benefit to wildlife, and perhaps detriment to important wildlife. Additionally, the NAP parks proposals ignore the serious public safety issues that should be addressed, especially at Sharp Park. An EIR, if it intends to conform with the Precautionary Principle (adopted in 2003 by the City of San Francisco) *must* cover the public safety issues for humans at every park in detail, as well as provide substantial verifiable scientific evidence to justify the proposed ecosystem changes.

Closure of part or the entire golf course to create a "Natural Areas wetland restoration" to benefit the red-legged frog and San Francisco garter snake is the latest proposal under consideration by SFRPD. This is pointless. **US Fish and Wildlife did NOT designate Sharp Park as critical habitat for the red-legged frog or SF Garter snake; therefore by the USFWS' own definition, whatever happens to either species in this area will have no impact upon the ultimate survival or failure of either species. There is NO legal imperative for expansion of the habitat to benefit these two species.** Environmental attorneys explain that there is "critical habitat" and everything else, so Sharp Park has the same requirements as a "habitat" as your home's driveway does. The NAP report acknowledges that the quality of habitat at Laguna Salada, Horse Stable Pond and the adjacent wetlands remains excellent--make the minor alterations biologists recommend and leave the rest of Sharp Park alone.

This plan for Sharp Park is the worst of any in the SF Parks System. It is clearly in violation of the Mission Statement for SFRPD which follows:

"*The San Francisco Recreation and Park Department's Mission is to provide enriching recreational activities, maintain beautiful parks and preserve the environment for the well-being of our diverse community.*"

Further, the plan for Sharp Park intentionally disregards the performance standards established in the SFRPD's own Operational Plan. The Operational Plan states *"the Department shall consider, among other matters, the following issues: Public safety, which shall include the reduction of environmental and other hazards, safe equipment operations and safe pesticide use"*. Public safety should always be a first priority, and this proposal ignores public safety in three circumstances.

## 1) VECTOR-BORNE DISEASES

Experts say "Biohazards are the greatest threat to humankind", and among them are the diseases mosquitoes carry and pass on to the victims of their bite. The mosquito has caused more human suffering than any other organism known to mankind. One million people die from mosquito-borne diseases every year, and about half of the world's population is at risk. World history is replete with reports of the life threatening diseases transmitted by mosquitoes including West Nile Virus, Eastern Equine Encephalitis, Malaria and Dengue.

The Centers for Disease Control (CDC) cites West Nile virus as the biggest mosquito-borne threat facing Americans, just a few years after being detected in the United States. The Centers for Disease Control reports West Nile virus is spread by infected mosquitoes, and can cause serious, life-altering and even fatal disease. In 2008, CDC records show California reported a total of 445 serious West Nile cases, 15 of which resulted in deaths. California reports fully a third of all West Nile virus cases and deaths reported in the entirety of the United States. On August 15, 2005, San Francisco health officials confirmed the City's first human case of West Nile virus.

The threat of mosquito breeding in the wetlands at Sharp Park which support the red-legged frog and San Francisco garter snake is currently severe enough to warrant treatment by helicopters with larvicide, as well as

spraying with pesticides on the ground every three weeks during the mosquito "season". California Health and Safety Code mandates San Francisco pay for this mosquito control. On January 7 of this year, a court ruling effectively bans the San Mateo County Mosquito Abatement District and 45 other mosquito abatement districts in the state of California from spraying pesticides to kill adult mosquitoes. Therefore, if any mosquito larvae survive the larvicide treatment (which they have in past years with no exception) SMCMAD is helpless to protect the public from any diseases they may carry, including West Nile virus. **There is no dispute expanding the wetlands will create a situation where mosquito breeding is clearly impossible to reliably control.** Changing pesticide regulations as well as the genetic evolution of pesticide-resistant species of mosquitoes are but two reasons that this is the case.

In fact, San Francisco Recreation and Park Department acknowledges the mosquito problem in their "***System Wide Management Actions and Practices***" document pertaining to significant natural areas. Section 5, page 22 of that document states:

"*First detected in the United States in 1999, West Nile virus (WNV) is a mosquito-borne disease that is common in Africa, west Asia and the Middle East. In 2004, there were a total of 829 WNV human infections, from 23 counties in California. West Nile virus activity has been detected in all counties, but there have been no cases reported from San Francisco (DHS 2005). Although it can be fatal to birds (and even humans), most of the people infected with WNV do not exhibit any symptoms. The San Francisco Health Department currently participates in the statewide IPM program targeting WNV. In Natural Areas, two types of BMPs [Best Management Practices] are recommended:*

*1. Staff should be provided education regarding the most effective way to avoid contracting WNV, which is to not get bitten by mosquitoes. Clothing such as long pants, long-sleeved shirts, and application of a mosquito repellent may all be helpful in this regard. Volunteers and site stewards working with the program should also be informed.*

*2. Some Natural Areas contain small water features such as abandoned tires and other refuse that holds water. These features could provide breeding habitat for mosquitoes. At times it may be feasible to remove the water from these areas or to treat the features with BT (Bacillus thuringiensis israeliensis), a safe and ready to use biocontrol treatment for mosquitoes. In other cases, removal of water cannot occur without damaging a sensitive resource.*"

The NAP plans for Sharp Park include cutting down 15,000 mature eucalyptus trees on the east side of Highway One in Sharp Park. Additionally, destruction of eucalyptus saplings and seedlings (these are by common definition trees) in areas designated by NAP shall be in total. NAP officials do not believe they need to be accountable to the public for the number of seedlings or saplings they remove.

These trees are targeted merely because they are defined by NAP as non-native, yet they provide habitat for 20 species of special status birds. The eucalyptus are to be cut down to create more scrub habitat. Scrub habitat exists on the hillsides all around Sharp Park! It is in abundance on Milagra and Sweeney Ridges, where it is protected and enhanced by the GGNRA (National Park Service). Why would you jeopardize the only habitat in the area for these special status birds? Also, the pattern and velocity of the winds in this area will be altered by the destruction of 15,000 mature trees as well as all others. This may well negatively affect the conditions in the remaining tree stands for those same birds should they attempt to relocate due to their displacement due to NAP. Additionally, the City of Pacifica has the ability to block this ideologically driven destruction of the ecosystem by virtue of the City of Pacifica's anti-logging ordinance and the citizens of Pacifica intend to demand their City officials hold the SFRPD to the terms of this ordinance.

## *CITY OF PACIFICA TREE ORDINANCES AND PERMITS*

**Logging Operations in Pacifica**
Logging operations within the City of Pacifica are defined as any removal, destruction or harvesting of 20 or more trees within one year from any parcel or contiguous parcel in the same ownership. In reference to logging regulations, a tree is defined as any tree six inches in diameter as measured 12 inches from the ground. City of Pacifica Ordinance No. 636-C.S. prohibits logging operation unless one of the following conditions is met:

* (a)Said operations are in conjunction with a city permit(s) requiring planning commission and/or city council approval, at which time said operations shall be evaluated and approved or denied at a duly noticed public hearing by the commission and /or council, concurrently with the other permit(s).
* (b) Said operations are necessary immediately for the safety of life or property, as determined by the director of public works or his/her designee.
* (c) Said operations occur on city-owned property and are necessary immediately to maintain public health and safety.

Refer to Ordinance No. 673-c.s. for more information concerning logging operations within the City of Pacifica.

**The NAP proposal for the east side of Highway One is not without its biological hazards to humans, wildlife and our pets.** Excerpts from San Francisco's "Natural Areas Program" (NAP) state:
"Issue: Important elements within natural habitats for the survival of small mammals as well as reptiles and amphibians include underbrush, fallen logs…debris such as lumber, brush piles…piles of abandoned lumber may be aesthetically unpleasing but provide important refuge habitat for many species…
Recommendation: The natural or biodegradable (branches trees and logs) elements shall be preserved during vegetation management activities or replaced with brush piles."

The Western Treehole Mosquito is the primary vector of Dog and Cat Heartworm in California. The Western Treehole Mosquito is so named because its immature stages frequently develop in rot holes of tree stumps such as oaks, laurels, eucalyptus, sycamores, etc. Unfortunately, because NAP cuts down 15,000 mature eucalyptus trees and fails to remove their stumps, they have created an ideal breeding ground for the Treehole Mosquito, as well as additional breeding grounds for the aforementioned mosquitoes which carry West Nile virus.

Many dogs and cats show the first visible indications of heartworm infection only after the disease has progressed to the point where treatment is no longer feasible and death becomes imminent.

**Unfortunately, there's more.** Locally, urban residents are noting for the first time ticks which can transmit Lyme and other diseases upon their own person, even if they have not been outside of their immediate neighborhood. They have also noted a dramatic increase in the number of the same ticks found on their dogs and cats as compared to previous years.

*"The District was contacted from residents of Belmont (near Water Dog Lake) and Pacifica with concerns about ticks in their neighborhoods. In Pacifica, questing ticks can be found in the open spaces between homes. In Belmont, western black-legged ticks were found inside a home adjoining the open space around Water Dog Lake, presumably brought in by the family cat. These instances illustrate the need to watch out for ticks even if one does not engage in outdoor activities at this time of year."*
(Excerpted from SMCMAD Entomology Report, January, 2007)

A study conducted at the Institute of Ecosystem Studies in New York and published in 2006, concludes that the risk of Lyme disease is correlated positively with the prevalence of small mammal hosts and the abundance of

their food supply, not the number of deer or fluctuations in climate. The small mammal hosts carry the ticks into residential neighborhoods when they search for food and/or shelter.

CDC recommends the use of landscaping techniques to create a tick-safe zone around homes, parks, and recreational areas:

- Removal leaf litter, brushpiles and woodpiles.
- Clear tall grasses and brush.
- Place wood chips or gravel between lawns and wooded areas to restrict migration to recreational areas.

**The environmental features the CDC instructs you to remove to protect you, your family and your community from ticks are precisely the environmental features these Park managers are proposing to enhance habitat for small mammals and to satisfy their obsession with the removal of non-native plants and trees.**

The CDC reports that Lyme disease is the most common vectorborne disease in the United States. Since Lyme disease became nationally notifiable in 1991, the annual number of reported cases has more than doubled.

## 2) EROSION

The safety concern posed by erosion on the portion of Sharp Park east of Highway One is acknowledged in the NAP proposal as being serious, but is specifically designated as a problem that will be addressed as a last priority "when capital funds are made available". This is absolutely unacceptable. The erosion problems should be addressed immediately, before funds are spent on habitat creation. Further, the removal of 15,000 mature eucalyptus trees as outlined in this proposal could certainly make the erosion problem worse.

## 3) TOXIC LEAD IN THE SOIL

The serious safety concern posed by toxic lead in the soil (way in excess of environmental screening levels) east of Highway One has been ignored for many years, and is briefly mentioned in this report. No time table has been set for cleanup and the promise to complete cleanup has been made and broken many times before. Prior communications with the Health Department of San Mateo County have cited the cost of the cleanup as being an impediment to its undertaking.

The impact of the lead upon the wildlife in that area is another concern. The perimeter fencing around the toxic lead area is not an impediment to the entry of many small forms of wildlife which are subsequently harmed by the toxic effects of the lead.
The possibility of the lead leaching into the groundwater, the stream in the canyon and flowing to Laguna Salada wetlands across the freeway would result in the contamination of the very sites this plan spends huge amounts of money to restore. Erosion and lead contamination present clear and present dangers to the human and wildlife population living adjacent to and frequenting that area. The failure to implement NAP at Sharp Park would minimize the risk of vector-borne diseases, and the money intended for NAP would be best utilized to address the public safety issues; the erosion and the toxic lead soil and water contamination.

This EIR should not ignore the opinions of experts who do not agree with the implementation of NAP as it is currently proposed. Take for example, the following letter from an ecologist and Professor from UC Davis, Arthur M. Shapiro:

UNIVERSITY OF CALIFORNIA, DAVIS

Division of Biological Sciences
Section of Evolution and Ecology
Fax (530) 752-1449

7 May 2002

The Hon. Gavin Newsom
Chairman, Neighborhood Services Committee
San Francisco County Broad of Supervisors
City Hall, 1 Carlton B. Goodlett Place
San Francisco, CA 94102

Dear Supervisor Newsom:

Re: Natural Areas Program (Rec. & Parks)

Because of both personal friendship and professional contacts in The City, I have been following the controversy over native plants and natural areas management and the removal of exotic tree species from public lands in San Francisco. I am a professional ecologist and have been teaching at U.C. Davis for over 30 years. During that time I have trained many professional environmental scientists and consultants. My former students are scattered over a variety of government agencies at several levels, firms in the private sector, and colleges and universities form Massachusetts to Texas to Florida, as well as California. I began teaching a course on the community concept in ecology at UCD in 1972, which has always contained a section on introduced, exotic and naturalized species in community context, with examples drawn form California - long before it became fashionable. I was on the phthises committee of James Carlton, the foremost US authority on weedy marine invertebrates. I have led California Native Plant Society and Sierra Club field trips in the Sierra Nevada and Central Valley for many years and do frequent presentation on butterfly gardening. I am telling you all this to try to establish credibility, because what I am about to say will be controversial - to say the least.

There is a widespread perception that the Natural Areas Program is spinning out of control: that it has overreached far beyond its goal of preserving the remnants of natural vegetation still extant in SF parklands and is now engaged in a compaign of restoration ecology in which overwhelmingly human-modified or - created landscapes are being removed to allow for the recreation of natural ones, or - more accurately - a simulacrum thereof.

The management of public open space necessarily involves a variety of tradeoffs. In a spatially highly constrained area like San Francisco, public open space is precious, and many members of the public are very strongly committed to its well - being. My emeritus colleague Seymour Gold at Davis, as well as other researchers, long ago demonstrate that urban open-spaces users have distinct psychological needs and preferences in landscapes - and that mature trees in specific spatial configurations tend to dominate those preferences. The anthropogenic landscapes we associate with SF parklands are in fact very close to the ideal. It is not surprising that they are so loved by their users.

As a teacher of conservation biology, I know it is important. I also know that it can be carried to extremes. In an urban setting - and San Francisco is such a setting! - it has its place, but it cannot be the dominant value in open-space management. It has to be integrated into a broader context that will be not only politically palatable but in fact pleasing to the public. With a graduate student, I have recently conducted and published a study showing that regulatory styles perceived as arbitrary and authoritarian can and have pushed groups of people normally friendly to environmentalism and conservation - in our study, butterfly collectors - into anti-government positions within the so-called "Wise Use" movement. I see the same process at work in San

Francisco, where a highly educated, sophisticated, politically liberal urban population is being needlessly turned against what it perceives as "environmentalism" run amok. Sierra Club members and butterfly gardeners are beginning to talk like the ranchers I interact with in Siskiyou and Lassen Counties.

The Natural Areas Program has its place, and it needs to be kept in that place. It cannot be allowed to trump the clear preferences of the vast majority of parkland users in San Francisco. The hatred of "exotic" trees, some of which are California natives anyway, is not only ideological but sometimes verges on the pathological, and has strong overtones of xenophobia and racism (look at the anti-"exotic" rhetoric yourself!). Senile, decadent, hazardous trees are numerous and pose a public-safety and fire problem that needs to be addressed. Healthy trees in pleasing, integrated landscapes are another story. "Native" nature can be preserved and augmented without damaging the peace of mind of San Franciscans. And should be.

Sincerely,

Arthur M. Shapiro
Professor of Evolution, Ecology and Entomology
Center for Population Biology, UC Davis

Further, the deed transferring Sharp Park to San Francisco will be voided should any part of the golf course be destroyed to create wetlands habitat. The documents that transferred the land to San Francisco control state: "This grant is made upon and subject to and in consideration of the express condition that the premises hereinabove described and hereby conveyed shall be used by said City and County of San Francisco only for a public park, or public playground, to be known as the 'Sharp Park', without right to sell or dispose of the same or any part thereof for private use, or any use other than as a public park, or public playground".

Some may claim that converting Sharp Park into wildlife habitat fulfills the "public park" requirement. But the rule of law demands that the interpretation of the words in a contract be guided by the intent of the parties to the contract at the time the contract was signed. It is pretty clear what a public playground was, but what did they mean by a "public park" in 1917 when the deed was transferred? Consider the 11th Edition of the Encyclopaedia Brittanica (published 1911) in which the term PARK is defined as follows:

> **PARK** (Fr. *part;* Ital. parco; Sp. *parque;* O.Eng. *pearroc;* connected with Ger. *pferch,* fold, and *pfarrei,* district, translating med. Lat. *parochia,* parish), a word ordinarily used in two senses: (a) an enclosed tract of ground, consisting of grass-land, planted with trees and shrubs, and surrounding a large country house; ' (*b*) a similar space in or near a town, laid out ornamentally, and used by the public as an "open space" for health or recreation.

It is clear that the parties to this contract would have approved of a golf course, but NOT a wetlands habitat for the express purpose of supporting frogs and snakes.

If you go to the City of San Francisco Real Estate Department and review the correspondence leading up to the transfer of the property, it is clear that the imposition of this "public park" restriction was not a whim. On the contrary, it was an adamant demand without which the property owner refused to transfer the property.

It is clear that any Court reviewing these documents would find the proposed property change to be in violation of the transfer documents and therefore Sharp Park would revert to the State of California (as specified in the deed), who would be bound by the same restrictions. Should the State fail to meet these restrictions, the property would revert to the heirs or legal representatives of the original grantor, Samuel G. Murphey. This issue should be addressed seriously as a part of this EIR as legal challenges to any decision to remove all or a portion of the golf course will be promulgated and likely be successful.

CITY & COUNTY OF S.F.
PLANNING DEPARTMENT
M E A

Bill Wycko
Environmental Review Officer
San Francisco Planning Department
Natural Area Management Plan
1650 Mission St
San Francisco, CA 94103

Re: Initial Study, Significant Natural Resource Areas Plan: Mount Davidson Park

Dear Mr. Wycko,

While the Miraloma Park Improvement Club supports the creation of a natural area plan (NAP) for Mt. Davidson to help preserve the natural area on the east side of the park, we are concerned about the environmental impact of the planned tree removal and trail closure in the historic forest area. We therefore support the finding of the initial study that the proposed project may have a significant potential negative impact on Mt. Davidson Park, which is an important example of a major period of California history, and may have environmental effects that would cause substantial adverse effects on human beings. We ask that a full environmental impact report be completed and that it address the following potential impacts:

1. Clearing of the trees to the great extent proposed in the NAP would significantly reduce the quality of human experience of this unique forest and viewpoint atop San Francisco's highest hill by: (1) eliminating a buffer from substantial noise pollution from the 280 freeway, BART, and Portola Drive; (2) altering the wind and fog pattern in the park and adjoining neighborhoods, because the trees provide protection from the prevailing westerly wind and fog; (3) promoting the growth of poison oak along trails, which fills in the areas where the trees are cut down and makes the trails unsafe for public use; and (4) promoting erosion and landslides onto trails and adjoining homes, environmental damage that is prevented by the existing trees.

2. The substantial cost of removing and replacing the trees would divert limited Recreation and Parks Department resources for providing basic maintenance of Mt. Davidson Park, including litter and graffiti removal, trail maintenance, and signage. Diversion of these funds would degrade the public's experience of the park.

3. Removal of as many trees as proposed in the NAP would significantly impair the current habitat for birds and animals provided by the forest.

Additionally, we believe that the NAP should also be assessed for the appropriateness of its proposals with respect to the status of both the Park and the Mt. Davidson Cross as important historical entities. The park and monument are important examples of a major period of CA history, as the historic trees were planted on Mt. Davidson over a century ago by Mayor Adolph Sutro to celebrate the nation's first Arbor Day. Naturalist poet, Joaquin Miller, inspired the planting of the trees. The forested hill was named for George Davidson at the request of the Sierra Club. The park's creation was a three-year community effort in 1929 in order to protect the trees as a scenic resource for enjoyment by the public. If not for this historic effort to protect the trees from destruction to make way for housing, there would not be a natural area left undeveloped on the east side of Mt. Davidson. Therefore, the NAP should record and document the existing resources in preparation for listing on the California Register of Historical Resources. Furthermore, any historical trails created and enhanced as Works Progress Administration projects during the Great Depression proposed for closure by the NAP should be maintained and should remain open to the public.

Mitigation measures for any approved NAP tree removal and trail closure should include documentation of all trees removed or fallen from storm in the park; advanced public notice of any further tree removal; removal of any downed trees to maintain the aesthetic quality of the forest and park; quarterly removal of all poison oak within 10 feet of trails; and maintenance and protection of WPA trails and retaining walls. Any activity for implementation of the NAP should not restrict public use of the park or access to the historic area or viewpoints for more than 30 days at a time.

Thank you for your attention to this matter.

Dan Liberthson, Corresponding Secretary

c: Supervisor Elsbernd

# Case # 2005.1912E

If you wish to submit written comments on the above project, you may do so on this sheet (although use of this form is not required). Please submit written comments at today's public scoping meeting, or by mail to Bill Wycko, San Francisco Planning Department, 1650 Mission Street, Suite 400, San Francisco, CA 94103. **All comments must be submitted no later than 5 P.M., May 26, 2009.**

***Write your comments regarding the environmental review for the project here. Use the back of the sheet or additional pages if necessary.***

I AM A GOLFER AND A ENVIRONMENTALIST (A SIERRA CLUB + WILDERNESS SOCIETY MEMBER), IF I THOUGHT THE GOLF COURSE WAS HARMING THE FROGS AND SNAKES I WOULD BE AT THE FOREFRONT of OPPOSITION TO THE GOLF COURSE. BUT I KNOW DIFFERENTLY.

SINCE IT WAS MADE KNOWN THAT PUMPING-OVERFLOWING-WATER OFF THE GOLF COURSE WAS DETRIMENTAL TO THE FROGS AND THAT PRACTICE AS WELL AS PESTICIDE USE ENDED A FEW YEARS BACK, I'M SURE THE FROG NUMBERS HAVE INCREASED. IF THEY HAVEN'T I'M SURE ITS NOT BECAUSE of THE GOLF COURSE. THE GOLF COURSE IS NOT HARMING THE FROGS. THIS IS A RED HERRING ARGUMENT

MANY GOLF COURSES GO THROUGH ENVIRONMENT SENSITIVE AREAS. BODEGA BAY, TEALBEND (SACRAMENTO) MONARCH BAY (SAN LEANDRO) AND STONEBRAE (HAYWARD)(WHICH JUST OPENED IN PRIME RED LEGGED FROG HABITAT, ARE JUST A FEW of MANY SUCH COURSES THAT COME TO MIND.

I HEARD THE ARGUMENT ABOUT USING THE GOLF COURSE AREA BY THE LAGOON FOR CHILDREN'S ENVIRONMENT EDUCATION AND OPEN SPACE, BUT THIS LAGOON EXTENDS BEYOND THE SOUTHERN BOUNDARY of THE GOLF COURSE THAT IS EASILY ACCESSABLE TO THE PUBLIC FOR THIS CAUSE, BUT I HARDLY EVER SEEN IT USED FOR THESE ACTIVITIES.

THERE IS PLENTY of OPEN SPACE AREA SURROUNDING THE GOLF COURSE AND MOREY'S POINT FOR HIKING, BIKING, NATURE STUDY ETC IT'S NOT LIKE THE GOLF COURSE IS IN THE MIDDLE of DOWNTOWN SAN FRANCISCO.

E-mail Address: _____

THERE IS NO REASON TO ALTER OR DESTROY THIS GREAT RECREATION FACILITY. THE PLANNING COMMISSION SHOULD LOOK INTO THINNING THE REEDS CHOKING THE LAGOON WHICH WILL GIVE MORE ROOM FOR THE WATER IN THE LAGOON. THIS WOULD PREVENT OVERFLOW ON THE GOLF COURSE WHICH WILL HELP THE FROG AND THE GOLF COURSE. MAKING IT MORE PLAYABLE DURING THE WET SEASON AND ATTRACTING MORE GOLFERS AND IMPROVING REVENUE.

SHARP PARK GC IS A WORK OF ART CREATED BY ONE OF MOST FAMOUS GOLF COURSE ARCHITECTS. MR. ALISTER MACKENZIE, ONE OF ONLY FOUR GOLF ARCHITECTS ENSHRINED IN THE GOLF HALL OF FAME.

SHARP PARK IS AND SHOULD BE ONE OF SAN FRANCISCO'S GREAT ASSETS.

IT WOULD BE TRAGIC AND CRIMINAL TO ALTER OR DESTROY ONE OF SAN FRANCISCO'S FINEST ATHLETIC RECREATIONAL VENUES UNNECESSARILY.

*Write your comments regarding the environmental review for the project here. Use the back of the sheet or additional pages if necessary.*

It is my understanding that prior to the seawall being built Lagunit Salitas Pond & Horse Stable Pond were flooded w. the seawater can unfriendly habitat for both the frogs & the snake. Then came the mother of all floods, the corp of engineers (Army) and the seawall with no drainage allowed for both creeks at the north end & south end of L.S. hence today's problem. Formerly both creeks emptied directly to the ocean now the water collects and creates the flooding & habitat for frogs & snakes.

The city has no $ to fix this problem. Since the Army Corps of E created the problem they should be made to rectify the situation. Since the creeks are the problem the north creek should be made to empty into the ocean. The south creek (Sanchez Crk) should be redirected to the N end of Nicol Point and used to help grow frogs & snakes (Presidio Corp has a half a dozen ponds on site and I'm sure would welcome the habitat.

Subject Consider off-road bicycle use in SF's open space EIR.

Ms. Jessica Range,

I am writing you to address the EIR that will analyze various needs and uses of San Francisco natural areas. I feel that too often, the needs of recreational trail users are overlooked, especially those of mountain bike users.

I urge the government of San Francisco to consider the development of multi-use trails, and bicycle skills parks to be considered as sustainable uses of our open spaces and parks. I work closely with SF Urban Riders, a non-profit committed to working with the city to provide these resources to her citizens.

Off road cycling is a fast growing sport that already enjoys a diverse and large following in the bay area. Besides its healthy benefits to the community and users, Mountain bikers are a largely untapped resource of volunteer labor and stewardship for our public lands, as has been demonstrated in the successful partnership between sfurbanriders and mt. sutro stewards in creating San Francisco's first true multi-use trail system.

Lastly, Mountain Biking has been shown to be of equal or less detriment to trail systems than hiking, and less damaging than equestrian use. Resources that back this claim can be found here.

Please let me know you have any questions, and thank you for your time.

Sincerely,

Dayton Crites

Natural Areas Management Plan
1650 Mission Street, Suite 400
San Francisco, CA 94103

Re: Notice of Preparation of an Environmental Impact Report dated April 22, 2009 Project Title: Natural Areas Management Plan (aka Natural Resources Areas Management Plan)

Dear Mr. Wycko:

Thank you for providing this initial study and Notice of Preparation ("NOP") and for conducting a scoping meeting in our community. We appreciate the acknowledgement that since the Sharp Park property is located within the boundaries of the City of Pacifica, we are naturally very attentive to any changes or alterations proposed for this site. Upon reviewing the NOP, we noted several items related to our Land Use regulations that were not included in the NOP and that should be acknowledged in the EIR documents.

This letter serves as the response of the City of Pacifica ("Pacifica"), a Responsible Agency as defined in California Public Resources Code Section 21080.4(a) and 14 California Code of Regulations Section 15082(b), to the above referenced Notice of Preparation ("NOP").

The NOP does not identify discretionary approvals required by Pacifica for the Natural Area identified as "Sharp Park", which is located in the jurisdiction of the City of Pacifica. The City and County of San Francisco ("San Francisco") must comply with the California Coastal Act. Pacifica has a certified Local Coastal Program ("LCP") pursuant to which Pacifica enforces Coastal Act regulations in the Coastal Zone within Pacifica's boundaries. That portion of Sharp Park west of Highway One is within the Coastal Zone, and is identified in the LCP. Thus, for projects affecting west Sharp Park such as this, San Francisco needs to obtain a Coastal Development Permit ("CDP") and comply with it. Please include the CDP in the list of discretionary approvals required to be analyzed in the EIR and throughout the discussion in the document.

Further, the proposed project is subject to Pacifica's Logging Operations Ordinances, Ordinance Numbers 636 C.S. and 673 C.S. Any tree removal, destruction or harvesting of twenty or more trees within one year is prohibited unless in conjunction with a Pacifica permit (such as the CDP) or unless the Pacifica Public Works Director makes specific findings regarding the tree removal operations. Again, please include these regulations in the environmental discussion.

In addition, Topic 14, "Hydrology and Water Quality", subsections (a), (c), (d), (e) and (h) reference the need for the EIR to study the proposed project's impacts on drainage patterns and flood hazards within the Sharp Park area. Pacifica concurs that the EIR must study those potential impacts, and emphasizes the need to study the risk of flooding not only within Sharp Park itself, but whether the proposed project will result in flooding of the adjacent residential areas, and, if so, propose appropriate mitigation. In addition, the EIR should address the effect that removing 54,000 trees will have on erosion and drainage patterns.

Pacifica reserves its rights to comment in greater detail on the contents of the initial study until the City has the opportunity to review a full draft EIR.

We appreciate your attention to these matters.

Sincerely,

Julie Lancelle

Bill Wycko, Environmental Review Officer
SF Planning Department
Natural Areas Management Plan
1650 Mission Street, Suite 400
San Francisco, CA 94103

Dear Mr. Wycko,

Thank you so much for the enlightening Public Scoping meeting last May 14th. I very much appreciated being presented with Lisa Wayne's Management Plan and with the CEQA objectives.

My family frequently uses Glen Canyon Park and Bernal Hill for walking and enjoying the outdoors as well as introducing our daughter to the wildflowers, plants, rocks, birds and bugs that can still be found in these exceptional areas. We also enjoy exploring Billy Goat Hill, Tank Hill, Duncan-Castro and McLaren Park.

I have reviewed the SNRA Management Plan. I was encouraged to see that in the MA-1 and MA-2 areas described in the Management Plan, there will be a comprehensive effort to attempt to restore natural areas to their original state.

I would like to suggest that the MA-3 areas be treated in a manner similar to the MA-2 areas. I understand that it is imperative to move quickly to preserve the native plants and geology in the MA-1 and MA-2 areas. The MA classifications are obviously meant to prioritize this. However, in order to create a congruent landscape in the long run, the MA-3 areas should be managed congruently with the other areas.

## Replant MA-3 Areas with Bay Area Native Oak Savannah Trees

As the SNRA Management Plan now stands, there is no plan to gradually replace the eucalyptus groves with native trees such as coast live oak:

***Recommendation GR-15b:*** In order to maintain the forest as it ages, it is necessary to maintain a stocking rate that will perpetuate the urban forest and promote forest health. Over time, it will be necessary to grow a new age class of trees, which will eventually replace the existing mature canopy. This will be accomplished through natural and artificial regeneration methods. Natural regeneration refers to the seedlings and saplings that establish naturally. Blue gum eucalyptus is likely to be the primary species that regenerates naturally although the other invasive species also regenerate. Artificial regeneration refers to the planting of trees by people for management purposes. California native trees that offer the greatest value to wildlife such as Monterey cypress, Monterey pine and Douglas fir (*Pseudotsuga menziesii*) will be used. Tree planting can take advantage of openings in the urban forest canopy that are created either naturally or from other management activities.

I would ask that the decision to include Eucalyptus, Monterey Pine and Monterey Cypress in the reforestation of these GR-15b areas be reconsidered. These trees discourage the growth of an understory in the forest. Coast Live Oak savannah, so prevalent in the savannah areas of Yerba Buena Island and Palo Alto, obviously were also prevalent in San Francisco. It would be a shame not to feature these beautiful, drought tolerant, fire resistant trees and grasses in replanting efforts.

## Carbon Sequestration

A concern for maximizing carbon sequestration in order not to further contribute to climate change has been expressed. I share this concern.

I would like to mention that it is increasingly apparent that deeply rooted grasslands sequester carbon permanently underground while rapidly growing trees such as eucalyptus sequester carbon temporarily and not as efficiently as native bunch grasses.

I would ask that the CEQA look carefully at this. The 2008 Hohhot World Temperate Grasslands Declaration, sponsored by the World Conservation Union, a United Nations affiliate, states:

"Considering that temperate indigenous grasslands provide critical ecological goods and services essential for life on earth as a source of food, fibre, human livelihoods and well being, cultural and biological diversity, the recharge of aquifers and the sequestration of carbon, particularly in the face of global climate change . . . we the participants of the Hohhot World Temperate Grasslands Conservation Initiative Workshop from five continents and 14 countries, declare that temperate indigenous grasslands are critically endangered and urgent action is required to protect and maintain the services they provide to sustain human life. We call upon all sectors of society to collaborate towards this goal."

The United States is a signatory of this declaration. According to the signatories of this declaration, the relative sequestration of eucalyptus forest versus native grassland is not well understood. However, it is becoming increasingly clear that native grasslands play a key role not only in carbon sequestration, but in the preservation of the world's biodiversity. It seems that the indigenous grasslands of San Francisco are critically endangered as are most of the world's grasslands.

## Maintain Management of MA-3 areas in NAP

I would also ask that the MA-3 areas be managed, along with the MA-2 and MA-2 areas, in the Natural Areas Program. This will allow for management economies in the use of labor and forestry resources. The suggestion that the MA-3 areas be managed by the Bureau of Urban Forestry would be disastrous for the overall goal of the Natural Areas program.

If there is any doubt that the Bureau of Urban Forests is terribly under resourced, I would ask CEQA and the Bureau of Urban Planning to consider this example: The Bureau of

Urban Forests repeatedly claims that they do not have the funds to fix a College Avenue city sidewalk in their jurisdiction which poses a tripping and liability hazard to the city.

Again, a partitioning of the management of MA-3 areas would be disastrous for the overall goal of restoring esthetic and biological continuity to the city's natural areas.

## Work toward Walkability in and between the City's Natural Areas

I was encouraged to see that the Management Plan included a vision of trail building. There are many beautiful trails in the city. Some of these are in the process of being rebuilt. I was lucky enough to be on a trail building crew in Glen Park last year.

I would suggest that an overall plan be made for the Natural Area trails. The plan should extend beyond the boundaries of the natural areas, interconnect natural areas where possible, and connect natural areas to public transit. An attempt should be made to map trails or walking routes that exist through open spaces, city parks and urban areas. They should incorporate the city's neglected stairways. Such a plan might take many years to execute, but it would mean that there are not wasted efforts with trails built to nowhere.

Some examples of potential trails that I can think of are to connect Glen Canyon Park to Twin Peaks or Glen Canyon Park with Walter Haas Park and Billy Goat Hill.

## Reconsider the Impact of Off Leash Dogs

As the parent of a small child and as a life long owner of dogs, I have spent quite a while considering how the city's dog policy works in practice, rather than theory.

First, I would suggest that San Francisco does not have the rain that most North American cities have. In fact, it is a highly populated area in a near dessert. Virtually all of the rain the city gets is in the winter. The rest of the year, the city has no rain. By August, I find myself avoiding going to areas such as Bernal Hill and Glen Canyon Park because of the dog urine and general dirtiness of these areas. It is always a great relief to get the first rain.

I have also observed that most dogs are not walked on leash, even in leash areas such as Glen Park. I try to be considerate toward dogs and their owners on this matter. However, I find myself carefully assessing the breed and disposition of dogs as to their risk to my child. Many people are not as comfortable or knowledgeable with dogs. I know many people who avoid natural areas for this reason, especially parents of young children. This does represent a lost opportunity for children. They are less likely to be taken into natural areas due to the ubiquitous presence of off leash dogs.

Research does indicate that children are more likely to be bitten by a dog than an adult. Children are often at eye level to a dog. Many dog attacks are unprovoked and can result from something as simple as the dog misinterpreting eye contact or an outstretched hand.

In dog play areas, such as the road on Bernal Hill, I have found that I am increasingly uncomfortable going there. There almost always seems to be a dog fight or a dog rushing me in the legs. Many dogs are walked by dog walkers with multiple dogs and these dogs are thus poorly under control.

Again, if the intent is to allow people to experience natural areas, the current behavior of dogs and their owners is limiting this experience. The policy of allowing dogs, who are almost never on leash, access to natural areas should be reassessed. Dog Play areas should be reexamined in light of the lack of control of dogs and the environmental impact. The need to allow children to experience natural areas should be considered, not just the needs of dogs and dog owners.

I thank the Planning Department for the opportunity to express my appreciation for this planning process as we work toward a management plan of the natural areas in our beautiful city.

Most sincerely,

Marnie Dunsmore

RE: Comments on Notice of Preparation of an EIR for
The Natural Areas Management Plan (SNRAMP)
Case Number 2005-1912E

Dear Mr. Wycko:

Enclosed are our comments on the notice of preparation of an EIR for the Natural Areas Management Plan (SNRAMP). We are a team of park advocates with a vision of the Natural Areas Program (NAP) that acknowledges the co-existence of recreation and urban natural areas, which is guided by science, that embraces a diverse biophilia, and that ensures the public's safety in our parks. Our combined experience to achieve these objectives includes:

2002 SF Recreation and Park Department, Green Ribbon Task Force for NAP plans
2002 – present CC of San Francisco, Parks, Recreation, Open Space Advisory Committee
2003 - 04 SF Department of Environment, Task Force for Quail Recovery Plan
2003 SF Board of Supervisors, NAP Citizen Advisory Committee
2004-05 SF Recreation and Park Department, members of negotiation team to revise NAP plans and plan public process in preparation for approval of plan in 2006
2007-08 SF Mayor's Open Space Task Force

The Natural Areas Program enjoys the passionate support of many citizens, as well as equally passionate citizens who question some of the strategies and methods of the program. A comprehensive Environmental Impact Report (EIR) represents an opportunity to resolve some of the controversies that the program has generated in the past 10 years of its operation. Our comments are intended to help those who prepare the EIR to answer the many questions that have been raised about the management plan. In answering those questions, we believe it will be necessary to conduct independent studies of the potential impacts on recreation, the loss of thousands of trees, exposure to hazards such as herbicides, fire, erosion and other concerns that originate with past experience with native plant restorations in the area. Since the Initial Study has not conducted such studies or taken into consideration present conditions in the natural areas, the EIR must do so now.

You have been assigned an important task, to put to rest years of concern and disappointing experiences with the Natural Areas Program. We urge you to take this task as seriously as the public does. This is the final opportunity to do so, as we have no desire to resort to legal means (as provided by CEQA) of achieving the necessary assurance of the public's safety and enjoyment in our parks.

Sincerely,
Karin Hu
Mary McAllister
Nancy Wuerfel

**Comment on the Notice of Preparation of an EIR for**
**The Natural Areas Management Plan (SNRAMP)**
**Case Number 2005.1912E**
**May 21, 2009**

The Initial Study of the environmental impacts of SNRAMP is inadequate in many respects:

- It dismisses as "insignificant" environmental impacts that have been experienced in the natural areas in the past and that caused considerable damage as well as public concern.
- It makes sweeping statements, dismissing environmental and safety issues without providing any evidence to support these dismissals
- It demonstrates that the author has either not read SNRAMP or has not understood important portions of it
- It demonstrates that the author has ignored basic scientific principles needed to analyze potential impacts, such as carbon sequestration and release
- It demonstrates that the author has not visited the natural areas and is unaware of the 10-year history of environmental and safety problems and public concern since the Natural Areas Program began to operate

**The Initial Study (IS) proposes further study and analysis by an EIR of only a few environmental issues for which there "is not sufficient information available at the time on the potentially effected resources or site conditions" (IS page 61). The following comments request that the proposed EIR be expanded to include several environmental issues for which the Initial Study is inadequate, inaccurate, or is inconsistent with the reality of past actions of the Natural Areas Program both in the present and in the past 10 years of its existence.**

## E.1 Land Use and Land Use Planning
## E.9 Recreation

### A. Changes in land use by the Natural Areas Program

*"There would be no change in land uses and no impact under the project..." (IS page 59)*

SNRAMP changes land use by restricting access to the natural areas:

- "Public use in all Natural Areas, unless otherwise specified, should encourage on-trail use...park signs should...include 'Please Stay on Trails...If off-trail use continues...permanent fencing shall be considered..." (SNRAMP, Recommendation GR-11, page 5-14)
- "Recreation goals: To provide opportunities for passive recreational uses (e.g., hiking, nature observation) compatible with conservation and restoration goals." (SNRAMP, Management Approach, page 2-2)
- "Some MA-1 areas may require installation of elevated boardwalks or permanent fences." (SNRAMP, page 1-5)
- 10.3 miles of 40 miles of trails within the natural areas will be closed (SNRAMP, Table 3-6)

The Recreation and Park Department has recently restricted bicycles to paved roads. There are few paved paths within the natural areas, which effectively bans bicycles from the natural areas. Plans to improve trails within the natural areas will not include paving.

*Recently installed sign at the Overlook Parking lot on Mansell Street in McLaren Park*

On November 19, 2008, the following comment was posted to the Natural Areas blog: "San Francisco's Significant Natural Resource Areas are now being assaulted by a new menace: mountain bikes...One thing needs to be perfectly clear: **Rec & Park Department policy prohibits bicycles in the parks except on PAVED surfaces...**The RPD should place signage at all entrances to all parks clearly prohibiting bike riding in any Significant Natural Resource Area." (sfnaturalareas.org)

*"Of the San Francisco Natural Areas, trails would increase at Edgehill Mountain and Interior Greenbelt." (IS, page 58)*

On April 27, 2009, the Natural Areas Program installed this sign at the only entrance to the Interior Greenbelt, one of the natural areas: **"No Public Access"**

The site-specific plan for the Interior Greenbelt does not indicate any trail closures in that natural area. In fact, the plan indicates the expansion of the existing trail (SNRAMP, page 6.23-2). Yet, the reality is that the Natural Areas Program is apparently closing this natural area to the public.

Both of these new signs in the natural areas cite Park Code 3.02 as the authority for these access restrictions. Park Code 3.02 provides: "Signs To Be Obeyed. No person shall willfully disobey the notices, prohibitions or directions on any sign posted by the Recreation and Park Commission of the Recreation and Park Department." In other words, the Natural Areas Program apparently gives itself the right to put ANY prohibition on a sign and the public is obligated to observe their prohibition.

When there is a conflict between the plans as stated in SNRAMP and the reality of what is happening in the natural areas, the latter should trump the former in the EIR evaluation. The EIR must acknowledge what has actually happened and presently exists in the natural areas.

None of these restrictions on recreational access are mentioned in E.9 Recreational element of the IS. These are omissions that must be corrected by the full EIR of the Recreational element.

**B. Everson/Digby Lots should not be included in this EIR**

The Initial Study announces the existence of a new natural area: "A portion of the Everson/Digby Lots park was recently determined to be a Natural Area" (IS, page 46). The Initial Study provides no information about this new natural area or what is planned for its future. Neither the Natural Areas Program website (sfnap.org) nor the Recreation and Park Department website (sfgov.org) acknowledge the existence of this new natural area, let alone provide any information about it. The Initial Study does not inform the reader if the Recreation and Park Commission has approved the designation of this natural area. Nor do we know if the visitors to and neighbors of this park are aware of this designation.

SNRAMP was subjected to a lengthy public process, including public meetings and hearings by the Commission that eventually resulted in its approval. Everson/Digby Lots have not been through this process and are therefore not ready for an EIR until this process is complete. A management plan must be written for this new natural area. After the public has considered this proposal and if the Commission approves it, it will be ready for environmental impact review.

**C. Changes in land use resulting from existence/reintroduction of legally protected species**

One of the objectives of the SNRAMP is the protection, enhancement, and reintroduction of sensitive species of plants and animals: "Augmenting existing populations and (re)establishing or (re)introducing additional populations where they once occurred (or were likely to have occurred) will help to ensure their continued survival in the City" (SNRAMP, page 5-3). Management actions in the MA-1 and MA-2 areas include "reintroduction of sensitive species" (SNRAMP, page 1-5). MA-1 and MA-2 areas are 623.0 acres (58%) of all natural areas. The definition of "sensitive species" includes federal and state legally protected species (SNRAMP, Table 3-6).

Consistent with that mission, the Natural Areas Program and its volunteers have successfully lobbied the Board of Supervisors to develop Sharp Park as habitat for legally protected species to be managed by the GGNRA: "This Thursday, April 30, [2009]...you'll have the opportunity to tell the Board of Supervisors to stop wasting our tax dollars operating the money-losing Sharp Park golf course. The Government Audit and Oversight Committee will consider legislation 'to develop a plan, schedule and budget for restoring Sharp Park habitat for the California red-legged frog and the San Francisco garter snake in conformance with the requirements of the Endangered Species Act, and transferring Sharp Park to, or developing a joint management agree with, the Golden Gate National Recreation Area and

making environmental findings.'" (sfnaturalareas.org) On May 5, 2009, the San Francisco Board of Supervisors unanimously approved this proposal verbatim as an "ordinance amending San Francisco Park Code Article 3 by adding Section 3.20..."

There are legally protected species in many other natural areas (SNRAMP Table 3-5), which could lead to similar changes in land use. For example, access restrictions will be required at Lake Merced to protect the Western Pond Turtle (WPT): "Recommendation LM-6c: To prevent native turtles from being disturbed during breeding season, restrict public access to the waters and shoreline of East lake between April 1 and August 31. It may be possible to achieve these access restrictions through signage. If not, temporary barriers that would prevent boat access to East Lakes could be installed." (SNRAMP, Lake Merced, page 6.1-17)

In Oregon, where the WPT is an endangered species, the recovery plan for the WPT requires restrictions on all human access—recreational and agricultural—within 500 feet of the water to protect the potential nesting range of the turtle. The recovery plan also requires that the entire potential nesting range be unshaded in order to maintain the optimal temperature for the turtle's eggs. This would require removal of all trees—native and non-native—within 500 feet of the perimeter of the East Lake and North Lakes, where the turtles have been found.

The Natural Areas Program is presently reintroducing the Mission Blue Butterfly to Twin Peaks (Oakland Tribune, 5/1/09). The Mission Blue Butterfly is a federal endangered species. The Xerxes Society lists as one of the management actions required to preserve populations of the Mission Blue, "protection from excessive recreational use." It also suggests that suppression of fire may have reduced habitat quality and negatively affected the historic population. In other words, the reintroduction of the Mission Blue on Twin Peaks has the potential to reduce recreational access and require periodic prescribed burns. The Endangered Species Act legally obligates management actions required to maintain a legally protected species, whether it has been reintroduced artificially or occurs naturally.

In addition to access restrictions defined by SNRAMP, the Natural Areas Program has identified new restrictions on recreational uses needed to protect natural areas and their resident wildlife. Therefore, the Initial Study is inaccurate to claim that the Natural Areas Program will not change land use. SNRAMP has the potential to eliminate all forms of recreation other than walking on a designated path as it implements its goals "To maintain viable populations of all special-status species" and "To maintain and enhance native plant and animal communities." (SNRAMP, Management Approach, page 2-1) The proposal to "transfer" or develop "joint management of" Sharp Park with the GGNRA, indicates the potential for ownership of natural areas to change in the pursuit of restoration goals. These changes in land use must be acknowledged and evaluated in the EIR. Recreational access restriction not identified by the Initial Study, must also be evaluated by the EIR.

## E.2 Aesthetics

**Most trees designated for removal will NOT be replaced with native trees**

*"Generally, trees removed would be replaced with native tree species at a roughly 1:1 replacement ratio, although not necessarily at the same location. In some locations, trees would be replaced by native scrub or grassland species." (IS page 63)*

SNRAMP contains no such commitment to replace all trees designated for removal with native trees in the same location or any other location. In most cases, SNRAMP says specifically that the trees

designated for removal will **not** be replaced by trees, but rather with grassland and dune scrub. All designated tree removals are in MA-1 and MA-2 areas (see Attachment A).

- "The long-term goal of urban forest management in MA-1 and MA-2 areas is to slowly convert those areas to native scrub, and grassland habitats or oak woodlands." (SNRAMP, Forestry Statement, page F-1)
- "The goal in most of the MA-1 and MA-2 stands at Sharp Park is the same as for the Natural Areas within San Francisco: eventual conversion of invasive forest into grasslands and scrub." (SNRAMP, Forestry Statement, page F-6)
- Most site-specific recommendations regarding tree removal say specifically that the trees will be replaced by scrub or grassland (SNRAMP, Forestry Statement, pages F-8-F-11):
    - Lake Merced: "These openings will remain as the forests in these areas are gradually converted to low-growing coastal scrub."
    - Mt. Davidson: "...tree removal will result in the conversion of some areas of forest to scrub and grasslands."
    - Glen Canyon: "...gradually converted into scrub habitat..."
    - Bayview Park: "Tree removal will focus on the existing edge of forests to preserve existing scrub and grassland."
    - McLaren: "Grasslands will increase in magnitude and the area...will support...diverse coastal scrub."
    - Interior Greenbelt: "...these areas will be converted to coastal scrub..."
    - Dorothy Erskine: "...scrub will fill in where trees have been removed."

Only the site-specific Forestry Statement for Corona Heights predicts long-term conversion to oak woodland. And, "Within MA-1 and MA-2, these sites [of tree removals] would then be replanted with native shrub and grassland species. Within MA-3, urban forest species would be planted or encouraged (see Section 5, GR-15)" (SNRAMP, Forestry Statement, page F-3)

These long-term goals for the conversion of the urban forest to scrub and grassland are consistent with the natural history of San Francisco: "Prior to the colonization and the stabilization of dunes and introduction of invasive species, trees were not a dominant feature of the San Francisco peninsula. It is likely that scrubby coast live oaks grew on north-facing slopes in moist drainages and that buckeyes, bays, and oaks lined creek channels that flowed to the bay or ocean. However, much of the area probably resembled the coastal scrub habitats of San Bruno Mountain or the grassland-scrub mosaics of the Marin Headlands. Management of MA-1 and MA-2 is focused on the gradual conversion of these areas into native scrub and grassland habitats. This is the long-term goal." (SNRAMP, Forestry Statement, page F-1)

As one might expect, given the treeless nature of the native landscape, most native plants are not adapted to shade, as there was little shade in native San Francisco. For that reason, attempts to restore the native landscape would not be served by planting native trees. Trees create shade whether they are native or non-native. A related issue also predicts that native trees will not be a conspicuous feature in the restored natural areas: "In many Natural Areas, trees capture moisture from the coastal fog. The moisture drips onto the ground creating artificially wetter than normal conditions which favor invasive weed species." (SNRAMP, Forestry Statement, page F-1)

Because most of the natural areas are rock outcrops and sand hills that were treeless prior to the arrival of Europeans, there is little acreage within the natural areas that is capable of supporting trees that are native to San Francisco: "Two native forest series...comprise approximately 17 acres, 2 percent of total vegetation [in the natural areas]" (SNRAMP, Setting, page 3-11). Obviously, it would not be

physically possible to plant 18,500 native trees in the small areas in which they would be able to survive.

The Natural Areas Program has also demonstrated in the past that it cannot successfully replace with native trees those non-native trees that it has already removed. Nearly 10 years ago, the Natural Areas Program removed approximately 12 of the 24 non-native trees on the top of Tank Hill. The neighbors of Tank Hill were angry about their removal. The Natural Areas Program planted native trees in an attempt to satisfy the angry neighbors. These native trees did not survive, as one might expect given the windy, rocky conditions on Tank Hill to which native trees are not adapted. Alders were also planted to replace the healthy non-natives removed from the western end of Pine Lake. The Alders did not survive one year.

The Initial Study is mistaken that any commitment has been made to replace all removed trees with native trees. Nor would such a commitment be advisable, given that planting native trees in most of the natural areas would not be successful because they are adapted to sheltered areas that are not representative of the natural areas. If they were planted, they would be unlikely to survive.

Therefore, the EIR must evaluate the impact of proposed tree removal, based on the accurate premise that most will NOT be replaced.

## E.7 Air Quality

**A. Trees designated for removal have NOT been selected because they are not healthy**

*"Trees would be removed to promote forest health and would focus on dead or dying trees, trees with disease or insect infestations, storm-damaged or hazardous trees, and trees whose growth is suppressed by overcrowding." (IS page 87)*

This statement is also inaccurate. A generous interpretation of this misstatement of fact is that the author of the Initial Study has confused General Recommendation GR-15 with the site-specific plans for tree removals in MA-1 and MA-2 areas. General Recommendation GR-15 says, "To promote forest health, removal of trees shall focus on the removal of dead or dying trees, trees with disease or insect infestation, storm-damaged or hazardous trees, and trees that are suppressed because of overcrowding." (SNRAMP, General Recommendations, Page 5-19) However, General Recommendation GR-15 applies **only** to non-native trees in MA-3 areas: "Urban forest stands that contain significant native plant understory and are planned for native plant and animal habitat restoration are classified as MA-1 or MA-2 and are **not considered here**. Recommendations for MA-1 and MA-2 areas are described in individual chapters in Section 6 and Appendix F [Forestry Statement] describes the species to be removed, removal methodology...and other tree removal impacts." (SNRAMP, General Recommendations, page 5-18).

Recall that all tree removals designated by SNRAMP are within MA-1 and MA-2 areas. Recommendations for their removal described within Section 6 and the Forestry Statement do **not** state that recommendations for their removal were based on their health or lack there of. Rather they were selected for removal if their removal would enhance or expand an adjacent native plant habitat. There is no basis upon which the Initial Study may assume that the non-native trees designated for removal are anything but healthy. Some may not be healthy, but that is not why they were selected for removal.

Removal of non-native trees within MA-3 areas are not specifically identified or quantified by SNRAMP. If they are removed, they would be incremental to the 18,500 trees that have been designated for removal. However, SNRAMP states clearly that management of MA-3 areas is a low

priority. Given the limitations on NAP resources, it is unlikely that any trees will be removed in MA-3 areas unless they fall down, as they do frequently.

**B. SNRAMP implementation will NOT increase carbon sequestration or decrease global warming**

*"Although old large trees are good at storing carbon, they are not as effective as young trees at taking up carbon. Replacing dead, dying and diseased trees that have limited capability to sequester carbon with young saplings that have long-term carbon sequestration capabilities would result in a net GHG benefit." (IS page 87)*

The author of the Initial Study does not provide a complete reference for this claim. A name is provided in parenthesis, but the complete citation does not appear in the list of references, so the reader is unable to verify its accuracy.

The USDA's "Urban Forest Effects Model" includes an assessment of San Francisco's urban forest. It reports that, "The amount of carbon annually sequestered is increased with healthier trees and larger diameter trees" (UFORE, page 8). In other words, a study by the US government specifically written for the City of San Francisco refutes the claim that young saplings have greater capabilities to sequester carbon than larger trees. Recall that the trees designated for removal by SNRAMP are not necessarily unhealthy. Clearly saplings are smaller than the mature trees over 15 feet tall that have been designated for removal.

Furthermore, the release of carbon stored in the 18,500 trees that would be removed would certainly swamp whatever benefit there may be in replacing some of the trees. Trees release their stored carbon as they decay. SNRAMP states that the trees would be left in place to slowly decay if they provide habitat or chipped, composted and used throughout the parks. In other words, all of the removed trees will release their sequestered carbon over time, as they decay in San Francisco's parks.

Finally, the Initial Study announces (page 11) that prescribed burns will occur in the natural areas and that the SNRAMP will be "updated to reflect this change." Fires release the stored carbon of the burned plants into the atmosphere as well as releasing particulate matter into the air. This is yet another source of increased carbon release and increased air pollution that may result from implementation of SNRAMP. Because of the accumulative effect of all the sources of carbon release predicted by the SNRAMP, the effect of prescribed burns on carbon release and air pollution must be considered by the EIR. Consideration of prescribed burns by a separate and later environmental review (as the Initial Study announces its intentions on page 11) is not acceptable.

*"Although the net effect on carbon sequestration capacity is unknown for the proposed replacement of mature eucalyptus with native saplings, replacing dying trees with healthy trees typically enhances the carbon sequestration process...As such tree replacement is expected to result in a net increase in the amount of carbon sequestered within the Natural Areas" (IS page 88)*

Even if it were true that only dying trees were being removed or that they would be replaced—and as noted above, neither is true—this statement is inaccurate. Carbon sequestration by trees and plants is directly proportional to their size (UFORE, Appendix III). Therefore, a small sapling is incapable of sequestering as much carbon as a large tree, whether it is healthy or not.

Furthermore, even if this statement were true, it does not take into account that within the MA-1 and MA-2 areas, the SNRAMP proposes to remove all seedlings and saplings (defined by SNRAMP as trees less than 15 feet tall) of non-native trees in order to convert these areas over time to scrub and

grassland (SNRAMP, Forestry Statement, page F-4). The removal of these seedlings and saplings are not quantified by SNRAMP because they are not defined by SNRAMP as trees (SNRAMP, Forestry Statement, page F-2). Therefore, their removal is incremental to the designated removal of 18,500 trees over 15 feet tall. In other words, countless small, young trees will be removed, reducing carbon sequestration in the natural areas further than can be quantified because their numbers are unknown.

Finally, the Initial Study assumes that all native trees—both those that presently exist and those that are planted in the future—will survive and continue to sequester carbon. The author of the Initial Study does not consider the potential for the death of many native trees if Sudden Oak Death continues to spread. It kills many species of tree that are native to San Francisco. It presently exists in Golden Gate Park. It is spreading throughout coastal California. The Nature Conservancy recently reported that more than one million trees have been killed by SOD in California.

*"...grassland above 50 degrees latitude reflects more sun than forest canopies, thereby keeping temperatures lower by an average of .8 degree Celsius...grassland and scrub habitat could act as a significant carbon sink." (IS page 88)*

Once again, the author of the Initial Study does not provide a complete citation for this claim, so the reader is unable to verify its accuracy. However, this reader is familiar with this claim, which will enable a response.

Ken Caldeira of Stanford University is one of the proponents of the so-called "reflected light" argument that forests might actually increase global warming by absorbing light. Caldeira's argument is based on the comparison between dark forests and the reflected light of snow in northern latitudes. The contrast between forest and snow is much greater than the contrast between forest and grass and scrub. It is clearly a stretch of the concept to apply it to the local climate where there is no snow.

Caldeira also makes it clear in his New York Times oped of January 2007 that he is not advocating for the destruction of forests: "Clear-cutting mountains to slow climate change is, of course, nuts...preserving and restoring forests is a valuable activity, regardless of its impact on climate—we need more trees, not fewer."

The Initial Study makes an illogical connection between increased temperature on the forest floor resulting from the absorption of light and the ability of the forest to sequester carbon. There is no such connection. Increased temperature on the forest floor does not reduce the carbon sequestering abilities of the forest that are a by-product of photosynthesis.

The USDA's "Urban Forest Effects Model" for the city of San Francisco also reports that the "tree cover" is less than 12% of the city's land. Yet, "Trees remove about 19 percent more air pollution than shrubs in San Francisco" (UFORE, page 7). This finding refutes the claim that converting many acres of trees into grassland will benefit air quality in San Francisco.

Furthermore, even if this argument can be applied to the local situation, it assumes that the native plant populations will survive in the long-term. The author of the Initial Study does not acknowledge that the ranges of native plant populations are changing in response to global warming: "Two-thirds of California's unique plants, some 2,300 species that grow nowhere else in the world, could be wiped out across much of their current geographic ranges by the end of the century because of rising temperatures and changing rainfall patterns according to a new study...California oaks could disappear from Central California in favor of cooler weather in the Klamath Mountains..." (Los Angeles Times, June 25, 2008)

Other researchers find that invasive weeds are frequently better adapted to conditions that are altered by man. For example, CO2 levels are higher in urban settings and promote the growth of invasive weeds that thrive in higher concentrations of CO2. Fire suppression is another means of promoting weed growth at the expense of native plan populations. "New research...suggests that invasive species, at least in some instances, aren't so much the causes of environmental degradation as eco-opportunists taking advantage of disturbed habitats." ("Can Weeds Help Solve the Climate Crisis," New York Times, June 29, 2008) In other words, simply removing invasive species does not necessarily enable the survival of native plants if they are no longer adapted to the conditions that have been altered by man.

These studies would explain the singular lack of success of the "restorations" of the Natural Areas Program for the past 10 years. Many natural areas have been planted repeatedly, only to fail repeatedly. It may not be possible to reestablish native plant populations in an urban setting that has been significantly altered by hundreds of years of human habitation.

If non-native plants and trees are removed from 25% of all park acreage in San Francisco (the size of the natural areas in SF) and it proves impossible to successfully grow native plants in those locations, there will clearly be no carbon sequestration benefit from these efforts.

Since the Initial Study has made mistaken assumptions in evaluating the impact of proposed tree removal and has not considered the question of whether or not a "restored" landscape will survive, the EIR must now fully analyze these issues. Since the author of the Initial Study has demonstrated a stunning lack of scientific knowledge regarding carbon sequestration, air quality, and global warning, a consultant with the necessary expertise must conduct the EIR.

## E.8 Wind and Shadow

**Tree removal HAS altered wind conditions in the natural areas resulting in windthrow hazard**

*"...removals within the Natural Areas are planned to take individuals or very small groups of trees within existing forest and scrub habitats to avoid altering the wind conditions. As such tree removal would not include wind-toughened edge trees and would not result in increased wind hazards or expose trees within a stand to high winds. Therefore, the potential wind hazard of windthrow that would result form the project is expected to be less than significant. (IS page 90)*

It is patently false that tree removals "are planned to take individuals or very small groups of trees within existing forest and scrub habitats to avoid altering the wind conditions." Here are a few examples of the large number of trees that will be removed from small areas (SNRAMP, Forestry Statement, Appendix F-14-F-17):

- Mt. Davidson: 1,000 trees will be removed from MA-1c (3.5 acres)
- Glen Canyon: 100 trees will be removed from MA-2e (.6 acres)
- Sharp Park: 1,476 trees will be removed from MA-2j (5.6 acres)
- Corona Heights: 10 trees will be removed from MA2C (less than .01 acre)
- Bayview Park: 140 trees will be removed from MA-1d (.02 acres)
- McLaren Park: 600 trees will be removed from MA-2b (9.9 acres)
- Interior Greenbelt: 100 trees will be removed from MA-2a (1 acre)

Tree removal on this scale cannot be done piecemeal, taking only a few individual trees on separate occasions. The game of "pick-up-sticks" is a good metaphor to understand the problem. Felling one

tree will impact those in close proximity. Whether intended or not, neighboring trees are likely to be felled by the falling tree.

Removing that individual tree will not be possible unless its neighbors are also removed. One can't pick up that felled tree when other standing trees surround it. Felled trees must be dragged out. As a qualified arborist said, when expressing his opinion of the proposed selective method of tree removal, "I don't have tweezers to pick these trees out of the forest."

Leaving the felled trees on the ground until they are all destroyed is not an option because the restoration objective is to plant the bared ground with native plants, which can't be accomplished if the ground is covered with dead trees.

Even if it were true that only "very small groups of trees" will be removed, it does not follow that "tree removal would not include wind-toughened edge trees" nor that removals "would not result in increased wind hazards or expose trees…to high winds." In fact, most of the tree removals will occur on the edge of the existing forest, which is consistent with the stated goal of the removals to expand the adjacent native scrub and grassland (SNRAMP, Forestry Statement, pages F-8-F-11):

- Mt. Davidson: "Additional removals will occur…on the eastern edge of the forest."
- Bayview Park: "Tree removal will focus on the existing edge of forests…"
- McLaren Park: "…removal will occur along forest edges…"
- Interior Greenbelt: "Tree removal will focus on the eastern border and the western tip of this Natural Area…"

In addition to these narrative descriptions of the location of tree removals, SNRAMP contains detailed maps of the natural areas in Section 6 that indicate the location of the tree removals. These maps reveal the vulnerability of the remaining trees as a consequence of some of the tree removals.

We will use Lake Merced only as an example, although identical logic could be applied to many other natural areas in which large tree removals are planned. Over 100 trees will be removed from the eastern shore of the South Lake. The Harding Park Golf Course is adjacent to this shore, to the east of the lake. The wind blows from the west. The golf course is presently sheltered from the wind by the trees that will be destroyed on the eastern shore of the lake. There is an old population of huge Cypress trees on the golf course that are nearing the end of their life span of about 100 years. These trees will be exposed to wind from which they were previously sheltered. Massive tree failure could result. One hopes it will not occur during a PGA TOUR golf tournament when there are thousands of spectators on the course.

The City of San Francisco has contracted with PGA TOUR, Inc, "for certain golf tournaments at Harding Park over the 15 year period beginning 1/1/05." The contract requires strict course maintenance standards be met as an obligation to hold any tournaments at this facility. The EIR should indicate that the PGA TOUR has been informed of the tree removal adjacent to the golf course and that the management actions in SNRAMP will not violate the terms of the contract between PGA TOUR and the City.

*The eastern shore of the South Lake at Lake Merced. The western edge of Harding Golf Course.*

San Franciscans have had a preview of the tree failure that could be precipitated by the removal of thousands of trees in the natural areas. Pine Lake and Stern Grove Parks are contiguous parks that essentially form one park of approximately 70 acres. It has been undergoing extensive capital improvement, beginning in 2000. There is a natural area at the western end of the park, including and surrounding Pine Lake. The wind enters this park from the western end. The entire park is a narrow, upwardly slopping canyon that funnels and accelerates the wind as it travels from the western to the eastern end of the park.

In 2003, in connection with the capital project, a survey of all trees in Pine Lake/Stern Grove was conducted by a certified arborist, resulting in a Tree Management Plan identifying hundreds of hazardous trees recommended for removal.

In early 2004 approximately 20 healthy non-native trees were removed from the western end of the park to accommodate the expansion of a native plant garden that requires full sun. This removal was documented and acknowledged by RPD at an RPD Commission hearing on 5/5/2004. A few Alders were planted to replace the trees that were removed. The Alders did not survive.

The concert meadow renovation in Stern Grove was the first phase of the capital project. In connection with that project, many trees were removed to accommodate that renovation. Some had been identified by the arborist's report as hazardous. Most had not. Funding was not sufficient to remove all of the 363 hazardous trees in Stern Grove recommended for immediate "priority removal" in 2003. Most hazardous trees in Stern Grove were left in place while many healthy trees were removed to accommodate renovation of the concert meadow.

Pine Lake was the second phase of the project. In 2007 hundreds of trees—of which most were considered hazardous--were removed during the Pine Lake Project. Recall that Pine Lake is west of Stern Grove, the windward side of Stern Grove. The removal of hundreds of trees from Pine Lake exposed Stern Grove to wind from which it had previously been sheltered. Recall that hundreds of the trees remaining in Stern Grove had been deemed hazardous in 2003. Shortly after removal of hundreds of trees in Pine Lake Park trees began to fail throughout the park at an alarming rate.

On April 14, 2008, a park visitor to Stern Grove was killed by a Redwood branch about 20 feet long that fell on her and her car, destroying her car (SF Examiner, 4/30/08). The Tree Management Report of 2003 had specifically identified this branch as potentially hazardous. The Redwood tree had been topped in the past, creating an unsupported "horizontal branch with poor taper and weight" (Tree Management Report). The branch extended over a heavily used parking lot, in which the park visitor was killed. Her family has sued the City of San Francisco for the negligence that caused her death because the dangerous branch had been identified 5 years earlier and hundreds of trees to its windward side had been removed, making the branch even more vulnerable to failure (SF Examiner, 9/24/08).

About two weeks earlier, an equally large branch fell onto the road that leads to the same parking lot. Park visitors were trapped in the parking lot. They called RPD, using their cell phones, but no one came to their rescue. They finally freed themselves by dragging the branch out of the road, using a rope and a truck of one of the visitors. These visitors notified RPD of this incident and recorded the incident in a weblog created for park visitors. This was the wake-up call that could have prevented the death on April 14, 2008.

Since then there have been approximately seven major tree failures in Pine Lake/Stern Grove.

*Two of the tree failures in Stern Grove/Pine Lake in the past year.*

SNRAMP mentions the removal of hazardous trees at Pine Lake, noting that these removals have not been quantified by SNRAMP (Forestry Statement, page F-2). The author of the Initial Study was therefore alerted to this opportunity to evaluate the potential for dangerous windthrow subsequent to large tree removals. The Initial Study makes no mention of Pine Lake tree removals, nor the consequences of those removals.

Given this experience with large tree removals in natural areas, the conclusion of the Initial Study that, "*Therefore, the potential wind hazard of windthrow that would result form the project is expected to be less than significant*" is irresponsible and potentially tragic. There is no basis upon which the Initial Study can dismiss the potential for significant tree failure in this cavalier manner.

SNRAMP makes similar efforts to dismiss the potential for windthrow in the Forestry Statement (page F-11-F-13). It states repeatedly, "potential windthrow hazard to people is minimal because there are no residential areas near the stands where tree removals will occur." In other words, SNRAMP's sole concern is for property, not for the people visiting the parks. Some of these parks are heavily used by people. The golf course at Lake Merced and the concert meadow in Stern Grove both have thousands of people in them during special events.

Of all the many issues in this Initial Study, this refusal to consider the seriousness of tree failure and consequent danger to the public is perhaps the most egregious. After a park visitor paid with her life for this failure to mitigate the consequences of massive tree removal, RPD appears to have learned nothing from this needless loss. The EIR must evaluate the potential for windthrow resulting from the removal of 18,500 trees. This evaluation must be done by a qualified consultant with expertise in forestry management.

## E.10 Utilities and Service Systems

**Native plant restoration WILL require new irrigation and water use**

*"Reinstating native species and replacing trees would require irrigation until they become established. However, irrigation needs would be met by existing water supply capacity and would not require new or expanded water supply resources. Therefore, impacts on water supply would be less than significant. (IS page 94)*

Natural areas have been established in previously undeveloped portions of the park. It is simply not true that these areas were irrigated prior to being planted with native vegetation. The naturalized, non-native vegetation does not require irrigation. Any irrigation in natural areas is new and incremental.

An adequate Initial Study would evaluate how much water over what period of time will be required to irrigate native plants and trees until they are established. It is typical of this Initial Study that no attempt is made to evaluate that need. It merely dismisses potential impacts on water supply as "less than significant" and eliminates this question from further study in the subsequent Environmental Impact Report, as it does with virtually every controversial issue. The EIR must now include the analysis of additional water use not provided by the Initial Study.

## E.12 Biological Resources

**A, Impact on wildlife of herbicide use by Natural Areas Program must be evaluated**

*"...certain actions could disturb these* (wildlife) *species..." (ID page 109)*

The potential for management actions of the Natural Areas Program to impact wildlife is one of the few controversial issues that the Initial Study proposes to study further in the Environmental Impact Report. The impact of herbicide use in the natural areas on wildlife must be considered in that EIR. Herbicide use by the Natural Areas Program is not even mentioned by the Initial Study.

SNRAMP reports its use of "chemical control" as one of its "management methods:" "chemical control, which involves the use of herbicides to suppress wildland weeds" and "...herbicides are used to control invasive weeds in Natural Areas." (SNRAMP, Integrated Pest Management, page 4-4). However, it downplays the significance of that usage: "on a per-acre basis pesticide usage in the Natural Areas is significantly less than usage rates in other park maintenance programs." (page 4-5)

This apologia is ineffective for two reasons:

- The natural areas are, by definition, undeveloped areas of the park. Clearly developed areas of the park, such as lawns and landscaped areas, make greater demands for pest and weed control. Any herbicide use in previously undeveloped areas of the park is new to these areas, which prior to the establishment of the Natural Areas Program, were left untended.
- The removal of thousands of eucalyptus trees will require application of herbicides such as Garlon and Round-Up to prevent resprouting of the trees: "Tree stumps of some exotic species may be treated (hand painted or sprayed) with herbicide to prevent re-growth." (SNRAMP, Forestry Statement, page F-4) This will substantially increase the use of herbicides by the Natural Areas Program as the SNRAMP is implemented.

The affect of many herbicides (including the active ingredients in Garlon and Round-up) on declining amphibian populations is well known and documented in the literature (e.g., Tyrone Hayes, UC Berkeley). In fact, the Center for Biological Diversity sued the US Department of Fish and Wildlife regarding the use of these chemicals in the proximity of populations of the legally protected, endangered red-legged frog ("EPA to limit use of 66 pesticides," SF Chronicle, 10/20/06). In response, Fish and Wildlife has prohibited their use within a certain distance of these animals. Based on research, these chemicals are equally likely to be harmful to other amphibians such as salamanders and newts that are ubiquitous in the natural areas.

The Environmental Impact Review must evaluate the impact on wildlife of herbicide use in the natural areas on wildlife.

**B. The potential impact of West Nile Virus must be evaluated**

The planned expansion of wetlands at Sharp Park to support the red-legged frog may increase the mosquito population, and the potential for West Nile Virus (WNV). This raises several questions that should be addressed by the EIR. Will spraying of pesticides to control the mosquito population be prohibited to protect the red-legged frog population? If so, is there potential for an increased mosquito population to spread WNV to birds and humans? These questions should be analyzed and evaluated by the EIR.

**C. Do tree removals at Sharp Park violate the Pacifica logging ordinance?**

*"...Significant Trees Ordinance of San Mateo County and Ordinance 636-CS, which limits logging within Pacifica and applies to tree removal at Sharp Park. Management actions would not conflict with these or other applicable ordinances. (IS page 109)*

The meaning of this statement is not clear. The first sentence seems to say that the Pacifica ordinance that limits logging, applies to the removal of 15,000 trees designated by SNRAMP. The second sentence seems to say "management actions" (that is, the removal of 15,000 trees at Sharp Park) do **not** violate this ordinance. This is an unsubstantiated claim that requires explanation. The ordinance requires permits for removing more than 20 trees per year. At that rate the removal of 15,000 trees would take 750 years. Has a permit been obtained, as required by this ordinance, to remove more than 20 trees per year? The reader deserves some explanation for how the requirements of this ordinance have been satisfied, IF they have been satisfied.

**D. Conflict with the General Plan**

*"Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance? No Impact" (IS, page 87)*

Tree removals designated in SNRAMP are in conflict with Policy 2.9 of the General Plan to "maintain and expand the urban forest." As we have noted earlier, 18,500 trees will be removed in the natural areas. Most will not be replaced. Most are presumed to be healthy, mature trees. In addition, countless trees less than 15 feet tall will also be destroyed to prevent the regeneration of the urban forest. The EIR must acknowledge this conflict.

## E.13. Geology and Soils

**Potential for further erosion problems requires further study**

*"The overall scale of the proposed project is relatively small, and while these activities may result in some increased erosion and loss of topsoil in the Natural Areas, these impacts are generally considered less than significant...This topic will not be discussed in the Environmental Impact Review." (IS page 112)*

Once again, the Initial Study dismisses a serious, controversial issue with a cavalier wave of its invisible hand. The removal of non-native plants has caused erosion in many natural areas, and the increased removal of non-native trees and vegetation prescribed by SNRAMP is likely to exacerbate the situation.

Many of the natural areas are on sandy hills that are surrounded by residential housing. As these residential neighborhoods were developed, the sand was stabilized with non-native vegetation, such as ice plant. When the Natural Areas Program began removing the ice plant from these sandy hills, the destabilized sand inundated the surrounding neighborhoods.

On July 26, 2006, Jeff Eng, President of the Golden Gate Heights Neighborhood Association testified to the Recreation and Park Commission regarding the adoption of SNRAMP (Attachment B). One of the concerns he expressed on behalf of his association was, "That the NAP continue to protect the remnants of native vegetation without damaging surrounding private properties, for example, causing erosion and resulting blowing sand."

NAP has repeatedly denied that the removal of ice plant has destabilized sand in Golden Gate Heights. I have heard them claim in public hearings that ice plant is actually less capable of stabilizing sand than the plants that are native to the sand dunes. However, the reality of the experience of the neighbors of natural areas in Golden Gate Heights contradicts this claim. An adequate Initial Study would evaluate this concern and respond to it in a meaningful way, rather than merely wave it away, as it attempts to do.

There are also several natural areas that have experienced serious erosion in the past, although I will focus only on Lake Merced in my comments. During a heavy rain year (2004), the eastern and southern shores of the Impound Lake (one of the lakes of Lake Merced) collapsed, undermining paved trails and roads. This is just one of several areas on the shore of all four lakes of which Lake Merced is composed that have collapsed into the lake in the past.

*East shore of Impound Lake at Lake Merced*

The planned removal of all trees on the steep, sandy eastern shore of South Lake has the potential to precipitate a massive collapse of that shore. The trees on that shore now help to stabilize the shore. The roots of trees are responsible for holding soil in place, particularly on steep slopes. As the roots decay slowly over time, their ability to hold the soil in place slowly declines. Certified Arborist, Ray Moritz, explained the process in the context of a question about the clear-cutting of bay laurels on a steep slope: "If the stumps have been killed with an herbicide, the root matrix, and its contribution to soil cohesion will only persist for approximately five years, generally diminishing over that period. So, in that case, you have only a short time to get another soil binder established." (Ray Moritz, SF

Chronicle, 7/5/08) In a personal email communication he confirmed that the same considerations apply to eucalyptus.

Recall that the eastern shore of South Lake is the western boundary of the Harding golf course. The collapse of that shore has the potential to undermine the western side of the golf course.

The removal of 18,500 non-native trees from the natural areas has the potential to cause significant erosion in many natural areas. SNRAMP proposes the use of "wood mulch, fiber rolls, and silt fences to minimize erosion." These strategies have not been successful in preventing erosion in the past. An adequate Initial Study would either analyze this potential or recommend that it be included in the Environmental Impact Review. It does neither. The EIR must now study past erosion sites in the natural areas and evaluate the SNRAMP for its potential to cause further erosion in the future.

## E.14 Hydrology and Water Quality

**Potential for drainage problems requires further study**

*There are no activities included in the proposed project which would significantly alter the existing drainage pattern of the sites, or substantially increase runoff such that flooding occurs." (IS page 122)*

It seems very unlikely that 15,000 trees can be removed from a steep canyon wall in Sharp Park without "significantly altering the existing drainage pattern." Water and sediment will drain down from this canyon into the water features on the western side of Sharp Park, where endangered species make their home.

The eucalyptus tree is notorious for its ability to absorb water. It was used early in the development of Australian agriculture to drain swamps and wetlands. Ray Moritz, Certified Arborist, says of the eucalyptus and the role it plays in erosion and drainage, "Trees, particularly Eucalyptus trees, reduce erosion in several ways. Eucalypts not only help hold the soil in place with their roots, sheltering canopies and deep ground litter, they are tremendous water pumpers. So much so that they were used throughout the world to dry out wet areas for malaria control, and got one of their mid-1800's nicknames, "the fever tree." [If Eucalypts are removed] the replacement plants [must be] well-established within five years." (private communication)

The removal of 18,500 non-native trees from the natural areas has the potential to significantly change drainage patterns in many natural areas because many are steep hills and canyons. An adequate Initial Study would either analyze this potential or recommend that it be included in the Environmental Impact Review. It does neither. The EIR must evaluate the impact of tree removals on existing drainage patterns in ALL natural areas. .

## E.15 Hazards and Hazardous Materials

*"Management of the Natural Areas would include removing trees, including those that are diseased and dying, thereby reducing easily combustible fuel loads. Also implementing recommendation GR-13a should reduce the presence of vegetation with high fire hazard ratings, such as dense and aging French broom and eucalyptus." (IS, page 129)*

As previously noted in this comment, the 18,500 trees that have been designated for removal are not necessarily "diseased and dying." They have been selected for removal insofar as they enhance and expand native plant populations.

Secondly, the restored landscape of native grassland and dune scrub is not less flammable than the non-native that will be removed. Here are comparison data from the Hills Emergency Forum, which is a group of East Bay agencies and organizations such as UC, EBRPD, and EBMUD.

Flame lengths: the distance from the average flame tip to the middle of the burning zone at the base of the fire.

| Type of Vegetation | Flame Length |
|---|---|
| Grassland | 12 to 38 feet |
| Brush and Scrub | 14 to 69 feet |
| Hardwoods forest (e.g., Oak) | 1 to 34 feet |
| Monterey pine forest | 2 to 7 feet |
| Eucalyptus forest | 6 to 21 feet |

Whether a plant or tree is native or non-native has nothing to do with how easily it ignites or how readily it will be burn. Here are a few quotes from experts about the flammability of grasslands and scrub:

> "The more critical concern for this vegetation type [grassland] is the rate at which grassland fires can spread and the ease of ignition. This is one of the most dangerous types of fires for fire fighter safety due to its rapid frontal speed." (Management Recommendations of Hills Emergency Forum)
>
> "Shrublands with their enhanced fuel loads produce more intense fires that are more difficult to suppress and result in somewhat larger fires." ("Fire History of the San Francisco East Bay Region and Implications for Landscape Patterns" (John E. Keeley, USGS)

It is a popular myth that eucalyptus is more flammable than other trees and native landscapes. Here are a few quotes from experts about that myth:

> "...many trees are highly fireproof, like redwoods and eucalypts..." (The Tree: A Natural History of What Trees Are, Colin Trudge)
>
> "Fire fuels (those with a diameter of ¼ inch or less) and not tree trunks are what contribute to the intensity of wildfire...the university [UC] has not reduced but compounded its wildfire danger problem in the UC hill area by replacing groves of eucalyptus trees with grassland." (Evaluation of Fire Management Plan for UC hill area by Alexander Kerr)

SNRAMP also acknowledges the important role that fire plays in the native landscape: "...fires may help native species germinate..." (SNRAMP, page 5-4). For this reason (and also to help control non-native vegetation) SNRAMP includes fires as a possible management action in Recommendation GR-3b (page 5-4).

The Initial Study announces the intention to use prescribed fires to manage the natural areas: "SNRAMP no longer is proposing prescribed burning would not occur. The SNRAMP will be updated to reflect this change." (IS, page 11) However, the Initial Study has not considered the potential hazard of employing fire as a management tool: "Should the SFRPD determine prescribed burning to be a desirable, feasible method for managing native grasslands, a separate environmental review would be required to comply with CEQA..." In other words, this Initial Study does not include the potential environmental impacts of prescribed burns.

Restoration efforts on San Bruno Mountain provide a test case for the use of prescribed burns to support restoration efforts. San Bruno Mountain has been undergoing extensive restoration efforts for many years. The focus of those efforts has been to increase the population of the Mission Blue Butterfly. As noted earlier in this comment, the San Francisco Natural Areas Program is reintroducing the Mission Blue to Twin Peaks. In 2003, a prescribed burn on San Bruno Mountain raged out of control, nearly destroying the adjacent residential neighborhoods:

> "The fire was lit Tuesday morning by the California Department of Forestry to burn off dry vegetation and restore natural habitat in San Bruno Mountain State Park...The blaze, fed by 25 mph afternoon winds, spread rapidly out of control, jumping across Guadalupe Canyon Parkway and moving southeast toward a couple of hundred homes along the mountain's eastern approach. At one point, it crossed a steep ravine and threatened the Mission Blue Drive neighborhood, where firefighters stopped the flames just spitting distance from some homes and condominiums under construction...state firefighters called for mutual aid and received dozens of reinforcements from fire departments, including Daly City, San Bruno, Brisbane, Burlingame and South San Francisco...The fire was supposed to be contained within three to five acres in the Wax Myrtle Ravine area, but it spread to about 50 acres before it was contained...said CDF Capt. Claire Frank." (San Francisco Chronicle, July 9, 2003)

In other words, the track record for the use of prescribed burns to support restoration efforts indicates that they can burn out of control. Therefore, fire hazards and the use of prescribed burns must be analyzed by this EIR. It cannot be delayed to a later date because it is inextricably related to other issues, such as air pollution and increased carbon release, contribution to global warming.

**In Conclusion**

The Initial Study has failed to meet the most minimal standards of CEQA. All environmental issues should be included in the Environmental Impact Review, including those not identified by the Initial Study.

There are many important environmental issues that are not mentioned in the Initial Study that must be acknowledged and analyzed:

- The increased use of herbicides required to prevent resprouting of vegetation and trees that are removed and the potential impact of that use on wildlife
- The prohibition against bicycles on unpaved trails in the natural areas
- The intention to close the golf course at Sharp Park to benefit endangered species and the potential for similar closures in other natural areas in San Francisco
- The fact that scientists have recently determined that the ranges of native plants have moved and will continue to move in response to climate change. The Environmental Impact Review must answer these questions to the public's satisfaction: "Is it still possible to sustain in San Francisco the same plants that were native to this area over 200 years ago?" and "Have the changes in air, soil and other conditions in San Francisco changed to the extent that they no longer support the plants that were native to this area over 200 years ago?"
- The EIR must acknowledge the existence of Sudden Oak Death and assess its potential to kill native trees in the natural areas.
- The EIR must acknowledge plans for prescribed burns and evaluate their impact on carbon release, air pollution, and fire hazards.

Special Hearing on Management Plan for Natural Areas Program

Recreation and Park CommissionWednesday, July 26, 2006

8:30 am

Room 416, City Hall

The Recreation and Park Commission will decide on Wednesday, July 26, whether to accept the Management Plan drafted by the Natural Areas Program (NAP). NAP originated out of concerns about protecting remnants of plants and wildlife that were native to the San Francisco peninsula and whose numbers were dwindling. The program, however, expanded to take as a main mission the re-creation of what San Francisco looked like before "white men" came and altered the landscape by planting non-native plants. In our neighborhood, the San Francisco that existed several hundred years ago was a windy, largely treeless areas with dunes of drifting sand, with areas of "dune scrub."

NAP claims nearly one-third of all city-managed parklands as "natural areas," although the tern "native areas" is really more accurate. NAP park areas are currently quite "natural," filled with plants and trees, most of which are not native to the San Francisco peninsula. NAP wants to remove many non-native trees and plants (and animals) from these areas, and replace them with dune scrub vegetation (in our neighborhood).

NAP has claimed all of Grandview Park, the Rock Outcrop (14th and Ortega), and Hawk Hill (hillside above Hoover Middle School). They have claimed an area along the western end of Golden Gate Heights Park (above 14th Ave). The Management Plan calls for areas of "scattered, open sand" in all four parks within or adjacent to the Golden Gate Heights neighborhood. NAP plans to remove all iceplant and other non-natives that had been planted on the steep slopes of these parks to stabilize the sand and keep it from drifting and blowing. Even with the iceplant, drifting sand frequently blocks 14th Ave near the Rock Outcrop, clogs sewers, and impacts neighboring property. Property owners adjacent to these parks have told us of hard-fought battles over the years to find the right mix of plants to keep the sand in place, and of their concerns that NAP plans to remove those non-native plants could destabilize the hills, with the potential for damage to their property.

The Management Plan also calls for the removal of 3,400 healthy, non-native trees in San Francisco city parks (and an additional 15,000 trees in Sharp Park in Pacifica). The total number of trees slated for destruction is actually higher because the Management Plan defines a tree as being over 15 feet tall, and therefore doesn't include any young trees that will be removed. These trees were planted, in many cases, to provide needed windbreaks and help stabilize areas, and their loss will increase erosion and wind problems in the parks and in the surrounding neighborhoods.

The Golden Gate Heights Neighborhood Association has asked the Recreation and Park Commission to revise the NAP Management Plan to better reflect the needs of San Francisco neighborhoods. Note that the GGNHA is not calling for the end of the NAP program. We just want changes to accommodate the following concerns:

1) That the NAP continue to protect the remnants of native vegetation without damaging surrounding private properties, for example, causing erosion and the resulting blowing sand, and

2) That the proposed plans for the natural areas in San Francisco be revised so that the urban forest is maintained and increased and is not sacrificed to facilitate the introduction of native plants, and

3) That the Recreation and Park Department be responsible for developing the natural areas in a manner that is consistent with the health and safety, as well as the recreational and aesthetic preferences, of the citizens of San Francisco, and

4) That the cost of implementing a management plan for the natural areas not be at the expense of other responsibilities of the Recreation and Park Department to provide recreational programs and clean, well-maintained facilities and parks for the people of San Francisco.

GGHNA encourages all of its members to let the Recreation and Park Commission know what you think about the Management Plan for the Natural Areas Program (to see the plan, go to: http://www.parks.sfgov.org/site/recpark_index.asp?id=1896 ).

If possible, try to attend the Wednesday meeting and tell them of your concerns about the program's impact on our neighborhood.

Or write the Commission at:

Rec and Park Commisssion President **Gloria Bonilla** at: gloria.bonilla@sfgov.org
Commission Vice-President **Lawrence Martin** at: lawrence.martin@sfgov.org

RE: Notice of Preparation of an Environmental Impact Report
Natural Areas Management Plan, Case # 2005.1912E

The project that is the subject of this Initial study is not in compliance with the approved resolutions from the Recreation and Park Commission (Commission).

1. The following resolutions have not been recognized or implemented in the Natural Areas Management Plan:

**At the Special Meeting of the Recreation and Park Commission held on July 26 and continued on August 21, 2006, the Commission unanimously voted to approve Resolution Number 0608-012 as follows:**

***RESOLVED, That this Commission does approve the Natural Resources Management Plan as amended as the proposed project to be considered under the California Environmental Quality Act (CEQA).***

**Prior to the vote on Resolution Number 0608-012 two amendments were passed by the Commission to the Natural Resources Management Plan. Those amendments were:**

- ***The MA3 areas shall be maintained by parks and squares and urban forestry Departments and may be reforested with native or non-native species. Weed and brush removal and erosion control in MA3 areas shall be undertaken in accordance with the Natural Areas Plan.***

- ***That where appropriate in the plan that feral cat relocation shall be implemented only upon a determination by the Commission that other methods of population reduction failed to adequately reduce cat populations in natural areas.***

**The Commission also voted unanimously to approve Resolution Number 0608-013 as follows:**

***RESOLVED, That this Commission does approve the Request for Proposals for consultant services to perform the necessary environmental analyses pursuant to the***

***California Environmental Quality Act on the Final Draft Significant Natural Resources Areas Management Plan as amended by Resolution Number 0608-012.***

The staff have not done due diligence to determine that the project, submitted for environmental review, was the project approved by the Commission that includes the amendments as noted above. This violates the CEQA requirement for the project to comply with the San Francisco City Charter. Sections 4.102 and 4.113, of the Charter authorize the Recreation and Park Commission to approve plans and set policies for the Recreation and Park Department.

In your cover letter, you referred to the Commission's approval in 1995 of the original management plan, but you do not mention the Commission action that brought this project to the attention of your department for CEQA review. All resolutions by the Commission referable to this project should be cited, complied with, and included as reference documents.

The amended project requires changes in the draft Management Plan of 2006 that have not been made or evaluated by the consultants, since the amendments were never acknowledged. Before the scoping for the EIR is completed, the Management Plan itself must be amended according the Commission's resolution.

The following issues must be acknowledged in the revised Management Plan and any environmental impacts evaluated in the EIR:

- that the MA 1, MA 2, and MA 3 zones are an integral part of the project
- that the maintenance of the MA 3 zone, 43% of the natural areas, is not the responsibility of the Natural Areas Program
- that GR 15 governs the activities in the MA- 3 zone
- that GR-7 referencing feral cat control must now include the Commission's amendment.

2. The following resolution has not been referenced in the Initial Study.

**At the Regular Meeting of the Recreation and Park Commission on October 4, 2007, the Commission unanimously voted to approve Resolution Number 0710-011**

***RESOLVED, That this Commission: 1) accepts the recommendation of staff and the general manager and does approve the award of a professional contract in the amount of $800,000 to Tetra Tech for the environmental analysis in support of the Draft Significant Natural Resource Areas Management Plan and to satisfy the requirements of CEQA guidelines, NEPA, and City, State and Federal regulations and 2) requests the a full EIR be conducted for the Natural Areas Plan and all 31 Natural Areas sites be analyzed.***

From reading the Initial Study, it is not clear to me that "all 31 natural areas sites" were analyzed as specified. There has been no quantification of the environmental effects to be experienced at each of the 31 natural areas sites as a result of the implementation of the

Management Plan. There is no evaluation of the cumulative effects on each natural area site of the proposed project. I believe it is incumbent on the Planning Department to ensure the Commission's request is complied with.

3. The Initial Study failed to discuss, in Sections C.1 and C.2 of the report, the CEQA requirement concerning "approvals and permits from City departments other than the Planning Dept..." . Specifically, the Administrative Code CHAPTER 63: LIMITATIONS ON WATER USE FOR LANDSCAPING IN NEW DEVELOPMENTS AND LANDSCAPING RENOVATIONS was not acknowledged or discussed.

Chapter 63 requires a report, plan and approval from the SFPUC for "landscaping renovation" defined as "renovations of landscaping larger than 1,000 square feet involving the installation of a new irrigation water meter to serve landscaping that has not been served by the San Francisco Water Department in the previous five years." Page 94 of the Initial Study states "Reintroducing native species and replacing trees would require irrigation until they become established." The authors claim the irrigation needs would be met by existing water supply capacity, but do not state what that capacity amount is, or quantify the amount of water needed for implementing the Management Plan, or the define the square footage of land to be irrigated. They also seem unaware that SFPUC in now required by law to charge city departments for water that once was free, which requires meters in the parks, which requires permission from the SFPUC to install the new meters.

4. The Initial Study failed to acknowledge that the Recreation and Park Commission, so far, has only approved of the project with amendments to have an environmental review under CEQA. The Commission did not give its approval of the project to be implemented as presented in the Natural Areas Management Plan. It has reserved this decision until after the completion of the CEQA review, at which time the Commission will decide if there will be further amendments to the project and what, if any, mitigations it requires to be done. This final authority must be acknowledged.

In conclusion, the Initial Study failed to include the rulings of the Recreation and Park Commission to amend the project and to direct the analysis of all 31 natural areas, and it does not recognize the Commission's authority to render the final approval of the project. The project description must be modified to reflect the authorized amendments. Compliance with Chapter 63 must be discussed. The oversights enumerated above must be corrected, and the scope of the Environmental Impact Report sufficient to address these issues.

Re: Natural Areas Management Plan EIR
Pacifica Scoping Meeting for Sharp Park Golf Course
Case No. 2005.1912 E

Dear Mr. Wycko:

The Sierra Club's Loma Prieta Chapter encompasses the Counties of San Benito, Santa Clara and San Mateo - and the Chapter's Coastal Issues Committee has particular focus on issues involving the Coastal Zone as defined in the California Coastal Act. The Sharp Park Golf Course is situated within the City of Pacifica within San Mateo County and, additionally, within Pacifica's Coastal Zone Local Coastal Program, certified by the California Coastal Commission. The Coastal Issues Committee supports San Francisco Planning Department's recognition of Pacifica in its role as the permitting authority for any work requiring a Coastal Development Permit at Sharp Park, and that that be duly considered as part of the EIR process.

Previously, the Loma Prieta Executive Committee passed a resolution that states in pertinent part:

"THEREFORE LET IT BE RESOLVED that the Sierra Club urges the City and County of San Francisco and the San Francisco Recreation and Parks Department to fully consider habitat protection and enhancement measures within Sharp Park Golf Course that could increase and stabilize California Red-legged Frog and San Francisco Garter Snake populations."

Given the extraordinary jurisdictional issues attendant to Sharp Park, we support this particular public recreation property being evaluated by the City of San Francisco in an entirely separate manner, and not in the aggregate of the City's other golf courses and public lands that lie within San Francisco's borders and land use authority. We look forward to reviewing the completed Draft EIR analysis after the input of all of the other oversight agencies is gathered.

Thank you for providing this opportunity for comment.

Sincerely,

Merrill Bobele

**Re: Expand the scope of the EIR on the Natural Areas Management Plan**

Dear Mr. Wycko,

Please expand the scope of the EIR to include a proper scientific study of virtues of Eucalyptus forest as described in today SF Chronicle, by Mr. Peter Ehrlich, the foremost knowledgeable expert on Eucalyptus.

**"Peter Ehrlich**, the head of forestry for the Presidio Trust, which manages the interior 80 percent of the park for the Golden Gate National Recreation Area. Mr. Ehrlich came to the Presidio in 2000 after serving as the forester for Golden Gate Park.

*"Without **eucalyptus** I don't think they could have stopped the winds or the moving sands in the Presidio," Ehrlich said. "The sea foam green canopies seen as one approaches the Presidio from Marin County are a significant part of the cultural landscape of San Francisco."*

*Blue gum eucalyptus trees were unique in that they would actually grow in the sandy soil and withstand the fierce winds blowing off the Pacific. They were used to establish Golden Gate Park, and in 1886, the Army began planting them on the ridges of the Presidio.*

Eucalyptus trees also are very effective wind breaks, Ehrlich said. Studies have shown that they slow the wind down at least 30 percent in the Presidio.

**Presidio branches out with eucalyptus swap**

Subject Please include off-road cycling in the NAP Recreational Trail EIR

Attention SFRPD, NAP, SF Planning Dept. and other parties involved in the Recreational Trails process:

I am a cyclist and member of SFBC and SF Urban Riders. I would like to urge you to include off-road bicycling in the scope of the Natural Areas Plan EIR. There are already lots of recreational cyclists riding in our parks and many more who would welcome the opportunity to ride on officially sanctioned trails. It is safer and more pleasurable to ride on trails in a natural setting, than on the streets where cars are an ever present danger.

I would like to see through-trails in the parks to allow cyclists to transit the city off-street as much as possible. Systems of loop riding trails should be implemented in some of the larger parks. Also, I would like to see at least one bicycle skills park built in the city. This would be an area of concentrated technical features analogous to a skateboard park, but made of wood, earth and rock. These things could be built cheaply and sustainably, largely with volunteer effort.

SF Urban Riders is a cyclist group working to promote off-road cycling venues within San Francisco. We are here to represent the interests of off-road cyclists, provide input to the city, volunteer labor, provide technical support, whatever it takes to get legitimate places to ride in the city.

Sincerely,

Tom Borden

**Re: Scoping comments on Natural Areas Management Plan**

These are the comments of the Center for Biological Diversity on the Significant Natural Resource Areas Management Plan regarding lands managed as "natural areas" by the San Francisco Recreation and Park Department - specifically those lands at Sharp Park in Pacifica.

The environmental review for the management of the natural areas must include an alternative that provides full ecological restoration of Sharp Park. The City of San Francisco should select full ecological restoration of Sharp Park as the preferred alternative for the management plan, to comply with the Endangered Species Act, manage Sharp Park consistently with the goals of the Natural Areas Program, provide suitable habitat for listed species at the site, and avoid legal liability to San Francisco for illegal "take" of listed species.

The full ecological restoration alternative should:

Eliminate the golf course holes at Sharp Park that are incompatible with maximizing suitable habitat for listed and sensitive species at Sharp Park, specifically the San Francisco garter snake, California red-legged frog, western pond turtle, San Francisco forktail damselfly, and salt marsh common yellowthroat;

eliminate all lawn mowing activities that have the potential to cause take of the San Francisco garter snake or the California red-legged frog, or to adversely modify habitat for these species;

restrict the use of all pesticides, including fungicides, herbicides, and rodenticides, known or suspected to adversely affect the California red-legged frog or the San Francisco garter snake, and include adequate buffer areas to prevent runoff of these pesticides into all aquatic habitats;

Jeff Miller, Conservation Advocate • 351 California St., Suite 600 • San Francisco, CA 94104
Phone: 415-436-9682 x303 • Fax: 415-436-9683 • jmiller@biologicaldiversity.org

cease all use of inorganic fertilizers, and implement a nitrogen and phosphorous monitoring program to discover the extent of nitrogen and phosphorous pollution in Sharp Park water bodies;

cease existing animal burrow management policies and allow development of gopher holes and other burrows within suitable habitat as refugia for the California red-legged frog and San Francisco garter snake;

restrict or cease all water pumping at Horse Stable Pond, at a minimum ceasing all pumping activities between September 1 through May 31, and screening the pump adequately to prevent entrainment of any and all life stages of California red-legged frogs and other wildlife;

create basking and hibernating/estivating habitat for the snake, frog and western pond turtle within Laguna Salada, Horse Stable Pond, and Arrowhead Lake;

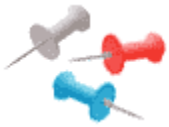
control invasive species in Laguna Salada, Horse Stable Pond, and Arrowhead Lake such as invasive fish and bullfrogs, using non-toxic control methods;

install unobtrusive fencing along the length of the sea wall, on its eastern slope, to keep recreational users from entering protected areas;

post interpretive signs around Sharp Park regarding the important habitat areas at Sharp Park and the importance of the San Francisco garter snake and the California red-legged frog; and

remove invasive exotic plants and lawn and replant the park and Sanchez Creek with appropriate native species.

The priority for management of Sharp Park should be to restore the park to its natural state as a coastal wetland, and provide more diverse recreational opportunities for the public at the site. The full ecological restoration alternative should prioritize endangered species protection and recovery, natural flood control, outdoor recreation, and sustainable land use.



Sincerely,

Jeff Miller

Subject Fw: Mountain Bicycle Recreation to be considered in NAP EIR

----- Forwarded by Bill Wycko/CTYPLN/SFGOV on 05/27/2009 09:33 AM -----

**Dayton Crites <dayton@sfurbanriders.org>**
Sent by: daytoncrites@gmail.com

05/26/2009 11:24 PM

To
cc
Subject Mountain Bicycle Recreation to be considered in NAP EIR

To those it may concern,

My name is Dayton Crites, and I am one of many San Francisco citizens who values and treasures our open spaces, and does so by recreating through them on a mountain bike. I urge you to add consideration of multi-use trails and bicycle skills areas to the Natural Areas Program Environmental Impact Review.

I volunteer my time as a board member of SF Urban Riders, and as such, work with SF Urban Riders to create healthy off road cycling opportunities for all San Francisco residents. Please do not ignore this significant segment of the park users and stewards by excluding multi use trails and bicycle skills areas from the scope of the NAP EIR.

Off Road cycling is a fast-growing, healthy, and environmentally friendly recreational activity that appeals to a wide demographic. Not to mention the fiscal sense in building trails to enhance the value of our natural areas. Square foot by square foot, trails are perhaps the least expensive land value improvement that can be made due to minimal materials and maintenance costs.

There exist many federal funding sources that favor the inclusion of bicycle trails within natural areas. As a non-profit 501-c3, SF Urban Riders seeks to partner with SFRPD through identifying and procuring funding, as well as mobilizing a volunteer workforce to assist in the construction of trail systems and or bicycle parks.

To gain a sense of our vision for San Francisco's park lands, and why multi-use trails and bicycle parks offer such a wise investment for the City, please visit our website and download our proposal. Pardon the spelling error in the html link. I assure you the spelling is better in the proposal.

Subject NAP environmental impact

Dear Ms. Range,

I just heard about the Natural Areas Program's plan to remove the current vegetation, especially Himalayan blackberry, from large areas of our city parks. As a wildlife rehabilitator and a native plant restoration volunteer, I would like to know more about this project. I understand that the proposal will be heard by the Rec and Park planning commission only. I have serious reservations about the impact that this project will have, both on the resident animals, especially mammals, and on the budget. It seems that in tough financial times Rec and Park's priorities should be on more immediate things than tearing up large swaths of animal habitat. I am very much a proponent of native plant restoration and volunteer weekly with GGNRA, but this project is misplaced and seems on a hasty path to approval. As a taxpayer I'd like to see my money spent for higher priority projects that take into account the many many animals that live in our parks. The non-native blackberry bushes are great habitat for many animals and provide food as well. We should carefully consider any changes that we make to plants that are so valuable to the animals that actually live in our city parks. We should also consdier whether the money spent on a project like this could be better spent on pressing human needs. I urge you to not approve this project. I would also like to be informed of its progress.

Sincerely,
Annemarie A. Donjacour

CITY & COUNTY OF S.F.
PLANNING DEPARTMENT
M E A

Name: Evan Elias

Organization (if any): neighbor and volunteer for SPCA

Address: 575 Belvedere St, SF, CA 94117

E-mail Address: eeliasmail@yahoo.com

Thank you for this opportunity to make comments on the scope of the EIR for the Natural Areas Management Plan.

I am a neighbor of the Interior Green Belt and Corona Heights Park. I volunteer with the SFSPCA to manage a Trap-Neuter-and Return feral cat colony in the area. I have spent four hours a week in the Interior Green Belt (IGB) for the past three years. During this nearly six hundred hours of being in and observing the forest there, I have learned a lot about the area and its fauna.

The initial study states that "...no important bird habitat has been designated." in the IGB. This is completely inaccurate. I have observed yellow warblers, Steller's Jays, bushtits, song sparrows, owls and Red-tailed Hawks. The yellow warbler is listed in the initial plan as a "species of concern" under CA state status. (Table 2, p.100.) Steller's

Jays and Red-tailed Hawks are listed as "species of local concern." (Table 3-5, p 3-34, p 3-33.)

I have also heard bird songs that I cannot identify, so there are potentially more sensitive bird species that live in or utilize the IGB. This is a biodiverse bird habitat that would be signifigantly negatively impacted by the removal of eucalyptus trees and brush.

The initial study also suggests removing fifteen Monterey Pines from the nearby Corona Heights Park. This park has a lot of Red-tailed Hawk activity. As previously mentioned, the Hawk is listed as a "species of local concern" in the initial study document. (Table 3-5, p 3-33.) Three Monterey Pines and a fourth large tree were recently removed near this area, two of the Pines because of disease. This loss of small bird habitat immediately led to a decrease in hawk activity. When their food source and perching

areas are removed, the hawks leave. Removing fifteen healthy trees in a known hawk area will significantly impact this species. These trees should not be removed.

The IGB has also been identified in the initial study as having "... no site specific wildlife related areas...." This area is home to skunks, raccoons, opossums and feral cats. The himalayan blackberry provides nesting area and protection for these local mammals. Where are they to go when their homes are destroyed?

The Natural Areas Resource group has singled out feral cats as a problem in local park areas. During my hours of observing, I have seen that the feral cats do not pose a threat to the local wildlife. The cats behave as part of the eco-system, not as top predators. The cats are cautious and on-guard in this environment, and their territory is small. The birds and mammals do not fear

them, and the cats do not exhibit hunting behaviors. Strange, but true.

I support habitat restoration and the protection of native species. But this forest is already home to many species that deserve the right to continue their existence.

In terms of Cumulative Impacts, UCSF is present applying for a FEMA grant to clear twenty three percent of the forest on Mt. Sutro and the IGB, and replant with natives. If the UCSF/FEMA plan and this Natural Areas plan both go forward, Mt. Sutro is slated to lose thirty percent of its present forest. This would be devastating in terms of lost bird and animal habitat. I strongly urge the EIR to take this other project into account when determining this plan's impact.

We are so lucky in San Francisco to have these open spaces in our midst. We need to manage them with care, taking into account all

the species that live in and depend on them. In our zeal to support and enhance some, it is important not to displace and discard others as if they are trash. All of our wildlife is valuable, and needs to be treated with respect.

Re: Case No. 2005.1912E: Natural Areas Management Plan

Dear Mr Wycko:

The Golden Gate Audubon Society (GGAS) supports the Natural Areas Management Plan and we are pleased that an Environmental Impact Report (EIR) is being prepared for it. There are several matters of concern we wish to express, and we think that the scope of the EIR should be broadened to cover geology and soils.

Our greatest concern is not with the EIR, but with the plan itself. There is an error of fact, repeated several times, that the bird nesting season in San Francisco and Pacific begins on April 1. That is incorrect. The nesting season for most local bird species is from about February 15 through July 15. In fact Great Blue Herons, owls and hummingbirds may begin nesting in January. Most birds that nest in woodlands, scrub and marshes are on territory by early to mid March and have eggs by April 1. Should vegetation removal take place between mid February and the end of March there will be serious negative impacts to many nesting species. If the plan cannot be changed, this error must be addressed through the EIR process. A reasonable practice that would ensure the safety of almost all nesting birds would be to follow the practices outlined in the plan from February 15 to July 15. Areas that are scheduled for vegetation removal between January 1 and February 15, or July 15 and September 1, should be surveyed for bird nests and nesting activity. If nests are found the project should be modified to ensure that nesting birds are not disturbed.

A4.4 Best Management Practices, Erosion Control: Wood chips may be appropriate in some locations but the use of this erosion control method should be evaluated so that it does not negatively impact wildlife including birds and bees. This should include consideration of birds that require dirt areas for dust baths.

GR-6b and c: These sections suggest using nest boxes for cavity nesting birds and in particular Wood Ducks. This idea may be more appropriate in our "naturalistic parks". Cavity nesting birds were probably fewer prior to the introduction of large trees in San Francisco. Nest boxes may replace cavity nests in such woodlands, but they would be alien in other natural areas. The issue of introducing non-native species into the City is another matter. There are no historic nesting records for Wood Duck in San Francisco County except for one report from the San Francisco Zoo that may have involved a wild Wood Duck with one from the zoo collection. Use

GOLDEN GATE AUDUBON SOCIETY
2530 San Pablo Avenue, Suite G Berkeley, California 94702
*phone* 510.843.2222 *fax* 510.843.5351 *web* www.goldengateaudubon.org

of nest boxes to enhance nesting for non-native species is questionable and is not supported by GGAS. Use of nest boxes as part of the natural areas plan such as this should trigger consideration in an EIR.

GR-15c: This section suggests maintaining urban forest health by removing dead and dying trees that show signs of disease or insect infestation. This is inconsistent with GR-6a, which calls for leaving snags and dead branches on live trees unless they are hazardous. The EIR should address the issue of snags and standing dead trees and perhaps even suggest alternatives to guide this plan. GGAS has long advocated for a snag policy in San Francisco and we would certainly support developing one through this EIR process.

A 5.15 India Basin Shoreline Park: India Basin Shoreline also supports a huge number and variety of species of waterfowl from fall through spring.

A 5.18 Lake Merced: The project description mentions the Double-crested Cormorant colonies at Lake Merced, but fails to mention Great Blue Herons. Though not a listed species, the herons should be mentioned in this document. In the past Great Blue Herons have shared the three colony sites with cormorants. In 2009 herons nested only in the North Lake Colony and the Mesa Colony.

LM-6c: Permitting access to the shores of the East Lake during any time of year should trigger consideration in the EIR. Such access would increase erosion and if allowed in the time frame suggested of September 1 through March 31 would be likely to impact several nesting species, including the "San Francisco" Common Yellowthroat. This certainly requires consideration in the EIR.

PL-2: This section should be applicable to all Natural Area sites and include Great Horned Owl, Western Screech Owl and Barn Owl nests.

Table 2: Special Status Species…: This should not be limited to breeding birds but should include other species that depend on natural areas during some part of the year. Tri-colored Blackbird utilize Lake Merced during the fall and winter. Brown Pelicans and Peregrine Falcons utilize both Lake Merced and India Basin on an occasional basis. A thorough search of bird records for San Francisco County would identify other species of concern that use natural areas.

E.13 Geology and Soils

We are deeply troubled that impacts on geology and soils are not considered potentially significant. In and of themselves, we see little impact from the projects. It is impacts that result after the projects are in place that should trigger consideration in the EIR. A5.22 Pine Lake is a case in point. Erosion due particularly to off leash dogs and their owners is a significant impact that is resulting in destruction of restoration sites. An associated problem is soil and water contamination resulting from dog and feral cat waste. These are impacts that are likely at other restoration sites like Buena Vista Park, Lake Merced, McLaren Park, and other parks with sandy soils and steep terrain. These impacts need to be treated in the EIR and solutions should be considered. We urge that the EIR process be applied to Geology and Soils.

In the discussion of Lake Merced under Geology and Soils removal of trees on the lake's banks is cited as a potential cause of erosion. The EIR should also consider the impact of not removing single cypress and pines along steep banks that cannot sustain them. Trees such as these have historically fallen and have taken significant amounts of soil with them. There are no cases of trees that were removed causing erosion. This matter in itself should trigger inclusion in the EIR.

Finally, we suggest the EIR should include an updated, comprehensive biological inventory that identifies and describes all species of concern within San Francisco County, their distributions, and their population conditions. If this exceeds the scope of this plan, then a comprehensive biological inventory should be developed specifically for the Natural Areas covered by this EIR.

Thank you for the opportunity to comment on this matter. If you would like to discuss these matters please feel free to contact me at <murphsf@yahoo.com>.

Very truly yours,
Dan Murphy

RE: Significant Natural Resource Area Management Plan (SNRAMP), Environmental Impact Report, Case No. 2005.0912E

Dear Mr. Wycko:

I attended the May 12, 2009 public scoping meeting, and I want to make a brief written comment reflecting the spoken comment that I made at the meeting.

In asking you to look at issues in the Natural Areas Management Plan (NAP), I am particularly concerned with animal welfare issues.

I live next to Golden Gate Park and near the Stanyan and Belgrave Streets entrance to the Interior Green Belt. I have worked on San Francisco SPCA (SF/SPCA) projects in those areas over the years and am very familiar with the areas.

*First*, while I support restoration efforts, I do not want to lose our forests and I am especially concerned about losing protective habitat for wildlife such as raccoons, skunks, possums, etc. For example, Himalayan blackberry offers protective animal habitat. Extensive clearing of underbrush and blackberry removal must be studied in terms of potential negative impacts. Areas of its protection must be maintained (with regards to the CEQA requirement, E.12 Biological Resources, Topic d: no project shall "interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sights"). In this regard Jamie Ray, Director of the San Francisco Wildlife Rehabilitation Program, must be consulted. Ms. Ray is licensed by the California Department of Fish & Game (sfromp.org).

The initial study contains tables listing sensitive species, special status species and an appendix listing bird species found within the Natural Areas. A listing of all animals found within the Natural Areas must be added to these lists.

*Second*, In regard to feral cats, G.R.7 continues to be very flawed. It must either be removed or completely revised in cooperation with San Francisco Animal Care and Control and San Francisco SPCA.

As a longtime volunteer in the SF/SPCA Feral Cat Program, I have extensive knowledge and experience in observing and working with feral cats in San Francisco. There are very few cats in San Francisco's designated Natural Areas. This is because of the SF/SPCA's Feral Cat TNR (trap, neuter, return) Program. Feral cats should not be singled out as the primary predator or some kind of urgent threat. That is very misguided. From my experience in the field, I would say that they have little impact.

In NAP's discussion of feral cats, rather than focus on the reality in San Francisco, NAP has chosen to dwell on anti-cat and out of state studies. These studies tell us nothing about the feral cats in San Francisco. Alley Cat Allies (alleycat.org) should be consulted as a resource regarding feral cats.

All matters of policy concerning animals in San Francisco need to involve communication and working together with San Francisco Animal Care and Control and the SF/SPCA. NAP has given lip service to these agencies, but has really not shown good faith in working with them. This is not acceptable.

*Third*, Educational materials must not be about good and bad plants and animals. Respect for all plants and animals must be nourished and developed. Under G.R14, educational materials must have input from all stakeholders including San Francisco Animal Care & Control, the San Francisco SPCA, Recreation and Parks Department and local wildlife expert Ms. Jamie Ray, through the San Francisco public process. Educational materials must not be developed solely by the Recreation and Parks Department.

G.R.7b lists the Cats Indoors program from the American Bird Conservancy as a source of educational information about feral cats and states that the Cats Indoors program is approved by the San Francisco SPCA. *In fact it is NOT approved by the San Francisco SPCA* and is seen as extremely anti-cat and misinformed in its bias. That claim of approval must be removed.

Sincerely,

Martha Hoffman

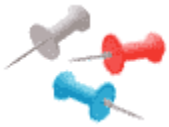
Subject: Comment Extension Request – Natural Areas Management Plan Initial Study



Dear Mr. Wycko:

This letter is in response to the Notice of Preparation of the Initial Study for the Natural Areas Management Plan. Due to staff shortage and vacations we were unable to gather comments regarding this plan by today's due date, May 26, 2009. We would like to request an extension of this due date to Friday, June 5, 2009 so that we may have more time to gather comments.

If you have questions or require additional information, please contact Steve Ortega, Environmental Protection Specialist, at (415) 561-2841.

Sincerely,

Nancy Hornor
Planning Division Chief

Subject Natural Areas Management Plan scoping comments

May 25, 2009

Bill Wycko
San Francisco Planning Department
Natural Areas Management Plan

Below are my scoping comments on the the City of San Francisco Planning Department's Natural Area Management Plan project EIR. I am a resident of Pacifica, a current City of Pacifica Planning Commissioner, and a former member of Pacifica's Open Space Committee and also a former member of the City of Pacifica's GGNRA Liaison Committee. I am submitting these comments solely on my personal behalf and my comments are focused on the Natural Area Management Plan involving Sharp Park.

I applaud the goals set forth in the Initial Study and the Natural Areas Program environmental review process.
I would like the City to review and select a full restoration alternative for Sharp Park. Also, the EIR must consider current information regarding sea-level rises and the impact on the western portion of Sharp Park.

The eastern canyon areas (east of Highway One)of Sharp Park contain especially well-preserved native habitat, important populations of special-status species, and other natural areas values. The eastern canyon areas of Sharp Park are susceptible to human impacts and should be off-limits to dogs. The EIR should not select any alternatives involving activities in Sharp Park that would increase recreation demands, including those involving increased vehicle traffic.

I fully support the Recommended Management Actions set forth in the Initial Study and would add restoration of all of Sanchez Creek as a goal. The Conservation and Restoration goals for all areas of Sharp Park in Pacifica should continue to be to maintain all viable populations of special-status species, improve habitat and natural areas connectivity, and prevent introduction of and decrease the amount of non-native invasive species.

Thank You,
Celeste Langille

Subject NAP EIR Scoping Comments

Jessica and others,

Thank you for involving the community of Pacifica to a be a part of the scoping process for teh upcoming DRAFT EIRs for San Francisco's Natural Areas.

Please pass this along to you contemporaries at SFRPD, NAP, SF Planning Dept., and any other interested parties involved in the Recreational Trails process.

SF Urban Riders is a Non-Profit 501c3 whose goal is to create healthy off road cycling recreation for all users, and encourage youth opportunities. We represent a growing number of recreational cyclists who are asking in unison to Please ADD multi use trails, off road bicycle trails, single track trails, and bike skills areas to the EIR scope of any projects in our larger parks and open spaces.

Off Road cycling is a growing contemporary activity that provides healthy recreation accessible at any level of entry, and appeals to a wide demographic. Trails are also the cheapest form of recreational improvement that can be made because they are sustainably designed, then constructed of natural materials by a large volunteer effort. There are many available federal funding sources that favor the inclusion of bicycle trails. SF Urban Riders would make a good partner with SFRPD on many levels and improve the overall quality of our parks.

Please refer to our Bicycle Trail Master Plan which was submitted to SFRPD in mid-April.

In closing, please add bike trails, single track trails and bike skills areas to the NAP EIR Scope.

Best regards,
--

Peter Brastow, Founding Director
Re: *Initial Study, Significant Natural Resource Areas Management Plan*

1. The SNRAMP EIR must include a **maximum possible ecological restoration** alternative for Recreation and Park's 31 Natural Areas, so that the public has the opportunity to understand the potential for a biodiverse urban ecological future, and how that future would affect people and our environment.

The maximum possible ecological restoration alternative would include the following, for example:

a. Eradication or thorough control of all invasive plants on the San Francisco Weed Management Area (SFMWA) priority weed list.
b. Removal of all isolated invasive tree and shrub stands (not including ones that are serving a specific wildlife habitat function from year to year) from within natural areas to optimize continuity of native wildlife and rare plant habitat.
c. Total enforcement of leash laws in our parks and natural areas, so that, in effect, dogs are ONLY off-leash in DPAs, many of which should be moved away from natural areas for this alternative.
d. Total integration of the Cats Indoors Program (http://www.goldengateaudubon.org/html/catsindoors/catsindoors_page_2.htm#Resources), so that feral cats are not allowed to harm birds and other wildlife and themselves.
e. No designation for MA1s, MA2s, MA3s. The natural landscape must be examined, planned, evaluated and managed as a whole for the benefit of San Francisco's natural heritage and biodiversity.

2. The management framework of MA1s, MA2s and MA3s presents some real problems; instead of explicitly addressing the ecological fragmentation of our natural heritage, this arrangement perpetuates it with a fragmented management approach for the natural areas. Regardless of the relative value of different pieces of our natural areas, they should be managed with coherence, continuity and consistency for wildlife, rare plants, and ecosystem processes. MA-3s should not be subject to "few restrictions on recreational use" nor the "prohibition on (re)introduction of sensitive species." The lines between the areas are fuzzy, and so they should be managed as a whole with the highest degree of conservation protection. Discard the MA1s, MA2s, MA3s approach. If this approach is ultimately applied to Tank Hill, for example, then the unique south-facing cliff habitat will always be considered an "MA3" with no opportunity for restoration of native plant and wildlife habitat.

3. The EIR should thoroughly evaluate the environmental impacts of leaving so many – 95% - of the invasive trees in the natural areas, according to the current plan.

4. The EIR should comprehensively evaluate the impacts of off-leash dog use on San Francisco Natural Areas and the fact that 90% of Dog Play Areas are in the natural areas, according to the current plan.

5. On Page 8 of the NOP, it states, "Trails would be created in previously inaccessible areas, as opposed to improving social trails."
In general, new areas should not be opened up for trail use. Hundreds of miles of social trails criss-cross the natural areas. These should be either improved, if appropriate or closed if appropriate, and the decisions should be based on a comprehensive approach to trail planning. Environmental impacts from trail building, restoration, and closure should be comprehensively evaluated.

6. The impact of the golf course on the natural areas and natural resources at Sharp Park should be thoroughly evaluated, particularly for the impact to the federally-listed endangered San Francisco garter snake and the federally-listed threatened Calfornia red legged frog. The preferred alternative should be the one that recovers the San Francisco garter snake to self-sustainability.

7. Geology and Soils should not be eliminated from the effects discussion in the EIR. We need to know the impact to our native geology and soils from:

a. Rampant commercial off leash dog walking.
b. Leaving eucalyptus and other tree species growing on steep cliffs, where they can contribute to severe bedrock erosion events.
c. Continued deposition of cypress and eucalyptus duff into the natural chert and other Franciscan soils.

Sincerely,

Peter Brastow, Founding Director

**INTEROFFICE MEMORANDUM**

**TO:** SAN FRANCISCO PLANNING DEPARTMENT

## INTRODUCTION

This memo provides scoping comments on the Significant Natural Resource Areas Management Plan, and the Laguna Salada Wetlands Enhancement Project at Sharp Park. It also provides comments on Pros Consulting, Inc.'s August 2008 report entitled San Francisco Recreational Opportunities Study Summary Report.

Sharp Park, located in Pacifica but owned and operated by the City and County of San Francisco, is arguably the most important natural area within the Recreation and Parks Department's jurisdiction. The status quo at Sharp Park is unsustainable: the golf course that occupies much of the property is losing money, killing two endangered species, and threatens the surrounding community every year when the golf course floods. These problems are only going to get worse as our climate warms and sea levels rise. Much of the comments I provide will address how to ensure that Sharp Park becomes a community-centered model for outdoor recreation, endangered species recovery, and natural flood control.

As a member of San Francisco's Golf Course Task Force, I was asked to provide comments on the Summary Report, and in particular, to comment on the assumptions made and analysis provided by the Summary Report. Moreover, because I was appointed to the Golf Course Task Force to represent San Francisco's environmental community, I have provided comments that address the environmental consequences of San Francisco's existing golf programs and services, as well as the likely consequences that would occur if any of the Summary Report's recommendations were implemented by San Francisco. See Exhibits AA, KK.

**COMMENTS ON THE LAGUNA SALADA WETLANDS ENHANCEMENT PROJECT, THE SIGNIFICANT NATURAL RESOURCE AREA MANAGEMENT PLAN, AND THE FINAL YOUNGER REPORT.**

The environmental review for the Significant Natural Resource Areas Management Plan includes an enormous amount of funding and work to implement site-specific measures at Sharp Park. These measures are designed to reduce the take and encourage the recovery of two protected species: the California red-legged frog and the San Francisco garter snake. To ensure that the San Francisco garter snake recovers, the City must analyze and select full restoration alternatives that redesign or eliminate the golf course at Sharp Park.

## A. SHARP PARK GOLF COURSE IS LOSING MONEY.

Sharp Park Golf Course costs the City and County of San Francisco hundreds of thousands of dollars a year in net losses to operate, losses that are not and cannot be recovered by the revenue generated by the golf course. The drain Sharp Park places on San Francisco resources robs our other municipal golf courses of needed maintenance; delays the golf fund's repayment of monies borrowed from the open space fund; and puts San Francisco's neighborhood parks and community centers at risk of closure.

These losses have been largely hidden to the public because of an incomplete accounting system: many of the expenses that the City spends to maintain Sharp Park Golf Course are not sourced from the Golf Fund, and therefore are not directly counted against the golf operations. For example, this Fiscal Year San Francisco spent approximately $240,000 from the Capital Fund to fix Sharp Park Golf Course's endangered species-killing pump house. See Exhibit C. San Francisco also spent $24,000 to hire monitors from the Natural Areas Program to reduce the number of endangered species killed by the golf course's operations this fiscal year, see Exhibit D, and even the environmental review process for the Laguna Salada Wetlands Enhancement Project—which is a prerequisite for the golf course to obtain permits to kill the endangered species found at Sharp Park—costs San Francisco taxpayers over $412,000. See Exhibit E.

But even within the Golf Fund, Sharp Park loses a staggering amount of money each year, money that could be used to provide recreational services where San Franciscan's actually live. For example, between Fiscal Year 04-05 and Fiscal Year 07-08, Sharp Park Golf Course drained between $30,000 and $300,000 each year from the golf fund alone. See Exhibit A. The variation in year-to-year losses is related to the number of rounds sold at Sharp Park, which in turn is driven by the wet conditions at Sharp Park that often leave the course unplayable.

Even these losses were hidden by official reports provided by the Recreation and Parks Department. See Exhibit B. The losses to the Golf Fund were hidden for three reasons. First, Exhibit B lists as revenue a subsidy to the Golf Fund from the General Fund. But the General Fund is simply a separate account that holds taxpayer monies: to a San Francisco taxpayer, this is simply another expense, not revenue generated by golf course operations. Second, Exhibit B lists as an expense funds repaid by Harding Golf Course to the Open Space Fund. But like the General Fund "revenues," this is not a true expense to San Francisco taxpayers, but just a transfer of taxpayer funds from one account to another.[1] Third, Exhibit B shows that a large sum of money is placed every year in a "golf unallocated" column. These are revenues and expenses that are drawn from or paid into the upkeep and management of each golf course, and to understand how each course is doing a methodology must be used that allocates these revenues and expenses to each course. Each of these three limitations in the RPD data are corrected in Exhibit A: the general fund and open space transfers are removed from the balance sheet, and the unallocated expenses and revenues are allocated to each course using two different methodologies, for comparison. Thus, Exhibit A is the most accurate reflection available of the day-to-day course operation and maintenance costs for Sharp Park and the City's other municipal golf courses. Combined with the subsidies provided to Sharp Park from the City's other sources of revenue, the golf course's drain on fiscal resources amounts to hundreds of thousands of dollars each year.

Future costs of Sharp Park Golf Course operations are predicted to be even more dire. In 2007, the Recreation and Parks Department concluded that unless changes are made at Sharp Park Golf Course, operating losses at Sharp Park Golf Course will total in the millions of dollars. See Exhibit F. Moreover, Sharp Park's illicitly built sea wall is likely to erode away due to anticipated changes to our ocean and coast wrought by climate change. See Exhibit G. Armoring the sea wall, which will be necessary only if Sharp Park Golf Course remains, will cost upwards of $32,000,000. See Exhibit H. Even the golf course's water supply is likely to become more expensive: the 400,000 gallons of water needed for peak demand must be provided by recycled water if we are to address ongoing droughts, and a recycled water project for Sharp Park is expected to cost $8,000,000. See Exhibit I.

The status quo at Sharp Park Golf Course is infeasible and simply cannot hold. The golf course operations lose too much money, money that could be spent to improve San Francisco's other

[1] It is of course a justified transfer, as Harding Park was given a large loan from the Open Space fund in order to upgrade the golf course several years ago, but to date has been unable to completely repay the funds it borrowed.

municipal golf courses, or keep our community centers open for more hours each day, or fund other essential city services.

### B. SHARP PARK PROVIDES A POOR GOLF EXPERIENCE, AND REFURBISHING THE GOLF COURSE IS NOT FEASIBLE.

Sharp Park Golf Course provides a poor golfing experience, and improving this experience will require tens-of-millions of dollars in permitting fees and capital improvements that the City and County of San Francisco simply doesn't have, making any proposed improvements infeasible.

Sharp Park Golf Course is considered substandard by nearly any golf measure. See Exhibit M. The National Golf Foundation found that Sharp Park Golf Course has poor turf conditions, an outdated and ineffective irrigation system, inadequate drainage, flooding problems, and dangerous cart paths. See Exhibit L. Moreover, a survey of golfers indicated that Sharp Park received "F" grades for friendliness of staff, conditions of golf carts, the availability of golf amenities, on-course services, the conditions of the golf greens, and overall course conditions. Id.

Because of the substandard conditions, golfers exhibit "very little loyalty" to the course: they play there primarily because it is cheap, rather than because of the quality or history of the course. See Exhibit L. Indeed, the existing prices—which are some of the lowest in the Bay Area golf market—are believed to be all the market will bear by golf industry experts given the poor conditions at the course. See Exhibit L. Yet even at the existing price points, rounds played at Sharp Park have declined precipitously. Between 2000 and 2006, rounds played at Sharp Park declined by 38%. See Exhibit L. Because of this, Sharp Park currently operates at 45% of its overall capacity, about 15% below industry standards. See Exhibit M. Thus, Sharp Park cannot increase its contribution to the golf fund simply by increasing prices: if prices are raised without concomitant improvements to the golf experience golfers would choose to play elsewhere, reducing overall revenues received from the golf course.

PROs Consulting has argued that Sharp Park should nonetheless be restored to the original Alister MacKenzie design and marketed as an elite, historic golf course. See Exhibit M. Capital improvements alone for this alternative are expected to run as high as 14 million dollars. Id. Additional costs for permitting from the U.S. Fish and Wildlife Service, the Department of Fish and Game, and the Coastal Commission are likely to cost an additional 5-10 million dollars. PROSs Consulting, the National Golf Foundation, and the Recreation and Parks Department all agree that this level of capital investment is not possible from the City and County of San Francisco. See

Exhibits L, M, F. Instead, the proposals suggest privatizing Sharp Park Golf Course operations by executing a long-term lease with a golf developer, allow the developer to raise prices to $120 per round and up, busting the labor union that works at the course, and using these incentives to convince the golf developer to invest the capital necessary to refurbish Sharp Park Golf Course. Id.

None of these requirements—privatization, union busing, and raising golf prices by an order of magnitude—are likely to be palatable in San Francisco. But even if these requirements could be met by San Francisco, it is unlikely the market could support such a golf course at this time or in the future. First, the collapse of the capital market in the past year makes it highly unlikely that the type of capital necessary to refurbish Sharp Park could be obtained: particularly when it is unlikely that permitting agencies such as the U.S. Fish and Wildlife Service and the Coastal Commission would ultimately permit such an intensive use of Sharp Park. More importantly, the Bay Area golf market is already oversupplied causing courses to close and driving prices downward precisely when Sharp Park would have to raise them. Golf demand is declining nationwide, see Exhibit J, and in the Bay Area the decline is particularly acute: the Bay Area currently supplies 6,000,000 more rounds of golf each year then Bay Area golfers demand.[2] See Exhibit K.

Under these market conditions, golf courses will close, and increasingly golf courses that do close are not used for open space, but for urban infill and other developments. See Exhibit O. For example, a municipal golf course in Livermore has been proposed to be partially sold to developers. See exhibit N. Because Sharp Park contains a deed restriction requiring the land to be used as a "public park, or public playground,"[3] it cannot be developed. Because of this, if Sharp Park remains open through ongoing government subsidy, it is likely that some other, better golf course will fail, the land will be sold, and the land will be converted to a more intensive development use. Conversely, if Sharp Park were to close, this would help sustain the market for other, better golf courses and because of Sharp Park's deed restriction we would not face concerns about development pressures impacting the existing open space landscape at Sharp Park.

[2] This data, from PROs Consulting, is likely an underestimate of the excess golf capacity in the Bay Area. PROs did a regional assessment of golf supply, but based Bay Area demand for golf on national averages, rather than conducting local assessments for golf demand. This is likely to overestimate golf demand in the Bay Area: the Bay Area is blessed with a multitude of recreational opportunities that compete with golf for our recreational time and dollars, and existing data indicates that regional golf courses continue to operate below capacity because of it.

[3] Thee deed restriction does not state that the land must be used for "recreational purposes," as is often reported. The existing golf course, which precludes entry to Sharp Park to anyone that is not golfing or obtains prior permission from the private golf concession arguably violates the deed restriction.

## C. SHARP PARK GOLF COURSE DESTROYED HISTORIC HABITAT FOR ENDANGERED SPECIES AND CONTINUES TO TAKE SPECIES WITHOUT A PERMIT.

Sharp Park has always provided suitable habitat for the San Francisco garter snake and the California red-legged frog, but the construction of Sharp Park Golf Course and the building of Sharp Park's sea wall has destroyed the vast majority of habitat present at the site. However, the Laguna Salada enhancement plan seems to presume that Laguna Salada was a salt-water lagoon that was inhospitable to the snake and the frog. It therefore seems to presume that the golf course and sea wall somehow prevent Laguna Salada from becoming too saline for these animals to survive. This erroneous assumption hinders the ability of the Recreation and Parks Department to consider feasible restoration alternatives at Sharp Park.

As a preliminary matter, the California red-legged frog is relatively tolerant to salinity for an amphibian, which is why we have exemplary coastal populations at places like Rodeo Lagoon at Fort Cronkhite and Abbotts Lagoon in Point Reyes. See Exhibit P. Indeed, a little bit of salinity is good for the frog, because the non-native, invasive, and predatory bullfrog is less tolerant of salt, and so a little salinity actually ensures that the California red-legged frog population remains robust while the bullfrog population is constrained.

Historically, both the California red-legged frog and the San Francisco garter snake thrived at Sharp Park: until the golf course and sea wall destroyed the functioning ecosystem there. See Exhibit Q. Sharp Park once contained a backbarrier lagoon system that protected the lagoon from coastal intrusion except in the most extreme storm events. During these events, salt water intrusion would be balanced against freshwater rainfall and freshwater drainage that funneled from the large watershed into Laguna Salada, keeping salinity levels balanced and low enough for the frog to survive. This would occur until the backbarrier lagoon would "heal" itself through natural sand movement that would rebuild the barrier system. Moreover, because the golf course did not exist, there was a gradient of wetlands upland of Laguna Salada, each with higher freshwater content, that the frog and snake could use through small-scale migrations until optimum conditions returned to the lagoon. See Exhibit R.

However, when the golf course was built, these upland wetland habitats were completely destroyed. Moreover, in a great act of hubris, Alister MacKenzie destroyed the natural barrier along the ocean in order to place 7 links of golf on the beach. When MacKenzie did this, massive coastal

floods were unleashed on Sharp Park and destroyed all seven of these holes, and in one instance ocean sea waters crept inland as far as the Sharp Park golf course clubhouse. See Exhibit S.

The frog and snake populations survived this inundation. The earliest surveys for the San Francisco garter snake at Sharp Park date back to the 1940s, after the course was designed but before the illicitly-built sea wall was constructed to protect Sharp Park from further coastal storms. At that time, the snake was considered "abundant" at Sharp Park. But follow-up surveys in the 1970s found a population in decline, and then, subsequent to the construction of the sea wall, surveys indicated that the snake was near extinction. In 2006, the US Fish and Wildlife Service concluded that a lawn mower killed a San Francisco garter snake at Sharp Park. See Exhibit T. Examination of the dead San Francisco garter snake indicated lacerations consistent with lawn mower blades and grass clippings in the wounds. See Exhibit U. In 2008, one to two San Francisco garter snakes were observed all year. See Exhibit V.

Today, the frog and the snake are literally squeezed between a fairway and a hard place. The golf course has destroyed all suitable upland habitats. If the sea wall were to the fail—and it will unless we invest millions of dollars to armor the sea wall or replace it with the natural barrier protections that were once there—the frog and the snake would not have any upland wetland areas to move into. Moreover, even if the sea wall does not fail, there is currently not enough habitat at the lagoon to ensure that the snake can recover: the population would remain at such a low level that a random event such as a disease or pollution spill or poaching would result in the extirpation of the population.

Moreover, the golf course's ongoing maintenance and operations take both species. Yet the City does not have a permit to take either species; it has implemented no mitigation measures to reduce take of the snake to date; and the mitigation measures that have been implemented to reduce take of the frog are not effective in reducing take of frog egg masses and tadpoles to zero. See Exhibit V. In addition, most of the California red-legged frog egg masses are laid at Horse stable Pond, where Sharp Park Golf Course's pump house is found. After the recent $240,000 construction project to fix a broken pipe from the pump house through the sea wall to the ocean, biologists concluded that entrainment of frog egg masses, tadpoles, and perhaps adults could occur, pumping individuals from Laguna Salada out to sea. See Exhibit W.

Because the San Francisco garter snake is a fully protected species under California law, the golf course's operations and maintenance can never be incorporated into a take permit for the species.

Therefore, as long as the golf course is in operation, it will be at risk for substantial civil and criminal penalties for taking the species. Take may occur directly, such as killing snakes with lawn mowers, or it may occur indirectly, through habitat modification that leads to the death or injury to individual animals, especially through the modification of habitat in ways that significantly impacts essential behavior patterns such as breeding, foraging, estivating, and other activities.

If the City were to attempt to obtain a permit for the Laguna Salada Wetlands Enhancement Project or the Natural Areas Program Management Plan that incorporates the threat to the species—the golf course ongoing maintenance and operations—into the permit, or the Department of Fish and Game were to issue such a permit, the permit would be unlawful, as only bona fide restoration and recovery efforts are eligible for fully protected species take permits under California law.

In the absence of any legal authority to continue golf course operations without violating California and federal environmental laws, alternatives that retain the golf course in its existing configuration and cause take are simply not feasible, and cannot be assessed under CEQA. Only alternatives that reduce take to zero with a reasonable certainty may be assessed as feasible alternatives under CEQA. Only alternatives that eliminate or redesign the golf course can meet this standard, and therefore these are the only alternatives that can be assessed as feasible.

The importance of Sharp Park for the long term survival and recovery of the San Francisco garter snake cannot be overstated. It is the northernmost population within the species range, and as climate change shifts the species habitats northward, this population is therefore the most likely to successfully adapt to changing conditions. See Exhibit LL. It is also the most genetically in tact of any population, which means it is the population that could best serve as a source population for the reintroduction of the species into historic habitats. Id. And reintroduction is needed: existing recovery goals require 10 viable populations be present in the wild before the species can be considered recovered, and at present there may only be six populations, none of which are known to be viable in the long run under existing conditions. Id.

If San Francisco only eliminates active take of the snake at Sharp Park, but does not provide adequate new habitat for the species to recover, in the 50-year time horizon the species will be lost from Sharp Park, and probably the entire world.

## D. THE LAGUNA SALADA WETLANDS RESTORATION PROJECT MUST CONSIDER THE IMPACTS OF CLIMATE CHANGE AND THE LONG-TERM SUSTAINABILITY OF THE SITE.

Our best predications about how global warming will impact Sharp Park indicate that existing problems with flooding, drainage, endangered species take, and the construction of the sea wall will only get worse. The City must consider alternatives that plan for the long-term adaptability of Sharp Park to these changes so that the recovery of the San Francisco garter snake can be assured at the site. See Exhibit Y.

Historically Sharp Park included a backbarrier lagoon system. This system contained a barrier sand system that separated Laguna Salada from the Pacific Ocean and protected the lagoon from massive coastal intrusions. However, Alister McKenzie's original golf course design destroyed this protection by laying seven links of golf on the beach. By destroying this protective system, the design unleashed two massive coastal storms that inundated much of Sharp Park with sea water, and destroyed much of the golf course, including the seven beach-side links.

To prevent the ocean tides from inundating Sharp Park, the City built, over time, an illicitly and poorly constructed sea wall at Sharp Park. However, in so doing the City plugged the natural freshwater outflow—Sanchez Creek—and prevented the freshwater that accumulated in the large water shed of which Sharp Park is a part from reaching the ocean. Thus, Sharp Park now annually floods with freshwater.

Sharp Park's sea wall is likely to erode away unless something is done to prepare the area for the impacts of global warming. See Exhibit G. There are essentially two alternatives: armor the sea wall at a cost of $32 million, or attempt to recreate an adaptive barrier that will be more resilient to the changes that will occur due to climate change and that will help protect the coast from global warming.

Armoring the sea wall could affect the entire beach at Sharp Park, as it may affect beach dynamics and sand movement. An alternative is to try and recreate, after snake and frog recovery efforts have succeeded and the population is secure, the more dynamic barrier lagoon system that likely existed at Sharp Park historically. This alternative is likely to be cheaper, more effective, and more sustainable than placing an unmovable barrier across the mouth of Sanchez Creek that will not be able to adapt to the changes wrought by global warming. See Exhibit X.

Therefore, it is essential that the City consider alternatives that will provide for the long-term sustainability and recovery of the Laguna Salada ecosystem and the San Francisco garter snake. Opportunities to learn more about this possibility will be discussed at a conference in Pacifica, CA at the end of June. See Exhibit Z.

### E. FULL RESTORATION OF SHARP PARK WILL PROVIDE SAN FRANCISCANS WITH RECREATIONAL AMENITIES THAT THEY ACTUALLY DEMAND.

Full restoration alternative must be considered at Sharp Park for another reason: San Francisco's number one recreational demand is for more hiking and biking trails, while golf finishes 16th out of 19 recreational options in the same survey. See Exhibit BB. This is direct evidence that San Francisco is not providing what modern San Franciscan's demand from their recreational facilities. The primary reason this is the case is because hundreds of acres of City property are locked into exclusive golf uses created decades ago and have remained static, while San Francisco residents' recreational preferences have changed.

Moreover, the San Francisco Board of Supervisors unanimously passed a resolution ordering the Recreation and Parks Department to consider full restoration alternatives at Sharp Park. This is another indication of the overwhelming public support for San Francisco to reconsider what it supplies to its residents. Even Sharp Park's existing concessionaire has recognized that San Franciscans have little demand for the existing golf course, stating in a proposal to the City that the typical golfer at Sharp Park is a "local resident" of the course. See Exhibit FF.[4]

Under these circumstances, it is imperative for the City to consider and select alternatives at Sharp Park that restore the site and provide recreational opportunities that are compatible with that protection. For example, a full restoration alternative has been proposed at www.restoresharppark.org. See Exhibit CC. This restoration proposal would create a community centered model of natural flood control, outdoor recreation, environmental education, and

[4] The Current concessionaire is on a month to month lease, and this lease should be cancelled as soon as practicable and not renewed. The concessionaire has shown outright hostility to the minimum environmental protections imposed on the golf course to date, by orchestrating a public relations campaign against the environmental protections and also be redesigning the golf course logo and emblem with a biologically inaccurate depiction of a California red-legged frog preventing a golf ball from being in play. This emblem was labeled "Sharp Park Home of the Red Legged Frog," and sold on t-shirts and other memorabilia at the golf course club house. See Exhibit GG. The existing management simply does not have the temperament or character necessary to solve the environmental problems imposed by the golf course. Moreover, as early as 1993, San Francisco's Civil Grand Jury discovered that mandatory investments in the golf course were not being made by the concessionaire. See Exhibit MM. A new concessionaire is needed to investigate and remedy these allegations.

endangered species recovery. These alternatives are feasible and must be considered during the EIR process.

### F. RPD MUST SELECT APPROPRIATE STAFF AND CONSULTANTS TO CONDUCT FULL RESTORATION ALTERNATIVES.

Currently RPD has an enormous contract with consulting giant TetraTech to perform the Laguna Salada enhancement restoration project. However, full restoration alternatives will require that existing subcontractors with relevant expertise become more involved in the restoration planning process. For example, subcontractor Greg Kamman is the only individual named in the Laguna Salada Wetlands Enhancement Project with enough expertise to prepare serious alternatives for Sharp Park that consider the long-term sustainability of the berm, the original historic conditions of the site, and the dynamic conditions that will be imposed by global warming on the site. Additional experts such as coastal ecologist Peter Baye, coastal engineer and Pacifica resident Bob Batallio of Philip Williams and Associates, Darren Fong of the National Park Service, Carlos Davidson of San Francisco State University, and many other local individuals with site-specific knowledge of Sharp Park and tidal conditions on amphibian and reptile habitats must be consulted, because no one on the team specified by TetraTech have expertise in these areas. Indeed, Karen Swaim, the consulting herpetologist, simply does not have the expertise and understanding of dynamic coastal systems to provide full support for a project of this magnitude.

More importantly, Dennis Murphy and his colleagues are inappropriate consultants for this project. See Exhibit HH. As a preliminary matter, Dr. Murphy is not qualified to consult on these projects, as he is a butterfly expert and not an expert in herpetology, coastal ecology, and climate change. Moreover, Dr. Murphy's objectivity and reputation have come into question because of his relationship with developers. See Exhibit DD. Mr. Murphy simply should not be permitted to consult on this project when local, objective experts with site-specific knowledge of Sharp Park and with relevant expertise are available for the Department.

### G. FULL RESTORATION CAN BE FUNDED BY PRIVATE MITIGATION BANKS OR BY PUBLIC-PRIVATE PARTNERSHIPS.

Full restoration alternatives must be considered for another reason: both private and public models indicate restoration will provide the City and County of San Francisco with net profits that are greater than any golf amenity that could be create at Sharp Park.

RPD has already received a prospectus from a wetlands mitigation banking company that has proposed to do a fully public wetlands mitigation bank at the site. For the types of wetlands that could be restored at Sharp Park, CalTrans was paying up to $3.5 million dollars per acre as recently as last year. See Exhibit II. There are approximately 200 acres at Sharp Park that could be developed into wetlands under this model, bringing in a gross revenue of over $700 million dollars. A portion of these funds would be held in trust to pay for ongoing maintenance and upkeep, another portion would be used to conduct the restoration work. But the remaining funds would be profit to San Francisco: and more profit that Sharp Park Golf Course could provide to the City over the next 100 years. Although mitigation banks have been controversial in the environmental community, a fully public mitigation bank with reasonable constraints on access to the bank would be met with 100% support from the Bay Area's environmental community and would allow San Francisco to be a leader in environmentally sound restoration and financing projects.

Another model is also feasible. At Crissy Field restoration was funded by a collaboration of public grants and private philanthropic donations. This model could also succeed at Sharp Park, and must be explored by the City. These restoration alternatives would also provide revenue for Pacifica. Golf courses are no longer the amenity that developers are designing projects around. See Exhibit NN. Instead, developers are looking for natural resources to use as a center piece and an attraction to their developments. Pacifica already has plans to create a new urbanism city scape at Palmetto Avenue, which currently dead-ends into a chain-link fence on Sharp Park's north side. If Sharp Park were restored and a trail created to link Palmetto Avenue with a restored trail system at Sharp Park, Pacifica would have a recreational amenity unlike any other on the California Coast, one that integrates the best of new urban design with the natural resource amenities that modern communities and tourists are willing to pay a premium for.

### H. RESTORING SHARP PARK TO A NATURALISTIC STATE WOULD BE GOOD FOR THE GAME OF GOLF.

Sharp Park Golf Course is losing money, killing two endangered species, and puts the surrounding community at risk every year when it floods. The status quo simply isn't sustainable at Sharp Park: something must change there. The question is what will Sharp Park become. For the good of the game, Sharp Park Golf Course must close.

Nationwide the game of golf is in decline. See Exhibit J. This decline is more acute in the Bay Area, where we have an unparalleled diversity of recreational opportunities competing with golf for our recreational dollars. See Exhibit K. Currently the Bay Area supplies 6 million more rounds of

golf than golfers demand each year, and this is causing golf courses to close in nearly every Bay Area county. Id. Golf courses in Livermore, Forest Knolls, San Francisco, and in Pacifica are already up for sale or are being proposed for conversion to some other use, and the best predictions indicate that more golf courses will suffer this fate before the golf market and our entire economy stabilize.

Sharp Park, by any measure, provides a marginal golf experience. In 2007 the National Golf Foundation gave Sharp Park an "F" grade in nearly every category it measured, including friendliness of staff, conditions of golf carts, the availability of golf amenities, on-course services, the conditions of the golf greens, and overall course conditions. If we continue to subsidize Sharp Park Golf Course to keep it open, under existing market conditions other, better golf courses will close, and the game of golf in the Bay Area will be worse because of it.

Even if we only concern ourselves with San Francisco's municipal golf courses, it would be best for the game if Sharp Park were to close. Sharp Park loses between $30,000 and $300,000 each year from San Francisco's golf fund alone, and it loses millions more from other taxpayer subsidies. These are loses, not just expenses: revenues from Sharp Park doesn't even cover the course's operating costs, let alone the capital and open space projects that are required to keep the golf course functioning. Every dollar that Sharp Park drains from our coffers is another dollar we cannot spend improving the City's other municipal courses. If we were to take a portion of the resources we spend at Sharp Park and instead spend those resources at Lincoln, Harding, Golden Gate, and our other courses that are in desperate need of attention, the playing conditions at these courses would improve greatly and San Francisco could truly bill itself as a premier golf destination.

There is no merit to the idea that Sharp Park Golf Course today contains some historic or architectural value that is worth preserving. The original McKenzie design was fundamentally flawed to begin with, and built in an inappropriate location to boot. The seven beach side holes were destroyed by two massive coastal storms which brought sea water to the clubhouse within a few years of opening day, and the subsequent construction of the sea wall, Highway 1, and years of deferred maintenance destroyed the rest of McKenzie's design. In 1972, the entire course was rebuilt by Robert Muir Graves, and golf historians such as Daniel Wexler have therefore concluded that "no appreciable trace of [McKenzie's] strategy remains in play" at Sharp Park today. See Exhibit JJ.

Some have argued that Sharp Park should be restored not to a naturalistic state, but to McKenzie's original design. But this is not feasible. To do so would cost between 14-20 million in capital, not to mention the several millions of dollars in permitting and mitigation fees for harming

endangered species. See Exhibit AA. In today's market and in Pacifica's relatively rural, low-density location, that level of capital investment simply cannot be found for such a risky investment. Moreover, regulatory agencies wouldn't permit such an intensive use on endangered species habitats, so any such proposal would eventually be denied. And other communities with publicly owned McKenzie courses have found that the design simply cannot generate revenue: McKenzie's designs too often fail to meet the demands of the modern golfer and new golf technology, and are being redesigned to modernize the course for today's game. Exhibit OO. But most importantly, if McKenzie's original design was recreated, it would suffer the same fate as the original: it would again wash away to sea, only this time more rapidly and violently as climate change causes sea levels to rise and storm intensity and frequency to increase along California's coast. See Exhibit G.

Some golfers will disagree with all of this. Those golfers, content with the status quo, will contest the financial data San Francisco has provided (without providing any alternative financial data); they will claim that McKenzie's design still exists at Sharp Park (without pointing to a single sand trap, let alone a link, that McKenzie would recognize as his handiwork today); they will argue that a private marketing company with a clever advertizing campaign is all that is necessary to reverse the decline in Bay Area golf (even though brining the PGA tour to San Francisco has been unable to do that).

If these golfers succeed keeping Sharp Park open at any price, the game will suffer. The demand simply isn't available to support all of the Bay Area's courses, and a great course will fail to keep Sharp Park alive. It could be Harding Park, or Crystal Springs, or Lake Chabot, or some other course: we currently do not have the data available to know which marginal enterprise will fail with any certainty. But we do know that courses on the margin of profitability simply can't compete in today's market with a golf course, even a terrible one, that is subsidized with hundreds of thousands of dollars in public capital every year.

And if our good courses close because we subsidize our poor ones, how can we expect the game to thrive in the future? The competition is stiff: we have the birthplace of mountain biking (Mt. Tam), the most famous big wave surf in the world (Mavericks), and perhaps most troubling to those who'd like to see more people golfing, we have the birthplace of the iPod and the internet search engine (Silicon Valley), which the data indicates are as responsible for this past decade's decline in outdoor recreation as anything else.

To have any hope for future growth, the game of golf must put its best foot forward against this competition. That means closing golf courses that provide a marginal experience, and reinvesting in our golf courses with more promise. That is why Sharp Park must close: for the good of the game.

Subject Request for bike friendly TRAILS in the NAP Recreational Trail EIR.....from SF Urban Riders

Attention SFRPD, NAP, SF Planning Dept. and any other interested parties involved in the Recreational Trails process

SF Urban Riders is a Non-Profit 501c3 whose goal is to create healthy off road cycling recreation for all users, and encourage youth opportunities.

We represent a growing number of recreational cyclists who are asking in unison to Please ADD multi use trails, off road bicycle trails, single track trails, and bike skills areas to the EIR scope of any projects in our larger parks and open spaces.

Off Road cycling is a growing contemporary activity that provides healthy recreation accessible at any level of entry, and appeals to a wide demographic. Trails are also the cheapest form of recreational improvement that can be made because they are sustainably designed, then constructed of natural materials by a large volunteer effort. There is many available federal funding sources that favor the inclusion of bicycle trails. SF Urban Riders would make a good partner with SFRPD on many levels and improve the overall quality of our parks.

For More Information on why sustainable multi use access is necessary please feel free to review our Master Plan which is available online:
http://sfurbanriders.org/wordpress/lead-story/unlease-the-proposal/

ADD BIKE TRAILS, SINGLE TRACK TRAILS AND BIKE SKILLS AREAS TO THE NAP EIR.

Sincerely,

Dan Schneider
SF Urban Riders

PLANNING DEPARTMENT
RECEPTION DESK

San Francisco Dog Owners Group

**PUBLIC COMMENT ON INTIAL STUDY SIGNIFICANT NATURAL RESOURCE AREAS MANAGEMENT PLAN (SNRAMP)**

**May 26, 2009**

Bill Wycko
San Francisco Planning Dept.
Natural Areas Management Plan
1650 Mission St, Suite 400
San Francisco, CA 94103

Dear Mr. Wycko,

The San Francisco Dog Owners Group (SFDOG) is a registered 501(c)(3) non-profit dedicated to responsible dog ownership and preserving off-leash access in our parks. We are active in our neighborhood parks, having organized park clean-ups and dog behavior/training workshops in the parks, and distributed flyers on "Park Petiquette", dog training, preventing poisoning, and emergency preparedness for pets. We have over 900 dues-paying members and our listserves and website routinely reach thousands more.

SFDOG has significant concerns with the Initial Study for the EIR for the Natural Areas Program as prepared by Tetra Tech. I have outlined our requests for improving the analysis to be undertaken for a quality EIR in the following pages. Briefly, our concerns include errors and omissions in information provided, obvious environmental impacts that are not addressed, biased descriptions of research, and policies based on anecdotes rather than rigorous scientific studies. Unfortunately, because of these errors and omissions, this document reflects poorly on the SF Planning Dept, as will any EIR based solely on the recommendations in this poorly crafted Initial Study.

The Natural Areas Program and its Management Plan have been one of the Recreation and Park Department's most controversial endeavors, and you can be sure that advocates on all sides will pore over the full EIR with an eye toward possible litigation. Please expand the scope of the EIR to include the suggestions described in this public comment. If you have any questions, I would be happy to discuss this comment with you in more detail. Thank you.

Sincerely,

Sally Stephens
Chair, SFDOG

# PUBLIC COMMENT ON INTIAL STUDY SIGNIFICANT NATURAL RESOURCE AREAS MANAGEMENT PLAN (SNRAMP)

**San Francisco Dog Owners Group (SFDOG)**
**May 26, 2009**

The Initial Study for the SNRAMP EIR has several glaring problems. These must be addressed if the full EIR is to have any validity.

SF Animal Care and Control estimates that 1/4 to 1/3 of the households in San Francisco are home to at least one dog (the national average is 1/4 of households). San Francisco consistently ranks as one of the most dog-friendly cities in the country and it is therefore likely that there are more households with dogs in San Francisco than the national average. There are therefore 130,000 to 150,000 dogs in San Francisco. People with dogs are the largest group of park users in the city; most visit parks with their dogs several times every day, rain or shine.

Dogs do not go to the parks by themselves; people bring them to parks. Attempts to restrict access by dogs to areas within or adjacent to natural areas are essentially attempts to keep a large group of people from enjoying those areas. The net effect of the Management Plan will be to deny access by a small group of people to a large group of people who simply want to visit their neighborhood parks.

Note that, of the 31 city parks with natural areas mentioned in the 2006 Management Plan, NAP claims the entire park (100%) in 17 of them. In an additional 10 parks, NAP claims over 50% of the park acreage. The four with fewer than 50% of their land claimed by NAP are: Golden Gate Park (3% of land is claimed by NAP), Pine Lake (28%), Buena Vista Park (17%), and Golden Gate Heights Park (13%). To be fair, not all NAP-claimed land will have significant restrictions on access. But a majority of NAP land (57%) will have significant restrictions (MA-1 and MA-2), with people restricted to paths only and dogs restricted to on-leash only, if allowed at all. In 8 parks, all land in the natural area will have significant restrictions on access (all the natural area is classified as MA-1 or MA-2). The NAP Management Plan keeps people out of 1/3 of the city's parkland. In some cases, this denial of access will be to the only park within easy walking distance in the neighborhood.

SFDOG has the following specific concerns about the Initial Study and the full EIR for the NAP:

## THERE IS NO SCIENTIFIC CONSENSUS TO SUPPORT THE BASIC PREMISE BEHIND GR-8 – THAT DOGS ARE HARMFUL TO PLANTS AND WILDLIFE. THERE IS THEREFORE NO REASON TO RESTRICT DOGS IN NATURAL AREAS, NO REASON FOR GR-8.

It is a basic gospel of the Natural Areas Program and its supporters, and therefore embedded in the management plan that is the subject of this EIR, that dogs, and in particular off-leash dogs, are harmful to plants, birds, and other wildlife. These claims are often stated as fact. However, the reality is that there is **no scientific consensus that off-leash dogs have a significant impact on bird and wildlife populations.** Some studies have shown an impact. But others have found no significant effect on bird and wildlife diversity and populations.

A recent study by Forrest and Cassady St. Clair (2006) studied the effects of dogs on diversity and abundance of birds and small mammals at 56 sites in urban parks in Edmonton, Alberta. Half of the sites were visited by off-leash dogs, half were on-leash or no dogs. City officials reported the on-leash sites had high public compliance with leash laws. Before beginning the study, the researchers fully expected "that designated off-leash

areas would represent comparatively poor habitat and would negatively influence diversity and/or abundance of birds and small mammals relative to nearby habitat where dogs were required to be leashed within the same urban park system."

To their surprise, they discovered that **whether a site was on- or off-leash had "no measurable effect on the diversity or abundance of birds and small mammals."** This lack of difference between on- and off-leash sites was seen even when they considered only those species that appeared to be breeding, or only those species that nested on the ground or in low shrubs.

This study may be more relevant to the NAP than other studies of dog impacts on diversity because both the NAP and the parks studied in Edmonton are urban parks. Indeed, one possible explanation the researchers give for why there was no observed difference is that "**wildlife, particularly birds, in suburban and urban areas exist there because they are fairly tolerant of moderate levels of human activity**."

Compare this to studies cited in a report, commissioned by the NAP to comment on the management plan, by Huntsinger and Bartolome (2005; available online at:
http://www.parks.sfgov.org/wcm_recpark/NAP/scientificreview_huntsinger.pdf)
that purports to prove negative impacts from dogs. They cite a report on dogs' impacts on Rocky Mountain wildlife (not urban) and on gazelles (definitely not urban). It is not clear whether other studies cited refer to birds and other wildlife in urban parks or not. The city of San Francisco is the second most densely populated city in the US (only Manhattan is denser). Our parks are not remote, pristine wildernesses. **When deciding the relevance of any study of the impacts of dogs on plants and wildlife to the NAP, the full EIR must consider whether the study took place in an urban park where wildlife is likely to be more tolerant of dogs and people. If not, the study's relevance to the NAP must be discounted.** The Huntsinger and Bartoleme review makes no attempt to sort out studies done under conditions like those in NAP areas (urban parks) from those done in remote wilderness areas. Therefore, its conclusions cannot be used as a basis for the restrictions proposed in GR-8.

In addition, the sections of the Huntsinger and Bartoleme review that deal with dogs are full of "anecdotal accounts" of negative impacts. The problem is that **anecdotal accounts are not reliable and cannot be used as the basis for public policy**. For example, an underlying assumption in the NAP Management Plan used to justify on-leash restrictions on trails is that off-leash dogs on trails roam widely and frequently disturb plants, wildlife, and other park visitors. However, a study by Beckoff and Meaney (1997), published in a peer-reviewed journal, tested this assumption and found that it is not true. Beckoff and Meaney observed the behavior of dogs in six parks in and around Boulder, Colorado. They positioned themselves at various vantage points along trails and recorded everything they saw. They also followed individual dogs during the entire time they were in the park, recording everything the dogs did. Finally, they gave a questionnaire to all park visitors, obtaining more responses from non-dog owners than dog owners.

Their data showed that off-leash dogs generally did not travel far off trail, and when they did, it was for short periods of time. "There is no doubt that *some* dogs go off trail for various amounts of time and that *some* dogs do occasionally disturb people, wildlife, and habitat. However, compared to people, dogs did not seem to do much damage to vegetation or bodies of water, and they only rarely chased wildlife... **People disrupt wildlife more frequently than dogs, and people cause more damage to vegetation and to bodies of water**."

Beckoff and Meaney note that: "In Boulder and perhaps in other areas, **reports of unruly dogs seem to attract a lot of attention, but of course, people do not report when dogs are well-behaved**." It is human nature to remember when something bad happens, but not to notice all the times nothing bad occurred. That's not a problem unless you take a remembered bad incident and assume it is "typical." That is the basic flaw in anecdotal accounts, which really say more about the biases of those making the reports than they say about what is really happening.

In a recent study that tested another common assumption, Warren (2007) tested whether recreational disturbances changed the feeding behavior of the Western Snowy Plover at Crissy Field and at two sites at Point Reyes. Warren admits in the study that she fully expected the data to show that as the frequency of disturbance increased, the birds would spend less time actively foraging for food and more time alert. Instead, she found no significant relationship between feeding behavior and direct disturbance by people recreating on the beach. What other assumptions about effects of disturbances by dogs and people will be similarly disproved when studies are done that put them to the test? How much bad public policy will have been set based on these erroneous assumptions?

**THE FULL EIR MUST INCLUDE A COMPLETE, UNBIASED ANALYSIS OF ANY SCIENTIFIC LITERATURE WITH REGARD TO DOGS IN PARKS. SPECIAL ATTENTION MUST BE PAID TO STUDIES OF THE IMPACTS OF DOGS CONDUCTED IN URBAN PARKS (COMPARABLE TO NAP), AS OPPOSED TO STUDIES MADE IN WILDERNESS AREAS WHERE WILDLIFE IS NOT ACCUSTOMED TO PEOPLE AND DOGS (NOT COMPARABLE TO NAP).**

## THE FULL EIR MUST CAREFULLY LOOK FOR AND CONSIDER BIAS IN DATA USED BY THE NAP TO JUSTIFY THE RESTRICTIONS IN GR-8.

In May 2006, the Point Reyes National Seashore (PRNS) management claimed that an oyster farm in Drakes Bay was harming marine wildlife and causing significant negative impacts on the environment and, therefore, should be closed. A PRNS report stated that the oyster farm workers disturbed seals, causing a huge decline in seal population, and that sediment from oyster feces was harming eelgrass beds. Therefore, the oyster farm did not belong in a national seashore. Corey Goodman, a microbiologist at UC Berkeley, member of the National Academy of Sciences, and a former Chair of the National Research Council's Board of Life Sciences, analyzed the raw data used in the studies cited by PRNS staff and found that the data did not support nearly every negative impact claimed.

On the September 27, 2007 episode of the KQED-FM program "Quest", Goodman said, about the published claims by PRNS staff: "Essentially every one of the scientific claims that they made are refuted by their own scientific data.... They have made intentionally misleading claims, statements about data that are untrue, claims of cause and effect that are untrue. I think this is serious because they have misused science to mislead the public."

An Interior Dept's Inspector General report and a second report by the National Academy of Sciences agreed with Goodman's analysis. Yet, convinced that the oyster farm did not belong there, PRNS staff misrepresented their data to support that conclusion.

Similar concerns have been raised about government claims of impacts of dogs on wildlife in the context of native plant restoration. For example, two reports (in 1996 and 2006) by Daphne Hatch, an employee of the Golden Gate National Recreation Area, argued that off-leash dogs should be restricted to protect Western Snowy Plovers at Ocean Beach (in the context of restoration of Ocean Beach). The 1996 Report states that on 15 occasions, at least 100 plovers were "inadvertently disturbed" by dogs running on the beach, and compared that to the 48 plovers inadvertently disturbed by people on the beach. However, if you look at the data, you see that the surveys that showed disturbances by people were a subset in time of those involving dogs. Indeed, the disturbances from people were noted in about half the recording time (24 hours of observations) as that devoted to studying dogs (40 hours). Had the people been observed for an equally long period of time, the numbers of disturbances caused by dogs and people would have been nearly the same. Other data presented in both studies

show no impact of off-leash dogs on the numbers of plovers. Yet the conclusion drawn in the report is that off-leash dogs have to be restricted to "protect" the plovers.

**THE FULL EIR MUST RE-ANALYZE ANY DATA PROVIDED BY NAP (ESPECIALLY DATA NOT PUBLISHED IN A PEER-REVIEWED JOURNAL) TO ENSURE THAT CONCLUSIONS AGAINST DOGS ARE ACTUALLY SUPPORTED BY THE DATA. THE FULL EIR MUST AVOID A SITUATION SIMILAR TO THE ONE IN POINT REYES, IN WHICH GOVERNMENT RESEARCHERS MISREPRESENTED SCIENTIFIC RESULTS TO BOLSTER A CASE AGAINST AN OYSTER FARM.**

**THE FULL EIR CANNOT CONSIDER CLOSING THE LAKE MERCED DOG PLAY AREA AS CALLED FOR IN THE INITIAL STUDY (LM-7a) B ECAUSE RPD MADE THIS AN OFFICIAL OFF-LEASH AREA YEARS AGO AND PROMISED IT TO THE DOG-OWNING COMMUNITY. EVEN NAP HAS ACKNOWLEDGED THIS STATUS PUBLICLY. THE FULL EIR MUST CORRECT INCORRECT STATEMENTS ABOUT THE RPD DOG POLICY MADE IN GR-8b.**

The Initial Study says (page 36): "Due to the CCSF moratorium on new DPAs, the Lake Merced DPA couldn't be relocated to a new location, so it would only be removed. Restoration of the site would continue, following the removal of the DPA." The Notice of Preparation of an EIR for the Natural Areas Management Plan states that the final draft plan was published in February 2006. That is the plan that will be studied in the full EIR. However, the 2006 Management Plan says about the Lake Merced DPA in Recommendation LM-7a (page 6.1-18): "The SFRPD and the Dog Advisory Committee should consider relocating the DPA to a different location. In the meantime, this DPA can remain open, but impacts should be monitored. If use levels increase during this time such that impacts to breeding bird habitat are detected, signs and other mitigations should be implemented." There is NO mention of closing the DPA. Monitoring and mitigation can be considered in the full EIR because they are mentioned in the 2006 Management Plan. Closing the DPA is NOT an option that can be considered in the full EIR for the Management Plan because it is not mentioned in the Management Plan. This must be corrected in the full EIR.

In addition, the 2002 RPD Dog Policy sets forth a public process to create or to close a DPA, which includes evaluation by the Dog Advisory Committee (DAC). DPAs cannot be closed without that public process. It is especially true that a DPA cannot be closed because a consultant doing an Initial Study or an EIR decides it should be. The DAC was "sunset"-ed in February 2007 and no public process to replace it has been announced by RPD. Until a replacement public process to close DPAs that does not include the DAC is devised by RPD, there is no legal way to close a DPA. While there is a moratorium on creating new DPAs as RPD conducts system-wide DPA planning, there is also a moratorium on closing existing DPAs until the system-wide planning is completed. Therefore, **closing the Lake Merced DPA cannot be considered as part of the Management Plan nor as part of the full EIR.**

It is not the role of the Initial Study to CHANGE what is in the draft 2006 Management Plan as described above. Nor is it their role to add a NEW natural area, # 32 the Everson/Digby lots (page 46 of the Initial Study) that is not in the 2006 Management Plan. The public has not been informed that the area currently used as neighborhood open space is now a "natural area" with who knows what restrictions attached to its use.

## WHEN CONSIDERING ANY IMPACTS OF DOGS IN PARKS, THE FULL EIR MUST TAKE INTO ACCOUNT THE DIFFERENCE BETWEEN "FREE-ROAMING" AND "OFF-LEASH" DOGS.

"Free-roaming" dogs are dogs that are running WITHOUT any human oversight. Examples of free-roaming dogs would be a dog whose owners did not know that it had escaped from a backyard, or a feral dog that lives without any human control. "Off-leash" dogs are dogs that are running WITH human oversight. Their guardian is nearby and controls them with voice commands. Studies that discuss impacts of free-roaming dogs CANNOT be used to indicate similar impacts from off-leash dogs. This distinction must be considered by the full EIR when considering any reported impacts of dogs in parks.

## THE EIR MUST ADDRESS THE NEGATIVE ENVIRONMENTAL IMPACT ON TRAFFIC (E-5a), AIR POLLUTION (E-7b), AND GLOBAL WARMING (E-7f) IF AREAS THAT ARE CURRENTLY OFF-LEASH ARE CLOSED TO PEOPLE WITH DOGS.

According to the Draft Management Plan for the Natural Areas Program (NAP), approximately 80% of the currently legal off-leash areas in San Francisco city parks are located either within or adjacent to areas subsequently claimed by the NAP (note that the off-leash areas were there first). The Plan calls for the immediate closure of parts of the currently off-leash areas in two parks (a reduction of 29% in Bernal Hill and of 14% in McLaren Park; note that the plan states that some of the area in Bernal Hill to be closed is steep and inaccessible and therefore is excluded from their claimed reduction of 17%). These two closures will reduce the total acreage in city parks available for off-leash recreation by approximately 15%. In addition, the Plan calls for monitoring of off-leash areas in Buena Vista Park, Golden Gate Park, Lake Merced, and McLaren Park. Should NAP claim that dogs are causing any problems, NAP will call for the closure of all or parts of those areas. Finally, the Plan calls for expanding the most-sensitive MA-1 areas into less-sensitive MA-2 and even MA-3 areas when funding becomes available. Thus, an off-leash area that is currently adjacent to an MA-3 area, and therefore, not under any restrictions, could find itself, in the future, adjacent to an MA-2 or even an MA-1 area. Should NAP determine that dogs in the off-leash area have a negative impact on newly adjoining MA-1 and MA-2 areas (or even on an MA-3), they can call for closure of the off-leash area.

Clearly, 80% of the currently legal off-leash areas in San Francisco's city parks are at risk of closure because of the potential activities of the NAP as outlined in the NAP Management Plan. What will happen to the hundreds of thousands of people with dogs who are shut out of their neighborhood park if any or all of the 80% of off-leash areas are closed? They will be forced to drive across town to the remaining legal off-leash areas. Public transit is not an option for people with dogs. MUNI buses and trains forbid dogs during rush hours before and after work, the primary times that people are walking and playing with their dogs in parks. Forcing large numbers of people to drive across town to use the remaining legal off-leash areas will increase traffic and air pollution, and will contribute to global warming. The negative impact on the environment of this driving must be acknowledged and addressed in the full EIR.

The full EIR must consider not only the impacts on traffic, air pollution, and global warming of the proposed closure of off-leash areas in McLaren Park and Bernal Hill, but also the impacts of closing the off-leash areas in the parks specifically slated for monitoring, as well as the impacts of closing all 80% of the legal off-leash areas within or adjacent to areas claimed by the NAP.

## THE ENVIRONMENTAL IMPACT ON THE REMAINING OFF-LEASH AREAS IF PEOPLE WITH DOGS ARE FORCED OUT OF LEGAL OFF-LEASH AREAS WITHIN OR ADJACENT TO NATURAL AREAS MUST BE CONSIDERED IN THE FULL EIR.

Any large group of park users that is concentrated into a small area – whether it be soccer players, kids with Frisbees, or people with dogs – can cause some damage to those areas. The full EIR must look at the impact on the remaining legal off-leash areas of serious overuse if closures of current off-leash areas are demanded by NAP because of the Management Plan.

In addition, tens of thousands of people with dogs walk off-leash in the Golden Gate National Recreation Area (GGNRA) every day, including Fort Funston, Ocean Beach, and Crissy Field. Many of these people live adjacent to these areas; indeed, proximity and ease of access for dog walking is one reason people buy homes in neighborhoods adjacent to the GGNRA. However, the GGNRA is considering severely restricting off-leash access to the lands under its control. Should the GGNRA's restrictions occur, thousands more people with dogs could be forced to use the legal off-leash areas in San Francisco city parks. The cumulative impact of closing off-leash areas because of the NAP and the GGNRA must be included in the full EIR.

## THERE ARE ALSO SEVERAL NON-DOG-RELATED ISSUES THAT SHOULD BE INCLUDED IN THE FULL EIR.

## THE FULL EIR MUST CONSIDER THE NEGATIVE IMPACTS ON WIND (E-8) AND EROSION (E-13) OF REMOVAL OF TREES AND NON-NATIVE PLANTS FROM NATURAL AREAS.

The Management Plan calls for replacing trees removed from natural areas with other trees, but says the replacement trees may not be planted at the same site. Also, new trees will not be the same size as the ones removed, for many years, if ever. Many trees were planted in parks to provide windbreaks not only for the parks, but also for the homes immediately adjacent to the parks. Removing these trees will remove the windbreaks, with potential property damage to the homes.

Over the years, homeowners and park officials planted many non-native plants, especially ice plant, because they were the only plants that would stabilize San Francisco's sandy hills. Native plants frequently require drifting sand to thrive, and they, therefore, were not effective at stabilizing the hills. Land within many natural areas is fairly steep. Removing the ice plant and other non-native plants that have stabilized the hills for decades will result in increased erosion in city parks.

For example, NAP plans for all four parks in the Golden Gate Heights neighborhood (Grandview, Rock Outcrop, Golden Gate Heights Park, and Hawk Hill) call for "scattered, open sand". These parks are located near the top of several hills, on steep, west-facing slopes with nothing to block strong ocean winds. Even with the ice plant that has covered the areas for decades, drifting sand still blocks streets, clogs sewers, and damages nearby homeowners' property. Clearly, removing the stabilizing plants and creating areas of "scattered, open sand" will cause significantly more erosion and damage.

NAP staff have stated in public meetings that the program has no "legal" responsibility for damage to homeowners' property that result from their actions (e.g., removing ice plant that stabilized sand resulting in drifting sand damaging a park neighbor's backyard, as has happened around Grandview Park). In a scientific review of the NAP Management Plan, reviewer Peggy Fielder, one of the paid authors of the original management plan, was asked: "Have the secondary consequences of management activities been adequately identified and

addressed (e.g., effects on healthy trees, forests, plants, animals, birds, wind patterns, erosion, restrictions, use of herbicides, and the necessity of removing invasive animals)?" Fielding replied: "Probably not, but this is not a function of the plan." These secondary consequences MUST be considered during the full EIR, especially the effects on windbreaks and erosion, and on the PEOPLE who live in homes next door to a city park!

Natural areas do not occur in a vacuum. Because our city parks are located within a densely populated urban city, the effects of NAP management decisions, such as removing non-native trees or plants that stabilize hillsides, extend beyond the public areas of the park itself. It is not sufficient to only consider wind and erosion within the park. The full EIR MUST evaluate the physical effects (not the just legal) that include erosion, sand and wind effects on homeowners and property adjacent to the parks that contain natural areas.

## THE FULL EIR MUST CONSIDER THE NEGATIVE IMPACT OF CREATING HABITAT IN NATURAL AREAS THAT ENCOURAGES MOSQUITO BREEDING, INCREASING THE PUBLIC HEALTH RISK OF WEST NILE VIRUS.

Many of the plans for individual natural areas call for creating ponds and standing water sources. These habitats are prime mosquito breeding areas. The Initial Study only mentions "small water features" as being potential mosquito breeding sites. However, larger ponds are also important breeding sites. The impact on public health of mosquito breeding at ALL ponds in ALL natural areas MUST be addressed in the full EIR. The impact of increasing the size and number of ponds at each site MUST be considered. This is an especially important issue at Sharp Park, one of only four places in San Mateo County where the threat of mosquito breeding is high enough to warrant helicopter spraying of larvicide in addition to ground applications. Increasing the size and number of ponds for frog habitat at Sharp Park will significantly increase the threat of mosquito breeding there. The impact of an increased use of BT, a biological control agent, to control mosquito breeding in larger or more ponds must be considered in the full EIR.

## THE NEGATIVE IMPACT ON HOMES ADJACENT TO NATURAL AREAS FROM PRESCRIBED BURNING SHOULD THOSE BURNS GET OUT OF HAND MUST BE CONSIDERED IN THE FULL EIR (E-15h).

The Initial Study states (page 11) that NAP "no longer is proposing prescribed burning would not occur. The SNRAMP will be updated to reflect this change." The full EIR is authorized to study the 2006 Management Plan. Significant changes to the 2006 Management Plan cannot be made before the EIR is done. Therefore, the change referred to in the Initial Study cannot be made. In any event, the full EIR MUST consider the potentially catastrophic impact of prescribed burns on adjacent homes, as well as parkland, should a burn get out of hand.

## THE FULL EIR MUST INCLUDE THE IMPACTS ON AESTHETICS OF POOR MAINTENANCE BY NAP STAFF AND THEIR VOLUNTEERS. THE FULL EIR MUST ALSO INCLUDE THE EFFECTS OF POOR MAINTENANCE ON THE NEED FOR MORE HERBICIDES IN NATURAL AREAS.

Any full EIR must consider whether or not the natural areas can be maintained as described in the management plan. In most parks, the 2006 Management Plan allocates fewer than 20 days/year for

planting/maintenance of the natural areas. In 16 of the 31 natural areas in the 2006 Management Plan, the total maintenance planned is 10 or fewer days each year. There are countless stories of volunteers who have spent long hours planting native plants in NAP areas, only to see absolutely no maintenance performed once the plants are there. Without maintenance, the plants die, creating unsightly vistas of dead and dying plants.

In addition, poor maintenance allows non-native vegetation to grow back, requiring repeated applications of herbicides to get rid of the unwanted non-natives.

The full EIR MUST consider the benefits of scaling back the program to a few areas that can be well maintained, as opposed to the current plans to take over one-third of San Francisco's city parkland for the program, too much area to be adequately maintained by NAP staff. The Management Plan is much more ambitious in the amount of work to be done annually, than NAP has demonstrated it has the capacity to actually DO on a consistent basis. It would be preferable to have a workable management plan that is achievable within the resources of the city and the volunteer commitment made to NAP, than to have a utopian plan including monitoring and research goals that are not attainable.

Finally, with regard to aesthetics… Who decides what is aesthetically pleasing? For many people, brush piles used in natural areas look like accumulations of trash and are aesthetically unpleasing. For many people, shaded areas with tall, non-native trees are aesthetically pleasing, while areas without tall trees are less so. People like to see their parks green, not brown half the year. How will the different aesthetics of what a park should look like be included in the full EIR? Will the full EIR include a study of what San Francisco residents want/like to see in their parks? How will people, who are part of the environment, be part of the EIR evaluation?

--end--

## THE STUDIES REFERENCED IN THIS PUBLIC COMMENT ARE:

1) **"Effects of dog leash laws and habitat type on avian and small mammal communities in urban parks", Andrew Forrest, Colleen Cassady St. Clair, *Urban Ecosyst* (2006) 9, p. 51-66**

Abstract: "Remnant natural areas within urban settings can act as important refuges for wildlife, substantially increasing local biodiversity. However, habitat suitability for these species is potentially affected by human recreational activities including the presence of free-running dogs. To compare the diversity and abundance of songbird and small mammal communities between areas with bylaws that require, or do not require, dogs to be leashed, point counts and live-trapping surveys were conducted in three habitat types (deciduous, coniferous, and meadow) in the river valley parks of Edmonton, Alberta. Among birds, there was no difference between areas with different leashing bylaws in species diversity for any of the three habitat types. Similarly, there was no difference in bird diversity for a subset of species that were plausibly breeding at these sites. However, higher bird diversity was recorded in deciduous and coniferous sites than in meadow sites, regardless of leash designation, probably as a function of the horticultural practice of mowing meadows. Among both birds and small mammals, there was no difference in the abundance of individuals as a function of leashing bylaws. Our results suggest that off-leash dogs have no effect on the diversity or abundance of birds and small mammals in urban parks, but it is also possible that other factors, such as leash law compliance, reduced or obscured the effects of off-leash dogs in this study."

Before beginning the study, the researchers "hypothesized that designated off-leash areas would represent comparatively poor habitat and would negatively influence diversity and/or abundance of birds and small mammals relative to nearby habitat where dogs were required to be leashed within the same urban park system… [On-leash sites] were believed by city officials to have high public compliance with leash laws. Off-leash sites were either in officially designated off-leash areas or, in two cases, in areas that were designated as on-leash but were known to experience frequent use by off-leash dogs and their owners." (p. 53)

Researchers conducted bird surveys in all 56 sites (half off-leash, half on-leash) a total of three times between May and July 2002. Each survey involved a 5-minute, 100 m, fixed radius point count, followed by a 5-minute playback of a black-capped chickadee mobbing call (known to attract several bird species and used to increase detection of less vocal species). A 5-mintue post-playback point count concluded the survey. Researchers recorded all birds that were seen or heard during the 15-minute period. They only counted birds if they interacted with the environment (that is, they did not count birds flying over the survey site). Small mammals were live-trapped at a randomly selected subset of 32 of the original 56 sites.

They found that "Designation of sites for dogs to be on- or off-leash had no measurable effect on the diversity or abundance of birds and small mammals within the sites that we surveyed in the Edmonton River valley. There was a similar lack of difference in bird abundance when we restricted analyses to only those species that appeared to be breeding, only those species that nest on the ground or in low shrubs, and only the most abundant species." (p.61)

2) **"Interactions Among Dogs, People, and the Environment in Boulder, Colorado: A Case Study", Marc Bekoff and Carron A. Meaney, *Anthrozoos*, (1997), 10(1), p. 12-31.**

Abstract: "From September 1995 to April 1996 we studied interactions among dogs, people, and the environment in Boulder, Colorado, Data on behavioral disturbances by off-leash dogs who were accompanied by a person were collected with respect to dog-dog and dog-human interactions, dog-wildlife encounters, dogs trampling vegetation, and dogs entering and disturbing bodies of water. A questionnaire also was administered. Behavioral data showed that off-leash dogs generally did not travel far off trail, that when they did it was for short periods of time, and that they rarely were observed to chase other dogs, disturb people, chase wildlife, destroy vegetation, or enter bodies of water. Results from analyses of the questionnaire (skewed toward non-dog owners) showed that dog owners and non-dog owners agreed that people were more disruptive to the environment than dogs and that unruly people were more problematic than unruly dogs. We conclude that the well-being and interests of dogs should not summarily and dismissively be compromised when dogs and people attempt to share limited space that can be used by all parties for recreational purposes. Indeed, a higher percentage of people reported that the quality of dogs' experience of the outdoors would be compromised more than their own enjoyment if dogs could not walk off-leash in areas where this is currently permitted. The methods used and the results from this case study can serve as a model for other locations in which dogs and people compete for limited spatial resources."

In this study, the researchers observed the behaviors of dogs in six parks in and around Boulder. They positioned themselves at various vantage points along trails and recorded what they saw. They also followed individual dogs during the entire time they were in the park, recording everything they saw the dogs do. They administered a questionnaire they designed, with the help of professional pollsters, to all visitors entering the parks being studied. More non-dog owners (53.2%) responded to the questionnaire than did dog owners (46.8%).

"There is no doubt that *some* dogs go off trail for various amounts of time and that *some* dogs do occasionally disturb people, wildlife, and habitat. However, compared to people, dogs did not seem to do much damage to vegetation or bodies of water, and they only rarely chased wildlife… People were more disruptive than were dogs, and when dogs did go far off trails they often were lured off by people [e.g., by chasing a thrown stick]…" (p.26) "People also reported (and direct observations confirmed the fact) that people disrupt wildlife more frequently than dogs, and people cause more damage to vegetation and to bodies of water." (p. 27)

3) **"Recreation Disturbance Does Not Change Feeding Behavior of the Western Snowy Plover", Megan Warren, UC Berkeley Environmental Sciences 196, Senior Research Seminar, May 7, 2007**

Abstract: "The Western Snowy Plover (*Charadrius alexandrinus nivosus*) is a small shorebird that has many scattered wintering populations along the Pacific Coast of the United State, including several in the Bay Area. This species has been listed as threatened since 1993 under the federal Endangered Species Act of 1973. For this study I measured disturbance rates, types, plover responses and feeding time in three different sites in the San Francisco Bay Area to explore the link between recreation disturbance and feeding behavior. I predicted that as frequency of disturbance

increased, the birds would spend less time actively foraging and more time alert. However, data showed no significant relationship between feeding behavior and direct disturbance by human recreators. Instead, I now predict that recreation has a more indirect effect on the western snowy plover feeding behavior. Future research should focus on indirect effects of recreation, such as habitat disturbance and food source quality."

Warren observed plover behavior at Crissy Field (high-use recreational site), Limantour Beach (medium-use recreational site), and Abbott's Lagoon (low-use recreational site). Surveys were made of birds' responses to recreational activity in four categories – no response, mild response (causing a resting plover to stand), moderate response (causing a plover to stand up and/or walk away), and major response (causing the plover to flush). Feeding behavior surveys quantified how the plovers budgeted their time during the dusk feeding period. Plovers were observed: 1) searching for food, defined as movement along the shoreline with its head down visually scanning for prey; 2) actively foraging, defined as head down with its beak in the sand eating the prey; and 3) time spent alert, defined as a bird standing still with its head up visually scanning the beach. A linear regression was used to test the relationship between frequency of disturbance and foraging, alert and searching time.

"The Crissy Field study did not provide any relevant results, however, the data from the two Point Reyes study sites do not support the hypothesis that western snowy plovers in more heavily disturbed areas devote less time to actively foraging and more time to being alert… These results suggest that direct recreation disturbance is not as significant as earlier thought, and that links between recreation and western snowy plover feeding behavior are more subtle." (p. 9)

# Effects of dog leash laws and habitat type on avian and small mammal communities in urban parks

**Andrew Forrest · Colleen Cassady St. Clair**

Published online: 28 April 2006
© Springer Science + Business Media, LLC 2006

**Abstract** Remnant natural areas within urban settings can act as important refuges for wildlife, substantially increasing local biodiversity. However, habitat suitability for these species is potentially affected by human recreational activities including the presence of free-running dogs. To compare the diversity and abundance of songbird and small mammal communities between areas with bylaws that require, or do not require, dogs to be leashed, point counts and live-trapping surveys were conducted in three habitat types (deciduous, coniferous, and meadow) in the river valley parks of Edmonton, Alberta. Among birds, there was no difference between areas with different leashing bylaws in species diversity for any of the three habitat types. Similarly, there was no difference in bird diversity for a subset of species that were plausibly breeding at these sites. However, higher bird diversity was recorded in deciduous and coniferous sites than in meadow sites, regardless of leash designation, probably as a function of the horticultural practice of mowing meadows. Among both birds and small mammals, there was no difference in the abundance of individuals as a function of leashing bylaws. Our results suggest that off-leash dogs have no effect on the diversity or abundance of birds and small mammals in urban parks, but it is also possible that other factors, such as leash law compliance, reduced or obscured the effects of off-leash dogs in this study.

## Introduction

In developed countries of the world, 75% of humans already live in urban areas and the worldwide urban population is estimated to be increasing by 175 000 people each day (UN,

2003). As urban areas expand to accommodate increases in both the human population and urbanization, remaining natural areas are giving way to further anthropogenic development (Searns, 1995). Increasing development in and surrounding cities heightens the value of remaining natural areas, which frequently occur in river valleys and ravines, and large areas of this sort may be capable of supporting several native wildlife species. In the city of Edmonton, Alberta, the North Saskatchewan River valley and several adjacent ravines comprise an enormous urban park system of 7400 ha, renowned as being the largest contiguous area of urban parkland in North America. Much of this area remains in a relatively natural state and appears to sustain a high diversity of wildlife (Mowat, 1993). In the past, city planners have developed park and trail systems within the river valley for a variety of human recreational uses. However, more recently and more generally, urban natural areas are recognised by both city planners and ecologists for their value in the conservation of biodiversity (Clergeau et al., 1998; Fernandez-Juricic and Jokimaki, 2001).

Protecting the biodiversity within urban parks requires that city planners carefully manage the variety of competing pressures on these areas. These pressures arise from high levels of human visitation associated with a number of recreational uses, the presence of both official and unofficial trail systems, and even such things as illegal garbage disposal (Tilghman, 1987). Dog-walking is one of the most common recreational activities in the Edmonton river valley and is conducted by about a quarter of park users (Edmonton Community Services, 2001). To accommodate dog-walkers, the City of Edmonton has designated certain parks and trails as 'off-leash' areas where dog owners are permitted to walk their dogs without a restraining leash. In total, there are 40 such areas in Edmonton, and 14 of these are within the North Saskatchewan River valley. Because the activity of domestic dogs may affect wildlife in urban areas, civic employees were interested in estimating diversity and abundance of small animals that might be most susceptible to dog disturbance in areas with and without leash laws.

A variety of negative effects on wildlife have been documented for domestic dogs elsewhere and these may plausibly apply to the Edmonton area. Most generally, wildlife may be chased or disturbed by dogs as a vestige of their natural hunting instincts (Sime, 1999). Flushing in response to the presence of dogs is a documented and conspicuous response shown by some city-dwelling passerines (e.g., Fernandez-Juricic and Telleria, 2000) and colonial shorebirds (e.g., Mitchell et al., 1988; Lafferty, 2001). Dogs can also cause physical injury (Doncaster, 1994; Shine and Koenig, 2001), nest disturbance (Govan, 1998), and even death (Fuller, 1990). Other effects may be more subtle and less easily observed. As examples, disturbance by dogs can cause energetic loss when it results in an evasive response, increased vigilance, or lost foraging opportunities (Burger, 1986; Fernandez-Juricic and Telleria, 2000). Domestic dogs also have the potential to introduce disease or parasites into urban wildlife populations (Sime, 1999). Finally, the presence of dogs may exert a cumulative effect with other disturbances to reduce habitat suitability (Fernandez-Juricic, 2002).

Because leashing of dogs may reduce some forms of disturbance (e.g., chasing) (Lafferty, 2001), we investigated the effect that dog leash laws have on the diversity and abundance of songbirds and small mammals. These groups are relatively unstudied in this context, yet appear to be both abundant and diverse (in the case of birds) in the Edmonton River Valley (Mowat, 1993). In general, urban bird communities appear to be more influenced by habitat features that occur at a local level than they are by large-scale landscape characteristics (Cleargeau et al., 1998, 2001) and this may be true of fragmented populations more generally (Mazerolle and Villard, 1999). Therefore, off-leash dogs in the Edmonton River Valley, which are officially restricted to designated sites, may affect wildlife on a very small spatial scale. Accordingly, we hypothesized that designated off-leash areas would represent comparatively

poor habitat and would negatively influence diversity and/or abundance of birds and small mammals relative to nearby similar habitat where dogs were required to be leashed within the same urban park system.

## Methods

### Study area

All census sites were located in the North Saskatchewan River valley and adjoining ravines within the city of Edmonton, Alberta (53° 33′ 00″ N–113° 28′ 00″ W). Within the 7400 hectares of parkland are 190 kilometers of multi-use trails and 22 different park areas. The presence of these amenities attracts an estimated 2 million users annually (Anonymous, 2002).

A total of 56 separate sites were selected within the river valley with an equal number of sites located in areas designated as requiring dogs to be on-leash and off-leash. On-leash sites were defined as sites which either disallowed dogs or required that they be leashed. These areas were also believed by City officials to have high public compliance with leash laws (K. Moore, personal communication). Off-leash sites were in officially designated off-leash areas or, in two cases, were in areas that were designated as on-leash, but were known to experience frequent use by off-leash dogs and their owners (K. Moore, personal communication). Sites were further categorized into three habitat classifications according to the dominant vegetation type: deciduous-dominated, coniferous-dominated, and meadow. Aspen (*Populus tremuloides*), the dominant tree species in the North Saskatchewan River valley, was qualitatively the most common tree species in deciduous-dominated sites (Mowat, 1993) which also contained balsam poplar (*Populus balsamifera*). Coniferous sites were generally located on north-facing slopes or in steep-sided ravines, and were dominated by white spruce (*Picea glauca*). Within meadow sites, we used two habitat sub-types; those that consisted of natural unmowed vegetation (i.e. semi-natural sites) and grassy areas comprised partly or mainly by introduced grass species that are routinely mowed by the City (i.e. manicured sites). We anticipated that manicured sites may have different communities than natural ones, but too few natural sites of sufficient size were available to obtain similar numbers of sites within that habitat alone. The few natural sites that we did find were located in small patches of grassland on south-facing slopes and along the bottom of the river valley. Vegetation cover in the natural sites was comprised of several species of grass (e.g. *Bromus inermis*, *Agropyron* spp., *Festuca* spp.), thistle, and leguminous species (e.g. *Melalotus* spp.) (Mowat, 1993). The distribution of on-leash sites among habitat types was 11 deciduous, 10 coniferous, and seven meadow sites. Within off-leash areas, sampling occurred at 10 deciduous, 10 coniferous, and eight meadow sites. We used 1:10 000 locally-produced orienteering maps to place our sampling sites at the center of target habitat patches and then navigated to them using known reference points. The location of trails was not considered during site selection. The centers of the sites were placed at least 250 meters apart to minimize the possibility of double-counting individuals.

### Bird surveys

We conducted bird surveys in all 56 sites a total of three times each between May and July 2002. Surveys were conducted between sunrise and 10 AM and only under calm weather

conditions (wind less than 5 on the Beaufort scale) without significant precipitation. Each site was sampled at a different time on each visit to control for temporal variation.

Each survey involved a 5-minute, 100 m, fixed-radius point count (Bibby et al., 1992) followed by a 5-minute playback (*sensu* Gunn et al. 2000 after Desrochers and Hannon, 1997) of a black-capped chickadee (*Poecile atricapillus*) mobbing call. The chickadee mobbing call is known to attract several bird species that occur within the study area (Hurd, 1996; Gunn et al., 2000) and we used it to increase detection of less vocal species (e.g., woodpeckers) and to provide opportunities for behavioural observations (below). A 5-minute post-playback point count concluded each survey. We recorded all birds that were seen or heard during the 15 min. Birds were only counted if they interacted with the habitat, meaning that birds observed flying over the study site were not recorded. Caution was taken to minimize the chance of double counting individual birds by carefully noting their direction and apparent movement during the census. When possible, we observed individual birds carefully to collect evidence of breeding activity (after Vickery et al., 1992) by taking advantage of the close approaches that typically followed use of the mobbing call (Gunn et al., 2000). Individual bird species were considered to be breeding at a site if we recorded one of the following criteria: (a) a male was singing on at least two of the three visits, or (b) an individual of either sex was seen exhibiting breeding behavior (i.e., traveling in a pair, carrying nesting material, food, or fecal sacs) on any visit (after Gunn et al., 2000).

## Small mammal surveys

To accommodate the greater effort that it required, small mammals were live-trapped at a randomly selected subset of 32 of the original 56 sites between mid-July and mid-August, 2002. The distribution among habitat types of the 32 sites was 10 deciduous, 10 coniferous and 12 meadow sites. Twelve meadow sites were selected to allow for equal sampling effort among meadow sub-types ($n$ = 6 of each) and among dog treatments ($n$ = 3 within each meadow sub-type).

Each site was sampled using an array of 10 Victor Tin-Cat® live-, multiple-capture traps placed approximately 20 m apart. The arrangement of traps varied between sites to accommodate local physical features, but was generally comprised by two parallel lines of traps placed greater than 3 m away from either side of a trail. When possible, all traps were placed within the site's point count radius. When this was not possible, traps were placed as close as possible to the point count center and within the same habitat type.

Each site was pre-baited for five nights then trapped for two consecutive nights to permit mark-recapture population estimation (Sutherland, 1996). Three or four sites were trapped per night and these were spread among two or more of the treatment and habitat types to control for seasonal variation in small mammal numbers. Pre-baiting was conducted using pop cans with enlarged openings that were nailed in place and baited with sunflower seeds. To maximize trapping success, traps were placed along woody debris and in other areas likely to be used by small mammals. Traps were covered with plant material to conceal their presence from the public and to provide insulation from both heat and cold. Traps were set in the evenings, baited with a handful of sunflower seeds and dry cat food, and checked the following mornings. During the day between the first and second night of trapping, each trap was locked open and left in place. Traps that were placed in manicured meadow sites were covered with wooden boards for additional protection from the elements.

Following the first night of trapping, each trapped individual was identified to species, sexed, weighed, and marked with a permanent marker at the base of its tail and then released.

The average time it took to process each animal was approximately 1 min. After the second night of trapping the same procedure was followed but no animals were marked.

### Statistical analysis

We calculated species diversity using the Shannon-Wiener diversity index (following Krebs, 1994). To examine differences in diversity and abundance among treatments and habitat types, we used parametric tests (ANOVA and *t*-tests) when the data satisfied the assumptions of normality and homogeneity of variance (Sokal and Rohlf, 1981). In some cases the data needed to be transformed to meet these assumptions so the square-root transformation ($\sqrt{Y} + \frac{1}{2}$) was applied (Sokal and Rohlf, 1981). We used Tukey's honestly-significant difference (HSD) statistic to conduct post-hoc, pair-wise tests among ANOVA means (Sokal and Rohlf, 1981). When the assumptions were not met and the data could not be transformed to meet them, we used the non-parametric analogue to a *t*-test, the Mann-Whitney U test.

## Results

### Birds

In total, 2 203 birds representing 61 species (including two unidentified *picidae* and *interidae* spp.) were counted during the bird censuses. The black-capped chickadee (see Table 1 for scientific names) was the most abundant species, accounting for 30% of all observations. Other common species, each accounting for at least 5% of all observations, were the least flycatcher, red-eyed vireo, red-breasted nuthatch, and yellow warbler.

We examined bird diversity as a function of habitat type and leashing bylaw designation in two ways; by including all birds that were detected and with only those birds that exhibited evidence of breeding. Across all species, bird community diversity differed as a function of habitat (Fig. 1(A); $F = 100.0, df = 2,50, P \leq 0.001$), but not as a function of dog leashing bylaws ($F = 1.5$, $df = 1,50$, $P = 0.23$) or the interaction between leashing bylaws and habitat ($F = 0.6$, $df = 2,50$, $P = 0.53$). Posthoc tests revealed that bird diversity did not differ between the deciduous-dominated and coniferous habitats (Tukey's HSD $P = 0.85$), but both of these were significantly more diverse than the meadow areas (Fig. 1(A); Tukey's HSD $P \leq 0.001$ for each). These results were qualitatively identical for birds that exhibited evidence of breeding (Fig 1(B)). Again, diversity differed as a function of habitat (Fig. 1(B); $F = 78.9, df = 2,50, P \leq 0.001$), but not bylaw designation (Fig. 1(B).; $F = 0.003$, $df = 1,50$, $P = 0.87$) or the interaction between bylaw designation and habitat ($F = 0.06$, $df = 2,50$, $P = (0.60)$. Pair-wise differences between habitats were also similar; breeding bird diversity did not differ between deciduous-dominated and coniferous habitats (Fig. 1(B). Tukey's HSD $P = 0.21$), but both of these habitat types had significantly greater diversity than meadow areas (Fig. 1(B); Tukey's HSD $P \leq 0.001$ for each).

To assess differences in the abundance of birds as a function of leash designation, we compared the maximum number of individuals of all species detected at each site. The average of these abundances differed between habitat types (Fig. 2; $F = 106.2, df = 2,50$, $P \leq 0.001$), but not between on-leash and off-leash sites (Fig. 2; $F = 0.004$, $df = 1,50$, $P = 0.95$) or as a function of the interaction between leashing bylaw designation and habitat type ($F = 1.1, df = 2,50, P = 0.34$). The effect of habitat resulted in similar differences as before, and meadow sites had approximately 80% fewer birds than deciduous and coniferous-dominated sites.

**Table 1** Summary of the number and species of birds detected during censusues

| Common name | Latin name | Number of detections during surveys (% of these detections made in OFF leash sites) | |
|---|---|---|---|
| ring-billed gull | *Larus delawarensis* | 8 (63) | |
| ring-necked pheasant | *Phasianus colchicus* | 2 (100) | |
| sharp-shinned hawk | *Accipiter striatus* | 3 (33) | |
| Cooper's hawk | *Accipiter cooperii* | 4 (50) | |
| pileated woodpecker | *Dryocopus pileatus* | 8 (50) | |
| downy woodpecker | *Picoides pubescens* | 44 (50) | a |
| hairy woodpecker | *Picoides villosus* | 3 (33) | |
| unidentified woodpecker | *Picidea* | 6 (33) | a |
| northern flicker | *Colaptes auratus* | 1 (0) | |
| yellow-bellied sapsucker | *Sphyrapicus varius* | 2 (50) | |
| western wood-pewee | *Contopus sordidulus* | 2 (50) | |
| eastern phoebe | *Sayornis phoebe* | 5 (40) | |
| alder flycatcher | *Empidonax alnorum* | 3 (33) | |
| least flycatcher | *Empidonax minimus* | 114 (56) | a |
| American crow | *Corvus brachyrhynchos* | 53 (66) | |
| common raven | *Corvus corax* | 2 (0) | |
| blue jay | *Cyanocitta cristata* | 14 (50) | |
| black-billed magpie | *Pica pica* | 56 (43) | |
| black-capped chickadee | *Poecile atricapillus* | 670 (51) | a |
| boreal chickadee | *Poecile hudsonicus* | 2 (0) | |
| white-breasted nuthatch | *Sitta carolinensis* | 47 (45) | a |
| red-breasted nuthatch | *Sitta canadensis* | 148 (45) | a |
| house wren | *Troglodytes aedon* | 12 (33) | a |
| ruby-crowned kinglet | *Regulus calendula* | 13 (46) | a |
| golden-crowned kinglet | *Regulus satrapa* | 8 (38) | a |
| American robin | *Turdus migratorius* | 68 (53) | a |
| Swainson's thrush | *Catharus ustulatus* | 7 (57) | b |
| hermit thrush | *Catharus guttatus* | 1 (0) | b |
| cedar waxwing | *Bombycilla cedrorum* | 10 (70) | a |
| blue-headed vireo | *Vireo solitarius* | 27 (30) | a |
| red-eyed vireo | *Vireo olivaceus* | 141 (57) | a |
| warbling vireo | *Vireo gilvus* | 4 (50) | |
| black-and-white warbler | *Mniotilta varia* | 1 (100) | |
| Tennessee warbler | *Vermivora peregrina* | 11 (36) | b |
| orange-crowned warbler | *Vermivora celata* | 3 (33) | |
| yellow warbler | *Dendroica petechia* | 194 (51) | a |
| Magnolia warbler | *Dendroica magnolia* | 1 (0) | |
| yellow-rumped warbler | *Dendroica coronata* | 31 (19) | a |
| blackpoll warbler | *Dendroica striata* | 7 (71) | |
| ovenbird | *Seiurus aurocapillus* | 13 (38) | a,b |
| Canada warbler | *Wilsonia canadensis* | 2 (100) | |
| American redstart | *Setophaga ruticilla* | 3 (0) | |
| red-winged blackbird | *Agelaius phoeniceus* | 1 (0) | |
| unidentified blackbird | *Icteridae* | 9 (11) | a |
| northern oriole | *Icterus galbula* | 7 (57) | a |
| western tanager | *Piranga ludoviciana* | 31 (48) | a |
| rose-breasted grosbeak | *Pheuticus ludovicianus* | 6 (50) | |
| purple finch | *Carpodacus purpureus* | 5 (40) | a |

| song sparrow | *Melospiza melodia* | 21 (62) | a,b |
| house sparrow | *Passer domesticus* | 4 (50) | |
| Total detections | | 2203 (49) | |

[a]Species considered to be breeding, within at least one study site (see methods for definition)
[b]Species that nest on the ground or in low shrubs which were thus considered to have potentially greater vulnerability to the effects of urban dogs

We considered the 11 species that nest on the ground or in low shrubs to have potentially greater vulnerability to the effects of urban dogs. Thus, we compared the abundance of these species individually as a function of dog designation and grouped birds by habitat to increase the power of the test (*sensu* Cohen, 1988). Eight species displayed clearly non-significant differences in abundance between on-leash and off-leash sites (Mann-Whitney $U \leq 92.0$, $df = 1$ to 29, $P \geq 0.16$ for each species). The ninth species, the song sparrow, was only marginally non-significant ($U = 9.0$, $df = 7$, $P = 0.08$), but in the unpredicted direction; almost twice as many sparrows were counted in off-leash sites as were in on-leash areas. When subjected to a Bonferroni adjustment to account for the multiple comparisons, all species-specific differences were highly non-significant (adjusted $P$ required for significance ( 0.0056). There were insufficient data to analyze the two other ground-nesting species (vesper sparrow and hermit thrush) that were counted during the surveys.

In addition to these ground-nesting birds, we also examined differences in the abundance of the five most common forest species encountered during the survey period for which differences may have been more apparent owing to larger values and lower variance (again, *sensu* Cohen, 1988); black-capped chickadee, least flycatcher, red-breasted nuthatch, red-eyed vireo, and yellow warbler). Four species showed non-significant differences in abundance between on-leash and off-leash sites (Mann-Whitney $U \leq 237.5$, $df = 26$ to 42, $P \geq 0.33$). Comparable to song sparrows, red-eyed vireos were 33% more abundant in the off-leash sites than they were in on-leash sites (Mann-Whitney $U = 116.0$, $df = 38$, $P = 0.03$). However, after subjecting the data to a Bonferroni adjustment to account for the multiple comparisons made between species this difference was not significant (adjusted $P$ required for significance (0.01).

## Small mammals

Three species were detected in the small mammal census. In order of decreasing abundance these species were the deer mouse (*Peromyscus maniculatus*), red-backed vole (*Clethri-*

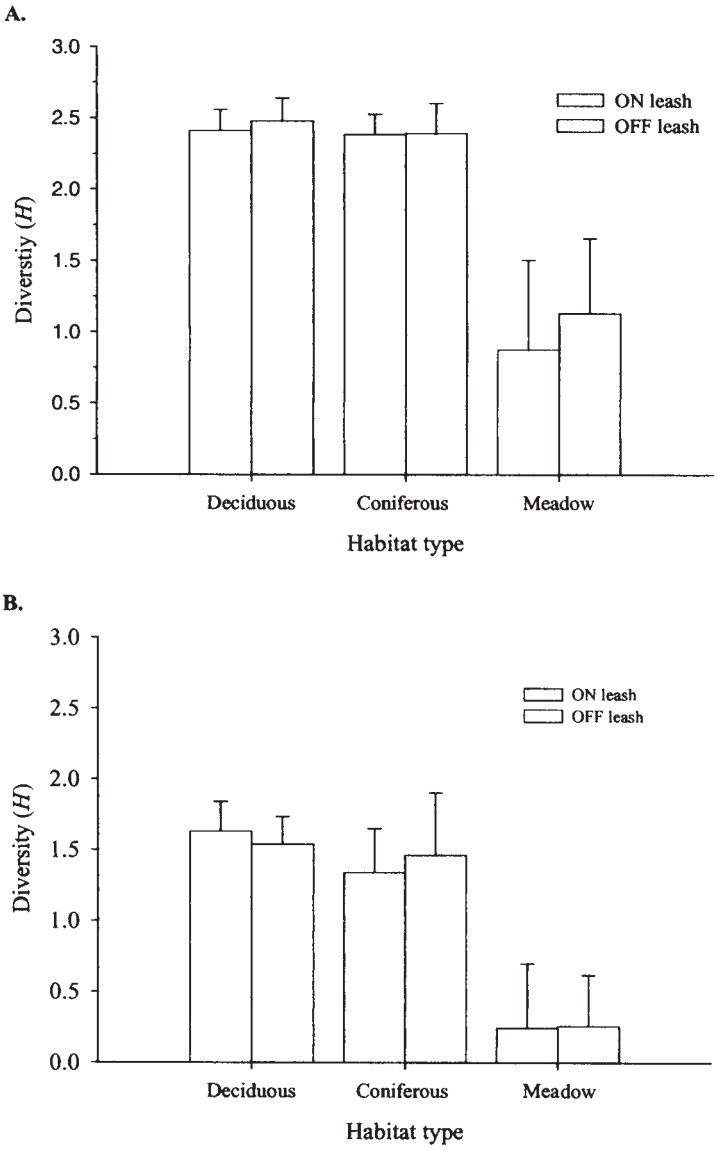

**Fig. 1** Shannon-Wiener indices of bird diversity (mean ± SD) across dog treatment and habitat types observed in the Edmonton river valley parks for (A) all bird species recorded during survey period and (B) only those bird species considered to be breeding at a site

*onomys gapperi*), and meadow vole (*Microtus pennsylvanicus*), comprising a total of 287 individuals. Sixty-one individuals were recaptured on the second night of trapping, bringing the total number of captures to 348.

Abundance was compared using two sources of data; the highest counts per site based on the greatest number of individuals trapped in one night and population estimates derived for each site using the Petersen mark-recapture technique (as described by Sutherland, 1996).

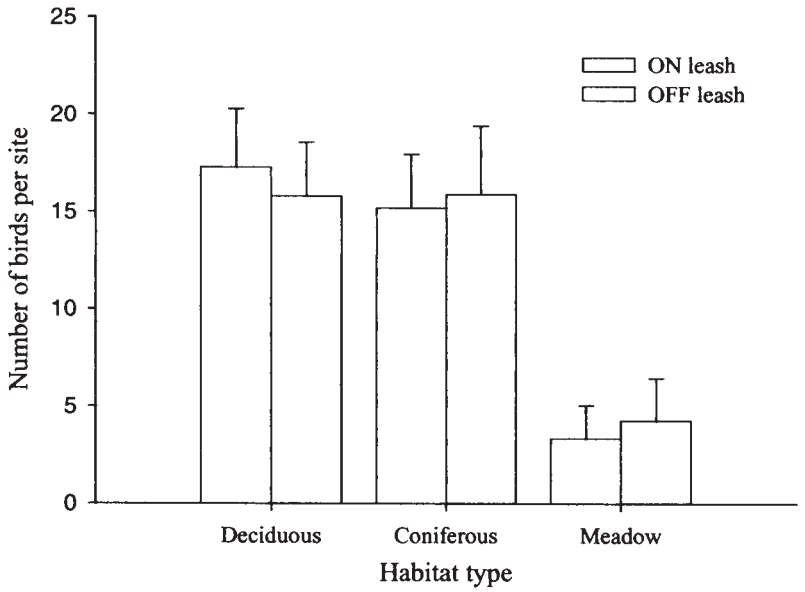

**Fig. 2** Average number of birds detected per site (mean ± SD) across all species, treatment, and habitat types in the Edmonton River valley parks

Square-root transformation population estimates of each species were analyzed separately via two-way ANOVA (for deer mice and red-backed voles which occurred in both forested habitat types) and $t$-test (for meadow voles which occurred only in meadow habitat). For deer mice and red-backed voles, population estimates did not differ as a function of habitat (Figs. 3(A) and (B), $F = 0.003$ and 1.02 respectively, $df = 2,9$ and 2,7, $P = 0.96$ and 0.33), leash designation ($F = 0.04$ and 0.64, $df = 1,9$ and 1,7, $P = 0.85$ and 0.43) or the interaction between dog treatment and habitat type ( $F = 0.63$ and 2.23, $df = 2,9$ and 2,7, $P = 0.44$ and 0.16). Meadow voles also displayed a clearly non-significant difference between on-leash and off-leash sites (Fig. 3(C), $t = -0.12$, $df = 2,3$, $P = 0.92$). Across all three species, these results were qualitatively unchanged when we made similar comparisons using the maximum one-night capture rate for each site as a measure of abundance.

## Manicured vs. semi-natural comparisons

Because the apparent bird and small mammal diversity of meadow habitat differed so strikingly in the field as a function of horticultural practice, we examined these differences with an *a posteriori* analysis. Bird diversity was significantly greater in semi-natural sites than it was in manicured sites ($t = 2.42$, $df = 8,4$, $P = 0.04$). However, overall, bird abundance did not differ as a function of horticultural practice ($t = 1.20$, $df = 10,9$, $P = 0.26$), presumably because of changes in the composition of the bird community. Predictably, more typically-urban species (i.e. black-billed magpie, American crow, ring-billed gull, American robin, and house sparrow) were found in manicured sites compared to a more native composition of the bird community within semi-natural sites (i.e. savannah sparrow, Le Contes sparrow, vesper sparrow and clay-colored sparrow).

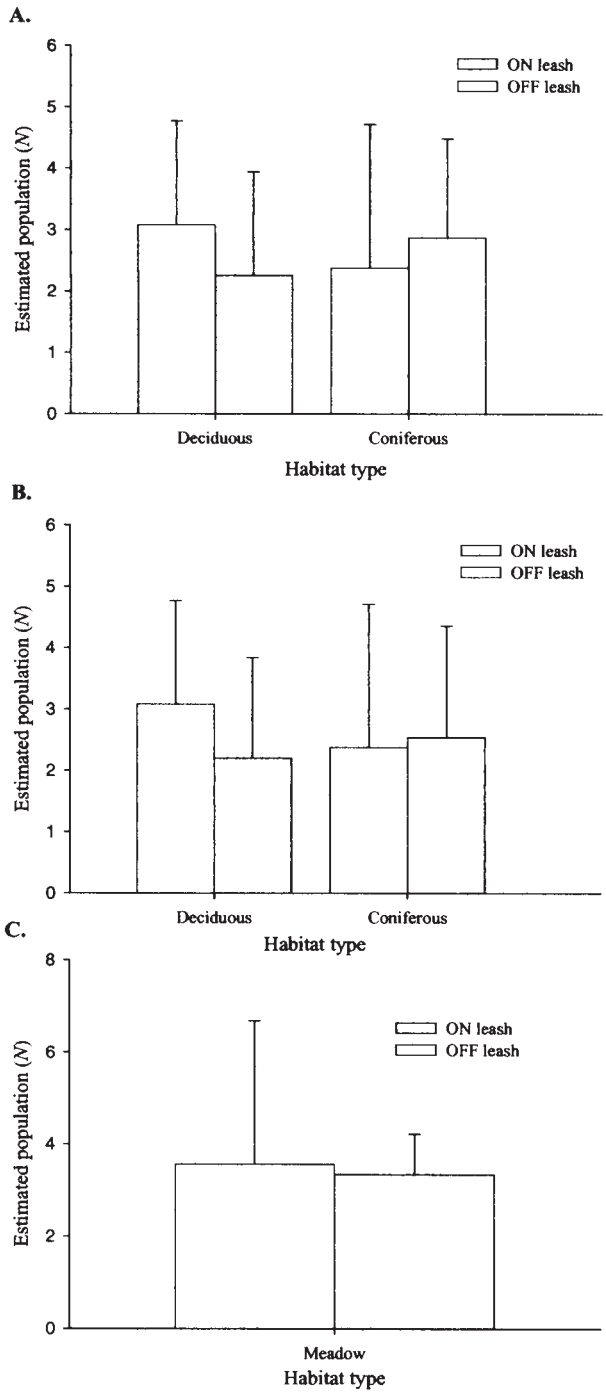

**Fig. 3** Estimates of small mammal population sizes (mean ± SD) across treatment and habitat types observed in the Edmonton river valley parks for (A) deer mice and (B) red-backed voles and (C) meadow voles. Estimates were calculated with square root transformed data using the Petersen method of mark-recapture

Small mammal abundance was also higher in semi-natural sites. As many as 11 meadow voles were caught during one night in a single semi-natural meadow site, and the average one-night maximum capture rate was six (only meadow voles were trapped in meadow sites). This average value corresponds to an approximate and average population estimate of 11 individuals per semi-natural meadow site. In contrast, not one individual of any species was caught among all manicured sites during the entire survey period. The lack of variance in this category precludes statistical analysis.

## Discussion

Designation of sites for dogs to be on- or off-leash had no measurable effect on the diversity or abundance of birds and small mammals within the sites that we surveyed in the Edmonton River valley. There was a similar lack of difference in bird abundance when we restricted analyses to only those species that appeared to be breeding, only those species that nest on the ground or in low shrubs, and only the most abundant species. These results contrast with some other studies, which reported that many species of wildlife are affected by free-running dogs (Sime, 1999; Lafferty, 2001). We expected that an effect on diversity of leash designation would be apparent at the scale of our censuses because comparable local scales appear more generally to influence the composition of urban bird communities (Clergeau et al., 1998, 2001; Melles et al., 2003). Given that our results did not support our hypothesis that leashing bylaws affect the diversity or abundance of birds and small mammals, there are two types of interpretations for them. In the first category, several factors make it is plausible that free-running dogs do not affect urban birds or wildlife, or not by the measures we employed (diversity and abundance). In a second category, our design may have precluded identifying effects of dogs that really exist.

Consistent with the first interpretation, free-running dogs may not affect birds and small mammals in the vicinity of human use trails because dog activity is restricted to such small temporal and spatial scales that its effects are negligible. Behavioral data suggests that off-leash dogs generally do not travel far off trail, and that when they do it is only for brief periods (Bekoff and Meaney, 1997). By our subjective and anecdotal assessment, dogs in our study area travelled off trail very little, especially in wooded sites, and only slightly more in semi-natural meadow sites. However, dogs did typically stray widely within the manicured meadow sites (AF, personal observation), but in those areas low habitat quality likely overwhelmed our ability to detect differences in diversity or abundance owing to dog activity.

A second biological reason that there was no apparent effect of leashing bylaws is that wildlife, particularly birds, in suburban and urban areas exist there because they are fairly tolerant of moderate levels of human activity (Cooke, 1980), including accompanying dogs. Fernandez-Juricic et al. (2001) have shown that birds can even become habituated to dogs in highly used urban parks. Bird tolerance appears to be highest once territories are established and nesting has begun (Tilghman, 1987) and this corresponds with the timing of our censuses. In fact, moderately perturbed habitats often have greater species richness than do the most natural habitats (Blair, 1996; Tilghman, 1987), perhaps as a function of greater habitat diversity. Thus, the tendency for song sparrows and red-eyed vireos to be more abundant in areas with off-leash dogs may mean that this disturbance somehow improves habitat quality for these species. This supports Mortberg's (2001) assertion that the effect of disturbance from recreation on densities of breeding birds is species-specific.

A third reason that leash designation may not affect birds and small mammals in Edmonton is because these communities may already have responded to the presence of wild coyotes (*Canis latrans*), which are abundant in Edmonton's North Saskatchewan River Valley (Mowat, 1993; Patriquin, 1992). Coyotes are a natural predator of both birds and small mammals (Pattie and Fisher, 1999) and historically occurred in the aspen parkland ecoregion that surrounds Edmonton. The presence of coyotes may reduce the novelty, and hence reaction to, free-running dogs and they may also enhance bird and small mammal communities by reducing the occurrence in ravine parks of domestic cats (Crooks and Soule, 1999).

A second category of explanation for our results is that free-running dogs had negative biological effects on wildlife in our study area, but we were not able to detect them. There are three main ways that this may have come about. The first is that the effect of leash laws was swamped by variation in one or more habitat or site characteristics that exerted greater influences on wildlife diversity or abundance. Among these potential characteristics are landscape structure adjacent to woodlands (Jokimaki, 1999; Melles et al., 2003), habitat structural complexity (e.g., Scott et al., 2003), distance to the nearest trail (Tilghman, 1987; Miller et al., 1998), distance to water (e.g., Tilghman, 1987), level of human activity (Fernandez-Juricic and Jokimaki, 2001), average canopy height (Tilghman, 1987), and the size of censused patches (Crooks et al., 2004). Trail proximity may have particular importance because trails can alter species composition in forest ecosystems (Miller et al., 1998) and both official and unofficial trails are ubiquitous in the Edmonton River Valley. Other studies have shown that bird diversity decreases along a gradient of increasing urbanization (Blair, 1996; Clergeau et al., 1998; Reynaud and Thioulouse, 2000), and such effects could obscure or contradict the potential negative effect of off-leash dogs. During site selection, we did not attempt to measure trail density, proximity to city center, patch size or any of the other habitat characteristics named above, and these may also be profitable subjects of further investigation.

A second reason that we may not have detected existing differences in the diversity or abundance of birds and small mammals is that this effect was confounded by variation in habitat quality between the two leashing designations. In contrast to the majority of the urban parks, it was our subjective impression that the designated off-leash areas within Edmonton were less developed. Parks personnel confirmed that off-leash areas are generally designated in areas where conflicts with a majority of other user types can be avoided (K. Moore and D. Frost, personal communications). Development levels may have an influence on wildlife because of its implications in both biotic and abiotic components of habitat quality. Biologically, less developed parks have increased amounts of vegetative cover (Jokimaki, 1999), and decreased occurrences of exotic species (Blair, 1996). Greater vegetation cover in particular is known to affect both birds (Jokimaki, 1999) and small mammals (Dickman, 1986). More specifically, increased cover can cause birds to show more tolerance towards human-related disturbances (Knight and Temple, 1995). Off-leash areas may also have occurred in areas with greater food availability, particularly for insectivorous species, which may generally be more sensitive to the effects of urbanization (Parsons et al., 2003; Lim and Sodhi, 2004). It would be worthwhile to subject this hypothesis, that off-leash areas occur in areas of higher habitat quality, to further investigation.

A final reason why we failed to detect an impact of leash designation within the urban parks of Edmonton may be that no difference existed in dog behaviour as a function of leashing bylaws. Via personal observation throughout the summer, and through personal communication with City of Edmonton Park Rangers, there is evidence that some people do not comply with leashing bylaws in city parks. Non-compliance may be a widespread problem as Lafferty (2001) also noted low levels of compliance with leash laws by dog

owners on a southern California beach. It is possible that the rate of non-compliance was high enough to nullify functional differences in our leash designation treatments and, consequently, differences in our response variables.

Whether or not there exist effects of off leash dogs on the diversity and abundance of birds and small mammals, dog activity may disrupt several more subtle aspects of wildlife communities that we did not measure. Most importantly, dogs may reduce nesting success (e.g., Gutzwiller et al., 1998), but not species abundance or the frequency of nesting attempts in habitats that ultimately function as sinks for regional populations (*sensu* Pulliam, 1988). For this reason, animal density and abundance may not be reliable indicators of habitat quality as we have implicitly assumed (Van Horne, 1983). In addition, domestic dogs have the potential to impose stress-related physiological effects on wildlife and may introduce diseases and parasites into populations of urban wildlife (Simes, 1999). Finally, dogs may exert greater effects on larger mammals that provide more visible targets for chase (e.g., white-tailed deer [Fuller, 1990; Ballard , 1999], red squirrel, snowshoe hare) that we did not census.

### Manicured versus semi-natural meadow sites

Because our sample of meadow habitat included both manicured and semi-natural sites, we were able to show that meadow sites with manicured grass had significantly lower levels of avian diversity and small mammal abundance than did semi-natural sites with non-manicured grass. The abundance of birds at manicured sites also tended to be lower than it was at semi-natural sites, but not significantly so with our conservative multiple-comparison procedure. The lower diversity of birds in manicured sites is probably a function of their decreased habitat suitability as nesting or foraging sites. Because most birds do not forage far from vegetative cover, which they perceive as protection from predators (Giesbrecht and Ankney, 1998; Rodriguez et al., 2001), the lack of vegetative cover in these areas probably compromised both habitat quality and resource availability (Scheiman et al., 2003). Similar limitations of short grass would have afflicted the small mammal community (Jensen and Honess, 1995), explaining the complete lack of mammal detections in this area. Most of the native songbirds in the study area, which are insectivorous, granivorous, or fruitivorous, probably also lacked appropriate forage in the manicured sites. Instead, these sites would have contained the kind of human refuse (i.e. because they are the site of picnics, festivals, and organized sport) that is favoured by the scavenging and urbanized species we found there (e.g., ring-billed gulls, black-billed magpies, American crows, house sparrows and American robins; see also Fernandez-Juricic et al., 2002; Parsons et al., 2003). Our findings support a general expectation that more heavily modified areas are typically dominated by a few species that occur at high densities (Tilghman, 1987; Edgar and Kershaw, 1994; Melles *et al.*, 2003; Fraterrigo and Wiens, 2005), and also suggest that these practices exert far greater effects than the presence of off-leash dogs.

## Conclusions

Although this study found no impact of dog leashing by-laws on the diversity and abundance of both birds and small mammals, it would be imprudent to conclude that dogs have no effect on wildlife for the several reasons described above. Among the results of this study, perhaps the most pertinent finding that relates directly to the management of urban parks that are assumed to have much value to resident wildlife (Fernandez-Juricic and Jokimaki, 2001) is

the issue of leash law compliance. The suspected lack of compliance indicates the need for investigation into the reasons why people ignore leashing bylaws so that steps can be taken to improve the situation. The striking effect of horticultural practices on the diversity (birds) and abundance (mammals) suggests an inexpensive solution for increasing biodiversity in urban areas. It is likely that cities could substantially increase biodiversity simply by letting existing green spaces revert to a more natural state (Crooks et al., 2004).

If future research finds that dogs do adversely affect wildlife, there are several measures that might reduce this impact. Increased enforcement and higher fines may increase the effect of leashing laws. Better visual delineation of sensitive areas might be effective to further restrict the spatial impact of dog activity. Finally, city planners might try to identify key habitat features that are elsewhere correlated with wildlife diversity (e.g., structural diversity: Linehan et al., 1967; Tilghman, 1987) and then assess and limit the impact of dogs and other recreational activity on these attributes.

**Acknowledgments** This project was funded by the Natural Sciences and Engineering Research Council through an Undergraduate Research Award to AF and a Discovery Grant to CCSC. Important logistical support was affably and capably provided by the City of Edmonton via its employees Doug Frost, Kevin Moore, and George Diduck. We thank Nathan Lemphers, Catherine O'Brien, and Robin Schlese for their help in the field.

## ABSTRACT

*From September 1995 to April 1996 we studied interactions among dogs, people, and the environment in Boulder, Colorado. Data on behavioral disturbances by off-leash dogs who were accompanied by a person were collected with respect to dog-dog and dog-human interactions, dog-wildlife encounters, dogs trampling vegetation, and dogs entering and disturbing bodies of water. A questionnaire also was administered. Behavioral data showed that off-leash dogs generally did not travel far off trail, that when they did it was for short periods of time, and that they rarely were observed to chase other dogs, disturb people, chase wildlife, destroy vegetation, or enter bodies of water. Results from analyses of the questionnaire (skewed toward non-dog owners) showed that dog owners and non-dog owners agreed that people were more disruptive to the environment than dogs and that unruly people were more problematic than unruly dogs. We conclude that the well-being and interests of dogs should not summarily and dismissively be compromised when dogs and people attempt to share limited space that can be used by all parties for recreational purposes. Indeed, a higher percentage of people reported that the quality of dogs' experience of the outdoors would be compromised more than their own enjoyment if dogs could not walk off-leash in areas where this is currently permitted. The methods used and the results from this case study can serve as a model for other locations in which dogs and people compete for limited spatial resources.*

## INTRODUCTION

Across the United States and in many other countries there is growing interest in how human and nonhuman animals (hereafter animals) can best share space that can be used by all parties for recreational purposes (see Knight and Gutzwiller 1995 for review). Although concern often focuses on the mutual well-being of humans and animals, when priorities have to be established, humans generally receive favorable treatment. Furthermore, when there are competing interests among humans, domestic dogs (*Canis familiaris*), wild animals, and "nature" in general, dogs' well-being and interests are often overridden (because they are "merely dogs" or "simply domesticated animals;" see Bekoff 1995, 1996a and Bekoff and Jamieson 1996 for discussion).

In the late 1800s, the people of Boulder, Colorado, had the foresight to set aside a large parcel of land backing into the foothills. Since then, additional land has been purchased under an Open Space program to create a greenbelt around the city, and to provide wildlife habitat and recreational opportunities. This program has been very successful and popular with the public.

Please send all correspondence to: Marc Bekoff, EPO Biology, University of Colorado, Boulder, Colorado 80309-0334 USA e-mail: marc.bekoff@colorado.edu

In recent years, there has been a large increase in the use of Open Space trails in Boulder. As emphasized by Roberts (1995), Boulderites who enjoy the outdoors "love their parks to death" as they pursue recreational activities. This community resource, which is shared by humans and animals, consists of about 25,000 acres and approximately 150 miles of trails. In 1993 there were about 1.3 million visits, an increase of 13% compared to previous years (Miller 1994). In one study, it was reported that 21.3% of groups visiting Boulder City Open Space participated in exercising their companion dogs (Zeller et al. 1994). In Boulder, as in other communities, companion animals such as dogs are very important to some people and problematic to others. The resulting conflicts between different groups (pro- and anti-dog factions) of people have placed the Boulder City Council in the position of having to consider various management decisions. Empirical data are necessary and can help to deal with controversial issues such as these in a more objective and straightforward manner. The development of sound management policies that attempt to maximize the well-being of all parties in recreational areas, including the possibility of placing restrictions on dogs, require detailed consideration of perceived and actual problems. Whereas there is a significant literature on human attitudes towards domestic and wild animals (e.g. Kellert 1994; Serpell 1995a,b, and references therein), there are very few data that can inform management decisions at the local level. As the number of humans and companion animals increases, existing land use problems continue to grow in Boulder (Roberts 1995; Zaslowsky 1995) and in other communities.

Among the major issues regarding land use in Boulder and other locales is the concern that off-leash dogs disturb other dogs, people, wildlife, and the environment. Some data support this claim (see Lowry and McArthur 1978, Gentry 1983, Mainini et al. 1993, Miller 1994, Knight & Gutzwiller 1995, and references therein), whereas other data suggest either that dogs have a minimal demonstrable effect on animals such as deer (e.g. Progulske and Baskett 1958; Sweeney et al. 1971; Scott and Causey 1973) or that human impacts are equally or more invasive (e.g. Yalden and Yalden 1990). Clearly, the issues concerning the impact of dogs on wildlife and habitat require further and more detailed attention.

# METHODS

Data were collected from September 1995 through April 1996 at six different locations in and around Boulder (four Open Space locations and on the University of Colorado, Boulder, campus and on the Pearl Street Mall). To achieve our goals of learning more about the behavior of off-leash dogs and about people's attitudes and perceptions towards dogs, we devised an original questionnaire and also collected detailed information on behavior. We felt that a combination of these two approaches should help to clarify distinctions between perceived problems and actual areas of conflict among dogs, people, and the environment.

## Questionnaires

Our questionnaire (Appendix A) characterized the respondents by place of residence, patterns of use of Open Space, whether or not they owned and had a dog with them, their attitudes toward dogs and people, their experiences with dogs and people on Open Space, their views of the impact of dogs and people on habitat and wildlife, and their concerns about Open Space in the future. The questionnaire was developed and implemented with the input of professional pollsters and administered at the same four locations on Open Space at which data were collected on behavioral disturbances (Mt. Sanitas, Bobolink Trail, Chautauqua, Doudy Draw) where dogs are allowed to be off-leash, and also at two other locations (University of Colorado, Boulder Campus and Pearl Street Mall) where dogs are required to be on a leash. (Two other areas [Sawhill and Walden Ponds] received too little use to be included in the present data set.) All visitors with and without dogs were asked to fill out the questionnaire while the researcher waited for its completion. The questionnaires were analyzed by Market Research Services, Longmont, Colorado and cross-tabulations were run so that responses to each question could be correlated with one another.

## Behavioral Disturbances

In this part of our study we were concerned with the following short-term and direct behavioral disturbances (for discussion, see Knight and Cole 1995, p. 61) by off-leash, companion dogs who were accompanied by a person. Data consisted of (i) characterization of the patterns of space use by individually observed dogs; (ii) characterization of patterns of chasing and flushing wildlife and disturbing vegetation and bodies of water; (iii) the nature of dog-dog encounters, and (iv) the nature of dog-people encounters.

Behavioral data were collected at six locations (see above). Observations were made "on trail" or from a stable vantage point, and efforts were made to minimize the effects of

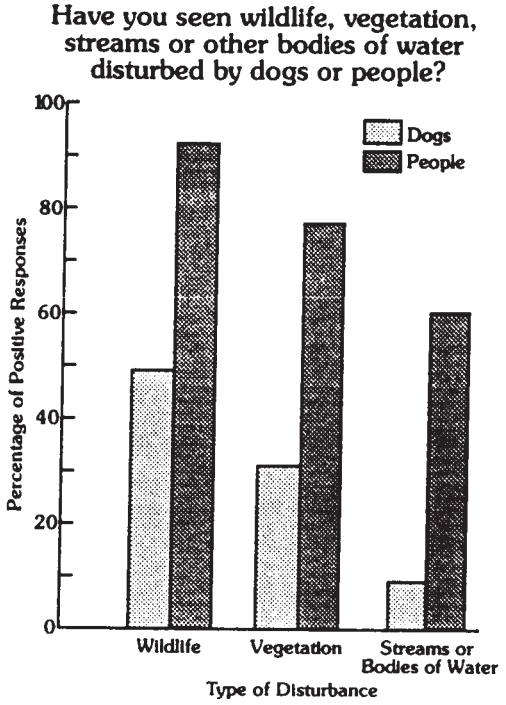
researchers' presence. For example, observers sat in the same place quietly and dogs generally paid little overt attention to them. At each location, beginning at the trailhead and extending for 500 meters (m), the trail was partitioned with flagging into five linear 100m sections. Other 100m sections further along a trail were randomly sampled to see if there was any "trailhead effect."

Seven different people collected field data and administered the questionnaires. Regular meetings were held to make sure that there was consistency among the different researchers. Focal animal sampling (Altmann 1974), in which individual dogs were followed during their travels within each of the 100-meter sections, was used. All of the dog's activities and its location were recorded on prepared score sheets or read into a voice-activated tape recorder. A continuous time-base was maintained using stop watches. For each 100-meter section, we recorded the frequencies and rates with which dogs were "off trail" and "on trail," the distances from the trail that dogs travelled, and whether or not leaving the trail was owner-induced (e.g. by throwing a Frisbee or a stick). We recorded all events of flushing and chasing, including and independent of the focal animal. We recorded observed instances when a dog did not appear to flush or to chase wildlife (recognizing that unobservable physiological changes can be caused by the presence of dogs; for discussion, see Gabrielson and Smith 1995). The mammalian species with which we were concerned included mule deer (*Odocoileus hemionus*), yellow-bellied marmots (*Marmota flaviventris*), black-tailed prairie dogs (*Cynomys ludovicianus*), rock squirrels (*Spermophilus variegatus*), jackrabbits (*Lepus* spp.), cottontails (*Sylvilagus* spp.), coyotes (*Canis latrans*), and red foxes (*Vulpes vulpes*). Avian species included black-billed magpies (*Pica pica*), robins (*Turdus migratorius*), dark-eyed juncos (*Junco hyemalis*), mallard ducks (*Anas platyrhynchos*), steller's jays (*Cyanocitta stelleri*), and mountain (*Parus gambeli*) and black-capped chickadees (*Parus atricapillus*).

Data were analyzed using proportions tests (Bruning and Kintz 1977, p. 222ff) which generate the z statistic. We used $p<0.05$ (two-tailed test; $z_{crit}>1.96$) to indicate significant differences between two percentages. The phrase "no significant difference" or similar terms mean that $z\leq1.96$ and $p>0.05$. Critical values of z for other levels of statistical significance are 2.58 ($p<0.010$) and 3.30 ($p<0.001$).

# RESULTS

## Behavioral Disturbances



Approximately 800 different dogs were observed for about a total of 150 hours. The behavior of dogs at different locations and at the same locale did not vary significantly (detailed analyses for the different locations are presented in Bekoff 1996b). Off-leash dogs generally travelled less than 2-5 m off trail for fewer than 1-2 minutes (min). For example, in one study (n=100 dogs) at Mt. Sanitas, 30 (=30%) dogs remained on the trail and 45 (=45%) dogs went off trail between 1-5m for less than 1 min. In a second study at Mt. Sanitas (n=80 dogs), 80% of dogs remained within 1-3m of the trail (15% remained on trail and 40% went less than 1m off trail) and in a third study at Mt. Sanitas (n=100 dogs), 93 (=93%) of dogs remained within 5m of the trail. The general impression of observers was that when dogs went far off trail, they were lured off by the people who were responsible for them (e.g. people threw sticks, Frisbees, or went off trail and then called their dogs). It is also notable that only 2 "earnest chases" of wildlife (1 deer and 1 unidentified squirrel) were observed in which it was unambiguously concluded that it was the dog who initiated and maintained the chase. Dogs also only rarely entered bodies of water. Similar behavioral data were collected at Chautauqua (n=272 dogs). In addition, information on dog-dog interactions showed that 20/26 (81%) were friendly (dogs greeted, sniffed, or played with one another) or neutral (dogs passed one another with no physical contact) and 6 (19%; $p<0.001$) had aggressive (threat) components. All observers noted that dogs off leash were friendlier than dogs on leash, although no detailed data were collected on this aspect of behavior. We also observed 172 dog-people interactions of which 146 (85%) were neutral and the rest (n=26, 15%; $p<0.001$) were friendly. When sufficient data could be collected, they indicated that there were no differences in the behavior of dogs in different segments of the trail (1st 100m, 2nd 100m, 3rd 100m).

## Questionnaires

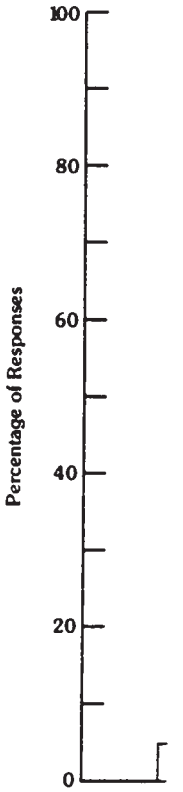
Four hundred and fifty (n=450) questionnaires were completed. More non-dog owners (53.2%) than dog owners (46.8%) were polled. Of all respondents, 96.4% were comfortable with dogs, and there were no significant differences ($p>0.05$) among different locations or between dog owners and non-dog owners. Most people ($p<0.01$) thought it would lessen the quality of their own (68.3%) and their dog's (82.2%) out-

door experience if dogs had to be leashed. In general, people were more disturbed by large dogs; breeds singled out as threatening (n=35 respondents) included: Rottweilers (35.3%), Doberman Pinschers (20%), Pit Bull Terriers (17.1%), and Chows (14.3%). Many more people reported seeing other people disturb wildlife (92.2%), vegetation (78.0%), and bodies of water (60.5%) significantly more often ($p<0.001$ for all comparisons) than dogs (49.7%, 31.4%, and 9.0%, respectively; Figure 1).

**Figure 1.**

**The percentage of positive ("yes") responses to the question "Have you seen wildlife, vegetation, streams, or other bodies of water disturbed by dogs or people?" (Questions 18-23, see Appendix A)**

While we did not detect any seasonal differences in water use by dogs, it is possible that in the hottest months of the year (when we were not in the field; June-August ) they would disturb water more than at other times of the year.



Overall responses to the question "What do you think is the biggest problem facing those who use parks and open space?" are presented in Figure 2. This question was also analyzed separately for dog owners and non-dog owners. A small, but significantly higher percentage of non-dog owners thought that there were too many dogs (10.6%) when compared to dog owners (2.9%; $p<0.01$), and a significantly higher proportion of non-dog owners (28.5%) thought that there were too many piles of dog feces left on or near trails when compared to dog-owners (19.5; $p<0.05$). Similar percentages ($p>0.05$) of non-dog owners and dog owners reported that there were too many people (non-dog owners: 47.3%; dog owners: 53.4%), too many unruly dogs (15.5%; 8.0%), and too many unruly people (32.4%; 28.2%). Both groups agreed that people, and not dogs, were the major problem. Regardless of location, respondents indicated that there were far too many people when compared to the number of dogs ($p<0.001$) and too many unruly people when compared to the number of unruly dogs ($p<0.001$). Disturbance by people included talking loudly, trampling vegetation, and littering.

Non-dog owners and dog owners were also asked what they thought about a number of different issues centering on purported problems with off-leash dogs. Similar proportions ($p>0.05$) indicated that there should be standardized obedience tests for dogs (non-dog owners: 48.2%; dog owners: 42.7%), that dogs should not be banned from Open Space (93.3; 98.2%), and that additional areas where dogs could run free should be established (72.3%; 64.3%). A significantly higher percentage of non-dog owners (55.0%) when compared to dog owners (37.3%) believed that there should be an annual fee for dogs using Open Space, that dogs should be on leashes at all times (30.5%; 19.0%), and that there should be stricter enforcement of voice and sight control (76.6%; 66.0%).

## DISCUSSION

The present study was concerned with interactions among domestic dogs, people, and the environment in Boulder, Colorado. There were few noteworthy differences when data were analyzed by location. While some of the results may be specific to this area, there seems to be a more general message that deserves serious attention from those who live in other environs. There is no doubt that *some* dogs go off trail for various amounts of time and that *some* dogs do occasionally disturb people, wildlife, and habitat. However, compared to people, dogs did not seem to do much damage to vegetation or bodies of water, and they only rarely chased wildlife. Dog-wildlife encounters are very important to study; however, it is often very difficult to identify precisely what factors directly cause wildlife disturbances (Gentry 1983). People were more disruptive than were dogs, and when dogs did go far off trails they often were lured off by people. There was no trailhead effect and dogs' behavior

**Figure 2.**

differed little when they first were let free, during their travels in intermediate segments of a trail, and when they completed their walks.

The results of the questionnaire support the behavioral data. In fact, the results of the questionnaire show clearly that dog owners and non-dog owners do not differ in their perceptions of major problems—essentially, too many people and too many unruly people using Open Space in Boulder. Almost 97% of people polled felt comfortable with dogs off-leash. People also reported (and direct observations confirmed the fact) that people disrupt wildlife more frequently than dogs, and people cause more damage to vegetation and to bodies of water. Less than one-third of the respondents reported that feces were a problem. There are many reasons why feces can cause problems (e.g. hygienic, environmental, aesthetic; Beck 1979) and perhaps they are more of a problem in urban areas (Dumont 1996) than in open recreational areas. Boulder is dealing with this problem by placing plastic bags and trash cans near trailheads and along trails. Interestingly, non-threatening barking by dogs was not an issue for either group. Also, all observers noted that dogs off leash were friendlier than dogs on leash, although no detailed data were collected on this aspect of behavior (see also Thomas 1996).

The relationship between people and dogs has changed greatly in Boulder over the past 25 years. In the early 1970s many uncastrated dogs ran free without their owners. Dogs occasionally formed packs, chased deer and, on at least one occasion, attacked a child. Since then, there appears to have been an increased interest in having well-behaved dogs. In 1980, the Boulder Humane Society regularly offered one obedience class, and in 1996 there are 20 concurrent classes (Nana Wills, personal communication). Dog owners have become more responsible (having their dogs castrated and watching over them more conscientiously), and rarely is a dog seen without their owner or another person in attendance.

We conclude that little needs to be done to manage dogs directly in the areas where we conducted our studies. There are always going to be "problem" dogs and "problem" people. In Boulder and perhaps in other areas, reports of unruly dogs seem to attract a lot of attention, but of course, people do not report when dogs are well-behaved. Additional enforcement may solve some problems but there really are few problems that could not largely be solved by continuing serious efforts to educate people about dog behavior and matters of etiquette and responsibility (see also Beck 1996 and Dumont 1996), and by requiring people to learn more about dog behavior and control of their companions, for people and their companions essentially are a cooperative social unit (Sanders 1990).

The fact that dog owners and non-dog owners did not disagree on important issues (that standardized obedience tests should be required and that banning dogs is not a viable option) also needs to be addressed. Although standardized obedience testing is possible and equally attractive to non-dog owners and dog-owners alike, the implementation of such a practice has not been given serious attention. While the details still need to be worked out for different locations, some possibilities would entail having people attend classes, hire a professional trainer, or train their dogs themselves and then go to their local humane society for testing. A set fee would be established to cover the cost of testing and licensing; the fee might also include a donation to the society.

Further concerns could be addressed by having various stipulations that could cover different sorts of violations. The following suggestions might be helpful for implementing obedience certification. People who were first-time offenders who did not have a license would be given a certain amount of time to complete the standardized test and pay a small fine. First-time offenders who had already received their licenses would have to pay for, and repeat, the standardized test within a certain period of time, but there would be no fine. However the obedience certification process is implemented, there seems to be little doubt that dogs and people would benefit.

It seems clear to us that the well-being and interests of dogs should not summarily be compromised when dogs and people attempt to share limited space that can be used by all parties for recreational purposes. The methods used and the results from this case study can serve as a model for other locations in which dogs and people compete for limited spatial resources.

## POSTSCRIPT

A recent study of dogs on the University of Colorado (Boulder) campus (Dwyer and Bekoff, unpublished data) showed that leashed dogs initiated contact with humans 5.5 times more than did unleashed dogs, and that people initiated contact with leashed dogs 3.8 times more than with unleashed dogs. Generally, unleashed dogs ignored humans and choose other unleashed dogs with whom to interact when they were not exploring their surroundings.

## ACKNOWLEDGMENTS

We thank Carrie Kull, Ed Leigh, Ron Hamilton, Kristen Gacek, Shelese Pratt, Gary Renne, David Fenyvesi, and Deborah Sapienza for help with data collection, and Myanna Lahsen, Rosalind Yanishevsky, Clint Miller, Ann Wichmann, and Andrew Smith for help with the development of the questionnaire. Rosalind Yanishevsky, Colin Allen, Alan Beck, Robert Eckstein, Ann Wolfe, and an anonymous reviewer provided helpful comments on an ancestral version of this manuscript. Rosalind Yanishevsky suggested how implementation of standardized testing might be initiated. We received financial support from an anonymous donor and the Department of EPO Biology, University of Colorado, Boulder.

# APPENDIX A: QUESTIONNAIRE

## Perceptions of the Impact of Dogs on Open Space

We are interested in learning more about how dogs and people use open space so that dogs and people can maximize the pleasure that can be had by being outdoors in the limited available space. We hope that you will take the time to answer these questions.

Date: Location: Time: Sex: Age: Children?

(1) Do you live in Boulder? City____
County_____ For how long?____ No_____

(2) How often do you use open space? (a) daily, (b) 5 times per week, (c) 2-4 times per week, (d) 2-4 times per month, (e) less than 1 time per month, (f) 2-4 times per year or less, (g) never

(3) How long have you used this portion of open space?_____

(4) Why do you come to open space? (a) to exercise myself, (b) to exercise my dog, (c) to see wildlife, (d) to be alone, (e) to enjoy nature, (f) other
Please rank your top three (3) choices by writing down the appropriate letter:

_____ _____ _____

(5) In what type of activity do you usually engage? (you can choose more than 1) (a) walk/hike, (b) jog/run, (c) bicycle, (d) equestrian, (e) exercise dog )

(6) Are you a dog owner? Yes:_____ No:_____

(7) Are you comfortable with dogs?
Yes:_____ No:_____

(8) Do you have a dog with you now?
Yes:_____ No:_____
On leash:_____ Off Leash:_____
Under excellent voice control:_____
Under control most of the time:_____
Not well-controlled:_____

(9) Do you think dogs should be (a) on leash always, (b) off leash always if dog not a threat to people, (c) off leash in certain areas and at certain times, (d) other?

(10) Would it lessen the quality of your open space experience if your dog had to be on a leash? Yes:_____ No:_____
How: _____
_____

(11) Would it lessen the quality of your dog's experience if your dog had to be on a leash?
leash? Yes:_____ No:_____
How: _____
_____

(12) Have you ever been attacked by a dog on open space? (a) two or more times, (b) once, (c) never. What were extent of injuries?

_____

(13) Have you ever felt uneasy when passing someone else's dog? (a) two or more times, (b) once, (c) never.

(14) In what ways did you feel uneasy? (a) disturbs me, (b) disturbs children,(c) disturbs my dog, (d) disturbs wildlife, (e) too many dogs, (f) dog out of control

(15) Do certain types of dogs bother you more than others? Yes:_____ No:_____
If YES, why: Please provide more details next to your choices

(a) breed _____

(b) size _____

(c) color _____

(d) behavior _____

(e) sex _____

(f) the behavior of the person with the dog?

_____

(16) Have you ever felt uneasy in the presence of other people on open space? (a) two or more times, (b) once, (c) never.

(17) Have you seen other people bothered by dogs? (a) two or more times, (b) once, (c) never.

(18) Have you seen wildlife disturbed by dogs?
Yes:_____ No:_____
If YES, (a) often, (b) occasionally, (c) never

(19) Have you seen wildlife disturbed by people?
Yes:_____ No:_____
If YES, (a) often, (b) occasionally, (c) never

(20) Have you seen vegetation disturbed by dogs in a harmful way?
Yes:_____ No:_____
If YES, (a) often, (b) occasionally, (c) never

(21) Have you seen vegetation disturbed by people in a harmful way?
Yes:_____
If YES, (a)

(22) Have you
water distu
Yes:_____
If YES, (a)

(23) Have you
water distu
way?
Yes:_____
If YES, (a)

# Recreation Disturbance Does Not Change Feeding Behavior of the Western Snowy Plover

**Megan Warren**

**Abstract** The Western Snowy Plover (*Charadrius alexandrinus nivosus*) is a small shorebird that has many scattered wintering populations along the Pacific Coast of the United States, including several in the Bay Area. This species has been listed as threatened since 1993 under the federal Endangered Species Act of 1973. For this study I measured disturbance rates, types, plover responses and feeding time in three different sites in the San Francisco Bay Area to explore the link between recreation disturbance and feeding behavior. I predicted that as frequency of disturbance increased, the birds would spend less time actively foraging and more time alert. However, data showed no significant relationship between feeding behavior and direct disturbance by human recreators. Instead, I now predict that recreation has a more indirect effect on the western snowy plover feeding behavior. Future research should focus on indirect effects of recreation, such as habitat disturbance and food source quality.

**Introduction**

Outdoor recreation has increased in popularity over the years, resulting in expansion and development of designated outdoor recreation areas (Flather and Cordell 1995). Non-motorized recreation, such as hiking, nature viewing, horseback riding, beach bathing and dog-walking have increased the most in popularity (Flather and Cordell 1995). As these activities become more popular, they often disturb and displace wildlife populations, causing them to change specific behaviors and habits. Once-popular breeding sites located in popular recreation areas may be abandoned for less hospitable sites simply due to the amount of disturbance (Knight and Cole 1995).

Shorebirds are especially vulnerable to recreation, which can disrupt available habitat for nesting and foraging (Burger 1995). Recreation can be especially harmful for species already struggling to make a living in a specific area. One such species is the western snowy plover, a small shorebird found along the Pacific Coast. This species has been listed as threatened since 1993 under the Endangered Species Act of 1973 (Smith 1993). Ruhlen et al. (2003) found that on average, more snowy plover (*Charadrius alexandrinus*) chicks died or wandered away on weekends at two beaches in the Point Reyes National Seashore, possibly due to increased recreation on those days. Many other studies on plover species (*C. alexandrinus, C. melodus*) have shown that human disturbance leads to changes in habitat use and foraging—both when and how long birds forage, as well as decreased nest success (Lafferty 2001b, Burger 1991, Burger 1994, Lafferty et al. 2006).

Foraging success is a good indicator of nesting success. Shorebirds with habitats more prone to high levels of disturbance spend more time fleeing from and watching for potential predators, depleting fat reserves and time spent caring for their broods (Burger 1991). The western snowy plover forages for both marine and terrestrial invertebrates by visually scanning then probing with its beak in the sand, washed-up seaweed, and low vegetation. Western snowy plover are often found foraging together in small groups (Page et al. 1995). Newly-hatched chicks are precocial, and can walk around and forage for themselves shortly after hatching (Tucker and Powell 1999). Recreational use of plover foraging areas is especially harmful to these newly-hatched chicks (Ruhlen et al. 2003). This study addresses how recreation affects wintering populations of the western snowy plover by examining its feeding behavior at several more

heavily used sites in the San Francisco Bay Area, where the relationship between shorebird feeding behavior and recreation has yet to be fully explored.

Since its inception in 1972, the Golden Gate National Recreation Area (GGNRA) has become one of the most popular and heavily used urban national parks, with more than 10 million visitors per year (NPS 2006). Even before the formation of the park the area was heavily used by recreationists. Many locations within the park are prime breeding habitat for the threatened sub-species western snowy plover (*Charadrius alexandrinus nivosus*), but within the park only wintering populations can be found (Merkle 2006, pers. comm.). Western snowy plover stopped breeding on the beaches in the GGNRA, most likely due to an increase in disturbances from recreation. One of the largest disturbances to western snowy plover, as well as other shorebirds, is dog-walking, especially those off-leash (Lafferty 2001a). In 2002 GGNRA began considering changes to its dog policy. Currently, off-leash pets are allowed in many areas of the park including those important to the western snowy plover—Crissy Field and Ocean Beach (US Department of the Interior 1979). An advisory committee was formed to take place in the negotiated rulemaking, which encompasses the many interest groups with stakes in the rule changes (NPS 2006). Changes in these policies could positively impact populations of the western snowy plover currently wintering in GGNRA, and is important to understand how recreation affects all matters of their biology before making any permanent changes.

It is also important to understand what kinds of disturbances adversely affect foraging behavior. Determining these and other answers are important when deciding how western snowy plover habitat, such as that in GGNRA, should be managed in the future. The main objective of this study is to see how recreation and direct disturbance impacts western snowy plover feeding behavior, which can then be used to create appropriate wildlife management plans. I predict that western snowy plover populations in more heavily-disturbed areas will devote more of their feeding time towards avoiding disturbances than to actively searching for and eating their food.

## Methods

For this study, two different kinds of direct observational surveys were developed and carried out weekly for five weeks at three different study sites during February and March 2007.

**Study Sites** Three study sites were used in this research. The first study site was at Crissy Field in San Francisco, California, which is part of the Golden Gate National Recreation Area

(Fig. 1). The stretch of beach where the western snowy plover is found is 100 meters east of the Gulf of the Farallones Visitors' Center (Fig. 2). The beach is 80 meters long and its habitat is characterized by sand dunes with low vegetation. This site supports a population of four to six birds. Crissy Field is readily accessible by car, foot, bike and public transit. This site has also recently (October 2006) changed from an off-leash to on-leash dog area. For this study, Crissy Field was classified as a high-use recreational site. The second study site was the spit at Limantour Beach in the Point Reyes National Seashore (PRNS), located about 56 kilometers north of San Francisco in Marin County, California (Fig. 3).

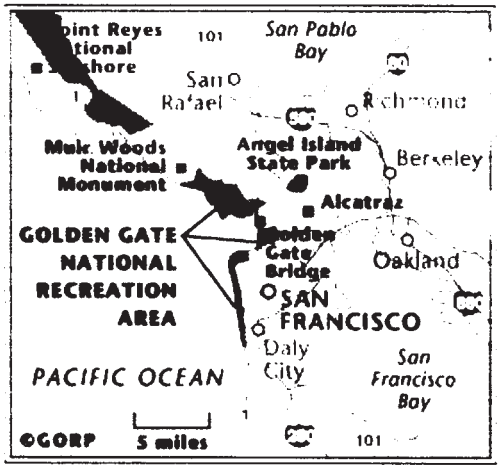

Figure 1: Golden Gate National Recreation Area, California

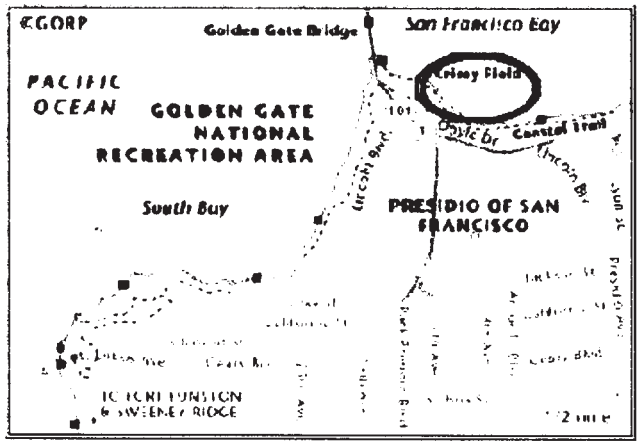

Figure 2: Crissy Field Study Site, in Golden Gate National Recreation Area, CA

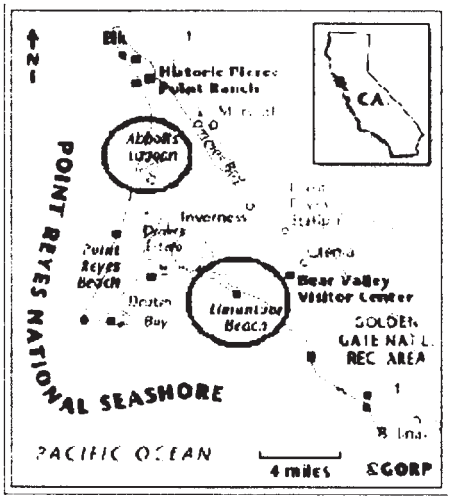

Figure 3: Limantour Beach and Abbott's Lagoon Study Sites, Point Reyes National Seashore, CA

Limantour Spit juts into Drake's Bay and is about four kilometers long, and is characterized by long stretches of beach with little vegetative cover. This site supports a population of 80-100 birds. Limantour Beach is relatively busy, as it is accessible just off a main road near the entrance of PRNS. Any type of recreation is permitted; however, dogs are restricted to the area of the beach away from the plovers. Limantour Beach was classified as a medium-use recreational site. The third study site was also located in the Point Reyes National Seashore at Abbott's Lagoon, which is 16 kilometers

northwest of Limantour Spit on the Pacific Ocean (Fig. 3). Abbott's Lagoon is characterized by low sand dunes with little vegetation, and supports a population of 45-50 birds on a two kilometer stretch of beach at the foot of the lagoon. This site is the most isolated and least accessible of the three sites, and was classified as a low-use recreational site.

**Disturbance Surveys** Disturbance surveys were conducted over a one-hour period just before dusk at each study site. The minimum population size for each survey sample period was four birds. Upon locating the population, date, time of day, general weather patterns and study site were noted at the top of the data sheet. For each instance of disturbance (defined as a recreational activity that could change behavior of the western snowy plover), time, type (individual or group), activity, distance from birds, number of birds disturbed and their response was recorded. The birds' responses were divided into four categories: no response, mild response (causing a resting plover to stand), moderate response (causing a plover to stand up and/or walk away), and major response (causing the plover to flush). The data gathered from these studies were used to create graphs showing frequency of certain types of recreation at each site.

**Feeding Behavior Surveys** Feeding behavior surveys quantified how the plovers budgeted their time during the dusk feeding period. The purpose of these surveys was to observe the percent breakdown of the plover behavior (based on time) and link behavioral changes to nearby recreational disturbances. Over the 30 minutes following the recreation disturbance surveys four different focus-animal surveys were carried out, each time on a different bird. Focus animal surveys were two minutes long. An Olympus digital voice recorder, model VN-3100, was used to measure the total amount of time the bird spent in each of three feeding behaviors. These behaviors were observed and defined during preliminary observation periods. The western snowy plover was seen (1) searching for food, defined as movement along the shoreline with its head down visually scanning for prey; (2) actively foraging, defined as head down with its beak in the sand eating the prey; and (3) time spent alert, defined as a bird standing still with its head up visually scanning the beach. Once transferred to the computer, the recorder shows exactly how many seconds were spent on each activity. A linear regression was used to test the relationship between frequency of disturbance and foraging, alert and searching time.

**Results**

Recreation and foraging data were collected at the Abbott's Lagoon, Limantour Beach and Crissy Field study sites over four observation days on a Thursday, Friday or Saturday between February 1, 2007 and March 8, 2007. Western snowy plover do not feed at Crissy Field, so data on recreation disturbance and feeding behavior comes from the two Point Reyes National Seashore sites.

**Recreational Use** Accessibility is the main factor distinguishing recreational use among the three beaches. Not surprisingly, the urban study site, Crissy Field, showed the highest and most varied recreational use of all the sites (Fig. 4). Limantour Beach, the next most accessible site had the second highest recreational use, though only walkers used the site. Finally, Abbott's Lagoon, the most isolated of the three sites, had the lowest recreational use. Again, this site was only frequented by walkers. Both PRNS sites were comparable in terms of type of recreation and foraging data.

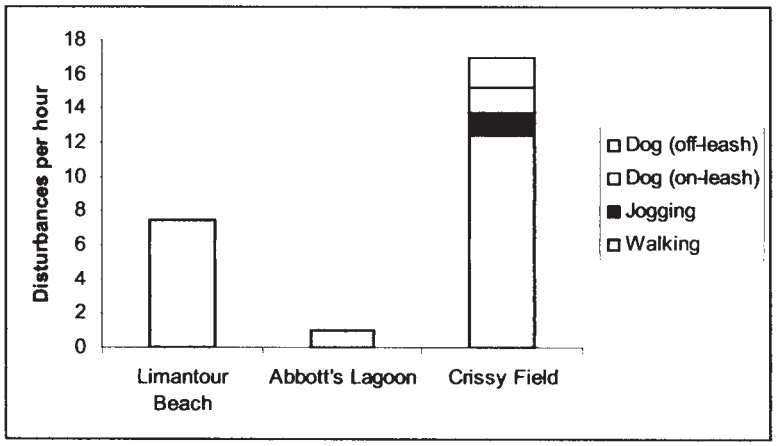

Figure 4: Recreation level and type per hour at each study site

**Disturbance Data** The disturbance surveys were used to determine two things. First, they were used to see how strongly resting birds responded in the presence of human recreators. Secondly, they were used in conjunction with feeding behavior surveys to infer changes in foraging, searching and alert time based on how heavily the site was used. Protocol dictated that western snowy plover response to recreators be classified as mild, causing a resting bird to stand; moderate, causing a resting bird to stand and walk away; or major, causing a resting bird to flush. The first part of the disturbance surveys showed by and large that resting plovers do not react strongly to the presence of recreators (Table 1). Since feeding behavior was not observed during any of the observation periods at Crissy Field, useful data came only from Limantour Beach and Abbott's Lagoon. A linear regression with these data shows no relationship between disturbance level and foraging time (Fig 5) ($R^2$=0.0011, p=0.86). Similarly, no relationship exists between

disturbance level and alert time (Fig 6) ($R^2$=0.0039, p=0.73). A slightly stronger positive linear relationship is found between disturbance level and searching time (Fig 7) ($R^2$=0.046, p=0.24); however, this is still an incredibly weak relationship, and cannot be considered significant.

Table 1: Proportion of plover mild, moderate or major response to recreation, by site

| | | % Plover Response to Recreation | | | | |
|---|---|---|---|---|---|---|
| | | None | Mild | Moderate | Major | Sample Size |
| **Crissy Field** | | | | | | 190 |
| | *Walking* | 45 | 9 | 7 | 0 | |
| | *Jogging* | 10 | 2 | 0 | 0 | |
| | *Dog (off-leash)* | 7 | 3 | 6 | 0 | |
| | *Dog (on-leash)* | 6 | 3 | 2 | 0 | |
| **Limantour Beach** | | | | | | 81 |
| | *Walking* | 59 | 11 | 15 | 15 | |
| **Abbott's Lagoon** | | | | | | 8 |
| | *Walking* | 25 | 37.5 | 37.5 | 0 | |

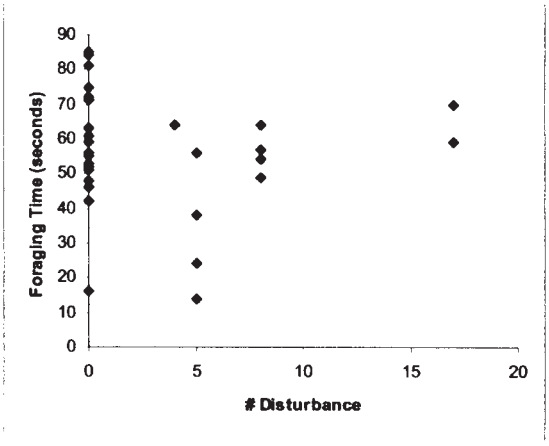

Figure 6: Disturbance level vs. alert time

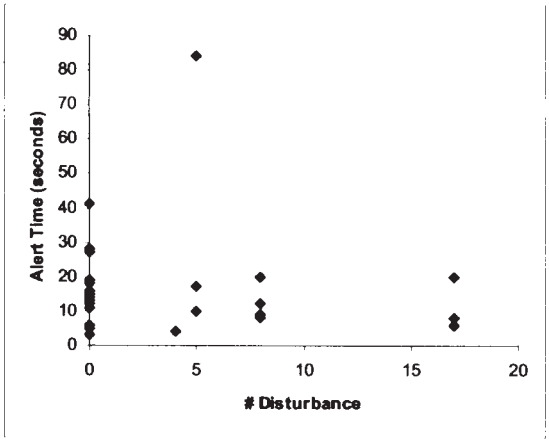

Figure 5: Disturbance level vs. foraging time

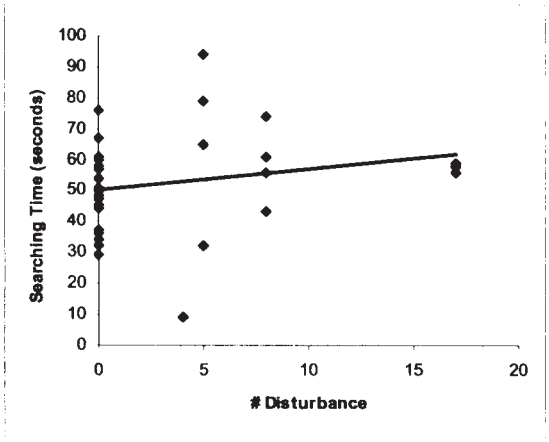

Figure 7: Disturbance level vs. searching time

**Feeding Behavior Data** Crissy Field is the only site at which the birds were not found foraging in the evening, and they are not always at the site. Of six survey dates, they were only on the beach for four of them, and not once were they foraging. When the birds are at this site, they begin to get restless around 5:45 p.m. and soon fly away, presumably to go forage in a different area. Data from Limantour Beach and Abbott's Lagoon suggest that no significant relationship exists between disturbance level and foraging behavior. Therefore, it can be assumed that the absence of foraging western snowy plover at Crissy Field is due to other factors, such as quality of the food source available at the site.

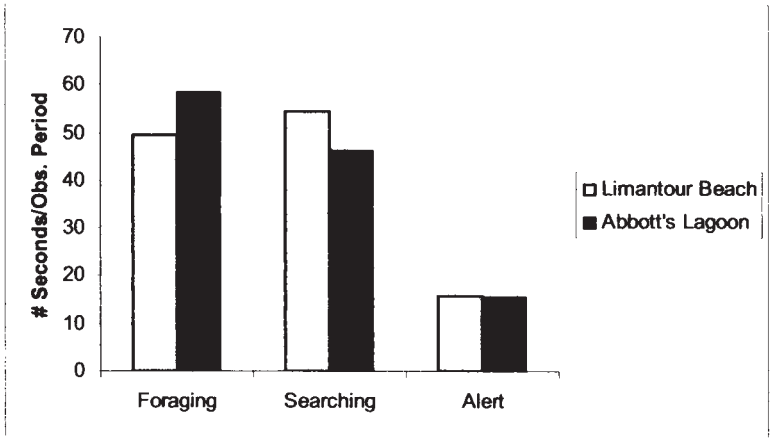

Figure 8: Average distribution of three feeding behaviors by over 2-minute focus-animal surveys

Average times for the three observed feeding behaviors are consistent between the Abbott's Lagoon and Limantour Beach data (Fig. 8), which also suggests no relationship between disturbance level and feeding behavior. Limantour Beach was a site with medium disturbance levels, and Abbott's Lagoon

was a site with low disturbance levels. Both sites had between 10 and 20 birds on each observation day.

**Discussion**

This study looked at links between disturbance level and foraging behavior of the western snowy plover at three different beaches in the San Francisco Bay Area. The Crissy Field study site did not provide any relevant results, however, the data from the two Point Reyes study sites do not support the hypothesis that western snowy plovers in more heavily disturbed areas devote less time to actively foraging and more time to being alert.

Data show no significant correlation between number of disturbances and time spent actively searching or foraging, or being alert while feeding at dusk. These results suggest that direct recreation disturbance is not as significant as earlier thought, and that links between recreation and western snowy plover feeding behavior are more subtle. Several possible explanations exist for explaining these relationships. The data suggest that as more disturbances occur, more time is spent on searching than on being alert or foraging. Though not significant, this relationship does bring to mind other possible explanations of the trend indirectly related to recreational use at certain sites.

Accessibility and disturbance are two possible explanations for increased searching time at more heavily used sites. At Limantour Beach, recreational use tends to be right at the shoreline, which is also where the western snowy plover forage. With an overall higher recreation use than Abbott's Lagoon, Limantour Beach may have a more disturbed habitat at the shoreline, which could make less overall food available, or just make it harder to find. Another explanation could be absence of biological debris, such as seaweed, kelp, and dead or decaying sea birds and mammals. Since Limantour Beach is used by more people, biological debris is either displaced or removed. This debris has been proven to be an important food source for shorebird communities in southern California (Dugan et al. 2003), and its removal could force the western snowy plover to spend more time searching for food along the disturbed shoreline. Finally, poor food source quality has been linked with failed hatching of western snowy plover eggs due to high mercury levels at Point Reyes Beach (Schwarzbach et al. 2005). Pollution may be an indirect result of recreation that may cause western snowy plover to spend more time seeking out

suitable food. Quality of the food source itself is very important for the continued success of this species.

The western snowy plover is affected by recreation, albeit indirectly (such as with shoreline disturbance). Future studies should focus on both the quality of the food source and the habitat disturbance at important breeding and wintering sites for the western snowy plover. More vigorous methods should also be developed for monitoring feeding behavior in order to take into account not only the time spent doing each activity, but also where the western snowy plover choose to forage, and what they choose to eat. Studies should also focus on the relative disturbance of foraging habitats. A more careful selection of study sites must take place. It is important to find habitats with varying levels of recreation and habitat disturbance where the birds are known to spend time feeding. Though this study had a range of disturbance levels at each site, feeding habitat was not suitable at Crissy Field and therefore not observed. Furthermore, the data from Limantour Beach and Abbott's Lagoon showed extremely weak to non-existent correlations that cannot be extended to Crissy Field. It is important to keep monitoring western snowy plover populations to detect any changes in their behavior (foraging or otherwise).

This research project is perhaps more useful as an education tool. If anything, increased monitoring of bird populations will make people more aware of their presence. The snowy plovers can be difficult to see, but are really interesting to watch. If recreationists are aware of their presence, they can conduct their activities in a way that still allows them to have fun, but to decrease their affect on wintering populations of the western snowy plover.

**Acknowledgements**

I would like to thank John Latto and the entire ES 196 crew for their support and input throughout the entire length of the project. I would also like to thank Sarah Reed, Bill Merkle from the National Park Service and Samantha Murray and Matthew Zlatunich from the Golden Gate Audubon Society for their help in putting the project together.

RE: Case Number 1912E Natural Areas Management Plan

Dear Mr. Wycko.

The Sierra Club is in general very supportive of the current iteration of the Significant Natural Areas Management Plan, and we are pleased that the process of environmental review is finally underway. The following are some technical comments regarding the scope of the review work which we feel should be addressed.

With regard to the significant natural areas located in San Francisco, we note that the plan itself adopts a hierarchical approach by dividing the natural areas into three separate categories (MA1's, MA2's and MA3's). While such an approach is useful for establishing priorities, it creates a patchwork situation which is less than ideal for planning purposes. In general, we would like to see a maximum restoration alternative studied for each of the city's natural areas. Of special concern are those areas, generally designated as MA3's, which contain stands of non-native trees. The study should address the effects of allowing unchecked growth of these non-native forests on the significant natural resources, as well as alternative scenarios for management of these sections, for instance by managing the understory for biodiversity, thinning, and allowing for a natural succession with the goal of eventual re-establishment of native plant communities.

For the treatment of Sharp Park and the Laguna Salada Enhancement plan, our understanding is that the DEIR will include the three alternatives (no-golf, 18-hole and 9-hole) approved by the city's Board of Supervisors. We believe that in each of these alternatives, the lead criterion should be the protection of habitat for the listed species. It is especially important that elaboration of these scenarios proceed according to the best available science, with the end of maximizing critical habitat for these species.

We look forward to the release of the DEIR, which we hope happens in a timely manner.

Yours truly,

Steven Chapman (for the San Francisco Group)

RE: Neighborhood comments and Criticism and Protest of Environmental review of Project title: Natural Areas Management Plan
Case No. 2005.1912E

Project size: 1, 105 acres.

Attached is a General comment on the general flaws and misconceptions of the plan.

In this section we will comment on Specific Details of the plan which are false, misleading, have no scientific merit, and have potential for great harm to our City.

The Natural Areas Program , instigated by zealots who regard native plants as 'good' and non-native as 'bad', has no scientific basis. For some reason they refer to eucalyptus trees as 'weeds' and the underlying motive of this project is to kill and destroy these beautiful trees.

FIRE: The threat of fire is a transparent ruse, used to generate fear in attempt to justify killing of healthy trees.
There has not been a serious fire in Sutro forest for over a hundred years.
The commonly repeated myth that eucalyptus is prone to fire and 'native trees are fire resistant is just that, a myth. All wood is flammable. There is NO evidence of significant advantage benefit of native trees, in fact there is no good definition of which trees are native. Try to burn a dry eucalyptus log in your fireplace and you will find it very difficult .

The forest is damp to wet most of the time and the winds predominantly from the West. The forest pulls moisture from the fog in vast amounts. Tree removal has potential to dry out the area. If dry native grasses replace trees, the threat of fire may Increase.

WIND PATTERNS:

Cutting down trees must alter the wind patterns. Most of the homes close to the forest are protected from winds by the forest, Tree removal has potential to INCREASE fire hazard by removing this protection.

Micro climates: Belgrave Ave is a good example. The street is generally calm with mild breezes. On Tank Hill at the East end, farther from the forest and at higher altitude, the winds are often 40 knots and more as there is no wind

protection. The same situation applies up to the top of Twin Peaks and to all the neighborhoods in the lee of the forest. These strong winds would only INCREASE the risk of fire.

Effects on WATER COLLECTION, DRAINAGE:

The forest pulls down thousands of gallons of water from the fog bank. Without tree roots to hold the ground what might happen to run off?

Without tree roots what is the potential for landslides and earth movement ? (let us not forget earthquakes). Earth movement has potential for people and property damage.

CARBON DIOXIDE EFFECT:
The program dismisses the beneficial effect of the forest in carbon dioxide removal and suggests that the small native plants will do as well.
This is preposterous pseudo science at its worst. Environmentalists bristle at the destruction of the Brazilian rain forest, and here there is intent to destroy an exquiste forest in the centre of our City! To suggest that native plants would be more effective than the forest is absolute nonsense.

AN IMMEDIATELY ADJACENT PROJECT currently intends to remove trees on 14 of 61 acres, about 25% of the forest owned by UC. The natural Areas program also wants to remove trees on the portion owned by the city, so that 1/3 of the forest would be stripped. The forest does not recognize a UCSF/city boundary line. Each affects the other and is not addressed in the plan.

HERBICIDES:
They indicate all the cut trees and brush will be 'painted' with herbicides. This would be thousands of gallons of herbicide, which will eventually wash away and contaminate. Numerous underground springs underly these areas.

WATER USE: Any native plantings require extensive irrigation systems, costly, and consuming water which may be in limited suppy. The previously planted areas with native plants required installation of expensive irrigation systems and increases water consumption.

MOST IMPORTANT:

The law requires a full Environmental Impact Report before huge projects like this be undertaken. The EIR requires response to 18 (eighteen) items of concern.

This project as outlined at the public meeting, chooses to arbitrarily ignore many of the 18 items. It does not require 'experts' to see the potential harm and unforseeable risks here. It just takes residents of the neighborhood who walk the

areas daily. This leads one to question the qualifications and the motives of the "consultants' . I am told they do not have a certified arborist on their staff.
I believe that no consultant has actually walked though Sutro forest or the neighborhood!
Many in the neighborhood have a profound distrust of those involved in this project. There are of course well meaning people who have been misled by the propaganda of the native plant zealots and accomplished bureaucrats.

The native plant advocates are intent on destroying eucalyptus trees, and experimenting with plants that may not survive in a modern setting.

In their zealousness they are promoting misinformation and attempting to circumvent the intent of the law, ie EIR reporting of 18 issues.

The neighborhood will be watching very closely to see the Intent of EIR laws is met.
What is proposed here is an experiment, with unpredictable results and little or nothing to be gained.

ECONOMICS:

Our Country, our City and our State are in the midst of unprecendented severe economic crisis. Our National leaders have asked us to help and take some personal responsibility.

When the Mayor indicates we may fire 1000 employees, cut back on essential services, when the State has billions of deficit, when people are still homeless in New Orleans, when the University announces need to increase student fees, does it seem 'right' to spend vast amounts on a purely elective project, that is ill conceived at the start? I repeat, Purely Elective and potentially disastrous.

Addendum:

We, the neighborhhod support the more detailed objections and criticisms submitted by Nancy Weurful and Mary McAllister
. We are in the process of consolidating lists of neighbors but submit this now because of time constraints imposed with short notice.

Mr. Bill Wycko
Environmental Review Officer
San Francisco Planning Department
1650 Mission Street
San Francisco, CA 94103
RE: Significant Natural Resource Area Management Plan (SNRAMP), Environmental Impact Report, Case No. 2005.0912E

Dear Mr. Wycko:

As the largest animal protection organization in San Francisco, The San Francisco SPCA (SF/SPCA) has a vested interest in the Significant Natural Resource Area Management Plan and we appreciate the opportunity to offer our recommendations regarding the scoping for the Environmental Impact Report.

**Our Concerns:**

GR-7: Predators: In section 5 "GENERAL RECOMMENDATIONS" of the 2006 SNRAMP the need for feral cat control is described as 'urgent'. However, there have been no scientific studies to determine the impact of feral cats or any other predator in San Francisco's Natural Areas. We do know that the Natural Areas Program website tells us that "Pollution, habitat loss and fragmentation, and invasive species all make it difficult for native plants and animals to survive in the city." Therefore, we do not accept that predators including feral cats play a major, much less an "urgent," role impacting wildlife in our parks and open spaces.

GR-7a: Refers to the Quail Recovery Plan: While this organization is in agreement with the general premise of the Quail Recovery Plan, the Plan does not define the circumstances that would require removal of a predator, how those circumstances would be proved, and what impact removal of a predator from the location would have on the rest of the environment , prior to ordering its removal.

SAN FRANCISCO
SPCA

GR-7b: While The SF/SPCA agrees that feral cat populations are initially generated by irresponsible breeding, the proposal to eliminate the release of cats into the wild is unrealistic and ineffective. On the contrary, Trap-Neuter- Return programs (TNR), when coupled with the adoption of tame cats and kittens, can maintain and will eventually decrease the population of feral cats (*Journal of the American Veterinary Medical Association. 01/02/200302/2003;222(1):42-6. ISSN: 0003-1488).*

GR-7c: "To the extent possible, all predator control shall be performed in a humane manner, such that harm and suffering to the animals is minimal."
The SF/SPCA continues to oppose the premise that "minimal suffering and harm" to animals is acceptable. There is no way to determine what this phrase means, what is minimal and what is not, and who is evaluating the level of suffering. Unfortunately, this language is too subjective to be protective of animals.

**Our Recommendations:**

1. GR-7a: Feral cats should not be assumed to be the predator in question without clear evidence.

2. GR-7a: The SF/SPCA deeply appreciates the Recreation and Park Commission's amendment to the Management Plan that elevates the recommendation of feral cat relocation to require their review and approval. For the record, this amendment was made on August 21, 2006 to Resolution Number 0608-012 which states; *"That where appropriate in the plan that feral cat relocation shall be implemented only upon a determination by the Commission that other methods of population reduction failed to adequately reduce cat populations in natural areas."*
We request that the SNRAMP reflect this additional language in GR-7a.

3. GR-7a: Clarify what scientific measures will be used to determine if a predator is negatively impacting a Natural Area and require those measures to be proven prior to considering a removal plan.

2500 - 16th St., San Francisco, CA 94103-4213 • (415) 554-3000 • Fax: (415) 552-7041 • www.sfspca.org • e-mail: publicinfo@sfspca.org

SAN FRANCISCO
SPCA

4. Please remove GR-7b. Acknowledge that eliminating the release of cats in San Francisco is an impractical objective and instead support the positive impact the SF/SPCA Feral Fix Program has had on Natural Areas and all parks and open spaces since 1993. During this time, the SF/SPCA has subsidized the sterilization, adoption, release of thousands of felines and has seen a reduction in feral cat populations throughout this community.

5. GR- 7c: This must be rewritten to remove the subjective language that allows suffering. Humane measures exercised under the control of San Francisco Animal Care and Control should be stressed.

The SF/SPCA would like to see in the future a well designed, long term, scientific, and objective study to evaluate both the positive and negative impacts of feral cats in the urban environment of San Francisco. Only then will we have a basis for a dialogue about feral cats based on facts. We recognize that the EIR process is not in a position to provide the resources and time for this study, but we do acknowledge the need for this information. The SF/SPCA continues to pledge itself to providing support for the TNR program that has contributed so greatly to the control of feral cats in San Francisco.

Sincerely,

Jan McHugh-Smith

**RE:**

Natural Areas Management Plan

Dear Mr. Wycko--

I am writing to express concern about the Natural Areas Management Plan as now written. Although I could discuss each site in as much detail as the plan itself, I will spare you. In short, the plan severely limits access to, and recreation in, areas now commonly used by a wide variety of citizens. It makes inaccurate and misleading assumptions about the level of present and future use, and the impact of those uses upon natural systems. It uses the excuse of "endangered" species to restrict access to many areas in which those species either do not exist or in which they are currently co-existing peacefully with other uses.

As background, I have worked professionally as a naturalist and restorationist for the last 35+ years. I worked with the National Park Service on their restoration programs as both a crew supervisor (with the California Conservation Corps) and a field biologist. I began my career as a planner and permit appeals analyst with the California Coastal Commission, specializing in access and wildlands issues . Over the years I've volunteered on many restoration projects, usually with my dog(s) and various children in tow. I've supported both restoration and public access over my career, and am dismayed to now see restoration used as a weapon to keep people out of public lands.

Over the last 10-15 years, I've watched as one site after another was either closed to public use or severely restricted. I've also seen agreements made and broken, most notably with the dog-walking community, but with others (horse-riders, cyclists, bird-watchers, golfers, day-camps) as well. Even if access was supposed to be restricted temporarily, the restrictions almost always became permanent. In turn, recreational pressure increased in other areas, producing more calls for restrictions.

A good example is the closure of many areas for dog-walking (assume this means walking with one's well-behaved off-leash canine companion). In the early to mid 1990's many popular dog-walking places on the Penninsula were abruptly closed, obstensibly for "environmental reasons". More people started coming to Fort Funston, some from as far away as Palo Alto. At the same time the GGNRA wanted to "restore" Fort Funston, and fenced many acres off for what was supposed to be a five year period (that was 15 years ago!). Similarly, battles in many local parks led to restrictions on neighborhood dog-walking. Suddenly Bernal Heights, Glen Park, and McLaren Park became more heavily used by citizens who needed to **walk** (not just stand) daily with their dogs.

Rec and Park's solution has been to build what they call DPA's. Some are walkable; most are not. Now the Natural Areas Program wants to restrict or eliminate these, too. There are many

problems with this; I will name just five: 1) This is not in the Natural Areas Program's jurisdiction, in part because (2) there have been agreements made over time through the Dog Advisory Committee and the Dog Policy to add more DPAs. 3) The Natural Areas Program ***assured*** us when a management plan first came out that they would work with the dog community and ensure that we could continue to utilize these areas for dog-walking. 4) The management plan also stipulates that before new "DPA"s are added extensive environmental studies would have to be performed. Historically, this means that they will ignore the existing heavy use of an area for dog-walking and pretend that they are starting with a pristine area that would be impacted by a new use. 5) Instead of finding ways to integrate native species into public areas, they plan to instead introduce threatened species and deny access.

Thank you for your time and attention. Lisa Vittori

RE: Significant Natural Resource Area Management Plan (SRAMP), Environmental Impact Report # 2005,0912E

Dear Mr. Wycko:

I have been involved with working to humanely reduce feral cat populations since the late 1990s both in San Francisco and in Italy. I have participated in trapping and sterilizing feral or community cats in San Francisco for the last 9 years and during that time have witnessed a marked reduction in the number of cats in the colonies with which I have been involved. When adult cats are spayed and neutered and kittens taken for adoption a group of feral cats can be immediately reduced by 50%.

There are fewer and fewer feral cats in the areas of the city that come under the jurisdiction of the Natural Resource Area Plan. The cats that there are sterilized, fed and monitored. Any new cat that shows up is taken to be spayed/neutered. Often these are recently abandoned cats that have not yet become wary of people and they find new homes.

In San Francisco the need to remove feral cats becomes less pressing every year, yet there are numbers of people who think cats are increasing in population rather than dramatically decreasing. The SF/SPCA has been offering free feral fix since the early 1990s. As a result of this program, thousands of cats have been spayed/neutered and hundreds of thousands of cats have never been born.

I believe that because of the cat's relationship to people as a companion animal, a relationship not shared with other wild animals such as crows, skunks, possums, foxes and raccoons, feral cats have become a stand-in for humans and the problems we have caused to the environment. Feral cats are not a significant problem and should not be singled out. There is no 'urgent' need to remove them as is stated in G.R. 7a, G.R 7b and G.R. 7c.

The G.R. section in the Environmental Impact Report needs to be removed. It is made up of unproven suppositions not based on what has been happening in San Francisco over the last 15 years.

Thank you.

Susan Wheeler

San Francisco Ca 94103

Dear Mr. Wycko:

RE: RE: Significant Natural Resource Area Management Plan (SNRAMP), Environmental Impact Report, Case# 2005.0912E

The Initial Study states, "Topics are included in the EIR if there is not sufficient information available at this time on the potentially affected resources or site conditions."

I have considerable expertise on issues regarding feral cats. Presently no one knows what their impact is on San Francisco's environment and are only using speculation based on a lack of knowledge and expertise.

I believe that the General Recommendations for Predators G.R.7a, G.R.7b and G.R.7c as they stand are extremely flawed. The Natural Areas Program states under G.R.7 that feral cats are an urgent matter. This statement is from Ms. Huntsinger and Mr. Bartolome's review and their scientific expertise does not include feral cats.

The facts are that there are only a few feral cats in the Natural Areas in San Francisco. These feral cats are all fixed, fed, monitored and not hungry. Since 2006 because of San Francisco SPCA's Feral Cat Program there are fewer feral cats in the Natural Areas and in all of San Francisco.

What is the justification for feral cats to be described as an "urgent" matter? What exactly does this mean? What studies have been done *in San Francisco* that show and prove this? Studies that are done in other areas of the United States do not prove that feral cats are an "urgent" matter in San Francisco.

Why is the feral cat the only predator that is called an urgent matter? There is no evidence, observational material or scientific studies done in San Francisco proving that. Other predators greatly outnumber feral cats in San Francisco. Feral cats are not the primary reason for losses due to preying. Feral Cats are being singled out for no legitimate reason and possibly just for ideological bias.

Here is a list of other predators in these same natural areas as listed in The Presidio Implementation Plan, Golden Gate Audubon Society; and Save The Quail Campaign, Setting and Site Assessment, LSA Associates, Inc.:
Western Scrub-Jay, Common Raven, American Crow, Cooper, Sharp Shinned Red-Tailed Hawk, owl, gray fox, striped skunk, northern raccoon, domestic cat, California ground squirrel, and red fox.

Then there are other predators in the NAP areas such as coyotes, feral pigs, frogs, snakes, cormorants, herons, turtles, badger (potential), mice, rats, bats, bobcats and of course Humans.

To give you a few specific examples--Raccoons eat bird eggs and young and adult animals. . .Skunks will eat bird eggs and young animals. . . Possums will eat bird eggs and young animals. . .Ground squirrels will eat bird eggs and young. . .Jays, ravens and crows will kill and eat anything, including bird eggs. . . Herons will eat anything that fits in their mouth. . .Raptors and owls will kill and eat anything they can catch. . .Coyotes and fox will kill and eat anything they can catch. . . Mice and rats will eat anything, etc, etc., etc....

My point is that there are many more predators than feral cats in the natural areas of San Francisco. Feral cats are being inappropriately singled out as the most dangerous predator, the one that does the most harm and kills more than any other predator. There is no scientific basis for this conclusion and the impact of feral cats is not accurately understood. Their predation could even be quite limited. Keep in mind that predators also have positive impacts such as rodent control and maintaining balance in the environment. *A clear definition of what a predator is must be put in the Glossary.*

In the Initial Study under G.R.7a, it states "implement the feral cat control policy from the Quail Recovery Plan" (QRP) passed in 2004 by the Board of Supervisors. There is no feral cat control policy mentioned in the QRP. The QRP only uses the word "predator" and states that quail recovery must be done *without killing other animals.*

The control of any predator should be undertaken only in situations where it is clearly demonstrated with hard proof that they are having a negative effect on an area. Any control program must be developed with the expertise and humane practices of San Francisco Animal Care and Control and the San Francisco SPCA.

All of G.R.7 as it stands is unacceptable. It must either be removed or completely revised in cooperation with San Francisco Animal Care & Control and the San Francisco SPCA.

Thank you and sincerely,

PLANNING DEPARTMENT

My comments are in reference to my experience in the Oak Woodlands - GG Park Natural Area.
I suggest that the EIR of NAP Management Plan take seriously the boots on the ground experience of local habitat restoration volunteers.
My view is that Oak Woodlands are about 3 % of GG P and represent a fraction of what remains of original Coast Scrub and Oak Woodland habitat that predates the Park.
Our experience with very large introduced tree canopy ( blue gum eucalyptus and monterey pine/cypress ) and varieties of smaller but pervasive and invasive tree species indicates that the Natural Areas mandate to protect these remnant habitats must trump the often misguided attempts to " protect " trees.
In the Oak Woodlands, very few, if any of the large canopy trees have been cut but they are very problematic and in some places should be removed.
A lot of the invasive ' monocultural ' shrubs and trees have been cut to enable healthy growth of original natural habitat and in fact we replant more than an equivalent amount of native forbs, shrubs and trees to restore aesthetic and habitat balance.
We also have cut invasive monocultures to reduce the danger of fire ( the Oak Woodland has suffered fires caused by vagrant campers ) and also to clear overgrown areas that provide cover for illegal camping and trash accumulation.
For this reason, among others, I strongly urge extra penalties ( at least a misdemeanor arrest) for those who camp in Natural Areas.
The overlapping GG P jurisdiction ( RPD - GG P management is not always on board with Natural Areas staff due to turf and bureaucratic squabbling ) produces a less than satisfactory record in coping with these issues .
This indicates to me that Natural Areas must have the clear mandate to completely regulate the core of the natural area, MA-1 , AND adjacent zones, MA-2 , MA-3.
I think that these current ' tri - level ' natural area designations are a recipe for fragmented management and undermines the mandate of Natural Areas to regulate, restore and steward these places based on science, factual evidence and common sense.
In regard to dogs - as of now everyone is free to use such restored places as Oak Woodlands' Coon Hollow - but if it becomes obvious that dogs digging, pooping and peeing in this place produce significant impact then Natural Areas must have the absolute right to require limits to dog use.
Overall, the Natural Areas mandate to restore and steward the tiny remnants of our ' original' natural habitats in this regional urban environment require some sacrifice on the part of narrow interests that don't put sustainable natural habitat front and center.
I think it is quite obvious that we continue to lose planetary biodiversity - we must do better.

Re: Project title: Natural Areas Management Plan
Case No. 2005.1912E

Dear Mr. Wycko:

I and my family have lived immediately adjacent to Tank Hill, a so-called 'natural area', for nearly twenty years. At the opposite end of our small street lies another so-designated site, the interior greenbelt of Sutro forest, managed under the auspices of the RPD Natural Areas Program (NAP), and the subject of comments herein because of the proposed Management Plan involving clear cutting of 140 or more mature trees in that specific area. This decision to convert existing forest adjacent to neighboring homes to a sensitive plant museum has been made without proper scientific study or input from residents.

I am writing to request that the Planning Department demand more studies – assessments with forest-specific expertise on the part of the consultants, unlike the Initial Study provided by Tetra Tech. Such studies are needed in order to fully evaluate the substantial impacts that would result from the loss of the trees noted in the NAP Management Plan.

The history of this neighborhood and the NAP is rich with conflict, stemming primarily from documented clandestine clear-cutting of trees atop Tank Hill. One only need regard this site to witness an unfortunate example of the effects of wholesale tree removal. Winds blow with extreme force without the buffer of mature trees and of the native flora planted there (with the help of neighbors, I among them) few plants survive today. The total area of the site is far smaller than the interior greenbelt just 2/10s of a mile away, and the evidence from the Tank Hill experience bodes poorly for the greenbelt proposal.

While the reasons to require more studies are legion, I will focus my remarks and questions on a few key points:

Geology: How do we know that erosion problems resulting from the loss of trees will not be incurred upon the neighboring homes? What will be the effects of herbicides to immediate neighbors, animal and insect denizens of the forest, and others?

While the forest is managed under two jurisdictions it nonetheless exists as a single entity, with the university and the NAP overseeing a combined total of 61 acres of Sutro forest. The university currently proposes clear-cutting a total of 14 +/- acres of trees, which is more than 20% of total forest acreage. How have the combined effects of such significant deforestation been evaluated? How have the risks to both people and property been evaluated in light of the fact that deforestation will be upslope from residential areas adjacent to the greenbelt? How has the City evaluated the cumulative effects of the UC/FEMA grant proposal along with the NAP Management Plan?

This EIR must evaluate this cumulative effect on the entire Sutro forest of both management proposals.

Biology: What is known of the effects of removing established trees as proposed? What will be the effects of the health of the forest in its entirety with this type of periodic and spotty tree removal?

Recreation/Land Use: One of the reasons this management plan is so controversial is because of the restriction of access to the public of their own public land. The interior greenbelt contains the Belgrave trailhead into the forest from the east. Neighbors and visitors use this greenbelt area on a year-round basis. Sensitive habitat plantings will restrict use to a degree unknown. The impact of these plantings on our use has not been quantified.

As your charge to implement CEQA, which defines *'environment'* as the *'existing setting'*, I respectfully request that the Planning Department provide for a comprehensive scientific Environmental Review to evaluate the above-stated concerns on our current environment. Such a report will address the deficiencies in the Initial Study and allow the effects of the scope of the Management Plan to be fully and scientifically evaluated.

Thank you for your attention to these important concerns. I appreciate the opportunity to contribute to this important Management Plan.

Sincerely,

Denise Lapins

RE: Scope and Content of Environmental Impact Report and Environmental Review of the San Francisco Natural Areas Management Plan.

The San Mateo County Mosquito and Vector Control District would like to ensure that two things are considered in any future environmental documents for the Natural Areas Management Plan

1) The impact of changes at Sharp Park on mosquito development there.

The San Mateo County Mosquito and Vector Control District has been conducting mosquito control at Laguna Salada in the Sharp Park Golf course in Pacifica for several years. Substantial populations of vector mosquitoes develop on this property. Over the past several years, sediment has accumulated in the Laguna and encouraged the growth of cattails. The cattail stands provide ideal habitat for tule mosquitoes. Because of the broad extent of these stands, they must be treated by helicopter, a very expensive operation. If left uncontrolled, mosquitoes from this site present a significant threat to the health and safety of the residents in surrounding neighborhoods and visitors to the golf course and surrounding area. Therefore, the impact of changes to the site on mosquito development there should be one of the issues addressed in environmental documents prepared for the property. Changes to the shape, depth, and vegetation will have immediate and long term consequences on the necessity for pesticide applications, the method by which they are applied, and even the types of materials that must be used at this site. There are ways in which physical changes to the site could greatly alleviate mosquito production and reduce the need for pesticide applications. Conversely, the extent of mosquito development could be increased, if larger areas of marsh become populated with thick vegetation. District staff can offer expertise on the impact of proposed changes on mosquito production at the site. Our staff would like to work with the Planning Department during the design phase to ensure that changes at the Laguna minimize the potential for mosquito development rather than exacerbating the problem.

2) Continued access for inspection and treatment activities.

The SMCMVCD is responsible to the citizens and taxpayers of San Mateo County to provide vector control services. Because mosquito development is currently occurring at this site and may continue, the environmental review should clearly state the need for access to all mosquito development areas for inspection and control operations.

The District would like to work closely with the Planning Department in the future and can provide information on the current state of mosquito development in Sharp Park and the potential impact of any changes to the landscape there.

**Re: Initial Study of the Natural Areas Management Plan**

Dear Mr. Wycko,

Please require a **full Environmental Impact Report of the Natural Areas Management Plan**. As director and founder of the SF Tree Council and an appointed founding member of the city's Urban Forest Council, and after attending 5 years of Natural Areas meetings -- I am greatly concerned about the past 10 years of the Natural Areas Program destroying healthy mature trees, and ignoring the tremendous loss and outrage of the majority of San Franciscans.

San Francisco's large, mature trees are truly an endangered species and need to be preserved. Only 5% of trees of the total 669,000 trees in San Francisco have diameters greater than 30 inches, according USDA 2007 report (UFORE) on the state of the urban forest in San Francisco.

I concur with Mary McAllister, Karin Hu, and Nancy Wuerfel's assessment of The Initial Study of the SNRAMP. It is flawed, incomplete, and does not provide the much needed proof that SNRAMP is sustainable, cost effective or will benefit the greater good of our citizens. The scientific communities in the United State question the value of native plants and its citizens have rejected it when requiring the removal of healthy trees.

The Initial Study of the environmental impacts of SNRAMP is inadequate in many respects:

- It dismisses as "insignificant" environmental impacts that have been experienced in the past and that caused considerable damage as well as public concern.
- It makes sweeping statements, dismissing environmental and safety issues without providing any basis for these dismissals
- It demonstrates that the author has either not read SNRAMP or has not understood important portions of it
- It demonstrates that the author has ignored basic scientific principles needed to analyze potential impacts, such as carbon sequestration and release
- It demonstrates that the author has not visited the natural areas and is unaware of the 10-year history of environmental and safety problems and public concern since the Natural Areas Program began

For the long-term health of our environment and that of the citizens of San Francisco, please require a full EIR of SNRAMP.

Sincerely yours,

Subject
Re: Scoping Comments on NAP EIR

Hi Jessica,

Thanks for talking to me about the Natural Areas Program/Laguna Salada Enhancement CEQA process last month. As I mentioned to you on the phone, the main purpose of the Laguna Salada Enhancement Plan is to "restore the Laguna Salad wetlands to provide suitable habitat for the San Francisco garter snake and the California red-legged frog." p. 1-1. To do so, the purposes and objectives section expressly states that San Francisco and/or its consultants must consider restoring vegetative conditions, water quality, migration corridors, etc. in "the lagoon and the surrounding area." Id. Thus, it seems that RPD must consider full restoration of Sharp Park through the CEQA process, and that the City may not simply presume that the golf course will continue to exist indefinitely.

I also previously sent you a copy of my comments, along with a website where you could download the comments and all the exhibits. Please let me know if you have any trouble accessing the documents. The link is posted again below.

Thank you,

Re: Sharp Park Golf Course

Alternate Use Study
Park Code, Article 3, Section 320
File No. 090329

Sensitive Natural Resource Areas Management Plan EIR
Case No. 2005.1912E

Dear Mr. Ginsburg, Ms. Kamalanathan, and Mr. Wycko,

In connection with your respective planning processes with regard to the Sharp Park Golf Course, the San Francisco Public Golf Alliance submits the following comments and suggestions.

(1) Sharp Park Golf Course is an historic public landscape of local, national and international significance, one of the few public golf courses, and the only surviving seaside public links, designed by the historically preeminent golf architect Alister MacKenzie.

(2) The golf course is culturally significant as a popular recreational asset used and enjoyed by men, women, and children of all ages, backgrounds, races, and cultures.

(3) The golf course is also a work landscape architecture of the highest aesthetic value, by an internationally-renowned master, and is enjoyed not only by the golfers, but also by the thousands of strollers, hikers, and bikers who pass by on the seawall that overlooks the golf course.

(4) Practical, cost-effective measures are readily available to preserve the full 18-hole golf course, in its current configuration, retaining all of MacKenzie's remaining original golf holes, while simultaneously protecting and enhancing the habitat for the red-legged frog and San Francisco garter snake at the ponds and waterways on the golf course.

(5) Simultaneously preserving the golf course and protecting the frog and snake can be accomplished more quickly, and at lower cost to the city in both money and administrative time, than eliminating the golf course or reducing it to 9 holes.

(6) Because of the golf course's international status as a public seaside Alister MacKenzie course, preservation of the golf course offers the city the opportunity for significantly greater revenue, than destruction or diminution of the golf course.

## I. HISTORICAL, AESTHETIC, AND CULTURAL SIGNIFICANCE OF SHARP PARK GOLF COURSE.

1. Sharp Park Golf Course, opened in 1932, is the work of the internationally preeminent golf architect, Dr. Alister MacKenzie, who was hired for the job by John McLaren, a kindred Scottish gardener and the father of Golden Gate Park. McLaren was head of the San Francisco Recreation and Park Department, and personally planted the trees on the golf course.

2. Sharp Park Golf Course is a nationally and internationally-significant cultural landscape, and has been formally recognized as worthy of preservation by public entities and non-governmental organizations, including the City of Pacifica, County of San Mateo, and the Cultural Landscape Foundation of Washington, D.C.

3. Golf architecture is a branch of landscape architecture, and MacKenzie was a naturalist, in the tradition of Capability Brown, the 18th Century father of the English school of landscape design, which turned away from the formal geometry of French and Italian gardens. "The chief object of every golf course architect worth his salt," MacKenzie famously said, "is to imitate the beauties of nature so closely as to make his work indistinguishable from nature itself."

4. The great aesthetic value of MacKenzie's landscape architecture is enjoyed not only by golfers, but by the thousands of walkers and hikers who pass by daily on the trail atop the seawall that adjoins the golf course to the west.

5. MacKenzie was a native Englishman and Bay Area resident, and the designer of several of the world's best-known and most beloved golf courses, including Cypress Point and Augusta National, the site of the annual Master's Tournament. Sharp Park is one of only a very few public courses designed by MacKenzie, and his only remaining public seaside links. As such, Sharp Park is a world cultural resource, the only place in the world where current and future generations of the general public can experience in person the seaside work of this master artist.

6. As Sharp Park's owner, San Francisco has an obligation of stewardship, which accompanies international masterworks.

7. In its current condition and configuration, the Sharp Park Golf Course has 12 of MacKenzie's original holes, complete with their greens complexes (numbers 1, 2, 3, 9, 10, 11, 13, 14, 15, 17, and 18), parts of two other holes (numbers 12 and 16), and another original green complex at the 8th hole. Although four ocean side holes were lost to the sea years ago, and other holes have lost original bunkers and consequently some of their original strategy (which could be restored), and

although the seawall now blocks ocean views, the course retains its seaside links character and the air, wind, sounds, and smells of the sea.

8. Sharp Park Golf Course also retains the artistry and ingenuity of Dr. MacKenzie's original design. Sharp Park's picturesque routing, the architect's trademark optical illusions, and his false-fronted, heaving and tumbling greens simultaneously entertain and challenge golfers as they walk the linksland. For example, MacKenzie's famous use of camouflage is displayed at the current 14th hole, where a large mound 30 yards in front of the right side of green creates an optical illusion that the green is closer to the player standing in the fairway than it is in fact.

9. "A golf course should be made interesting and a good test of golf," MacKenzie said, "by the tilt of the greens and the character of the undulations." (*The Spirit of St. Andrews,* 1934, at p. 75.) MacKenzie designed dramatic mounds in Sharp Park's greens and surrounds to deflect all but the very best shots away from the holes. He built "false fronts" at the greens on holes 2, 9, 13, 14, 17, and 18, to reject shots that land on the front of the greens. Likewise, MacKenzie used steep slopes off the sides of greens (for example, at the 17$^{th}$ green), to deflect the inexpertly-struck approach shot down an embankment to a very difficult short-side pitch.

10. Because the master's artistry can be seen and directly experienced by the public, Sharp Park has great value to the local, regional, national, and international golf communities, all of which look to San Francisco to act as a responsible caretaker of this internationally-known and beloved asset.

11. This unpretentious, old-fashioned, golf course provides golf at modest cost to the general public, and as a result the course closely resembles in spirit the seaside links of the sport's homeland, Scotland. In 2006-2007 and 2007-2008, the most recent years for which official figures are available, 56,000 and 51,000 annual rounds of golf were played at Sharp Park, according to the December 17, 2008 Report of Controller Ben Rosenfield to the San Francisco Board of Supervisors.

12. The City of San Francisco's recreational consultant Leon Younger and PROS Consulting, in its August, 2008

Recreational Opportunities Study Summary Report, urged the city to preserve the golf course: "A historic golf course designed by the most celebrated golf architect.... It is much like having a park designed by Olmstead or a Frank Lloyd Wright building.... The golf community around the world is aware of this golf course, its past and future potential... to be one of the best public golf courses in the United States.... Because of its heritage it has the potential for private fund raising or an endowment for restoration and remodel. Probably one of the few in America.... It provides the average golfer access to design greatness.... It should be a crown jewel of the Recreation and Park Department and the city of San Francisco, a prominent fixture extolling the quality of life in this area. A proud heritage of some of the best golf in the world and its relationship to the sea.... It would also become a great revenue source (especially with private funds for restoration/remodel) for the Recreation and Park Department, as it would be a great local golf course but also a destination golf course for golfers all over America." (PROS Report, August, 2008, at p. 44.)

13. Destruction of the Sharp Park Golf Course, or its disfigurement or diminution to 9 holes, as some have suggested, would be a great loss to San Francisco, and would be fatal to the international significance and appeal of the course. The world golf and landscape architectural communities would mourn and recriminate, and would regard the city as irresponsible and folly.

14. For these reasons, San Francisco should make every effort to maintain all of the remaining MacKenzie golf holes at Sharp Park.

## II. THE GOLF COURSE CAN BE RETAINED AND PRESERVED, WHILE SIMULTANEOUSLY ENHANCING THE ENVIRONMENT.

1. We recognize that the Sharp Park Golf Course has over the years--and precisely because the golf course has fostered a freshwater pond ecology in place of the brackish water ecology that preexisted the golf course and the seawall--become home to the federally-protected red-legged frog and the endangered San Francisco garter snake, and that the city is under state and federal mandate to protect these species.

2. Golf courses can be, and commonly are, operated in a manner that protects and enhances habitat for threatened and endangered species. In fact, this is done right now at the San Francisco Public Utilities Commission-owned Crystal Springs Golf Course, located on public watershed lands in Hillsborough. The golf course is leased by the city long-term to an environmental award-winning golf management company that specializes in operating municipally-owned courses. Since the lease began about 15 years ago, Crystal Springs has simultaneously provided public golf, enhanced habitat for native species including the red-legged frog and San Francisco garter snake, annually returned over $1 Million in net lease payments to the city, while also making nearly $5 Million in capital improvements to the property.

3. We understand from the description of the "Recommended Management Actions" at pages 43-44 of the Tetra-Tech Natural Areas Management Plan Initial Study, that the city intends to dredge Laguna Salada, and to remove some amount of the bulrushes that now fill that marsh, to create ponds of open water together with upland habitat islands. However, we have not seen any details of this dredging and tule-removal plan. How deep will the ponds be after dredging, and what will be their new dimensions and water-holding capacities? Will permits be required for such dredging and/or tule-removal operations? As between the City and County of San Francisco, the City of Pacifica, County of San Mateo, the Coastal Zone Commission, and the Corps of Engineers, where does the permitting authority for this work lie?

4. We also understand that the city's "Recommended Management Actions" include the creation of "a buffer zone between the Laguna Salada wetlands and the golf course fairways." We are unaware of any description of this buffer zone, or its dimensions or mechanics. And we have the same questions as to permit requirements and permitting authority, as described above at the end of paragraph II.3.

5. We have several questions about the drainage from Horse Stable Pond to the beach: (1) what is the water level of the outflow pipe(s); (2) what is the capacity of the pump(s); (3) what is the working condition of the pump(s); (4) what is the water level and the capacity of the gravity outflow line; and (5) what is the operational status of the gravity outflow line? We need a better understanding of how the gravity and the pump-

assisted outflows work together, and the reasons why there have in the past been problems. We understand that the gravity outflow pipe had been clogged for many years, but that it has recently been unclogged. When was that accomplished, and who was the project officer, and what is the contact information for that project officer? Who has the best understanding of these pond hydrology issues, and has there been a comprehensive written report on these issues? Can we get a copy of such a report? We need full understanding of these issues to address the fairway drainage issues discussed below in paragraph II.7(8).

6. We also understand the Golden Gate National Recreation Area's Mori Point property, immediately to the south of Horse Stable Pond, to be upland habitat for the San Francisco Garter Snake and the red-legged frog, and that the GGNRA has encouraged the city to manage Sharp Park compatibly with the species' migration between Mori Point Mori Point, Horse Stable Pond, and Laguna Salada.

7. Subject to our need for additional site information, we suggest a combination of measures, including but not limited to the following, at what appear to be the most environmentally-sensitive areas on the course--holes Nos. 12, 13, 14, and 15.

(1) create a native plant/no-golf area surrounding an "island" green complex in the vicinity of the current 12th green;

(2) alternately, relocate the 12th green complex (which is not a MacKenzie original) to the west, closer to the seawall;

(3) alternately relocate both the tee and green complex for the 12th hole to west and north of 12th green and 13th tee, which appears to be the site of an abandoned golf hole, currently overgrown with iceplant;

(4) create an "island tee" complex at the 13th tee, also surrounded by a native plant/no-golf area;

(5) connect the 12th tee and green, the 12th green and 13th tee, and the 13th tee and 13th fairway by raised boardwalk causeways, which would be the only access to these playing areas, and reduce golf maintenance at the 12th green and 13th tee complexes to hand-mowing;

(6) make these raised causeways at the 12th and 13th holes walking-only for both golfers and maintenance workers, and require golfers to park golf carts behind the 11th green, and retrieve them only after returning to the 13th fairway;

(7) restrict golf cart usage on the 13th, 14th, 15th, and 17th fairways to cart paths only, and move the cart paths away from Laguna Salada;

(8) raise the 14th fairway at its lowest points, and separate the fairway from the wetland area by some combination of mounds and/or low railroad-tie walls, and then follow the drainage overflow around the Laguna Salada, and contain the overflow with similar mounds and/or low walls;

(9) alternately, at times of high water at the 14th fairway, temporarily close that fairway to play, and utilize instead a new short 4-par hole that might be located running south to north alongside the seawall, behind the current 12th green and 13th tee; and

(10) connect the 15th tee and green complex with another causeway.

Similar measures to the foregoing have been taken at other courses with sensitive amphibian species, in the Bay Area and elsewhere, including at Bodega Bay and Crystal Springs.

8. The foregoing and similar measures could be accomplished consistent with and as part of the currently-ongoing Sensitive Natural Resource Areas Environmental Impact Report process. By comparison, we believe that destruction of the golf course, or significant reconfiguration with new holes in virgin areas, or reduction of the golf course from 18 to 9 holes, would require a separate, lengthy and expensive environmental review process, that would raise many complex and controversial environmental and social issues outside the scope of the current EIR process.

9. We have reviewed the Recreation and Park Department's recently-adopted Environmental Species Compliance Plan for Sharp Park. Employed in conjunction with the Recommended Management Actions listed for the Laguna Salada and Horse Stable Pond area in the Tetra Tech Initial Study, the

measures outlined in the Compliance Plan provide for continuation of the MacKenzie golf course, in harmony with protection of the frog and snake and enhancement of their habitat.

10. We understand that the city's contract for the Harding Park project requires the Professional Golfers Association ("PGA") to provide golf design at Sharp Park and/or Lincoln Park up to $1 Million. (See Management Audit of Recreation and Park Department, by San Francisco Budget Analyst's Office, January 12, 2006, at Section 6.) The sensitive ecology and hydrology issues at Sharp Park necessarily imply environmental and engineering study as part of golf course design, so that now would be a good time for the city to invoke the PGA's obligation to provide design at Sharp Park.

We anticipate consulting with a team including a species biologist, hydrologist, and golf architect, and we further anticipate that we may have additional or alternative suggestions aimed at finding creative, minimalist, nature-friendly solutions that will simultaneously preserve and enhance the habitats for the listed species, and preserve the legacy MacKenzie golf course at Sharp Park. And we look forward to working cooperatively with the Recreation and Park Department, Fish and Game, the Fish and Wildlife Service, and the relevant political entities and administrative agencies to this end.

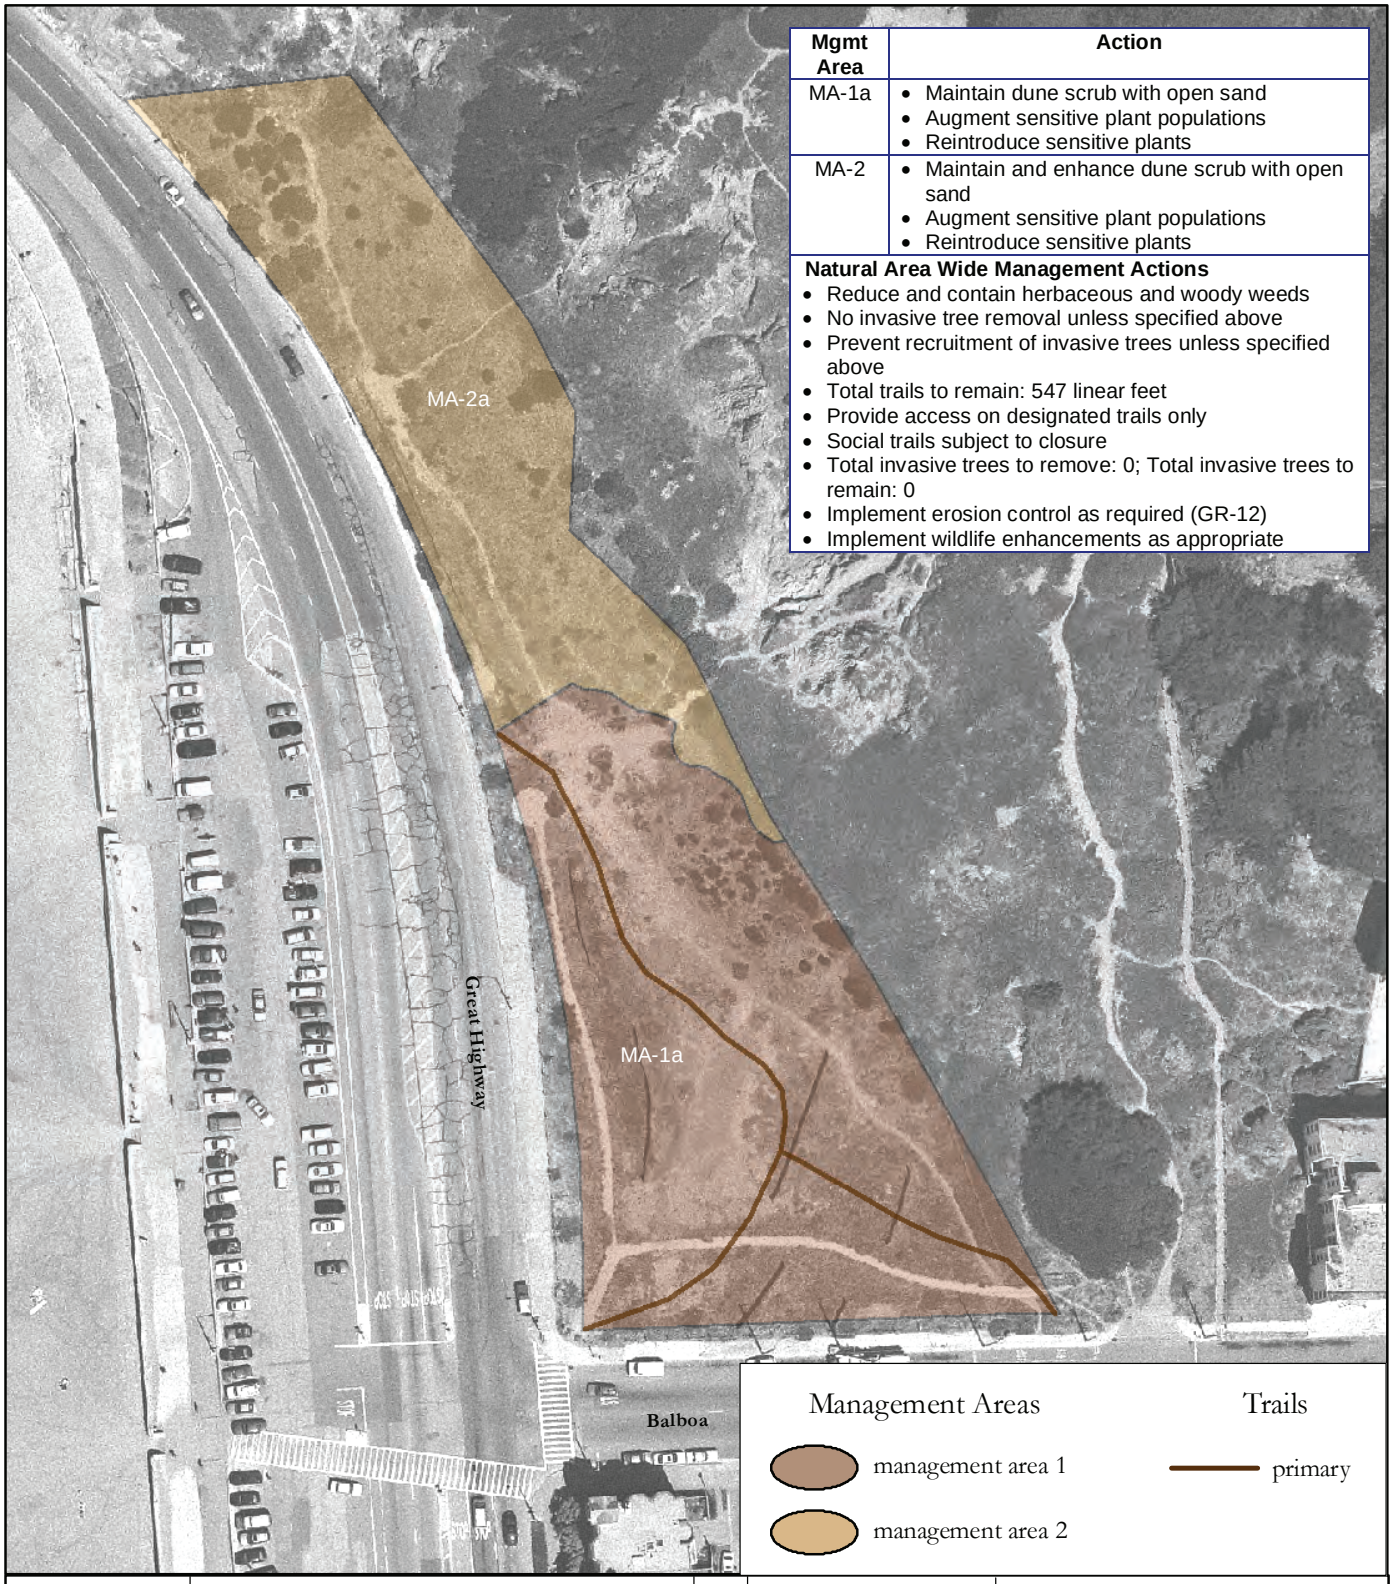
We ask you to advise us as soon as possible of the details of the city's dredging plans at Laguna Salada, Horse Stable Pond, and the connecting waterway and Sanchez Creek. These plans will affect the hydrological issues of the above-discussed drainage measures. We also ask that, as soon as possible, we be allowed to meet with the city's biologist and golf architect so that we can fully understand their scientific and topographic concerns at the site.

If working cooperatively we can simultaneously save the golf course and protect the frog and snake and enhance their habitat--and we are confident this can be done--then San Francisco will have an asset that will be valuable to the environment, to the citizens of San Francisco and its neighboring communities, to the local and international golf and cultural landscape communities, and to the treasury of the Recreation and Park Department. Such an environmentally-friendly golf course

will be a revenue-generator for the city, and an example to other communities with sensitive species issues in their parklands.

Because we would be preserving an asset of the broader golf community, we are endeavoring to obtain the support, financial and otherwise, of that community to make this possible. Initial responses to our inquiries in this regard have been very positive, on the assumption that the interrelated environmental and golf restorations, and golf at Sharp Park going forward, will require the very highest levels of biological science, engineering, stewardship, and golf operations.

We look forward to working closely with you and all of the interested political bodies and administrative agencies, and all persons of good will, on this important project.



Very truly yours,

Richard Harris

**PROPOSED PROJECT** ☐ Demolition ☒ Alteration

## PROJECT DESCRIPTION

The project is the implementation of the San Francisco Recreation and Parks Department's Significant Natural Resource Areas Management Plan. The plan establishes goals and objectives for 32 Natural Areas, including Sharp Park Golf Course located in Pacifica. The specific goals and objectives are listed fully in Chapters 2 and 3 of the Sharp Park Golf Course Historical Resources Evaluation (HRE) report. In summary, the proposed project would convert about 19 acres of the golf course to Natural Area to facilitate restoration of the Laguna Salada and wildlife habitats associated with the property. Both the lagoon and pond would be excavated extensively and the dredge spoils would be used to raise Holes 10, 14, 15, and 18, creating upland habitat on the east edge of Laguna Salada. Thirteen acres of the golf course would be converted to upland habitat along the east side of the lagoon and would require that Holes 10 and 13 are slightly shortened or narrowed. A dispersal corridor between the lagoon and the pond would be constructed with upland features and would necessitate closing Hole 12 of the golf course. A post and rail fence would also be installed along the seawall to the west of the lagoon, with additional fencing around the wetland complex to discourage human and pet intrusion.

## PRE-EXISTING HISTORIC RATING / SURVEY

The golf course and the clubhouse were separately designated as historic landmarks for the City of Pacifica in 2009. The property is not listed on the state or national registries. The property is considered a "Category A" (Known Historic Resource) property for the purposes of the Planning Department's California Environmental Quality Act (CEQA) review procedures.

## HISTORIC DISTRICT / NEIGHBORHOOD CONTEXT

The 411-acre golf course is located in the town of Pacifica in San Mateo County. It borders the Pacific Ocean and is bisected by Highway 1. Thirteen fairways, the clubhouse, and Laguna Salada are located to the west of the highway, and the four remaining fairways are located to the east of the highway.

1. **California Register Criteria of Significance:** A building may be an historical resource if it meets any of the California Register criteria listed below. If more information is needed to make such a determination please specify what information is needed. *(This determination for California Register Eligibility is made based on existing data and research provided to the Planning Department by the above named preparer / consultant and other parties. Key pages of report and a photograph of the subject building are attached.)*

| | | | |
|---|---|---|---|
| **Event:** or | ☒ Yes | ☐ No | ☐ Unable to determine |
| **Persons:** or | ☐ Yes | ☒ No | ☐ Unable to determine |
| **Architecture:** or | ☒ Yes | ☐ No | ☐ Unable to determine |
| **Information Potential:** | ☐ Further investigation recommended. | | |
| **District or Context:** | ☒ Yes, may contribute to a potential district or significant context. | | |
| | If yes, period of significance: 1929-1932 | | |

The Planning Department concurs with Tetra Tech's determination that the subject property appears to be eligible for listing on the California Register for its significance under Criteria 1 (Events) and 3 (Architecture). The golf course's development is associated with the broader event of the golden age of golf in the US and in California. The course is also an important example of a seaside golf course designed by a master landscape architect, Alister Mackenzie. Please refer to Section 5.2 of the HRE report for a full analysis of the resource's historical significance.

---

2. **Integrity** is the ability of a property to convey its significance. To be a resource for the purposes of CEQA, a property must not only be shown to be significant under the California Register criteria, but it also must have integrity. To retain historic integrity a property will always possess several, and usually most, of the aspects. The subject property has retained or lacks integrity from the period of significance noted above:

| | | | | | |
|---|---|---|---|---|---|
| **Location:** | ☒ Retains | ☐ Lacks | **Setting:** | ☒ Retains | ☐ Lacks |
| **Association:** | ☒ Retains | ☐ Lacks | **Feeling:** | ☒ Retains | ☐ Lacks |
| **Design:** | ☒ Retains | ☐ Lacks | **Materials:** | ☒ Retains | ☐ Lacks |
| **Workmanship:** | ☒ Retains | ☐ Lacks | | | |

The resource retains sufficient integrity in all aspects of its character to convey its historical significance. Please refer to Section 5.3 of the HRE report for a full analysis of property's integrity.

---

3. **Determination** of whether the property is an "historical resource" for purposes of CEQA.

☐ No Resource Present *(Go to 6 below.)* ☒ Historical Resource Present *(Continue to 4.)*

---

4. **If the property appears to be an historical resource,** would the proposed project materially impair the resource (i.e. alter in an adverse manner those physical characteristics which justify the property's inclusion in any registry to which it belongs)?

☐ The project would not cause a substantial adverse change in the significance of the resource such that the significance of the resource would be materially impaired. *(Continue to 5 if the project is an alteration.)*

☒ The project is a significant impact as proposed. *(Continue to 5 if the project is an alteration.)*

The Planning Department fully concurs with the impacts analysis provided by Tetra Tech in Section 5.4 of the HRE report. In summary:

**Project Impacts:**

- Raising Holes 10, 14, 15, and 18 *would not cause a significant impact* on the character-defining features of the golf course and the holes would remain in their original locations and the visual character of their fairways would only be minimally affected.

- The closure of Hole 12 *would cause a significant impact* to the historic resource as the work would eliminate an original hole and fairway on the west side of the course. Its removal would significantly alter the original golf course design and boundaries.

- The proposed fencing would add a modern element to the golf course but would not harm the character or setting of the resource. This addition to the landscape *would not cause a significant impact* to the historic resource.

- Modifying approximately 13 acres of the golf course to create upland habitat along the east side of the lagoon would require slightly shortening or narrowing Holes 10 and 13. This alteration would significantly alter the character of these original fairways. Therefore, the work *would cause a significant impact* to the historic resource.

**Alternative Project Impacts:**

- The recreation analysis of the SNRAMP EIR proposes a mitigation measure (Option 1) that would create a new hole on the east side of Highway 1 as a replacement for Hole 12. This would result in a total of 13 holes on the west side of the highway and five holes on the east side. This arrangement would not maintain the historic balance of holes on either side of the highway and would change the historic boundaries of the course. This *would cause a significant impact* to the original design of the historic resource.

- The recreation analysis of the SNRAMP EIR proposes a mitigation measure (Option 2) that would create a new hole on the west side of Highway 1 as a replacement for Hole 12. While the mitigation measure would change the layout of the holes, this alternative mitigation measure would restore some of the elements that Mackenzie had implemented in his original design by placing the new holes in areas of the course where holes were historically placed. The proposed holes would also be in keeping with the historic boundaries of the golf course. Because of the restorative aspect of the work, this mitigation *would cause a less than significant impact* to the resource.

The project would result in significant impacts to several character-defining features of the golf course, including Holes 10, 12, and 13.

5. **Character-defining features** of the building to be retained or respected in order to avoid a significant adverse effect by the project, presently or cumulatively, as modifications to the project to reduce or avoid impacts. Please recommend conditions of approval that may be desirable to mitigate the project's adverse effects.

   The character-defining features of the property are:

   - The original features and design of the clubhouse;
   - The original features and design of the permanent maintenance building; and,
   - The original features and design of the golf course, including the 12 original holes (current holes 1, 2, 3, 8, 9, 10, 11, 13, 14, 15, 17, and 18), the original landscape features, and the cypress tree plantings that line the fairways.

   Documentation of the historic cultural landscape by a qualified architectural historian should be completed before the commencement of any landscape alterations, as described in Chapter 6 of the HRE report. However, documentation of the resource will not mitigate the impacts of the project to Holes 10, 12, and 13 to a less than significant level.

---

6. **Would the proposed project have an adverse effect on off-site historical resources, such as adjacent historic properties?**

   ☐ Yes ☒ No ☐ Unable to determine

   There are no identified off-site historical resources that would be affected by the project.

---

## SENIOR PRESERVATION PLANNER REVIEW

**PROPOSED PROJECT** ☐ Demolition ☒ Alteration

## PROJECT DESCRIPTION

The project is the implementation of the San Francisco Recreation and Parks Department's Significant Natural Resource Areas Management Plan. The plan establishes goals and objectives for 32 Natural Areas, including Mount Davidson. The specific plan actions for this site are primarily vegetation changes to maintain the health of the existing forest. The work would include the removal of a portion of the existing invasive tree species, including approximately 1,600 of the estimated 11,000 blue gum eucalyptus trees, and the introduction of native plant species. There are no proposed changes to the hardscape features of the natural area (i.e. retaining walls and steps).

## PRE-EXISTING HISTORIC RATING / SURVEY

The property is not currently listed on any local, state, or national registries. The property is considered a "Category B" (Properties Requiring Further Consultation and Review) property for the purposes of the Planning Department's California Environmental Quality Act (CEQA) review procedures due to the age of the park and structures.

## HISTORIC DISTRICT / NEIGHBORHOOD CONTEXT

Mount Davidson Natural Area is in south-central San Francisco south of Portola Drive in the Miraloma neighborhood. Forests cover approximately 30 acres of the 40-acre Natural Area and the area contains WPA-era retaining walls and staircases. It is also the location of the Mount Davidson cross erected in 1929 (the cross has been privately owned since 1997 and is not considered part of the Mount Davidson Natural Area). Please refer to the attached "Mount Davidson WPA-Era Retaining Walls & Stairs" DPR form, Sections P3a and B10, for a full description of the site and associated structures and their historic context.

---

1. **California Register Criteria of Significance:** A building may be an historical resource if it meets any of the California Register criteria listed below. If more information is needed to make such a determination please specify what information is needed. *(This determination for California Register*

*Eligibility is made based on existing data and research provided to the Planning Department by the above named preparer / consultant and other parties. Key pages of report and a photograph of the subject building are attached.)*

| | | | |
|---|---|---|---|
| **Event:** or | ☒ Yes | ☐ No | ☐ Unable to determine |
| **Persons:** or | ☒ Yes | ☐ No | ☐ Unable to determine |
| **Architecture:** or | ☒ Yes | ☐ No | ☐ Unable to determine |
| **Information Potential:** | ☐ Further investigation recommended. | | |
| **District or Context:** | ☒ Yes, may contribute to a potential district or significant context. If yes, period of significance: 1885-1943 | | |

The WPA-era staircases and retaining walls located at Mount Davidson were evaluated by Tetra Tech for eligibility for listing on the California Register. These hardscape features were found to be eligible for listing on the California Register under Criterion 1 (Event) and 3 (Architecture) for their association with WPA/New Deal Construction. The Planning Department concurs with the findings presented in the attached DPR form, Section B10. (See form for full evaluation of these features.)

Tetra Tech also prepared a memorandum[1] describing the history of the urban forest located at Mount Davidson and the establishment of the city park in this location. Based upon this information the Planning Department finds that the Mount Davidson natural area is potentially eligible for listing on the California Register under Criteria 1 (Event) and 2 (Persons) as an ethnographic landscape. Although further research is required to establish a full historic context for the site, Mount Davidson is a prominent topographical feature in San Francisco that has historically held special natural and cultural significance for the city. The site is associated with local philanthropist Adolph Sutro, with an annual Easter ceremony established in 1923, and with the early development of natural areas dedicated to recreational use within San Francisco. For these reasons, the natural area will be considered a historic resource for the purposes of this review.

Sutro, known for his Comstock Lode engineering and as a philanthropist, and specifically his conservationist activities, purchased the Mount Davidson (then known as Blue Mountain) property in 1881 and began planting the forest circa 1885. This activity occurred around the same time that Sutro was helping to organize the first California Arbor Day held in 1886. The original forest was planted with pine, cypress, and eucalyptus trees; however, over time the eucalyptus have begun to dominate and have occasionally been thinned to retain the diversity of the forest. The property was transferred to A.S. Baldwin in 1909. During this time the mountain was given the name 'Mount Davidson', and the first public trails were established on the property. In 1923 the first Easter ceremony was held at the top of the mountain, beginning the tradition which continues through today. The property was finally purchased by the City in 1927 and the land was dedicated as a city park in 1929. In the same year as the park dedication, a permanent cross was constructed at the mountaintop for the yearly Easter services. As noted above the park became the site of a WPA-era work project between 1936-1943. Based upon these facts, the period of significance for the potential historic landscape would

[1] Memorandum regarding "Summary of History of Trees on Mount Davidson Taken from Research Conducted for DPR 523 Forms for Mount Davidson WPA-era Walls and Stairs" to Sophie Hayward, Planning Department, from Julia Mates, Historian, Tetra Tech, Inc. dated August 10, 2010.

appear to be 1885-1943, beginning with the forest planting and extending through to what appears to be the last major improvement project for the park.

---

2. **Integrity** is the ability of a property to convey its significance. To be a resource for the purposes of CEQA, a property must not only be shown to be significant under the California Register criteria, but it also must have integrity. To retain historic integrity a property will always possess several, and usually most, of the aspects. The subject property has retained or lacks integrity from the period of significance noted above:

| | | | | | |
|---|---|---|---|---|---|
| **Location:** | ☒ Retains | ☐ Lacks | **Setting:** | ☒ Retains | ☐ Lacks |
| **Association:** | ☒ Retains | ☐ Lacks | **Feeling:** | ☒ Retains | ☐ Lacks |
| **Design:** | ☒ Retains | ☐ Lacks | **Materials:** | ☒ Retains | ☐ Lacks |
| **Workmanship:** | ☒ Retains | ☐ Lacks | | | |

Other than the expected weathering of outdoor landscape features, the retaining wall and staircases have retained a high level of integrity in all aspects of their significance. Although a full survey of the site has not been conducted, the historic landscape also appears to be intact and to display the same range of vegetation first established in Sutro Forest in 1885. As is expected in a living landscape, the forest has grown over time; however this change does not diminish the integrity of the site.

---

3. **Determination** of whether the property is an "historical resource" for purposes of CEQA.

☐ No Resource Present *(Go to 6 below.)* ☒ Historical Resource Present *(Continue to 4.)*

---

4. **If the property appears to be an historical resource,** would the proposed project materially impair the resource (i.e. alter in an adverse manner those physical characteristics which justify the property's inclusion in any registry to which it belongs)?

☒ The project would not cause a substantial adverse change in the significance of the resource such that the significance of the resource would be materially impaired. *(Continue to 5 if the project is an alteration.)*

☐ The project is a significant impact as proposed. *(Continue to 5 if the project is an alteration.)*

Staff has reviewed the proposed project and found that the work will not result in any significant changes to the historic landscape or its hardscape features. The selective tree removal will help to restore the historic balance of tree species within the forest and will preserve its historic character. Moreover, the historic landscape's use as a public park will be preserved. Therefore, the project will not cause a substantial adverse change in the significance of the resource.

5. **Character-defining features** of the building to be retained or respected in order to avoid a significant adverse effect by the project, presently or cumulatively, as modifications to the project to reduce or avoid impacts. Please recommend conditions of approval that may be desirable to mitigate the project's adverse effects.

   The character-defining features of the Mount Davidson historic landscape appear to be the WPA-era hardscape retaining walls and stairs; the Sutro forest, composed of pine, cypress, and eucalyptus trees; and, the Mount Davidson cross.

---

6. **Would the proposed project have an adverse effect on off-site historical resources, such as adjacent historic properties?**

   ☐ Yes ☒ No ☐ Unable to determine

   There are no indentified historic resources at the perimeter of the Mount Davidson natural area. The project would not directly or indirectly affect any off-site historic resources.

---

# CHAPTER 1
# SUMMARY OF FINDINGS

In response to public concerns raised during the California Environmental Quality Act (CEQA) scoping process for the Significant Natural Resource Area Management Plan (SNRAMP) Environmental Impact Report (EIR), this Historical Resources Evaluation (HRE) addresses Sharp Park Golf Course as a designed historic landscape. CEQA requires that the lead agency for the project, the City and County of San Francisco Planning Department Major Environmental Analysis (MEA), determine the impact that implementing the SNRAMP may have on historical resources at Sharp Park Golf Course. MEA and the San Francisco Recreation and Park Department (SFRPD) are preparing an EIR for this project, for which this HRE will be a technical background report. Tetra Tech prepared this HRE, in accordance with Section 15064.5(a)-(b) of the CEQA guidelines and using the criteria outlined in Section 5924.1 of the California Public Resources Code and Section 15126.4 of the CEQA guidelines. The report identifies known or potential historical resources at Sharp Park Golf Course that could be impacted by the project and assesses potential impacts on those resources. The report also proposes measures to mitigate any substantial adverse changes to historical resources. The location of the Golf Course is shown in Figure 1.

Based on the scoping comments from the Initial Study, Tetra Tech and MEA established the project's area of potential effects (APE) as the footprint of the Sharp Park Golf Course[1] (Figure 2). Tetra Tech's historian identified the built environment resources within the APE that could be potentially impacted by this project. These resources constitute the survey population properties for this study, which are Sharp Park Golf Course, including the course itself, maintenance buildings, and clubhouse.

[1]The term "area of potential effect" is associated with historic resources studied in compliance with the National Historic Preservation Act, Section 106 and its regulation in Title 36, Code of Federal Regulations, Section 800. APE is used in this document to define the geographical area that the SNRAMP EIR project may directly or indirectly impact. This report is prepared for the project's compliance under CEQA and use of APE should not be taken to imply that the SNRAMP EIR project is a federal undertaking that must comply with Section 106.

TETRA TECH

***Existing Golf Course***

Pacifica, California

**Figure 2**

Tetra Tech inventoried and evaluated the golf course to assess whether it should be considered a historical resource for the purposes of CEQA, that is, whether it is listed on, determined eligible for listing on, or appears to meet the criteria for listing on the California Register of Historical Resources (CRHR) or the National Register of Historic Places (NRHP).

Tetra Tech concludes that Sharp Park Golf Course appears to meet the criteria for listing on the CRHR and NRHP and should be considered a historical resource for the purposes of CEQA. Furthermore, the project would cause a substantial adverse change to the Sharp Park Golf Course because some of the project activities would diminish the historic integrity of the property. Therefore, mitigation measures are proposed in this document.

# CHAPTER 2
# PROJECT DESCRIPTION

## 2.1 PROJECT OVERVIEW

While San Francisco is by and large a densely developed urban area, fragments of unique plant and animal habitats, known as Natural Areas, have been preserved in San Francisco and Pacifica, in the parks that are managed by the SFRPD. In the late 1990s, the SFRPD developed a Natural Areas Program to protect and manage these Natural Areas for the natural and human values they provide. The Natural Areas Program mission is to preserve, restore, and enhance the remnant Natural Areas and to promote environmental stewardship of these areas. On January 19, 1995, the San Francisco Recreation and Park Commission approved the first SNRAMP.

Over the course of several years, the SFRPD developed a new SNRAMP (SFRPD 2006), with a final draft plan based on the 1995 plan and published in February 2006. This SNRAMP contains detailed information on the biology, geology, and trails within 32 Natural Areas, all of which are in San Francisco except Sharp Park, which is in Pacifica. The SNRAMP is intended to guide natural resource protection, habitat restoration, trail and access improvements, other capital projects, and maintenance activities over the next 20 years. The proposed project is the SFRPD's implementation of the SNRAMP.

## 2.2 PROJECT OBJECTIVES

Summarized below are the goals and objectives of the SNRAMP.

### *Conservation and Restoration Goals*

- To identify existing natural resources;
- To maintain viable populations of all special status species;
- To maintain and enhance native plant and animal communities;
- To maintain and enhance local biodiversity;

- To reestablish native community diversity, structure, and ecosystem function where degraded;
- To improve Natural Area connectivity; and
- To decrease the extent of invasive exotic species cover.

### *Education Goals*

- To provide services that will enable all age groups to better understand the values of the Natural Areas, including ecosystem functions and socioeconomic values;
- To provide opportunities for service learning to students in the San Francisco Unified School District; and
- To provide diverse outdoor classroom opportunities.

### *Research Goals*

- To provide a research framework and research opportunities to schools and universities that will lead to an enhanced understanding of the natural systems and an informed adaptive management approach;
- To contribute to the scientific understanding of local natural systems; and
- To contribute to the field of restoration ecology and other applied sciences.

### *Stewardship Goals*

- To develop and support opportunities for public stewardship of Natural Areas;
- To foster neighborhood stewardship and volunteer groups; and
- To provide diverse opportunities for participation by stewardship groups.

### *Recreation Goals*

- To provide opportunities for passive recreational uses (e.g., hiking and nature observation) that are compatible with conservation and restoration goals and
- To improve and develop a recreational trail system that provides the greatest amount of accessibility while protecting natural resources.

### *Monitoring Goals*

To establish a long-term monitoring program to:

- Identify the species on which monitoring should focus;
- Detect increases and declines in abundance, distribution, or health of special status species;
- Detect significant changes in acreage of native communities, wildlife habitats, and invasive species;
- Detect significant increases and declines in native species richness;

- Assess success of restoration in achieving conservation and restoration goals; and
- Provide an adaptive management framework for evaluating changes (e.g., conceptual model).

### *Design and Aesthetic Goals*

- Where possible, to develop aesthetically pleasing landscapes that are consistent with surrounding landscapes and that create natural transitions, especially where adjacent parklands and traditionally landscaped areas abut Natural Areas;
- To maintain and develop viewpoints and viewsheds to enhance park experiences; and
- Where possible, to design and maintain landscapes to discourage the accumulation of trash and illegal encampments.

### *Safety Goal*

- To design and maintain landscapes that promotes public safety.

## 2.3 PROJECT LOCATION

The 411-acre Sharp Park is in the town of Pacifica in San Mateo County. The park borders the Pacific Ocean and is bisected by Highway 1. Thirteen fairways, the Sharp Park Golf Course clubhouse, and Laguna Salada are on the western side of Highway 1; the four remaining fairways are on the eastern side of Highway 1. Figure 1 is a map of Sharp Park Golf Course.

# CHAPTER 3
# PROPOSED PROJECT

Recommended Sharp Park Management Actions that include Sharp Park Golf Course in general are as follows:

- Implement improvements to protect and enhance the California red-legged frog and San Francisco garter snake at Laguna Salada, including the following:
  - Create shallow pools within existing wetlands,
  - Continue monitoring red-legged frogs and San Francisco garter snakes,
  - Remove tires from Horse Stable Pond,
  - Install signs and barriers to keep dogs out of Horse Stable Pond
- Separate the small peninsulas within Laguna Salada from the mainland by small canals,
  - Restore Sanchez Creek by deepening the channel, expanding the creek corridor upstream, and installing buffer zones to limit human disturbance;
- Raise the area directly east of Laguna Salada to prevent flooding and plant with willows and other native vegetation to provide snake and frog basking sites, and to provide nesting habitat for riparian birds;
- Work with golf course staff to minimize use of chemicals;
- Educate golf course staff about the importance of identifying California red-legged frogs, San Francisco garter snakes, and forktail damselflies and their habitats;
- Work with golf course maintenance staff to incorporate native plants within bank stabilization efforts along Sanchez Creek where it flows through the golf course.

The following specific project activities would impact Sharp Park Golf Course:

- The areas that are currently open water within the lagoon and Horse Stable Pond would be deepened by two to three feet, and parts of the eastern portions of the lagoon and pond would be excavated extensively to restore open water habitat and to ensure that ample edge habitat consisting of open water/emergent vegetation interface would persist for the foreseeable future. Excavated dredge spoils appropriate for use as golf course substrate materials would be used on-site to raise Holes 10, 14, 15, and 18 and to create the upland habitat on the east edge of Laguna Salada. A dispersal corridor between the lagoon and the pond would be constructed with upland features designed to support the San Francisco garter snake; this action would necessitate closing Hole 12 of the Sharp Park Golf Course.
- A post and rail fence would also be installed along the seawall to the west of the lagoon, with additional fencing around the wetland complex to discourage human and pet intrusion into the restored habitat area.

The proposed project would convert about 19 acres of the Sharp Park Golf Course to Natural Area to facilitate Laguna Salada restoration. To restore California red-legged frog and San Francisco garter snake habitat at Laguna Salada, approximately 13 acres of the golf course would be modified to create upland habitat along the east side of the lagoon to provide critically important San Francisco garter snake upland habitat, to discourage frogs from depositing egg masses in locations where the resulting tadpoles may end up being stranded and to allow for the creation of new wetlands to compensate for those filled during the restoration process. This would primarily affect the layout of the golf course Holes 13 and 14, directly east of Laguna Salada. Holes 10 and 13 would be slightly shortened or narrowed, and Hole 12 would be removed. This habitat corridor would be approximately six acres, bringing the total of modified area at the golf course to about 19 acres. This change would affect the playability of the course.

The EIR for the project identifies mitigation to reduce this recreation impact on Sharp Park Golf Course. In order to create a habitat corridor between Horse Stable Pond and Laguna Salada, one of two potential mitigation measures would be implemented. These measures are detailed below.

**Recreation Mitigation Measure, Option 1.** The SFRPD would coordinate with a golf course consultant and would restore the playability of the Sharp Park Golf Course. One possible approach is the creation of a new Hole 7 east of Highway 1. Under this option, there would be a total of 13 holes on the west side of the Highway 1 and five holes on the east side. The bunkering and sculptured contouring would be characteristic of the design and strategy aesthetics of Alister Mackenzie, the famous golf-architect who had designed several courses in the US and abroad. The SFRPD would use a professional golf course architect to design the new and reconfigured holes and fairways, while distinguishing the new holes from the original historic holes.

**Recreation Mitigation Measure, Option 2.** The SFRPD would coordinate with a golf course consultant and would restore the playability of the Sharp Park Golf Course. Under this option, the golf course would be reconfigured to include 15 holes on the west side of Highway 1 and three holes on the east side. Two new holes and fairways would be created on the coast side of the course, to the west of Laguna Salada. The bunkering and sculptured contouring would be characteristic of the design and strategy aesthetics of Alister Mackenzie, the famous golf-architect who had designed several courses in the US and abroad. The SFRPD would use a professional golf course architect to design the new and reconfigured holes and fairways, while distinguishing the new holes from the original historic holes.

# CHAPTER 4
# RESEARCH AND FIELD METHODOLOGY

Tetra Tech conducted preliminary research at the City and County of San Francisco Planning Department and the City of Pacifica Planning Department to determine whether any previous studies or evaluations had been conducted for Sharp Park Golf Course. We also reviewed the NRHP and California Inventory of Historic Resources, as the golf course would automatically be eligible for listing on the CRHR and would be considered a historical resource for the purposes of CEQA if it was listed in the NRHP. None of the state or national registers identified Sharp Park Golf Course as a historical resource.[2] The golf course and the clubhouse were separately designated as historic landmarks for the City of Pacifica in 2009.[3]

Tetra Tech inventoried the golf course for recordation on DPR 523 forms and conducted research for this HRE in March and April 2010. We prepared a historic context to address the themes and background for the property, which we evaluated under the CRHR and NRHP criteria on the DPR 523 forms; the latter criteria applied because properties that are listed on or eligible for listing on the NRHP are automatically eligible for listing on the CRHR. Historical research was conducted at the San Francisco Public Library History Center and its general collections, California Historical Society, San Mateo County Public Library (various branches), and the City of Pacifica Planning and Economics Department. Research revealed that the relevant themes and context for discussing the significance of the golf course as a designed historic landscape include the growth and development of golf in San Francisco. The relevant period for the themes and context, as they relate to the survey population, is the early to mid-twentieth century.

## 4.1 AREA OF POTENTIAL EFFECT

Tetra Tech and MEA established as the APE for this project the footprint of Sharp Park Golf Course, which has boundaries on both the east and west sides of the Highway 1. This APE includes all of the buildings and structures within the golf course boundaries.

## 4.2 HISTORICAL OVERVIEW

The following overview provides historic background to the project area and historic context for the golf course and includes a discussion of the development of golf in San Francisco. This historic context summarizes the context provided in the inventory and evaluation form in the appendix.

## 4.3 HISTORY OF SHARP PARK GOLF COURSE

Sharp Park Golf Course is on the former Mexican Rancho land of San Pedro. A portion of this land, 410 acres, was eventually owned by George Sharp, a prominent San Francisco attorney and corporate counsel for the Ocean Shore Railroad in the late 1880s.[4] When Sharp died in early 1882, the land was left to his wife, Honora. She died in 1905, and the land was left to her trustees, Ruben Lloyd and Adolph Spreckles, both members of the San Francisco Parks Commission. Spreckles sold his share of the property to the City and County of San Francisco in 1916 for 10 dollars in gold, and, after Lloyd passed away in 1917, the remaining shares of the land were bequeathed by the estate to the City of San Francisco.[5] The property was stipulated to be used for a park and recreation only.

The City and County of San Francisco commissioned Alister Mackenzie to design the course. Having worked on other seaside golf courses in Great Britain, Mackenzie believed that "golf in its early days was always played on commons or links land which bordered the sea. The natural characteristics of this type of land made it easily the most suitable for the game."[6] Mackenzie stated that Sharp Park, being constructed on land reclaimed from the sea "now has a great resemblance to real links land."[7] Jack Fleming, the City's golf course overseer appointed by the Parks Commission, was Mackenzie's assistant during the project. In the mid-1930s, Robert Hunter was appointed to supervise construction of the course.[8]

The location of Sharp Park Golf Course posed a challenge. The parcels of land designated for the course were next to the Pacific Ocean, and the land was composed of barren sand dunes and a lagoon. In order to construct the golf course and build up fairway grades, the Sharp Park site was dredged. The natural lagoon, Laguna Salada, remained within the golf course, and the design incorporated it by surrounding it with

[4]Sharp Park Golf Course occupies only 120 acres of this land.
[5]Sharp Park Golf Course Web site: http://www.sharpparkgc.com/.
[6]Alister Mackenzie, *The Spirit of St. Andrews* (1995 Published Posthumously Sleeping Bear Press, Chelsea, Michigan, p. 246).

fairways. Construction began on the course in 1929, and it took fourteen months to dredge the area around Laguna Salada marsh. Sharp Park Golf Club opened in 1932, after two delays due to drainage problems on the course from winter rains.[9]

The original layout of the golf course included Holes featuring multiple tees (Holes 2, 5, and 14), double fairways (Holes 5 and 10), cross bunkering (Hole 16), fairways in sand dunes (Holes 3 and 7), and several holes bordering Laguna Salada (Holes 4, 5, 8, 9, 10, and 11). Cypress trees dotted the setting.[10]

When constructed, the course used well water for irrigation. In the 1930s, the Works Progress Administration (WPA) installed a water pipeline for the course that extended from the San Bruno County Jail reservoir to a concrete pressure-reducing tank, 20 feet wide by 150 feet long. This pipeline provided water to the course for irrigation and for drinking until it was abandoned in place in 2008. The line extended through the canyon to the east of the course through the Hole 7 fairway.[11]

Golf courses have been called living things in the sense that they are mostly constructed of living elements, such as grass and trees, which grow and change over time. Soil erodes, changing the pitch of slopes; trees grow or are replanted, and the holes cannot be played as they were originally. Advancements in playing equipment also change the game.[12]

Courses are redesigned, replaced, or remodeled for two reasons; the first is to improve the layout of the course, the second is to adjust the course for advances in golf technology. Redesigning golf courses involves rerouting and adjusting holes. In golf course architecture, restoring courses is considered to be the act of bringing a course back to, or closer to, its original state.[13] At the same time, there are technological advances in the game of golf (balls, clubs, and mowing techniques) that advance and therefore result in alteration of the course to maintain playability. By the late 1920s, golf course designers accepted the idea that both natural and technological advances are factors, among others, that make it necessary to continuously improve golf courses, in order to maintain the strategy of the game.

### 4.3.1 Changes to the Course

The layout of Sharp Park Golf Course has undergone several alterations to accommodate natural changes in the landscape because of the course's location along the Pacific Ocean shoreline. The course was also modified to accommodate the anticipated realignment of Highway 1.

[9]Joe Faulkner, *Sharp Park*, 1970, www.sfpublic.golf.com.

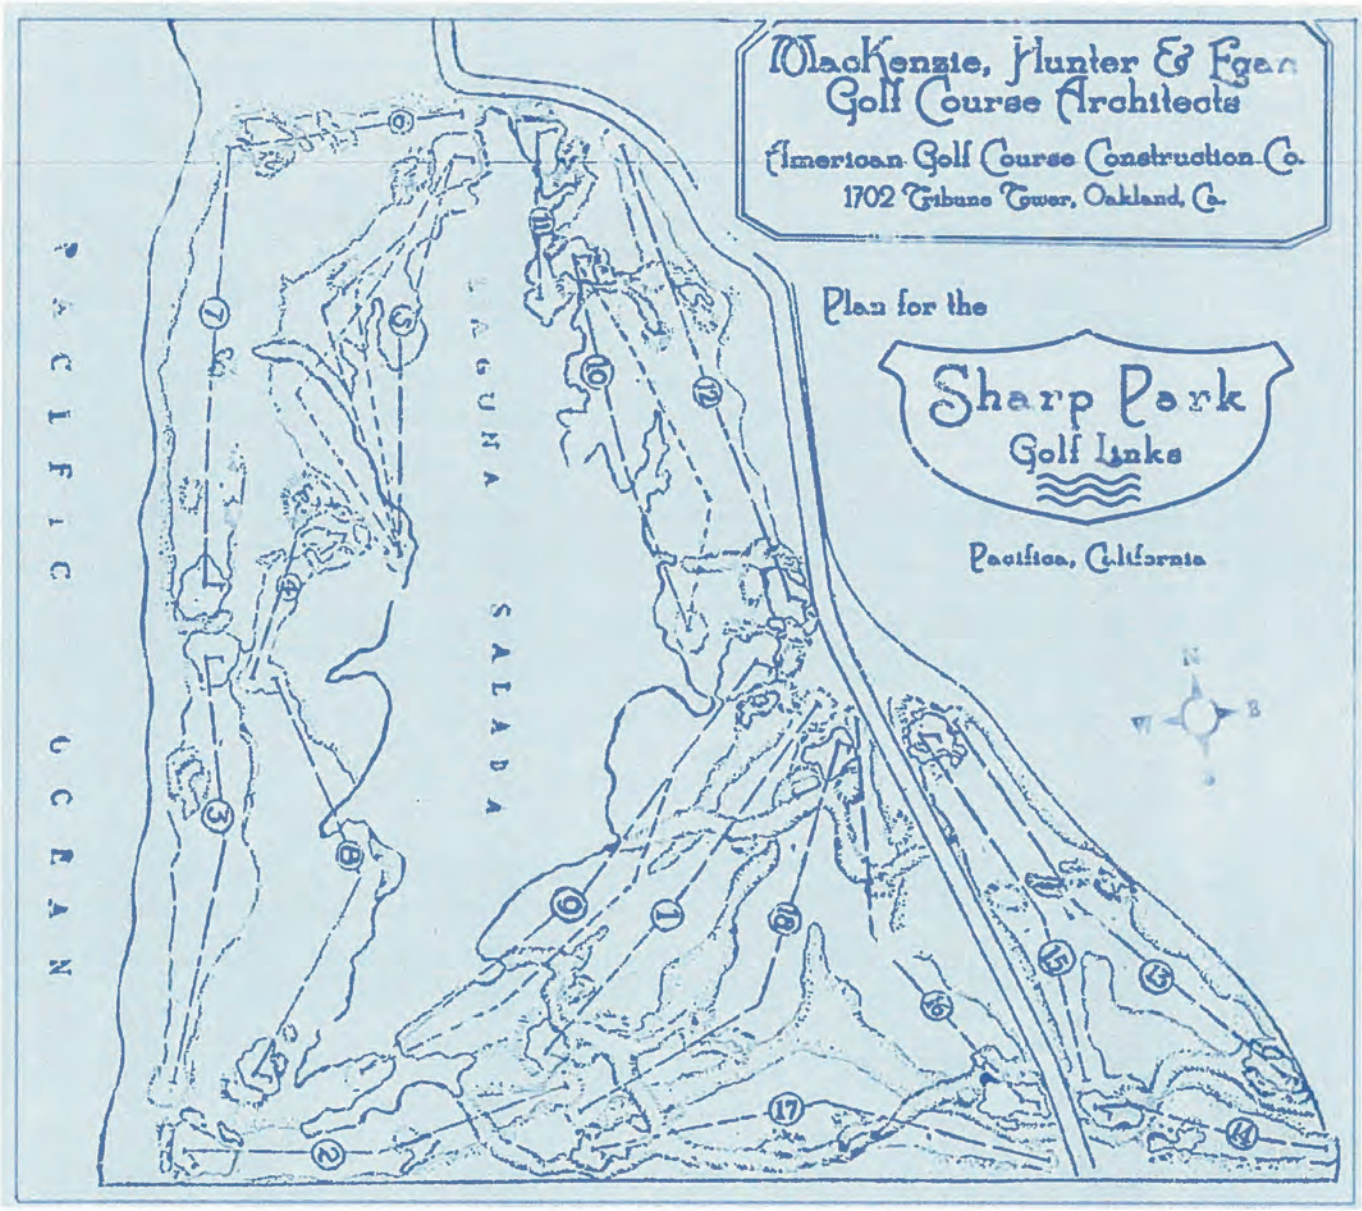
[13]Graves and Cornish, *Golf Course Design*, pp. 131-132.

The first major alteration was in 1941, when a seawall or berm was constructed to keep the ocean from reaching and flooding the course. To make room for the berm, the two original oceanside Holes 3 and 7 were moved inland. Another alteration was removing the lagoon and the second fairway at original Hole 10 (current Hole 14). Course modifications also included the installation of a 4,000-gallon pump to help with annual flooding of Laguna Salada, rerouting fairways for holes on the east side of Highway 1, and modest alterations, such as renumbering and shortening some of the original fairways. More recent changes involved lengthening fairways and adding and rebuilding tee boxes from 1985 until 1994.



The original design of the course had three holes on the east side of what was a county road, in front (on the west side) of the clubhouse, as shown in Figure 3. Around 1943, the county road was improved and rerouted to become Highway 1, which no longer passed the west side of the club house but was now on the east side. Although Highway 1 was not realigned until sometime after 1940, the designers of the course knew the course would have to be modified to accommodate the road (Figure 3). In 1932, Jack Fleming, in writing about the course in the *San Francisco Call-Bulletin*, described it as being "at present along the edge of the county road which is planned to re-locate." Other, more minor alterations included changing sand trap shapes, filling in sand traps with grass, and rerouting fairways in 1962 and 1963. Between 1985 and 1994, several tees were lengthened and tee boxes were added or enlarged in order to accommodate female players and to accommodate larger numbers of golfers. Concrete cart paths were constructed along the back nine holes by 1996.

There has been a strong desire to maintain the original design layout of the course to the greatest extent. Many of the alterations have been forced by the natural changes in the landscape, with only a few changes made to accommodate advanced technology in golf clubs and ball construction. The goal has been to make the necessary modifications while preserving Sharp Park's function as a golf course, laden with elements of challenge and surprise, and to maintain playability.

### 4.3.2 History of Public Golf in San Francisco

The game of golf came to California in the late 1800s, and the first course was constructed in southern California at the Riverside Country Club in 1891. The first northern California golf course, a three-hole course built in 1893, was at the Burlingame Country Club. The first course to be constructed in San Francisco was the private San Francisco Golf Club in 1895.[14]

## *Original Plan for Sharp Park Golf Course*

Pacifica, California

TETRA TECH

**Figure 3**

While golf courses at private country clubs were gaining in popularity, golfers unable to afford the high prices of country clubs had very few places to play. In the early 1900s, avid golfers and wealthy members of private clubs, Jack Neville and Vincent Whitney, approached John McLaren, Supervisor of Golden Gate Park, about constructing a municipal golf course. Neville and Whitney then began designing San Francisco's first municipal golf course, Lincoln Park.[15] Lincoln Park remained the only San Francisco municipal golf course for 23 years, until the construction in 1925 of Harding Park, designed by Sam Whiting and Willie Watson.

The popularity of golf in San Francisco reflected the popularity of the sport within the entire country, and peaked during the 1920s. Often called "the golden age of golf," the sport grew in popularity during the late 1910s through the early 1930s, with many well-designed courses constructed during this period. Within the City of San Francisco, Lincoln Park and Harding Park were the only two public golf courses in San Francisco and, on weekends, they were overrun with golfers. The City decided to use the land in San Mateo County, formerly owned by George Sharp, for a third public golf course, named for the former landowner. Alister Mackenzie was commissioned to design the course, assisted by Jack Fleming, Superintendent of Maintenance for Golf Courses and Bowling Greens in San Francisco. Supervision of construction was given to Chandler Eagan, with whom Mackenzie had worked on Pebble Beach Golf Links in 1929.[16] In 1930, Robert Hunter, Jr., was appointed the superintendent for the remaining ten months of the course's construction. Willis Polk and Company architect Angus McSweeney prepared plans for the golf clubhouse.

### *Alister Mackenzie*

Alister Mackenzie was born in Scotland in 1870. He served as the Alwoodley Golf Club Green Chairman in the early 1900s, assisting golf architect H. S. Colt with the design of the golf course in Leeds.[17] Mackenzie continued to work with Colt on other courses, and, in 1925, he established his own golf architecture firm and designed golf courses in Great Britain, Uruguay, Australia, Argentina, Canada, and the US.[18] Mackenzie's best work in America was done between 1928 and 1933. By the time Mackenzie was commissioned to work on Sharp Park, he was living in the Bay Area. He died in 1934.[19]

Mackenzie's concept of an ideal hole in perfect surroundings was one surrounded by sand dunes next to the seashore.[20] Mackenzie felt that the success of golf course construction depended entirely on making the best use of natural features and devising

[15]Joe Faulkner, 1970, p. 5; although the course was constructed in the early 1900s, it was not expanded to a full 18-hole course until 1917.

[20]Mackenzie, *Golf Architecture*, p, 28.

artificial ones indistinguishable from nature.[21] He also contended that a golf course must offer adventure in order to hold interest for continuous play. His courses provided interesting challenges for golfers, regardless of their skill level. Mackenzie's firm was also known for its original and distinctive bunkers, with irregular shapes and each with its own design.[22] He often had the overall vision for design of his courses and left the details to those who worked with him, such as Eagan. George Shackelford, in his book *Grounds for Golf*, describes Mackenzie as a master designer and offers that Mackenzie's secret to creating unique courses was his talent for routing.[23] Mackenzie designed his hole layout and sequencing on natural ground contours, not on any prescribed sequencing. Distinctive bunkering, the use of small hillocks around greens, and exciting hole locations were Mackenzie's trademark. As Shackelford describes, while many architects try to create a special course, Mackenzie "could figure out how best to fit holes onto a property and situate a golf course to evoke a comfortable, settled, connection to the ground. His course routings are always functional and original but rarely do they fight the contours of the property."

Mackenzie's notable US golf course designs were Cypress Point Golf Club, California (1928), Augusta National Golf Club, Georgia (1932), and Pasatiempo Golf Club, California (1929). Mackenzie was commissioned by the City and County of San Francisco to design Sharp Park Golf Course in 1929.

According to Geoffrey Cornish and Ron Whitten, golf architects and authors of the book, *The Architects of Golf*, post-World War II golf course designers were influenced most by Mackenzie's philosophies.[24]

### *Sharp Park Golf Course Clubhouse*

The two-story clubhouse was designed the prestigious design firm of Willis Polk and Company, a highly respected architectural firm, responsible for many architectural masterpieces throughout northern California. Examples are the Palace of Fine Arts and the Hobart Building in San Francisco and the Water Temple in Sunol. The firm was also instrumental in rebuilding San Francisco after the 1906 earthquake. After Polk died in 1924, his firm developed the plans for the Sharp Park Golf Course Clubhouse, the chief architect of which was Angus McSweeney. The building was constructed by the Works Progress Administration, and a plaque on the clubhouse states, "Improved by Works Progress Administration 1935-1936." The clubhouse, designed in the Mission style of architecture, has undergone a few alterations over time.

# CHAPTER 5
# FINDINGS AND CONCLUSIONS

Tetra Tech prepared this HRE using the criteria outlined in Section 5924.1 of the California Public Resources Code, as well as Section 15126.4 of the CEQA guidelines. The report identifies historical resources that could be impacted by the SNRAMP project and assesses potential impacts on the Sharp Park Golf Course.

## 5.1 EVALUATION CRITERIA

The criteria for identifying historical resources under CEQA are in Section 15064.5(a)(2)-(3) of the CEQA guidelines, which provide the criteria from Section 20524.1 of the California Public Resources Code. According to the CRHR (California Code of Regulations Title 14, Chapter 11.5), properties listed on or formally determined to be eligible for listing on the NRHP are automatically eligible for listing on the CRHR. The CRHR criteria are largely based on the NRHP criteria, which are codified in 36 CFR, Part 60, and are explained in guidelines published by the Keeper of the National Register.[25] Resources must be at least 50 years old in order to be eligible for listing on the NRHP or the CRHR.

National Parks Service Preservation Brief 36 defines a cultural landscape as "a geographic area, including both cultural and natural resources and the wildlife or domestic animals therein, associated with a historic event, activity, or person or exhibiting other values." There are four general types of cultural landscape, one of which is the historic designed landscape. National Parks Service *National Register Bulletin 18*, "How to Evaluate and Nominate Designed Historic Landscapes," defines a historic designed landscape as one that "has significance as a design or work of art; was consciously designed and laid out by a master gardener, landscape architect, architect, or horticulturalist to a design principle, or an owner or other amateur using a recognized style or tradition in response or reaction to a recognized style or tradition; has a historical association with a significant person, trend, or event, etc. in landscape

[25]The most widely accepted guidelines are contained in the US Department of Interior, National Park Service, "Guidelines for Applying the National Register Criteria for Evaluation," *National Register Bulletin 15* (US Government Printing, Washington, DC, 1991, revised 1995 through 2002).

gardening or landscape architecture; or a significant relationship to the theory or practice of landscape architecture." *Bulletin 18* goes on to list golf courses as an example of grounds designed or developed for outdoor recreation or sports that fall under the category of a designed historic landscape. Therefore, Sharp Park Golf Course is being evaluated for its historic significance as a designed historic landscape.

Historic significance is judged by applying NRHP Criteria A through D and CRHR Criteria 1 through 4. The NRHP guidelines state that a historic resource's "quality of significance in American history, architecture, archeology, engineering and culture" is determined by meeting at least one of the following, (properties may be significant at the local, state, or national level):

Criterion A: Association with events or trends significant in the broad patterns of our history;

Criterion B: Association with the lives of significant individuals;

Criterion C: A property that embodies the distinctive characteristics of a type, period, or method of construction that represents the work of a master, or that possesses high artistic values;

Criterion D: Has yielded, or is likely to yield, information important to history or prehistory.

In general, Criterion D is used to evaluate historic sites and archaeological resources.

"Integrity" is determined through applying seven factors to the historical resource: location, design, setting, workmanship, materials, feeling, and association. All of these aspects must be considered in order to determine whether a landscape retains enough of its important historic characteristics and features to convey its historically significant appearance or associations. Because landscape features change over time, a landscape need not retain all of the original features it had during its period of significance, but it must retain the essential features and characteristics that make its historic character clearly recognizable.[26]

The CRHR criteria closely parallel those of the NRHP. Each resource must be determined to be significant at the local, state, or national level under one of four criteria (paraphrased below) in order to be determined eligible:

Criterion 1: Resources associated with important events that have made a significant contribution to the broad patterns of our history.

Criterion 2: Resources associated with the lives of persons important to our past.

[26]National Park Service, "How to Evaluate and Nominate Designed Historic Landscapes," *National Register Bulletin No. 18*, p. 6, Web site: www. http://www.nps.gov/history/nr/publications/bulletins/pdfs/nrb18.pdf.

Criterion 3: Resources that embody the distinctive characteristics of a type, period, or method of construction, or represents the work of a master.

Criterion 4: Resources that have yielded, or may be likely to yield, information important in prehistory or history.[27]

As with NRHP Criterion D, Criterion 4 is generally used to evaluate historic sites and archaeological resources.

The CRHR definition of integrity and its special considerations for certain properties are slightly different from those for the NRHP. Integrity is defined as "the authenticity of an historical resource's physical identity evidenced by the survival of characteristics that existed during the resource's period of significance." The CRHR further states that eligible resources must "retain enough of their historic character or appearance to be recognizable as historical resources and to convey the reasons for their significance," and the CRHR lists the same seven aspects of integrity used for evaluating properties under the NRHP criteria.

## 5.2 EVALUATION

Tetra Tech concludes that Sharp Park Golf Course appears to meet the criteria for listing on the CRHR and NRHP and should be considered a historical resource for the purposes of CEQA.

The following provides a summary of Sharp Park Golf Course's historic significance. It is evaluated on the DPR 523 forms in the appendix.

Sharp Park Golf Course appears to meet the criteria for listing on the NRHP for its significance under Criteria A and C and for listing on the CRHR under Criteria 1 and 3. (See the DPR 523 form for the evaluation of this property under NRHP Criteria B and D, along with the evaluation of the property under CRHR Criteria 2 and 4.)

The property's period of significance is from 1929 to 1932, which represent the construction dates for the course's original design.

Sharp Park Golf Course is significant under Criterion A/1 because its construction is associated with the need within San Francisco for a third municipal golf course. The construction and development of Sharp Park Golf Course was a direct result of the overcrowding at Harding and Lincoln Park municipal courses and the City's desire to build a third course to accommodate San Francisco golfers. The construction of Sharp Park Golf Course represents a development pattern within the City of San Francisco and within the US in general, in which golf was an increasingly popular sport. The years between 1910 and the late 1930s have been called the "golden age of golf" in the US due to the fact that many of the great golf course architects designed courses during

[27]California Public Resources Code, Sections 4850 through 4858; California Office of Historic Preservation, "Instructions for Nominating Historical Resources to the California Register of Historical Resources," August 1997.

this period. Many of the courses, like Sharp Park Golf Course, are still in use today. The construction of Sharp Park Golf Course is directly associated with the growing popularity of recreational golf within the US during the early twentieth century.

Sharp Park Golf Course is significant under Criterion C/3 for its architecture and landscape architecture—a public golf course constructed between 1929 and 1932, embodying distinctive characteristics of a seaside golf course. This period is often called "the golden age of golf" because of the popularity of the game and the increase in golf courses constructed in the US. Sharp Park Golf Course contains many distinctive elements of its type, a golf course constructed on the oceanside, on sandy dunes, with original seaside holes that provide water hazards as part of the game. The course was designed by a well-known architect, with nuances, style, and innovation that enhanced golf courses constructed during this period in the US, many of which were private. The original layout of the golf course included holes featuring multiple tees, double fairways, cross bunkering, fairways in sand dunes, and several holes bordering Laguna Salada. Cypress trees dotted the setting. Although the course has been modified, it is common to modify a living landscape, although efforts to keep the fairways' general original course design were always in effect. Twelve of the original 18 holes are part of the current design, and two fairways are original but without original greens.

The golf course is also the work of a master. While there are other examples of Mackenzie's work that are more well known, Sharp Park Golf Course is an example of his idea of the perfect surroundings for a golf course—holes surrounded by sand dunes next to the seashore. Although alterations have been made to the course, during the period of significance the course retained Mackenzie's routing, surprise elements, and hole and fairway locations.

The clubhouse is a good example of an Eclectic architectural style, with Mission and Spanish elements, improved by the Works Progress Administration during the Great Depression. The clubhouse was built to serve the golfers of Sharp Park Golf Course, is directly associated with the golf course, and is considered a historical character-defining feature of the golf course. It is a good representation of its architectural type and period, and its alterations have not diminished its historic integrity, as discussed below. The golf course clubhouse has consistently been used as a clubhouse for Sharp Park golfers, as was its original purpose. The presence of the golf course clubhouse helps to convey the historic character of the entire golf course.

In rare instances, buildings and landscape features themselves can serve as sources of important information about historic construction materials or technologies (Criterion D/4); however, the Sharp Park Golf Course does not appear to be a principal source of information in this regard.

## 5.3 INTEGRITY

Integrity of a historic resource is measured by applying seven factors: location, design, setting, workmanship, materials, feeling, and association. Sharp Park Golf Course, including the clubhouse and maintenance building, has retained a sufficient level of

integrity in all measures. Although the course has been modified over time, the golf course is in its historic location and retains much of its historic appearance, except that the ocean is no longer visible from the course. Still present are the lagoon, the east and west locations of the holes, and the fairway, which were all elements of the original design. Mackenzie designed the course with interesting challenges for golfers, regardless of their skill level, which is still true of the current course. Man-made features that have been added, such as the seawall, do not diminish the historic integrity of the course because the land and its location were important to Mackenzie's design; thus, the course is still authentic to Mackenzie's plan. The course retains its integrity of design, workmanship, and materials, which provide it with a similar sense of feeling and association to its period of significance.

The clubhouse retains most of its historic design features, and original or in-kind materials illustrate the workmanship that went into its design. Modifications, such as additions to the dining area and replaced windows, have not reduced the overall historic character of the building that give it the sense of feeling and association to its period of significance.

Sharp Park Golf Course's character-defining features are the original features and design of the clubhouse, the original permanent maintenance building, and the course's original layout, including the 12 remaining original holes (current holes 1, 2, 3, 8, 9, 10, 11, 13, 14, 15, 17 and 18) and original landscape features. The cypress trees that line the fairways also contribute to its significance, although none of the specific shrubs or trees on the property are considered contributors. The property's noncontributing features are the practice green, the maintenance trailers, the cart paths, the four holes that were moved to the east side of Highway 1, and other alterations that occurred after the period of significance.

The permanent maintenance building is part of the original construction of the golf course and retains its original integrity. The cypress trees that line the fairways also contribute to its significance, although none of the specific shrubs or trees on the property are considered contributors. Together, these features contribute to the golf course's historic significance and must be present to do so. The property's noncontributing features are the practice green, the maintenance trailers, the cart paths, and the four holes that were moved to the east side of Highway 1. These noncontributing features are those that were constructed or added after the period of significance, or, as in the case of the maintenance trailers, are temporary structures.

## 5.4 IMPACTS ANALYSIS AND MITIGATION MEASURES

CEQA guidelines Section 15064.5(b) states that "a project with an effect that may cause a substantial adverse change in the significance of an historical resource is a project that may have a significant effect on the environment." The following provides reference to the project description in Section 2 as it relates to Sharp Park Golf Course and an impacts analysis for the golf course as a historic resource.

The SNRAMP project activities will be situated at and next to the eastern and western part of Sharp Park Golf Course and will not be near either the clubhouse or maintenance building. Therefore, none of the project components or construction will cause a substantial adverse change to these contributing buildings on this property such that they will be materially impaired or unable to continue to convey their significance. Potential impacts on this property would be on the designed historic landscape itself.

As part of the proposed project, some of the activities that will take place when implementing the SNRAMP will have the following direct potential impacts on Sharp Park Golf Course:

**Impact HR-1.** Excavated dredged spoils appropriate for use as golf course substrate materials would be used on-site to raise Holes 10, 14, 15, and 18 and to create the upland habitat on the east edge of Laguna Salada. Raising Holes 10, 14, and 15 would not have a significant impact on the historical character-defining features of the golf course because the holes would remain in place and alterations would be to elevate the holes, which would not impact the historic integrity of the fairways. There would be a less than significant impact on these holes from this proposed project activity.

**Impact HR-2.** The closure of Hole 12 (historic Hole 2) would have significant impacts on the historic character-defining features of the golf course because it would eliminate a hole and fairway on the west side of the course, along the ocean. Hole 2 was originally designed as a 262-yard fairway and a par 4. The hole was shortened in the early 1960s and was renumbered. Although Hole 12 has been altered from its original design, its closure and conversion to coastal/shrub habitat is a significant impact on the golf course because the Hole 12 area was included as part of the golf course design since the original construction of the course. The hole had always been at the edge of the lagoon or backed against the seawall. Using the area for habitat conservation and not as part of the golf course changes the boundaries of the golf course and its historic design. Closing Hole 12 would therefore be a significant impact. Implementing Mitigation Measure 1 (Document Historical Resources), as described in Section 5.0, would record the golf course following the Secretary of the Interior's *Standards for the Treatment of Historic Properties and Guidelines for the Treatment of Cultural Landscapes*. Because implementing Mitigation Measure 1 would not reduce this impact, there would still be a significant impact on the historic resource.

**Impact HR-3.** A post and rail fence would also be installed along the seawall, to the west of the lagoon, with additional fencing around the wetland complex to discourage human and pet intrusion into the restored habitat area. This fence would alter the visual appearance of the seawall and would add a modern element to the golf course. The seawall is not an original feature of the golf course but was constructed during the golf course's period of significance and would be a modern element within the historic setting of the course. The construction of a fence would add a modern element to the course but would not alter a historic character-defining feature. Therefore, constructing a fence would not have a significant impact on the golf course.

**Impact HR-4.** Modifying approximately 13 acres of the golf course to create upland habitat along the east side of the lagoon to provide critically important San Francisco garter snake upland habitat would require slightly shortening or narrowing Holes 10 and 13 (historic Holes 18 and 9). The habitat corridor would be approximately six acres, bringing the total of modified area at the golf course to about 19 acres. This would have a significant impact on the historic character-defining features, historic Holes 18 and 9, because these holes and fairways would be narrowed and shortened. Fairways have been altered in the past at Sharp Park Golf Course. Implementing Mitigation Measure 1 (Document Historical Resources) would record the golf course in its existing condition under the Secretary of the Interior's *Standards for the Treatment of Historic Properties and Guidelines for the Treatment of Cultural Landscapes*. It would serve as a record of the changes on the golf course through time, including the alterations on fairways and holes due to varying natural conditions. Implementing this mitigation measure would not reduce this impact to less than significant because modifying the historic character-defining features would still constitute a significant impact on the golf course, a historic resource.

**Impact HR-5.** The recreation analysis in the SNRAMP EIR proposes a mitigation measure (Recreation Mitigation Measure, Option 1) that would create a new hole on the east side of Highway 1, as a replacement for Hole 12. This reconfiguration would result in a total of 13 holes on the west side of Highway 1 and five holes on the east side. Adding another hole on the east side of the freeway diminishes the historic integrity of the landscape because it changes the balance of holes that were originally on the east and west side of Highway 1 and creates a hole in an area that was not originally planned and not originally part of the Mackenzie-designed course. Adding another hole on the east side of the course, in an area that would change the historic boundaries of the golf course design, would be a significant impact on Sharp Park Golf Course, a historic resource. Implementing Mitigation Measure 1 (Document Historical Resources), as described in Section 5.0, would record the golf course following the Secretary of the Interior's *Standards for the Treatment of Historic Properties and Guidelines for the Treatment of Cultural Landscapes*. Because implementing Mitigation Measure 1 would not reduce this impact, there would still be a significant impact on the historic resource.

**Impact HR-6.** The recreation analysis in the SNRAMP EIR proposes a mitigation measure (Recreation Mitigation Measure, Option 2) that would create a new hole on the west side of Highway 1, as a replacement for Hole 12. This reconfiguration would result in a total of 15 holes on the west side of Highway 1 and three holes on the east side. This alternative mitigation measure would be beneficial to the Sharp Park Golf Course because it would restore some of the elements that Mackenzie had implemented in his original design of this course, such as coast side holes. This mitigation measure would change the layout of the holes, but the new holes would be in areas of the course where Mackenzie situated holes in his original design, and would be in keeping with the historic boundaries of the golf course. Impacts on Sharp Park Golf Course, if this version of the mitigation measure were implemented, would be less than significant.

# CHAPTER 6
# MITIGATION

**Mitigation Measure 1, Document Historical Resources—**The SFRPD would document or retain a consultant to document Sharp Park Golf Course before any construction work or modifications to the course. The National Park Service has published some guidance for the preservation of cultural landscapes in *Preservation Brief 36: Protecting Cultural Landscapes, Planning, Treatment and Management of Historic Landscapes* and in the more complete Secretary of the Interior's *Standards for Treatment of Historic Properties Guidelines for the Treatment of Cultural Landscapes.* The appropriate level of documentation would be selected by a qualified professional who meets the standards for history, architectural history, or architecture (as appropriate) set forth by the Secretary of the Interior's Professional Qualification Standards, (36 CFR, Part 61). The documentation will consist of the following:

- Full sets of measured drawings depicting existing or historic conditions of the Sharp Park Golf Course;
- Digital photographs (does not have to be large-format negatives) of Sharp Park Golf Course;
- A written history and description of Sharp Park Golf Course and its alterations.

The professional historian will prepare the documentation and will submit it for review and approval by the San Francisco Planning Department's Preservation Specialist. The documentation will be disseminated to the San Francisco Library History Room and the SFRPD Headquarters.[28]

[28]Note that in most cases the use of drawings, photographs, and displays does not mitigate the physical impact caused by demolishing or destroying a historical resource (14 CCR, Section 15126.4[b]). However, CEQA requires that all feasible mitigation be undertaken even if it does not mitigate below a level of significance. Recordation serves a legitimate archival purpose; Office of Historic Preservation, *How Can Substantial Adverse Change be mitigated?* California State Parks Web site: www.ohp.parks.ca.gov.

# CHAPTER 7
# QUALIFICATIONS

Julia Mates Historian/Architectural meets the History and Architectural History professional qualifications as outlined by the federal government in Title 36, Code of Federal Regulations, Part 61. Ms. Mates prepared this HRE with assistance from Cultural Resource Specialists Erin King and Frank Stipe. Ms. Mates reviewed project information, assessed known and potential historical resources, and prepared the text for this report. Ms. Mates has a Masters Degree in History/Public History and ten years of experience conducting historic resource projects.

Ms. King assisted with field recordation of the Sharp Park Golf Course. She has an MA, RPA, and over nine years of experience.

Mr. Stipe assisted with peer review of the designed historic landscape report. Mr. Stipe has an MA, RPA, and over ten years of experience.

The Sharp Park Golf Course (SPGC) is an 18-hole, 120-acre golf course in the town of Pacifica in San Mateo County. The golf course borders the Pacific Ocean, is bisected by Highway 1, and contains the natural Laguna Salada lagoon, wetlands, and associated vegetation. The course is owned and maintained by the City of San Francisco Recreation and Parks Department. The clubhouse is at the east side of the property, overlooking the course, as shown in Photograph 1, below. (See Continuation Sheet)

(Discuss importance in terms of historical or architectural context as defined by theme, period, and geographic scope. Also address integrity.)

Sharp Park Golf Course, including the clubhouse, appears to meet the criteria for listing in the National Register of Historic Places (NRHP) for its significance under Criteria A and C. Furthermore, this property has been evaluated in accordance with Section 15064.5(a)(2)-(3) of the California Environmental Quality Act (CEQA) Guidelines, using the criteria outlined in Section 5024.1 of the California Public Resources Code, and the property appears to meet the significance criteria as outlined in these guidelines. Therefore, it is a historical resource for the purposes of CEQA. (See Continuation Sheet.)

## P3a. Description (continued)

Along with the 18-hole course, the facility includes a large clubhouse, practice green, and maintenance area. The course and clubhouse were completed in April 1932. Access to the facility is from Sharp Park Road; a chain link fence, trees, and bushes establish the property's boundaries. A parking lot is adjacent to the east side of the clubhouse. The course's front nine holes are on the southern and eastern sides of the course. Some of the front nine holes (holes 4 through 7) are on the east side of Highway 1 and are accessed by a tunnel under the highway. The back nine holes are located on the western and southern sides of the property. Routing of the course is accomplished with fairways running parallel to each other and divided by mature cypress trees. The fairways are surrounded by concrete cart paths. A natural lagoon, Laguna Salada, is located at the western end of the course, and four holes (14 through 17) play around the lagoon. The southern end of the lagoon is traversed by a bridge. A seawall divides the course from the ocean on the west side of the course. **Photograph 2**, **3**, and **4** are representative photos of the golf course.

The golf course has undergone alterations since its construction, including lengthening, relocating and renumbering fairways, infilling some sand dunes with grass, construction of a seawall/berm dividing the ocean from the course, lengthening tees, adding tee boxes, and re-routing the course to accommodate the alignment changes in Highway 1.

The two-story clubhouse has an irregular footprint with multiple wings. The clubhouse is shown in **Photographs 5, 6, 7, 8, 9 and 10**. It sits on a concrete foundation and is clad in stucco. The building is topped with a cross gable roof with multiple-level, cross-gabled roof wings that run on a north-south axis. The roof is sheathed in red clay tiles and is moderately pitched with no eave overhang. There are two extended entrances on the north axis, one facing east and the other facing west. An extension off the south end of the building is a modest addition, constructed in 1994.[1] The clubhouse was constructed in the Eclectic architectural style with elements of Spanish Revival and Mission styles, popular in California during the 1920s. Architect Agnus McSweeny, an associate at the San Francisco architectural firm started by Willis Polk, designed the building that was constructed by the Works Progress Administration (WPA). A plaque on the clubhouse states, "Improved by Works Progress Administration 1935-1936." Exterior details include a variety of sizes of fixed and vertical hung sliding sashes. Many windows on the building appear to have been replaced with modern sashes, with the exception of the windows on the east façade which are original wood, vertical hung and casement sashes. There are circular vents, some covered with wrought iron bars and others in the form of Mission Style canals in some of the gables. There are four chimneys along the roof line that are sheathed in stucco. A driving range is north of the clubhouse, and maintenance buildings are on the northeast side of the course.

The north wing faces the practice green. There is secondary entrance at the first floor of this north side that contains a set of original double wood doors with fixed center sashes covered by metal security grilles. The windows on this side of the building are comprised of replacement metal sliding sashes and original one-over-one hung wood sashes. There is a small north facing patio at the second story that is accessed through a set of paired, glazed doors, with multiple panes of rectangular glass.

[1] *Sharp Park Restaurant & Pro Shop plans for proposed work*, dated October 1994, on file at City of Pacifica Planning Department, Permit No. 1327994.

The east side of the building faces the parking lot and contains the main entrance to the club from the lot. This side has a projecting first story with a recessed, round arched entrance with a decorative iron work and gates set into the arch. The front doors are a set of original, paired glazed doors with multiple panes of rectangular glass, flanked by sets of fixed, windows with multiple panes of rectangular glass.

The western side of the clubhouse faces the golf course, and serves as the main façade. The main entrance on this side is recessed with an extended arch. Flanking the arch are two piers, sided in smooth stucco. A pair of original, wood doors identical to those at the east side of the building serve as the front doors. Metal security grilles cover the windows of these doors. The remainder of this west side features a ribbon of six large, replacement floor-to-ceiling windows. Each set of three windows flanks a central, wood door with multiple glass panes.

The south side of the building is an extension, constructed in 1994, that faces the current Hole 2 fairway. It has large, modern, fixed windows, and little architectural relief.

A compound of temporary and one permanent building serves as the maintenance area for the golf course and is north of the clubhouse, on the east end of the property, atop a small hill. This maintenance area is surrounded by trees and metal fencing. Most of the structures within the maintenance area are temporary storage containers; the only permanent building is a large, one-story barn that rests on a concrete foundation, and is topped with a front gable roof with shallow eaves with exposed wood roof rafter tails. **(Photograph 11**). The walls of this building are clad in vertical shiplap redwood. At both the north and south sides of the building are two over-head mounted wood doors. Fenestration along the building consists of original awning sashes with wood muntins. This barn is currently used for storage and is original to the course.

## B10. Significance (continued)

### History of Sharp Park Golf Course

Sharp Park Golf Course is located on the former Mexican Rancho land of San Pedro. A portion of this land, 410-acres, was eventually owned by George Sharp, prominent San Francisco attorney and corporate counsel for the Ocean Shore Railroad in the late 1880s.[2] When Sharp passed away in early 1882, the land was left to his wife, Honora. She passed away in 1905 and the estate land was left to her trustees, Ruben Lloyd and Adolph Spreckles, both members of the San Francisco Parks Commission. Spreckles sold his share of the property to the City and County of San Francisco in 1916 for 10 dollars in gold, and, after Lloyd passed away in 1917, the remaining shares of the land were bequeathed by the estate to the San Francisco.[3] The property was stipulated to be used for park and recreational purposes only.

Alister Mackenzie was commissioned by the City and County of San Francisco to design the course. Having worked on other seaside golf courses in Great Britain, Mackenzie believed that "golf in its early days was always played on commons or links land which bordered the sea. …the natural characteristics of this type of land made it easily the most suitable for the game."[4] Mackenzie stated that Sharp Park, being constructed on land reclaimed

[2] Sharp Park Golf Course is located on only 120 acres of this land.

[4] Alister Mackenzie, *the Spirit of St. Andrews*, (Chelsea, MI: Sleeping Bear Press 1995), 246.

## B10. Significance (continued)

from the sea "now has a great resemblance to real links land."[5] Jack Fleming, who was the Parks Commission-appointed City golf course overseer, served as Mackenzie's assistant during the project. In the mid-1930s, Robert Hunter was appointed to supervise construction of the course.[6]

The location of Sharp Park Golf Course posed a challenge. The parcels of land designated for the course were adjacent to the Pacific Ocean and the land was composed of barren sand dunes and a lagoon. In order to construct the golf course and build up fairway grades, the Sharp Park site was dredged. The natural lagoon, Laguna Salada, remained within the golf course, and the design incorporated it by surrounding it with fairways. Construction began on the course in 1929, and dredging the area around Laguna Salada marsh took 14 months. Sharp Park Golf Club opened in 1932, after two delays due to drainage problems on the course from winter rains.[7]

The original layout of the golf course included holes featuring multiple tees (holes 2, 5, and 14), double fairways (holes 5 and 10), cross bunkering (hole 16) fairways in sand dunes (holes 3 and 7) and several holes bordering the inland lake (hole 4, 5, 8, 9, 10, and 11). Cypress trees dotted the setting. [8]

When originally constructed, the course used well water for irrigation. In the 1930s, the WPA installed a water pipeline for the course that extended from the San Bruno county jail reservoir to a concrete pressure reducing tank, 20 feet wide by 150 feet long. This pipeline provided water to the course for irrigation and for drinking until it was abandoned in place in 2008. The line extended through the canyon to the east of the course through the current Hole 7 fairway.[9]

Golf courses have been called living things in the sense that they are mostly constructed of living elements, such as grass and trees, which grow and change over time. Soil erodes, changing the pitch of slopes; trees grow or are replanted, and the holes cannot be played as they were originally. Advancements in playing equipment also change the game.

Courses are redesigned, replaced, or remodeled for two reasons; the first is to improve the layout of the course, the second is to adjust the course for advances in golf technology. Redesigning golf courses involves rerouting and adjusting holes. In golf course architecture, restoring courses is considered to be the act of bringing a course back to, or closer to, its original state. At the same time, there are technological advances in the game of golf (balls, clubs, and mowing techniques) that advance and therefore result in alteration of the course to maintain playability. By the late 1920s, golf course designers accepted the idea that both natural and technological advances are factors, among others, that make it necessary to continuously improve golf courses, in order to maintain the strategy of the game.

## B10. Significance (continued)

### Changes to the Course

The layout of Sharp Park Golf Course has undergone several alterations to accommodate natural changes in the landscape because of the course's location along the Pacific Ocean shoreline. The course was also modified to accommodate the anticipated realignment of Highway 1.

The first major alteration was in 1941, when a seawall or berm was constructed to keep the ocean from reaching and flooding the course. To make room for the berm, the two original oceanside Holes 3 and 7 were moved inland. Another alteration was removing the lagoon and the second fairway at original Hole 10 (current Hole 14). Course modifications also included the installation of a 4,000-gallon pump to help with annual flooding of Laguna Salada, rerouting fairways for holes on the east side of Highway 1, and modest alterations, such as renumbering and shortening some of the original fairways. More recent changes involved lengthening fairways and adding and rebuilding tee boxes from 1985 until 1994.

The original design of the course had three holes on the east side of what was a county road, in front (on the west side) of the clubhouse, as shown in Figure 3. Around 1943, the county road was improved and rerouted to become Highway 1, which no longer passed the west side of the club house but was now on the east side. Although Highway 1 was not realigned until sometime after 1940, the designers of the course knew the course would have to be modified to accommodate the road (Figure 3). In 1932, Jack Fleming, in writing about the course in the San Francisco Call-Bulletin, described it as being "at present along the edge of the county road which is planned to re-locate." Other, more minor alterations included changing sand trap

### Historic Contexts

### Golf Course Design

Modern golf has its roots in Scotland beginning in the mid-fifteenth century on hilly grazing land along the coastline covered with fescues, broom, and other links plants. Early golf courses in the United States were referred to as "golf links" because they were designed in the tradition of Scottish links—the sandy seaside wasteland that links the ocean with the arable soil inland is the location where the Scottish used to construct golf grounds.[10] Holes were placed in an area that afforded interesting play, and aside from removing tall brush, little was done to modify the grounds. By the turn of the century, golf was becoming an important sport and golf course architecture was becoming a respected profession. Several early courses constructed in the United States during the mid to late nineteenth century were designed by professional golfers from Great Britain. Interest in golf evolved in the US during the late nineteenth and early twentieth centuries and increased in popularity during the post-World War II years.[11]

Prior to the 1920s, golf courses were designed by prominent players, not golf architects. Golf course architecture was a full time profession in the 1920s, and it was a period of growing prosperity for the US, a time when construction costs, real estate values, and interest rates were low. The 1920s have been called the Golden Age of

## B10. Significance (continued)

golf course style in America and the 1920s saw the style of golf courses enhance immeasurably.[12] By the mid-1930s, golf construction regained popularity and many municipalities hired course architects to design golf courses. During the Great Depression era, the federal WPA program was used to provide workers to build these public courses.[13]

Because golf courses are both natural and manmade, it is common for golf courses to be redesigned over time. Courses are redesigned, replaced, or remodeled for two primary reasons to accommodate for advances in golf technology and to improve the layout of the course to accommodate the natural changes that occur within a natural landscape such as vegetation growth, soil erosion, and changes in slope pitch.

**History of Public Golf in San Francisco**

The game of golf came to California in the late 1800s and the first course was constructed in Southern California at the Riverside Country Club in 1891. The first Northern California golf course was at the Burlingame Country Club, a three hole golf course, built in 1893. The first golf course to be constructed in San Francisco was the San Francisco Golf Club in 1895. [14]

While golf courses at private country clubs were gaining in popularity, golf courses for golfers unable to afford the high prices of country clubs had very few places to play. In the early 1900s, avid golfers and wealthy members of private clubs, Jack Neville and Vincent Whitney, approached John McLaren, Supervisor of Golden Gate Park, about constructing a municipal golf course. Neville and Whitney then began designing San Francisco's first municipal golf course, Lincoln Park.[15] Lincoln Park remained the only San Francisco municipal golf course for 23 years until the construction of Harding Park. Harding Park, designed by Sam Whiting and Willie Watson, was constructed in 1925.

The popularity of golf in San Francisco peaked during the 1920s. Lincoln Park and Harding Park were the only two golf courses in San Francisco and, on weekends, they were overrun with golfers. The City decided to use the land in San Mateo County, formerly owned by George Sharp, for the location of a third public golf course, named for the former land owner. Alister Mackenzie, the famous golf architect who had designed several courses in the US and abroad, was commissioned to design the course. Mackenzie was assisted by Jack Fleming, Superintendent of Maintenance for Golf Courses and Bowling Greens in San Francisco. Supervision of construction was given to Chandler Eagan, with whom Mackenzie had worked on Pebble Beach Golf Links in 1929.[16] In 1930, Robert Hunter Jr. was appointed the superintendent of construction for the course for the remaining ten months of construction. Willis Polk and Company architect Agnus McSweeny was hired to prepare plans for the construction of the golf clubhouse.

## B10. Significance (continued)

**Alister Mackenzie**

Alister Mackenzie was born in Scotland in 1870 and received a medical degree. He served as the Alwoodley Golf Club Green Chairman in the early 1900s, assisting golf architect H.S. Colt with the design of that golf course in Leeds.[17] Mackenzie continued to work with Colt on other courses, and, in 1925, he established his own golf architecture firm and designed golf courses in Great Brittan, Uruguay, Australia, Argentina, Canada, and the US.[18] Mackenzie's best work in America was done between 1928 and 1933 prior to his death in 1934.[19] By the time Mackenzie was commissioned to work on Sharp Park, he was living in the Bay Area.

Mackenzie's concept of an ideal hole in perfect surroundings was a hole surrounded by sand dunes next to the seashore.[20] Mackenzie felt that the success of golf course construction depended entirely on making the best use of natural features and the devising of artificial ones indistinguishable from nature.[21] He also contended that a golf course must offer adventure in order to hold interest for continuous play. His courses provided interesting challenges for golfers, regardless of their skill level. Mackenzie's firm was also known for its original and distinctive bunkers with irregular shapes, each with its own individual design.[22] Mackenzie often had the overall vision for design of his courses, and left the details to be created by those who worked with him, such as Eagan.

George Shackelford, in his book *Grounds for Golf*, describes Mackenzie as a master designer and offers that Mackenzie's secret to creating unique courses was his talent for routing.[23] Mackenzie designed his hole layout and sequencing on natural ground contours, not on any prescribed sequencing. Distinctive bunkering, the use of small hillocks around greens and exciting hole locations were Mackenzie's trademark. As Shackelford describes, while many architects try to create a special course, Mackenzie "could figure out how best to fit holes onto a property and situate a golf course to evoke a comfortable, settled, connection to the ground. His course routings are always functional and original but rarely do they fight the contours of the property."

Mackenzie's notable US golf course designs were Cypress Point Golf Club, California (1928), Augusta National Golf Club, Georgia (1932), and Pasatiempo Golf Club, California (1929). Mackenzie was commissioned by the City and County of San Francisco to design Sharp Park Golf Course in 1929. According to Geoffrey Cornish and Ron Whitten, golf architects and authors of the book, *The Architects of Golf,* it was Mackenzie's philosophies that most influenced post-World War II designers.[24]

## B10. Significance (continued)

**Agnus McSweeny**

The prestigious design firm of Willis Polk and Company was chosen as the clubhouse architect at Sharp Park. Willis Polk and Company was a highly respected architectural firm, responsible for many architectural masterpieces throughout Northern California. Willis Polk, the architect credited for such masterpieces as the Palace of Fine Arts, the Hobart Building and the Sunol Water Temple as well as the rebuilding San Francisco after the 1906 earthquake, died in 1924. His architectural firm carried on in his tradition and developed the plans for the Sharp Park Golf Clubhouse. The chief architect in charge of the project was Angus McSweeney.

**Evaluation**

**Significance**

The following provides an evaluation of the Sharp Park Golf Course under each NRHP and California Register of Historical Resources (CRHR) criteria. The property's period of significance is from 1929 to 1932, and represents the period from start of the property's construction to its completion.

Sharp Park Golf Course appears to meet the criteria for listing on the NRHP for its significance under Criteria A and C and for listing on the CRHR under Criteria 1 and 3.

Sharp Park Golf Course is significant under Criterion A/1 because its construction is associated with the "golden age of golf" in the US, during the late 1910s through the 1930s, a time of great popularity for the sport and a period during which golf architects designed many courses throughout the US. The trend in popularity of golf during this period is also reflected in the history of the golf within San Francisco, because during the early 1920s, the City had the need for a third municipal golf course. The construction and development of Sharp Park Golf Course was a direct result of the overcrowding at Harding Park and Lincoln Park municipal courses and the City's desire to build a third course to accommodate San Francisco golfers.

Sharp Park Golf Course is significant under Criterion C/3 for its architecture and landscape architecture—a public golf course constructed between 1929 and 1932, embodying distinctive characteristics of a seaside golf course. This period is often called "the golden age of golf" because of the popularity of the game and the spike in golf courses constructed in the US. Sharp Park Golf Course contains many distinctive elements of its type, a golf course constructed on the oceanside, on sandy dunes, with original seaside holes that provide water hazards as part of the game. The course was designed by a well-known architect, with nuances, style, and innovation that enhanced golf courses constructed during this period in the US, many of which were private. The original layout of the golf course included holes featuring multiple tees, double fairways, cross bunkering, fairways in sand dunes, and several holes bordering Laguna Salada. Cypress trees dotted the setting. Although the course has been modified, it is common to modify a living landscape, although efforts to keep the fairways' general original course design were always in effect. Twelve of the original 18 holes are part of the current design, and two fairways are original but without original greens.

## B10. Significance (continued)

The golf course is also the work of a master. While there are other examples of Mackenzie's work that are more well known, Sharp Park Golf Course is an example of his idea of the perfect surroundings for a golf course—holes surrounded by sand dunes next to the seashore. Although alterations have been made to the course, during the period of significance the course retained Mackenzie's routing, surprise elements, and hole and fairway locations.

The clubhouse is a good example of an Eclectic architectural style, with Mission and Spanish elements, improved by the WPA during the Great Depression. The clubhouse is associated with the golf course and is considered a historic character defining feature of the golf course.

Finally, in rare instances, buildings and landscape features themselves can serve as sources of important information about historic construction materials or technologies (Criterion D/4); however, the Sharp Park Golf Course does not appear to be a principal source of information in this regard.

**Integrity**

Integrity of a historic resource is measured by applying seven factors: location, design, setting, workmanship, materials, feeling, and association. Sharp Park Golf Course, including the club house and maintenance building has retained a sufficient level of integrity in all measures, with the exception of setting, because the seawall now obstructs the view of the ocean from the course. The CRHR definition of integrity is "the authenticity of a historical resource's physical identity as evidenced by the survival of characteristics or historic fabric that existed during the resource's period of significance."

The CRHR goes on to state that eligible resources "must retain enough of their historic character or appearance to be recognizable as historical resources and to convey the reasons for their significance," and then it lists the seven aspects of integrity. Although the course has been modified over time, the golf course is in its historic location and retains much of its historic appearance, with the exception of the fact that the ocean is no longer visible from the course. Still present are the lagoon, the east and west locations of the holes, and the freeway bisection, which were all elements of the original design. Mackenzie designed the course with interesting challenges for golfers, regardless of their skill level, which is still true of the current course. Man-made features that have been added, such as the seawall, do not diminish the historic integrity of the course because the land and its location was important to Mackenzie's design; thus, the course is still authentic to Mackenzie's plan. The course retains its integrity of design, workmanship, and materials that provide it with a similar sense of feeling and association to its forty-four years period of significance.

The clubhouse retains most of its historic design features; original or in-kind materials illustrate the workmanship that went into its design. Modifications, such as additions to the dining area and replaced windows, have not reduced the overall historic character of the building that give it the sense of feeling and association to its period of significance.

## B10. Significance (continued)

Sharp Park Golf Course's character-defining features are the original features and design of the clubhouse, the original permanent maintenance building, and the course's original layout, including the 12 remaining original holes (current holes 1, 2, 3, 8, 9, 10, 11, 13, 14, 15, 17 and 18) and original landscape features. The cypress trees that line the fairways also contribute to its significance, although none of the specific shrubs or trees on the property are considered contributors. The property's noncontributing features are the practice green, the maintenance trailers, the cart paths, the four holes that were moved to the east side of Highway 1, and other alterations that occurred after the period of significance.

## ABSTRACT

This assessment summarizes the factors that contribute to the archaeological sensitivity of 32 Significant Natural Resource Areas managed by the City and County of San Francisco's Recreation and Park Department. These areas are primarily within the City and County of San Francisco; one, Sharp Park, is in San Mateo County. The assessment was completed in support of the Environmental Impact Report analyzing the environmental effects of implementing a management plan for these Natural Areas. Research included records searches through the Northwest Information Center, a literature and archival review, an examination of historic maps, and a review of materials housed by the Staff Archaeologist at San Francisco Planning Department's Major Environmental Analysis Division. Little to no previous surveys or archaeological resources have been documented in the Natural Areas. This assessment addresses the potential for surface and subsurface archaeological resources only. Built environment and historical landscape resources were addressed in a separate document.

In total, nine Natural Areas were found to have a high level of archaeological sensitivity, nine have a moderate level as well as the Whiskey Hill portion of the Golden Gate Park Oak Woodlands Natural Area, and 14 have a low level (including the Lily Pond, Oak Woodlands, and Strawberry Hill portions of Golden Gate Park Oak Woodlands Natural Area).

# 1. INTRODUCTION

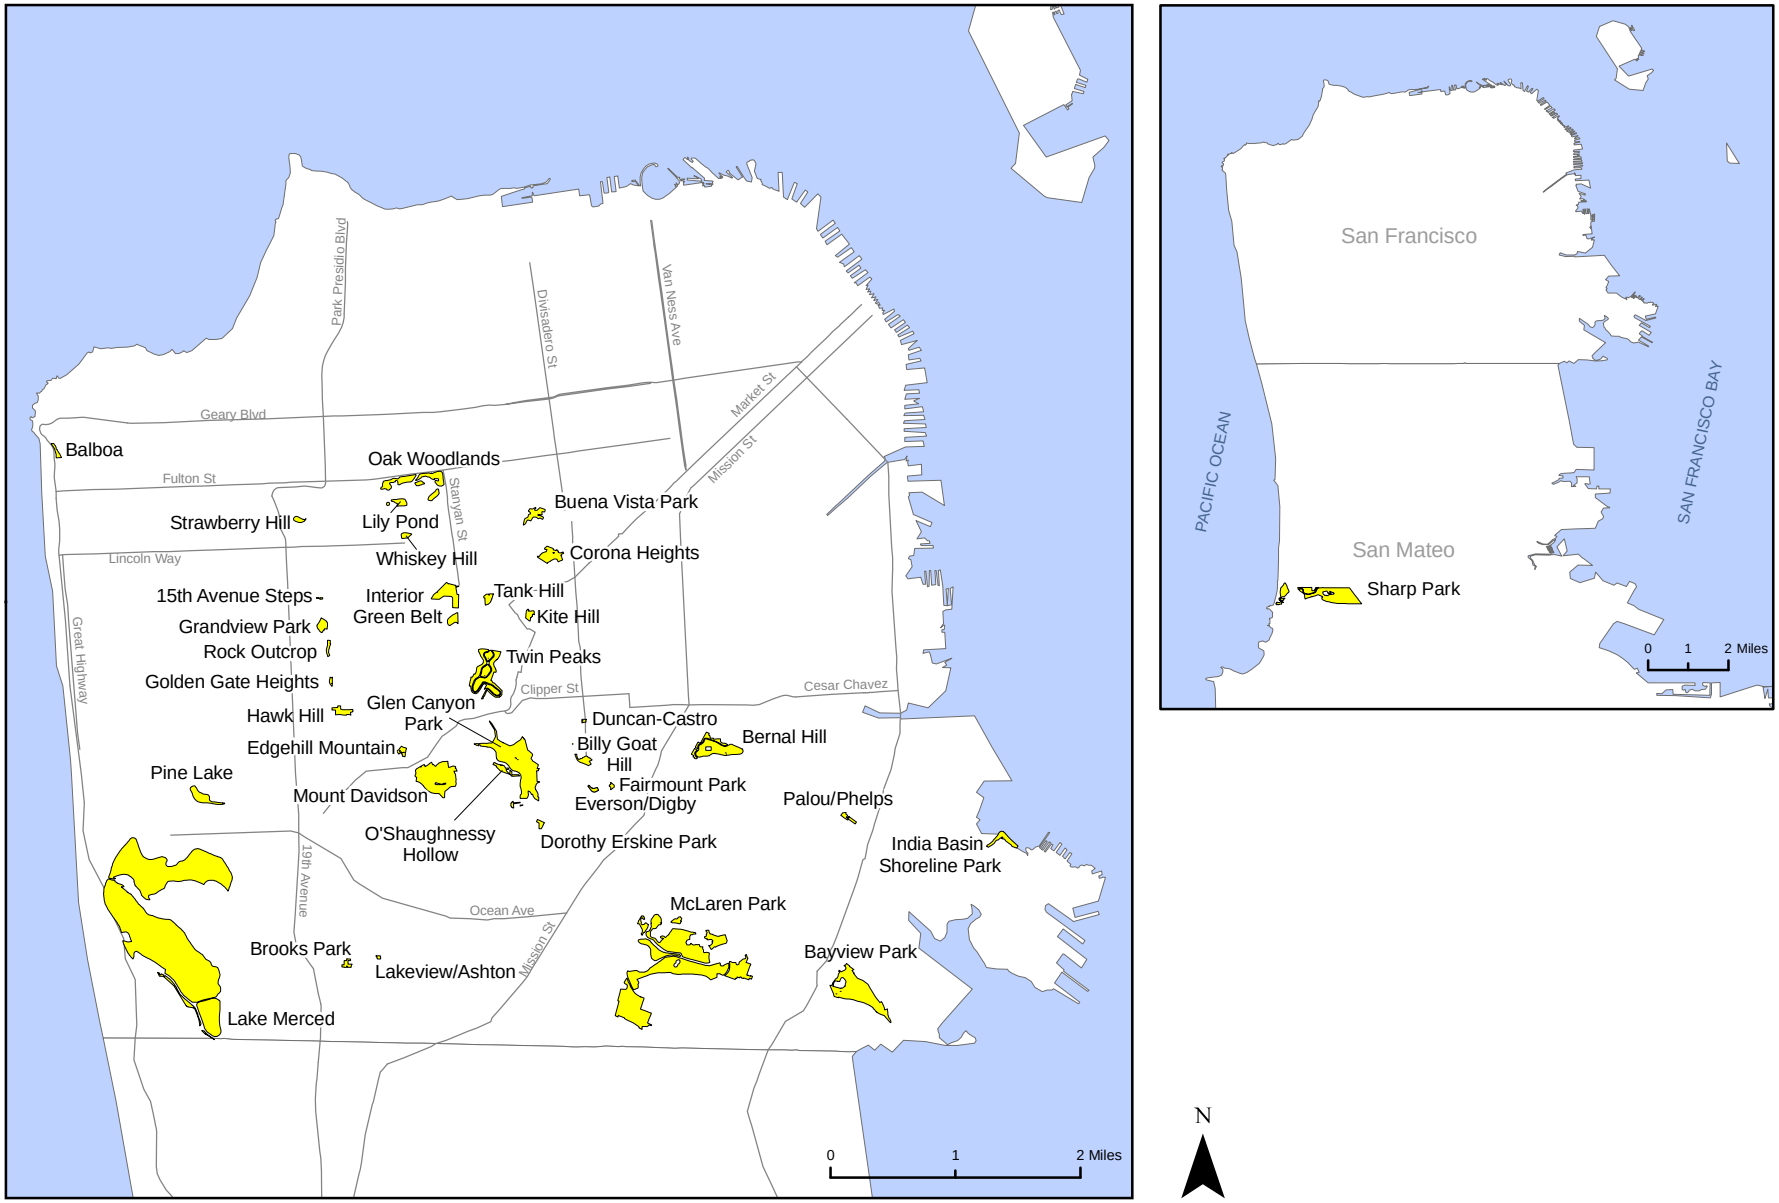
This report was prepared for the San Francisco Recreation and Park Department (SFRPD). It documents the archaeological resources inventory for the San Francisco Significant Natural Resource Areas Management Plan (SNRAMP) and assesses the archaeological sensitivity of each Natural Area. The inventory is based solely on previous surveys and studies, and no archaeological survey was conducted. There are 32 Natural Areas within San Francisco and one Natural Area in Pacifica in San Mateo County. This assessment addresses only archaeological resources and is meant to support the cultural resource impact analysis included in the associated project EIR (Tetra Tech 2010); buildings and structures are addressed in a separate report (Mates 2010).

## 1.1 SAN FRANCISCO SIGNIFICANT NATURAL RESOURCE AREAS MANAGEMENT PLAN AND ENVIRONMENTAL IMPACT REPORT

The Natural Areas are scattered mostly throughout the central and southern portions of San Francisco and constitute approximately four percent of the total city area; one Natural Area is in Pacifica (Figure 1-1). The areas range in size from less than one acre to almost 400 acres and include such popular locations as Twin Peaks and portions of Glen Canyon Park. While mostly owned by the SFRPD, some remnant Natural Areas are managed by other public and private entities. Some of these properties may eventually be transferred to the SFRPD. Detailed maps of each Natural Area depicting the designated management areas can be found in Appendix B of the associated project EIR (Tetra Tech 2010) as well as in Chapter 6 of the SNRAMP itself (SFRPD 2006). The *Significant Natural Resource Areas Management Plan, Final Draft* (SFRPD 2006) is incorporated by reference into this description of the project.

## 1.2 METHODOLOGY

In order to complete the archaeological sensitivity assessment, cultural resources records were reviewed and archives and literature were researched.



### 1.2.1 Cultural Resources Records Searches

Tetra Tech searched records through the Northwest Information Center (NWIC) of the California Historical Resources Information System at Sonoma State University for each of the Natural Areas and a 400-meter buffer around each (NWIC file numbers 07-1792, 08-0414, and 09-0630). The records search was done initially for the purposes of the EIR and in order to determine whether a subject parcel or its environs have been previously surveyed for cultural resources and whether any sites or historic buildings have been identified and recorded. In addition historic maps were consulted, and two directories of cultural resources were reviewed: Office of Historic Preservation's Historic Properties Directory and the California Inventory of Historical Resources.

### 1.2.2 Archival/Literature Research

Tetra Tech staff reviewed the records search results and conducted additional research based on past local projects in the San Francisco Major Environmental Analysis'(MEA) archaeology library and at local libraries. This included reviewing MEA's geographic information system (GIS) database, historic maps, site records, reports, and general history library.

Tetra Tech previously completed an archaeological properties assessment for the San Francisco Public Utilities Commission's San Andreas Pipeline No. 3 project in western San Francisco (King 2008). As part of that effort and in order to illustrate the types of archaeological resources potentially within

R:\NEW\19598\GIS\Layouts\Cultural Resources\Sensitivity Assessment\NaturalAreas.mxd - 08/02/10 - EK

The 32 Natural Areas total approximately 1,107 acres and range in size from 0.3 acres (15th Avenue Steps) to 395 acres (Lake Merced).

Tetra Tech, Inc

**Figure 1-1**

that project's developed CEQA Area of Potential Effect (C-APE), Tetra Tech staff conducted a general review of archaeological sites within the same study area used here. Much of this work and the understanding of site types and associated environmental settings were reviewed and incorporated into this sensitivity assessment.

### 1.2.3 Qualities of Archaeologically Sensitive Areas

Several elements contribute to the archaeological sensitivity of an area. Primarily, these elements are prehistoric and historic natural settings, historic and modern disturbances, and density and patterning of recorded archaeological resources. The potential for buried archaeological resources is also affected by landscape evolution, such as erosion, subsidence, and deposition.

Natural settings suggest to the researcher areas that would have been desirable settlement or activity areas for humans. The more resources available at or near a location, the more attractive the location would have been.

Disturbances and landform evolution can contribute to the destruction or preservation of an archaeological site. Although urban development is typically considered destructive of sites due to large-scale excavations or cuts made into landforms, it can also bury sites, effectively capping and protecting the resource from further disturbance.

The evolution of a landform can have similar effects when periods of sedimentation occur, burying sites sometimes tens of meters beneath the new surface. However, landform evolution can also include periods of erosion where the landform and archaeological materials deposited on them are removed. Similar effects are experienced during periods that lack sedimentation, when the site can become deflated (removal of the sediment matrix within the site, leaving only the artifacts). Further, the age of the landform contributes to the archaeological potential. It is generally accepted that humans did not occupy North America, particularly the California coast, before approximately 12,000 years ago; therefore, buried landforms that are Pleistocene (1.8 million years to 11,800 cal BP) in age are less likely to contain subsurface archaeological resources. Landforms that formed during the Holocene (10,500 cal BP to the present) are conversely more likely to include archaeological resources (Meyer and Rosenthal 2007:15).

The distribution and density of recorded archaeological resources can be more problematic in determining the archaeological sensitivity of an area. The archaeological record can suggest the potential for additional sites to exist, and the distribution pattern of the sites can also suggest the likelihood of unrecorded sites. For instance, if a stream corridor or other specific habitat is particularly dense with sites in one portion of a region, the potential for similar areas to include sites is increased. However, it is important to note that the archaeological record includes the biases of survey coverage, survey technique, records accuracy, and ground surface visibility, which can limit the ability to identify sites. Surveys are typically limited to defined project areas, so large portions of regions, if not most regions, are unsurveyed, as will be seen in the discussion here regarding the minimal survey coverage of the Natural Areas. Ground surfaces can be paved, landscaped, or heavily vegetated, limiting the ability of archaeologists to identify surface sites. If the survey techniques used do not account for subsurface resources, these sites can be missed as well. An additional problem with the archaeological record is the accuracy of site records, particularly older records or accounts of sites that were produced without the benefit of modern mapping techniques. In these instances, the "official" location of a site may simply be an approximate location.

## 1.3 CEQA AREA OF POTENTIAL EFFECT AND PROJECT STUDY AREA

A C-APE for archaeological resources is defined as those surface and subsurface areas that may be disturbed as a result of proposed. Additionally, a C-APE is expanded to include the boundaries and depths of any archaeological sites documented within or partially within the area of direct impact. For the proposed SNRAMP, the C-APE would encompass all areas where ground-disturbing activities would occur, as well as staging areas for those activities. Ground-disturbing activities include construction, trail creation and maintenance, new planting or plant removal, and activities that could contribute to erosion.

To better understand the likelihood for archaeological sites to occur within the C-APE, a larger project study area was established, similar in geologic and prehistoric environmental context and modern development. The area includes the northern end of the San Francisco Peninsula subregion (the Peninsula), from the intersection of Interstate Highways 280 and 380 (I-280 and I-380) in northern San Mateo County, and extending north to the Golden Gate Strait. Covering the area are the 7.5-minute United States Geological Survey (USGS) quadrangles Montara Mountain, San Mateo, San Francisco South, San Francisco North, Point Bonito, Hunters Point, and Oakland West. Expanding the project study area outside the C-APE allows for a more informed assessment of the possibility for unidentified archaeological resources to exist within the C-APE and what types of resources, such as prehistoric village sites and historic locales, may be anticipated.

# 2. ENVIRONMENTAL SETTING

The Natural Areas are described as oases surrounded by historic and modern urban development, providing some of the remaining natural habitats on the Peninsula. Vegetation within the parks include native and introduced species, notably eucalyptus groves. Surrounding areas include turf and greens at the Sharp Park Golf Course in Pacifica and others in San Francisco, isolated patches of introduced annual weeds, and vegetation, such as lawns, flower beds, and ornamental trees and shrubs associated with homes and yards near the parks. With the exception of Sharp Park, most historic watercourses have been covered by modern development. Detailed descriptions of each Natural Area, including geologic, biological, and hydrological descriptions, are included in the SNRAMP (SFRPD 2006). These are summarized below, with specific attention given to factors that may influence archaeological preservation or human attraction to the area. Reconstruction of the historic and prehistoric environmental settings of the Natural Areas is critical to assessing the likelihood of historic and prehistoric use of the areas, as well as the potential for the archaeological indicators of those activities to remain intact.

## 2.1 CLIMATE

The climate of the project area is classified as Mediterranean, characterized by seasonal precipitation of wet mild winters and dry summers (Golden Gate Weather Service 2008; Ritter 2008; SFRPD 2006). The project area is west of the Coast Range. While the Coast Range provides a wind buffer to the east, the areas west of the Coast Range are unprotected and experience cool marine winds and more summer fog. Summers in the study area experience cool marine air and persistent coastal clouds and fog. Specifically, within San Francisco, Twin Peaks acts as a prominent dividing point for the summer coastal fog. West-facing slopes receive substantial fog and strong winds while the east-facing slopes receive more sun and warmth (SFRPD 2006:6.8-1). Spring and fall often bring the warmest and most cloud-free periods to San Francisco. Rainfall during the spring is infrequent, while it is considered rare between May and September, when often only around one inch of rainfall accumulates. During winter, the polar jet stream and associated periodic storms reach into the lower latitudes of the Mediterranean zones, bringing rain to the San Francisco region. Most rain falls between November and March, predominantly in the western portion of the Peninsula. The combination of climate patterns with the variable topography of the area produces strong microclimates. Temperatures are generally moderate, with a comparatively small range of temperatures between the winter low and summer high (Golden Gate Weather Service 2008; Ritter 2008; SFRPD 2006).

## 2.2 TOPOGRAPHY AND GEOLOGY

The Natural Areas are spread primarily across southern and central San Francisco and are varied in their topography and geology. Descriptions of each are included in Section III of the associated project EIR (Tetra Tech 2010) as well as in the SNRAMP itself (SFRPD 2006). In general, the parks are underlain by Franciscan bedrock, and soils reflect the local bedrock condition. In most, a thick rocky soil is present over the Franciscan bedrock, but in others disturbed soils, including cut and fill material, is present. Fill depths vary greatly across the Peninsula. Erosion is common within the Natural Areas but is not necessarily active year-round. Such processes are intensified by steep slopes, road cuts, paved surfaces, and pedestrian traffic (SF Environment 2006; SFRPD 2006:3-1–3-2).

Historic-era explorers noted that the western areas of the Peninsula were dominated by sand dunes (Shoup and Baker 1981:9); most of San Francisco west of Twin Peaks is underlain by dune sand. Where the topography is relatively flat, the sand is deep and is not especially prone to erosion when undisturbed or vegetated. In steeper areas (such as Grandview Heights) the sand is shallow, is underlain by impermeable

bedrock, and is easily disturbed. In these areas erosion is more commonplace. More loamy soils tend to be less easily eroded than clean sandy soils due to their ability to hold water longer and develop deeper deposits and more dense vegetation (SFRPD 2006:3-2).

These dunes would have played a critical role in the formation and post-depositional processes of archaeological sites within the natural areas in this portion of the study area. The sand dunes of the Peninsula and San Francisco originated on the Pleistocene coastal plain, when sea level was at the 100-meter (328-foot) isobath, approximately 15,000 BP (Atwater et al. 1977; NPS 2002). Historically, they extended from Lake Merced north to Point Lobos and then east through the San Miguel Hills and what is now Golden Gate Park to the bay shore (SFRPD 2006:3-4). Older Aeolian sandstones underlie the Peninsula from Lake Merced south to Colma Creek Valley (city of San Mateo area) (SFRPD 2006:3-2). As sea levels rose and eventually stabilized, between 15,000 and 6000 BP, sand from the plain was transported to the beaches of the now modern coastline, where it was blown over the coastal hills to form the historic San Francisco sand dune complex composed of Sirdak sand (Atwater et al. 1977; NPS 2002; SFRPD 2006). Wind-driven processes such as this can cause both erosion and sediment deposition, typically of fine sand, silt, and clay. The wind-driven movement of materials can easily deflate an archaeological site, bury and obscure it, destroy its stratigraphy, or sandblast artifacts, altering their appearance. Deposits initially laid on the windward side of a dune are immediately subjected to deflation, while artifacts laid near the peak can be subject to deflation and be transported to the leeward side, where they can become buried. Deposits originating on the leeward side of a sand dune are more likely to be buried and preserved by sand drift (Schiffer 1983, 1987; Waters 1992).

Although the Natural Areas have the same general geological setting, the overlying soils and topography that can contribute to archaeological preservation are more specific to each area. of the effects of development and occurrence of bedrock outcrops that may have been prehistorically or historically quarried are also specific to each Natural Area. The following descriptions of each park's specific geologic and topographic setting are derived from SFRPD (2006).

***15th Avenue Steps:*** The 15th Avenue Steps Natural Area includes unexposed Franciscan chert bedrock overlain by dune sand. A chert quarry once existed near the southern end of the area. Slopes are extensively steep and a landslide scar is present in the northeast portion of the Natural Area (SFRPD 2006:6.16-1).

***Balboa:*** The Balboa Natural Area is composed entirely of a loose sand dune formation directly across the Great Highway from the Pacific Ocean. It is a beach and dune sand terrace at the base of a Franciscan sandstone bluff. The area has been restored since 2002 from prior use as a construction staging area. The sand used to form the dune is redeposited material from beneath the De Young Museum, and vegetation was planted between 2003 and 2005. The redeposited sand was mixed with the staging area surface, and some of these hardpan areas may still be present beneath the sand (SFRPD 2006:6.22-1).

***Bayview Park:*** Bayview Park Natural Area is atop a peak in the southeast corner of the city, overlooking San Francisco Bay. Soils consist of very gravelly sandy loam and fine sandy loam. Outcrops of chert and sandstone occur throughout the park, and bedrock is exposed in several areas along the main paved path. A history of anthropogenic ground surface disturbance is evidenced by benched slopes, old road grades, and very large soil slumps. The southeastern slope has been terraced. The northern slope is eroding rapidly in several locations due to water runoff. In one erosional area a landslide has

occurred near the base of the area's slope and the northern boundary . It appears to extend from an old rock quarry that is now an escarpment. Disturbances are apparent above the quarry, as well as remnant stockpiles on the quarry floor, and suggest the topsoil and sandy subsoil have been stripped from the rock surface (SFRPD 2006:6.17-1–6.17-2).

***Bernal Hill:*** The Bernal Hill Natural Area includes Franciscan chert and greenstone bedrock overlain by slope debris. The chert bedrock occurs in outcrops at the lower elevations of the park and is decomposed in areas. A remnant of a redeveloped quarry is present on the south side of the area, and a large soil slip is in the northwest corner. An ancient terrace is also present at the east end of the park, covered by sandy soil and slope debris (SFRPD 2006:6.21-1).

***Billy Goat Hill:*** The Billy Goat Hill Natural Area is underlain by Franciscan chert, sandstone, and volcanic greenstone bedrock. The greenstone bedrock mostly lies beneath a thin rocky slope debris soil and is exposed on the northern edge of the park. It is referred to as pillow lava due to its rounded shape, formed by an underwater volcanic eruption. At the top of the hill is a chert exposure with a thin debris deposit over it. At the southern end of the park ancient terraces are underlain by sandstone. Debris deposits on the terraces are evidence of shallow soil slips in this area. Erosion, particularly in denuded areas, can be extensive in this Natural Area (SFRPD 2006:6.9-1).

***Brooks Park and Lakeview/Ashton Mini Park:*** These two small Natural Areas are discussed together given their proximity and similar setting. Brooks Park sits atop an east-west trending bedrock ridge, with less than one-foot of sandy soil overlying Franciscan sandstone at its center. Exposures of the erodible sandstone are observable throughout the park. Slope debris and thick sandy soils several feet thick are present at the bases of slopes along the edges of the park. An area of thin fill has been placed in the southwest corner of the park where a soil slip is also present. Quarried areas of Franciscan sandstone bedrock are also present within the northwest and southeast corners. The Lakeview/Ashton Mini Park (also referred to colloquially as Orizaba Rocks) is at the highest point of the same bedrock ridge and is also composed primarily of Franciscan sandstone. Similar to Brooks Park, the center of the park includes the peak of the outcrop, while the edges include a less than 0.3-meter-deep layer of sandy soil. Slope debris and weathered sandstone bedrock accumulates on the slopes of the park (SFRPD 2006:6.6-1–6.6-2).

***Buena Vista Park:*** This park is composed of a moderately steep hill of historic dune sand. A small area of chert is present in the northeast corner of the Natural Area. Wind and water erosion is considered moderate and is exacerbated by paved roads and sandy foot trails (SFRPD 2006:6.10-1, 6.10-10).

***Corona Heights:*** Corona Heights Natural Area is near the center of San Francisco and is almost entirely underlain by Franciscan chert bedrock, with smaller areas of Franciscan sandstone and greenstone in the lower elevations of the northwest portion. Thin rocky slope debris covers most of the bedrock. Bedrock slopes are very steep, with ancient soil slips present on most of the hillsides, as well as steep escarpments on the northern and southern edges. The amphitheater at the center of the Natural Area is a former quarry and is bare ground today (SFRPD 2006:6.11-1).

***Dorothy Erskine Park:*** Like most of the other Natural Areas, Dorothy Erskine Park is underlain by Franciscan chert bedrock. Primarily, slope debris of a thin rocky soil overlies the bedrock. Bedrock

outcrops occur along the northern and eastern edges of the northeast corner, as well as at the top of the hill where soils are thin. The northern boundary is dominated by shallow soil slips (SFRPD 2006:6.24-1).

***Duncan-Castro:*** The Duncan-Castro Natural Area is underlain entirely by layered Franciscan chert bedrock. Thin rocky soil overlies the bedrock in areas. Folded chert layers are exposed along the south side as well as the escarpment along the west side of the area. Below the escarpment are landslide deposits and slope debris. Bedrock exposures and shallow slips of the soil are common (SFRPD 2006:6.12-1).

***Edgehill Mountain:*** This Natural Area is underlain by Franciscan chert bedrock covered by a thin rock layer of slope debris. The steep terrain of the area leads to soil slips and rock falls throughout the park and bedrock has been exposed in elongated scarps along the south-facing hillside and along road cuts for bordering streets (SFRPD 2006:6.25-1).

***Everson/Digby:*** Soils in the Everson/Digby Natural Area are thin, usually less than 30 centimeters deep. The area is underlain by Franciscan bedrock, which is evident in outcrops. Slopes are steep, with a terrace running east-west along the middle of the site (SFRPD 2006).

***Fairmount Park:*** The Fairmount Park Natural Area is underlain by Franciscan chert and greenstone bedrock. The chert bedrock is primarily in the southern portion, where loamy soils of varied depths dominate. The greenstone bedrock is primarily in a band across the southern half of the northern portion. Slope debris covers this area. Sandy soils are mapped in the northern and most southern portions. Roadcuts along the eastern edge of the Natural Area have exposed the bedrock, while eroded slopes are present in the central and southwestern portions (SFRPD 2006:6.26-1).

***Glen Canyon Park and O'Shaughnessy Hollow:*** Given their proximity, these two parks are discussed together. Both are within an area called the San Miguel Hills and gain elevation from south to north. The canyon for which Glen Canyon Park is named drops 107 meters over a horizontal distance of 1.6 kilometers, creating very steep slopes that lead down to Islais Creek. Franciscan chert underlies both parks, interbedded with very thin layers of shale. Less common in the parks is Franciscan sandstone with interbedded shale. Large areas of outcropping bedrock occur in the northwest and northeast rims of the canyon and along O'Shaughnessy Boulevard between the two parks. In fact, these outcrops are some of the city's largest. Franciscan greenstone has also been mapped along the southwest boundary of these parks. Soils are typically thin, with high rock content, but in flatter areas soils can include deep layers of eroded soils and fill material (SFRPD 2006:6.3-1–6.3-2, 6.3-4).

***Golden Gate Park Oak Woodlands (including Whiskey Hill, Lily Pond, and Strawberry Hill):*** The Oak Woodlands Natural Area's topography was likely altered when it was planted around the 1870s. Similar effects likely occurred when much of the native vegetation of Golden Gate Park was removed and the park was landscaped. Slopes within the park are often the result of grading and park management. Most soils are from the historic dune complex and are susceptible to erosion. In addition to sandy soils, chert outcrops and stabilized sand dune formations are found throughout Golden Gate Park. Whiskey Hill is a classic example of the latter. The ground surface is composed of moderately compacted silty fine sand. However, at the base of the windward north face of the hill, the sand is looser and has been exposed by erosion. No bedrock is exposed in Whiskey Hill, and borings indicate at least 150 feet of sand and other loose sediment rests above Franciscan bedrock here. The Lily Pond area is a

flatter sand dune than Whiskey Hill. Slopes are moderate to gentle on all sides. A quarried lake, Lily Pond, is next to the area. Strawberry Hill is surrounded by Stow Lake. Most of the island is a hill composed of Franciscan chert overlain by dune sand that ranges in depth from a few inches at the top to several feet at the base. Chert exposures, sandstone, and a mixture of rocky material are present, particularly on the leeward south face of the hill (SFRPD 2006:6.15-1–6.15-3).

***Grandview Park, Rock Outcrop, Golden Gate Heights Park, and Hawk Hill:*** Given the proximity and similar geologic setting of these Natural Areas, they are discussed together here. All of these parks sit atop a remnant ridgeline of the historic sand dune complex that once covered western San Francisco. Grandview Park includes chert overlain by these dune sands, as well as chert exposures. The peak of the park's hill exhibits extensive erosion, with exposed tree roots and bare ground. Exposed sand that erodes, particularly during storms, is also present within the southern and eastern slopes. Rock Outcrop Natural Area is composed primarily of a Franciscan chert outcrop with steep faces. Inclusions of sandstone and conglomerate and deposits of colluvium and fill are also present. Very little erosion has been noted, primarily due to the nature of the dominating chert outcrops. Golden Gate Heights Natural Area includes areas of exposed chert and chert outcrops but is predominantly sandy soils. Erosion has been primarily caused by public use. Hawk Hill soils are entirely dune sand, which is easily eroded. Installation of retaining walls has limited the extent of erosion (SFRPD 2006:6.5-1–6.5-2).

***India Basin Shoreline Park:*** The India Basin Shoreline Park is along the southern bayshore of San Francisco, near Hunters Point. Wetland restoration was completed in 2002, which included creation of a salt marsh. The park is entirely within a filled area that created an unnatural shoreline. Adjacent to the park, bay waters are at most 10 feet deep and the mudflats here are exposed at low tides (SFRPD 2006:6.18-1).

***Interior Greenbelt:*** This Natural Area is underlain by Franciscan chert and sandstone bedrock. Sandy soil covers the bedrock on the northern and eastern slopes with bedrock outcrops and small scarps. Near the center of the area, a loamy soil of varying depths is present. An ancient fault or shear zone is evidenced by a prominent valley along the northwest boundary of the area. The fault or shear has eroded with time to develop a narrow straight cleft in the bedrock. Shallow soil slips occur along the valley walls (SFRPD 2006:6.23-1).

***Kite Hill:*** The Kite Hill Natural Area is underlain almost completely by Franciscan chert and greenstone, with thin rocky soils atop the bedrock. Greenstone is concentrated along the western border at the base of the hill. Chert is primarily at the top of the hill, where there are chert knobs, and within terraces facing east. Bedrock slopes are very steep, and ancient landslide scarps are evident on most hillsides. Shallow slips are common, evidenced by debris deposits at the base of the terraces (SFRPD 2006:6.13-1).

***Lake Merced:*** Lake Merced was originally a brackish bay open to the Pacific Ocean. But during the Late Pleistocene and Early Holocene, the area became sedimented as a result of sea level rise, and a sand barrier formed, creating the lake. In 1852 the barrier was breached as a result of an earthquake, reopening the lake to the saltier ocean water. A sand bar reformed in the 1880s and a dam was constructed in the 1950s as a more permanent barrier (Shoup and Baker 1981:7-8). Similar incidents of sedimentation and breaching no doubt occurred in prehistory as well. Today, the lake is further divided into North, East, South, and Impound Lakes by berms constructed in the late 1800s and 1950s. Soils are primarily fill

material and Sirdak sands. Lakeshore slopes are fairly steep. In the northern and eastern terraces of the park, soils are underlain by bedrock, while deep sand dune areas are present in the south and west portions of the park (SFRPD 2006:6.1-2). In fact, Aeolian sandstones older than the northern dune system underlie the study area from Lake Merced south to the City of San Mateo (SFRPD 2006:3-2).

***McLaren Park:*** McLaren Park Natural Area includes a portion of a ridgeline that extends east to include Bayview Park. Slopes on the north face are more gradual than those on the south face of the hill that makes up the park. The northeast corner of the Natural Area contains loamy soils that vary in depth atop recent sand and silt sediments. In the rest of the northern half of the park is partially decomposed bedrock with thin rocky soils. Exposures of the bedrock are few, but greenstone has been mapped along the western slope, serpentine at the ridgetop and northeast corner of the park, and sandstone along most of the eastern slope. The ridgetop knolls are eroding, and soil creep has been noted on the east-facing slopes in the most northern areas of the park. A portion of the park in the northwest corner included a sandstone quarry face nine meters high. In the southern half of the park the same thin rocky soil is present as in the northern half, but there are also numerous greenstone and sandstone outcrops. Historic quarrying is evidenced by terraces in the extreme southwest corner. In the most eastern parts of the southern half, animal burrows and periodic fires have created soil slip over an area of old road fill. The soil slip continues downslope, south to two outcrops of conglomerate. Most of the southern half of the McLaren Park Natural Area includes the Gleneagles International Golf Course, which has likely altered the natural topography there. Greenstone outcrops and terracing are noticeable along the northern and southern boundaries, respectively, of the course. At the southernmost edge of the Natural Area is an extensive hillside soil slump (SFRPD 2006:6.19-1–6.19-3).

***Mount Davidson:*** Mount Davidson is the highest point in San Francisco. The park is underlain predominantly by Franciscan chert, with Franciscan sandstone in the northern corners of the park and Franciscan greenstone in the lower elevations of the southern slope. Outcrops of the chert do occur throughout the park (SFRPD 2006:6.2-1–6.2-2). Soils at Mount Davidson are a mixture of fine sandy loam, sandy loam, and gravelly loam (SFRPD 2006:3-2).

***Palou-Phelps:*** This Natural Area is dominated by a steep hill that rises to the east and south, creating steep slopes and escarpments. It is underlain by sandstone bedrock that is decomposing in areas to a thick rocky soil. Erosion in one area has created a six-meter drop-off along the northeast boundary (SFRPD 2006:6.20-1).

***Pine Lake:*** The Pine Lake Natural Area is within an elongated valley with steep wooded walls, the lake being at the western end. Underlying soils are sandy and susceptible to erosion. An escarpment parallels the northern shoreline of the lake, and a dog play area is east of the Natural Area in an open field (SFRPD 2006:6.7-1).

***Sharp Park:*** Coastal Sharp Park Natural Area includes a public golf course, creeks, an extensive lagoon and associated wetlands, and an extensive canyon. It borders Sweeney Ridge and extends west to the Pacific Ocean. Soils are loamy with sand, fill, and disturbed areas closer to the ocean. The canyon that forms the eastern and upper portion of the park consists of Franciscan sandstone overlain by approximately one foot of gravelly sandy loam. Franciscan greenstone is present in the northern and eastern areas of the park. In the upper canyon are thin, gravelly, sandy loam soils underlain by Franciscan

sandstone. Active and extensive erosion, landslides, and soil creep toward the west have been identified in this area of the park (SFRPD 2006:6.4-1–6.4-3).

***Tank Hill:*** The Tank Hill Natural Area is also entirely underlain by Franciscan chert bedrock with a thin layer of rocky soil over it. There is a concrete foundation pad for a historic Spring Valley Water Company water tank (no longer present) in the southern portion of the area where the Franciscan bedrock is altered to a mostly buried greenstone that extends south to an outcrop near the southern and eastern boundaries of the park. A thin layer of slope debris is present within the northwest corner, where there is a fault-sheared bedrock mixture of sandstone, chert, claystone, and shale. The eastern and northern slopes are exceedingly steep and ancient landslide scarps form most of the hillside in these areas. Debris deposits at the base of the slopes evidence common shallow soil slips and slope raveling. On the southeast slope an area of steep, weathered, and eroded chert is exposed (SFRPD 2006:6.14-1).

***Twin Peaks:*** The Twin Peaks Natural Area is near the geographic center of San Francisco and offers the second highest peak in the city. The two peaks are within the northern portion of the San Miguel Hills. Soils consist of a very gravelly sandy loam and a fine sandy loam lay over Franciscan bedrock. Roadcuts in the area have exposed chert and sandstone outcrops that range from five to fifteen feet in height. Spoils from these roadcuts were placed on the downslope side of the road. Erosion is primarily contained to along trails and where public use has degraded the ground surface. Ground surfaces are bare on the northwest-facing slope of the southern peak as well as at the top of the northern peak (SFRPD 2006:6.8-1–6.8-2).

## 2.3 HYDROLOGY

Specific discussions of the hydrologic setting of the natural areas are included in Sections III and V.H of the project EIR (Tetra Tech 2010), as well as in the SNRAMP (SFRPD 2006). The hydrology of an area affects the likelihood of it to have been prehistorically or historically occupied, and the potential for erosion to have affected the preservation of archaeological sites. Many of the Natural Areas do not have water bodies, but the following have natural or man-made water bodies: Bayview Park (proposed detention basin/seasonal wetland), Lake Merced, Pine Lake, India Basin Shoreline Park (San Francisco Bay), Golden Gate Park Oak Woodlands (Stow Lake), McLaren Park, Glen Canyon Park and O'Shaughnessy Hollow (Islais Creek), and Sharp Park (Sanchez Creek and Laguna Salada wetland complex). Numerous creeks, tributaries, wetlands, bay mudflats, tidal marsh, and lagoons once existed across the Peninsula and along the shorelines (SFEI 2010; USGS 1896). Several creeks begin in, are next to, or flow through a Natural Area. Similarly those Natural Areas along the bay shore or coastline are next to or in what was once marsh, lagoon, or mudflat habitat. Most of these creeks and habitats have been covered by modern development or are filled or otherwise altered.

Floods and drought likely occurred historically among the historic water bodies within the study area. Similar to wind-driven processes, hydrologic processes can affect archaeological sites postdepositionally. Overflow of lakes, rivers, and streams can result in fluvial flooding of nearby archaeological sites (Schiffer 1983, 1987; Sundborg 1967:335). They can also result in slope wash, alluvial fans, or colluvial deposits that can bury and preserve a site if activity occurs quickly and briefly. Erosion can result from streams and rivers cutting away at their banks, which can undercut the land and possibly destroy a site. Sometimes sites in what eventually becomes a waterway are eroded away by the flowing water, unless the flow is gentle enough to merely cover the site with alluvial sediment eroded from upstream. Rising groundwater levels, as would have been the case along sea and bay shores during periods of sea level rise, could submerge the lower reaches of a deposit.

Additionally, sea levels affect a region's coastline through erosion and inundation. Along the Peninsula's coast, old coastlines would have been located offshore, as noted above. The larger landmass would have offered a larger area available for settlement and use (Schiffer 1983, 1987).

The hydrology of the Natural Areas is specific to each. Those that possess significant hydrologic processes, historically and today, are discussed below; however, all of the areas exhibit erosion by water or public use. The hydrology of the Natural Areas not discussed below primarily consists of surface runoff.

***Glen Canyon Park and O'Shaughnessy Hollow:*** At the bottom of the canyon within Glen Canyon Natural Area flows Islais Creek on its way to San Francisco Bay. This is one of the few historic creeks that still flow through the city. However, the watershed of Islais Creek is today limited to Glen Canyon Park, 80 percent smaller than its historic extent. Overland flow and some hillside seeps feed the creek but also deposit eroded sediment. The additional sediment reduces stream flow, which can lead to periodic flooding and has reduced the historically open water channel (SFRPD 2006:6.3-1–6.3-3).

***India Basin Shoreline Park:*** Given the proximity of this Natural Area to San Francisco Bay, hydrology at India Basin Shoreline Park is primarily tidal action (SFRPD 2006:6.18-1).

***Interior Greenbelt:*** Water accumulates in the prominent valley of this Natural Area. The valley drains the higher slopes of Mount Sutro. The creek that is formed runs only in the early spring or after substantial rainfall (SFRPD 2006:6.23-1).

***Lake Merced:*** The Lake Merced Natural Area includes the largest expanse of wetland in San Francisco and the largest freshwater lake between Point Reyes and southern San Mateo County. Water today in the lake is lower than historic levels due to watershed alterations. Historic levels since 1935 have fluctuated between 6.4 and 11.28 meters amsl (SFRPD 2006:6.1-1–6.1-3). Lake Merced is fed by an underground spring and, historically, up to nine creeks (USGS 1896) and their tributaries, some of which originated near 19th Avenue. Modern topographic maps (USGS 1995) indicate that none of the streams and creeks currently flow directly to the water body. Prehistorically, the lake would have provided a source of freshwater and aquatic subsistence resources for human populations. As discussed above, Lake Merced was originally a brackish bay, fed by streams flowing to the Pacific Ocean, but during the late Pleistocene and early Holocene the area became sedimented as a result of sea level rise, and a sand barrier formed, creating the lake. In 1852, the barrier was breached as a result of an earthquake, reopening the lake to the saltier ocean water until a dam was constructed in the 1950s. In the past 100 years, the lake has been reduced to a series of three water bodies, separated by mudflats as a result of stream rechanneling and lake filling (Shoup and Baker 1981: 7-8).

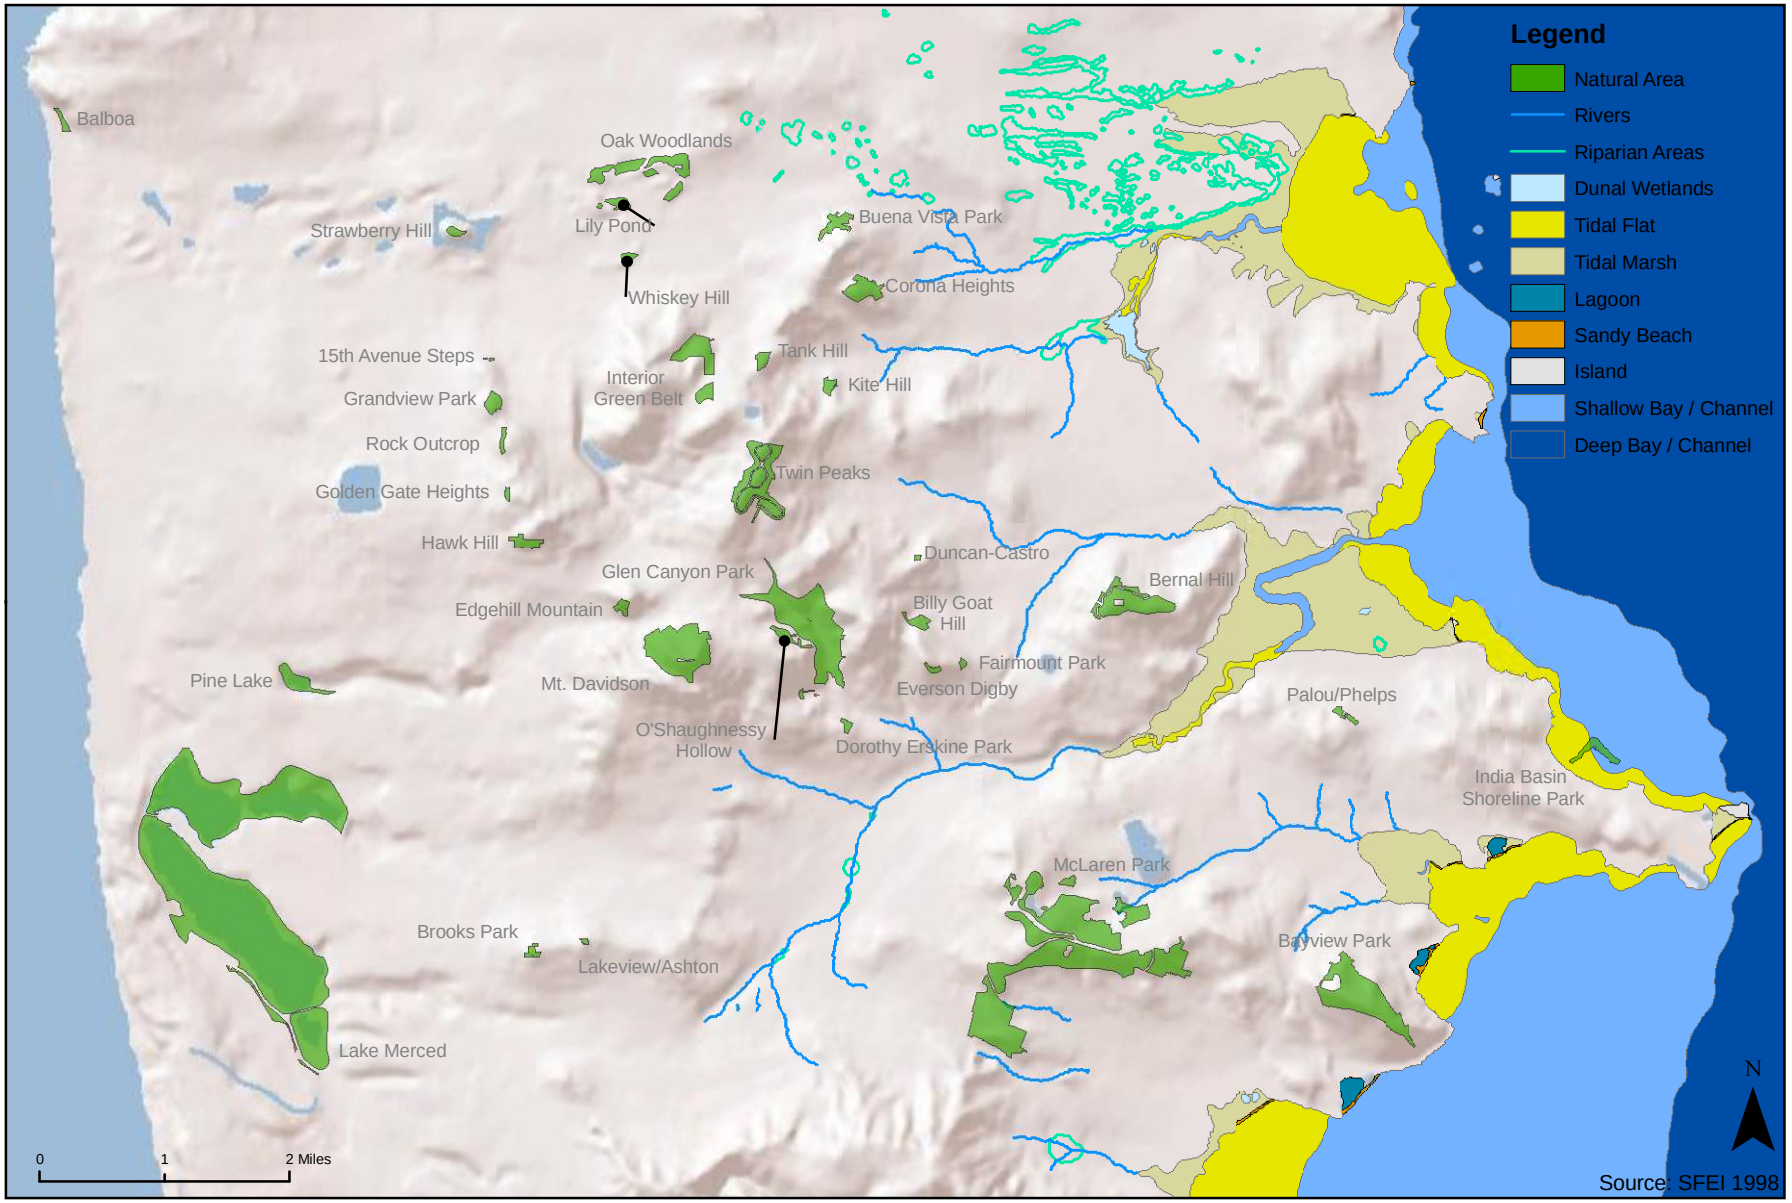
***Golden Gate Park Oak Woodlands:*** The Lily Pond portion of this Natural Area is next to a quarried lake (SFRPD 2006:6.15-3). It is unclear when the lake, also referred to as Lily Pond, was created. Stow Lake surrounds the Strawberry Hill portion of the Natural Area (SFRPD 2006:6.5-3). It is unclear when this man-made lake was created or by what methods.

***McLaren Park:*** Three springs on the northern slope of McLaren Park and Sunnydale Creek historically fed Yosemite Creek. Sunnydale Creek was fed by springs on the southern slope of McLaren Park. Yosemite Creek would then flow southeast from the park to Visitacion Bay. A marsh associated with Yosemite Creek is still present within the park, as are several ponds. Also within the northern

portion of the park is Gray Fox Creek, which flows north from the ridgeline and empties into McNab Lake in the northwest portion of McLaren Park. Seeps are present throughout the park (SFRPD 2006:6.19-1–6.19-3).

***Pine Lake:*** The Pine Lake Natural Area includes Pine Lake itself, also known as Laguna Puerca in what is now Stern Grove. Laguna Puerca was fed by one creek historically (USGS 1896). Modern topographic maps (USGS 1995) indicate that the creek does not currently flow directly to the water body. Prehistorically, the creek would have provided a source of freshwater and aquatic subsistence resources for populations.

***Sharp Park:*** There are seeps throughout Sharp Park and two major water features. The Natural Area includes free-flowing Sanchez Creek and brackish Laguna Salada. The creek originates on the ridge above the park and flows through the upper canyon to an irrigation reservoir, then through the golf course to a pond near the Pacific Ocean. The water is then pumped into the ocean via an automated system. Creek banks of expansive clay have been reinforced with ready-mix concrete where it flows through Sharp Park Golf Course. In segments that are not reinforced, undercutting and exposed roots have been noted. There is also evidence of dredging of the creek. Historically, Laguna Salada was similar to other coastal tidal lagoons that trapped winter runoff until levels topped adjacent dunes to connect the lagoon to the ocean. Construction of Sharp Park Golf Course modified the lagoon with a levee that prevents the exchange of tidal water. Today, a man-made channel drains the brackish water from the lagoon to the same pond that Sanchez Creek drains to (SFRPD 2006:6.4-1–6.4-2).



## 2.4 FLORA AND FAUNA

The C-APE encompasses some of the last vestiges of undeveloped land on the Peninsula, particularly within San Francisco. However, most of the habitats that are present within the Natural Areas today were altered historically by planting forests or landscaping. Further, numerous nonnative and invasive species occur in the areas today. The Natural Areas are surrounded by a modern landscape of paved streets, golf courses, and residential neighborhoods. Approximately 95 percent of the natural lands, wetlands, and shorelines within the Franciscan landscape have been altered in some way or have been destroyed altogether. Much of these areas were used historically for cattle grazing that led to nonnative and invasive vegetation or were planted with nonindigenous conifer and eucalyptus forests during the historic period. These practices have resulted in a highly fragmented and minimal natural or native landscape (SFRPD 2006:3-4).

Originally, as part of the South Coast Range, the region was dominated by a Southern Oak Woodland environment (Baumhoff 1978: 19). Acorns and other plant resources would have been available to the south in an area dominated by oak woodland plant community. Additionally, tule and coastal dune scrub communities, still found in the area today, would have been available along watercourses and in the dune complex (NPS 2002; Shoup and Baker 1981:9). Such vegetation, including maritime chaparral, costal scrub, manzanita, and perennial grasslands, would have stabilized the sand dune complex once the communities developed (SFRPD 2006:3-4).

The presence of freshwater in some Natural Areas likely made them attractive to various terrestrial fauna and birds, including elk and migratory birds along the Pacific Flyway. Additionally, marine mammals and pinnipeds would have been available along the coast. Shorelines would have also offered opportunities for nearshore fishing and shellfish collecting historically and prehistorically (Moratto 1984: 221; Shoup and Baker 1981: 8-9).

SFRPD (2006:Appendix E) documents vegetation and animal species that were likely historically present within each Natural Area. In general, forests, grasslands, scrub, mixed herbaceous vegetation, and nonnative species are present at each today. Wetlands and marsh habitat exist in Natural Areas with significant hydrological features, such as Lake Merced, Sharp Park, Pine Lake, and Golden Gate Park Oak Woodlands (Strawberry Hill). The San Francisco Estuary Institute's (SFEI) (SFEI 2010) has reconstructed the historic bay shore vegetation of the San Francisco Bay, including the eastern half of the city (Figure 2-1; no data available for western extent of Peninsula). The Natural Areas in the central area of San Francisco are near the heads of several creeks that empty into the bay, while the most north-central Natural Areas, such as Buena Vista Park and Golden Gate Park Oak Woodlands, are close to an extensive riparian environment. Bernal Hill, Palou-Phelps, and Bayview Park are next to historic tidal marshes and flats. Bayview Park is also next to several lagoons and sandy beaches. India Basin Shoreline Park is the only Natural Area that is not on the historic shoreline. It is instead in a tidal flat and a shallow bay environment. The SFEI has also mapped the modern bay shore vegetation (Figure 2-2) to illustrate the vast changes that have occurred since the historic period.

# 3. ARCHAEOLOGICAL RECORD

Tetra Tech completed records searches through the NWIC of the California Historical Resources Information System at Sonoma State University for each of the Natural Areas and a quarter-mile buffer around each (NWIC file numbers 07-1792, 08-0414, and 09-0630). The records search is done to determine whether a subject parcel or its immediate environs have been previously surveyed for cultural resources and whether any sites have been identified and recorded. In addition historic maps were consulted, and the Office of Historic Preservation's Historic Properties Directory and the California Inventory of Historical Resources were reviewed. All of the Natural Areas were covered by a study of pre-Spanish ecology of the Bay Area (Mayfield 1978). Cultural resources overviews (general discussions of resources that did not include formal surveys) and pedestrian surveys have been conducted within nine of the Natural Areas.

Tetra Tech staff also reviewed the records search results and conducted additional research at San Francisco MEA's archaeology library. This included a review of MEA's GIS database, historic maps, site records, reports, and general history library.

The following discussions describe information specific to each Natural Area obtained through the records search, research at MEA, and other research at local libraries.

## 3.1 SURVEYS AND OVERVIEWS WITHIN OR NEAR THE NATURAL AREAS

Cultural resource overviews (general discussions of resources that did not include formal surveys) and pedestrian surveys have been conducted within nine of the Natural Areas. All of the Natural Areas were covered by a study of pre-Spanish ecology of the Bay Area (Mayfield 1978). Table 3-1 summarizes the studies completed within specific Natural Areas. No archaeological surveys have been conducted at 23 of the Natural Areas: 15th Avenue Steps, Bernal Hill, Billy Goat Hill, Brooks Park, Buena Vista Park, Corona Heights, Dorothy Erskine Park, Duncan-Castro, Edgehill Mountain, Fairmont Park, Glen Canyon Park, Golden Gate Heights, Golden Gate Park Oak Woodlands (including Lily Pond, Strawberry Hill, and Whiskey Hill), Grandview Park, Interior Green Belt, Kite Hill, Lakeview/Ashton Mini Park, McLaren Park, Mount Davidson, O'Shaughnessy Hollow, Rock Outcrop, Tank Hill, and Twin Peaks.

|---|---|---|---|---|
| S-31602 | 2006 | Matthew R. Clark | *Historic Properties Inventory Research for National Historic Preservation Act Section 106 Compliance for North Coast County Water District* | Linear survey through the southern half of the eastern portion of the Natural Area. No archaeological resources identified within Natural Area; however, Pastron (2008:11) notes that survey S-31602 found possible evidence of a prehistoric cultural deposits over one meter below the surface along Archery Range Road, not included in the Natural Area's management area. |
| S-34499 | 2007 | Matthew R. Clark | *Historic Properties Inventory Research for National Historic Preservation Act Compliance North Coast County Water District, Pacifica Recycled Water Project* | Field survey in the central area of the eastern portion of the Natural Area, near the Sharp Park Rifle Range. No archaeological resources identified in Natural Area. |

*Tetra Tech did not obtain reports for each survey identified by the records searches, but the NWIC bibliographies contain resources identified in each survey.

## 3.2 ARCHAEOLOGICAL SITES WITHIN OR NEAR THE NATURAL AREAS

Fifteen Natural Areas contain or are near documented and undocumented archaeological resources (Table 3-2). Those indicated as "unrecorded" are potential resources identified in SFRPD (2006), the MEA GIS database, or survey reports, but not identified in the NWIC site records database. No archaeological resources were found to be in or near any of the remaining 17 Natural Areas: Billy Goat Hill, Dorothy Erskine Park, Duncan-Castro, Edgehill Mountain, Everson/Digby, Fairmount Park, Glen Canyon Park, Golden Gate Heights, Grandview Park, Hawk Hill, Interior Greenbelt, Kite Hill, Lakeview/Ashton Mini Park, McLaren Park, Mount Davidson, O'Shaughnessy Hollow, and Rock Outcrop.

**Table 3-2**
**Archaeological Sites Within or Near the Natural Areas**

| Trinomial (Primary No.) | Recorder, Year Recorded | Description |
|---|---|---|
| **15th Avenue Steps** | | |
| "Chert Quarry" | Unrecorded (based on SFRPD 2006:6.16-1; see discussion in Section 2.2 of this report). | The Natural Areas Management Plan indicates the presence of a former chert quarry in the southern Natural Area. The age of the quarry or its history is unknown. |
| **Balboa** | | |
| CA-SFR-5 (P-38-5) | N. C. Nelson, 1910; MEA GIS Database | Shellmound site, "Nelson 397." To the north of Balboa Natural Area, along the coast. |
| CA-SFR-20 (P-38-20) | N. C. Nelson, 1910; MEA GIS Database | Shellmound site, "Nelson 396." To the north of Balboa Natural Area, along the coast. |

**Table 3-2**
**Archaeological Sites Within or Near the Natural Areas**

| Trinomial (Primary No.) | Recorder, Year Recorded | Description |
|---|---|---|
| CA-SFR-21H (P-38-21) | Michael Meyer and Bryan Mischke, 2008 | Remains of Sutro Baths, constructed in the 1890s. There is also a prehistoric site at this location that was impacted and removed when the baths were constructed. This site was a large, loosely packed shell heap. |
| CA-SFR-164H (P-38-4466) | Michael Meyer, 2006 | Architectural remains and refuse deposits associated with buildings of Ocean Terrace, a residential and commercial complex of buildings that existed between 1890 and 1910. A portion of a headstone and brick piers also found at the site. May be potential for redeposited human bone at this site. |
| Possible redeposited materials from Midwinter International Exposition | Unrecorded (based on SFRPD 2006:6.22-1; see discussion in Section 2.2 of this report). | Sand from beneath the current De Young Museum in Golden Gate Park was redeposited in this Natural Area (SFRPD 2006:6.22-1). Based on the site record for CA-SFR-167H (P-38-4625), there is a potential that archaeological deposits associated with the Midwinter International Exposition are throughout undisturbed portions of Golden Gate Park (see discussion under Golden Gate Park Oak Woodlands below). It is therefore considered possible that the redeposited material now in Balboa Natural Area, originally from Golden Gate Park, included archaeological materials associated with the Midwinter International Exposition. |
| **Bayview Park** | | |
| CA-SFR-7 (P-38-7) | N. C. Nelson, 1910 | Shellmound site, "Nelson 387." Also known as Bayshore Mound, Crocker Mound, and Johnson's Landing Mound. Buried, intact prehistoric shellmound, 2.1 to 2.7 meters deep; human burials, one hearth, several concentrations of ash, fish scales, and rocks. Attributed to Middle to Late Period. Located south of Natural Area, along shoreline. Disturbed by construction of docks. |
| CA-SFR-8 (P-38-8) | P. Nichols, 1979, from N. C. Nelson, 1910 | Shellmound site, "Nelson 388." Located east of southern end of Natural Area along shoreline, based on Nelson (1910). Possibly destroyed or buried. |

**Table 3-2**
**Archaeological Sites Within or Near the Natural Areas**

| Trinomial (Primary No.) | Recorder, Year Recorded | Description |
|---|---|---|
| CA-SFR-9 (P-38-9) | P. Nichols, 1979, from N. C. Nelson, 1910 | Shellmound site, "Nelson 389." Located east of southern end of Natural Area along shoreline, based on Nelson (1910). Possibly destroyed or buried. |
| CA-SFR-10 (P-38-10) | P. Nichols, 1979, from N. C. Nelson, 1910 | Shellmound site, "Nelson 387A." Located northeast of the northern point of the Natural Area, based on Nelson (1910). Possibly destroyed or buried. MEA's GIS database includes another CA-SFR-10, also to the northeast, along Ingalls Street, recorded at 75 to 90 centimeters below ground surface during monitoring activities and interpreted as a secondary deposit. |
| CA-SFR-111H (P-38-109) | John Foster and James Delgado, 1986; MEA GIS Database | Historic burnt hull of a wooden sailing vessel in mudflat south of Candlestick Point; associated large wooden post found on beach. The hull may have been a nineteenth century lumber schooner. Possibly one of two shipwrecks, *Carmel* and *Gray's Harbor*, identified in MEA's GIS database in this area. |
| "Rock Quarry" | Unrecorded (based on SFRPD 2006:6.17-1–6.17-2; see discussion in Section 2.2 of this report). | The Natural Areas Management Plan indicates a former rock quarry in the northern section of the Natural Area. The age of the quarry and its history are unknown, but stockpiles of soils and sediments on the quarry floor are presumably associated with it. |
| "Chinese Shrimp Camps" | Unrecorded (based on Hamusek-McGann 1998). | The archaeological inventory of the Hunters Point Shipyard to the east of the Natural Area indicates that several Chinese shrimp fisheries/camps existed in the Hunters Point area. Such activities may have extended west along the shoreline, in the vicinity of the Natural Area. |
| **Bernal Hill** | | |
| "Anderson Shellmound" | MEA GIS Database; Miley Holman, 2007 | Shellmound site, approximately 290 meters to the south of the Bernal Hill Natural Area. Originally noted by Miley Holman in 1990 and reported to MEA in 2007. The site was exposed during removal of a fence in the backyards of the residences at 225 and 233 Anderson Street. Shell was dense, and large deposits of fish remains were observed. Depth of this primary deposit was on average 61 centimeters. |
| "Bernal's Stone Wall" | MEA GIS Database | Depicted on historic maps, including the County Recorder map for Precita Valley Lands (1856), the County Recorder map for the Pioneer Race Course Tract (1864), and the1886 Sanborn map. The wall was located along the base of the northern slope of Bernal Hill. |
| "Jose C. Bernal Adobe/Reserve" | MEA GIS Database | Depicted on historic maps, including the US Coast Survey (1857) and County Recorder map for RJ Tiffany and BD Dean (1864), as well as in Hendry |

**Table 3-2**
**Archaeological Sites Within or Near the Natural Areas**

| Trinomial (Primary No.) | Recorder, Year Recorded | Description |
|---|---|---|
| | | and Bowman (1940). Today, the location is the site of St. Luke's Hospital, bounded by Cesar Chavez Street, Guerrero Street/San Jose Avenue, and Mission Street. |
| "Rock Quarry" | Unrecorded (based on SFRPD 2006:6.21-1; see discussion in Section 2.2 of this report). | The Natural Areas Management Plan indicates the presence of a former rock quarry in the southern portion of the Natural Area. The age of the quarry and its history are unknown. |
| **Brooks Park** | | |
| "Sandstone Quarry" | Unrecorded (based on SFRPD 2006:6.6-1–6.6-2; see discussion in Section 2.2 of this report). | The Natural Areas Management Plan indicates the exposed sandstone bedrock in the northwest and southeast corners of the Natural Area have been quarried. The age of the quarrying and its history are unknown. |
| **Buena Vista Park** | | |
| "Potrero Stone Wall" | MEA GIS Database | Depicted on historic maps in Hendry and Bowman (1940). The wall was east of the base of the eastern slope of the Buena Vista Park Natural Area. |
| "Mission Acequia" | MEA GIS Database | Depicted on historic maps and in Hendry and Bowman (1940). The site is east of the base of the eastern slope of the Buena Vista Park Natural Area. |
| "Guerrero Adobe" | MEA GIS Database | Depicted on historic maps and in Hendry and Bowman (1940). The site is east of the base of the eastern slope of the Buena Vista Park Natural Area. |
| "Bernal's Unfinished Adobe" | MEA GIS Database | Depicted on historic maps and in Hendry and Bowman (1940). The site is east of the base of the eastern slope of Buena Vista Park Natural Area. |
| "DeHaro Adobe" and associated buildings and structures | MEA GIS Database | Depicted in Hendry and Bowman (1940). The site is east of the base of the eastern slope of the Buena Vista Park Natural Area. |
| Mission Dolores and associated buildings and structures, including cemetery and garden area | MEA GIS Database | Depicted on historic maps and in Hendry and Bowman (1940). The site is east of the base of the eastern slope of the Buena Vista Park Natural Area. |
| **Corona Heights** | | |
| "Potrero Stone Wall" | MEA GIS Database | Depicted on historic maps in Hendry and Bowman (1940). The wall was east of the base of the eastern slope of the Corona Heights Natural Area. |
| "Mission Acequia" | MEA GIS Database | Depicted on historic maps and in Hendry and Bowman (1940). The site is east of the base of the eastern slope of the Corona Heights Natural Area. |
| "Guerrero | MEA GIS Database | Depicted on historic maps and in Hendry and |

**Table 3-2**

| Trinomial (Primary No.) | Recorder, Year Recorded | Description |
|---|---|---|
| Adobe" | | Bowman (1940). The site is east of the base of the eastern slope of the Corona Heights Natural Area. |
| "Bernal's Unfinished Adobe" | MEA GIS Database | Depicted on historic maps and in Hendry and Bowman (1940). The site is east of the base of the eastern slope of the Corona Heights Natural Area. |
| "DeHaro Adobe" and associated buildings and structures | MEA GIS Database | Depicted in Hendry and Bowman (1940). The site is east of the base of the eastern slope of the Corona Heights Natural Area. |
| Mission Dolores and associated buildings and structures, including cemetery and garden area | MEA GIS Database | Depicted on historic maps and in Hendry and Bowman (1940). The site is east of the base of the eastern slope of the Corona Heights Natural Area. |
| "Rock Quarry" | Unrecorded (based on SFRPD 2006:6.11-1; see discussion in Section 2.2 of this report). | The Natural Areas Management Plan indicates a quarry once existed where an amphitheater sits today in the middle of the park. The age of the quarry and its history are unknown. |
| **Golden Gate Park Oak Woodlands (Lily Pond, Oak Woodlands, Strawberry Hill, and Whiskey Hill)** | | |
| CA-SFR-167H (P-38-4625) | Aimee Arrigoni, 2007 | Three features attributed to the 1894 Midwinter International Exposition. Historic trash deposits that correspond to the location of the Oriental Village, as well as a brick and mortar footing associated with Thompson's Scenic Railway. Located approximately 400 meters west of the Lily Pond area near the California Academy of Sciences building. (Slightly over 400 meters southwest of Oak Woodlands, approximately 800 meters east of Strawberry Hill, and just over 400 meters northwest of Whiskey Hill.) Construction of the Academy destroyed deposits in this location, but it is possible that intact deposits related to the Fair exist in other undisturbed portions of Golden Gate Park, such as the Oak Woodlands, Strawberry Hill, and Whiskey Hill management areas. |
| **India Basin Shoreline Park** | | |
| CA-SFR-11 (P-38-11) | N. C. Nelson, 1909; MEA GIS Database | Shellmound site, "Nelson 390." Likely destroyed. Location based on Nelson (1909). Multiple site locations are documented, though, including near the intersection of Crisp Road and Griffith Street and at the intersection of Palou Avenue and Fitch Street. |
| CA-SFR-12 (P-38-12) | N. C. Nelson, 1909; MEA GIS Database | Shellmound site, "Nelson 391." Likely destroyed. Located on southern shoreline of Hunters Point, based on Nelson (1909). |

**Table 3-2**
**Archaeological Sites Within or Near the Natural Areas**

| Trinomial (Primary No.) | Recorder, Year Recorded | Description |
|---|---|---|
| CA-SFR-14 (P-38-14) | N. C. Nelson, 1909; MEA GIS Database | Shellmound site, "Nelson 392A." Likely destroyed. Located at northern point of Hunters Point, based on Nelson (1909). |
| CA-SFR-15 (P-38-15) | N. C. Nelson, 1909; MEA GIS Database | Shellmound site, "Nelson 389A." Likely destroyed. Location based on Nelson (1909). Multiple site locations are documented, though, including intersection of Jerrold Avenue and Phelps Street (more north and inland) and along Ingalls Street, between Oakdale Avenue and Palou Avenue (on Hunters Point). |
| TEMP-HPS-IR07 | Karisa Miller, 2010 | An area of historic refuse and debris was recently recorded along a sandy beach within Hunters Point Shipyard, southeast of the Natural Area. The site is likely redeposited imported fill and has become deflated after being covered by riprap. Materials include glass and ceramic shards, building debris (including carved sandstone and marble), children's toys, a marble tombstone fragment, metal fragments, bottles, dishes, and personal items. |
| Various shipwrecks | MEA GIS Database | Four shipwrecks, including the ships *Janette*, *Viola*, *TH Allen*, and *Major Tomkins*, have been recorded offshore from the Natural Area. Further, Hamusek-McGann (1998) identified the shoreline of Hunters Point Shipyard as sensitive for buried "maritime resources" such as these. |
| **Lake Merced** | | |
| CA-SFR-101H (P-38-92) | L. Shoup, 1980 | Likely a concrete and rock well. The well is 84 cm deep, 67 centimeters aboveground on the south side, and is filled with glass. The feature may have been associated with a 1890s lifeguard station, an 1898 Spanish-American War cantonment, or a World War I-era Fort Funston battery bluff, all of which were in this area, within 400 meters of the northwest Lake Merced Natural Area. |
| CA-SFR-102H (P-38-93) | S. Baker and L. Shoup, 1980 | A brick-lined diversion canal constructed by the Spring Valley Water Company for wastewater. The canal is 1,158 meters long, 1.7 meters deep, and 2.6 meters wide. The canal was built in 1897 as part of the Spring Valley Water Company's water system to carry runoff to the Lake Merced Pump Station. Located along the southwestern boundary of the Natural Area. |
| CA-SFR-103H (P-38-94) | S. Baker and L. Shoup, 1980 | Concrete coal bin foundations that measure 15.5 meters by 15.5 meters. Concrete chunks are present as well as metal strips that are 15 centimeters wide by 5 centimeters thick. It is believed these strips were used for reinforcing the concrete foundations. The site was |

**Table 3-2**
**Archaeological Sites Within or Near the Natural Areas**

| Trinomial (Primary No.) | Recorder, Year Recorded | Description |
|---|---|---|
| | | likely associated with a 1940s coal bin at nearby Fort Funston. The adjacent barracks near the now-destroyed Battery Howe was one of the oldest barracks at Fort Funston. Approximately 400 meters west of the northwest corner of the Natural Area. |
| CA-SFR-25 (P-38-25) | Dietz and Jackson, 1970; MEA GIS Database | Possible sand midden on ground surface, with some shell and no charcoal. Hardly any shells found, except for one large oyster. One stone pestle found. Slight surface erosion. East of the Natural Area, in the vicinity of the San Francisco State University football field. |
| CA-SFR-106 (P-38-97) | Bjelajac, 1982; MEA GIS Database | Surface archaeological site of unknown date, discovered accidentally, on Fort Funston directly west of the south end of the Natural Area. |
| "Lake Merced Site" | Fentress, 2007; MEA GIS Database | Prehistoric midden deposit at high point of drainage into Lake Merced at the northeast corner of Natural Area. |
| Various shipwrecks | MEA GIS Database | One shipwreck, the *King Phillip*, has been recorded offshore of the Natural Area. A second, the *Cornelius W. Lawrence*, is documented as on the beach to the west of the Natural Area. |
| **Palou-Phelps** | | |
| CA-SFR-15 (P-38-15a) | N. C. Nelson, 1909; MEA GIS Database | See description under India Basin Shoreline Park. This is the alternate location at Jerrold Avenue and Phelps Street. |
| CA-SFR-124 (P-38-123) | Holman and Associates, 1991; MEA GIS Database | Surface archaeological site of unknown date discovered accidentally. Extends up to 90 centimeters deep and contains both primary and secondary deposits with historic materials that were possibly relocated from Hunters Point. Located just over 400 meters southeast of the Natural Area. |
| CA-SFR-171 | Philip Kaijankoski, 2009 | Buried prehistoric archaeological site to the north of Natural Area. The site consists of a 60 cm-thick deposit of prehistoric archaeological materials identified in a 2-inch diameter geoarchaeological core. The deposit is situated atop a terrestrial deposit adjacent to the former extent of the Islas Creek Marsh. It is overlain by artificial fill and is buried between 2.4 and 3.0 meters (8 to 10 feet) below surface. It is interpreted as a relatively intact prehistoric archaeological deposit. |
| **Pine Lake** | | |
| CA-SFR-25 (P-38-25) | Dietz and Jackson, 1970; MEA GIS Database | See description under Lake Merced. Located just over 1,600 meters southeast of Natural Area. |
| "Lake Merced Site" | Fentress, 2007; MEA GIS Database | See description under Lake Merced. Located just over 400 meters southeast of Natural Area. |

**Table 3-2**
**Archaeological Sites Within or Near the Natural Areas**

| Trinomial (Primary No.) | Recorder, Year Recorded | Description |
|---|---|---|
| **Sharp Park** | | |
| CA-SMA-114 (P-41-116) | S. Humphreys, 1969 | Shell midden with bone, chert chippage, and fire-fractured rock, along with broken historic glass bottles. Located next to southwest corner of Natural Area. Site has been destroyed by erosion and construction. Subsequent surveys have not been able to locate archaeological materials in the mapped site location (Pastron 2008:11). |
| CA-SMA-162/C-116 | C. S. Desgrandchamp, 1978 (based on Pastron 2008:9-10). | Secondary prehistoric midden deposit originally from the Sharp Park area, redeposited to the south along Reina Del Mar Road. Original location in Sharp Park was along Highway 1. Subsequent surveys by Caltrans along Highway 1 did not relocate remnants of CA-SMA-162. C-116 is thought to be the original location from which midden was taken and redeposited at CA-SMA-162. It is north of the Natural Area, near the intersection of Paloma Avenue and Highway 1. |
| CA-SMA-268 (P-41-264) | Caltrans, 1986 (based on Pastron 2008:9-10). | Midden exposed in the bank of Calera Creek. Includes human remains, obsidian projectile point, and a possible groundstone pestle. Extends to approximately 70 centimeters. Located south of the Natural Area, near Calera Creek. Subsurface testing as part of survey S-15828 documented chert debitage, fire-affected rock, mammal bone, and shell extending to 110 centimeters. Up to 70 centimeters of overburden may cover the site. |
| "State Relief Camp" | Unrecorded (based on Pastron 2008:9-10). | As part of a survey of the Sharp Park Rifle Range (an area excluded from the Natural Area) Pastron (2008 and 2009) found that Sharp Park housed a series of Quonset huts in the 1930s associated with a public assistance facility for San Franciscans struggling through the Great Depression. Camp residents were paid to plant trees within the park and other planted gardens in the area. Pastron (2008:13) describes a historical society member who has noted isolated concrete stairs that may be related to the camp or the detention station (described below). |

**Table 3-2**
**Archaeological Sites Within or Near the Natural Areas**

| Trinomial (Primary No.) | Recorder, Year Recorded | Description |
|---|---|---|
| "Sharp Park Temporary Detention Station" | Unrecorded (based on Pastron 2008:9-10). | As part of a survey of the Sharp Park Rifle Range (an area outside the Natural Area), Pastron (2008 and 2009) found that the range was the site of a World War II-era detention facility for suspected "enemy aliens." Sharp Park was one of two California detention stations that held the largest number of Japanese individuals (in addition to smaller populations of other nationalities). The station was closed in early 1946, and it is not clear when the buildings were cleared or to what extent. Pastron (2008:13) describes a historical society member who has noted isolated concrete stairs that may be related to the camp or the detention station. |
| "Sharp Park Rifle Range" | Pastron, 2008 | Three large earthen embankments, possible target mounds, along with shotgun shells were documented by Pastron (2008:12) in the area of the former Sharp Park Rifle Range, established in 1952 and closed in 1988. |
| Undocumented Resources | Matthew R. Clark, 2006 (based on Pastron 2008:9-10). | According to Pastron (2008:11) survey S-31602 by Clark, documented reports from archers using the archery range in Sharp Park of prehistoric artifacts observed and sometimes collected from the surface of the park. |
| **Tank Hill** | | |
| "Spring Valley Water Company Water Tank Foundation" | Unrecorded (based on SFRPD 2006:6.14-1; see discussion in Section 2.2 of this report). | The SNRAMP indicates a concrete foundation pad in the southern portion of the Natural Area. The foundation was for a former Spring Valley Water Company water tank. |
| **Twin Peaks** | | |
| "Rancho San Miguel House" | MEA GIS Database | Depicted in Hendry and Bowman (1940) and historic maps, including the US Coast Survey (1857), Goddard (1869), and Sanborn (1899). The site is east of the base of the eastern slope of Twin Peaks, along Douglas Street, between 22nd and 23rd Streets. |

## 3.3 ARCHAEOLOGICAL LANDSCAPE OF THE STUDY AREA AND C-APE

Relatively little archaeological research has been conducted within the study area compared to the rest of the San Francisco Bay Area. Most archaeological work in San Francisco has been within the city's historic core, the South of Market area, and along the northern and eastern shorelines. It has become clear from this work that the Peninsula in general witnessed significant occupations by prehistoric and historic Native American populations.

With the establishment of extensive tidal marshlands approximately 5,000 to 7,000 years ago (Bickel 1978), the San Francisco Bay shore became an attractive location for prehistoric Costanoan communities, with the

varied resources available there (Hylkema 2002). Attesting to this are the numerous large shellmounds documented around the margins of the bay. In the early 1900s, N. C. Nelson recorded 49 of these sites along the San Mateo County and southern San Francisco County bay shorelines (Nelson 1909); however, most if not all of these sites have since been leveled or built over by modern construction (Heath 1996).

According to an overview of archaeology in San Mateo County (Moratto 1971), an entirely different situation is seen along the Pacific Ocean coastline of the Peninsula, where research was delayed until later in the century. Following enactment of the National Historic Preservation Act (1966), contract archaeology projects have tested or salvaged archaeological sites for many projects, but few large-scale investigations or analyses have occurred. It would seem that most work of this nature has occurred along the entire bay and coastline of the Peninsula, based on the distribution of recorded archaeological sites. However, archaeological salvage programs do commonly occur more inland as part of development projects.

Early Period archaeological sites are rare in the San Francisco region, most likely due to a combination of lower population, sedimentary deposition, and the natural effects of erosion, landform evolution, and sea level rise (Atwater et al. 1977; Bickel 1978; Erlandson 1994; Meyer and Rosenthal 2007; Porcasi et al. 1999; Stanley and Warne 1994; Stright 1990). Evidence for this period predominantly comes from burials found in the lower levels of shellmounds along the eastern bay shore (Suggs 1965). The best evidence is from the northern San Joaquin Valley, well away from the current project area, where burials are typically on low knolls in swampy delta regions. However, there is also evidence of an early presence in San Mateo County from the University Village site (CA-SMA-77) at the southwestern edge of San Francisco Bay, along San Francisquito Creek (Moratto 1984). Relatively little subsistence refuse was found at the site. It was not viewed as a site entirely of the Early or Middle Period; instead it has been interpreted as representative of an early Bay Area culture more similar to prehistoric cultures to the south than to those in the Sacramento and San Joaquin Rivers Delta and the Bay Area. If this is the case, Costanoans may not have settled the western Bay Area until after ca. 1000 BC and older archaeological sites may be more closely related to cultures to the south.

Several other sites on the Peninsula would seem to support this notion (Hylkema 2002:243; Moratto 1984). Middle and Late Period sites include more dietary refuse than these earlier sites, and artifacts are much less formal. Most of these are shell midden sites representing habitation and shellfish processing (Moratto 1984). Of sites discussed in the general archaeology literature found in public and university libraries, CA-SMA-100 is one of the more important deposits most often mentioned. It is a small shell midden with associated features dating to ca. AD 800 and is along San Bruno Creek (Van Dyke 1971). It was discovered during salvage excavation of a neighboring site, CA-SMA-101.

### 3.3.1 Prehistoric Archaeological Sites

The most common prehistoric archaeological property type in the project study area is shell middens, varying in size, depth, density, and associated artifacts and features. Sites attributed to nonhabitation activities, due to their ephemeral nature or lack of residential artifacts, are also common prehistoric site types and include temporary camps or activity loci. Nelson's (1909) early work in the region and Rudo's (1982) overview of San Francisco's prehistory also document the dominance of shell middens in and around the project study area. Given that Hylkema (2002) describes Early Period sites of the region as predominantly burials and Middle and Late Period sites as more habitation oriented, the dominance of large middens in the area should be expected. Early sites would have been more ephemeral and subjected to more deterioration or burial over time. Most recorded sites in the sample reviewed for King (2008) are most often attributed to the Middle and

Late Periods. However, as Meyer and Rosenthal (2007) note, the lack of early sites can be a bias that has resulted from landscape evolution.

Recorded sites discussed in the literature are mostly in the northern half of the project study area, but this may be due to a bias in archaeological work. However, the pattern of sites predominantly located on the eastern and northern shoreline of San Francisco is supported by Milliken's conclusion of a higher population along the bayshore of the Peninsula, as opposed to the windward western side (Milliken 1983).

While some of the prehistoric sites recorded in the study area are visible from the ground surface or eroding from creek banks within a modern urbanized setting, most were buried by natural deposition, historic activities, or modern development. Depths to these resources typically ranged from 1 to 23 meters. These subsurface sites are usually found and recorded as a result of testing or monitoring of construction projects in modern heavily developed areas.

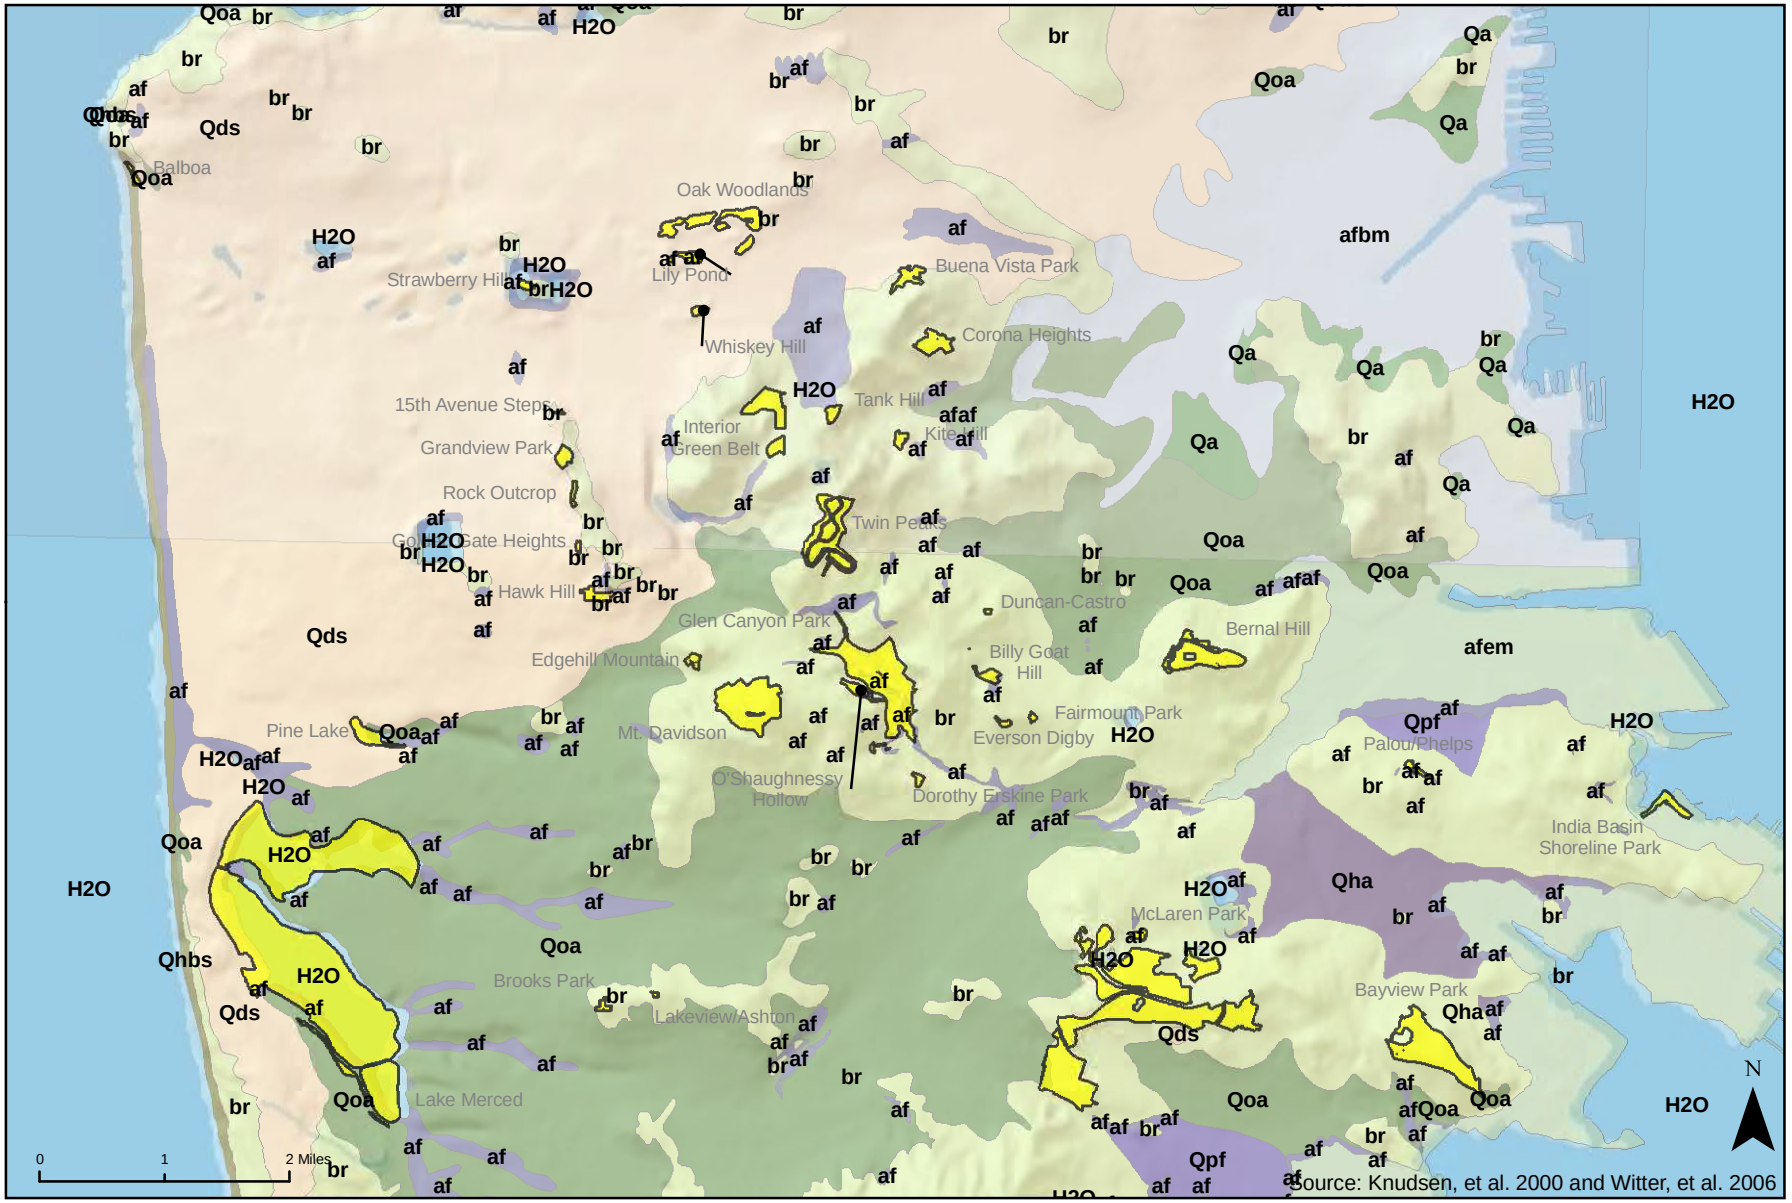
Many of the records reviewed for subsurface sites specifically state that the deposits are intact, at least in lower depths (King 2008:3-12). Most sites are situated along the edges of historic lagoons and estuaries or are slightly inland, along creeks. Based on the work of Mayfield (1978), Shoup and Baker (1981), and SFEI (2010) and the reviewed historic maps, most of these environmental features have been filled or covered or have dried up. Sites along the northern shoreline of the project study area appear to be most commonly atop bluffs.

### 3.3.2 Historic Archaeological Sites

The dominant historic archaeological type in the study area is structural remains, primarily from construction, water development, recreation, and military activities. Other common historic archaeological resources are secondary deposits and refuse deposits. Subsurface historic-era archaeological resources have also been documented in urban areas, particularly in areas of early historic development. Unique to areas along the bay shoreline is the potential for buried ships (see Hamusek-McGann et al. 1998). Obviously these resources would be possible only in bayshore areas that have been filled historically to create new land surface.

Numerous historic activities, including early exploration, ranching, agriculture, water development, recreation, tourism, transportation, and military activities, may have left archaeological markers. Activities such as these involved localized areas of use, as well as construction of temporary camps and various permanent structures. Dispersed historic-era buildings are visible on historic topographic maps (USAMS 1947; USCOE 1939; USGS 1896, 1899, 1915) and General Land Office maps (GLO 1857, 1861, 1863, 1864, 1868, 1882a, 1882b, 1884). Early historic Sanborn maps (Sanborn 1915, 1926) indicate the western half of San Francisco was developed later than the eastern half of the city and other portions of the Peninsula. This is not to rule out the possibility of historic archaeological deposits in this portion of the study area. Over time, the few structures in early western San Francisco may have collapsed or deteriorated due to abandonment, or they may have been demolished but not completely removed, such as the coal bins of CA-SFr-103H. Many historic archaeological deposits simply may not be discovered yet due to modern development and a lack of archaeological investigations being carried out with the intent to identify these resources.

Localities of historic activities discussed in the literature are mostly in the northern and eastern portions of the project study area. This distribution makes sense, given the earlier development of San Francisco-proper in the northeast part of the project study area. On the other hand, ranchers would have been drawn to the western areas, given the availability of freshwater at Lake Merced and the availability of open space on this



part of the Peninsula. Additionally, Lake Merced and the ocean would have drawn locals and tourists alike for recreation. Similarly, military activities would be expected to occur along the coastline for observation and defense.

### 3.3.3 Holocene Landforms of the C-APE and Subsurface Deposit Potential

As outlined in the methods above, landforms that date to the Holocene or later are more likely than earlier landforms to include archaeological resources. Meyer and Rosenthal (2007) used quaternary geology and liquefaction susceptibility studies of nine Bay Area counties completed by the USGS (Knudsen et al. 2000; Witter et al. 2006) to identify areas of increased potential for subsurface deposits associated with buried Holocene landforms. Meyer and Rosenthal (2007) identified at least three periods of landform stability in the San Francisco Bay Area: late Pleistocene (15,000 to 11,000 cal BP), early Holocene (10,500 to 7000 cal BP), and middle Holocene (6500 to 4000 cal BP). These periods are marked by buried soils separated by widespread depositional episodes that occurred around 11,500 and 7,000 years ago. More localized depositional periods are evident during the late Holocene, around 4,000, 2,800, and 650 years ago.

Typically, relatively intact archaeological resources are associated with buried soils that indicate these periods of landform stability (Meyer and Rosenthal 2007:8). Buried sites are also most common in lowland valleys of the Bay Area (Meyer and Rosenthal 2007:14). These areas contain the fans, floodplains, and dunes that formed during the Holocene and are the most likely environment to preserve archaeological remains (Meyer and Rosenthal 2007:19). Further, fans and floodplains are associated with freshwater sources that are likely to have drawn human populations to the area.

The same USGS studies and digital data used by Meyer and Rosenthal were reviewed for the current study. While Witter et al. (2006) is a more refined and detailed study of the Quaternary deposits, it does not cover the entire study area. As a result, Knudsen et al.'s (2000) more generalized data is used for the northern half of San Francisco. Due to the more localized application of this data, it is possible to focus this analysis on the specific locations of the Natural Areas. Of the eleven Quaternary deposits identified within the Natural Areas, nine developed during the Holocene (Figures 3-1 and 3-2). Table 3-3 summarizes the Quaternary deposits within each Natural Area and the ages of those deposits. Note that some deposits are either completely or partially buried beneath fill material.

Qhed: Holocene estuarine delta deposits
Qoa: Early to middle Pleistocene undifferentiated alluvial deposits (includes Colma Formation)

# 4. ARCHAEOLOGICAL SENSITIVITY OF THE NATURAL AREAS

This section outlines the overall archaeological sensitivity of each Natural Area. An intuitive approach was used in the assessment, based primarily on the qualities of archaeologically sensitive areas discussed in Section 1.2.3. In general, an area is considered to be sensitive based on the following factors:

- Presence of Holocene landforms of suitable depositional environments to preserve archaeological resources;
- Limited natural and human disturbances (although it is possible that historic human disturbances would constitute archaeological resources in and of themselves);
- Productive prehistoric and historic natural environment, including elements that would draw fauna, and proximity to freshwater, riparian corridors, and shoreline;
- Extent of previous survey coverage of the area; and
- Relatively high density of archaeological resources within or near the Natural Area.

The discussion below summarizes the factors affecting each Natural Area's archaeological sensitivity. Although the assessments are primarily intuitive, based on the summarized factors, an area is considered to have low archaeological sensitivity if it meets only one or none of the factors outlined above; a moderate level of sensitivity is designated for areas that meet two to three of the factors; areas of high sensitivity are those that meet four to five of the factors. Sensitivity levels for each Natural Area are provided in Table 4-1, which follows the summary discussions. Note that this evaluation is meant only as a preliminary assessment of surface and subsurface sensitivity for planning purposes and use in the associated project EIR (Tetra Tech 2010). Ground-truthing or additional, more detailed site-specific research may prove otherwise.

***15th Avenue Steps:*** The 15th Avenue Steps Natural Area is within the historic-era sand dune complex that once covered the western half of San Francisco. The management areas are underlain primarily by dune sands that are 30,000 years old or less, as well as a pre-Quaternary bedrock landform in its western end. Landslides have been noted to occur in the northeast portion. No significant freshwater sources are documented nearby. No archaeological surveys have occurred at this Natural Area, and no archaeological sites have been documented within the area boundaries or nearby; however, a chert quarry once existed in the southern portion of the Natural Area. Other Natural Areas, including Grandview Park, Rock Outcrop, and Golden Gate Heights, along the same ridgeline as the 15th Avenue Steps also do not have archaeological sites recorded but have also not been previously surveyed. Hawk Hill Natural Area at the opposite southern end of the ridgeline has been completely surveyed, and no archaeological resources were identified.

***Balboa:*** The Balboa Natural Area is within the historic-era sand dune complex that once covered the western half of San Francisco. The management areas are underlain by dune sands that are 30,000 years old or less. The surfaces today are still loose dune sand that was borrowed from beneath the De Young Museum in Golden Gate Park, where there was potential for Midwinter International Exposition-associated archaeological materials. The Natural Area's location, next to the Pacific Ocean, would have been a desirable location for prehistoric or historic fishing, hunting, or gathering of subsistence resources. Three surveys have partially covered the Natural Area, and no archaeological resources have been identified in the Natural Area. Four archaeological sites, including prehistoric and historic-era resources, have been documented nearby.

***Bayview Park:*** The Bayview Park Natural Area overlies pre-Holocene landforms with chert and sandstone outcrops and other areas of exposed bedrock. Extensive human disturbance of the park is apparent, including terracing, soil slumps, stockpiling of sediments, and a former rock quarry. Natural disturbances are also apparent, including erosional areas and landslides. The hilltop Natural Area overlooks and is next to several productive historic environments, including two creeks, tidal marshes, tidal flats, sandy beaches, lagoons, and the shallow bay shore. Only one linear field survey has been conducted within the boundaries of the Natural Area, but no archaeological sites have been recorded within those boundaries. It is possible that the former rock quarry is historic. There is a high density of prehistoric shellmound sites recorded by N. C. Nelson (1910) at lower elevations along the shoreline here, as well as historic Chinese shrimp fishing camps. Historic shipwrecks have been documented offshore.

***Bernal Hill:*** The Bernal Hill Natural Area overlies a pre-Quaternary bedrock landform with chert outcrops and an ancient terrace. Sediments are primarily thin deposits of sand, slope debris, and decomposed bedrock. Human disturbance of the Natural Area is evidenced by a former rock quarry, while natural disturbances include erosion and a soil slip. The hilltop Natural Area overlooks several productive historic environments, including two creeks, tidal marshes, a tidal flat, a channel through the marshes, and the shallow bay shore. The Natural Area has not been surveyed for archaeological resources, but three unrecorded archaeological resources are near the park: one prehistoric shellmound remnant at lower elevations to the south and two historic locations associated with Jose C. Bernal at the northern base of the hill. It is possible that the former rock quarry in the Natural Area is also historic.

***Billy Goat Hill:*** The Billy Goat Hill Natural Area overlies a pre-Quaternary bedrock landform with historic artificial fill cover in areas. Overall, however, sediments in the Natural Area consist of thin slope debris. Outcrops of greenstone and chert occur, as do soil slips and other incidents of extensive erosion. The hilltop Natural Area is between three tributaries of creeks. The Natural Area has not been surveyed for archaeological resources, and no resources have been identified within or near the Natural Area. The nearest Natural Areas to Billy Goat Hill, Duncan-Castro, Everson/Digby, and Fairmount Park, also do not include archaeological resources but have not been included in any field surveys (Everson/Digby has been covered by three regional overviews).

***Brooks Park:*** The Brooks Park Natural Area overlies a pre-Quaternary bedrock landform with thin sandy soils at the top and thicker at the base of slopes. Slope debris is present along the slopes and at their bases. The sandstone bedrock is exposed throughout the park, and several locations have been quarried in the past. An area of thin fill material is in the southwest portion of the park where a soil slip is present. The park overlooks Lake Merced a few miles to the west. The Natural Area has not been surveyed for archaeological resources. No archaeological resources have been recorded in the area, but the quarried areas of the park may be historic.

***Buena Vista Park:*** The Buena Vista Park Natural Area is next to the historic sand dune complex that once covered the western half of San Francisco. The management areas primarily overlie a pre-Quaternary bedrock landform, but a sand dune formation 30,000 years old or less underlies the most northern portion of the Natural Area. In fact, soils are composed predominantly of historic dune sand that is moderately eroded by natural and modern cultural processes. The park is just south of a historic creek tributary and riparian areas. The area has not been surveyed for archaeological resources, but an area of concentrated historic activity, including several adobes, Mission Dolores, and features associated with these historic buildings, are immediately east of the park.

***Corona Heights:*** The Corona Heights Natural Area is underlain by a pre-Quaternary bedrock landform. Sediments consist of thin slope debris over most of the area. Soils slips are apparent in areas of steep slopes where bedrock is exposed. An amphitheater has been constructed in the middle of the Natural Area, a location that had been a quarry. The park is next to the headwaters of three historic creek tributaries and riparian areas. The area has not been surveyed for archaeological resources, but an area of concentrated historic activity, including several adobes, Mission Dolores, and features associated with these historic buildings, are immediately northeast and east of the Natural Area. Additionally, the former quarry area may be historic.

***Dorothy Erskine Park:*** The Dorothy Erskine Natural Area is underlain by a pre-Quaternary bedrock landform. Sediments consist of thin slope debris over most of the area. Soil slips are apparent in some areas, and bedrock outcrops occur along two perimeters of the Natural Area. The park is between the headwaters of two creek tributaries as well as the creek itself. The Natural Area has not been surveyed for archaeological resources, and none have been recorded in the vicinity.

***Duncan-Castro:*** The Duncan-Castro Natural Area is underlain by a pre-Quaternary bedrock landform. Sediments are thin to nonexistent throughout the area. Shallow soil slips are common as are bedrock exposures and escarpments. The park is on a hill between the headwaters of two creek tributaries. The Natural Area has not been surveyed for archaeological resources, and none have been recorded in the vicinity.

***Edgehill Mountain:*** The Edgehill Mountain Natural Area is underlain by a pre-Quaternary bedrock landform. Sediments are thin throughout the area. The hill slope is steep, creating soil slips and rock falls throughout the area, which exposes the bedrock. Several roads have been graded and cut into the slopes. Historical environmental data for the Edgehill Mountain area is unavailable, but it is slightly east of the historic sand dune area. The Natural Area has not been surveyed for archaeological resources, and none have been recorded in the vicinity.

***Everson/Digby:*** The Everson/Digby Natural Area is a steep hill slope underlain by a pre-Quaternary bedrock landform. Sediments are thin throughout the area. The Natural Area is between the headwaters of two historic creek tributaries. No archaeological field surveys have occurred within the Natural Area, and no archaeological resources have been recorded in the vicinity.

***Fairmount Park:*** The Fairmount Park Natural Area is underlain by a pre-Quaternary bedrock landform. Sediments vary in depth across the park and include loamy soils, slope debris, and sandy soils. Slopes have evidence of erosion in some areas and roadcuts have been graded into other areas. The Natural Area is between the headwaters of two historic creek tributaries. No archaeological field surveys have occurred within the Natural Area, and no archaeological resources have been recorded in the vicinity.

***Glen Canyon Park:*** The Glen Canyon Park Natural Area is underlain by a pre-Quaternary bedrock landform with areas of historic-era artificial fill. Large areas of bedrock outcrops occur at the rim of the canyon and elsewhere in the vicinity. Soils are thin, with the exception of lower elevations where eroded and fill materials can be deep. The steep canyon is bisected by historic Islais Creek, which originates here. Seeps within the hillsides contribute to erosion and sedimentation, and the sedimentation contributes to episodic flooding and alluvial deposition. The Natural Area has not been previously surveyed for archaeological resources and none have been recorded in the vicinity.

***Golden Gate Heights Park:*** The Golden Gate Heights Natural Area is within the historic-era sand dune complex that once covered the western half of San Francisco. The management areas are underlain primarily by dune sands that are 30,000 years old or less, which overlie a pre-Quaternary bedrock landform. Bedrock outcrops occur in several areas and soils are primarily sandy and prone to erosion No significant freshwater sources are documented nearby. No archaeological surveys have occurred in this Natural Area, and no archaeological sites have been documented in the vicinity. Hawk Hill Natural Area immediately south of Golden Gate Heights Park on the same ridgeline has been completely surveyed, and no archaeological resources were identified.

### *Golden Gate Park Oak Woodlands:*

***Lily Pond Area:*** The Lily Pond area is within the historic-era sand dune complex that once covered the western half of San Francisco. The management areas are underlain by a Holocene dune sand landform and historic-era artificial fill. The dune sand is easily eroded. Although stabilized dune formations are found throughout Golden Gate Park, much of the area's topography was likely altered historically by park landscaping and continuing management. Lily Pond is a relatively flat dune. Lily Pond itself is a quarried lake, date unknown. No prehistoric freshwater sources are documented nearby. The area has not been surveyed for archaeological resources, but one historic-era archaeological resource associated with the 1894 Midwinter International Exposition has been recorded nearby. Additional archaeological resources associated with this historic event are considered to be possible throughout Golden Gate Park.

***Oak Woodlands Area:*** The Oak Woodlands area is within the historic-era sand dune complex that once covered the western half of San Francisco. The management areas are underlain by a Holocene dune sand landform and historic-era artificial fill. The dune sand is easily eroded. Although stabilized dune formations are found throughout Golden Gate Park, much of the area's topography was likely altered historically by park landscaping, including planting of the oaks for which this Natural Area is named, and continuing management. No prehistoric freshwater sources are documented nearby. The area has not been surveyed for archaeological resources, but one historic-era archaeological resource associated with the 1894 Midwinter International Exposition has been recorded nearby. Additional archaeological resources associated with this historic event are considered to be possible throughout Golden Gate Park.

***Strawberry Hill Area:*** The Strawberry Hill area is within the historic-era sand dune complex that once covered the western half of San Francisco. The management area is underlain by a pre-Quaternary bedrock landform overlain by dune sand. The area consists of a hill surrounded by Stow Lake. The dune sand ranges from thin at the hilltop to thick at its base, but it is easily eroded. Bedrock outcrops are also present. Although stabilized dune formations are found throughout Golden Gate Park, much of the area's topography was likely altered historically by park landscaping and continuing management. No prehistoric freshwater sources are documented as nearby. The area has not been surveyed for archaeological resources, but one historic-era archaeological resource associated with the 1894 Midwinter International Exposition has been recorded nearby. Additional archaeological resources associated with this historic event are considered to be possible throughout Golden Gate Park.

***Whiskey Hill Area:*** The Whiskey Hill area is within the historic-era sand dune complex that once covered the western half of San Francisco. The management areas are underlain by a Holocene dune

sand landform with compacted to loose silty sand soils. The loose sand is easily eroded. Borings suggest that the sand is at least 46 meters deep. Stabilized dune formations are found throughout Golden Gate Park, and Whiskey Hill is a prime example. However, much of the area's topography was likely altered historically by park landscaping and continuing management. No prehistoric freshwater sources are documented nearby. The area has not been surveyed for archaeological resources; however, one historic-era archaeological resource associated with the 1894 Midwinter International Exposition has been recorded nearby. Additional archaeological resources associated with this historic event are considered to be possible throughout Golden Gate Park.

***Grandview Park:*** The Grandview Park Natural Area is within the historic-era sand dune complex that once covered the western half of San Francisco. The management areas are underlain by a pre-Quaternary bedrock landform overlain by sandy soils that erode easily. Bedrock exposures occur in several areas. No significant freshwater sources are documented nearby. No archaeological surveys have occurred at this Natural Area, and no archaeological sites have been documented in the vicinity. Hawk Hill Natural Area at the opposite southern end of the same ridgeline has been completely surveyed, and no archaeological resources were identified.

***Hawk Hill:*** The Hawk Hill Natural Area is within the historic-era sand dune complex that once covered the western half of San Francisco. The management areas are underlain by a pre-Quaternary bedrock landform overlain by Holocene dune sand and historic-era artificial fill in certain areas. The dune sand is easily eroded, and retaining walls have been constructed to limit the natural process. No significant freshwater sources are documented nearby. The entirety of the Natural Area was surveyed for archaeological resources in 1987, but no archaeological sites were documented.

***India Basin Shoreline Park:*** The India Basin Shoreline Park Natural Area is underlain by Holocene San Francisco Bay mud and historic-era artificial fill over estuarine mud. A salt marsh has been constructed in the park. Mudflats in the area are exposed at low tide, and tidal action affects the eastern boundaries of the Natural Area. Before being filled, the park was an area of tidal flat and shallow bay. Two archaeological surveys have partially covered the Natural Area. Surveys noted that unrecorded historic-era archaeological resources were in the area, but no recorded archaeological sites are in the Natural Area. Several prehistoric and historic archaeological sites have been documented in the vicinity with the same setting: a historic refuse scatter along the sandy shoreline immediately south of the Natural Area, four prehistoric shellmound sites along the bayshore, and several shipwrecks offshore. The shoreline of Hunters Point has been identified as an area with potential for subsurface maritime resources, including shipwrecks.

***Interior Greenbelt:*** The Interior Greenbelt Natural Area is underlain by a pre-Quaternary bedrock landform covered by sandy soils in most areas. Loamy soils near the middle of the Natural Area vary in depths. Bedrock outcrops and small scarps are present in portions of the area. A prominent valley bisects a portion of the area, formed by a tectonic shear zone that causes shallow soil slips along the valley walls. A seasonal creek has also formed within this valley. No archaeological surveys have occurred at this Natural Area, and no archaeological sites have been documented in the vicinity.

***Kite Hill:*** The Kite Hill Natural Area is underlain by a pre-Quaternary bedrock landform covered by thin soils in most areas. Shallow slips and landslide scarps occur on most hillsides of the Natural Area, with debris deposits at the base of terraces and slopes. Bedrock outcrops occur in portions of the Natural Area. The

Natural Area overlooks the headwaters of two tributaries of a historic creek. No archaeological surveys have occurred at this Natural Area and no archaeological sites have been documented in the vicinity.

***Lake Merced:*** The Lake Merced Natural Area, historically an open bay, is underlain by a pre-Holocene alluvium landform, Holocene dune sand, Holocene alluvium, and areas of historic-era artificial fill. Sandy soils are comparatively deep in portions of the Natural Area. The area has historically experienced periods of sedimentation that would close the bay, only to be reopened by floods. The lake was fed historically by several creeks and is the largest wetland and freshwater lake in San Francisco. The area has experienced cultural disturbances associated with modifications of the shorelines, rechanneling, and lake filling. The Natural Area has been partially surveyed by five archaeological surveys, primarily focused in the northwest quarter. The area is dominated by historic-era archaeological resources along the lakeshore, in the sand dune beach to the west, and in the developed urban area to the east. Two shipwrecks, one offshore and one on the beach directly west of the Natural Area, have been documented.

***Lakeview/Ashton Mini Park:*** The Lakeview/Ashton Mini Park Natural Area overlies a pre-Quaternary landform with thin sandy soils around the edges. Slope debris with weathered bedrock thinly covers the slopes of the park's peak. At the top of the peak are bedrock outcrops. The park overlooks Lake Merced a few miles to the west. The Natural Area has not been surveyed for archaeological resources, and none have been recorded in the area.

***McLaren Park:*** The McLaren Park Natural Area is underlain by pre-Quaternary bedrock and pre-Holocene alluvium landforms. The hilly park includes loamy and rocky soils, as well as sandy and silty sediments that vary in depth. Bedrock exposures have been noted throughout the park. Soil creep has also been noted along the ridgetop and slopes and in the fire-prone eastern portions. A bedrock quarry of unknown age is within the northwest quarter, and documented historic quarries are in other, terraced areas. A golf course has been constructed in the southern half of the Natural Area, which is at the head of several creeks, including Yosemite and Sunnydale Creeks. Four springs and a marsh associated with Yosemite Creek are still present within the area, as well as several ponds. Seeps are throughout the park. The Natural Area overlooks extensive tidal flats and marshes along the bayshore, as well as sandy beaches and lagoons. The Natural Area has not been surveyed for archaeological resources, and none have been recorded in the area.

***Mount Davidson:*** The Mount Davidson Natural Area is underlain by a pre-Quaternary bedrock landform. The park is the highest point in San Francisco, and bedrock outcrops occur throughout. Soils consist of sandy and gravelly loams of unknown depths. The headwaters of one creek tributary is south of the Natural Area, which has not been surveyed for archaeological resources, and none have been recorded in the area.

***O'Shaughnessy Hollow:*** The O'Shaughnessy Hollow Natural Area is underlain by a pre-Quaternary bedrock landform with areas of historic-era artificial fill. Large areas of bedrock outcrops occur, and soils are thin, with the exception of lower elevations, where eroded and fill materials can be deep. The hydrologic features of adjacent Glen Canyon Park Natural Area would have been easily accessible from O'Shaughnessy Hollow. The Natural Area has not been previously surveyed for archaeological resources, and none have been recorded in the vicinity.

***Palou-Phelps:*** The Palou-Phelps Natural Area overlies a pre-Quaternary bedrock landform, with areas of historic-era artificial fill. Soils here are typically thin and rocky, and erosion is common. The hilltop Natural Area overlooks several productive historic environments, including four creek tributaries, tidal marshes, tidal

flats, a channel through the marshes, and the shallow bayshore. The Natural Area has been partially surveyed by three linear archaeological surveys, all of which focused on the rail line that runs through the hill on which the Natural Area is situated. Two prehistoric and one historic archaeological site have been documented in the vicinity, at elevations lower than the Natural Area.

***Pine Lake:*** The Pine Lake Natural Area is underlain by a pre-Holocene alluvium landform, Holocene dune sand, and areas of historic-era artificial fill. The sandy soils of the area are easily eroded. The Natural Area includes an elongated valley with wooded walls and an escarpment. Natural Pine Lake is on the valley floor, historically fed by a stream to the east. Lake Merced and its habitats are also to the south. Cultural disturbances include a modern dog play area next to the Natural Area. One archaeological survey has occurred within the Natural Area, as well as a landscape survey of the entire park, focused on historic features, that resulted in the Stern Grove and Pine Lake Park Historic District. One historic-era and one prehistoric archaeological site have been documented in the vicinity of the Natural Area.

***Rock Outcrop:*** The Rock Outcrop Natural Area is within the historic-era sand dune complex that once covered the western half of San Francisco. The management areas are underlain by a pre-Quaternary bedrock landform. The park is composed primarily of outcrops of this bedrock, which has contributed to the minimal amount of erosion in the Natural Area. No significant freshwater sources are documented nearby. No archaeological surveys have occurred at this Natural Area, and no archaeological sites have been documented in the vicinity. Hawk Hill Natural Area at the southern end of the same ridgeline has been completely surveyed, and no archaeological resources were identified.

***Sharp Park:*** The Sharp Park Natural Area includes a pre-Quaternary bedrock landform, along with Holocene dune sand, beach sand, alluvium, mud flats, and estuarine delta deposits. Deposits of historic-era artificial fill and fill over estuarine mud are also present. Gravelly, sandy loam soils approximately 30 centimeters deep are in the extensive canyon of the eastern portion of the Natural Area. Soils in the canyon become thinner in the farthest reaches of the canyon. Erosion is active and extensive in this area and includes landslides and soil creep. In the western portion of the Natural Area is a public historic golf course; creeks, a lagoon, and wetlands border a levee and beach. Creek banks have been reinforced, and soils in these lower elevations of the park are loamy sands but exhibit a greater degree of disturbance. Where not reinforced, the creeks easily erode the creek banks. Seeps occur throughout the park. Historically the lagoon would periodically connect to the ocean when water levels were high enough to top the adjacent sand dunes. The lagoon today has been highly modified by construction of the golf course. Seven surveys have partially covered the Natural Area, primarily along the western, northern, and southern boundaries of the eastern portion of the Natural Area. At least three prehistoric archaeological resources and three historic-era resources have been documented in the area: shell middens, collected surface artifacts, a State Relief Camp, the Sharp Park Temporary Detention Center, and the Sharp Park Rifle Range. Features of the three historic resources (the camp, detention center, and rifle range) are still present in the Natural Area.

***Tank Hill:*** The Tank Hill Natural Area is underlain by a pre-Quaternary bedrock landform with areas of historic-era artificial fill. The area is covered by thin soils and slope debris. Landslide scarps occur on the steep hillsides of the park, with debris deposits from common shallow soil slips and slope raveling at the base of the hill. Bedrock outcrops and weathered exposures occur in portions of the Natural Area. The Natural Area is overlooks the headwaters of two tributaries of a historic creek. No archaeological surveys have occurred at this Natural Area, and no archaeological sites have been recorded in the vicinity; however, a

concrete foundation pad described in the SNRAMP is associated with the historic Spring Valley Water Company.

***Twin Peaks:*** The Twin Peaks Natural Area overlies pre-Quaternary bedrock and pre-Holocene alluvium landforms. The park is the second highest point in San Francisco. Thin sandy loam soils cover the peaks. Roadcuts have been created throughout the Natural Area and the excavated materials placed on the downslope sides of the roads. Erosion is limited to areas of high use. No archaeological surveys have been conducted within the Natural Area. One area of historic activity, the Rancho San Miguel House, has been documented as being just east of the base of the eastern hillside.

**Table 4-1**
**Archaeological Sensitivity of Natural Areas**

| Natural Area | Considerations | Archaeological Sensitivity |
|---|---|---|
| 15th Avenue Steps | • Low comparative site density in surrounding area.<br>• Possible historic rock quarry; possibility for prehistoric use as well.<br>• No survey coverage.<br>• Limited natural resources.<br>• Holocene landform.<br>• Moderate natural and human disturbances. | Moderate |
| Balboa | • High comparative site density in surrounding area.<br>• Redeposition of Golden Gate Park fill may include subsurface archaeological resources associated with the Midwinter International Exposition.<br>• Evidence of high rate of historic activity.<br>• Partial survey coverage.<br>• Active Holocene landform.<br>• Extensive natural and human disturbances. | High |
| Bayview Park | • High comparative site density in surrounding area.<br>• Possible historic rock quarry; possibility for prehistoric quarrying of outcrops as well.<br>• Evidence of high rate of historic activity.<br>• Minimal survey coverage.<br>• Minimal soil/sediment depth over pre-Holocene landform.<br>• Extensive natural and human disturbances.<br>• Productive surrounding natural environment, including freshwater source and associated productive riparian habitats. | Moderate |
| Bernal Hill | • Low comparative site density in surrounding area.<br>• Possible historic rock quarry; possibility for prehistoric quarrying of outcrops as well.<br>• Evidence of high rate of historic activity.<br>• No survey coverage.<br>• Minimal soil/sediment depth over pre-Holocene landform.<br>• Moderate natural and human disturbances.<br>• Productive surrounding natural environment, including freshwater source and associated riparian habitats. | Moderate |

**Table 4-1**
**Archaeological Sensitivity of Natural Areas**

| Natural Area | Considerations | Archaeological Sensitivity |
|---|---|---|
| Billy Goat Hill | • Low comparative site density in surrounding area.<br>• Possibility for prehistoric quarrying of outcrops.<br>• No survey coverage.<br>• Minimal soil/sediment depth over pre-Holocene landform.<br>• Minimal natural and human disturbances.<br>• Between three historic freshwater sources and associated productive riparian habitats. | Low |
| Brooks Park | • Low comparative site density in surrounding area.<br>• Possible historic rock quarry; possibility for prehistoric quarrying of outcrops as well.<br>• No survey coverage.<br>• Minimal soil/sediment depth over pre-Holocene landform.<br>• Minimal natural and human disturbances.<br>• Near freshwater source and associated productive riparian habitats. | Low |
| Buena Vista Park | • Comparatively moderate site density in surrounding area.<br>• No survey coverage.<br>• Minimal soil/sediment depth over Holocene landform.<br>• Moderate natural and human disturbances.<br>• Next to freshwater source, associated productive riparian habitats, and other productive environments. | Moderate |
| Corona Heights | • Comparatively moderate site density in surrounding area.<br>• Possible historic rock quarry; possibility for prehistoric quarrying of outcrops as well.<br>• No survey coverage.<br>• Minimal soil/sediment depth over pre-Holocene landform.<br>• Moderate natural and human disturbances.<br>• Next to freshwater sources, associated productive riparian habitats, and other productive environments. | Moderate |
| Dorothy Erskine Park | • Low comparative site density in surrounding area.<br>• Possibility for prehistoric quarrying of outcrops.<br>• No survey coverage.<br>• Minimal soil/sediment depth over pre-Holocene landform.<br>• Minimal natural and human disturbances.<br>• Near freshwater sources and associated productive riparian habitats. | Low |
| Duncan-Castro | • Low comparative site density in surrounding area.<br>• Possibility for prehistoric quarrying of outcrops and exposures.<br>• No survey coverage.<br>• Minimal soil/sediment depth over pre-Holocene landform. | Low |

**Table 4-1**
**Archaeological Sensitivity of Natural Areas**

| Natural Area | Considerations | Archaeological Sensitivity |
|---|---|---|
| | • Minimal natural and human disturbances.<br>• Near freshwater sources and associated productive riparian habitats. | |
| Edgehill Mountain | • Low comparative site density in surrounding area.<br>• Possibility for prehistoric quarrying of outcrops and exposures.<br>• No survey coverage.<br>• Minimal soil/sediment depth over pre-Holocene landform.<br>• Moderate natural and human disturbances. | Low |
| Everson/Digby | • Low comparative site density in surrounding area.<br>• No survey coverage.<br>• Minimal soil/sediment depth over pre-Holocene landform.<br>• Minimal natural and human disturbances.<br>• Near freshwater sources and associated productive riparian habitats. | Moderate |
| Fairmount Park | • Low comparative site density in surrounding area.<br>• No survey coverage.<br>• Varied soil/sediment depth over pre-Holocene landform.<br>• Moderate natural and human disturbances.<br>• Near freshwater sources and associated productive riparian habitats. | Low |
| Glen Canyon Park | • Low comparative site density in surrounding area.<br>• Possibility for prehistoric quarrying of outcrops.<br>• No survey coverage.<br>• Thin to deep sediments and soils over pre-Holocene landform; alluvial deposition.<br>• Minimal natural and human disturbances.<br>• Includes and is next to freshwater sources and associated productive riparian habitats. | High |

| Oak Woodlands Area | • Low comparative site density in surrounding area. | Low |

**Table 4-1**
**Archaeological Sensitivity of Natural Areas**

| Natural Area | Considerations | Archaeological Sensitivity |
|---|---|---|
| | • Midwinter International Exposition-related deposits are possible.<br>• No survey coverage.<br>• Minimal soil/sediment depth over Holocene landform.<br>• High degree of natural and human disturbances.<br>• Limited natural resource availability. | |
| Strawberry Hill Area | • Low comparative site density in surrounding area.<br>• Midwinter International Exposition-related deposits are possible.<br>• No survey coverage.<br>• Minimal soil/sediment depth over pre-Holocene landform.<br>• High degree of natural and human disturbances.<br>• Limited natural resource availability. | Low |
| Whiskey Hill Area | • Low comparative site density in surrounding area.<br>• Midwinter International Exposition-related deposits are possible.<br>• No survey coverage.<br>• Extremely deep soil/sediment depth over Holocene landform.<br>• High degree of natural and human disturbances.<br>• Limited natural resource availability. | Moderate |
| Grandview Park | • Low comparative site density in surrounding area.<br>• Possibility for prehistoric quarrying of exposures.<br>• No survey coverage.<br>• Limited natural resources.<br>• Pre-Holocene landform.<br>• Moderate natural and human disturbances. | Low |
| Hawk Hill | • Low comparative site density in surrounding area.<br>• Complete survey coverage.<br>• Limited natural resources.<br>• Holocene landform and historic artificial fill.<br>• Moderate natural and human disturbances. | Low |
| India Basin Shoreline Park | • Low comparative site density in surrounding area.<br>• Partial survey coverage.<br>• Historic fill material over Holocene bay and estuarine mud.<br>• Minimal natural and human disturbances of historic fill. | Moderate |
| Interior Greenbelt | • Low comparative site density in surrounding area.<br>• Possibility for prehistoric quarrying of exposures.<br>• No survey coverage.<br>• Pre-Holocene landform with soils varying in depth.<br>• Minimal natural and human disturbances of historic fill.<br>• Includes seasonal freshwater source and associated productive riparian habitats. | High |

**Table 4-1**
**Archaeological Sensitivity of Natural Areas**

| Natural Area | Considerations | Archaeological Sensitivity |
|---|---|---|
| Kite Hill | • Low comparative site density in surrounding area.<br>• Possibility for prehistoric quarrying of outcrops.<br>• No survey coverage.<br>• Thin soils over pre-Holocene landform.<br>• Minimal natural and human disturbances.<br>• Near freshwater sources and associated productive riparian habitats. | Low |
| Lake Merced | • High comparative site density in Natural Area and surrounding area.<br>• Partial survey coverage.<br>• Holocene landforms with historic-era fill materials.<br>• Moderate natural and human disturbances.<br>• Includes major freshwater source and associated productive riparian/wetland habitats. | High |
| Lakeview/Ashton Mini Park | • Low comparative site density in surrounding area.<br>• Possibility for prehistoric quarrying of outcrops.<br>• No survey coverage.<br>• Minimal soil/sediment depth over pre-Holocene landform.<br>• Minimal natural and human disturbances.<br>• Near freshwater source and associated productive riparian habitats. | Low |
| McLaren Park | • Low comparative site density in surrounding area.<br>• Historic quarries are within the Natural Area; possibility for prehistoric quarrying of outcrops.<br>• No survey coverage.<br>• Varied soil/sediment depth over pre-Holocene landforms.<br>• Moderate overall degree of natural and human disturbances.<br>• Comparatively numerous freshwater sources and associated riparian habitats within park. Productive resource areas available. | High |
| Mount Davidson | • Low comparative site density in surrounding area.<br>• Possibility for prehistoric quarrying of outcrops.<br>• Highest peak in area likely to draw human activity.<br>• No survey coverage.<br>• Unknown soil/sediment depth over pre-Holocene landform.<br>• Minimal degree of natural and human disturbances.<br>• Near freshwater source and associated productive riparian habitats. | Moderate |

**Table 4-1**
**Archaeological Sensitivity of Natural Areas**

| Natural Area | Considerations | Archaeological Sensitivity |
|---|---|---|
| O'Shaughnessy Hollow | • Low comparative site density in surrounding area.<br>• Possibility for prehistoric quarrying of outcrops.<br>• No survey coverage.<br>• Thin to deep sediments and soils over pre-Holocene landform.<br>• Minimal natural and human disturbances.<br>• Next to freshwater sources and associated productive riparian habitats. | High |
| Palou-Phelps | • Moderate to high comparative site density in surrounding area.<br>• Minimal survey coverage.<br>• Minimal soil/sediment depth over pre-Holocene landform and historic fill materials.<br>• Moderate natural and human disturbances.<br>• Productive surrounding natural environment, including freshwater source and associated riparian habitats. | High |
| Pine Lake | • Moderate comparative site density in surrounding area.<br>• Partial survey coverage.<br>• Holocene landforms with historic-era fill materials.<br>• Minimal natural and human disturbances.<br>• Includes freshwater source and associated productive riparian/wetland habitats. Next to major natural resources. | High |
| Rock Outcrop | • Low comparative site density in surrounding area.<br>• Possibility for prehistoric quarrying of exposures.<br>• No survey coverage.<br>• Limited natural resources.<br>• Pre-Holocene landform with almost no soils.<br>• Minimal natural and human disturbances. | Low |
| Sharp Park | • High comparative site density in and around Natural Area.<br>• Partial survey coverage.<br>• High degree of available natural resources.<br>• Holocene landforms with soils no deeper than 30 centimeters.<br>• High degree of human disturbances; moderate natural disturbances. | High |
| Tank Hill | • Low comparative site density in surrounding area.<br>• Unrecorded Spring Valley Water Company water tank foundation pad is within the Natural Area.<br>• No survey coverage.<br>• Thin soils over pre-Holocene landform and historic-era fill materials.<br>• Moderate natural and human disturbances.<br>• Near freshwater sources and associated productive riparian habitats. | Moderate |
| Twin Peaks | • Low comparative site density in surrounding area. | Low |

**Table 4-1**
**Archaeological Sensitivity of Natural Areas**

| Natural Area | Considerations | Archaeological Sensitivity |
|---|---|---|
| | • No survey coverage.<br>• Thin soils over pre-Holocene landforms.<br>• Extensive natural and human disturbances.<br>• Limited natural resource availability. | |

# 5. RECOMMENDATIONS

As presented in Table 5-1 below, the research outlined in the preceding sections suggest that nine Natural Areas have a high level of sensitivity for archaeological sites, nine have a moderate level as well as the Whiskey Hill portion of the Golden Gate Park Oak Woodlands Natural Area, and 14 have a low level (including the Lily Pond, Oak Woodlands, and Strawberry Hill portions of Golden Gate Park Oak Woodlands Natural Area).

**Table 5-1**
**Distribution of the Natural Areas Across Archaeological Sensitivity Levels**

| Archaeological Sensitivity | Natural Areas | |
|---|---|---|
| Low | 1. Billy Goat Hill<br>2. Brooks Park<br>3. Dorothy Erskine Park<br>4. Duncan-Castro<br>5. Edgehill Mountain<br>6. Fairmount Park<br>7. Golden Gate Heights Park<br>8. Golden Gate Park Oak Woodlands (Lily Pond, Oak Woodlands, and Strawberry Hill areas only) | 9. Grandview Park<br>10. Hawk Hill<br>11. Kite Hill<br>12. Lakeview/Ashton Mini Park<br>13. Rock Outcrop<br>14. Twin Peak |
| Moderate | 1. 15th Avenue Steps<br>2. Bayview Park<br>3. Bernal Hill<br>4. Buena Vista Park<br>5. Corona Heights | 6. Everson/Digby<br>7. Golden Gate Park Oak Woodlands (Whiskey Hill area only)<br>8. India Basin Shoreline Park<br>9. Mount Davidson<br>10. Tank Hill |
| High | 1. Balboa Park<br>2. Glen Canyon Park<br>3. Interior Greenbelt<br>4. Lake Merced | 5. McLaren Park<br>6. O'Shaughnessy Hollow<br>7. Palou-Phelps<br>8. Pine Lake<br>9. Sharp Park |

Several of the general and site-specific management activities proposed in the SNRAMP (SFRPD 2006) could adversely affect archaeological resources. These management activities primarily include ground-disturbing activities, such as vegetation removal, livestock grazing, and activities associated with trail development and maintenance and erosion control.

Ms. Ramona Garibay
Representative
The Trina Marine Ruano Family
16010 Halmar Lane
Lathrop CA 95330

**Subject: San Francisco Significant Natural Resource Areas Management Plan, San Francisco County, California**

Dear Ms. Garibay:

The purpose of this letter is to inform The Trina Marine Ruano Family about a natural resource management plan developed to preserve, restore, and enhance 31 remnant Natural Areas within the City and County of San Francisco and managed by the San Francisco Recreation and Park Department (SFRPD), and to promote environmental stewardship of these areas. Natural Areas are remnants of San Francisco's historic landscape and contain the City's natural heritage. These areas support an array of native habitats and species, some found nowhere else in the world, such as the San Francisco garter snake and mission blue butterfly. The opportunity exists in these areas to protect and restore sensitive species and natural habitats for future generations. Pursuant to Government Code §65352.3(a)(2), the SFRPD is inviting your participation in government-to-government consultation as part of the CEQA process to identify possible cultural resources impacts associated with implementation of the management plan. Your participation in this process is important.

As envisioned, the *Significant Natural Resource Areas Management Plan* (SNRAMP) will provide the framework for long-term management of the identified Natural Areas. The 31 Natural Areas are scattered mostly throughout the central and southern portions of San Francisco and constitute approximately 4 percent of the total city area; one Natural Area is located in Pacifica. A map of the Natural Areas has been provided with this letter. They range in size from less than one acre to almost 400 acres and include such popular locations as Twin Peaks and portions of Glen Canyon Park. Many of these areas support sensitive plant and animal species and habitats. Others include striking geologic formations. Most are used as recreational open spaces by residents and visitors. While mostly owned by the SFRPD, some remnant natural areas are managed by other public and private entities. Some of these properties may eventually be transferred to SFRPD. The objectives of the SNRAMP are:

- to inventory the biological resources in Natural Areas to provide background information for planning, restoration, and management activities;
- to develop a Geographic Information System (GIS) database containing baseline information for each of the Natural Areas;
- to identify issues and impacts adversely affecting habitats, enhance biological diversity, and maintain populations of sensitive species;
- to identify and prioritize restoration, management, and monitoring actions;
- to provide guidelines and amenities for passive recreational uses compatible with natural resources; and

Golden Gate Park Conservatory (CA-SFR-37H [P-38-0037]) is adjacent to the Golden Gate Park Natural Areas. Historic canal features associated with the Spring Valley Water Company's water system (CA-SFR-102H [P-38-0093]) are within the Lake Merced Natural Area. The Pine Lake Natural Area is a part of the historic district of Stern Grove and Pine Lake Park (P-38-4472). An archaeological site containing "shell midden with some bone, chert chipage, and fire fractured rock" as well as some noted historic-era glass bottles and recorded in 1969 by S. Humphreys is adjacent to the Sharp Park Natural Area. At the time of its recording, it was remarked that the site was almost entirely destroyed by erosion and construction. Additionally, though not indicated in the records search, Golden Gate Park, including Oak Woodland, Lily Pond, Whiskey Hill, and Strawberry Hill Natural Areas, has been listed on the NRHP since 2004 as a historic district and would therefore be included on the CRHR as well. This would bring the total number of natural areas with documented cultural resources to ten. It should be noted that Geographic Information System (GIS) data received from SFRPD indicates there are additional cultural resources within and adjacent to the Natural Areas that have not been previously documented or evaluated. For instance, the Mount Davidson Cross in the Mount Davidson Natural Area was not indicated in the NWIC records search as a documented resource, but it is indicated as a historic-aged architectural resource in the SFRPD GIS.

No cultural resources survey has been conducted for this project. However, several cultural resources overviews and pedestrian surveys have been conducted within most of the 31 Natural Areas. All of the Natural Areas were covered by a study of pre-Spanish ecology of the Bay Area (S-9583). The Balboa Natural Area has been partially addressed in two overviews (S-5382 and S-18364) and one linear field surveys (S-18341). The Bayview Park Natural Area has been completely covered by a regional overview (S-25045) and partially covered by a linear field survey (S-28766). The Hawk Hill Natural Area has been fully covered by an archaeological field survey (S-9585). The India Basin Shoreline Park Natural Area has been addressed by one cultural resource overview (S-15602), one archaeological field survey (S-16555), and one linear archaeological field survey (S-16882). The Lake Merced Natural Area has been partially addressed in one regional cultural resource overview (S-3247), three field surveys (S-3240, S-3242, and S-19127), and one subsurface testing project (S-10168). The Palou-Phelps Natural Area has been partially covered by three linear archaeological field surveys (S-11396, S-22657, and S-29657). The Pine Lake Natural Area has been entirely covered by a cultural landscape report with register evaluations that included both archaeological and architectural field surveys (S-32280) and partially covered by a separate archaeological field survey (S-32271). The Sharp Park Natural Area has had nine overviews and surveys within and adjacent to it. The Natural Area itself has been partially covered by three archaeological field surveys (S-3039, S-6717, and S-15828), two linear archaeological field surveys (S-4877 and S-31602), and one archaeological field survey with a historic study and register evaluation (S-34499). The Bernal Hill, Billy Goat Hill, Brooks Park, Buena Vista Park, Corona Heights, Dorothy Erskine Park, Duncan-Castro, Edgehill Mountain, Fairmont Park, 15th Avenue Steps, Glen Canyon Park, Golden Gate Heights, Grandview Park, Kit Hill, Interior Green Belt, Lakeview/Ashton, Lily Pond, McLaren Park, Mount Davidson, O'Shaughnessy Hollow, Oak Woodlands, Rock Outcrop, Strawberry Hill, Tank Hill, Twin Peaks, and Whiskey Hill Natural Areas have not been covered by any field survey or a cultural resource overview specific to those areas.

Mr. Andrew Galvan
The Ohlone Indian Tribe
P.O. Box 3152
Mission San Jose, CA 94539

**Subject: San Francisco Significant Natural Resource Areas Management Plan, San Francisco County, California**

Dear Mr. Galvan:

The purpose of this letter is to inform the Ohlone Indian Tribe about a natural resource management plan developed to preserve, restore, and enhance 31 remnant Natural Areas within the City and County of San Francisco and managed by the San Francisco Recreation and Park Department (SFRPD), and to promote environmental stewardship of these areas. Natural Areas are remnants of San Francisco's historic landscape and contain the City's natural heritage. These areas support an array of native habitats and species, some found nowhere else in the world, such as the San Francisco garter snake and mission blue butterfly. The opportunity exists in these areas to protect and restore sensitive species and natural habitats for future generations. Pursuant to Government Code §65352.3(a)(2), the SFRPD is inviting your participation in government-to-government consultation as part of the CEQA process to identify possible cultural resources impacts associated with implementation of the management plan. Your participation in this process is important.

As envisioned, the *Significant Natural Resource Areas Management Plan* (SNRAMP) will provide the framework for long-term management of the identified Natural Areas. The 31 Natural Areas are scattered mostly throughout the central and southern portions of San Francisco and constitute approximately 4 percent of the total city area; one Natural Area is located in Pacifica. A map of the Natural Areas has been provided with this letter. They range in size from less than one acre to almost 400 acres and include such popular locations as Twin Peaks and portions of Glen Canyon Park. Many of these areas support sensitive plant and animal species and habitats. Others include striking geologic formations. Most are used as recreational open spaces by residents and visitors. While mostly owned by the SFRPD, some remnant natural areas are managed by other public and private entities. Some of these properties may eventually be transferred to SFRPD. The objectives of the SNRAMP are:

- to inventory the biological resources in Natural Areas to provide background information for planning, restoration, and management activities;
- to develop a Geographic Information System (GIS) database containing baseline information for each of the Natural Areas;
- to identify issues and impacts adversely affecting habitats, enhance biological diversity, and maintain populations of sensitive species;
- to identify and prioritize restoration, management, and monitoring actions;
- to provide guidelines and amenities for passive recreational uses compatible with natural resources; and
- to provide guidelines for educational, research, and stewardship programs.

0093]) are within the Lake Merced Natural Area. The Pine Lake Natural Area is a part of the historic district of Stern Grove and Pine Lake Park (P-38-4472). An archaeological site containing "shell midden with some bone, chert chipage, and fire fractured rock" as well as some noted historic-era glass bottles and recorded in 1969 by S. Humphreys is adjacent to the Sharp Park Natural Area. At the time of its recording, it was remarked that the site was almost entirely destroyed by erosion and construction. Additionally, though not indicated in the records search, Golden Gate Park, including Oak Woodland, Lily Pond, Whiskey Hill, and Strawberry Hill Natural Areas, has been listed on the NRHP since 2004 as a historic district and would therefore be included on the CRHR as well. This would bring the total number of natural areas with documented cultural resources to ten. It should be noted that Geographic Information System (GIS) data received from SFRPD indicates there are additional cultural resources within and adjacent to the Natural Areas that have not been previously documented or evaluated. For instance, the Mount Davidson Cross in the Mount Davidson Natural Area was not indicated in the NWIC records search as a documented resource, but it is indicated as a historic-aged architectural resource in the SFRPD GIS.

No cultural resources survey has been conducted for this project. However, several cultural resources overviews and pedestrian surveys have been conducted within most of the 31 Natural Areas. All of the Natural Areas were covered by a study of pre-Spanish ecology of the Bay Area (S-9583). Chairperson
The Amah/Mutsun Tribal Band
789 Canada Road
Woodside CA 94062

**Subject: San Francisco Significant Natural Resource Areas Management Plan, San Francisco County, California**

Dear Ms. Zwierlein:

The purpose of this letter is to inform the Amah/Mutsun Tribal Band the about a natural resource management plan developed to preserve, restore, and enhance 31 remnant Natural Areas within the City and County of San Francisco and managed by the San Francisco Recreation and Park Department (SFRPD), and to promote environmental stewardship of these areas. Natural Areas are remnants of San Francisco's historic landscape and contain the City's natural heritage. These areas support an array of native habitats and species, some found nowhere else in the world, such as the San Francisco garter snake and mission blue butterfly. The opportunity exists in these areas to protect and restore sensitive species and natural habitats for future generations. Pursuant to Government Code §65352.3(a)(2), the SFRPD is inviting your participation in government-to-government consultation as part of the CEQA process to identify possible cultural resources impacts associated with implementation of the management plan. Your participation in this process is important.

As envisioned, the *Significant Natural Resource Areas Management Plan* (SNRAMP) will provide the framework for long-term management of the identified Natural Areas. The 31 Natural Areas are scattered mostly throughout the central and southern portions of San Francisco and constitute approximately 4 percent of the total city area; one Natural Area is located in Pacifica. A map of the Natural Areas has been provided with this letter. They range in size from less than one acre to almost 400 acres and include such popular locations as Twin Peaks and portions of Glen Canyon Park. Many of these areas support sensitive plant and animal species and habitats. Others include striking geologic formations. Most are used as recreational open spaces by residents and visitors. While mostly owned by the SFRPD, some remnant natural areas are managed by other public and private entities. Some of these properties may eventually be transferred to SFRPD. The objectives of the SNRAMP are:

- to inventory the biological resources in Natural Areas to provide background information for planning, restoration, and management activities;
- to develop a Geographic Information System (GIS) database containing baseline information for each of the Natural Areas;
- to identify issues and impacts adversely affecting habitats, enhance biological diversity, and maintain populations of sensitive species;
- to identify and prioritize restoration, management, and monitoring actions;
- to provide guidelines and amenities for passive recreational uses compatible with natural resources; and

Golden Gate Park Conservatory (CA-SFR-37H [P-38-0037]) is adjacent to the Golden Gate Park Natural Areas. Historic canal features associated with the Spring Valley Water Company's water system (CA-SFR-102H [P-38-0093]) are within the Lake Merced Natural Area. The Pine Lake Natural Area is a part of the historic district of Stern Grove and Pine Lake Park (P-38-4472). An archaeological site containing "shell midden with some bone, chert chipage, and fire fractured rock" as well as some noted historic-era glass bottles and recorded in 1969 by S. Humphreys is adjacent to the Sharp Park Natural Area. At the time of its recording, it was remarked that the site was almost entirely destroyed by erosion and construction. Additionally, though not indicated in the records search, Golden Gate Park, including Oak Woodland, Lily Pond, Whiskey Hill, and Strawberry Hill Natural Areas, has been listed on the NRHP since 2004 as a historic district and would therefore be included on the CRHR as well. This would bring the total number of natural areas with documented cultural resources to ten. It should be noted that Geographic Information System (GIS) data received from SFRPD indicates there are additional cultural resources within and adjacent to the Natural Areas that have not been previously documented or evaluated. For instance, the Mount Davidson Cross in the Mount Davidson Natural Area was not indicated in the NWIC records search as a documented resource, but it is indicated as a historic-aged architectural resource in the SFRPD GIS.

No cultural resources survey has been conducted for this project. However, several cultural resources overviews and pedestrian surveys have been conducted within most of the 31 Natural Areas. All of the Natural Areas were covered by a study of pre-Spanish ecology of the Bay Area (S-9583). The Balboa Natural Area has been partially addressed in two overviews (S-5382 and S-18364) and one linear field surveys (S-18341). The Bayview Park Natural Area has been completely covered by a regional overview (S-25045) and partially covered by a linear field survey (S-28766). The Hawk Hill Natural Area has been fully covered by an archaeological field survey (S-9585). The India Basin Shoreline Park Natural Area has been addressed by one cultural resource overview (S-15602), one archaeological field survey (S-16555), and one linear archaeological field survey (S-16882). The Lake Merced Natural Area has been partially addressed in one regional cultural resource overview (S-3247), three field surveys (S-3240, S-3242, and S-19127), and one subsurface testing project (S-10168). The Palou-Phelps Natural Area has been partially covered by three linear archaeological field surveys (S-11396, S-22657, and S-29657). The Pine Lake Natural Area has been entirely covered by a cultural landscape report with register evaluations that included both archaeological and architectural field surveys (S-32280) and partially covered by a separate archaeological field survey (S-32271). The Sharp Park Natural Area has had nine overviews and surveys within and adjacent to it. The Natural Area itself has been partially covered by three archaeological field surveys (S-3039, S-6717, and S-15828), two linear archaeological field surveys (S-4877 and S-31602), and one archaeological field survey with a historic study and register evaluation (S-34499). The Bernal Hill, Billy Goat Hill, Brooks Park, Buena Vista Park, Corona Heights, Dorothy Erskine Park, Duncan-Castro, Edgehill Mountain, Fairmont Park, 15th Avenue Steps, Glen Canyon Park, Golden Gate Heights, Grandview Park, Kit Hill, Interior Green Belt, Lakeview/Ashton, Lily Pond, McLaren Park, Mount Davidson, O'Shaughnessy Hollow, Oak Woodlands, Rock Outcrop, Strawberry Hill, Tank Hill, Twin Peaks, and Whiskey Hill Natural Areas have not been covered by any field survey or a cultural resource overview specific to those areas.

Re: Proposed Significant Natural Resources Areas Management Plan project, San Francisco County.

Dear Ms. King:

A record search of the sacred land file has failed to indicate the presence of Native American cultural resources in the immediate project area. The absence of specific site information in the sacred lands file does not indicate the absence of cultural resources in any project area. Other sources of cultural resources should also be contacted for information regarding known and recorded sites.

Enclosed is a list of Native Americans individuals/organizations who may have knowledge of cultural resources in the project area. The Commission makes no recommendation or preference of a single individual, or group over another. This list should provide a starting place in locating areas of potential adverse impact within the proposed project area. I suggest you contact all of those indicated, if they cannot supply information, they might recommend others with specific knowledge. By contacting all those listed, your organization will be better able to respond to claims of failure to consult with the appropriate tribe or group. If a response has not been received within two weeks of notification, the Commission requests that you follow-up with a telephone call to ensure that the project information has been received.

If you receive notification of change of addresses and phone numbers from any of these individuals or groups, please notify me. With your assistance we are able to assure that our lists contain current information. If you have any questions or need additional information, please contact me at (916) 653-4038.

Sincerely,

Debbie Pilas-Treadway
Environmental Specialist III

**This list is current only as of the date of this document.**

**Distribution of this list does not relieve any person of statutory responsibility as defined in Section 7050.5 of the Health and Safety Code, Section 5097.94 of the Public Resources Code and Section 5097.98 of the Public Resources Code.**

**This list is only applicable for contacting local Native Americans with regard to cultural resources for the proposed Significant Natural Resource Areas Management Plan project, San Francisco County.**

APPENDIX D

# Biological Resources

**Table 3-5. Sensitive species presently and historically known to occur at Significant Natural Areas.**

| Species | Common Name | Status Federal, State, CNPS, Local | Local Significance |
|---|---|---|---|
| **Birds** | | | |
| *Aechmophorus clarkii* | Clark's Grebe | SLC | Few breeding records from Lake Merced. Also occurs at Sharp Park and India Basin on occasion. |
| *Podilymbus podiceps* | Pied-billed Grebe | SLC | Breeds at Lake Merced and Pine Lake. Also present at Sharp Park |
| *Phalacrocorax auritus* | Double-crested Cormorant | CSC (rookeries) | Presently nests at Lake Merced |
| *Phalacrocorax penicillatus* | Brandt's Cormorant | SLC | Found only at India Basin. |
| *Phalacrocorax pelagicus* | Pelagic Cormorant | SLC | Found only at India Basin. |
| *Nycticorax nycticoraz* | Black-crowned Night Heron | - | Locally uncommon, may breed at Lake Merced. Observed at Sharp Park, India Basin, and McLaren Park. |
| *Butorides striatus* | Green Heron | SLC | Presently occurs at Golden Gate Park and Pine Lake. Presently nests at Lake Merced. |
| *Areda herodias* | Great Blue Heron | Sens | Presently nests at Lake Merced |
| *Anas strepera* | Gadwall | SLC | Historically bred within San Francisco. Now a winter resident at Lake Merced, Pine Lake, Sharp Park, India Basin, and McLaren Park. |
| *Rallus limicola* | Virginia Rail | SLC | Presently occurs at Lake Merced |
| *Porzana carolina* | Sora | SLC | Presently occurs at Lake Merced |
| *Laterallus jamaicensis coturniculus* | Black Rail | SLC | Historically reported, not recently observed in the City |
| *Haematopus bachmani* | Black Oystercatcher | SLC | Occurs in India Basin only |
| *Charadrius alexandrinus* | Snowy Plover | FT, CSC | Presently occurs at Ocean Beach |
| *Cepphus columba* | Pigeon Guillemont | SLC | Occurs in India Basin only |
| *Buteo lineatus* | Red-shouldered Hawk | SLC | Lake Merced, Pine Lake, Palau Phelps, Golden Gate Heights, Billy Goat Hill, and Dorothy Erskine Park. Breeds at Sharp Park, Bayview Hill, McLaren Park, Buena Vista Park, and Glen Canyon. |
| *Buteo jamaicensis* | Red-tailed Hawk | SLC | Found in most Natural Areas. Breeds at Sharp Park, Bayview Hill, McLaren Park, Buena Vista Park, Dorothy Erskine Park, Glen Canyon Park, Mt. Davidson, Tank Hill, and Twin Peaks. |
| *Pandion haliaetus* | Osprey | SLC | Observed at Lake Merced, India Basin, and McLaren Park. |
| *Falco sparverius* | American Kestrel | SLC | Lake Merced, Sharp Park, Bayview Hill, India Basin, and Mt. Davidson. Breeds at McLaren Park. |
| *Falco peregrinus* | Peregrine Falcon | SLC | Likely forages in most Natural Areas. No breeding habitat in any of the Natural Areas. |
| *Callipepla californica* | California Quail | SLC | Presently occurs at the Presidio and the Arboretum in Golden Gate Park |
| *Columba fasciata* | Band-tailed Pigeon | SLC | Sharp Park, Buena Vista. Breeds in Glen Canyon, Mt. Davidson, and Twin Peaks |
| *Bubo virginianus* | Great Horned Owl | SLC | Found in Sharp Park. Breeds at Lake Merced, Pine Lake, McLaren Park, and Glen Canyon. |
| *Tyto alba* | Barn Owl | SLC | Presently occurs at Lake Merced. Historically reported from Golden Gate Park. |
| *Otus kennicottii* | Western Screech Owl | SLC | Presently occurs at Oak Woodlands (Golden Gate Park) |

**Table 3-5. Sensitive species presently and historically known to occur at Significant Natural Areas.**

| Species | Common Name | Status Federal, State, CNPS, Local | Local Significance |
|---|---|---|---|
| *Aeronautes saxatalis* | White-throated Swift | SLC | Found at Edgehill Mtn, Fairmount Park, Glen Canyon, Interior Greenbelt, Kite Hill, and Mt. Davidson. |
| *Picoides villosus* | Hairy Woodpecker | SLC | Found in Sharp Park. |
| *Contopus borealis* | Olive-sided Flycatcher | SLC | Currently nests at Lake Merced, Golden Gate Park, Buena Vista, and the Presidio |
| *Sayornis saya* | Say's Phoebe | SLC | Winter resident at Sharp Park, Bayview Hill, Bernal Heights, India Basin, McLaren Park, and Mt. Davidson. |
| *Empidonax difficilis* | Pacific-slope Flycatcher | SLC | Found in Sharp Park, Bayview Hill, McLaren Park, Billy Goat Hill, Corona Heights, Duncan-Castro, Glen Canyon Park, Mt. Davidson, Oak Woodlands, Tank Hill, and Twin Peaks. |
| *Eremophila alpestris* | Horned Lark | SLC | Occurs during migration only. Historic breeding records. |
| *Tachycineta bicolor* | Tree Swallow | SLC | Found in Sharp Park, Bayview Hill, and Golden Gate Heights. Breeds in Glen Canyon Park and McLaren Park. |
| *Tachycineta thalassina* | Violet-green Swallow | SLC | Found in Sharp Park, Bayview Hill, Golden Gate Heights, Glen Canyon Park, Kite Hill, Mt. Davidson, and Twin Peaks. |
| *Riparia riparia* | Bank Swallow | ST | Currently nest at Fort Funston and forage over Lake Merced |
| *Hirundo pyrrhonota* | Cliff Swallow | SLC | Currently nests at Lake Merced and Golden Gate Park |
| *Hirundo rustica* | Barn Swallow | SLC | Found in most Natural Areas. Breeds at Lake Merced, Pine Lake, McLaren Park, Buena Vista Park, Billy Goat Hill, Corona Heights, Glen Canyon Park, and Mt. Davidson. |
| *Cyanocitta stelleri* | Steller's Jay | SLC | Foung at Sharp Park, Buena Vista, Glen Canyon Park. Breeds at Mt. Davidson and Oak Woodlands. |
| *Chamaea fasciata* | Wrentit | SLC | Presently occurs at McLaren Park, and Bayview Hill. |
| *Sitta canadensis* | Red-breasted Nuthatch | SLC | Winter resident at Lake Merced, Pine Lake, Bayview Hill, McLaren Park, Golden Gate Heights, Corona Heights, Dorothy Erskine Park, Glen Canyon Park, Mt. Davidson, and Oak Woodlands. |
| *Sitta pygmaea* | Pygmy Nuthatch | SLC | Breeds at Brooks Park, Lake Merced, Pine Lake, Bayview Hill, McLaren Park, Buena Vista, Golden Gate Heights, Corona Heights, Dorothy Erskine Park, Edgehill Mtn, Fairmount Park, Glen Canyon, Interior Greenbelt, Mt. Davidson, Oak Woodland, Tank Hill, and Twin Peaks. Also found at Kite Hill. |
| *Thryomanes bewickii* | Bewick's Wren | SLC | Presently nests at Lake Merced and Fort Funston |
| *Catharus ustulatus* | Swainson's Thrush | SLC | Breeds at Sharp Park. Also found at Buena Vista, Golden Gate Heights, Glen Canyon, McLaren Park, Oak Woodlands, and Twin Peaks. |
| *Lanius ludovicianus* | Loggerhead Shrike | SLC | Occurs during migration only. Historic breeding records. |
| *Vireo huttoni* | Hutton's Vireo | SLC | Found at Sharp Park, Bayview Hill, McLaren Park, Pine Lake, and Buena Vista. Likely breeds in San Francisco. |

**Table 3-5. Sensitive species presently and historically known to occur at Significant Natural Areas.**

| Species | Common Name | Status Federal, State, CNPS, Local | Local Significance |
|---|---|---|---|
| *Vermivora celata* | Orange-crowned Warbler | SLC | Found at Lake Merced, Pine Lake, Bayview Hill, McLaren Park, Buena Vista, Billy Goat Hill, Edgehill Mt., Glen Canyon Park, Mt. Davidson, Oak Woodlands, and Twin Peaks. Likely breeds in San Francisco at Mt. Davidson. |
| *Dendroica petechia* | Yellow Warbler | CSC (nesting) | Observed at Lake Merced in spring 2000, breeding undocumented |
| *Wilsonia pusilla* | Wilson's Warbler | SLC | Found at Bernal Heights, Bayview Hill, McLaren Park, Buena Vista, Golden Gate Heights, Corona Heights, Dorothy Erskine, Glen Canyon Park, Oak Woodlands, and Twin Peaks. Breeds at lake Merced, Pine Lake, and Mt. Davidson. |
| *Geothlypis trichas* | Common Yellowthroat | CSC | Presently occurs at Lake Merced and Sharp Park |
| *Pipilo maculatus* | Spotted Towhee | SLC | Presently occurs at Mount Davidson, Presideo, Oak Woodlands (Golden Gate Park), McLaren Park, Glen Canyon Park, and Twin Peaks. |
| *Junco hyemalis* | Dark-eyed Junco | - | Breeding population limited, wintering birds widespread in parks and yards of San Francisco |
| *Zonotrichia leucophrys* | White-crowened Sparrow | - | Breeding population limited, wintering birds widespread in parks and yards of San Francisco |
| *Icterus cucullatus* | Hooded Oriole | SLC | Breeds at Lake Merced and Glen Canyon Park. Also found at McLaren Park, Buena Vista, and Mt. Davidson. |
| *Carduelis tristis* | American Goldfinch | SLC | Breeds at Lake Merced, Sharp Park, Bayview Hill, and McLaren Park. Also found at Glen Canyon, Mt. Davidson, and Twin Peaks. |
| *Carduelis psaltria* | Lesser Goldfinch | SLC | Breeds at Bayview Hill, McLaren Park, Gilly Goat Hill, Corona Heights, Glen Canyon Park, Mt. Davidson, and Twin Peaks. Also found at Brooks Park, Dorothy Erskine Park, and Farimount Park. |
| *Loxia curvirostra* | Red Crossbill | SLC | Winter resident found at Lake Merced, McLaren Park, Buena Vista, Golden Gate Heights, Oak Woodlands, and Twin Peaks. |
| *Carpodacus purpureus* | Purple Finch | SLC | Breeds at Lake Merced, Glen Canyon, Mt. Davidson, Oak Woodlads, and Twin Peaks. Also found at Pine Lake, Sharp Park, Bayview Hill, McLaren Park, Buena Vista, Golden Gate Heights, Corona Heights, and Dorothy Erskine Park. |

**Table 3-5. Sensitive species presently and historically known to occur at Significant Natural Areas.**

| Species | Common Name | Status Federal, State, CNPS, Local | Local Significance |
|---|---|---|---|
| **Fish** | | | |
| *Eucyclogobius newberryi* | Tidewater Goby | FPD (FE), CSC | Historically collected (1895), not recently observed in the City |
| **Reptiles and Amphibians** | | | |
| *Clemmys marmorata* | Western Pond Turtle | CSC | Presently occurs at Lake Merced. Presumed extant at Pine Lake but not recently observed. |
| *Rana aurora draytonii* | California Red-legged Frog | FT | Historically observed at Lake Merced. Recently observed at Sharp Park. |
| *Thamnophis sirtalis elegans* | San Francisco Garter Snake | FE, SE, SFP | Historically reported from Sharp Park |
| **Invertebrates** | | | |
| *Caecuditea tomalensis* | Tomales Isopod | FSC | Collected in 1984 from Lake Merced (CNDDB 2000) |
| *Euphydryas editha bayensis* | Bay Checkerspot Butterfly | FT | Reported from Mt. Davidson and Twin Peaks in 1980. Not currently present at either Natural Area. |
| *Icaricia icarioides missionensis* | Mission Blue Butterfly | FE | Reported at Sharp Park and McLaren Park in 1988 and from Bayview Park in 2001. Currently breeds on Twin Peaks |
| *Incisalia mossii bayensis* | San Bruno Elfin Butterfly | FE | |
| *Ischnura gemina* | San Francisco Forktail Damselfly | - | Not observed since 1989, presumed present in Glen Canyon. Presently occurs in McLaren Park. |
| *Lichnanthe ursina* | Bumblebee Scarab Beetle | FSC | 1980 report from dunes near Laguna Salada, presumed present |
| *Speyeria callippe callippe* | San Francisco Silverspot Butterfly | FE | |
| **Plants** | | | |
| *Amsinckia menziesii* var. *intermedia* | Common Fiddleneck | LS | Presently occurs at Bayview Park, and Twin Peaks |
| *Aquilegia formosa* | Red Columbine | LS | Presently occurs at Glen Canyon, O'Shaughnessy Hollow, and Mount Davidson |
| *Arabis blepharophylla* | Coast Rock Cress | CNPS List 4 | Presently occurs at Mt. Davidson, O'Shaughnessy Hollow, and Twin Peaks |
| *Arctostaphylos hookeri* ssp. *franciscana* | Franciscan manzanita | CNPS List 1A | Historically occurred at Mt. Davidson |
| *Arctostaphylos hookeri* ssp. *ravenii* | Raven's manzanita | FE, SE, CNPS List 1B | Historically occurred at Mt. Davidson |
| *Aristolochia californica* | California Pipevine | - | Presently occurs at occur at Lake Merced |
| *Aster radulinus* | Broadleaf Aster | LS | Presently occurs at Bayview Park |
| *Astragalus nutalli* var. *virgatus* | Nuttall's Milk Vetch | LS | Historically occurred at Lake Merced |
| *Blennosperma nanum* | Common Stickyseed | LS | Presently occurs at Bayview Park |
| *Calamagrostis nutkaensis* | Pacific Reed Grass | LS | Southern range limit, presently occurs at Mt. Davidson, Twin Peaks, and Edgehill Mtn. |
| *Castilleja exserta* | Purple Owl's Clover | LS | Presently occurs at Mount Davidson and Glen Canyon |
| *Castilleja wightii* | Paintbrush | LS | Presently occurs at Hawk Hill, Lake Merced, and Balboa Natural Area. |

**Table 3-5. Sensitive species presently and historically known to occur at Significant Natural Areas.**

| Species | Common Name | Status Federal, State, CNPS, Local | Local Significance |
|---|---|---|---|
| *Cerastium arvense* | Meadow White | LS | Presently occurs at Twin Peaks and Rock Outcrop |
| *Chenopodium californicum* | California Goosefoot | LS | Historically occurred at Lake Merced |
| *Chorizanthe cuspidata* var. *cuspidata* | San Francisco Spineflower | FSC, CNPS List 1B | Presently occurs at Ft. Funston, Golden Gate Heights, and Lake Merced |
| *Clarkia rubicunda* | Farewell-to-Spring | - | Presently occurs at Tank Hill, Bayview Hill, and Lakeview/Ashton Mini Park |
| *Collinsia multicolor* | San Francisco Collinsia | CNPS List 1B | Presently occurs at Bayview Hill |
| *Croton californica* | California Croton | LS | Northern distributional limit, presently occurs at Hawk Hill |
| *Delphinium californicum* | Larkspur | LS | Presently occurst at Bayview Park |
| *Delphinium decorum* | Coast Larkspur | LS | Presently occurs at Bayview Park |
| *Deschampsia danthonioides* | Annual Hairgrass | LS | Presently occurs at Corona and Rock Outcrop |
| *Disporum hookeri* | Fairy Bells | LS | Presently occurs at Interior Green Belt |
| *Dodecatheon clevelandii* | Shooting Star | LS | Presently occurs at Bernal Hill. |
| *Elymus multisetus* | Big Squirrel Tail | LS | Presently occurs at Bayview Park, Bernal Hill and McLaren Park |
| *Erigeron foliosus* | Leafy Daisy | LS | Presently occurs in O'Shaughnessey Hollow |
| *Erysimum franciscanum* | San Francisco Wallflower | FSC, CNPS List 4 | Presently occurs at Grandview Park, Golden Gate Heights, Hawk Hill, and Rock Outcrop |
| *Euthamia occidentalis* | Western Goldenrod | LS | Historically reported not recently observed in the City. |
| *Festuca californica* | California Fescue | LS | Presently occurs at Bayview Park, Edgehill Mtn. and Mt. Davidson |
| *Frankenia salina* | Alkali-Heath | LS | Presently occurs at India Basin Shoreline Park. |
| *Fritillaria liliacea* | Fragrant Fritillary | CNPS 1B | Presently occurs at Bernal Heights |
| *Gallium porrigens* | Climbing Bedstraw | LS | Presently occurs in Bayview Park , O'Shaughnessy Hollow, and Twin Peaks |
| *Garrya elliptica* | Silk Tassel Bush | LS | Presently found in Glen Canyon Park |
| *Gilia capitata* ssp. *chamissonis* | Dune Gilia | CNPS List 1B | Presently occurs at Hawk Hill and Lake Merced |
| *Gilia clivorum* | Grassland Gilia | LS | Historically reported not recently observed in the City. |
| *Grindelia hirsutula* var. *maritima* | San Francisco Gumplant | FSC, CNPS List 1B | Presently occurs at Mount Davidson, Twin Peaks, Corona Heights, and Balboa Natural Area. |
| *Grindelia stricta* var. *augustifolia* | Marsh Gumplant | - | Presently occurs at India Basin Shoreline Park. |
| *Heuchera micrantha* | Alumroot | LS | Presently occurs at O'Shaughnessy,and Glen Canyon |
| *Juncus xiphiodes* | Iris Leaf Rush | LS | Historically reported not recently observed in the City. |
| *Layia carnosa* | Beach Layia | FE, SE, CNPS List 1B | Historically reported from San Francisco, location not well mapped, presumed extirpated |
| *Lessingia germanorum* | San Francisco Lessingia | FE, SE, CNPS List 1B | Only current population found on the Presidio. |
| *Leymus x vancouverensis* | Vancouver's Ryegrass | LS | Presently occurs at Lake Merced |
| *Lilaea scilloides* | Flowering Quillwort | LS | Presently occurs at McLaren Park (is likely extripated) |

**Table 3-5. Sensitive species presently and historically known to occur at Significant Natural Areas.**

| Species | Common Name | Status Federal, State, CNPS, Local | Local Significance |
|---|---|---|---|
| *Linaria canadensis* | Canadian or Blue Toad-Flax | LS | Presently occurs at Hawk Hill |
| *Lithophragma heterophylla* | Prarie Star, Woodland Star | LS | Presently occurs in Bayview Park |
| *Marah oreganus* | Wild Cucumber, Man-root | LS | Presently occurs at McLaren Park and Lake Merced |
| *Monardella undulata* | Curly-leaved Monardella | CNPS List 4 | Not known to occur in the City |
| *Muilla maritima* | Common Muilla | LS | Presently occurs at Corona Heights, Tank Hill, Bernal Hill and Mount Davidson |
| *Navarretia squarrosa* | Skunkweed | LS | Presently occurs at Hawk Hill and McLaren Park |
| *Osmorhiza chilensis* | Sweet Cicely | LS | Presently occurs at Interior Greenbelt. |
| *Pellaea andromedifolia* | Coffee Fern | LS | Historically reported not recently observed in the City. |
| *Prunus emarginata* | Bitter Cherry | LS | Presently occurs at Bayview and Glen Canyon |
| *Prunus ilicifolia* | Holly-leaved Cherry Islais Cherry | LS | Presently occurs at Bayview Park, Glen Canyon |
| *Prunus virginiana var. demissa* | Western Choke Cherry | LS | Presently occurs at Tank Hill and Bayview Park |
| *Quercus chrysolepis* | Canyon Live Oak | LS | Presently occurs at Lake Merced |
| *Rhamnus crocea* | Spiny Redberry | LS | Presently occurs at Glen Canyon |
| *Ribes divaricatum* | Coastal Black Gooseberry | LS | Presently occurs at Lake Merced |
| *Ribes menziessi* | Canyon Gooseberry | LS | Presently occurs at Bayview Park |
| *Rosa gymnocarpa* | Wood Rose | LS | Presently occurs at Bayview Park, O'Shaughnessy and Mount Davidson |
| *Rubus parviflorus* | Thimbleberry | LS | Presently occurs at Lake Merced and Interior Green Belt |
| *Salvia spathacea* | Hummingbird Sage | LS | Presently occurs at Bernal Hill. |
| *Saxifraga californica* | California saxifrage | LS | Presently occurs at Billy Goat Hill |
| *Sedum spathulifolium* | Broadleaf Stonecrop | - | Larval food plant for San Bruno elfin butterfly, presently occurs at Glen Canyon, Mt. Davidson, O'Shaughnessy Hollow, Tank Hill, and Twin Peaks |
| *Senecio aronicoides* | Groundsel | LS | Presently occurs at Bayview Park and Mount Davidson |
| *Silene scouleri* ssp. *grandis* | Scouler's Large Campion | LS | Presently occurs at Bayview Hill |
| *Silene verecunda* ssp. *verecunda* | San Francisco Campion | FSC, CNPS List 1B | Presently occurs at Mt. Davidson and Rock Outcrop |
| *Sisyrinchium californicum* | Yellow-eyed Grass | LS | Only San Francisco population in Glen Canyon |
| *Tanacetum camphoratum* | Dune Tansy | - | Southern distributional limit. Presently occurs at Grandview Park, Golden Gate Heights, Hawk Hill, Rock Outcrop, Lake Merced, and Balboa Natural Area. |
| *Triphysaria eriantha* var. *rosea* | Johnny-tuck | LS | Presently occurs at McLaren Park |

**Table 3-5. Sensitive species presently and historically known to occur at Significant Natural Areas.**

| Species | Common Name | Status Federal, State, CNPS, Local | Local Significance |
|---|---|---|---|
| *Vaccinium ovatum* | California or Evergreen Huckleberry | LS | Presently occurs at Mount Davidson |
| *Viola adunca* | Blue Violet | LS | Presently occurs at Glen Canyon, Twin Peaks and O'Shaugnessy |
| *Viola pedunculata* | Johnny-Jump-Up | - | Larval food plant for San Francisco silverspot butterfly, presently occurs at Bayview Hill, McLaren Park, Tank Hill, Duncan-Castro, and Corona Heights |
| *Woodwardia fimbriata* | Giant Chain Fern | LS | Presently occurs at Glen Canyon |
| *Zigadenus fremontii* | Star Lily | LS | Presently occurs at Bernal Hill |

**Status Key:**

***Federal Status***

***FE*** Endangered. Species in danger of extinction throughout all or significant portion of its range.

*FT* Threatened. Species likely to become endangered within foreseeable future throughout all or a significant portion of its range.

*FPE* Proposed for listing as endangered.

*FC* Candidate for listing as endangered. Candidate information now available indicates that listing may be appropriate with supporting data currently on file.

*FSC* Species of Concern. Former Category 2 Candidate for listing as endangered.

*FPD* Proposed de-listing.

***California State Status***

*SE* Endangered. Species whose continued existence in California is jeopardized.

*ST* Threatened. Species, although not presently threatened with extinction, that is likely to become endangered in the foreseeable future.

*SSC* Species of Concern.

*SFP* State Fully Protected under Sections 3511 and 4700 of the Fish and Game Code.

*Sens* Considered a sensitive species by the California Department of Forestry.

***California Native Plant Society***

*1A* Plants presumed extinct in California

*1B* Plants that are rare or endangered in California and elsewhere.

*2* Plants that are endangered in California, but more common elsewhere.

*3* Plants about which more information is needed.

*4* Plants of limited distribution (a watch list).

*LS* Locally Significant.

***Golden Gate Audubon Society***

*SLC* Species of Local Concern

**Appendix Table C-1. Bird species found within the San Francisco Significant Natural Areas** (Based on Cotter [1998] as annotated by Josiah Clark, 2002).

| | Common Name | *Species Name* | N/I | Sensitive | Resident/ Migrant | Natural Area | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

**Notes**

| | |
|---|---|
| 1 | Once common, now very rare |
| 2 | Recently common but notably declining |
| 3 | Appears to be declining in recent years |
| 4 | Potentially at risk or declining |
| + | Rare breeder in San Francisco |
| X | Means expected at appropriate time of year and in appropriate habitat. This includes migrants. |
| x | Means recorded but not to be expected every visit or very rare- like recorded just once. |
| * | Indicates that the species breeds in the area. |
| r | Species that is resident with at least part of the population non-migratory and breeding in area |
| w | Species that regularly spends the winter in the area but migrates elsewhere to breed |
| m | Species seen during migration but neither breeds nor spends the winter |
| s | Species that migrate to the area to breed in the spring and summer months |
| v | Species that is very rare or a vagrant in the area and is far out of range or expected habitat |
| pb | Species regularly present post breeding as individuals disperse north to avoid competition for food around breeding colonies |
| (*) | Indicates that a few breeding records exist for this species in the area |
| r/m | Species that is primarily a resident but migrants of the species regularly pass through |
| m/w | Species that is primarily a migrant but winters with some regularity |
| m/s | Species that is primarily a migrant but some individuals do attempt to breed in the area |

Note that birds that are indicated as W or S are also migrants during spring and fall.
Migrants, vagrants and spring breeding birds may occasionally overwinter.

This list was created using the official bird list for the City of San Francisco (Cotter, 1998) as annotated by Josiah Clark, SFRPD 2002.

**Notes**

1 An "X" indicates presence and a "?" was used where it was uncertain if a species actually occurred within one of the Natural Areas.
2 "N/I" indicates if a species is native to San Francisco or if it has been introduced.

| 155 | *Corylus cornuta var. californica* | California Hazelnut | Yes | | | | X | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 156 | *Cotoneaster pannosa* | Cotoneaster | No | | | | | | X | | X | X | | | X | | | | | | | | | | X | | | | | | | | |
| 157 | *Cotoneaster sp.* | Cotoneaster | No | | | | | X | | | | | X | X | | | | | X | | | | | | | | | X | X | X | | X | |
| 158 | *Cotula australis* | New Zealand Brass Buttons | No | | | | | | | | | | | | | | | | | | | | | | X | | | | | | | | |
| 159 | *Cotula coronopifolia* | Brass Buttons | No | | | | X | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 160 | *Crassula argentea* | Jade Plant | No | | | | | | | | | | | | | | | | | | | | | | | | | X | | | | | |
| 161 | *Crassula connata* | Sand Pygmy-weed | Yes | | | | | X | X | | | | | | | X | X | | | | | | | | X | | | | | | | X | |
| 162 | *Crassula sp.* | (succulents) | No | | | | | | | | | | | | | X | | | | | | | | | | | | X | | | | X | |
| 163 | *Crocosmia masoniorum* | Crocosmia | No | | | X | X | | | | | | | | | | | X | | | | | | | | | | | | | | | |
| 164 | *Croton californicus* | California Croton | Yes | | | | | | | | | | | | | X | | | | | | | | | | | | | | | | | |
| 165 | *Cupressus macrocarpa* | Monterey Cypress | No | X | X | X | X | X | X | | X | | X | X | X | | | | | X | X | | | X | X | X | | X | | | | X | |
| 166 | *Cuscuta salina var. major* | Salt marsh Dodder | Yes | | | | | | | X | | | | | | | | | | | | | | | | | | | | | | | |
| 167 | *Cymbalaria muralis* | Kenilworth Ivy | No | | | | | | | | | | | | | | | | | | | | | | | | | | | | X | | |
| 168 | *Cynodon dactylon* | Bermuda Grass | No | | | | | | | | | | | | | | | | | | | | | | X | | | | | | | | |
| 169 | *Cynosurus echinatus* | Hedgehog Dogtail, Dogtail Grass | No | | | | | | | | X | | | | | | | | | | | | | | | | | | | | | | |
| 170 | *Cyperus eragrostis* | Tall Cyperus | Yes | | | | X | | X | | X | | | | | | | | | | | | | | X | | | | X | | | | |
| 171 | *Cyperus esculentus* | Nutsedge, Galingale | Yes | | | | X | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 172 | *Cytisus scoparius* | Scotch Broom | No | | | | X | | | | | | | | | | | | | | | | | | X | | | | | | | | |
| 173 | *Dactylis glomerata* | Orchard Grass | No | | | | X | | | | | | | | | | | | | | | | | | X | | | | | | | | |
| 174 | *Danthonia californica var. americana* | California Oatgrass | Yes | X | | | X | X | X | | X | X | | | | | | | | X | | X | | | X | | | X | | X | | X | |
| 175 | *Daucus carota* | Carrot | No | | | | X | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 176 | *Daucus pusillus* | Rattlesnake Weed | Yes | | | | | | | | | | | | | | | | | | | | | | X | | | | | X | | | |
| 177 | *Delairea odorata* | Cape-ivy, German-ivy | No | X | | X | X | X | | | X | | X | | | | | X | | | X | | | | X | X | | X | X | | | X | |
| 178 | *Delphinium californicum* | California Larkspur | Yes | | | | X | X | | | | | | | | | | | | | | | | | | | | | | | | | |
| 179 | *Delphinium decorum* | Coast Larkspur | Yes | | | | | X | | | | | | | | | | | | | | | | | | | | | | | | | |
| 180 | *Deschampia cespitosa* | Tufted Hairgrass | Yes | | | | | | | | | | | | | | | | | | | | | | X | | | | | | | X | |
| 181 | *Deschampsia cespitosa ssp. holciformis* | Tufted Hairgrass | Yes | | | | | X | | | | | | | | | | | | | | | | | | | | | | | | | |
| 182 | *Deschampsia danthonioides* | annual Hairgrass | Yes | | | | | | | | | | | | | | X | | | X | | | | | | | | | | | | | |
| 183 | *Dichelostemma capitatum* | Blue Dicks, Wild Hyacinth | Yes | X | | | | X | X | | X | X | | | | | | | X | X | X | X | X | | X | | X | X | | X | X | X | |
| 184 | *Dichondra donelliana* | Dichondra | Yes | | | | | X | X | | X | | | | | | | | | | X | | | | X | | X | X | | X | | X | |
| 185 | *Disporum hookeri* | Fairy Bells | Yes | | | | | | | | | | | | | | | | | | | | | | | | | X | | | | | |
| 186 | *Distichlis spicata* | Saltgrass | Yes | | | | X | | | X | | | | | | | | | | | | | | | | | | | | | | | |
| 187 | *Dodecatheon clevelandii ssp. patulum* | Shooting Star | Yes | | | | | X | X | | | | | | | | | | | | | | | | | | | | | | | | |
| 188 | *Dodecatheon hendersonii* | Mosquito Bills, Sailor Caps | Yes | | | | | X | X | | X | | | | | | | | | | | | | | | | | X | | | | X | |
| 189 | *Dryopteris arguta* | Spreading Coastal Wood Fern | Yes | | X | | X | X | | | | | | | | | | | | X | X | | X | | X | X | | X | X | X | | X | |
| 190 | *Duchesnea indica* | Mock-strawberry | No | | | | | | | | | | | | | | | | | | | | | | X | | | | X | | | | |
| 191 | *Dudleya farinosa* | Live-forever | Yes | | X | | X | X | | | X | | | X | X | X | X | | | X | | | X | | X | | | X | | X | X | X | |
| 192 | *Echinocloa crus-galli* | | No | | | | | | | | X | | | | | | | | | | | | | | | | | | | | | | |
| 193 | *Echium candicans* | Echium | No | | | | | | | | | | | | | | | | | | | | | | | | | | | | | X | |
| 194 | *Echium sp.* | Echium | No | | | | | | | | | | | | | | | | | | | | | | | | | | | | | X | |
| 195 | *Ehrharta erecta* | Ehrharta Grass | No | | X | X | X | | | | X | | X | X | X | | X | X | | | | X | | | | X | X | | X | X | | | |
| 196 | *Elymus californicus* | California Bottle-brush Grass | Yes | | | | | | | | | | | | | | | | | | | | | | | | | | | | | X | |
| 197 | *Elymus glaucus ssp. glaucus* | Blue Wild Rye, Western Wild Rye | Yes | X | | | X | X | X | | X | X | | X | | | | | X | X | X | | | | | X | | X | X | | X | | X | |

| 214 | *Erigeron blochmaniae* | Blochmans Leafy Daisy | No | | | | | | X | | | | | | | | | | | | | | | | | | | | | | | | |
| 215 | *Erigeron foliosus* | Leafy Daisy | Yes | | | | | X | | | | | | | | | | | | X | | | | | X | | | | | X | | | |
| 216 | *Erigeron glaucus* | SeasideDaisy | Yes | X | | | X | | | | | | | X | | | X | | | | | | | | X | | | X | | X | X | X | |
| 217 | *Erigeron sp.* | Fleebane Daisy | No | | | | | | | | X | | | | | | | | | | | | | | X | | | | | | | | |
| 218 | *Eriogonum latifolium* | Coast Buckwheat | Yes | X | X | | X | X | X | | X | X | | X | X | X | X | | X | X | X | X | | X | X | X | | X | X | X | X | X | |
| 219 | *Eriogonum nudum* | Nude Buckwheat | Yes | | | | | | | | | | | | | | | | | | | | | | X | | | | | | | | |
| 220 | *Eriophyllum confertiflorum* | Golden or Yellow Yarrow | Yes | | | | | X | | | X | | X | | | | | | | X | | | | | | | | X | | | | X | |
| 221 | *Eriophyllum confertiflorum var. confertiflorum* | Lizardtail | Yes | | | | | | | | | | | | | | | | | | | | | | X | | | | | X | | X | |
| 222 | *Eriophyllum staechadifolium* | Lizard-tail, Seaside Wooly Sunflower | Yes | X | X | | X | | | | X | | | | | | | | | | | | | | X | | | X | X | X | | X | |
| 223 | *Erodium botrys* | Broad-leaf Filaree, Long-beaked Filaree | No | | X | | | X | X | | X | X | | | | | | | | | | | | | X | | X | X | | | | X | |
| 224 | *Erodium cicutarium* | Red-stemmed Filaree, Storksbill | No | | | | | X | X | | X | X | | | | | X | | | X | | | | | X | | X | | | | | X | |
| 225 | *Erodium moschatum* | White-stemmed Filaree | No | | | | | X | X | | X | | | | | | | | | | | | | | X | | | | | | | X | |
| 226 | *Erodium sp.* | Filaree | No | | | | | | | | X | | | | | | | | | | | | | | | | | | | | | | |
| 227 | *Erysimum franciscanum* | San Francisco Wallflower | Yes | | X | | | | | | | | | X | X | X | X | X | | | | | | | | | | | | | | | |
| 228 | *Escallonia sp.* | Escallonia | No | | | | | | | | | | X | | | | | | | | | | | | | | | | | | | | |
| 229 | *Eschscholzia californica* | California Poppy | Yes | X | X | | X | X | X | | X | X | | X | X | X | X | X | X | X | | X | | | X | | X | X | X | X | X | X | |
| 230 | *Eucalyptus globulus* | Blue Gum Eucalyptus | No | | X | X | X | X | X | | X | X | | | | | | | | | X | | | X | X | X | | X | X | | X | | |
| 231 | *Eucalyptus nicholii* | Eucalyptus | No | | | | | X | | | | | | | | | | | | | | | | | | | | | | | | | |
| 232 | *Eucalyptus sp.* | Blue Gum | No | | | | X | | | | X | | X | | | | | | | | | | | | | | | X | | | | | |
| 233 | *Eucalyptus viminalis* | manna Gum | No | | | | | X | | | X | | X | | | | | | | | | | | | | | | | | | | | |
| 234 | *Euphorbia peplus* | Petty Spurge | No | | | | X | X | | | X | | | | | | | | | | | | | | X | | | | | | | | |
| 235 | *Euphorbia spathulata* | Spurge | Yes | | | | | | | | | | | | | | | | | X | | | | | | | | | | | | | |
| 236 | *Festuca arundinacea* | Tall Fescue, Alta Fescue, Reed Fescue | No | | | | | | | | X | | | | | | | | | | | | | | X | | | | | | | | |
| 237 | *Festuca californica* | California Fescue | Yes | | | | X | X | | | X | | | | | | | | | | | | | | X | | | X | | | | | |
| 238 | *Festuca idahoensis* | Idaho Fescue | Yes | | | | | X | | | | | | X | | X | | | | | | X | | | X | | | X | | X | | X | |
| 239 | *Festuca rubra* | Red Fescue | Yes | X | | | X | X | X | | X | X | | X | X | X | X | X | X | X | | X | | | | | X | X | | | X | X | |
| 240 | *Festuca sp.* | | No | | | | | | | | | | | | | | | | | | | | | | | | | | | | | X | |
| 241 | *Filago gallica* | Herba Impia | No | | X | | | X | X | | | X | | | | | | | | X | | | | | X | | | | | | | | |
| 242 | *Filago sp.* | | No | | | | | | | | | | | | | | | | | | | | | | | | | | | X | | | |
| 243 | *Foeniculum vulgare* | Sweet Fennel | No | | X | | X | X | X | | X | X | X | | | | | | | X | X | X | | | | X | | X | | X | | X | |
| 244 | *Fragaria chiloensis* | Beach or Dune Strawberry | Yes | X | | | X | | | | | | | X | X | X | X | | | X | X | | | | | X | | | X | | | | X | |
| 245 | *Fragaria sp.* | Strawberry | No | | | | | | | | | | | | | | | | | | | | | | | | | | X | | | | |
| 246 | *Fragaria vesca* | Wild or Woodland Strawberry | Yes | | | | X | X | | | | | | | | | | | | | | | X | | X | | | X | | X | | X | |
| 247 | *Frankenia salina* | Alkali heath, Yerba Reuma | Yes | | | | X | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 248 | *Fritillaria affinis* | Checker lily, Mission Bells | Yes | | | | | X | X | | | | | | | | | | | | X | X | | | X | | | X | | X | | X | |
| 249 | *Fumaria officinalis* | Fumitory | No | | | | | | | | X | | | | | | | | | | | | | | X | | | | X | | | | |
| 250 | *Fumaria parviflora* | Fumitory | No | | X | | X | | | | X | | | | | | | | | | | | | | | | | | | | | | |
| 251 | *Fumaria sp.* | | No | | | | | | | | | | | | | | | | | | | | | | X | | | | | | | | |
| 252 | *Fushia sp.* | Fushia | No | | | | | | | | | | | | | | | | | | | | | | | X | | X | | | | | |
| 253 | *Galium aparine* | Bedstraw, Cleavers, Goosegrass | Yes | | | X | X | X | | | X | | | | | X | | | | | X | | X | | X | X | | X | X | X | | X | |
| 254 | *Galium nuttallii* | Nuttall's Bedstraw, Climbing Bedstraw | No | | | | | | | | | | | | | | | | | | | | | | | | | | X | | | | |
| 255 | *Galium porrigens var. porrigens* | Climbing Bedstraw | Yes | | | | X | X | | | | | | | | | | | | | | | | | X | | | | | X | | X | |
| 256 | *Galium sp.* | Bedstraw | No | | X | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 257 | *Garrya elliptica* | Silk tassel Bush | Yes | | X | | | | | | | | | | | | | | | | | | | | X | | | | | | | | |
| 258 | *Gaultheria shallon* | Gaultheria | Yes | | | | | | | | | | | | | | | | | | | | | | X | | | X | | X | | | |
| 259 | *Gazania sp.* | Gazania | No | | | | | | | | X | | | | | | | | | | | | | | | | | | | | | | |
| 260 | *Genista monspessulana* | French Broom | No | | X | | X | X | X | | X | X | X | | | | X | | X | X | | | | | X | | | X | | X | X | X | |

| 397 | *Mimulus guttatus* | Common Monkey Flower | Yes | | | | X | | | | X | | | | | | | | | | | | | | X | | | | | | | | |
| 398 | *Minuartia douglasii* | Sandwort | No | | | | | | | | | | | | | | | | | X | | | | | | | | | | | | | |
| 399 | *Monardella villosa* | Coyote-Mint | Yes | | | | X | X | X | | | | | | | | | | | X | | | | | X | | | X | | | | X | |
| 400 | *Monardella villosa var. franciscana* | Western Pennyroyal | Yes | | | | | | | | | | | | | | | | | | | | | | X | | | | | X | | | |
| 401 | *Muilla maritima* | Muilla | No | | | | | | | | | | | | | | | | | X | | | | | | | X | X | | | X | X | |
| 402 | *Myoporum laetum* | Lollypop Tree | No | | X | | X | | | | | | | | | | | | | | | | | | | | | | X | | | | |
| 403 | *Myoporum sp.* | | No | | | | | | | | | | | | | | | | | | | | | | | | | X | | | | | |
| 404 | *Myosotis latifolia* | Forget-me-not | No | | | | | | | | | | | | | | | | | | | | | | X | | | | | | | | |
| 405 | *Myosotis sp.* | Forget-me-not | No | | | | | | | | | | | | | | | | | | | | | | | | | X | | | | | |
| 406 | *Myrica californica* | California Wax Myrtle | Yes | | X | X | X | | | | | | | | | | | | | | | | | | X | | | | X | | | | |
| 407 | *Narcissus sp.* | Daffodil | No | | | | | | | | | | | | | | | | | | | | | | X | | | | | | | | |
| 408 | *Nassella lepida* | Foothill Needlegrass | Yes | | | | X | X | X | | X | | | | | | | | | | | | | | | | | | | | | | |
| 409 | *Nassella pulchra* | Purple Needlegrass | Yes | X | | | X | X | X | | X | X | | | | | | | X | X | X | | X | X | X | | X | X | | X | X | X | |
| 410 | *Navarretia squarrosa* | Skunkweed | Yes | | | | | X | | | | | | | | | | | | | | | | | | | | | | | | | |
| 411 | *Nemophila maculata* | | No | | | | | | X | | | | | | | | | | | | | | | | | | | | | | | | |
| 412 | *Nemophila menziesii* | Baby Blue-eyes | Yes | | | | | | X | | | | | | | | | | | | | | | | X | | | | | | X | | |
| 413 | *Nymphaea odorata* | White Water Lily, Water Nymph | No | | | | X | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 414 | *Oemleria cerasiformis* | Oso Berry | Yes | | | | X | X | | | X | | | | | | | | | X | X | | | | X | X | | X | | X | X | X | |
| 415 | *Oenanthe sarmentosa* | Water Parsley | Yes | | X | X | X | | | | X | | | | | | | | | | | | | | X | | | | X | | | | |
| 416 | *Oenothera elata ssp. hookeri* | Beach Evening Primrose | Yes | | X | | X | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 417 | *Olea sp.* | Olive | No | | | | | | | | | | X | | | | | | | | | | | | | | | | | | | | |
| 418 | *Osmorhiza chilensis* | Sweet Cicely | Yes | | | | | | | | | | | | | | | | | | | | | | | X | | | | | | | |
| 419 | *Oxalis albicans ssp. pilosa* | Wood-sorrel | Yes | X | | | | | | | X | | | | | | | | | | | | | | | | | | | | | | |
| 420 | *Oxalis incarnata* | | No | | | | | | | | | | | | | | | | | | | | | | X | | | | | X | | | |
| 421 | *Oxalis latifolia* | | No | | | | | | | | | | | | | | | | X | | | | | | | | | | | | | | |
| 422 | *Oxalis pes-caprae* | Bermuda Buttercup | No | | X | | | X | X | | X | | | X | X | X | X | X | X | X | | | | | X | | X | X | X | X | X | X | |
| 423 | *Oxalis rubra* | | No | | | | | X | X | | | | | | | | | | | | | | | | | | | | | | | | |
| 424 | *Oxalis sp.* | | No | | | | | | | | | | | | | | | | | | | | | | | | | X | | | | | |
| 425 | *parietaria judaica* | | No | | | | | X | | | X | | | | | | | | | | | | | | | | | | | | | | |
| 426 | *Paronychia franciscana* | Nailwort | No | X | | | | | X | | X | | | | | | X | | X | X | X | | | | X | | | X | | X | X | X | |
| 427 | *Pellaea andromedifolia* | Coffee Fern | Yes | | | | X | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 428 | *Pellaea sp.* | | No | | | | | | | | | | | | | | | | | | | | | | | | | X | | | | | |
| 429 | *Pennisetum clandestinum* | Kikuyu Grass | No | X | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 430 | *Pentagramma triangularis* | Goldback Fern | Yes | | | | X | X | X | | | X | | | | | | | | X | | | | | X | | | | | X | | X | |
| 431 | *Perideridia kelloggii* | Yampah | Yes | | | | | X | X | | | | | | | | | | | | | | | | | | | | | | | | |
| 432 | *Phacelia californica* | California Coast Phacelia | Yes | | X | | X | X | | | | | | X | X | X | X | | | X | | | X | | X | | | | | | | X | |
| 433 | *Phacelia distans* | Wild-Heliotrope | Yes | | | | X | | | | | | | X | X | X | X | | | | | | | | | | | | | | | X | |
| 434 | *Phacelia malvifolia* | Stinging Phacelia | Yes | | | | X | | | | | | | X | | | | | | | | | | | X | | | | X | X | | | |
| 435 | *Phalaris aquatica* | Harding Grass | No | | | | | | X | | | | | | | | | | | | | | | | | | | | | | | | |
| 436 | *Phalaris sp.* | | No | | | | X | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 437 | *Picris echioides* | Bristly Ox-tongue | No | | | | X | X | X | | X | | | | | | | | X | | | | | | X | | | | | | | | |
| 438 | *Pinus pinea* | Italian Stone Pine | No | | | | | | | | | | | | | | | | | | | | | | | | X | | | | | | |
| 439 | *Pinus radiata* | Monterey Pine | No | X | X | | X | | X | | X | | X | | X | X | X | | | X | | | | | X | | | X | X | | | X | |
| 440 | *Pinus sp.* | Pine | No | | | | | | | | X | | | | | | | | | X | | | | | | | | | | | | | |
| 441 | *Piperia elegans* | Green Rein-orchid, Coast Piperia | Yes | | | | | X | X | | | | | | | | | | | | | | | | X | | | X | | X | | X | |
| 442 | *Piptochaetium setosum* | Ricegrass | No | | | | | | | | | | | | | | | | | | | | | | X | | | | | | | | |
| 443 | *Pittosporum crassifolium* | Thick-leaved Pittosporum | No | | | | | | | | | | X | | | | | | | | | | | | | | | | | | | | |
| 444 | *Pittosporum sp.* | | No | | | X | X | | X | | | | | | | | | | | | | | | | | | | | | | | | |
| 445 | *Pittosporum undulatum* | Victorian Box, Mock Orange | No | | | | | | | | | | X | | | | | | | | | | | | | | | | | | | | |
| 446 | *Plantago coronopus* | Split-Leaf Plantain | No | | | | X | X | | | | | | | | | | | | | | | | | | | | | | | | | |
| 447 | *Plantago erecta* | Dwarf Plantain | Yes | X | | | | X | X | | X | | | | | | X | | | X | | X | | | X | | | X | | X | X | X | |
| 448 | *Plantago lanceolata* | English Plantain | No | X | X | | X | X | X | | X | X | | X | | X | X | | X | X | X | | | X | | X | X | | X | X | X | | |
| 449 | *Plantago major* | Common Plantain | No | | X | | | | | | | | | | | | | | | | | | | | X | | | | | | | | |
| 450 | *Plantago sp.* | Plantain | No | | | | X | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 451 | *Plantago subnuda* | Mexican Plantain | Yes | | | X | X | | | | | | | | | | | | | | | | | | X | | | | | | | | |
| 452 | *Platanus racemosa* | Western Sycamore | Yes | | | | | | | | | | | | | | | | | | | | | | X | | | | | | | | |
| 453 | *Poa annua* | Annual Bluegrass | No | | X | X | | X | X | | | | | X | | | | | | | | | | | X | | X | X | | | | X | |
| 454 | *Poa douglasii* | Douglas or Sand-dune Bluegrass | Yes | | X | | | | | | | | | X | | X | X | | | | | | | | | | | | | | | | |
| 455 | *Poa secunda ssp. secunda* | One-sided Bluegrass, Pine Bluegrass | Yes | | | | | | | | | | | | | | | | | X | | X | | | | | | | | | | | |
| 456 | *Poa sp.* | | No | | | | | | | | | | | | | | | | | | | | | | | | | | | | | X | |
| 457 | *Poa unilateralis* | Ocean-bluff bluegrass | Yes | X | | | | X | X | | | X | | X | | | X | | X | X | | X | | | X | | | X | | X | X | X | |
| 458 | *Polycarpon tetraphyllum* | Four-leaved allseed | No | | | | | | | | | | | | | | | | | | | | | | X | | | | | | | | |
| 459 | *Polygala californica* | Milkwort | Yes | | | | | | | | | | | | | | X | | X | | | | | | | | | | | | | | |
| 460 | *Polygonum amphibium var. emersum* | Swamp Knotweed, Kelp | Yes | | X | X | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 461 | *Polygonum arenastrum* | Common or Dooryard Knotweed | No | | | | | | X | | | | | | | | | | | | | | | | X | | X | | | | | | |

# 1995 Significant Natural Resource Areas Management Plan

# RECREATION AND PARK DEPARTMENT

# STAFF REPORT ON THE

# SIGNIFICANT NATURAL RESOURCE AREAS MANAGEMENT PLAN

Adopted by the San Francisco
Recreation and Park Commission

January 19, 1995

Resolution No. 9501-008

YA 19210
V90

## *Introduction*

Significant natural areas in San Francisco are generally remnants of an original landscape region that stretched from San Bruno Mountain to the Golden Gate Headlands. This original landscape, sometimes known as the Franciscan biological region, was marked by the greatest inland penetration of ocean sand anywhere on the Pacific Coast and supported a rich sand dune ecosystem.

Rising above this belt of wind-blown sand, a ridge of Franciscan radiolarian chert extended in a southeast-northwest direction. Predominantly treeless except for small groves of coast live oak and toyon in more sheltered areas with sufficient soil, these grassy hilltops flourished with wildflowers in the spring.

Freshwater and saltwater wetlands teeming with wildlife lined the shoreline of the Bay. Small seasonal pools dotted the shifting sand dunes near the ocean and extensive stream systems fed vast marshes. A rising ocean deposited sand that effectively blocked the free-flow of a creek system resulting in the creation of Lake Merced.

The unique characteristics of this biological region made it different from any other ecosystem. Today, only very small examples of this rare environment remain as footnotes to the ecological history of San Francisco.

Many of these natural vestiges face degradation and destabilization from increasing urbanization. In order to effectively preserve and protect these valuable natural resources, the Recreation and Park Department proposes to develop a Significant Natural Resource Areas Management Plan.

## *Program Background*

As public awareness of the value of San Francisco's biological diversity has grown, so has the appreciation of notable natural resources within the City's park system.

To further the protection and enhancement of significant natural resources on property under the jurisdiction of the Recreation and Park Department, a total of $400,000 has been earmarked to fund a Significant Natural Resource Areas Management Plan (SNRAMP) through the San Francisco Park and Open Space Program. The purpose of this management plan is to establish a maintenance and preservation program related to the protection and enhancement of natural resource values.

It is envisioned that a significant portion of the funds would be used to address immediate threats to natural resources on park property, such as invasive weeds and erosion (see Attachment D). The remainder of the funds would be reserved for the development of the specific management programs of the natural resources management plan.

The Recreation and Park Department staff has drafted plan objectives, policies and guidelines for identifying significant natural areas and developing a standardized procedure for inventorying these areas and establishing management programs for their protection. The attached report provides the background and initial process contemplated by staff for the Significant Natural Resource Areas Management Plan.

An environmental consultant would be selected in the second part of the plan's development to further refine the plan, inventory natural resources within selected park properties, and make the site specific management program recommendations.

A stated objective of the proposed program is to "[i]ncrease City-wide level of awareness of the location and value of significant natural resource areas...." and to "[e]ncourage local participation in the protection or improvement of natural resources." Therefore, interested members of the public have been invited to participate in a series of community workshops to review and comment on the draft SNRAMP. Members of the public, community organizations, and agencies with natural resources expertise will be invited to participate with Recreation and Park Department staff on a task force to implement SNRAMP. The task force would also monitor the progress of the consultant and review and comment on further refinements of the plan by the consultant.

Following this process, the general public will be invited to attend a workshop to review and comment on the consultant-prepared plan. Upon completion of the environmental review for compliance with the California Environmental Quality Act (CEQA), the consultant-prepared SNRAMP would be reviewed and considered for approval by the Recreation and Park Commission at a public hearing.

*Program Overview*

The protection and enhancement of natural areas has become a priority goal for public agencies at both the state and federal levels. The Environmental Protection Agency, and Department of the Interior in particular, have initiated numerous programs to inventory natural resources on public lands, and have developed guidelines and standards for the preservation and enhancement of

resources such as threatened and endangered plants and animals, and habitat areas such as wetlands, vernal pools, desert communities and coastal zones.

Similarly, the State of California has a long history of priority policies and actions directed to the protection of statewide natural resources. In particular, the California Department of Fish and Game, Lands and Natural Areas Project has initiated a computerized inventory of natural areas, and a program designed to raise the awareness among developers, planners, conservationists and the general public about the presence of natural areas in local communities.

Many environmental organizations, such as The Nature Conservancy, also provide assistance in the preservation of unique natural resources. Groups with special expertise, such as the California Native Plant Society, the Sierra Club, the Audubon Society and others have played an active role in forwarding these programs.

Locally, there are a number of individual efforts under the auspices of the Golden Gate National Recreation Area and within the Recreation and Park Department (particularly through the Park and Open Space Program) that focus on the preservation and enhancement of natural areas and resources within the City and County of San Francisco.

The Recreation and Park Department would like to further these efforts by: 1) Developing guidelines and policies to protect or enhance valuable natural resources; 2) Setting standards for identifying these resources on property under the jurisdiction of the Recreation and Park Department; and 3) Following an approach and site-specific methodology for managing these areas. The result will be a Significant Natural Resource Areas Management Plan.

The following report produced by the staff of the Recreation and Park Department provides the background and initial process envisioned by staff for the Significant Natural Resource Areas Management Plan. This report is a summary of a program to identify significant natural resource areas, develop a standardized procedure for inventorying these areas, and establish management policies and actions for their protection.

***Relationship to Other Plans***

Other City departments and governmental agencies would comment on the consultant-prepared SNRAMP for consistency with other applicable plans and policies, including the following:

- *City Master Plan: Recreation and Open Space Element - Policy 13*: "Natural area management plans should be developed for publicly owned land throughout the City which would identify potentially significant natural areas,

inventory them, and identify the presence of natural resources. The plan should establish a consistent set of management policies and practices to protect and enhance the resources."

- Adopted master plans for individual parks
- Adopted forestry management plans for individual parks
- GGNRA: *General Management Plan* and *Resources Management Plan*
- Local Coastal Plan.

***Action Items for Adoption by the Recreation and Park Commission***

I. PROGRAM OBJECTIVES

- Increase City-wide level of awareness of the location and value of significant natural resource areas under the jurisdiction of the Recreation and Park Department.
- Encourage community participation in the protection or improvement of natural resources.
- Provide educational and recreational opportunities related to natural resources where appropriate; where feasible, restrict recreational uses and activity in sensitive habitat areas.
- Determine management needs and priorities for natural resources, particularly those identified by other agencies as rare, threatened or endangered species or habitat, or a species or habitat of special concern.
- Consult and coordinate with other city departments, agencies and groups with special expertise for inventory information and implementation.
- Implement measures designed to address immediate problems, such as invasive weed control.

## II. IDENTIFICATION OF SIGNIFICANT NATURAL RESOURCE AREAS

In order to identify the significant natural resource areas under the jurisdiction of the Recreation and Park Department, staff established a general set of criteria. These criteria are:

A. Park property contains naturally occurring biotic and/or geomorphic remnants of the indigenous landscape.

B. Conforms to State of California, Department of Fish and Game criteria:

1. Presence of rare type of species or habitat;
2. Presence of ensemble type of species or habitat (3 or more elements occurring together);
3. Presence of the best example of a type of species or habitat; and
4. Presence of high diversity type of species or habitat.

C. Special values: geology, riparian zones, wildlife habitat.

D. Corridor or connector between natural areas.

E. Natural resource area is vulnerable to degradation from an imminent ecological crisis, such as inundation by exotic plant species.

Many properties under the jurisdiction of the Recreation and Park Department are remnants (or include remnants) of the original natural landscape found in San Francisco prior to urbanization and therefore have significant natural values or features. Some examples of significant natural resource areas include:

- Native grasslands that thrive on the shallow soils of the windswept, foggy western slopes of San Francisco hilltops such as Bernal Hill, Twin Peaks, Bayview Park and the eastern side of Mt. Davidson. These grasslands are noteworthy for their ability to provide conditions of shade and water retention between bunches of grass that are ideal for native wildflowers. Many of these native wildflowers support a biologically diverse insect community, including rare species of butterflies.

- The most important avian habitat in San Francisco at Lake Merced. The Lake's proximity to the ocean, coastal cliffs and remnant dunes make it critical to the breeding ecology of as many as 50 bird species. It is a valuable habitat for thousands of migrating birds during spring and fall. Winter birds range from 60 to 100 species and number in the thousands of

individual birds. Lake Merced also provides habitat for remnant mammal, reptile and insect populations.

- Rare and diverse habitat areas in Glen Canyon Park, including a riparian habitat and a hillside native plant community.

- Rare and unusual geological formations found at Twin Peaks, the Rock Outcrop and Corona Heights.

- Important connectors between natural areas such as the many hilltop parks in San Francisco that serve as important links for certain species of birds and butterflies that require a range of suitable habitat.

- Rare, threatened or endangered species of animals and plants, such as the Mission Blue Butterfly found on Twin Peaks.

It is not the function of the SNRAMP to identify, inventory and maintain elements of park property which are not remnants of the original natural landscape, such as playgrounds, golf courses and ballfields. It is recognized, however, that certain parks that are characterized by a nonindigenous landscape are naturalistic, and as such, contribute to the biodiversity of the region by providing wildlife habitat. An example of such a park includes the vegetation of Stern Grove which supports many species of birds. These "naturalistic" parks are generally prioritized in Rank C in recognition of the fact that the park does not meet all of the criteria listed above (particularly criterion A).

Staff developed an evaluation matrix using the above criteria and suggested the following initial priority ranking of properties for "significant natural resource area" designation.

Following supplemental field inventories, this ranking may be revised based on site specific programs. Field work may also show that a particular park should be a higher priority because it is threatened by an immediate ecological crisis, pursuant to criterion E.

All or PART of the following parks would be considered candidates for significant natural areas.

| Rank A | Rank B | Rank C |
|---|---|---|
| Bayview Park<br>Glen Canyon Park<br>Lake Merced<br>Mt. Davidson<br>Twin Peaks | Bernal Hill<br>Billy Goat Hill<br>Buena Vista Park<br>Corona Heights<br>Golden Gate Heights -- (western edge)<br>Golden Gate Park— Oak Woodland Strawberry Hill<br>Grandview Park<br>Kite Hill<br>McLaren Park— southern grasslands McNab Lake/Marsh<br>Rock Outcrop<br>Sharp Park<br>Tank Hill | Brooks Property<br>Dorothy Erskine Park<br>Edgehill Mtn. Open Space<br>Fairmont Park<br>Golden Gate Park— Selected Lakes Park Presidio<br>Interior Greenbelt<br>Lincoln Park<br>Mountain Lake Park<br>Rolph Nicol (southern edge)<br>Stern Grove/Pine Lake<br>Zoo |

COMMENTS:

The program would focus on San Francisco park property and Sharp Park, however, Camp Mather may receive some review. Although the Zoo and Palace of Fine Arts (Lagoon) are included (Rank C), these sites may be questionable as natural areas.

## III. GENERAL POLICIES AND MANAGEMENT ACTIONS

### A. Vegetation

- Maintain/promote indigenous plant species; propagate native plants using seed collected from the specific site to avoid alteration of unique genetic strains of native plant species. This propagation policy should apply to the policies and management actions listed below to the extent possible.

- Control/remove invasive species.

- Provide fire breaks where appropriate and maximize indigenous vegetation with low flammability or low fuel volume in areas of high fire hazard.

- Utilize indigenous vegetation as ground cover to control erosion on steep slopes.

- Protect species listed as rare, threatened, endangered or of special concern.

- Remove exotic plants which adversely affect indigenous plant growth.

- Enhance riparian areas.

- Reforest and/or replant areas where appropriate to maintain diversity of indigenous plant communities.

- Preserve habitat which supports wildlife.

B. Wildlife

- Monitor wildlife population which is an indicator of a diverse ecosystem.

- Consult with agencies such as the State of California, Department of Fish and Game and The Nature Conservancy on habitat enhancement.

- Cooperate with other agencies (SPCA, Mayor's Office of Animal Care and Control) using established and humane procedures to remove or control free-roaming domestic dogs, feral cats and feral ducks or geese when their presence conflicts with natural wildlife.

- Develop educational programs with other agencies for wildlife protection.

C. Water Resources

- Maintain/improve water quality of streams and ponds.

- Protect riparian zones from erosion and sedimentation.

- Maintain drainage and erosion prevention devices along roads and service trails.

- Control drainage/runoff from roads.
- Establish and maintain tule encroachment zone around lakes.
- Use proper controls when applying aquatic herbicide.

D. Geotechnical/Soils

- Minimize erosion along roads and trails.
- Seed/plant bare soils with indigenous vegetation.
- Stabilize embankments when not in conflict with habitat.
- Minimize public access to and use of landslide areas and unstable slopes.
- Seek agreements with adjacent property owners to avoid development which contributes to erosion/runoff, or is subject to landslides.
- Clear landslide debris on park property.
- Install retaining devices where necessary to stabilize slopes.

E. Education

- Promote professional development of Recreation and Park Department staff in natural resources management.
- Develop nature programs to promote educational and recreational value of resources (for example, through the Randall Museum).
- Develop education programs aimed at private property owners adjacent to significant natural resource areas regarding the degradation of the resource resulting from such practices as dumping garden clippings or planting exotic species on park property.
- Develop education programs through the San Francisco Unified School District regarding significant natural resource areas. For example, work with staff at McAteer High School to develop an ecology program using Glen Canyon Park as an outdoor

classroom. Various aspects of the canyon ecology and history could be incorporated into the school curriculum in the form of class projects.

F. Public Use

- Develop guidelines for pathways and interpretative trails/signs.
- Control dirt bikes and off-road vehicle use.
- Encourage community participation in a public stewardship program.

# SIGNIFICANT NATURAL RESOURCES AREA MANAGEMENT PLAN

ATTACHMENT A
SIGNIFICANT NATURAL AREA INVENTORY

(Name of Park) _____

(Area Surveyed) _____

(Date of Survey) _____

| Natural Resources Notes | Applicable? Yes | No | |
|---|---|---|---|
| A. VEGETATION<br>Ground cover<br>Shrubs/vines<br>Perennials<br>Annuals<br>Grasses<br>Trees | | | Describe proportion of natural, exotics; any species on threatened or endangered plant list; sensitive plant endangered list; balance of flowering vs. non-flowering; habitat for animals; proportion of evergreen vs. deciduous self-seeding characteristics; pest and disease resistance; drought tolerant; irrigation; potential fire hazard.[1] |
| B. WILDLIFE | | | Describe all types; any species on T & E list; diversity; need for protection/enhancement.[1] |
| C. WATER | | | Natural water (ponds, creeks, streams, lakes); drainages; water quality; encroachment (tules, sedimentation).[1] |
| D. GEOLOGY/SOILS | | | Any rock outcropping; exposed soils/erosion; landslide areas; wetlands.[1] |
| E. PUBLIC USE | | | Active play area; viewing area; developed pathways; seating area; handicapped access; signage; lighting.[1] |

# SIGNIFICANT NATURAL RESOURCES AREA MANAGEMENT PLAN

## ATTACHMENT B
## MOBILE CREW WORK PLAN

A component of the proposed Significant Natural Resource Areas Management Plan is to address immediate problems in selected parks that contain significant natural resources. An initial program to hire 3 to 4 gardeners from a temporary Civil Service list and/or retain the services of the San Francisco Conservation Corps on an as-needed basis is being considered.

The types of projects that would be assigned to the mobile crew would include:

- Invasive Weed Control
- Erosion Control/Shoreline Restoration (small scale)
- Ivy Removal/Control
- Revegetation Projects related to Invasive Weed and Erosion Control
- Fire Hazard Control
- Weedy Tree Control

| RANK A PARKS | DURATION[1] |
|---|---|
| Bayview Park | 1 month |
| Glen Canyon Park | 2 months |
| Mt. Davidson (west side) | 1 month |
| Twin Peaks | 2 months |
| Lake Merced | 1 month |

| RANK B PARKS | DURATION[1] |
|---|---|
| Bernal Hill | 2 weeks |
| Corona Heights | 1 month |
| Golden Gate Park: Oak Woodland | 2 weeks |
| Golden Gate Park: Strawberry Hill | 1 week |
| McLaren Park (South) | 2 weeks |
| Billy Goat Hill | 2 weeks |
| Grandview Park | 1 month |
| Tank Hill | 2 weeks |
| Golden Gate Heights (west side) | 1 week |
| Rock Outcrop | 1 week |
| Buena Vista Park | 2 weeks |
| Sharp Park (Selected Natural Areas) | 1 month |
| Kite Hill | 2 weeks |

| RANK C PARKS | DURATION[1] |
|---|---|
| Stern Grove/Pine Lake | 1 month |
| Brooks Property | 1 week |
| Golden Gate Park (Selected Lakes) | 2 weeks |
| Mountain Lake Park | 2 weeks |
| Interior Greenbelt | 2 weeks |

[1]Weed Control: Duration noted is for first pass only. Repeated weed control will be needed.

APPENDIX F

# Everson/Digby Natural Area Description

# 6.27 EVERSON/DIGBY

## GENERAL DESCRIPTION AND LOCATION

Everson/Digby (E/D) is a 1.2-acre Natural Area located between Everson Street and Digby Street in the Diamond Heights area of San Francisco, east of Glen Canyon Park. Elevations range from 415 to 515 feet above sea level (Figure 6.27-1). The vegetation of E/D is composed primarily of grasslands with shrubs and trees along its lower boundary (Figure 6.27-1). E/D provides important habitat for native plants; grassland habitat; regionally significant City views; and suitable habitat for a variety of bird species.

## GEOLOGY, HYDROLOGY, AND TRAILS

This Natural Area is an undeveloped open space comprised mostly of a steep hill rising up from Everson Street to Digby Street. Soil in this Natural Area is relatively shallow, typically less than one foot deep, and is underlain by Franciscan bedrock. The bedrock outcrops in the middle of the site, in a steep slope area (Figure 6.27-2).

There is no surface water at the site. Drainage of the area is by overland flow. Some rainfall percolates into fissures in the rock, but runoff generally is rapid.

No primary or secondary trials were observed in the E/D Natural Area. A paved sidewalk runs along Digby Street at the upper boundary of the natural area.

## VEGETATION

The vegetation of E/D is classified into five series (Table 6.27-1; Figure 6.27-3). These series are within four sub-formations: approximately 79 percent of the area is grassland; 9 percent is forest; 7 percent is scrub; and 4 percent is classified as “other herb” (fennel). None of these series are dominated by native species.

### Forest

One forest series was mapped at E/D: acacia forest. Within the Natural Area, only a small amount of land is covered by this species (0.11 acres).

### Grassland

Two herbaceous series were mapped at E/D: wild oat grassland (0.95 acres) and fennel (0.05 acres). Wild oat grassland dominates the Natural Area.

### Scrub

Two non-native scrub series were mapped at E/D: cottoneaster scrub (0.04 acres) and mixed exotic scrub which contains Scotch broom (*Cytisus scoparius*) (0.05 acres).

### Sensitive Plant Species

No sensitive plant species have been observed at E/D. The California Natural Diversity Data Base (CNDDB) does not report the occurrence of any sensitive plant species at E/D (CNDDB 2009). It also does not provide potential habitat for sensitive plant species. Several native species were identified at E/D, including sky lupine (*Lupinus nanus*), yarrow (*Achillea millefolium*), and California melica (Melica californica).

### Invasive Plant Species

All of the vegetation series at E/D are dominated by invasive species. As previously mentioned, wild oat grassland dominates the site. Acacia trees are encroaching into the Natural Area from the residential development that abuts E/D on the southern edge. Cotoneaster scrub, mixed exotic scrub and fennel occur in the eastern portion of E/D. Additional invasive species within the grassland include Bermuda buttercup (*Oxalis pes-caprae*), English plantain (*Plantago lanceolata*), and wild radish (*Raphanus sativus*).

## WILDLIFE

### Birds

The multi-storied complex habitat found within E/D and below the Natural Area may provide some nesting and roosting habitat for a wide variety of species. The grassland habitats of E/D provide foraging habitat for raptors such as red-tailed (*Buteo jamaicensis*) and red-shouldered (*Buteo lineatus*) hawks, while the Acacia forest edge provides potential nesting habitat for these species. Habitat for smaller birds (songbirds) is available in the scrub and forest habitats in and below the Natural Area. No areas of important bird habitat were delineated for this Natural Area.

### Mammals, Reptiles, and Amphibians

No animal surveys were conducted at E/D; however, common animals are likely to occur here. Small mammals such as the California meadow vole (*Microtus californicus*), house mouse (*Mus musculus*), and pocket gopher (*Thomomys bottae*) are likely to be found in this habitat. Large mammals such as raccoons (*Procyon lotor*), striped skunks (*Mephitis mephitis*) and Virginia opossum (*Didelphis virginiana*) are typical of urbanized parks in general and are expected to occur within E/D. Reptiles typical of grassland habitats, such as garter snakes, are suspected to occur here, but have not been reported. The CNDDB does not report any sensitive species as

occurring within the area (CNDDB 2009), and the area does not provide potential suitable habitat for sensitive species.

**Invertebrates**

Sensitive Invertebrate Species

At least three special-status species of butterflies potentially occur within the City of San Francisco: mission blue butterfly (*Icaricia icarioides missionensis*), San Bruno elfin butterfly (*Incisalia mossii bayensis*), and bay checkerspot butterfly (*Euphydryas editha bayensis*). The CNDDB does not report the occurrence of any special-status species of invertebrates at E/D (CNDDB 2009), and the site does not provide potential habitat for these species.

## MANAGEMENT AREAS

The Management Areas (MAs) at E/D have been delineated based on the presence of diverse native grasslands. The MA-1a area supports a rich array of species including California poppy (*Eschscholzia californica*), purple needle grass (*Nassella pulchra*), and California melica (*Melica californica*), and is more intact habitat than the MA-2a area which borders Digby Street. The MA-3a areas include tree and shrub communities (Figure 6.27-4).

## ISSUES AND RECOMMENDATIONS

Several conservation and recreation-related issues have been identified for E/D. Recommendations developed for each of these issues will guide restoration, enhancement, and maintenance work. In the following discussion, system-wide issues and recommendations (GR-1 for example; see Chapter 5) that apply to the entire Natural Area at E/D are presented first within each topical area, followed by site-specific issues and recommendations. Site-specific recommendations are keyed to the Management Area in which they should occur.

**Site Improvements** – Implementation of management recommendations at E/D would not change significantly the overall look of the park and would result in:

- improved wildlife habitat;
- enhancement of native grasslands.

Careful management and restoration of the grasslands at E/D will create a native grassland that is rich in plant species and offers habitat for sensitive species of butterflies. This grassland may be comparable to that found on the northern slope of Bayview Park (Section 6.17) or on San Bruno Mountain.

## Vegetation

Issues relating to vegetation management at E/D involve the protection of habitats, typically though the control of invasive plants (GR-1). Specific actions to take in managing grasslands such as those present at E/D should be implemented (GR-3). No trees will be removed at E/D. Issues relating to the general safety of visitors and surrounding homes, fire hazards posed by vegetation and trees, and illicit activities must be considered during management of the Natural Areas (GR-13). In addition to these general recommendations, the following site-specific issues should be addressed.

**Issue ED-1:** Invasive species occur throughout E/D and pose a threat to the grasslands

> ***Recommendation ED-1a:*** Reduce and contain herbaceous and woody invasive species, including radish, fennel, and annual grasses in all Management Areas. Prevent the establishment of invasive trees in grasslands.
>
> ***Recommendation ED-1b:*** Areas where invasive species have been removed shall be revegetated using appropriate native plants. Existing grasslands will be enhanced and diversified as appropriate (MA-1a and MA-2a). Specifically, within MA-1a, efforts shall be taken to augment the existing uncommon grassland plant species such as silver lupine (*Lupinus albifrons* var. *collinus*). Within MA-2a, the existing non-native grassland should be slowly replaced with a native grassland including California poppy (*Eschscholzia californica*), purple needle grass (*Nassella pulchra*), and California melica (*Melica californica*). Using diversity, cover, and density targets generated from reference sites within and around San Francisco, plant native grassland species in the appropriate areas (see Appendix B).
>
> ***Recommendation ED-1c:*** Contain and/or reduce acacia, broom, cotoneaster, and fennel in MA-3a and diversify the grassland interface with wildlife-enhancing species and design.

## Wildlife

Implementation of system-wide recommendations that relate to vegetation management and nesting birds (GR-4), predation (GR-7), increasing cover for small mammals and birds (GR-9) and installation of host plants for native insects (GR-10) would all serve to enhance the wildlife habitat at E/D.

**Soils, Erosion, and Public Use**

No primary or secondary trials were observed in the E/D Natural Area. The issue of erosion and habitat impacts related to social trails that may develop is addressed through implementation of GR-11 and GR-12.

**Table xx. Vegetation series mapped at Everson/Digby.**

| | Vegetation Series | Total Acreage |
|---|---|---|
| **Forest** | acacia forest | 0.11 |

# Cumulative Projects

*San Francisco Related Cumulative Projects List*

**Area Plans**

| PLAN AREA | NATURAL AREAS |
|---|---|
| Bayview Hunters Point | Bayview Park, Bernal Hill, India Basin Shoreline Park, Palou/Phelps |
| Hunters Point Shipyard | India Basin Shoreline Park |
| Market and Octavia | Buena Vista Park, Corona Heights |
| Mission | Bernal Hill |

**Planning Cases**

| NATURAL AREAS | CASE NO | PROJECT NAME | NOTICE |
|---|---|---|---|
| 15th Avenue Steps | 2008.0612 | 1427 11TH AV | Two-story vertical addition to the existing one-story, 1,368 sqft single-family dwelling, and a three-story horizontal side addition to the south side of existing dwelling. The resulting structure will be three stories in height and 2-dwelling units. |
| 15th Avenue Steps | 2010.0264 | RPD-Grandview Park Restoration Work | Repair existing retaining walls, restore trail, provide new protective fencing, provide soil erosion control measures, and native plant restoration. |
| Balboa Natural Area | 2010.0350 | 640 46TH AV | 3rd-story vertical addition and remodel at 2nd-story of a single-family residence. |
| Bayview Park | 2006.0422 | Executive Park | General Plan Amendment and Zoning Map change to amend the Executive Park Subarea Plan of the South Bayshore Area Plan. |
| Bayview Park | 2009.0311 | SUNNYDALE SEWER IMPROVEMENT | SFPUC auxiliary sewer project to alleviate flooding in the Visitation Valley/Sunnydale neighborhood, with new main alignment N along county line to SF Bay; previous main tunnel alignment (1998.123E) Negative Declaration. |
| Bayview Park | 2008.1110 | 6600 Third Street | 100% Affordable DUs (42,238 square feet) and 21 off-street parking spaces. New building would be 40 feet tall. Demolition of 43 residential hotel rooms and construction of 25 new dwelling units and 55 group housing units. |
| Bayview Park | 2009.0815 | RPD-Candelstick Park | Add temporary pedestrain bridge over Hunters Point Expressway. |
| Bayview Park | 2009.0839 | BOS 091036-Third St/LeConte Affordable Housing SUD | Planning Code amendment establishing the Third Street and Le COnte Ave Affordable Housing Special Use District. |
| Bayview Park | 2010.0863 | Visitacion Valley Impact Fee | Amendments to the Planning Code Section 420.1-420.5: The Visitacion Valley Community Facilities and Infrastructure Fee and Fund [Board File No. 10-----]. Ordinance introduced by Supervisor Maxwell amending Planning Code Sections 420.1 (Findings), 420.2 |
| Bayview Park | 2010.0708 | RPD- Candlestick Park 2010 | Add temporary pedestrain bridge over Hunters Point Expressway. |
| Bernal Hill | 2008.0283 | 41 MIRABEL AV | Existing 2-unit, 3-story, 3298 sqft residential building. Proposed unit merge of the top two floors, remodel garage into a unit, and addition of a 1-car garage. |
| Bernal Hill | 2008.0409 | 384 HOLLADAY AV | Develop single-family dwellings on each lot with two off-street parking spaces each. Downslope Lots. |
| Bernal Hill | 2009.0195 | 280 BAYSHORE BL | Micro Bio Diesel Refinery; blending, fueling hybrid |
| Bernal Hill | 2009.0338 | 97 ANDOVER ST | Parking variance. Addition/Alteration of single-family residence. |
| Bernal Hill | 2009.0725 | 128 ELSIE ST | New single-family residence on a vacant downsloping lot. |
| Bernal Hill | 2009.1018 | 183 BREWSTER ST | New 2,811 sqft single-family residence on vacant lot. |
| Bernal Hill | 2009.0276 | CESAR CHAVEZ AUXILIARY SEWER | New 1.2mi auxiliary sewer to address localized flooding, Cesar Chavez Street Area. Alignment from east: off Napoleon, Jerrold, Precita, Cesar Chavez west to Valencia, Duncan, Guerrero, Fair, Coleridge, Coso. Replaces existing brick sewer in Cesar Chavez |
| Bernal Hill | 2009.0753 | 3155 Cesar Chavez Street | Vertical and horizontal addition of a church in an R-district. Requires CU per 209.3(j) |
| Bernal Hill | 2009.1173 | 1467 SHOTWELL ST | 2-story side addition and alterations to the existing entry way of a single-family residenence. |
| Bernal Hill | 2010.0306 | 10 Bernal Heights | Modify CU to install 5 dish antennas. |
| Billy Goat Hill | 2006.0974 | 1700 DIAMOND ST | Demolish existing single-family home, subdivide existing parcel resulting in four new lots, and construct four new single-family homes. |

SECTION 1

# PROJECT DESCRIPTION

The San Francisco Recreation and Park Department (SFRPD) proposes to implement the Significant Natural Resource Areas Management Plan at 32 Natural Areas in San Francisco and Pacifica. The largest individual project proposed under that plan is restoration of the wetland at Sharp Park located in Pacifica. The air quality analysis presented in this report analyzes the potential air quality impacts associated with the proposed restoration project. The estimated emissions from that project represent the highest level of emissions anticipated under the plan; this analysis serves as a guide for the anticipated emissions associated with other plan activities.

## 1.1 Project Location

The proposed project is to restore the wetland at Sharp Park located in the city of Pacifica, County of San Mateo, California. Sharp Park is one of the largest SFRPD parks and is surrounded by significant open spaces. The park borders the Pacific Ocean and is bisected by Highway 1. The Sharp Park Golf Course and Laguna Salada are on the western side of Highway 1. Mori Point borders the southwestern edge, and Sweeney Ridge borders the park on the southeastern and eastern edges. The northern side of Sharp Park is bordered by undeveloped areas within the cities of Pacifica and San Bruno. The Natural Area accounts for 237.2 acres within Sharp Park and encompasses the upper canyon areas, portions of Sanchez Creek, and the Laguna Salada wetlands and associated vegetation.

The proposed project is in the area under the jurisdiction of the Bay Area Air Quality Management District (BAAQMD). BAAQMD is the public agency entrusted with regulating stationary sources of air pollution in the nine counties that surround San Francisco Bay: Alameda, Contra Costa, Marin, Napa, San Francisco, San Mateo, Santa Clara, southwestern Solano, and southern Sonoma counties.

## 1.2 Proposed Project Description

Following are the proposed main activities to restore the wetland at Sharp Park:

- Dredging to remove sediment and decaying vegetation in Laguna Salada, Horse Stable Pond, and the channel that connects the two water bodies;
- Re-contouring the shoreline to create shallow water habitat;
- Creating a habitat corridor between Horse Stable Pond and Laguna Salada;

- Creating an upland peninsula in the middle of the lagoon to provide snakes and frogs with refugia from feral cats and other predators; and

- Constructing upland mounds on the east side of the lagoon and between Laguna Salada and Horse Stable Pond.

## 1.3 Types and Sources of Air Pollutants

There are three major sources of emissions for this project:

- Fugitive dust emissions – Dust is generally associated with excavation, windblown unpaved areas, vehicle and equipment travel on unpaved roads, and dirt/debris pushing. Dust generated during construction activities would vary substantially depending on the level of activity, the specific operations, and weather conditions;

- Construction Equipment – Construction requires use of heavy-duty equipment, such as bulldozers, excavators, loaders, etc. Exhaust emissions from this equipment during construction activities would vary daily as activity levels change; and

- Vehicles – Transport vehicles travelling to and from the site, including delivery trucks hauling materials and automobiles carrying workers, generate exhaust emission.

# SECTION 2

# PROJECT SETTING

## 2.1 Sources and Receptors

The emission sources for this project include: fugitive dust from site excavation, exhaust form construction equipment and exhaust from vehicles. The BAAQMD California Environmental Quality Act (CEQA) Air Quality guidelines require that air quality impact shall be assessed for receptors located within 1,000 feet of a project. These nearby receptors include residents, businesses, schools, churches, and hospitals. Figure 1 shows the emissions sources and the receptors within 1,000 feet of the proposed project. The area within 1,000 feet of the emissions source is often referred to as the zone of impact. The zone of impact is depicted as a circle on Figure 1. The nearest receptor is the golf course located east of the site where major construction activities will occur.

## 2.2 Existing Air Quality Standards

In California, local responsibility for air quality is assigned to air quality management districts and air pollution control districts. The project site is located in San Mateo County, which is under the jurisdiction of the BAAQMD. The impact analysis contained in this section was prepared according to the methodologies provided by the BAAQMD [Ref. 1].

The Federal Clean Air Act (42 USC Section 7401-7671q; CAA) requires the adoption of the National Ambient Air Quality Standards (NAAQS) to protect the public health and welfare from the effects of air pollution. Current standards are set for sulfur dioxide ($SO_2$), carbon monoxide (CO), nitrogen dioxide ($NO_2$), ozone ($O_3$), fine particulate matter equal to or less than 10 microns ($PM_{10}$), fine particulate matter equal to or less than 2.5 microns ($PM_{2.5}$), and lead (Pb). These pollutants are called criteria air pollutants. The State of California Air Resources Board (ARB) has established additional standards for criteria air pollutants that are generally more restrictive than the NAAQS. National and state standards are shown in Table 1 [Ref. 2].

The project site is located within the jurisdiction of the BAAQMD. The mission of the BAAQMD is to attain and maintain NAAQS and California Ambient Air Quality Standards (CAAQS) and to ensure air pollutants do not pose a nuisance or significant public health threat.

## 2.3 Climate

Air quality in the project area is not only affected by various emission sources (mobile, industry, etc.) but also by atmospheric conditions such as wind speed, wind direction, temperature, and rainfall, etc.

The climate near the proposed project features mild and wet winters and cool summers with frequent fog or wind. The lowest winter temperatures ranged from 36°F to 23°F (2°C to –5°C). The lowest temperature on record ranges from 30°F to 20°F (–1°C to –7°C). The average highest temperature ranges from 104°F to 116°F (40°C to 47°C).

The BAAQMD maintains a meteorological station near the proposed project (Fort Funston Meteorological Station). The station is located approximately 10 miles north of Sharp Park. Review of the wind data collected at this station shows that the prevailing wind is from the southwest with an average wind speed of 8 knots. Figure 2 shows the windrose plot.

## 2.4 Air Pollutant Constituents and Attainment Status

The following describes the criteria air pollutants and their attainment status in the Bay Area Air Basin. A state or region is given the status of "attainment" or "unclassified" if ambient air quality standards have not been exceeded. A status of "nonattainment" for particular criteria air pollutants is assigned if the ambient air quality standard for that pollutant has been exceeded. Once designated as nonattainment, attainment status may be achieved after three years of data showing non-exceedance of the standard. When an area is reclassified from nonattainment to attainment, it is designated as a maintenance area, indicating the requirement to establish and enforce a plan to maintain attainment with the standard.

Table 2 presents the air quality attainment status of the Bay Area Air Basin. The Bay Area is classified "attainment" for all of the national standards with the exception of ozone. It is classified "non-attainment" for state standards for ozone and particulate matters ($PM_{10}$ and $PM_{2.5}$). Following is a brief description of the criteria air pollutants.

### Ozone

Ozone results from chemical reaction of nitrogen oxides and reactive organic gases under sunlight influence. Ozone is a problematic air contaminant in the Bay Area Air Basin. Maximum ozone concentrations usually are recorded during summer months. The BAAQMD measured ambient air data show that state and national ozone air quality standards were exceeded approximately 32 days in 2009 [Ref. 3]. Under both national and state standards, the area is classified as nonattainment area for ozone.

### Nitrogen Dioxide

Nitrogen dioxide ($NO_2$) is a product of fuel combustion, during which the nitrogen in the air is converted to nitrogen dioxide ($NO_2$) and nitric oxide (NO). The combination of $NO_2$ and NO is collectively known as nitrogen oxides (NOx). The BAAQMD measured ambient air data show that state and national $NO_2$ air quality standards were not exceeded in 2009 [Ref. 3]. Under both national and state standards, the area is classified as attainment area for $NO_2$.

### Carbon Monoxide

Carbon monoxide (CO) is a product of inefficient combustion, principally from automobiles and other mobile sources of pollution. CO reduces the oxygen-carrying capacity of the blood and in high concentrations can cause death. At lower concentrations, people exposed experience dizziness and headaches. The BAAQMD measured ambient air data show that state and national CO air quality standards were not exceeded in 2009 [Ref. 3]. Under both national and state standards, the area is classified as attainment area for CO.

### Sulfur Dioxide

Sulfur dioxide ($SO_2$) is produced when any sulfur-containing fuel is burned. Chemical plants that treat or refine sulfur or sulfur-containing chemicals also emit $SO_2$. Because of the complexity of the chemical reactions that convert $SO_2$ to other compounds (such as sulfates), peak concentrations of $SO_2$ occur at different times of the year in different parts of the state, depending on local fuel characteristics, weather, and topography. $SO_2$ can cause bronchia constriction and may aggravate respiratory diseases. In moist environments, $SO_2$ may combine with water to form sulfuric acid, a component of acid deposition. The BAAQMD measured ambient air data show that state and national $SO_2$ air quality standards were not exceeded in 2009 [Ref. 3]. Under both national and state standards, the area is classified as attainment area for $SO_2$.

### Fine Particulates ($PM_{10}$, $PM_{2.5}$)

Particulate matter in the air is composed of windblown fugitive dust; particles emitted from combustion sources (usually carbon particles); and organic, sulfate, and nitrate aerosols formed in the air from emitted hydrocarbons, sulfur oxides, and oxides of nitrogen. In 1984, the ARB adopted standards for fine particulate ($PM_{10}$ - particulate matter of less than 10 microns), and phased out the total suspended particulate (TSP) standards used up to that time. $PM_{10}$ standards were substituted for TSP standards because $PM_{10}$ corresponds to the size range of inhalable particulate related to human health. In 1987, Environmental Protection Agency (EPA) also replaced national TSP standards with $PM_{10}$ standards. In July 1997, the EPA adopted new standards for fine particulate matter less than 2.5 microns in diameter ($PM_{2.5}$).

Particulates are a public health and welfare concern for several reasons. Particulates may be intrinsically toxic because of their inherent chemical and/or physical characteristics. Particulate matter may interfere with one or more of the mechanisms that normally clear the respiratory tract. Finally, fine particulates, which are easily carried deep into the lungs, may act as carriers of absorbed toxic substances. Thus elevated particulate concentrations may exacerbate pre-existing respiratory diseases such as bronchitis. Particulate matter, especially fine particulates, also interferes with visibility. The BAAQMD measured ambient air data show that state $PM_{10}$ air quality standards were exceeded on 1 day in 2009 [Ref. 3]. The national $PM_{2.5}$ air quality standards were exceeded on 11 days in 2009 [Ref. 3].

## Lead

Lead is found in old paints and coatings, plumbing, and various other materials. Once in the blood stream, lead can cause damage to the brain, nervous system, and other body systems. Children are highly susceptible to the effects of lead.

| Sulfates | 24 Hour | 25 µg/m$^3$ | | |
| Hydrogen Sulfide | 1 Hour | 0.03 ppm | | |
| Vinyl Chloride [7] | 24 Hour | 0.01 ppm | | |

µg/m$^3$ – micrograms per cubic meter
ppm – parts per million

1. California standards for ozone, carbon monoxide (except Lake Tahoe), sulfur dioxide (1- and 24-hour), nitrogen dioxide, suspended particulate matter ($PM_{10}$, $PM_{2.5}$) and visibility reducing particles, are values that are not to be exceeded. All others are not to be equaled or exceeded. California ambient air quality standards are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.

2. National standards (other than ozone, particulate matter, and those based on annual averages or annual arithmetic mean) are not to be exceeded more than once a year. The ozone standard is attained when the fourth highest 8-hour concentration in a year, averaged over three years, is equal to or less than the standard. For $PM_{10}$, the 24-hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 µg/m$^3$ is equal to or less than one. For $PM_{2.5}$, the 24-hour standard is attained when 98 percent of the daily concentrations, averaged over three years, are equal to or less than the standard.

3. Concentration expressed first in units in which it was promulgated; ppm in this table refers to ppm by volume, or micromoles of pollutant per mole of gas.

4. National Primary Standards: The levels of air quality necessary, with an adequate margin of safety to protect public health.

5. National Secondary Standards: The levels of air quality necessary to protect public welfare from any known or anticipated adverse effects of a pollutant.

6. New National 8-hour ozone and fine particulate matter standards were promulgated by EPA on July 18, 1997.

7. The ARB has identified lead and vinyl chloride as toxic air contaminants with no threshold level of exposure for adverse health effects determined. These actions allow for implementing control measures at levels below the ambient concentrations specified for these pollutants.

8. Extinction coefficient of 0.23 per kilometer, visibility of ten miles or more (0.07 – 30 miles or more for Lake Tahoe) due to particulates when relative humidity is less than 70 percent.

## SECTION 3

# THRESHOLDS OF SIGNIFICANCE

This section describes the air quality significant thresholds established by the BAAQMD. Section 4 presents the methodologies used to determine the air quality impacts associated with the proposed project and the actual air quality impacts using these methods.

For purposes of meeting national requirements, impact significance is related to conformance with the EPA-approved State Implementation Plan (SIP) and with the NAAQS. Air quality impacts would be significant if they exceed these standards or contribute to non-conformance. BAAQMD has published thresholds of significance for air quality, as shown in Table 3.

A project has a significant air quality impact if it does one of the following:

1. Generates total emissions that exceed the thresholds shown in Table 3; and/or

2. Exposes sensitive receptors to substantial pollutant concentrations, including those resulting in a cancer risk greater than or equal to 10 in a million and/or a Hazard Index (HI) (non-cancerous) greater than or equal to 1, or annual average $PM_{2.5}$ emissions above 0.3 $\mu g/m^3$.

A project with significant impacts must incorporate mitigation sufficient to reduce its impact to a level that is not significant. A project that cannot be mitigated to a level that is not significant must incorporate all feasible mitigation.

Table 3. Thresholds of Significance

| Criteria Air Pollutants | Construction-Related | Operational-Related | |
|---|---|---|---|
| | Average Daily Emissions (lbs/day) | Average Daily Emissions (lbs/day) | Maximum Annual Emissions (tons/yr) |
| ROG | 54 | 54 | 10 |
| NOx | 54 | 54 | 10 |
| $PM_{10}$ | 82 (exhaust only) | 82 | 15 |
| $PM_{2.5}$ | 54 (exhaust only) | 54 | 10 |
| CO | None | 9 ppm (8-hr average), 20 ppm (1-hr average) | |
| SOx | None | None | None |
| GHGs (stationary sources) | None | 10,000 MT/yr | |
| GHGs (non-stationary sources) | None | Compliance with Qualified GHG Reduction Strategy Or 1,100 MT of $CO_2e$/yr Or 4.6 MT $CO_2e$ /yr (residents and employees) | |
| Health Risk (Individual Project) | Same as Operational-related Thresholds | Cancer Risk < 10 in a million, Chronic Index <1, Acute Index <1, Ambient $PM_{2.5}$ < 0.3 ug/$m^3$ annual average, Zone of Impact = 1,000 feet from fence line | |
| Health Risk (cumulative) | Same as Operational-related Thresholds | Cancer Risk < 100 in a million, Chronic Index <10, Acute Index <10, Ambient $PM_{2.5}$ < 0.8 ug/ $m^3$ annual average (from all local sources), Zone of Impact = 1,000 feet from fence line | |

$CO_2e$ – carbon dioxide equivalent
GHG – greenhouse gas
lbs – pounds
MT – metric ton
ROG – reactive organic gas
yr – year

## SECTION 4

# CRITERIA AIR POLLUTANT EMISSIONS

This section presents the methodologies used to determine the types and quantities of the criteria air pollutant emissions and their impacts associated with the proposed Sharp Park restoration project.

## 4.1 Methodology

### 4.1.1 Construction Emissions

Air quality impacts associated with the proposed project are related to emissions that would occur during construction and subsequent operation of the proposed project. The principal sources of pollutants during construction would be the earth-moving activities, construction equipment, trucks bringing materials to site, and construction crew commuting vehicles. The sources of pollutants during project operations would be limited to the vehicles and equipment used by the operations and maintenance staff.

There are many air quality modeling tools available to assess air quality impacts of the project. Construction emissions were estimated based on the air emission modeling software package, ARB's URBEMIS 2007 [Ref. 4]. The model selection is consistent with the BAAQMD CEQA guidelines. The model contains data specific for each California air basin.

Construction is typically conducted in phases. The URBEMIS 2007 model divides construction into demolition, mass site grading, fine site grading, trenching, building construction, architectural coating, and paving phases. These model settings can be modified to fit applicable features of a specific project. For this project, the following construction phases are assumed:

- Barrier Installation and Ponds Dewatering
- Excavation and Grading
- Culvert Placement and Excavation
- Revegetation
- Rifle Range Excavation

Each construction phase can generate the following: (1) fugitive dust emissions resulting from soil disturbance activity; (2) emissions of air pollutants from fuel combustion in construction equipment; and (3) emissions of air pollutants from fuel combustion in vehicles used for worker commuting and material hauling and construction debris disposal.

Construction activities consist of wetland restoration activities in the Sharp Park area, west of Highway 1. The project is located in a coastal wetland which is currently home to several endangered species. The endangered species located on-site are migratory in nature and generally not present at Sharp Park from September to October each year..

The air quality impact analyses are conducted based on the assumption that construction activities would be conducted in a single year between May 1 and October 15. A summary of the quantitative construction activity information and assumptions used for the modeling analysis is provided in Appendix A

### 4.1.2 Operational-Related Emissions

Planned maintenance activities during the operation phase could result in emissions. However, because proposed operations are expected to be substantially similar to current operations, negligible changes are anticipated in the operation emissions. As a result, these operation emissions are not expected to exceed the BAAQMD significance thresholds and are not quantified.

## 4.2 Results of Analysis

### 4.2.1 Project Level

Table 4 shows the URBEMIS model output summary. Criteria air pollutant emissions from construction activities were compared to the June 2010 BAAQMD CEQA significance thresholds. As shown in Table 4, construction criteria air pollutant emissions would exceed the BAAQMD threshold for NOx, and mitigation measures would be required. Appendix A provides the complete URBEMIS files, including construction assumptions, schedules, types and quantities of equipment, model input and output files.

### 4.2.2 Cumulative

The BAAQMD considers projects that result in a significant criteria air pollutant or ozone precursor impact to also result in a cumulatively considerable contribution to criteria air pollutants or ozone precursors.

## 4.3 Mitigation Measures

The project will be required to implement all feasible mitigation measures to reduce NOx emissions.

Following are the mitigation measures considered for NOx emissions reduction:

1. For any Sharp Park restoration activities between 2011 and 2015, use Tier 3 equipment with best available control technology where feasible. For programmatic projects conducted after 2015, use Tier 4 equipment or interim Tier 4 equipment equipped with best available control technology where such equipment exists.

2. Use temporary power provided by the Pacific Gas & Electric Company instead of diesel generators; where it is not possible to plug into the electric grid, use Tier 3 diesel generators and air compressors.

3. Use concrete batched from local plants to limit concrete trucks' travel time and the amount of diesel exhaust emitted.

4. Minimize idling times by either shutting equipment and vehicles off when not in use or limiting the maximum idling time to five minutes (as required by the California airborne toxics control measure Title 13, Section 2485 of California Code of Regulations [CCR]). Provide clear signage for construction workers regarding idling rules at all access points.

5. Use on-road haul trucks model year 2007 or later.

6. Maintain and properly tune construction equipment in accordance with manufacturer's specifications. Have all equipment checked by a certified mechanic to determine that equipment is running in proper condition prior to operation.

There are commercially available post-combustion NOx emission control technologies, including selective catalytic reduction (SCR) system, selective non-catalytic reduction (SNCR) system, and NOxTECH. These technologies can reduce NOx emissions by up to 90 percent. However, they are more suitable for stationary equipment and have not been demonstrated and proven to operate effectively in mobile construction equipment. In summary, the proposed mitigation measures would reduce NOx emissions but not substantially. Using Tier 3 or similar engines would be the most effective way to reduce NOx emissions; however, it is not likely to reduce emissions below the significance threshold.

For dust control mitigation, the San Francisco Construction Dust Ordinance requires that all site preparation work, demolition, or other construction activities that have the potential to create dust or to expose or disturb more than 10 cubic yards or 500 square feet of soil must comply with specified dust control measures. For project sites greater than half an acre in size, the Ordinance requires that a Dust Control Plan be prepared and approved by the San Francisco Health Department. The SFRPD would be required to comply with the Ordinance and submit a Dust Control Plan for the Sharp Park restoration project and many of the programmatic projects.

In addition, BAAQMD fugitive emissions rule requires that fugitive dust be controlled with best available control measures so that the presence of such dust does not remain visible in the atmosphere beyond the property line of the emission source. The BAAQMD fugitive emissions rule requires implementing dust suppression techniques to prevent fugitive dust from creating an off-site nuisance. Implementing these dust suppression techniques will reduce the fugitive dust generation (and thus the $PM_{10}$ component). Compliance with these rules would reduce impacts on nearby sensitive receptors. Applicable dust suppression techniques include the following:

1. Water active sites. Locations where grading is to occur will be watered before earth moving activities;

2. All trucks hauling dirt, sand, soil, or other loose materials are to be covered or should maintain at least two feet of freeboard in accordance with the requirements of California Vehicle Code (CVC) section 23114 (freeboard means vertical space between the top of the load and top of the trailer);

3. Traffic speeds on all unpaved roads shall be reduced to 15 miles per hour or less.

The San Francisco Dust Control Ordinance includes these dust suppression requirements.

## 4.4 Summary of Project's Criteria Air Pollutant Impacts

In summary, the air quality analysis concludes that the project would result in NOx emissions that exceed the significant thresholds established by the BAAQMD. During the long-term operation of the project, all criteria air pollutant emissions are expected to be similar to current emissions levels.

Because construction-related NOx emissions exceed the BAAQMD significance threshold, the project would also be considered to result in a considerable contribution to cumulative ozone precursor emissions.

Table 4. CEQA Thresholds of Significance for Construction Emissions Versus Estimated Sharp Park Construction Emissions

| | **Average Daily ROG, lbs/day** | **Average Daily NOx, lbs/day** | **Average Daily $PM_{10}$, lbs/day** | **Average Daily $PM_{2.5}$, lbs/day** | **GHGs, $CO_2e$ (MT/year)** |
|---|---|---|---|---|---|
| BAAQMD Threshold for Construction Emissions | 54 | 54 | 82 (exhaust only) | 54 (exhaust only) | None for construction |
| Sharp Park Construction Emissions | 13 | 153 | 3.4 (exhaust only) | 3.1(exhaust only) | 1,630 |
| Exceed Threshold? | No | YES | No | No | NA |

NA = Not Applicable

# SECTION 5

# GREENHOUSE GAS EMISSIONS

This section presents the methodologies used to determine the types and quantities of the greenhouse gas (GHG) emissions and their impacts associated with the proposed Sharp Park restoration project.

## 5.1 Methodology

### 5.1.1 Construction Emissions

The BAAQMD does not have an adopted quantitative threshold of significance for construction-related GHG emissions. However, BAAQMD recommends that construction-related GHG emissions be quantified and that the project opponent make a determination on the significance of these construction-generated GHG emission impacts.

For this project, the sources of GHG are the fuel combustion in construction equipment, in vehicles used to haul materials and vehicles used by worker commuting to/from the site.

There are three types of GHG from fuel combustion, including carbon dioxide ($CO_2$), methane ($CH_4$) and nitrous oxide ($N_2O$). GHG emissions are presented as carbon dioxide equivalents ($CO_2e$). $CO_2e$ is computed based on global warming equivalence. The $CH_4$ global warming equivalence is 21 times that of $CO_2$, and the $N_2O$ global warming equivalence is 310 times that of $CO_2$.

Mathematically, the $CO_{2e}$ can be represented by the following equation:

$CO_{2e}$ Emissions = $CO_2$ Emissions + 21 x $CH_4$ Emissions + 310 x $N_2O$ Emissions

The BAAQMD has developed a GHG emission calculation tool (BGM Model). However, this model can only be used to estimate operation-related GHG emissions. Therefore, the URBEMIS model was used to estimate the GHG emissions during the construction phase of the proposed project.

### 5.1.2 Operation Emissions

Planned maintenance activities during the operation phase could result in GHG emissions. However, because proposed operations are expected to be substantially similar to current operations, negligible changes are anticipated in the operation emissions. As a result, these operation GHG emissions are not expected to exceed the BAAQMD significance thresholds and are not quantified.

## 5.2 Results of Analysis

### 5.2.1 Project Level

Tetra Tech used the URBEMIS model to estimate the GHG emissions during the construction phase of the project. Based on the construction schedule, types and quantities of construction equipment, and numbers of haul trucks, etc., Tetra Tech estimated that the maximum $CO_2$ emissions would be 21,777 pounds per day. Table 4 shows the calculation result.

The URBEMIS model provides a $CO_2$ profile only and does not quantify $CO_2e$, $CH_4$ and $N_2O$ emissions. Tetra Tech assumes that the $CO_2$ emissions of 21,777 pounds per day are $CO_2e$. Justification of the assumption is as follows: For typical diesel-fueled combustion equipment used in construction activities, the emissions factors adjusted with global warming equivalence are:

(1) $CO_2$ emission factors are 22.4 pounds of $CO_2e$ per gallon consumed,
(2) $CH_4$ emission factors are 0.065 pounds of $CO_2e$ per gallon consumed, and
(3) $N_2O$ emission factors are 0.068 pounds of $CO_2e$ per gallon consumed.

As shown in these emission factors, the $CO_2$ profile is 99 percent of the total GHG generated in combustion equipment. Therefore, Tetra Tech assumes that the $CO_2$ emissions of 21,777 lbs per day represent the $CO_2e$ levels.

The current BAAQMD CEQA guidelines have no quantitative GHG emissions significance threshold for construction. This GHG quantification is presented for information purpose only. The Sharp Park wetland restoration project has average $CO_2e$ emissions of 21,777 lbs per day, which are converted to 3,593,205 pounds based on 5.5 months per one year of construction activities. This annual emission profile converts to 1,630 MT.

### 5.2.2 Cumulative

The impacts of climate change are the cumulative result of GHG emissions and therefore a project-level analysis of GHG emissions is also considered an analysis of a project's contribution to cumulative effects of GHGs.

BAAQMD's approach is to identify the GHG emissions level for which a project would not be expected to substantially conflict with existing California legislation adopted to reduce statewide GHG emissions. If a project would generate GHG emissions above the threshold level, it would be considered to contribute substantially to a cumulative impact. Based on this approach, the GHG emissions of the proposed project during the operation phase would not make a considerable contribution to cumulative GHG impacts.

## 5.3 Mitigation Measures

The estimated project-level GHG emissions from operation would not have a significant impact; as result, no mitigation is required.

## 5.4 Summary of Project's GHG Impacts

In summary, the air quality analysis concludes that during the long-term operation of the project, all GHG emissions are expected to be similar to current emissions levels. There are no GHG emissions thresholds established by the BAAQMD for construction activities.

# SECTION 6

# HEALTH RISK ANALYSIS

This section presents the methodologies used to determine the health risks and the impacts associated with the proposed project.

## 6.1 Methodology

### 6.1.1 Construction

#### 6.1.1.1 Project-Level

During construction, toxic emissions are generated mainly from fuel combustion in the construction equipment. In order to determine the health impacts of these toxic emissions, a health risk assessment (HRA) was performed.

A HRA is an estimate of the probability that adverse health effects could occur due to exposure to toxic pollutants. A facility's air emissions, stack information, operation schedule, local weather conditions, chemical dose-response data, etc. are fed into a computer model to produce an estimate of the health risks to nearby people (receptors). HRA is performed in 3 steps: hazard identification, exposure assessment, and risk characterization.

Hazard Identification

Hazard identification refers to the identification of substances as carcinogens, reproductive toxins, chronic toxins, or acute toxins, or to the identification of a type of exposure as hazardous. Regulated hazardous substances are listed in BAAQMD's toxic rule and ARB's regulated toxic lists. The toxic air contaminants (TACs) used in the HRA include $PM_{2.5}$, diesel particulate matter (DPM) and acrolein. DPM and acrolein are byproducts of diesel fuel combustion. Sources of $PM_{2.5}$ include activities such as earthmoving. There are other TACs from diesel combustion besides DPM and acrolein, but they are less potent and thus are not included in the HRA.

Exposure Assessment

Exposure assessment is the identification and quantification of all routes of human exposure to substances of concern. The Industrial Source Code Short Term Version 3 (ISCST3) model issued by EPA was used for estimation of offsite concentrations of TACs. Based on land use surrounding the proposed project and EPA guidelines, an urban profile was assumed. Meteorology data from the BAAQMD's Fort Funston Station were used. The model selection is consistent with the BAAQMD CEQA guidelines. The following inputs were used for the ISCST3 model.

1. Emission Source Models

Construction activities were modeled as area sources placed over the area of wetland restoration activities. The project is expected to require soil export activities using haul trucks which have the potential to emit toxic air contaminants (TACs). Haul trucks travelling to and from the site were modeled as an area source extending ¼ mile from the project site. Pollutants modeled include $PM_{2.5}$, DPM, and acrolein which are emitted from heavy construction equipment and haul trucks.

2. Site Elevation

Elevation data and aerial photography was obtained from the United States Geological Survey (USGS) Seamless Data Warehouse [Ref. 5].

3. Receptor Models

Modeled sensitive receptor locations included residents located to the north and south of the project site. The project site is currently surrounded by a golf course which is expected to be operational during construction activities. Therefore, sensitive receptor locations were placed in the golf course to account for people who may be present during construction activities. Receptor locations were placed at 50-meter intervals. Construction emission sources and receptors included in the model are presented in Figure 3. To estimate a worst-case health impact, the nearest sensitive receptor was assumed to be a residential child at the project fence line.

Risk Characterization

Risk characterization is the final step of the HRA. It quantifies the human health risk based on the exposure assessment and dose-response relationships (cancer potency factors and reference exposure levels). In this assessment, three types of human health effects were considered: 1) cancer, 2) chronic effects, and 3) acute effects. Health risks including cancer, chronic, and acute risks are calculated based on the Office of Environmental Health and Hazard Assessment (OEHHA) guidelines. In order to present the worst-case scenario, the BAAQMD recommends that cancer risk be weighted by a factor of 10 for exposure that occurs to an individual from the third trimester of pregnancy to two years of age. Health risk (cancer, chronic, and acute) was calculated using the ARB Hot Spots Analysis Reporting Program (HARP) which is based on OEHHA risk factors [Ref. 6]. Annual $PM_{2.5}$ emissions from construction activities were also modeled to determine impacts on sensitive receptors.

Following is a summary of the OEHHA method to determine the cancer, chronic and acute health risk:

*Cancer Risk*

The cancer risks were calculated as the individual excess lifetime cancer risk (i.e., the probability that an individual may develop cancer from a lifetime exposure to the chemicals of concern).

There are different pathways that a toxicant can enter a human body. Gaseous toxicants can enter a human body through the inhalation pathway. Gaseous toxicants can also be deposited on soil, surface water, or plants, which can then enter a human body through ingestion and dermal pathways. Semi-volatile and metal toxicants can enter the body through inhalation, ingestion and dermal pathways.

For inhalation pathway, the cancer risk is computed using the following equation:

$$CRinh = (GLC \times CP \times CRAF \times BR \times EF \times ED \times 10^{-6}) / AT \quad \text{Eq. 1}$$

Where:

CRinh = Cancer Risk through inhalation
GLC = Annual Average Ground-level concentration (from air dispersion model)
CP = Cancer Potency factor
BR = Daily Breathing Rate
EF = Exposure frequency
ED = Exposure Duration
AT = Average Time Period
CRAF = Cancer risk adjustment factors:
1.7 for resident receptors exposure
1.0 for offsite worker exposure

OEHHA revised the HRA guideline in May 2009, which included procedures to consider the increased susceptibility of infants and children to carcinogens compared to adults. The revised procedures require incorporation of age sensitivity factors (ASFs) in the calculation of cancer risk for infants, children and adolescents. The ASFs results in weighting cancer risk by a factor of 10 for exposure that occurs from the third trimester of pregnancy to 2 years of age and a factor of 3 for exposure that occurs from 2 years through 15 years of age.

For the proposed project, the risks due to exposure of DPM thru the non-inhalation pathways are not considered. This is consisted with the BAAQMD guidelines [Ref. 7].

*Chronic Risk*

The potential for long-term chronic health effects is quantified by comparing the predicted level of exposure to a reference exposure level (REL). This ratio of predicted exposure to reference exposure is referred to as a chronic hazard index (HIc). HIc is calculated by summing the ratios of each toxic substance over its REL. The equation for estimating HIc is as follows:

$$HIc = \sum Ci / \text{chronic RELi}$$

Where:

Ci = Ground-level concentration of substance i (annual average concentration)
RELi = Chronic Reference Exposure Level for substance i.

*Acute Risk*

In the same manner as the quantification of chronic health effects, the potential for short-term acute health effects was quantified using a hazard index. The acute hazard index (HIa) is calculated by dividing the maximum estimated hourly concentration of each toxic air pollutant by its reference short-term exposure levels. The equation for estimating HIa is as follows:

$$HIa = \sum Ci / \text{Acute RELi}$$

Where:

Ci = Maximum hourly ground-level concentration of substance i
RELi = Acute Reference Exposure Level for substance i.

Table 5 provides the HRA input parameters.

### 6.1.1.2 Cumulative

Cumulative health risk was determined by obtaining risk values from nearby sources of toxics from the BAAQMD website. Within 1,000 feet of the project area, there is only one source, which is a gas station owned and operated by the SFRPD for refueling of golf carts. Tetra Tech contacted the BAAQMD for the health risks from this facility. The BAAQMD determined that the risk from the SFRPD gas station is insignificant.

The project is located within 1,000 feet of a Highway 1, which is a major roadway. Vehicles on Highway 1 emit TACs and $PM_{2.5}$. Health risk impacts from these nearby traffic flows on Highway 1 were determined using BAAQMD roadway screening models.

Relative to the project site at Sharp Park in San Mateo County, Highway 1 runs north and south and is approximately 400 feet from the project site. Based on this location, the BAAQMD screening model was used to determine risks and $PM_{2.5}$ emissions from Highway 1 [Ref. 8, 9]. The risk values and $PM_{2.5}$ emissions profiles were added to project-level risks to determine the cumulative risks for the project.

### 6.1.2 Operational

#### 6.1.2.1 Project-Level

During operation, planned activities would result in operational emissions. However, because proposed operations are expected to be substantially similar to current operations, negligible changes are anticipated in the operation emissions. As a result, health risks from these operation emissions are not quantified.

#### 6.1.2.2 Cumulative

Planned activities would result in operational emissions. However, because proposed operations are expected to be substantially similar to current operations, negligible changes are anticipated in the operation emissions. As a result, health risks from these operation emissions are not quantified.

## 6.2 Results of Analysis

### 6.2.1 Project Level

Table 6 summarizes the HRA results. The construction emissions would result in a less than significant impact with regard to TACs and health risk. Cancer risk and $PM_{2.5}$ concentrations are presented in Figures 4 and 5 respectively. Figure 4 identifies the locations of the highest cancer risk, chronic risk and acute risk. Figure 5 shows the location of the highest $PM_{2.5}$ concentrations. Appendix B provides the dispersion and risk model files. The output file data is provided electronically on CD.

### 6.2.2. Cumulative

As shown in Table 6, the cumulative emissions would result in a less than significant impact related to TACs and health risk.

## 6.3 Mitigation Measures

The estimated health risk is below the BAAQMD thresholds; therefore, no mitigation is required.

## 6.4 Summary of Project's Health Risk Impacts

In summary, the HRA concludes that toxic emissions during short-term construction do not exceed the significance thresholds established by the BAAQMD. During the long-term operation of the project, all emissions and health risks are expected to be remained at current levels.

Table 5. HRA Model Input Parameters

| **Input Parameters – ISCST3 MODEL** | | |

# SECTION 7

# CONCLUSIONS

This air quality analysis for the proposed Sharp Park wetland restoration project has the following conclusions.

## 7.1 Construction - Short-Term Impacts

During the construction phase, the short-term NOx emissions would exceed BAAQMD significant thresholds. Mitigation measures are proposed that can reduce such impacts.

All other short-term criteria air pollutant emissions would not exceed BAAQMD significant threshold.

The HRA concluded that toxic emissions during short-term construction do not exceed the significant health risk thresholds established by the BAAQMD.

## 7.2 Operation - Long-Term Impacts

During operation, planned maintenance activities would remain similar to current levels at the Park.

**Table B1. Cancer Risks Calculation from ISCST and HARP Output Files - Shap Park Wetland Restoration Project**

| Receptor | Type | UTME | UTMN | Annual (µg/m3) DPM GLC from construction | DPM GLC from Haul truck | Cancer Risk (70 Yr Exposure) | Cancer Risk (1 Yr Exposure) | Cancer Risk (1 Yr Exposure adjusted by ASF) |
|---|---|---|---|---|---|---|---|---|
| 583 | GRID | 544950 | 4164500 | 2.89E-02 | 2.47E-04 | 4.15482E-06 | 5.93546E-08 | 5.93546E-07 |
| 576 | GRID | 544950 | 4164450 | 3.09E-02 | 5.59E-04 | 4.48448E-06 | 6.40639E-08 | 6.40639E-07 |
| | | | | | | | | 6.40639E-07 |

Sample Calculation:

At the receptor (#576), which has the highest cancer risk:

Cancer = [(3.09E-2 + 5.59E-4)) x 1.1 x 302 x 365 x 3 x 0.00001] / 25550 [70 years exposure] =

Cancer ={ [(3.09E-02 + 5.59E-4) x 1.1 x 302 x 365 x 3 x 0.00001] / 25550} x (1/70) [1 years exposure] =

Cancer ={ [(3.09E-2 + 5.59E-4) x 1.1 x 302 x 365 x 3 x 0.00001] / 25550} x (1/70) x 10 [1 Year exposure for infants] =

**Table B2. Chronic Index, Acute Index and PM2.5 Calculation from ISCST and HARP Output Files - Shap Park Wetland Restoration Project**

| Receptor | Type | UTME | UTMN | Annual (µg/m3) DPM GLC from construction | Annual (µg/m3) DPM GLC from Haul truck | 1-hr (ug/m3) Acrolein GLC from construction | 1-hr (ug/m3) Acrolein GLC from Haul truck | Chronic Index Hic | Acute Index Hia | Annual (ug/m3) PM2.5 GLC from construction | Annual (ug/m3) PM2.5 GLC from Haul truck |

**8/27/2011 11:00:31 PM**

Urbemis 2007 Version 9.2.4

Detail Report for Summer Construction Mitigated Emissions (Pounds/Day)

File Name: G:\Sharp Park\New\URBEMIS\Construction4.urb924

Project Name: Sharp Park - Construction - 6-month Duration

Project Location: Bay Area Air District

On-Road Vehicle Emissions Based on: Version : Emfac2007 V2.3 Nov 1 2006

Off-Road Vehicle Emissions Based on: OFFROAD2007

CONSTRUCTION EMISSION ESTIMATES (Summer Pounds Per Day, Mitigated)

| | ROG | NOx | CO | SO2 | PM10 Dust | PM10 Exhaust | PM10 Total | PM2.5 Dust | PM2.5 Exhaust | PM2.5 Total | CO2 |

Construction Related Mitigation Measures

The following mitigation measures apply to Phase: Mass Grading 5/15/2012 - 8/31/2012 - Excavation/Grading

For Soil Stablizing Measures, the Water exposed surfaces 2x daily watering mitigation reduces emissions by:
PM10: 55% PM25: 55%

For Unpaved Roads Measures, the Manage haul road dust 2x daily watering mitigation reduces emissions by:
PM10: 55% PM25: 55%

For Excavators, the Diesel Particulate Filter (DPF) 1st Tier mitigation reduces emissions by:
PM10: 85% PM25: 85%

For Graders, the Diesel Particulate Filter (DPF) 1st Tier mitigation reduces emissions by:
PM10: 85% PM25: 85%

For Tractors/Loaders/Backhoes, the Diesel Particulate Filter (DPF) 1st Tier mitigation reduces emissions by:
PM10: 85% PM25: 85%

For Off Highway Tractors, the Diesel Particulate Filter (DPF) 1st Tier mitigation reduces emissions by:
PM10: 85% PM25: 85%

The following mitigation measures apply to Phase: Mass Grading 9/1/2012 - 9/30/2012 - Riffle Range Regrade

For Soil Stablizing Measures, the Water exposed surfaces 2x daily watering mitigation reduces emissions by:
PM10: 55% PM25: 55%

For Unpaved Roads Measures, the Manage haul road dust 2x daily watering mitigation reduces emissions by:
PM10: 55% PM25: 55%

For Excavators, the Diesel Particulate Filter (DPF) 1st Tier mitigation reduces emissions by:
PM10: 85% PM25: 85%

For Water Trucks, the Diesel Particulate Filter (DPF) 1st Tier mitigation reduces emissions by:
PM10: 85% PM25: 85%

The following mitigation measures apply to Phase: Mass Grading 9/1/2012 - 9/15/2012 - Culvert Placement

For Soil Stablizing Measures, the Water exposed surfaces 2x daily watering mitigation reduces emissions by:
PM10: 55% PM25: 55%

For Unpaved Roads Measures, the Manage haul road dust 2x daily watering mitigation reduces emissions by:
PM10: 55% PM25: 55%

For Tractors/Loaders/Backhoes, the Diesel Particulate Filter (DPF) 1st Tier mitigation reduces emissions by:
PM10: 85% PM25: 85%

The following mitigation measures apply to Phase: Building Construction 5/1/2012 - 5/14/2012 - Install Barriers, Signage, Dewatering Ponds

**8/27/2011 11:00:31 PM**

For Pumps, the Diesel Particulate Filter (DPF) 1st Tier mitigation reduces emissions by:
PM10: 85% PM25: 85%
For Water Trucks, the Diesel Particulate Filter (DPF) 1st Tier mitigation reduces emissions by:
PM10: 85% PM25: 85%
The following mitigation measures apply to Phase: Building Construction 10/1/2012 - 10/15/2012 - Revegetation
For Pumps, the Diesel Particulate Filter (DPF) 1st Tier mitigation reduces emissions by:
PM10: 85% PM25: 85%
For Water Trucks, the Diesel Particulate Filter (DPF) 1st Tier mitigation reduces emissions by:
PM10: 85% PM25: 85%

Phase Assumptions

Phase: Mass Grading 5/15/2012 - 8/31/2012 - Excavation/Grading
Total Acres Disturbed: 66
Maximum Daily Acreage Disturbed: 0
Fugitive Dust Level of Detail: Default
20 lbs per acre-day
On Road Truck Travel (VMT): 3443.04
Off-Road Equipment:
3 Excavators (168 hp) operating at a 0.57 load factor for 8 hours per day
3 Graders (174 hp) operating at a 0.61 load factor for 8 hours per day
3 Off Highway Tractors (267 hp) operating at a 0.65 load factor for 8 hours per day
2 Tractors/Loaders/Backhoes (108 hp) operating at a 0.55 load factor for 8 hours per day

Phase: Mass Grading 9/1/2012 - 9/30/2012 - Riffle Range Regrade
Total Acres Disturbed: 66
Maximum Daily Acreage Disturbed: 5
Fugitive Dust Level of Detail: Default
20 lbs per acre-day
On Road Truck Travel (VMT): 922.62
Off-Road Equipment:
2 Excavators (168 hp) operating at a 0.57 load factor for 8 hours per day
3 Water Trucks (189 hp) operating at a 0.5 load factor for 8 hours per day

Phase: Mass Grading 9/1/2012 - 9/15/2012 - Culvert Placement
Total Acres Disturbed: 66
Maximum Daily Acreage Disturbed: 5
Fugitive Dust Level of Detail: Default

**8/27/2011 11:00:31 PM**

20 lbs per acre-day
On Road Truck Travel (VMT): 454.55
Off-Road Equipment:
2 Tractors/Loaders/Backhoes (108 hp) operating at a 0.55 load factor for 8 hours per day

Phase: Building Construction 5/1/2012 - 5/14/2012 - Install Barriers, Signage, Dewatering Ponds
Off-Road Equipment:
1 Pumps (53 hp) operating at a 0.74 load factor for 8 hours per day
2 Water Trucks (189 hp) operating at a 0.5 load factor for 8 hours per day

Phase: Building Construction 10/1/2012 - 10/15/2012 - Revegetation
Off-Road Equipment:
1 Pumps (53 hp) operating at a 0.74 load factor for 8 hours per day
2 Water Trucks (189 hp) operating at a 0.5 load factor for 8 hours per day

Construction Related Mitigation Measures

The following mitigation measures apply to Phase: Mass Grading 5/15/2012 - 8/31/2012 - Excavation/Grading

For Soil Stablizing Measures, the Water exposed surfaces 2x daily watering mitigation reduces emissions by:
PM10: 55% PM25: 55%

For Unpaved Roads Measures, the Manage haul road dust 2x daily watering mitigation reduces emissions by:
PM10: 55% PM25: 55%

For Excavators, the Diesel Particulate Filter (DPF) 1st Tier mitigation reduces emissions by:
PM10: 85% PM25: 85%

For Graders, the Diesel Particulate Filter (DPF) 1st Tier mitigation reduces emissions by:
PM10: 85% PM25: 85%

For Tractors/Loaders/Backhoes, the Diesel Particulate Filter (DPF) 1st Tier mitigation reduces emissions by:
PM10: 85% PM25: 85%

For Off Highway Tractors, the Diesel Particulate Filter (DPF) 1st Tier mitigation reduces emissions by:
PM10: 85% PM25: 85%

The following mitigation measures apply to Phase: Mass Grading 9/1/2012 - 9/30/2012 - Riffle Range Regrade

For Soil Stablizing Measures, the Water exposed surfaces 2x daily watering mitigation reduces emissions by:
PM10: 55% PM25: 55%

For Unpaved Roads Measures, the Manage haul road dust 2x daily watering mitigation reduces emissions by:
PM10: 55% PM25: 55%

For Excavators, the Diesel Particulate Filter (DPF) 1st Tier mitigation reduces emissions by:
PM10: 85% PM25: 85%

For Water Trucks, the Diesel Particulate Filter (DPF) 1st Tier mitigation reduces emissions by:
PM10: 85% PM25: 85%

The following mitigation measures apply to Phase: Mass Grading 9/1/2012 - 9/15/2012 - Culvert Placement

For Soil Stablizing Measures, the Water exposed surfaces 2x daily watering mitigation reduces emissions by:
PM10: 55% PM25: 55%

For Unpaved Roads Measures, the Manage haul road dust 2x daily watering mitigation reduces emissions by:
PM10: 55% PM25: 55%

For Tractors/Loaders/Backhoes, the Diesel Particulate Filter (DPF) 1st Tier mitigation reduces emissions by:
PM10: 85% PM25: 85%

The following mitigation measures apply to Phase: Building Construction 5/1/2012 - 5/14/2012 - Install Barriers, Signage, Dewatering Ponds

For Pumps, the Diesel Particulate Filter (DPF) 1st Tier mitigation reduces emissions by:
PM10: 85% PM25: 85%

For Water Trucks, the Diesel Particulate Filter (DPF) 1st Tier mitigation reduces emissions by:
PM10: 85% PM25: 85%

**8/27/2011 11:03:13 PM**

The following mitigation measures apply to Phase: Building Construction 10/1/2012 - 10/15/2012 - Revegetation
For Pumps, the Diesel Particulate Filter (DPF) 1st Tier mitigation reduces emissions by:
PM10: 85% PM25: 85%
For Water Trucks, the Diesel Particulate Filter (DPF) 1st Tier mitigation reduces emissions by:
PM10: 85% PM25: 85%

Phase Assumptions

Phase: Mass Grading 5/15/2012 - 8/31/2012 - Excavation/Grading
Total Acres Disturbed: 66
Maximum Daily Acreage Disturbed: 0
Fugitive Dust Level of Detail: Default
20 lbs per acre-day
On Road Truck Travel (VMT): 3443.04
Off-Road Equipment:
3 Excavators (168 hp) operating at a 0.57 load factor for 8 hours per day
3 Graders (174 hp) operating at a 0.61 load factor for 8 hours per day
3 Off Highway Tractors (267 hp) operating at a 0.65 load factor for 8 hours per day
2 Tractors/Loaders/Backhoes (108 hp) operating at a 0.55 load factor for 8 hours per day

Phase: Mass Grading 9/1/2012 - 9/30/2012 - Riffle Range Regrade
Total Acres Disturbed: 66
Maximum Daily Acreage Disturbed: 5
Fugitive Dust Level of Detail: Default
20 lbs per acre-day
On Road Truck Travel (VMT): 922.62
Off-Road Equipment:
2 Excavators (168 hp) operating at a 0.57 load factor for 8 hours per day
3 Water Trucks (189 hp) operating at a 0.5 load factor for 8 hours per day

Phase: Mass Grading 9/1/2012 - 9/15/2012 - Culvert Placement
Total Acres Disturbed: 66
Maximum Daily Acreage Disturbed: 5
Fugitive Dust Level of Detail: Default
20 lbs per acre-day
On Road Truck Travel (VMT): 454.55
Off-Road Equipment:
2 Tractors/Loaders/Backhoes (108 hp) operating at a 0.55 load factor for 8 hours per day

**8/27/2011 11:03:13 PM**

Phase: Building Construction 5/1/2012 - 5/14/2012 - Install Barriers, Signage, Dewatering Ponds
Off-Road Equipment:
1 Pumps (53 hp) operating at a 0.74 load factor for 8 hours per day
2 Water Trucks (189 hp) operating at a 0.5 load factor for 8 hours per day

Phase: Building Construction 10/1/2012 - 10/15/2012 - Revegetation
Off-Road Equipment:
1 Pumps (53 hp) operating at a 0.74 load factor for 8 hours per day
2 Water Trucks (189 hp) operating at a 0.5 load factor for 8 hours per day

Construction Related Mitigation Measures

The following mitigation measures apply to Phase: Mass Grading 5/15/2012 - 8/31/2012 - Excavation/Grading

For Soil Stablizing Measures, the Water exposed surfaces 2x daily watering mitigation reduces emissions by:

PM10: 55% PM25: 55%

For Unpaved Roads Measures, the Manage haul road dust 2x daily watering mitigation reduces emissions by:

PM10: 55% PM25: 55%

For Excavators, the Diesel Particulate Filter (DPF) 1st Tier mitigation reduces emissions by:

PM10: 85% PM25: 85%

For Graders, the Diesel Particulate Filter (DPF) 1st Tier mitigation reduces emissions by:

PM10: 85% PM25: 85%

**8/27/2011 11:03:47 PM**

For Tractors/Loaders/Backhoes, the Diesel Particulate Filter (DPF) 1st Tier mitigation reduces emissions by:
PM10: 85% PM25: 85%

For Off Highway Tractors, the Diesel Particulate Filter (DPF) 1st Tier mitigation reduces emissions by:
PM10: 85% PM25: 85%

The following mitigation measures apply to Phase: Mass Grading 9/1/2012 - 9/30/2012 - Riffle Range Regrade

For Soil Stablizing Measures, the Water exposed surfaces 2x daily watering mitigation reduces emissions by:
PM10: 55% PM25: 55%

For Unpaved Roads Measures, the Manage haul road dust 2x daily watering mitigation reduces emissions by:
PM10: 55% PM25: 55%

For Excavators, the Diesel Particulate Filter (DPF) 1st Tier mitigation reduces emissions by:
PM10: 85% PM25: 85%

For Water Trucks, the Diesel Particulate Filter (DPF) 1st Tier mitigation reduces emissions by:
PM10: 85% PM25: 85%

The following mitigation measures apply to Phase: Mass Grading 9/1/2012 - 9/15/2012 - Culvert Placement

For Soil Stablizing Measures, the Water exposed surfaces 2x daily watering mitigation reduces emissions by:
PM10: 55% PM25: 55%

For Unpaved Roads Measures, the Manage haul road dust 2x daily watering mitigation reduces emissions by:
PM10: 55% PM25: 55%

For Tractors/Loaders/Backhoes, the Diesel Particulate Filter (DPF) 1st Tier mitigation reduces emissions by:
PM10: 85% PM25: 85%

The following mitigation measures apply to Phase: Building Construction 5/1/2012 - 5/14/2012 - Install Barriers, Signage, Dewatering Ponds

For Pumps, the Diesel Particulate Filter (DPF) 1st Tier mitigation reduces emissions by:
PM10: 85% PM25: 85%

For Water Trucks, the Diesel Particulate Filter (DPF) 1st Tier mitigation reduces emissions by:
PM10: 85% PM25: 85%

The following mitigation measures apply to Phase: Building Construction 10/1/2012 - 10/15/2012 - Revegetation

For Pumps, the Diesel Particulate Filter (DPF) 1st Tier mitigation reduces emissions by:
PM10: 85% PM25: 85%

For Water Trucks, the Diesel Particulate Filter (DPF) 1st Tier mitigation reduces emissions by:
PM10: 85% PM25: 85%

# Compliance Checklist
# Greenhouse Gas Analysis

## A. GENERAL PROJECT INFORMATION:

Instructions: Complete Sections A and B, below. Generally, only projects within the City and County of San Francisco can apply for a determination of consistency with the GHG Reduction Strategy.

**Date**: August 17, 2011

**Project name**: Significant Natural Resource Areas Management Plan **Case No**: 2005.1912E

**Project address and block and lot**: Various locations within San Francisco

**MEA planner**: Jessica Range

**Brief Project description**:

The San Francisco Recreation and Park Department (SFRPD) developed a Significant Natural Resource Areas Management Plan (SNRAMP), with the final draft plan published in February 2006. This SNRAMP contains detailed information on the biology, geology, and trails within 32 Natural Areas, 31 of which are in San Francisco and one of which (Sharp Park) is in Pacifica. The SNRAMP is intended to guide natural resource protection, habitat restoration, trail and access improvements, other capital projects, and maintenance activities over the next 20 years.

The proposed project, implementation of the SNRAMP, covers two categories of activity at Natural Areas in San Francisco: routine maintenance and programmatic projects, which are those projects that are not well defined at this time. The general actions under the SNRAMP that could affect emissions of greenhouse gases include operation of motorized equipment and the removal and replacement of invasive trees and other invasive vegetation with native trees and other native vegetation.

## B. COMPLIANCE CHECKLIST TABLE

Complete and attach to this form the appropriate compliance table by determining project compliance with the identified regulations and providing project-level details in the discussion column. Please note that Table 1 applies to Private Development Projects, Table 2 applies to Municipal Projects, and Table 3 is for plan-level analysis. Projects that do not comply with an ordinance/regulation may be determined to be inconsistent with San Francisco's qualified GHG reduction strategy.

Compliance Checklist Table attached: ☐ Table 1. Private Development

☒ Table 2. Municipal Project

☐ Table 3. Area Plan for _____
(specify area)

## C. DETERMINATION OF COMPLIANCE WITH CITY'S GHG REDUCTION STRATEGY

☒ Project Complies with San Francisco's *Strategies to Address Greenhouse Gas Emissions*

Project Notes:

The proposed project would emit GHGs primarily during construction of individual programmatic projects. Operational activities are not proposed to increase substantially and therefore any increase in GHGs from project operations (routine maintenance) would be minimal. Construction related GHG emissions would be short term and nominal given the anticipated level of construction activity required for programmatic projects. Although many of the GHG regulations are not applicable to the activities proposed by SFRPD because of the nature of the project (which includes primarily restoration, erosion control, trail development, and invasive vegetation removal), the SFRPD complies with existing regulations, such as the commuter benefit ordinance, emergency ride home program, and the mandatory recycling and composting ordinance. Further, the Natural Areas Management Plan would comply with all applicable City regulations identified as reducing greenhouse gas emissions, including the clean construction ordinance, which requires use of cleaner construction equipment and B20 biodiesel. Therefore, the proposed project would comply with San Francisco's GHG Reduction Strategy.

☐ Project Does Not Comply

If Project does not comply, provide discussion of non-compliant features:

| Healthy Air and | Requires all new purchases or | ☒ Project | The SFRPD follows the vehicle |

| | Requirement | Project Compliance | Discussion |
|---|---|---|---|
| Smog Ordinance (Environment Code, Chapter 4) | leases of passenger vehicles and light-duty trucks to be the cleanest and most efficient vehicles available on the market. There are also requirements for medium and heavy duty vehicles and for phasing out highly polluting vehicles (diesel MUNI buses). | Complies<br>☐ Not Applicable<br>☐ Project Does Not Comply | requirements of this ordinance. This is addressed in Section 3b, Fleet – Fuel Use and Reduction Measures, of the *San Francisco Recreation and Park Department Climate Action Plan Fiscal Year 2009-10.* |
| Biodiesel for Municipal Fleets (Executive Directive 06-02) | Requires all diesel using City Departments to begin using biodiesel (B20). Sets goals for all diesel equipment to be run on biodiesel by 2007 and goals for increasing biodiesel blends to B100. | ☒ Project Complies<br>☐ Not Applicable<br>☐ Project Does Not Comply | For the locations under the Significant Natural Resource Areas Management Plan, the SFRPD is implementing the biodiesel requirements of this ordinance, as documented in Section 3b, Fleet – Fuel Use and Reduction Measures, of the *San Francisco Recreation and Park Department Climate Action Plan Fiscal Year 2009-10.* |
| Clean Construction Ordinance (Administrative Code, Section 6.25) | Effective March 2009, all contracts for large (20+ day) City projects are required to:<br>• Fuel diesel vehicles with B20 biodiesel, and<br>• Use construction equipment that meet USEPA Tier 2 standards or best available control technologies for equipment over 25 hp. | ☒ Project Complies<br>☐ Not Applicable<br>☐ Project Does Not Comply | For all applicable contracts issued for work under the Significant Natural Resource Areas Management Plan, the NAP will include these requirements in its contract specifications, as required by the ordinance. |
| Bicycle Parking in City-Owned and Leased Buildings (Planning Code, Section 155.1) | Class 1 and 2 Bicycle Parking Spaces<br>Class 1 Requirements:<br>(A) Provide two spaces in buildings with 1-20 employees.<br>(B) Provide four spaces in buildings with 21 to 50 employees.<br>(C) In buildings with 51 to 300 employees, provide bicycle parking equal to at least five percent of the number of employees at that building, but no fewer than five bicycle spaces.<br>(D) In buildings with more than 300 employees, provide bicycle parking equal to at least three percent of the number of employees at that building, but no fewer than 16 bicycle spaces.<br>In addition to the Class 1 bicycle parking spaces provide Class 2 | ☐ Project Complies<br>☒ Not Applicable<br>☐ Project Does Not Comply | The proposed project would not construct or renovate City-owned and leased buildings. Therefore, Planning Code Section 155.1 is not applicable to the proposed project. |

| | Requirement | Project Compliance | Discussion |
|---|---|---|---|
| | bicycle parking.<br>Class 2 Requirements:<br>(A) In buildings with one to 40 employees, at least two bicycle parking spaces shall be provided.<br>(B) In buildings with 41 to 50 employees, at least four bicycle parking spaces shall be provided.<br>(C) In buildings with 51 to 100 employees, at least six bicycle parking spaces shall be provided.<br>(D) In buildings with more than 100 employees, at least eight bicycle parking spaces shall be provided. Wherever a responsible City official is required to provide eight or more Class 2 bicycle parking spaces, at least 50 percent of those parking spaces shall be covered. | | |
| Bicycle parking in parking garages (Planning Code, Section 155.2) | (A) Every garage will supply a minimum of six bicycle parking spaces.<br>(B) Garages with between 120 and 500 automobile spaces shall provide one bicycle space for every 20 automobile spaces.<br>(C) Garages with more than 500 automobile spaces shall provide 25 spaces plus one additional space for every 40 automobile spaces over 500 spaces, up to a maximum of 50 bicycle parking spaces. | ☐ Project Complies<br>☒ Not Applicable<br>☐ Project Does Not Comply | The proposed project does not involve parking garages. Therefore, Planning Code Section 155.2 is not applicable to the proposed project. |
| Transportation Management Programs (Planning Code, Section 163) | Requires new buildings or additions over a specified size (buildings >25,000 sf or 100,000 sf depending on the use and zoning district) within certain zoning districts (including downtown and mixed-use districts in the City's eastern neighborhoods and south of market) to implement a Transportation Management Program and provide on-site transportation management brokerage services for the life of the building. | ☐ Project Complies<br>☒ Not Applicable<br>☐ Project Does Not Comply | The proposed project would not construct new buildings and would therefore not generate any greenhouse gas emissions as a result of vehicle trips generated by new buildings. Therefore, Planning Code Section 163 is not applicable to the proposed project. |
| **Energy Efficiency Sector** | | | |
| Resource Efficiency and | The ordinance specifies requirements for all city buildings | ☐ Project | The proposed project would not construct or demolish buildings. |

| | Requirement | Project Compliance | Discussion |
|---|---|---|---|
| Green Building Ordinance (Environment Code, Chapter 7) | as well as requirements for construction and demolition debris recycling, and requirement for new construction. All new construction must comply achieve at a minimum the LEED® Silver standard. These buildings are required to perform commissions to ensure achievement of design standards.<br><br>All other buildings are required to meet the following minimum specifications related to energy efficiency:<br><br>1. Toilets must use no more than 1.6 gal/flush<br><br>2. Showerheads must use no more than 1.5 gal/ min.<br><br>3. All lighting and electrical fixtures must meet specified requirements.<br><br>4. All fluorescent lamps must be replaced | Complies<br><br>☒ Not Applicable<br><br>☐ Project Does Not Comply | Therefore, this ordinance is not applicable to the proposed project. |
| **Waste Reduction Sector** | | | |
| Resource Efficiency and Green Building Ordinance (Environment Code, Chapter 7) | The ordinance requires all demolition (& new construction) projects to prepare a Construction and Demolition Debris Management Plan designed to recycle construction and demolition materials to the maximum extent feasible, with a goal of 75% diversion.<br><br>The ordinance specifies requires for all city buildings to provide adequate recycling space | ☐ Project Complies<br><br>☒ Not Applicable<br><br>☐ Project Does Not Comply | The proposed project would not construct or demolish buildings. Therefore, this ordinance is not applicable to the proposed project. |
| Resource Conservation Ordinance (Environment Code, Chapter 5) | This ordinance establishes a goal for each City department to (i) maximize purchases of recycled products and (ii) divert from disposal as much solid waste as possible so that the City can meet the state-mandated 50% division requirement. Each City department shall prepare a Waste Assessment. The ordinance also requires the Department of the Environment to prepare a Resource Conservation Plan that facilitates waste reduction and recycling. The ordinance requires janitorial contracts to consolidate recyclable materials for | ☒ Project Complies<br><br>☐ Not Applicable<br><br>☐ Project Does Not Comply | All City Departments, including the SFRPD, meet these resource conservation requirements. |

| | Requirement | Project Compliance | Discussion |
|---|---|---|---|
| | pick up. Lastly, the ordinance specifies purchasing requirements for paper products. | | |
| Mandatory Recycling and Composting Ordinance (Environment Code, Chapter 19) | The mandatory recycling and composting ordinance requires all persons in San Francisco to separate their refuse into recyclables, compostables and trash, and place each type of refuse in a separate container designated for disposal of that type of refuse. | ☒ Project Complies<br>☐ Not Applicable<br>☐ Project Does Not Comply | All City Departments, including the SFRPD, meet these recycling and composting requirements. Minor quantities of solid waste and recyclable material would be generated during the management of the Natural Areas. Unless it can be used to create wildlife habitat, all large woody debris generated by the NAP would be composted in Golden Gate Park. The wood chips may be used to suppress understory invasive vegetation or could be used as beneficial mulch on other revegetation projects in the Natural Areas. The proposed project does not include a residential component. |
| Construction Recycled Content Ordinance (Administrative Code, Section 6.4) | Ordinance requires the use of recycled content material in public works projects to the maximum extent feasible and gives preference to local manufacturers and industry. | ☐ Project Complies<br>☒ Not Applicable<br>☐ Project Does Not Comply | The proposed project does not involve public works projects that could incorporate recycled content materials. Therefore, this ordinance is not applicable to the proposed project. |
| **Environment/Conservation Sector** | | | |
| Street Tree Planting Requirements for New Construction (Planning Code Section 143) | Planning Code Section 143 requires new construction, significant alterations or relocation of buildings within many of San Francisco's zoning districts to plant on 24-inch box tree for every 20 feet along the property street frontage | ☐ Project Complies<br>☒ Not Applicable<br>☐ Project Does Not Comply | The proposed project does not involve constructing or altering buildings. Therefore, Planning Code Section 143 is not applicable to the proposed project. For management actions in San Francisco, the proposed project would remove invasive trees and replace them on a one-to-one basis with native trees. |
| Environmentally Preferable Purchasing Ordinance (Formerly Precautionary Purchasing Ordinance) | Requires City Departments to purchase products on the Approved Green Products List, maintained by the Department of the Environment. The items in the Approved Green Products List has been tested by San Francisco City Depts. and meet standards that are more rigorous than ecolabels in protecting our health and environment. | ☒ Project Complies<br>☐ Not Applicable<br>☐ Project Does Not Comply | All City Departments, including the SFRPD, meet these purchasing requirements. The proposed project does not involve purchase of product types included on the Green Products List. |

| | Requirement | Project Compliance | Discussion |
|---|---|---|---|
| Tropical Hardwood and Virgin Redwood Ban (Environment Code, Chapter 8) | The ordinance prohibits City departments from procuring, or engaging in contracts that would use the ordinance-listed tropical hardwoods and virgin redwood. | ☐ Project Complies<br>☒ Not Applicable<br>☐ Project Does Not Comply | The proposed project does not involve constructing or renovating buildings. Therefore, this ban is not applicable to the proposed project. |
| Wood Burning Fireplace Ordinance (San Francisco Building Code, Chapter 31, Section 3102.8) | Bans the installation of wood burning fire places except for the following:<br>• Pellet-fueled wood heater<br>• EPA approved wood heater<br>• Wood heater approved by the Northern Sonoma Air Pollution Control District | ☐ Project Complies<br>☒ Not Applicable<br>☐ Project Does Not Comply | The proposed project does not involve installation of fireplaces. Therefore, this ordinance is not applicable to the proposed project. |
| Regulation of Diesel Backup Generators (San Francisco Health Code, Article 30) | Requires:<br>All diesel generators to be registered with the Department of Public Health<br>All new diesel generators must be equipped with the best available air emissions control technology. | ☐ Project Complies<br>☒ Not Applicable<br>☐ Project Does Not Comply | The proposed project does not include a diesel generator. Therefore, this regulation is not applicable to the proposed project. |

**Summary of Department Climate Action Plan**: For municipal projects only, provide a summary for the respective Department's Climate Action Plan as a separate attachment.

Summary of Department Climate Action Plan: ☒ Included ☐ Not Included

In the San Francisco Recreation and Park Department's climate action plans, the SFRPD actions to reduce operational greenhouse gas emissions toward the City's goal of an 80 percent reduction by 2050 include the following:

- Energy Efficiency and Conservation: The SFRPD is working with the Energy Efficiency Services of the San Francisco Public Utilities Commission (SFPUC) to reduce energy use through the selection of operational equipment such as electrical fixtures and sprinkler heads, design standards enforcement, and use of the San Francisco Greening Checklist for exterior spaces.
- Renewable Energy Generation: The SFRPD is working with the SFPUC to assess its facilities' solar potential and identify potential co-generation sites.

- Information Technology (IT): IT energy conservation measures include power management tools for all personal computers and monitors. The SFRPD plan includes full compliance by the third quarter of fiscal year 2010 with the City's adopted policy of the Committee on Information Technology (COIT).
- Green Building: The SFRPD plan includes compliance with the City's Environmental Code to achieve Leadership in Energy and Environmental Design (LEED®) certification.
- Fleets and Fuel: The SFRPD has identified specific plans to retire older vehicles to achieve fuel savings, maintenance cost savings, and lower residual costs for older vehicles. Further, the SFRPD only purchases clean light-duty passenger cars and trucks.
- Employee Commute: The SFRPD plan includes measures to reduce vehicle trips traveled by promoting alternative transportation incentives to its employees.
- Zero Waste: The SFRPD is close to realizing its goal of 100 percent compliance with the City's recycling initiative.
- Green Product Purchasing: The SFRPD uses the City's Approved Catalog to purchase environmentally conscious products.
- Carbon Sequestration: The SFRPD promotes the City's urban forestry program through tree planting campaigns and supports other City departments in their participation in the urban forest program.
- Community Wide Emissions: The SFRPD actions include providing community support to reduce greenhouse gas emissions through programs related to recycling, biodiversity, bicycling, and community education. To encourage recycling, the SFRPD is currently posting signs at all facilities to educate users on the importance of recycling and directing them on where to place their recyclables. For biodiversity, the NAP and SFRPD volunteer programs maintain and enhance natural biodiversity at many of SFRPD's park sites. Related to bicycling, the SFRPD will promote bicycling to and within SFRPD facilities by installing bike parking racks and SF Bicycle Route maps at all facilities and by providing bicycle access and program information on the SFRPD website and other publications. The community education efforts include holding recycling education seminars at SFRPD recreation facilities.

# Sharp Park Conceptual Restoration Plan
# Executive Summary

## BACKGROUND

Sharp Park is a 417-acre multiple use facility owned and maintained by the City of San Francisco, Recreation and Parks Department (SFRPD), and located in Pacifica, CA. One of the park's most prominent natural features is a wetland complex located at the west end of the park. The wetland complex consists of a lagoon (Laguna Salada), a pond (Horse Stable Pond), and a channel that connects the two bodies of water. The US Fish and Wildlife Service (USFWS) and California Department of Fish and Game (CDFG) have identified the wetland complex at Sharp Park as important habitat for the endangered and fully protected San Francisco garter snake (SFGS) *(Thamnophis sirtalis tetrataenia)* and the California red-legged frog (CRLF) *(Rana draytonii)*. Habitat quality for the SFGS and CRLF in the wetland complex has been steadily diminishing for several reasons, including sedimentation, reduced open water habitat, overgrowth of emergent wetland plant communities, and lack of adjacent upland habitat.

## PURPOSE

Both the USFWS and CDFG have recommended that SFRPD develop recovery actions to ensure the continued survival of populations of the SFGS and CRLF in Sharp Park. The purpose of preparing this conceptual plan is to develop and evaluate various alternatives for restoring SFGS and CRLF habitat within the wetland complex, the area surrounding the wetland complex, and the entire golf course area. The primary goal of each conceptual alternative was to propose an effective way of increasing upland habitat adjacent to existing or proposed wetland habitat, to restore the quality of existing wetland habitat, and to evaluate and respond to the changes such actions would require of the existing golf course design and operation.

## METHODS

Studies were performed to assess the presence or absence of the SFGS and CRLF, and to evaluate the quality of their habitat within the wetland complex. These studies are reported in Appendix C of the conceptual planning report. Hydrologists prepared studies to assess the hydrological features of the wetland complex and to assist in making restoration recommendations (Appendix A). A golf course designer prepared various realignment options for the 18-hole and 9-hole alternatives and worked with the restoration planners to accommodate needed habitat expansion areas. A local engineering firm prepared topographic and bathymetric maps of the wetland complex and surrounding area.

The information in these studies was used to define the problem and develop measures to enhance the quality of habitat for the SFGS and CRLF, to reduce the potential that these species would be harmed by golf course practices or by other park users, and to assess the differences in habitat value between an 18-hole golf course, a 9-hole golf course, and golf course closure.

## ALTERNATIVES

The common component of all alternatives is restoration of the wetland complex. Under all alternatives, similar features are proposed to restore wetland habitat and reduce the potential for recurrence of the problems that now occur, which include sedimentation, eutrophication due to dead and decaying vegetation, loss of open water habitat, and flooding of fairways. Implementing the restoration actions below would accomplish the main goal of the project, which is to enhance CRLF and SGFS habitat.

- **Dredging to remove sediment and decaying vegetation**. The areas that are currently open water within the lagoon would be deepened by up to 2 feet, and open water areas within the pond by up to 3 feet.
- **Recontouring the shoreline to create shallow water habitat**. The eastern edge of the lagoon, the edges of the connecting channel, and the north and south edges of the pond would be contoured to create shallow water habitat (1-3' deep) to allow for CRLF breeding habitat.
- **Creation of an upland peninsula.** A peninsula of approximately 2 acres will be created in the middle of the lagoon to create additional upland habitat for the SFGS and shallow water habitat for the CRLF.
- **Construction of upland mounds**. Upland mounds will be created on the east and south sides of the lagoon and in the dispersal corridor between the lagoon and the pond.
- **Pump Operations.** Altering the methods of operating pumps and other measures to control hydrological features is proposed under all alternatives.
- **Upland/Aquatic linkage and habitat segment.** A habitat linkage area between the lagoon and the pond would be constructed with native upland vegetation and mounds designed to allow SFGS movement and resting between the lagoon and the pond.
- **Completion of a Compliance Plan.** SFRPD has completed a compliance plan that is designed to avoid mortality and injury of SFGS and CRLFs resulting from maintenance and operations of the golf course (SFRPD 2009).
- **Closure of Hole 12.** Hole 12 would be closed under all alternatives to allow for creation of an upland habitat corridor between the lagoon and the pond/Mori Point area.
- **Catchment Basins**. To slow the rate of sedimentation from upstream sources, sediment catchment basins would be installed in two locations, one near the mouth of Sanchez Creek and the other on City of Pacifica property just outside the northern boundary of the Sharp Park.
- **Fencing**. All alternatives include installation of a post and rail fence along the seawall to the west of the lagoon, according to the Draft Compliance Plan. The wetland complex would also be fenced to discourage intrusion by humans or domestic animals, although the configuration of the fence may vary according to the alternative.
- **Revegetation**. Uplands, wetland, and shallow aquatic areas would be revegetated with an appropriate mix of native plant species.

## DESCRIPTION OF ALTERNATIVES

### Alternative A18

This alternative is intended to fulfill the recovery goals for the snake and frog while maintaining as much of the current golf course configuration as possible. In addition to the measures described above, Holes 10 and 13 would be slightly shortened and/or narrowed, and a new hole would be created near the rifle range/ archery course east of Highway 1. The area on the west side of the lagoon would be restored from its degraded condition to native upland habitat. Portions of the fairways in holes 10, 14 and 15 would be raised to 10.0' NAVD 88 from their current elevation of between 6.5' and 9.0', and hole 18 would be raised to allow a 2% slope relative to hole 14. In addition to the restoration of the entire wetland complex, this alternative would result in restoration or creation of 10.7 acres of California red-legged frog breeding / San Francisco garter snake primary foraging habitat and 23.4 acres of San Francisco garter snake upland basking / retreat habitat, all of which would be found either adjacent to the wetland complex or between the pond and the lagoon. Estimated construction costs for this alternative range from $5.9M (all excavated materials reused onsite) to $11.3M (all excavated materials hauled offsite).

### Alternative A-9

This alternative is intended as a compromise between golf considerations and expanded upland areas east of the main body of the lagoon, and to increase opportunities for recreational pursuits other than golf. In addition to implementing the measures common to all alternatives, all holes bordering the wetland complex would be closed and restored to coastal scrub/shrub habitat. Three holes (1, 8, and 9) would remain west of Highway 1, along with a driving range and teaching area, and two new holes would be constructed at the rifle range. All existing holes east of Highway 1 would remain in their current location. In addition to the restoration of the entire wetland complex, this alternative would result in restoration or creation of 10.7 acres of California red-legged frog breeding / San Francisco garter snake primary foraging habitat and 44.3 acres of San Francisco garter snake upland basking / retreat habitat, much of which would be constructed at a greater distance from the wetland complex than the upland habitat restored under Alternative A18. Estimated costs for this alternative range from $7.8M (all excavated materials reused onsite) to $15.6M (all excavated materials hauled offsite).

### **No Golf Alternative** (Alternative A-0)

This alternative was developed with the goal of maximizing the amount of available upland habitat for the snake and frog in the absence of golf operations. Because the lack of suitable upland habitat was identified as the limiting factor for the snake, the golf areas would be converted into uplands. Enhancements to wetland areas in lower Sanchez Creek and the wetland complex would be identical to those in Alternatives A18 and A9. Water from Sanchez Creek would be captured in two shallow ponds to provide additional breeding habitat for the CRLF. In addition to the restoration of the entire wetland complex, this alternative would result in restoration or creation of 11.3 acres of California red-legged frog breeding / San Francisco garter snake primary foraging habitat and 97.4 acres of San Francisco garter snake upland basking / retreat habitat, much of which would be constructed at a greater distance from the wetland complex than the upland habitat restored under Alternatives A18 or A9. Estimated costs for this alternative range from $9.0M (all excavated materials reused onsite) to $22.2M (all excavated materials hauled offsite).

## FINDINGS AND CONCLUSIONS

Habitat requirements of the SFGS vary throughout the year, and include foraging habitat and nearby upland retreats located in underground burrows and soil crevices, typically located in a grassland-shrub community. Upland habitat for this species at Sharp Park is restricted to a small area south of Horse Stable Pond. The lack of suitable upland habitat is therefore a primary limiting factor in ensuring the persistence of the SFGS at Sharp Park. The SFGS population may have also been affected by wave overwash, collecting, predation, and golf course maintenance practices.

The CRLF usually occurs in or near quiet permanent water of streams, marshes, ponds, and lakes, in habitats characterized by dense, shrubby riparian vegetation. The primary limiting factor for the CRLF in the Sharp Park wetland complex is a vegetation structure that is not conducive to successful breeding and/or recruitment of larval stages into the adult population. The dense emergent vegetation found in the lagoon and pond combined with little remaining open water offers poor habitat for the survival of egg masses or tadpoles.

With no action, the future of SFGS at Sharp Park is, at best, uncertain. Although historically SFGS have existed at Sharp Park while it functioned as a golf course, conditions of the wetland and adjacent uplands are far less favorable than in the past. Though beneficial, increasing CRLF breeding habitat alone will not increase the distribution and carrying capacity of the SFGS, due to the limited availability of upland habitat in Sharp Park. Increasing SFGS use of the area north of Horse Stable Pond, the areas adjacent to Laguna Salada, and the connecting canal will require maintaining undisturbed upland habitat in and between these areas. These enhancements can be accomplished without significant changes to the golf course design or to the movement of golfers on the course.

All three alternatives will achieve the habitat goals. The main differences between the various alternatives are the degree of upland habitat that would be created east of the wetland complex, the costs to implement the respective alternatives, and the tradeoff between the amount of habitat and the degree to which golf opportunities are lost. Implementing Alternative A-18 would be the least costly alternative, would result in the least impact to golf, and would restore the least amount of upland habitat. Implementing Alternative A-9 would cost more and restore more upland habitat than Alternative A-18 but would cost less and restore less upland habitat than the No Golf Alternative. Implementing the No Golf Alternative would have the highest costs, would result in the greatest impact to golf, and would restore the greatest amount of upland habitat of the three alternatives. However, because the best upland habitat for the SFGS is that which is found near water bodies, much of the upland habitat located east of the wetland complex would be of lower value than that located immediately adjacent to the wetland complex. Therefore, from a habitat restoration standpoint, converting uplands immediately adjacent to the wetland areas would result in the greatest net benefit to the SFGS per acre of enhanced habitat. Focusing restoration efforts on these areas also would result in the least amount of lost golf opportunities since more distant habitat would remain available for golf.

Although the value of the habitat gained through the No Golf Alternative would diminish with increasing distance from the wetland complex, the cost of restoring this habitat would not. Considering that there are limited funds available for a myriad of restoration projects in the Bay Area, extra money that would be required to restore habitat further from the wetland complex may be better spent elsewhere. Furthermore, because of the close proximity of Sharp Park to urban features including housing, highways, major roads, and businesses and the intrinsic threats posed by them to the SFGS, more extensive upland restoration carries its own risks. Restoring uplands and locating

additional wetland further to the east of the wetland complex would potentially increase the chance of take of this species by drawing the SFGS away from the relatively protected existing wetland complex into areas that would likely be extensively used by hikers, mountain bikers, and dog walkers. Finally, in the event of a seawall breach or overtopping of the seawall by storm surge, it is the connection to upland habitat at Mori Point, rather than restored golf areas east of the lagoon, that will be of critical importance to the SFGS. This fundamental aspect is met by all alternatives.

# 1. INTRODUCTION

Sharp Park is a 417-acre multiple use facility owned and maintained by the City of San Francisco, Recreation and Parks Department (SFRPD). Its main use is as an 18-hole golf course, of which 14 holes are on the west side of Highway 1, and 4 holes are east of Highway 1. Sharp Park also offers an archery course, opportunities for bird watching, and walking and cycling on the seawall that is found on the west side of the park. Sharp Park is located in San Mateo County near the City of Pacifica, California (Figure 1).

One of the most significant features of Sharp Park is a wetland complex at the west end of the park. The wetland complex consists of Laguna Salada, Horse Stable Pond, and a channel about 1,000 feet long that connects the two water bodies (Figure 2). Laguna Salada (the lagoon) is a large freshwater lagoon of approximately 27 acres which offers open water and marsh habitat for numerous wildlife species. Horse Stable Pond (the pond) is smaller than the lagoon but still offers viable wildlife habitat. Although the connecting channel is shallower than the lagoon and the pond and is overgrown with emergent vegetation, it still offers a viable aquatic corridor between the pond and lagoon under most conditions.

The US Fish and Wildlife Service (USFWS) and California Department of Fish and Game (CDFG) have identified the wetland complex at Sharp Park as important habitat for the endangered and fully protected San Francisco garter snake (SFGS) *(Thamnophis sirtalis tetrataenia)* and the California red-legged frog (CRLF) *(Rana draytonii)*. Although historically these species have existed at Sharp Park while it functioned as a golf course, conditions of the wetlands and adjacent uplands are far less favorable in than in the past. Both agencies have recommended that SFRPD enhance habitat conditions in and around the wetland to ensure the viability of the population of the populations of these species that are found there, and take measures to reduce the possibility of harm to these species (referred to as "take").

This conceptual plan was originally conceived to serve as a template to restore the wetland complex and immediate upland area as part of a recovery action recommended by CDFG and USFWS. In response to later events, the scope of this plan was increased to encompass restoration alternatives throughout the park, focusing mainly on the wetland complex and on those areas used for golf. Ultimately, 3 restoration alternatives were developed, including an 18-hole alternative, a 9-hole alternative, and a No Golf Alternative, under which the entire golf course would be closed and restored to native habitat.

The primary goal of each conceptual alternative was to propose an effective way of increasing upland habitat adjacent to existing or future aquatic habitat, to restore the quality of the wetlands, and to evaluate and respond to the consequences of such a change to the existing golf course design and operation. The objectives of this conceptual restoration plan are to describe the existing resources, develop possible restoration alternatives, assess the extent to which each alternative could increase the value and extent of habitat for the SFGS and CRLF, to give an estimate of construction costs for each alternative, and to describe the process that would need to occur to partially or completely restore the wetland complex and golf areas. Changes in mowing, golf operations, and maintenance practices that are intended to reduce the chance of take of listed species were addressed as part of a separate compliance plan completed by SFRPD in 2009.

The wetland restoration components are similar across all alternatives, but the degree of upland restoration varies considerably for each alternative. The primary components of the restoration plan are as follows:

> **Dredging.** Much of the wetland complex would be dredged to remove accumulated sediments and biomass. Dredging various parts of the wetland and open water areas will inhibit the growth of the type of emergent vegetation that now fills in the wetland complex. Dredging plans will be designed to maximize foraging and breeding habitat for the SFGS and CRLF, while minimizing future maintenance requirements, resulting in lower costs to the City as well as reduced habitat disturbance in the future. Dredge spoils will be reused onsite to the degree possible.

**Figure 2**

TETRA TECH

Q:\Projects\LagunaSalada\GIS\Figure2_General_features.mxd

**Habitat Conversion** The main limiting factor in terms of habitat for the SFGS is lack of suitable upland habitat immediately adjacent to the lagoon. The SFGS needs basking and resting habitat, with escape cover (vegetation) and burrows for retreat from daily thermal extremes, at or near its main foraging habitat, which is found where frogs congregate. All alternatives call for converting some areas of the golf course and the existing wetlands to upland habitat needed by the SFGS for basking and resting, and allowance for development of rodent burrow complexes in appropriate locations. The main objective would be to establish a habitat linkage for SFGS between the lagoon and the pond and adjacent upland areas at Mori Point, located south of the wetlands complex. Wetlands that are converted to uplands during this process would be replaced onsite.

Public access to sensitive wetland and upland areas would be controlled by installation of a post and rail fence, but would also be enhanced under some alternatives by creation of a walking trail around all or part of the lagoon, a boardwalk over wetlands and uplands between the lagoon and the pond, and interpretive signs or kiosks at various vantage points. Restoring an upland peninsula in the center of the lagoon will increase valuable edge and shallow water habitat over current conditions.

As the public agency charged with providing and maintaining recreational facilities for the City of San Francisco, SFRPD balances resource management with recreational concerns. To help meet this goal, SFRPD created the Significant Natural Resource Areas Program (SNRAP). The SNRAP manages 31 natural areas, 30 of which are within the City of San Francisco and one (the wetland complex at Sharp Park) in Pacifica. The mission of this program is to preserve, restore, and enhance the Natural Areas and promote environmental stewardship of these areas.

Under this program, the wetland complex is being and will be managed and protected for the natural and human values it provides. Therefore, every effort has been made to develop a conceptual plan that would maintain and restore viable, high-value habitat for the SFGS and CRLF while retaining as many recreational features as possible. Management planning for the wetland complex and all other Natural Areas managed under this program is detailed in the Significant Natural Resource Areas Management Plan (SNARMP, SFRPD 2006). The plan is intended to guide natural resource protection, habitat restoration, trail and access improvements, and maintenance activities over the next 20 years.

SFRPD is in the process of preparing an Environmental Impact Report (EIR) in accordance with the California Environmental Quality Act (CEQA) to assess the potential effects of implementing the SNARMP. Assessing the environmental, cultural, recreational, and economic effects of implementing the recommended wetland restoration actions within the natural areas at Sharp Park will be an integral part of the EIR. Consideration of actions proposed outside of the natural areas would occur during separate CEQA documentation.

## 1.1 PREPARATION OF THE CONCEPTUAL PLAN

This conceptual plan was created as a collaborative effort between SFRPD, Swaim Biological, Nickels Golf, and Tetra Tech, Inc. Public agencies including California Department of Fish and Game and US Fish and Wildlife Service were involved from the earliest phases of the project, and assisted with setting the goals of the project. Staff from the Golden Gate National Recreation Area (GGNRA) and the City of Pacifica added local knowledge and planning assistance during the conceptual planning process.

Tetra Tech is an environmental consulting firm with staff that specialize in preparation of natural resource management plans and wetland restoration plans. For this project, Tetra Tech is assisting SFRPD with project management, restoration design, engineering and cost estimating, assessment of general biological resources, and regulatory compliance and permitting. Tetra Tech's team includes Swaim Biological, who surveyed the wetland complex area for the presence of SFGS and CRLF and their habitat, and assisted in

preparing recommendations for restoration of habitat; Kamman Hydrology, who assessed and reported the hydrological features of the park, and provided recommendations for various restoration alternatives; and Nickels Golf Group, who prepared the golf course realignment alternatives. A local engineering firm was hired to prepare a topographical map of the wetland complex.

As part of the preparation of this conceptual plan, studies were completed to document topographic and hydrologic conditions and to determine the extent to which the marsh complex and surrounding areas are used by the snake and the frog during their lifecycle. At the same time, a golf course designer prepared a number of alternative golf course alignments that could be implemented to adjust the amount of available habitat while maintaining an attractive and challenging golf environment. A wetland delineation was conducted to determine the extent to which wetlands or other waters of the US under the jurisdiction of the US Army Corps of Engineers are found in the project area.

The information in these studies was used to develop measures to increase or maintain the amount and quality of habitat for the SFGS and CRLF, to reduce the potential that these species would be harmed by golf course practices or by other park users, and to assess the differences in habitat value between an 18-hole golf course, a 9-hole golf course, and golf course closure. One 18-hole alternative (Alternative A18) and one 9-hole alternative (Alternative A9) were brought forward for assessment. A single alternative (the No Golf Alternative) was also developed to assess closing the golf course and converting the fairways to upland habitat. The alternatives are described in detail in Section 4.

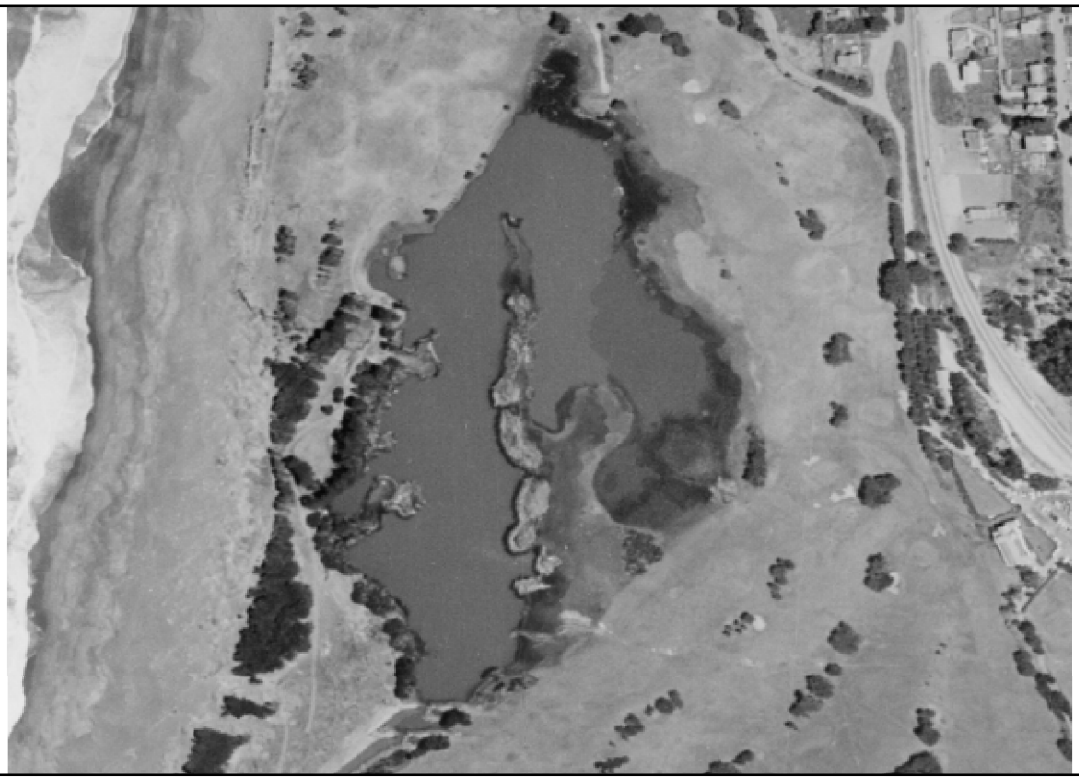
## 2. HISTORICAL CONDITIONS

Prior to the development of the Sharp Park Golf Course beginning in the 1920s, the Laguna Salada site was characterized by ranch lands, sand dunes, and a large lagoon (PWA 1992). Although it is likely that some freshwater wetlands existed behind the dunes, the common name of Laguna Salada (Salty Lagoon) suggests that the lagoon was formerly brackish to saline. In one of the early photographs of the region, a small channel that connected the lagoon with the Pacific Ocean can be seen, along with a shoreline of relatively low relief.

A direct hydrologic connection between the lagoon and the ocean was eliminated with the construction of the golf course and the seawall. To avoid flooding the golf course, tidal exchange was eliminated and runoff from the watershed has been pumped into the ocean from a location at the pond since 1941. The elimination of saline water allowed the establishment of saline-intolerant vegetation such as cypress, grasses, and shrubs for bank stabilization and landscaping purposes. However, salts in bottom sediments persist and make the lagoon and the pond slightly saline, a condition which increases as water levels decline throughout the drought period (Kamman 2009). An abandoned gravity flow outlet which was once used to convey overflow from the pond to the ocean is still in place, but the outboard end is covered by several feet of sand. It is possible that small amounts of seawater enter the pond through this pipe during very high tides.

Considerable shoreline erosion has occurred along the Laguna Salada shoreline since completion of the Sharp Park Golf Course in 1932. This unarmored earthen seawall was constructed between 1941 and 1952 to prevent waves from overtopping the shoreline and damaging the golf course (PWA 1992). This embankment was repeatedly breached by storm waves, allowing the former natural process of wave overwash to occur and damage fairway landscaping.

The most severe erosion occurred in 1983 when most of the embankment was eroded and wave overwash carried sand onto the golf course fairways and into the lagoon. It was estimated that nearly half of the 200-300 feet of shoreline lost between 1931 and 1984 occurred between 1978 and 1984, and largely due to the 1983 event (PWA 1992). The seawall was rebuilt after this event, and is being assessed by geotechnical experts under separate contract with SFRPD.



Flooding of the golf course has been a recurrent problem since the 1940s. In 1958, most of the golf course was submerged by a combination of wave overwash and storm inflows. In addition to damaging the golf course, increased salinity due to overwash may have been lethal to the CRLF and may have resulted in a near lack of SFGS prey during periods when the lagoon was too saline. A pump system was installed in 1941 to control the water level in the lagoon by pumping runoff to the ocean. Since the 1940s, the pump system has been augmented to pump up to 11,500 gallons per minute (GPM). Simulated storm models (Appendix A) show that this capacity is exceeded by rainfall events at or greater than 2-year recurrence intervals.

A defunct gravity flow drain is located at the pond, but currently does not function to remove stormwater. Reconstructing this drain would involve placing a new pipe through the seawall, over or through the beach on concrete footings placed on bedrock, and extending far enough into the surf to ensure that the outlet would not become buried in sand. Estimated costs for rebuilding this feature are between $400-800k. Rebuilding this structure would help to alleviate some of the flooding problems that are attributed to pump limitations.

The presence of the SFGS at Laguna Salada was documented as early as 1946 (Fox 1951). Although the CRLF was not considered rare at the time, their presence was also documented in 1946 as one was present in the stomach contents of an SFGS at the lagoon (Wade Fox, unpublished field notes). Comparing recent survey reports (Swaim, 2004 and 2008) to earlier reports (Fox 1951) indicates that the population of SFGS at Laguna Salada and likely at Horse Stable Pond has declined since early records of the presence and abundance of this species were recorded in 1946. This may be due to many factors including the sedimentation of the

lagoon, the conversion of upland habitat surrounding the exterior of the lagoon to golf fairways and greens, and illegal collecting of the species until listing in 1973. Barry (1978) suggested illegal collecting was one of the main factors in the decline of SFGS there, based on his interviews with reptile dealers. Field notes maintained by Wade Fox and obtained from the Museum of Vertebrate Zoology indicated that as early as 1946, the lack of upland habitat for SFGS was apparent. However, conditions were still such that Fox collected 44 specimens of SFGS at the lagoon over 1946 and 1947, over 15 years after the golf course was built and operating. In 1979, 37 SFGS were located in the wetland area adjacent to Horse Stable Pond and 46 in the Mori Point "bowl area" (Barry 1979). This indicates that at that time, the wetland complex, primarily Horse Stable Pond, was still supporting a relatively abundant population of SFGS. It was not until after the 1983 storms that a precipitous decline in SFGS in the Horse Stable Pond and Mori Point area was documented (McGinnis 1986; 1988, 1991, 1997).

Ongoing sedimentation of the lagoon has increased as sediment from the watershed is no longer flushed into the ocean during tidal surges or large storms. Sediment sources include erosion of dirt roads and parking areas, as well as natural input from erosion of Sanchez Creek and lightly vegetated hillsides. This has resulted in a higher bottom elevation of the wetland complex over time, allowing shallow emergent vegetation to spread at the expense of open water. Aerial photographs of the lagoon in 1956 and 2007 show the extent to which the open water part of the lagoon has converted to vegetated wetland (Figure 3).

# 3. EXISTING CONDITIONS

Assessment of historic aerial photographs of the Laguna Salada area indicates that prior to development of the Sharp Park Golf Course and the seawall located west of the wetland complex, environmental conditions at the project site were representative of a coastal lagoon system. Environmental changes during subsequent decades have modified the hydrologic characteristics of the system by isolating the lagoon and adjacent wetlands from the ocean.

The wetland complex at Sharp Park provides extensive habitat for the SFGS and the CRLF. SFGS habitat quality in the marsh complex is enhanced by its proximity to upland areas at Mori Point, located to the south of the lagoon and pond (Figure 2). The SFGS has been identified at Laguna Salada since at least 1940 (Fox 1951), but the importance of the population that occupies the area has gained more attention in recent years since the successful restoration of SFGS habitat at Mori Point and as other important habitat areas have been reduced in size or value.

Sharp Park's location near several open space areas makes it an important part of the overall distribution of SFGS and CRLF on the San Francisco Peninsula. The Golden Gate National Recreation Area (GGNRA) borders Sharp Park on the southwest and supports SFGS and CRLF. Habitat enhancement projects in 2004, 2005, and 2007 increased the amount of breeding habitat for CRLF and foraging habitat for SFGS at Mori Point. Trapping studies conducted in 2004, 2006, and 2008 have shown that the new ponds are being used by resident SFGS populations (Swaim Biological, Inc. 2008). Additional CRLF habitat is found at Sweeney Ridge, which lies to the east and southeast and provides habitat for the CRLF. SFGS were recently reconfirmed at the north end of San Andreas Reservoir, just east of Sweeney Ridge (SBI 2008 [unpublished]). To the north of Sharp Park, Milagra Ridge in the GGNRA supports CRLF and contains habitat suitable to support SFGS. To the south, beyond Mori Point, the Calera Creek watershed supports a large population of CRLF and also includes potential habitat for the SFGS. Individual SFGS and CRLFs probably move between some or all of these sites, and Sharp Park provides suitable habitat for dispersal and foraging for both species, as well as being a source population for CRLF.

## 3.1 WATERSHED CHARACTERISTICS

The natural watershed of Sanchez Creek includes 844 acres (1.3 square miles) (PWA 1992). The watershed consists of moderate to steep slopes in the upper watershed (Sweeney-Minchizo soil series) and flatter floodplain terraces (Tunites or Lockwood soil series) near the coast (PWA 1992). Most of the flatter terraces have been developed for residential, road, or golf course use, while most of the upper watershed remains undeveloped. The watershed is drained by Sanchez Creek, which extends approximately 1.7 miles between Horse Stable Pond and the watershed divide. Annual precipitation in the area ranges from about 29.5 inches annually at the coast to 30.5 inches annually at the watershed divide.

## 3.2 TOPOGRAPHY

Topographic information was reproduced on AutoCAD drawings that reflect the locations of thousands of vertical points taken by a roving, survey-grade GPS. Points were tied to five control points which were checked with a Total Station unit. Points in aquatic areas were taken by surveyors in a boat using a rod and level. In aquatic areas, bathymetry lines were produced at 0.5 foot contour intervals, and topographic lines outside of aquatic areas were produced at 1.0 foot contour intervals (Figure 4). Because the project originally only included the marsh complex and its immediate surroundings, topographic and bathymetric information at these contour intervals is not available beyond these areas. USGS topographic contour maps at 5 foot

contours have been used for other aspects of the conceptual plan, including development of alternative fairway alignments east of Highway 1.

The bathymetric survey determined the range of depths for all the aquatic features at the project site. The aquatic features including Laguna Salada and surrounding wetlands range from 0 to 7.5 feet (NAVD 88). The aquatic features including Horse Stable Pond and surrounding wetlands range from 3 to 9.5 feet (NAVD 88). The open water portion of the connecting channel ranges from 3 to 7 feet (NAVD 88). Cross sections and profile locations are shown in Figure 5, and topography/bathymetry at each cross section and along the profile is depicted in Figures 6-11.

## 3.3 HYDROLOGY

In combination with topography, the hydrology of the wetland complex creates the physical habitat which supports the vegetation and wildlife resources in this area. Water levels in the wetland complex, which is found in the lowest part of the park, are maintained primarily by groundwater, but are augmented in the rainy season by storm flows. The main components of the hydrologic system are described below.

### *Laguna Salada*

Laguna Salada, the main component of the wetland complex, consists of an open water pond and adjacent emergent wetland occupying about 27 acres. The lagoon has a bottom elevation of between 0 and 2.5 feet, and is up to 7.5 feet deep under normal circumstances.

### *Horse Stable Pond*

Horse Stable Pond, located at the south end of the wetland complex, consists of an open water pond and a freshwater wetland, which extends between the shoreline levee on the west and about 500 feet east to the housing subdivision. The pond is considerably smaller and shallower than the lagoon, with bottom elevations between 3 and 5 feet and typical water depths ranging from 1 to 3 ft.

Horse Stable Pond is fed by Sanchez Creek, which enters from the east, and Laguna Salada, which enters from the north via a connecting channel. Some surface water likely also enters from Mori Point, located to the south.

### *Connecting Channel*

A meandering channel approximately 1,000 ft. long connects the lagoon with the pond and allows for bidirectional flow under all but the lowest water levels. Although the true bottom of this channel is at approximately 3' (NAVD 88), dead and decaying vegetation has raised the functional floor and provides a platform from which rooted emergent grows across most of the channel.

### *Sanchez Creek*

Sanchez Creek is about 1.5 miles long and drains the 844 acre (1.3 sq. mile) watershed. The creek flows under Highway 1 just south of the Fairway Drive exit and is alternately culverted and daylighted across the golf course. Under original conditions, Sanchez Creek was approximately 5-7 feet wide and had a narrow riparian zone on either side.

### *Pacific Ocean/Seawall*

Coastal sediment processes, including littoral sand transport, ocean wave transport (on- and off-shore), and wind blown sand create the beach and dunes along the west side of Laguna Salada (PWA 1992). A compacted earthen seawall was significantly reconstructed by the City of San Francisco in 1989 to reduce the damage from wave overtopping. The seawall performs its role of preventing tidal inundation and flooding of the study area under most conditions, but has been overtopped during very high storm surges, including events in 1956 and 1983.

For the purposes of this restoration plan, it is assumed that the seawall is stable and will continue to provide the wetland complex with a high level of protection from tidal inundation. The integrity of the seawall is being assessed by a geotechnical team under separate contract with SFRPD.

### *Water Quality*

With the exception of salinity concentrations, water quality has not been identified as a limiting factor in the habitat value of the wetlands complex. Salinity concentrations were modeled under a variety of conditions, and were found to be below the threshold at which they would harm amphibians or other wildlife (Kamman 2009). Although water quality may be affected by nutrients carried by runoff from the golf course or by petroleum-based pollutants and heavy metals carried by runoff from Highway 1, water quality is being assessed under a separate contract and complete information is not yet available.

### *Sea Level Rise*

Sea levels are projected to rise by up to 1.4 meters by 2100 (CA Natural Resources Agency 2009). Mean Higher High Water (MHHW) elevations under current conditions as well as those projected for the years 2030, 2040, and 2100 are illustrated in Figure 12. Although floods occurring under predicted sea levels at 2100 would not cover a significantly larger area of Sharp Park than would a flood occurring under current conditions, the seawall would be put under more stress and would likely be overtopped more frequently, placing wildlife in the wetlands complex at greater risk of harm due to greatly increased salinity levels.

### *Hydrologic Evaluation*

Kamman Hydrology and Engineering, Inc. (KHE) performed a hydrological evaluation of the marsh complex and watershed during an entire hydrological cycle in 2008 and 2009. The purpose of the hydrological assessment was to improve understanding of the hydrologic processes which affect the distribution of ecological habitats in the wetland system and flooding of the adjacent golf course. Two of the main objectives behind the formulation of the hydrological study were to determine how to regulate water levels to avoid flooding parts of Holes 10, 12, 14, and 15 and to avoid stranding CRLF egg masses.

Much of what is currently known about the hydrology of the wetland complex was presented by Phil Williams and Associates et al. (PWA) in an earlier resource enhancement plan (PWA 1992). The PWA report includes a description of historical conditions at the site as well as results from a hydrologic monitoring study during the period 1990-1991. The KHE study aimed to expand on the findings of the earlier research to reflect current conditions at the site and to extend those findings into a suite of analytical models to be used in the planning and design for restoration alternatives.

# Sea Level Rise Projections Over 100 Years

This figure shows the portions of Sharp Park that would be inundated if the seawall were breached or were not present. Inundated areas are estimated based on projected sea level rise scenarios.

KHE maintained a hydrologic monitoring network at the site during the period April 2008 to April 2009. Field data collection focused on understanding the variability of water level and salinity in the wetland complex. Monitoring data were utilized to characterize current site conditions and to calibrate analytical models for additional investigation. Three specific analytical modeling tools were developed:

- A water budget model to investigate the seasonal variations of water supply and demand at the site.
- A salinity mass balance model to investigate the sources and relative impact on water quality.
- A hydraulic model to simulate the water level response in the wetland system to winter storm runoff.

Key findings of the report, in terms of relevance to SFGS and CRLF habitat and restoration design are as follows:

- The marsh system is not water limited, and water surface levels are maintained by groundwater even in very dry years. Increases in precipitation and runoff to the system only increase the amount of water that must be pumped out of the system. This is important in that it indicates that increasing the system's storage capacity through extensive dredging will not result in diminished water levels or compromised water quality.
- Although dense vegetation in the eastern part of the lagoon may slightly reduce the rate of drainage to the greater lagoon area and thus to the pumps in Horse Stable Pond, dense vegetation does not significantly contribute to water levels that encroach onto the golf fairways. Water surface elevations that result in standing water on the fairways result from inadequate pumping rates during periods of storm flows. Flooded fairways occur during dry months as well, possibly from poor drainage of golf course irrigation runoff or from input of runoff from the adjacent community, which would enter through a culvert at the north end of the lagoon. Poor drainage may be resulting from buildup of sediment in the main channel that separates the eastern half of the lagoon from the open water portion (west side) of the lagoon.
- Salinity varies according to the volume of water in the marsh complex at any given time. Salinity results from salts in the soils and water of the lagoon that are residual from the time that the lagoon was tidally inundated, and from salts deposited during subsequent overtopping of the seawall.
- Elevated salinity was found at a seep at the base of the seawall on the western edge of the pond (Wayne 2008). This saline water may have seeped through the seawall during sustained high tides, or may enter the pond through an abandoned culvert that once conveyed overflow from the pond to the ocean. Salinity from this seep is localized and is not of sufficient quantity to increase salinity levels in the rest of the pond (Kamman 2009). No other evidence of salt water intrusion through the seawall was found.

The complete hydrological report is found in Appendix A.

## 3.4 SEDIMENT

The wetland complex is at the hydrologic terminus of an 844-acre coastal watershed. The watershed includes one primary drainage, Sanchez Creek, and a smaller subbasin to the north that enters the main lagoon via a small, roadside swale and culvert. Neither of these waterways are gauged. Sanchez Creek drains to the pond, and the small swale drains to the main lagoon. Construction of the seawall has prevented sediment loads from exiting the watershed as they normally might have during storm events (high flows, tidal flushing, etc.).

As part of the engineering design for this project, a sediment yield analysis is being prepared. The primary objective of the sediment yield analysis is to better understand the rate at which sediment is transported to the wetland complex from the watershed. Annual sediment delivery rates, i.e., sediment yields, are estimated in

order to support design of sediment detention and removal facilities. The location and capacity of sedimentation basins will be designed to consider removal effectiveness and facility maintenance.

The approach to the sediment yield analysis includes a first-cut level of analysis based on the Revised Universal Soil Loss (RUSLE) methodology to estimate the long-term average annual soil loss from the tributary area. To the extent possible, existing information and studies and knowledge of the site will be used to guide estimation of parameters. Additionally, the Modified Universal Soil Loss Equation (MUSLE) is being used to predict soil erosion from the 2-, 5-, 10-, 25-, 50-, and 100-year storm events. Results from RUSLE and MUSLE will be compared to local or regional sediment yield data to evaluate the level of certainty in the yield estimates for the wetland complex. Uncertainties in sediment yield estimates will be taken into consideration during design through factors of safety and use of other conservative design parameters.

Data sources include existing reports, hydrologic analysis of the watershed, field reconnaissance, vegetation maps, land use maps, soil maps, and precipitation records. Total suspended sediment estimates will use, in part, the results of water samples pulled at Sanchez Creek and the sub-basin channel during a storm in winter of 2008.

## 3.5 VEGETATION

The majority of the Sharp Park study area is planted with golf course grasses including Kentucky bluegrass *(Poa pratensis)*, ryegrass *(Lolium* sp.), and kikuyu *(Pennisetum clandestinum)*, separated by occasional stands of Monterey cypress *(Cupressus macrocarpa)*. Although none of these grasses are native to the study areas, kikuyu in particular is considered a highly invasive weed and is very difficult to manage (Randall 2002). Areas used for golf are constantly disturbed by visitors and maintenance staff, and also have very minimal vegetative diversity. Therefore, they generally provide low value habitat and are only used by generalist species such as robins and starlings, which are adapted to these conditions. Primary habitat areas are found at the lagoon, the pond, the connecting canal, Sanchez Creek, and the uplands on GGNRA property found south of the pond. These areas provide habitat for six special status species as recognized by the State of California and US Fish and Wildlife Service: San Francisco forktail damselfly *(Ischnura gemina)*, California red-legged frog, western pond turtle *(Clemmys marmorata)*, San Francisco garter snake, salt marsh common yellowthroat *(Geothlypus tricha)s* and dusky-footed woodrat *(Neotoma fuscipes)*.

The construction of the Sharp Park Golf Course replaced native coastal scrub and grasslands, as well as artichoke farms (Sweeney 2008). Sanchez Creek, which runs through the golf course, has been culverted west of Highway 1. The stream remains daylighted east of Highway 1 except in the rifle range area, where it is also culverted. Some riparian scrub vegetation is found along the edges of Sanchez Creek east of the highway, and the stream is largely shaded in this area by large Monterey cypress trees. Freshwater marsh is found at the edges of the pond, the lagoon, and in the canal. Coastal scrub, dead Monterey cypress, and weedy, non-native plant species including iceplant are found to the west of the lagoon and wet meadow to the south and east. Most of the golf course is east of the lagoon; however, two holes are present in the area located northwest of the lagoon.

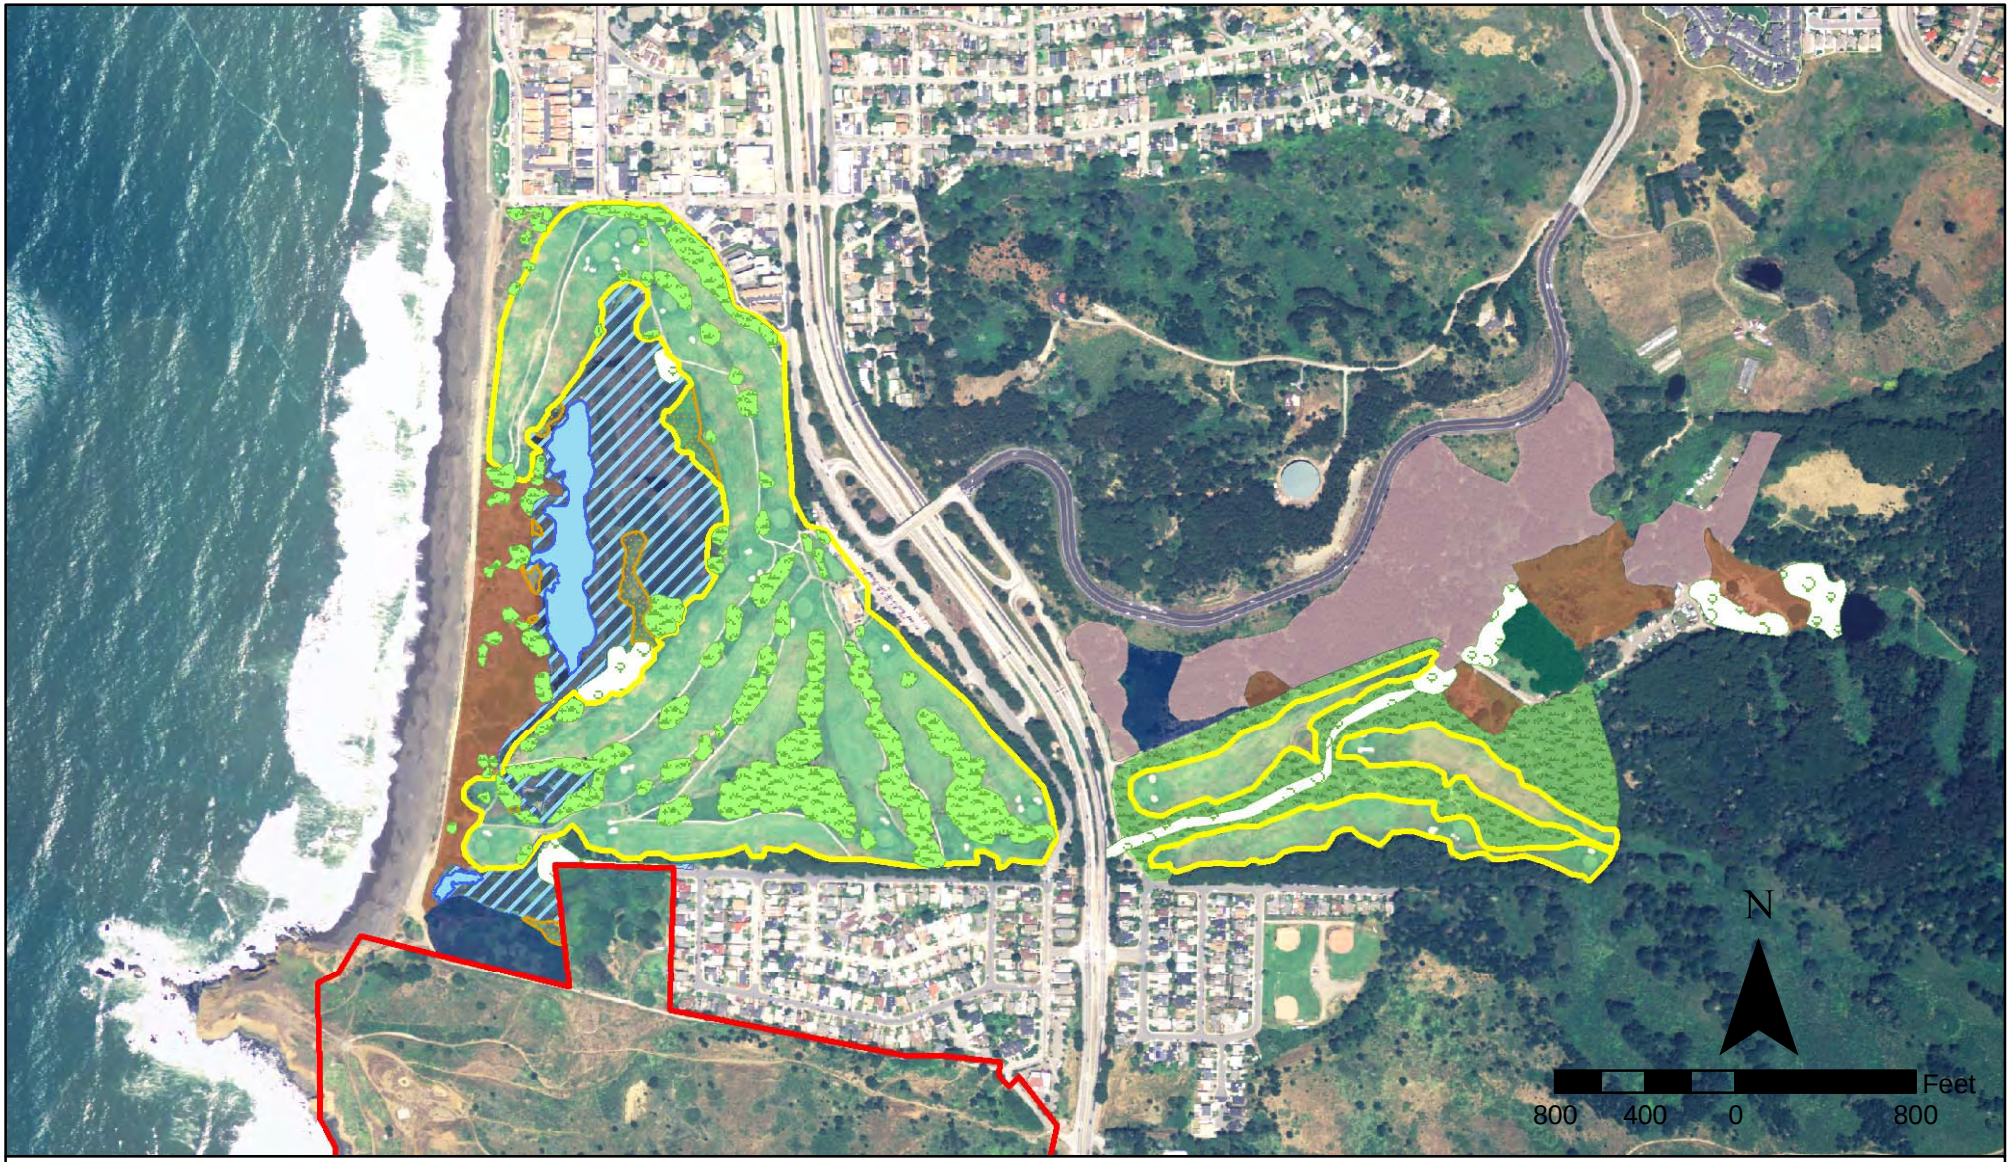
South of the pond are formerly grazed uplands which now consist of ruderal vegetation such as invasive weeds. To the west of the lagoon is a sparsely vegetated ~8 meter (~25 foot) high levee. Sand dunes interspersed with sections of golf course and marsh plants lie along the base of the levee on the landward side (PWA 1992).

In September 2008, a wetland delineation was performed to identify the wetland resources and other "Waters of the United States" that would fall under the jurisdiction of the U.S. Army Corps of Engineers (USACE) at the wetland complex. Wetlands in the study area were identified using NWI maps, soil survey information, and site observations. Potential wetlands were delineated in the field using the Interim Regional Supplement

to the Corps of Engineers Wetland Delineation Manual: Western Mountains, Valleys, and Coast Region (Environmental Laboratory 2008). Tetra Tech staff also prepared informal field maps of vegetation community types during several reconnaissance level field surveys.

### *Plant Community Descriptions*

Several types of wetland plant communities were identified in the marsh complex, and upland and ruderal communities were identified around the marsh complex. Wetland habitat types include freshwater marsh, willow scrub, and wet meadow. Other habitat types include foredune, ruderal, and riparian. These habitat types are described below. Other plant communities including mixed conifer forest, Monterey cypress forest, eucalyptus forest, and coastal scrub/grassland were identified at the far eastern part of the project area and at nearby Mori Point. All habitat types are displayed at the community level in Figure 13.



#### Freshwater Marsh

Freshwater marsh within the study area includes vegetated areas within and adjacent to Laguna Salada and Horse Stable Pond and the connecting channel (Tetra Tech 2008). Dominant vegetation within the freshwater marsh areas include bulrush *(Scirpus s*p.), cattail *(Typha angustifolia),* and coastal cinquefoil *(Potentilla anserina),* all of which are obligate wetland species. Cattails and bulrush have steadily encroached on much of what was formerly open water habitat in the eastern portion of Laguna Salada and in the connecting channel between the lagoon and the pond (Tetra Tech 2008). A small pond containing emergent vegetation was observed within the willow scrub area south of the golf course on GGNRA lands. GGNRA staff enhanced this pond by deepening an existing wetland to provide suitable breeding habitat for California red-legged frogs (Tetra Tech 2008).

Regular golf course maintenance appears to be controlling the growth of wetland habitat in some areas adjacent to the lagoon, as remnants of some hydrophytic plant communities were observed in lower elevation mowed areas (Tetra Tech 2008). Wetland vegetation has been encroaching onto the golf areas as poor drainage on the north and northwest parts of the lagoon has allowed for a larger flooded area.

#### Willow Scrub

Willow scrub within the study area was located south of the Sharp Park golf course, to the east of Horse Stable Pond, and near the archery range (Tetra Tech 2008). Small areas of this habitat type are also found on the northeast and southeast sides of Laguna Salada and along Sanchez Creek, east of Highway 1. The willow scrub communities are characterized by a dense overstory of arroyo willow *(Salix lasiolepis)* and sitka willow *(S. sitchensis),* which are both facultative wetland species, with an understory composed of obligate hydrophytes, such as panicled bulrush *(Scirpus microcarpus)* and coastal cinquefoil *(Potentilla anserina)* (Tetra Tech 2008).

Q:\Projects\LagunaSalada\GIS\Figure13_GeneralHabitatTypes.mxd

**Wet Meadow**

Wet meadow occurs on the east side of Laguna Salada where the fairways flatten out at the edges of Holes 14 and 15, and also where a swale forms a meadow directly east of and adjacent to Horse Stable Pond. Dominant plants in this area include Baltic rush *(Juncus balticus)*, spreading rush *(J. patens),* bulrush *(Scirpus americanus)*, curly dock *(Rumex crispus)*, and coastal cinquefoil. Coyote bush *(Baccharis pilularis)* occurs on the hummocks amid the wetlands, which may be evidence that uplands were once present near the lagoon. Wet meadow vegetation grades to riparian willows (*Salix* spp.) and cattails (*Typha* spp.) near Sanchez Creek.

Wet meadow also occurs along the east side of the lagoon as well as on a peninsula of higher ground in the middle of the lagoon. Salt concentrations in the soils in these areas, residual to the time when the lagoon was open to tidal action, are probably responsible for the occurrence of some salt marsh plants including saltgrass *(Distichlis spicata)*, fleshy jaumea *(Jaumea carnosa)*, and Virginia pickleweed *(Salicornia virginica)*. Salt tolerant plant species are also found at the edge of the pond.

**Ruderal Vegetation**

Ruderal vegetation is found in the areas around the parking lot, in the upland habitat south of the pond and west of the lagoon, at the site of the closed rifle range, and at the archery range (Tetra Tech 2008). The vegetation in these areas includes primarily invasive forbs such as wild radish *(Raphanus sativus),* curly dock *(Rumex crispus),* and wild oats *(Avena barbosa)* (Tetra Tech 2008).

The hills on Mori Point are covered with non-native annual grasses mixed with invasive forbs including wild radish, bristly ox tongue *(Picris echioides)*, and sweet fennel *(Foeniculum vulgare)* with a few Monterey cypress (PWA 1992, Tetra Tech 2008).

In addition to maintained tees, greens, fairways, and sand traps, the golf course roughs include many non-native plants. Where the fairways border the lagoon, wet meadow and marsh plants function as hazards for the golf course. Between the holes (in the rough) are various non-native grasses.

**Foredune**

The western portion of the lagoon has undergone considerable disturbance, both from periodic high tides and storms and from development of the golf holes that were once there. The 25-foot high seawall supports only sparse ruderal vegetation. At its base, sands support foredune species and, closer to the lagoon, salt marsh species. Areas of bare sand are interspersed with patches of foredune plants. Residual soil salts are probably responsible for the occurrence of these species, since the lagoon itself supports freshwater marsh species. Species observed include coastal sand verbena *(Abronia latifolia)*, silver bur ragweed *(Ambrosia chamissonis),* ice plant (*Mesembryanthemum* sp.), and New Zealand spinach *(Tetragonia expansa)*.

**Riparian**

West of Highway 1, Sanchez Creek has been channelized and runs through a corridor southeast of the lagoon, parallel to Fairway Drive. In open areas the banks are partially vegetated with plantain (*Plantago* sp.), panicled bulrush *(Scirpus microcarpus)*, knotweed *(Polygonum* sp.), and broom (*Cytisus* sp.) (PWA 1992). A dense overstory of Monterey pine *(Pinus radiata)* and Monterey cypress cover much of its course in this area and as a result, there is little riparian vegetation. Near the end of Fairway Drive, the creek is culverted under the golf course. When it emerges from the culvert it flows under a thicket of willows. The stream then flows west through a dense stand of cattails and enters the pond (PWA 1992).

**Wetlands**

Wetlands in the study area were identified using National Wetland Inventory (NWI) maps, soil survey information, and site observations. Potential wetlands were delineated in the field using the routine on-site method (level 2), as outlined in Section D of the Wetlands Delineation Manual (Environmental Laboratory 1987). This method is referred to as the three-parameter approach because it uses three criteria—presence of hydrophytic (water adapted) vegetation, hydric soils, and wetland hydrology. The three-parameter approach determines whether an area is a jurisdictional wetland under normal conditions. Jurisdictional wetlands are regulated by the USACE under Section 404 of the Clean Water Act (CWA) and by the Regional Water Quality Control Board under Section 401 of the CWA.

A total of 27.42 of acres of Waters of the US were delineated within the study area (Appendix B, Figure 3). Jurisdictional areas were classified into four habitat types: freshwater marsh, willow scrub, wet meadow, and unvegetated pond (open water). The amount of each jurisdictional habitat type within the study area is shown in Table 1, below.

**Table 1. Wetlands and Other Waters in the Wetlands Complex**

| Habitat Type | Jurisdictional Determination | Area (Acres) |
|---|---|---|
| Freshwater marsh | Wetlands | 19.56 |
| Willow scrub | Wetlands | 0.93 |
| Wet meadow | Wetlands | 2.44 |
| Unvegetated pond | Other Waters of the US | 4.49 |
| Total wetlands/waters | | 27.42 |

## 3.6 SENSITIVE WILDLIFE RESOURCES

Swaim Biological conducted surveys for the SFGS and CRLF at or near the wetland complex as part of this project in 2008, and in 2004, 2006, and 2008 as part of another project. Visual survey locations included the following aquatic habitats and associated uplands: Horse Stable Pond, Laguna Salada, the canal connecting Horse Stable Pond and Laguna Salada, Sanchez Creek west of Highway 1, and Arrowhead Lake east of Highway 1 and the archery range. Aside from determining the presence or absence of these species, one of the main objectives of the surveys was to identify limiting factors for the SFGS and CRLF and their prey species. The complete survey report is found in Appendix C.

**California Red-legged Frog**

*Habitat Requirements*

This species usually occurs in or near quiet permanent water of streams, marshes, ponds, and lakes (Stebbins 2003, NatureServe 2009) typically ~0.7 meter (2.3 foot) deep, in habitats characterized by dense, shrubby riparian vegetation (Hayes and Jennings 1988). During the dry summer months, California red-legged frogs estivate in small mammal burrows, leaf litter, or in other moist sites in or near riparian areas (~30 meters; 100 feet) (USFWS 1996). Individuals may range far from water along riparian corridors and in damp thickets and forests. The California red-legged frog is generally found near water but often disperses to upland habitat after rains (Stebbins 2003). Although frogs at most locations remain at the breeding site year-round, long-

distance movements of up to 2.2 miles to and from non-breeding sites have been observed (Bulger et al. 2003). Lack of a dispersal corridor leading to other viable habitat means that frogs found in the wetland complex at Sharp Park are unlikely to migrate.

Breeding occurs in permanent or seasonal water of ponds, marshes, or quiet stream pools, and sometimes in lakes (Fellers, in Jones et al. 2005). Eggs are often attached to emergent vegetation where they float at the surface (Hayes and Miyamoto 1984). CRLF typically breeds during or shortly after large rainfall events in late winter or early spring (Hayes and Miyamoto 1984, USFWS 1996). The breeding period lasts about 1 to 2 weeks and eggs hatch in 6 to 14 days. Larvae metamorphose in 3.5 to 7 months after hatching but occasionally overwinter (Fellers et al. 2001). Larval mortality tends to be very high within this species. Sexual maturity is reached in 3 to 4 years and individuals may live 8 to 10 years.

Diet for the California red-legged frog includes various terrestrial and aquatic invertebrates, mainly invertebrates of shoreline or water surface. Diet of large adults also includes small vertebrates. Larvae eat algae, organic debris, plant tissue, and other minute organisms (NatureServe 2009).

*Local Occurrence*

A total of 85 CRLF egg masses were located in or near the study area (SBI 2008). The highest concentration was in Horse Stable Pond, with 57 masses being located. Twenty egg masses were found in portions of Laguna Salada and four were found in the canal. East of Highway 1, four egg masses were found in Arrowhead Lake (SBI 2008). No egg masses were found in Sanchez Creek or in areas of extremely dense emergent vegetation that lacked open water (SBI 2008).

Areas that are suitable for foraging and basking but where no sign of breeding was observed include Sanchez Creek and portions of Laguna Salada, notably the north end. Juvenile and adult CRLFs were concentrated in and around the pond, the canal, and lower Sanchez Creek (SBI 2008). In these areas, CRLFs have been observed basking or sitting under vegetation next to the water. However, they were not observed in extremely dense cattails or bulrushes (SBI 2008).

The primary limiting factor for the CRLF in the wetlands complex is a vegetation structure that is inappropriate and not optimal for successful breeding and/or recruitment of larval stages into the adult population. The dense emergent vegetation combined with little remaining open water offers poor habitat for the survival of egg masses or tadpoles. Tadpoles hatched from eggs deposited on flooded areas of the golf course have been stranded in these areas due to their inability to penetrate the dense vegetation at the edge of the lagoon (Wayne 2008).

Locally, high salinity in the study area would lead to severely compromised habitat. One-hundred percent of CRLF egg masses die at salinity levels of 4.5 parts per thousand (ppt) (Jennings and Hayes 1990), and larvae cannot survive in concentrations higher than 7.0 ppt (USFWS 2002). The presence of egg masses in Laguna Salada, the canal, and Horse Stable Pond suggest salinity levels of less than 4.5 ppt are present during the breeding season. Although loss of CRLFs or their eggs due to salinity increases has not been documented at Laguna Salada in the past, the potential for this occurrence has led to the recommendation that any frog ponds created at Sharp Park be situated above the 100-year storm surge elevation that is predicted under current conditions and under projected conditions 30, 40, and 100 years in the future.

**San Francisco Garter Snake**

*Habitat Requirements*

The habitat requirements of the SFGS vary throughout the year, and multiple habitat types are used on a seasonal and often daily basis. From spring through early fall SFGS are found in wetland areas where they forage for frogs, tadpoles, and small fish. During these months they makes daily movements between foraging habitat and nearby upland retreats located in underground burrows and soil crevices, typically located in a grassland-shrub community. Grassy hillsides, floating algae, and rush mats also are used at this time for basking and mating. Beginning in mid- to late fall they may move to more distant uplands and winter underground retreats. Here they remain relatively inactive during the winter months versus the rest of the year. SFGS have been seen in all months of the year during warm weather, including individuals foraging in ponds during February. In some populations where uplands immediately adjacent to the aquatic habitat are suitable for winter retreats, SFGS will take advantage of these closer burrows (Larsen 1994).

*Local Occurrence*

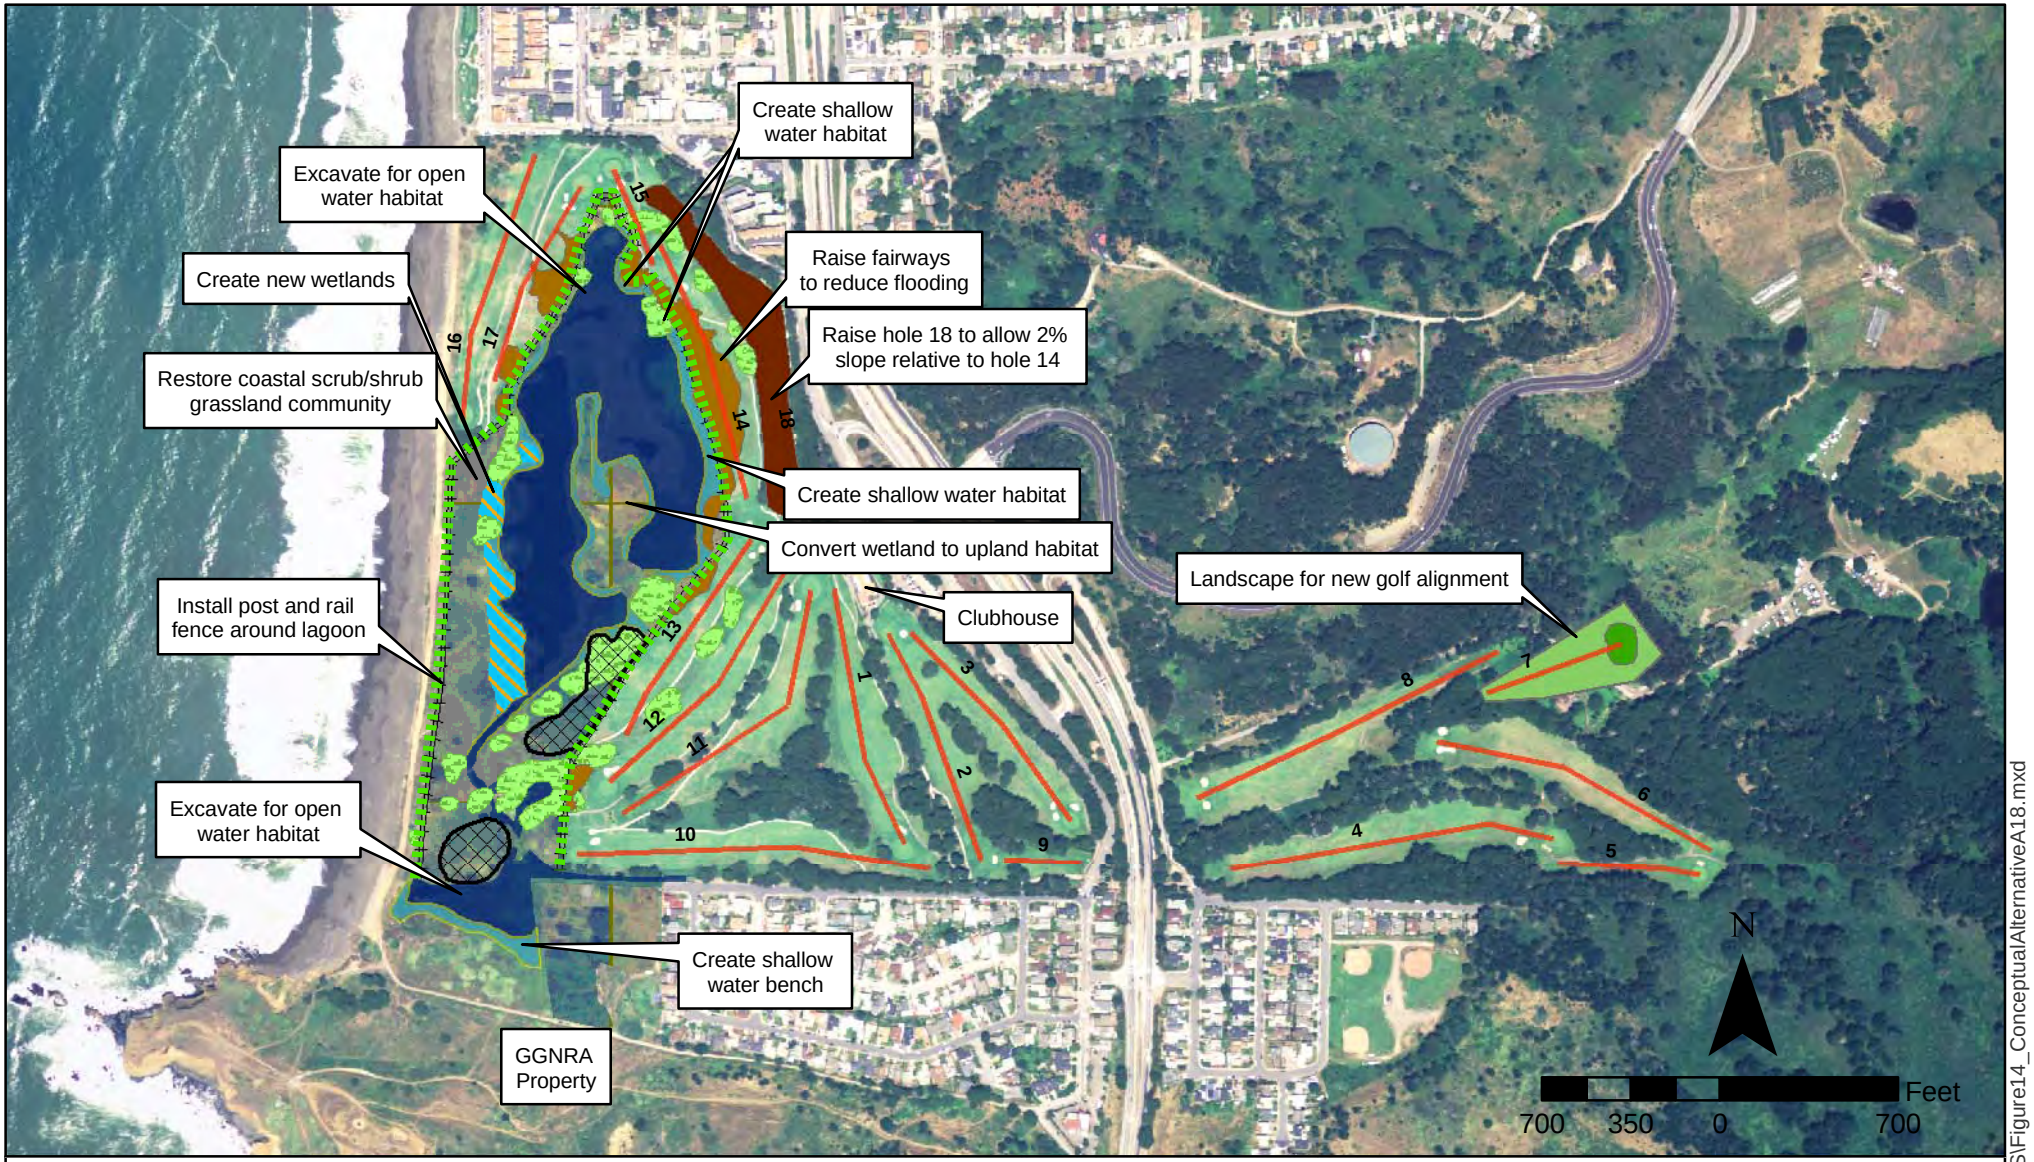
Under current conditions, high quality upland habitat for the SFGS at Sharp Park is restricted to a small area south of Horse Stable Pond. Laguna Salada and the connecting channel contain functionally little or no adjacent SFGS upland habitat that is secure from daily human disturbance and exposure to predators (SBI 2009). This lack of suitable upland habitat with disturbance by golf activity during the day minimizes the connectivity between the aquatic habitats in Horse Stable Pond and Laguna Salada and deters occupancy by the snake in all but the southernmost portion of the park. The edges of Laguna Salada currently are the most likely routes for SFGS to follow, and movement through these areas could expose snakes to mortality from predation, mowing, and being crushed by golf carts and people. The lack of suitable upland habitat that would be used on a regular basis is therefore a limiting factor in ensuring the persistence of the SFGS at Sharp Park. Upland habitat that would be suitable for winter retreats is also limited as any that exists immediately adjacent to the lagoon would be subject to the flooding that occurs each winter.

For SFGS that travel to the lagoon from uplands near the pond or Mori Point, the extremely dense structure of the aquatic vegetation combined with little open water/emergent vegetation edge habitat at the lagoon provides extremely poor foraging habitat (SBI 2009). The deterioration of breeding habitat due to inappropriately dense vegetation also limits CRLF productivity at Laguna Salada.

Arrowhead Lake supports a breeding population of California red-legged frogs and Pacific chorus frogs, and is bounded by dense riparian vegetation, providing suitable foraging habitat for the San Francisco garter snake. Although no San Francisco garter snakes were observed there during these surveys, Arrowhead Lake and the surrounding uplands may be used as habitat. There is a historical record of SFGS on the parcel north of and adjacent to Sharp Park with no barriers between. San Francisco garter snakes are also known to occupy the SFPUC watershed land to the east around San Andreas Reservoir below Sweeney Ridge.

*Survey Results*

SBI conducted visual surveys in 2008 specifically for SFGS in March, April, and May of 2008. No SFGS were observed during visual surveys, which included the areas around lower Sanchez Creek, the lagoon, the canal, and the pond. However, the abundance of prey items in these areas, their proximity to recent observations of the snake at Mori Point and the pond (SBI 2006), and historical occurrence suggest that they are likely to be used by SFGS for foraging and movement. Five SFGS were trapped at a nearby wetlands at Mori Point in 2008 (SBI unpubl. data) and in wetland habitats south of the golf course and east of Horse Stable Pond. On July 9th, 2008, Golden Gate National Recreation Area biologists reported seeing a SFGS in the 'north pond', a few hundred feet east of Horse Stable Pond (S. Bennett in litt 2008).



# 4. CONCEPTUAL PLANNING

During planning for the recovery effort, several broad goals were identified by SFRPD and through agency input. Those are as follows:

- Maintain and restore habitat for listed species, particularly the SFGS and CRLF;
- Meet the recommendations of the SFGS Recovery Plan (USFWS 1985);
- Restore functional wetland and upland habitat that is high-value and low maintenance;
- Comply with the requirements of state and federal regulations, including ESAs and the Clean Water Act; and,
- Preserve and enhance recreational opportunities that correspond to the listed species goals.

A series of conceptual alternatives have been created to detail proposed conditions that are predicted to occur under various alternatives and to assess whether each alternative would meet the recovery goals (Figures 14-16). A habitat assessment model was completed for existing conditions and for conditions that are projected to develop under each conceptual plan. Figure 17 shows habitat quality under existing conditions, and Figures 18-20 show projected habitat quality for the SFGS and CRLF under Alternatives A18, A9, and No Golf, respectively. Table 3 compares the amount of habitat for each species under the various alternatives compared to the projected costs. A detailed cost estimate is provided in Appendix D, and the process of determining costs is explained in Section 4.9.

Each alternative differs in the extent of upland habitat that would be restored as well as the alignment and location of golf holes. A gradient of measures is proposed under various alternatives, ranging from an alternative that would restore the wetlands and minimal surrounding upland habitat to a more comprehensive alternative that would also restore the wetlands but would also include a much greater amount of upland restoration as well as excavation of frog ponds and daylighting of Sanchez Creek. Alternatives include maintaining an 18-hole golf course, closing 9 holes and creating a 9-hole course with a driving range, and closing the park to golf while still allowing other recreational opportunities on the site. All alternatives share the same goal, which is to enhance habitat for the SFGS and CRLF, and share the same restoration features in and around the wetlands complex: creation of upland basking and retreat habitat adjacent to the wetlands, excavation of excess sediment and decaying vegetation from the wetlands complex, creation of an upland corridor between the pond and the lagoon, and recontouring the shoreline to create shallow water habitat.

### 4.1 Project Constraints

A number of physical, recreational, and biological factors influenced the design of this conceptual plan and in some cases limited or defined the extent of the proposed restoration. These included, but were not limited to, the following:

- *CRLF breeding habitat requirements* SFRPD closely monitors and regulates pumping from Horse Stable Pond into the ocean to avoid stranding CRLF egg masses at that breeding site. This occurs during the entire breeding period for the CRLF (generally December through March). This practice, in part, has resulted in water backing up onto the course flooding large portions of Holes 10, 14, and 15, and cutting off Hole 12 with a large pool of water around the culverted section of the connecting channel. The results of this are three-fold: 1) It eliminates all or portions of these holes from play, sometimes for extended periods 2) CRLFs sometimes lay their eggs during wet periods in the shallow pools that form in the flooded fairways. When the water levels drop, these egg masses can be stranded on dry ground and desiccate. Even if water persists long enough for eggs to hatch in these areas, most tadpoles would have limited mobility in the dense vegetation in the marsh area and may be stranded well before metamorphosis, and 3) Any potential SFGS upland available in areas not in play on the course is also flooded.

- *Presence of the seawall* A seawall separates the western edge of Sharp Park from the ocean and beach. Although members of the public suggested that a restoration option may include breaching the seawall to allow Sanchez Creek to run freely into the ocean, this option was considered infeasible for several reasons. The seawall plays a significant role in maintaining public safety by alleviating flooding during storm surges, and also keeps seawater out of the marsh complex, where saline water could harm resident reptiles and amphibians.

- *Sharp Park Clubhouse* The clubhouse is a historic feature, and its removal as a restoration feature was not considered as an option. Therefore, restoration plans were created assuming that the clubhouse and associated parking area would remain in place.

- *Archery Range* An archery range is located east of Highway 1 near the defunct rifle range. All plans were created to limit effects to the archery range or its access points.

- *Re-use of dredge spoils* It is assumed that some of the spoils removed during dredging of parts of the marsh complex would be used to restore fairways to upland habitat or to serve as the substrate for creation of new golf holes under some of the alternatives. However, spoils with greater than 50% organic material are deemed unsuitable for golf course substrate due to the potential for uneven settling, therefore organic sediments would only be spread where upland habitat is proposed.

- *Highway 1* Highway 1 provides a barrier to migration of the SFGS from the upper part of the park to the marsh complex and vice versa. Although a tunnel under the highway allows travel between the eastern and western parts of the park, the tunnel is not considered to be a viable corridor for migration of the snake. CRLF may have a low but significant flow of genetic exchange through culverts under Highway 1 and potentially overland.

- *Golf course history and alignment requirements* The golf course is a well known example of the design of Alistair McKenzie, a well known golf course architect who designed courses in the 1920s and 1930s. Although the prevailing goal in creating these conceptual plans was to enhance habitat value and diminish potential for harm to snakes and CRLF s, every effort was made to preserve the vision of Dr. MacKenzie and to minimize the need to substantially reconfigure the golf alignment. Furthermore, golf courses are generally constructed to follow a standard sequence of difficulty (par) from hole to hole, a factor that was considered in the various designs.

- *Mitigation for impacts to wetlands* Under all alternatives, an upland pensinsula will be created in the middle of the lagoon. Because this will result in fill of up to 2 acres of wetlands, 2 acres of wetlands must be created from the upland edges of the lagoon, which in some cases may encroach on existing fairways. By mitigating for impacts to wetlands and complying with other permit conditions required by the US Army Corps of Engineers (USACE) and the Regional Water Quality Control Board (RWQCB), SFRPD maintains compliance with Sections 404 and 401 of the Clean Water Act.

## 4.2 HABITAT CONSIDERATIONS

Historically, SFGS habitat at Sharp Park was concentrated in and around Laguna Salada and Horse Stable Pond. Habitat in these areas has become degraded over time as a result of sedimentation and excessive plant growth, flooding by seawater, and a variety of human impacts.

Both the SFGS and CRLF would benefit from the restoration of productive breeding and foraging habitat in each of these aquatic features. This could be accomplished by creating open water habitats adjacent to emergent vegetation in Laguna Salada, the canal, lower Sanchez Creek, and Horse Stable Pond. Because of their historic occupancy and the presence of features that currently support the SFGS, the conceptual plans were developed with the primary goal of restoring and enhancing habitat in these areas. Although CRLF are known to breed in Arrowhead Lake east of Highway 1, enhancements to the eastern portion of the park were not prioritized because there is no current evidence of occupation by the SFGS at Arrowhead Lake, nor is there a connection to the SFGS population at Mori Point. Each conceptual plan includes enhancements to wetland areas of the pond, the canal, and the lagoon in order to increase CRLF breeding and SFGS foraging habitat.

In order to address the shortage of suitable upland habitat for the SFGS, however, changes to the use of land adjacent to the wetland complex are required. The primary goal of each conceptual alternative was to propose an effective way of increasing upland habitat adjacent to existing or future aquatic habitat, and to evaluate the consequences of such a change to the existing golf course design and operation.

### *Restoration Options*

Under all alternatives, creating new uplands west of Highway 1 would require the conversion of Hole 12 to wildlife habitat that includes both enhanced wetland and upland features. The two former golf holes west of Laguna Salada taken out of play after saltwater flooding in the 1980s currently contain non-native plants and bare, sandy ground that provide little habitat value for the snake and frog. These areas could be converted into upland habitat for the SFGS if CRLF breeding habitat that is free from predatory fish and which contains shallow water and emergent vegetation is also created in adjacent parts of Laguna Salada. Upland habitat created in these areas however would be susceptible to pedestrian trespassing, off-leash dog activity, potential saltwater spray, and may be prone to future flooding. Locating newly-created upland habitat on Laguna Salada's southeast and northeast sides instead would reduce some of the risks of impact by pedestrians, pets and ocean water, but would require one or more golf holes to be modified or relocated, and could increase impacts by golf course maintenance activities such as mowing. Creating SFGS upland habitat on the east side of the lagoon rather than the west side would allow for creation of new wetlands on the west side of the lagoon to mitigate for wetlands that are filled during planned restoration activities.

Creating upland habitat on the east side of Highway 1 would not benefit snakes and frogs in the areas where they primarily occur. Success criteria would be expected to require that SFGS either colonize the area by crossing the highway, an event that probably occurs rarely and presents substantial hazards to snakes that attempt it or by moving into the area from the Crystal Springs watershed. Connectivity to the Crystal Springs watershed to the east is limited by the unsuitable nature of the dense stands of eucalyptus and mixed evergreen forest and lack of distinct hydrologic connection with optimal foraging opportunities for promoting longer movements of SFGS. The exception to this could benefit CRLF and would occur under

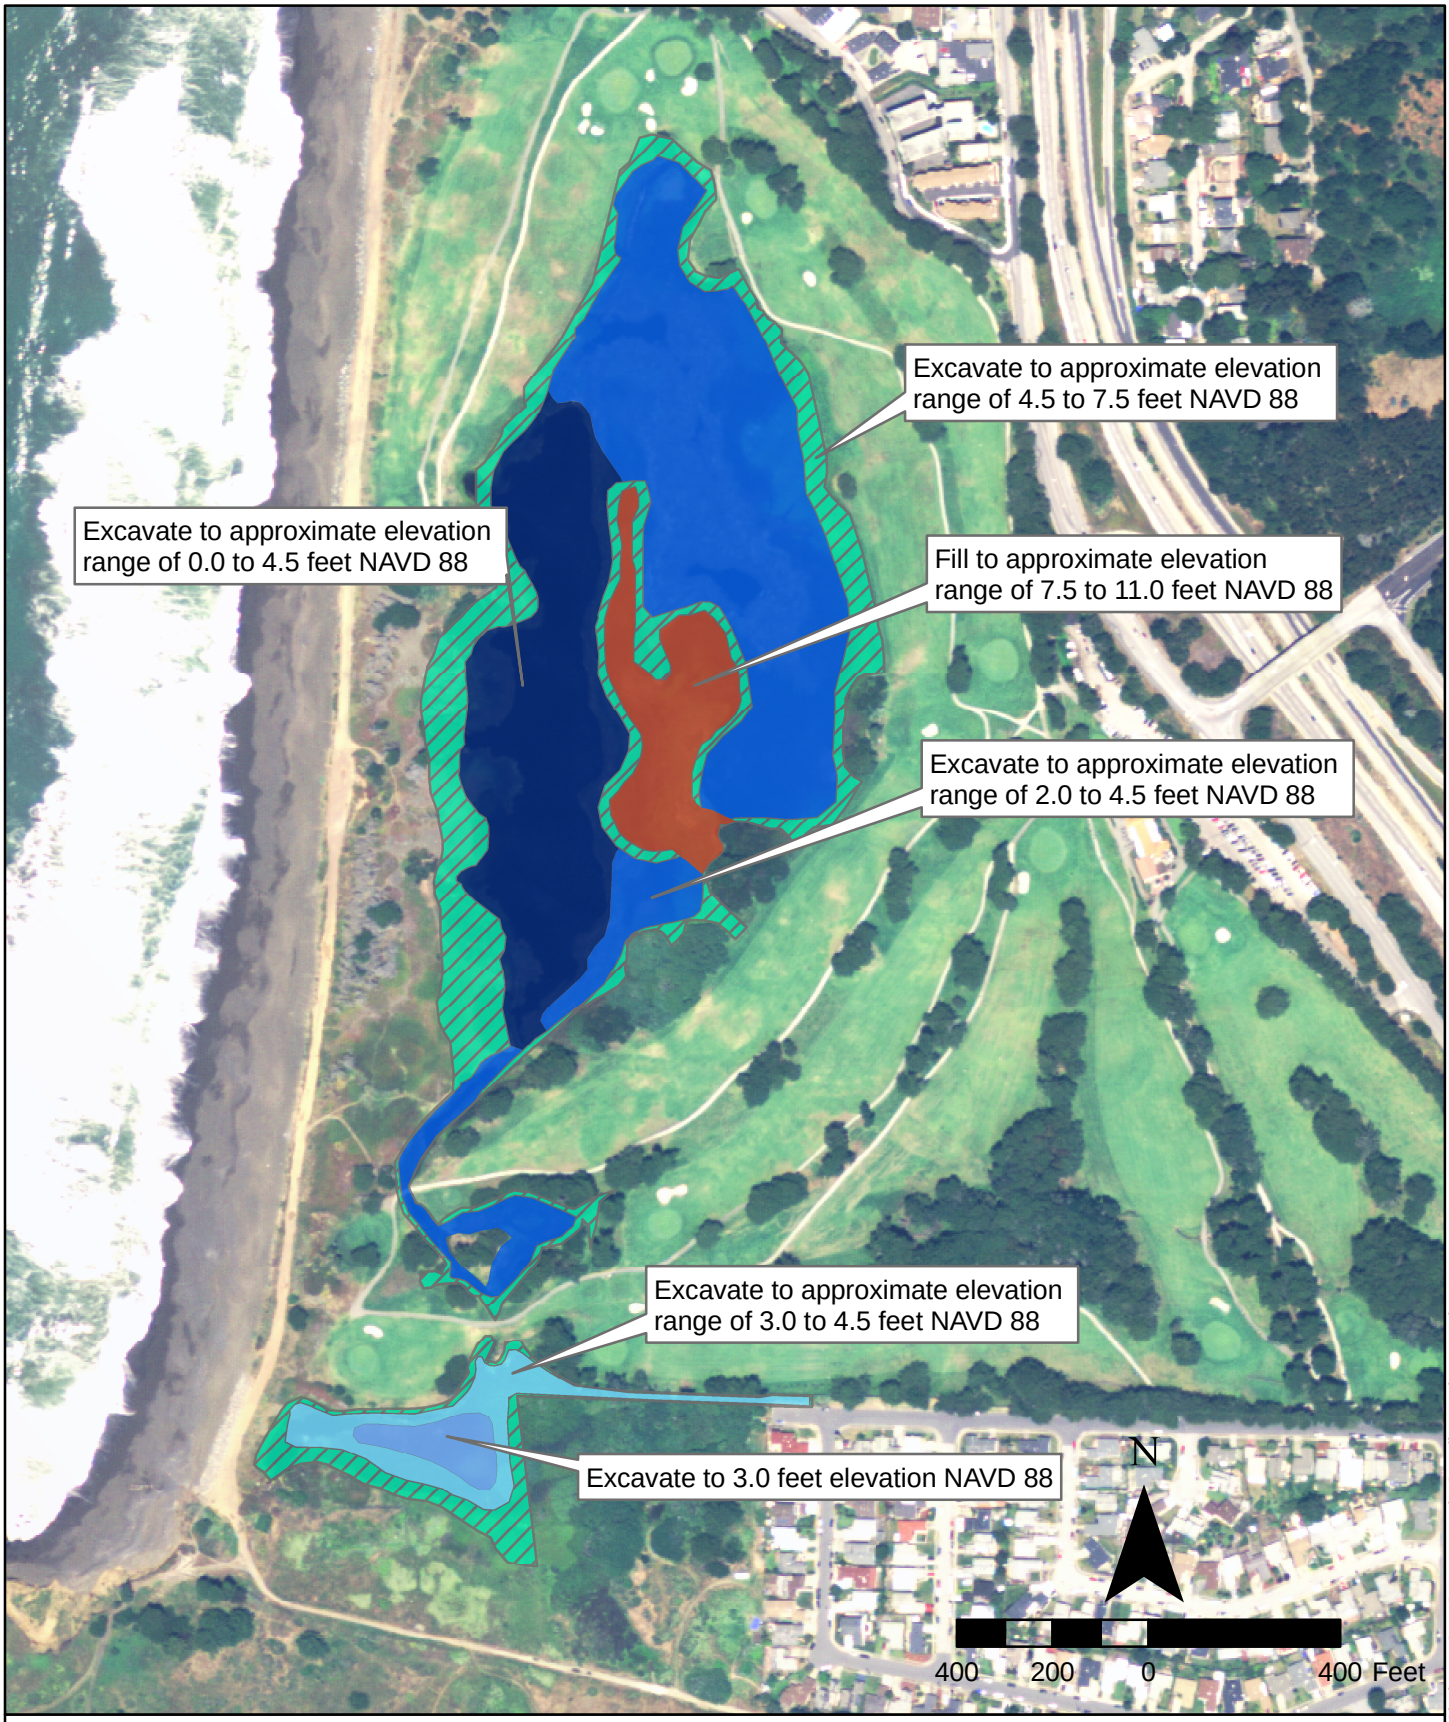
the No Golf Alternative, in which frog ponds would be created along Sanchez Creek, one of which would be constructed east of Highway 1. Sufficient CRLF populations in the immediate area are present and would be very likely to colonize new ponds on Sanchez Creek.

## 4.3 GOLF COURSE PLANNING CONSIDERATIONS

Developing viable design solutions for a reconfigured Sharp Park Golf Course involves tying together golf course playability, endangered species habitat requirements, the original vision of Dr. Alister MacKenzie, and the unique physical and natural components of site.

Redesigning the layout and design of the golf course included understanding the evolution of the original layout dating back to 1931. Since the course was constructed it has changed due to storms off the Pacific Ocean and construction of roads. The result is that four of the oceanfront holes were relocated to the east side of the park and a sea wall protects the golf course from the ocean.

Presently there are 11 holes that are in the original location plus a shortened par three with an original green complex. Over most of the past 80 years the typical MacKenzie characteristics have almost disappeared but can still be seen.



Alternative A18 keeps almost all of the original holes and would accomplish the goal of creating viable upland SFGS adjacent to the wetlands. To maintain an 18-hole regulation course on this property, it is important to keep the existing 18th hole in place because the course needs to return to the clubhouse. A scorecard showing the final lengths and pars of each hole under Alternative A18 is shown as Appendix E.

The proposed 9-hole alternative would eliminate golf around the lagoon by eliminating two golf holes and replacing the two holes at the rifle range. The 9-hole alternative would also add a driving range and practice hole.

## 4.4 FEATURES COMMON TO ALL ALTERNATIVES

The common component of all alternatives is restoration of the wetlands complex. Under all alternatives, the same features are proposed to restore wetland habitat and reduce the potential for recurrence of the problems that now occur, which include sedimentation, eutrophication due to dead and decaying vegetation, loss of open water habitat, and flooding of fairways. Implementing the restoration actions below would accomplish the main goal of the project, which is to enhance CRLF and SGFS habitat. The main components of the wetland restoration are as follows:

- **Dredging to remove sediment and decaying vegetation**. The areas that are currently open water within the lagoon would be deepened by up to 2 feet, and open water areas within the pond by up to 3 feet (Figure 21). Dredging to this extent would bring bottom elevations in the lagoon to 0' NAVD 88 at the deepest part of the lagoon, and down to +2' NAVD 88 in the pond. The eastern portions of the lagoon and pond as well as the connecting channel would be excavated up to 6 feet in the centers to restore open water habitat and to ensure that ample edge habitat consisting of open water/emergent vegetation interface and wetland/upland interface would persist for the foreseeable future. Deepening these areas will ensure persistence of open water habitat by discouraging the growth of dense stands of bulrush and cattails that are overgrowing the wetlands and diminishing habitat quality for the SFGS and CRLF.
- **Recontouring the shoreline to create shallow water habitat**. The eastern edge of the lagoon, the edges of the connecting channel, and the north and south edges of the pond would be contoured to create shallow water habitat (1-3' deep) to allow for CRLF breeding habitat. Shallower water (<1') will allow for growth of vegetation upon which frogs can attach egg masses, while deeper water (1-3') will allow for areas of open water or areas floating emergent vegetation.

**Wetland Grading Plan**

**Sharp Park Conceptual Restoration Plan**

Pacifica, CA

**Figure 21**

TETRA TECH

Q:\Projects\LagunaSalada\GIS\Figure21_Conceptual_Grading_Plan.mxd

- **Creation of an upland peninsula.** A peninsula of approximately 2 acres will be created in the middle of the lagoon and shallow water habitat for the CRLF. The peninsula is intended to address the shortage of upland SFGS habitat, and offer additional shallow water habitat at its edges for CRLF breeding. The peninsula will be constructed to be high enough above ordinary high water and the water table that it will develop an upland plant community and allow squirrels and other rodents to establish burrows which would later be used by the SFGS.

- **Construction of upland mounds**. Upland mounds will be created on the east and south sides of the lagoon and in the dispersal corridor between the lagoon and the pond.

- **Pump Operations.** Altering the methods of operating pumps and other measures to control hydrological features is proposed under all alternatives. The main purpose of altering pump operations is to be able to better control water levels without stranding CRLF egg masses, and thereby reduce the extent of golf course flooding. The main feature of this action is to cycle the pumps more frequently so that they turn on when the water is at a lower level than they currently do. The main disadvantage of cycling the pumps more frequently is that they will likely wear out more quickly than they would under current conditions. The need to operate the pumps more frequently could be reduced by raising the level of fairways that flood, as proposed under Alternative A18.

- **Upland/Aquatic linkage and habitat segment.** A habitat linkage area between the lagoon and the pond would be constructed with native upland vegetation and mounds designed to attract the SFGS. Construction of this corridor will require closing Hole 12 and revegetating the area with native upland species. The corridor would be bisected by the connecting channel, which will provide CRLF breeding habitat and SFGS foraging habitat. The habitat linkage will allow the SFGS population to inhabit a contiguous habitat segment area with features that will provide suitable habitat for SFSG on a year round basis between the lagoon and Mori Point without disturbance from humans or mowing equipment.

- **Completion of a Compliance Plan.** SFRPD has completed a compliance plan that is designed to avoid mortality and injury of SFGS and CRLFs resulting from maintenance and operations of the golf course (SFRPD 2009). Features of the compliance plan include increase monitoring to determine the earliest incidence of CRLF egg deposition, restrictions on mowing, gopher trapping, or repairs in sensitive areas, restrictions on use of particular types of herbicides, and increased stewardship training. Compliance planning is occurring under a separate process than the restoration planning described in this report.

- **Closure of Hole 12.** Due to its position directly between the lagoon and the pond, Hole 12 would be closed under all alternatives. Closing this hole would allow for creation of an uninterrupted habitat corridor between the lagoon and the pond and would also reduce the amount of human intrusion into areas that might be transited by SFGS. Hole 12 would be replaced under each alternative, although the exact alignments vary.

- **Catchment Basins**. To slow the rate of sedimentation from upstream sources, sediment catchment basins would be installed in two locations, one near the mouth of Sanchez Creek and the other on City of Pacifica property just outside the northern boundary of the Sharp Park.

- **Fencing**. A post and rail fence would also be installed to discourage human and pet intrusion into the restored habitat area, although the alignment of the fence in areas away from the seawall may vary according to the different alternatives. All alternatives include fencing along the seawall to the west of the lagoon, according to the Draft Compliance Plan.

- **Revegetation**. Uplands, wetlands, and shallow aquatic areas would be revegetated. The proposed plant palette includes aquatic, wetland, transitional and upland plant species known to occur in areas adjacent to Laguna Salada or similar habitat types. These plants occupy different strata to maximize habitat for a variety of species, particularly the SFGS and the CRLF, for cover, basking, and foraging. More specifically, emergent and floating-leaved species were selected to minimize the growth of non-native *Typha angustifolia* that currently provides poor CRLF habitat. Increased emergent and floating-leaved vegetation should also provide increased habitat for the San Francisco forktail damselfly. Sources of information include the recovery plans for the SFGS (USFWS 1985) and the CRLF (USFWS 2002). Table 2 lists plant species that are recommended for revegetation of all areas.

**Table 2. Native Plant Species Recommended for Revegetation**

| Type | Scientific Name | Common Name |
|---|---|---|
| Transitional | *Juncus patens* | Spreading Rush |
| Transitional | *Rubus ursinus* | CA Blackberry |
| Transitional | *Scrophularia californica* | Beeplant |
| Transitional/Wetland | *Rumex salicifolius* | Willow Dock |
| Transitional/Wetland | *Salix lasiolepis* | Arroyo Willow |
| Transitional/Wetland | *S. sitchensis* | Sitka willow |
| Upland | *Achillea millefolium* | Yarrow |
| Upland | *Anaphalis margaritacea* | Pearly everlasting |
| Upland | *Argentina anserina* | Silverweed cinquefoil |
| Upland | *Artemisia californica* | CA Sagebrush |
| Upland | *Baccharis pilularis* | Coyote Bush |
| Upland | *Bromus carinatus var. maritimus* | CA Brome |
| Upland | *Castilleja wightii* | Indian Paintbrush |
| Upland | *Clarkia rubicunda* | Farewell to Spring |
| Upland | *Danthonia californica* | Oatgrass |
| Upland | *Diplacus aurantiacus* | Orange Bush Monkeyflower |
| Upland | *Dudleya farinosa* | Liveforever |
| Upland | *Festuca rubra* | Red Fescue |
| Upland | *Leymus triticoides* | Creeping Rye/Beardless Rye |
| Upland | *Mimulus aurantiacus* | Sticky Monkey Flower |
| Upland | *Nassella pulchra* | Purple Needle Grass |
| Upland | *Rhamnus californica* | Coffeeberry |
| Upland | *Sidalcea malviflora* | Checkerbloom |
| Wetland | *Eleocharis macrostachya* | Common Spikerush |
| Wetland | *J. effusus* | Rush |
| Wetland | *Sagittaria latifolia* | Broad-leaved Arrowhead |
| Wetland | *Scirpus microcarpus* | Small-fruited Bullrush |
| Wetland/Aquatic | *Potamogeton diversifolius* | Waterthread Pondweed |
| Wetland/Aquatic | *Potamogeton nodosus* | Long-leaved Pondweed |
| Wetland/Aquatic | *Sparganium angustifolium* | Narrowleaf Burreed |
| Wetland/Aquatic | *S. eurycarpum* | Broad-fruit Burreed |
| Wetland/Aquatic | *Typha latifolia* | Cattail |
| Wetland/Aquatic | *Zizania palustris* | Wildrice |

Habitat features in restored upland areas would be the same under all alternatives, with the main difference being the extent of restored area. Ruderal areas and areas currently used for golf would all be restored as native coastal scrub/grasslands, although some of the uplands would be restored specifically for SFGS basking habitat.

- **Maintenance and Monitoring**. Assuming that the alternatives are designed and implemented correctly, success of any of the restoration alternatives will depend on the degree of maintenance and monitoring that occurs. Monitoring is recommended on a yearly basis, and maintenance needs will be determined by the results of the monitoring efforts. Monitoring for the following should occur on a yearly basis:

    - **Use by Listed Species** Since this is a recovery action for the SFGS, monitoring for use of restored areas by SFGS and the CRLF should be the major monitoring priority. As wetland and upland communities develop after restoration, habitats for SFGS and CRLF are anticipated to gradually develop as well. Surveys should begin prior to construction, and should continue after construction to document the extent of viable habitat and the population health of these species. Surveys should be coordinated with USFWS and CDFG to ensure compliance with endangered species laws and regulations.

    - **Invasive Plant Species** Since most of the habitat surrounding Sharp Park has been altered by the presence of non-native species, some of which are noxious invasive species, it is likely that restored areas will also be colonized by these species. Due to the relatively large area of restoration and the high labor needs associated with controlling invasive species, it is recommended that resources be applied to controlling the most noxious invasive species, including perennial pepperweed *(Lepidium latifolium),* gorse *(Ulex europaeus)*, reed canary grass *(Phalaris arundinaceae)*, and various types of thistle.

    - **Vegetation Cover** Percent vegetation cover in restored upland areas should be monitored at 6 month intervals for the first three years, and on a yearly basis thereafter. Wetland areas should be monitored to ensure that the target plant communities are developing and to ensure that areas do not become overgrown. Native species should be replanted yearly or as needed to provide a competitive edge over non-native species.

    - **Non-native Wildlife and Feral Species** Habitat restoration can be successful only if predation from non-native or feral species such as cats, bullfrogs, red foxes, and predatory fish can be minimized. Although predatory fish will be eliminated when the wetland complex is drained for construction, it is possible that new specimens will be deposited there later. Red foxes and feral cats have been seen at the site, and should be trapped and removed if they are identified as being threats to the SFGS or CRLF. Bullfrogs, which prey on CRLFs and juvenile SFGS in other areas, have not been identified in significant numbers at Sharp Park, but should be monitored for.

    - **Impacts from Human Use** Changing the use of lands immediately adjacent to the wetlands complex from primarily golf to other forms of recreation will affect the patterns of human use. Human incursion into restored uplands may affect SFGS in these areas, particularly by people on mountain bikes or those who allow dogs into the area, and should be monitored closely.

    - **Sediment** Although some sediment input into the wetlands system is desirable, controlling excessive sedimentation is one of the keys to ensuring that the current problem of overgrowth of emergent species in wetland areas does not occur in the foreseeable future. Sediment basins proposed for the north end of the park and on Sanchez Creek should be monitored for effectiveness on a yearly basis, and will likely need to be cleaned out at least

once every five years. Cross sections of the aquatic areas should be taken at established locations every five years to measure sediment accretion.

- **Water Quality** Water quality parameters to be monitored should include salinity, presence of heavy metals, dissolved oxygen, and input of fertilizers or herbicides from runoff or use of recycled water. Measurements should be taken at primary input locations and in the connecting channel. If water quality deficiencies are persistent and affect habitat quality for the SFGS and CRLF, remedial actions will be implemented as needed.
- **Construction Monitoring** A qualified biologist would be onsite during construction to monitor for sensitive species that may enter the construction area. The construction area should be surveyed for listed species prior to construction, and any specimens found in the construction footprint should be trapped and relocated. The biological monitor must be given authority to shut down construction in the event that listed species are found in the construction area.

## 4.5 ALTERNATIVES

The following alternatives have been considered in this report:

### *18-Hole Alternative (Alternative A18)*

Alternative A18 is the conceptual plan that was under design for recovery of the SFGS and the CRLF prior to consideration of restoring greater Sharp Park (Figure 14). This alternative is intended to fulfill the recovery goals for the snake and frog while maintaining as much of the current golf course configuration as possible.

Under this alternative, Hole 12 would be closed and restored as coastal scrub/grassland habitat. Holes 10 and 13 would be shortened, and a new hole would be created near the rifle range/ archery course east of Highway 1. No new holes would be restored on the west side of the lagoon; instead, this area would be restored from its degraded condition to native upland habitat. Portions of the fairways in holes 10, 14, and 15 would be raised to 10.0' NAVD 88 from their current elevation of between 6.5' and 9.0' to prevent flooding on the fairways and also to discourage frogs from depositing egg masses in locations where the resulting tadpoles may end up being stranded. The fairway, green and tee areas of hole 18 would be raised to allow a consistent 2% slope from the east side of hole 18 to the west side of hole 14. No boardwalk would be created under this alternative, as there would be no need to cross the restored habitat area between the lagoon and pond. Several Monterey cypress trees would be removed from fairways east and north of the lagoon, as well as from the ruderal habitat west of the lagoon.

SFRPD would develop a new 165 yard, par three hole (Hole 7) after the existing 6th hole and in the location of the current organic waste site and rifle range. This hole would replace the existing 12th hole which would be removed to allow habitat creation between the lagoon and the pond. The new hole will be 165 yards from the back tee and play slightly uphill. The bunkering and sculptured contouring would be characteristic of design strategy and aesthesis of Dr. Alister MacKenzie.

The length of the hole is approximate and would become the second longest par three on the course. This length helps provide a variety of distances of par threes which is desirable for a regulation golf course.

### *9-Hole Alternative (Alternative A9)*

This alternative is intended as a compromise between golf considerations and expanded upland areas east of the main body of the lagoon, and to increase opportunities for recreational pursuits other than golf. Under this alternative, all holes bordering the wetland complex would be closed and restored to coastal scrub/shrub habitat (Figure 15). Three holes (1, 8, and 9) would remain west of Highway 1, along with a driving range and

teaching area, and two new holes would be constructed at the rifle range. All existing holes east of Highway 1 would remain in their current location. Excess spoils from excavation of the lagoon would be deposited on the rifle range after remediation. Numerous Monterey cypress trees would be removed under this alternative. A concrete golf cart path would be removed and replaced with a crushed granite path that would start near the clubhouse, proceed around the north end of the lagoon, and end at an observation point and interpretive center located on a boardwalk that would extend into the marsh.

This alternative creates a driving range where existing holes #2 and #3 are located. To accommodate this range, and remove all golf around the lagoon, two new holes would be built at the east end of the golf course. The new holes would start after the existing 6th hole and be built on the site of the organic waste dump and the defunct rifle range.

> Hole 4 – Par 4, 400 yards. This would be an uphill hole playing longer than the 400 yards and has the potential to be a challenging par 4.
>
> Hole 5 – Par 3, 175 yards. This mid to long length par three would play slightly downhill. The setting would be very appealing with a natural area on the left and hills on the right.

***No Golf Alternative***

A single no golf alternative was developed (Figure 16). This alternative was developed with the goal of maximizing the amount of available upland habitat for the snake and frog in the absence of golf operations. Because the lack of suitable upland habitat was identified as the limiting factor for the snake, the golf areas would be converted into uplands. Enhancements to wetland areas in lower Sanchez Creek, Horse Stable Pond, and Laguna Salada would be identical to those outlined in the other concept plans. Water from Sanchez Creek would be captured in two shallow ponds to provide additional breeding habitat for the CRLF.

Under this alternative, all golf holes would be closed and the fairways would be restored to native coastal scrub/shrub habitat. Sanchez Creek would be daylighted as far east as the defunct rifle range and riparian habitat would be restored along the stream. Two shallow ponds would be constructed on Sanchez Creek to enhance CRLF habitat away from the marsh complex. These ponds would be constructed above the 100-year flood elevation that would occur under projected sea-level rise scenarios. A crushed granite walking path would replace concrete golf cart paths and would be extended to encompass the entire lagoon. No bicycles would be allowed on these paths. Visitors would cross the marsh and upland dispersal zone on a boardwalk that would span the entire habitat zone between the lagoon and the pond.

Maintenance of the restored area would still need to occur, and the pumps would need to be operated in the same manner that they currently operate during the winter.

## 4.6 POTENTIAL IMPACTS OF RESTORATION

If implemented, these plans could cause a number of temporary and permanent effects to natural resources and recreational opportunities at the park. The full range of potential effects will be assessed during preparation of CEQA documentation and will be addressed directly during the permitting phase of the project. The following have been identified as potentially occurring:

- *Take of listed species*. Although this project is considered a recovery action for listed species, accomplishing this goal will require a great deal of earthmoving and alteration of existing resources. Extensive human presence during construction, use of heavy excavating and earth-moving equipment, and noise can all harm wildlife species by interrupting their foraging or breeding habits or by resulting in direct harm to individuals.

- One of the first tasks that would occur during construction would be to drain the lagoon and the pond, which would discourage SFGS and CRLFs from remaining in the project area, reducing the potential for harmful effects to these species. However, although every effort would be made to capture and relocate sensitive wildlife resources prior to construction, the possibility of harm to listed species remains. Impacts to listed species would be addressed extensively during the Section 7 consultation process with USFWS and during similar consultation with CDFG, and standard and specific practices to minimize the potential for take will be developed at that time. Furthermore, impacts to listed species during construction will be offset in the long term by increasing the quantity and quality of their habitat in the marsh complex area.

- Under the 9-hole alternative, a walking path would encircle most of the lagoon area, enhancing opportunities for exercise and wildlife viewing. Under the No Golf alternative, the walking path would encircle the entire lagoon. The absence of golf operations would remove potential threats to wildlife posed by mowing and potential harm and harassment by players, but management for other threats would be required. Under both alternatives, the walking path would be located in the restored upland area, giving humans and dogs relatively unrestricted access to the area that is being restored for SFGS upland habitat. Although signs would be installed asking visitors to remain on the path, incursions into habitat areas would likely occur. Increased casual use of this area could increase disturbance of the SFGS, particularly by dogs and feral cats, which would be unlikely to use this area if it remained a golf course. Mountain biking would pose a threat to snakes basking on or attempting to cross trails.

- *Impacts on Recreation*. Although some recreational pursuits, such as bird watching, would likely be enhanced by the proposed restoration, other recreational aspects of the marsh area could be temporarily or permanently diminished. Dog walking would continue to be an unauthorized activity, and due to the greater presence of sensitive resources and higher potential for damage to egg masses after restoration, enforcement of this restriction, including issuance of tickets, will be increased.

- The most extensive impacts upon recreational resources would occur as a result of converting the golf course to a 9-hole course or by closing the golf course completely. A 9-hole course would be much less attractive to golfers than an 18-hole course, and a No Golf alternative would force golfers to find another course altogether.

- *Impacts to Visual Resources*. Extensive excavation and regrading of the marsh complex would occur and may have short term negative effects on local scenery. However, the marsh complex would be allowed to fill with water immediately upon completion of construction, and the visual impacts would subside at that time. Long-term effects from restoration of the wetlands complex would likely be positive as there would be a larger expanse of visually appealing open water. Some impacts to the viewshed would likely occur with the installation of a driving range, which would require construction of a chain link fence barrier at the south end of the course to keep golf balls from entering the residential area located south of the park.

- *Impacts to Wetlands*. Impacts to wetlands would occur during construction and as a result of creating an upland island in the middle of the lagoon. It is estimated that up to 1.5 acres will be filled during construction, an amount that would subsequently be recreated on the west and south sides of the marsh complex. Ultimately, there would be no net loss in amount or function of wetlands, and the end result would be restored wetland that provides better functions in terms of water quality benefits and wildlife habitat. Impacts to wetlands will be addressed during the Section 404 and 401 permitting processes and during preparation of a Lake and Streambed Alteration Agreement.

## 4.7 RESTORATION BENEFIT ASSESSMENT

To aid in evaluating the relative benefits of each alternative, SBI developed a habitat scoring system combined with a GIS model to determine the extent and quality of habitat that would be available to the SFGS and CRLF under each alternative. The scoring system was developed to characterize optimal habitat based on habitat correlates of the CRLF and SFGS from published literature, recorded observations of the species at the site during past surveys, and experience with these species at other sites in the region.

An aerial photograph of the site was divided into equal-sized cells, each 15 X 15 meters or about 1/20th acre, and a standardized scoring system was applied to each cell. Each cell was ranked least suitable (0), moderately suitable (1), or highly suitable (2) based on the presence of the 11 habitat characteristics included in the scoring system. Next, a raster surface consisting of cells, each with a habitat type and score associated with it was created over the photograph. Cells that were scored as containing high-quality habitat were summed in order to calculate the number of total acres of each habitat type in the photograph, and accuracy was verified with field visits to the site. This process was repeated using a concept drawing for each alternative to estimate the amount of habitat that would be created or lost under each alternative. Habitat quality under existing conditions is shown in Figure 17. Habitat quality projections for proposed alternatives are shown in Figures 18 through 20. Table 3 summarizes the results of the habitat quality assessment.

The following categories of habitat types were used in the analysis:

**CRLF breeding and SFGS primary foraging habitat**. Optimal habitat of this type contains water that persists long enough to facilitate CRLF tadpole development. It also would contain a mix of open water and emergent plant growth, as well as areas of shallow water extending at least one meter from shore. Wetlands in Horse Stable Pond and the connecting channel are examples of this habitat type.

**SFGS upland retreat and basking habitat.** Optimal upland habitat would consist of grassland or similar vegetation contacting CRLF breeding / SFGS foraging habitat with bushes providing some cover. Rodent burrows or large soil crevices would be present in soil that remains unsaturated throughout winter to provide upland retreats. Under existing conditions, this type of habitat is limited to an area south of Horse Stable Pond.

**CRLF non-breeding and SFGS movement and secondary foraging habitat.** Habitat containing year-round water or moisture but that is unsuitable for CRLF breeding was considered optimal non-breeding habitat so long as it also contained sufficient cover from predators, and was not separated from breeding habitat by a significant barrier or distance. Examples of this habitat type include dense shrubs located a short distance from water and riparian corridors. SFGS use this habitat type for movement and may forage here, though less frequently than in wetlands where CRLF breeding takes place.

**Table 3. Habitat Quality Assessment and Projection Summary**

| Alternative | Available High-Quality Habitat (Acres) /(Increase over existing conditions) | | | Advantages for Habitat Quality | Disadvantages for Habitat Quality |
|---|---|---|---|---|---|
| | B/F | Up | N/F | | |
| Existing conditions | 3.9 (*) | 3.8 (*) | 13.9 (*) | | Virtually no suitable SFGS upland habitat<br>Little upland connectivity between HSP and LS |
| All Restoration Alternatives | | | | Significant increase in uplands over existing conditions within LS and adjacent areas<br>Increased CRLF breeding / SFGS foraging habitat in LS<br>Adequate connectivity between HSP and LS<br>Elimination of predatory fish<br>Reduction of impacts of park visitors through fencing, signs | Golf operations would pose an ongoing potential threat to individual snakes, except under the No Golf Alternative |
| A18 | 10.7 (+6.8) | 23.4 (+19.6) | 10.0 (-3.9) | See above | SFGS foraging habitat on west and north sides of LS are adjacent to golf course |
| A9 | 10.7 (+6.8) | 44.3 (+40.5) | 10.1 (-3.8) | See above | Footpath through upland areas could result in pedestrian / pet impacts in habitat areas |
| No Golf | 11.3 (+7.4) | 97.4 (+93.6) | 12.9 (-1.0) | See above, and<br>Increased CRLF breeding / SFGS foraging habitat in LS, additional breeding ponds to mitigate potential future sea level rise<br>Increased SFGS habitat east of Highway 1<br>Increased habitat by daylighting portions of Sanchez Creek | Footpath through upland areas could result in pedestrian / pet impacts in habitat areas |

B/F = California red-legged frog breeding / San Francisco garter snake primary foraging habitat

Up = San Francisco garter snake upland basking / retreat habitat

N/F = California red-legged frog non-breeding / San Francisco garter snake secondary foraging habitat

Of the three habitat types mentioned above, CRLF non-breeding and SFGS movement and secondary foraging habitat is considered the least valuable in this location. This is because the moisture and cover that characterize high quality non-breeding habitat also would be available year-round at Laguna Salada, Horse Stable Pond, and the canal. For this and many other frog populations the shallow water and emergent vegetation which characterize high quality breeding habitat effectively function as non-breeding habitat outside of the breeding season. Furthermore, while some frogs at the site are likely to move relatively long distances from their breeding habitat, most probably stay or make only short movements from the water bodies. At one breeding site in Santa Cruz County as many as 80-90% of CRLF were found to remain there year-round (Bulger et al. 2003) although this number is probably very site-specific. While maintaining non-breeding and movement habitat also is important to ensure the survival of local CRLF populations by protecting individuals prone to long distance dispersal (Fellers and Kleeman 2007) addressing the lack of core breeding habitat should be the first priority for CRLF habitat enhancement at Sharp Park. Therefore habitat creation at this site emphasizes providing breeding habitat where moisture and cover persist year-round, and replacing non-breeding habitat with habitat of this type is considered to be a positive tradeoff.

Likewise, while the SFGS may occasionally use typical CRLF non-breeding habitats including riparian forest (SBI 2008), its primary upland habitat consists of grassland or similar areas with some shrubs and underground retreats. Therefore, replacement of CRLF non-breeding and SFGS movement and secondary foraging habitat with upland basking and retreat habitat is considered to be a positive tradeoff for the SFGS as well.

It is also important to note that while the No Golf Alternative offers by far the greatest amount of SFGS upland basking and retreat habitat, much of the newly created upland habitat is located relatively far from the marsh complex. These areas are unlikely to be used as frequently as similar upland areas closer to water, and evidence from another site suggests that extensive upland areas would not be required to maintain a stable population of SFGS. As an example of this, the West-of-Bayshore parcel located in Millbrae, California supports a large population of SFGS despite upland habitat at that site being limited to a relatively narrow area directly adjacent to the canals and marshes. The average total width of the 180-acre parcel is only about 750 feet, and a significant proportion of the area (more than 44%) is covered by wetlands. Consequently, few upland areas at the site extend farther than 350 feet from the wetlands, and most upland areas are considerably closer. Despite the relatively small amount of available upland habitat at that site (about 100 acres of upland vs. 80 acres of wetlands), the SFGS population was estimated to consist of several hundred individuals, and appears to be similar to when it was first estimated in 1994 (SBI 2009).

Under the No-Golf Alternative upland habitats would be created up to 800 feet from the main wetland complex. Upland habitat restored under the No-Golf Alternative east of Highway 1 would be located even farther from the existing wetlands in an area where there have been several studies with a negative finding for SFGS, and barriers to dispersal mean that colonization by SFGS is not guaranteed. While SFGS may eventually use these areas, distant uplands are less likely to be used extensively by the SFGS when suitable habitat exists nearby highly productive wetlands. Therefore, alternatives that concentrate upland basking and retreat habitat near the marsh complex may offer a comparable amount of highly utilized upland habitat in critical areas as does the No Golf Alternative.

Each alternative, including those that retain golf at the park, would provide a several-fold increase in high quality upland habitat over the 3.8 acres currently available, and each would be sufficient to allow the SFGS to persist at the site (Table 3). Alternative A18 would result in 23.4-acres of upland habitat located mainly south and west of the lagoon. Under Alternative A9, 44.3 acres of upland habitat would be distributed mainly around the perimeter of the lagoon. Each of these also would provide uninterrupted areas for SFGS to make seasonal movements to and from high quality winter uplands that will be created between Horse Stable Pond and the lagoon and to the slopes at Mori Point to the south.

## 4.8 Construction Sequence and Timeline for Implementation

A phased approach to construction was assessed. Under a phased approach, the most pressing tasks would be completed first, with other tasks to follow as funding allowed. The most pressing tasks in this plan are to dredge or excavate to improve water flow and to complete the restoration of the wetland complex and uplands on the east side of the lagoon and between the lagoon and the pond. Restoration of upland areas beyond the areas immediately adjacent to the lagoon or in the dispersal corridor south of the lagoon are considered to be of less importance, and could be constructed at a later time.

A phased approach would likely present a significant increase in the overall budget for the project. There are at least three reasons for this. The first is that the cost of mobilizing and demobilizing equipment, construction crews, traffic control staff, and other staff and equipment is a significant part of the estimated project cost. This cost would only be incurred a single time if the entire project were constructed at once, whereas it would be incurred multiple times under a phased approach. Furthermore, the least cost construction scenario would include re-use of much of the excavated material, which would be of such quantity that it would be impossible to stockpile it for later use. Therefore, it would need to be reused at the same time that it was excavated. A phased approach would make this impossible, necessitating offsite disposal of all excavated materials. Finally, the estimated construction costs for the various alternatives are based on 2009 prices and prevailing wages, which will increase each year after 2009. Therefore, the estimated cost for the same project will be higher in 2010 than the price estimated for 2009.

Under a single phase approach, the wetland complex would be restored first. Numerous steps need to occur before this can happen. Once a preferred alternative has been selected from the conceptual plan, the alternative will go through 30%, 60%, 90% and final design. Each of these levels of design can take several months. Permit applications will likely be prepared at the 30% design level and submitted shortly thereafter. The process of acquiring Section 7, Section 404, and Section 401 permits can take up to a year. Once designs are completed and permits have been secured, a bid package will be sent to prospective contractors, who will submit bids, and the winning contractor will contract with SFRPD and any other project sponsors to construct the project. It is recommended that the project be constructed during the dry period and after the CRLF and SFGS breeding seasons are over. Assuming that the project is designed during the winter and spring of 2010 and permit applications are being reviewed during the spring and summer of 2010, it is likely that the earliest possible opportunity to construct the project would be in summer of 2011.

## 4.9 Cost Considerations and Estimated Project Budget

### Restoration Cost Considerations

Preliminary cost estimates were developed for each Sharp Park restoration alternative using a unit cost-based approach. The unit cost values were based on recent cost quotations, standards for restoration projects, and recent, and/or location-specific bid sheets or unit cost analysis information. Unit cost values represent equipment, labor, materials, and contractor overhead and profit. These cost estimates are at a preliminary level (approximately a 10 percent design) and are intended to allow comparisons between alternatives. The costs do not account for phased construction (multiple mobilizations), and costs are in 2009 dollars. Summary cost estimates for each alternative appear in Tables 4 and 5.

Quantities were estimated from areas shown on the GIS figures, topographic/bathymetric data generated in and around the wetlands complex, and assumed averaged dimensions (e.g., depths of excavation or fill). Site preparation is represented as a percentage of direct constructions costs. It includes mobilization and demobilization, dewatering and/or diversion, erosion control and BMPs, traffic control, utilities, and general demolition of minor obstructions not accounted for in the major cost item costs. The total site preparation percentage was 17%, as shown on the unit cost breakdown table.

General markups are estimated as a percentage of direct construction cost plus site preparation costs. General markups include a contingency to account for uncertainties in design, topography and other site conditions. Markups also include costs of the design phase of the project and construction management. These markups total 50% as shown in the unit cost table. Real estate acquisition costs are assumed to be zero since all restoration activities occur on existing golf course property.

Operation and maintenance costs are represented as a net present value (NPV) over a 50-year assumed project life. These costs include maintenance of vegetation during the first five years, invasive species maintenance every year for the first five years and as needed after five years, pump maintenance at the Horse Stable Pond pumphouse every other year, wetlands maintenance at years 25 and 50, sedimentation basin maintenance every five years, and culvert maintenance at years 25 and 50. These costs are detailed in the operations and maintenance summary table.

An important cost component of each alternative is the cost to dispose of excess excavation or fill that cannot be reused onsite. For this estimate it was assumed that excavation for haul-away would be disposed in Half Moon Bay, California, at the Ox Mountain Landfill Facility. There is a transfer station located in Pacifica; however, the unit cost to dispose at this location is much higher because it requires rehandling before final disposal at a landfill. The total unit cost of $35 per cubic yard for this line item assumes the following:

- nominal cost of $4 per cubic yard for excavation and loading into 26 cubic yard semi end-dumps,
- semi end-dump haul rate of $130 per hour,
- total one-way distance of 20 miles (combined highway and surface street) between Sharp Park Golf Course and Ox Mountain Landfill,
- disposal fee of $23 per cubic yard including escalation and contractor mark-up per July 2009 quotation from Ox Mountain (operated by Republic Services, Inc.).

In general, alternative project costs are driven by earthwork line items such as excavation and grading. Removing, on average, the top 1.5 feet of sod and topsoil off the fairways to ensure that kikuyu is eradicated is one of the most expensive features of this plan, and dredging/placing organic and mineral sediments from the wetland complex is the other most expensive feature. With variations depending on the type and location of excavation, generally the costs are based on the amount of surface area moved. Because the No Golf Alternative proposes to have the greatest area of fairway excavated, it would have the greatest volume excavated (approximately 303,000 cy) whereas Alternative A18 has the least amount of fairway excavated and therefore the least volume of excavated materials (approximately 126,000 cy).

Materials deemed suitable for reuse as golf course substrate are those with low organic content and high sand/silt content. It was assumed that approximately 50% of excavated material was suitable for reuse as golf course substrate onsite. Under the off-site disposal scenario, the remaining fill requires haul-away and landfill disposal. Under this assumption the cost of hauling and disposing off-site of unsuitable fill is ~$10.0M for the No Golf Alternative and between ~$3.8M and $5.5M for Alternatives A18 and A9. If all excavated fill is reused onsite the cost of this task is reduced for each alternative by up to 56%. Further design stages should

verify assumptions made in estimating cut and fill quantities and lagoon water surface elevations, as well as the estimated excavation and grading unit costs.

Another element that differentiates the alternatives is the amount of planned riparian and coastal scrub/shrub restoration. The No Golf Alternative requires the greatest amount of riparian and coastal scrub/shrub restoration due to the removal of the golf greens, totaling 94 acres, which is over double the amount of the other three alternatives. Additionally, the No Golf Alternative requires importing nearly three times as much topsoil fill than the other alternatives.

Revegetation costs include mulch/topsoil as needed. Earthwork costs assume no contaminated material. If contaminated materials are encountered, additional costs will be incurred for treatment and/or transport to an appropriate disposal facility.

A final element that differs among alternative designs is the demolition and reconstruction of the golf cart path. Under the No Golf Alternative the entire cart path would be demolished and reconstructed for recreational use. Under Alternative A9, only 20% of the cart path would be demolished and reconstructed. Alternative A18 does not require any work on the cart path and therefore does not incur a cost for this action.

Under all action alternatives, some of the construction, revegetation, monitoring, and maintenance tasks could be performed by SFRPD staff, volunteers, interns, and students. SFRPD staff operate medium-duty equipment such as backhoes and dump trucks, and could perform tasks such as daylighting Sanchez Creek, excavating and maintaining sediment basins, and maintaining the connecting channel. SFRPD also has biological and natural resources management staff that can prepare and implement revegetation and invasive species control plans, monitor egg masses, CRLF populations, and vegetative conditions, and organize interns or volunteers to control invasive species or perform revegetation or other maintenance tasks. The Natural Areas Program also maintains close ties with area colleges, and can likely enlist the assistance of graduate students who could perform thesis work by monitoring vegetative succession, wildlife populations, sedimentation, or other aspects of the post-restoration process that need to be observed, recorded, and assessed in order to determine the success of the project and apply adaptive management as needed.

## GOLF COURSE REALIGNMENT COST CONSIDERATIONS

Preliminary cost estimates were developed for each of the Sharp Park Golf Course Alternatives. For a majority of the estimates a unit cost-based approach was used. The unit cost values were based on recent cost quotations, and recent local actual costs analysis information. Unit cost values represent equipment, labor, materials, and contractor overhead and profit. The costs assume all work for each phase will occur at the same time and not result in multiple mobilizations.

These estimates include work that is necessary for the proposed conceptual changes addressed in each alternative. Other course improvements such as bunkers, irrigation, drainage etc. that may need to be implemented are not included in the concepts or cost estimate.

The work addressed and quantities were estimated based on the layout of each alternative. The size of greens, tees, bunkers, irrigation, grading, drainage, grassing, cart path and landscaping are based on the conceptual layout and accepted parameters for golf holes. The work includes greens constructed to USGA recommendations, sand based tees and bunkers built to minimize maintenance. Soil amendment and additional drainage is proposed in newly constructed areas to assist in turf quality and playability.

The alternative project costs were driven by the size of the area being newly constructed or reconstructed and the size and number of golf course features. The construction areas would utilize suitable fill material generated by the habitat restoration process. The cost of moving the material is included in the restoration estimates. The cost to grade the soil into golf course features is included in the golf course estimate.

Both alternatives suggest creating new golf on the east side of the existing golf course and include removal of existing mature vegetation, mostly eucalyptus trees. The costs include hauling away the trees. One alternative provides for the realignment of the archery club access road to allow the construction of a new green.

The inclusion of netting for a driving range is a major component of the nine hole project cost. The costs were based on a generalized netting layout to protect the parking lot and the adjacent golf hole.

## ESTIMATED COSTS

Estimated costs reported here include site preparation, construction, and general markups but do not include long-term operations and maintenance. An estimated cost schedule, including maintenance costs, is given in Appendix D.

**Table 4. Construction Costs – Offsite Disposal**

| | NO GOLF | A18 | A9 |
|---|---|---|---|
| **Site Preparation** | $2,789,875 | $1,056,040 | $1,549,454 |
| **Restoration Construction** | $12,753,248 | $4,872,183 | $7,114,973 |
| **Golf Hole Construction** | n/a | $1,612,755 | $1,711,750 |
| **General Markups** | $7,771,561 | $3,770,489 | $5,188,089 |
| **Total** | **$ 23,314,684** | **$ 11,311,467** | **$15,564,266** |

**Table 5. Construction Costs – Excavated Materials Reused Onsite**

| | NO GOLF | A18 | A9 |
|---|---|---|---|
| **Site Preparation** | $858,361 | $330,772 | $498,867 |
| **Restoration Construction** | $5,121,184 | $2,017,719 | $3,006,509 |
| **Golf Hole Construction** | n/a | $1,612,755 | $1,711,750 |
| **General Markups** | $2,989,773 | $1,980,623 | $2,608,563 |
| **Total** | **$ 8,969,318** | **$ 5,941,869** | **$ 7,825,689** |

## 4.10 REGULATORY PROCESS

Many of the resources found in the wetlands complex and surrounding areas are protected under one or more state or federal regulations. These regulations are enforced by agencies including the USFWS, US Army Corps of Engineers (USACE), CDFG, and the Regional Water Quality Control Board (RWQCB). Table 6 describes the permits that may be needed for this project and the conditions under which they would be required. Permit applications are generally prepared after the 30% designs for the project have been completed.

This project will require significant consultation with the USACE and RWQCB. As the federal agency charged with enforcement of Section 404 of the Clean Water Act, USACE may permit this project under a Nationwide Permit (NWP) that allows fill of wetlands for restoration projects that result in greater amounts of restored wetlands, or under an Individual Permit. Under this or separate permit, USACE may also comment on the proposed reuse of dredged materials for restoration, as proposed under all alternatives. A Section 401 Water Quality Certification will be requested from RWQCB for impacts to wetlands, habitat, and water quality. Likely concerns during this process involve water quality effects that may arise during draining of the wetlands complex prior to construction, as well as the fate of decant water resulting from placement of dredge spoils in upland locations.

In addition to wetlands regulation, the main regulatory programs guiding this plan are the Federal Endangered Species Act (ESA) and the California Endangered Species Act (CESA), as well as the California provisions for fully-protected species. Although the City of San Francisco is carrying out the restoration of the wetland complex on a voluntary basis, as the owner of Sharp Park, the City must still comply with these regulatory programs in carrying out the alternatives set forth in this plan. Under the ESA, implementation of the plan may require consultation or permitting from the USFWS. Under CESA, implementation of the plan may require consultation or permitting from the CDFG

**Table 6. State and Federal Permits That May Be Required for Plan Implementation**

| Agency | Permit/Approval | Required for |
|---|---|---|
| ***Federal Agencies*** | | |
| USFWS/NMFS | Incidental Take Permit, Biological Opinion | Federal projects that may affect species listed as endangered, threatened, or proposed under the federal Endangered Species Act (16 USC 1531-1544) |
| USACE/EPA | Individual /Nationwide Section 404 Permit | Discharge of Dredge/fill into Waters of the U.S., including wetlands |
| | Section 10 Permit | Construction in navigable waters (may not apply to this project) |
| ***State Agencies*** | | |
| California Coastal Commission | Coastal Zone Consistency Determination | Land development within the coastal zone including grading, removing, placement, and extraction of any earth material; and harvesting of major vegetation |
| CDFG | Section 2080 Permit (Endangered Species Management) | Activity where a species listed as candidate, threatened, or endangered under the California Endangered Species Act may be present in the project area and state agency is acting as lead agency for CEQA compliance |
| | Section 2081 Incidental Take Permit | Needed if it is determined through the Section 2080 Permit process that the proposed project may result in take of a state-listed species |
| | Lake/Streambed Alteration Agreement (California Fish and Game Code 1602) | Change in natural state of a river, stream, lake (includes road or land construction across a natural streambed) |
| State Water Resources Control Board | Construction Activities Storm Water General Permit | Stormwater discharges associated with construction |
| Regional Water Quality Control Board | Waste Discharge Requirements (Water Code 13000 et seq.) | Discharge of waste that might affect groundwater or surface water (nonpoint source) quality |
| | 401 Certification (Clean Water Act, 33 USC 1341; required if the project needs a USACE Section 404 Permit) | Discharge into Waters of the US, including wetlands |
| State Historic Preservation Office | Section 106 (National Historic Preservation Act, PL 89-665, 16 U.S.C. 470 et seq.) | Projects that may impact a historic property within the area of potential effect. |

Specific measures to avoid potential adverse effects on the CRLF and the SFGS during enhancement activities would be developed in consultation with the USFWS and CDFG. The following general measures provide guidelines for implementation of the conceptual restoration enhancement plan:

- Prior to any ground-disturbing activity, a qualified biologist should provide environmental awareness training for all workers who will be on site. The training should include a brief overview of the ESA, a description of the CRLF and SFGS, what steps should be taken to avoid impacts to their habitats, and what to do if an individual frog or snake is found.

- A temporary exclusion fence should be installed to prevent listed species from entering the work area. The placement of the fence would be directed by a qualified biologist in consultation with the USFWS and CDFG.

- Following installation of the exclusion fence and at least 6 weeks prior to construction, a trapping program will be conducted to remove all listed species from the area to be impacted.

- A qualified biologist should monitor all work activities on site. The monitor would verify that exclusion fence, erosion control measures and any other environmental protection measures are properly installed.

- Work should be confined to the smallest area possible to safely complete the project. Workers should be instructed to stay within the work corridor and limits should be clearly marked.

- Vehicle refueling and maintenance should be conducted a minimum of 150 feet from aquatic habitats and other sensitive areas identified by a qualified biologist.

- Construction activities should be done during the dry season (June 1 through October 15).

- If a CRLF or SFGS is found inside a work area a USFWS and CDFG-authorized biologist should relocate it out of harms way.

## 5. CONCLUSIONS

With no action, the future of SFGS at Sharp Park is, at best, uncertain. Although historically SFGS have existed at Sharp Park while it functioned as a golf course, conditions of the wetlands and adjacent uplands are far less favorable than in the past. During the past several decades sedimentation of the lagoon and flooding of the surrounding uplands has reduced available habitat. Saline overwash from Pacific storms in the early 1980s probably caused a sharp reduction in both the SFGS population and its prey base. The current population is more a reflection of these historic events than of direct impacts from the golf course, although substantial conflicts do exist, particularly with regard to upland habitat. Mori Point provides nearly all suitable upland habitat used by snakes at Sharp Park, and snakes traveling from these areas to the relatively poor foraging habitat at Laguna Salada face significant hazards. Although these hazards are being addressed and reduced through measures described in the compliance plan, some potential for harm to SFGS from golf operations will always exist. At a minimum the SFGS requires more upland habitat between Horse Stable Pond and Laguna Salada, and would also benefit from having more high quality CRLF breeding habitat in the lagoon.

Though beneficial, due to the limited availability of upland habitat in Sharp Park, increasing the distribution and carrying capacity of the SFGS will not be accomplished by increasing CRLF breeding habitat alone. Increasing SFGS use of the area north of Horse Stable Pond, the areas adjacent to Laguna Salada, and the connecting channel will require maintaining undisturbed upland habitat in these areas. These enhancements can be accomplished without significant changes to the golf course design or to the movement of golfers on the course.

All four conceptual alternatives would accomplish the main goals of restoring, increasing, and diversifying SFGS and CRLF habitat, and meeting the recommendations of the SFGS recovery plan. Under all alternatives, this would be accomplished by:

- Dredging and recontouring the wetlands complex to remove overgrown wetland vegetation, create a mix of shallow water habitat and open water areas, and increase water flow through the wetlands;
- Closing Hole 12 and shortening or narrowing other holes to allow for an SFGS dispersal corridor and upland retreat/basking areas on the east edge of the lagoon, on a peninsula in the center of the lagoon, between the lagoon and the pond, and around the pond;
- Removing non-native Monterey cypress trees to reduce shading in SFGS and CRLF habitat and to reduce perching and spotting locations for predatory birds;
- Installing fencing to restrict intrusions into sensitive habitat and interpretive signs to educate visitors about sensitive wildlife; and
- Developing a water control plan that will alleviate the potential for egg mass and tadpole stranding.

The main differences between the various alternatives are the degree of upland habitat that would be created east of the wetlands complex, the costs to implement the respective alternatives, and the tradeoff between the amount of habitat and the degree to which golf opportunities are lost. Implementing Alternative A18 (with excavation re-use) would be the least costly alternative, would result in the least impact to golf, and would restore the least amount of restored upland habitat for the SFGS. Implementing the No Golf Alternative (with excavation re-use) would have higher costs, would result in the greatest impact to golf, and would restore the greatest amount of upland habitat. Alternative A9 would fall in the middle of the No Golf Alternative and Alternative A18 in terms of cost and amount of restored upland habitat. However, because the best upland habitat for the SFGS is that which is found near water bodies, much of the upland habitat restored east of the wetlands complex under the No Golf Alternative would be of lower value than that

located immediately adjacent to the wetlands complex. Therefore, from a habitat restoration standpoint, converting uplands immediately adjacent to the wetland areas would result in the greatest net benefit to the SFGS per acre of enhanced habitat. Focusing restoration efforts on these areas also would result in the least amount of lost golf opportunities since more distant habitat would remain available for golf. While the No Golf Alternative would result in a greater total amount of upland SFGS habitat, the value of the habitat gained through this alternative would diminish with increasing distance from the wetland complex. Furthermore, because of the close proximity of major urban centers including housing, freeways, major roads, and businesses and the intrinsic threats posed by them to the snake, restoring uplands and locating additional wetlands further to the east would potentially increase the chance of take of this species by drawing the SFGS away from the relatively protected existing wetlands complex into areas that would likely be extensively used by hikers, mountain bikers, and dog walkers.

APPENDIX J

# Summary of Changes to the SNRAMP

Edwin M. Lee, Mayor
Philip A. Ginsburg, General Manager

August 24, 2011

Bill Wycko, Environmental Review Officer
San Francisco Planning Department
1650 Mission Street, Suite 400
San Francisco, CA 94103

Re: Clarification of Changes to the SNRAMP Project Description

Dear Mr. Wycko,

The San Francisco Recreation and Parks Department (SFRPD) published the Draft Significant Natural Resource Area Management Plan (SNRAMP) for environmental review and the following describes the modifications made to the Plan for one or more of the following reasons:

- The activity was determined to be infeasible
- The activity has been completed under separate environmental review
- The activity was incorrectly described
- The activity has been reassessed as contrary to policy
- Additional details and specificity have been developed for the activity

1. Prescribed Burning. While General Recommendation GR-3b of the February 2006 Final Draft San Francisco Natural Areas Management Plan (SNRAMP) mentions prescribed burning, no burning is proposed as part of the project. The following text has been added to the project description (Section III.H of the EIR):

*(Note: The SNRAMP no longer is proposing prescribed burning. The SNRAMP will be updated to reflect this change. Should the SFRPD determine prescribed burning to be a desirable, feasible method for managing native grasslands, a separate environmental review would be required to comply with CEQA, and applicable permits and other regulatory agency approvals would be obtained.)*

2. Dog Play Areas. While General Recommendation GR-8b of the SNRAMP mentions consideration of new dog play areas, no new dog play areas are proposed as part of the project. The following text has been added to the project description (Section III.H of the EIR):

*(Note: An underlying assumption of this EIR is that there would be no new DPAs because there is direction from the Recreation and Park Commission not to establish new DPAs until systemwide DPA planning is completed. For the purposes of this EIR, this is considered a moratorium in that no new DPAs are reasonably foreseeable. This direction was announced at the October 10, 2006, meeting of the San Francisco Dog Advisory Committee. Should new DPAs be proposed at some point, the appropriate level of CEQA analysis would be undertaken, and applicable permits and other regulatory agency approvals would be obtained.)*

3. Bayview Park Key Avenue Modifications. While Recommendation VP-8a of the SNRAMP mentions modifying the Key Avenue roadway, some of those modifications have been completed and are not proposed as part of the project. The following text has been added to the project description (Section III.F.2 of the EIR):

*(note that portions of this management action have been completed)*

4. Lake Merced Dog Play Area. While Recommendation LM-7a of the SNRAMP mentions relocating a dog play area, no relocation of dog play areas is proposed as part of the project, in compliance with the current moratorium on dog play areas. The following text has been added to the project description (Section III.I.18 of the EIR):

*(Note: The SFRPD determined following completion of the final draft SNRAMP that, due to ongoing disturbance of breeding birds, this DPA should be closed, rather than monitored. This DPA would be closed in accordance with the SFRPD Final Dog Policy (SFRPD 2002) and SFPUC's Lake Merced Watershed Report (SFPUC 2011).Due to the San Francisco moratorium on new DPAs, the Lake Merced DPA couldn't be relocated to a new location, so it would only be removed. Restoration of the site would continue, following removal of the DPA.)*

5. Lake Merced Environmental Education Center. While Recommendation LM-8b of the SNRAMP mentions development of an environmental education center, no such center is proposed as part of the project. The following text has been added to the project description (Section III.I.18 of the EIR):

*(Note: Constructing and operating an environmental education center is no longer proposed as part of the SNRAMP. The SNRAMP will be updated to reflect this change. Should those activities be proposed at some point, the appropriate level of CEQA analysis would be undertaken, and applicable permits and other regulatory agency approvals would be obtained.)*

6. Former Sharp Park Rifle Range. While Recommendation SP-12a of the SNRAMP mentions cleanup and remediation of the former rifle range, those activities are not proposed as part of the project. Remediation of the rifle range is complete, and the CEQA lead agency for this project is the California Department of Toxic Substances Control. The following text has been added to the project description (Section III.I.23 of the EIR):

*(Note: Because these cleanup and remediation activities are part of a separate process led by the SFRPD Capital Division, are complete, and have been evaluated under a separate CEQA review, they are not addressed as part of the SNRAMP in this EIR.)*

7. Additional Management Details. To provide additional details for analysis of the potential environmental effects, the following text has been added to the project description regarding best management practices, program-level activities, and routine maintenance activities:

*(Section III.E.5 of the EIR)*
*Depending on site conditions, trails may or may not be created in previously inaccessible areas, as opposed to improving existing social trails. Trail placement would be designed to avoid sensitive vegetation and habitat to the extent possible. Trail alignments in the SNRAMP are conceptual and require further refinement and site-by-site evaluation to confirm the best alignment to provide access and minimize effects on surrounding natural resources.*

*The Natural Areas Program gardeners would continue to carry fire extinguishers in their trucks and would use appropriate fire prevention and suppression measures for more extensive tree and shrub removal. The SFRPD would continue to hold regular meetings with the San Francisco Fire Department and would coordinate management activities, such as tree removal, with that department.*

Tree Removal and Replacement. *Invasive trees removed in San Francisco would be replaced with native tree species at a ratio of roughly one-to-one, although not necessarily at the same location or within the same Natural Area. The SFRPD would take into consideration the views from Natural Areas when locations are being selected for new trees; locations of replacement trees in San Francisco Natural Areas would be selected to preserve views from important points. Tree removal and other activities conducted at the edges of Natural Areas may require temporary closure of sidewalks and roads. For Sharp Park in Pacifica, many of the trees would be replaced not with trees but with more appropriate native vegetation, specifically coastal scrub. Tree removal is discussed in detail in Appendix F of the SNRAMP. For accounting purposes, the SNRAMP defines a tree as any plant having a dominant vertical trunk that is over 15 feet tall; tree species less than 15 feet tall are considered seedlings or saplings in the SNRAMP. Natural Areas Program staff could remove trees that have a diameter at breast height (dbh) of six inches or less; Natural Areas Program staff would coordinate with the SFRPD arborist, who would evaluate the removal of larger trees. Tree work would generally be limited to the nonbreeding season for bird species. Where tree work is required during the breeding season, surveys would be conducted before tree removal to determine the presence or absence of breeding birds, in accordance with GR-4b. Typically, trees would be removed limb-by-limb, rather than felling an entire tree; limb-by-limb removal techniques would always be applied in areas adjacent to other trees or sensitive habitat unless this technique is not feasible or practical from a safety perspective. Minimally impacting tree removal techniques would be employed and would involve removing the individual limbs of a tree, then cutting the trunk into individual sections. Tree removal would be conducted manually by someone climbing the tree or someone on a mechanical cherry picker next to the tree. If tree removal occurs in an area that is roadway-accessible, the limbs and trunk sections typically would be transported from the area by a flatbed truck; in other areas, the limbs and trunk sections would be left in place on the ground. Tree removal would leave the tree stump and root ball intact to hold the soil and minimize subsurface disturbance; stumps may be ground to below grade where necessary to avoid tripping hazards. The SFRPD would spread tree removal across targeted portions of Natural Areas and would not concentrate it in a particular location. Larger-scale tree removal (that exceeds half an acre or on average more than 20 trees), identified and analyzed as long-term programmatic projects in this EIR, would remove trees within urban forests (MA-2 and MA-3) over time and not simultaneously in one portion of a Natural Area. The SFRPD's Tree Removal Procedures require that all trees designated for removal be posted at least 30 days before removal. The public is invited to comment about the proposed removal, and the SFRPD may or may not modify its plans based on public input.*

*Implementing the SNRAMP would involve thinning both individual trees and small clusters of trees. In most cases, some trees within the area would be left, and the surrounding forest would remain intact. Removal of other vegetation in MA-1 areas would primarily affect individual plants within roughly half-acre plots.*

*(Section III.F.1 of the EIR)*
*Programmatic projects would include the following:*

- *Rerouting or constructing trails, using heavy equipment (such as bobcats, backhoes, and excavators) at an average or maximum grading depth of two feet. This activity is typically conducted by contractors.*

- *Stabilizing hillsides, using erosion control measures that require heavy equipment and grading and possible installation of structures, such as gabions. This activity is typically conducted by contractors.*

- *Undertaking initial invasive weed or tree removal projects that typically exceed half an acre (or on average 20 trees) at any one time. Trees will be removed manually and limb-by-limb, as described previously. This activity can be conducted by contractors or SFRPD staff.*

*While the SNRAMP may identify additional types of programmatic projects, the environmental effects of those projects are anticipated to be similar to or less than the above categories of program-level projects.*

*(Section III.F.2 of the EIR)*
***Routine Maintenance***
*Routine maintenance would include the following:*

- *Removing invasive weeds by hand, either as follow-up on a previously treated site or as initial treatment in small areas (less than half an acre). This activity mostly involves the use of hand tools and volunteers, with some use of power equipment by SFRPD staff, such as brush blades or chainsaws. Ground disturbance from this activity is typically within the top inch or so of ground around the root zone.*

- *Installing plants using hand tools and plants in one-gallon containers or smaller. In addition to planting, volunteers also may assist Natural Areas Program staff with installation of erosion control materials, including coir rolls, straw bales, wattles, jute netting, and straw matting. These materials are installed with pins or two- to three-foot-long wooden stakes. This activity typically disturbs up to 12 inches of surface soil.*

- *Removing invasive trees (mostly eucalyptus), as well as overhanging tree limbs. This activity typically occurs in places where trees are expanding into or threatening a native habitat or presenting a safety concern. Following removal, stumps are left in place, resulting in little, if any, ground disturbance. Typically, no more than 20 trees (or half an acre) are treated at one time. This removal covers saplings and any tree over 15 feet high. Trees over six inches dbh are typically removed by tree crews at a rate of one to a few trees at a time. Trees will be removed manually and limb-by-limb, as described above.*

- *Maintaining trails, which includes clearing deposited soil from steps, replacing or installing steps or trail edging, and rerouting and benching trails. Ground disturbance for this activity is usually six inches or less.*

- *Maintaining catchment basins and sediment dams through hand removal of accumulated materials.*

*(Section III.G of the EIR)*
*When the San Francisco Recreation and Park Commission approved the SNRAMP for environmental analysis under CEQA, it passed the following two amendments:*

- *MA-3 areas would be maintained by the SFRPD Urban Forestry staff and may be reforested with native or nonnative species. Weed and brush removal and erosion control in MA-3 areas would be undertaken in accordance with the SNRAMP.*

- *Where appropriate in the SNRAMP, feral cat relocation would be implemented only on a determination by the San Francisco Recreation and Park Commission that other methods of population reduction failed to adequately reduce cat populations in the Natural Areas.*

8. General Recommendation GR-4b. The bird breeding season was changed from April to September 1 to February 1 to August 31. (Section III.H of the EIR)

9. General Recommendation GR-15c. The following language was added to the end of the description: "retain snags and dead branches on live trees, unless they are a hazard to public safety or contain significant harmful insect or disease infestations." (Section III.H of the EIR)

10. Recommended management action VP-7b. The following text was added: "(note that this new entryway may not be feasible given the steepness of the slopes)." (Section III.I.2 of the EIR)

11. Recommended management action CH-1e. The following text was added: "(note that a portion of these trees on the north side of Corona Heights were removed in August 2010 because they were determined to be hazardous)." (Section III.I.7 of the EIR)

12. Recommended management action DP-1b. The number of existing eucalyptus trees was changed from 120 to 100. (Section III.I.8 of the EIR)

13. Recommended management action DP-2a. The text was changed so that tree removal is prohibited within 150 feet of an occupied bird nest, rather than within 500 feet. (Section III.I.8 of the EIR)

14. Recommended management action GC/OH-4a. The text was changed so that tree removal is prohibited within 150 feet of an occupied bird nest, rather than within 500 feet. (Section III.I.12 of the EIR)

15. Recommended management action IG-2a. The following text was added: "(note that this work is underway and is expected to be completed in June 2011)." (Section III.F.16 of the EIR)

16. Recommended management action LM-3a. The text was changed so that tree removal is prohibited within 150 feet of an occupied bird nest, rather than within 500 feet. (Section III.I.18 of the EIR)

17. Recommended management action LM-3b. Heron nesting areas were added to the list of areas that could require closure of social trails to reduce disturbance of such areas. (Section III.I.18 of the EIR)

18. Sharp Park. The bulleted text under SP-4a was modified and deleted. The bulleted text under SP-4b was modified to match current restoration design. Under SP-4c, language was added indicating that the goal is to ensure that red-legged frog egg masses remain hydrated. Recommended actions SP-4e, SP-6a, SP-6b, and SP-9ca were deleted and the remaining measures were re-labeled. SP-10a was modified to specify that the subject trenches are located north of Sharp Park Road. The following detailed description of the Laguna Salada wetland complex restoration activities was added, as presented below (Section III.F.2 of the EIR):

***Sharp Park Restoration***

*As part of the Sharp Park restoration activities, the following measures from the SNRAMP would be implemented. The full set of Sharp Park SNRAMP measures are presented in Section III.I.23 and include additional measures that may fall under either programmatic projects or routine maintenance.*

- *SP-4a—Implement improvements to protect and enhance the habitat for the California red-legged frog and San Francisco garter snake at Laguna Salada, including the following:*
    - *Create upland mounds for foraging, resting, and escape cover for the California red-legged frog and the San Francisco garter snake;*
    - *Dredge excess sediments and accumulated organic matter, including stands of invasive tules, to maintain open water and fringe habitat in the wetlands complex and use appropriate dredged material on site to create or enhance upland habitat or to increase the elevation of certain golf course fairways;*
    - *Continue monitoring for California red-legged frogs and San Francisco garter snakes; and*
    - *Install and maintain signs and barriers to prevent disturbance of sensitive habitat in Horse Stable Pond and Laguna Salada by dogs or other possible nuisances.*

- *SP-4b—Construct upland mounds in the area directly south and southeast of Laguna Salada and plant with native grasses and herbs to provide snake and frog basking sites, and to provide nesting habitat for riparian birds; and*

- *SP-9b—Establish a vegetation management plan for the canal connecting Laguna Salada and Horse Stable Pond that would allow channel maintenance without affecting the forktail damselfly, California red-legged frog, or San Francisco garter snake.*

*The improvements to protect and enhance the California red-legged frog and San Francisco garter snake at Laguna Salada under measure SP-4a are focused on restoring the marsh complex and associated uplands. These restoration activities are intended to establish conditions that more resemble previous conditions and allow for thriving populations of these listed species. Figure 2 shows the restoration project footprint and the current vegetation communities, and Figure 3 shows the conceptual plan for restoring these areas. The goals of the Sharp Park restoration are to restore or enhance the wetland and upland habitat for the benefit of the San*

*Francisco garter snake and California red-legged frog, which will contribute to the recovery of these species, and to reduce the potential recurrence of the conditions that negatively affect the wetland complex and habitat for these species, including sedimentation, eutrophication due to the accumulation of dead and decaying vegetation, and loss of open water habitat due to accumulation of sediment and the proliferation of invasive plant species. Although the primary restoration features discussed in this section are not likely to change, some modification may occur during consultation with the USFWS and/or CDFG pursuant to the state and federal Endangered Species Acts and during other regulatory approval processes. The main components of the restoration to achieve recovery of the California red-legged frog and San Francisco garter snake populations are as follows:*

- *Dredging up to 60,000 cubic yards of material to remove sediment, encroaching plant species, and decaying vegetation in Laguna Salada, Horse Stable Pond, and the channel that connects the two water bodies, resulting in the conversion of freshwater marsh, willow scrub, and wet meadow wetland habitat to open water habitat;*

- *Recontouring freshwater marsh wetland and ruderal (disturbed) habitat along the Laguna Salada, Horse Stable Pond, and channel shorelines to create shallow water wetland habitat;*

- *Creating an upland and wetland habitat corridor between Horse Stable Pond and Laguna Salada;*

- *Converting about half an acre of wet meadow/freshwater marsh wetland to upland habitat, creating an upland refuge in the middle of Laguna Salada to provide snakes and frogs with refugia from feral cats and other terrestrial predators, and creating about an acre of replacement wetland along the northern and western edges of the lagoon in place of coastal scrub habitat; and*

- *Constructing up to four acres of upland mounds on landscaped grass on the east side of the lagoon and between Laguna Salada and Horse Stable Pond. These mounds would be placed in the area currently occupied by part of the Hole 13 fairway, which would be narrowed and reconfigured.*

*Some areas that are currently open water within Laguna Salada and Horse Stable Pond would be deepened by one to three feet, and parts of the eastern portions of the lagoon and pond shorelines, as well as the connector channel, would be excavated to restore open water habitat and to ensure that ample edge habitat consisting of open water/emergent vegetation interface would persist for the foreseeable future. This deepening would be conducted using excavating equipment positioned along the shore of the two water bodies. Up to 60,000 cubic yards of material would be excavated; of this, approximately 40,000 cubic yards would be used on-site and approximately 20,000 cubic yards would be stockpiled or spread at the Sharp Park rifle range site or disposed of at the Sharp Park organic dump. Excavated dredge spoils appropriate for use as golf course substrate materials would be used on-site to raise the elevation of Holes 10, 14, 15, and 18 and to create the upland habitat on the east edge of Laguna Salada. Prior to on-site use of dredged material, the sediments to be removed as part of the wetland restoration*

*project would be tested for elevated concentrations of sulfides and other characteristics to determine whether the sediments would serve as soils suitable for supporting desired vegetation. If the sediment proves unsuitable, it would be placed in a nonsensitive location or treated to render it capable of supporting the desired vegetation. Treatment may include spreading and mixing the dredged material with native soil to avoid concentrating acidic soils or adding lime to neutralize acidic soils. Excavation of the eastern portions of the lagoon, pond and the connector shoreline would convert up to six acres of freshwater marsh, willow scrub, and wet meadow wetland habitat to open water habitat.*

*To facilitate deepening of Laguna Salada, Horse Stable Pond, and the channel that connects them, as well as removal of encoraching bulrushes and tules, the water levels would be lowered temporarily to allow equipment to access the shoreline for removal of accumulated vegetation and sediments. This would be accomplished by operating the pumps at Horse Stable Pond to draw water through the wetland complex and out to the Pacific Ocean. It is anticipated that the water level in the wetland complex would be lowered from an approximate elevation of 7.5 feet above mean sea level (msl) to an elevation of approximately 4.5 feet msl, a decrease of 3 feet. Following lowering of the water levels, a qualified USFWS-approved biologist would survey the entire project area for California red-legged frogs and San Francisco garter snakes. If individuals are found during the survey, the biologist would relocate them to appropriate aquatic habitat, such as that near Mori Point, located south of Horse Stable Pond (or other suitable location as agreed to as part of consultation with the USFWS and/or CDFG); these activities would be conducted in coordination with the USFWS and CDFG.*

*An upland and wetland habitat corridor between the lagoon and the pond would be constructed with upland features designed to support the San Francisco garter snake; this action would necessitate permanently closing Hole 12 of the Sharp Park Golf Course. Sediment basins would be installed in two locations, one where Sanchez Creek enters a culvert to pass under Highway 1 and the other at the northern boundary of Sharp Park; the former sediment basin would be developed on about half an acre of the golf course (primarily upland Monterey pine habitat), and the latter sediment basin would be expanded onto about half an acre of ruderal and upland Monterey pine habitat. A post and rail fence would also be installed along the seawall to the west of the lagoon, with additional fencing around the wetland complex, to discourage human and pet intrusion into the restored habitat area.*

*Creating an upland refuge in the middle of the lagoon would require filling approximately half an acre of wet meadow and freshwater marsh wetlands. To compensate for this and other incidental loss of vegetated wetlands during construction, in-kind creation of approximately one acre of wetlands would occur in several upland locations around the northern and western edges of the lagoon. The newly created wetlands would cover the same or a greater amount of area as the wetlands that would be converted to upland habitat.*

*During the restoration activities, temporary equipment staging and materials storage would occur at the northwest corner of Sharp Park, at or near Hole 17 of the golf course. Equipment access to the project area from the north would be from Clarendon Street, which runs along the north side of Sharp Park. Access to the southern part of the project area would be from the sea wall levee road and the dirt road near the Horse Stable Pond pump house. Following completion*

*of each season's restoration activities (anticipated between May 1 and October 15), those staging and storage areas that are not permanently modified would be scarified, recontoured, and hydroseeded with native vegetation to approximate their pre-disturbance condition.*

*Creating, restoring, and enhancing California red-legged frog and San Francisco garter snake habitat at Laguna Salada would also involve a reconfiguration of some holes of Sharp Park Golf Course and converting a portion of the area currently occupied by the course to Natural Area. Approximately 13 acres of the golf course would be modified to create important upland habitat adjacent to the wetlands for the endangered San Francisco garter snake, to discourage frogs from depositing egg masses in locations where the resulting tadpoles may end up being stranded, and to allow for creation of new wetlands to compensate for those filled during restoration. In order to create a habitat corridor between Horse Stable Pond and Laguna Salada, Holes 10 and 13 would be slightly shortened or narrowed, and the existing Hole 12 would be permanently closed and relocated to another area. The habitat corridor would cover approximately six acres, bringing the total of modified area at the golf course to about 19 acres.*

*To protect the frogs and snakes during restoration work, the SFRPD anticipates conducting the restoration activities between May 1 and October 15 and would continue to coordinate the planning and undertaking of those activities with the USFWS and CDFG; this activity period avoids the breeding season for California red-legged frog and the season when San Francisco garter snakes are inactive in their winter burrows. The SFRPD would coordinate with the San Mateo County Mosquito and Vector Control District on the proposed changes to Laguna Salada to minimize the potential for development of mosquito breeding habitat.*

*While management options for the Sharp Park sea wall, including a naturally managed sea wall and shoreline, have been considered by the SFRPD, those options are not proposed as part of the SNRAMP.*

*Following completion of the restoration activities, the SFRPD would conduct maintenance to ensure the success of those activities. The scope of the maintenance is subject to modification during consultation with the USFWS pursuant to the ESA and through other regulatory approval processes. Maintenance would include weeding and maintaining the restored areas. Maintenance of the wetland areas may include removal of invasive plant species and additional planting of wetland plant species. As needed, the SFRPD also would conduct small-scale dredging of accumulated sediments from the wetlands using a backhoe. Maintaining the sediment basins would involve the periodic removal of accumulated sediment. Needed surveys would be coordinated with the USFWS and CDFG to ensure compliance with endangered species laws and regulations (SFRPD 2009a). Wetland functionality would be assessed using ecologically based criteria to determine success of the project objectives.*

*The most recent restoration plan for which theLaguna Salada restoration plan is based upon are shown in figure 3 of the EIR.*

*Added a discussion of the ongoing management measures at Horse Stable Pond, as presented below (Section III.I.23 of the EIR):*

*SFRPD would continue to use pumps to manage water levels in Horse Stable Pond to conserve the California red-legged frog by conducting post-rainfall inspections of the pond for California red-legged frog egg masses and making any pumping changes necessary to prevent stranding and other impacts to egg masses, if found to be present.*

19. Everson/Digby. The Everson/Digby Natural Area was added as the 32nd Natural Area in the Natural Areas Program, as detailed in Attachment 1. (Section III.I.27 of the EIR)

20. General Recommendation GR-8a. Lake Merced was removed from the list of Dog Play Areas whose boundaries and locations would be retained. (Section III.H of the EIR)

21. Recommended management action IB-1c. California seablite (Sueada californica) was added to the list of plants whose populations should be augmented. (Section III.I.15 of the EIR)

22. Recommended management action IG-2b. Language was added that only appropriate social trails would be formalized and inappropriate trails would be eliminated. (Section III.I.16 of the EIR)

23. Recommended management action MP-9b. Monitoring was expanded to include the Geneva Avenue dog play area. (Section III.I.19 of the EIR)

24. Recommended management action PL-1b. The phrase associated with the Pine Lake Park Improvement Project was removed, as that project has been completed. (Section III.I.22 of the EIR)

25. Recommended management action PL-7a. The number of dedicated access points to Pine Lake was changed from two to one. (Section III.I.22 of the EIR)

26. Recommended management action TK-2a. Language was added indicating that installed vegetation would include oaks. (Section III.I.24 of the EIR)

27. Recommended management action TP-3a. The following text was added: "Explore options with the San Francisco Municipal Transit Agency to convert a portion of Twin Peaks Boulevard to a multi-use trail." (Section III.I.25 of the EIR)

SFRPD intends to implement the recommended measures from the SNRAMP in our management of the Recreation and Park's Natural Areas, including the work practices related to integrated pest management and best management practices, as detailed in Section III.E.5 of the EIR, in a site appropriate manner.

Sincerely,

Dawn Kamalanathan
Director of Capital and Planning Division
San Francisco Recreation and Parks Department
30 Van Ness, 5th Floor
San Francisco, CA 94102

# CHAPTER 1 Introduction

## 1.A PURPOSE OF THE RESPONSES TO COMMENTS DOCUMENT

This Responses to Comments (RTC) document completes the Final Environmental Impact Report (EIR), analyzing potential environmental effects associated with implementation of the Significant Natural Resource Areas Management Plan (SNRAMP)[1] by the San Francisco Recreation and Park Department (SFRPD). The San Francisco Planning Department, as lead agency responsible for administering the environmental review for projects within the City and County of San Francisco (City) as required under the California Environmental Quality Act (CEQA) (California Public Resources Code [PRC] Sections 21000 et seq.), published a Draft EIR on August 31, 2011. The Draft EIR was subject to a 61-day public review period. Thereafter, the Planning Department issued a notice dated April 27, 2012, advising that the Planning Department would accept additional comments on the Draft EIR through June 11, 2012. The Draft EIR, together with this RTC document, will be considered by the Planning Commission in an advertised public meeting and certified as a Final EIR if deemed adequate. Only after certification of a Final EIR may the San Francisco Recreation & Park Commission consider approval of the proposed project.

The Draft EIR together with this RTC document constitute the Final EIR for the proposed project in fulfillment of CEQA requirements and consistent with CEQA Guidelines Section 15132. This RTC document contains a summary of all comments, the City's responses to comments, copies of the letters received, a transcript of the public hearing, and revisions to the Draft EIR to clarify or correct information in the Draft EIR. Refer to RTC Section 1.C, Document Organization, p. 1-4, for a description of the overall content and organization of this RTC document.

The Final EIR has been prepared in compliance with CEQA, the CEQA Guidelines (Title 14, California Code of Regulations [CCR] Chapter 3, Guidelines for Implementation of the California Environmental Quality Act), and San Francisco Administrative Code Chapter 31. It is an informational document for use by (1) government agencies (other than the City) and the public to aid in the planning and decision-making process by disclosing the physical environmental effects of the project and identifying possible ways of reducing or avoiding potentially significant impacts; and (2) the San Francisco Recreation & Park Commission to make a decision to approve, disapprove, or modify the proposed SNRAMP project. If the San Francisco Recreation & Park Commission approves the proposed project, it will be required to adopt CEQA findings and a Mitigation Monitoring and Reporting Program (MMRP) to ensure that mitigation measures identified in the

[1] The Significant Natural Resource Areas Management Plan, or SNRAMP, is now referred to as the Natural Resources Management Plan; however, to maintain consistency between the Draft EIR and the RTC document, the term SNRAMP will continue to be used.

Final EIR will be implemented. Refer to RTC Section 1.B, Environmental Review Process, p. 1-2, for further description of the environmental review process. This document has been prepared in compliance with the requirements of CEQA. Consistent with CEQA, responses to comments are focused on providing clarification to the description of the proposed project, an adequate and accurate analysis of the physical environmental impacts of the proposed project, identification of appropriate mitigation measures and alternatives to the proposed project (i.e., physical impacts or changes to the environment attributable to the project rather than social or financial implications of the project).

Consistent with CEQA Guidelines Section 15064(e), economic and social changes caused by a proposed project are not themselves treated as significant effects on the environment. However where a physical change in the environment is caused by an economic or social impact of a project, that physical change may be regarded as a significant impact on the environment in the same manner as any other physical change caused by the project. Alternatively, economic and social effects of a physical change may be used to determine that the physical change is a significant effect on the environment. If the physical change causes adverse economic or social effects on people, those adverse effects may be used as a factor in determining whether the physical change is significant. For example, if a project would cause overcrowding of a public facility and the overcrowding causes an adverse effect on people, the overcrowding would be regarded as a significant effect. Therefore, to the extent that comments pertaining to the socioeconomic impact of the proposed project results in physical environmental impacts, this document provides a thorough response.

## 1.B ENVIRONMENTAL REVIEW PROCESS

As described in the Draft EIR, the San Francisco Planning Department sent a Notice of Preparation (NOP) and Initial Study to more than 2,400 interested parties on April 22, 2009, including the California Office of Planning and Research (OPR, or State Clearinghouse), other governmental agencies, organizations and persons interested in the proposed projects. On that date, an environmental review notice associated with the NOP was published in the *San Francisco Examiner* and *Pacifica Tribune*. During a 30-day public scoping period that ended on May 26, 2009, the Planning Department accepted comments from agencies and interested parties identifying environmental issues that should be addressed in the EIR. The comment letters received in response to the NOP are available for review at the San Francisco Planning Department as part of the file for Case No. 2005.0912E. A summary of comment letters received in response to the NOP is included in Draft EIR Appendix A. In addition, two public scoping meetings were held (May 12, 2009, in the County Fair Building Auditorium in Golden Gate Park, and on May 14, 2009, at the Pedro Point Firehouse in Pacifica) to receive oral comments on the scope of the EIR. The Planning Department has considered the comments made by the public and agencies in preparing the EIR for the proposed project.

The Draft EIR was first published on August 31, 2011, and circulated to local, state, and federal agencies and to interested organizations and individuals for a 45-day public review period that was later extended for two weeks by the San Francisco Planning Commission, resulting in a 61-day public review period that began August 31, 2011, and continued through October 31, 2011. In addition, the Planning Commission held a public hearing on the Draft EIR on October 6, 2011, and Commissioners, organizations, and individuals made oral comments at that hearing. A second public review comment period, during which written comments were once again invited, was provided from April 27, 2012, to June 11, 2012, for a total of an additional 46 days. A Public Notice of the additional comment period was sent to over 300 neighborhood organizations and individuals through direct mailing and was also posted in the following locations: SFRPD's McLaren Lodge, the Planning Department, and the San Francisco County Clerk's office. Between the two public review periods, a total of 107 days were available to provide written public comment.

Paper copies of the Draft EIR were made available for public review at the following locations: (1) San Francisco Planning Department, 1660 Mission Street, 1st Floor, Planning Information Counter, San Francisco, California; and (2) San Francisco Main Library, 100 Larkin Street, San Francisco, California. The documents referenced in the EIR were also available for review at the San Francisco Planning Department, 1650 Mission Street, Suite 400, San Francisco, CA 94103.

On August 31, 2011, the Planning Department also distributed notices of availability of the Draft EIR, published notification of its availability in newspapers of general circulation in San Francisco (*San Francisco Chronicle*) and in Pacifica (*Pacifica Tribute*), and posted a notice at the Planning Department office and at SFRPD's McLaren Lodge, San Francisco, California. On October 6, 2011, the San Francisco Planning Commission conducted a public hearing to receive oral comments on the Draft EIR at the San Francisco City Hall, 1 Dr. Carlton B. Goodlett Place, Room 400. A court reporter present at the public hearing transcribed oral comments verbatim and prepared a written transcript; Attachment C, Draft EIR Hearing Transcript, of this RTC document contains a copy of the public hearing transcript. A public hearing before the Historic Preservation Commission (HPC) on the Draft EIR was held on September 20, 2011. The HPC transmitted written comments to the Planning Department on September 26, 2011. This RTC also provides a response to those comments. (The HPC comment letter is included in Attachment B, Draft EIR Comment Letters.)

During the Draft EIR public review period, including the extended period from April 27, 2012, through June 11, 2012, the Planning Department received a total of 308 comment letters from approximately 289 commenters, including seven public agencies, 31 nongovernmental organizations, and 251 individuals. Comments were received by email, facsimiles, mail, or hand delivery. In addition, 199 persons submitted a signed form letter. Oral testimony was also provided from 19 individuals at the October 6, 2011, Planning Commission hearing. RTC Chapter 3, List of Persons Commenting, p. 3-1, contains a complete list of persons commenting on the Draft EIR.

During the two public comment periods on the Draft EIR, which ended on June 11, 2012, the Planning Department received over 2,400 comments. This high volume of comments required extensive time to prepare adequate responses and to update or revise the text of the SNRAMP Draft EIR, where required. Contracting issues also contributed to the time required to prepare this RTC document.

The San Francisco Planning Department distributed this RTC document for review to the San Francisco Planning Commission, as well as to the agencies, organizations, and persons who commented on the Draft EIR. In compliance with CEQA requirements, the Planning Commission will hold a public hearing to consider the adequacy of the Final EIR (Draft EIR and the RTC document). If the Planning Commission finds that the Final EIR complies with CEQA requirements, it will certify the Final EIR. Following certification of the Final EIR, the Recreation & Park Commission will review and consider the certified Final EIR and the associated MMRP before making a decision and taking an approval action on the proposed project. Consistent with CEQA Guidelines Section 15097, the MMRP is a program designed to ensure that the mitigation measures identified in the Final EIR and adopted by decision makers to mitigate or avoid the project's significant environmental effects are implemented. CEQA also requires the adoption of findings prior to approval of a project for which a certified EIR identifies significant environmental effects (CEQA Guidelines Sections 15091 and 15092). If the EIR identifies significant adverse impacts that cannot be mitigated to less-than-significant levels, the findings must include a statement of overriding considerations for those impacts (CEQA Guidelines Section 15093(b)) if the project is approved. The project sponsor, SFRPD, would be required to adopt the CEQA findings and an MMRP in connection with project approval.

## 1.C DOCUMENT ORGANIZATION

This Comments and Responses document is organized by the four major chapters listed below:

- Chapter 1, Introduction
- Chapter 2, Project Description Revisions
- Chapter 3, List of Persons Commenting
- Chapter 4, Comments and Responses
- Chapter 5, Draft EIR Revisions

Chapter 2, Project Description Revisions, contains refinements or clarifications to the Project Description chapter of the Draft EIR either in response to comments received during the public review period for the Draft EIR or as initiated by the SFRPD.

Chapter 3, List of Persons Commenting, includes a list of persons, agencies, and organizations who submitted written comments on the Draft EIR and who testified at the Draft EIR public hearing held on October 6, 2011. The comment letters received and the public hearing transcript are presented in

Attachment B, Draft EIR Comment Letters, and Attachment C, Draft EIR Hearing Transcript, respectively.

Chapter 4, Comments and Responses, presents a summary of the substantive comments received on the Draft EIR and responses to those comments. The comments and responses are organized by topic area, as presented in the Draft EIR, with general comments on the EIR grouped together at the beginning of the section. This chapter also contains refinements or clarifications to the Draft EIR in response to comments received during the public review period for the Draft EIR.

Chapter 5, Draft EIR Revisions, contains all of the changes to the text of the Draft EIR that were previously identified in Chapter 2, Project Description Revisions, and Chapter 4, Comments and Responses. These changes are organized in the order of the Draft EIR table of contents. The proposed text changes (or text revisions) represent a refinement or clarification to the text of the EIR and are presented for informational purposes only. The changes do not result in new significant environmental impacts or substantially increase the severity of a significant impact identified in the Draft EIR, and no new mitigation measures are required. Further, none of the text changes identified in this Response to Comments document change any of the conclusions in the Draft EIR and do not constitute significant new information that requires recirculation of the Draft EIR under CEQA (California PRC Section 21092.1) or the CEQA Guidelines (14 CCR Section 15088.5).

[THIS PAGE INTENTIONALLY LEFT BLANK]

# CHAPTER 2 **Project Description Revisions**

## 2.A PROJECT DESCRIPTION REVISIONS

In response to comments received during the public review period for the Draft EIR and also as initiated by the San Francisco Recreation and Parks Department (SFRPD), the Project Description chapter of the Draft EIR for the SNRAMP Project has been refined or clarified. These changes are provided below; in addition, for those project description changes that are staff-initiated, they will be presented both in this Chapter and in Chapter 5. As part of the Sharp Park Conceptual Restoration Alternatives Report, the SFRPD proposed identified restoration alternatives that would be compatible with either a nine-hole layout at the Sharp Park Golf Course or with removal of the golf course entirely. These alternatives have been rejected because they are not compatible with the existing and planned continued 18-hole layout of the historic golf course.

For those project description changes that are in response to a comment, they will occur in this section, in response to the comment (in Chapter 4, Comments and Responses, RTC p. 4-1), and in Section 5.A, Changes in Response to Comments, RTC p. 5-1. The Project Description changes are followed by an evaluation of the environmental effects of implementing these project revisions. This evaluation considers whether incorporating the Project Description revisions would alter the impact analysis or conclusions presented in the Draft EIR.

Deleted text is shown in ~~strikethrough~~, and new text is <u>double underlined</u>. These changes are organized numerically according to where they occur in the Project Description.

As discussed in Response PD-13, RTC p. 4-175, beginning with the first paragraph on Draft EIR p. 77, the text has been changed as follows:

> While San Francisco is by and large a densely developed urban area, fragments of unique plant and animal habitats, known as Significant Natural Resource Areas (Natural Areas), have been preserved within the parks of San Francisco and Pacifica that are managed by the SFRPD. In the late 1990s, the SFRPD developed a Natural Areas Program to protect and manage these Natural Areas for the natural and human values they provide. The Natural Areas Program mission is to preserve, restore, and enhance the remnant Natural Areas and to promote environmental stewardship of these areas. On January 19, 1995, the San Francisco Recreation ~~and~~<u>&</u> Park Commission approved the first Significant Natural Resource Areas Management Plan.
>
> <u>Since 1995, the SFRPD has embarked on an almost 10-year process that involved SFRPD, meetings with over 3,000 members of the public, task forces, advisory groups, independent technical advisers, consultants, and decision-making bodies to study, consider, and ultimately propose the 2006 Significant Natural Resource Areas Management Plan.</u>
>
> <u>In June 2005, when the Draft SNRAMP was released for public review, three well-attended public workshops were held throughout the city. Outreach included sending fliers to neighborhood groups and residents within 300 feet of all Natural Areas, the Mayor's Office of Neighborhood Groups, SFRPD's list of neighborhood groups, and other interested parties. Announcements were also posted at all Natural Area sites. An online survey was available for individuals and members</u>

of the public that were unable to attend in person. Feedback was received from approximately 2,700 members of the public. Further, several task forces, committees, and working groups were convened as part of this process, including (1) the Natural Areas Program Citizen Advisory Committee, an ad hoc group that made recommendations on how to revise the plan, (2) a Science Round Table group that reviewed the Alternatives Report for Sharp Park, and (3) the Sharp Park Working Group. The Sharp Park Working Group, which was convened by SFRPD and facilitated by an independent party, consisted of land managers with an interest in the property, including San Mateo County, the City of Pacifica, the Golden Gate National Recreation Area, and the SFRPD. In addition, revisions to the Sharp Park Restoration Plan were also specifically made in response to input from scientists and regulatory agencies.

Three independent scientific reviews of the 2005 Draft SNRAMP were also conducted in August 2005. The goal of this independent review was to assess the scientific basis for the plan and evaluate the goals, issues, and recommendations. Additionally, the reviewers were asked to determine if the 2005 Draft SNRAMP was feasible to implement and if implementation of the proposed management activities would result in the desired outcome. The first review was conducted by Dr. Lynn Huntsinger and James W. Bartolome,[2] who provided a detailed report to the SFRPD (Huntsinger and Bartolome 2005). This review reached the following overall conclusions:

- The 2005 Draft SNRAMP was based on sound science and was a reasonable compromise between ideals, practicality, and competing uses.
- The management goals (conservation, restoration, education, stewardship, recreation, and monitoring) are consistently addressed throughout the Plan.
- The proposed actions and monitoring seemed generally feasible.

The review suggested revisions to the recommendations dealing with management of the urban forest understory, grasslands (see GR-3 in Section 5), and butterfly host plants (see GR-10). The general recommendations referenced by these comments have been revised and updated. The review also suggested minor changes to the Monitoring protocols (Section 7), which were implemented.

A second review was conducted by Roy A. Woodward, PhD. Dr. Woodward made comments on and suggested edits to the text, particularly as it related to the Monitoring Plan and Protocols. The 2005 Draft SNRAMP was revised per these edits as appropriate.[3]

A third review was conducted by Peggy Fiedler, PhD. Dr. Fiedler concluded that the 2005 Draft SNRAMP in general succeeded in its goals and "strikes a balance between natural resource protection and the needs of citizens in a highly urbanized, densely populated, highly ethnically diverse, overall well-educated area."[4]

~~Over the course of several years,~~ Ultimately, the SFRPD updated and expanded the level of detail in the 1995 plan, as well as incorporated the comments from the above scientific reviews on the

[2] Review: Significant Natural Resource Areas Management Plan, Lynn Huntsinger and James W. Bartolome, Submitted to the San Francisco Recreation and Parks Department, August 2005.

[3] Hand edits to 2005 SNRAMP text from Dr. Roy A. Woodward, Ph.D., Senior Environmental Scientist, Natural Resources Division, State of California, Department of Parks and Recreation, no date.

[4] Peer review of the Public Draft Significant Natural Resource Areas Management Plan, June 2005, Peggy L. Fieldler, Ph.D., Senior Scientist II/Associate, BBL Ecosystem Science and Restoration Services to Ms. Lisa Wayne, San Francisco Recreation and Parks, September 29, 2005.

2005 Draft SNRAMP, ~~ultimately~~ resulting in ~~a new~~ the 2006 Final Draft Significant Natural Resource Areas Management Plan (SNRAMP, SFRPD 2006)~~, with a final draft plan~~. The San Francisco Recreation ~~and~~& Park Commission approved the final draft SNRAMP ~~plan~~ for CEQA evaluation in August 2006. In April 2009, the Board of Supervisors introduced legislation that required the SFRPD to develop and plan for restoring Sharp Park for the California red-legged frog and the San Francisco garter snake; in response to this, the SFRPD began to develop the Sharp Park Conceptual Restoration Alternative Report, which was completed in September 2009.

In December 2009, the Recreation & Park Commission agreed to proceed with the Laguna Salada Restoration while preserving the 18-hole golf course at Sharp Park. In August 2011, the SNRAMP Draft EIR was released for public comment and in September 2011, a Historic Preservation Commission Hearing was held (with split votes as to whether Sharp Park is a historic resource) and in October 2011, the Planning Commission Hearing on the Draft EIR was held.

This SNRAMP contains detailed information on the biology, geology, and trails within 32 Natural Areas, 31 in San Francisco and one (Sharp Park) in Pacifica. The SNRAMP is intended to guide natural resource protection, habitat restoration, trail and access improvements, other capital projects, and maintenance activities over the next 20 years. The proposed project is the SFRPD's implementation of the SNRAMP

As discussed in Response HZ-1, RTC p. 4-531, the text on Draft EIR pp. 90 and 91 have been revised as follows:

IPM is a multistep ecologically based approach that enables staff to make decisions about where, when, and how resources should be best allocated to control pests. Conventional pest control methods attempt to control the symptoms of a pest problem, but IPM is a proactive strategy that focuses on identifying and reducing, or eliminating, the root cause of a pest problem. IPM implements effective, long-term management solutions through the use of a broad range of expertise, a combination of treatment methods, and comprehensive monitoring and evaluation.

In accordance with Chapter ~~39~~ of the San Francisco ~~Administrative~~ Environment Code, the Natural Areas Program employs IPM as its strategy for preventing new and managing existing pest infestations. Four general weed management strategies exist: prevention, containment, reduction, and eradication; each of these results in a different level of weed control and reflects available resources. The Natural Areas Program's policy is to use the least-toxic control methods whenever feasible and practical. In addition, to reduce the need for pesticides, manual pest control efforts are employed by a collaborative effort between SFRPD employees and volunteers. Apart from the 10 full-time staff that conduct management and maintenance actions within the Natural Areas, the Natural Areas Program also has a robust volunteer program, with individual groups that range in size from 10 to 50 people.

Factors that make manual and/or mechanical methods impractical include:

- Direct threats to human health and safety (e.g., steep, inaccessible, unstable slopes, significant poison oak infestations, etc.);
- Large infestations requiring ongoing repeated strenuous physical labor, such as picking and lifting, that may cause injury to staff, contract field crews, or volunteers; and
- Areas where access, human trampling, or soil disturbance may directly or indirectly damage native plant communities, affect wildlife, or cause soil erosion.

Management methods to be employed by the Natural Areas Program include:

- Physical control methods employed by Natural Areas Program staff and volunteers, which range from hand-pulling weeds to the use of hand and mechanical tools to uproot, girdle, or cut plants;
- ~~Biological~~Pest control,[5] which, in the case of the Natural Areas Program, involves revegetating cleared areas and introducing native plants in an area to encourage competition with weeds; and
- Chemical control, which involves the use of herbicides to suppress wildland weeds~~; and~~, in compliance with the San Francisco Pest Management Ordinance.
- ~~Public education and outreach.~~

Only aquatic-specific herbicides (those determined safe for aquatic life) would be applied to wetlands and to areas next to water bodies. The application of herbicides, including Garlon and Roundup, is not allowed within 15 feet of either side of established trails.

As discussed in Response GE-1, RTC p. 4-472, the text on Draft EIR p. 94 has been changed to add the following paragraph after the second bullet on the page:

Where alternative materials are available to achieve the intended erosion control objectives while also minimizing inadvertent impacts to wildlife and habitat, a preference would be given to the use of biodegradable, certified weed-free, and wheat-free erosion control materials. To help ensure that appropriate materials are used that are compatible with the materials and features present at the sites in which they are used, a qualified SFRPD biologist would be consulted during design of erosion control measures.

As discussed in Response PD-13, RTC p. 4-175, the beginning of the only full paragraph on Draft EIR p. 98 has been changed as follows:

The Sharp Park Restoration project is a voluntary and discretionary action by the City, a primary purpose of which is to provide higher quality habitat for the San Francisco garter snake, a State and Federally endangered species, as well as a species identified as fully protected under the State Fish and Game Code, and the California red-legged frog, a State threatened species; further, it is an action that is consistent with the species recovery objectives of both the federal Endangered Species Act and the California Endangered Species Act. The improvements to protect and enhance the California red-legged frog and San Francisco garter snake at Laguna Salada under measure SP-4a are focused on restoring the marsh complex and associated uplands. …

As discussed in Response BI-7, RTC p. 4-365, after the first paragraph on Draft EIR p. 102, the following text is added.

To facilitate the proposed sediment and emergent vegetation removal and to reduce potential impacts to California red-legged frog, suction hydraulic equipment may be used in consultation with the USFWS and CDFW to minimize the disturbance of sediments in the water. While

[5] Pest control generally involves the management of pests (insects, diseases, weeds) by manipulation of the environment or implementation of preventive practices including using plants that are resistant to pests, raising the mowing height of turf to shade out weeds, aerating turf to reduce compaction and plant stress, or dethatching to remove habitat, food sources and impediments to management.

> generally resulting in a higher percentage of water in the excavated materials than a clamshell dredge, the use of suction hydraulic equipment generally results in less turbidity and overall disturbance at the point of use than a clamshell. In sensitive environments, the use of suction hydraulic equipment is often preferred, provided that the excavated materials and residual water are properly handled. If suction hydraulic equipment is to be used as part of this project, the slurry that is created by suction hydraulic equipment would go into a settling area until the sediments settle out and the decant water can be tested for its acidity. If the result of such testing indicates that the water is pH neutral, it would either be released into the Horse Stable Pond or pumped into the Pacific Ocean.[6] No permit is required for discharges from the Laguna Salada Wetland Complex into the Pacific Ocean because both the Laguna Salada Wetland Complex and the Pacific Ocean are considered "waters of the United States" under the federal Clean Water Act. However, should any permit be required by SFBRWQCB or any other resource agency for the proposed SNRAMP project, SFRPD will seek such a permit and comply with any and all conditions that are attached to the permit,[7] as already indicated by Table 3, Potentially Required Regulatory Approvals, p. 81.

As discussed in Response PD-13, RTC p. 4-175, the text on Draft EIR p. 103, lines 7 to 10, has been changed as follows:

> Following completion of each season's restoration activities (anticipated between May 1 and October 15), those staging and storage areas that are not permanently modified (or identified as staging or storage areas for the next season's restoration activities) would be scarified, recontoured, and hydroseeded with native vegetation to approximate their pre-disturbance condition.

As discussed in Response BI-7, RTC p. 4-365, the text on Draft EIR p. 103, lines 22 to 26, has been changed as follows:

> To protect the California red-legged frogs and San Francisco garter snakes during restoration work, the SFRPD anticipates conducting the restoration activities between May 1 and October 15 and would continue to coordinate the planning and undertaking of these activities with the USFWS and CDFG; this activity period avoids the breeding season for the California red-legged frog and the season when San Francisco garter snakes are inactive in their winter burrows. …

As discussed in Response PD-12, RTC p. 4-168, the following paragraph has been added to Draft EIR p. 104 following Table 4, Laguna Salada Habitat Types within Restoration Footprint, to clarify the changes to the Sharp Park Natural Area boundary resulting from completion of the Sharp Park Restoration Project, as follows:

> Following completion of the Laguna Salada Sharp Park Restoration Project, those areas that were previously designated as part of the golf course that have been restored to provide habitat for special-status species would become part of the Sharp Park Natural Area.

---

[6] San Francisco Planning Department, *Sharp Park Safety, Infrastructure Improvement, and Habitat Enhancement Project Final Mitigated Negative Declaration*, January 17, 2014, p. 88.

[7] San Francisco Planning Department, *Sharp Park Safety, Infrastructure Improvement, and Habitat Enhancement Project Final Mitigated Negative Declaration*, January 17, 2014, p. 103.

As initiated by staff, the text provided in the last bullet on Draft EIR p. 105 has been changed as follows:

> ■ While General Recommendation GR-8b of the SNRAMP mentions consideration of new dog play areas (DPAs), no new DPAs are proposed as part of the project~~, due to the current moratorium on new DPAs;~~.[8]

As discussed in Response BI-32, RTC p. 4-441, the text on Draft EIR p. 109, fourth bullet, has been changed as follows:

> GR-4c – If surveys indicate that parasitism by brown-headed cowbirds or predation by crows, European starlings, English house sparrows, or other bird species subsidized by human activities is a significant problem, consult with the CDFG and the USFWS to determine the proper ~~protocols~~ course of action, if any, to address population increases of these species and to minimize the ~~negative~~ effects of ~~this~~ these species on local breeding birds.

As discussed in Response AE-1, RTC p. 4-220, a footnote has been added to Table 5 on Draft EIR p. 114 to indicate that the replacement locations have not yet been determined. In addition, as initiated by Staff, Table 5 has also been revised to indicate the reduction in the size of the McLaren Park Natural Area. The SNRAMP and the Draft EIR identified the entire McLaren Park Natural Area as subject to the SNRMAP. Since publication of the SNRAMP, the SFRPD noted that the SNRAMP identified the McLaren Park Natural Area as entirely within SFRPD jurisdiction; however, a 12-acre portion of McLaren Park known as the Amazon Reservoir Tract is under the jurisdiction of the San Francisco Public Utilities Commission (SFPUC). The SFPUC recently indicated their desire to regain management of 6.32 acres of the Amazon Reservoir Tract and have requested that it is removed from the SNRAMP and SNRAMP Draft EIR. Consequently, as the SNRAMP would no longer apply to a portion of the Amazon Reservoir Tract, the Draft EIR has been revised to reflect removal of this area from the SNRAMP.

---

[8] The Draft EIR conservatively characterized the ~~There is~~ direction from the Recreation ~~&~~and Park Commission ~~not to~~ concerning establishment of ~~establish~~ new DPAs as ~~until systemwide DPA planning is completed. For the purposes of this EIR, this is considered a~~ moratorium for the purpose of analyzing cumulative impacts in the Natural Areas ~~in that no new DPAs are reasonably foreseeable~~. This direction was ~~announced~~ presented at the October 10, 2006, meeting of the San Francisco Dog Advisory Committee; addressed in a July 19, 2007, SFRPD memorandum on the Status of the Dog Advisory Committee Work Plan; and discussed during the August 16, 2007, meeting of the San Francisco Recreation & Park Commission. New or improved DPAs may be pursued in San Francisco by the SFRPD and/or through community-driven efforts; however, none are proposed or envisioned in the Natural Areas. For the purposes of this EIR, it is assumed that no new DPAs are reasonably foreseeable to provide a worst-case analysis.

*The total acreages for the management areas do not exactly match the Natural Areas acreages. The Natural Areas acreages are based on vegetation series within each Natural Area where the geographic information system data was precisely clipped to the Natural Area boundary. Management areas were created by mapping their boundaries in the field with a GPS unit. This data was then edited by Natural Areas Program staff to match Natural Areas boundaries. This process created minor errors when the management area appeared to line up with the Natural Area boundary but in fact was off by a small amount. The average error is about 0.1 acre and never more than 0.8 acre. As would be expected, the error is largest in the larger Natural Areas because they have relatively longer boundaries.

**The SFRPD would monitor dog use and impacts on oak woodlands at Buena Vista and Golden Gate Park Oak Woodlands and impacts on small wildflower meadows in McLaren Park.

***Glen Canyon Park and O'Shaughnessy Hollow are two different Natural Areas; they are grouped together in this table, as they are in the SNRAMP.

****The acreage of the management areas within McLaren Park have been revised to reflect the exclusion of a portion of the Amazon Reservoir Tract that is under the jurisdiction of the SFPUC. Information regarding the number of trees, trails, or DPAs within the SFPUC Amazon Reservoir Tract and SFRPD McLaren Park is not available.

Note: All trees removed would be replaced, although not necessarily with the same species or within the same Natural Area.

[THIS PAGE INTENTIONALLY LEFT BLANK]

As discussed in Response G-23, RTC p. 4-93, the text provided in the fifth bullet on Draft EIR p. 110 has been changed as follows:

- GR-8b—Match on-leash and off-leash dog use with the sensitivity of the habitat when considering new DPAs within or next to Natural Areas;

  (Note: ~~An underlying assumption of this EIR is that there would be no new DPAs because there is~~ The Draft EIR conservatively characterized the direction from the Recreation &~~and~~ Park Commission concerning establishment of new DPAs as ~~not to establish new DPAs until systemwide DPA planning is completed. For the purposes of this EIR, this is considered~~ a moratorium for the purpose of analyzing cumulative impacts in the Natural Areas ~~in that no new DPAs are reasonably foreseeable~~. This direction was ~~announced~~ presented at the October 10, 2006, meeting of the San Francisco Dog Advisory Committee; addressed in a July 19, 2007, SFRPD memorandum on the Status of the Dog Advisory Committee Work Plan; and discussed during the August 16, 2007, meeting of the San Francisco Recreation & Park Commission. New or improved DPAs may be pursued in San Francisco by the SFRPD and/or through community-driven efforts; however, none are proposed or envisioned in the Natural Areas. ~~Should new DPAs be proposed at some point, the appropriate level of CEQA analysis would be undertaken, and applicable permits and other regulatory agency approvals would be obtained.~~)

As discussed in Response G-19, RTC p. 4-88 the text provided in the ninth bullet on Draft EIR p. 136 has been changed as follows:

- LM-7a—Relocate the DPA to a different area to avoid disturbing breeding birds in the current location; (Note: The SFRPD determined following completion of the final draft SNRAMP that, due to ongoing disturbance of breeding birds, this DPA should be closed, rather than monitored. This DPA would be closed in accordance with the SFRPD Final Dog Policy (SFRPD 2002) and SFPUC's Lake Merced Watershed Report (SFPUC 2011). ~~Due to the San Francisco moratorium on new DPAs, the Lake Merced DPA couldn't be relocated to a new location, so it would only be removed.~~ Restoration of the site would continue, following removal of the DPA.)

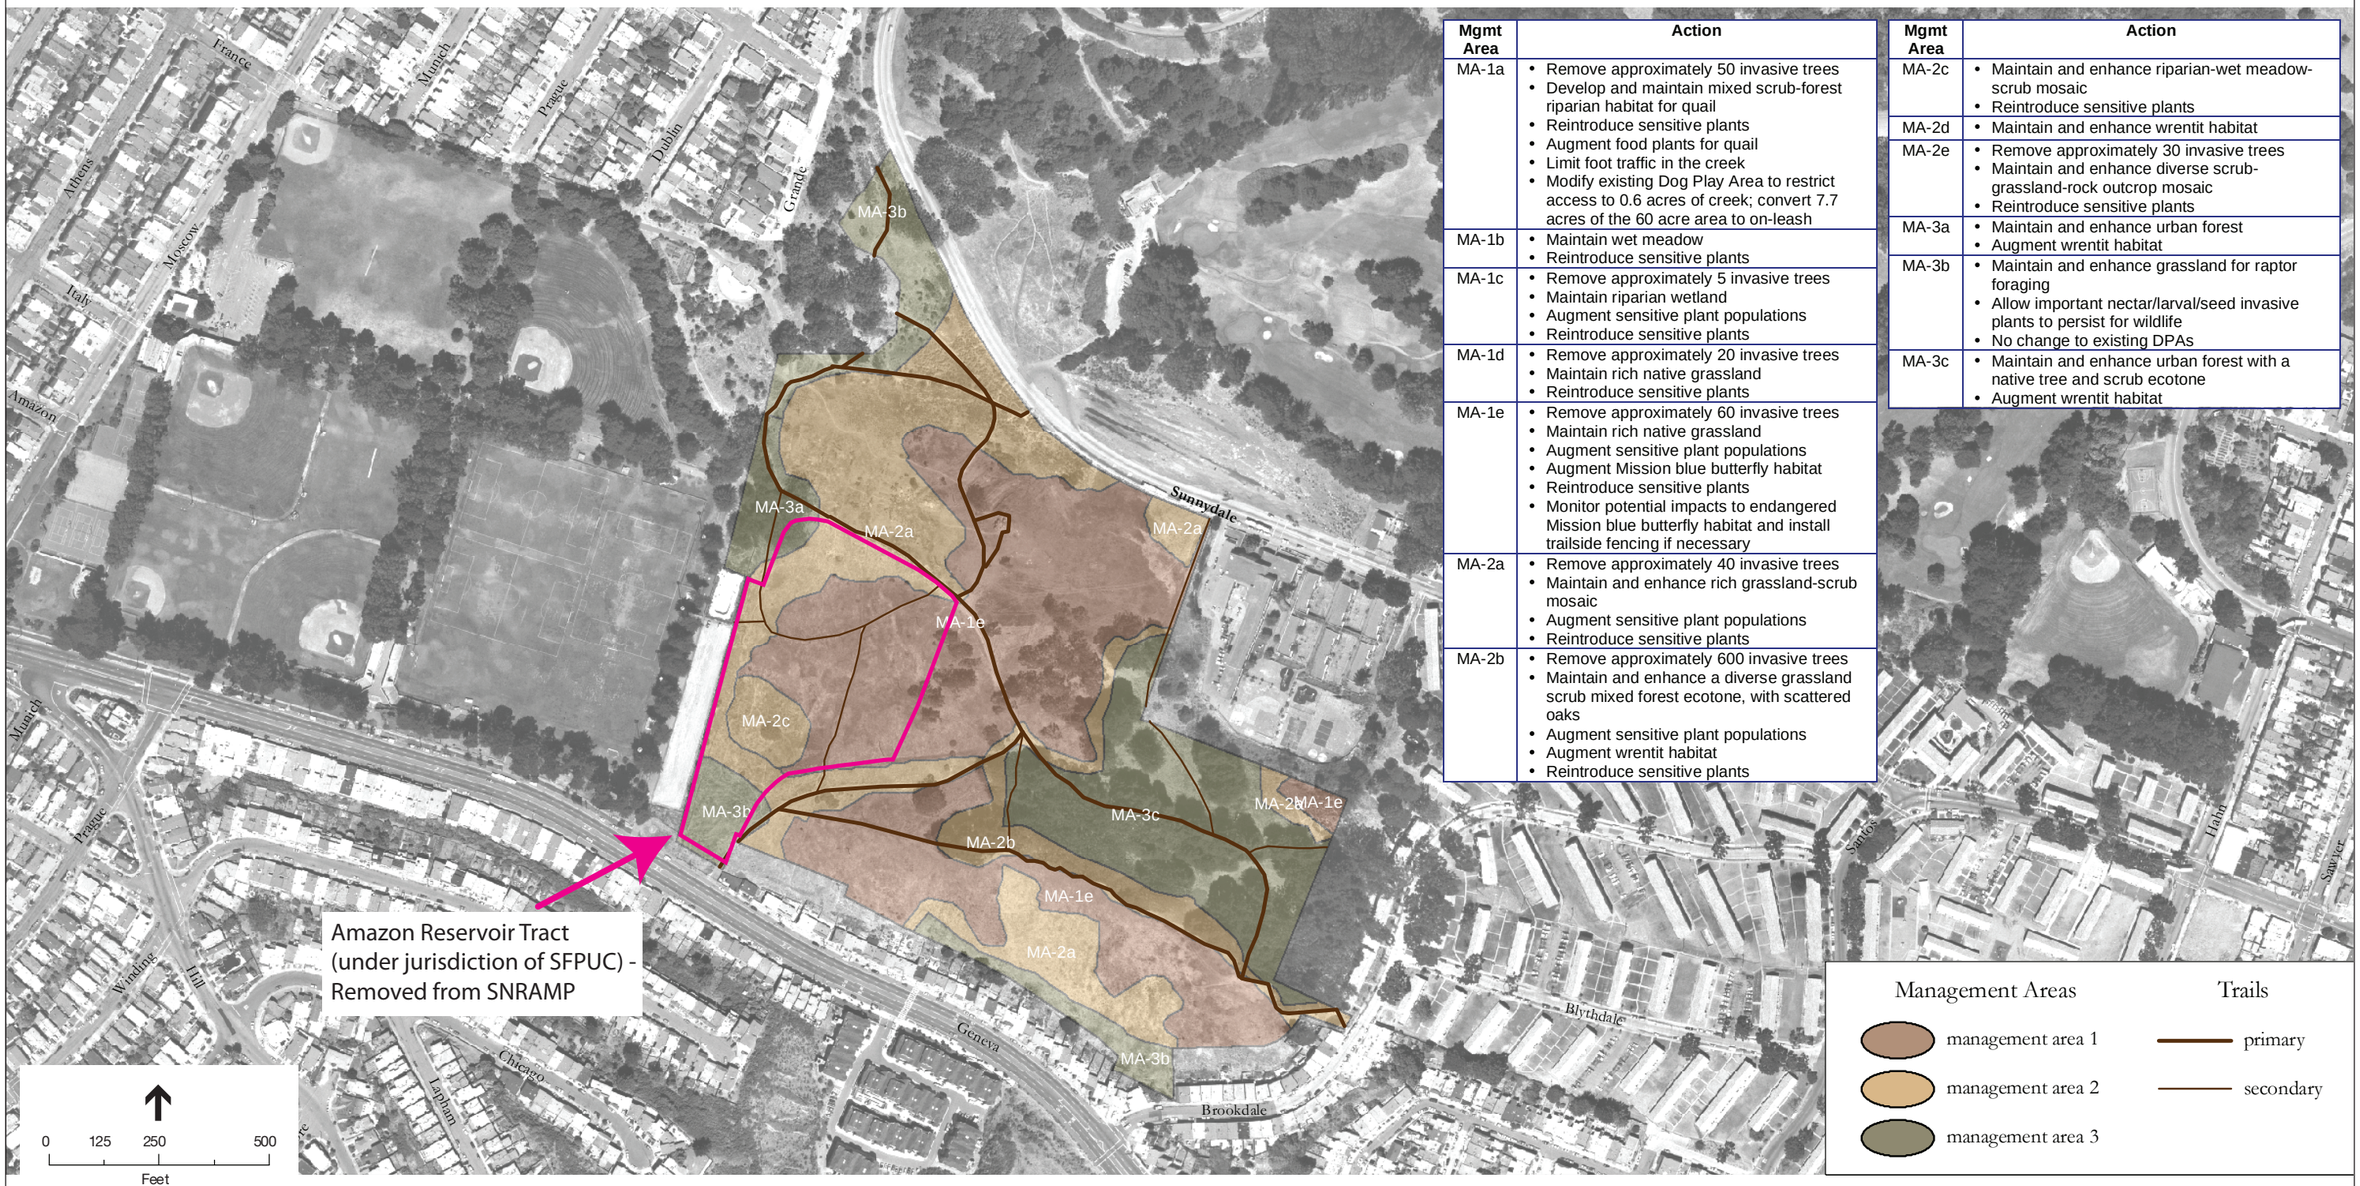
As initiated by staff, a second paragraph has been added to Draft EIR p. 137 of Section III.I.19:

> McLaren Park covers 312.6 acres near the southeast corner of San Francisco and is bisected by Mansell Street. Sunnydale and Visitacion Avenues cross the southern half of the park, while John F. Shelley Drive crosses the northern half. Recreational facilities within the park include over 11 miles of trails, tennis courts, ball fields, a golf course, picnic areas, and an amphitheater. Three designated DPAs are within the park, two within and one next to the Natural Area. The Natural Area covers 165.3 acres and is made up of grassland, scrub, and tree-dominated vegetation series.
>
> Since publication of the SNRAMP, the SFRPD noted that the SNRAMP identified the McLaren Park Natural Area as entirely within SFRPD jurisdiction; however, a 12-acre portion of McLaren Park known as the Amazon Reservoir Tract is under the jurisdiction of the SFPUC. The SFPUC has recently indicated their desire to regain management of 6.32 acres of the Amazon Reservoir Tract and have requested that it is removed from the SNRAMP and SNRAMP Draft EIR. Consequently, as the SNRAMP would no longer apply to a portion of the Amazon Reservoir Tract, the Draft EIR has been revised to reflect removal of this area from the SNRAMP. Table 5 of this EIR reflects this change, further describing which management areas would be reduced in size.

A graphical representation of the 6.32-acre portion of the Amazon Reservoir Tract relative to the rest of McLaren Park is provided as Figure RTC-1, p. 2-11.

As discussed in Response PD-35, RTC p. 4-211, the text on Draft EIR p. 143, line 14, has been changed as follows:

> Mori Point, ~~recently~~ acquired by the GGNRA in 2004, borders the southwestern edge, and the Sweeny Ridge GGNRA borders the park on the southwestern and eastern edges.



As discussed in Response PD-29, RTC p. 4-204, the text on Draft EIR p. 144, seventh bullet, has been changed as follows:

- SP-3a – Preserve natural or biodegradable elements (branches, trees, and logs) during vegetation management and remove other materials. Elements that are contaminated with invasive species (such as invaded with ripe seeds, cape ivy, untreated [chemically] eucalyptus trees, etc.) would not be retained;

# 2.B ENVIRONMENTAL EFFECTS OF THE PROJECT DESCRIPTION REVISIONS

The Project Description changes, as outlined above, include the following minor changes or clarifications: (1) clarification of existing text or data; (2) refinement of a project objective or SNRAMP Recommendation; (3) clarification of construction methods at Sharp Park; (4) clarification that the restored areas at Laguna Salada would become part of the Sharp Park Natural Area following restoration activities; (5) expanding the list of potential predators on native, local breeding birds; (6) removing a 6.32 acre portion of the Amazon Reservoir Tract that is under SFPUC jurisdiction from the McLaren Park Natural Area; and (7) editorial changes.

In summary, the modifications to the Project Description would not result in new significant environmental impacts or substantially increase the severity of a significant impact identified in the Draft EIR, and no new mitigation measures would be necessary. Therefore, no further analysis of the above Project Description modifications is necessary. Further, these revisions do not change any of the conclusions in the Draft EIR and do not constitute significant new information that requires recirculation of the Draft EIR under CEQA (California PRC Section 21092.1) and the CEQA Guidelines (14 CCR Section 15088.5).

| Mgmt Area | Action |
|---|---|
| MA-1a | • Remove approximately 50 invasive trees<br>• Develop and maintain mixed scrub-forest riparian habitat for quail<br>• Reintroduce sensitive plants<br>• Augment food plants for quail<br>• Limit foot traffic in the creek<br>• Modify existing Dog Play Area to restrict access to 0.6 acres of creek; convert 7.7 acres of the 60 acre area to on-leash |
| MA-1b | • Maintain wet meadow<br>• Reintroduce sensitive plants |
| MA-1c | • Remove approximately 5 invasive trees<br>• Maintain riparian wetland<br>• Augment sensitive plant populations<br>• Reintroduce sensitive plants |
| MA-1d | • Remove approximately 20 invasive trees<br>• Maintain rich native grassland<br>• Reintroduce sensitive plants |
| MA-1e | • Remove approximately 60 invasive trees<br>• Maintain rich native grassland<br>• Augment sensitive plant populations<br>• Augment Mission blue butterfly habitat<br>• Reintroduce sensitive plants<br>• Monitor potential impacts to endangered Mission blue butterfly habitat and install trailside fencing if necessary |
| MA-2a | • Remove approximately 40 invasive trees<br>• Maintain and enhance rich grassland-scrub mosaic<br>• Augment sensitive plant populations<br>• Reintroduce sensitive plants |
| MA-2b | • Remove approximately 600 invasive trees<br>• Maintain and enhance a diverse grassland scrub mixed forest ecotone, with scattered oaks<br>• Augment sensitive plant populations<br>• Augment wrentit habitat<br>• Reintroduce sensitive plants |

| Mgmt Area | Action |
|---|---|
| MA-2c | • Maintain and enhance riparian-wet meadow-scrub mosaic<br>• Reintroduce sensitive plants |
| MA-2d | • Maintain and enhance wrentit habitat |
| MA-2e | • Remove approximately 30 invasive trees<br>• Maintain and enhance diverse scrub-grassland-rock outcrop mosaic<br>• Reintroduce sensitive plants |
| MA-3a | • Maintain and enhance urban forest<br>• Augment wrentit habitat |
| MA-3b | • Maintain and enhance grassland for raptor foraging<br>• Allow important nectar/larval/seed invasive plants to persist for wildlife<br>• No change to existing DPAs |
| MA-3c | • Maintain and enhance urban forest with a native tree and scrub ecotone<br>• Augment wrentit habitat |

# 2.C CUMULATIVE IMPACT ANALYSIS CHANGES

The analysis of the potential for the project's incremental effects to be cumulatively considerable is based on a list of related projects identified by San Francisco and neighboring jurisdictions, as provided in Appendix G of the Draft EIR. This list includes those San Francisco Planning Department projects within a quarter mile of a Natural Area that are active or that were closed on or after January 1, 2009. The list also includes General Plan area plans within a quarter mile of each Natural Area. The analysis is also based on reasonably anticipated buildout of the San Francisco General Plan or other planning documents, depending on the specific impact being analyzed. The list of cumulative projects provided in Appendix G was updated in the summer of 2016 to include those past, present, or reasonably foreseeable projects identified since 2009. The updated list is provided in Section 5.B.9, RTC p. 5-58, which will augment Appendix G of the Draft EIR.

The cumulative analysis for recreation, hazards and hazardous materials, cultural resources, biological resources, and hydrology and water quality has been updated (as text changes to the Draft EIR) to reflect the new cumulative projects identified since 2009. The updated analysis is presented in the text changes provided in Chapter 5, RTC p. 5-1. In addition, key responses that also address cumulative impacts are provided in Response G-13, RTC p. 4-62; Response G-15, RTC p. 4-65; Response G-23, RTC p. 4-93; Response PD-9, RTC p. 4-151; Response PD-13, RTC p. 4-175; Response LU-4, RTC p. 4-216; Response CP-4, RTC p. 4-255; Response GG-1, RTC p. 4-297; Response RE-3, RTC p. 4-319; Response RE-4, RTC p. 4-320; Response RE-12, RTC p. 4-341; Response RE-13, RTC p. 4-347; Response BI-12, RTC p. 4-391; Response BI-34, RTC p.4-467; Response HY-2, RTC p. 4-493; and Response HY-5, RTC p. 4-501.

None of the projects identified since 2009 result in a change in the analysis or conclusions of the cumulative impact analysis provided in the Draft EIR.

# CHAPTER 3 List of Persons Commenting

## 3.A WRITTEN COMMENTS

Public agencies, organizations, and individuals submitted written comments (letters, emails, and facsimiles) on the Draft EIR, which the City received during the public comment period from August 31, 2011, to October 31, 2011, and from April 27, 2012, to June 11, 2012. In addition, the Planning Commission held a public hearing on the Draft EIR on October 6, 2011, and Commissioners, organizations, and individuals made oral comments at that hearing. A complete list of commenters, with the corresponding written communication and/or transcript designation for each, is provided below in Table 3-1, List of Written Comment Letters Received on the Draft EIR, and Table 3-2, Oral Comments Received on the Draft EIR, RTC p. 3-13. In Table 3-1, the names of persons who submitted written comments are presented first, organized into three groups: A, comments from agencies (i.e., federal, state, and local); B, comments from organizations; and C, comments from individuals. Within each group, written comments are organized alphabetically. In Table 3-2, commenters are presented in the order in which they spoke.

Attachment A, Comment Matrix by Commenter, contains a matrix identifying each commenter, the commenter's affiliation (if any), the comment letter number, a designation for individual comments contained within each comment letter, and the response number to which each individual comment is assigned within this RTC document.

# CHAPTER 4 **Comments and Responses**

The order of the comments and responses is shown below, with the subject area prefix indicated in square brackets:

Within each of these sections (or subject areas), such as General [G] or Biological Resources [BI], individual comments that are similar are further grouped together using a descriptive subheading and numbered sequentially. For example, General Comments [G] are listed as [G-1], [G-2], [G-3] and so on, with each responding to a similar set of comments (e.g., G-7, Prohibition on the Use of Artificial Turf; G-10, Public Outreach and Draft EIR Public Review Process; or G-17, Impacts on People within the Natural Areas). The response to the group of comments contained in Comment G-1 is termed Response G-1; similarly, the response to the group of comments contained in Comment PD-11 is termed Response PD-11.

The convention for assigning individual comment codes is as follows: Name of Agency/Organization/Individual-Letter Number-Comment Number. For instance, the first individual comment in Comment/Response G-6 is WTPCC-1-10, indicating that it is the first letter from the West of Twin Peaks Central Council (WTPCC), and it is the 10th comment in that letter. Using another example, Bowman-2-17 is the second letter from Arnita Bowman, and it is the 17th comment in that letter. Written comments were received as either letters or e-mails.

There are two primary tools to help the reader navigate the document, one allowing the reader to easily identify comments and responses by subject area and subheading, and the second allowing the reader to locate comments and responses by individual commenter. Each method is further described below.

Table 4-1, RTC p. 4-3, is organized by section of the Draft EIR and includes the detailed comment/response title and page number where both the comment and response is provided.

Because this RTC document groups similar comments together, as required by the City's Environmental Guidelines, an individual comment letter, and all of the responses to it, may be located in different parts of this document. Attachment A, Comment Matrix by Commenter, allows the reader to determine where responses to each of the comments are provided. Attachment A contains a matrix identifying each commenter (e.g., Arnita Bowman), the commenter's affiliation (if any), the comment letter number (e.g., Bowman-1 or Bowman-2), a designation of individual comments contained within each comment letter (e.g., Bowman-1-1, Bowman-2-1), and the response number that addresses each individual comment (e.g., G-6, PD-11, BI-16). For example, Attachment A shows that the response to Comment NPS-1-01 is addressed in Response PD-26. If a commenter wishes to cross-reference Table 4-1 and Attachment A, there is a common column – RTC Comment/Response No. – that allows easy correlation between the two tables.

Where revisions or clarifications to the text of the Draft EIR are made in response to public comments received on the Draft EIR or as initiated by City staff, deleted text is shown in ~~strikethrough~~, and new text is double underlined. These changes are organized in the order of the Draft EIR table of contents, which is consistent with the list provided at the beginning of this Chapter. If text changes are not identified in response to a comment, it is assumed that the comment did not necessitate any changes to the Draft EIR.

Many comments focus on the relative merits of the proposed project (that is, question the validity of the proposed project) or express support or opposition for the proposed project (or elements of the project), and do not comment on the adequacy or accuracy of the data, analysis, and conclusions of the Draft EIR. As required by CEQA, this Draft EIR evaluates the impact of the proposed action and does not—and need not—substantiate the reason for the action. While all of the information contained in this RTC document will be considered by the decision makers as part of their decision to approve, modify, or disapprove the proposed project, comments unrelated to the environmental analysis are considered independent of the decision to certify the EIR. Where responses are provided for comments that are unrelated to the environmental analysis, they are provided for informational purposes only.

The decision to certify the EIR is outlined in CEQA Guidelines Section 15090, which requires that the decision-making body certify that the Final EIR: (1) has been completed in compliance with CEQA; (2) has been presented to the decision-making body of the lead agency and the decision-making body reviewed and considered the information contained in the Final EIR prior to approving the project; and (3) reflects the lead agency's independent judgment and analysis.

None of the comments, responses, or additional information presented in this RTC or included in the EIR present significant new information, which is defined in CEQA Guidelines Section 15088.5 as a new significant environmental impact; a substantial increase in the severity of an environmental impact; a feasible project alternative or mitigation measure considerably different from others previously analyzed that would clearly lessen the environmental impacts of the project, but the project's proponents decline to adopt it; or the draft EIR was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded (Mountain Lion Coalition v. Fish and Game Com. (1989) 214 Cal.App.3d 1043). The information presented herein and revisions to the EIR add clarity or provide minor modifications to the EIR that do not change the conclusions. Thus, recirculation pursuant to CEQA (California PRC Section 21092.1) and the CEQA Guidelines (14 CCR Section 15088.5) is not required. Further, while revisions to the Draft EIR text have been proposed in this RTC document, none of the revisions change any of the conclusions in the Draft EIR and do not constitute significant new information, as defined above, which requires recirculation of the Draft EIR.

**Table 4-1 Topical List of Comment Letters Received**

| *RTC Comment/ Response No.* | *RTC Comment/Response Title* | *RTC Section No.* | *RTC Section Name* | *RTC Page No. of Comment* | *RTC Page No. of Response* |
|---|---|---|---|---|---|
| **General [G]** | | | | | |
| Comment G-1 | Data that the Natural Areas support a "substantial amount of outdoor recreation" | 4.A.1 | General Comments on SNRAMP and the Draft EIR | 4-13 | 4-13 |
| Comment G-2 | Draft EIR should acknowledge the current areas already set aside for native plant habitats | 4.A.1 | General Comments on SNRAMP and the Draft EIR | 4-15 | 4-15 |
| Comment G-3 | Previous Natural Areas Program actions | 4.A.1 | General Comments on SNRAMP and the Draft EIR | 4-16 | 4-19 |
| Comment G-4 | Financial considerations for implementation of SNRAMP | 4.A.1 | General Comments on SNRAMP and the Draft EIR | 4-25 | 4-29 |
| Comment G-5 | Impacts of Natural Areas access restrictions on social fabric of San Francisco | 4.A.1 | General Comments on SNRAMP and the Draft EIR | 4-30 | 4-31 |
| Comment G-6 | Impacts on Natural Areas from poor maintenance | 4.A.1 | General Comments on SNRAMP and the Draft EIR | 4-32 | 4-34 |
| Comment G-7 | Prohibition on use of artificial turf | 4.A.1 | General Comments on SNRAMP and the Draft EIR | 4-35 | 4-36 |
| Comment G-8 | Co-existence of sensitive species and golf | 4.A.1 | General Comments on SNRAMP and the Draft EIR | 4-36 | 4-36 |
| Comment G-9 | Need for a recirculated or subsequent project-specific Draft EIR | 4.A.2 | CEQA Process | 4-36 | 4-37 |
| Comment G-10 | Public outreach and Draft EIR public review process | 4.A.2 | CEQA Process | 4-39 | 4-50 |
| Comment G-11 | Draft EIR is adequate, accurate, and complete | 4.A.2 | CEQA Process | 4-54 | 4-57 |
| Comment G-12 | Objectivity of the EIR | 4.A.2 | CEQA Process | 4-58 | 4-60 |
| Comment G-13 | Sharp Park analysis piecemealed regarding sea wall and golf course redesign | 4.A.2 | CEQA Process | 4-61 | 4-62 |
| Comment G-14 | Historic Preservation Commission review of future project under the National Environmental Policy Act | 4.A.2 | CEQA Process | 4-64 | 4-64 |
| Comment G-15 | GGNRA activities (unrelated to the SNRAMP) | 4.A.3 | Dog Play Areas | 4-64 | 4-65 |
| Comment G-16 | Dog problems result from lack of monitoring, lack of enforcement of existing leash laws, and lack of responsibility from dog owners | 4.A.3 | Dog Play Areas | 4-67 | 4-68 |

|---|---|---|---|---|---|
| **Noise [NO]** | | | | | |
| Comment NO-1 | Permanent noise impacts of tree removal | 4.D.5 | Noise [NO] | 4-281 | 4-281 |
| **Air Quality [AQ]** | | | | | |
| Comment AQ-1 | Increased pollution from tree removal activities | 4.D.6 | Air Quality [AQ] | 4-283 | 4-283 |
| **Greenhouse Gas Emissions [GG]** | | | | | |
| Comment GG-1 | Climate change analysis of vegetation changes is insufficient and inaccurate | 4.D.7 | Greenhouse Gas Emissions [GG] | 4-285 | 4-297 |
| Comment GG-2 | Draft EIR ignores changes to San Francisco's climate | 4.D.7 | Greenhouse Gas Emissions [GG] | 4-302 | 4-303 |
| **Wind and Shadow [WS]** | | | | | |
| Comment WS-1 | Analysis of wind impacts from tree removal | 4.D.8 | Wind and Shadow [WS] | 4-304 | 4-309 |
| Comment WS-2 | Disagree that all tree removal will have less than significant effects on wind | 4.D.8 | Wind and Shadow [WS] | 4-310 | 4-310 |
| **Recreation [RE]** | | | | | |
| Comment RE-1 | Actual number of dog play areas is 29, not 19, and total acreage of DPAs is 120 acres, including DPAs outside of the Natural Areas | 4.D.9 | Recreation [RE] | 4-311 | 4-311 |
| Comment RE-2 | Characterization of dog play area moratorium | 4.D.9 | Recreation [RE] | 4-312 | 4-313 |
| Comment RE-3 | Use GGNRA estimate of closing 90% of off-leash lands for cumulative analysis | 4.D.9 | Recreation [RE] | 4-317 | 4-319 |
| Comment RE-4 | Address increase in passive recreation for cumulative analysis | 4.D.9 | Recreation [RE] | 4-320 | 4-320 |
| Comment RE-5 | Consider adding holes to the Sharp Park Golf Course east of Highway 1 | 4.D.9 | Recreation [RE] | 4-321 | 4-321 |
| Comment RE-6 | Replace the removed hole at the Sharp Park Golf Course to maintain 18 holes | 4.D.9 | Recreation [RE] | 4-321 | 4-322 |
| Comment RE-7 | If Bernal Hill and McLaren Park are closed, remaining dog play area land would be less suitable | 4.D.9 | Recreation [RE] | 4-322 | 4-323 |
| Comment RE-8 | Impacts resulting from restrictions on recreational access | 4.D.9 | Recreation [RE] | 4-323 | 4-324 |
| Comment RE-9 | Impacts on recreation from planting threatened and endangered species | 4.D.9 | Recreation [RE] | 4-326 | 4-329 |
| Comment RE-10 | Recreational analysis related to trails | 4.D.9 | Recreation [RE] | 4-330 | 4-337 |
| Comment RE-11 | Impacts of removing benches and recreational amenities | 4.D.9 | Recreation [RE] | 4-340 | 4-340 |

# 4.A GENERAL COMMENTS [G]

This section addresses general comments on the SNRAMP or the Draft EIR, including comments in opposition to, or in favor of, the proposed project, comments pertaining to the CEQA process, glossary, and definitions presented in the Draft EIR, and other comments on the Draft EIR that do not explicitly relate to, or would not substantially affect, the analysis contained in the Draft EIR.

## 4.A.1 General Comments on SNRAMP and the Draft EIR

| **Comment G-1** | **Data that the Natural Areas support a "substantial amount of outdoor recreation"** |
|---|---|

The response to Comment G-1 addresses all or part of the following individual comment:

NPS-1-07

- Pg. 252: We would appreciate receiving any user data collected in preparation of this draft EIR that underlies the statement that the natural areas support a "substantial amount of outdoor recreation." The City submitted comments on the GGNRA Dog Management Plan/DEIS asking that we consider the re-distributional effects of closing areas, and noted that the City would provide visitor information to this effect. User data that documents the number of visitors (and dog walkers) currently using these areas will help us address this comment. [NPS-1-07]

### Response G-1

This comment requests data supporting the statement that the Natural Areas support a "substantial amount of outdoor recreation" and also requests visitor use data. The response below provides the requested data to the extent possible.

While SFRPD does not have specific data or user counts for the outdoor recreation usage by visitors to the Natural Areas for all recreation categories, regular use of the trails and other passive areas, for a variety of recreational uses, such as dog-walking, is evident through general observation. While usage levels vary from one area to another, the Natural Areas, which make up 1,107 acres of SFRPD's 4,113 acres of total recreation and open spaces areas (with 3,100 acres located in the City of San Francisco), support a substantial amount of outdoor recreational activities. As reflected on SNRAMP pp. 3-13 and 3-14, Natural Areas are used extensively by residents and visitors of San Francisco for walking, hiking, running, nature watching, dog walking, and other passive recreational activities.[9] All Natural Areas provide easy trail-walking opportunities, and most

[9] Passive recreation—Recreation that occurs in a natural setting and that requires minimal site development or facilities. Under passive recreation, the importance of the environment or setting for the activities is greater than in developed or active recreation settings.

provide views of the city. The larger regional parks, such as Glen Canyon Park and McLaren Park, also provide hiking opportunities in areas of moderate to challenging steepness. Dog walking is popular in many Natural Areas. Key parks for wildlife observation are Bayview Park, McLaren Park, Mount Davidson, Glen Canyon Park, and Lake Merced. Stewardship and volunteering also are popular recreational activities that occur in Natural Areas. Approximately 15 stewardship groups work regularly restoring Natural Areas under the guidance of the Natural Areas Program (NAP).[10] Thousands of volunteer hours are spent each year enhancing natural and recreational features in Natural Areas. Development of site-stewardship and recreational uses compatible with natural resource protection are two of the main goals of the SNRAMP.

In 2004, SFRPD developed a Recreation Assessment[11] in order to evaluate community program and facility needs. As part of this assessment, a statistically significant number of households (1,035) were surveyed,[12] and 61 percent of respondents visit Natural Areas for some form of recreation.

In terms of recreational use of the Dog Play Areas (DPAs), in 2009 and 2011, the SFRPD not only conducted dog use counts at numerous dog parks throughout the city, but also specifically within the Natural Areas (Bernal Hill, McLaren Park, Lake Merced,[13] Buena Vista, Corona Heights, and Pine Lake). The 2009 and 2011 dog use count data is included in this EIR as new Appendix K (Dog Use Count Data: 2009 and 2011). The dog-use counts revealed that an average of 66 dogs and 38 owners use the parks on an hourly basis, excluding Lake Merced, which only had one dog (and one owner) use the park over the survey time periods. The survey time periods vary by park, and specific information regarding the survey dates and time periods are provided in Chapter 5, Draft EIR Revisions, "new" EIR Appendix K, which is provided on RTC p. 5-64. Based on the total dogs recorded over the survey time period, the park with the highest total recorded dog use was Pine Lake (with 122 dogs), and the park with the lowest total recorded dog use was Lake Merced (with 1 dog). The remaining Natural Area parks (Bernal Hill, McLaren Park, Buena Vista, and Corona Heights) had a combined total of 112 recorded dogs over the survey time period, with counts ranging from 19 (McLaren Park) to 32 (Corona Heights).

In summary, due to high urban density and limited park areas in San Francisco, the properties managed by the SFRPD, including the Natural Areas, are highly valued and utilized for their recreational opportunities.

---

10 The Natural Areas Program, or NAP, is now referred to as the Natural Resources Division; however, to maintain consistency between the Draft EIR and this RTC document, the term NAP will continue to be used.

11 San Francisco Recreation and Park Department, *Recreation Assessment Report*, August 2004. This document (and all other documents cited in this report, unless otherwise noted), is available for review at the San Francisco Planning Department, 1650 Mission Street, Suite 400, San Francisco, CA, 94103, as part of Case File No. 2012.1427E 400.

12 San Francisco Recreation and Park Department, *Recreation Assessment Report*, August 2004.

13 For Lake Merced, the dog counts were taken in 2011.

Refer also to Response RE-13, RTC p. 4-347, for a discussion of the impacts on other DPAs (in terms of recreational capacity) of the conversion of DPAs to on-leash dog areas, and refer to Response RE-1, RTC p. 4-311, for a discussion of the total number of dog parks available for on-leash, off-leash, or on-trail dog use in the city.

| **Comment G-2** | **Draft EIR should acknowledge the current areas already set aside for native plant habitats** |
|---|---|

The response to Comment G-2 addresses all or part of the following individual comment:

Lorenz-1-04

- Also, the plan does not recognize that the city of SF has already set aside huge areas for native plant habitats in the form of the San Francisco Peninsula Watershed. This needs to be acknowledged in the EIR. [Lorenz-1-04]

## Response G-2

This comment requests acknowledgement that there are native plant habitats set aside as part of the San Francisco Peninsula Watershed.

The 23,000-acre Peninsula Watershed, to which the commenter refers, is located in central San Mateo County, south of the city and is not under the jurisdiction of the SFRPD, but rather the SFPUC, which is why it is not included in the SNRAMP. While areas of the Peninsula are set aside for open space, as are other areas within the Bay Area, the Peninsula Watershed Plan Final EIR does not identify a specific acreage for native plant restoration activities.

Irrespective of other native plant habitat restoration activities in other portions of the Bay Area, the Recreation and Open Space Element (ROSE) of the City's General Plan (updated in April 2014) requires the City to protect and enhance the biodiversity, habitat value, and ecological integrity of open spaces and encourage sustainable practices in the design and management of the City's open space system (Objective 4). The ROSE identifies four policies that are applicable to the City's natural areas: Policy 4.1: Preserve, protect and restore local biodiversity; Policy 4.2: Establish a coordinated management approach for designation and protection of natural areas and watershed lands; Policy 4.3: Integrate the protection and restoration of local biodiversity into open space construction, renovation, management and maintenance; and Policy 4.4: Include environmentally sustainable practices in construction, renovation, management and maintenance of open space and recreation facilities.[14] Further, the protection of Natural Areas in San Francisco is also addressed in the City's *Sustainability Plan*[15] and SFRPD's Strategic Plan[16] under Strategy Four: Inspire Stewardship (Protect

[14] San Francisco Planning Department, *Recreation and Open Space Element of the San Francisco General Plan*, April 2014. This document is available online at: http://openspace.sfplanning.org/, accessed on January 29, 2016.

[15] City of San Francisco Commission on the Environment, *Sustainability Plan for the City of San Francisco,* 1997. This document is available online at: http://sustainablecity.org/, accessed on June 6, 2016.

and enhance San Francisco's precious natural resources through conservation, education, and sustainable land/facility management practices) and specifically through Objective 4.1: Conserve and strengthen natural resources and Objective 4.2: Increase biodiversity and interconnectivity on City parkland.

The proposed project does not involve converting areas outside of the Natural Areas managed by the SFRPD to native plant habitat (with exception of minor areas around the Laguna Salada wetland complex in Sharp Park), but instead seeks to improve and enhance those native plant communities within the Natural Areas.

## Comment G-3 Previous Natural Areas Program actions

The response to Comment G-3 addresses all or part of the following individual comments:

| | | |
|---|---|---|
| SFFA-3-12 | SFPGA-3-11 | WTPCC-1-09 |
| Bowman-2-17 | Kessler-1-09 | Kessler-2-09 |

- **1. The Natural Areas Program has violated California Fish & Game Code and the Migratory Bird Treaty Act**

  The DEIR states that SNRAMP is consistent with all federal and state laws governing the protection of biological resources. One of those laws is California Fish & Game Code 1600-1616 regarding the protection of fish and wildlife within "bodies of water of any natural river, stream or lake." These codes obligate those who are engaged in any "streambed alteration" to apply for a permit and "to propose reasonable project changes to protect the resource." (DEIR, page 274)

  Islais Creek in Glen Canyon Park is such a water body which is protected by this law. Accordingly, the Natural Areas Program applied to California Fish & Game for a Streambed Alteration Permit in preparation for their project which began in November 2011. **The Natural Areas Program made the following commitment to mitigate harm to wildlife in Glen Canyon Park in its Streambed Alteration Permit:**

  > "It is the policy of RPD's Natural Areas Program that **no new projects will begin during the breeding season (December to May).** Follow up work in previously cleared areas may be done during the breeding season, however, because areas will have been cleared previously. Wildlife will not likely be using these areas for breeding. This protocol has been effective in reducing impacts to breeding wildlife."

  The Natural Areas Program began to destroy the nonnative vegetation in Glen Canyon Park in San Francisco in November 2011. In addition to destroying valuable habitat with chainsaws, they also sprayed herbicides. This destructive activity continued through winter and spring 2012 and cannot be dismissed as "follow-up work" on previously cleared areas.

---

[16] San Francisco Recreation and Parks Department, *Strategic Plan FY 2016–2020*. This document is available online at: http://sfrecpark.org/wp-content/uploads/RPD-Strategic-Plan-FY16-20.pdf, accessed on June 6, 2016.

The San Francisco Forest Alliance (SFFA) protested this destructive project many times but it has continued unabated to as recently April 27, 2012, when they pruned trees and sprayed herbicides.

Earlier in April, SFFA learned from a public records request that this project violated a legal commitment to the California Department of Fish & Game. SFFA immediately brought this violation of NAP's commitment to the attention of the General Manager of the Recreation and Park Department. The head of the Natural Areas Program said that the violation was necessary because the grant funding for the project was about to expire. To avoid losing the funding for the project, the birds and animals of Glen Canyon Park were subjected to this destructive project during their breeding and nesting season.

SFFA brought this violation to the attention of the California Department of Fish & Game. Their regulations commit them to enforce the terms of the Streambed Alteration Permit, including the mitigation of potential harm to wildlife. Violations of the terms of the permit are subject to "civil penalties" according to the regulations: "A person who violates this chapter is subject to a civil penalty of not more than twenty-five thousand dollars ($25,000) for each violation."

One month after informing California Department of Fish & Game of this violation, nothing seems to be done about it. In fact, several weeks after sending this information to Fish & Game, another episode of destruction occurred in Glen Canyon Park on April 27, 2012.

As the breeding/nesting season is also the season during which migratory birds are occupying their nests and the federal Migratory Bird Treaty Act "… also applies to the removal of nests occupied by migratory birds during the breeding season," (DEIR, page 273) we assume this law was also violated.

**In other words, the legal commitments made by the Natural Areas Program to conduct the destructive phase of their project outside of the breeding and nesting season were not observed. Furthermore, no action was taken by California Fish & Game to stop this project when it was brought to their attention. The law is apparently ignored with impunity.**

In addition to the violation of federal and state laws, the Natural Areas Program has also violated the commitments made in both the SNRAMP and the DEIR: "In compliance with the MBTA [Migratory Bird Treaty Act], the SFRPD would avoid harming or removing the nests of these species and any migratory bird species. Measure GR-4b (page 109) in the SNRAMP requires that vegetation management activities be conducted outside the breeding season (February 1 to August 31), unless these activities had already begun before the breeding season and had already removed nesting habitat or if a breeding bird survey was conducted prior to vegetation removal activities and had determined that no nesting birds were present." (DEIR, page 305)

The commitment to California Fish & Game in NAP's Streambed Alteration Permit and the commitment made in Measure GR-4B of SNRAMP are contradictory. These contradictions should be resolved by the final EIR: When is the breeding season? What evidence is there that a breeding bird survey was conducted prior to vegetation removal activities which took

place continuously from November 2011 to April 27, 2012? Is the mitigation required by the Streambed Alteration Permit consistent with the caveats of Measure GR-4b?

The final EIR is not in a position to reassure the public that the implementation of SNRAMP will not harm wildlife because the Natural Areas Program has violated the laws that theoretically protect wildlife. [SFFA-3-12]

- The EIR should contain a detailed description of the process which led to the design and selection of the proposed Sharp Park Restoration project. (a) Over the last several years, the City has performed extensive analyses (including the Sharp Park Conceptual Restoration Alternatives Report included as Appendix I) of the endangered species and associated issues at Sharp Park, and engaged in a comprehensive and public effort to analyze numerous alternatives to address those issues. That process resulted in the decision by the City to implement the Restoration project which is now addressed in the Draft EIR. However, the Draft EIR is largely silent regarding how the Restoration project came to be. The Final EIR should rectify this oversight by incorporating into the Project Description section a detailed description of the City studies and decision-making processes that resulted in the City's decision to implement the Restoration project now being analyzed. [SFPGA-3-11]
- We are also concerned that some habitat conversion is being done during breeding and nesting season. For example, NAP applied for a "streambed alteration" permit from the California Fish and Game Dept. for habitat conversion work to be done near Islais Creek in Glen Canyon. In the application, NAP clearly stated: "It is the policy of RPD's Natural Areas Program that no new projects will begin during the breeding season (December to May)." Similar commitments were made in the SNRAMP. However, NAP contractors used chainsaws and herbicides to destroy underbrush habitat in Glen Canyon in March and April, continuing work done sporadically since November 2011. This work took place throughout the breeding/nesting season, despite NAP's legal commitment to CA Fish and Game and in the SNRAMP to not do habitat work during breeding season. When people informed RPD management about this, during a meeting at McLaren Lodge, Lisa Wayne, the head of NAP, said the work was being done during the breeding/nesting season because the grant for the project was set to expire. In other words, NAP's decision on habitat conversion in Glen Canyon appeared to be motivated by financial considerations, not by any concerns about the wildlife and birds living there. [WTPCC-1-09]
- It is also disturbing that RPD has proceeded with implementing much of the SNRAMP plans prior to the completion of the DEIR, which doesn't seem to comply with CEQA. For example, 1) signs are already posted at the Natural Area entrances calling the entire Natural Area "sensitive habitat" and requiring visitors to "stay on the designated trails" and 2) the 2008 Park Bond Trail Restoration Program - $4 million budget with about $900,000 already spent - has already been used to start the SNRAMP proposed plans to decommission trails, erect permanent fencing, remove existing landscaping, and install new native plants. In addition in the Glen Canyon Creekside Trail Habitat Conservation Fund (9/13/10) (See *Attachment A*), RPD claims that the proposed project is "not related to any larger project, series of projects, or program", when in fact the project is directly implementing the SNRAMP proposed plans and altering the park land use. [Bowman-2-17]

- NAP was originally intended to preserve the few remnants of San Francisco's historical habitat, but the program has morphed into an empire that controls over one-quarter of all the city-managed parkland – land for which access is being limited by the NAP program in a city coping with more and more people. We have wonderful natural areas – forests, thickets and overgrown areas, which everyone loves as they are – they are truly natural – but they are being removed for NAP's program. NAP is actually harming the environment by destroying trees, established habitat, and established ecosystems which include our existing wildlife. NAP wants to recreate our environment as one of native grasses which might have existed in the area in 1776 – in very delimited spaces this seems fine, but they should not be taking over our parks which have evolved on all levels since that time. The grasses were native to a sand-dune ecology, but that is no longer the case within the city, and the grasses provide no protective habitat to the animals which now occupy these spaces – animals which are not on NAP's "specified" or "endangered" lists. There has been an alarmingly high rate of failure when "endangered" species have been introduced – this is because they are no longer suited to this environment which has evolved and changed since 1776. NAP is a political program, not a program based on science, and one which is hampering people's enjoyment and use of their parks.

  We have now discovered that, for native plants, there is a huge issue of "sustainability" which has been totally overlooked by the NAP program: the Native Plants in fact cannot survive without artificial means of keeping them going, including huge amounts of human management and poisons to keep other growth down: this project is an absolute waste of resources. And the result is artificial museum gardens which preclude other uses of the parks – access to more and more areas is being restricted because of the NAP program. The very phrase "natural areas" is totally deceptive to the public – these are artificial creations.

  If you want to look at areas which have been left totally bare because NAP ripped out what was there, look at the periphery of Pine Lake – the NAP program first began there 15 years ago and it is a mess. And now the lush growth in Glen Canyon is slowly and systematically being removed, NAP is turning a gem of a wilderness park – something that everyone wants retained – into a native grassland area, even removing and thinning truly-native willows and coyote brush. No one wants these parks turned into these artificial museum gardens except the NAP people themselves. Twin Peaks is sprayed with poisons every four months so that native plants can grow. More people that I speak to are for ending the NAP domination of our so-called "natural areas." [Kessler-1-09] [Kessler-2-09]

### Response G-3

One of the comments asserts that SFRPD is violating CEQA by implementing elements of the 2006 SNRAMP before environmental review has been completed for the 2006 SNRAMP. Other comments question the scope of the parkland improvements under the management of the SFRPD. Another comment states that the NAP harms the environment, that previous restoration efforts have not been successful, and questions whether native plants are sustainable.

### *Compliance with CEQA*

The Natural Areas Program is currently operating under the 1995 Management Plan and any actions the Natural Areas Program is currently undertaking is either a separate project, such as the 2008 and 2012 Clean and Safe Neighborhoods Park Bond or the Glen Canyon Trail Restoration Project, or under the authorization of the 1995 Management Plan. The 2008 Clean and Safe Neighborhoods Parks Bond and the Glen Canyon Trail Restoration Project referenced in the comment above is separate and independent of the 2006 SNRAMP, and underwent separate CEQA analyses as described below. All current actions are currently authorized by the 1995 Management Plan or separate environmental review. The proposed SNRAMP would provide a comprehensive program for the ongoing management and stewardship of Natural Areas, building upon the conceptual framework outlined in the 1995 Management Plan.

### *Previous Actions of the Natural Areas Program*

Many of the commenters concerns relate to previous actions of the NAP, which are separate and independent from the 2006 SNRAMP. Nonetheless, a response has been provided for informational purposes. Further, as with all of the comments provided on this Draft EIR, they have been forwarded to the SFRPD staff and Commission for review and consideration.

These previous actions of the NAP, while independent of the 2006 SNRAMP, may include projects funded by the 2008 and 2012 San Francisco Clean and Safe Neighborhoods Bond. The 2008 General Obligation Bond (2008 Clean and Safe Neighborhoods Parks Bond) underwent CEQA review as part of Planning Department Case File No. 2007.1013E. The 2012 General Obligation Bond (2012 Clean and Safe Neighborhoods Parks Bond) underwent CEQA review as part of Case File No. 2011.1359E. The Glen Canyon Trail Restoration Project, referenced in the comment above was largely funded from the 2008 Clean and Safe Neighborhood Parks Bond, which underwent CEQA review under Planning Department Case File Nos 2007.1247E and 2010.0870E.

The 2008 Clean and Safe Neighborhood Parks Bond was a general obligation bond for improvements to parks owned and/or operated by the SFRPD and the Port of San Francisco. The 2012 San Francisco Clean and Safe Neighborhood Parks Bond, which is also a general obligation bond, would build on that precedent by delivering voter-approved parks and open-space recreation projects owned and/or operated by SFRPD or the Port of San Francisco. The projects identified in the 2008 and 2012 Clean and Safe Neighborhood Parks Bond are separate and independent from the SNRAMP; however, in the case of the 2012 Clean and Safe Neighborhood Parks Bond, some of the bond money is set aside for Citywide Parks improvements, which includes improvements to Golden Gate Park, McLaren Park, and Lake Merced Park. It is possible that some of these monies could be used for management actions and improvements proposed under the SNRAMP, but no physical improvements could be accomplished unless and until this EIR is certified by the Planning Commission.

The Glen Canyon Restoration Project, which is now substantially complete, repaired existing trails and steps, provided fencing for public safety, protected sensitive habitat areas, provided erosion control measures, restored native plants, and provided wayfinding signage. The existing trails were in poor condition and in need of restoration. The Glen Canyon Restoration Project improved safety, repaired retaining edges, addressed seeps and wet areas to improve pedestrian access, addressed invasive plant and hazardous tree removal, and enhanced the trail experience in Glen Canyon Park by retaining the rustic quality of the trail.[17] The Planning Department's Office of Environmental Review completed its environmental review and the project received a categorical exemption under CEQA State Guidelines (Case no. 2010.0870E, 9/29/10, after which time conceptual design for this project was approved by the Recreation & Park Commission in August 2011).

### *2006 SNRAMP and Sharp Park Restoration Development Process*

In response to a commenter's request that the EIR contain a description of the process that led to the design of the Sharp Park Restoration, the development of the SNRAMP occurred over almost 10 years, beginning in 1995 and initially culminating in the 2005 Draft SNRAMP. Development of the 2005 Draft SNRAMP consisted of numerous and extensive meetings with involvement of over 3,000 individuals. In June 2005, when the Draft SNRAMP was released for public review, three well-attended public workshops were held throughout the city. Outreach also included sending fliers to neighborhood groups and residents within 300 feet of all Natural Areas, the Mayor's Office of Neighborhood Groups, SFRPD's list of neighborhood groups, and other interested parties. Announcements were also posted at all Natural Area sites. An online survey was available for individuals and members of the public who were unable to attend in person. Feedback was received from approximately 2,700 members of the public and recommendations were received from three independent scientists. Further, several task forces, committees, and/or working groups were convened as part of the development of the SNRAMP, including the Natural Areas Program Citizen Advisory Committee, an ad hoc group that made recommendations on how to revise the plan, a Science Round Table group that reviewed the Alternatives Report for Sharp Park, and the Sharp Park Working Group. Scientists were members of these independent working groups, providing technical expertise and functioning in a peer review capacity. All of this input was considered during preparation of the 2006 Final Draft SNRAMP (or 2006 Public Review Draft), which was circulated for public review in February 2006. For clarity, the 2005 Draft SNRAMP was subject to scientific review and the 2006 Final (or public review) Draft was subject to public review.

Revisions to the Sharp Park Restoration Plan were also made in response to input from scientists and regulatory agencies. In fact, as previously mentioned, resource agencies, including the United States Fish and Wildlife Service (USFWS), California Department of Fish and Wildlife (CDFW), and the California Coastal Commission (CCC), have reviewed and provided input on the SNRAMP, the

[17] http://sfrecpark.org/project/glen-canyon-urban-trails-project/, accessed on July 28, 2014.

Sharp Park Conceptual Restoration Alternatives Report, and, ultimately, the Draft EIR, which was first circulated for public review August 31, 2011 and again on April 27, 2012. The USFWS also prepared the Biological Opinion[18] for the Sharp Park Pumphouse Project, with many of the conditions also applying to the proposed SNRAMP activities at Laguna Salada. Further, scientists commented on both the 2005 Draft SNRAMP and the 2011 SNRAMP Draft EIR, which provided another opportunity for technical review and input.

With respect to a formal scientific review, as stated on SNRAMP p. 1-10, three independent scientific reviews of the 2005 Draft SNRAMP were conducted in August 2005. Dr. Lynn Huntsinger[19] and James W. Bartolome[20, 21] reviewed the entire 2005 Draft SNRAMP and provided a detailed report to the SFRPD. The goal of the independent review was to assess the scientific basis for the SNRAMP and evaluate the goals, issues, and recommendations. Additionally, the reviewers were asked to determine if the 2005 Draft SNRAMP was feasible to implement and if implementation of the proposed management activities would result in the desired outcome. The review reached the following overall conclusions:

- The Plan was based on sound science and was a reasonable compromise between ideals, practicality, and competing uses.
- The management goals (conservation, restoration, education, stewardship, recreation, and monitoring) are consistently addressed throughout the Plan.
- The proposed actions and monitoring seemed generally feasible.

The review suggested revisions to the recommendations dealing with management of the urban forest understory, grasslands (see GR-3 in Section 5), and butterfly host plants (see GR-10). The general recommendations referenced by these comments have been revised and updated. The review also suggested minor changes to the Monitoring protocols (Section 7), which were implemented.

---

18 Letter from Susan K. Moore, Field Supervisor, United States Fish and Wildlife Service to Jane M. Hicks, Chief, Regulatory Division, United States Army Corps of Engineers, October 2, 2012.

19 Dr. Huntsinger holds a Ph.D. in Wildland Resource Science from the University of California, Berkeley; an M.S. in Rangeland Science from the University of California, Berkeley; and a B.A. in Chinese Studies (Modern History) from the University of California, San Diego. She is currently a Professor of Rangeland Ecology and Management at the University of California, Berkeley.

20 Dr. Bartolome holds a Ph.D. in Wildlife Resource Science from the University of California, Berkeley and a B.A. in Biology from the University of California, Santa Barbara. He is currently a Professor of Graduate-level Education at the University of California, Berkeley.

21 Review: Significant Natural Resource Areas Management Plan, Lynn Huntsinger and James W. Bartolome, Submitted to the San Francisco Recreation and Parks Department, August 2005.

A second review was conducted by Roy A. Woodward, PhD.[22, 23] Dr. Woodward made comments on and suggested edits to the text, particularly as it related to the Monitoring Plan and Protocols, which were implemented, as appropriate.

A third review was conducted by Peggy Fiedler, PhD.[24, 25] Dr. Fiedler concluded that the Plan in general succeeded in its goals and "strikes a balance between natural resource protection and the needs of citizens in a highly urbanized, densely populated, highly ethnically diverse, overall well-educated area." Dr. Fiedler made many comments regarding clarity, content, organization, editing, format, and consistency. To the extent possible, these clarity and organizational comments, as well as her specific technical comments, were incorporated.

Ultimately, all of the input from both scientists and regulatory agencies was considered and implemented, as appropriate, in the 2006 Final Draft SNRAMP, which was circulated for public review in February 2006.

### *Continued Access to Local Open Space and Recreational Areas*

There is significant parkland and recreation and open space areas within the city, estimated as upwards of 5,800 acres, both under the control of the SFRPD, as well as under the control of other public entities, such as the Port of San Francisco, federal government (e.g., Presidio Trust or Golden Gate National Recreation Area), SFPUC, and University of California San Francisco (UCSF). SFRPD maintains 4,113 acres of total recreation and open space areas and within this total acreage, the Natural Areas comprise about 1,107 acres. Refer also to Response PD-6, RTC p. 4-145, Response G-5, RTC p. 4-31, and Response RE-8, RTC p. 4-324, for a further discussion of potential impacts associated with access restrictions.

### *Native Plants and Plant Removal*

With respect to the sustainability of native plants, refer to Response G-2, RTC p. 4-15, and Response PD-11, RTC p. 4-159, for a discussion of the City's policy guidance that supports the protection and maintenance of biodiversity within the City's Natural Areas, including guidance

---

22 Dr. Woodward, Ph.D., CPESC, works with the California Department of Parks and Recreation in Sacramento, CA.

23 Hand edits to 2005 SNRAMP text from Dr. Roy A. Woodward, Ph.D., Senior Environmental Scientist, Natural Resources Division, State of California, Department of Parks and Recreation, no date.

24 Dr. Fiedler earned her B.A. from Harvard University and her Ph.D. from the University of California, Berkeley. She then joined the faculty at San Francisco State University (SFSU) where she was promoted to full Professor in 1997. While at SFSU she initiated the first Conservation Biology master's degree program of its kind in the United States. In 2000, Dr. Fiedler left SFSU to work as an environmental consultant in rare plant protection and ecosystem restoration.

25 Peer review of the Public Draft Significant Natural Resource Areas Management Plan, June 2005, Peggy L. Fieldler, Ph.D., Senior Scientist II/Associate, BBL Ecosystem Science and Restoration Services to Ms. Lisa Wayne, San Francisco Recreation and Parks, September 29, 2005.

provided in the City's *Sustainability Plan*[26] regarding the protection of Natural Areas in San Francisco. Refer also to Response BI-36, RTC p. 4-470, for a discussion of the temporary intervention and maintenance activities that are required for native species to become established.

One of the commenters questions whether the NAP is harming the environment by removing established trees, habitats, and ecosystems and also questions whether the removal of grasses would cause harm to species that use grassland as its habitat. Refer to Response BI-13, RTC p. 4-397, and Response BI-31, RTC p. 4-439, for a discussion of the impacts of removing vegetation, including impacts to common species, and refer to Response BI-15, RTC p. 4-402, for a discussion of the impacts of retaining nonnative vegetation and the relative benefits of removing nonnative vegetation.

### *Breeding and Nesting Season*

With regard to the commenter's reference to activities at Glen Canyon Park, prior to undertaking the project in Glen Canyon Park in 2011-2012 that is referenced in the above comments, NAP staff conducted a breeding bird survey pursuant to the requirements of the MBTA and found no nesting birds in the area.

With respect to the commenter's concerns about when activities proposed under the SNRAMP would occur relative to the breeding and nesting season, the section on *Invasive Vegetation Removal* provided under Impact BI-2 on Draft EIR pp. 304 and 305 notes that "vegetation management activities would be conducted outside the breeding season for bird species (February 1 through August 31, as designated by CDFW), unless these activities had already begun before the breeding season and had already removed nesting habitat, or if a breeding bird survey was conducted prior to vegetation removal activities and had determined that no nesting birds were present". Other impacts on sensitive species resulting from implementation of the programmatic projects, as well as the proposed maintenance activities and the Sharp Park Restoration Project, are comprehensively analyzed in Impacts BI-2 through BI-6 provided on Draft EIR pp. 306 through 330, concluding, in all cases, that impacts would be reduced to a less-than-significant level with the implementation of the identified mitigation measures.

**Comment G-4 Financial considerations for implementation of SNRAMP**

The response to Comment G-4 addresses all or part of the following individual comments:

| | | |
|---|---|---|
| GGAS-1-11 | MPIC-1-14 | MPIC-2-06 |
| WTPCC-1-14 | Art-1-06 | Bartley-1-04 |
| Blum-1-03 | Bowman-1-10 | Cook-1-07 |
| Delacroix-1-06 | Fitzer-1-04 | Fox-1-06 |
| Freedman-1-02 | Gomez-1-04 | Hess-1-07 |
| Johns-1-08 | Jungreis-1-07 | Lorenz-1-02 |
| Ray-1-06 | Rehling-1-03 | Risk-1-06 |
| Schlund-1-04 | Shepard-A-1-03 | Valente-1-10 |
| Wade-1-03 | | |

- Overall, Golden Gate Audubon endorses the Monitoring Program as written, but is concerned that the DEIR does not commit the City to fully executing or funding the Monitoring Program. (DEIR, at 94-95) Golden Gate Audubon strongly recommends that this section be improved to identify funding sources and state an affirmative commitment that monitoring will be conducted and that findings will be made available to the public (via reports or other means of sharing data) in a timely manner. This is of particular importance for the monitoring of special status species. [GGAS-1-11]

- Economic Factors. The DEIR lacks any cost estimate for implementing the SNRAMP and has no information about how it will be funded. It also does not address the potential impact of shifting resources such as park bond funds away from recreation and park maintenance/improvements to complete the SNRAMP. The substantial cost of removing the trees from Mt. Davidson will divert significant resources from providing what the MPIC considers a higher priority for resource use: basic maintenance of Mt. Davidson Park including litter and graffiti removal, forest and trail maintenance, and installation of benches and trail direction signage. [MPIC-1-14]

- The DEIR does not address the economic impact of the significant financial resources that would be diverted from SF Park and Recreation services to implement SNRAMP. There is no cost estimate for implementing the SNRAMP and no information about how it will be funded. It also does not address the potential impact of shifting resources, such as park bond funds, away from recreation and park maintenance and improvements in order to complete the SNRAMP. The substantial cost of removing the trees from Mt. Davidson will divert significant resources from providing what the MPIC considers a higher priority for resource use: basic maintenance of Mt. Davidson Park, including litter and graffiti removal, forest and trail upkeep, and installation of benches and trail direction signage. Ongoing costs for herbicide spraying, erosion control, replanting, and fencing are also not addressed. [MPIC-2-06]

- There are many tree maintenance issues around the City that need attention. The NAP funds would be put to much better use:

  1) getting the ivy out of all trees, as it will eventually strangle and kill all growth on the tree.

2) removing the fusarium from our remaining pine trees between November and February so that the pitch pine cankor and the bark beetle do not spread. If the pines are fed with deep root fertilizer and the yellowing needles are removed, the pines will be much healthier and have longer lives.

3) planting many more big beautiful trees that do well in our microclimate. [WTPCC-1-14]

- As SF's population continues to grow and more large housing developments are planned, demand for recreation and relaxing in our parks increases. The Natural Areas Program fences off the areas that they first denude then plant with insignificant / tiny dune plants to create their plant museums. Spending tax dollars to take away recreation areas from residents is outrageous. I want more Rec and Park gardeners hired and less staff positions paid to the Natural Areas Program, who are intent on removing the lush vegetation that I enjoy in our parks. [Art-1-06] [Cook-1-07] [Delacroix-1-06] [Fox-1-06] [Jungreis-1-07] [Ray-1-06]
- Considering long term costs and the current budget: Today San Francisco, like all U.S. municipalities, is suffering from the effects of a national recession. This will not likely be the case in five or ten years but maximizing the efficiency of available staff should always be a goal of long term planning. One way to maximize that efficiency is through a reduction of long term maintenance burden. Trees in a city require professional arborists for safety reasons and are much more expensive to maintain than grasslands or coastal chaparral in the long term. Most local native plants, once well established, require less or no irrigation and little or at least less maintenance. As has been demonstrated motivated volunteers can make a huge, cost-effective, difference on small scale restorations using simple tools. [Bartley-1-04]
- Some of the unresolved conflicts surrounding Sharp Park include:
  - > failure of RPD to deal with the financial losses of Sharp Park Golf Course which are being underwritten by San Francisco taxpayers even as San Mateo County has offered to help manage the Golf Course and take on certain responsibilities to alleviate the situation.
  - > improper redirection of limited RPD financial resources from San Francisco located RPD parks to shore up the losses of Sharp Park, in San Mateo County.
  - > Failure by RPD to implement sound financial restraint and management practices at Sharp Park in a way that makes it financially self-sustainable.
  - > Potential mis-management of taxpayer funds by taking funds from one RPD account, redirecting it to the Sharp Park Golf Course, and not reimbursing the original RPD account.
  - > Failure to consider the increased maintenance costs it will take to stave off sea rise which will further damage the park and the endangered species and who will pay for the increased maintenance cost
  - > Failure to ascertain if the citizens and taxpayers of San Francisco are willing to allow RPD to continue to redirect limited funds to continue to underwrite a failed San Mateo golf

experience at the cost of shortchanging San Francisco City parks even further than they are today. [Blum-1-03]

- In addition, the NAP is not free. Just removing and replanting some 15,000 trees in Sharp Park has to be a significant cost and yet no financial information is provided. I am personally quite appalled that large amounts of time and money are spent on removing healthy trees and vegetation when toilets are non-existent (e.g. Stern Grove) or badly maintained (e.g. Lake Merced), and the city is cutting other critical services. No plan should be complete without a financial analysis to evaluate the opportunity costs. [Bowman-1-10]
- For 10 years now, GGNRA has acted unilaterally and spent millions of dollars on a misguided plan that will require millions of dollars through the hiring of park rangers and police. I, for one, think this money would be more wisely spent on our schools. [Fitzer-1-04]
- Has the City no better use for taxpayer dollars during tough times than cutting down perfectly healthy trees to take us back to 1776? [Freedman-1-02]
- 3. Cost

  It is difficult to understand the logic of this reality: Throughout our City, young trees are being planted by our City workers in median strips, etc. as part of beautifying San Francisco. At the same time, plans are underway to remove thousands of healthy full grown trees in our parks. How does this make fiscal sense, especially during our current economic climate? City Departments are

  > Consider the cost of implementing this extensive tree removal plan during this time of fiscal crisis. This is not a prudent use of taxpayer funds. [Gomez-1-04]
- (7) Per the SF Forest Alliance taxpayer funds will be diverted to pay for this destruction and blight. [Hess-1-07]
- I would also like to know where the $$ is going to come from. The Parks budget is already stretched and our parks are suffering as a result. So the city wants to divert more funds from that budget to rip out “non-native” flora? Honestly, this “non-native” flora has been here for over 100 years - I am really not sure it’s so “non-native” now and it is a great improvement over sand dunes. Does the NAP extend to ripping out everything in Golden Gate Park as well and turning that beautiful stretch of land back into its “native” state? That would be sand dunes again.

  I will do everything I can to defeat this plan. [Johns-1-08]
- I also am quite concerned that limited city finances are being used for these type of obituary projects, and a financial analysis hasn’t been completed to understand the cost of the programs. [Lorenz-1-02]
- Thanks for listening. I am copying the mayor and the supervisor for this district on this message, so that they also will be aware of my concerns. Although the supervisor has been quoted in the SF Chronicle as dismissing the concerns of citizens such as me for being so much “rhetoric” and implying exaggeration, the fact is that approval of the EIR as it stands would privilege NAP to execute its misguided plan as it saw fit and on its own discretionary

time frame. That seems reason enough to me to sound an alarm. Of course, the huge cost of NAP's plans at a time when the budget should be managed most carefully also is a real shame. [Rehling-1-03]

- * The DEIR does not include any cost estimate for implementing the SNRAMP and does not explain how it will be funded. We object to spending scarce park funds on the Natural Areas Program when other essential services are being cut, Recreation Directors have been laid off, and fees are being charged for use of formerly free Park facilities. [Risk-1-06]
- The NAP program will produce an ongoing maintenance burden - since the pre-existing native species were displaced by the current non-natives, it seems logical that once planted native species will once again be displaced in a matter of time unless ongoing maintenance is applied. Maintenance = dollars last time I checked. Is this a good use of our limited funds? [Schlund-1-04]
- Bathrooms at playgrounds throughout the city are in pitiful condition. No human wants to go into these horrible pits, but RPD spends money on developing a NAP plan. NAP has been working on this plan for many years instead of providing the services that citizens want.

  And how is it that NAP is exempt from the standards established by Proposition C that apply to all other parks?

  One more thing needs mention. The idea of a city department taking so long to come up with a plan for what it is to do is completely absurd. NAP has been a major section of RPD since 1997. How much money should we spend developing a plan that provides so little return? And how long can we afford to keep the section of a city department functioning without a plan? [Shepard-A-1-03]
- NAP siphons funds from legitimate park purposes. NAP is exorbitantly expensive. At a time when SFRPD is not fulfilling its mandate to repair, maintain and improve existing park facilities, it is poor planning to incur even greater financial responsibility by undertaking the creation of Natural Areas within the parks. These areas are expensive to create and their maintenance is labor intensive and thus expensive to maintain. When children still are forced to play on fields so riddled with gopher holes that they risk serious injury, play in recreational centers that are severely in need of repair, and utilize bathrooms that are so unclean they present a health hazard, serious discussion of this NAP becomes ludicrous. [Valente-1-10]
- Finally, the cost of the proposed NAP Plan tree removals must be considered in relation to implementing this plan. San Francisco's park trees need serious attention and many older ones do need to be removed because they are dangerous. However, the Recreation and Park Department has almost no funding for this critical task. We cannot afford to maintain even the most hazardous trees in the most visited areas of popular parks; how can we possibly justify prioritizing the removal of perfectly healthy trees, all at huge financial and environmental cost to our City? [Wade-1-03]

## Response G-4

These comments express concern regarding the funding sources and cost for implementation of the SNRAMP. Some comments suggest that implementing the SNRAMP would result in the reallocation of SFRPD resources, specifically maintenance resources, in order to fund the actions proposed in the SNRAMP. Comment GGAS-1-11 expresses concern that the SNRAMP does not commit the City to execute or fund the SNRAMP's proposed Monitoring Program.

CEQA does not require that an EIR include a detailed financial analysis of the proposed project. CEQA does require that an EIR include a detailed statement setting forth all the significant effects on the environment of a proposed project (California PRC Section 21100 (b)(1)). Additionally, CEQA defines the "environment" as the physical conditions that exist within the area that would be affected by a proposed project, including: land, air, water, minerals, flora, fauna, noise, and objects of historic or aesthetic significance (California PRC Section 21060.5). CEQA Guidelines Section 15064(e) discusses the treatment of social and economic impacts under CEQA. In short, the social and economic effects of a proposed project are only considered significant if there are associated physical effects on the environment.

As described on Draft EIR p. 89, the NAP staff is composed of biologists, ecologists, and natural resource managers that conduct routine maintenance within the Natural Areas on a daily basis. The NAP staff of approximately ten gardeners would continue to conduct the management actions within Natural Areas. The NAP also utilizes volunteer groups that range in size from 10 to 50 people per activity, but there are thousands of volunteer hours spent on an annual basis in the Natural Areas. Therefore, it is not anticipated that routine maintenance activities, which are substantially similar to current activities, would result in a need for SFRPD to hire additional staff. Also discussed on Draft EIR p. 89, larger projects, identified as programmatic projects in the Draft EIR, would be implemented by the SFRPD's Capital Division.

Some comments suggest that implementation of the SNRAMP would result in a reallocation of resources away from park maintenance standards that are imposed by Proposition C. The commenter is correct in that the Natural Areas are not subject to the maintenance standards imposed by Proposition C. However, while funding of programmatic projects identified in the SNRAMP would be required for implementation, it is speculative to assume that funding of the proposed SNRAMP would result in the reallocation of resources required for other park maintenance or improvements, which could in turn result in a significant adverse physical impact on the environment. As stated in CEQA Guidelines Section 15064(d)(3), "[a]n indirect physical change is to be considered only if that change is a reasonably foreseeable impact which may be caused by the project. A change which is speculative or unlikely to occur is not reasonably foreseeable." Comments about the relative economic merits of the proposed project will be considered by the decision makers as part of their decision to approve, modify, or disapprove the

proposed project. That consideration is carried out independent of the environmental review process.

With respect to concerns regarding the implementation of the SNRAMP's proposed Monitoring Plan, the Monitoring Plan has been proposed by SFRPD in their proposal for management of the Natural Areas and is included in the project description, as discussed on Draft EIR pp. 94 to 96. Given the nature of the proposed project and the goals identified in the SNRAMP, which specifically include those related to monitoring of the Natural Areas (refer to Draft EIR pp. 85 to 87), it would be speculative to assume that SFRPD would not carry out the project as proposed. As stated on SNRAMP p. 7-4, the monitoring "protocols have been designed and adapted to provide critical information using methods that are easily repeatable by SFRPD personnel and volunteers." SNRAMP Appendix I describes the monitoring protocol, which includes mapping, data collection, and data recording and analysis. Furthermore, decision makers would consider the financial implication of the proposed project and the environmental impacts of the project in its decision to approve or disapprove the SNRAMP.

It is noted that the Monitoring Plan proposed in the SNRAMP is different from a Mitigation and Monitoring Reporting Program (MMRP) required by CEQA. CEQA requires that an EIR identify feasible mitigation measures which could minimize significant adverse impacts of a proposed project (CEQA Guidelines Section 15126.4(a)(1)) and that a public agency adopt a program for monitoring or reporting on the measures it has imposed to mitigate or avoid significant environmental effects (CEQA Guidelines Section 15097). Should decision makers choose to carry out the proposed project, they would adopt a MMRP, committing the SFRPD to implement the mitigation measures identified in the EIR that were found to be feasible.

| **Comment G-5** | **Impacts of Natural Areas access restrictions on social fabric of San Francisco** |
|---|---|

The response to Comment G-5 addresses all or part of the following individual comments:

Bartolotta-1-16 Bowman-2-11 Jake-1-06
Litehiser-1-04

- The NAP EIR does not adequately consider the impacts on the social fabric of San Francisco if one-quarter of its city parklands are closed to residents. Natural areas are not generally accessible to people, whether they have a dog or not. The NAP plan calls for the closure of many trails and reduction of recreational access. You cannot play catch with your child, have a picnic lunch, or play with a dog in a natural area. It can only be a plant museum. The EIR does not adequately consider the significant impact on families and the sense of shared community that access to parks fosters in our urban setting. [Bartolotta-1-16]
- 2. Evaluate the environmental impacts on public health related to discouraging daily exercise and recreation and on the changes to air quality for those exercising in the parks.

The DEIR does not specifically address the public health implications of policies that discourage exercise and diminish mental health benefits of the Natural Areas. In addition, trees benefit air quality and the plan does not address the impact of the removal of trees on air quality for those exercising or using the parks. The environmental impact on public health is significantly degraded by the SNRAMP proposed plan and the policies implemented by the Natural Areas Program since the creation of the SNRAMP [Bowman-2-11]

- More generally, the NARMP EIR does not adequately consider the impacts on the social fabric (environment) of San Francisco if one-quarter of its city parklands are closed to residents. Since the term "crime" is not found in the EIR, it evidently does not consider the effects of closing parks on changes in the park usage including more usage for criminal behavior such as drugs, camping out, and crimes against other citizens. [Jake-1-06]
- I also want to comment on what I consider an obsessive zeal of some Natural Areas promoters to restrict use of large parts of our parks for recreation … as well as the removal of plants, habitat and trees to "restore" the park lands to some sort of "pristine wilderness" dating back hundreds of years. We need to look first at the needs of our citizens to enjoy the outdoors in their local parks and have as much access to them as possible. Plans that restrict "people" use of the parks is going in the wrong direction. I am also concerned about the use of pesticides use on attempts to eradicate invasive species in areas where people ad pets may be exposed.

  I think my husband put it best, "a native plant is just an invasive species that got there first." We have to be sensible about how we use our open space. Urban parks need to serve their populations first. [Litehiser-1-04]

## Response G-5

These comments express concern that the SNRAMP would prohibit access to the Natural Areas, resulting in secondary social impacts on society including increased rate of crime and air quality and public health effects. Comments concerning the use of pesticides are directed to Response HZ-1, RTC p. 4-531, and comments concerning the air quality impacts of tree removal are directed to Response AQ-1, RTC p. 4-283.

The proposed project does not involve closing parks or reducing access to Natural Areas, but instead focuses on enhancing the remnant native communities within the Natural Areas. The impacts of trail closure on recreation and access is addressed under Impact RE-1 on Draft EIR p. 256. As discussed on Draft EIR p. 256, the SNRAMP calls for closing about 10.3 miles of social trails and creating about 1.1 miles of new trails. Social trails are defined as undesignated and redundant pathways that have developed through use of a Natural Area, and they are not maintained by the SFRPD. The SFRPD determined that social trails require closure because they are considered unsafe, to protect sensitive species or habitat, or to prevent erosion (Draft EIR p. 256). However, Natural Areas would remain open to the public and designated trail access would continue to be provided in all Natural Areas and, in some areas, existing trails would be improved and additional trails

would be created. On p. 256, the Draft EIR concludes that "[i]t is unlikely that closing social trails, redundant trails, or trails near sensitive species or habitat would deter a substantial number of people from using Natural Areas … because general access would remain unimpeded and may improve through the creation of new trails and improving existing trails." Furthermore, the recreation goals of the SNRAMP, as identified on Draft EIR p. 86, include providing opportunities for passive recreation, such as hiking and nature observation and development of a recreation trail system that provides the greatest amount of accessibility while protecting natural resources. Given that trail access within all Natural Areas would continue to be provided, it would be speculative to conclude that removal of social or redundant trails could result in the secondary social impacts suggested by the commenters. Furthermore, CEQA Guidelines Section 15064(e) discusses the treatment of social and economic impacts under CEQA. Social and economic effects under CEQA are only considered significant if they result in a significant physical environmental effect. The commenters have provided no evidence that any potential social effect resulting from implementation of the SNRAMP would have a significant physical impact on the environment.

One commenter reflected that "a native plant is just an invasive species that got there first." Throughout time, humans have moved plants and animals around the globe, out of the environments they evolved in. Some species were introduced intentionally, and others were introduced unintentionally. A portion of those species—invasive species—are capable of spreading rapidly and displacing native species generally because they are adapted to similar climatic conditions, they lack predators or pests, and/or they have other characteristics that have allowed them to thrive. If left alone, Natural Areas would contain only a handful of native plants, and the animals that rely on a diversity of flora could become extinct.[27] In fact, the California Invasive Plant Council states that:

> "When plants that evolved in one region of the globe are moved by humans to another region, a few of them flourish, crowding out native vegetation and the wildlife that feeds on it. Some invasives can even change ecosystem processes such as hydrology, fire regimes, and soil chemistry. These invasive plants have a competitive advantage because they are no longer controlled by their natural predators, and can quickly spread out of control. In California, approximately 3% of the plant species growing in the wild are considered invasive, but they inhabit a much greater proportion of the landscape."[28]

**Comment G-6 Impacts on Natural Areas from poor maintenance**

The response to Comment G-6 addresses all or part of the following individual comments:

| | | |
|---|---|---|
| DogPACSF-1-20 | GGHNA-1-05 | SFDOG-2-21 |
| Brown-1-17 | Carrington-1-03 | |

[27] http://sfrecpark.org/parks-open-spaces/natural-areas-program/natural-areas-faqs/, accessed on August 6, 2014.

[28] http://www.cal-ipc.org/ip/definitions/index.php, accessed on August 7, 2014.

- The NAP EIR does not adequately consider the negative impacts on aesthetics and land use of poor maintenance in natural areas. In most parks, the NAP plan allocates fewer than 20 days/year for planting/maintenance of the natural areas. In 16 of the 32 natural areas, the total maintenance planned is 10 or fewer days each year. There are countless stories of volunteers who have spent long hours planting native plants in NAP areas, only to see absolutely no maintenance performed once the plants are there. Without maintenance, the plants die, creating unsightly vistas of dead and dying plants. The NAP EIR should have considered the impacts of scaling back the program to a few areas that can be well maintained, as opposed to the current plans to take over one-quarter of San Francisco's city parkland. The NAP plan is more ambitious in the amount of work to be done annually than NAP has demonstrated it has the capacity to actually DO on a consistent basis. [DogPACSF-1-20] [Brown-1-17]
- The analysis does not adequately address impacts from poor maintenance of NAP areas.

  The NAP program has a history of poor maintenance. One of the GGRNA Board members has testified at hearings that he and his daughter once spent a very enjoyable time planting native plants in a NAP-managed natural area. Six months later, when his daughter wanted to see how "her" plants were doing, they went to the park and discovered nothing but a bunch of dead and dying plants. There had been no maintenance done since the original planting. His daughter was devastated at the death of all the plants she had worked so hard to plant. The NAP Management Plan allocates fewer than 20 days/year for planting/maintenance of each natural area. In 16 of the 32 natural areas, the total maintenance planned is 10 or fewer days each year. A few parks are scheduled for only one work day/year. Clearly, NAP cannot maintain all the areas that it now controls. The NAP EIR must consider the impacts on aesthetics, and on the biological resources themselves of this lack of maintenance. What good does it do to plant native plants if they die within a few months because no maintenance was done? These impacts must be considered in the NAP EIR. [GGHNA-1-05]
- The NAP EIR does not adequately consider the negative impacts on aesthetics and land use of poor maintenance in natural areas. In most parks, the NAP plan allocates fewer than 20 days/year for planting/maintenance of the natural areas. In 16 of the 32 natural areas, the total maintenance planned is 10 or fewer days each year. There are countless stories of volunteers who have spent long hours planting native plants in NAP areas, only to see absolutely no maintenance performed once the plants are there. Without maintenance, the plants die, creating unsightly vistas of dead and dying plants. The NAP EIR should have considered the impacts of scaling back the program to a few areas that can be well maintained, as opposed to the current plans to take over one-quarter of San Francisco's city parkland (1/3 if you add in Sharp Park in Pacifica). The NAP plan is more ambitious in the amount of work to be done annually than NAP has demonstrated it has the capacity to actually DO on a consistent basis. This must be considered in the NAP EIR when considering aesthetics and maintenance. [SFDOG-2-21]
- Suggestions that this added burden can be addressed with added monitoring are ludicrous. As the dust and dirt swirl up just what is going to be done? Hose us all down? Rather than

propose closures and restrictions the City should step up and improve its maintenance of these areas. There seems to be a disregard for the condition of many dog parks, orphans of the City. Shame. [Carrington-1-03]

### Response G-6

These comments express concern that the NAP currently does not provide sufficient maintenance of the Natural Areas including the DPAs within those Natural Areas. Comment Carrington-1-03 suggests that rather than closing DPAs, NAP should increase maintenance activities. Other comments suggest that NAP should scale back their program to a fraction of the existing Natural Areas.

In terms of maintenance, as described on Draft EIR p. 89, the NAP staff is composed of biologists, ecologists, and natural resource managers that conduct routine maintenance within the Natural Areas on a daily basis. The NAP staff of approximately 10 gardeners conducts management actions within the Natural Areas, and the NAP also uses volunteer groups that range in size from 10 to 50 people. The current levels of funding do not allow the SFRPD to employ additional maintenance staff; however, with the collaboration of SFRPD employees and volunteers, the Natural Areas are maintained to allow positive recreational experiences while enhancing natural habitats.

With respect to comments regarding closure of DPAs, the SNRAMP proposes the closure of only one DPA, located at Lake Merced. As described in Draft EIR Chapter III, Project Description, p. 136, this DPA is proposed for closure not because of poor maintenance, but rather to avoid disturbance to breeding birds. Although the SNRAMP proposes reducing the size of two other DPAs, no DPAs, other than the Lake Merced DPA, are proposed for closure at this time.

The SNRAMP does not propose to add new Natural Areas to its program, but rather outlines management activities within existing Natural Areas. The management actions of the SNRAMP are evaluated against the existing management actions as identified in the 1995 Management Plan and considering the existing physical conditions at the time of the Notice of Preparation of the EIR. Similar to the proposed project, the 1995 Management Plan outlines measures to maintain and enhance vegetation, wildlife, water quality, and control of erosion. The proposed SNRAMP, however, includes additional monitoring goals as well as design and aesthetic goals (Draft EIR pp. 86 to 87). The SNRAMP also includes a monitoring program to assess the success of restoration projects in achieving conservation and restoration goals, and proposes to employ an adaptive management approach in achieving those goals (Draft EIR pp. 90 and 94 to 96). It is reasonable to expect that with implementation of the identified monitoring plan, the survival and maintenance of newly planted vegetation would increase compared to existing conditions. Some successful restoration efforts include those implemented at Glen Canyon and Islais Creek, the oak woodlands at Golden Gate Park, Beacon Street at Billy Goat Hills, and Grandview Park, but there are others, as well.

The Draft EIR analyzes the environmental impacts of the proposed SNRAMP on aesthetic resources on Draft EIR pp. 189 to 199. With respect to scenic resources, the Draft EIR concludes that where nonnative vegetation is replaced with native vegetation that is more appropriate for the area's precipitation pattern, water availability, animal populations, and local ecosystems, new vegetation would be expected to thrive more successfully than invasive vegetation. The Draft EIR goes on to conclude that due to the relatively short maturation time, projects that involve the removal of trees and other vegetation with shrub, brush and grass cover would result in less-than-significant impacts to scenic resources. The Draft EIR also concludes that removal of nonnative trees and replacement with native trees would not be expected to result in a demonstrable adverse change to scenic resources (Draft EIR p. 195).

With respect to comments that suggest the scope of the SNRAMP should decrease in size, the purpose of this EIR is to evaluate the impacts of the project, as proposed by the project sponsor, as compared to baseline conditions. While an EIR can identify feasible mitigation measures that could minimize significant adverse impacts or identify alternatives that would feasibly attain most of the basic objectives of the project, but would avoid or substantially lessen any of the significant effects of the project, the purpose of this EIR is not to recommend a different project. However, the impacts of a reduced project were evaluated in RTC Section 4.E, Alternatives, and specifically Response AL–13, p. 4-606. An alternative that would result in removal of Natural Areas from the NAP would not meet the mission of the NAP, which is to "preserve, restore and enhance the remnant Natural Areas and to promote environmental stewardship of these areas" (Draft EIR p. 77). Such an alternative would also not meet the following primary CEQA project objective:

- To identify, prioritize, and implement restoration and management actions designed to promote the functioning of San Francisco's native ecosystem, including the maintenance and enhancement of native biodiversity.

Any alternative that would substantially reduce the scope of the Natural Areas would not meet the basic CEQA project objective, and it is unclear, which if any, significant environmental effects such an alternative would reduce or eliminate.

### Comment G-7 Prohibition on use of artificial turf

The response to Comment G-7 addresses all or part of the following individual comment:

Bartley-1-11

- Replacing natural play field areas with artificial turf is neither good for nature or humans. It has been clearly demonstrated that the long term impacts are overwhelmingly negative economically and environmentally. I don't at all understand why the city is still considering this. [Bartley-1-11]

### Response G-7

This comment expresses the view that replacing natural play field areas with artificial turf is neither good for nature nor humans.

The SNRAMP does not propose the conversion of grass fields to artificial turf.

| **Comment G-8** | **Co-existence of sensitive species and golf** |
|---|---|

The response to Comment G-8 addresses all or part of the following individual comments:

Archer-1-01 Mansbach-1-02 PH-Harris-01
PH-Links-02

- Many, many people LOVE Sharp Park Golf Course. We love golf, and we love that we are able to play this excellent public course. We don't think that there must be golf or animals, rather a partnership that makes everyone and every creature happy. It is possible to maintain and care for the wonderful Sharp Park Golf Course without doing away with the animals who also reside there. As I understand it, the animals did not come to live at Sharp Park until there was Sharp Park. [Archer-1-01]
- I am aware that the continued existence of Sharp Park as a golf course faces opposition. I really don't understand why as the golf course and the wildlife can and do coexist. Certainly my planning background influences my thinking that competing land uses for a specific property can be amicably accommodated. [Mansbach-1-02]
- Generally the notion of sharing the property between species and golfers, uhm, we support that. [PH-Harris-01]
- And the habitat restoration that's in the works in the subject of this EIR is by no means incompatible with maintaining that golf course. [PH-Links-02]

### Response G-8

These comments express the view that habitat, wildlife and golf can co-exist and are not incompatible. The comments do not relate to the adequacy or accuracy of the analysis contained in the Draft EIR. Comments concerning Sharp Park are also directed to Response PD-13, RTC p. 4-175.

## 4.A.2 CEQA Process

| **Comment G-9** | **Need for a recirculated or subsequent project-specific Draft EIR** |
|---|---|

The response to Comment G-9 addresses all or part of the following individual comments:

Baye-1-07 McAllister-1-02

- **4. Summary of CEQA deficiencies and recommendations for remedies.**

  The City should either recirculate the DEIR to address these issues, or it should prepare a subsequent project-specific DEIR for Sharp Park. I recommend as the most expedient and

efficient CEQA process the separation of the stand-alone Sharp Park project DEIR from an otherwise consistent programmatic DEIR. [Baye-1-07]

- I respectfully request that the document be corrected and recirculated with the correction of the error prominently displayed to readers. When the document has been corrected and recirculated, a new comment period should be announced of equal length to that first announced. [McAllister-1-02]

### Response G-9

These comments request that either the Draft EIR should be recirculated or a subsequent project-specific Draft EIR should be prepared for Sharp Park to address the issues they raised in their comment letter, which include issues related to the conversion of wetlands to uplands for golf course purposes, mitigation for wetlands impacts, an alternative to dredging, impacts associated with dewatering, sediment testing data, impacts associated with acid soil sulfate conditions, and cumulative impacts associated with dredging, salinity stratification, seawater intrusion, and sea level rise. This commenter also requests that a Sharp Park Draft EIR be provided separately from the rest of the programmatic SNRAMP analysis. The error mentioned in the second comment (McAllister-1-02) relates to the fact that Draft EIR p. 2 incorrectly identified the environmentally superior alternative, although it was correctly identified beginning on Draft EIR p. 525.

The second comment appears to request recirculation due to an error in the summary chapter that identified the maximum restoration alternative as the environmentally superior alternative, which is contrary to the discussion in the Alternatives chapter, which states that the maintenance alternative is the environmental superior alternative. This error is being corrected as a text change, which is provide in Response AL-4, RTC p. 4-566, and Response G-10, RTC p. 4-50.

With respect to recirculation, CEQA Guidelines Section 15088.5 states that recirculation of an EIR prior to certification is only required when significant new information is added to the EIR after public notice is given of the availability of the Draft EIR for public review. New information added to an EIR is not significant unless the EIR is changed in a way that deprives the public of a meaningful opportunity to comment upon a substantial adverse environmental effect of the project or a feasible way to mitigate or avoid such an effect. Significant new information can include (1) a new significant environmental impact; (2) a substantial increase in the severity of an environmental impact; (3) a feasible project alternative or mitigation measure, considerably different from others previously analyzed that would clearly lessen the significant environmental impacts of the project, but the project proponents decline to adopt it; or (4) the Draft EIR was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded.

Based on the comments received and the responses provided in this RTC document, there are no new significant impacts, substantial increases in the severity of an environmental impact, or identification of new alternatives or mitigation measures that are considerably different from those

previously analyzed (including those considered and fully evaluated in the EIR, rejected as infeasible pursuant to CEQA, or rejected from further analysis due to engineering, design, technological, or cost considerations). Further, as demonstrated in this RTC document, none of the comments received provide substantial evidence that the Draft EIR was fundamentally and basically inadequate, nor was meaningful public review and comment precluded. In fact, two separate comment periods were provided. Public agencies, organizations, and individuals were invited to provide written comments (letters, emails, and facsimiles) on the Draft EIR during the first public review comment period, which opened on August 31, 2011, and ended on October 31, 2011. In addition, the Planning Commission held a public hearing on the Draft EIR on October 6, 2011, and Commissioners, organizations, and individuals made oral comments at that hearing. A second public review comment period, for written comments, was provided from April 27, 2012, to June 11, 2012. A Public Notice of the additional comment period was sent to over 300 neighborhood organizations and individuals through direct mailing and was also posted in the following locations: SFRPD's McLaren Lodge, the Planning Department, and the San Francisco County Clerk's office. In total, the two public comment periods were open for 107 days, exceeding the 45-day public review period required by CEQA.

With respect to subsequent project-specific review for the Sharp Park restoration project, and consistent with CEQA Guidelines Section 15162, a Subsequent EIR can only be prepared after an EIR has been certified and only when one or more of the following conditions occur: (1) substantial changes are proposed in the project that require major revisions of the previous EIR due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects; (2) substantial changes occur with respect to the circumstances under which the project is undertaken that would require major revisions of the previous EIR due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects; or (3) new information of substantial importance, which was not known and could not have been known with the exercise of reasonable diligence at the time the previous EIR was certified as complete or the negative declaration was adopted. None of these three circumstances has occurred with respect to the SNRAMP Draft EIR; therefore, a Subsequent EIR is not required.

Also, with respect to whether the restoration activities at Sharp Park should be evaluated in a stand-alone EIR, refer to Response PD-12, RTC p. 4-168.

Lastly, issues raised by the first commenter, beyond the request to recirculate the document or prepare a subsequent project-specific DEIR for Sharp Park, are provided in Response BI-25, RTC p. 4-424, Response BI-7, RTC p. 4-365, Response HY-5, RTC p. 4-501, and Response AL-11, RTC p. 4-600.

**Comment G-10 Public outreach and Draft EIR public review process**

The response to Comment G-10 addresses all or part of the following individual comments:

| | | |
|---|---|---|
| OPR-1-01 | GGAS-1-04 | NTC-2-01 |
| SCBC-1-01 | SFDOG-2-01 | SFDOG-2-02 |
| SFFA-1-01 | SFFA-2-01 | SFFA-3-24 |
| WEI-2-01 | WTPCC-1-10 | WTPCC-1-11 |
| Bowman-2-16 | Gomez-1-03 | Johns-1-02 |
| McAllister-3-10 | McAllister-3-11 | Miller-E-2-01 |
| Miller-N-2-01 | Rehling-1-02 | Risk-1-01 |
| Shepard-A-1-04 | Vittori-1-01 | |

- The review period closed on October 17, 2011, and the comments from the responding agency (ies) is (are) enclosed. If this comment package is not in order, please notify the State Clearinghouse immediately.

  This letter acknowledges that you have complied with the State Clearinghouse review requirements for draft environmental documents, pursuant to the California Environmental Quality Act. [OPR-1-01]

- One of the clear failures of the Recreation and Parks Department and the Natural Areas Program to date has been the inability to effectively communicate that native wildlife, plants and their ecosystems are valuable and extremely vulnerable assets to the quality of life in San Francisco. In communications stating opposition to the Natural Areas Program, some have argued that because San Francisco is a city, it is inherently "unnatural" and that native ecosystems do not deserve protection. Others seek to push more domestic pets, including off-leash dogs and feral cats, into these few, remnant areas. Golden Gate Audubon believes that the Project must include an outreach element to dispel false information about the NAP, promote the importance of stewardship of natural areas, and help build a political constituency to keep the NAP adequately funded and empowered to meet the other objectives. [GGAS-1-04]

- Thus, the CUMULATIVE effect on the stakeholder public is to be overwhelmed by the necessity to participate in all of these processes, thereby potentially diluting effective public participation. Unfortunately, the public is not well-represented in any of these situations because funding for public-serving non-profits is in the toilet.

  Thus, your determination is detrimental to the optimization of a robust public process for the Significant Natural Resource Areas Management Plan, the single most important conservation document in the City's history. [NTC-2-01]

- We have reviewed the Significant Natural Resource Areas Management Plan DEIR, a large and complex document covering 32 natural areas, including areas with ancillary complicating issues, such as Sharp Park. All of the signatories to this letter have long and extensive involvement with these lands and expert knowledge and familiarity with their management problems. We find discrepancies, even contradictions, in the DEIR. We

appreciate the great amount of work that went into preparing this document, particularly when its preparation coincided with that of other documents such as the America's Cup DEIR. We, too, are heavily involved in commenting on these issues, as well as on the proposed revision of the Recreation & Open Space Element of the General Plan, and we find that their adequate address is beyond our capabilities in the time allowed. We therefore request that we be given an additional two months to process the large volume of information and form thoughtful and useful comments. [SCBC-1-01]

- SFDOG is very concerned about poor outreach by the Planning Department and the Recreation and Park Department to the public about the NAP EIR. There was no mention of the NAP EIR on either the SF Recreation and Park Department website, nor on the Natural Areas Program website. Neither site had a link to the Planning Dept. website where the NAP EIR was located. We heard frequently from people who tried to find the NAP EIR to read it, couldn't find it on the Rec and Park website, and had no idea where else to look for it. In addition, there was no official notice posted in parks most affected by the NAP, for example, on Bernal Hill (where part of the DPA will be closed by NAP). [SFDOG-2-01]
- In addition, the Planning Commission's hearing on the NAP EIR on October 6 was another case of poor outreach. The Planning Department's website (where the EIR was posted) listed the hearing as beginning at 1:30 p.m. This start time was posted even on October 6th itself. The only way to find out that the hearing time had been changed was to look at the meeting agenda. While the original agenda that was posted had the 1:30 pm starting time, at some point the agenda was changed to reflect the noon starting time. I happened to check the agenda on Monday, October 4 and noticed the change. But many people did not. I was at the Commission meeting and the NAP EIR item was over largely by 1:30 pm, the original starting time. Many people showed up for the Planning Commission meeting just after 1:30 pm, intending to speak about the NAP EIR but, because the agenda item was already over, they were denied the chance to give oral public comment. It is important for decision makers and Commission members to *hear* public comment, not just read it, to hear the passion in people's voices as they speak. By changing the starting time of its October 6th meeting and not letting people know, the Commission essentially denied people the chance to give oral public comment on the NAP EIR. When the problems with the hearing time are combined with the poor outreach described above, it is clear that the Planning Department cannot continue with the FIR process. Planning should re-start the public comment process with better outreach to ensure the comment process is fair and accurately reflects the public's opinions. [SFDOG-2-02]
- Attached is a letter from the San Francisco Forest Alliance requesting that you amend your notice for the Draft DER for the SNRAMP. We have asked for a formal response by no later than Friday, given the short comment period just established. We would be happy to discuss our proposal for resolving our concerns about the previous notice by telephone this week if that would be helpful to you. We look forward to hearing from you.

### *1. Notice - What The Law Requires*[1]

#### *(a) CEQA*

CEQA requires public involvement to ensure that environmental impacts are considered in governmental-decisionmaking *before* action is taken. Public agencies are required to have in place procedures that will ensure wide public involvement, both formal and informal, in order to receive and evaluate public reactions to environmental issues related to the agency's activities.[2] Notice must be given in sufficient time so that the public has notice of the full review period.[3]

CEQA's statutory and regulatory provisions set for the *minimum* notice requirements for government projects that may have an impact on the environment. CEQA provides that notice of a DEIR comment period can be accomplished through: (1) publication in the newspaper of largest circulation in the areas affected; (2) posting of notice on and off the site in the area where the project is to be located; (3) direct mailing to owners and occupants of parcels contiguous to the project parcel. In some cases, one form of notice may be sufficient, but in others, all three forms of notice may be required. In addition, other laws also impose additional notice requirements. In light of this and CEQA's goals of meaningful public participation, CEQA also provides that "the lead agency may also employ any other means of notification it desires to use."[4]

#### *(b) Due Process*

In instances where a project substantially affects constitutionally protected interests, due process requirements also must be met. In such cases, due process require that notice be "reasonably calculated to afford affected persons the realistic opportunity to protect their interests."[5] Such notice must "occur sufficiently prior to a final decision to permit a 'meaningful' predeprivation hearing to affected landowners."[6]

#### *(c) San Francisco Forestry Ordinance*

San Francisco's Urban Forestry Ordinance provides that before the City removes a tree, it must give 30 days' prior written notice to all interested San Francisco organizations and all owners and occupants of properties that abut, or are on or across from the block face where the affected tree is located. If any person appeals the notice, the City must hold a hearing to consider public testimony on the tree removal. Written notice of the date, time and place of the hearing must be posted on the affected tree, provided in a newspaper of general circulation, and sent to the objecting party, the owner of the property abutting the tree, and all interested organizations.[7]

#### *(d) San Francisco Planning Code*

The San Francisco Planning Code requires that neighboring property owners be. notified of projects that involve property demolition and alteration. Neighborhood notification is mailed to neighbors within 150 feet of the subject property and relevant neighborhood groups for a 30-day public review period.[8]

### *2. Why The Notice Procedures Followed For The DEIR Are Inadequate*

We are aware that notice of the completion of the DEIR was published in October 2011 and more recently noticed again in late April, but we believe such notice is, in light of the facts of the proposed project, legally deficient.

The DEIR contemplates *major* changes to parks that are used daily by thousands of San Francisco residents, and yet, according to our own research, very few park users know that the City has systematic and wide-scale plans to actively and permanently alter the landscape, recreational features, public uses and flora and fauna of the parks they visit every day. In addition, adjacent and other nearby property occupants and owners have not been notified of completion of the DEIR, despite the fact that the project will have a significant impact on them and their property interests.

Thirty-one parks, including a total of over 2,700 acres, and representing (with the exception of Golden Gate Park and areas managed by the federal government) substantially *all* of the recreational space of San Francisco's more than 800,000 residents are, according to the DEIR, slated to undergo radical change in pursuit of the misguided utopian goal of returning these areas to their natural pre-colonial state.

The impacts of the proposed project are significant and too varied to list here, but include cutting down over 18,000 trees, closing or relocating over 54,000 feet of trails, increasing use of pesticides to kill "invasive" species and protect "native" plants, and diversion of City funds from other recreational programs (e.g., kids' educational activities) and improvements, such as renovation of neighborhood restrooms, playgrounds, and clubhouses. Such actions will impact not only park users, but also resident bird, animal and plant species.

The potential impact of the proposed project on neighboring property owners is nothing short of devastating. Owners who purchased homes in view of city parks stand to have their homes devalued by deforestation. Other owners, for example those abutting the west side of Mount Davidson, are likely to face significant drainage and erosion problems as a result of alterations to the landscape. For other owners, property values (and enjoyment of life in the City) may be decreased by the loss of neighborhood trails, trees, play areas and dog-accessible areas.

The City has done virtually nothing to inform residents near affected areas about the proposed project. By comparison, when UCSF developed plans to remove trees in Mount Sutro Forest, it notified affected neighborhoods with flyers detailing the proposed nature and timing of the work, and held a neighborhood meeting at which they took comment from interested parties.

While we appreciate that the City has made efforts to notify neighborhood groups of the proposed project, we do not believe that such groups adequately represent the interests of those who live and recreate in San Francisco. In this regard, it is important to remember that the resources that are to be altered as part of the project are in fact legally *owned* by San Francisco residents. The City is a mere *trustee* for these resources, on their behalf.

*3. Correcting The Deficient DEIR Notice*

We recommend and. request that the following steps be taken to correct the deficient

DEIR Notice:

1. Revise the notice mailed out on April 27th to include Table 5 (Summary of Natural Areas Management Plan) from page 114 of the DEIR,[9] a copy of which is enclosed with this letter.
2. Hold at least one public hearing on a date approximately halfway through the comment period, and include time and place for the hearing in the revised notice.
3. Mail the revised notice to property owners and occupants within 150 feet of parks impacted by DEIR, and all others who, prior to issuance of the new notice, express, or have in the past expressed, an interest in the DEIR.
4. Post notice at all affected park trail and road entrances and exits, and in other highly visible locations such as at playgrounds, and near restrooms and dog run areas.
5. Extend the comment period to 60 days after the notice will have been accomplished pursuant to 3 and 4 above.

We would like to discuss these requests with you at your earliest convenience, especially in light of the fact that under the April 27th notice, the period for comments is set to expire on June 11th. We would like a written commitment from the City by May 18th that it will comply with the steps outlined above.

We would be happy to meet with you to discuss these steps further or discuss them by telephone or email. [SFFA-1-01]

- Thank you again for your prompt response, which our group has now reviewed. We appreciate your sending information about the steps the City has undertaken to attempt compliance with CEQA's notice-and-comment procedures; however, we continue to believe that the City's actions to date have been inadequate.

  In that regard, we would appreciate receiving a further response to our letter addressing the deficiencies we identified under California law other than CEQA, including due process requirements under state and federal law, as well as the San Francisco Forestry Ordinance and the Planning Department's neighborhood notification requirements. Specifically, we would like to understand the City's position that posting in and near the affected parks (rather than at McLaren Lodge, where most park users may not visit) and mailing notice to adjacent and other nearby property owners is not required for this project.

  Since these issues were part of our original letter, and especially in light of the fact that the current DEIR notice period expires soon, we respectfully request that you respond today.

  We greatly appreciate your responsiveness in this regard. [SFFA-2-01]

- The public review and comment process was further compromised by the last minute decision to hold the public hearing by the Planning Commission earlier than originally announced. The public hearing was originally announced to begin at1:30pm on October 6th. Shortly before the hearing, the starting time was moved up to noon.

The public was further confused about the timing of their opportunity to speak to the Commission about the DEIR by the placement of the item on the agenda. The DEIR for the SNRAMP was item number 13 on an agenda with 19 items. The public had no way of knowing when the 13th item would be heard. Many naturally assumed that it would not be at the beginning of the hearing. They were wrong.

The public comment period on the DEIR for the SNRAMP was completed by 2 pm. Many people came to the hearing, hoping to speak, only to find that they had missed the opportunity to do so.

A few people arrived in time to speak, but didn't arrive in time to hear the staff of the Planning Department acknowledge the mistake about the "Environmentally Superior Alternative." Therefore, they wasted their public comment by focusing on an error that the Planning Department had made a commitment to correct. No one showed them the courtesy of telling them during the hearing that the error would be corrected.

There are many neighbors of the so-called "natural areas" who have been following this issue for 15 years. They were deeply committed to speaking and they were deprived of the opportunity to do so by the change in the time of the hearing.

3. The public was not adequately informed of the extension of the deadline for comment

The President of the Planning Commission requested at the public hearing on October 6th that the deadline for written public comments be extended to October 31st. No effort was made to inform the public of this extension of the deadline. The Planning Department was asked (in writing) to inform any member of the public that had been informed of the original deadline of October 17th of this extension. That request was refused.

Such refusal to provide the public with notification of the extension of the deadline will further compromise the public review process.

4. The public was not adequately informed of the re-opening of the public comment period

The San Francisco Forest Alliance learned (from a neighborhood association) that the public comment on the DEIR was reopened on April 27, 2012, about one week after the notice was mailed. SFFA immediately requested that this public notice be distributed more widely to the neighbors of the natural areas and posted in the natural areas. This request was refused.

According to the mailing list that was used to distribute the notice of the reopening of the public comment period, the same neighborhood associations that were notified of the first public comment period were notified again. The second public comment period was not more widely distributed than the first. The organizations that had an opportunity to comment in October 2011were essentially given a second opportunity to comment. This is preferential treatment that will further jeopardize the fairness of the public process.

The reopening of the public comment period was another opportunity for the DEIR to be corrected. The incorrect statement on page 2 of the DEIR stating that the Maximum Restoration Alternative is the Environmentally Superior Alternative was not corrected when the public comment period was reopened. That incorrect statement was simply redistributed

and reposted to the Planning Department website. Once again, the refusal to correct this statement will prejudice the public comment.

**Conclusion**

- **Announce another public hearing along with the corrected DEIR**
- **Announce another deadline for written public comments that is at least as long as the original period**
- **Distribute the public notice regarding the new public comment period to the neighbors of the natural areas and post the public notice in the natural areas.**

**The public review and comment period for the DEIR for the SNRAMP has been a stunning display of unfair dealing with the taxpayers who are paying for this project. It is experiences such as this that turn taxpayers into protesters.** [SFFA-3-24]

- The Wild Equity Institute and the undersigned San Francisco-based organizations (collectively "Conservation Organizations") request that the San Francisco Planning Department reopen the public comment period for the Draft Environmental Impact Report (DEIR) of the Significant Natural Resource Areas Management Plan (SNRAMP), Case Number 2005.0912E.

  Yet we recently discovered that the City re-opened the public comment period for the SNRAMP DEIR on or about April 30, 2012, and through June 11, 2012. *Astonishingly, none of the Conservation Organizations were notified of San Francisco's decision to reopen the public comment period.*

  "Public participation is an essential part of the CEQA process" Cal. Code Regs. tit. 14, § 15201. The City of San Francisco has recognized this, stating that Public participation, both formal and informal, shall be encouraged at all stages of review, and written comments shall be accepted at any time up to the conclusion of the public comment period. The undersigned believe public notice of the reopened comment period was insufficient to properly inform all stakeholders. Perhaps the City's intent was to only give specific interest groups notice that had not commented during the previous comment period, and therefore the Conservation Organizations were not notified. But any opening of a CEQA comment period should be broadly publicized, and at bare minimum, should be publicized to those organizations and individuals who previously commented and requested notice pursuant to § 21092(b)(3) of the California Public Resources Code.

  Therefore we respectfully request the Planning Department reopen the comment period for the Draft EIR for another 4-6 weeks. Please inform us of the dates during which the comment period will be reopened as soon as possible.

  § 21092(b)(3) of the California Public Resources Code requires that "notice [of the public comment period] … shall be given to the last known name and address of all organizations and individuals who have previously requested notice." We reiterate our request that the Planning Department provide the Conservation Organizations with notice of all future CEQA proceedings involving Sharp Park and/ or Sharp Park Golf Course, and all future

CEQA proceedings involving the SNRAMP, the City's Natural Areas, and/or the Natural Areas Program. The requested notices should be mailed to the following address: [WEI-2-01]

- WTPCC opposes NAP in part because of the poor job NAP has done to inform park neighbors and neighborhood associations about its plans. Neighbors who live immediately adjacent to Mt. Davidson, for example, have said they were never given any official notice of NAP's plans for the park, especially its plans to cut down 1,600 trees. Established neighborhood associations, including many WTPCC members, have not been contacted by NAP. Many have said they never heard anything about the DEIR. Indeed, the Planning Department offered a tacit acknowledgement of this lack of public outreach when it re-opened public comment on the Draft DEIR last month. [WTPCC-1-10]
- NAP did not contact park neighbors and users or neighborhood associations to find out what they wanted in the natural areas in their neighborhood parks when NAP staff were developing their plans. During the plan development process, citywide NAP advocacy groups were contacted for input on what NAP should do in the parks, yet the people who live adjacent to or who regularly use the parks (that is, those who will be most impacted by any NAP restrictions) were ignored. The only input most people had was whatever they could say during a one-minute public comment at a Recreation and Park Commission meeting after the plans were already developed. The parks belong to the people of San Francisco, not to NAP staff. All park neighbors and users (not just those known to support NAP) must be involved in discussions about what to do in natural areas. Without this level of public outreach and engagement, NAP's plans lose support and credibility.

  Even when people have explained their concerns to NAP staff, it seems to fall on deaf ears. At a 2002 meeting of the Golden Gate Heights Neighborhood Association (GGHNA), members complained about NAP's removal of iceplant at the neighborhood's Grandview Park. Grandview is the only remaining sand dune in San Francisco (other than at the beaches), but it is completely surrounded by homes, some of which have backyards that abut the park. Over the years, neighbors and park staff had planted iceplant at Grandview because it was the only plant that seemed able to hold the sand in place. When NAP took control of the park, it began to remove the iceplant because it was non-native. At the GGHNA meeting, several park neighbors complained that the iceplant removal had caused sand to drift into and cover their backyards, damaging their property. Lisa Wayne, the head of NAP who had been invited to respond to the neighbors' concerns, responded that NAP had no responsibility for property damage outside park boundaries caused by its removal of erosion-controlling plants. When the SNRAMP was released several years later, it called for "scattered, open sand" at Grandview Park. Over the years, GGHNA has repeatedly submitted public comments asking NAP to remove the goal of "scattered, open sand" at Grandview, yet it remains in NAP's plans. [WTPCC-1-11]
- RPD has also made almost no effort to proactively inform the general public of this significant project that changes the land use of highly valued parks from neighborhood parks to "sensitive habitat." This change of the land use to conservation will significantly change the visitors' experience. As identified by SFFA, few residents are aware of the

proposed plan even though the plan with impact the more than 60% of people that say they use trails in SF parks. [Bowman-2-16]

- **2. Lack of communication by NAP**

  We read the Miraloma Park monthly newsletter, the Westside Observer local paper, along with the SF Chronicle, etc. But only recently did we become aware of the NAP plan for drastic tree removal in our backyard. They have not communicated their plans to our neighborhood. As homeowners whose property is adjacent to Mt. Davidson Park, we should have received personal notification of such drastic measures. If a home or business in our area plans major changes, they are required to notify residents within specific parameters. Why doesn't NAP have to notify us of their intentions to destroy our backyard? [Gomez-1-03]

- The only notice I received of this plan was from my local community association. And that was only 4 weeks ago. Where was the public notice of this plan published? [Johns-1-02]

- The public hearing for the DEIR limited public comment. The public review and comment process was further compromised by the last minute decision to hold the public hearing by the Planning Commission earlier than originally announced. The public hearing was originally announced to begin at 1:30 pm on October 6th. Shortly before the hearing, the starting time was moved up to noon.

  The public was further confused about the timing of their opportunity to speak to the Commission about the DEIR by the placement of the item on the agenda. The DEIR for the SNRAMP was item number 13 on an agenda with 19 items. The public had no way of knowing when the 13th item would be heard. Many naturally assumed that it would not be at the beginning of the hearing. They were wrong.

  The public comment period on the DEIR for the SNRAMP was completed by 2 pm. Many people came to the hearing, hoping to speak, only to find that they had missed the opportunity to do so.

  A few people arrived in time to speak, but didn't arrive in time to hear the staff of the Planning Department acknowledge the mistake about the "Environmentally Superior Alternative." Therefore, they wasted their public comment by focusing on an error that the Planning Department had made a commitment to correct. No one showed them the courtesy of telling them during the hearing that the error would be corrected.

  There are many neighbors of the so-called "natural areas" who have been following this issue for 15 years. They were deeply committed to speaking and they were deprived of the opportunity to do so by the change in the time of the hearing.

  Conclusion

  The public review and comment process was severely compromised by a serious mistake and by several actions of the Planning Department staff. The appropriate legal remedies for these mistakes are:

  - Correct the DEIR by accurately identifying the "Environmentally Superior Alternative"

- Distribute the corrected DEIR in the same manner as the original was distributed
- Announce another public hearing along with the corrected DEIR
- Announce another deadline for written public comments that is at least as long as the original period

The public review and comment period for the DEIR for the SNRAMP has been a stunning display of unfair dealing with the taxpayers who are paying for this project. It is experiences such as this that turn taxpayers into protesters. [McAllister-3-10]

- The public was not adequately informed of the extension of the deadline for comment

The President of the Planning Commission requested at the public hearing on October 6th that the deadline for written public comments be extended to October 31st. No effort was made to inform the public of this extension of the deadline. I asked (in writing) the Planning Department to inform any member of the public that had been informed of the original deadline of October 17th of this extension. That request was refused.

I have been following the destructive native plant restorations in the San Francisco Bay Area for 15 years. I have therefore received several EIRs and EISs for public comment. When there were extensions of the comment deadline, I received written notification of that extension. Based on that experience, I believe it is standard practice to notify members of the public who have expressed an interest in an EIR/EIS of an extension of deadlines.

Such refusal to provide the public with notification of the extension of the deadline will further compromise the public review process.

Conclusion

The public review and comment process was severely compromised by a serious mistake and by several actions of the Planning Department staff. The appropriate legal remedies for these mistakes are:

- Correct the DEIR by accurately identifying the "Environmentally Superior Alternative"
- Distribute the corrected DEIR in the same manner as the original was distributed
- Announce another public hearing along with the corrected DEIR
- Announce another deadline for written public comments that is at least as long as the original period

The public review and comment period for the DEIR for the SNRAMP has been a stunning display of unfair dealing with the taxpayers who are paying for this project. It is experiences such as this that turn taxpayers into protesters. [McAllister-3-11]

- Given that we have limited time before the current comment period expires, we would like to focus the City's attention on the big picture. The bottom line is that the City has failed to - address our due process concerns. Our review of City requirements was meant to be illustrative, not exhaustive, and to emphasize that where significant private property interests are at stake (e.g., where construction or tree removal is planned on neighboring properties), notice to affected residents is required. This notice is required not only by local law, but also as a matter of constitutional law. In our initial letter, we offered examples of

concrete ways in which San Francisco property owners will be impacted by the City's proposed project. There may be other impacts not detailed in our letter. For multiple legal reasons, we believe the City is obligated, in light of the magnitude of the project and the severity of the impacts, to notify city residents (especially affected property owners and park users) about the project with sufficient time to allow them to be involved in decision making.

We understand from your recent responses that you are unwilling to: (1) modify the April 27th notice to more clearly set forth the impacts of the proposed project; (2) notify property owners within 150 feet of affected parks; (2) post notice in and near the affected parks; (4) hold a public hearing on the project; or (5) or extend the notice period beyond June 11th.

We believe your response is deficient and we are considering our political and legal options in this regard. In the meantime, we would like to request that the City provide us with a list of property addresses located within 150 feet of affected parks, so that we can attempt to contact such property owners ourselves prior to expiration of the current notice period. We also would like to request that the City allow members of the SFFA to post the City's notice of the project in and near affected parks. [Miller-E-2-01]

- In meetings with several individuals and one group of friends, I learned that none of them had heard of NAP's plans either by direct contact or by public means; i.e. Newspapers or television.

  It seems too important and far-reaching a plan to be carried out without general public input. I hope we will be able to be well-informed before action is taken and irreversible harm is done to our environment. [Miller-N-2-01]

- One other thing: I live in Miraloma Park, just opposite the Stanford Reservoir which is just below Mt. Davidson Park. I should have been notified about NAP's plans and, specifically, about the methods that NAP would take to impose its extremist vision on my neighborhood and others in the city. Therefore, I also want to bring your attention to that failure to properly inform the public, especially those living in areas most affected by NAP's plans. [Rehling-1-02]

- So it came as quite a shock to us to learn that the San Francisco Recreation and Parks Department plans to remove large numbers of trees from the forested side of the mountain.

  We were first informed of those plans in February 2012 on a walk led by local historian Jacquie Proctor. It was most disconcerting for us to be told that the NAP plan has been under consideration since 1997, was finalized in 2006, and that the plan's DEIR is currently under review. Even though we were the ones who would be most affected by those plans, the Recreation and Parks Department has never organized any community informational meetings in our neighborhood or posted any signs on the main forest trail entrances to notify us of those plans. [Risk-1-01]

- NAP has forged ahead with developing this plan and with few exceptions, excluded citizen involvement. None of the neighborhood organizations west of twin peaks have ever been asked to host a presentation by NAP of their plans, even though Mt Davidson is in our backyard. On the other hand, we were asked to host presentations of RPD bonds in 2008 and

currently for the 2012 bond. So each time RPD needs money, they come to us asking for help. They do not involve us in planning for how to spend the money. Please reject the NAP plan and DEIR and demand that RPD be accountable to the citizens of our city and provide needed services.

NAP did finally make a presentation on at the West of Twin Peaks Central Council in May, 2012 of the NAP plan, but only after repeated calls to RPD. After reading the plan and listening to the NAP presentation I voted to oppose the plan and ask for you to do the same. [Shepard-A-1-04]

- I did restoration as a professional and a volunteer for 20 years. I ran a crew with the California Conservation Corps and the National Park Service doing habitat restoration all over the Bay Area. I worked on Bernal Hill, McLaren Park, Glen Canyon, and Sharp Park as a volunteer and community member. Unfortunately, what I have seen has saddened me; I think we've betrayed the principles of integration and inclusion that we started out with. Over time the restoration movement has become exclusionary, pushing the community out of the parks.

  This process is a perfect example of community exclusion. I go to Bernal Heights, Glen Park, Stern Grove, Pine Lake, and McLaren Park with my dogs several times a week. There are no official notices anywhere inviting public review. When advocacy groups place notices on the bulletin boards, they've been torn down.

  Please pay attention to the numerous efforts we have made over the years to make the Natural Areas Program more integrated with city life. I've attached a summary written by Sally Stephens of SFDog. She states, better than I could, the numerous attempts by the public to make this process fair and inclusive. I attended many of these meetings, and I have come out with a much more jaded view of the democratic process.

  The saddest part is that we could do habitat restoration right. We could easily integrate restoration with existing park uses. [Vittori-1-01]

### Response G-10

Some comments request extension of the public comment period, suggest that the Draft EIR be recirculated with revisions, express concerns regarding the posted timing of the public hearing on the Draft EIR, and express dissatisfaction with notification for the extension of the public comment period.

These comments acknowledge the public review period for the Draft EIR, state dissatisfaction with the public outreach process, or express concern that the Planning Department did not adequately notice the availability of the Draft EIR in accordance with CEQA requirements and noticing requirements identified in the San Francisco Forestry Ordinance and Public Works Code.

The commenters question the adequacy of the public outreach and communication process for the SNRAMP.

*Public Outreach and Notification Process*

The development of the SNRAMP has occurred over 10 years, beginning in 1995, and consisted of numerous and extensive meetings with involvement of over 3,000 individuals. In June 2005, when the Draft SNRAMP was released for public review, three well-attended public workshops were held throughout the city. Outreach also included sending fliers to neighborhood groups and residents within 300 feet of all Natural Areas, the Mayor's Office of Neighborhood Groups, SFRPD's list of neighborhood groups, and other interested parties. Announcements were also posted at all Natural Area sites. An online survey was available for individuals and members of the public who were unable to attend in person. Feedback was received from approximately 2,700 members of the public and recommendations were received from three independent scientists. Further, several task forces, committees, and/or working groups were convened as part of this process, including the Natural Areas Program Citizen Advisory Committee, an ad hoc group that made recommendations on how to revise the plan, a Science Round Table group that reviewed the Alternatives Report for Sharp Park, and the Sharp Park Working Group. In addition, revisions to the Sharp Park Restoration Plan were also made in response to input from scientists and regulatory agencies, which resulted in additional restoration areas and, as a result, additional impacts to the golf course. A detailed timeline of SFRPD's outreach and planning process is provided on the SFRPD's website at http://sfrecpark.org/parks-open-spaces/natural-areas-program/significant-natural-resource-areas-management-plan/.

The Planning Department's public outreach and notification process for the Draft EIR was conducted in accordance with CEQA and the CEQA Guidelines. The noticing requirements identified by commenters in the Planning Code apply to projects that are subject to various Planning Department approvals, including a conditional use or variance granted either administratively or by the Planning Commission, and are, therefore, not applicable to public review of the Draft EIR for the proposed SNRAMP. With respect to other noticing requirements, Draft EIR p. 157 acknowledges that tree removal activities must comply with the Urban Forestry Ordinance (contained in Article 16 of the Public Works Code), if the removal of a street tree or significant tree is proposed by SFRPD during implementation of the SNRAMP. As also stated on Draft EIR p. 157, no landmark trees are proposed for removal under the SNRAMP.

If removal of a tree is proposed and the Urban Forestry Ordinance applies (i.e., street tree, significant tree, or landmark tree), certain noticing requirements would apply, which are described in detail in Response LU-4, RTC p. 4-216; however, these requirements are not applicable to the noticing requirements for circulation of a Draft EIR under CEQA. Circulation of a Draft EIR, or certification of a Draft EIR for that matter, does not constitute project approval of any kind nor does it allow for tree removal activities. Implementation of the SNRAMP, if approved, and completion of the CEQA process for this Draft EIR, will comply with all applicable noticing requirements.

Refer also to Response G-3, RTC p. 4-19, for a discussion of the independent scientific review that was conducted for the 2005 Draft SNRAMP.

### *Public Review Period*

RTC Section 1.B, Environmental Review Process, p. 1-2, describes the environmental review process including the public review period of the Draft EIR, which is also summarized in this response. CEQA Guidelines Section 15105 prescribes that the minimum public review period for a Draft EIR submitted to the State Clearinghouse for review by State agencies shall be 45 days. Two separate public comment periods were provided for the SNRAMP Draft EIR. Public agencies, organizations, and individuals were invited to provide written comments (letters, emails, and facsimiles) on the SNRAMP Draft EIR during the first public review comment period, which opened on August 31, 2011, and was originally scheduled to end on October 17, 2011. On August 31, 2011, the Planning Department distributed a notice of availability of the Draft EIR, published notification of its availability in newspapers of general circulation in San Francisco (*San Francisco Chronicle*) and in Pacifica (*Pacifica Tribune*), and posted the notice on the Department's website and at the SFRPD's McLaren Lodge. As previously mentioned, the original public comment period was set to close on October 17, 2011, but was extended by the Planning Commission at its October 6, 2011, hearing on the Draft EIR to October 31, 2011, providing a 61-day comment period. Further, the Planning Commission held a public hearing on the Draft EIR on October 6, 2011, during which Commissioners, organizations, and individuals were invited to provide oral comments.

While not standard practice, at the request of the SFRPD, the Planning Department reopened public comment on the Draft EIR. A second 46-day public review comment period was provided from April 27, 2012, to June 11, 2012, during which written comments were also invited. A Public Notice of the additional comment period was sent to over 300 neighborhood organizations and individuals through direct mailing and was also posted in the following locations: SFRPD's McLaren Lodge, the Planning Department, and the San Francisco County Clerk's office. In total, the two public comment periods were open for 107 days, exceeding the 45-day public review period required by CEQA. The Public Notice for the second public review period also was published in the *Pacifica Tribune* and the *San Francisco Chronicle* on May 9, 2012. A link to this notice is provided on both the Planning Department's and the SFRPD's websites. The Draft EIR has been accessible on the Planning Department's website, as the CEQA lead agency, since its publication. Given the two public review periods, totaling 107 days and spanning over a period from August 2011 through June 2012, an additional public review period is not required.

As stated by the comment(s), CEQA Guidelines Section 15087(a) requires that notice of publication of a Draft EIR must be provided by at least one of the follow procedures: (1) publication at least one time by the public agency in a newspaper of general circulation, (2) posting of the notice by the public agency on and off-site in the area where the project is located, or (3) Direct mailing to nearby owners and occupants. As described above, the Planning Department has substantially complied

with these noticing requirements and additional notification as suggested by the commenter(s) is not required.

On July 23, 2012, Wild Equity Institute (WEI) requested that the public comment period be reopened for a third time, citing that they were not aware of the second public review period. While a third public review period was not provided, and it appears that WEI may not have been directly notified by the Planning Department of the second public review period, responses to the July 23, 2012, letter from WEI, which was received after the close of the second public review period, are provided in this RTC document. In addition, responses to all written comments received during the two public review periods and oral comments provided during the public hearing are provided in this RTC document as well.

### *Public Hearing*

The Planning Department held a public hearing on October 6, 2011, to receive oral comments on the Draft EIR. With regards to notification of the public hearing, the Draft EIR Notice of Availability (NOA), containing public hearing information, was distributed weeks in advance of the final Planning Commission calendar, which was and is typically not available until the week before the hearing; the NOA clearly states to call the week of the hearing for a more specific time and provides a phone number. The NOA specifically stated that:

> A public hearing on this Draft EIR and other matters has been scheduled by the City Planning Commission for October 6, 2011, in Room 400, City Hall, 1 Dr. Carlton B. Goodlett Place, beginning at 1:30 p.m. or later. (Call 558-6422 the week of the hearing for a recorded message giving a more specific time.)

This information is typically included in the Planning Department notices of availability of draft EIRs because Planning Commission hearings are subject to change. While the Planning Commission meeting time posted on the City's webpage may not have accurately reflected the actual start time, the meeting item for public comment on the Draft EIR was still open at the time of the originally posted start time, giving members of the public the opportunity for timely receipt of oral public comments (Attachment C, Draft EIR Hearing Transcript).

### *Environmentally Superior Alternative*

These comments are correct that Draft EIR p. 2 incorrectly identifies the Maximum Restoration Alternative as the Environmentally Superior Alternative. A detailed discussion of the environmentally superior alternative can be found on Draft EIR pp. 524 to 526.

As also discussed in RTC Response AL-10, RTC p. 4-595, the text on Draft EIR p. 2 (line 8) has been changed as follows:

> The ~~Maximum Restoration~~ Maintenance Alternative is the Environmentally Superior Alternative.

**Comment G-11 Draft EIR is adequate, accurate, and complete**

The response to Comment G-11 addresses all or part of the following individual comments:

City of Pacifica-1-01, CAAONC-1-01, FOW-GGP-1-01, MGSG-1-02, Sierra Club-1-03, Bowling-1-01, Campbell-C-1-01, Campbell-C-1-02, Crouch-1-01, Gerrie-1-01, Hayes-1-01, Holzman-1-02, Holzman-1-03, Kesel-1-01, Kushner-1-01, Langille-1-04, Moseley-1-01, Rafferty-1-02, Rosenthal-1-01, Swenerton-1-02, Wilson-1-01, PH-Skain-02

- Based on staff research the City Council determined that the report addressed the concerns raised and that the concerns will be alleviated by the actions proposed to be included as a part of the SNRAMP. The City of Pacifica appreciates the work that San Francisco put into the DEIR, particularly in addressing the concerns that had been raised regarding management plan work proposed for Sharp Park. [City of Pacifica-1-01]
- We believe that the Draft Environmental Impact Report for SNRAMP is an adequate, accurate and complete review of the plan. It considers a broad range of potential impacts to our City' resources and proposes feasible mitigation measures to address impacts where possible. The EIR looks at a range of alternatives and discusses the potential impacts for both natural and recreational amenities of the City's Natural Resources. [CAAONC-1-01]
- We of "Friends of Oak Woodlands – Golden Gate Park" (FOW-GGP) fully support the DEIR for SNRAMP as an adequate, accurate, and comprehensive review of the Plan. [FOW-GGP-1-01]
- The Draft Environmental Impact Report for SNRAMP is an adequate, accurate and complete review of the plan.

  Considers a broad range of potential impacts to our City's resources.

  Proposes mitigation measures to address impacts where possible.

  Has been based on detailed studies and scientific experts.

  Consistent with several directives, including the Recreation and Open Space Element (ROSE), the Public Utilities Commission (PUC) water saving mandates, and the City's Sustainability Plan.

  Looks at a range of alternatives and discusses the potential impacts for both natural and recreational amenities of the City's Natural Areas. [MGSG-1-02]
- The primary objective of the Management Plan, for the Sharp Park natural area, as for the other areas, is the protection of biological resources. However, in its analysis, the DEIR defines the project as that of protecting biological resources while maintaining an 18 link golf course.

The goals and objectives of the project need to be clarified, and the portions of the project related to reconstructing the golf course should either be removed from the DEIR, or the scope of the project needs to be broadened to include both elements. [Sierra Club-1-03]

- I support the Significant Natural Resource Area Management Plan because so much thought, research, and preparation has gone into it. I believe that the Draft Environmental Impact Report for the Natural Areas Management Plan is an adequate, accurate, and complete review of the plan based on detailed studies by scientific experts. It proposes mitigation measures to address any possible adverse effects, and it is consistent with several directives, including the Recreation and Open Space Element, the Public Utilities Commission's water-saving mandates, and the City's Sustainability Plan. It looks at alternatives and discusses the potential effects for both the natural and recreational amenities of the City's Natural Areas as well as potential effects on the City's resources. I believe that implementation of the Plan will help prevent the local extinction of plants and animals, improve habitat for wildlife, increase safety, and improve access and recreational use in Natural Areas. The Plan is the most cost-effective method for managing our resources and protecting these areas for future generations. It provides clear direction to the City on how to prioritize management and restoration of our Natural Areas, and it presents an innovative way to safeguard our City's Natural Areas. This is very important to me, all San Franciscans, and for future generations of San Franciscans. As you know, the mission of the plan is to provide guidelines and amenities for passive recreational uses compatible with natural resources, to identify the causes of adverse effects on habitats, to enhance biological diversity, and to maintain populations of sensitive species. It also aims to inventory the biological resources in our Natural Areas to provide background information for planning, restoration, and management activities; to develop a Geographic Information System database, containing baseline information for each of the Natural Areas; and finally, to provide guidelines for educational, research, and stewardship programs. These are all commendable goals and attainable with the Significant Natural Resource Area Management Plan to guide us. [Bowling-1-01]
- I reviewed the DEIR and feel it is an accurate and complete review of the SNRAMP. The plan reflects years of research and community input, incorporating scientific studies and expert opinions. The plan provides guidance for prioritizing restoration and management, enhancing biodiversity while maintaining populations of sensitive species. [Campbell-C-1-01]
- The DEIR considers a broad range of potential impacts to San Francisco's natural resources while providing guidelines for passive recreational uses compatible with natural resources. In addition, it proposes mitigation measures to address impacts where possible. [Campbell-C-1-02]
- Thank you so much for working towards a reasonable and balanced EIR on SF parkland. I am a pet owner & am being bombed by emails from pet owners and groups (mostly SF Dog) who are trying to stir dog owners up without helping people understand what is being done & why. You guys have a tough job, thanks for sticking with it. Unfortunately most of the

input I am sure you are getting is the result of groups like SF Dog getting people stirred up. [Crouch-1-01]

- I urge the Planning to adopt the SNRAMP DEIR. The report was to analyze the environmental impacts of the NAP. It has done that mostly very well.

  It has laid out a compromised approach to Rec & Parks natural areas land management. It is not enough to achieve sustainability at all sites but is doable.

  This is a compromised plan and is not extreme or radical. [Gerrie-1-01]

- The Draft Environmental Impact Report for SNRAMP has received a more than adequate and therefore accurate and complete review of the plan. It has considered the total range of potential impacts to our City's open space and uses and how to manage them for sustainability! [Hayes-1-01]

- I feel that the Draft EIR is adequate, accurate and complete and urge you to certify the document without further delay. The Natural Areas Program's mission is to maintain and enhance natural areas in San Francisco and the plan and creators of the Natural Areas Management Plan spent a great deal of time in discussions with the scientific community and citizens of San Francisco to create a plan that best served the citizenry and the critical need of maintaining and enhancing natural areas. The EIR reviewing this management plan considers a broad range of potential impacts to our City's resources and proposes mitigation measures to address impacts where possible to lessen any perceived impacts and recognizes that some impacts may be unavoidable. [Holzman-1-02]

- I believe the EIR accurately depicts the majority of potential impacts that could occur with plan implementation as less than significant and in need of no significant changes to the plan. The management plan in creating the recommended actions considered alternatives and attempted to achieve the greatest good with the least amount of negative impact and I believe this was accomplished and the DEIR attests to that. The initial management plan was based on detailed studies and scientific experts and is consistent with several directives, including the Recreation and Open Space Element (ROSE), the Public Utilities Commission (PUC) water saving mandates, and the City's Sustainability Plan. [Holzman-1-03]

- My comments pertain to the DEIR for the Natural Areas Management Plan (SNRAMP). The DEIR for SNRAMP is an accurate, adequate, and complete review of the plan. It considers a range of potential impacts to City resources and proposes mitigations where possible. This DIER is based on sound science and expert opinions. The DEIR is consistent with the City's Sustainability Plan as well as other directives. Furthermore, the DIER addresses potential impacts for natural and recreational amenities in San Francisco's Natural Areas. [Kesel-1-01]

- With respect to the description of the twenty-two natural areas in San Francisco, the DEIR is accurate, thorough and complete. [Kushner-1-01]

- The SNRAMP DEIR, with notable exceptions, does an excellent job analyzing the environmental impacts of the Natural Areas Plan. [Langille-1-04]

- I am writing to give my support to the Draft EIR for the Natural Areas Program. I believe the findings are adequate, accurate and complete and should be accepted by the San Francisco Planning Department. [Moseley-1-01]
- The Draft Environmental Impact Report for SNRAMP is an adequate, accurate and complete review of the plan. Our group looks forward to our ongoing work parties to improve Fairmont Park. [Rafferty-1-02]
- After reading the report in detail, I believe the DEIR to be adequate, accurate, and complete. It is not a radical plan and lays out a reasonable, conservative approach to natural resources management, and considers a broad range of potential impacts to our City's resources. The report should be accepted for the following reasons. It proposes mitigation measures to address impacts where possible. It is based on detailed studies and scientific experts. It is consistent with several directives: the Recreation and Open Space Element (ROSE), the Public Utilities Commission (SFPUC) water saving mandates, and the City's Sustainability Plan. It also looks at a range of alternatives and discusses the potential impacts for both natural and recreational amenities of the City's Natural Areas, which are in dire need of the protection this management plan addresses. [Rosenthal-1-01]
- I believe that the SNRAP DEIR is an adequate, accurate and complete review of the plan is based on detailed, comprehensive research and sound scientific studies conducted by experts. [Swenerton-1-02]
- The Natural Areas Plan goals are excellent. - The SNRAMP DEIR, with notable exceptions, does an excellent job analyzing the environmental impacts of the Natural Areas Plan. [Wilson-1-01]
- The San Francisco portion of the report is thorough, accurate, and adequate.

  In its treatment of the 22 natural areas located in San Francisco, the report does an admirable job analyzing the environmental impacts of the Proposed Project, as well as alternatives. In general, the portions of DEIR analyzing the programmatic portions of the plan and routine maintenance are thorough, accurate, and adequate.

  I do want to -- specifically to comment on the great work that staff did in preparing this and work done by all the consultants on it. [PH-Skain-02]

### Response G-11

These comments generally express support that the environmental analysis contained in the Draft EIR is adequate, accurate, and complete. However, one comment requests that the portions of the project related to reconstructing the golf course should either be removed from the Draft EIR, or the scope of the project needs to be broadened to include both elements.

The limited modifications to the golf course are included in the project description of the SNRAMP Draft EIR. With respect to the golf course modifications, as stated in Draft EIR Chapter III, Project Description, p. 102:

> "An upland and wetland habitat corridor between the lagoon and the pond would be constructed with upland features designed to support the San Francisco garter snake; this action would necessitate permanently closing Hole 12 of the Sharp Park Golf Course. Sediment basins would be installed in two locations, one where Sanchez Creek enters a culvert to pass under Highway 1 and the other at the northern boundary of Sharp Park; the former sediment basin would be developed on about half an acre of the golf course (primarily upland Monterey pine habitat), and the latter sediment basin would be expanded onto about half an acre of ruderal and upland Monterey pine habitat."

Draft EIR Chapter III, Project Description, p. 103, goes on to state that:

> "Creating, restoring, and enhancing California red-legged frog and San Francisco garter snake habitat at Laguna Salada would also involve a reconfiguration of some holes of Sharp Park Golf Course and converting a portion of the area currently occupied by the course to Natural Area. Approximately 13 acres of the golf course would be modified to create important upland habitat adjacent to the wetlands for the endangered San Francisco garter snake, to discourage frogs from depositing egg masses in locations where the resulting tadpoles may end up being stranded, and to allow for creation of new wetlands to compensate for those filled during restoration. In order to create a habitat corridor between Horse Stable Pond and Laguna Salada, Holes 10 and 13 would be slightly shortened or narrowed, and the existing Hole 12 would be permanently closed. The habitat corridor would cover approximately six acres, bringing the total of modified area at the golf course to about 19 acres."

In addition, a new hole would be created near the rifle range/archery course either east or west of Highway 1, which is required by Draft EIR Mitigation Measure M-RE-6, Restoration of the Sharp Park Golf Course to 18 Playable Holes, p. 264. Therefore, the proposed project includes the Sharp Park Golf Course modifications. Furthermore, proposed restoration actions at Sharp Park are not inconsistent with either the CEQA objectives listed on p. 82 of the Draft EIR or the SNRAMP objectives and goals listed on p. 84 of the SNRAMP.

## Comment G-12 Objectivity of the EIR

The response to Comment G-12 addresses all or part of the following individual comments:

| | | |
|---|---|---|
| Bowman-2-15 | Gomez-1-05 | Keating-1-03 |
| Kessler-1-01 | Kessler-2-01 | Rehling-1-01 |
| PH-Keating-01 | | |

- In general, I found the DEIR to be biased towards promoting the SNRAMP proposals instead of impartially and scientifically presenting the environmental impacts of the program. It is troubling that RPD spent more than $1 million for the development of such a flawed SNRAMP and DEIR and that this was done with limited input from the general public who are unlikely to support the costly implementation or the significant changes to the use of 25%

of park land in SF. RPD continually misuses words like "invasive" and "noxious" instead of the more clearly understood "non-native plants" which misleads the public about the types of plants and trees to be removed. RPD also uses "nature" and "natural" and "habitat" which would be more correctly stated as "native plants." Using these marketing words or codes represents a deceptive tactic that undermines the value of the entire DIER public comment and review process, since the general public is not being made aware of the significance of what is actually planned. [Bowman-2-15]

- Take another look at this plan, obtain viewpoints from geology/ erosion experts outside of SF Park and Rec, and definitely outside of NAP. They are too invested in this plan moving forward to be open to alternatives. One might say - they can't see the forest for the trees! [Gomez-1-05]
- Moreover, I think you should take a close look at the question of whether the staff DEIS report reflects a bias in that it appears based on a series of assumptions all of which favor the natural areas program, rather than a balanced approach where some assumptions end up favoring the program and other assumptions end up favoring recreational access. The DEIS should be a careful balanced analysis rather than an advocacy piece to justify a particular conclusion. [Keating-1-03]
- The current Draft Environmental Report appears to be slanted toward "Native Plant" management, at the expense of other interests. [Kessler-1-01] [Kessler-2-01]
- What NAP plans to do is not sound environmental stewardship, as claimed, but a damaging course of action that could do lasting harm to beloved and much-used urban forests and other recreation areas within the city. The draft EIR minimizes and misleads, not addressing some critical concerns and misrepresenting others, without consideration of the full range of expert opinion and without sufficiently considering community, ecological, and property impacts. The draft EIR does not acknowledge how reduction of trails and of dog-friendly acreage will affect the community, nor does the EIR accurately represent the potential consequences of using toxic pesticides on the health of children. Of course, these pesticides also threaten wildlife directly, and that wildlife also is threatened by the other changes to habitat that the NAP plan includes. The draft EIR does not appropriately address legitimate concerns about erosion, loss of windbreak and shade, and aesthetic consequences of NAP's plans. The draft EIR seems too informed by the voices of NAP staffers protecting their office and their budget and not sufficiently informed by those outside of NAP, but familiar with the areas and issues under discussion. I hope that you will seek out more sources and listen to them objectively, while bearing in mind the well-being of all residents and the importance of managing our parkland in a balanced way. [Rehling-1-01]
- I think your highest duty and your highest benefit you can provide in society is making sure that the staff reports you're getting in the environmental impact reports are straight up. That's all I think you can really do is make -- because you got to rely on your --those reports, but make sure they're straight up, and I don't know the answer to that. I've heard a lot of things both ways. What I suggest generally in other areas I've been involved in are the two easiest ways to find out whether you're getting good, impartial analysis is, one, what are the

> presumptions that are being made, the unfounded presumptions? Everyone always makes unfounded presumptions. So to find out whether it's biased or not, find out whether they're all sort of in one favor. Do they make presumptions that always go in one favor, or are the presumptions balanced in valuing recreation versus natural restoration, in evaluating whether these restoration efforts will have adverse short term impacts regardless of the long term impacts? So you look at whether the presumptions all go one way. The second thing I think you look at is what's being considered and what's not being considered. Are they looking at the relevant issues? We have maybe, what, 100, 150 years of managing these parks in our city balancing these issues. I think if you're finding that they're making a radical departure in a general management strategy, you ought to have a heightened scrutiny then. [PH-Keating-01]

## Response G-12

These comments express concern that the analysis in the Draft EIR is not objective.

As explained on Draft EIR p. 2, the San Francisco Planning Department has prepared this EIR in accordance with CEQA (California PRC Sections 21000–21177), the Guidelines for Implementation of the California Environmental Quality Act (CCR Title 14, Sections 15000–15387), and the requirements of San Francisco Administrative Code Chapter 31. The EIR identifies significant impacts of the proposed actions (including cumulative impacts), identifies feasible alternatives and mitigation measures that would that would avoid or substantially lessen significant impacts, and includes improvement measures to further reduce impacts identified as less than significant. The EIR reflects the independent judgment of the Planning Department.

One commenter indicated that the terms "invasive" and "noxious" have been misused and the more clearly understood term "non-native plants" should be used. As provided in Executive Order 13112, an "invasive species" is defined as a species that is nonnative (or alien) to the ecosystem under consideration and whose introduction causes or is likely to cause economic or environmental harm or harm to human health.[29] On the contrary, in North America, nonnative species are generally considered species that were not present in an ecosystem prior to European settlement.[30] A majority of nonnative species cause no harm, and some are even beneficial. In the SNRAMP, the SNRAMP Draft EIR, and this RTC document, every effort has been made to draw a distinction between invasive species (meaning those that could be harmful) and nonnative species (meaning those that are not harmful and introduced after European settlement). A noxious weed is any plant designated by a Federal, State, or county government as injurious to public health, agriculture, recreation, wildlife, or property.[31]

---

29 www.invasivespeciesinfo.gov/docs/council/isacdef.pdf, accessed on September 14, 2015.

30 http://www.nps.gov/plants/alien/bkgd.htm, accessed on September 14, 2015.

31 http://www.blm.gov/wo/st/en/prog/more/weeds/weed_definition.print.html, accessed on September 14, 2015.

One commenter states that the EIR does not acknowledge the impacts of closing trails or dog friendly acreage on the community, the environmental impacts of using pesticides, or impacts on erosion, shade, loss of windbreaks, and aesthetics. The Draft EIR addresses impacts from pesticide use in Section V.I, Hazards and Hazardous Materials; wind, windthrow,[32] and shade effects in Section V.E, Wind and Shadow; and aesthetic impacts in Section V.C, Aesthetics. Erosion effects are addressed in the Initial Study (Draft EIR Appendix A). The commenter has not provided substantial evidence[33] that significant adverse environmental impacts other than those described in the EIR would occur nor does the commenter raise specific environmental issues about the adequacy or accuracy of the analysis contained in the EIR.

As discussed in Response G-5, RTC p. 4-31, social impacts of a proposed project are only considered significant if there are associated physical effects on the environment. Refer also to Response RE-13, RTC p. 4-347, for a discussion of the effect of the reduction of DPAs on other DPAs in terms of recreational capacity; refer to Response G-25, RTC p. 4-106, for a discussion of dog impacts related to erosion; refer to Response HZ-1, RTC p. 4-531, for a discussion of the use of pesticides in the Natural Areas; refer to Response AE-1, RTC p. 4-219, and Response AE-2, RTC p. 4-223, for a discussion of the aesthetic impacts related to tree removal, brush piles, and brown vegetation; and refer to Response WS-1, RTC p. 4-309, for a discussion of wind impacts related to tree removal.

| **Comment G-13** | **Sharp Park analysis piecemealed regarding sea wall and golf course redesign** |
|---|---|

The response to Comment G-13 addresses all or part of the following individual comments:

Sierra Club-1-10 WEI-1-04

- "Piecemeal" Planning Process for Sharp Park.

  It can reasonably be inferred from the DEIR that the project, as currently envisioned, involves, in addition to the Laguna Salada restoration, both the reconstruction of the golf course and reconstruction/fortification of the seawall. However, these elements of the project, as well as the analysis of the recycled water component to provide irrigation for the golf course, are all treated as independent "projects" for CEQA purposes. Especially as the proposed project in this DEIR will result in the radical transformation of the hydrology of

[32] As stated on Draft EIR page 244, windthrow is used to describe the effects of wind on a stand of trees. When the wind blows a tree over, this action is called windthrow.

[33] As defined in CEQA Guidelines Section 15384, "'Substantial evidence' as used in these guidelines means enough relevant information and reasonable inferences from this information that a fair argument can be made to support a conclusion, even though other conclusions might also be reached. Whether a fair argument can be made that the project may have a significant effect on the environment is to be determined by examining the whole record before the lead agency. Argument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or inaccurate, or evidence of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment does not constitute substantial evidence."

Laguna Salada into a below sea-level frog pond, it is improper to treat these items separately, as is currently the case. [Sierra Club-1-10]

- **The DEIR piecemeals the environmental assessment of Sharp Park by delaying assessment of the future of Sharp Park's sea wall and ignoring the existing alternatives' relationship to a long-term golf course redesign.**

  The DEIR recognizes that the future Sharp Park's sea wall is subject to considerable uncertainty. As explained in the ESA/PWA report, sea level rise induced by climate change, along with storm surges and erosion, all make it infeasible to retain a sea wall at Sharp Park as it is currently designed. Only two options are available to the City: armoring the sea wall at Sharp Park, or allowing the sea wall to revert over time to a naturally managed coastal system.

  Yet while these alternatives are acknowledged in the DEIR, the DEIR expressly delays consideration of these impacts to some unknown point in the future. Specifically, the DEIR states that while these alternatives have been considered by SFRPD, "those options are not proposed as part of the SNRAMP. Thus, they are not addressed in this EIR." DEIR p. 103. But the DEIR is intended to guide management at Sharp Park for the next 20 years – a timeframe in which meaningful impacts to the sea wall may occur according to the ESA/PWA report, and which if the City fails to address could irreversibly harm the endangered species at Sharp Park, the existing infrastructure at Sharp Park Golf Course, and the surrounding communities. By failing to consider this impact presently, the City is piecemealing the environmental review for its plan at Sharp Park to retain an 18-hole golf course at Sharp Park on a permanent (relevant to the SNRAMP timeline) basis.

  The DEIR makes this problem express on p. 527, where it states that full natural restoration alternatives at Sharp Park "have been rejected because they are not compatible with the existing and planned 18-hole layout of the historic golf course." (emphasis added) Yet the planned golf course is not part of the DEIR environmental assessment – this is classic piecemealing of project to avoid cumulative, long-term, or complete environmental analysis of a project proposal. This can only be remedied by segregating out the Sharp Park section of the DEIR and subjecting it to a full and thorough environmental review as required by CEQA. [WEI-1-04]

## Response G-13

These comments express concern that the EIR "piecemeals" the analysis of the proposed actions at Sharp Park by not including potential proposals for the seawall, golf course, and recycled water projects. These comments address actions that are not proposed as part of the SNRAMP.

Draft EIR p. 103 acknowledges that options for addressing current and future conditions of the seawall have been considered, but those options are not proposed as part of the SNRAMP. Because a solution for the seawall has not been proposed, speculating on that solution or solutions is not appropriate for the CEQA analysis; therefore, evaluation of potential actions to address the effects of sea level rise on the seawall in the cumulative impact analysis is not appropriate at this time. Effects

of the proposed project in combination with SFPUC's recycled water and potential cumulative effects of sea level rise on Sharp Park project are addressed in the EIR's cumulative analysis (refer to Draft EIR p. 381). The Draft EIR concludes that over the long term, sea level rise could result in significant environmental effects but that the SNRAMP would not result in a cumulatively considerable contribution to sea level rise impacts.

While areas currently within the Sharp Park Golf Course are included as part of the Sharp Park wetland restoration project and will become part of the Natural Area at Sharp Park, these changes are appropriately addressed in the impact analyses for the project in the Draft EIR. Specifically, Hole 12 would be closed and restored as coastal scrub/grassland habitat to support the San Francisco garter snake. Sediment basins would be installed in two locations, one where Sanchez Creek enters a culvert to pass under Highway 1 and the other at the northern boundary of Sharp Park; the former sediment basin would be developed on about half an acre of the golf course (primarily upland Monterey pine habitat), and the latter sediment basin would be expanded onto about half an acre of ruderal and upland Monterey pine habitat. While other golf course modifications would occur, such as shortening holes, creating a new hole near the rifle range/archery course east of Highway 1, and raising fairways to prevent flooding and discourage frogs from depositing egg masses in locations where the resulting tadpoles may end up being stranded, these areas would not become part of the Natural Areas at Sharp Park.

Approximately 13 acres of the golf course would be modified to create important upland habitat adjacent to the wetlands for the endangered San Francisco garter snake, to discourage frogs from depositing egg masses in locations where the resulting tadpoles may end up being stranded, and to allow for creation of new wetlands to compensate for those filled during restoration. In order to create a habitat corridor between Horse Stable Pond and Laguna Salada, Holes 10 and 13 would be slightly shortened or narrowed, and the existing Hole 12 would be permanently closed. The habitat corridor would cover approximately six acres, bringing the total of modified area at the golf course to about 19 acres.

The impact to Hole 12 of the golf course as a result of the wetland restoration project has been identified and evaluated, with a mitigation measure formulated to address the impact on the playability of the 18-hole golf course (refer to Draft EIR p. 261 and pp. 264 to 269). In response to the comment regarding the environmental assessment of the golf course in the Draft EIR, the environmental impacts of the mitigation measure that would require restoration of the playability of the golf course was analyzed in the Draft EIR on pp. 264 to 269. It was determined that the impacts of the mitigation measure could be reduced to a less-than-significant level if the replacement hole would be located west of Highway 1. Neither the wetland restoration project nor the mitigation measure proposes a wholesale redesign of the golf course. Draft EIR p. 527 acknowledges that SFRPD identified alternatives to the golf course layout; however, SFRPD has not proposed a wholesale redesign of the golf course. The text on Draft EIR p. 527 (first paragraph) has been changed for clarification, as follows:

As part of the Sharp Park Conceptual Restoration Alternatives Report, the SFRPD ~~proposed~~ identified restoration alternatives that would be compatible with either a nine-hole layout at the Sharp Park Golf Course or with removal of the golf course entirely. These alternatives have been rejected because they are not compatible with the existing and ~~planned~~ continued 18-hole layout of the historic golf course.

| **Comment G-14** | **Historic Preservation Commission review of future project under the National Environmental Policy Act** |
|---|---|

The response to Comment G-14 addresses all or part of the following individual comment:

HPC-1-05

- The HPC also commented that it is likely that future projects involving federal permitting or funding will be reviewed and commented on by the Commission as part of the National Environmental Policy Act (NEPA) process. [HPC-1-05]

### Response G-14

This comment asserts that it is likely that future projects with a federal nexus will be reviewed and commented on by the HPC.

The comment addresses additional environmental review processes that would be required following the CEQA process and does not request changes to the text of the document.

## 4.A.3 Dog Play Areas

| **Comment G-15** | **GGNRA Activities (Unrelated to the SNRAMP)** |
|---|---|

The response to Comment G-15 addresses all or part of the following individual comments:

NPS-1-10 NPS-1-11 Fitzer-1-01
Fitzer-1-05

- General Comment (pg. 443): Please correct description of acreage open to dog walking at Funston; 200 acres is not a correct figure. Please contact Shirwin Smith of my staff at 561-4947 for a correct acreage figure. [NPS-1-10]
- General Comment: GGNRA is instituting a survey this fall to evaluate potential for redistribution onto other areas both within and outside the park resulting from implementation of the dog management plan and will share that those survey results with RPD. [NPS-1-11]
- Please support the Save the Off-Leash walking Areas in the GGNRA.

  Since our daughter graduated Lowell High School, we do not have a place to go to meet people and socialize. We have met many friends from our daily off leash dog walks at Ft. Funston. For us, it is our form of exercise, away to relieve the day's stress, our daily dose of fresh air. Our walks are as important to us as they are for our dogs. For me, it is a way to exercise and enjoy our beautiful city and the ocean air. I always take our out-of-town guests

for a walk and show off our beautiful city and the Fort. Our guests are always amazed at how lucky we are to have this spot to go to walk and run our dog Wanda.

Please tell the GGNRA to stop pushing its extreme proposal that will negatively impact so many of us who live in the Bay Area with our wonderful pet dogs. Our dog is a rescue. We don't know her breed, but we do know that her daily run is very important for her and for us.

Why is the GGNRA insisting on this extreme proposal that would eliminate a main form of recreation that takes place at these recreation areas? Doesn't the GGNRA have an obligation to respect the legislation that created these areas by managing them as urban recreation areas, not as pristine wilderness areas?

I understand that Congress could resolve this conflict by codifying the GGNRA's original 1979 Pet Policy as a Section Seven Special Regulation, and mandating that all properties added to the GGNRA after 1979 maintain historical recreational access.

The GGNRA dog management proposal has nothing to do with safety or the environment- it's part of a pattern of GGNRA bureaucracy that denies more and more and people/activities access to parks.

There so many more important issues that could use the time and money that is being spent on trying to close off-leash dog areas. Before our city and country goes to the dogs … leave well-enough alone and start focusing elsewhere.

Thanks for your attention to this matter. [Fitzer-1-01]

- Parts of Ft. Funston have already been shut off since we first started walking there in 1998. These closures have had a negative impact on the natural resources in the existing areas where we can walk. I not only think that Ft. Funston should remain an off-leash area, I also think the ares that were closed off should be opened up.

  Lastly, I would like to say that many dog-less people come to Funston just to be with and play with dogs. just yesterday, while walking our dog at Funston, I met a dog-less Dad who took his 2 small kids Ft. Funston so that his kids could see and pet the dogs there. They couldn't have a dog where they lived and his kids were thrilled to be able to be able to run with and pet the dogs. It also gave the Dad a chance to teach his kids how to behave with dogs, to ask, "May I pet your dog ? " and "May I feed your dog this treat ? " etc., [Fitzer-1-05]

## Response G-15

These comments state that the Golden Gate National Recreation Area (GGNRA) is instituting a survey to evaluate the redistribution potential occurring from implementation of its Dog Management Plan and identifies information and data to be provided to SFRPD, and it also requests a minor change to the amount of available off-leash DPAs at Fort Funston. Additional comments state that many people without dogs visit Fort Funston and, as such, it should remain an off-leash area.

The GGNRA (including Fort Funston) is neither under the management of the SFRPD or under the jurisdiction of the San Francisco Recreation & Parks Commission, and it is also not part of the SNRAMP project. The decision to allow Fort Funston to remain an off-leash area is under the purview of the National Park Service.

As stated on p. 339 of the Supplemental EIS (Fall 2013)[34] for the GGNRA's Dog Management Plan, the National Park Service (NPS) conducted a survey in the summer of 2012, the GGNRA Dog Walking Satisfaction Visitor Study to evaluate the perception of and satisfaction with the current dog walking policies, and the potential for redistribution of use based on access changes resulting from implementation of a new dog management regulation for GGNRA. The survey was conducted to respond to public comments received on the Draft GGNRA Dog Management Plan/EIS. Of the approximately 7,000 individuals contacted for the survey, 897 responded. Respondents included 662 dog walkers, 20 commercial dog walkers, and 212 individuals who do not walk dogs at the park. General satisfaction with the visitor's park experience was captured in the survey using the following categories: "not at all satisfied," "slightly satisfied," "moderately satisfied," "very satisfied," and "completely satisfied." Of the dog walkers who responded to the survey, 431 individuals (64 percent) indicated that they were "not at all satisfied," "slightly satisfied," or "moderately satisfied," with on-leash dog walking opportunities at the park. These same respondents were then asked if they would go (inside or outside GGNRA) somewhere else as an alternative site. The five most popular San Francisco alternative sites for on-leash dog walking included Pine Lake/Stern Grove, Golden Gate Park (all areas), McLaren Park, and Alta Plaza. Regarding satisfaction of off-leash dog walking, 659 respondents (98 percent) stated they would be moderately satisfied or less if they were not able to walk their dogs off leash at the sites they frequent now. When asked if they would go somewhere else to walk dogs off leash, the five most popular alternative sites indicated by those respondents for off-leash dog walking included the four San Francisco park sites: Pine Lake/Stern Grove, Golden Gate Park (all areas), McLaren Park, and Alta Plaza. Of these four San Francisco park sites, the SNRAMP is proposing to reduce the size of the DPA in McLaren Park. The SNRAMP Draft EIR analyzes the effects of DPA closures proposed by the SNRAMP in combination with the GGNRA Dog Management Plan in the cumulative analysis of various environmental topics.

As requested, the text on Draft EIR p. 444 (line 6) has been changed as follows:

> Fort Funston, located approximately 8,000 feet (about 1.5 miles) from the existing Lake Merced DPA has approximately ~~200~~ 160 acres open for off-leash dog use.

[34] National Park Service, U.S. Department of the Interior, *Golden Gate National Recreation Area Draft Dog Management Plan/Supplemental Environmental Impact Statement*, Fall 2013. This document is available online at: http://parkplanning.nps.gov/document.cfm?parkID=303&projectID=11759&documentID=55416, accessed June 7, 2016.

| **Comment G-16** | **Dog problems result from lack of monitoring, lack of enforcement of existing leash laws, and lack of responsibility from dog owners** |
|---|---|

The response to Comment G-16 addresses all or part of the following individual comments:

| | | |
|---|---|---|
| GGAS-1-14 | GGAS-1-15 | GGAS-1-20 |
| GGAS-1-27 | Bartley-1-08 | Griggs-1-01 |
| Kushner-1-04 | Pfister-1-07 | |

- The DEIR and the SNRAMP suffer from the larger problem endemic to San Francisco's management of dog-related activities. Though all city parks permit dogs only on-leash and off-leash in designated off-leash areas, non-compliance with leash requirements is rampant. Despite that dogs are regularly allowed to run off-leash throughout nearly every park in the city, off-leash dogs continue to oppose even reasonable restrictions on dogs in the few Natural Areas covered by this Project. [GGAS-1-14]

- In any event, any Dog Play Area in any Natural Area should be fully enclosed or otherwise well-marked. Enclosures provide dog owners with a clear explanation of where off-leash activity is appropriate. Enclosures also restrain dogs from activities that may result in significant, negative impacts on native wildlife and plants in the Natural Area. Finally, enclosures reduce conflicts with other park users and other dogs. [GGAS-1-15]

- Give the priorities of the Natural Areas Program, it is appropriate to prioritize protection of wetlands and creek channels above dog-related recreation. Staff should ensure effective implementation of this management measure by monitoring dog-related recreation in the area and enforcing leash requirements. A failure to enforce leash requirements will result in the ineffective implementation of this measure. [GGAS-1-20]

- While the DEIR does not identify any inconsistencies with the San Francisco Dog Policy, Golden Gate Audubon notes that San Francisco's failure to fully implement the Dog Policy does create ongoing and serious conflicts with the priorities of the NAP. (See DEIR, at 155-156) The lack of adequate enforcement of the Dog Policy, especially in sensitive areas where leashes are required or dogs are excluded, has perpetuated conflicts between different users of the park system in San Francisco and exacerbated impacts to local wildlife and plants. The DEIR should include provisions requiring active compliance monitoring and enforcement of the policy to ensure that the application of the Dog Policy is consistent with the NAP. [GGAS-1-27]

- It is time for the city to enforce existing dog owner laws including the requirement of licenses. These license fees pay for our understaffed and overwhelmed Animal Care and Control Department. Lack of enforcement is seen as a dereliction of duty from this citizen's point of view. [Bartley-1-08]

- The main problem is one of enforcement however. Dogs are already regulated by the rule either on leash or under voice control of owner. Obviously this is often not the case. It may require simply having officers or rangers on the ground watching over the beaches and parks in a more substantial manner. In all cases of my dog encounters, there has never been

anyone of authority nearby. I now carry pepper spray with me and will use it. I know of no other solution for the time being. [Griggs-1-01]

- "Dog activity in DPAs is an existing use, and the SNRAMP does not propose increasing this activity; however, closing or reducing DPAs under the SNRAMP could intensify dog use in the remaining DPAs. In addition, because resources to enforce leash laws are limited, dogs would likely continue to be let off leash in parts of Natural Areas outside of DPAs, even though that activity is prohibited. As a result, dogs may currently be impacting and may continue to impact protected plant species in or near DPAs. Pet owners may contribute to disturbance via trampling. As a result, implementation of the SNRAMP could have significant adverse impacts on these species." This conclusion is very odd and out of sorts with the intent of CEQA. A more appropriate conclusion would be the mitigation that the Recreation and Parks Department enforce leash laws more adequately. The department has a beefy Parks Patrol division that could certainly be used to enforce leash laws, with fines that strongly encourage compliance. [sfweekly.com – article attached] [Kushner-1-04]
- "The SFRPD welcomes dogs on leashes in most of its parks; dogs are allowed off–leash in 19 designated areas." Off-leash dogs are an important threat to biological diversity in the parks. There needs to be more enforcement of the leash law to limit off-leash activity to the designated areas. [Pfister-1-07]

### Response G-16

These comments request monitoring dog-related recreation in the parks and a stricter enforcement of leash laws.

Many parks, with or without DPAs, are experiencing a lack of compliance with existing leash and pooper scooper laws. The reasons for the lack of compliance include, but are not necessarily limited to (1) park users who are unwilling to be compliant, even when confronted by SFRPD staff or fellow park users; (2) a lack of SFRPD patrol resources to fully monitor all parks for compliance; and (3) park users who are not aware of leash and pooper scooper laws. Enforcement of the existing leash laws is an ongoing City responsibility that is beyond the sole management control of the NAP staff and the SNRAMP.

In the SFRPD Final Dog Policy (SFRPD 2002) (also referred to in this document as the "Dog Policy"), the SFRPD states that enforcement would necessitate a multi-agency effort to include the San Francisco Police Department (SFPD), the SFRPD, and Animal Care & Control (ACC); however, the SFRPD believes that the greatest voice for following established rules and policies will be from DPA partners and users.

Refer to Response PD-23, RTC p. 4-198, for a discussion of the SFRPD's policy and the Draft EIR's conclusion and mitigation measures for monitoring DPAs for impacts caused by dogs, as well as the various options available to prevent or reverse those impacts, and Response G-25, RTC p. 4-106, for a discussion of potential impacts of dogs on plants and wildlife.

**Comment G-17 Impacts of people within Natural Areas**

The response to Comment G-17 addresses all or part of the following individual comments:

| | | |
|---|---|---|
| CFDG-1-04 | DogPACSF-1-05 | SFDOG-2-06 |
| Bartolotta-1-05 | Brown-1-02 | Chambers-1-02 |
| Demetrious-1-04 | Kelly-1-02 | Naima-1-03 |
| Vitulano-1-04 | | |

- The NAP EIR does not differentiate between impacts caused by people with dogs and impacts caused by people without dogs. Do people in the natural areas with dogs cause significantly more impacts than people in the natural areas without dogs? Clearly a 200-pound person will have a much more significant impact on plants than a 20-pound dog. Because this was not evaluated in the EIR, the analyses presented in the NAP EIR are inadequate. If there is little difference in impacts, then the EIR cannot justify banning dogs from the natural areas. [CFDG-1-04] [DogPACSF-1-05] [SFDOG-2-06] [Bartolotta-1-05] [Brown-1-02] [Kelly-1-02]
- The EIR does not differentiate between impacts caused by people with dogs and impacts caused by people without dogs. For example, a 200-pound man will have a much more significant impact on plants that he walks on than a 20-pound dog will have on any that it walks on. If there is little difference in the impacts, then the EIR cannot justify banning off-leash dogs from natural areas. [Chambers-1-02]
- To that end, I believe that erosion and similar effects are more pronounced with human activity, and I feel that channeling the traffic with more regularly maintained trails is a good way to change the causes of negative effects on the land. There grows from that a greater, more frequent presence and adjustments are more easily made at a smaller scale to foster the positive outcomes in natural areas health and maintenance before bad outcomes have caused critical damage. [Demetrious-1-04]
- the NAP EIR does not take into account the damage caused by people or children [Naima-1-03]
- I personally see much more damage from people without dogs - especially kids hanging out, breaking glass, littering, The EIR should identify which percentage of impacts are attributable to dogs versus humans. [Vitulano-1-04]

## Response G-17

These comments express concern that the Draft EIR does not analyze the environmental impacts of humans versus that of dogs.

To clarify, the Draft EIR does not propose to close or reduce DPAs because of a potential environmental impact identified in the Draft EIR. Rather, the SFRPD has proposed, as part of the project, to close the Lake Merced DPA and to reduce the size of two other DPAs. The EIR, therefore,

analyzes the environmental impact of this action. The Draft EIR analyzes the impacts of closure and reduction of DPAs along with the potential for increased use by humans (visitors) and dogs.

The EIR concludes that the proposed closure and reduction of DPAs would not result in significant impacts to recreational resources (Impact RE-1 and Impact RE-4 on Draft EIR pp. 256 to 258 and 259 to 260). However, when combined with impacts resulting from the GGNRA Dog Management Plan, the EIR conservatively determines that the cumulative impact of these two projects could accelerate the physical deterioration of the remaining DPAs and in the Natural Areas, in general (Impact RE-7 on Draft EIR pp. 261 to 262; Impact RE-7 was further clarified and expanded in Response RE-2, RTC p. 4-313). With respect to increased use of the Natural Areas by visitors, the EIR finds impacts to recreational resources to be less than significant (Impact RE-1, Impact RE-4, and Impact RE-7). Refer also to Response RE-13, RTC p. 4-347, for a discussion of the effect of the reduction of DPAs on other DPAs in terms of recreational capacity.

With regard to biological resources, the EIR finds that impacts to protected species, their habitat and sensitive natural communities (including wetlands and riparian habitat resulting from increased visitors), and use of the Natural Areas by dogs would be significant, but would be reduced to less than significant with implementation of Draft EIR Mitigation Measure M-BI-1a, Protection of Protected Species and Riparian and Wetland Habitat, p. 298. The EIR also concludes that cumulative biological impacts resulting from the proposed project in combination with the GGNRA Dog Management Plan could be potentially significant and unavoidable (Draft EIR pp. 345 to 346). The Initial Study found erosion-related impacts to be less than significant (Initial Study pp. 111 to 118).

Increased use of the Natural Areas is discussed throughout the Draft EIR, including, but not necessarily limited to, Draft EIR pp. 256 through 259 ("Increased Use of Neighborhood and Regional Parks"); Draft EIR pp. 261 through 263 (cumulative recreational impacts caused by increased use); Draft EIR p. 292 ("Projects implemented under the SNRAMP can be categorized as either routine maintenance or programmatic projects involving large-scale weed removal, large-scale erosion control projects, trail modification, or other projects involving an increased use of an area"); Draft EIR p. 294 ("Operational impacts associated with the SNRAMP include increased foot traffic in areas of new trail creation"); Draft EIR p. 443 ("Implementation of the proposed project could result in a minor increase in vehicle trips from Natural Areas Program staff vehicles and visitors due to increased use of the Natural Areas"); and Draft EIR p. 444 ("The Natural Areas could experience increased use because of the improved trail system").

Other impacts related to dog use are addressed throughout this RTC document, including, but not necessarily limited to, Response BI-9, Contamination from dog urine, RTC p. 4-383; Response G-24, Data on disturbance to breeding birds at Lake Merced dog play area, RTC p. 4-95; Response G-26, Social impacts of dog ownership and reduced dog play areas, RTC p. 4-114; and Response RE-13, Effect of the reduction of DPAs on other DPAs in terms of recreational capacity, RTC p. 4-347.

Therefore, the Draft EIR appropriately analyzes the environmental impacts of the proposed SNRAMP, its potential to increase visitor use and dog use, and identifies mitigation measures where such effects could result in significant environmental impacts. The comments do not present substantial evidence that the analysis in the Draft EIR is inadequate or inaccurate.

**Comment G-18 Disagree that dog walkers should be limited to seven dogs**

The response to Comment G-18 addresses all or part of the following individual comment:

Tondelli-1-01

- I am writing to you as a concerned professional dog walker and resident of San Francisco. I strongly feel that the new proposed legislation restricting professional dog walkers to a maximum of seven dogs is simply disadvantageous for dogs, responsible dog owners, professional dog walkers, and the city of San Francisco. Dog walkers provide an invaluable service that many dog owners rely on to keep their dog well exercised, sociable and mannered. Furthermore, professional dog walkers help keep parks and recreation areas clean and maintained. I am not in opposition of regulating professional dog walking; in fact I support it as the industry is growing and regulation is long overdue. However limited the number of dogs to seven simply is not financially sustainable for myself and other professionals in this industry. The loss in income from losing one full time client is approximately $6,500 per year, which is a significant portion of my income. I feel that I speak for all dog walkers in the city of San Francisco when I say that there is nothing I would love more than to continue providing this necessary service in a professional manner, however this proposed legislation is something that I may not be able to overcome financially. I believe the most beneficial course of action is to follow the recommendation of the Commission of Animal Control and Welfare of San Francisco. The ACC proposes that professional dog walkers should be limited to eight dogs and adhere to strict, professional business practices including a thorough permit process, education and accountability. Eight dogs is a very reasonable limit that a professional dog walker can certain handle with professionalism and attentive care, and also is more financially sustainable. Please consider revising the proposed legislation to concede with the eight dog limit recommendation from the San Francisco ACC. I truly feel that this is the most beneficial to all parties who participate in dog walking services, including other park users. [Tondelli-1-01]

## Response G-18

This comment expresses the opinion that the new legislation restricting professional dog walkers to a maximum of seven dogs is disadvantageous for dogs, responsible dog owners, professional dog walkers, and the City of San Francisco. The comment addresses an issue that has been legislated by the City, but is not within the scope of the SNRAMP. The SNRAMP does not propose limits to the number of dogs a dog walker can walk.

| **Comment G-19** | **Support for maintaining or expanding amount of dog play areas/Opposition to reducing DPAs** |

- Dog Walkers and dog owners are the biggest reason McLaren Park is now a safe please to take your dogs and kids. Drug dealers and other undesirable people felt uncomfortable using the park and stayed away because of the dogs.

In my opinion, McLaren Park was designated a "dog park" and should remain so. All the other dog parks should remain without change to preserve the sanity. [DB-1-01]

- Without any demonstrated evidence of impacts from dogs, there is no justification for excluding people with off-leash dogs from natural areas. There is, therefore, no justification for the closure of the DPA at Lake Merced, nor for the reductions in the DPAs at McLaren Park and Bernal Hill. [SFDOG-2-04]]
- decreasing or eliminating off-leash play areas is not fair to the responsible residents who choose to bring their dogs with them to public parks, and doing so would greatly decrease their quality of life. [SFSPCA-1-01]
- I am completely against the elimination or reduction of city dog parks by San Francisco Department of Parks and Recreation. Dogs and their owners need MORE space for off-leash recreation, not less. Returning parks to their natural, original state should NOT be the goal of a parks and recreation department of a major metropolis. Many needs must be balanced and it is unfair of you to ignore the needs of 150,000 dogs and their owners who reside in San Francisco, especially since a major federal agency (GGNRA) is trying to eliminate off leash recreation from a major part of their land. I urge you to abandon your Natural Areas Program and let people go to nearby natural areas like Big Basin, Yosemite, or Muir Woods, for example, if they are looking for an experience in nature that they can't find in a city. But please, don't try to make San Francisco into Yosemite. [Adams-L-1-01]
- I am writing to express my deep concern over the above-referenced plan, which threatens to reduce and even eliminate many of the city's dog-play areas. As a person who struggles with severe depression and bipolar disorder, being able to spend time with my dog outdoors and seeing her run free contributes to my regime of mental health. This may sound trite, and I realize that it's difficult to understand mental disorders, but finding ANY way to smile is a big challenge for people like us. My dog is my 100% true companion, and she is sensitive to my moods and patterns. By keeping a "smile" on her face, she keeps a smile on mine. [Ahlberg-1-01]
- If you are forced to restrict dogs from certain areas, I request that you add an equal or greater amount of acreage adjacent to the DPA. I also ask that dogs be permitted to play in the reservoir at McLaren.

  Dogs play a vital role in the life of the city and ours does in our family. The exercise and joy she brings would be challenged if we lost access to those areas, especially McLaren. [Beberman-1-01]
- I am writing you today to beg you to reconsider the plan to eliminate or reduce off-leash dog areas in the city. These areas are so important to the mental and physical health of our dogs and our people. Please don't let this flawed report by the NAP convince you to take such drastic measures. Please be the voice of reason. You must listen to the howling of the dogs and the people! [Browning-1-01]
- I implore you to reconsider the NAP EIR plan. I have 3 dogs, all of them rescued, and I the off-leash areas in the bay area are crucial to their well-being. I take them to Ft. Funston,

Bernal Hill, McLaren Park, Alamo Square Park, Glen Park, Dolores Park, Alta Plaza Park, Golden Gate Park, Esprit Park, McKinley Park and Stern Grove. I am diligent about picking up after my dogs, and about making sure the dogs are not destroying the vegetation. I pick up after other people's dogs when I see it has been left there. Even if you don't care about dogs, you must recognize that eliminating these areas will have a SIGNIFICANT negative impact on the people who live with these dogs. Please do not let this happen. [Browning-2-01]

- PLEASE, PLEASE, PLEASE don't do this! The NAP EIR seems to be biased speculation; how can you drastically reduce the off-leash dog areas for thousands of dogs based on speculation? Please consider the impact of this plan on the citizens and the remaining dog parks. DO NOT DO THIS! I am begging you! [Browning-3-01]
- I am a dog owner, like so many other San Francisco residents. The Natural Areas Program already plans to eliminate dog play areas in San Francisco city parks, and if it is expanded, it could eliminate large swaths of off-leash dog walking areas at McLaren Park and Bernal Hill. I walk my dogs in these parks and appreciate the fact that they are large enough that I can get some exercise while also exercising my dogs. If these large off-leash areas are made smaller or eliminated, it will negatively impact me and thousands of other dog enthusiasts in San Francisco. Meanwhile, there is currently no way for San Francisco residents to propose new dog play areas in city parks. Thus the NAP could take away our current areas and leave us with no way to propose new dog play areas. [Buffa-1-02] [Cerf-1-02] [Hooker-1-02] [Minsuk-1-02]
- We are opposed to the elimination of off-leash dog walking as proposed in the NAP EIR.

  We have walked our dogs off-leash since 1989 without incident or without harming the natural habitat of many of the parks, including Glen Park, Bernal Heights, McLaren Park, as well as the GGNRA Beach areas – Fort Funston, Crissy Field & Ocean Beach.

  We walk our dogs as our way of enjoying the parklands. As taxpayers, we are opposed to NAP's attempts to stop us from exercising and enjoying the parks, especially since there is no proof that dogs off-leash cause harm to plants & wildlife.

  Those of us who walk dogs are a community and it is a diverse & fun community where we get to interact with people from all backgrounds and form bonds & friendships. DPA closures would severely impact this and for no clear reason! [Butler-1-01]
- I am a San Francisco resident of many years standing now and for a long time have also lived with and roamed with a dog. I wish to go on record against the proposed restrictions. First, if one were to look at old photographs of this City there were sand hills and rather barren landscape in many of the areas now being proposed for "restoration." This city needs to respond to the needs of its current residents and not turn its back on us. [Carrington-1-01]
- I'm writing to voice my concerns over closing and reducing public access areas where I can exercise with my dogs. We need more areas not less, that's why there's pressure on the few areas we can go. [Cech-1-01]

- I'm not a resident of SF, but a frequent visitor. I don't quite understand why SF is looking to drastically restrict off leash access for dogs in the park lands. SF has some wonderful extremely open lands that have been preserved. To consider these "natural" areas is a bit over stating the reality. They are open space, but have long since been transformed from wilderness as a result the urbanization around the area. You could consider this to be a shame, but actually its part of the history of the city. I don't believe anyone in New York City is hoping to return natural habitat back to central park. I think some restriction to offleash dog access is reasonable. For example, if you have an athletic field, its annoying to have offleash dogs to start chasing balls when a soccer team is playing - and of course, nobody wants to step in dog poop in a picnic area. If SF Parks wants to make ON leash access to dogs a general policy, then please set aside generous, fenced, off lease areas. People who use dog park areas tend to be frequent users of the park, and even become a sub community. If you foster this sense of community among the users of off lease dog areas, you'll find the community will police and pick up after itself. This is my observation as a participant in a few informal dog play areas. [Chase-1-01]

- I am writing to express my utter dismay that the city would consider eliminating our ability to bring dogs to several of the city's parks. I walk my dog many times a week at Bernal Hill. It is full of people walking their dogs, and one of the only nearby areas where dogs can run off leash. With all the problems facing our city, I think it is insane to make it harder for dogs, which there are more of than children in San Francisco, to have an opportunity to run and exercise, not to mention the enormous physical and mental health benefits to their owners of that exercise as well. Part of why I felt okay about raising a dog in the city is that I thought I could count on there being off leash facilities near my home where both I and my dog could get exercise. Your potential actions threaten that and I see no good justification for prioritizing some return of some plants over the use of the parks by residents and their pets. [Chasnoff-1-01]

- I am a long time resident of San Francisco. I am writing to express my deep concern about the proposed cuts to off-leash dog walking areas in the City. If off-leash areas are restricted it will mean more dogs, squeezed in to less space. This could lead to increased aggression and will negatively impact the environment.

  One of the things I love most about San Francisco is how dog friendly it is. Dogs are an integral part of many families in the City. They help ensure that families get out and exercise, and provide much valued company for many elderly residents. Dogs give us so much, please don't take away their space. [Corvan-1-01]

- I have lived in San Francisco for all of my 61 years and have always been a responsible dog owner. I live right next to McLaren park where I can let my "well behaved" dogs run free for a little bit each day. I am very respectful of those that are afraid of dogs and put their leashes on. The neighborhood I live in (ma Ct.) has a person with two huge pit bulls and they are stuck on a 6 x 6 deck at all times. In all the years I have lived here I have only seen them out for a walk once and that's pretty pitiful to do to dogs. Having said that, she is the same person that calls the cops on my dogs if I try to play ball with them in the cul-de-sac, therefore their only play time is in the park. Time & money would be better spent on

something "important" and not leashing up our dogs. I live in the last house and the lot next to me is completely vacant. This city has gotten to be so dreadful with all the rules and regulations. Please don't make me leash my dogs for the 15 minutes they get to be free. [D'Antonio-1-01]

- I can understand, then, the urgency in maintaining a level of integrity to these areas in the urban milieu. The effects of human activity and traffic is doubtless a prominent issue. In that regard, what concerns me is the closure of dog play areas. I am not convinced this is the best option. One reason why is that so many DPA's are in or adjacent to natural areas, and I'm afraid it would set a precedent which would be overly restrictive to the dog/human population. [Demetrious-1-02]
- Your recommended closures and limits on off leash dog areas is unfair & unwarranted in this economic struggle. These areas are large enough to have both natural areas for dogs to run in and places where natural habitats and endangered species can keep a foothold. Try putting some attention to the needs of the elderly, children & homeless. There are so many more important issues that really impact the quality of life of our citizens.

  As a founder of Greenpeace SF, a lifelong member of Sierra Club, Audubon Society, Nature Conservatory, CA Native Plant Society and many others, I have a good understanding & appreciation for the needed balance between use, & destruction of ecosystems. Please do not take away these places in our Bay Area where families and furry friends can run free, feel the sunshine on their faces, get exercise & feel proud that our government officials can understand and support what it means to go take a walk in the park. [Devine-1-01]
- I am writing about the plans to eliminate dog play areas that are adjacent to NAP areas. I have two large dogs who need exercise (ie running off leash on a regular basis) and I need the exercise I get when taking them for walks in recreational dog play areas. I have been walking my one dog in Bernal Hill for years, and he and I both love it. We are respectful of the plants and stay on the trails where they exist, and I feel like dogs are an important part of the area, so many people from San Francisco go there and seem really happy, enjoying the view, and letting their dogs get the exercise of running, which they cannot do on leashes.

  Native plants are important, and I am myself a native plant lover, however I do not see restricting dog access as the solution to the problem of establishing native plants in San Francisco. [DeWitt-1-01]
- I implore you to keep these spaces available for all San Franciscans and their dogs. [Donovan-1-04]
- I writing to register my profound objection to the closure of any part of Bernal Hill to off-leash dog recreation. I have been a homeowner living 2 blocks from Bernal Hill park since 1994 and have been a dog owner for all but 2 of those years. For all of those years I have been using the hill to exercise my dog and myself.

  I am also a passionate environmentalist. I am constantly delighted to see the variety of native wildlife found on the hill and have seen no evidence that it is impacted by the presence of off leash dogs. I regularly witness the presence of ground mammals such as squirrels, raccoons

and possum (its a beautiful walk at night). There is a thriving raptor community that hunts on the hill. We even had a coyote living on the hill one year. None of these species would be presnt if of leash dogs were a problem.

I appreciate the need to protect our native wild lands, but the continued closure of parkland to off leash dog exercise does not address the genuine human damage caused by pesticide use, urban crowding, off road biking, etc. Dogs have become a scapegoat. And should these closures go into effect who is going to enforce them? The city and county of San Francisco does not have the resources to manage the regulations already on the books. Why burden the government with additional, meaningless regulatory responsibility. [Dotz-1-01]

- However, any program implemented should not reduce or eliminate current recreation access in any way. Specifically, I object to the proposed reduction of dog play areas at McLaren Park, Bernal Hill and Lake Merced, especially in consideration of the proposal by the Golden Gate National Recreation Area proposal to ban people with dogs at most of the recreation areas it manages in San Francisco. [Emanuel-1-02] [Emanuel-2-02]
- I am a dog owner, like so many other San Francisco residents. The Natural Areas Program already plans to eliminate dog play areas in San Francisco city parks, and if it is expanded, it could eliminate large swaths of off-leash dog walking areas at McLaren Park and Bernal Hill. I walk my dogs in these parks and appreciate the fact that they are large enough that I can get some exercise while also exercising my dogs. If these large off-leash areas are made smaller or eliminated, it will negatively impact me and thousands of other dog enthusiasts in San Francisco. Meanwhile, there is currently no way for San Francisco residents to propose new dog play areas in city parks. Thus the NAP could take away our current areas and leave us with no way to propose new dog play areas. San Francisco is a city with limited open space. I rely on the open spaces we do have to get out into the outdoors and get some exercise. We cannot afford to give up recreational space in San Francisco to make way for more native plants. Less recreational space will negatively impact the quality of life in our city. [Fasman-1-02]
- I think dogs should be of leash because they should have the right to they have feelings and thoughts like us [Form Letter-1-07]
- I can't throw a ball with my dog on a leash!! And I'm responsible enough to pick up after her?? Much like other dog owners! [Form Letter-1-08]
- When you (GGNRA) were asking for my support, you were saying that you would protect my open space areas from development, that you (GGNRA) would protect my right too continue to recreate in the ways that I have since my birth. Dog walking is my only source of recreation/excersize. You (GGNRA) are adding to my mistrust of government. Stop The Lies! [Form Letter-1-11]
- Well exercised dogs are less stressed and better behaved in public. This is also better for public safety. [Form Letter-1-12]
- I am 100% for off leash not fair to our dogs of SF CA [Form Letter-1-13]
- Dogs need open space also! [Form Letter-1-14]

- I use city parks and would like them to stay off-leash [Form Letter-1-15]
- Dogs off leash are better socialized! [Form Letter-1-17]
- We need off leash areas for our dogs to play! [Form Letter-1-18]
- I walk in city parks. Taking away access for my dog and I impacts my ability to have the health benefits and quality of life living in this area. This is a huge social outlet for me. [Form Letter-1-21]
- Most dogs are not disruptive. To curtail their activities, i.e. keeping them on the leash actually creates more behavioral problems with canines … [Form Letter-1-28]
- These proposed closures will negatively impact my life. I might have to move away from SF if implemented. [Form Letter-1-31]
- Please keep Golden Gate Park oak woodland safe for dogs and legal off leash. [Form Letter-1-32 ]
- Please don't take it away! [Form Letter-1-33]
- Keep parks for everyone, it's what make this livable! [Form Letter-1-35]
- As a disabled person I am concerned with the loss of accessible opportunities for me and my dog. [Form Letter-1-37]
- Pls keep off leash available. [Form Letter-1-38]
- We need open spaces for BOTH dogs and people to spend time. DON'T take the parks away from the animals & people. [Form Letter-1-39]
- Keep off leash available *PLEASE*!!! [Form Letter-1-40]
- For our generation, keep dog areas open [Form Letter-1-47]
- Dogs are better dogs with off leash time. [Form Letter-1-49]
- I am a responsible dog owner & pick up/clean up after my dog. I appreciate the environment as much as my dog & if it weren't for off-leash parks, we would not have a place to run & exercise freely. Please, keep parks off leash & I will keep it clean. Thank you. [Form Letter-1-52]
- Keep them open! [Form Letter-1-53]
- To hear that the areas to walk dogs off leash are planned to be reduced leads me to wonder if the plan was really thought through to the impact it would have. I would like to know if the it was taken into consideration that people who walk their dogs off leash actually use a park more than people who do not walk a dog off leash? On any given day, no matter the weather, you will find a person walking their dog off leash, whereas a person who is walking for exercise will opt to walk at a mall or on a treadmill. So by restricting off leash dog walking you really are restricting an individuals right to exercise. [Gachowski-1-01]
- I am sad to hear that there are people that wish to change this and i believe that they don't understand how important and how vital off leash recreation is for the well-being of dogs

and their families. My family is so much happier and alive when we can walk our dogs at places like Fort Funston and Stern Grove. Off-leash recreation has my full support. Please let me know if I can provide any additional information. [Garnett-1-01]

- I am a dogowner and dogwalker, and I use the off-leash dogwalking areas in Bernal Hill and McLaren Park on a daily basis. I recognize the importance of native plant preservation, but I don't feel that it's appropriate to prioritize these projects in urban parks at the expense of these tremendously popular off-leash dogwalking areas. I feel that the first and foremost mission of urban parks should be to promote recreational opportunities for the citizens of San Francisco, and, since so many of us enjoy exercising with our dogs, off-leash dogwalking areas should at the very least be maintained in their current state. Additionally, given that citizens of San Francisco currently have no means of proposing new off-leash areas in parks, the reduction of current dog recreation areas would increase use of remaining areas, possibly to the point of negatively impacting them. [Gordon-1-02]
- I wanted to submit my comments regarding the elimination of close to 80% of dog play areas. I live in San Francisco and am a responsible dog owner. It makes it increasingly difficult to remain a responsible dog owner if the city continues to eliminate dog play areas. I believe most dog owners agree that our pets are like parts of our family and residents of San Francisco love living here. Please keep our dog play areas available so we can continue to love both our family pets and living in San Francisco.

  I understand the desire to keep the habitat natural and not have dogs ruin that. In fact I support it. But eliminating the dog play areas is not the way to do it. I bet if you ask the dog owner community that uses these dog play areas they will be more than willing to help encourage the growth of natural plants in any way possible. Whether it be enforcing the boundaries of the dog play areas or contributing to the cause financially. Please help us keep our dog play areas available to us. [Greenberg-1-01]
- As a San Francisco resident and dog owner for 16 years I'm appalled at the proposed changes to off leash dog play areas in SF parks based on NAPs EIR. They don't seem to have any hard facts that dogs, indeed, cause erosion and harm to natural areas. In my own experiences at Fort Funston I've seen massive dune damage done by teenagers and their parents "sledding" down the dunes. With a growing number of families adding dogs to their households any reduction of outdoor off-leash play areas would be negatively impactful on the spaces that do remain. I regularly use Glen Diamond park, Bernal Hill, Holly Park, MacLaren Park and Fort Funston to walk with my dogs and often observe dog owners picking up trash and performing plant maintenance. The negative impact of reducing available off leash play areas would be detrimental for EVERYONE …. [Grim-1-01]
- I am a dog owner and a dog lover, as are thousands and thousands of others in SF. The plan by the Natural Areas Program Plan is seriously flawed and must be stopped. There is no proof that dogs are destroying the natural areas. Don't allow these anti-dog people to ruin it for thousands of people and their dogs. We need to be able to continue taking our dogs to Ft. Funston, and Bernal Hill, and McLaren Park and all the other off-leash areas. Dogs are an important part of our society. Please listen to the dog owners. Thank you. [Hammer-1-01]

- As a resident of SF, and owner of a dog, I think of SF as a dog friendly city. Your wanting to restrict off leash areas is ridiculous. You should be looking to increase off leash areas. [Hartnett-1-01]
- I understand this is a "hot-button" issue for so many folks on both sides. I understand both arguments and seek a healthy compromise. Your leadership is crucial. First, don't forget the montre of all responsible politicians – if it is not broke, don't fix it. Second, if there are serious issues and concerns requiring some action, let's think of ways to address specific problems, including perhaps: 1) better fencing of our parks; 2) City-provided doggy poop bags; and 3) Park and Rec lead clean-up days in which the dog owners could be put to work to keep the parks in nice condition. [Hershkowitz-1-01]
- As a lifelong San Francisco resident with both a young child and a dog, I'm writing in support of maintaining the current off-leash areas. While it's wonderful that areas are being restored, let's allow all San Franciscans the opportunity to enjoy our parks. There are already very limited areas allowing dogs off-leash so would be great if they could be maintained at current levels. My mother, Christie Hochschild joins me in voicing our support for off-leash areas as well. [Hochschild-1-01]
- I request that you drop your plan to close the parks to dogs for habitat restoration. There are many, many dog owners in San Francisco. I believe that dog owners will vote their interests and there is no reason to assume that the SF Planning Department is beyond the influence of the will of the voters. [Huebsch-1-02]
- I am dismayed to learn that these dog walking areas are being considered for closure or reduction in size. Why would any urban city seek to discourage the health of its families? [Hull-1-01]
- The NARMP EIR acknowledges that the NARMP plans to close 15% of the DPAs in city parks immediately, when added to the GGNRA's desire to cut off-leash access by 90%, will have a disastrous cumulative impact on remaining off-leash areas in city parks and on recreation - however, the EIR does not analyze what that cumulative impact will be. This is a huge deficiency in the NARMP EIR! [Jake-1-02]
- My off-leash times with my dog are virtually the only times I ever use the GGNRA. Please let us keep the R in GGNRA. [Karpa-1-01]
- Ten times the space allotted to dog play is already restricted for people with dogs; in other words, we have use of one-tenth the space. If you dare to take even more space away, people with dogs may rise up to demand true representation of our actual real demographics by City employees rather than tolerating the way some City employees seem to represent only the interests of a small minority who unrealistically want to simulate wilderness in the middle of a major urban center at the expense of local people and their dogs.

  Although many of us pay taxes for public schools and do not begrudge a penny of it, all we need is open space for people and our canine family members. [Keats-1-01]
- Please do what you can to preserve or expand off-leash dog walking space in San Francisco parks. I don't own a dog, but my children and I like seeing dogs roaming freely in our parks

and support the rights of our dog-owning neighbors to enjoy our parks while letting dogs be dogs. [Kenealy-1-01]

- I am very much opposed to the NAP that would close the Lake Merced dog play area and reduce off-leash dog recreation on Bernal Hill and in McLaren Park. I believe enough land has been set aside for the preservation of native plants within our urban environment. These are areas where residents of San Francisco, myself included, regularly walk with their dogs and their children. [Kind-1-01]
- Open offleash is already so limited and busy. Please don't curb access. [Kovinsky-1-01]
- I am writing you in regarding on some of the public parks closures to dogs environmental impact report (EIR). I am asking you do not take away this beautiful city San Francisco provides to people and dogs. Dogs need places to run just like people need open space for outdoor activities. Dogs do not ask anything from human and they do not have voice. Let them have what nature can provide to them. [Lee-P-1-01]
- I have a dog and use many of the parks listed in the EIR report for dog play recreation. McLaren Park is my favorite park for off leash recreation. The park is large and has ample trails and areas for dog walkers. The park has struggled for years with perceptions of isolation and unsafe conditions. The introduction of large numbers of dog walkers in the past decade has increased park safety-- more people, more eyes on the trials-- has seen a big increase in people feeling comfortable walking alone in the park. This is also backed up by crime statistics. [Litehiser-1-03]
- Dog parks add to a community and as a friend of mine Amy Breeze once said "dogs make people more human." I have seen this over and over again and have experienced this myself. In a world when it seems most people are texting, talking on their smart phone or have head phones on and do not interact with each other, in dog parks you will see just the opposite. We are a little more "human" when we are at the dog park and educating park users and having guidelines for dog parks makes a difference, just take a look at Point Isabel across the bay the largest off leash dog park in the nation managed by East Bay Regional Parks District. [Lundeen-1-01]
- Hey this dog stuff is way crazy…I am opposed to this for many good reasons. Live and let live… [Lynch-1-01]
- Please preserve the few off-leash areas left in the city for our pets – it's important to us! [Madar-1-01]
- I implore you to not support a plan that will reduce the amount of off leash dog areas in this city and it's surroundings. When you consider the sheer number of active dog owners in the bay area you quickly realize that the existing off leash open space areas are already at a minimum. One visit to Fort Funston or Crissy Field on any given weekend day (or week day, for that matter) will give you an idea of the massive volume of dogs that enjoy it. Reducing these types of areas will force other areas to become dangerously crowded. Another group of people who will be severely impacted are the dog walkers. What do you think will happen to these professionals when their "office" is reduced so drastically? I speak from experience

when I say that the number of ill mannered dogs and, hence, ill mannered dog owners, are the minority. And I wish for there to be consequences for those folks. Perhaps the threat of fines could be introduced to discourage bad behavior (people who let their dogs out of their site, bring overly aggressive dogs, do not pick up their dogs waste, etc). [McCalla-1-01]

- I want to add my voice to the objection of closing all DPAs in Management Areas 1 and 2. If they, and those spaces like them, SF will become an even more difficult place to live in. The desirability of living in this city is closely tied to the ability to escape with my dog in not only 'non-urban' spaces but the variety of environments to do so. In my experience, those people that respect the non-dog people, environment, and picking up after their dogs are the vast majority. Like in any group, there are careless people (with kids, cars, bikes, etc) and education is an ongoing process! [Miller-J–1–01]
- In reference to the Natural Areas Program desire to limit or deny the presence of people with dogs, I am very concerned that any group would wish to deny another group's right to freedom of recreation. We have co-existed peacefully. We, the dog owners, do not wish to deny the NAP their rights, and I sincerely hope that we can both peacefully continue to enjoy our rights as we have in the past. [Miller-N-1-01]
- It will bring such great sadness to so many people and families to have these areas closed off to people and their dogs. So much of the world has been walled off in my 70-year lifetime. We need to be able to walk, hike and take our dogs with us so we can still feel our relationship to the Earth. These are almost sacred places for us, and our lives will greatly impoverished without them. [Monagle-1-01]
- I am in favor of expanding and opening new dog off leash play areas. [Mundy-1-01]
- As a concerned citizen and owner of a well-trained dog (puppy 1&2, SFSPCA animal assisted therapy, SFSPCA agility 1&2) it is of vital importance that we maintain the status quo of current off-leash dog areas in San Francisco. By reducing the current size and/ or number of off-leash dog play areas, 1) the potential to introduce crowding (an environment where dogs can often get aggressive) and/ or 2) Force owners to utilize marginal areas which could end up causing more degradation of NAP areas; grows. [Norton-1-01]
- First, as always, this plan would seriously restrict off-leash dog-walking areas available. I am a 64-year old woman who walks daily in McLaren Park with my two dogs. It is a matter of health and well being for us all that we can walk up and down hill for considerable distances. My doctor is always pleased to hear that I am getting this regular exercise-my dogs are inspiration, companion and, should it be necessary, protector. To deny them access to the wonderful open space we now enjoy in McLaren Park would be to deny me an important avenue for maintaining my health. I am sure this is true for many people throughout San Francisco. [O'Neill-1-01]
- I needn't tell you about the positive impacts dogs have on our community. Dog owners make our city's parks safer (e.g. look at the history of Dolores Park). I'm writing to encourage you to think through alternatives to closing off leash dog runs, particularly given that the draft environmental impact statement by the Golden Gate National Recreation Area has

already shown no direct link between dog walking and any environmental damage in GGNRA lands. [Olliphant-1-01]

- I am a dog owner and resident of San Francisco for the past 11 years. I appreciate the recreational space we have in the city to exercise my dog and to feel these health benefits myself, especially at Bernal Hill. We adopted our dog from the San Francisco SPCA and by nature of her herding breed she is a high energy dog that requires considerable running daily. We see this exercise as maintaining her good health and is the secret to her behavioral well-being. Like most residents in this city we do not have our own garden and completely rely on the recreational space of parks for exercise for canine companion. If the dog play areas described in the The Natural Areas Program are to be eliminated in San Francisco city parks, where will we go with our dogs? And will this be a continuing trend where we will loose more areas in the future? The reality is that San Francisco is a city of dogs, and dog lovers who are largely responsible contributing citizens. Please consider alternative areas to our recreational space to grow more native plants. Together we can support both efforts. [Perrins-1-02]
- I am opposed to the closure of the DPA on Bernal Hill, McLaren, and Lake Merced.

  We have lived in Bernal Heights for 13 years, just a block from the Hill down Wool Street. We have three dogs and two kids, and our entire family relies on access to this incomparable recreation space. It is integral to our urban quality of life.

  With more dogs than children currently living in San Francisco, we need to find ways to encourage healthy, sustainable use of our open spaces, not restrict dogs to more confined sites. A whole host of problems will come of that kind of crowding.

  Please keep Bernal, McLaren, and Lake Merced open to dogs and people. [Perry-J-1-01]
- One of the joys of living in San Francisco is the availability of so many dog-friendly areas, both on and off leash. Since we live in the western part of the city, most of our walks take place there. It's a huge concern to me that so many dog play areas are being threatened by the Rec and Park Department's proposed Natural Areas Program. I have been a member of the years of both the Sierra Club and the League of Conservation voters, so I am very aware of the impact on the environment of various activities. However, I don't believe that restricting off-leash recreation in this urban setting and replacing it with "natural" flora is the best decision. [Popoff-1-01]
- The EIR's arguments to remove off leash dog areas are not solid and ignore the actual usage of these areas by the city's inhabitants. The EIR's analysis is incomplete and bases many arguments on "potential" negative impacts not on data. Who is present in the parks in sunshine and inclement weather 365 days a year? People with dogs are. With the health department's focus on obesity, how can a plan like this that limits access to recreation areas be accepted? People often acquire dogs to get them out into nature, get them exercising and get them socializing. It's scientific fact that dogs help reduce stress and blood pressure in people. Shouldn't we try to improve life where we live instead of reduce its quality? The SPCA argues that dogs need off leash areas to keep aggression down in dogs. The dog

community in San Francisco is well known and provides great sense of belonging and community to many neighborhoods. To repeat a statistic I'm sure you know, there are more dogs in San Francisco than children. This reflects the importance of dogs in the lives of the city's inhabitants, voters, tax payers or however you want to describe us. EIR's are to take into consideration the impact on the communities that surround the areas in question and this one does not. I ask how can a dog chase a ball on a leash? I have suffered from mobility issues over the past year due to injuries (as do many of our dog owning residents, especially the elderly or disabled, a large dog owning population in my observation), and if I had not had access to areas where my dog could run free, the situation would have been inhumane. While I could get around enough to pick up their waste, providing the necessary exercise was medically not recommended or possible. [Pruitt-1-03]

- Also, do not restrict off leash access for dogs. Exclusion is not going to solve any problem. History shows, however, it always does. San Francisco is a tolerant, inclusive city, which is what makes this city feel more European than most. Go to London, off leash is the norm at all the wonderful parks. The experience increases the inhabitation of the parks, which are beautiful, and the gross of people and spread of dogs makes them safe and lovely. Restricting off leash access is simply discriminatory. Look at who is out there walking dogs. The majority are older people. Notice the sense of community this builds. These people are out getting exercise, meeting people, building community. Please, take actions that strengthen unity and community rather than tear it apart. [Quinn-1-02]

- I oppose, in the strongest terms, any expansion of the Natural Areas program at the expense of existing off-leash areas. Areas which are off-leash areas are multi-use; I see other people who are not dog owners using the park, and we all co-exist nicely. Designating the off-leash areas as Natural Areas would affect more people than just the dog owners.

  It is disturbing to me that there is no way to propose new dog play areas, should any curtailment occur, and in any case the approval process is sure to take years and leave dog owners who own dogs now without recourse. [Raffaelli-1-01]

- I'm a pet/dog owner in the city of San Francisco, and I understand that there are park areas that may be closing soon--or are up to discussion regarding closure. I won't be able to attend the meeting on October 6, but I want to note my support for dog parks in the city: both on-leash and off-leash areas (for dogs under voice command); the GGNRA's newest policy amendments to reduce spaces for dogs has been very disconcerting as a pet owner. Places like Muir beach and other notable spots in the Bay Area may soon become off limits. [Randt-1-01]

- I urge the city not to further restrict the areas where dogs are allowed to run free. Far and away the majority of dogs are pleasant and friendly. A few dogs have been badly trained, but they can be (slowly) removed from the parks. And some people just don't like dogs, or are worried about small children. These folks can easily avoid the free dog areas, there's a lot more park space just for people. I'm not a dog owner/guardian, but I do like dogs. [Reque-1-01]

- I am a responsible dog owner. I represent 99% of all dog owners. There is only a small percentage that gives us a bad name, as in any area. If my dog can't run around free, I don't know how I would be able to consume her energy? Dogs need to RUN freely! Secondly, these walks are as much for my dog's health as they are for mine.

  Please let's keep our parks for all, dogs and people. [Rodriguez-1-01]

- Please support off-leash dog walking in the GGNRA and NOT limit current areas. I walk my dog daily, yes daily rain or shine, in either Crissy Field or Land's End. We enjoy walking together off-leash. My dog is trained to remain nearby and to respond to my recall. I pick up her waste and we keep to the trails. The NAP EIR does not convince me putting dogs on leash will have a favorable impact nor does off-leash walking have any unfavorable impact. In addition, I've observed much unfavorable impact by people using these areas such as walking through native plants without regard as well as other negative items such as loud music or leaving behind trash. It seems that there are many negative aspects attributed to off-leash dog walking and dog owners that simply are not true or untested. Confining all dogs to smaller off-leash areas will not be tenable. There simply does not seem to be enough land devoted to be able to accommodate all the dogs in the city during reasonable used times. Off-leash space is needed and some workable manner can be accommodated. [Roman-1-01]

- I am sure that you have heard all of the comments from hundreds of dog owners in Sf but here is just one more. I adopted my dog over six years ago during a time when both of my parents were quite ill and ultimately passed away. The breaks that my dog and I took at Fort Funston and Chrissey Field beach walk together for a run off leash was liberating for both of us and quite literally helped us to remain strong for my parents. Please help us not lose this most magnificent gift to allow us all to be free. I do understand with a great gift comes great responsibility to be good custodians of the land which I am. I will also continue to be vigilant and outspoken to those that I see breaking the rules. Please help us to save this gift for the 99% who do a good job instead of removing it for the 1% who are just not careful people. [Salamone-1-01]

- NAP reduces the amount of space available for off-leash dog recreation. The dog population is increasing, so this is a clear step in the wrong direction [Schlund-1-01]

- Native Areas are off-limits to people, dogs, and almost any type of recreation. The new proposal could close up to 80% of the legal off-leash space in SF city parks. Added to the new dog management proposal by the GGNRA, the limits on dogs would be severe and unwarranted considering the number of people who wish to walk their dogs in city parks and pay to maintain those parks. [Scott-1-03]

- Please save current off leash areas for dogs. Also add more since there is not enough. There are many dog owners that follow rules and there have been more & more places posted in neighborhood parks: No Dogs Allowed. [Sebastian-1-01]

- As a dog owner and frequent visitor of dog park areas I would like to request that you reconsider the closure of any such spaces. The dog park space my dog utilizes is an integral part of his socialization. [Sharp-1-01]

- It's so important that those of us who share this beautiful part of the world remember the word "share." Dogs and dog people are part of a community of extremely varied interests. For decades, San Francisco has worked to balance and blend those interests – not just informally but under the law. The city's Natural Resource Areas Management Plan could tip that balance away from the needs of the city's responsible guardians and their dogs and undermine their quality of life. [Simons-1-01]
- I am a dog owner and not only should we keep, but we should expand, our dog parks. [Skippy-1-01]
- In my own small back yard, I grow native plants, never use pesticides or fertilizer, allow certain weeds to grow just because of butterflies, let bushes get overgrown for birds, try to grow sunflowers for bees etc. I would like to see more of this type of thing encouraged for the backyards of San Francisco, but I am very much opposed to closing areas where people now go with dogs or with their children (or both!) to devote to more native plant areas. [Smith-1-03]
- I wish to submit my strong objection to the proposal to limit off lease areas in the San Francisco.

  Please have more consideration for the benefits derived from people being able to keep and exercise animals. This seems a little far fetched to me that animals could have such a negative effect on the environment as to want to ban their being able to run loose entirely. The worst fights I have witnessed were in enclosed dog parks like the one in Golden Gate Park. It makes big dogs predatory, small dogs fearful and owners with dogs that are problems tend to bring their dogs to enclosed areas. [Stevenson-1-01]
- Please don't take away dog play space from me (and my dog, Otis!).

  Actually, it'd be useful if you could first explain what the problem is re: Dog Play Areas … I've never heard of anybody saying anything but terrific things about them. Why are people chipping away at these? They're aware that we have more dogs than just about anything else in SF, right?

  Dog Play Areas make San Francisco an amazing place to live. Please, keep them all – or expand them. But don't turn this magnificent city into Brisbane by deleting them. [Stewart-M-1-01]
- I'm writing to ensure that off leash areas for dogs are included in the voices about how we should manage our natural resources in San Francisco. It should be clear that green areas area crucial to a sociable and healthy city. San Francisco benefits greatly from not only allowing it's citizens to be dog owners, but to increase the health of pets and the owners. Many dog owners receive their exercise by walking around with dogs and many of our citizens who can't easily make it out of the house due to anxiety or other issues are coaxed from the house and encouraged to walk more and longer. This effect can't be duplicated by on-leash walks. Even breeds that are smaller and normally are considered lap dogs benefit from a long run and impart their health on their owners. Well exercised dogs are happier, healthier and exhibit a positive impact on the people of a city and their social and mental

health. By having legal places for dogs to run you encourage owners to be more proactive about registration and shots through the calming hand of social pressure. Making off-leash illegal or squeezing it into the shadows this will result in more people who are law-abiding citizens today becoming a concern for enforcement later. Please keep our off-leash areas safe – they are in the city's best interests. [Sutch-1-01]

- I'm writing to express concern regarding the proposal to reduce access for me and my dog for recreation activities and spiritual well-being - the two main uses for me in SF's parks. Hiking with my dog is a main source of exercise for me - it keeps me active and allows me to enjoy nature. I especially enjoy observing the changes that occur with the seasons, such as the many varied mushrooms that sprout up after the rains in the Winter, and the flowering trees in the Spring. I frequent McLaren Park and Bernal Hill, as well as Golden Gate Park and several other parks. [Vitulano-1-01]
- It is ridiculous that your org. keeps attempting to close parks and open state and federal land to dogs and their owners. Some time ago SF govt. put section 8 units all over the city opening up the way to theft, property and civilian harm. We only have our trusted dogs to assist us in protecting ourselves from harm. Dogs, like people, must exercise to remain healthy. If there are no places in the city with wide open spaces to run and play and eliminate then we, the owners, will be forced to use our neighbors lawns and other private property to achieve this function. If you expect the voters in the bay area to vote in improvements for fire and police and parks in general then STOP this outrage against the people of the Bay Area and San Francisco in particular. It is high time that the needs of, We the People, are considered by our elected and appointed officials. Look at what is happening all over America as well as in San Francisco and Oakland. The people are tired of all this oppression and REVOLT is going to be the only answer to situations like this. LEAVE OFF LEASH AREAS ALONE AND CREATE MORE SPACES FOR US, THE DOGS AND THEIR OWNERS, TO OCCUPY. [VonErb-1-01]
- Hello- I was working late last night and was not able to get an email to you ….I am a sf voter/homeowner/business owner and am completely against the nap plan to take over off leash dog areas- there are more dogs than children in San Francisco and the dogs need a place to go. Especially with all that is happening with the ggnra, it boggles my mind to think that the city would ok this action. What's even more distressing is that most dog owners don't realize that it's happening. I take my dogs to Mcclaren park and bernal hill regularly and those offleash dog areas need to remain as such. I am disheartened that this issue is a constant battle. I would think that the city would realize how many dogs are here and how important they are to their owners - who by the way, are the residents and voters of San Francisco. [Werger-1-01]
- I writing to express my opposition to the GGNRA Draft Dog Management Plan. We need place to take our dogs for off leash dog walk. It's vital for our health and our dogs health. Most of the parks-city, state, federal-are either on leash only or does not allow dogs at all. Off leash area is so limited and few. We need those spaces. Please do not take away these spaces but instead expand it. There are 4 millions perfectly adoptable pets being killed in shelters each year. We need to encourage caring people to adopt these pets and we need to give them

a place form the to enjoy time with their dogs off leash. Imagine having to live on leash all your life. You wouldn't want that for yourself. Why make our dogs? Please please leave our off leash areas alone. [Woo-1-01]

- Please realize that dog walking is a wonderful form of exercise both physically and mentally. This is true for both me and Winston. As I would never propose closing parks to people due to the small percentage of people who vandalize and litter, let's not close the parks to off-leash due to a small percentage of irresponsible dog owners. The majority of dog owners are good stewards of the parks of San Francisco and are responsible, caring people.

  I think it is interesting to hear arguments of how dogs have a negative impact on the parks when the facts listed in their own reports prove otherwise. The beauty of urban parks are the diversification of activities that take place nearly every day.

  Please do not be swayed by the small minority of narrow minded individuals who do not understand the true pleasures of urban living! [Zendarski-1-01]

- I don't think that this applies to the National Areas Program. As a senior, whose primary – okay, whose only exercise is walking with my dog, I feel that the increased removal of our shared open space is – by the Natural Areas Program, which is a single purpose exclusionary program, will drive more and more local residents into increasingly smaller areas for exercise, access, and enjoyment of our San Francisco landscape.

  I oppose this unfettered increase of the Natural Areas Program into more and more of San Francisco's parkland and open space, and I ask that you all, as members of the planning commission, recognize that this program removes shared space from the community on the basis of sharply and scientifically contested assumptions about what is native or natural and makes equally unfounded assumptions about what actions, such as walking with one's pooch, can or cannot occur in our shared and all-too-limited San Francisco open spaces.

  Please oppose any expansion of this program. [PH-Pittin-01]

### Response G-19

These comments all express support for maintaining, rather than reducing or closing, DPAs within City parklands. Some commenters also question whether dogs cause damage to Natural Areas. One commenter expressed opposition to the GGNRA Draft Dog Management Plan. Comments related to opposition of the proposed project and opposition to the GGNRA Draft Dog Management Plan do not relate to the adequacy or accuracy of the Draft EIR. These comments will be considered by decision makers as part of their decision to approve, modify, or disapprove the proposed project; however, that consideration is carried out independent of the environmental review process.

Currently, dogs are permitted, on leash, at all SFRPD parks, including the Natural Areas. In fact, within the 31 parks that contain Natural Areas within San Francisco and at Sharp Park, there are a total of approximately 2,724 acres of parkland that would be available for on-leash dog use (refer to Table 5 of the Draft EIR), and additional park acreage is available at other parks throughout the city.

In terms of off-leash dog use, the project proposed by the SFRPD—which is evaluated in this EIR—includes the conversion of 19.3 acres of off-leash DPAs within the Natural Areas to on-leash areas (refer to Draft EIR p. 257) in order to maintain and restore native habitats, while protecting areas of high conservation value. Eighty percent of off-leash areas would remain within the Natural Areas, with more on-leash and off-leash areas provided throughout the city, as further described in Response RE-13, RTC p. 4-347, and Response PD-19, RTC p. 4-189. Both of these responses also provide a discussion as to why each of the DPAs would be reduced in size or closed. Response RE-13, RTC p. 4-347, also summarizes the impacts of the reduction in DPAs on other DPAs in terms of recreational capacity, as well as a summary of the project-related and cumulative recreational impacts identified in the Draft EIR. Refer to Response G-25, RTC p. 4-106, for a discussion of the impacts caused by dogs to Natural Areas.

Cumulative impacts due to management of DPAs in City parks are addressed on Draft EIR pp. 261 to 262. The Draft EIR concludes that the potential effect of combined reductions in off-leash areas proposed by the GGNRA and the SFRPD could result in a significant and unavoidable cumulative impact on recreational resources. This determination assumes future implementation of the proposed GGNRA Dog Management Plan.[35]

To avoid the disturbance of breeding birds at Lake Merced, Management Action LM-7a (on SNRAMP p. 6.1-18) states that the SFRPD and the Dog Advisory Committee should consider relocating the DPA to a different location, and in the meantime, this DPA can remain open, but impacts should be monitored. However, following completion of the final Draft SNRAMP, and during preparation of the Draft EIR, the SFRPD determined that due to ongoing disturbance of breeding birds, this five-acre DPA should be closed rather than monitored (Draft EIR p. 136). Therefore, the text provided in the ninth bullet on Draft EIR p. 136 has been changed as follows:

- LM-7a—Relocate the DPA to a different area to avoid disturbing breeding birds in the current location; (Note: The SFRPD determined following completion of the final draft SNRAMP that, due to ongoing disturbance of breeding birds, this DPA should be closed, rather than monitored. This DPA would be closed in accordance with the SFRPD Final Dog Policy (SFRPD 2002) and SFPUC's Lake Merced Watershed Report (SFPUC 2011). ~~Due to the San Francisco~~

[35] The GGNRA Draft Dog Management Plan/Supplemental Environmental Impact Statement (SEIS), which contained six alternatives, was released in September 2013. Subsequently, in February 2016, the Proposed Rule for Dog Management in the GGNRA was released for a 60-day comment period. On February 24, 2016, the Proposed Rule for Dog Management in the GGNRA opened for a 60-day public comment period on www.regulations.gov (RIN 1024-AE16). The comment period was later extended to 90 days and ended on May 25, 2016. All substantive comments on both the SEIS and Proposed Rule will be documented and responded to by NPS in a Final Environmental Impact Statement FEIS. These comments, along with relevant data, expert opinions, and other facts accumulated during the SEIS and Proposed Rule stages, will be evaluated by NPS to determine whether the proposed solution will help accomplish the goals and solve the problems identified in the SEIS before moving forward with a Final Environmental Impact Statement, Record of Decision, and Final Rule. While no specific alternative has been selected, it is reasonable to assume that a reduction in off-leash dog play areas would occur as a result of implementation of one of the Plan's alternatives.

~~moratorium on new DPAs, the Lake Merced DPA couldn't be relocated to a new location, so it would only be removed.~~ Restoration of the site would continue, following removal of the DPA.)

At Bernal Hill and McLaren Park, the remaining off-leash portions of the DPA would be limited to flat and less-steep areas. At Bernal Hill, 15 acres of the 21-acre DPA would remain and at McLaren Park 53.4 acres of the 61.7-acre DPA would remain.

Refer also to Response G-1, RTC p. 4-13, which provides dog count data, indicating which DPAs are the most and least used.

**Comment G-20 Support for reduced dog play areas as proposed in the SNRAMP**

The response to Comment G-20 addresses all or part of the following individual comments:

| | | |
|---|---|---|
| Garbutt-1-01 | Hasbrouck-1-01 | Joyce-1-01 |
| Kathie-1-01 | Lock-1-01 | Masud-1-01 |
| Radetsky-1-01 | Walker-1-01 | |

- I am writing to show my approval of the proposed reduction of DPAs in city parks. I find myself regularly pestered and often harassed by aggressive dogs. The less I see of them the better. [Garbutt-1-01]
- I strongly urge you to make elimination of off-lease "dog play areas" the preferred alternative or, as the next-best alternative, to reduce the amount of public space dedicated to this use as much as possible. Off-leash dogs pose a danger that (1) deprives other members of the public of use of these areas, and (2) cannot be mitigated by training of dogs or other rules.

  San Francisco is one of the densest cities, with the least public space per capita, in the country. Choosing to dedicate space to off-leash dog play, when that denies the use of that space to other would-be users, is an inappropriate use of public land and resources.

  The City and County needs to consider the needs of people first, and pets second. There may be fewer play areas for dogs in the city than dog-owners would like, but dogs don't belong in the city, people do, and there are certainly too few outdoor play areas for people!

  Please, give me back the opportunity to enjoy Bernal Hill without risk of dog assault by eliminating (or reducing as much as possible) the off-leash dog play areas there and throughout San Francisco. [Hasbrouck-1-01]
- Please consider at least closing the un-fenced dog run areas. Both myself and my dog have been attacked when walking near a dog run area and the owners don't have control over their dogs - or worse, as in my case - the owners don't care if their dog attacks someone. [Joyce-1-01]
- I enthusiastically support limiting access of dogs in Natural Resource Areas so that these areas can be enjoyed by people who do not want dogs and dog mess all over their parks. Thank you. [Kathie-1-01]

- I am sickened by the fact that there are so many people out there who believe that the needs of their pets trump the health, safety and welfare of human beings. In addition to fines, confiscation and euthanasia of offending animals, I believe that the pet owners should undergo psychiatric counseling to straighten out their misconceptions that the welfare of pets takes precedence over that of human beings. POWER TO THE PEOPLE! [Lock-1-01]
- I'd like to express my support for additional restrictions on DPAs and off-leash dog access. [Masud-1-01]
- I used to love walking on Bernal Hill, but I have had too many encounters with aggressive dogs with irresponsible owners, and no longer walk on Bernal Hill. I read on SFGate that the city is considering reducing or eliminating off-leash dog play on Bernal Hill. Please, please take this step. The city needs to consider the needs of people first, and animals second. There may be fewer play areas for dogs in the city than dog-owners would like, but dogs don't belong in the city, people do, and there are certainly too few outdoor play areas for people! [Radetsky-1-01]
- I'd like to add my voice to those of us who feel that dogs are overrunning our public spaces. Everywhere I go there are dogs running around, often off-leash, urinating and defecating everywhere, and the owners frequently don't clean up after them. I can't take my children to the beach because people simply let their dogs run wild. I take them to the park and I'm having to constantly hover over them to make sure they don't fall into a big steaming pile or run afoul of some aggressive off-leash dog.

  I want to let my kids run free and play, but I really can't. Instead, they end up in the fenced-in playgrounds while the dogs run free in the tall grass.

  Please add my support to the idea of more public spaces that are simply off-limits to dogs, regardless of leash status, and to the idea of stricter enforcement of existing leash laws. [Walker-1-01]

### Response G-20

These comments express support for reduced off-leash DPAs as a part of the proposed project evaluated in the Draft EIR and are not comments on the adequacy or accuracy of the Draft EIR.

| **Comment G-21** | **No dog group advisory involvement for the Natural Areas Program** |
|---|---|

The response to Comment G-21 addresses all or part of the following individual comments:

Emanuel-1-05 Emanuel-2-05

- It is troubling that there appears to be no representation of people with dogs in an advisory capacity for the NAP. There are many dog groups that are qualified and representative of diverse communities and geographies within the city that would serve well, similar to the other partner groups that participate in this city program. [Emanuel-1-05] [Emanuel-2-05]

### Response G-21

This comment suggests that there is no representation of people with dogs in an advisory capacity for the NAP.

The comment is not a comment on the adequacy or accuracy of the Draft EIR, but a response has been voluntarily provided. As discussed in Response G-3, RTC p. 4-19, the development of the SNRAMP has occurred over about 10 years, beginning in 1995 and culminating in a 2005 Draft SNRAMP, which was distributed to scientists and regulatory agencies for review and ultimately became the 2006 Final Draft SNRAMP. During development of the 2005 Draft SNRAMP, numerous meetings were held with the Park Recreation and Open Space Advisory Committee (PROSAC), the Recreation & Park Commission, other governmental bodies and organizations, and over 3,000 individuals, including considerable participation from dog owners. In June 2005, when the Draft SNRAMP was released for public review, three well-attended public workshops were held throughout the city, and outreach also included neighborhood groups and residents within 300 feet of all Natural Areas. An online survey was also available for individuals and members of the public who were unable to attend in person. Feedback was received from approximately 2,700 members of the public and recommendations were received from three independent scientists. Further, several task forces, committees, and/or working groups were convened as part of this process, including the Natural Areas Program Citizen Advisory Committee, a separate ad hoc group that made recommendations on how to revise the plan, a Science Round Table group that reviewed the Alternatives Report for Sharp Park, and the Sharp Park Working Group. In addition, revisions to the Sharp Park Restoration Plan were also made in response to input from scientists and regulatory agencies, which resulted in additional restoration areas and, as a result, additional impacts to the golf course. Response G-3, RTC p. 4-19, also describes the independent scientific review that was conducted for the 2005 Draft SNRAMP. Also, the Recreation & Park Commission, which is the policy-making body for all department activities, provides an opportunity for public comment at all hearings. There is not a separate NAP advisory body.

| **Comment G-22** | **Recreation and Park Department process for closing dog play areas** |
|---|---|

The response to Comment G-22 addresses all or part of the following individual comment:

NPS-1-04

- Pg. 33, 301: It would be helpful to provide further details on what the process would be to document adverse affects in DPA's and what the order of steps would be to address impacts, especially prior to a decision to discontinue a DPA. n. [NPS-1-04]

### Response G-22

This comment requests further details on the process to document adverse effects in DPAs and to discontinue a DPA.

The process of identifying conditions that require modification or closure of a DPA would be conducted in accordance with the SFRPD Dog Policy (available at http://sfrecpark.org/wp-content/uploads/Final_Dog_Policy_2002.pdf). Dog Policy Section 6.2 describes how to modify or eliminate a DPA, stating that "If, after evaluation by the Advisory Committee, relevant park groups, and RPD, a DPA is determined to be flawed in nature, potential solutions will be developed and implemented. In essence, if an unfenced DPA fails to confine uses, hard barriers may be implemented. If adequate alternatives cannot be identified, or are deemed ineffective, RPD reserves the right to discontinue the DPA in question." This process is also identified in Mitigation Measure M-BI-1a of the Draft EIR, which requires evaluation and monitoring of DPAs for adverse effects to biological resources and various actions protect biological resources in accordance with the SFRPD Dog Policy.

The comment seeks additional information and does not raise any specific environmental issues about the adequacy or accuracy of the Draft EIR.

**Comment G-23 Prohibition on new dog play areas**

The response to Comment G-23 addresses all or part of the following individual comments:

NPS-1-05 DogPACSF-1-10 SFDOG-2-11
Brown-1-07

- Pg. 105, 110,262: Further explanation is needed as to why no more DPAs may be planned. Since direction on this point dates to 2006, we suggest that this decision be revisited within RPD areas especially given SF concerns regarding impacts on existing SF DPAs due to GGNRA draft dog management plan. Proposed reductions in SF DPAs could increase pressure and impact on remaining dog areas. [NPS-1-05]
- The NAP plan will last for decades, and for the NAP EIR not to consider a major mitigation like opening new DPAs to replace closed ones because of a temporary halt on new designations is absurd. Any analysis of alternatives that does not include this possible mitigation is incorrect and inadequate. [DogPACSF-1-10]
- The NAP plan will last for decades, and for the NAP EIR not to consider a major mitigation like opening new DPAs to replace closed ones is absurd. Any analysis of alternatives that does not include this possible mitigation is inadequate. [SFDOG-2-11] [Brown-1-07]

## Response G-23

These comments express concern that the Draft EIR did not consider opening new DPAs to replace closed ones and request a further explanation as to why additional DPAs are not being planned.

The Draft EIR conservatively characterized the direction from the Recreation & Park Commission concerning establishment of new DPAs as a moratorium for the purpose of analyzing cumulative impacts in the Natural Areas. This direction was presented at the October 10, 2006, meeting of the San Francisco Dog Advisory Committee; addressed in a July 19, 2007, SFRPD memorandum on the

Status of the Dog Advisory Committee Work Plan; and discussed during the August 16, 2007, meeting of the San Francisco Recreation & Park Commission. New or improved DPAs may be pursued in San Francisco by the SFRPD and/or through community-driven efforts; however, none are proposed or envisioned in the Natural Areas. In order to make this clear in the Draft EIR, the text provided in the fifth bullet on Draft EIR p. 110 has been changed as follows:

- GR-8b—Match on-leash and off-leash dog use with the sensitivity of the habitat when considering new DPAs within or next to Natural Areas;

  (Note: ~~An underlying assumption of this EIR is that there would be no new DPAs because there is~~ The Draft EIR conservatively characterized the direction from the Recreation ~~and~~ & Park Commission concerning establishment of new DPAs as ~~not to establish new DPAs until systemwide DPA planning is completed. For the purposes of this EIR, this is considered~~ a moratorium for the purpose of analyzing cumulative impacts in the Natural Areas ~~in that no new DPAs are reasonably foreseeable~~. This direction was ~~announced~~ presented at the October 10, 2006, meeting of the San Francisco Dog Advisory Committee; addressed in a July 19, 2007, SFRPD memorandum on the Status of the Dog Advisory Committee Work Plan; and discussed during the August 16, 2007, meeting of the San Francisco Recreation & Park Commission. New or improved DPAs may be pursued in San Francisco by the SFRPD and/or through community-driven efforts; however, none are proposed or envisioned in the Natural Areas. ~~Should new DPAs be proposed at some point, the appropriate level of CEQA analysis would be undertaken, and applicable permits and other regulatory agency approvals would be obtained.~~)

A more detailed discussion of the cumulative recreational impacts associated with the closure or reduction in size of DPAs is provided in Response RE-2, RTC p. 4-313.

As part of the CEQA process, each lead agency that seeks to increase or decrease on-leash or off-leash DPAs within the city or its environs would be required to include other nearby projects within their cumulative analysis, as was done for this project in considering the GGNRA Dog Management Plan.

In terms of evaluating an alternative that would allow DPAs in the future, in accordance with CEQA Guidelines Section 15126.6, an EIR need not evaluate every conceivable alternative to a proposed project; rather the EIR alternatives analysis must describe a reasonable range of alternatives that would feasibly obtain most of the basic project objectives and would avoid or substantially lessen the significant environmental impacts of the project. An alternative that assumes additional DPAs, given the fact that no new or improved DPAs are proposed or envisioned in the Natural Areas and the fact that the CEQA objectives do not seek to increase off-leash DPAs, would not be considered within a reasonable range of alternatives; therefore, it was not analyzed in the Draft EIR. In fact, Draft EIR p. 461 states that "[n]o new DPAs would be created under any of the project alternatives …" However, the Draft EIR identifies four alternatives to the proposed project: the Maximum Restoration Alternative, the Maximum Recreation Alternative, the Maintenance Alternative, and the No Project Alternative (the last of which is required under CEQA Guidelines Section 15126.6). The findings of the alternatives analysis is provided on Draft EIR pp. 461 to 527.

Under the No Project, Maximum Recreation, and Maintenance alternatives, no changes to DPAs would occur. Thus the EIR evaluates a reasonable range of alternatives that would avoid the significant environmental impacts associated with reduction of DPAs as proposed in the SNRAMP.

Refer to Response RE-13, RTC p. 4-347, for a discussion of the reduction of DPAs and the potential impact on recreational capacity.

**Comment G-24 Data on disturbance to breeding birds at Lake Merced dog play area**

The response to Comment G-24 addresses all or part of the following individual comment:

NPS-1-06

- Lake Merced DPA (pg. 136, 305-306): It would be helpful to our dog management planning for NPS to receive the report of data gathered (# of dogs/incidences of disturbance) on disturbance to breeding birds at Lake Merced DPA that led to the proposal to close this DPA. [NPS-1-06]

## Response G-24

This comment requests a report of data on disturbance to breeding birds at the Lake Merced DPA as a result of dogs.

The response below provides the requested data to the extent possible. While data has not been collected on the number of dog incidences and/or disturbances, either at Lake Merced or in other Natural Areas, data has been collected on the number of dogs and owners that visit the Natural Areas (refer to Response G-1, RTC p. 4-13, for that data). In addition, research has been conducted on the impacts of dogs on Natural Areas (refer to Response G-25, RTC p. 4-106).

With respect to Lake Merced, in particular, and based on NAP staff observations, this DPA is home to breeding white-crowned sparrows. As stated on p. 6.1-18 of the SNRAMP, the existing off-leash DPA at the Mesa (MA-1c and MA-2b) is located in a restored dune habitat that supports nesting white-crowned sparrow, which is declining in number in San Francisco, and includes sensitive plant species and some of the only raptor foraging habitat at Lake Merced. The remainder of Lake Merced is an on-leash park and Natural Area. To avoid the disturbance of breeding birds at Lake Merced, Management Action LM-7a (on SNRAMP p. 6.1-18) recommends relocating the DPA to a different area. However, following completion of the final Draft SNRAMP, and during preparation of the Draft EIR, the SFRPD determined that due to ongoing disturbance of breeding birds, this five-acre DPA should be closed rather than relocated (Draft EIR p. 136). Refer to Response G-19, RTC p. 4-88, for a more detailed discussion of the plans for the Lake Merced DPA.

**Comment G-25 Analysis of dog impacts related to plants, wildlife, and erosion**

- There is no evidence in this EIR to substantiate claims that dogs have an impact on plants or wildlife in natural areas. The EIR must be based on solid, documented impacts, and there is no evidence cited to justify closing or reducing the size of any Dog Play Area (DPA). [CFDG-1-01]
- There are a number of places in this EIR that state that dogs MAY impact plants or wildlife, yet offers no evidence these impacts are actually occurring or have ever occurred. And continues to state: If allowed to be in a natural area, dogs MAY continue to impact plants or wildlife. If there's no proof of an impact, then that impact cannot "continue." The analysis in this EIR based on this speculation is inadequate. [CFDG-1-02]
- In a few places, the NAP EIR says: Observations indicate dogs are impacting erosion, or natural communities, yet it offers no information on these "observations." Who made them? Were they done in a scientifically and objective way? EIRs should be based on solid, scientific data, not on anecdotal "observations." Any conclusions based on this information is again, inadequate. [CFDG-1-03]
- The NAP EIR provides no evidence to prove claims that dogs have an impact on plants and wildlife in natural areas. An EIR should be based on scientific evidence, and there is little presented here. Because the NAP EIR's analysis of impacts from dogs is not based on any evidence, the analysis is inadequate. Without any demonstrated evidence of impacts from dogs, there is no justification for excluding people with off-leash dogs from natural areas. There is, therefore, no justification for the closure of the DPA at Lake Merced, nor for the reductions in the DPAs at McLaren Park and Bernal Hill.

The NAP EIR does not take into account scientific studies that show off-leash dogs have little impact on plants and wildlife, including nesting birds when declaring that dogs have negative impacts. These studies were provided to the Planning Department by SFDOG in its comments on the Initial Study for the NAP EIR. Ignoring them shows that the NAP EIR is inadequate and inaccurate when it comes to dogs and "impacts." [DogPACSF-1-03]

- The NAP EIR repeatedly says: Dogs MAY be impacting protected plant species or wildlife (pp. 297, 298, 305, 306, 472, 473, 502, 517), yet offers no evidence these impacts are actually occurring or ever have occurred. Unsubstantiated claims cannot be made in an EIR. After each of these examples, the EIR then goes on to say: Dogs MAY continue to impact plants or wildlife. If there's no proof of an impact, then that impact cannot "continue." EIRs must be based on observed impacts, not things that "may" happen. The analysis in the EIR based on this speculation is incorrect and inadequate. In several places, the NAP EIR says: Observations indicate dogs are impacting erosion, or plant damage, or damage to natural communities (pp. 471, 500, 505, 516, 519), yet offers no information on these "observations." Who made them? Were they done in a scientifically rigorous way? Were they made by people biased against dogs? We have seen with the GGNRA's attempts to get rid of dogs and with Point Reyes attempts to get rid of an oyster farm that reports by "observers" biased against dogs or oyster farmers do not stand up to independent scientific scrutiny. Is this the case here as well? We do not know, since the NAP EIR provides no information about them. Again, EIRs should be based on solid, scientific data, and definitely not on anecdotal "observations." If not, their analyses cannot be trusted and are inadequate. [DogPACSF-1-04]
- Overall, the DEIR would be improved by a greater discussion of the environmental impacts of dogs on the Natural Areas. Because the stated priorities of the NAP, the protection of biodiversity and other natural values should be prioritized over dog-related recreation and other similar activities. Even where biodiversity is prioritized (in this small amount of San Francisco's total park acreage), there should be ample opportunities for responsible dog owners and other visitors to full enjoy the Natural Areas. [GGAS-1-16]
- The NAP EIR repeatedly says dogs MAY have an impact, but there is no evidence cited in the EIR that dogs are now or ever have done so. EIR's must be based on documented impacts, not hypothetical conjectures. Specific proof of impacts, not just claims of "observations" with no details, must be added to the NAP EIR. [SFDOG-1-03]
- The NAP EIR provides no evidence to prove claims that dogs have an impact on plants and wildlife in natural areas. In its comment on the Initial Study, SFDOG noted that there is no scientific consensus that dogs have any impact on plants and wildlife, including nesting birds, in city parks and listed scientific citations for research that showed no impacts from dogs. There is no indication in the NAP EIR that those studies were included, since the NAP EIR accepts the premise, without any evidence to support the premise, that dogs cause impacts. There was no acknowledgment that studies that show otherwise were ever considered in the NAP EIR. In addition, our comment on the Initial Study warned about considering studies that claim impacts from "free-roaming" dogs, since that means dogs that are running without any human control (for example, a dog that accidentally got loose without its owners knowing so there was no human in the park to handle or control the

dog). Off-leash dogs are NOT free-roaming, since they come to parks WITH humans who can control their behavior and activities. There is no indication in the NAP EIR that this warning was heeded, since we don't know what research the EIR used to back its premise that dogs cause impacts. An EIR should be based on scientific evidence, and there is little presented here to justify any claims of impacts. Because the NAP EIR's analysis of impacts from dogs is not based on any evidence, the analysis is incorrect and inadequate.

The NAP EIR repeatedly says: Dogs MAY be impacting protected plant species or wildlife (pp. 297, 298, 305, 306, 472,473, 502, 517), yet offers no evidence these impacts are actually occurring or ever have occurred. Unsubstantiated claims cannot be made in an EIR. After each of these examples, the EIR then goes on to say: Dogs MAY continue to impact plants or wildlife. If there is no proof of an impact, then that impact cannot "continue." EIRs must be based on observed impacts, not things that "may" happen. The analysis in the EIR based on this speculation is incorrect and inadequate.

In several places, the NAP EIR says: Observations indicate dogs are impacting erosion, or plant damage, or damage to natural communities (pp. 471, 500, 505, 516, 519), yet offers no information on these "observations." Who made them? Were they done in a scientifically rigorous way? Were they made by people biased against dogs? [SFDOG-2-03]

- In our comment on the Initial Study, SFDOG pointed out the EIR should re-analyze any data provided by NAP staff, especially data not published in a peer-reviewed journal, to ensure that conclusions against dogs are actually supported by the data. Because no data - only the word "observations" – is included in the NAP EIR, we don't know if there was any analysis of the observations to ensure they say what NAP staff claim they do. This is not just paranoia. In May 2006, Point Reyes National Seashore (PRNS) management claimed that an oyster farm in Drakes Bay was harming marine wildlife and causing significant negative impacts on the environment and, therefore, should be closed. A PRNS report stated that the oyster farm workers disturbed seals, causing a huge decline in seal population, and that sediment from oyster feces was harming eelgrass beds. Therefore, the oyster farm did not belong in a national seashore. Corey Goodman, a microbiologist at UC Berkeley, member of the National Academy of Sciences, and a former Chair of the National Research Council's Board of Life Sciences, analyzed the raw data used in the studies cited by PRNS staff and found that the data did not support nearly every negative impact claimed.

  Again, EIRs should be based on solid, scientific data, and definitely not on anecdotal "observations." If an EIR is based on anecdotal evidence, its analysis cannot be trusted and is inadequate. [SFDOG-2-05]

- As with the GGNRA Environmental Impact Statement of 2011, rational for the Significant Natural Resource Areas Management Plan (NAP; http://sfmea.sfplanning.org/2005.1912E DEIR.pdt) is based largely on allegations, with no substantive scientific studies or third party peer review provided as evidence. Without any demonstrated evidence of impacts from dogs, there is no justification for excluding people with off-leash dogs from natural areas. There is, therefore, no justification for the closure of the DPA at Lake Merced, nor for the reductions in the DPAs at Mclaren Park or Bernal Hill. Also, the NAP EIR does not take into

account scientific studies that show off-leash dogs have little impact on plants or wildlife, including nesting birds when declaring that dogs have negative impacts (http://www.sfdog.org/content/do-dogs-bother-birds). These studies were provided to the Planning Department by SFDOG in its comments on the Initial Study for the NAP EIR. Ignoring them shows that the NAP EIR is inadequate and inaccurate when it comes to dogs and "impacts." [Armanini-1-03]

- Dog impacts on the more environmentally sensitive areas such as wetlands and waterways need to be more fully addressed. I am a strong advocate for official dog play areas but these play areas should be situated well away from the most significant natural areas. A clear delineation of all dog play areas needs to be maintained in any case. [Bartley-1-07]
- The NAP EIR provides no evidence to prove claims that dogs have an impact on plants and wildlife in natural areas. An EIR should be based on scientific evidence, and there is little presented here. Because the NAP EIR's analysis of impacts from dogs is not based on any evidence, the analysis is inadequate. Without any demonstrated evidence of impacts from dogs, there is no justification for excluding people with off-leash dogs from natural areas. There is, therefore, no justification for the closure of the DPA at Lake Merced, no for the reductions in the DPAs at McLaren Park and Bernal Hill. [Bartolotta-1-01]
- The NAP EIR does not take into account scientific studies that show off-leash dogs have little impact on plants and wildlife, including nesting birds when declaring that dogs have negative impacts. These studies were provided to the Planning Department by SFDOG in its comments on the Initial Study for the NAP EIR. Ignoring them shows that the NAP EIR is inadequate and inaccurate when it comes to dogs and impacts. [Bartolotta-1-02]
- The NAP EIR repeatedly says: Dogs MAY be impacting protected plant species or wildlife (pp. 297, 298, 305, 306, 472, 473, 502, 517), yet offers no evidence these impacts are actually occurring or ever have occurred. Unsubstantiated claims cannot be made in an EIR. After each of these examples, the EIR then goes on to say: Dogs MAY continue to impact plants or wildlife. If there's no proof of an impact, then that impact cannot "continue." EIRs must be based on observed impacts, not things that "may" happen. The analysis in the EIR based on this speculation is incorrect and inadequate. [Bartolotta-1-03]
- In several places, the NAP EIR says: Observations indicate dogs are impacting erosion, or plant damage, or damage to natural communities (pp. 471, 500, 505, 516, 519), yet offers no information on these "observations." Who made them? Were they done in a scientifically rigorous way? Were they made by people biased against dogs? We have seen with the GGNRA's attempts to get rid of dogs and with Point Reyes attempts to get rid of an oyster farm that reports by observers biased against dogs or oyster farmers do not stand up to independent scientific scrutiny. Is this the case here as well? We do not know, since the NAP EIR provides no information about them. Again EIRs should be based on solid, scientific data, and definitely no on anecdotal observations. If not, their analyses cannot be trusted and are inadequate. [Bartolotta-1-04]
- This plan seems to give NAP free-will to exclude people with dogs based on "observations" and "mays" than can be used arbitrarily. For example, the claim is that dogs are causing

erosion at Lake Merced and thus dog play areas should be closed. In truth, dog have almost no impact on Lake Merced because few dogs use the area. The fact that a dog play area is there is almost hidden, and the dog play area signage is non-existent in the park; in fact, all the signs I see around the park indicate dogs on-leash only. While the area isn't currently being used, the NAP will assure that it can never become a dog play area. [Bowman-1-07]

- As another example, the city has attempted to exclude people and dogs from the lagoon at Sharp Park, where people have gone for generations. In Issue SP-8, NAP claims dogs "may" have an impact on the SF Garter Snake and the California Red Legged Frog and that is sufficient to exclude people with dogs. However, there is no concrete evidence that dogs are having any impact on either species or their populations, even at these sites. Collectors seem to be the biggest known impact at the site. [Bowman-1-08]
- The NAP EIR provides no evidence to prove claims that dogs have an impact on plants and wildlife in natural areas. An EIR should be based on scientific evidence, and there is little presented here. Because the NAP EIR's analysis of impacts from dogs is not based on any evidence, the analysis is inadequate. Without any demonstrated evidence of impacts from dogs, there is no justification for excluding people with off-leash dogs from natural areas. There is, therefore, no justification for the closure of the DPA at Lake Merced, nor for the reductions in the DPAs at McLaren Park and Bernal Hill.

  The NAP EIR does not take into account scientific studies that show off-leash dogs have little impact on plants and wildlife, including nesting birds when declaring that dogs have negative impacts. These studies were provided to the Planning Department by SFDOG in its comments on the Initial Study for the NAP EIR. Ignoring them shows that the NAP EIR is inadequate and inaccurate when it comes to dogs and "impacts."

  The NAP EIR repeatedly says: Dogs MAY be impacting protected plant species or wildlife (pp. 297, 298, 305, 306, 472, 473, 502, 517), yet offers no evidence these impacts are actually occurring or ever have occurred. Unsubstantiated claims cannot be made in an EIR. After each of these examples, the EIR then goes on to say: Dogs MAY continue to impact plants or wildlife. If there's no proof of an impact, then that impact cannot "continue." EIRs must be based on observed impacts, not things that "may" happen. The analysis in the EIR based on this speculation is incorrect and inadequate.

  In several places, the NAP EIR says: Observations indicate dogs are impacting erosion, or plant damage, or damage to natural communities (pp. 471, 500, 505, 516, 519), yet offers no information on these "observations." Who made them? Were they done in a scientifically rigorous way? Were they made by people biased against dogs?

  Again, EIRs should be based on solid, scientific data, and definitely not on anecdotal "observations." If not, their analyses cannot be trusted and are inadequate. [Brown-1-01]
- For example, I witnessed some of the people "studying impacts by people with dogs." I even spoke with them. They were not conducting studies based on solid, rigorous science. They weren't even scientists! Having walked up there for the last 15 years, I could have given you more accurate information, based on long-term observations. For instance, the main culprits

to ground erosion are rainwater, gophers, and certain species of invasive plants. I have watched, over time, the impact these have had on the hill, and it has been significant. Many of the Bernal residents spend time every year pulling these damaging plants. I have pulled entire sections and am happy to have seen no return, even after five years, at no cost to the city! [Browne-1-02]

- When I first started walking on the hill with my dogs, I'd run into the same neighbors at the same hours everyday. Now that more people in the city have discovered the hill, it has become a popular place for many. In fact, many users are refugees from various city parks that only allowed on-leash recreation for there dogs. They were **told** they could find off-leash walking on Bernal Hill. And so they came. And it's a wonderful refuge in this city. As far as the impact of people walking their dogs, the majority stay on the paved road or the designated paths. We don't have a problem of dogs digging that I have seen in other parks. Dogs are having a minimal impact on this area. The new signs that have been placed at the beginning of the park have been helpful in explaining how to use the park in these sustainable ways. Most our willing to comply. In other words, this community has been using this hill in a responsible and sustainable way for many years, with very little intervention. [Browne-1-03]
- The NAP EIR repeatedly says: "dogs MAY be impacting" plants or wildlife, yet offers no evidence that any impacts are actually occurring now or ever have occurred. An EIR must be based on solid scientific evidence. Because the NAP EIR's analysis of impacts from dogs on plants and wildlife is based on unsubstantiated claims, the analysis is inadequate. [Buckley-1-02] [Form Letter-1-01]
- After reviewing the NAP EIR, we find that no evidence is offered that dogs do have a negative impact on the plants and wildlife in the natural areas. Where is the evidence? [Butler-1-02]
- The NAP EIR provides no evidence to prove claims that dogs have an impact on plants or wildlife in natural areas. EIRs must be based on solid, documented impacts, and there is no evidence cited to justify closing or reducing the size of any DPA. The NAP EIR repeatedly says: Dogs MAY impact plants or wildlife, yet offers no evidence these impacts are actually occurring or have ever occurred. Unsubstantiated claims cannot be made in an EIR. The NAP EIR goes on to say: If allowed to be in a natural area, dogs MAY continue to impact plants or wildlife. If there's no proof of an impact, then that impact cannot "continue." Analysis in the EIR based on this speculation is incorrect and inadequate. [Chambers-1-01]
- The EIR is lacking in many respects. It states that dogs "may" be impacting plants and wildlife yet provides no evidence to support this claim, and it fails to mention scientific studies provided to the planning department that show little impacts on plants and wildlife by dogs. The EIR mentions "observations" that indicate the impact of dogs, but nowhere has any data to back up these "observations." Lacking such scientific evidence it is an incomplete EIR. [Donovan-1-02]

- I live and vote in SF, am dog owner, and enjoy the public parks with my dog, neighbors and friends. I am a member of SFDOG. I fully support UC Professor Arthur Shapiro's analysis of the NAP EIR.

  In addition, the NAP EIR offers no concrete evidence that dogs negatively impact plants or wildlife. Use of the term "may" in the report reveals the weakness and inadequacy of the report. [Dougherty-1-01]

- Moreover, the SFNAP EIR does not provide scientific evidence that dogs have an impact on plants and wildlife in natural areas. Therefore, it is my belief there is no justification for excluding people with off-leash dogs from natural areas. [Emanuel-1-04] [Emanuel-2-04]

- I understand that the GGNRA has a recreation first mandate with long practiced mixed-use activities (surfing, hiking, dog walking, horseback riding, hang-gliding, kite surfing, jogging, biking, festivals and events)

  People, dogs, wildlife and plants successfully co-exist in GGNRA - dogs have little negative impact on natural resources and bird life. [Fitzer-1-03]

- Plants and dogs can co-exist. One of the reasons we chose to purchase a house in SF and create a life here is because it is a very dog friendly city. Losing the spaces will change that for us! [Form Letter-1-44]

- The impact of an off leash animal is no different than that of a wild animal (which we do have even in San Francisco). And how can you really determine that such erosion or impact is due to an off leash animal? And do you really think by restricting off leash dog walking that it will just go away? Have you thought about the impact on the little areas left for people to walk their dog off leash? We will not go away, nor will we stop walking our dogs off leash. By limiting the areas in which we do so only begs for more erosion problems due to the high usage of the limited areas available. [Gachowski-1-02]

- It is true for this EIR, as it was for the GGNRA DEIR that there are very few scientific studies on the effect of dogs on wildlife. Some studies, in fact, show that the presence of dogs increases the presence of wildlife. [Garber-1-05]

- I'm also a dog owner (a reasonably minded one) who enjoys the hill daily. For this reason I've been continually annoyed by the incorrect conclusion by the "Significant Areas" people that dogs are a major factor in the erosion of Bernal Hill. [Gavin-1-01]

- The NAP EIR repeatedly says: "dogs MAY be impacting" plants or wildlife, yet offers no evidence that any impacts are actually occurring now or ever have occurred. An EIR must be based on solid scientific evidence. Because the NAP EIR's analysis of impacts from dogs on plants and wildlife is based on unsubstantiated claims, the analysis is inadequate. [Ghosh-1-02] [Yip-1-01]

- The NAP environmental impact report makes allegations of dog damages with no substantiating scientific study. Are these the same people who freely approve the use of Garlon in areas heavily used by dogs and small children? I feel this shows a disregard for

scientific evidence and study. I feel this shows that this organization is untrustworthy and does not deserve our public support. [Hull-1-03]

- I am a dedicated environmentalist and have been a member of Nature Conservancy, Greenpeace, Wilderness Society, and other environmental organizations for many years. Yet I see no reason to ban off leash dog walking in the dog play areas at Lake Merced, McLaren Park, Bernal Hill areas. In the years I have been enjoying these areas with my dogs, I have never seen any problems caused by dogs.

  The NAP EIR repeatedly says: Dogs MAY be impacting protected plant species or wildlife (pp. 297, 298, 305, 306, 472, 473, 502, 517), yet offers no evidence these impacts are actually occurring or ever have occurred. Unsubstantiated claims cannot be made in an EIR. After each of these examples, the EIR then goes on to say: Dogs MAY continue to impact plants or wildlife. If there's no proof of an impact, then that impact cannot "continue." EIRs must be based on observed impacts, not things that "may" happen. The analysis in the EIR based on this speculation is incorrect and inadequate. To deny many people the joy of walking their dogs off leash because of unsubstantiated data is poor administration to say the least. [Ingle-1-01]

- The NARMP EIR doesn't offer evidence to support its claims that dogs have an impact on plants and wildlife in natural areas. The NARMP EIR doesn't take into account scientific studies that show off leash dogs have little impact on plants and wildlife, including nesting birds when declaring that dogs have negative impacts. The NARMP EIR states that dogs MAY be impacting protected plant species or wildlife, but offers no scientific evidence these possible impacts are actually occurring or ever have occurred. In a number of places, the NARMP EIR says that someone's observation is that dogs impact erosion, or cause plant damage, etc., yet the EIR offers no supporting information on these "observations." EIRs should obviously be based on solid, scientific data, not on someone's anecdotal "observations." Further, if there are negative impacts by usage, the NARMP EIR does not differentiate between impacts caused by people with dogs and impacts caused by people without dogs. [Jake-1-01]

- The NAP EIR repeatedly says: Dogs MAY impact plants or wildlife, yet offers no evidence these impacts are actually occurring or have ever occurred. Unsubstantiated claims cannot be made in an EIR. The NAP EIR goes on to say: If allowed to be in a natural area, dogs MAY continue to impact plants or wildlife. If there's no proof of an impact, then that impact cannot "continue." Analysis in the EIR based on this speculation is incorrect and inadequate. [Kelly-1-01]

- I am writing to offer my brief comments on the changes being proposed by the recent NAP EIR as the relate to Dog Play Areas. I have lived directly across the street from McLaren park for over 6 years, and have walked my dog in that DPA nearly daily for that period. I have seen absolutely no visible deterioration of the natural resources of McLaren. (And in fact, the park has bece ome safer over the years due to the presence of so many dogs and their walkers & owners.)

The changes proposed appear to have been made based on a series of assumptions of how dogs MAY be impacting natural areas, but the" data" provided is spotty, inconclusive, and in some portions of the report, flat-out incorrect. The lack of scientific method or quantifiable results is disturbing, and certainly shouldn't provide a basis for making such sweeping changes that will negatively impact so many citizens.

McLaren Park in particular remains one of only places in the city where dogs and their owners can exercise together over great distances, while co-existing peacefully with the natural inhabitants of the park, as well as other human users. I urge you to reconsider the proposed changes being made, and allow our already limited DPAs to remain as they are. [King-1-01]

- It seems, however, that City officials have decided that dogs destroy native plants around here. I walk my dog everyday around these parks, and I am here to tell you that that is simply not true. Responsible dog owners (and we are the majority of dog owners) don't let there animals off trails, or on native grasses or other plants. Just because you love your dog does not make you an enemy to the environment. It is also my observation that irresponsible dog owners are irresponsible people in general. They are irresponsible parents, and citizens. These people let their children, and their own actions do way more damage to the environment than any dog could do. Are you also going to ban children form the parks because they cause environmental damage? [Mace-1-01]
- The EIR's arguments to remove off leash dog areas are not solid and ignore the actual usage of these areas by the city's inhabitants. The EIR's analysis is incomplete and bases many arguments on "potential" negative impacts not on actuality. Who is present in the parks in sunshine and inclement weather 365 days a year? People with dogs are. [Mills-1-02]
- I am a SF resident, and I have two small dogs, which were both rescued from shelters. I walk daily with my two dogs on Bernal Hill, after I finish work. My dogs are well behaved, under voice command, and I pick up after my dogs. In addition to this being my main form of exercise, there is also a social aspect to walking on the hill, and I have made many wonderful friends and acquaintances by walking my dogs. I adamantly oppose any change in the off-leash area in this park for the following reasons:

  1) The NAP EIR repeatedly says: "dogs MAY be impacting" plants or wildlife, yet offers no evidence that any impacts are actually occurring now or ever have occurred. An EIR must be based on solid scientific evidence. Because the NAP EIR's analysis of impacts from dogs on plants and wildlife is based on unsubstantiated claims, the analysis is inadequate. [Moyer-1-01]
- I am writing in regard to the NAP EIR and the potential impact on offleash dog areas. I am a dog owner, live and vote in San Francisco, and enjoy the public parks with my dog, neighbors and friends.

  I am a member of SFDOG. I fully support UC Professor Arthur Shapiro's analysis of the NAP EIR. In addition, the NAP EIR offers no concrete evidence that dogs negatively impact plants

or wildlife. Use of the term "may" in the report reveals the weakness and inadequacy of the report. [Nelson-1-01]

- Thank you for the opportunity to comment on the Natural Areas Program EIR.

  Errors and assumptions in the EIR demonstrate that there is a basic lack of research underlying this EIR, and this is not a basis for going forward with the plan.

  For example, assumptions are made regarding the impact of dogs, whereby it is stated that "Dogs may be impacting plants or wildlife," while there is no evidence given or reference made to any studies which state that such impacts *are* being made or felt. These hypotheticals are then used as fact, and the EIR then seeks to remove dogs' *continuing* impact, while the initial impact has never been demonstrated or justified by statistical, scientific, or other reasonable basis. The City cannot truncate a primary form of recreation, walking in our local parks and open spaces with our off-leash dogs, on the basis of hypotheticals and unproven assumptions.

  Dogs are generally regarded as nuisances in this EIR, and I find this position to be a very big problem indeed. The parks and the Dog Play Areas already created were established based on proven need. Indeed, there were to be more DPAs created after Rec and Park studied the issue, following the sunsetting of the Dog Advisory Committee (DAC). Rec and Park has never made this study, and has never come out with a plan for more off-leash areas. The NAP EIR seems to have been written in a vacuum, without consideration of the recreational requirements being met by already established DPAs, or the need for more space for off-leash and other forms of recreation. San Franciscans need more space for recreation, not less. [Pittin-1-01]

- The NAP EIR does not show evidence proving that dogs have an adverse impact on wildlife in natural areas, nor does it take into account studies that show dogs have little or no impact on plants and wildlife. [Popoff-1-02]

- There are so many things wrong with the NAP EIR that one hardly knows where to begin. Let's start with the lack of scientific evidence, just some unknown person(s) observations. The fact that the EIR repeatedly says that dogs "MAY" harm native plant gardens without proof or evidence of any kind is an excellent start. Well, they "MAY" be beneficial too.

  I urge you to reject this EIR and send them back to the drawing board to incorporate scientific evidence and to evaluate the impact to other parks when they close all these dog play areas, not just to people with dogs but all people. [Shepard-J-1-01]

- I am a District 9 homeowner residing at 286 Hamilton St., San Francisco. I am also an 11 year dog volunteer with the San Francisco SPCA. I am outraged that you would consider the huge cuts you proposing for dog play areas in San Francisco. First of all, a reminder: a draft environmental-impact statement by the Golden Gate National Recreation Area has already shown no direct link between dog walking and any environmental damage in GGNRA lands. Second, what do you think is going to happen when you cut these DPAs? There will be more pressure on the surviving DPAs because more dogs will be visiting fewer areas. Is

that your ultimate goal? To force dog owners and walkers out of parks altogether? Or, as you put it - is THIS the "environmental superior alternative"? [Strasbaugh-1-01]

- This email is in response to the NAP EIR, which is an inadequate plan that requires additional work. Buena Vista is my neighborhood park, which I have been walking in for the past 8 years with my dog. The NAP EIR will restrict my and my neighbor's access to this park, as well as a number of others.

  It's important that the EIR be based on solid scientific evidence, which is not the case here. The NAP EIR asserts a number of times that dogs may be impacting plants or wildlife but does not offering any evidence, past or present, while ignoring scientific studies that show the contrary. Ignoring scientific studies that do not agree with the plan while not providing any evidence of its own is not acceptable. [Summer-1-01]

- I am writing to comment on the NAP EIR. While I recognize the importance of native plants to the Bay Area, the NAP EIR is inadequate and additional work must be done. I frequently walk in Buena Vista and Bernal Hill par ks with my dog, both of which I've visited for the past 8 years, and this plan will adversely affect the public's access to those areas, among many others.

  An EIR needs to be based on solid scientific evidence. However, the NAP EIR repeatedly states that dogs may be impacting plants or wildlife without offering evidence of any impacts, past or present. It also ignores scientific studies that show off leash dogs to have little impact on plants and wildlife. [Winquist-1-01]

- The NAP EIR reportedly – repeatedly says dogs may have an impact, but there's no evidence cited in the EIR that dogs are now or ever have done so. EIRs must be based on documented impacts, not hypothetical conjectures. Specific proof of impacts, not just claims of observations with no details given, must be added to the EIR. [PH-Stephens-03]

### Response G-25

These comments question whether dogs could impact plants or wildlife and request scientific evidence.

The purpose of the EIR is to analyze the impacts of the proposed project, including the SNRAMP's proposal to reduce and close DPAs, converting them from off-leash to on-leash areas. The DPA modifications identified as part of the proposed project and evaluated in the Draft EIR are those known and anticipated at the time of document production. The project would close the Lake Merced DPA and reduce the acreage of the Bernal Hill and McLaren Park DPAs. No other direct or indirect DPA modifications are foreseen as a result of SNRAMP implementation, beyond what was disclosed and analyzed in the Draft EIR. Refer also to Response RE-3, RTC p. 4-319, and Response RE-13, RTC p. 4-347, for a discussion of the cumulative impacts of the reduction in DPAs within the SFRPD property and the GGNRA. The need for and scope of those DPA modifications were made independently by SFRPD and are not a result of this EIR analysis.

The purpose of an EIR is to disclose the environmental consequences of the project as described by the project proponent. As such, it is beyond the scope of the Draft EIR to justify or document the validity of the proposed management objectives and actions concerning off-leash dog use. As required by CEQA, the EIR analyzes the potential environmental impacts of closing and/or reducing DPAs in Impact RE-1, Draft EIR pp. 257 and 258, and concludes that because the Lake Merced DPA is not heavily used and the Bernal Hill and McLaren Park DPA reductions represent a small portion of otherwise large DPAs, the potential increase in users of other DPAs would not be substantial enough to result in the physical deterioration of recreational facilities. This impact was determined to be less than significant. The EIR concludes, however, that an increase in dog use could result in significant impacts to biological resources, specifically protected plants and special-status bird species (Impact BI-1 and Impact BI-2 on pp. 298 and 305 to 306, respectively). The EIR identifies Mitigation Measure M-BI-1a, Protection of Protected Species and Riparian and Wetland Habitat, Draft EIR p. 298, which calls for the SFRPD to continue to evaluate the impacts of DPAs and, where substantial adverse impacts to special-status species are confirmed, SFRPD shall take actions to protect those species. The mitigation measure specifically allows for DPAs within the Natural Areas to continue to be evaluated in accordance with the SFRPD's Dog Policy and be monitored for adverse effects to biological resources. If substantial adverse impacts to protected species are confirmed, the SFRPD shall take actions to protect those species, which may include installing signs, fencing, or protections including, but not limited to, decommissioning DPAs, in accordance with the SFRPD Dog Policy.

The conversion of the DPA at Lake Merced (to on-leash dog areas) is proposed to protect sensitive dune scrub habitat, special-status species, and breeding white-crowned sparrows within the DPA. The reduction in size of the DPAs at McLaren Park and Bernal Hill would be located in areas that contain sensitive wildlife and habitat and are also characterized by steep slopes, not conducive to dog use. The remaining 75.9 acres of off-leash DPAs are less vulnerable to erosion and other impacts from off-leash dog use. In total, the project would convert approximately 20 percent of the existing DPAs within the Natural Areas to on-leash dog areas, leaving 80 percent available for off-leash dog use.

Adverse impacts resulting from dog use is widely accepted by natural resource management professionals, and it is well supported in the scientific literature that dogs, particularly off-leash, can adversely affect wildlife and sensitive habitats. The SFRPD has documented the impacts of dog use in Natural Areas, which includes digging, soil disruption, weed growth, trampling, soil exposure, and plant loss.[36] Further, an article titled "Four-legged Friend or Foe? Dog Walking Displaces Native

[36] Lisa Wayne, San Francisco Recreation and Park Department, "Observations of Impacts of Dog Use in Natural Areas," memorandum to Lisa Beyer, Karen Mauney-Brodeck, and Jessica Range, March 12, 2012.

Birds from Natural Areas"[37] concluded that dog walking in woodland areas leads to a 35 percent reduction in bird diversity and a 41 percent reduction in abundance, both in areas where dog walking is common and where dogs are prohibited. In addition, BioOne, a nonprofit online aggregation of core research in the biological, ecological, and environmental sciences, published an article titled "The Effects of Dogs on Wildlife Communities,"[38] concluding that "regulating the activity of dogs in Natural Areas may be of particular importance when conservation goals include the management of species that may perceive dogs as predators."

In the Purpose and Need section of the Golden Gate National Recreation Area Draft Dog Management Plan/Supplemental Environmental Impact Statement,[39] in a sub-section titled "Dogs and Natural Resources" (pp. 32 to 34), the NPS provides a summary of the literature review that was conducted to determine the potential for adverse impacts from dogs or dog use on wildlife, wildlife diseases, and vegetation (including soils). In summary, the NPS determined that dogs can disturb wildlife species, with birds exhibiting a higher sensitivity than other species, and can also damage plant communities. This information was used to develop the NPS's proposed dog management regulations.

Based on the evidence provided in this response, supported by other technical studies evaluating the impacts of dogs on Natural Areas and parks in other cities and counties for the purposes of controlling unrestricted dog use, the proposed management actions to reduce off-leash dog use in certain areas that support sensitive species and habitats would likely have a beneficial effect on biological resources.[40] The Draft EIR concluded that other management actions, including the removal of invasive trees and vegetation, along with the habitat improvements, would similarly result in a beneficial impact on plants and wildlife, including aquatic species (Draft EIR pp. 296, 304, 307, 311, 312, 321, 323, 325, 329, 331, 333, 336, 338, 341, 343, and 346). In addition, Impact BI-1, on Draft EIR p. 298, states that dogs may currently be impacting and may continue to impact protected

39 National Park Service, U.S. Department of the Interior, *Golden Gate National Recreation Area Draft Dog Management Plan/Supplemental Environmental Impact Statement*, Fall 2013. This document is available online at: http://parkplanning.nps.gov/document.cfm?parkID=303&projectID=11759&documentID=55416, accessed June 7, 2016.

40 Policies for keeping dogs on-leash occur in other parks to protect wildlife. For example, the Portland Parks and Recreation Department has issued Policy 3.07 (Dogs in Natural Area Parks Policy), which states that dogs are not permitted off-leash in Natural Area parks. The policy goes on to state that "[m]any studies have documented the effects of domestic dogs on wildlife. As dogs are recognized as predators by wildlife, their presence may stress wildlife and reduce breeding success. Visiting dogs can transmit diseases to wild populations or pick up diseases carried by wildlife. Uncollected dog feces can result in fertilization which may favor invasive plant species. Dogs can also contribute to the spread of undesirable species through seeds in their fur."

plant species in or near DPAs, and Impact BI-2, on Draft EIR p. 306, similarly says that dogs may currently be impacting and may continue to impact protected or nesting birds within the DPA (referring to the Lake Merced DPA).

It is the intent of the SNRAMP to provide distance between the DPAs and sensitive plants, habitats, or wildlife in order to maintain or improve these sensitive plant and wildlife areas.

Regarding the comment that the intensity of use and the erosion potential may increase in areas that continue to allow off-leash use as a result of closing/reducing DPAs, this effect is addressed under Impact RE-7, the text of which has been clarified and expanded in Response RE-2, RTC p. 4-313. Impact RE-7 concludes that the proposed DPA closures under the SNRAMP in combination with the future implementation of the proposed GGNRA Dog Management Plan could accelerate the physical deterioration of the remaining DPAs, resulting in a potentially significant cumulative impact. The EIR adequately identified this as a significant cumulative impact, as further discussed in Response RE-2, RTC p. 4-313. Other impacts related to dog use are addressed throughout this RTC document, including, but not limited to, Response BI-9, Contamination from dog urine, RTC p. 4-383; Response G-24, Data on disturbance to breeding birds at Lake Merced dog play area, RTC p. 4-95; Response G-26, Social impacts of dog ownership and reduce dog play areas, RTC p. 4-114; and Response RE-13, Effect of the reduction of DPAs on other DPAs in terms of recreational capacity, RTC p. 4-347.

## Comment G-26 Social impacts of dog ownership and dog play access restrictions

The response to Comment G-26 addresses all or part of the following individual comments:

- The EIR refers to dogs as "nuisances." It does not consider the positive aspects of dog walking, including the physical and mental health benefits to people who walk with their dogs. These must be included in the analysis of different alternatives. People walk in McLaren Park and on Bernal Hill because they are large enough to take long walks with your dog. Most other DPAs are much smaller and do not offer the same walking experience. This EIR assumes all DPAs are interchangeable. They are not. This must be corrected. [CFDG-1-10]

- This EIR does not consider any impacts on the social community of people who walk with dogs in areas NAP wants to close. This is especially important if 80% of off-leash space is closed. These are significant impacts and must be evaluated and considered. [CFDG-1-12]
- The NAP EIR refers to dogs as "nuisances." The EIR does not consider any positive aspects of dog walking, including the physical and mental health benefits to people who walk with their dogs. This lack is especially noticeable in sections dealing with impacts on recreation of the various alternatives considered. The reason so many people walk their dogs off-leash in Bernal Hill and McLaren Park is that those areas are large enough that people can hike long distances with their dogs off-leash. The majority of DPAs in city parks are too small for similar hikes. You can play fetch with a dog in these smaller DPAs, but not take a long walk. You cannot have the same recreational experience in a small DPA that you can have in a larger one; DPAs are not interchangeable. This difference in DPAs creates a significant impact on the recreational experience for dog walkers if the DPAs in Bernal Hill or McLaren Park are closed. In addition, there would be a significant negative impact on the physical and mental health of dog walkers if 80% of off-leash space were closed because NAP claims impacts from dogs. This is not considered in the NAP EIR, which is inadequate without it. These negative impacts on the physical and mental health of dog walkers of the 80% closure will be amplified considerably when combined with closures of off-leash in the GGNRA. This must be considered in the cumulative impacts sections. [DogPACSF-1-14] [SFDOG-2-14] [Brown-1-11]
- The NAP EIR does not adequately consider the impacts on the social fabric of San Francisco if one-quarter of its city parklands are closed to residents. Natural areas are not generally accessible to people, whether they have a dog or not. The NAP plan calls for the closure of many trails and reduction of recreational access. You cannot play catch with your child, have a picnic lunch, or play with a dog in a natural area. It can only be a plant museum. The EIR does not adequately consider the significant impact on families and the sense of shared community that access to parks fosters in our urban setting. [DogPACSF-1-17]
- As such, the EIR must consider the impact of those closures on the human and urban environments, not just the natural environment. Throughout the EIR, dogs are described solely as "nuisances." The EIR does not consider any benefits of dogs and off-leash dog walking to people and communities. The NAP EIR must consider impacts on the physical and emotional health of people who can no longer walk their dogs in closed DPAs, and on the sense of neighborhood and park community that will be impacted if DPAs are closed or significantly reduced. Yet it does not. [SFDOG-1-04]
- The NAP EIR states that impacts to land use planning can be considered significant if they have a "substantial impact on the existing character of the vicinity." (p. 176) In all of its analysis of impacts on the existing character of the vicinity, the NAP EIR never considers the impact on the social community of people who walk with their dogs in the portions of DPAs that NAP wants to close. This community, in many cases, defines the "existing character" of the park. Dog walkers are perhaps the most common and most diverse group of park users. If you watch dog walkers in SF city parks, you will see kids and seniors, people with disabilities, gay and straight, every ethnic and religious group, and every socioeconomic

class walking, talking and laughing together, all united by their common love of dogs. There are few places in San Francisco where you will see so many different types of people interacting without rancor. People who walk in the same park at the same time every day know their fellow dog walkers. These friendships extend outside the park into the neighborhoods, helping create the sense of belonging to a community that is so important in today's impersonal urban society. Closures and reductions in DPAs (especially if 80% of the total off-leash space in city parks is closed) will have a significant negative impact on these social communities. DPA closures will destroy these communities. Because the NAP EIR did not consider these impacts on community of those who live near and walk in parks, it is inadequate. [SFDOG-2-16]

- The EIR does not adequately consider the significant impact on families and the sense of shared community that access to parks fosters in our urban setting. [SFDOG-2-17] [Brown-1-14]
- The NAP EIR refers to dogs as "nuisances." The EIR does not consider any positive aspects of dog walking, including the physical and mental health benefits to people who walk with their dogs. This lack is especially noticeable in sections dealing with impacts on recreation of the various alternatives considered. The reason so many people walk their dogs off-leash in Bernal Hill and McLaren Park is that those areas are large enough that people can hike long distances with their dogs off-leash. The majority of DPAs in city parks are too small for similar hikes. You can play fetch with a dog in these smaller DPAs, but not take a long walk. You cannot have the same recreational experience in a small DPA that you can have in a larger one; DPAs are not interchangeable. This difference in DPAs creates a significant impact on the recreational experience for dog walkers if the DPAs in Bernal Hill or McLaren Park are closed. In addition, there would be a significant negative impact on the physical and mental health of dog walkers if 80% of off-leash space were closed because NAP claims impacts from dogs. This is not considered in the NAP EIR, which is inadequate without it. These negative impacts on the physical and mental health of dog walkers of the 80% closure will be amplified considerably when combined with closures of off-leash in the GGNRA. This must be considered in the cumulative impacts sections. [Bartolotta-1-13]
- The NAP EIR states that impacts to land use planning can be considered significant if they have a "substantial impact on the existing character of the vicinity." (p. 176) In all of its analysis of impacts on the existing character of the vicinity, the NAP EIR never considers the impact on the social community of people who walk with their dogs in the DPAs and portions of DPAs that NAP wants to close. This community, in many cases, defines the "existing character" of the park. Dog walkers are perhaps the most diverse group of park users. If you watch dog walkers in SF city parks, you will see kids and seniors, people with disabilities, gay and straight, every ethnic and religious group, and every socioeconomic class walking, talking and laughing together, all united by their common love of dogs. There are few places in San Francisco where you will see so many different types of people interacting without rancor. People who walk in the same park at the same time every day know their fellow dog walkers. These friendships extend outside the park into the neighborhoods, helping create the sense of belonging to a community that is so important in

today's impersonal urban society. Closures and reductions in DPAs (especially if 80% of the total off-leash space in city parks is closed) will have a significant negative impact on these social communities. DPA closures will destroy these communities. Because the NAP EIR did not consider these impacts on community of those who live near and walk in parks, it is inadequate. [Bartolotta-1-15] [Jake-1-05]

- The NAP EIR states that impacts to land use planning can be considered significant if they have a "substantial impact on the existing character of the vicinity." (p. 176) In all of its analysis of impacts on the existing character of the vicinity, the NAP EIR never considers the impact on the social community of people who walk with their dogs in the portions of DPAs that NAP wants to close. This community, in many cases, defines the "existing character" of the park.

  Closures and reductions in DPAs (especially if 80% of the total off-leash space in city parks are closed) will have a significant negative impact on these social communities. DPA closures will destroy these communities. Because the NAP EIR did not consider these impacts on community of those who live near and walk in parks, it is inadequate. [Brown-1-13]

- My family and I have been walking our dogs on Bernal Hill for as long as we've lived here. The proposals in the NAP EIR would drastically impact our use and enjoyment of this area. I have read the NAP EIR and believe it's assessments and suggestions are faulty, to say the least. [Browne-1-01]

- The NAP EIR defines dogs as "nuisances." The EIR does not consider the impacts of DPA closures (especially the 80% potential closures) on the physical and mental health benefits of people who walk with their dogs. The EIR does not consider the impacts of DPA closures (especially the 80% potential closures) on the social community of dog walkers in parks and in the neighboring communities surrounding the parks. [Buckley-1-01] [Ghosh-1-04]

- The NAP EIR's analysis of the impact on dog play areas is inadequate. The NAP EIR's definition of dogs as a "nuisance" discloses its bias against dogs and ignores the scientifically proven benefits that dogs bring to society and nature as an integral part of the environment. Dogs serve humans and nature in numerous, beneficial ways. [Dougherty-1-02]

- Finally, the NAP EIR would have a negative impact on San Francisco's economy with the loss of jobs (e.g., professional dog walkers), more dogs being surrendered to the city shelter for lack of adequate venues for off-leash exercise, and loss of international status as a dog friendly tourist destination. [Dougherty-1-04]

- Please know that many of us do not see any value in these type of programs. Unless we are all going away and taking our cars and two centuries of urban planning with us, it seems more sensible for the parks to be maintained for the use and enjoyment of ALL of the people who pay for their upkeep and maintenance. This includes children, runners, classes, sportspeople, dogs and their people, sunbathers, gardeners and bicyclists.

  NAP is an attempt to undermine this great and successful social experiment by useless prohibitions on the citizens' enjoyment of what they have paid for. The benefits of this program are ill considered. Please do not continue down this garden path. [Enzi-1-02]

- More and more I have been reading articles in various national newspapers about the important role animals, and dogs, in particular, play in the lives of people. This is certainly true for our dog and I suspect for all dog owners. [Fitzer-1-06]
- The NARMP EIR refers to dogs as "nuisances," an extremely biased position that fails to consider any positive aspects of dog walking, including the physical and mental health benefits to having a dog, which has been rigorously studied and proven. [Jake-1-03]
- The NAP EIR refers to dogs as "nuisances." It does not consider the positive aspects of dog walking, including the physical and mental health benefits to people who walk with their dogs. These must be included in the analysis of different alternatives. People walk in McLaren Park and on Bernal Hill because they are large enough to take long walks with your dog. Most other DPAs are much smaller and do not offer the same walking experience. The NAP EIR assumes all DPAs are interchangeable. They are not. This must be corrected. [Kelly-1-05]
- 3) The NAP EIR defines dogs as "nuisances." The EIR does not consider the impacts of DPA closures (especially the 80% potential closures) on the physical and mental health benefits of people who walk with their dogs. The EIR does not consider the impacts of DPA closures (especially the 80% potential closures) on the social community of dog walkers in parks and in the neighboring communities surrounding the parks. [Moyer-1-03]
- The NAP EIR's analysis of the impact on dog play areas is inadequate. The NAP EIR's definition of dogs as a "nuisance" discloses its bias against dogs and ignores the scientifically proven benefits that dogs bring to society and nature as an integral part of the environment. Dogs serve humans and nature in numerous, beneficial ways. [Nelson-1-02]
- Finally, the NAP EIR would have a negative impact on San Francisco's economy with the loss of jobs (e.g., professional dog walkers), more dogs being surrendered to the city shelter for lack of adequate venues for offleash exercise, and loss of international status as a dog friendly tourist destination. [Nelson-1-04]
- I think the NAP EIR is inadequate and that additional work must be done:

  The NAP EIR defines dogs as "nuisances." The EIR does not consider the impacts of DPA closures (especially the 80% potential closures) on the physical and mental health benefits of people who walk with their dogs. The EIR does not consider the impacts of DPA closures (especially the 80% potential closures) on the social community of dog walkers in parks and in the neighboring communities surrounding the parks. [Form Letter-1-03] [Yip-1-03]
- Give us unbiased proven factors or don't kick us out. NAP has become a way to get rid of DPA's and city parks since the only real remedy from the alleged impacts from dogs is closure of the DPA. As such, the EIR must consider the impact of those closures on the human and urban environments, not the just the natural environment. [PH-Stephens-04]
- Throughout the EIR, dogs are described solely as nuisances. The EIR does not consider any benefits of dogs and off-leash dog walking to people and communities. The NAP EIR must consider impacts of a physical and emotional health of people who can no longer walk their

dogs in closed DPAs, and on the sense of neighborhood and park community that will be impacted if DPAs are closed or significantly reduced. Yet it does not. [PH-Stephens-05]

## Response G-26

These comments express concern that the Draft EIR needs to analyze a variety of social and/or economic impacts related to the conversion of off-leash DPAs to on-leash areas and that the Draft EIR's language exhibits a bias against dogs and DPAs.

As defined under CEQA Guidelines Section 15382, "significant effect on the environment" means a substantial or potentially substantial, adverse change in any of the physical conditions within the area affected by the project including land, air, water, minerals, flora, fauna, ambient noise, and objects of historic or aesthetic significance. Consistent with CEQA Guidelines Section 15064(e), an economic or social change, such as the physical and mental health effects of people who walk their dogs, the benefits that dogs bring to society, the potential loss of dog-walking jobs, or impacts associated with dogs being surrendered to a dog shelter, by itself shall not be considered a significant effect on the environment. However, where a physical change in the environment is caused by an economic or social impact of a project, that physical change may be regarded as a significant impact on the environment in the same manner as any other physical change caused by the project. The social effects described in the comments above would not result in a substantial or potentially substantial adverse change to the physical environment.
