Re: Responses to Comments Document on the
Draft Subsequent Environmental Impact Report on the
Event Center and Mixed-Use Development at Mission Bay Blocks 29-32

OCII Case No. ER 2014-919-97
San Francisco Planning Department Case No. 2014.1441E
State Clearinghouse No. 2014112045

Attached please find the Responses to Comments document for the Draft Subsequent Environmental Impact Report (SEIR) on the above-referenced project. This document together with the Draft SEIR constitute the Final SEIR on this project. **The Commission will consider certification of the Final SEIR on this project on November 3, 2015.**

The Commission does not conduct a hearing to receive comments on the Responses to Comments document, and no such hearing is required by the California Environmental Quality Act. The public review period on the Draft SEIR ended on July 27, 2015.

This Responses to Comments document, as well as the Draft SEIR, are available to view or download at either the OCII or the Planning Department's websites at the following URL internet addresses:

- http://www.sfocii.org/index.aspx?page=61
- http://www.sf-planning.org/sfceqadocs

Printed paper copies of the Responses to Comments document and the Draft SEIR are available for viewing at the following locations: (1) OCII at 1 South Van Ness Avenue 5th Floor, San Francisco; (2) Planning Information Center counter on the first floor of 1660 Mission Street, San Francisco; (3) San Francisco Main Library at 100 Larkin Street, San Francisco; and (4) San Francisco Library, Mission Bay Branch at 960 4th Street, San Francisco. Printed paper copies of the Responses to Comments document can be obtained at the cost of 10 cents per page by contacting Brett Bollinger, San Francisco Planning Department, at (415) 575-9024.

If you have any questions concerning the Responses to Comments document or the environmental review process, please contact Brett Bollinger at the number above. Thank you for your interest in this project and your consideration of this matter.

CHAPTER 10
Introduction to Responses to Comments

10.1 Purpose of the Responses to Comments Document

This Responses to Comments document completes the final supplemental environmental impact report (SEIR) analyzing potential environmental effects associated with the event center and mixed-use development at Mission Bay Blocks 29-32 as proposed by GSW Arena LLC (GSW), an affiliate of the Golden State Warriors, LLC. The San Francisco Office of Community Investment and Infrastructure (OCII), as lead agency responsible for administering the environmental review for private projects in the Mission Bay North and South Redevelopment Plan Area of San Francisco, published a Draft SEIR[1] on the proposed project on June 5, 2015, and the public review period ended on July 27, 2015. The Draft SEIR together with this Responses to Comments document constitute the Final SEIR for the proposed project in fulfillment of requirements of the California Environmental Quality Act (CEQA) and consistent with CEQA Guidelines Section 15132.

This Responses to Comments document provides written responses to comments received during the public review period. It contains the following: (1) a list of persons, organizations, and public agencies commenting on the Draft SEIR; (2) copies of comments received on the Draft SEIR; (3) written responses to those comments.

In addition, this document provides: (1) a description of project refinements and discussion of associated environmental effects; (2) a description and analysis of a new project variant (a minor variation of the proposed project); and (3) revisions to the Draft SEIR to clarify or correct information in the Draft SEIR. See Section 10.3, below, for a description of the overall contents and organization of the combined Draft SEIR and Responses to Comments document.

The Final SEIR has been prepared in compliance with CEQA (California Public Resources Code, Sections 21000 *et seq.*) and the CEQA Guidelines. It is an informational document for use by (1) governmental agencies and the public to aid in the planning and decision-making process by disclosing the physical environmental effects of the projects and identifying possible ways of reducing or avoiding their potentially significant impacts; and (2) the OCII prior to a decision to approve, disapprove, or modify the proposed project. If the OCII approves the proposed project, they will be required to adopt CEQA findings and the Mitigation Monitoring and Reporting Program (MMRP) to ensure that mitigation measures identified in the Final SEIR will be

[1] State Clearinghouse No. 2014112045, OCII Case No. ER 2014-919-97, and San Francisco Planning Department Case No. 2014.1441E

implemented as part of the project. See Section 10.2, below, for further description of the environmental review process.

10.2 Environmental Review Process

10.2.1 Notice of Preparation and Public Scoping

As described in the SEIR, the OCII sent a Notice of Preparation (NOP) to governmental agencies and organizations and persons interested in the proposed project on November 19, 2014 (see Appendix NOP-IS of the SEIR). During a 30-day public scoping period that ended on December 19, 2014, the OCII accepted comments from agencies and interested parties identifying environmental issues that should be addressed in the SEIR. The comment letters received in response to the NOP are available for review at the OCII as part of Case File No. ER 2014-919-97. In addition, a public scoping meeting was held on December 9, 2014 at Mission Creek Senior Community, 225 Street, San Francisco to receive oral comments on the scope of the SEIR. The OCII has considered the comments made by the public and agencies in preparing the SEIR on the proposed project.

10.2.2 Draft SEIR Public Review

The Draft SEIR on the proposed project was published on June 5, 2015 and circulated to local, state, and federal agencies and to interested organizations and individuals from June 5, 2015 through July 27, 2015. Paper copies of the Draft SEIR were made available for public review at the following locations: (1) OCII, at 1 South Van Ness Avenue 5th Floor, San Francisco, California; (2) San Francisco Planning Department, 1660 Mission Street, 1st Floor, Planning Information Counter, San Francisco, California; (3) San Francisco Main Library, 100 Larkin Street, San Francisco, California; and (4) San Francisco Library, Mission Bay Branch, 960 4th Street, San Francisco, California.[2] On June 5, 2015, the Planning Department also distributed notices of availability of the Draft SEIR, published notification of its availability in a newspaper of general circulation in San Francisco, and posted notices at the project site.

During the public review period, the OCII conducted a public hearing to receive oral comments on the Draft SEIR. The public hearing was held before the OCII Commission on June 30, 2015 at San Francisco City Hall. A court reporter present at the public hearing transcribed the oral comments verbatim and prepared a written transcript. See Appendix PH of this Response to Comments document for the public hearing transcript. During the Draft SEIR public review period, the OCII received comments from approximately 9 public agencies, 11 non-governmental organizations, and 155 individuals. See Chapter 11 for a complete list of persons commenting on the Draft SEIR.

[2] Electronic copies of the SEIR and the administrative record could be accessed through the internet on the OCII website, Mission Bay webpage starting on June 5, 2015 at the following address: http://www.sfocii.org/index.aspx?page=61, and on the Planning Department website, Environmental Impacts and Negative Declarations webpage at the following address: http://www.sf-planning.org/index.aspx?page=1828.

10.2.3 Comments and Responses Document and Final EIR

The OCII distributed this Responses to Comments document for review to the OCII Commission and in compliance with CEQA Guidelines Section 15088. The OCII Commission will hold a public hearing on November 3, 2015 at City Hall to consider the adequacy of the Final SEIR – consisting of the Draft SEIR and the Responses to Comments document – in complying with the requirements of CEQA. If the OCII Commission finds that the Final SEIR complies with CEQA requirements, it will certify the Final SEIR.

Following certification of the Final SEIR, the OCII will review and consider the certified Final SEIR and the associated MMRP before making a decision and taking an approval action on the proposed project. Consistent with CEQA Guidelines Section 15097, the MMRP is a program designed to ensure that the mitigation measures identified in the Final SEIR and adopted by decision-makers to mitigate or avoid the projects' significant environmental effects are implemented. CEQA also requires the adoption of findings prior to approval of a project for which a certified EIR identifies significant environmental effects (CEQA Guidelines Sections 15091 and 15092). If the SEIR identifies significant adverse impacts that cannot be mitigated to less-than-significant levels, the findings must include a statement of overriding considerations for those impacts (CEQA Guidelines Section 15093[b]) if the project is approved. The OCII will be required to adopt the CEQA findings and the MMRP as conditions of project approval actions.

10.3 Document Organization

This Responses to Comments document is organized to complement the Draft SEIR and follows the sequential numbering of chapters in the Draft SEIR. The Draft SEIR consists of Chapters 1 through 9 plus appendices as follows:

- **Chapter 1, Summary.** This chapter summarizes the contents of the entire SEIR by presenting a concise overview of the project description and providing in a tabular format a summary of the environmental impacts that would result from the project, mitigation measures identified to reduce or avoid significant impacts. It also briefly describes the project variant and its impacts, and the alternatives to the proposed project.

- **Chapter 2, Introduction.** This chapter describes the environmental review process, the previous environmental review of the Mission Bay Redevelopment Plans, the public and agency comments received on the scope of the SEIR, and the organization of the SEIR.

- **Chapter 3, Project Description.** This chapter discusses the project's background, objectives, and location; describes the physical characteristics of the project, including both the construction and operational phases; and identifies required project approvals.

- **Chapter 4, Plans and Policies.** This chapter provides a summary of the applicable plans, policies, and regulations of the local, regional, state, and federal agencies that have policy and regulatory control over the project site, and discusses the proposed project's consistency with those plans, policies, and regulations.

- **Chapter 5, Environmental Setting, Impacts, and Mitigation Measures.** This chapter describes the existing setting at the project site and vicinity and the project's environmental impacts with respect to transportation and circulation, noise and vibration, air quality, greenhouse gas emissions, wind and shadow, utilities and service systems, public services, and hydrology and water quality. Each environmental topic is discussed in a separate section within this chapter, and each section identifies the thresholds of significance used to assess the severity of the impacts. Within each section, there is a summary of the relevant sections of the Mission Bay FSEIR, descriptions of the setting and regulatory framework, and impact analyses of both project-specific and cumulative impacts of the proposed project and a determination of the significance of each impact. For impacts determined to be significant, mitigation measures that would reduce or avoid those impacts are presented.

- **Chapter 6, Other CEQA Issues.** This chapter addresses any growth-inducing impacts that would result from the proposed project, the significant environmental effects of the project that cannot be mitigated to a less-than-significant level, and areas of known controversy.

- **Chapter 7, Alternatives.** This chapter presents and evaluates alternatives to the proposed project that could feasibly attain most of the project's objectives as well as reduce identified significant adverse impacts of the project. It also identifies the environmentally superior alternative and describes other alternatives that were considered but rejected.

- **Chapter 8, Third Street Plaza Variant.** This chapter describes and analyzes a variant to the proposed project at an equal level of detail as the proposed project.

- **Chapter 9, Report Preparers.** This chapter identifies the SEIR authors and consultants; project sponsor and consultants; and agencies and persons consulted.

- **Appendices.** The appendices include the Notice of Preparation, the complete Initial Study, and supporting technical information for the SEIR.

This Responses to Comments document consists of Chapters 10 through 14 plus supplemental appendices, as follows:

- **Chapter 10, Introduction to Responses to Comments.** This chapter describes the purpose of the Responses to Comments document, the environmental review process, and the organization of this document.

- **Chapter 11, List of Persons Commenting.** This chapter describes the coding and organization of comments and lists the persons and organizations that submitted comments on the Draft SEIR.

- **Chapter 12, Project Refinements and New Variant.** This chapter describes a number of refinements that have evolved for the project since publication of the Draft SEIR. The project refinements consist of new information made available that updates, supplements, or replaces certain project description information and associated environmental analysis previously presented in the Draft SEIR. This chapter addresses all potential environmental impacts associated with the project refinements and discusses how the environmental impacts and mitigation measures are not substantially different from those identified in the Draft SEIR. This chapter also describes the Muni UCSF/Mission Bay Station Variant and its environmental impacts at an equal level of detail as the proposed project.

- **Chapter 13, Responses to Comments.** This chapter presents the substantive comments received on the Draft SEIR together with responses to those comments. The comments and responses in this chapter are organized by topic, including all of the same environmental topics addressed in Chapter 5 of the SEIR, and are generally presented in the same order of topics as presented in the Draft SEIR. Similar comments on the same topic received from multiple commenters are grouped together and a single, comprehensive response is provided, with each individual comment assigned a unique comment code. The complete letters, emails, and transcript containing the comments and assigned comment code are included in Appendices COM and PH to this document. The sub-sections in this chapter are as follows:

  13.1 Organization of Responses to Comments
  13.2 General Comments
  13.3 Environmental Review Process
  13.4 AB 900 Process
  13.5 Project Description
  13.6 Plans and Policies
  13.7 Impact Overview
  13.8 Land Use
  13.9 Population and Housing
  13.10 Cultural Resources
  13.11 Transportation and Circulation
  13.12 Noise and Vibration
  13.13 Air Quality
  13.14 Greenhouse Gas Emissions
  13.15 Wind and Shadow
  13.16 Recreation
  13.17 Utilities and Service Systems
  13.18 Public Services
  13.19 Biological Resources
  13.20 Geology and Soils
  13.21 Hydrology and Water Quality
  13.22 Hazards and Hazardous Materials
  13.23 Energy Resources
  13.24 Alternatives

- **Chapter 14, Draft SEIR Revisions.** This chapter presents changes and revisions to the Draft SEIR. The OCII has made changes and revisions to the Draft SEIR either in response to comments received on the Draft SEIR, to update information based on the project refinements, or as necessary to clarify statements and conclusions made in the Draft SEIR. In all cases, changes are provided to clarify or correct content in the Draft SEIR or to add information received after the release of the Draft SEIR. None of the changes and revisions in Chapter 14 substantially affect the analysis or conclusions presented in the Draft SEIR.

- **Comments and Responses Appendices.** The appendices include full copies of the written comments received on the Draft SEIR (Appendix COM, Comment Letters and Emails) and transcripts of the public hearing on the Draft SEIR (Appendix PH, Public Hearing Transcripts). Appendix COM and Appendix PH also show, in the margin of each letter or transcript, the bracketing and comment code used to identify comments and the topic code assigned to the corresponding response. Two studies conducted in support of the information in this Responses to Comments document are presented in Appendix TR-X (Supplemental Transportation Analysis, Off-Site Parking) and Appendix UD (Urban Decay). Additional technical appendices include Appendix AQ2 (Supplemental Air Quality Supporting Information), Appendix TR2 (Supplemental Transportation Supporting Information), and Appendix WS2 (Supplemental Wind Study). Finally, Appendix COM2 contains the complete uncoded written comments (including all attachments) on the Draft SEIR.

CHAPTER 11
List of Persons Commenting

This Comments and Responses document provides written responses to comments received on the Draft SEIR during the public review period, including all written comments submitted either by letter or email and all oral comments presented at the public hearing on the Draft SEIR. This chapter lists all persons who submitted comments on the Draft SEIR. Persons who submitted written comments are grouped according to whether they represent a public agency, non-governmental organization, or an individual citizen, as shown in **Tables 11-1**, **11-2**, and **11-3**, respectively; these tables include several comment letters that were received after the close of the public review period. Persons who provided oral comments at the public hearing are listed in **Table 11-4**. The complete set of written and oral comments received on the Draft SEIR is provided in Appendix COM, Comment Letters and Emails, and Appendix PH, Public Hearing Transcripts.

For each commenter, Tables 11-1, 11-2, 11-3, and 11-4 present the person's name, agency or organization as applicable, comment format, comment date, and a commenter code. The commenter codes were assigned to facilitate the preparation of responses, and there is a unique commenter code for each comment letter, email, comment card, and public hearing transcript based on the name of the agency, organization, or individual submitting the comment. Comments submitted by mail, email, comment card, or orally at the public hearing (as transcribed in the official public hearing transcript) are all coded and numbered the same way. The commenter code begins with a prefix indicating whether the commenter represents a public agency (A), a non-governmental organization (O), an individual (I), or a speaker at the public hearing (PH). This is followed by a hyphen and the acronym of the agency or organization, or the individual's last name. Within each category, commenters are listed in alphabetical order by code.

As described further in Chapter 13, the commenter codes are used to identify individual comments on separate topics within each comment letter, email, comment card, or public hearing transcript. Each individual comment from each commenter are bracketed and numbered sequentially following the commenter code. The bracketed comments and corresponding comment codes are shown in the margins of the comments in Appendices COM and PH. There is a unique comment code for each distinct comment.

CHAPTER 12
Project Refinements and New Variant

12.1 Introduction

Since publication of the Draft Subsequent Environmental Impact Report (Draft SEIR) on June 5, 2015, the project sponsor, GSW Arena LLC (GSW), has refined several aspects of the proposed project as part of the on-going planning, development, and design process. In addition, the project sponsor has requested that a second variant to the proposed project—the Muni UCSF/Mission Bay Station Variant—be included in the SEIR for analysis and disclosure of potential environmental impacts to satisfy requirements under the California Environmental Quality Act (CEQA). This chapter presents a description of the project refinements and the new variant together with a discussion of their environmental effects.

12.2 Operational Refinements

Minor refinements to the project design and operations include: generator relocation, design features to reduce wind hazards, and transportation improvements. These are discussed below.

12.2.1 Generator Relocation

Description

The Draft SEIR addressed the proposed use of on-site emergency standby generators. As presented in the Draft SEIR, Chapter 3, Project Description, all generators were proposed to be located within the parking structure on Lower Parking Level 1. The Draft SEIR assumed the proposed event center would have on-site generators capable of providing up to three megawatts (MW) of emergency, standby and optional power in the case of temporary loss of normal utility power. In addition, the Draft SEIR assumed that each office and retail building would have an on-site generator capable of approximately 0.75 MW, and the proposed food hall would have a generator capable of approximately 0.5 MW, to provide fire and life safety emergency power in the case of temporary loss of normal utility power in those uses. All generators would have Tier 4 motors.

Since publication of the Draft SEIR, the project sponsor has proposed to relocate the generators as discussed further below. Under the project as refined, the proposed Tier 4 generators for the event center would continue to be installed in the southwest portion of the site, although they would be located in the event center AHU (Air Handling Unit) on the Mezzanine Level at approximately 87 feet above ground level (agl). The proposed generators for the 16th Street office

and retail building, and the food hall, would continue to be located in the southwestern and northeastern portions of the site, respectively, but would be located in the at-grade Ground Level/Upper Parking Level. The generator for the South Street office and retail building would continue to be in the northern part of the site but would be located at the Plaza Level at approximately 10 feet agl. The power requirements for, and proposed use of, the generators for the event center, office and retail buildings, and food hall, would be identical to that described in the Draft SEIR. Furthermore, as was originally proposed, all proposed generators would be completely enclosed within dedicated generator rooms in the proposed buildings, and fitted with appropriate sound attenuation devices to limit generator noise.

Environmental Effects

With the exception of potential noise and air quality operational impacts, relocation of the emergency standby generators would result in no changes to the environmental impacts of the project as presented in Chapter 5 of the SEIR and the Initial Study in Appendix NOP-IS.

Noise

Section 5.3, Impact NO-4 of the Draft SEIR (pp. 5.3-27 to 5.3-28) qualitatively described potential operational noise impacts of the generators and concluded that the impact would be less than significant because in the sub-grade location, the generators would not increase ambient noise levels at the nearest existing residential land use about 300 feet away. Because the generators would no longer be in a sub-grade location with the project refinements, the potential noise impacts of the routine generator maintenance operations at the at- or above-grade locations were assessed quantitatively, as described below.

The two generators supporting the event center would be the largest (1.5 MW each) and would generate the highest sound levels. Maintenance operation of the generators would occur during daytime hours for a period of approximately one hour per week. The sources of noise associated with generator operations include fan and engine noise emanating from the air discharge vent as well as generator engine block noise emanating from the air intake screen and finally exhaust noise. The two 1.5 MW event center generators would be equipped with critical grade exhaust silencers and low pressure loss silencers at the intake and exhaust vents. Available data indicate[1] that the combination of low-pressure loss silencers on intake air and exhaust air and the industrial grade silencer at the exhaust port can achieve a reduction to 76 dBA at 50 feet.

The nearest sensitive receptor to the event center generators, which would vent on the south side of the event center, would be the UCSF hospital located approximately 650 feet to the southwest of the event center generator locations. At this distance, the noise-controlled generators at the event center would result in a daytime noise level from vents and exhaust of 54 dBA or 57 dBA if both generators were tested simultaneously; this would be less than 8 dBA above the existing

[1] American Society of Heating, Refrigeration and Air Conditioning Engineers (ASHRAE), Technical Committee 2.6 Sound and Vibration, Generator Noise Control, An Overview.2008 presentation

monitored daytime background noise level of 61 dBA (L_{90}). Consequently, operational noise impacts from these generators would be *less than significant*.

Also, on the south side of the project site, the generator for the south office tower would be approximately 600 feet from the UCSF Hospital. This proposed south office tower generator would be 750 kilowatts, which typically generates a noise level on the order of 91 dBA at 23 feet, which would attenuate to 63 dBA at the UCSF Hospital; this would be less than 8 dBA above the existing monitored daytime background noise level of 61 dBA (L_{90}). On the north side of the project site, the generator for the north office tower would be approximately 380 feet from the UCSF Hearst Tower housing building. This proposed north office tower generator would be 750 kilowatts, which typically produces a noise level on the order of 91 dBA at 23 feet, which would attenuate to 67 dBA at the UCSF Hearst Tower housing building; this would be less than 8 dBA above the existing monitored daytime background noise level of 61 dBA (L_{90}). The proposed market hall generator would be 500 kilowatts, which typically produces a noise level on the order of 88 dBA at 23 feet, which would attenuate to 58 dBA at UCSF Hearst Tower housing building, approximately 700 feet away; this would be less than 8 dBA above the existing monitored daytime background noise level of 61 dBA (L_{90}). Therefore, operational noise impacts from the proposed relocated generators would be *less than significant*.

Text changes reflecting the revised noise analysis associated with these project refinements for the event center generators are included in Chapter 14, Draft SEIR Revisions, of this document. The generator relocation and associated text changes do not affect the conclusions presented in the Draft SEIR with regard to operational noise impacts.

Air Quality

Air dispersion modeling was conducted for the generators using the approximate at or above-grade locations of each of the five proposed Tier 4 generators. The five generators include two generators to support the event center. The relocation of the generators would only affect the analysis of Impact AQ-3 regarding localized exposure to toxic air contaminants and not the analysis of Impact AQ-2 regarding operational emissions of criteria air pollutants, which used the same assumptions in the Draft SEIR to estimate daily and annual emissions from the generators in the assessment of regional operational air quality impacts.

In the Draft SEIR, localized risks and hazards from generator operations were assumed to comply with the maximum permitted risk level of the BAAQMD (10 in one million per permitted operator) and increases in localized cancer risks were not distinctly estimated for each generator. With the confirmation of the locations of the generators under the project refinements, the five engines were modeled as point sources in AERMOD, which is the recommended air dispersion model of the U.S. Environmental Protection Agency (U.S. EPA), as described in Appendix AQ of the Draft SEIR, using source parameters from the San Francisco City-wide Health Risk Assessment, as shown in Revised Table 2b (a complementary table for the operation period to Table 2: Modeling Parameters, of Appendix AQ of the SEIR, that describes the construction source parameters). The meteorological data and receptors used for construction modeling, as described in Section 3.2 of Appendix AQ of the SEIR, were also used for the operational

generator modeling. Generator diesel particulate matter (DPM) emissions were modeled conservatively assuming that emissions are distributed equally among all hours in the year modeled. Exposure parameters for the operational emissions are shown in Revised Table 6.1-7 of Appendix AQ2. Exposure over a 70-year lifetime is considered for residents, while exposure durations of one-year and 5.9 years are considered for a child (from 6 weeks of age to 6 years old) in the hospital and a child at daycare, respectively.

Results of the modeling are presented in Chapter 14 of this Responses to Comments document in revised Tables 5.4-10 and 5.4-11, as well as in revised Tables 6.1-2, 6.1-5, 6.1-6, 6.1-7, and 6.1-8 of Appendix AQ2 of the SEIR. The results show a substantial decrease in risk from the operation of standby generators with the source specific analysis. Therefore, the significance determination for Impact AQ-3 regarding the operational and cumulative health risk assessments due to the refined modeling of the five emergency generators, including other project corrections to the construction analysis,[2] would be *less than significant*, instead of less than significant with mitigation as reported in the Draft SEIR. This set of refined tables shows that the refined modeling does not result in an exceedance of the ambient $PM_{2.5}$ concentration threshold of significance, either during operation or on a cumulative basis. Although the revised analysis for Impact AQ-3 indicates that implementation of Mitigation Measure M-AQ-1 is not required to reduce the severity of this impact to less than significant, implementation of this measure would still be required under Impact AQ-1, which would, in turn, further reduce the severity of the less-than-significant health risk impact identified in the revised analysis for Impact AQ-3.

Conclusion

The proposed relocation of the emergency standby generators would result in minor revisions to the operational noise and air quality impact analyses that were presented in the Draft SEIR, but the impact conclusions would remain the same or be less severe. Operational noise impacts associated with the relocation of the noise-controlled generators would not result in a substantial increase in background noise levels at the UCSF hospital or at the Hearst Tower residences. Revised and refined analysis of localized operational health risk impacts associated with the generator relocation indicates that the significance determination would change from less than significant with mitigation to less than significant, and mitigation would not be required for Impact AQ-3.

Thus, the proposed generator relocation would not result in any new or more severe impacts than previously identified in the Draft SEIR. Text changes to the Draft SEIR to reflect the revised analysis associated with the proposed generator relocation are included in Chapter 14, Draft SEIR Revisions, of this document.

[2] The extension of the northbound Muni platform was inadvertently omitted from the air quality assumptions used in the Draft SEIR air quality analysis. Corrections for this omission are included in all revised air quality tables presented in this Responses to Comments document. However, this correction does not affect the air quality impact conclusions presented in the Draft SEIR.

12.2.2 Project Design to Reduce Wind Hazards

Description

The SEIR Wind and Shadow section analyzed the potential for the project to alter wind in a manner that would substantially affect off-site public areas. Impact WS-1 in the Draft SEIR (pp. 5.6-10 to 5.6-14) indicated that the project would result in a net increase in the total duration of the wind hazard exceedance at off-site public walkways in the project vicinity, and determined this impact would be significant and unavoidable with mitigation. The SEIR identified Mitigation Measure M-WS-1, which states the following:

> The project sponsor shall develop and implement design measures to reduce the identified project off-site wind hazards to the extent feasible. This may include on-site project design modifications or additions, additional on-site landscaping; and the implementation of potential additional off-site streetscape landscaping or other off-site wind-reducing features. Potential on- and/or off-site project site wind-reduction design measures developed by the sponsor would be coordinated with, and subject to review and approval, by OCII.

The impact analysis acknowledged that preliminary evaluation by the project sponsor of certain on-site design modifications indicated such modifications would be effective in reducing the project wind hazard impact to a less than significant level. However, given the preliminary development of the project design at that time, Impact WS-1 was conservatively determined to be significant and unavoidable with mitigation in the Draft SEIR.

Since publication of the Draft SEIR, the project sponsor pursued design measures as required by Mitigation Measure M-WS-1, and has identified an on-site design modification that would reduce the project wind hazard impact to less than significant. This design modification consists of the installation of a solid canopy with a porous vertical standoff at the ground level of the southwest corner of the proposed 16th Street office building.

Environmental Effects

To provide context, a brief summary of the Draft SEIR analyses of existing and existing-plus-project wind hazard conditions is presented, based on the wind study prepared by Rowan Williams Davies & Irwin Inc. (RWDI) referenced in the Draft SEIR.[3] (Please refer to Section 5.6, Wind and Shadow in the SEIR for the full analyses.) This is followed by an analysis of the mitigated project design based on a supplemental wind study prepared by RWDI of potential design modifications (see Appendix WS2).[4]

[3] Rowan Williams Davies & Irwin Inc., *Warriors Arena, San Francisco California, Pedestrian Wind Study*, April 23, 2015.
[4] Rowan Williams Davies & Irwin Inc., *Warriors Arena, San Francisco California, Pedestrian Wind Study*, May 12, 2015.

Table 12-1 presents the results of the updated wind analysis for the proposed project, including the wind analysis of the project as refined with the identified design modification. It shows the 10 percent exceeded equivalent wind speeds and the number of hours per year the wind hazard criterion would be exceeded at 46 off-site study test points located on public walkways along the site perimeter and vicinity for the existing, existing-plus-project, and refined project wind scenarios.

Existing Wind Hazard Conditions. Under existing conditions, the wind hazard criterion is exceeded at seven test locations on public walkways in the project vicinity. Currently, five test locations with wind hazards occur along 16th Street at test points adjacent to, across the street from, or upwind of the project site, one wind hazard location occurs along Gene Friend Way upwind of the project site, and one wind hazard location occurs on South Street adjacent to the project site.

The total duration of the existing wind hazards at the seven locations on public walkways in the project vicinity is 106 hours per year, with 101 of those hours occurring at the five test points along 16th Street.

Existing-Plus-Project Wind Hazard Conditions at Off-site Public Use Areas. Development of the proposed project would alter wind speeds among individual study test points at off-site public walkways. Under existing-plus-project conditions, the total net number of off-site study test points at which wind speed would exceed the wind hazard criterion would be reduced from 7 to 6. However, there would also be a net increase in the total duration of wind hazards on the off-site public walkways in the project vicinity, increasing from 106 hours per year under existing conditions to 139 hours per year under existing-plus-project conditions (an increase of 33 hours). This included new exceedances of the wind hazard criterion at two test points (Test Point No. 6 at the southeast corner of Third Street and 16th Street; and Test Point No. 50 on the north side of South Street between Third Street and Bridgeview Way across from the project site); and an increase in the duration of two existing wind hazard exceedances (Test Point No. 99 at the southeast corner of 16th Street and Illinois Street; and Test Point No. 106 at the southwest corner of Third Street and 16th Street).

Refined Project Wind Hazard Conditions at Off-site Public Use Areas. Under the refined project conditions, there would be 6 total off-site study test points at which wind speed would exceed the wind hazard criterion, similar to the proposed project. However, under the refined project conditions, there would be a net decrease in the total duration of wind hazards on the off-site public walkways in the project vicinity, decreasing from 106 hours per year under existing conditions and 139 hours per year under existing-plus-project conditions to 100 hours per year under the refined project conditions (i.e., a decrease of 6 hours per year compared to existing conditions, and decrease of 39 hours per year compared existing-plus-project conditions, respectively).

When considering individual wind test points, the refined project would result in the following changes to the wind environment in the variant vicinity compared to existing conditions:

- Create new exceedances of the wind hazard criterion at two test points: at the southeast corner of Third Street and 16th Street (Test Point No. 6: 30 hours per year); and on the north side of South Street between Third Street and Bridgeview Way across from the project site (Test Point No. 50: 7 hours per year);
- Increase the duration of two existing wind hazard exceedances: at the southeast corner of 16th Street and Illinois Street (Test Point No. 99: 1 hour increase per year); and at the southwest corner of Third Street and 16th Street (Test Point No. 106: 3 hour increase per year);

- Decrease the duration of two existing wind hazards: at the northwest corner of Third Street and 16th Street (Test Point No. 1: 7 hour decrease per year); and on 16th Street between Third and Fourth Streets (Test Point No. 105: 30 hour decrease per year); and
- Eliminate three existing exceedances of the wind hazard criterion: at the northeast corner of Third Street and 16th Street (Test Point No. 7: 6 hours eliminated per year); on South Street adjacent to the site (Test Point No. 54: 3 hours eliminated per year); and on Gene Friend Way adjacent to UCSF Hearst Tower (Test Point No. 103: 1 hour eliminated per year).

It should be noted that the wind test results indicate that under the refined project conditions, as under the existing-plus-project conditions, no wind hazard exceedances would occur on public walkways located on the east side of the project site. Given that the planned Bayfront Park is located even farther east, it can also be inferred from the wind test data that the refined project would not cause a new wind hazard within the planned Bayfront Park.

In summary, the refined project would result in a net decrease in the total duration of the wind hazard exceedance at off-site public walkways in the project vicinity compared to existing conditions, and existing-plus-project conditions. Consequently, the refined project would not alter wind in a manner that would substantially affect off-site public areas. Accordingly, with this revised analysis, the significance determination for Impact WS-1 is revised from significant and unavoidable with mitigation, to *less than significant with mitigation*. Mitigation Measure M-WS-1 has also been revised as follows to reflect the project sponsor's selection of an on-site design modification that would reduce wind hazard impacts to less than significant (deleted text shown in ~~strikethrough~~ and new text in underline).

> **Mitigation Measure M-WS-1: Develop and Implement Design Measures to Reduce Project Off-site Wind Hazards**
>
> The project sponsor shall develop and implement design measures to reduce the identified project off-site wind hazards~~ to the extent feasible~~. The project sponsor has selected a specific on-site design modification (installation of a solid canopy with a porous vertical standoff at the ground level of the southwest corner of the proposed 16th Street office building) that is demonstrated to be effective in reducing the project wind hazard impact to a less than significant level. Other measures ~~This~~ may include additional on-site project design modifications or additions, additional on-site landscaping; and the implementation of potential additional off-site streetscape landscaping or other off-site wind-reducing features. Potential on- and/or off-site project site wind-reduction design measures developed by the sponsor would be coordinated with, and subject to review and approval, by OCII.

Conclusion

Subsequent to the publication of the Draft SEIR, the project sponsor conducted additional testing of design measures as required under Mitigation Measure M-WS-1 and has identified a design modification that would reduce wind impacts to less than significant, as verified by wind tunnel testing. Therefore, the impact conclusion for Impact WS-1 has been revised from significant and unavoidable with mitigation, to *less than significant with mitigation*.

Text changes to the Draft SEIR to reflect the revised wind analysis associated with the identification of an on-site design modification that would reduce the significant project wind hazard impact to less than significant are included in Chapter 14, Draft SEIR Revisions, of this document.

12.2.3 Transportation Improvements

Description

SEIR Section 5.2, pp. 5.2-46 to 5.2-69, presents the transportation improvements that would be provided as part of the proposed project. These include improvements related to the physical transportation infrastructure adjacent to the project site including travel lanes, sidewalks, bicycle lanes, traffic signals, and the light rail platform, as well as transit service improvements including the expansion of the Mission Bay TMA shuttle system, provision of the Muni Special Event Transit Service Plan, and a Transportation Management Plan (TMP) for operations of the proposed project.

The TMP is summarized on SEIR pp. 5.2-55 to 5.2-69, and the entire document is included as SEIR Appendix TMP. As described on SEIR p. 5.2-55, the TMP is a working document that would be expanded and refined over time by the project sponsor and City agencies involved in implementing the TMP. If the project is approved, the requirement to implement and update the TMP would be incorporated into the project Mitigation Monitoring and Reporting Program (MMRP) as an enforceable condition of approval.

Subsequent to the publication of the Draft SEIR, the City and project sponsor have been working with UCSF and neighbors to add detail to the project TMP to better address concerns related to local access in the Mission Bay area prior to evening events. These refinements include:

- *Development of a Local/Hospital Access Plan*— The TMP would be expanded to include a Local/Hospital Access Plan (L/HAP) to facilitate movements in and out to residents and employees in the UCSF and Mission Bay Area. The L/HAP would be implemented by SFMTA for the pre-event period for all large weekday evening events at the event center (i.e., those events with more than 12,500 attendees that start between 6:00 and 8:00 p.m., on average, approximately 50 times per year). The L/HAP would be configured to discourage event attendees arriving by car from using portions of Fourth Street, Owens Street, UCSF campus internal roads such as Nelson Rising Lane, Campus Lane, Fifth Street, and local residential streets. As part of the L/HAP, special temporary and permanent signage would be positioned at appropriate locations to direct event traffic towards designated routes in order to access off-street parking facilities serving the event center and away from streets within the Local/Hospital Access Plan network. In addition, three PCOs would be stationed at key intersections (i.e., Fourth/16th, Owens/Mission Bay Traffic Circle, and Fourth/Nelson Rising Lane) before the start of an event to facilitate local driver access to their destinations. These three additional PCOs would also be available after the event to be positioned at the most effective locations to direct outbound pedestrians, bicyclists, and vehicles, as determined by the PCO Supervisor.
- *Expansion of TMP monitoring surveys*— The proposed monitoring methods and surveys in the TMP would be expanded to include surveys of UCSF patients and staff to obtain information on access to the UCSF campus and Medical Center. These surveys would be in addition to the surveys proposed for event attendees, event center employees, visitor surveys of Mission Bay neighbors, and UCSF emergency providers.

In addition to the revisions to the TMP described above, other refinements to the transportation improvements include:

- *Sidewalk Widening along Terry A. Francois Boulevard*. The proposed sidewalk width along the project frontage at Terry A. Francois Boulevard has been expanded from 12.5 to 22 feet by making minor adjustments to the project layout along the eastern frontage. The purpose of this refinement is to provide more space for pedestrians, and thus to provide an improved pedestrian experience.
- *Restriping of South Street*— South Street would be re-striped to maintain the two eastbound lanes currently present between Bridgeview Way and Terry A. Francois Boulevard. One westbound lane in the same section would remain. The previously-proposed parking lane and associated metered parking spaces at the northern side of the street are no longer part of the proposal for South Street. The purpose of this refinement is to better accommodate vehicles exiting the event center.
- *Central Subway/T Third Electrical Power Distribution System Expansion*—The existing power equipment for light rail service would be expanded to add two circuits at the King Substation, and the electrical power distribution system to the light rail segment in the vicinity of AT&T Park would be increased in the segment between the King Substation and Fourth Street.

The Central Subway/T Third Electrical Power Distribution System Expansion is part of the transit network improvements to be included in the proposed project (see SEIR pp. 5.2-49 to 5.2-50). The power distribution system expansion at the King Substation (located south of King Street at Second Street adjacent to the South Beach Harbor Yacht Club parking lot) would provide the additional traction power demanded by future growth and large events along the T Third/Central Subway corridor.[5] The electrical power distribution system to the light rail segment in the vicinity of AT&T Park would be increased in the segment between the King Substation and Fourth Street so that additional electrical power is available during peak demand periods to light rail vehicles operating along King and Fourth Streets.

The traction power expansion within the King Substation would provide two new circuits from the exiting King Substation for the inbound and outbound circuits of the new Central Subway. Construction would occur over a 12-month period. Provision of duct banks for the new electrical connection between the King Substation and the Central Subway line would involve construction of new duct banks on King Street, between Second and Fourth Streets, requiring trenching about 18 to 24 inches wide and about 36 inches deep within the eastbound or westbound travel lanes of King Street over a six-month period, although construction activities would not be continuous for the entire period. These construction activities would require temporary travel lane closure of one of the two through lanes on King Street, reducing the existing roadway capacity and requiring all vehicles to use the remaining lane. The SFMTA identifies King Street in the Blue Book as a Street of Major Importance, and no construction work is permitted on King Street Monday through Friday

[5] The need for expansion to the electrical power distribution system for light rail operations within and to the south of Mission Bay to accommodate increased frequencies and additional trains related demands of Central Subway, future growth along the southeastern part of the city, and existing and new special event operations had previously been identified by the SFMTA as a long-term improvement.

between 7:00 and 9:00 a.m. and between 3:00 and 7:00 p.m. During these hours, a contractor working within King Street would not be permitted to leave any debris, or any material or equipment in any of the travel lanes. During the a.m. and p.m. peak commute periods the trench for the new duct banks would be plated over, and all travel lanes would be open to traffic. To the extent feasible, this work would be scheduled on weekends when traffic volumes on King Street are lower than during weekdays. In addition, the existing variable message system installed in the vicinity of King Street (i.e., on The Embarcadero, Third Street, and on the I-280 freeway) as part of AT&T Park event TMP could be used during construction to further inform motorists of congested traffic conditions in the area.

Environmental Effects and Conclusion

All of the refinements to transportation improvements included in the proposed project would result in reducing the severity of impacts described in SEIR, Section 5.2, Transportation and Circulation, and as described below, would not result in any new or substantially more severe significant impacts. The Local/Hospital Access Plan and the re-striping of South Street would incrementally lessen the severity of identified traffic impacts, but would not be sufficient to reduce the impact to a less-than-significant level. The expanded survey program would provide more information that would enable the City, in consultation with the project sponsor and UCSF, to improve the effectiveness of the TMP. The widening of the sidewalk along Terry A. Francois Boulevard would improve pedestrian circulation, reducing the severity of an already less-than-significant impact. The expansion of the electrical power distribution system would ensure that the required electrical power would be available during peak demand periods to light rail vehicles operating along King and Fourth Streets.

Construction-related impacts of these refinements to the transportation improvements were included in the Draft SEIR Chapter 5, with the exception of the work along King Street. The electrical power expansion would involve work within the King Substation, as well as construction of duct banks between the King Substation and the Central Subway line along King Street. This work would incrementally add to the construction activities identified in the Draft SEIR, with temporary disruption of traffic along King Street during intermittent non-peak periods over the course of about six-months, but would not result in new or substantially more severe transportation impacts. Construction-related ground transportation impacts identified in Impact TR-1 would remain less than significant.

Similarly, the temporary impacts of construction noise would be limited to standard construction equipment such as a backhoe and jackhammer, which would not be expected to result in a significant construction noise impact, as these equipment types comply with the construction noise limits of the Sections 2907(a) and (b) of the Police Code, as discussed on page 5.3-14 of the SEIR and would occur in an area with elevated ambient background noise based on modeled baseline traffic volumes derived from the San Francisco County Transportation Authority travel demand model.[6]

[6] San Francisco Department of Public Health (DPH), San Francisco City-wide Noise Map, August 2006, Available online at http://www.sfdph.org/dph/files/EHSdocs/ehsPublsdocs/Noise/noisemap2.pdf Accessed April 30, 2013.

Temporary trenching activities would add incrementally to the NOx and ROG air quality emission burden of the project. However, these incremental emissions would be small and the operational emissions which form the basis of offsets under **Mitigation Measure M-AQ-2b** (see Chapter 14 of this document) would still represent the greater emission amount to be offset. To ensure these transportation improvements would not substantially contribute further to the significant impact identified in the SEIR in Impact AQ-1, a text change has been added to **Mitigation Measure M-AQ-2b** to ensure that the increment from transportation improvements are considered in the calculation of emissions to determine the offset funding**.** Localized health risk impacts from construction emissions would also be less than significant because of the relatively brief window of activity and the over one half mile distance from the contribution of emissions from the project site.

Construction disturbance within the roadway would be minimal, and generally within recently or previously disturbed subsurface materials so that potential cultural resources and hazardous materials impacts would also be less than significant; if construction disturbance were to encounter cultural resources or hazardous materials, the contractors would be required to comply with the same mitigation measures and/or regulations applicable to the proposed project, as were described in the Initial Study (Appendix NOP-IS of the SEIR).

These proposed refinements to the transportation improvements are considered beneficial. These refinements would not result in any new or substantially more severe impacts than previously identified in the Draft SEIR, and do not change the analysis or impact conclusions presented in the Draft SEIR. Text changes to the Draft SEIR to reflect the refinements to the transportation improvements are included in Chapter 14, Draft SEIR Revisions, of this document.

12.3 Construction Refinements

Since publication of the Draft SEIR, the project sponsor has identified minor construction refinements, including the following: refined construction tower crane plan, on-site soil treatment system, dewatering pump generators, and removal of rapid impact compaction. These are discussed below.

12.3.1 Refined Construction Tower Crane Plan

Description

The Draft SEIR, Section 5.2.6: Project Impacts on the UCSF Helipad Operations addressed potential safety issues associated with construction and operation of the proposed project in the vicinity of the UCSF Benioff Children's Hospital helipad. Impact TR-9a in the Draft SEIR specifically addressed the potential for the proposed construction tower cranes to temporarily obstruct UCSF helipad airspace surfaces. Impact TR-9a reported that based on the preliminary project construction plan for the project, of the five construction tower cranes proposed, the central-west project construction tower crane would have the potential to result in a temporary penetration of a 49 CFR Part 77 Transitional Surface associated with the helipad, which would be

considered a potentially significant impact. Draft SEIR Mitigation Measure M-TR-9a, Crane Safety Plan for Project Construction, identified feasible measures that would reduce potential, temporary impacts associated with the use of cranes during the construction period to less than significant.

Since publication of the Draft SEIR, the project sponsor refined its construction crane plan with the goal to further reduce potential project effects on the UCSF helipad during construction. The project sponsor's refined construction tower crane plan modifies certain locations, maximum working elevations[7] and /or working radii of its five proposed construction tower cranes. An analysis of the potential effects of the refined construction tower crane plan on UCSF helipad airspace surfaces is provided below.

Environmental Effects

Tower Crane Analysis - Project Effects

Under the refined tower crane plan, as under the original tower crane plan, four tower cranes are anticipated to be required between months 3 through 5 of construction, and five tower cranes would be used starting in month 6 through approximately the end of construction. Under the refined tower crane plan, the maximum tower crane heights would range between 207 and 277 feet agl, depending on the tower crane and its location. Revised Figure 5.2-28 (see Chapter 14, Draft SEIR Revisions, of this document) illustrates the proposed construction tower crane locations, tower crane maximum working elevations [mean sea level (msl)] and tower crane working radii under the refined construction crane plan.[8] As shown in Revised Figure 5.2-28, the estimated maximum elevation of the cranes would range from 221 to 291 feet msl, with a working radii of between 208 and 274 horizontal feet, depending on the tower crane and its location.

When evaluating the project construction tower cranes, the varying crane elevation across each crane's working radius was considered. This accounts for the fact that the critical tower crane working elevations change from the highest point at the fixed tower crane's vertical mast to the lowest point at the outer end of the tower crane's horizontal jib arm. These critical working elevations were then assessed for each tower crane to determine if they had the potential to penetrate the airspace surfaces associated with the UCSF helipad.

Using the approach and methodology discussed under SEIR Section 5.2.6.4, *Approach to Analysis*, the project construction tower cranes were assessed to determine if they would have the potential to penetrate the Part 77 Approach and Transitional airspace surfaces established for the UCSF helipad. Revised Figure 5.2-28 illustrates the UCSF helipad and its existing airspace surfaces in relation to the proposed refined construction tower crane plan. Based on the information provided and the evaluation of potential obstructions conducted for this study, the following observations can be made:

---

7 "Elevations" are expressed in mean feet above sea level (msl) referencing NAVD 88 datum, which is commonly used for airport and heliport drawings and conducting airspace evaluations.

8 Physical crane "heights" are expressed feet above ground level (agl). "Elevations" in Figure 5.2-28 are expressed in mean feet above sea level (msl) referencing NAVD 88 datum, which is commonly used for airport and heliport drawings and conducting airspace evaluations.

- As illustrated in Revised Figure 5.2-28, three construction tower cranes ([Southwest Tower Crane (Crane A), South Crane (Crane B), and Southeast Crane (Crane C)] would extend under the helipad's primary Approach and/or the adjacent Transitional Surface. However, no penetrations to the established Part 77 Approach and Transitional surfaces would occur from the construction tower cranes.

- The most critical locations for Cranes A, B and C, and associated vertical clearances, are illustrated in Revised Figure 5.2-28 and tabulated in Table 5.2-73A (see Chapter 14). The working radii of Crane A would experience a minimum vertical clearance of approximately 5 feet (see Point 3). The working radii of Crane B and Crane C would have minimum vertical clearances of 29 and 32 feet, respectively (see Points No. 6 and 11).

- None of the project construction tower crane masts would be located under the helipad's Approach Surfaces. However, the masts of Crane B and Crane C, would be located under the helipad's Transitional Surface adjacent to the primary Approach Surface, but with vertical clearances of 65 and 86 feet, respectively.

- As shown in Figure 5.2-26 in the Draft SEIR, one of UCSF's alternative arrival/departure flight paths follows along the alignment of South Street. As shown in Revised Figure 5.2-28, while the working radii of two construction tower cranes on the north side of the site [Northwest Tower Crane (Crane E) and Northeast Tower Crane (Crane D)] would extend over South Street, they are not located under any of the established Part 77 Approach or Transitional Surfaces. However, for purposes of analyzing the potential impact of the construction tower cranes on the use of the South Street alternate flight path, an 8:1 "curved" Approach Surface was assumed along this segment of the alternate flight path and it intercepted the existing northern approach surface for a 90 degree turn[9] at an elevation of approximately 250 feet msl. Under this assumed "curved" Approach Surface scenario, the minimum amount of clearance over Crane E would be approximately 64 feet and the minimum amount of clearance over Crane D would be approximately 65 feet.

Conclusion – Project Effects

In summary, based on the analysis of the refined construction crane plan, none of the proposed tower construction cranes would penetrate the Part 77 Approach or Transitional Surfaces associated with the UCSF helipad. Furthermore, adequate clearance for the construction cranes would be provided for the South Street alternate flight path. However, if the refined construction crane plan details were to change with respect to proposed tower crane size, location or other factors, then the project would have the potential to result in greater and/or less effects than those reported above. Mitigation Measure M-TR-9a, Crane Safety Plan for Project Construction, identifies feasible measures that would reduce potential temporary impacts associated with the use of cranes during the construction period to less than significant. The objective of the crane safety plan is to ensure the safe use of the UCSF Benioff Children's Hospital helipad, and the safety for people residing or working in the project area during construction. Therefore, as was reported in the Draft SEIR, with implementation of Mitigation Measure M-TR-9a, this impact would be *less than significant with mitigation*.

[9] Curved approach/departure surfaces have not been established for the helipad. Although FAA criteria for curved approach/departure surfaces would require a wider turn radius, this analysis assumed a tighter turn radius based on the use of existing approach/departure flight paths.

Mitigation Measure M-TR-9a: Crane Safety Plan for Project Construction

Prior to construction, the project construction contractor shall develop a crane safety plan for the project construction cranes that would be implemented during the construction period. The crane safety plan shall identify appropriate measures to avoid potential airspace conflicts that may be associated with the operation of the project construction cranes in the vicinity of the UCSF Benioff Children's Hospital helipad airspace. These safety protocols shall be developed in consultation with OCII (or its designated representative) and UCSF, and the crane safety plan shall be subject to approval by OCII or its designated representative. The crane safety plan shall include, but are not limited to, the following measures:

- Convey project crane activity schedule to UCSF and OCII
- If other projects on adjacent properties are under construction concurrently with the proposed project and are using tower cranes, the project sponsor shall participate in joint consultation with those project sponsors and OCII or its designated representative to ensure any potential cumulative construction crane effects on the UCSF helipad would be minimized.
- Use appropriate markings, flags, and/or obstruction lighting on all project construction cranes working in proximity to the helipad's airspace surfaces.
- Light all construction crane structures at night (e.g., towers, arms, and suspension rods) to enhance a pilot's ability to discern the location and height of the cranes.
- Inform crane operators of the location and elevation of the hospital helipad's Part 77 airspace surfaces and the need to avoid penetrations to the surfaces.
- Issue a Notice to Airmen (NOTAM) to advise pilots in the area of the presence of construction cranes at the project site.

Because project construction impacts to the UCSF helipad airspace discussed in this SEIR would be less than significant, the project would result in no new or substantially more severe significant impacts than was previously identified in the Mission Bay FSEIR, as addended.

Cumulative Effects

As discussed in Impact C-TR-9 in the SEIR, in the immediate project vicinity, cumulative building development is anticipated on the currently undeveloped portions of Blocks 27, 25, X3, and 33, located north, west, southwest and south of the project site, respectively. Depending on the construction schedules for these planned developments, the construction of the proposed project in combination with other planned development could result in a cumulative adverse impact to the UCSF helipad. Mitigation Measure M-TR-9a, Crane Safety Plan for Project Construction, would require that the project's crane safety plan include a measure to convey project crane activity schedule to UCSF and OCII. Furthermore, Mitigation Measure M-TR-9a would require that if other projects on adjacent properties are under construction concurrent with the proposed project and are using tower cranes, the sponsor would participate in joint consultation with those project sponsors and OCII to ensure any potential cumulative construction crane effects on the UCSF helipad would be minimized. With implementation of Mitigation Measures M-TR-9a, the

contribution to cumulative impacts by the project would not be considerable, and as was reported in the Draft SEIR, the impact would be *less than significant with mitigation*.

Because the proposed project's contribution to cumulative construction impacts of the project on the UCSF helipad operations would be less significant with mitigation, the project would result in no new or substantially more severe significant impacts than those previously identified in the Mission Bay FSEIR, as addended.

Please see Chapter 14, Draft SEIR Revisions, of this document for augmented text and graphics to the Draft SEIR to reflect the proposed refined construction tower crane plan and associated analysis of effects on UCSF helipad airspace surfaces.

As discussed in SEIR Chapter 3, Project Description, aside from the fixed tower cranes, the project also includes the use of mobile cranes on-site during construction. Specifically, the project proposes to use three mobile "crawler cranes," all of which would be comparatively shorter than the tower cranes. Nonetheless, in order to disclose all potential project construction-related effects on the UCSF helipad operations, Chapter 14 of this document augments text to the Draft SEIR to describe the type and use of the crawler cranes during construction, and associated analysis of potential effects on UCSF helipad airspace surfaces. Similar to the construction tower cranes as proposed in the refined tower crane plan, none of the proposed crawler construction cranes would penetrate the UCSF airspace surfaces associated with the helipad. The Draft SEIR addressed all other potential environmental effects associated with the proposed use of crawler cranes during construction, including the air quality and noise analyses. In addition, energy use associated with the use of crawler cranes during construction is addressed in Response EN-1 in this Response to Comments Document.

12.3.2 Other Construction Refinements

Refinements to the proposed construction techniques that were described in the Draft SEIR include: addition of on-site soil treatment, possible use of dewatering pump generators, and removal of rapid impact compaction equipment.

Description

On-site Soil Treatment

The Draft SEIR, Chapter 3: Project Description, Section 3.6.3: Proposed Construction, indicated that approximately 350,000 cubic yards (cy) of soils would be excavated and removed from the site during construction. The Draft SEIR, Initial Study, Section 16: Hazards and Hazardous Materials, discussed applicable hazardous materials agency oversight for the project site and proposed project; discussed relevant previous environmental investigation conducted for Mission Bay, project site and/or vicinity, [including the 1999 Mission Bay Risk Management Plan (RMP), 2006 Mission Bay Revised Risk Management Plan (RRMP), and a 2014 Phase I Environmental Site Assessment conducted in support of the project]; and documented applicable prior soil remediation and groundwater monitoring activities that have been conducted on the project site

and vicinity. The Initial Study Hazards and Hazardous Materials section concluded that the required implementation of RMP-specified risk management measures would ensure potential impacts to workers and the public associated with the handling of potentially contaminated soil at the project site during construction would be less than significant.

Subsequent to publication of the Draft SEIR, the project sponsor completed a Phase II Environmental Site Assessment[10] of the project site, a Site Mitigation Plan,[11] and a Dust Monitoring Plan[12] in accordance with the RMP and Article 22A of the San Francisco Health Code (Maher Ordinance). The Phase II Environmental Site Assessment classified and delineated hazardous materials at the project site that were planned for excavation and disposal, and characterized groundwater that would be discharged during construction dewatering. The Phase II Environmental Site Assessment determined that certain fill material at the project site contains elevated concentrations of chromium, lead, and nickel, petroleum hydrocarbons, and low concentrations of volatile organic compounds (VOCs) and semivolatile organic compounds (SVOCs).

As discussed in the recent Site Mitigation Plan, the project sponsor proposes to conduct on-site treatment of soils that exceed State hazardous waste criteria prior to off-site hauling to an appropriately regulated landfill. The on-site treatment of soils would be achieved by the installation and operation of a mobile "pug mill" at the project site. The pug mill is a self-contained treatment system, consisting of a 75 kilowatts (kW) motor, a screen unit (to remove cobbles and rocks), a conveyor belt, mixing tower, and bins to hold the treated soil. The pug mill would mix lime or cement material with the excavated soils requiring treatment. The additive used in the treatment process would stabilize the metals in the soil and reduce the solubility of the metals in the soil, thereby preventing transport of metals to stormwater and converting the soil from a Class I California hazardous waste to a Class II non-hazardous waste. This process would include post treatment soil sampling to confirm the treatment's effectiveness. Once this treatment process is completed, the treated soil would be loaded into trucks and hauled to a Class II non-hazardous regulated landfill.

The pug mill would be on the project site for approximately 3 months, operating 8 to 10 hours per day. The total estimated volume of on-site soil to be treated is approximately 98,000 cy. The pug mill would treat up to 3,100 cy of soil per day. The mobile pug mill would be moved within the interior of the project site as required to accommodate the proposed site excavation process. The proposed pug mill would be a Tier 4 emission unit, and permitted to operate under a Temporary Treatment Unit permit approved by the Department of Toxic Substances Control (DTSC) and the Bay Area Air Quality Management District (BAAQMD). The pug mill would be enclosed within a large canvas tent to control dust and noise generated by the plant.

---

10 Langan Treadwell Rollo, *Phase II Environmental Site Assessment, Golden State Warriors Arena, Blocks 29-32, Mission Bay, San Francisco, California,* June 2015.

11 Langan Treadwell Rollo, *Site Mitigation Plan, Golden State Warriors Arena, Blocks 29-32, Mission Bay, San Francisco, California*, June 2015.

12 Langan Treadwell Rollo, *Dust Monitoring Plan, Golden State Warriors Arena, Blocks 29-32, Mission Bay, San Francisco, California*, June 2015, as revised October 2015.

Soil stockpiles at the project site would include a stockpile of contaminated soils awaiting treatment, and multiple stockpiles of treated soil. The pug mill would be able to treat the contaminated soil faster than trucks would be able to haul the soil and return to the project site. As discussed above, there would be on-going testing of the treated soil prior to hauling off site, which would result in multiple treated soil stockpiles. Stockpiles would be uncovered for 8 to 10 hours during the workday. In accordance with the Dust Monitoring Plan, which is subject to approval by the San Francisco Department of Public Health (DPH) (see Section 13.22, Response HAZ-3, for further discussion), dust would be controlled by stockpile wetting, stopping work during high winds, and covering with plastic sheeting or tarp, and adequately securing stockpiles at the end of the work day. Active stockpiles would be thoroughly wetted and excess material would be removed and/or consolidated regularly to limit the size and extent of the stockpiles.

For those excavated soils that do not require on-site treatment (i.e., soils that have already been verified to be a Class II or Class III non-hazardous waste), the contractor would load that excavated soil directly into trucks for off-site disposal. If needed and requested by the regulated landfill or recycler, additional waste profiling of the Class II or Class III soil would be performed. If soil stockpiling of any suspected contaminated soil occurs, the excavation contractor would establish soil stockpile locations on the site and provide appropriate dust control per the approved Dust Monitoring Plan.

Dewatering Pump Generators

The project sponsor is now considering an option to use a series of nine generators (25 and 45 kilovolt amps [kVA]) to power dewatering pumps at intermittent locations throughout the excavation pit during approximately six months of the construction period. These generators would be used should the availability of temporary electrical power be limited.

Rapid Impact Compaction

The Draft SEIR, Chapter 3: Project Description, Section 3.6.3: Proposed Construction, described that the project sponsor proposed to compact soil on the site using rapid impact soil compaction equipment over approximately 30 work days. Since publication of the Draft SEIR, the project sponsor indicates that the use of rapid impact construction equipment is not required, and consequently, would not occur during construction.

Environmental Effects

The construction refinements described above would result in minor changes to the noise and air quality construction impacts, which are described below. All other impacts of the project as presented in Chapter 5 of the SEIR and the Initial Study in Appendix NOP-IS remain essentially unchanged with these project refinements, and all mitigation measures remain the same. Although these construction refinements could result in an incremental increase in construction energy expended, the refined project would not result in the use of large amounts of fuel or energy or use these in a wasteful manner (see Section 13.23 of this document for further discussion).

Noise

On-site Soil Treatment. Sound level monitoring data of the proposed pug mill operation was provided by the manufacturer indicating sound levels at four different locations surrounding the unit. The maximum recorded sound level at 7 meters from the unit was 80 dB, which is equivalent to 73 dB at a distance of 50 feet. This maximum measured value is generally consistent with other independent monitoring efforts of active pug mill operations,[13] which indicate 68 dBA at 50 feet. The SEIR presented an estimate of noise generated during shoring activities on page 5.3-21 based on simultaneous operation of two auger drills, two cranes, two slurry plants and two excavators, with resultant noise levels at the nearest receptor to be 73.6 dBA. The addition of pug mill operations to this noise level would result in a marginal increase to 73.8 dBA during the shoring/treatment phase. Table 5.3-8 on page 5.3-23 of the SEIR presents the combined noise levels that would result from simultaneous excavation, the now removed rapid impact compaction activity, pile installation, and shoring activities, which could take place concurrently during two months of the construction schedule. Increasing the shoring noise component to account for the pug mill results in the same estimate of combined construction noise of 80.8 dBA at the nearest receptor. Consequently, operations of the pug mill do not change the analysis or conclusions presented in the SEIR with regard to construction noise impacts.

A revised Table 5.3-8 (SEIR p. 5.3-23) is presented below (deleted text shown in ~~strikethrough~~ and new text in underline). This table adds the contributions from the pug mill and generator operations and removes the contributions of rapid impact compaction, and the results indicate that predicted noise levels for all three receptors would be marginally decreased compared to the results previously presented in the Draft SEIR.

TABLE 5.3-8
CUMULATIVE WORST CASE NOISE LEVELS FROM CONSTRUCTION ACTIVITIES AT SENSITIVE RECEPTORS IN THE PROJECT AREA

Location	Noise Levels in dBA (Hourly L_{eq})	
	Existing Leq	Concurrent Excavation, Dewatering, Soil Treatment ~~Compaction~~, Pile Installation and Shoring Activities
1. Madrone Mission Bay Residential Towers Nearby residential receptor 800 feet north of project site	70.1	~~70.9~~69.9
2. UCSF Mission Bay Housing (Hearst Tower) Nearby residential receptor 200 feet from the project site	71.2	~~80.8~~80.5
3. UCSF Hospital Nearby receptor 560 feet from the project site	67.0	~~72.8~~72.2

[13] Olson Associates, *Sound Survey PDS Energy Inc. Caerus/Piceance LLC, Metcalf Soil Treatment Facility*. August 22, 2013.

Dewatering Pump Generators. Small portable generators, such as the proposed 25 and 45 kVA generators, produce noise levels on the order of 82 dBA at 23 feet with only a weather protective enclosure. Four of the nine generators would be located within the excavation pit, which would serve to shield the additional noise from surrounding uses. The remaining five 45 kVa generators would be located intermittently around the perimeter of the site, with one at the corner of Third Street and 16th Street, one at the corner of Third Street and South Street, and three on the eastern side of the site. The additional increment of noise experienced at the UCSF housing tower receptor would be primarily influenced by the nearest generator at Third Street and South Street, approximately 200 feet away, as the remaining perimeter generators would be over 500 feet farther away. Generator noise would be attenuated from 82 dBA at 23 feet to 63 dBA at 200 feet. The addition of this increment of generator noise would not meaningfully contribute (less than 0.1 dBA) to the predicted cumulative construction noise level. As indicated in the revised Table 5.3-9 (see Chapter 14 of this document), cumulative construction noise levels would decrease when the removal of rapid impact compaction activities is considered. Consequently, potential operations of the dewatering generators during the construction period would not change the analysis or conclusions presented in the Draft SEIR with regard to noise impacts.

Removal of Rapid Impact Compaction. Removal of rapid impact compaction from the construction activities would result in minor reduction in noise levels at sensitive receptors in the project area, but would not substantially change the estimated noise levels predicted in SEIR Impact NO-1 (pp. 5.3-20 to 5.3-24). As presented in the SEIR, the impact would remain less than significant.

In addition, removal of rapid impact compaction would reduce the severity of impacts related to groundborne vibration levels during construction, as presented in Impact NO-3 (pp. 5.3-24 to 5.3-26). Even though this impact was determined to be less than significant, removal of this vibration-inducing construction activity would substantially reduce the estimated vibration levels from the overall construction activities. This construction refinement also eliminates the need for Improvement Measure I-NO-3, which required advanced notification of neighbors of the start of rapid impact compaction activities.

Air Quality

The methodology for the analysis of the additions of on-site soil treatment activities and the operation of dewatering pump generators are discussed individually below. After these discussions the cumulative result of these additions on the impact conclusions of Impact AQ-1 and Impact AQ-3 are assessed.

On-site Soil Treatment. Ramboll Environ conducted a screening-level human health risk assessment to evaluate the potential impacts of contaminants in fugitive dust from operation of the pug mill on offsite sensitive receptors (i.e., residents). This screening level assessment relies on the Site Mitigation and Dust Monitoring Plans prepared by Langan in June 2015 and revised in October 2015, which require monitoring for particulate matter (respirable particulate matter less than 10 micrometers [μm] in aerodynamic diameter or PM_{10}) in air at the site perimeter. Those plans delineate airborne dust action levels, which if exceeded, would require additional

actions to reduce PM_{10} concentrations in air to below those levels. For the 30-minute average, the airborne dust action level for PM_{10} is 50 micrograms per cubic meter ($\mu g/m^3$) or baseline dust (i.e., the difference between upwind and downwind dust levels), whichever is higher. The plan also specifies that no visible dust shall cross the property boundary and requires additional actions if neighbor complaints are received.

To determine whether offsite air concentrations would be of concern during excavation activities, for all detected chemicals in soil, the 24-hour and 10-minute air concentrations at the site perimeter were calculated using the maximum detected soil concentrations and the PM_{10} airborne dust action levels for the site described above. This calculation conservatively assumes the concentration in the soil is proportional to the concentration in the monitored dust. No dilution from the perimeter to any actual site receptors was assumed.

Operation of the pug mill could affect air quality in two ways: (1) additional diesel exhaust emissions from the generator associated with the pug mill and (2) airborne soil exposure associated with additional handling of contaminated soils. The screening-level human health risk assessment for airborne fugitive pre-treated soil, described above, directly applies to item 2 and, provided airborne dust action levels are not exceeded as required by the DPH-approved Dust Monitoring Plan (see Section 13.22, Response HAZ-3 for further description). This assessment shows that excavation activities at the site are not expected to cause significant adverse health effects to offsite sensitive receptors, and impacts associated with fugitive dust from the pug mill would not be significant.

To address item 1, a refined assessment of air pollutant emissions during construction was completed to include the operation of the pug mill. The methods used to analyze the impact of the pug mill emissions are the same as those in Appendix AQ of the SEIR. The pug mill consists of a 75-kW motor, assumed to be driven by a 335-hp Tier 4 diesel-fired engine (although in-line with previous methodology, emissions and resulting risks assuming use of both a Tier 2 (Uncontrolled) engine and a Tier 2 (Controlled) engine with ARB NOx VDECS are also disclosed).

Dewatering Pump Generators and Removal of Rapid Impact Compaction. The nine dewatering generators (25 and 45 kilovolt amps [kVA]) to power dewatering pumps would all be powered by Tier 4 engines and were lumped as an area source on the project site for purposes of modeling heath risks and localized $PM_{2.5}$ concentrations. However, unlike other construction activities, which were assume to occur during standard construction hours, dewatering generators were conservatively assumed to operate 24-hours a day. Since publication of the Draft SEIR, the project sponsor indicates that the use of rapid impact construction equipment is not required, and consequently, would not occur during construction.

Results of Construction Refinements with Regard to Impact AQ-1 (Construction Impacts from Fugitive Dust and Criteria Air Pollutant Emissions)

Revised Tables 5.4-7 and 5.4-8 of Section 5.4, Air Quality, of the SEIR (see Chapter 14, Draft SEIR Revisions, of this document) show that expected off-road construction emissions with the

addition of the pug mill, dewatering generators and the elimination of rapid impact compaction do not change the impact conclusions of Impact AQ-1, which remains *significant and unavoidable with mitigation.* Even with implementation of Mitigation Measure M-AQ-1, air pollutant emissions from project construction activities, with refinements would exceed the applicable significance thresholds for ROG and NOx. The addition of the construction refinements would not substantially increase (approximately 2 percent for ROG and 4 percent for NOx) the average daily construction-related emissions disclosed in the Draft SEIR. This would not result in a substantial increase in the severity of the previously identified significant and unavoidable impact, and the same mitigation measures would apply requiring the project sponsor to minimize construction emissions.

Results of Construction Refinements with Regard to Impact AQ-3 (Health Risk Impacts Due to Toxic Air Contaminants)

Revised Tables 5.4-10 and 5.4-11 of Section 5.4, Air Quality, of the SEIR and Revised Tables 6.1.2, 6.1.5, 6.1.6, 6.1.7, and 6.1.8 of Appendix AQ of the SEIR (see Chapter 14 and Appendix AQ2) show slight increases in the construction contribution to the predicted risk values and $PM_{2.5}$ concentrations. These increases are primarily the result of corrections to the construction analysis from what was presented in the Draft SEIR to account for the extension of the northbound Muni platform, which would occur closer to receptors than activity on the project site, and the addition of the pug mill and the dewatering generators. However, Impact AQ-3 analyzes the combined effects of construction and operation on health risk, with the substantial decrease in risk associated with the generator relocation described above, the revised impact analysis indicates that overall, Impact AQ-3 would be less severe than what was presented in the Draft SEIR; the impact would be *less than significant*, instead of less than significant with mitigation. This set of revised tables also shows that the addition of the pug mill and dewatering generators does not result in an exceedance of the ambient $PM_{2.5}$ concentration threshold of significance either during construction or on a cumulative basis. With the addition of the proposed pug mill during construction combined with the generator relocation, Impact AQ-3 would be *less than significant*. Although the revised analysis for Impact AQ-3 indicates that implementation of Mitigation Measure M-AQ-1 is not required to reduce the severity of this impact to less than significant, implementation of this measure would still be required under Impact AQ-1, which would in turn further reduce the severity of the less-than-significant health risk impact under Impact AQ-3.

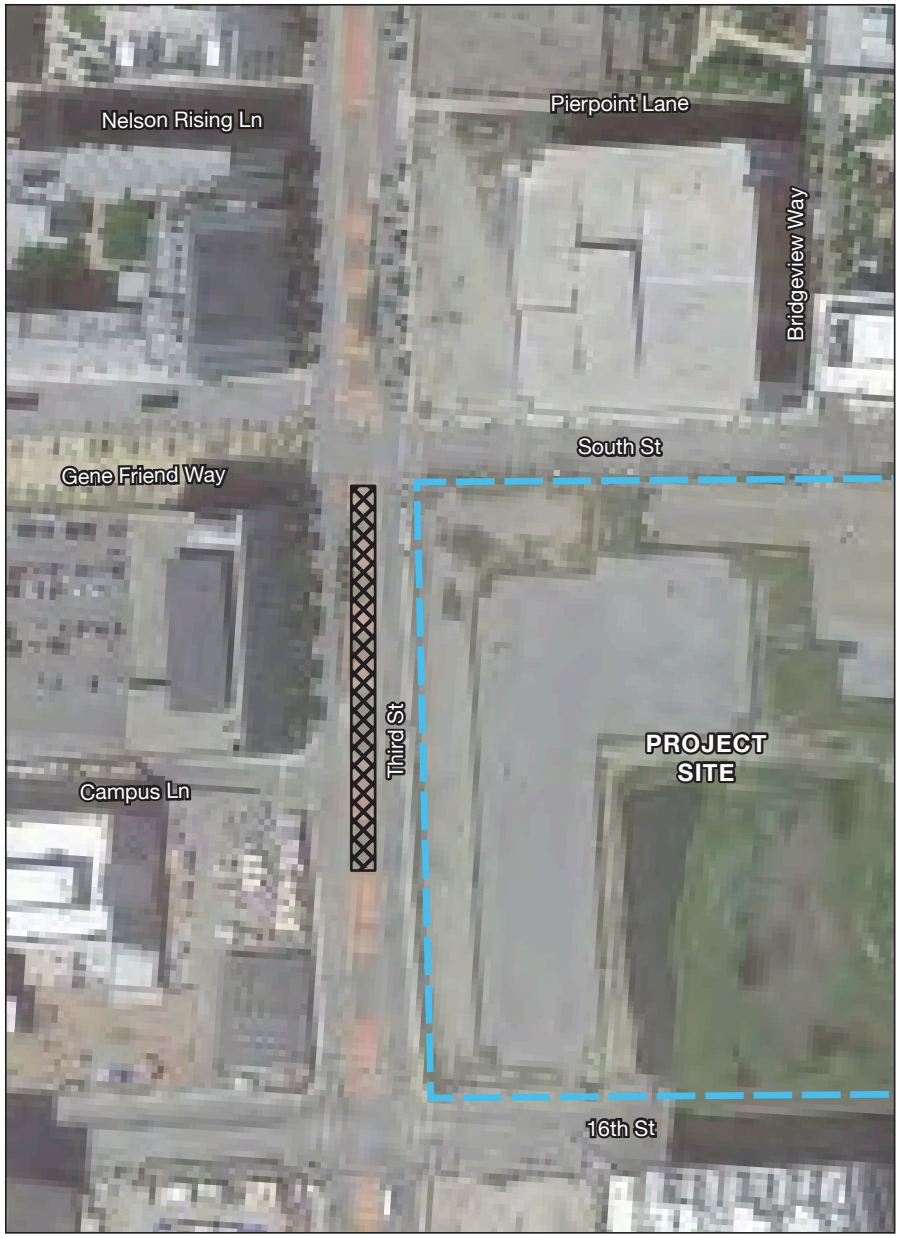
Conclusion

The proposed construction refinements would result in minor revisions to the construction noise and air quality impact analyses that were presented in the Draft SEIR, but the impact conclusions remain the same or less severe. The on-site soil treatment and operation of dewatering pump generators would result in a marginal increase in construction noise during the shoring/treatment phase, but the combined construction noise of simultaneous operation of multiple construction activities would decrease because rapid impact compaction would no longer occur, and construction noise impacts would be substantially the same as presented in the Draft SEIR and would remain less than significant. Removal of the vibration-inducing rapid impact compaction would substantially reduce the estimated vibration levels from the overall construction activities,

and this less-than-significant impact would remain less than significant. Analysis of construction air quality impacts associated with emissions of criteria air pollutants, fugitive dust, health risk, and cumulative health risk also indicates that the significance determinations would remain the same or less severe for all impacts as presented in the Draft SEIR, and the same mitigation measures would apply.

Thus, the proposed construction refinements would not result in any new or more severe impacts than previously identified in the Draft SEIR. Text changes to the Draft SEIR to reflect the proposed construction refinements are included in Chapter 14, Draft SEIR Revisions, of this document.

12.4 Muni UCSF/Mission Bay Station Variant



A new variant to the proposed project is being added for consideration as part of this Responses to Comments document. The project variant, the Muni UCSF/Mission Bay Station Platform Variant, is a minor variation of the proposed project at the same project site at Mission Bay Blocks 29-32, with all of the same objectives, background, and development controls, and same approvals as the proposed project. The Muni UCSF/Mission Bay Station Platform Variant is analyzed in this SEIR at an equal level of detail as the proposed project, and therefore the variant analysis satisfies all California Environmental Quality Act (CEQA) requirements, should this variant be selected for approval.

Description

Under the Muni UCSF/Mission Bay Station Platform Variant, all aspects of design, uses, programming, construction, and operation would be identical to that of the proposed project with one exception: the existing high-level northbound and southbound passenger platforms at the UCSF/Mission Bay light rail stop would be removed, and replaced with a single high-level center platform to accommodate both northbound and southbound light rail service passengers, and the extension of northbound platform at the UCSF/Mission By stop would not be required. Under this variant, the new center platform would be located between the northbound and southbound light rail tracks in the general location of the existing UCSF/Mission Bay Station southbound platform. **Figure 12-1** presents the location of the existing northbound and southbound platforms, as well as the location of the proposed center platform south of South Street.

The platform would be approximately 320 feet long by 17 feet wide (the existing side platforms are about 160 feet long by 9 feet wide), and would allow for two, two-car light rail trains to simultaneously board or alight passengers along the platform. Access ramps between 40 and 50 feet in length and about 13 feet wide would be constructed at both ends of the platform. Passenger amenities on the platform would include covered shelter with seating, CCTV, 311 telephone, NextBus display, and trash receptacles. Passenger access to the center platform would generally be provided from a single point at the north end of the platform closest to South Street, although the second egress ramp at the south end would allow for passenger access flexibility during events (e.g., post-event when the northbound lanes of Third Street adjacent to the project site are closed to vehicular traffic).

OCII Case No. ER 2014-919-97; Planning Department Case No. 2014.1441E:
Event Center and Mixed-Use Development at Mission Bay Blocks 29-32

Figure 12-1

Muni UCSF/Mission Bay Platform Variant

Similar to the proposed project, the Muni UCSF/Mission Bay Station Platform Variant includes crossover tracks to be constructed on Third Street near South Street within the existing light rail median to enable light rail vehicles to move from one set of tracks to another to reverse travel. The exact location (i.e., north and/or south of the UCSF/Mission Bay station) and the configuration of the crossover tracks (i.e., a single crossover, a double crossover, or a diamond crossover) have not been identified. In addition, similar to the proposed project, the existing power equipment for light rail service would be expanded to provide additional traction power for the Central Subway/T Third service. The new center platform would not require any changes to the number of northbound and southbound travel lanes on Third Street, and the existing southbound left turn lane at the Third Street approach to 16th Street would be maintained.

All other respects of the Muni UCSF/Mission Bay Station Platform Variant would be the same as the proposed project, including meeting LEED® Gold standards; total building square footage; number of above- and below-grade levels; building shapes, heights and massing; event center seating capacity; open space area; pedestrian, bicycle and vehicle facilities and access points; pervious/impervious surfaces; and utilities. All operational aspects of the Muni UCSF/Mission Bay Station Platform Variant would also be the same as those for the proposed project, including annual number, type and timing of games/events at the event center, site employment, and proposed implementation of a Transportation Management Plan. Moreover, proposed construction characteristics for the event center and mixed-use development on Blocks 29-32 would be the same as the proposed project, including proposed construction techniques, construction equipment, construction employment, and construction duration. However, construction of the extension of the northbound Muni platform would not occur, and therefore, there would be an incremental net increase in construction activities under this variant due to the removal of the existing light rail stop and construction of the center platform.

Demolition of the two existing side platforms and construction of the new center platform would occur over a 14-month period. Construction activities would not be continuous for the entire period and would be limited to shorter periods of construction, and generally on weekends. Construction of the track crossovers would occur over a three-day period. To the extent feasible, this work would be scheduled during periods of lower passenger demand, such as on weekends, when impacts on light rail service would be less than during the weekdays.

Construction would involve excavation at the new location, demolition of the existing platform, and reconstruction of the existing roadway, track and platform. Trenching would be required for new electrical and communication infrastructure conduits for the platform, traffic, and transit signals, as well as for relocation of above and below grade utilities as needed. Installation of the trackway and crossovers would occur within the concrete base. Construction equipment would include a digger, backhoe, jack hammer, dump truck, truck crane, bobcat, and saw cutter.

Construction activities would require temporary closures of one of the two northbound and/or southbound lanes on Third Street, depending on the phase of construction activity. The temporary lane closures would reduce the roadway capacity on Third Street and require all vehicles to use the remaining lane. Temporary lane closures would result in additional vehicle delay, and some drivers might shift to Terry A. Francois Boulevard to access their destinations. Construction activities that

involve track work or staging within the track area would require motor coach substitution for a portion of Muni's T Third service.

Environmental Effects

In essentially all respects, the Muni UCSF/Mission Bay Station Platform Variant would have the same environmental impacts as those identified for the proposed project in the Initial Study (Appendix NOP-IS) and in Chapters 4, 5, and 6 of the SEIR. The environmental analyses of the proposed projects on topics presented in the Initial Study—Land Use, Aesthetics, Population and Housing, Cultural and Paleontological Resources, Recreation, Biological Resources, Geology and Soils, Hazards/Hazardous Materials, Mineral Resources, and Agricultural and Forest Resources—apply identically to the Muni UCSF/Mission Bay Station Platform Variant because the design change related to the light rail platform would not affect any of the identified effects on these resource areas. All identified mitigation measures identified for the proposed project would also apply to the Muni UCSF/Mission Bay Station Platform Variant. Therefore, no further analyses of these topics is required.

The discussion in Chapter 4, Plans and Policies, also applies to the Muni UCSF/Mission Bay Station Platform Variant the same as it does to the proposed project because the change in platform location to the south of South Street would not alter the discussion of consistency with applicable plans and policies, and therefore, Chapter 4, Plans and Policies, also applies to the Muni UCSF/Mission Bay Station Platform Variant, and no further discussion is required.

Furthermore, the impact analyses in Chapter 5 with respect to Wind, Greenhouse Gas Emissions, Shadow, Utilities and Service Systems, Public Services, and Hydrology and Water Quality also apply to the Muni UCSF/Mission Bay Station Platform Variant as they do to the proposed project, and the same mitigation and improvement measures apply. The minor modifications to Muni operations associated with the Muni UCSF/Mission Bay Station Platform Variant would not change any of the underlying assumption used in the impact analyses for these resource areas. All assumptions, conditions, setting, impacts, and mitigation measures would be the same as those identified in Chapter 5 for all of these resource areas, and therefore, all of these sections of Chapter 5 also apply to the Muni UCSF/Mission Bay Station Platform Variant, and no further discussion is required.

The impacts and conclusions of SEIR Chapter 6 also apply to this variant, including growth inducing impacts, significant and unavoidable impacts, effects found not to be significant, irreversible and irretrievable commitments of resources, and areas of known controversy and issues to be resolved. Furthermore, because implementation of the Muni UCSF/Mission Bay Station Platform Variant would result in the same significant impacts as the proposed project, the alternatives analysis presented in Chapter 7 of this SEIR also applies to the variant and no further alternatives analysis is required.

Therefore, the only resource areas with potentially different environmental effects from the proposed project are Transportation, Noise and Vibration, Air Quality, and Energy, as discussed below.

Transportation

Chapter 5, Section 5.2, Transportation and Circulation also applies to the Muni UCSF/Mission Bay Station Platform Variant with respect to all aspects of the setting, approach to analysis, impacts, and mitigation and improvement measures, with one exception. Improvement Measure I-TR-4, Operational Study of the Southbound Platform at the T Third UCSF/Mission Bay Station, would not apply to this variant. The modification from extension of the northbound platform to construction of a new center platform would not affect the assumptions used for analyses of traffic, transit, bicycle, loading, emergency access, or helipad safety under any of the scenarios analyzed.

The only substantive change in the Muni UCSF/Mission Bay Station Platform Variant design relevant to the Transportation and Circulation section would be that instead of accessing the northbound platform to the north of South Street, as under existing conditions, passengers would instead access the platform south of South Street. For passengers traveling in the southbound direction, the new center platform would be located in a similar location as the existing southbound platform, and pedestrian access would not change from existing conditions.

As noted above, the center platform would be 320 feet long by 17 feet wide, and would provide adequate area to accommodate non-event transit riders, as well as two, two-car trains in both the northbound and southbound directions prior to or following a large event at the project site. Similar to the proposed project, prior to an event, PCOs would be stationed at the entrances to the light rail platforms on South Street to facilitate pedestrian crossings, and to minimize conflicts between pedestrians, light rail, and southbound vehicular traffic.

Similar to the proposed project, following an event, northbound Third Street would be closed to vehicular traffic between 16th Street and Mission Bay Boulevard South. As for pre-event conditions, PCOs would also be stationed at the entrances to the light rail platforms on South Street to facilitate pedestrian crossings, and to minimize conflicts between pedestrians, light rail, and northbound vehicular traffic. After an event, PCOs would stage passengers at a defined passenger waiting area within the closed portion of Third Street and would allow them to enter the center platform as soon as a train departs until the platform becomes reasonably full. Passenger loading onto the trains would be monitored by SFMTA Transit Fare Inspectors and Passenger Assistance Program Staff, who would be stationed at the light rail platforms.

The potentially significant pedestrian impacts of the Muni UCSF/Mission Bay Station Platform Variant at the intersection of Third/South during weekday and Saturday pre-event and post-event conditions for the Basketball Game scenario would be similar to those of the proposed project (see Impact TR-6, pp. 5.2-147 to 5.2-156). However, implementation of Mitigation Measure M-TR-6: Active Management of Pedestrian Flows at the Intersection of Third/South and the proposed TMP protocols for events would manage short-term peak pedestrian flows at adjacent intersections. Therefore, similar to the proposed project, this measure would mitigate the Muni UCSF/Mission Bay Station Platform Variant's pedestrian impacts to less-than-significant levels.

Noise

Chapter 5, Section 5.3, Noise and Vibration also applies to the Muni UCSF/Mission Bay Station Platform Variant with respect to all aspects of the setting, approach to analysis, operational impacts, and mitigation and improvement measures. The only minor differences relate to Impact NO-5 regarding operational impacts due to crowd noise at the Muni T-Line platform before and after events and to Impact NO-1 regarding construction noise.

As discussed on SEIR pages 5.3-37 and 5.3-38 under Impact NO-5, under the proposed project with the current location of the northbound platform, there would be a significant and unavoidable noise impact from the predicted 3,000 people that would be using the northbound Muni T-Line platform before and after approximately 45 basketball games per year and up to 60 additional full capacity concerts and other sporting events per year.

Under this project variant, the loading area for northbound passengers would no longer be north of South Street, directly in front of the UCSF Hearst Tower housing building but, instead, extend from 50 feet to approximately 400 feet south of South Street. This relocation of queuing MUNI passengers egressing events could marginally decrease the severity of the noise impact that would be generated by these crowds, as they would no longer be queuing directly in front of a sensitive land use. However, even considering this shift of the northbound platform approximately 300 feet to the south, a majority of the egressing crowd would likely access the platform by crossing Third Street at South Street, resulting in crowd noise as close as 150 feet from the UCSF Hearst Tower housing building. Additionally, northbound crowds queuing on the platform would now be as close as 900 feet from the UCSF hospital, instead of 1,200 feet, which could result in a slight increase in noise audible at the hospital after events. It should be noted that, unlike the UCSF Hearst Tower housing building, the UCSF hospital does not have operable windows, and thus would be less sensitive to crowd noise. Although this project variant can be assumed to result in an incremental noise reduction at Hearst Tower and serve as mitigation to the crowd noise impact identified in the Draft SEIR, the incremental reduction could still result in a substantial increase in noise levels at the housing building and potentially at the hospital. These changes would not be sufficient to reduce the impact to a less-than-significant level. Therefore, similar to the proposed project, operational noise impacts from crowd noise under this variant would be considered *significant and unavoidable*.

The replacement of the existing high-level northbound and southbound passenger platforms at the UCSF/Mission Bay light rail stop with a single high-level center platform to accommodate both northbound and southbound light rail service passengers would also result in temporary noise increases from construction activities. Construction activities would require temporary travel lane closure of one of the two northbound lanes on Third Street. As described above, work on the Muni platform would generally be scheduled on weekends when impacts on light rail service would be less than during the weekdays, and therefore, it would not occur simultaneously with construction activities for the event center or office towers. Assuming use of a backhoe, jack hammer and truck crane, construction activities for the demolition of the existing northbound platform would generate noise levels of 79.4 dBA, Leq at the nearest receptor (Hearst Tower), 75 feet away, which would result in a less than 10 dBA increase over existing ambient noise levels of 71.2 dBA, Leq.

Similar to the proposed project, construction noise impacts of the Muni UCSF/Mission Bay Station Platform Variant would be *less than significant*.

Air Quality

Chapter 5, Section 5.4, Air Quality, also applies to the Muni UCSF/Mission Bay Station Platform Variant with respect to all aspects of the setting, approach to analysis, operational impacts, and mitigation measures. The only minor differences relate to construction impacts, as discussed below.

Construction Criteria Pollutant Emissions

The Muni UCSF/Mission Bay Station Platform Variant would result in slightly different air quality impacts from those of the project with regard to project construction. Daily engine exhaust emissions from construction activities associated with the Muni UCSF/Mission Bay Station Platform Variant are compared with significance thresholds in **Table 12-2**. Total construction emissions were calculated in the same manner as for the proposed project in the Draft SEIR and total emissions were divided by the same number of construction days to derive average daily emissions for comparison against applicable significance thresholds. This is a conservative analysis of construction air quality impacts, as it is likely that platform work would be scheduled on weekends, which would increase the number of construction days and would result in a reduction in the calculation of average daily emissions.[14]

TABLE 12-2
MUNI VARIANT AVERAGE DAILY CONSTRUCTION-RELATED EMISSIONS

	Average Daily Construction Emissions (pounds/day)			
	ROG	**NOx**	**PM_{10}**	**$PM_{2.5}$**
Off-road Equipment Emissions	13	187	7.1	7.1
Truck and Vehicle emissions	7.4	51	0.84	0.77
Architectural Coating Emissions	39	0	0	0
Total[a]	60	238	7.9	7.9
Significance Threshold	54	54	82	54
Above Threshold?	**Yes**	**Yes**	No	No

NOTES:

[a] The total emissions may not sum precisely due to rounding of subtotals. The Project Sponsor has committed to Tier 4 Final engines for all construction generators used during construction, so those emissions are presented for the Uncontrolled and both mitigated scenarios. The Muni construction requires Tier 2 + NOx VDECS, so those emissions are presented for the Uncontrolled scenario.

SOURCE: Ramboll Environ, 2015

The construction significance thresholds for criteria pollutants are established in terms of average daily emissions, which is how emissions are reported in Table12-2.

[14] Keinath, Michael and Mukai, Catherine, Ramboll-Environ, 2015. Letter to Paul Mitchell, Environmental Science Associates, regarding *Effect of Number of Construction Days on Emissions Impact. October 19, 2015.*

Similar to the proposed project, the estimated construction emissions of ROG and NOx under the Muni UCSF/Mission Bay Station Platform Variant would exceed the applicable significance threshold, which would be a *significant and unavoidable with mitigation* air quality impact. The Muni UCSF/Mission Bay Station Platform Variant would not substantially increase (approximately 2 percent for ROG and 5 percent for NOx) the average daily emissions disclosed in the Draft SEIR for the proposed project (see Table 5.4-7, page 5.4-31). Furthermore, **Mitigation Measure M-AQ-1 (Construction Emissions Minimization)** would also apply to the variant. While the estimated construction emissions under the variant shown in Table 12-2 are slightly higher than those identified for the proposed project in the Draft SEIR, this impact is not substantially more severe than the previously identified significant and unavoidable impact. Further, the estimated emissions shown in Table 12-2 assume concurrent weekday construction activities, but typically construction activities for the Muni platform would be on weekends to minimize disruption to Muni riders, while most construction activities on the project site would occur on weekdays. Thus, the analysis presented in Table 12-2 is conservative. Without concurrent construction, as would be typical, average daily construction emissions would be less than reported in the Draft SEIR.[15]

Mitigated daily engine exhaust emissions from construction activities associated with the Variant are compared with emission significance thresholds in **Table 12-3**, assuming both the maximum level and the minimum level of compliance (Tier 4 and Tier 2 with NOx VDECS). As can be seen in Table 12-3, construction-related emissions would be reduced to the applicable threshold for ROG with both the maximum and minimum levels of compliance. However, while NOx emissions would be reduced by as much as 65 percent with fully compliant mitigation and 34 percent with minimally compliant mitigation, as with the proposed project, emissions of NOx would remain significant (84 pounds per day) under the variant, even with maximum compliance with Mitigation Measure M-AQ-1. Therefore, similar to the proposed project, **Mitigation Measure M-AQ-2b (Emission Offsets)** would also be required to reduce emissions of ROG and NOx emissions to the extent feasible and the residual impact would be *significant and unavoidable with mitigation*.

Construction TAC Emissions

Regarding construction emissions, a health risk assessment (HRA) was conducted for the proposed project's 26-month construction period under the Muni UCSF/Mission Bay Station Platform Variant and was performed using the same methodology as for the proposed project in the Draft SEIR. **Table 12-4** shows the results of the risk assessment for exposure to $PM_{2.5}$ during construction of this variant at the maximally impacted receptor. The Air Pollutant Exposure Zone standard for $PM_{2.5}$ is an annual average standard, and because construction and operational activities would not overlap, only the construction $PM_{2.5}$ concentrations are added to the background $PM_{2.5}$ concentrations to determine whether construction of the project would result in the project vicinity meeting the Air Pollutant Exposure Zone criteria. As shown in Table 12-4, cumulative $PM_{2.5}$ levels under the variant at the maximally impacted sensitive receptor would be 8.9 $\mu g/m^3$, and would not exceed the 10 $\mu g/m^3$ significance threshold. Thus, localized $PM_{2.5}$ impacts from construction activities at sensitive receptor locations would be *less than significant*.

[15] Keinath, Michael and Mukai, Catherine, Ramboll-Environ, 2015. Letter to Paul Mitchell, Environmental Science Associates, regarding *Effect of Number of Construction Days on Emissions Impact. October 19, 2015.*

TABLE 12-3

SOURCE: Ramboll Environ, 2015

The results of the cancer risk assessment are presented in **Table 12-5** below for both the unmitigated and mitigated scenarios for this variant, the latter of which assumes the minimum level of compliance (Tier 2 engines with NOx VDECS) with implementation of **Mitigation Measure M-AQ-1 (Construction Emissions Minimization)** described in the Draft SEIR. Table 12-5 shows that under unmitigated conditions, the excess cancer risk for a child resident at the UCSF Hearst Tower and Hospital would not exceed the significance threshold of 100 per one million persons exposed. Implementation of Mitigation Measure M-AQ-1 (Construction Emissions Minimization) would reduce the impacts from standardized construction equipment for which "tiered" equipment is available, as shown in Table 5.4-11. With the minimum level of compliance with this mitigation measure (Tier 2 plus NOX VDECS), increased cancer risk as a result of project construction activities at the maximally impacted receptor would be approximately 11 in one million and cumulative excess cancer risk at all receptor locations would be below the significance threshold of 100 per one million.

TABLE 12-5
LIFETIME EXCESS CANCER RISK AT OFF-SITE RECEPTORS

	Excess Cancer Risk (in one million)		
	UCSF Hearst Tower Receptor		UCSF Hospital Receptor
Source	**Child Resident**	**Adult Resident**	**(Child Resident)**

Project Operations – Generators	0.24	0.14	0.056
Project Operations – Mobile Sources	7.2	7.2	7.2
Cumulative Total (Unmitigated/with Mitigation)[a]	89 / 45	36 / 34	79 / 56
Significance Threshold	100	100	100
Above Threshold? (Unmitigated/with Mitigation)	No / No	No/ No	No/ No

NOTES:
[a] The total risks may not sum precisely due to rounding of subtotals.

SOURCE: Ramboll Environ, 2015

At no off-site location would cumulative excess cancer risk exceed 100 per one million persons exposed with or without implementation of Mitigation Measure M-AQ-1. Therefore, the Muni UCSF/Mission Bay Station Platform Variant would not result in sensitive receptor locations meeting the Air Pollutant Exposure Zone criteria for excess cancer risk, and similar to the proposed project (as refined), construction and operational cancer risk impacts associated with this variant would be *less than significant*.

Energy

Initial Study, Section 17, Mineral and Energy, as augmented by Section 13.23 of this Responses to Comments document, also applies to the Muni UCSF/Mission Bay Station Platform Variant with respect to all aspects of the setting, approach to analysis and operational impacts. This variant

would not change the operations of Muni, therefore there would be no increase in operational energy or water use. The only minor differences in energy impacts relate to construction impacts, as discussed below.

Similar to the proposed project, construction activities for this variant would require the use of diesel for the operation of off road construction equipment and on-road trucks for the off-site transport of soil and other wastes; electricity for electrical construction equipment and the use of dust control water; and gasoline for worker commute trips.

The estimated diesel usage for construction related to the Muni platform would be about 6,800 gallons, making the maximum annual construction-related diesel use about 576,900 gallons. Similar to the proposed project, the annual construction-related diesel consumption for this variant would be consistent with all fuel efficiency requirements, representing approximately 0.02 percent of the statewide annual totals.

Total gasoline consumption associated with worker commute trips for construction of the Muni platform would be approximately 500 gallons, but this would not increase the total annual maximum gasoline consumption for the variant as a whole (including construction of the event center and mixed use development) because of the timing of construction. As for the project, this estimate incorporate fuel efficiency improvements associated with implementation of the Pavley Clean Car Standards[16] and the Low Carbon Fuel Standard,[17] which promote the use of vehicles utilizing alternative fuel sources such as electricity and hydrogen. Annual gasoline usage would be consistent with all state and federal fuel efficiency requirements, and represents approximately 0.002 percent of the statewide totals.

Total electricity consumption associated with construction of the Muni platform would be about 40 kWh, but this would not increase the total maximum annual construction-related electrical use for the variant as a whole (including construction of the event center and mixed use development) because of the timing of construction. The project's annual construction-related electricity consumption would represent approximately 0.005 percent of the electricity purchased in San Francisco.

There would be no unusual project characteristics that would necessitate the use of construction equipment that would be less energy efficient than at comparable construction sites in other parts of the state. Further, Mitigation Measure M-AQ-1, Construction Emissions Minimization, would require the use of late-model generators (Tier 2 through 4 with Verified Diesel Emissions Control Strategies) that would generally be more fuel efficient. Therefore, construction activities would not require the use of unusually large amounts of fuels, electricity, or water as demonstrated above and would not result in the inefficient, wasteful, or unnecessary use of these resources. As concluded in the 1998 Mission Bay FSEIR Initial Study Energy/Natural Resources

[16] California Air Resources Board. Clean Car Standards – Pavley, Assembly Bill 1493. Accessed at http://www.arb.ca.gov/cc/ccms/ccms.htm on September 15, 2015.

[17] California Air Resources Board. Low Carbon Fuel Standard Program. Accessed at http://www.arb.ca.gov/fuels/lcfs/lcfs.htm on September 15, 2015.

section and in Impact ME-1 of the Initial Study (p. 123), impacts related to the use of energy resources during construction would be *less than significant*.

Conclusion

As indicated above, the impact analysis, conclusions, and significance determinations for the proposed project presented in the SEIR, with the exception of minor details of the Transportation, Noise, Air Quality, and Energy sections described above, would be similar under the Muni UCSF/Mission Bay Station Platform Variant. With the exception of Improvement Measure I-TR-4, Operational Study of the Southbound Platform at the T Third UCSF/Mission Bay Station, all impact conclusions and mitigation and improvement measures identified for the proposed project in the Draft SEIR, as revised in this Responses to Comments document, would also apply to the Muni UCSF/Mission Bay Station Platform Variant. The same alternatives analysis for the proposed project presented in the SEIR also applies to the Muni UCSF/Mission Bay Station Platform Variant.

CHAPTER 13
Responses to Comments

13.1 Organization of Responses to Comments

The San Francisco Office of Community Investment and Infrastructure (OCII), as lead agency for the California Environmental Quality Act (CEQA) environmental review process, has reviewed all letters, emails, and oral testimony presenting comments received on the Draft SEIR, as listed in Chapter 11, List of Persons Commenting. This chapter presents the substantive comments received on the Draft SEIR and responses to those comments, organized by topic. The substantive comments contained in the letters, emails, and public hearing transcripts have been bracketed and numbered, and this chapter groups together comments on the same topic and provides a comprehensive response on that topic. Substantive comments are those comments that relate to the proposed project, the adequacy or accuracy of the SEIR, or the environmental review process; all other comments and written materials submitted to OCII during the public review period, while considered by OCII and the decision-makers, do not require a written response under CEQA. Appendices COM and PH contain the full text of all comments on the Draft SEIR and shows the bracketing and associated numbering of each comment.[1]

This chapter presents the topics of comments and responses generally in the same order as presented in the Draft SEIR. The order of the comments and responses in this chapter is shown below, along with the prefix to the topic codes (indicated in parenthesis):

13.2 General Comments (GEN)
13.3 Environmental Review Process (ERP)
13.4 AB 900 Process (AB)
13.5 Project Description (PD)
13.6 Plans and Policies (PP)
13.7 Impact Overview (IO)
13.8 Land Use (LU)
13.9 Population and Housing (PH)
13.10 Cultural Resources (CULT)
13.11 Transportation and Circulation (TR)
13.12 Noise and Vibration (NOI)
13.13 Air Quality (AQ)
13.14 Greenhouse Gases Emissions (GHG)
13.15 Wind and Shadow (WS)
13.16 Recreation (RE)
13.17 Utilities and Service Systems (UTIL)
13.18 Public Services (PS)
13.19 Biological Resources (BIO)
13.20 Geology (GEO)
13.21 Hydrology and Water Quality (HYDRO)
13.22 Hazards and Hazardous Materials (HAZ)
13.23 Energy Resources (EN)
13.24 Alternatives (ALT)

[1] Each bracketed comment is assigned a unique comment code that corresponds to the type of commenter (i.e., public agency [A], non-governmental organization [O], individual [I], and public hearing speaker [PH]); an acronym for the agency or organization (or, in the case of individuals, their last name); and the sequentially numbered, bracketed comment from that commenter. For example, the comment letter from the Bay Area Air Quality Management District is coded A-BAAQMD, and the first comment in the letter is coded A- BAAQMD-1, the second comment on a different subtopic is coded A- BAAQMD-2.

Within each section of this chapter under each topic area, similar comments are grouped together and numbered sequentially using the topic code prefix and sequential numbering for each subtopic. For example, General Comments (GEN) are listed as (GEN-1), (GEN-2), (GEN-3), and so on. Within each topic code and corresponding heading that introduces the comment subject, there is a list of the comments addressed using the unique comment code that identifies the commenter and the specific comment. Following the list of comment codes for each subtopic, the comments are presented verbatim.

Following each comment or group of comments on a specified subtopic, a comprehensive response is provided that addresses issues raised in the comments and clarifies or augments information in the Draft SEIR as appropriate. Response numbers correspond to the topic code; for example, the response to comments on topic GEN-1 is provided under Response GEN-1. In some cases, where a comment addresses more than one topical subject, the response includes a cross-reference to other responses. The responses provide clarification of the information presented in the Draft SEIR and may also include revisions or additions to the Draft SEIR. Revisions to the Draft EIR are shown as indented text. New or revised text is <u>underlined</u>; deleted material is shown in strikethrough (~~strikethrough~~).

13.2 General Comments

13.2.1 Overview of General Comments

The comments and corresponding responses in this section address topics that do not relate to any specific section of the SEIR or to the environmental review process, but rather relate to other aspects of the proposed project that are outside the purview of the California Environmental Quality Act (CEQA). These include topics related to:

- GEN-1: Funding
  - GEN-1a: City Funding
  - GEN-1b: Mitigation Funding
- GEN-2: Quality of Life
- GEN-3: Environmental Justice
- GEN-4: Urban Decay
- GEN-5: Opinions on the Project
- GEN-6: Miscellaneous Opinions

13.2.2 Funding (GEN-1)

Issues Raised by Commenters: City Funding (GEN-1a)

This response addresses all or part of the following comments, which are quoted below:

A-UCSF-21 A-UCSF-27 O-PBNA-4

"The adoption of an effective mechanism to fully fund the City's operating costs to manage impacts as described above for the life of the Event Center would help to eliminate funding as a criteria for determining the feasibility of the measures that are the responsibility of the City." (*University of California San Francisco, Lori Yamauchi, letter, July 27, 2015 [A-UCSF-21]*)

"Page 3-36 through 37, UCSF appreciates the City and GSW' s commitment to the improvements listed. UCSF requests the DEIR include documentation to confirm these improvements are fully funded." (*University of California San Francisco, Lori Yamauchi, letter, July 27, 2015 [A-UCSF-27]*)

"For the Arena to coexist within its rapidly developing surrounding neighborhoods, the City must maintain dedicated funding of full time transit and transportation solutions and review the parking management programs throughout the adjacent areas. Proper attention must be paid to the travel needs of the populations that live and work (and who will soon live and work) in the area full time, and not be reserved for those few times a year when the confluence of San Francisco Giants and Arena events bring about the largest transportation challenges. New transit should be based on current data and SFMTA should be prepared to move away from more outdated transit planning." (*Potrero Boosters Neighborhood Association, J.R. Eppler, letter, July 27, 2015 [O-PBNA-4]*)

Response GEN-1a: City Funding

The City and County of San Francisco (CCSF or City) has introduced a resolution for consideration by the San Francisco Municipal Transportation Agency (SFMTA) and an ordinance for the Board of Supervisors that are intended to secure funding for the project's transportation service plan and other services and to ensure that the incremental City costs of providing transit, traffic enforcement, street sweeping and public safety services outside the premises are fully funded through the life of the project. Both actions require certification of the Final Subsequent EIR prior to adoption.

The first, a resolution for adoption by the SFMTA Board, would do the following: (1) adopt the CEQA findings, including the specified mitigation and improvement measures and the Mitigation Monitoring and Reporting Program (MMRP); (2) approve the capital improvements and operating commitments described in the project's transportation service plan under the jurisdiction of the SFMTA Board (as described in Section 5.2.5.2 of the Draft SEIR and subsequent refinements as described in the Section 13.11 of this Responses to Comments document); (3) recommend that the Board of Supervisors approve an ordinance creating a Special Reserve Account to fund City services and capital improvements and establish an Advisory Committee to make funding recommendations for the Project; and (4) delegate to the Director of Transportation the authority to expend monies pursuant to the Special Reserve Account. The resolution would specify two funding sources: (1) project-generated revenues currently mandated by the Charter to accrue to the SFMTA's Municipal Transportation Fund; and (2) a portion of project-generated General Fund revenues required to fully fund agency costs. The capital improvements are anticipated in the Muni Special Event Transit Service Plan description (see SEIR, pp. 5.2-53 to 5.2-55), and the resolution will commit the funds to implement these improvements.

The second, an ordinance for adoption by the Board of Supervisors, would direct the Controller to create a Special Reserve Account setting aside the full annual amount of the General Fund portion of the cost of providing eligible City costs to service the project to address certain operational components of the Muni Special Event Transit Service Plan, other SFMTA services, and other City services. The ordinance would define eligible City costs including those specified in the SFMTA Board resolution as well as by the San Francisco Police, Fire, and Public Works departments. The Special Reserve Account deposits would be made annually based on department budget requests subject to a maximum funding amount certified by the San Francisco Controller's Office. In determining their proposed annual budgets for uses of the fund, the departments would be required to consult with an Advisory Committee consisting of representatives from the event center, the surrounding residential and commercial communities, and UCSF, and would be required to hold a public hearing on the proposed budget.

The ordinance would further include a Designated Overlapping Event Reserve Account in an amount estimated to be sufficient to cover the transit enhancements and traffic enforcement costs of servicing certain non-Golden State Warriors events at the event center that occur on the same weekday evening during the pre-event peak period as a San Francisco Giants regular season, evening game. The annual deposit of funds would remain in effect for the useful life of the Event Center.

While the deposit of funds to the Special Reserve Account would not be tied to projected tax revenues, the $14.1 million in annual project-generated revenues projected by Economic & Planning Systems, Inc.'s Fiscal Feasibility Analysis[1] are expected to more than cover the expected total annual operating costs, capital financing costs, funds to replenish the Designated Overlapping Event Reserve Account as well as a balance to cover unanticipated costs or to add additional transit or traffic enforcement service as needed. If at the end of any fiscal year during the term of the Special Reserve Account, the balance in the Special Reserve Account exceeds expenditures, such excess monies would be carried forward as a reserve for uses consistent with the Special Reserve Account's purpose to the extent such excess monies do not exceed a specified percentage of the total expenditures from the Special Reserve Account for the previous fiscal year.

Issues Raised by Commenters: Mitigation Funding (GEN-1b)

This response addresses all or part of the following comments, which are quoted below:

I-Carpinelli-3	I-Springer-3	I-Woods-4	I-Zboralske-13
PH-Gisslow-2	PH-Rosales-2		

"3. Dogpatch Neighborhood mitigation projects/ funds need to be identified and funded by the Warriors:

"These could include:

"a. 250 parking space garage located on Port land or south of 24th St. Dogpatch (with shuttle buses to the stadium). This lot would also serve workers and shoppers in Dogpatch while not sending traffic through the neighborhood. It could be designed such that it could be a park-like setting or off-leash dog park on non-game days.

"b. Ongoing funds for Esprit Park maintenance and capital improvements

"c. Ongoing maintenance and upgrading of neighborhood basketball court at the Historic Scott School (1060 Tennessee St) playground area on Minnesota St.

"d. Ongoing cleaning/greening funds for public sidewalks and now neighborhood volunteer maintained spaces in and around Dogpatch.

"e. Increased funding for more N/S T-Third cars and E/W MTA routes and ongoing funding/maintenance of these expansions

"f. Ongoing funding for Blue Greenway

"g. Ongoing educational scholarship funds for underprivileged Dogpatch/Potrero neighborhood children to attend Dogpatch and Mission Bay pre-schools, after school programs, and charter schools"

(*Janet Carpinelli, email, August 4, 2015 [I-Carpinelli-3]*)

---

[1] Keyser Marston Associates, Inc., 2015. Memorandum to Office of Community Infrastructure (OCII), Successor to the San Francisco Redevelopment Agency, regarding Peer Review of "San Francisco Multi-Purpose Venue Project: Fiscal Impact Analysis—Revenues" prepared by Economic & Planning Systems, Inc., September 25, 2015.

"3) The funding must be guaranteed for the mitigations outlined in the SEIR. Whether it comes from the City or the Warriors, the mitigations must not be reliant on there being sufficient funds; those funds should be identified and secured before the project is approved, or else the EIR is irrelevant." (*Matt Springer, email, July 16, 2015 [I-Springer-3]*)

"It has been our experience that adequate funding and oversight of mitigations, and flexibility to amend the plan, is the key to success. While the project sponsors are supposed to be drafting a Special Reserve Account to set aside the operational costs of the impacts of the arena, there needs to be a specific and enforceable reference in the SEIR that funding of mitigations will be dedicated for the life of the plan and not subject to the vagaries of City General Fund budget cycles." (*Corinne Woods, email, July 27, 2015 [I-Woods-4]*)

"The Warriors have a huge financial incentive to use the site extensively in order to generate revenue and help pay for the project and ultimately make more profits.

"The City should be a staunch steward of City resources and funds, taking appropriate measures to ensure we do not over-commit limited resources or over-spend for service delivery." (*James Zboralske, email, July 27, 2015 [I-Zboralske-13]*)

"A problem, I think, with the EIR and the public's opinion is, people are very uninformed about what's actually going on with the costs going into this arena.

"Yes, the arena is publicly -- I mean, privately financed, but one thing they haven't talked about is the resulting public transportation improvements that will come along with this project.

"So, Caltrans had a proposed and approved line going through King Station, but the Mayor wants to change that line going to the new arena he's proposing, and that would cost $2.5 billion.

"That is not privately funded. That would be taxpayer money. And I think that's a huge problem that's not addressed in the EIR. That's a huge amount of money not accounted for, let alone the $40 million of proposed improvements to the public transportation, as well as $6.6 million in annual upkeep fees to the public transportation.

"These are all costs that are not addressed at all in the EIR. These are all under the radar that no one talks about or knows about, and I think that's a huge problem with this project." (*Blaise Gisslow, public hearing transcript, June 30, 2015 [PH-Gisslow-2]*)

"And we've heard a lot of concerns, and I will continue to read the document, but I want to make sure that the comments here regarding those impacts and the mitigation measures are kind of looked at in depth and to the extent of exploring funding mechanisms or recommended or suggested mechanisms, so that they don't go into the document -- that the Commission be told of potential funding mechanisms that we might be able to recommend to ensure that those mitigations are essentially guaranteed and those impacts are mitigated." (*Chairperson Rosales, public hearing transcript, June 30, 2015 [PH-Rosales-2]*)

Response GEN-1b: Mitigation Funding

Compliance with the Mitigation Monitoring and Reporting Program (MMRP) will be a condition of OCII Commission approval including full funding and implementation of all mitigation measures identified in the Final SEIR. If the project is approved, the project sponsor will bear responsibility for funding and implementing all mitigation measures assigned to the project other than those expressly assigned to the City. See Response GEN-1a above for a description of the Special Reserve Account for Board of Supervisors adoption and the resolution for SFMTA Board adoption to cover the full costs of all City responsibilities. As these actions would dedicate funds generated by the project, would not rely on existing discretionary City funds, and cannot predetermine the outcome of any approval actions adopting the project, action to create them must occur after the Final SEIR is certified.

In addition to these funding commitments, if the project is approved, OCII or its designated representative will track the current implementation status and responsible party for each measure in the MMRP. In addition, OCII or its designated representative will provide annual updates to the Advisory Committee described above, as well as the Mission Bay Ballpark Transportation Coordination Committee, Mission Bay Citizens Advisory Committee, or their citizen's advisory successor bodies as requested.

The commenters also raise concerns over the level of attention paid to the travel needs of the populations that live and work, or will live and work, in the area full time. In addition to the transportation improvements proposed as part of the project, the City is engaged in several efforts to improve public transportation in southeastern San Francisco, including but not limited to the following:

- **Muni Forward** – a multi-year planning and implementation process throughout San Francisco to align bus routes with updated population densities, travel routes, and modal decisions including realignment of the 22 Fillmore and the 10 Townsend bus routes, creation of the new 55-16th Street bus route (and future protected bus rapid transit lane on 16th Street between Third and Church Streets), the planned 11Downtown Connector and 33-Ashbury/18th bus routes, the recent extension of the E Embarcadero historic streetcar to Fourth and King Streets, and reduced headways and longer trains on the T Third light rail line.

- **Central Subway** – the $1.6 billion second phase of the T Third light rail line currently under construction and scheduled to open in early 2019 which will extend the rail line north on Fourth Street to Market Street and then continue north on Stockton Street to Chinatown, with four new stations along the way.

- **Regional Transit Improvements** – including the 2017 opening of the new $4.5 billion Transbay Terminal, 2017 fleet replacement to clean fuel ferries for the Water Emergency Transportation Agency, 2020 San Francisco Downtown Ferry Terminal Expansion, and 2020 conversion of Caltrain from diesel to electric power.

- **Local Right of Way Improvements** – including completion of the Mission Bay street grid, Terry A. Francois Boulevard cycletrack, and the Blue Greenway bicycle and pedestrian paths.

- **Bikeshare Expansion** – Bay Area Bikeshare, the region's membership-based system for short-term bicycle rental, announced plans to expand San Francisco's bikeshare fleet from 350 bicycles to nearly 5,000 bicycles in 2017, including expansion south of Mission Creek into Mission Bay and points south.

- **Waterfront Transportation Assessment** – an expansive planning process led by the SFMTA and the San Francisco County Transportation Agency to analyze existing transportation supply and deficiencies, project future growth patterns, and travel demand and make recommendations for service changes and capital improvements.

OCII acknowledges the commenter's list of Dogpatch neighborhood projects. The SEIR identifies mitigation measures to avoid or lessen impacts associated with physical environmental impacts of the project, and measures must be "roughly proportional" to the impacts of the project [CEQA Guidelines Section 15126.4(a)(4)]. Two of the projects suggested by the commenter could be considered mitigation for traffic impacts of the proposed project—parking lot on Port land and increased funding for T Third rail line; Section 13.11 describes and analyzes proposed off-site parking areas located on Port of San Francisco lands, and funding of additional Muni service including the T Third light rail line is discussed above. The other of Dogpatch neighborhood projects listed by the commenter would not serve as CEQA mitigation measures for adverse environmental impacts identified in the SEIR. Specifically, Esprit Park maintenance and upgrade of neighborhood basketball courts are not warranted as mitigation for the proposed projects because the Initial Study (Appendix NOP-IS of the SEIR) determined that recreation impacts would be less than significant. Similarly, funding of cleaning and greening for public sidewalks, or for the Blue Greenway, or for educational scholarships would not avoid or lessen any significant impacts of the proposed project, although as described above the City is engaged in completing the Blue Greenway bicycle and pedestrian paths.

See Chapter 10, Section 10.2.3, for further discussion of CEQA requirements for a MMRP.

13.2.3 Quality of Life (GEN-2)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

I-Cehand-2 I-Tuialu'ulu'u-1 I-Zboralske-8 PH-Battat-2 PH-Ortiz-4

"Public urination and discarded trash/alcohol bottles- fans urinating on our building and landscaping." (*Jadine Cehand, email, June 30, 2015 [I-Cehand-2]*)

"Mission bay is a beautiful area where I go on a regular basis to take loved ones to medical appointments and visits. The arena being built here is going to be a huge inconvenience to many residents, commuters, and especially hospital visitors and staff in general. More than that, I feel it poses a safety issue to the community's children." (*R. Tuialu'ulu'u, email, July 14, 2015 [I-Tuialu'ulu'u-1]*)

"With regard to quality of life issues, they are of great importance and can be described as:

> Those issues which affect the residents, businesses and visitors to the area by creating fear or adversely impacting their health, safety, and welfare.

"Some typical quality of life issues in Mission Bay and our surrounding areas include, but are not limited to:

- Aggressive panhandling
- Ticket scalpers hassling people and/or stepping into traffic
- Chronic public intoxication
- Drinking in Public and open containers
- Litter, graffiti and public nuisances such as urinating and defecating in public
- Incidents that involve the mentally ill
- Illegal encampments
- Illegal dumping
- Chronic noise complaints
- Illegally parked vehicles
- Dust and grime associated with on-going construction projects
- Significant numbers of California Vehicle Code violations being committed by motor vehicles, bicycles and pedestrians.
- Constant and often poorly designed and implemented road and/or lane closures and traffic modifications disrupt all modes of both public and private transportation with regularity."

(*James Zboralske, email, July 27, 2015 [I-Zboralske-8]*)

"While I appreciate these fans supporting our local Giants, I do not appreciate the out-of-town, In-N-Out Burger trash, nor the empty containers left in the streets. This speaks to the way that crowds rush into the games and are often not supporting the local" -- excuse me -- "and how the crowds are not supporting the local community since the games are already so expensive.

"Adding basketball season to the event calendar for this neighborhood will definitely have a negative impact on the traffic and parking in the surrounding neighborhoods, and residents will be hurt, along with business development and growth." (*Andrew Battat, public hearing transcript, June 30, 2015 [PH-Battat-2]*)

"And, lastly, I want to just leave you with a question about, What would responsible development look like in San Francisco?

"You know, it's not just a problem with the stadium, but in San Francisco in general. What does that really look like for the council members? And, you know, we can't deny that traffic is a problem in the quality of life for all of San Francisco." (*Annabel Ortiz, public hearing transcript, June 30, 2015 [PH-Ortiz-4]*)

Response GEN-2: Quality of Life

This group of comments asserts that the proposed project would have an adverse effect on the quality of life to the local residents. As described in SEIR Section 5.8, Public Services (pp. 5.8-9 to 5.8-10), it is acknowledged that other effects could result from the proposed project—such as the potential for an increase in crime, public drinking, outdoor crowd noise, building defacement, public urination, ticket scalping, pan-handling, vandalism, litter, graffiti, and other activities that may result in a diminished quality of life for neighborhood residents. These effects are generally not considered impacts under CEQA unless such effects result in the need for the construction of new or physically altered governmental facilities in order to maintain acceptable levels of public services, *and* the construction of such facilities result in adverse physical environmental impacts. (See *Goleta Union School District v. Regents of University of California* (1995) 37 Cal.App.4th 1025, 1032 [school overcrowding is not an environmental impact, though new school construction might cause such impacts]; *City of Pasadena v. State of California* (1993) 810, 828-834 [court upholds use of categorical exemption for relocation of parole office, rejecting contentions that the presence of parolees in the affected neighborhood and associated "irregular activities" would lead to physical impacts subject to CEQA]; *Saltonstall v. City of Sacramento* (2015) 234 Cal.App.4th 549, 584-587 [court upholds EIR for new basketball arena, treating concerns about crowd control to be social issues outside the scope of CEQA]; and CEQA Guidelines Appendix G, Environmental Checklist Form, XIV, Public Services [questions generally focus not on adverse effects on services per se but on whether expanded facilities with physical impacts might be necessary]. With respect to potential noise and aesthetic impacts associated with these quality of life concerns see Sections 13.12.7 and 13.3.9, respectively, of this document.

Regardless, the proposed project would incorporate certain services, facilities, and site management practices that would minimize the project's effects on the quality of life for the surrounding neighborhood. These include: the provision of on-site space, including a command center at the event center for use by the project sponsor's security personnel, the San Francisco Police Department (SFPD), the San Francisco Fire Department (SFFD), and the San Francisco Municipal Transportation Agency (SFMTA); provision of private security guards to regularly patrol buildings and grounds; increased security for games/events to provide on-site crowd management and public safety; inclusion of applicable on-site security equipment; use of traffic control personnel and implementation of a transportation management plan for games and other events to facilitate safe movement of, and minimize potential conflicts among, pedestrians, bicyclists, and vehicles; use of maintenance and cleaning staff to regularly clean and maintain the buildings and grounds and provide litter control; participation in the Mission Bay Commercial Maintenance Corporation to provide power washing, street-tree maintenance, graffiti removal, and other services; incorporation of public restroom facilities in proposed buildings and open space areas; and installation of recycling/trash/compost receptacles included in the Mission Bay Streetscape Plan.

In addition, the project sponsor must apply to the Entertainment Commission for an entertainment permit through a formal process as discussed on page 5.3-15 of the SEIR. Police Code Sections 1060.5(g) and 1060.31 require that all places of entertainment have a Security Plan approved by the Entertainment Commission Director or the Commission and that a condition of

approval of a place of entertainment permit include a Security Plan. A Security Plan is defined in Police Code Section 1060(n) as including, among other things "providing for the orderly dispersal of individuals and traffic from the premises of the Business and within 100 feet of any door that patrons use to enter or exit the premises", as well as mandating certain ratios of Security Guards to the number of patrons.

Further, Police Code Section 1060.20.1(a) provides a procedure for suspension of Entertainment Permits by the Entertainment Commission where the Permittee has operated the Business "[i]n a manner that has harmed the public health, safety or welfare by significantly increasing pedestrian congestion, the incidence of disorderly conduct, or the level of noise in the area in which the premises are located…" and where the Permittee has refused or failed, upon request of the Police Department, Entertainment Commission or the Director to take reasonable steps to alleviate the conditions.

OCII would consider these quality of life issues as part of the City's project planning and approval processes, outside of the CEQA environmental review process. For specific issues regarding traffic, transit, and parking, refer to discussions in SEIR Section 5.2 and Section 13.11 of this Responses to Comments document. For specific issues regarding noise, refer to discussion in SEIR Section 5.3 and Section 13.12 of this Responses to Comments document.

13.2.4 Environmental Justice (GEN-3)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

O-PBNA-11

"*Impact AQ-2 and Mitigation M-AQ-2b*

"The air quality mitigation disbursement plan described in AQ-2 and M-AQ-2b is not adequate to meet the needs of the Potrero neighborhoods and our neighbors to the south. Given our proximity to freeways, industrial activities (including a UPS distribution center and a Recology recycling facility), heavy trucking, and the historical uses of our neighborhoods (including a recently decommissioned power plant), we feel that this represents a significant environmental justice issue.

"While the Bay Area Air Quality Management District ("BAAQMD") may be able to use mitigation funding anywhere in the counties of Alameda, Contra Costa, Marin, Napa, San Francisco, San Mateo, Santa Clara and portions of Solano, and the Arena is likely to draw automobile traffic from all of these areas, the bulk of the pollution by vehicles will be within two miles of the Arena. Mitigating pollution sources in Solano County will not go to reduce the impacts in our neighborhoods, which will experience additional car traffic at least 225 times per year.

"As pointed out by the San Francisco Department of Environment, "The City's neighborhoods in the Southeast areas are heavily burdened by air pollution-not only from major industrial facilities, but also from the thousands of automobiles and heavy-duty diesel trucks that travel daily on nearby freeways and City streets."

"The SEIR forecasts that 53% of Arena attendees on a weekday, and 59% on a weekend, will drive to the Arena. While those mobile sources of pollution will travel through other Bay Area counties, they will all

arrive in our neighborhood, the analysis of the BAAQMD seems to equate moving efficiently at freeway speeds to idling on our neighborhood off-ramps and our poor level-of-service intersections.

"As Arena traffic is the source of the impact, money should mitigate pollution sources near the Arena." (*Potrero Boosters Neighborhood Association, J.R. Eppler, letter, July 27, 2015 [O-PBNA-11]*)

Response GEN-3: Environmental Justice

The commenter states that Mitigation Measure M-AQ-2b, Emission Offsets, is inadequate and represents a significant environmental justice issue. The U.S. Environmental Protection Agency defines environmental justice as "the fair treatment and meaningful involvement of all people regardless of race, color, national origin, or income with respect to the development, implementation, and enforcement of environmental laws, regulations, and policies.[2]" Similarly, California Government Code Section 65040.12(e) defines environmental justice as "the fair treatment of people of all races, cultures, and incomes with respect to the development, adoption, implementation, and enforcement of environmental laws, regulations, and policies."

The purpose of Mitigation Measure M-AQ-2b, Emission Offsets, is to mitigate the project-generated increases in emissions of criteria air pollutants to the San Francisco Bay Area Air Basin (SFBAAB). Implementation of this measure would require the project sponsor to fund emissions reduction projects within the SFBAAB, which covers a nine-county region and including the project area. Implementation of this measure would not result in biased treatment of any specific group of people based on race, color, national origin, or income level; rather, this measure provides funding that would enable the Bay Area Air Quality Management District to implement projects within the SFBAAB. Furthermore, implementation of an emissions reduction project anywhere within the air basin would improve air quality throughout the air basin and would benefit everyone in the region including the residents of San Francisco and its neighborhoods.

The commenter quotes a statement from the San Francisco Department of the Environment regarding the "City's neighborhoods in the Southeast areas." The project site is located in the Mission Bay area, not in the southeast area of the City, so this quote is not relevant to the proposed project.

The commenter is also concerned that the project would result in localized impacts on air quality that would affect the local neighbors. As stated on SEIR Section 5.4, Impacts AQ-1 and AQ-2 (pp. 5.4-29 to 5.4-42), the proposed project would result in reactive organic gases (ROG) and nitrogen oxides (NOx) increases that could contribute to new or exacerbated air quality violations in the SFBAAB region by contributing to more days of ozone exceedance or result in air quality index values that are unhealthy for sensitive groups and other populations. Ozone is referred to as a regional air pollutant because its precursors are transported and diffused by wind concurrently with ozone production through the photochemical reaction process. Consequently,

[2] U.S. Environmental Protection Agency, Environmental Justice. Accessed on September 8, 2015. http://www.epa.gov/environmentaljustice/

mitigation of this impact related to increased emissions of criteria air pollutants on a region-wide or air basin wide scale is appropriate.

SEIR Section 5.4, Impact AQ-3 (pp. 5.4-43 to 5.4-51), analyzes the potential for the proposed project to generate toxic air contaminants that could expose sensitive receptors to substantial air pollutant concentrations. This analysis considers the air quality effects of the project on the local residents and includes a health risk assessment to assess both increased cancer risk and localized $PM_{2.5}$ concentrations from both construction and operational sources. Chapter 12, Project Refinements and New Variant, updates the analysis provided in the Draft SEIR to account for project refinements. The updated analysis determined that with the project refinements, the project's impact on annual average $PM_{2.5}$ concentrations and lifetime excess cancer risk at the closest sensitive receptors (UCSF Hearst Tower and UCSF hospital) would not exceed the applicable significance thresholds. Therefore, the proposed project would not have a significant air quality impact on the local residents due to toxic air contaminants. Nevertheless, implementation of Mitigation Measure M-AQ-1, Construction Emissions Minimization, which would be required to mitigate construction emissions of criteria air pollutants, would also reduce the project's emissions of toxic air contaminants and associated cancer risk, further reducing this less-than-significant impact.

For further discussion on air quality impacts of the project, refer to SEIR Section 5.4, Air Quality, and Chapter 12 and Section 13.13 of this Responses to Comments document.

13.2.5 Urban Decay (GEN-4)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

O-MBA7S2-37 O-MBA7S2-39 O-MBA7S2-91

"As explained by Ph.D. economist Philip King, it would be unreasonable for Oracle Arena to continue to operate with so few events. Dr. King concludes that one likely scenario is that Oracle Arena would need to close as a result of the reduced demand, which in turn creates the potential for urban decay at the Oracle Arena site. The DSEIR never analyzed the resultant potential for urban decay. Nor did the DSEIR analyze the impacts associated with demolition of the existing Oracle Arena as a result of its shuttering." (*Mission Bay Alliance, Soluri Meserve, letter, July 26, 2015 [O-MBA7S2-37]*)

"**9. The DSEIR Fails to Analyze Possible Urban Decay in Oakland.**

"Under CEQA, a lead agency must address the issue of urban decay in an EIR when a fair argument can be made that the proposed project will adversely affect the physical environment." (CCEC, supra, 225 Cal.App.4th at 188.) An EIR is to disclose and analyze the direct and the reasonably foreseeable indirect environmental impacts of a proposed project if they are significant. (CEQA Guidelines, §§ 15126.2, 15064, subd. (d)(3).) Economic and social impacts of proposed projects are outside CEQA's purview. (Guidelines, § 15131.) However, when there is evidence that economic and social effects caused by a project could result

in a reasonably foreseeable indirect environmental impact, such as urban decay or deterioration, then the CEQA lead agency is obligated to assess this indirect environmental impact. (*CCEC, supra*, 225 Cal.App.4th at 188; *Anderson First Coalition v. City of Anderson* (2005) 130 Cal.App.4th 1173, 1182; *Citizens for Quality Growth v. City of Mt. Shasta* (1988) 198 Cal.App.3d 433, 446 ("The potential economic problems caused by the proposed project could conceivably result in business closures and physical deterioration of the downtown area").)

"Here, substantial evidence supports a fair argument that the Project will result in economic impacts that would foreseeably lead to urban decay in Oakland. The DSEIR explains that the project include relocating the Warriors home games from the existing Oracle Arena in Oakland to San Francisco. (DSEIR, p. 1-3.) In addition to relocating all NBA games from Oakland to San Francisco, the Project description also includes relocating half of all existing non-NBA games from Oakland to San Francisco. (AB 900 Application; DSEIR, p. 5.5-11.) Thus, a direct economic impact of the Project is to reduce Oracle Arena events from 89 to 21 per year. As explained by economist Philip King, this is a severe direct economic impact from the Project. (See Exhibit E, a memorandum from Philip King, Ph.D., dated July 13, 2015 ("King Report"), pp. 6-7.)

"Such a dramatic economic impact may reasonably be expected to have indirect impacts. Dr. King explains that revenues from a mere 21 events per year will not likely justify the ongoing operational costs of maintaining such a facility. (King Report, pp. 7- 8.) Accordingly, a likely indirect impact is the ultimate shuttering of Oracle Arena. Repurposing such a massive facility is difficult to impossible, and so it is very likely that the facility will likely stand dormant and invite the physical deterioration that is characteristic of urban decay. (King Report, pp. 8-9; *Bakersfield Citizens for Local Control v. City of Bakersfield* (2004) 124 Cal.App.4th 184, 1212 [urban decay characteristic of "long-term vacancies that deteriorate and encourage graffiti and other unsightly conditions"].)

"Despite acknowledging that the Project would have significant detrimental economic impacts in Oakland, which in turn may result in physical deterioration, the DSEIR ignores the issue of urban decay. It thus fails as an informational document on this issue. The recirculated DSEIR will need to provide an analysis of the economic impacts in Oakland resulting from the predicted reduction of events at Oracle Arena, the potential for physical deterioration to result, and feasible mitigation measures to address these potentially significant impacts. (CCEC, supra, 225 Cal.App.4th at 188-190.)" (*Mission Bay Alliance, Soluri Meserve, letter, July 26, 2015 [O-MBA7S2-39]*)

"However, the project's EIR took an inconsistent approach to the scope of the project, and did not analyze the potential for urban decay resulting from these significant event reductions, which has been recognized as an environmental impact that should be analyzed under the California Environmental Quality Act (CEQA).

"My analysis (Table A below and described in more detail in this memo) indicates that the move from Oakland to San Francisco would lead to a direct loss of $44.9 million and 494 jobs. When one also includes the indirect and induced impacts, this impact increases to $86.6 million and 805 jobs.

"Although Oakland has benefited from the recent economic recovery, it's well known that the City suffers from high crime rates as well as high levels of blight and urban decay. Indeed, the Oracle Arena is located in a former Redevelopment Area (RDA) that the City declared blighted. Removing these jobs and this economic activity will exacerbate existing urban decay and seriously impact the City's ability to respond to this decay.

Table A: Economic Impact of the Golden State Warriors in Alameda County

Economic Impact in Alameda County			
Impact Type	**Employment**	**Labor Income**	**Output**
Direct Effect	494.3	$28,490,621	$43,900,000
Indirect Effect	110.8	$6,084,031	$13,153,869
Induced Effect	200.6	$10,746,179	$29,546,005
Total Effect	**805.6**	**$45,320,831**	**$86,599,874**

"**The Economics of Moving a Basketball Team**

"A convenient starting point to examine the economic impact of the Golden State Warriors' relocation to San Francisco from Oakland is the Seattle Supersonics' relocation to Oklahoma City. An economic report prepared in conjunction with the move indicated that the departure of the team would result in the loss of 1,200 – 1,300 jobs and $188 million in economic activity, slightly larger than the $170 million that the City of Oklahoma projected it would gain from the arrival of the team. Contrary to both of these projections, a sports economist for the Supersonics testified to the broad consensus within the economics literature that the departure or arrival of a professional sports team has no significant economic impact whatsoever upon the larger metropolitan area as a whole. When pressed by the city's legal team, this economist did, however, concede that the arrival, departure or relocation of a professional sports team can have a measureable effect upon the distribution of economic activity within the larger metropolitan area.[2]

"There are two primary reasons given within the sports economics literature for why the presence of a professional sports team within a metropolitan area has no significant economic impact: substitution and leakage.

> "Promotional impact studies ignore or underestimate the effects of consumer substitution and leakages from the local economy connected to sports facilities… These studies rely largely on the assumption that all (or much of the) spending on sports teams is new to the local economy and that this spending has a similar effect on the local economy as spending on other consumption goods and services. Both of these assumptions are false."[3]

"When a sports team relocates to a city, the money that is spent at its games does not come from outside the metropolitan area, but instead generally comes from money that is already being spent on leisure activity within that same metropolitan area. Similarly, when the team departs, the money that was previously being spent at the games will now be spent on other leisurely activities within the same area. The amount of money that people spend on leisurely activity is relatively fixed and spending at a sports venue only comes as a substitute for and thus at the expense other venues within the area. "The net effect on spending within the metropolitan area then is zero, or very close to zero. While sports teams may rearrange the spending and economic activity in an urban area, they are not likely to add much to it."[4]

"In addition to the high degree of substitution associated with spending on professional sports, a high degree of economic leakage is also cited as a reason for the low impact that a professional sports team has upon a metropolitan area. The professional sports industry involves almost always involves the large transfer of money from local spectators to highly paid athletes and investors whose households typically do not reside and thus do not frequent businesses within the same metropolitan area. This outward flow of money typically cancels out whatever economic activity the team might bring from outside the metropolitan area.

"The high degrees of economic substitution and leakage associated with the professional sports industry are responsible for the negligible economic impact that results from the relocation of a professional team from one metropolitan to another. **However, the same cannot be said for the relocation of a professional sports team within the same metropolitan area as in the case of the Golden State Warriors.**

> "Even though it is difficult to justify new stadium construction on economic growth grounds, it is possible that such construction would facilitate efforts to redevelop an urban core… [I]t is possible for sports facilities to reposition economic activity within a metropolitan area."[5]

"Since the Warriors are relocating within the larger San Francisco/Oakland metropolitan area we can reasonably assume both substitution and leakage will remain constant before and after the move. Whereas we could not say that Oklahoma City was taking economic activity from the City of Seattle since the same fans would no longer be attending Supersonic games, we can, however, say that the City of San Francisco will take economic activity from the City of Oakland since the same fans will continue to attend Warriors games.

"**Reversing Directions across the Bay Bridge**

"After the relocation of the Warriors from Oakland to San Francisco, spectators from the East Bay will then choose between finding a local substitute within the East Bay and traveling to the West Bay to watch the Warriors games. While it is the case that leisured spending has a high substitution effect over a large

community such as a metropolitan area, the same cannot be said for more narrowly deigned areas, such as the East Bay industrial area.

> "A stadium or arena will have more added effects on a very narrowly defined community than on a largely encompassing community. The reason for this is that the more narrowly the host community is defined, the more of the spending at the stadium and the nearby restaurants, bars, and hotels will come from outside the community. However, that spending will come largely at the expense of the home communities of the fans that travel into the stadium from outlying areas. The substitution effect for the broadly defined area is quite large, but for the narrowly defined stadium community it is much smaller. What this points out is that stadiums and sports teams may be a tool for redistributing income in which the people from suburbs subsidize businesses in the city."[6]

"Consequently, we can expect that most Warriors fans will continue attending games after the relocation rather than seeking local substitutes. The relocation of the Warriors, then, constitutes a significant redistribution of economic activity within the larger Bay Area.

"During the Warriors' 2014/15 season 803,436 fans attended home games in Oakland (34% more than the Supersonic their last season in Seattle) and took in $168 million dollars in total revenue.7 Table 1 (below) shows that, assuming that the distribution of Warriors spectators is proportionate to the distribution of residents within the larger metropolitan area, $99 million in Warriors revenue came from the East Bay while $69 million came from San Francisco and the Peninsula. It is worth emphasizing, however, that the Warriors relocation to San Francisco does not merely entail that the $69 million will cease coming into the East Bay from the West, but that the additional $99 million that was being spent by local East Bay residents will be lost to San Francisco. Spending in Oakland will decrease by $168 million regardless of where the fans actually reside.

Table 1. Attendance and Revenue for Warriors' 2014/15 Season

Attendance and Revenue for Golden State Warriors Home Games (2014/15 Reg. Season)			
	Total	**East Bay (59%)**	**West Bay (41%)**
Attendance	803,436	475,538	327,898
Spending	$168,000,000	$99,435,935	$68,564,065

"**Leakage**

"In the last section we discussed where the money that is spent on Warriors games comes from within the larger Bay Area. In this section we will briefly consider where the money goes after these games, as well as the effect of economic leakage.

Table 2. The Redistribution of Economic Activity due to the Warriors' Relocation

The Redistribution of Economic Activity due to the Golden State Warriors' Relocation			
	Total (millions)	**Percent**	**Redistributed (millions)**
Operating Income:	$44.9	0%	$0.0
Players' Salary:	$78.0	10%	$7.8
Other Expenses:	$45.1	80%	$36.1
Total:	**$168.0**	**26%**	**$43.9**

"Table 2 (above) divides up the Warriors' $168 million in total revenue into three categories: operating income, players' salary and other expenses. $44.9 million in operating income is the money that goes to the owners and investors of the Warriors. Since we have little reason to assume that these people live within the larger metropolitan area, let alone the East Bay, we can assume that relocating the team will not redistribute this money to any significant degree. Similarly, only 29% of NBA players live within the same larger metropolitan area as the team they play for[8]. We can also expect a large amount of the $78.0 in Warriors players' salary to be spent outside of, and thus "leak" from the larger San Francisco/Oakland

metropolitan area leaving 10%, or $7.8 million to be redistributed within the Bay Area. This leaves $45.1 million that went to other expenses (wages, inventory, etc.) during the 2014/15 season. We assume that 80%, or $36.1 million, was spent within the larger metropolitan area.

"While $168 million was spent by fans within the Bay Area on Warriors games, we estimate that only 26% or $43.9 million stayed within the area. It is this $43.9 million that will be redistributed from the Easy Bay to the West with the Warriors' relocation. Table 3 (below) lists the most popular professions among the 3,432 Bay Area residents that are employed within the sports spectator industry and gives a general idea regarding how a professional sports team such as the Warriors spend their money[9].

Table 3. Occupations within the Sports Spectator Industry

Employed	Sports Spectator Industry within the San Francisco/Oakland Metropolitan Area	Hourly Wage	Annual Salary
878	Personal Care and Service Occupations	$12.06	$25,080
572	Arts, Design, Entertainment, Sports, and Media Occupations	$31.60	$65,730
559	Entertainment Attendants and Related Workers	$11.32	$23,540
455	Entertainers and Performers, Sports and Related Workers	$33.10	$68,850
402	Athletes, Coaches, Umpires, and Related Workers	*	$72,060
324	Sales and Related Occupations	$15.70	$32,660
285	Office and Administrative Support Occupations	$16.91	$35,170
258	Protective Service Occupations	$15.76	$32,790
251	Food Preparation and Serving Related Occupations	$10.28	$21,380
243	Other Protective Service Workers	$15.26	$31,730
243	Animal Care and Service Workers	$12.49	$25,980
233	Ushers, Lobby Attendants, and Ticket Takers	$10.21	$21,230
3,432	**Industry Total**	**$20.45**	**$42,540**

"**Economic Impact**

"In addition to the direct loss of $43.9 million in economic activity to the City of Oakland, there are also indirect and induced effects which are associated with this loss. However, in addition to this direct spending, there are indirect and induced impacts, often referred to as "multiplier effects" –since arena and team spending also generate other jobs and economic activities in the region, and without the Warriors' spending other economic sectors of the Alameda County would shrink as well.

"IMPLAN is standard Input/Output software specifically design to project the indirect and induced multiplier effects associated with the Warriors' direct spending in Alameda County. Table 4 (below) lists the economic impact of the Golden State Warriors within Alameda County by impact type. With indirect and induced impacts included, the Warriors generate 805 jobs and $86.6 million in economic activity. Table 5 (below) lists 10 most impacted industries within the county. In addition to the 547 jobs and $48.6 million in economic activity created within spectator sports industry, food and drinking places, real estate establishments, private hospitals and other physicians are significantly affected by the East Bay presence of the Warriors.

Table 4. Economic Impact of the Golden State Warriors in Alameda County

Economic Impact in Alameda County			
Impact Type	**Employment**	**Labor Income**	**Output**
Direct Effect	494.3	$28,490,621	$43,900,000
Indirect Effect	110.8	$6,084,031	$13,153,869
Induced Effect	200.6	$10,746,179	$29,546,005
Total Effect	**805.6**	**$45,320,831**	**$86,599,874**

Table 5. Industries in Alameda County Impacted by the Golden State Warriors

Industries in Alameda County Impacted by the Golden State Warriors			
Description	**Employment**	**Labor Income**	**Output**
Spectator sports companies	547.3	$31,541,779	$48,601,401
Food services and drinking places	25	$617,563	$1,701,992
Real estate establishments	13.1	$299,013	$2,820,104
Promoters and agents for public figures	12.9	$133,694	$717,837
Private hospitals	11.6	$1,363,445	$2,336,587
Physicians and other health practitioners	10.4	$886,704	$1,498,858
Employment services	7.2	$287,482	$370,425
Retail Stores - Food and beverage	7.2	$290,137	$520,763
Nursing and residential care facilities	6.5	$274,706	$490,435
Private household operations	6.5	$77,727	$82,572
All Industries	**805.6**	**$45,320,831**	**$86,599,874**

"**Urban Decay**

"Although the EIR ignores the issue in the context of urban decay impacts, the EIR and AB900 Application conclude that that Oracle Arena will continue to operate with approximately 21 events per year. This is an impractical assumption from an economic perspective. As a practical matter, one of two outcomes will occur. The first possible outcome is that the Oracle Arena will continue to operate by attracting more than 21 non-NBA events per year.

"The second possible outcome is that Oracle Arena will close without the Golden State Warriors. I spoke with Alexander Michael, an expert on the business and financing of sporting arenas. Based on that information, a strong argument exists that the Oracle Arena (or indeed any similar venue in a similar situation) will not be viable without the Golden State Warriors and there are no other sports teams in the offing for this venue. A similar case is the IZOD center located in East Rutherford, New Jersey. The IZOD center housed the New Jersey Devils hockey team Nets NBA basketball team until they left in 2007. The IZOD arena also hosted the New Jersey Nets basketball team, who left in 2010. The State of New Jersey attempted to keep the Izod arena open for many years. However, the demand for other events such as concerts, ice shows, etc., was insufficient. As with the Oracle arena in Oakland, the Izod arena is located near a number of other sports venues and near Manhattan, which offers a wide variety of venues. The Izod arena shutdown earlier this year after an official forecast that the center would lose $8.5 million a year.[10]

"It is difficult to determine which outcome is more likely since the EIR ignored the issue of potential urban decay associated with reduced events at Oracle Arena. The EIR should have included an economic impacts analysis that would have provided more information about the ultimate fate of Oracle Arena and, by extension, impacts to the physical environment.

"Once the Oracle arena has been shutdown, it would be extremely difficult and expensive to repurpose the arena for other activities and thus it will almost certainly be shuttered and perhaps demolished at some future date. A closed arena will be a magnet for graffiti, crime, drug deals and other signs of urban decay. The City of Oakland can mitigate for this urban decay, but it would involve a costly increase in police and other public safety officials.

"The City of Oakland and Alameda County are obligated to a $79.7 million dollar Lease Revenue Bond that must be paid or default. Without revenues from the Oracle Arena the bond would either go into default or the City/County would have to pay the principal and interest on the bond. If the City County pay out of their General Fund dollars, it will reduce their ability to fund other needed public services. If the default it could damage their credit rating and make it more difficult to finance other future (non-sports) projects which could enhance the welfare of the City and County

"Oakland was rated the third most dangerous City in the Country in 2012.[11] According to the FBI, Oakland had the highest crime rate of any major City in California[12] and this year (2015) homicides in Oakland are on track to exceed 2014.[13]

"The City declared the area blighted and formed a redevelopment area (see Figure 1 below). Although Redevelopment Areas have been disbanded, the blight issues remain. Indeed, the suspension of RDAs eliminates a funding stream for the City to help ameliorate urban decay and blight.

"The reduction in economic activity also significantly reduces the tax base for the City that reduces its ability to mitigate for urban decay and provide police and other public safety officials.

"**In my professional opinion, this issue (urban decay) should have been identified in any environmental analysis and mitigated where possible. A number of mitigation options are available including: (1) paying a mitigation fee to the City of Oakland, (2) preserving some of the jobs for Oakland residents; (3) shifting some of the taxes/fees to the City of Oakland. Without any kind of urban decay analysis none of these mitigation options are possible.**

(*Mission Bay Alliance, Soluri Meserve, letter, July 26, 2015 [O-MBA7S2-91]*)

Response GEN-4: Urban Decay

In the opinion of the commenter, the SEIR did not analyze the potential for urban decay resulting from event reductions at the Oracle Arena, and the comment further states that the issue of "urban decay should have been identified in any environmental analysis and mitigated where possible."

Urban decay is not an explicit CEQA topic identified in CEQA Guidelines Appendix G. Economic impacts are not required to be analyzed in a CEQA document unless they have the reasonably foreseeable indirect effect of leading to physical changes in the environment, such as urban decay. The information provided by the commenter does not reasonably lead to the conclusion that the relocation of the Warriors from Oakland will lead to urban decay. The commenter speculates that the relocation of the Warriors would result in a loss of employment and revenue in the East Bay, which cannot reasonably be verified at this time. And regardless, the commenter does not demonstrate that any loss of employment and revenue to the East Bay will lead to urban decay at the Oracle Arena site. The commenter attributes the SEIR as saying that the Oracle Arena site will experience a substantial reduction in events, but bases that statement on assumptions used in the AB 900 process for the proposed project, which is separate from the CEQA environmental review process, with a separate public review process; the assumptions used in the AB 900 application are not necessarily the same as those used for the CEQA environmental review (see Section 13.4, Response AB-1, of this document). Finally, the one example of the closure of a sports stadium provided by a commenter does not necessarily indicate that the Oracle Arena site will turn into an urban decay location.

The discretionary action that is the subject of this SEIR includes only the construction and operation of the event center and mixed use development at Mission Bay Blocks 29-32 and does not include any actions associated with the future uses of the Oracle Arena. The SEIR does, however, analyze the impacts of the No Project Alternative (see SEIR Chapter 7), and in that context points out (SEIR page 7-23) that in March 2015, the City of Oakland certified a Final EIR on the Coliseum Area Specific Plan, in which various future scenarios for the Oracle Arena are analyzed. Those scenarios include future use of the Oracle Arena by parties other than the Warriors as well as a new mixed use development at the Oracle Arena site.

Although the commenter does not present a supportable argument that the project will lead to urban decay, nevertheless, ALH Urban & Regional Economics has prepared a response to the commenter's concerns, which is included in Appendix UD of this Responses to Comments document. In brief, the study presented in Appendix UD points out that the comment includes a number of fallacies, misinterpretations, overstatements, and inappropriate comparisons.

Although not indicative of whether urban decay would occur at the Oracle Arena site, the commenter estimates losses of employment and revenues to the East Bay as a result of the Warriors' relocation. One significant fallacy is the implicit assumption that 100 percent of the Golden State Warriors revenues are derived from spectators, or essentially ticket sales; in contrast, ticket sales are only one revenue source of many, including merchandise bearing the team name or logo, media revenues, game day temporary signage and advertising revenues, a share of game day food and drink sales, and a share of parking revenues. Based on a 2011 study of NBA teams for the 2010-2011 season, it is estimated that ticket sales represent 41 percent of revenues. Thus, a significant portion of revenues come from sources other than patrons.

The ALH Economics study also demonstrates, based on data obtained from the Golden State Warriors, that the commenter significantly overestimates the percent of patrons from the East Bay. ALH Economics further explains why the commenter overstates by a significant factor the potential loss of employment for East Bay residents as a result of the Warriors relocation from Oakland to San Francisco. This analysis is based on a review of the Bay Area commute patterns and Bay Area housing costs, and concludes that most Warriors' employees who reside in the East Bay will continue to do so. Moreover, for Golden State Warriors employees living in San Francisco and the Peninsula, commutes may improve. The combination of erroneous estimates on the sources of revenues combined with erroneous assumptions about the location of patrons and the effect of a locational move on where employees live results in a seriously flawed estimate as to the degree to which the Golden State Warriors relocation would cause revenues to "reverse directions across the Bay Bridge."

ALH Economics further identifies inappropriate use of the IMPLAN model by the commenter in his economic impact analysis. The commenter uses an outdated version of the model, misrepresents his findings, and applies inappropriate datasets, resulting in limited validity in his findings.

Finally, in sharp contrast to the commenter's assertion, based on one example, that the relocation of the Warriors will result in the closure of Oracle Arena, ALH Economics presents seven case studies that provide examples of indoor arenas that continued to meet with success after losing sports teams that were historically associated with the arenas. This includes two arenas similar to the Oracle Arena, in that they are located relatively close to the new facility where their former sports teams currently play. ALH Economics also establishes that no urban decay exists now at the Oracle Arena site, and that numerous factors support the reasoned conclusion that the area will continue to be a desirable site in the future either as an arena site or for new mixed use development; both potential scenarios are listed in Oakland's recently adopted Specific Plan for the area.

In summary, the commenter's concerns about urban decay appear unfounded and unwarranted. Please see Appendix UD of this document for further discussion.

13.2.6 Opinions on the Project (GEN-5)

"Professor Richard Zitrin is absolutely correct in his June 18th op ed that the Warriors need to stay in Oakland. What he did not address is what one of my law professors said you always need to examine: "cui bono", to whose benefit. Moving the Warriors to San Francisco is all about getting more money for the out-of-state owner of the Warriors. Think luxury boxes and increased ticket prices. Just like Larry Ellison after extracting concessions for the America's Cup abandoned San Francisco and chose to go to San Diego for the next Cup, do you think the Warrior's owners are acting in the best interest of the Bay Area. The ads they have placed in the Chronicle using sports figures like Joe Montana to promote their scheme is pure hypocrisy. Where was Joe when the 49ers moved, looking to invest in real estate in Santa Clara. Remember how San Francisco felt when the Yorks moved the 49ners. Let's put a stop to such behavior. Maybe we should be talking about with public ownership of sports teams such as in Green Bay and demand the owners provide that as a condition of locating in a city. Over the 40 years between championships, the arena in

Oakland has been sold out regardless of the Warrior's record. There is no reason to move the Warriors from Oakland. The Coliseum site has much better access, particularly to public transportation than the proposed Mission Bay site adjacent to a new hospital. One only needs to go to ATT Park and recognize the traffic problems when the Giants are playing. Hopefully, you do not need to see a doctor when the Warrior's are playing. Its about time that we see professional sports teams as a benefit to the entire Bay Area and that we plan for multiple venues so all cities can share the benefit and burdens. This is the true "sharing" economy." (*Law Offices of Robert F. Kane, letter, June 18, 2015 [O-Kane-1]*)

"The Mission Bay Alliance objects to approval of this Project and certification of this EIR for the reasons stated in this letter.

"The Alliance opposes this Project because it will change the Mission Bay community and environment in ways never envisioned when the Mission Bay Redevelopment Plan was adopted in 1998 ..." (*Mission Bay Alliance, Bruce Spalding, letter, July 27, 2015 [O-MBA5-1]*)

"The Mission Bay Alliance objects to approval of this Project and certification of this EIR for the reasons stated in this letter." (*Mission Bay Alliance, Thomas Lippe, letter, July 26, 2015 [O-MBA8L2-1]*)

"The Mission Bay Alliance objects to approval of this Project and certification of this EIR for the reasons stated in this letter." (*Mission Bay Alliance, Thomas Lippe, letter, July 25, 2015 [O-MBA9L3-1]*)

"The Mission Bay Alliance objects to approval of this Project and certification of this EIR for the reasons stated in this letter." (*Mission Bay Alliance, Thomas Lippe, letter, July 27, 2015 [O-MBA10L4-1]*)

"The Mission Bay Alliance objects to approval of this Project and certification of this EIR for the reasons stated in this letter." (*Mission Bay Alliance, Thomas Lippe, letter, July 24, 2015 [O-MBA11L5-1]*)

"As a result, we are compelled to comment on the SEIR. We do so not with an eye to preventing the Arena from being built. We do so based on our belief that the City is capable, with the right measures in place, of making this development an asset to not just the City as a whole, but to its direct neighbors as well." (*Potrero Boosters Neighborhood Association, J.R. Eppler, letter, July 27, 2015 [O-PBNA-3]*)

"I am a San Francisco resident and I am dismayed that the city would devote substantial resources, obstruct views, and congest an already highly over-used area for the sake of a sports franchise. I happen to be a major sports fan, but this type of municipal support (financial and political) is profoundly inconsistent with the needs of the vast majority of San Franciscans." (*Martin Sabelli, email, July 23, 2015 [O-Sabelli-1]*)

"Background

"Over the course of nearly a year, GSW Arena LLC, an affiliate of Golden State Warriors, LLC ("Warriors") and the San Francisco Bicycle Coalition ("SFBC") have had on-going discussions, outside of the formal EIR

process, to address bicycle access and infrastructure at the proposed arena site. Discussions thus far between SFBC and the Warriors have led to strong plans and support of existing and future bicycle travel to and from the Project, as well as plans to address enhanced bicycle infrastructure in and around the Project site, including publicly accessible bicycle parking, bicycle valet and additional secure bicycle parking for special events, secure commercial bike parking for employees. These discussions have also led to the Warriors and SFBC's commitment to work with appropriate agencies to add public bike share to the project vicinity, intersection management during special events to maximize bicycle and pedestrian safety, ongoing bicycle encouragement for special events, and a commitment to expanding bicycle capacity if/when need increases over the life of the Project.

"We would like to commend the Warriors for being receptive and responsive partners that have demonstrated a strong commitment to promoting bicycle trips to the Project site in this Draft Subsequent Environmental Impact Review document (DSEIR) and in their goals beyond this document. Both the Warriors and SFBC acknowledge that bicycle infrastructure and promotion on and near the Event Center site are critical and cost-effective investments for the immediate and long-term success of the project and help to reduce neighborhood congestion, improve local environmental quality, support positive health outcomes, and drive local economic development." (*San Francisco Bicycle Coalition, Paolo Cosulich-Schwartz, letter, July 27, 2015 [O-SFBC-1]*)

In summary, we urge you and the city to reconsider the wisdom of proceeding with current construction plans. (*Bruce Alberts, et. al, letter and email, September 22, 2015 [I-Alberts-3]*)

"I am very concerned about the new warrior stadium in San Francisco...The health and well being of patients and people are at risk here...

"Please help with the new stadium NOT coming to San Francisco!!!" (*Sula Anagnostou, email, July 13, 2015 [I-Anagnostou-1]*)

"I think putting a sporting arena that close to a hospital with very sick people is not only bad planning, it is greedy and selfish. The hospital and the UCSF buildings were there first." (*Patricia Arack, email, July 24, 2015 [I-Arack-1]*)

"Warriors stadium should remain in Oakland where accessibility to the entirety of the Bay Area is best" (*Maylou Bartlett, email, July 17, 2015 [I-Bartlett-1]*)

"I live in the surrounding area, Potrero Hill, of the future Warriors Arena and I am writing this email in support of the new arena. I believe the stadium is the perfect choice for this neighborhood. The Mission Bay has been poorly planned up to this point as outlined in this video clip comparing SF and Vancouver https://vimeo.com/86566866. The Mission Bay has become a sterile business park without any character or life. It needs something that can give it some kind of character and a major NBA sporting arena can help do just that. The arena alone will not give it a character, but the businesses that will sprout up once it is developed to support the people coming and going should reflect more character than another office building that closes down at 5 pm. I am excited for the bars, restaurants, and other small businesses that will come to this area to support the weekend and after 5 pm events (note: I am a parent of two, not a single kid just looking for parties)" (*Jason Barton, email, July 27, 2015 [I-Barton-1]*)

"This is private land and it will be developed along with the traffic. Please approve this project so we do not get another boring business park and a neighborhood without character and turns into a ghost town on weekends and evenings." (*Jason Barton, email, July 27, 2015 [I-Barton-7]*)

"Can you imagine what it will be like with Warriors games and the events that will certainly be held their off season year round? I think this is absolutely the wrong place for a new stadium and yet another development to be built." (*Sharon Beals, email, July 27, 2015 [I-Beals-2]*)

"As a second generation San Franciscan, I am writing to voice my opposition to the building of the proposed Golden State Warriors Arena and Events Center at Mission Bay. This is the worst idea and it would not be a welcome addition to the neighborhood." (*Lynda Bilodeau, email, July 26, 2015 [I-Bilodeau-1]*)

"As the most congested city in the US, we have seen what a mess ensues with each game by observing the ball park." (*Norman Bookstein, email, July 13, 2015 [I-Bookstein-1]*)

"Please do not go forward with this project. It is not good for the neighborhood nor for the Warriors to move out of Oakland." (*Cathy Bullard, email, July 24, 2015 [I-Bullard-1]*)

"They belong in Oakland!!!" (*Karen Burkhart, email, July 16, 2015 [I-Burkhart-1]*)

"We dont need a new stadium we need to help out earth nd community's survive and live" (*Marcus Corey, email, July 23,2015 [I-Corey-1]*)

"What a total worthless crock of s*** [*expletive deleted*]!" (*Michael Crosson, email, July 23, 2015 [I-Crosson-1]*)

"This project is not a welcome addition and will only burden the city in the years to come; creating an impossibly hellish situation in an environment that is already unlivable and unsustainable! Again, I appeal to you to you please DO NOT place your support behind this project." (*Micki Cunningham, email, July 23, 2015 [I-Cunningham-8]*)

"The Warriors already have an excellent facility for its games in Oakland. Why compromise the care of children for the sake of a basketball team? The City of San Francisco needs to get its priorities straight. The City needs to be more concerned about children and families, and not the financial goals of the rich owners of the Warriors." (*Arthur D'Harlingue, email, June 22, 2015 [I-D'Harlingue-2]*)

"I am writing to express my opposition to building a stadium at Mission Bay." (*Helen Dickey, email, July 13, 2015 [I-Dickey-1]*)

".....NOT!

"don't do it. Please understand what the effects on our community would be. Specifically the destruction of the environment, and encouraging people to spend money they don't have.

"What does the Warriors team, or the basketball league as a whole do for their community? How do they give back? I only see children who have been pummeled by their parents and coaches, happened to be the best of the best, to be paid exorbantly to "entertain" the crowds, only to piddle it away on childish things, go into debt, and be expected to be perfect spouses and parents as well as players. What kind of upside down world do we live in ?

"Please see that we really don't need another stadium around. It is unfortunate football and soccer got their stadium around here but please respect where our lives are and our environment.

"Please do not turn your cheek to the extremely fragile state the earth is in.

"Please understand and choose to be the honorary example of a man who chooses to put the earth he lives on, the great great grandchildren he doesn't know yet, a fighting chance at survival." (*Janessa Faye, email, July 13, 2015 [I-Faye-1]*)

"DO NOT BUILD IT IN SF!!! Please! Think of the families and the people that live there!" (*Alaina Fischer, email, June 20, 2015 [I-Fischer-2]*)

"Danger to Medical care. Please relocate." (*Peter Freedman, email, July 26, 2015 [I-Freedman-1]*)

"I am greatly oppose to having the Warriors move to San Francisco. I am opposed to this move for several reasons, but more importantly the Warriors are where they are supposed to be. They are in a city that love them--win or loose, support them, and are very loyal to them, not a city that only want them when they are at there best for financial gains.

"In addition, San Francisco is becoming overly crowded with parking being a major problem and the city is becoming a city only for the wealthy. And despite of the wealth in the city, no one wanted to spend the money to repair Candlestick park and keep San Francisco 49ers in San Francisco. So , it's an enigma to me as to why it is okay to spend the money to build a new arena to steal the Warriors from Oakland?

"Vehicle manslaughter is on the rise in San Francisco, parking is a nightmare, and traffic is a nightmare so a Warriors Arena is not a welcoming addition." (*Max Grant, email, July 13, 2015 [I-Grant-1]*)

"There is hardly room in this tiny city for one sports team. The 49ers move although sentimentally disappointing made sense which is proving to be beneficial for San Francisco, I believe." (*Cassidy Hansen, email, July 27, 2015 [I-Hansen-2]*)

"Do not build a new WARRIORS arena in SF; we have too much traffic, the Giants, and all the glorification SF needs! Oakland needs the Warriors, and it gives their young people role models to look up to." (*Constance Harvey, email, July 23, 2015 [I-Harvey-1]*)

"Thus, we ask that the City of San Francisco avoid the disastrous impacts of the proposed entertainment center on the Mission Bay community, including the health and welfare of patients, families, employees and neighbors." (*Alison Heath, email, June 30, 2015 [I-Heath-10]*)

"Please note that I am opposed to the building of a monster stadium in San Francisco's South of Market area. I moved to Potrero Hill in 1987 and, since then, every inch of land has been taken over by the developers and big money interests." (*Dorothy Hill, email, July 27, 2015 [I-Hill_D-1]*)

"We are tired of broken promises!

"I have no faith that this is going to be a good move. There is nowhere for the traffic to go. We have run out of land, folks, and also air space and all I see in the area now is one high rise after the other. Those movies now showing San Francisco destroyed are depicting what is going to happen when the next earthquake hits and it is not a pleasurable thing.

"Ed Lee and the Board of Supervisors need to get back to taking care of the people who pay the taxes and love San Francisco for its unique qualities. Stop selling our streets to the highest bidder – remember the America's Cup..." (*Dorothy Hill, email, July 27, 2015 [I-Hill_D-3]*)

"I live in Potrero Hill and totally support the new Warriors arena." (*Mary Hill, email, July 1, 2015 [I-Hill_M-1]*)

"8. The new Arena will be an economic boom to both the city and local business, including UCSF, the Dogpatch area and others in the South Eastern part of town.

"9. The proposed location is in an ideal part of town. The Sponsor has already done a diligent job in selecting this new site from the original Pier 30-32 which was voted down." (*Dennis Hong, email, July 27, 2015 [I-Hong-12]*)

"13. It would be a true shame if the sponsor should abandon this Project. Lets not loose this opportunity of a life time.

"In Conclusion: Based on my comments and evaluation of this Draft SEIR, case 2014.1441E of June 5, 2015; I have concluded there is sufficient information and I fully support this Project and this Draft SEIR." (*Dennis Hong, email, July 27, 2015 [I-Hong-18]*)

"There's a win-win way around a potential Warriors /UCSF-land-bankers quarrel whose aim is to thwart the basketball team's Third Street arena plans until a distant time when UCSF may need additional space for research -- and then junk the arena altogether.

"In this win-win scenario, the **Warriors** would get an arena a year ahead of when they would have if the mysterious non-UCSF-affiliated group sued "until the cows come home," as they've threatened. Plus, the Warriors would have an assured income stream from office leasing, leading to the best financing rate available in the commercial real estate market; **UCSF and biotech firms** would get access to a half-million square feet of research space accommodating 2000 workers, at a timing of the university's or biotech companies' choosing; the **anti-arena crowd** would get to claim a victory plus save at least $228 million in cash in the first year and earn untold millions later in a few years; and **non-basketball-fan San Franciscans** wouldn't have to travel 100 miles to San Jose and back to see a concert.

"Here's how the idea would work:

"The property upon which the arena and two 250,000 square foot office/research buildings would be built was purchased by Salesforce in 2010 for $278 million, according to Bloomberg Business News. So UCSF's benefactors would presumably have to pay that sum or more to acquire and land-bank the property. But suppose they land-banked it by leasing all 500,000 square feet now and then sub-leased completed, ready-to-occupy space as researchers needed it over the next several years. At the going rate of $60 per square foot for Class A San Francisco office space, the benefactors would have an expense of $30 million a year. That's as opposed to a minimum $278 million cost of buying-and-banking it…a savings of at least a cool $248 million. The cream upon this cake is that the benefactors would almost certainly be able to sublease the space for more than they leased it, thereby making a neat profit on their good deeds.

"In such a scenario, the only losers would be the delay-delay lawyers whose salivating over the prospect of years of fees would suddenly dry up." (*Stan Horn, email, July 20, 2015 [I-Horn1-1]*)

"Because San Francisco couldn't get its act together and build an arena 40 years ago -- the proposed arena site at 4th and Howard was turned into low-cost housing -- the Warriors defaulted to the nearest suitable place, the Oakland Coliseum. Oakland has had a good run. But now the party's over.

"There are many good reasons why the Warriors belong in San Francisco.

- San Francisco has twice the population of Oakland. So it should have twice the fan base.
- San Francisco is much wealthier per capita, so it should provide the Warriors with a bigger potential.
- San Francisco's cachet alone will make the team more valuable as it basks in the reflections of one of the world's most popular cities.
- According to FBI statistics, fans visiting the Coliseum must forge through some of the nation's highest-crime zip codes. In San Francisco, the site is bounded by the bay, a world-renowned university, and some of the highest-priced real estate in America…none of which are known as highcrime breeders.
- Before and after games, there are nothing but acres of asphalt parking and concrete freeways and raw gray elevated train stations to greet fans in Oakland. Across the bay the arena would be surrounded by scores of cafes, night-spots, restaurants, bars, bayside parks, and pleasant walks in attractive, lively neighborhoods.

"But perhaps the main reason the Warriors belong in the City is that it will finally bring San Francisco a modern events center. San Francisco is the only big city in America that doesn't have one. San Franciscans who want to see a concert, for example, must make a 100-mile round trip to San Jose or a 40-mile round trip to Oakland. No other residents of America's principal cities have to go through that.

"Dozens of cultural, entertainment, artistic, educational, and sports experiences that are not now available to San Franciscans would be if there were an arena. In that sense, the events center would be as much a cultural addition to the region as our great museums. And not only San Franciscans would benefit: because of the new Muni-to-BART subway, Caltrain, future high-speed rail, ferry service, and thousands of parking spaces, the arena would be much more accessible to all Northern Californians than the freeway-and-parking-girded Coliseum is.

"And don't cry for Oakland. The forever-wannabe has gone after -- and won -- virtually all of San Francisco's port jobs, more than a thousand former San Francisco BART headquarters jobs, more than a thousand former San Francisco Caltrans District IV headquarters jobs, more than a thousand former San Francisco federal government jobs, and more. Some would say that giving a little back is not unreasonable." (*Stan Horn, email, July 10, 2015 [I-Horn2-1]*)

"A Chronicle letter-writer pointed out that more than a dozen cities have arenas near hospitals and co-exist well.

"Perhaps the best such example is right here in San Francisco.

"For three generations, the 60,000-seat Kezar Stadium was closer to the main entrance of the UCSF Hospital on Parnassus than the proposed 18,000-seat Warriors arena will be to the main entrance of UCSF Mission Bay. Yet never in those generations -- and thousands of 49er, USF, and high school games and traffic --were there reported complaints about ambulance access. With 200 events per year scheduled and perhaps an hour or two of heavy traffic at each, that means that **96% of each year will be free of arena traffic that might affect ambulances**.

"As for parking, there was none at Kezar. The Warriors will build almost 1000 spaces and the Giants are about to build several thousand spaces virtually adjacent to the new arena. Several thousand spaces already exist in UCSF garages, largely empty at nights and weekends when events will be scheduled." (*Stan Horn, email, July 10, 2015 [I-Horn3-1]*)

"Thus, I ask that the City of San Francisco avoid the disastrous impacts of the proposed entertainment center on the Mission Bay community, including the health and welfare of patients, families, employees and neighbors." (*Richard Hutson, email, June 29, 2015 [I-Hutson-4]*)

"To be brief and to the point, I am totally opposed to the Warriors Stadium being located in San Francisco for these reasons:

"OAKLAND
Oakland needs the Warriors and the jobs.

BART goes to Oakland, it is efficient and has long term sustainability

The City of Oakland and the Warriors can easily enhance the stadium with activities, shops, museums, and other businesses." (*Kathryn Hyde, email, July 15, 2015 [I-Hyde-1]*)

"Warriors owner Joe Lacob admits that SF waterfront arena is 'going to be a challenge and "waterfront arena starting in 2017 might not be … can not comply with the public trust doctrine." (*No name, email, July 23, 2015 [I-Jadeinsf-1]*)

"Also it monopolizes the waterfront. I object to this choice of location. It would best be put somewhere else. Let's stop it now before the trouble begins.

"Please record me as being against the Warriors Stadium at the Mission Bay location." (*Jackie Jones, email, July 1, 2015 [I-Jones-3]*)

"I would like to register my opposition to the planned Warrior Stadium Complex in Mission Bay. I work at UCSF and am a nurse in the outpatient department." (*Jennie Kajiko, email, July 25, 2015 [I-Kajiko-1]*)

“No new major projects should be approved unless and until a solution to the existing problem is solved.

“I ask that the City of San Francisco recognize the health and welfare of patients, families, employees and neighbors of the Mission Bay area and avoid the disastrous impacts of the proposed entertainment center.” (*Thomas Kornberg, email, July 17, 2015 [I-Kornberg-2]*)

_____

“The Golden State Warriors have given new inspiration to sports fans this year.

“This inspiration will be even more appreciated when the team decides to build their arena elsewhere, rather than at Mission Bay.

“That is an unwelcome addition and will supersede the needed protection of the bay.

“Please ask the warriors to choose another site and leave Mission Bay alone.” (*Michelle Lanting, email, July 20, 2015 [I-Lanting-1]*)

_____

“Having a sick child is stressful enough, I would hope that adding this extra burden to families and staff caring for them, is something you would consider as a serious negative impact that the stadium would have in its current proposed location.

“I hope that the children and their families would hold a higher priority than a "nice to have" new stadium.” (*Rachel Leavitt, email, June 29, 2015 [I-Leavitt-2]*)

_____

“I signed the petition to try and stop the stadium but it was a mistake. I honestly do not find any problem with building a new stadium even if it is near a hospital. I want to change my vote and I support the stadium project.” (*Denise Lowe, email, July 26, 2015 [I-Lowe-1]*)

_____

“And what about Oakland? Sure, we can think about all the benefits this has for Oakland, but taking 20 steps back and looking at the bigger picture, we are taking away a positive force from Oakland. A city that needs more positivity in the community. San Francisco has the Giants, we have the techies, we have the city that everyone wants to be in, why not allow Oakland to keep the Warriors and provide them with a new stadium? Because after all, they are our neighbors and as San Francisco continues to grow and spill over, our communities will be shared. Let's allow the Bay Area to grow and flourish together so people have more incentive to stay close and not feel like SF is the ONLY option. Because THAT is what makes people move to other states.” (*Tina Ly, email, July 2, 2015 [I-Ly-3]*)

_____

“I am a nurse at UCSF BCH. I have major concerns regarding the warriors stadium location proposal in San Francisco.

“I have heard the debates both for and against the proposal. However, having two stadiums so close to the hospital would be detrimental to our patients, families, and employees.

“I am less concerned with my personal commuting problems.” (*Amber Mason, email, June 27, 2015 [I-Mason-1]*)

_____

"Thank you for the opportunity to comment on the proposed Warriors Arena project and related office buildings in Mission Bay. As a local resident (I live by the Ballpark at 2nd and King) I strongly support the proposed development as a sport and entertainment destination for our neighborhood." (*Bruce McDougal, email, July 27, 2015 [I-McDougal-1]*)

_____

"3. Neighborhood benefits. Just as with the Giants ballpark, the presence of the Arena in Mission Bay will attract and encourage the development of restaurants, bars, and other entertainment facilities, more than would be drawn to the simple residential and office neighborhood that's been built around UCSF. As in the South Beach neighborhood, those bars and restaurants will attract more residents to the area and will generate taxes and activities even when the Arena is dark." (*Bruce McDougal, email, July 27, 2015 [I-McDougal-4]*)

_____

"We don't need or want another congestion-producing sports palace in San Francisco. This city has a very limited geographical area which is already far too built-up. Please think about the consequences to the residents of the city --instead of catering to the money-grubbers who would gladly turn the city into a dysfunctional ants' nest if they can make money from it." (*Rusty Mills, email, July 13, 2015 [I-Mills-1]*)

_____

"I AM 100 PERCENT AGAINST THE IDEA OF BUILDING A WARRIORS STADIUM ON 3RD ST AND 16TH STREET!!!!!!!!!!!!!

"WE DO NOT WANT THAT STADIUM BUILT HERE IN SAN FRANCISCO!!!!!!!!

"KEEP YOUR TEAM IN OAKLAND!!!!!!

"The Oracle arena in Oakland is a PERFECT place for that team!!!

"WE HAVE BEEN BOMBARDED WITH AN INSANE AMOUNT OF DEVELOPMENT HERE IN THE EASTERN NEIGHBORHOOD. PLEASE GIVE US A FLIPPEN BREAK!! FOR GOD'S SAKES!!!!!!!" (*Jani Mussetter, email, July 27, 2015 [I-Mussetter-1]*)

_____

"New York City went through the same process when a stadium was proposed for Manhattan . It was defeated, sensibly, as incompatible with Manhattan.

"Same logic-different city, it doesn't belong in the Mission." (*Steven Pelly, email, July 23, 2015 [I-Pelly-1]*)

_____

"I'm writing to offer my perspective on the proposed Golden State Warriors Arena and Events Center at Mission Bay.

"The Warriors have been Oakland's team for decades, and they belong here. This is where the heart is. You will lose a significant portion of your regular ticketholders with the move, and derail the (current and ongoing) accessibility of East Bay youth and community to continue to afford and gain access to the team we love.

"Moving to SF may seem strategically great from a financial/investment perspective, but that's not everything. It's not that I dislike change, it's that if you saw the turnout that came to the parade, or the energy in the playoffs and the finals, you know that Oakland doesn't just support, Oakland needs and loves this team. And Oakland needs a team to love.

"I was born in SF, and my family has been here for 5 generations. I love the city. It's not about that. San Francisco has plenty of reason to party and celebrate, with all the attractions and civic and community

pride. I'm thinking Pride Parade, BatKid, St. Paddy's day parade, not to mention the Giants and the 49ers (Okay, so they've left or may leave. You'll still have their parades in SF, and ATT park will continue to be a hip destination and tourist destination.) SF doesn't need more congestion to already overstressed transit, street parking, and street and ramp traffic. It also doesn't need the kind of regentrification that displaces hundreds or thousands of hardworking San Franciscans who keep the lights on and do much of the heavy lifting in the local economy. It needs to fine-tune the garden it's growing, by helping the homeless, supporting underserved neighborhoods, cleaning up the urine-soaked streets and entryways, and providing more grassroots community events to engage the public and energize neighborhood continuity.

"Oakland deserves to keep the Warriors. The spirit of connection and civic pride that's evolved from this championship is beyond compare. People here are talking to each other in supermarkets, gas stations, banks, cafes. It's such a happy vibe, and it's pulling Oakland together. Don't hijack one of the most significant bright spots this east bay community has seen in years." (*Mary Pezzuto, email, July 13, 2015 [I-Pezzuto-1]*)

"am writing to plea that you do not approve construction of the planned sports arena at Mission Bay. Such a facility would have a devastating impact on the Mission Bay Environment and the workers who must travel there to go to work and home again, as well as to the accessibility of U.C. Medical Center." (*Elaine Pierce, email, July 23, 2015 [I-Pierce-1]*)

"I am a nurse practitioner at UCSF Benioff Children's Hospital, and I am strongly opposed to building a new Warriors stadium at Mission Bay." (*Kay Ramsdell, email, June 24, 2015 [I-Ramsdell-1]*)

"ABSOLUTELY NOT!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!" (*Jana, email, July 24, 2015 [I-Rosa-1]*)

"The San Francisco water front is a national treasure. We don't need an ugly visually polluting stadium or the cluster of bars and fan excesses that go along with the highly commercialized and hyped up nature of professional sports today.

"Stadiums can go anywhere. There is only one San Francisco Bay. It should be a place where anyone can walk, enjoy sweeping views and feel the power and healing nature of the ocean and tides. Do not ruin this national treasure by giving into crass commercial interests who what to take this treasure from all of us, to put up a massive building that cannot but be ugly, polluting, noisy and the equivalent of trading paradise for a parking lot." (*Mark Shull, email, July 14, 2015 [I-Schull-1]*)

"We are supportive of the Warriors development if proper steps are taken to guarantee parking and traffic will be mitigated in the Dogpatch neighborhood." (*David Siegel, email, July 14, 2015 [I-Siegel1-1]*)

"Building the stadium at Mission Bay is a bad idea. Many of us think so and we vote. Please find somewhere else or send them back to Oakland." (*Amy Steiner, email, July 23, 2015 [I-Steiner-1]*)

"I'm against building the Warriors stadium at its proposed site …" (*Kaylah Sterling, email, July 13, 2015 [I-Sterling-1]*)

"I ask that the City of San Francisco avoid the disastrous impacts of the proposed entertainment center on the Mission Bay community, including the health and welfare of patients, families, neighbors, and university students and employees including faculty members like me." (*Michael Stryker, email, July 26, 2015 [I-Stryker-8]*)

"3. I believe that this event center will be a very positive addition to San Francisco." (*Jim Sullivan, email, July 9, 2015 [I-Sullivan-2]*)

"The current health care and research center is a hub of care and innovation, the future of this world-class medical center should not be jeopardized by billionaires seeking to double the value of the Warriors as a sports franchise on the backs of San Francisco residents." (*Judy Tan, email, July 27, 2015 [I-Tan-7]*)

"Thus, we ask that the City of San Francisco avoid the disastrous impacts of the proposed entertainment center on the Mission Bay community, including the health and welfare of patients, families, employees and neighbors." (*Judy Tan, email, July 27, 2015 [I-Tan-10]*)

"I think it would be another great enhancement to and for the City of San Francisco to have the stadium here in the City" (*JoAnn Trossbach, email, July 24, 2015 [I-Trossbach-1]*)

"Entertaining this idea is reckless and irresponsible. As the local SF government you have a responsibility to the health and public safety of the community and that MUST come first!" (*R. Tuialu'ulu'u, email, July 14, 2015 [I-Tuialu'ulu'u-3]*)

"An arena is not a welcome addition to the neighborhood in which it is proposed to be located. It does not fit well into an areea [*sic*] where families reside and should be placed in a more business dedicated locale." (*Elizabeth Waldron, email, July 13, 2015 [I-Waldron-1]*)

"… I am writing to request that you do not approve a stadium to be built in Mission Bay right next to a busy hospital." (*P. Wheeler, comment type, date [I-Wheeler2-1]*)

"I feel that the City is congested enough and that adding another arena will make it worse. Let the Warriors stay in Oakland!" (*Johns Wife, email, July 14, 2015 [I-Wife-1]*)

"The Warriors, as spoiled as they are right now, are perfectly accommodated in Oakland right now! I don't care how much these rich, little whiners piss and moan about it - screw 'em! They are doing well enough, right where they are!!

"DO NOT BRING THEM TO SAN FRANCISCO!! THEY DON'T BELONG TO SAN FRANCISCO!! THEY BELONG TO THE ENTIRE STATE! KEEP THEM PLAYING IN OAKLAND (in a fine, modern venue)! THEY ARE DOING VERY WELL, RIGHT WHERE THEY ARE ....." (*James Woody, email, July 14, 2015 [I-Woody-3]*)

"Don't ruin Mission Bay!

"and certainly don't subsidize any stadiums!" (*Dave Yost, email, July 13, 2015 [I-Yost-1]*)

"I am a current resident of Mission Bay and am submitting the attached letter to voice my concerns and opposition to the planned Warriors Arena Project in my neighborhood." (*James Zboralske, email, July 27, 2015 [I-Zboralske-1]*)

"Based on my direct observations, review of the EIR and my prior experience, I have many concerns and do not believe the City should allow this development to proceed as designed." (*James Zboralske, email, July 27, 2015 [I-Zboralske-9]*)

"We need to focus on, and remedy, the current pressing problems that we face before embarking on additional major projects that will only exacerbate the situation.

"In summary, I urge you to prohibit the Warriors Arena project in Mission Bay. The area simply cannot handle a project of this magnitude, especially given all the other major developments currently underway or on the drawing board. The over-all negative impact to the local residents, and ultimately the City, is very concerning. There are far too many unknowns, uncertainties and ambiguities in the report." (*James Zboralske, email, July 27, 2015 [I-Zboralske-34]*)

"I'm a supporter of the arena project and look forward to the Warriors coming home to San Francisco." (*Bruce Agid, public hearing transcript, June 30, 2015 [PH-Agid-1]*)

"I proudly support the Warriors mixed-used development, because it will serve as a community hub for performing arts, retail space, restaurants, and a wide range of community events, and the Warriors have outreached to us and communicate within our community." (*Vanessa Aquino, public hearing transcript, June 30, 2015 [PH-Aquino-1]*)

"… I'm here today to express our strong support for the Warriors arena in Mission Bay.

"Throughout the EIR process, the City has done a thorough analysis of the project and every conceivable impact it could have on the city. The team has been above board and maintained complete transparency in their plans since they've been talking about this project many, many years ago.

"We have confidence in the City's assessment that traffic be manageable, and we believe that the benefits of having a multipurpose arena that will serve all of San Francisco will far outweigh any potential impacts." (*Jon Ballasteros, public hearing transcript, June 30, 2015 [PH-Ballasteros-1]*)

"I am in favor of neighborhood growth, but unfortunately, I think this stadium will only profit the developer, and I would rather have long-term business growth that this neighborhood is already invested in." (*Andrew Battat, public hearing transcript, June 30, 2015 [PH-Battat-3]*)

“I'm going to weigh in on this proposal.

“I think that's it's a wonderful idea to have an arena here in the San Francisco. The area has gone through an extensive EIR early on, when it became the Mission Bay.

“I remember hearing my dad's stories -- who used to be a part of customs, going through the warehouses that used to be there. And, trust me, there's some things you never want to hear that happened down that way.

“But the issue is, it had that EIR that made it the great possible [sic] that it is now. And now we're doing a second EIR that is turning into making it so that the Warriors can have the arena here, which is a true gem for San Francisco.

“It will complement the hospital, it will complement everything there, and it will be a great thing for San Francisco. So, I fully want to say I support this project and I support the arena with all of my existence.” (*Nick Belloini, public hearing transcript, June 30, 2015 [PH-Belloini-1]*)

“I want to talk today about the impact that this stadium, this arena, will have on San Francisco's nightlife.

“It is -- all those groups that I spoke of, it's our job to support vibrant, world-class nightlife in San Francisco, and we feel that this arena will contribute in a very meaningful way to bringing San Francisco up to a world-class city in terms of nightlife, not just from the events that will be there, from sporting events to A-list concerts and music events such as the Red Hot Chili Peppers or Beyoncé, which now have a chance of actually playing in our city, but also in all the people that it'll draw from the outside areas, who will then stay in the city, some of them, and go in the City and spend their time and their money and their joyous smiles at our nightlife venues. So, we're very excited about that.

“They've outlined the existing parking near the venue and the extensive of public transportation that will serve the site, and the traffic management plan that I've looked at is very thoughtful and thoroughly done, and it gives us no reason for concern.

“So, we want to go on record to support the arena in the strongest possible terms.” (*Benjamin Bleiman, public hearing transcript, June 30, 2015 [PH-Bleiman-1]*)

“… I’m here to express my strong support for the Warriors and the arena at Mission Bay.

“Pat actually stated -- I was extremely impressed on how green the project itself is based off the EIR. The arena emission rate will be LEED gold certified and will truly set a standard for sustainable building design, I think, here in the City.

“And the Warriors are more than just a basketball team, as we've seen, especially with the championship that we just had. And what the team will actually do is be a partner in the community.

“I know just that Young Community Developers alone, within the past two seasons, we've been able to employ well over 200 individuals from Bayview-Hunters Point that we actually transported from Bayview-Hunters Point to Oakland to work in the arena. So, just imagine how many more folks, from an economic standpoint, that will be able to work once those guys are here in Mission Bay.” (*D.J. Brookter, public hearing transcript, June 30, 2015 [PH-Brookter-1]*)

"I support the Warriors arena project in San Francisco, knowing that it will have a positive impact on our Mission Bay Community. I've reviewed the arena plan, and what really stands out to me is the steps that the architects have taken to minimize the impact that this project has on our environment." (*John Caine, public hearing transcript, June 30, 2015 [PH-Caine-1]*)

"We do believe that by having the arena there, we will continue to attract more events and other activities to the City that will help not only those who are participating in the events, but those who are working in industries like the hotel industry that will get extra hours and be able to work to be able to support the events as well." (*Kevin Carroll, public hearing transcript, June 30, 2015 [PH-Carroll-1]*)

"This City is going to have something that they've needed desperately for years. We have a big venue, we have many small venues, but we don't have a an arena. If we want to call ourselves a world-class city, we're going to need a venue that they're proposing today. More than just basketball. Concerts. Events.

"I remember, in 2001, I worked with Bob Arum of Top Rank to bring Mayweather-Chavez before Mayweather was money. And we had that event at the Civic. And I remember how important that was. We can attract more venues like this.

"This EIR is very thorough, well thought out, and this arena will be nestled in Mission Bay, which many people will embrace." (*Stefano Cassolato, public hearing transcript, June 30, 2015 [PH-Cassolato-1]*)

"I'm a student here in San Francisco, and like so many San Franciscans, I rely on riding my bicycle everywhere. I'm excited for the Warriors to move to Mission Bay, because I think this venue will have tremendous bicycle access, with the abundant bike parking as outlined in the EIR. It has over 300 valet spots, over 100 secure bike parking spots in the office buildings, and dozens more around the site. Plus this project will bring new bike lines on Terry Francois and 16th Street, making it simple and safe to get to." (*Sebastian Conn, public hearing transcript, June 30, 2015 [PH-Conn-1]*)

"I'm here just in support for the Warriors to be here in our neighborhood and in San Francisco. It would create an enormous amount of opportunity for our people in the community." (*Rudy Corpus, public hearing transcript, June 30, 2015 [PH-Corpus-1]*)

"And, first and foremost, I just wanted to thank you for the time and deliberation that you have already taken into looking at the EIR, and then also to express just gratitude for the way that the Warriors and the City have worked together to address some of the issues identified.' (*Sheryl Davis, public hearing transcript, June 30, 2015 [PH-Davis-1]*)

"I'm a student, I'm a bicycle advocate, and I'm very impressed by how bike friendly this venue will be.

"Furthermore, the project promises to bring new bike lanes to Terry Francois Boulevard and 16th Street, making it simple and easy to get in and out of the area. By making the venue so accessible to bicyclists, they are reducing carbon emissions in cars and traffic congestion in the area as well." (*Drakari Donaldson, public hearing transcript, June 30, 2015 [PH-Donaldson-1]*)

"We've also launched a petition, calling for the City to reject this project. In the past few weeks alone, we've collected more than 4,600 signatures from residents, U.C.S.F. healthcare workers, employees, and neighbors who are concerned about the impact of this 18,500-seat arena." (*Alex Doniach, public hearing transcript, June 30, 2015 [PH-Doniach-2]*)

"I'd just like to acknowledge my support on record that I do support this project, and if we'd been able to do this with a relationship across the Bay, imagine how many more organizations that the Warriors can affect right here in the City.

"And I really do believe that the Warriors' mission, outside of basketball, is community. We've been a direct result and have been privileged to experience those things, and we're looking forward to those in the future as well." (*Celestino Ellington, public hearing transcript, June 30, 2015 [PH-Ellington-1]*)

"… I'm really excited about this stadium and arena, because it's really bike-friendly, and I bike everywhere in the City.' (*Abe Evans, public hearing transcript, June 30, 2015 [PH-Evans-1]*)

"… I'm here to support the Warriors arena in Mission Bay." (*Adam Greenstein, public hearing transcript, June 30, 2015 [PH-Greenstein-1]*)

"I'd also like to point out there were similar concerns when the San Francisco Giants built their stadium, but I've witnessed how that stadium has revitalized the SOMA area. And as a future homeowner in Mission Bay, because I plan to buy a place this year, I'd like to see that same transformation happen in Mission Bay." (*Adam Greenstein, public hearing transcript, June 30, 2015 [PH-Greenstein-3]*)

"I have worked with hundreds of people renting, purchasing, developing in the area, and I am here to support the progress.

"I know change is difficult, and I believe, witnessing, attending meetings, talking to people that I have worked with, for the most part they're supportive of a responsible vote.

There is no place in the City that does not have a traffic headache at this moment in time, that I, too, have witnessed. I, too, live in a neighborhood with retail. That comes with some pros and cons, but the majority of the people with this vision for this neighborhood moved here knowing this change was inevitable. And I think that the outcome, if people will collaborate, could be very, very positive for the entire City, not just Mission Bay." (*Dianne Hartnett, public hearing transcript, June 30, 2015 [PH-Hartnett-1]*)

"But I want to just thank the Warriors for doing what they have done. Prior to coming into our community, they've hired peoples in our community, and we hope and we really believe that they will hire minority contractors, 50 percent out of Bayview-Hunters Point, 100 percent citywide, following our Memorandum of Understanding we wrote in 1970, which had a grandfather clause in our community.

"I support them 100 percent. I would like the U.C., since the nurses are talking about all they're talking about -- traffic and what have you -- is to come up with some scholarships that they should have done getting that free property -- for scholarships in our community to train peoples in our community for nursing, being doctors, and what have you. Do the same thing that the Golden State Warriors are doing.

"I was living and I was -- I once went to the games at Kezar Pavilion when the Warriors were there a long time ago, and I'm saying today welcome back to the San Francisco Warriors, and I support this 100 percent." (*Oscar James, public hearing transcript, June 30, 2015 [PH-James-1]*)

"I am in full support of the Warriors arena project in San Francisco, knowing it will have a positive impact not only on Mission Bay, but also on our gem of a city. I want to thank the City for taking the time and energy to create a world-class project that is deserving of a world-class city." (*Henry Karnilowicz, public hearing transcript, June 30, 2015 [PH-Karnilowicz-1]*)

"We've been involved with planning in Mission Bay for many decades, and while we understand that the idea of putting an arena in Mission Bay is a change, we think it's going to be very positive overall for the neighborhood. It's how cities work.

"Over the years, different people bring you ideas, and places evolve through the layering process of each generation contributing something different. It's going to make Mission Bay a more interesting place than have it all being one thing." (*Alyssa Kies, public hearing transcript, June 30, 2015 [PH-Kies-1]*)

"I've come today to fully support the Warriors' plan to move to Mission Bay.

"I'd like to express my support, mostly because of some of the environmental plans that have been made for this project. In reviewing those plans and by looking at many of the renditions, I'm impressed with the emphasis on landscaping and green space, as well as the incorporation of the natural environment with the site.

"From trees and grass lawns and all of the green rooftops that have been designed, I think that this project will have a big impact on making our City more green." (*Elizabeth Kirk, public hearing transcript, June 30, 2015 [PH-Kirk-1]*)

"… I am here to express my support for the Warrior's arena in Mission Bay.

"After taking some time to review the EIR, I am excited about the open pedestrian accessibility in the arena. The walk is going to be flat. It's going to be easy and beautiful along the waterfront.

"The venue's proximity to public transportation means that anyone who lives near BART, Muni, or a Caltrain line can walk to a stop or station and arrive at the arena's doorstep within minutes.

"The new arena also triggers the construction of the new bayfront park, which will make Mission Bay more hospitable for runners, families, and allow people to enjoy the waterfront. Right now, that is not currently possible." (*Kim Kobasic, public hearing transcript, June 30, 2015 [PH-Kobasic-1]*)

"… we urge this Commission to support that EIR and to move this project forward as quickly as possible." (*Jim Lazarus, public hearing transcript, June 30, 2015 [PH-Lazarus-3]*)

"… and first of all, I am wholeheartedly in support of this arena and believe all City family leaders can get together and find solutions to this traffic part." (*Dennis Mackenzie, public hearing transcript, June 30, 2015 [PH-Mackenzie2-1]*)

"I'm here today to express our union's strong support for the Warriors project. From the prospective of creating good, quality, working-class jobs, the proposed arena is probably the most important development we have seen in San Francisco in the last 15 years.

"At a time when working-class families are being squeezed out of our City through a combination of stagnant incomes and rising rents, we should be doing everything we can to promote projects like this one.

"As you may know, our union represents 800 concession workers at the AT&T park. While we struggle hard to raise wages and benefits at the ballpark, those remain very part-time jobs because of the nature of the baseball season.

"The prospect of a basketball and event center close by holds out the possibility that food service workers could string jobs at these facilities together to something that gives them a real pathway to middle-class jobs. That would be a game changer for food service workers in San Francisco.

"The Warriors reached out to our union early on to ensure that workers who currently staff their concessions are guaranteed a place at the new arena, and that the addition of positions created here will be the kind of jobs that raise the bar in San Francisco. That's exactly the kind of development that our City should be investing in." (*Alejandro Madi, public hearing transcript, June 30, 2015 [PH-Madi-1]*)

"The Alliance believes the proposed entertainment center will not work for the site and does not warrant the massive public investment planned by the State." (*Osha Meserve, public hearing transcript, June 30, 2015 [PH-Meserve-1]*)

"Bayview Merchants Association, and we're here in support of the EIR for the Warriors, and we think it would be one big jewel of an anchor tenant for all small businesses in and out of the area, and we support it wholeheartedly and support the other associations who are in favor of you passing this EIR so we can go ahead and go to work and establish a relationship that will benefit everyone economically associated with this project." (*Al Norman, public hearing transcript, June 30, 2015 [PH-Norman-1]*)

"One of the many reasons I support the project is because it's -- it is so pedestrian friendly. I will be able to actually walk to the arena events from my home, as well as be able to take dogs the new green area that's going to be developed because of this arena.

"I also like the fact that they're gonna have year-round retail as well as restaurants for local residents. So, it's going to be a new meeting place and a place for us to enjoy." (*Ray Nyden, public hearing transcript, June 30, 2015 [PH-Nyden-1]*)

"… I am here to talk about the opposition, because we do not want the stadium to be built at the Mission Bay.

"So, over the past two weeks, I have been canvassing the Mission Bay area, and I've been speaking with residents and employees, and I've been speaking to the relatives who are visiting patients at the hospital, and I've been asking them, What are your views on building the stadium in such a closed unit?

"And overwhelmingly, the response that I received frequently was, Do not build it. I do not want the stadium here." (*Annabel Ortiz, public hearing transcript, June 30, 2015 [PH-Ortiz-1]*)

"This a great use for this location. I urge you to approve the project, certify the EIR, and move forward.

"It's a great -- we're very lucky to have an organization like the Golden State Warriors willing to come to this City and invest in our City." (*Paul Osmundson, public hearing transcript, June 30, 2015 [PH-Osmundson-4]*)

"… there still were concerns that people had about traffic mitigation next to a hospital.

"And we take that very seriously, and we take the nurses very seriously. But I've been assured by the Warriors and the City as we go through this ongoing process that those mitigations will take place.

"Again, this is an evolving neighborhood, and it's a wonderful neighborhood, and it's exciting that the Warriors are coming here, and I think that we will get to the right place at the right time to make sure that this happens." (*Tim Paulson, public hearing transcript, June 30, 2015 [PH-Paulson-1]*)

"We're strong supporters of the proposed arena in the Mission Bay area, in large part because there's no major arena in San Francisco, and this great city deserves a great arena, and we know the Warriors have planned for one.

"As San Francisco's first ever multipurpose arena, the Warriors will attract people from around the Bay Area, from around the state, and around the world for major events." (*Matt Prieshoff, public hearing transcript, June 30, 2015 [PH-Prieshoff-1]*)

"We want to go on record to you to voice our enthusiastic support of this arena plan, and we hope you will consider our recommendation throughout this process." (*Matt Prieshoff, public hearing transcript, June 30, 2015 [PH-Prieshoff-3]*)

"Thus, we ask the City of San Francisco, avoid the disastrous impacts of the proposed entertainment center at the Mission Bay community, including the health and welfare of patients, families, employees and neighbors." (*Damion Scott, public hearing transcript, June 30, 2015 [PH-Scott-8]*)

"We're very excited as a family, not only to watch the championship Warriors basketball team in the arena, but we feel strongly that San Francisco needs this entertainment destination, with the family shows such as "Disney on Ice," the Globetrotters, and concerts we can attend together.

"I'm also excited about the waterfront park as there's nothing like this currently in the south neighborhoods, and it provides a place for kids and families to enjoy the beautiful views, have fun in a safe environment.

"The Warriors and the City have gone through thorough analysis of the project, including extensive meetings -- the Mission Bay CAC, U.C.S.F., and our neighborhood -- to address our concerns. They have made good progress with all of us, especially U.C.S.F., in coordinating their respective operations so both can function productively in our neighborhood.

"As a result, the Warriors team have come up with a project that fits well in the community and that we, as neighbors, are very excited about, if you would put us down for three." (*Cathy Searby, public hearing transcript, June 30, 2015 [PH-Searby-1]*)

"I find the Warriors a good attraction to San Francisco. I'm not opposed to the team moving back to San Francisco or even a new arena in Oakland …" (*Michael Sesich, public hearing transcript, June 30, 2015 [PH-Sesich-1]*)

"We think the arena is an unexpected bonus for our neighborhood, with the bike paths, with the new parks, with the holiday ice arena as a possibility. All of these things are things that we think enhance our neighborhood for families in a way that few alternatives really could achieve.

"So, in that sense, we are excited about the arena. Of course, we support the Warriors, but we're also excited about what the arena can mean for our neighborhood, and particularly, children in our neighborhood. And there are now 250 new children in our neighborhood. We're very excited for them to have access to all of this." (*Esther Stearns, public hearing transcript, June 30, 2015 [PH-Stearns-1]*)

"Again, we shouldn't look through the lense of the automobile and what might have been construction in the 1950's, but look forward to what we're doing today.

"I very much support this project, and so does our association." (*Patrick Valentino, public hearing transcript, June 30, 2015 [PH-Valentino-3]*)

"As others have talked about this document, this document is incredibly thorough, and I applaud the City for looking at all the issues so carefully and demonstrating attention to the impacts to my neighborhood.

"I'm especially pleased about the new businesses and parks that will go in within walking distance.

"As you know, the Warriors and the City have been working very closely with neighbors like myself, listening to our feedback and incorporating the community suggestions into their plan. As a result, they've come up with a project that perfectly fits into the Mission Bay, Dogpatch, and other surrounding communities.

"Most of the neighbors that I've talked about [sic] are extremely excited about it. I'd like to go on record that I am personally in support of the new arena." (*Scott Van Horn, public hearing transcript, June 30, 2015 [PH-VanHorn-1]*)

"I'm a big supporter of the Warriors and their move to Mission Bay. I know the team and the City have worked really hard to take feedback from the community, address their needs, and put this into a plan. I think this is great for that community." (*Curt Yagi, public hearing transcript, June 30, 2015 [PH-Yagi-1]*)

Response GEN-5: Opinions on the Project

This group of comments consists of opinions and observations of numerous commenters expressing support for or opposition to the proposed project. These comments are presented herein for consideration by OCII and the decision-makers as part of the project approval process.

None of these comments refer to the adequacy or accuracy of the SEIR or to environmental effects of the proposed project. For specific issues regarding traffic, transit, and parking, refer to discussions in SEIR Section 5.2 and Section 13.11 of this Responses to Comments document.

13.2.7 Miscellaneous Opinions (GEN-6)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

O-BCTA-1	O-BCTA-5	I-Barton-3	I-Lee-1
I-Lee-2	I-Lee-3	I-Zboralske-30	PH-Boss-1
PH-Johnson-1	PH-Pan-1	PH-Ushman-1	PH-Washington-1

"The undersigned small business owner/operators of trucks locally based in Bayview-Hunters Point want to thank you and OCII for giving us the opportunity to comment on the Draft SEIR for the proposed Golden State Warriors Arena at Mission Bay. Our group of highly qualified hazardous certified truckers are made up of local minority truck owners who reside in and/or hire our drivers and other employees from the local community. We park our vehicles at the Port of San Francisco railyard off Third Street, which also hires exclusively from the local community. Our member truckers transport contaminated and hazardous waste to the railyard from remediation projects all over San Francisco and the Bay Area. The local truck-to-rail system offers the following benefits to projects like the Warriors Arena project:

- Railyard is just a few blocks from arena site compared to 250 miles one-way for long-haul truck trip to Southern California landfills;
- Excavation phase impacts can be reduced months by using truck-to-rail option;
- Reduced fuel consumption by hundreds of thousands of gallons and reduced toxic air emissions (C02) by millions of pounds per project;
- Reduced liability of hazardous waste at high speeds down public highways;
- Economic development dollars stay in our neighborhood."

(*Bayview Community Truckers Association, letter, July 24, 2015 [O-BCTA-1]*)

"Other projects that our team of local truckers have successfully hauled hazardous and contaminated soils to the railyard at the Port, in addition to the adjacent Shorenstein project, include: UCSF Medial [*sic*] Center at Mission Bay; Kaiser Medical Center @ Mission Bay; Transbay Terminal; Pac Bell Park; The Gap Headquarters; SFMT A Third Street Light Rail; Hunters Point Naval Shipyard; Equity Potrero - 16th Street; Embarcadero Waterfront Improvement; A val on Bay Communities; SFMTA Central Subway; and hundreds more that have chosen the local truck-to-rail option as the best option.

"We would like that our community truckers be able to take part in this exciting and historic project using our successful truck-to-rail approach. And again, we appreciate the opportunity to comment on the EIR." (*Bayview Community Truckers Association, letter, July 24, 2015 [O-BCTA-5]*)

-The space is for bio science

I'd say there is an ample amount of research space provided for research between the hospital and UCSF campus. (*Jason Barton, email, July 27, 2015 [I-Barton-3]*)

"I lived in Mission Bay for two years at the Radiance Building on Mission Bay Blvd and recently moved out of the neighborhood. I left Mission Bay primarily because AT&T Park and its crowds wrecked havoc on the burgeoning neighborhood. Anytime there was a Giants game, it became impossible to get home using the inbound T line. Fans would transfer to the T line starting at Civic Center and fill it beyond capacity. Working in SoMa, it became impossible to board a train home." (*Jeremiah Lee, email, July 20, 2015 [I-Lee-1]*)

"Driving was also impaired. Just trying to leave my home or return to it during a game sometimes meant planning an additional half hour to get through the few blocks of traffic." (*Jeremiah Lee, email, July 20, 2015 [I-Lee-2]*)

"After games, the neighborhood sidewalks were covered in trash, vomit, and urine of drunken fans." (*Jeremiah Lee, email, July 20, 2015 [I-Lee-3]*)

"The City's Public Works Department admittedly struggles now to deal with keeping our streets, sidewalks and neighborhoods clean." (*James Zboralske, email, July 27, 2015 [I-Zboralske-30]*)

"So, I just want to express the opinion that if we really, as a community at San Francisco, wanted to get something done, you would probably crack a whip and have the Warriors have to work with the Giants all on Lot A and B.

"And, you know, maybe I'm whistling "Dixie," but you do not have a method of taking care of the traffic. You can say MTA is going to take care of it. MTA couldn't even, in a ten-year period, get a turnaround movement planned and executed. Very, very terrible." (*Joe Boss, public hearing transcript, June 30, 2015 [PH-Boss-1]*)

"(Unintelligible) put the BART system to where it can go to the stadium, and that way, we would have a lot impact with our plans than when we go to see the Warriors.

"And I think there's more solutions to those problems -- is that we need to agree with the Warriors, which would eliminate a lot of these impacts. Maybe put that in thought, that -- to build a BART over there behind the mountains there. You see on this picture right there." (*Silvia Johnson, public hearing transcript, June 30, 2015 [PH-Johnson-1]*)

"I have a dream of working on creating a non-profit that can create paid jobs for people coming out of hardship. The idea is to open a café, eatery, and meeting spaces, community spaces where people can use for meet-up groups, conferences, study groups, and have them adjoining a café so it's free, just buy some food and some drinks.

"Making it a non-profit would allow people to have a reintegration into the workforce, would allow the community a place to gather.

"And the idea of doing something like this would be hugely tremendous, because there aren't a lot of 9- or 10,000-square-foot plates that are available to be custom-built out in San Francisco. We all know the retail spaces aren't available.

"So, I'm working on trying to propose this with the Warriors, and I've had some very good feedback from members of the community, from Urban Solutions to Cafe La Vie, to Hayes Valley Bakeworks, Delancey Street Crossroads Café, some of the non-profits that have succeeded on a business model similar to this, and others.

"I've spoken with Jane Kim, District Supervisor, District 6. I'd like to say thank you very much for your time.

"I very much support the Warriors coming to San Francisco. I think it would help a lot of people in a lot of different ways." (*David Pan, public hearing transcript, June 30, 2015 [PH-Pan-1]*)

"I find it difficult to believe that the Nurses Association believes that the City, U.C.S.F., and the Warriors have turned a blind eye to the legitimate traffic concerns surrounding the new arena and have not taken steps to deal with this issue. After all, we are talking about approximately 200 events per year.

"Salesforce would have brought in at least that number of people into the area five days a week, 52 weeks a year.

"Let's not use traffic concerns that have been or are being addressed as a foil for other people's agendas." (*Neal Ushman, public hearing transcript, June 30, 2015 [PH-Ushman-1]*)

"But right now, let's talk about the players we've got here. The players. This is all about dollar bills. You know, you talk about the EIR. This is about dollar bills.

"Right here. Let's talk about the players, the bases. Let's talk about who is representing who. One side is an ex-member of the Mayor's, and then you got a next side that's a -- what -- he's a community or -- he works for consultants for the big Lennar out there. So, you've got big two big consultants. We're talking about money now. We don't mention that in the EIR, but I'm here to tell you, that A-C-E has been studying it.

"So, we're going got put all these things together and we're gonna up with a solution, Mr. Warrior. It's called "community reform," to get -- you know, flip-flop and drop all this other stuff.

"We, as community people, must be involved with the growth of this city for the next 10 years for the generation in the back. So, therefore, I've got a method to all this pollution.

"You need to have some kind of conversations about how we're going to put things together. And the only way to do that is you've got to collectively deal with our legislators out here, with our supervisors -- London Breed and Cohen." (*Ace Washington, public hearing transcript, June 30, 2015 [PH-Washington-1]*)

Response GEN-6: Miscellaneous Opinions

This group of comments consists opinions and observations of various commenters on miscellaneous issues that may or may not be related to the proposed project. These comments are presented herein for consideration by OCII and the decision-makers as part of the project approval process.

None of these comments refer to the adequacy or accuracy of the SEIR or to environmental effects of the proposed project. For specific issues regarding traffic, transit, and parking, refer to discussions in SEIR Section 5.2 and Section 13.11 of this Responses to Comments document. For specific issues regarding quality of life, see Section 13.2.2, above.

13.3 Environmental Review Process

13.3.1 Overview of Comments on the Environmental Review Process

The comments and corresponding responses in this section cover topics generally discussed in SEIR Chapter 2, Introduction, regarding the process and requirements of the California Environmental Quality Act (CEQA). These include topics related to:

- ERP-1: State Clearinghouse Review
- ERP-2: Noticing and Mailing List
- ERP-3: Request for Documents
- ERP-4: Public Review Period
- ERP-5: Recirculation
- ERP-6: CEQA Standards of Adequacy
- ERP-7: Tiering
- ERP-8: Aesthetics
- ERP-9: General Comments on the SEIR and Environmental Topics

13.3.2 State Clearinghouse Review (ERP-1)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

A-SC1-1 A-SC2-1

"This letter acknowledges that you have complied with the State Clearinghouse review requirements for draft environmental documents, pursuant to the California Environmental Quality Act. Please contact the State Clearinghouse at (916) 445-0613 if you have any questions regarding the environmental review process." (*State Clearinghouse, Scott Morgan, letter, July 21, 2015 [A-SC1-1]*)

"The enclosed comment (s) on your Supplemental EIR was (were) received by the State Clearinghouse after the end of the state review period, which closed on July 20, 2015. We are forwarding these comments to you because they provide information or raise issues that should be addressed in your final environmental document.

"The California Environmental Quality Act does not require Lead Agencies to respond to late comments. However, we encourage you to incorporate these additional comments into your final environmental document and to consider them prior to taking final action on the proposed project." (*State Clearinghouse, letter, August 6, 2015 [A-SC2-1]*)

Response ERP-1: State Clearinghouse Review

As required by CEQA Guidelines Section 15085 and acknowledged by the commenter, a Notice of Completion was filed with the Office of Planning and Research (State Clearinghouse) on June 5, 2015. Comment letters from Caltrans and the California Highway Patrol were received during the public review period through this process. Copies of those letters are included in Appendix COM, and responses to their comments are all addressed in Section 13.11, Transportation, of this Responses to Comments document.

13.3.3 Noticing and Mailing List (ERP-2)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

A-SMCTD-1	O-SFBT-6	I-Heath-12	I-Hestor-1
I-Hutson-6	I-Kornberg-4	I-Stryker-10	I-Tan-12

"Who at Caltrain (or Samtrans) was the notice of availability sent to?" (*San Mateo County Transit, Sebastian Petty, email, July 15, 2015 [A-SMCTD-1]*)

"While the Bay Trail Project was a commenter on the Notice of Preparation for this project, we were not notified regarding the availability of the Draft EIR. Please add us to your list of interested parties so that we will be notified when the Final EIR is available for review." (*San Francisco Bay Trail, Maureen Gaffney, letter, July 27, 2015 [O-SFBT-6]*)

"Additionally, please place my name on the notice list for this project so that I may receive notice of any future actions by the City with respect to this project." (*Alison Health, email, June 30, 2015 [I-Heath-12]*)

"In other words I can wait in line for an hour or so to pick up the EIR CDs at 1660. The people I talked to in Potrero Hill/Dogpatch had no mailed notice of this EIR even though the parking lots are in their neighborhood. (*Sue Hestor, email, June 22, 2015 [I-Hestor-1]*)

"Additionally, please place my name on the notice list for this project so that I may receive notice of any future actions by the City with respect to this project." (*Richard Hutson, email, June 29, 2015 [I-Hutson-6]*)

"Additionally, please place my name on the notice list for this project so that I may receive notice of any future actions by the City with respect to this project." (*Thomas Kornberg, email, July 17, 2015 [I-Kornberg-4]*)

"Finally, please place my name on the notice list for this project so that I may receive notice of any future actions by the City concerning this project." (*Michael Stryker, email, July 26, 2015 [I-Stryker-10]*)

"Additionally, please place my name on the notice list for this project so that I may receive notice of any future actions by the City with respect to this project." (*Judy Tan, email, July 27, 2015 [I-Tan-12]*)

Response ERP-2: Noticing and Mailing List

OCII conducted public noticing of the availability of the Draft SEIR at the start of the public review period on June 5, 2015, consistent with CEQA Guidelines Section 15087. The public noticing process included: (1) publication of the Notice of Availability in the *San Francisco Examiner* on June 3 and 5, 2015, (2) posting of notices on all sides of the project site on June 5, 2015, (3) direct mailings and emails to over 800 persons (including the Dogpatch Neighborhood Association and the Potrero Hill Neighbors/Save the Hill) on June 5, 2015. In addition, notice of the availability and the Draft SEIR itself were posted on the OCII website and on the San Francisco Planning Department website on June 5, 2015, and paper copies of the Draft SEIR were available at the OCII and Planning Department offices and at the San Francisco Main Library and Mission Bay Library. The distribution list for the Notice of Availability and affidavit of mailing can be found at the following website: http://gsweventcenter.com.

Although Caltrain (or Samtrans) was not specifically included in the direct mailing of the Notice of Availability of the Draft SEIR, the information was posted in multiple media accessible to the public. Names of all persons who submitted comments on the Draft SEIR will receive notice of availability of the Response to Comments documents, including those commenters who have made this specific request.

13.3.4 Request for Documents and Documents Received (ERP-3)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

O-MBA2S1-3 O-MBA2S1-4 O-MBA5-11 O-Fibrogen-1 I-Hong-13

"Thank you for your call. The date of the report linked below is March 28, 2008, whereas the date of the document referenced on p. 3 of the April 11, 2014 Updated Phase I Assessment is March 7, 2008. The document title appears to be the same, but if there was a prior draft, we would request that as well.

"Here are the additional source documents citations to references that my consultant has identified as essential to his review of the DSEIR:

1. The September 17, 1998 SEIR, Section V.H.5 cites a 1995 geotechnical investigation by Treadwell & Rollo, Inc. The reference listed "/15/" for that report cites to "The results of earlier geotechnical

investigations are discussed in the 1990 FEIR, Volume One, pp. II.76 II.77, and Volume Two, pp. VI.K. 1-VI.K. 11, VI.K.24-VI.K.30.*"

The 1995 Treadwell & Rollo report is needed for review.

2. Reference "/16/" cites to the following:

   Treadwell & Rollo, Inc., Environmental and Geotechnical Consultants, Lori A. Simpson, PE, and Frank L. Rollo, PE, Proposed UCSF Site, Mission Bay, San Francisco, CA, letter report to Kerstin Magary, Catellus Development Corporation, 31 October 1994, 2 pages accompanied by 38 figures; Treadwell & Rollo, Inc., Environmental and Geotechnical Consultants, Loft A. Simpson, PE, letter to EIP Associates, March 12, 1997, 1 page accompanied by 6 figures.

   The 1994 Treadwell & Rollo report letter report and 1997 letter report are needed for review.

3. Recent Geotechnical Reports: The only geotechnical report that is listed on the http://www.gsweventcenter.com/ site is a March 28, 2014 Preliminary Geotechnical Evaluation by Langan Treadwell Rollo. This letter report is lacking any site data or analysis. The report presents conclusions and recommendations based on unidentified previous site investigations. The supporting data/reports/analysis should be identified and presented for review.

4. According to the June 2015 Phase II ESA by Langan Treadwell Rollo, the following geotechnical reports have been completed for the site:

   Langan, 2011. Geotechnical Investigation, Blocks 29-32, Mission Bay, San Francisco, California. 21 December.

5. According to the April 11, 2014, Update Phase I, ESA by Langan Treadwell Rollo, the following geotechnical reports have been completed for the site:

   Treadwell & Rollo (T&R), 2007. Geotechnical Investigation, Block 30, Mission Bay, San Francisco, California. 17 October.

   T&R, 2008. Preliminary Geotechnical Evaluation, Blocks 29-32, Mission Bay, San Francisco, California. 7 March.

   T&R, 2008. Preliminary Geotechnical Evaluation, Blocks 33-34, Mission Bay, San Francisco, California. 29 May."

(*Mission Bay Alliance, Soluri Meserve, letter, July 9, 2015 [O-MBA2S1-3]*)

"We are trying to locate the references listed below from pp. 3-4 the Phase I Environmental Site Assessment dates April 11, 2014 that was prepared by Langan Treadwell Rollo that is posted at the Record website (http://www.gsweventcenter.com/). The direct link to the document is: http://www.gsweventcenter.com/Draft_SEIR_References/2014_0411_Updated_Phase_1_ESA.pdf.

"Treadwell & Rollo (T&R), 2007. Geotechnical Investigation, Block 30, Mission Bay, San Francisco, California. 17 October.

"T&R, 2008. Preliminary Geotechnical Evaluation, Blocks 29-32, Mission Bay, San Francisco, California. 7 March.

"T&R, 2008. Preliminary Geotechnical Evaluation, Blocks 33-34, Mission Bay, San Francisco, California. 29 May.

"Would you please provide these documents to me?" (*Mission Bay Alliance, Soluri Meserve, letter, July 9, 2015 [O-MBA2S1-4]*)

"A list of the Alliance's counsels' and consultants' comment letters follow.

"Thomas Lippe, Susan Brandt-Hawley, Patrick Soluri, and Osha Meserve have jointly submitted the following comment letters on Alliance letterhead:

1. July 26, 2015, letter regarding EIR tiering; and
2. July 26, 2015, letter regarding litigation streamlining under AB 900.

"Thomas Lippe has submitted the following comment letters and consultant reports:

3. July 24, 2015, letter regarding impacts on Hydrology, Water Quality, and Biological Resources including:
    a. July 21, 2015, letter report authored by Matt Hageman, P.G., C.Hg., QSD, QSP; and
    b. July 21, 2015, letter report authored by Erik Ringelberg, B.Sc., M.Sc., Ph.D candidate; and Kurt Balasek, PG, CHg, QSD.
4. July 25, 2015, letter regarding impacts on Noise and Vibration, including:
    a. July 24, 2015, letter report authored by acoustic engineer Frank Hubach.
5. July 26, 2015, letter regarding impacts on Air Quality, including:
    a. July 19, 2015, letter report authored by Greg Gilbert; and
    b. July 20, 2015, letter report authored by Paul Rosenfeld, Ph.D, and Jessie Jaeger.
6. July 27, 2015, letter regarding impacts on Transportation, including:
    a. July 23, 2015, letter report authored by traffic engineer Dan Smith; and
    b. July 21, 2015, letter report authored by traffic engineer Larry Wymer.
7. June 29, 2015, letter requesting an extension of the public comment period on the DSEIR.

"Susan Brandt-Hawley has submitted the following comment letter:

8. July 26, 2015, letter regarding impacts on Land Use, Aesthetics, Cultural Resources, and Project Alternatives.

"Patrick Soluri and Osha Meserve have submitted the following comment letters and consultant reports:

9. July 26, 2015, letter regarding impacts on Geology and Soils, Recreation, Hazardous Materials, Greenhouse Gases, Wind and Shadow, Utilities and Service Systems, Public Services, Energy and Urban Decay, including:
    a. July 22, 2015, letter report authored by air quality professionals Patrick Sullivan, CPP, REPA, and Joh Henkelman, regarding Greenhouse Gas Emissions;
    b. July 22, 2015, letter report authored by geotechnical engineer Lawrence Karp, CE, CEG, regarding Geology and Soils impacts;
    c. July 22, 2015, letter report authored by engineering geologist Marin Cline, CEG, and hydrogeologist Kurt Balasek, PG, CHg, QSD, regarding Geology and Soils impacts);
    d. July 22, 2015, letter report authored by geotechnical engineer Martin Cline, GEG and Kurt Balasek, PG, CHg, QSD, regarding Hazardous Materials; and
    e. July 22, 2015, letter report authored by economist Philip King, Ph.D., regarding Urban Decay.
10. June 29, 2015, letter regarding the City's failure to comply with AB 900 record keeping procedures and the resultant ineligibility of the Project for AB 900's litigation fast track procedures."

(*Mission Bay Alliance, Bruce Spalding, letter, July 27, 2015 [O-MBA5-11]*)

"We are reading through the Warrior's DEIR and encountering major heartburn with the noise and vibration analysis and mitigation. First, we see continuing reference to the MB Good Neighbor Policy and the SFEIR for MB completed in 1998. None of us in the MB life science community have seen those documents much less participated in the development of same. Life science and specifically sophistication of instrumentation and evolution of preclinical work has changed dramatically since 1998.

"Could you please forward a copies of at least the Good Neighbor Policy as soon as is possible." (*FibroGen, Catherine Sharpe, email, July 6, 2016 [O-Fibrogen-1]*)

"10. Include any other comments made to the (RTC) Response to Comments made during any of the public Planning Commission meetings, i.e., Planning Commission hearing held on June 30, 2015." (*Dennis Hong, email, July 27, 2015 [I-Hong-13]*)

Response ERP-3: Request for Documents and Documents Received

These comments either request additional documents for review as part of the Draft SEIR public review process or indicate submittal of documents as part of comments on the Draft SEIR.

Request for Documents. With the exception of the Mission Bay Good Neighbor Policy, none of the documents that are identified by the commenters were relied upon by OCII in the preparation of the Draft SEIR, nor are they cited in the Draft SEIR. Nevertheless, on July 6, July 16 and August 5, 2015, OCII and the San Francisco Planning Department responded to all requests for additional documentation to the extent that the requested documents are available.[1,2,3] Furthermore, all documents referenced in the Draft SEIR and all additional documents made available during the public review period are available at the following website: http://gsweventcenter.com. Disagreements regarding the scope of the administrative record for an AB 900 project do not affect a project's eligibility; rather, as explained in CEQA §21186, a party challenging a project in court may file a motion to augment the record. (CEQA §21186(i).)

Documents and Comments Received During the Public Review Period. OCII acknowledges receipt of all materials submitted during the public review period relevant to the Draft SEIR, including oral testimony submitted during the public hearing before the OCII Commission (not the Planning Commission, as indicated in comment I-Hong-13) on June 30, 2015. All written comments on the Draft SEIR—including those listed in comment O-MBA5-11—are included in Appendix COM, and transcripts of the public hearing are included in Appendix PH. Additional supplemental written materials submitted during the public review period (such as resumes of persons preparing the comments or background reports referenced in the comments but not directly pertinent to the proposed project) are described in Appendix COM and are available for

1 Myall, Hilde, OCII. Email to Catherine Sharpe regarding Mission Bay CAC Agenda -- July 9th Meeting, dated July 6, 2015.
2 Bollinger, Brett, San Francisco Planning Department. Letter to Osha Meserve regarding Notice Regarding Incomplete Record for Warriors Event Center Environmental Review, dated July 16, 2015.
3 Bollinger, Brett, San Francisco Planning Department. Email to Osha Meserve regarding GSW Document and Draft EIR Comment Period Extension Requests, dated August 5, 2015.

review at OCII and the Planning Department. All of these documents are also available at the following website: http://gsweventcenter.com.

13.3.5 Public Review Period (ERP-4)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

O-MBA1L1-1 O-MBA2S1-2 PH-Meserve-5 PH-Meserve-7

"I write to request a 45-day extension, to September 3, 2015, of the public comment period on the Draft Subsequent Environmental Impact Report ("DSEIR"), currently set to expire on July 20, 2015. This extension is necessary for the public, including my client, to meaningfully comment on the DSEIR.

"The Project is a large, multifaceted sports, entertainment, and office complex situated in a densely populated metropolitan area. The Project vicinity is expected to experience large increases in traffic even without this Project. (See San Francisco Transportation Plan, 2040.) Also, the Project setting has a long history of industrial and chemical pollution, yet retains a wide diversity of environmental resources and amenities that are threatened by further development.

"As a result, this DSEIR has a long and complex environmental review history under CEQA, including the 1990 FEIR for the Mission Bay Plan, the 1998 FSEIR for the Mission Bay North Redevelopment Plan and the Mission Bay South Redevelopment Plan, and nine addenda to the 1998 Mission Bay FSEIR (completed between 2000 and 2013) for specific developments within Mission Bay that required additional environmental review beyond the 1998 FSEIR. (See DSEIR, p. 2-4 - 2-5.)

"Consequently, 45-days is simply not enough time to meaningfully review and comment on the DSEIR. Indeed, in recognition of the depth and complexity of the environmental review needed for the Project, the City recently obtained a one year extension (from January 1, 2016, to January 1, 2017),[1] from the state legislature of the deadline by which the City must certify the Project's Final SEIR in order to qualify for the "super fast track" litigation schedule provided in AB 900 (codified at Public Resources Code section 21178 et seq.).

"The City has been engaged in the environmental review of development in Mission Bay for over 25 years. The City has also been engaged in the environmental review of the Warriors Arena Project for over a year, since April 29, 2014,[2] or at least since preparing the June 24, 2015, Administrative Draft of the DSEIR. Further, with the comment period ending on July 20, 2015, the City will have almost a year and a half to respond to public comments and issue the Final SEIR, and process any appeal of the FSEIR certification to the Board of Supervisors and still take advantage of AB 900's "super fast track" litigation schedule.[3]

"These facts reveal an EIR preparation schedule that confers a vast advantage on the City over members of the public who do not share the City's strong desire to locate the Warriors arena in Mission Bay. In the interests of fairness and meaningful public participation in the EIR process, the City should extend the comment period on the DSEIR for at least 45 additional days, to September 3, 2015. Indeed, public participation in the EIR process is fundamental state policy:

> An EIR is an "environmental 'alarm bell' whose purpose it is to alert the public and its responsible officials to environmental changes before they have reached ecological points of no return." [citations omitted] The EIR is also intended "to demonstrate to an apprehensive citizenry that the agency has, in fact, analyzed and considered the ecological implications of its action." [citations omitted] Because the EIR must be certified or rejected by public officials, it is a document of accountability. If CEQA is scrupulously followed, the public will know the basis on which its responsible officials either approve or reject environmentally significant action, and the public,

being duly informed, can respond accordingly to action with which it disagrees. [citation omitted] The EIR process protects not only the environment but also informed self-government.

Laurel Heights Improvement Assn. v. Regents of University of California (1988) 47 Cal.3d 376, 392."

Footnotes:

1 See Public Resources Code section 21189.1.
2 See April 29, 2014, CCII Agenda, Item # *.
3 The deadline for filing the EIR appeal is 30-days after OCII certifies it. The clerk is required to schedule the hearing on the appeal no earlier than 21-days and no later than 45-days after the 30-day appeal period expires. (San Francisco Administrative Code § 31.16.)

(*Mission Bay Alliance, Thomas Lippe, letter, June 29, 2015 [O-MBA1L1-1]*)

"AB 900 expressly mandates that a complete record be posted online at the time of release of the DSEIR in order to receive streamlining benefits. (Pub. Resources Code, § 21167.6, subd. (b).) As those documents already in existence that comprise the record have not yet been posted, the 45-day comment period has not properly commenced, and may only commence when all of the documents now in the City/OCII's possession that constitute the record are posted. The current comment deadline of July 20, 2015, will need to be extended accordingly. Until there is compliance with the record posting requirements of Public Resources Code section 21086, this project cannot proceed under the AB 900 process.

"Please feel free to call me to discuss proper resolution of the issue of the posting of a complete record as required under the AB 900 process. I also request immediate confirmation that the 45-day DEIR comment period will not commence until the necessary documents, as set forth above, are posted in compliance with AB 900. We look forward to your prompt response." (*Mission Bay Alliance, Soluri Meserve, letter, July 9, 2015 [O-MBA2S1-2]*)

"With analysis scattered throughout the EIR and other documents prepared over the course of 25 years, the fast-tracking of this project's environmental review process is precluding meaningful public participation." (*Osha Meserve, public hearing transcript, June 30, 2015 [PH-Meserve-5]*)

"For this reason, we have requested an extension of the public review period to better match the complexity of this project, and we look forward to further informing the Commission to review this important project." (*Osha Meserve, public hearing transcript, June 30, 2015 [PH-Meserve-7]*)

Response ERP-4: Public Review Period

On July 15, 2015, OCII extended the public review period for the Draft SEIR from July 20, 2015 to July 27, 2015, adding seven days to the original 45-day public review period. OCII determined that under the circumstances of this project, the 45-day period is adequate time for the public to provide meaningful comment on the Draft SEIR but that the extra seven days should sufficiently account for the Independence Day holiday that occurred during the review period. Notwithstanding the fact that some documents were made available to the public after the start of the public review period, as noted in Response ERP-3 above, OCII determined that none of the documents were relied upon in the preparation of the Draft SEIR and that the availability of these specific documents does not affect the ability of the public to provide meaningful comment on the Draft SEIR.

CEQA Guidelines Section 15105(a) provides that "[t]he public review period for a draft EIR shall not be less than 30 days nor should it be longer than 60 days except in unusual circumstances." Consistent with these guidelines, the City's standard public review period for a draft EIR that is submitted to the State Clearinghouse for review by state agencies is 45 days. OCII, in consultation with the San Francisco Planning Department, determined that the conditions under which the public review period for the Draft SEIR on the proposed project occurred are not considered "unusual circumstances" for the following reasons: (1) the project would not affect multiple sites in various locations or an area larger than a single site; (2) an Initial Study on the project was prepared; (3) multiple major federally-recognized holidays did not occurred during the 45-day comment period; (4) there were no particular circumstances in which a population that might have interest in the project would, as a group, have difficulty accessing or reviewing the Draft SEIR (i.e., the project is not located in an area with a high concentration of non-English speakers or parties with limited online access); and (5) the public review period did not need to align with other review periods, such as review under the National Environmental Policy Act. Thus, OCII has determined that the total public review period of 52 days is adequate time for the public to provide meaningful comments on the Draft SEIR and no further extension is warranted.

It should be noted that the Initial Study on the proposed project was published on November 14, 2014, over six months prior to publication of the Draft SEIR, which provided ample opportunity for the public to review and comment on the scope of the Initial Study and SEIR. The Initial Study included a description of the site's historical land uses and associated soil and groundwater contamination and provided a detailed impact analysis of the potential impacts of the proposed project related to hazards and hazardous materials. As indicated in SEIR, Chapter 2, Table 2-1, no comments on hazards or hazardous materials were received during the scoping period for the Draft SEIR.

Please see Section 13.4, AB 900 Process, for responses associated with posting of the administrative record for the SEIR.

13.3.6 Recirculation (ERP-5)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

O-MBA5-12 O-MBA6B1-1 O-MBA10L4-38

"The Board of Directors of the Mission Bay Alliance fully supports and endorses the comment letters and reports listed above, and respectfully urges the City to remedy the DSEIR's informational deficiencies and circulate a Revised DSEIR for a 45 day public comment period." (*Mission Bay Alliance, Bruce Spalding, letter, July 27, 2015 [O-MBA5-12]*)

"On behalf of the Mission Bay Alliance ("the Alliance"), please respond to these enumerated comments on the Draft Subsequent EIR vis-à-vis project alternatives as well as the analysis and mitigation of aesthetics, land use, and cultural resources impacts. Substantial omissions in these topic areas require revision and recirculation of the EIR to inform the discretion of the City and to apprise the concerned public." (*Mission Bay Alliance, Susan Brandt-Hawley, letter, July 26, 2015 [O-MBA6B1-1]*)

"Hence, the document should be recirculated in draft status for a full 45 day review period." (*Mission Bay Alliance, Thomas Lippe, letter, July 27, 2015 [O-MBA10L4-38]*)

Response ERP-5: Recirculation

The commenters request that the Draft SEIR be revised and recirculated for public review. CEQA Guidelines Section 15088.5(a) sets forth the conditions under which recirculation of an EIR is warranted prior to certification. These conditions do not apply to the Draft SEIR on the proposed project for the reasons described below. Thus, OCII has determined that recirculation of the Draft SEIR is not warranted.

New information is added to the EIR including changes in the project. As described in Chapter 12 of this Responses to Comments document, the project sponsor has developed several project refinements subsequent to publication of the Draft SEIR, but all of the refinements are minor changes (generator relocation, project design to reduce wind hazards, transportation improvements, revised construction tower crane plan, modification of certain construction techniques, and modification of sources of electricity during construction). As also described in Chapter 12, none of these refinements would result in changes to the impact conclusions presented in the Draft SEIR. Chapter 12 also introduces a new variant to the project, a minor variation of the proposed project that would generally have the same impacts as those identified for the proposed project in the Draft SEIR and all impact significance determinations would be the same. These additions to the SEIR are considered insignificant modifications, and do not warrant recirculation.

New information is added to the EIR including changes in the environmental setting as well as additional data or other information. There have been no changes to the environmental setting since publication of the Draft SEIR. In addition to the project refinements and other information presented in Chapter 12 described above, supplemental data and information have been developed since publication of the Draft SEIR to further support the information already presented in the SEIR. None of this supplemental information affects the conclusions or results in substantive changes to the information presented in the Draft SEIR. This supplemental information and study results are considered insignificant modifications to the SEIR and do not warrant recirculation. (See *Mount Shasta Bioregional Ecology Center v. County of Siskiyou* (2012) 210 Cal.App.4th 184, 221 [incorporation of technical studies in the FEIR did not involve a new significant impact, a substantial increase in the severity of an environmental impact, or the rejection of a feasible project alternative or mitigation measure].) The supplemental data and

information are described in various places in this Responses to Comments document as appropriate, including in Chapter 14, Draft SEIR Revisions, and are summarized below:

- *Off-site Parking Lots Analysis*. Appendix TR-X of this Responses to Comments document includes a technical memorandum describing a follow-up study to support Mitigation Measure M-TR-11c, Additional Strategies to Reduce Transportation Impacts of Overlapping Events, identified in the Draft SEIR, Section 5.2 (page 5.2-180). Changes to the Draft SEIR resulting from this study are included in Chapter 14, Draft SEIR Revisions, of this Responses to Comments document. See Appendix TR-X for further discussion.

- *Phase II Environmental Site Assessment, Site Mitigation Plan, and Dust Monitoring Plan*. As described further in Section 13.22 of this report, the project sponsor completed these reports subsequent to the publication of the Draft SEIR in accordance with 1999 Mission Bay Risk Management Plan, Article 22A of the San Francisco Health Code, and Building Code Section 106A.3.2.6. Results of these studies have helped refine the construction methods for the proposed project, and have not changed the impact conclusions of the SEIR or the Initial Study.

- *Design Refinements to Reduce Wind Hazards*. The Draft SEIR identified Mitigation Measure M-WS-1, which described potential design measures that would serve to reduce or avoid the significant wind hazard impact. Since publication of the Draft SEIR, the project sponsor selected an on-site design modification from the list of potential measures that reduces the project wind hazard impact to less than significant, as verified by wind tunnel testing. See Chapter 12 for further discussion.

- *Archeological Testing Program*. Since publication of the Draft SEIR, the sponsor conducted an archaeological testing program to: (1) to determine if buried soils representing former stable and livable land surfaces during the Early to Middle Holocene period are intact or if the upper surfaces were eroded in antiquity; and (2) to assess the presence or absence of previously unidentified buried prehistoric archeological resources. An Archaeological Testing Report (ATR) prepared indicates that the testing program revealed no evidence of intact, livable Early to Middle Holocene land surfaces underlying the project area. In addition, the ATR indicates the testing program did not identify any archeological resources or other evidence of past human use and/or occupation associated with buried deposits on the project site. See Section 13.10, Cultural Resources, for further discussion.

- *Additional Reconnaissance-level Surveys of Biological Resources***.** Additional reconnaissance-level surveys of the project site were conducted by professional biologists in September and October 2015, and no substantial changes to biological site conditions were observed from what was documented in the Initial Study. See Section 13.19, Biological Resources, for further discussion.

- *Tsunami Hazard Mapping*. In August 2015, a more detailed analysis of tsunami risks at the project site was conducted to determine the maximum inundation level. The results determined that the project site elevation would be above the maximum tsunami inundation level, corroborating the conclusion in the Initial Study that the project impact related to tsunami risk would be less than significant. See Section 13.21, Hydrology and Water Quality, for further discussion.

A new significant impact would result from the project or from a new mitigation measure proposed to be implemented. No new significant impacts and no new mitigation measures have been identified since publication of the Draft SEIR.

A substantial increase in the severity of an environmental impact would result unless mitigation measures are adopted that reduce the impact to a level of insignificance. No substantial increase in the severity of an environmental impact has been identified since publication of the Draft SEIR.

A feasible project alternative or mitigation measure considerably different from other previously analyzed would clearly lessen the environmental impacts of the project, but the project's proponents decline to adopt it. No new feasible alternatives or mitigation measures that would lessen the impacts of the project have been identified since publication of the Draft SEIR that the project sponsor has declined to adopt.

The draft EIR was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded. As described further in Response ERP-6 below, the Draft SEIR meets the standards of adequacy of an EIR consistent with CEQA Guidelines Section 15151. The Draft SEIR, including the Initial Study presented in Appendix NOP-IS, provides a complete analysis of the physical environmental effects of the proposed project at a project-level of detail and covering all of the environmental topics required under CEQA and in full compliance with CEQA (California Public Resources Code, Sections 21000 *et seq*.) and the CEQA Guidelines. Based on the nature and volume of public comment received on the Draft SEIR, as evidenced by the list of persons commenting in Chapter 11 of this document and the comments presented in Appendices COM and PH, meaningful public review and comment did indeed occur.

As described in Response ERP-3 above, some documents were made available to the public after the start of the public review period in response to specific requests from the public. However, as noted in Responses ERP-3 and ERP-4, OCII determined that none of the documents were relied upon in the preparation of the Draft SEIR and that the availability of these specific documents did not affect the ability of the public to provide meaningful comment on the Draft SEIR during the 52-day public review period. Similarly, for the same reasons, availability of these documents to the public after the start of the public review period does not warrant recirculation.

In response to Comment O-MBA6B1-1 regarding specific environmental topics, please refer to the following sections of the SEIR: Alternatives, see SEIR Chapter 7 and Responses to Comments Section 13.24; Aesthetics, see SEIR Chapter 2, Appendix NOP-IS Initial Study Section E.2, and Response ERP-8, below; Land Use, see Appendix NOP-IS Initial Study Section E.1 and Responses to Comments Section 13.8; and Cultural Resources, see Appendix NOP-IS Initial Study Section E.4 and Responses to Comments Section 13.10.

13.3.7 CEQA Standards of Adequacy (ERP-6)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

O-MBA5-2	O-MBA5-9	O-MBA6B1-2	O-MM-7
O-MM-20	O-MM-21	I-Lighty-8	PH-Sesich-3

"… the City's Draft Subsequent Environmental Impact Report ("DSEIR") for the project does not present a good faith, adequate analysis of these impacts." (*Mission Bay Alliance, Bruce Spalding, letter, July 27, 2015 [O-MBA5-2]*)

"These are but a few of dozens of legal defects the Alliance's counsel found in the DSEIR. The volume, scope, and depth of the DSEIR's legal flaws demand, and suggest, an explanation. It appears the Warriors and the City have been in such a rush to get this Project approved and built that they have ignored elementary principles of environmental analysis and CEQA law in the process. The sources of this haste are presumably the previous January 1, 2016, deadline, now extended to January 1, 2017, to certify the EIR in order to obtain the litigation streamlining benefits of AB 900, and the expiration, in late September of 2015, of the Warriors option to purchase the site from Salesforce.com." (*Mission Bay Alliance, Bruce Spalding, letter, July 27, 2015 [O-MBA5-9]*)

"1. Mission Bay EIRs Did Not Consider an Event Center

"EIRs, including the Draft Subsequent EIR ("the DSEIR"), are measured for "adequacy, completeness, and a good faith effort at full disclosure." (CEQA Guidelines, § 15151.) Whether the Event Center EIR analysis meets that measure presents a question of law. (*E.g., Vineyard Area Citizens v. City of Rancho Cordova* (2007) 40 Cal.4th 412, p. 435.)

"An overarching problem with the DSEIR is its misapplication of CEQA via a conclusory reliance on earlier CEQA documents — the 1990 Mission Bay EIR and 1998 Mission Bay Subsequent EIR — prepared for the Redevelopment Plan for the Mission Bay South Redevelopment Project and its related Design for Development. The City cannot now rely on those EIRs because both the Redevelopment Plan and the Design for Development contemplated no uses comparable to the Event Center. Its environmental effects were not "adequately examined by an earlier EIR." (Pub. Resources Code, § 21094; Guidelines, § 15063.) (*Mission Bay Alliance, Susan Brandt-Hawley, letter, July 26, 2015 [O-MBA6B1-2]*)

"These defects make the DSEIR legally inadequate, since it fails to inform the public and decisionmakers of the Project's true impacts and fails to mitigate them. Further, the DSEIR's conclusory statements are in many instances unsupported. The large number of references to other EIR's and documents on other projects make the document user-unfriendly and its conclusions unsupported. The minimal public comment period on the DSEIR from June 5 to July 27, 2015, is inadequate for a Project of this size, regional importance, magnitude, and severity of impact, and a DSEIR of this complexity. The location of the Project area in downtown San Francisco and the large number of affected travelers and residents in the area make this Project of regional and statewide importance. Therefore, this public comment is necessarily incomplete, and other comment may be submitted later on issues not addressed here. The following are some inadequacies of the DSEIR." (*Mary Miles, Attorney at Law, email, July 27, 2015 [O-MM-7]*)

"11. The SDEIR Lacks Objectivity.

"The DSEIR fails to fulfill CEQA's requirement of objectivity, instead advocating for the Project sponsor. The lack of objective analysis flaws the DSEIR as an informational document and violates CEQA. (See e.g., Citizens for Ceres v. Superior Court (2013) 217 Cal.App.4th 889, 918-919.)" (*Mary Miles, Attorney at Law, email, July 27, 2015 [O-MM-20]*)

"For the foregoing and other reasons, the DSEIR is legally inadequate in violation of CEQA." (*Mary Miles, Attorney at Law, email, July 27, 2015 [O-MM-21]*)

"Overall, we are disappointed in the City's approach to environmental review of this project, which fails to fully assess the impacts of the project and fails to provide adequate mitigation for the impacts that are identified in the Draft EIR." (*Michael Lighty, email, July 27, 2015 [I-Lighty-8]*)

"And I must praise the organization of the Warriors too. I think they've done a good job of reaching out. But when I read the Environmental Report, I came across terms like "provide adequate," "various management strategies," "encourage," "should not," "commercially reasonable efforts." All that could be sidestepped and not get what you want." (*Michael Sesich, public hearing transcript, June 30, 2015 [PH-Sesich-3]*)

Response ERP-6: CEQA Standards of Adequacy

Commenters' opinions regarding the objectivity or adequacy of the Draft SEIR are noted. Because many of these comments are general in character, and do not provide specific examples of the lack of objectivity of the Draft SEIR, or cite particular inadequacies in the analysis, specific responses to these comments are not provided. (*City of Irvine v. County of Orange* (2015) 238 Cal.App.4th 526, 546-548; *Friends of the Eel River v. Sonoma County Water Agency* (2003) 108 Cal.App.4th 859, 878; *Gilroy Citizens for Responsible Planning v. City of Gilroy* (2006) 140 Cal.App.4th 911, 937.) OCII provides the following, general responses to these general comments.

Objectivity of Analysis

OCII believes that claims regarding lack of objectivity are incorrect. The Draft SEIR has been prepared by consultants working at the direction of OCII. The Draft SEIR identifies these consultants. These consultants are experts in their respective fields, and are qualified to perform the analyses set forth in the Draft SEIR. Staff from various City departments have also participated in the preparation of the Draft SEIR. Consultants and City staff assisting with the preparation of the Draft SEIR are listed in Chapter 9, pages 9-1 and 9-2, and the qualifications of the consultants are on file at OCII and the Planning Department.

The project sponsor has also provided information relied upon by OCII in the preparation of the Draft SEIR. Project sponsor representatives and consultants include those listed at SEIR page 9-3. Information provided by the project sponsor is located in OCII's files, and (pursuant to AB 900) has been posted on the web site maintained by OCII for the project. The web site is located at:

http://www.gsweventcenter.com/. This same web site includes all other documents received by OCII. Thus, the information available to OCII in preparing the Draft SEIR is also available to the public. In this respect, OCII's evaluation of the project has been transparent and publicly accessible in accordance with AB 900.

Prior to taking action on the project, the OCII Commission will determine whether to certify the SEIR. To certify the document, the OCII Commission must, among other things, certify that the SEIR reflects the independent judgment of OCII. (Pub. Resources Code, § 21082.1, subd. (c)(3).) If the Commission determines that the SEIR has not been prepared in an objective manner, then the Commission will not certify the SEIR. The certification process provides further assurance of the objectivity of the analysis, in that it provides decision-maker oversight of the work performed by consultants and staff.

Time Frame within which CEQA Analysis has been Performed

OCII does not believe that the environmental review process has been truncated or "rushed." OCII released a "Notice of Preparation of an Environmental Impact Report" on November 19, 2014. OCII held a scoping meeting on December 9, 2014, and accepted comments on the Notice of Preparation (NOP) through December 19, 2014. A copy of the NOP is provided at Appendix NOP-IS, a summary of comments received on the NOP is presented in the SEIR pages 2-11 to 2-21, and copies of all comments received on the NOP are available at http://www.gsweventcenter.com/. This process meets the requirements of CEQA (CEQA Guidelines, § 15082.) OCII released the Draft SEIR on June 5, 2015. OCII held a public hearing to receive comments on the Draft SEIR on June 30, 2015. Initially, the comment period ended on July 20, 2015. In response to requests, OCII extended the comment period to July 27, 2015. The public review process meets the requirements of CEQA. (CEQA Guidelines, §§ 15085, 15087, 15105.)

CEQA identifies certain projects as of "statewide, regional, or areawide significance." (CEQA Guidelines, § 15206.) The comment period for EIRs for such projects must be not less than 45 days. (CEQA Guidelines, § 15105, subd. (a).) The public review period for the project's Draft SEIR exceeds this time period.

CEQA provides agencies with discretion to seek to shorten the public review period. (CEQA Guidelines, § 15105, subd. (d), Appendix K.) OCII has not sought to shorten the public review period for the project. Comments speculating about the reasons why the environmental review process has been truncated or rushed are based on an incorrect premise.

The project has been certified by Governor Brown as an environmental leadership development project under AB 900. As a result of such certification, the project is subject to the requirements of Public Resources Code section 21185. This section provides that litigation involving OCII's approval of the project will be subject to rules adopted by the Judicial Council with respect to such projects. These rules do not address the CEQA process performed by OCII; rather, these rules pertain only to litigation involving the project. (See Pub. Resources Code, § 21189.) In particular, Governor Brown's certification of the project under AB 900 does not alter the rules applicable to OCII with respect to the substance of its environmental analysis. The time lines that

apply to EIRs generally are the same as those that apply to OCII for the proposed project. CEQA provides that lead agencies should generally complete the CEQA process within one year after the date the lead agency determines that the project application is complete. (CEQA Guidelines, § 15108.) In this case, the CEQA process has been carried out in a manner that is consistent with this requirement, and OCII disagrees that the process has been "rushed."

Advocacy

The SEIR does not advocate for or against the project. The SEIR does not contain any general statements of support for the project, or urge OCII to approve the project. Instead, the SEIR provides a detailed, objective analysis of the impacts that may result in the event the OCII Commission approves the project, and identifies mitigation measures to address those impacts determined to be significant. OCII has received a number of comments on the SEIR that express opinions in favor of or opposition to the project (see Section 13.2, Response GEN-5). Opinions regarding the merits of the project will be considered by OCII as part of its decision-making process. (*Twain Harte Homeowners Assn. v. County of Tuolumne* (1982) 138 Cal.App.3d 664, 686.) Those comments are included in the Final SEIR, however, so they will be available to decision-makers.

Reliance on, and Citation to, Other Documents

The SEIR describes the Mission Bay Redevelopment Plan, and the 1990 EIR and 1998 SEIR certified in connection with the approval of that plan. (Draft SEIR, pp. 1-1 to 1-3, 2-2 to 2-8, 3-6 to 3-9; Notice of Preparation / Initial Study, pp. 4 to 6.) These prior EIRs have been relied upon by the Redevelopment Agency and, following its dissolution, by OCII to approve various projects in the Mission Bay area. These projects have generally been approved based upon addenda to the 1990 and 1998 EIRs. (See Draft SEIR, p. 2-5.) The SEIR being prepared for the proposed project is noteworthy in that it represents the first time OCII has prepared a subsequent or supplemental EIR, rather than an addendum, for a specific project within the Mission Bay Redevelopment Plan area.

OCII's reliance on the 1990 EIR and 1998 SEIR and the Mission Bay Redevelopment Plan is appropriate. The Plan is the governing statement of land-use policy in the area in which the proposed project is located. The 1990 EIR and 1998 SEIR analyze the impacts of development of the area, including development of the project site. The Draft SEIR is clear regarding those areas in which OCII has relied on the analysis set forth in the 1990 EIR and 1998 SEIR. To the extent the Draft SEIR relies on the 1990 EIR and 1998 SEIR, those documents are readily available, and can be reviewed for information regarding those subjects addressed by the 1990 EIR and 1998 SEIR.

OCII has reviewed the project against the analysis set forth in the 1990 EIR and 1998 SEIR to determine whether the project's impacts were adequately addressed in the prior EIRs. OCII has determined that certain impacts were adequately addressed in the prior EIRs. This analysis is reflected in the Initial Study prepared for the project, which is included at Appendix NOP - IS to the Draft SEIR. OCII circulated the NOP - IS for a 30-day comment period, as required by CEQA, and also held a public scoping meeting. (CEQA Guidelines, § 15082.) OCII did not receive comments regarding its reliance on the 1990 EIR and 1998 SEIR during the scoping period. Lead

agencies routinely use Initial Studies in the preparation of EIRs to determine which, if any, topics do not require further, detailed analysis in the EIR.

In response to the comment regarding the Mission Bay EIR considering an event center, please refer to the discussion on the consistency of the project with applicable land-use policies, including the Mission Bay Redevelopment Plan, as provided in Sections 13.5, 13.6, and 13.8 of the Response to Comments document.

OCII acknowledges that the Draft SEIR contains a number of references to other documents, including the 1990 EIR and 1998 SEIR. The documents referenced in the Draft SEIR are publicly available and, as required by Public Resources Code section 21186, subdivision (b), posted to the web site maintained by OCII at http://gsweventcenter.com. OCII disagrees that the conclusions in the Draft SEIR are unsupported, or that the Draft SEIR is "user unfriendly." Because no specifics are provided in the comment on this point, no further response is provided.

Standard of Review in Litigation

Comments regarding the standard of judicial review do not address the analysis in the Draft SEIR, and therefore do not require a detailed response. In addition, the standard of judicial review will not be determined by commenters, or by OCII, but by the courts. OCII provides the following general observations regarding the applicable standard of review.

A party challenging agency action under CEQA has the burden to show the agency abused its discretion. (Pub. Resources Code, § 21168.5; *Citizens of Goleta Valley v. Bd. of Supervisors* (1990) 52 Cal.3d 553, 564.) If the court finds the agency has abused its discretion, then the court considers whether that abuse of discretion is prejudicial. (Pub. Resources Code, §§ 21168.5, 21005; *Neighbors for Smart Rail v. Exposition Metro Line Construction Authority* (2013) 57 Cal.4th 439, 463 (*Neighbors*) [court first considers whether respondent agency abused its discretion, then separately considers whether abuse of discretion was prejudicial].)

In reviewing the record for abuse of discretion, the court presumes the agency complied with the law. (Evid. Code, § 664; *Al Larson Boat Shop, Inc. v. Bd. of Harbor Comm*. (1993) 18 Cal.App.4th 729, 740.) The court presumes the EIR is adequate (Pub. Resources Code, § 21167.3) and "the party challenging the EIR has the burden of showing otherwise." (*Santa Clarita Organization for Planning the Environment v. County of Los Angeles* (2007) 157 Cal.App.4th 149, 158.) An abuse of discretion is shown if (1) the agency failed to proceed in a manner required by law, or (2) the agency's determination or decision is not supported by substantial evidence. (Pub. Resources Code, § 21168.5; see also *id.*, § 21168 ["the court shall not exercise its independent judgment on the evidence"]; *Laurel Heights Improvement Association v. Regents of the University of California* (1988) 47 Cal. 3d 376, 392, fn. 5.)

"Judicial review of these two types of errors differs significantly"; the "court must adjust its scrutiny to the nature of the alleged defect, depending on whether the claim is predominantly one of improper procedure or a dispute over the facts." (*Vineyard Area Citizens for Responsible Growth, Inc. v. City of Rancho Cordova* (2007) 40 Cal.4th 412, 435.) The court determines *de novo*

whether the agency has employed the correct procedures, "scrupulously enforc[ing] all legislatively mandated CEQA requirements." (*Ibid*., internal citations omitted.) If the claim focuses on facts or methodology, then the court upholds the agency's conclusions if supported by substantial evidence. (*Ibid.*; *Santa Monica Baykeeper v. City of Malibu* (2011) 193 Cal.App.4th 1538, 1546 (*Santa Monica Baykeeper*).)

With respect to process, the statute and Guidelines outline broad categories of information that an EIR must include. (e.g., Pub. Resources Code, §§ 21100, 21002.1, subd. (a), 21003, subds. (b)-(c), 21061; CEQA Guidelines, §§ 15122-15132.) A court determines *de novo* whether the agency "failed to proceed in the manner required by law" by omitting from an EIR one or more of CEQA's required topics. (See, e.g., *Sierra Club v. State Board of Forestry* (1994) 7 Cal.4th 1215, 1236 [board failed to proceed in the manner required by law by approving timber harvest plans despite the absence of any site-specific information on the plans' impacts on special status species, based on the false premise that the board lacked authority to require the applicant to provide such information]; *Laurel Heights Improvement Assn. v. Regents of Univ. of Cal.* (1988) 47 Cal.3d 376, 406 (*Laurel Heights I*) [agency failed to analyze foreseeable future phase of project and to analyze project alternatives].)

By contrast, CEQA and the Guidelines provide the lead agency with discretion regarding how to fulfill the requirements of the statute and Guidelines for a particular project. (See Pub. Resources Code, §§ 21061, 21003.1; CEQA Guidelines, § 15064, subds. (b)-(c).) Thus, where a claim goes to the substance of the EIR's analysis, "'[t]he highly deferential substantial evidence standard of review . . .' [is applied] to such determinations." (*California Native Plant Society v. City of Santa Cruz* (2009) 177 Cal.App.4th 957, 984-985 [quoting *Western States Petroleum Assn. v. Super. Ct.* (1995) 9 Cal.4th 559, 572].) Under the substantial evidence test, the court does not rule on the correctness of an EIR's conclusions, but only on its sufficiency as an informational document. (*Save Cuyama Valley v. County of Santa Barbara* (2013) 213 Cal.App.4th 1059, 1066-1067.) "Substantial evidence" means "enough relevant information and reasonable inferences from the information that a fair argument can be made to support a conclusion, even though other conclusions might also be reached." (CEQA Guidelines, § 15384, subd. (a).) In reviewing for substantial evidence, the court "may not set aside an agency's approval of an EIR on the ground that an opposite conclusion would have been equally or more reasonable," for, on factual questions, [the court's] task "is not to weigh conflicting evidence and determine who has the better argument." (*Laurel Heights I*, *supra*, 47 Cal.3d at p. 393.) Rather, the court's role is to "scrutinize the record and determine whether substantial evidence supports the administrative agency's findings and whether these findings support the agency's decision. In making these determinations, the reviewing court must resolve reasonable doubts in favor of the administrative findings and decision." (*Topanga Assn. for a Scenic Community v. County of Los Angeles* (1974) 11 Cal.3d 506, 514.)

The petitioner bears the burden of showing that no substantial evidence in the administrative record supports the agency's actions. To meet this burden, the petitioner must describe the evidence favorable to the agency and show why it is lacking. (*Citizens for a Sustainable Treasure Island v. City and County of San Francisco* (2014) 227 Cal.App.4th 1036, 1064; *Defend the Bay v. City of Irvine* (2004) 119 Cal.App.4th 1261, 1266.) If the record contains any substantial evidence

supporting the agency's decision, the court must reject the CEQA claim. (*Barthelemy v. Chino Basin Mun. Water Dist.* (1995) 38 Cal.App.4th 1609, 1620.)

As one of the comments states, an EIR is reviewed for "adequacy, completeness, and a good faith effort at full disclosure." (CEQA Guidelines, § 15151.) Whether an EIR meets that standard is a question, not of procedure, but of substance. For this reason, the "substantial evidence" standard applies to judicial review of whether the agency has met that standard. (See *City of Long Beach v. Los Angeles Unified School Dist.* (2009) 176 Cal.App.4th 889, 898; *Santa Monica Baykeeper*, *supra*, 193 Cal.App.4th at p. 1546.) Treating this issue as one of procedure, reviewed *de novo*, would turn CEQA compliance into a purely legal exercise to be determined, not by the lead agency, but by the courts. In OCII's view, such an application of CEQA's standard of judicial review is inconsistent with the statute. (See Pub. Resources Code, § 21083.1.)

OCII recognizes that in the event of litigation, the appropriate standard of review will be determined, not by the parties to the litigation, but by the court.

13.3.8 Tiering (ERP-7)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

O-MBA3-1	O-MBA3-3	O-MBA5-4	O-MBA6B1-3
O-MBA7S2-1	O-MBA11L5-11	I-Heath-8	I-Hutson-2
I-Tan-8	PH-Meserve-6		

"The undersigned counsel for the Mission Bay Alliance write on the Alliance's behalf regarding a threshold procedural issue affecting the Draft Subsequent EIR ("DSEIR") for the Warriors Event Center & Mixed Use Development (the "Project"). The DSEIR unlawfully tiers to prior CEQA documents.

"The Mission Bay Alliance objects to the improper use of "tiering" to avoid analysis of important environmental issues in the DSEIR. Both the NOP/IS and the DSEIR announce that they "tier" to the 1998 Mission Bay EIR pursuant to CEQA Guideline 15168(c). (NOP/IS, pp. 23-24; DSEIR, pp. 1-1, 5.1-2, 3.) Both the NOP/IS and the DSEIR exclude resource topics from the DSEIR based on standards CEQA provides to determine when a subsequent EIR is required under Public Resources Code ("CEQA") section 21166 and Guideline section 15162. (See NOP/IS, pp. 23-25; DSEIR, p. 5.1-3.)

"Based on these predicates, the City prepared a focused EIR and conducted no environmental review regarding Biological Resources, Aesthetics, Land Use, Cultural Resources, Paleontological Resources, Geology and Soils, Recreation, Hazardous Materials, and Population and Housing. The exclusion of those topics from the DSEIR is erroneous as a matter of law and precludes informed public review.

"Tiering" under CEQA is not permitted where the later project is a separate project from the earlier project, where the EIR for the earlier project did not include an analysis of the environmental impacts of the later project, or where the later project is inconsistent with the "program, plan, policy, or ordinance for which an environmental impact report has been prepared and certified" or is inconsistent with "applicable local land use plans and zoning of the city, county, or city and county in which the later project would be located." (*Center for Sierra Nevada Conservation v. County of El Dorado* (2012) 202 Cal.App.4th

1156, 1173 (*Sierra Nevada Conservation*); *Sierra Club v. County of Sonoma* (1992) 6 Cal.App.4th 1307, 1318; CEQA, § 21094(b).) (*Mission Bay Alliance, letter, July 26, 2015 [O-MBA3-1]*)

"These major differences between the project described in the 1998 FSEIR (that evaluated the effects of developing the Mission Bay plan area as described in 1998 [see DSEIR Figure 3-7]) and the Warriors Event Center and Mixed Use Development now being proposed, preclude tiering under CEQA section 21094. Therefore, the City cannot use a "tiered" EIR and the DSEIR must be reissued in "non-tiered" form.

"Further, the exclusion of resource topics from the DSEIR is not, as the NOP/IS and DSEIR presume, governed by CEQA section 21166 and Guideline section 15162 or their standards. Pursuant to section 21151, the DSEIR must analyze the Project's impacts on any environmental resource for which substantial evidence supports a fair argument of significant impact. (Protect the *Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal.App.4th 1099 ["EIRs must "consider and resolve every fair argument that can be made about the possible significant effects of a project."]; see also, *Sierra Nevada Conservation*, supra, 202 Cal.App.4th 1156, 1173 ["If a proposed new activity is a separate project, the "fair argument" test should apply to an agency's decision whether to require a tiered EIR.] Sierra Nevada Conservation cited the holding of *Sierra Club v. County of Sonoma*, *supra*, 6 Cal.App.4th 1307, 1318, that under the fair argument test, "deference to the agency's determination is not appropriate and its decision not to require an EIR can be upheld only when there is no credible evidence to the contrary." (Ibid.) Sierra Club applied the fair argument standard to a proposed project that was not "either the same as or within the scope of" the program described in the EIR.

"As discussed in comment letters submitted on behalf of the Mission Bay Alliance, evidence relating to these excluded resource topics meets the "fair argument" standard. Although CEQA section 21166 does not apply here, its standards are also met. Therefore, the City must prepare and recirculate for public review a Revised Draft EIR addressing all Project-related environmental impacts. (Since this is a stand-alone EIR, the title 'Subsequent' is a misnomer.)

"To the extent the City chooses to use data from the 1990 or 1998 Mission Bay EIRs, that information must be restated in the Revised Draft EIR in a manner that results in a single, cohesive, understandable document meeting CEQA's mandates for adequacy, completeness, and a good faith effort at full disclosure. (Guideline § 15151.) (*Sierra Club*, *supra*, 6 Cal.App.4th 1307, 1321.)" (*Mission Bay Alliance, letter, July 26, 2015 [O-MBA3-3]*)

"For example, based on the incorrect premise that the DSEIR is permitted to "tier" to a seventeen year old prior EIR, the DSEIR fails to even discuss half of the environmental topics that an EIR would ordinarily include. One of these excluded topics is "land use." This is truly remarkable considering that the 1998 Redevelopment Plan to which this DSEIR attempts to tier never contemplated a major sports and entertainment center of this type and scale. Instead, the Arena will divert land and civic resources away from the land uses, i.e., health sciences and biotechnology, that the 1998 Redevelopment Plan was intended to promote." (*Mission Bay Alliance, Bruce Spalding, letter, July 27, 2015 [O-MBA5-4]*)

"Every environmental issue that has potentially significant impacts must be addressed in a project---specific EIR for the Event Center, and feasible mitigations and alternatives must be identified. The City instead improperly "tiered" the DSEIR from the prior Mission Bay EIRs to evade full environmental analysis, as counsel for the Alliance have explained in a separate letter. Consequently, the DSEIR fails to analyze many of the potentially significant project-specific environmental impacts of the Event Center. As in Center for Sierra Nevada Conservation v. County of El Dorado (2013) 202 Cal.App.4th 1156, a revised stand---alone EIR must do so." (*Mission Bay Alliance, Susan Brandt-Hawley, letter, July 26, 2015 [O-MBA6B1-3]*)

"The comments set forth in this letter and its attachments address deficiencies contained in the DSEIR's analyses as well as subject areas where the DSEIR impermissibly failed to provide any substantive analysis. The Notice of Preparation / Initial Study ("NOP/IS") for the Project determined that nine topical areas were adequately analyzed in the 1990 and 1998 EIRs prepared for the Mission Bay Redevelopment Plan, and therefore no additional analysis was required in the present DSEIR for these specific areas. A fundamental problem with this approach is that the Mission Bay Plan was 303 acres and lacked site-specific review of the current 11-acre site. In the Mission Bay Redevelopment Plan, the four-block Project area was designated as "Commercial Industrial (Mixed Use including Retail)." (DSEIR, Figure 3-3.) This land use was then analyzed at a very general level. As described in the letter as shown in the "Land Use" section of the July 27, 2015 letter from the Brandt-Hawley Law Group, the Project is not consistent with the Mission Bay Redevelopment Plan or with the land use plans and zoning controls that are subordinate to the Mission Bay Redevelopment Plan.

"In addition to the Project itself being different, the conditions under which the Project is undertaken, as compared to 1998, have changed substantially. Changed conditions include both changes in standards and practices for analyzing impacts, changes in overall environmental conditions, and changes to the site itself. As described in the comment letter submitted by the Mission Bay Alliance regarding tiering, all of these changes, in combination with the massive and impactful Project now being proposed, require preparation of a new EIR that examines every resource area at project-level detail. The City's strategy of relying on a very general environmental review document that is over 17 years old for topics required to be analyzed and mitigated in detail does not work for the public, nor is it compliant with CEQA's most basic requirements." (*Mission Bay Alliance, Soluri Meserve, letter, July 26, 2015 [O-MBA7S2-1]*)

"**III. The DSEIR Is Not Sufficient as an Informational Document with Respect to Project Impacts on Biological Resources, Including Wetlands and Wildlife.**

"A. The City's decision to exclude the Project's impacts on biological resources from the DSEIR is erroneous.

"The City's decision to exclude the Project's impacts on biological resources from the DSEIR (see DSEIR, p. 5.1-1) is erroneous as a matter of law. Both the NOP/IS and the DSEIR announce that their analyses are "tiered" to the 1998 Mission Bay FSEIR pursuant to CEQA Guideline 15168(c). (IS, p. 23-24; DSEIR, pp. 1-1, 5.1-2, 3.) Both the NOP/IS and the DSEIR also announce that the standards used to exclude resource topics from the DSEIR are the standards used to determine if a subsequent EIR is required under CEQA section 21166 and Guideline section 15162. (See NOP/IS, pp. 23-25; DSEIR, p. 5.1-3.)

"Based on these predicates, the City decided to prepare a focused EIR, and to conduct no environmental review with respect to the following resources: Biological Resources, Aesthetics, Land Use Cultural Resources, Paleontological Resources, Geology and Soils, Recreation, Hazardous Materials, and Population and Housing. As discussed in more detail in the July 27, 2015, letter from the Mission Bay Alliance's legal counsel regarding "tiering," the City's assumption that it may prepare an EIR for this Project that tiers to the 1998 Mission Bay FSEIR is legally incorrect. As discussed in several comment letters submitted on behalf of the Mission Bay Alliance, and below regarding the Project's impacts on biological resources, the evidence relating to these excluded resource topics meets both the "fair argument" standard, as well as the CEQA section 21166 standards. Therefore, the City must prepare and recirculate for public review a Revised Draft EIR addressing all of the Project's environmental impacts." (*Mission Bay Alliance, Thomas Lippe, letter, July 24, 2015 [O-MBA11L5-11]*)

"Overall, we are disappointed in the City's approach to environmental review of this project, which fails to fully assess the impacts of the project and fails to provide adequate mitigation for the impacts that are identified in the Draft EIR. Specifically, reliance on the 1998 EIR prepared for entirely different land uses for several important impact areas defies common sense and CEQA's review requirements." (Alison Heath*, email, June 30, 2015 [I-Heath-8]*)

"Overall, I am disappointed in the City's approach to environmental review of this project, which fails to fully assess the impacts of the project and fails to provide adequate mitigation for the impacts that are identified in the Draft EIR. Specifically, reliance on the 1998 EIR prepared for entirely different land uses for several important impact areas defies common sense and CEQA's review requirements." (*Richard Hutson, email, June 29, 2015 [I-Hutson-2]*)

"Overall, we are disappointed in the City's approach to environmental review of this project, which fails to fully assess the impacts of the project and fails to provide adequate mitigation for the impacts that are identified in the Draft EIR. Specifically, reliance on the 1998 EIR prepared for entirely different land uses for several important impact areas defies common sense and CEQA's review requirements." (*Judy Tan, email, July 27, 2015 [I-Tan-8]*)

"And the document is not -- because it is not thorough, in that people have said it's thorough, but there are important issues that are relegated to these other 1998 and 1990 documents that the public must also review in order to understand the project. Land use, geology, soils, recreation, and hazardous materials are some of those topics." (*Osha Meserve, public hearing transcript, June 30, 2015 [PH-Meserve-6]*)

Response ERP-7: Tiering

The comments above question whether OCII has properly relied on the 1990 and 1998 Mission Bay EIRs, and properly applied tiering principles, to focus the analysis of the project in the Draft SEIR. To the extent these comments focus on a particular resource area, responses are provided elsewhere, in the various sections of Chapter 13, which respond to comments pertaining to that particular resource area. Thus, for example, comments regarding the use of tiering principles to focus the SEIR's analysis of biological resources are provided in responses to comment O-MBA11 L5-11 in Section 13.19, Biological Resources. Here, OCII provides overall responses regarding the use of tiering principles, and their applicability to the SEIR prepared for the project.

Program EIRs and Tiering

An EIR should "be prepared with a sufficient degree of analysis to provide decision-makers with information which enables them to make a decision which intelligently takes account of environmental consequences." (CEQA Guidelines, § 15151; see *Dry Creek Citizens Coalition v. County of Tulare* (1999) 70 Cal.App.4th 20, 25-28; *Citizens for a Sustainable Treasure Island*, *supra*, 227 Cal.App.4th at p. 1052.) At the same time, the level of detail in an EIR should "correspond" to the "degree of specificity involved in the underlying activity which is described in the EIR." (CEQA Guidelines, § 15146; see *Al Larson Boat Shop*, *supra,* 18 Cal.App.4th at pp. 741-742 [level of specificity required in an EIR is determined by the nature of the project and the rule of reason].) Thus, an EIR for a construction project will necessarily be more detailed than an EIR prepared for a large-scale plan, "because the effects of the construction can be predicted with greater accuracy." (CEQA Guidelines, § 15146, subd. (a); see also CEQA Guidelines, § 15161 [project EIR focuses impacts of constructing and operating project].)

A program EIR, by contrast, is commonly used in conjunction with "tiering" – "the analysis of general matters contained in a broader EIR (such as one prepared for a general plan or policy statement) with later EIRs and negative declarations on narrower projects; incorporating by reference the general discussion from the broader EIR; and concentrating the later EIR or negative declaration solely on the issues specific to the later project." (CEQA Guidelines, § 15152, subd. (a); see Pub. Resources Code, § 21068.5; CEQA Guidelines, § 15385.) Tiering is appropriate where an EIR is completed for a large-scale plan at an early stage, and further analyses will be prepared at later stages as individual projects are proposed that implement the plan, enabling the agency to consider broad policy alternatives and cumulative impacts early in the process, and to defer analysis of project-level details until specific projects are proposed. (Pub. Resources Code, § 21093, subd. (a) [tiering "helps a public agency to focus upon the issues ripe for decision at each level of environmental review"]; CEQA Guidelines, §§ 15168, subd. (b) [advantages of programmatic review], 15385, subd. (b).) Thus, a program-level EIR, "need not be as detailed as an EIR on the specific construction projects that might follow." (CEQA Guidelines § 15146, subd. (b).) As the California Supreme Court explained in the leading case on tiering and program EIRs:

> [T]he CEQA Guidelines state that "[w]here a lead agency is using the tiering process in connection with an EIR for a large-scale planning approval, such as a general plan or component thereof … , the development of detailed, site-specific information may not be feasible but can be deferred, in many instances, until such time as the lead agency prepares a future environmental document in connection with a project of a more limited geographic scale, as long as deferral does not prevent adequate identification of significant effects of the planning approval at hand."
>
> (*In re Bay-Delta Programmatic Environmental Impact Report* (2008) 43 Cal.4th 1143, 1169-1170 (*In re Bay-Delta*), quoting CEQA Guidelines, § 15152, subd. (c).)

Courts have explained that "[t]iering is properly used to defer analysis of environmental impacts and mitigation measures to later phases when the impacts or mitigation measures are not determined by the first-tier approval decision but are specific to the later phases." (*In re Bay-Delta*, *supra*, 43 Cal.4th at pp. 1169-1170 (*In re Bay-Delta*); see *Center for Biological Diversity v. Department of Fish and Wildlife* (2015) 234 Cal.App.4th 214, 232-240 [upholding program EIR for state-wide fish stocking program]; *Town of Atherton v. California High-Speed Rail Authority* (2014) 228 Cal.App.4th 314, 343-346 (*Town of Atherton*) [upholding program EIR that deferred analysis of construction details]; *Al Larson Boat Shop*, *supra*, 18 Cal.App.4th 729 [upholding first-tier EIR prepared for amendments to Port Master Plan, and rejecting claims that the EIR contained insufficient analysis of alternatives and cumulative impacts]; *Rio Vista Farm Bureau Center v. County of Solano* (1992) 5 Cal.App.4th 351, 371-373 (*Rio Vista*) [upholding EIR for county's hazardous waste management plan]; see also *Koster v. County of San Joaquin* (1996) 47 Cal.App.4th 29, 35-38 [general discussion of concept of "tiering" under CEQA].)

In this case, the 1990 EIR and 1998 SEIR are both "program" EIRs. Further, the 1998 SEIR was identified as a program EIR under State CEQA Guidelines section 15168 for a redevelopment plan EIR under Public Resources Code Section 21090and CEQA Guidelines Section 15180. (1998 FSEIR at I.1.) Both of these EIRs provide first-tier, plan-level analysis of the impacts of

development envisioned under the Mission Bay North and South Plans. Both EIRs have been certified, and the statute of limitations for those plans expired years ago. (Pub. Resources Code, § 21167, subd. (c).) For this reason, both EIRs are presumed to be adequate (Pub. Resources Code, § 21167.2), and comments that these EIRs are not adequate are legally immaterial and do not require a response.

The South Plan authorizes development of the project site, and the 1990 EIR and 1998 SEIR analyze the impacts of development in the area, including the project site. The 1990 EIR and 1998 SEIR therefore provide relevant information for purposes of addressing the impacts of development of the project site.

Use of Program EIR for Purposes of Focusing Second-Tier Review

The CEQA Guidelines address how a lead agency is to use a certified first-tier EIR when analyzing a specific development proposal within the area covered by the plan. CEQA Guidelines section 15152 provides general guidance regarding tiering. Section 15152 states in pertinent part:

> (d) Where an EIR has been prepared and certified for a program, plan, policy, or ordinance consistent with the requirements of this section, any lead agency for a later project pursuant to or consistent with the program, plan, policy, or ordinance should limit the EIR or negative declaration on the later project to effects which:
>
> (1) Were not examined as significant effects on the environment in the prior EIR; or
>
> (2) Are susceptible to substantial reduction or avoidance by the choice of specific revisions in the project, by the imposition of conditions, or other means.
>
> (e) Tiering under this section shall be limited to situations where the project is consistent with the general plan and zoning of the city or county in which the project is located, except that a project requiring a rezone to achieve or maintain conformity with a general plan may be subject to tiering.
>
> (f) A later EIR shall be required when the initial study or other analysis finds that the later project may cause significant effects on the environment that were not adequately addressed in the prior EIR. A negative declaration shall be required when the provisions of Section 15070 are met.
>
> (1) Where a lead agency determines that a cumulative effect has been adequately addressed in the prior EIR, that effect is not treated as significant for purposes of the later EIR or negative declaration, and need not be discussed in detail.
>
> (2) When assessing whether there is a new significant cumulative effect, the lead agency shall consider whether the incremental effects of the project would be considerable when viewed in the context of past, present, and probable future projects. At this point, the question is not whether there is a significant cumulative impact, but whether the effects of the project are cumulatively considerable. For a discussion on how to assess whether project impacts are cumulatively considerable, see Section 15064(i).
>
> (3) Significant environmental effects have been "adequately addressed" if the lead agency determines that:

(A) they have been mitigated or avoided as a result of the prior environmental impact report and findings adopted in connection with that prior environmental report; or

(B) they have been examined at a sufficient level of detail in the prior environmental impact report to enable those effects to be mitigated or avoided by site specific revisions, the imposition of conditions, or by other means in connection with the approval of the later project.

(g) When tiering is used, the later EIRs or negative declarations shall refer to the prior EIR and state where a copy of the prior EIR may be examined. The later EIR or negative declaration should state that the lead agency is using the tiering concept and that it is being tiered with the earlier EIR.

(See also Pub. Resources Code, §§ 21068.5, 21094.)

To the extent that commenters oppose OCII's decision to call the SEIR a tiered EIR, such commenters "improperly focus[] on the EIR's title rather than its substance . . . courts strive to avoid attaching too much significance to titles in ascertaining whether a legally adequate EIR has been prepared for a particular project." (*Citizens for a Sustainable Treasure Island, supra*, 227 Cal.App.4th at p. 1048.) All lead agencies may, prior to preparing any type of EIR, prepare an Initial Study to "[a]ssist in the preparation of an EIR, if one is required, by . . . [f]ocusing the EIR on the effects determined to be significant . . . [and] [e]xplaining the reasons for determining that potentially significant effects would not be significant. . . ." (CEQA Guidelines, § 15063, subds. (c)(3)(A), (C).) Thereafter, CEQA only requires the EIR to "contain a statement briefly indicating the reasons that various possible significant effects of a project were determined not to be significant and were therefore not discussed in detail in the EIR. Such a statement may be contained in an attached copy of an Initial Study." (CEQA Guidelines, § 15128.)

Here, the Initial Study determined that the proposed project would have no new significant impacts or no substantially more severe significant impacts than those previously found significant in the 1998 SEIR on the following resources: Land Use (Initial Study Section E1); Population and Housing (Initial Study Section E3); Cultural and Paleontological Resources (Initial Study Section E4); Air Quality (odors) (Initial Study Section E7); Recreation (Initial Study Section E10); Utilities and Services Systems (water supply and solid waste) (Initial Study Section E11); Public Services (schools, parks, and other services) (Initial Study Section E12); Biological Resources(Initial Study Section E13); Geology and Soils (Initial Study Section E14); Hydrology and Water Quality (construction water quality, groundwater, drainage, flooding, and inundation) (Initial Study Section E15); Hazards and Hazardous Materials (Initial Study Section E16); Mineral and Energy Resources (Initial Study Section E17); and Agricultural and Forest Resources(Initial Study Section E18). In each of these Initial Study sections, the Initial Study properly explains why the project would not have new significant impacts or substantially more severe significant impacts than those previously identified in the 1998 SEIR. The SEIR (pp. 5.1-1 to 5.1-2) acknowledges the conclusions of the Initial Study and refers to the Initial Study, included as Appendix NOP-IS, for further details. Therefore, while OCII finds that the proposed project constitutes a later project within the scope of the prior 1990 EIR and 1998 SEIR, because OCII did not rely on this conclusion to avoid preparing a project-specific EIR for the proposed project or to scope out any impact that

remained potentially significant after mitigation identified in the Initial Study or the 1998 SEIR, OCII's approach to the environmental analysis fully complies with CEQA.

CEQA Guidelines section 15168 provides similar guidance regarding the use of a program EIR to focus analysis of a later project carried out under the plan for which the program EIR was prepared. Section 15168 states:

> (c) Use With Later Activities. Subsequent activities in the program must be examined in the light of the program EIR to determine whether an additional environmental document must be prepared.
>
> (1) If a later activity would have effects that were not examined in the program EIR, a new initial study would need to be prepared leading to either an EIR or a negative declaration.
>
> (2) If the agency finds that pursuant to Section 15162, no new effects could occur or no new mitigation measures would be required, the agency can approve the activity as being within the scope of the project covered by the program EIR, and no new environmental document would be required.
>
> (3) An agency shall incorporate feasible mitigation measures and alternatives developed in the program EIR into subsequent actions in the program.
>
> (4) Where the subsequent activities involve site specific operations, the agency should use a written checklist or similar device to document the evaluation of the site and the activity to determine whether the environmental effects of the operation were covered in the program EIR.
>
> (5) A program EIR will be most helpful in dealing with subsequent activities if it deals with the effects of the program as specifically and comprehensively as possible. With a good and detailed analysis of the program, many subsequent activities could be found to be within the scope of the project described in the program EIR, and no further environmental documents would be required.
>
> (d) Use With Subsequent EIRS and Negative Declarations. A program EIR can be used to simplify the task of preparing environmental documents on later parts of the program. The program EIR can:
>
> (1) Provide the basis in an initial study for determining whether the later activity may have any significant effects.
>
> (2) Be incorporated by reference to deal with regional influences, secondary effects, cumulative impacts, broad alternatives, and other factors that apply to the program as a whole.
>
> (3) Focus an EIR on a subsequent project to permit discussion solely of new effects which had not been considered before.
>
> (e) Notice With Later Activities. When a law other than CEQA requires public notice when the agency later proposes to carry out or approve an activity within the program and to rely on the program EIR for CEQA compliance, the notice for the activity shall include a statement that:
>
> (1) This activity is within the scope of the program approved earlier, and

(2) The program EIR adequately describes the activity for the purposes of CEQA.

An agency may determine that a proposed project is within the scope of a program EIR. In that instance, no further environmental analysis is required, and the agency's conclusion will be upheld if supported by substantial evidence. (*Concerned Dublin Citizens v. City of Dublin* (2013) 214 Cal.App.4th 1301, 1316; *Citizens for Responsible Equitable Environmental Development v. City of San Diego Redevelopment Agency* (2005) 134 Cal.App.4th 598.)

Application of Tiering Principles to Project

One premise underlying the use of either tiering or program EIRs is that the specific project under consideration is consistent with the larger project that was the subject of the first-tier or program EIR. Some commenters state the rules governing tiering ought not to apply because, in their view, the proposed project is not consistent with the Mission Bay South Plan or, alternatively, not within the scope of the program EIRs certified for the Mission Bay area.

OCII disagrees. As discussed above, the Mission Bay Redevelopment Plan analyzed under the 1998 SEIR permits all of the project uses as either principally permitted uses (Office, Retail, Arts Activities, Open Recreation / Outdoor Activity Areas, Parking) or as secondary uses (Assembly and Entertainment Uses, including Nighttime Entertainment and Recreation building uses, as well as other uses such as Public Structures and Uses of a Nonindustrial Character). To permit the project's secondary uses, the OCII Executive Director will be required to make a determination that the proposed secondary use makes a positive contribution to the character of the Plan area, and that the secondary use "will provide a development that is necessary or desirable for, and compatible with, the neighborhood or community." (South Plan, § 302.)

In determining the categories of environmental impacts to address in the SEIR, OCII relied on processes and principles drawn from section 15152, section 15168, and section 15180 of the CEQA Guidelines, with the goal of determining whether the proposed project could cause potentially significant effects not adequately addressed in the prior EIRs. This thought process is embodied in the Initial Study prepared in connection with the Notice of Preparation for the proposed project.

In the Initial Study, OCII's analysis focused on how current the prior analysis remained and whether the proposed project would cause site-specific impacts not anticipated by the previously-prepared programmatic analysis. To the extent that the prior "big picture" analysis (e.g., of the general consequences of developing the overall Mission Bay South Redevelopment Plan area) remained valid, OCII concluded that there was no need for additional, duplicative analysis. Where existing analyses or existing standards or mitigation requirements were insufficient to ensure the avoidance of significant effects or the mitigation of such effects to less than significant levels, OCII opted to address a subject matter in detail in the Draft SEIR, as explained more fully below. In doing so, OCII used an "existing conditions" baseline (see SEIR page 5.1-2), rather than a baseline that assumed full buildout of the original Redevelopment Plan as assumed in the prior EIRs. This approach is environmentally protective insofar as mitigation proposals are addressed at on-the-ground conditions rather than potential future conditions that

might exist at buildout of the Redevelopment Plan as previously conceived. Nothing about this approach represents an insufficiently robust and transparent public process.

Comments cite cases in which the courts have ruled that an agency misapplied the rules governing tiering and second-tier review. Specifically, the comments cite *Center for Sierra Nevada Conservation v. County of El Dorado* (2012) 202 Cal.App.4th 1156 and *Sierra Club v. County of Sonoma* (1992) 6 Cal.App.4th 1307.

In *Center for Sierra Nevada Conservation v. County of El Dorado* (2012) 202 Cal.App.4th 1156, the county certified a program EIR and adopted a general plan. The plan included a policy to develop an integrated natural resources management plan. The plan had two options to protect woodlands: "Option A" required adherence to canopy retention standards and replacing woodland habitat at a 1:1 ratio; and "Option B" required payment of an in lieu fee into the county's integrated plan's conservation fund. Four years later, the county adopted an oak woodland management plan, which laid the groundwork for the "Option B" fee program. To analyze the environmental effects of the management plan, the county prepared an initial study and negative declaration that tiered from the 2004 program EIR. The court ruled that this approach violated CEQA because (1) the oak woodland management plan and Option B fee program were not encompassed in the 2004 program EIR, and (2) the record showed the oak woodland management plan and Option B fee program might have significant effect on the environment. The county erred in relying on a second-tier negative declaration, and should have prepared an EIR.

Similarly, in *Sierra Club v. County of Sonoma* (1992) 6 Cal.App.4th 1307, the county certified a program EIR for a long-term plan to manage aggregate resources. The county later amended the plan and issued a use permit so that a gravel operation could expand. The litigation focused not on the adequacy of the program EIR, but on whether the gravel operation was within the scope of the long-term plan. Because the proposed gravel mine was proposed within a geographic area designated for agricultural uses and not mining within the long-term plan, the court held the county could not use a negative declaration to approve the mine and instead should have prepared a tiered EIR. (*Id*. at pp. 1320-1321.) The case thus illustrates the sort of review an agency must perform when a developer proposes a project that is not consistent with a plan for which the agency certified a program EIR. (See also *Natural Resources Defense Council v. City of Los Angeles* (2002) 103 Cal.App.4th 268, 284-285 [city had to perform project-specific review for port improvement project that was not within the scope of program EIR].)

The current circumstances differ from those at issue in *Center for Sierra Nevada Conservation* and *Sierra Club v. County of Sonoma* in at least two key respects:

> First, the 1990 EIR and 1998 SEIR both contemplated development of the project site in a manner consistent with the Mission Bay Plan. (See, e.g., 1998 Mission Bay FSEIR, Figure III.B.3.) The Mission Bay Plan does not need to be amended for the project to proceed. In *Sierra Club v. County of Sonoma*, in contrast, the county attempted to tier off a program EIR for a project that was located outside the plan area addressed by the program EIR. Moreover, because the court concluded the project in *Sierra Club v. County of Sonoma* was not "the same as or within the project, program, or plan described in the program EIR[,]" the court concluded that "the County should have required a tiered EIR…" (*Id*. at

> p. 1321.) Here, consistent with the approach recommended by the court in *Sierra Club v. County of Sonoma*, OCII directed that a tiered EIR be prepared to evaluate potentially significant project-specific impacts that were not adequately examined in the prior program EIR.
>
> Second, in *Center for Sierra Nevada Conservation* the county relied on a negative declaration to analyze the impacts of the oak woodland management plan, which was impermissible in light of evidence in the record that the plan might result in significant environmental effects. Here, by contrast, OCII does not propose to rely on a negative declaration. Rather, OCII has prepared a Subsequent EIR. Thus, OCII has responded to the potential for significant environmental effects in the manner contemplated by CEQA Guidelines sections 15152 and 15168.

OCII recognizes that, although the project is consistent with the Mission Bay Plan, neither previous EIR expressly contemplated the development of the event center, and that the event center may result in impacts that differ from those contemplated in the 1990 EIR and 1998 SEIR. In many respects, however, the nature of the development that occurs on the site is not relevant to the environmental consequences that will result from development of the site. For example, development of the site will affect cultural resources, if any, that are present there. Those impacts are associated with construction activities such as excavation. The impact will be identical, regardless of whether the project consists of an office building, a research laboratory, an event center, or some other development. In this instance, the nature of the ultimate use does not bear on the underlying impact that the project will cause.

In each instance, the Initial Study explains why the 1990 EIR and 1998 SEIR provide an adequate analysis of these issues. In the language of the CEQA Guidelines, second-tier, project specific review should focus on those impacts that were not "adequately addressed" in the first-tier document (CEQA Guidelines, § 15152, subd. (f)) or "not examined in the program EIR" (CEQA Guidelines, § 15168). That is the approach that OCII has followed here. The Initial Study addresses each resource area, and examines whether the 1990 EIR and 1998 SEIR provide an adequate analysis of the project's impact on that resource area. Where the project might have significant impacts that have not been adequately addressed in the 1990 EIR and 1998 SEIR, either due to the nature of the project, or due to new information that was not previously available, those issues were carried forward for detailed analysis. Where the 1990 EIR and 1998 SEIR provided adequate analysis of a particular resource or the Initial Study determined that the impacts would be less than significant (with or without mitigation), those issues were "scoped out" from analysis in the SEIR. That is generally consistent with the scoping process (whether or not the EIR tiers from prior EIRs), and with the approach called for under CEQA Guidelines sections 15152 and 15168.

As noted above, OCII circulated the NOP / IS for public review from November 19, 2014 to December 19, 2014. This public review period allowed agencies and other interested people and organizations the opportunity to provide comments regarding the appropriate scope of environmental review in the SEIR. No comments were received indicating that tiering principles do not apply, or suggesting that OCII ought not to rely on the 1990 EIR and 1998 SEIR. OCII first

received comments on these issues in comments on the Draft SEIR. The Final SEIR includes responses to these comments.

Comments state the SEIR must address every resource area in which a "fair argument" exists that the project may have a significant environmental effect, citing *Protect the Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal.App.4th 1099.) The Initial Study sets forth OCII's analysis regarding those issues adequately addressed in the 1990 and 1998 EIRs, and explains the basis for OCII's conclusion that further, detailed analysis is not required with respect to certain resource areas. By including this analysis, the Draft SEIR complied with CEQA Guidelines section 15128, which requires that a draft EIR "contain a statement briefly indicating the reasons that various possible significant effects of a project were determined not to be significant and were therefore not discussed in detail in the EIR. Such a statement may be contained in an attached copy of an Initial Study." To the extent comments on the Draft SEIR raise concerns about these resource areas, OCII has responded to those concerns. Under such circumstances, the "fair argument" standard of review does not apply. When an agency determines that a particular impact would not be significant, and therefore does not warrant further discussion in an EIR, those determinations are reviewed under the "substantial evidence" test.

Notably, in *Protect the Historic Amador Waterways v. Amador Water Agency*, *supra*, 116 Cal.App.4th at p. 1113, the Court of Appeal explained that, if an EIR contains a brief statement of reasons for concluding an impact is less than significant, then the petitioner has the burden of demonstrating "the conclusion was not supported by substantial evidence in the administrative record." The court applied this principle in rejecting the petitioner's contention that the EIR had not dealt sufficiently with the subject project's potential impacts on riparian habitat on local streams. (*Id*. at pp. 1113-1114; see also *North Coast Rivers Alliance v. Marin Municipal Water District* (2013) 216 Cal.App.4th 614, 638-639 [lead agencies' brief statements under CEQA Guidelines section 15128 that impacts are less than significant must be upheld if supported by substantial evidence]; *Eureka Citizens for Responsible Government v. City of Eureka* (2007) 47 Cal.App.4th 357, 375-376 [same].) The Initial Study is part of the Draft SEIR, and therefore may be relied upon by OCII to support its conclusions. Because the Initial Study is part of the EIR, the "substantial evidence" test applies to OCII's conclusions regarding whether the project will have significant environmental effects.

It should also be noted that in many instances the Initial Study includes detailed analysis of potential environmental impacts equivalent to the level of detail required for EIRs. And the Initial Study is included as part of the Draft SEIR. (See SEIR Vol. 3.) Thus, the standard of review applicable to EIRs, also applies to the analysis in the Initial Study.

Comments state the rules applicable to supplemental review under Public Resources Code section 21166 are inapplicable. These comments are incorrect. (Pub. Resources Code, § 21094, subd. (b)(3) [rules governing tiering require further review where standard set forth in section 21166 are met]; CEQA Guidelines, § 15168, subd. (c)(2) [refers to CEQA Guidelines section 15162, which deals with the standards that trigger the preparation of subsequent EIRs, in stating that agencies may dispense with further review where a subsequent activity is determined to be "within the scope of the project covered by the program EIR"].) The same standard applies under both Public Resources Code

section 21166 and CEQA Guidelines section 15168 to determine whether further review is required for an activity covered by a program EIR. (*Citizens for a Sustainable Treasure Island, supra,* 227 Cal.App.4th at p. 1051.)

13.3.9 Aesthetics (ERP-8)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

O-MBA6B1-8 I-Hong-11 I-McDougal-3 I-Pollack-2

"While the Initial Study and the DSEIR rely upon Public Resources Code section 21099 to excuse the lack of analysis of aesthetics, claiming that such impacts of a mixed-use project on an infill site within a transit priority area are not subject to CEQA review, the DSEIR acknowledges that the Mission Bay South urban design standards apply to the Event Center project. The DSEIR must still consider aesthetic impacts that are addressed and protected by the City's design review ordinances.

"These impacts are significant. The height and bulk of the project, sited directly on the waterfront, will disrupt views and alter the aesthetics and community character carefully planned for Mission Bay South for many years. The City's fundamental vision for Mission Bay would be forever compromised by dropping a tall, bulky sports arena at the water's edge, destroying planned vara blocks and historic view corridors." (*Mission Bay Alliance, Susan Brandt-Hawley, letter, July 26, 2015 [O-MBA6B1-8]*)

"7. Aesthetics of the project, both the sponsor and the architects have done an wonderful job. However, I do disagree with some of the comments made on the describing the Area. The use of color Photosimulations has done an excellent job in showing what this arena may look like. As the design, color and material could have an impact on the visual skyline. I also realize CEQA does not require this step. (*Dennis Hong, email, July 27, 2015 [I-Hong-11]*)

"2. Aesthetics. The Arena, with its round, gleaming design, will be a striking presence on the waterfront and in the neighborhood. The Mission Bay neighborhood has been built, for better or worse, with a very standardized, stucco-box and concrete aesthetic, and the proposed arena will shake that up quite a bit. When the building is empty, which will be most of the time, it will be an enhancement to have a modern building in our midst. Also, the landscaping of the waterfront park will help extend the beautiful jogging/bike trail that's been started further north." (*Bruce McDougal, email, July 27, 2015 [I-McDougal-3]*)

"2. The water front view belongs to all, and the stadium will deprive us of this pleasure" (*Robert Pollak, email, July 23, 2015 [I-Pollack-2]*)

Response ERP-8: Aesthetics

These comments relate to various commenters' views on the aesthetics of the event center and mixed-use development in Mission Bay, with some in favor of and others opposed to the proposed design. As described in the Initial Study, Section E.2 (pp. 36 to 37) and reiterated in SEIR Chapter 2, Introduction (pp. 2-23 to 2-24), the proposed project qualifies as an infill project located within a transit priority area under CEQA Public Resources Code Section 21099 (also known as Senate Bill 743 or SB 743), and as a result of this determination, aesthetics—including effects on scenic vistas and visual character of the site within its surroundings—are not considered in the SEIR in determining the significant environmental impacts of the project.

Nevertheless, outside of the context of CEQA compliance, OCII must still consider aesthetic impacts pursuant to applicable design review ordinances and urban design standards and guidelines. These include the Mission Bay South Redevelopment Plan, Mission Bay South Design for Development, and Mission Bay South Signage Plan. Furthermore, OCII has design review approval authority over the project with respect to the Major Phase and Basic Concept/Schematic Designs for all structures and open space areas.

13.3.10 General Comments on the SEIR and Environmental Topics (ERP-9)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

I-Stryker-1	I-Tan-1	PH-Doniach-1	PH-Doniach-3
PH-Doniach-5	PH-Meserve-3	PH-Mondejar-1	PH-Osmundson-3
PH-Scott-1			

"We also appreciate the City's and GSW's commitment to identify and mitigate negative impacts that could result from the Project. After a careful review of the DEIR, UCSF continues to be concerned about the Project's potential impacts on UCSF' s Mission Bay campus and Medical Center, the greater Mission Bay area and its environs." (*University of California San Francisco, Lori Yamauchi, letter, July 27, 2015 [A-UCSF-1]*)

"The DSEIR is noteworthy because it concedes the Project will cause numerous significant impacts on the Mission Bay community and environment (e.g., traffic, air pollution, noise pollution, and many others). Nevertheless, the Alliance's counsel have discovered many deep flaws in the DSEIR that obscure the true scope and severity of the Project's impacts." (*Mission Bay Alliance, Bruce Spalding, letter, July 27, 2015 [O-MBA5-3]*)

"On behalf of the Mission Bay Alliance ("the Alliance"), please respond to these enumerated comments on the Draft Subsequent EIR vis-à-vis project alternatives as well as the analysis and mitigation of aesthetics, land use, and cultural resources impacts. Substantial omissions in these topic areas require revision and recirculation of the EIR to inform the discretion of the City and to apprise the concerned public." (*Mission Bay Alliance, Susan Brandt-Hawley, letter, July 26, 2015 [O-MBA6B1-1]*)

"This letter will address the DSEIR's omitted analyses of critical project---specific impacts relative to land use, aesthetics, and cultural resources." (*Mission Bay Alliance, Susan Brandt-Hawley, letter, July 26, 2015 [O-MBA6B1-4]*)

"This is Public Comment on the Draft Supplemental Environmental Impact Report ("DSEIR") for the "Golden State Warriors Event Center and Mixed Use Development at Mission Bay Blocks 29-32" ("the Project"). The Project proposes placing a championship basketball team drawing capacity crowds of more than 18,000 for every game in a new sports arena and "event space" with drastically inadequate parking and access for vehicles, inadequate public transportation, less than one mile from the AT&T baseball stadium with overlapping events and already-existing severe traffic congestion. The proposed Project location is directly adjacent to the largest medical facility in San Francisco, creating blocked access for both existing staff, visitors, and emergency vehicles." (*Mary Miles, Attorney at Law, email, July 27, 2015 [O-MM-1]*)

"The Project proposes a sports arena for the Golden State Warriors in San Francisco, relocating that arena and "event center" from its present location in Oakland California to the Mission Bay complex adjacent to new medical centers and residential developments, where the Warriors would then host capacity crowds of 18,000 from all over the Bay Area. (DSEIR, pp.1-8; 5.2-235.) The "events" would be held 225 times per year. (DSEIR p. 1-8.) Even the severely flawed SDEIR admits the Project will generate significant traffic and transit impacts affecting travel throughout the City and the entire region "at multiple intersections and freeway ramps" with "regional transit providers exceeding capacity," "noise and crowd noise affecting sensitive receptors," air quality impacts, wind impacts, and impacts on public utilities, including wastewater facilities with existing already-"inadequate capacity to serve the project's wastewater demand." (SDEIR, p. 1-9.) The SDEIR proposes no effective or publicly enforceable mitigation for those significant impacts." (*Mary Miles, Attorney at Law, email, July 27, 2015 [O-MM-2]*)

"The Potrero Boosters Neighborhood Association believes that, without mitigation, the Arena would significantly impact our neighborhoods for the worse. The SEIR, with its failure to identify reasonable mitigations to predicted impacts, causes us significant concern. That said, we are still optimistic that, with dedicated funding and enforceable agreements between the City and the Warriors, and with appropriate air quality management, there are opportunities to not only accommodate the Arena, but to address concerns with the context in which it is proposed to be built." (*Potrero Boosters Neighborhood Association, J.R. Eppler, letter, July 27, 2015 [O-PBNA-14]*)

"Many have commented on parking, traffic congestion and the impact on nearby hospitals, UCSF and businesses. I fully concur and will not add to the discussion here, except in voicing my support for the filed objections." (*Ralph Anavy, email, July 27, 2015 [I-Anavy-2]*)

"The traffic, noise, pollution, and general crowding and confusion that this plan would bring should be obvious to everyone concerned. I vote no on the arena in Mission Bay." (*Patrick Arack, email, July 24, 2015 [I-Arack-2]*)

Since we've launched our efforts, we've been out talking to employees and residents in the Mission Bay neighborhood. We've heard from hundreds, if not thousands, of people who are concerned about this project and its significant impacts on traffic, parking, access, and quality of life in Mission Bay. (*Alex Doniach, public hearing transcript, June 30, 2015 [PH-Doniach-1]*)

I am submitting that petition today. We have received letters, too, which we're also submitting, from neighbors who are concerned about the impacts of this project on parking, access to hospitals, traffic, and air quality… (*Alex Doniach, public hearing transcript, June 30, 2015 [PH-Doniach-3]*)

"The Draft EIR shows that the project would cause severe traffic gridlock, noise and air pollution in Mission Bay, right next to UCSF and other medical facilities." (*Alison Heath, email, June 30, 2015 [I-Heath-1]*)

"Good afternoon and thank you for the opportunity to comment on this draft SEIR. I am a new resident to San Francisco who has followed this project with interest. Prior to this year I lived and worked in Brooklyn, New York, where I had the opportunity to participate professionally in the planning and public discussion of the Barclays Center arena and associated Atlantic Yards development, which saw the relocation of the Nets basketball team from New Jersey to Brooklyn. Although there are obviously differences between that development and this proposal, there are also some interesting parallels, namely, the creation of a new 18,000 seat multiuse arena at an urban infill site accessible by transit, with major concerns initially expressed by some about traffic and parking impacts.

"I would like to offer some observations on my experience in Brooklyn that can be instructive as we think about how to plan for the Warriors arena development." (*Christopher Hrones, email, June 30, 2015 [I-Hrones1-1]*)

"The Draft EIR shows that the project would cause severe traffic gridlock, noise and air pollution in Mission Bay, right next to UCSF and other medical facilities." (*Michael Lighty, email, July 27, 2015 [I-Lighty-1]*)

"As a professor at UCSF-Mission Bay, I believe that the proposed Warriors Arena will have a devastating impact on the faculty and students of UCSF and on the health care professionals and patients in our hospital. The impact of this project on traffic and transportation is not appropriately analyzed in the portions of the Draft EIR that I have read." (*Michael Stryker, email, July 26, 2015 [I-Stryker-1]*)

"The Draft EIR shows that the project would cause severe traffic gridlock, noise and air pollution in Mission Bay, right next to UCSF and other medical facilities." (*Judy Tan, email, July 27, 2015 [I-Tan-1]*)

"Since we've launched our efforts, we've been out talking to employees and residents in the Mission Bay neighborhood. We've heard from hundreds, if not thousands, of people who are concerned about this project and its significant impacts on traffic, parking, access, and quality of life in Mission Bay." (*Alex Doniach, public hearing transcript, June 30, 2015 [PH-Doniach-1]*)

"I am submitting that petition today. We have received letters, too, which we're also submitting, from neighbors who are concerned about the impacts of this project on parking, access to hospitals, traffic, and air quality …" (*Alex Doniach, public hearing transcript, June 30, 2015 [PH-Doniach-3]*)

"Just yesterday, the California Nurses Association expressed their concerns about this project. In the weeks and months to come, more people will be joining the growing numbers who are coming to understand just how bad this will be for the neighborhood, U.C.S.F. access to emergency care, and traffic throughout the entire east side of the City." (*Alex Doniach, public hearing transcript, June 30, 2015 [PH-Doniach-5]*)

"In our review of the Draft EIR so far, we have found that the traffic, parking, and associated health impacts of the facility will be even more devastating than disclosed in the EIR, and there's inadequate mitigation." (*Osha Meserve, public hearing transcript, June 30, 2015 [IPH-Meserve-3]*)

"So, I just wanted to say that I hope that all of the comments will be taken into consideration and carefully examined. I know I have reviewed the documents that have been presented to us as Commissioners." (*Commissioner Mondejar, public hearing transcript, June 30, 2015 [IPH-Mondejar-1]*)

"There's definitely going to be impacts that have to be mitigated or can't be dealt with --unavoidable impacts. That's always the situation." (*Paul Osmundson, public hearing transcript, June 30, 2015 [PH-Osmundson-3]*)

"I have serious concerns regarding the environmental impacts of the proposed Warriors arena which are not fully disclosed or fully analyzed in the Draft EIR.

"The Draft EIR shows that the project would cause severe traffic gridlock, noise, and air pollution in Mission Bay, right next to the U.C.S.F. and other medical facilities …" (*Damion Scott, public hearing transcript, June 30, 2015 [PH-Scott-1]*)

Response ERP-9: General Comments on the SEIR and Environmental Topics

The comments in this category are general statements regarding overall concerns with the Draft SEIR or potential impacts on various environmental topics. Due to the lack of specific information in these comments, the responses to these comments are incorporated in the responses to specific comments on the same general topics. The reader is referred to other sections of the SEIR for the following topics that are mentioned in this group of comments:

- Air Quality, including health risk: see SEIR Section 5.4 and Responses to Comments Section 13.13
- Alternatives: see SEIR Chapter 7 and Responses to Comments Section 13.24
- Aesthetics: see SEIR Chapter 2, Appendix NOP-IS Initial Study Section E.2, and Response ERP-8, above
- Cultural Resources: see Appendix NOP-IS Initial Study Section E.4 and Responses to Comments Section 13.10.
- Land Use: see Appendix NOP-IS Initial Study Section E.1 and Responses to Comments Section 13.8
- Noise: see SEIR Section 5.3 and Responses to Comments Section 13.12
- Quality of Life: see SEIR Section 5.8, Public Services, and Responses to Comments Section 13.2, Response GEN-2
- Transportation, including traffic, transit, emergency vehicle access and parking: see SEIR Section 5.2 and Responses to Comments Section 13.11
- Utilities: see Appendix NOP-IS Initial Study Section E.11, SEIR Section 5.7, and Responses to Comments Section 13.17
- Wind: see SEIR Section 5.6 and Responses to Comments Section 13.15

13.4 AB 900 Process

13.4.1 Overview of Comments on the AB 900 Process

The comments and corresponding responses in this section cover topics related to the Jobs and Economic Improvement through Environmental Leadership Act (Assembly Bill 900 or AB 900), which is discussed in SEIR Chapter 2, Introduction, Section 2.7, Assembly Bill 900. These include topics related to:

- AB-1: AB 900 Environmental Leadership Certification
- AB-2: AB 900 Administrative Record

For comments and corresponding responses related to the greenhouse gases (GHG or GHGs) emissions impact analysis in the SEIR, please see Section 13.14, Greenhouse Gases Emissions, of this Responses to Comments document.

13.4.2 AB 900 Environmental Leadership Certification (AB-1)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

O-MBA7S2-2	O-MBA7S2-3	O-MBA7S2-4	O-MBA7S2-35
O-MBA7S2-40	O-MBA7S2-41	O-Sierra-1	O-Sierra-9
O-Sierra-10	O-Sierra-11	PH-Greenstein-2	PH-Meserve-4
PH-Mondejar-2	PH-Vaughan-1		

"Under AB 900, a "Leadership Project" receives an expedited CEQA review process and other streamlining benefits. (Pub. Resources Code, § 21178 et seq.) Leadership projects are supposed to create high quality permanent jobs and innovative measures to reduce environmental impacts, including greenhouse gas ("GHG") emissions. As a result of the certification received under AB 900, the DSEIR claims that the Project will "not result in any net additional GHG emissions." (DSEIR, p. 5.5-10.)

"As explained below and in the attached technical comments by SCS Engineers, dated July 20, 2015 ("SCS" attached as Exhibit A), the AB 900 Application process does not meet minimum standards for calculation of GHG emissions, nor does it provide a substitute for CEQA's EIR process or substantive standards. The DSEIR relies entirely on the existence of the AB 900 certification for its analysis of the Project's contribution to the cumulative impact to GHG emissions. While the AB 900 certification is not subject to judicial review (Pub. Resources Code, § 21184, subd. (b)(1)), the content of the Application for AB 900 certification does not substitute for an adequate analysis of GHG emissions in the DSEIR. As a result, the DSEIR fails to meet minimum standards of disclosure and also incorrectly concludes that GHG emissions are less than significant. These flaws in the DSEIR require revision and recirculation of the DSEIR with an adequate GHG analysis." (*Mission Bay Alliance, Soluri Meserve, letter, July 26, 2015 [O-MBA7S2-2]*)

"a. The AB 900 Application Conflicts with State GHG Policies.

"As explained in the SCS Memo (pp. 4-6), the AB 900 Application severely underestimated the emissions from this Project. It did so by overestimating the baseline for comparison, and then by underestimating Project emissions. The AB 900 Application made several unsupported assumptions to minimize the baseline conditions against which the Project's GHG emissions would be compared, including:

- Assuming a 76 percent reduction in baseline GHG emissions from Oracle arena due to relocation of the team to San Francisco, potentially omitting emissions that would occur if Oracle continues to emit more than 24 percent of its current GHG emissions (SCS, p. 4); and
- Overestimating, possibly by a factor of two, the trip linking benefits provided by location of the arena adjacent to other uses (SCS, p. 5). The AB 900 Application then underestimated the Project's GHG emissions by:
- Omitting from its analysis entirely the GHG emissions for structures other than the arena that are planned as part of the Project, including the two 160 foot office towers, the gatehouse, the food hall, Warriors Headquarters, and retail uses, which comprise approximately 730,000 square feet of new uses that clearly will emit GHG (SCS, p. 5; see also NOP/IS, p. 11).

(*Mission Bay Alliance, Soluri Meserve, letter, July 26, 2015 [O-MBA7S2-3]*)

"Additionally, the GHG mitigation offered in the AB 900 Application is not effective. After miscalculating the GHG emissions of the Project, the Application simply states that "with offsets purchased, there will be no net greenhouse gas emissions from the operation of the project." (Leadership Application, p. 9.) Yet, as explained by SCS Engineers (pp. 6-8), there are several flaws with this approach, including:

- Not requiring that any GHG emissions offsets be purchased unless the Project has a 90 percent utilization rate, raising the possibility that GHG emissions offsets would not be purchased at all (SCS, p. 7);
- The failure to require that purchased GHG emissions offsets are verified by the California Air Resources Board ("CARB"), consistent with California GHG reduction policies and AB 32, to ensure that they are real, permanent, quantifiable, verifiable, enforceable, and additional and thus will actually result in GHG emissions reductions (SCS, pp. 2-3, 8; see also Health & Saf. Code, § 38562, subd. (d)(1),(2));
- Not requiring that the emissions offsets purchased as mitigation for the Project be retired so that the offsets cannot be reused later to allegedly mitigate other projects' GHG emissions (SCS, pp. 2, 8);
- Only requiring that GHG emissions from the Project be offset for the first 30 years, ignoring GHG emissions that the Project would continue to produce after that point (SCS, p. 7);
- Using the faulty GHG inventory to estimate total GHG emissions from the Project over a 30-year period now, and allowing the applicant to purchase 30 years of GHG emissions offsets now, rather than continuing to use updated data regarding actual Project GHG emissions (SCS, p. 6); and
- Not including ongoing monitoring to ensure that estimated Project GHG emissions are similar to actual emissions and that purchased GHG offsets are actually effective in reducing GHG emissions (SCS, pp. 7-8).

"In addition to these technical flaws (described in more detail by SCS Engineers in Exhibit A), the reliance on offsets to reduce GHG emissions is inconsistent with the intent of AB 900 to promote use of innovative measures to reduce GHG emissions. (Pub. Resources Code, § 21178, subd. (g).) Design features and/or mitigation measures could actually reduce the project's GHG emissions and create other environmental benefits. Instead, the Project simply plans to write a check to an unknown entity to supposedly "offset" GHG emissions.

"Further, the deduction for GHG emissions based on the assumption that Oracle will only host 21 events into the foreseeable future is unwarranted in light of the City of Oakland's express plans to turn "Coliseum City" into an economically viable sports and entertainment hub. (See pp. 10-12 of July 19, 2015 Comments Regarding Air Quality Impact Analysis and Mitigation; Event Center and Mixed-Use Development at Mission Bay Blocks 29 – 32 by Autumn Wind Associates, Inc., attached as Exhibit 1 to the July 26, 2015 letter from the Law Offices of Thomas N. Lippe regarding the Project's Air Quality Impacts." (*Mission Bay Alliance, Soluri Meserve, letter, July 26, 2015 [O-MBA7S2-4]*)

_____

"Consistent with this approach, the Project's AB 900 Application expressly incorporates into the project description reduced events at the existing Oracle Arena in order to reduce the Project's greenhouse gas emissions. This strategy is depicted both textually and graphically in the AB 900 Application:

> Though the Oracle Arena will no longer host GSW games, it is assumed that approximately 50% of the non-game events will still occur at the Oracle Arena, or 24% of a typical year's game and non-game events will still occur at the Oracle Arena. Thus, emissions calculations for the remaining non-game events at Oracle Arena use a 24% scaling factor to account for this reduction in number of events.

(AB 900 Application, p. 63.)

Table 1. Project Description

Element	Oracle Arena and GSW Oakland Headquarters	Event Center Project
First Operational Year Considered	2017	2017
Oracle Arena	500 KSF	500 KSF
GSW Games[1]	100%, 47 games	No games
Non-game Events[2]	100%, 42 events	50%, 21 events
Mission Bay Event Center	-	750 KSF
GSW Games[1]	-	100%, 47 games
Non-game Events[3]	-	100%, 161 events
GSW Headquarters	Oakland	Mission Bay, 25 KSF

1. Number of GSW games in both scenarios is based on the 2013-2014 season. Averages for the previous years were skewed by the 2011 NBA lockout.
2. Number of non-game events at Oracle Arena is based on the schedule from recent years. In the Event Center Project scenario, half of the non-game events are assumed to remain at Oracle Arena while the other half are transferred to the Mission Bay Event Center.
3. Number of non-game events at Mission Bay Event Center is based on the Notice of Preparation dated 11/19/2014.

"Consistent with the DSEIR's discussion of project objectives on page 1-3 as well as in the AB 900 Application, the DSEIR's analysis of greenhouse gas emissions incorporated event reductions at Oracle Arena for purposes of decreasing the Project's carbon footprint. (DSEIR, p. 5.5-11.) Page 5.5-11 of the DSEIR provides in relevant part:

> As part of the AB 900 application, the project sponsor has committed to purchase carbon credits from a qualified GHG emissions broker in an amount sufficient to offset all GHG emissions from project construction and operations, as reiterated in Improvement Measure I-C-GG-1, Purchase Voluntary Carbon Credits. Net additional GHG emissions would be calculated in accordance with the methodology agreed upon by CARB in connection with the AB 900 certification of the project.[6]

"Thus, while not expressly stated in the text of the DSEIR's analysis of GHG emissions, the analysis nonetheless incorporates reduced events at Oracle Arena for purposes of calculating the project's net GHG emissions.

"**Footnote:**

[6] Curiously absent from the DSEIR's discussion is any reference that the "net additional GHG emissions" from the AB 900 certification expressly relies upon credits from reduced events at Oracle Arena.

(*Mission Bay Alliance, Soluri Meserve, letter, July 26, 2015 [O-MBA7S2-35]*)

"SCS does not agree with the conclusion of the AB900 determination letter from the California Air Resources Board (CARB) dated April 20, 2015 stating that the Project would not result in any net additional GHG emissions for purposes of certification under AB900. The methodology used to conclude there would be no increase in GHG emissions is inconsistent CARB GHG policies such as the First Update to the Climate Change Scoping Plan (CARB 2014) and furthermore does not substitute for an adequate analysis of GHG under CEQA.

"The Project quantified the expected GHG emissions for the construction and operating phases of the Project. The construction emissions were quantified using the California Emissions Estimator Model (CalEEMod) with some site-specific inputs. Operational emissions analysis includes the emissions from the existing Oracle Arena, the existing GSW headquarters, and the proposed Event Center in the analysis. The emissions from the Oracle Arena were quantified using some site-specific values and some intensity factors obtained from CalEEMod and projected electricity intensity factors from CalEEMod. GHG emissions for the proposed Event Center were calculated using a similar methodology, but all electricity and utility use must be projected using CalEEMod factors. The GHG emission calculations for the Event Center also include GHG reductions for energy efficiency and trip linking.

"The Project proposes to achieve GHG neutrality through the acquisition of GHG emission offsets equal to the projected GHG emissions from the Project over a 30-year Project life. The Project includes Mitigation Measure (MM) I-C-GG-1, which requires offsets for GHG emissions from construction and operation of the proposed Event Center.

"The GHG analysis provided and proposed MM I-C-GG-1 are not sufficient to demonstrate that the Project will result in no net increase in GHG emissions for the following reasons:

- GHG methodology includes inappropriate Project operational emission baseline
- Monitoring of GHG emissions is not sufficient to demonstrate that GHG emissions are net zero
- MM I-C-GG-1 does not require use of offsets consistent with California GHG policy

"As a result, the determination in the Draft Subsequent Environmental Impact Report (DSEIR) that GHG emissions are a less than significant impact is erroneous.

"**GHG OFFSETS BACKGROUND**

"GHG offsets are a critical element of the MM I-C-GG-1, which the GHG evaluation indicates would result in net zero GHG emissions from the Project. The concept behind a GHG offset is that a project developer creates GHG emission reductions above and beyond what is considered to be "business as usual" (BAU), meaning that the GHG reduction would not have occurred in the absence of the GHG reduction project. For a GHG reduction offset to be generated for use in the CARB Cap and Trade (C&T) program, the reduction must be *real, additional, quantifiable, permanent, verifiable, and enforceable*. The GHG reduction registries that may create GHG offsets under the C&T program, Climate Action Reserve[1] (CAR), the American Carbon Registry[2] (ACR), and the Verified Carbon Standard[3] (VCS), also adhere to similar principles when creating their GHG offset protocols.

The "Real" requirement for eligible offset sources means that reductions must result from demonstrable action and the methodology used to quantify that reduction must account for appropriate GHG emission sources, sinks, and reservoirs. "Real" assures that GHG generated by GHG offset projects is accounted for and that projects emitting more GHG than they reduce do not generate offsets.

"Offset "additionality" means that the GHG reduction activity must produce a result better than BAU. The activity cannot be the normal practice. For example, destruction of ozone depleting substances (ODS) by

governments is common practice but that destruction is not commonplace for commercial or industrial facilities. Thus, destruction of ODS is not additional when the ODS is sourced from a government but it is additional when the ODS comes from a company facility.

"Quantifiable, verifiable, and enforceable assure that the GHG reduction can be measured, that a third party can confirm the quantification, and that CARB can hold a party liable for performing the GHG offset activity if necessary. These principles provide assurance that GHG reductions are calculated accurately and the supporting data have been reviewed by CARB and a third party verifier.

"The principles of real, additional, quantifiable, permanent, verifiable, and enforceable are critical to achieving the goal of reducing GHG in the atmosphere. The need for these assurances is shown by problems with some markets and programs, such as the Clean Development Mechanism (CDM) and Chicago Carbon Exchange (CCX), which have suffered from a lack of confidence in the legitimacy of the generated GHG reduction offsets.

"CARB currently allows GHG reduction credits for forest projects, livestock projects, ozone depleting substance (ODS) projects, and mine methane capture (MMC). CARB has proposed the adoption of a rice cultivation project type. The livestock, ODS, and MMC projects achieve GHG reduction through the destruction of gases with a high potential for global warming (methane or ODS). For forest projects, the carbon reduction occurs by setting aside forested land where trees remove carbon from the atmosphere and store it as wood and plant material.

"When the GHG offset developer wishes make the offsets available for purchase on the market, the developer uses a third-party verifier to confirm that the project meets program requirements and that reductions have been accurately quantified. The offset registry (CAR, ACR, or VCS) then issues the offsets to the developer. If the protocol was one of those eligible under the C&T regulation, those offsets are traded in the CARB offset market and used for regulatory compliance under the C&T regulation. If those GHG offsets are not generated under a C&T protocol, as apparently intended with the Warriors Arena, they are traded through environmental offset brokers. Non-C&T GHG offsets can be retired at the request of the offset holder to remove those offsets from the market, thereby finalizing the GHG reduction.

"**FLAWS IN PROJECT OPERATIONAL EMISSIONS CALCULATION**

"The GHG analysis in the AB900 Certification by CARB and the Application for *CEQA Streamlining: GHG Emissions Methodology and Documentation* makes several assumptions about the Project operational emissions that are not appropriate, including an assumption that the number of events at the Oracle Arena will be limited to 21 and in the reduction of emissions from the Oracle Arena by a factor of 76 percent.

"**Unsupported Oracle Arena Emission Reductions**

"The GHG analysis underestimates GHG emissions from the Project by using the operation of the Oracle Arena as the baseline emissions (*Application for CEQA Streamlining: GHG Emissions Methodology and Documentation*, Environ 2015). The new arena Project emissions are then calculated by subtracting the projected Oracle Arena emissions from the proposed Project emissions. Operational emissions for the Oracle Arena in the Project scenario assume that all GSW games plus 50 percent of all non-GSW events that occur at the Oracle Arena will be held at the new arena location in San Francisco. This assumption results in a reduction of emissions from Oracle Arena by 76 percent (based on the current 47 GSW games and non-GSW 42 events per year).

"No basis for the validity of this assumption is provided in the GHG analysis. The GHG analysis includes the Oracle Arena in the baseline condition then limits the number of events at the Oracle Arena in the Project scenario, providing the Project with a large and unenforceable GHG credit at the outset of the calculation.

"When assumptions are made that limit impacts from a Project, those assumptions must be the result of enforceable conditions. In this case, MM I-C-GG-1 does not limit the events at the Oracle Arena to a maximum of 21. With no enforceable condition limiting the number of events at the Oracle Arena, it is not appropriate to assume that the number of events will decrease. The GHG analysis has already assumed that arena events will be generated by the Project based on the 89 events at Oracle Arena in the baseline scenario and 229 events in the Project scenario (21 at Oracle Arena, 47 GSW games at the Event Center,

161 non-GSW events at the Event Center). The GHG Analysis provides no justification for the reduced number of events at the Oracle Arena while assuming that the total number of events will increase.

"If an enforceable condition were to be added to limit the number of events at Oracle Arena to only 21, it would be appropriate to reduce GHG emissions in the Project scenario. However, the methodology used to calculate the reduction in emissions associated with the reduced number of events at the Oracle Arena is not appropriate.

"The emissions from the Oracle Arena are also directly scaled using the 76 percent reduction factor based on the number of events. This is unreasonable because it assumes that no emissions occur when events are not scheduled. It is unlikely that the Oracle Arena will cease all energy and utility use while not holding an event. It is even more unlikely that the emissions from area sources (e.g. landscaping equipment) will directly scale with the number of events.

"**Application Omits GHG Non-Arena Buildings**

"The AB900 Application does not include any GHG emissions from the non-Arena buildings that are included in the Project. Only the GHG emissions from the proposed Event Center were included in the AB900 Analysis. Emissions from other structures, including the two 160-foot office towers, the gatehouse, the food hall, GSW headquarters and retail uses for instance, are not included in the analysis, which are 730,000 square feet of space. (DSEIR, p. 2-18 to 2-19, Figure 3-5 and Table 3-1.) This omitted square footage is comparable to the square footage of the Event Center (750,000 square feet), and the emissions could equal or exceed the emissions from the Event Center. The AB900 analysis for the Project scenario omits any GHG emissions from these structures because they are assumed to be "fully vested legal rights" in the Project scenario. (Application, pp. 2, 8.)

"This approach of omitting the GHG emissions from non-Arena facilities in the Project scenario because it is a "fully vested legal right" is inappropriate because those buildings have been included in the Project Description and they do not already exist. Excluding those buildings because of "fully vested legal rights" is inconsistent with CEQA requirements that impacts be evaluated based on the actual (i.e. existing) baseline condition, not a possible (i.e. permitted) condition. Also, since the AB900 certification is for the entire Project, GHG emissions from all project components must be included for the inventory to be complete.

"**Double Counting of Emission Reductions from Trip Linking**

The Project includes a significant GHG emission reduction (7 percent of total before reductions) from trip linking. This GHG reduction accounts for some trips which would combine retail trips and trips to the arena. Some of the project operational GHG emissions were calculated with CalEEMod, and CalEEMod already includes factors for trip linking in its emission calculations for mobile sources. The GHG analysis offers no justification for why the trip linking described in the GHG analysis is not already accounted for in the CalEEMod emission calculation. This error overestimates the benefits of trip linking.

"**Project Methodology is Not Rigorous and is Poorly Defined**

The description of the Project in the AB900 Application performed by Environ and relied upon in the GSW AB900 Application is internally inconsistent. The Environ document describes the Project as "development of a new arena." (Application p. 1.) The Environ Project Description shows the proposed land uses near the proposed Event Center, but does not clearly include the buildings in the Project. The Environ AB900 Application then proceeds with the GHG analysis from only the proposed Event Center, omitting emissions from all other buildings and implying that the Project consists of only the Event Center. That Project described in the Environ Application does not discuss the two office buildings, a gatehouse, food hall, GSW headquarters, and retail uses, and consequently uses inappropriate boundaries when analyzing the GHG emissions from the Project.

"The Project described in the DSEIR consists of the proposed event center as well as two office buildings, a gatehouse, food hall, GSW headquarters, and retail uses.

"That Project Description is consistent with the Project description in the CARB Analysis, and the GSW Application, which includes the Event Center plus several other buildings including the two office buildings, the gatehouse, food hall, and retail uses; however, no emissions from these other sources are included in the evaluation.

"Throughout the AB900 Analysis, the boundaries of the analysis are poorly defined and no justification for the boundaries is provided. The CARB Analysis confirmed the GHG calculations are accurate but failed to analyze the appropriateness of the boundaries or the concept of "vested legal rights" used in the AB900 Analysis.

"The baseline scenario includes the Oracle Arena, though the Project itself involves no modifications to the Oracle Arena. The Project scenario assumes a 76 percent reduction in the emissions from Oracle Arena without proposing modifications to the facility or limiting activity at the Oracle Arena. The Project excludes GHG emissions from towers included in the Project Description from the Project GHG emission calculation. All of these inconsistencies serve to increase the baseline scenario GHG emissions while reducing the Project scenario GHG emissions, resulting in an artificially small increase in GHG emissions from the Project. The actual GHG emissions increase is likely to be significantly larger than the projected increase due to these inconsistent boundaries.

"**THE ALLEGED PROJECT EMISSIONS REDUCTIONS LACK MONITORING AND ENFORCEABILITY**

"The AB900 Application and the 2015 DSEIR refer to mitigation in the form of the acquisition of GHG offsets. MM I-C-GG-1 requires that the Project acquire GHG offsets for the GHG emissions for a 30-year period. As described above, the GHG emissions methodology utilized relied on CalEEMod and projected emissions forward for 30 years. This mitigation is insufficient because it is based on modeled emissions rather than actual emissions, and GHG emissions are projected well into the future with no confirmation that predicted emissions are accurate.

"**30-Year Evaluation Period**

"The evaluation of the Project's operational emissions for purposes of offset purchases is for a 30-year period, which is too long to be consistent with California's GHG policy. Evaluating the GHG emissions for such a long period is not reasonable and not consistent with California's GHG offset program. GHG offsets generated for use in California's C&T program only have a ten year crediting period, with the exception of forestry offsets. This ten year accounting period is consistent with other GHG evaluation programs such as the CAR, ACR, and VCS. Similarly, the California GHG Scoping Plan requires updates every five years. Projecting GHG emissions 30 years into the Project lifetime, and then purchasing offsets for 30 years into the future from an unverified source is unreasonable and will certainly be inaccurate in terms of matching the actual GHG emissions of the Project.

"While the 30-year evaluation period is too long to be consistent with accepted GHG accounting periods, there is no reason to arbitrarily end the Project's GHG emissions after the 30-year period. Oracle Arena opened in 1966, 49 years ago. The proposed Event Center should have a similar operating lifespan of 49 or more years. The analysis of GHG emissions after 30 years is unaccounted for in the GHG evaluation. The conclusion that the Project results in no net GHG emissions is based on MM I-C-GG-1, which requires that the Project acquire GHG offsets for the GHG emissions for a 30-year period. Any GHG emissions after this 30-year period would not be offset, resulting in emissions greater than zero from the Project. The Project must include enforceable conditions to require offsetting of emissions beyond the 30-year period or require cessation of emission after that period.

"**Operational Mitigation Trigger Requirement too Lenient**

"As discussed above, MM I-C-GG-1 requires that operational GHG emissions be offset. The offset requirement is triggered when the Event Center reaches 90 percent utilization. Thus, it is possible that the offset requirement is never triggered. Oracle Arena currently holds 89 events per year. Even if every one of these events were moved to the proposed Event Center, it would be at only 42 percent of the number of events in the Project GHG evaluation. There is no mechanism in the Project or mitigation measures that would require that offsets from the Project be offset if the Project does not reach 90 percent utilization.

"**No GHG Monitoring Plan**

"Monitoring of the mitigation for GHG emissions is inadequate. It has been the experience of SCS that Projects that result in GHG emissions prior to mitigation should be required to submit GHG monitoring plans for relatively small periods of time, typically three to five years. Such periodic reevaluation of GHG emissions is consistent with the California Scoping Plan, which must be updated every five years. Such a plan must

require quantification of GHG emissions since the previous GHG monitoring plan and a projection of GHG emissions until the next GHG monitoring plan. The quantification of historical GHG emissions in each plan must rely on as much site-specific data as feasible. At a minimum, those data must include the electricity use, natural gas use, other utility and fuel use, the number of events, and the event attendance or trip count.

"Such monitoring is also needed to confirm that the energy efficiency assumed in the GHG evaluation due to the Leadership in Energy and Environmental Design (LEED) gold certification is accurate. By using actual measured electricity use to calculate GHG emissions, uncertainties in the actual energy efficiency of the structures would be removed. This monitoring is critical due to the failure of many LEED certified buildings to achieve expected energy use reduction predictions.

"The GHG monitoring plan must also include all facilities included in the GHG emission calculations, including the Oracle Arena. If the Oracle Arena is included in the GHG monitoring plan, GHG emissions resulting from more than 21 events in a year would be then captured by the evaluation. An ongoing GHG monitoring plan would also resolve the issue of GHG emissions after the 30-year evaluation period.

"**MITIGATION APPROACH INCONSISTENT WITH STATE GHG POLICIES**

"The AB900 Application and MM I-C-GG-1 require that the Project proponents obtain GHG emission offsets for the GHG emissions resulting from the Project. However, there is no assurance that the GHG offsets will be consistent with CARB GHG reduction goals.

"The Project is only required to purchase GHG offsets from a "qualified GHG emissions broker." To be consistent with state GHG policy, the offsets should meet California GHG reduction goals and be required to be real, additional, quantifiable, permanent, verifiable, and enforceable. The offsets purchased to meet mitigation requirements should also be thereafter retired and removed from circulation. As written, this "mitigation" allows the credits to be sold again, allowing those same offsets to be used again as mitigation on other projects.

"Because neither the AB900 Document nor MM I-C-GG-1 require that the GHG offsets be obtained from a registry that demonstrates that the offset will result in real, additional, quantifiable, permanent, verifiable, and enforceable GHG offsets, and the language allows the GHG offsets to be sold after acquisition, the measure does not provide any assurance that the Project GHG emissions will be net zero or less than significant.

"**Footnotes:**

[1] Climate Action Reserve Program Manual (CAR October 2011)
[2] American Carbon Registry Standard v4.0 (ACR January 2015)
[3] VCS Program Guide (October 2013)

(*Mission Bay Alliance, Soluri Meserve, letter, July 26, 2015 [O-MBA7S2-40]*)

"The GHG analysis used to support the determination that the Project met the requirements of AB900 is insufficient to demonstrate that the GHG emissions from the Project will be net zero and less than significant under CEQA for the following reasons:

- The GHG analysis makes unsupported assumptions about Oracle Arena, trip linkage, and energy use which artificially lower the expected GHG emissions from the Project and do not provide an accurate evaluation of the GHG emissions that can be expected to result from the Project.
- The GHG analysis does not require project monitoring and periodic GHG reporting to assure the accuracy of the projected emissions.
- The GHG offsets proposed as a mitigation measure are not required to be consistent with California GHG reduction goals and policies, could be used for other projects, and may not ever be required for the operational emissions."

(*Mission Bay Alliance, Soluri Meserve, letter, July 26, 2015 [O-MBA7S2-41]*)

"The Sierra Club does not agree that this project fits the definition of an AB 900 Leadership project. The state legislature passed, and the governor signed, AB 900 as an economic boost during the Great Recession. It was designed to fast track infill projects through any CEQA litigation proceedings if those projects created good permanent jobs while at the same time minimizing environmental impacts, including GHG emissions, as determined by the CARB. We are well past the Great Recession, and California's economy is booming. In this midst of this boom, the project sponsors have proposed constructing a venue to nearly match the current Oracle Arena in capacity." (*Sierra Club, Susan E. Vaughan, letter, July 27, 2015 [O-Sierra-1]*)

"The Sierra Club does not agree that the purchase of carbon credits is an adequate method for reducing greenhouse gases, in this case, or that the purchase of carbon credits, in this case, render the project "GHG neutral." (*Volume 2, 5-5-11: As part of the AB 900 application, the project sponsor has committed to purchase carbon credits from a qualified GHG emissions broker in an amount sufficient to offset all GHG emissions from project construction and operations, as reiterated in Improvement Measure I-C-GG-1, Purchase Voluntary Carbon Credits*.) The Sierra Club believes mitigations should be implemented at the point of impact." (*Sierra Club, Susan E. Vaughan, letter, July 27, 2015 [O-Sierra-9]*)

"The Sierra Club is also concerned that there is no requirement to purchase carbon credits until the site is 90 percent leased and occupied, and, for the arena, until 90 percent of the available booking dates are utilized. (Volume 2, 5-5-12). If more than 10 percent of the facility remains vacant and/or more than 10 percent of the available booking dates are never filled, the project sponsors will never have to purchase carbon credits – let alone mitigate for the impacts of all the additional car traffic and transit use on the ground. The Sierra Club believes that the project sponsors should mitigate for all GHG emissions." (*Sierra Club, Susan E. Vaughan, letter, July 27, 2015 [O-Sierra-10]*)

"Additionally, the Sierra Club thinks that the requirement to mitigate for greenhouse gas emissions should not end after 30 years, as the project sponsors propose, but should continue as long as the facility is in use." (*Sierra Club, Susan E. Vaughan, letter, July 27, 2015 [O-Sierra-11]*)

"They made a promise to offset 100 percent of the arena's greenhouse gas emissions by paying to the state's Carl Moyer program, which funds the upgrade of vehicles such as dirty school buses, in terms of getting clean, fuel-burning buses. This focus on climate-change mitigation is the future of responsible building, and I'm proud that the Golden State Warriors are leading the way." (*Adam Greenstein, public hearing transcript, June 30, 2015 [PH-Greenstein-2]*)

"The project is also being mis-advertised as greenhouse gas neutral. Purchasing unverified assets from a broker for 4,000 tons per year of carbon dioxide is not mitigation and doesn't do anything to help the localized air pollution that will become so much worse under the gridlocked conditions." (*Osha Meserve, public hearing transcript, June 30, 2015 [PH-Meserve-4]*)

"And one other thing that just occurred to me -- that the purchasing of carbon offsets is something that was new to me this afternoon. That, I didn't get out of -- I need a little bit more of an understanding of that, but I'm sure that you could respond to that." (*Commissioner Mondejar, public hearing transcript, June 30, 2015 [PH-Mondejar-2]*)

"I'm very concerned that a piece of State legislation, AB 900, was extended purely for the reason just to get this project -- and apparently one in L.A. -- through the fast-track process so that there are fewer hearings, maybe, for the public. And I'm very concerned about that." (*Susan Vaughan, Public Hearing Transcript, June 30, 2015 [PH-Vaughan-1]*)

Response AB-1: AB 900 Environmental Leadership Certification

Many commenters confuse the greenhouse gases (GHG) analysis conducted for the AB 900 process with the GHG emissions impact analysis conducted for the SEIR as part of the CEQA environmental review process. As described in the response below, the AB 900 process and the Governor's certification of the proposed project as an environmental leadership project is a separate process from the CEQA process with different requirements. Even though both the AB 900 process and the CEQA process require analysis of GHGs, the two processes have separate and distinct requirements and purposes. For further discussion of the SEIR analysis for GHG emissions as required under CEQA, please refer to SEIR Section 5.5 and Section 13.14 of this Responses to Comments document.

SEIR Chapter 2, Section 2.7 (pp. 2-21 to 2-23), describes the Jobs and Economic Improvement through Environmental Leadership Act (Assembly Bill 900 or AB 900). The project sponsor (GSW Arena LLC, an affiliate of the Golden State Warriors LLC) applied to the governor of California for certification of the proposed project as a leadership project under AB 900, and the application was subject to public review from March 2, 2015 through April 1, 2015. On March 21, 2015, the California Air Resources Board (CARB) issued Executive Order G-15-022 determining that the proposed project would not result in any net additional GHGs for purposes of certification under AB 900. On April 30, 2015, Governor Jerry Brown certified the proposed project as an eligible project under AB 900,[1] and the Governor's Office of Planning and Research (OPR) forwarded the Governor's determination to the Joint Legislative Budget Committee. OPR prepared an independent evaluation of the transportation efficiency analysis.[2] On May 22, 2015, the State Legislative Analyst's Office indicated that the project aligns with the intent of AB 900, and recommended to the Joint Legislative Budget Committee that they concur with the Governor's determination. On May 27, 2015, the Joint Legislative Budget Committee concurred with the Governor's determination that the project is an eligible project under AB 900.[3]

The AB900 process included a public comment period from March 2, 2015, to April 1, 2015, prior to the Governor's Certification on April 30, 2015. AB 900 does not, however, affect the local project approval process, which has included numerous informational and public hearings, and which will require additional public hearings prior to a decision on the merits of the project. As discussed in Response AB-2 below, the AB 900 administrative record is complete, sufficient, and publically available (hosted at http://gsweventcenter.com/).

1 http://opr.ca.gov/docs/GSW_determination.pdf
2 http://opr.ca.gov/docs/ex2.pdf
3 http://opr.ca.gov/docs/warriors_final.pdf

The process of certifying a proposed project as an environmental leadership project pursuant to AB 900, including quantification of GHG emissions, is a separate process from the preparation of an EIR under CEQA, with separate and distinct review and approval requirements. In order to qualify for AB 900 judicial streamlining a project must meet certain criteria. First, the project must be "residential, retail, commercial, sports, cultural, entertainment, or recreational in nature" and second, it must "entail a minimum investment of $100 million in California upon completion of construction." Additional requirements include consistency with a Sustainable Communities Strategy if adopted by the applicable metropolitan planning organization and accepted by CARB, that the project be located at an infill site, that the project qualify for LEED Silver certification, that the project achieve at least ten percent greater transportation efficiency than comparable projects, and that the project does not result in "any net additional" GHG emissions, as determined by CARB (PRC 21178 et seq.).

The proposed event center and mixed use development complies with all AB 900 criteria, as certified by the Governor, with the assistance of the Governor's Office of Planning and Research. The proposed project is, by design, retail, commercial, sports, cultural, entertainment, and recreational in nature, meeting the first criterion of an AB 900 project. All other criteria are supported in the Application for Environmental Leadership Development Project.[4] The project, as described in Exhibit F of the AB 900 application, would invest $100 million in California upon completion of construction and satisfy the prevailing and living wage requirements of Public Resources Code section 21183(b). The project design aims for LEED Gold certification (exceeding LEED silver qualifications), generating LEED points through, for example, site selection and density, stormwater and landscaping water controls, and waste diversion. Alternative transportation measures would contribute to anticipated LEED points (final LEED certification is not granted until a project is completed and operational) and would also contribute to the 10 percent increase in transportation efficiency over comparable projects. The project would be served by local public transit via Muni and regional public transit via Caltrain and BART. In addition, the project would include a number of transportation improvements that would reduce the automobile mode share, including the Mission Bay TMA Shuttle Program improvements and the Muni Special Event Transit Service Plan (see SEIR pp. 5.2-46 to 5.2-69).

The AB 900 GHG emissions analysis of the project uses a methodology established by CARB for purposes of determining whether the project would result in any net additional emissions of greenhouse gases, which is different from the approach used for the SEIR GHG emissions analysis under CEQA. The AB 900 GHG analysis required by CARB is a quantitative analysis of GHG emissions, while the SEIR GHG impact analysis required by OCII for CEQA purposes is a qualitative analysis (see SEIR page 5.5-9 and Section 13.14 of the Responses to Comments document for a description of the SEIR GHG approach to analysis).

The commenter's assertion that the AB 900 application "does not clearly include the buildings in the Project" is acknowledged. As described above, the AB 900 GHG analysis was conducted consistent with CARB requirements and has been approved by CARB. The GHG emissions for

[4] Available online at http://opr.ca.gov/docs/2015.02.17_GSW_Blocks29-32_AB900_Application_Submission.pdf

the AB 900 application were estimated using standard methods that were confirmed by CARB to be in accordance with AB 900. The methodology included the use of CalEEMod® and emission factors developed by CARB for use in AB 900 projects.[5] For discussion of the GHG analysis used in this SEIR, please see SEIR Section 5.5 and Section 13.14 of the Responses to Comments document.

In addition, the AB 900 analysis for GHG emission uses purchased offsets to achieve "no net additional" GHG emissions. This offsets program involves the purchase of voluntary carbon credits and follows AB 900 precedent, based on the Soitec Solar Energy Project, McCoy Solar Energy Project, and 8150 Sunset Boulevard determinations. The Golden State Warriors (GSW) have committed to retiring the offsets once purchased so they cannot be used for other projects. As set forth in the CARB staff evaluation approved by CARB as part of the AB 900 process, "[t]he Applicant has committed to execute a contract to offset the net increase in GHG emissions generated during project operation no later than six months after the arena component of the project is 90 percent leased and occupied. The Applicant will enter into a binding and enforceable agreement with the project's lead agency (OCII) to offset all GHG emissions associated with project operation and will purchase any necessary offsets from a qualified GHG emissions broker." (ARB Staff Evaluation, p. 2.) The requirement to purchase carbon credits to offset operational GHG emissions is a binding and enforceable condition of approval of the project, as this amendment to the project sponsor's AB 900 application was accepted as part of the Governor and Joint Legislative Budget Committee approvals. As explained further in Section 13.14, the requirement to purchase carbon credits to offset operational GHG emissions is not relied upon in the SEIR as a basis for the conclusion that the proposed project's GHG emissions are less than significant. However, as the requirement to purchase such credits is, pursuant to the AB 900 process, a binding and enforceable obligation, the requirement to purchase offsets is identified as an improvement measure in the SEIR that will further reduce the proposed project's less-than-significant GHG emissions impact (see Section 5.5, p. 5.5-12). If the project is approved, this improvement measure will be incorporated into the Mitigation Monitoring and Reporting Program and will thereby become an enforceable condition of the project's approval.

Comments state this requirement may not be enforceable if the project never becomes 90 percent leased and occupied. CARB established the timing of this obligation – at "project stabilization" – to ensure that operational GHG emissions are calculated when the project is fully operational, and thus, offsets will reflect actual, operational GHG emissions. If operational GHG emissions were to be calculated prior to project stabilization, the quantity of offsets acquired by the project sponsor may be insufficient to offset emissions of the project.

Comments question whether the project will ever meet "project stabilization," as defined in the AB 900 application. OCII acknowledges this comment. The terms of this commitment were approved, not by OCII, but by the Governor, in consultation with CARB, as part of the AB 900 certification process. CARB performed a thorough review of the GHG analysis performed on the

[5] http://opr.ca.gov/docs/ARBDeterminationAppleCampus2.pdf

proposed project for the AB 900 process. As detailed in its determination letter of April 20, 2015, CARB Executive Officer Richard Corey writes:

> ARB staff conducted a technical evaluation of the GHG emission estimates and voluntary mitigation submitted by GSW and confirmed the documentation provides an adequate technical basis for estimating total GHG emissions and voluntary mitigation for the Event Center. Based on the documentation submitted by GSW, ARB has determined the Event Center does not result in any net additional GHG emissions for purposes of certification under AB 900.[6]

OCII acknowledges that the commenter (O-MBS7S2-4) disagrees with GHG mitigation developed as part of the AB 900 application and finds flaws with the approach to analysis. However, OCII concurs with the determination of CARB and the Governor's certification. Given that the GHG analysis for the AB 900 certification was subject to public review from March 2, 2015 to April 1, 2015 and that the GHG analysis and results for the AB 900 process have been reviewed and approved by CARB (the state agency charged with developing and implementing statewide policies), no further response is required in this document regarding the assumptions and methodology used for the GHG emissions analysis for the AB 900 process.

OCII acknowledges that the commenter (Comment O-MBA7S2-40) disagrees with the CARB determination letter on the AB 900 application for the project, but OCII defers to the conclusions of CARB as stated in that letter. Similarly, OCII acknowledges that the commenter (Comment O-Sierra-1) does not agree that this project fits the definition of an AB 900 leadership project, but OCII defers to the Governor's certification of the project as an eligible project under AB 900 and the Joint Legislative Budget Committee's concurrence with the Governor's determination.

OCII's environmental review process under CEQA is not affected by the Governor's decision to designate the project an "Environmental Leadership Project." OCII has performed the CEQA analysis of the project in the same manner as it would for a project that is not so designated. The attributes of the project that qualify it for designation by the Governor are described in the SEIR, and the project sponsor will be required to carry them out. The sole "benefit" associated with the project's designation as an environmental leadership project is that, if OCII approves the project and a lawsuit is filed challenging that decision, then the litigation will be subject to certain deadlines that would not apply to a project that is not so designated. (See Pub. Resources Code, § 21178 et seq.)

For responses to comments concerning the adequacy of the GHG analysis in the SEIR, see Section 13.14, Response GHG-2. For responses to comments concerning the impacts of future uses of the Oakland Coliseum, see Section 13.7, Response IO-1.

13.4.3 AB 900 Administrative Record (AB-2)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

O-MBA2S1-1 O-MBA4-1

"This firm represents the Mission Bay Alliance with respect to the Warriors Event Center project. Under Public Resources Code section 21186, which pertains to preparation of the administrative record for projects under the AB 900 "Environmental Leadership" process:

> (a) The lead agency for the project shall prepare the administrative record pursuant to this division concurrently with the administrative process.
>
> (b) All documents and other materials placed in the administrative record shall be posted on, and be downloadable from, an Internet Web site maintained by the lead agency commencing with the date of the release of the draft environmental impact report.
>
> (c) The lead agency shall make available to the public in a readily accessible electronic format the draft environmental impact report and all other documents submitted to, or relied on by, the lead agency in the preparation of the draft environmental impact report.

"Upon review of the records posted at www.gsweventcenter.com it is apparent that all of the available documents that would be part of the record as defined by Public Resources Code section 21167.6, subdivision (e) are not included. For instance, references cited in the 2015 DSEIR, 2014 NOP/Initial Study, the 1998 Mission Bay SEIR and the 1990 Mission Bay EIR are not included. These references would fall under both Public Resources Code section 21186, subdivision (c) (documents relied upon by lead agency) as well as Public Resources Code section 21167.7, subdivision (e)(10) (materials relevant to compliance with CEQA). (See also CEQA Guidelines, § 15150, subd. (b) ("Where part of another document is incorporated by reference, such other document shall be made available to the public . . . .).)

"As just one example, a cultural resources evaluation that was prepared for the 1990 Mission Bay EIR and referenced in the 2014 NOP/Initial Study that is the basis of the entire cultural resources section is also missing.[1] Since the 2015 DSEIR completely relies on analyses found in prior environmental review documents for analysis of cultural impacts (and several other resources), it is essential that the public have access to all of the documents that form the basis for this analysis. Additionally, some references in the 2015 DSEIR are not yet included on the website. For instance, the 2015 DSEIR cites to "54 Federal Register 38044, September 14, 1989." (DSEIR, p. 5.4-13, fn. 21.) This office has also already requested several reference documents cited in the NOP/Initial Study and other reference documents that are critical to analysis of seismic hazards for the site and appreciates your attempts to locate those documents. (See email attached as Exhibit A.)

"Moreover, we believe that not all of the correspondence regarding the project has been posted. (See Pub. Resources Code, §§ 21167.6, subd. (e)(7), (10), 21186, subd. (c).) Specifically, all of the documents responsive to Mr. Spaulding's May 18, 2015 Sunshine Act/Public Records Act request would properly be included in the record and appear to not yet be posted on the record website.

"**Footnote:**

[1] "Cultural Resources Evaluation for the Mission Bay Project, San Francisco, CA" Dec. 1987, prepared by David Chavez & Associates. This report is cited at page VI.J.30 of the 1990 EIR and referenced on page 46 of the November 19, 2014 NOP/Initial Study. There is also a 1997 Archaeological resources review, also prepared by David Chavez & Associates, and referenced in the Initial Study that is not included in the online record.

(*Mission Bay Alliance, Soluri Meserve, letter, July 9, 2015 [O-MBA2S1-1]*)

"The undersigned counsel for the Mission Bay Alliance write on the Alliance's behalf regarding the Draft Subsequent EIR ("DSEIR") for the Warriors Event Center & Mixed Use Development (the "Project"). The City's failure to post online administrative record documents before starting the DSEIR comment period renders the Project ineligible for the litigation streamlining provisions of AB 900.

"On July 9, 2015, the Mission Bay Alliance advised the City that it had failed to post available portions of the administrative record online as required by CEQA section 21186, subdivision (b), and as a result, the 45-day comment period on the DSEIR could not commence. The City responded on July 16, 2015, stating that the record was complete and that the documents alleged to be missing were not considered by the City in preparing the DSEIR. The City also extended the public comment period by a mere seven days, a decision it explained elsewhere was to "account for any time off that the public may have enjoyed over the Independence Day holiday." (July 15, 2015, Letter from OCII to Tom Lippe.)

"The City's position ignores CEQA's statutory language regarding the required content of the record. Under CEQA section 21186, subdivision (a), preparing the "administrative record pursuant to this division" means that the record posted must include all of the available documents that are part of the record as defined by section 21167.6, subdivision (e).[1] The 45-day public comment period cannot begin until all existing administrative record documents are posted to the City's record website.

"Regarding specific documents the City has omitted from its record website, the City has taken the position that references cited in the 2015 DSEIR, 2014 NOP/Initial Study, the 1998 Mission Bay SEIR and the 1990 Mission Bay EIR are not part of the record and that the online record is complete. But this position is entirely at odds with the City's reliance on a tiered SEIR. Since the 2015 DSEIR relies completely on analyses found in prior environmental review documents to avoid analysis in the DSEIR of at least half the CEQA mandated resource areas, it is essential that the public have access to all of the documents that form the basis for these analyses.

"Additionally, the online record is missing additional categories of documents. For example, the City has failed to post correspondence among City employees and with consultants regarding the project. The Mission Bay Alliance understands that several different consultants and City agencies are involved in the project, yet there is not even a category on the record website for this correspondence. These materials are part of the record. (CEQA § 21167.6, subd. (e)(2).) The City has also failed to post agendas and staff notes from ongoing weekly City meetings regarding this Project and its environmental review.[2]

"There has also been staff correspondence regarding the procedures applicable to the online record, such as a June 10, 2015, ESA memorandum entitled: AB 900 Administrative Record Update Procedures for the Golden State Warriors Event Center and Mixed Use Development at Mission Bay Blocks 29-32.

"These are just a few examples of how the City has not carried out its obligation to post all available record documents online before commencing the 45-day comment period. Contrary to the position taken in the City's July 16, 2015, letter, which implies the public must identify the missing documents, it is the City's duty to locate, index, and post the documents comprising the record.

"AB 900 requires the City to post all available record documents online when the DSEIR is issued in order to receive its litigation streamlining benefits. For this purpose, "record documents" is defined in CEQA section 21167.6, subdivision (e). The City cannot have it both ways. It cannot violate AB 900's record posting requirements and at the same time enjoy the benefits of AB 900's litigation streamlining provisions. Therefore, in order to take advantage of AB 900's litigation streamlining provisions, the City must post all existing record documents before commencing the 45-day comment period. Otherwise, the Project is ineligible for the streamlining provisions of AB 900. (*Sierra Club*, *supra*, 6 Cal.App.4th 1307, 1321.)

"**Footnotes:**

[1] The City cannot argue AB 900 implicitly repealed section 21167.6 because the Legislature is presumed aware of existing law when it acts (see, e.g., *Voters for Responsible Retirement v. Board of Supervisors* (1994) 8 Cal.4th 765, 779, fn. 3). This is especially true here, where the relevant definition is within the same statute the Legislature amended.

[2] To the extent these documents are posted, they are not individually indexed as required. (See Cal. Rules Court, rule 3.2205.)

(*Mission Bay Alliance, letter, July 26, 2015 [O-MBA4-1]*)

Response AB-2: AB 900 Administrative Record

On June 5, 2015, the date of publication of the Draft SEIR, OCII posted the complete administrative record for the proposed project and associated CEQA review process in accordance with the requirements of AB 900. All documents and other materials in the administrative record were posted in a downloadable format at the following website: http://gsweventcenter.com. The posted documents included over 300 separate files as well as project correspondence dating back to June 2012. The administrative record contains the Draft SEIR and all other documents submitted to, directly cited or relied on by, the lead agency and its environmental consultants in the preparation of the Draft SEIR and Initial Study.

The commenters cite a number of examples of reference materials that they believe should be part of the administrative record. Documents submitted to or, relied upon by the lead agency, including documents referenced in the Draft SEIR and 2014 Notice of Preparation/Initial Study were made available on the date of release of the Draft SEIR, as required by AB 900. Additional documents identified in the comment are not part of the administrative record that must be posted online for this project and, as such, they were not posted to the website at the time OCII released the Draft SEIR. OCII does not believe that all references included *within* sources relied upon must also be included in the online record. Moreover, to the extent a commenter disagrees with the content of the record that may ultimately be certified by OCII pursuant to AB 900, Public Resources Code section 21186(i) provides the remedy that may be pursued. Specifically, "[a]ny dispute arising from the administrative record shall be resolved by the superior court. Unless the superior court directs otherwise, a party disputing the content of the record shall file a motion to augment the record at the time it files its initial brief." (*Ibid*.)

Since publication of the Draft SEIR and the original posting of the administrative record, OCII has continually added documents to the website as they have been received or produced in accordance with the requirements of AB 900.

The specific responses to the documents identified are presented below:

- "A cultural resources evaluation that was prepared for the 1990 Mission Bay EIR." The commenter is correct that this study is mentioned in the Initial Study prepared for the proposed project. However, the commenter is mistaken that this report "is the basis of the entire cultural resources section." This report in question is mentioned in the Initial Study as the background study used for the historic and prehistoric archaeological resources analysis in the 1998 Mission Bay Final SEIR, but it is not cited as a reference document for the Initial Study. The Initial Study acknowledges the conclusions of the programmatic 1998 Mission Bay Final SEIR, but it also provides a project-level, site specific analysis of potential impacts of the proposed project on archaeological resources based on current, site-specific data collected as part of an archaeological testing and monitoring program. The impact analysis in the Initial Study does not rely on the previous cultural resources evaluation that was prepared for the 1990 Mission Bay EIR.

  As requested by the commenter during the public review period, OCII has provided a copy of the subject cultural resources report to the commenter and has also posted the report on the AB 900 administrative record website for the project.

- Correspondence among City and OCII employees and with consultants regarding the project. All substantive correspondence to and from City and OCII employees that are relevant to the preparation of the Draft SEIR, compliance with CEQA, or the decision on the merits on the project, have been posted on the AB 900 website.

- Agendas and staff notes from ongoing weekly City and OCII meetings regarding this project and its environmental review. Agendas and staff notes that are relevant to the preparation of the Draft SEIR, compliance with CEQA, or the decision on the merits on the project, have been posted on the AB 900 website. OCII has determined that beyond the information posted in City and OCII correspondence, the specific agendas and staff notes from project meetings were not materially relied upon in the preparation of the Draft SEIR. California Rules of Court 3.2205, cited in the comment, applies to organization of CEQA administrative records lodged with a superior court, and does not require separate indexing of agendas or notes from staff meetings.

- Staff correspondence regarding the procedures applicable to the online record. As stated above, all substantive correspondence to and from City and OCII employees regarding the proposed project and relevant to the preparation of the Draft SEIR have been posted on the on line AB 900 administrative record website, including the particular memo referenced by the commenter.

- The commenter is correct in noting that the following reference is cited in the Draft SEIR but is excluded from the on-line AB 900 administrative record website: 54 Federal Register 38044, September 14, 1989. The online administrative record need not, and does not, include all of the codified laws and legal regulations that guide preparation of the Draft SEIR. These documents are already available to the public, including from many online sources.

- Mr. Spaulding's May 18, 2015 Sunshine Act/Public Records Act request sought documents regarding multiple land use projects, including a Railyard Alternatives and I-280 Boulevard Feasibility study, which is not related to the proposed project. Thus, the documents responsive to that request are not a part of this project's administrative record. Because the commenter does not note any specific documents that the commenter believes should be included in the proposed project's administrative record, this response cannot provide any more specific details.

Please refer to Section 13.3, Environmental Review Process, Response ERP-4 regarding the public review period for the Draft SEIR.

13.5 Project Description

13.5.1 Overview of Comments on the Project Description

The comments and corresponding responses in this section cover topics discussed in SEIR Chapter 3, Project Description. These include topics related to:

- PD-1: Mission Bay Redevelopment Plan, South Plan Area Development Controls
- PD-2: Assumptions for SEIR impact analysis
- PD-3: Construction Assumptions
- PD-4: Project Characteristics—Sustainability

13.5.2 Mission Bay Redevelopment Plan, South Plan Area Development Controls (PD-1)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

O-MBA3-2	O-MBA5-1	O-MBA5-10	O-MBA6B1-6
I-Anavy-1	I-Anavy-4	I-Barton-4	I-Osborn-2
I-Woods-9	I-Zboralske-28		

"Here, as shown in the "Land Use" section of the July 26, 2015, letter from the Brandt-Hawley Law Group, the Project is not consistent with the Mission Bay Redevelopment Plan or with the land use plans and zoning controls that are subordinate to the Mission Bay Redevelopment Plan. None of them include, anticipate, or allow a 750,000 square foot Event Center! The 2015 DSEIR also states that the Project requires "amendments to the Mission Bay South Design for Development, and modifications to the Mission Bay South Signage Master Plan and Mission Bay South Streetscape Plan, and conditions of approval," among other changes, in the list of approvals required for the Project." (DSEIR, p. 3-51.) (*Mission Bay Alliance, letter, July 26, 2015 [O-MBA3-2]*)

"The Mission Bay Alliance objects to approval of this Project and certification of this EIR for the reasons stated in this letter.

"The Alliance opposes this Project because it will change the Mission Bay community and environment in ways never envisioned when the Mission Bay Redevelopment Plan was adopted in 1998 ..." (*Mission Bay Alliance, Bruce Spalding, letter, July 27, 2015 [O-MBA5-1]*)

"a. The Event Center is not 'Nighttime Entertainment' as Defined in the Mission Bay South Redevelopment Plan. The primary objective of the Warriors Event Center is to "[c]onstruct a state-of-the-art multi-purpose event center in San Francisco that meets NBA requirements for sports facilities […]" (DSEIR, p. 1-3.) The Mission Bay South Redevelopment Plan designates Blocks 29-32 as Commercial Industrial/Retail. While the mixed-use commercial/retail development portion of the project is an allowed

primary use, the Event Center itself would have to qualify as "Assembly and Entertainment: Nighttime Entertainment" in order to be approved as an allowed "secondary use" under the Plan.

"The Initial Study pronounces that the Event Center — the primary project use — is encompassed within the secondary "nighttime entertainment" use analyzed in the Mission Bay EIR and is thus allowed on the Commercial Industrial/Retail site. The City contends that the Event Center is a nighttime entertainment use per the 1998 EIR, although "the size and intensity of the event center use was not previously analyzed." (NOP/IS, p. 33.)

"This is not based on fact. Aside from being a "secondary" use of the site, the Warriors Event Center does not meet the plain language of the "nighttime entertainment" designation that anticipates and encompasses small---scale clubs, restaurants, and bars.

"(Mission Bay South Redevelopment Plan, p. 50.) At the time of the 1998 EIR, several small neighborhood bars occasionally offered nighttime entertainment. This minor "secondary" use that existed in the area thus appeared to be compatible with the 3rd Street Corridor and the waterfront. Nothing in the definition of "nighttime entertainment" anticipates or allows a venue of the type or at the scale now proposed for the Event Center.

"The 1998 Mission Bay EIR focused on entertainment-oriented commercial development in Mission Bay North, "intended to complement" the San Francisco Giants Ballpark. The 1998 EIR anticipated almost 400,000 square feet of related entertainment-oriented retail ancillary to the ballpark, including a theater complex of up to 25 screens. If a regional event venue had been anticipated in Mission Bay South, the 1998 EIR would have called it out. It is also telling that "entertainment-oriented retail" in Mission Bay South was projected at only 56,000 square feet, 15% of the size anticipated in Mission Bay North. (1998 Mission Bay EIR, pp. III.2, 10-11; see also 1998 CEQA Findings, Mission Bay Plan [projecting only 50,000 square feet of entertainment-oriented retail].)

"And while professional basketball games are nighttime events, the Event Center also anticipates 31 annual events "related to conventions, conferences, civic events, corporate events and other gatherings," with an estimated attendance of between 9,000 and 18,500 patrons. (NOP/IS, p. 15.) "[T]he majority of events are expected to occur during day time hours." (Ibid.) The definition of "nighttime entertainment" cannot reasonably stretch to consider over a month of daytime events never contemplated or considered by the 1990 and 1998 Mission Bay EIRs.

"In these many respects, the Event Center is inconsistent with the adopted land use plan and has potentially significant impacts that require revision of the EIR." (*Mission Bay Alliance, Susan Brandt-Hawley, letter, July 26, 2015 [O-MBA6B1-6]*)

"Given the Arena's many severe environmental and community impacts, and the DSEIR's attempt to sweep many of these issues under the rug, the Alliance urges the City to slow down and carefully consider both the legality of siting the Arena in Mission Bay as well as the lack of wisdom in doing so." (*Mission Bay Alliance, Bruce Spalding, letter, July 27, 2015 [O-MBA5-10]*)

"Mission Bay is a planned community with specific businesses allowed in the Master plan.

"Mission Bay is subject to strict usage and zoning rules, in particular for type of business, building heights, density, open space. It is a planned community and all buildings must fit within the guidelines of the Master plan.

"While the Mission Bay master plan should be respected in its entirety, one can visualize needs for minor modifications. Any requested for variances to the Master plan should be fully justified, and provide offsets." (*Ralph Anavy, email, July 27, 2015 [I-Anavy-1]*)

"Second the Usage issue: The Mission Bay plan is quite explicit about the type of businesses it allows. An arena and entertainment center are not considered as valid developments in the Master Plan. If an exception is granted, it should be for cause. And the impact on the rest of Mission Bay should be minimized.

"But more that just an arena, aspects of the design, not properly addressed in the EIR are of great concern. In particular, the so called "viewing deck" or "sky bar" which it really is.

"Usage and reason for the "viewing deck" or "sky bar".

"In addition to asking that the height limitations of the Master Plan be raised to 130 ft for the arena on lots zoned 90 ft, (understandable if an arena is to be built, as an arena does require a certain height), the Warriors plan adds a "viewing deck" at 110 ft elevation (on lots zone maximum 90 ft) for the sole purpose of gaining views of the downtown and bridge for their sky bar patrons. This would put the "sky bar", well above the adjacent buildings which are all built within code! Gaining views is an outrageous request for a height variance, one of at least 20 ft, and more like 30 ft! These views are not even guaranteed as the Giants may yet build higher than allowing them to the North! But the impact will not change!

"No one gets to climb higher than allowed by code just to get views, especially if it impacts the nearby buildings! And for what? a "sky bar"! Are they also contemplating a restaurant, as it was once described during preliminary meetings? The plans are devoid of any specifics for it, and should be disallowed just for this cause alone. Its impact is not measured. It is being swept under the rug! The views on the Bay are just as spectacular on the East side. If the Warriors want to add a "viewing deck" or "sky bar", justifying its use which is not allowed in the Mission Bay plan, it should not tower above adjacent buildings, encroaching even more than the arena on the 90 ft maximum height limit of lots 30 & 32.

"Furthermore the open deck now looks straight into office and residential buildings windows next to it. These, built specifically within the Mission Bay Master Plan will now have this new invasive intrusion, a few hundred feets [*sic*] away. Above all it is not allowed in the plan.

"And its stated usage occupancy of thousands of guests, its hours of occupation (conceivably until 11pm, 365 days per year), its ill-defined and open ended purpose, the bright light pollution impact and the potential noise pollution impact (it is an open deck) on nearby residences is just unjustifiable.

"And it is totally ignored in the EIR study. No impact discussed, no offsets, no specifics... a quick underhanded way of trying to slip in this totally unjustifiable aspect of the project!

"There are no "sky decks", "sky bars", "sky restaurants" or "sky lounges" allowed in the Mission Bay plan. That aspect of the Arena project should be cut out. Not modified. Just cut out! There are no functional justifications for it, except the Warriors wanting it, at the height they chose!" (*Ralph Anavy, email, July 27, 2015 [I-Anavy-4]*)

"-The original plan did not call for a stadium

While the very original plan did not include a stadium, the Giants have been kicking around the idea of putting a stadium across the ball park since 2001" (*Jason Barton, email, July 27, 2015 [I-Barton-4]*)

"The original city plan for the area included more EVENING entertainment space, not a massive new stadium with hundreds of events at all times of day, all year long." (*Kim Osborn, email, July 27, 2015 [I-Osborn-2]*)

"Some of the proposed mitigations in the Mission Bay SEIR still haven't been implemented, and without specific designated authority and responsibility for implementation, there is no assurance that important

mitigations for the impacts of the GSW Arena will actually occur or be maintained." (*Corinne Woods, email, July 27, 2015 [I-Woods-9]*)

"The overwhelming majority of responses cite great concern about too much growth in Mission Bay. They raised concerns about inadequate public transportation and infrastructure, the immense scope and scale of the arena and all the other developments that are underway or planned. Specific objections usually involved: traffic congestion, noise and nuisance problems and some mention of one of the quality of life issues I referenced earlier." (*James Zboralske, email, July 27, 2015 [I-Zboralske-28]*)

Response PD-1: Mission Bay Redevelopment Plan, South Plan Area Development Controls

Commenters reference the land use development programs presented in the 1998 Mission Bay FSEIR project description and the 1998 Mission Bay FSEIR CEQA findings, which assumed certain amounts of entertainment-oriented retail land use in the Mission Bay North and South Redevelopment areas, but did not specifically account for an event center, and assert that if a regional event venue had been anticipated in Mission Bay South, the 1998 Mission Bay FSEIR would have called it out. OCII disagrees. "Redevelopment is… a process which occurs over a period of years. These realities dictate that a redevelopment plan be written in terms that enhance a redevelopment agency's ability to respond to market conditions, development opportunities and the desires and abilities of owners and tenants." (*Friends of Mammoth v. Town of Mammoth Lakes Redevelopment Agency* (2000) 82 Cal.App.4th 511, 539; *County of Santa Cruz v. City of Watsonville* (1985) 177 Cal.App.3d 831, 841 [same].) As stated in the SEIR, Chapter 3 (p. 3-1), development is allowed with the Mission Bay South Redevelopment Plan Area, including Blocks 29-32, consistent with the land use program and subject to the development controls of the Mission Bay South Redevelopment Plan (South Plan), Mission Bay South Design for Development, and other related documents. Please refer to the adopted South Plan's land use map, which assigns the proposed land uses to be permitted in the Plan area. See also Figure 3-3 in the SEIR, which updates certain land uses within the Plan area that have occurred. These designated land uses include a mix of the land use development program uses identified by the commenter. As a long term planning document, the South Plan does not identify specific uses but rather permits a broad range of uses that would conform to general land use designations to enhance OCII's "ability to respond to market conditions, development opportunities and the desires and abilities of owners and tenants." (*Friends of Mammoth v. Town of Mammoth Lakes Redevelopment Agency* (2000) 82 Cal.App.4th 511, 529 [stating a redevelopment plan "cannot always outline in detail each project that a redevelopment agency will undertake during the life of the plan"].)

The South Plan identifies principal uses that are permitted without further specific findings by OCII. The South Plan also provides OCII with the discretion to approve secondary uses authorized in a land use district subject to the Director's finding of consistency. As discussed in the SEIR Chapter 3, Project Description, (SEIR pp. 3-6 to 3-9), the Initial Study Project Description, South Plan Area Development Controls (Initial Study pp. 7 to 9), and Impact LU-3 (Initial Study pp. 32 to 34), the South Plan designates the permitted land use for the project site as Commercial

Industrial/Retail, which provides for either principal or secondary uses at this site. The Commercial Industrial/Retail land use district permits a broad array of uses under the South Plan. It identifies allowed secondary uses, including Public Structures and Uses of a Nonindustrial Character as well as Assembly and Entertainment Uses, including Nighttime Entertainment and Recreation building uses. To the extent event center uses are not principally permitted uses, the proposed event center would qualify as a secondary use under the South Plan, provided the OCII Executive Director makes a determination that the secondary uses generally conform with redevelopment objectives and planning and design controls established pursuant to this plan and the secondary uses will make a positive contribution to the character of the plan area based on a finding that the secondary use, at the size and intensity contemplated and at the proposed location, "will provide a development that is necessary or desirable for, and compatible with, the neighborhood or the community." (South Plan, § 302.)

The Mission Bay South Redevelopment area objectives and policies are set forth in sections 103 and 104 of the Redevelopment Plan. These objectives and policies include, for example, the "major objectives" of (1) eliminating blighting influences and correcting environmental deficiencies in the Plan Area, including, but not limited to, abnormally high vacancies, abandoned buildings, incompatible land uses, depreciated or stagnant property values, and inadequate or deteriorated public improvements, facilities and utilities, (2) retaining and promoting, within the City and County of San Francisco, academic and research activities associated with the University of California San Francisco, (3) assembling land into parcels suitable for modern, integrated development with improved pedestrian and vehicular circulation in the Plan Area, (4) replanning, redesigning and developing undeveloped and underdeveloped areas which are improperly utilized, and (5) providing flexibility in the development of the Plan Area to respond readily and appropriately to market conditions.

Evidence supports the conclusion that the proposed project is consistent with these and other objectives in the Plan. Moreover, the proposed project would further diversify the economic base of the Mission Bay South Redevelopment Plan area and add retail and entertainment amenities to the area and provide Mission Bay employees and residents with additional opportunities to recreate near their homes and jobs. For these reasons, the proposed project also promotes the Plan Bay Area's objective to create "neighborhoods where transit, jobs, schools, services and recreation are conveniently located near people's homes." (Association of Bay Area Governments (ABAG) / Metropolitan Transportation Commission (MTC) Plan Bay Area, p. 42.) However, the final determination of consistency with the Mission Bay South Redevelopment Plan must be made by OCII's Executive Director.

In the context of general plan consistency, the court in *Clover Valley Foundation v. City of Rocklin* (2011) 197 Cal.App.4th 200, explained that "a project is consistent with the general plan 'if, considering all its aspects, it will further the objectives and policies of the general plan and not obstruct their attainment.' A given project need not be in perfect conformity with each and every general plan policy. To be consistent, a … development must be 'compatible with' the objectives, policies, general land uses and programs specified in the general plan." (*Id*. at p. 238 [internal citations omitted].) Because policies in the Mission Bay South Redevelopment Plan "reflect a

range of competing interests," OCII "must be allowed to weigh and balance the plan's policies when applying them, and it has broad discretion to construe its policies in light of the plan's purposes." (*Save Our Heritage Organisation v. City of San Diego* (2015) 237 Cal.App.4th 163, 185-186 [explaining further "courts have repeatedly recognized that, when reviewing a … project's alleged inconsistency with the relevant land use documents, a court must 'accord great deference to a local governmental agency's determination of consistency ….'."]; see also *Sequoyah Hills Homeowners Assn. v. City of Oakland* (1993) 23 Cal.App.4th 704, 717 [a lead agency's determination of consistency with its land use plans comes with a "strong presumption of regularity"].)

Furthermore, as explained in the SEIR, policy conflicts do not, in and of themselves, indicate a significant environmental effect within the context of CEQA environmental review, in that the intent of CEQA is to determine physical environmental effects associated with a project. (*Lighthouse Field Beach Rescue v. City of Santa Cruz* (2005) 131 Cal.App.4th 1170, 1207.) Additionally, the mere fact that a project may have "some elements that conflict[] with a few of the policies embodied in the applicable land use plans does not preclude… [the lead agency] from finding the project as a whole was consistent with the objectives, policies, general land uses, and programs specified in the applicable plans." (*Save Our Heritage Organization v. City of San Diego* (2015) 237 Cal.App.4th 163, 187.) See also Sections 13.8.2 (Response LU-1) to 13.8.3 (Response LU-2) and Section 13.6.2 (Response PP-1) of this document for further discussion of land use compatibility, land use plan consistency, and project consistency with environmental plans and policies. As stated, the ultimate determination of consistency is made by the designated decision-maker, in this case, the Executive Director.

A commenter mischaracterizes that the Initial Study indicates that the proposed event center is the primary project use encompassed within the secondary use analyzed in the Mission Bay FSEIR. The Initial Study makes no such specific statement. Certainly, the event center and office and retail buildings are all proposed key land use components. However, in the context of describing the proposed event center use as a permitted use within the Commercial Industrial/Retail district, the SEIR (p. 3-51) and Initial Study (p. 21) appropriately refer to the proposed event center as a secondary use. It should also be noted that the South Plan does not require that a project include a principal use in order for a secondary use to be permitted on a specific parcel within the redevelopment plan area. Although, as noted by commenters, the proposed project includes mixed-use commercial / retail development which is an allowed principal use on the project site. Therefore, the proposed project includes both principal and secondary uses as defined by the Plan, as shown in **Table 13.5-1**, below.

The South Plan includes several broad secondary use categories including "assembly and entertainment" uses such as "nighttime entertainment" and "recreation buildings" as well as "public structures or uses of a nonindustrial character." Each of these secondary use categories may be reasonably interpreted to permit the Events Center. (*Paris v. Community. Redevelopment Agency* (1985) 167 Cal.App.3d 489, 496 ["[n]ecessarily some of the statements in a redevelopment plan will be general and tentative, and formal amendment of the plan is not required for a subsequent administrative interpretation and filling in of details."].) The ultimate determination as to the secondary use(s) that cover the event center is a policy question that will be made by the

TABLE 13.5-1
SUMMARY OF PROPOSED PROJECT FACILITIES AND DESIGN FEATURES

Project Component	Area[1]	Principal or Secondary Use under the South Plan
Event Center	750,000 GSF	Principal and Secondary Use
Golden State Warriors Office Space	25,000 GSF	Principal Use
Office Space	580,000 GSF	Principal Use
Retail Space	125,000 GSF	Principal Use
Parking and Loading	475,000 GSF	Principal Use
Open Space	3.2 acres	Principal Use

[1] GSF = gross square feet. See SEIR Table 3-1 for definitions.

OCII Executive Director and the Commission on Community Investment and Infrastructure as OCII's land use decision-making body. As discussed further in Section 13.8.3 of this document OCII's interpretation of its Plan and the uses permitted therein is accorded substantial deference.

Some commenters suggest the event center is not a nighttime entertainment use pursuant to the Mission Bay South Redevelopment Plan. As noted above, nighttime entertainment is only one of several examples of a secondary use authorized on the project site that OCII may reasonably conclude covers the event center. The Plan defines nighttime entertainment to include "an assembly and entertainment use that includes dance halls, discotheques, nightclubs, private clubs, and other similar evening-oriented entertainment activities, excluding Adult Entertainment, which require dance hall keeper police permits or place of entertainment police permits which are not limited to non-amplified live entertainment, including Restaurants and Bars which present such activities, but shall not include any arts activities or spaces as defined by this Plan, any Theater performance space which does not serve alcoholic beverages during performances, or any temporary uses permitted by this Plan." (Plan, p. 50 (Attachment 5).) The proposed project is an "evening-oriented entertainment [use]… which requires… place of entertainment police permits which are not limited to non-amplified live entertainment…" (*Ibid*.) Furthermore, as permitted by the definition of nighttime entertainment, the proposed project would generally serve alcoholic beverages during events.

Commenters assert that the proposed event center does not qualify as a "nighttime entertainment" use that anticipates and encompasses small-scale clubs, restaurants, and bars in order to be approved as an allowed "secondary use" under the Plan. Commenters assert that the "nighttime entertainment" use does not anticipate or allow a venue of the type or scale proposed for the event center, and that the "nighttime entertainment" use description does not apply since the event center would include events that would occur during daytime hours. OCII disagrees. The South Plan's examples of "nighttime entertainment" uses are just that: examples, not an exhaustive list of the uses that may be permitted. Further, the definition of the "nighttime entertainment" use does not use the term "small-scale" as the commenter claims. Where the South Plan intends to limit the size of a use, the Plan expressly includes such a size limitation. For

example, in the Mission Bay South Residential land use designation only "small" residential care, social service / philanthropic, and vocational / job training facilities are permitted. (South Plan, § 302.1(B).) No such size limitations are included for any primary or secondary use permitted within the Commercial Industrial / Retail land use designation. Moreover, as is evident throughout the City, dance halls, night clubs, and private clubs can be very large facilities or complex of facilities. While the Plan does not limit the size of any individual nighttime entertainment use included within the Plan area, the Plan establishes general limitations on overall development within the Mission Bay South Redevelopment area. As discussed in the SEIR, on a plan-wide basis the Mission Bay South Redevelopment Plan area will not exceed any of the development limitations set forth in the Plan if the proposed project is approved. (SEIR, pp. 4-5 to 4-6.) Therefore, the proposed project is consistent with the overall scale of development contemplated within the Mission Bay South Redevelopment Plan.

Some commenters also suggest that because the proposed project would include daytime events at the event center, the event center cannot constitute a nighttime entertainment use. This is incorrect. Nighttime entertainment includes, for example, uses such as private clubs that, like the event center, may include daytime hours of operation. Nothing in the Mission Bay South Redevelopment Plan suggests daytime hours of operation are prohibited. The definition of nighttime entertainment only requires the use be "evening-oriented." As discussed in the SEIR, pp. 3-38 to 3-42, the majority of events anticipated at the event center would occur in the evening hours. Therefore, the event center constitutes an "evening-oriented" assembly and entertainment use. Further, the Mission Bay South Redevelopment Plan allows Arts Activities as well as Art Spaces as a principal use, defined in the South Plan to include such performance arts as dance, music, and dramatic art, such as daytime, family-focused live shows proposed as part of the event center activities.

Commenters indicate the proposed project will change the Mission Bay community and environment in ways never envisioned when the Mission Bay Redevelopment Plan was adopted in 1998; that the project will have many severe environmental and community impacts; and that the event center is inconsistent with the adopted land use plan and has potentially significant impacts that require revision of the EIR; and general comments about inadequate public transportation and infrastructure, traffic congestion, noise and cumulative effects. OCII disagrees. The commenters are referred to the land use impact analysis contained in Impacts LU-1, LU-2, LU-3, and C-LU-1 in the Initial Study (Appendix NOP-IS), and as summarized in Section 13.8, Responses LU-1 and LU-2. The land use impact analysis explained that all project land use impacts would be less than significant, and furthermore, that the project would not have any new or substantially more severe effects than those identified in the Mission Bay FSEIR related to conflict with land use. Aside from land use effects, the physical impacts with all other environmental topics, including those cited above, are appropriately addressed in the applicable sections of the SEIR and Initial Study. The commenter is also referred to Section 13.3: Environmental Review Process, Response ERP-5, which explains that no environmental issues have been raised that would require recirculation of the Draft SEIR under CEQA.

A commenter also makes a general comment about project effect on quality of life. The commenter is referred to SEIR Section 5.8.5.2, Approach to Analysis (pp. 5.8-9) and Section 13.2, Response GEN-2; quality of life issues are not considered impacts under CEQA unless such effects result in the need for the construction of new or physically altered governmental facilities in order to maintain acceptable levels of public services, *and* the construction of such facilities result in adverse physical environmental impacts. (See CEQA Guidelines, § 15384, subd. (a).)

A number of comments were made regarding the proposed event center "bayfront terrace" (which the commenter refers to as a "viewing deck," "sky deck," "sky bar," "sky restaurant" and "sky lounge"). As described in the SEIR Project Description, the bayfront terrace would be an extension of the event center (pedestrian deck would be 97 feet in height, and terrace roof would be 122 feet in height) that would provide views of the San Francisco skyline, Bay Bridge, Bay waters and East Bay shoreline. Portions of the bayfront terrace would connect to the interior of event center, and other portions of the Bayfront terrace would connect to the main pedestrian path at the base of the event center, and to a lobby located on Terry Francois Boulevard, via elevators.

A commenter states that the bayfront terrace would be situated above adjacent buildings built within code. The South Plan includes a maximum building height within the Plan area of 160 feet. The proposed project would not exceed this maximum building height limit. However, as explained in the SEIR, additional height criteria included in the Mission Bay South Design for Development would need to be amended as part of the proposed project; with the amendments to the Mission Bay South Design for Development that would occur as part of the project approvals for the proposed event center, the proposed bayfront terrace would be in compliance with the applicable design standards and guidelines governing height limits in Mission Bay. The fact that the proposed project requires an amendment to the design guidelines does not, in itself, demonstrate that a project may have a significant impact on the environment. (*Lighthouse Field Beach Rescue v. City of Santa Cruz* (2005) 131 Cal.App.4th 1170, 1207; Pub. Resources Code, § 21083, subd. (b); CEQA Guidelines, §§ 15063, subd. (d)(5), 15065, subd. (a).)

A commenter indicates that the bayfront terrace would allow views into the office and residential buildings next to it. First, it should be noted that while the project-proposed office and retail buildings would be located on-site adjacent to the event center, and existing office uses would be located directly north and south of the event center, there would be no existing or proposed residential buildings directly adjacent to the proposed event center, consistent with the land use designations in the South Plan. The nearest residential use (UCSF residential housing) is located northwest of (and over 500 feet from) any portion of the proposed bayfront terrace; furthermore, the proposed bayfront terrace viewing deck is oriented such that the predominant views from it would be to the north and east (see aerial renderings in Figure 3-17, p. 3-54, and Figure 3-22, p. 3-59 in the SEIR Project Description).

A commenter also indicates that the bayfront terrace would generate noise pollution; and the commenter inquires if a restaurant is proposed at the bayfront terrace. While, as indicated above, the bayfront terrace would provide an observation deck, no other specific uses have been identified

at this time for the bayfront terrace. However, any other potential uses that could be developed at the bayfront terrace, including potential restaurant, bar and/or lounge, would be subject to the applicable design standards and guidelines governing development in Mission Bay, and subject to approval by OCII. As indicated above, the open deck portion of the event center bayfront terrace would be oriented away from the nearest sensitive receptor, and correspondingly, any incidental noise generated from the open portion of the bayfront terrace would similarly be oriented away from this receptor. Potential noise impacts of the proposed event center are discussed in SEIR Section 5.3, Impact NO-4 (pp. 5.3-27 to 5.3-32), which identifies Mitigation Measure M-NO-4a, Noise Control Plan for Outdoor Amplified Sound, and Mitigation Measure M-NO-4b, Noise Control Plan for Place of Entertainment Permit. Implementation of these mitigation measures would ensure that noise levels at the proposed event center would be less than significant.

A commenter also indicates that the bayfront terrace would generate light pollution. This comment is noted. With respect to aesthetic effects associated with event center bayfront terrace, including light and glare, the commenter is referred to SEIR Chapter 2 and Section 13.3, Response ERP-8, in the SEIR. Pursuant to CEQA Public Resources Code Section 21099 (Senate Bill 743), aesthetics are not considered in the SEIR in determining the significant environmental impacts of the project; and consequently potential project impacts on aesthetics are not analyzed in this SEIR. However, aesthetics and lighting effects of the proposed project would still be considered by decisionmakers as part of the design review approvals. The commenter is also referred to the Initial Study Section E.13, Biological Resources, Impact BI-4, which addresses potential effects of project nightlighting effects on birds, and SEIR Section 5.3 Transportation and Circulation, Impact TR-9d which addresses potential project effects on UCSF helipad operations from project specialized exterior lighting. In both cases, feasible mitigation is identified to ensure these lighting impacts would be mitigated to a less than significant level.

A commenter indicates that proposed mitigations identified in the Mission Bay FSEIR still have not been implemented, and without specific designated authority and responsibility for implementation, there is no assurance that important mitigations for the impacts of the proposed project will actually occur or be maintained. The commenter is mistaken. As indicated in SEIR Chapter 3 (pp. 3-6 to 3-9), the authority to implement the Mission Bay FSEIR mitigation measures applicable to individual projects in the Mission Bay Plan area occurs as part of the development controls for each project through conditions of approval. Accordingly, Mission Bay FSEIR mitigation measures that are applicable to the proposed project would similarly be implemented as part of conditions of approval for this project. Moreover, as a legal matter, it is presumed that OCII will comply with its official duty to act in accordance with adopted mitigation measures. (*Bus Riders Union v. Los Angeles County Metropolitan Transportation Agency* (2009) 179 Cal.App.4th 101, 108 ["[a]ll presumptions of law are in favor of the good faith of public officials"]; *San Joaquin River Exchange Contractors Water Authority v. State Water Resources Control Bd.* (2010) 183 Cal.App.4th 1110, 1135; Evid. Code, § 664.)

13.5.3 Assumptions for SEIR Impact Analysis (PD-2)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

O-MBA7S2-34 O-MBA7S2-36 O-MBA7S2-38 I-Zboralske-11

"8. <u>The DSEIR's Project Description is Inconsistent.</u>

"The DSEIR is fundamentally flawed because the project description is internally inconsistent, thwarting intelligent public participation relating to the Project and its impacts. (*County of Inyo v. City of Los Angeles* (1977) 71 Cal.App.3d 185, 197.) As described more fully below, the DSEIR appears to variously include and exclude the departure of the Warriors from the existing Oracle Arena.

> DSEIR section 1.1.2 (Project Objectives) provides in relevant part:
>
> The Golden State Warriors currently play their home games at Oracle Arena, located at 7000 Coliseum Way in Oakland, California and lease their management offices and practice facility at the Oakland Convention Center at 1011 Broadway in downtown Oakland. The proposed project would consolidate these facilities in one location."

(DSEIR, p. 1-3.) (*Mission Bay Alliance, Soluri Meserve, letter, July 26, 2015 [O-MBA7S2-34]*)

"While taking the environmental "benefit" of lower mobile-source GHG emissions resulting from reduced events at Oracle Arena, the DSEIR deftly avoids analysis of the environmental consequences of this component of the overall Project. For example, the project description includes continued operation of Oracle Arena even though it is predicted to host merely 21 events per year." (AB 900 Application, pp. 63, 81 of 155.) (*Mission Bay Alliance, Soluri Meserve, letter, July 26, 2015 [O-MBA7S2-36]*)

"The DSEIR is thus flawed because the project description is internally inconsistent. The project description includes reduced events at Oracle Arena when doing so helps to minimize the Project's environmental impacts, but excludes operation of Oracle Arena in order to avoid addressing its problematic environmental impacts. This inconsistency misleads the public about the Project and its impacts. (See, e.g., San Joaquin Raptor Rescue Center v. County of Merced (2007) 149 Cal.App.4th 645, 655- 656 ("By giving such conflicting signals to decision makers and the public about the nature and scope of the activity being proposed, the Project description was fundamentally inadequate and misleading").)

"The same analysis applies to the DSEIR's inconsistent treatment of the construction of Bayfront Park and realignment of Terry Francois Blvd. The DSEIR notes, consistent with the redevelopment plan, that both the Bayfront Park and realignment are triggered by the Project, which makes them "reasonably foreseeable consequence[s] of the initial project" requiring analysis in the DSEIR. (Laurel Heights, supra, 47 Cal. 3d at 396.) Even though these are components of the Project as a matter of law, the DSEIR purports to characterize Bayfront Park and the roadway alignment as separate projects for purposes of CEQA. (DSEIR, p. 3-37.) As a result of this inconsistent project description, the DSEIR fails to address potentially significant hazardous materials impacts associated with construction and occupancy of Bayfront Park.

"In summary, a lead agency may not concurrently expand and contract the described scope of a proposed project – and may certainly not do so when the result is to avoid analysis of potentially significant impacts.

The recirculated DSEIR will need to provide a stable and consistent project description." (*Mission Bay Alliance, Soluri Meserve, letter, July 26, 2015 [O-MBA7S2-38]*)

"The report fails to adequately address many of the actual event usage plans. The Warriors intend to have up to an additional 200+ events at the site. In total, the arena may easily host more than 250+ events a year. This is only an estimate. This number of events is excessive. The area cannot handle these events without significant negative impacts affecting local residents and other people that work in the area.

"The plan focuses on the Warriors games and potential overlap with some San Francisco Giants home games. It refers vaguely to other events, but offers no specificity on the types of events, the days or hours of the events and/or any realistic estimate of the number of people expected to attend. Possible events seem to have a classified threshold of whether they expect to attract over 12,500 attendees or not. This is pure guesswork." (*James Zboralske, email, July 27, 2015 [I-Zboralske-11]*)

Response PD-2: Assumptions for SEIR Impact Analysis

A commenter states that the SEIR Project Description is internally inconsistent because it both includes and excludes the departure of the Warriors from the existing Oracle Arena. This statement is incorrect. The SEIR Project Description clearly describes existing and project conditions related to the disposition of the Golden State Warriors facilities, games and operations. First, the SEIR Project Description states that under existing conditions, the Golden State Warriors currently play their home games and lease their management offices and practice facility in Oakland (see pp. 3-14 to 3-15). The SEIR Project Description then states that under the project, the proposed event center at Blocks 29-32 would serve as the new venue for the Golden State Warriors home games, and provide a year round venue for a variety of other uses, including concerts, family shows, other sporting events, cultural events, conferences and conventions (see p. 3-1, and pp. 3.38 to 3-42). The SEIR Project Description also states that existing Golden State Warriors operations, including management offices and practice facility, would relocate from their existing facilities in Oakland to the new event center at Blocks 29-32. In addition, the SEIR Project Description describes the other proposed new office and retail facilities and other supporting facilities that would be developed under the project at Blocks 29-32 (see p. 3-1, and pp. 3-42 to 3-43). Nonetheless, the text in the SEIR, Chapter 1, Summary, that is cited by the commenter in the comment is rephrased to be more consistent with the description of the project presented in the SEIR, Chapter 3, Project Description. Please see Chapter 14, Draft SEIR Revisions, for appropriate revisions made to this text.

The commenter incorrectly compares the project description in the SEIR with assumptions used to describe the project in the sponsor's greenhouse gases (GHG) analysis in support of its AB 900 application. As discussed in Section 13.4, Response AB-1, the process of certifying a proposed project as an environmental leadership project pursuant to AB 900, including quantification of GHG emissions, is a separate process from the preparation of an EIR under CEQA, with separate and distinct review and approval requirements. As such, the AB 900 GHG emissions analysis of the project used assumptions specifically applicable to the AB 900 requirements, which are not necessarily the same as those used in the SEIR impact analysis. For instance, the commenter

references the AB 900 GHG emissions analysis assumption that half the non-Golden State Warriors game events would remain at Oracle Arena while the other half would transfer to the proposed event center at Blocks 29-32. In contrast, the SEIR air quality analysis (see Impact AQ-2 in Section 5.4) conservatively assumed that under the project, the Oracle Arena would maintain its current levels of non-Golden State Warriors events, and therefore was based on a higher estimate of net new vehicle trips to the air basin.

For responses concerning the adequacy of the GHG analysis in the SEIR, see Section 13.14, Response GHG-2. For responses concerning the impacts of future uses of the Oakland Coliseum, see Section 13.7, Response IO-1.

The commenter asserts that the construction of Bayfront Park and realignment of Terry A. Francois Boulevard require analysis in the SEIR. Potential cumulative impacts of constructing the Bayfront Park and realignment of Terry A. Francois Boulevard are considered in the SEIR. As discussed in the SEIR Project Description, pursuant to the Mission Bay South Plan and the Mission Bay BCDC Permit No. 5-00, as amended, development of Blocks 29-32 would trigger the realignment of Terry A. Francois Boulevard to extend adjacent to the east side of Blocks 29-32, and the construction of public access improvements at Bayfront Park east of this realigned roadway (see pp. 3-37 to 3-38). Therefore, the SEIR correctly explains that, independent of the proposed project, construction of Bayfront Park and realignment of Terry A. Francois Boulevard are requirements of the Mission Bay Plan, temporally tied to any proposal to develop Blocks 29-32. With the exception of potential cumulative construction impacts not otherwise considered in the 1998 Mission Bay FSEIR, the 1998 Mission Bay FSEIR addressed the environmental impacts of the development of Bayfront Park and realignment of Terry A. Francois Boulevard in the context of the overall Mission Bay Plan. As discussed in SEIR Section 5.1, page 5.1-10, Bayfront Park and realignment of Terry A. Francois Boulevard are evaluated in this SEIR with respect to the potential to contribute to cumulative construction-related impacts. Consequently, all potential cumulative environmental effects of these independently approved projects are appropriately addressed in this SEIR. With respect to potential hazard materials impacts with Bayfront Park, please see Section 13.22, Response HAZ-9. Please see Response REC-1 for additional information regarding Bayfront Park.

A commenter asserts that a recirculated Draft SEIR will be need to be prepared providing a stable and consistent project description will need to be provided. OCII disagrees. For the reasons discussed above, the SEIR Project Description does not contain internal inconsistencies, and meets all requirements for adequacy under CEQA. The commenter is also referred to Section 13.3: Environmental Review Process, Response ERP-5, which explains that no environmental issues have been raised that would require recirculation of the Draft SEIR under CEQA.

A commenter asserts that the SEIR does not adequately address actual usage plans, and that the arena may host more than 250 events a year. As explained in the SEIR Project Description (pp. 3-38 to 3-42), the event center is expected to be used for up to approximately 225 events per year, including up to 60 Warriors basketball home games, and approximately 45 concerts, 55 family shows, 30 other sporting events, and 31 conventions/corporate events. This estimate is based on usage data for other, similar venues in comparable locations and assumes a full post-season

schedule for the Warriors, which would not be a regular occurrence. This data represents the best available evidence on the nature and extent of events that will occur at the site, and necessarily involves a degree of forecasting about events that will occur in the future. (CEQA Guidelines, § 15144.) The commenter makes a general comment that the area cannot handle these events without significant negative impacts affecting local residents and other people that work in the area. All potential project and cumulative environmental impacts of the project are disclosed in the SEIR based on the number and types of event presented in the SEIR Project Description, and the SEIR identifies mitigation measures for all significant impacts that would mitigate those impacts to the extent feasible.

A commenter indicates that the discussion of project overlap (besides Warriors games) with San Francisco Giants homes games is vague and does not provide specificity on these types, days, times and attendance associated with those other events. It is currently not possible to specify the dates, hours, and types of events that could overlap with San Francisco Giants home baseball games because future scheduling of such events have not yet been developed. However, the SEIR does provide an estimate of the anticipated frequency and type of overlapping events. The commenter is referred to SEIR Section 5.2, Transportation and Circulation on pp. 5.2-80 to 5.2-81, which provides detail on the type and number of project events besides Warriors games that could overlap with San Francisco Giants homes. As discussed, it is anticipated that approximately 10 concerts, 10 family shows, 7 other non-Golden State Warriors sporting events, and 3 conventions/corporate events – for a total of approximately 30 project events besides Golden State Warrior games – could overlap with San Francisco Giants homes annually. Even including Warriors games, only about nine large events (i.e., at least 12,500 attendees) are anticipated to overlap with San Francisco Giants evening games annually. The project sponsor, based on market projections, anticipates approximately two basketball and seven large non-basketball events overlapping with San Francisco Giants evening games. In any particular year, however, the number may be smaller or larger. The number of such events, however, does not affect the impact analysis, which addresses conditions that could occur during individual days and evenings. The commenter is referred to SEIR Project Description, Table 3-3 on p. 3-39 for additional detail on the expected temporal characteristics and attendance associated with other project events besides Warriors games.

13.5.4 Construction Assumptions (PD-3)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

I-Hong-14 I-Hong-16

"14. Construction Phase, request that the Final EIR provide time lines of this Project." (*Dennis Hong, email, July 27, 2015 [I-Hong-14]*)

"b. Provide the following for controls, signs and etc., for pedestrians and traffic during the construction; traffic control officers, signs, control barriers, etc.

"c. Communicate with the local merchants, residences in the area of the dates, construction schedules. Especially if certain streets will be closed. A contact i.e., Project Manager to call if needed.

"d. Provide provisions for dust controls, safety barriers and control signs.

"e. Can the use of dust barriers be used to control the dust from getting in to the restaurants, business and residences and the hospital?

"f. Can any of the recent/current legislation under consideration (regarding construction dust) be used here? I believe there was something the Board of Supervisors were looking at on this matter. "

(*Dennis Hong, email, July 27, 2015 [I-Hong-16]*)

Response PD-3: Construction Assumptions

A commenter requests the SEIR provide a timeline of construction. The commenter is referred to SEIR Project Description, Section 3.6.3, Proposed Construction. As discussed in Section 3.6-3, construction of the proposed project would occur over an approximate 26-month period, which was originally anticipated to begin in late 2015. Based on information provided by the sponsor's construction contractor, a preliminary project construction schedule is also provided (Table 3-5 on page 3-47) showing additional detail on estimated duration for major construction components for each proposed building. At this time, the scheduled start date of construction is pending project approval.

The commenter requests use of signage, barriers and traffic control officers during construction, and communication with the local merchants, residences in the area of the dates, and construction schedules. Impact TR-1 in the SEIR, Section 5.2, Transportation and Circulation addresses potential construction-related ground transportation impacts, including a discussion of anticipated temporary street land and curb closures, and construction staging. As an improvement measure, the SEIR identifies the sponsor to implement a Construction Management Plan that would require the project sponsor/construction contractor(s) to meet with DPW, SFMTA, the Fire Department, Muni Operations and other City agencies to coordinate feasible measures to reduce traffic congestion, including temporary transit stop relocations and other measures to reduce potential traffic, bicycle, and transit disruption and pedestrian circulation effects during construction of the proposed project. As indicated on SEIR page 5.1-4, this improvement measure would be included as a condition of project approval. In addition, to minimize construction impacts on access to nearby institutions and businesses, the Construction Management Plan could provide nearby residences and adjacent businesses with regularly-updated information regarding project construction, including construction activities, peak construction vehicle activities (e.g., concrete pours), travel lane closures if applicable, and parking lane and sidewalk closures. A regular email notice could be distributed by the project sponsor that would provide current construction information of interest to neighbors, as well as contact information for specific construction inquiries or concerns.

The commenter requests that provisions be provided for dust control during construction; inquires if the use of dust barriers can be used to control the dust from getting in to the restaurants, business and residences and the hospital; and inquires if any of the recent/current legislation under consideration regarding construction dust be used. All potential impacts associated with the potential for the project to generate fugitive dust during construction are addressed in Impact AQ-1 in Section 5.4, Air Quality, in the SEIR (see p. 5.4-29). The SEIR reports that the San Francisco Board of Supervisors approved the Construction Dust Control Ordinance (Ordinance 176-08).[1] Project construction would be subject to the requirements of this ordinance. Dust suppression activities identified in the Construction Dust Control Ordinance include watering all active construction areas sufficiently to prevent dust from becoming airborne; wet sweeping or vacuuming streets, sidewalks, paths, and intersections where work is in progress at the end of the workday; covering or using other equivalent soil stabilization techniques on inactive stockpiles; or other practices that result in equivalent dust control.

In addition, because the project site is over one-half acre, the Dust Control Ordinance requires that the project sponsor implement a Dust Control Plan that would require the project sponsor to: submit a map to the Director of Public Health showing all sensitive receptors within 1,000 feet of the site; wet down areas of soil at least three times per day; provide an analysis of wind direction and install upwind and downwind particulate dust monitors; record particulate monitoring results; hire an independent, third-party to conduct inspections and keep a record of those inspections; establish shut-down conditions based on wind, soil migration, etc.; establish a hotline for surrounding community members who may be potentially affected by project-related dust; limit the area subject to construction activities at any one time; install dust curtains and windbreaks on the property lines, as necessary; limit the amount of soil in hauling trucks to the size of the truck bed and securing with a tarpaulin; enforce a 15 mph speed limit for vehicles entering and exiting construction areas; sweep affected streets with water sweepers at the end of the day; install and utilize wheel washers to clean truck tires; terminate construction activities when winds exceed 25 mph; apply soil stabilizers to inactive areas; and sweep off adjacent streets to reduce particulate emissions; and designate an individual to monitor compliance with these dust control requirements. As required by the Construction Dust Control Ordinance, the dust control plan must be reviewed and approved by the Director prior to commencement of construction.

Implementation of dust control measures in compliance with the regulations and procedures set forth by the Construction Dust Control Ordinance would ensure that potential dust-related construction air quality impacts of the proposed project would be less than significant.

[1] Dust Control Ordinance (Ordinance Number 176-08) underwent its own CEQA review in 2007 prior to its approval.

13.5.5 Project Characteristics—Sustainability (PD-4)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

I-Heath-9 I-Hutson-3 I-Tan-9 PH-Valentino-2

"Moreover, the Draft EIR does not reflect a commitment to in innovative and sustainable development, and rather represents a step backward from environmental stewardship." (*Alison Heath, email, June 30, 2015 [I-Heath-9]*)

"Moreover, the Draft EIR does not reflect a commitment to in innovative and sustainable development, and rather represents a step backward from environmental stewardship." (*Richard Hutson, email, June 29, 2015 [I-Hutson-3]*)

"Moreover, the Draft EIR does not reflect a commitment to in innovative and sustainable development, and rather represents a step backward from environmental stewardship." (*Judy Tan, email, July 27, 2015 [I-Tan-9]*)

"As far as quality of life goes, you know, we're evolving and finding out that cities are some of the greenest places that we can be, and this is where we have a chance to put housing next to work, next to play.

"And the event center is a sense of place that can happen in Mission Bay. It can create a very new and exciting place for us that is environmentally very aware and sensitive to our surroundings.

"It's going to be a LEED gold-certified construction -- that's significantly important – with offers to mitigate 100 percent of any greenhouse gas emissions." (*Patrick Valentino, Public Hearing Transcript, June 30, 2015 [PH-Valentino-2]*)

Response PD-4: Project Characteristics—Sustainability

Several commenters state that the SEIR does not reflect a commitment to innovative and sustainable development, but rather represents a step backward from environmental stewardship. The commenters are referred to the discussion of project sustainability on page 35 in the SEIR, Chapter 3. As discussed, the proposed development would be subject to a number of sustainability requirements, including the California CalGreen Code, City of San Francisco Green Building Code, South Design for Development for the Mission Bay South Area, and the 2012 NBA Arena Design Standards – Sustainability Requirements. The project would be designed to Leadership in Energy and Environmental Design (LEED®) Gold standards using a campus approach, whereby each individual proposed structure as well as the overall site would qualify for individual Gold ratings. It should be noted the proposed event center would be only the second basketball venue in the

NBA to achieve this level of LEED certification for New Construction (after Amway Center), and that this is the highest LEED certification level achieved by any NBA venue to date (i.e., there are no Platinum buildings in the league). This would be achieved through incorporation of a variety of design features and implementation of practices during construction and operation to provide energy and water conservation and efficiency, encourage alternative transportation, promote a healthy indoor environment, minimize waste, and maximize recycling opportunities.

SEIR Chapter 4, Plans and Policies, discussed consistency of the project with applicable plans and policy documents including *Plan Bay Area*. As discussed in Chapter 4, the *Plan Bay Area*, the Plan calls for concentrating housing and job growth around transit corridors, particularly within areas identified by local jurisdictions as Priority Development Areas (PDAs). *Plan Bay Area* also specifies strategies and investments to maintain, manage, and improve the region's multi-modal transportation network and proposes transportation projects and programs to be implemented with reasonably anticipated revenue. The project site, like much of eastern San Francisco, is within a PDA, where growth is anticipated and planned for in proximity to transit (see also the discussion on Population and Housing, in Appendix NOP-IS, Initial Study, Section E.3). The proposed project would not conflict with any projects in the regional transportation plan. Therefore, the proposed project would be consistent with *Plan Bay Area*.

The commenters are also referred to Section 13.23, Response EN-1, which provides a detailed analysis regarding the goals of CEQA Guidelines Appendix F, available energy supplies, and the project's energy use. This analysis discusses a range of project-proposed and/or required design features and/or strategies that the project would implement to ensure the project would not result in the use of unusually large amounts of, nor would it result in the inefficient, wasteful, or unnecessary use of fuel, electricity, water and or natural gas during construction and/or operation. See also Chapter 14, Draft SEIR Revisions which augments the project description for sustainability to acknowledge specific energy conservation features proposed in the project design.

The commenters are also referred to Chapter 5.5 of the Draft SEIR, and to Section 13.14, which discuss the project's consistency with the City's *Strategies to Address Greenhouse Gas Emissions*.

13.6 Plans and Policies

13.6.1 Overview of Comments on the Plans and Policies

The comments and corresponding responses in this section cover topics discussed in SEIR Chapter 4, Plans and Policies. These include topics related to:

- PP-1: Design for Development for the Mission Bay South Project Area

13.6.2 Design for Development for the Mission Bay South Project Area (PP-1)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

O-MBA6B1-7 O-MBA6B1-9 I-Anavy-3 I-Ellingham-1

"b. The Event Center Conflicts with Mission Bay South Design Criteria. Despite the Initial Study's contention that the Event Center would be consistent with adopted area land use policies established by the Mission Bay South Redevelopment Plan and the Design for Development, it concedes that the project sponsors seek material changes. The DSEIR anticipates amendments to the Mission Bay South Design for Development, the Mission Bay South Signage Master Plan, and the Mission Bay South Streetscape Plan. The Initial Study notes that the "unique nature of the proposed event center would require the sponsor to receive [City] approval of variations or amendments to some of these standards." (NOP/IS, p. 31.)

"The Mission Bay South Redevelopment Plan codifies objectives and policies for urban design that must be applied to the Event Center, including:

> **Objective 3:** Emphasize in Mission Bay South the characteristic San Francisco development patterns …
>
> **Policy 2:** Design in consideration of protecting major views of the Bay, the Bay Bridge and the Downtown skyline from Mission Bay South … using street view corridors, open space, the careful placement of building forms and building massing.
>
> Policy 3: Create a visual and physical access to San Francisco Bay and the channel of China Basin.
>
> Policy 4: Recognize that buildings, open spaces and view corridors, seen together, will create the character of Mission Bay South.
>
> Objective 4: Create a building form for the Mission Bay South area such that the scale of new development relates to the adjacent waterfront and to adjacent buildings.
>
> Policy 1: Building heights should decrease as they approach water's edge.

"The Event Center proposal creates at least 16 inconsistencies with the Design for Development (D4D), and its Appendix A recites amendments for:

- Raising maximum arena height limits from 90 to 135 feet
- Construction of a 160+ foot tower[1] close to another tower
- Increasing the bulk of the arena

- Changing arena setbacks, street wall heights, view corridors, public rights of way, and parking standards

"The addition of large signage, electronic advertising, and nighttime light and searchlight effects that accompany basketball games and other large events also conflicts with design review standards and further impacts aesthetics/view corridors. The Commercial Industrial/Retail zone prohibits flashing signs, moving signs, and roof signs as well as business signs "above 1/2 of the base height of the building." (D4D, p.45.)

"Even if amendments to the Design for Development could avoid legal inconsistencies, the proposed removal of codified urban design protections significantly impacts the design of the Mission Bay community and aesthetic environment and requires EIR analysis and mitigation.

"The Design for Development also delineates urban design concepts that protect the community character of Mission Bay South via view corridors and a planned street grid that extends "San Francisco's historic urban pattern of Spanish measure Vara blocks."

"(D4D, p. 39.) "A Vara is an early Spanish unit of measure equal to 2.75 feet." (D4D, p.16.)

> First is an urban street grid which builds off of the primary existing streets and a traditional San Francisco pattern of Vara blocks, to allow for the transformation of an industrial pattern to one which welcomes the buildings and open spaces of a living/working/shopping neighborhood. In the tradition of cities by the water, this same framework of streets serves as view corridors that visually connect Mission Bay to the Bay and the City's downtown.
>
> View corridors are based on the following principles: to preserve the orientation and visual linkages to the Bay and Channel; as well as vistas to hills, the Bay Bridge and the downtown skyline; to preserve orientation and visual linkages that provide a sense of place within Mission Bay.

"(D4D, pp. 39, 47.) The Design for Development specifies that "no building or portion thereof shall block a view corridor." (D4D, p. 39.)

"As explained in the statewide planning out by Vioget in 1839." (*CP&DR*, 1 September 1998, *attached*.) The vara block is not only of historic importance but "has near---ideal dimensions for an urban block" and "helps clarify, if clarity were needed, what precisely makes San Francisco the most walkable city in America: the dimensions of the grid …" publication *California Planning & Development Report* in a 1998 article praising the Mission Bay South Redevelopment Plan, "a 'vara block' is the same dimension as the first 10 blocks of San Francisco laid "This new plan … promises to extend the pedestrian experience of San Francisco to the newest part of the city."

"CP&DR marvels that the Redevelopment Plan takes a "giant canvas of largely undeveloped waterfront acreage" and uses vara blocks "to integrate this former railyard into the cultural and business life of the larger city." And "what is most remarkable about this scheme is how thoroughly the [UCSF] campus has been integrated into the grid … likened [] to residential blocks in Paris."

"The Warriors Event Center proposes to eliminate four blocks, including two vara blocks and two smaller blocks, creating one large single block for the Event Center with structures that obscure both a north-south and east-west view corridor. The DSEIR must be revised to analyze and mitigate the environmental impacts of required amendments to adopted land use plans and policies, addressing the destruction of vara blocks and the related adverse impacts to aesthetics, view corridors, and pedestrian amenities.

"**Footnote:**

[1] The tower heights exceed 160 feet with the 16-foot mechanical parapet.

(*Mission Bay Alliance, Susan Brandt-Hawley, letter, July 26, 2015 [O-MBA6B1-7]*)

"The EIR must be revised to analyze and mitigate the project's inconsistencies with plans and policies in Mission Bay South adopted for environmental protection." (*Mission Bay Alliance, Susan Brandt-Hawley, letter, July 26, 2015 [O-MBA6B1-9]*)

"This addresses specific design flaws that are totally ignored in the EIR and are in complete disagreement with the Mission Bay Master plan.

"First the height issue: Lots 30 and 32 are zone 90 ft. Lots 29 and 31 are zoned 160 ft and height density is spelled out. Not all the lot surface can be built to 160 ft.

"The Warriors could have put the arena that has a peak height of 130 ft on the lots zoned 160 ft max height. Instead they chose to located mostly of it to the east, on the lots zoned maximum 90 feet. This is counter to the Master plan for Mission Bay. Yet they chose to put it on the 90 ft max height lots asking for variances and offering no offsets by lowering the height of buildings on lot 29 and 32. In order to get conditional approval to the plan, and stay within the Master plan intent for Mission Bay, they should either move the arena to lots 29 & 31(the lots zoned to the proper height for the arena) or offset their request for the height variance (necessitated by placing the arena on lots 30 & 32), by lowering significantly the remaining buildings." (*Ralph Anavy, email, July 27, 2015 [I-Anavy-3]*)

"I oppose this project for two reasons: (1) height-limit increases …" (*Lewis Ellingham, email, July 13, 2015 [I-Ellingham-1]*)

Response PP-1: Design for Development for the Mission Bay South Project Area

The commenter asserts that the project sponsor's request for amendments to the Mission Bay South Design for Development demonstrates that the Project conflicts with applicable land use policies. As acknowledged and discussed in the SEIR, the proposed project is requesting some amendments to the Design for Development for the Mission Bay South Area. (See, e.g., SEIR, pp. 4-7 to 4-8.) A request to amend the Mission Bay South Design for Development, however, does not establish that a proposed project is inconsistent with the land use policies of the Mission Bay South Redevelopment Plan.

As required under the California Community Redevelopment Law, the South Plan establishes the essential land use and design controls for the Project Area. Cal. Health & Safety Code §§ 33330 et seq. The South Plan contains a Land Use Map providing the location of Plan Area boundaries and permitted land uses. Attachment 2 to the Redevelopment Plan. Section 304 (General Controls and Limitations) of the South Plan establishes, among other things, the number of permitted buildings and dwelling units, open space requirements, and limitations on type, size and height of buildings. In particular, Section 304.5 establishes the amount of square footage that can be developed in each of several land use districts, floor area ratios, and a maximum height of 160 feet; it also provides that "[t]he type of buildings may be as permitted in the Building Code as in effect from time to time." Furthermore, the South Plan authorizes secondary uses, as described in Section 302, if they generally conform to the redevelopment objectives and planning and design controls established pursuant to the Plan. As part of the project review process, OCII will consider the project and its event center in the context of these objectives and controls of the Mission Bay South Redevelopment Plan.

Significantly, OCII's exercise of discretion in considering Project approvals will be guided by the principle that "[a] redevelopment plan is typically a very general document providing the agency

with maximum flexibility." (Coomes, et al., Redevelopment in California (2009) at p. 35; see also *County of Santa Cruz v. City of Watsonville* (1985) 177 Cal. App. 3d 831, 841. [redevelopment plans are "written in terms that enhance a redevelopment agency's ability to respond to market conditions, development opportunities and the desires and abilities of owners and tenants"].) The dissolution of redevelopment agencies has not diminished the authority of OCII over this project because OCII is acting pursuant to an enforceable obligation, the Mission Bay South Owner Participation Agreement, which the California Department of Finance has finally and conclusively determined to be in effect and which incorporates the land use authority of the South Plan and the Community Redevelopment Law.

In addition, OCII will consider amendments to the Mission Bay South Design for Development, an ancillary set of standards that apply to all development within the Plan Area and that must be consistent with the South Plan. As noted in the Design for Development, "[i]n the event of any conflict between this Design for Development and the Redevelopment Plan, the Redevelopment Plan provisions shall control." (Design for Development at p. 7 [as amended March 17, 2015].) As explained in the Initial Study, the project would be generally consistent with the major development standards of the Mission Bay South Design for Development with the required approval of the variations and amendments to certain standards of that document. (See *Save Our Peninsula Committee v. Monterey County Bd. of Supervisors* (2001) 87 Cal.App.4th 99, 142 ["the governmental agency must be allowed to weigh and balance the plan's policies when applying them, and it has broad discretion to construe its policies in light of the plan's purposes"].) In undertaking this evaluation, OCII must consider whether the proposed project is "'in agreement or harmony with' the terms of the applicable plan, not in rigid conformity with every detail thereof." (*San Franciscans Upholding Downtown Plan v. City and County of San Francisco* (2002) 102 Cal.App.4th 656, 678, quoting *Sequoyah Hills Homeowners Assn. v. City of Oakland* (1993), 23 Cal.App.4th 704, 718.) As discussed further in Section 13.8.3 of this document OCII's interpretation and application of its regulations to a project is accorded substantial deference. Moreover, amendments to the Mission Bay South Design for Development, and modifications to the Mission Bay South Signage Plan and Mission Bay South Streetscape Plan would occur as part of the project approvals, and with these amendments and modifications, the project would be in compliance with the applicable design standards and guidelines governing Mission Bay.

Another commenter indicates that Blocks 30 and 32 are zoned for 90 feet height limit, Lots 29 and 31 are zoned for 160 feet height limit, that height density is spelled out in the Mission Bay South Design for Development, and that not all lot surface can be built to 160 feet. The commenter indicates the sponsor chose to locate most of the event center to the east on the lots zoned for maximum 90 feet height and requested variances with no offsets by lowering the height of proposed buildings on Blocks 29 and 32. The commenter suggests that the sponsor should either relocate the event center to Blocks 29 and 31, or offset their request for the height variance by substantially lowering the remaining buildings. Another commenter also notes their opposition to the proposed height-limit increases. As noted above, the Redevelopment Plan establishes the basic zoning for the Plan Area and provides for an overall height limit of 160 feet. The event center would comply with this standard, but would require amendments to the Design for

Development document, which is an action subject to OCII approval and the consent of the Owner under the Owner Participation Agreement.

The SEIR (see Chapter 3, Project Description, and Chapter 4, Plans and Policies) and Initial Study (see Section A, Project Description, and Section E.1, Land Use and Land Use Planning) discussed South Plan area development controls on height, including those contained in the South Design for Development document. As discussed in the SEIR Plans and Policies, the project site falls within Height Zone 5 of the South Design for Development. Height Zone 5 has a maximum base height of 90 feet and a maximum tower height of 160 feet, and commercial/industrial uses must be consistent with those two heights. Further, towers (buildings taller than 90 feet) are not permitted on Blocks 30 and 32. The proposed project would include amendments to the Design for Development that would allow an "Event Center" on the project site at a height not to exceed 135 feet.

Also as discussed in the SEIR Chapter 4, Plans and Policies, a maximum of three towers are permitted with a maximum height and bulk within Height Zone 5; towers must be separated by at least 100 feet when located on the same block, and tower widths on Third Street cannot exceed 160 feet. In addition, no intersection can have more than two towers within 50 feet of the corner. To accommodate the proposed project, the Design for Development would be amended to reallocate an undeveloped tower contemplated in the Design for Development from Height Zone 2 to Height Zone 5 consistent with the project's proposal to develop two office and retail towers in addition to the event center. The amendment would also clarify the tower separation requirements to accommodate the proposed distances between the towers and the event center building. The amendment would increase to four the number of towers allowed within 50 feet of the intersection of 16th Street and Third Street.

While the project proposes some amendments to the South Design for Development, OCII staff has reviewed the requested amendments and believes that the proposed project generally conforms to the South Design for Development. The Executive Director and OCII Commission will consider these issues further during the decisionmaking process. Furthermore, as discussed above, with approval of the above discussed amendments, the project would be in compliance with development standards of the South Design for Development. The commenter's suggestion to either relocate the event center to Blocks 29 and 31, or to lower the two office and retail building is noted; however, as discussed above these suggestions would not be required for the proposed project to generally conform with redevelopment objectives and planning and design controls established pursuant to this Plan. Nevertheless, the commenter's suggestion will be considered by OCII as part of their decisionmaking process.

A commenter states that the Initial Study concedes that the project sponsor seeks "material changes." The commenter also states the SEIR anticipates amendments to the Mission Bay South Design for Development, Mission Bay South Signage Master Plan and the Mission Bay South Streetscape Plan. The commenter is misinterpreting the Initial Study. With respect to the first statement, both the Initial Study (p. 21) and the SEIR (p. 3-52) list the following under Approvals Required: " Approval by Mayor, Department of Public Works Executive Director and OCII

Executive Director of any non-*material changes* [emphasis added] to Mission Bay South Infrastructure Plan." The fact that approval would be required for non-material changes does not mean that the project is seeking "material changes." With respect to the second statement, the Initial Study (p. 21) and SEIR (p. 3-52) indicate as a matter of disclosure that approvals would be required for amendments to the Mission Bay South Design for Development, the Mission Bay South Signage Master Plan, and the Mission Bay South Streetscape Plan.

A commenter indicates that the addition of large signage, electronic advertising, and nighttime light and searchlight effects that accompany basketball games and other large events would conflict with design review standards and further impacts aesthetics/view corridors. Comments further assert that the proposed removal of codified urban design protections would significantly impact the design of the Mission Bay community and aesthetic environment and requires EIR analysis and mitigation. Other comments assert that the Draft SEIR must be revised to analyze and mitigate the environmental impacts of required amendments to adopted land use plans and policies, addressing the elimination of planned Vara blocks on the project site and related adverse impacts to aesthetics, view corridors, and pedestrian amenities. Another comment asserts the SEIR must analyze and mitigate the project's inconsistencies with plans and policies in Mission Bay South adopted for environmental protection.

First, with respect to potential aesthetic effects of project nighttime lighting and signage, and potential view blockage from new structures and elimination of planned blocks, the commenter is referred to SEIR Chapter 2 and Section 13.3, Response ERP-8, in the SEIR. Pursuant to CEQA Public Resources Code Section 21099 (Senate Bill 743), aesthetics impacts of a mixed-use or employment center project on an infill site located within a transit priority area are not, as a matter of law, considered significant impacts on the environment; and consequently potential project impacts on aesthetics are not analyzed in this SEIR. However, aesthetics and lighting effects of the proposed project would still be considered by decisionmakers as part of the design review approvals. The commenter is also referred to the Initial Study Section E.13, Biological Resources, Impact BI-4, which addresses potential effects of project nightlighting effects on birds, and SEIR Section 5.3 Transportation and Circulation, Impact TR-9d which addresses potential project effects on UCSF helipad operations from project specialized exterior lighting. In both cases, feasible mitigation is identified to ensure these lighting impacts would be mitigated to a less-than-significant level.

Secondly, the SEIR addresses potential conflicts with plans, policies and design standards adopted for the purpose of avoiding environmental effects, and project effects on the Mission Bay community, to the extent that any such conflict would result in physical environmental impacts. As such, the commenter is referred to the land use impact analysis contained in Impacts LU-1, LU-2, LU-3, and C-LU-1 in the Initial Study (Appendix NOP-IS). As explained in Impact LU-1, the proposed project would be incorporated within the overall planned street network of Mission Bay (i.e., South Street, Third Street, extended 16th Street and realigned Terry A. Francois Boulevard). The project would also include a number of features to encourage and promote public access and circulation, including setbacks along the 16th Street frontage that would serve as a connector to Bayfront Park; and proposed plazas, pedestrian walkways and other open space

within the project site. The land use impact analysis explained that all project land use impacts would be less than significant, and furthermore, that the project would not have any new or substantially more severe effects than those identified in the 1998 Mission Bay FSEIR related to land use conflicts. Aside from land use effects, the physical impacts with all other environmental topics are appropriately addressed in the applicable sections of the SEIR and Initial Study.

13.7 Impact Overview

13.7.1 Overview of Comments on the Impact Overview

The comments and corresponding responses in this section cover topics discussed in SEIR Section 5.1, Impact Overview. These include topics related to:

- IO-1: Scope of Analysis
- IO-2: Mitigation Measures
- IO-3: Assumptions for Cumulative Analysis

13.7.2 Scope of Analysis (IO-1)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

O-MBA7S2-37

"As explained by Ph.D. economist Philip King, it would be unreasonable for Oracle Arena to continue to operate with so few events. Dr. King concludes that one likely scenario is that Oracle Arena would need to close as a result of the reduced demand, which in turn creates the potential for urban decay at the Oracle Arena site. The DSEIR never analyzed the resultant potential for urban decay. Nor did the DSEIR analyze the impacts associated with demolition of the existing Oracle Arena as a result of its shuttering." (*Mission Bay Alliance, Soluri Meserve, letter, July 26, 2015 [O-MBA7S2-37]*)

Response IO-1: Scope of Analysis

The proposed project — the subject of the environmental impact analysis in the SEIR— consists of the construction and operation of a multi-purpose event center and mixed-use development at Blocks 29-32 in Mission Bay. As described in SEIR Chapter 3 (p. 3-14), the Golden State Warriors currently play their home games at Oracle Arena, which is owned by the Oakland-Alameda County Coliseum Authority and operated by Anschutz Entertainment Group (AEG). The Golden State Warriors currently maintain a lease agreement to play their basketball games at Oracle Arena through the NBA 2016-2017 season. Outside the terms of their lease agreement, the Golden State Warriors organization (or the project sponsor) does not have control over operation or management of Oracle Arena. Furthermore, upon termination of their lease agreement, all operations and management of Oracle Arena would be beyond the control of the Golden State Warriors and the project sponsor.

As described in SEIR Chapter 7, Alternatives (pp. 7-20 to 7-22), under the analysis of the No Project Alternative, the SEIR acknowledges that if the proposed project were not approved, then it is likely that the Warriors organization would either build a new arena at its current location or relocate and build a new facility elsewhere. The SEIR notes that the City of Oakland certified a

Final EIR on the Coliseum Area Specific Plan, which discloses the environmental impacts of a sports venue at the current location of Oracle Arena and the surrounding area.

CEQA provides that "[a]n indirect physical change is to be considered only if that change is a reasonably foreseeable impact which may be caused by the project. A change which is speculative or unlikely to occur is not reasonably foreseeable." (CEQA Guidelines, § 15064, subd. (d)(3).) Demolition of the existing Oracle Arena is not appropriate to include in this SEIR since it is not part of the proposed project, nor is it a reasonably foreseeable outcome of project approval. For a discussion regarding urban decay, see Section 13.2 of this Responses to Comments document under Response GEN-4.

13.7.3 Mitigation Measures (IO-2)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

A-UCSF-20	O-MM-6	O-MM-14	I-Springer-3
I-Woods-8	PH-Scott-7		

"**D. Inadequate Mitigation Measures**

"An EIR shall describe feasible mitigation measures which could minimize significant adverse impacts ... " CEQA Guidelines section 15126.4(a)(l). "Mitigation measures must be fully enforceable through permit conditions, agreements, or other legally-binding instruments." CEQA Guidelines sections 15126.4(a)(2).

"Many of the Mitigation Measures contained in the DEIR, as summarized in Table 1-2, are conditioned upon language such as "if feasible."

"In addition, some Mitigation Measures lack implementation or enforcement mechanisms or performance standards include TR- 2 ("if feasible", "if available", "working in good faith", "make good faith efforts"), TR- 4, TR-5, TR-9a, TR-11 ("make good faith efforts", "if feasible", "shall exercise commercially reasonable efforts"), N0-4, and WS-1.

"We suggest that the significance determination for each of these impacts be reassessed assuming a worst-case scenario in which the proposed mitigation measures are not feasible. Also, the Final EIR should identify whom at OCII or other City agencies will be responsible for determining "feasibility," "availability," "good faith," and 'commercially reasonable efforts." We respectfully submit that GSW should not be allowed to make these determinations." (*University of California San Francisco, Lori Yamauchi, letter, July 27, 2015 [A-UCSF-20]*)

"The DSEIR also fails comply with CEQA's mandate to mitigate the Project's impacts by proposing in a separate section of the EIR feasible, effective, and enforceable mitigation measures for each impact identified, and to present a full range of alternatives, including off-site alternatives, to the Project to eliminate or reduce the Project's impacts." (*Mary Miles, Attorney at Law, email, July 27, 2015 [O-MM-6]*)

"6. The DSEIR Fails To Propose Effective And Feasible Mitigation Measures For The Project's Impacts.

"Under CEQA, "An EIR is an informational document which will inform public agency decisionmakers and the public generally of the significant environmental effect of a project, identify possible ways to minimize

the significant effects, and describe reasonable alternatives to the project." (14 Cal. Code Regs. ["Guidelines"] §15121(a); PRC §21002.1(a),(b).) CEQA requires specific content in the EIR, including either a separate chapter on mitigation measures proposed to minimize the significant effects or a table showing where that subject is discussed. (Guidelines §15126.) The DSEIR contains no chapter on mitigation and no table showing where mitigation, including feasibility analyses, are discussed. (Id.)

"Proposed mitigation measures include "[a]voiding the impact altogether by not taking a certain action or parts of an action." (Guidelines, §15370(a).) The EIR should propose effective, enforceable mitigation measures for each impact it identifies. The effectiveness of proposed mitigation measures should be supported by substantial evidence.

"Claiming a significant impact is "unavoidable" does not excuse the failure to propose effective mitigation, but that is what this DSEIR assumes it may do, including significant transportation and circulation impacts, noise impacts, air quality impacts, wind impacts, and utilities impacts. (DSEIR 6-1 - 6-4.) That does not comply with CEQA." (*Mary Miles, Attorney at Law, email, July 27, 2015 [O-MM-14]*)

"3) The funding must be guaranteed for the mitigations outlined in the SEIR. Whether it comes from the City or the Warriors, the mitigations must not be reliant on there being sufficient funds; those funds should be identified and secured before the project is approved, or else the EIR is irrelevant." (*Matt Springer, email, July 16, 2015 [I-Springer-3]*)

"As an active participant in the development of Mission Bay, Chair of the Mission Bay Citizens Advisory Committee, 30 year resident of the neighborhood, and MBCAC representative to the B/MBTCC, I am very concerned that resources for mitigations are overestimated, enforcement and funding are underestimated, and authority and responsibility for implementation of mitigations is vague and unenforceable as expressed in the SEIR." (*Corinne Woods, email, July 27, 2015 [I-Woods-8]*)

"Overall, we are disappointed with the City's approach to the environmental review of the project, which fails to fully access the impacts of the project and fails to provide adequate mitigation for the impacts that are identified in the Draft EIR." (*Damion Scott, public hearing transcript, June 30, 2015 [PH-Scott-7]*)

Response IO-2: Mitigation Measures

This group of comments question the general feasibility, effectiveness, enforceability, and adequacy of mitigation measures. For the reasons described below, OCII disagrees with these assertions. Because these comments do not identify specific mitigation measures, this response provides a general response regarding the overall approach to identifying and implementing mitigation measures.

As indicated in SEIR Section 5.1, Impact Overview (page 5.1-4), for impacts determined to be significant, the SEIR impact analysis identifies mitigation measures that would avoid or reduce the severity of the identified impact and describes how the measures would accomplish this. The analysis describes all mitigation measures that are applicable to the proposed project, whether they are the same as those previously specified in the 1998 Mission Bay FSEIR, are updated versions of those measures, or new site-specific measures. All mitigation measures identified in the SEIR are consistent with CEQA Guidelines Section 15126.4 and are considered feasible or

potentially feasible. Also described in SEIR Section 5.1, for some impacts, the SEIR identifies "improvement measures," which are feasible measures that would reduce the severity of impacts that were determined to be less than significant.

The project sponsor has reviewed the mitigation and improvement measures identified in the SEIR and has agreed to implement all mitigation measures and all improvement measures as a condition of project approval. The sponsor has therefore waived its chance to argue that any of the measures are infeasible and should be rejected, at the time of project approval, for that reason. (See CEQA Guidelines, § 15091, subd. (a)(3) [agency decision-makers can reject proposed mitigation measures as infeasible].) Even though CEQA does not require mitigation for less-than-significant impacts, the project sponsor has agreed to implement the identified improvement measures as well as the mitigation measures, if the project is approved. As described in Section 13.2, under Response GEN-1b, the project sponsor will bear responsibility for funding and implementing all mitigation and improvement measures included in the SEIR other than those expressly assigned to the City.

For impacts determined to be significant or potentially significant, the impact discussions for all impacts in SEIR Chapter 5 and in the Initial Study include an explanation of how the identified mitigation measure would reduce the severity of the impact, including whether or not the measure would effectively reduce the severity of the impact from significant to less than significant. In many cases, mitigation measures are standard measures that have been required and implemented for many projects in San Francisco and have been demonstrated to be feasible and effective. Mitigation measures are listed directly following the corresponding impacts, providing a direct connection between the impact and mitigation measure. If the measure would reduce the impact to a less-than-significant level, then the overall significance determination is designated as *less than significant with mitigation*. If there is uncertainty in the effectiveness or feasibility of a mitigation measure or in the ability of the project sponsor to implement the measure, then the impact is designated as *significant and unavoidable with mitigation*.

In the latter case, the text of the mitigation measure might include terms such as "if feasible" or "if available" in acknowledgment of the uncertainty in the effectiveness, feasibility or implementability of the measure. The determination as to whether or not an impact is *significant and unavoidable with mitigation* is made only after review and analysis of the nature and severity of the impact, availability of feasible measures, and the reasonable ability of the project sponsor to implement the measure. This approach represents OCII's best effort to explore and implement the maximum reasonable mitigation for any impacts determined to be significant. Thus, in many cases, the SEIR identifies mitigation measures that the project sponsor will be required to implement—even though there is some degree of uncertainty as to the effectiveness of the measure—in order to reduce the severity of impacts deemed to be significant and unavoidable, even with mitigation. In each such instance, if a measure ultimately proves to be ineffective or infeasible, that determination would be made, not by the project sponsor, but by the public agency department or entity responsible for enforcing that measure, as set forth in the Mitigation Monitoring and Reporting Program (MMRP), described below. All mitigation measures adopted by OCII must be carried out. If a measure cannot be carried out, then OCII would have to revise

or delete that measure, following appropriate review under CEQA. In a few cases, there is no mitigation available for a significant impact that would be within the ability of the project sponsor to implement, and those impacts are designated as *significant and unavoidable*.

Table 1-2, Summary of Impacts and Mitigation Measures, on SEIR pages 1-14 to 1-63 lists all mitigation and improvement measures identified in the SEIR and specifies the corresponding impact and where the impact discussion can be located in the SEIR or Initial Study.

If the project is approved, the project sponsor will be required to implement all mitigation and improvement measures identified in the SEIR as part of the conditions of approval. The conditions of project approval will include a MMRP, consistent with CEQA Guidelines section 15097(a), which requires that "In order to ensure that the mitigation measures and project revisions identified in the EIR … are implemented, the public agency shall adopt a program for monitoring or reporting on the revisions which it has required in the project and the measures it has imposed to mitigate or avoid significant environmental effects." The MMRP will include the full text of all mitigation and improvement measures in the SEIR and Initial Study and is a fully enforceable legal mechanism for ensuring that all mitigation and improvement measures will be implemented. The MMRP will identify the entity responsible for carrying out each measure and the specific department responsible for monitoring to confirm compliance. As shown in the MMRP, many of the identified measures will be carried out by the project sponsor, and the project sponsor's compliance would be monitored by a public agency. Thus, all of the mitigation measures described in the SEIR are enforceable. OCII will adopt a mitigation monitoring program at the time of project approval to ensure that the mitigation measures committed to in the action are carried out. (Pub. Resources Code, § 21081.6; CEQA Guidelines, § 15097.)

For Comment O-MM-6, refer to Section 13.24 for a response to the portion of the comment pertaining to alternatives.

13.7.4 Assumptions for Cumulative Analysis (IO-3)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

I-deCastro1-4	I-Hong-3	I-Hong-15	I-Zboralske-3
I-Zboralske-7	I-Zboralske-10		

"The concept of a "lock box" for ticket tax revenue is a good idea. However I am waiting for legislative action to make it a reality. Given that the Eastern Neighborhoods Plan called for improved transit 5 years ago. We have seen little progress on that front." (*John deCastro, email, July 27, 2015 [I-deCastro1-4]*)

"3. Under Cumulative Projects 5.1.5.2, were the following projects considered? HOPE, possible removal of the 280 freeway, Giants Project-Pier 70, 590 Minnesota-UCSF proposed Student Housing and 600 Minnesota-UCSF proposed Student Housing? Several of these Projects may be identified as another name –

specifically the HOPE Project. For clarity purposes, could all of these cumulative projects be shown on a map, similar to fig 5-2-12?" (*Dennis Hong, email, July 27, 2015 [I-Hong-3]*)

"a. A construction time line showing all ongoing/current, cumulatively or upcoming projects in the vicinity of this project must be considered." (*Dennis Hong, email, July 27, 2015 [I-Hong-15]*)

"Over the past years things have changed significantly in Mission Bay and throughout a large portion of San Francisco. Specifically, in Mission Bay many large residential buildings have been completed and occupied. Others are in various states of construction. The new UCSF Children's Hospital project has been built and opened in early 2015. The new Public Safety Building has been completed and occupied. The San Francisco Giants' plan for significant development on Lot A is working its way through a process and has yet to be finalized. It does call for significant proposed changes on that parcel. Proposed changes to Pier 48 are in the works. High-profile businesses plan to build and locate their corporate offices in the area. A significant amount of newly planned residential developments are in the proverbial "pipeline" in Mission Bay, Dogpatch, Potrero Hill and Showplace Square.

"Virtually all of these projects impact local residents by causing traffic congestion, noise pollution, taxing public transit and affecting important quality of life issues in the area. As the projects are completed, the influx of new residents living in the area has increased significantly and at a rapid rate. The influx of new workers (in significant numbers) also impacts traffic and public transportation ridership. This will only be accelerated over the next couple of years as thousands of new residential units and many large-scale new retail and commercial buildings will be built and occupied. The scope and pace of development in Mission Bay and its surrounding areas is astonishing." (*James Zboralske, email, July 27, 2015 [I-Zboralske-3]*)

"The article did not mention the proliferation of commercial and retail developments and their significant impacts on San Francisco over the last five years. It is the cumulative impacts of all of these changes that affect our daily lives, our health and our outlook on the City." (*James Zboralske, email, July 27, 2015 [I-Zboralske-7]*)

"The construction of the Warriors arena is only one piece of the local puzzle. Multiple major projects are in various states of planning and/or development. These include:

- Expanding UCSF – Several projects
- Developing Pier 50 – Anchor Steam
- Building a hotel in Mission Bay
- Developing Seawall Lot 337 – Lot A – A massive project
- Pier 70 – A large mixed use development
- The Eastern Neighborhood Program
- The Uber Headquarters Project
- Realignment of Terry A. Francois Boulevard and Mission Bay Park
- The construction of many new residential complexes that will contain several thousand new units in Mission Bay, Dogpatch, Potrero and Showplace Square

"In congested urban areas like San Francisco, no new development can be evaluated in isolation. For that reason you need to consider the total cumulative impacts these projects will have. The Warriors Arena was never originally intended to be built in Mission Bay. It was never included in any previous plan for Mission Bay. It would, however, be arguably the biggest and most impactful project ever built in the area.

It was thrust and forced on San Francisco when the owners of the Warriors went into contract to buy parcels of land in Mission Bay. This was after the failed attempt to build the arena along the Embarcadero." (*James Zboralske, email, July 27, 2015 [I-Zboralske-10]*)

Response IO-3: Assumptions for Cumulative Analysis

This group of comments address the assumptions used in the analysis of cumulative impacts. SEIR Section 5.1.5 (pp. 5.1-6 to 5.1-11) presents the general approach and assumptions used for analyzing cumulative impacts of the proposed project. Cumulative impacts, as defined in CEQA Guidelines Section 15355, refer to two or more individual effects that, when taken together, are "considerable" or that compound or increase other environmental impacts. A cumulative impact from several projects is the change in the environment that would result from the incremental impact of the project added to the impacts of other closely related past, present, or reasonably foreseeable future projects. The cumulative impact analysis in the SEIR is consistent with CEQA Guidelines Section 15130.

Two approaches to a cumulative impact analysis are provided in CEQA Guidelines Section 15130(b)(1): (a) the analysis can be based on a list of past, present, and probable future projects producing related or cumulative impacts; or (b) a summary of projections contained in a general plan or related planning document can be used to determine cumulative impacts. The projections model includes individual projects and applies a quantitative growth factor to account for other growth that may occur in the area. The analyses in the SEIR employ both the list-based approach and a projections-based approach, depending on which approach best suits the individual resource topic being analyzed. For those topics using the list-based approach, a list of projects considered in the cumulative analysis is provided on SEIR pages 5.1-8 to 5.1-11.

In response to the specific project identified by the commenters, the SEIR has considered all of these projects as part of the cumulative analysis as described below:

- **Eastern Neighborhoods Program.** This program is described on SEIR pages 5.1-8 to 5.1-9 and is considered in the cumulative analysis for operational impacts for topics using the list-based approach. For the Transportation analysis, the cumulative traffic and transit analyses are based on cumulative development and growth identified by the San Francisco County Transportation Authority SF-CHAMP travel demand model (see SEIR pp. 5.2-108 to 5.2-111), which incorporates broad assumptions for all projects included on the cumulative list, including the Eastern Neighborhood Program. While the Eastern Neighborhood Program called for transit improvements, no specific improvements were specified. However, a number of transit improvements have been implemented in the project area (see SEIR pp. 5.2-16 to 5.2-20) including the Muni Forward program.

- **Residential development projects in Mission Bay, Dogpatch, Potrero Hill, and Showplace Square.** These projects are all part of the Eastern Neighborhoods Program described above.

- **HOPE public housing revitalization projects.** These projects are included in the SF-CHAMP model used for the projections-based cumulative analysis for transportation impacts.

- **Removal of I-280 Freeway.** This project is included in the SF-CHAMP model used for the projections-based cumulative analysis for transportation impacts.

- **Seawall Lot 337 and Pier 48 Mixed Use project** (also known as Mission Rock, Giants Project, or Lot A). This project is described on SEIR page 5.1-9 and is considered in the cumulative analysis for operational impacts for topics using the list-based approach. This includes the Anchor Steam project, which is part of the Pier 48 development and not Pier 50. For the Transportation analysis, this project is included in the SF-CHAMP model used for the projections-based cumulative analysis.

- **Pier 70 Mixed-Use Development.** This project is described on SEIR page 5.1-9 and is considered in the cumulative analysis for operational impacts for topics using the list-based approach. For the Transportation analysis, this project is included in the SF-CHAMP model used for the projections-based cumulative analysis.

- **UCSF Children's Hospital.** This project, completed in spring 2015, was included as part of the baseline, existing conditions analysis, and is not considered a cumulative project (see SEIR page 5.2-8).

- **UCSF student housing projects.** These UCSF projects are included as part of the UCSF Long Range Development Plan (LRDP), which is described on SEIR page 5.1-9 and is considered in the cumulative analysis for operational impacts for topics using the list-based approach. For the Transportation analysis, the UCSF LRDP is included in the SF-CHAMP model used for the projections-based cumulative analysis.

- **New Public Safety Building.** This project, completed in spring 2015, was included as part of the baseline, existing conditions analysis, and is not considered a cumulative project (see SEIR page 5.2-8).

- **Hotel in Mission Bay.** A hotel project on Mission Bay Block 1 is described on SEIR page 5.1-11 and is considered in the cumulative analysis for construction impacts for topics using the list-based approach. Operational impacts of this project were considered as part of the 1998 Mission Bay Final SEIR. For the Transportation analysis, this project is included as part of the overall Mission Bay Development in the SF-CHAMP model used for the projections-based cumulative analysis.

- **Uber Headquarters project.** This project is described on SEIR page 5.1-10 and is considered in the cumulative analysis for construction impacts for topics using the list-based approach. Operational impacts of this project were considered as part of the 1998 Mission Bay Final SEIR. For the Transportation analysis, this project is included as part of the overall Mission Bay Development in the SF-CHAMP model used for the projections-based cumulative analysis.

- **Realignment of Terry A. Francois Boulevard and Mission Bay Park.** This project is described on SEIR pages 5.1-10 to 5.1-11 and is considered in the cumulative analysis for construction impacts for topics using the list-based approach. Operational impacts of this project were considered as part of the 1998 Mission Bay Final SEIR. For the Transportation

analysis, this project is included as part of the overall Mission Bay Development in the SF-CHAMP model used for the projections-based cumulative analysis.

Comment I-deCastro1-4 regarding the commenter's favorable opinion of a "lock box" for ticket tax revenue is acknowledged.

Comment I-Hong-3 requests a map showing the location of cumulative projects. The SEIR elected not to include a map of the locations of projects used in the cumulative analysis because some of these analyses, such as Transportation, are based on projections rather than specific projects, and a map could be misleading. For those projects used in the list-based approach, the descriptions of projects include clear identification of geographic locations that can then be located on project vicinity maps such as Figure 3-2 (page 3.3) or Figure 3-3 (page 3.7).

Comment I-Hong-15 requests a construction time line showing cumulative projects in the vicinity of the project. SEIR Section 5.1.5.3 (pp. 5.1-10 to 5.1-11) describes the cumulative construction projects in the vicinity of Blocks 29-32, including the estimated construction period for each project.

"c. The Event Center Will Destroy Planned Community Character. Development of Mission Bay South has been the subject of intensive planning for 25 years, as reflected in the 1990 EIR, the 1998 EIR, and the Mission Bay Redevelopment Plans. The character of the community revolves around medical and biotechnology development. "Because a major UCSF site would likely be a magnet for biotechnology research, an emphasis on biotechnology is anticipated." (1998 Mission Bay EIR, p. IA.89.)

"The Warriors Event Center proposes a signature disruption in the long---planned development of Mission Bay South as a biotechnology and medical hub, and EIR analysis of that planned land use change is required. In comments on the Initial Study, research---based biotechnology company FibroGen, located adjacent to the project site, raised concerns about the Event Center's likely disturbance of the company's "operations, sensitive instrumentation, laboratories, and chemicals," all highly sensitive to noise and vibration. "… [G]iven the Project's significant scope coupled with the sensitivity of FibroGen's use and ongoing operations, … it is critical that the EIR thoroughly disclose and evaluate any potential land use incompatibilities with surrounding land uses."

"This major planning detour requires EIR revision and recirculation." (*Mission Bay Alliance, Susan Brandt-Hawley, letter, July 26, 2015 [O-MBA6B1-10]*)

"**10. The SDEIR Fails to Address The Project's Direct and Cumulative Land Use Impacts.**" (*Mary Miles, Attorney at Law, email, July 27, 2015 [O-MM-18]*)

"The DSEIR incorrectly claims that an "Initial Study" can substitute for the analysis and mitigation of the Project's land use impacts, claiming the Project "would not physically divide an established community; conflict with land use plans, policies, or regulation adopted for the purpose of avoiding or mitigating an environmental effect; or have impacts on the existing character of the vicinity." (DSEIR 6-4.) In fact, the Project it plainly incompatible with existing uses in the immediate vicinity, including a major medical center, research and hospital facility, and residential uses. The Project's significant impacts clash with and affect all of those other land uses. Indeed a "subsequent" environmental impact report is inappropriate for this Project, since it drastically departs from existing land uses." (*Mary Miles, Attorney at Law, email, July 27, 2015 [O-MM-19]*)

"As you know, the plan for Mission Bay approved by the Board of Supervisors (October 1998) states, as one of the major objectives of this visionary project:

> Facilitating emerging commercial and industrial sectors including those expected to emerge or expand due to the proximity to the new UCSF site, such as research and development, bio-technical research, telecommunications, business service, multi-media services, and related light industrial…

"And indeed, Mission Bay has rapidly become one of the most prominent academic-industry biotechnology/medical complexes in the world. But we cannot stop here: we face increasing competition from other rapidly growing complexes of this type, both in the US and abroad. It will be critical to keep moving aggressively forward, if we are to continue to attract the very best talent – both academic and private sector – to San Francisco.

"It is absolutely clear to us that the planned new Golden State Warriors Arena and Events Center in Mission Bay would severely degrade the environment for the many thousands of researchers and private sector biomedical scientists who come to work at Mission Bay each day. It would also curtail the beehive-like, daily exchanges of personnel – from the South Bay and elsewhere – on which the success of the Mission Bay biomedical complex depends. Our major fear is that the Mission Bay site will lose its appeal – not only for the new biomedical enterprises that the city would like to attract here, but also for most of its current occupants. The result could critically harm not only UCSF, but also the enormously promising, larger set of biomedical enterprises that currently promises to make San Francisco the envy of the world." (*Bruce Alberts, et. al, letter and email, September 22, 2015 [I-Alberts-1]*)

"I am San Francisco homeowner and a local (4th and Townsend) worker concerned about the impact of the proposed Golden State Warriors stadium on the future of the close-knit, surrounding neighborhood communities and the medical campus at Mission Bay." (*Micki Cunningham, email, July 23, 2015 [I-Cunningham-1]*)

"… and is not a good fit with the surrounding medical establishment." (*Helen Dickey, email, July 13, 2015 [I-Dickey-3]*)

"A new massive entertainment center is inconsistent with these current and previously planned future uses, previously proposed under the carefully developed Mission Bay Plan. Yet, the Draft EIR does not even discuss the land use impacts of the project, which were not analyzed in the Mission Bay Plan EIR." (*Alison Heath, email, June 30, 2015 [I-Heath-2]*)

"Regular events at the stadium will have a negative impact for the neighborhood, businesses and UCSF hospitals in the area.

"We do not need more sports and events in that area of the city." (*Kathryn Hyde, email, July 15, 2015 [I-Hyde-5]*)

"I think the Warriors need a new home outside of SF...it wasn't okay to over-develop at the waterfront/exceeding height limits, and it's not okay to bring huge crowds into an area that is rapidly becoming overcrowded and already houses a major new hospital …" (*Lauris Jensen, email, July 13, 2015 [I-Jensen-1]*)

"This is an incompatible combination and should be allowed to proceed. The UCSF Medical Center is there already. Adding a sports stadium next to it would be detrimental to UCSF. It would be wiser to seek another location for the Stadium, not nextdoor to UCSF Medical center hospital." (*Jackie Jones, email, July 1, 2015 [I-Jones-1]*)

"I am disappointed that the land set aside for this is not being used for the biotech or health science industry rather than entertainment." (*Jennie Kajiko, email, July 25, 2015 [I-Kajiko-3]*)

"Adding a basketball stadium to Mission Bay would make this nightmare a year round nuisance. Stadiums don't belong in urban centers. Don't let the Warriors ruin the neighborhood with the most potential in San Francisco." (*Jeremiah Lee, July 20, 2015 [I-Lee-4]*)

"A new massive entertainment center is inconsistent with these current and previously planned future uses, previously proposed under the carefully developed Mission Bay Plan. Yet, the Draft EIR does not even discuss the land use impacts of the project, which were not analyzed in the Mission Bay Plan EIR." (*Michael Lighty, email, July 27, 2015 [I-Lighty-2]*)

"Given these impacts, which the SEIR fails to identify and/or mitigate, and which may not be possible to mitigate, point to the incompatibility of locating the project across the street from a hospital serving some of the most sensitive patients in the region." (*Michael Lighty, email, July 27, 2015 [I-Lighty-10]*)

"We could use a lot more retail establishments around here, and smaller restaurants would do well. The thousands of us working out here don't have a lot of choices to walk to at lunch time. That would be a welcome addition. And that is the type of thing that was on the original plan I believe." (*Kim Osborn, email, July 27, 2015 [I-Osborn-5]*)

"The arena development is completely ill-suited to a university campus and medical center location--not to mention a prime waterfront site. The scale is ill judged and it just does not fit with a world class research institution." (*Gavin Rynne, email, July 27, 2015 [I-Rynne-2]*)

"A new massive entertainment center is inconsistent with these current and previously planned future uses, previously proposed under the carefully developed Mission Bay Plan. Yet, the Draft EIR does not even discuss the land use impacts of the project, which were not analyzed in the Mission Bay Plan EIR." (*Judy Tan, email, July 27, 2015 [I-Tan-2]*)

"I respect the Warriors. They're a good organization, but they're not this non-profit organization that should be exempt from smart urban planning; right?

"If we had a bank headquarters that was going to go in that spot with that traffic density as it now exists, and you're going to have 20,000-some-odd visitors, you would write that off immediately. That's awful urban planning.

"They're not a non-profit. They're a multibillion-dollar asset and a very profitable organization. And it does not make sense for a company that is going to put that kind of burden on the community and the region; right?" (*John, public hearing transcript, June 30, 2015 [PH-Cornwell2-1]*)

"In particular, we're concerned about the compatibility of the center with the existing health and research facilities in Mission Bay, and while health and related biosciences was planned to expand under the Mission Bay Redevelopment Plan, this project takes this area in a completely new and incompatible direction." (*Osha Meserve, public hearing transcript, June 30, 2015 [PH-Meserve-2]*)

"The project is a perfect fit for this neighborhood. Mission Bay was envisioned as a mixed-use development project. The Port worked -- we worked on it for many years in the late '80's and early '90's. It's a mixed-use development project. It's not just a life science center. So, this is use fits into the City's plan for this area." (*Paul Osmundson, public hearing transcript, June 30, 2015 [PH-Osmundson-2]*)

"The Draft EIR shows that the project would cause severe traffic gridlock, noise, and air pollution in Mission Bay, right next to the U.C.S.F. and other medical facilities, yet the Draft EIR does not even discuss the land-use impacts of the project. They were not analyzed in the mission of the planned EIR." (*Damion Scott, public hearing transcript, June 30, 2015 [PH-Scott-2]*)

"The D.N.A. [Dogpatch Neighborhood Association] is not opposed to the stadium. However, the development will have direct and lasting impact on our neighborhood, and of course, is of grave concern to the Dogpatch Neighborhood Association and residents of the community." (*David Siegel, public hearing transcript, June 30, 2015 [PH-Siegel2-1]*)

Response LU-1: Land Use Character and Compatibility

Several comments assert that the proposed project would be inconsistent with, and would result in direct and/or cumulative impacts to, existing and/or planned nearby UCSF-related medical uses, UCSF and non-UCSF biotechnical uses, and residential uses in the vicinity, and that the SEIR and the Mission Bay FSEIR did not address land use impacts.

The impact significance criteria used in the SEIR are based on San Francisco Planning Department protocol and CEQA Guidelines, Appendix G. For the purposes of analyzing land use, CEQA Guidelines Appendix G, asks whether a project would:

(a) Physically divide an established community?

(b) Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

(c) Have a substantial impact upon the existing character of the vicinity?

As discussed further below, the Initial Study addresses each of the above issues and concludes the proposed project would not have the potential to result in any potentially significant land use impacts. As explained by CEQA Guidelines section 15128, where an effect is found to be less than significant, a "statement briefly indicating the reasons that various possible significant effects of a project were determined not to be significant… may be contained in an attached copy of an Initial Study."

The Initial Study, Section E.1: Land Use and Land Use Planning first summarized the land use impacts analysis of the Mission Bay Plan from the Mission Bay FSEIR, including its conclusion that the implementation of the Mission Bay Plan would not result in any significant land use impacts. Specifically, the Initial Study observed that the Mission Bay FSEIR determined that the Mission Bay Plan would not physically disrupt or divide an established community, or have a substantial impact upon the existing character of the vicinity.

The Initial Study then addressed all potential land use impacts of the proposed project. With respect to the potential to physically divide an established community, in *Cathay Mortuary, Inc. v. San Francisco Planning Com.* (1989) 207 Cal.App.3d 275, the court held that similar language in subdivision (u) of former Guidelines Appendix G ("A project will normally have a significant effect on the environment if it will . . . [d]isrupt or divide the physical arrangement of an established community")[1] was intended to apply to projects, such as highway construction, that would constitute physical barriers dividing a community. (*Id*. at p. 280; see also *Gentry v. City of Murrieta* (1995) 36 Cal. App. 4th 1359, 1419.) The Initial Study considers the potential for the proposed project to cause such an impact, Impact LU-1 (pp. 29 to 30), and explains that the proposed project would be incorporated within an established street plan, would not include any physical barriers or obstacles to pedestrian or vehicle circulation, and that any temporary disruption to traffic/pedestrian flow related to events at the event center would be minimized to the extent feasible with implementation of the proposed Transportation Management Plan. On the basis of these factors, as explained in the Initial Study, the project would not have any new or

[1] Former Appendix G to the CEQA Guidelines, a list of impacts "normally" considered significant, was repealed as part of the 1998 update to the CEQA Guidelines. At that time, the sample Initial Study Checklist, formerly found in Appendix I to the Guidelines, was modified and retitled Appendix G.

substantially more severe effects than those identified in the Mission Bay FSEIR related to physical division of an established community.

With respect to potential project conflicts with plans and policies adopted for the purpose of mitigating environmental effects, the Initial Study Impact LU-2 (pp. 30-32) discussed that the project would not conflict with the Mission Bay South Redevelopment Plan, under which the proposed office and retail uses are considered primary uses, and the proposed event center is considered a secondary use. As explained in the Initial Study, the project would be generally consistent with the major development standards of the Mission Bay South Design for Development with approval of the required variations and amendments to certain standards contained in that document.

The Initial Study also explained that the project would not substantially conflict with the other applicable regional planning documents, including the *Plan Bay Area*, 2010 Clean Air Plan, *San Francisco Bay Plan*, and the *San Francisco Basin Plan*. With respect to *Plan Bay Area*, as discussed in SEIR Chapter 4, Plans and Policies, the project site is located within a Priority Development Area (PDA) of Plan Bay Area where growth is anticipated and planned for in proximity to transit. The proposed project would not conflict with any projects in the Regional Transportation Plan, and accordingly, would be consistent with *Plan Bay Area*. With respect to 2010 Clean Air Plan (2010 CAP), as discussed in SEIR Chapter 4 notes that the proposed project would include appropriate transportation, energy, and sustainability measures to reduce automobile trips, energy usage, and associated emissions and would not disrupt or hinder implementation of control measures identified in the 2010 CAP. Furthermore, the project sponsor has agreed to implement mitigation measures that would reduce pollutant emissions, including offsetting emissions generated by construction and operations of the project. (See e.g., Mitigation Measure M-AQ-2b in SEIR Section 5.4, page pp. 5.4-42 to 5.4-43.) Therefore, as described in detail in Section 5.4, Air Quality, the project would not conflict with the 2010 CAP. With respect to the S*an Francisco Basin Plan* and *San Francisco Bay Plan,* as described in Chapter 5, Section 5.9, Hydrology and Water Quality, as well as Section E.14 of the Initial Study, the proposed project would not result in substantial water quality effects; thus the project would not conflict with the Basin Plan. Accordingly, the project would not substantially conflict with these other regional planning documents, and in fact would promote or assist achieving in the goals of those plans.

The Initial Study noted that aside from land use effects, the physical environmental impacts of potential policy conflicts were addressed in other applicable sections of the Initial Study and SEIR; see Initial Study Section E.13 (Biological Resources), and SEIR Section 5.2 (Transportation and Circulation), Section 5.4 (Air Quality), Section 5.4 (Greenhouse Gas Emissions), and Section 5.9 (Hydrology and Water Quality). This approach is consistent with established CEQA case law. As explained in *Lighthouse Field Beach Rescue v. City of Santa Cruz* (2005) 131 Cal.App.4th 1170, 1207, planning inconsistency is "merely a factor to be considered in determining" the significance of changes in the physical environment caused by the project.

In addition, the Initial Study notes that there were no substantial changes with respect to circumstances under which the project is undertaken nor has any new information become

available (e.g., the 2014 UCSF Long Range Development Plan) that would result in new or more severe impacts associated with the proposed project. On the basis of these factors, as explained in the Initial Study, the project would not have any new or substantially more severe effects than those identified in the Mission Bay FSEIR related to conflict with land use plans or policies adopted for the purpose of avoiding or mitigating an environmental effect.

With respect to potential project impacts on the existing character of the vicinity, the Impact LU-3 (pp. 32 to 34) explained that the proposed retail and office uses would generally be consistent with the previously proposed uses for the site, such that no new or more severe conflicts with land use character would occur. The Initial Study acknowledged that although the Mission Bay FSEIR did not directly contemplate development of an event center, it did analyze the potential for secondary "nighttime entertainment uses." The Initial Study states that the proposed event center would increase the intensity of the site's use and would thus alter the land use character of the project site from that analyzed in the Mission Bay FSEIR, and the presence of event center-associated spectators in the surrounding Mission Bay neighborhood would be noticeable compared to existing conditions. However, the Initial Study also explains that the proposed project would not hinder operation of those existing uses such that adverse land use impacts may occur. The Initial Study acknowledged other changes in land use conditions that have occurred since preparation of the Mission Bay FSEIR, including the expanded UCSF Mission Bay campus (including the establishment of the medical center, which like the proposed event center, is a secondary "public structure" and "use of a nonindustrial character" land use). But, the Initial Study concluded that the operation of office, entertainment and retail uses at the project site would not conflict with the changed land use character. On the basis of these factors, as explained in the Initial Study, the project would not have any new or substantially more severe effects than those identified in the Mission Bay FSEIR upon the existing character of the vicinity.

The Impact C-LU-1 (pp. 34 to 36) addressed potential cumulative land use impacts resulting from additional planned development in Mission Bay South Plan Area and nearby vicinity, including the Pier 70 project, Seawall Lot 337 and Pier 48 Mixed-Use project, and other reasonably foreseeable development. The Initial Study explained that these projects, in combination with the proposed project, would create a wider mix of uses than currently exists in this portion of the City, but such change would not result in significant adverse cumulative effects to land use character. On the basis of the factors discussed above, the Initial Study stated that cumulative land use impacts would be less than significant.

A commenter indicates that, in response to the Notice of Preparation to prepare a SEIR, the biotechnology company FibroGen raised concerns about the potential for the project's construction noise and vibration to disturb the company's operations, sensitive instrumentation, laboratories, and chemicals. SEIR Section 5.3, Noise and Vibration, Impacts NO-1 and NO-3 did not identify any significant construction noise or vibration impacts to sensitive equipment in nearby land uses under CEQA. As discussed in the SEIR, no pile driving is proposed during construction; rather, all piles would be cast in place with drilled auger holes, reducing potential project construction-related noise and vibration effects. In addition, please refer to SEIR Chapter 12, Project Refinements and New Project Variant, which documents that the project

sponsor now no longer proposes to use Rapid Impact Compaction during construction of the proposed project, which would further reduce project construction noise and vibration effects. For additional information regarding vibration impacts during construction, see Sections 13.12.4 and 13.12.6. Finally, please note the Mission Bay Plan contemplates a diverse array of uses to address blight and enhance economic development in the area.

A commenter claims the project's effect on community character would require SEIR revision and recirculation. As discussed above, there were no significant project impacts to community character identified in the Initial Study. The commenter is also referred to Chapter 13.3: Environmental Review Process, Response ERP-5, which explains that no environmental issues have been raised that would require recirculation of the Draft SEIR under CEQA.

A commenter mischaracterizes the use of the Initial Study prepared for the proposed project, claiming that the Initial Study substitutes for the analysis and mitigation of the project's land use impacts. As discussed in the Initial Study, Section A.1, the Initial Study, consistent with CEQA Guidelines Sections 15063(b)(1)(C) and 15168(d)(1), provides documentation to determine which of the project's effects were adequately examined in the Mission Bay FSEIR and which topics warrant more detailed environmental analysis. For the topics which warrant more detailed environmental analysis (i.e., those resulting in either new significant effects or substantially more severe impacts than were previously identified in the Mission Bay FSEIR), a focused SEIR was prepared. The Initial Study identified no significant land use impacts, and consequently, no additional analysis of this environmental topic was warranted in the SEIR. Please see also Response LU-2, below.

Several commenters suggested that the project should be developed at another location. The SEIR Chapter 7, Alternatives, included a detailed analysis of potential alternatives to the proposed project, including a No-Project Alternative and an Off-site Alternative. See also Section 13.24 of this document for further discussion of alternatives.

Finally, several commenters offered various opinions of the proposed project. These include comments that more sports and events were not needed in this area of the City; that the Golden State Warriors need a new home outside of San Francisco; that the project site should be set aside for the biotech and health science industry rather than for entertainment uses; that stadiums do not belong in urban centers; that more retail and small restaurants are needed in the area; that the arena is ill-suited to a university campus and medical center location and prime waterfront site; that the scale of the project is ill-sized; that the project sponsor should not be exempt from smart urban planning; and that other potential projects that would generate the similar visitorship as the proposed project would be written off immediately. These comments manifest the concern by some commenters that the project may alter the local lifestyle and result in other social impacts within the Mission Bay area. "[E]vidence of social . . . impacts which do not contribute to or are not caused by physical impacts on the environment does not constitute substantial evidence" that a project may have a significant environmental effect. (CEQA Guidelines, § 15384, subd. (a).) Therefore, these comments do not address the adequacy of the SEIR, and consequently, no response is required. However, the commenters' opinions will be forwarded to the decision-makers.

13.8.3 Land Use Plan Consistency (LU-2)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

O-MBA6B1-5

"2. The Draft Subsequent EIR Must Address Land Use

"The Notice of Preparation and Initial Study ("NOP/IS" or "Initial Study") acknowledges that, per the 1998 Mission Bay EIR, "the Mission Bay Redevelopment Plans and Design for Development documents … constitute the regulatory land use framework for the Mission Bay plan area." (NOP/IS, p. 30.) The Initial Study finds no need to address land use issues in the DSEIR, contending that the Event Center would not conflict with land use policy, divide a community, or substantially impact area character. (NOP/IS, p. 27). Without additional discussion, the DSEIR agrees, reiterating that project land use impacts are insignificant and that no environmental analysis is required. (DSEIR, pp. 1---49, 5.1.1.)

"While clearly aware that CEQA requires revision of the DSEIR to address the project's conflicts with Mission Bay land use policies and significant adverse impacts to community character, the City simply kicks the can down the road:

> As part of the project approval process, OCII, the San Francisco Planning Commission, and other relevant regulatory agencies would determine whether the proposed project is consistent with their respective plans as applicable to the proposed project. Thus, the proposed project would have a less---than---significant impact with regard to conflicts with land use plans, policies, or regulations adopted for the purpose of avoiding or mitigating an environmental effect.

"(NOP/IS, p. 31, italics added.) This statement implicitly acknowledges the requirements of Appendix G of the CEQA Guidelines. Under Appendix G, Section X, a project's potentially---significant conflicts with land use plans that were adopted for environmental protection or mitigation must receive environmental review in an EIR. A rote finding by a lead agency that simply assumes that a project will comply with such land use plans via future action by involved regulatory agencies cannot substitute for the analysis contemplated by Appendix G. (The Pocket Protectors v. City of Sacramento (2004) 124 Cal.App.4th 903.)

"The Event Center's Draft Subsequent EIR does just that; unlawfully deferring the analysis and enforcement of land use plan consistency. The DSEIR must be revised and recirculated to provide environmental analysis and mitigation. EIRs must "consider and resolve every fair argument that can be made about the possible significant effects of a project." (Protect the Historic Amador Waterways v. Amador Water Agency (2004) 116 Cal.App.4th 1099.) Here, the record illustrates many inconsistencies with land use plans and policies that have potentially significant environmental impacts:" (*Mission Bay Alliance, Susan Brandt-Hawley, letter, July 26, 2015 [O-MBA6B1-5]*)

Response LU-2: Land Use Plan Consistency

Commenter claims that the Initial Study finds no need to address land use issues in the Draft SEIR, contending that the event center would not divide a community, conflict with a land use policy, or substantially impact area character. The Initial Study analyzed all potential land use impacts, including the three land use topics stated on page 27 of the Initial Study [i.e., would the project: 1) physically divide an established community?; 2) conflict with any applicable land use

plan, policy, or regulation of an agency with jurisdiction over the project adopted for the purpose of avoiding or mitigating an environmental effect?; or 3) have a substantial impact upon the existing character of the vicinity?]. The commenter is referred to the land use impact analysis contained in Impacts LU-1, LU-2, LU-3, and CU-LU-1 in the Initial Study, and as summarized in Response LU-1, above.

With respect to Land Use Issue No. 2, the Initial Study correctly notes that as part of the project approval process, OCII, and other relevant regulatory agencies would determine whether the proposed project is consistent with their respective plans as applicable to the proposed project. Commenters misinterpret this statement to mean that the Initial Study did not provide an impact analysis of conflict with plans and policies adopted for the purpose of avoiding or mitigating an environmental effect, and defers analysis.

To the contrary, as discussed in additional detail in Response LU-1, above, the Initial Study Impact LU-2 described general consistency of the project with the Mission Bay planning documents and applicable regional planning documents. Initial Study Impact LU-2 also appropriately noted that aside from land use effects, that the physical environmental impacts of potential policy conflicts would be addressed in the other applicable sections of the SEIR and its Initial Study. In addition, the Initial Study Impact LU-2 noted that there were no substantial changes with respect to circumstances under which the project is undertaken nor has any new information become available that would result in new or more severe impacts associated with the proposed project. On the basis of these factors, the Initial Study determined that the project would not have any new or substantially more severe effects than those identified in the Mission Bay FSEIR related to conflict with land use plans or policies adopted for the purpose of avoiding or mitigating an environmental effect.

In summary, the SEIR properly acknowledges and considers land use consistency considerations and acknowledges that the final determination is left to OCII, the San Francisco Planning Commission, and other relevant regulatory agencies. The approach taken in the SEIR is consistent with CEQA and general principle that the ultimate determination of consistency with applicable land use plans is left the decisionmaker. (*North Coast Rivers Alliance v. Marin Municipal Water Dist.* (2013) 216 Cal.App.4th 614, 632-633; *Sequoyah Hills Homeowners Assn. v. City of Oakland* (1993) 23 Cal.App.4th 704, 719 ["it is the province of elected city officials to examine the specifics of a proposed project to determine whether it would be 'in harmony' with the policies stated in the plan"].) That decision once made by OCII is accorded substantial deference. (See *Anderson First Coalition v. City of Anderson* (2005) 130 Cal.App.4th 1173, 1192 ["When we review an agency's decision for consistency with its own general plan, we naturally accord great deference to the authoring agency's determination…. If the agency's decision is not arbitrary, capricious, unsupported, or procedurally unfair, it is upheld."]; *Sequoyah Hills Homeowners Assn. v. City of Oakland* (1993) 23 Cal.App.4th 704, 719-720 ["It is, emphatically, not the role of the courts to micromanage these development decisions…. [A reviewing court's role] is simply to decide whether the city officials considered the applicable policies and the extent to which the proposed project conforms with those policies."] (original emphasis); *Save Our Peninsula Committee v. Monterey County Bd. of Supervisors* (2001) 87 Cal.App.4th 99, 142 [In reviewing an agency's

decision for consistency with its own plan, "we accord great deference to the agency's determination. This is because the body which adopted the general plan policies in its legislative capacity has unique competence to interpret those policies when applying them in its adjudicatory capacity. [Citation omitted.] Because policies in a general plan reflect a range of competing interests, the governmental agency must be allowed to weigh and balance the plan's policies when applying them, and it has broad discretion to construe its policies in light of the plan's purposes."]; *Sierra Club v. County of Napa* (2004) 121 Cal.App.4th 1490, 1509-1510 [same]; *Families Unafraid to Uphold Rural etc. County v. Board of Supervisors* (1998) 62 Cal.App.4th 1332, 1338 ["[I]t has been said that a determination of general plan consistency will be reversed only if, based on the evidence before the local governing body, '. . . a reasonable person could not have reached the same conclusion.'"], quoting *No Oil, Inc. v. City of Los Angeles* (1987) 196 Cal.App.3d 223, 243; *San Franciscans Upholding Downtown Plan v. City and County of San Francisco* (2002) 102 Cal.App.4th 656, 677 ["A city's findings that [a] project is consistent with its general plan can be reversed only if [they are] based on evidence from which no reasonable person could have reached the same conclusion."], quoting *A Local & Regional Monitor v. City of Los Angeles* (1993) 16 Cal.App.4th 630, 648; *Ross v. California Coastal Com.* (2011) 199 Cal.App.4th 900, 929 ["we grant broad deference to the commission's interpretation of the local coastal program it prepared"]; *Albertstone v. California Coastal Com.* (2008) 169 Cal.App.4th 859, 864 [In interpreting a local coastal program, a court "will not depart from the Commission's interpretation unless it is clearly erroneous."]; *Gray v. County of Madera (2008) 167 Cal.App.4th 1099, 1129* ["It is well settled that a county is entitled to considerable deference in the interpretation of its own general plan."]; *County of Sacramento v. State Water Resources Control Bd.* (2007) 153 Cal.App.4th 1579, 1587 ["[W]here the language of the regulation is ambiguous, it is appropriate to consider the agency's interpretation. [Citation omitted.] Indeed, we defer to an agency's interpretation of a regulation involving its area of expertise, 'unless the interpretation flies in the face of the clear language and purpose of the interpretive provision.'"], quoting *Divers' Environmental Conservation Organization v. State Water Resources Control Bd.* (2006) 145 Cal.App.4th 246, 252; *Banker's Hill, Hillcrest, Park West Community Preservation Group v. City of San Diego* (2006) 139 Cal.App.4th 249, 273 fn. 23 ["To the extent that the Plan contains any ambiguity, we defer to the City's interpretation of its own Plan."]; *State Water Resources Control Bd. Cases* (2006) 136 Cal.App.4th 674, 726 ["'the court generally will not depart from the agency's interpretation [of its own regulations] unless it is clearly erroneous or unauthorized.' (Citation omitted)"].)

The cases cited by the commenter are easily distinguished. In *Pocket Protectors v. City of Sacramento* (2004) 124 Cal.App.4th 903, the court reviewed the adequacy of a Mitigated Negative Declaration (MND) and therefore applied the "fair argument" standard of review. Here, the City has prepared an EIR so the "fair argument" standard does not apply. Further, the MND at issue in that case was "devoid of reasoning and evidence" supporting its conclusion that the project would not conflict with land use plans that were adopted to avoid or mitigate environmental effects. (*Id*. at p. 932.) Here, in contrast, the SEIR describes the reasoning for its consistency determination and the determination is supported by substantial evidence. (See Initial Study, pp. 30-32; see also Response LU-1.)

Protect the Historic Amador Waterways v. Amador Water Agency (2004) 116 Cal.App.4th 1099, does not address the issue of land use plan or policy consistency. That case stands for the proposition that, where an agency concludes that an impact is less than significant pursuant to CEQA Guidelines section 15128 and therefore does not warrant further analysis, it must provide a statement briefly indicating the reasons for its determination. (*Id*, at pp. 1109-1112.) Here, the Initial Study analyzes whether the project would conflict with land use plans or policies adopted for the purpose of avoiding or mitigating an environmental effect and its determination that the impact would be less than significant is supported by substantial evidence. (See Initial Study, pp. 30-32; see also Response LU-1.)

13.9 Population/Housing/Growth

The Initial Study, Section E.3, Land Use, included in Appendix NOP-IS of the SEIR, analyzed issues associated with population, housing, and growth inducement. No comments were received on this topic.

This page intentionally left blank

13.10 Cultural Resources

13.10.1 Overview of Comments on Cultural Resources

The comments and corresponding responses in this section cover topics analyzed in the Initial Study, Section E.4, Cultural and Paleontological Resources, which is included in Appendix NOP-IS of the SEIR. These include topics related to:

- CULT-1: Archeological Resource

13.10.2 Archaeological Resources (CULT-1)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

O-MBA6B1-14

"**4. The EIR must assess Cultural Resources**

"The Initial Study and DSEIR contend that cultural resources were sufficiently addressed in the 1990 and 1998 Mission Bay EIRs. The Alliance disagrees. The DSEIR should be revised to provide project-specific analysis and mitigation as well as an updated investigation of resources as part of the environmental setting. The DSEIR description of the environmental setting is critical to provide a baseline of physical conditions from which to measure the significance of project impacts. (Guidelines, § 15125.)[2]

"To address impacts to paleontological and archaeological resources, the DSEIR proposes adoption of the mitigation measures recommended in the 1998 Mission Bay EIR, and concludes that environmental impacts will thereby be mitigated via standard archaeological testing, monitoring, and data recovery. (DSEIR, pp. 1-51, 1-57.)

"The 1998 Mission Bay EIR relied on the 1990 Mission Bay EIR that in turn consulted a *Cultural Resources Evaluation for the Mission Bay Project* prepared in 1987 by David Chavez & Associates. (1990 EIR, p. VI.J.30, NOP/IS, p. 46.) As reflected in the prior EIRs, the shallows of Mission Bay were filled beginning in the 1860s and the Event Center site at Blocks 29-32 is on that filled land. The Initial Study references the Chavez report as stating that the filled land in Mission Bay had "no substantial potential for archaeological resources." (NOP/IS, p. 46; 1990 EIR, pp. II.64, VI.J.1-30.) However, the 1990 EIR nonetheless concluded that development could cause "significant impacts to subsurface prehistoric or historic archaeological resources … within the vicinity of Blocks 29-32," and identified mitigation measures. (*Ibid*.)

"David Chavez and historian Jan Hupman subsequently prepared an *Archaeological Resources Review* report in 1997 for the 1998 Mission Bay EIR, concluding that "[t]he entire Mission Bay project area has at least some sensitivity for the presences of unknown archeological remains. Prehistoric cultural deposits could be encountered in three identified areas and unknown historical features, artifact caches and debris areas could be located anywhere in the project area." (Chavez & Hupman, *Archaeological Resources Review for the Mission Bay Project Subsequent EIR*, 1997, p. 7, italics added.)

"Since then, geotechnical investigations at the project site in March 2014 identified a "medium dense to very dense sand, sand with clay, clayey sand, silty sand and sand with silt, known as the Colma Formation, [] encountered below the sand and clay in portions of the site." (Langan Treadwell Rollo Preliminary Geotechnical Evaluation, p. 2---3.) The Colma Formation involved sand between 5 and 35 feet thick, more

than 19 feet below the ground surface. (Ibid.) That is a greater depth than the Event Center's projected excavations, but a 2014 report by ESA Associates Cultural Resources team suggest a pre-construction boring strategy as part of an Archaeology Testing Program ("ATP"):

> The ATP will need to include a pre-construction geoarchaeological boring strategy across the project area to determine: (a) whether the upper surface of the Colma Formation is intact or was eroded away in antiquity (and therefore whether there is even the potential for archaeological materials to be present); and (b) if the upper surface of the Colma Formation is intact, whether there are, in fact, any archaeological materials present.

"The actual boring strategy is not known. A firm called Archeo-Tec made a proposal, but it was criticized by the ESA team: "The Archeo-Tec proposal only specifies trenching beginning at a depth of 10-15 feet below ground surface (after mass excavation has already started)." ESA noted that the Archeo-Tec plan did "not correlate with ERO standards" and was "not in line with Planning Department requirements for the project area." Further, "trenching will not address [City archaeologist Randall Dean's] specific concerns …"

"The 1987 Chavez report had conceded that "[w]ith the exception of some limited archaeological testing in sensitive areas" the "actual areal extent, specific nature and location of historic features and artifact caches, and depositional integrity of the archaeological deposits" in South Mission Bay are unstudied. Further, "specific information of that nature is important in determining the actual significance of archaeological resources and in developing appropriate mitigation plans." (Chavez, Cultural Resource Evaluation For the Mission Bay Project, p. 105.)

"Years later, archaeologist Dean properly criticized the Initial Study's cursory review of archaeological impacts, pointing out that:

> … [w]e know a lot more than we did 20 years ago about both buried and submerged potential horizontal and vertical locations and types of prehistoric deposits that may be present throughout SF. The project site lies within the mudflats of Mission Bay subject to shallow tidal waters but well within the paleoshorelines of 5,000 B.P. [...] the type of prehistoric deposits that might be affected would be within the Middle Holocene epoch which would make them of significant scientific value.

"Incomplete information regarding cultural resources conflicts with CEQA's requirements for an adequate environmental setting/baseline to provide "special emphasis" on "resources that are rare or unique …" (Guidelines, § 15125 (c).) Mitigation measures proposed in the Initial Study and DSEIR, including the Archaeological Testing Program, must be preceded by updated analysis of affected resources and performance standards. Since the Initial Study and the DSEIR rely on outdated information from the 1990 Mission Bay EIR, there is a higher potential for subsurface archaeological resources at the site than previously evaluated. The EIR must be revised to include a current analysis of cultural resources, potentially significant impacts, and performance-based mitigation.

"**Footnote:**

[2] Inadequacies in the EIR environmental setting and baseline led to inadequate analysis of environmental issues that will be addressed in other Alliance comment letters, including the jurisdictional wetlands identified on the project site.

(*Mission Bay Alliance, Susan Brandt-Hawley, letter, July 26, 2015 [O-MBA6B1-14]*)

Response CULT-1: Archaeological Resources

Contrary to the commenter's assertions, the SEIR Initial Study sufficiently addressed potential impacts to archaeological resources by summarizing relevant analyses conducted as part of the program-level Mission Bay FEIR and Mission Bay FSEIR, addressing potential project-level impacts of the proposed project, and identifying feasible project-level mitigation measures, including certain new mitigation measures, to reduce potential impacts to less than significant.

The analysis included in the SEIR Initial Study updates the analyses presented in the Mission Bay FEIR and Mission Bay FSEIR by incorporating knowledge gained through recent San Francisco investigations of deeply buried prehistoric archaeological resources in areas previously thought to have low potential for prehistoric archaeological resources. In addition, subsequent to the publication of the Draft SEIR, new archaeological testing and monitoring of the project site was conducted in support of the project, as described below.

As discussed in the SEIR Initial Study, Section E.4 (pp. 45 to 57), the Mission Bay FSEIR Initial Study Cultural Resources section summarized information from the Mission Bay FEIR on historic and prehistoric resources within the Mission Bay plan area, including information from a Cultural Resources Evaluation conducted in 1987 by David Chavez & Associates, and supplemented with an archaeological resources review conducted in 1997 also by David Chavez & Associates. The Mission Bay FSEIR Initial Study indicated that in 1997 the overall potential for prehistoric Native American sites within the Mission Bay plan area was considered to be low.

Blocks 29-32 were also identified as having a low potential for the presence of historic-period archaeological resources, although other portions of the Mission Bay plan area outside of Blocks 29-32 were identified as sensitive for historic-period archaeological resources.

The Mission Bay FSEIR Initial Study concluded that the entire Mission Bay plan area, including Blocks 29-32, has some sensitivity for the presence of unknown historic or prehistoric archaeological resources, and development and associated construction within the plan area would result in potentially significant impacts to subsurface prehistoric or historic archaeological resources. The Mission Bay FSEIR identified Mitigation Measures D.3, D.4, and D.6, which when implemented would reduce the impacts to a less-than-significant level.

As discussed in the SEIR Initial Study, the proposed project includes subsurface construction activities that could disturb potentially significant subsurface prehistoric and historic archaeological resources, should such resources be present. These types of subsurface construction activities were anticipated and analyzed in the Mission Bay FSEIR, and there is nothing specific to the proposed subsurface construction activities at the project site that would result in new significant impacts or substantially increase the severity of previously-identified significant impacts to archaeological resources. Thus, impacts of the proposed project on archaeological resources would be potentially significant, but impacts could be reduced to less than significant with identified mitigation measures.

The SEIR Initial Study identified Mitigation Measure M-CP-2a (Archaeological Testing, Monitoring and/or Data Recovery Program), which is consistent with the City's current standard protocols, and this measure would in effect implement the requirements of FSEIR Mitigation Measures D.3 and D.4 as applied to include Blocks 29-32. In addition to Mitigation Measure M-CP-2a for archaeological testing, monitoring, and/or data recovery, Mitigation Measure M-CP-2b (Accidental Discovery of Archaeological Resources) replaces and implements Mission Bay FSEIR Mitigation Measure D.6. This replacement does not imply that there would be a new more severe significant impact or an impact of greater severity than was analyzed and disclosed in the Mission Bay FSEIR. Consistent with the conclusions of the FSEIR, FSEIR Mitigation Measure D.6, as implemented

through Mitigation Measure M-CP-2b, would reduce the proposed project's impact to a less-than-significant level. As such, the proposed project would not result in any new or substantially more severe impacts on archaeological resources than were analyzed and disclosed in the Mission Bay FSEIR.

The SEIR Initial Study, including Mitigation Measure M-CP-2a, updated the analysis of the Mission Bay FSEIR Initial Study by incorporating knowledge gained from recent archaeological investigations in San Francisco that have identified deeply buried prehistoric archaeological resources associated with the Colma Formation. Therefore, the SEIR sufficiently addressed potential impacts to unidentified archaeological resources in Blocks 29-32.

Subsequent to the publication of the Draft SEIR, archaeological testing was conducted at Blocks 29-32 consistent with the requirements of the approved and adopted FSEIR Mitigation Measures D.3 and D.4. As required by these mitigation measures, an archaeological testing program was conducted in accord with an archaeological testing plan[1] by an archaeological consultant on the San Francisco Planning Department Qualified Archaeological Consultant List (QACL). No archaeological deposits or potential stable land surfaces available for occupation by prehistoric populations (palesols) were identified in the archaeological testing program[2], confirming the finding of no potential effect to legally-significant archaeological resources by the proposed project.

13.11 Transportation

13.11.1 Overview of Comments on Transportation

The comments and corresponding responses in this section cover topics analyzed in SEIR Section 5.2, Transportation. These include topics related to:

- **TR-1: Setting**
- **TR-2: Methodology**
  - TR-2a: Analysis Scenarios
  - TR-2b: Analysis Locations
  - TR-2c: Baseline Conditions
  - TR-2d: Trip Generation
  - TR-2e: Travel Modes
  - TR-2f: Traffic LOS Methodology
  - TR-2g: Transit Capacity Utilization
  - TR-2h: Cumulative Analysis Year and Context
  - TR-2i: Significance Thresholds
  - TR-2j: Adequacy of Transportation Analysis
- **TR-3: Project Transportation Improvements**
  - TR-3a: Transportation Management Plan
  - TR-3b: PCOs
  - TR-3c: Transportation Impact Fees
- **TR-4: Traffic Impacts**
- **TR-5: Transit Impacts**
  - TR-5a: Muni
  - TR-5b: BART
  - TR-5c: Caltrain
  - TR-5d: Other Transit
- **TR-6: Pedestrian Impacts**
- **TR-7: Bicycle Impacts**
- **TR-8: Loading Impacts**
- **TR-9: Emergency Vehicle Access Impacts**
- **TR-10: Construction-related Transportation Impacts**
- **TR-11: Improvement Measures**
- **TR-12: Mitigation Measures**
  - TR-12a: Traffic Mitigation Measures
  - TR-12b: Transit Mitigation Measures
  - TR-12c: Mission Bay FSEIR Mitigation Measures
  - TR-12d: Implementation of Mitigation Measures
- **TR-13: Parking Conditions**
- **TR-14: Helipad Impacts**

13.11.2 Setting (TR-1)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

A-BART-2	O-SFBT-1	O-SFBT-2	O-SFBT-3
O-SFBT-4	I-Zboralske-2		

"2. BART should be represented on the Ballpark/Mission Bay Transportation Coordinating Committee. BART looks forward to working with the City to identify appropriate short-term and long-term mitigation strategies and operational actions to address identified transportation shortcomings." (*BART, Val Menotti, letter, July 27, 2015 [A-BART-2]*)

"**Page 5.2-3**, under "Local Access" states "As part of the Mission Bay Plan, Terry A. Francois Boulevard will be realigned to the west to be adjacent to the east side of Blocks 30 and 32, and a buffered two-way cycle track (Class II)[3] will be provided as part of the San Francisco Bay Trail on the east side of the street." The term "Class II" is a Caltrans standard that refers to a striped bicycle lane as opposed to the buffered two-way cycletrack referenced here. Cycletracks do not currently have a Caltrans classification, though it is our understanding that one may be forthcoming. The footnote at the bottom of this page also erroneously defines both a bike lane and a cycletrack as a Class II bikeway." (*San Francisco Bay Trail, Maureen Gaffney, letter, July 27, 2015 [O-SFBT-1]*)

"Page 5.4-4 states that Fourth Street between King and Mission is part of the Bay Trail alignment. It is not. The Bay Trail alignment in this area is on Terry Francois, Lefty O'Doul Bridge, waterside of AT&T Park, and north along the Embarcadero. See attached map." (*San Francisco Bay Trail, Maureen Gaffney, letter, July 27, 2015 [O-SFBT-2]*)

"Page 5.2-28 states "At various locations, the Bay Trail consists of paved multi-use paths, dirt trails, bike lanes, sidewalks or city streets signed as bicycle routes." The vision and goal of the Bay Trail is a Class I, multi-use pathway for cyclists and pedestrians, separated from traffic, as close to the shoreline as possible. While in certain locations, on a case-by-case-basis, the Bay Trail can consist of Class II bike lanes and sidewalks where there is no possibility for a multi-use path, city streets signed as bike routes are never proposed or accepted as complete segments of Bay Trail." (*San Francisco Bay Trail, Maureen Gaffney, letter, July 27, 2015 [O-SFBT-3]*)

"On page 5.2-43, the DEIR states that the Bay Trail is a 400-mile pathway, and that 338 miles are complete. Please note the Bay Trail's total length is 500 miles, and we are happy to report that 341 miles are complete." (*San Francisco Bay Trail, Maureen Gaffney, letter, July 27, 2015 [O-SFBT-4]*)

"During these walks I am constantly evaluating vehicular traffic flow, pedestrian and bicycle traffic patterns, signal light timing, traffic signage effectiveness, the impacts of on-going construction projects

and observing, when possible, traffic control and mitigation efforts by police officers, parking control officers and employees of construction companies." (*James Zboralske, email, July 27, 2015 [I-Zboralske-2*])

"The report indicates in section 5.2.3.7 that bicycle conditions were observed to be operating acceptably, with no conflicts, between bicyclists, pedestrians and vehicles. I dispute this.

"It is actually fairly common for bicyclists to ride their bikes on the sidewalk northbound on 3rd Street from South Street up to AT&T Park. They choose to do this because the pavement is wide and 3rd Street has no delineated bike lane in the roadway. Apparently, shifting over to Terry Francois Boulevard or 4th Street, which both have established bike lanes is cumbersome." (*James Zboralske, email, July 27, 2015 [I-Zboralske-25*])

Response TR-1: Setting

In response to the request that BART be represented at the Ballpark/Mission Bay Transportation Coordinating Committee, it should be noted that BART, along with Caltrain, AC Transit and Golden Gate Transit, were members of the original committee created in early 1999 (i.e., prior to the opening of AT&T Park in April 2000. The Ballpark/Mission Bay Transportation Coordinating Committee membership included numerous San Francisco agencies and departments (i.e., SFMTA, Port), State (i.e., Caltrans, UCSF), the regional transit agencies noted above, as well as neighborhood, ballpark, and Mission Bay representatives. In response to the request, in August 2015 SFMTA has renewed the invitation to BART to actively participate in the committee.

In response to the comment regarding the accuracy of the description of cycle tracks as a Class II facility, the text and footnote on SEIR p. 5.2-3 was clarified as follows (deleted text is shown as ~~strikethrough~~ and new text is <u>underlined</u>):

> **Terry A. Francois Boulevard** is a two-way, north-south roadway to the east of Third Street, extending between Third Street and Mariposa Street (at Illinois Street). The roadway generally has two travel lanes each way, with on-street parking on both sides of the street. As part of the Mission Bay Plan, Terry A. Francois Boulevard will be realigned to the west to be adjacent to the east side of Blocks 30 and 32, and a buffered two-way cycle track ~~(Class II)~~[3] will be provided as part of the San Francisco Bay Trail on the east side of the street. A bicycle lane (Class II facility) currently runs on each side of Terry A. Francois Boulevard between Illinois Street and Third Street.
>
> [3] Class I bikeways are bike paths with exclusive right-of-way for use by bicyclists. Class II bikeways are bike lanes striped within the paved areas of roadways and established for the preferential use of bicycles. Class III bikeways are signed bike routes that allow bicycles to share the travel lane with vehicles. A cycle track ~~is a Class II bikeway, and~~ is an exclusive bicycle facility that is separated from vehicle traffic and parked cars by a buffer zone. Cycle tracks offer safer and calmer cycling conditions for a much wider range of cyclists and cycling purposes, especially on street with greater traffic volumes traveling at relatively high speeds. <u>Assembly Bill 1193 (Assembly Member Ting; Chapter 495 Statures of 2014) categorizes cycle tracks, or separated bikeways, as Class IV bikeways and requires Caltrans to establish and publish minimum safety design criteria for Class IV bikeways by January 1, 2016. Information on AB 1193 available online at: http://leginfo.legislature.ca.gov/faces/billTextClient.xhtml?bill_id=201320140AB1193. Accessed August 24, 2015.</u>

The revision does not change the analysis or conclusions presented in the SEIR.

In response to the comment that the Bay Trail alignment of the Bay Trail on Fourth Street was described incorrectly in the SEIR, the text on p. 5.2-4 was corrected as follows (deleted text is shown as ~~strikethrough~~ and new text is underlined):

> **Fourth Street** is a principal north-south arterial between Market and Mariposa Streets. Between Market and King Streets, Fourth Street runs southbound and has four southbound travel lanes. From King Street to Berry Street, Fourth Street has two lanes each way. Between Berry and 16th Streets, Fourth Street is two-way and has one travel lanes each way. South of 16th Street, Fourth Street provides local access to the UCSF Medical Center; there is no through motor-vehicle access between 16th and Mariposa Streets. Fourth Street is classified as a Congestion Management Network Major Arterial and a part of the Metropolitan Transportation System. Fourth Street is designated as a Primary Transit Important Preferential Street; is a part of the Citywide Pedestrian Network from Market Street to Folsom Street; ~~is part of the Bay Trail between King and Mission Streets;~~ and is designated as a Neighborhood Commercial Pedestrian Street. The T Third Street light rail line runs northbound on Fourth Street within mixed-flow lanes between Channel and Berry Streets, and in a semi-exclusive center median right-of-way between Berry and King Streets. Fourth Street has bicycle lanes (Class II) both ways between Channel and 16th Streets.

The revision does not change the analysis or conclusions presented in the SEIR.

In response to the comment regarding the description of the Bay Trail, a footnote was added on SEIR p. 5.2-28 to the clarify the vision and goal of the Bay Trail, as follows (deleted text is shown as ~~strikethrough~~ and new text is underlined):

> **Figure 5.2-7** also presents the San Francisco Bay Trail. The San Francisco Bay Trail is designed to create recreational pathway links to the various commercial, industrial and residential neighborhoods that surround the San Francisco Bay. In addition, the trail connects points of historic, natural and cultural interest; recreational areas such as beaches, marinas, fishing piers, boat launches, and numerous parks and wildlife preserves. At various locations, the Bay Trail consists of paved multi-use paths, dirt trails, bike lanes, sidewalks or city streets signed as bicycle routes.[1] In the project vicinity, an improved Bay Trail path follows the shoreline of San Francisco Bay, east of Terry A. Francois Boulevard within the area that will be developed as part of the Mission Bay Plan as the Bayfront Park.
>
> [1] The vision and goal of the Bay Trail is a Class I, multi-use pathway for cyclists and pedestrians, separated from traffic, as close to the shoreline as possible. While in certain locations, on a case-by-case basis, the Bay Trail can consist of Class II bicycle lanes and sidewalks, where there is no possibility for a multi-use path, city streets signed as bicycle routes are never proposed or accepted as complete segments of the Bay Trail.

The revision does not change the analysis or conclusions presented in the SEIR.

In response to the comment that the description of the Bay Trail's total length and miles completed is incorrect, the text on SEIR p. 5.2-43 was corrected as follows (deleted text is shown as ~~strikethrough~~ and new text is underlined):

> ***San Francisco Bay Trail Plan***
> The Association of Bay Area Governments (ABAG) administers the San Francisco Bay Trail Plan (Bay Trail Plan). The Bay Trail is a multi-purpose recreational trail that, when complete, would encircle San Francisco Bay and San Pablo Bay with a continuous 500~~400~~-mile network of bicycling and hiking trails; to date, 341~~338~~ miles of the alignment have been completed. The 2005 Gap Analysis Study, prepared by ABAG for the entire Bay Trail area, attempted to identify the remaining gaps in the Bay Trail system; classify the gaps by phase, county, and benefit ranking; develop cost estimates for individual gap completion; identify strategies and actions to overcome gaps; and present an overall cost and timeframe for completion of the Bay Trail system.

The revision does not change the analysis or conclusions presented in the SEIR.

The comments regarding observations of existing conditions in Mission Bay is noted. The existing transportation setting is presented on SEIR pp. 5.2-3 – 5.2-42, and presents conditions without and with a SF Giants evening game at AT&T Park. As noted in a comment, some bicyclists may ride northbound on the east Third Street sidewalk because of the wider sidewalks and low pedestrian volumes in the area. As Mission Bay builds out, and pedestrian presence on the sidewalks increases, it is anticipated that bicyclists would be less inclined to ride on the sidewalks. Note that the San Francisco Transportation Code prohibits bicycling on sidewalks, except by children under the age of 13.[1] As noted SEIR p. 5.2-29, bicycle volume counts indicate that more bicyclists travel on Terry A. Francois Boulevard than on Third Street.

[1] San Francisco Transportation Code Section 1007. Bicycle Riding on Sidewalks, Available online at: http://www.amlegal.com/nxt/gateway.dll/California/transportation/transportationcode?f=templates$fn=default.htm$3.0$vid=amlegal:sanfrancisco_ca$sync=1 (accessed on September 28, 2015).

13.11.3 Methodology (TR-2)

Issues Raised by Commenters: Analysis Scenarios (TR-2a)

This response addresses all or part of the following comments, which are quoted below:

A-Caltrans-2 A-Caltrans-4 A-Caltrans-6 O-MBA10L4-15 O-MBA10L4-17

"Please clarify or revise the report. The report should identify traffic turning movements per study intersection under Basketball Game Only, Convention Only Conditions separately." (*Department of Transportation, Patricia Maurice, letter, July 20, 2015 [A-CALTRANS-2]*)

"
- Please elaborate how the AT&T Park Post-Game Event Traffic Plan is incorporated within the Project's Transportation and Circulation analysis regarding parking impacts on the surrounding neighborhood and roadways. According to the Post-Game Event Traffic Plan and noted in the report, some streets near AT&T Park and its parking lots are closed beginning in the 7th inning to approximately one hour post-event. Given the Project's additional number of vehicles seeking parking, potential safety issues for all road users should be identified and fully mitigated." (*Department of Transportation, Patricia Maurice, letter, July 20, 2015 [A-CALTRANS-4]*)

"The AT&T Park Post-Game Event Traffic Plan is available at the webpage above." (*Department of Transportation, Patricia Maurice, letter, July 20, 2015 [A-CALTRANS-6]*)

"H. The DSEIR's Discussion of Transportation Impacts Is Incomplete.

"The DSEIR analyzes transportation impacts in two broad scenarios: with and without implementation of the Special Events Transit Service Plan.

"In the scenario 'With Implementation of the Special Events Transit Service Plan' the DSEIR analyzes two narrower scenarios: with and without a Giants game. In each Giants game scenario, the DSEIR analyzes three narrower scenarios: no event, convention event, and basketball game. The result is six scenarios applied to ten different transportation resources, as shown in Table 2.

Table 2

With Implementation of the Special Events Transit Service Plan					
Without Giants game			With Giants game		
No event	Convention event	Basketball game	No event	Convention event	Basketball game
TR-1 Construction - Traffic		LS	TR-1 Construction - Traffic		LS
TR-2 Traffic - Intersections		SUM	TR-11 Traffic - Intersections		SUM
TR-3 Traffic - Freeway Ramps		SUM	TR-12 Traffic - Freeway Ramps		SUM
TR-4 Transit - Muni		LS	TR-13 Transit - Muni		LSM
TR-5 Transit - Regional – Caltrain		SUM	TR-14 Transit - Regional -All		SUM
TR-6 Pedestrian		LSM	TR-15 Pedestrian		LSM
TR-7 Bicycle		LS	TR-16 Bicycle		LS
TR-8 Loading		LS	TR-17 Emergency Vehicle Access		LS
TR-9a Construction Helipad		LSM			
TR-9b Const. Lights Helipad		LS			
TR-9c Operation Helipad		LS			
TR-9b Operation Lights Helipad		LSM			
TR-10 Emergency Vehicle Access		LS			

"In the scenario 'Without Implementation of the Special Events Transit Service Plan' the DSEIR analyzes only one narrower scenario: without a Giants game and with a basketball game. The result is one scenario applied to ten different transportation resources, but the omission of the other five scenarios, as shown in Table 3.

Table 3

Without Implementation of the Special Events Transit Service Plan	
Without Giants game	
Basketball Game	
TR-1 Construction - Traffic	LS
TR-18 Traffic - Intersections	SUM
TR-19 Traffic - Freeway Ramps	SUM
TR-20 Transit - Muni	SUM
TR-21 Transit - Regional	SUM
TR-22 Pedestrian	LSM
TR-23 Bicycle	LS
TR-24 Loading	LS
TR-25Emergency Vehicle Access	LS

"Since the scenario 'Without Implementation of the Special Events Transit Service Plan' is likely enough to justify including it in the DSEIR, the DSEIR should include the other five omitted scenarios.

"In addition, the DSEIR's cumulative impact analysis does not even inform the reader if it is performed for the 'with' or 'without' scenario for 'Implementation of the Special Events Transit Service Plan.' The cumulative impact analysis should include both scenarios, and should inform the reader which is which." (*Mission Bay Alliance, Thomas Lippe, letter, July 27, 2015 [O-MBA10L4-15]*)

"The DSEIR Only Analyzes Impacts of Weeknight Basketball Games That Start at 7:30 PM, Not at Other Start Times Closer to the PM Peak.

"The only scenarios analyzed involving weeknight basketball games assume a start time of 7:30 pm. But this is not the only times that weeknight basketball games start although it does account for a majority. In the three preceding full seasons to the time of the NOP, 6 percent of the weeknight home games started at 6 PM (average 2.5 games per season) and over the three seasons there were individual games starting at 5 PM and 7 PM. However, the recently completed season proves that earlier games than 7:30 PM start times are not likely to be just a rarity in future years. In the three regular seasons considered in the DSEIR, the Warriors team was mediocre to 'emerging'. However, after this year's excellent regular season, the team played 11 home playoff games, seven of which were weekday games that started at 6 PM. With an outstanding young team, the prospects are that the team could play similar numbers of home 6 PM weeknight playoff games (6 PM being the time nationally broadcast weeknight games normally start) for several seasons hence. Moreover, the national attention this team has attracted could result in several more national broadcasts of regular season home games (also normally starting at 6 PM). So there is a substantial likelihood that weeknight 6 PM games could become a frequent occurrence rather than a rarity. There might easily be 16 out of 54 or so combined regular season and playoff home games that start at 6 PM, or just under 30 percent of the total weeknight home games. Obviously, the 6 PM start puts more travel pressure on the 4 – 6 PM peak. The DSEIR should analyze this basketball start time as a separate scenario rather than dismissing it as an anomaly" (*Mission Bay Alliance, Thomas Lippe, letter, July 27, 2015 [O-MBA10L4-17]*)

Response TR-2a: Methodology, Analysis Scenarios

In response to the comment that the SEIR should identify traffic turning movements for the study intersections for Basketball Game only and Convention only conditions separately, please refer to SEIR Appendix TR Figures 6a and 6b, which present the existing plus project traffic volumes for the weekday p.m. peak hour for the Convention Event scenario, and Figures 7a and 7b for the weekday p.m. peak hour for the Basketball Game scenario. As these figures show, the traffic volumes for the two scenarios are presented separately. Appendix TR also includes figures presenting the volumes for the No Event scenario and the Basketball Game scenarios for additional analysis days and hours (i.e., weekday p.m., weekday evening, weekday late evening, and Saturday evening peak hours). It should be noted that the analysis for both the Basketball Game and Convention scenarios include the travel demand associated with the office and retail uses.

SEIR section 5.2.5.3, Approach to analysis on SEIR pp. 5.2-69 – 5.2-79 presents the approach to the impact analysis, including analysis scenarios, analysis periods, analysis years, and analysis methodology. For each of the event scenarios and analysis periods, the transportation analysis considered the impact of the project on vehicle traffic, transit, pedestrians, bicycles, loading, emergency vehicle access, as well as parking conditions. As part of the transportation impact analysis of the various modes, the safety of all transportation network users was considered.

Existing transportation network conditions with a SF Giants Evening Game at AT&T Park are described on SEIR pp. 5.2-35 – 5.2-42, and include a description of the pre-game and post-game travel lane closures. This setting is used for the analysis of proposed project conditions with an overlapping SF Giants evening game at AT&T Park addressed in Impact TR-11 through Impact TR-17 on SEIR pp. 5.2-170 – 5.2-208. Impact TR-11 on SEIR pp. 5.2-1715.2 – 180 presents the analysis of a project event with an overlapping evening event at AT&T Park. As noted on SEIR p. 5.2-171, due to the restricted access on the Third and Fourth Street bridges, no project-generated vehicles were assumed to travel northbound on Third and Fourth Street bridges during overlapping events. Project-generated vehicles would instead be directed west and south to avoid roadway closures and congestion on Third Street near Lot A and AT&T Park. See Response TR-13: Parking for a discussion of parking conditions.

A comment presents tables summarizing analysis scenarios and states that analysis of conditions without implementation of the Muni Special Event Transit Service Plan should have been conducted for five additional scenarios. The No Event and Convention Event scenarios analyzed in the SEIR do not include implementation of any special transit service plan by Muni or other transit operations Therefore analysis of four of the five scenarios referred to in the comment (i.e., No Event without an overlapping SF Giants evening game at AT&T Park, Convention Event without an overlapping SF Giants evening game at AT&T Park, No Event with an overlapping SF Giants evening game at AT&T Park, Convention Event with an overlapping SF Giants evening game at AT&T Park) are already analyzed in the SEIR; further analysis is not necessary or required. Only the Basketball Game scenario without an overlapping SF Giants evening game at AT&T Park was analyzed in the SEIR both without and with implementation of the Muni Special Event Transit Service Plan. The purpose of analyzing conditions without the Muni Special Event

Transit Service Plan was to be conservative in the assessment of transportation impacts, in the unanticipated event that Muni would reduce or eliminate the proposed Muni Special Event Transit Service Plan. Thus, the only scenario referred to in the comment that was not included in the SEIR is the Basketball Game scenario without the Muni Special Event Transit Service Plan with an overlapping SF Giants evening game at AT&T Park.

As indicated on SEIR p. 5.2-191, the proposed project includes provision of the Muni Special Event Transit Service Plan, and the impact analysis in Impacts TR-2 through TR-17 analyze the project assuming that the Muni Special Event Transit Service Plan would be implemented. However, as stated in the SEIR, because the Muni Special Event Transit Service Plan would be provided by the City, rather than the project sponsor, as a conservative assessment of impacts, an analysis was conducted to disclose the potential impacts that could occur for the transportation topics if all or a portion of the Muni Special Event Transit Service Plan is not provided. Mitigation Measure M-TR-18: Auto Mode Share Performance Standard and Monitoring identifies measures that could be implemented by the project sponsor to meet specific performance standards. The purpose of this analysis is to identify the potential impacts of a reasonable worst-case scenario – i.e., if the project did not include the Muni Special Event Transit Service Plan and to establish performance standards that the project sponsor would be required to meet to reduce traffic, transit, and pedestrian impacts.

The quantitative analysis of the Basketball Game scenario with an overlapping SF Giants evening game at AT&T Park without the Muni Special Event Transit Service Plan was not included in the SEIR as it represents a worst-of-the-worst scenario, which would be expected to occur, on average, about nine times a year, and then only if Muni was unable to provide the additional services included in the Muni Special Event Transit Service Plan. As indicated on SEIR p. 5.2-80, the City fully anticipates implementation of this plan and has identified sufficient funding. See Response GEN-1a: City Funding for the resolution to the SFMTA and ordinance to the Board of Supervisors which are intended to secure funding for the City's contribution to the Muni Special Event Transit Service Plan. While a quantitative analysis of traffic impacts was not conducted for conditions with a SF Giants evening game at AT&T Park, Impact TR-18 and Impact TR-19, which present the traffic impacts for conditions without implementation of the Muni Special Event Transit Service Plan for the Basketball Game scenario without an overlapping SF Giants evening game, state that the additional impacts at intersections and freeway ramps would be in addition to the significant impacts identified in Impact TR-2 and Impact TR-3 for conditions without a SF Giants evening game at AT&T Park and in Impact TR-11 and Impact TR-12 for conditions with a SF Giants evening game at AT&T Park.

Impact TR-20 presents the Muni transit impacts for conditions without implementation of the Muni Special Event Transit Service Plan for the Basketball Game scenario without an overlapping SF Giants evening game, and identifies impacts to both the T Third and 22 Fillmore. Similar impacts would be anticipated for conditions with overlapping SF Giants evening games. The following text on SEIR page 5.2-202 was clarified as follows (deleted text is shown as ~~strikethrough~~ and new text is <u>underlined</u>):

Overall, under existing plus project conditions without the Muni Special Event Transit Service Plan, the proposed project would result in *significant* project-specific transit impacts, as follows:

- T Third during the weekday evening, weekday late evening, and Saturday evening peak hours.
- 22 Fillmore during the weekday late evening, and Saturday evening peak hours.

Impacts to the T Third and 22 Fillmore would be in addition to the significant impacts identified for the proposed project with implementation of the Muni Special Event Transit Service Plan in Impact TR-13 for conditions with an overlapping SF Giants evening game.

The revision does not change the analysis or conclusions presented in the SEIR.

For regional transit, without implementation of the Muni Special Event Transit Service Plan, the number of attendees arriving by regional transit is projected to decrease, as travel by public transit would become less attractive (there would be fewer or slower options connecting the regional transit hubs in San Francisco with the project site). Because additional regional transit service is not proposed as part of the project or as part of the Muni Special Event Transit Service Plan, regional transit impacts without the Muni Special Event Transit Service Plan would be similar to or less than those identified in Impact TR-14 for conditions with the Muni Special Event Transit Service Plan and with a SF Giants evening game at AT&T Park.

Project impacts related to bicycles (Impact TR-7 and Impact TR-16), loading (Impact TR-8), emergency vehicle access (Impact TR-10 and Impact TR-17) were identified as less than significant for conditions without and with a SF Giants evening game at AT&T Park, and impacts related to pedestrians (Impact TR-6 and Impact TR-15) were identified as less than significant with mitigation for conditions without and with a SF Giants evening game at AT&T Park. For these topics (i.e., bicycle, pedestrian, loading, and emergency vehicle access) the Basketball Game scenario without an overlapping SF Giants evening game at AT&T Park and without the Muni Special Event Transit Service Plan identified similar impacts and impact determinations as the Basketball Game scenario without a SF Giants evening game at AT&T Park and with the Muni Special Event Transit Service Plan. Therefore, impacts and the impact determination for a Basketball Game scenario with an overlapping SF Giants evening game at AT&T Park and without the Muni Special Event Transit Service Plan would also be expected to be the same as those for the Basketball Game scenario with an overlapping SF Giants evening game at AT&T Park with implementation of the Muni Special Event Transit Service Plan as presented in the SEIR. Therefore, for the above reasons, discussion and disclosure of potential impacts of the project provided in the SEIR for conditions without implementation of the Muni Special Event Transit Service Plan is complete and additional analysis scenarios are not required.

In response to the comment, the following clarifications are provided on SEIR page 5.2-87 (deleted text is shown as ~~strikethrough~~ and new text is underlined):

> The mode split assumptions for the daytime convention/corporate event did not assume implementation of the Muni Special Event Transit Service Plan. Mode split assumptions for convention/corporate events attendees were based on data provided by the Moscone Center Operator and documented in the Moscone Center Expansion EIR…

The revision does not change the analysis or conclusions presented in the SEIR.

A comment suggests that the future year 2040 cumulative conditions analysis should have included analysis of conditions without implementation of the Muni Special Event Transit Service Plan. Such an analysis not only would have been inconsistent with reasonably foreseeable conditions in 2040, but was also unnecessary from an impact disclosure standpoint. Impacts TR-18 to TR-24 on SEIR pp. 5.2-190 – 5.2-208, which address "existing plus project" (as opposed to cumulative) conditions, already present the potential impacts that could occur for the transportation topics if all or a portion of the Muni Special Event Transit Service Plan is not provided. Mitigation Measure M-TR-18: Auto Mode Share Performance Standard and Monitoring identifies measures that could be implemented by the project sponsor to meet specific performance standards. The purpose of this analysis is to identify the potential impacts if the project did not include the Muni Special Event Transit Service Plan and to establish performance standards that the project sponsor would be required to meet to reduce traffic, transit, and pedestrian impacts, and analysis of cumulative conditions without the Muni Special Event Transit Service Plan is not required.

In response to the comment, and to clarify that the 2040 cumulative analysis of the Basketball Game scenarios includes implementation of the Muni Special Event Transit Service Plan, the following clarifications are provided on SEIR page 5.2-210 (deleted text is shown as ~~strikethrough~~ and new text is underlined):

> As described in Section 5.2.5.3 above, future 2040 cumulative traffic, transit and pedestrian forecasts were estimated based on cumulative development and growth identified by the SFCTA SF-CHAMP travel demand model. The 2040 cumulative analysis for the Basketball Game scenarios include implementation of the Muni Special Event Transit Service Plan.

The revision does not change the analysis or conclusions presented in the SEIR.

A comment stated that the transportation analysis should have included analysis of events starting at 6:00 p.m. Table 3-3 on SEIR page 3-39 presents the event characteristics at the proposed event center, and as stated in a comment, the regular season basketball game start at 7:30 p.m., which is the start time assumed for the impact analysis for the Basketball Game scenario for conditions without and with an overlapping SF Giants evening game. As indicated on Table 3-3, the Golden State Warriors preseason and postseason games (i.e., two to three preseason games, and up to 16 postseason games) would have variable start times, and could include start time of 6:00 p.m., which could overlap with the commute peak hour, and would worsen the weekday p.m. peak period traffic conditions from those reported in the SEIR. The variability of preseason and postseason games' timing is due in part to TV deals, opposing team traveling schedules, and/or outcomes of postseason series that are beyond the scope of Golden State Warriors control. The two to three preseason games that could start at 6:00 p.m. would be rare and represent a

minor portion of the evening events that would occur throughout the year with lower expected attendance (an average attendance of 11,000 attendees at pre-season games, versus 17,000 attendees at regular season games). If the Golden State Warriors make it to the playoffs, the number of evening events starting at 6:00 p.m. could increase; however, given the normal NBA cycles by which teams typically rise and fall in the standings over time as player lineups change, it is unlikely that this scenario would occur on a regular basis during the time horizon addressed in the SEIR. Consistent with common practice in the transportation planning profession, the SEIR includes an analysis of the highest demand with the most frequent conditions for evening events, and identifies mitigation measures to reduce impacts associated with pre-event and post-event conditions. These mitigation measures would also be applicable to events that start earlier than the typical 7:30 p.m. start time considered in the analysis.

Issues Raised by Commenters: Analysis Locations (TR-2b)

This response addresses all or part of the following comments, which are quoted below:

A-Caltrans-5	O-MBA5-5	O-MBA10L4-2	O-MBA10L4-20
O-MBA10L4-39A	I-Cornwell1-2		

"Project-related queuing impacts on nearby State facilities should be analyzed." (*Department of Transportation, Patricia Maurice, letter, July 20, 2015 [A-CALTRANS-5]*)

"In another example, the DSEIR's analysis of the Arena's severe traffic impacts is artificially and arbitrarily limited to the Mission Bay area plus a handful of additional intersections and freeway ramps. The Alliance's traffic engineers demonstrate, in a more objective analysis, that the Arena's traffic snarling influence will extend much farther into SOMA, Downtown, and Dogpatch areas." (*Mission Bay Alliance, Bruce Spalding, letter, July 27, 2015 [O-MBA5-5]*)

A. The DSEIR Fails to Assess the Project Traffic Impacts on the Entire Affected Environment.

The DSEIR studies Project-induced increases in congestion and delay, for both incremental and cumulative impacts, at twenty-two (22) intersections and six (6) freeway ramps, as shown in Table 1.

Table 1

Incremental Impact Assessment (With Implementation of the Special Events Transit Service Plan)	Incremental Impact Assessment (Without Implementation of the Special Events Transit Service Plan)	Cumulative Impact Assessment

p. 5.2-181, Table 5.2-49 p. 5.2-181, Table 5.2-50		

Remarkably, the DSEIR fails to disclose the criteria the City used to select these intersections and freeway ramps. More importantly, the DSEIR fails to disclose the criteria the City used to exclude other intersections and freeway ramps. The omission of this fundamentally important information renders the DSEIR so legally inadequate as an informational document that it frustrates CEQA's goal of providing the public with a meaningful opportunity to comment on the DSEIR.

Also, as shown in the attached report from traffic engineers Larry Wymer and Dan Smith, the DSEIR omitted from its area of study numerous intersections and freeway ramps that will also suffer potentially substantial increases in traffic congestion and delay. The omission of these intersections and freeway ramps from the DSEIR's analysis of the Project's effect on traffic also renders the DSEIR so legally inadequate as an informational document that it frustrates CEQA's goal of providing the public with a meaningful opportunity to comment on the DSEIR.

How did this happen? The DSEIR simply states: "The traffic impact assessment for the proposed project was conducted for 23 study intersections and six freeway ramp locations in the vicinity of the project site" (DSEIR, p. 5.2-72),[1] with no further explanation. The same is true for the six freeway ramps. (DSEIR, p. 5.2-74.)

The DSEIR does inform the reader that:

> The impacts of the proposed project on the surrounding transportation network were analyzed using the Transportation Impact Analysis Guidelines issued by the Planning Department in 2002 (SF Guidelines 2002), which provides direction for analyzing transportation conditions and in identifying the transportation impacts of a proposed project.

(DSEIR, p. 5.2-69.) These Guidelines provide:

> 2. Project Setting
>
> The setting information shall be presented immediately following the Project Description as a discrete chapter or report section. The goal is to provide a brief but complete description of existing transportation infrastructure and conditions in the vicinity of the project. Normally, the described vicinity is a radius between two blocks and 0.25 mile, however, a larger area may be determined in the scoping process. *The specific perimeters of the study area, for both setting and project impact analysis, are to be confirmed as part of the approval for the scope of work*.

(Transportation Impact Analysis Guidelines (October 2002), pp.6-7 (italics added).) Based on this text, the reader would expect to find the criteria and rationale for delimiting "the specific perimeters of the study area" in the Scope of Work which the City approved pursuant to these Guidelines as a prerequisite to preparation of the DSEIR. Unfortunately, this expectation is disappointed, because the City-approved Scope of Work is also silent on the topic. (DSEIR, Appendix TR, pp. TR-8 to TR 14.)

Consequently, the City must revise the DSEIR to include an analysis of the Project's congestion and delay impacts on the excluded intersections and freeway ramps and then recirculate the Revised DSEIR for at least 45 days for public review and comment.

Footnote:

[1] The DSEIR actually studies 22 intersections, not 23, in the tables listed in footnote 1.

(*Mission Bay Alliance, Thomas Lippe, letter, July 27, 2015 [O-MBA10L4-2]*)

The City's Selections of Intersections (and Freeway Ramps) Studied in the DSEIR Excludes Intersections it Knew or Should Have Known Would Potentially Be Significantly Impacted by the Project

Intersections selected for study in the DSEIR for the subject Project exclude a number of intersection that were to be subject to analysis in the DEIR for the prior proposal for essentially the same project but located on the Piers 30/32 site. Among the intersections slated for study in the prior edition of the project but not studied in the current work are the 9 major intersections along Embarcadero from and including that with Brannan all the way to that with Broadway, plus those at Main with Harrison, Main with Bryant, Beale with Mission, Beale with Bryant, Delancy and the 80 on ramp, Fremont with each of Mission, Harrison and Folsom/80 off, Third with Harrison, Third with Mission, Second and Bryant, Second and Brannan, Second and King, Second and Bryant, First with Harrison and the 80 on ramp, Fourth and Howard, Fourth and Harrison/80 on ramp, Fourth and Bryant/80 off ramp, Bryant with Sterling/80 on ramp. Virtually all of these excluded intersections are heavily congested in the pm peak.

Although the Project location is now shifted to a site approximately 6800 feet south, and the DSEIR has added study intersections in that direction, the excluded intersections are still on the likely paths of traffic coming from the Northbay, Eastbay and northern parts of San Francisco. The project is fundamentally the same size and will generate fundamentally the same amount of traffic. The amount of traffic through the excluded intersections approaching from and departing to the Northbay, Eastbay and northern parts of San Francisco is essentially unchanged from the totals that would have occurred with the Piers 30/32 site. So there is no reasonable logic for excluding these intersections from the current DSEIR analysis.

That the excluded intersections are at risk to be impacted by the Project is demonstrated in the DSEIR's own analysis of Alternatives to the Project. One of the alternatives it analyzes is putting the Project back on the previously proposed Piers 30-32 /Seawall Lot 330 site. Appendix TR at page TR-783 analyzes the project on the alternate (or formerly proposed site) at the intersections formerly proposed for evaluation. It shows the Existing + Project with Basketball Event would have significant project-specific impacts at 8 intersections, 5 of which are intersections excluded from the current DSEIR analysis of the Project at its current site, and would make significant contributions to traffic at 4 intersections already at LOS E or F, 3 of which are among the intersections excluded from the analysis of the Project at its currently proposed site. We reiterate, it is clear that most of the traffic contributory to the impacted intersections with the Project on the formerly proposed site would still pass through these intersections with the Project located at the currently proposed site. So the DSEIR is deficient for excluding these intersections from the analysis of the Project.[7]

We also note that DSEIR Figures 5.2-14 E and 5.2-14 F indicate that approximately 31 percent of Warriors game weekday and Saturday attendees would approach and depart two [sic] and from the northwest via 7th Street at times when there are no overlapping Giants games. Although the DSEIR does not specifically present usage of this corridor by Warrior's attendee traffic at times of overlapping Giants home games, it would doubtless be considerably greater. In both cases, this suggests that the capacity-challenged intersections of Seventh and Townsend, Seventh and Brannan, Eighth and Brannan and Eighth and Bryant should have been analyzed in the DSEIR. Please do so.

There is a similar situation with the study of freeway ramps. The current DSEIR analyzes 6 ramps. The study for the prior site analyzed 12 ramps. Four of the six ramps studied in the current work are new (not considered in the analysis of the former proposed site). In other words, ten of the ramps to be studied in the analysis of the prior site, all problematic in peaks, are eliminated from consideration. There is no reasonable justification for their elimination.

Footnote:

[7] Our colleague, Mr. Larry Wymer of Larry Wymer and Associates Traffic Engineering has provided a separate letter of comment on this DSEIR (dated July 21,2015) that concurs in the need for study of additional intersections and provides supporting data.

(*Mission Bay Alliance, Thomas Lippe, letter, July 27, 2015 [O-MBA10L4-20]*)

OPINION 1 - The DSEIR's Transportation and Circulation analysis does not adequately analyze the entirety of the study area impacted by the development

The defined study area for the DSEIR is taken to be a subsection of the study area identified for the "Mission Bay Final Subsequent Environmental Impact Report", from which the DSEIR was tiered. Since the Mission Bay FSEIR was completed in 1998, the assumptions included therein are presently 17 years old and require appropriate revisions, and possibly expansions beyond those assumed within that report, to provide a similar level of impact analysis as provided therein.

Numerous San Francisco regional planning documents conclude that auto trips within and adjacent to the DSEIR's study area will increase significantly up to the 2040 cumulative year horizon. Specifically, the "2040 San Francisco Transportation Plan" concludes that daily auto trips within the "SoMa/Mission Bay" (South of Market/Mission Bay) regions along roadways arena traffic would travel will grow by the following percentages between 2012 and 2040:[1]

- Overall SoMa/Mission Bay auto trips (2012-2040) = +82% (+125,000 vehicles)
- So/Ma between Downtown Core & I-80 (2012-2040) = +42%
- So/Ma (south of I-80) to Mission Bay = +174%

The DSEIR provides six figures showing "Project Vehicle Trip Patterns to Major Parking Facilities" serving the arena. **Table 1** summarizes the information within these figures establishing the trip percentages that travel to/from or through the SoMa and North Mission Bay areas.

Table 1
Project Vehicle Trip Patterns to Major Parking Facilities

Source: "Event Center and Mixed Use Development at Mission Bay Blocks 29-32" DSEIR (June 5, 2015)

The table above establishes that the arterials within the northern portion of the study area will experience significant increases in traffic volumes ranging from 9% to 32%. At issue for much of this traffic is where the traffic will originate.

Table 5.2-23 (page 5.2-85), and corresponding text on pages 5.2-84 to 5.2-86, describes expected trip distribution patterns to the project site from attendees arriving from the downtown area, with increased numbers on weekdays due to attendees traveling to the study area directly from their jobs downtown:

> *The origin/destination distribution range for a weekday basketball game reflects an adjustment for event attendees who would travel to the event center directly from work rather than from their place of residence. The adjustment was based on a survey of Golden State Warriors season ticket holders (see Appendix TR). As shown in Table 5.2-23, the number of trips starting in San Francisco on a weekday is projected to be about 7.5 percentage points greater than on a weekend, with the corresponding*

reductions in trips arriving from the East Bay (2 percentage points), North Bay (4 percentage points), and South Bay (1.5 percentage points) areas. The majority of visitor trips to a convention event, retail, office, and restaurant uses would be from within San Francisco (70 to 81 percent), followed by South Bay (9 to 10 percent), and then East Bay (3 to 9 percent) origins/destinations.

Because these attendees will be arriving largely from the high employment areas in and near downtown, significant numbers of attendees would be required to pass through the SoMa area and northern portion of the DSEIR's defined study area to arrive at either the stadium or one of the ancillary land uses (i.e. restaurants) in the vicinity of the proposed arena. And because these attendees will be travelling to the arena directly from work, it can be reasonably assumed many (if not most) would initiate their trip within the later part of the PM peak period (i.e. 5:00/5:30 to 6:00 pm). Thus it can be expected many intersections north of those studied within the DSEIR (i.e. from north of Market Street to south of King Street) will experience large increases in PM peak hour traffic volumes as a result of this Project.

When these project volumes are combined with the 42% to 174% increases within this same area (from north of Market Street to south of King Street), the potential impacts are compounded necessitating the need to widen the study area northward towards downtown. Thus the increases in both cumulative background and project traffic volumes, particularly during weekday PM peak hour periods, requires widening the study area beyond that included within the Mission Bay Blocks 29-32 DSEIR, and beyond the study area within the 1998 "Mission Bay Final Subsequent Environmental Impact Report" from which the more recent DSEIR was tiered.

A revised SEIR should expand the study area northward to at least Market Street, an area henceforth referred to as the "expanded study area". For planning purposes, the expanded study area into north Mission Bay and SoMa is assumed to be northward from the existing study area within an area bounded generally by 8th Street to the west, Market Street to the north between 8th Street and The Embarcadero, northward along The Embarcadero to Broadway, and the San Francisco Bay to the east. A few additional intersections are included in the neighborhood east of the I80/US-101 interchange.

Further justification for expanding the study area northward is provided in Opinion 2 below.

The following opinion will almost exclusively focus on weekday PM peak hour conditions since that is the time period my proposed expanded analysis is assumed will largely experience the most significant impacts.

OPINION 2 - The DSEIR's Transportation and Circulation analysis does not analyze impacted study intersections and ramps in the SoMa and North Mission Bay areas, most notably those between Market Street and King Street

To assist in reviewing the adequacy of the DSEIRs study area limits, I reviewed the draft traffic study (in memorandum format) for the previous proposed arena site. That memorandum report was titled "*Travel and Parking Demand Estimates for the Proposed Event Center and Mixed Use Development at Piers 30-32 and Seawall Lot 330*"; stamped "Draft-Subject to Revisions; dated August 9, 2013; submitted by Jose I. Farran of Adavant Consulting; and submitted to the San Francisco Planning Department (Brett Bollinger, Chris Kern and Viktoriya Wise), Orion Environmental (Joyce Hsiao), and Environmental Science Associates (Paul Mitchell). The traffic study for this earlier proposed arena will henceforth be referred to as the "2013 memorandum traffic study," or "2013 arena study" within tables.

Although the arena analyzed in the 2013 memorandum traffic study was also originally proposed to be located south of I-80 (same as the currently proposed arena), trip distribution patterns and intersections identified as critical intersections warranting study stretches significantly further northward into and through the entire SoMa area, with a few even included north of Market Street. Since both versions of the arena project are located south of I-80, traffic arriving at the respective arena sites would include traffic originating from the downtown areas as described in Opinion 1, traffic would travel southeastward along SoMa arterials and through SoMa intersections to both sites, and traffic would also pass through still more intersections within the first several blocks south of I-80. The original 2013 memorandum traffic study analyzed 12 intersections north of I-80 and 10 intersections between I-80 and King Street, whereas none of these 22 intersections were analyzed within the DSEIR. A review of trip distribution patterns for both versions of the project reveal that trip distribution and assignment patterns are not substantially different between the two, however the DSEIR fails to reflect this reality with a noticeable absence of much needed analysis of the critical intersections identified in the traffic study for the earlier site.

Table 2 provides a summary of 27 study intersections located within the SoMA area and blocks north and south of I- 80 which were analyzed within the 2013 memorandum traffic study, and the PM peak hour levels of service which were established therein for Existing (No Project), Existing Plus Project, and Existing Plus "No Event" Project conditions. The table also notes that 10 of these 27 intersections were analyzed within the1998 Mission Bay DSEIR, yet only 5 of those 10 intersections (and 5 of the 27) were analyzed within the DSEIR. And finally, the table shows that 13 of the 22 intersections neglected in the DSEIR would operate at deficient level of service (LOS) E or F operations for no project and/or plus project conditions.

NOTES:

Deficient LOS E or F within 2015 DSEIR LOS analysis.

[1] = Analyzed in Original 2013 Arena Study - "Event Center & Mixed-Use Development at Piers 30-32 & Seawall Lot 330" (GSW P30-32 LOS_Table 052815_FP.xlsx)(pg TR-783) [2] = Analyzed in 1998 "Mission Bay Final Subsequent Enviroronmental Impact Report"

[3] = Analyzed in 2015 "Event Center and Mixed Use Development at Mission Bay Blocks 29-32" (SCN:2014112045). Table only considers study intersections north of the proposed project site, thus study intersections #6 through #22 of the DSEIR are neglected herein.

[4] = Incomplete data from memoranudm traffic study indicates deficient LOS E &/or F but no specifics regarding intersection #, delays, and which scenarios are projected to experience LOS E/F.

The information provided in the Table above supports Opinion 1 that the DSEIR's Transportation and Circulation analysis does not adequately analyze the entirety of the study area impacted by the development, and that by extension the DSEIR's Transportation and Circulation analysis also does not adequately analyze impacted study intersections and ramps in the SoMa and North Mission Bay areas.

Based on the deficient levels of service identified in the table above which the proposed project would potentially add significant traffic volumes, a revised SEIR should add (at a minimum) the following 13 study intersections from the expanded study area identified above.

1) Mission Street / The Embarcadero
2) Howard Street / The Embarcadero
3) Folsom Street / The Embarcadero
4) Harrison Street / The Embarcadero
5) Bryant Street / The Embarcadero
6) Townsend Street / The Embarcadero
7) King Street / Second Street
8) Harrison Street / Main Street
9) Bryant Street / Beale Street
10) Folsom Street / Freemont Street
11) Harrison Street / First Street
12) Bryant Street / Fourth Street
13) Bryant Street / Second Street

Further justification for adding these 13 intersections is provided below.

Table 3 (divided into 3 sections 3a, 3b and 3c) summarizes a review of all of the CEQA Documents and notices for non-SFPUC projects consisting of Environmental Impact Reports, Negative Declaration, NOPs, etc. which were listed on the City/County of San Francisco's Planning Department Website as of July 17, 2015.[2] Each of the projects were reviewed to establish the location of the project relative to the arena, and more importantly if traffic generated by the project would impact any intersections the arena might also impact.

If a cumulative project is located both well outside of the expanded study area, and it can be reasonably concluded the project would add little to no traffic to potential study intersections within the expanded study area, the project was eliminated from further consideration and not included in Table 3.

If the cumulative project was located near the expanded study area with the potential to add traffic volumes to potential study intersections within the expanded study area, the project was reviewed further to make a determination whether or not it should be added to Table 3.

If a cumulative project was located within the general boundaries of the expanded study area, it was included in Table 3 regardless of whether an EIR had been prepared or the project was at the initial NOP stage with study intersections yet to be determined.

For those projects which have an EIR and corresponding traffic impact study, I reviewed the traffic impact study with particular attention to trip distribution and study intersection graphics, and LOS intersection and freeway ramp operations analysis tables. I noted any study intersections located within the expanded study area described in Opinion 1 which were found to operate at a deficient level of service for weekday PM peak hour conditions for any scenario whether it be existing, cumulative, no project, plus project, etc. These intersections, along with corresponding deficient delays and LOS E and/or F operations, are noted in Table 3.

If the proposed project was located within the expanded study area itself, it is included in Table 3 whether it has completed an EIR with corresponding LOS tables, or simply an NOP with no traffic analysis yet. They were included because the project will obviously add some level of (yet to be determined) traffic to (yet to be determined) study intersections in the expanded study area, some of which might be newly added study intersections for the arena project. Cumulative NOP projects without an EIR or traffic impact study are included for future planning purposes with the assumption an EIR and traffic impact study might be

ready when a review is initiated to establish a revised scope and study area for a revised DSEIR. In the meantime, Table 3 includes an "NA" (not applicable) notation in place of a list of intersections operating at deficient levels of service.

Note that Table 3 is considered a planning level tool. Because a more detailed analysis will need to be performed at a later time to establish trip distribution and assignment patterns through the expanded study area, there is at present some uncertainty regarding the complete list of intersections within the expanded study area which will warrant study. Although an initial list of additional study intersections is provided below which in my opinion satisfies that criteria, it is not comprehensive and requires additional planning level analysis to expand to a full list. Thus without foresight regarding what intersections may or may not be included within that final list, and in the interest of providing an initial list of potential study intersections, Table 3 simply lists any and all study intersections identified as operating deficiently within the expanded study area within any EIR or traffic study.

Table 4 (divided into tables 4a and 4b due to length) combines and refines information provided within Tables 2 and 3 to provide a better planning level focus on the selection of study intersections within the expanded study area. It includes all of the intersections identified and included within Table 2 and/or Table 3. The table is organized with intersections separated into five different categories with those within the top most section being those which in my opinion absolutely satisfy the criteria of requiring analysis within a revised DSEIR, and those at the bottom of the list not requiring analysis unless a future screening analysis included them. A full and complete list of additional study intersections should be determined through a planning level analysis which considers trip distribution and assignment through the SoMa and northern Mission Bay areas north and south of I-80.

For clarity, intersections are organized within Table 4 with a specific order. For example, intersection "A"/"B" is such that street "A" consists of the northwest-southeast street (i.e. The Embarcadero, 1st St, 2nd St, ... , 7th St, 8th St, etc.) and street "B" consists of the southwest-northeast street (i.e. Market St, Mission St, ... , Harrison St, Bryant St, Brannan St, Bryan St, King St, Berry St, etc.). Additionally, lists of intersections are ordered beginning in the northeast (i.e. The Embarcadero/Broadway) and ending in the southwest (i.e. 8th St/Berry St).

The first five intersections (included within Table 4a) were already included within the DSEIR and are assumed would be included within the revised DSEIR. They are included simply to provide a full list of the intersections included in the 2013 memorandum traffic study.

The second set of intersections (also included within Table 4a) are comprised of the same thirteen intersections identified above as those which a revised SEIR should add (at a minimum) into the traffic analysis, all of which were also included within the 2013 memorandum traffic study.

The third set of intersections (also included within Table 4a) are comprised of the nine remaining intersections analyzed within the 2013 memorandum traffic study which may or may not be established as being included within a revised SEIR depending on the outcome of a refined trip distribution/assignment process.

The fourth set of intersections (also included within Table 4a) are comprised of the eleven remaining intersections analyzed within the 1998 Mission Bay FSEIR excluded from the 2015 DSEIR which may or may not be established as being included within a revised SEIR depending on the outcome of a refined trip distribution/assignment process.

The fifth and final set of intersections (comprising the entirety of Table 4b) are all of the remaining intersections included within Table 3, some of which may be established as being included within a revised SEIR depending on the outcome of a refined trip distribution/assignment screening process.

(*Mission Bay Alliance, Thomas Lippe, letter, July 27, 2015 [O-MBA10L4-39A]*)

I believe a wider traffic study area needs to be defined for mitigation analysis. (*John Cornwell, email, July 27, 2015 [I-Cornwell1-2]*)

Response TR-2b: Methodology, Analysis Locations

A comment requests that potential project impacts on nearby State freeways (I-80 and I-280) be analyzed in the SEIR.

The SEIR does include analysis of ramp touchdowns (off-ramps) at two locations (i.e., the I-80 westbound off-ramp at Fifth/Harrison, and the I-280 northbound off-ramp at Mariposa Street), and includes the analysis of three intersections where freeway on-ramps are located (i.e., the I-80 eastbound on-ramps at Fifth/Bryant and at Sterling/Bryant, and the I-280 southbound on-ramp at Mariposa Street). The depth and approach of the analysis of freeway conditions presented in the SEIR is consistent with similar evaluations of transportation conditions conducted as part of recently completed or ongoing large planning studies in San Francisco, including the Central Corridor EIR, UCSF 2014 Long Range Development Plan (LRDP) EIR, California Pacific Medical Center LRDP EIR, etc. The 1998 Mission Bay FSEIR also did not address freeway ramp operation or queuing as a distinct transportation topic.

The I-80 westbound off-ramp at the intersection of Fifth/Harrison and the I-280 northbound off-ramp at Mariposa Street have multiple lanes at the approach to the street network. As explained on SEIR pp. 5.2-6 – 5.2-7, the I-280 northbound off-ramp will soon be expanded as part of the Mission Bay Area South infrastructure plan from the existing two to future three lanes at the approach to Mariposa Street. This off-ramp extends about 600 feet from Mariposa Street to the ramp gore point, and has multiple lanes for about 300 feet. In addition, the lane feeding into the Mariposa ramp is not part of the mainline freeway, rather an auxiliary exit lane that extends for approximately 1,500 additional feet to the south.

As indicated in Tables 5.2-37 and 5.2-38 on SEIR p. 5.2-133, under existing plus project conditions (No Event, Convention Event, and Basketball Game scenarios), the off-ramp (northbound approach) to the intersection would operate at LOS D or better for all scenarios without an overlapping evening baseball game at AT&T Park. During the overlapping of a large event at the event center with a SF Giants evening game (which would be infrequent), the northbound off-ramp would generally operate at LOS D or better (Tables 5.2-49 and 5.2-50, SEIR p. 5.2-181), except during the weekday evening peak hour when it would operate at LOS F, while the eastbound and westbound approaches (Volume 3, p. TR-349) would operate at LOS B (eastbound) and LOS C (westbound). As part of Mitigation Measure M-TR-11c: Additional Strategies to Reduce Transportation Impacts of Overlapping Events, a PCO would be stationed at this intersection and would be able to facilitate right-turns from the freeway off-ramp onto Mariposa Street (i.e., right-turning vehicles would not have to perform a full stop and look for oncoming traffic when waved by the PCO), thus improving the ramp LOS to an acceptable condition.

The I-80 westbound off-ramp at Fifth/Harrison also has multiple lanes at the approach to Fifth and Harrison Streets. There are about 1,600 feet between the Fifth/Harrison intersection and the

I-80 westbound mainline, with two travel lanes for approximately 88 percent (1,400 feet) of this distance. Similar to the I-280 northbound off-ramp at Mariposa Street, the off-ramp (westbound approach) to the intersection would operate at LOS D or better for all scenarios without or with an overlapping evening baseball game at AT&T Park, except during the weekday evening peak hour when the approach would operate at LOS E. Given the length and configuration of the Fifth/Harrison off-ramp with two dedicated lanes, it is expected that the project-generated vehicles during the evening peak hour would be accommodated at the off-ramp without affecting mainline operations. In addition, as stated on SEIR p. 5.2-135, implementation of Mitigation M-TR-2b: Additional Strategies to Reduce Transportation Impacts would encourage non-auto modes of travel to the event center through parking pricing and enhanced regional transit access to the area, which would reduce the project traffic increase on the freeway mainline and ramps, particularly during the evening peak hour.

Several comments state that the selection of study intersections and freeway ramps in the SEIR was arbitrary and geographically limited to the vicinity of the project site, which precludes the SEIR from disclosing additional potential traffic impacts. The commenters express particular concern that sufficient intersections in the South of Market (SoMa) area have not been evaluated, citing as references previous or ongoing transportation analyses for other development projects in the area as well as the partially completed transportation analysis conducted for the previously proposed event center at Piers 30-32.

Per the CEQA Guidelines section 15130, the identification of the geographic context within which probable future projects considered in the cumulative analysis are located is within the lead agency's reasonable discretion. As noted in CEQA case law related to the analysis of cumulative impacts, a geographic scope that is too extensive may dilute the significance of potential impacts (*Ebbetts Pass Forest Watch v. Dept. of Forestry & Fire Protection* (2004) 123 Cal. App. 4th 1331, 1352). Therefore, in identifying the geographic context for the cumulative analysis, the SEIR attempts to limit the scope to an area wherein other projects with similar impacts are reasonably expected to occur.

Within the identified geographic context, the SEIR considers the impacts of the project, in combination with other past, present, and reasonably anticipated relevant projects, and in the context of previously analyzed area plans governing the project and surrounding development. This approach adequately reflects "the severity of impacts and their likelihood of occurrence." [CEQA Guidelines § 15130(b).] Further, insofar as the CEQA Guidelines stipulate that the discussion of cumulative impacts "need not provide as great detail as is provided for the effects attributable to the project alone" [Guidelines § 15130(b)], the level of quantitative analysis recommended by some of the commenters is not required under CEQA.

A comment states that the SEIR does not disclose the criteria the City used to select the intersections and freeway ramps included in the transportation analysis; this is not correct. As stated on SEIR p. 5.2-7, the study intersections were selected because they a) represent access points to the regional highway system, b) are located along major street corridors serving the Mission Bay Area, or c) are located in the immediate vicinity of the project site, and because they are the intersections most likely to be potentially affected by traffic generated by the proposed

project. As stated on SEIR p. 5.2-15, the freeway ramps were selected for ramp operations analysis (i.e., four on-ramps and two off-ramp) as they represent the regional highway facilities most likely to be impacted by traffic generated by the proposed project.

As noted by one of the commenters, the *Transportation Impact Analysis Guidelines* issued by the Planning Department in 2002 (*SF Guidelines*) suggests that a project study area would encompass a radius between two blocks and 0.25 miles, but that a larger area may be determined depending on the type of project. Of the 22 project study intersections, 10 are located in the vicinity of the project site within a 0.25-mile radius, 10 are located between a 0.25 and a 1-mile distance to the project site, and two are located more than 1 mile away from the project site. In addition, about one quarter (five of 22) of the study intersections are located at freeway ramps providing access to I-80 or I-280. Thus, the selected study intersections provide a wide range of geographical distribution and access characteristics within the study area.

One comment refers to 27 study intersections located within the SoMa area that were analyzed as part of the previous Event Center project at Piers 30-32 and suggests that they should all be analyzed as part of this SEIR as well. The previously proposed center at Piers 30-32 was located at the intersection of The Embarcadero and Bryant Street, with very different access patterns compared to the proposed project. Most of the vehicle access to the Piers 30-32 site would have taken place through the SoMa and Waterfront areas. As such, of the 27 intersections listed by the commenter, nine are located along The Embarcadero north of Pier 40, and 15 are located in the SoMa area at or east of Fourth Street. The 27 intersections were selected for the Piers 30-32 project because they represented major access points to the regional highway system or were located along major street corridors serving Piers 30-32, which is not true for the proposed project site located in the Mission Bay area. The same criteria applied to the selection of intersections for the Mission Bay location, but given the change in location, intersections studied for the Piers 30-32 project were no longer major access points to the regional highway system or located along major street corridors serving the project site.

As noted by the commenter, the proposed project is located approximately 1.3 miles to the south of Piers 30-32. Access from the northeast quadrant of the City and from I-80 to the proposed project site would be different than for Piers 30-32, and would likely occur further to the west, away from the evening commute congestion that typically occurs near the Financial District and the Rincon Hill areas (drivers on I-80 westbound would exit at ramps further west, such as at Fifth Street, and those coming from the northern part of the City would use Van Ness Avenue, as well as Tenth, Eighth and Sixth Streets, rather than The Embarcadero or other north-south streets in the Financial District). Thus, the study intersections would necessarily have to be different. It should be noted that the SEIR considered five of these 27 intersections (King/Third, King/Fourth, Fifth/King, Fifth/Harrison, and Fifth/Bryant) for evaluation of potential traffic impacts, and these intersections are included in the traffic analysis presented in the SEIR.

A comment noted that because some of the basketball game attendees would be arriving from the San Francisco downtown and Financial District areas, they would be required to pass through SoMa to arrive at the project site, so that additional intersections in the SoMa area would have to be evaluated. Mode of travel and place of origin surveys of baseball game attendees conducted

by the SF Giants, as well as available parking occupancy surveys, suggest that many of those game attendees that drove to work at their jobs in the Financial District and SoMa areas, tend to walk, ride transit, or take a taxi to AT&T Park, leaving their cars at their commuter parking locations in order to avoid the evening commute congestion that typically occurs near I-80 and AT&T Park and having to re-park their cars at game-day rates. It is likely that a similar condition would occur with the proposed project, with many of those working in downtown riding Muni or special event shuttles, and taking taxis or TNC vehicles[2], such as Uber or Lyft to the event center, rather than driving and having to park again with limited space availability.

It should also be noted that the number and locations of study intersections presented in the SEIR is also consistent with those selected for evaluation in other studies of proposed development in the Mission Bay Area. For example, the recently completed UCSF Long Range Development Plan EIR[3] identified 21 study intersections for the analysis of transportation impacts in the vicinity of the Mission Bay Campus and Medical Center. The majority of the intersections selected by UCSF (13 of 21) coincide with those evaluated in the SEIR for the proposed project; the remaining eight study intersections analyzed as part of the UCSF LRDP were either intersections in close proximity to proposed UCSF facilities within Mission Bay, or intersections along likely travel paths, and impacted by UCSF related vehicle travel (e.g., intersections further west along 16th Street).

Notwithstanding the above, an additional intersection in the SoMa area was evaluated as part of this Response to Comment document to evaluate potential project impacts in this area. The intersection of Eighth/Brannan was selected as most relevant for additional analysis compared to the numerous other additional intersections enumerated in the comments because: a) it is located in close proximity to two I-80 ramps (the I-80 eastbound on-ramp and westbound off-ramp are located at Bryant Street and Harrison Street, respectively), b) provides access to Mission Bay from the SoMa and Mid-Market areas via Eighth Street, and c) was recently evaluated as part of a transportation impact study[4] in the Western SoMa area. Approximately 25 percent of the inbound project traffic arriving from the northeast quadrant of the City or the East Bay would travel through the intersection of Eighth/Brannan. The remainder of this traffic would distribute along multiple parallel southbound streets such as Van Ness Avenue, Tenth Street, Sixth Street, Fifth Street, Fourth Street, and The Embarcadero.

The results of the intersection LOS conducted for the weekday p.m., evening, and late evening conditions with and without an overlapping SF Giants evening game are summarized in **Table 13.11-1** below. As indicated in the table, the signalized intersection of Eighth/Brannan is currently operating at an acceptable LOS and would continue to do under existing plus project conditions. Other SoMa intersections to the east and to the north suggested by the commenter

[2] Transportation Network Company (TNC) is a company or organization that provides transportation services using an online-enabled platform to connect passengers with drivers using their personal vehicles (e.g., Lyft, SideCar, Uber).

[3] UCSF 2014 LRDP Final Environmental Impact Report, certified by the Board of Regents of the University of California in November 2014 (http://www.ucsf.edu/content/lrdp-environmental-impact-report-downloads).

[4] 510-520 Townsend Street Transportation Impact Study, August 2015. A copy of this document is available for review at the San Francisco Planning Department, 1650 Mission Street, Suite 400, as part of Case File No. 2013.0679E.

(e.g., north of I-80 up to Market Street, along The Embarcadero, etc.) would be more remote to the project site and would experience lower, more dispersed project-related traffic volumes. LOS results for many of these intersections are presented in the analysis of the project alternative at Pier 30-32, which describes background traffic conditions at some of these intersections as congested. The analysis of the more relevant example of Eighth/Brannan, which has higher concentrated volumes of project-related inbound traffic, demonstrates that these other, more remote intersections – with lower volumes of project-related traffic – would not be expected to significantly contribute to existing or cumulative traffic impacts.

See also Response TR-2d regarding the SEIR transportation cumulative impact analysis.

Issues Raised by Commenters: Baseline Conditions (TR-2c)

This response addresses all or part of the following comments, which are quoted below:

O-MBA10L4-21 O-MBA10L4-22 O-MM-4

The DSEIR does not comply with CEQA's requirements to accurately state existing (baseline) conditions of traffic, thus negating the impacts analysis, the mitigations analysis, and the alternatives analysis on these crucial impacts affecting traffic, transit, air quality, safety, and human health throughout the affected area. The DSEIR contains no traffic counts or other traffic indicators and inadequate analysis of operational air quality impacts from the congestion inevitably caused by removing traffic lanes and parking. (*Mary Miles, Attorney at Law, email, July 27, 2015 [O-MM-4]*)

The Transit Analysis Understates Impacts Because It Relies On Stale Transit Baseline Data

This DSEIR's Notice of Preparation was filed on November 19, 2014. The DSEIR's transit impact analysis relies upon transit ridership data published in a City Planning Department memo dated June 21, 2013 entitled Transit Data for Transportation Impact Studies[8]. However, the data published in that memo is from counts taken in the fall of 2010 and in 2011. Between 2010/11 and late 2014 when the NOP was filed there have been a large number of significant development projects that have been completed and occupied in the C-3, SOMA and Mission Bay and numerous others approved and placed under construction. These render the transit database collected in 2010/11 stale for evaluation of a Project whose NOP was filed in late 2014. Hence, the transit analysis is inadequate for relying on stale data.

Similarly, for the regional transit corridor screenlines, the cited Transit Data for Transportation Impact Studies memo relies on data from a SFMTA TEP Project document produced in October, 2012. Obviously, the transit ridership data in that document reflects observations some time before October, 2012. Again, significant development has occurred in the C-3, SOMA and Mission Bay between whenever the data published in October 2012 was collected and the date of the NOP for the subject Project. This would result in significantly heavier loadings on the regional transit carriers in the peak periods at the time of the NOP than represented in the Transit Data for Transportation Impact Studies memo. For example, the data relied on in the DSEIR indicates BART's Transbay peak hour ridership is 19,716. BART Sustainable Communities Operations Analysis report[9] indicates peak hour Transbay ridership at 21,600 passengers in 2012 and projects 21,815 peak hour peak direction riders by 2015. BART's ridership values would respectively put BART at 98 percent of capacity in 2012 and at 98.9 percent currently. This leaves considerably less capacity for peak hour travelers to the Project to be accommodated without impact.

The DSEIR transit analysis should be redone based on updated estimates of baseline transit ridership, taking into account projections of transit use from the environmental documents for all projects known to the City to have been completed since the time of the actual transit ridership counts or known to be reasonably certain, at the time of this Project's NOP, of being completed by the estimated time of completion of this Project

Footnote:

[8] *Transit Data For Transportation Impact Studies* is reproduced in DSEIR Appendix TR at pages TR-624 thru TR-632.

(*Mission Bay Alliance, Thomas Lippe, letter, July 27, 2015 [O-MBA10L4-21]*)

The Traffic Analysis Underestimates Impacts Because It Relies on Stale Baseline Data

The traffic impact component of the DSEIR relies on a number of traffic counts taken in 2013 and others in June, 2014. It adjusts those counts to account for traffic from the UCSF Medical Center Phase 1 and the Public Safety Building that are located close to the Project site and were under construction when the counts were taken but were occupied about the time of the NOP. However, it seems likely that there was other development in C-3, SOMA and Mission Bay completed in the period between when the 2013 counts were taken and the date of the NOP that would logically affect baseline traffic at some of the intersections analyzed in the DSEIR and still more that is known to the City to be reasonably certain of completion by the time of completion of the subject project. Please list all such developments and adjust the baseline traffic used in the DSEIR analysis accordingly.[10]

Footnote:

[10] The aforementioned separate comment letter on this Project by Mr. Larry Wymer includes a spreadsheet reflecting, to the best of Mr. Wymer's ability based on culling the posting of environmental documents of development projects on the City Planning Department's web site, a listing of such projects and the traffic they would contribute to locations that were or should have been studied in this DSEIR's traffic analysis. However, responsibility for developing a comprehensive list of such projects and adjusting the baseline for their effects rests with the City Planning Department that is charged with generating and maintaining these records, not to an independent party attempting to do so from the outside.

(*Mission Bay Alliance, Thomas Lippe, letter, July 27, 2015 [O-MBA10L4-22]*)

Response TR-2c: Methodology, Baseline Conditions

Traffic Baseline Data

The SEIR did not rely on stale baseline data. Rather, the City's staff and consultants took steps to ensure that the data on which they relied was as up-to-date as feasible and subject to ongoing review and reappraisal. Further reassessment has occurred in response to public comment on the Draft SEIR; and, as will be explained below, the City's conclusions regarding the significance of impacts remain unchanged.

The existing conditions used for the traffic impact analyses are presented on SEIR pp. 5.2-7 – 5.2-15. As discussed in that section, the existing conditions at the study intersections were developed for four peak hours (i.e., weekday p.m., weekday evening, weekday late evening, and Saturday evening peak hours) for conditions without and with a SF Giants evening game at AT&T Park, for a total of eight analysis hours. Intersection turning movement counts were collected during multiple weeks in June, July, October, November and December 2013, and May and June 2014. As stated on SEIR p. 5.2-8, because the UCSF Medical Center Phase 1 and the Public Safety building were under construction when the counts were taken, the estimated vehicle travel demand associated with these uses was added to the counts to reflect full occupancy and operation of these facilities (both facilities opened in early 2015). In April 2015, additional weekday p.m., evening and late evening counts were conducted at key intersections (i.e., Third/16th, Fourth/16th, and Fourth/Mariposa) and compared to the adjusted traffic volumes (as described above) to confirm that the adjustments to the traffic volumes accurately reflected traffic volumes and patterns associated with the newly opened facilities. Because the adjusted volumes used in the analysis were similar to or higher than those collected in the field in April 2015, it can reasonably be inferred that the traffic volumes used in the existing and existing plus project analyses also adequately reflect any changes that may be associated with recently completed projects further afield (e.g., in SoMa).

SEIR Appendix TR includes traffic volume figures for all of the analysis scenarios – Figure 1a/1b through Figure 12a/12b on SEIR Appendix TR pages TR-125 to TR-169. These traffic volumes were used in the air quality analyses. See Section 13.3, Response AQ-5 for additional information regarding the proposed project's air quality analysis and impacts.

Intersection LOS conditions were analyzed for the various existing plus project and cumulative conditions, and the intersection LOS analysis results are documented in Impact TR-2 (for conditions with a SF Giants evening game at AT&T Park), Impact TR-11 (for conditions with a SF Giants evening game), Impact TR-18 (for conditions without the Muni Special Event Transit Service Plan), and Impact C-TR-2 (for cumulative conditions).

Transit Baseline Data

The existing conditions for the transit impact analysis were based on information currently used in the assessment of transit impacts by the San Francisco Planning Department, and the data was supplemented to account for the additional analysis peak hours (i.e., weekday evening, weekday late evening, and Saturday evening), and to reflect the Muni service that would be available upon completion of the Central Subway project.

The San Francisco and regional screenline analysis for the weekday p.m. peak hour were used for the project impact analysis of outbound trips from the event center for the No Event and Convention Event scenarios. The San Francisco Planning Department and SFMTA periodically update the weekday p.m. peak hour Muni downtown and regional screenlines for existing conditions as part of larger planning-level studies (e.g., the SFMTA Transit Effectiveness Project EIR). The Muni downtown screenline analysis presented in SEIR Table 5.2-43 was based on the screenlines included in the San Francisco Planning Department's memorandum *Transit Data for Transportation Impact Studies* dated June 21, 2013, which represented the official screenline analysis at the time of the impact analysis. In May 2015, the SFMTA updated the downtown screenline analysis based on the most recently-available data, as documented in the San Francisco Planning Department's Memorandum *Transit Data for Transportation Impact Studies* dated May 15, 2015.

In response to the comment, as shown in Table 5.2-43 as modified, the Muni downtown screenline analysis was updated to reflect the data that was made available in May 2015 for existing plus project conditions for the weekday p.m. peak hour for the No Event and the Convention Event scenarios. The Muni downtown screenline analysis was conducted for these two scenarios because they would generate more outbound transit trips during the weekday p.m. peak hour than the Basketball Game scenario (see Table 5.2-26 on SEIR p. 5.2-92). With the updated baseline transit data for the Muni downtown screenlines, two corridors operate under existing conditions at more than the 85 percent capacity utilization standard: the Fulton/Hayes corridor of the Northwest screenline, and the Third Street corridor of the Southeast screenline. Under existing plus project conditions for the No Event and the Convention Event scenarios, as updated with the May 2015 information, the Fulton/Hayes corridor of the Northwest screenline would operate at 91.1 percent, and the Third Street corridor of the Southwest screenline would operate at 102.8 percent. The project's contributions to these two corridors would be less than 1.5 percent for the Fulton/Hayes corridor (16/1,204 = 1.33 percent, 18/1,206 = 1.49 percent), and less than 3.7 percent for the Third Street corridor (30/815 = 3.68 percent, 27/813 = 3.32 percent), and, therefore, project impacts on the Muni screenlines would be less than significant. Note that the T Third data in the updated screenlines reflects conditions prior to operation of the Central Subway project, and the line analysis presented in Table 5.2-40 on SEIR p. 5.2-136 for weekday p.m. peak hour conditions, presents a more detailed analysis of impacts on the T Third light rail line and 22 Fillmore bus route serving the project site.

Use of the updated Muni downtown screenlines does not result in any changes to the impact determination for Muni transit presented in Impact TR-4.

As discussed on SEIR p. 5.2-76, the Muni transit ridership and capacity data for the T Third light rail line and the 22 Fillmore bus route were obtained from the SFMTA, and reflect conditions that would occur following completion of the Central Subway project and the 22 Fillmore Transit Priority Project. Thus, the ridership at the maximum load point and related capacity of the 22 Fillmore and T Third reflect 2020 conditions for the Central Subway (i.e., conditions for the year following the start of revenue service on the light rail lines, and when the 22 Fillmore Transit Priority Project is completed and replaces the 55 16th Street route.) Hence, the ridership used in the analysis accounts for development that occurred and is projected to occur by 2020.

NOTE:

[a] Muni downtown screenlines reflect outbound trips from downtown San Francisco.

SOURCE: Adavant Consulting/Fehr & Peers/LCW Consulting, 2015

The regional screenline data for the weekday p.m. peak hour conditions has not been updated by the Planning Department. However, in May 2015, BART provided updated transit ridership and capacity for the East Bay and South Bay cordons, based on transit ridership from April 2015.[5] Thus, BART's impact determination is based on the most up to date data provided by BART, and accounts for development that occurred in SoMa through April 2015. Thus, this April 2015 data is more up to date than the data presented in the BART Sustainable Communities Operations Analysis cited in a comment.

As indicated on SEIR p. 5.2-110, the 2040 cumulative analysis takes into account the cumulative development projects in the project vicinity, in Mission Bay, as well as growth in the rest of San Francisco and the region.

Overall, the transit impact analysis presents a reasonable representation of transit conditions based on available data for both the Muni and regional transit providers, and additional analysis is not required. Nor have commenters identified any flaws in the analyses that built upon the transit impact analysis. Although a somewhat different, and yet technically plausible, approach might have been possible, the City's approach is abundantly supported by substantial evidence and represents a reasonable exercise of technical judgment. In general, a lead agency's determination regarding how "existing physical conditions without the project' could 'most realistically be measured'" is "quintessentially a discretionary determination[.]" (*Cherry Valley Pass Acres & Neighbors v. City of Beaumont* (2010) 190 Cal.App.4th 316, 337.) "Neither CEQA nor the CEQA Guidelines mandates a uniform, inflexible rule for determination of the existing conditions baseline. Rather, an agency enjoys the discretion to decide, in the first instance, exactly how the existing physical conditions without the project can most realistically be measured, subject to review, as with all CEQA factual determinations, for support by substantial evidence." (*Communities for a Better Environment v. South Coast Air Quality Management Dist.* (2010) 48 Cal.4th 310, 328.) As the California Supreme has recognized, "'the date for establishing baseline cannot be a rigid one. Environmental conditions may vary from year to year and in some cases it is necessary to consider conditions over a range of time periods.' In some circumstances, peak impacts or recurring periods of resource scarcity may be as important environmentally as average conditions. Where environmental conditions are expected to change quickly during the period of environmental review for reasons other than the proposed project, project effects might reasonably be compared to predicted conditions at the expected date of approval, rather than to conditions at the time analysis is begun. A temporary lull or spike in operations that happens to occur at the time environmental review for a new project begins should not depress or elevate the baseline; overreliance on short-term activity averages might encourage companies to temporarily increase operations artificially, simply in order to establish a higher baseline." (*Id.*, pp. 327-328, citations omitted.) Also see Response TR-5a through Response TR-5d for additional discussion of the SEIR transit impact analysis.

Issues Raised by Commenters: Trip Generation (TR-2d)

This response addresses all or part of the following comments, which are quoted below:

A-Caltrans-1	O-MBA10L4-7	O-MBA10L4-16	O-MBA10L4-39B
I-Hrones1-2	I-Sullivan-1		

Please clarify why there is only minor difference in volumes at Study Intersections 9, 10, 11, 12, and 13 between Cumulative Project-No Event and Cumulative Project-With Basketball Game Conditions, as shown in Figures 13a and 15a (SEIR, Appendix TR, pgs. TR-156, TR-152). Additionally, Study Intersection 12 shows greater southbound and eastbound volumes in Figure 13a than 15a. The volumes of inbound vehicle trips during the weekday 4-6 and 6-8 peak hour periods are estimated 379 & 2,489 respectively and 2,797 outbound vehicle trips during the 9-11 PM peak period (pg. TR-37). This would appear to show significant Cumulative volumes. (*Department of Transportation, Patricia Maurice, letter, July 20, 2015 [A-CALTRANS-1]*)

E. The DSEIR's Analysis of the Project's Operational Traffic and Transit Congestion and Delay Impacts Is Legally Flawed.

1. The DSEIR understates traffic and transit volumes in the PM peak period of 4:00 to 6:00 PM by using "time of arrival" at the Arena as a proxy measurement for "time of travel."

In modeling traffic and transit impacts, the DSEIR assumes only 5% of basketball game attendees will be traveling in the "study area" in the PM peak period of 4:00 to 6:00 p.m. Table 5.2- 21 states that 5% of arrivals are expected before 6:00 p.m. for 7:30 p.m. weekday basketball games; another 11% will arrive between 6:00 and 6:30 p.m. (DSEIR, p. 5.2-83.) This data is based on turnstile counts of people entering the arena.

As explained by Dan Smith in his attached report, this proxy measurement does not provide reliable data as to when game or event attendees are actually traveling through affected intersections or freeway ramps or using affected transit routes:

> These considerations are so obvious to any transportation professional knowledgeable about sports stadium transportation issues that the analysis presented in the DSEIR cannot be said to constitute the good faith effort to disclose impact that the California Environmental Quality Act demands. Since the entire analysis of transportation impacts flows from the estimate of trip generation and time-of-travel analysis, the entire transportation impact component of the DSEIR must be redone to accurately reflect the time that event attendees are actually traveling on the transportation system instead of the time they enter the event venue.

(Exhibit 1, p. 3.)

In his analysis, Mr. Smith found:

> it seems highly probable that as much as one-third or more of the trips that the DSEIR considers to take place in the 6 to 7 PM period and the 7 to 8 PM period would actually be on the transportation system in the more critical 5 to 6 PM commute peak hour. That would put 7,466 event-related travelers on the transportation system in the 5 PM to 6 PM period instead of the 1,866 assumed in the DSEIR, a difference that would likely result in transportation impacts not disclosed in the DSEIR and/or intensification of impacts and mitigation needs of those that were disclosed.

(Exhibit 1, p. 3.)

Even just applying common sense to the DSEIR's data indicates that many or most of the 11% that the DSEIR says arrive at the turnstile between 6:00 and 6:30 p.m. would be traveling to the event in the PM

peak period of 4:00 to 6:00 pm. This minimal adjustment alone changes the assumption on which the modeling is based from 5% to 16% traveling in the "study area" in the PM peak period of 4:00 to 6:00 pm. As shown by Mr. Smith, this minimal adjustment more than doubles the Project's contribution of traffic to affected intersections, and would change the DSEIR's determination from less-than-significant to significant at some intersections. (Exhibit 1, p. 4.)

This issue was flagged in public scoping comments on the DSEIR. (DSEIR, p. 2-15.) Yet, somehow, the DSEIR did not adjust its reliance on turnstile data to develop a reliable metric to use instead. Instead, the DSEIR offers a series of weak or irrelevant rationales for its methodology, including:

> because basketball games typically start at 7:30 p.m. a higher percentage of inbound event attendees would travel to the event center during the 6:00 to 8:00 p.m. period than during the 4:00 to 6:00 p.m. commute peak period.

(DSEIR p. 5.2-71); and

> the SF Guidelines do not include travel demand characteristics for the specialized uses (e.g., sports events, conventions, and other events) that would take place at the proposed event center. Similarly, standard trip generation resources, such as the Institute of Transportation Engineer's Trip Generation Manual, do not include sufficiently detailed trip generation data for such specialized uses. Therefore, the travel demand for the event center component of the proposed project was based on the estimated attendance, as well as information on current travel characteristics of Golden State Warriors basketball attendees at the Oracle arena in Oakland.

(DSEIR, p. 5.2-81); and

> The data are based on information provided by the Golden State Warriors for their current facility, which was then adjusted to provide for earlier arrival patterns based on comparable information collected at similar NBA facilities to account for the increased availability of retail and restaurant uses at the proposed project site compared to Oracle Arena in Oakland. A summary of this data is provided in the travel demand technical memorandum included in Appendix TR.

(DSEIR, p. 5.2-82.)[5]

A discussion and summary of the data from other venues than Oracle is provided in DSEIR, Appendix TR, at pp. TR-21 to TR-25 and TR-37 [Appendix A, p. A-9]. The table at page TR-37 provides time of arrival data from, in addition to Oracle, six purportedly "comparable" venues, namely: Icon Venue Group, Houston, Phoenix, Sacramento, Brooklyn (2013-2014), and Brooklyn (2014-2015). An interesting fact about this table is that the data for 4:00 to 6:00 p.m. arrivals at four of these six venues (i.e., Icon Venue Group, Houston, Phoenix, Sacramento) is "included in" the data for later time periods. So, in fact, the only purportedly comparable venue for which the DSEIR presents supporting data is Brooklyn (2013-2014 and 2014-2015). The venue with the largest proportion of arrivals in the 4:00 to 6:00 p.m. period is Brooklyn (2014-2015), with 4.1%.

In short, the City and the Warriors failed to develop reliable accurate, reliable data on the key variable in the entire transportation analysis, i.e., the number of people traveling to events in the peak PM time period when traffic and transit crowding are at their worst. A lead agency "must use its best efforts to find out and disclose all that it reasonably can." (CEQA Guideline, § 15144.)

The above quoted rationales do not excuse this failure. The scoping comments flagging this issue were submitted to the City between November 19, 2014, and December 19, 2014, during the middle of the basketball season. (DSEIR, p. 2-8 and 2-9, 2-15.) The Warriors played fifty-seven (57) games between December 19, 2014, through the close of the regular season on April 15, 2015.[6] There are thirty (30) teams in the NBA.[7] That means there were approximately eight-hundred and fifty five (i.e., 15 x 57 = 855) regular season games played in the 2014-2015 regular season after December 19, 2014. In the playoffs following the regular season, sixteen teams played a total of seventy-nine games after April 15, 2015.[8]

Therefore, both the Warriors and the City had ample opportunity to conduct market research by interviews and exit polling of a sample of the hundreds of thousands of fans attending these games to discover how far in advance of arriving at the turnstile they traveled through the traffic and transit

impacted area surrounding the venue. The City's and Warriors' decision to pass up this opportunity after being informed of the issue does not satisfy their duty to use best efforts to find out and disclose all they reasonably can.

Indeed, the City was fully aware of the need to gather information more relevant to fans "time of travel" than turnstile counts and made some efforts to do so. But it failed to disclose that there are alternative metrics for "time of travel" or the results of its efforts in this regard. For example, an email exchange dated January 12, 2015, between the City's EIR consultant (ESA) and City Planning officials includes data on arrivals before 6:00 p.m. at the Arco Arena parking lot for a 7:00 p.m. Sacramento Kings game and arrivals before 6:00 p.m. in buildings for other NBA venues. Thus, the City was aware of other measurements (e.g., parking lot entry rather than turnstile counts) that could more accurately predict peak PM period travel to games.

Also, the arrival numbers cited in this email exchange show 14% arriving at the Arco Arena parking lot before 6 p.m. for one 7 p.m. game and 9% arriving before 6 p.m. in buildings for other NBA venues. These numbers indicate the DSEIR's assumption that 5% of fans will be traveling through the study area before 6 p.m. for 7:30 p.m. games is vastly understated. Yet the DSEIR fails to reference these numbers.

The DSEIR must be revised to provide accurate peak period traffic data and analysis

Footnotes:

[5] In the "Travel Demand Methodology and Results" section of Chapter 5.2, the DSEIR states:

> The Basketball Game scenario reflects the travel demand of the office, retail and restaurant uses, plus an evening basketball game. The transportation impact analysis of the Basketball Game scenario was conducted for four analysis hours (weekday p.m., weekday evening, weekday late evening, and Saturday evening), for conditions without and with an overlapping SF Giants evening game at AT&T Park.
>
> Table 5.2-21 presents the expected temporal distribution of arrival and departure patterns for basketball game attendees of the proposed project. The data are based on information provided by the Golden State Warriors for their current facility, which was then adjusted to provide for earlier arrival patterns based on comparable information collected at similar NBA facilities to account for the increased availability of retail and restaurant uses at the proposed project site compared to Oracle Arena in Oakland. A summary of this data is provided in the travel demand technical memorandum included in Appendix TR. Based on this information, it was assumed that approximately 5 percent of arrivals to a basketball game would occur during the p.m. peak hour (5:00 to 6:00 p.m.), and up to 66 percent of arrivals would occur during the evening peak hour (7:00 to 8:00 p.m.). Similarly, up to 70 percent of the departures would occur during the late evening peak hour (9:00 to 10:00 p.m.).
>
> Event staff for basketball games would be expected to arrive between 4:30 and 5:00 p.m. and would be on post prior to the gate opening time; event staff would leave between 11:00 and 11:30 p.m.

The DSEIR's Transportation Impact Analysis Understates and Fails To Disclose and Mitigate Arena Event Impacts on PM Commute Peak Hour Travel Because It Fails to Consider the Time and Duration of Attendees Travel In Advance of Passing Through Venue Entry Turnstiles

The DSEIR considers turnstile data on time of arrival at the Golden State Warriors current venue site (Oracle Arena) and other basketball venues to estimate how many attendees traveling to a game with a 7:30 PM start time would be traveling on the area transportation system in the 4 to 6 PM peak commute period versus in the 6 to 8 PM early evening peak shoulder period. However, it uses an overly simplistic relationship between turnstile arrival data and whether the attendee traveled in the 4 to 6 peak or in the 6 to 8 shoulder: If the attendee arrives at the turnstiles more than 1.5 hours before the 7:30 event start, they are assumed to have traveled in the 4 to 6 peak; if they hit the turnstiles less than 1.5 hours in advance of the event start, they are presumed to have traveled in the 6 to 8 shoulder. The problem with this is it fails to take into account the duration of each attendee's travel (which varies by where each person is coming from, the

mode or modes they choose and the travel time on that mode or modes). It also fails to consider the substantial portion of attendees who, rather than passing through the turnstiles immediately, choose to remain outside for a while (such as stopping at a nearby restaurant / bar for a meal or drinks, or just waiting outside, as in the circumstance where 2 or more people are going to sit together but are traveling independently from different points and one person has all the tickets). Turnstile data is only a weak surrogate measure for end-time of trip for travel to stadium and arena event venues. It is weak and non-representative of the actual times attendees may be traveling on the transportation system for the following reasons. Many attendees at weeknight Warriors games will be coming from places where they will have to travel more than 45 minutes or an hour to get there. Many attendees, when they reach the area of the Project will choose to patronize nearby bars or restaurants or need to wait outside to meet up with others. In reality, someone who has traveled an hour to get to the Project site and passes through the turnstile directly on arrival at 6:30, say, will have actually completed a substantial portion of their trip within the PM peak hour. Another person who has only traveled for, say, 45 minutes but spends a half-hour in a nearby bar before passing through the turnstiles at 6:45 will also have completed most of their trip in the PM peak hour. These offsets of actual time-of-travel on the transportation system from time of passage through the turnstiles are not adequately considered in the DSEIR.

The DSEIR States that 5 percent of arriving 7:30 PM basketball event attendees arrive between 5:00 and 6:00 PM (per Table 5.2-21) which would be 903 person trips for 18,064 maximum attendance. However, Table 5.2-22 shows a total of 1,803 person trips within the 4-6 PM peak hour. Presumably, this discrepancy accounts for roughly 900 trips of the assumed 1100 day-of-game workers (ushers, ticket-takers, vendors, event-level security personnel and other day-of-game functionaries who generally need to be in place when the turnstiles open). Some 95 percent of the attendees are assumed to arrive in the 6 – 8 PM early evening peak shoulder per Table 5.2-21 with the maximum arrival hour between 7 and 8 pm involving 11,742 trips (65 percent of attendees per Appendix TR Table 3).

But, considering the facts that:

- over 70 percent of the attendees will be coming from outside San Francisco (including 31.1 percent from the East Bay, 8.9 percent from the North Bay, 26.7 percent from the South Bay and 4 percent from completely outside the Bay Region)[1] meaning many of their trips to the Project site will take 45 minutes to an hour or more,
- many attendees will, after traveling to the vicinity of the Project site, stop in neighboring restaurants and bars for drinks or a meal, thereby advancing the actual time of their trip ahead of their time of passage through the arena turnstiles by 30 minutes to an hour or more. This would apply to attendees coming from points in San Francisco as well as those making longer trips.
- many of the attendees, after completing their trip to the site, may need to wait to meet with others before passing through the turnstiles, thereby advancing the actual time of their trip ahead of their time of passage through the arena turnstiles. While some waits to meet are of short duration, the arrivals may often be disparate by 30 minutes or more. This would apply to attendees coming from points in San Francisco as well as those making longer trips.

When all of these factors are considered, it seems highly probable that as much as one-third or more of the trips that the DSEIR considers to take place in the 6 to 7 PM period and the 7 to 8 PM period would actually be on the transportation system in the more critical 5 to 6 PM commute peak hour. That would put 7,466 event-related travelers on the transportation system in the 5 PM to 6 PM period instead of the 1,866 assumed in the DSEIR, a difference that would likely result in transportation impacts not disclosed in the DSEIR and/or intensification of impacts and mitigation needs of those that were disclosed.

These considerations are so obvious to any transportation professional knowledgeable about sports stadium transportation issues that the analysis presented in the DSEIR cannot be said to constitute the good faith effort to disclose impact that the California Environmental Quality Act demands.[2] Since the entire analysis of transportation impacts flows from the estimate of trip generation and time-of-travel analysis, the entire transportation impact component of the DSEIR must be redone to accurately reflect the time that event attendees are actually traveling on the transportation system instead of the time they enter the event venue.

In order to illustrate how consequential is the DSEIR's failure to consider the time difference between the time when event attendees pass through the arena turnstiles and the time when they are actually travelling on the transportation system, we review a simplified scenario. Undisputedly, people who pass through the arena turnstiles in the half-hour between 6:00 AND 6:30 PM were traveling on the transportation system before 6 PM – that is, within the 5 to 6 PM peak period. DSEIR Table 5.2-21 at page 5.2-83 estimates that 11 percent of turnstile arrivals do so in the 6:00 to 6:30 PM half-hour, amounting to 1987 person trips at capacity basketball attendance of 18,064. When these trips are added to the 1803 trips the DSEIR already estimates are traveling in the 5 to 6 pm peak hour[3], there would really be a total of 3790 Project basketball-related trips traveling in the pm peak hour. In other words, the Project's basketball-related trips in the PM peak hour would be more than doubled (actual factor 2.102).

The effects of a doubling of PM peak hour travel attributable to adding the Project with a 7:30 PM basketball game as compared to what the DSEIR estimates would be most evident at the intersection of Seventh Street with Mission Bay Drive where, instead of operating at LOS D as projected in table 5.2-24, it would operate at deficient LOS E, a significant impact. The effect on outbound MUNI lines T Third and 22 Filmore requires some special attention because Table 5.2-40 is obviously in error, showing the ridership on each of these lines as being less with a basketball game than without one. This is completely inconsistent with the text in the first bullet point on page 5.2-141 which states that a basketball game would add 681 new outbound transit trips to these lines in the PM peak hour. If we correct the table to be consistent with the text of the DSEIR analysis, the DSEIR's analysis of these two lines in the "with basketball" scenario should show a total outbound ridership of 3862 trips (or 81.3 percent of capacity).[4] If we add to that the riders who pass through the turnstiles in just the 6 to 6:30 PM period who, because of the offset between overall ride time and the 6-to 6:30 turnstile entry count, must have been riding on the transportation system in the 5 to 6 PM commute peak hour, the analysis would show an added ridership due to basketball of 1431, a net ridership in that situation of 4612, and a capacity utilization of 97.1, extremely close to crush capacity.[5]

1 Per DSEIR Appendix TR Table 8 at page TR 25.

2 This commenter has consulted regarding transportation issues related to many professional sports stadiums and arenas. In addition, by being an attendee at a very large number of professional sports events and concert events, this writer has observed with a professional eye the transportation and pre-event behavior of attendees at nearly 1200 major league stadium and arena events at various venues. The writer has held season tickets to the Giants at their current venue for 8 years, to the 49ers for 33 years, to the Oakland Raiders for 20 years and a quarter-share of season tickets to the San Jose Sharks.

3 See DSEIR Table 5.2-24 at page 5.2-90.

4 Regardless of whether the City agrees with our further analysis of the PM peak ridership with a basketball game, it must correct this table to make it consistent with the analysis findings in the text.

5 Under the City's normal impact threshold, which is riders exceeding 85 percent of screenline capacity, this would be a significant impact on transit. However, because the City has improperly created a Project-specific impact threshold of 100 percent of screenline capacity for this Project, the ridership would fall just below the gerrymandered impact threshold. The impropriety of creating a specially relaxed threshold of impact for this one Project is discussed in a subsequent section.

(*Mission Bay Alliance, Thomas Lippe, letter, July 27, 2015 [O-MBA10L4-16]*)

OPINION 3 –The DSEIR's Transportation and Circulation analysis understates and fails to disclose and mitigate arena event impacts on PM commute peak travel because it fails to consider the time and duration of attendees travel in advance of passing through venue entry turnstiles

I have reviewed Dan T. Smith Jr.'s opinion within his report dated July 15, 2015 regarding The DSEIR's failure to adequately consider PM peak hour impacts due to its failure to consider the time and duration of attendees travel in advance of their arrival at the turnstile. I agree particularly with his statement that:

> *"many attendees will, after traveling to the vicinity of the Project site, due to their this stop in neighboring restaurants and bars for drinks or a meal, thereby advancing the actual time of their trip ahead of their time of passage through the arena turnstiles by 30 minutes to an hour or more."*

I can personally attest to this dynamic. I have personal experience with 'time of arrival' issues pertaining to the NBA arena where the Sacramento Kings play, presently called 'Sleep Train Arena', but historically called (and still commonly called) 'Arco Arena'. I lived in Sacramento for sixteen years (1996-2012), and during seven of those years (1996-2003) I literally lived within 100 ft of the I-80/Truxel Road interchange. The I-80/Truxel Road interchange is presently 1 of 3 main interchanges providing primary access to the arena, and during the time I lived near the interchange I witnessed the building of the interchange (about 1998, which at the time became the 2nd main interchange providing primary access to the arena). I also witnessed and experienced the development of nearly ALL of the ancillary commercial developments (including restaurants, bars, shopping, etc.) surrounding the arena following the completion of the Truxel interchange. Throughout those seven years I commuted to/from work along the highways and arterials surrounding the arena, and frequented the commercial developments surrounding the arena during and immediately after the PM peak hour period. Thus on each and every game day, whether I personally went to a game myself or not, I experienced first-hand the increased trip generation to ancillary land uses during the later part of the PM peak hour (i.e. 5:00-6:00), experienced increased traffic volumes on I-80 and connecting arterials near the arena, and experienced worsening levels of service and increased delays. In addition to living for a time in the immediate vicinity of the arena, I also attended over 200 NBA games at the arena (as well as dozens of other special events at the arena) throughout the sixteen years I lived in Sacramento. Although I moved to and lived in the Rocklin area between 2003 and 2012, I continued to visit the arena for games, concerts, etc. and would often arrive early to meet with friends and/or frequent one of the many restaurants in the area. Through this experience, I can personally attest to the fact that the ancillary commercial uses surrounding the arena most definitely experiences a significant uptick beginning about 5:00/5:30 pm on game days (and other special events), and that this uptick most definitely increases traffic volumes along I-80, on I-80 freeway ramps to the three interchanges providing primary access to the arena, and along the arterials (and surface streets) surrounding the arena. As part of my research to provide opinions of the sufficiency of review for the proposed Golden State Warriors Arena in Mission Bay, I contacted one of the traffic engineers in the City of Sacramento's Department of Transportation to discuss this 'early arrival' dynamic. He was in agreement that the area most definitely experiences an uptick in traffic and resulting worsening in levels of service during the end of the PM peak period.

[1] San Francisco Transportation Plan 2040, Appendix K: SF Travel At a Glance
[2] http://www.sf-planning.org/index.aspx?page=3562

(*Mission Bay Alliance, Thomas Lippe, letter, July 27, 2015 [O-MBA10L4-39B]*)

"First, the traffic congestion impact feared by many at the Barclays Center site for the most part did not materialize. As a transportation professional involved in the project from the government agency side, the biggest story for me was that the fear of congestion generated by the arena so greatly exceeded the actual impact that when the facility opened traffic congestion was more or less a non-story. This was due to a number of factors, but the two most important were that transit utilization did meet the project goals, and that vehicle arrivals to the arena were more spread out than projected, as many people who drove came early to the area to go to nearby restaurants, bars, etc. Given this, I am happy to see that this EIR does focus on transit investments. Also, developing retail at the site as proposed will encourage some people to arrive early and eat or drink before an event. This should among, other potential benefits, disperse traffic impacts" (*Christopher Hrones, email, June 30, 2015 [I-Hrones1-2]*)

---

1) The planned event center will hold less than half of AT&T Park's capacity and by far the majority of events at the new arena will be held on days/times when the Giants will not be playing.

2) As at AT&T Park, the arrival times of attendees will be occur over a longer period than at other venues in the country because of the various attractions and amenities (food and otherwise) that will exist

around the arena site. Traffic of all types (autos, public, walking) will not all occur right before the start of the events easing the various traffic flows. (*Jim Sullivan, email, July 9, 2015 [I-Sullivan-1]*)

Response TR-2d: Methodology, Trip Generation

Trip Generation for the Weekday PM Peak hour

Several comments indicate that the number of basketball game attendees assumed in the SEIR to arrive at the arena during the weekday 4:00 to 6:00 p.m. period is underestimated, and therefore additional significant transportation impacts might occur beyond those identified in the transportation impact analysis. One comment indicates that about 7,450 event attendees (more than 40 percent of the maximum capacity of the event center) should be assumed traveling through the study intersections and riding the transit lines in the vicinity of the project site within one and a half to two and a half hours prior to the start of an event. For reasons explained below, the City disagrees with these comments and stands by its analysis, which reflects a number of evidence-backed, conservative assumptions. Though some of the points raised in the comments seem intuitively believable, actual data from comparable situations show that the comments have exaggerated the likely numbers of people would arrive before 6:00 p.m. for a 7:30 p.m. event.

The transportation analysis in the SEIR assumes that 5 percent of the basketball attendees would arrive at the event center between 5:00 and 6:00 p.m. (more than one and a half hours prior to the start of a basketball game), which was derived from information obtained from other NBA venues. The comments state that because this information is based on the time that attendees arrive at the event center, it would be necessary to also include attendees that might arrive later (e.g., between 6:00 and 6:30 p.m.) to account for those who might be using the transportation network before 6:00 p.m. but have not yet arrived at the event center, as well as those who might stop at a nearby restaurant/bar for a meal or drinks, or are just waiting outside. The comments suggest, but do not provide supporting evidence, that one-third or more of the attendees would arrive during the 5:00 to 6:00 p.m. peak hour.

As shown in the table on SEIR p. TR-37 of Volume 3 of the SEIR, multiple basketball venues from various sources were evaluated to derive the arrival patterns at the proposed project arena. Of these, two locations (Oracle Arena in Oakland and Barclays Center in Brooklyn) separately reported arrivals occurring more than one and a half hour prior to the start of a basketball game The remaining facilities reported all arrivals occurring more than one hour before to the start of a game, most likely because those occurring more than one and a half hour prior to the game represent a small fraction of the total attendance. The average percentage of arrivals occurring between 5:00 and 6:00 p.m. for those instances where arrivals occurring more than one and a half hour prior to the start of a basketball game (i.e., between 5:00 and 6:00 p.m. for a typical game starting at 7:30 p.m.) is less than 2.5 percent. Thus, to account for potential daily variability in arrival patterns, as well as the additional time it may take for attendees to enter to the event center after their arrival at the site or nearby vicinity, the SEIR conservatively assumed that more than twice as many attendees as the average (i.e., 5 percent) would arrive between 5:00 and 6:00 p.m.

In addition, the transportation analysis locations (intersections and freeway ramps) evaluated in the SEIR are located within relatively close proximity of the project site, necessitating only a short, relatively quick walk to the event center, so that the assumed 5 percent of game attendees arriving at the event center adequately accounts for those using the transportation infrastructure between 5:00 and 6:00 p.m.

Furthermore, in order to avoid understating impacts, the transportation analysis assumes an exact overlap between the peak hour for background traffic and the arrival of game attendees (i.e., between 5:00 and 6:00 p.m.). In reality, at various study locations, the highest peak hour traffic volumes actually occur earlier (e.g., from 4:30 to 5:30 p.m. or from 4:45 to 5:45 p.m.), resulting in a more conservative assessment of potential traffic impacts in the SEIR.

Additional surveys of attendee arrivals at the Oracle Arena where the Golden State Warriors currently play or other NBA facilities, as suggested in a comment, were deemed unnecessary, because, as noted above, arrivals to the Oracle Arena during the 5:00 to 6:00 p.m. peak hour are low (about 1 percent of the total) and because data from another location with similar urban and development conditions to the proposed project (i.e., Barclays Center in Brooklyn, New York) was already available. The Barclays Center, a 19,000-seat arena at the intersection of Atlantic and Flatbush Avenues in Brooklyn, New York is located within a mixed-use neighborhood. Office, retail, and restaurant uses are located on the major arteries, within walking distance of the arena, while residential buildings are located on the minor streets further away. The Atlantic Terminal and Atlantic Center shopping malls are located across from Barclays Center with a combined area of approximately 750,000 square feet. Major retail and restaurant tenants include Target, Best Buy, Old Navy, Marshalls, Starbucks, Uniqlo, Applebee's, Buffalo Wild Wings, Chuck E. Cheese's, Coldstone Creamery, and McDonald's.

In response to the comment, the following clarification was made to SEIR p. 5.2-82 (deleted text is shown as ~~strikethrough~~ and new text is <u>underlined</u>).

> **Table 5.2-21** presents the expected temporal distribution of arrival and departure patterns for basketball game attendees of the proposed project, <u>representing the percentages and time period when attendees would be expected to be on the transportation network in the study area</u>. The data are based on information provided by the Golden State Warriors for their current facility, which was then adjusted to provide for earlier arrival patterns based on comparable information collected at similar NBA facilities to account for the increased availability of retail and restaurant uses at the proposed project site compared to Oracle Arena in Oakland

The revision does not change the analysis or conclusions presented in the SEIR.

Traffic Volumes

The following responds to Caltrans's questions regarding why there are only minor differences in traffic volumes in certain Study Intersections, as shown in Figures 13a and 15a of Appendix TR, which present the 2040 Cumulative traffic volumes for the weekday PM (4:00 to 6:00 p.m.) and

Saturday evening peak hour (7:00 to 9:00 p.m.) conditions for the No Event and Basketball Game scenarios. The minor differences between the No Event and the Basketball Game scenarios at the intersections adjacent to the project site are primarily due to the following: the slight reduction in project-generated outbound trips under the Basketball Game scenario during these two analysis hours (see Table 5.2-25 on SEIR p. 5.2-91); the fact that the project parking supply of 950 spaces remains unchanged between No Event and Basketball Game conditions; and the use of other publicly accessible parking facilities to accommodate the project-generated parking demand (and the associated assignment of vehicle trips to off-site parking rather than to the project site). Overall, as shown in Table 5.2-25 on SEIR p. 5.2-91, total vehicle trip generation during the p.m. peak hour would not be very different (125 vehicles higher or 26 percent) during a basketball game compared to No Event conditions. This somewhat reduced increase is due to the relatively low amount of event traffic during this period (5 percent), as well as an expected reduction in unlinked demand in retail and sit-down restaurant customers (those customers unrelated to an event with only one destination at the project site; see SEIR Volume 3, Appendix TR, p. 23).

In addition, travel patterns would be different in the hours prior to a basketball game compared to No Event conditions, particularly at those intersections that provide access to the project garage. As stated in the project TMP, on a basketball game day, the project garage would be reserved for designated event attendees who had pre-purchased their parking space. Typical garage customers, hourly and daily parkers, would be prevented from parking at the project garage from several hours prior to the start of the game and would either have had to arrive at the site by other means (e.g., transit), leave the garage earlier in the day, or park at other nearby facilities not reserved for game attendees (e.g., UCSF Third St garage). Furthermore, because those attendees parking at the site garage would have a guaranteed space, they would not need to arrive early to find parking, resulting in somewhat lower volumes during the 4:00 to 6:00 p.m. period in the immediate vicinity of the project garage entrances.

Transit Ridership

The weekday p.m. peak hour transit analysis of the T Third and 22 Fillmore on Table 5.2-40 on SEIR p. 5.2-136 is correct. The existing plus project ridership presented in the table indicate that Muni's transit ridership departing the project site during a basketball game during the p.m. peak hour (3,137 riders) is comparable to those occurring under the No Event scenario (3,181 riders), a 44-transit rider (or less than 1.5 percent) difference. This is consistent with the expected project travel behavior as described in the SEIR methodology section starting on SEIR p. 5.2-81. Basketball game attendees would travel inbound towards the project site during the p.m. peak hour, while office employees would primarily travel outbound from the project site. Table 5.2-40 presents the number of outbound trips only, which are unaffected by game attendees. The difference in the number of transit trips between the No Event and the Basketball Game scenarios is more clearly indicated in Table 5.2-24 on SEIR p. 5.2-90, which shows 881 project-generated total transit riders (inbound and outbound) during the p.m. peak hour under the No Event scenario, versus 1,625 total transit riders under the Basketball Game scenario.

Furthermore, as described in the travel demand analysis methodology memorandum (SEIR Volume 3, Appendix TR, starting on Appendix TR p. TR-17), trip generation for the project retail

and sit-down restaurant uses would be different during a No Event compared to a Basketball Game scenario. As described on page Appendix TR p. TR-23, fewer retail and sit-down restaurant no-event customers would be expected to visit the project site ahead of a game, reducing the trip generation for those uses, thus somewhat reducing outbound ridership taking Muni from the project site (less than 1.5 percent) during the p.m. peak hour. Table 5.2-24 on SEIR p. 5.2-90 shows that total transit trips not attending an event during the p.m. peak hour for retail and sit-down restaurant uses would be 285 trips during a No Event scenario and 170 trips during a Basketball Game scenario.

SEIR p. 5.2-141 states that the Basketball Game scenario would generate 681 outbound transit trips. Of the 681 outbound transit trips, 647 trips were assigned to the T Third line (496 trips) and the 22 Fillmore route (151 trips), and 34 trips would walk to the Caltrain station (about 50 percent of the outbound trips assigned to Caltrain). In response to the comment, the following clarification was made to SEIR p. 5.2-141 (deleted text is shown as ~~strikethrough~~ and new text is underlined).

- During the weekday p.m. peak hour, the Basketball Game scenario would generate 1,625 new transit trips (944 inbound and 681 outbound). About 73 percent of the outbound transit demand would be on the T Third (496 trips), about 22 percent on the 22 Fillmore (151 trips), and 5 percent would walk to Caltrain (34 trips). As indicated in **Table 5.2-40**, the additional outbound trips would be accommodated on the T Third line and 22 Fillmore.

The revision does not change the analysis or conclusions presented in the SEIR.

Also refer to Response TR-2g regarding transit capacity utilization analysis, including definition of crush load conditions.

Issues Raised by Commenters: Travel Modes (TR-2e)

This response addresses all or part of the following comments, which are quoted below:

O-Sierra-7 I-Zboralske-12

The Sierra Club notes that project sponsors intend to rely on the availability of livery and TNC vehicles after events to transport people (*Volume 1 – TR-2*). No analysis, to the knowledge of the Sierra Club, has ever yet been done on the environmental impact of TNCs in San Francisco. No one knows how many additional vehicle miles are being traveled in the City due to the availability of TNCs. No study, to the knowledge of the Sierra Club, has been done on the impact of TNCs on congestion or air quality, including GHG emissions. And yet the project sponsors propose to rely on TNCs for an unspecified portion of transportation needs of people going to and getting from events. Project sponsors should include an analysis of the GHG and other air pollution impacts of the TNCs they intend to rely on for transporting people to and from events. (*Sierra Club, Susan E. Vaughn, letter, July 27, 2015 [O-Sierra-7]*)

The Warriors, to my knowledge, have never publicly released any demographic information about their season ticket holder base. It would be easy for them to acknowledge, for instance, how many of their season ticket holders reside or work in various postal codes in the Bay Area. This measure, would at least

offer a starting point to evaluate the efficiency and effectiveness of current public transportation options for their large base to use as many presumably would need to travel to San Francisco from other communities. The following issues could, at least, preliminarily be looked into:

- Are viable public transportation options currently available?
- How would the scheduling work for transferring between agencies?
- Would it be convenient for those individuals to take public transit?
- How many transfers would the average rider to need make?
- What would the average cost for a round-trip fare likely be?
- How long would a sampling of journeys take each way on average?
- Would the transit options run late enough for attendees staying in the area after a game to still use public transportation to get home?

(*James Zboralske, email, July 27, 2015[I-Zboralske-12]*)

Response TR-2e: Methodology, Travel Modes

As noted in a comment, it is correct that an analysis of the overall environmental impacts of transportation network company (TNC) vehicles in San Francisco, as a kind of vehicle fleet, has not been conducted separate from this SEIR. This SEIR, however, does account for that portion of the fleet that would likely be involved in transporting persons to and from basketball games at the event center. The use of TNC vehicles as a mode of travel to the event center was incorporated into the travel demand estimates, including estimates of vehicle trips. As indicated on SEIR p. 5.2-89, person trips made by ridershare, such as taxis, shuttle buses, Uber and similar other smart phone application-based transportation services, were included in the vehicle trip analysis as two vehicle trips during the analysis hour (i.e., one inbound and one outbound trip). Thus, the traffic volumes provided for use in the air quality and noise analyses reflect TNC trips, as they relate to the proposed project.

As discussed on SEIR p. 5.2-85, the distribution of basketball game attendees was derived from information provided by the Golden State Warriors. The origin/destination distribution range for a weekday basketball game (which was used in the development of the Muni Special Event Transit Service Plan and for the impact analysis) reflects an adjustment for event attendees who would travel to the event center directly from work in downtown San Francisco rather than from their place of residence. The adjustment was based on a survey of Golden State Warriors season ticket holders.

The methodology used to estimate mode of travel for the proposed project is presented on SEIR pp. 5.2-87 – 5.2-94. The issues raised in the comment were considered in developing the estimated transit mode share for events at the project site. The mode of travel for basketball game attendees was derived from similar data obtained from surveys conducted by the San Francisco Giants of baseball game attendees at AT&T Park. The transit mode for evening events at the project site was assumed to be lower than for a baseball game, given that transit access to the project site is more limited than at AT&T Park. Similarly, given that the project site is located further away from downtown and from the Market Street corridor, the component of event center attendees either walking to the event center or taking transit to downtown and then walking to the project site would also be lower than at AT&T Park.

Issues Raised by Commenters: Traffic LOS Methodology (TR-2f)

This response addresses all or part of the following comments, which are quoted below:

O-MBA10L4-3 O-MBA10L4-4 O-MBA10L4-23 O-MBA10L4-24 O-MBA10L4-27

B. The DSEIR Fails to Disclose the Severity of the Project's Impacts on Intersections and Freeway Ramps which the Project Will Cause to Deteriorate to Level of Service (LOS) F.

As explained by Dan Smith in his attached report, the DSEIR fails to disclose the severity of the Project's congestion and delay impacts on intersections and freeway ramps which the Project will cause to deteriorate to Level of Service (LOS) F.

The DSEIR discloses the Project will cause significant congestion and delay impacts at numerous intersections and freeway ramps in the "study area," where Project-induced increases in congestion and delay will cause deterioration in Level of Service (LOS) to LOS E or F. (See intersections and freeway ramps listed in footnote 1.) For the intersections and freeway ramps in the "study area" where Project-induced increases in congestion and delay will cause deterioration to LOS E, the DSEIR provides a measurement of the degree of severity of the significant impact (i.e., average delay for intersections or average density for freeway ramps).

However, for the intersections and freeway ramps in the study area where Project-induced increases in congestion and delay will cause deterioration to LOS F, the DSEIR fails to provide a full measurement of the degree of severity of the significant impact. Instead, for intersections pushed to LOS F, instead of presenting a measure of average delay, the DSEIR provides a "greater than" measurement of "80 seconds per vehicle." (See 5.2-74 and Tables cited above.) For freeway ramps pushed to LOS F, instead of providing the average density, the DSEIR provides no measurement of "existing plus project" density. Instead, the severity of the Project's impacts at intersections and freeway ramps pushed to LOS F has no upper limit, and remains undisclosed, other than to note that "demand exceeds capacity." (See 5.2-75, Table 5.2-19 and Tables cited above.)

Thus, the DSEIR fails to comply with CEQA because, beyond making the binary determination that the Project's impacts on these intersections and freeway ramps are significant, the DSEIR fails to disclose the severity of these significant impacts. (See *Santiago County Water Dist. v. County of Orange* (1981) 118 Cal.App.3d 818, 831 ["The conclusion that one of the unavoidable adverse impacts of the project will be the 'increased demand upon water available from the Santiago County Water District' is only stating the obvious. What is needed is some information about how adverse the adverse impact will be"].) Consequently, the City must revise the DSEIR to include this missing information, then recirculate the Revised DSEIR for at least 45 days for public review and comment. (*Mission Bay Alliance, Thomas Lippe, letter, July 27, 2015 [O-MBA10L4-3]*)

C. The DSEIR Fails to Identify the Significance and Severity of the Project's Impacts on Intersections Where the Project Will Use Parking Control Officers.

In its impact assessment tables for "Intersection Level of Service - Existing plus Project Conditions - With a SF Giants Evening Game – Weekday PM and Saturday Evening Peak Hour" (DSEIR, p. 5.2-172, Table 5.2-47) and "Intersection Level of Service - Existing plus Project Conditions - With a SF Giants Evening Game – Weekday Evening and Late Evening Peak Hour" p. 5.2-174, Table 5.2-48), the DSEIR measures the significance of impacts by the use of Level of Service (LOS) and delay measurements.

But for two intersections, King and Third streets, and King and Fourth streets, the DSEIR provides no LOS or delay measurements, and therefore, no information on whether the Project's congestion and delay impacts on these intersections are significant, and if so, the severity of these significant impacts.

Instead, the DSEIR indicates that the Project calls for posting Parking Control Officers (PCOs) at these intersections at the times indicated. But the adoption of a mitigation measure cannot substitute for disclosing whether the Project's impacts on these intersections are significant or their severity.[2]

Footnote:

[2] CEQA does not permit an agency to simply adopt mitigation measures in lieu of fully assessing a project's potentially significant environmental impacts because mere acknowledgment that an impact would be significant is inadequate; the EIR must include a detailed analysis of "how adverse" the impact would be. (*Lotus v. Department of Transportation* (2014) 223 Cal.App.4th 645, 655-56' *Galante Vineyards v. Monterey Peninsula Water Management Dist.* (1997) 60 Cal.App.4th 1109, 1123; *Santiago County Water Dist. v. County of Orange* (1981) 118 Cal.App.3d 818, 831.)

(*Mission Bay Alliance, Thomas Lippe, letter, July 27, 2015 [O-MBA10L4-4]*)

The DSEIR Fails to Evaluate Impacts at Intersections Under PCO Control

The DSEIR does not report LOS or delay at intersections that are under PCO control in certain situations, claiming that LOS cannot be calculated for intersections under PCO control. However, this interpretation evades the issue of why PCO control is employed in the first place. The reason is because it is assumed or known through experience that these locations would become gridlocked (deep LOS F conditions) if left to automated traffic control. In theory, the PCO or group of PCOs is/are smarter than an automated traffic signal in such circumstances. In particular, the human controllers can observe downstream blockages and give advantage to movements with unblocked downstreams and alter phase sequences to give green to movements as their downstreams become unblocked. But fundamentally, any intersection under PCO control should be regarded as being at LOS F. But this poses another issue. There is no determination of how much worse (more impacted) conditions are in the Existing + Giants game + Warriors game situation than in the Existing + Giants game alone scenario. This determination is an essential purpose of this DSEIR and it is not being evaluated. (*Mission Bay Alliance, Thomas Lippe, letter, July 27, 2015 [O-MBA10L4-23]*)

The DSEIR Fails To Evaluate Quantitatively the Severity of the Project's Traffic Impacts at Locations That Are Already In LOS F Condition

The DSEIR tables reporting intersection delay and intersection LOS for the various locations and scenarios analyzed fail to report the actual delay at intersections experiencing delay at or above the threshold of LOS F. They merely report the delay as being greater than 80 seconds of delay per vehicle. This manner of reporting prevents the public from knowing the severity of the Project's traffic impacts when it affects intersections already in impacted condition.

Most commercially available intersection LOS/delay calculation programs do calculate the actual delay of intersections that are above the LOS F threshold. It is the analyst's option to display the actual value in the program output or to suppress reporting it and display the >80 symbol. Some analysts claim that once an intersection is in LOS F, the delay value is irrelevant. But that is nonsense. If an existing condition is, say, just at the 80 second delay LOS threshold and a project causes the delay value to increase to 81 seconds, in that instance the degradation caused by the project may be almost imperceptible. But if the computation shows that the project increases delay to, say, 120 seconds per vehicle, than the degradation caused by the project is clearly quite severe and seriously impactful. Since an essential objective of an EIR is to disclose how adverse or severe a project's impacts are, the DSEIR is deficient in failing to disclose information relative to severity that it easily could have disclosed.

The same considerations apply to the freeway ramp analysis where, once a ramp has reached the average vehicle density threshold of LOS F operations[11], the DSEIR presents a special character symbol instead of the actual density compiled, thereby thwarting the ability of the public or professional reviewers to

understand how severe and adverse the impacts of the project really are. We also note that DSEIR Table 5.2-2 contains an apparent error in the entry for the I- 80 eastbound ramp at Sterling for the weekday evening (6-8 PM) period. It reports that vehicle density is 38 vehicles per vehicle lane-mile but a LOS of C. If the density really is 38, this ramp would be in the LOS E-F range; if the LOS really is C, the density would have to be less than 28. Please correct the error.

Footnote:

[11] Vehicle density, the number of vehicles per lane mile, is the logical measure of either congestion or high quality service on freeways and ramps in merge and diverge areas. In free-flowing conditions, vehicles operate with substantial space between them so the number of vehicles per lane mile is low. At highly congested conditions, stop-and-go or crawl speed operations, vehicles are closely spaced and the number of vehicles per lane mile is high. Per Highway Capacity Manual 2000 the threshold for LOS E and F operations is 35 passenger car equivalents per lane-mile per hour. With true scientific caution, Highway Capacity Manual 2000 counsels against reporting vehicle densities in the LOS E-F range because flow rates, a principle factor in calculating vehicle density, vary radically in LOS E-F situations. Nevertheless, the computed vehicle densities are what they are, and constitute the only reasonable way to measure weather the Project's effects on an already unacceptable ramp situation are significantly deleterious or not.

(*Mission Bay Alliance, Thomas Lippe, letter, July 27, 2015 [O-MBA10L4-24]*)

There Is No Evidence The DSEIR Considered the Disruptive Impacts of the At-Grade Rail Crossing of 16th Street on Intersection LOS at the Intersections of 16th and 3rd and 16th and 7th Streets.

The Caltrain rail mainline crosses Sixteenth Street in an at-grade crossing between the study intersections of Sixteenth with Third and with Seventh Streets. In the 5 to 6 PM peak hour, gate closure protection to allow train passage blocks Sixteenth Street traffic 10 times and another 10 times in the 6 to 7 PM early evening peak shoulder period. Increased rail traffic and increased train lengths will increase the blockage time. There is no evidence this blockage has been taken into account in the LOS calculations for the nearby intersections.

If it has, please explain how. If it hasn't, please adjust the calculations or explain why not. (*Mission Bay Alliance, Thomas Lippe, letter, July 27, 2015 [O-MBA10L4-27]*)

Response TR-2f: Traffic LOS Methodology

Intersections and Freeway Ramps Operating at LOS F conditions

"Level of Service," or "LOS," is used widely in the City and County of San Francisco, and elsewhere, as a means of identifying whether an intersection, road segment or freeway ramp operates, or would operate, in a free-flowing or congested condition. (See City and County of San Francisco, *Transportation Impact Analysis Guidelines for Environmental Review*, Appendix B (October 2002).)

LOS is designated with a letter – from A to F – ranging from less to more congested conditions. The Draft EIR identifies the meaning of each of these designations. (See SEIR, Table 5.2-18.) The "significance thresholds" used in the traffic analysis focus on the extent to which the project would cause, or substantially contribute to, an unacceptable LOS. (See SEIR pp. 5.2-45 – 5.2-46.)

"LOS F" means an intersection, road segment, or ramp would operate with "excessive delays." Delay is considered excessive if "average control delay" would be more than 80 seconds per vehicle. (SEIR, Table 5.2-18.)

This designation provides sufficient information to disclose whether the project's impact would be significant, as well as the relative severity of that impact. Having provided this quantitative information, the EIR has fulfilled its function as an information document. Many published decisions involve EIRs that use similar "level of service" designations to indicate whether a project's traffic impacts would be significant. (See, e.g., *Napa Citizens for Honest Government v. Napa County Board of Supervisors* (2001) 91 Cal.App.4th 342, 361-362; *Sierra Club v. City of Orange* (2008) 163 Cal.App.4th 523, 541-545; *South County Citizens for Smart Growth v. County of Nevada* (2013) 221 Cal.App.4th 316; *Neighbors for Smart Rail v. Exposition Metro Line Construction Authority* (2013) 57 Cal.4th 439; cf. *Wollmer v. City of Berkeley* (2011) 193 Cal.App.4th 1329, 1336 fn. 5 [LOS as qualitative description of intersection operations]; *Citizen Action to Serve All Students v. Thornley* (1990) 222 Cal.App.3d 748 755-756 [upholding negative declaration for school closure].)

The comment appears to state that an EIR, having determined that a project would cause or contribute to LOS F conditions, must also identify the specific number of seconds of delay expected to occur. That is, the comment appears to state that the EIR must state not merely that delay would be in excess of 80 seconds per vehicle, and therefore unacceptable; rather, the comment states the EIR must also identify how many seconds of delay, beyond the 80 seconds of average control delay signified by "LOS F," would occur.

CEQA does not require this. The case cited in the comment – *Santiago County Water District v. County of Orange* (1981) 118 Cal.App.3d 818 – did not address traffic impacts. Rather, that case involved an EIR prepared for a proposed gravel mine. The EIR estimated the amount of water that would be needed in order to operate the mine. The EIR did not, however, provide any information regarding whether the local water district had sufficient supplies to serve the mine, or the impact of supplying water to the mine on existing customers. (118 Cal.App.3d at pp. 830-831.)

The City's approach is consistent with its adopted *Transportation Impact Analysis Guidelines for Environmental Review* (October 2002). The analysis is also consistent with EIRs prepared by the City for other development projects, including the EIRs prepared for the Treasure Island/Yerba Buena Island Redevelopment Plan and Parkmerced projects.

Traffic LOS techniques have been developed primarily to enable traffic engineers to design and operate intersections to improve traffic flows. The original LOS analysis techniques were based on volume to capacity (v/c) ratios that estimated how close to fully using the capacity of an intersection existing and projected traffic volumes were, with additional traffic lanes typically prescribed to increase capacity when there was a mismatch between traffic volumes and an intersection's carrying capacity. Over the years since 1985, traffic LOS techniques have been refined to emphasize delay as a measure of effectiveness that more accurately reflects traffic conditions. LOS based on delay incorporates signal timing and progression, intersection design geometrics, the relative influence of transit, pedestrians, bicycles, and trucks, and other factors into the calculations of delay. These techniques also show LOS results not only for the overall intersection but also for particular directional through and turning movements. These tools can be used to pinpoint primary sources of conflict that create delay, thereby facilitating

identification of effective improvements that include changes to signal timing and intersection redesign as well as construction of additional lanes to expand capacity.

LOS has also commonly been used in evaluations of environmental impacts as a metric to measure traffic conditions. When unsatisfactory LOS conditions are indicated (e.g., generally LOS E or LOS F in San Francisco and many other jurisdictions), LOS analysis tools are applied to identify unsatisfactory traffic conditions and to measure the effects of implementing appropriate mitigation measures to the extent that this is feasible. When improvements or mitigation measures are feasible with respect to an intersection operating with average delays greater than 80 seconds per vehicle, the mitigated results are shown in seconds of delay within the LOS A to LOS E range for which traffic LOS has primarily been validated. These techniques have been fully applied in the traffic analysis in this SEIR such that all conclusions about the infeasibility of mitigation for adverse or significant traffic impacts reflect the author's sense of how traffic operations can best be optimized within the feasibility constraints of local conditions.

LOS F reflects unstable traffic conditions whose severity is not reliably replicated for future conditions by the traffic LOS analysis tools used for traffic impact studies. Traffic LOS techniques were developed primarily to enable traffic engineers to apply a variety of tools to improve traffic flows to achieve satisfactory conditions and the mathematical formulae used are grounded in extensive empirical data that reliably reflects intersections operating at or below their maximum capacity (LOS A to LOS E conditions). The equations used to determine vehicle delay have been validated for conditions when an intersection is below, or slightly above capacity, and therefore do not properly represent oversaturated (i.e., beyond LOS F) conditions. For example, Exhibit 16-14 on page 16-24 of the *Highway Capacity Manual 2000 (HCM 2000)*[6] which relates delay calculations with vehicle capacity shows that once a delay of 80 seconds per vehicle is reached, maximum capacity (v/c=1) is also attained. For calculated delay values above 80 seconds, the exhibit shows corresponding v/c values above 1.0 (the traffic volume is over the intersection capacity), which are not possible in the field. Thus, while LOS calculation sheets can produce outputs that show seconds of delay in excess of 80 seconds and these are available in the transportation analysis background files for this SEIR,[7] these calculations should not be used to indicate the degree of "worseness" for traffic LOS F conditions due to these methodological limitations. Moreover, CEQA does not require specification of degrees of "worseness" so long as significant traffic impacts are identified according to established significance standards. Consistent with the methodological strengths of LOS analysis techniques, these techniques have been appropriately used in this SEIR to apply all feasible mitigation measures and to identify all significant traffic impacts when mitigation was not feasible.

6 Transportation Research Board, National Research Council, Highway Capacity Manual, Washington D.C., 2000.

7 In all cases, the actual number of seconds of delay are reported for all intersections and scenarios in SEIR Appendix TR. It is in the summary tables presented in the main body of the SEIR, that the average delay value at those intersections operating at LOS with an average vehicle delay of more than 80 seconds per vehicle are reported as "> 80".

It bears mentioning in this context that transportation-related impacts differ from other categories of environmental impacts in certain respects. For some environmental resources, a relatively precise sense of the degree to which a proposed project would worsen already unacceptable conditions could be relevant to a complete CEQA analysis. Thus, for example, where an air basin or a body of water already suffers from ambient conditions that are unhealthy for human beings or plants or animals, the release of additional pollutants could exacerbate existing health or ecological problems; and having a relatively precise sense of the *degree* of the impacts involved might contribute meaningfully to an informed discussion of whether such effects should be endured. The need for such relatively detailed information in such circumstances is consistent with the CEQA definition of "environment," which refers to "the *physical conditions* which exist within the area which would be affected by a proposed project including land, air, water, minerals, flora, fauna, ambient noise, and objects of historical or aesthetic significance." (CEQA Guidelines, § 15360, italics added.) In contrast, describing the precise degree of congestion already designated as LOS F would add little to a discussion of impacts on "land, air, water, minerals, flora, fauna, ambient noise, and objects of historical or aesthetic significance," in that what is being measured is not a project's consequences to resources of this kind but rather, as noted above, the movement of vehicles through an urban transportation system designed to function most efficiently at certain levels of use and congestion. In general, the effects of worsened congestion translate primarily into increased inconvenience to people, but not into adverse effects on public health or ecosystems. CEQA demands less of lead agencies when they are attempting to measure human inconvenience than when they are trying to understand the severity of harms to public health, wildlife, and more traditional ecological resources. (See *San Franciscans Upholding the Downtown Plan v. City & County of San Francisco* (2002) 102 Cal.App.4th 656, 697 [city acted within its discretion in determining that, in urban setting, parking is not an environmental issue under CEQA].)

Recent legislative and regulatory developments indicate that, in the near future, the City's CEQA documents may no longer be required to consider LOS for many projects, at least in areas effectively served by transit. Public Resources Code section 21099, enacted in 2013, requires the Governor's Office of Planning and Research (OPR) to develop and transmit to the Secretary of the Natural Resources Agency proposed CEQA Guidelines revisions establishing new criteria for determining the significance of transportation impacts of projects within "transit priority areas" which include areas within one-half mile of a major transit stop that is existing or planned, if the planned stop is scheduled to be completed within the planning horizon included in a Transportation Improvement Program. If and when the Secretary of Resources adopts such Guidelines revisions, "automobile delay, as described solely by level of service or similar measures of vehicular capacity or traffic congestion shall *not* be considered a significant impact on the environment pursuant to [CEQA], except in locations specifically identified in the guidelines, if any." (*Id*., subd. (b)(2), italics added.) OPR and the Secretary of Resources have the option to abolish the use of LOS as a CEQA impact measurement throughout the State. (*Id*., subd. (c)(1).)

As of the fall of 2015, the Secretary of Natural Resources has not yet formally proposed for adoption any proposed revisions addressing these issues. In December 2013, however, as part of its efforts required by Public Resources Code section 21099, OPR published a document entitled,

"Preliminary Evaluation of Alternative Methods of Transportation Analysis."[8] This preliminary evaluation discusses why LOS is not the best measure of a project's environmental impacts and describes the extent to which too great a focus on LOS can undermine other environmental goals, such as the need to facilitate urban infill development as part of larger efforts to combat climate change. For example, the preliminary evaluation explains:

> **LOS is biased against "last in" development.** Typical traffic analyses under CEQA compare future traffic volumes against LOS thresholds. A project that pushes LOS across the threshold triggers a significant impact. In already developed areas, existing traffic has already lowered LOS closer to the threshold. Because the LOS rating used to determine significance of the project's impact is determined by total traffic (existing traffic plus traffic added by the project), infill projects disproportionally trigger LOS thresholds compared to projects in less developed areas.
>
> ***
>
> **As a measurement of delay, LOS measures motorist convenience, but not a physical impact to the environment**. Other portions of an environmental analysis will account for vehicular emissions, noise and safety impacts.

These observations support the conclusion that the project's traffic analysis includes a legally sufficient level of quantitative precision in the expression of significant unavoidable effects on transportation levels of service. In short, as explained above, the transportation analysis satisfies existing CEQA requirements and adequately analyzes LOS impacts at study intersections.

See Section 13.3, Response AQ-5 for information regarding the proposed project's air quality analysis and impacts.

Analysis of PCO-controlled intersections during SF Giants Games

Two comments raise issues regarding impact analysis for conditions with a SF Giants evening game at AT&T Park. One comment states that the SEIR does not provide LOS or delay measurements for two intersections, King/Third streets and King/Fourth streets, for the existing plus project conditions with a SF Giants evening game at AT&T Park scenario, that the project calls for Parking Control Officers (PCOs) at these intersections at specified times, and that the adoption of mitigation measures cannot substitute for disclosing whether the Project's impacts at these intersections are significant or their severity. Another comment states that because the SEIR does not report LOS or delay at intersections that are currently under PCO control during SF Giants evening games, there is no determination of the extent that conditions would worsen with the proposed project.

The comment that states that the project calls for PCOs at the intersections of King/Third and King/Fourth as mitigation, instead of providing LOS, is incorrect. The intersections of King/Third and King/Fourth are already controlled by PCOs during peak hours on SF Giants game days,

[8] *Preliminary Evaluation of Alternative Methods of Transportation Analysis*, December 30, 2013. Available online at: / http://www.opr.ca.gov/docs/PreliminaryEvaluationTransportationMetrics.pdf. Accessed October 4, 2015.

including during all of the timeframes included in the SEIR transportation analysis. Assignment of PCOs or additional PCOs above those already being deployed during SF Giants games is not being proposed at the intersection of King/Third because no project impacts were identified at this location. **Mitigation Measure M-TR-2a: Additional PCOs during events** calls for additional PCOs to be deployed at the intersection of King/Fourth, but only on event days with no overlapping events at AT&T Park (and thus, on days when there would not already by PCOs stationed at that intersection). In any case, the intersection LOS and delay values for the intersections of King/Third and King/Fourth are provided on SEIR Table 5.2-34 through Table 5.2-36 for the various analysis hours.

In San Francisco, PCOs, also known as Traffic Control Officers, are deployed to manage and direct vehicular, transit, bicycle, and pedestrian flows, in an effort to better manage peak traffic and pedestrian flows, increase safety and reduce congestion. As explained in the SEIR p. 5.2-38 in the section describing existing conditions with a SF Giants evening game, intersection LOS cannot be calculated at the intersections where PCOs are currently deployed and direct traffic flow prior to or following SF Giants games (i.e., at the intersections of King/Third, King/Fourth, Third/Channel, Fourth/Channel, Illinois/Mariposa, and Third/Mariposa). (SEIR, p. 5.2-38.) The SEIR explains that the Highway Capacity Manual (HCM) methodology used to calculate intersection LOS at signalized intersections is based on the peak 15-minute period of the one hour with the greatest traffic volume, and it assumes that during the analysis period, the traffic signal operation and traffic movements and flow would generally operate under the same regular pattern. This is not the case at intersections managed by PCOs before or after events at AT&T Park. At those locations, the normal operation of the traffic signal is interrupted due to travel lane or roadway closures, PCOs providing longer crossing times for pedestrians, PCOs halting traffic flow temporarily to clear out the intersection or to allow transit to move, among other event-related transportation management strategies. These real-time responses to unfolding events allow for improved levels of traffic control compared with what mechanized traffic-light systems can deliver. Mechanized systems operate with less flexibility, and are unable to respond immediately, in real time, to observed traffic conditions. As a result, the analytical tools and measurements appropriate for assessing the effectiveness of mechanized systems do not apply to PCO-controlled intersections. For all of these reasons, the intersection LOS at PCO-controlled intersections does not provide meaningful information and is not presented for those locations where PCOs already actively manage intersection operations. (SEIR p. 5.2-38, fn. 19.)

The SEIR estimates the number of days that a project-related event might overlap with a SF Giants game at AT&T Park. Specifically, there would only be about 32 events per year that would overlap with a SF Giants game and in rare circumstances there could be as many as 40 events in one year. (SEIR p. 5.2-80, 5.2-170.)

The use of PCOs at intersections alleviates congestion and improves safety compared to exclusively signalized or sign-controlled intersections. Using PCOs allows the officers to respond to real-time traffic conditions and minimize queues, prevent blockages or avoid unsafe conditions. Thus, PCOs are an effective way to minimize traffic impacts that may occur otherwise.

Because the Draft SEIR does not adopt mitigation measures in lieu of assessing the project's environmental impacts as alleged in the comment, the cases cited in the comment are inapposite. In *Lotus v. Department of Transportation* (2014) 223 Cal.App.4th 645, the court determined that the discussion of certain impacts in an EIR was inadequate because the EIR did not identify any standards of significance or apply such standards to its analysis of the project. The problem was compounded because the EIR relied on certain "Avoidance Minimization and/or Mitigation Measures" in the project description to conclude that the project would have no significant environmental impacts. The court noted that these measures, which included restorative re-planting, invasive plant removal, and use of specialized precision construction equipment, were intended to mitigate or offset impacts of the road construction on the adjacent redwood trees, and were not part of the project itself. As explained above, that did not occur here. PCOs are already deployed at the King/Third and King/Fourth intersections during SF Giants game-days and are not proposed as mitigation for the project for conditions with overlapping baseball games at AT&T Park.

The comment also cites *Galante Vineyards v. Monterey Peninsula Water Management Dist*. (1997) 60 Cal.App.4th 1109. In that case, the court found an EIR inadequate where it failed to discuss certain traffic and construction-related impacts, including the impact of fugitive dust on viticultural and horticultural enterprises. Instead, the EIR merely acknowledged that impacts from fugitive dust will be significant and unavoidable generally, without addressing the impact of fugitive dust on viticultural and horticultural enterprises. The court held that a more detailed account of the impacts was required to comply with CEQA Guidelines section 15151, which states that "[a]n EIR should be prepared with a sufficient degree of analysis to provide decisionmakers with information which enables them to make a decision which intelligently takes account of environmental consequences."

Similarly, in *Santiago County Water District v. County of Orange* (1981) 118 Cal.App.3d 818, also cited in the comment, the court held that the EIR failed to provide sufficient information concerning the delivery of water to a proposed sand and gravel mine. In its discussion of water demand, the EIR simply stated that there would be an "increase" in demand for water available from the Santiago County Water District and that this was a significant and unavoidable impact. But there was no information about what the specific impact would be; the EIR was "silent" on this issue. (*Id*. at p. 831.)

In contrast, the SEIR at issue describes the potential impacts at the study intersections in detail without the implementation of any of the proposed mitigation measures. The City followed the methodology in the HCM and in the City's Transportation Impact Analysis Guidelines. (See *Saltonstall v. City of Sacramento* (2015) 234 Cal.App.4th 549, 579, 582-583 [upholding traffic analysis that used methodology described in the Highway Capacity Manual].) As explained above, and in the SEIR, it was not possible to provide meaningful information regarding LOS at intersections where PCOs are currently deployed during peak hours on SF Giants game days, including the intersections of King/Third and King/Fourth. "CEQA 'does not demand what is not realistically possible[.]'" (*Id.* at p. 543, quoting *Foundation for San Francisco's Architectural Heritage v. City and County of San Francisco* (1980) 106 Cal.App.3d 893, 910.) Further, as recognized by the Supreme

Court in *Laurel Heights Improvement Association v. Regents of the University of California* (1988) 47 Cal.3d 376, 415, "[a] project opponent or reviewing court can always imagine some additional study or analysis that might provide helpful information. It is not for them to design the EIR. That further study ... might be helpful does not make it necessary."

At-grade Caltrain Crossing

A comment requests information on how the Caltrain crossings of 16th Street at Third Street and at Seventh were incorporated into the LOS analysis, and how the analysis accounts for increased delay associated with more frequent and longer trains, presumably due to Caltrain's Peninsula Corridor Electrification Project.

It is noted that Caltrain does not cross 16th Street at Third Street, and therefore is not reflected in the LOS analysis for the intersection of Third/16th. The SEIR analysis did not explicitly include the delay associated with the at-grade crossing of Caltrain at the study intersections of Seventh/Mississippi/16th and Seventh/Mission Bay Drive, but the delay and LOS presented in the summary tables does reflect traffic conditions, including automatic gate operations. As noted on SEIR page 5.2-6, the analysis of existing conditions assumes implementation of the 22 Fillmore Transit Priority Project, which includes converting one of the two mixed-flow travel lane in each direction on 16th Street to a side-running transit-only lane. Prior to incorporating the 22 Fillmore Transit Priority Project into the intersection LOS analysis, the LOS conditions were verified based on field surveys of intersection operations conducted as part of this project and the UCSF Long Range Development Plan (LRDP) analysis. The results were also compared to the LOS analysis for existing conditions presented in the EIR prepared for the Caltrain electrification project[9]. The LOS results obtained for these two study intersections for the weekday p.m. peak hour were found to be generally consistent with field observations and the analyses presented at the two aforementioned reports. At the intersection of Seventh/Mississippi/16th, the SEIR and both analysis efforts identified LOS D for weekday p.m. peak hour conditions for conditions without a SF Giants evening game. With the implementation of the 22 Fillmore Transit Priority, the weekday p.m. peak hour LOS for existing conditions without a SF Giants evening game at the study intersection of Seventh/Mississippi/16th would be LOS E conditions (see Table 5.2-1 on SEIR page 5.2-10).

Under existing plus project conditions, the addition of project-generated vehicles would worsen the existing LOS conditions at these two intersections where Caltrain operates. As indicated in Impact TR-2 for conditions without a SF Giants evening game at AT&T Park, the proposed project would result in significant traffic impacts at the intersections of Seventh/Mississippi/16th (weekday p.m. and weekday evening peak hours) and Seventh/Mission Bay Drive (weekday evening and Saturday evening peak hours). With an overlapping SF Giants evening game presented in Impact TR-11, the proposed project would also result in significant traffic impacts at Seventh/Mississippi/16th (weekday p.m., weekday evening, and Saturday evening peak hours)

[9] Peninsula Corridor Electrification Project, Final EIR, January 2015. SCH # 3013012079. Available online at: http://www.caltrain.com/projectsplans/CaltrainModernization/Modernization/PeninsulaCorridorElectrificationProject/PCEP_FEIR_2014.html. Accessed September 15, 2015.

and Seventh/Mission Bay Drive (weekday p.m., weekday evening, weekday late evening, and Saturday evening peak hours).

Under 2040 cumulative conditions (Impact C-TR-2), the proposed project would result in project-specific impacts or contribute considerably to the LOS E conditions during the weekday p.m. peak hour at the two intersections. Since the LOS intersection analysis methodology becomes unreliable for replicating actual conditions once average vehicles delays exceed 80 seconds per vehicle, it is also not possible to quantify additional delays associated with Caltrain operations at these two at-grade crossings. See Response TR-2f: Traffic LOS Methodology for additional discussion of the LOS methodology.

As a reference, the Peninsula Corridor Electrification Project Final EIR included an analysis of the impacts associated with Caltrain electrification, including the additional delay associated with the extra trains that would be implemented as part of that project. At the intersection of Seventh/Mississippi/16th, the average aggregate gate down time during the weekday p.m. peak hour, which is currently about 8 minutes 6 seconds, is projected to increase to 11 minutes 38 seconds. These represent an additional average delay of approximately five seconds per vehicle per traffic signal cycle (212 additional seconds of delay divided by 45 cycles per hour). Project vehicles would also be subject to the increased delay.

Issues Raised by Commenters: Transit Capacity Utilization (TR-2g)

This response addresses all or part of the following comments, which are quoted below:

O-MBA10L4-13A O-MBA10L4-18

F. The DSEIR's Methodology for Analyzing Project Impacts on the Transit System Is Legally Flawed.

The DSEIR summarizes its methodology for analyzing Project Impacts on the transit system, as follows:

> The impact of additional transit ridership generated by the proposed project on local and regional transit providers was assessed by comparing the projected ridership to the available transit capacity at the maximum load point. Transit "capacity utilization" refers to transit riders as a percentage of the capacity of the transit line, or group of lines combined and analyzed as screenlines across which transit lines travel. The transit analyses were conducted for the peak direction of travel for each of the analysis time periods.

(DSEIR, p. 5.2-75.)

1. The DSEIR's use of transit screenline and route capacities is misleading and unsupported.

For its Project specific (or incremental) transit impact analysis, the DSEIR uses the following thresholds of significance:

> The proposed project was determined to have a significant transit impact if project-generated transit trips would cause downtown or regional screenlines, and, where applicable, directly affected routes, operating at less than its capacity utilization standard under existing conditions, to operate at more than capacity utilization standard. For Muni, the capacity utilization standard is 85 percent for conditions without an event at the project site, and 100 percent for conditions with an

> event at the project site. For regional operators, the capacity utilization standard is 100 percent for conditions without and with an event at the project site.

(DSEIR, p. 5.2-76, 77.)

For its cumulative transit impact analysis, the DSEIR uses the following thresholds of significance:

> Under 2040 cumulative conditions, the proposed project was determined to have a significant cumulative impact if its implementation would cause the capacity utilization at the Muni and regional screenlines and/or corridors within the screenlines to exceed the capacity utilization standard noted above for conditions without and with an event at the project site, or if its implementation would contribute considerably to a screenline or corridor projected to operate at greater than the capacity utilization standard under 2040 cumulative plus project conditions (i.e., a contribution of 5 percent or more to the transit ridership on the screenline or route). In addition, if it was determined that the proposed project would have a significant project-specific transit impact under existing plus project conditions, then the impact would also be considered a significant cumulative impact under 2040 cumulative conditions.

(DSEIR, p. 5.2-76, 77.)

For both Project specific (incremental) and cumulative impacts, the DSEIR uses "capacity utilization standards" as baselines against which to measure the Project's impacts. Capacity utilization standards are specific percentages of the theoretical maximum capacity of a transit screenline or transit line.

For Project specific (or incremental) thresholds of significance for Muni, the DSEIR uses two different capacity utilization standards against which to measure the Project's impacts. For conditions without an event at the Project site, the capacity utilization standard is 85 percent of maximum theoretical capacity of the transit screenline or line. For conditions with an event at the Project site, the capacity utilization standard is 100 percent of maximum theoretical capacity.

If the question to be answered by the transit impact analysis is whether the Project will inflict significant suffering on people riding Muni, why does the DSEIR use two different baselines for its impact assessment. If exceeding 85% inflicts suffering without an event, then exceeding 85% will inflict suffering with an event.

The DSEIR does not examine this use of inconsistent baselines. However, the June 21, 2013, Planning Department Memorandum "Transit Data for Transportation Impact Studies" (at Appendix-TR, p. TR-624) states:

> The SFMTA Board has adopted an "85 percent" capacity utilization standard for transit vehicle loads. In other words, transit lines should operate at or below 85 percent capacity utilization. The SFMTA Board has determined that this threshold more accurately reflects actual operations and the likelihood of "pass-ups" (i.e., vehicles not stopping to pick up more passengers). The Planning Department, in preparing and reviewing transportation impact studies, has similarly utilized the 85 percent capacity utilization as a threshold of significance for determining peak period transit demand impacts to the SFMTA lines.

(DSEIR, Appendix-TR, p. TR-624.) Thus, the 85 percent capacity utilization threshold apparently has nothing to do with the suffering of Muni's passengers; it simply reflects the reality of Muni's operations. And even if 85% of capacity is the break point at which Muni drivers tend to refuse to pick up more passengers due to overcrowding, then using 100% of capacity as a threshold of significance is entirely unsupportable. (*Mission Bay Alliance, Thomas Lippe, letter, July 27, 2015 [O-MBA10L4-13a]*)

The City's Process for Evaluating a Project's Impacts on Public Transit Evades Disclosure of Significant Impacts

The City's process for evaluating transit impacts for projects in the "greater downtown area" (the C-3, SOMA and Mission Bay districts) is to consider peak hour ridership on the routes that cross designated screen lines across portions of the City or, for regional routes, on its perimeters versus the aggregate

capacity of the peak hour services crossing those screenlines. There are several problems with this procedure that result in failure to disclose impacts.

- Considering aggregate capacity across screen lines versus aggregate patronage does not reasonably disclose impacts. For the routes inside San Francisco served by the San Francisco Municipal Railway (MUNI), a standard has been established that there is significant impact when ridership crossing the screen line exceeds 85 percent of capacity on that screen line. But this standard of significance involves an underlying assumption that individual travelers could use any of the routes crossing a particular screen line to accomplish their trip. But in actual fact, an individual traveler's particular trip is most often only well served by one route. When some routes crossing a screen line are heavily patronized while others are less patronized, the excess capacity on the less popular routes does not cancel out the overcrowding on the most popular routes. It is noted that the City Planning Department can request that transit impacts be analyzed on an individual line basis. When this is done, if the individual line ridership exceeds 85 percent of capacity and the project's contribution exceeds 5 percent of the total ridership at its maximum load point (MLP), then the project would be found to have significant transit impact.
- MUNI's capacity standards per vehicle involve percentages of standees above seating capacity ranging from 30% to 80% of seating capacity (depending on vehicle type); therefore, the above addition of 5 percent ridership to the impact threshold in analysis of individual lines represents a substantial crush loading.
- The capacity as considered in the analysis is the theoretical capacity of the services as scheduled. However, rarely, if ever, does MUNI deliver all of its scheduled service. San Francisco Municipal Transportation Authority statistics show that MUNI typically delivers an average of between 95 and 98 percent of scheduled services although on some days the percentage of missed runs can be much worse. MUNI's goal is to only deliver 98.5 percent of scheduled service. Principal causes of missed runs include driver unavailability, insufficient vehicle availability and in-service breakdowns. On the light rail lines, the percentage of weekdays when enough light rail vehicles were operationally available to deliver scheduled service averaged only 61.7 percent in fiscal year 2014 and was well under 50 percent in the two preceding years.
- Difficulty maintaining schedule reliability (on-time performance) exacerbates capacity problems. Muni's on-time performance is normally less than 20 percent. As a result, there is difficulty maintaining planned headways between vehicles on a given route. Bunching occurs. When that happens, the lead vehicle in a bunch becomes overcrowded while the one or more closely following vehicles in the bunch are underutilized. Muni experiences bunching on about 4 percent of its trips overall; in excess of 5 percent on its "Rapid Network".

If the threshold of impact were measured at 85 percent of the capacity of actual effective service delivered instead of theoretical schedule-based service capacity, more of the individual lines and screen lines would be found to be closely approaching or above the 85 percent of capacity criterion. And as a consequences of these circumstances in the City's procedures and policy criteria, it is rare for a project to be found to have significant impact on MUNI transit services despite the fact that the public perception is that MUNI is overburdened and dysfunctional.

We also note that for scenarios involving arena events at this Project, the DSEIR alters the City's normal criterion for evaluating transit impacts, changing the threshold of significant impact from 85 percent of capacity to 100 percent of capacity. Its basis for making this alteration, which tends to shield the Project from disclosure of significant transit impacts, is that event-goers accept a higher level of crowding than normal riders. However, "accept" is too generous a word. Nobody wants to ride in 'crush load' conditions. Event attendees grudgingly tolerate 'crush loads' as the least undesirable of their other options of a)walking long distances, b)paying much more for taxis or shared ride services, c) paying even much more to drive and park or d) (only in the post-event exit) waiting until the crowding has dissipated. Moreover, this shift in acceptability criterion is impactful of itself in that it imposes the values and tolerances of event-attendees upon normal riders who use the involved lines at that particular time of day. Furthermore, the DSEIR is unclear whether the change in impact criterion is operative only for lines directly serving the Project site, or system-wide, which would have a far greater impact on normal riders.

The City's action to alter its normal thresholds of impact in the case of one particular project to lessens the chance of findings of significant impact and is not consistent with the good faith effort to disclose impact that CEQA demands. The City should faithfully disclose impacts as measured by its normal criteria, and, if it still wants to approve the Project, make findings of overriding considerations. (*Mission Bay Alliance, Thomas Lippe, letter, July 27, 2015 [O-MBA10L4-18]*)

Response TR-2g: Transit Capacity Utilization Methodology

The transit capacity utilization analysis methodology, and specifically the transit screenline analysis, used for the impact analysis of the proposed project, is the standard methodology documented in the *SF Guidelines* and has been used for Transportation Impact Studies in San Francisco since the early 1990s.[10] The Planning Department requires line analysis for projects where downtown screenlines analysis is not appropriate (the screenline analysis is for trips into or out of the downtown area), or where transit serving the project site is limited.

The transit analysis for the proposed project was expanded from the standard screenline analyses to also include individual line analysis of the T Third light rail line and the 22 Fillmore bus route that each serve the project site. The line-specific analysis was conducted for the standard weekday p.m. peak hour as well as for the weekday evening, weekday late evening, and Saturday evening peak hours. For the weekday p.m. peak hour analysis, all project-generated outbound transit trips were first assigned to the T Third or 22 Fillmore route, and then distributed to the various corridors within the four screenlines.

Hourly Muni ridership for bus routes is estimated by multiplying the average maximum load at the maximum load point based on counts obtained from Automated Passenger Counter (APC) devices installed on buses, by the number of scheduled trips during the analysis hour. The average maximum load is the average ridership of the transit vehicle trips that occur during the peak 30 minutes with the greatest ridership during the peak period, and would reflect higher ridership when transit headways are not met. Therefore, the ridership used in the analysis accounts for actual operations, including the extent of crowding when transit headways are not met. The estimation of peak hour ridership using the greatest ridership for the peak 30 minutes of the peak period reflects the impact of the Muni issues related to on-time performance and scheduled service that were raised in a comment. Hourly ridership for light rail lines is estimated based on manually collected ridership data, adjusted for observed service gaps, and therefore also reflects the possibility of missed service. For Muni bus and light rail service, the peak hour service capacity is estimated by multiplying the passenger capacity of the transit vehicle by the scheduled number of trips during the analysis hour.

[10] The concept of screenlines is used to describe the magnitude of travel to or from the greater downtown area, and to compare estimated transit ridership to available capacities. Screenlines are hypothetical lines that would be crossed by persons traveling between downtown and its vicinity (i.e. the Northeast, Northwest, Southeast, and Southwest screenlines) and other parts of San Francisco and the region (i.e., the East Bay, North Bay, and South Bay screenlines).

With respect to the capacity of the transit vehicles, the capacity used in the analysis is the planning capacity that represents seated passengers as well as a substantial number of standees, and differs based on the transit vehicle size and configuration. Appendix E of the *SF Guidelines* identifies the planning capacity values for the various Muni transit vehicles. The planning capacity is not the maximum theoretical capacity or a crush load capacity referred to in a number of comments. The SFMTA identifies the crush load capacity as 125 percent of the planning capacity used in the analysis.

Muni's capacity utilization standard of 85 percent is related to provision of a desirable level of transit service related to comfort, rather than maximum capacity. It is not, as stated in some comments, the break point at which Muni drivers tend to refuse to pick up more passengers, or the point at which more riders inflict suffering.

The use of the 100 percent capacity utilization for the event scenarios was not to lessen the chance of finding significant impacts, as stated in a comment, but instead to most efficiently accommodate peak ridership loads prior to and following an event. The use of different capacity utilization thresholds for transit analysis related to pre-event and post-event conditions is not uncommon and reflects riders' higher tolerance for near-capacity loads following big events. In San Francisco, the 100 percent capacity utilization for Muni for special events was previously used for the event-related transit analysis in The 34th America's Cup and James R. Herman Cruise Terminal and Northeast Wharf Plaza EIR[11]. In New York City, the *CEQR Technical Manual*[12] states that for some large-scale special events, such as during entrance and exit periods for a special event, it is expected that ridership may temporary exceed off-peak loading guidelines, but not the maximum load guidelines. In other words, in New York City, the maximum planning capacity of the transit vehicle (i.e., 100 percent of planning capacity) is used for peak hour transit analyses, as compared to 85 percent of the planning capacity used in San Francisco.

SEIR p. 5.2-76 states that a capacity utilization standard of 100 percent was used only for analysis of events at the project site. For the weekday p.m. peak hour, the T Third and 22 Fillmore line analysis for the No Event, Convention Event, and Basketball Game scenarios is presented on Table 5.2-40 (on SEIR p. 5.2-136), and the downtown screenline analysis is presented on Table 5.2-43 (on SEIR p. 5.2-139). As indicated in these tables, during the weekday p.m. peak hour, the 85 percent capacity utilization standard is not exceeded on either the T Third light rail line, the 22 Fillmore bus route, or on any screenlines or corridors. For the weekday evening, weekday late evening, and Saturday evening analysis hours the analysis was conducted for the T Third light rail, the 22 Fillmore route, and the Muni Special Event Shuttles (i.e., the 16th Street BART shuttle, the Van Ness Avenue shuttle, and the Transbay Terminal/Ferry Building/Caltrain shuttle). The existing plus project analysis is presented on Table 5.2-41 (on SEIR p. 5.2-137) for the weekday evening and weekday late evening conditions, and Table 5.2-42 (on SEIR p. 5.2-138) for the Saturday evening conditions. For

[11] The 34th America's Cup and James R. Herman Cruise Terminal and Northeast Wharf Plaza EIR, A copy of this document is available for review at the San Francisco Planning Department, 1650 Mission Street, Suite 400, as part of Case File No. 2010.0493E.

[12] New York City Mayor's Office of Environmental Coordination, CEQR Technical Manual, March 2014 Edition, Chapter 16, Transportation.

the weekday evening peak hour for inbound trips to the event center, with the additional service provided as part of the Muni Special Event Transit Service Plan, both the T Third and Muni Special Event Shuttles would operate at 93 to 94 percent of planning level capacity, and during the weekday late evening the Muni Special Event Transit Shuttles would operate at 96 percent of capacity. During the weekday evening and weekday late evening the 22 Fillmore would not exceed the 85 percent capacity utilization standard. The operating conditions of 93 to 96 percent indicate that the transit vehicle is almost fully occupied, approaching the capacity of the vehicle. However, as described above, it does not indicate "crush load" conditions, which are conditions when ridership exceeds 125 percent of the planning capacity of the vehicle.

The use of the 85 percent utilization standard for line analysis and for the screenline analysis consistently applies the SFMTA standard, and a different criteria is not required for the transit impact analysis.

Issues Raised by Commenters: Cumulative Analysis Year and Context (TR-2h)

This response addresses all or part of the following comments, which are quoted below:

O-MBA5-6	O-MBA10L4-9	O-MBA10L4-10	O-MBA10L4-11
O-MBA10L4-12	O-MBA10L4-26	O-MBA10L4-36	O-MM-9
I-deCastro1-5	I-Hong-2	I-Stryker-7	

The DSEIR also ducks revealing more bad news about the Arena's cumulative impact on traffic in the years following its construction. Instead of projecting cumulative traffic effects 5 to 10 years out, the DSEIR offers up a virtually meaningless projection for the year 2040, fully 25 years in the future. (*Mission Bay Alliance, Bruce Spalding, letter, July 27, 2015 [O-MBA5-6]*)

---

b. The year 2040 baseline for assessing the significance of the Project's cumulative impacts violates CEQA.

The DSEIR assesses the Project's incremental traffic and transit impacts and its cumulative traffic and transit impacts pegged to the year 2040, which is 25 years in the future.[11] While the Alliance supports such long range forecasting in general, as used in this DSEIR the year 2040 baseline for assessing the significance of the Project's cumulative impacts is misleading, for two reasons.

First, this approach overlooks the Project's cumulative traffic and transit impacts pegged to its first 1 to 10 years of operations. This time period is of immediate interest to the citizens of San Francisco because the traffic mess predicted by the DSEIR will be upon them then. And who among them know whether they will even be in the City by the year 2040. Thus, while including a year 2040 baseline is not in itself objectionable, the omission of a baseline 5 to 10 years in the future renders the DSEIR informationally defective.

Footnote:

[11] "Future 2040 cumulative traffic volumes were estimated based on cumulative development and growth identified by the San Francisco County Transportation Authority SF-CHAMP travel demand model, using model output that represents Existing conditions and model output for 2040 cumulative conditions." (DSEIR, p. 5.2-110.)

(*Mission Bay Alliance, Thomas Lippe, letter, July 27, 2015 [O-MBA10L4-9]*)

Second, by using a baseline projected to the year 2040, the DSEIR inflates the denominator in the 5% "ratio" it uses to determine the significance of Project cumulative impacts at LOS E and F intersections, thereby masking actual significant effects. (See Exhibit 2 (D. Smith), p. 25.) (*Mission Bay Alliance, Thomas Lippe, letter, July 27, 2015 [O-MBA10L4-10]*)

---

c. The DSEIR's use of a "projection" based approach to the Project's cumulative impacts is misleading.

The DSEIR states that:

> Future 2040 cumulative traffic volumes were estimated based on cumulative development and growth identified by the San Francisco County Transportation Authority SF-CHAMP travel demand model, using model output that represents Existing conditions and model output for 2040 cumulative conditions. .... The 2040 cumulative traffic volumes take into account cumulative development projects in the project vicinity, such as the build-out of the Mission Bay Area, completion of the UCSF Research Campus and the UCSF Medical Center, the Mission Rock Project at Seawall Lot 337, Pier 70, etc., as well as the additional vehicle trips generated by the proposed project.

(DSEIR, p. 5.2-110.)[12]

Footnote:

[12] In the section titled "Approach to Cumulative Impact Analysis" (DSEIR 5.1-6, § 5.1.5), the DSEIR asserts that the CEQA Guidelines provide "two approaches to a cumulative impact analysis ... (a) the analysis can be based on a list of past, present, and probable future projects producing related or cumulative impacts; or (b) a summary of projections contained in a general plan or related planning document can be used to determine cumulative impacts. The projections model includes individual projects and applies a quantitative growth factor to account for other growth that may occur in the area." (DSEIR, p. 5.1-7.) The DSEIR asserts that "The analyses in this SEIR employ both the list-based approach and a projections-based approach, depending on which approach best suits the individual resource topic being analyzed ... the Transportation and Circulation analysis relies on a citywide growth projection model that also encompasses many individual projects anticipated in and surrounding the project site vicinity, which is the typical methodology the San Francisco Planning Department applies to analysis of transportation impacts." (DSEIR, p. 5.1-7.)

(*Mission Bay Alliance, Thomas Lippe, letter, July 27, 2015 [O-MBA10L4-11]*)

The DSEIR presents no evidence supporting the DSEIR's assumption that the year 2040 projection is reliable for predicting future traffic and transit demand, other than the vague assertion that the "SF-CHAMP travel demand model, using model output that represents Existing conditions and model output for 2040 cumulative conditions ... has been validated to represent future transportation conditions in San Francisco." (DSEIR, p. 5.2-110.) But, as explained by Mr Smith, the SF-CHAMP model's margin of error is greater than the 5% threshold used to determine the significance of Project cumulative impacts at LOS E and F intersections. (See Exhibit 2 (D. Smith), p. 25.) Therefore, SF-CHAMP is the wrong tool for the task.

Further, given the sheer number of developments in this area of the City (see table 3 of Mr. Wymer's report) and the breakneck pace of their approval and implementation, the projection approach is misleading, not informative. Therefore, the DSEIR's cumulative impact assessment must use a list based approach to forecast reasonably foreseeable travel demand, and do so in a meaningful time frame.

(*Mission Bay Alliance, Thomas Lippe, letter, July 27, 2015 [O-MBA10L4-12]*)

Since at least as long ago as 2012, the City has been actively considering a proposal to demolish the northern portion of I-280 as far south as the Mariposa Interchange, eliminating the on- and off -ramp connections to King Street and to Sixth Street[12]. If carried out, the I-280 truncation would shift much of the traffic that now uses those ramps to surface streets in the immediate vicinity (including two of the frontage streets) of the subject Project. Moreover, development of the site freed up would add to demands on the traffic and transit system. In view of the City's continuing active consideration and refined development of this proposed

major change in transportation infrastructure[13] both well before and after the NOP for the subject Project, this DSEIR should have, at a minimum, in addition to the cumulative scenarios studied, analyzed the proposed Project in the context of an alternative transportation network scenario that reflects the truncation of I-280 as far south as the Mariposa Interchange. However, the DSEIR's only mentions the I-280 truncation project in two places. One is a single short background paragraph about ongoing projects in the vicinity of the site in the Appendix TMP introductory section. The other is a lengthier two-paragraph description at DSEIR pages 5.2-109 and 5.2-110. That section concludes by stating that the information on the 280 truncation is provided for information purposes only and that because that project is not fully designed, has not received the approval of other responsible agencies and is not funded, it is speculative and is not considered in the DSEIR cumulative 2040 analysis. However, since the City has already spent in excess of $ 1.7 million in design and feasibility studies, has already approached other responsible agencies for funding involvement and approvals and since it has such a vast potential consequence for the transportation network in the immediate area of the subject Project by the forecast year of the cumulative analysis, and since that forecast year, 2040, is 25 years hence, it is evasive, irresponsible, improper for the City to have failed to at least considered an alternative cumulative scenario that assumes the latest design concept from the Railyard Alternatives and I-280 Boulevard Feasibility Study in addition to the cumulative scenario that was analyzed. The DSEIR should be revised to include such a cumulative alternative and recirculated in draft status for the 45 day review period.

Footnotes:

[12] Evidence of this is the unveiling by the Mayor's Transportation Policy Director, Gillian Gillett, at a San Francisco Planning and Urban Renewal Association (SPUR) forum on January 10, 2013, releasing a City study deceptively named Fourth and King Street Railyards, Final Summary Memo dated December, 2012 and a related request dated January 7, 2013 by the Office of the Mayor to Steve Hemminger. Executive Director of the Metropolitan Transportation Commission.

[13] The City's continuing interest in the I-280 truncation is demonstrated by the initiation of the San Francisco Planning Department's Railyard Alternatives and I-280 Boulevard Feasibility Study, which began in June, 2014 and in the May 11, 2015 San Francisco Chronicle column by Matier & Ross lead by the statement "San Francisco Mayor Ed Lee is quietly shopping plans to tear down Interstate 280 at Mission Bay and build an underground rail tunnel through the area – complete with a station between the proposed Warriors arena and AT&T Park.".

(*Mission Bay Alliance, Thomas Lippe, letter, July 27, 2015 [O-MBA10L4-26]*)

Excessively Distant Time Frame and Massive Development Assumptions Masks Significance of Project's Nearer Term Cumulative Impacts

The cumulative analysis of the Project's transportation and circulation impacts is done in the context of a Year 2040 (25 years hence) plan-based development scenario. That scenario assumes development in Downtown, the SOMA and Mission Bay that would add 162,000 new PM peak hour trips over existing[15]. Per DSEIR Table 5.2-22, the Project, at its highest PM peak hour trip generation intensity (with an evening capacity basketball game scheduled) would generate some 4599 person trips. This is only 2.84 percent of the new downtown-SOMA-Mission Bay trips projected in the 2040 cumulative analysis. As previously noted, San Francisco transportation impact thresholds require a project to add 5 percent to critical movements at an intersection already at unacceptable LOS, 5 percent to vehicle density on freeway ramps already at unacceptable levels, and 5 percent to MUNI ridership on screen lines and specific routes already exceeding acceptable percentages of capacity. Because the Project comprises only 2.84 percent of the PM peak hour core area trip growth contemplated in the cumulative analysis, it is highly unlikely that this Project, or any project of similar size, or even nearly double its size, could ever be found to cause transportation impacts that are cumulatively significant, given the nature of the impact thresholds and the distant and bloated development scenario that is the context of the cumulative transportation impact analysis of the Project. A more reasonable cumulative analysis would consider a future analysis year of, say, 10 years forward, and consider other development projects and transportation infrastructure projects that are reasonably foreseeable in that time frame. The cumulative analysis should be redone in that or similar context.

While on this subject, it is worthwhile considering the transportation forecast model relied upon in the cumulative analysis – SF Champ. This is a model that, by its nature, is intended to provide information

guiding major planning development policy decisions and major transportation investment decisions. It is not intended, or suitable, for providing microscale information at the level of transportation impact assessment of individual development projects on intersections, freeway ramps, individual transit lines and so on. This is evident in the validation statistics of the model. On traffic screenlines its validation accuracy is within 10 percent on only 80 percent of the screenlines tested[16]. Its accuracy on individual roadways and intersections would be significantly less. Since the criterion of significant cumulative impact at unsatisfactory intersections and ramps is a 5 percent contribution to the traffic at that location, the accuracy of the model is less than the impact threshold that the environmental analysis is attempting to measure. So using this forecast model for an EIR type micro- analysis is like using a sledge hammer or pile driver to drive a common pin. The lesson in this is that the City should be using a project-based build-up analysis over a shorter term future to develop the cumulative scenario.

2. The Cumulative Traffic Analysis Is Factually and Legally Defective.

Even though its cumulative analysis is severely flawed, the DSEIR admits that the Project will cause cumulative traffic impacts at 16 "study intersections" including I-80 and I- 280 freeway ramps. (DSEIR 5.2-219-221.) The DSEIR then fails to propose any effective mitigation measures for those impacts.

The DSEIR's cumulative traffic impacts analysis legally inadequate and unsupported. The document claims that it assessed cumulative impacts "by calculating the project-generated traffic conditions at intersections that are projected to operate at LOS E or LOS F under 2040 cumulative conditions for the No Event scenario for the weekday p.m. and Saturday evening peak hours." (DSEIR 5.2-212-213.) However, that "methodology" is irrelevant to, and does not meet the legal requirements of, CEQA for assessing cumulative impacts. Rather, the DSEIR was required to identify the Project's impacts in combination with other past, present, and reasonably foreseeable future projects that would also result in traffic impacts. The baseline for assessing cumulative traffic impacts is not conditions existing in 2040 but is conditions existing now. The DSEIR's pointless computer exercise thus does not comply with CEQA. (DSEIR 5.2-212-215.) Further, the DSEIR fails to include in the cumulative analysis many other reasonably foreseeable future projects that will also result in traffic impacts, such as the "Second Street Bicycle Plan project," a major project that will eliminate two traffic lanes, turning facilities, and all parking on Second Street from Market Street to King Street to create raised separated bicycle lanes, and similar bicycle plan "road diet" features proposed by the City in the "Central Soma Plan" on Third, Fourth, and Fifth Streets and the closure of Market Street to vehicles in August, 2015, and large private development projects in the project area, all of which should have been included in the cumulative analysis. In short, the Project's impacts today and in the future will contribute significantly to the creation of severe congestion and gridlock throughout the downtown area, the freeway system, and the Project area. The failure to identify and mitigate these foreseeable cumulative impacts violates CEQA. (*Mary Miles, Attorney at Law, email, July 27, 2015 [O-MM-9]*)

Finally, traffic caused by on going development of thousands of units has not been addressed. How can I believe that the Warriors & City will follow through with their promises? (*John deCastro, email, July 27, 2015 [I-deCastro1-5]*)

---

2. My main concern is making sure that the traffic issues with pedestrian, vehicle, public transit (Muni,Cal Trains), are worked out with UCSF's master Plan. If the removal of the 280 freeway happens as proposed,

it needs to be part of the EIR/plan. Removing this major link and rerouting it under ground as proposed may have a major impact to the project and this area. As I understand it a tunnel would be under Third street which happens to be land fill. (*Dennis Hong, email, July 27, 2015 [I-Hong-2]*)

None of the assessments of traffic take account of the huge increase in the residential population of the Mission Bay community that will take place when the many apartment blocks under construction are occupied. The transit-first philosophy of the City assumes, I suppose, that the public transit system that is already overburdened and frequently dysfunctional can accommodate the thousands of additional patrons without further deterioration. Given features like the transit constriction at the 4th street bridge, such a view is unreasonable. The transit system and traffic will surely become worse even before the proposed Warriors Arena is in place. No reasonable assessment of the traffic impact of the proposed Arena can be made without measuring that of the new residential developments, something that will be possible only in a year or two. (*Michael Stryker, email, July 26, 2015 [I-Stryker-7]*)

Response TR-2h: Methodology, Cumulative Analysis Year and Context

One of the fundamental purposes of CEQA is to "[e]nsure that the *long term* protection of the environment . . . shall be the guiding criterion in public decisions." (Pub. Resources Code, § 21001, subd. (d) [emphasis added].) Consistent with this purpose, CEQA requires agencies to consider the cumulative impacts of a project viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects. (CEQA Guidelines, § 15064, subd. (h)(1).) Thus, the need to consider long-term future conditions is especially important where the evaluation of cumulative impacts is concerned. Aside from general guidance in the CEQA Guidelines, CEQA provides agencies discretion to determine the appropriate approach for analyzing a project's cumulative impacts. (CEQA Guidelines, §§ 15064, subd. (b), 15130, subd. (b)(3).) CEQA contains no rule fixing the time horizon for cumulative impacts analyses.

To evaluate cumulative traffic and circulation impacts, the SEIR analyzes a "2040 Cumulative plus Project" scenario, which assesses the long-term impacts of the proposed project in combination with other reasonably foreseeable development. The methodology for the development of 2040 cumulative travel demand forecasts is described in detail on SEIR pp. 5.2-72; 5.2-108 – 5.2-111. The SEIR follows the City's standard methodology for cumulative analysis, which is based on the *CEQA Guidelines*, and is not a departure from other environmental review documents. *CEQA Guidelines* Section 15130(b)(1)(A)-(B) provides the authority for two alternative approaches (list of projects and summary of projections). Under either method, an EIR must summarize the expected environmental effects of a project and related projects, provide a reasonable analysis of cumulative impacts, and examine reasonable options for mitigating or avoiding the project's contribution to any significant cumulative impacts, *CEQA Guidelines* 15130(b)(4)-(5).

The list of projects approach is based on a list of past, present and probable future projects that is identified and used to assess where impacts of the proposed project, combined with similar impacts of identified cumulative projects, would result in significant cumulative impacts. The summary of projections method is based on projections from adopted local, regional, or statewide plans, a related planning document, or a certified environmental document. When a plan or

environmental document describes or evaluates conditions contributing to a cumulative impact, the EIR may use the projections for its cumulative impacts. These projections may be supplemented with additional information such as a regional modeling program that includes a uniform database such as a traffic model. For example, the SEIR transportation analysis relies on a summary of projections approach, which is also validated by a list-based approach to ensure that major projects are accounted for, as detailed below.

Cumulative impact analysis in San Francisco generally employs both a list-based approach and a projections approach, depending on which approach best suits the individual resource topic being analyzed. For topics such as aesthetics, shadow, and wind, the analysis typically considers large, individual projects that are anticipated in the project area. By comparison, and as described below, transportation analysis relies on a citywide growth projection model that also encompasses individual projects anticipated in the project vicinity. Factors considered in determining which cumulative projects to consider in an EIR include the resources affected, the geographic scope and location relative to the affected resource, and the timing and duration of implementation of the proposed and cumulative projects.

Pursuant to the requirements in the *SF Guidelines*, the analysis of the transportation impacts was conducted for existing and 2040 cumulative conditions. As stated on SEIR p. 5.2-72k, year 2040 was selected as the future analysis year because 2040 is the latest year for which travel demand forecasts were available from the San Francisco County Transportation Authority (SFCTA) SF-CHAMP travel demand forecasting model, and because the use of 2040 provides a 25 year horizon year for the impact analysis. The SF-CHAMP model was originally developed by SFCTA in the mid-1990s and has been expanded, improved, and refined on a regular basis over the years. In addition to using demographic and socio-economic data inputs for San Francisco that are consistent with regional forecasts, the methodology and results of the SF-CHAMP model are reviewed regularly by the San Francisco Bay Area Metropolitan Transportation Commission (MTC) for consistency with accepted modeling practices as part of City's Congestion Management Program.

The model starts with regional population and employment data consistent with regional assumptions (described below) and predicts person travel for a full day based on assumptions of growth in population, housing units, and employment, which are then allocated to different periods throughout the day, using time of day sub-models. Future 2040 Cumulative traffic volumes and transit ridership were estimated based on cumulative development and growth identified by the SF-CHAMP travel demand model, using model outputs that represent existing conditions and model output for 2040 cumulative conditions that is validated and updated regularly with new projects and intersections conditions. The 2040 Cumulative forecasts include the additional trips generated by the proposed project.

The SFCTA model divides San Francisco into approximately 981 geographic areas, known as Traffic Analysis Zones (TAZs). The SF-CHAMP model also includes zones outside of San Francisco for which data is obtained through the current MTC Model. For each TAZ, the SF-CHAMP model estimates the travel demand based on TAZ population and employment

growth assumptions developed by the ABAG for year 2040 using the Sustainable Communities Strategy Preferred Scenario Projections.

The transportation analysis is based on a summary of projections approach, but is also validated and refined to reflect known major projects. Within San Francisco, the San Francisco Planning Department is responsible for allocating ABAG's countywide population and employment growth forecast to each SF-CHAMP model TAZ, based upon existing zoning and approved plans, using an area's potential zoning capacity, and the anticipated extent of redevelopment of existing uses. The SF-CHAMP land use inputs developed by the Planning Department for the 2040 cumulative analysis account for major projects in and around downtown and SoMa such as the Central SoMa Plan rezoning, Moscone Center Expansion, San Francisco Giants project at Seawall Lot 337, Pier 70 development, and UCSF LRDP, as well as development throughout San Francisco.

Therefore, the 2040 cumulative analyses provided in the SEIR reasonably represent the future cumulative conditions in the project vicinity, given the economic forecasts for San Francisco and the Bay Area.

In addition, the SF-CHAMP model takes into consideration the planned roadway infrastructure improvements within Mission Bay that are being implemented by the Mission Bay Development Group (i.e., MBDG, the infrastructure master developer), consistent with the 1998 Mission Bay South Area Plan, as well as the transportation network improvements throughout the City, such as Muni Forward, the Second Street bicycle lane, the electrification and extension of Caltrain, expanded WETA, etc. The SF-CHAMP model used in the development of the 2040 Cumulative conditions also incorporates the Central SoMa Plan roadway network changes. The recent turn restrictions onto Market Street (and not closure, as indicated in a comment) are unlikely to affect traffic patterns or operations at any of the study intersections as the effects are localized to one to two blocks north and south of Market Street. However, the SF-CHAMP model includes the planned improvements to the transit-only lanes on Market Street and a reduction in capacity for vehicular travel along Market Street. The potential removal of I-280 north of Mariposa or 16th Street noted in some comments was not included as a future transportation network improvement for the 2040 cumulative conditions, because, as stated on SEIR p. 5.2-110, a substantial amount of additional discussion and analyses is required before the details of the feasibility and potential design and removal of I-280 and construction of California planned high speed rail network and related components within San Francisco are developed to a level at which that project's effect on the transportation system could be understood. Because feasibility and alternative options are currently being studied, there is no "latest design concept," as suggested in a comment. While the preliminary feasibility study is currently underway, as noted on SEIR p. 5.2-110, funding has not been secured to study the potential options beyond the alternatives development phase (such as environmental review), or to undertake or implement any aspect of the project, and thus the project is speculative and not reasonably foreseeable in the cumulative analysis. (See *City of Maywood v. Los Angeles Unified School District* (2012) 208 Cal.App.4th 362, 399-401 [EIR for school project was not inadequate for failing to address cumulative impacts related to proposed future freeway off-ramp, as the off-ramp proposal was not sufficiently well-defined at the time of EIR preparation to allow for meaningful analysis].)

Some comments state the SEIR was required to also include an analysis of cumulative impacts during interim years before 2040 (e.g., 2020 or 2025). There is no such requirement under CEQA. A similar argument was recently rejected in *City of Irvine v. County of Orange* (2015) 238 Cal.App.4th 526. In that case, an EIR prepared for a jail facility upgrade project analyzed traffic impacts by comparing the project to both 2014 and 2030 "baseline" traffic conditions. Conditions in 2014 were intended to describe conditions at the end of the first phase of the project. The petitioner argued that, because the project schedule had slipped over the course of the lengthy environmental review process with the result that the first phase was subsequently projected to be completed by as late as 2018, the EIR should have be modified to analyze an additional short- or medium-term condition reflecting changed assumptions about the first phase (i.e., that it would not be built until 2018). (*Id*. at pp. 543-544.) The court rejected this argument, stating that CEQA "does not require multiple, intersection-by-intersection, studies of traffic impacts on all nearby intersections on a year-by-year basis, plugging the multiple variables of not only the completion of the project itself, but of any nearby projects." (*Ibid*.)

The same principles apply here. CEQA requires that a cumulative impacts analysis address the cumulative impacts by considering reasonably foreseeable future conditions. CEQA does not require multiple iterations of reasonably foreseeable future conditions, involving interim horizon years. Here, the SEIR explains why 2040 was selected as the horizon year. That is sufficient.

Courts have emphasized that "perfection in a cumulative impact analysis is not required." (*Citizens for Open Government v. City of Lodi* (2012) 205 Cal.App.4th 296, 320; see also *City of Long Beach v. Los Angeles Unified School Dist.* (2009) 176 Cal.App.4th 889, 906 [good-faith effort to disclose cumulative impacts is sufficient]; CEQA Guidelines, § 15151 [reviewing courts do not look for perfection in determining the adequacy of an EIR].) As explained in the CEQA Guidelines, "[t]he discussion of cumulative impacts should be guided by a standard of practicality and reasonableness." (CEQA Guidelines, § 15064.) "A project opponent or reviewing court can always imagine some additional study or analysis that might provide helpful information. It is not for them to design the EIR. That further study [] might be helpful does not make it necessary." (*Laurel Heights Improvement Assn. v. Regents of Univ. of Cal.* (1988) 47 Cal.3d 376, 415; see also *Sacramento Old City Assn. v. City Council* (1991) 229 Cal.App.3d 1011, 1033 [rejecting argument that agency failed to adequately address cumulative traffic impacts despite a comment letter from Caltrans requesting additional analysis]; *Saltonstall v. City of Sacramento* (2015) 234 Cal.App.4th 549, 578-583 [upholding traffic analysis for proposed arena as supported by substantial evidence, despite claims that city had to expand geographic scope of analysis]; *Sierra Club v. City of Orange* (2008) 163 Cal.App.4th 523, 543-546 [agency's chosen methodology to assess traffic impacts entitled to substantial deference].)

The 2040 cumulative horizon year is preferable to shorter period because the 25-year horizon year more accurately accounts for land use changes and their associated transportation network changes, as well as other planned transportation improvements. Future growth occurs according to the vagaries of variable economic conditions, development trends, changing sponsor development priorities, and legal actions that delay or curtail proposed development, and therefore, short-term land use growth patterns cannot be accurately predicted in five-year

increments. In particular, redevelopment projects such as those included in the 2040 growth forecasts (e.g., Mission Bay Plan, Candlestick Point-Hunters Point Shipyard Plan, redevelopment of Pier 70 and Seawall Lot 337), often take longer than anticipated to be completed. For example, the Mission Bay Plan was anticipated to be substantially built-out by 2015, which is the cumulative analysis year for transportation conditions in the Mission Bay FSEIR; however, construction of development is still underway and the UCSF Mission Bay campus is anticipated to be completed by 2019. Nearby, the Candlestick Point-Hunters Point Shipyard Phase II Development Plan identified completion of about 3,100 residential units by 2017; however, only about 240 of the 3,100 residential units are anticipated to be completed by the end of 2015. Construction of development part of the Pier 70 project is anticipated to continue through 2030. Thus, because larger multi-year development proposals would be built over a number of years, a future cumulative analysis year considers completion of buildout of these projects. Therefore, the cumulative impact analysis presented on SEIR pp. 5.2-208 – 5.2-232 (i.e., Impact C-TR-1 though Impact C-TR-10) adequately reflects the proposed project's impacts in combination with other past, present, and reasonably foreseeable future projects, and a different or additional cumulative analysis year is not warranted.

Also see Response TR-2b regarding extent of the study area and analysis locations, Response TR-2f regarding significance thresholds used for cumulative impact analyses, and Response TR-12d regarding implementation of mitigation measures identified in the SEIR.

Issues Raised by Commenters: Significance Thresholds (TR-2i)

This response addresses all or part of the following comments, which are quoted below:

O-MBA10L4-8 O-MBA10L4-13A

---

2. The DSEIR's Analysis of the Project's Cumulative Impacts Does Not Comply With CEQA.

a. The 5% threshold of significance for impacts at intersections and freeway ramps operating at LOS E or F violates CEQA.

For intersections operating at LOS E or F, the DSEIR uses a threshold of significance of "a contribution of 5 percent or more to the traffic volumes at the critical movements operating at LOS E or LOS F" (DSEIR, p. 5.2-73-74.) For freeway ramps operating at LOS E or F, the DSEIR uses a threshold of significance of "a contribution of 5 percent or more to the traffic volumes on the ramp." (DSEIR, p. 5.2-74.)[9]

No rationale for the 5% threshold is provided. Indeed, blind reliance on this number ignores the law governing the assessment of cumulative impacts, which requires a fact based assessment that takes into account the severity of preexisting impacts. A one-size-fits-all "ratio" violates CEQA.(See *Communities for a Better Environment v. California Resources Agency* (2002) 103 Cal.App.4th 98, 120 ("Communities"); *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 720-21 (*Kings County*). *Communities and Kings County* teach that the significance of a cumulative impact depends on the environmental setting in which it occurs, especially the severity of existing environmental harm, and that focusing on the magnitude (i.e., "ratio") of the Project's incremental contribution to severe preexisting harm is inconsistent with the definition of cumulative impacts under CEQA.[10]

Footnotes:

[9] "The project may result in significant adverse impacts at intersections that operate at LOS E or LOS F under existing conditions depending upon the magnitude of the project's contribution to the worsening of the average delay per vehicle." (DSEIR, p. 5.2-45.)

[10] (Communities, 103 Cal.App.4th at p. 120 ["[T]he relevant question"... is not how the effect of the project at issue compares to the preexisting cumulative effect, but whether "any additional amount" of effect should be considered significant in the context of the existing cumulative effect. [footnote omitted] In the end, the greater the existing environmental problems are, the lower the threshold should be for treating a project's contribution to cumulative impacts as significant. [footnote omitted]"]; Kings County, 221 Cal.App.3d at pp. 720-21 ["They contend in assessing significance the EIR focuses upon the ratio between the project's impacts and the overall problem, contrary to the intent of CEQA.... We find the analysis used in the EIR and urged by GWF avoids analyzing the severity of the problem and allows the approval of projects which, when taken in isolation, appear insignificant, but when viewed together, appear startling. Under GWF's 'ratio' theory, the greater the overall problem, the less significance a project has in a cumulative impacts analysis. We conclude the standard for a cumulative impacts analysis is defined by the use of the term 'collectively significant' in Guidelines section 15355 and the analysis must assess the collective or combined effect of energy development"].)

(*Mission Bay Alliance, Thomas Lippe, letter, July 27, 2015 [O-MBA10L4-8]*)

For its cumulative impact analysis, the DSEIR uses the same baselines and thresholds of significance discussed above plus one more if the Project "would contribute considerably to a screenline or corridor projected to operate at greater than the capacity utilization standard under 2040 cumulative plus project conditions (i.e., a contribution of 5 percent or more to the transit ridership on the screenline or route)."

The 5% threshold for determining a Project's contribution to be "considerable" is stated at Appendix-TR, p. TR-625. No rationale for this number is provided. A Project contributing 1%more capacity utilization to a screenline that usually operates at 84%, resulting in a total capacity utilization of 85%, may not contribute considerably to a significant impacts, while a Project contributing 1% more capacity utilization to a screenline that usually operates at 94%, resulting in a total capacity utilization of 95%, may well contribute considerably to a significant impact. A one-size-fits-all "ratio" violates CEQA. (See *Communities, supra; Kings County, supra*.) (*Mission Bay Alliance, Thomas Lippe, letter, July 27, 2015 [O-MBA10L4-13b]*)

Response TR-2i: Significance Thresholds

The comments states using a "5 percent contribution" as the threshold of significance for cumulative impacts at intersections and freeway ramps operating at LOS E or LOS F, and transit impacts exceeding the capacity utilization standard violates CEQA. The comment states that no rationale for the 5 percent threshold is provided, and that reliance on this number ignores the law governing the assessment of cumulative impacts, which requires a fact-based assessment that takes into account the severity of pre-existing impacts.

"The cumulative impact from several projects is the change in the environment which results from the incremental impact of the project when added to other closely related past, present, and reasonable foreseeable probable future projects. Cumulative impacts can result from individually minor but collectively significant projects taking place over a period of time." (CEQA Guidelines, § 15355, subd. (b).) A cumulative impact analysis under CEQA involves a two-step process. First, the EIR must determine whether an impact is cumulatively significant; that is, whether the project when added to other closely related past, present, and reasonable foreseeable probable future projects, would result in a significant cumulative impact. Second, if the impact is cumulatively significant, the EIR must determine whether the project's incremental contribution

to the impact is itself cumulatively considerable. (See CEQA Guidelines, § 15130; see also *Communities for a Better Environment v. California Resources Agency* (2002) 103 Cal App 4th 98, 120 [endorsing two-step process for cumulative impact analysis].) "Cumulatively considerable" means that the incremental effects of an individual project are significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects. (CEQA Guidelines, § 15065, subd (a)(3).)

As explained in the CEQA Guidelines, "[t]he discussion of cumulative impacts shall reflect the severity of the impacts and their likelihood of occurrence, but the discussion need not provide as great detail as is provided for the effects attributable to the project alone. The discussion should be guided by the standards of practicality and reasonableness, and should focus on the cumulative impact to which the identified other projects contribute rather than the attributes of other projects which do not contribute to the cumulative impact." (CEQA Guidelines, § 15130, subd. (b).) "[A] good faith and reasonable disclosure of such impacts is sufficient." (*Fairview Neighbors v. County of Ventura* (1999) 70 Cal.App.4th 238, 245 [upholding EIR's analysis of cumulative traffic impacts]; *Banning Ranch Conservancy v. City of Newport Beach* (2012) 211 Cal.App.4th 1209, 1228 ["traffic cumulative impact analysis was reasonable and practical"].) Further, "[t]he mere existence of significant cumulative impacts caused by other projects alone shall not constitute substantial evidence that the proposed project's incremental effects are cumulatively considerable." (CEQA Guidelines, § 15064, subd. (h)(4).)

The SEIR's discussion of cumulative transportation impacts fulfills these requirements. On SEIR p. 5.2-74, the SEIR explains that LOS E and F are considered unacceptable levels of service and are therefore used in the thresholds of significance for determining whether there would be a cumulatively significant impact. The SEIR then explains the methodology used to determine whether the project's contribution to a cumulatively significant impact is cumulatively considerable: "At signalized intersections that operate at LOS E or LOS F under 2040 cumulative conditions and would continue to operate at LOS E or LOS F under 2040 cumulative plus project conditions, the proposed project would have a significant impact if it would contribute considerably to delays at intersections operating at LOS E or LOS F. The increases in project-related vehicle trips were reviewed at the critical movements to determine whether these increases would contribute considerably to the critical movements (i.e., a contribution of 5 percent or more to the traffic volumes at the critical movements operating at LOS E or LOS F)."

Similarly, on SEIR p. 5.2-77, the SEIR explains that a cumulatively significant effect would result if the project's "implementation would contribute considerably to a screenline or corridor projected to operate at greater than the capacity utilization standard under 2040 cumulative plus project conditions (i.e., a contribution of 5 percent or more to the transit ridership on the screenline or route)."

"An ironclad definition of significant effect is not possible because the significance of an activity may vary with the setting." (Guidelines, § 15064, subd. (b).) Agencies are therefore generally afforded broad discretion in determining appropriate thresholds of significance to measure the severity a particular impact. (Guidelines § 15064, subd. (b) ["The determination of whether a project may have a significant effect on the environment calls for careful judgment on the part of

the public agency involved...."]; *Napa Citizens for Honest Government v. Napa County Bd. of Supervisors* (2001) 91 Cal.App.4th 342, 362 [significance threshold for traffic impacts developed by drafters of EIR upheld]; *Mira Mar Mobile Community v. City of Oceanside* (2004) 119 Cal.App.4th 477, 493 [agency has discretion to determine whether to classify impacts as "significant" depending on the circumstances and nature of affected area].) This discretion extends to the thresholds used to determine whether a project's contribution to a significant cumulative impact is cumulatively considerable. (See, e.g., *Mount Shasta Bioregional Ecology Center v. County of Siskiyou* (2012) 210 Cal.App.4th 184, 211-212 [upholding threshold of significance used to determine that project's contribution to cumulatively significant noise impacts was not cumulatively considerable].)

A comment seems to disagree with the SEIR's methodology for assessing contributions to cumulative impacts, but does not provide any evidence that the "5 percent contribution" threshold is not appropriate. To the extent the comment is suggesting that *any* contribution to a cumulatively significant impact is necessarily cumulatively considerable (and therefore significant), such an argument has been rejected by the courts. For example, in *Communities for a Better Environment v. California Resources Agency* (2002) 103 Cal.App.4th 98, 120, which is cited in the comment, the court noted that the "relevant question" in a cumulative impacts analysis is not how the effect of the project at issue compares to the preexisting cumulative effect, but whether "any additional amount" of effect should be considered significant in the context of the existing cumulative effect. (*Id*. at p. 120.) The court was careful to clarify, however, that this does not mean that any contribution necessarily creates a significant impact and explained that "one [additional] molecule rule" is not the law." (*Ibid*.; see also CEQA Guidelines § 15064, subd. (h)(4) ["[t]he mere existence of significant cumulative impacts caused by other projects alone shall not constitute substantial evidence that the proposed project's incremental effects are cumulatively considerable"].)

Here, the SEIR described the methodology for determining whether traffic impacts are cumulatively significant (i.e., LOS E or F) and whether the project's contribution to those impacts would be cumulatively considerable (i.e., contribution of 5 percent or more to the traffic volumes at the critical movements operating at LOS E or LOS F). Using their expertise regarding traffic analysis in the city, the City and its traffic consultants determined that using a "5 percent contribution" as the threshold of significance was appropriate. (See *Napa Citizens for Honest Government v. Napa County Board of Supervisors* (2001) 91 Cal.App.4th 342, 362 [agency has the discretion to rely on the advice of experts in determining significance of traffic impacts].)

The methodology used to evaluate this project's contributions to cumulative transportation impacts is fully consistent with long-standing practices in San Francisco. To this end, the Planning Department developed guidelines for analyzing cumulative traffic impacts and to calculate if the project contribution at the critical movements is above or below a 5 percent threshold (i.e., *Guidelines for analyzing project specific and cumulative traffic impacts at signalized intersections*, May 24, 2010). For intersections, the threshold of significance of 5 percent or more project volumes of critical movements operating at LOS E or LOS F, is both reasonable and exacting. Critical movements are the highest volume conflicting movements that are used to

determine LOS. Even if a project's volumes were less than 5 percent of overall intersection volumes, a significant cumulative contribution could result if project traffic was concentrated in the movements that matter, i.e., critical movements, that determine how well or how poorly an intersection operates. The evaluation of cumulative contributions for freeway ramps similarly focuses on project volumes affecting the ramp density used to calculate LOS conditions.

The 5 percent threshold is well within the range of daily variability in travel demand (including traffic volumes and transit ridership) in San Francisco. This occurs for travel downtown even for land uses dominated by offices and retail that have fairly consistent travel patterns. For an event center with episodic events, variability may be more pronounced than for offices or retail because event center attendees may alter how they travel based on whether travelling from home or from work or if they are combining an event center visit with other activities before or after an event. The transportation analysis assumes that event center travel would temporally affect locations near the event center with considerable more daily variability than office of retail travel. Therefore, the transportation analysis conservatively concentrates event impacts despite likely differences in how visitors may travel to each event.

Using 5 percent contribution as the threshold of significance represented a conservative assessment of the project's cumulative impact because a variation of 5 percent or less is unlikely to be perceptible to the average motorist or transit rider. Moreover, as noted above, this is a commonly used threshold in the City of San Francisco.

The law does not compel the conclusion that, where projected cumulative traffic or transit conditions are already bad or would be bad even without the project, *any* additional trips from a proposed project necessarily represents a cumulatively considerable contribution to a significant cumulative impact. This is especially so with respect to transportation-related impacts, as opposed to other categories of environmental impact involving public health or ecological concerns. Worsened congestion or crowding might cause inconvenience to people, but not any adverse effects on public health or ecosystems. Thus, the addition of relatively small amounts of air pollution in a polluted air basin might worsen the adverse health effects of air pollution. Similarly, the loss of relatively small amounts of the habitat of an endangered or threatened species might cause ecological consequences of note. Worsened traffic congestion, by contrast, has no such intrinsic consequences to public health or biological resources. In fact, in many areas of California, "mitigation" for traffic impacts often has its own adverse consequences on biological resources (i.e., road widening often removes habitat areas). In short, a "one car" or "one transit rider" threshold of significance for impacts on already-congested transportation facilities is neither practical nor desirable from a policy standpoint. Nor is such an approach mandated by CEQA or CEQA case law. While the 5 percent threshold might require drivers to endure minor additional delays, or transit riders to experience crowded conditions which do not exceed the maximum capacity of the transit vehicle, these purely human inconveniences need not, as a matter of law, be treated as a "significant effect on the environment."

See also Response TR-2f regarding the traffic intersection LOS methodology.

Issues Raised by Commenters: Adequacy of Transportation Analysis (TR-2j)

This response addresses all or part of the following comments, which are quoted below:

O-MBA10L4-37 O-MM-3 I-deCastro1-1

Due to all of the foregoing, the DSEIR transportation and circulation section is inadequate. The document must be completely revised, a revision that will involve disclosure of significant new information. (*Mission Bay Alliance, Thomas Lippe, letter, July 27, 2015 [O-MBA10L4-37]*)

Instead of improving severely congested traffic and already substandard air quality conditions, the Project proposes to make them worse throughout the Project area, which includes the entire downtown area cumulatively, freeway ingress and egress, and AT&T Ballpark. The Project therefore directly and facially conflicts with the mandates of the California Environmental Quality Act ("CEQA," Pub. Res. Code [PRC] § 21000 et seq.) to "enhance the environmental quality of the state," to mitigate the Project's impacts, and to "consider alternatives to proposed actions affecting the environment." (PRC § 21001.) The DSEIR fails propose feasible mitigation measures or alternatives for the admitted impacts of the Project, and therefore violates not only those mandates but the legal requirements of CEQA to inform the public of the Project's impacts and mitigate them. The DSEIR fails propose feasible mitigation measures or alternatives for the admitted impacts of the Project, and therefore violates not only those mandates but the legal requirements of CEQA to inform the public of the Project's impacts and mitigate them.

The SDEIR fails to accurately identify the magnitude of the obvious congestion, transportation and parking impacts of the proposed Project, has no coherent or accurate cumulative impacts analysis, and no accurate direct or cumulative analysis of the Project's impacts on air quality, and fails to meet other requirements of the California Environmental Quality Act ("CEQA"), Public Resources Code ("PRC") §§21000 *et seq*. (*Mary Miles, Attorney at Law, email, July 27, 2015 [O-MM-3]*)

I am disappointed that the City is calling traffic, transit and parking issues "significant and unavoidable". (*John deCastro, email, July 27, 2015 [I-deCastro1-1]*)

Response TR-2j: Adequacy of Transportation Analysis

State CEQA Guidelines Section 15121(a) states that an EIR is an informational document for decision-makers and the general public that analyzes the significant environmental effects of a project, identifies possible ways to minimize significant effects, and describes reasonable alternatives to the project that could reduce or avoid its adverse environmental impacts. Neither CEQA nor the CEQA Guidelines requires any kind of project to *improve* baseline environmental conditions such as severely congested traffic or substandard air quality conditions, as suggested in a comment. Rather, CEQA is concerned with the avoidance or mitigation, where feasible, of significant *adverse* environmental changes. (See Pub. Resources Code, §§ 21068 [defining "significant effect on the environment"], 21002 [state policy "that public agencies should not approve projects as proposed if there are feasible alternatives or feasible mitigation measures available which would substantially lessen the significant environmental effects of such projects"].)

The SEIR's analysis of Transportation and Circulation impacts was prepared within this legal framework. SEIR section 5.2, Transportation and Circulation, on SEIR pp. 5.2-1 – 5.2-274 provides a summary of the Mission Bay FSEIR transportation section, an overview of existing transportation conditions in the project vicinity, a description of the applicable transportation regulations and policies, methodologies and assumptions used in the impact analysis, and impact assessment and mitigation measures. The section analyzes the potential project-level and cumulative impacts on transportation and circulation during construction and operation of the proposed project; and the transportation-related issues of study include transit, vehicle traffic on local and regional roadways, bicycles, pedestrians, loading, emergency vehicle access, parking, construction-related transportation activities. The SEIR includes mitigation measures to reduce impacts on traffic, transit, and pedestrians, although even with implementation of these mitigation measures, the impacts would remain significant and unavoidable. Mitigation measures addressing project construction period impacts on UCSF helipad operations would reduce these impacts to less than significant levels. (See also Response TR-14, below) In addition, the SEIR identifies improvement measures to further reduce the proposed project's less than significant impacts related to construction-related ground transportation impacts, transit operations, emergency vehicle access, and loading operations. Alternatives to the proposed project are described and analyzed in Chapter 7, SEIR pp. 7.1 – 7-116.

The transportation analysis conducted for the SEIR was prepared according to a scope of work approved by the San Francisco Planning Department on August 19, 2014, and follows the *SF Guidelines*, as appropriate. Specific comments regarding the adequacy of the transportation analysis are addressed in Responses TR-3 through TR-14, below.

The responses do not include significant new information, and no new or substantially more severe environmental impact has been identified; nor has any new feasible project alternative or mitigation measure been identified that would lessen significant transportation impacts of the project. The SEIR adequately provides supporting evidence and explanation of the methodology to accurately analyze impacts and to support its conclusions. Therefore, recirculation of the Draft SEIR is not required. The OCII Commission would consider the adequacy and accuracy of the SEIR, including Section 5.2, Transportation and Circulation, based on the administrative record as a whole (including all comments submitted on the Draft SEIR and responses to them) at the SEIR certification hearing.

See SEIR Section 5.4 regarding project impacts on air quality conditions. Refer also to Section 13.3, Response ERP-6, concerning the general adequacy of the SEIR. See SEIR Chapter 7 regarding alternatives to the project that would avoid or lessen significant impacts of the project.

13.11.4 Project Transportation Improvements (TR-3)

Issues Raised by Commenters: Transportation Management Plan (TR-3a)

This response addresses all or part of the following comments, which are quoted below:

A-BART-3	A-BART-6	A-Caltrans-9	A-UCSF-2
A-UCSF-3	A-UCSF-5	A-UCSF-11	O-PBNA-1
O-SFBT-5	I-Hong-17	I-Hrones1-4	I-McDougal-2
I-Springer-2	I-Woods-3	PH-Agid-2	PH-deCastro2-2
PH-Kies-2	PH-Lazarus-2	PH-Osmundson-1	PH-Prieshoff-2
PH-Valentino-1	PH-Vaughan-6		

---

3. The proposed Transportation Management Plan's (TMP) objective is to mitigate surface traffic impacts by shifting trips from personal vehicles to other modes. Given the significant traffic impact of the project under all scenarios analyzed and the subsequent need for a successful implementation of the TMP, the impacts of the target mode shift to transit on BART capacity should be anticipated, quantified and closely monitored. (*BART, Val Menotti, letter, July 27, 2015 [A-BART-3]*)

---

6. The project sponsor should work with regional transit providers to encourage inbound event patrons to consider AC Transit Transbay service during the Inbound PM Peak. In general, all transit information should be seamlessly integrated with proposed dissemination of parking information so patrons understand all travel options simultaneously, including transit. (*BART, Val Menotti, letter, July 27, 2015 [A-BART-6]*)

Transportation Management Plan
We commend the City's Transportation Management Plan (TMP) to encourage sustainable mode shares and reduce single vehicle occupancy trips. The Project's participation in the Waterfront Transportation Assessment reflects comprehensive early planning efforts and ongoing coordination between agencies to assess the mobility needs of travelers and provide additional services within the Mission Bay Area. We agree the TMP should include documentation for monitoring vehicle trip reduction, including annual reports to demonstrate the ongoing reduction of vehicle trips while continuing to survey the travel patterns of residents and employees within the project area. We recommend the TMP elaborate future coordination between nearby proposed large-scale development projects and their associated Transportation Management Agencies and various Transportation Demand Management measures to ensure the TMP is thoughtfully planned. (*Department of Transportation, Patricia Maurice, letter, July 20, 2015 [A-CALTRANS-9]*)

UCSF acknowledges and appreciates the efforts made by the City and GSW to date to address concerns that UCSF has expressed about the impacts of the proposed Event Center on UCSF patients, patient visitors, patient care givers, and emergency vehicles. In the spirit of cooperation that has marked those conversations between UCSF, the City and GSW, UCSF offers the following comments on the DEIR, with the understanding that the City will continue to work with UCSF, GSW, and neighbors to develop more detailed plans to address and mitigate the negative impacts of the Project. We understand that these more detailed plans will be included in the Final EIR and incorporated into the Event Center's conditions of project approval, which will result in a project that will fit well in the neighborhood, be supported by UCSF, and be an asset for the City. (*University of California San Francisco, Lori Yamauchi, letter, July 27, 2015 [A-UCSF-2]*)

Driven by its commitment to patient care and public safety, UCSF's primary goal is to ensure that patients, patient visitors and patient care workers, as well as emergency vehicles, have 24/7 unimpeded access to its Mission Bay hospitals. This goal may be impeded by traffic congestion and parking impacts of the proposed Event Center, especially when there are dual and/or overlapping large events at the Event Center and AT&T Park. The DEIR indicates that there would be an average of nine dual and/or overlapping large events at the Event Center per year, comprised of two basketball games and seven concerts with an average attendance of 12,500 or more (DEIR p. 5.2-171). As such, large dual and/or overlapping events at AT&T Park and the Events Center should be managed judiciously. In addition, the impacts of such events-particularly on traffic flow-should be monitored and the City should have the ability to employ additional mitigation measures to ensure traffic can be maintained at acceptable levels and access to the Mission Bay hospitals is assured. Should the City's efforts to maintain acceptable traffic levels fail and access to the hospitals be impeded, UCSF supports a trigger mechanism giving the City the ability to manage the scheduling of dual and/or overlapping large events until such time that traffic can operate during such events at acceptable levels. Further, UCSF encourages City efforts to ensure funding is secured to manage these impacts and to ensure a robust monitoring program. (*University of California San Francisco, Lori Yamauchi, letter, July 27, 2015 [A-UCSF-3]*)

We support the City's efforts to optimize public transit service to and from the Event Center. Toward that end, we offer the following comments:

> "Page 5.2-51, funding of incremental event-only Mission Bay shuttles is left to the discretion of GSW. Please consider making it a requirement that GSW fund additional shuttles if the Mission Bay TMA requests such service.
>
> "Page 5.2-52, Table 5.2-14, we suggest Mission Bay TMA shuttle hours be expanded to cover post-game as well as pre-game (6-8 pm) hours.
>
> "Page 5.2-53, it is unclear whether GSW or the City will pay for the four additional light rail vehicles. The Final EIR should specify.
>
> "Page 5.2-56, we would appreciate the City/GSW consulting UCSF when the number and location of PCOs are refined after Year 1.
>
> "Page 5.2-57 through 58, the text indicates that the listed transportation management strategies would apply to concerts with more than 12,500 attendees, but Table 5.2-16 (footnote b) says more than 14,000 attendees. UCSF believes that the lower number should be used.
>
> "Page 5.2-64 through 68, it is unclear who will decide which TOM measures will be implemented. We recommend that this not be solely at the discretion of GSW. Please describe which City agency will have the authority to order specific additional TDM measures.
>
> "Page 5.2-67 through 68, UCSF appreciates the performance standards set forth in the TMP. Please describe how the City would enforce these measures. In addition, we would appreciate receiving copies of the monitoring reports upon their submittal to OCII.
>
> "Page 5.2-68, third bullet, in addition to event traffic not blocking access to the UCSF emergency room entrance, please consider deploying PCOs to ensure vehicle queuing does not block access to the UCSF hospital and hospital garage for medical staff, patients and visitors.
>
> "Page 5.2-80, the TSP should apply to all large events (+12,500).
>
> "Page 5.2-130, we request that marquee events, such as National Hockey League regular season games, not be allowed to be regularly scheduled as overlapping events given the significant traffic impacts posed by such overlapping events and the unknown transportation mode profile of those attending such events.

(*University of California San Francisco, Lori Yamauchi, letter, July 27, 2015 [A-UCSF-5]*)

"**Comments on May 2015 TMP**

Section 10.2.8, UCSF surveys need not be limited to only emergency access, but also could include surveys of general patient and staff access to the UCSF campus and Medical Center.

Section 10.4.4, we request that this performance standard be expanded to require that event traffic not block patient, staff and visitor access to the UCSF hospitals, not just emergency room access." (*University of California San Francisco, Lori Yamauchi, letter, July 27, 2015 [A-UCSF-11]*)

When the Golden State Warriors announced the acquisition of the rights to Mission Bay blocks 29-32, the Potrero Boosters Neighborhood Association was carefully optimistic that the City, with its stated desire to lure the Warriors to San Francisco, would provide additional transportation and transit infrastructure to our neighborhoods.1 Indeed, we saw the Warriors as a tremendous opportunity, as the City has lagged in developing the infrastructure to accommodate the growth, both residential and commercial, experience by our neighborhoods over the last decade. (*Potrero Boosters Neighborhood Association, J.R. Eppler, letter, July 27, 2015 [O-PBNA-1]*)

The San Francisco Bay Trail should be included in wayfinding signage on and around the project site. We would be happy to provide either the physical signs or our logo in electronic format for incorporation into the Warriors Arena signage and wayfinding plans. (*San Francisco Bay Trail, Maureen Gaffney, letter, July 27, 2015 [O-SFBT-5]*)

---

12. Will this plan include some of Muni's "Traffic Calming" measures such as some of the intersections along Market Street? This might be a great project to include some of these concept along Market and the Van Ness Corridor. (*Dennis Hong, email, July 27, 2015 [I-Hong-17]*)

Third, inappropriate staging and idling by for-hire vehicles was a major community quality of life concern that the Barclays Arena plan did not in my opinion adequately address. Subsequent to the arena opening, a curbside area was designated for staging in response to this concern and efforts were made to reach out to the for hire vehicle industry. However, limousines and other vehicles idling in bus stops, no standing zones, etc. continues to remain an issue well after the arena opening. With this in mind, I was pleased to see that the SDEIR calls for a specific plan to stage these types of vehicles. Early and thorough communication with the for-hire vehicle industry will be important to ensure that utilization of the designated staging areas actually occurs. (*Christopher Hrones, email, June 30, 2015 [I-Hrones1-4]*)

---

1. Traffic. The original proposal to locate the Warriors Arena at Pier 32/34 was far preferable from a traffic perspective as it would have permitted visitors to the Arena to use the multiple public transit lines that pass within a few blocks of that location. However, in view of the significant politics and expense associated with that proposal, I feel the current proposal is the "next best thing" while still providing our neighborhood the benefits of the vibrancy and activity that will be generated by the Arena. I call on Muni and Caltrans, in particular, to take whatever steps they can to enhance service in and around the proposed arena and understand that the Arena would use extra traffic-control officers during events in the same way that Giants games do. (*Bruce McDougal, email, July 27, 2015[I-McDougal-2]*)

---

2. Page 5.2-68 states that preferred performance standards include that "event traffic does not block access to the UCSF emergency room entrance for emergency vehicles or patients on Mariposa Street between I-280 and Third Street" and says "In the event that ongoing monitoring shows at any time that the performance standards outlines above are not being met,…" It is crucial that lack of blocking of patient access to the UCSF hospital will never be a performance standard that isn't being met. That is, monitoring of the blocking of access to the hospital to identify a problem is not sufficient; rather, monitoring should be in place to prevent that from ever occurring and to actively control event traffic to allow patient access at all times. (*Matt Springer, email, July 16, 2016 [I-Springer-2]*)

Creation of a Transportation Management Plan and coordination and implementation of the TMP demand oversight and authority to enforce and if necessary, amend the plans to respond to "lessons learned", conflicts and changing conditions. While the Ballpark/Mission Bay Transportation Coordinating Committee (see Mitigation Measure M-TR-11b) has been helpful in both interagency coordination of traffic and transportation impacts of the ballpark and expression of neighborhood issues, the BMBTCC has no official authority or standing to enforce or amend plans, or ensure adequate funding for required mitigations. The OCII is in no position to become an enforcing agency, and leaving implementation to "the City" is too vague – there's no authority or accountability. The SEIR should clearly designate a responsible authority to enforce, amend and access funding for mitigations. (*Corrine Woods, email, July 27, 2015 [I-Woods-3]*)

"My comments today are focused on the transportation aspect of the EIR and the associated mitigation plans.

"A review of the Draft EIR clearly indicates a detailed account regarding the traffic and transit impacts on Mission Bay. There is no sugarcoating of the assumptions, and all the impacts of the traffic and traffic congestion appear to have been identified.

"Those of us who live in the area understand the congestion that exists today, can anticipate the impacts of events at the arena, and the assumptions outlined in the EIR seem to align with my intuitive perspective on the subject.

"With that said, I've attended public meetings and have reviewed the mitigation measures outlined in the Event Management Plan. Some of those included transit improvements, supplemental service, a robust Traffic Management Plan, and the bike and ped improvements, again, just to name a few -- and have confidence that with the appropriate event coordination, resource availability, and effective implementation of these mitigation measures, the traffic and transit congestion can be managed effectively." (*Bruce Agid, public hearing transcript, June 30, 2015 [PH-Agid-2]*)

"We talk about a "Transportation Management Plan" in 6.5. Where is it? I don't trust the City or the MTA to come forward with a decent Transportation Management Plan when my wife and I tried to go to a Giants game on Sunday, and we waited -- we checked the next Muni -- 58 minutes to the 10. My wife is disabled. I had to call a taxi so we could make our ballgame. That was the only way we could get there, because she couldn't walk down to the T. It was way too far." (*John deCastro, public hearing transcript, June 30, 2015 [PH-deCastro2-2]*)

"And on the issue involving transportation impacts, we believe the Warriors are doing pretty much everything we could hope for. Between the transit investments, the existing transit infrastructure, and the fact that some people will be able to walk from Caltrans or from their neighborhood, the impacts are going to be manageable. The City is making the proper investments in transportation infrastructure to support the project." (*Alyssa Kies, public hearing transcript, June 30, 2015 [PH-Kies-2]*)

"The Draft EIR outlines a mitigation plan for traffic and congestion management that will work for U.C.S.F., it will work for the residents, and it will work for the businesses in Mission Bay …" (*Jim Lazarus, public hearing transcript, June 30, 2015 [PH-Lazarus-2]*)

"I've reviewed the EIR, and I can tell you that the -- when the City and MTA has made commitments to manage the traffic to and from the waterfront, these special-event venues, the Giants system works the way they said it would -- the way the Giants said it would, the way the City said it would. That system works. It has worked day in and day out, all 81 home games and the playoff games. It works." (*Paul Osmundson, public hearing transcript, June 30, 2015 [PH-Osmundson-1]*)

"As a city, we should be pushing transit first, and we believe that the Warriors EIR plan does that. We believe that this is a transit-rich area and -- that they've done a phenomenal job studying all the potential parking areas around the arena as well." (*Matt Prieshoff, public hearing transcript, June 30, 2015 [PH-Prieshoff-2]*)

"I've taken some time to look at the Traffic Management Plan and the Draft EIR, and a couple of things, I think, are very important to point out.

"Number one, if you start to compare traffic management plans of arenas that have been constructed in the recent decade, you'd see that this is probably one of the most in-depth and forward-looking plans, moving to a transit-first plan, as opposed to prioritizing the automobile, which I think is extremely important. This one talks about having the most bike parking spaces that we'll ever see for an arena.

"Also, in discussions, as I understand it from attending a lot of the public meetings, is that there's talk about having direct right-of-way for hospital workers and emergency vehicles. And I think that's extremely important to consider.

"It is not the case that the hospital and the emergency issues have been taken off the table. That is very much part of the discussions, and we should pay deference to that." (*Patrick Valentino, public hearing transcript, June 30, 2015 [PH-Valentino-1]*)

"And I would add that I don't think a lot of public transit enhancements are happening in this project, and that really does need to happen. We're not interested in seeing more parking. It's got to be --we're really serious about dealing with climate change. It's got to be public transportation." (*Susan Vaughan, public hearing transcript, June 30, 2015 [PH-Vaughan-6]*)

Response TR-3a: Transportation Management Plan

SEIR pp. 5.2-46 – 5.2-69 present the transportation improvements that would be provided as part of the project. These include improvements related to the physical transportation infrastructure adjacent to the project site - including travel lanes, sidewalks, bicycle lanes, traffic signals, and light rail platform. These improvements also include transit service improvements such as the expansion of the Mission Bay TMA shuttle system, provision of the Muni Special Event Transit Service Plan, and a Transportation Management Plan (TMP) for operations of the proposed project. The TMP provides for, among other things, pre-event and post-event operation of the curbs adjacent to the project site to accommodate shuttles stops, and taxi zone, and private vehicle and TNC passenger

loading/unloading zones. The TMP also includes Transportation Demand Management (TDM) strategies designed to reduce use of single-occupant vehicles and to increase the use of rideshare, transit, bicycle, and walk modes for trips by employees and visitors to and from the project site.

The TMP is summarized on SEIR pp. 5.2-55 – 5.2-69, and the entire document is included as SEIR Appendix TMP. As described on SEIR p. 5.2-55, the TMP is a working document that would be expanded and refined over time by the project sponsor and City agencies involved in implementing the plan. If the project is approved, the TMP would be incorporated into the project Mitigation Monitoring and Reporting Report (MMRP) as an enforceable condition of approval, and mitigation measures and additional changes identified in this RTC document would be incorporated into the TMP, as necessary.

SEIR pp. 5.2-53 – 5.2-55 present the additional service on the T Third light rail and Muni Metro light rail and three shuttle bus routes that would be provided on event days. The shuttle bus routes would serve the 16th Street BART station, Van Ness Avenue with limited stops at key transfer point, and a shuttle serving the Transbay Terminal, the Ferry Building, and the Caltrain station. The amount of additional service would vary depending on the event size, as presented on Table 5.2-15 on SEIR p. 5.2-55. The additional transit service, as well as the cost for the four light rail vehicles required to increase the light rail capacity on the T Third line, would be funded via the proposed Special Reserve Account. Also please see Section 13.2, Response GEN-1a: City Funding regarding funding of project improvements, and mitigation and improvement measures. Responsibility for implementation and enforcement of individual mitigation measures would be set forth in the adopted MMRP.

With implementation of the project, the existing Mission Bay TMA shuttle service would be expanded with more frequent service, and a new TMA shuttle stop would be located on South Street adjacent to the project site. The proposed Mission Bay TMA shuttle service improvements are presented on SEIR pp. 5.2-51 - 5.2-52, and the shuttles would continue to be free of charge. In addition to the project-related transit improvements described above and included in the project's TMP, SFMTA has ongoing and planned transit service improvements that would serve the project vicinity, which are described on SEIR pp. 5.2-19 – 5.2-20. These include the Central Subway project, which is currently under construction, and the Muni Forward service improvements, including on the 22 Fillmore, 10 Townsend, 38 Stanyan, and 58 24th Street.

The project sponsor has indicated that it would incorporate San Francisco Bay Trail logo into the event center signage and wayfinding signs, as appropriate. In addition, updates to the TMP, such as changes to the location of PCOs for pre-event and post-event periods, and submittal of monitoring reports would be coordinated with UCSF directly, as well as through the Ballpark/Mission Bay Transportation Coordinating Committee.

Event Transportation Management Plan Refinements

As acknowledged in a number of comments, the City and project sponsor have been working with UCSF and neighbors to add detail to the project TMP in order to better address concerns related to local access in the Mission Bay area prior to evening events. These refinements include:

- Development of a Local/Hospital Access Plan
- Expansion of TMP monitoring surveys to include surveys of UCSF general patients and staff access to the UCSF campus and Medical Center

Local/Hospital Access Plan. The TMP would be expanded to include more detailed Local/Hospital Access Plan for the Mission Bay area. The TMP would include a description of the Plan, including supplemental guidance signage, physical controls (if any), and likely location and duties of deployed PCOs. Similar to the other elements of the TMP, the Local/Hospital Access Plan would be reviewed by SFMTA on a regular basis, in coordination with the project sponsor, UCSF and local residents and employers, to assess its effectiveness and implement appropriate changes when necessary.

In addition, SEIR p. 5.2-64 is revised to include the addition of the Local/Hospital Access Plan (deleted text is shown as ~~strikethrough~~ and new text is underlined).

> **Local/Hospital Access Plan.** A Local/Hospital Access Plan (L/HAP) to facilitate movements in and out to residents and employees in the UCSF and Mission Bay Area would be implemented by SFMTA for the pre-event period for all large weekday evening events at the event center (i.e., those events with more than 12,500 attendees that start between 6:00 and 8:00 p.m., on average, approximately 50 times per year). The L/HAP would be configured to discourage event attendees arriving by car from using portions of Fourth Street, Owens Street, UCSF campus internal roads such as Nelson Rising Lane, Campus Lane, Fifth Street, and local residential streets. As part of the L/HAP, special temporary and permanent signage would be positioned at appropriate locations to direct event traffic towards designated routes in order to access off-street parking facilities serving the event center and away from streets within the Local/Hospital Access Plan network. In addition, three PCOs would be stationed at key intersections (i.e., Fourth/16th, Owens/Mission Bay Traffic Circle, and Fourth/Nelson Rising Lane) before the start of an event to facilitate local driver access to their destinations. These three additional PCOs would also be available after the event to be positioned at the most effective locations to direct outbound pedestrians, bicyclists, and vehicles, as determined by the PCO Supervisor.

The revision does not change the analysis or conclusions presented in the SEIR.

TMP Monitoring Surveys. In response to the comments, SEIR p. 5.2-67 is revised to include the addition of the UCSF patient surveys as well as additional clarifications regarding SFMTA review and approval of the surveying and reporting program (deleted text is shown as ~~strikethrough~~ and new text is underlined).

> **Monitoring, Refinement, and Performance Standards**
>
> The TMP outlines the process to monitor and refine the strategies within the TMP in conjunction with the City throughout the life of the project. Monitoring methods include field monitoring of operations during the first four years and an annual surveying and reporting program to be approved by the SFMTA, thereafter. Surveys of event attendees and event center employees would be conducted annually, and visitor surveys of

Mission Bay neighbors and UCSF patients and staff, and emergency providers would be conducted in the initial years of operation. Prior to conducting data collection and surveys, the project sponsor would develop a Survey methodology and implementation plan that would be approved by the SFMTA.

The revisions do not change the analysis or conclusions presented in the SEIR.

Attendance Levels and Event Type

As noted in a comment, the correct level of attendees at which implementation of the Muni Special Event Transit Service Plan would be implemented is 12,500 attendees, and not 14,000 attendees. In response to the comment, the following edits have been made (deleted text is shown as ~~strikethrough~~ and new text is underlined).

On SEIR p. 5.2-52:

- One Event Express route (the Fourth/King Caltrain route) with limited stops, would be provided prior to and following a peak event (i.e., events with more than ~~14,000~~ 12,500 attendees).

On SEIR p. 5.2-57:

[b] Refers to an evening concert with more than ~~14,000~~ 12,500 attendees.

On SEIR pp. 5.2-79 to 5.2-80:

- Conditions *without* implementation of the Muni Special Event Transit Service Plan, **Impact TR-18** to **Impact TR-25**. The two overarching scenarios above assume implementation of the Muni Special Event Transit Service Plan, as described above in Section 5.2.5.2 and on Table 5.2-15, which indicate that the SFMTA intends to provide additional transit service to accommodate peak evening events, including basketball games and concerts with more than ~~14,000~~ 12,500 attendees. The City and County of San Francisco fully anticipates implementation of this plan and has identified sufficient funding to implement this plan.[13] However, in order to provide a conservative CEQA analysis as well as information to the public and decision-makers, this group of impacts discloses the impacts of the proposed project if for some unknown reasons in the future, the City is unable to implement the Muni Special Event Transit Service Plan. This group of impacts analyzes only the Basketball Game scenario as the representative worst-case scenario.

On SEIR p. 5.2-126:

…Specifically, the TMP specifies that for all events with more than ~~14,000~~ 12,500 attendees, up to 17 PCOs would be stationed in the project vicinity to manage vehicular, transit, bicycle and pedestrian flows (see **Figure 5.2-11**), including at the intersections of

[13] Letter to Tiffany Bohee, Executive Director, OCII, from Edward D. Reiskin, Director of Transportation, SFMTA, Re: SFMTA Transit Service Plan, Enforcement Support and Capital Investment Funding for the Golden State Warriors Multipurpose Arena, dated May 15, 2015.

Fourth/Channel, Third/Channel, Third/South, Bridgeview/South, Terry A. Francois/South, Third/16th, Illinois/16th, Terry A. Francois/16th, I-280 northbound ramps/Owens/Mariposa, Fourth/Mariposa, Third/Mariposa, and Illinois/Mariposa.

On SEIR p. 5.2-128:

…TMP measures, such as street closures for events with more than ~~14,000~~ 12,500 attendees, would not be required for many of the other events. See **Table 5.2-16** for the TMP measures associated with various events at the proposed event center.

On SEIR p. 5.2-141:

Basketball Game Scenario

Capacity Utilization. As indicated in Section 5.2.5.2, in addition to the existing scheduled transit service in the project vicinity, the SFMTA would provide additional service to accommodate peak evening events, including basketball games and concerts with more than ~~14,000~~ 12,500 attendees (see **Table 5.2-15** for the proposed frequencies).

On SEIR p. 5.2-143:

Other Events

Transit conditions during other events at the project site would be similar to or better than described above for the Basketball Game scenario which assessed the maximum attendance event for evening conditions, and which would also be representative of conditions for sell-out concert events. The proposed Muni Special Event Transit Service Plan would be provided for other large events (i.e., with more than ~~14,000~~ 12,500 attendees), and the service levels of the additional service would be adjusted to reflect the anticipated attendance level.

On SEIR p. 5.2-160:

Other Events. Bicycle conditions during other events at the project site would be similar to or better than described above for the Basketball Game scenario, which assessed the maximum attendance event, and which is also representative of conditions for sell-out evening concert events. TMP measures, such as street closures for events with more than ~~14,000~~ 12,500 attendees, would not be required for many of the other events.

On SEIR p. 5.2-168:

…For events that necessitate closure of the northbound travel lanes of Third Street between 16th and South Streets (generally events with ~~14,000~~ 12,500 or more attendees) for post-game conditions for a period of one to two hours depending on the size of the event, emergency vehicles traveling on Third Street southbound would not be affected, and if necessary, emergency vehicles traveling northbound on Third Street would be permitted to continue through the closed segment between 16th and South Streets, as PCOs would be able to remove the temporary barriers…

On SEIR p. 5.2-191:

> As described in Section 5.2.5.3, the project sponsor is working with the City to secure funding for the Muni Special Event Transit Service Plan as part of the project improvements, and which would be implemented by the SFMTA during large evening events with more than ~~14,000~~ 12,500 attendees at the project site.

The revisions do not change the analysis or conclusions presented in the SEIR.

In response to a comment requesting clarification whether National Hockey League games would be held at the event center, the project sponsor has confirmed that NHL games would not be held at the event center. In response to the comment, the following edit has been made on SEIR p. 5.2-130 (deleted text is shown as ~~strikethrough~~ and new text is underlined):

- The City and the project sponsor to meet to discuss transportation and scheduling logistics following signing any marquee events (national tournaments or championships, political conventions, or tenants interested in additional season runs: ~~NHL,~~ NCAA, etc.).

The revision does not change the analysis or conclusions presented in the SEIR.

Mission Bay TMA

In response to a comment regarding coordinating with the proponents of future development projects and their associated Transportation Management Agencies, it is noted that the project site is located within the Mission Bay South Plan area with a Transportation Management Association and a TMP. The Mission Bay Transportation Management Association (referred to in the SEIR document as the Mission Bay TMA) is the non-profit organization that was formed to meet the requirements of the Mission Bay FSEIR Mitigation Measure E.46: Transportation Management Organization. As indicated on SEIR p. 5.2-131, the Mission Bay South TMP and the Mission Bay North TMP are part of the Mission Bay Ownership Participation Agreement, and all development within Mission Bay is subject to the Ownership Participation Agreement. The proposed project's TMP builds upon the requirements within the Mission Bay South TMP. For example, as stated on SEIR p. 5.2-51, with implementation of the project, the existing Mission Bay TMA shuttle service would be expanded with more frequent service, and a new TMA shuttle stop would be located on South Street east of Third Street adjacent to the project site. The project sponsor would join the Mission Bay TMA and the project's required contribution to the association would enable the expanded shuttle service. The Mission Bay TMA would determine any additional changes to the shuttle service, including extending the hours of shuttle service. The TMP includes a section on Monitoring, Refinement, and Performance Standards that outlines the process to monitor and refine the strategies within the TMP in conjunction with the City and the Mission Bay TMA throughout the life of the project. As noted above, the TMP would be incorporated into the project MMRP as an enforceable condition of approval.

Other

As noted in a number of comments, the City, project sponsor, and UCSF have been working on developing Local/Hospital Access Plan strategies (see above) to ensure that inbound access to the Mission Bay Area by residents, employees and UCSF staff during the weekday 6:00 to 7:00 p.m. evening period, when the maximum inbound project demand is expected to occur and which coincides with the UCSF staff shift, is not substantially delayed as a result of event-related traffic. In addition to the Local/Hospital Access Plan, additional strategies have been identified by the City, UCSF, and the project sponsor that could be implemented during non-Golden State Warriors overlapping events to minimize the impacts during the pre-event period. As described in Response GEN-1a: City Funding, the City has introduced a resolution for consideration by the SFMTA and an ordinance for the Board of Supervisors that are intended to secure funding for its contribution to the project's transportation service plan and ensuring that the incremental City costs of providing transit, traffic enforcement, street sweeping and public safety services outside the premises are fully funded through the life of the project. If adopted, the ordinance would establish a Designated Overlapping Event Reserve Account to fund transit enhancements and traffic enforcement costs of servicing non-Golden State Warriors events at the event center that occur on the same weekday evening as a SF Giants evening game. The ordinance would authorize an annual deposit of funds for the useful life of the event center. The Designated Overlapping Event Reserve Account would be used to implement supplemental transportation management actions, including a number of measures noted in comments, such as providing additional Mission Bay TMA and event-specific shuttle service. General categories of the types of measures that would be implemented include: separation of traffic destination, increased transit capacity, increased capacity of other modes, reduction in transit costs, disincentives to driving, incentives for alternative modes, and increased marketing efforts.

Thus, in response to comments, Mitigation Measure M-TR-11c: Additional Strategies to Reduce Transportation Impacts during Overlapping Events was expanded to include additional strategies. Collectively, these measures may reduce traffic congestion in the project vicinity, but would not reduce traffic impacts to less than significant levels, and traffic impacts in Impact TR-11 would remain *significant and unavoidable with mitigation.* See Response TR-12a: Traffic Mitigation Measures for the additional strategies included in Mitigation Measure M-TR-11c: Additional Strategies to Reduce Transportation Impacts during Overlapping Events.

Additional PCOs are not proposed to monitor queues at entrances to UCSF parking facilities, as suggested in a comment, and performance standards would not be expanded to include operations at UCSF parking facilities. Instead, the supplemental actions identified above would be implemented to address concerns raised by UCSF.

A comment inquired if the project includes turn prohibitions such as those recently implemented on Market Street. The project does not propose any permanent turn prohibitions at intersections in the project vicinity; however, during events, some temporary turn restrictions would be implemented. These temporary turn restrictions are described on SEIR p. 5.2-63, and include left turn restrictions from westbound 16th Street onto Third, Owens, and Mississippi Streets through signage, temporary barriers, and/or PCOs.

A comment noted that vehicle queues on City streets blocking access to the UCSF emergency room entrance on Mariposa Street should not be subject to a performance standard, but rather should be monitored during events to ensure that access is available at all times. In addition to satisfying the performance standard included in the TMP, the pre-event and post-event management plan include stationing of additional PCOs as well as additional improvement measures (e.g., Improvement Measure M-TR-10b: Mariposa Street Restriping Study), and mitigation measures to reduce the potential for queues, to monitor conditions, and to intervene if the emergency room entrance is blocked.

Comments regarding monitoring and coordinating with regional transit agencies, including BART and AC Transit, in developing and implementing strategies to accommodate event-related travel demand, particularly in response to the monitoring of event attendee travel characteristics, are noted. Such monitoring and inter-agency coordination are proposed to be part of the implementation of the TMP.

Issues Raised by Commenters: PCOs (TR-3b)

This response addresses all or part of the following comments, which are quoted below:

A-Caltrans-7 I-Carpinelli-2 I-Hong-7 I-Zboralske-19

- Please quantify how many additional Parking Control Officers (PCOs) will be utilized when there are overlapping events. Mitigation Measure M-TR-1 la, under Conditions With a SF Giants Evening Game at AT&T Park, states the Project's Transportation Management Plan shall be expanded to include additional PCOs that shall be deployed at some specific intersections (pg. 1-22). Mitigation Measure M-TR-2a, under Conditions Without a SF Giants Game at AT&T Park, states "four additional PCOs shall be deployed to intersection where the proposed project would result in significant impacts, as conditions warrant during events (pg. 1-15). (*Department of Transportation, Patricia Maurice, letter, July 20, 2015 [A-CALTRANS-7]*)

---

2. Need for more PCO's pre and post game/event located throughout Dogpatch and south to Cezar Chavez to avoid traffic going through neighborhood to/from 23rd St. on/off ramp at 280 N. Traffic should be kept off Tennessee, Minnesota, Indiana, 22nd St and 20th streets as these are mainly residential in nature. (*Janet Carpinelli, email, August 4, 2015 [I-Carpinelli-2]*)

---

b. Provide additional traffic control officers before and after the events. (*Dennis Hong, email, July 27, 2015 [I-Hong-7]*)

In my opinion, the proposed number of parking control officers (PCOs) slated for deployment is not nearly sufficient.

The report identifies PCO controlled intersections during the various scenarios. Table 5.2-10 gives an example in which only six of 22 locations are staffed. There is no mention of how many PCOs are assigned to each location and no indication of what traffic control measures they will utilize to expedite the safe

flow of all modes of traffic. My observations tell me that much PCO intervention focuses on monitoring traffic from a distance and/or controlling the signals via the override function. I do not see a lot of engagement and interaction. Pedestrians and bicyclists regularly do what they want on many of the local streets. The intersections of King Street and 3rd Street, King Street and 4th Street and King Street and 2nd Street are staffed with more personnel. The staff working those intersections appears to be much more engaged and interactive in their efforts to safely control the various modes of traffic. If you do not facilitate the flow of traffic all the way to freeway on-ramps and other major exit routes, traffic will always "bottleneck upstream" and clog its way back toward the event site.

Over the past three years, I've often observed one and sometimes two PCOs at intersections who were simply controlling the traffic signals (manual override) to facilitate vehicular traffic. They were not adequately engaging with pedestrians to prevent jaywalking, pedestrians crossing against red lights and people crowding into the roadway. They also weren't able to control bicyclists that were weaving through traffic. The focus was on cycling the lights rather than a comprehensive effort to facilitate all modes of traffic. PCOs must engage with people to control the intersection and make it clear how the manual traffic flow cycle will be handled and monitored. Each mode of transportation must be addressed independently, but within the context of a master plan, during times of heavy congestion to promote safe traffic movement for all modes.

Traffic control duties can be quite difficult and require significant resources and constant engagement. Simply standing at a signal light control box and manually controlling the light cycle at signalized intersections is not sufficient to ensure the safe movement of vehicles, bicyclists and pedestrians. Active engagement and proper use of traffic control devices (cones, barricades, signs, flares, reflective sleeves and message boards) is also required. Many of the intersections listed in the report indicate "a PCO" will be used. In my opinion, most of these intersections would require between two-three PCOs to safely facilitate the movement of vehicles, bicyclists and pedestrians.

Remember, many attendees may not be familiar with the area. Many events will conclude at night when it is dark. Some people leaving the venue will have consumed alcohol. Existing lighting at some of the critical intersections is not robust. There may be inclement weather. It is likely that with the ongoing construction of other projects that roadway modifications may need to be navigated, which only makes facilitating traffic more difficult. I view the plan as significantly understaffing the traffic control aspect.

According to the plan during overlapping events, due to restricted access on the 3rd Street and 4th Street bridges, it is assumed that no vehicles will travel north on either street during overlapping events. This will be a self-induced "double bottleneck" that will force traffic south and west. The plan calls for "a PCO to be stationed at the intersection of 4th and 16th Streets to "discourage the use of this street except for local access." Good luck with that!

The intersection would require minimally two and maybe three PCOs to safely facilitate all modes of traffic and respond to inquiries made by individuals on congested days. People will stop and ask PCOs questions. When they do stop or at least slow down, traffic disruption occurs. This is predictable and inevitable to some degree. (*James Zboralske, email, July 27, 2015 [I-*Zboralske-19])

Response TR-3b: Transportation Improvements, PCOs

The number of PCOs who would be stationed at intersections in the project vicinity during overlapping events would vary depending on the event size at the proposed event center for basketball games and large concert events with more than 12,500 attendees. As indicated on SEIR p. 5.2-58, the TMP includes up to 17 PCOs stationed at adjacent intersections in the project vicinity (see SEIR p. 5.2-58). Note that subsequent to the publication of the Draft SEIR, a Local/Hospital Access Plan was developed for the pre-event period on weekdays for events with more than 12,500 attendees, and on those days three additional PCOs would be stationed at the

intersections of Fourth/16th, Owens/Mission Bay Traffic Circle, and Fourth/Nelson Rising during the pre-event period, and would be stationed as determined most effective during the post-event period.

- **Without a SF Giants Game at AT&T Park** – For project events with more than 12,500 attendees that do not overlap with a SF Giants evening game at AT&T Park, 17 PCOs would be stationed in the project vicinity, as indicated on SEIR p. 5.2-58. In addition, as part of Mitigation Measure M-TR-2a: Additional PCOs during Events (as described on SEIR p. 5.2-128) four additional PCOs would be deployed, for a total of 21 PCOs during large events. As noted above, the Local/Hospital Access Plan would add three additional PCOs during weekday events with more than 12,500 attendees. Thus, up to 24 PCOs would be provided during weekday events and 21 PCOs would be provided during weekend events.

- **With a SF Giants Game at AT&T Park** – For project events with more than 12,500 attendees that overlap with a SF Giants evening game at AT&T Park, 17 PCOs would be stationed in the project vicinity, as stated on SEIR p. 5.2-58. In addition, six additional PCOs identified in Mitigation Measure M-TR-2a: Additional PCOs during Events (four PCOs) and Mitigation Measure M-TR-11a: Additional PCOs during Overlapping Events (two PCOs) would be provided for pre-event and post-event conditions. As noted above, the Local/Hospital Access Plan would add three PCOs during weekday events with more than 12,500 attendees. Thus, on days with overlapping evening events, up to 26 PCOs would be associated with the proposed project TMP and mitigation measures during overlapping weekday events and 23 PCOs would be provided during overlapping weekend events. These PCOs would be in addition to the 22 to 24 PCOs that are typically assigned by the SFMTA on a game day at AT&T Park.

Table 5.2-10 presents the intersection LOS for existing conditions with a SF Giants evening game at AT&T Park, and identifies the intersections where PCOs are currently stationed during SF Giants evening games. SEIR p. 5.2-58 identifies that for large events, up to 17 PCOs would be stationed in the project vicinity, and identifies likely intersections.

Although the preliminary list of intersections at which PCOs would be stationed was identified in the TMP in consultation with SFMTA staff based on experience during events at AT&T Park, as noted in the SEIR, the exact location during each event would be determined by the PCO Supervisor, and would be responsive to actual traffic conditions. At some intersections, more than one PCO may be warranted for a brief period, or for just pre-event or post-event periods (and not both pre-event and post-event).

The comments regarding observations of PCO activity before and after an event at AT&T Park are noted. As indicated on SEIR p. 5.2-58, PCOs would be responsible for managing vehicular, transit, bicycle, and pedestrian flows. In particular, the PCO would be responsible for ensuring that vehicles do not block intersections or crosswalks, conditions that result in gridlock and cause delay to vehicles and transit, as well as unsafe conditions for pedestrians and bicyclists. Types of activities that are typically conducted by PCOs during special events include such things, among others, as keeping intersection and sidewalks clear of stopped vehicles, discouraging double parking, enforcing taxi zones, stopping traffic to allow pedestrians to cross the street, stopping

pedestrians to allow transit and vehicles to cross the street, and directing transit riders to queuing areas. In July through September 2014, SFMTA conducted the *South of Market Intersection Gridlock Enforcement Pilot Study*[14], which determined that the incidence of vehicles blocking intersections and crosswalks is lower when PCOs are present compared to when no traffic enforcement activity is happening. The study found that hand signals were more effective at reducing instances of crosswalk and intersection blocking than issuing citations. Overall, the data from the pilot study show a reduction by more than 50 percent in intersection and crosswalk blocking during traffic enforcement by SFMTA.

PCOs are not anticipated to be stationed within the residential areas south of Mariposa Street, as it is not anticipated that project-generated vehicle trips would travel on these residential streets for access to or from I-280. However, during major events, at least one roving PCO would be available to monitor general parking issues and respond to complaints called in throughout adjacent neighborhoods[15]. The proposed event center would accommodate substantially fewer attendees than AT&T Park (i.e., proposed maximum of 18,500 attendees at the event center, compared to a maximum of 42,000 attendees at AT&T Park), the number of vehicle trips traveling to and from the I-280 ramps would be accommodated at the Mariposa Street ramps (see intersection LOS on Tables 5.2-34 to 5.2-36, and Figures 2.5-15 to 5.2-17 on SEIR pp. 5.2-118 – 5.2-123). As discussed in Impact TR-11, events overlapping with a SF Giants evening game at AT&T Park would result in increased congestion at the intersection of Mariposa/I-280 during the evening peak hour (i.e., pre-event condition). The projected increase in congestion and LOS E conditions at this intersection, however, do not reflect the fact that, as part of the proposed project, a PCO would be stationed at this location to facilitate the northbound right-turn movement from the I-280 northbound off-ramp onto Mariposa Street eastbound.

To the extent that traffic congestion associated with overlapping events results in substantial diversions onto the residential streets south of 18th Street, the PCO Supervisor would reassign PCOs to direct vehicles to the primary routes and not divert through the residential neighborhoods. This would be conducted through the proposed TMP, and additional PCOs are not anticipated to be required.

Issues Raised by Commenters: Transportation Impact Fees (TR-3c)

This response addresses all or part of the following comments, which are quoted below:

A-Caltrans-10

Transportation Impact Fees
Please identify any transportation impact fees to be used for project mitigation. Consider including information from the City's local and any relevant regional impact fee program and identify if those programs include improvements to alternative modes. Caltrans encourages the City to ensure sufficient

[14] SFMTA, *South of Market Intersection Gridlock Enforcement Pilot Study*, Final Report, December 2014.
[15] Final TMP, 6.4.3 Pre-Event Controls, p. 81

allocation of contributions toward regional transit improvements in order to better mitigate and plan for the impact of future cumulative growth on the regional transportation system. We support projects and measures to reduce vehicle miles traveled and to increase sustainable mode shares. (*Department of Transportation, Patricia Maurice, letter, July 20, 2015 [A-CALTRANS-10]*)

Response TR-3c: Transportation Impact Fees

The proposed project would be subject to San Francisco's Transit Impact Development Fee (TIDF). The TIDF attempts to recover the cost of carrying additional riders generated by new development by obtaining fees on a square footage basis. TIDF funds may be used to increase revenue service hours reasonably necessary to mitigate the impacts on non-residential development on public transit. Although the City and County of San Francisco does not have a regional development impact fee, San Francisco does fund a large number of transportation improvements to both City-owned and state-operated transportation facilities. Funding for these improvements comes from a variety of sources including state and federal grants, tolls collected from Bay Area bridges, and a countywide ½ cent sales tax dedicated toward funding transportation improvements authorized under Proposition K. Please see Section 13.2, Response GEN-1a: City Funding regarding funding of improvements included as part of the proposed project and mitigation measures.

Thank you for the opportunity to review the "Notice of Completion" environmental document from the State Clearinghouse regarding the Golden State Warriors multi-purpose event center project, State Clearinghouse #2014112045. The California Highway Patrol is the primary agency that provides traffic law enforcement, safety and traffic management on Interstate 80, Interstate 280 and US I 01 within the city limits of San Francisco, California. The San Francisco Area is responsible for these functions and will be affected by the implications of this project. To that end, we offer the following comment:

Our concerns relate to the final design of the proposed 18,064 seat multi-purpose event center with regard to the potential increase in traffic congestion, changes in traffic congestion patterns and the additional enforcement demands on freeways and transition ramps at and near the proposed event center. (*Department of California Highway Patrol, C. Sherry, letter, August 3, 2015 [A-CHP-1]*)

_____

Our recommendation would be to further analyze traffic patterns and schedule events appropriately with other event centers and/or city organizers in order to reduce traffic congestion to the greatest extent possible. (*Department of California Highway Patrol, C. Sherry, letter, August 3, 2015 [A-CHP-4]*)

_____

1. Traffic Impacts Are Neither Adequately Analyzed Nor Mitigated.

Even though it drastically underestimates the vehicle traffic generated by the Project, the DSEIR concludes that the Project will have significant "project-specific" impacts at seven study intersections, including King/Fourth; Fifth/Harrison; I-80 westbound off-ramp; Fifth/Bryant/I-80 eastbound on-ramp; Third/Channel; Seventh/Mission Bay Drive; and seventh/Mississippi/16th. (DSEIR 5.2-128.) The DSEIR then claims that it will not provide proposed mitigation measures for the Project's gridlock-creating mess throughout downtown San Francisco and on major freeways in violation of CEQA's fundamental mandate, claiming that any mitigation of the Project's impacts would have to increase lane capacity, which the DSEIR claims would "generally be infeasible," providing no substantial evidence to support the conclusion of infeasibility. (DSEIR 5.2-128.)

The Project description in the DSEIR fails to include an accurate description of The Project area, since the Project's impacts extend far beyond the Project site and will affect citywide and regional streets, freeways, and transit lines.

There appears to be no accurate traffic count data supporting the baseline (existing) conditions from which the impacts analysis proceeds. Further, even if only seven of the analyzed intersections streets were impacted by the Project, the backup from those intersections would affect many entire streets and other intersections that the DSEIR claims would not be degraded. An EIR that fails to inform the public and decisionmakers of the Project's impacts is legally defective.

The DSEIR proposes admittedly ineffective "mitigation," such as on-site "PCO's that shall be deployed," without saying where and when they would be "deployed," who would pay for them (the public), and how they would affect the intersections where impacts are identified. (DSEIR 5.2-128.) Instead of proposing effective mitigation measures for the identified impacts, the DSEIR then claims that "strategies to reduce traffic congestion"

"could" include more ineffective "outreach" to urge people not to drive, urging the project sponsor to buy up more parking spaces, and other vague "strategies." (DSEIR 5.2-129.) The DSEIR then proposes a "Strategy to Enhance Non-auto Modes," which also would not mitigate the Project's impacts on traffic, including traffic that is not attending a basketball game or a "special event," which is not even considered in the DSEIR. (DSEIR 5.2-129.) The "Non-auto Mode" strategy includes, e.g., a "promotional incentive…for public transit use and/or bicycle valet use at the event center." (Id.) The "Non-auto Mode" strategy, however, again fails to address the traffic impacts of the Project, and does nothing to mitigate them.

Regardless of whether the City provides additional Muni "Special Event Transit Service," a central assumption of the DSEIR, the document admits that traffic impacts will affect the entire Project area, freeway ingress/egress, and Bay Bridge travel. (DSEIR 5.2-118 - 129, 5.2-191-207.)

The DSEIR's analysis and the proposed "mitigation" fall far short of the requirements of CEQA to identify significant impacts and mitigate them. (*Mary Miles, Attorney at Law, email, July 27, 2015 [O-MM-8]*)

However, upon reading the Supplemental Environmental Impact Report (the "SEIR") for the Golden State Warriors Event Center and Mixed Use Development (the "Arena"), we have some significant concerns. We are distressed by the volume of identified impacts on traffic transit and parking identified as "significant and unavoidable." A failure to avoid significant impacts will directly reduce the day-to-day quality of life for the residents living and moving into the Potrero neighborhoods. (*Potrero Boosters Neighborhood Association, J.R. Eppler, letter, July 27, 2015 [O-PBNA-2]*)

Impact TR-5: Traffic

Traffic is perhaps the Boosters greatest concern; increased traffic drives every other discussion in this letter. The intersection of 7th and 16th Streets is already at an "F" grade for level of service, creating danger to bicycles and pedestrians at all hours of the day. New drivers, not familiar with the area, will only compound the difficulties of an intersection where four modes (Caltrain's tracks run adjacent to 7th Street) of traffic come together. Prior to the Arena's opening, this intersection should be reworked under the City's Vision Zero plan. (*Potrero Boosters Neighborhood Association, J.R. Eppler, letter, July 27, 2015 [O-PBNA-8]*)

Much attention has been properly focused on how traffic gridlock caused by the new stadium would affect access to the three new UCSF hospitals that are immediately adjacent to the site, one of which houses one of only two Children's Emergency rooms in San Francisco. It is unavoidable that terrible, and possibly even life-threatening, traffic congestion will be associated with the planned complex, given that it is intended to be the site of some 220 events per year, held both in the evening and during the day (New York Times, September 6, 2015; business section, pages 1, 4 and 5). Many of us have experienced the hours-long gridlock that paralyzes all Mission Bay streets before and after San Francisco Giants home games. The absolute paralysis that it creates is already a non-trivial problem, which the planned stadium promises to both greatly expand and intensify.

The presence of the 41,000-seat AT&T Park less than a mile (a 15-minute walk) from UCSF Mission Bay has not been sufficiently factored into the plans to build the Warriors' huge new sports/entertainment complex. The ballpark already significantly impacts life and work at Mission Bay, with nearly 50 San Francisco Giants home weekday games per season. Due to these events, it can take cars and UCSF shuttle buses over an hour to exit from the UCSF parking lot onto the streets, and a 20-minute trip may require two hours.

The widespread traffic impact of AT&T Park games is noted on the website for the San Francisco Municipal Transportation Agency (SFMTA):

> "Motorists are advised to avoid the increased congestion in downtown San Francisco related to these special events and advises commuters to use transit, taxis, bicycles or walk and to avoid using the Bay Bridge in the two hours before or after these games. ... As a reminder to fans, in order to reduce congestion on city streets after all events at AT&T Park, the SFMTA will close eastbound King Street between 3rd and 2nd streets from the seventh inning until after the post-game traffic has died down. Additionally, the northbound portion of the 4th Street (Peter R. Maloney) Bridge will be closed to all traffic except streetcars, buses, taxis and bicycles during the post-game period. (https://www.sfmta.com/news/press-releases/sfmta-weekend-transit-and-traffic-advisory)

Adding an 18,500-seat Warriors complex on top of what is already a transportation mess is asking for disaster. We are highly skeptical of any plan that proposes to segment traffic by restricting 4th street and other routes for "UCSF business only," since those of us at Mission Bay have experienced the unruly behavior of frustrated drivers stuck for long times in traffic jams. In fact, there is no believable transportation solution for two very large complexes placed in such close proximity at Mission Bay.

Imagine dropping a 41,000-seat stadium anywhere within a 1-mile radius of San Francisco City Hall, and then tripling the capacity of Bill Graham Civic Auditorium. It would make no sense, for the same reason that it makes no sense to squeeze the planned Warriors facility into the Mission Bay neighborhood. The resulting perfect storm of traffic would make it miserable for both the existing neighborhood and for sports fans – in addition to threatening the entire future of UCSF as the center of a world-class academic/ biotech/medical complex. (*Bruce Alberts, et. al, letter and email, September 22, 2015 [I-Alberts-2]*)

I own a unit in the Madrone and have lived here since December, 2012. I'm rather concerned about the traffic implications of the new Warriors stadium. Frankly, it feels like SF doesn't understand traffic flow and density in Mission Bay in general, and I'm concerned that the Warrior's impact is totally unknown/inaccurately-planned. For example:

* I frequently seeing fire trucks driving the wrong way on 3rd St so that they can get to China Basin St.
* Around game times, the traffic on 3rd st backs up so much it's faster to walk downtown and catch a cab than try to drive somewhere.
* The light timing, especially around Berry St and 3rd/4th, makes it very hard to get out of Mission Bay during games. I've had it take me 50 minutes to go from the Madrone to 4th & King because of the light timing.

Right now, during a Giants game, the only way to get out of Mission Bay is to head towards 3rd & 16th, and if the Warriors are there, with 200 events/year at least, we'll basically be trapped. Yes, I know if Salesforce had been there we would've had additional traffic, but I suspect the number of employees would be significant less than the people at a game, and tech busses + people biking to work take even more cars off the road. (*Josh Anon, email, July 13, 2015 [I-Anon-1]*)

I've also heard the mayor wants to add additional public transit into the area, reducing road space, but I'm sure many people will still drive, and this will just make the roads more congested. (*Josh Anon, email, July 13, 2015 [I-Anon-3]*)

-The traffic will be horrible

The traffic is already horrible because of the Giants game. The addition of additional cars are not going to make traffic worse it will just be traffic more frequently something that will happen no matter what is built there. The detractors make it seem like the traffic will be analogous to a flood where cars are going to pile on top of each other and block every nook and cranny preventing any kind of human movement (*Jason Barton, email, July 27, 2015 [*I-Barton-2*]*)

As someone who has lived on Potrero Hill for over 25 years, I must comment on the proposed Warriors project. Traffic getting in and out of our neighborhood has already increased and slowed to a crawl during rush hour, and is even worse before and after Giant's games. Third to Cesar Chavez is impossible, and the other directions to 80 on 3rd and 5th are a half hour crawl to get on the freeway. All despite the promise of better public transportation that were made before the Giants moved into town. (Sharon Beals, email, July 27, 2015 *[*I-Beals-1*]*)

The area is already congested with traffic and this structure would only add more congestion. (*Lynda Bilodeau, email, July 26, 2015 [*I-Bilodeau-2*]*)

We really do not need a new stadium, especially in an area that impacts the whole bay area. (*Norman Bookstein, email, July 13, 2015 [*I-Bookstein-2*]*)

I'm writing to oppose the construction of the Warriors new stadium at the currently proposed site in Mission Bay. I'm a neighbor in the area, already affected by the great increase in traffic on game days from the Giants Stadium. We often have complete gridlock NOW on home game days. An additional arena for a very popular team (!) would make the area impassable on Warriors game days. I have read the traffic solution currently being considered by the City and the Warriors, and find it laughable. (*Jessie Bunn, email, July 6,2015 [*I-Bunn-1*]*)

- People driving the wrong way down *one-way* Mission Bay Blvd. North and South

(Jadine Cehand, email*, June 30, 2015 [*I-Cehand-4*]*)

- Mission Bay shuttles stuck in traffic, mainly due to the next:
- No traffic officers at Mission Bay Blvd N. and S.; cars blocking the intersection in bumper to bumper traffic. Cross traffic not getting through.
- Local traffic diverted off China Basin St. down Mission Bay Blvd. North to accommodate SFPD Southern Station during games.
- People double parked/idling in the "mews" on Bridgeview (our garage entrance).
- Cars idling across our driveway entrance- blocking access to our homes.

(Jadine Cehand, email*, June 30, 2015 [*I-Cehand-6*]*)

---

keep the warriors arena out! We have enough congestion in our neighborhood as is….Wishing that the residents of mission bay have a voice in this! (*Erin Collins, email, July 17, 2015 [*I-Collins-1*]*)

---

1) The additional auto trips generated by this project will have far-reaching impacts across the entire SOMA district, including on the Embarcadero, and the on-ramps to the eastbound lanes of the Bay Bridge from Bryant, Harrison and First Streets. These are already heavily congested freeway access points.

2) Indeed, it will have a regional impacts on highways, including the Bay Bridge/580/880 maze and 101/92 interchanges, much as Giant's games currently do. On dates with overlapping events at AT&T and the proposed project, traffic will likely be negatively impacted for 8+ hours, including the main auto egress points out of the Financial District.

(*John Cornwell, email, July 27, 2015 [*I-Cornwell1-1*]*)

I believe that the proposed stadium will unequivocally add unbearable congestion and stress to the current neighborhood environment, besides creating an impossible situation for the local services including Fire Stations, and healthcare providers such as USCF and Kaiser Permanente.

My co-workers, many of whom are also homeowners in the Soma/Mission Bay have already been impacted by the traffic caused just by the SF GIANTS' home games! Many of us have had to adjust our work hours to

avoid the traffic gridlock. This congestion has also impacted the health and welfare of our outside environment and has impeded our enjoyment of daily walks and outside lunching— which we deem necessary to keep up our health and sanity. (*Micki Cunningham, email, July 23, 2015 [*I-Cunningham-2*]*)

This stadium project absolutely promises additional traffic logjams and parking nightmares. (*Micki Cunningham, email, July 23, 2015 [*I-Cunningham-4*]*)

I DO NOT HAVE ANY FAITH, that the City Officials will be able to provide any traffic control that will alleviate the hellish congestion created by this proposed project. (*Micki Cunningham, email, July 23, 2015 [*I-Cunningham-6*]*)

I wish to comment on the Warriors/Mission Bay project. I was recently informed that Kaiser Permanente medical offices will be moving in the Mission Bay Area early 2016. My doctor and my elderly mother's doctor will be located there. My concern is the traffic especially during game days/special events. Yes, I can plan in advance my appointments but in case of an emergency or urgent care appointment I do not want to be stuck in traffic. I am not a basketball fan and I would not know when game days /special events are. I prefer to drive my mother to her appointments and I would not consider taking an 80 year old woman in a wheelchair on MUNI. I was born and raised in San Francisco and I respect the development of The City. So I hope the necessary steps will be considered to make automobile traffic flow better in the areas of the UC hospital and Kaiser Permanente Medical offices in the Mission Bay Area most of the time and especially during game days and special events. (*Marian Dalere, email, July 27, 2015 [*I-Dalere-1*]*)

I am writing to express my concern about the proposed new stadium for the Golden State Warriors in the Mission Bay area. I feel that this new complex will have a huge negative impact upon the UCSF Mission Bay medical center and upon the patients which it serves. The traffic congestion created by this new sports complex will make it very difficult for patients and their families to reach the medical center, which could delay urgent or emergency medical care. It is far more important to be able to provide care for the children and families of San Francisco and the larger Bay Area, than to meet the needs of the Golden State Warriors. (*Art D'Harlingue, email, June 22, 2015 [*I-D'Harlingue-1*]*)

I am concerned about the dangerous impact of having the warriors stadium/concert hall across the street from the ucsf childrens hospital. I feel like this part of the city already has issues during the baseball games at ATT park, sometimes hidering [sic] staff from getting where they are vitally needed in a timely manner. I also think its a burden stressed parents should not have to deal with. These streets cant handle much more congestion. I hope these concerns are looked at before anything is built because I think it will have a very negative impact on our facility. (*Ragina Dhillon, email, June 24, 2015 [*I-Dhillon-1*]*)

It would cause too much traffic for the area; is too remote and difficult to access; (*Helen Dickey, email, July 13, 2015 [*I-Dickey-2*]*)

I am an employee at UCSF and mother to a small child. I am writing today to share my very serious concerns for the Warriors stadium planned for the Mission Bay area of San Francisco. I commute every

day to work along both the Bart and Muni lines (either T or 55). I have literally lost sleep about the commute home on days where the Giants are playing as it makes the commute home absolutely terrible and I am often late to pick my child up from daycare. Commuter trains are packed, late, or they get stuck after on a few stops due to the huge foot and car traffic that results on game days. Busses that were added that can sometimes avoid the Giant's stadium (55, Mission Bay Shuttle, UCSF Shuttles) are no better as cars in the area are desperate to find ways around the traffic and they clog up every side street and major through way for blocks around. (*Desiree Dieste, email, July 27, 2015 [*I-Dieste-1*]*)

Kindly refrain from pursuing a plan to build an enormous arena and event center in such close proximity to UCSF Mission Bay. My daughter is a patient at UCSF Mission Bay and I can see that traffic congestion would likely impede patient access to critical care medical services. (*Jeanie Dorrance, email, July 13, 2015 [*I-Dorrance-1*]*)

Keep the Warriors in Oakland. This is an incredibly ill conceived plan and will result in traffic beyond belief! You propose a few traffic cops to help with the congestion and a few hundred parking spaces?

Surely you must be insane! Have you been in that neighborhood now with the gridlock? No point in directing traffic in complete gridlock. (*Alaina Fischer, email, June 10, 2015 [*I-Fischer-1*]*)

I am writing to express my personal concerns over the planned stadium at Mission Bay. I am a professor and faculty member at the University of California, San Francisco, and my research lab and office are located on the Mission Bay Campus. The traffic in this region of the city is terrible on many days, especially those that have an event at the baseball stadium. A few months ago it took me 2 hours and 40 minutes to drive a car from Mission Bay across the Bay Bridge. This is completely unacceptable, and it highlights that the growth in this region of the city is outpacing the infrastructure for transport into and out of the region. As you know, this traffic problem is only going to get worse if this new proposed stadium is built in Mission Bay. Therefore, I oppose this new stadium, and I believe that the city should oppose this new construction also. (*Michael Grabe, email, July 27, 2015 [*I-Grabe-1*]*)

3rd street is a parking lot when Giants' games get out. When the two seasons overlap, it will be catastrophic to the locals and those trying to reach the Bay Bridge. (*Cassidy Hansen, email, July 27, 2015 [*I-Hansen-1*]*)

Unless a way could be devised to inhibit/divert the majority of extra cars coming into the city with some sort of shuttle service (we know Muni cannot handle it), Mission Bay is going to suffer. Let's also remember there is a hospital with emergency capabilities there. It would be devastating to generate a bunch of gridlock right around a major hospital. (*Cassidy Hansen, email, July 27, 2015 [*I-Hansen-3*]*)

The proposed arena would be a major contributor to an already overly congested area. (*Constance Harvey, email, July 23, 2015 [*I-Harvey-2*]*)

Additionally, the project will further hinder access to other parts of the City and the Bay Bridge to Mission Bay. Even with the improvements promised by the City, Mission Bay cannot handle up to 18,500 fans at 225 events per year, especially when both stadiums have games. Parking will also be a nightmare, with less than

200 dedicated parking spaces for the 18,500-seat entertainment center. While restricting the number of parking spaces may be considered a means of traffic management under the City's regulations, the practical effect will be yet more gridlock … (*Alison Heath, email with letter attachment, date [*I-Heath-3*]*)

Meantime, our quality of living has suffered and it is now impossible to even go to the grocery store without encountering traffic jams. When there is a game at AT&T, traffic is a nightmare and getting worse every day. We were told that measures would be taken to alleviate traffic problems when that stadium was proposed – that has not happened. At the beginning, there were traffic cops to assist with the traffic flow but they disappeared pretty quickly. **My street has become a thoroughfare before and after the games and I take my life in my hands trying to back out with cars racing up and down the hill.** On Sunday, the cars used my street to bypass the runners during the San Francisco Marathon—one after the other coming up the hill from 3rd Street to get onto the 280 south freeway. They are not polite and slide through the stop signs! (*Dorothy Hill, email, July 27, 2015 [*I-Hill_D-2*]*)

---

d. Restrict traffic along some of the main streets during the events for a smother flow of traffic.

e. During game/event time, work with Caltrans and the city to use a electronic freeway/street type of sign to help direct the traffic before they get in to the Mission Bay area, these events. They are doing this now when freeway sections and the bridge/s close and it works fine.

(*Dennis Hong, email, July 27, 2015 [*I-Hong-9*]*)

With all that said; a little more work needs to be done with communicating and working on the traffic issues, especially how this will or will not impact the Hospitals operations. (*Dennis Hong, email, July 27, 2015 [*I-Hong-19*]*)

"First, the traffic congestion impact feared by many at the Barclays Center site for the most part did not materialize. As a transportation professional involved in the project from the government agency side, the biggest story for me was that the fear of congestion generated by the arena so greatly exceeded the actual impact that when the facility opened traffic congestion was more or less a non-story. This was due to a number of factors, but the two most important were that transit utilization did meet the project goals, and that vehicle arrivals to the arena were more spread out than projected, as many people who drove came early to the area to go to nearby restaurants, bars, etc. Given this, I am happy to see that this EIR does focus on transit investments. Also, developing retail at the site as proposed will encourage some people to arrive early and eat or drink before an event. This should among, other potential benefits, disperse traffic impacts" (*Christopher Hrones, email, June 30, 2015 [I-Hrones1-2]*)

Aren't things bad enough already? How can you consciously decide to add yet one more traffic creating, system clogging stadium to an area already mired by traffic jams. It should not take us 1.5 hours to get to the east bay during game time, or an hour and a half to get to the embarcadero from the Bayview if there is a game at any point that day, but it does and we endure. Now you're going to add to the infrastructural nightmare? And for what? We already know that the residents of the Bayview neighborhood factor the least in all city planning decisions, but to essentially ensure gridlock along the only pathway from it to the main segment of the city, and along the least efficient public transit line to boot (the T?) When do the concerns of the constituents finally stack up against the dollar signs? Where is the city planner who has chosen to do this to our city? Have they been to the neighborhood during game time? Have they commuted to and from the Bayview during a 6:00 Giants let-out? Only 2 months ago it took me two and a

half hours to make it from the Bayview to the Exploratorium for a presentation, attempted arrival time 5pm. The game had let out at 3! If this city does not have the wherewithal to make it stop and improve our already laughable traffic conditions, can we not at least stop actively making it worse? Please, don't shut down transit for all. Find another location! (*Brynn Hurlstone, email, July 23, 2015 [*I-Hurlstone-1*]*)

I have serious concerns regarding the environmental impacts of the proposed Warriors Arena, which are not fully disclosed or fully analyzed in the Draft EIR.

have lived on Potrero Hill for a long time, and while it is perhaps a better place to live now than it was 50 years ago, recent development has drastically increased traffic and threatens to make parking impossible for residents. Building the Warriors Arena in this neighborhood will only exacerbate these problems. We already have serious gridlock at certain times of the day at the bottom of Mississippi Street where 7th and 16th Street come together. Soon we will become prisoners in our own neighborhood. (*Richard Hutson, email, June 29, 2015 [*I-Hutson-1*]*)

SF does not need more congestion and traffic problems; Parking lots and a new bus line will not solve the problem (*Kathryn Hyde, email, July 15, 2015 [*I-Hyde-2*]*)

The traffic has changed dramatically for the worse at Mission Bay (*Kathryn Hyde, email, July 15, 2015 [*I-Hyde-4*]*)

… the access to which could easily become compromised when traffic backs up. (*Lauris Jensen, email, July 13, 2015 [*I-Jensen-2*]*)

I am concerned about the impact on traffic and access for our patients. I also live in the area and feel that one sports complex in a crowded urban area is enough. (*Jennie Kajiko, email, July 25, 2015 [*I-Kajiko-2*]*)

<u>Unmanageable Traffic Flow</u>

Based on the dEIR, I have significant concerns about how the traffic will be monitored, handled, and directed around the proposed stadium. The idea that busses will transport people from more distant parking structures ignores the immediate problem of the complete gridlock in the area that blocks all movement in and around Mission Bay for 2-3 hours after Giants games. In looking at another recent stadium example that was also executed poorly, the busses that transport people to the train station from the 49ers Levi's stadium are overcrowded, infrequent and delayed by gridlock, making the trip between Santa Clara and San Francisco a four-hour journey after events. I fear that the proposed Warriors stadium will devolve into a similar unmanageable outcome.

I believe that two dedicated traffic lanes will be insufficient to handle the surge of traffic to this small, landlocked site. I recall all too well that the traffic lanes at Candlestick Park that were specifically directed and reconfigured to handle pre- and post-game traffic did not solve the problem of gridlock and congestion. And Candlestick had direct access to the freeway with no traffic contributing other than game traffic. In contrast, traffic along 3rd Street is already a problem. There is a major traffic flow every afternoon through the area along 3rd Street toward the Giants stadium that contributes significantly to the gridlock that follows every afternoon Giants games. Traffic congestion in the Mission Bay area is certain to continue to worsen as other already approved construction projects are completed and is likely

to be devastating to our environment if the Warriors project is approved. I am aware of businesses that have already moved from the area to escape the existing traffic problems, and it is certainly not wise public policy to contribute further to them.

The dEIR appears to assume that scheduling events in the evening will avoid traffic issues, but this seems unlikely if projections of traffic flow have not considered the contributions of all the approved projects that bring new residents and new businesses to the area, or the many occasions when there are coincident events at both the Giants and Warriors stadiums. Does the planning anticipate that attendees will arrive earlier and earlier as traffic and parking problems increase, so that the traffic to night games will inevitably encounter afternoon rush hour traffic? Does the planning address whether TV networks will be able to require earlier than normal Warriors game times? Will there be a stipulation that no event can be scheduled earlier than a certain night hour?

Other major cities with stadiums and sports arenas in urban centers have infrastructure to handle traffic. Madison Square Garden in New York City is serviced almost entirely by public transport. Cincinnati, which has adjacent football and baseball stadiums in its downtown, has adjacent ample parking lots with direct freeway access. By contrast, Mission Bay has no infrastructure to support the increased traffic. The claim recently made on the Michael Krasny forum that the number of attendees to Warriors games is 20% of Giants games does not compute—18,500 is closer to 50% of 42,000. The notion that Warriors' games would only overlap with Giants games on rare occasions ignores the larger number of other events the facility will host – and the combination of other events happening in the City in large spaces such as the Moscone Center that draw traffic through this area. It is not just the Giants games that impact the area and must be considered.

It must be understood as a given that traffic and parking issues will reduce access for emergency and urgent care for patients seeking health care services and will add to the existing commute challenges for the nurses, doctors and medical staff who work at the Mission Bay medical campus. The dEIR ignores the health and safety impacts of interfering with access to essential medical facilities.

Additionally, the project will further hinder access to other parts of the City and the Bay Bridge to Mission Bay. Even with the improvements promised by the City, Mission Bay cannot handle a surge of up to 18,500 fans, especially when both stadiums have games. Parking will be a nightmare, with less than 200 dedicated parking spaces for the 18,500-seat entertainment center. While restricting the number of parking spaces may be considered a means of traffic management under the City's regulations, the practical effect will be yet more gridlock and unhealthy air emissions.

I am disappointed by the City's failure to realistically consider the inevitable traffic problems and the compatibility of the project with the homes, businesses and hospitals already located in the area. There is already a major problem with traffic that the City has not addressed and the modest improvements to public transport and efficiency of existing traffic lanes that have been proposed solution seem to be woefully insufficient. Certainly, the claim that there is already ample infrastructure and public transport to handle traffic is false, and the problem will only be exacerbated by the growth that is already approved. (*Thomas Kornberg, email, July 17, 2015 [*I-Kornberg-1*]*)

The stadium would impact the already overloaded traffic/parking … in the city. Regardless of proposed income incentives from this project, I feel we have too many outsiders coming into the city and they only add to the traffic/parking … (*Donna Lange, email, July 23, 2015 [*I-Lange-1*]*)

I fully agree with John deCastro's position on the Warriors project (I've pasted a copy of his letter below). I am already concerned with the level of traffic and congestion in our neighborhood and on the highway exits that bring us home. The city has not presented solutions to our current problems, and so I have no confidence in any action in the future. Also, these traffic and parking troubles won't only affect the residents here, they will affect the potential ticketholders and event-goers. If the arena develops a reputation of being difficult to get to and relentlessly hard and expensive to park at the attendance

numbers will be affected. I currently oppose the new arena because of the lack of planning for transit. (*Amy Laverdiere, email, July 27, 2015 [*I-Laverdiere-1*]*)

The infrastructure is not in place to accomodate [sic] the immense increase in traffic to the area, if a new stadium is built in the proposed location. I am concerned that staff, patients and families will have an undue amount of stress and increased travel time to and from the hospital on game days (already experienced on Giant's home game days). It took more than an hour to go 2 miles on the last Giant's home game day, and I would expect this issue to occur routinely if the proposed stadium is built. (*Rachel Leavitt, email, June 29, 2015 [*I-Leavitt-1*]*)

Having the Stadium built across from the medical center will surely impact the quality of life for all the employees in how they get to and from work. I commute across the Bay Bridge, which isn't bad now (30min average commute), but am very afraid that the numerous game days will extend this. Public transportation is not efficient enough to get me to work in the same amount of time or less. I work 12-hour night shifts from 7pm to 7:30am the next morning and when i get off work, i just want to be home and in bed. (*Tina Ly, email, July 2, 2015 [*I-Ly-1*]*)

We who work in Mission Bay already face many days a year in which a normally 35 minute commute home takes 60 minutes or more due to traffic congestion from Giants' games. Even if we like baseball, it makes us glad whenever the Giants are away or baseball season is over. For those away or off season days we actually get a sensible commute time. (*Kim Osborn, email, July 27, 2015 [*I-Osborn-1*]*)

If the traffic were more congested after dark, that would probably be fine. During the day time, however, the Giants' stadium congestion is already enough of a challenge. (*Kim Osborn, email, July 27, 2015 [*I-Osborn-3*]*)

It really isn''t [sic] fair to take a neighborhood already seriously damaged by the congested traffic around AT&T ballpark events to endure a doubling of the traffic with the Warriors' stadium. (*Kim Osborn, email, July 27, 2015 [*I-Osborn-4*]*)

---

1. Traffic to stadium may occasionally during game days impede or interfere with traffic flow to SF Hospital nearby (*Robert Pollak, email, July 23, 2015 [*I-Pollak-1*]*)

It is already very difficult to commute in and out of the area, so much so that some co-workers have resigned their positions since we left the Parnassus campus. I will also likely resign if this stadium is built. I work in an Intensive Care Unit, and cannot withstand the additional stress of negotiating gridlock at the end of my workday.

The report that traffic can be managed in the area when the new stadium is built is not realistic, and leads me to suspect financial motives/bias in the 'experts' generating this report.

I also cannot imagine adding to the stress of parents with sick children, who already find it difficult to travel to the new Benioff campus. (*Kay Ramsdell, email, June 24 2015 [*I-Ramsdell-2*]*)

As a medical practitioner, I think it is important to ensure that there are adequate provisions for traffic to and from the Mission Bay hospital site in normal and emergency conditions, that parking for hospital employees and patient-families is prioritized and that there is attention to very sensitive environment of a high-acuity hospital, where many patients and their families are under terrific stress. In this regard, behavior of attendees leaving sports or concert events in the neighborhood of the hospital vicinity is an important concern.

I think that clear plans to address these issues are needed to determine suitability of the Warriors Stadium located across the road from a busy hospital. (*David Rowitch, email, July 23, 2015 [*I-Rowitch-1*]*)

I work at UCSF Mission Bay and am convinced that the proposed arena development is a huge mistake. I am fortunate to be able to walk to work, but for my colleagues game days at AT&T Park already involve forward planning, changes to schedules, or work from home. Traffic is awful and the already glacial Muni cars are further slowed. (*Gavin Rynne, email, July 27, 2015 [*I-Rynne-1*]*)

- The post-game traffic planning involves shutting down 3rd Street to northbound traffic. This is justified to allow pedestrian traffic to get onto Muni.
- Therefore, all northbound traffic will go on TAF northbound.
- The Giants development plan calls for closing TAF north of Mission Rock Street. TAF is currently often closed at the north intersection with 3rd.
- The Police and Fire station limits cross traffic on Mission Rock and China Basin Streets. They limit traffic when there are ball games; it is reasonable to expect that they will do likewise during arena events.
- Thus, **all northbound TAF traffic will need to funnel through Mission Bay Blvd North**.
- Mission Bay Blvd North is a single lane road adjacent to residences and a park. It is the only reasonable ingress/egress point for residents of the Radiance and the Madrone.

My question: Has this untenable situation been discussed, and accepted as the correct approach? Or, has this not yet been fully considered? If the later, I hope to raise awareness and effect a change to this plan. (*Todd Simpson, email, June 18, 2015 [*I-Simpson1-1*]*)

All northbound traffic after arena events will end up on a one way one lane residential street (Mission Bay Blvd North) as all other connectors to 3rd Street from Terry A. Francois are blocked or closed (due to Giants and/or PSB).

This is unacceptible [sic]. (*Todd Simpson, speaker card, June 30, 2015 [*I-Simpson2-1*]*)

I am from NY City, I realize change happens, areas get rejuvenated! There needs to be thorough and realistic approach to any considerations of any further developments. Quite frankly, lives are at stake. The area already has enough congestion and lack of insightfulness around how to alleviate the already cramped roadways in the Mision [sic] Bay area. The impact of such a large stadium in this hospital area would be multifold. I am writing this letter in hopes for more to gain insight into actually what we are doing here everyday at UCSF, this isn't about money, getting stuck in traffic on the way to /from work, this is about providing efficient, reliable, state of the art healthcare. The city of SF needs to reevaluate what its primary goals are and be thoughtful about how major decisions such as an arena could single handedly increase the mortality and morbidity of its citizens. Is this really worth it? (*Christine Smith, email, June 19, 2015 [*I-Smith-3*]*)

---

4. Egress from Mission Bay South to the west occurs via the traffic circle and via 16th/Mariposa corridors. The arena attendees will be encouraged to use the 16th and Mariposa corridors or to exit to the north, but I suggest that they be actively diverted away from Mission Bay Blvd. MB Blvd doesn't show up as a preferred route but it is hard to interpret from the maps whether the traffic will be kept away from it. The residents of Mission Bay South, and those of Mission Bay North via the west end of Berry St, will rely on the traffic circle to be able to get in and out of their homes during pre- and post-event times. If arena traffic is pouring westward through the traffic circle, the residents will be trapped in Mission Bay or prevented from reaching it, especially as the Caltrains come through. The traffic circle should be reserved for non-event traffic. Please note that from my experience on Berry St before the west end was completed through Mission Bay Drive to 7th St, we were trapped on Berry whenever there was pre- or post-AT&T Park traffic, and we had to plan to not leave home or come home during those times via car or transit. If the traffic circle becomes held hostage to event traffic as well, then everyone in Mission Bay will experience unacceptable access limitations to their homes. (*Matt Springer, email, July 16, 2015 [*I-Springer-4*]*)

I'm not in favor of:

More traffic near the UCSF hospital/medical offices
More traffic in SOMA
More traffic on the bay bridge
Parking issues

(*Kaylah Sterling, email, July 13, 2015 [*I-Sterling-2*]*)

The idea that there would be more than 225 traffic-generating events per year at the proposed Warriors Arena, which is much closer to our campus and hospital than AT&T Park, is a nightmare that can not be alleviated by having policemen direct traffic. The fact that events at AT&T Park and the proposed Warriors Arena would coincide more than than 30 time a year is truly horrible. No one will be able to go to or from work on those days, or get to our hospital, without delays that are completely unreasonable.

Access to the Bay Bridge and to the south, as well as to the hospitals, will also be tremendously compromised by the gridlock that will ensue when fans come to the stadium. Bay Bridge commuters have to go north, and 3rd and 4th streets will be impassible or perhaps closed to cars in order to allow the Muni to run. The Mariposa freeway entrance and exit can take only very low traffic flows, nothing like the freeway entrances and exits at the present Warriors arena in Oakland. (*Michael Stryker, email, July 26, 2015 [*I-Stryker-3*]*)

I am a physician at UCSF Mission Bay (research buildings, not the recently opened hospital) and am concerned about the impact to traffic a new Warriors stadium will bring to the area. I commute daily to Mission Bay by car and have already noted a significant increase in traffic since the hospital opened. On days with Giant's games or other events, traffic is pretty much a stand still.

There are currently only really 4 options into and out of Mission Bay for the vast majority of people coming from the city, or bay bridge. When one consults a map, you can see that you need to take either 16th street west, Mariposa West, or you can take 3rd or 4th street north. The entire Portrero Hill area cannot exit west unless at 16th, 17th street or all the west south to Cesar Chavez. This creates huge bottle necks at 16th and Mariposa, which are at times only single lanes due to construction or people making left turns.

7th street or Owens street to 7th street will NOT be a viable option. The intersection of Owens to 7th Street is very complicated, spanning 2 lights and a busy Cal Train crossing. People who want to turn onto

7th from Owen often cannot because during rush hours, 7th street is a parking lot and the Cal train is frequently passing by.

Let's not even try using 3rd and 4th street to exit/enter Mission Bay during a Giant's game, let alone a Giant's game and/or other events at the proposed Warriors stadium.

The ability for patients and healthcare givers to access Mission Bay in a timely manner is of paramount importance, and another giant, busy public venue such as the Warrior's stadium will certainly impede that. (*Richard Tsai, email, July 23, 2015 [*I-Tsai-1*]*)

Considering the new UCSF hospital and current traffic jams in the Mission Bay Area locating the Warrior Stadium in the area if absurd and should not be allowed by city. Certainly, the owners of the 12 acre parcel have a profit motive with utter disregard for the crowded development around the area. Hope that the civic minded authorities in the city hall will prevent this from happening. (*Girish Vyas, email, July 15, 2015 [*I-Vyas-1*]*)

"Please do not allow a stadium to be built next to the hospital. This is a crazy plan. The MTA says it will have solutions for traffic. Does anyone who lives in this city believe the MTA about anything? Just look at the job they are doing now with traffic 'solutions'. I am a native San Franciscan and enough is enough!!!" (*Priscilla Wheeler, email, July 24, 2015 [*I-Wheeler1-1*]*)

"The idea that the MTA will come up with traffic solutions is laughable on the face of it. (*Priscilla Wheeler, email, July 24, 2015 [*I-Wheeler2-3*]*)

I am a San Francisco native, a UCSF employee of 10 years at the UCSF Mission Bay campus and a Warriors fan. I am concerned about how traffic will be directed during Warriors games if the stadium is built at Mission Bay. We already have severe traffic congestion during SF Giants game time. (*Joanne Williams, email, July 23, 2015 [*I-Williams-1*]*)

What will happen when there is a Giants and a Warriors game during rush hour? I can't see how this will work, especially for the UCSF patients. (*Joanne Williams, email, July 23, 2015 [*I-Williams-3*]*)

Impact TR-2 and TR-3. While parking in and of itself is not considered a significant environmental impact (based on SB743), the traffic caused by searching for (acknowledged inadequate) parking, or drop-off/pick-ups around the Arena, will create a significant and unavoidable impact, even with mitigation. If this neighborhood is to survive the impact of the arena in addition to the already unacceptable conditions that result from ballpark events, there needs to be effective mitigation of the unavoidable impacts. The SEIR suggests mitigation strategies that "could" be implemented "if feasible", but there are no teeth in the recommendations. Mitigation measures must be specific and enforceable through permits, conditions, agreements or other measures. Mitigations contingent upon further (required) discretionary approvals may not be enforceable, and cannot be deferred. The SEIR mitigation strategies need to be tightened up so that "could" becomes "shall", and the necessary mitigations are stated as conditions of project approval. (*Corrine Woods, email, July 27, 2015 [*I-Woods-2*]*)

Geographical constraints make access to the area problematic already. To the east is the Bay. To the north there are only two access routes, namely 3rd and 4th Streets.

To the west, the Mission Bay Boulevard extension to 7th Street has not been completed. Sixteenth Street also runs east/west. It crosses the railroad tracks at 7th Street and dead ends at Illinois. Much of the local traffic uses 16th Street to access retail establishments in Potrero, the Mission and beyond. Access to the new UCSF Medical facilities is accomplished by taking 16th Street. Seventh Street extends south, crossing 16th Street and becomes Mississippi Street. This is taken to access southbound Highway 280 from Mariposa Street.

Mariposa Street also runs east/west. It is a primary entrance and exit point for traffic using Highway 280. The ramp northbound frequently gets backed up for up to one-half mile during normal commute times. The ramp to southbound 280 is heavily used and traffic on Mariposa during normal days can be brutal during the afternoon commute. From the south, 3rd Street and Illinois Street allow access to César Chavez and Pennsylvania to access Highway 280 south.

In reality, there are limited points of ingress and egress to the project area. The streets are either one or two lanes in each direction. Many are controlled by signalized intersections and the freeway entrance and exit ramps are poorly designed to handle significant traffic. These ramps were built decades ago and have not been modernized to reflect current demands.

To make modifications would be costly and is in conflict with the City's transit first policy. The old adage, "you can't have it both ways" comes to mind. The City would resist making improvements and modifications that might actually increase vehicle traffic efficiency and effectiveness because it contradicts established policy.

The City would also have to coordinate with other local and state agencies to accomplish any improvements to freeway on and off ramps. It is unknown what funding sources would exist to do this type of work. Local community groups would surely oppose such measures. In short, this appears to be a non-starter, which bodes poorly for the proposed arena attendees, local residents in the area and other merchants or businesses that are reliant on the use of these public roadways. (*James Zboralske, email, July 27, 2015 [*I-Zboralske-18*]*)

Twice this last week, for example, between 2:00 – 2:30 p.m. I observed northbound 3rd Street backed up (bumper to bumper) from South Street all the way to King Street and beyond. In both instances it took vehicles over 35 minutes to traverse this short distance. Yes, I stayed, watched and timed a truck. Terry Francois Boulevard was no better, being backed up around the bend all the way to Pier 50. It was an absolute mess and the drivers were frustrated.

Oftentimes when the traffic lights at the signalized intersections turned green no more than a dozen or so cars could get through. This is because the signal light cycles are not long enough and may not be synchronized. The "bottleneck upstream" that was causing the congestion clearly wasn't being handled properly. The "bottleneck upstream" in this instance was the temporary closure of King Street between 3rd and 4th Streets. One closure (or other incident that blocks a road) had the cumulative ripple effect of bringing an entire section of town to a virtual grind for a period of hours. I have gone out to this location on five occasions and spent an hour or two watching traffic, watching the efforts of traffic control personnel and have been unimpressed. It's not uncommon for the traffic control staff to simply stand on the sidewalk and watch the gridlock. They only seem to intervene when somebody tries to do something unsafe.

At the intersection of 3rd Street and Townsend I found two PCOs manually overriding the signal in an effort to facilitate traffic flow. Unfortunately, neither was engaging and controlling the pedestrians and bicyclists in the area. At that location, 3rd Street has four lanes of traffic (one way) heading north. There were so many pedestrians in the area crossing the street that vehicles wanting to make left or right hand turns onto Townsend, Brannan or Bryant could not turn and had to wait. This means two of the four lanes did not flow. No efforts were being made to stop all pedestrians, at some point, and allow vehicles to

proceed and turn. The City's effort to mitigate this street closure (planned for about a month during weekday hours) is pretty dismal.

All it takes is one incident to bottleneck and clog any of these arteries for hours. It is blatantly irresponsible and defies logic to believe that hundreds if not thousands of cars will descend on the Mission Bay, Dogpatch and Potrero areas over 260+ times a year without a level of congestion and disruption

To reiterate, traffic control duties can be quite difficult and require significant resources and constant engagement. Simply standing at a signal light control box and manually controlling the light cycle at signalized intersections is not sufficient to ensure the safe movement of vehicles, bicyclists and pedestrians. Active engagement and proper use of traffic control devices (cones, barricades, signs, flares, reflective sleeves and message boards) is also required. (*James Zboralske, email, July 27, 2015 [*I-Zboralske-21*]*)

"I am amazed at the congestion and traffic gridlock trying to access the Bay Bridge. I also see Giants fans parking in lots and on the streets along the way. Once again, on a normal non-game day, the traffic gridlock on these streets is often remarkable. On game days it can be worse. I see people in their Giants garb driving, parking and wandering the area hours before the opening pitch. There is no reason to believe Warriors fans and other event attendees will not come to the area hours before an event. When "newbies" to the area discover how bad navigating the City can be they will likely: adjust schedules to arrive even earlier, decide not to come as often or look at public transportation options." (*James Zboralske, email, July 27, 2015 [I-Zboralske-23]*)

"I am very concerned about the negative impact of traffic and parking in the neighborhood by the proposed stadium at 3rd and 16th Streets.

"Currently, when there is an event at the Giants Stadium, my commute to the Financial District is doubled, be it by car, T-train, or bicycle, due to the influx of people to the neighborhood. Furthermore, parking in the neighborhood is filled with fans, and makes it difficult for residents returning from work." (*Andres Battat, public hearing transcript, June 30, 2015 [PH-Battat-1]*)

"I only ask that you guys go out to that area during commutes and see how bad the traffic is now. The Third Street corridor already is saturated.

"And, you know, this isn't about the surface streets in the that [sic] area. That's bad enough. But you're talking about the Bay Bridge. We all know that the Bay Bridge rush hour starts at 2:30 and goes to 8:30. So, now are we ready to basically have there be no non-rush hour, for the morning rush hour to run into the afternoon rush hour?

"Even if you have 80 percent traffic utilization, already traffic is at a breaking point in San Francisco. I think we all know that from everyday experience. It's not smart urban planning.

"These EIR statements about, There will be adequate -- yeah, there may be transparency, but that still doesn't change the fact that it is a huge impact, and it's not a proper use. And you can do all the mitigation you want, but there's not the ability to add bandwidth and traffic capabilities around there. That's common sense." (*John Cornwell, public hearing transcript, June 30, 2015 [PH-Cornwell2-2]*)

"And my biggest concerns are, as I look at 6.2, "significant unavoidable impacts, specifically transportation and transit." Those are a mess today.

"And I echo the other speaker that suggested that you might want to come down there between 4:00 and 6:00 in the evening and take a look at that 280 and Mariposa interchange – Mariposa and Pennsylvania Street, 16th and 7th Street. It is a disaster four nights out of five, especially Thursday night. Every time the Giants have a day game, the traffic starts backing up at 2:00 – 1:30 or two o'clock and never quits" (*John deCastro, public hearing transcript, June 30, 2015 [PH-deCastro2-1]*)

"We talk about a "Transportation Management Plan" in 6.5. Where is it? I don't trust the City or the MTA to come forward with a decent Transportation Management Plan when my wife and I tried to go to a Giants game on Sunday, and we waited -- we checked the next Muni -- 58 minutes to the 10. My wife is disabled. I had to call a taxi so we could make our ballgame. That was the only way we could get there, because she couldn't walk down to the T. It was way too far." (*John deCastro, public hearing transcript, June 30, 2015 [PH-deCastro2-2]*)

"6.2 calls traffic "an unavoidable impact." Today, without a game, the traffic is backed up every night and almost every morning at the 280. I have learned ways around the neighborhood and some way to do that." (*John deCastro, public hearing transcript, June 30, 2015 [PH-deCastro2-3]*)

"As you know, the area around the hospital and clinic facilities at Mission Bay is almost like a small island unto itself, with a very narrow corridor between the Bay and the highways. It is an increasingly dense community with little public transportation that can become easily congested.

"A major additional project such as this will undoubtedly increase congestion during the events it is intended to house. We know that the games or other special events -- in those narrow corridors, the traffic can result in gridlock and can limit access for everyone, and that is our major concern.

"What will the City do to ensure the patients who need the highly specialized care that we provide, and other patients coming to Mission Bay -- will they have access in a timely manner when they need it -- 24 hours a day, every day of the year, including during games, concerts, or other special events?

"What will the City do to ensure the parents of the children I care for and members of other patients --will they be able to get to the hospital to be by the side of the -- of their loved ones?

"What will the City do to ensure that nurses like myself and doctors and other healthcare professionals and personnel will be able to get to the hospital and clinics at Mission Bay to care for our patients?

"In a small, densely-packed city such as ours, congestion that affects public health and safety must always be addressed, and the needs of the whole community, not just the wealthy developers, must always be addressed." (*Anna Fernandez, public hearing transcript, June 30, 2015 [PH-Fernandez-1]*)

"In the interest of time, I'm going to focus on three things which seem to come up the most today, which are traffic congestion, parking, and emergency vehicle access.

"As far as traffic congestion goes, the impact feared by many of the Barclays Center site, for the most part, did not materialize.

"As a transportation professional involved in the project from the government agency side, the biggest story for me was that the fears of congestion greatly --were greatly -- were exceeded by -- greatly exceeded the actual impact, so that when the facility opened, traffic congestion was more or less a nonstory.

"This was due to a number of factors, but the two most important were that transit utilization did not meet the project goals, and that vehicle arrivals to the arena were more spread out than projected." (*Christopher Hrones, public hearing transcript, June 30, 2015 [PH-Hrones2-1]*)

"If the issue is traffic congestion, it can be managed. Hospitals throughout San Francisco are in locations that deal with access issues every day." (*Jim Lazarus, public hearing transcript, June 30, 2015 [PH-Lazarus-1]*)

"We do not need the traffic. We do not have enough parking/

"Again, you know, the BART station doesn't go in that direction, so more people are going to be driving in. So, number one, the concern is to definitely avoid the traffic congestion.

"One employee said that when he's driving out of the parking area to go home, and if there's a Giant's game, it takes him about 30 minutes just to drive one block, and it takes about two hours or two-and-a-half hours just to get out of the area and to catch the freeway. So, in thinking about that, the infrastructure is not suited for a stadium. It's not suited to bring 18,000 fans into this area." (*Annabel Ortiz, public hearing transcript, June 30, 2015 [PH-Ortiz-2]*)

"The only comment I'd like to make is consistent with all the comments I have made in the prior workshops regarding this project, and it deals with two things: Primarily, the traffic impacts and the neighborhood impacts, which are related." (*Chairperson Rosales, public hearing transcript, June 30, 2015 [PH-Rosales-1]*)

"Additionally, the project will further hinder access to other parts of the City and the Bay Bridge to Mission Bay. Even with the improvements proposed by the City, Mission Bay cannot handle up to 18,500 fans and 225 events per year, especially when both stadiums have games." (*Damion Scott, public hearing transcript, June 30, 2015 [PH-Scott-3]*)

"The proximity to the hospital, which the nurses' association is pointing out, makes it difficult to get to that location. And I know from living two blocks away from the proposed site how bad the traffic is now with just the AT&T traffic in that area." (*Michael Sesich, public hearing transcript, June 30, 2015 [PH-Sesich-2]*)

Response TR-4: Traffic Impacts

The comments generally raise concerns that the vehicular traffic generated by the proposed project would result in a substantial increase in existing congestion levels in the project vicinity, and express concern for visitors to the nearby UCSF medical facilities and residents within Mission Bay and Potrero Hill. A number of comments express concerns regarding existing congestion associated with events at AT&T Park, particularly afternoon baseball games that start around 1:00 p.m. and end around 4:00 p.m., and concerns regarding increased commute times.

Proposed Project TMP and Mission Bay Plan Infrastructure Improvements

SEIR pp. 5.2-46 – 5.2-69 present the project transportation improvements that would be provided as part of the project. These include improvements related to the physical transportation infrastructure adjacent to the project site, including travel lanes, sidewalks, bicycle lanes, traffic signals, and light rail platform, as well as transit service improvements such as the expansion of the Mission Bay TMA shuttle system, provision of the Muni Special Event Transit Service Plan, and a Transportation Management Plan (TMP) for operations of the proposed project. The TMP provides for, among other things, pre-event and post-event operation of the curbs adjacent to the project site to accommodate shuttles stops, and taxi zone, and passenger loading/unloading zones. The TMP also includes Transportation Demand Management (TDM) strategies designed to reduce use of single-occupant vehicles and to increase the use of rideshare, transit, bicycle, and walk modes for trips by employees and visitors to and from the project site. Thus, the project includes a comprehensive plan, developed with the SFMTA, to accommodate access to and from the project site during events. As noted on SEIR p. 5.2-60, temporary lane closures would be implemented on Third Street between Mariposa Street and Mission Bay Boulevard South, on South Street between Third Street and Bridgeview Way, on 16th Street between Third Street and Terry A. Francois Boulevard, and on Illinois Street between Mariposa and 16th Streets. As indicated on SEIR p. 5.2-60, the temporary lane closures would be implemented prior to the end of the event, and would remain in place for approximately 30 to 45 minutes after the end of the event, or until vehicular traffic dissipates and most event attendees taking transit have boarded. The SFMTA PCO Supervisor would determine when the temporary lane closures would end based on traffic conditions following an event.

Some comments refer to the roadway infrastructure in Mission Bay as incomplete and the I-280 freeway ramps configuration as obsolete, and identify coordination with local and state agencies, funding issues, as well as community opposition, as obstacles to implementing improvements in a timely manner. Although, as of today, several roadway links in Mission Bay are not completed, such as the extension of Owens Street between 16th and Mariposa Streets, the extension of Mission Bay Boulevard to the west to connect with Mission Bay Circle, or the extension of Channel Street to Owens Street, as discussed in the SEIR (pp. 5.2-6 - 5.2-7) these improvements are all part of the Mission Bay South Infrastructure Plan, are approved and funded, and are expected to be completed prior to the opening of the proposed project. Similarly, the Mission Bay South Infrastructure Plan, as described on SEIR p. 5.2-7, includes the widening of the I-280 off-ramp at Mariposa Street and the signalization of the adjacent I-280 on-ramp. These freeway ramp improvements have been approved by Caltrans, are funded, and are expected to be completed by spring 2016, before the anticipated opening of the proposed event center.

Proposed Event Center Size and Event and Travel Demand Characteristics

A number of comments incorrectly state that the proposed event center would have 18,500 attendees for 225 events per year. The event characteristics at the proposed event center are presented on Table 3-3 on SEIR p. 3-39. It is currently anticipated that about 90 of the 225 events (i.e., 40 percent of events) would have an average attendance of 12,500 or more attendees, about 65 events (i.e., 29 percent of events) would have an average attendance of between 7,000 and

11,000 attendees, and about 70 events (i.e., 31 percent of events) would have an average attendance of between 3,000 and 5,000 attendees.

A number of comments incorrectly state that the project would provide 200 on-site parking spaces. The proposed project would provide a total of 950 on-site vehicle parking spaces, and, as part of the project, the sponsor has also acquired the right to park at 132 existing off-street parking spaces in the 450 South Street parking garage, accessed from South Street and Bridgeview Way directly north of the project site. Combined, the proposed project would have 1,082 vehicle parking spaces serving the project uses. Also see Response TR-13: Parking Conditions for a discussion of study area parking supply and demand assumptions used in the traffic analysis, which includes, in addition to the 1,082 parking spaces that would be provided as part of the project, the use of other nearby public parking facilities, including UCSF and Port-owned facilities. Response TR-12a: Traffic Mitigation Measures for discussion and impact analysis of two off-site parking facilities included as part of Mitigation Measure M-TR-11c: Additional Strategies to Reduce Transportation Impacts during Overlapping Events.

Several comments incorrectly refer to the proposed event center arena as a stadium and compare the potential project impacts on traffic congestion to those experienced in the vicinity of the 49ers Levi's Stadium in Santa Clara, or the recently demolished Candlestick Park in San Francisco. Some comments also suggest that traffic conditions before or after an event at the center would be comparable to those currently experienced before or after a SF Giants game at AT&T Park. As described in Table 3-3 on SEIR p. 3-39, the maximum capacity of the proposed event center for Golden State Warriors games would be about 18,000 seats. Most large concerts would be configured to accommodate up to 14,000 attendees, but certain, rare configurations (expected to occur no more than four times per year) could accommodate up to 18,500 attendees. As noted above, the total number of large events (those with an average attendance of 12,500 or more attendees) expected at the event center is estimated at about 90 per year. The maximum capacity at AT&T Park is 42,000 attendees, and the typical attendance at AT&T Park when traffic data was collected for the SEIR analysis was about 41,000. Maximum capacity at the event center (18,000) constitutes 43 percent of the maximum capacity at AT&T Park. Additionally, the event center's maximum capacity is 26 percent of Levi's Stadium (which has a capacity of 68,500 seats) and 25 percent of Candlestick Park (which had a capacity of 70,200 seats). Thus the proposed event center would have a maximum attendee capacity of between 25 and 43 percent of the three sport venues cited in the comments, and therefore, the extent of transit service, parking facilities, and roadway infrastructure required to provide access and parking to the project would be less for the event center. Thus, the proposed project would not result in a doubling of the traffic generated by a SF Giants game during overlapping events, as stated in a number of comments.

In response to the comment regarding arrivals to the event center, Table 5.2-21 on SEIR p. 5.2-83 indicates that only about 5 percent of basketball game attendee arrivals are anticipated to occur during the weekday p.m. peak hour. Please see Response TR-2d: Trip Generation regarding anticipated arrivals and departure assumptions used for analysis of basketball games at the proposed event center.

Existing Traffic Conditions without and with SF Giants Game

Existing traffic conditions for the four peak hours of analysis (i.e., weekday p.m., weekday evening, weekday late evening, and Saturday evening) at the study intersections and ramps are presented on SEIR pp. 5.2-7 – 5.2-16 for conditions without a SF Giants evening game, and on SEIR pp. 5.2-35 – 5.2-40 for conditions with a SF Giants evening game at AT&T Park. As indicated in the SEIR, level of service conditions at the study intersections are generally less congested during the weekday evening peak hour than during the weekday p.m. peak hour, although intersection LOS designations are similar at the intersections at the approaches to the I-80 and I-280 ramps. During the weekday late evening and Saturday evening peak hours, traffic volumes decrease substantially from weekday p.m. peak hour conditions and all intersections operate at LOS C or better. Intersection conditions in Mission Bay are affected by traffic associated with special events and during baseball season when the SF Giants have home games at AT&T Park. Transportation impacts associated with game day conditions at AT&T Park are most severe prior to games and after the conclusion of games. The greatest traffic congestion occurs after weekday afternoon sellout events (i.e., day games) that start around 1:00 p.m. and end around 3:30 to 4:30 p.m. Traffic, transit, and pedestrian flows exiting the ballpark (and game-day street closures near the park) coincide in time and direction with the evening commute traffic already on the transportation network. As a result, as noted in a number of comments, on days when the SF Giants play home games at AT&T Park, existing service levels at the study intersections are worse than on days with SF Giants evening games or when no SF Giants game takes place. The number of SF Giants day games at AT&T Park (i.e., those starting around 1:00 p.m.) is limited to about 9 to 12 per year (10 day games took place at AT&T Park during the 2015 season).

Proposed Project Traffic Impacts without Overlapping SF Giants Game

Analysis of existing plus project traffic impact analysis at the study intersections is presented in Impact TR-2 on SEIR pp. 5.2-117 – 5.2-132 for the No Event, Convention Event, and Basketball Game scenarios for conditions without an overlapping SF Giants evening game at AT&T Park for four analysis hours (i.e., weekday p.m., weekday evening, weekday late evening, and Saturday evening peak hours). Overall, under existing plus project conditions without a SF Giants game at AT&T Park, the proposed project would result in *significant* project-specific impacts at seven study intersections:

- King/Fourth (weekday p.m., weekday evening)
- Fifth/Harrison/I-80 westbound off-ramp (weekday evening, Saturday evening)
- Fifth/Bryant/I-80 eastbound on-ramp (weekday late evening)
- Third/Channel (weekday evening, Saturday evening)
- Fourth/Channel (weekday evening, weekday late evening)
- Seventh/Mission Bay Drive (weekday evening, Saturday evening)
- Seventh/Mississippi/16th (weekday p.m., weekday evening)

Regarding the comment from the California Highway Patrol about potential increased traffic congestion and the need for additional enforcement demands as a result of the project, the analysis identified Impact TR-2 in the SEIR. As summarized above, analysis of the proposed

project indicates that the additional vehicle trips associated with evening events at the project site would result in a worsening of intersection LOS conditions from LOS D or better to LOS E or LOS F, or from LOS E to LOS F, at two of the 22 study intersections during the weekday p.m. peak hour and at six intersections during the weekday evening peak hour.

Mitigation Measure M-TR-2a: Additional PCOs during Events would reduce the proposed project's impacts related to event traffic conditions, and Mitigation Measure M-TR-2b: Additional Measures to Reduce Transportation Impacts would require the project sponsor to continue to work with the City to establish additional feasible measures to reduce transportation impacts. These measures would reduce traffic congestion in the project vicinity by providing drivers information on traffic conditions and alternate routes, providing information on on-street and off-street parking conditions, discouraging use of on-street parking through the Residential Permit Parking program, encouraging non-auto modes through parking pricing, and enhancing regional transit access to the area, and would not result in adverse secondary transportation impacts. However, even with implementation of these measures, the arrival and departure peak of vehicle trips to and from the event center through these intersections would continue to occur, and therefore, the proposed project's significant traffic impacts would remain significant and unavoidable with mitigation.

Impact TR-3 on SEIR pp.5.2-132 – 5.2-135 presents the proposed project impact at the six freeway ramps analyzed for the four analysis peak hours. The proposed project would add vehicle trips to I-80 and I-280 facilities, including during the weekday p.m. peak hour. The proposed project would not result in significant traffic impacts at the freeway ramp locations for the No Event and Convention Event scenarios. However, for the Basketball Game scenario, the proposed project would result in a significant traffic impact at the I-80 westbound off-ramp at Harrison Street during the weekday evening peak hour (i.e., attendees driving to San Francisco from the East Bay). As discussed in the SEIR, Mitigation Measure M-TR-2b (described above) would be implemented to address this significant traffic impact. However, the impact would remain significant and unavoidable with mitigation. For issues related to additional enforcement demand, please see SEIR Section 5.8 and Responses to Comments Section 13.18, Response PS-1.

Proposed Project Traffic Impacts with Overlapping SF Giants Game

Comments regarding increased congestion that currently occurs during SF Giants games, particularly weekday day games starting around 1:00 p.m., are noted. SEIR pp. 5.2-80 – 5.2-81 presents the potential for proposed project events overlapping with SF Giants evening games. As stated on SEIR p. 5.2-80, there would be a potential for about 32 overlapping events per year, and in rare circumstances as many as 40 overlapping events in a year. However, based on an assessment of the event types, projected distribution throughout the year, and start times, it is anticipated that in a regular year, on average, there would be approximately nine large events (i.e., events with more than 12,500 attendees) at the event center overlapping with a SF Giants evening game at AT&T Park (i.e., two basketball games and seven concerts). If either or both teams make it further into their sports' respective playoffs or to their respective championships, the number of large events overlapping could moderately increase from the average of nine per year; however, it is unlikely that this scenario would occur on a regular basis.

The existing traffic conditions for days with a SF Giants game are discussed on SEIR pp. 5.2-35 – 5.2-42, and the existing plus project impacts for conditions with a SF Giants evening game are presented in Impact TR-11 and Impact TR-12 for intersection and freeway ramps, respectively. As described in Impact TR-11, on days with overlapping evening events at the project site and at AT&T Park, intersections in the project vicinity would become more congested prior to and following the events, and the proposed project would result in significant traffic impacts at the following ten study intersections: King/Fifth/I-280 ramps, Fifth/Harrison/I-80 westbound off-ramp, Fifth/Bryant/I-80 eastbound on-ramp, Third/South, Seventh/Mission Bay Drive, Fourth/16th, Owens/16th, Seventh/Mississippi/16th Street, Illinois/Mariposa, and Mariposa/I-280 northbound off-ramp.

The SEIR identifies Mitigation Measure M-TR-11a: Additional PCOs During Overlapping Events and Mitigation Measure M-TR-11b: Regular Participation in Ballpark/Mission Bay Transportation Coordinating Committee, which, in combination with Mitigation Measure M-TR-2b: Additional Strategies to Reduce Transportation Impacts, would minimize the severity of traffic impacts at these intersections, but would not improve intersection LOS to LOS D or better, and the identified traffic impacts during overlapping events would be significant and unavoidable with mitigation. See Response TR-12a: Traffic Mitigation Measures regarding project mitigation measures meeting CEQA requirements.

Impact TR-12 on SEIR pp. 5.2-180 – 5.2-182 presents the proposed project's impacts at the six freeway ramps analyzed for the four analysis peak hours for the Basketball Game scenario for conditions with an overlapping SF Giants evening game at AT&T Park. The analysis represents conditions for high attendance events (including but not limited to Golden State Warriors games) at both the proposed event center and at AT&T Park, which, as discussed above, are estimated to occur an average of nine times a year. For the remaining days during which events at both facilities could overlap, the average attendance levels for the event center events would be less than 12,500 attendees, and therefore, the number of vehicle trips generated by these smaller events would be less, as would the impact on freeway ramp operating conditions. For the Basketball Game scenario with an overlapping SF Giants evening game, in addition to the significant traffic impact at the I-80 westbound off-ramp at Harrison Street, the proposed project would result in significant traffic impacts at the I-280 northbound off-ramp at Mariposa Street (pre-event during the weekday evening peak hour), and I-80 eastbound on-ramp at Fifth/Bryant (post-event during the weekday late evening peak hour).

As noted in a comment, in addition to SF Giants games at AT&T Park, a number of special events also take place in the City, including conventions and exhibits at the Moscone Center, which could potentially overlap with an event at the project site. Conventions, exhibits and other special events are typical in San Francisco. These non-SF Giants events generally only occur on limited days throughout the year (excluding move-in and break-down days, the Moscone Center has a scheduled event approximately 50 percent of the days in a given year), generally take place during the daytime hours, and are further north and west of the project site. Therefore, conditions in the project vicinity are not substantially affected by these events. Event attendance data gathered as part of the Moscone Center Expansion Project indicates that the average daily

attendance at the Moscone Center during a convention, exhibit, or other special event is about 15,600 attendees, with 85 percent of the event days having less than 22,000 attendees. Nevertheless, these other events could overlap with events at the project site, and impacts of the proposed project overlapping with these events would vary depending on time of day and day of week, size, location, and access routes to the event. Moscone Center conventions primarily occur during the daytime hours, and, with the exception of two events that include a one-block closure of Howard Street for approximately one week, do not substantially affect transportation conditions in Mission Bay. These two events – Oracle's Open World and Salesforce's Dreamforce – occur in August and either September or October, prior to the NBA regular season, which begins in the last week of October. Therefore, it is not anticipated that these large Moscone Center conventions would overlap with Golden State Warriors games at the project site. Sunday Streets events in the Bayview/Dogpatch area have included daytime closures of Mariposa Street and Terry A. Francois Boulevard in the project vicinity (i.e., generally between 11:00 a.m. and 4:00 p.m.; however, it is anticipated that the annual Sunday Streets roadway closures would be coordinated with events at the project site, similar to what is currently done with events at AT&T Park, to avoid overlap. Transportation impacts during other events would be similar to or better than described in Impact TR-11 and Impact TR-12 for the project scenarios that assessed the maximum attendance event for evening conditions at the project site and at AT&T Park for weekday and Saturday conditions. Generally, other special events in the vicinity of the project site would lead to an increase in parking demand in their vicinity, as event attendees would try to park within walking distance of their final destination. Special events would also lead to a temporary increase in vehicle trips and transit demand on the T Third light rail and 22 Fillmore bus route serving the project site.

It should be noted that the purpose of the environmental analysis is to determine if a proposed project would result in significant adverse changes to the existing physical conditions in the project vicinity. At locations where problems exist now, the proposed project's contributions to the existing problems are examined, and the proposed project's contributions to worsening conditions are assessed to determine if the proposed project would result in significant transportation impacts. CEQA does not require analysis of existing conditions unrelated to the proposed project that would continue to occur, as these activities are reflected in the baseline conditions. Mitigation of existing transportation problems is also not required under CEQA.

Impacts of Traffic Congestion on Adjacent Intersections

One comment indicates that traffic back-ups and queuing from study intersections identified in the SEIR as operating poorly would also affect nearby intersections and other locations, causing significant traffic impacts not identified in the SEIR. As stated on SEIR p. 5.2-7, the selection of the study intersections presented in the SEIR was performed based, among other criteria, on those locations most likely to be potentially affected by traffic generated by the project. As such, other locations would experience lower project traffic volumes. See Response TR-2b: Analysis Locations above, for additional discussion regarding study area and intersections included in the impact analysis, and Response TR-2c: Baseline Conditions regarding the baseline conditions assumed for the traffic impact analysis.

In response to the comment regarding backups from intersections identified as operating at LOS E or LOS F conditions, it should be noted that traffic conditions at the study intersections were evaluated using the nationally observed Transportation Research Board's Highway Capacity Manual 2000 (HCM 2000) for both signalized and unsignalized intersections. The use of HCM 2000 is directed by the *SF Guidelines*, and adherence to this methodology provides a consistent basis for land use and environmental determinations by City agencies. The traffic impact analysis was based on a conservative approach, in which project traffic was routed along the appropriate most direct paths to the project site, without any option for background traffic to divert from expected areas of congestion. The results of this conservative analysis reveal the potential for significant impacts at a number of study area intersections in all time periods.

Regarding intersections outside of the study area that are currently operating at LOS E and LOS F conditions, it is already SFMTA's practice to install appropriate signage and pavement markings at locations with chronic queuing problems (e.g., at freeway on-ramps in the SoMa area during the evening commute period) in order to keep intersections clear and permit cross-traffic to flow, as well as to assign PCOs where necessary to avoid, to the extent practicable, areawide congestion and any resulting traffic spillback. These SFMTA's effort would continue once the project is implemented, and would be expanded as provided in the project TMP.

As part of the proposed project's TMP, up to 17 PCOs would be stationed at adjacent intersections and in the project vicinity, and the Local/Hospital Access Plan would provide three additional PCOs during large weekday events. Mitigation Measure M-TR-2a: Additional PCOs During Events as described on SEIR p. 5.2-128 includes the deployment of four additional PCOs, for a total of 24 PCOs during large weekday events and 21 PCOs during large weekend events. Mitigation Measure M-TR-11a: Additional PCOs during Overlapping Events identified the need for PCOs at six intersections, of which two would be in addition to those identified in Mitigation Measure M-TR-2a. Thus, on days with large overlapping evening events, the number of PCOs that would be associated with the proposed project TMP and mitigation measures would be 26 PCOs during weekday events and 23 PCOs during weekend events. These PCOs would be in addition to the PCOs already assigned to key intersections (e.g. freeway ramps) during the weekday p.m. peak hour, as well as the 22 to 24 PCOs that are typically assigned by the SFMTA on a game day at AT&T Park. PCOs would be responsible for ensuring that vehicles do not block intersections or crosswalks, conditions that result in gridlock and cause delay to automobiles and transit vehicles, as well as unsafe conditions for pedestrians and bicyclists. Types of activities that are typically conducted by PCOs during special events include such things as keeping intersection and sidewalks clear of stopped vehicles, prioritizing the movement of transit vehicles, deterring vehicles from stopping within a travel lane or bicycle lane, discouraging illegal parking at passenger loading/unloading zones, enforcing taxi zones, stopping traffic to allow pedestrians to safely cross the street, stopping pedestrians to allow transit and vehicles to cross the street, and directing transit riders to queuing areas. Traffic cones, barricades, signs, and message boards, among other traffic control devices, would be used, as appropriate.

Traffic Impacts on Adjacent Neighborhoods

Some comments expressed concerns about expected traffic congestion related to the proposed project to prevent adequate access to the residences, and jobs such as those at the UCSF Research Campus, UCSF Medical Center, and planned Kaiser Medical Office Building (MOB). See Response TR-9: Emergency Vehicle Access Impacts, which discusses the proposed project's impacts related to emergency vehicle access and access to UCSF Medical Facilities. In addition, as described in Response TR-3a: Transportation Management Plan, the TMP would be expanded to include more detailed Local/Hospital Access Plan for the Mission Bay area. The TMP would include the Local/Hospital Access Plan, including supplemental guidance signage, physical controls (if any), and likely location and duties of deployed PCOs. Similar to the other elements of the TMP, the Local/Hospital Access Plan would be reviewed by SFMTA on a regular basis, in coordination with the project sponsor, UCSF and local residents and employers, to assess its effectiveness and implement appropriate changes when necessary. See Response TR-3a: Transportation Management Plan for a description and discussion of the Local/Hospital Access Plan.

A few comments expressed concern that northbound traffic on Third Street would be redirected towards Terry A. Francois Boulevard following an event, when northbound Third Street is closed between 16th Street and Mission Bay Boulevard South, and that these vehicles would end up on local residential streets such as Mission Rock Street, China Basin Street, or Mission Bay Boulevard North. The statement that northbound traffic on Third Street would be detoured towards Terry A. Francois Boulevard and then through residential neighborhoods in Mission Bay is incorrect. As described on SEIR p. 5.2-127, prior to the end of a large event, temporary travel lane closures would be implemented on northbound Third Street between Mariposa Street and Mission Bay Boulevard South. These temporary lane closures would be implemented prior to the end of the event, and would remain in place for approximately 30 to 45 minutes after the end of the event, or until vehicular traffic dissipates and most event attendees taking transit have boarded. The SFMTA PCO Supervisor would determine when the temporary lane closures would end based on traffic conditions following an event. As a result of the northbound lane closures, approximately 140 vehicles currently traveling northbound on Third Street and continuing north of 16th Street during the late evening peak hour would be rerouted westbound onto 16th Street (i.e., left turn only at the northbound approach to 16th Street). The projection that 140 northbound vehicles would be rerouted is based on existing volumes at the intersection, but the actual number of vehicles that would need to be diverted would likely be lower, since drivers not associated with an event would likely avoid the area after an event (e.g., they would use I-280, U.S. 101, or Potrero Avenue instead). Some of the rerouted vehicles would be expected to turn left at Mariposa Street, while others would continue to 16th Street where they would be rerouted. Southbound traffic flow on Third Street would not be affected by these temporary northbound travel lane closures.

It is not expected that the approximately 140 rerouted vehicles would travel east on Mariposa Street and then north on Terry A. Francois Boulevard as stated in the comment, as the drivers of such vehicles would have to contend with project vehicles exiting nearby garages. It is expected however, that some project vehicles would exit the 450 South Street garage via Bridgeview Way,

then travel north on Bridgeview Way to Mission Bay Boulevard North, and then west on Mission Bay Boulevard North on their way out of the Mission Bay area. For issues related to additional enforcement demand, please see SEIR Section 5.8 and Responses to Comments Section 13.18, Response PS-1.

The intersection of Seventh/Mississippi/16th, as presented on SEIR p. 5.2-10, currently operates at LOS E conditions during the weekday p.m. and evening peak hours, and LOS B conditions during the weekday late evening and Saturday evening peak hours for conditions without a SF Giants game at AT&T Park. On days with a SF Giants evening game at AT&T Park, the intersection of Seventh/Mississippi/16th, as presented on SEIR 5.2-39, operates at LOS F conditions during the weekday p.m. peak hour, at LOS E conditions during the weekday evening peak hour, and at LOS C conditions during the weekday late evening and Saturday evening peak hours. These LOS conditions include the implementation of the 22 Fillmore Transit Priority Project, which includes converting one mixed-flow lane each way on 16th Street to a side-running transit-only lane. As presented in Impact TR-2 (without an overlapping SF Giants evening game) and Impact TR-11 (with an overlapping SF Giants evening game), the proposed project would result in significant traffic impacts at the intersection of Seventh/Mississippi/16th for sell-out events on days without and with a SF Giants game at AT&T Park.

Mitigation Measure M-TR-2b: Additional Strategies to Reduce Transportation Impacts and Mitigation Measure M-TR-11a: Additional PCOs During Overlapping Events were identified to minimize the severity of traffic impacts. Even with implementation of these measures, however, the arrival and departure peak of vehicle trips to and from the event center would continue to occur, and therefore the proposed project's traffic impact at this intersection was determined to be significant and unavoidable with mitigation. While the intersection of Seventh/Mississippi/16th was not identified among the intersections in San Francisco as a Vision Zero High Priority intersection (the closest Vision Zero High Priority intersection is 17th/Vermont Streets, located about 0.9 miles to the west of the project site), 16th Street between Seventh/Mississippi and Castro Streets is included as a Vision Zero High Priority network.[16] Engineering plans for the segment of 16th Street within the Vision Zero High Priority network have not been developed, and it is uncertain whether the intersection of Seventh/Mississippi/16th would be included as part of improvements to that segment of 16th Street. However, design of the 22 Fillmore Transit Priority Project, which, as noted above, would convert one mixed-flow lane each way of 16th Street to a side-running transit-only lane, would incorporate strategies to enhance pedestrian and bicycle travel along 16th Street.

See Response TR-12a: Traffic Mitigation Measures and Response GEN-1a: City Funding for discussion regarding feasibility and implementation of traffic mitigation measures.

[16] The City and County of San Francisco adopted Vision Zero as a policy in 2014, committing to build better and safer streets, educate the public on traffic safety, enforce traffic laws and adopt policy changes that save lives. The goal is to create a culture that prioritizes traffic safety and to ensure that mistakes on San Francisco roadways don't result in serious injuries or death. The result of this collaborative, citywide effort will be a safer, more livable streets, with traffic fatalities eliminated by 2024. Available online at http://visionzerosf.org/about/what-is-vision-zero/. Accessed August 24, 2015.

13.11.6 Transit Impacts (TR-5)

Issues Raised by Commenters: Muni (TR-5a)

This response addresses all or part of the following comments, which are quoted below:

O-MBA10L4-25	O-MM-10	I-Barton-6	I-Cehand-5
I-deCastro1-3	I-Ellingham-2	I-Hong-6	I-Rynne-3
I-Stryker-2	I-Zboralske-6	PH-deCastro2-4	PH-Gisslow-1

Complex Interrelated Issues Are Not Addressed In the DSEIR

At present, persons traveling between BART or the MUNI LRT lines and the Project site can make a simple in-station transfer to/from the K-T line from any of the downtown Market Street stations. Once the Central Subway is completed, the T-Third line will no longer be directly inter-routed with the K-Ingleside line in the Market Street subway. Instead, access from BART and the Market Street LRT lines to the T line that serves the proposed Project site will only be via the Powell Street station and only via a 1,000 foot tunnel in the wrong direction that connects Powell to the Union Square station where T LRT trains can be boarded – an unattractive and slower transfer than at present. Although other MUNI LRT lines from the Market Street subway will continue to connect to 4th and King via the Embarcadero, passengers on those lines or those from BART who transfer to them at the Market Street stations will be faced with another transfer to the T-Third at that point or an walk of .8 miles to the Project site. These are less attractive options than what is available at present. With the rise of ride-share services like Uber and Lyft that can be summoned via a cell phone application – a new phenomenon, the percentage of persons who take ride share services or conventional taxi instead of transit all the way to the site may be far more than for AT&T Park events (which will continue to be served by LRT lines that stop directly in all the Market Street BART stations). This is detrimental as each time people use ride-share or conventional taxi services to access the Project, they cancel the environmental savings of direct transit access usage and double the number of motor vehicle trips to the area as compared to if they drove and parked in the area (because the ride-share or taxi vehicle drives away after dropping passengers off). The DEIR does not appear to address these considerations. Please do so. (*Mission Bay Alliance, Thomas Lippe, letter, July 27, 2015 [O-MBA10L4-25]*)

---

3. The Project Will Overwhelm Transit Capacity With No Effective Mitigation.

There is no accurate analysis of transit impacts in the SDEIR. The SDEIR says that "the project sponsor is working with the City to secure funding for the Muni Special Event Transit Service Plan as part of the project improvements." (SDEIR 5-2.191.) That vague promise is not a legally adequate project description or baseline assumption. The SDEIR then engages in an argument to secure that funding, which requires public subsidy in an unstated amount, with a series of claims showing how much worse vehicle traffic will be if that funding isn't provided. However, that strong-arm tactic is irrelevant to CEQA's required analysis and mitigation of the Project's transit impacts. (DSEIR 5-2-192 - 194)

The DSEIR fails to properly identify and propose mitigation for the Project's specific impacts on Muni, concluding that "the project would result in no new or substantially more severe significant effects than those identified in the Mission Bay FSEIR related to transit impacts." (DSEIR 5.2-224.) That conclusion improperly relies on an EIR that is both outdated and irrelevant to the Project, which was not included in that EIR.

Transit will also be delayed by queuing and gridlock caused by the project, since buses and vehicles will have to share the congested streets resulting from the Project. (*Mary Miles, Attorney at Law, email, July 27, 2015 [O-MM-10]*)

-It will be difficult for employees to drive to work

SFMTA has been employing a policy of making driving worse for years and years

-The infrastructure is not adequate to support this arena.

I am not aware of SFMTA being proactive in creating infrastructure for a neighborhood. You need to build it first and then use the funds to create the infrastructure (*Jason Barton, email, July 27, 2015 [*I-Barton-6*]*)

- Full Muni cars as I am trying to get home from work. I now ride a Vespa because of this. (*Jadine Cehand, email, June 30,2015 [*I-Cehand-5*]*)

Second, transit is promised to be improved as a result of the Warriors Event Center. However plans are very fluid and not well described to the neighborhood. The only minor improvement is the 55 line which is an interim measure until the only reliable bus line (22) is removed from 18th St. The 22 is proposed to be replaced by the unreliable 33. (*John deCastro, email, July 27, 2015 [*I-deCastro1-3*]*)

I oppose this project … congestion. I am a frequent user of the UCSF Mission Bay campus, by public transportation. The 3rd Street MUNI line and local bus service is already strained. This huge add-on would be very damaging to both my concerns. (*Lewis Ellingham, email, July 13 2015 [*I-Ellingham-2*]*)

"a. During the Events at the arena, add a MUNI shuttle/service to and from the two BART stations 16th and 24th Mission Street to the arena." (*Dennis Hong, email, July 27, 2015 [*I-Hong-6*]*)

"The site is poorly served by public transport, just two routes--it only functions now because of extensive private shuttle links." (*Gavin Rynne, email, July 27, 2015 [*I-Rynne-3*]*)

"We who work at UCSF Mission Bay and use public transportation (the T line and the Golden Gate ferry) know that the transportation system frequently fails during Giants games, extending commute times unreliably often by hours as a result of missed connections in the intermodal travel. The overall impact of the Giants home games on public transportation (and on alternatives like Uber and taxis) are such that I personally, along with many others, choose to drive a car back and forth to Marin when there are events at AT&T Park during the times I would travel. The failure of public transportation can not be remedied when the Muni shares right of way with cars and the intersections are blocked. The proposed Warriors Arena would exacerbate this situation beyond measure." (*Michael Stryker, email, July 26, 2015 [I-Stryker-2]*)

"City officials and the public have long recognized that the City's public transportation system is not as efficient, effective and robust as it needs to be. Complaints about the system have been occurring for decades. Former Mayor Willie Brown vowed to fix Muni within his first 100 days in office and we all know how that turned out." (*James Zboralske, email, July 27, 2015 [I-*Zboralske-6])

"The transit doesn't work today. We need better plans in that area if the Warriors are going to come to Mission Bay." (*John deCastro, public hearing transcript, June 20, 2015 [PH-deCastro2-4]*)

"And I know we've all heard a lot of statistics about parking and stuff, so I'm going to start with a quote I read from an SF Gate article. The quote was from a City official. It said:

"Will there be traffic?"

"Yes."

"Will we be able to handle it?"

"Yes."

"Well, I look around the City, and I don't think it's been handled at all. I don't see the credibility in an official who says they know how to handle traffic in a city that's been overrun with traffic for years now." (*Blaise Gisslow, public hearing transcript, June 20, 2015 [PH-Gisslow-1]*)

Response TR-5a: Transit Impacts, Muni

The Muni Special Event Transit Service Plan, which would be provided as part of the proposed project, is intended to avoid the possibility that special events would overwhelm the existing transit system. It would do so by providing additional options to accommodate attendees traveling to and from the event center. The Muni Special Event Transit Service Plan is described in detail on SEIR pp. 5.2-53 - 5.2-55, where the additional light rail service and special event shuttles are described; Table 5.2-15 presents the proposed service levels for the various event sizes; and Figure 5.2-10 presents the routes proposed Muni Special Event Shuttles. The three primary components of the Muni Special Event Transit Services Plan are (i) the "Muni Special Event 16th Street BART Shuttle," which would run on 16th Street between the event center and the 16th Street BART station; (ii) the "Muni Special Event Van Ness Avenue Shuttle," which would run between the event center and Fort Mason; and (iii) the "Muni Special Event Transbay Terminal/Caltrain/Ferry Building Shuttle," which would loop between the event center, the new Transbay Terminal, and the Ferry Building via Fourth, King, Third, Folsom, Fremont, and Mission Streets.

The transit travel demand used in the analysis assumes that a system of transit shuttles and increased light rail service would be provided to supplement the T Third light rail line and the 22 Fillmore bus route that are the primary transit service in the area (see SEIR pp. 5.2-87 – 5.2-90 regarding estimate of mode of travel). The Muni Special Event Transit Service Plan is part of the project transportation improvements, as described on SEIR pp. 5.2-53, and includes increased service on the Central Subway/T Third, as well as additional light rail service via The Embarcadero (i.e., a short line, which would turn around south of the project site). The majority of passengers, however, would be expected to take the Central Subway/T Third line and would need to walk between the Union Square/Market Street Central Subway station and the Powell Street BART station. The Central Subway project will provide a below-grade pedestrian connection between the two stations for this purpose. A portion of passengers could make an in-station transfer at the Embarcadero station between BART or other Muni light rail lines and the shuttles to the project site. Attendees would also have the option to take the Muni Special Event

16th Street BART station shuttle or the Ferry Building/Caltrain/Transbay Terminal shuttle to either the 16th Street or Embarcadero stations, respectively. It is possible that some attendees taking transit would use TNC services for a portion of the trip, as noted in a comment. The use of these services is a new phenomenon and although such services are similar to taxi services, the precise percentage of attendees who might use TNC services is not possible to determine at this time. The transportation impact analysis assumes that some portion of attendees would arrive by taxis or TNC vehicles (about 3 percent on weekdays), and these trips were accounted for as two vehicle trips (one to the site and one leaving the site) in the traffic analysis. The TDM Plan, however, encourages event center visitors to use transit. As described on SEIR p. 5.2-66, TDM strategies include promotional incentives for those arriving via transit, determining the market feasibility of bundling the cost of a round-trip Muni fare into the cost of all ticketed events, marketing strategies to use transit, and real-time transit information.

Impacts of the proposed project on Muni transit is presented in Impact TR-4 for conditions without a SF Giants evening game at AT&T Park, and Impact TR-13 for conditions with a SF Giants game at AT&T Park. Impacts TR-18 to TR-24 on SEIR pp. 5.2-190 – 5.2-208 present the potential impacts that could occur for the transportation topics if all or a portion of the Muni Special Event Transit Service Plan is not provided. Mitigation Measure M-TR-18: Auto Mode Share Performance Standard and Monitoring identifies measures that could be implemented by the project sponsor to meet specific performance standards. The purpose of this analysis was not to support an argument for securing funding for the Muni Special Event Transit Service Plan, as stated in a comment, but to identify the potential impacts if the project did not include the Muni Special Event Transit Service Plan and to establish performance standards that the project sponsor would be required to meet to reduce traffic, transit, and pedestrian impacts.

The projected increase in travel time delay at study intersections is presented in Impact TR-2 for conditions without an overlapping SF Giants evening game, and in Impact TR-11 for conditions with an overlapping SF Giants evening game. As presented in the tables, figures and supporting discussion, the addition of project-generated vehicles to the roadway network would result in traffic impacts at one of the 22 study intersections for the No Event scenario (i.e., office and retail uses, no event), two intersections under the Convention Event scenario (office and retail uses, plus daytime convention event with about 9,000 attendees), and at seven intersections for the Basketball Game scenario (i.e., office and retail uses, plus a basketball game with 18,000 attendees). The intersections operating at LOS F conditions would not result in gridlock conditions in Mission Bay. In the project vicinity, the T Third light rail operates in a semi-exclusive center median right-of-way, and would not be subject to increased vehicle delays at intersections along Third Street. The Central Subway project will eliminate a pinch point on the existing T Third route at the intersection of Fourth/King (i.e., the left turn from westbound King Street onto southbound Fourth Street and vice versa). The Central Subway route will run northbound and southbound on Fourth Street across King Street and will no longer include this turn, thereby reducing travel times and enhancing reliability. In addition, with implementation of the Central Subway service, two-car trains, instead of the existing one-car train, will run on the T Third with increased frequencies throughout the day. With implementation of the 22 Fillmore Transit Priority Project, the 22 Fillmore will also be operating within exclusive transit lanes and will be activating signal priority on 16th Street and

would not be subject to increased vehicle delays at intersections. In addition, with implementation of Muni Forward, the frequency of service on the 22 Fillmore throughout the day will increase. During large events, the TMP includes up to 17 PCOs stationed at adjacent intersections in the project vicinity (see SEIR p. 5.2-58). The PCOs would focus on managing queuing at key intersections and use their expertise to ensure that potential transit delays due to traffic congestion are avoided. PCOs would use various methods such as manually controlling the light cycle at signalized, active engagement of pedestrians, bicycles and vehicles using hand signals, as well as cones, barricades, and Variable Message Signs, and possibility ticketing for intersection blocking, double parking, or other parking violations as traffic management tools.

For all impact topics, a comparison is provided to the impact determination for that topic from the Mission Bay FSEIR impact analysis to identify whether the proposed project would result in new significant impacts not previously identified in the Mission Bay FSEIR. As described on page 5.1-3, the comparison is provided because the SEIR is a subsequent EIR to the Mission Bay FSEIR. The comparison of SEIR impacts to those identified in the Mission Bay FSEIR is provided for informational purposes, and the proposed project's impact determination does not rely on the comparison. Thus, the SEIR properly identifies transit impacts and mitigation measures, and does not rely on the MB FSEIR.

Issues Raised by Commenters: BART (TR-5b)

This response addresses all or part of the following comments, which are quoted below:

A-BART-1	A-BART-4	A-BART-5	A-BART-7
A-BART-8	A-BART-9	O-MBA10L4-19	O-Sierra-2
PH-Vaughan-4			

"1. System capacity improvements (i.e., rail car fleet expansion, stations, train control modernization, and additional shop & yard facilities) are needed to alleviate peak period constraints from projected ridership, but are unfunded. The BART Fleet Management Plan (FMP) (2010) service levels shared with the City in our January 23, 2013 Scoping Comments on the NOP are based on projected demand. The BART FMP indicates that BART will need to increase base service frequency from to 12-minute headways, and have approximately 1,100 vehicles by 2025 in order to adequately serve the demand generated in San Francisco. BART's current funding, however, leaves us more than 300 rail cars short of this total. The DEIR should take this information into account in analyzing projected transit capacity and crowding." (*BART, Val Menotti, letter, July 27, 2015 [A-BART-1]*)

"4. The DSEIR analysis does not sufficiently detail its methodology and assumptions to enable the reader to interpret the analysis and the extent of impact for both BART operations and station capacity. For all scenarios, assumptions should be documented, including numbers of trains, train capacity, transfer (station) locations and directions of travel, average travel times to each station (to better understand passenger arrival times at the stations and their impact on station and operation capacity), etc." (*BART, Val Menotti, letter, July 27, 2015 [A-BART-4]*)

"5. Timing of Central Subway Service: Currently, the arena is scheduled to open prior to commencement of Central Subway service. If that sequence holds, Warriors fans taking BART will rely almost solely upon the Embarcadero Station - with nearly 38,000 daily boardings, the most heavily patronized station in the BART system. BART currently experiences heavy congestion at both Embarcadero and Montgomery Stations (and is working with the City to develop capacity improvements to these stations). Embarcadero Station also has the narrowest platform width of the Market Street stations. To ensure that BART can safely deliver patrons to events (in addition to accommodating peak commute loads), the City should work with BART to mitigate the short-term impact to ridership at these stations. BART seeks mitigation measures in the both short and long term to divert trip generation at Montgomery and Embarcadero stations." (*BART, Val Menotti, letter, July 27, 2015 [A-BART-5]*)

"7 BART is concerned about Transbay operating capacity in the eastern direction during the late evenings after events, especially after simultaneous events throughout the city on Friday and Saturday nights. Analysis for this scenario (OUTBOUND from project site) was not included in the DSEIR. Given the timing of the ends of basketball games and large events, and the time required to travel to BART stations, event patrons may be using the last trains of the evening when stations and trains are already crowded. For this scenario, the DSEIR needs a broader definition of " simultaneous events" that are known to significantly increase BART ridership. This includes other events occurring and ending simultaneously throughout the city and along the Market Street Corridor (i.e. concert venues), as well as the "ambient" increase in ridership on weekend late evenings. At a minimum, the project should call for monitoring transit capacity during this condition (late evening OUTBOUND to East Bay on Fridays and Saturdays)." (*BART, Val Menotti, letter, July 27, 2015 [A-BART-7]*)

"8. Station Capacity: BART's NOP comment letter stated that the City needs to work with BART to analyze the impacts of the proposed Project on peak period travel for station capacity as well as line haul capacity to ensure that BART can safely deliver patrons to and from events. However, there was no station level ridership forecast, or analysis, to determine the impacts to individual stations." (*BART, Val Menotti, letter, July 27, 2015 [A-BART-8]*)

"9. 16th Street Station: BART is particularly aware of station loading capacity constraints at the 16th St. station. It is unclear from the analysis how many patrons would need to transfer to Muni service at this station, or what impacts that could have at the station plazas. This station does not have faregates on the concourse level nearest the entrance on the north-east corner of Mission St. and 16th St. To accommodate passengers that will be dropped off at this entrance from either MUNI #22 buses or supplementary shuttles, a new fare area may need to be added, including faregates, station booth and support infrastructure such as CCTV. Staffing needs include a station agent, police and possibly staff to meter passengers at the concourse and platform level." (*BART, Val Menotti, letter, July 27, 2015 [A-BART-9]*)

"With regard to regional transit services, considering capacity versus ridership at San Francisco perimeter screenlines (North Bay, East Bay, South Bay) as the sole criterion of impact on the regional systems results in the analysis failing to address other significant impacts that are unrelated to corridor screenline ridership to capacity relationships. For example, in the case of BART, while Transbay capacity (the screen line analyzed) is a concern, an equal concern is the peak period platform capacity at the Embarcadero and Montgomery Street stations. These stations each individually serve 22 percent of all BART travelers and in the peaks are simultaneously serving peak-direction travelers to/from both eastbound and westbound corridors as well as serving contra-peak direction travelers in both directions. The platform congestion at both these stations is a serious operational and safety concern, has been documented in public[6], is visibly worse in the pm peak hour when the Giants have weekday night games scheduled and would presumably

be similarly affected by weekday evening Warriors games and other large events at the Project. BART is actively developing designs for adding outboard platforms at both of these stations – a mitigation measure that the Project (and others) could make fair share contributions toward if the Project's impacts at these locations were properly analyzed. But for the present, the DSEIR's is deficient because it completely fails to analyze, disclose and mitigate the Project's impacts on this situation."

Footnote:

[1] See *BART Sustainable Communities Operations Analysis*, June 2013

(*Mission Bay Alliance, Thomas Lippe, letter, July 27, 2015 [O-MBA10L4-19]*)

"However, the project sponsors are proposing a project in Mission Bay without proposing adequate transportation infrastructure to match the capacity of BART in Oakland, especially when events are happening simultaneously at AT&T Park and in Mission. (*Volume 1, TR-2 through TR-6*)." (*Sierra Club, Susan E. Vaughn, letter, July 27, 2015 [O-Sierra-2]*)

"And on that line, I want to add that I think that probably most of the people who work that venue in Oakland right now work -- don't live in San Francisco. So, I'm wondering about the impact to BART …" (*Susan Vaughan, public hearing transcript, June 20, 2015 [PH-Vaughan-4]*)

Response TR-5b: Transit Impacts, BART

The significance thresholds and methodology used in the analysis of regional transit is presented on SEIR pp. 5.2-75 – 5.2-77, and additional information is provided in Appendix TR. This methodology is consistent with analysis of all development projects in San Francisco and focuses on BART capacity utilization at the East Bay and South Bay cordons. Existing BART ridership and capacity for the analysis hours were provided by BART in May 2015 and are based on April 2015 data. These BART assumptions regarding trains and train capacity were incorporated into the data that was provided for use in this SEIR. The ridership and capacity presented in the SEIR are at the maximum load point for trips between San Francisco and the East Bay and the South Bay: the maximum load point to and from the East Bay is at the Embarcadero and West Oakland stations, respectively, while the maximum load point for trips to and from the South Bay is at the Civic Center and 16th Street stations, respectively.

Table 5.2-26 on SEIR p. 5.2-92 presents the total transit trips by origin/destination for the seven analysis scenarios. **Table 13.11-2** presents the project-generated inbound and outbound trips assigned to BART to and from the East Bay and South Bay for the peak hours of analysis (from information contained in the SEIR Appendix TR). These project-generated BART ridership data by direction were used in analysis of BART in Impact TR-5 for conditions without an overlapping SF Giants evening game, in Impact TR-14 for conditions with an overlapping SF Giants evening game, in Impact TR-21 for conditions without the Muni Special Event Transit Service Plan, and Impact C-TR-5 for the cumulative impact analysis.

TABLE 13.11-2
PROPOSED PROJECT-GENERATED BART RIDERSHIP TO AND FROM THE EAST BAY AND SOUTH BAY – WEEKDAY AND SATURDAY PEAK HOURS

Direction/Analysis Peak Hour/Analysis Scenario	Inbound	Outbound	Total

SOURCE: Adavant Consulting/Fehr & Peers/LCW Consulting, 2015

Table 4.5-40 on SEIR p. 5.2-136 presents the capacity utilization analysis for the weekday p.m. peak hour for the peak direction of travel for the regional agencies, which is outbound from San Francisco for the No Event, Convention Event, and Basketball Game scenarios. Table 4.5-41 on SEIR p. 5.2-137 presents the capacity utilization analysis for weekday evening for the inbound direction (i.e., attendees traveling to the event center), as well as for the weekday late evening period for the OUTBOUND direction (i.e., attendees leaving the event center). Table 4.5-42 on SEIR p. 5.2-138 presents the capacity utilization analysis for the Saturday evening for the inbound direction.

The transit analysis assumed that riders taking BART to and from the East Bay would primarily use the Embarcadero and Powell Street Muni/BART stations and the T Third/Central Subway light rail between the event center and the Muni/BART stations, while riders taking BART to and from the South Bay would primarily use the 16th Street BART station and the Muni Special Event 16th Street BART Shuttle between the event center and the 16th Street BART station.

As indicated on Table 13.11-2, during the weekday late evening peak hour, about 240 passengers are projected to access the 16th Street BART station for the return trip to the South Bay, and about 1,850 passengers would access the Embarcadero and Powell Street BART/Muni stations for the return trip to the East Bay. The 240 late evening peak hour passengers accessing the 16th Street BART station would be accommodated by the existing seven fare gates, and it is not anticipated that additional fare gates, station booths or supporting infrastructure and staffing would be needed to accommodate the increased demand. As a comparison, for the peak one-hour during

the 7:00 to 9:00 a.m. morning commute period approximately 400 riders entered and 360 riders exited the station via the stairs at the northeast corner of the intersection of Mission/16th Street (total of 760 persons), while 1,300 riders entered the paid area and 1,360 riders exited the paid area through the seven fare gates (total of 2,680 persons). While commute riders may be more familiar than event attendees with ticketing and use of the fare gates, the processing capacity of the fare gates would be adequate to accommodate the demand without resulting in substantial overcrowding on the concourse or platform levels. Similar to existing conditions, passengers entering the concourse level via the entrance on the northeast corner of the intersection of Mission/16th Street would walk to the existing fare gates to access the paid concourse area and stairs/escalators/elevator to the platform.

As indicated in Impact TR-14 on SEIR pp. 5.2-14 – 5.2-185, under existing plus project conditions with an overlapping SF Giants evening game at AT&T Park, additional BART capacity would be required to accommodate the combined BART travel demand to the East Bay, and as a result, the proposed project would result in a significant impact on BART. Mitigation Measure M-TR-14: Additional BART Service to the East Bay during Overlapping Events was identified to accommodate the transit demand following weekday and weekend evening events. The need for additional service would be based on the characteristics of the overlapping events (e.g., event type, projected attendance levels, and anticipated start and end times), and the additional service by event type would be developed and refined based on ongoing monitoring and surveys of conditions as part of the TMP. Because full funding for the additional service has not been identified, and because additional transit service relies on future discretionary actions by the board of directors for each agency, implementation of the mitigation measure remains uncertain. Accordingly, impacts to BART would be considered significant and unavoidable.

In response to the comment related to BART's January 2013 scoping comments on the NOP, it should be noted that BART's comments were for the prior NOP when the event center was proposed to be located at Piers 30-32. Attendees traveling to and from an event center at Piers 30-32 would all use the Embarcadero Muni/BART station, raising BART's concerns regarding the ability to process the additional peak loads during a project event overlapping with a SF Giants game. With the project now proposed to be located at Mission Bay Blocks 29-32, and with the Muni Special Event Transit Service Plan, attendees taking BART would be distributed among the three stations: 16th Street BART station and the Powell Street and Embarcadero Muni/BART stations, with the greatest number of attendees destined to and from the Powell Street Muni/BART station. As indicated on Table 13.11-2, during the weekday late evening peak hour, about 1,850 passengers are projected to access the Powell Street and Embarcadero Muni/BART stations for the return trip to the East Bay. The number of passengers destined to the East Bay following a full-capacity event at the event center (i.e., 18,000 attendees) would be substantially less than a full capacity event at AT&T Park (i.e., 42,000 attendees). Furthermore, trips to and from the event center would utilize the Central Subway line, and would therefore primarily use the Powell Street Muni/BART station, and not the Embarcadero Muni/BART station. Prior to operation of the Central Subway, special event shuttles would be deployed for attendee access between the event center and the Powell Street Muni/BART station. With the Central Subway, the new Union Square/Market Street station will include a direct concourse-to-concourse connection

to the Powell Street Muni/BART station. Therefore, because only a small portion of the attendees taking BART during overlapping events would use the Embarcadero Muni/BART station, the limited number of additional transit trips accessing the Embarcadero Muni/BART station post-event would be accommodated without substantially affecting station operations, and a station capacity analysis was therefore not conducted.

A station capacity analysis was not conducted for the Powell Street Muni/BART station because the project-generated peak pre-event and post-event demands are anticipated to be less than existing commute ridership demands that are currently accommodated at the station during the weekday a.m. and p.m. peak hours. Post-event arrivals at the Powell Street Muni/BART station would be spread out as passengers arrive in separate Muni trains and then walk between the Central Subway Union Square/Market Street station and the Powell Street Muni/BART station. Overall, the Powell Street Muni/BART station has a lower passenger demand than the Embarcadero and Montgomery Street Muni/BART stations, a more spacious concourse and platforms, and has not been identified by BART as constrained or requiring additional capacity. Therefore, a station capacity analysis was not conducted for this station. It is not anticipated that the project attendees would use the Montgomery Street Muni/BART station in quantifiable numbers for travel to and from the East Bay and South Bay, as transfers to Muni routes connecting with the event center are not convenient from this station.

The comment regarding needed systemwide BART capacity improvements, as well as station capacity improvements is noted. As stated in the comment, the City is working with BART on the Embarcadero-Montgomery Capacity Implementation Plan study in a regionally coordinated approach to develop improvements to accommodate the current and increased ridership at the Montgomery Street and Embarcadero Muni/BART stations. The SFMTA and SFCTA are working with BART to develop concepts to increase platform capacity at these two stations, including a potential project to build new side platforms on the opposite side of the existing tracks. Matching funds for this study were provided by the SFMTA (Proposition K), the Golden State Warriors, and the San Francisco Giants.[17] The SFMTA was part of the Project Steering Committee and the Technical Advisory Committee for the Metropolitan Transportation Commission's (MTC's) regional Transit Sustainability Project (TSP), which included recommendations to provide investment for fund service improvements on major regional bus and rail corridors within the San Francisco Bay Area.

Regarding funding for BART's systemwide needs, San Francisco does fund a large number of transportation improvements to local and regional transportation facilities. Funding for these improvements comes from a variety of sources including state and federal grants, tolls collected from Bay Area bridges, and a countywide ½-cent sales tax dedicated toward funding transportation improvements authorized under San Francisco's Proposition K. The MTC, as the transportation planning, coordinating and financing agency for the nine-county San Francisco Bay Area, administers and distributes federal, state and regional moneys among the various regional transit

[17] Embarcadero-Montgomery Capacity Implementation Plan, Available online at: http://www.bart.gov/about/planning/embarcadero-montgomery_capacity_implementation_plan. Accessed on September 30, 2015.

operators. For example, MTC's Core Capacity Challenge Grant Program commits $7.5 billion (including federal, state and regional funds) over 15 years to fund high-priority transit capital improvements to the region's largest transit systems, including BART. The grant program will fund transit vehicle replacement fleet expansion, and key facility upgrades noted in the comments.

Issues Raised by Commenters: Caltrain (TR-5c)

This response addresses all or part of the following comments, which are quoted below:

A-Caltrain-1 A-SMCTD-2

"The Project site is located 0.8 miles south of the Caltrain terminal at Fourth/King and 0.9 miles northeast of Caltrain's station at 22"d Street and the analysis in the DSEIR indicates that travel demand generated by the project on event days will result in a substantial addition of riders to the Caltrain system. Specifically Caltrain notes that Impacts TR-5 and TR-14 identify Caltrain service as being significantly capacity-impacted to and from the South Bay during the weekday evening, weekday late evening, and Saturday evening peak hours during both the "Basketball Game Scenario" (Impact TR-5) and the "Basketball Game with Overlapping SF Giants Game at AT&T Park Scenario" (Impact TR-14) evaluated in the DSEIR.

"In response to the above impacts the DSEIR identifies mitigation measure M-TR-5a "Additional Caltrain Service," noting that implementation of this measure would reduce or minimize the severity of the capacity utilization exceedances for Caltrain and would not result in secondary transportation impacts. The DSEIR also notes. however, that the provision of additional Caltrain service is uncertain and full funding for the service has not yet been identified. Implementation of the mitigation measure thus remains uncertain and impacts TR-5 and TR-14 are found to be Significant and Unavoidable with mitigation.

"Caltrain agrees with the DSEIR's analysis of capacity impacts to our service, the conclusion that additional service has the potential to mitigate a portion of these impacts, and the statement that additional Caltrain service has not yet been defined, funded or agreed to. Caltrain understands the importance of the regional transportation services we provide and we look forward to working collaboratively with the City and County of San Francisco and the project sponsors to address the transportation challenges and opportunities presented by this unique project. As the project advances through the environmental process we encourage the City and the project sponsors to engage with us directly to more formally define, analyze and identify funding for any contemplated increase in Caltrain service." (*Caltrain, Marian Lee, letter, July 27, 2015 [A-CALTRAIN-1]*)

"Did the EIR analyze capacity impacts to Caltrain inbound service during the PM (pre-event) condition?" (*San Mateo County Transit, email, July 15, 2015 [A-SMCTD-2]*)

Response TR-5c: Transit Impacts, Caltrain

The acknowledgement of the proposed project's impact on Caltrain service during the weekday and Saturday evening and late evening periods, and associated mitigation measure (i.e., Mitigation Measure M-TR-5c: Additional Caltrain Service on SEIR p. 5.2-147) is noted. The City and project sponsor would work with Caltrain, as well as BART, which also provides transit service to the South Bay, to determine the actual need for additional Caltrain service for different events (e.g., event type, projected attendance levels, and anticipated start and end times). As

indicated on SEIR p. 5.2-146, the additional capacity needed to accommodate the transit demand to the South Bay during the weekday and Saturday evening conditions is projected to be one train car on at least one inbound train per hour, and for the weekday late evening period, two additional train cars on at least one outbound train per hour (or via the provision of at least one special outbound train similar to that provided following a SF Giants evening game). Because funding for the additional service has not been identified, implementation of the mitigation measure remains uncertain, and the proposed project's transit impact on Caltrain was determined to be significant and unavoidable.

As indicated on SEIR p. 5.2-75, the weekday p.m. peak hour transit analysis was conducted for the outbound direction of travel (i.e., away from the project site and outbound from San Francisco). The weekday p.m. peak hour coincides with the peak evening commute period, and with the time when most employees at the project site would be departing from work. This weekday p.m. peak hour thus represents the analysis hour most likely to be impacted by project-generated transit trips. During that time period, capacity for incoming event attendees traveling towards the project site is comparatively more available, given the greater percentage of transit riders traveling in the opposite direction. In contrast, for weekday and Saturday evening peak hours, the transit analysis was conducted for the inbound direction of travel (i.e., towards the project site and inbound into San Francisco). The evening peak hour coincides with the period when most attendees would be traveling to the event center for an evening event, and represents the analysis hour most likely to be impacted by project-generated transit trips.

Table 13.11-3 presents the project-generated inbound and outbound trips assigned to Caltrain to and from the South Bay for the peak hours of analysis (from the information in the SEIR Appendix TR). As indicated in the table, the proposed project would generate about 110 inbound transit trips on Caltrain during the weekday p.m. peak hour, and 610 inbound transit trips during the evening peak hour. Therefore, the analysis of the weekday evening period, as well as the weekday p.m. peak hour, represents a conservative analysis of project impacts on Caltrain.

TABLE 13.11-3
PROPOSED PROJECT-GENERATED CALTRAIN RIDERSHIP TO AND FROM THE SOUTH BAY – WEEKDAY AND SATURDAY PEAK HOURS

Analysis Peak Hour/Analysis Scenario	Inbound	Outbound	Total
South Bay			
Weekday PM Peak Hour - No Event	3	67	70
Weekday PM Peak Hour – Convention Event	10	93	103
Weekday PM Peak Hour – Basketball Game	108	67	175
Weekday Evening Peak Hour – Basketball Game	610	24	635
Weekday Late Evening Peak Hour – Basketball Game	**0**	718	718
Saturday Evening Peak Hour – No Event	4	21	25
Saturday Evening Peak Hour – Basketball Game	616	17	634

SOURCE: Adavant Consulting/Fehr & Peers/LCW Consulting, 2015

As noted in Response TR-5c: Transit Impacts, BART above, San Francisco contributes funding for local and regional transportation improvements from a variety of sources including state and federal grants, tolls collected from Bay Area bridges, and a countywide ½-cent sales tax dedicated toward funding transportation improvements authorized under San Francisco's Proposition K. As noted above, MTC administers and distributes federal, state and regional moneys among the various regional transit operators, including Caltrain.

Issues Raised by Commenters: Other Transit (TR-5d)

This response addresses all or part of the following comments, which are quoted below:

O-PBNA-6 I-Zboralske-33

"Impact TR-4: Traffic

"We would celebrate the introduction of ferry service to the Arena site, and would hope that an electrified Caltrain would provide additional service to and from the Peninsula. We consider both improvements to be part of the critical path to the Arena opening—that is, they must be operational prior to the Arena's first tip-off. That parochial interests on the Peninsula have tied-up Caltrain electrification is of great concern. Ridership is already at capacity levels throughout much of the weekday schedule. Without additional trains on the schedule, we question the extent that Caltrain can be depended on in the Arena rideshare models." (*Potrero Boosters Neighborhood Association, J.R. Eppler, letter, July 27, 2015 [O-PBNA-6]*)

"The City may have admirable intentions by implementing a transit first policy. The City cannot, however, impose this policy on the region. There are about 26 different public transportation entities in the Bay Area. Oftentimes, their systems do not operate on schedule and delays occur. Any glitch on one system will negatively affect an individual's ability to make transfers. Until the entire public transportation system in the region is improved and integrated more cohesively, traveling throughout the region by linking multiple systems can be problematic.

"Trying to force a transit first policy on people throughout the region is problematic. To try and impose your will, and policy, on people throughout the region will not be successful. In my view, the City is mistaken if it believes the transit first policy and existing public transportation system will be able to alleviate traffic congestion and disruptions in Mission Bay.

"Many patrons attending events at the proposed arena will come from cities throughout the greater Bay Area. Most will want to see events with friends and family. People want to go together so they can socialize, hang out and perhaps dine before or after events. Many people have friends and coworkers that live in different cities, have different work hours and may not have robust public transportation options immediately available to them. In the end, much of what we choose to do or not do really involves details, logistics and convenience.

"So what inevitably happens? Often groups of attendees make a decision to carpool and drive to the event together. This allows them to share costs. They can decide if they want to leave early or stay late without the constraints of an unpredictable transit schedule. They keep their options open. This is modern day life. This is what happens. This is predictable.

"Although not related to the arena project, take a look at recent incidents at Dolores Park. Recently, newspaper articles have reported the park has been besieged by people on weekends, vandalized multiple times and is a filthy mess. Garbage has been strewn about and an inadequate number of trash

receptacles were installed. Apparently, the City thought if they didn't put a significant number of trash receptacles in the park that park goers would responsibly haul their trash out and pick up their own mess. How did that work out?

"The City is also grappling with measures to curb people urinating and defecating on City streets. So far that effort has not been successful. These issues are the types of quality of life issues that are so important to residents." (*James Zboralske, email, July 27, 2015 [I-Zboralske-33*])

Response TR-5d: Transit Impacts, Other Transit

There is no ferry terminal in the vicinity of the project site, and therefore the proposed project does not include the provision of new ferry service. Instead, in order to take advantage of existing ferry service available at the San Francisco Ferry Building about 2.0 miles northwest of the project site, the project includes within its Muni Special Event Transit Service Plan a commitment to shuttle attendees between the event center and the Ferry Building, as well as several other regional transit stations in San Francisco. Furthermore, in the event that the proposed project does not meet the performance standards outlined in the project TMP, provision of additional ferry service would be among the measures that the project sponsor could implement to help meet the performance standards. As stated on SEIR p. 5.2-69, under this performance standard the project sponsor would be required to offer special event ferry service to the closest ferry stop to the project site (similar to the existing service provided between AT&T Park and Alameda, Marin and Solano Counties by Golden Gate Transit, Alameda/Oakland and Vallejo ferry service). In addition, as part of Mitigation Measure M-TR-2b: Additional Strategies to Reduce Transportation Impacts on SEIR p. 5.2-129, the City would work with the Water Emergency Transportation Agency (WETA), the project sponsor, UCSF, and other interested parties to explore the possibility of construction of a ferry landing near the terminus of 16th Street, and provision of ferry service during events.

As described in Response TR-5c above, the assessment of transit impacts against existing baseline environmental conditions was conducted assuming the current schedule and ridership characteristics of Caltrain service during the analysis hours. The 2040 cumulative analysis, however, accounts for the planned electrification of Caltrain as part of the Caltrain Modernization Project, which is scheduled to be operational by 2020.[18] This future electrification will create the opportunity for Caltrain to provide additional service capacity (i.e., add additional trains during the a.m. and p.m. commute periods) that was not assumed in the project-specific transit impact analysis but was assumed in the cumulative analysis.

As presented in Impact TR-5, under existing plus project conditions without a SF Giants game at AT&T Park, the proposed project would result in significant project-specific regional transit impacts on Caltrain to and from the South Bay during the weekday evening, weekday late evening, and Saturday evening peak hours. Additional service to the South Bay would be required for conditions without and with overlapping events at AT&T Park. As stated on Mitigation Measure M-TR-5a:

[18] Caltrain Modernization Program will electrify and upgrade the performance, operating efficiency, capacity, safety and reliability of Caltrain's commuter rail service. Available online at http://www.caltrain.com/projectsplans/CaltrainModernization.html. Access August 24, 2015.

Additional Caltrain Service on SEIR p. 5.2-147, as a mitigation measure to accommodate transit demand to and from the South Bay for weekday and weekend evening events, the project sponsor shall work with the Ballpark/Mission Bay Transportation Coordinating Committee to consult with Caltrain to provide additional Caltrain service to and from San Francisco on weekdays and weekends.

The comment stating that the City cannot impose a transit first policy on the region is noted. The City recognizes the limitations of the ability of local governments to alter private behavior but nevertheless stands behind the transit ridership assumptions it has used. They are based in large part on empirical information derived from comparable circumstances and thus should be realistic to use for planning purposes. The analysis of the event center assumes that all modes of travel, including transit and driving, would be used to access the site. SEIR pp. 5.2-87 – 5.2-88 present the methodology used to estimate the proposed project's trip generation by mode. As described in the SEIR, access to the event center by transit (i.e., about 35 percent for both local and regional transit combined) is anticipated to be similar to, but slightly lower proportionally, than the current transit mode share for AT&T Park baseball games.

13.11.7 Pedestrian Impacts (TR-6)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

I-Cehand-8 I-Cunningham-3 I-Hrones-6 I-Woods-5

"Also- anything you can do to route foot traffic away from our homes [420 Mission Bay Boulevard North] would be appreciated." (*Jadine Cehand, email, June 30, 2015 [I-Cehand-8]*)

"My co-workers, many of whom are also homeowners in the Soma/Mission Bay have already been impacted by the traffic caused just by the SF GIANTS' home games! Many of us have had to adjust our work hours to avoid the traffic gridlock. This congestion has also impacted the health and welfare of our outside environment and has impeded our enjoyment of daily walks and outside lunching— which we deem necessary to keep up our health and sanity. During home games, it is virtually impossible to navigate the sidewalks and cars around 4th and Townsend not to mention the continuous bombardment of pedestrians who have parked in Mission Bay for the game. This creates sidewalk congestion even when walking on the San Francisco Bay Trail (one of our favorite walking trails) that runs along the Bay near Terry A Francois Blvd, RIGHT at the site of the proposed Warriors Stadium and other mixed-use buildings. This stadium project absolutely promises additional traffic logjams and parking nightmares." (*Micki Cunningham, email, July 23, 2015 [I-Cunningham-3]*)

"Fifth, management of pedestrian flows, especially immediately after events, can be challenging. Barclay's Center has an excellent pedestrian safety record; however, there was a need to make adjustments after the opening, which in addition to pedestrian management by operational personnel, included creating more effective sidewalk space, adding crosswalks, and installing barriers to prevent midblock crossing. The SDEIR is correct to propose solutions to prevent mid-block crossings to the southbound light rail platform at 3rd Street, and to acknowledge that the intersection of 3rd Street and South Street requires active operational management. I would suggest in addition to this that permanent physical infrastructure to adequately accommodate pedestrian flows, especially at 3rd Street and South Street, be included in the project. It is much easier to implement measures such as pedestrian bulbouts and additional crosswalks as part of the project than trying to create retrofits after the arena has opened." (*Christopher Hrones, email, June 30, 2015 [I-Hrones-6]*)

"Impact TR-6, TR-21, TR-22 While the SEIR addresses active management of pedestrian flows, it needs to be tied to priority for transit. Pedestrians need to be controlled so that transit vehicles have priority over vehicles exiting garages and pedestrian movement." (*Corrine Woods, email, July 27, 2015 [I-Woods-5]*)

Response TR-6: Pedestrian Impacts

The primary pedestrian routes between the event center and destinations to the north (e.g., Caltrain, Lot A parking) would be via Third Street, as the primary pedestrian access to the event center is at the northwest side of the block via the Third Street Plaza. Terry A. Francois Boulevard

would serve as a secondary pedestrian access route, as the food hall in the northeast corner of the site would be accessed directly via Terry A. Francois Boulevard. Therefore, it is anticipated that some project-generated pedestrians would walk past the residential buildings bordering Third Street and Terry A. Francois Boulevard. Routing these pedestrians to other streets to the west would not be practical. It is not anticipated, however, that pedestrians would use Bridgeview Way, as this street is not continuous between China Basin and Mission Rock Streets (while a pathway would be provided between China Basin and Mission Rock Streets, it would not be aligned with Bridgeview Way, and would therefore not be as visible and attractive as a pedestrian route). As described on SEIR p. 3-46, the project would be subject to the San Francisco Entertainment Commission's Place of Entertainment permits, and the sponsor would develop and implement Event Center Site Management practices to minimize potential disruption associated with event center operations to the quality of life for the surrounding neighborhood.

The additional pedestrians generated by the proposed project would be accommodated on the sidewalks adjacent to the project site, which would be designed to meet the peak pre-event and post-event demand. Pedestrian volumes further from the project site would be lower, and minimal increases would be expected north of King Street (i.e., north of the Caltrain station). Further, the number of pedestrians generated by the largest event at the event center (i.e., 18,500 attendees) would be less than half of the number generated by the typical attendance at a baseball game at AT&T Park (i.e., 41,000 attendees). While development of the project would result in increases in the number of pedestrians on the Bay Trail, it is not anticipated that the Bay Trail would be a primary or secondary route to and from the event center.

During pre-event and post-event conditions, pedestrian flows at the adjacent intersections and crosswalks would be managed to ensure that pedestrians could safely cross the streets and access light rail and shuttle buses. As indicated on SEIR p. 5.2-64, following an event, when pedestrian volumes are greatest, PCOs would be located at key locations adjacent to the project site and at the 16th Street garage driveway. They would manage alternating traffic flow of vehicle traffic exiting the garage with pedestrians and bicycle flow along and crossing 16th Street, managing alternating flows of vehicle traffic exiting the garage with the Muni Special Event 16th Street BART shuttle accessing 16th Street eastbound from Illinois Street northbound, and with the Muni Special Event Van Ness Avenue shuttles traveling westbound on 16th Street, as well as managing pedestrians crossing 16th Street. PCOs would also manage alternating pedestrian, bicycle, and/or traffic flows at the intersections of Terry A. Francois Boulevard/16th, Terry A. Francois Boulevard/South, and Third/South (the primary pedestrian access point between the project site and the T Third UCSF/Mission Bay light rail station would be at the intersection of Third/South).

13.11.8 Bicycle Impacts (TR-7)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

O-PBNA-9 O-SFBC-2

"Additional bicycle infrastructure may also be appropriate. Both 16th Streets and Mariposa Streets experience significant automobile traffic, and with dedicated bus lanes coming to 16th Street, neither are ideal for bicycles. A pedestrian and bicycle connector at 17th Street, including an overpass over the Caltrain tracks, would extend the bicycle routes already on 17th Street through the Mission and the western part of Potrero Hill. Such improvements should be evaluated so that bicycling can be a safer, more prevalent means of reaching the Arena." (*Potrero Boosters Neighborhood Association, J.R. Eppler, letter, July 27, 2015 [O-PBNA-9]*)

"SFBC, working in close partnership with the Warriors, supports the following activities to create better biking at the Project Site. These recommendations, if not already included in the DSEIR, should be addressed under Mitigation Measure M-TR-2b, Impact TR-7, or wherever appropriate in the DSEIR document:

"New and Enhanced On-Street Bicycle Facilities
SFBC supports the Warriors' and this DSEIR's inclusion of new and/or enhanced on-street bicycle facilities, to be designed in coordination with SFBC, the San Francisco Municipal Transportation Agency (SFMTA), Port of San Francisco, Office of Community Investment and Infrastructure (OCII), and Mission Bay Development Group (MBDG). These priority streets for bicycle infrastructure include:

- Terry Francois Boulevard, two-way protected bikeway on the East side of the roadway from Lefty O'Doul Bridge to Mariposa Street;
- 16th Street between 3rd and Terry Francois Boulevard: one-way buffered and/or parking protected bike lanes on North and South side;
- Enhanced intersection designs around the arena, with special attention paid to bicycle and pedestrian safety at 16th and Illinois Streets and 16th Street and Terry Francois Boulevard and;
- Managed intersections around the site during special events, with special attention paid to 16th and Illinois Streets.

"The Warriors should encourage Mission Bay Development Group and public agencies to construct or implement these improvements prior to the opening of the event center.

"Bicycle Parking
Adequate bicycle parking is critical to support the mode share goals of the project. SFBC encourages the Warriors to provide ample bicycle parking at the Project for special events, as well as for everyday commercial and neighborhood use. SFBC appreciates the Warriors commitment in on-going discussions to expand bicycle capacity as needed over the life of the development to meet additional capacity requirements that may arise.

"Valet Bicycle Parking
The Warriors and this DSEIR indicate a need for enclosed bicycle valet space with a minimum capacity of 300 bikes. SFBC supports and encourages the current allocation of roughly 2,000 square feet for the operation and management of on-site bicycle valet, which would allow proper space for expansion, as noted above. The valet space should be designed to maximize the amount of bike storage available and to

be consistent with current and projected neighborhood transportation plans. The bicycle valet should be sited as close to a main entrance to the Event Center as reasonably possible and located along one of the new or enhanced on-street bicycle facilities described above. The bicycle valet space should be completed and fully operational in conjunction with the opening of the Project.

"We are pleased that valet bicycle parking will be provided at special events at the Event Center, including concerts and performances throughout the year, and at other events with an expected attendance past a threshold size to be reasonably determined in consultation with the SFBC, and revisited annually, as needed. Bicycle valet services could also be scaled up or down based on expected attendance levels on a per-event basis.

"SFBC could plan to promote the availability of bicycle valet parking in communications and in programs to drive use. This could include promotion on the SFBC website, newsletters and social media with a reach of over 30,000 San Franciscans, and through programs and events as outlined below.

"Commercial Bicycle Parking
As indicated in the DSEIR, the Warriors should provide secure (Class 1) bicycle parking for commercial office tenants and short-term bike parking (Class 2) for retail tenants, customers and guests at or above the requirements of applicable law including the City of San Francisco Planning Code Section 155.2, which sets standards for the provision of bike parking in new commercial development.

"Other Bicycle Parking and As-Needed Expansion
SFBC supports the Warriors' and this DSEIR's proposal for an approximately 100-bike "pop-up" corral in a publicly accessible and highly visible location at the Event Center for special events on an as-needed basis. The pop-up corral should be monitored by event security staff and should be set up no less than one hour before such events.

"SFBC also supports the Warriors' intention to identify on-site locations for additional pop-up corrals and/or additional bike parking facilities if/when the need for expanded bicycle parking capacity should arise. This additional bike parking capacity should be provided as additional pop-up corrals, expanded valet, and/or other forms of secure, monitored bicycle parking.

"SFBC is encouraged by the Warriors' plan to identify additional future bike parking capacity to achieve a total of up to 900 potential spaces available to the general public during full-capacity special events (the sum of on-site bicycle valet spaces, on-site Class 2 spaces, pop-up corral spaces, and other publicly accessible secure bike parking spaces in the project vicinity). The Warriors should assess the need for expanded event bicycle parking facilities up to this number on a yearly basis and in consultation with SFBC to meet projected growth in bicycle trips. These spaces would be in addition to the permanent bike rooms in each on-site office building, which together with expanded event bicycle parking as described above, may in the future exceed 1,000 total available bike spaces for varied users at the project site.

"SFBC is committed to continue working with the Warriors to find secure, public, and appropriate locations and systems to accommodate future bicycle capacity at the Project site.

"Bay Area Bike Share Stations
SFBC supports the Warriors and this DSEIR's inclusion of Bay Area Bike Share stations at and/or around the Project site.

"Marketing and Bicycle Promotion
We are pleased that the Warriors and this DSEIR acknowledge that increasing the number of bicycle trips to and from the Project will support the Citywide goal of a 8% bicycle mode share by 2023. As such, trends in bicycle trip generation and mode split should be studied and evaluated on at least a yearly basis, with bicycle parking expansion, marketing, and promotion adjusted, to support this goal.

"The Warriors and this DSEIR discuss integrating bicycle transportation into marketing and promotional activities for the Event Center to support the above stated goals. SFBC is supportive and committed to work with the Warriors on an on-going basis to further develop, implement, and promote the programs outlined below.

"The Warriors and this DSEIR note that marketing and promotion are possible mitigations under *Mitigation Measure M-TR-2b: Additional Strategies to Reduce Transportation Impacts* for enhancing non-auto modes. As consistent with on-going discussions with the Warriors, SFBC encourages the Warriors to also consider marketing the Event Center as a bicycle-friendly destination in other press and marketing materials that may include but are not limited to:

- Warriors players and employees on bicycles at Warriors events and at SFBC events
- Feature bicycle facilities and programs in sustainability or environmental promotional materials or media
- Encourage bicycle travel information in non-Warriors special event promotions and marketing, such as concerts and performances

"Promotions to enhance the bicycle experience should also include a recurring, season-long program that encourages more people to arrive to basketball games by bicycle. Similar promotions could also be used to promote bicycle trips at other events at the Event Center throughout the year.

"The Warriors should design a plan prior to the opening of the Project for promoting bicycling to the Event Center that may include but is not limited to:

- Regular "Bike to Game" nights that include group rides from various starting locations in San Francisco and the region, rides with GSW staff prior to the game, and/or special offers for people who bike to the game;
- Bike-related raffles or prizes for people who bike to games. Giveaways could include branded lights, stickers, discount tickets, etc.;
- Special services and programs for people who bike to games. These could include monthly free or discounted tune-ups and minor repairs, and other incentives for people who frequently ride their bikes to games, such as a Bike Fan of the Month/Year program, and;
- Special events leading up to and during NBA "Green Week", in coordination with the Green Sports Alliance.

"SFBC could help organize, implement and promote bicycle-related events and promotions, ensuring strong attendance and participation. SFBC could promote the plan and the Warriors' commitment through existing email and social media channels, through partners, and on our website.

"The Warriors and SFBC, through both the EIR process and on-going discussions, are committed to continued refinement of the plans and roles described in this letter and in the DSEIR.

"Thank you for considering these comments as part of a truly collaborative effort to make the proposed Mission Bay Arena and Event Center the most bicycle-friendly sports venue in the country and an addition to the neighborhood that supports current city and neighborhood transportation goals." (*San Francisco Bicycle Coalition, Paolo Cosulich-Schwartz, letter, July 27, 2015 [O-SFBC-2]*)

Response TR-7: Bicycle Impacts

The bicycle improvements noted in the San Francisco Bicycle Coalition (SFBC) comment letter are included in the SEIR as part of the proposed project, either as physical characteristics of the project and adjacent transportation network, or as part of the proposed Transportation Management Plan (TMP). Specifically, the bicycle improvements noted in the comment letter include:

- **New and Enhanced On-street Bicycle Facilities** – As noted on SEIR p. 5.2-51, new bicycle lanes are part of the proposed project or are roadway infrastructure improvements that would be completed prior to the opening of the event center.

- **Bicycle Parking, Valet Parking, Commuter Bicycle Parking, and Other Bicycle Parking As Needed Expansion** – The proposed Class 1 and Class 2 bicycle parking spaces provided as part of the proposed project are described on SEIR p. 5.2-157. When defining the project, the sponsor worked with the SFBC to determine the bicycle strategies and number of bicycle parking spaces that would be appropriate for events, and would continue to work with the SFBC to refine the event-related needs based on the varying attendance levels and event types.

- **Bay Area Bike Share Stations** – As noted on SEIR p. 5.2-67, the location of the bike share station sponsored by the project would be determined through coordination between the project sponsor, the SFMTA, the Port of San Francisco, and the bicycle share operator. The project sponsor would also consult with the SFBC regarding location and sizing of the station.

- **Marketing and Bicycle Promotion** – The project TMP described on SEIR pp. 5.2-55 – 5.2-69 includes TDM strategies, including communications/marketing for non-auto modes, including bicycling. Therefore the suggested promotional activities do not need to be added to Mitigation Measure M-TR-2b: Additional Strategies to Reduce Transportation Impacts. In response to this comment, the project sponsor has indicated that they would work with the SFBC to develop and implement a plan to promote bicycle trips to the event center.

In response to the comment that states that additional bicycle infrastructure for east-west bicycle travel might be appropriate, please see SEIR p. 5.2-29, which describes the existing bicycle network and planned improvements. As indicated on SEIR p. 5.2-29, bicycle lanes are currently provided in both directions of 16th Street between Kansas and Third Streets. As part of SFMTA's 22 Fillmore Transit Priority Project, the existing bicycle lanes on 16th Street (Bicycle Route 4) between Seventh and Kansas Streets, will be relocated to 17th Street between Seventh and Kansas Streets. On 17th Street at Kansas Street, the relocated bicycle lanes will connect with the existing bicycle lane on the same street to the west, while at the east end, the bicycle lanes will connect with the existing north-south bicycle lanes on Mississippi Street that run between Mariposa and 16th Streets.

The proposed project also includes numerous improvements that would enhance bicycle access to the project vicinity. As described on SEIR p. 5.2-51, with implementation of the proposed project, 16th Street between Illinois Street and Terry A. Francois Boulevard would be completed, and Class II bicycle lanes on 16th Street would be extended east to the reconfigured Terry A. Francois Boulevard. In addition, with relocation of Terry A. Francois Boulevard, the existing bicycle lanes on both sides of the street would be replaced with a 12-foot to 13-foot wide two-way protected bicycle lane, known as a cycle track on the east side of the street. Where new traffic signals are proposed, bicycle signals would be provided, and at the intersection of Terry A. Francois Boulevard/16th Street, two-stage turn queue boxes would be installed to facilitate turns between the bicycle lanes on 16th Street and the two-way cycle track on the east side of Terry A. Francois Boulevard.

Construction of a pedestrian and bicycle overpass over the Caltrain tracks at 17th Street connecting Pennsylvania Avenue with Owens Street would not be feasible since it would have to traverse private property within Mission Bay (Development Block 40) in order to reach Owens

Street. Furthermore, Owens Street, where the new path would end, is a major arterial street without bicycle lanes where substantial traffic is expected. The concept of building a pedestrian and bicycle overpass over the Caltrain tracks on the north side of Mariposa Street, connecting Pennsylvania Avenue with Owens Street and Mariposa Park, has been raised before as part of various past planning efforts in the area. However, such a concept is considered speculative since its construction feasibility is unclear due to the presence of the I-280 freeway support columns and the adjacent Mariposa Street bridge over the Caltrain tracks. Furthermore, this concept is not part of the San Francisco Bicycle Plan and no funding has been allocated for its analysis, design, or construction.

13.11.9 Loading Impacts (TR-8)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

O-MBA10L4-28 I-Zboralske-4

"The Project's Truck Loading and Truck Staging Provisions Appear Inadequate.

"With regard to loading facilities, the Project Description narrative at DSEIR page 3- 20 states: *"The loading and service areas, including 13 truck loading docks, would be located on the Lower Parking Level 1". After describing dimensions of those loading dock spaces, the narrative continues: "In addition to the 13 on-site below grade loading area, 17 on-street commercial loading spaces would be provided on South Street (8 spaces), Terry A Francois Boulevard south of South Street (8 spaces) and 16th Street (1 space) …"*.

This statement in the Project Description has multifold inaccuracies:

- The accompanying scale drawing of Lower Parking Level 1 actually shows 14 off street truck loading spaces but about half of them cannot be accessed or egressed if trucks, especially the 70± foot tractor trailer rigs, are occupying nearby spaces.
- Other docks, if not completely blocked by vehicles in other loading docks, involve extremely difficult backing maneuvers.
- Some docks involve "blind" right hand backing turns from the "hammerhead" area that are ordinarily avoided in truck loading area design.
- The Project does not provide 17 on-street commercial loading spaces. It does not provide any. It simply asserts claim to enough on-street parking area to park 17 large trucks, taking use of area that otherwise would be available for public parking.
- In addition to the above, the Project does not appear to have sufficient area for staging of trucks that have already been unloaded. Headliner rock concerts and family shows are often supported by large numbers of trucks. For instance, concerts for U-2's current tour are supported by 26 tractor-trailer rigs. The Rolling Stones are supported by about the same number. A national political convention would involve many more. It is obvious that this many trucks cannot be staged within the proposed site plan, especially since the loading docks also need to be used for the truck loading that is routine for any event (such as delivery of food. drink and souvenir supplies for the concessions, removal of garbage and support for the other uses in the proposed Project. It appears that the Project will either stash those trucks, when not actively loading or unloading, by preempting public on-street parking areas in the Project vicinity or by obtaining a formal off-site staging area. Which of these is planned and if a formal staging area is planned, where is it and what is its capacity?"

(*Mission Bay Alliance, Thomas Lippe, letter, July 27, 2015 [O-MBA10L4-28]*)

"New local residents use many services that draw additional traffic to our neighborhood. Many of these services use or even require the use of vehicles such as: taxis and ride share companies, delivery services (UPS, FedEx), moving services, pet walkers, house cleaners, nannies, home repair and remodel services and meal delivery companies. In my building alone there are 50-70 of these occurrences on most days. Many of the local businesses also receive deliveries and they face the same problem.

"Few of the streets have any commercial loading zones or parking spaces for these vehicles and as a result vehicles frequently circle the area looking for parking, double-park, park in front of fire hydrants, block

driveways, and illegally park in turn lanes and the like. This is a regular and predictable practice that is only going to get worse. Although most of these indiscretions last for short periods of time, there is a cumulative effect on the neighborhood and its residents." (*James Zboralske, email, July 27, 2015 [I-Zboralske-4*])

Response TR-8: Loading Impacts

The proposed project's estimated freight delivery and service vehicle demand (i.e., the number of daily trucks generated by the use and the average and peak loading space required to accommodate the demand) is presented by land use (i.e., event center, office, retail, and restaurant) on SEIR pp. 5.2-101 – 5.2-102.

In San Francisco, the use of on-street curbs is regulated to support multiple needs, including bus stops, passenger loading/unloading zones, commercial loading spaces, travel lanes (i.e., red zones), bicycle lanes, and not just vehicle parking spaces. Figure 5.2-9 on SEIR p. 5.2-48 presents the proposed curb regulations for the streets adjacent to the project site. SEIR pp. 5.2-47 – 5.2-49 describe the proposed curb regulations for the curb adjacent to the project site, and indicate that the proposed curb regulations, including the proposed 17 on-street commercial loading spaces, would be subject to SFMTA and Port Commission approval. Overall, adjacent to the project site, 17 on-street commercial loading spaces, 58 vehicle parking spaces, a TMA shuttle stop, a taxi zone, and a paratransit stop are proposed. The proposed 17 on-street commercial loading spaces were considered part of the proposed project supply because the proposed curb regulations were developed in consultation with SFMTA staff to ensure that standard curbside activities such as parking, commercial vehicle loading/unloading, transit stops, and passenger loading/unloading activities are adequately accommodated without adversely affecting adjacent bicycle and/or travel lanes and, therefore, are anticipated to be approved by SFMTA and the Port Commission.

Impact TR-8 on SEIR pp. 5.2-161 – 5.2-166 describes the proposed on-site loading area containing 13 trucks and on-street commercial loading spaces adjacent to the project site, and compares the proposed supply with the projected demand. The loading spaces are designed to accommodate trucks of varying size and would be accessible even if the larger spaces (designed for the larger tractor trailer rigs) are occupied. Lower Parking Level 1 also provides sufficient room for trucks to back into the loadings docks, including from the hammerhead area, if necessary. Impact TR-8 also presents a discussion of the passenger loading/unloading for conditions without and with an event on the project site.

The on-site loading area was designed to accommodate trucks accessing all loading spaces. In response to the comment that the on-site loading spaces would not be accessible if nearby loading spaces are occupied, truck turning diagrams were developed for each loading space and are presented on the attached figures. Large semi-trailer trucks serving the event center would not be staged on-street adjacent to the project site. As described on SEIR p. 5.2-164, the proposed temporary curb regulations for pre-event and post-event conditions do not include provisions for any commercial vehicle loading spaces, with the exception of television truck staging on 16th Street. As indicated on SEIR p. 5.2-162, television trucks would be staged within the north curb

parking lane of 16th Street adjacent to the project site, between Third Street and the driveway to the project site.

Project-related semi-trailer trucks would stage off-site at the Western Pacific site on the waterfront (i.e., adjacent to and north of Pier 80, located approximately one mile south of the project site) and/or Pier 96 (located about two miles southeast of the project site). The Western Pacific site is currently used for construction staging for development projects and staging of trucks associated with the Moscone Center, while the Pier 96 site is currently used as a bulk cargo facility. After unloading within the project site, project-related trucks needing to stage during an event would travel to the Port of San Francisco's Western Pacific site or Pier 96. Both sites are identified as potential staging areas and would be available, even in the event that the Western Pacific site is used for off-site vehicle parking during overlapping events at AT&T Park as part of Mitigation Measure M-TR-11c: Additional Strategies to Reduce Transportation Impacts of Overlapping Events. The Port of San Francisco has confirmed that if the Western Pacific site is unavailable due to parking demand during overlapping events, Pier 96 would be available to accommodate both the Moscone Center and project truck staging demand. Also see Response TR-12a for additional information on the analysis of off-site parking as part of Mitigation Measure M-TR-11c: Additional Strategies to Reduce Transportation Impacts of Overlapping Events.

A freight operator manages the freight marshaling and staging for the Moscone Center on a portion of the Western Pacific site, and currently parks about 100 trailers year round within the lease area of the Western Pacific Site. During the largest Moscone Center events, 60 or more trucks come through marshaling at the site. In addition to the Moscone Center demand, the Western Pacific site would be able to accommodate the additional demand of at least 25 semi-trailer trucks, and would therefore accommodate staging demand for large concerts such as the Rolling Stones, or a national political convention. Pier 96 could accommodate substantially more trucks than the projected combined demand for the maximum number of Moscone Center trucks and the project-related demand of about 25 semi-trailer trucks. Thus, project-related semi-trailer trucks that would need to stage off-site would be accommodated on nearby off-street surface lots that would be large enough to accommodate the staging needs for project-generated trucks.

In the event that Pier 96 is not available for staging both Moscone Center and project-related semi-trailer trucks, a conceptual facility layout was prepared that confirmed that the maximum truck staging demand (i.e., 100 trailer plus 60 semi-trailer trucks for the Moscone Center operations and 25 project-generated semi-trailer trucks) and the proposed 800-vehicle surface parking facility could be accommodated entirely within the Western Pacific site.[19]

PH-Scott-5			

"A year-round event center of this magnitude could potentially affect emergency response times for Area personnel during peak commute times which may have a negative impact on departmental services." (*Department of California Highway Patrol, C. Sherry, letter, August 3, 2015 [A-CHP-2]*)

"The DSEIR also offers no data to support its conclusion that Arena events will not interfere with emergency access to UCSF Hospital. Instead, it offers weak rationalizations, such as the idea that drivers are supposed to get out of the way of emergency vehicles. But it is common knowledge that in special event situations, and even on normal days in SOMA, vehicles are often queued bumper-to-bumper and pedestrians are swarming the crosswalks. In these situations, drivers often cannot clear the way for emergency vehicles. Regardless of the DSEIR's prevarications to the contrary, this scenario will occur during basketball games and ambulances will be delayed." (*Mission Bay Alliance, Bruce Spalding, letter, July 27, 2015 [O-MBA5-7]*)

"The DSEIR Concludes, Without Adequate Foundation, That the Project Would Not Have Adverse Impact on Emergency Access

"The emergency entrance to the newly opened UCSF Benioff Children's Hospital is located on Fourth Street near its intersection with Mariposa, about 1050 feet (as the crow flies) from the nearest corner of the Project site. At two locations in the Transportation and Circulation section the DSEIR states that if a project were to result in inadequate emergency access, the project would be found to have a significant impact on the environment. Yet incredibly, it concludes that the subject Project would not result in inadequate emergency access when capacity events are taking place at the Project on weekday evenings, weekend afternoons or weekend evenings, regardless of whether or not the Giants or other events at AT&T park are taking place at overlapping times. The DSEIR offers no objective data to support its conclusion that emergency access would not be adversely impacted in event travel peaks – such as relative emergency vehicle travel time data with and without event traffic[14]. Instead, the DSEIR relies on its own rationalizations of why emergency vehicles might not be slowed during event travel peaks to justify concluding the Project would not have significant impact.

"The DSEIR notes drivers' obligations to get out of the way of emergency vehicles under the vehicle code. However, it fails to note that in special event access/egress situations, when vehicles are queued bumper to bumper and pedestrians are swarming the crosswalks, drivers abilities to clear the way for emergency vehicles are impaired and the emergency vehicles will inevitably be delayed more than in a normal traffic situation. The DSEIR notes that the presence of PCOs will help clear paths or emergency vehicles through

event traffic. PCOs can help, but when event traffic is jammed up with scant maneuvering space and pedestrians are swarming about, PCOs can only do so much and the emergency vehicle(s) will inevitably be delayed compared to normal traffic. The DSEIR also claims emergency vehicles can utilize the proposed exclusive transit lane on 16th Street to bypass normal vehicles in event jams. This will be fine until an emergency vehicle overtakes a transit vehicle, at which time a more confusing than normal maneuvering will have to take place. And not all the emergency vehicles will be approaching from points from which 16th Street is the best route. Finally, not all vehicles traveling in emergencies are official emergency vehicles equipped with emergency lights and sirens. Quite often, parents, caregivers or friends attempt to rush a person requiring emergency care to the emergency room in private vehicles. Private vehicles on an emergency mission are often not recognized as such by other drivers, pedestrians, or PCOs and consequently, it event traffic, suffer even more delay than official emergency vehicles.

"Because of these considerations, the DSEIR's conclusions about emergency access impacts are not only unsupported by objective data but incorrect and implausible.

Footnote:

[14] Emergency responders ordinarily log the time calls are received by dispatch, the time the subject is reached and the time the subject is delivered to an emergency care facility. So there is an objective data base that could have been examined to assess the consequences when special events currently take place in the area versus times when special events are not taking place.

(*Mission Bay Alliance, Thomas Lippe, letter, July 27, 2015 [O-MBA10L4-30]*)

"The DSEIR's disingenuous conclusion that the Project will have no impact on emergency services is false and dangerous. With the gridlock created by bottlenecked traffic, those emergency vehicles will not be able to climb over the backed up cars and buses." (*Mary Miles, Attorney at Law, email, July 27, 2015 [O-MM-5]*)

"8. There Is No Accurate Analysis or Mitigation of Impacts on Emergency and Public Services on the Directly Adjacent Major Medical Complex.

"The DSEIR's conclusions that the Project will not cause significant impacts for emergency vehicles is false, dangerous, and irresponsible. The false implication that the entire area would not be gridlocked is silly, since the backup from gridlocked intersections would prevent any vehicles from moving anywhere during "events." (*Mary Miles, Attorney at Law, email, July 27, 2015 [O-MM-16]*)

"*Impact TR-10: Emergency Vehicle Access*

"The SEIR should provide greater clarity as to how emergency vehicles, patients and hospital staff will access the UCSF medical facilities adjacent to the Arena. Mariposa Street between 101 and 280 has an increasingly residential character and a three-ton vehicle weight limit, and runs adjacent to a school and Jackson Park. It should not be depended upon as a route from the 101 Freeway to UCSF. Emergency traffic along this stretch would be dangerous and inconvenient to residents and patients alike.

"Early discussions on UCSF transportation showed Minnesota Street through the Dogpatch Historic District serving the hospital. The SEIR should make clear that this routing has been abandoned, and show an alternative route that allows ease of access to the hospital under the heaviest of traffic conditions." (*Potrero Boosters Neighborhood Association, J.R. Eppler, letter, July 27, 2015 [O-PBNA-10]*)

"I can't imagine the fire department, police departments, and UCSF are terribly happy about having to get through even more traffic to get to an emergency, and in some emergencies, seconds can make the

difference between life and death. It seems like a lack of foresight to have built this new station if they can't function at 100% efficiency." (*Josh Anon, email, July 13, 2015 [I-Anon-2]*)

"-The traffic will be horrible

"The traffic is already horrible because of the Giants game. The addition of additional cars are not going to make traffic worse it will just be traffic more frequently something that will happen no matter what is built there. The detractors make it seem like the traffic will be analogous to a flood where cars are going to pile on top of each other and block every nook and cranny preventing any kind of human movement" (*Jason Barton, email, July 27, 2015 [I-Barton-2]*)

"I'm also a nurse, and completely agree with the California Nurses Association's opposition to the new Warriors stadium. The traffic congestion will make it difficult or impossible for patients, families and emergency responders to reach the new UCSF Hospital on game days. Emergency access to the Hospital is critical to the survival of patients. The gridlock produced by the proposed Warriors stadium would result in patient deaths." (*Jessie Bunn, email, July 6, 2015 [I-Bunn-3]*)

"Beyond the commute, imagine being in labor and getting stuck in the traffic or having a child critically ill and needing to get to ER immediately. I have heard of ambulances getting stuck in traffic and have noticed that families are very late to their appointments on days where there are day games. As a mother and patient, I cannot even fathom the anxiety this would produce and would never plan any of my care at UCSF Mission Bay if any additional traffic hazards (like the stadium) were added to an already clogged area.

"I feel like the planned stadium would be a huge liability to the City of San Francisco, the Warriors franchise, UCSF, and Kaiser (who is also building in the area) - imagine if the traffic held up an ambulance and a child died? Please consider the patients, employees, and families of San Francisco when considering this proposed development and the true cost it would have to our community." (*Desiree Dieste, email, July 27, 2015 [I-Dieste-2]*)

"The traffic and parking impacts will reduce access for emergency and urgent care for patients seeking health care services and add to the existing commute challenges for the nurses, doctors and medical staff who work at the Mission Bay medical campus. The Draft EIR also ignores the health and safety impacts of interfering with access to essential medical facilities." (*Alison Heath, email, June 30, 2015[I-Heath-5]*)

"f. Consider closing off some of the streets for emergency only access to the hospitals." (*Dennis Hong, email, July 27, 2015 [I-Hong-10]*)

"Fourth, emergency vehicle access, which has been raised as a potential concern by some with this project, was effectively accommodated in Brooklyn, where police and fire stations are located immediately adjacent to Barclay's Center. There were no significant issues that I am aware of with fire or police vehicle response. However, close coordination between these agencies and the project owner was necessary to ensure things went smoothly." (*Christopher Hrones, email, June 30, 2015 [I-Hrones1-5]*)

"The traffic and parking impacts will reduce access for emergency and urgent care for patients seeking health care services and add to the existing commute challenges for the nurses, doctors and medical staff who work at the Mission Bay medical campus. The Draft EIR also ignores the health and safety impacts of interfering with access to essential medical facilities." (*Michael Lighty, email, July 27, 2015 [I-Lighty-5]*)

"For example, the assertion that there will be no significant impact on access to Emergency Services during events at the project lacks plausibility given the traffic volume and restricted road network. Traffic patrol officers will not be sufficient to identify non-ambulance patients coming to the Medical Center with an emergency, including women in labor. The ambulances themselves may be delayed, which is of course a matter of life and death." (*Michael Lighty, email, July 27, 2015 [I-Lighty-9]*)

"While the Medical Center has a heli-pad, we are limited in the hours we are allowed to use it because of the noise it would create for our resident neighbors. Therefore, we need to rely on efficient ambulance transfers of sick patients in order to get them care. When you are THAT sick, EVERY MINUTE COUNTS." (*Tina Ly, email, July 2, 2015, [I-Ly-2]*)

"I am less concerned with my personal commuting problems. More so, I am concerned with the fact that critically ill patients will not receive the care and attention they deserve and are now able to receive. I have spoken with several AMR employees as well who have major concern regarding the transportation of patients to the hospital when there are events. I am also a transport nurse that works closely with AMR and I have seen first hand how badly traffic can impact our patient care.

"Often patients are in a Code III situation, where lights and sirens are permitted. Most often, however, our patients are getting transported because they are very very ill and are near code status. It is imperative that we not sit in heavy traffic and get in and out of the hospital very quickly. Our resources are limited on the ambulance and we simply need to get back in a safe manner of time.

"I am afraid that our paitent's safety will be compromised and also that patient and family satisfaction will dramatically decrease and therefore the hospital will eventually lose the funding we need to continue to be one of the top hospitals." (*Amber Mason, email, June 27, 2015 [I-Mason-2]*)

"My greatest concern regarding the proposed development of an arena in such close proximity to the hospital is that is would prevent the ambulances/personal cars transporting patients from reaching the hospital in a timely matter, potentially creating life threatening situations for a mother or child that is in urgent need of medical care. The importance of this cannot be understated." (*Christine Smith, email, June 19, 2015 [I-Smith-1]*)

"I have personally witnessed the traffic jams from an afternoon game getting out from SF Giants Stadium, which is actually further away than the proposed stadium would be. I was outside the UCSF Benioff CHildrens Hospital after a day of work at approximately 430 pm, waiting for muni. There was complete gridlock, no T train was able to easily move and people in their independent cars were stuck, people were acting aggressively, honking, yelling, and actually driving up on the designated muni sectioned off train path to break out of the gridlock. UCSF Shuttle buses downloaded their passengers to get on the T train towards downtown since they were unable to move for at least 30 minutes. Although I was frustrated to not to be able to get home from work, I was feeling relieved that I wasn't in the back of an ambulance providing life sustaining care to a child that needed further care that I cannot provide in the back of an ambulance. To say that we have a helipad, transports will fly in, is an inaccurate statement. Contact our

transport team and you will see that the majority of our tranports are ambulance based, some from even here within our own city. Children often need life sustaining treatments that only UCSF can provide, such as ECMO. In fact, there are limitations on the number of helicopter landings we can do per month per the community board. I remember also thinking, I hope there is not a laboring mother in any of these cars, because I certainly wouldn't want to be in her shoes. Now what if there was an event at this new proposed arena and an event at Giants stadium? It is already so bad as it is! Not to mention there was not one security or police presence in the entire area near UCSF. It is literally an accident and lawsuit waiting to happen!" (*Christine Smith, email, June 19, 2015 [I-Smith-2]*)

"Finally, the traffic situation will surely impair ambulance access to our hospitals. I have seen this happen during occasional Giants game gridlock, as ambulances get stuck on 3rd Street for more than 5 minutes through 3 lights. This problem will be unimaginably worse with the addition of the proposed arena. The Draft EIR ignores the health and safety impacts of interfering with access to essential medical facilities." (*Michael Stryker, email, July 26, 2015 [I-Stryker-6]*)

"The traffic and parking impacts will reduce access for emergency and urgent care for patients seeking health care services and add to the existing commute challenges for the nurses, doctors and medical staff who work at the Mission Bay medical campus. The Draft EIR also ignores the health and safety impacts of interfering with access to essential medical facilities." (*Judy Tan, email, July 27, 2015 [I-Tan-5]*)

"I demand that the powers that be understand and truly consider the implications of building an arena in this area. The new children's hospital and its EMERGENCY ROOM are located there. The traffic that this arena will bring to the area will devastate any chances of parents, in a true emergency, being able to get to the hospital in time. By building this arena here, you are putting the lives of children unnecessarily at risk all so you can have one more sports team in the city." (*R. Tuialu'ulu'u, email, July 14, 2015 [I-Tuialu'ulu'u-2]*)

"We already have severe traffic congestion during SF Giants game time. How will the patients get access to the new medical center, especially in an emergency?" (*Joanne Williams, email, July 23, 2015 [I-Williams-2]*)

"How would you expect an ambulance to transport a patient facing death to get to the UCSF Emergency Room at the Hospital there?" (*James Woody, email, July 14, 2015 [I-Woody-2*)

"With respect to emergency vehicle access (5.2.3.6) and parking conditions (5.2.3.7) the report is woefully lacking.

"The report indicates the primary access for emergency vehicles would be 3rd Street because it has two lanes of traffic in each direction. Although 3rd Street has two lanes in each direction, they are separated by raised curbs and Municipal rail tracks. The lanes on 3rd Street are standard width and there are no shoulders, delineated bike lanes, loading zones, parking spots or any place to pull out of traffic between intersections.

"Subsequently, should any disruption occur mid-block that impedes any lane of traffic, all vehicles behind it will be negatively affected and congestion will begin occurring almost immediately. In essence a

"bottleneck" will occur. There are many scenarios in which this could happen; a traffic collision, a stalled vehicle, or any type of police, fire or medical response to a fixed location along the corridor – to name only a few of the likely possibilities.

"If a traffic collision occurred where an individual needed immediate medical assistance and transport to a hospital and/or have their disabled vehicle towed, it could easily take an hour or longer to clear the scene. The traffic back-up associated with this type of incident and closure would be stifling. Emergency responders, in vehicles, would have a difficult time getting to the incident. Police on motorcycles and bicycles would be able to get there, but they don't have the ability to transport injured parties or move and tow disabled vehicles." (*James Zboralske, email, July 27, 2015 [I-Zboralske-16*])

"I agree with the nurses. It is going to be a serious problem. And you're trying to route traffic, I believe, through the Minnesota Street area and through the Dogpatch neighborhood, to get people -- emergency vehicles to the hospital, or people that are in trouble that need to get to the hospital. That is not an acceptable alternative." (*John deCastro, public hearing transcript, June 30, 2015 [PH-deCastro2-5]*)

"And finally, for emergency vehicle access, which has been raised as a potential concern here, this was effectively accommodated in Brooklyn, where police and fire stations are located immediately adjacent to Barclays Center, and there are no significant issues that I'm aware of." (*Christopher Hrones, public hearing transcript, June 30, 2015 [PH-Hrones2-3]*)

"A nurse also mentioned her concerns, which are, How are the emergency vehicles going to access? How can they come in and out of the area?

"Well, there's really no plan, and if there is, it hasn't been communicated, and that's a problem." (*Annabel Ortiz, public hearing transcript, June 30, 2015 [PH-Ortiz-3]*)

"…traffic and parking impacts will reduce access for emergency and urgent care for patients and add to the existing commute challenges for the nurses, doctors, and medical staffs who work at the Mission Bay medical campus." (*Damion Scott, public hearing transcript, June 30, 2015 [PH-Scott-5]*)

Response TR-9: Emergency Vehicle Access Impacts

Proposed project impacts on emergency vehicle access, including emergency vehicle access by the Police Department, Fire Department, and ambulances, is presented on SEIR pp. 5.2-166 – 5.2-170. Conditions for the No Event and With Event scenarios are presented, along with improvement measures (Improvement Measure I-TR-10a: UCSF Emergency Vehicle Access and Garage Signage Plan and Improvement Measure I-TR-10b: Mariposa Street Restriping Study) for consideration by City decision makers to further reduce the proposed project's less-than-significant impacts related to emergency vehicle access. Discussion of potential emergency vehicle access impacts is also presented in Impact TR-17 for conditions with an overlapping SF Giants evening game at AT&T Park (SEIR pp. 5.2-189 – 5.2-190), and Impact TR-25 for conditions without implementation of the Muni Special Event Transit Service Plan (SEIR p. 5.2-208). Access to UCSF Medical Center facilities is a focus of the impact discussion.

In response to comments that raise concerns regarding access to medical facilities, key sections of the Impact TR-10 discussion are provided in this response.

It is not possible to provide emergency vehicle travel times with and without an event for the proposed project, as suggested in a comment, for a number of reasons: the roadway infrastructure supporting the UCSF hospital facilities is currently incomplete (buildout of Owens Street and I-280 off-ramp improvements, restriping of Mariposa Street, etc.); conditions during a SF Giants evening game with 42,000 attendees is not representative of conditions that would occur with a 18,000-attendee event at the event center; the UCSF Medical Center Phase 1 and the Public Safety Building (i.e., Police Department and Fire Department stations, and Police Department headquarters) opened in early 2015; and conditions with a SF Giants game occurred only shortly before publication of the SEIR, and as noted above, do not reflect conditions that would be present with the proposed project. Instead, as described below, the SEIR includes a qualitative assessment of project impacts on emergency vehicle access.

Pre-event and post-event vehicular traffic destined to the on-site garage containing 950 parking spaces would be managed to minimize impacts on UCSF facilities. The TMP for the event center includes strategies to provide attendees with suggested driving routes to and from the garage. Examples of strategies include website, emails, and smart phone applications. For example, during pre-game conditions, attendees driving from the south of the project site exiting at the I-280 northbound off-ramp would be directed to use Mariposa Street, rather than Owens Street and 16th Street, to reduce congestion during UCSF's shift changes. For post-event, attendees destined to the south would be encouraged to use Mariposa, Illinois or Third Streets, and not 16th or Owens Streets, to access the I-280 southbound on-ramp. As specified in the TMP, the pre-event and post-event recommended routes would be subject to revision based on monitoring during the first year of operation.

Event attendees driving to the site would park within the on-site parking garage containing 950 spaces, as well as in multiple parking facilities in the vicinity of the project site. The majority of the parking spaces available to event attendees would be located to the north of the project site, with the majority located in Lot A. However, it is anticipated that event attendees may also park within UCSF facilities to the west and southwest of the project site. Thus, travel to and from the event center would be dispersed over a broader area, reducing the effect of traffic associated with an event, particularly following an event.

During pre-event and post-event conditions, with implementation of the TMP and project mitigation measures between 21 and 26 PCOs would be stationed in the project vicinity to direct and facilitate vehicular and pedestrian travel. Locations where PCOs would be stationed in the vicinity of the UCSF Children's Hospital emergency room and urgent care facility include the intersections of Third/16th, Mariposa/I-280 northbound off-ramp/Owens (pre-game only), Mariposa/Third, Mariposa/Illinois, and 16th/Owens (post-game only). No roadway closures are proposed for pre-event conditions for any events. For events that necessitate closure of the northbound travel lanes of Third Street between 16th and South Streets (generally events with 14,000 or more attendees) for post-game conditions for a period of one to two hours depending on the size of the event, emergency vehicles traveling on Third Street southbound would not be

affected, and if necessary, emergency vehicles traveling northbound on Third Street would be permitted to continue through the closed segment between 16th and South Streets, as PCOs would be able to remove the temporary barriers. If necessary, emergency vehicles would also be able to travel on Muni's light rail right-of-way in the median or northbound within the southbound lanes on Third Street. The Event Center Transportation Coordinator would provide emergency service providers, including the fire stations and UCSF facilities, with a list of dates and times during which temporary closure of Third Street would be required following an event. Furthermore, all drivers must comply with the California Vehicle Code § 21806, which requires that drivers yield right-of-way to authorized emergency vehicles, drive to the right road curb or edge, stop, and remain stopped until the emergency vehicle has passed.

In addition, as described above, with implementation of the planned 22 Fillmore Transit Priority Project, transit-only lanes will be implemented adjacent to the curb on 16th Street west of Third Street, and emergency vehicles (i.e., Police Department and Fire Department vehicles and ambulances) will be permitted use of the transit-only lanes. The transit-only lanes on 16th Street would have fewer vehicles in them than the adjacent mixed-flow lanes, and the emergency vehicles would not be subject to any turn restrictions. Persons accessing the UCSF Medical Center emergency room and urgent care center in their personal vehicles during an emergency would, if necessary, also be able to utilize the transit-only lanes to bypass congested segments on 16th Street. In addition, when PCOs are deployed for an event, they would have the capability to radio ahead to other PCOs down the street regarding the approaching vehicle requiring emergency access. The SFMTA has indicated that PCO training for event center detail would include anticipation that some drivers destined to the UCSF Medical Center emergency room and urgent care center may require emergency access, and would be trained on identifying and facilitating these emergency trips in personal vehicles through the project vicinity. As described above, on Mariposa Street, emergency vehicles and others accessing the emergency room and urgent care center in their personal vehicles during an emergency would be able to travel within the eastbound center left-turn lane to access the intersection of Fourth/Mariposa. For smaller events, PCOs would be stationed at key intersections, monitoring traffic conditions, and could be reassigned to respond to conflicts between event center traffic and UCSF hospital access.

Under existing plus project conditions, the majority of the study intersections in the vicinity of the project site and the UCSF Medical Center Phase 1 are projected to operate at LOS D or better (the exception would be the intersection of Seventh/Mississippi/16th which would change from LOS E to LOS F conditions), and the gridlock conditions noted in the comments is not anticipated. Therefore, for these reasons, the proposed project would not result in a substantial increases in vehicle delay for emergency vehicles or other persons accessing the emergency room and urgent care center in their personal vehicles, and impacts of the proposed project on emergency vehicle access would be less than significant. Closing down streets to provide for emergency vehicle access to the hospitals, as noted in a comment, would not enhance emergency vehicle access to the area, as it may result in additional congestion on the streets leading up to the closed streets.

The proposed project would not change any planned or possible emergency vehicle access routes between US 101 and the UCSF hospitals, including the possible use of Mariposa Street by vehicles

traveling to UCSF facilities. With implementation of the proposed project, emergency vehicles would not be restricted from traveling on any street. However, it is likely that it would be quicker for emergency vehicles on US 101 northbound to access I-280 northbound and exit I-280 at Mariposa Street, than traveling on US 101 northbound to Vermont Street and then eastbound on Mariposa Street to Fourth Street.

13.11.11 Construction-related Transportation Impacts (TR-10)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

O-BCTA-3	O-MBA10L4-5	O-MBA10L4-6	O-MBA10L4-29
I-Hrones1-7	I-Wheeler2-2	I-Woods-1	

"2. The project plans show the arena building being sunken down into the site, which means the soils currently there will need to be excavated and removed. Since the arena site is at least as big as the adjacent Shorenstein site, and since the fill material is likely similar, in excess of 100,000 tons of soils will likely need to be removed. The traffic, air and other impacts from this soil removal activity during the construction period should be discussed in the EIR. We believe using the same very successful approach as used on the Shorenstein project, mass excavation and 1-mile haul down Illinois Street to the rail yard - would result in the least environmental impacts of all options." (*Bayview Community Truckers Association, letter, July 24, 2015 [O-BCTA-3]*)

"D. The DSEIR's Analysis of the Project's Construction-Related Traffic Congestion and Delay Impacts Is Legally Flawed.

"The DSEIR's analysis of the Project's construction related traffic congestion and delay impacts is legally flawed because it is based on invalid criteria, it fails to lawfully assess the Project's cumulative construction period impacts, and it improperly defers the development of mitigation measures to reduce the Project's construction-related traffic impacts to less than significant.

"The DSEIR states "Construction related impacts generally would not be considered significant due to their temporary and limited duration." (DSEIR, p. 5.2-46.) This statement is placed in the section describing the DSEIR's thresholds of significance. Therefore, it appears this conclusion reflects a policy decision rather than a fact-based assessment.

"In the impacts analysis section, the DSEIR states: "Construction related impacts generally would not be considered significant due to their temporary and limited duration." (DSEIR p 5.2- 111). Elsewhere the DSEIR quantifies the construction period's "temporary and limited duration" as 26 months. (DSEIR, p. 5.2-112.) However, the notion that the DSEIR can determine the Project's construction related traffic impacts to be "less than significant" based primarily on their temporary duration is legally and logically flawed because from a cumulative standpoint, the Project's construction impacts are part of an essentially permanent, not temporary, condition of ongoing construction in this part of San Francisco." (*Mission Bay Alliance, Thomas Lippe, letter, July 27, 2015 [O-MBA10L4-5]*)

"Indeed, the DSEIR's discussion of the Project's cumulative construction period impacts recognizes there are numerous other construction projects planned in Mission Bay and that the construction related traffic impacts of these projects will combine with this Project's construction related impacts. (DSEIR, p. 5.2-210 (Impact C-TR-1.)

"However, the DSEIR's discussion of the Project's cumulative construction period impacts is flawed because it is constrained by several artificial limits.

"First, as discussed in section I.A above, the impact assessment is limited to impacts and intersections and freeway ramps within the artificially restricted geographic "study area."

"Second, the impact assessment considers only construction projects within the Mission Bay neighborhood without regard to whether other "past, present, or reasonably foreseeable future projects" may be "closely related" because their impacts may combine with the Project's impacts.

"Third, the DSEIR's analysis of cumulative traffic impacts for construction of the project only references a handful of foreseeable projects located very close to the Project, and the DSEIR's discussion of these projects is solely in terms of whether their construction periods overlap with construction of this Project, as if the operational impacts of other "past, present, and reasonably foreseeable future projects" are not "closely related." (See DSEIR, p. 5.2-10 and 11.)[3] This is incorrect because "closely related" simply means the other projects' impacts may combine with the Project's impacts.

Table 3 in the attached report by Larry Wymer shows that it is possible to include a broader range of projects - across both time and area - in the assessment of the Project's cumulative construction period traffic impacts, and that when this is done, there are many Projects that will be under construction or operational in the period before, during, and after construction of the Project whose effects will combine with those of the Warriors Arena construction. Therefore, the Project's construction impacts are part of an essentially permanent, not temporary, condition of ongoing construction in this part of San Francisco and the DSEIR errs by basing its determination of significance on the "limited duration" of the construction period. (DSEIR, p. 5.2-212.)

"The second basis for the DSEIR's less-than-significant determination is the DSEIR's statement that "construction activities would be ... required to be conducted in accordance with City requirements." (DSEIR, p. 5.2-212.) This vague assurance is meaningless because the DSEIR does not specify what these " City requirements" are, does not specify a performance standard that these City requirements would either impose or achieve, and presents no evidence that these unspecified "City requirements" are likely to avoid significant cumulative construction related traffic effects.(See *Communities for a Better Environment v. City of Richmond* (2010) 184 Cal.App.4th 70, 95 (CBE); *Gentry v. City of Murrieta* (1995) 36 Cal.App.4th 1359; 1394 (*Gentry*).

"The third and final basis for the DSEIR's less-than-significant determination is "Improvement Measure I-TR-1: Construction Management Plan and Public Updates." The DSEIR suggests this Plan would help avoid significant cumulative construction related traffic effects.(DSEIR, p. 5.2-212.) But it is improper for the DSEIR to rely on Improvement Measure I-TR-1 to help reduce impacts to less than significant because it is not identified as a mitigation measure necessary to substantially reduce significant Project impacts; therefore, it is not enforceable. (CEQA Guideline 15126.4(a)(4).)

"Finally, the DSEIR fails to quantify the Projects' construction period impacts, presumably based on its qualitative conclusion that unspecified "City requirements" and "Improvement Measure I-TR-1" will avoid significant impacts. This puts the cart before the horse.[4]"

Footnote:

[3] These projects are:
- 1.13 million gsf of UCSF LRDP projects under construction at the Mission Bay Campus, including, the UCSF East Campus project on Blocks 33/34,
- Construction of Bayfront Park,
- realignment of Terry A. Francois Boulevard,
- construction of a neighborhood park on the north side of Mariposa Street east of Owens Street,
- the Exchange project on Mission Bay Block 40,
- the Family House project on Mission Bay Block 7 East,
- the Residential and Hotel project on Mission Bay Block 1,
- the 360 Berry Street project on Mission Bay Block N4/P3, and
- Caltrain's Peninsula Corridor Electrification Project.

"Construction Impacts on Transportation and Circulation Are Not Adequately Addressed

"In its section describing thresholds of significance, the DSEIR's transportation and circulation analysis declares that "Construction related impacts generally would not be considered significant due to their temporary and limited duration". This assessment by fiat rather than by a reasonable effort to measure or estimate the Project's construction impacts on the transportation and circulation system is inconsistent with the good faith effort to disclose impact demanded by CEQA. It also flies in the face of common sense. For example:

- A project that is located on a heavily trafficked street, a street with highvolume transit service or a street with heavy pedestrian flows would tend to have much more construction impacts on transportation than a project on a minor street that has none of those characteristics.
- A project whose construction causes closures of traffic lanes or closures of continuous sidewalks or temporarily eliminates or relocates transit stops has more construction impact on transportation than one that does not. A project that does those things on busy streets has more construction impact on transportation than one on lesser-used streets.
- A project that is large tends to involve more workers commuting daily, more daily import of supplies and construction materials, more export of demolition and construction refuse and, as a consequence of its size, tends to be of longer duration, tends to have greater construction impacts on transportation than a smaller one.

"These considerations that distinguish the severity of construction impacts on transportation can be defined or measured both qualitatively and quantitatively. The DSEIR is deficient in failing to do so.

"Despite its "by fiat" finding that the Project's construction impacts on transportation and circulation are less than significant (LS in the Summary Of Impacts And Mitigation Measures), the DSEIR identifies "Improvement Measure I-TR-1: Construction Management Plan and Public Updates". This so called 'Improvement Measure' is a surrogate 'Mitigation Measure' and, by its very existence, is de facto admission that the Project does have construction impacts on transportation and circulation that should have been disclosed as such.

"Unfortunately, the measure is in part, vague and yet to be defined (deferred mitigation that is improper under CEQA, and in other parts, defies common sense. We discuss these subjects in a subsequent section." (*Mission Bay Alliance, Thomas Lippe, letter, July 27, 2015 [O-MBA10L4-29]*)

"Finally, the phased nature of the buildout of the Atlantic Yards/Barclays Arena project led to prolonged and repeated construction impacts that overlapped with arena events. This including suboptimal temporary conditions for pedestrians, cyclists, and motorists. I was therefore pleased to see that the plan here is to complete all construction on the site including the office towers prior to the opening of the arena, and I would urge that course of action be maintained." (*Christopher Hrones, email, June 30, 2015 [I-Hrones1-7]*)

"We are already experiencing gridlock on our streets and constant disruption from construction site everywhere." (*Priscilla Wheeler, email, July 24, 2015 [I-Wheeler2-2]*)

"Impact TR-1. While the SEIR states that the project would not result in construction-related ground transportation impacts because of their temporary and limited duration, the use of Terry Francois Boulevard for construction staging will have a significant impact on traffic flow to and from AT&T ballpark parking lots. Improvement Measure 1-TR-1 needs to be stronger. Where suggested mitigations "could" be required, the word should be changed to "shall", and enforcement must be incorporated in the plans. When there are events at AT&T Park, Terry Francois Boulevard needs to be vacated by construction

staging and equipment to allow clear traffic flow, as is done by Mission Bay infrastructure developers to clear roads on event days to allow free traffic flow." (*Corrine Woods, email, July 27, 2015 [I-Woods-1]*)

Response TR-10: Construction-related Transportation Impacts

As part of the significance criteria for construction-related transportation impacts on SEIR pp. 5.2-44 – 5.2-46, the Planning Department acknowledges that construction-related impacts would generally not be considered significant due to their temporary and limited duration. This statement is not a policy decision, as suggested in a comment, but rather an acknowledgement that construction activities associated with many projects would result in less travel demand than the project operation, and would only temporarily affect the transportation network. Every project subject to environmental review at the Planning Department includes an assessment of construction-related transportation impacts, and a qualitative assessment of construction-related transportation impacts is typically conducted for development projects. While in most instances, construction-related transportation impacts are determined to be less than significant, some projects involving concurrent construction of multiple buildings on a constrained site, prolonged construction period, high intensity of construction activities, and with likely impacts to adjacent or nearby traffic, transit, pedestrian, and bicycle circulation have been determined to have significant and unavoidable construction-related transportation impacts (e.g., 5M Project).

Project construction-related ground transportation impacts are presented in Impact TR-1 for project construction (on SEIR pp. 5.2-111 to 5.2-117), and in Impact C-TR-1 for cumulative impacts (on SEIR pp. 5.2-210 to 5.2-212), and construction-related ground transportation impacts under existing plus project and cumulative conditions were determined to be less than significant. Although no mitigation is necessary because the impact would be less than significant, Improvement Measure I-TR-1: Construction Management Plan and Public Updates was identified to further reduce the proposed project's less-than-significant existing plus project and cumulative impacts related to potential conflicts between construction activities and pedestrians, transit and autos. Improvement Measure I-TR-1 includes provisions for construction truck traffic management, a construction worker parking plan, project construction updates for adjacent businesses and residents, and carpool, transit, and non-motorized modes of access for construction workers. If the project is approved, Improvement Measure I-TR-1 would be incorporated into the project MMRP as an enforceable condition of approval.

The construction impact assessment was based on preliminary information provided by the project sponsor on the construction program, including construction phasing and duration, construction vehicles and equipment, site staging and construction plans, and the City's understanding of similar construction projects throughout the City. Because detailed construction plans have not yet been developed, the SEIR identifies the procedures that would occur before the construction contractor is issued permits for the construction activities. These are not included as reasons for the impact determination, but rather as information for the decision-makers and the public showing that construction activities affecting the transportation network are subject to further review by City agencies prior to initiation of construction activities.

Prior to project construction, as part of the construction application phase, the project sponsor and construction contractors would meet with staff from DPW and SFMTA to develop and review the truck routing plans for the disposal of excavated materials, materials delivery and storage, and staging for construction vehicles. Construction contractors would be required to meet the City of San Francisco's Regulations for Working in San Francisco Streets, including those regarding sidewalk and lane closures, and would meet with SFMTA staff to determine if any special traffic permits would be required. In addition to the Regulations for Working in San Francisco Streets, the contractor would be responsible for complying with all City, state and federal codes, rules, and regulations. Construction activities that require use of any portion of the adjacent sidewalk are required to maintain pedestrian access for all users, and where complete sidewalk closures are required, alternate pedestrian access routes and detours are required to be implemented. See Section 13.3, Response AQ-5 for additional information regarding the proposed project's air quality analysis and impacts.

Impact TR-1 provides information on projected construction schedule (i.e., phasing and duration), construction hours, the number of construction vehicles (vehicles by phase), construction staging areas, potential travel lane and sidewalk closures, location of access driveways and routes between the project site and the regional facilities, construction worker parking demand, and potential overlap with other nearby projects primarily in Mission Bay that could be under construction at the same time as the project. This assessment, therefore, is consistent with the construction impact considerations identified in a comment that should be used to determine whether a project would result in significant construction impacts: roadway type, pedestrian and traffic volumes, lane closures, size of project, and number of construction-related vehicles. Based on the assessment of project construction activity impacts on the transportation network, it was determined that the proposed project's construction-related transportation impacts would be less than significant. For example, the following assessments were considered in developing the less than significant determination for construction-related ground transportation impacts:

- Travel lane closures associated with the project construction would be limited to the curb lane on South Street adjacent to the project site; however, both eastbound and westbound traffic flow on South Street would be maintained. Given the current low volumes on South Street throughout the day, the reduction in one travel lane would not substantially affect traffic operating conditions adjacent to the project site or elsewhere in the project vicinity, or at intersections further afield.

- Construction staging would occur off-street, on-site and between the existing alignment of Terry A. Francois Boulevard and the west face of the proposed event center. Therefore, traffic flow on Terry A. Francois Boulevard would not be affected.

- The sidewalk on Third Street adjacent to the project site would need to be closed during the building steel erection phase, and a temporary protected walkway cannot be provided because the existing Third Street sidewalk is too narrow to accommodate the construction needs and a protected walkway (i.e., 12 feet wide). In addition, because the northbound travel lane on Third Street is located directly adjacent to the sidewalk, a temporary protected walkway in the travel lane would result in only one travel lane on Third Street between 16th and South Streets. Pedestrians would be directed to use the west side of Third Street for north/south travel. While the temporary disruption of pedestrian access on the east side of

Third Street may be an inconvenience for some pedestrians, the low pedestrian volumes could be accommodated on the west side of the street, and therefore the temporary closure would not substantially affect pedestrians in the project vicinity or further afield.

- The number of construction trucks would generally be limited to less than 14 trucks per hour during the peak of the construction phase, and less than 10 per hour on average. These additional trucks traveling to and from the project site would not substantially affect traffic operations. The preliminary truck routes are described in the SEIR on page 5.2-114. Access to and from I-280 would be via the Mariposa Street and Cesar Chavez Street ramps, while access to and from I-80 would be via the Eighth Street (inbound to site) and Fifth Street (outbound from site) ramps. As indicated in the SEIR, the truck access routes would be reviewed with the SFMTA as part of the permit process during construction. As documented in Table 5.2-1 and Table 5.2-10, most study intersections currently operate at LOS D or better during the p.m. peak hour, and the addition of 10 to 14 trucks between the project site and I-80 and I-280, would not substantially change the intersection operations of the study intersection, or intersections further afield, or contribute considerably to intersections operating at LOS E or LOS F conditions. Also see Response TR-2b regarding definition of study area and selection of study intersections.

- Similarly, a portion of the construction workers are expected to drive; however, the number of construction workers driving to or from the project area would be less than generated by the project (i.e., 703 vehicle trips under the No Event scenario). During peak overlapping construction periods, the number of construction workers would range between 330 and 705, and only a portion of these workers would be driving from the site during the p.m. peak hour.

As the discussion above demonstrates, the SEIR accurately assessed construction-related ground transportation impacts and disclosed potential impact of construction activities, and did not rely on impacts being less than significant based solely on their temporary duration or on the fact that construction activities need to be conducted in accordance with City requirements. The assessment of the project-related construction activities on the ground transportation network did not identify substantial conflicts or safety issues with traffic, transit, pedestrian, or bicycle circulation in the area, and therefore, Impact TR-1 correctly identifies construction-related ground transportation impacts as less than significant. In response to the comments, though, the following clarifications are made to the summary paragraph on SEIR p. 5.2-116 (deleted text is shown as ~~strikethrough~~ and new text is <u>underlined</u>).

> Overall, because construction activities would be temporary and limited in duration, <u>they would not substantially affect traffic, transit, pedestrians or bicycle conditions or circulation in the area</u>, and are required to be conducted in accordance with City requirements, construction-related ground transportation impacts of the proposed project would be *less than significant.*

The revision does not change the analysis or conclusions presented in the SEIR.

One comment states that the SEIR relies on Improvement Measure I-TR-1: Construction Management Plan and Public Updates to help reduce the project impacts to less than significant, and because it is not identified as a mitigation measure, it is not enforceable. As noted above,

because the proposed project's construction-related ground transportation impacts were determined to be less than significant, a mitigation measure is not required. This does not mean, however, that Improvement Measure I-TR-1 would not be enforceable. Improvement Measure I-TR-1 would be incorporated into the project MMRP as an enforceable condition of approval. Therefore, the manner in which the SEIR described Improvement Measure I-TR-1 is appropriate and no additional changes are required. Also see Response TR-11 regarding inclusion of Improvement Measure I-TR-1: Construction Management Plan and Public Updates.

A comment also states that the cumulative construction impact analysis is flawed for the following reasons: the impact assessment is limited to an artificially restricted study area; the analysis only considers projects in the Mission Bay area as part of the cumulative projects; and only considers construction-impacts, and not the operational impacts, of cumulative projects in the project vicinity.

As explained on SEIR p. 5.2-211 localized cumulative construction-related transportation impacts could occur as a result of reasonably foreseeable projects in the vicinity of the project site that would generate increased traffic at the same time and on the same roads as the proposed project. The SEIR further explains on SEIR pp. 5.2-211 – 5.2-212 that as part of the construction permitting process, each development project would be required to work with the various departments of the City to develop a detailed and coordinated plan that would address construction vehicle routing, traffic control, and pedestrian movement adjacent to the construction area. The cumulative construction-related transportation impacts of the multiple nearby construction projects would occur over an extended duration, and the project sponsor would coordinate with various City departments such as SFMTA and San Francisco Department of Public Works (DPW) through the SFMTA Transportation Advisory Committee (TASC), a multi-agency review body, to develop coordinated plans that would address construction-related vehicle routing and pedestrian movements adjacent to the construction area for the duration of construction overlap.

See Response TR-2b: Analysis Locations regarding the extent and scope of the study area. In assessing cumulative construction-related transportation-related impacts, the SEIR appropriately focused on other projects with construction periods overlapping with that of the proposed project. Under CEQA, there was no need for the City to consider the potential construction-related effects of potential future projects for which construction would not even commence until after the proposed project is already built and operational. The cumulative effects of concern under CEQA are the *combined* or *additive* effects of multiple projects, and not the independently occurring effects of multiple different projects with no compounding or overlapping effects. (See CEQA Guidelines, §§ 15064, subd. (i)(5) ["the mere existence of significant cumulative impacts caused by other projects alone shall not constitute substantial evidence that the proposed project's incremental effects are cumulatively considerable"], 15130, subd. (a)(1) ["[a]n EIR should not discuss impacts which do not result in part from the project evaluated in the EIR"]; see also *Robinson v. City and County of San Francisco* (2012) 208 Cal.App.4th 950, 959; *San Francisco Beautiful v. City and County of San Francisco* (2014) 226 Cal.App.4th 1012, 1030-1031.) See Response TR-2b: Analysis Locations regarding the extent and scope of the study area. The SEIR states that construction activities would be required to be conducted in accordance with "City requirements." A comment states this assurance is inadequate because the SEIR does not describe

"City requirements," does not specify a performance standard that these requirements would impose or achieve, and does not present evidence that these requirements are likely to avoid significant cumulative construction-related traffic effects.

The "City requirements" that the project would be required to comply with are described in the cumulative impacts analysis and are described in greater detail under Impact TR-1. As explained in Impact TR-1 on SEIR pp. 5.2-111 – 5.2-112, prior to construction, as part of the construction application phase, the project sponsor and construction contractor(s) would be required to meet with DPW and SFMTA staff to develop and review truck routing plans for disposal of excavated materials, materials delivery and storage, as well as staging for construction vehicles. The construction contractor would be required to meet the City of San Francisco's Regulations for Working in San Francisco Streets (the Blue Book), including those regarding sidewalk and lane closures, and would meet with SFMTA staff to determine if any special traffic permits would be required. Prior to construction, the project contractor would meet with Muni's Street Operations and Special Events Office to coordinate construction activities and avoid any impacts to transit operations. In addition to the regulations in the Blue Book, the contractor would be responsible for complying with all City, State and federal codes, rules and regulations.

The requirements described above, and in the SEIR, are mandatory for all construction projects in the City. It is therefore reasonable to assume that all projects, including the proposed project, would comply with these requirements. (*Oakland Heritage Alliance v. City of Oakland* (2011) 195 Cal.App.4th 884 [holding it was reasonable for agency to expect that environmental regulations would be followed]; *City of Maywood v. Los Angeles Unified School Dist.* (2012) 208 Cal.App.4th 362, 411-412 [citing compliance with regulatory standards as adequately addressing hazardous materials at school site].) Moreover, although they are not project-specific mitigation measures, these existing regulatory requirements would be included in the MMRP for the project, which would further ensure that these requirements are complied with. (Pub. Resources Code, § 21081.6, subd. (a); *Lincoln Place Tenants Assn. v. City of Los Angeles* (2007) 155 Cal.App.4th 425, 446.)

California courts recognize that an agency may rely on compliance with existing regulations or requirements in finding a project's impacts would be less than significant. (See, e.g., *Tracy First v. City of Tracy* (2009) 177 Cal.App.4th 1933 [holding agency could rely on project's compliance with Building Code's energy efficiency standards for conclusion that project would not have significant energy impacts, and therefore did not require mitigation]; *Oakland Heritage Alliance v. City of Oakland* (2011) 195 Cal.App.4th 884 [project's compliance with existing laws and regulations provided substantial evidence that seismic impacts would be less than significant]; see also *San Francisco Tomorrow v. City and County of San Francisco* (2014) 228 Cal.App.4th 1239, 1252 [in determining general plan consistency, the City's reliance on building codes and regulations to assist in its determination that a project will reduce potential hazards was proper].) Reliance on compliance with the applicable regulatory framework is a common and widely accepted practice. (See *ibid*.; see also *City of Maywood v. Los Angeles Unified School Dist*., *supra*, 208 Cal.App.4th at pp. 411-412.)

The comment cites *Communities for a Better Environment v. City of Richmond* (2010) 184 Cal.App.4th 70, 95 (*Communities for a Better Environment*), and *Gentry v. City of Murrieta* (1995) 36 Cal.App.4th

1359, 1394 (*Gentry*). Neither of those cases are relevant to the points raised in the comment. The issue in both of those cases was whether the agency had improperly deferred formulation of mitigation measures until after project approval. Here, as the comment notes, the SEIR determined that cumulative construction-related transportation impacts would be less than significant, and therefore, no mitigation is required. Therefore, *Communities for a Better Environment* and *Gentry* do not apply.

In addition, the implementation of Improvement Measure I-TR-1: Construction Management Plan and Public Updates would be effective in managing construction traffic. Construction projects are of limited duration. Construction traffic tends to be dynamic, and varies depending on the construction activities that are occurring at any particular stage of construction. For this reason, the appropriate approach to addressing construction traffic is to put in place a flexible plan that allows for managing construction traffic on an ongoing basis, as the construction project proceeds. This approach is consistent with the *SF Guidelines*, which include the following "typical" mitigation measures for projects located in the downtown area:

> During the construction period, the project sponsor would cause to limit construction truck movement to the hours between 9:00 a.m. and 3:30 p.m., and to prohibit staging or unloading of equipment and materials during the periods of 7:30 a.m. to 9:00 a.m. and 3:30 p.m. to 6:00 p.m., to minimize peak period traffic conflicts and to accommodate queuing of Muni buses prior to the peak hours of service. The project sponsor and construction contractor would meet with the SFMTA, the Fire Department, Muni, and the Planning Department to determine feasible traffic management and mitigation measures to reduce traffic congestion during construction of this project and other nearby projects. To minimize cumulative traffic impacts due to lane closures during construction, the project sponsor would coordinate with construction contractors for any concurrent nearby projects that are planned for construction or which later become known.

Thus, the City's guidance emphasizes coordination on an ongoing basis with appropriate City departments. That is the approach reflected in Improvement Measure I-TR-1: Construction Management Plan and Public Updates.

In response to the comment regarding transporting excavated soils, Table 5.2-33 on SEIR p. 5.2-113 presents the estimated daily construction trucks and construction workers by project phase, including excavation and shoring activities, and these construction vehicle trips were included in the assessment of construction-related transportation impacts. See Section 13.3, Response AQ-5 for additional information regarding the proposed project's air quality analysis and impacts.

The comment that states that concurrent construction of the proposed event center and two office buildings, with all construction on the project site completed prior to opening of the event center, would facilitate access for pedestrians, bicyclists, and motorists to the event center (i.e., rather than a phased development as occurred at the Barclay's Center in New York), is noted.

The comment that states that there is ongoing construction activities within Mission Bay is noted. As described on SEIR pp. 2-6 to 2-8, the Mission Bay Plan area of approximately 303 acres is

currently being built out, both in terms of the roadway network and new development. The project site, Mission Bay Blocks 29-32, is part of the Mission Bay Plan area. As noted above, Improvement Measure I-TR-1: Construction Management Plan and Public Updates would ensure the coordination of the traffic management plans for the overlapping construction projects, including those in Mission Bay.

In response to the comment concerning the possible use of Terry A. Francois Boulevard for construction staging, proposed project construction staging activities would not use the travel lanes on Terry A. Francois Boulevard. Instead, as described above and on SEIR p. 5.2-112, the proposed construction staging for the majority of the project construction would take place between the existing alignment of Terry A. Francois Boulevard and the west face of the proposed event center (i.e., west of the existing Terry A. Francois Boulevard travel lanes). The staging area would be used until such time the planned realignment of Terry A. Francois Boulevard by the master MB developer occurs. Project construction would not close any travel lanes on Terry A. Francois Boulevard or Third Street, and would therefore not affect traffic flows to or from AT&T Park on game days. Therefore, an addition to Improvement Measure I-TR-1: Construction Management Plan and Public Updates, as suggested in a comment, is not required.

13.11.12 Improvement Measures (TR-11)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

A-UCSF-8 O-MBA10L4-32 I-Hong-5

"Page 5.2.169, Improvement Measure 1-TR-lOb, we request that the traffic engineering study for Mariposa Street be completed prior to, not after, certification of the Final EIR and that it be implemented and included as a condition of project approval, if determined feasible." (*University of California San Francisco, Lori Yamauchi, letter, July 27, 2015 [A-UCSF-8]*)

"A number of the mitigation measures (and de facto mitigation measures identified as "improvement measures") identified in the DSEIR are vague, insubstantive, unresponsive to the impact purportedly addressed or offer no basis for the DSEIR's conclusion. Measure having these characteristics, which disqualify them as adequate mitigation under CEQA, are not limited to those cited as egregious examples highlighted below.

"De Facto Mitigation Measure: Improvement Measure I-TR-1: Construction Management Plan and Public Updates

"The first section of this measure states as follows:

> *Construction Coordination* – To reduce potential conflicts between construction activities and pedestrians, bicyclists, transit and vehicles at the project site, the project sponsor shall require that the contractor prepare a Construction Management Plan for the project construction period. The preparation of a Construction Management Plan could be a requirement included in the construction bid package. Prior to finalizing the Plan, the project sponsor/construction contractor(s) shall meet with DPW, SFMTA, the Fire Department, Muni Operations and other City agencies to coordinate feasible measures to include in the Construction Management Plan to reduce traffic congestion, including temporary transit stop relocations and other measures to reduce potential traffic, bicycle, and transit disruption and pedestrian circulation effects during construction of the proposed project. This review should consider other ongoing construction in the project vicinity, such as construction of the nearby UCSF LRDP projects and construction on Blocks 26 and 27.

> While expressing good intention, what will be done as the result of this measure is so vague and subject to future determination as to constitute deferred mitigation. To be an effective measure, it should commit to explicit features such as the following examples:

> A continuous protected sidewalk will be maintained at all times on the Project's frontage on the east side of Third Street. Third Street will not be subject to lane closures at any time during the construction period. All access to the Project for workers, import of construction materials and equipment and export of demolition and construction debris shall be from the Sixteenth Street, South Street or Terry Francois Boulevard frontages. All connections to underground utilities shall be made from the Sixteenth Street, South Street or Terry Francois Boulevard frontages.

"The second section of this measure states as follows:

> *Carpool, Bicycle, Walk and Transit Access for Construction Workers* – To minimize parking demand and vehicle trips associated with construction workers, the construction contractor could include as part of the Construction Management Plan methods to encourage carpooling, bicycle, walk and transit access to the project site by construction workers (such as providing transit subsidies to construction workers, providing secure bicycle parking spaces, participating in free-to-employee ride matching program from www.511.org, participating in emergency ride home program through the City of San Francisco (www.sferh.org), and providing transit information to construction workers.

"This section contradicts common sense and common knowledge. It is common knowledge that few construction workers will use a bicycle, walk or use transit to travel to and from work - for compelling reasons. Many workers carry their personal tools and equipment with them each day; it is impractical to do this while walking, bicycling or riding transit. Construction work often involves strenuous physical labor.

Consequently, even if not carrying tools and equipment, construction workers are normally disinclined to walk or bike to and from work. Because of the physical labor aspect, construction workers are frequently dirty and sweaty on the homebound commute. Because of this, construction workers are themselves uncomfortable and make other riders uncomfortable if they ride transit. Because these considerations are well known, it is ridiculous and cynical for the City to pad the DSEIR with useless statements such as that reproduced above." (*Mission Bay Alliance, Thomas Lippe, letter, July 27, 2015 [O-MBA10L4-32]*)

---

5. The Draft SEIR does a good job trying to identify the Traffic issues. However, as I mentioned above, since it's publication additional thoughts from the community, MTA, UCSF and others came up are good, these comments should be part of the RTC / Final EIR. All stakeholders have done a relatively good job here. Most importantly the new Arena Facility needs to work with UCSF's Master Plan. (*Dennis Hong, email, July 27, 2015 [I-Hong-5]*)

Response TR-11: Improvement Measures

Improvement Measure I-TR-1: Construction Management Plan and Public Updates

One comment states that Improvement Measure I-TR-1: Construction Management Plan and Public Updates is a de facto mitigation measure because impacts of project construction activities on the transportation network should be significant impacts, and states that improvements were vague, insubstantive, and unresponsive. The first two components of this improvement measure (Construction Coordination and Carpool, Bicycle, Walk and Transit Access for Construction Workers) are specifically noted in the comment.

Because the proposed project's construction-related ground transportation impacts were determined to be less than significant, a mitigation measure is not required and Improvement Measure I-TR-1 is accurately identified as an improvement measure. Also see Response TR-10 regarding the analysis conducted for construction-related ground transportation impacts and the impact determination of less than significant.

Regarding the Construction Coordination component of Improvement Measure I-TR-1, because it is not possible to know either what specific projects in the vicinity of the project site would be under construction at the time the proposed project would be under construction or what the construction traffic control plans for such projects would require, it is not possible to prepare a coordinated construction management plan as part of the SEIR. Thus, this improvement measure requires that the construction contractor prepare a Construction Management Plan that would be responsive to the refined project construction schedule, phasing, and duration, as well as incorporate the actual construction activities of nearby projects that may share the same truck access routes or staging area. For example, as noted in the SEIR on page 5.2-211, construction of the UCSF East Campus project on Blocks 33/34, located directly south of the project site across 16th Street, is anticipated to start in 2016, but it is unknown what phase of construction would be occurring at the time construction on the proposed project starts. The Construction Management Plan would require coordination between these two projects which would share 16th Street as a primary truck access route.

Regarding the Carpool, Bicycle, Walk and Transit Access for Construction Workers component of Improvement Measure I-TR-1: Construction Management Plan and Public Updates, the comment states that a measure to encourage construction workers to carpool, bicycle, walk, and take transit, rather than drive, contradicts common sense and common knowledge. The comment states that it is well known that few construction workers use non-auto modes because many carry their personal tools and equipment with them each day, construction workers are normally disinclined to walk or bicycle to and from work, and are frequently dirty and sweaty on the homebound commute making other riders uncomfortable if they ride transit. Perhaps such generalizations are accurate in some places, but not in San Francisco. In San Francisco, many construction workers do take transit, walk, and bicycle to and from the job site. In San Francisco many construction workers carry a change of clothes to address the issue related to leaving work dirty and sweaty, and construction workers at big projects with extended construction schedules are also often able to store tools at the site; and City policy is to further encourage transit and other non-auto modes for all trips in San Francisco. Thus, inclusion of this measure for the construction contractor to implement strategies to encourage non-auto modes by construction workers is appropriate, and further, it is realistic, based on experience in San Francisco, to expect compliance.

Therefore, inclusion of Improvement Measure I-TR-1: Construction Management Plan and Public Updates in the SEIR, as currently presented on SEIR pp. 5.2-116 – 5.2-117 is appropriate, and no additional changes are required. Also see Response TR-10 regarding construction-related ground transportation impacts.

Improvement Measure I-TR-10b: Mariposa Street Restriping Study

In response to the comment on Improvement Measure I-TR-10b: Mariposa Street Restriping Study, additional coordination between City staff and SFMTA determined that the Mariposa Street restriping associated with the Owens Street extension and I-280 ramp improvements will be conducted in 2016, and that the SFMTA will evaluate the feasibility of extending the left turn pocket on eastbound Mariposa Street at Fourth Street west from its existing length of about 150 feet to provide for additional queuing area. Therefore, the improvement measure was clarified to reflect the SFMTA effort prior to opening of the event center, while allowing for additional review of the length of the left turn pocket after the event center opens. The project sponsor has agreed to all of the transportation improvement measures identified in the SEIR, including Improvement Measure I-TR-10b: Mariposa Street Restriping Study, and this measure would be included in the proposed project's MMRP. In response to this comment, Improvement Measure I-TR-10b: Mariposa Street Restriping Study on SEIR p. 5.2-169 was clarified as follows (deleted text is shown as ~~strikethrough~~ and new text is underlined):

> **Improvement Measure I-TR-10b: Mariposa Street Restriping Study**
>
> In connection with the Mission Bay Plan improvements to the I-280 on-ramp and off-ramp at Mariposa Street and the Owens Street extension, the SFMTA will be reevaluating the travel lane striping plan for Mariposa Street between Pennsylvania Avenue and Fourth Street. As part of this evaluation, the SFMTA will assess the feasibility of lengthening the dedicated left turn lane from eastbound Mariposa Street onto

northbound Fourth Street. The evaluation is anticipated to take place in 2016, two years prior to the opening of the proposed event center. A re-evaluation may be needed following the opening of the event center. Therefore, ~~A~~as an improvement measure to enhance access to the UCSF Medical Center Children's Hospital, subsequent to the opening of the event center, the project sponsor shall retain a qualified transportation professional approved by SFMTA to conduct a traffic engineering study to evaluate potential changes to the travel lane configuration and related signage on Mariposa Street between the I-280 ramps and Fourth Street. The study, to be conducted in ~~coordination~~ consultation with UCSF and SFMTA, would be used to determine if the dedicated eastbound left turn lane into Fourth Street/UCSF passenger loading/unloading and emergency vehicle entrance to the UCSF Children's Hospital should ~~could~~ be extended west from its existing length of about 150 feet to provide for a longer ~~additional~~ queuing area separated from event-related traffic flow. If the study recommends restriping, the project sponsor shall fund SFMTA's cost of the design and implementation of the restriping.

The revision does not change the analysis or conclusions presented in the SEIR.

13.11.13 Mitigation Measures (TR-12)

Issues Raised by Commenters: Traffic Mitigation Measures (TR-12a)

This response addresses all or part of the following comments, which are quoted below:

A-Caltrans-8	A-Caltrans-11	A-UCSF-7	A-UCSF-9
A-UCSF-10	O-MBA10L4-31	O-MBA10L4-33	I-Carpinelli-1
I-Cehand-7	I-deCastro1-6	I-Hong-1	I-Woods-6
I-Zboralske-26	I-Zboralske-27	I-Zboralske-31	PH-Siegel2-2

"Interstate 280 Mitigation
Please explain the possible interventions on the I-280 Mariposa Street on-ramp, listed under Contraflow Lane Mitigation in Table 2-1 (pg. 2-17)." (*Department of Transportation, Patricia Maurice, letter, July 20, 2015 [A-CALTRANS-8]*)

"Mitigation Responsibility
As the lead agency, the City and County of San Francisco is responsible for identifying and ensuring the coordinated implementation of all project mitigations. The project's fair share contribution, financing, scheduling, implementation responsibilities associated with planned improvements on Caltrans ROW should be listed, in addition to identifying viable funding sources per General Plan Guidelines." (*Department of Transportation, Patricia Maurice, letter, July 20, 2015 [A-CALTRANS-11]*)

"Page 5.2-167 and page 5.2-181, Table 5.2-50, the fact that the 1-280 northbound off-ramp at Mariposa is projected at LOS F during the evening peak hour during overlapping events is significant. This off ramp is an important access path to the UCSF hospitals and to neighboring land uses, and cannot be in a failing condition on a regular basis. We request a mitigation measure requiring the City to investigate the reconfiguration of the 1-280 Mariposa Street northbound off-ramp lanes to better segregate Event Center traffic from UCSF and other non-Event Center traffic." (*University of California San Francisco, Lori Yamauchi, letter, July 27, 2015 [A-UCSF-7]*)

"Page 5.2-180, Mitigation Measure M-TR-llc, UCSF encourages efforts to avoid scheduling non-Warriors events at the Event Center of 12,500 or more attendees that start within 60 minutes of the start of events at AT&T Park, as stated in this mitigation measure. We suggest that the mitigation measure be modified to limit large overlapping non-GSW events to what was analyzed in the DEIR-- no more than seven large Arena concerts per year. In 2014, the City imposed a numeric limit on large concerts at the Masonic Auditorium, providing a precedent for this type of condition." (*University of California San Francisco, Lori Yamauchi, letter, July 27, 2015 [A-UCSF-9]*)

Page 5.2-249, we request that the City commit to the additional parking lots south of the Event Center in order to minimize traffic and parking impacts of overlapping events. The total projected shortfall of about 2,000 spaces in the cumulative condition during overlapping events is substantial." (*University of California San Francisco, Lori Yamauchi, letter, July 27, 2015 [A-UCSF-10]*)

"**Mitigation Measures Are Vague, Insubstantive, Unresponsive to the Impact Purportedly Addressed or Do Not Qualify as Mitigation Under CEQA**" (*Mission Bay Alliance, Thomas Lippe, letter, July 27, 2015 [O-MBA10L4-31]*)

"Mitigation Measure M-TR-2

"This sequence of mitigation measures purportedly reduces the effects of Impact TR- 2 (that the proposed Project would result in significant traffic impacts at multiple intersections that would operate at LOS E or LOS F under Existing plus Project conditions without a SF Giants game at AT&T Park) even though the impacts are still classified Significant and Unavoidable with Mitigation (SUM). While many of the measures sound potentially useful, close consideration reveals they do not have quantifiable effects, they affect conditions that are not part of the original quantification of impact or they are ineffective in changing the behavior of the problem traveler population. We consider the mitigation measures for Impact TR-2 in sequence.

Mitigation Measure M-TR-2a: Additional PCOs during Events

This measure involves providing four more PCOs during events than the Project's proposed TMP and suggests 5 intersections where they may be deployed. The problem with this is that while PCOs can help prevent unnecessary degeneration of conditions (such as drivers 'blocking the box' or jaywalkers obstructing lanes on the green phase, they cannot cure fundamental LOS E or F conditions.

Mitigation Measure M-TR-2b: Additional Strategies to Reduce Transportation Impacts

This measure involves fourteen itemized strategies in four subgroups. The lead in states:

"The project sponsor shall work with the City to pursue and implement, if feasible, additional strategies to reduce transportation impacts. In addition, the City shall pursue and implement, if feasible, additional strategies that could be implemented by the City or other public agency (e.g., Caltrans)."

Critical words here are "if feasible". CEQA requires that "feasible mitigation" be developed. If there is any doubt at this point about the feasibility of the mitigation proposals, they cannot be presented in the DSEIR as mitigation.

Strategies to Reduce Traffic Congestion

Variable message signing only helps LOS if there are uncongested routes to which traffic can be directed. The variable message signs placed on the freeway approaches to Candlestick Park when the 49ers still played there were noteworthy in their uselessness because there were no uncongested routes to which traffic could be directed.

The City to provide coordinated outreach efforts to surrounding neighborhoods to explore the need/desire for new on-street parking management strategies, which could include implementation of time limits and Residential Parking Permit program areas.

Neighborhood parking conditions and parking permit programs have nothing to do with the LOS E and F conditions at major intersections that are the object of mitigation in this item. The proposal is irrelevant.

The project sponsor to offer for pre-purchase substantially all available on-site parking spaces not otherwise committed to office tenants, retail customers or season ticket holders, and to cooperate with neighboring private garage operators to presell parking spaces, as well as notify patrons in advance that nearby parking resources are limited and travel by non-auto modes is encouraged.

Preselling parking so that drivers have a fixed destination they can travel to directly instead of circling blocks looking for parking is a good idea. But it solves a problem not accounted for in the DSEIR's original measurement of impact. The DSEIR's underlying traffic assignments all assume

drivers are destined for explicit destinations, not milling about looking for one. So this would not reduce the LOS impacts forecast.

The project sponsor to create a smart phone application, or integrate into an existing smart phone application, transportation information that promotes transit first, allows for pre-purchase of parking and designates suggested paths of travel that best avoid congested areas or residential streets such as Bridgeview north of Mission Bay Boulevard and Fourth Street.

The problem with this entry is similar to some of the prior entries. At event times, there really are no uncongested paths to the Project vicinity, pre-purchase of parking helps solve a problem unaccounted for in the intersection LOS computations, keeping people out of residential streets is inconsistent with the supposed objective of reducing congestion at major intersections and people driving and using the app to find parking or avoid most congested routes are likely inured to transit first promotional messages.

The City and the project sponsor to work to identify off-site parking lot(s) in the vicinity of the event center, if available, where livery and TNC vehicles could stage prior to the end of an event.

This is a worthwhile action. But it avoids an on-street clutter of pick-up activity that was not accounted for in the original intersection LOS impact estimates. Hence, it does not mitigate the impact disclosed.

The City to include on-street parking spaces within Mission Bay in the expansion and permanent implementation of SFpark, including installation of sensors, dynamic pricing, and smart phone application providing real-time parking availability and cost.

This is a worthwhile action. But again, it helps solve a problem that is not reflected in the DSEIR intersection LOS analysis – that of vehicles cruising the area searching for parking. The 'searching' traffic would be additive to the traffic that was considered in compiling the LOS impacts.

The City shall work to include the publicly accessible off-street facilities into the permanent implementation of SFpark, and incorporate data into a smart phone application and permanent dynamic message signs.

The problem with this is the same issue as above – the 'searching' traffic it may reduce was never considered in the DSEIR's analysis. Hence, it does not reduce the LOS impacts as disclosed.

If necessary to support achievement of non-auto mode shares for the project, the project sponsor shall cooperate with future City efforts for active interventions to effectively manage and price the parking supply in the project vicinity to reduce travel by automobile, thus improving traffic conditions.

The problem with this proposed mitigation measure is twofold. First, the project sponsor does not control most of the parking event attendees may use in the Project vicinity. Hence, it cannot meaningfully "manage and price" the parking supply. Second, for the 2015-16 basketball season, Warriors individual game tickets at season ticketholder prices range from $30 to $60 in the upper deck and from $85 to $550 in the lower deck. Season ticketholder per game prices for the recent 2015 playoffs ranged from $100 to $165 (upper deck) and from $210 to $1050 (lower deck) in the first round to, in the final round, from $230 to $345 (upper deck) and $525 to $2000 (lower deck). At these ticket prices, very few of the attendees who haven't already chosen to ride transit for other reasons are going to be sensitive enough to parking pricing to change mode. So this strategy is unlikely to be effective.

The project sponsor to seek partnerships with car-sharing services.

Given the above ticket pricing inference as to the economics of event goers, it is doubtful that car-sharing partnerships would have quantifiable effect on travel habits or the ultimate intersection LOS impacts. Hence, there is no mitigation.

Strategy to Enhance Non-auto Modes

The project sponsor to provide a promotional incentive (e.g., show Clipper card or bike valet ticket for concession savings, chance to win merchandise or experience, etc.) for public transit use and/or bicycle valet use at the event center.

Given the above ticket pricing inference as to the economics of event goers, it is doubtful that the suggested incentives would have any effect on travel habits or the ultimate intersection LOS impacts. Hence, there is no mitigation.

Strategies to Enhance Transportation Conditions in Mission Bay and Nearby Neighborhoods

The project sponsor to participate as a member of the Mission Bay Ballpark Transportation Coordination Committee (MBBTCC) and to notify at least one month prior to the start of any non-GSW event with at least 12,500 expected attendees. If commercially reasonable circumstances prevent such advance notification, the GSW shall notify the MBBTCC within 72 hours of booking.

The notification provided herein is useful to set the ordinary event traffic management procedures in place for the scheduled date. However, there is no inference that this would change the intersection LOS impacts disclosed in the DSEIR. Hence, there is no mitigative effect.

The City and the project sponsor to meet to discuss transportation and scheduling logistics following signing any marquee events (national tournaments or championships, political conventions, or tenants interested in additional season runs: NHL, NCAA, etc.).

Again, the notification provided herein is useful to set the ordinary event traffic management procedures in place for the scheduled date. However, there is no inference that this would change the intersection LOS impacts disclosed in the DSEIR. Hence, there is no mitigative effect.

Strategies to Increase Transit Access

The City to coordinate with regional providers to encourage increased special event service, particularly longer BART and Caltrain trains, and increased ferry and bus service.

If the City really wanted to mitigate the significant impacts on intersection LOS, instead of just asking the regional service providers for more services, it should condition the Project to pay the regional providers for the incremental cost of such services over fare revenue generated. Otherwise, the measure as constituted is unenforceable and ineffective.

The City to work in good faith with the Water Emergency Transportation Agency, the project sponsor, UCSF, and other interested parties to explore the possibility of construction of a ferry landing at the terminus of 16th Street, and provision of ferry service during events.

Discussing possibilities is not mitigation. If the City wants to have this measure as an effective mitigation, it must condition the Project to contribute a fair-share payment to the ferry landing, if developed, and to pay fair share incremental costs over fare revenues for ferry operations.

(*Mission Bay Alliance, Thomas Lippe, letter, July 27, 2015 [O-MBA10L4-33]*)

"1. No added parking at 19th St./Illinois St because it will:

a. add to Dogpatch traffic congestion while not serving the neighborhood in any way.

"2. It will draw game and function day Peninsula parkers through Dogpatch via 280 N. 23rd St off/on ramp, and THIRD St., crowd out the official Traffic route for trucks and bikes on Illinois St. and interfere with the planned but also opposed MTA turn-around loop at 19th and Illinois St as well as the proposed and opposed 19th St. extension and egress for 10 wheeler trucks from BAE ship repair business on SFPort land.

"3. It will interfere with/cause safety issues for pedestrians, park users of the upcoming Crane Cove Park at 19th St./Illinois and Blue Greenway along Illinois St and Pier 70." (*Janet Carpinelli, email, August 4, 2015 [I-Carpinelli-1]*)

And now there will be "traffic lanes" with the new stadium? Please make sure we can get across 3rd Street to get to our homes. I strongly recommend/request stickers for our vehicles to make passing through traffic lanes an easier process." (Jadine Cehand, email*, June 30, 2015 [I-Cehand-7]*)

"Potrero Hill is an island with only two east - west streets on the north slope of the Hill that cross the 101. Most of our intersections are gridlocked twice a day during morning and evening commute. Add a Giants game to the mix and we get a third rush hour gridlock.

"I am not optimistic that the City is going to be able to implement an effective traffic management plan. The promised traffic officers will disappear during the next economic downturn, never to return unless the ticket tax money is in a "lock box" in the City budget." (*John deCastro, email, July 27. 2015 [I-deCastro1-6]*)

"1. TRAFFIC- I am writing to express my sincere and significant concern with the impact of the additional traffic to this area; both pedestrians and vehicles; both during and after construction. Especially when the project is completed. I have been tracking this project as best as I could. Both the sponsor (GSW) and UCSF have been doing the best possible and with other involved stake holders to resolve some of these issues. This Draft SEIR captures some of that. However, it did not include some of the recent comments and or concessions that came up since it's publication. The recent concerns are mainly with traffic; during and after the games. The possibilities of these issues seem endless. But it looks like all stakeholders are on the same page and are closer than ever to resolving these issues. Most of these issues have been vented, but a compromised plan still needs to be made, the best part is, we are getting there." (*Dennis Hong, email, July 27, 2015 [I-Hong-1]*)

"The most important mitigation for traffic congestion is to reduce the number of private passenger vehicles attempting to access the arena through Mission Bay's limited and congested street network. It is important that the SEIR require off-site parking, shuttle access to off-site parking, link ticket sales to off-site parking or transportation alternatives, create smart phone or other electronic links to available parking (including reactivation of SFPark), and actively discourage private passenger vehicle access to the Mission Bay neighborhood by providing better transit service." (*Corrine Woods, email, July 27, 2015 [I-Woods-6]*)

"For example, the report openly acknowledged that many intersections would have significant traffic impacts that would remain "significant and unavoidable with mitigation," under specified scenarios. Accordingly, the report says the City and the project sponsor should work together to seek feasible mitigation measures to reduce transportation impacts.

"One strategy being considered is to use additional off-site parking lots south of the project (not within walking distance) and providing a free shuttle service to patrons.

"The report says location sites (yet to be identified) that could provide up to 250 parking spaces for events drawing less than 12,500 patrons and up to 1,000 total spaces on days with overlapping events would be used to accomplish this. Working details regarding to this traffic mitigation option have yet to be specified and defined. Unfortunately, no sites have been identified as possibilities to date. There is no guarantee the sponsor and City could negotiate acceptable terms that would be feasible in the long term.

"The report says the sponsor would need to provide, as needed, up to six (6) shuttle trips per hour both before and after the events. There is no mention of the types of shuttles being considered or their capacity. These shuttles would be required to navigate to and from drop-off and pick-up points and be subject to traffic disruptions like other vehicles. If, in the extreme, the maximum 1,000 cars were to use

this service it is likely a minimum of 2,000 people (two people per vehicle average) would be shuttled to and from.

"Most shuttles (airport rental car and hotel type) probably hold a maximum of 25 people. Doing that math, it could take up to 80 shuttle trips to accommodate the patrons. At six shuttle trips per hour there would be a significant capacity shortfall to move patrons in a timely fashion. Using a lower number of only 500 cars and 1,000 patrons would require up to 40 shuttle trips (given full capacity for each trip) and would also result in capacity shortages, delays and disruptions.

"Given the lack of specifics and details about this option, I believe patrons using this mode of transportation will incur significant delays both before and after games.

"As the report continues other notable references to traffic problems are aptly addressed. Some of these include:

"Page 5.2-178 of the report addresses other factors that affect traffic mitigation efforts. These include physical limitations of the City's street grid and the City's Transit First policies and goals that seek to limit private vehicle usage." (*James Zboralske, email, July 27, 2015 [I-Zboralske-26*])

"Page 5.2-182 of the report specifically and clearly states, "for conditions without an overlapping SF Giants evening game, no feasible mitigations are available for the freeway ramp impacts because there is insufficient physical space for additional capacity without redesign of the I-80 and I-280 ramps and mainline structures, and which may require acquisition of additional right-of-way, and other potential measures would not adequately address the short term peak travel patterns associated with special events." Later it states, "Thus, for these reasons, the proposed project's impacts related to freeway ramp operations would be significant and unavoidable with mitigation." (*James Zboralske, email, July 27, 2015 [I-Zboralske-27*])

"Traffic mitigation options that include concepts like private shuttles, identifying and using new parking lots and increasing public transportation services lack details, specificity, funding sources and could take many years to build." (*James Zboralske, email, July 27, 2015 [I-Zboralske-31*])

"Today, specifically, I want to direct my remarks to the proposed parking lot at Crane Cove. There are a number of issues that we're concerned about regarding this parking lot location.

"First of all, Illinois Street is the official route for trucks and bikes as part of the Transportation Plan of the City. This street would be the nearest street to the proposed parking lot. The Port is also planning on having a 19th Street extension serve as a BAE heavy large-truck route, and Muni is also planing a turnaround loop, as well, directly in that area. Further, Crane Cove is a small patch of green space on the waterfront that serves the community and needs to be protected." (*David Seigel, public hearing transcript, June 30, 2015 [PH-Siegel2-2]*)

Response TR-12a: Traffic Mitigation Measures

Traffic Impacts

Traffic impacts identified at study intersections and ramps are primarily associated with pre-event evening and post-event late evening conditions for large events. A number of mitigation measures were identified that would reduce, but not eliminate, the significant traffic impacts associated with the proposed project. As stated on SEIR p. 5.2-130, the identified measures would

reduce traffic congestion in the project vicinity by providing drivers information on traffic conditions and alternate routes, providing information on on-street and off-street parking conditions, discouraging use of on-street parking through the Residential Permit Parking program, encouraging non-auto modes through parking pricing, and enhancing regional transit access to the area. However, even with implementation of these measures, the arrival and departure peak of vehicle trips to and from the event center through these intersections would continue to occur, and the proposed project's traffic impacts would be significant and unavoidable.

The Transportation Management Plan includes provision of 17 PCOs, the Local/Hospital Access Plan includes provision for three additional PCOs during weekday events with more than 12,500 attendees, and as part of Mitigation Measure M-TR-2a: Additional PCOs during Events and Mitigation Measure M-TR-11a: Additional PCOs during Overlapping Events, six additional PCOs would be required. As part of the proposed project, the City is proposing legislation to the SFMTA and the Board of Supervisors that would establish a Special Reserve Account for project improvements, improvement measures, and mitigation measures that would be implemented by the City. Also see Section 13.2, Response GEN-1a regarding funding of the Muni Special Event Transit Service Plan and other project improvements, improvements measures, and mitigation measures.

Mitigation Measure M-TR-2a and M-TR-2b

A comment questions the usefulness and effectiveness of Mitigation Measure M-TR-2a: Additional PCOs during Events and each of the measures included in Mitigation Measure M-TR-2b: Additional Measures to Reduce Transportation Impacts in mitigating the significant traffic impacts identified in the SEIR. The comment further asserts that these mitigation measures do not qualify as valid mitigation measures under CEQA.

Both mitigation measures included in Impact TR-2 were developed following review of the intersection operations at the seven intersections where significant impacts were identified. While physical changes to the intersections in terms of additional capacity would not be possible to reduce the intersection LOS to less than significant levels, transportation management strategies, including travel demand strategies would lessen the impact of additional vehicle trips generated by the proposed project. Under CEQA, a mitigation measure need not reduce impacts to less than significant levels in order to be legally adequate. As case law makes clear, it is better to mitigate significant impacts to the degree that is feasible, even if they remain significant and unavoidable, than not to try to mitigate at all. (See, e.g., *Masonite Corporation v. County of Mendocino* (2014) 218 Cal.App.4th 230, 239; *Citizens for Open Government v. City of Lodi* (2012) 205 Cal.App.4th 296, 324.)

As stated above and on SEIR p. 5.2-130, the identified measures would reduce traffic congestion in the project vicinity by providing drivers information on traffic conditions and alternate routes, providing information on on-street and off-street parking conditions, discouraging use of on-street parking through the Residential Permit Parking program, encouraging non-auto modes through parking pricing, and enhancing regional transit access to the area. The SEIR acknowledges that even with implementation of these measures, the arrival and departure peak of vehicle trips to and

from the event center through these intersections would continue to occur, and the proposed project's significant traffic impacts at the intersections would remain. Still, the measures include many worthwhile elements and would be helpful in reducing, if not totally eliminating, the severity of traffic-related impacts. Because the SEIR does not state that these measures would reduce the significant impacts to less than significant levels, and because the significant traffic impacts were identified as significant and unavoidable with mitigation, the SEIR accurately presents the impact determination, and the mitigation measure is appropriate under CEQA as presented.

A number of the measures address parking. The cost and availability of parking are key considerations in individual decisions related to mode choice; the ability to affect parking pricing would be most effective in discouraging single-occupant auto mode. The identified measures would provide the City flexibility to implement these measures in the future if technology and other considerations make them financially and practically feasible. The concern that some strategies are not currently feasible, for example, because the project sponsor does not control the parking in the vicinity of the project site and cannot be implemented in the near term is noted. However, this does not preclude the potential that the strategy may become feasible in the future (e.g., Seattle's downtown parking program includes both publicly owned and privately owned public parking garages, but overcame similar challenges related to managing both publicly-owned and privately-owned publicly-accessible parking facilities). The commenter cited no legal authority for the assertion that "[i]f there is any doubt at this point about the feasibility of the mitigation proposals, they cannot be presented in the DSEIR as mitigation." Indeed, such a legal position is contrary to public policy, as it would require lead agencies to offer no mitigation of any kind unless they are certain at the time of project approval that all of the details are feasible. It is better to approve measures that *may* be feasible than not to approve any measures at all. Here, the inclusion of such measures in the MMRP would ensure that they would be pursued by the City, and they can be reevaluated in the future based on the result of the annual monitoring of event conditions and attendee travel characteristics. If determined to be feasible, the measures would be fully implemented.

In response to the comment regarding the variable message sign, SFMTA's experience with SF Giants game conditions indicated that a variable message sign on I-280 northbound would be useful following overlapping evening events to direct drivers on I-280 northbound to use the off-ramp at the intersection of Sixth/Brannan events rather than the King Street off-ramp that terminates close to AT&T Park or the Mariposa Street ramps located near the project site. The I-280 Sixth Street off-ramp is a viable alternative for drivers during the late evening hours following overlapping events. In addition, a variable message sign, as opposed to a fixed message sign, could be used to provide additional, more accurate, information to motorists in real time.

Mitigation Measure M-TR-11c: Additional Strategies to Reduce Transportation Impacts of Overlapping Events - Analysis of Off-site Parking

The proposed off-site parking facilities included in Mitigation Measure M-TR-11c: Additional Strategies to Reduce Transportation Impacts during Overlapping Events have been further defined by the City, and additional analysis was conducted as part of this Response to Comments

document to determine the potential environmental impacts of the use of two surface parking lots south of the project site as part of this mitigation measure. The two sites include: a surface lot containing 250 vehicle spaces on Port property within the Pier 70 area located about half-mile south of the event center (referred to as the 19th Street parking lot) that is currently being planned for by the Port; and a surface lot containing 800 vehicle spaces on Port property adjacent to and north of Pier 80 located about 1.2 miles south of the event center (referred to as the Western Pacific parking lot). Both of these options would be included as part of this mitigation measure.

The transportation impact analysis conducted for the use of the two off-site lots is in Appendix TR-X of SEIR Appendix TR.

The discussion of the Mitigation Measure M-TR-11c on SEIR pp. 5.2-178 – 5.2-179 was revised as follows (deleted text is shown as ~~strikethrough~~ and new text is underlined):

> In addition to the mitigation measures describe above, **Mitigation Measure M-TR-11c: Additional Strategies to Reduce Transportation Impacts of Overlapping Events,** has been identified to ~~would~~ require the project sponsor to continue to work with the City to pursue ~~seek~~ additional strategies ~~feasible mitigation measures~~ to reduce transportation impacts during overlapping events. The feasibility of these ~~measures~~ strategies has not yet been determined. One strategy involves using off-site parking lot(s) south of the event center and providing shuttles to the event center if the location of off-site parking is not within walking distance to the event center. ~~If this strategy were to become feasible, the City would identify one or more off-site parking lot(s) on Port of San Francisco or other lands to the south of the event center to provide approximately 250 additional parking spaces for all events and up to an approximately 750 additional parking spaces (for a total of approximately 1,000 spaces) during dual events of 12,500 or more event center attendees or for other circumstances if needed, and the project sponsor shall provide free shuttles from such off-site parking lot(s) to the event center on a maximum 10-minute headway (i.e., six shuttles per hour) before and after events. Preliminary discussions with the Port have identified potential parking lot locations at an area northwest of Pier 70 in the vicinity of the intersection of Illinois/19th and an area near Pier 80 referred to as the Western Pacific site. These locations are approximate only and subject to change based on a variety of factors including, but not limited to, proximity to the event center, infrastructure and development cost, and availability. In addition, any specific locations identified for this purpose would be subject to subsequent review, design, and approvals that may involve both local and State agencies.~~
>
> ~~Given the current uncertainties regarding the availability, location, and size of one or more off-site parking lots, the effectiveness of this strategy cannot be quantified at this time.~~ If ~~such~~ an off-site parking lot(s) were to be determined to be feasible, it is possible that use of this off-site parking could reduce traffic impacts in the project vicinity. However, drivers who may use these potential additional parking facilities could travel along different routes, which could result in significant traffic impacts south of the project site such as along Third Street, Cesar Chavez Street, 25th Street or other streets that may be used as access to or from affected freeway on-ramps and off-ramps and

approaches in the vicinity of the parking lot(s). Mitigation for such traffic impacts may be available depending on the areas affected~~. Standard mitigation techniques that could be employed involve temporary or permanent removal of on-street parking to accommodate traffic flow, addition of stop signs or traffic signals, adjustment to signal timing where signals exist, addition of dedicated turn lanes or turning lane traffic indicators if the physical constraints of the intersection or adjoining streets could accommodate such changes, and other available traffic control devices. These measures could be implemented where feasible~~ to maintain a LOS D or better;~~. Similar physical or geometric constraints to fully mitigating traffic impacts may also be applicable at affected freeway on-ramps, off-ramps and approaches.~~ ~~H~~however, due to the physical limitations of the City's street grid, land may not be available for City purchase that would allow for the expansion of street width to accommodate additional travel lanes or other design techniques to achieve the standard of LOS D or better, and City policies disfavor expansion of roadway capacity in order to achieve the City's Transit First and other goals that attempt to limit private vehicle use. Consequently,~~ until a site-specific analysis of the identified parking lot(s) is conducted,~~ it cannot be determined what mitigation measures may be available for affected areas, and then whether the measures would be feasible given the physical constraints of the street network and the availability of funding to implement the measures. ~~Under the circumstances, the~~ The City would implement those measures that it deems feasible to achieve a LOS D or better in the affected areas, but regardless, secondary traffic impacts associated with Mitigation Measure M-TR-11c, Additional Strategies to Reduce Transportation Impacts of Overlapping Events, involving the use of one or more off-site parking lot(s) at this time would be considered potentially *significant and unavoidable with mitigation.*

The City has identified two sites located south of the project site: a surface lot containing 250 vehicle spaces on Port property within the Pier 70 area located less than a half-mile south of the event center (referred to as the 19th Street parking lot) that is currently being planned for by the Port; and a surface lot containing 800 vehicle spaces on Port property adjacent to and north of Pier 80 located about one mile south of the event center (referred to as the Western Pacific parking lot) included as part of this mitigation measure. Environmental review and Port approval is required for implementation of these parking facilities.

- At the 19th Street site, a 24-hour parking facility is currently being pursued by the Port, and the facility is proposed to be operational prior to the operation of the event center. Thus, the facility would likely be available for use during all events at the project site. Vehicular access to the facility would be via 20th Street from the planned Georgia Street (i.e., to the west of Michigan Street). Attendees would walk approximately one half mile between the parking lot and the event center, or they could take the T Third. Pedestrian access to the site would be either via 20th Street or via the planned 19th Street extension (as part of the Crane Cove Park project).

- The Western Pacific site would be converted into a temporary parking facility for use during large events (i.e., more than 12,500 attendees) that overlap with SF Giants evening games at AT&T Park (i.e., on average about nine times per year).

Vehicular access to this site would be via Cesar Chavez Street and Michigan Street. The facility would open two hours prior to the start of an event, and close two hours following the end of an event. Free bus service procured by the project sponsor would shuttle event attendees between the project site and the Western Pacific parking lot before and after the event.

The following edits are made to the text of the mitigation measure on page 5.2-180 (deleted text is shown as ~~strikethrough~~ and new text is underlined):

Mitigation Measure M-TR-11c: Additional Strategies to Reduce Transportation Impacts of Overlapping Events

The project sponsor shall work with the City to pursue and implement~~, if feasible,~~ additional strategies to reduce transportation impacts associated with overlapping events at AT&T Park and the proposed event center. These strategies ~~could~~ include the following:

- The project sponsor shall exercise commercially reasonable efforts to avoid scheduling non-Golden State Warriors events of 12,500 or more event center attendees that start within 60 minutes of the start (respectively) of events at AT&T Park.

- When overlapping non-Golden State Warriors events of 12,500 or more event center attendees and evening SF Giants games cannot be avoided ~~through commercially reasonable efforts~~, the project sponsor shall exercise commercially reasonable efforts to negotiate with the event promoter ~~as feasible~~ to stagger start times such that the event headliner starts no earlier than 8:30 p.m.

- The City has identified two ~~shall identify one or more~~ off-site parking lot~~s~~(~~s~~) on Port of San Francisco or other lands to the south of the event center (19th Street and Western Pacific sites) that can accommodate ~~to provide~~ approximately 250 additional parking spaces for all events and up to approximately ~~950~~ 800 additional parking spaces for use during dual events of 12,500 or more event center attendees (for a total of approximately ~~1,000~~ 1,050 additional off-site parking spaces). As long as the Port of San Francisco takes all necessary actions to make the land available for public parking, the ~~The~~ project sponsor shall: (1) make commercially reasonable efforts to negotiate with the Port of San Francisco or its designee to acquire sufficient rights for the use of such parking lot(s) through lease, purchase, or other means as necessary; and (2) ~~pay its fair~~fare share contribution towards any improvements required for the use of such parking lot(s), including but not limited to grading, paving, striping, fencing, lighting, drainage, stormwater pollution prevention measures, curb cuts, and ramps; and (3) (if such negotiations are successful) provide free shuttles to the event center from such off-site parking lot~~(s)~~ that are more than ½~~¼~~ mile from the event center on a maximum 10-minute headway before and after events.

- In the event that the off-site parking lots at 19th Street and the Western Pacific site are implemented, the SFMTA shall consult with Caltrans in assessing the feasibility of signalizing the intersection of Pennsylvania/I-280 southbound off-ramp. If determined feasible by the SFMTA and Caltrans, the SFMTA and Caltrans shall establish the level of traffic volumes that would trigger the need for a signal, and the project sponsor shall fund its fair share cost of the design and implementation

of the new signal, based on project contributions to annual average weekday traffic volumes at this intersection.

In addition, as part of monitoring of traffic conditions during overlapping events, the SFMTA shall consult with Caltrans regarding the need to deploy an SFMTA PCO or CHP officer to expedite traffic exiting I-280 southbound (i.e., waving vehicles exiting I-280 southbound and turning left onto southbound Pennsylvania Street through the existing stop sign) during overlapping events when the Western Pacific parking lot is used for project event parking. The PCO or CHP officer would be deployed during those events prior to installation of a traffic signal or if signalization of this intersection is determined not to be feasible.

Impacts of Mitigation Measure M-TR-11c, Off-site Parking

As required by CEQA Guidelines Section 15126.4, this section presents a summary of the potential effects of implementation of the proposed off-site parking facilities at the 19th Street site, located at the southeast corner of Illinois and 19th Streets less than one-half mile from the project site, and at the Western Pacific site, located adjacent to Pier 80, approximately one mile south of the project site. More detailed discussion and supporting data for the information below is included in Appendix TR-X of SEIR Appendix TR. Environmental review and Port approval is required for implementation of these two parking facilities.

Traffic. With implementation of the 19th Street and Western Pacific parking facilities, project vehicle trips would be dispersed over a broader area south of the project site, reducing the effect of increased traffic at intersections closer to the project site. Attendees traveling to the facilities from the south would be encouraged to park at these facilities instead of seeking parking closer to the event center. Intersection LOS analysis was conducted for the Basketball Game scenario for conditions without and with a SF Giants evening game at AT&T Park for the weekday p.m. weekday evening, weekday late evening, and Saturday evening peak hours (see Appendix TR-X in Appendix TR). In addition to the 22 study intersections analyzed for the proposed project, nine additional study intersections in the vicinity of the two parking lots were analyzed. The additional study intersections include 18th/I-280 southbound off-ramp, 18th/I-280 northbound on-ramp, Third/20th, Pennsylvania/I-280 southbound off-ramp, Pennsylvania/I-280 southbound on-ramp, Indiana/25th/I-280 northbound on-ramp, Third/25th, Pennsylvania/Cesar/I-280 northbound off-ramp, and Illinois/Cesar Chavez. The four intersections with the I-280 ramps on 18th and Pennsylvania Streets are unsignalized intersections, and the others are signalized intersections. Traffic counts for conditions without and with a SF Giants evening game at AT&T Park were obtained from earlier counts conducted in June 2013 and January 2014, supplemented with new counts conducted in July and August 2015.

For the Basketball Game scenario without a SF Giants evening game at AT&T Park, the analysis assumed that all of the 250 parking spaces within the 19th Street parking lot would be available to event center attendees. For these analyses, vehicles that had been

assigned to UCSF parking facilities (i.e., specifically the vehicles assigned to the Medical Center and Community Center garages) were reassigned to the 19th Street parking lot. The intersection LOS analysis results for the weekday p.m., weekday evening, weekday late evening, and Saturday evening indicate that the nine additional study intersections would continue to operate at LOS D or better, with minimal changes in delay. At the original 22 study intersections, average vehicle delay would change minimally and LOS conditions would generally remain the same as identified in Impact TR-2 above. Use of the 19th Street parking lot would not result in new significant traffic impacts, or eliminate the significant traffic impacts identified in Impact TR-2 (i.e., at King/Fourth, Fifth/Harrison/I-80 westbound off-ramp, Fifth/Bryant/I-80 eastbound on-ramp, Third/Channel, Fourth/Channel, Seventh/Mission Bay Drive, Seventh/Mississippi/16th). Thus, without or with the use of the 19th Street parking lot, the project would result in significant and unavoidable traffic impacts at seven study intersections that would operate at LOS E or LOS F conditions under existing plus project conditions without a SF Giants evening game at AT&T Park. This impact is no more severe than described above.

For the Basketball Game scenario with a SF Giants game at AT&T Park, the analysis assumed use of both parking lots by event attendees, for an additional parking supply of 1,050 vehicle spaces. Similar to the conditions without a SF Giants evening game, vehicles that were assigned to UCSF parking facilities were reassigned to both parking lots. In addition, vehicles that had conservatively been previously assumed to park at Mission Bay garages that were close to or slightly over capacity, such as the 450 South Street or the 1670 Owens Street garages, were also reassigned to the two lots. Due to the two parking facilities south of the project site, vehicle access to/from I-280 would shift from the Mariposa Street ramps to those located at Pennsylvania Avenue and Cesar Chavez Street. The analysis also assumes that for post-event late evening conditions, one to two PCOs would be stationed at the intersection of Third/Cesar Chavez, and that both travel lanes on the westbound approach of Cesar Chavez Street would be westbound through lanes (i.e., westbound left turns would not be permitted, drivers destined to destinations south on Third Street would be required to make a westbound left turn at Illinois Street). West of Third Street there are two westbound travel lanes, and the temporary post-event travel lane configuration can be accommodated. With implementation of the off-site parking facilities, the intersection LOS analysis results indicate that for conditions with overlapping events, intersections LOS would remain similar to those reported for the proposed project, with the following exceptions:

Weekday p.m. peak hour – Implementation of the off-site parking facilities would cause the intersection of Pennsylvania/Cesar Chavez/I-280 northbound off-ramp to operate at LOS E rather than LOS D; however, with use of the off-site parking facilities, the intersection of Fourth/16th Street would operate at LOS D rather than LOS E.

Weekday evening peak hour - Implementation of the off-site parking facilities would cause the intersection of Pennsylvania/Cesar Chavez/I-280 northbound off-ramp to operate at LOS F rather than LOS D; however, with use of the off-site parking

facilities, the intersection of Mariposa/I-280 northbound off-ramp would operate at LOS C rather than LOS E.

Weekday late evening peak hour – With implementation of the off-site parking facilities, intersection LOS conditions and identified impacts would remain the same as described in Impact TR-11. As described above, with implementation of traffic management strategies to provide for two westbound through lanes at the intersection of Third/Cesar Chavez, the intersection would operate at overall LOS D conditions.

As described above, traffic impacts for the Basketball Game scenario with an overlapping SF Giants evening game at AT&T Park were identified as significant and unavoidable at ten study intersections. With implementation of this mitigation measure, the significant project impacts at the intersection of Fourth/16th during the weekday p.m. peak hour, and at the intersection of Mariposa/I-280 northbound off-ramp would not occur. With implementation of the mitigation measure, the proposed project would result in traffic impacts at nine, rather than ten intersections.

The change in location of traffic impacts at intersections (i.e., no project impact at the intersections of Fourth/16th and Mariposa/I-280 northbound off-ramp, and a project impact at the intersection of Pennsylvania/Cesar Chavez/I-280) is consistent with the determination noted above, that it is possible that use of this off-site parking lots during overlapping events could reduce traffic impacts in the project vicinity, but that drivers who may use these additional parking facilities could travel along different routes, which could result in traffic impacts south of the project site, such as along Third Street, Cesar Chavez Street, 25th Street, or other streets that may be used as access to or from affected freeway on-ramps and off-ramps and approaches in the vicinity of the parking lots. Thus, use of off-site parking facilities identified in Mitigation Measure M-TR-11c would not result in a substantial increase in the severity of the proposed project's traffic impacts identified for conditions without this measure. Therefore, with implementation of Mitigation Measure M-TR-11c, Impact TR-11 conclusion remains the same: the proposed project would result in significant traffic impacts at multiple intersections that would operate at LOS E or LOS F under existing plus project conditions with an overlapping SF Giants evening game at AT&T Park. Impact TR-11 would be considered potentially *significant and unavoidable with mitigation.*

Transit. The additional parking facilities would serve to reduce the number of attendees seeking and finding parking at parking facilities closer to the project site, and are not expected to result in a mode shift for access to and from the event center. Therefore, with the two additional facilities accommodating a total of 1,050 vehicle parking spaces, the transit impact analysis related to capacity utilization would remain the same as presented in Impact TR-4 and Impact TR-5 for conditions without an overlapping SF Giants evening game at AT&T Park, and in Impact TR-13 and Impact TR-14 for conditions with an overlapping SF Giants evening game at AT&T Park.

Shuttle buses would connect the event center with the Western Pacific site. Prior to an event, shuttle buses would travel to the event center via Cesar Chavez Street westbound, Illinois Street northbound, and would return via 16th Street westbound, Third Street southbound to Cesar Chavez Street eastbound. Pre-event, the shuttle buses would drop off passengers on the east side of Illinois Street between 16th and Mariposa Streets. The shuttle zone on the east curb of Illinois Street would be used by the Muni Special Event 16th Street BART station shuttle post-event, and therefore, would not result in additional temporary parking displacement during overlapping events. Following an event, shuttle buses would travel to the event center via Cesar Chavez Street westbound, Third Street northbound, 16th Street eastbound, Illinois Street southbound, and would return via Illinois Street southbound, Mariposa Street westbound, Third Street southbound, to Cesar Chavez Street eastbound. Post-event, buses would use the west curb of Illinois Street between 16th and Mariposa Streets to load passengers, which would require temporary parking prohibition for a portion of the west side of Illinois Street between 16th and Mariposa Streets during overlapping events (currently there are about 40 on-street parking spaces on this section of Illinois Street). The shuttle zone on the east curb of Illinois Street would be used by the Muni Special Event 16th Street BART station shuttle post-event, and therefore, would not result in additional temporary parking displacement during overlapping events.

The project sponsor would be responsible for accommodating the passenger demand on the shuttles. The majority of the arrivals and departures would occur within one hour of the start and end of the event, and would be greater during the post-event period. Assuming a shuttle capacity of 60 passengers per bus, about eight buses making three round trips between the event center and the Western Pacific parking lot would be needed to accommodate the peak post-event passenger demand of 1,400 passengers (i.e., 800 vehicles each with an average vehicle occupancy of 2.52 passengers, and about 70 percent of the demand occurring within a one-hour period). If shuttle buses with less capacity are used, more shuttle buses would be required to accommodate the passenger demand. Impacts would be less than significant.

Pedestrians. The 19th Street site is located about 0.45 miles south of the project site, and it is anticipated that given this short distance attendees would walk between the event center and the parking lot. Pedestrian access to the 19th Street lot would be via 20th Street, where a sidewalk is currently provided on the north side of 20th Street, or via the planned extension of 19th Street as part of the Phase 1 of Crane Cove Park. Because a sidewalk is not currently provided on the east side of Illinois Street between 20th and Mariposa Streets (it is being built out as development on the east side of Illinois Street occurs), pedestrians would walk on the west side of Illinois Street. At Mariposa Street, pedestrians would most likely continue north on Terry A. Francois Boulevard to access the main entrance to the site. Some pedestrians may choose to walk between the event center and the 19th Street site on Third Street. The ultimate configuration of the sidewalk on the west side of Terry A. Francois Boulevard is 12.5 feet wide, on the west side of Illinois Street is generally 10.5 feet wide, and on the east side of Third Street is 12 feet

wide. Pedestrian volumes during the evening and late evening periods are generally low, and the additional pedestrians walking between the event center and the 19th Street parking lot would be accommodated on the sidewalks and at the crosswalks at intersections without substantially affecting pedestrian flows.

Travel for event attendees between the Western Pacific parking lot and the event center would be via a shuttle bus. Pedestrians would enter the shuttle bus within the Western Pacific parking lot (e.g., similar to a shuttle bus system at an airport parking lot), and exit at a temporary stop on the east side (pre-event) and west side (post-event) of Illinois Street between 16th and Mariposa Streets. For pre-event and post-event conditions, PCOs would be stationed at the intersection of Illinois/16th to manage pedestrian, transit, traffic, and bicycle flows through the intersection.

The two parking lots would result in fewer pedestrians accessing the project site, particularly from parking facilities located primarily west of the project site (i.e., fewer attendees would park at UCSF parking facilities that were assumed to be available for parking during events at the project site), which would instead travel via shuttle. This would reduce the effect of additional pedestrians at the intersections of Third/South and Third/16th. Impacts would be less than significant.

Bicyclists. Illinois Street in the vicinity of both parking facilities is part of Bicycle Route 5 and a bicycle lane is provided in each direction. The additional vehicles traveling to and from the parking lots would primarily travel on Third Street and turn onto or from 20th Street and Cesar Chavez Street to access the lots. Therefore, it is not anticipated that the parking lots would result in a substantial number of project-generated vehicles on Illinois Street. In addition, the use of the sites would result in a reduction in the number of vehicles on streets in the project vicinity, where bicycle lanes are also located, but it would result in an increase of bus shuttles on 16th Street between Third and Illinois Streets, and on the west side of Illinois Street, both of which include bicycle facilities. Pre-event, the Western Pacific parking lot shuttle bus would unload passengers on the east curb of Illinois Street between 16th and Mariposa Streets, and post-event would load passengers at the west curb of Illinois Street between 16th and Mariposa Streets. On both sides of Illinois Street, the passenger loading/unloading zones would be adjacent to existing bicycle lanes. Post-event both the Muni Special Event 16th Street BART shuttle and the Western Pacific parking lot shuttle bus would load passengers along Illinois Street between 16th and Mariposa Streets, which could result in an increased potential for bus-bicycle conflicts and bicycle safety concerns. As described in the SEIR, post-event 16th Street between Illinois Street and Terry A. Francois Boulevard, as well as northbound Illinois Street between Mariposa and 16th Streets, would be closed to vehicular traffic to facilitate Muni Special Event Shuttle operations (local access to adjacent building from Mariposa Street would be permitted). As the event center bicycle valet parking would be accessed from the north sidewalk along 16th Street in this segment, signage, cones and PCOs would be used to direct departing bicyclists towards the signalized intersection of Terry A. Francois Boulevard/16th Street, where they can

safely mount their bicycles and travel northbound and southbound on Terry A. Francois Boulevard within the planned cycle track. At the intersection of Illinois/16th, a PCO would be stationed to facilitate transit, vehicle and bicycle travel along 16th Street, as well as direct southbound pedestrians and vehicles across 16th Street. Thus, post-event bicyclists traveling southbound would be directed towards Terry A. Francois Boulevard, away from Illinois Street between 16th and Mariposa Streets, which would be extensively used by event shuttle buses and vehicles departing the project garage, and instead directed towards the cycle track on Terry A. Francois Boulevard. Thus, implementation of TMP measures during events would facilitate bicycle access and minimize conflicts. Impacts would be less than significant.

Loading. Implementation of the two parking lots would not affect on-site loading operations. However, the Western Pacific site is currently used to stage semi-trailer trucks serving the Moscone Center. With implementation of the parking lot, the staging of trucks would either continue on-site or be relocated to Pier 96. A conceptual facility layout was prepared for the Western Pacific site that confirmed that the maximum truck staging demand (i.e., 100 trailer plus 60 semi-trailer trucks for the Moscone Center operations and 25 project-generated semi-trailer trucks) and the proposed 800-vehicle surface parking facility could be accommodated within the Western Pacific site. Therefore, the existing uses on the Western Pacific site would continue to be accommodated. During overlapping events when the Western Pacific site is proposed to be used for parking, the semi-trailer trucks staging at the Western Pacific site would be parked, and not circulating, and therefore conflicts between pedestrians, vehicles, and the staging trucks would not occur. Impacts would be less than significant.

Emergency Vehicle Access. With implementation of the off-site parking lots on Port of San Francisco properties, the project-generated vehicles would be dispersed over a broader area south of the project site, reducing the effect of increased vehicle traffic on the roadway network closer to the project site. The operation of the two facilities would not block access to 20th, Illinois, or Cesar Chavez Streets. Impacts would be less than significant.

Construction-related Transportation Impacts. Construction activities associated with the Western Pacific lot would include minimal construction activities, and would primarily include application of organic surfactant to reduce dust, installation of temporary night-lighting stands, and signage. The improvements would occur over a six months to a year. The 19th Street parking lot would be constructed as part of a separate environmental review and permitting process. Impacts would be less than significant.

Air Quality Impacts. The off-site parking lot refinement does not affect the operational traffic health risk assessment (HRA) as presented in the SEIR. As shown in the Air Quality Appendix Tables 6.1-3 and 6.1-4, a screening level HRA was conservatively performed assuming that each of the trips generated circled a city block, and the highest possible resulting risk from the four roadways was presented. Since the total number of

trips generated does not change, this screening level analysis still represents a hypothetical maximum impact.

Noise Impacts. The additional availability of parking at these locations would result in a subtle redistribution of vehicle traffic on the local roadways which could affect the predicted roadway noise impacts. Roadway noise modeling was conducted to evaluate increases in roadside noise levels along local roadways where sensitive receptors exist (see Appendix TR-X). In addition to the six roadway segments that were analyzed for the proposed project, two new roadway segments were analyzed to assess potential impacts to Third Street between 20th Street and 23rd Street and to 20th Street between Illinois Street and 3rd Street, both of which have residential uses adjacent to roadways. Roadside noise level increases at all of the roadway segments would be less than 5 dBA, and therefore, the impact would be less than significant. The severity of the significant and unavoidable noise impact along Illinois Street between Mariposa Street and 20th Street would be marginally decreased with this mitigation measure, but the overall impact (Impact NO-5) would remain significant and unavoidable with mitigation.

In addition, noise modeling was conducted in the cumulative (Year 2040) scenario assuming a basketball game event and a simultaneous Giants Game event at AT&T Park and operation of both the 19th Street lot and the Western Pacific lot, the results of which are presented in Appendix TR-X. There would still be significant and unavoidable noise impacts along Illinois Street and Mariposa Street as was identified in the SEIR even with the off-site parking lot mitigation.

Cultural Resources Impacts. The 19th Street site is located within the Union Iron Works Historic District (Historic District), a maritime industrial district listed on the National Register of Historic Places. The approximately 8,300-square foot Building 40 (former Employment Office Annex) located in the southwest corner of the 19th Street site was determined to be a contributing resource to this Historic District; however it was not hierarchically rated as significant or significant among the 41 buildings in the Historic District. The Port plans to remove Building 40 as a part of the construction phase of the rehabilitation of the 20th Street Historic Buildings in order to permit the future development of a continuous sidewalk on the east side of the Illinois Street frontage. The Port determined, and the Planning Department concurred, that Building 40's removal would not affect the historic significance of the Historic District.[49a,49b] If Building 40 were to remain, it would not affect the capacity (number of spaces) or access points of the proposed parking lot. At the Western Pacific site, there would be no impacts on historic resources because there would be no demolition or excavation required for construction of the parking lot. While construction of either parking lot would only involve minor grading, there would be the potential to encounter archaeological resources in the shallow soils; but this potentially significant impact would be subject to and reduced to less than significant with implementation of the same mitigation measure as the proposed project.

Hydrology and Water Quality Impacts. At the 19th Street site, construction of the parking lot would need to comply with San Francisco's Stormwater Guidelines, including the installation of stormwater controls to reduce the volume and rate of stormwater runoff from the site by 25 percent; thus, impacts related to constructing new stormwater infrastructure, exceeding the capacity of a stormwater system or providing and additional source of polluted runoff would be less than significant. For this site, the project sponsor would be required to obtain a Construction Site Runoff Control Permit and implement an Erosion and Sediment Control Plan for construction activities, in accordance with the Construction Site Runoff requirements of Article 4.2 of the *San Francisco Public Works Code*, Section 146. The Western Pacific site is located within an area served by a separate storm sewer system. There would be no changes to the surface conditions that would result in a change in stormwater runoff from the site. Construction activities at the Western Pacific site would be required to comply with the State Water Resources Control Board General Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities, so construction impacts would also be less than significant.

Flooding and Tsunami Impacts – The 19th Street site is not located within a 100-year flood zone,[49c] therefore there would be no impact related to flooding. The Western Pacific site is partially located within a 100-year flood zone,[49d] but the parking lot project does not include construction of any structures that could be damaged by flood flows or impede flood flows. Both sites are located within a tsunami inundation zone,[49e] but the parking lots would not include the construction of any structures in this zone that could be damaged. Neither site would be permanently inundated with 11-inches of sea level rise by 2050 or with 36-inches of sea level rise by 2100.[49f] Even if flooding were to occur in the future, the parking lots do not include the construction of structures that could be damaged. Further, no people would be put at risk because of the intermittent use of the site. Therefore, impacts related to flooding as a result of sea level rise would be less than significant.

Hazardous Materials Impacts – The 19th Street site is also located within the Pier 70 Master Plan Area and soil may have been contaminated as a result of historic land uses. However, similar to the proposed project, impacts related to exposure to hazardous materials in the soil would be less than significant with implementation of the requirements of the Pier 70 Risk Management Plan.[49g] Impacts related to the potential to encounter naturally-occurring asbestos would be substantially the same or less than that of the proposed project, and the same mitigation measure would apply. The Western Pacific site was a former switchyard for Western Pacific, and the soil and groundwater are contaminated with inorganic and organic chemicals as a result of past activities. The City and County of San Francisco recorded a deed restriction[49h] on the property in 2002, which reports that a 2000 Human Health and Ecological Risk Assessment (approved by the RWQCB) determined that the chemicals in the soil would not pose a human health risk under most land uses. In addition, construction of the parking lot at this site would

not involve any excavation, so workers and the public would not be exposed to hazardous materials or naturally occurring asbestos potentially present in the soil.

Other Impacts. Implementation of these two surface parking lots would result in no impacts on wind/shadow, recreation, utilities, public services, and geology, because none of these resources would be affected. Impacts associated with land use, population/ housing, GHG emissions, biological resources and energy resources would be substantially the same or less than those disclosed for the proposed project and the same mitigation measures would apply.

Overall, as described above, the use of the parking facilities at the 19th Street site (planned by the Port of San Francisco) and Western Pacific site (implemented as part of this mitigation measure) during evening events at the project site would not result in any new or substantially more severe transportation impacts associated with the proposed project related to vehicular traffic, transit, pedestrians, bicycles, emergency vehicle access, or construction-related transportation impacts. Potential impacts on other resources would be less than significant, assuming implementation of the same mitigation measures as those identified for the proposed project. However, as discussed above, even with implementation of the off-site parking facilities included in Mitigation Measure M-TR-11c, the identified traffic impacts in Impact TR-11 would remain *significant and unavoidable with mitigation.*

As with the Impact TR-11, without or with implementation of the off-site parking facilities included in Mitigation Measure M-TR-11c, under 2040 cumulative conditions described in Impact C-TR-2, the proposed project in combination with other past, present, and reasonably foreseeable future projects would result in significant cumulative traffic impacts at 16 intersections in the project vicinity. To further address traffic impacts of the proposed project after implementation of the parking facilities at the 19th Street site and Western Pacific site, Mitigation Measure M-TR-11c is augmented as shown above. With implementation of Mitigation Measure M-TR-11c, cumulative Impact C-TR-2 would remain *significant and unavoidable.*

Impact C-TR-2 on SEIR page 5.2-219, second and third full paragraphs, were revised as follows to reflect the detailed analysis of off-site parking locations associated with implementation of Mitigation Measure M-TR-11c (deleted text is shown as ~~strikethrough~~ and new text is underlined):

> Generally, to mitigate poor operating conditions of study intersections, additional travel lane capacity would be needed on one or more approaches to the intersection, particularly at intersections with the I-80 ramps. The provision of additional travel lane capacity by narrowing sidewalks, removal of on-street parking, and/or removal of bicycle lanes would generally be infeasible and inconsistent with the transit, bicycle, and pedestrian environment encouraged by the City's *Transit First* Policy by removing space dedicated to pedestrians, and/or bicycles and increasing the distances required for pedestrians to cross streets. Implementation of **Mitigation Measure M-TR-2a: Additional PCOs during Events, Mitigation Measure M-TR-2b: Additional Strategies to Reduce Transportation Impacts, Mitigation Measure M-TR-11a: Additional PCOs During Overlapping Events, Mitigation Measure M-TR-11b: Participation in Ballpark/Mission Bay Transportation Coordinating Committee,** and **Mitigation Measure M-TR-11c: Additional Strategies to Reduce Transportation Impacts of Overlapping Events,** as revised, would reduce the proposed project's contribution to cumulative impacts related to event-related traffic conditions but would not reduce the contribution to less-than-significant levels.
>
> Overall, combined for all analysis peak hours, the proposed project would result in cumulative impacts, or contribute to 2040 cumulative impacts at the following 16 study intersections: King/Third, King/Fourth, King/Fifth/I-280 ramps, Fifth/Harrison/I-80 westbound off-ramp, Fifth/Bryant/I-80 eastbound on-ramp, Third/Channel, Fourth/Channel, Seventh/Mission Bay Drive, Third/South, Third/16th, Fourth/16th, Owens/16th, Seventh/Mississippi/16th, Illinois/Mariposa, Mariposa/I-280 northbound off-ramp, Third/Cesar Chavez. As noted above, the proposed project would result in project-specific impacts or contribute considerably to cumulative impacts at nine intersections during the weekday p.m. peak hour, and at the eight intersections during the Saturday evening peak hour, and these impacts would be *significant and unavoidable with mitigation.* With implementation of Mitigation Measure M-TR-11c, the proposed project would result in cumulative impacts, or contribute to 2040 cumulative impacts at 16 study intersections; however, significant traffic impacts would not occur at the intersections of Fourth/16th or Mariposa/I-280 northbound off-ramp, and instead would occur at the intersections of Pennsylvania/Cesar Chavez/I-280 northbound off-ramp and Pennsylvania/I-280 southbound off-ramp, and these impacts would be *significant and unavoidable with mitigation.* Thus, under 2040 cumulative conditions, implementation of Mitigation Measure M-TR-11c would not result in a substantial increase in the severity of the proposed project's traffic impacts identified for conditions without this measure.

The revision does not change the analysis or conclusions presented in the SEIR.

A number of comments expressed opposition to the off-site parking lots due to conflicts with the planned light rail turnaround, the 19th Street extension east of Illinois Street, and increased traffic on streets west of Third Street. The comments also expressed opposition to the planned light rail turnaround and the 19th Street extension east of Illinois Street. The operation of the 19th Street parking lot would not conflict with the planned light rail turnaround loop at 19th and Illinois Streets because light rail vehicles using the loop will access 18th Street eastbound from Third Street southbound, turn right onto Illinois Street southbound, and then right onto 19th Street westbound to Third Street. The primary access to the parking lot would be from Third Street northbound and southbound at 20th Street, where a left turn pocket is provided (southbound left turn pockets are provided at 18th and 20th Streets, but not 19th Street). In addition, few vehicles exiting I-280 southbound at 18th Street would continue through on 18th Street to Illinois Street and continue south on Illinois Street.

The 19th Street parking lot would not conflict with the proposed 19th Street extension for access to the BAE ship repair because 19th Street is not anticipated to be a primary access point to the parking lot. As indicated above, left turns from southbound Third Street onto 19th Street are not permitted, and the vehicles traveling southbound on Third Street would turn left onto 20th Street, and vehicles traveling northbound on Third Street would turn right onto 20th Street. Access to the parking lot from 20th Street east of Illinois Street would not affect access or use of the bicycle lanes on Illinois Street.

Crane Cove Park, along with the 19th Street extension, and the 19th Street parking lot would be developed as part Phase I construction of the planned Crane Cove Park. Sidewalks would be provided as part of the improvements, and therefore pedestrians traveling in the vicinity of the 19th Street parking lot would not experience substantial conflicts or substandard pedestrian conditions. In addition, because the facility would be available for public parking throughout the day, it would support access by people driving to the Crane Cove Park.

Mitigation Measure M-TR-11c: Additional Strategies to Reduce Transportation Impacts of Overlapping Events - Additional Measures

As noted in a number of comments, the City, project sponsor and UCSF have been working on developing Local/Hospital Access Plan strategies (see above) to ensure that inbound access to the Mission Bay Area by residents, employees and UCSF staff during the weekday 6:00 to 7:00 p.m. evening period, when the maximum inbound project demand is expected to occur and which coincides with the UCSF staff shift occurs, is not substantially delayed as a result of event-related traffic. In addition to the Local/Hospital Access Plan, additional strategies have been identified by the City, UCSF, and the project sponsor that would be implemented during non-Golden State Warriors overlapping events to minimize the impacts during the pre-event period. As described in Response GEN-1a: City Funding, the City has introduced a resolution for consideration by the SFMTA and an ordinance for the Board of Supervisors that are intended to secure funding for its contribution to the project's transportation service plan and ensuring that the incremental City costs of providing transit, traffic enforcement, street sweeping and public safety services outside the premises are fully funded through the life of the project. If adopted, the ordinance would establish a Designated Overlapping Event Reserve Account to fund transit enhancements and

traffic enforcement costs of servicing non-Golden State Warriors events at the event center that occur on the same weekday evening as a SF Giants evening game. The ordinance authorizes an annual deposit of funds for the useful life of the event center. The Designated Overlapping Event Reserve Account would be used to implement supplemental transportation management actions, including a number of measures noted in comments, such as providing additional Mission Bay TMA and event-specific shuttle service. General categories of the types of measures that would be implemented include: separation of traffic destination, increased transit capacity, increased capacity of other modes, reduction in transit costs, disincentives to driving, incentives for alternative modes, and increased marketing efforts.

Thus, in response to comments, additional strategies were added to Mitigation Measure M-TR-11c: Additional Measures to Reduce Transportation Impacts of Overlapping Events. These measures may reduce traffic congestion in the project vicinity, but would not reduce traffic impacts to less than significant levels, and traffic impacts in Impact TR-11 would remain *significant and unavoidable with mitigation.*

Mitigation Measure M-TR-11c: Additional Strategies to Reduce Transportation Impacts of Overlapping Events on SEIR page 5.2-180, was revised as follows to include additional strategies that would be implemented by the City and the project sponsor; the following is added as the final bullet (deleted text is shown as ~~strikethrough~~ and new text is underlined):

- To manage traffic flows and minimize congestion associated with non-Golden State Warriors events overlapping with events at AT&T Park, and to incentivize event attendees and UCSF employees to use alternatives to the private automobile, the City and the project sponsor shall pursue and implement additional transportation management actions, during the pre-event period during overlapping events. This measure shall be implemented in coordination with and in addition to Mitigation Measure M-TR-11a: Additional PCOs during Events and Mitigation Measure M-TR-11b: Additional Strategies to Reduce Transportation Impacts. Strategies shall include one or more of the following:

Strategies to Increase Use of Non-auto Modes

- Encouraging coordinated parking pricing strategies among nearby facilities designed to discourage driving for event attendees and employees.
- Marketing "No drive" events.
- Installing Clipper Card add-value machines on-site at the event center to facilitate purchase and value-adding, and to minimize impacts on transit "dwell times" of paying cash fares.
- Exploring implementation of congestion pricing tools to charge event-related fees for driving and parking in the immediate area.
- Establishing event-sponsored promotions to encourage additional use of transit, such as event-branded Clipper Cards, bundled discounts and subsidies for transit

ticket purchases, or automatic prize/raffle entries/merchandise discounts for event attendees taking transit.

- Exploring implementation of priority access or fast-track security clearance to the event center for attendees arriving by transit or bicycling to the event center.
- Promoting the above strategies through event tickets and ticketholder emails, website transit information, and real-time updates.
- Consulting with local TMAs targeting employees who might drive during the peak pre-event period to provide increased shuttle service, alternative travel mode promotions, and advertising the use of real-time information and technology applications.
- Sponsoring use of taxis, TNCs, or pedicabs by event sponsor to facilitate and subsidize the connection between the regional transit hubs and the event center, as well as between the regional transit hubs and AT&T Park.

Strategies to Increase Transit, Capacity of Alternative Modes, and Enhance Pedestrian Safety

- Providing additional PCOs to manage and direct local traffic, and to favor circulation of pedestrians, cyclists, and persons arriving or departing by transit.
- Expanding the network of PCO-controlled intersections during the peak pre-event period beyond those identified in the Local/Hospital Access Plan.
- Exploring implementation of a program to require employees driving in the vicinity during the peak pre-event period to produce vehicle badges (e.g., rearview hanger, sticker) by employer for access to local employment sites, and coordinating with SFMTA and SFPD to honor said badges.
- Using the Western Pacific site for off-site parking for all events, not only large overlapping events.
- Increasing transit or High Occupancy Vehicle (HOV) capacity by operating additional SFMTA buses and/or additional private shuttle buses.
- Supporting WETA analysis of the feasibility and operational benefits of a ferry/water taxi landing near 16th Street.
- Increasing capacity and use of alternative modes, such as secure or valet bicycle parking, bicycle sharing, or bicycle infrastructure along the east-west corridors.
- Expanding the SFMTA's Vision Zero treatments to nearby intersections to improve the physical pedestrian environment to enhance pedestrian safety.

A comment requests that Mitigation Measure M-TR-11c: Additional Strategies to Reduce Transportation Impacts of Overlapping Events be modified to limit the number of large non-Warriors events overlapping with SF Giants evening games at AT&T Park, similar to limits imposed by the City for the Masonic Center. It should be noted that limits on Masonic Center

events were part of political negotiations facilitated by former Supervisor Chiu, and were not mitigation measures included in the Masonic Center Renovation Project EIR.

Request for Additional Mitigation Measures

A comment notes the LOS F operating conditions for the I-280 northbound off-ramp at Mariposa Street during the weekday evening peak hour during overlapping events (Table 5.2-50), and suggests a mitigation measure to reconfigure (i.e., restripe) the travel lanes on the I-280 off-ramp. The suggested change to the off-ramp where the single off-ramp lane widens to three lanes at the approach to the intersection of Mariposa/I-280 Northbound off-ramp (a distance of about 550 feet) would not change the analysis for either the freeway diverge analysis, as only one off-ramp lane would still be provided at the freeway ramp diverge location. Nor would such an improvement alter the SEIR's impact conclusions with respect to the intersection with Mariposa Street. Therefore, the suggestion would not be appropriate as a mitigation measure for the project. It is possible, however, that the suggested changes to the ramp lane configuration could be incorporated into the upcoming Owens Street extension project, which also includes a planned widening of the northbound I-280 off-ramp to provide for an additional lane and to better align with the Owens Street extension between 16th and Mariposa Streets. The City has initiated discussion with the Mission Bay Development Group (i.e., MBDG, the Mission Bay Area Plan infrastructure master developer), UCSF, and Caltrans to determine whether the restriping can be incorporated into this upcoming I-280 northbound off-ramp widening project.

A comment requested clarification if there would be "traffic lanes", and recommended stickers to make sure that drivers, presumably referring to residents in Mission Bay, can get across Third Street. The TMP for pre-event or post-event conditions does not propose any special use lanes, and access across Third Street would be maintained at all times north and south of the project site (e.g., at Mission Bay Boulevard South and Mission Bay Boulevard North). Post-event, Third Street between Mariposa Street and Mission Bay Boulevard South, and portions of South and 16th Streets adjacent to the project site would be closed to provide for transit passenger loading activities.

Mitigation Measures included in Public Scoping Comments

Table 2-1 on SEIR pp. 2-11 – 2-19 identifies comments received on the project during the public scoping period. The public scoping comment on SEIR p. 2-17 suggested the use of contraflow lanes on Mariposa Street as a mitigation or improvement measure to facilitate access to the I-280 on-ramp at Mariposa Street. The suggested measure in the comment for post-event conditions proposes to cone off one lane of eastbound Mariposa Street to temporarily enable three (rather than the existing two) westbound travel lanes, and possibly include interventions on the I-280 on-ramp. The suggested contraflow lane was not considered as part of the development of the TMP by City staff and the project sponsor, as only two lanes are provided on the I-280 southbound on-ramp at Mariposa Street, which then merge to one lane prior to the merge with the I-280 southbound mainline travel lane. A contraflow lane would not result in increased throughput onto I-280 southbound, and was therefore not considered as a feasible traffic management strategy.

Mitigation Responsibility

None of the project's planned improvements or mitigation measures in the SEIR would occur on Caltrans right-of-way (ROW), and therefore, there is no need to identify the project's fair share contribution, financing, scheduling, or implementation responsibilities for any projects on Caltrans ROW. However, as part of Mitigation Measure M-TR-2b: Additional Strategies to Reduce Transportation Impacts, the City would communicate with Caltrans to regarding installation of changeable message signs upstream of key entry points onto the San Francisco street network, such as on I-280 northbound upstream from the Mariposa Street off-ramp. If implemented, the changeable message signs would be installed by Caltrans. As part of project approvals, a Mitigation Monitoring and Reporting Program (MMRP) will be prepared and adopted to ensure proper implementation of the mitigation measures identified in the Final SEIR. Consistent with *CEQA Guidelines* Section 15097, the MMRP is designed to ensure implementation of the mitigation measure identified in the Final SEIR and adopted by decision makers to mitigate or avoid the project's significant environmental effects. CEQA also requires the adoption of findings prior to approval of a project for which a certified EIR identifies significant environmental effects (*CEQA Guidelines* Sections 15091 and 15092). Because this SEIR identifies significant adverse impacts that cannot be mitigated to less-than-significant levels, the findings must include a Statement of Overriding Considerations for those impacts (*CEQA Guidelines Section* 15093[b]). As noted above, the project sponsor would be required to implement the MMRP as a condition of approval.

Regarding comments that suggest that the project should provide fair share incremental costs over fare revenues for regional transit service, such as BART, Caltrain, and ferry service, it is noted that these regional agencies have not established any fair share program for such contributions. Also see Section 13.2, Response GEN-1 regarding funding of project mitigation measures, as well as several projects to improve public transportation in southeast San Francisco.

Issues Raised by Commenters: Transit Mitigation Measures (TR-12b)

This response addresses all or part of the following comments, which are quoted below:

A-UCSF-6 O-MBA10L4-35 O-MM-11 O-PBNA-7

"Page 5.2-146 through 147 and 5.2-185, given the relatively high auto mode share by South Bay and North Bay event attendees, can funding be secured for additional South Bay and North Bay transit service needs? Mitigation Measures M-TR-5a and b require GSW to "work with the Ballpark/Mission Bay Transportation Coordinating Committee to coordinate" with Caltrain, Golden Gate Transit and WETA to provide additional service; how can this mitigation measure be strengthened?" (*University of California San Francisco, Lori Yamauchi, letter, July 27, 2015 [A-UCSF-6]*)

"Impact and Mitigation Measure TR-5

The DSEIR finds that the Project would result in a substantial increase in transit demand that could not be accommodated by regional transit capacity and finds it significant and unavoidable with mitigation (SUM). However, many of the purported mitigations disclosed are fatally flawed as demonstrated below.

Mitigation Measure M-TR-5a: Additional Caltrain Service
As a mitigation measure to accommodate transit demand to and from the South Bay for weekday and weekend evening events, the project sponsor shall work with the Ballpark/Mission Bay Transportation Coordinating Committee to coordinate with Caltrain to provide additional Caltrain service to and from San Francisco on weekdays and weekends. The need for additional service shall be based on surveys of event center attendees conducted as part of the TMP.

Coordination does not qualify as mitigation. Doing something substantial such as offering to pay for incremental cost of additional services over revenues is necessary to consider this as mitigation. And determining the need for special service should have been done in this DSEIR, not deferred to subsequent surveys.

Mitigation Measure M-TR-5b: Additional North Bay Ferry and/or Bus Service
As a mitigation measure to accommodate transit demand to the North Bay following weekday and weekend evening events, the project sponsor shall work with the Ballpark/Mission Bay Transportation Coordinating Committee to coordinate with Golden GateTransit and WETA to provide additional ferry and/or bus service from San Francisco following weekday and weekend evening events. The need for additional service shall be based on surveys of event center attendees conducted as part of the TMP.

The same comment as immediately above applies. M-TR -5b does not qualify as mitigation under CEQA.

"In summary, as these examples demonstrate, the measures proposed in an attempt to mitigate the Project's significant impacts lack substance, and their feasibility is still undetermined. Hence, the attempt at disclosing feasible mitigation is inadequate under CEQA." (*Mission Bay Alliance, Thomas Lippe, letter, July 27, 2015 [O-MBA10L4-35]*)

"The DSEIR admits that the Project will cause significant impacts due to exceeding capacity on other transit services, including BART, proposing no mitigation. (DSEIR 5.2-226.)

"The SDEIR also admits that the Project would result in significant cumulative transit impacts on BART, Caltrain, Golden Gate Transit, and WETA, particularly with overlapping events, again proposing no mitigation. (DSEIR 5.2-226.)" (*Mary Miles, Attorney at Law, email, July 27, 2015 [O-MM-11]*)

"Transit improvements should be funded from dedicated sources, regardless of whether those funds come from the incremental property, sales or ticket taxes arising from the Arena. With a current estimate of $14 million being collected by the City annually, at least half that mount should be funding improvements to our transportation system intended to move people out of cars. Our neighborhood intersections are overburdened as they are, with many graded a "D" or an "F" under level of service standards. We do not have any excess capacity to accommodate more drivers.

Transit funding can go to infrastructure and operations that, when not deployed for the largest of events, can mitigate the day-to-day concerns of the neighborhood. We have identified the following necessary enhancements:

- Connecting the 11 North Point-Mission Bay line through to the commercial districts on 17th, 18th, and 20th streets in Potrero Hill, to the 22nd Street Caltrain Station, and terminating adjacent to the Pier 70 and NRG Power Plant development projects. This line can serve as an outlet for residents and business to move around, rather than through, the greatest Arena impacts.
- Increased running of the 10 Townsend to three times an hour during events.
- Making the E Embarcadero a seven-days-a-week line, turning south from its current 4th and King terminus to serve the Arena, with a terminus at the 25th Street Muni Yard.

- Moving the proposed Muni Turnaround from the congestion inducing 18th and 19th Streets to the 25th Street Muni Yard, where staging could be done more efficiently and more residents to the south of the Arena could be served on a daily basis.
- Keeping the 55 16th Street line as a dedicated connector from 16th Street BART to Mission Bay, and perhaps extending the line to incorporate transfers from the J Church.

"This list of improvements is not intended to be exhaustive. But they represent the need for a global transit plan for the area—one with a growing population and growing businesses—and one that has additional transit decreases planned, exacerbating cuts made in 2008-2009." (*Potrero Boosters Neighborhood Association, J.R. Eppler, letter, July 27, 2015 [O-PBNA-7]*)

Response TR-12b: Transit Mitigation Measures

On the subject of why it is permissible under CEQA to adopt mitigation measures that are not able to reduce significant impacts to less than significant levels, please see the Response TR-12a, Traffic Mitigation Measures.

As discussed in Impact TR-5, for analysis scenarios that assume a sell-out basketball game at the project site, the capacity utilization of Caltrain and ferries to the North Bay are projected to operate at more than the 100 percent capacity utilization threshold. The SEIR identifies the additional capacity that would be required to accommodate the demand for the Basketball Game scenario. However, because some or all of the additional demand could be accommodate by other transit providers serving the East Bay, North Bay, and South Bay (e.g., BART also serves the South Bay and is not projected to operate at more than 100 percent capacity utilization), the actual additional service needed to accommodate the demand may be less than identified in the SEIR. Thus, in order to provide additional transit most efficiently, the amount of additional service should be responsive to the actual travel patterns, as determined during monitoring of events.

Neither the project sponsor nor the City has the legal authority and logistical ability to provide the additional service to and/or from the North Bay and South Bay, or to commit to funding of the additional service. However, the proposed TMP and Mitigation Measures require that the City and project sponsor to work with the regional transit agencies to provide additional service. Despite the lack of any guaranteed outcome, such efforts might well bear fruit, based on past experience. The provision of additional regional transit service during special events is common in San Francisco. As noted in the SEIR, additional service can include adding cars to scheduled trains, or provision of special event trains.

As described on SEIR pp. 5.2-53 – 5.2-55, the project includes the provision of additional bus and light rail service to accommodate the transit demand associated with the event center, and this transit demand would be accommodated within the existing and proposed Muni service. On days without events, the additional transit demand generated by the proposed office and retail uses would also be accommodated within the planned transit service. Thus the following additional Muni service and infrastructure identified in a comment would not be required to accommodate the project-generated transit riders.

- The 11 Downtown Connector was approved by the SFMTA Board in March 2015 and does not include the streets and neighborhoods suggested in a comment. The 11 Downtown Connector is planned to run on North Point, Powell, Columbus, Sansome, Second, Folsom/Harrison Streets, and then extend into the Mission via the current 12 Folsom routing. As part of the Rincon Hill Transit Study, SFMTA staff have proposed an alternative route for the 11 Downtown Connector into Mission Bay. They are also evaluating community input to extend the route further into Potrero Hill. At this time, however, the 11 Downtown Connector is not proposed to be called the 11 North Point-Mission Bay route, or travel on 17th, 18th, or 20th Streets in Potrero Hill, access the 22nd Caltrain station or the proposed development at Pier 70. As part of ongoing public outreach and planning for implementation of the 11 Downtown Connector, the SFMTA may revise the planned route to address issues raised in the comments.

- As described on SEIR p. 5.2-19, as part of Muni Forward, the 10 Townsend motor coach line will be renamed the 10 Sansome, with a new alignment within Mission Bay. Service would be rerouted off of Townsend down Fourth Street. From Fourth Street the route will extend through Mission Bay to new proposed street segments on Seventh Street between Mission Bay Boulevard and Irwin Street, on Irwin Street between Seventh and 16th Streets, on 16th Street between Irwin and Connecticut Streets, and on Connecticut Street between 16th and 17th Streets. Peak period headways will be reduced from 20 to 6 minutes. Midday headways will be reduced from 20 to 12 minutes.

- The E Embarcadero route would provide minimal additional capacity to service the event center compared to the planned additional capacity that would be provided via light rail shuttles via The Embarcadero. Extending two-car light rail vehicles from King Street south to serve the event center would add capacity and provide a direct connection to BART and other light rail lines at the Embarcadero station.

- The planned Muni light rail turnaround on 18th, Illinois, and 19th Streets would adequately service the additional light rail service proposed for the event center.

- The planned 22 Fillmore Transit Priority route will replace the 55 16th Street route, and the 22 Fillmore will run on 16th Street between Church and Third Streets. As described on SEIR p. 5.2-19, as part of the 22 Fillmore Transit Priority Project, the 22 Fillmore trolley bus line will be rerouted to continue along 16th Street east of Kansas Street, creating new connections to Mission Bay from the Mission neighborhood. The route change will add transit to 16th Street between Kansas and Third Streets, and to Third Street between 16th Street and Mission Bay Boulevard North. Muni Forward will change the a.m. peak period headway on the 22 Fillmore from 9 minutes to 6 minutes between buses. The service improvements will require upgrading and extending the overhead wire system on 16th Street between Potrero Avenue and Third Street. In addition to the service improvements, side-running transit-only lanes will be implemented on 16th Street between Seventh and Third Streets, and either side-running or center-running transit-only lanes will be implemented between Church and Seventh Streets by converting a mixed-flow lane to a transit-only lane. The 22 Fillmore Transit Priority Project will also include corridor-wide transit network improvements such as transit bulbs, new traffic signals, pedestrian signals, sidewalk widening, and upgrading of the bicycle infrastructure on 17th Street between Church and Seventh Streets to provide a parallel, contiguous, and safe bicycle route for traveling in the east-west direction.

Issues Raised by Commenters: Mission Bay FSEIR Mitigation Measures (TR-12c)

This response addresses all or part of the following comments, which are quoted below:

O-MBA10L4-34 O-Sierra-4 O-Sierra-5

"Have the sponsors estimated how many FTEs will take advantage of the proposed transportation subsidies described in FSEIR Mitigation Measure E47.c: *Employee Transit Subsidies - Provide a system of employee transportation subsidies for major employers*?" (*Sierra Club, Susan E. Vaughn, letter, July 27, 2015 [O-Sierra-4]*)

"… And will part-time employees who are not actually employees of the Warriors or other event sponsors (but who may work for food and souvenir concessions that have contracts with event sponsors) be eligible for these subsidies?" (*Sierra Club, Susan E. Vaughn, letter, July 27, 2015 [O-Sierra-5]*)

"The next section of mitigation for Project Impact TR-2 counts on the Mission Bay FSEIR Mitigation Measure E.47: the Transportation System Management Plan. However, the effects of those portions of that TSM Plan that have been implemented have been absorbed and are reflected in the existing baseline counts that underlie this DSEIR's disclosures of impact TR-2. To constitute effective mitigation for the subject Project, this DSEIR should identify the specific elements of the hypothetical Mission Bay FSEIR Mitigation Measure E.47 that have actually been implemented and what enhancements to it this Project needs to carry out. For instance, considering the elements of Mission Bay FSEIR Mitigation Measure E.47 the following observations can be made.

> *"FSEIR Mitigation Measure E.47.a*: Shuttle Bus - Operate shuttle bus service between Mission Bay and regional transit stops in San Francisco (e.g., BART, Caltrain, Ferry Terminal, Transbay Transit Terminal), and specific gathering points in major San Francisco neighborhoods (e.g., Richmond and Mission Districts).
>
> "To be effective mitigation, the DSEIR must disclose what additions to shuttle routes and times of service would be needed to alter conditions reported in Impact TR-2 and commit the Project to implement them.
>
> "*FSEIR Mitigation Measure E.47.b*: Transit Pass Sales - Sell transit passes in neighborhood retail stores and commercial buildings in the Project Area.
>
> "The effect of this measure is not quantifiable as mitigation. It is doubtful that anyone who might use transit to and from the Project site is deterred from doing so for want of a convenient location selling transit passes.
>
> "*FSEIR Mitigation Measure E.47.c*: Employee Transit Subsidies - Provide a system of employee transportation subsidies for major employers.
>
> "While transit subsidies might alter the commute modes of some daytime employees at the Project, given the composition of uses proposed, it is unclear how many employers would be characterized as "major" and consequently, how many employees would be qualified for subsidies. Hence, the effect of this measure cannot be quantified.
>
> "*FSEIR Mitigation Measure E.47.e*: Secure Bicycle Parking - Provide secure bicycle parking area in parking garages of residential buildings, office buildings, and research and development facilities. Provide secure bicycle parking areas by 1) constructing secure bicycle parking at a ratio of 1 bicycle parking space for each 20 automobile parking spaces, and 2) carry out an annual survey program

during project development to establish trends in bicycle use and to estimate actual demand for secure bicycle parking and for sidewalk bicycle racks, increasing the number of secure bicycle parking spaces or racks either in new buildings or in existing automobile parking facilities to meet the estimated demand. Provide secure bicycle racks throughout Mission Bay for the use of visitors.

"This measure might change the mode of choice of a few daytime employees or visitors to the site who would otherwise not use bicycle but it is not likely to change the choices of event attendees, particularly in the evening or evening workers.

"*FSEIR Mitigation Measure E.47.f*: Appropriate Street Lighting - Ensure that streets and sidewalks in Mission Bay are sufficiently lit to provide pedestrians and bicyclists with a greater sense of safety, and thereby encourage Mission Bay employees, visitors and residents to walk and bicycle to and from Mission Bay.

"Since adequate lighting is a prerequisite of any modern urban development, it is unlikely that this measure would change the mode splits the DSEIR already projects in disclosing impact TR-2. The measure has no. quantifiable mitigation effect.

"*FSEIR Mitigation Measure E.47.g*: Transit and Pedestrian and Bicycle Route Information - Provide maps of the local and citywide pedestrian and bicycle routes with transit maps and information on kiosks throughout the Project Area to promote multi-modal travel.

"The amount of change in the mode choice pattern the DSEIR already projects that provision of this information would result in is not quantifiable. Hence, there is no clear mitigation of Impact TR-2.

"*FSEIR Mitigation Measure E.47.h*: Parking Management Strategies - Establish parking management guidelines for the private operators of parking facilities in the Project Area.

"This measure is so vague that consequences of it are not quantifiable. Hence, there is no clear mitigation of Impact TR-2.

"*FSEIR Mitigation Measure E.47i*: Flexible Work Hours/Telecommuting - Where feasible, offer employees in the Project Area the opportunity to work on flexible schedules and/or telecommute so they could avoid peak hour traffic conditions.

"This FSEIR mitigation measure does nothing to address the Project's special event transportation impacts in the PM peak and Early Evening hours.

"*FSEIR Mitigation Measure E.49*: Ferry Service - Make a good faith effort to assist the Port of San Francisco and others in ongoing studies of the feasibility of expanding regional ferry service. Make good faith efforts to assist in implementing feasible study recommendations.

"As previously noted in the context of other mentions of ferry service, this item does not qualify as mitigation for the DSEIR subject project since the DSEIR has failed to determine that ferry service is feasible and since it does not condition the Project to take qualifying actions such as paying fair share contributions to development of a ferry landing serving the Project or paying a fair share of the incremental cost of ferry operations over revenue."

(*Mission Bay Alliance, Thomas Lippe, letter, July 27, 2015 [O-MBA10L4-34]*)

Response TR-12c: Mission Bay FSEIR Mitigation Measures

As stated on SEIR pp. 2-7 and 5.2-2, the Mission Bay FSEIR mitigation measures, their current status, and their applicability to the proposed project are described in Appendix TR and Appendix MIT. The majority of the infrastructure improvements contemplated by those measures have been completed or partially built out, while some are pending with planned development (e.g., Mission Bay Boulevard North, Mission Bay Boulevard South, and Nelson Rising Lane between Fifth and Owens Streets). Consistent with the Mission Bay South Owner's

Participation Agreement, the master developer, FOCIL-MB, LLC, is responsible for the infrastructure serving the Mission Bay South Plan area, including implementation of the Mission Bay South Infrastructure Plan. The Mission Bay South OPA includes triggers for the phasing of required infrastructure improvements based on adjacency, ratios, and performance standards to ensure that the master developer phases the required infrastructure to match the phasing of private development occurring on adjacent blocks.

One comment provides a qualitative assessment on whether the FSEIR Mitigation Measures 47a – 47c and 47e – 47i, listed on SEIR p. 5.2-131, would be effective, and asserts that the SEIR should identify the specific elements of the measure that have already been implemented and what elements would be carried out by the project. As described on SEIR p. 5.2-131, the Mission Bay FSEIR Mitigation Measures were adopted as part of the Mission Bay Plan to encourage use of alternate modes and reduce auto mode. The Mission Bay South TMP incorporates these mitigation measures, and the TMP is part of the Mission Bay South Owner Participation Agreement for development within Mission Bay South. Because development on Mission Bay Blocks 29-32 would be subject to the Owner Participation Agreement, the Mitigation Measures were assumed as part of the proposed project, and were listed for informational purposes. It should be noted that these measures were developed for the entire Mission Bay Plan area and are not specific to the Blocks 29-32 site. Therefore, the SEIR does not delineate between components of the measure that have already been implemented and those that would be implemented by the project. Rather, additional measures are identified as part of this SEIR to mitigate impacts resulting from implementation of the proposed project.

The project-specific TDM strategies included in the project's TMP are summarized on SEIR p. 5.2-65 and include strategies such as participation in pre-tax commuter benefits, free to employee Emergency Ride Home program, compliance with California's parking cash-out program, the Mission Bay TMA shuttle program, among others. The project sponsor has confirmed that it would provide these programs and incentives to its employees. The project sponsor would also encourage all other on-site employers to make these strategies available to their employees. At this time, it is not known how many employees would take advantage of the transportation subsidies included in the TMP. As part of the project, the TMP includes annual surveys of employees to determine travel modes and determine their awareness of TDM programs that are available to them as an alternative to driving to work. The results of the surveys would be part of the TMP monitoring report submitted to OCII annually.

Because, as described above, the Mission Bay FSEIR mitigation measures are required for all development within Mission Bay, the comments are noted, but do not result in any changes to the analysis or mitigation measures included in the SEIR.

Issues Raised by Commenters: Implementation of Mitigation Measures (TR-12d)

This response addresses all or part of the following comments, which are quoted below:

O-MBA10L4-14

"**G. The DSEIR Unlawfully Defers the Development of Mitigation Measures.**

"The DSEIR sketches out a number of concepts for mitigating the Project's significant transportation effects where it defers the development of specific mitigation measure until a future date. The DSEIR's deferral all of the mitigation measures listed below in this section does not meet CEQA requirements to identify specific mitigation measures in the Draft EIR so the public may meaningfully review and comment on them. These measures violate CEQA's requirements for deferred mitigation because the DSEIR does not specify binding performance standards by which the measures' success can be judged, there is no evidence it is impracticable to develop and include the specific measures in the DSEIR, there is no evidence the measures will be effective, there is no evidence the measures are feasible, there is no evidence the measures will be implemented because the Project Sponsor may deem them infeasible, and the measures are not enforceable. (See *Communities for a Better Environment v. City of Richmond* (2010) 184 Cal.App.4th 70, 95 (CBE); *Gentry v. City of Murrieta* (1995) 36 Cal.App.4th 1359; 1394 (*Gentry*).

"The listed measures are qualified by language such as "if feasible" or "could include" (e.g., Measure M-TR-2b). Such qualifications render the measures illusory, unenforceable, and ineffective for purposes of the DSEIR's claim of substantial reductions in impact or reductions in impact to less-than-significant levels. (See *Federation of Hillside & Canyon Associations v. City of Los Angeles* (2000) 83 Cal.App.4th 1252, 1260-1262; *Lincoln Place Tenants Association v. City of Los Angeles* (2005) 130 Cal.App.4th 1491, 1508 ["mitigating conditions are not mere expressions of hope..."].)

"Even the listed measures that include performance standards (e.g., Measure M-TR-18) do not require they be achieved. For example, Measure M-TR-18 only requires that the Project Sponsor "work to achieve" the performance standards. CEQA requires that deferred mitigation measures include binding performance standards.

- Mitigation Measure M-TR-11c: Additional Strategies to Reduce Transportation Impacts of Overlapping Events. (DSEIR, p. 1-23.)
- Mitigation Measure M-TR-13: Additional Muni Transit Service during Overlapping Events. (DSEIR, p. 1-24.)
- Mitigation Measure M-TR-14: Additional BART Service to the East Bay during Overlapping Events. (DSEIR, p. 1-24.)
- Mitigation Measure M-TR-18: Auto Mode Share Performance Standard and Monitoring. (DSEIR, p. 1-25.)"

(*Mission Bay Alliance, Thomas Lippe, letter, July 27, 2015 [O-MBA10L4-14]*)

Response TR-12d: Implementation of Mitigation Measures

The comment states the SEIR unlawfully defers the development of mitigation measures. The comment lists several mitigation measures that allegedly constitute improper deferral of mitigation because commenter asserts that the measures do not specify binding performance standards or lack evidence that they will be effective, are feasible, will be implemented, or are enforceable.

In general, the adequacy of mitigation measures depends on whether a lead agency's administrative record, taken as a whole, includes substantial evidence supporting the agency's conclusions regarding the significance of impacts. This analysis turns in part on whether the lead agency finds the measure will or will not reduce impacts to less than significant levels; whether the lead agency relies on the measure by itself to address a particular environmental impact, or instead relies on the measure as a part of a larger package of measures that, taken together, address the impact; whether the measure, and perhaps others that complement it, are sufficiently detailed that they do not need performance standards to achieve impact reduction; whether, if a measure or set of measures lacks sufficient detail to effectively mitigate impacts, at least one of the measures contains a performance standard that, if satisfied, would support the agency's ultimate factual conclusion; and, finally, whether the administrative record, viewed as a whole, supports the lead agency's ultimate factual conclusion regarding the effectiveness of the measure, or a package of measures, to reduce an environmental impact to a less than significant level or not.

Improper deferral of mitigation occurs when an agency concludes that a project's significant impacts would be reduced to a less than significant level or avoided with the implementation of a mitigation measure that has not yet been formulated and for which success is uncertain. (See, e.g. *Sundstrom v. County of Mendocino* (1988) 202 Cal.App.3d 296; *Center for Biological Diversity v. Department of Fish and Wildlife* (2015) 234 Cal.App.4th 214, 240.) Conversely, improper deferral of mitigation generally does not occur where the agency finds that the proposed mitigation measures would not reduce the identified impact to a less than significant level, or where the allegedly deferred mitigation is only one of several mitigation measures designed to address a particular impact, and there is evidence in the record that the mitigation measure or measures would be effective to the extent described in the EIR. (See e.g., *Fairview Neighbors v. County of Ventura* (1999) 70 Cal.App.4th 238, 244-245 [although mitigation measure called for future preparation of a plan, measure did not constitute impermissible deferral because impact addressed by plan remained "significant and unavoidable"].)

In this case, most of the mitigation measures cited in the comment are not relied on to reduce an impact to a less than significant level. Rather, in recognition that these mitigation measures entail a degree of uncertainty, the SEIR identifies the impacts addressed by these measures as significant and unavoidable. For this reason, the cases cited in the comments – *Communities for a Better Environment v. City of Richmond* (2010) 184 Cal.App.4th 70, 93-95 (*City of Richmond*) and *Gentry v. City of Murrieta* (1995) 36 Cal.App.4th 1359, 1394-1396 (*Gentry*) – are distinguishable. In both cases, the court found the mitigation was improperly deferred because there was no evidence that the mitigation would be effective, or that it would reduce the impact to a less than significant level as claimed in the environmental document. That is not the case here; most of the mitigation measures cited in the comment letter are not relied on to reduce impacts to a less than

significant level. The SEIR acknowledges that the mitigation measures would *not* reduce the impacts to a less than significant level and therefore concludes that the impacts are significant and unavoidable. For example, as described in the SEIR, implementation of Mitigation Measure M-TR-2b: Additional Strategies to Reduce Transportation Impacts, M-TR-11b: Participation in the Ballpark/Mission Bay Transportation Coordinating Committee, and Mitigation Measure M-TR-11c: Additional Strategies to Reduce Transportation Impacts of Overlapping Events would reduce traffic congestion in the project vicinity by providing drivers information on traffic conditions and alternate routes, providing information on on-street and off-street parking conditions, discouraging use of on-street parking through the Residential Permit Parking program, encouraging non-auto modes through parking pricing, and enhancing regional transit access to the area. The SEIR acknowledges, however, that even with implementation of these measures, the arrival and departure peak of vehicle trips to and from the event center through intersections where significant impacts were identified would continue to occur, and the proposed project's significant traffic impacts at the intersections would remain.

Measures such as Mitigation Measure M-TR-5a: Additional Caltrain Service, Mitigation Measure M-TR-5b: Additional North Bay Ferry and/or Bus Service, and Mitigation Measure M-TR-14: Additional BART Service to the East Bay during Overlapping Events identify specific actions that would reduce or minimize the severity of various capacity utilization exceedances, but the SEIR recognizes that the provision of additional service by regional agencies is uncertain and full funding has not yet been identified. Therefore, the SEIR does not rely on these measures to find the corresponding impacts less than significant, but rather determines the impacts would be significant and unavoidable with mitigation.

Mitigation Measure M-TR-18: Auto Mode Share Performance Standard and Monitoring was developed as part of the portion of the transportation impact analysis that discloses the impacts of the proposed project if for some unknown reasons in the future, the City is unable to implement the Muni Special Event Transit Service Plan. As part of this mitigation measure, the project sponsor would be responsible for implementing TDM measures intended to reach an auto mode share performance standard for different types of events. This mitigation measure provides the flexibility for the project sponsor to implement whatever measures they determine feasible to meet the performance standards, and identifies the monitoring and reporting program for assessing compliance. The performance standard itself, however, must be achieved. As indicated in Impact TR-18 through Impact TR-21, though, even if the performance standards are met, the proposed project would result in significant traffic and transit impacts. Also see Section 13.2, Response GEN-1a: City Funding regarding funding of the project transportation improvements that would be implemented by the City, including the Muni Special Event Transit Service Plan.

Moreover, it is well recognized that formulation of precise mitigation measures is not always required for a project pre-approval, even when those measures are relied on to reduce an impact to a less than significant level. (CEQA Guidelines, § 15126.4 subd. (a)(1)(B).) The courts have developed legal principles regarding the extent to which an agency can rely on a mitigation measure that defers some amount of environmental problem-solving until after project approval. In particular, deferral is permissible where the adopted mitigation measure commits the agency

to a performance standard or criterion that would ensure the mitigation of the significant effect or lists alternative means of mitigating an impact that must be considered, analyzed, and possibly adopted in the future. (See CEQA Guidelines, § 15126.4 subd. (a)(1)(B) ["measures may specify performance standards which would mitigate the significant effect of the project and which may be accomplished in more than one specified way"]; *Endangered Habitats League v. County of Orange* (2005) 131 Cal.App.4th 777, 793-794 [deferral is permissible where the agency commits itself to mitigation and either (1) adopts a performance standard and makes further approvals contingent on finding a way to meet the standard or (2) lists alternative means of mitigating the impact which must be considered, analyzed, and possibly adopted in the future]; *Riverwatch v. County of San Diego* (1999) 76 Cal.App.4th 1428, 1448–1450 [a deferred approach may be appropriate where it is not reasonably practical or feasible to provide a more complete analysis before approval and the EIR otherwise provides adequate information of the project's impacts].)

Whether the performance standards included in a particular mitigation strategy are sufficiently definite and specific to satisfy CEQA's mitigation requirements would generally depend on the circumstances surrounding the agency approval or even the particular impact at issue. In any event, the performance criteria must be sufficiently definite to ensure that the potential impacts would be mitigated. (*Rialto Citizens for Responsible Growth v. City of Rialto* (2012) 208 Cal.App.4th 899, 945 (*Rialto Citizens*); *Save Panoche Valley v. San Benito County* (2013) 217 Cal.App.4th 503, 524-525; *North Coast Rivers Alliance v. Marin Municipal Water Dist. Bd. of Directors* (2013) 216 Cal.App.4th 614, 629-631, 646-648; *Clover Valley Foundation v. City of Rocklin* (2011) 197 Cal.App.4th 200, 237.) In determining whether a particular mitigation strategy is sufficient, reviewing courts do not look at just the measure itself, but consider all of the evidence in the administrative record. (See, e.g., *Laurel Heights Improvement Association v. Regents of the University of California*, supra, 47 Cal.3d at p. 408.)

The only mitigation measures cited in the letter that the SEIR relies on, even partially, to reduce a potential significant impact to a less than significant level are (1) Mitigation Measure M-TR-9a: Crane Safety Plan for Project Construction; (2) Mitigation Measure M-TR-9d: Event Center Exterior Lighting Plan; and (3) Mitigation Measure M-TR-13: Enhanced Muni Transit Service During Overlapping Events.[20] These measures do not constitute improper deferral of mitigation.

Mitigation Measure M-TR-9a: Crane Safety Plan for Project Construction

The SEIR analyzed potential impacts to UCSF helipad airspace surfaces and described the impacts in detail (Impact TR-9a and Impact C-TR-9a). The SEIR concludes that, based on the preliminary project construction plan for the project construction cranes, one of the project construction cranes would have the potential to result in a temporary penetration of a Part 77 Transitional Surface associated the helipad, which would be considered a potentially significant impact.

[20] Note that the Mitigation Measure M-TR-13 title has been changed from "Additional Muni Transit Service During Overlapping Events" to "Enhanced Muni Transit Service During Overlapping Events." Please see Chapter 14 for corresponding revisions to the Draft SEIR.

As discussed in Response TR-14, below, the commenter is referred to Section 12.3.1, Refined Construction Crane Plan. Since publication of the Draft SEIR, the project sponsor refined its construction crane plan (described and analyzed in Section 12.3.1; Chapter 14, Draft SEIR Revisions provides associated augmented text and graphics to the Draft SEIR), the analysis of which demonstrates that none of the proposed project construction cranes would penetrate the UCSF helipad airspace. However, if the refined construction crane plan details were to change with respect to proposed tower crane size, location or other factors, then the project would have the potential to result in greater and/or less effects than those reported above. Mitigation Measure M-TR-9a, Crane Safety Plan for Project Construction, identifies feasible measures that would reduce potential temporary impacts associated with the use of cranes during the construction period to less than significant. Therefore, with implementation of Mitigation Measure M-TR-9a, this impact would be *less than significant with mitigation*.

Mitigation Measure M-TR-9a, Crane Safety Plan for Project Construction (see Chapter 14), sets forth a performance standard (avoidance of potential conflicts with helipad airspace) and then identifies individual feasible measures that would reduce potential temporary impacts associated with the use of cranes during the construction period to less than significant. The crane safety plan is required to identify appropriate measures to avoid potential conflicts that may be associated with the operation of the construction cranes in the vicinity of the UCSF Benioff Children's Hospital helipad airspace. This need to avoid conflicts with airspace used by helicopters seeking the helipad is a performance standard that must be satisfied, and represents what is needed to reduce impacts to less than significant levels. The contemplated safety protocols must be developed in consultation with OCII (or its designated representative) and UCSF, and the crane safety plan would be subject to approval by OCII or its designated representative. The measure also lists numerous specific measures that can be included in the plan that would reduce the impact. The objective of the crane safety plan is to provide assurance of the safe use of the UCSF Benioff Children's Hospital helipad, and the safety for people residing or working in the project area during construction. OCII's experts have reviewed the list of measures to be incorporated into the Crane Safety Plan for Project Construction and has confirmed that implementation of such measures would avoid potential conflicts that may be associated with the operation of the project construction cranes in the vicinity of the helipad airspace. Therefore, there is sufficient evidence that this mitigation measure would be effective and would reduce the impact to a less than significant level as described in the SEIR.

Mitigation Measure M-TR-9d: Event Center Exterior Lighting Plan

The SEIR analyzes the potential for specialized lighting systems to adversely affect UCSF helipad flight operations and describes the impact in detail (Impact TR-9d and Impact C-TR-9). The SEIR concludes that lights that adversely affect the night vision of pilots and interfere with the execution of a visual nighttime approach to the helipad would endanger the pilot, passengers, and people on the ground. Therefore, as stated on SEIR p. 5.2-272, the possible use of these specialized lighting systems would be considered a potentially significant impact.

Mitigation Measure M-TR-9d identifies feasible measures that would reduce potential impacts associated with potential specialized lighting systems to less than significant. Under this measure,

the project sponsor must develop an exterior lighting plan that incorporates measures to ensure specialized exterior lighting systems would not result in a substantial air safety risk and/or create a safety hazard on helipad operations. This performance standard would be achieved through a number of proposed individual measures. The plan would be developed in consultation with San Francisco International Airport (SFO) staff knowledgeable of the effects of lighting on pilots and safe air navigation, and OCII (or its designated representative), and the exterior lighting plan would be subject to approval by OCII or its designated representative. As noted, the measure lists numerous specific measures that can be included in the plan that would reduce the severity of the impact. See also, Response TR-14 and Chapter 14, Draft SEIR Revisions, for additional measures included in Mitigation Measure M-TR-9d. Although a detailed lighting plan has yet to be developed by the sponsor, OCII's experts have reviewed the list of measures and has confirmed that impacts could be avoided through the measures identified. Therefore, there is sufficient evidence that this mitigation measure would be effective and would reduce the impact as described in the SEIR.

Mitigation Measure M-TR-13: Enhanced Muni Transit Service During Overlapping Events

The SEIR analyzes potential impacts to Muni transit service during overlapping events and describes the impacts in detail (Impact TR-13 and Impact C-TR-4). The SEIR explains that the project could result in a substantial increase in transit demand that could not be accommodated by adjacent Muni transit capacity such that significant adverse impacts to Muni transit service would occur under existing plus project conditions with an overlapping SF Giants evening game at AT&T Park. Mitigation Measure M-TR-13 is provided to accommodate Muni transit demand to and from the project site and AT&T Park on the T Third light rail line during overlapping evening events. It requires the project sponsor to work with the Ballpark/Mission Bay Transportation Coordinating Committee and with the SFMTA to provide additional Muni light rail service and/or shuttle buses between key Market Street locations and the project. Examples of the additional service include Muni bus shuttles between Union Square and/or Powell Street Muni/BART station and the project site. This measure does not constitute impermissible deferral of mitigation. Rather, this measure requires the project sponsor to work with the transit agencies to provide additional service to accommodate demand during overlapping events and allows the agencies the flexibility necessary to do so. For example, the measure states that the need for additional Muni service would be based on characteristics of the overlapping events (e.g., projected attendance levels, and anticipated start and end times). Therefore, there is sufficient evidence that this mitigation measure would be effective and would reduce the impact as described in the SEIR. As described in Response TR-12: Traffic Mitigation Measures above, all of the mitigation measures described in the SEIR are enforceable. OCII would adopt a mitigation monitoring program at the time of project approval to ensure that the mitigation measures committed to in the action are carried out. (Pub. Resources Code, § 21081.6; CEQA Guidelines, § 15097.)

As indicated on SEIR p. 5.2-131, Mission Bay FSEIR Mitigation Measure E.47: Transportation System Management Plan was adopted as part of the Mission Bay Plan to encourage use of alternate modes and reduce auto mode. A Mission Bay South Transportation Management Plan was developed which incorporates the measures included as part of Mitigation Measures 47a – 47c and 47e-47i, and it is part of the Mission Bay South Owner Participation Agreement for development within Mission Bay. Because the project sponsor would be subject to the Owner Participation Agreement, these mitigation measures are assumed to be part of the proposed project.

13.11.14 Parking Conditions (TR-13)

"• Given the Project is located on AT&T Parking Lots B & E, please clarify if Mitigation Measure M-TR-1 lc, which provides additional off-site parking from the Project Plus Overlapping Giants Evening Game Scenario, should be revised from 1,000 to 1,600 spaces to account for AT&T Park's displaced 600 parking spaces. Table 1-1, which presents the Summary of Proposed Project Facilities, shows the arena will have seating capacity of maximum 18,500 patrons. Approximately 950 vehicle parking spaces are proposed from the combined Blocks 29-32 and the existing off-site 450 South Street Parking Garage (SEIR, Vol. 1, pg. 1-7). Mitigation Measure M-TR-11 c states the City shall identify one or more off-site parking lots to provide approximately 250 additional parking spaces for all events and up to approximately 750 additional parking spaces for use during dual events of 12,500 or more event center attendees, for a total of 1,000 additional offsite parking spaces (pg. 1-23). The AT&T Park Post-Grune Event Traffic Plan, courtesy of the Mission Bay Transportation Management Agency, is available at the following webpage and identifies AT&T Parking Lots B & E: http://sanfrancisco.giants.mlb.com/sf/downloads/y2015/postgrune map.pdf." (*Department of Transportation, Patricia Maurice, letter, July 20, 2015 [A-CALTRANS-3]*)

"Page 5.2-32, Table 5.2-8, and page 5.2-237, Table 5.2-68 of the DEIR assumes that four UCSF lots and garages, totaling 2,590 parking spaces, will be available to event attendees. UCSF has informed the City that it should not include any of UCSF's parking spaces in the baseline parking supply in the DEIR because UCSF's current use and projected demand demonstrate that UCSF needs its parking spaces for its staff, patients and visitors. UCSF's future parking demand is expected to increase over existing demand. We appreciate that the parking supply/demand analysis in the DEIR does include tables showing the parking surplus/shortfall when UCSF's garages are not included in the parking supply." (*University of California San Francisco, Lori Yamauchi, letter, July 27, 2015 [A-UCSF-4]*)

"Even the DSEIR's assumptions made about the available parking supply present a stark departure from the reality of parking conditions at Mission Bay and underscore the high level of wishful thinking involved in selling a project wholly incompatible with this region. The project itself only includes 200 onsite parking spaces specifically dedicated for the arena's use. Yet, rather than concede the limited onsite parking, the DSEIR suggests that ample parking will be available to serve the arena's needs by listing all 9,135 possible parking spaces in the Mission Bay region, including street parking. Unfortunately, the vast majority of those spots are currently reserved by UCSF hospitals, UCSF facilities, the Giant's stadium and neighboring businesses, and the DSEIR lacks any evidence to support the assumption that any of these spaces - let alone the majority - will be available for use by arena patrons. It also fails to explore the impact on

neighboring communities in the Dogpatch and Potrero Hill areas that will bear the burden of accommodating the thousands of additional cars seeking, but unable, to park in Mission Bay." (*Mission Bay Alliance, Bruce Spalding, letter, July 27, 2015 [O-MBA5-8]*)

"4. Direct, Indirect, Secondary, and Cumulative Parking Impacts Are Not Analyzed or Mitigated

"The DSEIR claims that it need not analyze or mitigate the Project's direct, indirect, secondary, and cumulative impacts from creating a shortfall of thousands of parking spaces throughout the area, falsely claiming that the Project is either a "residential, mixed-use residential, or employment center project on an infill site within a transit priority area." (DSEIR 5.2-233, citing PRC §21099(d).) The Project fits none of those categories, and the DSEIR must therefore analyze and propose effective mitigation for the Project's significant parking impacts.

"The parking analysis understates the drastic parking shortfall created by the Project and misleadingly overstates the number of available parking spaces outside the Project area on which it irresponsibly relies.

"Warriors games will always draw peak attendance of 18,000 (DSEIR, pp.1-5 [stadium capacity of 18,064 seats]; 1-8.) with most attendees driving and parking at the arena. The Project admits that it will supply only 1,082 parking spaces, including 950 in the "on-site parking garage" and 132 "within the 450 South Street Parking Garage for which the project sponsor has acquired parking rights to serve the project." (DSEIR 5.2-235.)

"Admitting that the Project's proposed on-site parking is grossly inadequate and that there are few metered parking spaces in the Project area, the DSEIR claims to include parking lots within a mile of the Project, and still comes up drastically short of the parking capacity needed for the "events" in the stadium.

"The parking availability baseline is outdated and inaccurate, particularly since it incorrectly lists in its offsite parking inventory the "SF Giants Facilities," which are slated for removal and development under the "Mission Rock Project." Therefore, where the DSEIR claims there are "2,530" available parking spaces at "SF Giants facilities," no such spaces will be available under the planned development, and those spaces are not available when Project "events" overlap with "events" at the AT&T stadium. (DSEIR 5.2-236-238.) The baseline (existing conditions) thus grossly overestimates the existing parking supply, disregarding the reality of ongoing development throughout the downtown and Project area.

"The baseline also grossly underestimates existing parking demand for its proposed "events," claiming without support that, with 18,000 event attendees, the parking space

"demand" would be only 5,937 spaces for midday events, and 9,614 spaces for evening events. (DSEIR 5.2-242.) The DSEIR does not state how those baseline "demand" figures were derived. The failure to set forth either an accurate baseline supported by evidence and an accurate description of the Project demand not surprisingly results in the DSEIR's implausible and irresponsible conclusions that it need not realistically assess and effectively mitigate the Project's significant parking and traffic impacts due to a lack of parking.

"Instead, we are told that by creating a parking shortfall, attendees "may instead use transit to arrive at the site because the perceived convenience of driving is lessened by a shortage of parking" (DSEIR 5.2-241) is completely unsupported, and evades the Project's impacts on other travelers who are not attending a Project "event" who must also contend with the secondary impacts of snarled traffic, congestion, delays, and lack of parking throughout the area. That conclusion is even more dubious in view of the DSEIR's admission that existing transit cannot accommodate Project demand. (DSEIR 5.2-140-147.)

"The DSEIR concludes that, "By promoting carpooling, providing parking attendant services, providing clear direction to alternative parking locations in advance of events, and adjusting event parking rates (raising them), the parking supply would likely be more efficiently utilized during the event days and the potential parking deficit would be eliminated." (DSEIR 5.2-241.) That absurd conclusion is again completely unsupported.

"The same error that flaws all of the cumulative impacts analyses in the DSEIR also applies to the cumulative parking impacts analysis, which again mistakenly begins with a baseline of "existing" conditions in 2040, instead of present existing conditions. (DSEIR 5.2-248)" (*Mary Miles, Attorney at Law, email, July 27, 2015 [O-MM-12]*)

"Impact TR-2b: Parking

"Parts of northeast Potrero Hill and Dogpatch are currently part of Residential Parking Permit ("RPP") Zone X. RPP enforcement is from Monday to Friday, from 8:00 am to 6:00 pm reflecting the out-of-City commuter concerns RPP was designed to remedy. These hours do not correspond with the weekend and evening operations of the Arena. Due to proximity to the Arena and existing transit options, Zone X is well within the parking shed for the Arena.

"Extension of RPP enforcement hours should be considered. Yet mere extension of enforcement may not be enough. RPP areas marked with four-, rather than two-, hour limits, which may serve local businesses well, would not generally provide protection from Arena parking. Areas in our neighborhoods not currently under RPP, but which are otherwise residential in character, cannot be allowed to suffer the pressures of Arena parking. And, of course, enforcement must have the resources behind it to provide appropriate ticketing and towing for violators.

"A plan needs to be developed to prevent our neighborhoods from becoming a free parking zone for Arena event attendees. Metering by itself will not provide an adequate solution given the day-to-day mixed uses of the areas in question. A meeting with community stakeholders would ensure the adequacy of a plan and help garner the support necessary to make it a reality.

"We also believe that parking for the Arena should be bundled with the tickets sold. No person driving to an event at the Arena should have to guess about where they will be parking. Remote, satellite parking served by shuttles and taking advantage of mobile application technology should be required under the SEIR." (*Potrero Boosters Neighborhood Association, J.R. Eppler, letter, July 27, 2015 [O-PBNA-5]*)

"Last, I have additional concerns about parking. We're fortunate enough to have 1 space per unit, but we don't have guest parking and some units have multiple cars. It's quite difficult to find parking during a game, and it's expensive for me to have a driving guest over given how expensive the meters are during games. That hassle will only increase with the Warriors. (Plus guests hate having to drive over here because of the game traffic!)" (*Josh Anon, email, July 13, 2015 [I-Anon-4]*)

"The neighborhood simply doesn't have enough parking to support TWO major stadiums within blocks of each other." (*Jessie Bunn, email, July 6,2015 [*I-Bunn-2*]*)

"I'm a homeowner on Mississippi St and would love the Arena in my Neighborhood. For people who are concerned with parking issues maybe we can extend the permit parking hours." (*John Cale, email, July 27, 2015 [I-Cale-1]*)

"• All public parking around the building taken up by sports fans. Try having friends over." (Jadine Cehand, email*, June 30, 2015 [*I-Cehand-3*]*)

"This stadium project absolutely promises additional traffic logjams and parking nightmares." (*Micki Cunningham, email, July 23, 2015 [*I-Cunningham-4*]*)

"First many of our blocks already have Residential Permits. What is the City going to do to keep people hunting for parking in our residential neighborhoods? We already suffer daily commuter parking problems cause by UCSF, Mission Bay and Caltrain that have not been addressed for years." (*John deCastro, email, July 27, 2015 [I-deCastro1-2]*)

"While I'm very excited for the Warriors on their 2015 Championship - I am concerned with the impact that having their new stadium at their proposed SF location.

"I live in the neighborhood nearby - Dogpatch - and street parking is already limited by the new hospital, university, private business and Giants fans (why use the paid parking when street is free?).

"I would like to see the neighborhood parking restrictions extended later in the day for those without a permit to discourage game goers from using all the street parking before residents get home from work. We see this impact already with the AT&T stadium events and the continuing growth of the neighborhood - it will no doubt occur more with another event center nearby." (*Jay Herda, email, June 22, 2015 [I-Herda-1*)

"c. Possibly use other near by garages for additional parking." (*Dennis Hong, email, July 27, 2015 [I-Hong-8]*)

"A second observation from Brooklyn is that off-street parking supply provided by the project, combined with existing nearby off-street parking, far exceeded demand, and parking availability was therefore not an issue. The 541 parking spaces provided on site were never at full capacity and the lot was typically less than half full for major events such as basketball games. This was due, in addition to high transit mode share, to the availability of many nearby parking lots and garages that had capacity after the workday was over, as well as free and low cost on street parking. Many of the same conditions are present at the Warriors site and therefore I do not believe parking availability will be an issue here either. I will mention one negative impact associated with parking in Brooklyn -- there has been some concern from residents about parking becoming more difficult in surrounding neighborhoods as a result of arena patrons parking on street. The investigation into Residential Permit Parking zone expansion referenced in the EIR will be important if this type of impact is to be minimized in Mission Bay." (*Christopher Hrones, email, June 30, 2015 [I-Hrones1-3]*)

"Parking will also be a nightmare, with less than 200 dedicated parking spaces for the 18,500-seat entertainment center. While restricting the number of parking spaces may be considered a means of traffic management under the City's regulations, the practical effect will be yet more gridlock and unhealthy air emissions." (*Michael Lighty, email, July 27, 2015 [I-Lighty-3]*)

"We are concerned about the negative impact the new stadium will have on our already over taxed neighborhood parking.

"Hospital workers and patients at the newly opened UCSF Hospital are currently parking on Minnesota and Tennessee streets further taxing street parking already at capacity. This is happening in spite of UCSF promising to provide traffic mitigation for 5 years prior to the hospital opening. In addition to the hospital, Giants fans are also parking in the neighborhood during games both day and night.

"The addition of the Warriors stadium and other events planned at the site will only worsen an already untenable situation.

"The Warriors and the City must take the necessary steps to limit further street parking in Dogpatch. Muni and Caltrain and the City must commit in writing upgrading existing public transport to accommodate increased traffic and pressure on Dogpatch parking." (*David Siegel, email, July 14, 2015 [I-Siegel1-2]*)

"1) Use of third-party parking structures: In Figure 5-2 in the Transportation Management Plan, it appears that several UCSF or residential parking structures are being provided as examples of where fans might park. A note in accompanying text states that the figure does not reflect actual third-party agreements, but residential parking garages should not be used for fan parking, and while perhaps the UCSF parking garage closest to the arena could potentially be incorporated into a deal of some sort with the university, the parking structure on the other side of campus in the Rutter Center should not be used as a preferred fan parking structure because that would result in a horde of fans, sometimes drunken fans, pouring through the campus. This is not acceptable at any time of day, as the research mission of the university is not confined to business hours." (*Matt Springer, email, July 16, 2015 [I-Springer-1]*)

"I'm not in favor of: … Parking issues" (*Kaylah, email, July 13, 2015 [I-Sterling-3]*)

"The proposed parking restriction, with 200 spaces for 18,000 fans at the proposed Warriors Arena, is also ludicrous, and will result in further gridlock … as fans cruise the neighborhoods in search of a place to park." (Michael Stryker, *email, July 26, 2015 [I-Stryker-4]*)

"Additionally, the project will further hinder access to other parts of the City and the Bay Bridge to Mission Bay. Even with the improvements promised by the City, Mission Bay cannot handle up to 18,500 fans at 225 events per year, especially when both stadiums have games. Parking will also be a nightmare, with less than 200 dedicated parking spaces for the 18,500-seat entertainment center. While restricting the number of parking spaces may be considered a means of traffic management under the City's regulations, the practical effect will be yet more gridlock …" (*Judy Tan, email, July 27, 2015 [I-Tan-3]*)

"I live 2 blocks away from the proposed site (18th and Tennessee). Street parking is already limited by the new hospital (why use the paid parking when street is free?).

"I would like to see the restrictions extended later in the day for those without a permit to discourage game goers from using all the street parking before residents get home from work. (Some already happens with ATT, even though not as close.). Or maybe restricted sections on each street for only permit holders. Or some other solution.

"People are not going to pay for parking in those "many" available spots if they can park on street. And that will cause untold problems for residents." (*Joanne Watson, email, June 15, 2015 [I-Watson-1]*)

"The assumption that UCSF or Alexandria (ARE) parking garages or private parking lots in Mission Bay will be available for Arena patrons is faulty. This incorrect assumption, which inaccurately overstates available parking in the neighborhood, makes it even more critical to discourage "at will" attempts by arena patrons to drive and hope to find parking or the congestion caused by ride-hailing services (TNC's)." (*Corrine Woods, email, July 27, 2015 [I-Woods-7]*)

"NO WAY!!! Look at the logistics!! Suppose there is a Warriors game and a Giants game going on at the same time!!

"Uhhh.....think about the traffic and think about the parking nonsense.....THERE IS NO MORE PARKING - ANYWHERE!!!!

"ARE YOU KIDDING?

"There is NO room to put up an arena for the Warriors! There are NO PARKING SPACES AVAILABLE!!!" (*James Woody, email, July 14, 2015 [I-Woody-1*)

"Parking in the area is very restrictive. Some of the area is controlled by the Port Authority and metered on a sliding pricing model. Other streets have abusive (in my view) parking restrictions which include two-hour parking zones from 7 a.m. – 10 p.m. daily. On many weekdays (non SF Giant game days) after 6 p.m. and most weekend days, the immediate area around my building is a virtual ghost town. It is not uncommon to have dozens upon dozens of vacant parking spaces on nearby streets throughout the day. Terry Francois Street often has 50 – 75, if not more, open spaces alone. Yet restrictive parking restrictions are in place. The Port Authority does not make it a practice to offer residential parking permits in our area. Residents understand the need for parking restrictions, but in our area the two-hour parking hours should be relaxed to a more realistic timeframe of perhaps between 8 a.m. – 7 p.m. on non-event days." (*James Zboralske, email, July 27, 2015 [I-Zboralske-5*])

"The existing parking was looked at in the parking study area. That area was defined to include off-street parking facilities located within a reasonable walking distance from the project site – one-half (.5) mile with easy access to major street corridors that provide access to Mission Bay." (*James Zboralske, email, July 27, 2015 [I-Zboralske-17*])

"The parking lot assessment in section 5.2.3.7 is flawed in my opinion. It claims the 15 off-street parking facilities are located in areas "with easy access from the major street corridors that provide access to the Mission Bay Area." Unfortunately, given the geographical constraints in the area, and the limited points of ingress and egress, everybody that needs to access Mission Bay for any reason will be on the same few roads. There is no such thing as "easy access" in this area today. To claim "easy access to the major street corridors" is a blatant misrepresentation. Existing conditions do not warrant that description. In theory, by looking at a map, one would expect simple access. In practice this is simply not true." (*James Zboralske, email, July 27, 2015 [I-Zboralske-20*])

"With respect to the timeframes used to evaluate parking and occupancy rates, the evening hours used in the study were from 7:00 – 8:30 p.m. This timeframe is flawed. I have seen, with the San Francisco Giants games, fans are often arriving very early to the area. In fact, people come several hours early regardless of transportation mode; hang out, walk the waterfront, and frequent local eating establishments.

"If this trend holds, the people looking to park in these 15 facilities will be arriving hours before the 7:00 p.m. threshold. Spots will not be available because day workers will not have vacated them yet. These people will circle the area looking for other options or decide to park further away in residential areas." (*James Zboralske, email, July 27, 2015 [I-Zboralske-22*])

"At any rate, limiting the survey hours in the evening from 7:00 – 8:30 p.m. is flawed. The survey should look at parking supply and occupancy rates in the 15 lots beginning as early as 4:30 p.m. and starting no

later than 5:30 p.m. to accurately assess parking availability." (*James Zboralske, email, July 27, 2015 [I-Zboralske-24*])

"Although I support the quest for an event arena that might serve as the Warriors' home in San Francisco, the site proposed to cross the U.C.S.F. Mission Bay is not appropriate.

"The lack of parking, coupled with the proximity to both the Medical Center and AT&T park is a recipe for congestion and a potential disturbance for the quiet care of patients at the Medical Center." (*Alexander Granowski, public hearing transcript, June 30, 2015 [PH-Granowski-1]*)

"In terms of parking, the main observation is that off-street parking supply provided by the project, combined with existing nearby off-street parking, far exceeded demands. And so, parking availability was not an issue there either." (*Christopher Hrones, public hearing transcript, June 30, 2015 [PH-Hrones2-2]*)

"When the AT&T park went in, we were told that people would take the train and people would take public transportation, yet the parking lots of that park are overflowing, and they're looking for new space now that there's a building going in.

"So, I'm very concerned about the project's impact on the neighborhood parking and traffic, but not opposed to the Warriors." (*Michael Sesich, public hearing transcript, June 30, 2015 [PH-Sesich-4]*)

Response TR-13: Parking Conditions

Inclusion of Parking Analysis in SEIR

Parking conditions for existing plus project and cumulative conditions are presented on SEIR pp. 5.2-233 – 5.2-251. As indicated on SEIR p. 5.2-233, SB 743 amended CEQA by adding Public Resources Code Section 21099 regarding the analysis of parking impacts for certain urban infill projects in transit priority areas. Public Resources Code Section 21099(d), effective January 1, 2014, provides that "parking impacts of a residential, mixed-use residential, or employment center project on an infill site located within a transit priority area shall not be considered significant impacts on the environment." The proposed project meets each of the above three criteria of SB 743: it is in a transit priority area because of its location within ½ mile of a major transit stop; it is an infill site because it is located on a previously developed site in an urban area; and it is an employment center because it would be an expansion of existing commercial support uses, located in a transit priority area on a site already developed and zoned for commercial uses. (See Pub. Resources Code, §§ 21061.3 [defines "infill site"], 21064.3 [defines "major transit stop"], 21099, subd. (a)(1) [defines "employment center"], 21099, subd. (a)(7) [defines "transit priority area"]; see also *San Franciscans Upholding the Downtown Plan v. City and County of San Francisco* (2002) 102 Cal.App.4th 656, 697 ["[p]arking deficits are an inconvenience to drivers, but not a significant *physical* impact *on the environment*"] [emphasis in original].) Thus, the SEIR does not consider adequacy of parking in determining the significance of project impacts under CEQA. However, OCII acknowledges that parking conditions may be of interest to the public and the decision makers, and a parking demand analysis is presented for informational purposes and

considers secondary physical impacts associated with constrained supply (e.g., queuing by drivers waiting for scarce onsite parking spaces that affects the public right-of-way).

Proposed Project Parking Supply

A number of comments stated that the project would provide 200 on-site parking spaces; this is incorrect. The proposed project would provide a total of 950 on-site vehicle parking spaces, and, as part of the project, the sponsor has also acquired the right to park at 132 existing off-street parking spaces in the 450 South Street parking garage, accessed from South Street and Bridgeview Way directly north of the project site. Combined, the proposed project would have 1,082 vehicle parking spaces serving the project uses.

The two existing surface parking lots on the project site are temporary public parking facilities that would be eliminated with the project. As described on SEIR p. 5.2-101, the traffic analysis for conditions without and with a SF Giants evening game at AT&T Park assumed that the vehicles currently traveling to and from these two surface lots would park instead at nearby public parking garages (e.g., USCF Third Street Garage, 450 South Street Garage), following similar travel paths to these alternate parking facilities. As presented in Table 5.2-9 on SEIR p. 5.2-33, the two surface parking lots are about 40 percent occupied during the weekday midday period on days without a SF Giants evening game at AT&T Park, and on days with a SF Giants evening game at AT&T Park (Table 5.2-13, SEIR p. 5.2-42) about 35 percent occupied during the weekday evening and 95 percent occupied during the Saturday evening.

Replacement parking for these 610 spaces on the two surface lots would not be provided as part of the project. As discussed in SEIR p. 5.2-233, the SEIR does not consider the adequacy of parking in determining the significance of project impacts under CEQA, and therefore, the provision of replacement parking in Mitigation Measure M-TR-11c: Additional Strategies to Reduce Transportation Impacts of Overlapping Events, is not required or considered. However, OCII acknowledges that parking conditions may be of interest to the public and decision makers, and therefore, a parking demand analysis is included on SEIR pp. 5.2-233 – 5.2-251. The existing parking supply of 610 spaces within the two surface parking lots on the project site was removed from the areawide parking supply used in the analysis and its associated parking demand reallocated to other nearby facilities.

Off-Street Parking Supply in Study Area

The parking supply used in the analysis includes publicly-accessible parking generally within the parking study area, which is bounded by Townsend to the north, Seventh and Mississippi Streets to the west, 18th Street to the south, and San Francisco Bay to the east. The parking study area was defined to include those off-street parking facilities located within a reasonable walking distance from the project site for an event, up to 0.5 miles, with access from the major streets that provide access to the Mission Bay Area. Studies of sport facilities and special events have documented that most attendees will walk up to about 0.3 miles between their parking location and the nearest

entrance to their destination, with greater distances being acceptable at high attendance events.[21] This acceptable walking distance for event attendees is supported by SF Giants game attendees that currently park at the project site and then walk to AT&T Park, located approximately 0.6 miles to the north. The off-street parking supply does not include any residential parking spaces, or the parking demand associated with those spaces, nor does the off-street parking supply include spaces reserved for other uses. For the analysis of overlapping events, the parking supply on Lot A and other parking lots directly catering to the SF Giants fans such as Pier 48 or Lot C (Figure 5.2-8, page 5.2-31) was not assumed to be available for event center parking. However, as described on SEIR p. 5.2-236, a number of parking facilities currently open, or remain open, during games at AT&T Park to accommodate attendees driving to a baseball game. Specifically, parking facilities at 185 Berry Street, Pier 48 Sheds A and B, and Lot C with about 1,100 parking spaces overall are closed in the evening or on Saturdays on no game days but become available for public parking during a SF Giants game on weekday evenings, while Pier 48 Sheds A and B and Lot C become available for public parking on Saturdays. As a result of this variation in the operation of existing parking facilities during SF Giants games at AT&T Park, the parking supply would also vary for existing plus project conditions without and with an event at the project site, and without and with an overlapping SF Giants evening game at AT&T Park.

As described on SEIR pp. 5.2-32 – 5.2-33, existing off-street parking supply and utilization data were obtained from available studies conducted in Mission Bay for the UCSF LRDP EIR (with surveys conducted in March and September 2013), and supplemented with additional field surveys in March 2013 and September and October 2014. The parking supply and demand survey data from 2013 and 2014 were adjusted to reflect changes in the parking conditions since the surveys were conducted. Specifically, the parking supply includes the new garage and surface lot associated with the recently-opened UCSF Medical Center Phase 1 (a total of 1,050 parking spaces), and the elimination of 320 spaces in the surface parking lot at 1000 Third Street (referred to as Lot D on Block 1 through Block 4), elimination of 300 spaces in the surface parking lot at Lot C South (Block 7), and reduction of 100 spaces in Lot A where development projects are pending in early 2015, and an increase in parking supply on Lot C (physically two lots located at Blocks 3E and 4E) from 160 to 320 spaces. The weekday parking occupancy for the analysis hours for the new UCSF Medical Center Phase 1 garage and lot was based on the parking demand at full occupancy identified in the UCSF LRDP EIR as well as information on parking utilization at other UCSF parking facilities; this assumption was later confirmed by parking occupancy surveys conducted in April 2015. Because the UCSF LRDP EIR did not include an analysis of Saturday conditions, the Saturday parking occupancy for the analysis hours for the new UCSF Medical Center Phase 1 garage and lot was based on surveys of UCSF facilities conducted in April 2015. The parking demand associated with the eliminated parking spaces (project site, portion of Lot A, Lot C South, and Lot D), was redistributed to other nearby facilities.

[21] Edward M. Whitlock, *Parking for Institutions and Special Events,* Eno Foundation for Transportation, 1982, and, Mary S. Smith and Thomas Butcher. *"How Far Should Parkers Have to Walk," Parking,* National Parking Association, May 2008.

Parking demand at the parking facilities within the study area was collected for the 7:00 to 8:30 p.m. period because this time frame represents the maximum occupancy at the time that the entire parking demand for an evening event would need to be accommodated (i.e., the maximum number of available parking spaces to accommodate project parking demand can be determined). The attendees who arrive several hours prior to the event are accounted for in the parking demand assessment. As noted in Response TR-2d, about 5 percent of event attendees are anticipated to travel to the event center between 5:00 and 6:00 p.m., resulting in a parking demand of about 200 vehicles, and it is anticipated that these vehicles would occupy parking spaces vacated by people leaving work at the end of the day. Because of the limited number of event attendees arriving at the site before 6 p.m., another analysis period in addition to the midday and evening periods is therefore not required.

The 2040 Cumulative parking conditions are presented on SEIR pp. 5.2-245 – 5.2-251. A summary of the planned cumulative increases in non-residential development and corresponding parking supply and demand changes in the Mission Bay South area are presented on SEIR p. 5.2-246. These developments include buildout of the UCSF campuses per the UCSF 2014 LRDP, Seawall Lot 337 and Pier 48 Mixed-Use Project (Mission Rock Project), and the buildout of the Mission Bay Plan. Thus the 2040 cumulative parking analysis takes into account the additional new non-residential parking supply and demand, as well as the loss of existing surface parking facilities that would be displaced as a result of the development.

On-Street Parking Supply in Study Area

On-street parking conditions are described on SEIR pp. 5.2-34 – 5.2-35. On-street parking in the project vicinity is primarily metered one-hour, four-hour and unlimited time restricted parking spaces. Exceptions include portions of Terry A. Francois Boulevard, Mission Bay Boulevard North, Mission Bay Boulevard South, 16th Street, and Mariposa Street. Parking is prohibited on 16th Street west of Third Street. Metered parking regulations are in effect Monday through Saturday between 9:00 a.m. and 10:00 p.m., and between 9:00 a.m. and 6:00 p.m. on Sundays. The SFMTA and the Port of San Francisco have established Mission Bay as a metered district, and installation of meters is ongoing, as street construction and parcel development is completed. In February 2012, the Port Commission reconfirmed its approval for parking meters in Mission Bay. These new meters will have no time limit, thereby removing the two-hour time limited parking restrictions currently in effect in much of Mission Bay. Thus, streets with unrestricted and unmetered parking spaces, such as Terry A. Francois Boulevard, South Street, and 16th Street adjacent to the project site, will be metered, regardless of whether the proposed project is constructed. Special event pricing is in effect for all parking meters within Mission Bay South; rates are higher for meters located closer to AT&T Park.

Project Parking Demand

The methodology used to estimate parking demand for the various land uses and analysis scenarios is presented on SEIR pp. 5.2-102 – 5.2-105, and are summarized by land use in Table 5.2-28 on SEIR p. 5.2-103. Parking demand for attendees at a basketball game was estimated based on the total number of attendee vehicle trips expected at the event (i.e., the maximum number of vehicles

arriving at Mission Bay for the event, not just those arriving during the analysis hours). Vehicle trips themselves are estimated as part of overall trip generation, which includes assumptions of travel using various modes (e.g., transit, walk, bicycle, and other modes).

A comment states that the proposed event center would have 18,500 attendees for 225 events per year; this is incorrect. The event characteristics at the proposed event center are presented on Table 3-3 on SEIR p. 3-39. It is currently anticipated that only about 90 of the 225 events would have an average attendance of 12,500 or more attendees.

Assessment of Parking Conditions

As noted in a comment, the existing plus project parking demand analysis presents conditions as if the UCSF parking facilities currently available for public parking remain open for all drivers, as well as, per the request from UCSF, for conditions as if UCSF's public parking facilities were not made available for events at the event center.

The transportation analysis assumes that current operating characteristics of the public parking facilities supporting the SF Giants evening game at AT&T Park do not change, and that the existing facilities currently open to the general public on weekdays and weekends would remain available to the public (e.g., most UCSF public parking facilities currently operate 24 hours a day every day), including employees and visitors to the proposed project site.

The discussion on page 5.2-241 of the SEIR acknowledges that south of the proposed event center, the streets between Mariposa and 18th Streets and between Indiana and Third Streets are subject to the RPP "X" regulation, which restricts on-street parking Monday through Friday, to a two- or four-hour period between the hours of 8:00 a.m. and 4:00 p.m. unless an RPP "X" permit is displayed, in which case there is no time limit enforced. On these streets, the RPP regulation is not in effect during the weekday evenings, thus residents arriving to these areas could have difficulty parking on-street.

The SEIR also states that if residents in adjacent residential areas to the south perceive an increased challenge in finding on-street parking in their neighborhoods, residents can request the establishment of a new or expand the existing RPP Area "X" through the SFMTA. They may also explore other possible parking management strategies to address spillover parking in residential areas. The extent of spillover into the nearby residential neighborhoods to the south could be minimized by extending the RPP regulations to a larger area, reducing all non-residential on-street parking to two hours, adding parking meters at key locations, and increasing weekday midday enforcement. Changes to the designation of the RPP hours and additional streets would need to be initiated by the residents on those streets, and the project sponsor cannot request these changes. The extension and changes in RPP regulations in the residential neighborhoods south of Mariposa Street (e.g., 18th, Minnesota, and Tennessee Streets) would also serve to improve parking conditions for residents currently affected by visitors to, and employees of, the UCSF facilities parking on the residential streets south of Mariposa Street.

In August 2015, the SFMTA initiated coordination regarding on-street parking conditions in the Dogpatch and Potrero Hill neighborhoods. The Potrero Boosters and the Dogpatch Neighborhood Association recommended working with the SFMTA to design and implement a comprehensive on-street parking management plan for the north side of the Dogpatch and Potrero neighborhoods that would feature RPP time limits that operate into the evening and on weekends, would include all streets within the area, and would consider the existing weekday daytime commute pressures as well as evening and weekend event pressures. The RPP Area X area would be expanded rationally, based on resident petition. As these two neighborhood organizations only represent a portion of the community (other organizations include the Potrero-Dogpatch Merchants Association, a number of condominium homeowners associations, and other groups and individuals), the SFMTA, the Potrero Boosters, and the Dogpatch Neighborhood Association would consult with and work with the overall community to bring forward to the community a neighborhood curb management plan. In response to the comment that parking for the event center should be bundled with the tickets, Mitigation Measure M-TR-2b: Additional Strategies to Reduce Transportation Impacts, described on SEIR p. 5.2-129, includes a measure that would require the project sponsor to offer for pre-purchase substantially all available on-site parking spaces not otherwise committed to office tenants, retail customers or season ticket holders, and to cooperate with neighboring private garage operators to pre-sell parking spaces, as well as notify patrons in advance that nearby parking resources are limited and travel by non-auto modes is encouraged.

In response to the comment that satellite parking with shuttle service should be required, Mitigation Measure M-TR-11c: Additional Strategies to Reduce Transportation Impacts of Overlapping Events, described on SEIR page 5.2-180, includes a measure that would require the City to identify one or more off-site parking lot(s) on Port of San Francisco or other lands to the south of the event center to provide approximately 250 additional parking spaces for all events and up to approximately 750 to 800 additional parking spaces for use during dual events of 12,500 or more event center attendees (for a total of approximately 1,000 to 1,050 additional off-site parking spaces). See Response TR-12a: Traffic Mitigation Measures for a summary of the analysis of the potential implementation of the proposed off-site parking facilities.

The cumulative parking demand analysis is presented on SEIR pp. 5.2-249 – 5.2-251, and, as noted above, discusses the planned and proposed changes to the off-street parking supply in the project vicinity due to development projects, and in particular, buildout of the UCSF campus per the UCSF 2014 LRDP, Seawall Lot 337 and Pier 48 Mixed-Use Project, and the buildout of the Mission Bay Plan. Thus the 2040 cumulative parking analysis takes into account the additional new non-residential parking supply and demand, as well as the loss of existing surface parking facilities that would be displaced as a result of the development.

13.11.15 Helipad Impacts (TR-14)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

A-UCSF-12 A-UCSF-13 A-UCSF-14 A-UCSF-15 A-UCSF-28

"After a review of the DEIR, UCSF remains concerned about the projected impact on UCSF's medical helipad, and about the DEIR's analysis of this matter. UCSF's helipad provides access to critical emergency care for children and pregnant women in distress. UCSF undertook an extensive community process and received helipad and access route approval by various regulatory agencies, including the Federal Aviation Administration, the California Department of Transportation's Aeronautics Division, and the San Francisco Board of Supervisors. Any activities proposed by GSW that would render UCSF's flight paths·unusable or that would compromise the safety of air medical access are unacceptable to UCSF.

"UCSF understands and appreciates that the City and GSW continue to work on addressing the impacts. Nonetheless, the DEIR identifies the following:

- There would be 5 construction cranes at the Event Center construction site (see DEIR Figure 5.2-28), which would extend over all streets surrounding the project site, Third Street, 16th Street, Terry Francois Boulevard, and South Street.
- One crane would penetrate the airspace of UCSF's primary flight path --the flight path over 16th Street that is most frequently used, which arrives from and departs to the east. The DEIR concluded that this constitutes a potentially significant impact.
- Other cranes could penetrate the airspace of one or more of UCSF' s secondary flight paths.

"We understand that GSW may have a revised plan that relocates the construction cranes so that no penetration of the UCSF flight path airspace would occur, and we appreciate GSW's efforts on this matter. However, there is no commitment to avoid penetration of the flight path airspace at this time. We would appreciate GSW working toward a commitment to avoid penetration of the UCSF flight path, which we want included in the Final EIR." (*University of California San Francisco, Lori Yamauchi, letter, July 27, 2015 [A-UCSF-12]*)

"
- Page 5.2-265, the mitigation measure calls for the development of a Crane Safety Plan. The DEIR provides that the safety plan would identify appropriate measures "to reduce, and where possible, avoid, potential conflicts", by, among other things, seeking to "minimize penetrations" or "the duration of penetrations" into helicopter flight airspace. As currently written, the mitigation measure would allow for construction cranes to penetrate the flight path's airspace, which potentially compromises the ability of the helipad to operate 24/7. Accordingly, UCSF does not concur that Mitigation Measure MTR-9a reduces this impact to less than significant levels. Rather, UCSF requests that the mitigation measure be revised with the objective to ensure safe, 24/7 operation of the UCSF medical helipad by requiring GSW to locate their constructions cranes so that no penetrations of airspace occur during the construction of the Project." (*University of California San Francisco, Lori Yamauchi, letter, July 27, 2015 [A-UCSF-13]*)

"
- Page 5.2-263, the discussion of impacts on the alternative flight path over South Street is unclear. The text states that the working radii of the two construction cranes over South Street are not located

under any part of UCSF's alternative arrival/departure flight path. However, the text also identifies the minimum amount of vertical clearance anticipated between the cranes and the approach and transitional surfaces of the flight path. It is extremely important that the analysis of impacts be clear." (*University of California San Francisco, Lori Yamauchi, letter, July 27, 2015 [A-UCSF-14]*)

"• Page 5.2-270 through 272, while the DEIR does require GSW to develop an exterior lighting plan, it does not discuss the impact of laser pointers and drones which could present a real danger to helicopter pilots and passengers. Both UCSF' s helipad consultant and pilots whom we have consulted agree that this is a real safety issue.

"Although incidents are rare, it seems that in an event/crowd atmosphere, especially if there were an outdoor activity at the Third Street Plaza, the likelihood would be increased that an incident could occur. UCSF requests that mitigation measures be identified to reduce or eliminate this potential. Mitigation Measure M-TR-9d does not go far enough. It promises to develop an exterior lighting plan that incorporates measures to ensure specialized exterior lighting systems "would not have an undue impact on helipad operations." Any impact to a helicopter pilot transporting a critically-ill patient should be considered an undue and unacceptable impact, and further mitigation should be imposed." (*University of California San Francisco, Lori Yamauchi, letter, July 27, 2015 [A-UCSF-15]*)

"Page 3-49, as discussed in greater detail in Section B, above, contractor compliance with all codes, rules and regulations is not enough to ensure that tower cranes do not interfere with helicopter flight path." (*University of California San Francisco, Lori Yamauchi, letter, July 27, 2015 [A-UCSF-28]*)

Response TR-14: Helipad Impacts

The commenter expresses concern over the potential project construction impacts on UCSF's helipad. The commenter also indicates that the project sponsor may have a revised construction crane plan, and requests that the Final SEIR include a commitment by the project sponsor to avoid construction crane avoid penetration of UCSF's helipad flight paths. The commenter is referred to Section 12.3.1, Refined Construction Crane Plan, in this SEIR. Since publication of the Draft SEIR, the project sponsor refined its construction crane plan with the goal to further reduce potential project effects on the UCSF helipad during construction. The project sponsor's refined construction crane plan modifies certain construction tower crane locations, tower crane maximum working elevations and/or tower crane working radii. Section 12.3.1 provides a detailed description of the refined construction tower crane plan, and an analysis of the potential for the refined construction crane plan to obstruct UCSF helipad airspace surfaces. Chapter 14, Draft SEIR Revisions provides associated augmented text and graphics to the Draft SEIR.

As discussed in SEIR Chapter 3, Project Description, aside from the fixed tower cranes, the project also includes the use of mobile cranes on-site during construction. Specifically, the project proposes to use of three "crawler cranes," all of which would be comparatively smaller than the tower cranes. Nonetheless, in order to disclose all potential project construction related effects on the UCSF helipad operations, Chapter 14 provides augmented text to the Draft SEIR that describe the type and use of the crawler cranes during construction, and the associated analysis of the potential for the crawler cranes to obstruct UCSF helipad airspace surfaces.

In summary, based on the analysis of the refined construction crane plan, none of the proposed tower construction cranes would penetrate the Part 77 Approach or Transitional Surfaces associated with the UCSF helipad. Furthermore, adequate clearance for the construction cranes would be provided for the South Street alternate flight path. However, if the refined construction crane plan details were to change with respect to proposed tower crane size, location or other factors, then the project would have the potential to result in greater and/or less effects than those reported above. Mitigation Measure M-TR-9a, Crane Safety Plan for Project Construction, identifies feasible measures that would reduce potential temporary impacts associated with the use of cranes during the construction period to less than significant. The objective of the crane safety plan is to ensure the safe use of the UCSF Benioff Children's Hospital helipad, and the safety for people residing or working in the project area during construction. Therefore, with implementation of Mitigation Measure M-TR-9a, this impact would be *less than significant with mitigation*.

As discussed in Impact C-TR-9 in the SEIR, in the immediate project vicinity, cumulative building development is anticipated on the currently undeveloped portions of blocks located north, west, southwest and south of the project site. Depending on the construction schedules for these planned developments, the construction of the proposed project in combination with other planned development could result in a cumulative adverse impact to the UCSF helipad. Mitigation Measure M-TR-9a, Crane Safety Plan for Project Construction, would require that the project's crane safety plan include a measure to convey project crane activity schedule to UCSF and OCII. Furthermore, Mitigation Measure M-TR-9a would require that if other projects on adjacent properties are under construction concurrent with the proposed project and are using tower cranes, the sponsor would participate in joint consultation with those project sponsors and OCII to ensure any potential cumulative construction crane effects on the UCSF helipad would be minimized. With implementation of Mitigation Measures M-TR-9a, the contribution to cumulative impacts by the project would not be considerable, and the impact would be *less than significant with mitigation*.

The commenter indicates the Crane Safety Plan measures as presented in the Draft SEIR would not avoid penetrations to the airspace, and therefore do not reduce the impact to less than significant. As discussed above, based on the analysis of the refined construction crane plan, none of the proposed construction cranes would penetrate the Part 77 Approach or Transitional Surfaces associated with the UCSF helipad. Furthermore, the Crane Safety Plan outlined in Mitigation Measure M-TR-9a as revised in this Response to Comment document specifies that the crane safety plan shall "identify appropriate measures to avoid-potential conflicts that may be associated with the operation of the project construction cranes in the vicinity of the UCSF Benioff Children's Hospital helipad airspace" and "(i)nform crane operators of the location and elevation of the hospital helipad's Part 77 airspace surfaces and the need to avoid-penetrations to the surfaces." Consequently, the project would not compromise the ability for the UCSF helipad to operate 24 hours a day, 7 days a week. The commenter is referred to Section 12.3.1 and Chapter 14 for additional detail.

The commenter indicates that the discussion of impacts on the alternative flight path over South Street is unclear. Specifically, the commenter indicates that the Draft SEIR states that the working

radii of the two construction cranes over South Street are not located under any part of UCSF's alternative arrival/departure flight path. However, the Draft SEIR does not specifically state that; rather, it states that "while the working radii of two project cranes would extend over South Street, they are not located under any of the Part 77 Approach or Transitional Surfaces." Stated differently, the construction tower cranes over South Street are not located under any part of the *established* Part 77 Approach or Transitional Surfaces (i.e., those airspace surfaces illustrated in Figure 5.2-27 and Figure 5.2-28). However, for purposes of analyzing the potential impact of the construction tower cranes on the use of the South Street alternate flight path, an *assumed* curved Approach Surface was estimated for the alternate flight path on South Street; and the SEIR acknowledges that the northern crane working radii would extend under that assumed curved Approach Surface. However, please note that based on the refined construction crane plan discussed above, the description of analysis results has been revised; the commenter is referred to Section 12.3.1 and Chapter 14 for additional detail and associated text that augments the Draft SEIR.

The commenter indicates the Draft SEIR does not discuss the impact of laser pointers and drones which could present a danger to helicopter pilots and passengers. The commenter indicates that an event/crowd atmosphere, especially associated with outdoor activities at the proposed Third Street Plaza would increase the likelihood of hazards to pilots involving laser pointers or drones. It should be noted there is nothing inherent to the proposed project that would increase the likelihood of potential lasers and/or drones compared to any other areas in the City that provide open space and opportunities for outdoor events. Nevertheless, the commenter is referred to Chapter 14 for additional detail and associated Draft SEIR revisions made to address the potential for use by the public of laser pointers and/or drones at the project site. First, Section 5.2.6.3, Regulatory Framework of the Transportation section is revised to include applicable federal regulations governing use of laser pointers. Secondly, Mitigation Measure M-TR-9d is revised to specify that the event center exterior lighting plan shall 1) identify appropriate management policies and procedures to respond to the use of handheld laser pointers by the public on the project site which may pose a hazard to pilots; and 2) identify appropriate management policies regarding the use of drones on the project site and procedures to respond to aerial drone activity that may pose a hazard to pilots.

The commenter takes issue with language in Mitigation Measure M-TR-9d that indicates the project sponsor shall develop an exterior lighting plan that incorporates measures to ensure specialized exterior lighting systems "would not have an undue impact on helipad operations." In response to this comment, the language in Mitigation Measure M-TR-9d is reworded that "(t)he project sponsor shall develop an exterior lighting plan that incorporates measures to ensure specialized exterior lighting systems would not result in a substantial air safety risk and/or create a safety hazard on helipad operations." The commenter is referred to Chapter 14 for applicable Draft SEIR revisions.

Finally, the commenter indicates that contractor compliance with all codes, rules and regulations is not enough to ensure that tower cranes do not interfere with helicopter flight path. The Draft SEIR does not solely rely on mere compliance with codes, rules and regulations in its

determination of significance of project impacts to the UCSF helipad flight paths. As discussed in SEIR Section 5.2.6, Section 12.3.1, and Chapter 14, a project specific analysis of the refined crane plan demonstrates that all potential significant project and cumulative impacts from project construction and operation on UCSF helipad operations can be mitigated to a less than significant level. Therefore, with implementation of the mitigation measures identified above, the project would result in no new or substantially more severe impacts than those previously identified in the Mission Bay FSEIR, as addended.

Responses to Comments

13.12 Noise and Vibration

13.12.1 Overview of Comments on Noise and Vibration

The comments and corresponding responses in this section cover topics analyzed in SEIR Section 5.3, Noise and Vibration. These include topics related to:

- NOI-1: Sensitive Receptors
- NOI-2: Noise Significance Thresholds
  - NOI-2a: Construction Noise Thresholds
  - NOI-2b: Operational Noise Thresholds
- NOI-3: Methodology / Approach to Analysis
  - NOI-3a: Noise Impact Methodology
  - NOI-3b: Vibration Impact Methodology
- NOI-4: Construction Noise Impacts
- NOI-5: Vibration Impacts
- NOI-6: Crowd Noise

13.12.2 Sensitive Receptors (NOI-1)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

A-UCSF-19

"Tables 5.3-2 and 5.3-4, the distance from the "project site" to the UCSF Medical Center at Mission Bay is listed as 560 feet, without any explanation of measuring points. Elsewhere in the DEIR it is listed as 300 feet. This distance needs to be confirmed because at page 5.3-14, summarizing Article 1, Section 47.2 of the San Francisco Police Code, the DEIR states that "except as permitted by the Entertainment Commission, [amplified] sound shall not be issued within 450 feet of hospitals." As GSW proposes noise sources and noise generating events in the outdoor plaza areas as well as within the Event Center, the Final EIR should be specific and consistent about the locations from which distances were measured and what those distances are." (*University of California San Francisco, Lori Yamauchi, letter, July 27, 2015 [A-UCSF-19]*)

Response NOI-1: Sensitive Receptors

The correct distance between the project site and the nearest hospital is 560 feet, as set forth in Table 5.3-4 on page 5.3-9 of the Draft SEIR. This distance was measured using the Google Earth ruler tool and is the diagonal distance from the southwesternmost corner of the project site at the setback of the proposed 16th Street tower to the northeast corner of the building housing the

Betty Irene Moore Women's Hospital and Bakar Cancer Hospital. The distance between the Betty Irene Moore Women's Hospital and Bakar Cancer Hospital and the proposed Third Street Plaza where outdoor amplified sound is proposed is approximately 750 feet.

The 300-foot distance presented in Table 5.4-5 on page 5.4-17 of the Draft SEIR, incorrectly identified the distance between the project site and the energy center adjacent to the hospital. Consequently, Table 5.4-5 (p. 5.4-17) is revised as follows (deleted text is shown as ~~strikethrough~~ and new text is underlined):

TABLE 5.4-5
SENSITIVE RECEPTORS IN THE PROJECT SITE VICINITY

Receptor Type	Distance and Direction from the Project Site
Residential: UCSF Mission Bay Housing (Hearst Tower), Block 22	200 feet northwest
Residential: Madrone Mission Bay Residential Towers	800 feet to the north, on Mission Bay Boulevard North
Hospital: UCSF Benioff Children's Hospital facility at Mission Bay, plus the UCSF Betty Irene Moore Women's Hospital and the UCSF Bakar Cancer Hospital	~~300~~560 feet southwest

SOURCE: Environmental Science Associates, 2015

This revision does not change the analysis or conclusions presented in the Draft SEIR.

13.12.3 Noise Significance Thresholds (NOI-2)

Issues Raised by Commenters: Construction Noise Thresholds (NOI-2a)

This response addresses all or part of the following comments, which are quoted below:

O-MBA9L3-2 O-MBA9L3-7

"I. The DSEIR Is Not Sufficient as an Informational Document with Respect to Noise Impacts.

"A fundamental defect in the DSEIR's analysis of noise impacts is its use of thresholds of significance that do not actually measure the impacts that matter. This is readily demonstrated by comparing the two impacts that relate to the consistency of the Project with governing noise standards or plans (i.e., Impacts NO-2 (construction) and NO-4 (operations)) with the two impacts that relate to how noise affects people (i.e., Impacts NO-1 (construction) and NO-5 (operations)). Even in its discussion of the impacts that affect people, the DSEIR uses thresholds of significance that conflate compliance with non-CEQA regulatory programs with less-than-significant impacts under CEQA. This is error.

"The DSEIR uses several general thresholds of significance for noise impacts:

- Result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies;

- Result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels;
- Result in a substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project;
- Result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project.

(DSEIR, p. 5.3-16.)

"Impact NO-1 is described as "Construction of the proposed project would not cause a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project. (Less than Significant)." (DSEIR 5.3-20.) For construction impacts, the DSEIR uses several more specific thresholds of significance, including:

- Non-impact equipment. The impact is considered less than significant as long as construction noise from non-impact equipment is less than 80dba at 100 feet from the noise generating equipment.1
- Impact equipment. The impact is considered less than significant as long as the 1-hour Leq is less than 90 dBA for daytime and 80 dBA for nighttime construction noise exposure at residential uses, and 100 dBA for commercial and industrial uses.2

"The DSEIR then rigidly adheres to the regulatory scheme of the San Francisco Noise Ordinance in assessing the significance of noise from non-impact equipment, erroneously assuming the noise ordinance's regulatory scheme provides an appropriate threshold for determining whether impacts are significant under CEQA. Subdivision (d) of section 2909 of the San Francisco Noise Ordinance establishes thresholds for determining significance of noise impacts on nearby residents of 45 dBA nightime/55 dBA daytime noise, stating:

> Fixed Residential Interior Noise Limits. In order to prevent sleep disturbance, protect public health and prevent the acoustical environment from progressive deterioration due to the increasing use and influence of mechanical equipment, no fixed noise source may cause the noise level measured inside any sleeping or living room in any dwelling unit located on residential property to exceed 45 dBA between the hours of 10:00 p.m. to 7:00 a.m. or 55 dBA between the hours of 7:00 a.m. to 10:00p.m. with windows open except where building ventilation is achieved through mechanical systems that allow windows to remain closed.

"These standards (i.e., 45 dBA nightime/55 dBA daytime noise) are based on the actual health and welfare of people. But the DSEIR does not use them for construction noise or operational traffic or crowd noise because this provision of the City's noise ordinance only applies to fixed noise sources. The DSEIR thus conflates compliance with the noise ordinance for less-than-significant impacts under CEQA.

"The EIR's assumption in this regard violates CEQA, because compliance with regulatory standards cannot be used as a substitute for a fact-based analysis of whether an impact is significant. While San Francisco is free to adopt a noise ordinance that exempts specific noise sources from its regulatory effect, it is not free, under CEQA, to fail to disclose the significance of noise that exceeds these interior noise limits.[3]

"Because the DSEIR did not use the thresholds stated in section 2909(d), the noise impact assessment does not present relevant information that is necessary for determining whether the impact is significant. Instead, we have an impact assessment that is constrained by a series of arbitrary distinctions (i.e., the source fixed or not, the equipment impact or non-impact, the receptors are located in residences or hospitals) that have nothing to do with whether the affected community will suffer significant noise impacts.

"The DSEIR refers to the World Health Organization (WHO) as "perhaps the best source of current knowledge regarding the health effects of noise impacts because European nations have continued to study noise and its health effects, while the United States Environmental Protection Agency all but

eliminated its noise investigation and control program in the 1970s." (DSEIR, p. 5.3- 4.) The DSEIR also cites WHO's Guidelines for Community Noise and its thresholds for adverse effects of noise on people.

> In contrast to many other environmental problems, noise pollution continues to grow and it is accompanied by an increasing number of complaints from people exposed to the noise. The growth in noise pollution is unsustainable because it involves direct, as well as cumulative, adverse health effects.

(WHO, Guidelines for Community Noise, p. vii.)

> Specific effects to be considered when setting community noise guidelines include: interference with communication; noise-induced hearing loss; sleep disturbance effects; cardiovascular and psycho-physiological effects; performance reduction effects; annoyance responses; and effects on social behaviour.

(WHO, Guidelines for Community Noise, p. v.

> The scope of WHO's effort to derive guidelines for community noise is to consolidate actual scientific knowledge on the health impacts of community noise and to provide guidance to environmental health authorities and professionals trying to protect people from the harmful effects of noise in non-industrial environments.

(WHO, Guidelines for Community Noise, p. iii.)

> As discussed by Mr. Hubach:
>
> WHO's night-time standard for sleep disturbance inside bedrooms is 30 dBA, and outside bedrooms with "window open (outdoor values)" is 45 dBA. WHO's night-time and daytime standard for "speech intelligibility and moderate annoyance" for inside dwellings is 35 dBA. For outdoor living areas, WHO's daytime and evening standard for moderate annoyance is 50 dBA and for serious annoyance is 55 dBA.

"(Exhibit 1, p. 3.) Yet, despite citing the WHO Guidelines, the DSEIR fails to use these standards as its thresholds of significance, and finds that "ambient plus project" noise levels much higher than the WHO's standards for harmful noise are less than significant.

> Another human health and welfare based standard is provided by the State of California:
>
> State regulations include requirements for the construction of new hotels, motels, apartment houses, and dwellings other than detached single-family dwellings that are intended to limit the extent of noise transmitted into habitable spaces. These requirements are collectively known as the California Noise Insulation Standards and are found in Title 24 of the California Code of Regulations
>
> The State of California updated its Building Code requirements with respect to sound transmission, effective January 2014. Section 1207 of the California Building Code (Title 24 of the California Code of Regulations) establishes material requirements in terms of sound transmission class (STC) 13 rating of 50 for all common interior walls and floor/ceiling assemblies between adjacent dwelling units or between dwelling units and adjacent public area. The previous code requirements (before 2014) set an interior performance standard of 45 dBA from exterior noise sources. This requirement will be re-instated in July of 2015.

Footnotes:

[1] DSEIR, p. 5.3-16 - 5.3-17 ["Proposed construction activities would be required to comply with the San Francisco Noise Ordinance and the Mission Bay Good Neighbor Construction Noise Policy. The San Francisco Noise Ordinance prohibits construction activities between 8:00 p.m. and 7:00 a.m. and limits noise from any individual piece of construction equipment, except impact tools approved by the Department of Public Works, to 80 dBA at 100 feet. The Mission Bay Good Neighbor Construction Noise Policy limits pile driving or other extreme noise generating activity (80 dBA at a distance of 100 feet) to 8:00 a.m. to 5:00 p.m., Monday through Friday. As long as project construction activities comply with the noise ordinance, construction noise impacts from non-impact equipment would be considered less than significant. If construction activities using non-impact equipment would exceed these standards and the restrictions of the Mission Bay Good Neighbor Policy, then the noise effects would be potentially significant and mitigation measures would be required."]

[2] DSEIR, p. 5.3-17 ["The San Francisco Noise Ordinance does not identify any quantitative noise limit standard for impact equipment. To assess the potential impacts related to rapid impact compaction, this analysis employs the general construction noise assessment methodology and criteria suggested by the Federal Transit Administration (FTA). This guidance identifies a 1-hour Leq of 90 dBA for daytime and 80 dBA for nighttime construction noise exposure at residential uses. Commercial and industrial land use exposure to construction noise of 100 dBA is suggested as an assessment criterion."]

[3] See, e.g., *Californians for Alternatives to Toxics v. Department of Food & Agriculture* (2005) 136 Cal.App.4th 1, 16 (lead agencies must review the site-specific impacts of pesticide applications under their jurisdiction, because "DPR's [Department of Pesticide Regulation] registration does not and cannot account for specific uses of pesticides..., such as the specific chemicals used, their amounts and frequency of use, specific sensitive areas targeted for application, and the like"); *Protect the Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal.App.4th 1099, 1109 ["the fact that a particular environmental effect meets a particular threshold cannot be used as an automatic determinant that the effect is or is not significant ... a threshold of significance cannot be applied in a way that would foreclose the consideration of other substantial evidence tending to show the environmental effect to which the threshold relates might be significant"]; *Citizens for Non-Toxic Pest Control v. Department of Food & Agriculture* (1986) 187 Cal.App.3d 1575, 1587- 1588 (state agency applying pesticides cannot rely on pesticide registration status to avoid further environmental review under CEQA); *Oro Fino Gold Mining Corporation v. County of El Dorado* (1990) 225 Cal.App.3d 872, 881-882 (rejects contention that project noise level would be insignificant simply by being consistent with general plan standards for the zone in question). See also *City of Antioch v. City Council of the City of Pittsburg* (1986) 187 Cal.App.3d 1325, 1331-1332 (EIR required for construction of road and sewer lines even though these were shown on city general plan); *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 712-718 (agency erred by "wrongly assum[ing] that, simply because the smokestack emissions would comply with applicable regulations from other agencies regulating air quality, the overall project would not cause significant effects to air quality.").

(*Mission Bay Alliance, Lippe, letter, July 25, 2015 [O-MBA9L3-2]*)

"The DSEIR omits important information about the environmental setting.

"For example, to judge the noise impact on residents of the Hearst Tower, it is important to know whether these residents typically open their window to get fresh air or, conversely, whether the building is subject to any requirements to keep windows closed. This is because closed windows provide significant sound transmission loss.

"It also important to know what kind of windows nearby buildings have, because standard windows provide much less sound transmission loss than acoustically-rated windows.

California State Building Code Section 1207 requires an interior performance standard of 45 dBA DNL. Given that windows in the Hearst Tower, and adjacent residences, are operable and ostensibly used for ventilation, achieving 45 dBA interior may be in jeopardy. It is unknown if the Hearst Tower has mechanical ventilation to allow the windows to be closed for noise control. Even if they do already have mechanical ventilation, their windows may not have sufficient sound transmission loss for the predicted increased noise levels.

"The Title 24 compliance for Hearst Towers may have permitted windows to be open and not have required mechanical ventilation systems. If that is the case, they would need to keep windows open for fresh air and then suffer the increased noise.

"I tried to find out if there is a ventilation system mandated by code for Hearst Tower. This is Section 1207.11 of the California State Building Code, which says in noisy settings, windows must be closed to achieve the state's 45 dB interior standard, in which case a mechanical ventilation system must be installed. I searched for an acoustical report typically filed with Planning and/or Department of Building Inspection (DBI) to see what original design requirement were in place. I visited DBI and spoke with Dwayne Farrell who said they had no record of Hearst Tower at 1560 3rd St, and only a crane permit for the parking garage on the opposite corner. He suggested I visit the inspectors and planners in the building to see if they could find a permit number or block and lot information. I did, to no avail. However, it was suggested that perhaps since it is a State building, the State Architect might have all records. So I contacted Luke Molinar, DSA, who did a records search but came up empty on this topic (See Attachment 1 [email exchange with Luke Molinar].)

"Nevertheless, I visited the Project site on 8 July 2015, to make visual and aural observations. I walked along 3rd St from South St to 16th St, and South St to Terry Francois Blvd. The predominant noise is due to traffic – largely Muni, trucks and the occasional motorcycle. It was noticeably quieter away from 3rd St approaching the waterfront to the east. I spent some time in the pedestrian mall along Gene Friend Way.

"I observed many of the windows in Hearst Tower and adjacent Mission Bay Housing were open.(See Attachment 2 [a photograph I took on 8 July 2015, showing part of the Mission Bay Housing building on the left and part of the Hearst Tower on the right], and Attachment 3 [a photograph I took on 8 July 2015, showing part of the Hearst Tower on the right].)

"Therefore, regardless of whether the buildings are required to keep windows closed. The residents are opening them, presumably for fresh air." (*Mission Bay Alliance, Lippe, letter, July 25, 2015 [O-MBA9L3-7]*)

Response NOI-2a: Construction Noise Thresholds

These comments suggest that the analysis of construction noise in the SEIR inappropriately applies the significance thresholds for construction noise as codified in the San Francisco Noise Ordinance (Article 29 of the Police Code) and the Mission Bay Good Neighbor Construction Noise Policy. Instead, the comments suggest using a fixed residential interior noise standard set forth in Section 2909(d) the Noise Ordinance (45 dBA nighttime and 55 dBA daytime) as the significance threshold for assessing construction noise. The comments further state that the Draft SEIR should have used the World Health Organization standards as the significance thresholds for noise. Finally, the comments request information regarding the mechanical ventilation systems and windows at Hearst Tower.

The assessment of construction noise in the SEIR applies two different significance criteria as suggested in Appendix G of the CEQA Guidelines, Section XII. The first criterion that is applicable to construction activity addresses whether the proposed project would result in "exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies standard." This criterion specifies an assessment relative to an adopted noise ordinance or other standards. The CEQA guidance recognizes that no one noise level fits all settings and communities. Thus a community standard of an acceptable noise level is built into local noise controls. The City's Noise Ordinance (Article 29 of the Police Code) identifies specific compliance standards for construction activity and equipment, and therefore, the analysis of construction noise impacts properly addresses the project's noise impacts as compared to the local Noise Ordinance standards (see Impact NO-2 on page 5.3-24 of the SEIR). Consequently, consistent with CEQA Guidelines, Appendix G, it is these construction-specific standards of the local noise ordinance that are applied in the construction noise analysis and not the standards applicable to fixed noise sources. Thresholds for fixed noise sources are designed to establish not-to–exceed standards for noise sources such as building mechanical equipment and industrial or commercial processing machinery; fixed noise thresholds are not appropriate for measuring and analyzing construction noise. Similarly, the interior noise levels suggested by the World Health Organization, which have been developed as guidance for interior standards for new residential development, would be inappropriate for analyzing construction noise. Substantial evidence supports the thresholds identified in the SEIR. The Police Code standards relied upon in the analysis are described in the SEIR at page 5.3-13. The standards both

restrict the hours during which noise-generating construction activities can occur, and establish limits on the amount of noise that can be generated at a distance of 100 feet from the equipment. (See San Francisco Police Code, §§ 2907, 2908.)

OCII has determined that, as long as project construction activities comply with the Noise Ordinance, construction noise impacts from non-impact equipment would be considered less than significant. This reflects the recognition that construction-related noise is temporary in character, is generally acceptable when limited to daylight hours, and is part of what residents of urban areas expect as part of a typical urban noise environment (along with sirens, vehicles, etc.). Contrary to suggestions made by the commenter, both the temporary nature of these construction noise impacts and the fact that they will occur during times when urban residents expect ambient noise levels to be at their highest are legitimate reasons to conclude impacts are less than significant.

The second criterion suggested in Appendix G of the CEQA Guidelines that is applicable to construction activity addresses whether the proposed project would result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project. This potential impact is addressed in Impact NO-1 (SEIR pp. 5.3-20 to 5.3-23). Here CEQA indicates that the appropriate threshold to be applied could be an increase over existing ambient noise levels without the project but leaves the determination of the quantitative threshold to be applied at the discretion of the lead agency. For this project, as discussed on pages 5.3-17 and 5.3-18, the SEIR applies a threshold of a 10 dBA increase over the existing noise levels, which represents a perceived doubling of loudness as the threshold representing a substantial temporary increase in noise levels warranting implementation of construction noise control measures. A more liberal threshold was developed to be applied to construction impacts given that construction is an inherently noisy activity and application of a lesser threshold, such as the 5 dBA increase applied to operational impacts which denotes a readily perceptible increase, would be exceeded by the most routine construction activity and is therefore not considered to be a realistically applicable criterion for construction. Additionally, a 10 dBA increase threshold is codified in Section 2909 (c) of the Police Code as a noise limit for noise affecting public property. This increase is an appropriate threshold for construction activity as it reflects OCII's understanding that allowable increases in noise levels can be dependent on a number of factors, including source and the duration of the noise and the receiver of the noise.

As stated on page 5.3-20 of the SEIR, piles would be cast in place into augured holes and would not require use of an impact or vibratory pile driver. Consequently, there would be no noise impacts from pile driving associated with the proposed project. And as described in Chapter 12, Project Refinements and New Variant, rapid impact compaction is no longer a proposed method of construction. Thus, the construction noise caused by the project would be limited to noise from equipment such as bulldozers, cranes, concrete saws, and other mobile and stationary construction equipment as listed in SEIR Table 5.3-5 (p. 5.3-17). The temporary noise increase from construction would be less than 10 dBA over existing conditions, and would be less than significant. Construction noise would be temporary, and extreme noise-generating activities would only occur during daytime hours, 8:00 a.m. to 5:00 p.m., Monday to Friday, consistent

with the Mission Bay Good Neighbor Construction Noise Policy. The Police Code establishes limits on the hours during which noise-generating construction activities can occur, and establishes limits on the amount of noise that can be generated, as measured at a distance of 100 feet from the equipment. (See San Francisco Police Code, §§ 2907, 2908.) These standards apply to all construction sites, and do not vary depending on neighboring uses. These standards also focus on exterior noise levels. For these reasons, whether neighboring buildings have windows that are open or closed does not affect the analysis.

OCII acted within its discretion in relying on these standards to determine the significance of construction-related noise. "A threshold of significance is an identifiable, quantitative, qualitative, or performance level of a particular environmental effect, non-compliance with which means the effect will normally be determined to be significant by the agency and compliance with which means the effect normally will be determined to be less than significant." (CEQA Guidelines, § 15064.7 subd. (a).) The lead agency has substantial discretion in determining the appropriate threshold of significance to evaluate the severity of a particular impact. (See CEQA Guidelines, § 15064, subd. (b); *Save Cuyama Valley v. County of Santa Barbara* (2013) 213 Cal.App.4th 1059, 1068 [explaining agency discretion to fashion significance thresholds of significance].) As explained in the CEQA Guidelines, "[t]he determination of whether a project may have a significant effect on the environment calls for careful judgment on the part of the public agency involved, based to the extent possible on scientific and factual data. An ironclad definition of significant effect is not always possible because the significance of an activity may vary with the setting. For example, an activity which may not be significant in an urban area may be significant in a rural area." (CEQA Guidelines, § 15064, subd. (b).). This discretion extends to the lead agency's determination regarding what threshold to use to determine whether construction noise is significant. (*Sierra Club v. Tahoe Regional Planning Agency* (E. D. Cal. 2013) 916 F.Supp.2d 1098, 1146-1151 [significance threshold limited hours during which construction could occur, but did not otherwise impose limit on construction noise; county's approach was consistent with noise ordinance and therefore upheld]; see *Mount Shasta Bioregional Ecology Center v. County of Siskiyou* (2012) 210 Cal.App.4th 184, 204-207 [upholding analysis of increased noise generated by project based on significance thresholds adapted from other agencies]; *National Parks & Conserv. Assn. v. County of Riverside* (1999) 71 Cal.App.4th 1341, 1353 [upholding EIR's use of county noise standards for assessing significance of project's noise impacts].)

Ordinances, plans, policies, and regulations adopted by a lead agency, or adapted from those of another agency with expertise over the resource at issue, can serve as the basis for setting thresholds of significance. (See *North Coast Rivers Alliance v. Marin Mun. Water Dist.* (2013) 216 Cal.App.4th 614, 651 [upholding analysis of greenhouse gas emission based on consistency with county's emissions reduction goals]; *National Parks & Conserv. Assn. v. County of Riverside* (1999) 71 Cal.App.4th 1341, 1353 [upholding EIR's use of county noise standards for assessing significance of project's noise impacts]; *Mira Mar Mobile Community v. City of Oceanside* (2004) 119 Cal.App.4th 477, 492-493 [upholding thresholds of significance for aesthetic impacts derived from city's local coastal program policies].) CEQA case law also endorses the use of existing environmental standards or regulations as thresholds of significance. (See *Tracy First v. City of Tracy* (2009) Cal.App.4th 912 [upholding determination that energy impact of project was less

than significant because the project achieved energy efficiencies greater than those required by California Energy Efficiency Standards]; *Cadiz Land Co. v. Rail Cycle* (2000) 83 Cal.App.4th 47 [upholding finding that incremental impacts of criteria pollutants on sensitive crops would be less than significant based on National Ambient Air Quality Standards promulgated to protect public health and welfare from adverse effects of a pollutant]; *Protect the Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal.App.4th 1099, 1107 ["thresholds can be drawn from existing environmental standards, such as other statutes or regulations"]; *Rialto Citizens for Responsible Growth v. City of Rialto* (2012) 208 Cal.App.4th 899 [upholding use of thresholds of significance recommended by SCAQMD to assess air quality impacts]; *Oakland Heritage Alliance v. City of Oakland* (2011) 195 Cal.App.4th 884, 896 [agency has discretion to rely on adopted standards to serve as significance thresholds for a particular project].)

Where an agency's significance thresholds are challenged by a project opponent, the standard of review for a court reviewing the selected threshold is the "substantial evidence" standard, meaning the court must give deference to the lead agency's decision to select particular significance thresholds, including the threshold for construction noise. (See *National Parks and Conservation Association v. County of Riverside* (1999) 71 Cal.App.4th 1341, 1358 [court applies the substantial evidence test to review of an agency's decision to select particular thresholds for an EIR]; *Mount Shasta Bioregional Ecology Center v. County of Siskiyou* (2012) 210 Cal.App.4th 184, 204-207 [upholding operational noise analysis]; *Eureka Citizens for Responsible Government v. City of Eureka* (2007) 147 Cal.App.4th 357, 371-374 [deferring to city's determination that noise analysis was performed in a manner consistent with general plan policy]; *Sierra Club v. Tahoe Regional Planning Agency* (E. D. Cal. 2013) 916 F.Supp.2d 1098, 1146-1151 [upholding agencies' application of significance threshold for construction noise].)

The SEIR does not rely solely on compliance with regulatory standards in the Police Code to determine whether noise impacts are considered significant., the analysis for construction-related noise impacts also discusses the Mission Bay Good Neighbor Policy. This policy is described at page 5.3-15 of the SEIR. This policy has the effect of imposing additional limits on the days and hours when noise-generating construction activities can occur. This policy applies to the project and would limit extreme noise-generating activity to 8:00 a.m. to 5:00 p.m., Monday through Friday and prohibit such activity on Saturdays, Sundays, and holidays. The SEIR also relies on the general construction noise assessment methodology and criteria recommended by the Federal Transit Administration (FTA). (See SEIR, p. 5.3-17.) This methodology is a quantitative construction noise assessment and is performed by comparing the predicted noise levels with impact criteria appropriate for the construction stage. The approach requires an appropriate descriptor, a standardized prediction method and a set of recognized criteria for assessing the impact. The *descriptor* used for construction noise is the Leq, which is appropriate because it can be used to describe the noise level from operation of each piece of equipment separately, it can be used to describe the noise level during an entire phase, and it can be used to describe the average noise over all phases of the construction.

In addition to OCII's criteria described above and the criteria recommended by FTA, the SEIR considers whether the project would result in a substantial temporary increase in noise levels in

the project vicinity above levels existing without the project. Persistent construction equipment noise related to an increase of 10 dBA over the existing noise levels would represent a perceived doubling of loudness and is considered a substantial temporary increase in noise levels warranting implementation of construction noise control measures and is also codified in Section 2909 (c) of the Police Code which applies to noise limits for public property. (See SEIR, pp. 5.3-17 to 5.3-18; 5.3-20 to 5.3-24.) In any event, as explained above, it is appropriate for the SEIR to rely on ordinances, policies, and other established standards to establish thresholds of significance for noise impacts.

The comment cites a number of cases to support its view that compliance with regulatory standards cannot be relied upon to determine whether an impact is significant under CEQA. Specifically:

- In *Californians for Alternatives to Toxics v. Department of Food & Agriculture* (2005) 136 Cal.App.4th 1, 16-17, the project involved a state-wide plan to apply pesticides to control the spread of crop disease. The EIR stated the application of pesticides would not result in impacts because pesticides had to undergo a registration process in order to be licensed for use. The court held the EIR's approach was improper because the registration process was not designed to account for the environmental effects of state-wide use of the pesticides. Here, the EIR has not dismissed the project's construction noise impacts by virtue of some other regulatory program. Instead, the EIR discloses these impacts, and evaluates their significance using thresholds embodied in the City's Police Code and derived from FTA guidance.

- In *Citizens for Non-Toxic Pest Control v. Department of Food & Agriculture* (1986) 187 Cal.App.3d 1575, 1587-1588, the agency performed no CEQA review at all, but simply cited the previous registration of the pesticides proposed for use. That did not occur here; OCII has not cited the Police Code or the FTA guidance as a basis for foregoing analysis; rather, OCII used this guidance to determine whether the project's construction noise impacts would be significant.

- In *Protect the Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal.App.4th 1099, 1109, the court stated that an agency cannot cite compliance with a regulatory standard as a conclusive determination that the impact at issue will not be significant; if the record contains evidence that an impact may be significant, despite compliance with that threshold. Here, however, the regulatory standard addresses directly the impact at issue, and OCII applied a quantitative threshold in addition to the regulatory threshold to determine significance.

- *Oro Fino Gold Mining Corporation v. County of El Dorado* (1990) 225 Cal.App.3d 872, 881-882 stands for the proposition that an agency has discretion to prepare an EIR, rather than a negative declaration, even if the project complies with applicable noise standards. Here, OCII has prepared an EIR.

- *City of Antioch v. City Council of the City of Pittsburg* (1986) 187 Cal.App.3d 1325, 1331-1332 held the agency had to prepare an EIR, even though the road and infrastructure was already shown on the city's general plan. Here, OCII has not taken the position that, because the project is consistent with the Mission Bay Plan, no analysis is required.

- In *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 712-718, the agency erred by applying air district permitting rules as significance thresholds to the entire project, including those sources of pollutants that were not subject to these rules; the error, therefore, was in considering only part of the agency's emissions, and measuring them against an inapplicable standard. These factors are not present here.

OCII therefore concludes that it has acted within its discretion in relying on Appendix G of the CEQA Guidelines, as well as the Police Code, the Mission Bay Good Neighbor Policy, and FTA Guidance, to determine standards of significance for purposes of construction noise.

The comment suggests different thresholds of significance that, in the commenter's view, should have been used to assess the severity of construction noise impacts (e.g., World Health Organization standards). The commenter's disagreement over the methodology used in the SEIR is noted. However a lead agency is vested with discretion to choose the proper significance threshold and does not violate CEQA when it chooses to reject different thresholds proposed by a project opponent. (See *Citizens for Responsible Equitable Environmental Development v. City of Chula Vista* (2011) 197 Cal.App.4th 327, 335-336 ("*CREED*") [rejecting petitioners' argument that the City erred by not applying a different significance threshold]; C*alifornia Oak Foundation v. Regents of University of California* (2010) 188 Cal. App. 4th 227, 282 [rejecting petitioner's argument that a lead agency used the incorrect significance threshold in evaluating the biological significance of tree impacts]; *National Parks & Conservation Assn. v. County of Riverside* (1999) 71 Cal. App. 4th 1341, 1356-1357 [upholding a biological significance threshold used by Riverside County as supported by substantial evidence].)

With regard to the windows and building design of the Hearst tower residential units, as stated in UCSF's Long Range Development Plan EIR published in 2014, UCSF is not subject to local plans, policies, or ordinances whenever using land under its control in furtherance of its educational mission. However, it is UCSF policy to be consistent with such plans, policies or ordinances to the extent feasible. Consequently, it was entirely UCSF's discretion as to what building standards to apply to its residential hall. If windows are operable, it allows occupants the individual choice to control interior noise levels as they could be affected by existing roadway traffic on Third Street or nearby construction noise, whether it is from UCSF projects, other construction projects in Mission Bay, or the proposed project.

Issues Raised by Commenters: Operational Noise Thresholds (NOI-2b)

This response addresses all or part of the following comments, which are quoted below:

O-MBA9L3-4 O-MBA9L3-8

"For operational traffic noise, the DSEIR states:

> Traffic noise level significance is determined by comparing the increase in noise levels (traffic contribution only) to increments recognized by Caltrans as representing a perceptible increase in noise levels. Additionally, it is widely accepted methodology by both FTA18 and the Federal Interagency Committee on Noise (FICON)19 that thresholds should be more stringent for

> environments that are already noise impacted. Consequently, for noise environments where the ambient noise level is 65 dBA DNL or less, the significance threshold applied is an increase of 5 dBA or more, which Caltrans recognizes as a readily perceptible increase. In noise environments where the ambient noise level exceeds 65 dBA DNL, the significance threshold applied is an increase of 3 dBA or more, which Caltrans recognizes as a barely perceptible increase.

(DSEIR, p. 5.3-19.)

> Operational noise from non-transportation sources such as egress of patrons from events or sound amplification equipment in common areas are assessed based on noise increases of 8 dBA (for noise generated by commercial uses) over existing ambient (L90) levels and any applicable restrictions of the City's noise ordinance and Police Code. Although these operational noise increases would be of limited duration, they would be expected to occur throughout the life of the project and are therefore considered permanent changes in noise conditions.

(DSEIR, p. 5.3-19.)

> As described by Mr. Hubach, for operational noise impacts (Impact NO-5), the DSEIR uses a series of "ambient plus increment" thresholds. As discussed by Mr. Hubach, using "ambient plus increment" thresholds where existing noise levels are already high:
>
> > disregards the fact the Project will make severe conditions worse. In addition, using these "ambient plus increment" thresholds for operational noise results in an unsustainable gradual increase in ambient noise. It is a formula for ever-increasing noise levels because each new project establishes a new, higher, baseline; then when the next project is approved, the incremental change will be added to the new baseline.

(Exhibit 1, p. 5.)

"By ignoring the severity of existing noise levels and only looking to the "de minimis" nature of the Project's incremental effect, the DSEIR's noise impact determinations violate CEQA. (See *Communities for a Better Environment v. California Resources Agency* (2002) 103 Cal.App.4th 98, 120 ("*CBE*") ["[T]he relevant question"... is not how the effect of the project at issue compares to the preexisting cumulative effect, but whether "any additional amount" of effect should be considered significant in the context of the existing cumulative effect. [footnote omitted] In the end, the greater the existing environmental problems are, the lower the threshold should be for treating a project's contribution to cumulative impacts as significant. [footnote omitted]"].)[4] *Communities* and *Kings County* teach that the significance of a cumulative impact depends on the environmental setting in which it occurs, especially the severity of existing environmental harm.

Footnote:

[4] *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 720-21 ["They contend in assessing significance the EIR focuses upon the ratio between the project's impacts and the overall problem, contrary to the intent of CEQA.... We find the analysis used in the EIR and urged by GWF avoids analyzing the severity of the problem and allows the approval of projects which, when taken in isolation, appear insignificant, but when viewed together, appear startling. Under GWF's 'ratio' theory, the greater the overall problem, the less significance a project has in a cumulative impacts analysis. We conclude the standard for a cumulative impacts analysis is defined by the use of the term 'collectively significant' in Guidelines section 15355 and the analysis must assess the collective or combined effect of energy development"].)

(*Mission Bay Alliance, Lippe, letter, July 25, 2015 [O-MBA9L3-4]*)

"For Impact NO-1 and Impact NO-5, the DSEIR uses a threshold of significance of the "ambient plus increment" type. For Impact No-1, the "ambient plus increment" threshold of significance is whether the "the increase in noise levels over existing conditions would be less than 10 dBA." (DSEIR, p. 5.3-23.)

"This type of threshold discounts the significance or severity of pre-existing noise levels and treats them as if they are irrelevant to whether the incremental change caused by the Project is "significant." The DSEIR finds that "Peak cumulative construction activities would occur during a 3-month period in 2015–

2016 and during this time, the increase in noise levels over existing conditions would be less than 10 dBA (without mitigation). All other periods of construction would similarly be under 10 dBA. Therefore, this impact would be less than significant." (DSEIR, p. 5.3-23.)

"This conclusion is based on Table 5.3-8, which shows that all three receptors chosen for analysis have pre-existing ambient noise levels that are very loud already (i.e., Madrone Residential Tower is at 70.1 dBA (hourly Leq), Hearst Residential Tower is at 71.2 dBA (hourly Leq), and UCSF Hospital is at 67 dBA (hourly Leq).

"As a point of reference for these noise levels, the World Health Organization's (WHO) standards for harmful noise are much lower than these pre-existing noise levels. WHO's night-time standard for sleep disturbance inside bedrooms is 30 dBA, and outside bedrooms with "window open (outdoor values)" is 45 dBA. WHO's night-time and daytime standard for "speech intelligibility and moderate annoyance" for inside dwellings is 35 dBA. For outdoor living areas, WHO's daytime and evening standard for moderate annoyance is 50 dBA and for serious annoyance is 55 dBA.

"Another point of reference for the pre-exiting noise levels at the three "sensitive receptor locations" selected by the DSEIR is the San Francisco Noise Ordinance. As the DSEIR describes it, section 2909(d) provides "maximum noise levels at any sleeping or living room in any dwelling unit located on residential property must not exceed 45 dBA between 10:00 p.m. and 7:00 a.m., and 50 dBA between 7:00 a.m. and 10:00 p.m" where source of the noise is "fixed sources of noise, such as building mechanical equipment and industrial or commercial processing machinery." (DSEIR, pp. 5.3-13, 14.)

"The DSEIR does not use the WHO standards at all. With respect to the San Francisco Noise Ordinance, the DSEIR does not use the 45 dBA between 10:00 p.m. and 7:00 a.m., and 50 dBA between 7:00 a.m. and 10:00 p.m standard for any aspect of the Project's noise except the fixed machinery (e.g. generators) because the noise ordinance does not use this standard to regulate the Project's noise from construction equipment or operational noise from increased traffic, crowds, concerts, etc.[1]

"This approach may be useful to the City for Impacts NO-2 and NO-4, which assess the Project's consistency with other applicable plans and laws, but it does not makes sense for assessing the construction or operational impacts of the Project on actual people.

"Table 5.3-8 shows that all three receptors chosen for analysis will add construction noise to pre-existing ambient noise levels that already exceed the health and welfare based standards discussed above. As a result of construction operations (assuming all noise producing construction operations occur at the same time, noise levels at the Madrone Residential Tower will rise from 70.1 to 70.9 dBA (hourly Leq), at the Hearst Residential Tower from 71.2 to 80.8 dBA (hourly Leq), and at UCSF Hospital from 67 to 72.8 dBA (hourly Leq).

"The DSEIR's use of compliance with the San Francisco Noise Ordinance as a threshold for judging the significance of the Project's construction noise impacts (see DSEIR p. 5.3-17) appears to reflect a policy decision, because it is not based on science.

"The same is true of the DSEIR's use, for operational noise impacts, of a threshold of 8 dBA or 8 dBC above ambient noise, based on the San Francisco Noise Ordinance. (DSEIR, p. 5.3-13). The same is true of the DSEIR's use, for mobile sources of operational noise impacts, of "ambient plus increment" thresholds of significance:

> "Traffic noise level significance is determined by comparing the increase in noise levels (traffic contribution only) to increments recognized by Caltrans as representing a perceptible increase in noise levels. Additionally, it is widely accepted methodology by both FTA18 and the Federal Interagency Committee on Noise (FICON)19 that thresholds should be more stringent for environments that are already noise impacted. Consequently, for noise environments where the ambient noise level is 65 dBA DNL or less, the significance threshold applied is an increase of 5 dBA or more, which Caltrans recognizes as a readily perceptible increase. In noise environments where the ambient noise level exceeds 65 dBA DNL, the significance threshold applied is an increase of 3 dBA or more, which Caltrans recognizes as a barely perceptible increase."

(DSEIR, p. 5.3-17).

> "Consequently, for noise environments where the ambient noise level is 65 dBA DNL or less, the significance threshold applied is an increase of 5 dBA or more, which Caltrans recognizes as a readily perceptible increase. In noise environments where the ambient noise level exceeds 65 dBA DNL, the significance threshold applied is an increase of 3 dBA or more, which Caltrans recognizes as a barely perceptible increase."

(DSEIR, p 5.3-19)

"Using these "ambient plus increment" thresholds where existing noise levels are already too high, as shown in Tables 5.3-9 and 5.3-10 (DSEIR, pp. 5.3-34, 36), disregards the fact that the Project will make already severe conditions worse. In addition, using these "ambient plus increment" thresholds for operational noise results in an unsustainable gradual increase in ambient noise. It is a formula for ever-increasing noise levels because each new project establishes a new, higher, baseline; then when the next project is approved, the incremental change will be added to the new baseline.

"Therefore, the operational impact assessment needs to be redone using valid, science-based thresholds that relate to actual human health and welfare effects of noise.

"In my opinion, is the Project will cause a significant increase in Impact NO-1 and Impact NO-5 above levels existing without the project.

Footnote:

[1] The DSEIR states that: "The HUD regulations also include a goal (not a standard) that interior noise levels not exceed 45 dB DNL" (DSEIR, p. 5.3-9.) But HUD's goal of 45 DNL interior, is 10 dB greater than the 35 dB Leq level the DSEIR cites as a threshold for sleep disturbance (see DSEIR, 5.3-2), and 15 dB greater than the 30 dB Leq guideline given by WHO. noise, when added to background or ambient noise, exceeds these health and welfare based standards, the impact is significant even if the impact does not violate the San Francisco Police Code standard.

(*Mission Bay Alliance, Lippe, letter, July 25, 2015 [O-MBA9L3-8]*)

Response NOI-2b: Operational Noise Thresholds

These comments suggest that use of an ambient-plus-project increment significance threshold for operational traffic noise and operational noise from non-transportation sources is not appropriate because it will result in an unsustainable gradual increase in ambient noise. Commenter also suggests the World Health Organization (WHO) standards should be used as significance thresholds for project related noise, and states that the Noise Ordinance is an improper threshold for assessing construction noise impacts.

The commenter disagrees with the thresholds used to assess the construction noise impacts (Impact NO-1) and operational noise impacts from mobile sources (Impact NO-5). According to the commenter, these thresholds disregard the fact that the project will make already severe cumulative noise conditions worse. The commenter cites case law addressing CEQA's requirements for conducting cumulative analyses. Notably, however, Impacts NO-1 and NO-5 relate to project-level impacts, not cumulative impacts. Cumulative construction noise is analyzed in Impact C-NO-1 on page 5.3-39 to 5.3-41 of the SEIR, which concludes that "even though construction noise generated by the proposed project alone would not result in a significant noise impact, the proposed project's contribution to the cumulative noise impact from overlapping construction activities in the immediate project vicinity could be cumulatively considerable," however implementation of mitigation would reduce the project's contribution to cumulative construction noise impacts to a less than significant level. Cumulative operational noise from mobile sources is analyzed in

Impact C-NO-2, which concludes that operational noise impacts (primarily from increased traffic) would be less than significant along Third Street but would be significant and unavoidable along Illinois Street and along Mariposa Street during Saturday basketball events. In cases where a project's significant effects cannot be mitigated or avoided, an agency, after adopting proper findings, may nevertheless approve the project if it first adopts a statement of overriding considerations setting forth the specific reasons why the agency found that the "benefits of the project outweigh the significant effects on the environment." (Public Resources Code, Section 21081, sub. (b); *see also,* CEQA Guidelines, Sections 15093, 15043, sub.(b).) The determination regarding whether to adopt a statement of overriding considerations will be made by the decision-makers.

The above notwithstanding, existing-plus-project increment thresholds are appropriate to assess operational noise under CEQA in the Mission Bay Plan area for two reasons. The first reason is that CEQA Guidelines Appendix G identifies a noise impact criterion to address whether the proposed project would result in "exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies standard." As stated on page 5.3-13 of the SEIR, the noise ordinance limits for commercial and industrial properties (Section 2909(b)) provide that "no person shall produce or allow to be produced, a noise level more than 8 dBA above the local ambient level at the property plane." Consequently, the SEIR must consider operational noise impacts of commercial properties in terms of increased noise levels over existing ambient noise levels.

The second reason existing-plus-project increment thresholds are appropriate to assess operational noise under CEQA is because Appendix G of the CEQA Guidelines inquires whether the proposed project would result in a "substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project." Here CEQA suggests that an appropriate threshold to apply is an increase over existing ambient noise levels without the project but leaves the determination of the quantitative threshold to be applied at the discretion of the lead agency.

With regard to the potential for cumulative projects to successively increase ambient noise levels, this potential impact is assessed on pages 5.3-42 and 5.3-43 of the SEIR. Noise levels in the project area are predominantly the result of transportation sources. The assessment of cumulative traffic noise presented in Table 5.3-11 compares traffic noise generated by the project in addition to future traffic volumes generated by foreseeable development in the project vicinity to the existing ambient noise levels. If a significant cumulative noise level increase is predicted, an assessment is made to determine whether the project contribution is cumulatively considerable. As identified in Table 5.3-11, receptors along two roadways would experience cumulative roadway noise impacts resulting in a significant and unavoidable cumulative noise impact.

The comment states that for operational noise impacts (Impact NO-5), the SEIR improperly ignores the severity of existing noise levels by looking only at the project's incremental effect. This comment is incorrect. The SEIR assesses both project-level and cumulative noise impact analyses.

For the project level analysis, the SEIR describes existing noise levels in the area and explains the increase in noise levels that would be attributable to project-related activities. The SEIR then analyzes whether the increase in noise would be considered significant based on the described thresholds of significance. For example, regarding vehicular traffic noise, the SEIR explains that for noise environments where the ambient noise level is 65 dBA DNL or less, the applicable significance threshold is an increase of 5 dBA or more, which Caltrans recognizes as a readily perceptible increase. In noise environments where the ambient noise level exceeds 65 dBA DNL, the applicable significance threshold is an increase of 3 dBA or more, which Caltrans recognizes as a barely perceptible increase (SEIR, p. 5.3-32.). The SEIR then describes the potential for vehicular traffic noise to exceed these thresholds (SEIR, pp. 5.3-32 to 5.3-36). This analysis fulfills the requirements of CEQA. (*Mount Shasta Bioregional Ecology Center v. County of Siskiyou*, *supra*, 210 Cal.App.4th at pp. 210-216 [upholding analysis of cumulative noise impacts].) Furthermore, the SEIR discussion of Impact NO-5 does not mask potential significant noise impacts, as the comment suggests. Rather, the SEIR describes potential impacts in detail and acknowledges that noise levels generated by crowds and increases in roadway traffic noise would be significant and unavoidable even with implementation of the identified mitigation measures (SEIR, pp. 5.3-32 to 5.3-39).

The cumulative noise impact is addressed in Impact C-NO-2 on page 5.3-42 of the SEIR. Here, vehicular traffic noise is assessed from traffic data that include not only existing traffic volumes and those of the proposed project but also cumulative traffic increases as calculated by the transportation analysis. The cumulative transportation analysis was based on cumulative development and growth identified by the San Francisco County Transportation Authority SF-CHAMP travel demand model (see SEIR pp. 5.2-108 to 5.2-111), which includes, among other assumptions, the following developments described in Section 5.1.5 of the SEIR.

- University of California at San Francisco (UCSF), 2014 Long Range Development Plan (LRDP), Mission Bay Campus
- Eastern Neighborhoods Area Plans
- Seawall Lot 337 and Pier 48 Mixed-Use Project (Mission Rock Project)
- Pier 70 Mixed-Use Development

Roadway noise increases under the cumulative-with-project scenario were compared to existing roadway noise levels, and in this way, the noise impact analysis of the SEIR contained a conservative estimate of both project-level and cumulative noise impacts.

Please see Response NOI-2a above regarding the lead agency's ability to (1) select its own significance thresholds rather than the WHO standards suggested by commenter and (2) rely upon the Noise Ordinance as a significance threshold.

13.12.4 Methodology / Approach to Analysis (NOI-3)

Issues Raised by Commenters: Noise Impact Methodology (NOI-3a)

This response addresses all or part of the following comments, which are quoted below:

O-MBA9L3-6

"1. Does the DSEIR use a reliable methodology to determine the significance of Impact NO-1 and Impact NO-5.

"Impact NO-1 is "Construction of the proposed project would not cause a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project. (Less than Significant)." (DSEIR, pp. 5.3-20 to 5.3-23.)

"Impact NO-5 is "Operation of the proposed project would cause a substantial permanent increase in ambient noise levels in the project vicinity. (Significant and Unavoidable with Mitigation)." (DSEIR, pp. 5.3-32 to 5.3-39.)

"In my opinion the DSEIR does not use a reliable methodology to determine whether Impact NO-1 or NO-5 is significant." (*Mission Bay Alliance, Lippe, letter, July 25, 2015 [O-MBA9L3-6]*)

Response NOI-3a: Noise Impact Methodology

The methodologies for assessment of Impact NO-1 is discussed on pages 5.3-16 through 5.3-19 of the SEIR and are based on both (1) assessing consistency with the City's noise ordinance, and (2) adhering to limits on the absolute increase in construction noise over ambient levels, consistent with CEQA Guidelines Appendix G. OCII disagrees with the commenter's assertion that these are not reliable methodologies. .

Overall increases in construction noise were assessed using modeling techniques of the FHWA Road Construction Noise Model. Separate modeling runs were performed for each construction phase for multiple pieces of equipment associated with each phase, as provided by the project sponsor's contractor. Cumulative construction noise levels were then calculated for periods where one or more phases would overlap and are presented on Table 5.2-8 on page 5.3-23 of the SEIR.

The methodologies for assessment of Impact NO-5 are discussed on pages 5.3-16 through 5.3-19 of the SEIR. Traffic noise modeling was completed using the Federal Highway Administration Traffic Noise Model. Traffic noise level impact significance was determined by comparing the increase in noise levels (traffic contribution only) to increments recognized by Caltrans[1] as representing a perceptible increase in noise levels. Additionally, the analysis applied a widely

[1] Caltrans, *Technical Noise Supplement to the Traffic Noise Analysis Protocol*, September 2013, p. 2-44.

accepted methodology used by both FTA[2] and the Federal Interagency Committee on Noise (FICON)[3] that thresholds should be more stringent for environments that are already noise impacted. Consequently, a more stringent significance threshold of 3 dBA, which Caltrans recognizes as a barely perceptible increase, was applied for noise environments where the ambient noise level exceeds 65 dBA DNL, while in areas where the ambient noise level is 65 dBA DNL or less, the significance threshold applied is an increase of 5 dBA or more, which Caltrans recognizes as a readily perceptible increase. Substantial evidence supports the methodology applied in the SEIR. Potential impact from operational noise from non-transportation sources such as egress of patrons from events or sound amplification equipment in common areas are assessed based on noise increases of 8 dBA (for noise generated by commercial uses) over existing ambient (L_{90}) levels and applicable restrictions of the City's noise ordinance such as Article 1, Section 47.2 of the Police Code, which regulates the time of use of any sound amplifying equipment. Although these operational noise increases would be of limited duration, they would be expected to occur throughout the life of the project and are therefore considered permanent changes in noise conditions. This methodology of comparing resultant noise of a proposed source with the ambient (L_{90}) levels is recommended by the City of San Francisco in its recently published City-wide noise guidance for enforcement of its noise ordinance,[4] and OCII determined that this methodology is appropriate for the SEIR. Please see Response NOI-2a above regarding the agency's ability to rely upon the Noise Ordinance as a significance threshold.

Issues Raised by Commenters: Vibration Impact Methodology (NOI-3b)

This response addresses all or part of the following comments, which are quoted below:

O-MBA9L3-9

"2. Does the DSEIR use a reliable methodology to determine the significance of Impact NO-3?

"Impact NO-3 is "Construction of the proposed project would not expose people and structures to or generate excessive groundborne vibration levels. (Less than Significant)." (DSEIR, pp. 5.3-24 to 5.3-26.)

"In my opinion the DSEIR does not use a reliable methodology to determine whether Impact NO-3 is significant.

"The DSEIR omits important information about the environmental setting. In particular, the DSEIR acknowledges that "Sensitive receptors to vibration include ... vibration-sensitive equipment." (DSEIR, p. 5.3-8.) But the DSEIR does not provide any evidence relating to the use of such equipment in the vicinity. Such information should include the type of equipment, the purpose of its use, its degree of sensitivity, and its distance from Project related sources of vibration.

---

2 U.S. Department of Transportation, Federal Transit Administration (FTA), Transit Noise and Vibration Impact Assessment, May 2006.

3 Federal Interagency Committee on Noise, Federal Agency Review of Selected Airport Noise Analysis Issues, August 1992.

4 City of San Francisco, *San Francisco Police Code Article 29: Regulation of Noise Guidelines for Noise Control Ordinance Monitoring and Enforcement*, December 2014.

"In its impact assessment, the DSEIR inexplicably excludes also the users of vibration sensitive equipment from the category of sensitive receptors, and based on this policy decision, concludes that construction vibration effects are not significant, stating:

> "As discussed in the 1998 FSEIR, construction vibration effects on sensitive equipment would be a concern for users of research buildings and could be an inconvenience. However, these users are not considered sensitive receptors, and therefore, construction vibration effects are not considered a significant environmental effect under CEQA."

(DSEIR, p. 5.3-25.)

"Since UCSF is a "research hospital" is it safe to assume that scanning electron-beam microscopes are used by researchers and pathologists. These devices are extremely sensitive to low level vibration. It is common for them to have environmental criteria specifically for vibration. If the specified vibration levels are exceeded the image will blur rendering the instrument useless. Therefore, in my opinion, the DSEIR should include users of vibration-sensitive equipment in the category of sensitive receptors, and then assess the Project's impact on the users.

"For "Human annoyance" from groundborne vibration, the DSEIR uses a threshold of significance of : "For adverse human reaction, this analysis applies the "strongly perceptible" threshold of 0.1 inches per second PPV." (DSEIR, p. 5.3-25.) In my opinion, this threshold should be "perceptible, not "strongly perceptible."

"In applying its "strongly perceptible" threshold, the DSEIR says:

> "The closest residence would be the UCSF Mission Bay Housing (Hearst Tower), approximately 200 feet from the project site while the nearest hospital would be approximately 560 feet away. A recent study of vibration induced by rapid impact compaction indicated that at a distance of 30 meters (100 feet), cumulative vibration energy results in maximum vibration level of 2.3 millimeters per second (0.09 inches per second). Because sensitive land uses would be more than 100 feet away, worst-case cumulative vibration levels generated by rapid impact compaction would be below the strongly perceptible threshold."

(DSEIR, p. 5.3- 25.)

"In my opinion, this conclusion is incorrect because the DSEIR's calculation of vibration does take into account the increased vibration on upper floors of this building. Soil attenuation varies with the type of soil and moisture content, and distance attenuation from 100 to 200 feet may only be a factor of 0.5, or less. Accordingly, actual PPV at the Hearst Tower is likely to be 0.045 ips, or considerably greater depending on site-specific parameters. In addition, the DSEIR's calculation does not take into account building resonance effects for above-grade floors which amplify vibration at certain frequencies. Recalculating to take this factor into account indicates vibration on upper floors would certainly be "perceptible" and likely "strongly perceptible."

> Alternate Calculation:
>
> rapid impact compaction - 0.09 ips PPV @100 feet
> distance attenuation factor - x 0.5 from 100 to 200 feet
> rapid impact compaction - 0.045 ips PPV @200 feet
> soil attenuation variation - x 2 (6 dB) ground floor
> result at Hearst Tower - 0.09 ips PPV @100 feet
> resonant amplification - x 3 (10 dB)
> result at Hearst Tower - 0.27 ips PPV upper floors
> criterion for humans - 0.1 ips PPV "strongly perceptible"

"In my opinion, the Project likely to cause a significant increase in Impact NO-3 above levels existing without the project, particularly when compaction is occurring during construction." (*Mission Bay Alliance, Lippe, letter, July 25, 2015 [O-MBA9L3-9]*)

Response NOI-3b: Vibration Impact Methodology

The commenter's opinion that the vibration threshold for adverse human reaction should be "perceptible" and not "strongly perceptible" is acknowledged. However, given that the previously proposed rapid impact compaction would have been a temporary activity conducted during daytime hours and not during sleep-sensitive hours, the less stringent threshold was applied to this activity for the determination of a "significant" effect. As explained above, moreover, rapid impact compaction is no longer a proposed method of construction so the main source of construction-related vibration has been eliminated from the project, and the vibration impact would be less than significant regardless of which threshold is applied. (See Chapter 12, Project Refinements and New Variant.)

The methodology used in the assessment of vibration-related construction impacts in the SEIR was appropriate and used the published General Assessment[5] methodology of the FTA in its document *Transit Noise and Vibration Impact Assessment* for calculation of the magnitude of construction-related vibration impacts. This document states that the purpose of the General Assessment is to provide a relatively simple method of developing estimates of the overall levels of ground-borne vibration that can be compared to acceptability criteria. The methodology thus serves as an appropriate screening-level analysis that provides a sufficient level of detail for the environmental impact assessment. If the General Assessment method identifies potential exceedance of applicable criteria then a more detailed analysis may be undertaken.

As described in SEIR Chapter 12, Project Refinements and New Variant, the project sponsor no longer proposes to use rapid impact compaction as a method of construction which, as described on page 5.3-25 of the SEIR, would have resulted in vibration levels of 0.09 inches per second at 100 feet. Consequently, with the proposed project refinements, there would be no substantial vibration-inducing construction activity at the project site. Other standard construction equipment proposed, such as bulldozers and drill rigs, generate much more modest vibration levels on the order of 0.089 inches per second at 25 feet, which would be further reduced to 0.01 inches per second at the nearest structure, approximately 100 feet away, and would not be perceptible, based on Caltrans criteria.[6] Vibration levels from this equipment at the UCSF hospital, approximately 560 feet away, would be reduced to below 50 VdB (0.0015 inches per second) and would not be expected to interfere with vibration-sensitive equipment, were it considered to be an environmental impact.

Please see Response NOI-2a above regarding the lead agency's ability to select project-specific significance thresholds.

5 The general level of assessment, as described in the FTA Guidance, is an extension of the screening procedure. It uses generalized data to develop a curve of vibration level as a function of distance.

6 Caltrans, Transportation and Construction vibration Guidance Manual, September 2013, Page 21.

13.12.5 Construction Noise Impacts (NOI-4)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

A-UCSF-18 O-MBA9L3-3

"Page 5.3-41, the DEIR provides that construction-related vehicles and equipment will be required to use designated truck routes to travel to and from the project site, as determined in consultation with the SFMT A. UCSF requests that truck routes be designated in consultation and coordination with UCSF and other nearby developers." (*University of California San Francisco, Lori Yamauchi, letter, July 27, 2015 [A-UCSF-18]*)

"(DSEIR, p. 5.3-10.) DSEIR does not tell us what buildings in area comply with this code. (See DSEIR § 5.3.3.4 [Sensitive Receptors], and Table 5.3-4.) However, as Mr. Hubach observes:

> Table 5.3-8 shows that all three receptors chosen for analysis will add construction noise to pre-existing ambient noise levels that already exceed the health and welfare based standards discussed above. As a result of construction operations (assuming all noise producing construction operations occur at the same time, noise levels at the Madrone Residential Tower will rise from 70.1 to 70.9 dBA (hourly Leq), at the Hearst Residential Tower from 71.2 to 80.8 dBA (hourly Leq), and at UCSF Hospital from 67 to 72.8 dBA (hourly Leq).

"(Exhibit 1, p. 4.) Since the Project's noise, when added to background or ambient noise, exceeds the above health and welfare based standards, the impact is significant even if the impact does not violate the San Francisco Police Code." (*Mission Bay Alliance, Thomas Lippe, letter, July 25, 2015 [O-MBA9L3-3]*)

Response NOI-4: Construction Noise/Truck Route Impacts

Construction Truck Routes

Construction truck routes are discussed on page 5.2-114 of the SEIR. Access from I-280 northbound would be via the I-280 off-ramp at the intersection of Mariposa/ Owens, continuing on Mariposa Street to Third Street or Terry A. Francois Boulevard, then to 16th Street or South Street, or from the off-ramp continuing on the new Owens Street segment to 16th Street. Alternately, trucks would exit I-280 northbound at the Cesar Chavez Street, and continue north on Third Street to 16th Street, Terry A. Francois Boulevard, and South Street.

Access to I-280 southbound would be via South Street, Third Street, 16th Street, to the new Owens Street segment and onto the on-ramp, or Third Street to Mariposa Street to the I-280 on-ramp at Owens Street. Alternately, trucks could access the I-280 southbound via South Street, Third Street, 25th Street, to the on-ramp at Pennsylvania Street. Access from I-80 westbound would be via the Eighth Street off-ramp at Harrison Street, continuing on Eighth Street, Bryant Street, and Seventh Street to 16th Street. Access to I-80 eastbound would be via South Street, Third Street, 16th Street, Seventh Street, Bryant Street to the on-ramp at Fifth Street. Truck access routes have been established by SFMTA and are not within the purview of the project sponsor. If the project sponsor

proposes a street closure in order to perform construction, the SFMTA Construction Regulations (https://www.sfmta.com/services/streets-sidewalks/construction-regulations) must be adhered to. In addition, SFMTA operates its Interdepartmental Staff Committee on Traffic and Transportation (ISCOTT) that meets approximately twice a month to discuss proposed temporary street closures for special events including street fairs, athletic events and neighborhood block parties. These meetings are open to the public.

As stated on page 5.3-22 of the SEIR, while truck trips would increase hourly noise levels on Third Street, Mariposa Street, and Caesar Chavez Street, the addition of 40 heavy duty truck trips to the existing peak hour traffic would increase traffic noise contributions by 2.3 dBA along Third Street during peak excavation activities. This would be a *less than significant* contribution to roadway noise levels.

Construction Noise

As indicated in Table 5.3-8 of the SEIR (p. 5.3-23), concurrent construction activities could result in increased noise levels at the nearest sensitive receptors. The maximum estimated increase at any receptor is approximately 9.6 dBA. As described in Chapter 12, Project Refinements and New Variant, rapid impact compaction is no longer a proposed method of construction, which would reduce this worst-case predicted increase to about 9.2 dBA. Such an increase would be noticeable—not an uncommon occurrence in an urban area when construction activity is ongoing. However, construction activity would be limited to daytime hours and would not exceed OCII's criteria for a significant impact. Therefore, on the basis of the established methodology for construction noise impacts as discussed in Response NOI-2a, above, Impact NO-1 was determined to be less than significant. Nevertheless, the SEIR does identify a significant cumulative noise impact from construction of the project in combination with other construction activities in the vicinity during the same period, and identifies Mitigation Measure M-C-NO-1: Construction Noise Control Measures to address construction noise, the implementation of which would reduce the severity of construction noise impacts.

13.12.6 Vibration Impacts (NOI-5)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

A-UCSF-16	O-Fibrogen-1	O-MBA7S2-17	O-MBA7S2-65
O-MBA9L3-5	O-MBA9L3-9	I-Schreiner-1	

"When UCSF planned and developed a large student housing complex along Third Street in 2002, it relied on the zoning districts in the South Plan, which called for commercial/industrial uses on adjacent blocks such as Blocks 29-32. Those uses would be primarily daytime uses, not uses that would disgorge up to 18,000 people after 10:00 p.m. on more than 100 days per year.

"Page 5.3-26, Improvement Measure I-N0-3. UCSF requests that this measure be modified to expand the distance for notification of owners and occupants to include all occupants of the UCSF Medical Center at

Mission Bay and the student housing on Third Street." (*University of California San Francisco, Lori Yamauchi, letter, July 27, 2015 [A-UCSF-16]*)

"Vibrations from pile driving can also create additional risks, which have not been analyzed for this Project." (Karp Geotech, p. 6.) (*Mission Bay Alliance, Soluri Meserve, letter, July 26, 2015 [O-MBA7S2-17]*)

"Vibrations During Construction

"Driving displacement piles causes noise and vibrations from impact that are transferred though dense sub grade materials to nearby structures. As the configuration of the proposed arena will likely be circular or elliptical and vibrations, particularly driving those at the western side of the project, would likely affect the UCSF Medical Center building at 1650 3rd Street. Prior to project approval, an indicator pile test program must be implemented to monitor vibrations and verify the suitability of the intended foundation system for the area.

"Drilling and casting-in-place reinforced concrete shafts, if feasible to required depths, may be an appropriate suitable alternative to driven piles. As noted below for shoring, shafts are augered and spoils removed through casing contained in the rig that is withdrawn as concrete is placed. Using tremie methods, concrete displaces water in the hole so it rises and is pumped out with low groundwater loss. Before the project is approved, a test program should be implemented to ascertain the feasibility of using cast-in-place piles or where appropriate, a combination of drilled and driven piles." (*Mission Bay Alliance, Soluri Meserve, letter, July 26, 2015 [O-MBA7S2-65]*)

"With respect to vibration impacts, as Mr. Hubach states:

> The DSEIR omits important information about the environmental setting. In particular, the DSEIR acknowledges that "Sensitive receptors to vibration include ... vibration-sensitive equipment." (DSEIR, p. 5.3-8.) But the DSEIR does not provide any evidence relating to the use of such equipment in the vicinity. Such information should include the type of equipment, the purpose of its use, its degree of sensitivity, and its distance from Project related sources of vibration.
>
> In its impact assessment, the DSEIR inexplicably excludes also the users of vibration sensitive equipment from the category of sensitive receptors, and based on this policy decision, concludes that construction vibration effects are not significant, stating:
>
> "As discussed in the 1998 FSEIR, construction vibration effects on sensitive equipment would be a concern for users of research buildings and could be an inconvenience. However, these users are not considered sensitive receptors, and therefore, construction vibration effects are not considered a significant environmental effect under CEQA." (DSEIR, p. 5.3-25.)

"The DSEIR cannot omit an analysis of potentially significant effects by the simple expedient of arbitrarily defining the receptors of such effects as non-sensitive." (*Mission Bay Alliance, Lippe, letter, July 25, 2015 [O-MBA9L3-5]*)

"2. Does the DSEIR use a reliable methodology to determine the significance of Impact NO-3?

"Impact NO-3 is "Construction of the proposed project would not expose people and structures to or generate excessive groundborne vibration levels. (Less than Significant)." (DSEIR, pp. 5.3-24 to 5.3-26.)

"In my opinion the DSEIR does not use a reliable methodology to determine whether Impact NO-3 is significant.

"The DSEIR omits important information about the environmental setting. In particular, the DSEIR acknowledges that "Sensitive receptors to vibration include ... vibration-sensitive equipment." (DSEIR, p. 5.3-8.) But the DSEIR does not provide any evidence relating to the use of such equipment in the vicinity. Such information should include the type of equipment, the purpose of its use, its degree of sensitivity, and its distance from Project related sources of vibration.

"In its impact assessment, the DSEIR inexplicably excludes also the users of vibration sensitive equipment from the category of sensitive receptors, and based on this policy decision, concludes that construction vibration effects are not significant, stating:

> "As discussed in the 1998 FSEIR, construction vibration effects on sensitive equipment would be a concern for users of research buildings and could be an inconvenience. However, these users are not considered sensitive receptors, and therefore, construction vibration effects are not considered a significant environmental effect under CEQA."

(DSEIR, p. 5.3-25.)

"Since UCSF is a "research hospital" is it safe to assume that scanning electron-beam microscopes are used by researchers and pathologists. These devices are extremely sensitive to low level vibration. It is common for them to have environmental criteria specifically for vibration. If the specified vibration levels are exceeded the image will blur rendering the instrument useless. Therefore, in my opinion, the DSEIR should include users of vibration-sensitive equipment in the category of sensitive receptors, and then assess the Project's impact on the users.

"For "Human annoyance" from groundborne vibration, the DSEIR uses a threshold of significance of : "For adverse human reaction, this analysis applies the "strongly perceptible" threshold of 0.1 inches per second PPV." (DSEIR, p. 5.3-25.) In my opinion, this threshold should be "perceptible, not "strongly perceptible."

"In applying its "strongly perceptible" threshold, the DSEIR says:

> "The closest residence would be the UCSF Mission Bay Housing (Hearst Tower), approximately 200 feet from the project site while the nearest hospital would be approximately 560 feet away. A recent study of vibration induced by rapid impact compaction indicated that at a distance of 30 meters (100 feet), cumulative vibration energy results in maximum vibration level of 2.3 millimeters per second (0.09 inches per second). Because sensitive land uses would be more than 100 feet away, worst-case cumulative vibration levels generated by rapid impact compaction would be below the strongly perceptible threshold."

(DSEIR, p. 5.3- 25.)

"In my opinion, this conclusion is incorrect because the DSEIR's calculation of vibration does take into account the increased vibration on upper floors of this building. Soil attenuation varies with the type of soil and moisture content, and distance attenuation from 100 to 200 feet may only be a factor of 0.5, or less. Accordingly, actual PPV at the Hearst Tower is likely to be 0.045 ips, or considerably greater depending on site-specific parameters. In addition, the DSEIR's calculation does not take into account building resonance effects for above-grade floors which amplify vibration at certain frequencies. Recalculating to take this factor into account indicates vibration on upper floors would certainly be "perceptible" and likely "strongly perceptible."

> Alternate Calculation:
>
> rapid impact compaction - 0.09 ips PPV @100 feet
> distance attenuation factor - x 0.5 from 100 to 200 feet
> rapid impact compaction - 0.045 ips PPV @200 feet
> soil attenuation variation - x 2 (6 dB) ground floor
> result at Hearst Tower - 0.09 ips PPV @100 feet
> resonant amplification - x 3 (10 dB)
> result at Hearst Tower - 0.27 ips PPV upper floors
> criterion for humans - 0.1 ips PPV "strongly perceptible"

"In my opinion, the Project likely to cause a significant increase in Impact NO-3 above levels existing without the project, particularly when compaction is occurring during construction." (*Mission Bay Alliance, Lippe, letter, July 25, 2015 [O-MBA9L3-9]*)

"We are reading through the Warrior's DEIR and encountering major heartburn with the noise and vibration analysis and mitigation. First, we see continuing reference to the MB Good Neighbor Policy and the SFEIR for MB completed in 1998. None of us in the MB life science community have seen those documents much less participated in the development of same. Life science and specifically sophistication of instrumentation and evolution of preclinical work has changed dramatically since 1998.

"Could you please forward a copies of at least the Good Neighbor Policy as soon as is possible." (*FibroGen, Catherine Sharpe, email, July 6, 2016 [O-Fibrogen-1]*)

"The following statement is provided in addition and as complementary information to the comments provided to you by Tom Lippe (Law Offices of Thomas N. Lippe APC, 201 Mission St., 12th Floor, San Francisco, CA 94105) on behalf of the Mission Bay Alliance regarding the Warriors Arena Project.

"Surveying the vibration-sensitive equipments that are mostly used at the UCSF Mission Bay (MB) by members of the Neuroscience research community, there appear to be two groups of equipment that fall under different criteria when considering vibration design/tolerance features for buildings (according to the ASHRAE Handbook).

"The main category (VC-B) relevant for MB includes: Microsurgery, eye surgery, neurosurgery; bench microscopes greater than 400x magnification; optical equipment on isolation tables such as two-photon microscopes. Tolerance vibration velocities (in microns/sec) are indicated as the yellow line in the two attached figures from a study in another building (not at MB but relevant as general reference for vibration-sensitive equipment used here). Acceptable values for vibration velocities above 8Hz vibration frequencies are 25 microns/sec (max) and up to 50 microns/sec for lower frequencies, especially those in the range of walking-induced vibrations (~2Hz). Actual values of measurements should fall below those lines (as in the example measurement in the second slide; again not made at MB) for equipment to work error free.

"The next category (VC-C) deals with ultrahigh vibration requirements (< 6 microns/sec Max.) for electron microscopes (TEMs, SEMs). However, I did not hear from any of the Neuroscience faculty whether those currently are in use.

"The EIR considers vibration-sensitive equipment not to be 'sensitive receptors' but we would disagree with that since those pieces of equipment are indispensable for performing our research, largely supported by the National Institute of Healths. The EIR indicates that, during construction, research buildings may experience vibration velocities that exceed 0.008 in/s (or 203.2 microns/s), 5 to10-fold the values considered acceptable for operating the equipment (although the affected vibration frequency range is not indicated). Additionally, the EIR does not indicate by how much those velocities may be exceeded. Without a more thorough assessment of the potential vibration levels and spectra to be expected during construction and usage of the facility the impact on vibration-sensitive equipment is not possible. Even from the few points mentioned in the EIR it appears that vibration levels would be significantly above the VC-B criteria and, thus, may constitute intolerable interference with ongoing research or medical practice." (*Christopher Schreiner, email, July 27, 2015 [I-Schreiner-1]*)

Response NOI-5: Vibration Impacts

As described in Chapter 12, Project Refinements and New Variant, rapid impact compaction is no longer a proposed method of construction. Piles would be installed using drilling and cast-in-place techniques. Impact or vibratory pile driving are not proposed construction techniques. Other standard construction equipment proposed, such as bulldozers and drill rigs, generate much more modest vibration levels on the order of 0.089 inches per second at 25 feet, which would be further reduced to 0.01 inches per second at the nearest structure, approximately 100 feet away, and would not be perceptible, based on Caltrans criteria.[7] Consequently, there would be no substantial vibration-inducing construction activity at the project site.

In response to Comment A-UCSF-16 regarding Improvement Measure I-NO-3, Neighbor Notification of Vibration-Inducing Construction Activities, this measure is no longer required as the activity of concern, rapid impact compaction, is no longer proposed.

Comment O-MBA7S2-17 asserts that the SEIR does not analyze additional risks from vibrations from pile driving. As stated on page 5.3-20 of the SEIR, piles would be cast in place into augured holes and would not require use of an impact or vibratory pile driver. Consequently, there would be no noise or vibration impacts from pile driving associated with the proposed project, and the indicator pile test program suggested by the commenter is not warranted.

Vibration effects to sensitive equipment were discussed on page V.G-32 of the 1998 FSEIR, which concludes that "because construction vibration effects on sensitive equipment would be a concern for future users of research buildings, rather than a physical impact on people or the environment, it could be an inconvenience but would not be a significant environmental effect."

The commenter's opinion that the vibration threshold for adverse human reaction should be "perceptible" and not "strongly perceptible" is acknowledged. However, given that the previously proposed rapid impact compaction would have been a temporary activity conducted during daytime hours and not during sleep-sensitive hours, the less stringent threshold was applied to this activity for the determination of a "significant" effect.

Please see Response NOI-3b above regarding vibration impact assessment methodologies.

The Mission Bay Good Neighbor Policy is described on SEIR page 5.3-23 and was forwarded to the requesting commenter, as described in Section 13.3, Response ERP-3.

[7] Caltrans, Transportation and Construction vibration Guidance Manual, September 2013, Page 21.

13.12.7 Crowd Noise (NOI-6)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

A-UCSF-17 I-Cehand-1 I-Jones-2

"Pages 5.3-37 through 5.3-38, the DEIR indicates that the excessive noise would occur at the northbound Muni line platform adjacent to the UCSF student housing building on up to 105 evenings following basketball games, concerts and other major events. To address this impact, the DEIR indicates that the project sponsor will urge patrons to respect the quiet of the neighborhood as they leave the area and provide to all interested neighbors a contact agency and phone number that would be prepared to respond to complaints. We respectfully request that GSW and the City devise more effective mitigation measures to address this significant impact.

"The land uses most affected are the UCSF Mission Bay Housing units on Block 20 that front onto Third Street and onto Gene Friend Way. These buildings have no air conditioning and rely on a passive ducting system for ventilation when windows are closed for noise control. At the time these structures were built, it was anticipated that adjacent development would consist of biotechnology or office uses. It was not anticipated that an arena and event center with over 200 events per year would be proposed directly across the street, of which up to 150 large events would generate crowd noise that, according to the DEIR, would be significant and unavoidable due to "the increase in noise levels from crowds gathering at the Muni T-line platform during quieter nighttime periods". The significant and unavoidable impact of crowd noise on the UCSF Mission Bay Housing complex would most acutely affect those units in Hearst Tower which contain bedrooms that face Third Street or Gene Friend Way (83 units), those units in the South Building which contain bedrooms that face Gene Friend Way (63 units), and those units in the North Building which contain bedrooms that face Third Street (18 units). For these reasons, UCSF requests that the following mitigation measure be included in the Final EIR:

> To minimize the effect of crowd noise on nearby sensitive receptors at the UCSF Mission Bay Housing complex, the project sponsor will evaluate and implement feasible noise control measures to limit the significant increase in noise affecting the existing UCSF Mission Bay Housing complex on Block 20. The noise control measures will be submitted to the City for review and approval, and following City approval, will be implemented to reduce the significant and unavoidable noise impacts affecting UCSF Mission Bay Housing on Block 20." (*University of California San Francisco, Lori Yamauchi, letter, July 27, 2015 [A-UCSF-17]*)

"• Noise- Intoxicated people being loud outside after games- after 10 pm and weeknights." (*Jadine Cehand, email, June 30, 2015 [I-Cehand-1]*)

"Sports games tend to attract a loud and rowdy crowd, which can be aggressive and sometimes violent." (*Jackie Jones, email, July 1, 2015 [I-Jones-2]*)

Response NOI-6: Crowd Noise

These comments express concerns associated with crowd noise, and one comment requests additional mitigation measures to address crowd noise at the MUNI platform.

As discussed on page 5.3-38 of the SEIR, the project sponsor, as part of its site management practices, would implement the San Francisco Entertainment Commission's Good Neighbor Policy for nighttime entertainment activities, urging patrons to respect the quiet of the neighborhood as they leave the area and providing a phone number to all interested neighbors to respond to complaints.

The project sponsor must apply to the Entertainment Commission for an entertainment permit through a formal process as discussed on page 5.3-15 of the SEIR. Police Code Sections 1060.5(g) and 1060.31 require that all Places of Entertainment have a Security Plan approved by the Entertainment Commission Director or the Commission and that a condition of approval of a Place of Entertainment permit include a Security Plan. A Security Plan is defined in Police Code Section 1060(n) as including, among other things "providing for the orderly dispersal of individuals and traffic from the premises of the Business and within 100 feet of any door that patrons use to enter or exit the premises", as well as mandating certain ratios of Security Guards to the number of patrons. In addition to the Security Plan, the Entertainment Commission permit could include such conditions as:

1. Notices shall be well-lit and prominently displayed at all entrances to and exits from the establishment urging patrons to leave the establishment and neighborhood in a quiet, peaceful and orderly fashion and to please not litter or block driveways in the neighborhood.

2. Employees of the establishment shall be posted at all entrances and exits to the establishment during the period from 10:00 p.m. to such time past closing that all patrons have left the premises. These employees shall insure that patrons waiting to enter the establishment and those exiting the premises are urged to respect the quiet and cleanliness of the neighborhood as they walk to their parked vehicle or otherwise leave the area.

Further, Police Code Section 1060.20.1(a) provides a procedure for suspension of Entertainment Permits by the Entertainment Commission where the Permittee has operated the Business "[i]n a manner that has harmed the public health, safety or welfare by significantly increasing pedestrian congestion, the incidence of disorderly conduct, or the level of noise in the area in which the premises are located…" and where the Permittee has refused or failed, upon request of the Police Department, Entertainment Commission or the Director to take reasonable steps to alleviate the conditions.

Further, the Entertainment Commission encourages public outreach before issuing a permit, and the hearing requirement for issuing a permit would afford UCSF and other neighbors the opportunity to provide input into the development of permit conditions to address noise impacts that may occur during pre- and post-event crowd ingress and egress either in writing during the 30-day notice period or in person at the hearing. UCSF and neighbors would also have the opportunity to participate in the procedures pertaining to complaints, enforcement and

suspension of permits if the Event Center were to operate in violation of the standards set forth in the conditions established in its place of entertainment permit. Therefore, given this already established process for UCSF to participate in the development of feasible noise control measures as part of the Entertainment Commission's permit process, the addition of the mitigation measure requested by the commenter is not warranted.

It should be noted that, as part of the new Muni UCSF/Mission Bay Station Variant, the existing northbound and southbound passenger platforms at the UCSF/Mission Bay light rail stops would be removed and replaced with a single center platform to accommodate both northbound and southbound light rail service passengers. The station would be located in the general location of the existing UCSF/Mission Bay Station southbound platform in front of UCSF hospital. Please see Section 12.4 of the RTC. As described in Section 12.4, the new station would be located approximately 300 feet further south of the UCSF Hearst Tower housing complex. Further, UCSF hospital does not contain operable windows and is, therefore, less sensitive to noise.

However, the noise impact remains significant and unavoidable with mitigation.

13.13.2 Significance Thresholds (AQ-1)

Issues Raised by Commenters: Lead Agency's Use of BAAQMD Thresholds (AQ-1a)

This response addresses all or part of the following comments, which are quoted below:

O-MBA8L2-3 O-MBA8L2-6 O-MBA8L2-23

———————————

"B. Criteria air pollutants: the DSEIR's impact assessment for construction and operational criteria air pollutants is based on legal errors and not supported by substantial evidence.

1. The City cannot use the DSEIR's thresholds of significance for criteria air pollutants until it formally adopts them in a rule--making procedure.

The DSEIR's thresholds of significance are:

For the impacts analyzed in this section, the project would have a significant impact related to air quality if it were to:

- Conflict with or obstruct implementation of the applicable air quality plan;
- Violate any air quality standard or contribute substantially to an existing or projected air quality violation;
- Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is in nonattainment under an applicable federal or state ambient air quality standard (including releasing emissions that exceed quantitative thresholds for ozone precursors);
- Expose sensitive receptors to substantial pollutant concentrations; or
- Result in a cumulative air quality impact in combination with past, present and reasonably foreseeable future projects in the vicinity.

(DSEIR 5.4-23.)

For criteria pollutants, the DSEIR uses numerical thresholds of significance borrowed from the Bay Area Air Quality Management District ("BAAQMD") for ROG (54 lbs/day); NOx (54 lbs/day); Exhaust PM10 (82 lbs/day); Exhaust PM2.5 (54 lbs/day).

> The potential for a project to result in a cumulatively considerable net increase in criteria air pollutants that may contribute to an existing or projected air quality violation is based on the State and federal Clean Air Acts emissions limits for stationary sources. To ensure that new stationary sources do not cause or contribute to a violation of an air quality standard, BAAQMD Regulation 2, Rule 2 requires that any new source that emits criteria air pollutants above a specified emissions limit must offset those emissions. For ozone precursors ROG and NOx, the offset emissions level is an annual average of 10 tons per year (or 54 pounds (lbs.) per day). These levels represent emissions below which new sources are not anticipated to contribute to an air quality violation or result in a considerable net increase in criteria air pollutants that could result in increased health effects.

(DSEIR p. 5.4-25; see also p. 5.4-31.)

The City uses these numerical thresholds of significance for virtually all land use development projects in the city that require CEQA review. This is shown by the following sample of excerpts from recent Environmental Impacts Reports and Negative Declarations attached hereto as Exhibits 4 through 16. All of them use the BAAQMD numbers as the thresholds of significance for these pollutants.

Therefore, the City is required to undertake its own rule-making proceeding to adopt these thresholds as its own and determine in a public process that they are supported by substantial evidence.

> (b) Thresholds of significance to be adopted for general use as part of the lead agency's environmental review process must be adopted by ordinance, resolution, rule, or regulation, and developed through a public review process and be supported by substantial evidence.
>
> (c) When adopting thresholds of significance, a lead agency may consider thresholds of significance previously adopted or recommended by other public agencies or recommended by experts, provided the decision of the lead agency to adopt such thresholds is supported by substantial evidence.

(CEQA Guideline, § 15064.7.) Since the City has not formally adopted the air quality significance thresholds in a public process supported by substantial evidence, it cannot use these thresholds on an ad hoc basis as it has done in this EIR." (*Mission Bay Alliance, Thomas Lippe, letter, July 26, 2015 [O-MBA8L2-3]*)

"The DSEIR's use of the BAAQMD thresholds of significance is erroneous as a matter of law for several other reasons.[4] The DSEIR cannot merely reference a project's compliance with another agency's regulations. Lead agencies must conduct their own fact-based analysis of project impacts, regardless of whether the project complies with other regulatory standards. The DSEIR uses BAAQMD's thresholds of significance uncritically, without any factual analysis of its own, in violation of CEQA.[5] This uncritical application of the BAAQMD's thresholds of significance represents a failure of the City to exercise its independent judgment in preparing the DSEIR.[6] Just as disagreement from another agency does not deprive a lead agency of discretion under CEQA to judge whether substantial evidence supports its conclusions,[7] agreement from another agency does not relieve a lead agency of separately discharging its obligations under CEQA. The BAAQMD CEQA Guidelines do not provide any factual explanation as to why the 54 lbs. per day standard represents an appropriate threshold for judging the significance of project-level ozone pollution impacts. More importantly, the DSEIR also fails to include any such explanation, and is therefore inadequate as a matter of law.[8] It is well-settled that compliance with other regulatory standards cannot be used under CEQA as a basis for finding that a project's effects are insignificant, nor can it substitute for a fact-based analysis of those effects.[9]

"Also, the DSEIR's reliance on information not contained in the DSEIR for purposes of showing these thresholds are supported by substantial evidence violates CEQA's informational requirements. (*Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal.3d 376, 405 ["whatever is required to be considered in an EIR must be in that formal report; what any official might have known from other writings or oral presentations cannot supply what is lacking in the report"]; *Vineyard Area Citizens for Responsible Growth, Inc. v. City of Rancho Cordova* (2007) 40 Cal.4th 412, 442 ["[I]nformation 'scattered here and there in EIR appendices' or a report 'buried in an appendix,' is not a substitute for 'a good faith reasoned analysis'"], 443 ["The audience to whom an EIR must communicate is not the reviewing court but the public and the government officials deciding on the project. That a party's briefs to the court may explain or supplement matters that are obscure or incomplete in the EIR, for example, is irrelevant ... The question is therefore not whether the project's significant environmental effects can be clearly explained, but whether they were"] (emphasis in original).)

"Finally, the attached report by Greg Gilbert and Paul Rosenfeld and Jessie Jaeger detail additional reasons why the DSEIR has not adequately supported its use of these thresholds.

"**3. The DSEIR's impact assessments for construction related criteria pollutants (ozone precursors, PM10, PM2.5) and TAC emissions are invalid.**

"DSEIR Table 5.4-8 shows construction-related daily emissions of the ozone precursor ROG at 47 lbs/day (mitigated by Tier 2 and NOx VDECS engines) or 49 lbs/day (mitigated by Tier 4 engines) and of the ozone precursor NOx at 144 lbs/day (mitigated by Tier 2 and NOx VDECS engines) or 73 lbs/day (mitigated by Tier 4 engines).

"The DSEIR's impact assessments for construction-related ozone precursor emissions are invalid because the DSEIR uses the invalid thresholds of significance discussed above.

"Because NOx construction-related emissions are reported as higher than the applicable (but invalid) threshold of significance for ROG (i.e., 54 lbs/day), the DSEIR concludes the Project's impact on ozone pollution is significant. While this conclusion is correct, it is also misleading because it understates the severity of the impact deemed "significant." The DSEIR implies that the only fraction of the Project's NOx emissions that are "significant" is the fraction above 54 lbs/day. But as discussed above, this threshold of significance is invalid. Using this invalid threshold implies that most of the quantity of emissions below the threshold are not "significant." (*Santiago County Water Dist. v. County of Orange* (1981) 118 Cal.App.3d 818, 831 ["The conclusion that one of the unavoidable adverse impacts of the project will be the 'increased demand upon water available from the Santiago County Water District' is only stating the obvious. What is needed is some information about how adverse the adverse impact will be"].)

Department of Food & Agriculture* (2005) 136 Cal.App.4th 1, 16 (lead agencies must review the site-specific impacts of pesticide applications under their jurisdiction, because "DPR's [Department of Pesticide Regulation] registration does not and cannot account for specific uses of pesticides..., such as the specific chemicals used, their amounts and frequency of use, specific sensitive areas targeted for application, and the like"); *Citizens for Non-Toxic Pest Control v. Department of Food & Agriculture (*1986) 187 Cal.App.3d 1575, 1587-1588 (state agency applying pesticides cannot rely on pesticide registration status to avoid further environmental review under CEQA); *Oro Fino Gold Mining Corporation v. County of El Dorado* (1990) 225 Cal.App.3d 872, 881-882 (rejects contention that project noise level would be insignificant simply by being consistent with general plan standards for the zone in question). *See also City of Antioch v. City Council of the City of Pittsburg* (1986) 187 Cal.App.3d 1325, 1331-1332 (EIR required for construction of road and sewer lines even though these were shown on city general plan); *Kings County Farm Bureau v. City of Hanford*, *supra*, 221 Cal.App.3d at pp. 712-718 (agency erred by "wrongly assum[ing] that, simply because the smokestack emissions would comply with applicable regulations from other agencies regulating air quality, the overall project would not cause significant effects to air quality.").

(*Mission Bay Alliance, Thomas Lippe, letter, July 26, 2015 [O-MBA8L2-6]*)

"**IX. CEQA Air Quality Thresholds of Significance Have Not Been Adopted By the Lead Agency**

"At Page 5.4-25 the DSEIR establishes criteria pollutant thresholds adopted by the Bay Area Air Quality Management District (BAAQMD). Following their adoption by the BAAQMD, the City of San Francisco has used these numerical thresholds for virtually all land use development projects undertaken in the City and requiring CEQA review.

"However, CEQA Guidelines, § 15064.7(b) requires that "[t]hresholds of significance to be adopted for general use as part of the lead agency's environmental review process must be adopted by ordinance, resolution, rule, or regulation, and developed through a public review process and be supported by substantial evidence." Without exception, this Guidelines section requires that, prior to application of thresholds in actual CEQA environmental reviews, the City undertake its own rule-making proceeding to adopt these thresholds as their own after determining in a public process that they are supported by substantial evidence. Since the City has not formally adopted the air quality significance thresholds in a public process, supported by substantial evidence, their ad hoc application to the DSEIR is inappropriate." (*Mission Bay Alliance, Thomas Lippe, letter, July 26, 2015 [O-MBA8L2-23]*)

Response AQ-1a: Lead Agency's Use of BAAQMD Thresholds

The comment states the use of BAAQMD's recommended thresholds for the project is not supported by substantial evidence.

OCII disagrees with the comment. OCII has discretion to rely on BAAQMD's recommended thresholds of significance and the use of those thresholds is supported by substantial evidence. In consideration of state and federal air quality standards, and based on its own independent review of thresholds of significance for air quality impacts recommended by the BAAQMD, OCII and its environmental consultants have determined that BAAQMD's recommended significance thresholds are appropriate to use to evaluate potentially significant air quality impacts associated with the proposed project. While others may disagree, such disagreement does not alter the fact that OCII staff's, its consultant's, and BAAQMD's expert conclusions developed in its 2009 document *Revised Draft Options and Justification Report, California Environmental Quality Act*

Thresholds of Significance referenced in the SEIR (pp. 5.4-24 to 5.4-27) constitute substantial evidence upon which OCII may rely. (See *Center for Biological Diversity v. Department of Forestry & Fire Protection* (2014) 232 Cal.App.4th 931, 948 ["disagreement is insufficient… [a challenger must] *affirmatively show* there was no substantial evidence in the record…" (original emphasis)].) BAAQMD's 2009 Justification Report develops and considers a variety of air quality thresholds and recommends thresholds of significance that BAAQMD staff believed to provide a fair share of emission reductions from land use development.

Under CEQA, lead agencies have discretion in determining the appropriate threshold of significance to determine the severity of a particular impact. "A threshold of significance is an identifiable, quantitative, qualitative, or performance level of a particular environmental effect, non-compliance with which means the effect will normally be determined to be significant by the agency and compliance with which means the effect normally will be determined to be less than significant." (CEQA Guidelines, § 15064.7 subd. (a).)

CEQA Guidelines section 15064.7 states that public agencies are "*encouraged* to develop and publish thresholds." (Subd. (a), italics added.) CEQA does not, however, require the adoption of formal thresholds for individual projects. (*Oakland Heritage Alliance v. City of Oakland* (2011) 195 Cal.App.4th 884, 896 [section 15064.7 "does not *require* a public agency to adopt [] significance thresholds . . . and it does not forbid an agency to rely on standards developed for a particular project."]; *Save Cuyama Valley v. County of Santa Barbara* (2013) 213 Cal.App.4th 1059, 1068 [formal adoption of project-specific thresholds is not required].) As the court in *Save Cuyama Valley* explained, "CEQA only requires that a threshold be formally adopted if it is for 'general use'—that is, for use in evaluating significance in all future projects." (213 Cal.App.4th at p. 1068; see also 2 Kostka & Zischke, Practice Under the Cal. Environmental Quality Act (Cont. Ed. Bar 2015) § 13.12, p. 13-13 ["An agency needs to follow the requirements for threshold adoption set forth in CEQA Guidelines § 15064.7 only when it is formally adopting thresholds to be used as a matter of general application."].)

Here, neither the City nor OCII has formally adopted thresholds of significance to be used as a matter of general application. No project in the City is *required* to use the thresholds of significance developed by the Bay Area Air Quality Management District (BAAQMD). As permitted under CEQA, agencies have discretion to determine the thresholds of significance that are appropriate for a particular project or impact. Using the same threshold for multiple projects in the same area, such as multiple projects in the City or multiple projects within an air district's boundaries, is often appropriate and even desirable because it promotes consistency. (*Communities for a Better Environment v. California Resources Agency* (2002) 103 Cal.App.4th 98, 111 [recognizing the use of existing environmental standards in determining the significance of a project's environmental impacts is desirable "because it is an effective means of promoting consistency in significance determinations."].) The use of such thresholds is particularly appropriate where, as here, they have been developed by an agency with particular expertise with respect to the resource area addressed by that threshold. Therefore, using the thresholds of significance for air quality impacts developed by the BAAQMD is within the discretion of the

OCII. Moreover OCII may, but is not required to, undergo a formal rulemaking process in order to cite and rely upon these thresholds.

The significance thresholds used in the SEIR for criteria air pollutants are based on state and federal air quality emissions limits for new stationary sources, which are set at levels designed to assure that new sources will not impede achievement of health-based ambient air quality standards. As explained on SEIR pp. 5.4-25-to 5.4-27, the criteria air pollutant thresholds are set at levels below which a project, when considering not just stationary sources but all sources of criteria air pollutants, is not anticipated to substantially contribute to a violation of either the state or federal air quality standards. The SEIR identifies the known adverse health effects of the contaminants in the air quality setting (pp. 5.4-4 to 5.4-16).

The SEIR need not specifically cite the exact same literature or studies as the comment to satisfy the CEQA mandate of disclosing the impacts. Policy 4.1 of the Environmental Protection Element of the City's General Plan directs the City to support and comply with objectives, policies, and air quality standards of the Bay Area Air Quality Management District, and OCII is in agreement with this policy as it relates to the selection of significance thresholds for use in the SEIR.

Significance standards recommended in regulatory agency guidance documents are "routinely used because their use ordinarily cannot be challenged as inappropriate or unsupported." (2 Kostka & Zischke, Practice Under the Cal. Environmental Quality Act (Cont. Ed. Bar 2015) § 13.14, p. 13-15.) There is abundant CEQA case law endorsing the use of existing environmental standards or regulations as thresholds of significance. (See *Tracy First v. City of Tracy* (2009) Cal.App.4th 912 [upholding determination that energy impact of project was less than significant because the project achieved energy efficiencies greater than those required by California Energy Efficiency Standards]; *Cadiz Land Co. v. Rail Cycle* (2000) 83 Cal.App.4th 47 [upholding finding that incremental impacts of criteria pollutants on sensitive crops would be less than significant based on National Ambient Air Quality Standards promulgated to protect public health and welfare from adverse effects of a pollutant]; *Protect the Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal.App.4th 1099, 1107 ["thresholds can be drawn from existing environmental standards, such as other statutes or regulations"].)

Rialto Citizens for Responsible Growth v. City of Rialto (2012) 208 Cal.App.4th 899, is instructive. In that case, the EIR used the methodology and thresholds of significance recommended by the South Coast Air Quality Management District (SCAQMD) to analyze a project's cumulative air quality impacts. The EIR concluded the project would have a significant cumulative impact on air quality because the project would generate emissions exceeding the thresholds of significance adopted by the SCAQMD. The court held that the EIR included a reasonable analysis of cumulative air quality impacts because it complied with the SCAQMD's recommendation that those thresholds be used to assess a project's contribution to cumulative air quality impacts. (*Id*. at p. 933.)

Similarly, here, the SEIR uses the significance thresholds and methodology developed by BAAQMD to analyze the project's criteria pollutant air quality impacts. The SEIR's use of those thresholds is appropriate and is supported by substantial evidence developed by BAAQMD in its

2009 document *Revised Draft Options and Justification Report, California Environmental Quality Act Thresholds of Significance*. The cases cited in the comment are either distinguishable inapposite. In *Endangered Habitats League v County of Orange* (2005) 131 Cal.App.4th 777, 793, the county erred by relying on a significance threshold that was more lenient than a threshold expressly required by the CEQA Guidelines. The threshold derives from a CEQA Guideline establishing, as a matter of State law, "mandatory findings of significance," and focuses on impacts to rare, threatened or endangered species. (CEQA Guidelines, § 15065, subd. (a).) No mandatory significance threshold applies here. OCII therefore has discretion to determine a threshold, and acts within its discretion in electing to follow BAAQMD guidance.

In *Protect the Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal.App.4th 1099, 1109, the court observed that compliance with a threshold cannot be used as a conclusive determination that the impact at issue will not be significant; if the record contains evidence that an impact may be significant, despite compliance with that threshold, then the agency must perform further analysis. In this case, however, OCII is relying on a threshold expressly developed by BAAQMD as a means of determining whether a project's criteria air pollutant emissions are significant. The comment is an unsupported statement that the threshold is inappropriate. While commenters do not posit alternative significance thresholds for OCII to consider, OCII acknowledges that different experts may reach different conclusions. However, as noted above, OCII and its expert consultants have carefully considered the appropriateness of using significance thresholds developed by the BAAQMD to analyze potentially significant air quality impacts of the proposed project. Based on this evaluation and the expertise of the BAAQMD, OCII has determined the thresholds are appropriate.

In *Mejia v. City of Los Angeles* (2005) 130 Cal.App.4th 322, 342, where the court observed that "[a] threshold of significance is not conclusive . . . and does not relieve a public agency of the duty to consider the evidence under the fair argument standard" the issue was whether an EIR instead of a negative declaration should have been prepared. *Mejia* stands for the proposition that, where a "fair argument" exists, notwithstanding compliance with a recommended significance threshold, an EIR must be prepared. (See also *Oro Fino Gold Mining Corporation v. County of El Dorado* (1990) 225 Cal.App.3d 872, 881-882 [agency had discretion to prepare EIR, rather than relying on negative declaration, notwithstanding evidence that project would comply with applicable noise standards].) In this case, OCII has not prepared a negative declaration. For this reason, the "substantial evidence" test applies.

In *Californians for Alternatives to Toxics v. Department of Food & Agriculture* (2005) 136 Cal.App.4th 1, 16-17, the project involved a state-wide plan to apply pesticides to control the spread of crop disease. The EIR stated the application of pesticides would not result in impacts because pesticides had to undergo a registration process in order to be licensed for use. The court held the EIR's approach was improper because the registration process was not designed to account for the environmental effects of state-wide use of the pesticides. Here, the SEIR has not dismissed the project's air quality impacts by virtue of some other regulatory program. Instead, the SEIR discloses the project's air quality emissions, and evaluates their significance using thresholds recommended by an expert agency for that purpose.

In *Citizens for Non-Toxic Pest Control v. Department of Food & Agriculture (*1986) 187 Cal.App.3d 1575, 1587-1588, the agency performed no CEQA review at all, but simply cited the previous registration of the pesticides proposed for use. That did not occur here; OCII has not cited the BAAQMD guidance as a basis for forgoing analysis; rather, OCII has followed BAAQMD's recommendations regarding how to determine whether the project's criteria air pollutant emissions are significant.

In *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 712-718, the court held the county erred by relying on the local air district's permitting rules to establish significance thresholds under CEQA where those rules addressed only a portion of the air pollutants that the project would emit, and by analyzing separately the project's direct and indirect emissions. Here, OCII is not relying on BAAQMD's permitting rules, which apply only to "stationary sources," and which therefore do not encompass indirect emissions. Rather, OCII is using BAAQMD guidance that is directly applicable to the CEQA process. Moreover, OCII is not segregating direct and indirect emissions as a means of understating impacts.

The comment states OCII may not rely on information not included in the Draft SEIR itself to support the use of the thresholds of significance. That statement is incorrect. In reviewing the adequacy of an EIR and particularly whether substantial evidence supports an agency's decision, courts look to the whole administrative record, not just the EIR itself. (See, e.g., *Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal.3d 376, 392-393 [the Court must uphold an EIR if there is any substantial evidence *in the record* to support the agency's determination that the EIR is adequate and complies with CEQA]; *Gray v. County of Madera* (2008) 167 Cal.App.4th 1099, 1108 [reviewing court considers whether there is any substantial evidence *in light of the whole record* to support the decision].) In any event, the Draft SEIR explains why the thresholds are used and expressly refers to the BAAQMD guidance documents from which the thresholds were derived. (See Draft SEIR, pp. 5.4-24 to 5.4-58.) Where an EIR incorporates reports, studies, or other documents by reference, the incorporated material is considered as part of the EIR. (CEQA Guidelines, § 15150, subd. (a).)

The comment states the SEIR "understates the severity" of project-related emissions. This statement is incorrect. The SEIR describes the existing environmental setting and discloses the amount of emissions the project would generate from various sources. The SEIR then evaluates the severity of the impact against the thresholds of significance. This analysis fulfills the requirements of CEQA. The case cited in the comment – *Santiago County Water Dist. v. County of Orange* (1981) 118 Cal.App.3d 818 – is distinguishable. There, the court found that an EIR failed to adequately address potential water supply impacts for a proposed gravel mine. Specifically, the EIR was "silent" about the effect of the water delivery necessary to serve the project on water service elsewhere in the Water District's jurisdiction. (*Id*. at p. 831.) The EIR simply stated that the project would result in "an increased demand upon water available from the Santiago Water District." (*Ibid*.) According to the court, there needed to be "some information about how adverse the adverse impact will be."

Here, in contrast, the SEIR describes the potential impacts in detail and analyzes the severity of the impacts using the stated thresholds of significance. The analysis complies with CEQA. (See

CEQA Guidelines, § 15151 ["An EIR should be prepared with a sufficient degree of analysis to provide decisionmakers with information which enables them to make a decision which intelligently takes account of environmental consequences. An evaluation of the environmental effects of a proposed project need not be exhaustive"].)

Please see Response AQ-1c regarding significance thresholds for cumulative air quality impacts.

Issues Raised by Commenters: Use of BAAQMD Guidelines and Significance Thresholds for Construction and Operation (AQ-1b)

This response addresses all or part of the following comments, which are quoted below:

O-MBA8L2-4 O-MBA8L2-5 O-MBA8L2-10 O-MBA8L2-16

"**2. The DSEIR's numerical thresholds of significance for criteria pollutants (ozone precursors, PM10, PM2.5) borrowed from the BAAQMD are invalid.**

"As noted above, for its impact assessment and mitigation strategy for criteria pollutants, the DSEIR uses numerical thresholds of significance borrowed from the BAAQMD. But the DSEIR cannot merely reference a project's compliance with another agency's regulations. Lead agencies must conduct their own fact-based analysis of project impacts, regardless of whether the project complies with other regulatory standards.

"The result of using these thresholds is a deeply misleading impact assessment and mitigation strategy because using these invalid thresholds allows the DSEIR to avoid finding impacts are significant, and it allows the DSEIR to understate the severity of impacts deemed "significant" because it implies that most of the quantity of emissions below the thresholds are not "significant." Also, using these invalid thresholds underestimates the degree of mitigation required to reduce significant impacts to less than significant, and therefore, the DSEIR curtails its consideration of the feasibility of additional mitigation measures that could further substantially reduce emissions.

"The numerical thresholds borrowed from the BAAQMD are logically and legally invalid, and they are not supported by substantial evidence. The thresholds are contained in the BAAQMD's "CEQA Air Quality Guidelines."[1] But neither the DSEIR or the BAAQMD CEQA Air Quality Guidelines describe any evidence that might support the use of these thresholds. The same is true of BAAQMD's other publications relating to these thresholds, i.e., Appendix D of the BAAQMD CEQA Air Quality Guidelines, BAAQMD's Revised Draft Options and Justification Report,(October 2009), and the Bay Area AQMD Proposed Air Quality CEQA Thresholds of Significance, published May 3, 2010.

"While these BAAQMD publications purport to include substantial evidence supporting the use of these thresholds for all criteria air pollutants for which the Bay Area is in non-attainment, they do not. Instead, the BAAQMD CEQA Air Quality Guidelines merely provide policy rationales for why it is a good idea to have thresholds of significance. Nowhere does the document actually provide evidence for why any number of pounds per day below, for example, 54 for NOx or ROG, is not "cumulatively considerable."

"The BAAQMD's Revised Draft Options and Justification Report (October 2009) states the thresholds "are based on the trigger levels for the federal New Source Review (NSR) Program and BAAQMD's Regulation 2, Rule 2 for new or modified sources." (See page 2.) These New Source Review Program rules provides that any new source that will emit pollutants above the levels stated in the left hand column of Table 4 (e.g., 10 lbs/day of NOx and ROG) must impose "Best Available Control Technology ("BACT")." (Id. pp. 16-17.) These rules also provide that any new source emitting pollutants above the levels stated in the right hand column of Table 4 (e.g., 54 lbs/day of NOx and ROG) must offset all emissions. (Id. pp. 16-17.)

"In addition to the inherent flaws in the NSR rules described above, it is inappropriate to base the EIR's significance determination for purposes of CEQA on the Air District's "triggers" for an entirely different regulatory program, i.e., New Source Review under the Clean Air Act ("CAA").[2] One of CEQA key purposes is to require "disclosure" of significant impact, and it allows agencies to approve projects where emissions exceed its thresholds of significance after feasible mitigations are first adopted and as long as the project's benefits outweigh the environmental harm. The CAA, in contrast, is not primarily concerned with public disclosure, and it provides absolute limits on emissions (i.e., the offset triggers in Table 4) that cannot be exceeded under any circumstances. A standard that shuts down economic activity (i.e., the CAA offset standard) is necessarily and appropriately different than a standard (i.e. a CEQA threshold of significance) that requires disclosure of the impact to the public and the adoption of feasible mitigation measures.

"Indeed, if it is possible to borrow any CAA NSR standard for use as a CEQA threshold of significance, it would be the BACT triggers in Table 4 (i.e., when ROG or NOx emissions exceed only 10 lbs/day), because those standards force the adoption of feasible mitigation measures, similar to CEQA's thresholds of significance.

"NSR Regulation 2, Rule 2 for new or modified sources requires that if ozone precursor emissions exceed 54 lbs per day (i.e., 10 tpy), the polluter must offset all emissions. In contrast, the DSEIR Mitigation Measure M-AQ-2b only requires offsetting emissions above 54 lbs per day (i.e., 10 tpy). This BACT standard is much lower than the NSR offset standard and the DSEIR's threshold of significance of 54 lbs/day. But, there is no parallel requirement in the DSEIR for imposing anything like BACT to this Project's construction or operational emissions that exceed 10 lbs/day.

"**Footnotes:**

[1] The BAAQMD CEQA Air Quality Guidelines were published May 2010, and updated May 3, 2011.

[2] The CAA establishes health-based ambient air quality standards and ranks air districts nationwide based on their level of attainment of those standards. The CAA also establishes a timetable for air districts to reach attainment, and authorizes specific penalties where a deadline is not met. CEQA, on the other hand, requires lead agencies to analyze and discuss significant impacts on air quality, and to continue to mitigate those impacts so long as they remain significant or no additional mitigation is feasible."

(*Mission Bay Alliance, Thomas Lippe, letter, July 26, 2015 [O-MBA8L2-4]*)

"Regarding NSR Regulation 2, Rule 2's offset standards (i.e., 54 lbs/day for ROG or NOx), the BAAQMD's Revised Draft Options and Justification Report (October 2009) observes: "These levels represent a cumulatively considerable contribution."[3] But there is no evidence that emissions below these thresholds are not also "cumulatively considerable."

"Moreover, regardless of any evidence included in these other BAAQMD documents, no such evidence can overcome a fundamental logical and legal flaw in the EIR's assumption that these thresholds are appropriate for the purpose for which the DSEIR uses them. Using the DSEIR's logic, if the City finds that one project will add 53 lbs/day of ozone precursors, it is considered a less-than-significant impact, but if that project will add 55 lbs/day of ozone precursors, it is considered significant. Yet, if the City approved two new large projects in the area in the same 2- or 3-year period, or where operational impacts cause increased emissions, each emitting 53 lbs/day of ozone precursors, it is considered a less-than-significant impact even though the total of the two added together equals 106 lbs/day of ozone precursors!

"This scenario is not hypothetical; it is unfolding in San Francisco, and in the Mission Bay area now. (See Table 3, July 21, 2015, letter report by traffic engineer Larry Wymer, attached as Exhibit 2 to the July 27, 2015, letter from this office regarding impacts on Transportation for a list of project undergoing or about to undergo construction in this area of San Francisco.) As a result, the thresholds violate a fundamental CEQA principal that regardless of whether projects' incremental impacts are deemed insignificant in isolation, they may be cumulatively significant.

"The significance of a cumulative impact depends on the environmental setting in which it occurs, especially the severity of existing environmental harm. (Communities for a Better Environment v. California Resources Agency (2002) 103 Cal.App.4th 98, 120 ("CBE") ["[T]he relevant question"... is not how the effect of the project at issue compares to the preexisting cumulative effect, but whether "any

additional amount" of effect should be considered significant in the context of the existing cumulative effect. [footnote omitted] In the end, the greater the existing environmental problems are, the lower the threshold should be for treating a project's contribution to cumulative impacts as significant. [footnote omitted]"]; *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 720-721.)

"This area is in "non-attainment" status under federal and state clean air laws for these criteria pollutants; and this project, along with many others, will substantially contribute to that existing significant adverse impact. There is no evidence to the contrary. The City's untenable position is that public agencies in the Air Basin can approve project after project, each emitting (in the case of ozone precursors) up to 54 lbs/day of new and additional ozone precursors, without ever causing a cumulatively considerable increase in air pollution. This approach runs counter to the reason for conducting cumulative impact analysis. If the City (and other agencies in the Air Basin) continues to find that projects that make air quality worse - when it is already significantly degraded - do not have a significant adverse cumulative impact on air quality, then the City will have no legal obligation to adopt feasible mitigation measures to reduce the significant cumulative impact.

"Here, the BAAQMD CEQA Guidelines present ample evidence that the Bay Area's air quality is degraded and has been for a very long time. Therefore, the idea that agencies can forever approve multiple projects that each add 53 lbs of ROG and NOx to the air every day and never be deemed cumulatively considerable is absurd. Rather than explain why this is not true, the BAAQMD documents simply ignore the issue.

"**Footnote:**

[3] Exhibit 4, p. 2."

(*Mission Bay Alliance, Thomas Lippe, letter, July 26, 2015 [O-MBA8L2-5]*)

"**4. The DSEIR's impact assessments for operational criteria pollutants (ozone precursors, PM10, PM2.5) and TAC emissions are invalid.**

"The operational impact assessment for ozone precursor, PM10, PM2.5 and TAC emissions is invalid for many reasons.

"DSEIR Table 5.4-9 shows operational daily emissions of criteria pollutants as follows:

ROG: 79 lbs/day [14 tpy]
NOx: 124 lbs/day [23 tpy]
PM10: 80 lbs/day [14.6 tpy]
PM2.5: 25 lbs/day [4.5 tpy]

(DSEIR, p. 5.4-39.)

"The DSEIR's impact assessments for these criteria pollutants emissions are invalid because they are based on the invalid thresholds of significance discussed above.

"Because construction-related emissions of ROG and NOx are higher than the applicable (but invalid) threshold of significance for these pollutants, the DSEIR concludes the Project's impact on ozone pollution is significant. As discussed above, while correct, this conclusion is misleading because it understates the severity of the impact deemed "significant" by implying that the only fraction of the Project's NOx emissions is are "significant" is the fraction above 54 lbs/day.

"The DSEIR's impact assessment for operational ozone precursor emissions is also misleading because it omits from its quantitative tally of criteria pollutants the emissions the Project will generate in San Francisco and the Mission Bay neighborhood from basketball game-associated "vehicle miles traveled" (DSEIR, p. 5-37.) The DSEIR's rationale for this startling omission is that moving the Warriors games from Oakland to San Francisco will reduce the same number of "vehicle miles traveled" in Oakland that the Project will generate in San Francisco and the Mission Bay neighborhood.

"This rationale is based on the unstated, but incorrect, assumption that the environmental setting at Oracle Arena and the Mission Bay site are identical. These settings are very different, in many crucial respects. First and foremost, the Mission Bay neighborhood and the surrounding areas of San Francisco are populated by San Franciscans, not Oaklanders. The residents, citizens, and registered voters of San Francisco are entitled to know what the Project's air quality impacts will be on them, regardless of whether the residents, citizens, and registered voters of Oakland will experience an air quality benefit as a result of the move.

"Second, Oracle Arena sits in the middle of a vast parking lot. To the west is I-880, various commercial properties, wetlands, and the Bay. To the east is the Coliseum, railroad tracks, ABC Supply (provider of industrial equipment), East Bay Truck and Auto Repair, BART tracks and the Coliseum BART Station, and then, over 2,000 feet away to the northeast there is a group of apartment buildings. To the north and south stretch commercial properties for well over a mile without any residences. This stands in stark contrast to the dense residential population surrounding the Mission Bay site.

"The DSEIR's suggestion that respiratory disease, heart disease, and cancer-causing air pollution is fungible and transferable, without regard to the location or environmental setting in which it occurs, is unsupported." (*Mission Bay Alliance, Thomas Lippe, letter, July 26, 2015 [O-MBA8L2-10]*)

_____

"**III. Air Quality Thresholds of Significance Used in the DSEIR Are Based On Outdated, Non-Scientific NSR Values**

"BAAQMD (District) is regionally responsible for attaining or maintaining healthy air quality in the 9-county Bay Area that includes the proposed Event Center and Mission Bay Blocks 29 -32; the District implements a number of programs for attainment of regional air quality, including issuance of CEQA guidance used by Lead Agencies in the review and mitigation of air quality impacts and specified emissions of new development. The District has historically acted under CEQA as a commenting agency for new developments subject to CEQA review not otherwise subject to District regulations. CEQA thresholds, used by the City as Lead Agency and applied to the DSEIR (see Table 5.4-6 Criteria Air Pollutant Thresholds), were developed by the BAAQMD many years ago, well prior to the last Ozone Attainment Plan issued by the District in 2001.

"How the District's air quality CEQA thresholds were developed is relevant to whether they are appropriate and effective for use in evaluating the potential significance of air impacts of the proposed event center and other land use types anticipated within the DSEIR. While CEQA encourages the use of thresholds (Guidelines section 15064.7) to promote consistency and integration of environmental review activities across regulatory and planning disciplines and programs, the Lead Agency's air quality thresholds must reflect the true significance of the environmental impact for which they act as an impact or mitigation measuring device. Moreover, the courts have found that use of regulatory thresholds must not be applied "in a way that forecloses the consideration of any other substantial evidence showing there may be a significant effect" (CBE v. CA Resources Agency; 126 Cal. Rptr. 2d. 441, Cal.App.3 Dist., 2002).

"In this case, the Lead Agency's use of District thresholds ignores air pollution nonattainment and ambient air quality monitoring evidence that they have not been adequately effective in reducing land-use related mobile source emissions in the air basin. Importantly, the BAAQMD's CEQA threshold increments (expressed in lbs/day or tons/yr of specified pollutants) were based decades ago on NSR (New Source Review) quantitative increments intended solely for ensuring that the region's stationary source emissions, regulated under permits issued by the BAAQMD, would not cause the region to fall out of "attainment" status for complying with federal air quality ozone standards. NSR increments were established decades ago within federal Clean Air Act programs, aimed exclusively at regulating stationary (not mobile) sources of air pollution, and were keyed quantitatively to an area's air quality designations; worse air quality invokes use of more restrictive NSR daily or annual emission limits.

"Surprisingly, there is no scientific basis for how NSR values were established, nor is there any substantive information regarding their formulation or formation left in the historical record; we have researched this issue extensively and have been unable to find written material or anyone in regulatory air agencies

(CARB, EPA) who is intimately familiar with or is still alive who can recall how NSR increments were established nearly fifty years ago.

"In the DSEIR, BAAQMD's CEQA thresholds of significance were used; those thresholds were established by borrowing NSR values intended to ensure that the BAAQMD's stationary sources would not lead to regional air pollution "nonattainment" episodes. As a practical matter, the region's failure to attain the federal ozone standard is evidence of the lack of scientific credibility in how the BAAQMD's CEQA thresholds were established, as well as their lack of efficacy-had they been scientifically tied to land use growth and the mobile source emissions they create, it would be easily argued that the Bay Area would not now be designated "marginal nonattainment" for ozone air pollution after years of nonattainment.

"Use of NSR values that were never scientifically designed, to establish current BAAQMD CEQA thresholds, makes even less sense when comparing the emissions inventory of stationary sources in the Bay Area to emissions resulting from mobile sources (vehicles) that routinely emit regulated pollutants traveling to or from new land use developments. Quite simply, there is no rational nexus between the two categories since stationary source emissions equate to typically less than one-sixth those emitted by the basin's mobile sources.

"A more effective method for use by BAAQMD in designing CEQA threshold levels would have been to base them on growth in vehicle emissions expected to occur from projected land use growth in the basin---this method was developed and used in 2002 by the Sacramento Metropolitan Air Quality Management District (SMAQMD) to establish CEQA thresholds logically and arithmetically based on estimated increments of mobile source emissions of new development. The increment of new development-related emissions was derived from careful review of five years of immediately-prior building permit records obtained in the nonattainment area, and then adjusted to account for processes (such as ongoing development of rapid transit in the basin) expected to reduce vehicle-miles-travelled from new developments. CEQA threshold emission quantities (expressed as lbs/day or tons/yr) were then set at levels that would account for---and mitigate---only that new land use portion of the basin's total emissions determined by modeling and inventory analyses as necessary to achieve attainment of air quality standards under federal Clean Air Act requirements.

"Under this 'nexus analysis' approach, CEQA thresholds are scientifically established by correlating increased mobile source emissions from projected land use growth in the nonattainment area to the number of tons of related reductions needed for attainment by CAA-specified date(s). Such an approach greatly reduces the risk of under- or over-mitigating, and provides far more certainty that the estimated tons of emission reductions to result from their use, and critical to ensuring attainment of ambient air quality standards, will be realized. BAAQMD CEQA thresholds were not established scientifically, and the region has continued to violate ambient air quality standards for ozone for many years now-both act as potent evidence to call into serious question the effectiveness of BAAQMD's NSR-based CEQA thresholds in the DSEIR for Event Center/Mission Bay Blocks 29 - 32. Further, they suggest that air quality impacts are likely underestimated, and mitigation values are overestimated in the DSEIR." (*Mission Bay Alliance, Thomas Lippe, letter, July 26, 2015 [O-MBA8L2-16]*)

Response AQ-1b: Use of BAAQMD Guidelines and Significance Thresholds for Construction and Operation

The comment suggests that the Draft SEIR conclusions regarding the significance of air quality impacts is erroneous because the analysis applied guidelines developed by the BAAQMD in determining whether impacts were significant. The comment also questions the use of BAAQMD's recommended thresholds of significance for cumulative impacts related to ROG and NOx emissions. The comment suggests there is no evidence that emissions below these thresholds would not be cumulatively considerable.

Use of BAAQMD Guidelines

For a general discussion of OCII's discretion to rely on the BAAQMD 2010 CEQA Guidelines to provide significance thresholds for use in CEQA analysis, please see Response AQ-1a. The BAAQMD 2010 CEQA Guidelines and significance thresholds are the subject of current ongoing litigation on an issue unrelated to the one raised by the comment.[1] In the most recent judicial decision in August 2013, the Court of Appeal reversed a previous trial court's decision and held that BAAQMD's adoption of the thresholds was not a "project" subject to CEQA review. The court also agreed with BAAQMD that there were scenarios in which the thresholds could be used to properly assess whether and in what amount a project would add pollution to the environment. As a result, the court concluded, the thresholds were not invalid.

The California Supreme Court granted a petition for review filed in that case. (*California Building Industry Association v. Bay Area Air Quality Management Dist.* (No. S213478).) Oral argument occurred on October 7, 2015. The Supreme Court is therefore expected to issue a decision in the case in the near future. The outcome of this case will not affect whether the significance thresholds at issue here are appropriate for the project. The question for review in that case, as framed by the Supreme Court, is: "Under what circumstances, if any, does the California Environmental Quality Act (Pub. Resources Code, § 21000 et seq.) require an analysis of how existing environmental conditions will impact future residents or users (receptors) of a proposed project?" The resolution of this issue will not affect the significance thresholds relied upon by OCII.

Although BAAQMD has withdrawn its thresholds as a result of this litigation, the Planning Department has determined that substantial evidence supports the use of many of BAAQMD's thresholds, and thus relies on this evidence to support the SEIR's significance thresholds. OCII is relying on the information published by BAAQMD and EPA for developing- thresholds used to assess criteria pollutant and health risk assessment impacts. For example, the thresholds listed in SEIR Table 5.4-6 are the criteria air pollutant thresholds developed by the BAAQMD. The SEIR (pp. 5.4-25 to 5.4-26) provides substantial evidence in support of these thresholds. The efficacy of these thresholds will not be addressed in the California Supreme Court's decision.

In light of BAAQMD's decision to withdraw its guidance, BAAQMD recommends that lead agencies consider relying on BAAQMD's previous guidance with respect to thresholds, which was issued in 1999. The 1999 Guidance established the thresholds shown in **Table 13.13-1** with respect to criteria air pollutants of concern:

[1] In a ruling dated February 14, 2012 Alameda County Superior Court Judge Frank Roesch found that in adopting new air quality CEQA significance thresholds (new thresholds), the BAAQMD violated CEQA by not first studying the potential environmental impacts of its new thresholds on future growth and transportation patterns. Judge Roesch required that the new thresholds be rescinded pending formal CEQA approval. Judge Roesch did not rule on the merits of the new thresholds. This case is pending before the State Supreme Court.

TABLE 13.13-1
BAAQMD'S 1999 AIR QUALITY THRESHOLDS OF SIGNIFICANCE

Pollutant	Annual Threshold in tons per year	Daily Threshold in pounds per day
ROG	15	80
NOx	15	80
PM10	15	80
PM2.5	None	None

SOURCE: (BAAQMD CEQA Guidelines, Assessing the Air Quality Impacts of Projects and Plans (December 1999), p. 16.)The 1999 Guidance does not include a significance threshold for fine particulate matter ($PM_{2.5}$).

These thresholds are less stringent than those set forth in the guidance that have been withdrawn by BAAQMD as a result of litigation. Although OCII could use the thresholds established in the 1999 guidance, OCII has exercised its discretion to continue to use the 2010 thresholds, in that the 2010 thresholds are more stringent. If the 1999 thresholds were used, OCII's conclusions with respect to the significance of air quality impacts would be the same, since the project's estimated operational emissions of NOx would still exceed the 1999 threshold.

The construction and operation emission thresholds for criteria pollutants applied in the SEIR were developed by BAAQMD based upon offset thresholds used to implement its Regulation 2 Rule 2 for permitting of stationary sources of air pollution (New Source Review). It is the existing practice by most air Districts[2] within California that develop significance thresholds under CEQA for criteria pollutants to use New Source Review (NSR) emission limits for deriving thresholds of significance for project-level emissions of criteria pollutants.

As stated on page 5.4-28 of the SEIR, the project-level thresholds for criteria air pollutants are based on levels by which new sources are not anticipated to contribute to an air quality violation or result in a considerable net increase in criteria air pollutants. Therefore, if a project's emissions are below the project-level thresholds, the project would not be considered to result in a considerable contribution to cumulative regional air quality impacts.

Some comments suggest that the NSR thresholds which underlie the BAAQMD significance thresholds are not appropriate given the non-attainment status of the air district with respect to ozone. While the air basin is still designated as a non-attainment region, which is partially reflective of recent increases in the stringency of state and federal air quality standards for ozone, California Air Resources data show that monitored ozone concentrations in the San Francisco Bay Area Basin have declined 17 percent over the past 20 years despite a region-wide increase in vehicle miles travelled of over 100 percent.[3] Consequently, it is clear that measures taken locally

2 Inclusive of The South Coast Air Quality Management District (see page 6-1 of the District's *CEQA Air Quality Handbook*), the San Joaquin Air Pollution Control District (see page 81 of the Districts *Guidance for Assessing and Mitigating Air Quality Impacts*, 2015 and the Monterey Bay Unified Air Pollution Control District (see page 2-2 of the District's CEQA Air Quality Guidelines from 2008).

3 CARB, California Almanac of Emissions and Air Quality -2013 Edition, Chapter 4 Regional Trends and Forecasts.

by BAAQMD are effective and a large portion of these reductions has been achieved by curtailing emissions from stationary sources. The NSR thresholds are therefore enabling the BAAQMD to capture a sufficient percentage of projects to effectively reduce ozone precursors within the basin. Basing the CEQA significance thresholds on these same rates also ensures a similar capture of projects on which to impose mitigation through the CEQA process.

One comment suggests that use of a brightline threshold such as 54 pounds per day of NOx, is inappropriate because two projects assessed independently could combine to exceed this threshold and not be captured in a project-level analysis. However, Appendix G of the CEQA Guidelines specifies that air quality analysis should include assessment of a project's emissions relative to "quantitative thresholds for ozone precursors" because ozone is a regional pollutant that for the most part is not emitted directly to the atmosphere and, therefore, like greenhouse gases emissions, represents a cumulative impact. Accordingly, in its 2011 CEQA Guidelines BAAQMD state that "no single project is sufficient in size to, by itself, result in nonattainment of ambient air quality standards. Instead, a project's individual emissions contribute to existing cumulatively significant adverse air quality impacts."

In developing thresholds of significance for air pollutants, BAAQMD considered the emission levels for which a project's individual emissions would be cumulatively considerable. If a project exceeds the identified significance thresholds, its emissions would be cumulatively considerable, resulting in significant adverse air quality impacts to the region's existing air quality conditions.

The California Natural Resources Agency acknowledges that there is no "one molecule" rule under CEQA for the purposes of identifying cumulative impacts.[4] Consequently, it is not necessary to mitigate significant air pollutant emissions to a net zero level but only to below the identified threshold, emissions below which would represent a *de minimis* contribution to existing air quality.

Threshold of Significance for Cumulative Impacts

The BAAQMD guidance provides specific recommendations for determining whether a project's emissions of criteria pollutants would be cumulatively considerable. The BAAQMD guidance lists recommended thresholds of significance for criteria pollutants and explains that these thresholds represent the emission levels above which a project's individual emissions would result in a cumulatively considerable contribution to the SFBAAB's existing air quality conditions. The Guidance provides that the thresholds would be an evaluation of the incremental contribution of a project to a significant cumulative impact. These threshold levels are well-established in terms of existing regulations as promoting review of emissions sources to prevent cumulative deterioration of air quality.[5] It was therefore appropriate to use the recommended thresholds in evaluating the project's cumulative air quality impacts.

---

4 California Natural Resources Agency, Initial Statement of Reasons for Regulatory Action, Proposed Amendments to the State CEQA Guidelines Addressing Analysis and Mitigation of Greenhouse Gas Emissions Pursuant to SB97, July 2009, p.23.

5 Bay Area Air Quality Management District, *Revised Draft Options and Justification Report, California Environmental Quality Act Thresholds of Significance,* October 2009.

Rialto Citizens for Responsible Growth v. City of Rialto (2012) 208 Cal.App.4th 899, is on point. In that case, the challenged EIR used the methodology and thresholds of significance recommended by the South Coast Air Quality Management District (SCAQMD) in determining whether the project's emissions of criteria pollutants (ROG, NOx, etc.) would be significant. The EIR also used the methodology and thresholds of significance recommended by the SCAQMD in determining whether the project's emissions of criteria pollutants was cumulatively considerable. The EIR concluded that the project would have a significant cumulative impact on air quality because the project would "generate emissions that exceed the thresholds of significance recommended by the SCAQMD for ROG, NOx, and CO." (*Id*. at p. 932; see also *id*. at p. 932.) The court determined that the EIR's reliance on the SCAQMD methodology and thresholds of significance was appropriate and provided substantial evidence supporting the EIR's cumulative impacts analysis. (*Id*. at pp. 931-934.)

Notably, in *Rialto Citizens*, the SCAQMD recommended using the thresholds of significance for project-specific emissions to determine whether a project's incremental contribution to a cumulative significant impact was cumulatively considerable. The EIR explained: "The SCAQMD neither recommends quantified analyses of cumulative construction or operational emissions, nor does it provide separate methodologies or thresholds of significance to be used to assess cumulative construction or operational impacts. *Instead, the SCAQMD recommends that a project's potential contribution to cumulative impacts should be assessed using the same significance criteria as those for project specific impacts.* Therefore, individual development projects that generate construction-related or operational emissions that exceed the SCAQMD recommended daily thresholds for project-specific impacts would also cause a cumulative considerable increase in emissions for those pollutants for which the Basin is nonattainment." (*Id*. at p. 933, emphasis added.) The court concluded that "[i]n view of the SCAQMD's recommendations, the EIR reasonably analyzed the project's cumulative impact on air quality based on the project's emissions alone." (*Ibid*.)

Similarly, here, the BAAQMD recommends assessing whether a project's incremental contribution to emissions of criteria pollutants are cumulatively considerable by considering the emissions specific to the project and provides specific thresholds of significance for making that determination. It was therefore appropriate for the Draft SEIR to rely on the thresholds and methodology recommended by BAAQMD in determining whether the project's emissions of criteria pollutants are cumulatively considerable. Like the EIR upheld in *Rialto Citizens*, the Draft SEIR "addressed whether the project's additional impact on air quality should be considered cumulatively significant in light of the existing air quality problem, and concluded that it was." (208 Cal.App.4th 899, 932.)

Furthermore, the Draft SEIR concludes that the project would result in a cumulatively considerable contribution to regional air quality impacts even with implementation of the proposed mitigation measures, and therefore, the cumulative impact is considered significant and unavoidable with mitigation. Therefore, the comment's suggestion that using the BAAQMD's recommended thresholds provided a means for avoiding the disclosure of a potential significant impact is not accurate. The Draft SEIR describes project-related emissions in detail and concludes the project's contribution to the impact would be cumulatively considerable and the impact is considered significant and unavoidable.

Further, the comment misstates the standards for an adequate cumulative impacts analysis under CEQA. Although the significance of a cumulative impact depends on the environmental setting in which it occurs, any contribution to a significant cumulative impact is not necessarily cumulatively considerable. Even if a project contributes to a cumulatively significant impact, "[t]his does not mean [] that any additional effect in a nonattainment area for that effect necessarily creates a significant cumulative impact; the "one [additional] molecule rule" is not the law." (*Communities for a Better Environment v. California Resources Agency* (2002) 103 Cal.App.4th 98, 128.) Instead, the lead agency has discretion to determine whether the project's incremental contribution to a significant cumulative impact is cumulatively considerable. (*Ibid*. ["the basic approach set forth in Guidelines section 15064, subdivision (i)(1) seems sound - that is, in assessing whether a cumulative effect requires an EIR, the lead agency shall consider whether the cumulative impact is significant and whether the proposed project's incremental effects are cumulatively considerable."].) Here, OCII properly exercised its discretion and relied on the thresholds of significance recommended by the BAAQMD to determine whether the project's incremental contribution to ROG and NOx emissions impacts was cumulatively considerable.

Issues Raised by Commenters: Health Risk Significance Thresholds (AQ-1c)

This response addresses all or part of the following comments, which are quoted below:

O-MBA8L2-12 O-MBA8L2-28 O-MBA8L2-33 O-MBA8L2-34

"**5. The DSEIR's impact assessment for Project-caused increases in Toxic Air Contaminants (TACs) is invalid.**

"The DSEIR's impact assessment for operational Toxic Air Contaminants (TACs) - Impact AQ-3 - is invalid for a number of reasons, in particular because the DSEIR's use of thresholds of significance for Project-caused increases in cancer risk and PM2.5 is inconsistent, confusing, and legally erroneous.

"**a. The DSEIR's health impact assessment for the Project-caused increases in cancer risk from TACs is invalid.**

"The DSEIR uses a threshold of significance for the Project's impact of increasing cancer risk in the area of "100 in one million." As discussed above, for criteria pollutants the DSEIR borrows thresholds of significance from the BAAQMD to determine the significance of both the direct, incremental increase in emissions caused by the Project, and the Project's contribution to cumulative increase in emissions in the area.

"In contrast, in its assessment of the Project's impact of increasing cancer risk in the area, the Project ignores BAAQMD's stated "Individual Project" threshold of significance "for Risk and Hazards for new sources and receptors" which is stated as "Increased cancer risk of >10.0 in a million." (Exhibit 1, p. 2-2.) Instead, the DSEIR uses BAAQMD's stated "Cumulative Project" threshold of significance "for Risk and Hazards for new sources and receptors" which is stated as "Increased cancer risk of >100.0 in a million." (DSEIR, p. 5.4-13; see, May 2011, BAAQMD Updated CEQA Guidelines, p. 2-2.).[13]

Table 1

Hearst Tower Child		No Tier 2/VDECS	Tier 2/VDECS
Background	26	26	26
No Tier 2/VDECS	54	54	
Tier 2/VDECS	9.2		9.2
Operations - Generators	30	30	30
Operations - Mobile	7.2	7.2	7.2
Total	126.4	117.2	72.4
less background		26	26
Project incremental impact		91.2	46.4

"The DSEIR estimates the Project's impact of increasing cancer risk for adults living at UCSF's Hearst Tower as either 40 or 38 additional cancer cases per one million persons, depending on whether the Project is able to successfully use off-road construction equipment meeting Tier 2 and NOx VDECS standards. (See Figure 2, DSEIR, p. 5.4-49, Table 5.4-11.)

Table 2

Hearst Tower – Adult		No Tier 2/VDECS	Tier 2/VDECS
Background	26	26	26
No Tier 2/VDECS	2.8	2.8	
Tier 2/VDECS	0.48		0.48
Operations - Generators	30	30	30
Operations - Mobile	7.2	7.2	7.2
Total	66.48	66	63.68
less background		26	26
Project incremental impact		40	37.68

"The DSEIR estimates the Project's impact of increasing cancer risk for adults living at UCSF's Hearst Tower as either 45 or 42 additional cancer cases per one million persons, depending on whether the Project is able to successfully use off-road construction equipment meeting Tier 2 and NOx VDECS standards. (See Figure 3, DSEIR, p. 5.4-49, Table 5.4-11.)

Table 2

UCSF Hospital Child		No Tier 2/VDECS	Tier 2/VDECS
Background	44	44	44
No Tier 2/VDECS	28	28	
Tier 2/VDECS	4.8		4.8
Operations - Generators	30	30	30
Operations - Mobile	7.2	7.2	7.2
Total	114	109.2	86
less background		44	44
Project incremental impact		65.2	42

"As discussed above, the DSEIR's premise that the Project Sponsor can obtain a substantial quantity of off-road construction equipment meeting Tier 2 and NOx VDECS standards is illusory. Therefore, the only relevant numbers are the three higher numbers, i.e., 91, 40 and 45. But even using the lower numbers, i.e., 46, 38, and 42, all of them exceed the BAAQMD's "Individual Project" threshold of significance for increased cancer risk of 10 per one million." (Exhibit 1, p. 2-2.) Instead of explaining why, after using BAAQMD's thresholds of significance for all criteria pollutants, the DSEIR does not use the BAAQMD's "Individual Project" increased cancer risk threshold of significance of 10 per one million, the DSEIR simply ignores this threshold.

"Thus, the DSEIR uses at least two strategies to avoid disclosing a significant increase in cancer risk: using BAAQMD's cumulative standard instead of its individual project standard, and assuming the Project Sponsor can obtain a substantial quantity of off-road construction equipment meeting Tier 2 and NOx VDECS standards. Dropping either of these unwarranted predicates reveals the Project's impact of increasing cancer risk is significant.[14]

"The DSEIR explains its choice of a threshold of significance for cancer risk from TAC's of 100 per one million persons as follows:

> The 100 per one million persons (100 excess cancer risk) criterion discussed above is based on USEPA guidance for conducting air toxic analyses and making risk management decisions at the facility and community-scale level. As described by the BAAQMD, the USEPA considers a cancer risk of 100 per million to be within the "acceptable" range of cancer risk. Furthermore, in the 1989 preamble to the benzene National Emissions Standards for Hazardous Air Pollutants (NESHAP) rulemaking, the USEPA states that it "…strives to provide maximum feasible protection against risks to health from hazardous air pollutants by (1) protecting the greatest number of persons possible to an individual lifetime risk level no higher than approximately one in one million and (2) limiting to no higher than approximately one in ten thousand [100 in one million] the estimated risk that a person living near a plant would have if he or she were exposed to the maximum pollutant concentrations for 70 years." The 100 per one million excess cancer cases is also consistent with the ambient cancer risk in the most pristine portions of the Bay Area based on BAAQMD regional modeling.

(DSEIR, p. 5.4-13.)[15]

"The City's reliance on the EPA's judgment of "acceptable" cancer risk is legally flawed for several reasons. First, the City relies on a simplistic misrepresentation of actual EPA policy. Second, even if EPA policy is what the City implies it is, the DSEIR errs as a matter of CEQA law by using the EPA's judgment of "acceptable" cancer risk to determine the significance of the Project's impacts.

"The EPA's actual policy is to assess increased cancer risk based on a host of site-specific factors within a range of values from 1 in one million to 100 in one million. This policy reflects the agency's attempt to balance the costs and benefits of protecting public health in its implementation of a host of federal environmental laws, including the Clean Air Act, Clean Water Act, Resource Conservation and Recovery Act, CERCLA (Superfund), etc. (See e.g., Starfield, L.E., "The 1990 National Contingency Plan: More Detail and More Structure, But Still a Balancing Act"; Environmental Law Reporter, June 1990, pp. 10222-10251, attached hereto as Exhibit 3.)[16]

"Instead of following this analytic approach, the DSEIR selects one value at the least environmentally protective end of the EPA's "acceptable risk" range and uses it to determine the significance of the Project's impacts, but without regard to the Project's site-specific considerations. Again, the DSEIR has cherry-picked a threshold of significance to avoid finding the Project's cancer risk impact significant.

"Also, CEQA neither requires nor allows the City to use the EPA's judgment of "acceptable" cancer risk to determine the significance of the Project's impacts. The City's discretion to decide that significant environmental harm is "acceptable" in light of the project's benefits arises at the end of the CEQA analysis, in the context of a statement of overriding considerations, not at the beginning of the process, in determining whether impacts are significant.

> A statement of overriding considerations is required, and offers a proper basis for approving a project despite the existence of unmitigated environmental effects, only when the measures necessary to mitigate or avoid those effects have properly been found to be infeasible. (Pub. Resources Code, § 21081, subd. (b).) Given our conclusion the Trustees have abused their discretion in determining that CSUMB's remaining effects cannot feasibly be mitigated, that the Trustees' statement of overriding circumstances is invalid necessarily follows. CEQA does not authorize an agency to proceed with a project that will have significant, unmitigated effects on the environment, based simply on a weighing of those effects against the project's benefits, unless the measures necessary to mitigate those effects are truly infeasible. Such a rule, even were it not wholly inconsistent with the relevant statute (id., § 21081, subd. (b)), would tend to displace the fundamental obligation of "each public agency [to] mitigate or avoid the significant effects on the environment of projects that it carries out or approves whenever it is feasible to do so" (id., § 21002.1, subd.(b)).

"City of Marina v. Board of Trustees of the California State University (2006) 39 Cal.4th 341, 368-69.

"This is a critical distinction, because where the Project does not exceed thresholds of significance that are erroneously inflated by the concept of "acceptable risk," the City is absolved of further legal obligation to mitigate the impact. As a result, the public cannot know whether the City will allow an unknown

number of cancer cases to occur that it could have feasibly avoided had it scrupulously followed CEQA. Nor does the public know, had the EIR determined that 46 additional child cancer cases per one million persons is significant, whether or not the City would have found the Project's benefits outweigh its environmental and adverse human health effects.

"The DSEIR also attempts to support its "100 in a million excess cancer cases" by stating: "The 100 in a million excess cancer cases is also consistent with the ambient cancer risk in the most pristine portions of the Bay Area based on the District's recent regional modeling analysis." (DSEIR p. 5.4-13, citing the 2009 BAAQMD Justifications report, p. 67). Neither document, however, explains what this means. For example, how are "excess" cancer cases "consistent" with "ambient" cancer risk? What does "most pristine" mean? On a scale of 1 to 10, are Mission Bay and the "most pristine areas" separated by 1 unit, or 10 units, or somewhere in between? In short, this justification for the threshold is mere verbiage.

"**Footnotes:**

[13] This is also a City criterion for defining "Air Pollutant Exposure Zones" (APEZ). (DSEIR, p. 5.4-12.) An APEZ is "an area in which modeled air pollution exceeds "either: (1) a cancer risk of greater than 100 per one million exposed, and/or (2) PM2.5 concentrations in excess of 10 microgram per cubic meter (ug/m3) (including ambient).... Since the Project is not in an APEZ, the subsequent criterion of significance is whether or not the Project will create an APEZ." (DSEIR, Appendix-TR, Air Quality Appendix, p. 9.)

[14] See e.g., DSEIR, p. 5.4-49 ["With the minimum level of compliance with this mitigation measure (Tier 2 plus NOX VDECS), increased cancer risk as a result of project construction activities at the maximally impacted receptor would be approximately 9.2 in one million and cumulative excess cancer risk at all receptor locations would be reduced to below the significance threshold of 100 per one million. While unmitigated increased cancer risk at the maximally impacted receptors would exceed the threshold of 100 in one million, with implementation of Mitigation Measure M-AQ-1 (Construction Emissions Minimization), increased cancer risk at the maximally impacted receptors would be below the threshold of 100 in one million"].)

[15] Footnote 21 cites to "54 Federal Register 38044, September 14, 1989." As of July 6, 2015, this document was not included on the City's AB900 mandated web page dedicated to preparing the administrative record concurrently with its CEQA review of the Project. (See Pub. Res. Code § 21186 (a), (b), and (c).)

[16] "In the proposed NCP [Superfund National Contingency Plan], the Agency [EPA] had defined the acceptable risk range as being from 10^{-4} to 10^{-7}, meaning that when the excess risk to an individual of contracting cancer due to a lifetime exposure to a certain concentration of a carcinogen falls between approximately 1 in 10,000 [100 in one million] and 1 in 10 million, it is judged to be an acceptable exposure. As a measure of additional protection, the proposal provided that there should be a "point of departure" of 10^{-6}, toward the more protective end of the scale, that should be used in setting preliminary remediation goals; if conditions warranted, the final remedy could achieve a level elsewhere within the range. ¶ The final rule maintained the point of departure of 10^{-6}, but narrowed the risk range to 10^{-4} through 10^{-6}. This action was taken in response to public comment and concerns that the Superfund range went below the accepted de minimis level used by other EPA programs and those of other federal agencies. ... the Agency has retained the discretion to select a cleanup level outside the range in appropriate circumstances (e.g., where concerns about sensitive populations, synergistic effects among chemical mixtures, etc., suggest that the remedy should attain a level below 10^{-6}. The use of a range of acceptable risk is general practice for most government programs. As discussed below in the section on role of cost, it affords the Agency the flexibility to take into account different situations, different kinds of threats, and different kinds of technical remedies. If a single risk level had been adopted, (e.g., at the more stringent end of the risk range), fewer alternatives would be expected to pass the protectiveness threshold and qualify for consideration in the balancing phase of the remedy selection process." (Id., 20 ELR 10237 [footnotes omitted].)

(*Mission Bay Alliance, Thomas Lippe, letter, July 26, 2015 [O-MBA8L2-12]*)

"3. The DSEIR does not assess the Project's individual excess cancer risk to the Bay Area Air Quality Management District's (BAAQMD) 10 in one million significance threshold.[2] Rather, it determines the Project's significance by comparing the cumulative cancer risk (background risk plus Project risk) to BAAQMD's cumulative risk threshold of 100 in one million.

"**Footnote:**

(*Mission Bay Alliance, Thomas Lippe, letter, July 26, 2015 [O-MBA8L2-28]*)

"**Failure to Assess Individual Health Risk from Proposed Project**

"The DSEIR fails to assess the individual health risk that construction of the Project may have on nearby sensitive receptors. According to the DSEIR, because "both the PM2.5 and cancer risk assessments account for background (existing) concentrations and risk levels," the Project's contribution to PM2.5 concentrations and excess cancer risks are instead combined with background concentrations, and are then compared to cumulative significance thresholds (Volume 2, p. 5.4-45). Instead, the DSEIR uses the individual project cancer risk threshold of 10 in one million to determine the significance of emissions from the proposed emergency generators, exclusively (Volume p. 5.4-46). This application of the 10 in one million threshold is inconsistent with CEQA thresholds set forth by BAAQMD. As a result, the significance of the Project's toxic air contaminant (TAC) emissions during construction is not adequately determined. An updated DSEIR should be prepared to accurately assess the Project's individual health risk according to CEQA guidance set forth by BAAQMD.

"The DSEIR does not apply the project risk threshold of 10 in one million to the Project as a whole (stationary, area, and mobile sources of TACs); rather, the DSEIR applies this threshold to stationary sources, exclusively, to the proposed emergency generators that will be used during Project operation (Volume 2, p. 5.4-46). The DSEIR explains this application by stating the following:

"The permitting process under BAAQMD Regulation 2, Rule 5 requires a Health Risk Screening Analysis, the results of which are posted on the District's website. Per its Policy and Procedure Manual, the BAAQMD requires implementation of Best Available Control Technology for Toxics and would deny an Authority to Construct or a Permit to Operate for any new or modified source of TACs that exceeds a cancer risk of 10 in one million" (Volume 2, p. 5.4-46).

"The requirements and thresholds set forth in BAAQMD's Regulation 2, Rule 5, as referred to in the DSEIR, however, apply only to stationary sources. As a result, the TAC emissions from on- and off-road mobile sources, such as construction equipment and heavy duty diesel trucks, are not held to any sort of significance threshold. This application of the 10 in one million threshold is inconsistent with CEQA thresholds set forth by BAAQMD. According to the BAAQMD's May 2011 Recommended Methods for Screening and Modeling Local Risks and Hazards, "the thresholds for local risks and hazards from TAC and PM2.5 are intended to apply to all sources of emissions, including both permitted stationary sources and on- and off-road mobile sources, such as sources related to construction, busy roadways, or freight movements."[18] Therefore, an individual project would be considered significant if the total project's TAC emissions, including exhaust from construction equipment, heavy duty diesel trucks, and diesel-powered generators, would result in an increased cancer risk greater than 10 in one million, or would result in an increased ambient air PM2.5 concentration greater than 0.3 $\mu g/m^3$.

"The BAAQMD's October 2009 Revised Draft Options and Justification Report[19] outlines four ways of siting a new source and determining a significance threshold. Any project with the potential to expose people (receptors) to substantial levels of TAC is currently deemed to have a significant impact. The BAAQMD uses the following approach (Option 1) to determine significance:

> "Proposed development projects that have the potential to expose receptors to TAC in excess of the following thresholds from any source, mobile or stationary would be considered to have a significant air quality impact if the:
>
> - Probability of contracting cancer for the Maximally Exposed Individual (MEI) exceeds 10 in one million.
> - Ground-level concentrations of non-carcinogenic toxic air contaminants would result in a Hazard Index greater than 1 for the MEI" (p. 59).

"The second option consists "of applying the current stationary source permitting thresholds to project-generated stationary, area-, and mobile-source TAC emissions" (p. 60). As previously stated, stationary sources of emissions are subject to BAAQMD's permit process per Regulation 2, Rule 5. The permitting process requires that all new or modified stationary sources that emit TACs perform modeling to determine what the concentration of TACs will be at the boundary of their property. This current permitting approach does not include area or mobile sources of emissions in the modeling or permitting assessment. If a proposed stationary source will have operational TAC concentrations from permitted equipment that result

in an estimated 1 excess cancer risk in a million, the project is required to install Toxic Best Available Control Technology (TBACT) to minimize emissions of TACs. The TAC modeling must also demonstrate to BAAQMD that implementation of the proposed project would not result in additional incremental exposure of surrounding receptors to levels that exceed 10 in one million for excess cancer risk or a hazard index above one. The BAAQMD will not issue an authority to construct or permit to operate for any stationary source of TACs that would result in concentrations exceeding a 10 in one million threshold.

"Option 2 expands on Option 1 by requiring the application of the one in a million threshold for stationary sources to install TBACT to projects that have TAC emissions from sources (primarily mobile) not currently required to obtain permits to operate. These non-stationary source type projects, such as the Warriors Arena Project, would be required to implement Toxic Best Practices (TBPs), such as site and circulation design, setbacks from roadways, air conditioning, and vegetation buffers, if their modeled cancer risks are above the one in a million threshold. The BAAQMD would identify a list of TBPs for non-stationary sources to implement if they are above the one in a million threshold. The threshold of significant impact, thereby requiring implementation of all feasible on-site mitigation measures would be the 10 in a million excess cancer risk and a HI of 1.0.

"The more stringent Option 3 involves application of a tiered CEQA threshold. New sources of TACs locating in impacted communities, as identified by the BAAQMD's Community Air Risk Evaluation (CARE) Program, would have to install TBACT and/or TBPs and would be subject to a significance threshold of 5 in one million (after consideration of TBACT and/or TBPs). New sources of TACs locating in a community other than an impacted community would be subject to a significance threshold of 10 in one million. Finally, Option 4 proposes a no net increase inhalation cancer risk. Option 4 does not define a "substantial change" because any increase would be considered significant.

"The first two options suggest that projects with the potential to expose receptors to TACs greater than 10 in one million excess cancers, from any source, mobile or stationary, should be considered significant. The third option suggests a more stringent significance threshold of 5 in one million, and the fourth option suggests an even more stringent threshold, which deems any increase in TACs as significant. Regardless, all four options specify that emissions from both stationary and mobile sources be included when determining project significance. As a result, the maximum threshold that could reasonably apply to the Project's stationary and mobile source TAC emissions is the BAAQMD's individual project threshold of 10 in one million.

(*Mission Bay Alliance, Thomas Lippe, letter, July 26, 2015 [O-MBA8L2-33]*)

"**Failure to Use District's PM2.5 Cumulative Threshold**

"To evaluate the cumulative impacts of the Project, the DSEIR implements criteria used to define an Air Pollutant Exposure Zone (APEZ). The DSEIR states:

> "an APEZ [is] defined as an area in which modeled air pollution exceeds 'either: (1) a cancer risk of greater than 100 per one million exposed, and/or (2) PM2.5 concentrations in excess of 10 microgram per cubic meter ($\mu g/m^3$) (including ambient)'" (Volume 3, Appendix AQ, p. 9).

"The cancer risk cumulative threshold of 100 in one million, used in the DSEIR, is consistent with the cumulative cancer risk threshold set forth by the BAAQMD, but not, as explained above, with the individual project cancer risk threshold. However, the PM2.5 threshold of 10 $\mu g/m^3$ is inconsistent with the BAAQMD's cumulative threshold, and represents a value that is far greater than the BAAQMD's

recommended value. According to the BAAQMD's May 2011 CEQA Guidelines, "a project would have a significant cumulative impact if the total of all past, present, and foreseeable future sources within a 1,000 foot radius (or beyond where appropriate) from the fence line of a source, or from the location of a receptor, plus the contribution from the project, exceeds the following:

- Non- compliance with a qualified Community Risk Reduction Plan;
- An excess cancer risk levels of more than 100 in one million or a chronic hazard index greater than 10 for TACs; or
- 0.8 μg/m^3 annual average PM2.5."[20]

"BAAQMD suggests that a project would have a significant cumulative impact if the total of all past, present, and foreseeable future sources within a 1,000 foot radius would result in an annual average PM2.5 concentration greater than 0.8 μg/m^3. This threshold is much more stringent when compared to the 10 μg/m^3 threshold used in the DSEIR. As a result, the DSEIR should implement the recommended cumulative threshold set forth by BAAQMD, rather than the 10 μg/m^3 threshold.

"Furthermore, the DSEIR uses BAAQMD thresholds to determine the significance of other air quality impacts, but then uses APEZ criteria to determine health risk significance, even though BAAQMD suggests significance thresholds for cumulative health risks. For example, the DSEIR uses BAAQMD's average daily emissions construction thresholds to determine significance of construction emissions on air quality (Volume 2, p. 5.4-25). As is apparent, there is a huge discrepancy between the 10 μg/m^3 threshold used in the DSEIR and the 0.8 μg/m^3 cumulative threshold recommended by BAAQMD. Using an alternative threshold, rather than the one set forth by BAAQMD, demonstrates that the Applicant is picking and choosing the thresholds that apply to the Project to determine significance.

(*Mission Bay Alliance, Thomas Lippe, letter, July 26, 2015 [O-MBA8L2-34]*)

Response AQ-1c: Health Risk Significance Thresholds

The comment disputes the validity of using the 100 in one million incremental cancer risk as a threshold of significance for determining cumulative impacts from toxic air contaminants. The comment also states that the BAAQMD recommended threshold for individual projects (10 per one million) was ignored.

The threshold used in the Draft SEIR of 100 in a million incremental cancer risk threshold for assessing cumulative impacts from toxic air contaminants is appropriate and supported by substantial evidence. As explained in Response AQ-1, a lead agency has discretion to determine the appropriate threshold of significance to evaluate the severity of a particular impact. A lead agency's determination of whether to characterize impacts as significant necessarily requires the lead agency to make policy judgments. As the CEQA Guidelines explain, "[t]he determination of whether a project may have a significant effect on the environment calls for careful judgment on the part of the public agency involved, based to the extent possible on scientific and factual data." (CEQA Guidelines, § 15064, subd. (b).) An agency may, but is not required to, rely on thresholds of significance recommended or adopted by other agencies. (See *Rialto Citizens for Responsible Growth v. City of Rialto* (2012) 208 Cal.App.4th 899 [agency may rely on thresholds recommended

by other agencies]; *Save Cuyama Valley v. County of Santa Barbara* (2013) 213 Cal.App.4th 1059, 1068 [agency discretion to fashion significance thresholds of significance].) In any event, agencies are permitted to use their expertise and must make policy judgments to determine the threshold of significance that is appropriate for a particular impact.

Here, the Draft SEIR explains in detail the rationale for using 100 in one million as the threshold of significance for increased cumulative cancer risk from TACs. (See SEIR, p. 5.4-13; 5.4-27.) The health risk thresholds identified in the SEIR on pp. 5.4-27 to 5.4-28 are based on a combination of the BAAQMD 2010 CEQA Guidelines and assessments by the City of localized sources of toxic air contaminants and proximity to sensitive receptors. The thresholds developed by the City and relied on by OCII do not ignore a threshold of 10 per one million for individual project emissions as the comment suggests. Instead, the project site conditions were such that the threshold did not apply in this instance as further explained below.

The City in partnership with the BAAQMD has identified the Air Pollutant Exposure Zone in the City – areas with poor air quality under existing and cumulative conditions[6]. The project site is not located within an Air Pollutant Exposure Zone. The SEIR states that in such a case, if the project could result in sensitive receptor locations meeting the Air Pollutant Exposure Zone criteria that otherwise would not occur without the project, a significant impact would occur if the proposed project results in an excess cancer risk greater than 10.0 per million (page 5.4-27). The analysis demonstrated that the project would not result in sensitive receptor locations meeting the Air Pollutant Exposure Zone criteria. Therefore, the 10.0 per million excess cancer risk criterion does not apply. Using this tiered threshold approach, the City can minimize the creation of new Air Pollutant Exposure Zones and the impact on existing Air Pollutant Exposure Zones through the CEQA process.

The localized health risk thresholds explained above were developed based on City specific information and consultation with BAAQMD staff[7] as part of the development of both the City's Clean Construction Ordinance and Article 38 of the San Francisco Health Code, which addresses toxic air contaminants and sensitive land use developments within the Air Pollutant Exposure Zone. As part of the development of these codes and ordinances, the Planning Department and the San Francisco Public Health Department (DPH) partnered with the BAAQMD to inventory and assess air pollution and exposures from vehicles, stationary, and area sources within San Francisco.

---

6 San Francisco DPH, the Planning Department, and the Bay Area Air Quality Management District have worked together to utilize third-party-verified modeling to identify locations in the City that exceed two health-based criteria: 1) an excess cancer risk from all modeled sources; and 2) PM2.5 concentrations from all modeled sources (including ambient) that exceed defined health-protective limits. These locations are referred to as the Air Pollutant Exposure Zone. In addition, the City has identified parcels within 500 feet of elevated freeways as part of the Air Pollutant Exposure Zone, consistent with guidance from the California Air Resources Board. A "health vulnerability layer" was then added based on the Air District's evaluation of health vulnerability in the Bay Area. For those zip codes in the worst quintile of Bay Area Health Vulnerability scores (94102, 94103, 94105, 94124, and 94130), the City lowered the standard for identifying city lots in the Air Pollutant Exposure Zone to: (1) excess cancer risk greater than 90 per one million persons exposed, and/or (2) PM25 concentrations in excess of 9 μg/m3.

7 BAAQMD staff was also present and spoke in support at an October 6, 2014 public hearing during which the Ordinance was considered and recommended for approval by the San Francisco Board of Supervisors Land Use and Economic Development Committee.

Citywide dispersion modeling was conducted using AERMOD[8] to assess the emissions from the following primary sources: roadways, permitted stationary sources, port and maritime sources, and Caltrain. Emissions of PM_{10} (DPM is assumed equivalent to PM_{10}), $PM_{2.5}$, and total organic gases (TOG) were modeled on a 20-meter-by-20-meter receptor grid covering the entire City. The results represent a comprehensive assessment of existing cumulative exposures to air pollution throughout the City. The methodology and technical documentation for modeling citywide air pollution is available in the document entitled *The San Francisco Community Risk Reduction Plan: Technical Support Documentation*.[9]

With further consultation among the Planning Department, DPH, and BAAQMD staff and the public, the City identified areas with poor air quality, termed "Air Pollutant Exposure Zone." Projects within an Air Pollutant Exposure Zone require special consideration when siting uses that emit toxic air contaminants (such as construction equipment exhaust) or siting sensitive land uses.

Modeling and mapping of all known existing sources of air pollution as well as identifying the criteria for an Air Pollutant Exposure Zone involved considerable stakeholder outreach and public participation. The designation and establishment of Air Pollutant Exposure Zone was subsequently adopted by the San Francisco Board of Supervisors and is codified in both the Article 38 of the San Francisco Health Code and as part of the Clean Construction Ordinance (Ordinance No. 28-15). Sites outside an Air Pollutant Exposure Zone have generally good air quality, even for sensitive populations. Within and outside the Air Pollutant Exposure Zone, projects that could emit substantial pollutant concentrations require more detailed analysis to determine if the impacts are significant.

The project site is not within an Air Pollutant Exposure Zone and, based on citywide modeling, the highest mitigated risk at a receptor near the project site (UCSF Hospital) from the contribution of emissions from all modeled sources is an excess cancer risk of 86 per one million persons exposed with an increased risk of 44 per one million due to background ambient sources and the remainder from modeled vehicles (construction and operation) and stationary source contributions from the project. These levels are below the SEIR threshold levels for identifying when sensitive populations may be exposed to substantial pollutant concentrations. The SEIR clearly discloses the threshold levels for this location as a cancer risk of 100 per one million (SEIR p. 5.4-27).

Evidence collected by the Planning Department and the BAAQMD guides establishment of the significance thresholds used by OCII, and the thresholds are specifically designed to ensure that the

[8] AERMOD is the USEPA's preferred/recommended steady state air dispersion plume model. For more information on AERMOD and to download the AERMOD Implementation Guide see www.epa.gov/ttn/scram/dispersion_prefrec.htm#aermod (accessed May 20, 2014).

[9] Bay Area Air Quality Management District, San Francisco Department of Public Health, and San Francisco Planning Department, *The San Francisco Community Risk Reduction Plan: Technical Support Documentation*, December 2012. Available online at ftp.baaqmd.gov/pub/CARE/SFCRRP/SF_CRRP_Methods_and_Findings_v9.pdf. Accessed February 25, 2015.

ambient air quality standards are not exceeded. U.S. EPA's Residual Risk Report to Congress[10] set an upper limit of acceptability of 1 in 10,000 (i.e., 100 in 1 million) lifetime cancer risk for the most exposed individual. In the Benzene NESHAP rule, EPA explained, "The EPA will generally presume that if the risk to that individual [the Maximum Individual Risk] is no higher than approximately 1 in 10 thousand, that risk level is considered acceptable and EPA then considers the other health and risk factors to complete an overall judgment on acceptability." More restrictive thresholds are identified in Residual Risk Report to Congress and are for the purposes of identifying a de minimis threshold for screening level assessments below which a refined analysis is not required.

Further, the contributions considered in the report consider specific sources of a permitted facility. Because the 100 in one million threshold used in the analysis of the SEIR is used as a cumulative threshold that considers multiple sources not typically considered by EPA in a facility analysis, such as contributions from roadways and railways, as well as from multiple stationary sources from multiple operators as well as from construction activity, the 100-in-one-million threshold serves as an appropriately conservative threshold for such an analysis. As the lead agency, OCII may consider thresholds recommended by other agencies provided that those thresholds are supported by substantial evidence, such as that discussed above.

It should be noted that when BAAQMD developed its 100 in one million cumulative criterion characterized in its CEQA Air Quality Guidelines as reflective of air quality in a "pristine" portion of the Bay area, it was originally designated as its "Point Reyes" approach,[11] reflecting the air quality in this National Seashore that the U.S. Park Service identifies as a Class I Park and wilderness area. Consequently, even such pristine areas as Point Reyes National Seashore can have a sizeable background cancer risk, largely due to cumulative global atmospheric transport.

The Draft SEIR identified a significant impact under Impact AQ-3 with regard to localized increases in cancer risk and identified Mitigation Measure M-AQ-1 Construction Emissions Minimization to reduce this impact to a less than significant level. As part of the Responses to Comments document, a refined health risk analysis was performed for the relocation of the emergency standby generators (see Chapter 12), and the results indicated that Impact AQ-3 would be less than significant. However, Mitigation Measure M-AQ-1 is still required to address the significant air quality impact identified for Impact AQ-1. Consequently, no statement of overriding considerations is necessary with respect to localized increases in cancer risk.

Because the SEIR, with the refined analysis, concludes that the impact is less than significant, the comment's discussion regarding a "statement of overriding considerations" is not applicable with respect to Impact AQ-3. CEQA provides that a project may be approved despite its significant and unavoidable impacts if the agency adopts a statement of overriding considerations stating the specific reasons to support its action. (Pub. Resources Code, § 21081,

[10] U.S. Environmental Protection Agency (U.S. EPA), Office of Air Quality Planning and Standards, Residual Risk Report to Congress, March, 1999.
[11] BAAQMD, Bay Area Air Quality Management District CEQA Guidelines Public Workshop Presentation, "Developing Thresholds of Significance", Slide 10, February 26, 2009.

subd. (b); CEQA Guidelines, § 15093.) As noted in the comment, however, an agency may not adopt a statement of overriding considerations in lieu of proposing feasible mitigation measures for significant impacts. (See *City of Marina v. Board of Trustees of the California State University* (2006) 39 Cal.4th 341.) That has not occurred here. Rather, here, OCII properly exercised its discretion in determining the appropriate thresholds of significance to analyze toxic air contaminants and the Draft SEIR proposes feasible mitigation that would reduce the impact to a less than significant level. Therefore, it is not necessary to adopt a statement of overriding considerations and the commenter's reliance on *City of Marina v. Board of Trustees of the California State University* (2006) 39 Cal.4th 341, is misplaced.

The response to comments O-MBA8L2-7 and O-MBA8L2-9 in Section 13.13.7: Mitigation Measure, Feasibility and Enforcement later in this section provides substantial evidence for the availability of construction equipment capable of achieving the risk reductions presented in Table 5.4-11 of the SEIR.

Issues Raised by Commenters: $PM_{2.5}$ Significance Thresholds (AQ-1d)

This response addresses all or part of the following comments, which are quoted below:

O-MBA8L2-13 O-MBA8L2-29 O-MBA8L2-34

"**b. The DSEIR's health impact assessment for Project-caused increases in $PM_{2.5}$ invalid.**

"The DSEIR uses a threshold of significance for the Project's health impact of increasing PM2.5 concentrations of "10 µg/cubic meter." As discussed above, for criteria pollutants, the DSEIR borrows thresholds of significance from the BAAQMD to determine the significance of both the direct, incremental increase in emissions caused by the Project, and the Project's contribution to cumulative increase in emissions in the area.

"In contrast, in its assessment of the Project's health impact of increasing PM2.5 concentrations, the Project ignores BAAQMD's stated cumulative threshold of 0.8 µg/cubic meter.(See Exhibit 1, p. 2-2.) According to BAAQMD, "Cumulative emissions within the 1,000 foot evaluation zone would be considered significant where the increased average annual ground-level concentrations of PM2.5 would be greater than 0.8 µg/m3." (Exhibit 4, p. 5.)

"Obviously, there is a huge discrepancy between the 10 µg/cubic meter threshold used in the DSEIR compared to the 0.8 ug/cubic meter threshold recommended by BAAQMD. This discrepancy is particularly troubling given that the DSEIR reports Project-caused cumulative increases in PM2.5 concentrations just below the 10 µg/cubic meter threshold, but well above the 0.8 µg/cubic meter threshold.

"It would appear, once again, that the DSEIR has cherry-picked a threshold of significance to avoid finding the Project's health risk impact from increases in PM2.5 significant." (*Mission Bay Alliance, Thomas Lippe, letter, July 26, 2015 [O-MBA8L2-13]*)

"4. The DSEIR also fails to utilize BAAQMD's cumulative PM2.5 threshold of 0.8 µg/m^3." (*Mission Bay Alliance, Thomas Lippe, letter, July 26, 2015 [O-MBA8L2-29]*)

"**Failure to Use District's PM2.5 Cumulative Threshold**

"To evaluate the cumulative impacts of the Project, the DSEIR implements criteria used to define an Air Pollutant Exposure Zone (APEZ). The DSEIR states:

> "an APEZ [is] defined as an area in which modeled air pollution exceeds 'either: (1) a cancer risk of greater than 100 per one million exposed, and/or (2) PM2.5 concentrations in excess of 10 microgram per cubic meter (µg/m^3) (including ambient)'" (Volume 3, Appendix AQ, p. 9).

"The cancer risk cumulative threshold of 100 in one million, used in the DSEIR, is consistent with the cumulative cancer risk threshold set forth by the BAAQMD, but not, as explained above, with the individual project cancer risk threshold. However, the PM2.5 threshold of 10 µg/m^3 is inconsistent with the BAAQMD's cumulative threshold, and represents a value that is far greater than the BAAQMD's recommended value. According to the BAAQMD's May 2011 CEQA Guidelines, "a project would have a significant cumulative impact if the total of all past, present, and foreseeable future sources within a 1,000 foot radius (or beyond where appropriate) from the fence line of a source, or from the location of a receptor, plus the contribution from the project, exceeds the following:

- Non- compliance with a qualified Community Risk Reduction Plan;
- An excess cancer risk levels of more than 100 in one million or a chronic hazard index greater than 10 for TACs; or
- 0.8 µg/m^3 annual average PM2.5."[20]

"BAAQMD suggests that a project would have a significant cumulative impact if the total of all past, present, and foreseeable future sources within a 1,000 foot radius would result in an annual average PM2.5 concentration greater than 0.8 µg/m^3. This threshold is much more stringent when compared to the 10 µg/m^3 threshold used in the DSEIR. As a result, the DSEIR should implement the recommended cumulative threshold set forth by BAAQMD, rather than the 10 µg/m^3 threshold.

"Furthermore, the DSEIR uses BAAQMD thresholds to determine the significance of other air quality impacts, but then uses APEZ criteria to determine health risk significance, even though BAAQMD suggests significance thresholds for cumulative health risks. For example, the DSEIR uses BAAQMD's average daily emissions construction thresholds to determine significance of construction emissions on air quality (Volume 2, p. 5.4-25). As is apparent, there is a huge discrepancy between the 10 µg/m^3 threshold used in the DSEIR and the 0.8 µg/m^3 cumulative threshold recommended by BAAQMD. Using an alternative threshold, rather than the one set forth by BAAQMD, demonstrates that the Applicant is picking and choosing the thresholds that apply to the Project to determine significance.

"**Footnote:**

Response AQ-1d: PM2.5 Significance Thresholds

The comment disputes the validity of using cumulative PM2.5 concentrations of 10 micrograms per cubic meter (µg/m^3) as the threshold of significance for determining the project's health impacts from PM2.5 emissions. Instead, the comment suggests the Draft SEIR should have found

that the project would have a significant cumulative impact if the total of all past, present, and foreseeable future sources within a 1,000 foot radius, plus the project, would result in an annual average $PM_{2.5}$ concentration greater than 0.8 $\mu g/m^3$. The threshold used by OCII for assessing the significance of cumulative levels of $PM_{2.5}$, which follows the City's approach, is supported by substantial evidence and satisfies the requirements of CEQA. As stated in Response AQ-1c, a lead agency's determination of whether to characterize impacts as significant necessarily requires the lead agency to make policy judgments. Agencies are permitted to use their expertise and make policy judgments to determine the threshold of significance that is appropriate for a particular impact.

The overall $PM_{2.5}$ maximum cumulative concentration reported in the Draft SEIR that is expected to result at the project site with the project and existing ambient levels is 9.0 $\mu g/m^3$ with 8.6 $\mu g/m^3$ $PM_{2.5}$ due to background ambient sources. The project contribution is 0.4 $\mu g/m^3$ from modeled vehicles (construction and operation) and stationary source contributions from the project. The cumulative level of 9.0 $\mu g/m^3$ is below the SEIR threshold level of 10 $\mu g/m^3$ for identifying when sensitive populations may be exposed to substantial pollutant concentrations. The SEIR clearly discloses the threshold level for this location as a $PM_{2.5}$ concentration above 10 $\mu g/m^3$ (SEIR p. 5.4-27).

With respect to the selected threshold for $PM_{2.5}$ exposure, OCII relied on San Francisco specific thresholds developed by the City in consultation with BAAQMD and in reference to USEPA policy guidance. The project site is not within an identified Air Pollutant Exposure Zone (where the City would apply a more stringent incremental limit); therefore the exposure criteria limit that the City applies to this location is based on cumulative $PM_{2.5}$ concentrations greater than 10 $\mu g/m^3$. This threshold is inclusive of existing background concentrations and is more stringent than either federal or state ambient air quality standards.

To more specifically explain the genesis of the standard the City is using, as further stated on SEIR page 5.4-12, in April 2011, the USEPA published *Policy Assessment for the Particulate Matter Review of the National Ambient Air Quality Standards*. In this document, USEPA staff concludes that the then-current federal annual $PM_{2.5}$ standard of 15 $\mu g/m^3$ should be revised to a level within the range of 13 to 11 $\mu g/m^3$, with evidence strongly supporting a standard within the range of 12 to 11 $\mu g/m^3$. The Air Pollutant Exposure Zones established in San Francisco as explained in Response AQ-1a are based on the health protective $PM_{2.5}$ standard of 11 $\mu g/m^3$, as supported by the USEPA's Particulate Matter Policy Assessment, although lowered by City of San Francisco staff in consultation with BAAQMD staff to 10 $\mu g/m^3$ to account for uncertainty in accurately predicting air pollutant concentrations using emissions modeling programs and hence are even more conservative as a significance threshold. The project site is not in an Air Pollutant Exposure Zone and the cumulative levels of $PM_{2.5}$ with the project will not exceed 10 $\mu g/m^3$, a health-protective level as documented above. Therefore, the SEIR properly concluded that the project impact to $PM_{2.5}$ would not be significant.

13.13.3 Dust Control Plan (AQ-2)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

O-MBA8L2-2 I-Hong 4

"**I. The DSEIR Is Not Sufficient as an Informational Document with Respect to Air Quality Impacts.**

A. Dust: the DSEIR's impact assessment for construction-related dust pollution is based on legal errors and not supported by substantial evidence.

Regarding dust pollution, the DSEIR states:

The site-specific Dust Control Plan would require the project sponsor to: submit a map to the Director of Public Health showing all sensitive receptors within 1,000 feet of the site; wet down areas of soil at least three times per day; provide an analysis of wind direction and install upwind and downwind particulate dust monitors; record particulate monitoring results; hire an independent, third-party to conduct inspections and keep a record of those inspections; establish shut-down conditions based on wind, soil migration, etc.; establish a hotline for surrounding community members who may be potentially affected by project-related dust; limit the area subject to construction activities at any one time; install dust curtains and windbreaks on the property lines, as necessary; limit the amount of soil in hauling trucks to the size of the truck bed and securing with a tarpaulin; enforce a 15 mph speed limit for vehicles entering and exiting construction areas; sweep affected streets with water sweepers at the end of the day; install and utilize wheel washers to clean truck tires; terminate construction activities when winds exceed 25 mph; apply soil stabilizers to inactive areas; and sweep off adjacent streets to reduce particulate emissions. The project sponsor would be required to designate an individual to monitor compliance with these dust control requirements.

(DSEIR, p. 5.4-30.)

"The Dust Control Plan is either part of the project description, or a mitigation measure, or both. Either way, what the Project Sponsor is actually going to do to control dust - on the ground -must be described. Otherwise, the DSEIR violates CEQA.

"If the Dust Control Plan is part of the project description, the DSEIR fails to present a complete project description, making it impossible for the public or other agencies to comment on the potential environmental impacts of this part of the project.

"If the Dust Control Plan is a mitigation measure, the DSEIR defers the development of this mitigation measure until after Project approval, without meeting CEQA requirements for doing so, because (1) Article 22 B specifies a suite of measures but does not require the adoption of any in particular, (2) the DSEIR does not specify a performance standard by which the success of the Dust Control Plan can be judged, and (3) there is no evidence it is impracticable to develop and include the Dust Control Plan in the DSEIR, before project approval. (*Communities for a Better Environment v. City of Richmond* (2010) 184 Cal.App.4th 70, 95 (CBE); *Gentry v. City of Murrieta* (1995) 36 Cal.App.4th 1359; 1394 (*Gentry*).

"Also, by failing to identify the Dust Control Plan as a CEQA mitigation measure, the DSEIR throws the enforceability of the Plan under CEQA into doubt. (See *Federation of Hillside & Canyon Associations v. City of Los Angeles* (2000) 83 Cal.App.4th 1252, 1260-1262; *Lincoln Place Tenants Association v. City of Los Angeles* (2005) 130 Cal.App.4th 1491, 1508 ["mitigating conditions are not mere expressions of hope..."]. (*Mission Bay Alliance, Thomas Lippe, letter, July 26, 2015 [O-MBA8L2-2]*)

"4. I realize that the control of Fugitive Dust and construction work is hard to handle. All to[o] often the "best practices" does not work. But with all this work going on how will it affect/impact the ongoing adjacent projects, UCSF's adjacent facilities and their daily operations? The current project at Union Square, Central Subway Station is doing a better than usual job in controlling the dust from entering these high-end retail shops. This includes the California Pacific Medical Center along the Van Ness Corridor. (Use of semi- closed barriers with mesh screens). This may be an better option than some of the best practices." (*Dennis Hong, email, July 27, 2015 [I-Hong-4]*)

Response AQ-2: Dust Control Plan

The comment states that the SEIR improperly relies on compliance with the San Francisco Construction Dust Control Ordinance in finding the project's construction-related dust impacts will be less than significant.

As explained in the SEIR, the project sponsor is required to comply with the San Francisco Construction Dust Control Ordinance (San Francisco Health Code Article 22B and San Francisco Building Code Section 106A.3.2.6). The City adopted the ordinance to reduce the quantity of dust generated during site preparation, demolition, and overall construction work in order to protect the health of the general public and onsite workers, to minimize public nuisance complaints, and to avoid orders to stop work by the Department of Building Inspection (DBI). The ordinance represents a regulation of general applicability, adopted for the purpose of environmental protection, that is not peculiar to the parcel or to the project. (CEQA Guidelines, § 15183.)

Additionally, the Risk Management Plan (RMP) requires a dust plan and dust monitoring for all construction work in Mission Bay. The RMP is enforceable by the Regional Water Quality Control Board through the recorded Covenant and Environmental Restrictions. With respect to dust control, RMP section 4.3.1 specifies measures that must be implemented, contains a Dust Plan and, specifies circumstances under which dust monitoring is required. Performance standard and specified mandatory measures are included, such as watering of active construction areas to prevent visible dust plumes from migrating outside of the parcel under development, hydroseeding any areas that are not actively under construction for ten days or more, etc. For the daily average, the airborne dust action level for PM_{10} is 50 micrograms per cubic meter ($\mu g/m^3$) or baseline dust (i.e., the difference between upwind and downwind dust levels), whichever is higher. For the 10-minute time weighted average (TWA), the airborne dust action level is 250 $\mu g/m^3$. The mechanisms ensuring that these plans are developed and implemented are described in detail on SEIR pages 5.4-22 and 5.4-23 as well as in the impact discussion on page 5.4-30.

The Construction Dust Control Ordinance requires that all site preparation work, demolition, or other construction activities within San Francisco that have the potential to create dust or to expose or disturb more than 10 cubic yards or 500 square feet of soil comply with specified dust control measures whether or not the activity requires a permit from the Department of Building Inspection (DBI). For projects over one-half acre, the Dust Control Ordinance requires that the project sponsor submit a Dust Control Plan for approval by the San Francisco Department of Public Health (DPH) prior to issuance of a building permit by the DBI which has already been submitted by the sponsor. The goal of the Dust Management Plan is no visible dust and includes a mechanism to temporarily

stop work and apply more aggressive dust control measures, until there are no visible dust clouds migrating off-site.

Building permits will not be issued without written notification from the Director of Public Health that the applicant has an approved site-specific Dust Control Plan in place. The Construction Dust Control Ordinance requires project sponsors and contractors responsible for construction activities to control construction dust on the site or implement other practices that result in equivalent dust control that are acceptable to the Director of Public Health.

As explained in the SEIR, due to the project's size, the project sponsor is required to prepare a Dust Control Plan, which has already been submitted to the San Francisco DPH and received conditional approval.[12] That plan must include a number of equivalent measures to minimize dust. Specifically, the site-specific Dust Control Plan requires the project sponsor to: submit a map to the Director of Public Health showing all sensitive receptors within 1,000 feet of the site; wet down areas of soil at least three times per day; provide an analysis of wind direction and install upwind and downwind particulate dust monitors; record particulate monitoring results; hire an independent, third-party to conduct inspections and keep a record of those inspections; establish shut-down conditions based on wind, soil migration, etc.; establish a hotline for surrounding community members who may be potentially affected by project-related dust; limit the area subject to construction activities at any one time; install dust curtains and windbreaks on the property lines, as necessary; limit the amount of soil in hauling trucks to the size of the truck bed and securing with a tarpaulin; enforce a 15 mph speed limit for vehicles entering and exiting construction areas; sweep affected streets with water sweepers at the end of the day; install and utilize wheel washers to clean truck tires; terminate construction activities when winds exceed 25 mph; apply soil stabilizers to inactive areas; and sweep off adjacent streets to reduce particulate emissions. The project sponsor will be required to designate an individual to monitor compliance with these dust control requirements. These requirements are laid out in the SEIR. (SEIR, pp. 5.4-29 to 5.4-31; 5.4-22 to 5.4-23.) Please also see Section 13.22, Response HAZ-3 for further description of the Dust Control Plan.

The requirements described above, which are also described in the SEIR, are mandatory for all construction projects in the City. For example, the San Francisco Building Code Section 106A.3.2.6 states that: "Dust control required. All applicants for a building, demolition, excavation, grading, foundation, or other permit required by this Code to construct a new building, to demolish a building, to substantially alter or to add to an existing building shall comply with the requirements for dust control and, in addition, for projects over a half acre the applicant will be required to submit a Dust Control Plan for approval by the San Francisco Health Department as set forth in Article 22B of the San Francisco Health Code."

The BAAQMD has acknowledged that implementation of best management practices represent sufficient insurance of avoiding significant impacts related to fugitive dust generated by

[12] City and County of San Francisco, Department of Public Health, Environmental Health. Dust Monitoring Plan Conditional Approval, Golden State Warriors Arena, Blocks 29-32, San Francisco, CA 94158, September 15, 2015.

construction activities.[13] Studies[14] have demonstrated that the application of best management practices at construction sites have significantly controlled fugitive dust emissions. Individual measures have been shown to reduce fugitive dust by anywhere from 30 percent to more than 90 percent. These studies support BAAQMD staff's recommendation that projects implementing these construction best management practices will reduce fugitive dust emissions to a less than significant level.[15] In the aggregate, best management practices will substantially reduce fugitive dust emissions from construction sites. These studies support the SEIR's finding that projects implementing construction best management practices will reduce fugitive dust emissions to a less than significant level.

In light of these requirements, it is reasonable to assume the project will comply with the ordinance. (*Oakland Heritage Alliance v. City of Oakland* (2011) 195 Cal.App.4th 884 [holding it was reasonable for agency to expect that environmental regulations would be followed].) There is also substantial regulatory oversight built into the City's ordinance. For example, the Dust Control Plan must be approved by the San Francisco Department of Public Health (DPH) prior to issuance of a building permit by the DBI. The project sponsor must hire an independent, third-party to conduct inspections and keep a record of those inspections and must designate an individual to monitor compliance with the dust control requirements. The project sponsor has submitted an updated Dust Control Plan to the City in October of 2015. The plan provides additional information regarding how the project sponsor will carry out these obligations. The plan has already been developed and received conditional approval by the DPH. Although they are not project-specific mitigation measures, these existing regulatory requirements will be included in the Mitigation Monitoring and Reporting Program (MMRP) for the project, to further help the public understand compliance documentation for this particular regulation. (Pub. Resources Code, § 21081.6, subd. (a); *Lincoln Place Tenants Assn. v. City of Los Angeles* (2007) 155 Cal.App.4th 425, 446.) Therefore, the comment's skepticism regarding the enforceability of the Dust Control Plan is unwarranted.

The comment also states the SEIR cannot rely on compliance with existing regulations in finding an impact will be less than significant. This statement is incorrect. California courts recognize that an agency may rely on compliance with existing regulations or requirements in finding a project's impacts would be less than significant. (See, e.g., *Tracy First v. City of Tracy* (2009) 177 Cal.App.4th 1933 [holding agency could rely on project's compliance with Building Code's energy efficiency standards for conclusion that project would not have significant energy impacts, and therefore did not require mitigation]; *Oakland Heritage Alliance v. City of Oakland* (2011) 195 Cal.App.4th 884 [project's compliance with existing laws and regulations provided substantial evidence that seismic impacts would be less than significant].) In fact, reliance on compliance with the applicable regulatory framework is common and widely accepted CEQA practice. (See *ibid*.; see also *City of*

[13] BAAQMD, *Revised Draft Options and Justification Report, California Environmental Quality Act Thresholds of Significance,* October 2009, pages 2 and 25.
[14] Western Regional Air Partnership. 2006. *WRAP Fugitive Dust Handbook.* September 7, 2006. Available: http://www.wrapair.org/forums/dejf/fdh/content/FDHandbook_Rev_06.pdf. Accessed September 2015.
[15] Bay Area Air Quality Management District, *CEQA Air Quality Guidelines*, May 2011, page D-47.

Maywood v. Los Angeles Unified School Dist. (2012) 208 Cal.App.4th 362, 411-412 [citing compliance with regulatory standards as adequately addressing hazardous materials at school site].)

Because compliance with the City's Construction Dust Control Ordinance is not mitigation, the comment's claim that reliance on the ordinance is improper deferral of mitigation is misplaced. In any event, even if compliance with the ordinance could be considered mitigation, it would not constitute improper deferral of mitigation. Courts may find that mitigation is improperly deferred when an agency concludes that a project's significant impacts will be reduced to a less than significant level or avoided with the implementation of a mitigation measure that has not yet been formulated and for which success is uncertain. (See *Center for Biological Diversity v. Department of Fish and Wildlife* (2015) 234 Cal.App.4th 214, 240 ["Impermissible deferral of mitigation measures occurs when an EIR puts off analysis or orders a report without either setting standards or demonstrating how the impact can be mitigated in the manner described in the EIR. [Citation.]"].) For example in *Gentry v. City of Murrieta* (1995) 36 Cal.App.4th 1359, cited in the comment, the court found that a mitigation measure adopted to reduce impacts to the Stephens' kangaroo rat was improperly deferred. The measure provided that the project sponsor would obtain biological report regarding the Stephens' kangaroo rat only "if deemed necessary by the Planning Director," and in that event, the project sponsor would comply with any recommendations in the future report. (*Id*. at p, 1396.) The court found the measure constituted improper deferral of mitigation because it deferred analysis of the impact itself until after project approval and merely required the project sponsor to comply with unspecified recommendations in a future report that may never be prepared and there was no evidence that the measure would mitigate impacts to the Stephens' kangaroo rat. (*Ibid*.) Because it was not certain whether a report would ever be prepared, whether any additional mitigation would be imposed, or whether the measure would result in any reduction in impacts, the court held it was improper for the agency to rely on the measure in adopting a negative declaration. (*Ibid*.)

That has not occurred here. The SEIR discusses fugitive dust in detail and acknowledges that project-related demolition, excavation, grading, and other construction activities may cause windblown dust that could contribute particulate matter into the local atmosphere. The SEIR explains that health risks associated with particulate matter (i.e., fugitive dust) require that, where possible, public agencies take feasible available actions to reduce sources of particulate matter exposure. The San Francisco Construction Dust Control Ordinance was adopted for this purpose. It describes actions that must be taken to limit fugitive dust for construction projects to minimize health effects. Compliance with these requirements is feasible and mandatory and will ensure that potential dust-related construction air quality impacts of the project will be less than significant. The project sponsor has submitted a Dust Control Plan applying these requirements to this project. Therefore, the SEIR properly relied on compliance with the ordinance in finding potential dust-related construction air quality impacts of the project will be less than significant.

The City's Construction Dust Control Ordinance establishes "best management practices," or "BMPs," to reduce dust emissions during construction. An agency's decision to rely on BMPs to address a project's impacts has been upheld on numerous occasions under both federal and state law. (See *Hapner v. Tidwell*, 621 F.3d 1239, 1246 (9th Cir. 2010) [citing use of BMPs to reduce soil

disturbance during logging operations]; *Envtl. Prot. Info. Ctr. v. U.S. Forest Serv.*, 451 F.3d 1005, 1015-16 [references to detailed BMPs incorporated into proposed timber sale supported the conclusion agency had taken "hard look" at project's impacts as required by National Environmental Policy Act]; *Alaska Survival v. Surface Transp. Bd.*, 705 F.3d 1073, 1089 (9th Cir. 2013); [agency properly relied on BMPs imposed under the Clean Water Act as mitigation for wetlands impacts]; *Endangered Habitats League, Inc. v. County of Orange* (2005) 131 Cal.App.4th 777, 795-796 [upholding agency's reliance on mitigation measure requiring installation and maintenance of BMPs to address run-off].)

13.13.4 Construction Impacts, Methodology, and Assumptions (AQ-3)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

O-MBA8L2-8 O-MBA8L2-15 O-MBA8L2-26 O-MBA8L2-31

"Also, the DSEIR incorrectly utilizes a default hauling trip length of 20-miles, provided by the California Emissions Estimator Model ("CalEEMod"), to determine the on-road hauling emissions that would occur during construction. Using this default value, rather than a site-specific trip length to the actual haul destination, results in an underestimation of the Project's construction emissions. Therefore, the impact assessment must be recalculated to realistically account for the actual haul destination of the excavation spoils. (See Exhibit 2.)" (*Mission Bay Alliance, Thomas Lippe, letter, July 26, 2015 [O-MBA8L2-8]*)

"**II. Construction Emissions From Wastewater Improvements Have Not Been Adequately Reviewed in the DSEIR**

"At DSEIR pg. 1-9, significant environmental impact areas in the Event Center environmental review process are identified. One of those includes sewer processing plant and related utility improvements made necessary for the Events Center and associated development of the 11 acre project area:

> "As indicated on Table 1-2, the SEIR determined that the proposed project would result in significant and unavoidable impacts in the areas of....utilities (construction of new or upgraded wastewater facilities, and determination by the San Francisco Public Utilities Commission that it currently has inadequate capacity to serve the project's wastewater demand)."

"Based on the language noted above, it appears the DSEIR's project at Mission Bay Blocks 29 - 32 cannot proceed without sewer and associated utility improvements. However, at DSEIR pg. 1-43 it appears that the project is considered by the Lead Agency to not require or result in the construction of new wastewater treatment facilities or expansion of existing facilities. Then, at DSEIR pg. 1-44 information from measure M-C-UT-4 shows that the project sponsor must pay for "fair share" improvements to the Mariposa Pump Station:

> The project sponsor shall pay its fair share for improvements to the Mariposa Pump Station and associated wastewater facilities required to provide adequate sewer capacity within the project area and serve the project as determined by the SFPUC. The contribution shall be in proportion to the wastewater flows from the proposed project relative to the total design capacity of the upgraded pump station(s). The project sponsor shall not be responsible for any share of costs to address pre-existing pump station deficiencies.

"However, at DSEIR, pg. 5.7-13, it appears the wastewater improvements are made necessary by the project and that it cannot proceed without them:

> "Therefore, permanent improvements to the pump station and a long term increase in capacity would be needed to accommodate the proposed project in combination with other proposed and planned development in the Mission Bay South Plan area. In addition, as discussed in Section 5.9, Hydrology and Water Quality, the increased wastewater flows from **the proposed project** (emphasis added) in combination with other foreseeable future projects could increase the volume of combined sewer discharges (CSDs) from the Mariposa Pump Station which could necessitate improvements to the Mariposa wet weather pump station."

"If the DSEIR project necessitates the improvements to local wastewater treatment facilities and related utility improvements, the associated construction emissions should be analyzed and mitigated as appropriate within the DSEIR and not piecemealed to some other review process or ignored altogether. No information is found in the DSEIR's Air Quality element that shows that construction-related emissions from the necessary wastewater utility improvements were recognized and evaluated within the DSEIR." (*Mission Bay Alliance, Thomas Lippe, letter, July 26, 2015 [O-MBA8L2-15]*)

"1. The FEIR incorrectly utilizes a default hauling trip length of 20-miles, provided by the California Emissions Estimator Model ("CalEEMod"),[1] to determine the on-road hauling emissions that would occur during construction; however, utilizing this default value, rather than a site specific trip length, results in an underestimation of the Project's construction emissions.

Footnote:

[1] CalEEMod website, available at: http://www.caleemod.com/

(*Mission Bay Alliance, Thomas Lippe, letter, July 26, 2015 [O-MBA8L2-26]*)

"**Inadequate Use of CalEEMod Default Values**

"The DSEIR calculates the emissions from on-road haul trucks during Project construction by assuming a trip length of 20-miles, which represents the default hauling trip length provided by CalEEMod (Volume 3, Appendix AQ, p. 6). This default trip length, however, does not represent the actual haul trip length that would occur. Therefore, in an effort to accurately estimate the actual haul trip length, we conducted an independent analysis using the best resources available.

"The DSEIR "estimates that the maximum depth of excavation on-site would be approximately 30 feet below San Francisco City Datum; this would require approximately 350,000 cubic yards of soils on-site to be excavated and removed from the site" (Volume 3, Appendix AQ, p. 17). In order to transport this soil off-site, the DSEIR anticipates that approximately 39,952 haul trips will be required over the course of approximately four months (Volume 3, Appendix AQ, Table 6.1-13, pp. 1243).

"The DSEIR fails to disclose where this excavated soil will be transported to. According to the DSEIR, in 2006, the City of San Francisco adopted the Construction and Demolition Waste Ordinance[3], which mandates that 75 percent of construction and demolition debris be recycled (Volume 3, Appendix AQ, p. 70). Therefore, it can be assumed that 75 percent of the approximately 350,000 cubic yards of construction debris will be transported to a registered construction and demolition (C&D) debris recovery facility, and the remaining 25 percent will be transported to a registered landfill. The Construction and Demolition Waste Ordinance requires that C&D materials be transported to a registered recovery facility, and provides a list of the facilities currently approved by the City.[4] The permitted daily capacity of each facility is not disclosed in the DSEIR; however, due to the large amount of debris that will have to be transported off-site over a very short period of time (four months), it can be assumed that this material will most likely be transported to multiple recovery facilities. Again, because the DSEIR does not disclose where this material will be transported to, we measured the distance of each recovery facility to the Project site, and then used the average distance of these facilities to represent the one-way hauling trip length (see table below).

Recovery Facility Name	Distance From Project Site (miles)
Big for Hauling and Demolition	2.1
Marin Resource Recovery Center	25.6
Smart Demolition	3.1
Blue Line Transfer, Inc.	12.1
Premier Recycle	55.3
West Contra Costa Sanitary Landfill	21.1
Certified Blue Recycling, Inc	19.6
Recology San Francisco	5.0
Windsor Materials Recovery Facility	70.6
Davis Street Transfer & Recycling Center	19.5
SF Recovery Inc	5.5
Zanker Materials Processing Facility	58.5
Average Distance From Project Site	**25**

"Using this method, we can assume that approximately 29,964 haul trips will transport 262,500 cubic yards of material approximately 25 miles one-way.

"The remaining 25 percent, or approximately 87,500 cubic yards, of C&D material will most likely be transported to a landfill. San Francisco currently has a contract with Waste Management, Inc., to transport waste to the Altamont Landfill, which is approximately 53 miles away from the Project site.[5] Once the Altamont Landfill contract expires in 2016, the City of San Francisco is proposing to enter a new agreement with Recology's Hay Road Landfill, which is located approximately 70 miles away from the Project site.[6] According to the DSEIR, construction activities are anticipated to occur starting in 2015, with full Project build out in 2018 (Volume 3, Appendix AQ, p. 5). For that reason, depending on when construction activities actually start, there is the possibility that C&D materials will be transported to the Hay Road Landfill. Therefore, we estimated total haul emissions assuming that 25 percent of C&D material would be transported to the Altamont Landfill (Scenario 1), and then we estimated emissions from an alternative scenario, where we assumed that 25 percent of C&D material would be transported to the Hay Road Landfill (Scenario 2).

"The tables below summarize the results of our analysis for each scenario.

Scenario 1: Current Contract with Altamont				
Location		One-Way Distance (miles)	Total One-Way Haul Trips	Total Vehicle Miles Traveled
75%	Recovery Facilities	25	29,964	744,106
25%	Altamont Landfill	53	9,988	527,366
100%	-	-	**39,952**	**1,271,472**

Scenario 2: Proposed Contract with Hay Road Landfill Approved				
Location		One-Way Distance (miles)	Total One-Way Haul Trips	Total Vehicle Miles Traveled
75%	Recovery Facilities	25	29,964	744,106
25%	Hay Road Landfill	70	9,988	695,165
100%	-	-	**39,952**	**1,439,271**

"When we compared the total vehicle miles traveled (VMT) from each of the above scenarios to the VMT from the CalEEMod default trip length of 20 miles, we found that Scenario 1 would result in a 37 percent increase in VMT, and found that Scenario 2 would result in a 44 percent increase in VMT (see table below).

Scenario	Vehicle Miles Traveled (VMT)
1 – Altamont Landfill	1,271,472
CalEEMod Default	799,040
Net Increase in VMT	**472,432**
Percent Increase in VMT	***37%***
2 – Hay Road Landfill	1,439,271
CalEEMod Default	799,040
Net Increase in VMT	**640,231**
Percent Increase in VMT	***44%***

"We derived emission factors from the California Air Resources Board's (CARB) EMFAC2011 model to estimate the increase in emissions when site specific hauling trip lengths are used.[7] We specified a 2015 calendar year for Scenario 1, which assumes that the Altamont Landfill contract is still active, and we specified a 2016 calendar year for Scenario 2, which assumes that the Altamont Landfill contract has expired, and has been replaced by a new contract with Hay Road Landfill. Additional parameters used to derive these emission factors are specified in the table below.

EMFAC2011 Parameter	Input
Region Type	Air Basin
Region	San Francisco Bay Area
Season	Annual
Vehicle Class	T7 Tractor
Model Year	Aggregated
Speed	Aggregated

"EMFAC2011 does not provide emission factors for CH_4 and N_2O, which are mobile-source greenhouse gases that contribute to the effects of climate change. Therefore, we used heavy duty diesel truck emission factors from the Environmental Protection Agency's (EPA) *Emission Factors for Greenhouse Gas Inventories,* which specifies a CH_4 emission factor of 0.0051 grams per mile (g/mile), and a N_2O emission factor of 0.0048 g/mile.[8] We applied Global Warming Potentials (GWPs) to each of these pollutants in order to convert these emissions to carbon dioxide equivalents (CO_2e).[9]

"According to the DSEIR, the CalEEMod default vehicle type for hauling is a mix of all heavy-heavy duty trucks (HHDT), labeled as a T7 vehicle type (Volume 3, Appendix AQ, pp. 1244). Furthermore, the CalEEMod emissions estimates take into account idling emissions, starting exhaust, evaporative emissions, and running losses, as well as emissions from road dust (Volume 3, Appendix AQ, pp. 1245 – 1248). Because our analysis is a bit more simplistic than the emissions calculated in CalEEMod, we estimated the emissions, using the methods and input parameters described above, from a 20-mile default hauling trip length. In an effort to demonstrate consistency, we used 2015 emissions factors to estimate the net increase in emissions for Scenario 1, and used 2016 emission factors to estimate the net increase in emissions for Scenario 2. The results of our analyses are summarized in the table below (see attachment for calculation details).

Scenario 1 vs. CalEEMod Default Hauling Emissions						
	ROG	**CO**	**NOx**	**CO2e**	**PM10**	**PM2.5**
Pounds per Day:						
Scenario 1	9.530	42.934	287.657	54,337	7.346	5.023
CalEEMod Default (2015)	5.989	26.982	180.774	34,147	4.616	3.157

Net Increase	**0.172**	**0.772**	**5.345**	**1,081**	**0.136**	**0.087**

"Our simple analysis indicates that the use of a CalEEMod default hauling trip length results in an approximate 37 – 44 percent underestimation in mobile-source, hauling emissions. CalEEMod default values should only be relied upon when site specific information is not available. As indicated by our analysis above, hauling destinations can be derived very easily. If site specific information is used to determine hauling trip lengths, the emissions increase significantly. As a result, an updated DSEIR should be prepared to adjust the hauling trip length to reflect site specific distances. Furthermore, worker and vendor trip lengths, which we were not able to determine due to a lack of information disclosed in the DSEIR, should also be adjusted to reflect site specific distances.

Response AQ-3: Construction Impacts, Methodology, and Assumptions

Comments suggest that the analysis of construction-related criteria pollutant emissions incorrectly utilize the default 20-mile trip length assumption of CalEEMod for material hauling trips rather than a project specific value accounting for a variety of potential disposal sites. The comment also says that construction emissions from improvements to the Mariposa Pump Station were not analyzed and mitigated.

The analysis used in the SEIR assumes the 20-mile default haul truck trip length for a variety of reasons. First, it is unknown what quantities of materials would be required to be disposed of at Class I (if any) or Class II disposal sites. The purpose of the air quality analysis is to inform decision makers and disclose known impacts based on substantial evidence. CEQA section 15384 cites that speculation does not constitute substantial evidence. Rather than engage in speculative estimates of receiving land fill locations and associated haul trips, the 20-mile CalEEMod default was used as a conservative estimate of average trip length. This assumption is conservative because, although it is unknown what quantities would be required to be disposed at Class I or Class II disposal sites, construction and demolition debris can be accepted at the Recology recycling and recovery facility in San Francisco, approximately five miles from the project site and clean soils can be accepted at the Brisbane soils facility, also about five miles from the project site. Both facilities have the capacity to serve the project's disposal needs[16]. Also, as discussed in Chapter 12, Project Refinements and New Variant, the project sponsor is now proposing on-site soil treatment. The total estimated volume of on-site soil to be treated is approximately 98,000 cubic yards, which would substantially reduce the volume of Class I and Class II designated wastes and associated truck trips for disposal. The CalEEMod recommended default value of 20 miles has been vetted by the BAAQMD and the California Air Pollution Control Officers Association as a reasonable assumption for CEQA-related air quality analyses. Construction-related emissions were identified as significant and unmitigatable in the SEIR and, consequently, variations in haul truck trip length would not result in a change to the significance determination. Furthermore, Mitigation Measure M-AQ-2b requires the project sponsor to fund offsets based upon actual emissions, not estimated emissions and thus fees would be determined based on the actual distances of haul truck trip length.

Construction Impacts of the Mariposa Pump Station (O-MBA8L2-15)

While improvements to the Mariposa Pump Station are not a part of the proposed project, or required for the proposed project, Impact C-UT-2 (SEIR pp. 5.7-13 to 5.7-15) acknowledges that permanent improvements to the Mariposa Pump Station would be required under future cumulative conditions, and that the potential impacts of the construction of required pump station improvements would result in potential impacts to air quality, among other potential environmental effects. This utility impact is identified as significant and unavoidable because specific plans and design for permanent pump station improvements have not been finalized, CEQA environmental review has not been completed for these improvements, and construction of such pump station improvements is under the jurisdiction of the San Francisco Public Utilities Commission (SFPUC) and beyond the control of the project sponsor. Because the design and construction of permanent improvements to the pump station are within the discretion of the SFPUC, the date is uncertain as to when these improvements will be necessary. These improvements would be subject to its own future CEQA review, and air quality impacts associated with construction of the Mariposa Pump Station improvements will be identified in

[16] Per Daniella Mattucci Assistant Manager at Baylands Soils Processing their facility has capacity to accept 300,000 cubic yards of clean soil from this project.

the CEQA document for that project. The permanent improvements to the Mariposa Pump Station are not required for the project to proceed.

13.13.5 Operational Impacts, Methodology, and Assumptions (AQ-4)

Issues Raised by Commenters: Consideration of Vehicle Trips from Golden State Warriors Basketball Events (AQ-4a)

This response addresses all or part of the following comments, which are quoted below:

O-MBA8L2-10 O-MBA8L2-21

"**4. The DSEIR's impact assessments for operational criteria pollutants (ozone precursors, PM10, PM2.5) and TAC emissions are invalid.**

"The operational impact assessment for ozone precursor, PM10, PM2.5 and TAC emissions is invalid for many reasons.

"DSEIR Table 5.4-9 shows operational daily emissions of criteria pollutants as follows:

ROG: 79 lbs/day [14 tpy]
NOx: 124 lbs/day [23 tpy]
PM10: 80 lbs/day [14.6 tpy]
PM2.5: 25 lbs/day [4.5 tpy]

(DSEIR, p. 5.4-39.)

"The DSEIR's impact assessments for these criteria pollutants emissions are invalid because they are based on the invalid thresholds of significance discussed above.

"Because construction-related emissions of ROG and NOx are higher than the applicable (but invalid) threshold of significance for these pollutants, the DSEIR concludes the Project's impact on ozone pollution is significant. As discussed above, while correct, this conclusion is misleading because it understates the severity of the impact deemed "significant" by implying that the only fraction of the Project's NOx emissions is are "significant" is the fraction above 54 lbs/day.

"The DSEIR's impact assessment for operational ozone precursor emissions is also misleading because it omits from its quantitative tally of criteria pollutants the emissions the Project will generate in San Francisco and the Mission Bay neighborhood from basketball game-associated "vehicle miles traveled" (DSEIR, p. 5-37.) The DSEIR's rationale for this startling omission is that moving the Warriors games from Oakland to San Francisco will reduce the same number of "vehicle miles traveled" in Oakland that the Project will generate in San Francisco and the Mission Bay neighborhood.

"This rationale is based on the unstated, but incorrect, assumption that the environmental setting at Oracle Arena and the Mission Bay site are identical. These settings are very different, in many crucial respects. First and foremost, the Mission Bay neighborhood and the surrounding areas of San Francisco are populated by San Franciscans, not Oaklanders. The residents, citizens, and registered voters of San Francisco are entitled to know what the Project's air quality impacts will be on them, regardless of whether the residents, citizens, and registered voters of Oakland will experience an air quality benefit as a result of the move.

"Second, Oracle Arena sits in the middle of a vast parking lot. To the west is I-880, various commercial properties, wetlands, and the Bay. To the east is the Coliseum, railroad tracks, ABC Supply (provider of industrial equipment), East Bay Truck and Auto Repair, BART tracks and the Coliseum BART Station, and then, over 2,000 feet away to the northeast there is a group of apartment buildings. To the north and south stretch commercial properties for well over a mile without any residences. This stands in stark contrast to the dense residential population surrounding the Mission Bay site.

"The DSEIR's suggestion that respiratory disease, heart disease, and cancer-causing air pollution is fungible and transferable, without regard to the location or environmental setting in which it occurs, is unsupported." (*Mission Bay Alliance, Thomas Lippe, letter, July 26, 2015 [O-MBA8L2-10]*)

"**VII. Offsets for Operational Emissions from Warriors Games Appear to be Double-Counted**

"At DSEIR pg. 5.4-37, new operational emissions from vehicle trips generated by Warrior games are, for the purposes of mitigation, discounted based on the assumption that those emissions have already been counted in the CEQA-review process conducted for Warriors' games at the Oracle Arena (Oakland). This approach is used in the DSEIR to justify the purchase of fewer emission offsets from BAAQMD necessary to reduce the project's onroad emission impacts to less-than-significant levels, and it is predicated on the assumption that no new large sports events will occur at the Oakland Coliseum/Oracle Arena once large-venue sports games move across the Bay to the proposed Arena in San Francisco. From pg. 5.4-37:

> "Some of the motor vehicle trips that would be generated by Golden State Warriors basketball games at the proposed event center would be regional trips similar to those currently generated by basketball games occurring at the Oracle Arena in Oakland, and as a result, the emissions associated with these regional trips would not represent new emissions to the air basin."

"At the bottom of the same page, additional material reinforces the crediting strategy:

> "It is unlikely that there would be another NBA franchise in the Bay Area, so all of the professional basketball games occurring in the region would likely be played at the new event center. This assumption is consistent with that of the City of Oakland in its CEQA related analyses."

"For the purposes of estimating vehicle trip emissions from large Warriors game-style sporting events that will be held at the proposed San Francisco Events Center, the Lead Agency has assumed that existing (Oracle Arena-based) Warriors game-related vehicle trip emissions will shift from Oakland to the new San Francisco Events Center. Under this DSEIR perspective, there would be no net increase in vehicle trips (and related emissions) since game attendees are expected to drive the same distance (25 miles on average) to the new facility in San Francisco that they are assumed to currently drive to attend a Warriors game (or similar large-venue sports event) at the Oracle Arena in Oakland. Crucial to this perspective is the notion that there would be no new, large-venue sporting events at the Oracle arena which would then act to backfill the loss of Warriors games---otherwise there must be a net gain in total, large-venue sporting event emissions created between the two arenas. In fact, the "no net gain" perspective taken by the Lead Agency in the DSEIR is used to justify deducting those Warriors game "existing trip" emissions from the project's emissions modeling so that fewer emission offsets would be required for the project. Based on our review of information contained in a recent Oakland EIR, this appears to be inappropriate.

"For the above-referenced approach to be viable for use in the DSEIR, the vehicle-trip emissions resulting currently from the large-sports venue games held at Oracle must transfer to the proposed San Francisco Event Center *and must then not be backfilled with new, large-sports venue games at Oracle*—otherwise there will be a net gain in emissions not accounted for in either the new Events Center DSEIR or the EIR conducted for the expanding Oracle Arena.

"In contradiction to the DSEIR's claim is this statement from Oakland's Coliseum Area Specific Plan DEIR1, Vol. I, pg. 1-1:

> "The Project seeks to retain Oakland's three major professional sports franchises with three new venues and an accompanying mixed-use residential....."

"On the next page, this information further clarifies that Oakland will backfill with large sports venues that will continue the emissions currently associated with the Warriors operation at the Oracle Arena:

> "The development of Sub-Area A and a portion of Sub-Area B (the "Coliseum District") is based on the Coliseum City Master Plan, which calls for three new sports venues (a new football stadium and a new baseball park in Sub-Area A plus a new basketball arena and multi-purpose events center in Sub-Area B)..."

"At Coliseum Area Spa DEIR, pg. 4.2-59, mobile source emission impacts were modeled based on three scenarios:

- Existing criteria pollutant emissions from the Coliseum District area ("Existing No Project", or "2013 Baseline"),
- Future 2035 criteria pollutant emissions from the Coliseum District if the Project were not developed (i.e., future no Project, or 2035 Baseline), and
- Future 2035 criteria pollutant emissions from the Coliseum District (i.e., future plus Project, or 2035 plus Project).

"By logical inference from the first- and second-bulleted points noted above, large sports venue- related emissions currently attributed to Warriors games appear to remain "on the books" for Oracle. Correspondingly, at pg. 4.2-60, existing emissions quantities associated with the Warriors games are retained:

> "Table 4.2-7 shows estimated average daily and annual maximum criteria emissions under current conditions (2013 Baseline), as well as the emissions projected from current land uses at the Coliseum District as they would occur in 2035 (2035 Baseline). These projected 2035 baseline emissions are based on a continuation of existing land uses, vehicle trips, and VMTs."

"Based on the information cited above, it is clear that the City of Oakland anticipates retention of mobile source emissions generated by the equivalent of Warriors games at their Coliseum/Oracle Arena. Further, it appears that the Coliseum/Oracle EIR was certified prior to issuance of the Warriors NOP---thus the claim in the Warriors EIR that large sports venue- related emissions can be transferred from Oakland to San Francisco, and with credit applied to compliance with Mitigation Measure M-AQ-2b (Emission Credits) shown at pg. 5.4-41, is likely neither applicable nor appropriate under CEQA." (*Mission Bay Alliance, Thomas Lippe, letter, July 26, 2015 [O-MBA8L2-21]*)

Response AQ-4a: Consideration of Vehicle Trips from Golden State Warrior Basketball Events

Comments suggest that the assessment of air quality impacts from project operations should have considered vehicle trips generated by basketball events in the analysis of regional emissions.

The air quality analysis of the SEIR contains analysis of both regional operational air quality impacts (Impact AQ-2 on SEIR pages 5.4-37 to 5.4-43) and localized air quality impacts (Impact AQ-3 on pages 5.4-44 to 5.4-51). The analysis of localized impacts considered emission from all vehicle trips generated by the event center and mixed-use development at Mission Bay, inclusive of basketball events as well as localized air quality conditions as modeled by BAAQMD for development of both the City's Clean Construction Ordinance and Article 38 of the San Francisco Health Code, which address toxic air contaminants and sensitive land use developments within Air Pollutant Exposure Zone.

The regional air quality analysis, on the other hand, considered new regional emissions generated by the proposed project. Vehicle trip emissions associated with existing basketball games at Oracle Arena represent the existing regional condition and, therefore, are not new regional emissions. These trips occur now so they are part of the existing baseline condition. It is reasonable to assume that the Oracle Arena will not be host to another NBA franchise in the Bay Area, so no new vehicle emissions associated with NBA basketball games would be expected in the region. This assumption is supported by substantial evidence and vetted by OCII. The assumption was also accepted by the California Air Resources Board when it approved the project sponsor's analysis of greenhouse gas emissions pursuant to its AB 900 application. Further, as a conservative analysis for CEQA purposes, the operational emissions quantified in Impact AQ-2 of the Draft SEIR assume that Oracle Arena maintains its current levels of non-Golden State Warriors events and that all of such non-Golden State Warriors events (i.e., concerts, family shows etc.) at the proposed event center in San Francisco would represent new vehicle trips and associated emissions to the air basin.

One comment makes reference to proposed new facilities considered in the Final EIR for the Oakland Coliseum Area Specific Plan, which was certified in March 31, 2015, over four months after the Notice of Preparation of the proposed event center at Mission Bay. The Specific Plan is based on Oakland's assumption that all three current City of Oakland sports franchises (the Raiders, the A's and the Warriors) will make independent business decisions to remain in Oakland,[17] and at the Coliseum District, and that each of the sports franchises will have new, separate venues for their games. Consequently, the assumptions within the Coliseum Area Plan Final EIR are entirely different from those of the proposed project. But, as evidenced by even Oakland's specific plan, Golden State Warriors basketball games will not occur at both locations. To count vehicle emissions associated with Golden State Warrior's basketball games at both the existing arena and proposed event center would overestimate air quality impacts.

Issues Raised by Commenters: Significant and Unavoidable Air Quality Impacts from Gridlock and Parking Problems (AQ-4b)

"While restricting the number of parking spaces may be considered a means of traffic management under the City's regulation, the practical effects will be yet more … unhealthy air emissions …" (*Damion Scott, public hearing transcript, June 30, 2015 [PH-Scott-4*)

"Increased car and truck emissions in the area will be unhealthy for residents, workers, and hospital patients. This will have a disastrous impact on the health and welfare of Mission Bay residents." (*Damion Scott, public hearing transcript, June 30, 2015 [PH-Scott-6]*)

Response AQ-4b: Significant and Unavoidable Air Quality Impacts from Gridlock and Parking Problems

Several individual comments voice concern that traffic congestion and lack of available parking will result in significant and unavoidable impacts in the immediate project area related to air quality.

While the SEIR identified significant and unavoidable air quality impacts from operational air emissions, these impacts are regional impacts related to emissions of ozone precursors (ROG and NOx) in an area designated as non-attainment for ozone. Consequently, impacts associated with these emissions will be experienced in the regional air basin and not disproportionately in the localized area around the proposed project.

As discussed on page 5.4-40, although the most stringent applicable ozone standards were not exceeded at the Potrero Hill monitoring station over the past five years, the San Francisco Bay Area Air Basin (SFBAAB) experienced an average of 8.4 days of exceedance per year between 2010 and 2014.[18] The proposed project's ROG and NOx increases could contribute to new or exacerbated air quality violations in the SFBAAB region by contributing to more days of ozone exceedance or result in Air Quality Index values that are unhealthy for sensitive groups and other populations. As shown in Table 5.4-3, the SFBAAB has averaged between 8 and 19 days per year that are considered unhealthy for sensitive groups and had 2 unhealthy (red) days in the last five years. Consequently, while ozone precursor emissions are significant and unavoidable, the likely area of impact would be downwind (primarily to the east of the project site) due to ozone formation after transport of these precursor emissions.

Regarding fine particulate matter emissions that might affect conditions in the immediate project vicinity, a localized health risk assessment was conducted as part of the analysis and is presented on pages 5.4-43 through 5.4-50 of the SEIR. Table 5.4-10 presents localized fine particulate ($PM_{2.5}$) concentrations at the maximally impacted sensitive receptor locations in the project area from mobile sources (vehicles). The values in this table include all existing vehicles in addition to vehicle traffic generated by the proposed office and retail uses and all the vehicle trips in the area associated with a basketball event as well as contributions from local existing and proposed permitted stationary sources. Additionally, for the health risk analysis, it was conservatively assumed that all vehicle trips generated by the project would travel on all local roadways to account for localized congestion and vehicles seeking available parking. Table 5.4-11 presents increased cancer risk contributions at the maximally impacted sensitive receptor locations in the project area from these same sources. Both tables indicate that localized pollutant exposure would not exceed the significance thresholds for $PM_{2.5}$ or increased cancer risks. Consequently, localized air quality impacts associated with the proposed project would be less than significant.

[18] Bay Area Air Quality Management District, *Annual Bay Area Air Quality Summaries*, 2014. Available online at www.baaqmd.gov/Divisions/Communications-and-Outreach/Air-Quality-in-the-Bay-Area/Air-Quality-Summaries.aspx (accessed October 3, 2014).

Page 5.4-26 of the SEIR included an assessment of localized carbon monoxide concentrations. This analysis determined that localized roadway volumes were insufficient to result in a violation of the carbon monoxide standard, which has not been violated anywhere in the Bay Area for over 11 years due primarily to reformulation of gasoline within the state.

Issues Raised by Commenters: Quantification and Analysis of Air Quality Impacts (AQ-4c)

This response addresses all or part of the following comments, which are quoted below:

O-MM-13

"5. There Is No Accurate or Legally Adequate Analysis and Mitigation of the Project's Air Quality Impacts or GHG Impacts.

"The DSEIR fails to quantify or coherently analyze air quality impacts, complaining, for example, that "it is difficult to predict the magnitude of health effects from the project's exceedance of significance criteria for regional ROG and NOx emissions. (DSEIR 5.4-40.) The DSEIR also admits that its proposed "mitigation" of reducing vehicle trips by not providing adequate parking or transportation capacity "would be difficult to quantify." The DSEIR may not hide behind its failure to gather the necessary data to analyze these and other air quality impacts, because that failure also violates CEQA's requirement to inform the public and decisionmakers of the Project's impacts and to mitigate them." (*Mary Miles, Attorney at Law, email, July 27, 2015 [O-MM-13]*)

Response AQ-4c: Quantification and Analysis of Air Quality Impacts

The commenter states that the SEIR fails to quantify or coherently analyze air quality impacts. OCII disagrees. Quantified construction-related air quality impacts are presented in Table 5.4-7 (SEIR page 5.4-31), while mitigated emissions are presented in Table 5.4-8 (SEIR page 5.4-33). These tables present quantified emission totals for all project construction sources and compare them to significance thresholds which are also presented in the tables. An explanation of the methodology for calculating these emissions is provided on page 5.4-31 and explanation of the significance criteria applied is presented on pages 5.4-24 through 5.4-26 of the SEIR.

Quantified operational air quality impacts are presented in Table 5.4-9 (SEIR page 5.4-39). This table presents quantified emission totals for all project operational sources and compares them to significance thresholds which are also presented in the table. An explanation of the methodology for calculating these emissions is provided on pages 5.4-37 and 5.4-38 and explanation of the significance criteria applied is presented on pages 5.4-24 through 5.4-26 of the SEIR. Localized health risk impacts are also quantified and presented in Table 5.4-10 and 5.4-11 (SEIR pages 5.4-48 and 5.4-49).

Potential impacts of quantified operational exceedance of air quality thresholds are discussed on page 5.4-40 which begins with the accurate statement that prediction of the health effects

associated with significant emissions in ozone precursors is difficult to quantify. The analysis following this statement, however, provides a quantified perspective to the potential health impacts based on existing air quality within the air basin.

With respect to mitigation, quantified estimates of the potential benefits of implementing transportation demand management (TDM) measures would be speculative at this time, and consequently, the SEIR conservatively assumed no quantified emissions benefits associated with implementing additional TDM mitigation measures. The assumptions and calculations included in the SEIR were developed by OCII and City staff in consultation with its environmental consultants. The assumptions and calculations are both reasonable and conservative and are supported by substantial evidence.

13.13.6 Health Risk Methodology and Assumptions (AQ-5)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

O-MBA8L2-22

"**VIII. Project Health Risks May Be Underestimated Using Older Guidance**

"The DSEIR provides analysis and discussion of the project's potential to cause significant health risks from project-related toxics, with specific details on health risks and PM2.5 calculations and methodology found in Appendix AQ. Exposure parameters presented in Section 3 of Appendix AQ do not appear to reflect current methods for calculating excess cancer risks, and as a result it is likely that the HRA underestimates Warriors Arena's potential excess cancer risks.

"Table 3 lists daily breathing rates referencing BAAQMD's Air Toxics NSR Program Health Risk Screening Analysis (HRSA) Guidelines released in January 2010.[2] These breathing rates are consistent with rates recommended by the California Environmental Protection Agency's Office of Environmental Health Hazard Assessment (OEHHA) Air Toxics Hot Spots Program Risk Assessment Guidelines released in 2000.[3] After publicly working on revisions during 2014, OEHHA released updated Risk Assessment Guidelines in early 2015 that outline risk calculations for specific age groupings. The new methods incorporate higher daily breathing rates than those listed in the BAAQMD's 2010 Guidelines and used in the HRA. To comply with the latest OEHHA Guidelines, the inhalation intake factors should be re-calculated for the EIR using the updated 95% daily breathing rate for children of 1,090 L/kg-day.[4]

"Additionally, the screening approach taken in the HRA to evaluate operational cancer risks should be revised to include a refined, site-specific analysis of impacts using the USEPA AERMOD model. With respect to the number of years of data to model, the USEPA Guideline on Air Quality Models states:

> "Five years of representative meteorological data should be used when estimating concentrations with an air quality model. Consecutive years from the most recent, readily available 5-year period are preferred.[5]"

"The DSEIR used meteorological data from 2008; updated AERMOD results, employing five years of the most recent meteorological data, should be used with exposure parameters and methodology in compliance with the 2015 OEHHA Risk Assessment Guidelines to calculate excess cancer risk.

Response AQ-5: Health Risk Methodology and Assumptions

One comment expresses concern that the health risk impacts estimated in the SEIR may be underestimated because the analysis did not employ increased breathing rate assumptions recently published by the state of California's Office of Health Hazard Assessment (OEHHA) and used meteorological data from 2008.

In March of 2015 (after the Notice of Preparation was issued), OEHHA adopted revised guidance on recommended breathing rates for use in health risk screening analyses. BAAQMD has indicated[19] that, as an implementing agency for the guidance issued by OEHHA, it is striving to implement the recommended changes to health risk assessment analysis by the beginning of 2016. It is noteworthy that air districts do not always adopt OEHHA methodologies verbatim or immediately. For example, the San Joaquin Air Pollution Control District recently adopted some of the methodology recently adopted by OEHHA but also adopted a revised increased cancer risk threshold that is less stringent than that recommended in the OEHHA guidance.

The Planning Department and the San Francisco Public Health Department (DPH) have worked extensively with the BAAQMD to inventory and assess air pollution exposure from vehicles, stationary, and area sources within San Francisco, which forms the basis of the development of Air Pollution Exposure Zones and specific air quality protection measures codified in the Clean Construction Ordinance and Article 38. (See Response AQ-1a.) Consequently, the City believes BAAQMD's existing health risk assessment methodology protocols are appropriate for evaluating potential incremental health risk form the project, and OCII agrees. While BAAQMD's methodology may be updated in the future to implement revised OEHHA guidance methodologies as well as other potential future recommendations that may be released by OEHHA and other organizations, the analysis of the SEIR uses methodology currently embraced by the BAAQMD, which is consistent with the existing methods used to compile inventories of existing risks throughout the City, and therefore represents a valid conservative estimate of incremental health risk resulting from the project.

[19] BAAQMD, Chong, Daphne, Toxicologist, e-mail correspondence to Wade Wietgrefe, Senior Planner, City of San Francisco Environmental Planning

With regard to the use of a single year of meteorological data in the health risk analysis, Appendix W 8.3.1.2(b) of U.S. EPA's Guideline on Air Quality Models[1] clarifies that "[t]he use of 5 years of NWS meteorological data or at least one year of site specific data is required." The AERMOD modeling used in the health risk analysis, in accordance with SF Planning and BAAQMD protocol for the citywide modeling, used one year of meteorological data collected in Mission Bay. The meteorological data used for the health risk assessment is site specific, as it was collected at the Mission Bay station. SF Planning and the BAAQMD determined that this meteorological data set is sufficient for the citywide HRA that forms the basis of SF Planning's CEQA significance policy, and OCII concurs.

13.13.7 Mitigation Measure, Feasibility and Enforcement (AQ-6)

Issues Raised by Commenters: Mitigation of Construction–related Impacts (AQ-6a)

This response addresses all or part of the following comments, which are quoted below:

O-MBA8L2-7 O-MBA8L2-9 O-MBA8L2-27 O-MBA8L2-32

"The DSEIR assumes that adoption of Mitigation Measure M-AQ-1, requiring use of off-road equipment with engines meeting Tier 2 or Tier 4 standards, will reduce construction-related ROG emissions to 47 or 49 pounds per day, respectively, which are both below the applicable (but invalid) threshold of significance for ROG (i.e., 54 lbs/day). (DSEIR, p. 5.4-33, Table 5.4-8.) But equipment meeting Tier 2 or Tier 4 standards are not sufficiently available to meet either requirement. (See Exhibit 2.) Therefore, the impact assessment must be recalculated to more realistically estimate the percentage of construction equipment that will meet Tier 2 or 4 standards." (*Mission Bay Alliance, Thomas Lippe, letter, July 26, 2015 [O-MBA8L2-7]*)

"**a. Mitigation Measure M-AQ-1 does not comply with CEQA's legal requirements.**

"Mitigation Measure M-AQ-1 (at DSEIR, p. 5.4-35) does not comply with CEQA's legal requirements. As discussed above, the requirement that off-road equipment meet Tier 2 standards is illusory, and therefore ineffective, because the Project Sponsor will not be able to obtain enough equipment meeting this standard.

"M-AQ-1 includes a limit on idling time of two minutes, and provides exceptions to this limit as provided in state law (DSEIR, p. 5.4-36), but utterly fails to describe what these exceptions are. The DSEIR must fully describe this measure in order for the public and City decision makers to assess its effectiveness.

"M-AQ-1 requires the Project Sponsor prepare a Construction Emissions Minimization Plan, and the Project Sponsor must certify compliance with the Plan. (DSEIR, p. 5.4-36.) This is asking the fox to guard the henhouse. (See Exhibit 1.) (*Mission Bay Alliance, Lippe, letter, July 26, 2015 [O-MBA8L2-9]*)

"2. The DSEIR attempts to mitigate the Project's criteria air pollutant emissions by limiting the off-road equipment used during construction to machinery equipped with, at a minimum, Tier 2 engines with 40 percent NOx verified diesel emission control strategies (VDECS), and at a maximum, Tier 4 or Tier 4 interim engines (Volume 2, p. 5.4-32). However, the DSEIR does not demonstrate the feasibility of this proposed measure. The Project will need to acquire approximately 195 pieces of equipment outfitted with Tier 2 and/or Tier 4 engines. Due to the limited supply of cleaner-burning off-road equipment, the

implementation of this measure, in its entirety, is highly unrealistic. As a result, the proposed Project should not rely on this mitigation measure to reduce emissions; rather the Project should pursue additional, feasible mitigation measures other than Tier 2/Tier 4 construction equipment to reduce the Project's criteria air pollutant emissions." (*Mission Bay Alliance, Thomas Lippe, letter, July 26, 2015 [O-MBA8L2-27]*)

_____

"**Incorrectly Presumed the Use of Tier 2 and Tier 4 Interim Engines**

"In this updated analysis, it is presumed that all off-road construction equipment will be outfitted with, at a minimum Tier 2 engines with 40 percent NOx verified diesel emission control strategies (VDECS), and at a maximum, Tier 4 or Tier 4 interim engines (Volume 2, p. 5.4-32). There is no substantial evidence, however, to support the assumption that the roughly 195 pieces of off-road equipment utilized during Project construction will meet these standards. Furthermore, it may not be technically feasible to acquire machinery with Tier 2 or Tier 4 engines for the Project's entire construction equipment fleet. As a result, this mitigation measure should not be relied upon to reduce the Project's construction emissions to below levels of significance. Rather, the Project should pursue additional mitigation measures that are more technically feasible to implement.

"The United States Environmental Protection Agency's (USEPA) 1998 nonroad engine emission standards were structured as a three-tiered progression. Tier 1 standards were phased-in from 1996 to 2000 and Tier 2 emission standards were phased in from 2001 to 2006. Tier 3 standards, which applied to engines from 37-560 kilowatts (kW) only, were phased in from 2006 to 2008. The Tier 4 emission standards were introduced in 2004, and were phased in from 2008 – 2015.[10] These tiered emission standards, however, are only applicable to newly manufactured nonroad equipment. According to the United States Environmental Protection Agency (USEPA) "if products were built before EPA emission standards started to apply, they are generally not affected by the standards or other regulatory requirements."[11] Therefore, pieces of equipment manufactured prior to 2000 are not required to adhere to Tier 2 emission standards, and pieces of equipment manufactured prior to 2008 are not required to adhere to Tier 4 emission standards. Construction equipment often lasts more than 30 years; as a result, Tier 1 equipment and non-certified equipment are currently still in use.[12] It is estimated that of the two million diesel engines currently used in construction, 31 percent were manufactured before the introduction of emissions regulations.[13] Furthermore, in a 2010 white paper, the California Industry Air Quality Coalition estimated that approximately 7% and less than 1% of all off-road heavy duty diesel equipment in California was equipped with Tier 2 and Tier 3 engines, respectively.[14] It goes on to explain that "cleaner burning Tier 4 engines…are not expected to come online in significant numbers until 2014." Given that significant production activities have only just begun within the last year, it can be presumed that there is limited availability of Tier 4 equipment. Furthermore, due to the complexity of Tier 4 engines, it is very difficult if not nearly impossible, to retrofit older model machinery with this technology.[15] Therefore, available off-road machinery equipped with Tier 4 engines are most likely new. According to a September 20, 2013 EPA Federal Register document, a new Tier 4 scraper or bulldozer would cost over $1,000,000 to purchase.[16] It is also relatively expensive to retrofit a piece of old machinery with a Tier 3 engine. For example, replacing a Tier 0 engine with a Tier 3 engine would cost roughly $150,000 or more.[17] Therefore, before applying mitigation measures of this caliber to a Project, the applicant should consider both the cost of the proposed equipment as well as determine the probability of obtaining an entirely Tier 2 or Tier 4 construction fleet. Unless the Project applicant can demonstrate to the public, either through budget or through a signed contractual agreement with a contractor or supplier, that they will purchase/rent exclusively Tier 2 or Tier 4 construction equipment, this mitigation measure should not be relied upon as a feasible way of reducing Project emissions.

Response AQ-6a: Mitigation of Construction–related Impacts

Comments state that Tier 2 and Tier 4 off-road construction equipment, use of which is identified as mitigation for significant construction-related impacts under Mitigation Measure M-AQ-1, may not be sufficiently available and do not represent feasible mitigation measures.

Regarding the feasibility of obtaining Tier 2 and Tier 4 off-road construction equipment, the City of San Francisco has recently updated is Clean Construction Ordinance and implementation guidance, which applies to the City's own projects and is consistent with the requirements of Mitigation Measure M-AQ-1 and codified by the City (Ordinance No. 28-15). As a part of the implementation guidance, the City Planning Department presents the results of a statewide data summary[20] gathered by the California Air Resources Board as part of compliance with the In-Use Off-Road Diesel Regulation. The data indicate the available construction equipment at various engine tier levels. These data indicate that in 2014 approximately 59 percent of all off-road equipment in the state were operating with Tier 2 engines or better. Given that the majority of equipment statewide is capable of complying with the conditions of Mitigation Measure M-AQ-1, it is reasonable to conclude that the measure represents feasible mitigation.

When an EIR determines that a particular environmental impact would be "significant," the EIR must propose and describe feasible mitigation measures that will minimize or reduce the impact. (Pub. Resources Code, § 21100, subd. (b)(3); CEQA Guidelines, §§ 15126, subd. (e), 15126.4; 15370.) If an EIR determines that an impact would be less than significant, however, there is no duty to propose mitigation. (See CEQA Guidelines § 15126.4(a)(3) ["Mitigation measures are not required for effects which are not found to be significant."]; *Santa Clarita Organization for Planning the Environment v. City of Santa Clarita* (2011) 197 Cal.App.4th 1042, 1056 [same].) Similarly, if an EIR concludes that the proposed mitigation measures will reduce an impact to a less than significant level, the agency has fulfilled its obligation to mitigate that impact. In other words, while an EIR is required to describe feasible measures which could minimize significant impacts, CEQA does not require that mitigation measures must eliminate environmental impacts altogether. (See CEQA Guidelines, § 15370; see also *Oakland Heritage Alliance v. City of Oakland*

[20] San Francisco Department of the Environment et.al., *San Francisco Clean Construction Ordinance Implementation Guide for San Francisco Public Projects*, Final August 2015 available online at https://www.sfdph.org/dph/EH/Air/CleanConstruction.asp. Accessed September 10, 2015.

(2011) 195 Cal.App.4th 884, 899 ["A less than significant impact does not necessarily mean no impact at all."]; *National Parks and Conservation Assn. v. County of Riverside* (1999) 71 Cal.App.4th 1341, 1359 [CEQA does not require a finding of "zero impact"].)

Here, the SEIR identifies mitigation measures that would reduce construction-related ROG emissions below the applicable threshold of significance. Because construction-related ROG emissions would be less than significant with the mitigation proposed in the SEIR, there is no duty to identify additional mitigation measures that would further mitigate the impact.

Issues Raised by Commenters: Construction Mitigation—Truck Idling (AQ-6b)

This response addresses all or part of the following comments, which are quoted below:

O-MBA8L2-9

"**a. Mitigation Measure M-AQ-1 does not comply with CEQA's legal requirements.**

"Mitigation Measure M-AQ-1 (at DSEIR, p. 5.4-35) does not comply with CEQA's legal requirements. As discussed above, the requirement that off-road equipment meet Tier 2 standards is illusory, and therefore ineffective, because the Project Sponsor will not be able to obtain enough equipment meeting this standard.

"M-AQ-1 includes a limit on idling time of two minutes, and provides exceptions to this limit as provided in state law (DSEIR, p. 5.4-36), but utterly fails to describe what these exceptions are. The DSEIR must fully describe this measure in order for the public and City decision makers to assess its effectiveness.

"M-AQ-1 requires the Project Sponsor prepare a Construction Emissions Minimization Plan, and the Project Sponsor must certify compliance with the Plan. (DSEIR, p. 5.4-36.) This is asking the fox to guard the henhouse. (See Exhibit 1.) (*Mission Bay Alliance, Lippe, letter, July 26, 2015 [O-MBA8L2-9]*)

Response AQ-6b: Construction Mitigation–Truck Idling

Comments suggest that the DSEIR does not explain exceptions to limits on idling times and the mitigation is therefore inadequate.

Exceptions to limits on idling times cited in the SEIR rely on those specified in the California Code of Regulations (CCR) Title 13, Division 3, § 2485 (on-road) and § 2449(d)(2) (off-road). Examples of these exceptions would include traffic conditions and safe operating conditions. CCR Title 13 provides 14 specific instances where such exception would apply. Moreover, to ensure compliance the measure – as with all mitigation measures include in the Draft SEIR – will be included in the Mitigation Monitoring and Reporting Program. The ultimate responsibility to review the compliance records prepared by the project sponsor and to confirm compliance properly rests with OCII.

Issues Raised by Commenters: Construction Mitigation— Compliance Certification (AQ-6c)

This response addresses all or part of the following comments, which are quoted below:

O-MBA8L2-9 O-MBA8L2-19

"**a. Mitigation Measure M-AQ-1 does not comply with CEQA's legal requirements.**

"Mitigation Measure M-AQ-1 (at DSEIR, p. 5.4-35) does not comply with CEQA's legal requirements. As discussed above, the requirement that off-road equipment meet Tier 2 standards is illusory, and therefore ineffective, because the Project Sponsor will not be able to obtain enough equipment meeting this standard.

"M-AQ-1 includes a limit on idling time of two minutes, and provides exceptions to this limit as provided in state law (DSEIR, p. 5.4-36), but utterly fails to describe what these exceptions are. The DSEIR must fully describe this measure in order for the public and City decision makers to assess its effectiveness.

"M-AQ-1 requires the Project Sponsor prepare a Construction Emissions Minimization Plan, and the Project Sponsor must certify compliance with the Plan. (DSEIR, p. 5.4-36.) This is asking the fox to guard the henhouse. (See Exhibit 1.) (*Mission Bay Alliance, Lippe, letter, July 26, 2015 [O-MBA8L2-9]*)

"Similarly, M-AQ-2a begins with "The project sponsor shall implement the following measures as feasible:"... The introduction of "as feasible" is a poison pill, since the measure does not conclusively identify the party responsible (and liable) for determining sub-component measure feasibility. This determination must not be left to the project sponsor, but, rather, vested with a qualified independent contractor chosen by and reporting solely to the OCII, or to the BAAQMD on behalf of OCII, to ensure measure implementation at every truly "feasible" turn. Without specifying duties for the accurate determination of what constitutes "as feasible", and then ensuring that those duties are actually implemented by a non-conflicted 3rd party (which, as written currently, the project sponsor cannot possibly fulfill without potential for conflict of interest), M-AQ-2a lacks necessary enforceability and cannot be expected to produce those real, quantifiable, surplus mitigated emission benefits claimed in the DSEIR.

"Finally, M-AQ-2b leaves it to the project sponsor to calculate the amount of emission offsets required to satisfy the project's estimated ozone precursor burden of 17 tons per year, after they have decided what is feasible for Tier 4 equipment to be used at the site and what then to report to OCII under the requirements of M-AQ-1. In total, the construction mitigations proposed in the DEIR are riddled with potential conflicts of interest by leaving the determination of compliance and feasibility to the very party that must identify, implement and pay for them. As written, they cannot be relied upon to deliver the emission benefits that the DEIR assumes will actually occur. The DEIR must be revised to place a qualified, independent, 3rd party entity at the project site daily for the 26 month project duration, making them responsible and liable for accurate, weekly (not quarterly) verifications of equipment emission rates and reductions in reports to the City." (*Mission Bay Alliance, Thomas Lippe, letter, July 26, 2015 [O-MBA8L2-19]*)

Response AQ-6c: Construction Mitigation – Compliance Certification and Operational Mitigation Feasibility

Comments state that requiring the project sponsor to certify compliance with the conditions of **Mitigation Measure M-AQ-1: Construction Emissions Minimization** is insufficient to ensure adequate implementation of mitigation. This requirement C of **Mitigation Measure M-AQ-1** is

only an intermediate step in the process of implementing a Construction Emissions Control Plan (CEMP). This step requires the project sponsor to play a review role in the mitigation measure. Subsequent to this certification, the CEMP must then be submitted to OCII (or its designated representative) for review and approval (requirement A of **Mitigation Measure M-AQ-1)**. Consequently, the project sponsor would not be the only reviewing party so as to ensure adequate implementation of **Mitigation Measure M-AQ-1**. Rather, the lead agency – here, OCII – retains authority to monitor and enforce the measure. The Mitigation Monitoring and Reporting Program will reflect this requirement.

With regard to the use of the term "as feasible" in **Mitigation Measure M-AQ-2a**, changes to SEIR text page 5.4-42 have been revised as indicated in the Response AQ-6f below.

Please see Response AQ-6a regarding availability of off-road equipment with Tier 2, Tier 3, and Tier 4 engines.

Issues Raised by Commenters: Use of Renewable Diesel as Construction Mitigation Measure (AQ-6d)

This response addresses all or part of the following comments, which are quoted below:

O-MBA8L2-17

"**IV. Construction and Operational Mitigation Options Have Not Been Thoroughly Reviewed for Diesel Alternatives**

"Mitigation Measure M-AQ-1 at DSEIR pg. 5-4.36 under item B requires reporting of alternative fuel quantities used to power construction vehicles and equipment at the project site during its 26 month duration. M-AQ-1 should be revised to require the use of low-emission and/or low- CO2 alternative fuels unless costs are substantially (-100%) greater than routine diesel fuel costs. One such product that should have been carefully evaluated in the DSEIR is "Diesel HPR", made from 98% renewable content (a rate about 4 times greater than regular B-20 biodiesel) and currently marketed at 18 locations throughout northern CA and the Bay Area. The price for this ultra-low carbon-intensity diesel, said to have better performance characteristics than traditional petroleum diesel fuel, is competitive with standard onroad and offroad diesel available in CA (as advertised recently in the Sacramento area at $2.89 a gallon).

"Fossil diesel has a cetane rating of 40. The HPR Diesel product, or similar, has a cetane rating of 74. That level of higher cetane results in lower PM and NOx---which are needed reductions for the project. Because the density of the fuel is slightly lower, so is the chemical energy per unit volume (3%). But because the cetane rating is so much higher PM otherwise not emitted is converted into productive energy, with tractive horsepower (per unit volume) slightly higher than fossil diesel (1%).

"Onroad project-serving construction vehicles that cannot otherwise operate without diesel fuel should also be required to use the very low carbon-intensity "Diesel HPR" or similarly effective product, with receipts proving purchase and use provided to the independent, onsite construction mitigation manager (referred to inappropriately as an "Air Quality Specialist" in the DSEIR, as noted elsewhere in this letter) for regular, weekly relay to the OCII. ("Similarly effective" does not mean use of B-20, since its proportion of bio-derived fuel will not exceed 20%, whereas the Diesel HPR product or similar will come almost entirely from renewable sources.)

"Additionally, the project will rely on several emergency diesel gensets---these power units will produce emissions during regular testing, and are very likely to emit far greater quantities of emissions during any actual power outages. Those units should be operated on an alternative, low-emission non-diesel fuel. If not possible, those diesel units should be operated solely on the "Diesel HPR" or similar product. No information is found in the DEIR that discusses whether the diesel (and not alternatively fueled) genset option is critically necessary, whether lower-emitting options are available for them, and why those options are or are not permissible for use at the project.

"See http://www.sacbee.com/news/business/article15203738.html for more information on the Diesel HPR product, and particularly its locations for purchase, costs, and emission benefits over traditional diesel fuel." (*Mission Bay Alliance, Thomas Lippe, letter, July 26, 2015 [O-MBA8L2-17]*)

Response AQ-6d: Use of Renewable Diesel as Construction Mitigation Measure

One comment suggests that the use of renewable diesel (Diesel HPR) should be considered as a potential mitigation measure to reduce construction-related impacts of ROG and NOx.

While not considered as part of the Draft SEIR analysis, a search of dispensing locations for renewable diesel revealed that the nearest such facility is presently over 12 miles from the project site and procurement of fuel would result in additional NOx and ROG emissions from regular fuel transport to project equipment. Consequently, such a mitigation measure may not result in meaningful additional NOx and ROG reductions. Regardless, the following SEIR text on page 5.4-36 is revised as follows (deleted text is shown as ~~strikethrough~~ and new text is underlined) to add this option to element 4 of Mitigation Measure M-AQ-1: Construction Emissions Minimization:

> 4. The Plan shall include estimates of the construction timeline by phase with a description of each piece of off-road equipment required for every construction phase. Off-road equipment descriptions and information may include, but are not limited to: equipment type, equipment manufacturer, equipment identification number, engine model year, engine certification (Tier rating), horsepower, engine serial number, and expected fuel usage and hours of operation. For VDECS installed: technology type, serial number, make, model, manufacturer, ARB verification number level, and installation date and hour meter reading on installation date. For off-road equipment using alternative fuels, reporting shall indicate the type of alternative fuel being used. Renewable diesel shall be considered as an alternative fuel if it can be demonstrated to OCII or the City's air quality specialists that it is compatible with tiered engines and that emissions of ROG and NOx from transport of fuel to the project site will not offset its NOx reduction potential. The plan shall also include estimates of ROG and NOx emissions.

This revision does not change the analysis or conclusions presented in the SEIR.

With regard to the suggested use of alternative fuels for back-up generators, natural gas-fueled generators are subject to reliability problems in an emergency such as an earthquake if natural gas transmission is interrupted. For safety reasons, provision of backup power to evacuate an

event center full of spectators via diesel fuel stored on-site represents a more prudent technology for the proposed event center. As noted above, use of renewable diesel has been added as a text revision to the menu of available measures in Mitigation Measure M-AQ-2a, Reduce Operational Emissions, as indicated in Response AQ-6f below.

Issues Raised by Commenters: Implementation and Enforceability of Mitigation Measure M-AQ-1 (AQ-6e)

This response addresses all or part of the following comments, which are quoted below:

O-MBA8L2-18

"**V. Construction Mitigation Is Unenforceable and Places Inappropriate Reliance on Project Sponsor for Interpretation and Compliance Determinations**

"At DSEIR pg. 5.4-35, Mitigation Measure M-AQ-1 is identified and discussed for reducing project- related construction equipment emissions. Under this measure's Item A, a Construction Emissions Minimization Plan is required:

> "**Construction Emissions Minimization Plan.** Prior to issuance of a construction permit, the project sponsor shall submit a Construction Emissions Minimization Plan (Plan) to the OCII or its designated representative for review and approval by an Air Quality Specialist."

"The measure then goes on to lay out "Compliance Alternatives" that require use of specified types of engines with prescribed emission standards (known as Tiers) utilizing VDECS (Verified Diesel Emission Control Strategies) to reduce equipment NOx emissions and particulates.

"Because the project's construction emissions are estimated to exceed the BAAQMD's NOx threshold of significance, and due to the serious nature of diesel particulate matter (DPM) as a toxic air contaminant subject to EPA and CARB regulations resulting from PM2.5 emissions for which the region is designated nonattainment, it is essential that this measure be implemented and executed effectively for the duration of the project. As written, however, the measure lacks enforceability because there is no recognized definition of or qualification process provided in the DSEIR for "Air Quality Specialist" who will pass judgment on the adequacy of construction equipment and emissions levels to be submitted by the project sponsor for approval.

"While the BAAQMD has agency positions designated "Air Quality Specialist", those positions possess skillsets exclusive to their particular area of expertise, ranging across the sub-specialties of air quality planning, permitting, compliance and enforcement, stationary source inspection, engineering, air monitoring, incentive programs, etc. There is no generic "air quality specialist", as implied in the DEIR's use of the term, and the DSEIR fails to identify the necessary skillsets for this important position. Ensuring compliance with the components of M-AQ-1 will require an individual experienced with CEQA mitigation requirements; air quality regulations and VDECS technology options and functionality; construction site operations and safety issues; a wide variety of offroad and onroad construction equipment and vehicle engines; hands-on engine and VDECS experience to ensure daily compliance with the applicable Compliance Alternative; and precise, effective record-keeping skills, across the 26 month construction duration. The "'Specialist" must be present during all work hours at the site for each day of construction work across the two-plus years of work that would involve operations of construction engines and vehicles at the 11-acre site.

"Because of the importance of the role of the "air quality specialist" in ensuring compliance with M-AQ-1 across the many phases and months of the Arena's construction, this position must be independent, full-

time on the project site, and required to provide weekly report submittals to OCII. At pg. 5.4-36, reporting to OCII is required on a quarterly basis. This is without doubt too long a duration since equipment will come and go on a daily basis, and as written now M-AQ-1 can (and probably will) permit a project sponsor "Specialist" to creatively develop post-hoc equipment compliance records that may appear legitimate but are, in fact, not. Considering that there are no checks and balances built into the Measure, the Lead Agency cannot ensure that compliance with the essential objective of the mitigation measure will actually occur.

"Because of the unusual nature of the duties of the Measure's "Specialist", and as a result of the need for independence from the Applicant to prevent conflict of interest, the EIR must discuss filling the position with a capable, qualified BAAQMD employee under contract to OCII. Should this not be possible, the position must be filled by a qualified, independent contractor chosen by and subject only to the authority of OCII.

"Further, M-AQ-1 specifies numerous sub-part requirements (A 1 through 5) to be included in the Construction Emissions Mitigation Plan, and in each case compliance with those sub-parts is left to the "project sponsor". So, too, is compliance with the Measure's additional duties required under M-AQ-1 items B and C. This is not appropriate when considering the extent, complexity, and costs that will be incurred for effective mitigation measure compliance across the 26-month construction period; permitting the project sponsor to create, implement, report, and determine compliance with the Measure is akin to having the fox guard the henhouse and must not be allowed.

"As written, the measure is not enforceable due to the subjective, undefined nature of "Air Quality Specialist" who will approve the project sponsor's Construction Emissions Mitigation Plan. Further, it is unacceptable that the Measure will permit the project sponsor to determine compliance with each of the measure's components, record and report information signifying compliance, and then, under part C certify their own compliance with the Plan and its various requirements.

"We have inspected construction project sites, under air district contract, to determine compliance with air district-imposed construction equipment mitigations and have found uniformly poor compliance; to exemplify, at one residential subdivision project in south Sacramento County we determined that only one offroad construction vehicle out of nearly twenty were actually compliant with the mitigation requirements that had been imposed on the project by the Lead Agency. This is because there has traditionally been very little, if any, post- EIR follow-through to verify mitigation compliance by Lead Agencies or by the local air district after the CEQA project has been approved for development and construction has started. Knowing this, construction and development firms commonly let air quality mitigations go unmet, although records purporting to show compliance can be easily formulated and submitted post hoc in order to fulfill a paper requirement. Without an independent, qualified 3rd party contractor onsite each day to track, verify, and record emissions- and activity-related information on construction vehicles used at the project site to ensure the EIR's mitigations are implemented effectively, the project is very unlikely to produce more than a token of the emission reductions claimed in the DSEIR." (*Mission Bay Alliance, Thomas Lippe, letter, July 26, 2015 [O-MBA8L2-18]*)

Response AQ-6e: Implementation and Enforceability of Mitigation Measure M-AQ-1: Construction Emissions Minimization

A commenter states that there are not sufficient mechanisms in place to ensure that **Mitigation Measure M-AQ-1: Construction Emissions Minimization** will be successfully implemented and that the term "air quality specialist" is not succinctly defined by skill sets or capabilities.

As discussed in the Response AQ-6d above, the Construction Emissions Minimization Plan (CEMP) must be submitted to OCII for review and approval (requirement of Mitigation Measure M-AQ-1). OCII staff or its designated representative will coordinate their review with

designated air quality specialists[21] at the San Francisco Planning Department (SF Planning), as necessary.

The City and OCII have successfully monitored implementation of emissions minimization requirements on numerous construction projects over the past several years. Examples of past and ongoing projects with CEMP emissions minimization requirements include Candlestick Point-Hunters Point Shipyard Phase II Development Project, which requires staged increases in the percentage of Tier 4 equipment; the Seismic Upgrade of BDPL Nos. 3 & 4 at Hayward Fault Project, which had one year of tiered engine requirements for on-road spoils hauling trucks and off-road construction equipment; and the Pacific Rod and Gun Club Upland Soil Remedial Action Project, which also had tiered engine requirements for off-road construction equipment. Not only does the City's track record demonstrate the capability of, and success in, monitoring implementation of emissions minimization requirements, but agencies are presumed as a matter of law to comply with their legal obligations such as monitoring and implementing a Mitigation Monitoring and Reporting Program prepared for the purposes of CEQA compliance. (*Bus Riders Union v. Los Angeles County Metropolitan Transportation Agency* (2009) 179 Cal.App.4th 101, 108 ["[a]ll presumptions of law are in favor of the good faith of public officials …"]; *San Joaquin River Exchange Contractors Water Authority v. State Water Resources Control Bd.* (2010) 183 Cal.App.4th 1110, 1135; Evid. Code, § 664.)

Furthermore, SF Planning has developed a CEMP compliance spreadsheet[22] for the purposes of demonstrating compliance with the City's Clean Construction Ordinance, which assigns SFEP the role of verifying compliance of City contractors with the requirements of the ordinance. The SFEP requires the contractor to provide the identification number, engine tier certification, and engine serial number for each piece of off-road equipment to be used, inclusive of subcontractor and rental equipment. The contractor must complete this equipment list, which is a component of the CEMP, prior to issuance of a construction permit, monthly during construction activities, and a final report within six month of the completion of construction.

The provisions of this mitigation measure satisfy CEQA's requirement that the lead agency make mitigation measures an enforceable condition of its approval.

---

[21] The SF Planning has an air quality group with technical expertise in CEQA-related air quality technical analysis, including the ability to assess, availability and quality of existing data; evaluation of air quality modeling parameters and potential air quality impacts; and development, evaluation, and monitoring of air quality mitigation measures. Air quality specialists within the group provide an analysis of a project's potential to emit criteria air pollutants, toxic air contaminants, and greenhouse gases, as well as the potential for pollutants to adversely affect sensitive receptors. Air quality specialists are familiar with modeling programs including, but not limited to: CalEEMod, URBEMIS, EMFAC, AERMOD, and CAL3QHCR Line Source Dispersion Model.

Issues Raised by Commenters: Feasibility of Mitigation Measure M-AQ-2a (AQ-6f)

This response addresses all or part of the following comments, which are quoted below:

O-MBA8L2-19

"Similarly, M-AQ-2a begins with "The project sponsor shall implement the following measures as feasible:"... The introduction of "as feasible" is a poison pill, since the measure does not conclusively identify the party responsible (and liable) for determining sub-component measure feasibility. This determination must not be left to the project sponsor, but, rather, vested with a qualified independent contractor chosen by and reporting solely to the OCII, or to the BAAQMD on behalf of OCII, to ensure measure implementation at every truly "feasible" turn. Without specifying duties for the accurate determination of what constitutes "as feasible", and then ensuring that those duties are actually implemented by a non-conflicted 3rd party (which, as written currently, the project sponsor cannot possibly fulfill without potential for conflict of interest), M-AQ-2a lacks necessary enforceability and cannot be expected to produce those real, quantifiable, surplus mitigated emission benefits claimed in the DSEIR.

"Finally, M-AQ-2b leaves it to the project sponsor to calculate the amount of emission offsets required to satisfy the project's estimated ozone precursor burden of 17 tons per year, after they have decided what is feasible for Tier 4 equipment to be used at the site and what then to report to OCII under the requirements of M-AQ-1. In total, the construction mitigations proposed in the DEIR are riddled with potential conflicts of interest by leaving the determination of compliance and feasibility to the very party that must identify, implement and pay for them. As written, they cannot be relied upon to deliver the emission benefits that the DEIR assumes will actually occur. The DEIR must be revised to place a qualified, independent, 3rd party entity at the project site daily for the 26 month project duration, making them responsible and liable for accurate, weekly (not quarterly) verifications of equipment emission rates and reductions in reports to the City." (*Mission Bay Alliance, Thomas Lippe, letter, July 26, 2015 [O-MBA8L2-19]*)

Response AQ-6f: Feasibility of Mitigation Measure M-AQ-2a: Reduce Operational Emissions

In response to a comment stating that the term "as feasible" in M**itigation Measure M-AQ-2a: Reduce Operational Emissions** is vague, the following SEIR text on page 5.4-42 is revised as follows (deleted text is shown as ~~strikethrough~~ and new text is <u>underlined</u>). In addition, as discussed in Response AQ-6d, an additional measure is added regarding alternative diesel fuel as indicated below.

Mitigation Measure M-AQ-2a: Reduce Operational Emissions

The project sponsor shall implement the following measures ~~as feasible~~:

- Provision of outlets for electrically powered landscape equipment
- <u>Use of renewable diesel to power back-up diesel generators if it can be demonstrated to OCII or the City's air quality specialists that it is compatible with tiered engines and that emissions of ROG and NOx from transport of fuel to the project site will not offset its NOx reduction potential.</u>

- **Mitigation Measure M-TR-2eb: Additional Strategies to Reduce Transportation Impacts** (see Section 5.2, Transportation and Circulation, Impact TR-2)
- **Mitigation Measure M-TR-11c: Additional Strategies to Reduce Transportation Impacts of Overlapping Events** (see Section 5.2, Transportation and Circulation, Impact TR-11)

This revision does not change the analysis or conclusions presented in the SEIR.

With regard to review of and assessment of feasibility of mitigation, by a non-conflicted third party, SF Planning has an air quality group with technical expertise in CEQA-related air quality and health risk who would assist OCII in determination of adequate demonstration of infeasibility.

13.13.8 Emissions Offset Mitigation Measure (AQ-7)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

A-BAAQMD-1	O-MBA8L2-11	O-MBA8L2-19	O-MBA8L2-20
O-MBA8L2-24	O-PBNA-12	O-PBNA-13	

"If a stationary source of mitigation cannot be identified near the Arena, then mitigation could take the form of additional hybrid and electric buses for the SFMTA." (*Potrero Boosters Neighborhood Association, J.R. Eppler, letter, July 27, 2015 [O-PBNA-12]*)

"Air District staff greatly appreciates the opportunity to work with the City to address the potentially significant air quality impacts estimated for this Project. Project design features and the mitigation measures identified in the DSEIR will substantially lessen the local and regional air quality impacts from construction and operation of the Project.

"However, even with these Project design features and on-site mitigation measures, air quality impacts from the Project still exceed the City's thresholds of significance. Therefore, Mitigation Measure M-AQ-2b Emissions Offsets (M-AQ-2b) commits the Project applicant to providing funds to achieve additional emission reductions to reduce air emissions below the thresholds of significance. To this end, M-AQ-2b states that the Project applicant would provide funding of $321,646 to the Air District to fund emissions reduction projects in the region in order to offset the remaining criteria pollutant emissions generated by both the construction and operation activities from the Project.

"However, as Air District staff previously has discussed with the City, the Project Applicant would need to contribute $620,922 to fully offset the remaining criteria pollutant emissions from this Project through the Air District's grant programs. The Air District recommends that the DSEIR MM-AQ-2b be updated to reflect this funding amount." (*Bay Area Air Quality Management District, Jean Roggenkamp, letter, July 20, 2015 [A-BAAQMD-1]*)

"**a. Mitigation Measure M-AQ-2b does not comply with CEQA's legal requirements.**

"Mitigation Measure M-AQ-2b requires the Project Sponsor pay a fee to the BAAQMD that the BAAQMD will use to purchase ozone precursor offsets. The purpose is to offset the amount by which the project's ozone precursors emissions exceed the numerical thresholds discussed in the previous section of this letter.

"Therefore, to the extent the thresholds are invalid, as argued above, M-AQ-2b fails to reduce ozone precursor emissions to less-than-significant levels. Further, the DSEIR does not even consider the feasibility or effectiveness of more robust mitigation strategies that could reduce ozone precursor emissions further below the (invalid) thresholds. (See DSEIR, p. 5.4-39, Table 5.4-9, "Estimated Emissions Reduction Required".)

"The amount of the offset fee required by M-AQ-2b is calculated by multiplying the total amount of annual criteria pollutant emissions exceeding the annual (invalid) thresholds by $18,030 per weighted ton of criteria pollutant emissions; then adding 5% of that product for BAAQMD's administrative fees, as follows:[10]

ROG tons	4.4
NOx tons	12.6
PM tons x 20	0
Subtotal	17
Fee per ton	$18,030.00
Subtotal	$306,510.00
Admin fee 5%	0.05
Admin fee	$15,325.50
Total Fee	$321,835.50

"The DSEIR indicates M-AQ-2b requires the Project Sponsor to pay only $321,835.50, which is the amount required to offset one year's worth of the Project's operational criteria pollutant emissions.(See DSEIR, p. 5.4-41.) But the sports and entertainment arena portion of this Project has an operational life of at least 50 years, probably much longer,[11] and the office towers will last even longer. In contrast, the life spans of offset credit sources are much shorter than the expected life span of this Project. (See Exhibit 1.) Therefore, the actual amount required to offset the Project's above-threshold ozone precursor emissions is much higher than $321,835.50. Therefore, the DSEIR's premise that M-AQ-2b will achieve a complete offset of the Project's above threshold construction and operational criteria pollutant emissions is misleading and false.[12]

"To address this deficiency, M-AQ-2b must be amended. The DSEIR must disclose the average life span of the offset credit sources the BAAQMD typically buys, then amend M-AQ-2b to require recalculation of the offset fee or other offset requirement after the average life span of such offset credit sources to account for their limited life span, changes in emissions, changes in attainment status, etc. In addition, M-AQ-2b must be amended to include a mechanism, in the event that BAAQMD does not spend the offset fee and returns it, to ensure the required offsets are purchased through another bona fide, verifiable offset program.

"Accepting, *arguendo*, the validity of the 17 ton offset requirement, the DSEIR's discussion of Mitigation Measure M-AQ-2b leaves many questions unanswered regarding BAAQMD's offset program. For example, the effectiveness of the measure depends directly on the validity of numerous assumptions, including: (1) the assumption that $18,030 is enough to purchase a ton of criteria pollutant emissions; (2) the assumption that the offset market has 17 tons of criteria pollutant emissions that can be reduced by engine retrofits or other offset techniques; (3) the assumption the Project Sponsor will accurately measure actual construction and operational emissions for purpose of determining how many tons of criteria pollutants must be offset; and (4) the assumption that BAAQMD has and will have reliable verification procedures in place ensuring that 17 tons of offset will actually be achieved.

"**Footnotes:**

[10] 54 lbs per day of ROG emissions equals 10 tons per year.

[11] Oracle Arena was built in 1966, 49 years ago, and is still functional.

[12] The DSEIR indicates that construction-related criteria pollutant emissions are mitigated by including them in the operational period emission mitigation strategy. (DSEIR, p. 5.4-34.)

(*Mission Bay Alliance, Thomas Lippe, letter, July 26, 2015 [O-MBA8L2-11]*)

"Similarly, M-AQ-2a begins with "The project sponsor shall implement the following measures as feasible:"... The introduction of "as feasible" is a poison pill, since the measure does not conclusively identify the party responsible (and liable) for determining sub-component measure feasibility. This determination must not be left to the project sponsor, but, rather, vested with a qualified independent contractor chosen by and reporting solely to the OCII, or to the BAAQMD on behalf of OCII, to ensure measure implementation at every truly "feasible" turn. Without specifying duties for the accurate determination of what constitutes "as feasible", and then ensuring that those duties are actually implemented by a non-conflicted 3rd party (which, as written currently, the project sponsor cannot possibly fulfill without potential for conflict of interest), M-AQ-2a lacks necessary enforceability and cannot be expected to produce those real, quantifiable, surplus mitigated emission benefits claimed in the DSEIR.

"Finally, M-AQ-2b leaves it to the project sponsor to calculate the amount of emission offsets required to satisfy the project's estimated ozone precursor burden of 17 tons per year, after they have decided what is feasible for Tier 4 equipment to be used at the site and what then to report to OCII under the requirements of M-AQ-1. In total, the construction mitigations proposed in the DEIR are riddled with potential conflicts of interest by leaving the determination of compliance and feasibility to the very party that must identify, implement and pay for them. As written, they cannot be relied upon to deliver the emission benefits that the DEIR assumes will actually occur. The DEIR must be revised to place a qualified, independent, 3rd party entity at the project site daily for the 26 month project duration, making them responsible and liable for accurate, weekly (not quarterly) verifications of equipment emission rates and reductions in reports to the City." (*Mission Bay Alliance, Thomas Lippe, letter, July 26, 2015 [O-MBA8L2-19]*)

"**VI. Operational Mitigation Measure for Electrical Outlets is Vague and Unenforceable**

"Mitigation Measure M-AQ-2a at DSEIR pg. 5.4-42 is designed to reduce the project's operational emissions, requiring the project sponsor to provide outlets for electrically powered landscape equipment "as feasible." As written, this measure is unenforceable since it permits the sponsor to determine feasibility. There is no doubt that the measure will be feasible, since electric power will be ubiquitous across the project site in built structures, at their exteriors, and in power supplied to lighting and other exterior improvements across the project's eleven acres.

"Additionally, the mitigation measure should be revised to require that the project sponsor and any future property owners or tenants require in any landscaping contracts the requirement that landscape maintenance firms at the project use only electrically powered landscape equipment. Merely requiring outlets without mandating their use for landscaping onsite renders this portion of M-AQ-2a entirely unreliable for producing actual emission benefits." (*Mission Bay Alliance, Thomas Lippe, letter, July 26, 2015 [O-MBA8L2-20]*)

"**X. Mobile-Based Emission Offsets Are Unlikely To Produce Needed Project-Lifetime Reductions**

"Mitigation Measure M-AQ-2b at DSEIR pg. 5.4-42 identifies the use of emission offsets for the project, requiring the project sponsor pay a mitigation-offset fee to the Bay Area Air Quality Management District's (BAAQMD) Strategic Incentives Division. The measure is designed to offset operational project emissions that have been estimated to exceed the DSEIR's air quality thresholds of significance. As noted at pg. 5.4-42:

> "...the project sponsor shall pay a mitigation offset fee to the Bay Area Air Quality Management District's (BAAQMD) Strategic Incentives Division in an amount not to exceed $18,030 per weighted

ton per year of ozone precursors plus a 5 percent administrative fee to fund one or more emissions reduction projects within the San Francisco Bay Area Air Basin (SFBAAB). This fee is intended to fund emissions reduction projects to achieve reductions of 17.0 tons per year of ozone precursors."

"There is a serious, fundamental flaw in the logic applying to the measure's requirement to purchase emission offsets, since emission reductions developed through the BAAQMD's Strategic Incentives Division are based on mobile source emission reduction projects with limited and intentionally impermanent lifetimes. These projects typically operate for several years before they are rendered obsolete by new vehicle emission control standards and technologies, and thus they must not be expected to produce the 17 tons per year of ozone precursor offsets, year in and year out, across what is at least a 30 year project planning lifetime.

"Accordingly, M-AQ-2b must be revised to require emission offsets for project operations for, at a minimum, the aforementioned 30 year life of the project. To exemplify, if the BAAQMD purchases mobile emission offsets with an emission reduction life of less than 10 years, the project sponsor must then pay mitigation-offset fees for mobile emission reductions until emission offsets are realized for the minimum 30 year period. Without such protection the project can be expected to offset its significant ozone precursors for no more than one-third of its lifetime; this is clearly inconsistent with CEQA's interest in mitigating the project's significant impacts across its planned lifetime." (*Mission Bay Alliance, Lippe, letter, July 26, 2015 [O-MBA8L2-24]*)

"As a result, 80% of the funds called for in Mitigation M-AQ-2b should go to reducing the impacts in the area of the Arena itself." (*Potrero Boosters Neighborhood Association, J.R. Eppler, letter, July 27, 2015 [O-PBNA-13]*)

Response AQ-7: Emissions Offsets Mitigation Measure

The commenter states that the project applicant must provide a greater amount of funds than is required under Mitigation Measure M-AQ-2b (Emissions Offsets) to fully offset the project's criteria pollutant emissions. Under CEQA, a lead agency can only impose mitigation on the project applicant to the extent necessary to reduce an impact to a less-than-significant level.

Among other constraints, a lead agency's authority to impose mitigation is limited by the U.S. Constitution. As explained in CEQA Guidelines section 15041, subdivision (a), "[a] lead agency for a project has authority to require feasible changes in any or all activities involved in the project in order to substantially lessen or avoid significant effects on the environment, consistent with applicable constitutional requirements such as the 'nexus' and 'rough proportionality' standards established by case law." (Citing *Nollan v. California Coastal Commission* (1987) 483 U.S. 825, *Dolan v. City of Tigard* (1994) 512 U.S. 374, and *Ehrlich v. City of Culver City* (1996) 12 Cal.4th 854; see also CEQA Guidelines, § 15126.4, subd., (a)(4)(A), (B).)

Mitigation measures must have an "essential nexus" (i.e., connection) to a legitimate government interest. (CEQA Guidelines, § 15126.4, subd, (a)(4)(A), citing *Nollan v. California Coastal Commission* (1987) 483 U.S. 825.) The mitigation measures must also bear a "rough proportionality" to the project's adverse impacts, and if the mitigation measure is an ad hoc exaction, it must be "roughly proportional" to the impacts of the project. (CEQA Guidelines, § 15126.4, subd, (a)(4)(B), citing *Dolan v. City of Tigard* (1994) 512 U.S. 374 and *Ehrlich v. City of Culver City* (1996) 12 Cal.4th 854.)

The nexus between the mitigation measure and a legitimate government interest is outlined on pg. 5.4-41 of the Draft SEIR. The mitigation measure is required (the nexus) as a result of the project's operational emission levels of ROG and NOx exceeding the SEIR's significance thresholds. Mitigation Measure M-AQ-2b, Emission Offsets, is identified to offset project operational emissions of ROG and NOx to the extent they exceed the significance thresholds by funding the implementation of one or more emission reduction projects within the air basin. The BAAQMD administers the Carl Moyer program within the San Francisco Bay Area Air Basin (SFBAAB), which establishes the cost-effectiveness criteria for funding emissions reduction projects at $18,030 per weighted ton of ROG, NOx and PM emissions.[23,24] The program has established guidelines and criteria for the funding of emissions reduction projects. The BAAQMD administers the Carl Moyer program within the SFBAAB.

The "rough proportionality" standard means that the type and amount mitigation must roughly correspond in size, degree, and intensity to the project impact. In other words, an agency may not impose mitigation (including mitigation fees) on a project that is greater than necessary to mitigate a particular impact of the project to a less than significant level. (*Dolan v. City of Tigard, supra,* 512 U.S. 374; see also *Ehrlich v. City of Culver City* (1996) 12 Cal.4th 854, [$280,000 "recreation fee" assessed against a property owner as a condition of approving a residential project did not satisfy the "rough proportionality" standard of *Dolan*].)

Here, the proportionality of the mitigation to the air quality impact is based on the existing Carl Moyer program cost effectiveness criteria and a 5 percent administrative fee. Using this criteria, it was determined that a payment of $321,646 to the Strategic Incentives Division of the BAAQMD to implement emission reduction projects within the SFBAAB would be the appropriate fee to offset the regional criteria pollutant emissions generated by operation of the proposed project that would remain in excess of the applicable thresholds. This is based on 4.4 tons per year of ROG and 12.6 tons per year of NOx during operation of the project, or a total of 17.0 tons per year of ozone precursors at the rate of $18,030 per weighted ton plus the administrative fee, the rate established under the Carl Moyer program. Estimated emissions offsets for construction emissions for the project (which would occur during the construction period before project operation commences) are less than 17 tons per year, so this payment would also mitigate for the project's construction emissions, but as explained in SEIR p. 5.4-34, if actual construction emissions exceeded this amount, additional offset fees would be assessed. The $321,836 fee matches the fee rates adopted by other established Carl Moyer programs in both Sacramento and San Joaquin county air basins.

The project sponsor would implement Mitigation Measure M-AQ-2b (Emission Offsets) through payment of the $321,836 offset fee, which has a clear nexus between the project's operational air quality impacts and the BAAQMD's authority to implement emission reduction projects as part

[23] The following equation is used to calculated the Weighted Emissions Reductions: Weighted Emissions Reductions= NOx reductions (tons/year)+ROG Reductions (tons/year) +(20 x (PM Reductions (tons/year))).

[24] California Air Resources Board. Memorandum Re: Carl Moyer Program: Review and Update of the Cost-Effectiveness Limit and Capital Recovery Factors for 2015. March 27, 2015. Available online at: http://www.arb.ca.gov/msprog/mailouts/msc1509/msc1509.pdf. Accessed April 24, 2015.

of the Carl Moyer program. Therefore, $321,836 offset fee identified in Impact AQ-2 was calculated to be "roughly proportional" to the operational air quality impacts, using the offset funding equation of $18,030 per weighted ton of ROG, NOx and PM emissions and a 5 percent administrative fee.

SF Planning has been in communication with BAAQMD with regard to its suggestion that a higher fee may be warranted to offset project emissions to a less than significant level and found that BAAQMD could not establish that an increased rate beyond that of the Carl Moyer Program plus a five percent administrative fee could meet the "rough proportionality" standard required under CEQA. The Carl Moyer fee structure was reviewed and updated by CARB in March of 2015 and became fully implemented on July 1, 2015.[25] The offset costs cited in Mitigation Measure M-AQ-2b Emission Offsets are consistent with those of the CARB and other operating California air districts. For example, in the Sacramento Metropolitan Air Quality Management District, the off-site construction mitigation fee rate is $18,030 per ton of excess NOx emissions as of July 1, 2015 (plus an administrative fee of 5 percent) and is based on the cost effectiveness formula established in California's Carl Moyer Incentive Program. In the San Joaquin Valley Air Pollution Control District, the Indirect Source Review (ISR) program requires that an offsite reduction fee of $9,350/ton plus a 4 percent administration fee be applied for NOx emission reductions that cannot be achieved through onsite emission reduction measures. Furthermore, the offset costs in Mitigation Measure M-AQ-2b is consistent or even higher than comparable offset programs in the SFBAAB.[26]

The comment states that Mitigation Measure M-AQ-2b, Emission Offsets, fails to reduce ozone precursors to less-than-significant levels. The Draft SEIR identifies Impact AQ-2 as significant and unavoidable even with the implementation of Mitigation Measure M-AQ-2b. This finding is based upon acknowledgement that implementation of an emissions offset project would either be conducted by the BAAQMD and would be dependent in part on the actions of a third party and not fully within the control of the project sponsor or alternatively, the project sponsor would identify and fund an emissions offset project. In either case, the fee would be designed to fully mitigate for the impact for the life of the project, as explained above. However, because no specific mitigation projects have been identified by either the BAAQMD or the project sponsor at this time, the appropriate conclusion is that the impact is *significant and unavoidable with mitigation*.

Another commenter states that the offset amount presented on page 5.4-41 of the SEIR would only offset a single year of emissions. This assertion is incorrect. Emissions offset programs replace existing high-polluting engines with cleaner more efficient engines and the incremental benefit of these replacements are realized for successive years into the future until the original engine would have reached the end of its useful life [27] or its operation is prohibited by regulation

[25] *Ibid.*
[26] Keinath, Michael, Rambol Environ, 2015. Analysis of the Proposed Offset Program for the Golden State Warriors. October 19, 2015.
[27] Keinath, Michael, Rambol Environ, 2015. Analysis of the Proposed Offset Program for the Golden State Warriors. October 19, 2015.

(e.g., California Code of Regulations, Title 13, Division 3, § 2449(d)(2) (in-use off-road diesel regulation)). Other offset programs, such as the shoreside power unit implemented by the Port of San Francisco pursuant to the Final EIR for the 34th America's Cup and James R. Herman Cruise Terminal and Northeast Wharf Plaza (Case No. 2010.0493E) continue to offset hoteling emissions of diesel ships in dry dock at Pier 70.

One comment suggests a specific mitigation alternative by funding hybrid and electric buses for the SFMTA. Mitigation Measure M-AQ-2b allows the BAAQMD discretion in its choice of mitigation projects, which would most effectively offset project emissions. BAAQMD Grant programs include the Carl Moyer program or the option to upgrade or replace heavy-duty diesel vehicles and equipment, which may include SFMTA transit vehicles.

Another commenter states concern that the project sponsor would act alone in the ultimate determination of the quantity of offsets to be procured. To address this concern, a text change has been made to Mitigation Measure M-AQ-2b requiring the project sponsor to provide calculations to the satisfaction of OCII or its designated representative of the amount of emissions offset. The SEIR text page 5.4-42 is revised as follows (deleted text is shown as ~~strikethrough~~ and new text is underlined):

Mitigation Measure M-AQ-2b: Emission Offsets

Upon completion of construction, and prior to issuance of certificate of occupancy, the project sponsor, with the oversight of OCII or its designated representative, shall either:

1. ~~p~~Pay a mitigation offset fee to the Bay Area Air Quality Management District's (BAAQMD) Strategic Incentives Division in an amount not to exceed $18,030 per weighted ton per year of ozone precursors per year requiring emissions offsets plus a 5 percent administrative fee to fund one or more emissions reduction projects within the San Francisco Bay Area Air Basin (SFBAAB). This fee is intended to fund emissions reduction projects to achieve reductions of 17~~.0~~ tons ~~per year~~ of ozone precursors per year, the estimated tonnage of operational and construction-related emissions offsets required. Documentation of payment shall be provided to OCII or its designated representative.

   The project sponsor shall provide calculations to the satisfaction of OCII or its designated representative of the final amount ~~calculate the amount~~ of emissions ~~offset required~~ from construction activities based on the reporting requirements of Mitigation Measure M-AQ-1, which shall consider the final destination of off-hauled soil and construction waste materials by on-road trucks, contributions from Electrical Power Distribution System Expansion, and the degree of compliance with off-road equipment types that were ~~determined to be~~ commercially available. If the calculated construction emissions of ozone precursors require~~s~~ offsets in excess of 17~~.0~~ tons per year, then the applicant shall provide the additional offset amount commensurate with the calculated ozone precursor emissions exceeding 17~~.0~~ tons per year.

   Acceptance of this fee by the BAAQMD shall serve as an acknowledgment and commitment by the BAAQMD to: (1) implement an emissions reduction project(s) within one year of receipt of the mitigation fee to achieve the emission reduction objectives specified above; and (2) provide documentation to OCII or its

designated representative and to the project sponsor describing the project(s) funded by the mitigation fee, including the amount of emissions of ROG and NOx reduced (tons per year) within the SFBAAB from the emissions reduction project(s). If there is any remaining unspent portion of the mitigation offset fee following implementation of the emission reduction project(s), the project sponsor shall be entitled to a refund in that amount from the BAAQMD. To qualify under this mitigation measure, the specific emissions retrofit project must result in emission reductions within the SFBAAB that would not otherwise be achieved through compliance with existing regulatory requirements~~.~~ or

2. Directly implement a specific offset project to achieve reductions of 17 tons per year of ozone precursors (or greater as described in item 1 above). To qualify under this mitigation measure, the specific emissions retrofit project must result in emission reductions within the SFBAAB that would not otherwise be achieved through compliance with existing regulatory requirements. Prior to implementation of the offset project, the project sponsor must obtain OCII's approval of the proposed offset project by providing documentation of the estimated amount of emissions of ROG and NOX to be reduced (tons per year) within the SFBAAB from the emissions reduction project(s). The project sponsor shall notify OCII within six months of completion of the offset project for OCII verification.

This revision does not change the analysis or conclusions presented in the SEIR.

13.13.9 General Comment Related to Air Quality Impacts (AQ-8)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

O-MBA8L2-14 O-MBA8L2-25 O-MBA8L2-30

"This review and commentary focuses on the DEIR's use of flawed construction mitigation measures that will not deliver purported emission benefits; a failure to provide substantive discussion on whether wastewater improvement-related emissions made necessary for completion of the Event Center project should have been reviewed in the DSEIR; failure to meaningfully evaluate and mitigate with effective alternatives to diesel equipment and diesel fuel, including requirement to use zero-emission electric options when appropriate; the unjustified use of trip-related emissions of major sports events from the Oracle Arena for application to the project's sports arena; failure to evaluate the use of the latest available OEHHA health risk guidance known to be under discussion during the preparation of the DSEIR; the Lead Agency's reliance on thresholds of significance that have not been adopted in compliance with CEQA Guidelines; and the use of emission offsets with substantially less lifetime mitigation value than that relied upon by the Lead Agency in the DSEIR." (*Mission Bay Alliance, Thomas Lippe, letter, July 26, 2015 [O-MBA8L2-14]*)

"In summary, we believe the project DSEIR's treatment of air quality impact analysis and mitigation has inaccurately characterized certain project emissions, applied mitigation measures which are unenforceable or will simply not be implemented effectively if they are substantively implemented at all,

failed to use thresholds of significance previously adopted by the Lead Agency's Board of Directors pursuant to CEQA Guidelines, and has incorrectly assumed the transfer of Warriors game-related operational emissions established for the Oracle Arena to apply to the project arena to be built in San Francisco." (*Mission Bay Alliance, Thomas Lippe, letter, July 26, 2015 [O-MBA8L2-25]*)

_____

"A revised DSEIR should be prepared to address these inadequacies and to incorporate mitigation to reduce impacts which otherwise would affect regional air quality, and health impacts from toxic air contaminants." (*Mission Bay Alliance, Thomas Lippe, letter, July 26, 2015 [O-MBA8L2-30]*)

_____

Response AQ-8: General Comments Related to Air Quality Impacts

This group of comments consists of either introductory or conclusion paragraphs that summarize overall air quality issues raised by the commenter(s). All of the specific issues raised in these summary paragraphs are addressed in detail under the appropriate sub-topic headings included in this Section 13.13, Air Quality, of the Responses to Comments document.

13.14 Greenhouse Gases Emissions

13.14.1 Overview of Comments on Greenhouse Gases

The comments and corresponding responses in this section cover topics analyzed in SEIR Section 5.5, Greenhouse Gas Emissions. These include topics related to:

- GHG-1: Setting
- GHG-2: Approach to Analysis

13.14.2 Setting (GHG-1)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

O-Sierra-8

"The SEIR notes that there are many GHG regulations – both state and local – with which the project must comply. It credits these laws with reducing emissions of greenhouse gases in San Francisco. However, the Sierra Club notes that a large part of the reason the City's GHG emissions levels have dropped is because of the closure of the PG&E power plant in the Bayview a few years ago. (*Volume 2, 5-5-11*)" (*Sierra Club, Susan E. Vaughan, letter, July 27, 2015 [O-Sierra-8]*)

Response GHG-1: Setting

The comment states that the closure of the PG&E power plant has reduced the City's greenhouse gas (GHG) emissions. This statement is correct. SEIR Section 5.5 states that in 2010 the two largest sources of GHG emissions in San Francisco were motorized transportation and natural gas sectors. The closure of stationary sources, such as the PG&E power plant closure, is one factor in citywide GHG reductions. The San Francisco Climate Action Plan[1] addresses reductions due to efforts in the transportation, energy efficiency, renewable energy, and solid waste sectors. The GHG Reduction Strategy considers additional GHG reductions from policies affecting land use. Meeting City and statewide GHG reduction targets for 2020 and beyond will require concerted effort in all sectors, as addressed in the San Francisco Climate Action Plan, the San Francisco Greenhouse Gas Reduction Ordinance, and the San Francisco Greenhouse Gas Reduction Strategy.

[1] San Francisco Department of the Environment and San Francisco Public Utilities Commission, 2004. Climate Action Plan for San Francisco, Local Actions to Reduce Greenhouse Gas Emissions. September.

13.14.3 Approach to Analysis (GHG-2)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

O-MBA7S2-2	O-MBA7S2-5	O-MBA7S2-41	O-Sierra-3
O-Sierra-6	O-Sierra-10	O-Sierra-11	PH-Cornwell2-3

PH-Vaughan-5			

"Under AB 900, a "Leadership Project" receives an expedited CEQA review process and other streamlining benefits. (Pub. Resources Code, § 21178 et seq.) Leadership projects are supposed to create high quality permanent jobs and innovative measures to reduce environmental impacts, including greenhouse gas ("GHG") emissions. As a result of the certification received under AB 900, the DSEIR claims that the Project will "not result in any net additional GHG emissions." (DSEIR, p. 5.5-10.)

"As explained below and in the attached technical comments by SCS Engineers, dated July 20, 2015 ("SCS" attached as Exhibit A), the AB 900 Application process does not meet minimum standards for calculation of GHG emissions, nor does it provide a substitute for CEQA's EIR process or substantive standards. The DSEIR relies entirely on the existence of the AB 900 certification for its analysis of the Project's contribution to the cumulative impact to GHG emissions. While the AB 900 certification is not subject to judicial review (Pub. Resources Code, § 21184, subd. (b)(1)), the content of the Application for AB 900 certification does not substitute for an adequate analysis of GHG emissions in the DSEIR. As a result, the DSEIR fails to meet minimum standards of disclosure and also incorrectly concludes that GHG emissions are less than significant. These flaws in the DSEIR require revision and recirculation of the DSEIR with an adequate GHG analysis." (*Mission Bay Alliance, Soluri Meserve, letter, July 26, 2015 [O-MBA7S2-2]*)

"b. The Flawed AB 900 Application Cannot Substitute for an Adequate Analysis Under CEQA in the DSEIR.

"The DSEIR simply refers to the result of the AB 900 certification process, providing no additional analysis or disclosure in the DSEIR itself regarding the expected GHG emissions of the Project or how those impacts would be mitigated. To the extent the DSEIR intends to incorporate the faulty AB 900 Application into the DSEIR instead of setting forth the analysis in the DSEIR, it did not follow procedures required to do so. CEQA Guidelines section 15150 requires that "the incorporated part of the referenced document shall be briefly summarized where possible or briefly described if the data or information cannot be summarized." The AB 900 Application was not summarized or described in the DSEIR, nor was it included as an appendix. If the AB 900 Application is to be offered as environmental analysis in the DSEIR, it would have to be included as an appendix to the DSEIR so that the public could review it. (CEQA Guidelines, § 15147; *Vineyard Area Citizens for Responsible Growth v. City of Rancho Cordova* (2007) 40 Cal.4th 412, 442 (where lead agency "relied on information not actually incorporated or described and referenced in the FEIR, it failed to proceed in the manner provided in CEQA").)

"Nor can the DSEIR rely on analysis in the 1998 FSEIR. Though GHG emissions are briefly mentioned in the 1998 FSEIR (DSEIR, p. 5.5-1), this Project being proposed years later was not analyzed. Moreover, the approach to GHG emissions has changed dramatically in the intervening years.

"The approach to calculating GHG emissions in the AB 900 Application is also inconsistent with basic CEQA principles as well as the DSEIR's approach to analysis of other impacts of the Project. As described above, large components of the Project to which the AB 900 certification and the "no net increase in GHG emissions" allegedly apply were simply omitted from the inventory, including over 700,000 square feet of

retail and office uses. (DSEIR, Figure 3-5 and Table 3-1.) While there is no discussion in the DSEIR, the AB 900 Application claims that these other uses were "fully vested legal rights" permitted by the land use plan, and therefore did not quantify the GHG emissions from that part of the Project. (Leadership Application, p. 8.)

"The Leadership Project application process does not provide any direction to exclude aspects of the project from the Leadership Application. (Pub. Resources Code, § 21183, subd. (c).) Nor does it substitute the AB 900 certification for an adequate analysis under CEQA. Certainly if the Legislature had intended that an approved Leadership application could substitute for mandated analysis in an EIR, it would have so stated; it did not. As the certification is for the entire complex, including office and retail, there is no justification to exclude part of the project from the analysis. The result is an impermissible decrease of the GHG emissions calculated to occur as a result of the Project.

"The notion that having a vested right to do something affects the obligation under CEQA to disclose the impact of doing it has been squarely rejected. (*Communities For A Better Environment v. South Coast Air Quality Management Dist*. (2010) 48 Cal.4th 310, 323-25, citing Pub. Resources Code, §§ 21002.1, subd. (b), 21081, subd. (a)(1); CEQA Guidelines, § 14, §§ 15040, 15126.4, subd. (a)(2) [lead agency ability to condition project]; § 21081; CEQA Guidelines, § 15042 [lead agency ability to deny the project].) Moreover, consistency with a plan does not preclude the need for analysis. (See *Environmental Planning & Information Council v. County of El Dorado* (1982) 131 Cal.App.3d 350, 354.) Notably, neither the air quality nor the traffic impact chapters of the DSEIR attempt to include credit for baseline development claimed as "vested." The completely different approach taken by the DSEIR with respect to analysis of GHG emissions is unsupported and must be corrected; the correct baseline is "no project."

"The "mitigation" proposed for GHG emissions impacts is also contrary to CEQA's most basic requirements. Mitigation must be enforceable in order to be effective.. (CEQA Guidelines, § 15126.6, subd. (a)(2).) Here, as described above, the purchase of offsets may never occur, or if it does occur, may do nothing to reduce GHG emissions. The DSEIR's failure to identify enforceable mitigation measures is an error of law. (See *Federation of Hillside & Canyon Associations v. City of Los Angeles* (2000) 83 Cal.App.4th 1252, 1260–1262; *Lincoln Place Tenants Association v. City of Los Angeles* (2005) 130 Cal.App.4th 1491, 1508 ["mitigating conditions are not mere expressions of hope. . . ."].) To the extent that the City intends to incorporate the purchase of offsets as a "design feature" or otherwise incorporate it into the project description, recent case law clarifies that this strategy violates CEQA's mandate to disclose project impacts and separately address feasible mitigation measures. (*Lotus v. Department of Transportation* (2014) 223 Cal.App.4th 645, 655-56 (incorporating mitigation measures for redwood trees into the project description violated CEQA "[b]y compressing the analysis of impacts and mitigation measures into a single issue . . ."].)

As a result of the City's improper approach to analysis of GHG emissions from the Project, the GHG analysis is incomplete and must be rewritten. Moreover, the "less than significant" determination for the Project's GHG emissions is based on errors of law described above, including splitting the Project into smaller pieces and excluding several of these pieces from the GHG calculation and failing to identify enforceable mitigation measures. According to air quality experts versed in GHG emissions and the use of GHG offsets: "The GHG analysis provided and proposed MM I-C-GG-1 are not sufficient to demonstrate that the Project will result in no net increase in GHG emissions" and "the determination in the [DSEIR] that GHG emissions are a less than significant impact is erroneous." (SCS, p. 2.) (*Mission Bay Alliance, Soluri Meserve, letter, July 26, 2015 [O-MBA7S2-5]*)

"The GHG analysis used to support the determination that the Project met the requirements of AB900 is insufficient to demonstrate that the GHG emissions from the Project will be net zero and less than significant under CEQA for the following reasons:

- The GHG analysis makes unsupported assumptions about Oracle Arena, trip linkage, and energy use which artificially lower the expected GHG emissions from the Project and do not provide an accurate evaluation of the GHG emissions that can be expected to result from the Project.
- The GHG analysis does not require project monitoring and periodic GHG reporting to assure the accuracy of the projected emissions.

- The GHG offsets proposed as a mitigation measure are not required to be consistent with California GHG reduction goals and policies, could be used for other projects, and may not ever be required for the operational emissions."

(*Mission Bay Alliance, Soluri Meserve, letter, July 26, 2015 [O-MBA7S2-41]*)

"The Sierra Club also believes there are other inadequacies in the SEIR. For example, the Warriors currently have about 150 full-time employees (Volume 3, Page 16). Have the project sponsors done an analysis of where these employees live, and to what extent GHG emissions will increase or decrease as a result of their commutes to the new location?" (*Sierra Club, Susan E. Vaughan, letter, July 27, 2015 [O-Sierra-3]*)

"The SEIR notes that the roughly 1,000 day-of-game/event staff at the Mission Bay site will be assumed to be new hires (Volume 3, Page 42). The SEIR is inadequate because of this assumption. Project sponsors have not actually determined the number of events that will still be held at the Oracle Arena or surveyed current part-time employees to determine where they live and how many might transfer to the Mission Bay site in lieu of losing hours, if not their jobs, at the Oracle Arena. If roughly 1,000 part-time day-of-game employees will commute to events at the Mission Bay site from the East Bay, or anywhere else in the Bay Area, what are the GHG impacts?" (*Sierra Club, Susan E. Vaughan, letter, July 27, 2015 [O-Sierra-6]*)

"The Sierra Club is also concerned that there is no requirement to purchase carbon credits until the site is 90 percent leased and occupied, and, for the arena, until 90 percent of the available booking dates are utilized. (Volume 2, 5-5-12). If more than 10 percent of the facility remains vacant and/or more than 10 percent of the available booking dates are never filled, the project sponsors will never have to purchase carbon credits – let alone mitigate for the impacts of all the additional car traffic and transit use on the ground. The Sierra Club believes that the project sponsors should mitigate for all GHG emissions." (*Sierra Club, Susan E. Vaughan, letter, July 27, 2015 [O-Sierra-10]*)

"Additionally, the Sierra Club thinks that the requirement to mitigate for greenhouse gas emissions should not end after 30 years, as the project sponsors propose, but should continue as long as the facility is in use." (*Sierra Club, Susan E. Vaughan, letter, July 27, 2015 [O-Sierra-11]*)

"So, you can offset carbon utilization and all the rest, but the bottom line is this is a really bad regional project." (*John Cornwell, public hearing transcript, June 30, 2015 [PH-Cornwell2-3]*)

"They made a promise to offset 100 percent of the arena's greenhouse gas emissions by paying to the state's Carl Moyer program, which funds the upgrade of vehicles such as dirty school buses, in terms of getting clean, fuel-burning buses. This focus on climate-change mitigation is the future of responsible building, and I'm proud that the Golden State Warriors are leading the way." (*Adam Greenstein, public hearing transcript, June 30, 2015 [PH-Greenstein-2]*)

"The project is also being mis-advertised as greenhouse gas neutral. Purchasing unverified assets from a broker for 4,000 tons per year of carbon dioxide is not mitigation and doesn't do anything to help the

localized air pollution that will become so much worse under the gridlocked conditions." (*Osha Meserve, public hearing transcript, June 30, 2015 [PH-Meserve-4]*)

"We don't know, additionally, in terms of the greenhouse gas emissions. It's my understanding that the project sponsors intend to purchase carbon offsets. We don't know what those offsets are, and we need to see that in the EIR." (*Susan Vaughan, public hearing transcript, June 30, 2015 [PH-Vaughan-2]*)

"To my knowledge, no greenhouse gas comparison has been done between this proposed project and just keeping the project in Oakland." (*Susan Vaughan, public hearing transcript, June 30, 2015 [PH-Vaughan-3]*)

"… and I'm wondering about increased greenhouse gas emissions, because employees might be taking the bridge across the river -- or, not the river -- the Bay." (*Susan Vaughan, public hearing transcript, June 30, 2015 [PH-Vaughan-5]*)

Response GHG-2: Approach to Analysis

These comments question the analysis and impact conclusions of the greenhouse gases (GHG) emissions section of the SEIR. Many commenters confuse the GHG analysis conducted for the AB 900 process with the GHG emissions impact analysis conducted for the SEIR as part of the CEQA environmental review process. Even though both the AB 900 process and the CEQA process require analysis of GHGs, the two processes have separate and distinct requirements and purposes. The AB 900 process involved a particular *quantitative* GHG analysis required by the California Air Resources Board (CARB). The SEIR analysis, performed consistent with CEQA Guidelines as described below, used a *qualitative* GHG analysis. This response describes the GHG emissions impact analysis used in the SEIR as required by CEQA. For further discussion of the AB 900 process and the Governor's certification of the proposed project as an environmental leadership project, please refer to Section 13.4 of this Responses to Comments document.

SEIR Section 5.5 (pp. 5.5-8 to 5.5-9) presents the significance thresholds used in the GHG emissions impact analysis and explains the approach to the analysis of the potential impacts of GHG emissions due to the proposed project. The GHG emissions significance thresholds are based on CEQA Guidelines Appendix G, section VII. These thresholds state that the project would have a potentially significant impact related to GHG emissions if the project were to: "generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment; or conflict with any applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases." The analysis used in the SEIR is consistent with CEQA Guidelines Sections 15064.4 and 15183.5, which address the analysis and determination of significant impacts from a proposed project's GHG emissions. CEQA Guidelines Section 15064.4 allows lead agencies to rely on a qualitative analysis to describe GHG emissions resulting from a project. CEQA Guidelines Section 15183.5 allows for public agencies to analyze and mitigate GHG emissions as part of a larger plan for the reduction of greenhouse gases and describes

the required contents of such a plan. This approach is in recognition of the fact that while no single project could generate enough GHG emissions to noticeably change the global average temperature, the combination of GHG emissions from past, present, and future projects around the world have contributed and will continue to contribute to global climate change and associated environmental impacts. Therefore, the impact analysis focuses on the project's contribution to cumulatively significant GHG emissions.

Accordingly, San Francisco has prepared its own Greenhouse Gas Reduction Strategy, which the BAAQMD has reviewed and concluded provides aggressive GHG reduction targets and comprehensive strategies that help the Bay Area move toward reaching the State's AB 32 goals. San Francisco's Greenhouse Gas Reduction Strategy identifies actions the City is implementing to achieve cleaner energy, energy conservation, and alternative transportation and solid waste policies. For instance, the City has implemented mandatory requirements and incentives that have measurably reduced GHG emissions; these actions include, but are not limited to, increasing the energy efficiency of new and existing buildings, installation of solar panels on building roofs, implementation of green building strategies, adoption of a zero waste strategy, a construction and demolition debris recovery ordinance, a solar energy generation subsidy, incorporation of alternative fuel vehicles in the City's transportation fleet (including buses), and a mandatory recycling and composting ordinance. The Strategy identifies 42 specific regulations for new development that would reduce a project's GHG emissions. San Francisco's policies and programs have resulted in a reduction in GHG emissions to below 1990 levels, exceeding statewide AB 32 GHG reduction goals.

The SEIR analysis for determining the significance of GHG impacts is based on finding consistency of the project with San Francisco's Greenhouse Gas Reduction Strategy. Because the City's local GHG reduction targets are more aggressive than those of the region or the State, consistency with the City's Greenhouse Gas Reduction Strategy necessarily demonstrates consistency with the State's GHG regulations, the Governor's executive orders, and the Bay Area 2010 Clean Air Plan. If the project is consistent with the City's Greenhouse Gas Reduction Strategy, then the project's impacts related to GHG emissions would be considered less than significant.

As described in Impact C-GG-1 (SEIR pp. 55.5-10 to 5.5-12), the project is consistent with the City's Greenhouse Gas Reduction Strategy, as documented on the Greenhouse Gas Analysis Compliance Checklist.[2] Although the project would contribute to annual long-term increases in GHGs as a result of increased vehicle trips (mobile sources) and event-related, commercial, and office operations, the proposed project would be subject to and required to comply with many regulations adopted to reduce GHG emissions as identified in the Greenhouse Gas Reduction Strategy.

The proposed project would comply with the following regulations or their equivalent: Commuter Benefits Ordinance; Emergency Ride Home Program; Transportation Management

[2] Greenhouse Gas Analysis: Compliance Checklist, May 22, 2015. This document is on file and available for public review at the San Francisco Planning Department as part of Case File No. 2014.1441E.

Programs; Transit Impact Development Fee as applicable under the Mission Bay Redevelopment Plan; Jobs-Housing Linkage Program (residential uses less than ¼ -mile north of the project site); Bicycle Parking requirements (the project would exceed these requirements and provide a total of 586 bicycle parking spaces); Fuel Efficient Vehicle and Carpool Parking (providing 51 carpool spaces and 51 fuel efficient and vehicle charging stations); San Francisco Green Building Requirements (increased energy efficiency, purchase of renewable energy credits, reduction of potable water consumption by about 35 percent, enhanced energy commissioning); San Francisco Stormwater Management Ordinance (low impact development practices including filtration basins, rain gardens, and approximately 50,000 square feet of self-treating green roofs); San Francisco Water Efficient Irrigation Ordinance (the project's landscaped areas include low-water use planting selections, use of sedum and allium-based green roof materials, and soil mix design for a high available water holding capacity); Mandatory Recycling and Composting Ordinance (paper, glass, corrugated cardboard, plastic, and metals would be collected on site for recycling, and recycling bins and composting containers would be located throughout the buildings); San Francisco Construction and Demolition Debris Recovery Ordinance (to be included as part of the construction specifications); Street Tree Planting Requirements for New Construction (the project includes approximately 79 new street trees); Light Pollution Reduction (exterior lighting fixture selections will have minimum backlight/uplight/glare ratings as allowed by required illuminance levels); Construction Site Runoff Control (site is served by a separate storm sewer system and construction contractors would implement best management practices to comply with conditions of a site-specific stormwater pollution prevention plan); Enhanced Refrigerant Management; Finished Material Pollutant Control; and Regulation of Diesel Backup Generators. Therefore, on the basis of consistency with the Greenhouse Gas Reduction Strategy, the project's impacts on GHG emissions were determined to be *less than significant*.

Contrary to the commenters' assertions, the SEIR analysis of GHG emissions does not rely on the AB 900 process or the project's certification as an environmental leadership project under AB 900 for the impact significance determination. As described above, the SEIR uses a qualitative analysis to describe GHG emissions as permitted under CEQA Guidelines Section 15064.4. Thus, the SEIR does not need to quantify or calculate the extent to which GHG emissions will increase or decrease as a result of employee commutes to a new location or to quantitatively compare the GHG emissions of implementing the project with keeping the Warriors in Oakland, as asserted in Comments O-Sierra-3, O-Sierra-6, and PH-Vaughan-3. The results of the GHG analysis conducted as part of the AB 900 process are presented in the SEIR only to supplement and further support the findings of the *qualitative* CEQA GHG emissions impact analysis.

Also contrary to the commenters' assertion (Comment O-MBA7S2-5), the SEIR impact analysis of GHG emissions does not rely on the analysis in the 1998 Mission Bay Final SEIR, although the SEIR summarizes the discussion of GHGs from the 1998 document (see page 5.5-1). Instead, the SEIR relies on the analysis of the project's consistency with the City's Greenhouse Gas Reduction Strategy as explained above in this response.

The commenters (Comment O-MBA7S2-5) also assert that the SEIR GHG analysis should use "no project" as the baseline. As described above, the SEIR approach to GHG emission impact analysis

is based on the project's consistency with the City's Greenhouse Gas Reduction Strategy and does not rely on a methodology that compares a project with baseline conditions. Therefore, this assertion is incorrect as applied to the SEIR GHG emissions impact analysis.

The commenters (Comments O-MBA7S2-5, O-MBA7S2-41, and PH-Vaughan-2) assert that the SEIR fails to identify enforceable mitigation measures and that the GHG analysis does not require project monitoring. As described above, the GHG impact was determined to be less than significant based on the project's consistency with the City's Greenhouse Gas Reduction Strategy. Although no mitigation measures are required for this less-than-significant impact, the regulations listed in the Greenhouse Gas Analysis Compliance Checklist would be included in the Mitigation Monitoring and Reporting Program (MMRP), which, as described in Section 13.7, Response IO-2, would be part of the conditions of project approval.

Comments O-Sierra-10, O-Sierra-11, PH-Cornwall2-3, PH-Meserve-4, and PH-Vaughan-2 express concerns regarding the AB 900 requirements to purchase carbon credits and confuse the AB 900 requirements with the CEQA process. OCII acknowledges these concerns. The SEIR identifies Improvement Measure I-C-GG-1, Purchase Voluntary Carbon Credits, but this is not a mitigation measure. It is not required to reduce the project's impacts to less than significant, rather, this improvement measure is a reiteration of a project requirement under the AB 900 environmental leadership certification, though it would also serve to further reduce the project's less-than-significant GHG impact. Specific details of the amount of carbon offsets are not required to be included in the SEIR because CEQA does not require mitigation of less-than-significant impacts; those offsets would be developed during project implementation. Please see Section 13.4 for further discussion of the AB 900 process.

Comment PH-Greenstein-2 has confused SEIR Mitigation Measure M-AQ-2b, Emission Offsets, with Improvement Measure I-C-GG-1, Purchase Voluntary Carbon Credits. Mitigation Measure M-AQ-2b is intended to offset project emissions of criteria air pollutants in the San Francisco Bay Area Air Basin through a project similar to those under the Carl Moyer program (see SEIR pp. 5.4-42 to 5.4-43), while Improvement Measure I-C-GG-1 would offset GHG emissions in accordance with a methodology agreed upon by the California Air Resources Board.

To clarify the distinction between the CEQA GHG emissions impact analysis and the AB 900 GHG analysis, SEIR text on pages 5.5-10 to 5.5-12 is revised as follows (deleted text is shown as ~~strikethrough~~ and new text is <u>underlined</u>; text below does not include the footnotes in the original text, which remain unchanged):

> **Impact C-GG-1: The proposed project would generate greenhouse gas emissions, but not at levels that would result in a significant impact on the environment or conflict with any policy, plan, or regulation adopted for the purpose of reducing greenhouse gas emissions. (Less than Significant)**
>
> Individual projects contribute to the cumulative effects of climate change by directly or indirectly emitting GHGs during construction and operational phases. Direct operational emissions include GHG emissions from new vehicle trips and area sources (natural gas

combustion). Indirect emissions include emissions from electricity providers, energy required to pump, treat, and convey water, and emissions associated with waste removal, disposal, and landfill operations.

The proposed project would increase the activity onsite primarily by introducing occupants of the new office buildings and commercial businesses as well as event attendees. Therefore, the proposed project would contribute to annual long-term increases in GHGs as a result of increased vehicle trips (mobile sources) as well as event-related, commercial, and office operations that would result in an increase in energy use, water use, wastewater treatment, and solid waste disposal. Construction activities would also result in temporary increases in GHG emissions. ~~However, as described above under Regulatory Framework, the proposed project is a certified environmental leadership project under AB 900 and CARB has determined that the project would not result in any net additional GHG emissions due in part to the voluntary purchase of carbon credits by the project sponsor (see Improvement Measure I-C-GG-1, below).~~

~~Moreover~~However, the proposed project would be subject to and required to comply with several regulations adopted to reduce GHG emissions as identified in the ~~GHG~~ Greenhouse Gas Reduction Strategy. The proposed project would comply with the following regulations or their equivalent: Commuter Benefits Ordinance; Emergency Ride Home Program; Transportation Management Programs (see Project Description and Appendix TMP); Transit Impact Development Fee to the extent applicable under the Mission Bay Redevelopment Plan; Jobs-Housing Linkage Program (residential uses less than ¼ -mile north of the project site); Bicycle Parking requirements (the project would exceed these requirements and provide a total of 586 bicycle parking spaces); Fuel Efficient Vehicle and Carpool Parking (providing 51 carpool spaces and 51 fuel efficient and vehicle charging stations); San Francisco Green Building Requirements (increased energy efficiency, purchase of renewable energy credits, reduction of potable water consumption by about 35 percent, enhanced energy commissioning); San Francisco Stormwater Management Ordinance (low impact development practices including filtration basins, rain gardens, and approximately 50,000 square feet of self-treating green roofs); San Francisco Water Efficient Irrigation Ordinance (the project's landscaped areas include low-water use planting selections, use of sedum and allium-based green roof materials, and soil mix design for a high available water holding capacity); Mandatory Recycling and Composting Ordinance (paper, glass, corrugated cardboard, plastic, and metals would be collected on site for recycling, and recycling bins and composting containers would be located throughout the buildings); San Francisco Construction and Demolition Debris Recovery Ordinance (to be included as part of the construction specifications); Street Tree Planting Requirements for New Construction (the project includes approximately 79 new street trees); Light Pollution Reduction (exterior lighting fixture selections will have minimum backlight/uplight/glare ratings as allowed by required illuminance levels); Construction Site Runoff Control (site is served by a separate storm sewer system and construction contractors would implement best management practices to comply with conditions of a site-specific stormwater pollution

prevention plan); Enhanced Refrigerant Management; Finished Material Pollutant Control; and Regulation of Diesel Backup Generators.

These regulations, as outlined in San Francisco's *Strategies to Address Greenhouse Gas Emissions*, have proven effective as San Francisco's GHG emissions have measurably ~~reduced~~decreased when compared to 1990 emissions levels, demonstrating that the City has met and exceeded the GHG reduction goals specified in EO S-3-05, EO B-30-15, AB 32, and the Bay Area 2010 Clean Air Plan for the year 2020. The proposed project was determined to be consistent with San Francisco's ~~GHG~~ Greenhouse Gas Reduction Strategy. Other existing regulations, such as those implemented through AB 32, will continue to reduce a proposed project's contribution to climate change. Therefore, the proposed project's GHG emissions would not conflict with state, regional, and local GHG reduction plans and regulations, and thus the proposed project's contribution to GHG emissions would not be cumulatively considerable or generate GHG emissions, either directly or indirectly, that would have a significant impact on the environment. As such, the proposed project would result in a *less-than-significant* impact with respect to GHG emissions.

As described in Chapter 2 ~~In addition to compliance with the applicable provisions of the San Francisco's GHG Reduction Strategy or their equivalents~~, the project has been certified by Governor Brown as a leadership project under the Jobs and Economic Improvement Through Environmental Leadership Act of 2011 (AB 900). As discussed under Regulatory Framework above, on April 20, 2015, CARB determined that based on the documentation submitted by the project sponsor, the proposed project would not result in any net additional GHG emissions for purposes of certification under AB 900. CARB's determination and the Governor's certification of the project under AB 900 further supports the impact conclusion above that the project's GHG emissions would be a less-than-significant impact.

As part of the AB 900 application, the project sponsor has committed to purchase carbon credits from a qualified GHG emissions broker in an amount sufficient to offset all GHG emissions from project construction and operations, as reiterated in **Improvement Measure I-C-GG-1, Purchase Voluntary Carbon Credits**. Net additional GHG emissions would be calculated in accordance with the methodology agreed upon by CARB in connection with their determination and the AB 900 certification of the project. ~~Thus, the Governor's certification of the proposed project as a leadership project further supports the determination that the proposed project would not have a significant impact on global climate change due to GHG emissions.~~

~~Therefore, the proposed project's GHG emissions would not conflict with state, regional, and local GHG reduction plans and regulations, and because the proposed project would not result in any net additional GHG emissions, the project would not contribute to cumulative GHG emissions impacts. As such, the proposed project would result in a *less-than-significant* impact with respect to GHG emissions.~~

This revision does not change the analysis or conclusions presented in the SEIR.

For comments and corresponding responses related to the AB 900 application and the associated analysis of greenhouse gases, please see Section 13.4, Response AB-1, of this Responses to Comments document.

13.15 Wind and Shadow

13.15.1 Overview of Comments on Wind and Shadow

The comments and corresponding responses in this section cover topics analyzed in SEIR Section 5.7, Wind and Shadow. These include topics related to:

- WS-1: Wind
- WS-2: Shadow

13.15.2 Wind (WS-1)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

O-MBA7S2-32

"7. <u>Wind and Shadow – DSEIR Chapter 5.6.</u>

"a. Wind Impacts are Inadequately Analyzed.

"According to the DSEIR, a wind impact would be significant if it would alter wind in a manner that would substantially affect public areas. (DSEIR, p. 5.6-6.) Thus, the wind analysis only addresses offsite areas. (DSEIR, pp. 5.6-10 to -13.) Yet, this Project is so large that it also contains publicly accessible areas within the Project. While the DSEIR includes a discussion of wind impacts in these areas, it does so only for "informational purposes." (DSEIR, p. 5.6-18.) This analysis shows that exceedances of the criteria will occur, yet no mitigation is required. Instead, the DSEIR discusses "refinements that could be incorporated into the project . . . ." (DSEIR, p. 5.6-19.)

"The City's approach to addressing wind impacts violates CEQA's mandates that an EIR identify potentially significant impacts and set forth with specificity all feasible mitigation measures. The DSEIR must identify potentially significant impacts to public spaces within the Project site, and cannot conflate public disclosure of that impact with the separate and distinct analysis of feasible mitigation measures. (*Lotus, supra*, 223 Cal.App.4th at 655-56.) Further, the DSEIR may not defer formulation such mitigation measures in the absence of any performance standards and explanation as to why deferral is necessary. (*Communities for a Better Environment, supra*, 184 Cal.App.4th at 93.)" (*Mission Bay Alliance, Soluri Meserve, letter, July 26, 2015 [O-MBA7S2-32]*)

Response WS-1: Wind

The comment characterizes the proposed project as a large development with publically accessible but private recreational areas. This characterization is accurate. This characterization is also true of other existing and planned development throughout the Mission Bay Redevelopment Plan area, such as the adjacent UCSF Mission Bay campus.

CEQA does not specifically require analysis of potential wind impacts and the CEQA Guidelines do not provide any guidance on the subject of wind. (See CEQA Guidelines, Appendix G [wind not included as a resource area requiring analysis].) Nevertheless, the City generally includes an analysis of wind impacts in environmental documents. The City analyzes potential wind impacts by determining whether a project would exceed an applicable wind hazard standard.

City Planning Code Section 148's wind standards were developed for the reduction of ground-level winds in the City's C-3 (Downtown Commercial) District. The Mission Bay FSEIR determined the use of City Planning Code Section 148's wind hazard standards were an appropriate methodology and criteria for the original wind analysis conducted for the Mission Bay Redevelopment Plan. Consistent with the determination made in the Mission Bay FSEIR, the use of City Planning Code Section 148's wind hazard standards are also an appropriate methodology and criteria for the analysis of individual projects planned in the Mission Bay Redevelopment Plan area subject to additional wind analysis (e.g., projects exceeding 100 feet in height) per the Mission Bay South Design for Development, including the proposed project. (See, e.g., CEQA Guidelines, § subd. (b) ["The determination of whether a project may have a significant effect on the environment calls for careful judgment on the part of the public agency involved"]; *Save Cuyama Valley v. County of Santa Barbara* (2013) 213 Cal.App.4th 1059, 1068 [explaining agency discretion to fashion significance thresholds of significance]; see also *National Parks & Conserv. Assn. v. County of Riverside* (1999) 71 Cal.App.4th 1341, 1353 [endorsing use of existing environmental standards as thresholds of significance]; *Rialto Citizens for Responsible Growth v. City of Rialto* (2012) 208 Cal.App.4th 899 [same]; *Protect The Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal.App.4th 1099, 1107 ["thresholds can be drawn from existing environmental standards, such as other statutes or regulations"].)

The intent and applicability of the City's Section 148 wind hazard standards are to assess the environmental impact of winds in public areas of substantial pedestrian use. Section 148 criteria are not applied to private open spaces (with or without public access), service areas, and other non-public areas. Consequently, the SEIR explicitly states that the potential project exceedance of this hazard criterion in off-site public areas would be a significant environmental impact. Because Section 148 criteria are not applied to private areas, the wind effects on on-site publically accessible open space are not considered a significant environmental impact. Accordingly, the SEIR appropriately analyzes project wind hazard effects at off-site public areas, and identifies feasible mitigation measures to reduce those effects. This approach has been applied by the City for other development projects, such as the redevelopment of Treasure Island / Yerba Buena Island, with the potential for wind impacts in public areas of substantial pedestrian use.

Please see Chapter 14, Revisions to the Draft SEIR, which provides additional wind analysis to demonstrate that specific design refinements identified by the project sponsor would meet the wind hazard standards set forth in Section 148, and thereby reduce project wind hazards to a less than significant level.

Because project wind effects on pedestrians at on-site, private open space may be of interest to members of the public and to decision-makers, the SEIR presents a separate discussion of

potential wind effects at the on-site areas of substantial pedestrian use. This discussion is for informational purposes only. While the wind analysis indicates three test points on the project site would exceed the wind hazard criterion, the SEIR notes that the project sponsor shall develop and implement a range of feasible design refinements to effectively reduce on-site wind effects, including but not limited to, the proposed addition of landscaping within the plazas; and the potential installation of vertical porous screens, overhead protection such as tilted foils and archways, and/or other screening features on the event center perimeter walkway and other publicly accessible areas. As explained above, however, wind effects at these locations are not considered significant impacts on the environment, and therefore, mitigation is not required.

It should also be acknowledged that the event center and office and retail building operators would have control of all on-site areas so as to be able to manage or preclude pedestrian access in the event of hazardous windy conditions (e.g., during a storm), which are actions typical of other private developments in the City that have on-site publically accessible open space. This would include the building podium roofs, food hall roof, event center bayfront terrace, as well as plaza areas and on-site pedestrian walkways. This can be effectively achieved through use of on-site security personnel, temporary signage and/or barriers to limit public access where needed and direct pedestrians to alternate access points and pathways.

The proposed use of on-site design refinements, in conjunction with proposed management practices to control pedestrian access when needed, would ensure that potential on-site wind hazard effects at on-site publically accessible areas would be addressed.

The comment states the EIR's analysis is flawed based on the Court of Appeal's decision in *Lotus v. Department of Transportation* (2014) 223 Cal.App.4th 645. In that case, the court determined that the discussion of certain impacts in an EIR was inadequate because the EIR did not identify any standards of significance or apply such standards to its analysis of the project. The problem was compounded because the EIR relied on certain "Avoidance Minimization and/or Mitigation Measures" in the project description to conclude that the project would have no significant environmental impacts. The court noted that these measures, which included restorative re-planting, invasive plant removal, and use of specialized precision construction equipment, were intended to mitigate or offset impacts of the road construction on the adjacent redwood trees, and were not part of the project itself. Here, however, the Draft SEIR cites the specific wind hazard criteria with which the project must comply. The additional wind analysis provided in Chapter 14 (Revisions to the Draft SEIR) demonstrates that specific design refinements identified by the project sponsor would meet these standards. For these reasons, *Lotus* is inapplicable.

CEQA generally focuses on a project's significant effects on the environment, not the effects of the environment on a project. (See, e.g., *Ballona Wetlands Land Trust v. City of Los Angeles* (2011) 201 Cal.App.4th 455; *Baird v. County of Contra Costa* (1995) 32 Cal.App.4th 1464.) In other words, how the environment might affect users of the project (e.g., whether project users might be subject to windy conditions) is, under this line of authority, beyond CEQA's purview. Although, based on this line of authority, OCII could have omitted this discussion from the SEIR, OCII has, at its discretion, included such analysis in the SEIR.

13.15.3 Shadow (WS-2)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

O-MBA7S2-33

"b. Shadow Impacts are Undisclosed.

"According to the DSEIR, the Project would have a significant shadow impact if it substantially affected a publicly-accessible open space area, such as Bayfront Park. (DSEIR, p. 5.6-6.) With respect to the methodology for assessing the Project's impacts, the DSEIR refers to the South Design for Development. (DSEIR, p. 5.6-8.) However, the land use designation in the Mission Bay Redevelopment Plan for the four-block Project area was designated as "Commercial Industrial (Mixed Use including Retail)." (DSEIR, Figure 3-3.) The proposed Project will require that the South Design for Development be modified to accommodate the arena and accompanying development, so it is not clear that the standards developed for the 1998 land use plan apply in this circumstance. Moreover, conditions have likely changed such that the South Design for development, which did not require any analysis of shadow for the months from October to February, no longer reflects current practices and values. Especially with the increased visitors to the area as a result of the Project throughout the year, shadow impacts on the very parks those people will use should be fully analyzed.

"The DSEIR's approach of ignoring the generally-applicable City standard is also inconsistent with the DSEIR's approach to analysis of wind impacts. With respect to wind, the DSEIR relies on Planning Code section 148 to determine what level of wind would constitute a substantial alteration, even though it is superseded by the South Design for Development Standards. (DSEIR, p. 5.6-6.) Yet the DSEIR does not mention the typically applicable standard – Section 295 of the Planning Code, also known as "Proposition K" and "the Sunlight Ordinance." The absence of a substantive standard for shadow is all the more reason to refer to Section 295 for purposes of analyzing shadow impacts.

> Section 295 mandates that new structures above 40 feet in height that would cast additional shadows on properties under the jurisdiction of, or designated to be acquired by the Recreation and Parks Department can only be approved by the Planning Commission if the shadow is determined to be insignificant or not adverse to the use of the park. Also, a recommendation from the Recreation and Parks Commission is required prior to the Planning Commission hearing.

"(S.F. Planning Department Application Packet for Shadow Analysis, available at: http://www.sf-planning.org/Modules/ShowDocument.aspx?documentid=539.) Impacts to Bayfront Park should be analyzed according to Section 295 to ensure that shadow impacts are disclosed and mitigated.

"In conclusion, the analysis in the DSEIR fails to adequately address the wind and shadow impacts of the Project under current conditions, using standards developed by the City to ensure public spaces are comfortable and enjoyable. The DSEIR should be revised and recirculated to provide a thorough analysis and incorporate all feasible mitigation. Such mitigation may include changes to the structures to address wind and shadow impacts both on and off the Project site." (*Mission Bay Alliance, Soluri Meserve, letter, July 26, 2015 [O-MBA7S2-33]*)

Response WS-2: Shadow

The commenter questions whether the shadow standards included in the South Design for Development would apply to the proposed project in light of the amendments to South Design for Development that would occur as a result of the project. As the comment indicates, and as

discussed in SEIR Chapter 4, Plans and Policies, the Mission Bay South Redevelopment Plan land use designation for the project site is Commercial Industrial/Retail. SEIR Section 4.2.3 notes that this land use designation permits office and retail uses, and secondary assembly and entertainment uses if the use generally conforms with the redevelopment objectives and planning and design controls, among other factors. The land use designation also permits arts and arts activities as a primary use. SEIR Section 4.2.3 also discusses the proposed amendments to the South Design for Development that would occur under the project, including for the event center height and bulk, additional tower and other provisions.

As discussed in the SEIR, the objective of the *Sunlight Access to Open Space* design standards is to ensure sunlight to, and limit the extent and duration of shadows on, Mission Bay Plan area public open spaces. Regardless of the land uses proposed by the project, and associated amendments that would occur for the South Design for Development, the Sunlight Access to Open Space design standards in the South Design for Development are wholly applicable to, and appropriate for, the proposed project. In fact, the Sunlight Access to Open Space design standards were specifically developed to apply to projects proposed in the Mission Bay Plan area for which exceptions (e.g., variances in height, bulk, etc.) are sought, including the proposed project.

The commenter states conditions have likely changed such that the South Design for development no longer reflects current practices and values. The commenter provides no evidence to support this claim. The Sunlight Access to Open Space design were, in fact, developed in consideration of addressing all planned development in the Mission Bay Plan area through Plan buildout. Accordingly, the shadow analysis conducted in the SEIR is cumulative in nature in that it takes into account shadow impacts from all building development adjacent to Bayfront Park, including the proposed project buildings. Furthermore, as discussed in the South Design for Development, the methodology accounts for assessing shadows on public open space in the Mission Bay Plan area during the most active months of year (March to September) and the most active times (10:00 a.m. to 4:00 p.m.). Finally, based on the shadows analysis conducted for the proposed project in the SEIR, the resultant shadowing of Bayfront Park from all assumed development, including the proposed project, is well under the significance threshold, and consequently, less than significant.

The commenter states that the SEIR ignores Planning Code 295 when assessing the project shadow impacts. This statement is incorrect. SEIR Section 5.6.2.2 notes that City Planning Code Section 295 (Sunlight Ordinance), which provides for the protection of public open spaces under the jurisdiction of the City Recreation and Parks Department from shadowing from new structures, does not apply to proposed development within the Mission Bay plan area, as no City Recreation and Parks Department open space is located within the Mission Bay plan area. The SEIR also notes that proposed development under the Mission Bay plan would not shade any nearby City Recreation and Parks Department open space area located outside the Mission Bay plan area at any time, and consequently, would have a less-than-significant effect on these facilities. However, as discussed above, the Sunlight Access to Open Space design standards were developed specifically for ensuring sunlight to, and limiting shadowing within Mission Bay Plan area open spaces, including Bayfront Park.

The commenter states that the SEIR should rely on Section 295 to analyze project shadow impacts, in the same fashion that the SEIR relies on Planning Code section 148 to determine project wind impacts. As discussed in Response WS-1, above, with respect to wind, the Mission Bay FSEIR determined that the wind hazard criterion in City Planning Code Section 148, was appropriate for the analysis of wind hazards in the Mission Bay Redevelopment Plan area. In contrast, the Mission Bay South Design for Development's Sunlight Access to Open Space design standards were specifically developed for, and are the adopted design standard governing shadow analysis in, the Mission Bay Redevelopment Plan area, and accordingly, were used to analyze the project's shadow effects in the SEIR. Because the Sunlight Access to Open Space standards apply to the project site, it would be inappropriate to instead rely on Section 295, which does not apply to the project site.

13.16 Recreation

13.16.1 Overview of Comments on Recreation

The comment and corresponding response in this section cover topics analyzed in the Initial Study, Section E.10, Recreation, which is included in Appendix NOP-IS of the SEIR. These included comments related to:

- REC-1: Bayfront Park
- REC-2: Open Space

13.16.2 Bayfront Park (REC-1)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

O-MBA7S2-30

"**30. <u>The DSEIR Improperly Excluded Analysis of Impacts to Recreation – 1998 SEIR Chapter 5.M.</u>**

"The DSEIR did not address the Project's impacts on recreational facilities because the NOP/IS determined that no new or more severe significant impacts would occur than previously identified in the 1998 SEIR. As set forth more fully below, the information contained in the DSEIR supports a fair argument that use of Bayfront Park by thousands of crowded arena visitors will accelerate its substantial deterioration, which will be a significant environmental impact. (CEQA Guidelines, Appendix G, section XV(a).) . . . Even if the Project is considered a "revision" to the project analyzed in the 1998 SEIR, the addition of a massive, 18,000-seat arena will have a significantly greater impact to Bayfront Park than disclosed in the 1998 SEIR requiring analysis in a recirculated DSEIR.

"**a. Crowds From the Project May Substantially Degrade Bayfront Park.**

"The DSEIR failed to include an analysis of impacts to recreation based on the NOP/IS's determination there would be no new or more severe impacts than identified in the 1998 SEIR. (NOP/IS, pp. 61-64.) This conclusion is in error because a fair argument exists that the Project will result in potentially significant impacts to recreation and recreational facilities.

"The fundamental flaw in the NOP/IS's analysis is seen in the following statement: "The increase in demand for recreational facilities generated by the project would generally be consistent with that described in the Mission Bay FSEIR." (NOP/IS, p. 63.) This remarkable conclusion is unsupported by any citation or factual support. Rebutting this statement is the project description itself: an arena with a capacity of more than 18,000 seats holding up to 225 events per year. The expected huge crowds, and employees associated with the 580,000 square feet of commercial uses, would be crammed into an 11 acre parcel. The only respite to the congested arena environment would be 3.2 acres of alleged open space. While at first blush this might appear adequate, in reality this "open space" consists of small, disjointed spaces. Many of these spaces are located on the tops of buildings and unavailable to thousands of arena visitors.

"In contrast to the functionally unusable "open space" within the Project site, immediately across the street from the Project is the planned Bayfront Park – a single, expansive, ground level, landscaped park of 5.5 acres. It is very likely that the near-daily crowds of congested arena visitors will use Bayfront Park to gather both before and after shows rather than the oddly disjointed "open spaces" located on top of various buildings throughout the site.

These thousands of additional arena visitors are in addition to the people associated with the Project's 580,000 square feet of office space, the Project's 125,000 square feet of retail space, and all other people within the larger Mission Bay area who are anticipated to visit Bayfront Park. The open space needs of such arena crowds were nowhere contemplated in the 1998 SEIR. The Project will result in significantly accelerated physical deterioration of Bayfront Park, not disclosed in the 1998 SEIR, and is a significant impact under CEQA. (CEQA Guidelines, Appendix G, section XV(a).) (*Mission Bay Alliance, Soluri Meserve, letter, July 26, 2015 [O-MBA7S2-30]*)

b. The Project Will Require Construction of Bayfront Park That May Have an Adverse Impact on the Environment.

"The DSEIR acknowledges the development of the Project triggers development of Bayfront Park and must be completed prior to occupancy. (DSEIR, p. 3-37-38.) In other words, development of the Project requires construction of Bayfront Park. (See, e.g., CEQA Guidelines, Appendix G, section XV(b).) Accordingly, construction of Bayfront Park is a "reasonably foreseeable consequence of the initial project," and requires analysis in the DSEIR. (*Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal. 3d 376, 396.) It may not, as occurred here, be dismissed as a separate project for purposes of CEQA. (DSEIR, p. 3-37.) Serious questions exist about whether construction of Bayfront Park will result in adverse physical effects on the environment due to the presence of hazardous materials on that site. (*Ibid*.)

"As set forth above, the NOP/IS failed to disclose the present existence of hazardous waste in the soil within the Project site. The soil underlying the future Bayfront Park is similarly contaminated. (2006 RRMP, p. 2-5.) This contamination has not been disclosed in the NOP/IS or the DSEIR. Since it appears that Bayfront Park will be constructed along with the Project, the same questions are raised about hazardous materials impacts as discussed in sections 2(b) and (c) of this letter.

"The potentially significant impacts regarding hazardous materials are exacerbated because Bayfront Park will be a ground-level landscaped park. Having failed to disclose that the soil underlying Bayfront Park is contaminated, the NOP/IS also fails to explain whether such contaminated soil will be left in place and thereby expose visitors to hazardous materials. There is no discussion of whether an impermeable cap will be used to protect future park visitors from the existing contaminated soil.

"The failure to address these critical issues supports a fair argument that the Project will require construction of a recreational facility (i.e., Bayfront Park) that will have an adverse effect on the environment by facilitating the exposure of contaminated soils to humans and the environment. (CEQA Guidelines, Appendix G, section XV(b)). The City may not dismiss this potentially significant impact based on its own failure to conduct a reasonable analysis of the issue. (*Sundstrom v. County of Mendocino* (1988) 202 Cal.App.3d 296, 311 ("[t]he agency should not be allowed to hide behind its own failure to gather relevant data . . . . If the local agency has failed to study an area of possible environmental impact, a fair argument may be based on the limited facts in the record").) The recirculated DSEIR will need to analyze this potential significant impact. (*Mission Bay Alliance, Soluri Meserve, letter, July 26, 2015 [O-MBA7S2-30]*)

Response REC-1: Bayfront Park

The SEIR Initial Study Section E.10, Recreation, acknowledges that development of the proposed project would increase demand for recreational facilities. Such demand would be generally consistent with that described in the Mission Bay FSEIR for the entire Plan area and would be readily met by planned parks and open space areas developed as part of the Mission Bay Plan, as well as by existing facilities in the project vicinity. As reported in the Initial Study, the Mission Bay FSEIR indicated 47 acres of open space was proposed within the Mission Bay Plan area, of which more than 15 acres of new, non-UCSF parks and open space have been completed.

Pursuant to the Mission Bay Plan, open space would be constructed with each phase of Mission Bay development, in the amount of 0.46 acres of open space for each 1.0 acre of developable area until all open space is developed. The SEIR Initial Study, Recreation, also noted that the commercial uses proposed under the project would be located within the recommended 900-foot distance of open space, pursuant to the Mission Bay Plan.

Existing and planned urban recreational facilities, such as Bayfront Park, Agua Vista Park, Bay Trail, and the cycle track on Terry A. Francois Boulevard are/would be designed and constructed to withstand substantial use and are capable of serving large numbers of visitors. Similar use is currently experienced at existing recreational facilities in the vicinity of AT&T Park, including China Basin Park, South Beach Park, The Embarcadero Promenade, and Bay Trail, prior to and following San Francisco Giants baseball games. These facilities are regularly maintained by the applicable City departments to ensure substantial deterioration from use does not occur.

The commenter also mischaracterizes the publically-accessible on-site open space proposed as part of the project as functionally unusable. In fact, the largest open space component – the proposed Third Street Plaza, would be easily accessed from Third Street, comparable in size to the Union Square central plaza area, landscaped, and would offer both programmed and passive uses. Other proposed on-site publically accessible areas offering landscaping, walking opportunities and/or elevated viewing would include the Southeast Plaza, Bayfront Overlook, Food Hall roof and various on-site pedestrian paths. Convenient bicycle facilities would also be located throughout the project site, including bike racks, and during events, temporary bike corrals. These on-site areas would directly serve the project demand for recreational facilities, and consequently, would limit the project demand for use of, and any associated effects to, other existing nearby recreational facilities.

Given the availability of existing recreational facilities in the project vicinity and region and the ability of these facilities to accommodate large crowds combined with the inclusion of on-site publically accessible open space proposed by the project that would directly serve the project's demand for recreational facilities, the increased use of existing recreation facilities would not result in substantial physical deterioration of these resources, or otherwise result in physical degradation of existing recreational resources. As explained in the Initial study, the proposed project's impacts on recreational resources were determined to be less than significant, and no mitigation is required. Furthermore, the project would not result in any new or substantially more severe impacts than those previously identified in the Mission Bay FSEIR.

The comment also states that the SEIR is required to study the environmental impacts of Bayfront Park because the park is a "reasonably foreseeable consequence" of the project. This statement is incorrect. Bayfront Park is a planned linear park comprising Mission Bay plan parcels P21 through P24, and when completed, will extend from Mission Bay Boulevard south to Mariposa Street. The north portion of the park is already complete. Construction is underway in 2015 for the south portion of Bayfront Park, and construction of this portion of the park will be complete by the end of 2016. Following realignment of Terry A. Francois Boulevard, the central portion (Parcel P22) of Bayfront Park located east of the project site and consisting of approximately 5.5 acres will be

developed. Both the realignment of Terry A. Francois Boulevard and Bayfront Park public access improvements on P22 are triggered by development on Block 29-32 and would be implemented by the master developer, FOCIL-MB, LLC, prior to occupancy of buildings at the project site. (Draft SEIR, pp. 3-37 to 3-38.)

Although development on Block 29-32 "triggers" Bayfront Park public access improvements on P22 according the Mission Bay Plan, Bayfront Park is not part of the Project and therefore does not need to be analyzed in the Draft SEIR. Bayfront Park was planned as part of the Mission Bay Plan and analyzed in the Mission Bay FSEIR long before the project and will be implemented by the master developer, FOCIL-MB, LLC.

The case cited in the comment – *Laurel Heights Improvement Assn. v. Regents of the Univ. of Cal.* (1988) 47 Cal.3d 376 (*Laurel Heights I*) – is inapposite. In *Laurel Heights I*, the court concluded that a university violated CEQA when the EIR prepared for the relocation of a medical facility analyzed only the initial occupancy of a portion of the new building, even though the university had plans to occupy the entire building. (*Id*. at pp. 397-399.) The court found the EIR was inadequate because it did not assess the environmental effects of full occupancy (i.e., the entire project). (*Ibid*.) In other words, the EIR's project description was defective because the lead agency had segmented or "piecemealed" a single project into smaller parts. Here, in contrast, the Draft SEIR analyzes the entire project, and Bayfront Park is not a future phase of the project. Thus, the development of Bayfront Park was properly approved separate from the project as part of the Mission Bay Plan.

Banning Ranch Conservancy v. City of Newport Beach (2012) 211 Cal.App.4th 1209, is instructive. In that case, the court held that two proposed projects in the city's general plan could be analyzed as separate projects even though an access road built as part of one project would provide access for the other. (*Id*. at pp. 1224-1227.) The court determined that analyzing the projects separately was not improper piecemealing because the project with the access road did not cause the other project to come into existence, as the general plan already contemplated the proposed developments and road construction. (*Ibid*.) The court further noted that a project is not impermissibly "piecemealed" if it "can be implemented independently." (*Id*. at pp. 1223-1224.) Because the two projects had independent utility and could be implemented independently of each other, there was no improper piecemealing, even though there was temporal overlap in the period during which both projects would be implemented. (*Ibid*.)

Similarly, here, the project does not cause Bayfront Park to come into existence. As explained above, Bayfront Park was planned as part of the Mission Bay Plan long before the project was proposed. Environmental review for the park has already been completed as part of the Mission Bay Plan and portions of the park have already been developed. Further, the project and Bayfront Park each have independent purposes, can be implemented independently, and have different project sponsors. Therefore, Bayfront Park was not required to be analyzed in the Draft SEIR as a component of the project.

The comment also suggests that further development of Bayfront Park will result in additional impacts regarding hazardous materials that have not been disclosed. As explained above, Bayfront

Park is not part of the project and is not being approved as part of the project. Rather, Bayfront Park was reviewed and approved as part of the Mission Bay Plan. Development of the park is subject to the controls in the Covenant and Environmental Restrictions recorded against all of the property in Mission Bay, and incorporates the provisions of the Risk Management Plan, which governs management of hazardous materials that might be found in site soil or groundwater during development and post-development. For additional information regarding hazardous materials, see Response HAZ-9.

13.16.3 Open Space (REC-2)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

I-Cunningham-5 I-Cunningham-7

"This is area no longer a Healthy SF but a STRESS SF. This community is already impacted with very dense structures. This area should be PRESERVED and developed as a GREENSPACE PUBLIC PARK. As far as I have seen from walking this neighborhood for over 3 years, there is definitely not enough OPEN SPACE allotted for the population. Preserving this area should be a priority for the City of San Francisco!" (*Micki Cunningham, email, July 23, 2015 [I-Cunningham-5]*)

"I appeal to the Planning Department to step up, turn this proposition around and instead consider funding an OPEN SPACE 'Heritage' Project – one that this world-class city needs and deserves and an oasis to be enjoyed for many years by the surrounding neighborhoods, the guests and children of UCSF, local workers and visitors. I implore you to consider preserving what little is left of our beautiful waterfront by creating a gem to be enjoyed like Golden Gate Park on the western edge of our city." (*Micki Cunningham, email, July 23, 2015 [I-Cunningham-7]*)

Response REC-2: Open Space

The commenter indicates that the community is already impacted with very dense structures, that there is not open space allotted for the population, and the area should be preserved and developed as a greenspace public park. The commenter also requests that the City consider funding an open space heritage project.

These comments do not specifically address the adequacy of the SEIR. However, the commenter is referred to the SEIR Initial Study Section E.10, Recreation, which describes open space planning for the Mission Bay Plan area. As discussed in the Initial Study, Section E.10, implementation of the Mission Bay Plan would develop 47 acres of open space within the Mission Bay plan area, of which more than 15 acres of new, non-UCSF parks and open space have been completed.

As discussed in SEIR Chapter 3, within the project site vicinity, the planned Bayfront Park will extend from Mission Bay Boulevard south to Mariposa Street. The north portion of the park (located east of Terry A. Francois Boulevard, between Mission Bay Boulevard South and just south of Pierpoint Lane) is complete. Construction of the south portion of Bayfront Park (located west of Terry A. Francois Boulevard, between 16th Street and Mariposa Street) is expected to be complete by the end of 2016. Following realignment of Terry A. Francois Boulevard, the central portion of Bayfront Park located east of the project site and consisting of approximately 5.5 acres will be developed. The Bayfront Park public access improvements triggered by development on Block 29-32 would be implemented by the master developer prior to occupancy of buildings at the project site. In addition, Agua Vista Park, located just outside the Mission Bay Plan area but adjacent to the planned Bayfront Park, has just completed undergoing a renovation.

The SEIR Initial Study Section E.10 addressed potential impacts of the project on recreation and open space. Impact RE-1 (pp. 62 to 63) determined that the proposed project would not increase the use of existing parks and recreational facilities such that substantial physical deterioration of the facilities would occur or otherwise result in physical degradation of existing recreational resources. Please note also that 3.2 acres of publically accessible open space are proposed on the project site as part of the project; and the project would provide a number of elevated views of the Bay.

13.17 Utilities

13.17.1 Overview of Comments on Utilities

The comments and corresponding responses in this section cover topics analyzed in SEIR Section 5.7, Utilities and Service Systems and the Initial Study, Section E.11, Utilities, which is included in Appendix NOP-IS of the SEIR. These include topics related to:

- UTIL-1: Water Supply – Conveyance System
- UTIL-2: Water Supply – Water Supply Assessment
- UTIL-3: Wastewater System – Description and Environmental Effects of New Facilities
- UTIL-4: Wastewater System – Wastewater Flow Projections
- UTIL-5: Wastewater System – Fair Share Mitigation
- UTIL-6: Wastewater System – Description of Interim Improvements
- UTIL-7: Wastewater System – Wastewater Flows during Interim Period
- UTIL-8: Stormwater System – Impact Analysis
- UTIL-9: Stormwater System – Sizing of Stormwater System

13.17.2 Water Supply – Conveyance System (UTIL-1)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

O-MBA7S2-24

---

a. Inadequate Analysis of Water Supply and Conveyance Facilities.

The DSEIR impermissibly fails to consider whether the Project will result in the construction or expansion of any water conveyance facilities that may result in significant environmental impacts. This approach is based on the claim that the NOP/IS establishes that there are no significant impacts. (DSEIR, p. 5.7-9.) The NOP/IS, however, fails to provide sufficient information to make any conclusion in this issue by deferring any meaningful analysis. (NOP/IS, pp. 68-69.)

> More specifically, the NOP/IS acknowledges:
>
> If the water distribution system as approved under the Mission Bay Infrastructure Plan is inadequate to meet the project's demand, the project sponsor would be responsible for funding the construction of required new water mains and appurtenances. The construction of the new water mains and appurtenances would require excavation, trenching, soil movement, and other activities typical of construction of development projects in San Francisco.

(NOP/IS, p. 69.)

This analysis is flawed in several respects. First, having acknowledged that the infrastructure may not be adequate for the Project, and that construction of an unknown scope may be necessary to install this infrastructure, the SDEIR may not simply defer analysis of whether the infrastructure is adequate. And yet that is precisely what the City purports to do, stating in relevant part: "As part of the standard permit review process, the Mission Bay master developer, in coordination with the project sponsor, would be required to request a hydraulic analysis of the SFPUC water distribution system to confirm that the existing and planned water distribution system is adequate to meet the project's water distribution

demands, including fire suppression system pressure and flow demands." (NOP/IS, p. 69.) No explanation is given as to why this assessment could not have been made prior to the release of the DSEIR, which is the intended vehicle to provide public disclosure of these very issues. As a result, the decision-makers and the public are left completely in the dark about the very matter at issue, namely whether additional infrastructure is required and, if so, the scope of construction work that may be necessary to install that infrastructure.

The environmental impacts of construction may not be lightly dismissed as done in the NOP/IS. (NOP/IS, p. 69.) While construction of water conveyance facilities might, generally speaking, be "typical of construction of development projects in San Francisco," the Project site includes soil and groundwater contamination that make such construction activities anything but "typical." (Exhibit B, comments A1, A2, A3, B1, B3, B4, B5, B6, C1.)

The DSEIR fails as an informational document because it impermissibly defers any meaningful analysis of water conveyance facilities. Moreover, there is substantial evidence of a fair argument that construction of these facilities, if required, may result in significant environmental impacts. The recirculated DSEIR needs to address this issue. (*Mission Bay Alliance, Soluri Meserve, letter, July 26, 2015 [O-MBA7S2-24]*)

Response UTIL-1: Water Supply – Conveyance System

The comment contends that the analysis presented in the Initial Study fails to consider whether the project will result in the construction or expansion of any water conveyance facilities that may result in significant impacts. The comment then asserts an hydraulic analysis should have been prepared to determine the project's final water distribution demands prior to publication of the Draft SEIR, and concludes that the Draft SEIR fails as an informational document because it defers analysis of whether water conveyance infrastructure is adequate to serve the project. OCII disagrees with these comments.

Contrary to the commenter's claim that the DSEIR "impermissibly fails to consider whether the Project will result in the construction or expansion of any water conveyance facilities that may result in significant environmental impacts", substantial evidence supports the conclusion that the proposed project is not anticipated to require construction or expansion of any water conveyance facilities. The 1998 Mission Bay FSEIR includes an assessment of the impacts of construction of the community services and utilities required to serve the entire Mission Bay plan area to build out of 6,000 dwelling units and 30,000 projected employees, including fire protection, police protection, public health services, recreation and parks, schools, solid waste, water supply, sewers and wastewater treatment, energy transmission capacity and infrastructure, and telecommunications. The 1998 FSEIR describes and evaluates the impacts from construction of low pressure (drinking water), high pressure (fire suppression), and reclaimed water systems, including installation of pipelines, hydrants, valves and fittings. As discussed in the 1998 Mission Bay FSEIR and in the Utilities and Services section of the Initial Study (p. 65 and Impact UT-1, pp. 66 through 68), the FSEIR estimated that the Mission Bay Plan would require approximately 2.9 million gallons per day (mgd) of potable water at full build out. The water conveyance system for the Mission Bay Plan area was constructed to accommodate this demand.

The entitled water demand for Blocks 29-32 under the Mission Bay Plan is 0.15 mgd. Water delivery infrastructure, including water mains located along Third and South Streets, has been

sized to accommodate this estimated demand along with estimated fire flow demands in accordance with the Mission Bay Infrastructure Plan. Water mains to be installed by the master developer at 16th Street and Terry A. Francois Boulevard independent of the project will also accommodate these demands. As discussed in Impact UT-1 of the Initial Study (p. 66), the total estimated water demand for the proposed project would be 0.1 mgd, based on compliance with current building code requirements, which require more water conservation measures than previous code versions. This estimated demand is 0.05 mgd less than the entitled demand under the Mission Bay Plan. As such, the entitled water demand exceeds the project's requirements. In addition, there are several existing service laterals extending from the utility mains along South Street that would be used to service the project site. Therefore, the proposed project will result in a less than significant impact associated with construction or expansion of any water conveyance facilities.

In addition, the Initial Study notes that as part of the standard permit review process the project proponent will be required to conduct a hydraulic analysis. OCII is not required to perform this additional analysis as part of the CEQA process. Specifically, the fact that additional studies might be helpful to further support a conclusion reached by the lead agency does not mean they must be conducted pursuant to CEQA. (Clover Valley Foundation v. City of Rocklin (2011) 197 Cal. App. 4th 200, 245; see also CEQA Guidelines, § 15204, subd. (a).) Moreover, the hydraulic analysis can only be conducted once detailed building construction plans are completed and under review by the Department of Building Inspection and other departments, including SFPUC and San Francisco Fire Department. CEQA on the other hand, calls for environmental review to be done much earlier, "as early as feasible in the planning process to enable environmental considerations to influence project program and design and yet late enough to provide meaningful information for environmental assessment." (CEQA Guidelines Section 15004.) Therefore, it was proper for OCII to prepare this SEIR now even though it would be premature to prepare the final hydraulic analysis at this time.

Additionally, although OCII does not anticipate that the hydraulic analysis will demonstrate a need for water conveyance facility upgrades, the Initial Study discloses that, if required, "[t]he construction of new water mains and appurtenances would require excavation, trenching, soil movement, and other activities typical of construction of development projects in San Francisco, and similar to those activities analyzed in the Mission Bay FSEIR for the various infrastructure improvements." Therefore, the Initial Study and Draft SEIR conclude that impacts of any improvements to the water conveyance system for the proposed project have been adequately disclosed in the 1998 Mission Bay FSEIR.

Of particular note, the 1998 FSEIR states "[t]renching and removal of soils for installation of water lines could unearth contaminated soils. This issue is discussed in "Exposure From Construction Activities" under "Impacts During Project Development" in Section V.J, Contaminated Soils and Groundwater: Impacts." Section V.J. Contaminated Soils and Groundwater Impacts of the 1998 FSEIR includes a detailed assessment of impacts resulting from construction in areas containing hazardous materials in soil and groundwater, including installation of water conveyance systems and other infrastructure under the Mission Bay Plan.

The FSEIR discloses significant impacts and identifies applicable regulations and feasible mitigation measures that would reduce the significant impacts from construction in areas containing hazardous materials to less than significant levels. Thus, the Initial Study correctly concludes that, even if water conveyance facility upgrades were needed, "[t]he proposed project would not result in new or more severe impacts associated with construction of new water facilities or pipelines than previously identified in the [1998 Mission Bay] FSEIR." (Impact UT-2, p. 69.)

13.17.3 Water Supply – Water Supply Assessment (UTIL-2)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

O-MBA7S2-23 O-MBA7S2-25

---

4. <u>The DSEIR's Analysis of Utilities and Service Systems Violates CEQA –DSEIR Chapter 5.7.</u>

The DEIR's analysis of utilities and service systems fails to comply with CEQA's mandates. First, the DSEIR relies upon a water supply assessment for an earlier, different project, in a different location, prepared before the City had its water rights curtailed. The DSEIR also fails to address necessary stormwater infrastructure issues and relies on the prior NOP/IS that affirmatively misrepresents the capacity of that anticipated system. Finally, the DSEIR impermissibly defers virtually all substantive analysis and mitigation regarding needed wastewater infrastructure. (*Mission Bay Alliance, Soluri Meserve, letter, July 26, 2015 [O-MBA7S2-23]*)

Similarly, the DSEIR dismisses the question of adequate water supply without analysis, relying on the lack of potentially significant impacts identified in the NOP/IS. (DSEIR, p. 5.7-1.) The NOP/IS states that the City is relying on a water supply assessment ("WSA") prepared in May 2013 for the then-proposed arena site located at Piers 30-32 ("2013 WSA"). The DSEIR fails as in informational document with respect to water supply issues because it may not rely on the 2013 WSA.

First, the DSEIR does not address how the proposed Project is a revision of the Piers 30-32 project for purposes of Water Code section 10910. While the two projects may share some common features of an arena, there are considerable differences. The projects are at different locations. Further, the prior project proposed 208,844 square feet of residential uses and 178,406 square feet of hotel uses, that are eliminated in the current Project that proposes 580,000 square feet of commercial uses. The basic site plans are different for the two projects.

Second, even if the proposed Project could be considered a revision to the abandoned Piers 30-32 project, the DSEIR may not rely on the prior WSA because there has been a significant change in circumstances since preparation of the 2013 WSA. (Wat. Code, § 10910, subd. (h).) Water Code section 10910, subdivision (h)(2) provides that a prior WSA may not be subsequently relied upon when there are "[c]hanges in the circumstances or conditions substantially affecting the ability of the public water system . . . to provide a sufficient supply of water for the project." The ongoing drought is a major change in circumstances that substantially affects the City's ability to provide water to the Project. On June 26, 2015 the State Water Board sent the City a notice curtailing its pre-1914 water rights. With no relief to the drought in sight, it is reasonable to expect further curtailments to the City's water rights. This change in circumstances prohibits the City from relying on the 2013 WSA for the project. And the DSEIR's failure to discuss this critical water

supply issue renders it inadequate as an informational document. (*Mission Bay Alliance, Soluri Meserve, letter, July 26, 2015 [O-MBA7S2-25]*)

Response UTIL-2: Water Supply – Water Supply Assessment

The comments contend that the analysis of the available water supply presented in the Initial Study incorrectly relies on a water supply assessment for an earlier version of the project at a different location where the site layout and some of the site uses were different than the currently proposed project. The commenter misrepresents the nature of the water supply assessment and conditions triggering the need for a revised water supply assessment.

As discussed in the Utilities and Services section of the SEIR Initial Study (Impact UT-1, pp. 66 through 68), a water demand memorandum prepared by the sponsor for the proposed project, which considered the current site and uses, conservatively estimated that the potable water demand for the currently proposed development at Blocks 29-32 would be 0.100 mgd,[1] The Initial Study concluded that there would be sufficient water supply for the proposed project because the proposed project's demand is less than the 0.109 mgd approved by the SFPUC in the July 9, 2013, Water Supply Assessment for the proposed Event Center and Mixed-Use Development Project previously proposed at Piers 30-32 and Seawall Lot 330, which included a slightly different sized event center and different square footages of commercial and retail uses.[2] This demand is also less than the 0.15 mgd entitled demand for Blocks 29-32 estimated in the 1998 Mission Bay FSEIR.[3]

The SFPUC made the same conclusion in a letter dated November 25, 2014.[4] In this letter, the SFPUC stated that an additional Water Supply Assessment is not necessary for the Event Center and Mixed-Use Development at Mission Bay Blocks 29-32 because the following factors listed in Water Code Section 10910(h) that warrant preparation of another Water Supply Assessment do not exist:

- There are no changes to the project that result in a substantial increase in water demand.
- There has been no change in the circumstances or conditions which would substantially affect the ability of the SFPUC to provide a sufficient supply of water for the currently proposed project.
- There is no new information that might affect the conclusions of previous Water Supply Assessment that sufficient water supplies are available.

---

1 BKF Engineers, 2014. *Mission Bay Blocks 29-32—Water Demand Memorandum*. Technical Memorandum to Clarke Miller, Strada Investment Group from Sravan Paladugu, P.E. and Jacob Nguyen, P.E. BKF No. 20136004-20, November 14, 2014.

2 SFPUC, 2013. Water Supply Assessment for the Event Center and Mixed-Use Development Project at Piers 30-32 and Seawall Lot 330. July 1, 2013.

3 BKF Engineers, 2014. *Mission Bay Blocks 29-32—Water Demand Memorandum*. Technical Memorandum to Clarke Miller, Strada Investment Group from Sravan Paladugu, P.E. and Jacob Nguyen, P.E. BKF No. 20136004-20, November 14, 2014.

4 SFPUC, 2014. Letter to Chris Kern, San Francisco Planning Department. November 25, 2014.

Proposed Project at Mission Bay Blocks 29-32. OCII acknowledges that the location of the project has changed and that the design of the project is not identical to the previous proposal. However, the currently proposed project would result in less of a demand on the SFPUC's regional water supply system than the previously proposed project at Piers 30-32 and Seawall Lot 330. Further, unlike the previous project, the proposed project at Mission Bay Blocks 30-32 would be subject to San Francisco's Non-potable Water Ordinance which applies to projects located within San Francisco's designated recycled water use area as of November 1, 2015. In accordance with this ordinance, all new buildings with a gross square footage of at least 250,000 square feet must be constructed, operated, and maintained using available alternate water supply sources for toilet and urinal flushing, as well as for irrigation. Use of an alternative water supply for these purposes would reduce the potable water demand of the project in the future when such sources become available. Both the previously analyzed project and the proposed project are located in San Francisco which is served by the SFPUC's regional water system. Therefore, as stated by the SFPUC in their November 25, 2014 letter, the relocation and redesign of the proposed project at Mission Bay Blocks 29-32 does not affect the conclusions of the previous Water Supply Assessment that the SFPUC has sufficient water supply to serve the project.

Changes in Circumstances or Conditions. The commenter's statement that the drought constitutes a change in circumstances that prohibits reliance on the 2013 Water Supply Assessment is unsupported. Not only did the SFPUC confirm by its 2014 letter that no changes had occurred since 2013 that warranted a new assessment, but the commenter's presumption that drought conditions were not reflected in the earlier assessment is incorrect. The SFPUC's water supply assessment reflects its water supply planning that takes into account an 8.5-year design drought, consisting of the 1987-92 drought, the 1976-77 drought and another 18 months of hypothetical drought – in other words, a more conservative drought estimate than is on record since the SFPUC's current water system was constructed in the early 1900s.

These assumptions of the need to plan for an 8.5-year drought are documented in San Francisco's 2010 Urban Water Management Plan,[5] and being implemented through the SFPUC's adopted Water System Improvement Program (WSIP). Water supply planning under the WSIP includes using various water supplies and implementing water efficiency and conservation measures to ensure an adequate water supply for its service area, including during these hypothetical drought conditions. In fact, water conservation by San Francisco and the SFPUC's regional water customers in 2015 has exceeded the water savings goal of the WSIP by almost 4 billion gallons through September of 2015,[6] resulting in less of a regional potable water demand than planned for in the WSIP. This has reduced demands on the regional water system during the current drought.

San Francisco's ability to supply water to the project, as reflected in the SFPUC's 2013 Water Supply Assessment, has not been affected by the State Water Resources Control Board's (State Water Board) curtailment actions this year. On June 26, 2015, the SFPUC received a "Clarification Notice of Unavailability of Water for Statements of Water Diversion and Use S002637, S014379,

5 SFPUC, 2011. 2010 Urban Water Management Plan for the City and County of San Francisco. June 2011.
6 San Francisco Water Power, Sewer. *Drought Update.* Presentation by Steven R. Ritchie, Assistant General Manager, Water Enterprise. September 22, 2015.

S018734 and S018735 of City and County of San Francisco" (Clarification Notice) issued by the State Water Board. The SFPUC responded to the Clarification Notice stating that it was not currently diverting water at three of the four identified points of diversion, and that water diversions from Canyon Ranch Creek to Camp Mather are supported by pre-1914 appropriative water rights that predate the 1903 cutoff date used in the notice.

On July 15, 2015, the State Water Board issued a "Partial Rescission of April, May and June 2015 Curtailment Notices and Clarification of State Water Board Position Re: Notices of Unavailability of Water for Those Diverting Water in the Sacramento River Watershed, San Joaquin River Watershed and Delta, and Scott River" (Partial Rescission). The Partial Rescission specifically applies to eight notices, including the June 26, 2015 Clarification Notice to San Francisco, and explains, "[t]o the extent that any of the notices described above contain language that may be construed as an order requiring you to stop diversions under your affected water right, that language is hereby rescinded." Thus, SFPUC's ability to divert water from the Tuolumne River watershed and meet its projected water delivery service levels were not affected by the Clarification Notice. In sum, this notice does not constitute new information that affects the SFPUC's ability to supply water to the project.

Therefore, drought conditions do not constitute new circumstances that would affect the SFPUC's ability to provide a sufficient water supply.

New Information. There is no new information that affects the SFPUC's ability to supply water to the project.

As demonstrated above, the SFPUC would have a sufficient water supply for the project even under drought conditions, and impacts on water supply would remain less than significant.

See Response UTIL-1 regarding capacity of the water conveyance system.

See Response UTIL-8 regarding stormwater infrastructure.

13.17.4 Wastewater System – Description and Environmental Effects of New Facilities (UTIL-3)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

O-MBA11L5-2 O-MBA11L5-10 O-MBA7S2-29 O-MBA8L2-15

I. The DSEIR Is Not Sufficient as an Informational Document with Respect to the Project's Wastewater Treatment Infrastructure Impacts.

The DSEIR concedes the Project's cumulative wastewater flow, in combination with other approved projects, will exceed the Mariposa Pump Station's capacity, and therefore, the Project will have a significant and unavoidable impact because it "would require or result in the construction of new

wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects." (DSEIR, p. 5.7-13 - 5.7-20 [Impact C-UT-2].) But the DSEIR's disclosure of the nature and severity of the potentially significant impacts of building these new wastewater treatment facilities falls far short of CEQA's requirements.

The DSEIR generally describes the type of new wastewater treatment facilities that might be built, stating:

> the SFPUC anticipates that improvements might include actions such as complete pump station replacement, enlarging or realigning the existing sewer main on Mariposa Street between 3rd Street and the Mariposa Pump Station; upgrading and adding dry weather pumps with potential temporary wet weather pump modifications; upgrading or replacing the dry-weather sump in the pump station; constructing new connections to the transport and storage box structure and rehabilitating the structure; and improving the hydraulic capacity of the downstream gravity sewers, if needed. If a new dry weather pump station is required, it could potentially be constructed within approximately a quarter mile radius of the existing Mariposa Pump Station.

(DSEIR, p. 5.7-14.)

The DSEIR then identifies a number of potentially significant impacts of constructing new wastewater treatment facilities necessitated by the Project, stating:

> These construction activities would be expected to result in temporary increases in truck and construction employee traffic, noise, and air pollutant and greenhouse gas emissions. In addition, depending on the site-specific design and location, the pump station improvements could result in physical effects on cultural resources, biological resources, water quality, and hazardous materials.

The DSEIR then vaguely suggests that these impacts could be mitigated to less than significant levels by adopting "typical" mitigation measures, stating:

> Most, if not all, of these potential impacts can generally be mitigated to a less-than-significant level with typical mitigation measures, similar to those identified in the Initial Study and the SEIR for this project. Long-term operational impacts would likely be less than significant because operation of the pump stations would be similar to existing operations of these facilities.

(DSEIR, p. 5.7-14.)

These vague descriptions fail to discharge the City's legal obligations under CEQA to fully describe the Project, including its "reasonably foreseeable consequence" of necessitating the construction of additional wastewater treatment facilities, and to include an "analysis of the environmental effects" of this future action and the mitigation measures that may reduce those impacts. (See e.g., *Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal.3d 376, 396 (*Laurel Heights I*) ["an EIR must include a analysis of the environmental effects of future expansion or other action if: (1) it is a reasonably foreseeable consequence of the initial project; and (2) the future expansion or action will be significant in that it will likely change the scope or nature of the initial project or its environmental effects].)

As shown in both the DSEIR's analysis of mitigation measures and the Mission Bay Alliance's comments on many types of impacts that construction of additional wastewater treatment facilities will cause (e.g., air quality, noise, traffic), the "mitigation measures ... identified in the Initial Study and the SEIR for this project" do not ensure that "impacts can generally be mitigated to a less-than-significant level." (*Mission Bay Alliance, Thomas Lippe, letter, July 24, 2015 [O-MBA11L5-2]*)

Also, the numbers for Mariposa Pump Station capacity and wastewater or stormwater flows are confusing. For example, DSEIR page 5.9-35 says the Mariposa wet- and dry-weather pump stations have a "combined capacity of 11.2 mgd." DSEIR page 5.7-7 also refers to "the combined capacity of the Mariposa pump station and transport/storage structure (11.2 mgd)."[6] But DSEIR page 5.9-34 says: "The potential effect would be greatest in the reconfigured Mariposa sub-basin, which has a *wet weather capacity of 12 mgd* (italics added)." Which is correct?

Footnote:

[6] "In the event that wet weather flows in the Mariposa subbasin exceed the combined capacity of the Mariposa pump station and transport/storage structure (11.2 mgd), the excess flows are discharged to the Bay as a combined sewer discharge after receiving flow-through treatment in the transport and storage structure."

(*Mission Bay Alliance, Thomas Lippe, letter, July 24, 2015 [O-MBA11L5-10]*)

The DSEIR's analysis of cumulative wastewater impacts also fails to provide necessary information to the public and decision-makers. While acknowledging that permanent improvements are necessary, the DSEIR fails to provide any information about the environmental impacts of these improvements. (DSEIR, pp. 5.7-13 – 14.) The DSEIR dismisses this deficiency because "SFPUC has not completed the planning and design of specific improvements," (DSEIR, 5.7-14), but this does not alleviate the duty of a lead agency to disclose available information. (CEQA Guidelines, § 15144.) One critical piece of information with respect to future construction activity, ignored in the DSEIR, is that a substantial amount of such construction would likely occur in areas of existing soil and groundwater contamination. (Exhibit B, comments A1, A2, A3, B1, B3, B4, B5, B6, C1.) The DSEIR's conclusory dismissal of the impacts associated with constructing necessary wastewater infrastructure fails to address that issue.[5]

Footnote:

[5] Further discussion regarding the City's abdication of its CEQA duties with respect to wastewater treatment is addressed in the July 26, 2015, letter submitted by Tom Lippe.

(*Mission Bay Alliance, Soluri Meserve, letter, July 26, 2015 [O-MBA7S2-29]*)

II. Construction Emissions From Wastewater Improvements Have Not Been Adequately Reviewed in the DSEIR

At DSEIR pg. 1-9, significant environmental impact areas in the Event Center environmental review process are identified. One of those includes sewer processing plant and related utility improvements made necessary for the Events Center and associated development of the 11 acre project area:

> "As indicated on Table 1-2, the SEIR determined that the proposed project would result in significant and unavoidable impacts in the areas of....utilities (construction of new or upgraded wastewater facilities, and determination by the San Francisco Public Utilities Commission that it currently has inadequate capacity to serve the project's wastewater demand)."

Based on the language noted above, it appears the DSEIR's project at Mission Bay Blocks 29 - 32 cannot proceed without sewer and associated utility improvements. However, at DSEIR pg. 1-43 it appears that the project is considered by the Lead Agency to not require or result in the construction of new wastewater treatment facilities or expansion of existing facilities. Then, at DSEIR pg. 1-44 information from measure M-C-UT-4 shows that the project sponsor must pay for "fair share" improvements to the Mariposa Pump Station:

> The project sponsor shall pay its fair share for improvements to the Mariposa Pump Station and associated wastewater facilities required to provide adequate sewer capacity within the project area and serve the project as determined by the SFPUC. The contribution shall be in proportion to the wastewater flows from the proposed project relative to the total design capacity of the upgraded pump station(s). The project sponsor shall not be responsible for any share of costs to address pre-existing pump station deficiencies.

However, at DSEIR, pg. 5.7-13, it appears the wastewater improvements are made necessary by the project and that it cannot proceed without them:

> "Therefore, permanent improvements to the pump station and a long term increase in capacity would be needed to accommodate the proposed project in combination with other proposed and planned development in the Mission Bay South Plan area. In addition, as discussed in Section 5.9,

> Hydrology and Water Quality, the increased wastewater flows from **the proposed project** (emphasis added) in combination with other foreseeable future projects could increase the volume of combined sewer discharges (CSDs) from the Mariposa Pump Station which could necessitate improvements to the Mariposa wet weather pump station."

If the DSEIR project necessitates the improvements to local wastewater treatment facilities and related utility improvements, the associated construction emissions should be analyzed and mitigated as appropriate within the DSEIR and not piecemealed to some other review process or ignored altogether. No information is found in the DSEIR's Air Quality element that shows that construction-related emissions from the necessary wastewater utility improvements were recognized and evaluated within the DSEIR. (*Mission Bay Alliance, Thomas Lippe, letter, July 26, 2015 [O-MBA8L2-15]*)

Response UTIL-3: Wastewater System – Description and Environmental Effects of New Facilities

The comments state that the SEIR is inconsistent in its statements as to whether the project will cause the need for new wastewater treatment facilities. The comments also contend that construction of improvements to the Mariposa Pump Station to accommodate cumulative wastewater flows within the Mariposa sub-basin of San Francisco's combined sewer system are a reasonably foreseeable consequence of the proposed project and that the SEIR does not adequately disclose the nature and severity of impacts related to construction of the needed improvements.

As concluded in Impact UT-5 of the SEIR (pp. 5.7-11 through 5.7-13) and modified in Section 14.4, Changes in Distribution of Wastewater Flows, the proposed additional discharge of 0.892 mgd of peak wastewater flows from the project site to Mariposa Pump Station would increase the total peak wastewater flows to 3.43 mgd, which is within the 3.5 mgd capacity of the pump station with the recently completed interim improvements described on SEIR p. 5.7-7 and in Response UTIL-6. Therefore, the project would not require the construction of new or expanded wastewater treatment facilities and this project level impact would be less than significant.

However, with the addition of flows from reasonably foreseeable future projects as discussed in Impact C-UT-2 of the SEIR (pp. 5.7-13 through 5.7-17) total wastewater flows to the pump station could exceed the pump station capacity. As a result, the SFPUC would need to construct permanent improvements to the Mariposa Pump Station to accommodate future wastewater flows. The project thus contributes to a cumulative impact related to the need for permanent improvements to the pump station.

The cumulative analysis presented in Impact C-UT-2 of the SEIR addresses the potential impacts of future permanent improvements to the Mariposa Pump Station. As explained in the CEQA Guidelines, "[t]he discussion of cumulative impacts shall reflect the severity of the impacts and their likelihood of occurrence, but the discussion need not provide as great detail as is provided of the effects attributable to the project alone. The discussion should be guided by the standards of practicality and reasonableness." (CEQA Guidelines, § 15130, subd. (b).) "[A] good faith and reasonable disclosure of such impacts is sufficient." (*Association of Irritated Residents v. County of*

Madera (2003) 107 Cal.App.4th 1383, 1403; see also *Rialto Citizens for Responsible Growth v. City of Rialto* (2012) 208 Cal.App.4th 899, 933-934 [same].)

Impact C-UT-2 explains that the project, in combination with past, present, and foreseeable future development in the drainage area of the Mariposa Pump Station, would require or result in the construction of new wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects. As the owner and operator of the combined sewer system, the SFPUC is responsible for design and construction of the needed improvements to the wastewater facilities in the Mariposa sub-basin. The SFPUC has not identified the specific improvements that would be required to accommodate wastewater flows from the reasonably foreseeable projects and site-specific analysis cannot be performed until they are identified by the SFPUC. (SEIR, p. 5.7-15.) For this reason, site-specific environmental review for the future improvements cannot be included in the SEIR.

Although it is not possible to analyze the impacts of construction of the permanent pump station improvements in greater detail than provided in the SEIR because the SFPUC has not identified specific improvements required, Impact C-UT-2 discloses the type of environmental impacts that would be expected from construction of new wastewater treatment facilities or expansion of existing facilities and the likelihood that such impacts will occur. This discussion satisfies CEQA's requirements for cumulative impacts analyses. (CEQA Guidelines, § 15130, subd. (b); see also *Association of Irritated Residents v. County of Madera*, *supra*, 107 Cal.App.4th at p. 1403 [cumulative impacts analysis satisfies CEQA when it "sets forth the possible cumulative impacts . . . and then analyzes the likelihood of the actual occurrence of such impacts"].)

Any future permanent improvements to address cumulative wastewater impacts are not part of the project and are not a reasonably foreseeable consequence of the project itself. (SEIR, pp. 5.7-11 to 5.7-13 [the existing wastewater treatment facilities have sufficient capacity for the proposed project by itself].) Rather, as explained in Impact C-UT-2, the improvements would be necessary only as a result of the combined demand on the wastewater system from the project in combination with other future cumulative development projects in the drainage area of the Mariposa Pump Station. Future improvements in the SFPUC's wastewater system are beyond the project sponsor's control.

Moreover, as courts have confirmed, "where future development is unspecified and uncertain, no purpose can be served by requiring an EIR to engage in sheer speculation as to future environmental consequences." (*Lake County Energy Council v. County of Lake* (1977) 70 Cal.App.3d 851, 854–855; *Rio Vista Farm Bureau Center v. County of Solano* (1992) 5 Cal.App.4th 351, 372; see also *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 739 ["CEQA does not require discussion in an EIR of future developments which are unspecified and uncertain. Such an analysis would be based upon speculation about future environmental impact."].) Although any future improvements under the cumulative scenario are uncertain, Impact C-UT-2 provides a reasonable discussion of potential impacts based on information known or reasonably assumed today. Further, as acknowledged in Impact C-UT-2, CEQA environmental review of the future improvements/replacement of the Mariposa and/or Mission Bay Sanitary Pump Station, associated force mains, and conveyance system would ensure that measures to avoid or minimize

impacts on the environment would be considered in the approval process for these improvements. (SEIR, p. 5.7-15.) Thus, the environmental impacts of any future improvements will be fully analyzed when they are ripe for review.

The case cited in comment O-MBA11L5-2, *Laurel Heights Improvement Association v. Regents of the University of California* (1988) 47 Cal.3d 376 (*Laurel Heights I*), is inapposite. In *Laurel Heights I*, the court concluded that a university violated CEQA when the EIR prepared for the relocation of a medical facility analyzed only the initial occupancy of a portion of the new building, even though the university had plans to occupy the entire building. (*Id*. at pp. 397-399.) The court found the EIR was inadequate because it did not assess the environmental effects of full occupancy (i.e., the entire project). (*Ibid*.) In other words, the EIR's project description was defective because the lead agency had segmented or "piecemealed" a single project into smaller parts. Other CEQA cases hold that, where a project depends on infrastructure improvements, the environmental analysis must address impacts associated with providing those improvements. (*Santiago County Water District v. County of Orange* (1981) 118 Cal.App.3d. 818 [EIR for mining operation should have examined impacts of extending waterlines to serve the mine].)

Here, by contrast, there is sufficient capacity to accommodate wastewater flows generated by the project. Improvements to the Mariposa sub-basin of San Francisco's wastewater system are required to accommodate possible future development in the area; the project alone does not trigger the need for these improvements. Impact UT-5 analyzes the entire project, and the future improvements are not a reasonably foreseeable consequence of the project. Nor are the improvements necessary for the project to proceed. (See *Banning Ranch Conservancy v. City of Newport Beach* (2012) 211 Cal.App.4th 1209, 1220-1227 [EIR for park project did not need to analyze impacts of adjacent proposed development, despite shared roadways, approval of park did not make development reasonably foreseeable].)

The comments state the SEIR dismisses potential impacts associated with future improvements under the cumulative scenario. These comments are incorrect. SEIR Impact C-UT-2 acknowledges the need for future improvements and provides a reasonable discussion of the potential impacts that could occur from their construction (SEIR, pp. 5.7-13 to 5.7-17.) Because the project, along with past, present and reasonably foreseeable projects, would contribute to the need for improvements, the SEIR conservatively concludes that the project's contribution to the need for new improvements would be cumulatively considerable. The impact is significant and unavoidable because the solution, construction of improvements, is outside the project sponsor's control and the specific improvements, and, therefore, the magnitude of specific effects is uncertain. The analysis in the SEIR satisfies the requirements for cumulative impacts analysis under CEQA.

Note that the text on page 5.9-34 of the SEIR incorrectly states the wet weather capacity of the Mariposa Pump Station. The fourth sentence of the third paragraph on page 5.9-34 is revised as follows to reflect the correct capacity (deleted text is shown as ~~strikethrough~~ and new text is underlined):

> The potential effect would be greatest in the reconfigured Mariposa sub-basin, which has a wet weather capacity of ~~12~~ 11.2 mgd.

In addition, the last paragraph on page 1-9 of the SEIR is revised as follows to reflect that the significant and unavoidable impact related to utilities is a cumulative impact (deleted text is shown as ~~strikethrough~~ and new text is underlined):

> As indicated on Table 1-2, the SEIR determined that the proposed project would result in significant and unavoidable impacts in the areas of transportation and circulation (traffic impacts at multiple intersections and freeway ramps, and transit demand on regional transit providers exceeding capacity); noise (substantial permanent increase in roadway noise and crowd noise affecting sensitive receptors); air quality (construction and operational emissions of ozone precursors exceeding thresholds), wind (substantial increase in wind hazard hours at off-site public areas); and utilities (construction of new or upgraded wastewater facilities, and determination by the San Francisco Public Utilities Commission that it currently has inadequate capacity to serve the project's wastewater demand in combination with other reasonably foreseeable future projects).

These revisions do not change the analysis or conclusions presented in the SEIR.

13.17.5 Wastewater System – Wastewater Flow Projections (UTIL-4)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

A-UCSF-22 A-UCSF-23 A-UCSF-24 A-UCSF-26

Page 5.7-2, the DEIR indicates that the Mission Bay FSEIR determined that the projected increases in wastewater generation and storm water flows could be accommodated by the planned infrastructure at Mission Bay, and that the Mission Bay Plan's effects on wastewater and stormwater collection and treatment facilities would be less than significant. The DEIR now states that wastewater capacity will be inadequate when Project flows are added to existing and planned flows. But the DEIR presents no evidence other than a letter to SFPUC from its consultant, Hydroconsultant Engineers, as to current demands on the wastewater and stormwater collection and treatment facilities at Mission Bay and concerning what happened to make the 1998 prediction untrue. The DEIR discussion suggests that UCSF development at Mission Bay is the reason why peak flows would exceed the capacity of the dry weather pump stations, but this contention is contradicted by the analysis recently conducted by UCSF's consultants, as described below. In response to the UCSF's review of the supporting studies listed in the DEIR on page 5.7-7 (SF-DPW I SF-PUC memos "Mariposa Pump Station (MPS) Dry Weather Flow Hydraulic Analysis" dated February 3, 2015, and "Hydraulic Assessment of Mission Bay Sanitary Pump Station" dated February 25, 2015), UCSF undertook sanitary sewer flow monitoring to address questions in those analyses of the actual sewage flow contributions UCSF has to the respective pump stations. This information was provided to the City, however the relevant information from this study does not seem to be incorporated into the DEIR.

Page 5.7-7, the DEIR indicates that the SFPUC is performing interim improvements at the Mariposa Pump Station to accommodate planned and approved peak wastewater flow rates from UCSF that would exceed the Mariposa Pump Station's dry weather capacity. Also, at page 5.7-12, a similar statement is made that the peak flows from UCSF are contributing to peak dry weather flows from the Mariposa subbasin that now exceed the Mariposa Pump Stations dry weather capacity and therefore interim improvements are being

made. The interim improvements described in the DEIR include connecting the existing 10-inch dry weather force to the 20-inch wet weather force main as well as upsizing the influent sewer to the pump station.

The February 2015 SF DPW memo did describe the same force main improvements, but the increases in dry weather flows were not attributed to UCSF. UCSF's consultants, Freyer & Laureta, Inc., prepared a May 15, 2015, memorandum presenting results of flow monitoring from Blocks 24a/b, 25a, and Phase I of the UCSF Medical Center. The memorandum concluded that the cumulative measured average and peak sanitary sewer flow rates from these UCSF facilities was generally less than both the Mission Bay Master Plan and 2014 LRDP estimated sanitary sewer flow rates. (*University of California San Francisco, Lori Yamauchi, letter, July 27, 2015 [A-UCSF-22]*)

Page 5.7-13 through 17, the discussion related to Impact C-UT-2 indicates that the projected peak flow rates from the UCSF planned development of Block 25b, Block 33/34, Block 40, and Phase 2 of the MCMB is 1.2 mgd. However, the 1.2 mgd projected peak flow rate includes both Phase 1 and Phase 2 of the Hospital construction. The correct projected peak wastewater flow rate from Block 25b, Block 33/34, Block 40, and Phase 2 of the Hospital should be 0.95 mgd based on the LRDP. (*University of California San Francisco, Lori Yamauchi, letter, July 27, 2015 [A-UCSF-23]*)

Page 5.7-16, the statement that UCSF flows to the Mission Bay Pump Station would be 6.63 mgd with full LRDP development is not accurate. See 2014 LRDP Draft EIR at page 7-99 (indicating that the estimated peak flow increase to the Mission Bay Block P15 pump station from UCSF's proposed growth under the 2014 LRDP would be 0.23 mgd, resulting in a need for P15 pump station capacity of 6.63 mgd.). (*University of California San Francisco, Lori Yamauchi, letter, July 27, 2015 [A-UCSF-24]*)

Page 5.7-19, the DEIR indicates again that existing and planned UCSF development at Mission Bay would result in a major contribution to cumulative wastewater flows in the subbasin. (See responses above) (*University of California San Francisco, Lori Yamauchi, letter, July 27, 2015 [A-UCSF-26]*)

Response UTIL-4: Wastewater System – Wastewater Flow Projections

The comments state that projected wastewater flows from the University of California San Francisco (UCSF) are not the reason that interim improvements were required to the Mariposa Pump Station and also states that UCSF flows are lower than those analyzed in the SEIR. The comments question why previous flow monitoring results from UCSF were not included in the SEIR analysis.

Projected dry weather flows to the Mariposa Pump Station are addressed in a memorandum describing a hydraulic analysis conducted by the San Francisco Public Works (SFPW).[7] This memo discusses total existing and anticipated dry weather wastewater flows to the Mariposa Pump Station; the existing dry weather flows are based on flow monitoring by the SFPW and anticipated dry weather flows from the project and future development at UCSF as well as from Block 40 and other planned development within the drainage area of the Mariposa Pump Station. Existing and

[7] San Francisco Department of Public Works, Memo to Manfred Wong and Bessie Tam of the San Francisco Public Utilities Commission, *Mariposa Pump Station (MPS) Dry Weather Flow Hydraulic Analysis*. February 3, 2015.

projected wet weather flows are addressed in the wet weather analysis conducted by Hydroconsult Engineers.[8] The Hydroconsult report is included as Appendix HYD of the SEIR.

As stated in the SFPW memorandum, the SFPUC has constructed interim improvements based on SFPW's dry weather flow monitoring to accommodate existing developments in the Mission Bay plan area, including the UCSF's Phase 1 Medical Center, which began operation in early 2015. The SFPUC determined that these interim improvements were necessary based on measured flows to the Mariposa Pump Station. The SFPUC completed these improvements in the summer of 2015, were planned prior to evaluation of the proposed project, and were determined necessary regardless of project implementation. Because the improvements have been completed, they are part of the existing environmental setting.

While UCSF has conducted independent flow monitoring this past spring that may more accurately detail UCSF's flow contribution to existing dry weather flows, incorporation of UCSF's data into the SEIR analysis would not alter the conclusions of Impacts UT-5 or C-UT-2, which address project-related and anticipated cumulative wastewater flows to the Mariposa Pump Station, respectively. Therefore, no changes to the SEIR are necessary.

In response to the comment about flows to the Mission Bay Pump Station, the first sentence on SEIR p. 5.7-16 is revised as follows to address total flows to the Mission Bay Pump Station (deleted text is shown as ~~strikethrough~~ and new text is underlined):

> As discussed above in Impact UT-5, total wastewater flows to the Mission Bay Pump Station would be ~~3.53~~ 3.48 mgd with the addition of flows from the proposed project. UCSF has indicated to the SFPUC that under full build out of its recently approved LRDP, ~~UCSF~~ total flows to this pump station would be 6.63 mgd, close to the most recently measured capacity of 6.7 mgd.

This revision does not change the analysis or conclusions presented in the SEIR.

13.17.6 Wastewater System – Fair Share Mitigation (UTIL-5)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

A-UCSF-25

Page 5.7-13 through 5.7-17, it is not clear why Impact C-UT-2 does not require mitigation involving a fair share contribution by the project sponsor; rather it states that no mitigation is currently available. (*University of California San Francisco, Lori Yamauchi, letter, July 27, 2015 [A-UCSF-25]*)

---

[8] Hydroconsult Engineers, Inc. 2015. *Combined Sewer Impact Analysis, Golden State Warriors Arena EIR*. February 25.

Response UTIL-5: Wastewater System – Fair Share Mitigation

The comment questions why the Impact C-UT-2 does not require mitigation involving a fair share contribution by the project sponsor.

As discussed below, Impact C-UT-2 analyzes the physical impacts related to construction or expansion of new wastewater facilities while Impact C-UT-4 analyzes whether the existing facilities have capacity to accommodate projected wastewater flows. Fair share mitigation is required for Impact C-UT-4.

Impact C-UT-2 (SEIR pp. 5.7-13 through 5.7-17) addresses whether "the proposed project, in combination with past, present, and foreseeable future development in the Mission Bay South area, would require or result in the construction of new wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects." This impact focuses on the physical impacts of construction of new or expanded wastewater facilities. As discussed in Impact C-UT-2, construction of pump station improvements, and possibly replacement of the Mariposa Pump Station, would be required to accommodate cumulative flows from reasonably foreseeable future development in the Mission Bay South area. Impacts related to construction of these improvements are considered significant and unavoidable because specific plans and design for permanent pump station improvements have not been finalized and CEQA environmental review has not been completed. Therefore, it is not possible at this time to conclude whether impacts resulting from these improvements could be mitigated to a less than significant level. Furthermore, implementation of any improvements to the City's pump stations and force mains is outside of the project sponsor's control and there is uncertainty in timing as to when the SFPUC will be able to complete the necessary capacity improvements. There is no feasible mitigation available to the project sponsor related to these physical impacts as discussed in the SEIR.

Impact C-UT-4 (SEIR pp. 5.17-19 through 5.7-21) addresses whether "the project, in combination with past, present, and foreseeable future development in the Mission Bay South area, would result in a determination by the SFPUC that it has inadequate capacity to serve the project's projected wastewater demand in addition to its existing commitments." This impact focuses on whether the existing facilities have the capacity to accommodate cumulative wastewater flows in the Mariposa sub-basin of the SFPUC's combined sewer system. As concluded in Impact C-UT-4, the SFPUC has determined that there is currently inadequate capacity to serve the project's wastewater demand in combination with anticipated increased wastewater flows from other projects (including UCSF's demand and other reasonably foreseeable development). The impact analysis determined that the project's contribution to this impact would be cumulatively considerable, and therefore, this cumulative impact on the wastewater system was determined to be *significant and unavoidable with mitigation*.

Implementation of Mitigation Measure M-C-UT-4, Fair Share Contribution for Pump Station Upgrades, would offset the project's contribution to this significant and unavoidable impact. But, the SEIR determined that the impact would still be significant and unavoidable, even with the fair share contribution from the project sponsor because the SFPUC has not completely defined

the necessary improvements, and implementation of the improvements to the City's wastewater system is outside of the project sponsor's control.

13.17.7 Wastewater System – Description of Interim Improvements (UTIL-6)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

O-MBA11L5-3 O-MBA7S2-28

Finally, the DSEIR states:

> In the event that additional future wastewater flows would exceed the pump station capacities before the needed wastewater system improvements could be completed, it is assumed that the SFPUC would make internal operational or piping changes to accommodate the additional flows in the interim in order to remain in compliance with RWQCB permit requirements. The interim system modifications would be subject to the approval of the RWQCB under the terms of the Bayside NPDES permit. Approval by the RWQCB would ensure that water quality of the Bay would be protected during the interim period. Any interim system modifications are assumed to be operational or internal to the existing pump stations and therefore would not result in any physical environmental effects.

This remarkable passage suggests that the City is prepared to approve and allow construction of this Project without ensuring the construction of additional, adequate, sewage treatment capacity required by the Project. This is the opposite of responsible planning. Moreover, the City is apparently poised to take this action based on several unsupported assumptions. First, the DSEIR assumes, without discussion or evidentiary support, that interim modifications will not have a significant effect on the environment.

Second, the DSEIR assumes the Project's wastewater impacts on the Bay will only be "interim" until the SFPUC builds or expands permanent new wastewater treatment facilities; and that in this supposedly "interim" period, the Regional Water Quality Control Board will mitigate any "interim" impacts to less than significant. But there is no evidence to support the assumption the Project's wastewater can be treated to avoid significant adverse effects on Bay water quality before the SFPUC builds or expands permanent wastewater treatment facilities. Nor is there evidence that Regional Water Quality Control Board regulation during any purported "interim" period would avoid significant adverse effects on Bay water quality. Nor is there any evidence as to how long this purportedly "interim" period will last, or how many other projects that will cumulatively exceed the Mariposa Pump Station's capacity will commence operations during this purportedly "interim" period.

Indeed, this DSEIR's approach represents a total abdication of the City's legal responsibility under CEQA to identify the Project's significant effects, to identify mitigation measures that would substantially reduce those effects, and to adopt all feasible mitigation measures that would substantially reduce those effects. To put it colloquially, punting the problem to the SFPUC or Regional Water Quality Control Board does not pass muster under CEQA. (*Mission Bay Alliance, Thomas Lippe, letter, July 24, 2015 [O-MBA11L5-3]*)

---

c. The DSEIR Deferred Analysis of Wastewater Impacts.

The DSEIR's analysis with respect to wastewater capacity and infrastructure is similarly flawed. After acknowledging that the City does not have sufficient wastewater capacity to address project-level impacts, the DSEIR very generally mentions vague "interim improvements to temporarily increase the dry-weather capacity" of the Mariposa Pump station. (DSEIR, p. 5.7-12) In failing to explain when these interim

improvements will be completed or to analyze their environmental impacts, the DSEIR fails as an informational document. (*Ibid*.) (*Mission Bay Alliance, Soluri Meserve, letter, July 26, 2015 [O-MBA7S2-28]*)

Response UTIL-6: Description of Interim Improvements

The comments question whether construction of interim improvements to the Mariposa Pump Station would result in any physical environmental effects. The comments also question how long the interim period will be and what types of operational changes may be necessary to accommodate future wastewater flows before long-term improvements to the Mariposa Pump Station are completed.

As discussed on SEIR p. 5.7-7 and addressed above in Response UTIL-4, construction of the interim facilities improvements was completed in the summer of 2015 and was necessary to accommodate existing planned and approved developments in the Mission Bay Plan area, including the UCSF's Phase 1 Medical Center, which began operation in early 2015. The interim facilities improvements consisted of connecting the 10-inch dry weather force main to the 20-inch wet weather force main and upsizing the influent sewer, which increased the capacity of the dry-weather pump station to 3.5 mgd in dry weather conditions. These interim improvements have been completed and are in operation; they were necessary regardless of whether the proposed project is constructed. With the completion of these improvements, there is sufficient capacity to accommodate project-related wastewater flows. Therefore, impacts related to construction of the interim facilities improvements are not related to or triggered by the proposed project. Thus, it is not necessary to analyze the environmental impacts related to construction of these improvements in the SEIR for the proposed project.

The following text revision is included on SEIR page 5.7-7 to reflect the status of construction of the interim facilities improvements (deleted text is shown as ~~strikethrough~~ and new text is underlined; text below does not include the footnotes in the original text, which remain unchanged):

> The Mariposa Pump Station consists of a dry-weather and wet-weather pump station. The dry weather pump station was built in 1954 and ~~has~~ originally had a capacity of 1.2 mgd. The SFPUC constructed interim improvements to the pump station in 2015 to accommodate ~~With the addition of~~ peak wastewater flows from the planned and approved development in the plan area, including those of the University of California, San Francisco (UCSF) ~~developments in the Plan area, the SFPUC anticipates that peak flows would exceed the capacity of the dry-weather pump station. To address this need for additional capacity, the SFPUC is~~. The interim improvements consisted of connecting the 10-inch dry weather force main to the 20-inch wet weather force main and upsizing the influent sewer, which ~~will~~ increased the capacity of the dry-weather pump station to 3.5 mgd in dry weather conditions ~~on an interim basis until long-term improvements can be constructed to permanently increase the capacity of the pump station.[5] Completion of this connection is expected by fall of 2015~~.

This revision does not change the analysis or conclusions presented in the SEIR.

Total peak wastewater flows to the Mariposa Pump Station would be 3.43 mgd with the addition of the estimated 0.892 mgd peak flows from the proposed project as reported in Impact UT-5 (SEIR pp. 5.7-11 through 5.7-13). This total peak wastewater flow volume is close to the 3.5 mgd interim capacity of the Mariposa Pump Station. The total peak flows of 3.43 mgd assumes that all peak flows from the various developments in the drainage area of the Mariposa Pump Station would occur simultaneously, a highly unlikely occurrence. Nonetheless, the capacity of the Mariposa Pump Station with the completion of these interim improvements is adequate to handle projected project peak flows. Average flows would be approximately 1.4 mgd which is far less, meaning that the pump station would seldom, if ever, need to accommodate the total peak flow volume.

The SFPUC has concluded that long-term permanent improvements to the Mariposa Pump Station will be required in order to handle anticipated, cumulative future flows. As noted in Impact C-UT-2 of the SEIR (p. 5.7-15), the SFPUC has not identified a timetable for completing the long term improvements to the Mariposa Pump Station, and has not developed specific plans or designs for construction of the proposed improvements. But, in the unlikely event that additional cumulative flows were to exceed the pump station capacity before the SPUC completed permanent pump station improvements, the SFPUC could make internal operational or piping changes to accommodate the additional flows on a temporary basis and comply with RWQCB permit requirements. The SFPUC has identified several specific operational changes that could be made to accommodate future flows should the interim Mariposa Pump Station capacity of 3.5 mgd be exceeded before the long-term improvements are constructed. These temporary changes could include:[9]

- Routing of dry weather flows to existing wet weather transport/storage boxes to temporarily store select peak flows until flows can be pumped to the Southeast Water Pollution Control Plant, as consistent with the SFPUC's Bayside National Pollutant Discharge Elimination System (NPDES) permit requirements.

- Reducing flows within the Mission Bay basin by modifying sewers/sewer connections to allow temporary redirection of some flows to other basins, as feasible, including potential increased routing of flows from the proposed event center (or other Mission Bay facilities) to Mission Bay Sanitary Pump Station or Channel Pump Station, as appropriate.

As discussed on SEIR p. 5.7-15, these operational changes would be conducted under the terms of the Bayside NPDES permit and thus would not affect water quality of the Bay. The modifications explained above would be implemented by SFPUC through operational or internal modifications to the existing pump stations and would therefore not result in any physical environmental effects from construction activities.

[9] San Francisco Public Utilities Commission. Email from Craig Freeman to Chris Kern, San Francisco Planning Department. August 28, 2015.

See Section 13.21, Hydrology and Water Quality, Response HYD-3, for further discussion regarding potential water quality effects during the interim period.

13.17.8 Stormwater System – Impact Analysis (UTIL-7)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

O-MBA7S2-26

---

b. The DSEIR Provides a Misleading Discussion of Stormwater Treatment Facilities.

The DSEIR also fails as an informational document with respect to its analysis of stormwater treatment because it provides both inconsistent and misleading information about the facilities intended to handle stormwater runoff.

First, the DSEIR is internally inconsistent with the NOP/IS, upon which it purportedly relies. With respect to stormwater facilities, the NOP/IS asserts that the impact is potentially significant (IS, p. 64 Table 11.c) and will be analyzed in the DSEIR (IS, p. 72.) The subsequent DSEIR, however, states that it is not providing a project level analysis of the issue, asserting in relevant part:

> With respect to stormwater facilities, however, the stormwater system improvements already construction and currently under construction address both the near-term and long-term needs. . . . ***A separate project impact analysis is not provided.***

(DSEIR, p. 5.7-10 (emphasis added).)

The DSEIR violates CEQA because it fails to address the potentially significant impacts of project-level stormwater infrastructure. While the DSEIR provides some analysis of cumulative stormwater impacts, it concludes that the impact is less than significant with no need for any mitigation. (DSEIR, p. 5.7-18.) Thus, the NOP/IS and the DSEIR play a shell game with respect to analysis of stormwater impacts. It is unclear what the DSEIR's ultimate conclusion is regarding project-level stormwater infrastructure impacts, and no substantial evidence supports this unknown conclusion. (*Mission Bay Alliance, Soluri Meserve, letter, July 26, 2015 [O-MBA7S2-26]*)

Response UTIL-7: Stormwater System – Impact Analysis

The comment suggests that the SEIR provides inconsistent and misleading information regarding stormwater treatment because impacts related to construction of stormwater facilities are found to be potentially significant in the Initial Study, and less than significant in the SEIR.

Impacts related to construction of new or expanded stormwater facilities were considered potentially significant in the Initial Study because it was determined that this discussion warranted a more detailed analysis in the SEIR pending further refinement of the proposed project design. Based on the further analysis, the SEIR determined that the stormwater system improvements already constructed and currently under construction address both the near-term and long-term needs in the Mission Bay South area as discussed on p. 5.7-10 of the SEIR. Therefore, the impact analysis in the SEIR accounts for the effects of stormwater flows of the

project in combination with the flows from past, present, and foreseeable future projects within the drainage basin. Thus the project's direct impacts are analyzed in the context of cumulative impacts.

Based on the more detailed analysis presented in Impact C-UT-3 of the SEIR (p. 5.7-18), the SEIR concluded that impacts related to construction of new or expanded stormwater facilities would be less than significant. This determination was based on the fact that the project site would be served by the Mission Bay South storm drain infrastructure, as constructed and operated by the master developer in accordance with the approved Mission Bay South Infrastructure Plan. The stormwater analysis completed for the proposed project concluded that the capacity of the separated stormwater system as built is adequate to serve the project as well as other development projects that would be constructed at full build out of the Mission Bay South area.[10] Therefore, the project, either individually or cumulatively, would not require the construction of new stormwater drainage facilities nor expansion of the existing facilities. The project-level analysis is incorporated into the cumulative analysis, and a separate project-level analysis is not required.

13.17.9 Sizing of Stormwater System (UTIL-8)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

O-MBA7S2-27

Setting aside the internal inconsistency, the DSEIR's ultimate conclusion of less than significant cumulative impact is based on a misleading characterization of the Project's stormwater infrastructure. The DSEIR asserts:

> The project stormwater analysis completed for the project sponsor concluded that the capacity of the separated stormwater system as built is adequate to serve the project as well as other development projects that would be constructed at full buildout of Mission Bay South.

(DSEIR, p. 5.7-18.)

This representation is inaccurate and misleading. A technical report, referenced in a footnote but not actually attached as an Appendix to the DSEIR, describes the stormwater facilities very differently. (DSEIR, p. 5.7-18, fn 20 citing "BKF, Mission Bay Blocks 29-32 – Stormwater Memorandum, January 6, 2015" ("Stormwater Memorandum").) The Stormwater Memorandum provides a more accurate description of the stormwater infrastructure, and provides in relevant part:

> The storm drain system and pump station are designed to handle runoff from a 5-year storm event. During larger events such as a 100-year storm event, runoff is conveyed through the streets to a controlled overflow to the Bay.

(Stormwater Memorandum, p. 6.)

[10] BKF, Mission Bay Blocks 29-32 – Stormwater Memorandum, January 6, 2015

Thus, the Project's stormwater system can in no way handle project-level stormwater runoff, much less the Project's runoff in combination with cumulative projects. This is because the system has the capacity to handle only up to five-year storm events, which is significantly smaller than the 100-year capacity typically required. Any storm larger than a five-year event will result in flooding the streets.[4] In light of this anticipated flooding, the Project, which includes multiple levels below grade, will "be sufficiently flood proofed to prevent 100-year overland flow in perimeter streets from entering below grade structures or inundating utilities and equipment." (Stormwater Memorandum, p. 6.) The necessity to flood proof the Project due to inadequate stormwater facilities was never addressed in the DSEIR. Moreover, to the extent that increasing impervious surfaces on the Project site will result in additional flooding in the public streets that are shared by other structures, the DSEIR fails to address the need for additional flood proofing of other buildings in the area.

The analysis contained in the Stormwater Memorandum is also inconsistent with the DSEIR's analysis of flooding risks, which is based on the NOP/IS's analysis of Impact HY-4. Contrary to the information provided in the NOP/IS, the Project would result in exposing people and structures to a significant risk of loss and injury due to flooding for any event above the five-year event. (CEQA Guidelines, Appendix G, Section IX(i).) This is true for both the Project site as well as offsite. Finally, the strategy of relying on public streets as de facto spillways significantly contributes to substantial additional sources of polluted runoff. (CEQA Guidelines, Appendix G, Section IX(e).) This represents a new significant impact that was never addressed in the DSEIR.

The resulting public safety risk created by this situation cannot be overstated. The Project includes an 18,000-seat arena. In instances where arena events occur during moderate storm events (anything above a five-year event), thousands of visitors to the arena will exit onto streets that are serving as flood channels for stormflow. The combination of flooded streets, thousands of densely-packed pedestrians, at-grade transit cars and automobiles – all at night – presents a very dangerous situation that has never been discussed, analyzed, or mitigated in the DSEIR.

Footnote:

[4] The Stormwater Memorandum asserts that use of public streets to channel storm flows in this manner was analyzed in a *Revised Summary Drainage Study for the South of Channel Watershed for Mission Bay Project*, dated December 1, 2000, yet this document was not posted on the OCII as required for the project to comply with the streamlining requirements of AB 900.

(*Mission Bay Alliance, Soluri Meserve, letter, July 26, 2015 [O-MBA7S2-27]*)

Response UTIL-8: Sizing of Stormwater System

The comment correctly quotes an excerpt from Impact C-UT-3 of the SEIR, but incorrectly interprets this information. The comment states that the Mission Bay South stormwater infrastructure cannot handle project-related stormwater runoff because it only has the capacity to handle a five-year storm event rather than a 100-year storm event. The fact that the separate stormwater system serving the project site has adequate capacity is consistent with the statement that the system is designed to handle runoff from a five-year storm event.

The Mission Bay South stormwater infrastructure has been constructed in accordance with the Mission Bay South Infrastructure Plan. Design of the stormwater infrastructure to accommodate flows from a five-year storm event is consistent with both the Mission Bay Subdivision Regulations that apply to the proposed project and the Subdivision Regulations that apply to the remainder of San Francisco (adopted on March 24, 2015). This is standard design practice, and therefore, compliance with these practices by definition would provide adequate stormwater drainage capacity.

The commenter is correct that one hundred-year storm flows in excess of the five-year storm event would be directed to the Bay via street areas and other approved corridors designed to accommodate the 100-year flows. This is also consistent with the Mission Bay South infrastructure plan and subdivision regulations. Further, the overland flow analysis of the separated storm drain system design for the Mission Bay project concluded that the design meets all requirements of the Mission Bay Subdivision Regulations; stormwater flows generated by the 5 year storm event can be conveyed within the underground storm drain system, and excess run-off produced by the 100-year storm event can be contained within the street rights-of-way prior to release into the China Basin Channel or the San Francisco Bay.[11] It is not necessary to exceed the established design criteria for the stormwater system to alleviate on-or off-site flooding risks.

As discussed in Section 13.21, Hydrology and Water Quality, Response HYD-6, under CEQA, impacts related to flooding would be significant if the project would expose people or structures to a significant risk of loss, injury, or death involving flooding or if structures placed within a 100-year flood zone would impede or redirect flood flows. Because the corridors used to convey stormwater flows in excess of the five year storm are designed to accommodate 100-year flood flows in accordance with the subdivision regulations, the project would neither impede nor redirect flood flows, nor would the project expose people or structures to substantial flood risks. Therefore, impacts related to flooding would remain less than significant. Further, the stormwater system is designed to accommodate flood flows from the entire Mission Bay plan area at full build out. Therefore, the system is designed to accommodate flows from the proposed project site, even with the increased impervious surfaces, and no flood proofing measures are necessary to protect the on-site or downstream structures from existing flood risks.

See Section 13.21, Hydrology and Water Quality, Responses HYD-2 and HYD-6 for responses to the commenters concerns regarding the potential for polluted stormwater runoff and on and for additional analysis of off-site flooding.

13.18.1 Overview of Comments on Public Services

The comments and corresponding responses in this section cover topics analyzed in SEIR Section 5.8, Public Services, and the Initial Study, Section E.12, Public Services, which is included in Appendix NOP-IS of the SEIR. These include topics related to:

- PS-1: Law Enforcement
- PS-2: Fire Protection
- PS-3: Schools

13.18.2 Law Enforcement (PS-1)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

A-CHP-3	I-Lange-2	I-Zboralske-14	I-Zboralske-15
I-Zboralske-29	I-Zboralske-32		

"Furthermore, in addition to a potential increase in overall traffic congestion, Area resources may also be negatively affected with a potential increase in the number protective service details associated with this event center." (*Department of California Highway Patrol, C. Sherry, letter, August 3, 2015 [A-CHP-3]*)

"The stadium would impact … level of crime in the city. Regardless of proposed income incentives from this project, I feel we have too many outsiders coming into the city and they only add to the … crime level." (*Donna Lange, email, July 23, 2015 [I-Lange-2]*)

"Section 5.8 – Public Services

"This section evaluates if the project would require new or physically altered governmental facilities to maintain adequate public safety. This is a misleading measure. We should really be assessing the issues associated with providing the broad range of public services to the geographic area impacted by the project.

"There is no way to evaluate if there are more or fewer calls on special event days compared to non-event days. There is no way to determine which days of the week and hours of the day are peak response times. Simple raw data does not give us the information we need to determine if the proposed arena project, along with all the other projects, will cause service delays or disruptions.

"The San Francisco Police Department (SFPD) is currently understaffed by as many as 300 officers. Although they plan to aggressively hire recruits and increase staffing, this process is arduous and slow. SFPD intends to offer up to three (3) new academy classes with as many as 50 recruits per class over the next several years. Unfortunately, during the next three years they will lose other staff members to retirement, lateral transfer, disability leave and others who choose to transition into other career fields.

"The process of recruiting, hiring and training an individual to become a fully functioning and solo officer can easily take up to 18 months. This means that even if you have staff "on paper" there are likely many officers in various stages of the employment and training process. Individuals, who are not yet fully trained and have not completed the FTO program and are not qualified to perform solo officer duties. A police department's current staffing level is merely a number. The more important number is how many physically able and qualified officers can actually be deployed to staff events and/or handle calls for service. These numbers are usually quite different.

"Furthermore, if SFPD is successful in sponsoring an academy class with 50 recruits, it is unlikely that all new hires will pass the police academy. Others will fail to complete the rigorous Field Training Program and some will fail to complete their probationary period. This is the nature of police hiring and training programs. It is a predictable outcome that occurs in all local law enforcement agencies.

"It is therefore highly unlikely that SFPD can achieve full staffing levels by mid-2018. Any new officers would be inexperienced. It can easily take several years or more for new hires to become truly skilled and competent in handling the broad range of police calls that occur in municipal jurisdictions after achieving solo officer status.

"Because SFPD will not, in my view, ever reach its authorized staffing level it may be stretched to safely, professionally and adequately staff another 250+ special events each year. They may be required, at times, to have staff pull double shifts (working patrol and then stay over to work an event), require some form of mandatory overtime and utilize creative scheduling practices.

"With respect to staffing levels at special events, the document indicates:

- Staffing levels are determined by SFPD's Event Commander in coordination with the event sponsor in advance of the event as well as by levels established in event security/operations plans. The Department of Parking and Traffic typically provides traffic control services for special events.

"Without more specificity, I am not able to determine if adequate resources and [*sic*] being utilized for on-site security by sworn members of SFPD and parking control officers (PCOs).

"I can tell you from my own personal experience that sponsors have a financial incentive for fewer personnel usage because they often pay for these services. Sponsors often try to supplant the use of sworn officers and trained PCOs with far less expensive "private security" personnel. Unfortunately, when things go bad – and they will at some point, the ultimate burden to respond and resolve an incident will rest with the sworn police officers and PCOs.

"Private security guards can be a deterrent and provide valuable services, particularly inside venues, but for the most part they will not be arresting, citing or physically ejecting people from an event site. They will not be writing a detailed crime report, but rather are usually treated as "witnesses." They will observe, report on conditions and request assistance from uniformed sworn officers or PCOs in enforcement-related incidents or in any circumstance in which the personal safety of a patron or themselves is involved." (*James Zboralske, email, July 27, 2015 [I-Zboralske-14]*)

"The numbers reported appear to be crimes that require reporting under the FBI's Uniform Crime Reporting Program. These are crimes that all police departments report annually. They serve as a basis to compare crime rates between jurisdictions in an "apples to apples" approach or crimes that occur year over year for comparison purposes.

"While interesting you'll notice that there is no mention of any of the following:

- Actual police calls for service (CFS) in the area
- CFS types and frequencies on event days versus non-event days
- Number of self-initiated detentions, stops, citations issued and arrests made by SFPD
- Number of parking citations issued and vehicles tows by PCOs

- Statistics relating to the many **quality of life issues – previously listed**
- Vehicle collisions
- Disturbance calls
- Disorderly conduct calls
- Alcohol or drug-related calls and crimes
- Total number of crime reports taken
- Response times to crimes in the event area.
- Alarm calls
- Incidents occurring at public transportation facilities
- Incidents occurring on public transportation vehicles of all types
- Number of private person arrests made

"Having accurate statistics relating to these types of incidents (in addition to the FBI UCR) gives you significantly more information to evaluate and determine accurate levels of overall police activity in any given area.

"Critical information is not provided for analysis in the report. Simply put, utilizing the FBI Uniformed Crime Reporting for SFPD alone is a very ineffective way to gauge the actual level of police, parking and traffic related incidents in a given geographical area or associated with special events.

"Given the location of the proposed project it would be prudent to obtain the more comprehensive crime statistics and information from the following agencies:

- University of California Police Department
- The California Highway Patrol
- Port of San Francisco Police Office
- Bay Area Rapid Transit Police Department (BART)

"Once the appropriate information is gathered from all relevant sources a detailed analysis of the actual impacts to public safety could be evaluated." (*James Zboralske, email, July 27, 2015 [I-Zboralske-15]*)

"The City's current infrastructure can't efficiently and effectively handle the large influx of people to an estimated 250+ yearly events in our neighborhood. The police and fire departments did not adequately address relevant issues in their sections of the report." (*James Zboralske, email, July 27, 2015 [I-Zboralske-29]*)

"People living, working or visiting the area would be exposed to a tremendous increase in the number of quality of life incidents and upsurge in crimes. These increases would degrade our personal quality of life. Local residents and local workers often bear the unpleasant burden of over-development, poor infrastructure and the increases in crime, nuisances and disruptions that it brings." (*James Zboralske, email, July 27, 2015 [I-Zboralske-32]*)

Response PS-1: Law Enforcement

A commenter questions the use of the significance criteria presented in the SEIR used to judge the significance of impacts to public services. This significance criteria presented in Section 5.8.5.1 (p. 5.8-9) in the SEIR was adapted from Appendix G in the CEQA Guidelines. It is important for the commenter to understand that the scope of the SEIR is to address potential physical environmental impacts of the project. Accordingly, the context for judging impacts to law enforcement services in

the SEIR is if the proposed project would result in substantial adverse physical impacts associated with the provision of or need for new or physically altered law enforcement facilities in order to maintain acceptable service levels, the construction of which could cause significant environmental impacts.

General comments were received concerning the potential for the project to increase crime, and for the project to result in a potential increase in the number of "protective service details." Such comments do not raise "environmental" issues cognizable under CEQA, as both the potential increases in crime and potential impacts on police services are examples of social effects beyond the scope of CEQA. (See, e.g., *Baird v. County of Contra Costa* (1995) 32 Cal.App.4th 1464, 1469– 1470, fn. 2 ["increased crime...is not a proper subject of CEQA inquiry"]; CEQA Guidelines, § 15131, subd. (a) ["[e]conomic or social effects of a project shall not be treated as significant effects on the environment"]; see also *City of Pasadena v. State of California* (1993) 14 Cal.App.4th 810, 827–830 [in rejecting an attack on use of categorical exemption for the relocation of a parole office to an existing building, court explains that, although the proposed project may have had some social impacts, including the presence of people engaged in "irregular activities" into the affected area, "CEQA does not address the purely social effects of a project" without a physical change in the environment]; *San Franciscans for Reasonable Growth v. City and County of San Francisco* (1989) 209 Cal.App.3d 1502, 1521–1522, fn. 13 ["project-specific demands for additional downtown housing implicate social and economic, not environmental, concerns and, thus, are outside the CEQA purview"]; *Saltonstall v. City of Sacramento* (2014) 234 Cal.App.4th 549, 584-587 [issue of crowd control at basketball arena not an environmental effect requiring analysis under CEQA].)

Because the potential for increased crime and increased demands on police departments are not environmental effects subject to CEQA, the standard sample questions in the model Initial Study found in Appendix G to the CEQA Guidelines focus instead on whether such social or economic effects might require the construction of new *facilities* that would involve environmental effects during construction and operation. (See CEQA Guidelines, appen. G, Sample Questions, XIV, "Public Services"; see also *Goleta Union School District v. Regents of the University of California* (1995) 37 Cal.App.4th 1025, 1031-1033 [CEQA is not concerned with the social effects of "classroom overcrowding per se," but is concerned with the physical effects of expanded school facilities constructed to address classroom overcrowding].) In light of these well-established legal principles, the City's significance criteria appropriately focused not on crime rates or the rapidity of police responses thereto, but on the possibility of physical effects from construction and operation of any new police facilities that might have been required because of the project.

Despite the fact that the above-referenced comments raising concerns about crime and police service impacts do not raise environmental issues subject to CEQA, the City nevertheless addresses such comments as follows.

In support of the SEIR, the San Francisco Police Department (SFPD) was directly consulted regarding potential impacts of the proposed project, and its contribution to cumulative impacts. As discussed in Impact PS-4 in the SEIR (pp. 5.8-14 to 5.8-16), the SFPD determined that the periodic increases in demand for law enforcement services would not require construction or need

for new or physically altered law enforcement facilities to serve the proposed project. The SFPD indicates that during non-event periods at the project site, the proposed project would require typical SFPD police protection services, similar to those services currently being provided to other mixed-use developments in the City. The SEIR notes that the newly-built and operational Public Safety Building, which includes the new SFPD headquarters and Southern District Station, conveniently operates only one-third mile from the project site. In addition, the SEIR discusses that the SFPD would increase local police staffing for games/events at the proposed event center, as specified in the event security/operations plans, similar to how SFPD routinely provides additional police protection for other games/special events in the City. Impact PS-4 also describes proposed space within the event center that would be dedicated for SFPD administrative and operational functions. Furthermore, a separate proposed command center at the event center would be used prior to, during, and after games/events by the SFPD, the San Francisco Fire Department (SFFD), the San Francisco Municipal Transportation Agency (SFMTA), and/or the project's private security and emergency medical personnel to coordinate incident response, facilitate communication and surveillance, and to implement the transportation management plan (TMP) and deploy parking control officers (PCOs). Consequently, adequate police protection services and facilities would be available and provided for the games/events at the project site, and such services would not detract from other SFPD police operations within the City. Given all these factors, the proposed project would have a less than significant impact related to the construction of new or physically altered police protection facilities.

A commenter discusses existing SFPD officer staffing levels and the Department's recruiting, hiring and training program, and opines that it would be unlikely that SFPD can achieve full staffing levels by mid-2018. SEIR Section 5.6.3.2 acknowledges that existing SFPD full-duty sworn officer staffing is presently below that mandated in the City Charter. However, the SEIR also explains that the SFPD predicts that, with implementation of its six-year hiring plan initiated in 2012, the mandated SFPD levels are expected to be reached in mid-2018.

A commenter indicates that private security at the event center would not be arresting, citing or physically ejecting people from an event site. This is correct, but the SEIR does not assume the project's private security would be handling law enforcement duties of sworn police officers. Rather, SEIR Impact PS-4 states that the event center, office and retail uses would provide their own on-site private security personnel and install proper security equipment, and that the event center would provide an on-site command center for on-site security personnel to monitor access to the site and provide continuous communications resources. The SEIR also notes that during games and events at the event center, the Warriors and/or event sponsor would provide increased private security to assist in on-site crowd management and public safety during events, and would use traffic control personnel to assist in implementing the TMP to facilitate safe movement of, and minimize potential conflicts among, pedestrians, bicyclists, and vehicles. However, the SEIR makes clear that increased levels of SFPD police protection personnel would be required on- and/or off-site for patrolling and responding to potential incidents(e.g., citations, ejections of fans from the arena and arrests, public intoxication, thefts from vehicles, and low-level assaults). The SFPD personnel required on- and/or off-site for games/events would be determined in advance of

the game/event by the SFPD's Event Commander in coordination with the Warriors and/or event sponsor, and would be specified in event security/operations plans.

A commenter indicates that the inclusion of more detailed SFPD crime statistics would provide more information to evaluate and determine accurate levels of police activity or associated with special events, and also that would be prudent to obtain more comprehensive crime statistics and information from the University of California Police Department, California Highway Patrol (CHP), Port of San Francisco Police, and Bay Area Rapid Transit (BART) Police. As discussed in the SEIR Section 5.8, the primary responder to law enforcement calls associated with the project would be the SFPD, and a 3-year summary of annual crime statistics from the SFPD for the Mission Bay Plan area is presented in the SEIR for informational purposes in connection with a description of the environmental setting. This level of crime statistic data is appropriate for the SEIR to provide an overview of existing crime level in the project area. Furthermore, as discussed above, the SFPD was directly consulted to receive their concerns regarding potential projects impacts to its services. Please note also that the Draft SEIR was distributed to UCSF, CHP, the Port of San Francisco, and BART for their review and comment; please see associated comment letters on the Draft SEIR that were submitted by these agencies (UCSF, CHP, and BART only) in this document. The commenter's request for additional crime statistics for SFPD or other law enforcement agencies would not yield any new meaningful information that would alter the analysis or change the conclusions reached in the SEIR regarding the significance of project impacts and/or contribution to cumulative impacts associated with law enforcement services.

General comments were made by commenters regarding the potential for the project to affect quality of life. As discussed in SEIR Section 5.8.5.2, Approach to Analysis, quality of life issues are not considered impacts under CEQA. In the assessment of impacts to public services, such quality of life effects would not result in adverse physical environmental impacts under CEQA unless such effects result in the need for the construction of new or physically altered governmental facilities in order to maintain acceptable levels of public services, *and* the construction of such facilities result in adverse physical environmental impacts. These quality of life issues would be considered as part of OCII and the City's project planning and approval processes, outside of the CEQA environmental review process. However, as discussed in the SEIR, the proposed project would incorporate certain services, facilities, and site management practices that would minimize the project's effects on the quality of life for the surrounding neighborhood. In addition to those proposed security personnel and facilities described above, the project proposes (i) use of traffic control personnel and implementation of a transportation management plan for games/events to facilitate safe movement of, and minimize potential conflicts among pedestrians, bicyclists, and vehicles; (ii) use of maintenance and cleaning staff to regularly clean and maintain the buildings and grounds and provide litter control; (iii) incorporation of public restroom facilities in proposed buildings and open space areas; and (iv) installation of recycling/trash/compost receptacles as required by the City. See also Section 13.2, Response GEN-2, regarding quality of life issues. Please see also, 13. 2, GEN-1A which discusses a City and County of San Francisco ordinance introduced for consideration by Board of Supervisors that would ensure that the incremental City costs of providing police, fire and public works services outside the premises are fully funded through the life of the project.

13.18.3 Fire Protection (PS-2)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

I-Zboralske-14 I-Zboralske-29

"This section evaluates if the project would require new or physically altered governmental facilities to maintain adequate public safety. This is a misleading measure. We should really be assessing the issues associated with providing the broad range of public services to the geographic area impacted by the project.

"There is no way to evaluate if there are more or fewer calls on special event days compared to non-event days. There is no way to determine which days of the week and hours of the day are peak response times. Simple raw data does not give us the information we need to determine if the proposed arena project, along with all the other projects, will cause service delays or disruptions.

"For example Table 5.8-2 addresses San Francisco Fire Department (SFFD) responses in the project area over a 12-month period. Staff at four fire stations responded to 10,702 medical responses and 4,968 fire calls. In total, SFFD responded to 15,670 incidents. For urban municipal fire departments, medical aid calls typically outnumber all other types of calls for service. Indeed, nearly 70% of the calls at the four stations were medical in nature. Should all the projects in the pipeline be constructed and occupied, the number of total calls will increase dramatically in the target area. With the increase of traffic congestion and associated factors of event management, SFFD response times under current staffing levels are likely to increase.

"There is no way to evaluate if there are more or fewer calls on special event days compared to non-event days. There is no way to determine which days of the week and hours of the day are peak response times. Simple raw data does not give us the information we need to determine if the proposed arena project, along with all the other projects, will cause service delays or disruptions. (*James Zboralske, email, July 27, 2015 [I-Zboralske-14]*)

"The City's current infrastructure can't efficiently and effectively handle the large influx of people to an estimated 250+ yearly events in our neighborhood. The police and fire departments did not adequately address relevant issues in their sections of the report." (*James Zboralske, email, July 27, 2015 [I-Zboralske-29]*)

Response PS-2: Fire Protection

The commenter questions the use of the significance criteria presented in the SEIR used to judge the significance of impacts to public services. This significance criteria presented in Section 5.8.5.1 (p. 5.8-9) in the SEIR was adapted from Appendix G in the CEQA Guidelines. It is important for the commenter to understand that the scope of the SEIR is to address potential physical environmental impacts of the project. Accordingly, the context for judging impacts to fire protection services in the SEIR is if the proposed project would result in substantial adverse physical impacts associated with the provision of or need for new or physically altered fire

protection facilities in order to maintain acceptable service levels, the construction of which could cause significant environmental impacts.

In support of the SEIR, the San Francisco Fire Department (SFFD) was directly consulted regarding potential impacts of the proposed project, and its contribution to cumulative impacts. As discussed in Impact PS-3 in the SEIR (pp. 5.8-12 to 5.8-14), the SFFD determined that the periodic increases in demand for fire protection and emergency medical services would neither adversely affect SFFD service standards nor require an increase in SFFD staff that would require the construction of new fire protection facilities. The SEIR notes that the newly-built and operational Public Safety Building, which includes the new SFFD Fire Station No. 4, conveniently operates only one-third mile from the project site, and several other existing fire stations are located within the project site vicinity as well. In addition, the City's high pressure emergency water infrastructure would serve the project site. As part of project operations for games and large events at the event center, the Warriors or other event sponsors would provide on-site medical services, including a first aid station and on-site medical personnel, to provide first aid to game/event patrons or employees that may require medical assistance, which would further reduce potential effects on general emergency medical response providers. The proposed development would also be designed to comply with the most up-to-date building and fire codes and include state-of-the-art fire safety measures and equipment, and provision of adequate emergency access ways around the project site for emergency vehicles. Project fire safety plans would be subject to review and approval by the SFFD. Furthermore, as part of the project, a proposed command center at the event center would be used prior to, during, and after games/events by the SFFD, SFPD, SFMTA, and/or the project's private security and emergency medical staff to coordinate incident response, facilitate communication and surveillance, implement the TMP, and deploy PCOs. Given all these factors, the proposed project would have a less than significant impact related to the construction of new or physically altered fire protection facilities.

The commenter references statistics for SFFD responses for fire stations in the project area that are presented in Table 5.8-2 in the SEIR. The commenter asserts that if all cumulative projects are developed, the number of total SFFD response calls would increase dramatically in the project area, and SFFD response times under current staffing levels are likely to increase. The summary of SFFD responses for the Mission Bay Plan area is presented in Table 5.8-2 in the SEIR for informational purposes to describe the environmental setting. However, it is not used to determine potential project impacts. Cumulative impacts to public services, including fire protection services, are addressed in Impact C-PS-2 in the SEIR. As discussed in Impact C-PS-2, the SFFD has not identified a citywide service gap, and determined that the increased need for fire protection services resulting from the proposed project and reasonably foreseeable projects would not be above levels anticipated by the SFFD. Given these factors, the project's contribution to cumulative impacts associated with fire protection services would not be considerable, and the impact would be less than significant.

Please see also, 13. 2, GEN-1A which discusses a City and County of San Francisco ordinance introduced for consideration by Board of Supervisors that would ensure that the incremental City

costs of providing police, fire and public works services outside the premises are fully funded through the life of the project.

13.18.4 Schools (PS-3)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

I-MacKenzie1-1 I-MacKenzie1-2 I-MacKenzie1-3

"One of many potential impacts that a "No Project Alternative" would have if the construction of the proposed Warrior's San Francisco Arena & Event Center is not built at this Mission Bay location, is a fact that has become crystal clear; that is, the Warriors would not be able to return to San Francisco in order to build a new state-of-the-art Arena & Event Center. This option would also prevent the opportunity to offer an indoor multi-purpose facility that would provide not only Warriors professional NBA basketball games, concerts and a variety of sports tournaments and games for numerous college, high schools and other youth programs, but it would also prevent the potential creation of an innovative Model indoor Education & Career Development Classroom within this facility capable of offering a wide range of social-economic benefits including education, career development programs and new businesses for an untold amount of public and private sector organizations, students and youth, young adults, families and our entire San Francisco-Oakland Bay Area Community as a whole.

"This is a unique opportunity to build an Event Center and Mixed-Use Development at Mission Bay on Blocks 29-32, that can offer unique and invaluable incentives, inspiration and real-world career guidance and skills development and leadership training opportunities for our youth that would disappear if this Warriors Arena project does not get built. This project can also inspire and create new jobs and careers, as well as build education and career development programs that will not be possible in any other central location in San Francisco, Oakland or other Bay Area cities. I believe it would be an unfortunate failure of our collective responsibilities if we do not cooperate as a city and community and demonstrate the successful leadership necessary to construct an NBA Arena in San Francisco at the Mission Bay location. This is a once in a life time opportunity for San Francisco leaders to collaborate effectively in order to build a professional sports facility integrated with a model visionary, innovative and strategically located indoor Classroom facility capable of enhancing and expanding our capacity to establish effective wide-ranging and healthy socio-economic growth and opportunities for our entire diverse, cross-cultural San Francisco community. At the same time, I believe our public and private sector agencies, corporate leaders and Non-Profit Foundations and officials can work together in collaboration with the Warriors in order to benefit, support and share their professional knowledge and experience inside this Arena & Event Center environment for all our San Francisco, Oakland and our Bay Area schools, youth, teachers, families and communities all year-round." (*Dennis MacKenzie, email, July 26, 2015 [I-MacKenzie1-1]*)

"Once again, the failure to build this Arena & Event Center - including the loss of socio-economic growth, enhanced and newly created business opportunities and a wide range of educational and career development programs, jobs, internships, practical real-world experience, leadership training and comprehensive support for our San Francisco, Oakland and Bay Area high school and college age students, non-profit youth and community organizations that can all be served year-round through visiting an indoor Warriors Arena Classroom - would be a huge loss for all sectors of our San Francisco, Oakland and the Bay Area Community; as well as the loss of creating an educational Model for our nations professional sports organizations and teams that would be worthy of emulation for future construction of Arenas and Stadiums throughout our country – and beyond.

"The potential loss of building this San Francisco Warriors professional NBA Basketball Arena & Event Center, would also include the lost opportunity to create a model facility with the visionary capacity to initiate and develop an Education and Career Development Classroom in collaboration with San Francisco government, public and private sector officials and business leaders, the San Francisco Unified School District, non-profit youth and community organizations; while at the same time, create effective partnerships with public-private Non-Profit Foundations and philanthropists for financial support and matching funds as well.

"The loss of this unique opportunity would also prevent enhancing and expanding much needed opportunities for our San Francisco-Oakland and Bay Area high schools and college students. This Mission Bay location also has the opportunity to inspire new businesses, and offer our public-private sectors and government leaders and agencies to work together in order to enhance and expand long-term, comprehensive socio-economic initiatives and cross-cultural, international sports and education exchange programs as well; if not, this will be instead - a huge and irreplaceable missed opportunity for our interdependent communities of San Francisco, Oakland and the entire Bay Area." (*Dennis MacKenzie, email, July 26, 2015 [I-MacKenzie1-2]*)

_____

"My comments and perspectives below address these above items contained within the SEIR, and the 'less than significant' impact, which will not require any additional schools to be built for our San Francisco Unified School District and family needs. With this in mind, I ask that our collective efforts envision this opportunity to build a Warriors Arena & Event Center in Mission Bay to be considered an invaluable opportunity for the Warriors, City and County of San Francisco's public and private sector officials, the SF Chamber of Commerce, Non-Profit Foundations and organizations – as well as business and community leaders to support the inclusion of an indoor Classroom to be built within this Warriors facility that can be accessible to all of our San Francisco Unified School District's high schools, students and teachers in order to initiate, create and establish an Educational Methodology Model 'Magnet Education & Career Development Classroom' within this Warriors Arena & Event Center in Mission Bay:

"I believe the proposal I have shared with the Warriors and all San Francisco public and private sector officials, agencies and leaders can create a "Model Magnet Sports Management & Facilities Operations Pathway" studies, including the numerous multi-media, journalism, business and other curriculums I've shared with you, the Warriors, all San Francisco Unified School District leaders and San Francisco officials that can contribute to our current challenge to attract parents and families to raise their children in San Francisco, and attend our San Francisco public schools. The numerous jobs and careers associated with any professional Basketball Arena and NBA team, ownership and organization, could initiate tremendously inspiring incentives for high school age students to listen to and learn from all the professionals presenting their knowledge, experience and guidance within this proposed state-of-the-art Warriors Arena and Event Center High School-College Career Pathway & Field Study Classroom. I trust there would be tremendous interest throughout our San Francisco and Bay Area communities and schools to participate and become involved in an education system that included real-world experience and training within this Warriors Arena in San Francisco's Mission Bay.

"This indoor Warriors Arena Classroom would have the capacity to create first-of-its-kind Model programs; including the ability to serve as a model for building future NBA Arenas throughout the country, and the Americas - as well as a unique opportunity to serve our community, city, state and country by establishing and building a National Model for other professional sports organizations and teams across the country for generations to come.

"In addition to my comments above addressing these issues contained within the SEIR, I respectfully ask that you and your OCII and Planning Department staff and city officials take into consideration the details of the comprehensive programs and positive influential impacts of this Arena that I have shared with you through my previous communications and materials in writing and in public comments at both the OCII and Planning Commission hearings regarding this Arena & Event Center, my proposal to include a high school classroom within this Arena, and this Environmental Impact Report.

"I respectfully ask that my proposal requesting the Warriors and SF city officials and leaders collaborate in order to include the far-reaching positive impact the construction of a High School-College Career Pathway & Field Study Classroom© within this SF-Warriors Multi-Use Arena & Event Center can have for San Francisco and this proposed project to be built on Blocks 29-32 in Mission Bay. I also ask that this Environmental Impact Report consider - and comment on - the immense potential loss that not building this Arena & Event Center would have; including the lost socio-economic benefits and educational programs and options lost through the failure to build this project would have without initiating a national Model Education and Career Development Classroom for the benefit of supporting our students, youth, young adults, families, communities and newly created business opportunities in the present - and for generations to come." (*Dennis MacKenzie, email, July 26, 2015 [I-MacKenzie1-3]*)

Response PS-3: Schools

The commenter indicates that not developing the proposed project, and the commenter's proposed "indoor Warriors Arena Classroom," would have a number of negative socio-economic effects, including loss of: socio-economic growth, business opportunities, educational and career development programs, jobs, internships, leadership training and support for Bay Area high school and college age students, non-profit youth and community organizations.

The commenter's proposed indoor Warriors Arena Classroom is not part of the proposed project, and consequently, is not considered for analysis in this SEIR. Furthermore, the assessment of economic or social effects is not within the purview of CEQA, unless an economic effect would itself result in an environmental impact (CEQA Guidelines Section 15131). All potential impacts of the proposed project on public schools are addressed in the SEIR Initial Study Section E.12, Public Services, which is included in Appendix NOP-IS of the SEIR. As discussed therein, the overall Mission Bay plan included the transfer of land within the plan area for a new 500-student elementary school to the San Francisco Unified School District (SFUSD) prior to issuance of building permits for the Mission Bay plan residential units. On this basis, the Mission Bay FSEIR concluded that Mission Bay plan impacts to public schools would be less than significant. Potential impacts associated with the construction and operation of the new school were included in the overall analysis of the Mission Bay plan in the Mission Bay FSEIR. That document also determined that the proposed school site within the Mission Bay plan area would not be large enough to house a middle school or high school, or all of the potential new elementary school students, and consequently, that additional classroom space would need to be developed by SFUSD outside of the Mission Bay plan area, most likely for all grade levels. The Mission Bay FSEIR concluded it was too speculative to identify impacts from construction of additional school facilities, although any new facilities that would be proposed by SFUSD would be subject to appropriate environmental review for site-specific physical environmental impacts.

Because the proposed project does not include a residential component, the proposed project will not bring new school-aged children to the area. Even if it did, however, there would be legal limitations on the City's ability to deal with any resulting increases in student numbers. Local governments' ability to mitigate for school-related impacts is limited under 1998 legislation commonly known as Senate Bill 50. Among other things, Senate Bill 50 eliminated local governments' ability to turn down development projects (whether legislative or adjudicatory in character) on the ground that they

would cause or exacerbate school overcrowding (Gov. Code, § 65996, subd. (b)); and, with some qualifications, the legislation capped the amount of fees that could be imposed on new development by school districts, cities, and counties (id., § 65995, subd. (h)).

Please also refer to the No Project Alternative in Section 7, Alternatives, in the SEIR for a discussion of potential environmental effects if the proposed project were not to be developed. Nonetheless, when deciding whether or not to approve the project, the OCII would consider the environmental impacts and all other relevant information, including social or economic effects.

13.19 Biological Resources

13.19.1 Overview of Comments on Biological Resources

The comments and corresponding responses in this section cover topics analyzed in the Initial Study, Section E.13, Biological Resources, which is included in Appendix NOP-IS of the SEIR. These include topics related to:

- BIO-1: General Approach to Analysis
- BIO-2: Setting
- BIO-3: Special-Status Species
- BIO-4: Sensitive Natural Communities
- BIO-5: Wetlands
- BIO-6: Avian Impacts

13.19.2 General Approach to Analysis (BIO-1)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

O-MBA11L5-11 O-MBA11L5-12 O-MBA11L5-13 O-MBA11L5-20 O-MBA11L5-27

III. The DSEIR Is Not Sufficient as an Informational Document with Respect to Project Impacts on Biological Resources, Including Wetlands and Wildlife.

A. The City's decision to exclude the Project's impacts on biological resources from the DSEIR is erroneous.

The City's decision to exclude the Project's impacts on biological resources from the DSEIR (see DSEIR, p. 5.1-1) is erroneous as a matter of law. Both the NOP/IS and the DSEIR announce that their analyses are "tiered" to the 1998 Mission Bay FSEIR pursuant to CEQA Guideline 15168(c). (IS, p. 23-24; DSEIR, pp. 1-1, 5.1-2, 3.) Both the NOP/IS and the DSEIR also announce that the standards used to exclude resource topics from the DSEIR are the standards used to determine if a subsequent EIR is required under CEQA section 21166 and Guideline section 15162. (See NOP/IS, pp. 23-25; DSEIR, p. 5.1-3.)

Based on these predicates, the City decided to prepare a focused EIR, and to conduct no environmental review with respect to the following resources: Biological Resources, Aesthetics, Land Use Cultural Resources, Paleontological Resources, Geology and Soils, Recreation, Hazardous Materials, and Population and Housing. As discussed in more detail in the July 27, 2015, letter from the Mission Bay Alliance's legal counsel regarding "tiering," the City's assumption that it may prepare an EIR for this Project that tiers to the 1998 Mission Bay FSEIR is legally incorrect. As discussed in several comment letters submitted on behalf of the Mission Bay Alliance, and below regarding the Project's impacts on biological resources, the evidence relating to these excluded resource topics meets both the "fair argument" standard, as well as the CEQA section 21166 standards. Therefore, the City must prepare and recirculate for public review a Revised Draft EIR addressing all of the Project's environmental impacts. (*Mission Bay Alliance, Thomas Lippe, letter, July 24, 2015 [O-MBA11L5-11]*)

B. There is substantial evidence supporting a fair argument the Project will have a significant adverse effect on biological resources.

While the NOP/IS give short shrift to on-site biological resources, there is substantial evidence, in the NOP/IS and the attached reports from Matt Hageman and Erik Ringelberg, supporting a fair argument the Project may have significant effects on (1) migratory birds; (2) off-site special status species downstream of the Project, including steelhead (Oncorhynchus mykiss); and (3) the on-site wetland and its ecology and associated wildlife. (*Mission Bay Alliance, Thomas Lippe, letter, July 24, 2015 [O-MBA11L5-12]*)

With respect to migratory birds, the NOP/IS admits that the 1998 Mission Bay FSEIR did not assess the redevelopment Plan's effects on migratory birds. (NOP/IS, p. 81.) In addition, the NOP/IS concedes the Project may have significant impacts on migratory birds because it recommends the adoption of mitigation measures to substantially reduce these impacts, stating: "With implementation Mitigation Measures M-BI-4a, Preconstruction Surveys for Nesting Birds, and M-BI-4b, Bird Safe Building Practices, the project would not result in any new or substantially more severe significant impacts on resident or migratory bird species than those identified in the FSEIR." (NOP/IS, p. 81.)

This approach violates CEQA in a number of ways. First, as discussed above, the Project is a separate project from the 1998 Redevelopment Plan, or at a minimum, is not within the scope of the 1998 Mission Bay FSEIR. This fact precludes the City from "tiering" to the 1998 FSEIR for any resource, including impacts on biological resources such as migratory birds.[7] Second, trying to mitigate significant impacts before assessing their nature and extent puts the cart before the horse.[8] Third, as discussed above, the NOP/IS's concession that the Project may have significant impacts on migratory birds is substantial evidence supporting a fair argument the Project will have a significant adverse effect on migratory birds; therefore, the City is required to include an assessment of these impacts in the DSEIR.[9] Fourth, even if the City's assumption that CEQA section 21166 applies is correct, the addition of a 750,000 square foot sports arena and an additional 160 foot office tower to the Mission Bay Redevelopment Plan are substantial changes in the Redevelopment Plan that give rise to new potentially significant effects on birds that must be analyzed in the subsequent EIR.

Footnotes:

7 *Sierra Nevada Conservation, supra.*

8 CEQA does not permit an agency to simply adopt mitigation measures in lieu of fully assessing a project's potentially significant environmental impacts because mere acknowledgement that an impact would be significant is inadequate; the EIR must include a detailed analysis of "how adverse" the impact would be. (*Lotus v. Department of Transportation (2014) 223 Cal. App. 4th 645, 655-56; Galante Vineyards v. Monterey Peninsula Water Management Dist. (1997) 60 Cal. App.4th 1109, 1123; Santiago County Water Dist. v. County of Orange (1981) 118 Cal .App.3d 818, 831.)*

9 *Protect the Historic Amador Waterways, supra.*

(*Mission Bay Alliance, Thomas Lippe, letter, July 24, 2015 [O-MBA11L5-13]*)

In our opinion, the SEIR, in several key areas related to biological resources, failed to adequately characterize the nature and the extent of the site's resources; failed to identify the full range of potential significant impacts from the proposed project on those resources; failed to examine those impacts at a sufficient level of detail to understand the project impacts; and, failed to provide adequate mitigation for those resources, both during construction and cumulatively. Specifically, key species and sensitive habitat(s) were left out of the discussion, and mitigation measures were missing, or inadequate, to reduce the impacts of the project on those species below the threshold of significance; and finally, significant changes have occurred at the site affecting both the applicable policies and the relevant resource use since the original analysis. (*Mission Bay Alliance, Thomas Lippe, letter, July 24, 2015 [O-MBA11L5-20]*)

2014 NOP-IS

The 2014 NOP-IS Applies the Prior Impact Analysis to the Modified Current Setting

1. The NOP-IS (Pg. 76) re-characterizes the 1998 FSEIR in order to minimize the type, extent and value of current ecological features of the site. The analysis conflates the prior CEQA analysis with the current ecological conditions, without fully assessing the significant changes that currently exist under and the impacts of the project on the biological resources. The analysis further parses the "upland" species and habitat from the aquatic species and habitat, without identifying and relating the project impacts associated with each of those contexts. For example, the proposed project has both direct (loss of habitat) and indirect environmental impacts (potential contamination) to both terrestrial and aquatic resources, within and adjacent to the site (dust, groundwater and stormwater), but these impacts are not fully identified (impacts identified only to nesting and flying birds). The project must be evaluated with an associated impact analysis that defines the specific project impacts on the site's (and Plan Area) biological resources. (*Mission Bay Alliance, Thomas Lippe, letter, July 24, 2015 [O-MBA11L5-27]*)

Response BIO-1: General Approach to Analysis

This group of comments address broad comments on the SEIR approach to analysis of biological resources. This responses provides the cross-references to other parts of the Responses to Comments document where the specific issues are addressed.

Initial Study and Tiering

Comments O-MBA11L5-11, O-MBA11L5-12, and O-MBA11L5-13 state it was improper for OCII to rely on the 1990 and 1998 EIRs and to use an Initial Study to scope out certain impacts from further review in the SEIR. These comments claim OCII was required to analyze biological impacts in the SEIR because the potential for impacts to biological resources meets the "fair argument" standard and the CEQA section 21166 standards. The comments further raise concerns: regarding the approach of tiering from the 1998 Mission Bay FSEIR; that the Initial Study fails to analyze significant impacts apart from the proposed mitigation; that migratory birds should have been analyzed in the Draft SEIR; and that the proposed project is a substantial change from the Mission Bay Redevelopment Plan that gives rise to new potentially significant effects on birds that must be analyzed in the SEIR. OCII disagrees.

For a general discussion of "tiering," and OCII's reliance on the 1990 and 1998 EIRs, please see Sections 13.3.7 and 13.3.8, Responses ERP-6 and ERP-7, of the Responses to Comment document. Those responses provide a general discussion of how OCII used the 1990 and 1998 EIRs to determine the scope of the SEIR, and discuss CEQA provisions that authorize this approach.

CEQA encourages agencies to rely on previously certified program EIRs in preparing subsequent EIRs. (See CEQA Guidelines, § 15168.) The CEQA Guidelines explain that when relying on a previously certified program EIR, a subsequent EIR should focus solely on environmental effects that were not already covered in the program EIR. (*Id*., subd. (d)(3).) The Guidelines recommend the use of "a written checklist or similar device to document the evaluation of the site and the activity to determine whether the environmental effects of the operation were covered in the program EIR." (*Id*., subd. (c)(4).) The environmental review for the proposed project followed this recommended approach. OCII used an Initial Study to determine whether the environmental effects of the project were adequately covered in the 1998 Mission Bay FSEIR. To avoid waste of

public resources and duplication of analysis, the environmental effects that were already covered in the 1998 Mission Bay FSEIR were not analyzed again in the SEIR. OCII's determinations in this regard are supported by substantial evidence.

Further, the Initial Study is included as part of the SEIR (Appendix NOP-IS in Volume 3) and includes an analysis of potential impacts, including impacts to biological resources. It is not necessary to reproduce the text again under a separate section in the SEIR. The "substantial evidence" standard applicable to EIRs also applies to an agency's determinations regarding the scope of the EIR and the amount or type of analysis contained in the EIR. Here, the Initial Study is part of the proposed project's SEIR, and its scope, analysis, and conclusions are each governed by the same substantial evidence standard. Therefore, the comment's suggestion that the "fair argument" standard applies to the discussion of Biological Resources is not accurate. The comment seems to suggest the text of the Initial Study must be reproduced in the SEIR if it is to be governed under the "substantial evidence." But again, the Initial Study is already included as part of the SEIR and repeating that information would be redundant and is unnecessary.

The case cited in the comments to support the assertion that the fair argument standard applies, *Center for Sierra Nevada Conservation v. County of El Dorado* (2012) 202 Cal.App.4th 1156, is inapposite. *Center for Sierra Nevada Conservation* concerned the county's adoption of a negative declaration for an oak woodland management plan and mitigation fee program. The county's negative declaration was premised on its 2004 general plan and attendant EIR, which required onsite mitigation of the loss of oak woodland habitat, but anticipated the option of allowing developers to pay a conservation fee under an oak woodland management plan instead. Because neither the general plan nor the EIR specified the fee rate or how the collected fees should be used to mitigate the impact on oak woodlands, and because the record contained evidence that the manner in which the fees were collected and used could have impacts, the court held the county was required to prepare a tiered EIR before it adopted the oak woodland management plan and implemented the fee. (*Id*. at p. 1162.) As the court explained, the plan and fee program were separate projects from that analyzed in the program EIR. The court then explained that "[i]f a proposed new activity is a separate project, the 'fair argument' test should apply to an agency's decision whether to require a tiered EIR for the later project." Applying the fair argument standard, the court held the county could not rely on the negative declaration because there was substantial evidence supporting a fair argument that the oak woodland management plan and mitigation fee program would have a significant effect on the environment and therefore an EIR was required.

In this case, OCII is not relying on a negative declaration. Rather OCII prepared a SEIR for the proposed project and the analysis included in the Initial Study is part of the SEIR. Accordingly, the fair argument standard does not apply. In addition, the 1990 and 1998 Mission Bay EIRs anticipated development of the project site and, accordingly, analyzed whether the site contained biological resources that would be significantly affected by such development. The Initial Study summarizes this information. (See Initial Study, pp. 76-81.) The Initial Study supplemented this analysis with additional information obtained after preparation of the 1998 EIR. (See Initial Study, pp. 81-84.) For these reasons, the court's decision in *Center for Sierra Nevada Conservation* does not apply to the

current circumstances. (See *Citizens Against Airport Pollution v. City of San Jose* (2014) Cal.App.4th 227 Cal.App.47th 788, 800-802.)

Initial Study

An Initial Study is an appropriate tool to determine whether an environmental impact was adequately addressed in a prior EIR both for purposes of tiering and for determining the level of analysis required in subsequent environmental documents. As noted above, the CEQA Guidelines recommend that agencies use "a written checklist or similar device to document the evaluation of the site and the activity to determine whether the environmental effects of the operation were covered in the program EIR." (CEQA Guidelines, § 15168, subd. (c)(4).) This approach – the use of initial studies to determine the level of analysis necessary for subsequent projects following program EIRs – has been upheld by the courts on numerous occasions. For example, in *Latinos Unidos de Napa v. City of Napa* (2013) 221 Cal.App.4th 192, 196, the court upheld the City of Napa's use of an Initial Study to amend its Housing Element based on a previously certified program EIR. Based on the Initial Study, the city concluded that its approval of revisions to its housing element and related general plan and zoning amendments would not result in any new significant environmental impacts that were not adequately analyzed in its 1998 General Plan program EIR. The court held that the city's determination was supported by substantial evidence and that no further environmental review was required pursuant to CEQA Guidelines section 15168, subdivision (c)(2). (*Latinos Unidos de Napa, supra,* 221 Cal.App.4th at p. 203; see also *Santa Teresa Citizen Action Group v. City of San Jose* (2003) 114 Cal.App.4th 689 [upholding agency's use of an Initial Study to determine whether subsequent activities were adequately covered in program EIR].)

Here, OCII properly used an Initial Study to scope out impacts from further review that would not be significant or were adequately analyzed in the 1998 Mission Bay FSEIR. The "fair argument" standard does not apply to the conclusions in the Initial Study. Furthermore, the SEIR is a *focused* EIR prepared in accordance with CEQA Guidelines sections 15063(b)(1)(C) and 15168(d)(1). Like Public Resources Code section 21166, the "fair argument" standard does not apply to agency determinations that additional review is not necessary under CEQA Guideline sections 15063 or 15168. (*Citizens for a Sustainable Treasure Island v. City and County of San Francisco* (2014) 227 Cal.App.4th at p. 1051.)

Under CEQA, an EIR must analyze a project's significant environmental impacts. Conversely, impacts that are not significant need not be analyzed in an EIR. Public Resources Code Section 21003, subdivision (f) states: "it is the policy of the state that... [a]ll persons and public agencies involved in the environmental review process be responsible for carrying out the process in the most efficient, expeditious manner in order to conserve the available financial, governmental, physical, and social resources with the objective that those resources may be better applied toward the mitigation of actual significant effects on the environment." This policy is reflected in CEQA Guidelines section 15126.2, subdivision (a), which states that "[a]n EIR shall identify and focus on the significant environmental impacts of the proposed project" and section 15143, which states that "[t]he EIR shall focus on the significant effects on the environment." Thus, CEQA provides that an EIR is not required to include detailed analysis of impacts that are not

significant. (See CEQA Guidelines, § 15128; *North Coast Rivers Alliance v. Marin Municipal Water District Board of Directors* (2013) 216 Cal.App.4th 614 ["CEQA does not require detailed analysis of an impact that is less than significant."].)

The CEQA Guidelines allow the use of an Initial Study to document project effects that are less than significant. (CEQA Guidelines, § 15063, subd. (a).) CEQA Guidelines section 15128 provides that "[a]n EIR shall contain a statement briefly indicating the reasons that various possible significant effects of a project were determined not to be significant and were therefore not discussed in detail in the EIR. Such a statement may be contained in an attached copy of an Initial Study." Therefore, the use of the Initial Study to scope out impacts that would not be significant is not only appropriate, but encouraged under CEQA.

When an agency determines that a particular impact would not be significant, and therefore does not warrant further discussion in an EIR, those determinations are reviewed under the "substantial evidence" test. (*North Coast Rivers Alliance v. Marin Municipal Water District* (2013) 216 Cal.App.4th 614, 638-639 [lead agencies' brief statements under CEQA Guidelines section 15128 that impacts are less than significant must be upheld if supported by substantial evidence]; *Eureka Citizens for Responsible Government v. City of Eureka* (2007) 47 Cal.App.4th 357, 375-376 [same]; see also *Protect The Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal.App.4th 1099, 1113 [when an EIR contains a brief statement of reasons for concluding an impact is less than significant, then the petitioner has the burden of demonstrating "the conclusion was not supported by substantial evidence in the administrative record."].) Further, CEQA Guidelines section 15128 states that agencies may rely on Initial Studies to determine that impacts are less than significant. Thus, where an Initial Study concludes that detailed analyses of certain topics are unnecessary, those determinations must be upheld if supported by substantial evidence; the "fair argument" test does not apply under those circumstances.

The Initial Study prepared for the proposed project includes detailed analysis of potential impacts to biological resources and is included as part of the SEIR. This information appears at pages 76 to 84 of the Initial Study. Additional information appears in Appendix A to the Initial Study. As shown on SEIR Table 2-2 (pp. 2-20 to 2-21), no comments on the Initial Study's biological resources impact analysis were received during the 30-day public scoping period following issuance of the Notice of Preparation and Initial Study. The Initial Study identified and analyzed new potentially significant impacts on wildlife as described in Impact BI-4 and additional mitigation measures (M-BI-4a, Preconstruction Surveys for Nesting Birds and M-BI-4b, Bird Safe Building Practices), which were not identified in the 1998 Mission Bay FSEIR. These new impacts and associated mitigation measures are reflective of the current project conditions and of the City's adoption in 2011 of the Standards for Bird Safe Buildings (Planning Code Section 139). However, these new impacts were determined to be *less than significant* with mitigation incorporated. The same "substantial evidence" standard applicable to the SEIR applies to the analysis and conclusions in the Initial Study. Because the Initial Study is already included in SEIR, the text of the Initial Study does not need to be reproduced again in a separate section of the SEIR.

Tiering

CEQA affords a variety of mechanisms for relying on environmental review of successive projects to avoid duplicative analysis of environmental effects examined in previous EIRs. (See *Gentry v. City of Murrieta* (1995) 36 Cal.App.4th 1359, 1373.) Relying on the environmental analysis in a previous EIR is particularly appropriate where, as here, a "program" EIR has been prepared for a large project or plan under which subsequent approvals or projects are anticipated.

Under CEQA and the CEQA Guidelines, agencies are able to rely on previously certified program EIRs in a variety of ways. For example, CEQA directs that EIRs shall be "tiered" whenever feasible. (Pub. Resources Code, § 21093, subd. (b).) "Tiering" refers to the coverage of matters in broader EIRs, with subsequent narrower EIRs or ultimately site-specific EIRs incorporating by reference the analysis in the previous EIR and "concentrating solely on the issues specific to the EIR subsequently prepared." (CEQA Guidelines, § 15385; see also Pub. Resources Code, §§ 21068.5, 21093, CEQA Guidelines, §§ 15152, 15168.) The CEQA Guidelines note that tiering is appropriate when the sequence of EIRs is "[f]rom an EIR on a specific action at an early stage to a subsequent EIR or a supplement to an EIR at a later stage." (CEQA Guidelines, § 15385, subd. (b).) When tiering is utilized, the later EIR will concentrate on the environmental effects that "were not analyzed as significant effects on the environment in the prior environmental impact report." (Pub. Resources Code, § 21068.5; see also *id*., § 21094(a); see also CEQA Guidelines, §§ 15152, 15385.) Tiering is encouraged under CEQA because it promotes efficiency and avoids "repetitive discussions of the same issues in successive" EIRs. (CEQA Guidelines, § 15152, subd. (b); see Pub. Resources Code, §§ 21068.5, 21093; Guidelines, § 15152 [same]; *Sierra Club v. County of Sonoma* (1992) 6 Cal.App.4th 1307, 1318-1319.) In adopting CEQA's tiering provisions, the Legislature stated that tiering should be used "to exclude duplicative analysis of environmental effects examined in previous environmental impact reports." (Pub. Resources Code, § 21093, subd, (a).)

CEQA also allows lead agencies to rely on previously certified EIRs when preparing subsequent or supplemental EIRs for later activities or for determining whether any additional environmental review is required. Generally, once an EIR has been prepared, a public agency cannot require the preparation of a subsequent or supplemental EIR unless either: "(a) Substantial changes are proposed in the project which will require major revisions of the [EIR]. [¶] (b) Substantial changes occur with respect to the circumstances under which the project is being undertaken which will require major revisions in the [EIR]. [¶] (c) New information of substantial importance, which was not known and could not have been known at the time the [EIR] was certified as complete, becomes available." (Pub. Resources Code, § 21166; see also CEQA Guidelines, § 15162.) A change is "substantial" and "require[s] major revisions" in a previous EIR only if it involves new significant environmental impacts that were not considered in the previous EIR. (Guidelines, § 15162, subds. (a)(1), (a)(2).) If an agency determines that a subsequent EIR is required, CEQA directs that the analysis in the subsequent EIR should focus solely on environmental impacts that were not already analyzed in the previous EIR.

When relying on a previously certified program EIR, the lead agency must examine subsequent activities in the light of the program EIR to determine whether additional environmental review is required. (CEQA Guidelines, § 15168, subd. (c).) The CEQA Guidelines advise that "[w]here

the subsequent activities involve site specific operations, the agency should use a written checklist or similar device to document the evaluation of the site and the activity to determine whether the environmental effects of the operation were covered in the program EIR." (CEQA Guidelines, § 15168, subd. (c)(4).) The CEQA Guidelines further provide that a program EIR can, and should, be used to streamline the analysis in a subsequent EIR. Section 15168 states that a program EIR can be used to "[f]ocus an EIR on a subsequent project to permit discussion solely of new effects which had not been considered before." (Subd. (d)(3).) The ability to scope out environmental impacts from further analysis when preparing a subsequent EIR that tiers off of a program EIR is further evidenced by CEQA Guidelines section 15168, subdivision (c)(2), which states that "[i]f the agency finds that pursuant to [CEQA Guidelines] Section 15162, no new effects could occur or no new mitigation measures would be required, the agency can approve [a subsequent] activity as being within the scope of the project covered by the program EIR, and no new environmental document would be required." (See *Latinos Unidos de Napa v. City of Napa* (2013) 221 Cal.App.4th 192, 203 [upholding use of Initial Study to determine whether environmental impacts of later activity were adequately analyzed in previously certified program EIR]; see *Concerned Dublin Citizens v. City of Dublin* (2013) 214 Cal.App.4th 1301, 1316 [describing process for determining scope of analysis of project within the context of a previously certified program EIR]; *Citizens for Responsible Equitable Environmental Development v. City of San Diego Redevelopment Agency* (2005) 134 Cal.App.4th 598 [upholding agency's determination that impacts of hotel project were adequately addressed in previously certified program EIR].) Therefore, here, the Draft SEIR properly tiered off the 1998 Mission Bay FSEIR and did not need to analyze impacts that were determined to be adequately analyzed in the previous EIR.

An agency's determination that an environmental impact was adequately analyzed in a previous EIR, and therefore does not need to be analyzed again in a subsequent EIR, is reviewed under the "substantial evidence" standard, not the "fair argument" standard. "In reviewing an agency's decision not to require additional environmental review pursuant to section 21166, courts are not reviewing the record to determine whether it demonstrates a possibility of environmental impact, but are viewing it in a light most favorable to the agency's decision in order to determine whether substantial evidence supports the decision not to require additional review." (*Latinos Unidos de Napa v. City of Napa* (2013) 221 Cal.App.4th 192, 204-205, internal quotations and citations omitted.) The substantial evidence standard applies regardless of whether the previous EIR was a "program" EIR or a "project" EIR. (See *Citizens for a Sustainable Treasure Island v. City and County of San Francisco* (2014) 227 Cal.App.4th 1036, 1049-1050 ["the same substantial evidence standard applies to subsequent environmental review for a project reviewed in a program EIR or a project EIR"], citing *Latinos Unidos de Napa v. City of Napa*, *supra*, 221 Cal.App.4th at pp. 201–202 [substantial evidence standard applies in reviewing an agency's determination that a project's potential environmental impacts were adequately analyzed in a prior program EIR]; *Santa Teresa Citizen Action Group v. City of San Jose* (2003) 114 Cal.App.4th 689, 704 [substantial evidence standard applies when agency has already prepared a program EIR and the question is whether implementing later phases of the program will result in new impacts].)

Recirculation

For discussion regarding recirculation of the SEIR, please see Section 13.3.6, Response ERP-5.

General Comments on Biological Resources

Comment O-MBA11L5-20 states that the SEIR failed to adequately characterize the nature and extent of the site's biological resources and claims that significant changes have occurred at the site affecting both the applicable policies and relevant biological resources since the analysis conducted in the 1998 Mission Bay FSEIR. Similarly, Comment O-MBA11L5-27 asserts that the Initial Study "re-characterizes" the 1998 FSEIR in order to minimize the ecological features of the site and that the analysis conflates the prior CEQA analysis with the current ecological conditions. Both comments are mistaken.

As described in Response BIO-2, below, the biological resources setting description is provided under Impact BI-1 (pp. 77 to 79) and Appendix A of the Initial Study, and is based on conditions at the time of preparation of the Initial Study (2014). Follow-up site visits in 2014 and 2015 confirm reconnaissance survey observations of the project site remain accurate as do descriptions of site conditions within the Initial Study.[1] The Initial Study also includes a comparison of the current conditions with the site conditions described in the 1998 Mission Bay FSEIR. This updated setting information also states that "there have been no substantial changes with respect to the circumstances under which the proposed project would be undertaken, nor has any new information become available." This conclusion applies to updates of applicable policies and the relevant resource use. Impact BI-5 (p. 83) analyzes the relevant biological resources policies or ordinances currently applicable to the proposed project, and finds that the project does not conflict with such policies and ordinances.

Comment O-MBA11L5-20 also presents general statements asserting that the SEIR failed to identify the full range of potential significant impacts, examine those impacts at a sufficient level of detail, and provide adequate mitigation. OCII disagrees. The Initial Study clearly addresses the full range of biological resources issues identified in CEQA Guidelines Appendix G, Section IV, (a) to (f). Criteria (a), (b), (c), (d), and (e) are addressed in the Initial Study (pp. 76 to 84) in Impacts BI-1 (regarding special status species), BI-2 (regarding sensitive natural communities), BI-3 (regarding wetlands), BI-4 (regarding wildlife), and BI-5 (regarding biological resources polices or ordinances), respectively. Criterion (f) regarding conflicts with adopted or approved habitat conservation plans is addressed on page 76, which explains why this criterion does not apply to the proposed project. Due to the non-specific nature of this comment regarding the level of detail and adequate mitigation, the responses regarding the adequacy of the analyses are addressed throughout this Section 13.19 under various sub-topics, including the existing conditions at the site (Response BIO-2), special-status species (Response BIO-3), sensitive natural communities (Response BIO-4), wetlands (Response BIO-5, and birds (Response BIO-6). As indicated in those responses, mitigation measures are identified consistent with CEQA Guidelines section 15126.4 for any impacts determined to be significant or potentially significant.

Comment O-MBA11L5-27 states that the analysis parses the upland species and habitat from the aquatic species and habitat without identifying and relating the project impacts associated with

[1] WRA, Inc. 2015. *Technical Memorandum: Biological Reconnaissance at the Proposed Event Center and Mixed-Use Development at Mission Bay Blocks 29-32.* October 1.

each of those contexts. The commenter is mistaken. The separate discussions of upland and aquatic biological resources are part of the summary of the biological resources impacts in the 1998 Mission Bay FSEIR and do not refer to the Initial Study impact analysis. Instead, the biological resource impacts of the proposed project are analyzed and discussed under five general categories — special-status species, sensitive natural communities, wetlands, wildlife, and biological resources policies or ordinances — each of which is analyzed in detail in Impacts BI-1 through BI-5, as described above. Contrary to the commenter's assertion, the Initial Study indeed analyzes the specific project impacts on the biological resources currently present at the project site.

For a discussion of the existing conditions or Setting used for the impact analysis of biological resources, please see Response BIO-2, below.

In response to Comment O-MBA11L5-12, regarding the potential for the proposed project to have significant effects on biological resources, please refer to responses below relevant to the specific topics raised. For a discussion of sensitive species concerns and critical habitat, please see; Response BIO-3: Special-Status Species, and Response BIO-4: Sensitive Natural Communities (including steelhead), respectively. For a discussion of the regulatory status, ecology, and habitat value of the onsite ponded depression, please see Response BIO-5: Wetlands. For a discussion of impacts on migratory birds, please see Response BIO-6: Avian Impacts.

13.19.3 Setting (BIO-2)

Issues Raised by Commenters

This response addresses all or part of the following comments, which are quoted below:

O-MBA11L5-21

ECOLOGICAL CONDITIONS REVIEW

The project area has two boundaries, the larger "Mission Bay Redevelopment Plan Area Boundary," (Plan Area) which is described in the 1998 FSEIR and the current "site" boundary (site), which includes Blocks 29-32 within that larger planning boundary (Figure 1). Both boundaries will be used for the purposes of discussion as they relate to the corresponding environmental analysis documents and the project's potential impacts on biological resources. A current aerial photo is provided for detailed site context (Figure 2).

The Plan Area's near surface soils are the result of mixed fills and have been identified by the Natural Resource Conservation Service as: 134, Urban land-Orthents, reclaimed complex, 0 to 2 percent slopes (Figure 3). The soils are the result of historic filling of the Mission Bay with debris, earthquake waste spoils, and other material to reclaim the site from the San Francisco Bay (ESA 2014; Pg. 1). This soils information is consistent with other analyses, developed by others, discussed later.

The U.S. Fish & Wildlife Service, National Wetlands Inventory (NWI) identified several features adjacent to the Plan Area, but none within the site (Figure 4). The relative elevation of these features both within (and nearby) the project boundary appear to correlate with the local shallow water table (ESA 2014; LTR 2015; Pg. 13-14 and Figures A-2 and A-3).

The site itself appears to be a largely ruderal area that has been subject to various anthropogenic disturbances, within an urban setting, containing two large surface parking areas. The site currently contains an open water feature, actively used by wildlife, and a narrow swale to the east (Figure 5). The site's current conditions are detailed in the following site observations.

SITE OBSERVATIONS

The Blocks 29-32 footprint consists of two large paved areas (Southwest parking lot approximately 79,910 sq.ft./1.83 ac. and Northeast parking lot approximately 91,776 sq.ft./2.11 ac.)[1] currently being used as paid parking lots; an area of soil stockpiles (31,066 sq.ft./0.71 ac) on the eastern edge of the property (Terry A. Francois Boulevard); and an adjoining large open field, open water (22,115 sq.ft./0.51 ac) and wetland swale complex, (904 sq.ft./0.02 ac.) (closest to the Southwest parking lot) shown on Figure 2. A series of photographs were taken of the site and the adjoining areas (Attached Photo Plates).

At the time of observation, the open water area encompassed the majority of the water feature, with a patchy, but substantial fringe of palustrine emergent (predominately alkali bulrush [Bolboschoenus maritimus]) and riparian plants (willows [Salix sp.]). The emergent plants and shrubs were concentrated on the two narrower ends of the water feature. The narrower channel and the seasonal wetlands apparent from the aerial photographs (Figures 2a-i) were not clearly visible from the site perimeter fence(es).

Numerous native birds were observed within, and in some cases flying to and from the water body. Several Canada geese (Branta canadensis) were seen, including what appear to be adult plumage juveniles; three killdeer (Charadrius vociferous), including two juveniles; a female mallard and a juvenile (Anas platyrhynchos); several crows (Corvus brachyrhynchos); two non-native Eurasian collared-doves (Streptopelia decaocto); and numerous non-native rock doves/pigeon (Columba livia). The site has significant use for nesting and foraging by these bird species.

2015 DSEIR

The DSEIR uses an incomplete description of the environmental setting in its impact assessment.

The DSEIR incompletely characterizes the site's biological resources in the project site description and existing uses. The sole description of the site as it related to its biological resources in the DSEIR is as follows:
