TO: Distribution List for the Pier 70 Mixed-Use District Project Draft EIR

FROM: Lisa M. Gibson, Acting Environmental Review Officer

SUBJECT: Request for the Final Environmental Impact Report for the Pier 70 Mixed-Use District Project (Planning Department File No. 2014-001272ENV)

This is the Draft of the Environmental Impact Report (EIR) for the Pier 70 Mixed-Use District Project. A public hearing will be held on the adequacy and accuracy of this document. After the public hearing, our office will prepare and publish a document titled "Responses to Comments," which will contain all relevant comments on this Draft EIR and our responses to those comments. It may also specify changes to this Draft EIR. Those who testify at the hearing on the Draft EIR will automatically receive a copy of the Responses to Comments document, along with notice of the date reserved for certification; others may receive a copy of the Responses to Comments document and notice by request or by visiting our office. This Draft EIR together with the Responses to Comments document will be considered by the Planning Commission in an advertised public meeting and will be certified as a Final EIR if deemed adequate.

After certification, we will modify the Draft EIR as specified by the Responses to Comments document and print both documents in a single publication called the Final EIR. The Final EIR will add no new information to the combination of the two documents except to reproduce the certification resolution. It will simply provide the information in one document, rather than two. Therefore, if you receive a copy of the Responses to Comments document in addition to this copy of the Draft EIR, you will technically have a copy of the Final EIR.

We are aware that many people who receive the Draft EIR and Responses to Comments document have no interest in receiving virtually the same information after the EIR has been certified. To avoid expending money and paper needlessly, we would like to send copies of the Final EIR [in Adobe Acrobat format on a CD] to private individuals only if they request them. Therefore, if you would like a copy of the Final EIR, please fill out and mail the postcard provided inside the back cover to the Environmental Planning division of the Planning Department within two weeks after certification of the EIR. Any private party not requesting a Final EIR by that time will not be mailed a copy. Public agencies on the distribution list will automatically receive a copy of the Final EIR.

Thank you for your interest in this project.

SUMMARY

This Summary chapter is intended to highlight major areas of importance in the environmental analysis as required by Section 15123 of the California Environmental Quality Act (CEQA) Guidelines. This chapter briefly summarizes the Pier 70 Mixed-Use District Project (referred to in this Environmental Impact Report [EIR] as "the Proposed Project").

To cover a full range of potential land uses that could be developed under the proposed Special Use District (SUD), this EIR analyzes a maximum residential-use scenario and a maximum commercial-use scenario for the project site (i.e., Maximum Residential Scenario and Maximum Commercial Scenario). Three options for sewer/wastewater treatment, three options for grading around Building 12, and an option for pedestrian passageways are evaluated in this EIR. The Proposed Project also includes four variants that consider modifications to the proposed infrastructure and building systems to enhance sustainability. The EIR analyzes three alternatives to the Proposed Project including a No Project Alternative, Code Compliant Alternative, and 2010 Port Master Plan Alternative.

Following the synopsis of the Proposed Project and scenarios, and its project options and variants, a summary table presents the environmental impacts of the Proposed Project and its project variants, and mitigation and improvement measures identified to reduce significant impacts. Following the summary tables is a description of the alternatives to the Proposed Project that are addressed in this EIR and a table comparing the impacts of those alternatives with the Proposed Project. The final subsection in this chapter is a summary of environmental issues to be resolved and areas of known controversy.

Table S.1: Summary of Impacts of Proposed Project, beginning on p. S.7, provides an overview of the following:

- Environmental impacts with the potential to occur as a result of the Proposed Project and project variants, scenarios, and options;
- The level of significance of the environmental impacts before implementation of any applicable mitigation measures;
- Mitigation measures that would avoid or reduce significant environmental impacts;
- Improvement measures that would reduce less-than-significant impacts; and
- The level of significance for each impact after the mitigation measures are implemented.

A. PROJECT SYNOPSIS

The Pier 70 area (Pier 70) encompasses 69 acres of historic shipyard property along San Francisco's Central Waterfront. Under the Burton Act, Pier 70 is owned by the City and County

of San Francisco (City) through the Port Commission of San Francisco (Port or Port Commission).[1] The Port intends to rehabilitate or redevelop Pier 70 and has selected Forest City Development California, Inc. (Forest City) to act as master developer for 28 acres of the site and initiate rezoning and development of design standards and controls for a multi-phased, mixed-use development on that site and two adjacent parcels.[2] As envisioned, the proposed Pier 70 Mixed-Use District Project would include market-rate and affordable residential uses, commercial use, retail/arts/light-industrial (RALI) uses,[3] parking, shoreline improvements, infrastructure development and street improvements, and public open space. Together, the Port and Forest City are the project sponsors for the Proposed Project.

The proposed Pier 70 Mixed-Use District Project, for which this project-level EIR has been prepared, comprises a project site of an approximately 35-acre area bounded by Illinois Street to the west, 20th Street to the north, San Francisco Bay to the east, and 22nd Street to the south. The project site is south of Mission Bay, east of the Potrero Hill and Dogpatch[4] neighborhoods, and within the northeastern portion of San Francisco's *Central Waterfront Area Plan*, one of four areas covered by the *Eastern Neighborhoods Rezoning and Area Plans (Eastern Neighborhoods Plan)*. The project site is located within Pier 70, except for the 3.6-acre parcel adjacent to Pier 70's southwest corner, known as the Hoedown Yard, which is owned by the Pacific Gas and Electric Company (PG&E). [5]

---

1 The Burton Act (Chapter 1333 of the Statutes of 1968) was adopted by the California Legislature in 1968. Under the Burton Act and the companion Burton Act transfer agreement, the State transferred ownership of the tidelands making up San Francisco harbor to the City, with the requirement that the City form a Port Commission with complete authority to use, operate, manage, and regulate the granted lands.

2 The Port and Forest City entered into an Exclusive Negotiating Agreement in July 2011 as authorized by Port Commission Resolution No. 11-49. The Port Commission subsequently endorsed a Term Sheet outlining features of the Proposed Project, which the San Francisco Board of Supervisors endorsed in June 2013 by Resolution No. 201-13.

3 The project sponsors describe the RALI use as including neighborhood retail, arts, eating and drinking places, production distribution and repair, light manufacturing, and entertainment establishments, which are collectively referred to for the purposes of this EIR as RALI uses.

4 The Dogpatch neighborhood is bounded by Mariposa Street to the north, I-280 to the west, Cesar Chavez Street to the south, and Illinois Street to the east.

5 Under an option agreement with PG&E, the City has an option to purchase the Hoedown Yard. PG&E has consented to including the Hoedown Yard in the project sponsors' rezoning efforts; however, the City will not exercise its option to purchase the Hoedown Yard, and development of this parcel may not proceed, unless PG&E locates a suitable relocation site for the current utility operations at the Hoedown Yard. PG&E's consent is reflected in the letter from Kendrick Li, Supervisor Land Acquisition Development, PG&E, to Brad Benson, Port of San Francisco, regarding the Hoedown Yard, June 6, 2014. A copy of this letter is available for public review at the San Francisco Planning Department, 1650 Mission Street, Suite 400, in Case File No. 2014.001272E. The environmental analysis assumes that the City will exercise its option with PG&E, and will subsequently purchase the Hoedown Yard.

Two development areas constitute the project site. The "28-Acre Site" is an approximately 28-acre area located between 20th, Michigan, and 22nd streets and San Francisco Bay that includes Assessor's Block 4052/Lot 001 and Lot 002 and Block 4111/Lot 003 and Lot 004. The "Illinois Parcels" form an approximately 7-acre site that consists of an approximately 3.4-acre Port-owned parcel, called the "20th/Illinois Parcel," along Illinois Street at 20th Street (Assessor's Block 4110/Lot 001) and the approximately 3.6-acre "Hoedown Yard," at Illinois and 22nd streets (Assessor's Block 4120/Lot 002 and Block 4110/Lot 008A), which is owned by PG&E. The Hoedown Yard includes a City-owned 0.2-acre portion of street right-of-way that bisects the site.[6]

The Proposed Project would amend the *San Francisco General Plan* (*General Plan*) and Planning Code, adding a new Pier 70 SUD, which would establish land use zoning controls for the project site and incorporate the design standards and guidelines in the proposed *Pier 70 SUD Design for Development* document (*Design for Development*).[7] All new construction at the project site must be consistent with the *Design for Development.* The Zoning Maps would be amended to show changes from the current zoning (M-2 [Heavy Industrial] and P [Public]) to the proposed SUD zoning. Height limits on the 28-Acre Site would be increased from 40 feet to 90 feet, except for a 100-foot-wide portion adjacent to the shoreline that would remain at 40 feet, as authorized by Proposition F in November 2014. The Planning Code text amendments would also modify the existing height limits on an eastern portion of the Hoedown Yard from 40 to 65 feet. Height limits are further restricted through the design standards established in the proposed *Design for Development*. The Proposed Project would also amend the Port's *Waterfront Land Use Plan*.

Under the proposed SUD, the Proposed Project would provide a phased mixed-use land use program in which certain parcels could be developed for either primarily commercial uses or residential uses, with much of the ground floor dedicated to RALI uses. In addition, two parcels on the project site (Parcels C1 and C2) could be developed for structured parking or for residential/commercial or residential use, depending on future market demand for parking and future travel demand patterns. Development of the 28-Acre Site would include up to a maximum of approximately 3,422,265 gross square feet (gsf) of construction of new buildings and improvements to existing structures (excluding basement-level square footage allocated to accessory and district parking). New buildings would have maximum heights of 50 to 90 feet. Development of the Illinois Parcels would include up to a maximum of approximately 801,400 gsf in new buildings; these new buildings would not exceed a height of 65 feet, which is the

[6] The 0.2-acre Michigan Street right-of-way is a recorded easement; however, no physical roadway exists.

[7] The proposed *Pier 70 Design for Development* document, which is included as part of the Proposed Project, would set forth the underlying vision and guidelines for development of the project site, and establish standards and design guidelines to implement the intended vision and principles.

existing height limit along Illinois Street on both the Port-owned and the western portion of the Hoedown Yard.

The majority of the project site is located within the Union Iron Works Historic District, which is listed in the National Register of Historic Places (National Register) in recognition of Pier 70's role in the development of steel shipbuilding in the United States and for industrial architecture built at the site between 1884 and the end of World War II. The 28-Acre Site contains 12 of the Historic District's 44 contributing historic resources and one of the ten non-contributing resources. With implementation of the Proposed Project, three contributing resources (Buildings 2, 12, and 21) would be rehabilitated in compliance with the Secretary of the Interior's Standards for the Treatment of Historic Properties and adapted for reuse; one (the existing remnant of Irish Hill[8]) would be mostly retained; and seven structures and sheds (Buildings 11, 15, 16, 19, 25, 32, and 66), containing 92,945 gsf, would be demolished. The Port has proposed to demolish the 30,940-gsf Building 117, located on the project site, prior to approval of the Proposed Project as part of the Historic Core Project.[9,10] The single non-contributing resource on the project site (Slipways 5 through 8, which are currently covered by fill and asphalt) would be partially demolished.

The Proposed Project includes transportation and circulation improvements, new and upgraded utilities and infrastructure, geotechnical and shoreline improvements, and 9 acres of public open space. Three options for sewer/wastewater treatment, three options for grading around Building 12, and an option for pedestrian passageways are evaluated in this EIR. The Proposed Project also includes four variants that consider modifications to the proposed infrastructure and building systems to enhance sustainability.

B. SUMMARY OF IMPACTS AND MITIGATION MEASURES

The Planning Department published Notice of Preparation (NOP) on May 6, 2015, announcing its intent to prepare and distribute an EIR (the NOP is presented as Appendix A to this EIR). Topics analyzed in the EIR are Land Use and Land Use Planning; Population and Housing; Cultural Resources; Transportation and Circulation; Noise and Vibration; Air Quality; Greenhouse Gas Emissions; Wind and Shadow; Recreation; Utilities and Service Systems; Public Services; Biological Resources; Geology and Soils; Hydrology and Water Quality; Hazards and Hazardous Materials; Mineral and Energy Resources; and Agricultural and Forest Resources.

---

[8] Today, approximately 1.4 acres remain from the original 20.6 acres of Irish Hill.

[9] San Francisco Planning Department, Notification of Project Receiving Environmental Review, Illinois and 20th Streets/Pier 70 ("20th Street Historic Core"), Case No. 2016-000346ENV, September 8, 2016.

[10] Building 117 is proposed for demolition as part of the 20th Street Historic Core project to allow the adjacent building (Building 116) located on the 20th Street Historic Core site to be rehabilitated to meet fire code.

All impacts of the Proposed Project and its variants, scenarios, and options, and associated mitigation measures and improvement measures identified in this EIR are summarized in Table S.1. These impacts are listed in the same order as they appear in the text of Chapter 4, Environmental Setting and Impacts, of this EIR. For all of the topics evaluated in the EIR, the levels of impacts, with any applicable mitigation measures, are identified as:

- **No Impact** – No adverse changes (or impacts) to the environment are expected.
- **Less Than Significant** – Impact that does not exceed the defined significance criteria or would be eliminated or reduced to a less-than-significant level through compliance with existing local, State, and Federal laws and regulations.
- **Less Than Significant with Mitigation** – Impact that is reduced to a less-than-significant level through implementation of the identified mitigation measures.
- **Significant and Unavoidable with Mitigation** – Impact that exceeds the defined significance criteria and can be reduced through compliance with existing local, State, and Federal laws and regulations and/or implementation of all feasible mitigation measures, but cannot be reduced to a less-than-significant level.
- **Significant and Unavoidable** – Impact that exceeds the defined significance criteria and cannot be eliminated or reduced to a less-than-significant level through compliance with existing local, State, and Federal laws and regulations and for which there are no feasible mitigation measures.

Where applicable, this table identifies project revisions or conditions, expressed as mitigation measures that would reduce the identified impact(s) to less-than-significant levels. The impact's level of significance after implementation of the required mitigation measure is provided in the column labeled "Level of Significance after Mitigation." All mitigation measures and improvement measures that are applicable to the Proposed Project are also applicable to each of the project variants.

This table should not be relied upon for a thorough understanding of the Proposed Project and its impacts and mitigation needs, but is presented for the reader as an overview of project impacts, mitigation measures, and improvement measures. Please see the relevant environmental topic sections in Chapter 4, Environmental Setting and Impacts, for a thorough discussion and analysis of the impacts of the Proposed Project and its project variants, scenarios, and options, and alternatives, and the mitigation measures identified to address those impacts.

As described below in Table S.1, this EIR identifies ten significant and unavoidable impacts of the Proposed Project. It would:

- Cause one individual Muni route (48 Quintara/24th Street bus routes) to exceed 85 percent capacity utilization in the a.m. and p.m. peak hours in both the inbound and outbound directions;

- Cause loading demand during the peak loading hour to not be adequately accommodated by proposed on-site/off-street loading supply or in proposed on-street loading zones, which may create hazardous conditions or significant delays for transit, bicycles, or pedestrians;
- Contribute considerably to significant cumulative transit impacts on the 48 Quintara/24th Street and 22 Fillmore bus routes;
- Cause a substantial temporary or periodic increase in ambient noise levels during construction in the project vicinity above levels existing without the project;
- Cause substantial permanent increases in ambient noise levels in the project vicinity (22nd Street [east of Tennessee Street to east of Illinois Street]; and Illinois Street [20th Street to south of 22nd Street]);
- Combine with cumulative development to cause a substantial permanent increase in ambient noise levels in the project vicinity (22nd Street [east of Tennessee Street to east of Illinois Street] and Illinois Street [20th Street to south of 22nd Street]);
- Generate fugitive dust and criteria air pollutants during construction, which would violate an air quality standard, contribute substantially to an existing or projected air quality violation, and result in a cumulatively considerable net increase in criteria air pollutants;
- Result in operational emissions of criteria air pollutants at levels that would violate an air quality standard, contribute to an existing or projected air quality violation, and result in a cumulatively considerable net increase in criteria air pollutants; and
- Combine with past, present, and reasonably foreseeable future development in the project area to contribute to cumulative regional air quality impacts.

Significant project-level impacts are identified in Table S.1: Summary of Impacts of the Proposed Project, with mitigation measures that would reduce impacts to less-than-significant levels.

Table S.1. Summary of Impacts of the Proposed Project

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
Legend: NI = No Impact; LS = Less than Significant; LSM = less than significant with mitigation; S = Significant; SU = Significant and unavoidable impact; SUM = Significant and unavoidable impact with mitigation			
Land Use and Land Use Planning			
LU-1: The Proposed Project would not physically divide an established community.	LS	None required.	LS
LU-2: The Proposed Project would not conflict with land use plans, policies, or regulations adopted for the purpose of avoiding or mitigating an environmental effect, such that a substantial adverse physical change in the environment related to Land Use would result.	LS	None required.	LS
C-LU-1: The Proposed Project, in combination with past, present, or reasonably foreseeable future projects, would not contribute considerably to significant cumulative land use impacts related to (a) physical division of an established	LS	None required.	LS

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
community, or (b) conflicts with applicable land use plans and policies adopted for the purpose of avoiding or mitigating an environmental effect.			
Population and Housing			
PH-1: The Proposed Project would not induce substantial population growth in an area, either directly or indirectly.	LS	None required.	LS
PH-2: The Proposed Project would not displace substantial numbers of existing housing units or create demand for additional housing, necessitating the construction of replacement housing elsewhere.	LS	None required.	LS

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
C-PH-1: The Proposed Project under the Maximum Residential and Maximum Commercial scenarios, in combination with past, present, and reasonably foreseeable future projects, would not result in a cumulatively considerable contribution to significant cumulative population and housing impacts.	LS	None required.	LS
Cultural Resources (Archeological Resources)			
CR-1: Construction activities for the Proposed Project would cause a substantial adverse change in the significance of archeological resources, if such resources are present within the project site.	S	**M-CR-1a: Archeological Testing, Monitoring, Data Recovery and Reporting** Based on a reasonable presumption that archeological resources may be present within the project site, the following measures shall be undertaken to avoid any potentially significant adverse effect from the Proposed Project on buried or submerged historical resources. The project sponsors shall retain the services of an archeological consultant from rotational Department Qualified Archeological Consultants List (QACL) maintained by the Planning Department archeologist. The project sponsor shall contact the Department archeologist to obtain the names and contact information for the next three archeological consultants on the QACL. The archeological consultant shall undertake an archeological testing program as specified herein. In addition, the consultant shall be available to conduct an archeological monitoring and/or data recovery program if required pursuant to this measure. The archeological consultant's work shall be conducted in accordance with this measure at the direction of the Environmental Review Officer (ERO). All plans and reports prepared by the consultant as specified herein shall be submitted first and directly to the ERO for review and comment, and shall be considered draft reports subject to revision until final approval by the ERO.	LSM

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		Archeological monitoring and/or data recovery programs required by this measure could suspend construction of the project for up to a maximum of four weeks. At the direction of the ERO, the suspension of construction can be extended beyond four weeks only if such a suspension is the only feasible means to reduce to a less than significant level potential effects on a significant archeological resource as defined in State CEQA Guidelines Section 15064.5 (a) and (c). <u>Consultation with Descendant Communities</u> On discovery of an archeological site[11] associated with descendant Native Americans, the Overseas Chinese, or other potentially interested descendant group, an appropriate representative[12] of the descendant group and the ERO shall be contacted. The representative of the descendant group shall be given the opportunity to monitor archeological field investigations of the site and to consult with the ERO regarding appropriate archeological treatment of the site, of recovered data from the site, and, if applicable, any interpretative treatment of the associated archeological site. A copy of the Final Archeological Resources Report shall be provided to the representative of the descendant group. <u>Archeological Testing Program</u> The archeological consultant shall prepare and submit to the ERO for review and approval an archeological testing plan (ATP). The archeological testing program shall be conducted in accordance with the approved ATP. The ATP shall identify the property types of the expected archeological resource(s) that potentially could be adversely affected by the Proposed Project, the testing method to be used, and the locations recommended for testing. The purpose of the archeological testing program will be to determine to the extent possible the presence or absence of archeological resources and to identify and to evaluate whether any archeological resource encountered on the site constitutes an historical resource under CEQA.	

[11] The term "archeological site" is intended here to minimally include any archeological deposit, feature, burial, or evidence of burial.

[12] An "appropriate representative" of the descendant group is here defined to mean, in the case of Native Americans, any individual listed in the current Native American Contact List for the City and County of San Francisco maintained by the California Native American Heritage Commission and in the case of the Overseas Chinese, the Chinese Historical Society of America.

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		At the completion of the archeological testing program, the archeological consultant shall submit a written report of the findings to the ERO. If based on the archeological testing program the archeological consultant finds that significant archeological resources may be present, the ERO in consultation with the archeological consultant shall determine if additional measures are warranted. Additional measures that may be undertaken include additional archeological testing, archeological monitoring, and/or an archeological data recovery program. If the ERO determines that a significant archeological resource is present and that the resource could be adversely affected by the Proposed Project, at the discretion of the project sponsors either: A) The Proposed Project shall be redesigned so as to avoid any adverse effect on the significant archeological resource; or B) A data recovery program shall be implemented, unless the ERO determines that the archeological resource is of greater interpretive than research significance and that interpretive use of the resource is feasible. <u>Archeological Monitoring Program</u> If the ERO in consultation with the archeological consultant determines that an archeological monitoring program (AMP) shall be implemented, the AMP would minimally include the following provisions: • The archeological consultant, project sponsors, and ERO shall meet and consult on the scope of the AMP prior to any project-related soils disturbing activities commencing. The ERO in consultation with the archeological consultant shall determine what project activities shall be archeologically monitored. A single AMP or multiple AMPs may be produced to address project phasing. In most cases, any soils-disturbing activities, such as demolition, foundation removal, excavation, grading, utilities installation, foundation work, driving of piles (foundation, shoring, etc.), site remediation, etc., shall require archeological monitoring because of the risk these activities pose to potential archeological resources and to their depositional context. The	

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		archeological consultant shall advise all project contractors to be on the alert for evidence of the presence of the expected resource(s), of how to identify the evidence of the expected resource(s), and of the appropriate protocol in the event of apparent discovery of an archeological resource; • The archeological monitor(s) shall be present on the project site according to a schedule agreed upon by the archeological consultant and the ERO until the ERO has, in consultation with project archeological consultant, determined that project construction activities could have no effects on significant archeological deposits; • The archeological monitor shall record and be authorized to collect soil samples and artifactual/ecofactual material as warranted for analysis; If an intact archeological deposit is encountered, all soils-disturbing activities in the vicinity of the deposit shall cease. The archeological monitor shall be empowered to temporarily redirect demolition/excavation/pile driving/construction activities and equipment until the deposit is evaluated. If in the case of pile driving activity (foundation, shoring, etc.), the archeological monitor has cause to believe that the pile driving activity may affect an archeological resource, pile driving activity that may affect the archeological resource shall be suspended until an appropriate evaluation of the resource has been made in consultation with the ERO. The archeological consultant shall immediately notify the ERO of the encountered archeological deposit. The archeological consultant shall make a reasonable effort to assess the identity, integrity, and significance of the encountered archeological deposit, and present the findings of this assessment to the ERO. If the ERO determines that a significant archeological resource is present and that the resource could be adversely affected by the Proposed Project, at the discretion of the project sponsors either: A) The Proposed Project shall be redesigned so as to avoid any adverse effect on the significant archeological resource; or	

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		B) A data recovery program shall be implemented, unless the ERO determines that the archeological resource is of greater interpretive than research significance and that interpretive use of the resource is feasible. Whether or not significant archeological resources are encountered, the archeological consultant shall submit a written report of the findings of the monitoring program to the ERO. <u>Archeological Data Recovery Program</u> If the ERO, in consultation with the archeological consultant, determines that an archeological data recovery programs shall be implemented based on the presence of a significant resource, the archeological data recovery program shall be conducted in accord with an archeological data recovery plan (ADRP). No archeological data recovery shall be undertaken without the prior approval of the ERO or the Planning Department archeologist. The archeological consultant, project sponsors, and ERO shall meet and consult on the scope of the ADRP prior to preparation of a draft ADRP. The archeological consultant shall submit a draft ADRP to the ERO. The ADRP shall identify how the proposed data recovery program will preserve the significant information the archeological resource is expected to contain. That is, the ADRP will identify what scientific/historical research questions are applicable to the expected resource, what data classes the resource is expected to possess, and how the expected data classes would address the applicable research questions. Data recovery, in general, shall be limited to the portions of the historical property that could be adversely affected by the Proposed Project. Destructive data recovery methods shall not be applied to portions of the archeological resources if nondestructive methods are practical. The scope of the ADRP shall include the following elements: • *Field Methods and Procedures.* Descriptions of proposed field strategies, procedures, and operations. • *Cataloguing and Laboratory Analysis.* Description of selected cataloguing system and artifact analysis procedures.	

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		• *Discard and Deaccession Policy.* Description of and rationale for field and post-field discard and deaccession policies. • *Interpretive Program.* Consideration of an on-site/off-site public interpretive program during the course of the archeological data recovery program. • *Security Measures.* Recommended security measures to protect the archeological resource from vandalism, looting, and non-intentionally damaging activities. • *Final Report.* Description of proposed report format and distribution of results. • *Curation.* Description of the procedures and recommendations for the curation of any recovered data having potential research value, identification of appropriate curation facilities, and a summary of the accession policies of the curation facilities. <u>Human Remains and Associated or Unassociated Funerary Objects</u> The treatment of human remains and of associated or unassociated funerary objects discovered during any soils disturbing activity shall comply with applicable State and Federal laws. This shall include immediate notification of the coroner of the City and County of San Francisco and in the event of the coroner's determination that the human remains are Native American remains, notification of the California State Native American Heritage Commission (NAHC) who shall appoint a Most Likely Descendant (MLD) (Pub. Res. Code Sec. 5097.98). The archeological consultant, project sponsors, ERO, and MLD shall make all reasonable efforts to develop an agreement for the treatment of, with appropriate dignity, human remains and associated or unassociated funerary objects (State CEQA Guidelines Section 15064.5(d)). The agreement shall take into consideration the appropriate excavation, removal, recordation, analysis, custodianship, curation, and final disposition of the human remains and associated or unassociated funerary objects.	

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		Final Archeological Resources Report The archeological consultant shall submit a Final Archeological Resources Report (FARR) to the ERO that evaluates the historical significance of any discovered archeological resource and describes the archeological and historical research methods employed in the archeological testing/monitoring/data recovery program(s) undertaken. Information that may put at risk any archeological resource shall be provided in a separate removable insert within the final report. The FARR may be submitted at the conclusion of all construction activities associated with the Proposed Project or on a parcel-by-parcel basis. Once approved by the ERO, copies of the FARR shall be distributed as follows: California Archaeological Site Survey Northwest Information Center (NWIC) shall receive one (1) copy and the ERO shall receive a copy of the transmittal of the FARR to the NWIC. The Environmental Planning division of the Planning Department shall receive one bound, one unbound and one unlocked, searchable PDF copy on CD of the FARR along with copies of any formal site recordation forms (CA DPR 523 series) and/or documentation for nomination to the National Register of Historic Places/California Register of Historical Resources. In instances of high public interest in or the high interpretive value of the resource, the ERO may require a different final report content, format, and distribution than that presented above. **M-CR-1b: Interpretation** Based on a reasonable presumption that archeological resources may be present within the project site, and to the extent that the potential significance of some such resources is premised on CRHR Criteria 1 (Events), 2 (Persons), and/or 3 (Design/Construction), the following measure shall be undertaken to avoid any potentially significant adverse effect from the Proposed Project on buried or submerged historical resources if significant archeological resources are discovered. The project sponsors shall implement an approved program for interpretation of significant archeological resources. The interpretive program may be combined	

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		with the program required under Mitigation Measure M-CR-4b: Public Interpretation. The project sponsors shall retain the services of a qualified archeological consultant from the rotational Department Qualified Archeological Consultants List (QACL) maintained by the Planning Department archeologist having expertise in California urban historical and marine archeology. The archeological consultant shall develop a feasible, resource-specific program for post-recovery interpretation of resources. The particular program for interpretation of artifacts that are encountered within the project site will depend upon the results of the data recovery program and will be the subject of continued discussion between the ERO, consulting archeologist, and the project sponsors. Such a program may include, but is not limited to, any of the following (as outlined in the ARDTP): surface commemoration of the original location of resources; display of resources and associated artifacts (which may offer an underground view to the public); display of interpretive materials such as graphics, photographs, video, models, and public art; and academic and popular publication of the results of the data recovery. The interpretive program shall include an on-site component. The archeological consultant's work shall be conducted at the direction of the ERO, and in consultation with the project sponsors. All plans and recommendations for interpretation by the consultant shall be submitted first and directly to the ERO for review and comment, and shall be considered draft reports subject to revision until final approval by the ERO.	
CR-2: Construction activities for the Proposed Project would cause a substantial adverse change in the significance of human remains, if such resources are present within the project site.	S	Implement **M-CR-1a: Archeological Testing, Monitoring, Data Recovery and Reporting**, above.	LSM

Table S.1 Continued

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
physical characteristics of the UIW National Register Historic District that justify its inclusion in the California Register of Historical Resources.		buildings proposed for demolition within the UIW Historic District. The documentation for the property should be prepared based on the National Park Service's Historic American Building Survey (HABS)/Historic American Engineering Record (HAER) Historical Report Guidelines. This type of documentation is based on a combination of both HABS/HAER standards and National Park Service's policy for photographic documentation, as outlined in the NRHP and National Historic Landmarks Survey Photo Policy Expansion. The written historical data for this documentation should follow HABS/HAER standards. The written data should be accompanied by a sketch plan of the property. Efforts should also be made to locate original construction drawings or plans of the property during the period of significance. If located, these drawings should be photographed, reproduced, and included in the dataset. If construction drawings or plans cannot be located, as-built drawings should be produced. Either HABS/HAER-standard large format or digital photography should be used. If digital photography is used, the ink and paper combinations for printing photographs must be in compliance with NR-NHL Photo Policy Expansion and have a permanency rating of approximately 115 years. Digital photographs should be taken as uncompressed, TIFF file format. The size of each image should be 1,600 by 1,200 pixels at 330 pixels per inch or larger, color format, and printed in black and white. The file name for each electronic image should correspond with the index of photographs and photograph label. Photograph views for the dataset should include (a) contextual views; (b) views of each side of each building and interior views, where possible; (c) oblique views of buildings; and (d) detail views of character-defining features, including features on the interiors of some buildings. All views should be referenced on a photographic key. This photographic key should be on a map of the property and should show the photograph number with an arrow to indicate the direction of the view. Historic photographs should also be collected, reproduced, and included in the dataset. The project sponsors should transmit such documentation to the History Room of the San Francisco Public Library, and to the Northwest Information Center of the California Historical Information Resource System. The project sponsors should scope the documentation measures with Planning Department Preservation staff.	

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		Department Preservation staff should also review and approve the submitted documentation for adequacy. **Improvement Measure I-CR-4b: Public Interpretation** Following any demolition, rehabilitation, or relocation activities within the project site, the project sponsors should provide a permanent display(s) of interpretive materials concerning the history and architectural features of the District within publicly accessible areas of the project site. The content of the interpretive display(s) should be coordinated and consistent with the sitewide interpretive plan prepared for the 28-Acre Site in coordination with the Port. The specific location, media, and other characteristics of such interpretive display(s) should be presented to Planning Department preservation planning staff for review and comment and to Port preservation staff for approval prior to any demolition or removal activities.	
CR-5: The proposed rehabilitation of Buildings 2, 12, and 21 would materially alter, in an adverse manner, the physical characteristics of the UIW National Register Historic District that justify its inclusion in the California Register of Historical Resources and would materially alter the physical characteristics of Building 21 that justify its individual eligibility for inclusion in the California Register of Historical Resources.	S	**Mitigation Measure M-CR-5: Preparation of Historic Resource Evaluation Reports, Review, and Performance Criteria.** Prior to Port issuance of building permits associated with Buildings 2, 12 and 21, Port of San Francisco Preservation staff shall review and approve future rehabilitation design proposals for Buildings 2, 12, and 21. Submitted rehabilitation design proposals for Buildings 2 and 12 shall include, in addition to proposed building design, detail on the proposed landscaping treatment within a 20-foot-wide perimeter of each building. The Port's review and analysis would be informed by Historic Resource Evaluation(s) provided by the project sponsors. The Historic Resource Evaluation(s) shall be prepared by a qualified consultant who meets or exceeds the Secretary of the Interior's Professional Qualification Standards in historic architecture or architectural history. The scope of the Historic Resource Evaluation(s) shall be reviewed and approved by Port Preservation and Planning Department Preservation staff prior to the start of work. Following review of the completed Historic Resource Evaluation(s), Planning Department preservation staff would prepare one or more Historic Resource Evaluation Response(s) that would contain the Department's determination as to the effects, if any, on historical resources of the proposed renovation. The Port	LSM

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		shall not issue buildings permits associated with Buildings 2, 12, and 21 until Planning Department and Port preservation staff concur that the design (1) conforms with the Secretary of the Interior's Standards for Rehabilitation; (2) is compatible with the UIW Historic District; and (3) preserves the building's historic materials and character-defining features, and repairs instead of replaces deteriorated features, where feasible. Should alternative materials be proposed for replacement of historic materials, they shall be in keeping with the size, scale, color, texture, and general appearance. The performance criteria shall ensure retention of the following character-defining features of each historic building: • **Building 2**: (1) board-formed concrete construction; (2) six-story height; (3) flat roof; (4) rectangular plan and north-south orientation; (5) regular pattern of window openings on east and west elevations; (6) steel, multi-pane, fixed sash windows (floors 1-5); (7) wood sash windows (floor 6); (8) elevator/stair tower that rises above roofline and projects slightly from west façade. • **Building 12**: (1) steel and wood construction; (2) corrugated steel cladding (except the as-built south elevation which was always open to Building 15); (3) 60-foot height; (4) Aiken roof configuration with five raised, glazed monitors; (5) clerestory multi-lite steel sash awning windows along the north and south sides of the monitors; (6) multi-lite, steel sash awning widows, arranged in three bands (with a double-height bottom band) on the north and west elevations, and in four bands on the east elevation; (7) 12-bay configuration of east and west elevations; (8) north-south roof ridge from which roof slopes gently (1/4 inch per foot) to the east and west • **Building 21:** (1) steel frame construction; (2) corrugated metal cladding; (3) double-gable roof clad in corrugated metal, with wide roof monitor at each gable; (4) multi-lite, double hung wood or horizontal steel sash windows[13]; and (5) two pairs of steel freight loading doors on the north elevation, glazed with 12 lites per door.	

[13] Many of the building's windows have been covered with plywood or metal security grates; the monitor windows have been covered with corrugated metal.

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		Planning Department staff and Port staff shall not approve any proposal for rehabilitation of Buildings 2, 12, and 21 unless they find that such a scheme conforms to the Secretary's Standards as specified for each building.	
CR-6: The proposed relocation of contributing Building 21 would not materially alter, in an adverse manner, the physical characteristics of the UIW National Register Historic District that justify its inclusion in the California Register of Historical Resources, nor the physical characteristics of Building 21 that justify its eligibility for individual inclusion in the California Register of Historical Resources.	LS	None required.	LS
CR-7: The proposed demolition of non-contributing slipways would not materially alter, in an adverse manner, the physical characteristics of the UIW National Register Historic District that justify its inclusion in the California Register of Historical Resources.	LS	None required.	LS

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
CR-8: The proposed site grading work associated with contributing Buildings 2 and 12 would not materially alter, in an adverse manner, the physical characteristics of the UIW National Register Historic District that justify its inclusion in the California Register of Historical Resources.	LS	None required.	LS
CR-9: The proposed alteration of Irish Hill, a contributing landscape feature, would not materially alter, in an adverse manner, the physical characteristics of the UIW National Register Historic District that justify its inclusion in the California Register of Historical Resources.	LS	None required.	LS

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
CR-10: The proposed changes and additions to the network of streets and open space would not materially alter, in an adverse manner, the physical characteristics of the UIW National Register Historic District that justify its inclusion in the California Register of Historical Resources.	LS	None required.	LS
CR-11: The proposed infill construction would materially alter, in an adverse manner, the physical characteristics of the UIW National Register Historic District that justify its inclusion in the California Register of Historical Resources.	S	**Mitigation Measure M-CR-11: Performance Criteria and Review Process for New Construction** In addition to the standards and guidelines established as part of the Pier 70 SUD and *Design for Development*, new construction and site development within the Pier 70 SUD shall be compatible with the character of the UIW Historic District and shall maintain and support the District's character-defining features through the following performance criteria (terminology used has definition as provided in the *Design for Development*): 1. New construction shall comply with the Secretary of the Interior's Rehabilitation Standard No. 9: "New Addition, exterior alterations, or related new construction shall not destroy historic materials that characterize the property. The new work shall be differentiated from the old and shall be compatible with the massing, size, scale and architectural features to protect the integrity of the property and its environment." 2. New construction shall comply with the Infill Development Design Criteria in the Port of San Francisco's *Pier 70 Preferred Master Plan* (2010) as found in Chapter 8, pp 57-69 (a policy document endorsed by the Port Commission to guide staff planning at Pier 70).	LSM

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		3. New construction shall be purpose-built structures of varying heights and massing located within close proximity to one another. 4. New construction shall not mimic historic features or architectural details of contributing buildings within the District. New construction may reference, but shall not replicate, historic architectural features or details. 5. New construction shall be contextually appropriate in terms of massing, size, scale, and architectural features, not only with the remaining historic buildings, but with one another. 6. New construction shall reinforce variety through the use of materials, architectural styles, rooflines, building heights, and window types and through a contemporary palette of materials as well as those found within the District. 7. Parcel development shall be limited to the new construction zones identified in *Design for Development* Figure 6.3.1: Allowable New Construction Zones. 8. The maximum height of new construction shall be consistent with the parcel heights identified in *Design for Development* Figure 6.4.1: Building Height Maximum. 9. The use of street trees and landscape materials shall be limited and used judiciously within the Pier 70 SUD. Greater use of trees and landscape materials shall be allowed in designated areas consistent with *Design for Development* Figure 4.7.1: Street Trees and Plantings Plan. 10. New construction shall be permitted adjacent to contributing buildings as identified in *Design for Development* Figure 6.3.2: New Construction Buffers. 11. No substantive exterior additions shall be permitted to contributing Buildings 2, 12, or 21. Building 12 did not historically have a south-facing façade; therefore, rehabilitation will by necessity construct a new south elevation wall. Building 21 shall be relocated approximately 75	

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		feet east of its present placement, to maintain the general historic context of the resource in spatial relationship to other resources. Building 21's orientation shall be maintained. Building Specific Standards Each development parcel within the Pier 70 SUD has a different physical proximity and visual relationship to the contributing buildings within the UIW Historic District. For those façades immediately adjacent to or facing contributing buildings, building design shall be responsive to identified character-defining features in the manner described in the *Design for Development* Buildings chapter. All other façades shall have greater freedom in the expression of scale, color, use of material, and overall appearance, and shall be permitted if consistent with Secretary Standard No. 9[14] and the *Design for Development*. Table M.CR.1: Building-Specific Responsiveness, indicates resources that are located adjacent to, and have the greatest influence on the design of, the noted development parcel façade. **Table M.CR.1: Building-Specific Responsiveness** **Façade/Parcel Name-Number** / **Contributing Building (Building No.)** North and West; A — 113 North and Northeast; B — 113, 6 North; C1 — 116 East and South; C2 — 12 South and West; D — 2, 12	

[14] Secretary Standard No. 9 states that "New Addition, exterior alterations, or related new construction shall not destroy historic materials that characterize the property. The new work shall be differentiated from the old and shall be compatible with the massing, size, scale and architectural features to protect the integrity of the property and its environment."

Palette of Materials

In addition to the standards and guidelines pertaining to application of materials in the *Design for Development*, the following material performance standards would apply to the building design on the development parcels (terminology used has definition as provided in the *Design for Development*):

- Masonry panels that replicate traditional nineteenth or twentieth century brick masonry patterns shall not be allowed on the east façade of Parcel PKN, north and west façades of Parcel A or on the north façade of Parcel C1.
- Smooth, flat, minimally detailed glass curtain walls shall not be allowed on the façades listed above. Glass with expressed articulation and visual depth or that expresses underlying structure is an allowable material throughout the entirety of the Pier 70 SUD.
- Coarse-sand finished stucco shall not be allowed as a primary material within the entirety of the UIW Historic District.
- Bamboo wood siding shall not be allowed on façades listed above or as a primary façade material.
- Laminated timber panels shall not be allowed on façades listed above.
- When considering material selection immediately adjacent to contributing buildings (e.g., 20th Street Historic Core; Buildings 2, 12, and 21; and Buildings 103, 106, 107, and 108 located within or

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		immediately adjacent to the BAE Systems site), characteristics of compatibility and differentiation shall both be taken into account. Material selection shall not duplicate adjacent building primary materials and treatments, nor shall they establish a false sense of historic development. • Avoid conflict of new materials that appear similar or attempt to replicate historic materials. For example, Building 12 has character-defining corrugated steel cladding. As such, the eastern façade of Parcel C2, the northern façade of Parcels F and G, and the southern façade of Parcel D1 shall not use corrugated steel cladding as a primary material. As another example, Building 113 has character-defining brick-masonry construction. As such, the northern and western façades of Parcel A and the eastern façade of Parcel K North shall not use brick masonry as a primary material. • Use of contemporary materials shall reflect the scale and proportions of historic materials used within the UIW Historic District. • Modern materials shall be designed and detailed in a manner to reflect but not replicate the scale, pattern, and rhythm of adjacent contributing buildings' exterior materials. <u>Review Process</u> Prior to Port issuance of building permits associated with new construction, San Francisco Preservation Planning staff, in consultation with the San Francisco Port Preservation staff, shall use the Final Pier 70 SUD *Design for Development* Standards, including Secretary Standard No. 9, to evaluate all future development proposals within the project site for proposed new construction within the UIW Historic District. As part of this effort, project sponsors shall also submit a written memorandum for review and approval to San Francisco Preservation Planning staff that confirms compliance of all proposed new construction with these guiding plans and policies.

Register of Historical Resources.			
C-CR-3: The impacts of the Proposed Project, in consideration of other past, present, and future projects, would not materially alter, in an adverse manner, the physical characteristics of historical resources (outside of the UIW National Register Historic District) that justify its inclusion in the California Register of Historical Resources, resulting in a cumulative impact.	LS	None required.	LS
Transportation and Circulation			
TR-1: Construction of the Proposed Project would not result in significant impacts on the transportation and circulation network because they would be of limited duration and temporary.	LS	**Improvement Measure I-TR-A: Construction Management Plan** Traffic Control Plan for Construction – To reduce potential conflicts between construction activities and pedestrians, bicyclists, transit, and autos during construction activities, the project sponsors should require construction contractor(s) to prepare a traffic control plan for major phases of construction (e.g., demolition and grading, construction, or renovation of individual buildings). The project sponsors and their construction contractor(s) will meet with relevant City agencies to coordinate feasible measures to reduce traffic congestion, including temporary transit stop relocations and other measures to reduce potential traffic and transit disruption and pedestrian circulation effects during major phases of construction. For any work within the public right-of-way, the contractor would be required to comply with San Francisco's Regulations for	LS

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		Working in San Francisco Streets (i.e., the "Blue Book"), which establish rules and permit requirements so that construction activities can be done safely and with the least possible interference with pedestrians, bicyclists, transit, and vehicular traffic. Additionally, non-construction-related truck movements and deliveries should be restricted as feasible during peak hours (generally 7:00 a.m. to 9:00 a.m. and 4:00 p.m. to 6:00 p.m., or other times, as determined by SFMTA and the Transportation Advisory Staff Committee [TASC]). In the event that the construction timeframes of the major phases and other development projects adjacent to the project site overlap, the project sponsors should coordinate with City Agencies through the TASC and the adjacent developers to minimize the severity of any disruption to adjacent land uses and transportation facilities from overlapping construction transportation impacts. The project sponsors, in conjunction with the adjacent developer(s), should propose a construction traffic control plan that includes measures to reduce potential construction traffic conflicts, such as coordinated material drop offs, collective worker parking, and transit to job site and other measures. Reduce Single Occupant Vehicle Mode Share for Construction Workers – To minimize parking demand and vehicle trips associated with construction workers, the project sponsors should require the construction contractor to include in the Traffic Control Plan for Construction methods to encourage walking, bicycling, carpooling, and transit access to the project construction sites by construction workers in the coordinated plan. Project Construction Updates for Adjacent Residents and Businesses – To minimize construction impacts on access for nearby residences, institutions, and businesses, the project sponsors should provide nearby residences and adjacent businesses with regularly-updated information regarding construction, including construction activities, peak construction vehicle activities (e.g., concrete pours), travel lane closures, and lane closures via a newsletter and/or website.	

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
TR-2: The Proposed Project would not cause substantial additional VMT nor substantially induce automobile travel.	LS	None required.	LS
TR-3: The Proposed Project would not create major traffic hazards.	LS	None required.	LS
TR-4: The Proposed Project would not result in any Muni Screenlines exceeding 85 percent capacity utilization nor would it increase ridership by more than five percent on any Muni Screenline forecast to exceed 85 percent capacity utilization under Baseline conditions without the Proposed Project.	LS	None required.	LS
TR-5: The Proposed Project would cause one individual Muni route to exceed 85 percent capacity utilization in the a.m. and p.m. peak hours in both the inbound and outbound directions.	S	**Mitigation Measure M-TR-5: Monitor and increase capacity on the 48 Quintara/24th Street bus routes as needed.** Prior to approval of the Proposed Project's phase applications, project sponsors shall demonstrate that the capacity of the 48 Quintara/24th Street bus route has not exceeded 85 percent capacity utilization, and that future demand associated with build-out and occupancy of the phase will not cause the route to exceed its utilization. Forecasts of travel behavior of future phases could be based on trip generation rates forecast in the EIR or based on subsequent surveys of occupants of the project, possibly including surveys conducted as part of ongoing TDM	SUM

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		monitoring efforts required as part of Air Quality Mitigation Measure M-AQ-1f: Transportation Demand Management. If trip generation calculations or monitoring surveys demonstrate that a specific phase of the Proposed Project will cause capacity on the 48 Quintara/24th Street route to exceed 85 percent, the project sponsors shall provide capital costs for increased capacity on the route in a manner deemed acceptable by SFMTA through the following means: • The project sponsors shall pay the capital costs for additional buses (up to a maximum of four in the Maximum Residential Scenario and six in the Maximum Commercial Scenario). While the project sponsors could assist with purchasing the buses, SFMTA would need to find funding to pay for the added operating cost associated with operating increased service made possible by the increased vehicle fleet. The source of that funding has not been established. Alternatively, if SFMTA determines that other measures to increase capacity along the route would be more desirable than adding buses, the project sponsors shall pay an amount equivalent to the cost of the required number of buses toward completion of one or more of the following, as determined by SFMTA: • Convert to using higher-capacity vehicles on the 48 Quintara/24th Street route. In this case, the project sponsors shall pay a portion of the capital costs to convert the route to articulated buses. Some bus stops along the route may not currently be configured to accommodate the longer articulated buses. Some bus zones could likely be extended by removing one or more parking spaces; in some locations, appropriate space may not be available. The project sponsors' contribution may not be adequate to facilitate the full conversion of the route to articulated buses; therefore, a source of funding would need to be established to complete the remainder, including improvements to bus stop capacity at all of the bus stops along the route that do not currently accommodate articulated buses.	

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		• SFMTA may determine that instead of adding more buses to a congested route, it would be more desirable to increase travel speeds along the route. In this case, the project sponsors' contribution would be used to fund a study to identify appropriate and feasible improvements and/or implement a portion of the improvements that would increase travel speeds sufficiently to increase capacity along the bus route such that the project's impacts along the route would be determined to be less than significant. Increased speeds could be accomplished by funding a portion of the planned bus rapid transit system along 16th Street for the 22 Fillmore between Church and Third streets. Adding signals on Pennsylvania Street and 22nd Street may serve to provide increased travel speeds on this relatively short segment of the bus routes. The project sponsors' contribution may not be adequate to fully achieve the capacity increases needed to reduce the project's impacts and SFMTA may need to secure additional sources of funding. • Another option to increase capacity along the corridor is to add new a Muni service route in this area. If this option is selected, project sponsors shall fund purchase of the same number of new vehicles outlined in the first option (four for the Maximum Residential Alternative and six for the Maximum Commercial Alternative) to be operated along the new route. By providing an additional service route, a percentage of the current transit riders on the 48 Quintara/24th Street would likely shift to the new route, lowering the capacity utilization below the 85 percent utilization threshold. As for the first option, funding would need to be secured to pay for operating the new route.	

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
TR-6: Two individual Muni routes would continue to operate within the 85 percent capacity utilization standard in the a.m. and p.m. peak hours in both the inbound and outbound directions with addition of the Proposed Project.	LS	None required.	LS
TR-7: The Proposed Project would not cause significant impacts on regional transit routes.	LS	None required.	LS
TR-8: Pedestrian travel generated by the Proposed Project could be accommodated on the new roadway and sidewalk network proposed for the project site.	LS	**Improvement Measure I-TR-B: Queue Abatement** It should be the responsibility of the owner/operator of any off-street parking facility with more than 20 parking spaces (excluding loading and car-share spaces) to ensure that vehicle queues do not occur regularly on the public right-of-way. A vehicle queue is defined as one or more vehicles (destined to the parking facility) blocking any portion of any public street, alley, or sidewalk for a consecutive period of 3 minutes or longer on a daily or weekly basis. If a recurring queue occurs, the owner/operator of the parking facility should employ abatement methods as needed to abate the queue. Appropriate abatement methods will vary depending on the characteristics and causes of the recurring queue, as well as the characteristics of the parking facility, the street(s) to which the facility connects, and the associated land uses (if applicable). Suggested abatement methods include but are not limited to the following: redesign of facility to improve vehicle circulation and/or on-site queue capacity; employment of parking attendants; installation of LOT FULL signs with active management by parking attendants; use of valet parking or other space-efficient	LS

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		parking techniques; use of off-site parking facilities or shared parking with nearby uses; use of parking occupancy sensors and signage directing drivers to available spaces; TDM strategies such as additional bicycle parking, customer shuttles, delivery services; and/or parking demand management strategies such as parking time limits, paid parking, time-of-day parking surcharge, or validated parking. If the Planning Director, or his or her designee, suspects that a recurring queue is present, the Planning Department should notify the property owner in writing. Upon request, the owner/operator should hire a qualified transportation consultant to evaluate the conditions at the site for no less than 7 days. The consultant should prepare a monitoring report to be submitted to the Planning Department for review. If the Planning Department determines that a recurring queue does exist, the facility owner/operator should have 90 days from the date of the written determination to abate the queue.	
TR-9: Existing pedestrian facilities in the vicinity of the project site, while incomplete, would not pose substantial hazards to pedestrian traffic generated by the Proposed Project.	LS	None required.	LS
TR-10: Existing pedestrian facilities at the Proposed Project's access points would present barriers to accessible pedestrian travel.	S	**Mitigation Measure M-TR-10: Improve pedestrian facilities on Illinois Street adjacent to and leading to the project site.** As part of construction of the Proposed Project roadway network, the project sponsors shall fund the following improvements: • Install ADA curb ramps on all corners at the intersection of 22nd Street and Illinois Street • Signalize the intersections of Illinois Street with 20th and 22nd Street.	LSM

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		• Modify the sidewalk on the east side of Illinois Street between 22nd and 20th streets to a minimum of 10 feet. Relocate obstructions, such as fire hydrants and power poles, as feasible, to ensure an accessible path of travel is provided to and from the Proposed Project.	
TR-11: The Proposed Project would not create potentially hazardous conditions for bicyclists and would not interfere with bicycle accessibility to the project site or adjoining areas.	LS	None required.	LS
TR-12: The Proposed Project's loading demand during the peak loading hour would not be adequately accommodated by proposed on-site/off-street loading supply or in proposed on-street loading zones, which may create hazardous conditions or significant delays for transit, bicycles or pedestrians	S	**Mitigation Measure M-TR-12A: Coordinate Deliveries** The Project's Transportation Coordinator shall coordinate with building tenants and delivery services to minimize deliveries during a.m. and p.m. peak periods. Although many deliveries cannot be limited to specific hours, the Transportation Coordinator shall work with tenants to find opportunities to consolidate deliveries and reduce the need for peak period deliveries, where possible. **Mitigation Measure M-TR-12B: Monitor loading activity and convert general purpose on-street parking spaces to commercial loading spaces, as needed.** After completion of the first phase of the Proposed Project, and prior to approval of each subsequent phase, the project sponsors shall conduct a study of utilization of on- and off-street commercial loading spaces. The methodology for the study shall be reviewed and approved by the Planning Department prior to completion. If the result of the study indicates that fewer than 15 percent of the commercial loading spaces are available during the peak loading period, the project sponsors shall incorporate measures to convert existing or proposed general purpose on-	SUM

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		street parking spaces to commercial parking spaces in addition to the required off-street spaces.	
TR-13: The Proposed Project would not result in significant impacts on emergency access to the project site or adjacent locations.	LS	**Improvement Measure I-TR-C: Strategies to Enhance Transportation Conditions During Events.** The project's Transportation Coordinator should participate as a member of the Mission Bay Ballpark Transportation Coordination Committee (MBBTCC) and provide at least 1-month notification where feasible prior to the start of any then known event that would overlap with an event at AT&T Park. The City and the project sponsors should meet to discuss transportation and scheduling logistics for occasions with multiple events in the area.	LS
C-TR-1: Construction of the Proposed Project would occur over an approximately 11-year time frame and may overlap with construction of other projects in the vicinity.	LS	Implement **Improvement Measure I-TR-A: Construction Management Plan**, above.	LS
C-TR-2: The Proposed Project's incremental effects on regional VMT would not be significant, when viewed in combination with past, present, and reasonably foreseeable future projects.	LS	None required.	LS
C-TR-3: The Proposed Project would not contribute to a major traffic hazard.	LS	None required.	LS

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
C-TR-4: The Proposed Project would contribute considerably to significant cumulative transit impacts on the 48 Quintara/24th Street and 22 Fillmore bus routes.	S	**Mitigation Measure M-C-TR-4A: Increase capacity on the 48 Quintara/24th bus route under the Maximum Residential Scenario.** The project sponsors shall contribute funds for one additional vehicle (in addition to and separate from the four prescribed under Mitigation Measure M-TR-5 for the Maximum Residential Scenario) to reduce the Proposed Project's contribution to the significant cumulative impact to not cumulatively considerable. This shall be considered the Proposed Project's fair share toward mitigating this significant cumulative impact. If SFMTA adopts a strategy to increase capacity along this route that does not involve purchasing and operating additional vehicles, the Proposed Project's fair share contribution shall remain the same, and may be used for one of those other strategies deemed desirable by SFMTA. **Mitigation Measure M-C-TR-4B: Increase capacity on the 22 Fillmore bus route under the Maximum Commercial Scenario.** The project sponsors shall contribute funds for two additional vehicles to reduce the Proposed Project's contribution to the significant cumulative impact to not considerable. This shall be considered the Proposed Project's fair share toward mitigating this cumulative impact. If SFMTA adopts an alternate strategy to increase capacity along this route that does not involve purchasing and operating additional vehicles, the Proposed Project's fair share contribution shall remain the same, and may be used for one of those other strategies deemed desirable by SFMTA.	SUM
C-TR-5: The Proposed Project would not contribute considerably to a significant cumulative impact on the KT Third Ingleside Muni line.	LS	None required.	LS

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
C-TR-6: The Proposed Project would not contribute considerably to significant cumulative impacts at Muni Downtown screenlines.	LS	None required.	LS
C-TR-7: The Proposed Project would not contribute considerably to significant cumulative impacts on regional transit routes.	LS	None required.	LS
C-TR-8: The Proposed Project would not contribute considerably to significant cumulative pedestrian impacts.	LS	None required.	LS
C-TR-9: The Proposed Project would not contribute considerably to a significant cumulative bicycle impact.	LS	None required.	LS
C-TR-10: The Proposed Project would not contribute to a significant cumulative loading impact.	LS	None required.	LS

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
C-TR-11: The Proposed Project would not contribute considerably to a significant cumulative impact on emergency vehicle access.	LS	None required.	LS
Noise and Vibration			
NO-1: Construction of the Proposed Project would expose people to or generate noise levels in excess of standards in the Noise Ordinance (Article 29 of the San Francisco Police Code) or applicable standards of other agencies.	S	**Mitigation Measure M-NO-1: Construction Noise Control Plan.** Over the project's approximately 11-year construction duration, project contractors for all construction projects on the Illinois Parcels and 28-Acre Site will be subject to construction-related time-of-day and noise limits specified in Section 2907(a) of the Police Code, as outlined above. Therefore, prior to construction, a Construction Noise Control Plan shall be prepared by the project sponsors and submitted to the Department of Building Inspection. The construction noise control plan shall demonstrate compliance with the Noise Ordinance limits. Noise reduction strategies that could be incorporated into this plan to ensure compliance with ordinance limits may include, but are not limited to, the following: • Require the general contractor to ensure that equipment and trucks used for project construction utilize the best available noise control techniques (e.g., improved mufflers, equipment redesign, use of intake silencers, ducts, engine enclosures, and acoustically-attenuating shields or shrouds). • Require the general contractor to locate stationary noise sources (such as compressors) as far from adjacent or nearby sensitive receptors as possible, to muffle such noise sources, and to construct barriers around such sources and/or the construction site, which could reduce construction noise by as much as 5 dBA. To further reduce noise, the contractor shall locate stationary equipment in pit areas or excavated areas, to the maximum extent practicable.	LSM

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		• Require the general contractor to use impact tools (e.g., jack hammers, pavement breakers, and rock drills) that are hydraulically or electrically powered wherever possible to avoid noise associated with compressed air exhaust from pneumatically powered tools. Where use of pneumatic tools is unavoidable, an exhaust muffler on the compressed air exhaust shall be used, along with external noise jackets on the tools, which would reduce noise levels by as much as 10 dBA. • Include noise control requirements for construction equipment and tools, including concrete saws, in specifications provided to construction contractors to the maximum extent practicable. Such requirements could include, but are not limited to, erecting temporary plywood noise barriers around a construction site, particularly where a site adjoins noise-sensitive uses; utilizing noise control blankets on a building structure as the building is erected to reduce noise levels emanating from the construction site; performing all work in a manner that minimizes noise; using equipment with effective mufflers; undertaking the most noisy activities during times of least disturbance to surrounding residents and occupants; and selecting haul routes that avoid residential uses.[15] • Prior to the issuance of each building permit, along with the submission of construction documents, submit to the Planning Department and Department of Building Inspection or the Port, as appropriate, a plan to track and respond to complaints pertaining to construction noise. The plan shall include the following measures: (1) a procedure and phone numbers for notifying the Department of Building Inspection or the Port,	

[15] Based on FHWA documentation, the following reductions can be achieved: 3-dBA reduction for a noise barrier or other obstruction (like a dirt mound) that interrupts the line-of-sight between the noise source and the receptor; 8-dBA reduction if the noise source is completely enclosed or completely shielded with a solid barrier located close to the source; 5-dBA reduction if the enclosure and/or barrier have some gaps in it; 10-dBA reduction if the noise source is completely enclosed and completely shielded with a solid barrier located close to the source; 15-dBA reduction if a building stands between the noise source and receptor and completely shields the noise source; and 5-dBA reduction if noise source is enclosed or shielded with heavy vinyl noise curtain material (e.g., SoundSeal BBC-13-2 or equivalent).

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		the Department of Public Health, and the Police Department (during regular construction hours and off-hours); (2) a sign posted on-site describing permitted construction days and hours, noise complaint procedures, and a complaint hotline number that shall be answered at all times during construction; (3) designation of an on-site construction complaint and enforcement manager for the project; and (4) notification of neighboring residents and non-residential building managers within 300 feet of the project construction area at least 30 days in advance of extreme noise-generating activities (such as pile driving) about the estimated duration of the activity.	
NO-2: Construction of the Proposed Project would cause a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project.	S	**Mitigation Measure M-NO-2: Noise Control Measures During Pile Driving.** The Construction Noise Control Plan (required under Mitigation Measure M-NO-1) shall also outline a set of site-specific noise and vibration attenuation measures for each construction phase when pile driving is proposed to occur. These attenuation measures shall be included wherever impact equipment is proposed to be used on the Illinois Parcels and/or 28-Acre Site. As many of the following control strategies shall be included in the Noise Control Plan, as feasible: • Implement "quiet" pile-driving technology such as pre-drilling piles where feasible to reduce construction-related noise and vibration. • Use pile-driving equipment with state-of-the-art noise shielding and muffling devices. • Use pre-drilled or sonic or vibratory drivers, rather than impact drivers, wherever feasible (including slipways) and where vibration-induced liquefaction would not occur. • Schedule pile-driving activity for times of the day that minimize disturbance to residents as well as commercial uses located on-site and nearby. • Erect temporary plywood or similar solid noise barriers along the boundaries of each Proposed Project parcel as necessary to shield affected sensitive receptors. • Other equivalent technologies that emerge over time.	SUM

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
NO-3: Construction of the Proposed Project would expose people and structures to or generate excessive groundborne vibration levels.	S	**Mitigation Measure M-NO-3: Vibration Control Measures During Construction.** As part of the Construction Noise Control Plan required under Mitigation Measure M-NO-1, appropriate vibration controls (including pre-drilling pile holes and using smaller vibratory equipment) shall be specified to ensure that the vibration limit of 0.5 in/sec PPV can be met at adjacent or nearby existing structures and Proposed Project buildings located on the Illinois Parcels and/or 28-Acre Site, except as noted below: • Where pile driving and other construction activities involving the use of heavy equipment would occur in proximity to any contributing building to the Union Iron Works Historic District, the project sponsors shall undertake a monitoring program to minimize damage to adjacent historic buildings and to ensure that any such damage is documented and repaired. The monitoring program, which shall apply within 160 feet where pile driving would be used and within 25 feet of other heavy equipment operation, shall include the following components: o Prior to the start of any ground-disturbing activity, the project sponsors shall engage a historic architect or qualified historic preservation professional to undertake a pre-construction survey of historical resource(s) identified by the San Francisco Planning Department within 160 feet of planned construction to document and photograph the buildings' existing conditions. o Based on the construction and condition of the resource(s), a structural engineer or other qualified entity shall establish a maximum vibration level that shall not be exceeded at each building, based on existing conditions, character-defining features, soils conditions and anticipated construction practices in use at the time (a common standard is 0.2 inch per second, peak particle velocity). o To ensure that vibration levels do not exceed the established standard, a qualified acoustical/vibration consultant shall monitor vibration levels at each structure within 160 feet of planned	LSM

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		construction and shall prohibit vibratory construction activities that generate vibration levels in excess of the standard. Should vibration levels be observed in excess of the standard, construction shall be halted and alternative construction techniques put in practice. (For example, pre-drilled piles could be substituted for driven piles, if soil conditions allow; smaller, lighter equipment could possibly also be used in some cases.) The consultant shall conduct regular periodic inspections of each building within 160 feet of planned construction during ground-disturbing activity on the project site. Should damage to a building occur as a result of ground-disturbing activity on the site, the building(s) shall be remediated to its pre-construction condition at the conclusion of ground-disturbing activity on the site. • In areas with a "very high" or "high" susceptibility for vibration-induced liquefaction or differential settlement risks, the project's geotechnical engineer shall specify an appropriate vibration limit based on proposed construction activities and proximity to liquefaction susceptibility zones and modify construction practices to ensure that construction-related vibration does not cause liquefaction hazards at these homes.	
NO-4: Operation of the Proposed Project would result in a substantial permanent increase in ambient noise levels in the immediate project vicinity, or permanently	S	**Mitigation Measure M-NO-4a: Stationary Equipment Noise Controls.** Noise attenuation measures shall be incorporated into all stationary equipment (including HVAC equipment and emergency generators) installed on buildings constructed on the Illinois Parcels and 28-Acre Site as well as into the below-grade or enclosed wastewater pump station as necessary to meet noise limits specified in Section 2909 of the Police Code.[16] Interior noise limits shall be met under both existing and future noise conditions, accounting for foreseeable	LSM

[16] Under Section 2909 of the Police Code, stationary sources are not permitted to result in noise levels that exceed the existing ambient (L_{90}) noise level by more than 5 dBA on residential property, 8 dBA on commercial and industrial property, and 10 dBA on public property. Section 2909(d) states that no fixed noise source may cause the noise level measured inside any sleeping or living room in a dwelling unit on residential property to exceed 45 dBA between 10:00 p.m. and 7:00 a.m. or 55 dBA between 7:00 a.m. and 10:00 p.m. with windows open, except where building ventilation is achieved through mechanical systems that allow windows to remain closed.

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
expose persons to noise levels in excess of standards in the San Francisco General Plan and San Francisco Noise Ordinance		changes in noise conditions in the future (i.e., changes in on-site building configurations). Noise attenuation measures could include provision of sound enclosures/barriers, addition of roof parapets to block noise, increasing setback distances from sensitive receptors, provision of louvered vent openings, location of vent openings away from adjacent commercial uses, and restriction of generator testing to the daytime hours. **Mitigation Measure M-NO-4b: Design of Future Noise-Generating Uses near Residential Uses.** Future commercial/office and RALI uses shall be designed to minimize the potential for sleep disturbance at any future adjacent residential uses. Design approaches such as the following could be incorporated into future development plans to minimize the potential for noise conflicts of future uses on the project site: • Design of Future Noise-Generating Commercial/Office and RALI Uses. To reduce potential conflicts between sensitive receptors and new noise-generating commercial or RALI uses located adjacent to these receptors, exterior facilities such as loading areas/docks, trash enclosures, and surface parking lots shall be located on the sides of buildings facing away from existing or planned sensitive receptors (residences or passive open space). If this is not feasible, these types of facilities shall be enclosed or equipped with appropriate noise shielding. • Design of Future Above-Ground Parking Structure. If parking structures are constructed on Parcels C1 or C2, the sides of the parking structures facing adjacent or nearby existing or planned residential uses shall be designed to shield residential receptors from noise associated with parking cars.	

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
NO-5: Operation of the Proposed Project would cause substantial permanent increases in ambient noise levels along some roadway segments in the project site vicinity.	S	Implement **Mitigation Measure M-AQ-1g** and **Mitigation Measure M-NO-6a**, above and below.	SUM
NO-6: The Proposed Project's occupants would be substantially affected by existing and future noise levels on the site.	S	**Mitigation Measure M-NO-6: Design of Future Noise-Sensitive Uses** Prior to issuance of a building permit for vertical construction of specific residential building design on each parcel, a noise study shall be conducted by a qualified acoustician, who shall determine the need to incorporate noise attenuation measures into the building design in order to meet Title 24's interior noise limit for residential uses as well as the City's (Article 29, Section 2909(d)) 45-dBA (L_{dn}) interior noise limit for residential uses. This evaluation shall account for noise shielding by buildings existing at the time of the proposal, potential increases in ambient noise levels resulting from the removal of buildings that are planned to be demolished, all planned commercial or open space uses in adjacent areas, any known variations in project build-out that have or will occur (building heights, location, and phasing), any changes in activities adjacent to or near the Illinois Parcels or 28-Acre Site (given the Proposed Project's long build-out period), any new shielding benefits provided by surrounding buildings that exist at the time of development, future cumulative traffic noise increases on adjacent roadways, existing and planned stationary sources (i.e., emergency generators, HVAC, etc.), and future noise increases from all known cumulative projects located with direct line-of-sight to the project building. To minimize the potential for sleep disturbance effects from tonal noise or nighttime noise events associated with nearby industrial uses, predicted noise levels at each project building shall account for 24/7 operation of the BAE Systems Ship Repair facility, 24/7 transformer noise at Potrero Substation (if it	LSM

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		remains an open air facility), and industrial activities at the AIC, to the extent such use(s) are in operation at the time the analysis is conducted. Noise reduction strategies such as the following could be incorporated into the project design as necessary to meet Title 24 interior limit and minimize the potential for sleep disturbance from adjacent industrial uses: • Orient bedrooms away from major noise sources (i.e., major streets, open space/recreation areas where special events would occur, and existing adjacent industrial uses, including AIC, Potrero Substation, and the BAE site) and/or provide additional enhanced noise insulation features (higher STC ratings) or mechanical ventilation to minimize the effects of maximum instantaneous noise levels generated by these uses even though there is no code requirement to reduce L_{max} noise levels. Such measures shall be implemented on Parcels D and E1 (both scenarios), Building 2 (Maximum Residential Scenario only), Parcels PKN (both scenarios), PKS (both scenarios), and HDY (Maximum Residential Scenario only); • Utilize enhanced exterior wall and roof-ceiling assemblies (with higher STC ratings), including increased insulation; • Utilize windows with higher STC / Outdoor/Indoor Transmission Class (OITC) ratings; • Employ architectural sound barriers as part of courtyards or building open space to maximize building shielding effects, and locate living spaces/bedrooms toward courtyards wherever possible; and • Locate interior hallways (accessing residential units) adjacent to noisy streets or existing/planned industrial or commercial development.	

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
NO-7: The Proposed Project's special events would result in substantial periodic, temporary noise increases	S	**Mitigation Measure M-NO-7: Noise Control Plan for Special Outdoor Amplified Sound.** The project sponsor shall develop and implement a Noise Control Plan for operations at the proposed entertainment venues to reduce the potential for noise impacts from public address and/or amplified music. This Noise Control Plan shall contain the following elements: • The project sponsor shall comply with noise controls and restrictions in applicable entertainment permit requirements for outdoor concerts. • Speaker systems shall be directed away from the nearest sensitive receptors to the degree feasible. • Outdoor speaker systems shall be operated consistent with the restrictions of Section 2909 of the San Francisco Police Code, and conform to a performance standard of 8 dBA and dBC over existing ambient L90 noise levels at the nearest residential use.	LSM
NO-8: Operation of the Proposed Project would not expose people and structures to or generate excessive groundborne vibration or noise levels.	LS	**None required.**	LS

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
C-NO-1: Construction of the Proposed Project combined with cumulative construction noise in the project area would not cause a substantial temporary or periodic increase in ambient noise levels in the project vicinity during construction.	LS	**None required.**	LS
C-NO-2: Operation of the Proposed Project, in combination with other cumulative development would cause a substantial permanent increase in ambient noise levels in the project vicinity.	S	Implement **Mitigation Measure M-AQ-1g**, below.	SUM
Air Quality			
AQ-1: During construction, the Proposed Project would generate fugitive dust and criteria air pollutants, which would violate an air quality standard, contribute substantially to an existing or projected air quality violation, and result in a cumulatively	S	**Mitigation Measure M-AQ-1a: Construction Emissions Minimization** The following mitigation measure is required during construction of Phases 3, 4, and 5, or after build-out of 1.3 million gross square feet of development, whichever comes first: A. *Construction Emissions Minimization Plan.* Prior to issuance of a site permit, the project sponsors shall submit a Construction Emissions Minimization Plan (Plan) to the Environmental Review Officer (ERO) for review and approval by an Environmental Planning Air Quality Specialist. The Plan shall detail project compliance with the following requirements:	SUM

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		How to use the table: If the requirements of (A)(2) cannot be met, then the project sponsors would need to meet Compliance Alternative 1. Should the project sponsors not be able to supply off-road equipment meeting Compliance Alternative 1, then Compliance Alternative 2 would need to be met. [1] CARB, Currently Verified Diesel Emission Control Strategies (VDECS). Available online at http://www.arb.ca.gov/diesel/verdev/vt/cvt.htm. Accessed January 14, 2016.	
		i. With respect to Tier 4 equipment, "commercially available" shall mean the availability taking into consideration factors such as: (i) critical path timing of construction; and (ii) geographic proximity of equipment to the project site. ii. With respect to renewable diesel, "commercially available" shall mean the availability taking into consideration factors such as: (i) critical path timing of construction; (ii) geographic proximity of fuel source to the project site; and (iii) cost of renewable diesel is within 10 percent of Ultra Low Sulfur Diesel #2 market price. iii. The project sponsors shall maintain records concerning its efforts to comply with this requirement. Should the project sponsor determine either that an off-road vehicle that meets Tier 4 emissions standards or that renewable diesel are not commercially available, the project sponsor shall submit documentation to the satisfaction of the ERO and, for the former condition, shall identify the next cleanest piece of equipment that would be use, in compliance with Table M-AQ-1-1. 3. The project sponsors shall ensure that future developers or their contractors require the idling time for off-road and on-road equipment be limited to no more than 2 minutes, except as provided in exceptions to the applicable State regulations regarding idling for	

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		off-road and on-road equipment. Legible and visible signs shall be posted in multiple languages (English, Spanish, and Chinese) in designated queuing areas and at the construction site to remind operators of the 2-minute idling limit. 4. The project sponsors shall require that each construction contractor mandate that construction operators properly maintain and tune equipment in accordance with manufacturer specifications. 5. The Plan shall include best available estimates of the construction timeline by phase with a description of each piece of off-road equipment required for every construction phase and shall be updated pursuant to the reporting requirements in Section B below. Reporting requirements for off-road equipment descriptions and information shall include as much detail as is available, but are not limited to: equipment type, equipment manufacturer, equipment identification number, engine model year, engine certification (Tier rating), horsepower, engine serial number, and expected fuel usage and hours of operation. For Verified Diesel Emission Control Strategies (VDECS) installed, descriptions and information shall include technology type, serial number, make, model, manufacturer, CARB verification number level, and installation date and hour meter reading on installation date. The Plan shall also indicate whether renewable diesel will be used to power the equipment. The Plan shall also include anticipated fuel usage and hours of operation so that emissions can be estimated. 6. The project sponsors and their construction contractors shall keep the Plan available for public review on site during working hours. Each construction contractor shall post at the perimeter of the project site a legible and visible sign summarizing the requirements of the Plan. The sign shall also state that the public may ask to inspect the Plan at any time during working hours, and shall explain how to request inspection of the Plan. Signs shall be posted on all sides of the construction site that face a public right-of-way. The	

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		project sponsors shall provide copies of the Plan to members of the public as requested. B. *Reporting.* Quarterly reports shall be submitted to the ERO indicating the construction activities undertaken and information about the off-road equipment used, including the information required in Section A(5). In addition, reporting shall include the approximate amount of renewable diesel fuel used. Within 6 months of the completion of all project construction activities, the project sponsors shall submit to the ERO a final report summarizing construction activities. The final report shall indicate the start and end dates and duration of each construction phase. The final report shall include detailed information required in Section A(5). In addition, reporting shall include the actual amount of renewable diesel fuel used. C. *Certification Statement and On-site Requirements.* Prior to the commencement of construction activities, the project sponsors shall certify through submission of city-standardized forms (1) compliance with the Plan, and (2) all applicable requirements of the Plan have been incorporated into contract specifications. **Mitigation Measure M-AQ-1b: Diesel Backup Generator Specifications** To reduce NOx associated with operation of the Maximum Commercial or Maximum Residential Scenarios, the project sponsors shall implement the following measures. A. All new diesel backup generators shall: 1. have engines that meet or exceed CARB Tier 4 off-road emission standards which have the lowest NOx emissions of commercially available generators; and	

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		2. be fueled with renewable diesel, if commercially available, which has been demonstrated to reduce NOx emissions by approximately 10 percent. B. All new diesel backup generators shall have an annual maintenance testing limit of 50 hours, subject to any further restrictions as may be imposed by the BAAQMD in its permitting process. C. For each new diesel backup generator permit submitted to BAAQMD for the project, anticipated location, and engine specifications shall be submitted to the San Francisco Planning Department for review and approval prior to issuance of a permit for the generator from the San Francisco DBI or the Port. Once operational, all diesel backup generators shall be maintained in good working order for the life of the equipment and any future replacement of the diesel backup generators shall be required to be consistent with these emissions specifications. The operator of the facility at which the generator is located shall maintain records of the testing schedule for each diesel backup generator for the life of that diesel backup generator and provide this information for review to the Planning Department within 3 months of requesting such information. **Mitigation Measure M-AQ-1c: Use Low and Super-compliant VOC Architectural Coatings in Maintaining Buildings through** Covenants Conditions and Restrictions (**CC&Rs) and Ground Lease** The Project sponsors shall require all developed parcels to include within their CC&R's and/or ground leases requirements for all future interior spaces to be repainted only with "Super-Compliant" Architectural Coatings (http://www.aqmd.gov/home/regulations/compliance/architectural-coatings/super-compliant-coatings). "Low-VOC" refers to paints that meet the more stringent regulatory limits in South Coast AQMD Rule 1113; however, many manufacturers have reformulated to levels well below these limits. These are referred to as "Super-Compliant" Architectural Coatings.	

Table S.1 Continued

	Mitigation Measure M-AQ-1d: Promote use of Green Consumer Products The project sponsors shall provide education for residential and commercial tenants concerning green consumer products. Prior to receipt of any certificate of final occupancy and every five years thereafter, the project sponsors shall work with the San Francisco Department of Environment (SF Environment) to develop electronic correspondence to be distributed by email annually to residential and/or commercial tenants of each building on the project site that encourages the purchase of consumer products that generate lower than typical VOC emissions. The correspondence shall encourage environmentally preferable purchasing and shall include contact information and links to SF Approved. The website may also be used as an informational resource by businesses and residents. **Mitigation Measure M-AQ-1e: Electrification of Loading Docks** The project sponsors shall ensure that loading docks for retail, light industrial or warehouse uses that will receive deliveries from refrigerated transport trucks incorporate electrification hook-ups for transportation refrigeration units to avoid emissions generated by idling refrigerated transport trucks. **Mitigation Measure M-AQ-1f: Transportation Demand Management.** The project sponsors shall prepare and implement a Transportation Demand Management (TDM) Plan with a goal of reducing estimated one-way vehicle trips by 20 percent compared to the total number of one-way vehicle trips identified in the project's Transportation Impact Study at project build-out. To ensure that this reduction goal could be reasonably achieved, the TDM Plan will have a monitoring goal of reducing by 20 percent the one-way vehicle trips calculated for each building that has received a Certificate of Occupancy and is at least 75% occupied compared to the one-way vehicle trips anticipated for that building based on anticipated development on that parcel, using the trip generation rates contained within the project's Transportation Impact Study. There shall be a Transportation Management Association that would be responsible for the administration, monitoring, and adjustment of the TDM Plan. The project sponsor is responsible for identifying the components of the TDM Plan that could reasonably be expected to achieve the reduction goal for each new building associated with the project, and for making good faith efforts to implement them. The TDM Plan may include, but is not limited to, the types of measures summarized below for explanatory example purposes. Actual TDM measures	

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		selected should include those from the TDM Program Standards, which describe the scope and applicability of candidate measures in detail and include: • Active Transportation: Provision of streetscape improvements to encourage walking, secure bicycle parking, shower and locker facilities for cyclists, subsidized bike share memberships for project occupants, bicycle repair and maintenance services, and other bicycle-related services; • Car-Share: Provision of car-share parking spaces and subsidized memberships for project occupants; • Delivery: Provision of amenities and services to support delivery of goods to project occupants; • Family-Oriented Measures: Provision of on-site childcare and other amenities to support the use of sustainable transportation modes by families; • High-Occupancy Vehicles: Provision of carpooling/vanpooling incentives and shuttle bus service; • Information and Communications: Provision of multimodal wayfinding signage, transportation information displays, and tailored transportation marketing services; • Land Use: Provision of on-site affordable housing and healthy food retail services in underserved areas; • Parking: Provision of unbundled parking, short term daily parking provision, parking cash out offers, and reduced off-street parking supply. The TDM Plan shall include specific descriptions of each measure, including the degree of implementation (e.g., for how long will it be in place, how many tenants or visitors will it benefit, on which locations within the site will it be placed, etc.), and the population that each measure is intended to serve (e.g. residential tenants, retail visitors, employees of tenants, visitors, etc.). It shall also include a	

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		commitment to monitoring of person and vehicle trips traveling to and from the project site to determine the TDM Plan's effectiveness, as outlined below. The TDM Plan shall be submitted to the City to ensure that components of the TDM Plan intended to meet the reduction target are shown on the plans and/or ready to be implemented upon the issuance of each certificate of occupancy. *TDM Plan Monitoring and Reporting*: The Transportation Management Association, through an on-site Transportation Coordinator, shall collect data and make monitoring reports available for review and approval by the Planning Department staff. • Timing: Monitoring data shall be collected and reports shall be submitted to Planning Department staff every year (referred to as "reporting periods"), until five consecutive reporting periods display the project has met the reduction goal, at which point monitoring data shall be submitted to Planning Department staff once every three years. The first monitoring report is required 18 months after issuance of the First Certificate of Occupancy for buildings that include off-street parking or the establishment of surface parking lots or garages that bring the project's total number of off-street parking spaces to greater than or equal to 500. Each trip count and survey (see below for description) shall be completed within 30 days following the end of the applicable reporting period. Each monitoring report shall be completed within 90 days following the applicable reporting period. The timing shall be modified such that a new monitoring report shall be required 12 months after adjustments are made to the TDM Plan in order to meet the reduction goal, as may be required in the "TDM Plan Adjustments" heading below. In addition, the timing may be modified by the Planning Department as needed to consolidate this requirement with other monitoring and/or reporting requirements for the project. • Components: The monitoring report, including trip counts and surveys, shall include the following components OR comparable alternative	

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		methodology and components as approved or provided by Planning Department staff: o Trip Count and Intercept Survey: Trip count and intercept survey of persons and vehicles arriving and leaving the project site for no less than two days of the reporting period between 6:00 a.m. and 8:00 p.m. One day shall be a Tuesday, Wednesday, or Thursday during one week without federally recognized holidays, and another day shall be a Tuesday, Wednesday, or Thursday during another week without federally recognized holidays. The trip count and intercept survey shall be prepared by a qualified transportation or qualified survey consultant and the methodology shall be approved by the Planning Department prior to conducting the components of the trip count and intercept survey. It is anticipated that the Planning Department will have a standard trip count and intercept survey methodology developed and available to project sponsors at the time of data collection. o Travel Demand Information: The above trip count and survey information shall be able to provide travel demand analysis characteristics (work and non-work trip counts, origins and destinations of trips to/from the project site, and modal split information) as outlined in the Planning Department's *Transportation Impact Analysis Guidelines for Environmental Review*, October 2002, or subsequent updates in effect at the time of the survey. o Documentation of Plan Implementation: The TDM Coordinator shall work in conjunction with the Planning Department to develop a survey (online or paper) that can be reasonably completed by the TDM Coordinator and/or TMA staff to document the implementation of TDM program elements and other basic information during the reporting period. This survey shall be included in the monitoring report submitted to Planning Department staff.	

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		○ Assistance and Confidentiality: Planning Department staff will assist the TDM Coordinator on questions regarding the components of the monitoring report and shall ensure that the identity of individual survey responders is protected. *TDM Plan Adjustments.* The TDM Plan shall be adjusted based on the monitoring results if three consecutive reporting periods demonstrate that measures within the TDM Plan are not achieving the reduction goal. The TDM Plan adjustments shall be made in consultation with Planning Department staff and may require refinements to existing measures (e.g., change to subsidies, increased bicycle parking), inclusion of new measures (e.g., a new technology), or removal of existing measures (e.g., measures shown to be ineffective or induce vehicle trips). If three consecutive reporting periods' monitoring results demonstrate that measures within the TDM Plan are not achieving the reduction goal, the TDM Plan adjustments shall occur within 270 days following the last consecutive reporting period. The TDM Plan adjustments shall occur until three consecutive reporting periods' monitoring results demonstrate that the reduction goal is achieved. If the TDM Plan does not achieve the reduction goal then the City shall impose additional measures to reduce vehicle trips as prescribed under the development agreement, which may include restriction of additional off-street parking spaces beyond those previously established on the site, capital or operational improvements intended to reduce vehicle trips from the project, or other measures that support sustainable trip making, until three consecutive reporting periods' monitoring results demonstrate that the reduction goal is achieved. **Mitigation Measure M-AQ-1g: Additional Mobile Source Control Measures** The following Mobile Source Control Measures from the BAAQMD's 2010 Clean Air Plan shall be implemented: • Promote use of clean fuel-efficient vehicles through preferential (designated and proximate to entry) parking and/or installation of charging stations beyond the level required by the City's Green Building code, from 8 to 20 percent.	

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		• Promote zero-emission vehicles by requesting that any car share program operator include electric vehicles within its car share program to reduce the need to have a vehicle or second vehicle as a part of the TDM program that would be required of all new developments. **Mitigation Measure M-AQ-1h: Offset of Operational Emissions** Prior to issuance of the final certificate of occupancy for the final building associated with Phase 3, or after build out of 1.3 million square feet of development, whichever comes first, the project sponsors, with the oversight of the ERO, shall either: **(1) Directly fund or implement a specific offset project within San Francisco** to achieve reductions of 25 tons per year of ozone precursors and 1 ton of PM_{10}. This offset is intended to offset the estimated annual tonnage of operational ozone precursor and PM_{10} emissions under the buildout scenario realized at the time of completion of Phase 3. To qualify under this mitigation measure, the specific emissions offset project must result in emission reductions within the SFBAAB that would not otherwise be achieved through compliance with existing regulatory requirements. A preferred offset project would be one implemented locally within the City and County of San Francisco. Prior to implementation of the offset project, the project sponsors must obtain the ERO's approval of the proposed offset project by providing documentation of the estimated amount of emissions of ROG, NOx, and PM_{10} to be reduced (tons per year) within the SFBAAB from the emissions reduction project(s). The project sponsors shall notify the ERO within 6 months of completion of the offset project for verification; or **(2) Pay a one-time mitigation offset fee** to the BAAQMD's Strategic Incentives Division in an amount no less than $18,030 per weighted ton of ozone precursors and PM_{10} per year above the significance threshold, calculated as the difference between total annual emissions at build out under mitigated conditions and the significance threshold in the EIR air	

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		quality analysis, which is 25 tons per year of ozone precursors and 1 ton of PM_{10}, plus a 5 percent administrative fee, to fund one or more emissions reduction projects within the SFBAAB. This one-time fee is intended to fund emissions reduction projects to offset the estimated annual tonnage of operational ozone precursor and PM_{10} emissions under the buildout scenario realized at the time of completion of Phase 3 or after completion of 1.3 million sf of development, whichever comes first. Documentation of payment shall be provided to the ERO. Acceptance of this fee by the BAAQMD shall serve as an acknowledgment and commitment by the BAAQMD to implement one or more emissions reduction project(s) within 1 year of receipt of the mitigation fee to achieve the emission reduction objectives specified above, and provide documentation to the ERO and to the project sponsors describing the project(s) funded by the mitigation fee, including the amount of emissions of ROG, NOx, and PM_{10} reduced (tons per year) within the SFBAAB from the emissions reduction project(s). If there is any remaining unspent portion of the mitigation offset fee following implementation of the emission reduction project(s), the project sponsors shall be entitled to a refund in that amount from the BAAQMD. To qualify under this mitigation measure, the specific emissions retrofit project must result in emission reductions within the SFBAAB that would not otherwise be achieved through compliance with existing regulatory requirements.	

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
AQ-2: At project build-out, the Proposed Project would result in emissions of criteria air pollutants at levels that would violate an air quality standard, contribute to an existing or projected air quality violation, and result in a cumulatively considerable net increase in criteria air pollutants.	S	Implement **Mitigation Measures M-AQ-1b through M-AQ-1h**, above.	SUM
AQ-3: Construction and operation of the Proposed Project would generate toxic air contaminants, including DPM, which would expose sensitive receptors to substantial pollutant concentrations.	S	Implement **Mitigation Measure M-AQ-1a: Construction Emissions Minimization**, above.	LSM
AQ-4: The Maximum Residential or Maximum Commercial Scenarios would conflict with implementation of the Bay Area 2010 Clean Air Plan.	S	Implement **Mitigation Measure M-AQ-1f and Mitigation Measure M-AQ-1g**, above.	LSM

Source: SWCA.

Requirements

A wind impact analysis shall be required prior to building permit issuance for any proposed new building that is located within the project site and meets the conditions described above. All feasible means (e.g., changes in design, relocating or reorienting certain building(s), sculpting to include podiums and roof terraces, adding architectural canopies or screens, or street furniture) to eliminate hazardous winds, if predicted, shall be implemented. After such design changes

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		and features have been considered, the additional effectiveness of landscaping may also be considered. 1. Screening-level analysis. A qualified wind consultant approved by the Planning Department's Environmental Review Officer (ERO) shall review the proposed building design and conduct a "desktop review" in order to provide a qualitative result determining whether there could be a wind hazard. The screening-level analysis shall have the following steps: For each new building proposed that meets the criteria above, a qualified wind consultant shall review and compare the exposure, massing, and orientation of the proposed building(s) on the subject parcel to the building(s) on the same parcel in the representative massing models of the Proposed Project tested in the wind tunnel as part of this EIR and in any subsequent wind analysis testing required by this mitigation measure. The wind consultant shall identify and compare the potential impacts of the proposed building(s) to those identified in this EIR, subsequent wind testing that may have occurred under this mitigation measure, and to the City's wind hazard criterion. The wind consultant's analysis and evaluation shall consider the proposed building(s) in the context of the "Current Project Baseline," which, at any given time during construction of the Proposed Project, shall be defined as any existing buildings at the site, the as-built designs of all previously-completed structures and the then-current designs of approved but yet unbuilt structures that would be completed by the time of occupancy of the subject building. (a) If the qualified wind consultant concludes that the building design(s) could not create a new wind hazard and could not contribute to a wind hazard identified by prior wind tunnel testing for the EIR and in subsequent wind analysis required by this mitigation measure, no further review would be required. If there could be a new wind hazard, then a quantitative assessment shall be conducted using wind tunnel testing or an equivalent quantitative analysis that produces comparable results to the analysis methodology used in this EIR.	

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		(b) If the qualified wind consultant concludes that the building design(s) could create a new wind hazard or could contribute to a wind hazard identified by prior wind tunnel testing conducted for this EIR and in subsequent wind analysis required by this mitigation measure, but in the consultant's professional judgment the building(s) can be modified to reduce such impact to a less-than-significant level, the consultant shall notify the ERO and the building applicant. The consultant's professional judgment may be informed by the use of "desktop" analytical tools, such as computer tools relying on results of prior wind tunnel testing for the Proposed Project and other projects (i.e., "desktop" analysis does not include new wind tunnel testing). The analysis shall include consideration of wind location, duration, and speed of wind. The building applicant may then propose changes or supplements to the design of the proposed building(s) to achieve this result. These changes or supplements may include, but are not limited to, changes in design, building orientation, sculpting to include podiums and roof terraces, and/or the addition of architectural canopies or screens, or street furniture. The effectiveness of landscaping may also be considered. The wind consultant shall then reevaluate the building design(s) with specified changes or supplements. If the wind consultant demonstrates to the satisfaction of the ERO that the modified design and landscaping for the building(s) could not create a new wind hazard or contribute to a wind hazard identified in prior wind tunnel testing conducted for this EIR and in subsequent wind analysis required by this mitigation measure, no further review would be required. (c) If the consultant is unable to demonstrate to the satisfaction of the ERO that no increase in wind hazards would occur, wind tunnel testing or an equivalent method of quantitative evaluation producing results that can be compared to those used in the EIR and in any subsequent wind analysis testing required by this mitigation measure is required. The building(s) shall be wind tunnel tested in the	

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		context of a model that represents the Current Project Baseline, as described in Item 1, above. The testing shall include all the test points in the vicinity of a proposed building or group of buildings that were tested in this EIR, as well as all additional points deemed appropriate by the consultant to determine the wind performance for the building(s). Testing shall occur in places identified as important, e.g., building entrances, sidewalks, etc., and there may need to be additional test point locations considered. At the direction and approval of the Planning Department, the "vicinity" shall be determined by the wind consultant, as appropriate for the circumstances, e.g., a starting concept for "vicinity" could be approximately 350 feet around the perimeter of the subject parcel(s), subject to the wind consultant's reducing or increasing this radial distance. The wind tunnel testing shall test the proposed building design(s), as well as the Current Project Baseline, in order to clearly identify those differences that would be due to the proposed new building(s). In the event the wind tunnel testing determines that design of the building(s) would increase the hours of wind hazard or extent of area subject to hazardous winds beyond those identified in prior wind testing conducted for this EIR and in subsequent wind tunnel analysis required by this mitigation measure, the wind consultant shall notify the ERO and the building applicant. The building applicant may then propose changes or supplements to the design of the proposed building(s) to eliminate wind hazards. These changes or supplements may include, but are not limited to, changes in design, building orientation, sculpting building(s) to include podiums and roof terraces, adding architectural canopies or screens, or street furniture. All feasible means (changes in design, relocating or reorienting certain building(s), sculpting to include podiums and roof terraces, the addition of architectural canopies or screens, or street furniture) to eliminate wind hazards, if predicted, shall be implemented to the extent necessary to mitigate the impact. After such design changes and features have been considered, the	

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		additional effectiveness of landscaping at the size it is proposed to be installed may also be considered. The wind consultant shall then reevaluate the building design(s) with specified changes or supplements. If the wind consultant demonstrates to the satisfaction of the ERO that the modified design would not create a new wind hazard or contribute to a wind hazard identified in prior wind tunnel testing conducted for this EIR and in subsequent wind analysis required by this mitigation measure, no further review would be required. If the proposed building(s) would result in a wind hazard exceedance, and the only way to eliminate the hazard is to redesign a proposed building, then the building shall be redesigned.	
WS-2: For public open space built on rooftops, the Proposed Project would alter wind in a manner that affects those public open spaces.	S	**Mitigation Measure M-WS-2: Wind Reduction for Rooftop Winds** If the rooftop of building(s) is proposed as public open space and/or a passive or active public recreational area prior to issuance of a building permit for the subject building(s), a qualified wind consultant shall prepare a wind impact and mitigation analysis in the context of the Current Project Baseline regarding the proposed architectural design. All feasible means (such as changing the proposed building mass or design; raising the height of the parapets to at least 8 feet, using a porous material where such material would be effective in reducing wind speeds; using localized wind screens, canopies, trellises, and/or landscaping around seating areas) to eliminate wind hazards shall be implemented as necessary. A significant wind impact would be an increase in the number of hours that the wind hazard criterion is exceeded or an increase in the area subjected to winds exceeding the hazard criterion as compared to existing conditions at the height of the proposed rooftop. The wind consultant shall demonstrate to the satisfaction of the ERO that the building design would not create a new wind hazard or contribute to a wind hazard identified in prior wind testing conducted for this EIR.	LSM

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
WS-3: At full build-out, the Proposed Project would not alter wind in a manner that substantially affects ground-level public areas.	LS	**Improvement Measure I-WS-3a: Wind Reduction for Public Open Spaces and Pedestrian and Bicycle Areas** For each development phase, a qualified wind consultant should prepare a wind impact and mitigation analysis regarding the proposed design of public open spaces and the surrounding proposed buildings. Feasible means should be considered to improve wind comfort conditions for each public open space, particularly for any public seating areas. These feasible means include horizontal and vertical, partially-porous wind screens (including canopies, trellises, umbrellas, and walls), street furniture, landscaping, and trees. Specifics for particular public open spaces are set forth in Improvement Measures I-WS-3b to I-WS-3f. Any proposed wind-related improvement measure should be consistent with the design standards and guidelines outlined in the *Pier 70 SUD Design for Development*. **Improvement Measure I-WS-3b: Wind Reduction for Waterfront Promenade and Waterfront Terrace** The Waterfront Promenade and Waterfront Terrace would be subject to winds exceeding the pedestrian wind comfort criteria. A qualified wind consultant should prepare written recommendations of feasible means to improve wind comfort conditions in this open space, emphasizing vertical elements, such as wind screens and landscaping. Where necessary and appropriate, wind screens should be strategically placed directly around seating areas. For maximum benefit, wind screens should be at least 6 feet high and made of approximately 20 to 30 percent porous material. Design of any wind screen or landscaping shall be compatible with the Historic District. **Improvement Measure I-WS-3c: Wind Reduction for Slipways Commons** The central and western portions of Slipways Commons would be subject to winds exceeding the pedestrian wind comfort criteria. Street trees should be considered along Maryland Street, particularly on the east side of Maryland Street between Buildings E1 and E2. Vertical elements such as wind screens would help	LS

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		for areas where street trees are not feasible. Where necessary and appropriate, wind screens should be strategically placed to the west of any seating areas. For maximum benefit, wind screens should be at least 6 feet high and made of approximately 20 to 30 percent porous material. Design of any wind screen or landscaping shall be compatible with the Historic District. **Improvement Measure I-WS-3d: Wind Reduction for Building 12 Market Plaza and Market Square** Building 12 Market Plaza and Market Square would be subject to winds exceeding the pedestrian wind comfort criteria. For reducing wind speeds in the public courtyard between Buildings 2 and 12, the inner south and west façades of Building D-1 could be stepped by at least 12 feet to direct downwashing winds above pedestrian level. Alternatively, overhead protection should be used, such as a 12-foot-deep canopy along the inside south and west façades of Building D-1, or localized trellises or umbrellas over seating areas. For reducing wind speeds on the eastern and southern sides of Building 12, street trees should be considered, along Maryland and 22nd streets. Smaller underplantings should be combined with street trees to reduce winds at pedestrian level. Design of any wind screen or landscaping shall be compatible with the Historic District. **Improvement Measure I-WS-3e: Wind Reduction for Irish Hill Playground** The Irish Hill Playground would be subject to winds exceeding the pedestrian wind comfort criteria. For maximum benefit, wind screens should be at least 6 feet high and made of approximately 20 to 30 percent porous material. Design of any wind screen or landscaping shall be compatible with the Historic District. **Improvement Measure I-WS-3f: Wind Reduction for 20th Street Plaza** The 20th Street Plaza would be subject to winds exceeding the pedestrian wind comfort criteria. A qualified wind consultant should prepare written recommendations of feasible means to improve wind comfort conditions in this open space, emphasizing hardscape elements, such as wind screens, canopies, and umbrellas. Where necessary and appropriate, wind screens should be strategically placed to the northwest of any seating area. For maximum benefit, wind screens should be at least 6 feet high and made of approximately 20 to 30 percent porous	

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		material. If there would be seating areas directly adjacent to the north façade of the PKN Building, localized canopies or umbrellas should be used. Design of any wind screen or landscaping shall be compatible with the Historic District.	
C-WS-1: The Proposed Project at full build-out, when combined with other cumulative projects, would not alter wind in a manner that substantially affects public areas within the vicinity of the project site.	LS	None required.	LS
WS-4: The Proposed Project would not create new shadow in a manner that substantially affects outdoor recreation facilities or other public areas.	LS	None required.	LS
C-WS-2: The Proposed Project, in combination with past, present, and reasonably foreseeable future projects in the project vicinity, would not create new shadow in a manner that substantially affects outdoor recreation facilities or other public areas. The Proposed Project would not make a cumulatively considerable	LS	None required.	LS

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
contribution to a significant cumulative shadow impact.			
Recreation			
RE-1: The Proposed Project would increase the use of existing neighborhood and regional parks or other recreational facilities, but not to such an extent that substantial physical deterioration of existing facilities would occur or be accelerated, or such that the construction of new facilities would be required.	LS	None required.	LS
RE-2: Construction of the parks and recreational facilities proposed as part of the Proposed Project would not result in substantial adverse physical environmental impacts beyond those analyzed and disclosed in this EIR.	LS	None required.	LS

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
C-RE-1: The Proposed Project, in combination with past, present, and reasonably foreseeable future development, would not result in a cumulatively considerable contribution to significant cumulative impacts on recreation.	LS	None required.	LS
Utilities and Service Systems			
UT-1: The City's water service provider would have sufficient water supply available to serve the Proposed Project from existing entitlements and resources, and would not require new or expanded water supply resources or entitlements.	LS	None required.	LS
UT-2: The Proposed Project would not require or result in the construction of new water treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects.	LS	None required.	LS

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
UT-3: The Proposed Project would not exceed wastewater treatment requirements of the Southeast Water Pollution Control Plant.	LS	None required.	LS
UT-4: The Proposed Project would not require or result in the construction of new wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects. Nor would the project result in a determination by the SFPUC that it has inadequate capacity to serve the project's projected demand in addition to its existing commitments.	LS	None required.	LS

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
UT-5: The Proposed Project would not require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects.	LS	None required.	LS
UT-6: The Proposed Project would be served by a landfill with sufficient capacity to accommodate the Proposed Project's solid waste disposal needs.	LS	None required.	LS
UT-7: The Proposed Project would not fail to comply with Federal, State, and local statutes and regulations related to solid waste.	NI	None required.	NI

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
C-UT-1: The Proposed Project, in combination with other past, present, and reasonably foreseeable future projects, would not result in significant adverse cumulative utilities and service systems impacts.	LS	None required.	LS
Public Services			
PS-1: The Proposed Project would not result in the need for new or physically altered facilities in order to maintain acceptable service ratios, response times, or other performance objectives for police protection.	LS	None required.	LS
PS-2: The Proposed Project would not result in the need for new or physically altered facilities in order to maintain acceptable response times for fire protection and emergency medical services.	LS	None required.	LS

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
PS-3: The increase in students associated with implementation of the Proposed Project would not require new or expanded school facilities, the construction of which could result in substantial adverse impacts.	LS	None required.	LS
PS-4: The Proposed Project would not result in an increase in demand for library services that could not be met by existing library facilities.	LS	None required.	LS
C-PS-1: The Proposed Project, in combination with other past, present, and reasonably foreseeable future projects, would not result in a cumulatively considerable contribution to significant adverse cumulative impacts that would result in a need for construction of new or physically altered facilities in order to maintain acceptable service ratios, response	LS	None required.	LS

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
times, or other performance objectives for any public services, including police protection, fire protection and emergency services, schools, and libraries.			
Biological Resources			
BI-1: Construction and operation of the Proposed Project would have a substantial adverse effect either directly or through habitat modifications on migratory birds and/or on bird species identified as special status in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service.	S	**Mitigation Measure M-BI-1: Worker Environmental Awareness Program Training** Project-specific Worker Environmental Awareness Program (WEAP) training shall be developed and implemented by a qualified biologist and attended by all project personnel performing demolition or ground-disturbing work prior to beginning demolition or ground-disturbing work on site. The WEAP training shall generally include, but not be limited to, education about the following: a. Applicable State and Federal laws, environmental regulations, project permit conditions, and penalties for non-compliance. b. Special-status plant and animal species with the potential to be encountered on or in the vicinity of the project site during construction. c. Avoidance measures and a protocol for encountering special-status species including a communication chain. d. Preconstruction surveys and biological monitoring requirements associated with each phase of work and at specific locations within the project site (e.g., shoreline work) as biological resources and protection measures will vary depending on where work is occurring within the site, time of year, and construction activity. e. Known sensitive resource areas in the project vicinity that are to be avoided and/or protected as well as approved project work areas, access roads, and staging areas.	LSM

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		f. Best management practices (BMPs) (e.g., straw wattles or spill kits) and their location around the project site for erosion control and species exclusion, in addition to general housekeeping requirements.	
BI-2: Construction of the Proposed Project would have a substantial adverse effect either directly or through habitat modifications on bats identified as special-status in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or the United States Fish and Wildlife Service.	S	**Mitigation Measure M-BI-2: Avoidance and Minimization Measures for Bats** A qualified biologist (as defined by CDFW[17]) who is experienced with bat surveying techniques (including auditory sampling methods), behavior, roosting habitat, and identification of local bat species shall be consulted prior to demolition or building relocation activities to conduct a pre-construction habitat assessment of the project site (focusing on buildings to be demolished or relocated) to characterize potential bat habitat and identify potentially active roost sites. No further action is required should the pre-construction habitat assessment not identify bat habitat or signs of potentially active bat roosts within the project site (e.g., guano, urine staining, dead bats, etc.). The following measures shall be implemented should potential roosting habitat or potentially active bat roosts be identified during the habitat assessment in buildings to be demolished or relocated under the Proposed Project or in trees adjacent to construction activities that could be trimmed or removed under the Proposed Project: a) In areas identified as potential roosting habitat during the habitat assessment, initial building demolition, relocation, and any tree work (trimming or removal) shall occur when bats are active, approximately between the periods of March 1 to April 15 and August 15 to October 15, to the extent feasible. These dates avoid the bat maternity roosting season and period of winter torpor.[18]	LSM

[17] CDFW defines credentials of a "qualified biologist" within permits or authorizations issued for a project. Typical qualifications include a minimum of five years of academic training and professional experience in biological sciences and related resource management activities, and a minimum of two years of experience conducting surveys for each species that may be present within the project area.

[18] Torpor refers to a state of decreased physiological activity with reduced body temperature and metabolic rate.

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		b) Depending on temporal guidance as defined below, the qualified biologist shall conduct pre-construction surveys of potential bat roost sites identified during the initial habitat assessment no more than 14 days prior to building demolition or relocation, or any tree trimming or removal. c) If active bat roosts or evidence of roosting is identified during pre-construction surveys, the qualified biologist shall determine, if possible, the type of roost and species. A no-disturbance buffer shall be established around roost sites until the qualified biologist determines they are no longer active. The size of the no-disturbance buffer would be determined by the qualified biologist and would depend on the species present, roost type, existing screening around the roost site (such as dense vegetation or a building), as well as the type of construction activity that would occur around the roost site. If special-status bat species or maternity or hibernation roosts are detected during these surveys, appropriate species- and roost-specific avoidance and protection measures shall be developed by the qualified biologist in coordination with CDFW. Such measures may include postponing the removal of buildings or structures, establishing exclusionary work buffers while the roost is active (e.g., 100-foot no-disturbance buffer), or other compensatory mitigation. d) The qualified biologist shall be present during building demolition, relocation, or tree work if potential bat roosting habitat or active bat roosts are present. Buildings and trees with active roosts shall be disturbed only under clear weather conditions when precipitation is not forecast for three days and when daytime temperatures are at least 50 degrees Fahrenheit. e) The demolition or relocation of buildings containing or suspected to contain bat roosting habitat or active bat roosts shall be done under the supervision of the qualified biologist. When appropriate, buildings shall be partially dismantled to significantly change the roost conditions,	

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		causing bats to abandon and not return to the roost, likely in the evening and after bats have emerged from the roost to forage. Under no circumstances shall active maternity roosts be disturbed until the roost disbands at the completion of the maternity roosting season or otherwise becomes inactive, as determined by the qualified biologist. f) Trimming or removal of existing trees with potential bat roosting habitat or active (non-maternity or hibernation) bat roost sites shall follow a two-step removal process (which shall occur during the time of year when bats are active, according to a) above, and depending on the type of roost and species present, according to c) above). i. On the first day and under supervision of the qualified biologist, tree branches and limbs not containing cavities or fissures in which bats could roost shall be cut using chainsaws. ii. On the following day and under the supervision of the qualified biologist, the remainder of the tree may be trimmed or removed, either using chainsaws or other equipment (e.g., excavator or backhoe). iii. All felled trees shall remain on the ground for at least 24 hours prior to chipping, off-site removal, or other processing to allow any bats to escape, or be inspected once felled by the qualified biologist to ensure no bats remain within the tree and/or branches.	
BI-3: Construction of the Proposed Project would have a substantial adverse effect, either directly or through habitat modifications, on aquatic species identified as candidate, sensitive, or special-status species in	S	**Mitigation Measure M-BI-3: Pile Driving Noise Reduction for Protection of Fish and Marine Mammals** Prior to the start of reconstruction of the bulkhead in Reach II, the project sponsors shall prepare a detailed Construction Plan that outlines the details of the piling installation approach. This Plan shall be reviewed and approved by the City of San Francisco or other designated City, State, or Federal agency, as determined by the San Francisco Planning Department. The information provided in this plan shall include, but not be limited to, the following:	LSM

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
local, regional, or Federal plans, policies, or regulations, or by California Department of Fish and Wildlife, United States Fish and Wildlife Service, or National Oceanic and Atmospheric Administration.		• The type of piling to be used (whether sheet pile or H-pile); • The piling size to be used; • The method of pile installation to be used; • Noise levels for the type of piling to be used and the method of pile driving; • Recalculation of potential underwater noise levels that could be generated during pile driving using methodologies outlined in CalTrans 2009;[19] and • When pile driving is to occur. If the results of the recalculations provided in the detailed Construction Plan for pile driving discussed above indicate that underwater noise levels are less than 183 dB (SEL) for fish at a distance of 33 feet (less than or equal to 10 meters) and 160 dB (RMS) sound pressure level or 120 dB (RMS) re 1 μPa impulse noise level for marine mammals for a distance 1,640 feet (500 meters), then no further measures are required to mitigate underwater noise. If recalculated noise levels are greater than those identified above, then the project sponsors shall develop a sound attenuation reduction and monitoring plan. This plan shall be reviewed and approved by the Planning Department Environmental Review Officer or other City-designated person. This plan shall provide detail on the sound attenuation system, detail methods used to monitor and verify sound levels during pile-driving activities, and all BMPs to be taken to reduce impact hammer pile-driving sound in the marine environment to an intensity level of less than 183 and 160/120 dB (as identified above) at distances of 33 feet (less than or equal to 10 meters) for fish and 1,640 feet (500 meters) for marine mammals. The sound-monitoring results shall be made available to NOAA Fisheries. If, in the case of marine mammals, recalculated noise levels are greater than 160 dB (peak) at less than or equal to 1,640 feet (500 meters), then the project sponsors shall consult with NOAA to determine the need to obtain an Incidental Harassment	

[19] Caltrans, Technical Guidance for Assessment and Mitigation.

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		Authorization (IHA) under the MMPA. If an IHA is required by NOAA, an application for an IHA shall be prepared by the project sponsor. The plan shall incorporate as appropriate, but not be limited to, the following BMPs: • Any impact-hammer-installed soldier wall H-pilings or sheet piling shall be conducted in strict accordance with the Long-Term Management Strategy (LTMS) work windows for Pacific herring,[20] during which the presence of Pacific herring in the project site is expected to be minimal unless, where applicable, NOAA Fisheries in their Section 7 consultation with the Corps determines that the potential effect to special-status fish species is less than significant. • If pile installation using impact hammers must occur at times other than the approved LTMS work window for Pacific herring or result in underwater sound levels greater than those identified above, the project sponsors shall consult with both NOAA Fisheries and CDFW on the need to obtain incidental take authorizations to address potential impacts to longfin smelt and green sturgeon associated with reconstruction of the steel sheet pile bulkhead in Reach II, and to implement all requested actions to avoid impacts. • A 1,640-foot (500-meter) safety zone shall be established and maintained around the sound source to the extent such a safety zone is located within in-water areas, for the protection of marine mammals in the event that sound levels are unknown or cannot be adequately predicted. • In-water work activities associated with reconstruction of the steel sheet pile bulkhead in Reach II shall be halted when a marine mammal enters the 1,640-foot (500-meter) safety zone and shall cease until the mammal has been gone from the area for a minimum of 15 minutes.	

[20] U.S. Army Corps of Engineers, Programmatic Essential Fish Habitat (EFH) Assessment for the Long-Term Management Strategy for the Placement of Dredged Material in the San Francisco Bay Region. July 2009.

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		• A "soft start" technique shall be used in all pile driving, giving marine mammals an opportunity to vacate the area. • A NOAA Fisheries-approved biological monitor shall conduct daily surveys before and during impact hammer pile driving to inspect the safety zone and adjacent San Francisco Bay waters for marine mammals. The monitor shall be present as specified by NOAA Fisheries during the impact pile-driving phases of construction. • Other BMPs shall be implemented as necessary, such as using bubble curtains or an air barrier, to reduce underwater noise levels to acceptable levels. Alternatively, the project sponsors may consult with NOAA directly and submit evidence to their satisfaction of the Environmental Review Officer of NOAA consultation. In such case, the project sponsors shall comply with NOAA recommendations and/or requirements.	
BI-4: The Proposed Project would have a substantial adverse effect on Federally-protected waters as defined by Section 404 of the Clean Water Act through direct removal, filling, hydrological interruption, or other means.	S	**Mitigation Measure M-BI-4: Compensation for Fill of Jurisdictional Waters** To offset temporary and/or permanent impacts to jurisdictional waters of San Francisco Bay adjacent to the 28-Acre Site, construction associated with repair or replacement of the Reach II bulkhead shall be conducted as required by regulatory permits (i.e., those issued by the Corps, RWQCB, and BCDC) and in coordination with NMFS as appropriate. If required by regulatory permits, compensatory mitigation shall be provided as necessary, at a minimum ratio of 1:1 for fill beyond that required for normal repair and maintenance of existing structures. Compensation may include on-site or off-site shoreline improvements or intertidal/subtidal habitat enhancements along San Francisco's eastern waterfront through removal of chemically treated wood material (e.g., pilings, decking, etc.) by pulling, cutting, or breaking off piles at least 1 foot below mudline or removal of other unengineered debris (e.g., concrete-filled drums or large pieces of concrete).	LSM

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		Improvements would be implemented in accordance with NMFS as appropriate. On-site or off-site restoration/enhancement plans, if required, must be prepared by a qualified biologist prior to construction and approved by the permitting agencies prior to beginning construction, repair, or replacement of the Reach II bulkhead. Implementation of restoration/enhancement activities by the permittee shall occur prior to project impacts, whenever possible.	
BI-5: The Proposed Project would interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.	S	Implement **Mitigation Measure M-BI-3: Pile Driving Noise Reduction for Protection of Fish and Marine Mammals,** above.	LSM
BI-6: The Proposed Project would not conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance, and would not have a substantial conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or State habitat conservation plan.	LS	None required.	LS

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
C-BI-1: The Proposed Project, in combination with past, present, and reasonably foreseeable future projects in the site vicinity, would result in a cumulatively considerable contribution to significant biological resources impacts.	S	Implement **Mitigation Measures M-BI-1: Worker Environmental Awareness Program Training, M-BI-2: Avoidance and Minimization Measures for Bats, Mitigation Measure M-BI-3: Pile Driving Noise Reduction for Protection of Fish and Marine Mammals,** and **Mitigation Measure M-BI-4: Compensation for Fill of Jurisdictional Waters**, above.	LSM
Geology and Soils			
GE-1: The Proposed Project would not expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving fault rupture, seismic ground shaking, seismically induced ground failure, or seismically induced landslides.	LS	None required.	LS
GE-2: The Proposed Project would not result in substantial erosion or loss of topsoil.	LS	None required.	LS

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
GE-3: The project site would not be located on a geologic unit or soil that is unstable, or that could become unstable as a result of the Proposed Project.	S	**Mitigation Measure M-GE-3a: Reduction of Rock Fall Hazards** The project sponsors shall prepare a site-specific geotechnical report(s), subject to review and approval by the Port, that evaluates the design and construction methods proposed for Parcels PKS, C-1, and C-2, the Irish Hill playground, and 21st Street. The investigations shall determine the potential for rock fall hazards. If the potential for rock fall hazards is identified, the site-specific geotechnical investigations shall identify measures to minimize such hazards to be implemented by the project sponsors. Possible measures to reduce the impacts of potential rock fall hazards include, but are not limited to, the following: • Limited regrading to adjust slopes to stable gradient; • Rock fall containment measures such as installation of drape nets, rock fall catchment fences, or diversion dams; and • Site design measures such as implementing setbacks to ensure that buildings and public uses are outside areas that could be subject to damage as a result of rock fall. **Mitigation Measure M-GE-3b: Signage and Restricted Access to Pier 70** Prior to issuance of the first certificate of occupancy under the Proposed Project, the project sponsors shall install a gate or an equivalent measure to prevent access to the existing dilapidated pier at the project site. A sign shall be posted at the potential access point informing the public of potential risks associated with use of the structure and prohibiting public access.	LSM
GE-4: The Proposed Project would not create substantial risks to life or property as a result of locating buildings or other features on expansive or corrosive soils.	LS	None required.	LS

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
GE-5: The Proposed Project would not substantially change the topography or any unique geologic or physical features of the site.	LS	None required.	LS
GE-6: The Proposed Project would directly or indirectly destroy a unique paleontological resource or site.	S	**Mitigation Measure M-GE-6: Paleontological Resources Monitoring and Mitigation Program** Prior to issuance of a building permit for construction activities that would disturb sedimentary rocks of the Franciscan Complex (based on the site-specific geotechnical investigation or other available information), the project sponsors shall retain the services of a qualified paleontological consultant having expertise in California paleontology to design and implement a Paleontological Resources Monitoring and Mitigation Program (PRMMP). The PRMMP shall specify the timing and specific locations where construction monitoring would be required; emergency discovery procedures; sampling and data recovery procedures; procedures for the preparation, identification, analysis, and curation of fossil specimens and data recovered; preconstruction coordination procedures; and procedures for reporting the results of the monitoring program. The PRMMP shall be consistent with the Society for Vertebrate Paleontology (SVP) Standard Guidelines for the mitigation of construction-related adverse impacts to paleontological resources and the requirements of the designated repository for any fossils collected. During construction, earth-moving activities that have the potential to disturb previously undisturbed native sediment or sedimentary rocks shall be monitored by a qualified paleontological consultant having expertise in California paleontology. Monitoring need not be conducted for construction activities in areas where the ground has been previously disturbed or when construction activities would encounter artificial fill, Young Bay Mud, marsh deposits, or non-sedimentary rocks of the Franciscan Complex.	LSM

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		If a paleontological resource is discovered, construction activities in an appropriate buffer around the discovery site shall be suspended for a maximum of 4 weeks. At the direction of the Environmental Review Officer (ERO), the suspension of construction can be extended beyond 4 weeks if needed to implement appropriate measures in accordance with the PRMMP, but only if such a suspension is the only feasible means to prevent an adverse impact on the paleontological resource. The paleontological consultant's work shall be conducted at the direction of the City's ERO. Plans and reports prepared by the consultant shall be submitted first and directly to the ERO for review and comment, and shall be considered draft reports subject to revision until final approval by the ERO.	
C-GE-1: The Proposed Project, in combination with past, present, and reasonably foreseeable future projects, would not substantially contribute to cumulative impacts on geology and soils.	LS	None required.	LS
Hydrology and Water Quality			
HY-1: Construction of the Proposed Project would not violate a water quality standard or a waste discharge requirement, or otherwise substantially degrade water quality.	LS	None required.	LS

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
HY-2: The Proposed Project could violate a water quality standard or waste discharge requirement or otherwise substantially degrade water quality, but runoff from the Proposed Project could exceed the capacity of a storm drain system or provide a substantial source of stormwater pollutants.	S	**Mitigation Measure M-HY-2a: Design and Construction of Proposed Pump Station for Options 1 and 3** The project sponsors shall design the new pump station proposed as part of the Proposed Project to achieve the following performance criteria. • The dry-weather capacity of the new pump station and associated force main shall be sufficient to convey dry-weather wastewater flows within the 20th Street sub-basin, including flows from the existing baseline, the Proposed Project at full build-out, and cumulative project contributions; and • The wet-weather capacity of the new pump station shall be sufficient to ensure that potential wet-weather combined sewer discharges from the 20th Street sub-basin and associated downstream basins do not exceed the long-term average of ten discharges per year specified in the SFPUC Bayside NPDES permit or applicable corresponding permit condition at time of final design. The capacity shall be based on the existing baseline, the Proposed Project at full build-out, and cumulative project contributions, The project sponsors shall coordinate with the SFPUC regarding the design and construction of the pump station. The final design shall be subject to approval by the SFPUC. **Mitigation Measure M-HY-2b: Design and Construction of Proposed Pump Station for Option 2** The project sponsors shall design the new pump station proposed as part of the Proposed Project to achieve the following performance criteria. • The dry-weather capacity of the new pump station and associated force main shall be sufficient to convey dry-weather wastewater flows within the 20th Street sub-basin, including flows from the existing baseline, the Proposed Project at full build-out, and cumulative project contributions;	LSM

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		• During wet weather, wastewater flows from the project site shall bypass the wet-weather facilities and be conveyed to the combined sewer system in such a manner that they do not contribute to combined sewer discharges within the 20th Street sub-basin; and • The wet-weather capacity of the new pump station shall be sufficient to ensure that potential wet-weather combined sewer discharges from the 20th Street sub-basin and associated downstream basins do not exceed the long-term average of ten discharges per year specified in the SFPUC Bayside NPDES permit or applicable corresponding permit condition at time of final design. The capacity shall be based on the existing baseline and cumulative project contributions. The project sponsor shall coordinate with the SFPUC regarding the design and construction of the pump station. The final design shall be subject to approval by the SFPUC.	
HY-3: The Proposed Project would not substantially deplete groundwater supplies or interfere with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table.	LS	None required.	LS

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
HY-4: The Proposed Project would not substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner that would result in substantial erosion, siltation, or flooding on- or off site.	LS	None required.	LS
HY-5: Operation of the Proposed Project would not place housing within a 100-year flood zone or place structures within an existing 100-year flood zone that would impede or redirect flood flows.	LS	None required.	LS
HY-6: Operation of the Proposed Project would not place structures within a future 100-year flood zone that would impede or redirect flood flows.	LS	None required.	LS

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
HY-7: The Proposed Project would not expose people or structures to substantial risk of loss, injury, or death due to inundation by seiche, tsunami, or mudflow.	LS	None required.	LS
C-HY-1: The Proposed Project, in combination with past, present, and reasonably foreseeable future projects in the site vicinity, would not result in a considerable contribution to cumulative impacts on hydrology and water quality.	LS	None required.	LS
Hazards and Hazardous Materials			
HZ-1: Construction and operation of the Proposed Project would not create a significant hazard through routine transport, use, or disposal of hazardous materials.	LS	None required.	LS
HZ-2: Demolition and renovation of buildings under the Proposed Project would not expose workers and the public to hazardous building	S	**Mitigation Measure M-HZ-2a: Conduct Transformer Survey and Remove PCB Transformers** The project sponsors shall retain a qualified contractor to survey any building and/or structure planned for demolition, renovation, or relocation to identify all electrical transformers in use and in storage. The contractor shall determine the	LSM

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
materials including asbestos-containing materials, lead-based paint, bis (2-ethylhexyl) phthalate (DEHP), and mercury, or result in a release of these materials into the environment during construction. However, workers and the public would be exposed to PCBs as a result of the removal of electrical transformers.		PCB content using name plate information, or through sampling if name-plate data do not provide adequate information regarding the PCB content of the dielectric equipment. The project sponsors shall retain a qualified contractor to remove and dispose of all transformers in accordance with the requirements of Title 40 of the Code of Federal Regulations, Section 761.60 (described under the Regulatory Framework) and the Title 22 of the California Code of Regulations, Section 66261.24. The removal shall be completed in advance of any building or structural demolition, renovation, or relocation. **Mitigation Measure M-HZ-2b: Conduct Sampling and Cleanup if Stained Building Materials Are Observed** In the event that leakage is observed in the vicinity of a transformer containing greater than 50 parts per million PCB (determined in accordance with Mitigation Measure H-HZ-2a), or the leakage has resulted in visible staining of the building materials or surrounding surface areas, the project sponsors shall retain a qualified professional to obtain samples of the building materials for the analysis of PCBs in accordance with Part 761 of the Code of Federal Regulations. If PCBs are identified at a concentration of 1 part per million, then the project sponsors shall retain a contractor to clean the surface to a concentration of 1 part per million or less in accordance with Title 40 of the Code of Federal Regulations, Section 761.61(a). The sampling and cleaning shall be completed in advance of any building or structural demolition, renovation, or relocation. **Mitigation Measure M-HZ-2c: Conduct Soil Sampling if Stained Soil is Observed** In the event that leakage is observed in the vicinity of a PCB-containing transformer that has resulted in visible staining of the surrounding soil (determined in accordance with Mitigation Measure M-HZ-2a), the project sponsors shall retain a qualified professional to obtain soil samples for the analysis of PCBs in accordance with Part 761 of the Code of Federal Regulations. If PCBs are identified at a concentration less than the residential Environmental Screening Level of 0.22 milligrams per kilogram, then no further action shall be required. If PCBs are identified at a concentration greater than or equal to the	

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		residential Environmental Screening Level of 0.22 milligrams per kilogram, then the project sponsors shall require the contractor to implement the requirements of the Pier 70 RMP, as required by Mitigation Measure M-HZ-6. The sampling and implementation of the Pier 70 RMP requirements shall be completed in advance of any building or structural demolition, renovation, relocation, or subsequent development.	

HZ-3: Project development within the 28-Acre Site and 20th/Illinois Parcel would be conducted on a site included on a government list of hazardous materials sites and could encounter hazardous materials in the soil and groundwater, creating a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment.	S	**Mitigation Measure M-HZ-3a: Implement Construction and Maintenance-Related Measures of the Pier 70 Risk Management Plan**
		
		The project sponsors shall provide notice to the RWQCB, DPH, and Port in accordance with the Pier 70 RMP, in advance of ground-disturbing activities that would disturb an area of 1,250 square feet or more of native soil, 50 cubic yards or more of native soil, more than 0.5 acre of soil, or 10,000 square feet or more of durable cover (Pier 70 RMP Sections 4.1, 4.2, and 6.3).
		
		The project sponsors shall also (through their contractor) implement the following measures of the Pier 70 RMP during construction to provide for the protection of worker and public health, including nearby schools and other sensitive receptors, and to ensure appropriate disposition of soil and groundwater removed from the site:
		
		• A project-specific health and safety plan (Pier 70 RMP Section 6.4);
		• Access controls (Pier 70 RMP Section 6.1);
		• Soil management protocols, including those for:
		  o soil movement (Pier 70 RMP Section 6.5.1),
		  o soil stockpile management (Pier 70 RMP Section 6.5.2), and
		  o import of clean soil (including preparation of a project-specific Soil Import Plan) (Pier 70 RMP Section 6.5.3);
		• A dust control plan in accordance with the measures specified by the California Air Resources Board for control of naturally occurring asbestos (Title 17 of California Code of Regulations, Section 93105) and
			LSM

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		Article 22B of the San Francisco Health Code and other applicable regulations as well as site-specific measures (Pier 70 RMP Section 6.6); • A project-specific stormwater pollution prevention control plan (Pier 70 RMP Section 6.7); • Off-site soil disposal (Pier 70 RMP Section 6.8); • A project-specific groundwater management plan for temporary dewatering (Pier 70 RMP Section 6.10.1); • Risk management measures to minimize the potential for new utilities to become conduits for the spread of groundwater contamination (Pier 70 RMP Section 6.10.2); • Appropriate design of underground pipelines to prevent the intrusion of groundwater or degradation of pipeline construction materials by chemicals in the soil or groundwater (Pier 70 RMP Section 6.10.3); and • Protocols for unforeseen conditions (Pier 70 RMP Section 6.9). Following completion of construction activities that disturb any durable cover, the integrity of the previously existing durable cover shall be re-established in accordance with Section 6.2 of the Pier 70 RMP and the protocols described in the Operations and Maintenance Plan of the Pier 70 RMP. All plans prepared in accordance with the Pier 70 RMP shall be submitted to the RWQCB, DPH, and/or Port for review and approval in accordance with the notification requirements of the RMP (Pier 70 RMP Section 4.0). **Mitigation Measure M-HZ-3b: Implement Well Protection Requirements of the Pier 70 Risk Management Plan** In accordance with Section 6.11 of the Pier 70 RMP, the project sponsors shall review available information prior to any ground-disturbing activities to identify any monitoring wells within the construction area. The wells shall be appropriately protected during construction. If construction necessitates destruction of an existing well, the destruction shall be conducted in accordance	

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		with California and DPH well abandonment regulations, and must be approved by the RWQCB. The Port shall also be notified of the destruction. If required by the RWQCB, DPH, or the Port, the project sponsor shall reinstall any groundwater monitoring wells that are part of the ongoing groundwater monitoring network.	
HZ-4: Project development within the Hoedown Yard would be conducted on a site included on a government list of hazardous materials sites and could encounter hazardous materials in the soil and groundwater, creating a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment.	S	**Mitigation Measure M-HZ-4: Implement Construction-Related Measures of the Hoedown Yard Site Management Plan** In accordance with the notification requirements of the Hoedown Yard SMP (Section 4.2), the project sponsors (through their contractor) shall notify the RWQCB, DPH, and/or Port prior to conducting any intrusive work at the Hoedown Yard. During construction, the contractor shall implement the following measures of the Hoedown Yard SMP to provide for the protection of worker and public health, and to ensure appropriate disposition of soil and groundwater. • A project-specific Health and Safety Plan (Hoedown Yard SMP Section 5): o Dust management measures in accordance with the measures specified by the California Air Resources Board for control of naturally occurring asbestos (Title 17 of California Code of Regulations, Section 93105) and Article 22B of the San Francisco Health Code. The specific measures must address dust control (SMP Section 6.1) and dust monitoring (SMP Section 6.2). • Soil and water management measures, including: o soil handling (Hoedown Yard SMP Section 7.1.1), o stockpile management (Hoedown Yard SMP Section 7.1.2), o on-site reuse of soil (Hoedown Yard SMP Section 7.1.3), o off-site soil disposal (Hoedown Yard SMP Section 7.1.4), o excavation dewatering (Hoedown Yard SMP Section 7.1.5), o stormwater management (Hoedown Yard SMP Section 7.1.6),	LSM

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		o site access and security (Hoedown Yard SMP Section 7.1.7), and o unanticipated subsurface conditions (Hoedown Yard SMP Section 7.2).	
HZ-5: Operation of the Proposed Project within the PG&E Responsibility Area would expose residents, site workers, and site visitors to hazardous materials in the soil, creating a significant hazard to the public or the environment.	S	**Mitigation Measure M-HZ-5: Delay Development on Proposed Parcels H1, H2, and E3 Until Remediation of the PG&E Responsibility Area is Complete** The project sponsors shall not start construction of the proposed development or associated infrastructure on proposed Parcels H1, H2, and E3 until PG&E's remedial activities in the PG&E Responsibility Area within and adjacent to these parcels have been completed to the satisfaction of the RWQCB. During subsequent development, the project sponsors shall implement the requirements of the Pier 70 RMP within the PG&E Responsibility Area, as is enforced through the recorded deed restriction.	LSM
HZ-6: Operation of the Proposed Project within the 28-Acre Site and the 20th/Illinois Parcel would expose residents, site workers, and site visitors to hazardous materials in the soil or soil vapors, creating a significant hazard to the public or the environment.	S	**Mitigation Measure M-HZ-6: Additional Risk Evaluations and Vapor Control Measures for Residential Land Uses** The notification submittals required under Mitigation Measure M-HZ-3a shall describe site conditions at the time of development. If residential land uses are proposed at or near locations where soil vapor or groundwater concentrations exceed residential cleanup standards for vapor intrusion (based on information provided in the Pier 70 RMP) , this information shall be included in the notification submittal and the RWQCB and DPH determine whether a risk evaluation is required. If required, the project sponsors or future developer(s) shall conduct a risk evaluation in accordance with the Pier 70 RMP. The risk evaluation shall be based on the soil vapor and groundwater quality presented in the Pier 70 RMP and the proposed building design. The project sponsors shall conduct additional soil vapor or groundwater sampling as needed to support the risk evaluation, subject to the approval of the RWQCB and DPH. If the risk evaluation demonstrates that there would be unacceptable health risks to residential users (i.e., greater than 1×10^{-6} incremental cancer risk or a non-cancer hazard index greater than 1), the project sponsors shall incorporate measures into the building design to minimize or eliminate exposure to soil vapor	LSM

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		through the vapor intrusion pathway, subject to review and approval by the RWQCB and DPH. Appropriate vapor intrusion measures include, but are not limited to design of a safe building configuration that would preclude vapor intrusion; installation of a vapor barrier; and/or design and installation of an active vapor monitoring and extraction system. If the risk evaluation demonstrates that vapor intrusion risks would be within acceptable levels (less than 1×10^{-6} incremental cancer risk or a non-cancer hazard index less than 1) under a project-specific development scenario, no additional action shall be required. (For instance, the project sponsors could locate all residential uses above the first floor which, in some cases, could eliminate the potential for residential exposure to organic compounds in soil vapors.)	
HZ-7: Operation of the Proposed Project within the Hoedown Yard would expose residents, site workers, and site visitors to hazardous materials in the soil, creating a significant hazard to the public or the environment.	S	**Mitigation Measure M-HZ-7: Modify Hoedown Yard Site Mitigation Plan** The project sponsors shall conduct a risk evaluation to evaluate health risks to future site occupants, visitors, and maintenance workers under the proposed land use within the Hoedown Yard. The risk evaluation shall be based on the soil, soil vapor, and groundwater quality data provided in the existing SMP and supporting documents and the project sponsors shall conduct additional sampling as needed to support the risk evaluation. Based on the results of the risk evaluation, the project sponsors shall modify the Hoedown Yard SMP to include measures to minimize or eliminate exposure pathways to chemicals in the soil and groundwater, and achieve health-based goals (i.e., an excess cancer risk of 1×10^{-6} and a Hazard Index of 1) applicable to each land use proposed for development within the Hoedown Yard. At a minimum, the modified SMP shall include the following components: • Regulatory-approved cleanup levels for the proposed land uses; • A description of existing conditions, including a comparison of site data to regulatory-approved cleanup levels; • Regulatory oversight responsibilities and notification requirements; • Post-development risk management measures, including management measures for the maintenance of engineering controls (e.g., durable	LSM

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
		covers, vapor mitigation systems) and site maintenance activities that could encounter contaminated soil; • Monitoring and reporting requirements; and • An operations and maintenance plan, including annual inspection requirements. The risk evaluation and proposed risk management plan shall be submitted to the RWQCB, DPH, and Port for review and approval prior to the start of ground disturbance.	
HZ-8: Operation of the Irish Hill Playground would expose site visitors to naturally occurring asbestos and naturally occurring metals, creating a significant hazard to the public or the environment.	S	**Mitigation Measure M-HZ-8a: Prevent Contact with Serpentinite Bedrock and Fill Materials in Irish Hill Playground** The project sponsors shall ensure that a minimum 2-foot thick durable cover of asbestos-free clean imported fill with a vegetated cover is emplaced above serpentinite bedrock and fill materials in the level portions of Irish Hill Playground. The fill shall meet the soil criteria for clean fill specified in Table 4 of the Pier 70 RMP and included in Appendix F, Hazards and Hazardous Materials, of this EIR. Barriers shall be constructed to preclude direct climbing on the bedrock of the Irish Hill remnant. The design of the durable cover and barriers shall be submitted to the DPH and Port for review and approval prior to construction of the Irish Hill Playground. **Mitigation Measure M-HZ-8b: Restrictions on the Use of Irish Hill Playground** To the extent feasible, the project sponsors shall ensure that the Irish Hill Playground is not operational until ground disturbing activities for construction of the new 21st Street and on the adjacent parcels (PKN, PKS, HDY-1, HDY2, C1, and C2) is completed. If this is not feasible, and Irish Hill Playground is operational prior to construction of the new 21st Street and construction on all adjacent parcels, the playground shall be closed for use when ground-disturbing activities are occurring for the construction of the new 21st Street and on any of the adjacent parcels.	LSM

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
HZ-9: The Proposed Project would not handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school. Although construction activities would emit diesel particulate matter and naturally occurring asbestos, these emissions would not result in adverse effects on nearby schools.	LS	None required.	LS
HZ-10: The Proposed Project would not expose people or structures to a significant risk of loss, injury, or death involving fires, nor would it impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan.	LS	None required.	LS

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
C-HZ-1: The Proposed Project, in combination with other past, present or reasonably foreseeable future projects in the project vicinity, would not result in a considerable contribution to significant cumulative impacts related to hazards and hazardous materials.	LS	None required.	LS
Mineral and Energy Resources			
ME-1: The Proposed Project would not have a significant adverse impact on the availability of a known mineral resource and/or a locally important mineral resource recovery site.	NI	None required.	NI
ME-2: The Proposed Project would not have a substantial adverse effect on the use of fuel, water, or energy consumption, and would not encourage activities that could result in the use of large amounts of fuel, water, or energy, or use these in a wasteful manner.	LS	None required.	LS

Table S.1 Continued

Impact	Level of Significance before Mitigation	Mitigation and Improvement Measures	Level of Significance after Mitigation
ME-3: The Proposed Project would not result in new or expansion of existing electric or natural gas transmission and/or distribution facilities that would cause significant physical environmental effects.	LS	None required.	LS
C-ME-1: The Proposed Project, in combination with other past, present and reasonably foreseeable future projects in the vicinity, would not result in a cumulatively considerable contribution to a significant adverse cumulative impact on mineral and energy resources.	LS	None required.	LS

C. SUMMARY OF PROJECT VARIANTS

Four project variants are evaluated in this EIR, and are described in detail in Chapter 6, Variants. These include: a Reduced Off-Haul Variant; a District Energy System; a Wastewater Treatment and Reuse System (WTRS); and an Automated Waste Collection System (AWCS). There is one proposed construction-related variant of the Proposed Project and three proposed variants on infrastructure features of the Proposed Project, all of which focus on sustainability.

For each variant, all other features would be the same as or similar to the Proposed Project. The variants do not involve any change to the mix of land uses, the space allocation of uses, or the residential unit count under the Maximum Residential and Maximum Commercial Scenarios of the Proposed Project. Likewise, the variants would not involve any change to the locations, configurations, or building envelopes of the programmed development under the two scenarios analyzed for the Proposed Project. Physical environmental effects from the project variants would be the same or similar to the Proposed Project. All mitigation measures and improvement measures identified for the Proposed Project would be the same under the project variants.

Reduced Off-Haul Variant

The Reduced Off-Haul Variant is a construction-related variant. It is focused on minimizing the overall volume of excavated soils and the number of off-haul truck trips required for the transport and disposal of excavated soils. The strategy for achieving a reduction in the volume of excavated soils and the resultant off-haul truck trips is three-fold: 1) modify the preliminary grading plan developed for the Proposed Project to raise the base elevation for a portion of the 28-Acre Site; 2) eliminate the proposed 15-foot-deep below-grade basement levels at selected locations on the 28-Acre Site and extend the footprint of one proposed 15-foot-deep below-grade basement level; and 3) eliminate a portion of one of the two below-grade basement levels on Parcel C1. The combination of the proposed increase to the base elevation on a portion of the 28-Acre Site and the modifications to the below-grade basement level parking program would result in an approximately 56 percent reduction in the volume of excavated soils that would need to be transported off site (from approximately 340,000 cubic yards under the Proposed Project to approximately 150,000 cubic yards).

District Energy System Variant

Under the District Energy System Variant, building space heating and space cooling systems within the project site would be linked together via an underground shared energy distribution and exchange loop. This variant would include a single central plant with boilers and chillers to regulate the water temperature circulating in the network of subsurface pipes and laterals leading

to all buildings on the 28-Acre-Site. The central plant would be located in the basement of a building on Parcel C1, which is located at the corner of new Louisiana and 21st streets. Development of Parcel C1 could be an above grade parking structure, a residential building, or commercial building, all with two below-grade basement levels. Up to five 15- to 20-foot-tall cooling towers would be located on the roof or would be located adjacent to the building and would obviate the need, under the Proposed Project, for a mechanical cooling tower located on the roof of each building.

Each building on the project site would have heat pumps and a point-of-connection to the energy distribution loop tied to the water loop to provide space heating, hot water, and cooling to more efficiently meet building thermal demands. Buildings that require heat would remove heat from the loop. Buildings that require cooling would reject that heat by pumping heated water into the loop, thereby enhancing the efficiency of each building's heating, ventilation, and air conditioning system. To maintain the loop at a desired temperature, the central plant would use natural gas-fired boilers to increase heat and cooling towers to reject heat.

Wastewater Treatment and Reuse System Variant

Under the WTRS Variant, wastewater in the form of blackwater, graywater, and rainwater would be collected from all newly constructed buildings, treated, and reused for toilet and urinal flushing, irrigation, and cooling towers. The WTRS Variant is an infrastructure-related variant. The variant is different from the Proposed Project because it would include a centralized facility (as opposed to the capture of graywater, and rain water, and its reuse within the individual building). Unlike the Proposed Project, this variant also assumes blackwater (wastewater from toilets, urinals, dishwashers, kitchen sinks, and utility sinks containing feces, urine, other bodily wastes, or other biological wastes) would be collected and treated along with the graywater, and rainwater, that would be captured under the Proposed Project.

The WTRS Variant would consist of a single treatment facility to be located in an existing building (Building 108) or in a new building (approximately 20,000 square feet and 35 feet tall) on the BAE Systems Ship Repair site north of 20th Street opposite the proposed commercial office uses on Parcels A and B.

Automated Waste Collection System Variant

An AWCS Variant is under consideration by the project sponsor because it has the potential to operate more efficiently and reduce the number of trash collection truck trips and the associated noise. The automated waste collection system would be designed to accept recyclables, compostables, and trash at separate loading stations in buildings and in public areas. These waste streams would then be transported through a subsurface pipeline system to a central waste

collection facility. In order to minimize the potential for odors from organic decomposition and other odorous waste, the subsurface pipeline system would be designed to be under negative pressure (i.e., vacuum towards the central waste collection facility) and activated carbon filters would be used to eliminate odors at the system exhaust.

Under the AWCS Variant, residents, workers, and visitors would deposit recyclables, compostables, and trash in designated receptacles both within and outside of buildings. Once deposited, the material would be temporarily stored at the loading point. A pneumatic system would direct the solid waste through the subsurface pipeline system to the central waste collection facility. The central waste collection facility would be up to 10,000 square feet and up to 35 feet in height. It would be located outside of the project site on land north of Parcels A and B on the BAE Systems Ship Repair site (a surface parking lot) and would likely be constructed as part of the first phase of development

D. SUMMARY OF PROJECT ALTERNATIVES

Three alternatives are evaluated in this EIR: the No Project Alternative; the Code Compliant Alternative; and the 2010 Pier 70 Master Plan Alternative. The three alternatives are described in detail in Chapter 7, Alternatives. Table S.2: Comparison of Project and Alternative Impacts, on pp. S.118-S.122, shows a comparison of the potential environmental impacts that may result from the alternatives to those of the Proposed Project.

No Project Alternative

CEQA Guidelines Section 15126.6(e) requires that, among the project alternatives, a "no project" alternative be evaluated. CEQA Guidelines Section 15126.6(e)(2) requires that the no project alternative analysis "discuss the existing conditions…as well as what would be reasonably expected to occur in the foreseeable future if the project were not approved, based on current plans and policies and consistent with the available infrastructure and community services." As noted in CEQA Guidelines Section 15126.6, an EIR on "a development project on identifiable property," typically analyzes a no project alternative, i.e., "the circumstance under which the project does not proceed. Such a discussion would compare the environmental effects of the property remaining in its existing state against environmental effects that would occur if the project is approved. If disapproval of the project under consideration would result in predictable actions by others, such as the proposal of some other project, this 'no project' consequence should be discussed."

DESCRIPTION

Under the No Project Alternative, existing conditions at the Pier 70 project site would not change. Under this alternative, there would be no exchange of land under the Public Trust Exchange Agreement. The 35-acre project site that contains approximately 351,800 gsf of mostly vacant buildings and facilities, most of which are unoccupied, would be retained in its current condition with the current level of maintenance. Current uses on the site, all of which are on short-term leases or temporary, would continue. The Port would continue to renew the existing short-term leases on the project site; no tenant relocation plan would be proposed. While it is likely that the Port and/or developers could develop portions or all the 28-Acre Site and Illinois Parcels over a period of time, such development is speculative and therefore not analyzed under the No Project Alternative.

Under the No Project Alternative, there would be no amendment to the Planning Code, no rezoning of the entire 35-acre project site, and no adoption of a SUD enabling development controls. None of the approximately 3,422,265 gsf or 801,400 gsf of new buildings and improvements to existing structures on the 28-Acre Site and the Illinois Parcels, respectively, proposed as part of the Proposed Project would be constructed or improved. No new proposed residential, commercial, RALI, or open space uses would be constructed on the project site under this alternative. No affordable residential units complying with the City's Affordable Inclusionary Housing Ordinance would be built. There would be no demolition or rehabilitation of contributing historic architectural resources in the Union Iron Works (UIW) Historic District on the project site under the No Project Alternative; no traffic or street and circulation improvements; no infrastructure or utilities improvements; no new 20th Street pump station; no grading or stabilization improvements; and no shoreline protection or sea level rise adaptation strategies on the project site.

Code Compliant Alternative

DESCRIPTION

The purpose of the Code Compliant Alternative is to evaluate a development scheme that would meet applicable provisions of the Planning Code and would not require any Planning Code amendments.

Under this alternative, there would be no establishment of an SUD; the project site would remain in M-2 and P Zoning Districts. The Code Compliant Alternative would include approximately 1,881,360 gsf of development, about 45 percent less than under the Proposed Project overall. This alternative would include 590 residential units totaling 519,950 gsf, 1,162,260 gsf of commercial (office) use, 156,780 gsf of retail use, and 42,370 gsf of arts/light-industrial uses.

The Code Compliant Alternative would provide 150 on-street vehicle parking spaces and 985 off-street spaces located on several surface parking lots on the site. Under this alternative, 5.76 acres of public open space would be constructed, including promenade and terrace areas along the waterfront, an Irish Hill playground area, and a plaza and market square around Building 12. Unlike the Proposed Project, this alternative does not include the Maximum Residential Scenario and the Maximum Commercial Scenario as optional development scenarios.

Under this alternative, the project site would remain within the existing Height and Bulk Districts of 65-X and 40-X. No voter approval would be required pursuant to Proposition B under the Code Compliant Alternative because no changes to the height districts would be proposed.

Like the Proposed Project, this alternative would include a Design for Development document comparable to that of the Proposed Project, but would apply specifically to the height districts, use program, and site plan for streets, configuration of parcels, and open spaces under this alternative. As with the Proposed Project, the Design for Development under this alternative would establish standards and guidelines for the rehabilitation of historic buildings, buildable zones for infill construction, and would contain project-wide as well as location-specific massing and architecture requirements that would govern the design of infill construction within the project site to ensure architectural compatibility with historic buildings within the UIW Historic District.

Under the Code Compliant Alternative, 237,800 gsf located in Buildings 2, 12, and 21 on the project site would be retained and rehabilitated in accordance with Secretary of the Interior's Standards. As with the Proposed Project, the northern spur of the Irish Hill remnant would be removed.to allow for the construction of 21st Street. Also, as under the Proposed Project, Building 21 would be relocated about 75 feet to the southeast. The remaining seven structures on the project site (Buildings 11, 15, 16, 19, 25, 32, and 66), containing 123,200 gsf, would be demolished.

Similar to the Proposed Project, the Code Compliant Alternative includes construction of transportation and circulation improvements. Under this alternative, the following transportation and circulation improvements would be implemented: construction of new 21st Street, reconstruction of 20th and 22nd streets, and construction of new Louisiana and Maryland streets. All new and reconstructed streets would be built with sidewalks. As under the Proposed Project, the Code Compliant Alternative would include the same bicycle circulation improvements (Bay Trail extension, Class II and Class III facilities on internal streets, and a bikeshare location). The Code Compliant Alternative would include same Transportation Demand Management (TDM) program as the Proposed Project, with exception of those items that pertain only to residential tenants. A TDM program would include the following: establishment of a Transportation Management Agency (TMA) that employs an on-site transit coordinator, operation of a shuttle

system, maintenance of a TMA website with real-time transit information, distribution of educational documents, coordination of ride-matching services, enrollment in Emergency Ride Home program, employment of a structured parking strategy, unbundled residential and commercial parking, provision of car-share parking spaces, metering of on-street parking, and parking wayfinding signage across the site.

Under this alternative, new and upgraded utilities and infrastructure would be constructed, including a new 20th Street pump station. A combined sewer and stormwater system would be built, similar to Option 1 under the Proposed Project, but it would have slightly different alignments due to different building and roadway siting and locations. Unlike the Proposed Project, this alternative does not include variants. The Code Compliant Alternative would further some of the project sponsors' objectives.

The Code Compliant Alternative includes about 47,962 cubic yards of off-haul of excavated materials and about 8,900 cubic yards of clean fill import. This alternative includes construction of an engineered berm along the eastern property boundary with an approximately 3:1 slope and a maximum height of approximately 4 feet to address projected sea level rise flooding risks. Shoreline protection improvements, including placing rip-rap along the water's edge, under this alternative would be similar to those under the Proposed Project. Like the Proposed Project, implementation of this alternative would take place over a period of 11 years, similar to the Proposed Project, and in several phases (up to five for the Proposed Project, up to four for this alternative).

Under this alternative, an exchange of land under the Public Trust Exchange Agreement would occur under in order to clarify the Public Trust status of portions of Pier 70 that would free some portions of the project site from the Public Trust while committing others to the Public Trust.

2010 Pier 70 Master Plan Alternative

DESCRIPTION

The purpose of the 2010 Pier 70 Master Plan Alternative is to evaluate the environmental impacts of a development scheme for the project site that conforms with the Port of San Francisco's *2010 Pier 70 Preferred Master Plan*. See "Port of San Francisco Pier 70 Preferred Master Plan" in Chapter 3, Plans and Policies, on pp. 3.7-3.9. The 2010 Pier 70 Master Plan Alternative includes approximately 31.4 acres, and would not include development on the 3.6-acre Hoedown Yard; this parcel would continue to be owned and operated by PG&E as a storage and maintenance yard.

Similar to the Proposed Project, this Alternative would amend the *General Plan* and Planning Code, adding a new Pier 70 SUD, which would establish land use and zoning controls for the 31.4-acre site. (See Figure 7.3: 2010 Pier 70 Master Plan Alternative – Land Use Plan in Chapter 7, Alternatives, p. 7.58.) The existing Zoning Map would be amended to show changes from the current Zoning District (M-2 and P) to the proposed SUD zoning. Under this alternative, as under the Proposed Project, the existing Height and Bulk Districts of 65-X and 40-X would be increased to 90-X, except for a 100-foot-wide portion adjacent to the shoreline that would remain at 40 feet, but would become public open space under this alternative. (See Figure 7.4: 2010 Pier 70 Master Plan Alternative – Maximum Height Plan in Chapter 7, Alternatives, p. 7.60.)

The 2010 Pier 70 Master Plan Alternative would include approximately 2,153,330 gsf of development, about 50 percent less square footage than under the Proposed Project. (See Figure 7.3.) This alternative would include 195 residential units totaling 160,440 gsf, 1,698,780 gsf of commercial (office) use, 188,610 gsf of retail use, and 105,500 gsf of arts/light-industrial uses. The 2010 Pier 70 Master Plan Alternative would provide 405 on-street vehicle parking spaces and 2,120 off-street spaces located on several surface parking lots on the site. Under this alternative, 8.07 acres of open space would be constructed, including promenade and terrace areas along the waterfront, a plaza and market square around Buildings 2 and 12, an open space block along the northern portion of the 28-Acre Site, and a plaza on 20th Street around Building 3A. Unlike the Proposed Project, this alternative does not include the Maximum Residential Scenario and the Maximum Commercial Scenario as optional development scenarios.

Like the Proposed Project, this alternative would include a Design for Development document comparable to that of the Proposed Project, but would apply specifically to the height districts, use program, and site plan for streets, configuration of parcels, and open spaces under this alternative. As with the Proposed Project, the Design for Development under this alternative would establish standards and guidelines for the rehabilitation of historic buildings, buildable zones for infill construction, and would contain project-wide as well as location-specific massing and architecture requirements that would govern the design of infill construction within the project site to ensure architectural compatibility with historic buildings within the UIW Historic District.

Under the 2010 Pier 70 Master Plan Alternative, a total of 293,228 gsf of existing buildings would be retained and rehabilitated in accordance with the Secretary of the Interior's Standards. Buildings 2, 12, and 19 on the project site would be retained and rehabilitated in their current location, and Building 21 would be relocated just to the south of the Historic Core boundary, at the intersection of Louisiana and 21st streets within the project site. The remaining six structures on the project site (Buildings 11, 15, 16, 25, 32, and 66), containing about 858,572 gsf, would be demolished. As with the Proposed Project, the northern spur of the Irish Hill remnant would be

removed to allow for the construction of 21st Street. Similar to the Proposed Project, the 2010 Pier 70 Master Plan Alternative includes construction of transportation and circulation improvements. Under this alternative, the following transportation and circulation improvements would be implemented: construction of new 21st Street, reconstruction of 20th and 22nd streets, and construction of new Louisiana and Maryland streets. All new and reconstructed streets would be built with sidewalks. The 2010 Pier 70 Master Plan Alternative would include the same bicycle circulation improvements (Bay Trail extension, Class II and Class III facilities on internal streets, and a bikeshare location) as the Proposed Project. The 2010 Pier 70 Master Plan Alternative would include the same TDM program as the Proposed Project, with exception of those items that pertain only to residential tenants. The TDM program would include establishment of a TMA that employs an on-site transit coordinator, operation of a shuttle system, maintenance of a TMA website with real-time transit information, distribution of educational documents, coordination of ride-matching services, enrollment in Emergency Ride Home program, employment of a district parking strategy, unbundled residential and commercial parking, provision of car-share parking spaces, metering of on-street parking, and parking wayfinding signage across the site.

Under this alternative, new and upgraded utilities and infrastructure, and a new 20th Street pump station, would be constructed. A combined sewer and stormwater system would be built, similar to Option 1 under the Proposed Project, but with slightly different alignments due to different building and roadway siting and locations. Unlike the Proposed Project, this alternative does not include variants. The 2010 Pier 70 Master Plan Alternative would further some of the project sponsors' objectives.

The 2010 Pier 70 Master Plan Alternative includes about 47,962 cubic yards of off-haul of excavated materials and about 8,900 cubic yards of clean fill import. It also includes construction of an engineered berm along the eastern property boundary with an approximately 3:1 slope and a maximum height of approximately 4 feet to address projected sea level rise flooding risks. Shoreline protection improvements under this alternative, including placement of new rip-rap along the water's edge, would be similar to those under the Proposed Project. Like the Proposed Project, implementation of this alternative would take place over a period of 11 years and in several phases (up to five for the Proposed Project, up to four for this alternative). Similar to the Proposed Project, an exchange of land under the Public Trust Exchange Agreement would occur under the 2010 Pier 70 Master Plan Alternative in order to clarify the Public Trust status portions of Pier 70, which would free some portions of the project site from the Public Trust while committing others to the Public Trust.

Table S.2: Comparison of Proposed Project to Alternatives and Summary of their Significant and Unavoidable Impacts

	Proposed Project – Maximum Residential Scenario	Proposed Project – Maximum Commercial Scenario	No Project Alternative	Code Compliant Alternative	2010 Pier 70 Master Plan Alternative
Legend: NI = No Impact; LS = Less than Significant; S = Significant; SU = Significant and unavoidable; SUM = Significant and unavoidable impact with mitigation; NA = Not Applicable

E. ENVIRONMENTALLY SUPERIOR ALTERNATIVE

The EIR is required to identify the environmentally superior alternative that has the fewest significant environmental impacts from among the other alternatives evaluated. The Proposed Project would result in significant and unavoidable impacts related to transportation (transit), noise, and air quality.

The Code Compliant Alternative is the environmentally superior alternative. Due to the substantially lower number of residential units and the decrease in the amount of commercial and RALI space to be constructed and occupied under the Code Compliant Alternative, that Alternative would lessen (but not avoid) the significant adverse impacts identified for the Proposed Project related to the topics of transportation, noise, and air quality.

Additionally, the Code Compliant Alternative would also lessen impacts of the Proposed Project that were found to be less than significant, or less than significant with mitigation, related to the topics of Land Use, Population and Housing, Cultural Resources (Archeological and Historic Architectural), Greenhouse Gas Emissions, Wind, Shadow, Recreation, Utilities and Service Systems, Public Services, Geology and Soils, Hazards and Hazardous Materials, and Mineral and Energy Resources. (There are no Agricultural Resources within the project site.)

The Code Compliant Alternative would partially meet the objectives of the Proposed Project. Like the Proposed Project, it would retain, rehabilitate, and reuse a former industrial complex that would continue to be a part of an historic district. It would provide public open spaces and waterfront access, commercial and retail space, and would contribute market-rate and affordable units toward meeting San Francisco's regional housing needs. However, it would provide substantially less public open space, market-rate and affordable residential units, and commercial and retail space than the Proposed Project. This alternative would not elevate building parcels, nor would it include a financing strategy to enable the project to adapt to future, increased levels of sea level rise. This alternative would not construct a high-quality, public-private development project that could attract sources of public investment, equity, and debt financing to fund site and infrastructure costs, and ongoing maintenance, and produce a market rate return investment that allows the Port to further its Public Trust mandate and mission.

F. AREAS OF KNOWN CONTROVERSY AND ISSUES TO BE RESOLVED

The Planning Department published an NOP on May 6, 2015, announcing its intent to prepare and distribute an EIR (the NOP is included in this EIR as Appendix A). The public review period began on May 6, 2015, and ended on June 5, 2015. During the NOP public review period, five

comment letters were submitted to the Planning Department by public agencies and other interested parties. On May 28, 2015, a public scoping meeting was held and four speakers contributed comments. A Notice of Preparation Public Comments Summary Report was prepared.[21]

Comments raised the following issues:

- Plans and Policies: Comments raised issues concerning the need for the EIR to evaluate conflicts between the Proposed Project and the goals of the *Central Waterfront Area Plan*.
- Land Use and Land Use Planning: A comment noted that the EIR should evaluate physical land use impacts from the Proposed Project and other past, present, and reasonably foreseeable projects. Also, a commenter noted that land use conflicts may arise from rezoning the Illinois Parcels.
- Cultural Resources: Comments raised issues concerning impacts of the Proposed Project on the historic and existing industrial land uses of the area.
- Transportation and Circulation: Comments raised issues concerning the Proposed Project's connectivity with the rest of San Francisco, particularly by way of 20th and 22nd streets; traffic and pedestrian safety impacts, specifically at the Illinois Parcels; traffic conflicts between the Proposed Project and the trucking route along Illinois Street, as well as noise, air quality, and pedestrian safety impacts created by trucks; the Transportation Impact Study prepared for the EIR; a TDM Plan that would reduce vehicle trips; mitigation measures to be included in the EIR; transportation impact fees; and consistency with the Waterfront Transportation Assessment.
- Noise: A comment asserted that the EIR should evaluate the noise impacts from nearby industrial uses (e.g., BAE Systems Ship Repair facility, PG&E Potrero Substation, and American Industrial Center) on future residents and employees.
- Air Quality: A comment asserted that the EIR should evaluate the air quality and odor impacts from the nearby industrial uses on future residents and employees.
- Hazards and Hazardous Materials: Comments raised concerns about serpentine soils, potential soil/groundwater contamination from underground tanks, and contaminated soil from past industrial uses on the project site and the risks to future residents and employees. One comment recommended that a full environmental remediation of the project site be considered, in accordance with Proposition D.
- Recreation: A comment stated that the EIR should consider the Bay Area Water Trail, and that storage, access, and landing areas remain available for non-motorized small watercraft (e.g., kayaks and canoes) who wish to use San Francisco Bay.
- Utilities: Comments raised issues concerning the need for the EIR to include City of San Francisco Ordinances regarding irrigation, use of non-potable water during construction, and water efficiency; stormwater management requirements and system configuration; the proposed recycled water system; updates to the Water Supply Assessment; and the

[21] *Pier 70 Mixed-Use District EIR NOP Public Scoping Summary*, September 16, 2015.

design of proposed utility systems, including the water distribution, wastewater, stormwater, and sewer/storm drain systems.

- Cumulative Impacts: A comment noted several projects that should be considered in the cumulative analysis, including the adjacent PG&E site (potential for redevelopment), water taxis, a second BART tunnel, and any other miscellaneous projects in the adjacent Dogpatch neighborhood.
- Alternatives: Comments suggested two alternatives to be considered in the EIR: a Reduced Parking Alternative and a Maximum Housing Alternative.
- General: A comment stated that the EIR should incorporate factual, direct statements as opposed to vague terminology.

Comments expressing support for the Proposed Project or opposition to it will be considered independent of the environmental review process by City decision-makers, as part of their decision to approve, modify, or disapprove the Proposed Project.

1. INTRODUCTION

Chapter 1, Introduction, presents a summary of the Pier 70 Mixed-Use District Project, outlines the purpose of this Environmental Impact Report (EIR), summarizes the environmental review process, and describes the organization of the EIR.

A. PROJECT SUMMARY

The Pier 70 area (Pier 70) encompasses approximately 69 acres of historic shipyard property along San Francisco's Central Waterfront. Most of Pier 70 is listed on the National Register of Historic Places as the Union Iron Works Historic District (UIW Historic District or Historic District). Pier 70 is owned by the City and County of San Francisco through the Port of San Francisco (Port). The Port intends to rehabilitate and redevelop Pier 70, and has selected Forest City Development California, Inc. (Forest City) to act as master developer for 28 acres of the Pier 70 site, and initiate rezoning and development of design standards and controls for a multi-phased, mixed-use development on that site and two adjacent parcels. Together, the Port and Forest City are the project sponsors for the Pier 70 Mixed-Use District Project (Proposed Project).

The project site is an approximately 35-acre area bounded by Illinois Street to the west, 20th Street to the north, San Francisco Bay to the east, and 22nd Street to the south. The site is divided into two development areas, the 28-Acre Site and the Illinois Parcels (the 20th/Illinois Parcel and the Hoedown Yard), which contain approximately 351,800 gross square feet (gsf) of deteriorating buildings and facilities. The majority of the project site is located within the UIW Historic District. The 28-Acre Site includes 12 of the 44 contributing historic resources and one of the ten non-contributing resources to the Historic District. All current uses on the site are temporary.

The Proposed Project would include market-rate and affordable residential uses, commercial use, retail/arts/light-industrial (RALI) uses, parking, shoreline improvements, infrastructure development and street improvements, and public open space. Project implementation would require amendments to the *San Francisco General Plan* and San Francisco Planning Code, adding a new Pier 70 Special Use District (SUD), changes to the Zoning Maps, and Planning Code text amendments to modify existing height limits and amendments to the Port's *Waterfront Land Use Plan*. The land use program under the SUD would be flexible, allowing for the development of certain parcels with either primarily commercial-office or residential uses, or, for two parcels on the project site (Parcels C1 and C2), structured parking. The Proposed Project would be implemented in up to five phases and would encompass between 4,179,300 to 4,212,230 gsf of new and rehabilitated development at build-out. Three contributing features to the UIW Historic District on the 28-Acre Site would be rehabilitated, consistent with the

Secretary of Interior's Standards for Treatment of Historic Properties, and adaptively reused. The Proposed Project would demolish seven contributing sheds, structures, and features on the site.[1]

B. PURPOSE OF THIS ENVIRONMENTAL IMPACT REPORT

This EIR has been prepared by the San Francisco Planning Department (Planning Department) in the City and County of San Francisco, the Lead Agency for the Proposed Project, in compliance with the provisions of the California Environmental Quality Act (CEQA) and the CEQA Guidelines (California Public Resources Code Section 21000 et seq., and California Code of Regulations Title 14, Section 15000 et seq., "CEQA Guidelines"), and Chapter 31 of the San Francisco Administrative Code. The lead agency is the public agency that has the principal responsibility for carrying out or approving a project.

Pursuant to CEQA Guidelines Section 15161, this is a project-level EIR, defined as an EIR that examines the physical environmental impacts of a specific development project. This EIR assesses potentially significant impacts in the areas of land use and land use planning, population and housing, cultural resources (archeological resources and historic architectural resources), transportation and circulation, noise and vibration, air quality, greenhouse gas emissions, wind and shadow, recreation, utilities and service systems, public services, biological resources, geology and soils, hydrology and water quality, hazards and hazardous materials, mineral and energy resources, and agriculture and forest resources. As defined in CEQA Guidelines Section 15382, a "significant effect on the environment" is:

> . . . a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project including land, air, water, minerals, flora, fauna, ambient noise, and objects of historic or aesthetic significance. An economic or social change by itself shall not be considered a significant effect on the environment. A social or economic change related to a physical change may be considered in determining whether the physical change is significant.

On September 27, 2013, Governor Brown signed Senate Bill (SB) 743, which became effective on January 1, 2014. Among other things, SB 743 added Section 21099 to the California Public Resources Code, which removes requirements for the analysis of aesthetics and parking impacts for certain urban infill projects from CEQA. The Proposed Project meets the definition of a mixed-use residential project on an infill site located within a transit priority area as specified by California Public Resources Code Section 21099.[2] Accordingly, this EIR does not contain a

[1] An additional building located on the project site, Building 117, is proposed by the Port to be demolished prior to approval of the Proposed Project to allow the adjacent building (Building 116) located on the 20th Street Historic Core site to be rehabilitated to meet fire code. San Francisco Planning Department, Notification of Project Receiving Environmental Review, Illinois and 20th Streets/Pier 70 ("20th Street Historic Core"), Case No. 2016-000346ENV, September 8, 2016.

[2] San Francisco Planning Department, *Transit-Oriented Infill Project Eligibility Checklist*, Pier 70 Mixed Use Project, Case No. 2014-001272ENV, dated November 18, 2015.

separate discussion of the topic of aesthetics, which can no longer be considered in determining the Proposed Project's physical environmental effects under CEQA. The EIR nonetheless provides visual simulations for informational purposes as part of Chapter 2, Project Description. In addition, parking is discussed for informational purposes in Section 4.C, Transportation and Circulation. (See Section 4.A, Introduction to Chapter 4, pp. 4.A.3-4.A.5, for further discussion of SB 743 and California Public Resources Code Section 21099.)

This EIR assesses potentially significant impacts of the Proposed Project. As stated in CEQA Guidelines Section 15121(a), an EIR is an informational document intended to inform public agency decision-makers and the public of the significant environmental effects of a project, identify possible ways to minimize the significant effects, and describe reasonable alternatives to the project. CEQA requires that public agencies not approve projects until all feasible means available have been employed to substantially lessen the significant environmental effects of such projects.

Before any discretionary project approvals may be granted for the Proposed Project, the San Francisco Planning Commission (Planning Commission) must certify the EIR as adequate, accurate, and objective. EIR adequacy is defined in CEQA Guidelines Section 15151, Standards for Adequacy of an EIR, which states:

> An EIR should be prepared with a sufficient degree of analysis to provide decision-makers with information which enables them to make a decision which intelligently takes account of environmental consequences. An evaluation of the environmental effects of a proposed project need not be exhaustive, but the sufficiency of an EIR is to be reviewed in the light of what is reasonably feasible. Disagreement among experts does not make an EIR inadequate, but the EIR should summarize the main points of disagreement among the experts. The courts have looked not for perfection but for adequacy, completeness, and a good faith effort at full disclosure.

The degree of specificity required in an EIR should "correspond to the degree of specificity involved in the underlying activity which is described in the EIR" (CEQA Guidelines Section 15146).

City decision-makers will use the certified EIR, along with other information and public processes, to determine whether to approve, modify, or disapprove the Proposed Project, and to require any feasible mitigation measures as conditions of project approval.

C. ENVIRONMENTAL REVIEW PROCESS

On November 5, 2014, the project sponsors, the Port and Forest City, submitted an Environmental Evaluation Application for the Pier 70 Mixed-Use District Project to the Planning

Department.[3] The environmental review process for the Proposed Project includes a number of steps: publication and circulation for public comment of a Notice of Preparation (NOP), publication of a Draft EIR for public review and comment, preparation and publication of responses to public and agency comments on the Draft EIR, and certification of the Final EIR. These steps are described below.

Notice of Preparation

The Planning Department published an NOP of an EIR on May 6, 2015, announcing its intent to prepare and distribute an EIR on the Pier 70 Mixed-Use District Project (Appendix A to this EIR).

PUBLIC REVIEW OF AND COMMENTS ON THE NOTICE OF PREPARATION

Publication of the NOP initiated a 30-day public review and comment period that ended on June 5, 2015. Pursuant to the California Public Resources Code Section 21083.9 and CEQA Guidelines Section 15206, a public scoping meeting was held on May 28, 2015, to receive oral comments concerning the scope of the EIR. Four commenters spoke at the meeting. In addition to these comments, the Planning Department received five comment letters from interested parties during the public review and comment period. The comment letters received in response to the NOP and a copy of the transcript from the public scoping meeting are available for review at the Planning Department offices as part of Case File No. 2014-001272ENV. The Planning Department has considered the comments made by the public in preparation of the Draft EIR for the Proposed Project. Comments on the NOP that relate to environmental issues are summarized below and are addressed in this EIR, as noted.

Comments on the NOP raised the following issues:

Plans and Policies: Comments raised issues concerning the need for the EIR to evaluate conflicts between the Proposed Project and the goals of the *Central Waterfront Area Plan*. The Proposed Project's compatibility with applicable plans and policies is discussed in Chapter 3, Plans and Policies.

Land Use and Land Use Planning: A comment noted that the EIR should evaluate physical land use impacts from the Proposed Project and other past, present, and reasonably foreseeable projects. Project-specific and cumulative land use impacts are discussed in Section 4.B, Land Use and Land Use Planning, pp. 4.B.17-4.B.28.

[3] Environmental Evaluation Application for the Pier 70 Mixed-Use District Project, dated November 5, 2014.

Cultural Resources: Comments raised issues concerning impacts of the Proposed Project on the historic and existing industrial land uses of the area. The Proposed Project's impacts on historical resources are evaluated in Section 4.D, Cultural Resources (Historic Architectural Resources), pp. 4.D.33-4.D.115, and land use compatibility is addressed in Section 4.B, Land Use and Land Use Planning, pp. 4.B.24-4.B.28.

Transportation and Circulation: Comments raised issues concerning the Proposed Project's connectivity with the rest of San Francisco, particularly by way of 20th and 22nd streets; traffic and pedestrian safety impacts, specifically at the Illinois Parcels; traffic conflicts between the Proposed Project and the trucking route along Illinois Street, as well as noise, air quality, and pedestrian safety impacts created by trucks; the Transportation Impact Study prepared for the EIR; a Transportation Demand Management Plan that would reduce vehicle trips; mitigation measures to be included in the EIR; transportation impact fees; and consistency with the Waterfront Transportation Assessment.

The Proposed Project's Transportation Demand Management Plan is described in Chapter 2, Project Description, on pp. 2.51. The proposed roadway network is also described in Chapter 2 on pp. 2.49-2.50. Section 4.E, Transportation and Circulation, addresses applicable regulatory compliance, and the construction and operation impacts that the Proposed Project's transportation and land use changes would have on traffic, transit, pedestrian, and circulation conditions. Section 4.E summarizes the information in the Transportation Impact Study prepared for the Proposed Project. Mitigation measures are presented as part of the impact evaluation in Section 4.E. Proposed roadway improvements are discussed in Chapter 2 on pp. 2.49-2.50, and analyzed in Section 4.E, pp. 4.E.84-4.E.126. The Proposed Project's noise and air quality impacts are analyzed in Section 4.F, Noise and Vibration, and Section 4.G, Air Quality, respectively.

Noise: A comment asserted that the EIR should evaluate the noise impacts from nearby industrial uses (e.g., BAE Systems Ship Repair facility, the Pacific Gas and Electric Company (PG&E) Potrero Substation, and American Industrial Center) on future residents and employees. Section 4.F, Noise, describes the existing noise environment in the project area and evaluates the potential noise impacts on future residents and employees.

Air Quality: A comment asserted that the EIR should evaluate the air quality and odor impacts from nearby industrial uses on future residents and employees. Section 4.G, Air Quality, discusses the existing air quality conditions in the project area and evaluates the Proposed Project's potential air quality impacts during construction and operation. The section includes an assessment of potential odor impacts.

Hazards and Hazardous Materials: Comments raised concerns about serpentine soils, potential soil/groundwater contamination from underground tanks, and contaminated soil from past industrial uses on the project site, and the risks to future residents and employees. One comment recommended that a full environmental remediation of the project site be considered, in accordance with Proposition D. Existing conditions at the project site and impacts of the Proposed Project in regard to hazards and hazardous materials are described in Section 4.P, Hazards and Hazardous Materials.

Recreation: A comment stated that the EIR should consider the Bay Area Water Trail, and that storage, access, and landing areas remain available for non-motorized small watercraft (e.g., kayaks and canoes) who wish to use San Francisco Bay. The *Enhanced Water Trail Plan* is discussed in Section 4.J, Recreation, pp. 4.J.20.

Utilities: Comments raised issues concerning the need for the EIR to include a discussion of City of San Francisco Ordinances regarding irrigation, use of non-potable water during construction, and water efficiency; stormwater management requirements and system configuration; the proposed recycled water system; updates to the Water Supply Assessment; and the design of proposed utility systems, including the water distribution, wastewater, stormwater, and sewer/storm drain systems. The utilities and service system design for the Proposed Project is described in Chapter 2, Project Description, pp. 2.55-2.67. Section 4.K, Utilities and Service Systems, addresses the potential effects of the Proposed Project on existing public utilities and service systems, including water supply, wastewater, and stormwater, as well as applicable regulatory compliance and the design of proposed systems.

Cumulative Impacts: A comment noted several projects that should be considered in the cumulative analysis, including the adjacent PG&E Site (potential for redevelopment), water taxis, a second BART tunnel, and any other miscellaneous projects in the adjacent Dogpatch neighborhood. Applicable cumulative projects considered in the EIR are presented in Section 4.A, Introduction to Chapter 4, pp. 4.A.12-4.A.18, and analyzed in applicable sections throughout Chapter 4, Environmental Setting and Impacts.

Alternatives: Comments suggested two alternatives to be considered in the EIR: a Reduced Parking Alternative and a Maximum Housing Alternative. EIR Chapter 7, Alternatives, presents and analyzes a reasonable range of feasible alternatives to the Proposed Project. Alternatives are presented and analyzed in this EIR for the purpose of fostering informed decision-making by presenting a range of alternatives that could lessen the significant and less-than-significant impacts identified for the Proposed Project while feasibly attaining most of the basic project objectives.

General: A comment stated that the EIR should incorporate factual, direct statements as opposed to vague terminology. Terms are defined in text or in footnotes in each of the chapters. A list of acronyms and abbreviations used in the EIR is presented on pp. x-xiii.

Draft Environmental Impact Report

This Draft EIR has been prepared in accordance with CEQA and the CEQA Guidelines. It provides an analysis of the project-specific physical environmental impacts of construction and operation of the Proposed Project, and the project's contribution to the environmental impacts from foreseeable cumulative development in the project site vicinity and the City as a whole.

Copies of the Draft EIR are available at the Planning Information Counter, San Francisco Planning Department, 1660 Mission Street, 1st Floor, San Francisco, CA 94103. The Draft EIR is also available for viewing or downloading at the Planning Department website, http://tinyurl.com/sfceqadocs, by choosing the link for Negative Declarations and EIRs under "Current Documents for Public Review" and searching for Case File No. 2014-001272ENV. You may also request that a copy be sent to you by calling (415) 575-9041 or emailing the EIR Coordinator, Melinda Hue, at melinda.hue@sfgov.org.

All documents referenced in this Draft EIR, and the distribution list for the Draft EIR, are available for review at the San Francisco Planning Department, 1650 Mission Street, Suite 400, San Francisco, CA 94103, as part of Case File No. 2014-001272ENV.

How to Comment on the Draft Environmental Impact Report

This Draft EIR was published on December 21, 2016. There will be a public hearing before the Planning Commission during the 60-day public review and comment period for this EIR to solicit public comment on the adequacy and accuracy of information presented in this Draft EIR. The public comment period for this EIR is December 22, 2016, to February 21, 2017. The public hearing on this Draft EIR has been scheduled before the Planning Commission for February 9, 2017, in Room 400, City Hall, 1 Dr. Carlton B. Goodlett Place beginning at 10:00 a.m. or later. Please call (415) 558-6422 the week of the hearing for a recorded message giving a more specific time. In addition, during the public review and comment period, members of the public are invited to submit written comments on the adequacy of the document, that is, whether this Draft EIR identifies and analyzes the possible environmental impacts and identifies appropriate mitigation measures.

Written comments should be submitted to:

Lisa Gibson, Acting Environmental Review Officer
Re: Pier 70 Mixed-Use District Project Draft EIR
San Francisco Planning Department
1650 Mission Street, Suite 400
San Francisco, CA 94103

Comments may also be submitted by email to lisa.gibson@sfgov.org. Comments must be received by 5:00 p.m. on February 21, 2017.

Commenters are not required to provide personal identifying information. All written or oral communications, including submitted personal contact information, may be made available to the public for inspection and copying upon request and may appear on the Planning Department's website or in other public documents.

Only commenters on the Draft EIR will be permitted to file an appeal of the certification of the Final EIR to the Board of Supervisors.

Final Environmental Impact Report

Following the close of the Draft EIR public review and comment period, the Planning Department will prepare and publish a document entitled "Responses to Comments," which will contain a copy of all comments on this Draft EIR and the City's responses to those comments and any necessary changes to the text, along with copies of the letters received and a transcript of the Planning Commission public hearing on the Draft EIR. This Draft EIR, together with the Responses to Comments document, will be considered by the Planning Commission in an advertised public meeting, and then certified as a Final EIR, if deemed adequate.

The Planning Commission and the Board of Supervisors will use the information in the Final EIR in their deliberations on whether to approve, modify, or deny the Proposed Project or aspects of the Proposed Project. If the Planning Commission and the Board of Supervisors decide to approve the Proposed Project, their approval action must include findings that identify significant project-related impacts that would result; discuss mitigation measures or alternatives that have been adopted to reduce significant impacts to less-than-significant levels; determine whether mitigation measures or alternatives are within the jurisdiction of other public agencies; and explain reasons for rejecting mitigation measures or alternatives if any are infeasible for legal, social, economic, technological, or other reasons.

A Mitigation Monitoring and Reporting Program (MMRP) must be adopted by the Planning Commission and the Board of Supervisors as part of the adoption of the CEQA findings and project approvals by those bodies to the extent that mitigation measures are made part of the

Proposed Project. The MMRP identifies the measures included in the Proposed Project or imposed by the decision-makers as conditions of approval, the entities responsible for carrying out the measures, and the timing of implementation. If significant unavoidable impacts would remain after all feasible mitigation measures are implemented, the approving body, if it elects to approve the Proposed Project, must adopt a statement of overriding considerations explaining how the benefits of the Proposed Project would outweigh the significant impacts.

D. ORGANIZATION OF THIS EIR

This EIR is organized into eight chapters, as described below.

The Summary chapter provides a concise overview of the Proposed Project and the necessary approvals; the environmental impacts that would result from the Proposed Project; mitigation measures identified to reduce or eliminate these impacts; project alternatives; and areas of known controversy and issues to be resolved.

Chapter 1, Introduction, provides a summary of the Proposed Project and describes the type, purpose, and function of the EIR; the environmental review process and comments received on the NOP; and the organization of the EIR.

Chapter 2, Project Description, presents details about the Proposed Project and the approvals required to implement it.

Chapter 3, Plans and Policies, describes inconsistencies of the Proposed Project with applicable State, regional, and local plans and policies.

Chapter 4, Environmental Setting and Impacts, addresses the following topics:

- A. Introduction
- B. Land Use and Land Use Planning
- C. Population and Housing
- D. Cultural Resources
- E. Transportation and Circulation
- F. Noise and Vibration
- G. Air Quality
- H. Greenhouse Gas Emissions
- I. Wind and Shadow
- J. Recreation
- K. Utilities and Service Systems
- L. Public Services
- M. Biological Resources
- N. Geology and Soils
- O. Hydrology and Water Quality
- P. Hazards and Hazardous Materials
- Q. Mineral and Energy Resources
- R. Agriculture and Forest Resources

Each topic section presents the environmental setting; regulatory framework; approach to analysis; project features that are relevant to the topic; project-specific and cumulative impacts; and mitigation measures and improvement measures, when appropriate.

Chapter 5, Other CEQA Issues, addresses potential growth-inducing impacts of the Proposed Project and identifies significant effects that cannot be avoided if the Proposed Project is implemented, as well as significant irreversible impacts of the project, and areas of known controversy and project-related issues that have not been resolved.

Chapter 6, Project Variants, presents one proposed construction-related and three proposed operational-related variants on infrastructure features of the Proposed Project that focus on sustainability. The variants modify one limited feature or aspect of the Proposed Project. The four variants considered are a Reduced Off-Haul Variant, a District Energy System Variant, a Wastewater Treatment and Reuse System Variant, and an Automated Waste Collection System Variant.

Chapter 7, Alternatives, presents and analyzes a range of alternatives to the Proposed Project. Three alternatives are described and evaluated: a No Project Alternative, which is required by CEQA; a Code Compliant Alternative; and a 2010 Pier 70 Master Plan Alternative. This chapter also identifies the environmentally superior alternative. It discusses any alternatives that were considered for analysis in the EIR but rejected, and gives the reasons for their rejection.

Chapter 8, Report Preparers, identifies the EIR authors and the agencies, organizations, and individuals consulted during preparation of the Draft EIR. In addition, the project sponsors, their attorneys, and any consultants working on their behalf are listed.

The EIR has six appendices:

- Appendix A: Notice of Preparation
- Appendix B: Transportation Impact Study
- Appendix C: Noise Technical Memorandum
- Appendix D: Air Quality Technical Report
- Appendix E: Biological Resources
- Appendix F: Hazards and Hazardous Materials

1. INTRODUCTION

Chapter 1, Introduction, presents a summary of the Pier 70 Mixed-Use District Project, outlines the purpose of this Environmental Impact Report (EIR), summarizes the environmental review process, and describes the organization of the EIR.

A. PROJECT SUMMARY

The Pier 70 area (Pier 70) encompasses approximately 69 acres of historic shipyard property along San Francisco's Central Waterfront. Most of Pier 70 is listed on the National Register of Historic Places as the Union Iron Works Historic District (UIW Historic District or Historic District). Pier 70 is owned by the City and County of San Francisco through the Port of San Francisco (Port). The Port intends to rehabilitate and redevelop Pier 70, and has selected Forest City Development California, Inc. (Forest City) to act as master developer for 28 acres of the Pier 70 site, and initiate rezoning and development of design standards and controls for a multi-phased, mixed-use development on that site and two adjacent parcels. Together, the Port and Forest City are the project sponsors for the Pier 70 Mixed-Use District Project (Proposed Project).

The project site is an approximately 35-acre area bounded by Illinois Street to the west, 20th Street to the north, San Francisco Bay to the east, and 22nd Street to the south. The site is divided into two development areas, the 28-Acre Site and the Illinois Parcels (the 20th/Illinois Parcel and the Hoedown Yard), which contain approximately 351,800 gross square feet (gsf) of deteriorating buildings and facilities. The majority of the project site is located within the UIW Historic District. The 28-Acre Site includes 12 of the 44 contributing historic resources and one of the ten non-contributing resources to the Historic District. All current uses on the site are temporary.

The Proposed Project would include market-rate and affordable residential uses, commercial use, retail/arts/light-industrial (RALI) uses, parking, shoreline improvements, infrastructure development and street improvements, and public open space. Project implementation would require amendments to the *San Francisco General Plan* and San Francisco Planning Code, adding a new Pier 70 Special Use District (SUD), changes to the Zoning Maps, and Planning Code text amendments to modify existing height limits and amendments to the Port's *Waterfront Land Use Plan*. The land use program under the SUD would be flexible, allowing for the development of certain parcels with either primarily commercial-office or residential uses, or, for two parcels on the project site (Parcels C1 and C2), structured parking. The Proposed Project would be implemented in up to five phases and would encompass between 4,179,300 to 4,212,230 gsf of new and rehabilitated development at build-out. Three contributing features to the UIW Historic District on the 28-Acre Site would be rehabilitated, consistent with the

Secretary of Interior's Standards for Treatment of Historic Properties, and adaptively reused. The Proposed Project would demolish seven contributing sheds, structures, and features on the site.[1]

B. PURPOSE OF THIS ENVIRONMENTAL IMPACT REPORT

This EIR has been prepared by the San Francisco Planning Department (Planning Department) in the City and County of San Francisco, the Lead Agency for the Proposed Project, in compliance with the provisions of the California Environmental Quality Act (CEQA) and the CEQA Guidelines (California Public Resources Code Section 21000 et seq., and California Code of Regulations Title 14, Section 15000 et seq., "CEQA Guidelines"), and Chapter 31 of the San Francisco Administrative Code. The lead agency is the public agency that has the principal responsibility for carrying out or approving a project.

Pursuant to CEQA Guidelines Section 15161, this is a project-level EIR, defined as an EIR that examines the physical environmental impacts of a specific development project. This EIR assesses potentially significant impacts in the areas of land use and land use planning, population and housing, cultural resources (archeological resources and historic architectural resources), transportation and circulation, noise and vibration, air quality, greenhouse gas emissions, wind and shadow, recreation, utilities and service systems, public services, biological resources, geology and soils, hydrology and water quality, hazards and hazardous materials, mineral and energy resources, and agriculture and forest resources. As defined in CEQA Guidelines Section 15382, a "significant effect on the environment" is:

> . . . a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project including land, air, water, minerals, flora, fauna, ambient noise, and objects of historic or aesthetic significance. An economic or social change by itself shall not be considered a significant effect on the environment. A social or economic change related to a physical change may be considered in determining whether the physical change is significant.

On September 27, 2013, Governor Brown signed Senate Bill (SB) 743, which became effective on January 1, 2014. Among other things, SB 743 added Section 21099 to the California Public Resources Code, which removes requirements for the analysis of aesthetics and parking impacts for certain urban infill projects from CEQA. The Proposed Project meets the definition of a mixed-use residential project on an infill site located within a transit priority area as specified by California Public Resources Code Section 21099.[2] Accordingly, this EIR does not contain a

[1] An additional building located on the project site, Building 117, is proposed by the Port to be demolished prior to approval of the Proposed Project to allow the adjacent building (Building 116) located on the 20th Street Historic Core site to be rehabilitated to meet fire code. San Francisco Planning Department, Notification of Project Receiving Environmental Review, Illinois and 20th Streets/Pier 70 ("20th Street Historic Core"), Case No. 2016-000346ENV, September 8, 2016.

[2] San Francisco Planning Department, *Transit-Oriented Infill Project Eligibility Checklist*, Pier 70 Mixed Use Project, Case No. 2014-001272ENV, dated November 18, 2015.

separate discussion of the topic of aesthetics, which can no longer be considered in determining the Proposed Project's physical environmental effects under CEQA. The EIR nonetheless provides visual simulations for informational purposes as part of Chapter 2, Project Description. In addition, parking is discussed for informational purposes in Section 4.C, Transportation and Circulation. (See Section 4.A, Introduction to Chapter 4, pp. 4.A.3-4.A.5, for further discussion of SB 743 and California Public Resources Code Section 21099.)

This EIR assesses potentially significant impacts of the Proposed Project. As stated in CEQA Guidelines Section 15121(a), an EIR is an informational document intended to inform public agency decision-makers and the public of the significant environmental effects of a project, identify possible ways to minimize the significant effects, and describe reasonable alternatives to the project. CEQA requires that public agencies not approve projects until all feasible means available have been employed to substantially lessen the significant environmental effects of such projects.

Before any discretionary project approvals may be granted for the Proposed Project, the San Francisco Planning Commission (Planning Commission) must certify the EIR as adequate, accurate, and objective. EIR adequacy is defined in CEQA Guidelines Section 15151, Standards for Adequacy of an EIR, which states:

> An EIR should be prepared with a sufficient degree of analysis to provide decision-makers with information which enables them to make a decision which intelligently takes account of environmental consequences. An evaluation of the environmental effects of a proposed project need not be exhaustive, but the sufficiency of an EIR is to be reviewed in the light of what is reasonably feasible. Disagreement among experts does not make an EIR inadequate, but the EIR should summarize the main points of disagreement among the experts. The courts have looked not for perfection but for adequacy, completeness, and a good faith effort at full disclosure.

The degree of specificity required in an EIR should "correspond to the degree of specificity involved in the underlying activity which is described in the EIR" (CEQA Guidelines Section 15146).

City decision-makers will use the certified EIR, along with other information and public processes, to determine whether to approve, modify, or disapprove the Proposed Project, and to require any feasible mitigation measures as conditions of project approval.

C. ENVIRONMENTAL REVIEW PROCESS

On November 5, 2014, the project sponsors, the Port and Forest City, submitted an Environmental Evaluation Application for the Pier 70 Mixed-Use District Project to the Planning

Department.[3] The environmental review process for the Proposed Project includes a number of steps: publication and circulation for public comment of a Notice of Preparation (NOP), publication of a Draft EIR for public review and comment, preparation and publication of responses to public and agency comments on the Draft EIR, and certification of the Final EIR. These steps are described below.

Notice of Preparation

The Planning Department published an NOP of an EIR on May 6, 2015, announcing its intent to prepare and distribute an EIR on the Pier 70 Mixed-Use District Project (Appendix A to this EIR).

PUBLIC REVIEW OF AND COMMENTS ON THE NOTICE OF PREPARATION

Publication of the NOP initiated a 30-day public review and comment period that ended on June 5, 2015. Pursuant to the California Public Resources Code Section 21083.9 and CEQA Guidelines Section 15206, a public scoping meeting was held on May 28, 2015, to receive oral comments concerning the scope of the EIR. Four commenters spoke at the meeting. In addition to these comments, the Planning Department received five comment letters from interested parties during the public review and comment period. The comment letters received in response to the NOP and a copy of the transcript from the public scoping meeting are available for review at the Planning Department offices as part of Case File No. 2014-001272ENV. The Planning Department has considered the comments made by the public in preparation of the Draft EIR for the Proposed Project. Comments on the NOP that relate to environmental issues are summarized below and are addressed in this EIR, as noted.

Comments on the NOP raised the following issues:

Plans and Policies: Comments raised issues concerning the need for the EIR to evaluate conflicts between the Proposed Project and the goals of the *Central Waterfront Area Plan*. The Proposed Project's compatibility with applicable plans and policies is discussed in Chapter 3, Plans and Policies.

Land Use and Land Use Planning: A comment noted that the EIR should evaluate physical land use impacts from the Proposed Project and other past, present, and reasonably foreseeable projects. Project-specific and cumulative land use impacts are discussed in Section 4.B, Land Use and Land Use Planning, pp. 4.B.17-4.B.28.

[3] Environmental Evaluation Application for the Pier 70 Mixed-Use District Project, dated November 5, 2014.

Cultural Resources: Comments raised issues concerning impacts of the Proposed Project on the historic and existing industrial land uses of the area. The Proposed Project's impacts on historical resources are evaluated in Section 4.D, Cultural Resources (Historic Architectural Resources), pp. 4.D.33-4.D.115, and land use compatibility is addressed in Section 4.B, Land Use and Land Use Planning, pp. 4.B.24-4.B.28.

Transportation and Circulation: Comments raised issues concerning the Proposed Project's connectivity with the rest of San Francisco, particularly by way of 20th and 22nd streets; traffic and pedestrian safety impacts, specifically at the Illinois Parcels; traffic conflicts between the Proposed Project and the trucking route along Illinois Street, as well as noise, air quality, and pedestrian safety impacts created by trucks; the Transportation Impact Study prepared for the EIR; a Transportation Demand Management Plan that would reduce vehicle trips; mitigation measures to be included in the EIR; transportation impact fees; and consistency with the Waterfront Transportation Assessment.

The Proposed Project's Transportation Demand Management Plan is described in Chapter 2, Project Description, on pp. 2.51. The proposed roadway network is also described in Chapter 2 on pp. 2.49-2.50. Section 4.E, Transportation and Circulation, addresses applicable regulatory compliance, and the construction and operation impacts that the Proposed Project's transportation and land use changes would have on traffic, transit, pedestrian, and circulation conditions. Section 4.E summarizes the information in the Transportation Impact Study prepared for the Proposed Project. Mitigation measures are presented as part of the impact evaluation in Section 4.E. Proposed roadway improvements are discussed in Chapter 2 on pp. 2.49-2.50, and analyzed in Section 4.E, pp. 4.E.84-4.E.126. The Proposed Project's noise and air quality impacts are analyzed in Section 4.F, Noise and Vibration, and Section 4.G, Air Quality, respectively.

Noise: A comment asserted that the EIR should evaluate the noise impacts from nearby industrial uses (e.g., BAE Systems Ship Repair facility, the Pacific Gas and Electric Company (PG&E) Potrero Substation, and American Industrial Center) on future residents and employees. Section 4.F, Noise, describes the existing noise environment in the project area and evaluates the potential noise impacts on future residents and employees.

Air Quality: A comment asserted that the EIR should evaluate the air quality and odor impacts from nearby industrial uses on future residents and employees. Section 4.G, Air Quality, discusses the existing air quality conditions in the project area and evaluates the Proposed Project's potential air quality impacts during construction and operation. The section includes an assessment of potential odor impacts.

Hazards and Hazardous Materials: Comments raised concerns about serpentine soils, potential soil/groundwater contamination from underground tanks, and contaminated soil from past industrial uses on the project site, and the risks to future residents and employees. One comment recommended that a full environmental remediation of the project site be considered, in accordance with Proposition D. Existing conditions at the project site and impacts of the Proposed Project in regard to hazards and hazardous materials are described in Section 4.P, Hazards and Hazardous Materials.

Recreation: A comment stated that the EIR should consider the Bay Area Water Trail, and that storage, access, and landing areas remain available for non-motorized small watercraft (e.g., kayaks and canoes) who wish to use San Francisco Bay. The *Enhanced Water Trail Plan* is discussed in Section 4.J, Recreation, pp. 4.J.20.

Utilities: Comments raised issues concerning the need for the EIR to include a discussion of City of San Francisco Ordinances regarding irrigation, use of non-potable water during construction, and water efficiency; stormwater management requirements and system configuration; the proposed recycled water system; updates to the Water Supply Assessment; and the design of proposed utility systems, including the water distribution, wastewater, stormwater, and sewer/storm drain systems. The utilities and service system design for the Proposed Project is described in Chapter 2, Project Description, pp. 2.55-2.67. Section 4.K, Utilities and Service Systems, addresses the potential effects of the Proposed Project on existing public utilities and service systems, including water supply, wastewater, and stormwater, as well as applicable regulatory compliance and the design of proposed systems.

Cumulative Impacts: A comment noted several projects that should be considered in the cumulative analysis, including the adjacent PG&E Site (potential for redevelopment), water taxis, a second BART tunnel, and any other miscellaneous projects in the adjacent Dogpatch neighborhood. Applicable cumulative projects considered in the EIR are presented in Section 4.A, Introduction to Chapter 4, pp. 4.A.12-4.A.18, and analyzed in applicable sections throughout Chapter 4, Environmental Setting and Impacts.

Alternatives: Comments suggested two alternatives to be considered in the EIR: a Reduced Parking Alternative and a Maximum Housing Alternative. EIR Chapter 7, Alternatives, presents and analyzes a reasonable range of feasible alternatives to the Proposed Project. Alternatives are presented and analyzed in this EIR for the purpose of fostering informed decision-making by presenting a range of alternatives that could lessen the significant and less-than-significant impacts identified for the Proposed Project while feasibly attaining most of the basic project objectives.

General: A comment stated that the EIR should incorporate factual, direct statements as opposed to vague terminology. Terms are defined in text or in footnotes in each of the chapters. A list of acronyms and abbreviations used in the EIR is presented on pp. x-xiii.

Draft Environmental Impact Report

This Draft EIR has been prepared in accordance with CEQA and the CEQA Guidelines. It provides an analysis of the project-specific physical environmental impacts of construction and operation of the Proposed Project, and the project's contribution to the environmental impacts from foreseeable cumulative development in the project site vicinity and the City as a whole.

Copies of the Draft EIR are available at the Planning Information Counter, San Francisco Planning Department, 1660 Mission Street, 1st Floor, San Francisco, CA 94103. The Draft EIR is also available for viewing or downloading at the Planning Department website, http://tinyurl.com/sfceqadocs, by choosing the link for Negative Declarations and EIRs under "Current Documents for Public Review" and searching for Case File No. 2014-001272ENV. You may also request that a copy be sent to you by calling (415) 575-9041 or emailing the EIR Coordinator, Melinda Hue, at melinda.hue@sfgov.org.

All documents referenced in this Draft EIR, and the distribution list for the Draft EIR, are available for review at the San Francisco Planning Department, 1650 Mission Street, Suite 400, San Francisco, CA 94103, as part of Case File No. 2014-001272ENV.

How to Comment on the Draft Environmental Impact Report

This Draft EIR was published on December 21, 2016. There will be a public hearing before the Planning Commission during the 60-day public review and comment period for this EIR to solicit public comment on the adequacy and accuracy of information presented in this Draft EIR. The public comment period for this EIR is December 22, 2016, to February 21, 2017. The public hearing on this Draft EIR has been scheduled before the Planning Commission for February 9, 2017, in Room 400, City Hall, 1 Dr. Carlton B. Goodlett Place beginning at 10:00 a.m. or later. Please call (415) 558-6422 the week of the hearing for a recorded message giving a more specific time. In addition, during the public review and comment period, members of the public are invited to submit written comments on the adequacy of the document, that is, whether this Draft EIR identifies and analyzes the possible environmental impacts and identifies appropriate mitigation measures.

Written comments should be submitted to:

Lisa Gibson, Acting Environmental Review Officer
Re: Pier 70 Mixed-Use District Project Draft EIR
San Francisco Planning Department
1650 Mission Street, Suite 400
San Francisco, CA 94103

Comments may also be submitted by email to lisa.gibson@sfgov.org. Comments must be received by 5:00 p.m. on February 21, 2017.

Commenters are not required to provide personal identifying information. All written or oral communications, including submitted personal contact information, may be made available to the public for inspection and copying upon request and may appear on the Planning Department's website or in other public documents.

Only commenters on the Draft EIR will be permitted to file an appeal of the certification of the Final EIR to the Board of Supervisors.

Final Environmental Impact Report

Following the close of the Draft EIR public review and comment period, the Planning Department will prepare and publish a document entitled "Responses to Comments," which will contain a copy of all comments on this Draft EIR and the City's responses to those comments and any necessary changes to the text, along with copies of the letters received and a transcript of the Planning Commission public hearing on the Draft EIR. This Draft EIR, together with the Responses to Comments document, will be considered by the Planning Commission in an advertised public meeting, and then certified as a Final EIR, if deemed adequate.

The Planning Commission and the Board of Supervisors will use the information in the Final EIR in their deliberations on whether to approve, modify, or deny the Proposed Project or aspects of the Proposed Project. If the Planning Commission and the Board of Supervisors decide to approve the Proposed Project, their approval action must include findings that identify significant project-related impacts that would result; discuss mitigation measures or alternatives that have been adopted to reduce significant impacts to less-than-significant levels; determine whether mitigation measures or alternatives are within the jurisdiction of other public agencies; and explain reasons for rejecting mitigation measures or alternatives if any are infeasible for legal, social, economic, technological, or other reasons.

A Mitigation Monitoring and Reporting Program (MMRP) must be adopted by the Planning Commission and the Board of Supervisors as part of the adoption of the CEQA findings and project approvals by those bodies to the extent that mitigation measures are made part of the

Proposed Project. The MMRP identifies the measures included in the Proposed Project or imposed by the decision-makers as conditions of approval, the entities responsible for carrying out the measures, and the timing of implementation. If significant unavoidable impacts would remain after all feasible mitigation measures are implemented, the approving body, if it elects to approve the Proposed Project, must adopt a statement of overriding considerations explaining how the benefits of the Proposed Project would outweigh the significant impacts.

D. ORGANIZATION OF THIS EIR

This EIR is organized into eight chapters, as described below.

The Summary chapter provides a concise overview of the Proposed Project and the necessary approvals; the environmental impacts that would result from the Proposed Project; mitigation measures identified to reduce or eliminate these impacts; project alternatives; and areas of known controversy and issues to be resolved.

Chapter 1, Introduction, provides a summary of the Proposed Project and describes the type, purpose, and function of the EIR; the environmental review process and comments received on the NOP; and the organization of the EIR.

Chapter 2, Project Description, presents details about the Proposed Project and the approvals required to implement it.

Chapter 3, Plans and Policies, describes inconsistencies of the Proposed Project with applicable State, regional, and local plans and policies.

Chapter 4, Environmental Setting and Impacts, addresses the following topics:

- A. Introduction
- B. Land Use and Land Use Planning
- C. Population and Housing
- D. Cultural Resources
- E. Transportation and Circulation
- F. Noise and Vibration
- G. Air Quality
- H. Greenhouse Gas Emissions
- I. Wind and Shadow
- J. Recreation
- K. Utilities and Service Systems
- L. Public Services
- M. Biological Resources
- N. Geology and Soils
- O. Hydrology and Water Quality
- P. Hazards and Hazardous Materials
- Q. Mineral and Energy Resources
- R. Agriculture and Forest Resources

Each topic section presents the environmental setting; regulatory framework; approach to analysis; project features that are relevant to the topic; project-specific and cumulative impacts; and mitigation measures and improvement measures, when appropriate.

Chapter 5, Other CEQA Issues, addresses potential growth-inducing impacts of the Proposed Project and identifies significant effects that cannot be avoided if the Proposed Project is implemented, as well as significant irreversible impacts of the project, and areas of known controversy and project-related issues that have not been resolved.

Chapter 6, Project Variants, presents one proposed construction-related and three proposed operational-related variants on infrastructure features of the Proposed Project that focus on sustainability. The variants modify one limited feature or aspect of the Proposed Project. The four variants considered are a Reduced Off-Haul Variant, a District Energy System Variant, a Wastewater Treatment and Reuse System Variant, and an Automated Waste Collection System Variant.

Chapter 7, Alternatives, presents and analyzes a range of alternatives to the Proposed Project. Three alternatives are described and evaluated: a No Project Alternative, which is required by CEQA; a Code Compliant Alternative; and a 2010 Pier 70 Master Plan Alternative. This chapter also identifies the environmentally superior alternative. It discusses any alternatives that were considered for analysis in the EIR but rejected, and gives the reasons for their rejection.

Chapter 8, Report Preparers, identifies the EIR authors and the agencies, organizations, and individuals consulted during preparation of the Draft EIR. In addition, the project sponsors, their attorneys, and any consultants working on their behalf are listed.

The EIR has six appendices:

- Appendix A: Notice of Preparation
- Appendix B: Transportation Impact Study
- Appendix C: Noise Technical Memorandum
- Appendix D: Air Quality Technical Report
- Appendix E: Biological Resources
- Appendix F: Hazards and Hazardous Materials

2. PROJECT DESCRIPTION

A. PROJECT OVERVIEW

The Pier 70 area (Pier 70) encompasses 69 acres of historic shipyard property along San Francisco's Central Waterfront. Under the Burton Act, Pier 70 is owned by the City and County of San Francisco (City) through the Port Commission of San Francisco (Port or Port Commission).[1] The Port intends to rehabilitate and redevelop Pier 70, and has selected Forest City Development California, Inc. (Forest City) to act as master developer for 28 acres of the site. Forest City will initiate rezoning and develop design standards and controls for a multi-phased, mixed-use development on that site and two adjacent parcels.[2] (See Figure 2.2: Existing Site Plan, p. 2.11.) As envisioned, the proposed Pier 70 Mixed-Use District Project (Proposed Project) would include phased development of market-rate and affordable residential uses, commercial use, retail/arts/light-industrial (RALI) uses,[3] parking, shoreline improvements, infrastructure development and street improvements, and public open space. Together, the Port and Forest City are the project sponsors for the Proposed Project.

The proposed Pier 70 Mixed-Use District Project, for which this project-level Environmental Impact Report (EIR) has been prepared, comprises a project site of an approximately 35-acre area bounded by Illinois Street to the west, 20th Street to the north, San Francisco Bay to the east, and 22nd Street to the south. The project site is south of Mission Bay, east of the Potrero Hill and Dogpatch[4] neighborhoods, and within the northeastern portion of San Francisco's *Central Waterfront Area Plan*, one of four areas covered by the *Eastern Neighborhoods Rezoning and Area Plan (Eastern Neighborhoods Area Plan).* The project site is located within Pier 70, except

[1] The Burton Act (Chapter 1333 of the Statutes of 1968) was adopted by the California Legislature in 1968. Under the Burton Act and the companion Burton Act transfer agreement, the State transferred ownership of the tidelands making up San Francisco harbor to the City, with the requirement that the City form a Port Commission with complete authority to use, operate, manage and regulate the granted lands.

[2] The Port and Forest City entered into an Exclusive Negotiating Agreement in July 2011, as authorized by Port Commission Resolution No. 11-49. The Port Commission subsequently endorsed a Term Sheet outlining features of the Proposed Project, which the San Francisco Board of Supervisors endorsed in June 2013 by Resolution No. 201-13.

[3] The project sponsors describe the RALI use as including neighborhood retail, arts, eating and drinking places, production distribution and repair, light manufacturing, and entertainment establishments, which are collectively referred to for the purposes of this EIR as RALI uses.

[4] The Dogpatch neighborhood is bounded by Mariposa Street to the north, I-280 to the west, Cesar Chavez Street to the south, and Illinois Street to the east.

for a 3.6-acre parcel adjacent to Pier 70's southwest corner, known as the Hoedown Yard, which is owned by Pacific Gas and Electric Company (PG&E). [5]

The project site contains two development areas. The "28-Acre Site" is an approximately 28-acre area located between 20th, Michigan, and 22nd streets, and San Francisco Bay. This site includes Assessor's Block 4052/Lot 001 and Lot 002 and Block 4111/Lot 003 and Lot 004. The "Illinois Parcels" form an approximately 7-acre site that consists of an approximately 3.4-acre Port-owned parcel, called the "20th/Illinois Parcel," along Illinois Street at 20th Street (Assessor's Block 4110/Lot 001) and the approximately 3.6-acre "Hoedown Yard," at Illinois and 22nd streets (Assessor's Block 4120/Lot 002 and Block 4110/Lot 008A), which is owned by PG&E. The Hoedown Yard includes a City-owned 0.2-acre portion of street right-of-way that bisects the site.[6]

The Proposed Project would amend the *San Francisco General Plan* (*General Plan*) and Planning Code, adding a new Pier 70 Special Use District (SUD). The SUD would establish land use zoning controls for the project site, and incorporate the design standards and guidelines for all new construction at the project site as set forth in the proposed *Pier 70 SUD Design for Development* document (*Design for Development*).[7] The Zoning Maps would be amended to show changes from the current zoning (M-2 [Heavy Industrial] and P [Public]) to the proposed SUD zoning. Height limits on the 28-Acre Site would be increased from 40 to 90 feet, except for a 100-foot-wide portion adjacent to the shoreline that would remain at 40 feet, as authorized by Proposition F in November 2014. The Planning Code text amendments would also modify the existing height limits on an eastern portion of the Hoedown Yard from 40 to 65 feet. Height limits are further restricted through the design standards established in the proposed *Pier 70 SUD Design for Development*. The Proposed Project would also amend the Port's *Waterfront Land Use Plan* (WLUP).

Under the proposed SUD, the Proposed Project would provide a phased mixed-use land use program in which certain parcels could be developed with either primarily commercial uses or residential uses, with much of the ground floor dedicated to RALI uses. In addition, two parcels

[5] Under an option agreement with PG&E, the City has an option to purchase the Hoedown Yard. PG&E has consented to including the Hoedown Yard in the project sponsors' rezoning efforts; however, the City would not exercise its option to purchase the Hoedown Yard and development of this parcel would not proceed, unless PG&E locates a suitable relocation site for the current utility operations at the Hoedown Yard. PG&E's consent is reflected in the letter from Kendrick Li, Supervisor Land Acquisition Development, PG&E, to Brad Benson, Port of San Francisco, regarding the Hoedown Yard, June 6, 2014. The environmental analysis assumes that the City will exercise its option with PG&E, and will subsequently purchase the Hoedown Yard.

[6] The 0.2-acre Michigan Street right-of-way is a recorded easement; however, no physical roadway exists.

[7] The proposed *Pier 70 Design for Development* document, which is included as part of the Proposed Project, would set forth the underlying vision and principles for development of the project site, and establish implementing standards and design guidelines.

on the project site (Parcels C1 and C2) could be developed for structured parking, residential/commercial use, or solely residential use, depending on future market demand for parking and future travel demand patterns. Development of the 28-Acre Site would include up to a maximum of approximately 3,422,265 gross square feet (gsf) of construction in new buildings and improvements to existing structures (excluding square footage allocated to accessory parking[8]). New buildings would have maximum heights of 50 to 90 feet. Development of the Illinois Parcels would include up to a maximum of approximately 801,400 gsf in new buildings; these new buildings would not exceed a height of 65 feet, which is the existing height limit along Illinois Street on both the Port-owned and the western portion of the Hoedown Yard.

The Union Iron Works Historic District (Historic District) is listed in the National Register of Historic Places (National Register) in recognition of Pier 70's role in the development of steel shipbuilding in the United States and for industrial architecture built at the site between 1884 and the end of World War II. The majority of the project site is within the Historic District. The 28-Acre Site contains 12 of the 44 contributing buildings/structures/features (collectively "contributing features") of the Historic District and one of the ten non-contributing features. With implementation of the Proposed Project, three contributing features (Buildings 2, 12, and 21) would be rehabilitated in compliance with the Secretary of the Interior's Standards for the Treatment of Historic Properties and adapted for reuse; one landscape feature (the existing remnant of Irish Hill[9]) would be mostly retained; and seven structures and sheds (Buildings 11, 15, 16, 19, 25, 32, and 66), containing 92,945 gsf, would be demolished. The Port has proposed to demolish the 30,940-gsf Building 117, located on the project site, prior to approval of the Proposed Project.[10] The single non-contributing feature on the project site (Slipways 5 through 8, which are currently covered by fill and asphalt) would be partially demolished.

The Proposed Project includes transportation and circulation improvements, new and upgraded utilities and infrastructure, geotechnical and shoreline improvements, and 9 acres of public open space. Three options for sewer/wastewater treatment, three options for grading around Building 12, and an option for pedestrian passageways are evaluated in this EIR. The Proposed Project also includes four variants that consider modifications to the proposed infrastructure and building systems to enhance sustainability.

---

[8] All proposed parking is considered accessory, excluding those parking spaces within the C1 and/or C2 parking garages. Parking spaces within the two parking garages are considered principal use.

[9] Today, approximately 1.4 acres remain from the original 20.6 acres of Irish Hill.

[10] Building 117 is proposed for demolition as part of the 20th Street Historic Core project to allow the adjacent building (Building 116) located on the 20th Street Historic Core site to be rehabilitated to meet fire code. The Port filed an application to demolish Building 117 on January 7, 2016, Case No. 2016-000346ENV. Any approval of the demolition of Building 117 will undergo appropriate environmental review, as required by CEQA. San Francisco Planning Department, Notification of Project Receiving Environmental Review, Illinois and 20th Streets/Pier 70 ("20th Street Historic Core"), Case No. 2016-000346ENV, September 8, 2016.

B. PROJECT SPONSORS' OBJECTIVES

The Port and Forest City seek to achieve the following objectives by undertaking the Proposed Project:

- Create a unique San Francisco neighborhood within an industrial historic district that includes new, activated waterfront open spaces with the amenities and services necessary to support a diverse, thriving community of residents and workers, while addressing potential land use conflicts with ongoing ship repair at Pier 70.
- Implement the open space, housing, affordability, historic rehabilitation, artist community preservation, commercial, waterfront height limit and urban design policies endorsed by the voters in Proposition F for the 28-Acre Site (November 2014).
- Provide dense, mixed-income housing that includes both ownership and rental opportunities, to attract a diversity of household types in order to help San Francisco meet its fair share of regional housing needs.
- Provide a model of 21st century sustainable urban development by implementing the *Pier 70 Risk Management Plan* approved by the San Francisco Bay Regional Water Quality Control Board; encouraging energy and water conservation systems; and reducing vehicle usage, emissions, and vehicle miles traveled to reduce the carbon footprint impacts of new development, consistent with the Port's *Climate Action Plan*.
- Provide access to San Francisco Bay where it has been historically precluded, by opening the eastern shore of the site to the public with a major new waterfront park, extending the Bay Trail, and establishing the Blue Greenway, and create a pedestrian- and bicycle-friendly environment.
- Rehabilitate three contributors to the Union Iron Works Historic District to accommodate new uses consistent with the Secretary of the Interior's Standards for the Treatment of Historic Properties, and design and build new infrastructure, public realm areas, parks and buildings consistent with the Infill Development Design Criteria within the Port's *Pier 70 Preferred Master Plan* and support the continued integrity of the Union Iron Works Historic District.
- Create business and employment opportunities for local workers and businesses during the design, construction, and operation phases of the Proposed Project.
- Elevate and reinforce site infrastructure and building parcels to allow the new Pier 70 neighborhood to be resilient to projected levels of sea level rise and any major seismic event, as well as incorporate financing strategies that enable the project and the Port's Bay shoreline to adapt to future, increased levels of sea level rise.
- Along with the Historic Core and Crane Cove Park, serve as a catalyst project for Pier 70 to support the Port's site-wide goals established in the *Pier 70 Preferred Master Plan*, including new infrastructure, streets and utilities, and new revenue to fund other Pier 70 improvements.
- Construct a high-quality, public-private development project that can attract sources of public investment, equity, and debt financing sufficient to fund the Proposed Project's site and infrastructure costs, fund ongoing maintenance and operation costs, and produce a market rate return investment that meets the requirement of Assembly Bill (AB) 418 (2011) and allows the Port to further its Public Trust mandate and mission.

- Through exercise of the City's option with PG&E to purchase the Hoedown Yard, provide funds for the City's HOPE VI rebuild projects in accordance with Board Resolution No. 54-14, such as the Potrero Terrace and Annex project.

C. PROJECT LOCATION AND SITE CHARACTERISTICS

PROJECT SITE VICINITY

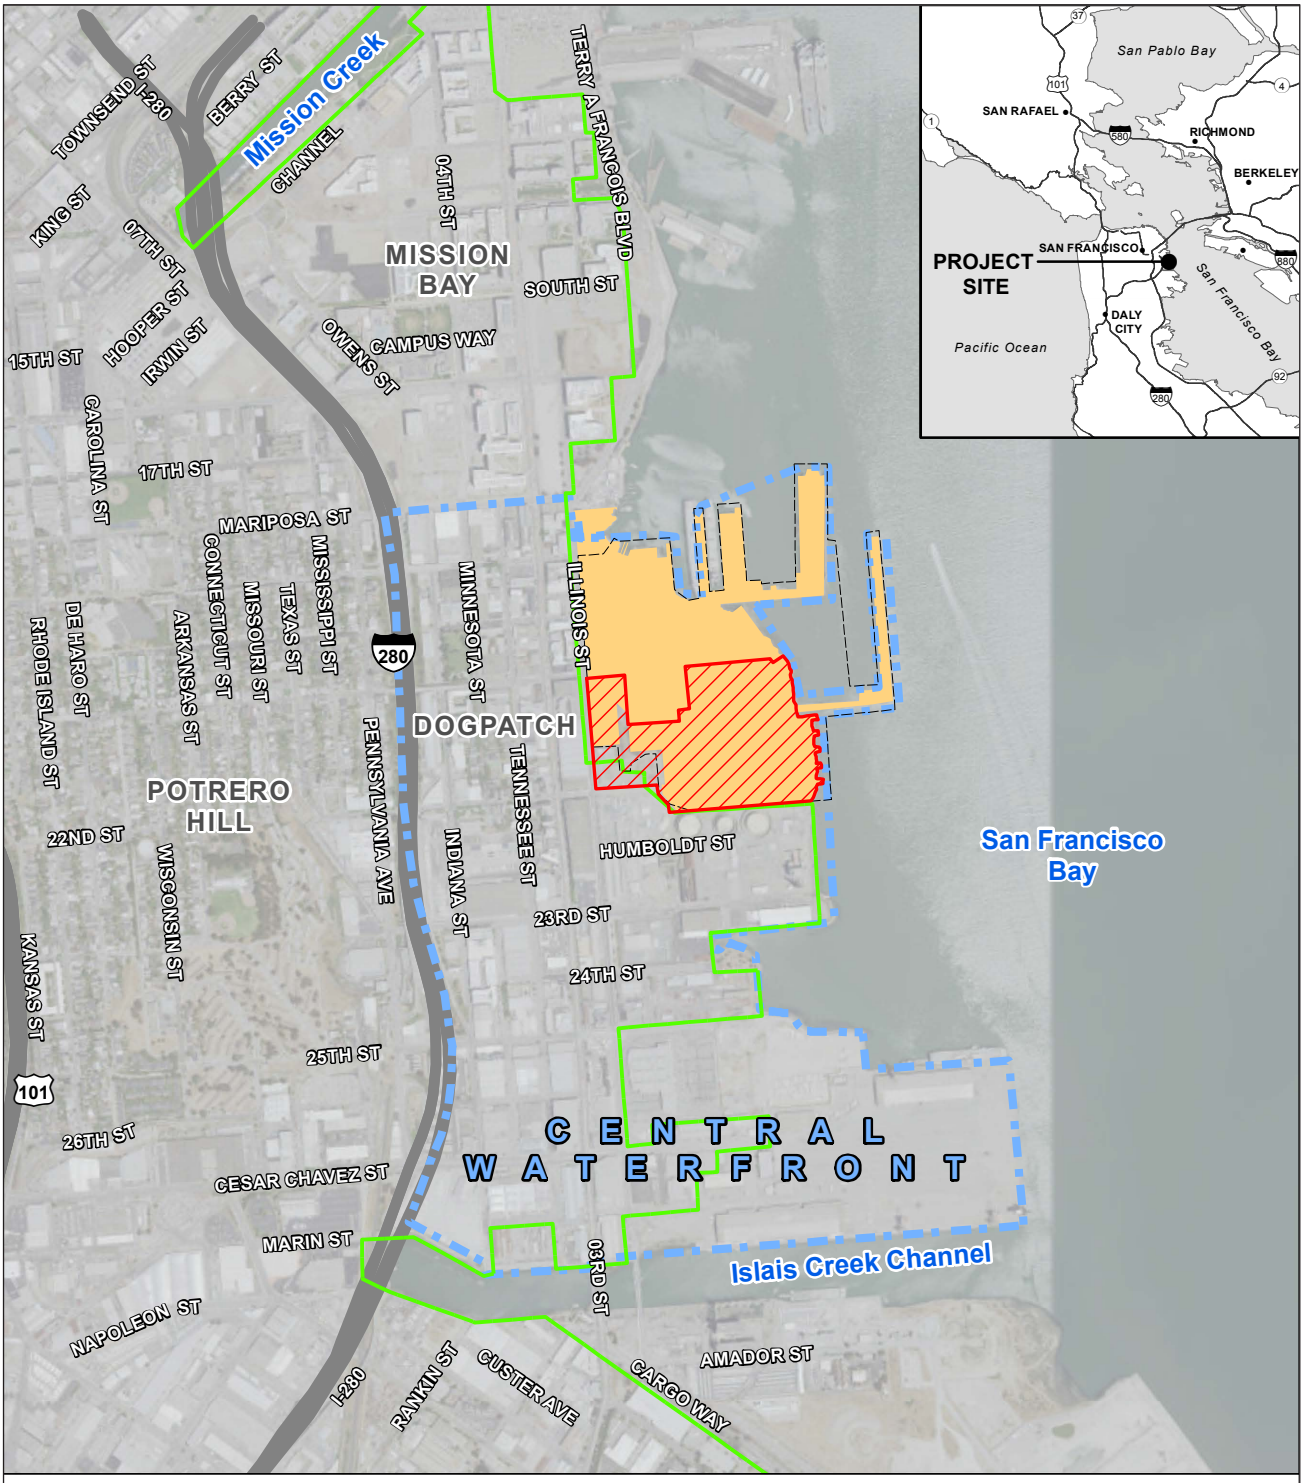
The 35-acre project site is located within the 69-acre Pier 70 area on San Francisco Bay along San Francisco's Central Waterfront, described on p. 2.6. (See Figure 2.1: Project Location.) It is just south of Mission Bay South and east of the Potrero Hill and Dogpatch neighborhoods. The American Industrial Center, a large multi-tenant light-industrial building, is located across Illinois Street, west of the Illinois Parcels. To the north of the project site are the BAE Systems Ship Repair facility, the 20th Street Historic Core (Historic Core) of the Union Iron Works Historic District,[11] future Crane Cove Park (construction of which is scheduled to begin in 2016), and the Mission Bay South redevelopment area. To the south of the project site are PG&E's Potrero Substation (a functioning high-voltage transmission substation serving San Francisco), the decommissioned Potrero Power Plant, and the TransBay Cable converter station, which connects the Pittsburg-San Francisco 400-megawatt direct-current, underwater electric transmission cable to PG&E's electricity transmission grid by way of the Potrero Substation.

Nearby transportation infrastructure includes Third Street, a major arterial[12] located about 300 feet west of the project site; the Caltrain right-of-way and 22nd Street station,[13] located approximately 0.3 mile to the west; and the north-south-running Highways 101 and 280, about 0.5 mile and 0.3 mile west of the project site, respectively. Cesar Chavez Street runs east-west about 0.5 mile to the south of the project site and connects to Highways 101 and 280. Muni's Third Street light rail line has two station stops between 500 to 1,000 feet from the project site, one at Third and 20th streets and the other at Third and 23rd streets. The project site is approximately 0.5 mile from stops for Muni's 22 Fillmore and 48 Quintara/24th Street bus routes. Major bikeways near the project site are Route 5 (Illinois Street), a dedicated north-south bikeway along the waterfront (including The Embarcadero to Bayshore Boulevard); Route 40 (16th and Illinois streets), a dedicated east-west bike lane; Route 7 (Indiana Street), a north-south bike route through the Dogpatch neighborhood; and Route 23 (Mariposa Street), which overlaps with Route 7 along Mariposa Street and turns into a bike lane on Mississippi Street.

[11] The Historic Core is an approximately 7-acre portion of the Union Iron Works Historic District and contains 270,000 gsf of largely vacant industrial and office space currently undergoing rehabilitation for adaptive reuse.

[12] *San Francisco General Plan* Transportation Element, Map 6, Vehicular Street Map.

[13] Caltrain's Fourth and King terminus is about 1.25 miles north of the project site.



PIER 70 MIXED-USE DISTRICT PROJECT

FIGURE 2.1: PROJECT LOCATION

There is a dilapidated pier extending from the project site into San Francisco Bay immediately northeast of the slipways, but outside of the project site boundary. The pier is constructed of creosote-treated wood and is not structurally sound. There are no alterations planned for this pier, which would remain in place under the Proposed Project. The dilapidated pier is not part of the Proposed Project analyzed in this EIR.

PROJECT SITE DEVELOPMENT BACKGROUND

Pier 70 is owned by the Port and encompasses approximately 69 acres of historic shipyard property along San Francisco's Central Waterfront. Most of Pier 70 (66 of the total 69 acres) is listed in the National Register as the Union Iron Works Historic District, described on pp. 2.9-2.10. Portions of Pier 70 are still used today for ship repair operations, as well as for other industrial operations.

In 1997, the San Francisco Port Commission identified the preservation of Pier 70's ship repair industry and history as key priorities for its WLUP.[14] In 2010, the Port Commission published the *Pier 70 Preferred Master Plan*[15] (*Preferred Master Plan*), stating its vision to "create a vibrant and authentic historic district that re-establishes the historic activity level, activates new waterfront open spaces, creates a center for innovative industries, and integrates ongoing ship repair operations" at Pier 70.[16] The *Preferred Master Plan* also provides a framework for Pier 70 that serves to allocate land to parks, ship repair, historic rehabilitation, and new development sites; establish infill design guidelines to protect the integrity of the Historic District as new development occurs; and prioritize investment in the most significant historic buildings.

COMPETITIVE SOLICITATION AND EXCLUSIVE NEGOTIATION AGREEMENT

The Port intends to rehabilitate or redevelop a portion of Pier 70 in furtherance of the goals identified in the *Preferred Master Plan*. In August 2010, the Port initiated a public solicitation process through a Request for Developer Qualifications to select a private developer partner for the development of the 28-Acre Site. After considering a staff memorandum that evaluated Request for Qualification responses and public comments made at Port Commission hearings, in April 2011 the Port Commission selected Forest City as the master developer to initiate rezoning, develop design standards and controls, and implement development of a multi-phased, mixed-use development on the project site. The parties entered into an Exclusive Negotiating Agreement in

[14] Port of San Francisco, *Waterfront Land Use Plan*, adopted 1997.

[15] Port of San Francisco, *Pier 70 Preferred Master Plan*, April 2010. Available online at http://www.sfport.com/ftp/uploadedfiles/about_us/divisions/planning_development/southern_waterfront/pier70masterplan_intro-overview.pdf, accessed September 24, 2015.

[16] Ibid., p. 1.

July 2011 as authorized by Port Commission Resolution No. 11–49. In compliance with the Exclusive Negotiating Agreement, Forest City conducted community outreach and developed a land use plan for the Proposed Project, drawing on the framework established by the *Preferred Master Plan*.

The Port Commission and the Board of Supervisors endorsed a nonbinding Term Sheet between the Port and Forest City outlining features of the Proposed Project in May and June 2013, respectively. Under the Term Sheet, the Illinois Parcels would be included in the proposed SUD, and Forest City, although it would not have development rights to those parcels, would in a public-private partnership with the Port, and in collaboration with the Office of Economic and Workforce Development and other City agencies, seek entitlements for mixed-use development on both the 28-Acre Site and the Illinois Parcels. Forest City would act as master developer to construct the parks, streets, and infrastructure to support new development on the 28-Acre Site. Forest City would either construct the planned new buildings on the 28-Acre Site or assist the Port in the disposition of property to third-party builders.

PROPOSITION F

On November 4, 2014, the San Francisco electorate approved Proposition F, a ballot measure that authorized a height increase at the 28-Acre Site from the existing 40 to 90 feet, directed that the project proposed on the 28-Acre Site undergo environmental review, and established policies regarding the provision of certain significant public benefits as part of the proposed project at the 28-Acre Site. Proposition F complied with the requirement established by Proposition B (June 2014) for San Francisco voter approval for any proposed height limit increase along the San Francisco waterfront on Port-owned property that would exceed existing height limits in effect on January 1, 2014. Proposition B does not apply to the Hoedown Yard, because the property is not owned by the Port. Proposition F conditioned the effective date of the proposed height increase on completion of an EIR and approval of a development plan for the 28-Acre Site by the Port Commission and Board of Supervisors. Proposition F did not address heights on the Illinois Parcels.

The height increase approved in Proposition F was contingent on the City's later approval of a project at the 28-Acre Site that would include the following:

- Provision of 9 acres of waterfront parks, playgrounds, and recreation opportunities on and adjacent to the 28-Acre Site;
- Construction of between approximately 1,000 and 2,000 new housing units;
- Provision of 30 percent of all new housing units at below-market rates;
- Stipulation that the majority of new housing units be offered for rent;

- Restoration of those historic structures on the site that are essential to the integrity of the Union Iron Works Historic District;
- Creation of substantial new and renovated space for arts, cultural, small-scale manufacturing, local retail, and neighborhood-serving uses;
- Preservation of the artist community currently located in Building 11 (the Noonan Building) by providing new state-of-the-art, on-site space that is affordable, functional and aesthetic, and by continuing to accommodate the Noonan Building community within the Union Iron Works Historic District during any transition period associated with the construction of new space;[17]
- Creation of between approximately 1,000,000 and 2,000,000 square feet of new commercial and office space; and
- Provision of accessory parking facilities and other transportation infrastructure as part of a transportation demand management program that enhances mobility in the district and neighborhood.

UNION IRON WORKS HISTORIC DISTRICT

Most of Pier 70 (66 of the total 69 acres) is listed in the Historic District. The Historic District's National Register nomination report[18] documents the significance of Union Iron Works (UIW) and Bethlehem Steel at Pier 70 and their role in the nation's maritime history, supporting multiple war efforts, as well as in the evolution of industrial architecture in San Francisco. The Historic District's 44 contributing features and 10 non-contributing features include "buildings, piers, slips, cranes, segments of a railroad network, and landscape elements." Most of the buildings are of an industrial architectural style and historic use, and made of "unreinforced brick masonry, concrete, and steel framing, with corrugated iron or steel cladding."[19] Pier 70's contributors to the Historic District are widely recognized as constituting the most intact industrial complex west of the Mississippi that represents the industrialization of the western United States. The Historic District was listed in the National Register in large part because the area "maintains exceptional integrity in terms of location, design, setting, materials, workmanship, feeling, and association."[20] UIW built or repaired ships at Pier 70 from the time of the Spanish American War in 1898, and ship repair operations continue today. The Historic District is not locally designated under Articles 10 or 11 of the San Francisco Planning Code.[21]

---

[17] Rents are to be based on the Port's current parameter rent schedule for the Noonan Building inflated to the date the new space is available, and thereafter as outlined in project approval documents.

[18] The Historic District nomination provides a complete account of the history of the site and can be accessed on the Port's website at http://sfport.com/Modules/ShowDocument.aspx?documentID=6608. Accessed September 24, 2015.

[19] Ibid., p. 5.

[20] Ibid., p. 23.

[21] Article 10 of the Planning Code describes Preservation of Historical Architecture and Aesthetic Landmarks, and Article 11 of the Planning Code describes Preservation of Buildings and Districts of Architectural, Historical, and Aesthetic Importance in the C-3 District.

The Historic District is characterized by the following features:

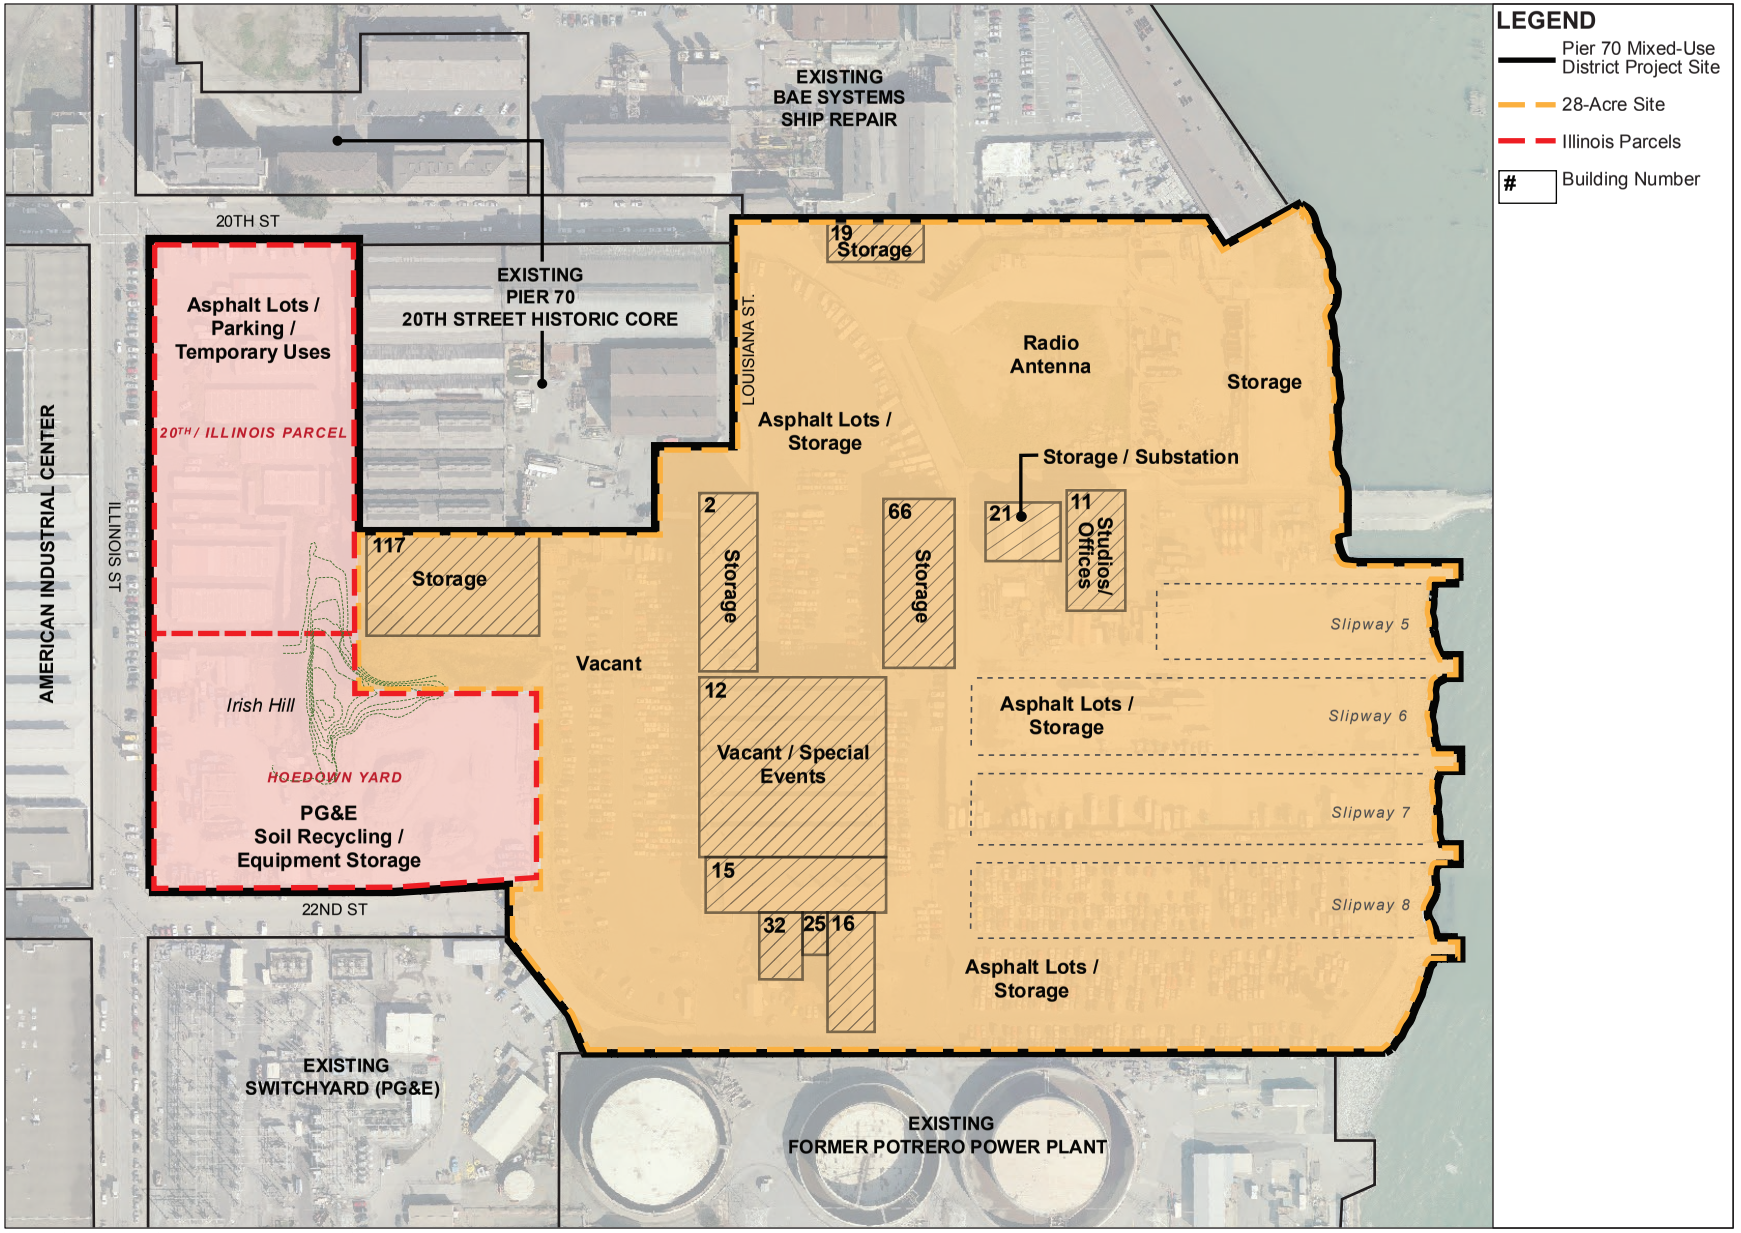
- Waterfront location;
- Numerous contributing features dating from 1884 to 1945;
- Minimal planted vegetation;
- Open areas that are paved or covered with gravel;
- Streets without curbs or gutters (except for 20th Street, which has granite curbs);
- Dense urban industrial character;
- Buildings that vary in scale, from 60,000 to 100,000 square feet and heights from one to six stories (80 feet), as well as a wide range of architectural treatments and materials;
- Unique groupings of buildings, including the unreinforced monumental masonry Buildings 113 and 114, as well as the steel-frame and corrugated-metal World War II Building 12 complex;
- Wharves, piers, slips, cranes and floating drydocks; and
- Ongoing ship repair activity.

The project site contains 12 of the 44 contributing features in the Historic District and one of the ten non-contributing features in the Historic District. The Hoedown Yard is not within the Historic District, but it has also been used for industrial purposes since the 1880s. Identifiable historical uses at the Hoedown Yard appear to have been limited to the storage of fuel oil in above-ground storage tanks (30,000- to 40,000-barrel capacity) for adjacent industrial activities. PG&E acquired the Hoedown Yard over time from various companies, including UIW and Bethlehem Steel. (See Figure 2.2: Existing Site Plan.)

HISTORIC UPLANDS AND TIDELANDS

A portion of the San Francisco Bay shoreline as mapped in 1869 now falls on land areas of the project site, following an undulating pattern east-to-west, then curving south. The 1869 shoreline started south of what is now 20th Street, traversing the project site in the southern direction.[22] Portions of the shoreline were later filled to form the eastern edge of project site and lands to the north.

[22] Treadwell and Rollo, "Environmental Site Investigation Report: Pier 70 Master Plan Area, San Francisco, California," prepared for the Port of San Francisco, January 13, 2011, Figure 4, Current Land Use (PDF p. 309).



Source: Sitelab Urban Studio, Turnstone Consulting/SWCA (2016)

PIER 70 MIXED-USE DISTRICT PROJECT

FIGURE 2.2: EXISTING SITE PLAN

A substantial portion of the project site has always been upland, meaning that it is located upward of the historical shoreline. The uplands were originally part of the privately owned Rancho del Potrero Nuevo, but title to the rancho was never confirmed and the lands were ultimately confirmed as being within the San Francisco pueblo.[23] The City's Van Ness Ordinance ultimately conveyed title of the pueblo lands to those persons in actual possession.[24]

In the late 1860s, the State authorized tidelands grants in the Pier 70 area to William Alvord and his company (and successor in interest), the Pacific Rolling Mills Company, with a condition requiring that iron production facilities be constructed. In 1900, the Pacific Rolling Mills Company conveyed all of its property in the Pier 70 area to Risdon Iron & Locomotive Works, creating the Risdon Yard.

The uplands, generally east of the north-south-running Georgia Street,[25] were part of the Risdon Yard. The Risdon Yard was transferred to several successive private owners until the U.S. government acquired the yard in 1940, then immediately leased it to Bethlehem Steel in connection with the war effort. The State purchased the Risdon Yard, including the uplands, in 1967, and then conveyed the property to the Port under the 1968 Burton Act grant. Bethlehem Steel held the remainder of the Pier 70 uplands until 1982, when the Port acquired the uplands property, along with former tidelands from Bethlehem Steel, as described below.

The largest portion of the Pier 70 site comprises lands mapped and sold by the Board of Tide Land Commissioners (BTLC). The sales were authorized by Chapter 543 of the Statutes of 1868. That statute directed the BTLC to establish a waterfront line in San Francisco south of Second Street; to reserve lands for streets, docks, piers, slips, canals, drains, and other uses as necessary for the public convenience and for the purposes of commerce; and to auction into private ownership the remaining lands landward of the waterfront line. Most of the BTLC lots were owned by Bethlehem Steel or Risdon Iron & Locomotive Works by the turn of the nineteenth century into the twentieth century.

All of the filled lands north of the Bethlehem Steel property appear to have been reserved from sale by the State, including Illinois Street, portions of 20th and Michigan streets, and the Central Basin. The State conveyed these lands to the City as part of the Burton Act grant.

---

[23] The pueblo lands were granted by Mexico and, after extensive litigation, ultimately patented by the United States to the City, resulting in the 1883 Pueblo Line, which represents the land comprising the San Francisco pueblo. The confirmed pueblo line is determinative of the boundary between uplands granted to the City and the sovereign tide and submerged lands of the State at statehood.

[24] Brad Benson, Port of San Francisco, memorandum to Jennifer Luchessi, Executive Director, California State Lands Commission, September 24, 2015.

[25] The north-south-running Georgia Street, which bisects the project site beginning at 20th Street through the Historic Core site and continuing south to 22nd Street, is not a physical street. The northern portion of this roadway was closed in 1884, and the southern portion was closed in 1940.

PROJECT SITE LAND USE RESTRICTIONS

PUBLIC TRUST LANDS

Portions of the 28-Acre Site and Illinois Parcels are subject to the common law tidelands public trust for commerce, navigation, and fisheries and the statutory trust under the Burton Act, as amended (the Public Trust). (See Figure 2.3: Existing Public Trust Lands.) The Public Trust imposes certain use restrictions on historical tidal and submerged lands along the waterfront to protect the interests of the people of the State of California for commerce, navigation, and fisheries, as well as other public benefits recognized to further trust purposes, such as recreation and environmental preservation.[26]

SAN FRANCISCO

Eastern Neighborhoods Area Plan

Central Waterfront Area Plan

The Proposed Project comprises the northeastern portion of the *Central Waterfront Area Plan*, as shown on Figure 2.1, p. 2.6. The *Central Waterfront Area Plan* is one of the four plan areas covered by the *Eastern Neighborhoods Rezoning and Area Plan (Eastern Neighborhoods Area Plan)*, which the Board of Supervisors adopted in 2009.[27] The Eastern Neighborhoods area contains much of the City's industrial zoned land and has been transitioning to other uses over the past several decades. One of the goals of the Eastern Neighborhoods planning effort was to find a balance between the growth of housing and office uses and the preservation of production, distribution, and repair (PDR) facilities.[28] The project site was included in one of the four sub-areas of the *Eastern Neighborhoods Area Plan* (as part of the *Central Waterfront Area Plan)*, but, except for height increases affecting the Illinois Parcels, the Pier 70 parcels were not rezoned, deferring to the Port-led community planning process for Pier 70, described previously on p. 2.7.

[26] California State Lands Commission, The Public Trust Doctrine. Available online at http://www.slc.ca.gov/About_The_CSLC/Public_Trust/Public_Trust_Policy.pdf. Accessed on October 19, 2016.

[27] San Francisco Planning Department website, *Eastern Neighborhoods*, available online at www.sf-planning.org/index.aspx?page=1673, accessed April 6, 2015. The other plan areas within the *Eastern Neighborhoods Area Plan* are Central Waterfront (adjacent and west of the Central Waterfront Area Plan), Mission (west of Potrero), Showplace Square/Potrero (adjacent and north of Potrero), and East SOMA (i.e., East South of Market, which is northwest of Mission Bay).

Source: Port of San Francisco (2015)

PIER 70 MIXED-USE DISTRICT PROJECT

FIGURE 2.3: EXISTING PUBLIC TRUST LANDS

Zoning and Height and Bulk Districts

The 28-Acre Site is zoned M-2 (Heavy Industrial) and located in a 40-X Height and Bulk District. The Illinois Parcels are zoned M-2 and P (Public) and located in a 40-X and a 65-X Height and Bulk District. Existing and proposed height and bulk limits are shown on Figure 2.4: Existing and Proposed Height and Bulk Districts. Planning Code amendments associated with the *Eastern Neighborhoods Area Plan* increased height limits, from 40 to 65 feet, for the Illinois Parcels and the western portion of the Hoedown Yard. Height limits for the eastern portion of the Hoedown Yard and the entirety of the 28-Acre Site were not changed and remain at 40 feet. As authorized by Proposition F in November 2014, height limits on the 28-Acre Site would be increased to 90 feet, except for a 100-foot-wide band adjacent to the shoreline that would remain at 40 feet.

PORT OF SAN FRANCISCO

Waterfront Land Use Plan

The majority of the Proposed Project is within the Port of San Francisco's WLUP, which is a land use policy document governing property under the jurisdiction of the Port, generally from Fisherman's Wharf to India Basin.[29] The Hoedown Yard is not under Port jurisdiction and is therefore not covered in the WLUP. The WLUP Southern Waterfront Subarea extends from Mariposa Street, just north of the project site, south to and including India Basin.[30]

Port of San Francisco Pier 70 Preferred Master Plan

As noted on p. 2.7, through a community-based planning process, the Port developed the *Preferred Master Plan*, dated April 2010. The *Preferred Master Plan* sets forth the Port's vision for Pier 70, which is to "create a vibrant and authentic historic district that re-establishes the historic activity level, activates new waterfront open spaces, creates a center for innovative industries, and integrates ongoing ship repair operations." The plan also provides a framework for Pier 70 that serves to allocate land between parks, ship repair, historic rehabilitation, and new development sites; establish infill design guidelines to protect the integrity of the Historic District as new development occurs; and prioritize investment in the most significant historic buildings.

[29] City and County of San Francisco, Port of San Francisco, *Waterfront Land Use Plan*, Revised Version, 2009. Available online at http://www.sfport.com/index.aspx?page=294. In 2014-2015, Port staff completed the comprehensive Waterfront Plan 1997-2014 Review Report and developed a public process for targeted updates to the Waterfront Plan. Draft updates to the *Waterfront Land Use Plan* are anticipated in the spring of 2017.

PIER 70 MIXED-USE DISTRICT PROJECT

FIGURE 2.4: EXISTING AND PROPOSED HEIGHT AND BULK DISTRICTS

PROJECT SITE CHARACTERISTICS

The project site currently contains approximately 351,800 gsf of buildings and facilities, most of which are deteriorating. Current uses on the site, all of which are temporary, include special event venues, artists' studios, self-storage facilities, warehouses, automobile storage lots, a parking lot, a soil recycling yard, and office spaces.

The project site has varying topography, sloping up from San Francisco Bay, with an approximately 30-foot increase in elevation at the western extent of the 28-Acre Site. The 35-foot-tall remnant of Irish Hill is located in the southwestern portion of the project site and straddles both the 28-Acre Site and Illinois Parcels. Impervious surface covers approximately 98 percent of the 28-Acre Site and approximately 43 percent of the Illinois Parcels.

28-ACRE SITE

The existing buildings on the 28-Acre Site are mostly low- to mid-rise structures in deteriorating condition. The site also includes a small portion of the remaining 1.4-acre remnant of Irish Hill. (See Figure 2.2, p. 2.11.) The Port has entered into interim leases and licenses for all of the useable buildings. Current uses of these buildings are as follows:

- Building 2, a warehouse space, is leased by Paul's Stores for storage.
- Building 11, known as the Noonan Building and previously used as administration and design offices for the World War II shipbuilding yard, is currently leased as artists' studios and office space.
- The Building 12 complex and the paved lot to the west of the complex are used for community, arts and cultural, and special events through a Port license to Forest City. The complex, made up of Building 12 (former Plate Shop No. 2), Building 15 (former Layout Yard), Building 16 (former Stress Relieving Building), Building 25 (former washroom and lockers), and Building 32 (former Template Warehouse), was once used for producing ship hull plates.
- Building 19 is part of the BAE Systems lease premises, where it is used to store sandblasting grit. Building 19 is identified in the BAE lease as an area the Port can remove from the lease with a 6-month notice starting in January 2017.
- Building 21, an electrical substation and a former Risdon Iron Locomotive Works and Pacific Rolling Mills Company building, is partially leased to the SOMArts Cultural Center for storage.

The Port has also leased certain portions of the land within the project site, including four former slipways (Slipways 5, 6, 7, and 8) on the 28-Acre Site, which have been filled and paved. Current uses are as follows:

- West of Building 11 (the Noonan Building), SOMArts and Ernest Rivera lease paved land for storage.

- Affordable Self Storage leases the southeastern corner of the slipways, which includes rows of self-storage lockers.
- Immediately north of Affordable Self Storage, Boas International leases an area for new automobile storage.

With the exception of a portion of the Affordable Self Storage lease area along the southern border of the project site and the studio/office uses in Building 11, all described leases and licenses are operating on a month-to-month basis as of July 31, 2016.

ILLINOIS PARCELS

20th/Illinois Parcel

The 20th/Illinois Parcel, which is owned by the Port and within the greater 69-acre Pier 70 boundary and the Historic District, is a paved area with asphalt lots used for paid parking, construction lay-down, and other temporary uses. The Port has leased this site to Imperial Parking, Inc. for commuter parking, terminable with 30 days' notice. Also, the 20th/Illinois Parcel contains a portion of the 1.4-acre remnant of Irish Hill, which straddles both the southeastern corner of the 20th/Illinois Parcel and the northeastern corner of the Hoedown Yard.

Hoedown Yard

South of the 20th/Illinois Parcel, the PG&E-owned Hoedown Yard is used by PG&E for vehicle parking, equipment storage (in the western portion of the yard), and temporary stockpiling of materials generated from subsurface utility maintenance operations in San Francisco (in the eastern portion of the yard). PG&E also uses a portion of the site as a settling area for drilling mud (a mixture of bentonite and water) that has been used by PG&E crews for off-site utility work.

A remaining section of Irish Hill is located in the northeastern corner of the Hoedown Yard. The Hoedown Yard is outside of the 69-acre Pier 70 boundary, but it is included in the project site and proposed SUD.

LANDSCAPE AND VEGETATION

The project site has varying topography, sloping down toward San Francisco Bay, with a prominent decrease in elevation at the eastern extent of the 28-Acre Site. The project site has almost no vegetation, with the exception of the remnant of Irish Hill in the Hoedown Yard, which contains scattered ground-level shrubs and a stand of eucalyptus trees, and scattered vegetation east of Building 19, near the radio antenna in the northeastern part of the site. There are no significant landscape elements or street trees.

INFRASTRUCTURE

Potable and Recycled Water Systems

The San Francisco Public Utilities Commission (SFPUC) provides potable water to the project site through a 12-inch-diameter domestic water line that runs underneath 20th Street and extends along the northern boundary of the project site. Other domestic water lines in the vicinity of the project site include an 8-inch-diameter water line underneath Illinois Street and an 8-inch line beneath 22nd Street. This system provides potable water to the project site for all site uses, as well as low-pressure water for firefighting purposes. The fire hydrants closest to the project site are located near the intersections of Illinois and 22nd streets (one hydrant), Illinois and 20th streets along the northern property boundary (four hydrants), and 19th and Illinois streets (one hydrant). Currently the City does not provide recycled (reclaimed) water on the eastern side of San Francisco or within the project site.

The Auxiliary Water Supply System (AWSS), also known as the San Francisco Emergency Firefighting Water System, provides a supplemental high-pressure water source for fire-fighting in certain areas of San Francisco. At this time, the AWSS does not extend into the project site, although there is a 14-inch distribution line location beneath Third Street.

Wastewater and Stormwater System

The project site is served by the City's combined sewer system that is operated by the SFPUC. The project site is located within the 20th Street sub-basin of the City's combined sewer system. This sub-basin includes 8-inch and 18-inch sewer conveyance pipes in 20th Street from Illinois Street to Louisiana Street that convey both stormwater and wastewater to 42-inch sewer line beneath 20th Street east of Louisiana Street, and a 54-inch storage and detention pipe along the eastern portion of the site that extends south from the pump station. These sewer lines are owned by the SFPUC and convey flows to the 20th Street pump station[31] near the northeast corner of the project site. In addition, the Port owns 6- to 12-inch mains across the site that connect to SFPUC-owned infrastructure. The pump station has a dry-weather capacity of approximately 2.65 million gallons per day (mgd).[32] Based on existing wastewater flows, the remaining capacity of the pump station is about 1.2 mgd. The existing 20th Street pump station is described in Section 4.K, Utilities and Service Systems.

[31] A pump station is a facility that includes pumps and equipment for pumping fluids from one place to another.

[32] San Francisco Public Utilities Commission (SFPUC), 20th Street Pump Station Volumetric Discharge Test and Contributing Flows, Technical Memorandum, August 30, 2013

Flows from the 20th Street pump station are conveyed to a 27-inch-diameter gravity sewer main under Illinois Street via a 10-inch-diameter force main located beneath 20th Street. From there, the combined stormwater and wastewater flows are conveyed to the Southeast Water Pollution Control Plant (SEWPCP) for treatment prior to discharge to San Francisco Bay in accordance with the National Pollutant Discharge Elimination System (NPDES) permit for the SEWPCP, North Point Wet Weather Facility, and all of the Bayside wet-weather facilities (Bayside NPDES Permit).

The 20th Street sub-basin includes 20th and 22nd streets combined sewer discharge (CSD) structures that are connected by the 54-inch storage and detention pipe. During wet weather, stormwater and wastewater flows that exceed the capacity of the 20th Street pump station plus the storage capacity of the 42- and 54-inch sewer lines are discharged through the CSD structures.

Electricity and Natural Gas

Electrical service to the project site is provided by PG&E and SFPUC Power via three 12-kilovolt (kV) electrical distribution circuits. One circuit is at 22nd Street, originating from the adjacent substation and transferring to a Port-owned underground distribution line near the edge of the property. The second runs overhead from the substation, traversing the remnant of Irish Hill, and continuing along Michigan Street to the corner of 20th Street before going underground to Port-owned distribution equipment in Building 102 near the edge of the 28-Acre Site. This currently serves as the primary circuit for the BAE Systems Ship Repair site. The third runs underground down 20th Street to the Port-owned distribution equipment in Building 102, and currently serves as the secondary circuit to the BAE site. An additional smaller overhead circuit also runs down 20th Street from Illinois Street and provides power to the combined sewer pump station. Two north-south overhead 12-kV electrical distribution lines traverse Illinois Street and connect to the PG&E Potrero Substation located on the eastern side of Illinois Street between 22nd and 23rd streets. There are 12 street lights around the asphalt lots on the southeastern end of the project site.

Natural gas is delivered to the project site through a PG&E-owned east-west natural gas line under 20th and Michigan streets. The Port owns natural gas lines that connect to the PG&E line on 20th Street. From there, several smaller Port-owned natural gas distribution lines circulate natural gas throughout the 28-Acre Site. Additionally, several abandoned Port-owned natural gas lines also exist within the project site. There are no existing natural gas lines connecting to the Illinois Parcels.

D. PROPOSED PROJECT CHARACTERISTICS

DEVELOPMENT CHARACTERISTICS

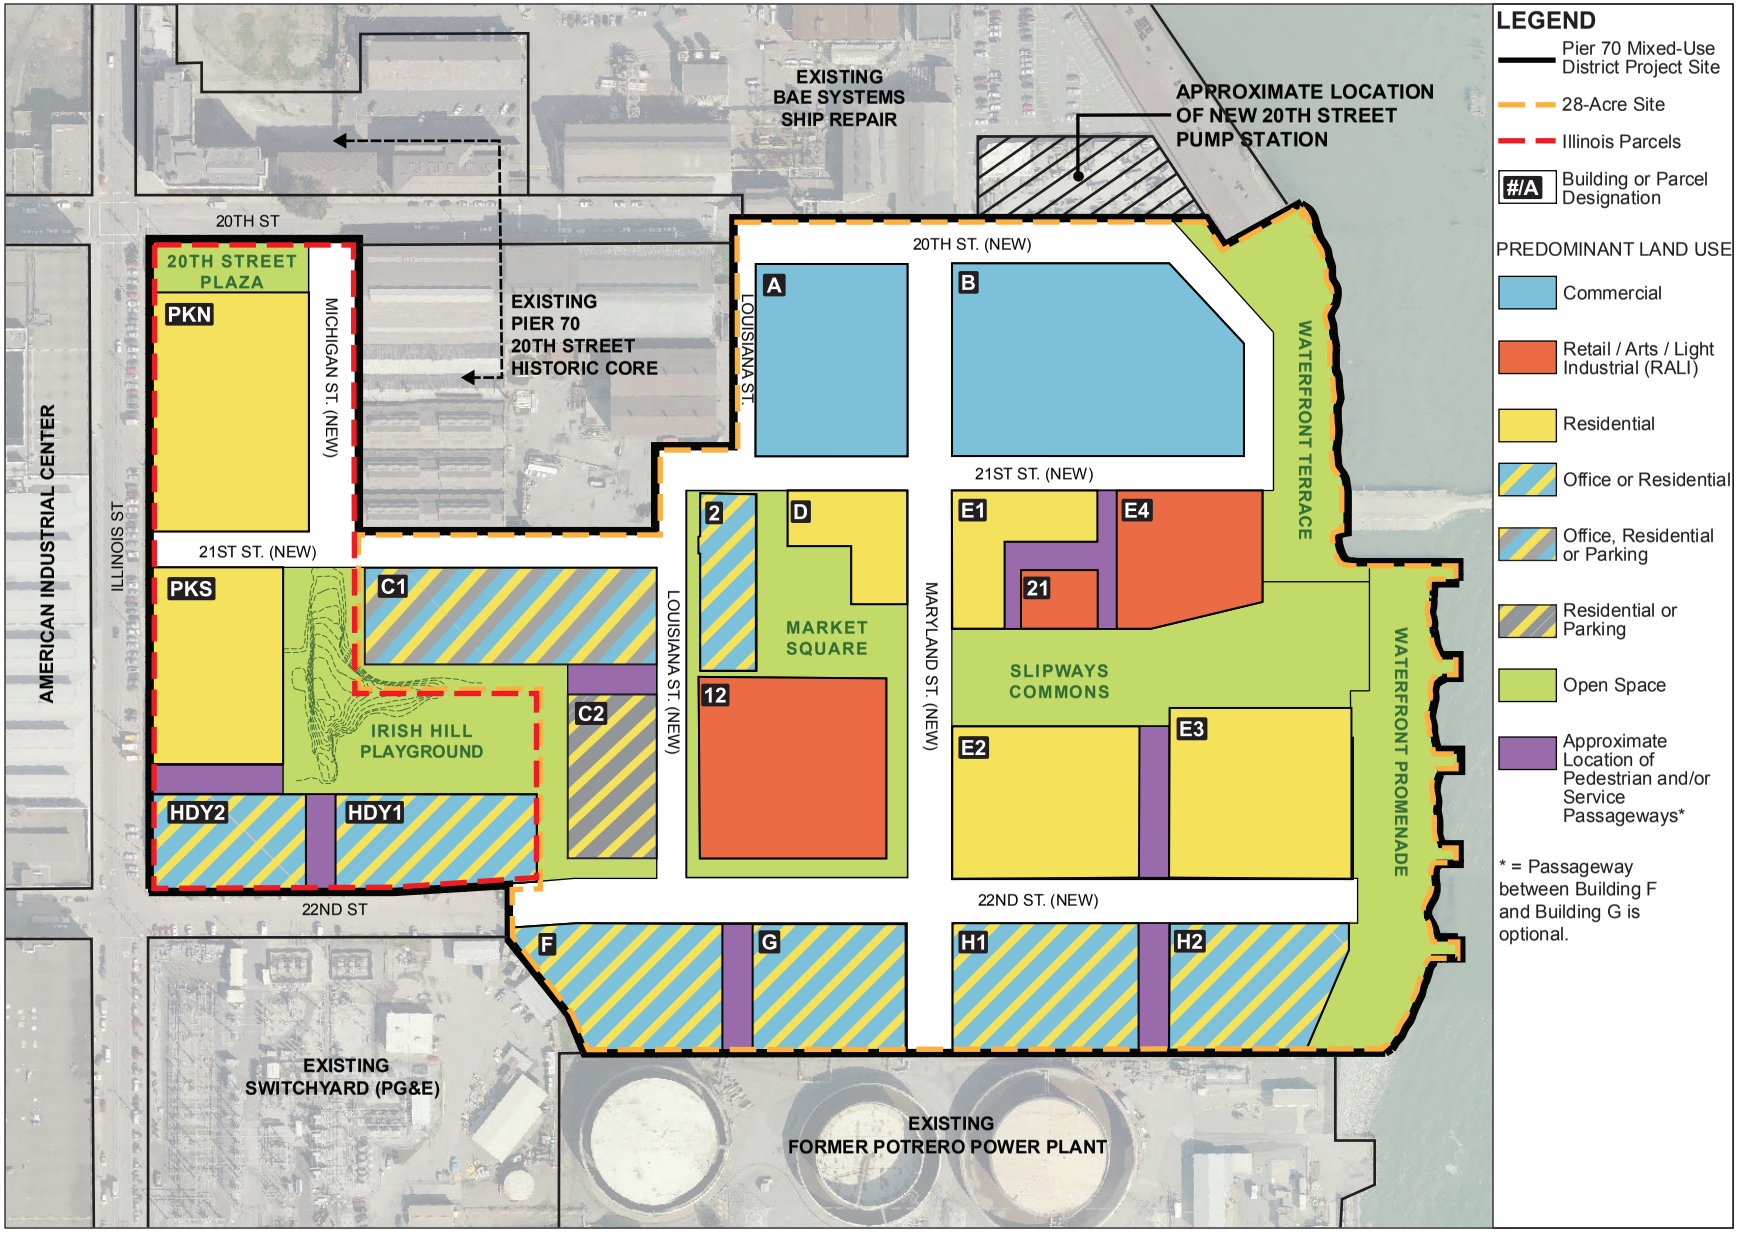
The Proposed Project would rezone the entire 35-acre project site and establish development controls for the site through adoption of a proposed SUD. (See Figure 2.5: Proposed SUD Land Use Program.) As envisioned, the Proposed Project would include market-rate and affordable residential uses, commercial use, RALI uses,[33] parking, shoreline improvements, infrastructure development and street improvements, and public open space. The proposed SUD would provide a mixed-use land use program in which certain parcels on the project site could be zoned as mixed-use, allowing for either commercial or residential uses. In addition, the proposed SUD would provide that two parcels on the project site (Parcels C1 and C2, located at the corner of Louisiana and the new 21st streets and near the western boundary of the 28-Acre Site) would be designated for structured parking, accessible to the public, but could be developed with either residential or commercial uses (Parcel C1) or residential uses (Parcel C2), depending on future market demand for parking and future methods of travel for residents and visitors.

Under the Proposed Project, development of the 28-Acre Site would include up to approximately 3,422,265 gsf of construction in new buildings and improvements to existing structures (excluding square footage allocated to accessory and structured parking). New buildings would range in height from 50 to 90 feet. Development of the Illinois Parcels would include up to approximately 801,400 gsf of construction in new buildings (excluding square footage allocated to accessory parking). New buildings on the Illinois Parcels would not exceed a height of 65 feet.

DEMOLITION AND REHABILITATION

The project site has 12 contributors to the Historic District and one non-contributor, totaling 351,800 gsf. The Proposed Project includes rehabilitation, in compliance with the Secretary of the Interior's Standards for the Treatment of Historic Properties, of approximately 227,800 gsf in Buildings 2, 12, and 21 for reuse. Buildings 2 and 12 would remain in their current location. Building 21 would be relocated about 75 feet to the southeast, to create public frontage along the waterfront park and maintain a visual connection to Buildings 2 and 12. (See Table 2.1: Existing and Rehabilitated Buildings on the Project Site, and Figure 2.6: Proposed Rehabilitation, Retention and Demolition Plan.) As part of the Proposed Project, seven of the remaining contributing buildings and structures on the site (Buildings 11, 15, 16, 19, 25, 32, and 66), containing 92,945 gsf, would be demolished. A small portion of the contributing feature, the

[33] The project sponsors describe the RALI use as including neighborhood-serving retail, arts activity, eating and drinking places, production distribution and repair, light manufacturing, and entertainment establishments.



Source: Sitelab Urban Studio, Turnstone Consulting/SWCA (2015)

PIER 70 MIXED-USE DISTRICT PROJECT

FIGURE 2.5: PROPOSED SUD LAND USE PROGRAM

remnant of Irish Hill, would also be removed. The Port has proposed to demolish the 30,940-gsf Building 117, located on the project site, separately from and prior to approval of the Proposed Project.[34] The non-contributing feature on the project site (subterranean portions of Slipways 5 through 8) would be partially removed as part of the Proposed Project.

Table 2.1: Existing and Rehabilitated Buildings on the Project Site

	Existing Gross Square Footage	Existing Gross Square Footage to Be Retained and Rehabilitated
Existing Buildings	351,800[1]	227,800[2]

Notes:

1 Includes Buildings 2, 11, 12, 15, 16, 19, 21, 25, 32, 66, and 117. The Port has proposed to demolish Building 117 separately from and prior to approval of the Proposed Project. The demolition of Building 117 will undergo appropriate environmental review, as required by CEQA.

2 The existing 227,800 gsf of retained building space are located in Buildings 2, 12, and 21 on the 28-Acre Site. These three buildings would be retained and rehabilitated as part of the Proposed Project.

Sources: Forest City; Turnstone/SWCA

RELOCATION OF EXISTING TENANTS

The Port negotiated most of the existing leases on the 28-Acre Site and the 20th/Illinois Parcel after entering into exclusive negotiations with Forest City. All existing leases are short-term leases for interim uses, and all leases, except those for the tenants in Building 11 (the Noonan Building) and a portion of the Affordable Self Storage lease, are operating on a month-to-month basis and will be terminated in anticipation of the Proposed Project. The Port will develop a plan for tenant relocation to the extent required under the California Relocation Assistance Law (Cal. Gov. Code Sections 7260-7277) and applicable regulations. The Port will also try to relocate larger-scale tenants to other available, suitable Port property. As part of its proposed Fiscal Year 2015-2016 capital budget, the Port intends to improve 17 acres of the Pier 94 Backlands[35] as

[34] Building 117 is proposed for demolition as part of the 20th Street Historic Core project to allow the adjacent building (Building 116) located on the 20th Street Historic Core site to be rehabilitated to meet fire code. The Port filed an application to demolish Building 117 on January 7, 2016, Case No. 2016-000346ENV. Any approval of the demolition of Building 117 will undergo appropriate environmental review, as required by CEQA. San Francisco Planning Department, Notification of Project Receiving Environmental Review, Illinois and 20th Streets/Pier 70 ("20th Street Historic Core"), Case No. 2016-000346ENV, September 8, 2016.

[35] Pier 94 Backlands is a 23-acre unimproved Port-owned site located about one mile to the south of the project site. Future improvements associated with Pier 94 Backlands will undergo a separate review and entitlement process and are not included as part of the Proposed Project.

PIER 70 MIXED-USE DISTRICT PROJECT

FIGURE 2.6: PROPOSED REHABILITATION, RETENTION, AND DEMOLITION PLAN

paved, open industrial land. If constructed in time, the Backlands would be one of the potential relocation areas identified by Port staff for existing major tenants of industrial and storage uses currently at Pier 70.

In accordance with the Term Sheet between the Port and Forest City[36] and Proposition F (November 2014), the tenants of the Noonan Building would be provided on-site space that is affordable, functional, and aesthetic. Rent on the new space will be based on the Port's current parameter rent schedule for the Noonan Building inflated to the date the new space is available. Tenants of the Noonan Building would be continuously accommodated. If new space is not yet constructed on the project site prior to the demolition of the Noonan Building, the Port or Forest City would offer the tenants (most of whom are on month-to-month leases) replacement space elsewhere within the Pier 70 area.

SPECIAL USE DISTRICT AND LAND USE PROGRAM

The Proposed Project would amend the Planning Code to include the proposed Pier 70 SUD, and would amend the Zoning Maps to reflect the proposed SUD. The proposed SUD would require compliance with the proposed *Pier 70 SUD Design for Development*, which is discussed on p. 2.35. Under the proposed SUD, the Proposed Project would provide a mixed-use land use program in which certain parcels (Parcels F, G, H1, H2, HDY1, and HDY2) and Building 2 could be developed for either primarily commercial uses or residential uses. Parcels C1 and C2 would be designated for structured parking, but could be developed with either residential or commercial (Parcel C1) or residential uses (Parcel C2), depending on future methods of travel for residents and visitors.

Proposed new zoning in the SUD would permit the following uses, listed below by parcel and shown in Table 2.2: Proposed Pier 70 Special Use District – Primary Uses by Parcel and Rehabilitated Building.

On the 28-Acre Site:

- Parcels A and B: Restricted to primarily commercial use, with RALI uses allowed on the ground floor.
- Parcel C1: Permitted for commercial, residential, or structured parking uses with RALI uses allowed on the ground floor.
- Parcel C2: Permitted for either residential or structured parking uses, with RALI uses allowed on the ground floor.
- Parcels D, E1, E2, and E3: Restricted to primarily residential use, with RALI uses allowed on the ground floor.

[36] *Term Sheet for Pier 70 Waterfront Site*, between the Port Commission and Forest City, June 11, 2013.

Notes:

[1] In addition to the uses listed, all 28-Acre Site parcels are permitted to include accessory parking. However, this does not apply to existing Buildings 2, 12, and 21, and Parcel E4.

[2] In addition to the uses listed, all Illinois Parcels are permitted to include accessory parking.

Sources: Forest City; Turnstone/SWCA

- Parcels F, G, H1, and H2, and Building 2: Permitted for either commercial or residential uses, with RALI uses allowed on the ground floor.
- Parcel E4 and Buildings 12 and 21: Permitted for RALI uses with commercial allowed on the upper floor of Parcel E4 and Building 12.
- All 28-Acre Site parcels except existing Buildings 2, 12, and 21 and Parcel E4: Permitted to include accessory parking.

On the Illinois Parcels:

- 20th/Illinois Parcel (Subdivided into Parcel K North [PKN] and Parcel K South [PKS]): Restricted to primarily residential use, with RALI uses on the ground floor.
- Hoedown Yard (Subdivided into Parcel Hoedown Yard 1 [HDY1] and Parcel Hoedown Yard 2 [HDY2]): Permitted for either commercial or residential uses, with RALI uses allowed on the ground floor.
- All Illinois Parcels: Permitted to include accessory parking.

Development under the proposed SUD is intended to provide a balanced mix of uses to support revitalization of the project site and respond to market conditions in the project site vicinity. To cover a full range of potential land uses that could be developed under the proposed SUD, this EIR analyzes a maximum residential-use scenario and a maximum commercial-use scenario for the project site. The two scenarios bracket specific maximum ranges of uses that could be developed under the proposed SUD.

The Maximum Residential Scenario and the Maximum Commercial Scenario for both the 28-Acre Site and the Illinois Parcels are mutually exclusive: the maximum commercial and maximum residential programs could not both be built. If the Proposed Project were to be built with the maximum amount of commercial space, less space would be developed with residential uses; conversely, if the maximum number of residential units were constructed, less space would be developed with commercial uses, as described below. Depending on the uses developed, the Proposed Project's total gsf would range between a maximum of 4,212,230 gsf, under the Maximum Residential Scenario, to 4,179,300 gsf, under the Maximum Commercial Scenario, excluding square footage associated with accessory and structured parking.[37] Total construction would not exceed a maximum of 3,422,265 gsf on the 28-Acre Site and 801,400 gsf on the Illinois Parcels.

For both development scenarios, construction is projected to begin in 2018 and would be phased over an approximately 11-year period, concluding in 2029. Proposed development is expected to involve up to five phases.

[37] Per the Planning Code, parking and mechanical equipment space do not count toward gross square footage.

Maximum Residential Scenario

28-Acre Site

Development under the Maximum Residential Scenario on the 28-Acre Site would include a maximum of up to 3,410,830 gsf in new and renovated buildings (excluding square footage allocated to parking). (See Table 2.3: Project Summary Table – Maximum Residential Scenario, and Figure 2.7: Proposed Land Use Plan – Maximum Residential Scenario.) Under this scenario, there would be up to 2,150 residential units (up to approximately 710 studio/one-bedroom units and 1,440 two- or more bedroom units), totaling about 1,870,000 gsf, as well as approximately 1,095,650 gsf of commercial space and 445,180 gsf of RALI space (241,655 gsf of retail space, 60,415 gsf of restaurant space, and 143,110 gsf of arts/light-industrial space). The overall development envelope includes rehabilitation of 237,800 gsf in Buildings 2, 12, and 21 in compliance with the Secretary of the Interior's Standards for the Treatment of Historic Properties. Table 2.3 assumes that the parcels (Parcels F, G, H1, and H2) and Building 2 would be devoted to residential use, and Parcels C1 and C2 would be built as residential use in order to study the maximum gsf of development area on the project site under the Maximum Residential Scenario.

Illinois Parcels

Development under the Maximum Residential Scenario on the Illinois Parcels would include a maximum of up to 801,400 gsf in newly constructed buildings (see Table 2.3). Under this scenario, there would be up to 875 residential units (up to approximately 290 studio/one-bedroom units and 585 two- or more bedroom units[38]) totaling about 760,000 gsf, as well as approximately 6,600 gsf of commercial area and approximately 34,800 gsf of RALI space (27,840 gsf of retail space and 6,960 gsf of restaurant space) in new buildings.

Maximum Commercial Scenario

28-Acre Site

Development on the 28-Acre Site under the Maximum Commercial Scenario would include a maximum of up to about 3,422,265 gsf in new and renovated buildings. (See Table 2.4: Project Summary Table – Maximum Commercial Scenario, and Figure 2.8: Proposed Land Use Plan – Maximum Commercial Scenario.) Under this scenario, there would be up to 1,100 residential units (up to approximately 365 studio/one-bedroom units and 735 two- or more bedroom units)

[38] The exact mix of dwelling unit types to be provided by the Project has not been established at this time; For purpose of analysis in this EIR, it has been assumed that 33 percent of the total number of dwelling units under each scenario would be analyzed as studios or one-bedroom units, while 67 percent would be analyzed as having two or more bedrooms.

Table 2.3: Project Summary – Maximum Residential Scenario

Use	28-Acre Site (New and Rehabilitated Construction)	Illinois Parcels (New Construction)	Maximum Proposed Project Totals
Residential	1,870,000 gsf	760,000	**2,630,000 gsf**
No. of units	2,150 units	875 units	**3,025 units**
Parcels	*C1, C2, D, EI, E2, E3, F, G, H1, H2, Building 2*	*PKN, PKS, HDY1, HDY2*	
Commercial	1,095,650 gsf[1]	6,600 gsf	**1,102,250 gsf**
Parcels	*A, B*	*PKN*	
RALI	445,180 gsf	34,800 gsf	**479,980 gsf**
Retail	241,655 gsf	27,840 gsf	269,495 gsf
Restaurant	60,415 gsf	6,960 gsf	67,375 gsf
Arts/Light-Industrial	143,110 gsf		143,110 gsf
Parcels	*A, B, C1, C2, D, E1, E2, E3, E4, F, G, H1, H2; Buildings 2, 12, 21*[2]	*PKN, PKS, HDY1, HDY2*[3]	
Total	**3,410,830 gsf**	**801,400 gsf**	**4,212,230 gsf**
Parking[4, 5]			
Off-Street	2,708 spaces	662 spaces	3,370 spaces
On-Street	253 spaces	32 spaces	285 spaces
Open Space	6.5 acres	2.5 acres	9 acres

Notes:

1 The existing 227,800 gsf of retained, rehabilitated building space in Buildings 2, 12, and 21 on the 28-Acre Site would be renovated and converted into commercial, RALI, or residential, depending on location. The Proposed Project's total gsf reflects this retained and renovated space.

2 On the 28-Acre Site parcels, RALI would be located on the ground floor of the new or rehabilitated buildings. Building 21 would contain only RALI uses.

3 On Illinois Parcels PKN, PKS, HDY1, and HDY2, RALI would be located on the ground floor of the new buildings.

4 Parking totals reflect a maximum of one parking space per 1,000 gsf of commercial development and 0.75 parking spaces per residential unit.

5 All Illinois Parcels and 28-Acre Site parcels are permitted to include parking as an accessory use. Parcels C1 and C2 may have structured parking.

PIER 70 MIXED-USE DISTRICT PROJECT

FIGURE 2.8: PROPOSED LAND USE PLAN - MAXIMUM COMMERCIAL SCENARIO

totaling about 957,000 gsf, as well as approximately 2,024,050 gsf of commercial area, and 441,215 gsf of RALI space (238,485 gsf of retail space, 59,620 gsf of restaurant space, and 143,110 gsf of arts/light-industrial space). The overall development envelope includes the rehabilitation of 227,800 gsf in Buildings 2, 12, and 21 in compliance with the Secretary of the Interior's Standards for Treatment of Historic Properties. As noted above, the mixed-use land use program contemplates two parcels, Parcels C1 and C2, that may be developed for parking, residential, or commercial use depending on future market demand for parking and future travel patterns. The project summary shown in Table 2.4 assumes that certain parcels (Parcels C1, F, G, H1, H2, and Building 2) would be developed as commercial use and that Parcel C2 would be developed as residential use in order to study the maximum gsf of development area on the project site under this Maximum Commercial Scenario.

Illinois Parcels

Development on the Illinois Parcels under the Maximum Commercial Scenario would include a maximum of about 757,035 gsf in new buildings (see Table 2.4). Under this scenario, there would be up to 545 residential units (up to approximately 180 studio/one-bedroom units and 365 two-or-more bedroom units[39]) totaling about 473,000 gsf, as well as approximately 238,300 gsf of commercial area and approximately 45,735 gsf of RALI (36,590 gsf of retail space and 9,145 gsf of restaurant space) in new buildings.

PUBLIC TRUST EXCHANGE

As described on p. 2.13, portions of the 28-Acre Site and Illinois Parcels are subject to the common law public trust for commerce, navigation, and fisheries and the statutory trust under the Burton Act, as amended (the Public Trust). (See Figure 2.3, p. 2.14.) In order to clarify the Public Trust status of portions of Pier 70, the Port has obtained State legislation (AB 418) that authorizes the State Lands Commission to approve a Public Trust exchange that would free some portions of the project site from the Public Trust while committing others to the Public Trust.[40] (See Figure 2.9: Proposed Public Trust Exchange Configuration.) To implement the Proposed Project in accordance with the proposed SUD, the Port and State Lands Commission would have to implement a public trust exchange that would lift the Public Trust from designated portions of Pier 70 in accordance with the terms of a negotiated trust exchange agreement meeting the requirements of AB 418. The Hoedown Yard is not subject to the Public Trust and will not be affected by the trust exchange.

PIER 70 MIXED-USE DISTRICT PROJECT

FIGURE 2.9: PROPOSED PUBLIC TRUST EXCHANGE CONFIGURATION

AFFORDABLE HOUSING PROGRAM

Under the Proposed Project, 30 percent of all completed residential units on the 28-Acre Site would be required to be offered at below market rate prices, and a majority of residential units constructed would be rentals, in compliance with Proposition F. The Proposed Project's affordable housing requirement would be established through transaction documents between the City, the Port, and Forest City for the Proposed Project. Residential units on the Illinois Parcels would be subject to the affordable housing requirements in Section 415 of the Planning Code. Under Board of Supervisors Resolution No. 54-14, if the City exercises its option to purchase the Hoedown Yard from PG&E, proceeds from the sale of the Hoedown Yard would be directed to the City's HOPE SF housing program, which includes the Potrero Terrace and Annex HOPE SF project.

PROPOSED PIER 70 SUD DESIGN FOR DEVELOPMENT BUILDING DESIGN STANDARDS AND GUIDELINES

The Proposed Project would amend the *General Plan* and Planning Code, adding a new Pier 70 SUD, which would establish land use zoning controls for the project site, and incorporate the design standards and guidelines in the proposed *Design for Development*. The *Design for Development* includes proposed building design standards and guidelines (Building Design Standards) which are intended to address compatibility of new development within the project site with the Historic District, guide rehabilitation of existing historic buildings as critical anchors, and encourage architecture of its own time in new construction.

Future vertical development at the project site, whether constructed by Forest City, Forest City affiliates, or third-party developers selected by the Port through broker-managed offerings, would be bound by the *Design for Development,* including the Building Design Standards. The Port and Planning Department would use the proposed Building Design Standards to evaluate these future development proposals within the project site for conformity with the *Pier 70 SUD Design for Development.* The Port will review historic rehabilitation proposals through its building permit process, for compatibility with the Secretary's Standards in the context of the Historic District.

Components of the proposed Building Design Standards are described below. Conceptual renderings showing visualizations of representative design viewpoints are shown in Figure 2.10: Representative Waterfront Promenade and Building 12 Market Square Views, Figure 2.11: Representative Slipways Commons Views, and Figure 2.12: Representative 20th Street and 22nd Street Views.

PIER 70 MIXED-USE DISTRICT PROJECT

FIGURE 2.12: REPRESENTATIVE 20TH STREET AND 22ND STREET VIEWS

BUILDABLE ZONES AND MAXIMUM BUILDING ENVELOPES

New construction within the Illinois Parcels (Parcels HDY1, HDY2, PKN and PKS) would have a maximum height of 65 feet. On the 28-Acre Site, buildings up to 90 feet in height could generally be constructed along its southern, western, and northern perimeters (Parcels A, B, C1, C2, D, and portions of Parcels E1, F, G, H1, and H2). (See Figure 2.13: Proposed Height Limits Plan.)

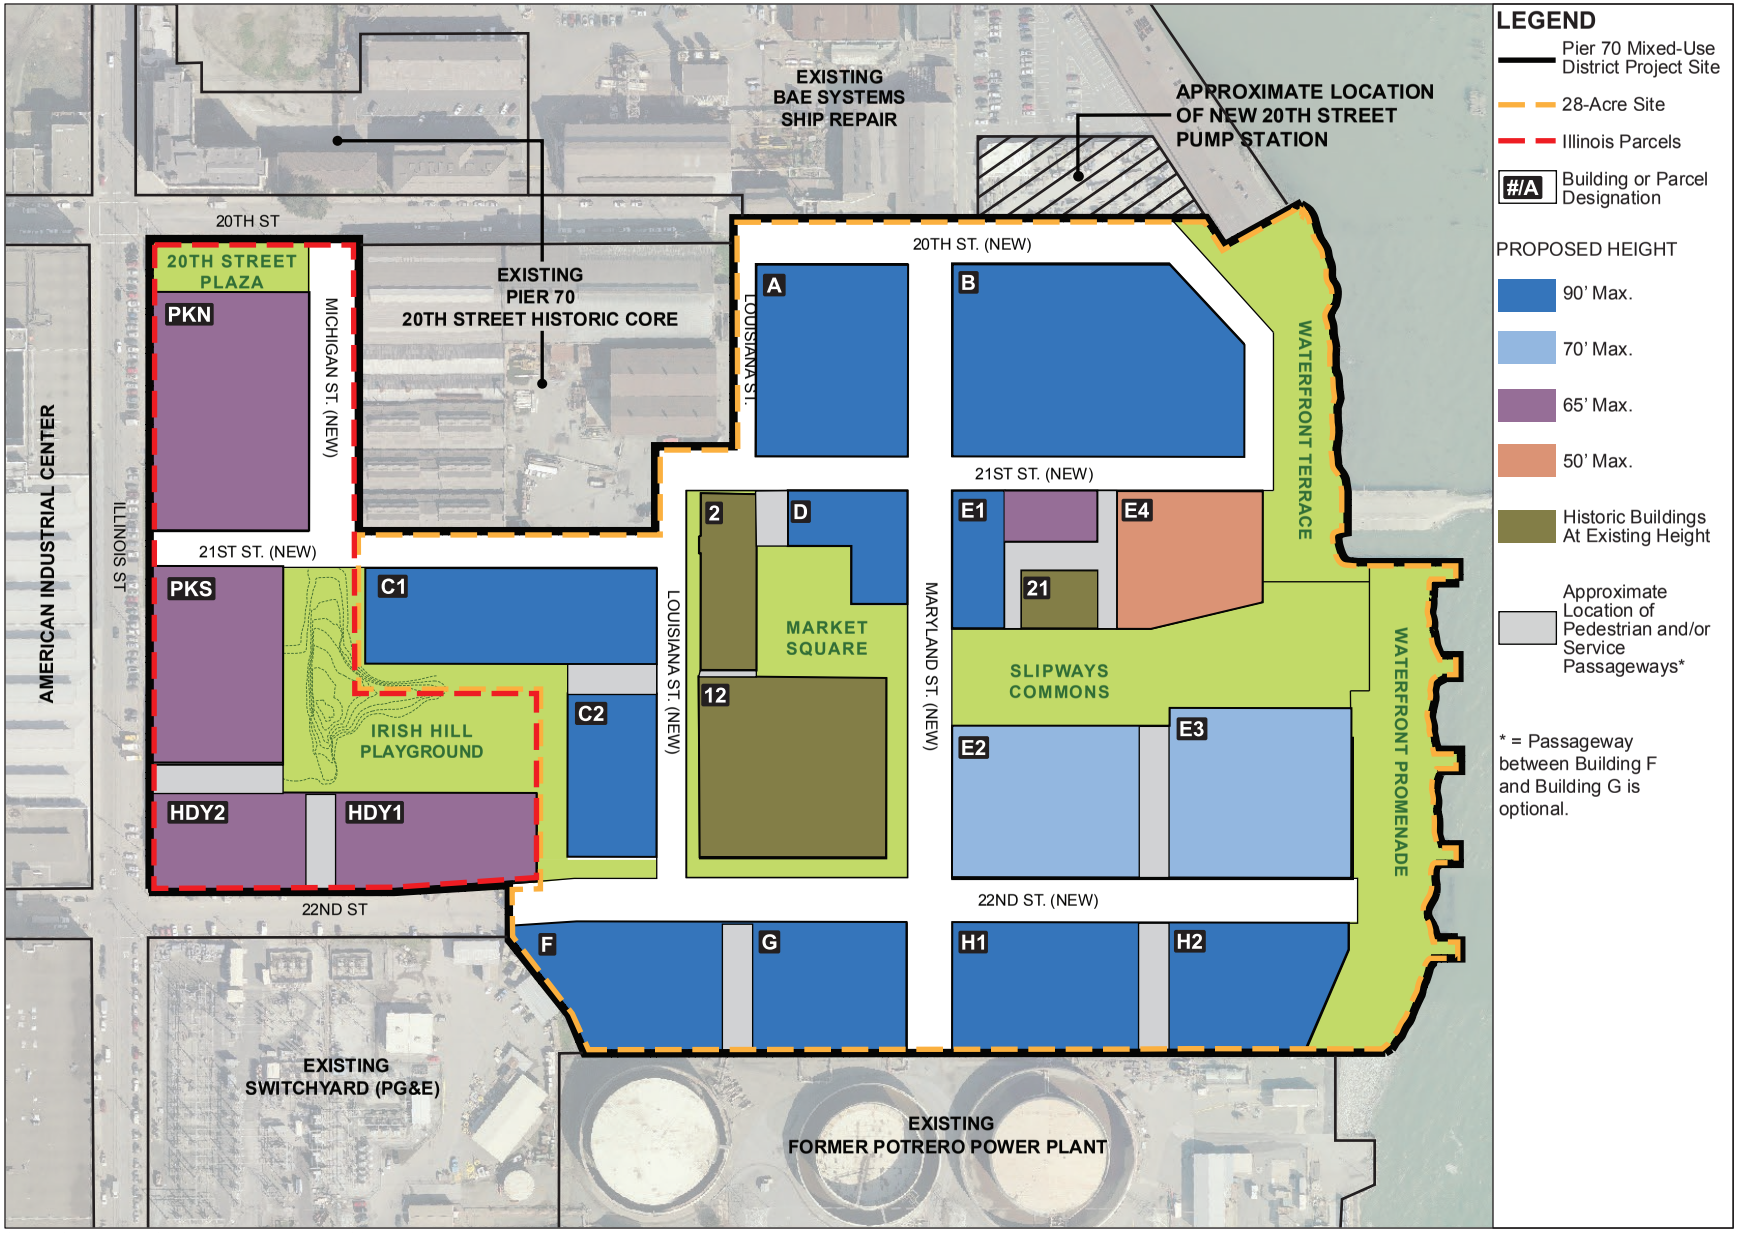
The Building Design Standards define new construction zones within the project site, separated from retained historic structures by buffer zones formed by the proposed network of streets and open spaces. Within the new construction zones, the Building Design Standards would establish building envelopes for new construction within each parcel intended to maintain varied heights in new construction and create juxtapositions of scale to relate to the historic character of the site. As part of the Proposed Project, existing Buildings 2 and 12, in the central portion of the site, would be retained at their existing heights of approximately 82 feet and 60 feet, respectively. At the center and eastern portions of the site (portion of Parcel E1, and Parcels E2, E3, and E4), new buildings would be limited to heights between 50 to 70 feet. Existing Building 21, which is 44 feet tall, would be moved about 75 feet southeast from its current location to a new site on the northern edge of the proposed Slipways Commons open space. In its new location, Building 21 would front the Slipways Commons open space and maintain a visual connection to Buildings 2 and 12. It would be framed by new 90-, 65-, and 50-foot-tall buildings to the west, north, and east, respectively.

REHABILITATION OF CONTRIBUTING STRUCTURES

The Building Design Standards call for rehabilitation of Buildings 2, 12, and 21 in accordance with the Secretary of the Interior's Standards for Rehabilitation. Except for grading activities necessary for the construction of 21st Street, the Building Design Standards specify that no substantial intervention shall be permitted on the remnant of Irish Hill that would be retained under the Proposed Project.

PROJECT-WIDE MASSING AND ARCHITECTURE

Project-wide standards and guidelines apply to all new construction, and are intended to encourage building variety and a pedestrian scale that meets the needs of a mixed-use neighborhood. The Building Design Standards include standards and guidelines that promote a strong building streetwall in all new construction to support a cohesive urban fabric, relate to the pattern of historic buildings, define views through the site and to the water, and create an active urban street for pedestrians. Standards and guidelines also call for the following:



Source: Sitelab Urban Studio, Turnstone Consulting/SWCA (2015)

PIER 70 MIXED-USE DISTRICT PROJECT

FIGURE 2.13: PROPOSED HEIGHT LIMITS PLAN

- Defining a differentiated building base zone;
- Reinforcing a transparent and active ground floor to engage pedestrians;
- Promoting high-quality storefront and building entry design;
- Prohibiting long expanses of blank wall;
- Prohibiting the replication of historic buildings in new construction;
- Promoting architectural variety requiring that all new buildings be visually distinct from each other, with variations in building massing, materials, and fenestration;
- Promoting depth and texture in façades with a variety of materials and treatments;
- Providing for non-occupiable horizontal projections such as marquees, awnings, and canopies, cornices, and louvers; and
- Providing for occupiable projections such as bay windows and balconies.

Other standards and guidelines address roof treatments, residential open space, garage and service entry design, and sustainability strategies for maximizing efficiency through thoughtful building design.

LOCATION-SPECIFIC MASSING AND ARCHITECTURE

Location-specific requirements call for increased attention to the design of the building envelope at particular key locations to respond to specific design issues at those locations.

Adjacency to Contributors of Historic District

To enhance compatibility of new construction with adjacent contributors to the Historic District, new buildings would reference adjacent contributing features through a range of strategies established to relate to the inherent qualities of the Historic District and to respect its character-defining features and unique views.

Setback and Massing Standards of Parcel A for Views of Historic Building 113

To maintain a visual gateway into the Historic District, and to maintain relationship with the adjacent 60-foot height of Building 113, the massing at the northwestern corner of Parcel A would be set back above 60 feet (the remainder of new construction on Parcel A would be 90 feet in height).

Height Referencing Dimensional Quality

To enhance compatibility of new construction with adjacent contributors to the Historic District, select façades of new construction across the street from or adjacent to contributing features would distinctly reference the height of the adjacent building, within a 5-foot height range in

order to align with the finished floors of new buildings. Dimensional quality means that certain key façades of new buildings would respond to the height of adjacent historic buildings by projecting or recessing from the vertical plane through the use of distinct fenestration lines, massing, setback, volumetric shifts, or changes in the façade material or color.

Related Treatment to Adjacent Contributors of Historic District

To enhance the compatibility of new construction with adjacent contributors to the Historic District, select façades of new construction would incorporate elements that relate to the adjacent historic building, in keeping with contemporary design and construction methods. Façades would include one or more of the following elements: (1) height, (2) bay rhythm/vertical modulation, (3) glazing proportions and/or pattern, (4) horizontal banding, (5) material grain, and (6) alignments with key edges or openings.

Limited and Prohibited Façade Materials

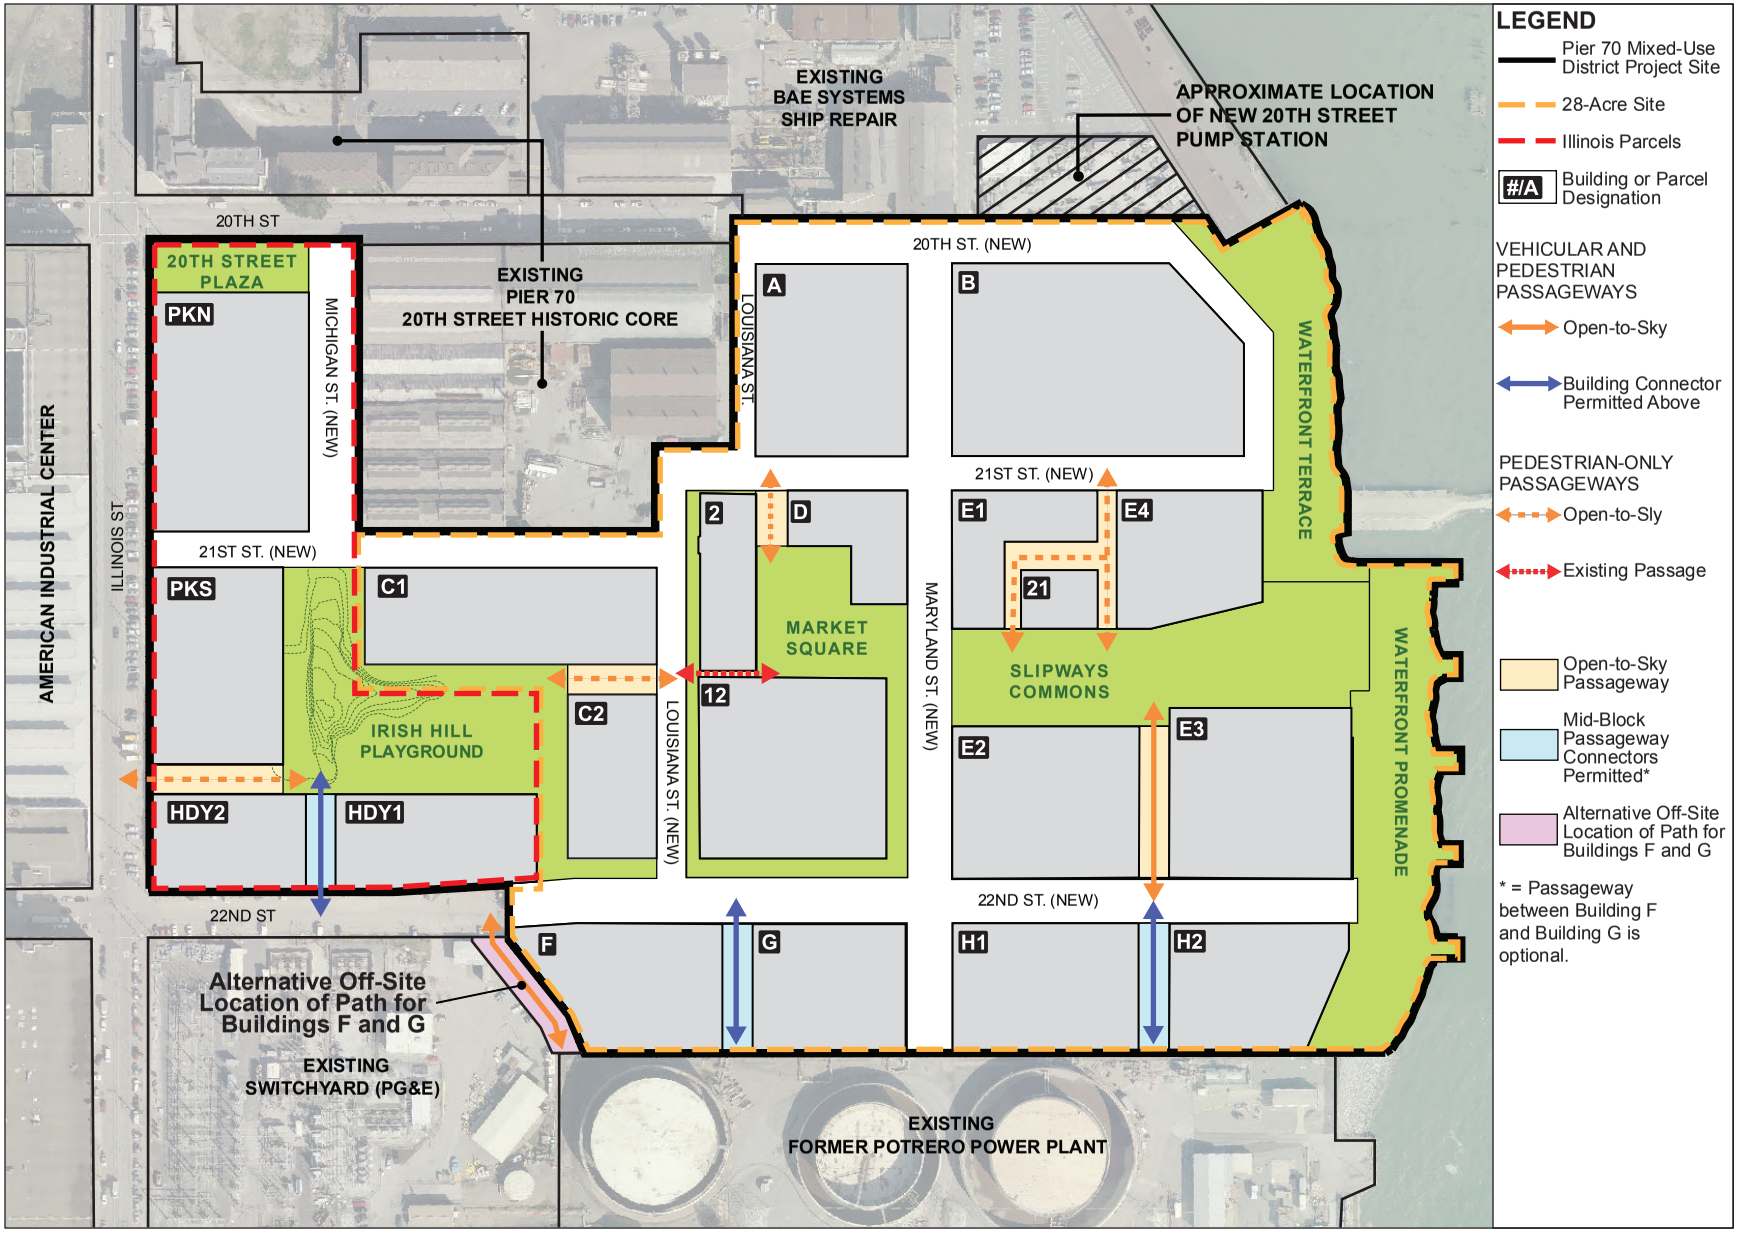
To enhance compatibility of new construction with adjacent contributors to the Historic District, the following materials would be limited on façades of new construction immediately adjacent to contributors to the Historic District: (1) bamboo wood, (2) smooth, flat glass curtain walls, (3) coarse-sand finished stucco, (4) highly reflective glass, and (5) wood resin panels. The following materials would be prohibited on façades of new construction immediately adjacent to the contributing features: (1) vinyl planks and siding, and (2) artificial stone or fiberglass. In addition, building façades finished entirely with solid stucco would not be permitted. Stucco could only be used in combination with other permitted building materials.

Bird-Safe Controls

All new construction façades are subject to the City's Bird Safe Standards for "feature-related hazards." The City's Bird Safe standards for "location-related hazards" shall apply to façades fronting on Irish Hill Playground and façades within 300 feet of and facing San Francisco Bay.

Mid-Block Passages

The Proposed Project includes mid-block passages that would allow for a connector between Parcels F and G, Parcels H1 and H2, and Parcels HDY1 and HDY2, as identified on Figure 2.14: Mid-Block Passageway Locations. The Building Design Standards include standards and guidelines for these connectors to provide for adequate clearance from the ground, maintain visual separateness from the building façade, and maintain a minimum openness to the sky. Since design details for these pedestrian building connectors between these parcels are not decided, the Proposed Project would include a pedestrian passageway option under the Maximum



Source: Sitelab Urban Studio, Turnstone Consulting/SWCA (2016)

PIER 70 MIXED-USE DISTRICT PROJECT

FIGURE 2.14: MID-BLOCK PASSAGEWAY LOCATIONS

Commercial Scenario. A Pedestrian Passageway Option is not applicable under the Maximum Residential Scenario since mid-block pedestrian passageways are not planned under that scenario. Both the Maximum Commercial Scenario and the Pedestrian Passageway Option would include a 40-foot-wide mid-block pedestrian passage that differentiates building massing in the southern parcels (Parcels F and G, Parcels H1 and H2, and Parcels HDY1 and HDY2). However, the Pedestrian Passageway Option would require that an above-ground building connection over the passageways retain at least 60 percent exposure to the sky, whereas the Maximum Commercial Scenario would require a minimum setback of at least 10 feet with an additional setback of another 10 feet on the upper floor.

Long Façades in Key Locations

The Building Design Standards identify long façades in key locations which would be subject to further architectural requirements beyond the Project-wide Standards. The Building Design Standards identify and illustrate examples of design strategies for long façades in key locations to promote flexibility, variety, creativity, and thoughtfulness in building design. These strategies fall under the categories of large-scale massing, modulation, and fine-grained materiality, described below, and should be used in combination.

Massing

Massing strategies are large urban-scale setback, projections, and interventions that activate public space, respond to historic context, and offer improved views and sun exposure to provide massing variation along the length of the façade. These strategies include ground-floor and base setbacks, upper-level setback, passageways or entryways that subdivide the façade, courtyards and terraces that subdivide the façade, and substantial subtractions or projections to the building envelope.

Modulation

Modulation strategies are occupiable small-scale shifts of the building envelope in order to achieve variation and depth along the length of a façade, such as inset vertical or horizontal bays or shifts in massing, subdividing the façade into two offset façade systems, volumetric façade articulation, and roofline modulation.

Materiality

Materiality strategies identify materials and treatments to be applied to façades. These include preferred façade materials, material treatment, pattern of assembly, façade depth, and shading elements.

Waterfront Façades

The Building Design Standards identify and apply architectural requirements for key waterfront façades. The waterfront façade standards serve to reinforce the following waterfront-specific goals: reinforce the public nature of the waterfront park through the adjacent ground-floor treatments and uses; provide views of the water from the buildings; maximize sunlight on adjacent open spaces; and promote pedestrian scale on the ground floor along the waterfront.

PROPOSED OPEN SPACE PLAN

The Proposed Project would include 9 acres of publicly owned open space. (See Figure 2.15: Proposed Open Space Plan.) The Building Design Standards for the proposed open space plan respond to several key objectives:

> "to connect the Dogpatch neighborhood to the waterfront, to create a variety of vibrant public spaces for social interaction and respite, to enhance the resiliency of the site against sea-level rise, to retain a defining feature of the Historic District open areas, and to project an identity for the site that draws from the character of the adjacent neighborhood and the history of the Pier 70 industrial waterfront."[41]

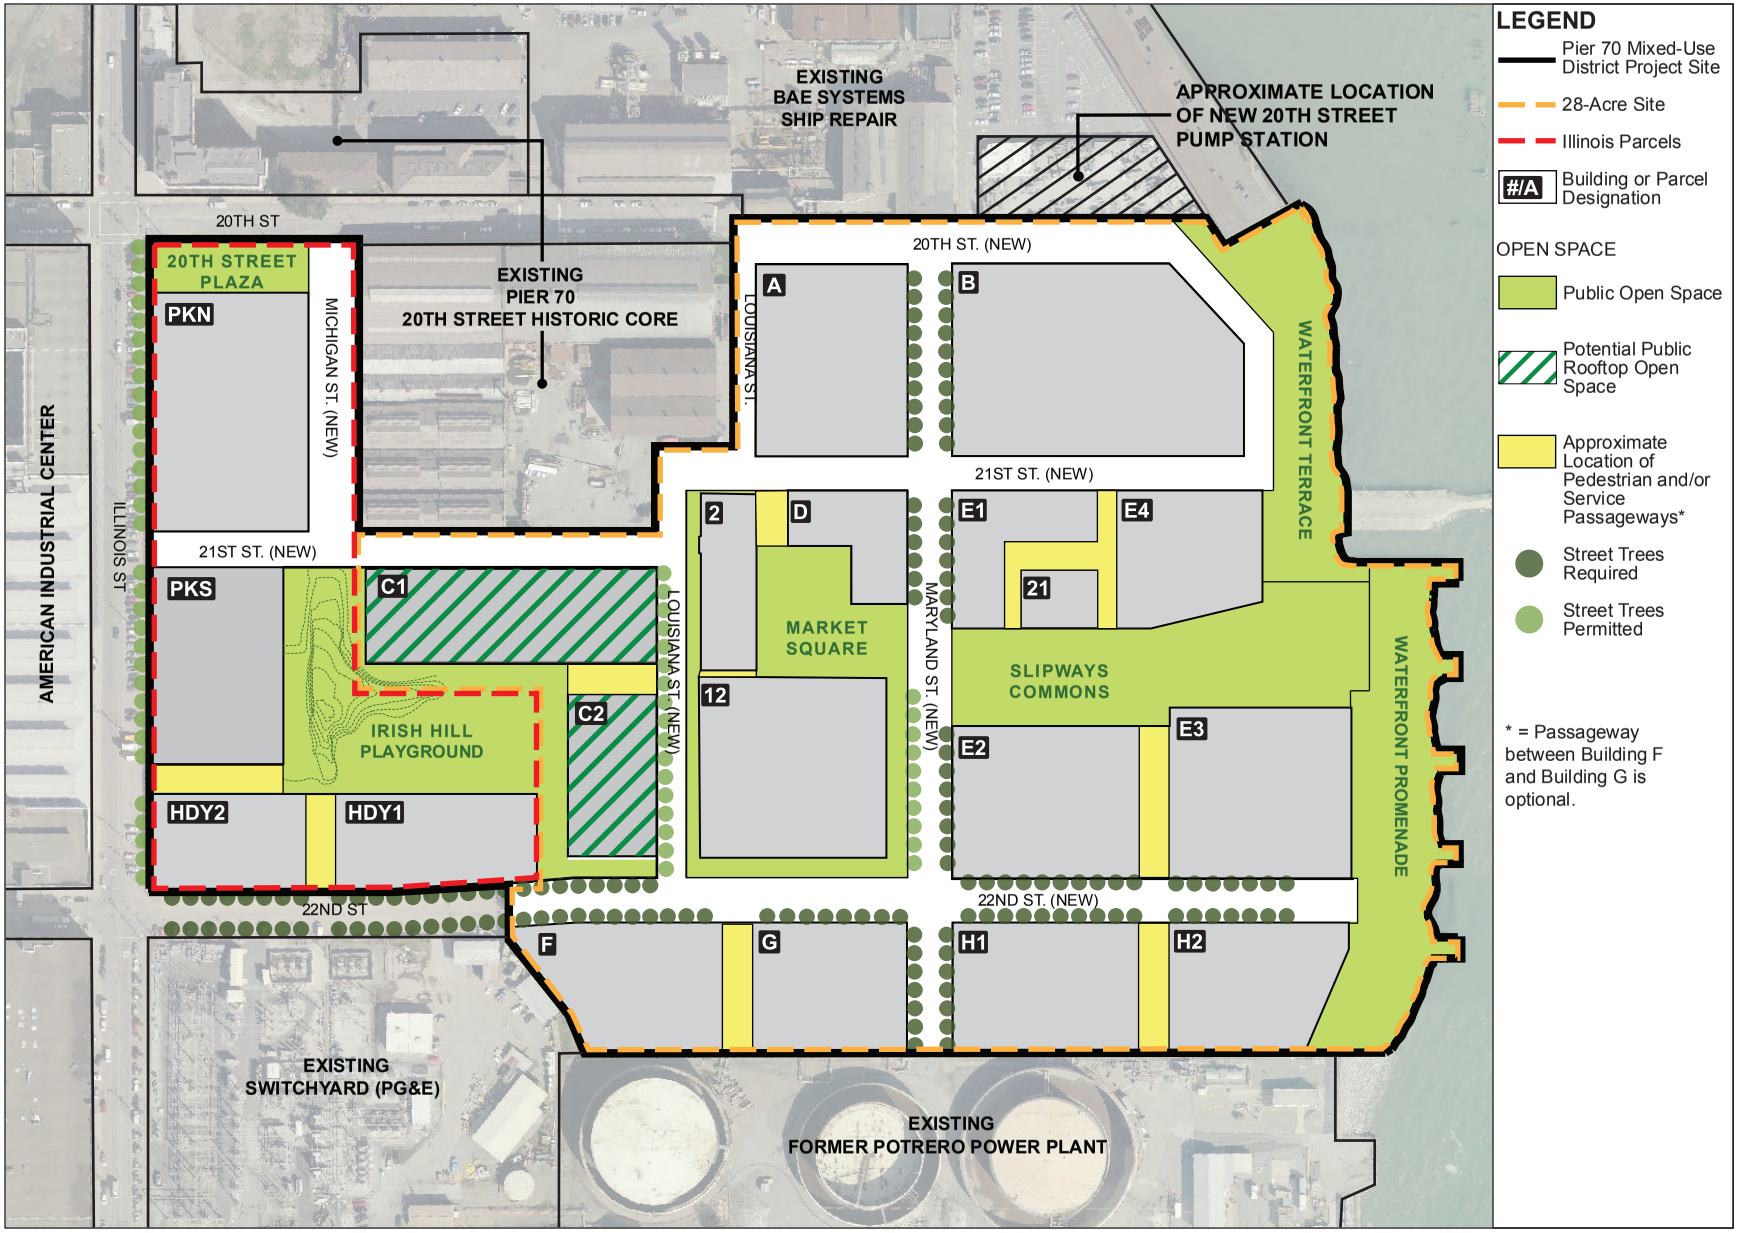
The proposed open space would supplement recreational amenities in the vicinity of the project site, such as the future Crane Cove Park in the northwestern part of Pier 70, and would include extension of the Blue Greenway[42] and Bay Trail through the southern half of the Pier 70 area.

As described below, open spaces programmed as part of the Proposed Project are the Waterfront Promenade, the Waterfront Terrace, Slipways Commons, the Building 12 Market Plaza and Market Square, the Irish Hill Playground, 20th Street Plaza, and Buildings C1 and C2 structured parking rooftops, if parking structures are built on these parcels. These open spaces are anticipated to accommodate everyday passive uses as well as public outdoor events, including art exhibitions, theater performances, cultural events, outdoor fairs, festivals and markets, outdoor film screenings, evening/night markets, food events, street fairs, and lecture services. Fewer than 100 events per year are anticipated and would likely include approximately 25 mid-size events attracting between 500 to 750 people, and four larger-size events attracting up to 5,000 people.

---

[41] *Draft Pier 70 SUD Design for Development*, April 1, 2016, Section 3.1, "Open Space Vision and Objectives," p. 39.

[42] The Blue Greenway is a City of San Francisco project to improve the City's southerly portion of the 500-mile, 9-county, region-wide Bay Trail, as well as to extend the newly established Bay Trail and associated waterfront open space system. This 13-mile trail corridor will connect China Basin in the north to Candlestick Point State Recreation Area in the south. Trail information is available online at http://www.sf-port.org/index.aspx?page=1433, accessed September 24, 2015.



Source: Sitelab Urban Studio, Turnstone Consulting/SWCA (2016)

PIER 70 MIXED-USE DISTRICT PROJECT

FIGURE 2.15: PROPOSED OPEN SPACE PLAN

The Proposed Project would also include private open space areas such as balconies, rooftops, and courtyards that would be accessible only to building occupants.

WATERFRONT PROMENADE

The Waterfront Promenade would encompass a minimum 100-foot-wide portion of an approximately 5-acre waterfront park area (which also includes the Waterfront Terrace and Slipways Commons open space areas, described below) located along the central and southern shoreline of the project site. The Waterfront Promenade would include a north-south-running pedestrian and bicycle promenade as part of the 20-foot-wide Blue Greenway and Bay Trail system that extends from Mission Creek to the southern San Francisco County line at Candlestick Point. Anticipated features include outdoor dining terraces east of Parcel E3 and H2, and furnished picnic and seating terraces east of Parcels E3 and H2, which would provide park users with opportunities for waterfront viewing and passive recreation. A 6-foot-wide informal shoreline pathway would run parallel to the riprap along the water's edge and would connect the various features at the San Francisco Bay edge. The Pier 70 slipway structures along the water's edge would also be made accessible to the public and would offer opportunities for fishing and views of the San Francisco Bay and Pier 70 historic buildings.

The Proposed Project includes installation of four viewing pavilions along the water's edge. These viewing pavilions are large-scale public art and artifact pieces, which would be designed to emphasize the view of the horizon as well as accommodate a variety of public program uses such as cultural events and gatherings. The Waterfront Promenade includes two of the four viewing pavilions; the remaining two would be installed in the Waterfront Terrace and Slipways Commons, discussed below.

WATERFRONT TERRACE

The Waterfront Terrace would be constructed along the northern half of the project site's shoreline, to the north of the Waterfront Promenade, and orient views towards the active shipbuilding activities north of the project site. The Waterfront Terrace includes three primary spaces: a viewing pavilion to the north, a social lawn along the central portion, and picnicking and seating areas along the southern portion. The Waterfront Terrace would also include the northern portion of the 20-foot-wide Blue Greenway and Bay Trail system within the project site.

SLIPWAYS COMMONS

Slipways Commons open space would connect existing Buildings 2, 12, and 21 to the waterfront. This area would be designed as the most flexible, multi-purpose open space, intended to accommodate community gatherings, festivals, performances, art installations, and nighttime and cultural events, as well as passive recreation. Anticipated features include a multi-function

commons, an event plaza, and a viewing pavilion. No roadway would be permitted between Parcels E1, E2, E3 and E4 and Building 21 and the park, in order to maximize recreational use of the park and encourage pedestrian travel.

BUILDING 12 PLAZA AND MARKET SQUARE

The Building 12 Plaza and Market Square would be a series of small plazas and outdoor market spaces. Market Square would be located directly north of Building 12 and east of Building 2 with four pedestrian access points. The approximately 1.5-acre plaza and square would provide the opportunity for informal and formal events, supporting flexible space for open-air markets, market stalls, and small performances and gatherings. Along the eastern and southern edges of Building 12, small plazas (approximately 26 to 28 feet wide) would provide opportunities for artwork displays, seating, and ground-floor uses within adjacent buildings to extend into these outdoor areas. The southern plaza would also have a café terrace. The Proposed Project would potentially retain a metal-frame remnant of Building 15 above the new 22nd Street, directly south of Building 12.

IRISH HILL PLAYGROUND

The Irish Hill Playground installation would be a 2-acre area south and east of the existing remnant of Irish Hill. The Irish Hill Playground would include children's play areas (play slope and play pad), other recreation opportunities, a picnic grove, a lounging terrace, and planted slopes and pathways. The non-native stand of eucalyptus trees located on the remnant of Irish Hill would remain.

20TH STREET PLAZA

The 0.5-acre 20th Street Plaza open space area would be located at the southeast corner of the intersection of 20th and Illinois Street streets, directly north of Parcel PKN. This gateway space would allow for direct views from 20th and Illinois streets to Building 113, on the Historic Core site. Potential features within the 20th Street Plaza include terraced seating areas and stormwater management facilities.

ROOFTOP OPEN SPACE AREAS

As described above, Parcels C1 and C2 would be designated for parking structures, but could be developed with either residential or commercial uses, depending on future market demand for parking and travel patterns. If parking structures are constructed on those parcels, the rooftops would be used to provide additional public open space and amenities such as active sports courts and play fields, community gardens, seating, and observational terrace areas. This acreage would be in addition to the 9 acres of public open space proposed at the project site.

PROPOSED TRAFFIC AND CIRCULATION PLAN

OVERVIEW

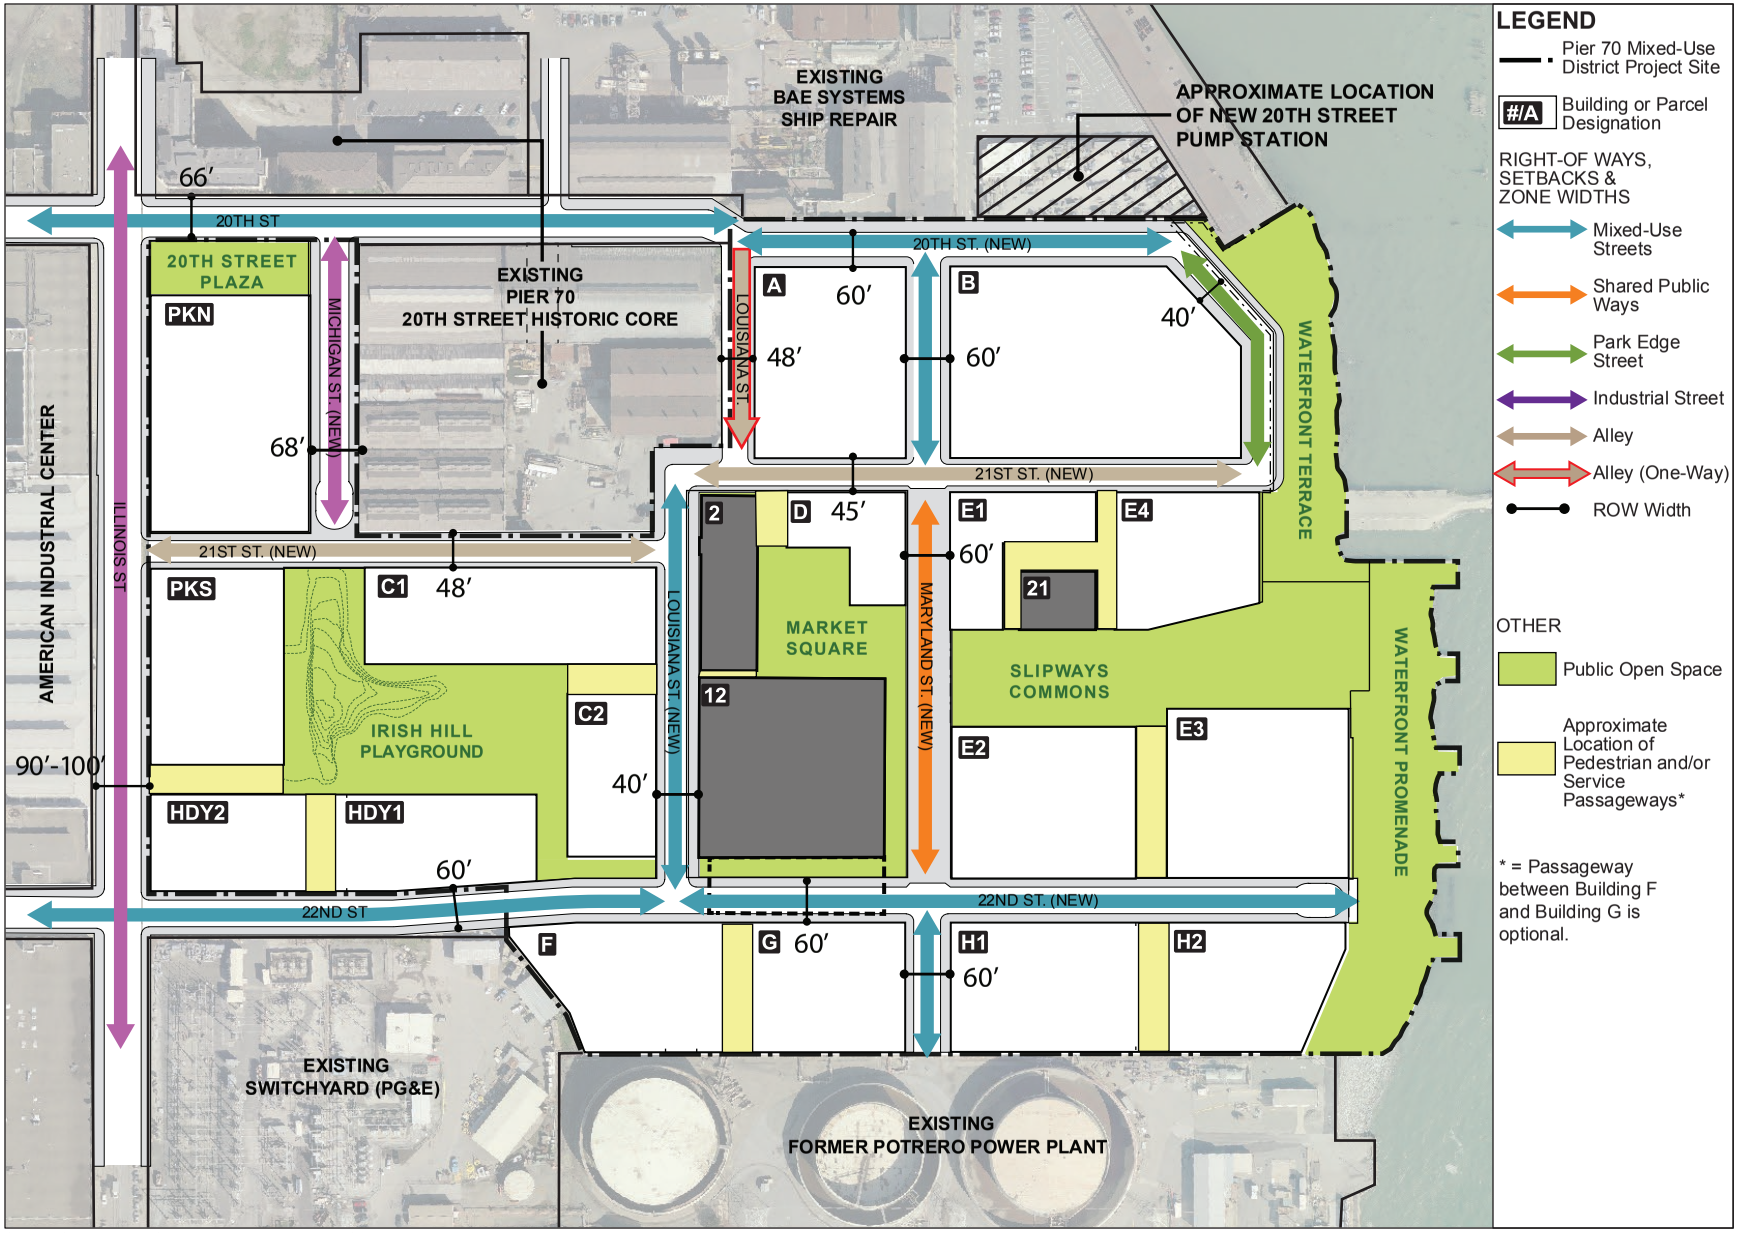
The Proposed Project would encourage alternative modes of transportation (transit, walking, and biking) by building a dense, pedestrian friendly, mixed-use, and transit-oriented development; using Transportation Demand Management (TDM) strategies;[43] prioritizing safety, especially for bicyclists and pedestrians; implementing a shuttle bus service to connect Pier 70 to regional transit hubs; and establishing a bicycle share system. The TDM strategies would be presented in a section of the *Pier 70 SUD Transportation Plan*. Entitlement and transaction documents would require the Proposed Project to establish a Transportation Management Agency (TMA) to coordinate and implement TDM measures, including the shuttle service.

STREET IMPROVEMENTS AND CIRCULATION

As shown on Figure 2.16: Proposed Roadway Network, the proposed primary streets on the project site would be 20th and 22nd streets, built out from west to east. The proposed Maryland Street would be a secondary north-south-running street designed as a shared street.[44] New minor streets proposed as part of the Proposed Project include a new 21st Street, running west to east from Illinois Street to the waterfront, and Louisiana Street, running north from 22nd Street. New traffic signals would be installed at the intersection of Illinois and 21st streets. Louisiana Street from 21st Street to 20th Street would include a jog to accommodate existing historic structures within the Historic Core. Except for the western side of Louisiana Street adjacent to the Historic Core, all proposed streets would include sidewalks, and street furniture where appropriate. Maryland, 20th, and 22nd streets would include bicycle infrastructure or signage. With the exception of Louisiana Street between 20th and 21st streets, all proposed streets would be two-way, with a single lane of travel in each direction. Louisiana Street would be one-way in the southbound direction, with a single lane of travel. The Proposed Project does not include bus or truck routes, although buses could be accommodated in the future. The proposed new streets would provide access for emergency vehicles and off-street freight loading. Michigan, Louisiana, and 21st streets would be designed as primary on-street loading corridors.

[43] Transportation Demand Management is the application of strategies and policies to reduce travel demand (specifically that of single-occupancy private vehicles), or to redistribute this demand in space or in time.

[44] Shared streets are generally curbless streets that maintain driveway-like access for vehicles operating at low speeds to provide necessary services and are designed to prioritize pedestrian travel by implicitly slowing traffic speeds using design features, and other cues to slow or divert traffic.



Source: Sitelab Urban Studio, Turnstone Consulting/SWCA (2015)

PIER 70 MIXED-USE DISTRICT PROJECT

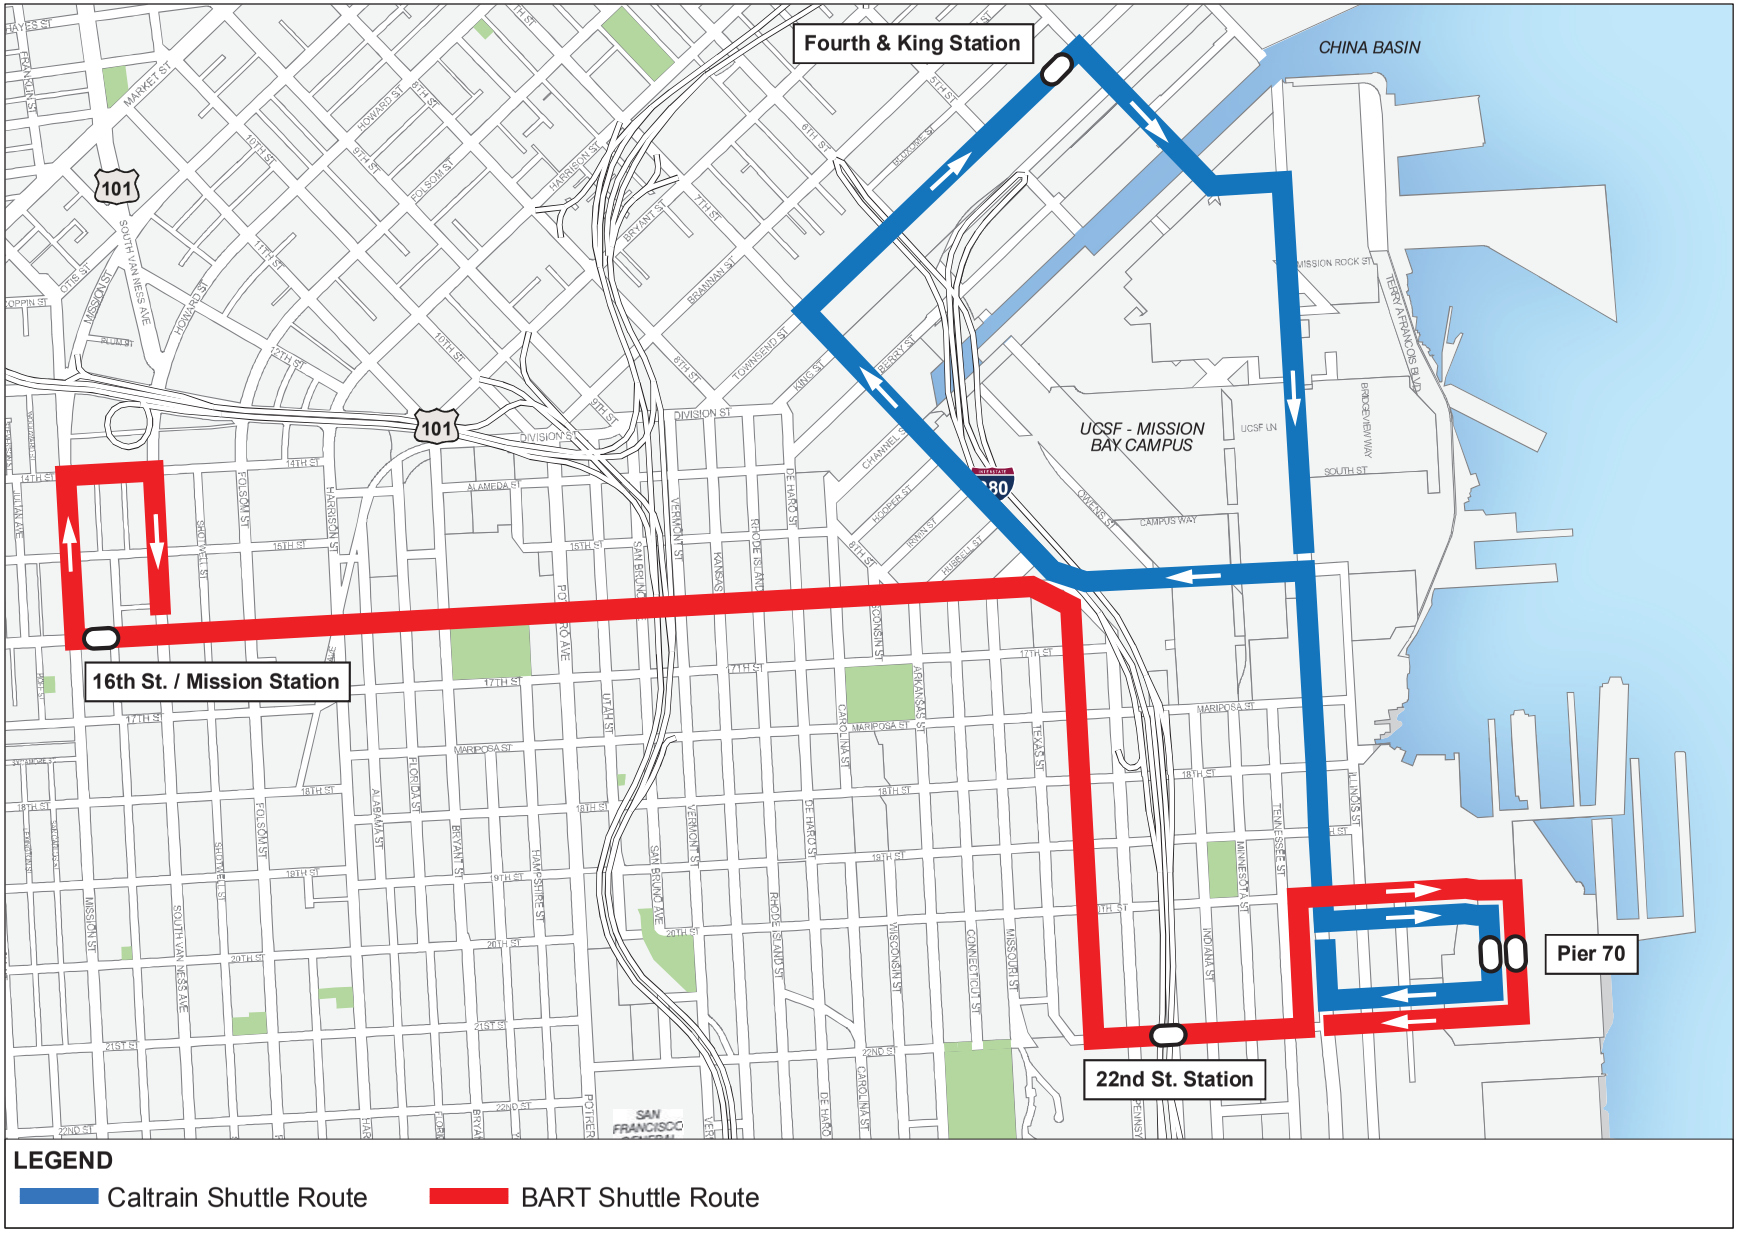
FIGURE 2.16: PROPOSED ROADWAY NETWORK

As part of the Proposed Project, Michigan Street from the southern side of 20th Street towards 21st Street would be narrowed from 80 to 68 feet with 12 feet of the right-of-way converted from a public street to private use, i.e., "vacated," and developed as part of the Illinois Parcels. Vehicle travel would not be connected through to 21st Street due to a grade change, but pedestrian pathways would connect.

TRANSPORTATION PLAN

The Proposed Project would include a *Pier 70 SUD Transportation Plan* intended to manage transportation demands and to encourage sustainable transportation choices, consistent with the City of San Francisco's Transit First, Better Streets, Climate Action, and Transportation Sustainability Plans and Policies. The *Pier 70 SUD Transportation Plan* would include a TDM Program that would establish a TMA to manage implementation of TDM measures at the site. The TMA for the Proposed Project would be funded by project-generated sources and would be responsible for working with future subtenants of the project site (e.g., employers, residents, etc.) to ensure that they are actively participating in the TDM program. The TMA would be managed by a Transportation Coordinator who would oversee implementation of the TDM Program.

Key strategies to be included in the TDM Program would be a shuttle service, bike sharing stations and other means of encouraging bicycle use, unbundled parking, car-sharing services, and other approaches to discourage use of single-occupant private vehicles. The shuttle service would connect residents and workers to regional transit hubs, such as the 16th/Mission BART station, the 22nd Street Caltrain station, and the Caltrain station at Fourth and King streets. (See Figure 2.17: Proposed Shuttle System.) Routes, vehicle size, and frequency would be augmented over the course of build-out of the Proposed Project to respond to demand. The shuttle service would be operated by the TMA, with no fee, most likely through a third-party service provider. It would enroll in the SFMTA Commuter Shuttle Program and be subject to that Program's policies, including establishing specific designated locations for pick-up and drop off, and only using shuttle vehicles which comply with the 2012 California vehicle emissions standards. The Proposed Project would establish a bicycle sharing system to work collaboratively with SFMTA and Bay Area Bike Share (BABS) representatives or a similar bicycle sharing service. Through the TMA, the Proposed Project would implement a number of amenities and education strategies regarding transportation choices, including real-time occupancy data for shared parking facilities, on-street carshare spaces, unbundled parking for residents, preferential treatment for high-occupancy vehicles, a website, production of brochures and newsletter, as well as a dedicated Transportation Coordinator staff member. See "Transportation Demand Management Plan" in Section 4.E, Transportation and Circulation, pp. 4.E.46-4.E.47, for a more thorough discussion of TDM Plan strategies.



Source: Forest City (2015)

PIER 70 MIXED-USE DISTRICT PROJECT

FIGURE 2.17: PROPOSED SHUTTLE SYSTEM

BICYCLE AND PEDESTRIAN IMPROVEMENTS

The Proposed Project includes bike lanes, bike-safety-oriented street design, and bike-parking facilities to promote bicycling in and around the project site. (See Figure 2.18: Proposed Bicycle Network.) Under the provisions of the SUD, bike amenities would be constructed on the project site that would meet or exceed the existing Planning Code requirements at the time of permit submittal.[45] Under the Maximum Residential Scenario, 1,142 Class 1 and 514 Class 2 bicycle parking spaces would be required.[46] Sufficient Class 2 bicycle parking should also be provided at key entrance areas of the major open spaces. Under the Maximum Commercial Scenario, 995 Class 1 and 475 Class 2 bicycle parking spaces would be required. Improvements proposed for the Proposed Project include construction of Class II facilities (bicycle lanes) and Class III facilities (shared-lane markings and signage) on 20th, 22nd, and Maryland streets. A Class I separated bicycle and pedestrian facility would be provided along the Bay Trail and Blue Greenway the length of the project site along the shoreline, connecting at Georgia Street to the northbound path to Crane Cove Park and the southern waterfront park boundary to the future southern connection through the former Potrero Power Plant site.

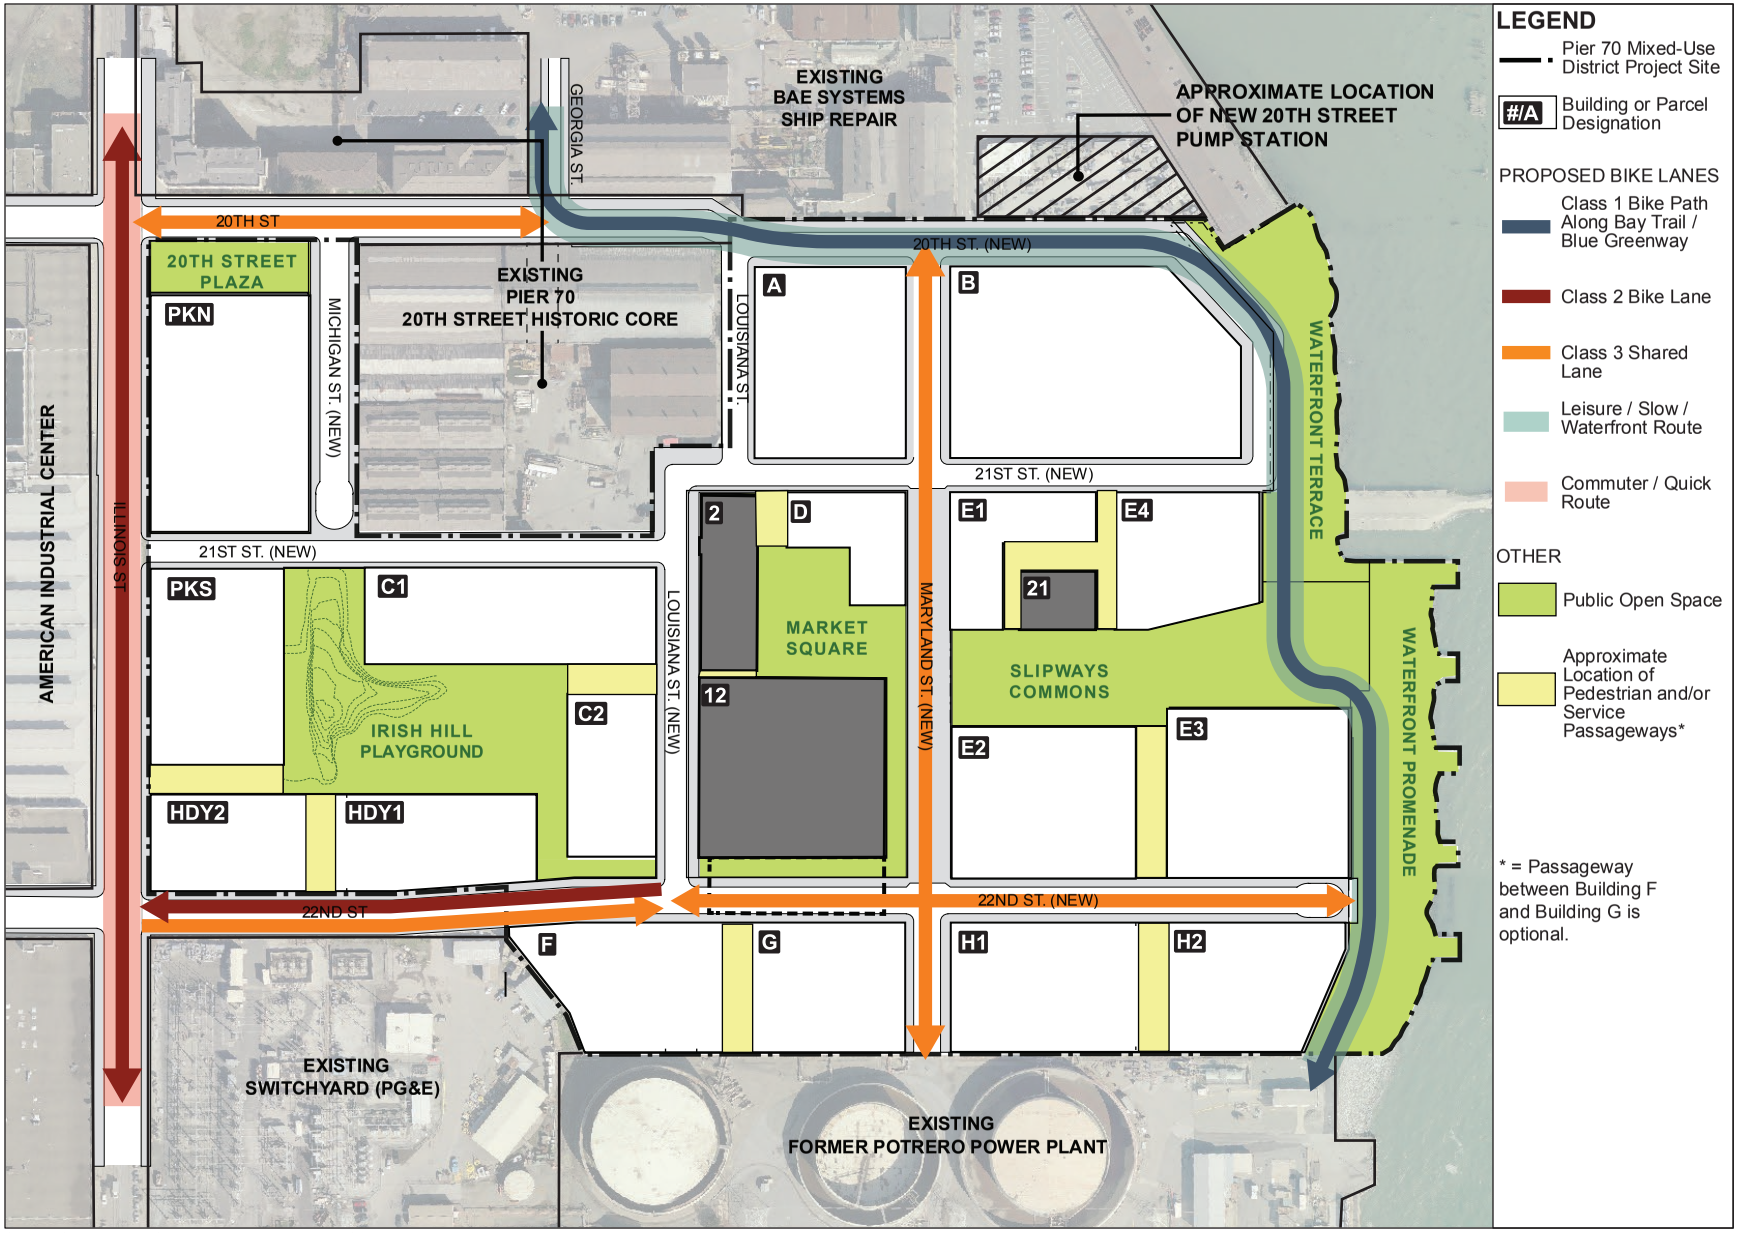
Pedestrian travel would be encouraged throughout the project site by establishing a network of connected pedestrian pathways running both west-to-east and north-to-south to connect open spaces. Street and open space design would also incorporate pedestrian-safe sidewalk and street design and signage. All streets on the project site would include 9- to 18-foot-wide sidewalks. The project site is designed to make the area east of Maryland Street a predominantly pedestrian zone, and there would be no vehicular streets along the length of waterfront parks, with the exception of the north-south running portion of 20th Street. Maryland Street could potentially have a shared street condition, to reinforce the pedestrian connection from the western portion of the site, across the street, and to San Francisco Bay. Both 20th and 22nd streets would feature pedestrian amenities to encourage walking from the Dogpatch neighborhood, as well as transit use along the Third and 22nd streets corridors.

PARKING

The Proposed Project would provide parking spaces within a site-wide maximum and a maximum ratio per use. Under the Maximum Residential Scenario a maximum of 3,370 off-street parking spaces would be allowed, and under the Maximum Commercial Scenario a maximum of 3,496

[45] Current Planning Code bicycle requirements at the time of publication of the Draft EIR are set forth in San Francisco Planning Code Section 155.2, available online at: http://planning.sanfranciscocode.org/1.5/155.2/. Accessed June 30, 2016.

[46] Class 1 bicycle parking provides lockers, monitored bike parking, or other restricted-access facilities. Class 2 bicycle parking is unprotected bike racks.



Source: Sitelab Urban Studio, Turnstone Consulting/SWCA (2015)

PIER 70 MIXED-USE DISTRICT PROJECT

FIGURE 2.18: PROPOSED BICYCLE NETWORK

off-street parking spaces would be allowed. The Proposed Project would provide about 285 on-street parking spaces along most the streets internal to the project site under either scenario. One parking space per 1,000 square feet of gross floor area would be provided for office/commercial and RALI uses, and 0.75 parking spaces per residential unit would be allowed. If not developed as residential or commercial uses, planned structured parking on Parcels C1 and C2 would provide shared parking for multiple uses. The Illinois Parcels and most parcels on the 28-Acre Site, excluding Buildings 2, 12, and 21, would also have accessory parking. All residential parking would be unbundled, which means parking would be an optional, additional cost to the price of renting or purchasing a dwelling unit.

PROPOSED INFRASTRUCTURE AND UTILITIES

POTABLE WATER

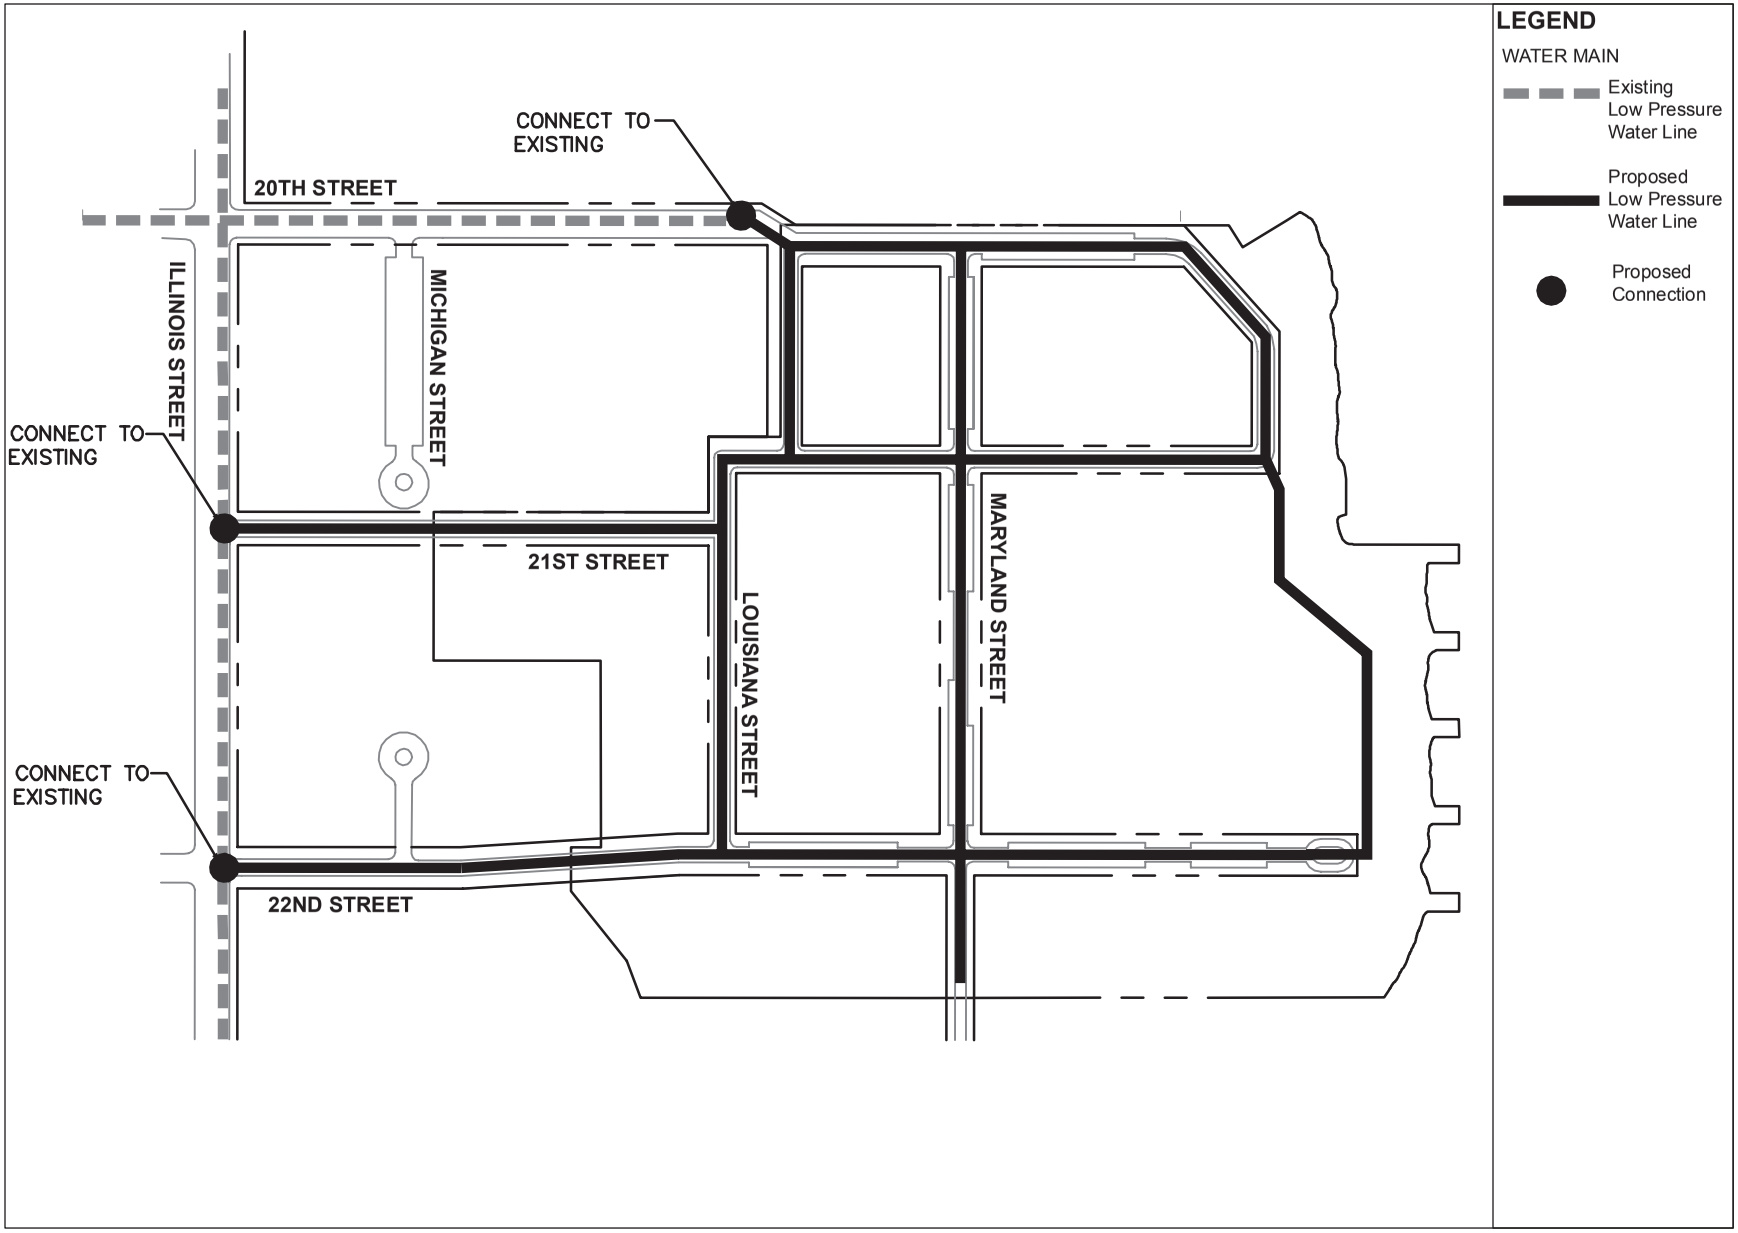
Potable water distribution piping would be constructed in trenches under the planned streets to provide water for site uses and firefighting needs. This piping would connect to the existing water mains of the City's low-pressure water distribution system underneath 20th, Illinois, and 22nd streets. (See Figure 2.19: Proposed Low Pressure Water Distribution System.) Connections to existing water mains would be made at the intersections of Illinois/22nd streets, Illinois/21st streets, and at the intersection of 20th and Louisiana streets.[47] If necessary, the water main underneath the western portion of 20th Street would be replaced. To reduce potable water demand, high-efficiency fixtures and appliances would be installed in new buildings, and fixtures in existing buildings would be retrofitted, as required by City regulations.

RECYCLED (RECLAIMED) WATER

The project site is located within the City's designated recycled water use area and is subject to Article 22 of the San Francisco Public Works Code, referred to as the Recycled Water Use Ordinance. The goal of the ordinance is to maximize the use of recycled water. Therefore, buildings and facilities that are subject to this ordinance must use recycled water for all uses authorized by the State once a source of recycled water is available and projects must include recycled water distribution systems within buildings as well as throughout the project sites. Commonly approved uses include irrigation, cooling, and toilet and urinal flushing.

The SFPUC's Eastside Recycled Water Project may ultimately provide an estimated 2 mgd of tertiary recycled water on the eastern side of San Francisco. However, the Eastside Recycled Water Project is in the planning stages, with construction expected to be completed by the end of

[47] BKF, Pier 70, Proposed Utilities, Low Pressure Water System diagram, February 26, 2015.



Source: BKF (2016)

PIER 70 MIXED-USE DISTRICT PROJECT

FIGURE 2.19: PROPOSED LOW PRESSURE WATER DISTRIBUTION SYSTEM

2029.[48] Although a source of recycled water is not yet available from the City, the project sponsors would install distribution pipelines to ultimately connect with the City's recycled water distribution system once it is constructed. Accordingly, the Proposed Project includes the installation of distribution pipelines beneath existing and proposed streets within the project area, as shown on Figure 2.20: Proposed Recycled Water Distribution System. These lines would temporarily connect to the in-City, low-pressure water system at the intersection of 22nd and Illinois streets and the intersection of 20th and Louisiana streets. Backflow prevention devices would be installed at each connection to prevent backflow from the recycled water system to the potable low-pressure water system. Once the City's recycled water system is constructed, the Proposed Project's recycled water pipelines would connect to the City's recycled water system.

ON-SITE NON-POTABLE WATER

San Francisco's Non-potable Water Ordinance requires new buildings larger than 250,000 square feet to use on-site "alternate water sources" of graywater (e.g., wastewater from bathtubs, showers, bathroom sinks, and clothes washing machines, but not from kitchen sinks, dishwashers or toilets), rainwater (e.g., precipitation collected from roofs and other above-ground collection surfaces, excluding stormwater runoff), and foundation drainage water (e.g., nuisance groundwater that is pumped out to maintain a building's or facility's structural integrity) to meet that building's toilet and urinal flushing and irrigation demands.[49] The Proposed Project would include the diversion and reuse of graywater and rainwater for toilet and urinal flushing and irrigation.

AUXILIARY WATER SUPPLY SYSTEM

To meet supplemental firefighting water requirements for the AWSS, the Proposed Project would be required to include on-site AWSS high-pressure distribution piping. This network of high-pressure pipelines would connect to the existing AWSS distribution pipeline in Third Street. The pipelines would be installed beneath existing and proposed streets and would supply fire hydrants within the project site for the purposes of firefighting. The AWSS may also include a permanent manifold installed upland of the shoreline that can be connected to a temporary, portable submersible pump for redundancy.

FIGURE 2.20: PROPOSED RECYCLED WATER DISTRIBUTION SYSTEM

PROPOSED WASTEWATER (SANITARY SEWER) AND STORMWATER FACILITIES

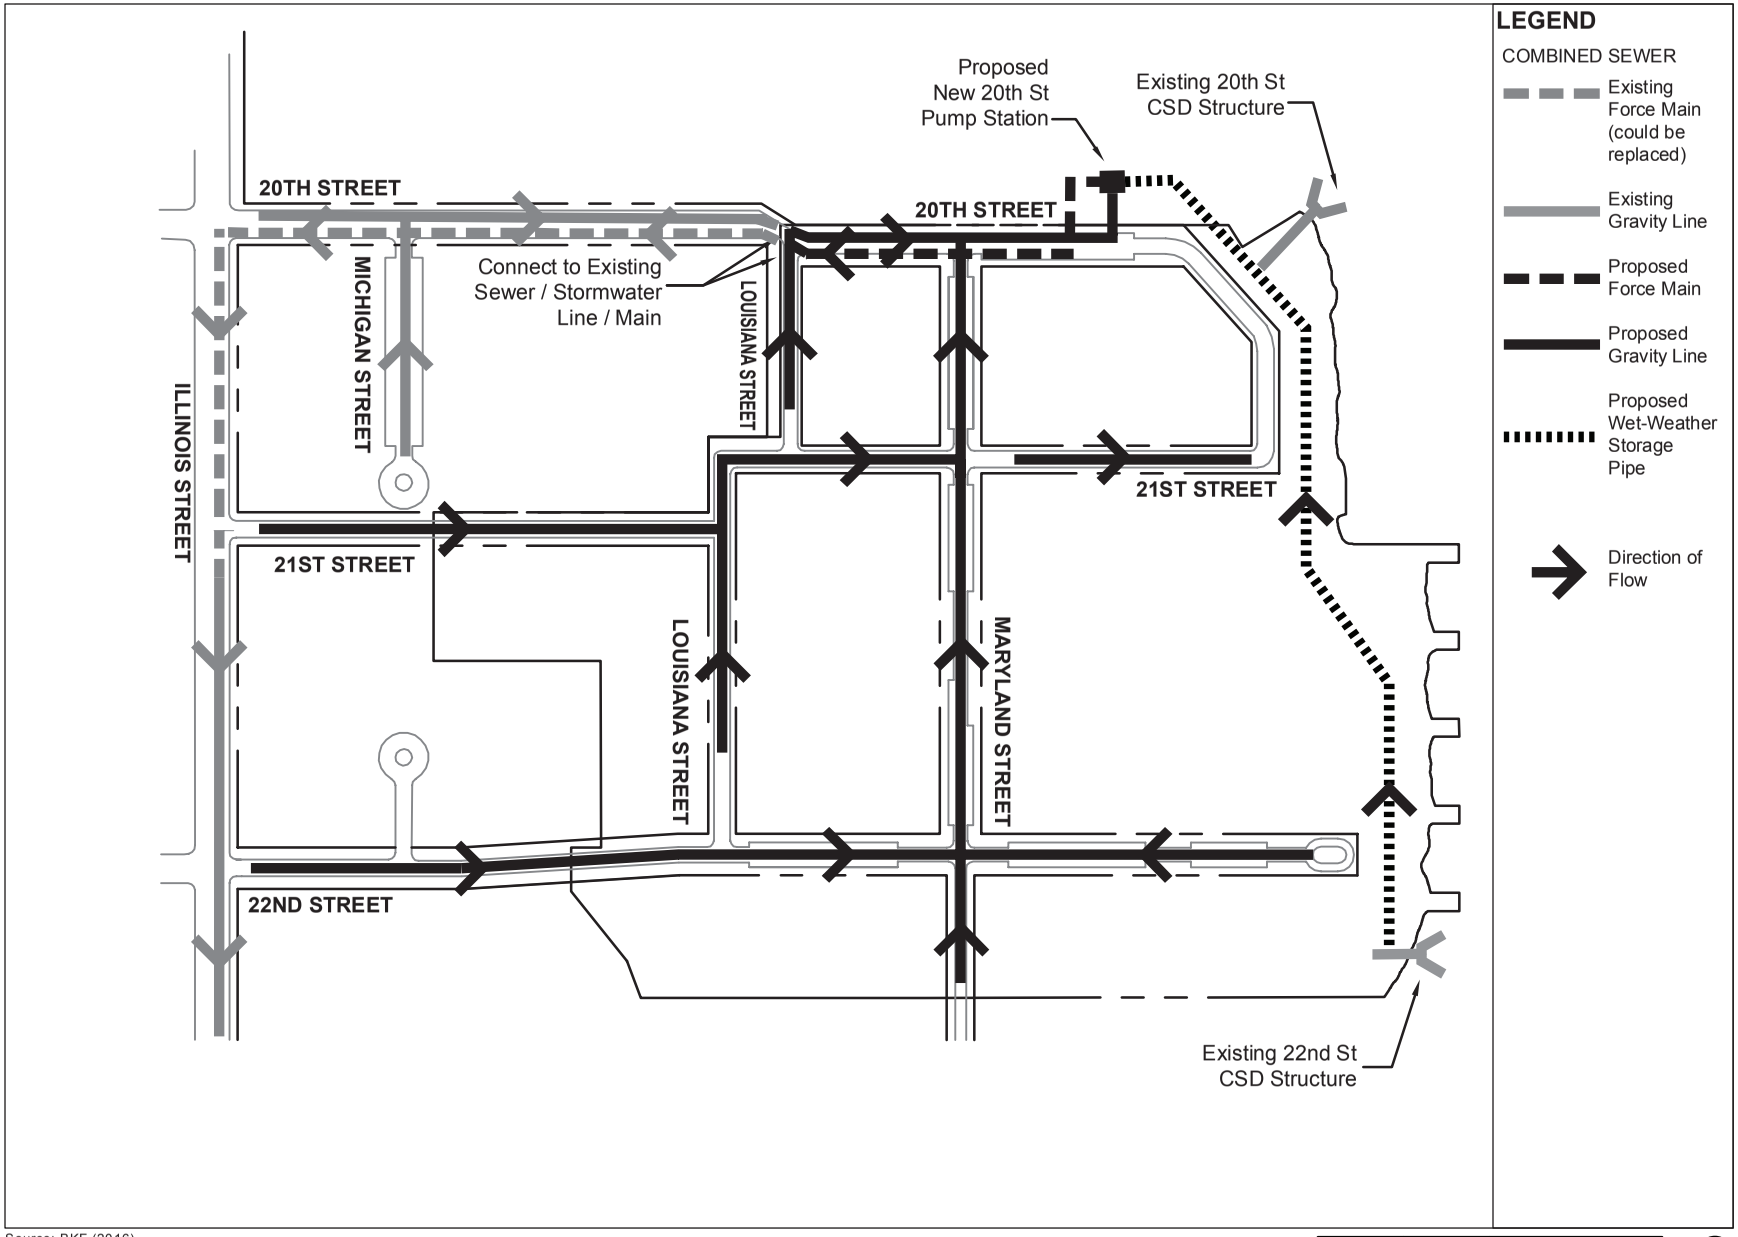
As described under "Infrastructure" on pp. 2.19-2.20, wastewater and stormwater flows from the project site are currently conveyed to the SEWPCP for treatment via the City's combined sewer system. The Port also owns and maintains many gravity sewer lines that connect the existing buildings on the site to the SFPUC sewer lines.

The project sponsors are considering three options for managing wastewater and stormwater flows from the project site: Option 1, Combined Sewer System; Option 2, Separate Wastewater and Stormwater Systems; and Option 3, Hybrid System. These options are described below. Stormwater and wastewater system improvements common to each option are described first, followed by improvements that are specific to each option.

Common Improvements

Under all of the wastewater and stormwater management options, the Proposed Project would replace SFPUC's 20th Street Pump Station to accommodate the existing stormwater and wastewater flows within the 20th Street sub-basin along with anticipated wastewater flows from the project site and future development in the 20th Street sub-basin. The new 20th Street Pump Station would be located on Port lands, likely at a location immediately north of the project site boundary, between Buildings 6 and 108 on or near the BAE Systems Ship Repair site, as shown on Figure 2.21: Option 1 – Combined Sewer System. The new 20th Street Pump Station would include the following features, which would be refined during the detailed design phase of the Proposed Project in coordination with the SFPUC:

- The pump station structure and ancillary equipment such as the electrical control panel, and electrical transformer would likely be constructed within an approximately 50-by-60-foot area that would be fenced and allow for vehicular maintenance access. The control panel could be exposed or enclosed within an approximately 15-by-30-foot structure about 10 feet in height.
- A 30-by-30-foot wet well would be constructed to a depth of approximately 20 feet below grade. All of the pumps, valves, and associated mechanical equipment would be enclosed below ground in the wet well and valve vault structures.
- The pump station would be elevated to accommodate a minimum of 66 inches (5.5 feet) of sea level rise above the present day 2000 mean high water line, and would be designed to meet City design guidelines and limit combined sewer discharges into San Francisco Bay, in conformance with the City's permit requirements through a combination of overflow weirs, sump pumps, and upstream hydraulic systems.



Source: BKF (2016)

PIER 70 MIXED-USE DISTRICT PROJECT

FIGURE 2.21: OPTION 1 - COMBINED SEWER SYSTEM

It is possible that, in conjunction with installation of the new pump station, a new force main would be constructed to replace all or part of the existing 10-inch force main. The new force main would be installed beneath 20th Street and a portion of Illinois Street to convey flows from the new pump station to the existing 27-inch-diameter gravity sewer main of the City's combined sewer system beneath Illinois Street, as shown on Figure 2.21. In addition, the existing 900-foot-long, 54-inch storage and detention pipe would be replaced and relocated to an area beneath the proposed Waterfront Terrace and Waterfront Promenade, also as shown on Figure 2.21. Similar to existing conditions, the storage and detention pipe would be connected to the existing 20th and 22nd streets CSD outfalls and the storage capacity provided by this pipe, the 42-inch sewer line beneath 20th Street, and the wet well of the 20th Street Pump Station would be used to control the frequency of CSDs from the 20th Street sub-basin. The BAE line connecting to the pump station would be relocated or extended as part of the Proposed Project. All of the Port gravity sewer lines within the project site would also be removed.

The dry-weather capacity of the new pump station and force main would be sufficient to convey the total of all peak dry-weather flows to the 27-inch sewer line of the combined sewer system in Illinois Street. The wet weather capacity of the pump station and storage facilities would be sufficient to ensure that wet-weather combined sewer discharges from the 20th Street sub-basin do not exceed a long-term average of 10 combined sewer discharges per year in accordance with the Bayside NPDES Permit, or contribute to an increase in CSDs from other drainage basins of the combined sewer system that would exceed the long-term average specified in the Bayside NPDES permit. The SFPUC would participate in the design of the new 20th Street Pump Station to ensure these performance criteria are achieved.

Wastewater and Stormwater Flow Options

Three stormwater and wastewater options, described below, are under consideration for implementation under the Proposed Project. For each option, the project sponsors would install the pipelines in trenches beneath the Proposed Project's roadway and open space network. Only one of these options would be implemented, and none of the proposed variants to the Proposed Project, described below in Section E, Project Variants, pp. 2.74-2.79, would change the conceptual description of any of the options under consideration. Under each option, the wastewater flows for each of the three options would be conveyed to the SEWPCP for treatment in accordance with the existing Bayside NPDES Permit. The options differ in the way that stormwater would be managed at the project site.

Option 1: Combined Sewer System

Under Option 1, the project sponsors would construct the new combined sewer lines beneath existing and proposed streets to convey both wastewater and stormwater flows to the new 20th

Street Pump Station. The combined flows would be conveyed from the pump station to SFPUC's gravity sewer beneath Illinois Street via the existing 10-inch force main or a new force main installed concurrently with the 20th Street Pump Station, if replacement of the existing force main is required. (See Figure 2.21, p. 2.60.) The storage capacity provided by the 42- and 54-inch storage and detention pipelines along with the wet well of the 20th Street Pump Station would be used to help control the frequency of CSDs from the 20th Street sub-basin.

Option 2: Separate Sewer and Stormwater System Option (Separated Approach)

Under Option 2, Separate Wastewater System and Stormwater System, wastewater and stormwater would be conveyed in separate wastewater and stormwater systems. (See Figure 2.22: Option 2 – Separate Wastewater System, and Figure 2.23: Option 2 – Separate Stormwater System.) For the wastewater system, the project sponsors would construct new wastewater lines beneath existing and proposed streets to convey wastewater flows to the new 20th Street Pump Station. Wastewater flows would continue to be conveyed to the City's combined sewer system via the existing 10-inch force main or a new force main installed concurrently with the 20th Street Pump Station, if required.

For the stormwater system, the project sponsors would install new storm drain lines beneath existing and proposed streets to convey stormwater flows via gravity to a new outfall located near the foot of the realigned 21st Street. The new outfall would discharge stormwater to the Central Basin of Lower San Francisco Bay. The separate stormwater system would be considered a Small Municipal Separate Storm Sewer System and would be managed in accordance with the SWRCB Small MS4 General Stormwater Permit, described in Section 4.O, Hydrology and Water Quality.

Option 3: Combined Sewers with Separate Sewer in Eastern Portion of Project Site (Hybrid Approach)

Under Option 3, Hybrid System, a combined sewer system would continue to serve most of the project site, except for the area to the east of the proposed Maryland Street. (See Figure 2.24: Option 3 – Hybrid System.) The project sponsors would construct new separate stormwater and wastewater systems to serve the portion of the project site to the east of Maryland Street, including proposed open space areas.

In the area west of the proposed Maryland Street, the project sponsors would construct new combined sewer lines beneath the existing and proposed streets to convey both stormwater and wastewater flows to the new 20th Street Pump Station. The combined flows from this portion of the site would continue to be conveyed to the City's combined sewer system via the existing 10-inch force main or a new force main installed concurrently with the 20th Street Pump Station, if

PIER 70 MIXED-USE DISTRICT PROJECT

FIGURE 2.24: OPTION 3 - HYBRID SYSTEM

replacement of the existing force main is required. The storage capacity provided by the 42- and 54-inch storage and detention pipelines along with the 20th Street Pump Station's wet well would be used to help control the frequency of CSDs from the 20th Street sub-basin.

In the area east of the proposed Maryland Street, the project sponsors would construct new storm drain lines beneath the existing and proposed streets to convey stormwater flows via gravity to a new outfall located near the foot of the realigned 21st Street. The new outfall would discharge stormwater to the Central Basin of Lower San Francisco Bay. This separate stormwater system would be considered a Small Municipal Separate Storm Sewer System and would be managed in accordance with the Small MS4 General Stormwater Permit, described in Section 4.O, Hydrology and Water Quality. The project sponsors would also construct new wastewater lines beneath the same streets. Wastewater flows would be conveyed to the new 20th Street Pump Station. Under this option, all wastewater flows from the project site would continue to be conveyed to the City's combined sewer system via the 10-inch force main or a new force main installed concurrently with the 20th Street Pump Station, if replacement of the existing force main is required. The wastewater flows would be conveyed to the SEWPCP for treatment in accordance with the existing Bayside NPDES Permit.

Electricity and Natural Gas

The Proposed Project would replace overhead electrical distribution with a joint trench utilities distribution system which would follow the proposed realigned roadways. Connecting to the existing 12-kV electricity lines along Illinois, 20th, and 22nd streets, the new electric piping would be within placed within the joint trench system to serve each parcel on the project site.

The Proposed Project would also extend the existing natural gas distribution system from 20th Street to connect to the 28-Acre Site. A new natural gas distribution system would be constructed to extend to the Illinois Parcels. New gas lines would be placed in the joint utilities trench distribution system following the realigned roadways.

The Proposed Project would comply with San Francisco Green Building Requirements for energy efficiency in new buildings. Energy-efficient appliances and energy-efficient lighting would be installed in the three rehabilitated historic buildings.

Back-up emergency diesel generators are required by the San Francisco Building Code for new buildings with occupied floor levels greater than 75 feet in height. There are 10 parcels (all in the 28-Acre Site) that would allow building heights of up to 90 feet: Parcels A, B, C1, C2, D, E1, F, G, H1, and H2. Each of the buildings on Parcels A, C1, C2, D, E1, F, G, H1, and H2 would have a back-up diesel generator, if built with occupied floor levels greater than 75 feet; such generators would operate in emergency situations, each having an average size of 400 horsepower. Due to

the larger size of Parcel B, the building proposed for that parcel would have two 400-horsepower, back-up diesel generators to operate in emergency situations. In total, 11 generators are anticipated on the project site.

As part of the necessary mechanical equipment, the Proposed Project includes installation of mechanical cooling towers located on the roof of each proposed building.

Renewable Energy

The Proposed Project is required to meet the State's Title 24 and the San Francisco Green Building Requirements for renewable energy and the Better Roof Requirements for Renewable Energy Standards.[50,51] The Proposed Project would allow for roof-mounted or building-integrated solar photovoltaic (PV) systems and/or roof-mounted solar thermal hot water systems for all proposed buildings, excluding existing Buildings 2, 12, and 21. At least 15 percent of the roof area would include roof-mounted or building-integrated PV systems and/or roof-mounted solar thermal hot water systems that would be installed in residential and commercial buildings. Solar PV systems transform sunlight into electricity and solar thermal water systems use the sun's energy to heat water for consumer use. These systems would partially offset the energy demands of the associated buildings. No ground-mounted facilities are proposed under the Proposed Project. The solar PV arrays located on various rooftops could be interconnected via a community microgrid that serves as a site-wide distribution network capable of balancing captive supply and demand resources to maintain stable service within the Project. Microgrids combine various distributed energy resources – such as whole-building energy efficiency improvements, solar photovoltaics, other clean generation such as fuel cells, battery storage, and localized smart energy management technologies – to form a whole system that is greater than its parts. The microgrid can be backed up by the local public utility grid and would not necessarily supply all of the demand from the Proposed Project.

PROPOSED GRADING AND STABILIZATION PLAN

SITE GRADING

The Proposed Project would involve excavation of soils for grading and construction of the 15- to 27-foot-deep basements planned on Parcels A, B, C1, C2, D, E1, E2, E3, E4, F, G, H1, H2, PKN, PKS, HDY1 and HDY2. No basement levels are planned for existing Buildings 2, 12, or 21. The Proposed Project would raise the grade of the 28-Acre Site and the southern, low-lying portions

[50] San Francisco Building Code, Chapter 13C.

[51] San Francisco Green Building, Environment Codes – Better Roof Requirements for Renewable Energy Standards, Ordinance No. 71-16, April 19, 2016.

of the Illinois Parcels by adding up to 5 feet of fill in order to help protect against flooding and projected future sea level rise, as described below, and as required for environmental remediation.

A portion of the northern spur of the remnant of Irish Hill would be removed for construction of the new 21st Street. The remnant of Irish Hill stands approximately 35 feet tall. Retaining walls would be necessary along the sides of the new 21st Street to protect the adjacent Building 116 in the Historic Core as well as the remnant of Irish Hill and along the reconfigured 22nd Street, to account for the proposed elevation difference between the streets and adjacent ground surfaces.[52]

While the grading plan assumes some on-site reuse of the excavation soil, which would be stockpiled and reused as fill throughout the project site, a substantial amount of soil export would be required. The Proposed Project would result in a net export total of about 340,000 cubic yards of soil and an import of about 20,000 cubic yards of clean fill, which would be phased over the duration of the planned construction activities.

BUILDING 12 GRADING OPTIONS

In order to provide flexibility for site grading work anticipated as part of the rehabilitation of Building 12, the Proposed Project includes three grading options for Building 12, described below. The determination of a final grading option will ultimately be decided prior to building permit issuance.

Grading Option 1: Raise the Exterior Grade Only

Under Grading Option 1, the structural frame of Building 12 would remain at the current grade. The grade differential of up to about 4 feet between the finished floor elevation of Building 12 and the surrounding street elevation would be bridged by stepped or sloped treatment of the area adjacent to the building, allowing the exterior wall to remain fully exposed. No changes to the interior floor elevation would occur under this option. All exterior, character-defining features of Building 12 would remain visible.

Grading Option 2: Raise the Interior Slab on Grade of Building 12 Structural Frame and Raise the Exterior Grade

Grading Option 2 would raise the interior slab up to a maximum of 3 feet, and raise the adjacent exterior an additional 4 feet, while leaving the Building 12 structure in place. A new slab on grade would be placed over compacted fill and a thickened edge of slab would be placed around the building perimeter. This alternative would cover some currently exposed steel column-to-foundation connections, shorten the height of pedestrian and vehicular openings, and lower the

[52] The areas on the 28-Acre Site and Illinois Parcels directly adjacent to the 20th Street Historic Core would conform to existing grades; fill would not be placed in these adjacent areas.

sill heights of ground-floor windows, as viewed from the interior. Except for the first 4 feet, the exterior walls of Building 12 would remain fully visible and unchanged from current conditions. To accommodate any remaining elevation change necessary to meet street elevations, the grade differential would be bridged by stepped or sloped treatments.

Grading Option 3: Raise Building 12 Structural Frame

Grading Option 3 would raise and place Building 12 on a new slab foundation at the new grade elevation. The surrounding grade would gradually slope away from the building as needed for drainage purposes. This option would entail disconnecting the structural steel columns from the foundations by unbolting the existing anchor bolts, then incrementally jacking up the building columns to the desired elevation. Due to sitewide grading, the building foundation would be exposed on the northern and eastern sides.

GEOTECHNICAL STABILIZATION

To address the potential hazard of liquefaction and lateral spreading that may occur during a major earthquake, the Proposed Project would include construction of improvements to control the amount of lateral displacement that could occur. These improvements could include either reinforcing the existing slope with structural walls or implementing ground improvements. The structural walls would consist of below-grade secant pile walls along the northeastern and southeastern portions of the project site (north and south of the Slipway structures), to contain and stabilize the soil. Secant pile walls are formed as a series of intersecting reinforced concrete piles, and could generally be constructed by installing a set of primary piles or concrete-filled drill holes, followed by an interlocking, secondary set of piles, with a concrete cap on top, which would be supported by micropile or tie-back anchors set at an angle. Ground improvements may consist of chemical treatments, such as deep soil mixing to add a cement slurry, or vibratory methods, such as vibro-compaction, vibro-replacement, and/or compaction, to strengthen the existing soil.

PROPOSED SHORELINE PROTECTION IMPROVEMENTS AND SEA LEVEL RISE ADAPTATION

The project sponsors' primary criteria for sea level rise adaptation include the following:[53]

- Reserve the 100-foot shoreline band for public access that is safe and feasible;
- Elevate all buildings and immovable facilities (e.g., roadways) such that adaptation would not be necessary for current worst-case end-of-century sea level rise estimates

[53] Moffat and Nichol, "Pier 70 Development, Preliminary Shoreline Improvements Report, San Francisco, California," Draft, August 2015, p. 16.

provided in the National Research Council's June 2012 *Sea-Level Rise for Coasts of California, Oregon and Washington;*[54] and

- Elevate the Bay Trail such that adaptation would not be necessary over the next 20 to 30 years (by mid-century).

Based on the above criteria, the Proposed Project would include the following improvement concepts:

- Finished floors of buildings within the project site would be elevated to a minimum elevation of 15.4 feet NAVD88 (+104 feet project datum [+4 feet SF Datum])[55,56,57] to accommodate 66 inches of sea level rise and the 100-year storm surge.
- The Bay Trail in the vicinity of the shoreline would be located at an elevation to accommodate 24 inches (2 feet) of sea level rise before adaptation may be necessary.
- The approximately 40-foot-wide zone between the Bay Trail and the water's edge would be designed to provide safe public access to the water in the near term. This zone would also function as the space where future adaptations could be creatively implemented based on the concepts of "Living with the Bay" and "Managed Retreat." Future adaptations in this area would allow for public access to retreat within the zone between the Bay Trail and shoreline. Adaptations could also include relocating and raising pathways and spur trails, or reconfiguring the shoreline protection to provide flatter slopes, wetlands and wave breaks.

These protection improvement concepts would allow for future adaptations along the shoreline to address higher levels of sea level rise with either the same or a different structural configuration. The Proposed Project would include a public financing mechanism to pay for the cost of future improvements related to sea level rise adaptation, should such improvements be necessary, with the City and the Port responsible for implementing these strategies.

---

[55] The Project Datum elevations are equal to San Francisco Datum elevations plus 100 feet.

[56] North American Vertical Datum of 1988 (NAVD88) is a fixed reference point (vertical elevation) adopted as the official, civilian, vertical datum for elevations determined by federal surveying. Historically, the average (mean) sea level or some variation of sea level has served as a reference point for elevations. One problem with using sea level is that it changes. In addition, the earth is not spherical, but has an ellipsoid shape, and has local variations due to uplift and sinking of portions of the earth's crust. Therefore, sea level in relation to the earth's crust varies. A vertical datum system not based on sea level avoids these problems. NAVD88 is based on a point in Quebec, Canada. Sources: U.S. Geologic Survey, http://water.usgs.gov/ADR_Defs_2005.pdf, pp. 8-9, accessed June 22, 2015.

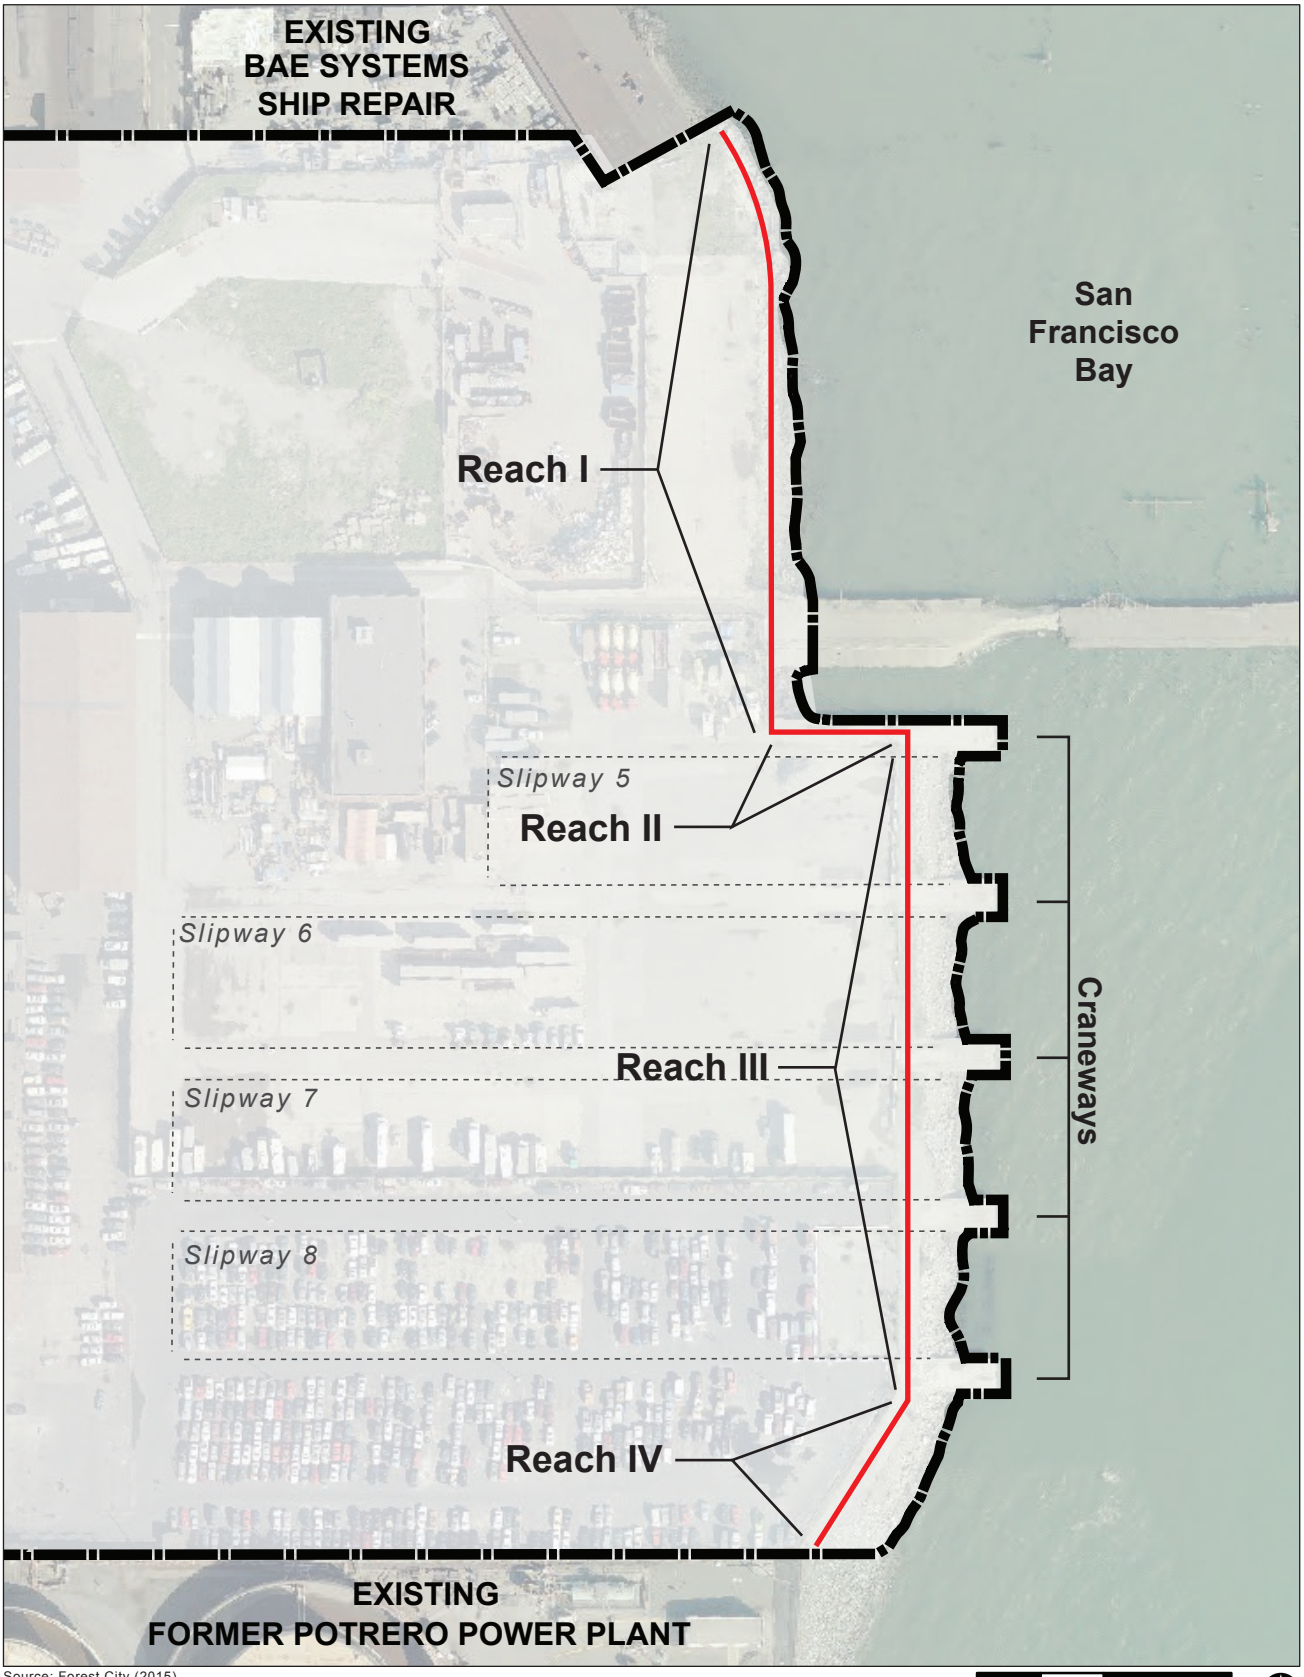
[57] San Francisco City Datum establishes the City's zero point for surveying purposes at approximately 11.4 feet above the 1988 North American Vertical Datum. The project sponsors have also established a project datum for project-specific purposes that is equal to San Francisco City Datum plus 100 feet. This is 88.6 feet higher than NAVD88.

SHORELINE PROTECTION IMPROVEMENTS

The 28-Acre Site has about 1,380 feet of shoreline along its eastern edge. The objectives of the proposed shoreline protection improvements include maintaining a stable shoreline in the project area by preventing shoreline erosion and protecting the proposed development from coastal flooding. The proposed shoreline protection system is designed to minimize the need for placing fill in San Francisco Bay; maximize open space and public access to the shoreline edge; improve existing slope protection, where feasible; develop aesthetically pleasing and cost-efficient shoreline protection; and provide for future sea level rise adaptation. For design purposes, the existing shoreline is divided into four separate "reaches"[58] (see Figure 2.25: Shoreline Improvements Map):

- The Reach I shoreline consists of 480 feet along the northern portion of the project site. The top of the bank elevation is 12 to 13.5 feet NAVD88 (+100.6 to +102.1 feet Project Datum [+0.6 to +2.1 feet SF Datum]). This shoreline contains scattered rock and concrete debris (riprap) placed historically for shoreline protection and washed ashore by wind and waves. Portions of the shoreline have a concrete apron. Remnant piles from a former pier structure are scattered through the reach.
- Reach II is a 100-foot stretch of east-west shoreline that faces north and consists of a vertical bulkhead. The top of the bulkhead elevation is 12 to 11.8 feet NAVD88 (+100.6 to +100.4 feet Project Datum [+0.6 to +0.4 feet SF Datum]). Reach II forms the northern limit of the slipways. The vertical bulkhead is made up of steel sheet piles with an overhanging concrete cap.
- Along the southern portion of the project site, Reach III consists of the Slipways 5, 6, 7, and 8, which are bounded by craneways that are perpendicular to the shore. Reach III is 530 feet long. The top of bank elevation is 11.1 to 13 feet NAVD88 (+99.7 to +101.6 feet Project Datum [-0.3 to +1.6 feet SF Datum]). The craneways are constructed of concrete bulkhead walls with an overhanging concrete cap. Located between the craneways, the slipways have a concrete ramp that extends into San Francisco Bay. There is a sheet pile wall at the mudline where the craneways end. Along the existing top of bank, riprap has been placed on the slipways prevent scour. The inland portions of slipways have been filled and covered with asphalt.
- Reach IV encompasses 270 feet along the southern portion of the project shoreline. The top of bank elevation is 12 to 11.3 feet NAVD88 (+100.6 to +99.9 feet Project Datum [+0.6 to -0.1 feet SF Datum]). The Reach IV shoreline faces southeast and consists of riprap. The southern portion of Reach IV is covered by an armor stone revetment installed by PG&E as a remedial measure. This revetment consists of a layer of permeable reactive material on the previous shoreline surface, an overlying bedding layer of gravel, and an armor stone layer on the stabilized shoreline surface. There is an engineered retaining wall at the southern end of the project site, which protects the shoreline of the former Potrero Power Plant property.

[58] A reach is a continuous stretch of or extent of land.



Source: Forest City (2015)

0 50 100 200 FT

PIER 70 MIXED-USE DISTRICT PROJECT

FIGURE 2.25: SHORELINE IMPROVEMENTS MAP

Options for shoreline protection improvements were developed for each reach. The proposed shoreline protection improvements and sea level rise adaptation planning criteria are described below.

Reach I

Along Reach I, the existing rip-rap revetment above would be repaired by removing the rip-rap and placing new geotextile fabric and rip-rap materials. The repaired shoreline would have an approximately 3:1 slope. Construction of these repairs would require in-bay construction activities below the high tide level of 7.4 feet NAVD88 (96 feet project datum [-4 feet SF Datum]).

Above 11.4 feet NAVD88 (+100 feet elevation), the slope would include an engineered riprap revetment option or a flatter slope option.[59] The revetment option would consist of a rock slope protection system made up of armor stones, to protect the shoreline from erosion that would be underlain by geotextile fabric. A crushed-rock leveling course (i.e., top) would also be emplaced. The flatter slope option would consist of erosion-resistant materials (e.g., vegetation).[60] At this elevation there would also be an approximately 6-foot-wide informal pathway to provide pedestrian access to the shoreline until such time as it becomes infeasible.

Reach II

Along Reach II, the existing bulkhead would be studied and either repaired or replaced. The repair or replacement would be constructed on the water side of the existing bulkhead wall, located in San Francisco Bay shoreline. Since repair and replacement would require excavation and fill, below the high tide level of 7.4 feet NAVD88 (96 feet project datum [-4 feet SF Datum]), two options are being considered: a sheet pile wall or a soldier pile wall.

- Sheet Pile Wall Option: Under the sheet pile wall option, interlocking steel sheet piles would be installed. These can be driven below the water surface without the need of temporary cofferdams or dewatering. Individual sheets would be Z-shaped or U-shaped with a ball and socket type of interlock. Once the sheet piles are installed, a concrete (or steel) cap would be constructed to distribute the loads and to provide a finished look to the wall.
- Soldier Pile Wall Option: The soldier pile wall option consists of individual piles spaced a short distance apart, with gaps between the piles filled with lagging. The piles would be cast-in-drilled-hole piles, which are built by drilling a hole and inserting a reinforcing cage, then filling the hole with concrete. Installing a soldier pile wall may require temporary cofferdams or dewatering.

[59] A revetment is a retaining wall or facing of masonry or other material, supporting or protecting a rampart or wall.

[60] Armor stones are the outer layer of any rock slope protection. The rocks can be of any size.

Reach III

Proposed shoreline protection improvements for Reach III include repairing the existing slope protection with armor stone and a crushed-rock leveling course. Construction of these repairs would require in-water construction activities below the high tide level of 7.4 feet NAVD88 (96 feet project datum).

For the 11.4 to 15.4 feet NAVD88 (+100 to +104 feet Project Datum [+0 to +4 feet SF Datum]) elevation areas, several options are possible, including a riprap revetment, hardscape steps, or a cantilevered/pile-supported deck.[61] The riprap revetment option would include armor stone and a crushed-rock leveling course. The hardscape steps option would consist of wide concrete steps that could also be used for sitting and walking. The cantilevered/pile-supported deck would extend over the sloping shoreline for a short distance between craneway structures, and would allow visitors to be closer to the water and could offer a space for public art. At this elevation there would also be an approximately 6-foot-wide informal pathway to provide pedestrian access to the shoreline until such time as it becomes infeasible.

Reach IV

The proposed shoreline protection improvements along Reach IV would include improvements and repairs to the existing revetment to create a smooth sloped revetment. Construction of these improvements would require in-water construction activities below the high tide level of 7.4 feet NAVD88 (96 feet project datum). Above 11.4 NAVD88 (+100 feet Project Datum [+0 feet SF Datum]). Above 11.4 feet NAVD88 (+100 feet Project Datum [+0 feet SF Datum]) elevation, the slope would include an engineered riprap revetment option or flatter slopes option with erosion-resistant materials (e.g., vegetation).[62] At this elevation, there would also be an approximately 6-foot-wide informal pathway to provide pedestrian access to the shoreline until such time as it becomes infeasible.

E. PROJECT VARIANTS

In addition to the specific characteristics of the Proposed Project described in this chapter, there are four proposed variants to the Proposed Project, each of which modifies one limited feature or aspect of the Proposed Project. One, a Reduced Off-Haul Variant, is a construction-related variant; the other three – a District Energy System Variant, a Wastewater Treatment and Reuse System (WTRS) Variant, and an Automated Waste Collection System (AWCS) Variant – are variants on infrastructure features of the Proposed Project, and all of the proposed variants focus on sustainability. The four variants are described below.

[61] These elevations are above the reach of present-day tides.
[62] This elevation is above the reach of present-day tides.

These variants to the Proposed Project are fully analyzed in Chapter 6, Project Variants, at a sufficient level of detail so that one or more of them would be available for selection by the decision-makers and the project sponsors as part of the project approval actions.

REDUCED OFF-HAUL VARIANT

The Reduced Off-Haul Variant would minimize the overall volume of excavated soils and the number of off-haul truck trips required for the transport and disposal of excavated soils. The strategy for achieving a reduction in the volume of excavated soils and the resultant off-haul truck trips is three-fold: (1) modify the preliminary grading plan developed for the Proposed Project to raise the base elevation for a portion of the 28-Acre Site; (2) eliminate the proposed 15-foot-deep below-grade basement levels at selected locations on the 28-Acre Site and extend the footprint of one proposed 15-foot-deep below-grade basement level; and (3) eliminate a portion of one of the two level below-grade basement levels. The combination of the proposed increase to the base elevation on a portion of the 28-Acre Site and the modifications to the below-grade basement level parking program would result in an approximately 56 percent reduction in the volume of excavated soils that would need to be transported off site (from approximately 340,000 cubic yards under the Proposed Project to approximately 150,000 cubic yards under this variant). As with the Proposed Project, under the Reduced Off-Haul Variant clean fill would need to be imported to the project site to help protect against flooding and projected future sea level rise. Under the Reduced Off-Haul Variant there would be a slight increase in the volume of clean fill that would need to be imported (from approximately 20,000 cubic yards under the Proposed Project to approximately 21,150 cubic yards). Overall, the Reduced Off-Haul Variant would result in an approximately 52 percent reduction in the combined earth movement.

DISTRICT ENERGY SYSTEM VARIANT

The Proposed Project assumes all heating and cooling would be done at the individual building level and independent from adjacent buildings. PG&E would provide natural gas, and electricity would be provided by the SFPUC and renewable power generated on the project site (e.g., roof-mounted or building-integrated solar photovoltaic systems and/or roof-mounted solar thermal hot water systems for all proposed buildings, if implemented).

Under the District Energy System Variant, a single central energy plant would be located in one of the basement levels of a newly constructed building on Parcel C1. The central energy plant would have a footprint of approximately 8,000 to 14,000 square feet, depending on the equipment used. Exhaust ducts would be required on the roof or façade of the building on Parcel C1. Fifteen- to twenty-foot-tall cooling towers would be located on the roof or would be adjacent to the building. The proposed central energy plant would provide heating and cooling for a linked

group of residential and commercial buildings. Hot water would be used for space heating and water heating, and chilled water would be used for space cooling.

Under this variant, building space heating and space cooling systems within the project site would be linked together via an underground shared energy distribution and exchange loop. The central energy plant would circulate the loop water to individual buildings via the shared energy distribution and exchange loop system that would be located under the proposed street and sidewalk network alongside other utilities. Each building would have heat pumps and a point-of-connection to the shared energy distribution and exchange loop system. Buildings that require heat would remove heat from the loop. Buildings that require cooling would reject that heat by pumping heated water into the loop, therefore removing it from each building's system. The peak water flow capacity of the closed loop system would be approximately 9,000 gallons per minute. The desired temperature range of the water in the loop system would be 50°F to 90°F. To maintain the water in the shared energy distribution and exchange loop system within the desired temperature range, the central energy plant would use natural-gas fired boilers to increase heat and cooling towers to reject heat. The central energy plant would also contain heat exchangers, pumps, boilers, and other ancillary equipment, and would obviate the need for a mechanical cooling tower located on the roof of each building.

WASTEWATER TREATMENT AND REUSE SYSTEM VARIANT

City Ordinance No. 109-15 (the Non-potable Water Ordinance) requires the use of on-site "alternate water sources" of treated blackwater, greywater, and rainwater water for toilet and urinal flushing and for irrigation demand for projects that require a subdivisions approval. Blackwater means wastewater contaminated by feces, urine, other bodily wastes, or other biological wastes, and includes wastewater from toilets, urinals, dishwashers, kitchen sinks, and utility sinks. Graywater is wastewater that has not been contaminated by any toilet discharge and has not been affected by infectious, contaminated, or unhealthy bodily wastes, including from processing, manufacturing, or operating wastes. Examples of graywater are wastewater from bathtubs, showers, bathroom sinks, and clothes washing machines, but not from toilets, kitchen sinks and dishwashers. Foundation drainage water is nuisance groundwater that is extracted to maintain the structural integrity of a building or facility and that would otherwise be discharged to the City's combined sewer system.[63]

Under the WTRS Variant, blackwater, graywater, and rainwater would be collected from all newly constructed buildings, treated, and reused for toilet and urinal flushing, irrigation, and

[63] City and County of San Francisco Ordinance 109-15, "Health, Public Works Codes - Mandatory Use of Alternate Water Supplies in New Construction" (June 15, 2016), amending San Francisco Health Code section 12C.2.

cooling tower makeup. The variant is different from the Proposed Project, because it assumes blackwater is treated and recycled and that all newly constructed buildings would form a district system.

The WTRS Variant consists of a single modular tertiary wastewater treatment system, along with associated collection and distribution piping. This modular system is in essence a miniature version of a typical advanced wastewater treatment plant, including primary treatment (settling and skimming to remove solids), secondary treatment (biological breakdown of organic materials), and advanced treatment (various methods of eliminating pathogens and certain other pollutants).

Under the variant there would be one WTRS module located on the BAE Systems Ship Repair site north of Parcels A and B. The WTRS module would have a footprint of approximately 10,000 to 20,000 square feet and would be fully enclosed within Building 108 (after seismic and structural upgrades to the existing building are completed) or in a newly constructed building on the adjacent asphalt parking lot. Installation of the WTRS module would occur in Phase 1. The piping system that would collect blackwater, graywater, and rainwater from the project site and send out treated wastewater for reuse would have backflow protection and meet other requirements toward the goal of preventing the contamination of potable water piping. This system would also have a cross-connection to the City's combined sewer system to discharge wastewater flows in excess of non-potable demand and in case of emergency.

The WTRS module would be sized to treat approximately 150,000 gallons per day (gpd) depending on the associated non-potable demands for the phase and location. The non-potable (or reuse) demand means the volume of treated wastewater needed for toilet and urinal flushing, irrigation, and cooling towers. Estimated water reuse demand for the Maximum Residential Scenario would be 126,150 gpd.[64] For the Maximum Commercial Scenario, this demand would be 150,500 gpd. Actual water reuse quantities would be determined in part by San Francisco Health Code Section 12.C.4, regarding Water Budget Documentation and related requirements. Wastewater flow in excess of the non-potable demand would be discharged into the City's combined sewer.

The WTRS module would include at least the following components or functions: feed tank (wastewater input); trash trap; bioreactor; disinfection and storage tank; and heat recovery. Chemicals required for the treatment process would include sodium hydroxide, citric acid (if membranes are used), and an oxidizing disinfection agent, such as sodium hypochlorite. Truck delivery of chemicals for each module would be once every two to six weeks per module.

[64] BKF, Memorandum to Forest City, re: "Pier 70 – Water Demand Memorandum," April 28, 2016, p. 4 and Tables 3 and 4 on pp. 7-8.

Excess liquid waste from the WTRS module would be discharged into the municipal sewer or hauled away by truck. If allowed by law and by the City, trash trap waste would be double-bagged and disposed of at a landfill.

Odor control units would be installed. The exhaust gases likely would be vented at the top of the building where the module would be located.

The following agencies would oversee the implementation the WTRS Variant at the project site: the SFPUC, the San Francisco Department of Building Inspection, the Port of San Francisco, and the San Francisco Department of Public Health. Collected wastewater would be treated to meet the water quality criteria as set forth by the California Code of Regulations, Title 22, Division 4, Chapter 3.

AUTOMATED WASTE COLLECTION SYSTEM VARIANT

Under the Proposed Project, typical collection trucks would drive around the project site to pick up solid waste (separated by residents and businesses into recyclables, compostables, and trash/waste) from each individual building for transport to Pier 96 (recyclables) in San Francisco, the Jepson-Prairie facility (compostables) in Solano County, and the Hay Road Landfill (trash/waste) in Solano County. An automated waste collection system is under consideration, because it has the potential to operate more efficiently and would reduce the number of trash collection truck trips and the associated noise and air pollutant emissions.

Under the AWCS Variant, an automated waste collection system would be installed to transport solid waste from individual new buildings and in public areas, replacing interior and outdoor trash receptacles. Occupants would be expected to properly disaggregate solid waste into the categories of recyclables, compostables, and trash, and deposit these waste streams into designated receptacles. The waste streams would be temporarily stored at the loading point of each building and then the pneumatic or vacuum system would transport the solid waste with an air suction stream (typically up to 60 miles per hour) through subsurface pipes to a central waste collection facility. Sensors in the temporary solid waste storage locations would initiate the vacuum sequence when the collected solid waste reaches the capacity of the temporary storage space. Alternatively, the vacuum sequence could be initiated according to a pre-determined schedule. Each collected waste stream would be compacted at the central waste collection facility before being hauled to an off-site processing facility.

The central waste collection facility would be located in a stand-alone building near the proposed 20th Street Pump Station on the BAE Systems Ship Repair site directly north of Parcels A and B on the project site. The footprint of the central waste collection facility would be approximately 5,000 square feet and would be housed within a two-story structure (approximately 35 feet in

height), for a total of 10,000 square feet. The central waste collection facility would house the suction equipment fans, air compressors, air filters, waste separators, compactors, containers for temporary storage, and other miscellaneous equipment. Full containers would be collected at a staging area within the AWCS facility and loaded onto trucks for off-site hauling. There would be an average of one truck per day.

Air filters (possibly including wet scrubbers) would be designed and operated to remove airborne particulates. To address odors from decomposing organic matter, the collection system pipes would be under negative pressure (i.e., vacuum towards the central waste collection facility). The AWCS facility would have activated carbon filters to reduce odors in the air flow and exhaust. Noise from fans, other equipment, and trucks would be reduced by using acoustical treatments on walls and ceilings, silencers, and other methods on the exhaust pipe, to reduce noise to 85 decibels or less, measured at the device. The project sponsors would install noise shielding to achieve the compliance standards of the San Francisco Noise Ordinance.

F. PROJECT CONSTRUCTION PHASING AND DURATION

For both development scenarios, the Maximum Residential Scenario and the Maximum Commercial Scenario, Proposed Project construction is conceptual; however it is expected to begin in 2018 and would be phased over an approximately 11-year period, concluding in 2029. Proposed development is expected to involve up to five phases, designated as Phases 1, 2, 3, 4, and 5. Phasing estimates for the Maximum Residential Scenario are shown in Table 2.5: Project Construction and Rehabilitation Phasing for the Maximum Residential Scenario, and Figure 2.26: Proposed Phasing Plan – Maximum Residential Scenario. Phasing estimates for the Maximum Commercial Scenario are shown in Table 2.6: Project Construction and Rehabilitation Phasing for the Maximum Commercial Scenario, and Figure 2.27: Proposed Phasing Plan – Maximum Commercial Scenario. These phases are subject to change, but would occur within the maximum development ranges presented in the two scenarios.

Infrastructure improvements (utilities, streets, and open space) and grading and excavation activities would be constructed by Forest City, as master developer, and would occur in tandem, as respective and adjacent parcels are developed. Vertical development on the various parcels could be constructed by Forest City and its affiliates, or by third party developers.

Table 2.5: Project Construction and Rehabilitation Phasing for the Maximum Residential Scenario

Phase	Project Site	Parcel or Building	Proposed Construction and Rehabilitation			Open Space	Roadways and Other Improvements
			Residential (gsf / No. of Residential Units)	Commercial (gsf)	RALI (gsf)		
Phase 1 (2018-2019)	*28-Acre Site*						
	Illinois Parcels	PKN	261,700 / 300 units	6,600	6,600	20th Street Plaza	Michigan Street (new) 20th Street Pump Station (new)
Phase 2 (2018-2020)	*28-Acre Site*	Building 2*, Parcel C1, Parcel C2, Parcel D, Parcel E2	578,250 / 662 units	221,100	52,035	Building 12 Market Plaza Market Square Slipways Commons (western portion)	20th Street (new/central portion) 21st Street (new/eastern portion) 22nd Street (existing and new) Louisiana Street (new/southern portion) Maryland Street (new/northern portion)
		Building 12*		60,000	105,500		
	Illinois Parcels						
Phase 3 (2021-2023)	*28-Acre Site*	Parcel A, Parcel F, Parcel G	436,100 / 505 units	288,200	57,270	Irish Hill Playground	Maryland Street (new/southern portion [continued from Phase 2]), and Louisiana Street (new/northern portion) [continued from Phase 2)
	Illinois Parcels	PKS	213,100 / 240 units		11,000

PIER 70 MIXED-USE DISTRICT PROJECT

FIGURE 2.27: PROPOSED PHASING PLAN - MAXIMUM COMMERCIAL SCENARIO

G. PROJECT APPROVALS

The Proposed Project is subject to review and approvals by local, regional, State, and Federal agencies, with jurisdiction after completion of environmental review, including the following:

San Francisco Board of Supervisors

- Approval of *General Plan* amendments.
- Approval of Planning Code Amendments and associated Zoning Map Amendments.
- Approval of a Development Agreement.
- Approval of the Interagency Cooperation Agreement.
- Approval of a Public Trust Exchange Agreement.
- Approval of a Disposition and Development Agreement, including forms of ground leases and purchase and sale agreements.
- Approval of Final Subdivision Maps.
- Approval of street vacations, approval of dedications and easements for public improvements, and acceptance (or delegation to Public Works Director to accept) of public improvements, as necessary.
- Approval of the formation of one or more community facilities districts and adoption of a Rate and Method of Apportionment for the districts and authorizing other implementing actions and documents.
- Approval of one or more appendices to the Infrastructure Financing Plan for City and County of San Francisco Infrastructure Financing District No. 2 (Port of San Francisco) and formation of one or more sub-project areas for the 28-Acre Site and some or all of the Illinois Parcels and authorizing other implementing actions and documents.

San Francisco Planning Commission

- Certification of the Final EIR.
- Adoption of findings that the Public Trust Exchange is consistent with the *General Plan*.
- Approval of Proposition M Office Allocation per Planning Code Section 321, to the extent applicable.
- Approval of Pier 70 SUD Design for Development.
- Initiation and recommendation to Board of Supervisors to approve amendments to the *General Plan*.
- Initiation and recommendation to the Board of Supervisors to approve Planning Code amendments adopting a Special Use District and associated Zoning Map amendments.
- Recommendation to Board of Supervisors to approve a Development Agreement.
- Approval of the Interagency Cooperation Agreement.

San Francisco Port Commission

- Adoption of findings regarding Public Trust consistency.
- Approval of Disposition and Development Agreement, including forms of Ground Leases and Purchase and Sale Agreements, authorizing other actions and documents necessary to implement the project, and recommending that the Port Commission and the Board of Supervisors take other actions and documents necessary to implement the project.
- Consent to a Development Agreement and recommendation to the Board of Supervisors to approve.
- Approval of the Interagency Cooperation Agreement.
- Approval of a Development Plan for the 28-Acre Site in accordance with Section 11 of Proposition F.
- Approval of *Pier 70 SUD Design for Development*.
- Approval of amendments to *Waterfront Land Use Plan*.
- Public Trust consistency findings and approval of Public Trust Exchange Agreement with the State Lands Commission.
- Approval of project construction-related permits for property within Port jurisdiction.
- Approval of Construction Site Stormwater Runoff Control Permit.

San Francisco Public Utilities Commission

- Consent to Development Agreement.
- Consent to Interagency Cooperation Agreement.

San Francisco Public Works

- Review of subdivision maps and presentation to the Board for approval.
- Approval of Interagency Cooperation Agreement.
- Issuance of Public Works street vacation order.

San Francisco Municipal Transportation Agency

- Approval of transit improvements, public improvements and infrastructure, including certain roadway improvements, bicycle infrastructure and loading zones, to the extent included in the project, if any.
- Consent to Development Agreement.
- Consent to Interagency Cooperation Agreement.

San Francisco Fire Department

- Consent to Interagency Cooperation Agreement.

San Francisco Art Commission

- Approval of design of public structures and private structures located within public property, to the extent any such structures are located outside of Port jurisdiction.

San Francisco Department of Public Health

- Oversee compliance with San Francisco Health Code Article 22A (Maher Ordinance).

Bay Conservation and Development Commission

- Approval of permits for improvements and activities within the San Francisco Bay Conservation and Development Commission's jurisdictions.

State Lands Commission

- Approval of Public Trust Exchange Agreement.

Regional Water Quality Control Board – San Francisco Bay Region

- Approval of Section 401 water quality certification.
- Site-Specific Remediation Completion Approval(s) under Risk Management Plan.

Bay Area Air Quality Management District

- Approval of any necessary air quality permits (e.g., Authority to Construct and Permit to Operate) for individual air pollution sources, such as boilers and emergency diesel generators.

California Public Utilities Commission

- Approval of PG&E's sale of Hoedown Yard parcel, if PG&E's operations on the site have not already been relocated.

California Department of Fish and Wildlife

- Possible Section 404/Section 10 Permit.

U.S. Army Corps of Engineers

- Possible Section 404/Section 10 Permit.

U.S. Fish and Wildlife

- Possible Section 404/Section 10 Permit.

National Marine Fisheries Service

- Possible Essential Fish Habitat Consultation.
- Possible Endangered Species Act Consultation.

3. PLANS AND POLICIES

In accordance with CEQA Guidelines Section 15125(d), Chapter 3, Plans and Policies, discusses inconsistencies between the Proposed Project and applicable local, regional, and State plans and policies. Inconsistencies with existing policy do not, in and of themselves, indicate a significant physical environmental effect within the meaning of CEQA. To the extent that adverse physical environmental impacts may result from such inconsistencies, these impacts are analyzed in this EIR in the specific topic sections in Chapter 4, Environmental Setting and Impacts. The staff reports and approval motions prepared for the decision-makers as part of the entitlements approval process will include a comprehensive project analysis and findings regarding the consistency of the Proposed Project with applicable plans, policies, and regulations independent of the environmental review process.

A. LOCAL PLANS AND POLICIES

San Francisco General Plan

The *San Francisco General Plan* (*General Plan*) is the embodiment of the City's vision for the future of San Francisco.[1] It provides general policies and objectives to guide land use decisions and contains some policies that relate to physical environmental issues. The *General Plan* comprises a series of ten elements, each of which pertains to a particular topic that applies Citywide: Air Quality, Arts, Commerce and Industry, Community Facilities, Community Safety, Environmental Protection, Housing, Recreation and Open Space, Transportation, and Urban Design. The *General Plan* also includes area plans, each of which focuses on a particular area of the City. The project site is within the geographic area covered by the *Central Waterfront Area Plan*, discussed on p. 3.2.

The Planning Department, the Zoning Administrator, the Planning Commission, the Board of Supervisors, and other City decision-makers will evaluate the Proposed Project for conformance with the objectives and policies of the *General Plan*, and will consider potential inconsistencies as part of the decision-making process. The consideration of *General Plan* objectives and policies is carried out independent of the environmental review process, as part of the decision to approve, modify, or disapprove a proposed project.

Potential conflicts with the *General Plan* Urban Design Element will be considered by the decision-makers as part of actions to approve, modify, or disapprove the Proposed Project. As discussed on pp. 1.2-1.3, Public Resources Code Section 21099 eliminates the analysis of

[1] San Francisco Planning Department website. Available online at http://www.sf-planning.org/ftp/General_Plan/index.htm. Accessed December 8, 2015.

aesthetics in the environmental review for this Proposed Project under CEQA. The topic of aesthetics may no longer be considered in determining the physical environmental effects of the Proposed Project under CEQA. Therefore, insofar as impacts resulting from the Proposed Project's conflict with the *General Plan* Urban Design Element are premised on underlying aesthetic concerns (such as impacts on visual and scenic resources, public views, urban design, and visual character and quality), such conflicts are not considered significant impacts for the purposes of CEQA under Public Resources Code Section 21099.

CENTRAL WATERFRONT AREA PLAN

The *Central Waterfront Area Plan* is one of the four plan areas covered by the *Eastern Neighborhoods Rezoning and Area Plan*, which was adopted in 2008. The Eastern Neighborhoods encompass much of the City's industrial zoned land and have been transitioning to other uses over the past several decades. One of the goals of the Eastern Neighborhoods planning effort was to find a balance between growth of housing and office uses and preservation of production, distribution, and repair (PDR) facilities. The *Central Waterfront Area Plan* acknowledges recent changes in the land use character in the vicinity of the project site within the northern portion of the *Central Waterfront Area Plan*.

> Portions of the Central Waterfront have been transitioning from PDR to a more mixed-use character. This has been particularly the case in the northern portion of the neighborhood, with new residential development and a small amount of new retail occurring along Third Street. In addition, life science and medical related uses are expected to desire locations close to Mission Bay in the northern portion of this neighborhood. This mix of uses in the northern portion of the neighborhood should be maintained and promoted, while the core PDR areas south of 23rd Street and east of Third Street should be protected.[2]

Although the project site is included in the geographic area covered by the *Central Waterfront Area Plan*, that plan did not revise zoning and height controls for the majority of the Pier 70 area; only heights for the western end of the project site, west of the Michigan Street alignment, were revised,[3] deferring to the Port's Pier 70 area planning process, which was ongoing when the *Central Waterfront Area Plan* was being prepared.[4] (See the discussion of the Port's *Pier 70 Preferred Master Plan* on pp. 3.7-3.9.) As described on pp. 3.3-3.4, implementation of the Proposed Project would require amendment of the existing Use Districts and Height and Bulk Districts within the project site.

---

[2] City and County of San Francisco, *Central Waterfront Area Plan*, December 2008, p. 7.

[3] The Height District for the area covered by the Illinois Parcels PKN, PKS, and HDY2 was changed from 40-X to 65-X.

[4] City and County of San Francisco, *Central Waterfront Area Plan*, December 2008, p. 8. "Because the Port's Pier 70 planning process for Pier 70 is ongoing, this Plan leaves zoning and height controls for the area as-is, in recognition that the Plan may need to be amended, and zoning modified, to reflect the outcome of the Port's Pier 70 area planning process."

San Francisco Planning Code

The San Francisco Planning Code, which incorporates by reference the City's Zoning Maps, implements the *General Plan* and governs permitted uses, density, and configuration of buildings within the City. Permits to construct new buildings (or to alter or demolish existing ones) may not be issued unless (1) a project complies with the Planning Code, (2) allowable exceptions are granted pursuant to provisions of the Planning Code, or (3) amendments to the Planning Code are included as part of the Proposed Project.

The Zoning Map consists of a series of numbered maps that divide the City into geographic sections and show the locations and boundaries of zoning districts (Maps ZN01 through ZN14) and Height and Bulk Districts (Maps HT01 through HT14). Use Districts are the base zoning that prescribes which land uses are permitted and most development standards (except height and bulk). Height and Bulk Districts are mapped separately from the Use Districts and prescribe the maximum height and bulk of buildings.

USE DISTRICTS

As shown on Figure 4.B.1: Existing Use Districts in the Project Vicinity, in Section 4.B, Land Use and Land Use Planning, p. 4.B.3, the project site is zoned P (Public) in the eastern portion of the Hoedown Yard within the Illinois Parcels, and the rest of the project site is zoned M-2 (Heavy Industrial). Some of the proposed land uses within the project site (residential, commercial, and retail/arts/light-industrial [RALI][5]) are inconsistent with these existing zoning designations.

Implementation of the Proposed Project would therefore require an amendment to the Planning Code that would create a new Pier 70 Special Use District (SUD) to establish land use zoning controls for the project site. The proposed SUD would also incorporate the design standards and guidelines in the proposed *Pier 70 SUD Design for Development* document.[6] The Zoning Maps would be amended to show changes from the current zoning P (Public) and M-2 (Heavy Industrial) districts to the proposed SUD zoning.

HEIGHT AND BULK DISTRICTS

As shown on Figure 4.B.2, Existing Height and Bulk Districts in the Project Vicinity, in Section 4.B, Land Use and Land Use Planning, p. 4.B.4, the Illinois Parcels, on the westernmost portion of the project site, are currently within a 65-X Height and Bulk District. The remainder

[5] The proposed project would include market-rate and affordable residential uses, commercial use, retail, restaurant, and arts/light industrial (which are collectively referred to for the purposes of this EIR as RALI uses).

[6] The proposed *Pier 70 SUD Design for Development* document, which is included as part of the Proposed Project, would set forth the underlying vision and principles for development of the project site, and establishes standards and design guidelines to implement them.

of the project site (encompassing the 28-Acre Site and the eastern portion of the Hoedown Yard within the Illinois Parcels) is currently within a 40-X Height and Bulk District. Bulk controls (i.e., limits on horizontal building dimensions) do not apply within an "X" Bulk District.

On November 4, 2014, the San Francisco electorate approved Proposition F, a ballot measure that authorized a height increase at the 28-Acre Site from the existing 40 feet to 90 feet, except for a 100-foot-wide portion adjacent to the shoreline that would remain at 40 feet. Proposition F conditioned the proposed height increase on completion of an EIR and approval of a development plan for the 28-Acre Site by the Port Commission and the Board of Supervisors. Proposition F did not apply to the Illinois Parcels; the area along Illinois Street had already been rezoned from 40-X to 65-X Height and Bulk District under the *Central Waterfront Plan*.

Building heights under the Proposed Project are inconsistent with the existing height limits on the project site. Upon certification of this EIR and the approval of a development plan for the 28-Acre Site by the Port Commission and Board of Supervisors, the legislative amendment to the existing Planning Code height and bulk limits within the project site adopted under Proposition F would become effective, and the existing 40-X Height and Bulk District within the inland portions of the 28-Acre Site would become 90-X, a height limit increase of 50 feet (the existing height and bulk designation along a 100-foot-wide area along the shoreline would remain at 40-X). (See Figure 2.13: Proposed Height Limits Plan, in Chapter 2, Project Description, p. 2.40.) The existing 40-X Height and Bulk District of the eastern portion of the Hoedown Yard within the Illinois Parcels would be changed from 40-X to 65-X, a height limit increase of 25 feet. The existing 65-X height and bulk designation within the rest of the Illinois Parcels would remain at 65-X.

The Accountable Planning Initiative

In November 1986, the voters of San Francisco approved Proposition M, the Accountable Planning Initiative, which added Section 101.1 to the Planning Code and established eight Priority Policies. These policies are (1) preservation and enhancement of neighborhood-serving retail uses and future opportunities for resident employment in and ownership of such businesses; (2) conservation and protection of existing housing and neighborhood character to preserve the cultural and economic diversity of neighborhoods; (3) preservation and enhancement of affordable housing; (4) discouragement of commuter automobiles that impede Muni transit service or that overburden streets or neighborhood parking; (5) protection of industrial and service land uses from commercial office development and enhancement of resident employment and business ownership; (6) maximization of earthquake preparedness; (7) preservation of landmarks and historic buildings; and (8) protection of parks and open space and their access to sunlight and vistas.

Prior to issuing a permit for any demolition, conversion, or change of use, and prior to taking any action that requires a finding of consistency with the *General Plan*, the City is required to find that such project or action would be consistent with the Priority Policies. The staff reports and approval motions prepared for the decision-makers will include a comprehensive project analysis and findings regarding the consistency of the Proposed Project with the Priority Policies. The consistency of the Proposed Project with plans and policies related to environmental topics associated with the Priority Policies is discussed in Chapter 4, Environmental Setting and Impacts, of this EIR (under Sections 4.B, Land Use and Land Use Planning; 4.C, Population and Housing; 4.D, Cultural Resources; 4.E, Transportation and Circulation; 4.I, Wind and Shadow; 4.J, Recreation; and 4.N, Geology and Soils).

Port of San Francisco

WATERFRONT LAND USE PLAN

Approved in June 1997, the Port of San Francisco's *Waterfront Land Use Plan* (WLUP) is a land use policy document governing property under the jurisdiction of the Port of San Francisco, generally from Fisherman's Wharf to India Basin.[7] (See Figure 2.1: Project Location, p. 2.6, which shows the boundaries of the Waterfront Land Use Plan Area in relation to the project site.) The project site is located within the *Waterfront Plan*'s Southern Waterfront Subarea (except for the Hoedown Yard, which is not under Port jurisdiction and therefore is not covered in the WLUP). The Southern Waterfront Subarea extends from Mariposa Street, just north of the project site, south to and including India Basin.[8] The WLUP contains the following objectives for the Southern Waterfront Subarea:[9]

- Maximize the utilization of existing cargo terminal facilities.
- Pursue financing mechanisms to develop competitively priced maritime support facilities in the Southern Waterfront.
- Maximize the productivity of Port assets through interim use of property reserved for maritime expansion.
- Development of non-maritime land uses that would be beneficial to the Port and compatible with maritime activities in areas which are surplus to long-term maritime needs.
- Promote non-maritime activities in and around three historic Union Iron Works buildings to facilitate the revitalization of an area that survives as an example of San Francisco's earliest maritime industry.

[8] City and County of San Francisco, Port of San Francisco, *Revised WLUP*, Map of the Southern Waterfront Subarea, Revised Version, 2009, p. 163A.

[9] City and County of San Francisco, Port of San Francisco, *Revised WLUP*, pp. 155-161.

- Reserve or improve areas which will provide opportunities for the protection of wildlife habitat and for passive and active recreational uses.
- Enhance the public's appreciation of the waterfront by providing greater opportunities for access in a manner which does not compromise the efficiency of maritime operations.

The WLUP reserves most of the Pier 70 area for "Existing Maritime" or "Maritime Expansion" (roughly encompassing the 28-Acre Site within the project site and also the adjacent BAE Systems Ship Repair site).[10] According to the WLUP, "Maritime Uses consist of all uses, which depend on a waterfront location to operate all their related support and ancillary services and activities," including cargo shipping, ship repair, fishing industry, recreational boating and water use, ferry and excursion boats and water taxis, passenger cruise ships, historic ships, maritime support services, temporary and ceremonial berthing, and maritime office.[11] The WLUP identifies several maritime uses as "acceptable" uses within the Maritime areas in the Southern Waterfront Subarea.

The proposed residential, commercial, RALI, parking, and open space uses, under both the Maximum Residential Scenario and the Maximum Commercial Scenario, would be inconsistent with the "Existing Maritime" or "Maritime Expansion" designations under the WLUP.[12]

In addition to addressing the Port's maritime uses, WLUP policies designate "Mixed Use Opportunity Areas" (roughly encompassing the 20th/Illinois Parcel within the project site, and also the adjacent Historic Core and the site of future Crane Cove Park).[13] The Mixed Use Opportunity Area allows for development of several non-maritime commercial uses (artists/designers, assembly and entertainment, general office, museums, retail, recreational enterprises, warehousing/storage, and wholesale trade/promotion center).

Residential use is not among the acceptable uses within the Mixed Use Opportunity Area. Therefore, the Proposed Project's residential use under both the Maximum Residential Scenario and the Maximum Commercial Scenario would be inconsistent with the existing "Mixed Use Opportunity" designation under the WLUP.[14] To the extent that the Proposed Project could be inconsistent with certain provisions of the existing WLUP, in order to approve the Proposed Project, the San Francisco Port Commission would need to approve amendments to the WLUP as necessary to ensure consistency between the Proposed Project and the amended WLUP. In

2014-2015, Port staff completed the comprehensive WLUP *1997-2014 Review Report* and have developed a public process for targeted updates to the WLUP. Draft updates to the WLUP are anticipated in the spring of 2017.

PORT OF SAN FRANCISCO PIER 70 PREFERRED MASTER PLAN

Through a community-based planning process, the Port of San Francisco, with its Central Waterfront Advisory Group and a variety of interested stakeholders, developed the *Pier 70 Preferred Master Plan (Preferred Master Plan)*, dated April 2010.[15] The *Preferred Master Plan* was endorsed by the Port Commission in May 2010.[16]

The *Preferred Master Plan* articulates the following goals to provide a policy framework to guide Pier 70's transformation:

1. Create a Pier 70 National Register Historic District and rehabilitate its extraordinary historic resources.
2. Preserve the long-term viability of the ship repair industry.
3. Create a major new shoreline open space system that extends the San Francisco Bay Trail and the Blue Greenway to and through Pier 70.
4. Promote sustainable mixed-use infill development and economic vitality that includes climate adaptation strategies appropriate to this waterfront location.
5. Provide sites for office, research, emerging technologies, light industry, commercial, cultural, and recreational uses to expand San Francisco's economic base and generate revenues to fund public benefits.
6. Promote development that is pedestrian-oriented and fosters use of alternative, sustainable transportation modes and practices.
7. Extend the City street grid to enhance public access and integrate new development with the Central Waterfront.
8. Remediate environmental contamination to enable public use and enjoyment of Pier 70 and its waterfront and improve environmental quality.[17]

The Proposed Project would further many of these primary goals of the *Preferred Master Plan*. However, the Proposed Project differs from the plan in its implementation, particularly with respect to the density envisioned for new infill construction and the amount and location of residential use under the plan.

[15] Port of San Francisco, *Pier 70 Preferred Master Plan*, April 2010 (hereinafter referred to as "*Preferred Master Plan*").
[16] Port of San Francisco Port Commission, Resolution 10-27, "Request to authorize real estate developer solicitations to implement the April 2010 Preferred Master Plan for the Pier 70," May 11, 2010.
[17] Port of San Francisco, *Preferred Master Plan*, p. 3.

Density of Infill Construction

The *Preferred Master Plan* presents a Density Study Development Program to "test the capacity of development within the parameters established by the Plan and to inform the feasibility analysis."[18] The density study assumed 2,263,630 gross square feet (gsf) of new infill construction within the general area now covered by the 28-Acre Site, and 337,744 gsf of new infill construction within the general area now covered by the 20th/Illinois Parcel.[19] The plan notes that,

> evolving market opportunities and fluctuating development cycles may require varying approaches and design solutions to achieve these Plan goals and objectives. Thus, the Plan is not "hard-wired" or overly prescriptive in specifying a development program or physical siting of new development. The implementation strategy anticipates the need for an open, collaborative relationship with private development partner(s) and the community to determine how best to balance and achieve the Plan goals and objectives.[20]

The amount of infill construction proposed within the 28-Acre Site under the Proposed Project (3,410,830 gsf under the Maximum Residential Scenario and 3,422,265 gsf under the Maximum Commercial Scenario) would exceed the amount of new infill construction assumed for the general area under the *Preferred Master Plan* (an increase of around 50 percent under either scenario).

The amount of infill construction proposed within the 20th/Illinois Parcel under the Proposed Project (approximately 499,000 gsf under the Maximum Residential Scenario and approximately 500,200 gsf under the Maximum Commercial Scenario[21]) would exceed the amount of new infill construction assumed for the general area under the *Preferred Master Plan* (an increase of around 48 percent under either scenario).

Residential Use

To facilitate the continuation of heavy industrial ship repair operations within the adjacent BAE Systems Ship Repair site, the *Preferred Master Plan* contemplated limited residential use for the project site. The *Preferred Master Plan* did not envision any residential use within the 28-Acre

[18] Port of San Francisco, *Preferred Master Plan*, Table A1: Density Study Development Program, p. 110.
[19] Port of San Francisco, *Preferred Master Plan*, Table A1: Density Study Development Program, p. 110.
[20] Port of San Francisco, *Preferred Master Plan*, pp. 3-4.
[21] Under the Maximum Residential Scenario, proposed infill construction within the PKN Parcel would total 274,900 gsf (261,700 gsf residential + 6,600 gsf office + 6,600 gsf RALI), and proposed infill construction within the PKS parcel would total 224,100 gsf (213,100 gsf residential + 11,000 gsf RALI). Under the Maximum Commercial Scenario, proposed infill construction within the PKN Parcel would total 273,700 gsf (260,500 gsf residential + 6,600 gsf commercial + 6,600 gsf RALI), and proposed infill construction within the PKS Parcel would total 226,500 gsf (215,500 gsf residential + 11,000 GSF RALI).

Site. However, the *Preferred Master Plan* provides some opportunity for limited residential development along Illinois Street within the 20th/Illinois Parcel, but does not specify an amount.

> Pier 70 is not planned as a residential district. The continuation of heavy industrial operations for ship repair, which can involve loud, around-the-clock activities, generally conflicts with living standards and conditions conducive to significant new residential development. While the land use program primarily calls for non-residential activities, the Plan provides some opportunity for a limited amount of residential development along Illinois Street. One site is north of 20th Street near Crane Cove Park, across from existing housing developments. The other is the parcel just south of 20th Street along Illinois Street. These locations have been identified because they are close to public transit, can support new construction, are located upland away from the shipyard, and are near other residences. Proposals for housing would require thorough review of the design and program to demonstrate compatibility with the ship repair industry.[22]

The Proposed Project would be inconsistent with the land use program contemplated for the general area now occupied by the 28-Acre Site under the *Preferred Master Plan.* Under the proposed Maximum Residential Scenario, the 28-Acre Site would include up to 2,150 residential units. Under the proposed Maximum Commercial Scenario, the 28-Acre Site would include up to 1,100 residential units. However, the Proposed Project would be generally consistent with the land use program contemplated for the general area now occupied by the 20th/Illinois Parcel considered under the *Preferred Master Plan*.

B. REGIONAL PLANS AND POLICIES

Plan Bay Area

Plan Bay Area is a long-range integrated transportation and land use/housing strategy through 2040 for the San Francisco Bay Area and is considered the Sustainable Communities Strategy for the San Francisco Bay Area.[23] On July 18, 2013, *Plan Bay Area* was jointly approved by the Association of Bay Area Governments (ABAG) and by the Metropolitan Transportation Commission. *Plan Bay Area* marks the nine-county region's first long-range plan to meet the requirements of California's 2008 Senate Bill (SB) 375, which calls on each of the State's 18 metropolitan areas to develop a Sustainable Communities Strategy to accommodate future population growth and reduce greenhouse gas emissions from cars and light trucks. Working in collaboration with cities and counties, *Plan Bay Area* advances initiatives to expand housing and transportation choices, create healthier communities, and build a stronger regional economy.

---

[22] Port of San Francisco, *Preferred Master Plan*, p. 49.

[23] Association of Bay Area Governments (ABAG) and Metropolitan Transportation Commission, *Plan Bay Area*. Available online at http://files.mtc.ca.gov.s3.amazonaws.com/pdf/Plan_Bay_Area_FINAL/pbafinal/index.html. Accessed January 4, 2016.

Since 2002, the regional population, household, and job forecast has been "policy-based," meaning that it promotes policy objectives that increase housing development and alternative transportation modes, specifically by increasing the proportion of growth near transit and in existing urban areas. With the adoption of SB 375 and its requirement that regional planning agencies create a plan to meet targets for greenhouse gas emissions reduction tied to land use, the Bay Area can expect to see further development directed towards existing urban areas like San Francisco to increase housing near jobs, reduce urban sprawl, and reduce greenhouse gas emissions.

These areas have been identified as Priority Development Areas (PDAs). A PDA is an infill location of at least 100 acres served by transit that is designated for compact land development, along with investments in community improvements and infrastructure. Under *Plan Bay Area*, 88 percent of population growth, 78 percent of new housing and 62 percent of new jobs in the Bay Area will be concentrated in PDAs.[24] The project site is located within the Port of San Francisco PDA, which includes approximately 678 acres of public waterfront lands and stretches 7.5 miles from Fisherman's Wharf to India Basin, adjacent to Hunters Point Shipyard in the Bayview/Hunters Point community. The Port of San Francisco PDA is one of 12 PDAs in the City where 88 percent of new housing production and population growth in the City is expected to take place. *Plan Bay Area* projects the creation of 1,497 residential units (households) by 2040 within the Port of San Francisco PDA.[25]

The Proposed Project under the Maximum Residential Scenario would provide 2,150 residential units within the 28-Acre Site and 540 residential units within the 20th/Illinois Parcel, for a total of 2,690 residential units within the Port of San Francisco PDA, and would alone exceed the growth projections for the entire Port of San Francisco PDA.[26]

Although the number of residential units under the Maximum Residential Scenario exceeds the specific growth projections for housing in the Port of San Francisco PDA, it is consistent with the overall goals of *Plan Bay Area* of accommodating future population growth within infill locations served by transit. *Plan Bay Area*'s projections serve more as targets for new infill development within PDAs rather than as limits to development. As such, the Proposed Project would enable the Port of San Francisco PDA to meet and exceed its targets for housing production under *Plan Bay Area*.

[24] ABAG, *Projections 2013*, July 2013, p. 71.

[25] ABAG, Plan Bay Area Priority Development Area Showcase, February 2015. Available online at http://gis.abag.ca.gov/website/PDAShowcase/. Accessed March 7, 2016.

[26] The Proposed Project under the Maximum Commercial Scenario would provide 1,100 residential units within the 28-Acre Site and 545 residential units within the Illinois Parcels, for a total of 1,654 residential units within the Port of San Francisco PDA, and would not alone exceed the growth projections for the entire Port of San Francisco PDA.

San Francisco Bay Conservation and Development Commission

The San Francisco Bay Conservation and Development Commission (BCDC), created by the McAteer-Petris Act (California Government Code Sections 66600-66682), functions as the State's coastal management agency for San Francisco Bay. The *San Francisco Bay Plan* (*Bay Plan*) was prepared by BCDC from 1965 through 1969 and amended through 2007 in accordance with the McAteer-Petris Act. The *Bay Plan* guides the protection and use of the Bay and its shoreline. BCDC has permit jurisdiction for the nine Bay Area counties with Bay frontage over areas subject to tidal action up to the mean high tide line and including all sloughs, tidelands, submerged lands, and marshlands lying between the mean high tide and 5 feet above mean sea level, and the land lying between the Bay shoreline and a line drawn parallel to, and 100 feet from, the Bay shoreline, known as the 100-foot shoreline band. Under the McAteer-Petris Act, BCDC has permit authority for the placement of fill, extraction of materials, or substantial changes in use of land, water, or structures within its jurisdiction, and to enforce policies aimed at protecting the Bay and its shoreline, as well as maximizing public access to the Bay.

For the Proposed Project, BCDC's jurisdiction includes the Bay and areas within 100 feet inland of the mean high tide line. The Proposed Project would require BCDC approval of activities within BCDC's jurisdiction along the Bay shoreline. BCDC will make the final determination of consistency with *Bay Plan* policies for the portions of the project site that are within its permit jurisdiction.

San Francisco Bay Plan and San Francisco Waterfront Special Area Plan

BCDC completed and adopted the *Bay Plan* in 1968, and the plan has been periodically amended during the past 40 years, most recently in 2011 to address climate change. In 1975, after a collaborative planning process with the San Francisco Planning Department, BCDC adopted the *San Francisco Waterfront Special Area Plan* (*Special Area Plan*). The *Special Area Plan* was amended in 2012. This plan, together with the McAteer-Petris Act and the *Bay Plan* and subsequent amendments to all three documents, prescribes a set of rules for shoreline development along the San Francisco waterfront.

Several policies of the *Bay Plan* are aimed at protecting the Bay's water quality, managing safety of fills, and guiding the dredging activities of the Bay's sediment. The *Bay Plan* policies that are most relevant to the Proposed Project with respect to water quality and hydrology are as follows:

Water Quality

Policy 1: Bay water pollution should be prevented to the greatest extent feasible. The Bay's tidal marshes, tidal flats, and water surface area and volume should be conserved and, whenever possible, restored and increased to protect and

improve water quality. Fresh water inflow into the Bay should be maintained at a level adequate to protect Bay resources and beneficial uses.

Policy 2: Water quality in all parts of the Bay should be maintained at a level that will support and promote the beneficial uses of the Bay as identified in the San Francisco Bay Regional Water Quality Control Board's Basin Plan. The policies, recommendations, decisions, advice and authority of the State Water Resources Control Board and the San Francisco Bay Regional Water Quality Control Board should be the basis for carrying out BCDC's water quality responsibilities.

Policy 3: New projects should be sited, designed, constructed and maintained to prevent or, if prevention is infeasible, to minimize the discharge of pollutants into the Bay by: (a) controlling pollutant sources at the project site; (b) using construction materials that contain non-polluting materials; and (c) applying appropriate, accepted and effective best management practices, especially where water dispersion is poor and near shellfish beds and other significant biotic resources.

Policy 4: When approving a project in an area polluted with toxic or hazardous substances, the Commission should coordinate with appropriate local, state and federal agencies to ensure that the project will not cause harm to the public, to Bay resources, or to the beneficial uses of the Bay.

Policy 6: To protect the Bay and its tributaries from the water quality impacts of nonpoint source pollution, new development should be sited and designed consistent with standards in municipal stormwater permits and state and regional stormwater management guidelines, where applicable, and with the protection of Bay resources. To offset impacts from increased impervious areas and land disturbances, vegetated swales, permeable pavement materials, preservation of existing trees and vegetation, planting native vegetation and other appropriate measures should be evaluated and implemented where appropriate.

Policy 7: Whenever practicable, native vegetation buffer areas should be provided as part of a project to control pollutants from entering the Bay, and vegetation should be substituted for rock riprap, concrete, or other hard surface shoreline and bank erosion control methods where appropriate and practicable.

Climate Change

Policy 2: When planning shoreline areas or designing larger shoreline projects, a risk assessment should be prepared by a qualified engineer and should be based on the estimated 100-year flood elevation that takes into account the best estimates of future sea level rise and current flood protection and planned flood protection that will be funded and constructed when needed to provide protection for the proposed project or shoreline area. A range of sea level rise projections for mid-century and end of century based on the best scientific data available should be used in the risk assessment. Inundation maps used for the risk assessment should be prepared under the direction of a qualified engineer. The risk assessment should identify all types of potential

flooding, degrees of uncertainty, consequences of defense failure, and risks to existing habitat from proposed flood protection devices.

Policy 3: To protect public safety and ecosystem services, within areas that a risk assessment determines are vulnerable to future shoreline flooding that threatens public safety, all projects—other than repairs of existing facilities, small projects that do not increase risks to public safety, interim projects and infill projects within existing urbanized areas—should be designed to be resilient to a mid-century sea level rise projection. If it is likely the project will remain in place longer than mid-century, an adaptive management plan should be developed to address the long-term impacts that will arise based on a risk assessment using the best available science-based projection for sea level rise at the end of the century.

Policy 4: To address the regional adverse impacts of climate change, undeveloped areas that are both vulnerable to future flooding and currently sustain significant habitats or species, or possess conditions that make the areas especially suitable for ecosystem enhancement, should be given special consideration for preservation and habitat enhancement and should be encouraged to be used for those purposes.

Policy 5: Wherever feasible and appropriate, effective, innovative sea level rise adaptation approaches should be encouraged.

Safety of Fills

Policy 2: Even if the Bay Plan indicates that a fill may be permissible, no fill or building should be constructed if hazards cannot be overcome adequately for the intended use in accordance with the criteria prescribed by the Engineering Criteria Review Board.

Policy 3: To provide vitally needed information on the effects of earthquakes on all kinds of soils, installation of strong-motion seismographs should be required on all future major landfills. In addition, the Commission encourages installation of strong-motion seismographs in other developments on problem soils, and in other areas recommended by the U.S. Geological Survey, for purposes of data comparison and evaluation.

Policy 4: Adequate measures should be provided to prevent damage from sea level rise and storm activity that may occur on fill or near the shoreline over the expected life of a project. The Commission may approve fill that is needed to provide flood protection for existing projects and uses. New projects on fill or near the shoreline should either be set back from the edge of the shore so that the project will not be subject to dynamic wave energy, be built so the bottom floor level of structures will be above a 100-year flood elevation that takes future sea level rise into account for the expected life of the project, be specifically designed to tolerate periodic flooding, or employ other effective means of addressing the impacts of future sea level rise and storm activity. Rights-of-way for levees or other structures protecting inland areas from tidal flooding should be sufficiently wide on the upland side to allow for future levee widening to support additional levee height so that no fill for levee widening is placed in the Bay.

Shoreline Protection

Policy 1: New shoreline protection projects and the maintenance or reconstruction of existing projects and uses should be authorized if: (a) the project is necessary to provide flood or erosion protection for (i) existing development, use or infrastructure, or (ii) proposed development, use or infrastructure that is consistent with other Bay Plan policies; (b) the type of the protective structure is appropriate for the project site, the uses to be protected, and the erosion and flooding conditions at the site; (c) the project is properly engineered to provide erosion control and flood protection for the expected life of the project based on a 100-year flood event that takes future sea level rise into account; (d) the project is properly designed and constructed to prevent significant impediments to physical and visual public access; and (e) the protection is integrated with current or planned adjacent shoreline protection measures. Professionals knowledgeable of the Commission's concerns, such as civil engineers experienced in coastal processes, should participate in the design.

Policy 2: Riprap revetments, the most common shoreline protective structure, should be constructed of properly sized and placed material that meet[s] sound engineering criteria for durability, density, and porosity. Armor materials used in the revetment should be placed according to accepted engineering practice, and be free of extraneous material, such as debris and reinforcing steel. Generally, only engineered quarrystone or concrete pieces that have either been specially cast, are free of extraneous materials from demolition debris, and are carefully selected for size, density, and durability will meet these requirements. Riprap revetments constructed out of other debris materials should not be authorized.

Policy 3: Authorized protective projects should be regularly maintained according to a long-term maintenance program to assure that the shoreline will be protected from tidal erosion and flooding and that the effects of the shoreline protection project on natural resources during the life of the project will be the minimum necessary.

Policy 4: Whenever feasible and appropriate, shoreline protection projects should include provisions for nonstructural methods such as marsh vegetation and integrate shoreline protection and Bay ecosystem enhancement, using adaptive management. Along shorelines that support marsh vegetation, or where marsh establishment has a reasonable chance of success, the Commission should require that the design of authorized protection projects include[s] provisions for establishing marsh and transitional upland vegetation as part of the protective structure, wherever feasible.

Policy 5: Adverse impacts to natural resources and public access from new shoreline protection should be avoided. Where significant impacts cannot be avoided, mitigation or alternative public access should be provided.

Public Access

Policy 2: In addition to the public access to the Bay provided by waterfront parks, beaches, marinas, and fishing piers, maximum feasible access to and along the waterfront and on any permitted fills should be provided in and through

every new development in the Bay or on the shoreline, whether it be for housing, industry, port, airport, public facility, wildlife area, or other use, except in cases where public access would be clearly inconsistent with the project because of public safety considerations or significant use conflicts, including unavoidable, significant adverse effects on Bay natural resources. In these cases, in lieu access at another location preferably near the project should be provided.

Policy 5: Public access should be sited, designed, managed, and maintained to avoid significant adverse impacts from sea level rise and shoreline flooding.

Policy 9: Access to and along the waterfront should be provided by walkways, trails, or other appropriate means and connect to the nearest public thoroughfare where convenient parking or public transportation may be available. Diverse and interesting public access experiences should be provided which would encourage users to remain in the designated access areas to avoid or minimize potential adverse effects on wildlife and their habitat.

Policy 11: Federal, state, regional, and local jurisdictions, special districts, and the Commission should cooperate to provide appropriately sited, designed and managed public access, especially to link the entire series of shoreline parks, regional trail systems (such as the San Francisco Bay Trail) and existing public access areas to the extent feasible without additional Bay filling and without significant adverse effects on Bay natural resources. State, regional, and local agencies that approve projects should assure that provisions for public access to and along the shoreline are included as conditions of approval and that the access is consistent with the Commission's requirements and guidelines.

San Francisco Bay Water Quality Control Plan (Basin Plan)

San Francisco Bay waters are under the jurisdiction of the San Francisco Bay Regional Water Quality Control Board, which established regulatory standards and objectives for water quality in the Bay in its *Water Quality Control Plan for the San Francisco Bay Basin*, commonly referred to as the *Basin Plan*.[27] The *Basin Plan* identifies existing and potential beneficial uses for surface waters and provides numerical and narrative water quality objectives designed to protect those uses. The preparation and adoption of water quality control plans is required by the California Water Code (Section 13240) and supported by the Federal Clean Water Act. Adoption or revision of surface water standards is subject to the approval of the U.S. Environmental Protection Agency. Because beneficial uses, together with their corresponding water quality objectives, can be defined per Federal regulations as water quality standards, the *Basin Plan* is a regulatory reference for meeting the State and Federal requirements for water quality control.

[27] San Francisco Bay Regional Water Quality Control Board, *Water Quality Control Plan for the San Francisco Bay Basin*, March 20, 2015. Available online at http://www.swrcb.ca.gov/rwqcb2/water_issues/programs/planningtmdls/basinplan/web/docs/BP_all_chapters.pdf. Accessed November 28, 2015.

The project site is located adjacent to Lower San Francisco Bay, which extends from approximately the Bay Bridge on the north to the Dumbarton Bridge on the south. The combined sewer discharge structure for the 20th Street sub-basin of the City's combined sewer system discharges to the Central Basin, an inlet of Lower San Francisco Bay along the City's bay shoreline. Identified beneficial uses for the Central Basin of Lower San Francisco Bay are commercial and sport fishing, estuarine habitat, wildlife habitat, water contact recreation, noncontact water recreation, and navigation. Identified beneficial uses for Lower San Francisco Bay are industrial service supply, commercial and sport fishing, shellfish harvesting, estuarine habitat, fish migration, preservation of rare and endangered species, fish spawning, wildlife habitat, water contact recreation, noncontact water recreation, and navigation.

Total maximum daily loads for polychlorinated biphenyls (PCBs) and mercury in San Francisco Bay have been approved by the U.S. Environmental Protection Agency and officially incorporated into the *Basin Plan*.

C. STATE PLANS AND POLICIES

Public Trust Doctrine

The Public Trust Doctrine is a legal doctrine that governs the use of tidal and submerged lands, including former tidal and submerged lands that have been filled. It is not a codified set of laws but a doctrine primarily established in Court decisions and in decisions and interpretations by the California State Lands Commission and the California Attorney General. The purpose of the Public Trust Doctrine is to ensure that land that adjoins the State's waterways or is actually covered by those waters remains committed to water-oriented uses. Uses of Public Trust land are generally limited to waterborne commerce; navigation; fisheries; water-oriented recreation, including commercial facilities that must be located on or adjacent to water; and environmental preservation and recreation, such as natural resource protection, wildlife habitat and study, and facilities for fishing, swimming, and boating. Ancillary or incidental uses that promote Trust uses or accommodate the public's enjoyment of Trust lands are also permitted, such as hotels, restaurants, and specialty retail. Because the Public Trust Doctrine is based on judicial cases, there is no zoning code or general statute setting forth a list of permitted Trust uses.

Certain formerly tidal and submerged portions of the 28-Acre Site are subject to the Public Trust. (See Figure 2.3: Existing Public Trust Lands, in Chapter 2, Project Description, p. 2.14.) The proposed placement of certain non-Trust uses on land within the 28-Acre Site that is subject to the Public Trust would be inconsistent with the Public Trust. In order to resolve the Public Trust status of portions of Pier 70, the Port has obtained State legislation (Assembly Bill 418) that authorizes the State Lands Commission to approve a Public Trust exchange that would free some land from the Public Trust, while committing other land to the Public Trust. (See Figure 2.9: Proposed Public Trust Exchange Configuration, on p. 2.34.) For the City and Port to allow some

of the uses in the proposed SUD, the State Lands Commission would have to approve a Trust exchange agreement meeting the requirements of Assembly Bill 418 that would lift the Public Trust from designated portions of Pier 70.

This page intentionally blank.

4. ENVIRONMENTAL SETTING AND IMPACTS

A. INTRODUCTION TO CHAPTER 4

Chapter 4, Environmental Setting and Impacts, addresses the physical environmental effects of the Proposed Project. This Introduction to Chapter 4 describes the format of the environmental analysis in each environmental topic section of the chapter; discusses the effect of Senate Bill 743 (SB 743) on the scope of California Environmental Quality Act (CEQA) analysis for the Pier 70 Mixed-Use District Project (Proposed Project); and explains the general approach to baseline setting and cumulative analysis in this Environmental Impact Report (EIR).

FORMAT OF THE ENVIRONMENTAL ANALYSIS

This chapter contains the following 17 sections in addition to this Introduction, each addressing a different environmental topic.

- Section 4.B, Land Use and Land Use Planning
- Section 4.C, Population and Housing
- Section 4.D, Cultural Resources
- Section 4.E, Transportation and Circulation
- Section 4.F, Noise and Vibration
- Section 4.G, Air Quality
- Section 4.H, Greenhouse Gas Emissions
- Section 4.I, Wind and Shadow
- Section 4.J, Recreation
- Section 4.K, Utilities and Service Systems
- Section 4.L, Public Services
- Section 4.M, Biological Resources
- Section 4.N, Geology and Soils
- Section 4.O, Hydrology and Water Quality
- Section 4.P, Hazards and Hazardous Materials
- Section 4.Q, Mineral and Energy Resources
- Section 4.R, Agriculture and Forest Resources

Each of these sections contains the following subsections: Environmental Setting, Regulatory Framework, and Impacts and Mitigation Measures.

The Environmental Setting subsection for each environmental topic defines and describes the existing conditions in the project site and vicinity as they relate to specifically to each of the topics. While typically existing conditions are generally defined as the physical conditions that existed at the time that the Notice of Preparation (NOP) for the Proposed Project is issued (CEQA Guidelines Section 15125(a)), existing conditions analyzed in the Pier 70 Mixed-Use District EIR include projects that are approved and under construction, which are reasonably likely to be

completed and occupied or in operation when the Proposed Project is expected to be implemented. As further described below on p. 4.A.5, the modified existing conditions serve as the baseline for the analysis of environmental impacts (adverse physical changes) that would result from implementation of the Proposed Project, presented under the Impacts and Mitigation Measures subsection.

The Regulatory Framework subsection describes Federal, State, regional, and local regulatory requirements that are directly applicable to the environmental topic.

The Impacts and Mitigation Measures subsection describes the physical environmental impacts of the Proposed Project for each topic, as well as any mitigation measures that could reduce impacts to less-than-significant levels. This subsection begins with a listing of the significance thresholds used to assess the severity of the environmental impacts for that particular topic. These thresholds reflect the Planning Department's Initial Study checklist. Environmental topic sections also include a topic-specific "Approach to Analysis," which follows the "Significance Thresholds" subsection. This discussion explains the parameters, assumptions, and data used in the analysis, and specifically outlines how the Maximum Residential Scenario and Maximum Commercial Scenario are analyzed in the each of the individual environmental topic sections. This is followed by a "Project Features" discussion, which summarizes the particular aspects of the Proposed Project relevant to each topic.

Under the "Impact Evaluation" discussion, the project-level impact analysis for each topic begins with an impact statement that reflects the applicable significance thresholds. Some significance thresholds may be combined in a single impact statement, if appropriate. Each impact statement is keyed to a subject area abbreviation (e.g., LU for Land Use) and an impact number (e.g., 1, 2, 3) for a combined alpha-numeric code (e.g., Impact LU-1, Impact LU-2, Impact LU-3). When potentially significant impacts are identified, mitigation measures are presented to avoid, eliminate, or reduce significant adverse impacts of the project. Improvement measures are identified that would further reduce less-than-significant effects of the Proposed Project. Each mitigation measure corresponds to the impact statement and has an "M" in front to signify it is a mitigation measure (e.g., Mitigation Measure M-LU-1 for a mitigation measure that corresponds to Impact LU-1). If there is more than one mitigation measure for the same impact statement, the mitigation measures are numbered with a lowercase letter suffix (e.g., Mitigation Measures M-LU-1a and M-LU-1b). Improvement measures are designated with an "I" to signify "improvement measure," the topic code, and a letter (e.g., I-LU-A).

Each impact statement describes the impact that would occur without mitigation. The level of significance of the impact is indicated in parentheses at the end of the impact statement based on the following terms:

- **No Impact** – No adverse physical changes (or impacts) to the environment are expected.
- **Less than Significant** – Impact that does not exceed the defined significance criteria or would be eliminated or reduced to a less-than-significant level through compliance with existing local, State, and Federal laws and regulations.
- **Less than Significant with Mitigation** – Impact that is reduced to a less-than-significant level through implementation of the identified mitigation measures.
- **Significant and Unavoidable with Mitigation** – Impact that exceeds the defined significance criteria and can be reduced through compliance with existing local, State, and Federal laws and regulations and/or implementation of all feasible mitigation measures, but cannot be reduced to a less-than-significant level.
- **Significant and Unavoidable** – Impact that exceeds the defined significance criteria and cannot be eliminated or reduced to a less-than-significant level through compliance with existing local, State, and Federal laws and regulations and for which there are no feasible mitigation measures.

The Proposed Project's cumulatively considerable contributions to cumulative impacts are described in a separate subsection following the project-level impact analysis for each environmental topic. Cumulative impact statements are numbered consecutively for each impact statement with a combined alpha-numeric code to signify it is a cumulative impact. For example, C-LU-1 refers to the first cumulative impact for Land Use and Land Use Planning.

PUBLIC RESOURCES CODE SECTION 21099

Aesthetics and Parking Analysis

CEQA Section 21099(d), provides that "aesthetics and parking impacts of a residential, mixed-use residential, or employment center project on an infill site located within a transit priority area shall not be considered significant impacts on the environment." Accordingly, aesthetics and parking are not considered in determining if a project has the potential to result in significant environmental effects for projects that meet all of the following three criteria:

1. The project is in a transit priority area[1]; and
2. The project is on an infill site; and
3. The project is residential, mixed-use residential, or an employment center.

[1] A "transit priority area" is defined as an area within one-half mile of an existing or planned major transit stop. A "major transit stop" is defined in California Public Resources Code Section 21064.3 as a rail transit station, a ferry terminal served by either a bus or rail transit service, or the intersection of two or more major bus routes with a frequency of service interval of 15 minutes or less during the morning and afternoon peak commute periods. A map of San Francisco's Transit Priority Areas is available online at http://sfmea.sfplanning.org/Map%20of%20San%20Francisco%20Transit%20Priority%20Areas.pdf.

The Proposed Project meets each of the above three criteria and thus, this EIR does not consider aesthetics and the adequacy of parking in determining the significance of project impacts under CEQA.[2]

The Planning Department recognizes that the public and decision-makers nonetheless may be interested in information pertaining to the aesthetic effects of a proposed project and may desire that such information be provided as part of the environmental review process. Therefore, some information that would have otherwise been provided in an aesthetics section of the EIR (i.e., "before" and "after" visual simulations) has been included in Section 4.C, Cultural Resources, of this EIR. However, this information is provided solely for informational purposes and is not used to determine the significance of the environmental impacts of the project, pursuant to CEQA. In addition, Public Resources Code Section 21099(d)(2) states that a Lead Agency maintains the authority to consider aesthetic impacts pursuant to local design review ordinances or other discretionary powers and that aesthetics impacts do not include impacts on historical or cultural resources (e.g., historic architectural resources). As such, the Planning Department does consider aesthetics for design review and to evaluate effects on historic and cultural resources.

The Planning Department acknowledges that parking conditions may be of interest to the public and the decision-makers. Therefore, this EIR presents parking demand analysis for informational purposes and considers any secondary physical impacts associated with constrained supply (e.g., queuing by drivers waiting for scarce on-site parking spaces that affects the public right-of-way) as applicable in the transportation analysis in Section 4.E, Transportation and Circulation.

Automobile Delay and Vehicle Miles Traveled Analysis

In addition, Public Resources Code Section 21099(b)(1) requires that the State Office of Planning and Research (OPR) develop revisions to the CEQA Guidelines establishing criteria for determining the significance of transportation impacts of projects that "promote the reduction of greenhouse gas emissions, the development of multimodal transportation networks, and a diversity of land uses." Public Resources Code Section 21099(b)(2) states that upon certification of the revised guidelines for determining transportation impacts pursuant to Section 21099(b)(1), automobile delay, as described solely by level of service or similar measures of vehicular capacity or traffic congestion shall not be considered a significant impact on the environment under CEQA.

[2] San Francisco Planning Department, *Transit-Oriented Infill Project Eligibility Checklist*, Pier 70 Mixed Use Project, Case No. 2014-001272ENV, November 18, 2015. A copy of this document is available for review at the San Francisco Planning Department, 1650 Mission Street, Suite 400, as part of Case File No. 2005.0679E.

In January 2016, OPR published for public review and comment a *Revised Proposal on Updates to the CEQA Guidelines on Evaluating Transportation Impacts in CEQA*[3] recommending that transportation impacts for projects be measured using a vehicle miles traveled (VMT) metric. On March 3, 2016, based on compelling evidence in that document and on the City's independent review of the literature on level of service and VMT, the San Francisco Planning Commission adopted OPR's recommendation to use the VMT metric instead of automobile delay to evaluate the transportation impacts of projects (Resolution 19579). The VMT metric does not apply to the analysis of impacts on non-automobile modes of travel such as riding transit, walking, and bicycling.

Accordingly, this EIR does not contain a discussion of automobile delay impacts. Instead, a VMT and induced automobile travel impact analysis is provided in Section 4.E, Transportation and Circulation. The topic of automobile delay, nonetheless, may be considered by decision-makers, independent of the environmental review process, as part of their decision to approve, modify, or disapprove the proposed project.

APPROACH TO BASELINE SETTING

Project development characteristics are typically compared to the existing physical environment to isolate impacts caused by the project on its surroundings. In other words, the existing condition (also referred to as the environmental setting) is normally the baseline against which the project's impacts are measured to determine whether impacts are significant. Therefore, the Environmental Setting subsection of each topic describes existing conditions on and around the project site. These existing conditions are ordinarily established as of the date that the NOP is published. In some circumstances, however, it is appropriate to use a different baseline to identify project impacts to account for circumstances that can change over time during the course of the environmental review, project construction, and operation.

The Central Waterfront, Mission Bay, and Dogpatch neighborhoods are currently undergoing rapid changes and development. For both development scenarios, construction is projected to begin in 2018 and would be phased over an approximately 11-year period, concluding in 2029. Proposed development is expected to involve five phases. The Proposed Project is likely to be constructed well after a number of approved transportation improvements and land use development projects are implemented. These projects were under construction as of the date of the publication of the NOP or are approved and are reasonably likely to be completed and occupied or in operation when the Proposed Project is expected to be implemented. The adjusted "existing conditions" that include these development projects form an appropriate baseline

[3] San Francisco Planning Department, *Transit-Oriented Infill Project Eligibility Checklist*, Pier 70 Mixed Use Project, Case No. 2014-001272ENV, dated November 18, 2015.

against which the Pier 70 Mixed-Use Project should be measured for many of the analysis topics in the EIR, rather than using the existing conditions as of the time the NOP was published.

Presented below is a list of the development projects included in the baseline for the analyses of topics for which a baseline other than existing conditions is appropriate. The number of the project listed below corresponds to its numbered location on Figure 4.A.1: Location of Baseline and Foreseeable Future Projects. The figure shows the location of baseline projects within the vicinity of the project site. Baseline projects are shown in green. Figure 4.A.1 also corresponds to the locations of projects for which the Planning Department had an application on file, but for which construction had not commenced as of NOP publication of the Proposed Project. Such projects are considered additional reasonably foreseeable future projects and are discussed in cumulative impact analysis below in the "Approach to Cumulative Analysis" on pp. 4.A.12-4.A.18. Cumulative, "foreseeable future" projects are shown in yellow on the figure.

For most environmental topics, projects included in the baseline or cumulative analysis are no greater than an approximate one-half-mile radius from the project site. However, for issues related to transportation and circulation, several projects located within a reasonable distance of the project site (between approximately Interstate 280 [I-280] to the west, Cesar Chavez Street to the south, and Bryant Street to the north) were completed and began operation after traffic counts were taken at the transportation study intersections (these intersections are identified in Section 4.E, Transportation and Circulation, and shown on Figure 4.E.1: Transportation Study Area and Study Intersections, p. 4.E.2). These projects are adding traffic to local roadways and freeway ramps and to the local transit system; therefore, the trips generated by these projects have also been added to existing conditions to provide a final adjusted baseline for the traffic analysis and traffic-related air quality and noise analyses in order to properly reflect conditions against which the Proposed Project will be analyzed. Other projects outside the one-half-mile radius related to sanitary sewer facilities have also been considered in the analysis in Section 4.K, Utilities and Service Systems.

PIER 70 MIXED-USE DISTRICT PROJECT

FIGURE 4.A.1: LOCATION OF BASELINE AND FORESEEABLE FUTURE PROJECTS

This page intentionally blank.

Adjacent Pier 70 Baseline Project

1. **20th Street Historic Core Project, Case No. 2013.1168E:**

   This project will renovate, remediate, and reuse ten Port-owned historic industrial buildings and develop an outdoor publicly accessible plaza located at Pier 70 along portions of 20th Street between Illinois and Louisiana streets. The ten historic buildings (Buildings 14, 101, 102, 104, 113, 114, 115, 116, 122, and 123) are contributors to the Union Iron Works Historic District, individually eligible historic resources, and historic architectural resources under CEQA. Buildings will be reused as primarily light industrial and commercial uses. The project will add approximately 69,000 gross square feet (gsf) of new building space primarily in interior mezzanines, and remove approximately 5,000 gsf of previous additions to Buildings 104 and 113. Roadway, sidewalk, and parking lot improvements will also occur. In total, this project includes approximately 334,000 gsf of existing and new building space.

   Approved and under construction 2014, planned to be operational 2017.

Baseline Projects within Approximately One-Half Mile of the Project Site

2. **1245 Third Street (Public Safety Building):**

   The project involved the construction of an approximately 285,000-gsf Public Safety Building to house San Francisco Police Department Headquarters-South District Police Station and Fire Station #4.

   Constructed 2011 and operational 2015.

3. **Bayfront Park:**

   The project will construct a park from four parcels (P21, P22, P23, and P24) owned by the Port in the Mission Bay Redevelopment Area. P21 and P22 are located east of Terry Francois Boulevard between South and Mariposa streets. P21 is an existing 1.83 acre area featuring a boat launch with a parking lot, and a 300-foot-long portion of the San Francisco Bay Trail. P22 is partially developed by a 990-foot-long, 8-foot-wide continuation of the San Francisco Bay Trail (0.18 acre). An additional 5.22 acres of P22 will be developed (5.4 acres total) to include a new grass lawn and other amenities to complement the existing trail and waterfront. P23 (0.76 acre) and P24 (1.13 acres) are two triangular parcels located west of Terry Francois Boulevard between Mariposa and 16th streets that will be developed into new park spaces.

   Approved 2016 and under construction.

4. **University of California, San Francisco (UCSF) Medical Center Hospital and Mission Bay Hall:**

   The UCSF Medical Center Hospital is located in Mission Bay between Third, Fourth, 16th, and Mariposa streets and includes a new 878,000 gsf hospital complex with 289 beds (183 in UCSF Benioff Children's Hospital San Francisco, 36 in UCSF Betty Irene Moore Women's Hospital birth center, and 70 in UCSF Bakar Cancer Hospital). Mission Bay Hall is located at the northwestern corner of Third and 16th streets and includes a seven-floor, 265,000-gsf building for the university's global health programs and offices.

   Mission Bay Hall constructed 2013 and operational October 2014, Medical Center Hospital constructed 2010 and operational as of February 2015, after traffic counts were completed for the transportation analysis.

5. **1000 16th Street, Case No. 2003.0527E:**

   The mixed-use project includes approximately 453 residential and 39 commercial units with ground-floor retail space, and an approximately 0.9-acre public park.

   Constructed 2014 and operational December 2015.

6. **1001 17th Street/140 Pennsylvania Street, Case No. 2011.0187E:**

   The project calls for demolition of a two-story warehouse and construction of two new buildings: a mixed-use, 36-unit residential and commercial building at 1001 17th Street and a mixed-use, 12-unit residential and commercial building at 140 Pennsylvania Avenue.

   Approved 2013 and operational November 2015.

7. **Mariposa Park:**

   The project constructed a 2.38 acre park from of two parcels (P26 and P27) owned by the City in the Mission Bay Redevelopment Area. The park, located north of Mariposa Street between Minnesota Street and I-280, will provide a grass lawn and walking paths, a kids play area, and benches and tables.

   Approved 2009 and operational July 2016.

8. **650 Indiana Street, Case No. 2012.1574E:**
   The project includes demolition of the existing structures and construction of approximately 114,700 gsf with 111 residential units and approximately 1,900 gsf of ground-floor neighborhood-serving retail uses. The project has two approximately 58-foot-tall, five-story buildings, separated by a mid-block alleyway. The buildings include approximately 79 parking spaces and 103 Class 1 bicycle spaces, as well as building services and storage space. The project also includes construction of an 8,200 gsf public plaza on the portion of 19th Street located west of Indiana Street and streetscape improvements pursuant to the City's Better Streets Plan.

   Approved 2014, under construction 2015, planned to be operational 2017.

9. **800 Indiana Street, Case No. 2011.1374E:**

   This project includes demolition of the existing two-story industrial warehouse and one-story office and construction of a five-story residential building with 338 dwelling units and up to 230 parking spaces. The project will include 37,775 gsf of publicly accessible open space.

   Approved 2015, under construction 2016, planned to be operational 2018.

10. **1201–1225 Tennessee Street, Case No. 2012.0493E:**

    The project will demolish the existing commercial building and construct a six-story mixed use building with 259 dwelling units, 2,260 ground-floor retail space, and 147 off-street parking spaces.

    Approved 2015 and under construction.

11. **740 Illinois Street/2121 Third Street, Case No. 2010.0094E:**

    Under this project, the existing commercial fueling facility was demolished and a new building, with approximately 106 dwelling units and 80 parking spaces, was constructed. The new building is six stories tall and totals approximately 62,516 gsf.

    Constructed and operational 2013.

12. **2235 Third Street, Case No. 2002.1302E:**

    Under this project, two existing vacant buildings totaling about 27,200 gsf were renovated and an approximately 180,000 gsf addition was constructed. The development has approximately 141 dwelling units with 128 off-street parking spaces and approximately 10,000 gsf of ground-floor retail space.

    Constructed and operational 2012.

13. **616 20th Street, Case No. 2006.0427E:**

    This project included demolition of an existing one-story restaurant and construction of 16 dwelling units over a ground-floor restaurant with 11 parking spaces. A portion of the building is in use as the Dogpatch Alternative School [Site 2].

    Constructed and operational 2013.

14. **2265 Third Street (Dogpatch Alternative School [Site 1]):**

    The project conducted tenant improvements to an existing building to facilitate a change in use from retail to school.

    Constructed and operational 2013.

15. **851 Tennessee Street, Case No. 2013.0775E:**

    Under this project new Italian International School facilities were constructed.

    Constructed and operational 2013.

This baseline setting is used where relevant in the analyses of the Proposed Project's impacts in the Land Use, Transportation and Circulation, Noise, Air Quality, Wind and Shadow, Recreation (Parks only), and Biological Resources sections presented in Sections B, E, F, G, I, J, and M, respectively, of Chapter 4, Environmental Setting and Impacts.

In addition, the traffic and transit analyses, and the transportation-related analyses in the Noise and Air Quality sections of the EIR (Sections 4.F and 4.G, respectively), account for the following transportation improvements that are under construction or are approved and funded and are expected to be completed and in use by the time the Pier 70 Mixed-Use Development Project is implemented:

- Central Subway (*under construction, planned to be operational 2019*).
- Muni bus route 55 16th Street (*operational January 2015*).
- Mariposa Street infrastructure upgrades and Owens Street extension (part of UCSF Mission Bay Medical Center improvements) consisting of:
  - Owens Street extension between 16th and Mariposa streets to connect with the I-280 ramps;
  - Mariposa Street widening on the north side near the I-280 ramps;
  - Northbound I-280 off-ramp widening at Mariposa Street to better align with Owens Street;
  - Mariposa Street restriping between I-280 off-ramp and Pennsylvania Avenue; and
  - Mariposa Street/I-280 on-ramp intersection signalization.

- Muni bus route 22 Fillmore extension east on 16th Street to Third Street and north on Third Street to a turnaround in Mission Bay, and Muni bus route 33 Stanyan re-routed from Potrero Avenue to provide service on 18th Street presently provided by the 22 Fillmore. (*Planned to be operational 2020.*)
- Transit-only travel lane on 16th Street. (*Planned to be operational 2019.*)
- T Third Muni Metro line short loop on new tracks in Mission Bay around the block of 18th, Illinois, and 19th streets and leading back to Third Street, to allow short runs during peak periods and special events when the Central Subway begins operation extending the T Third north into Chinatown and adding capacity north of the loop.[4] (*Under construction July 2016, planned to be completed 2018.*)

This baseline, including the development projects and transportation system improvements listed above, added to existing conditions, present a reasonable representation of conditions expected in the project vicinity at the time the Proposed Project is implemented. The Proposed Project's potential traffic and transit impacts, and transportation-related air quality and noise impacts have been analyzed against this baseline rather than to existing land use and transportation conditions to avoid providing misleading information about impacts to the public and decision-makers.

Forecast-based analyses, such as the analyses prepared for Section 4.C, Population and Housing and Section 4.J, Recreation,[5] relate the Project-generated impacts to the existing conditions as compared to region-wide population and housing projections, rather than the sum of individual development projects to create an updated "baseline." The development projects listed for the baseline conditions are instead already included in forecasts of future growth in population that are the basis for the analyses of population-related impacts and Project-generated demand for various services such as recreational facilities, wastewater facilities, and water supply.

APPROACH TO CUMULATIVE IMPACT ANALYSIS

Cumulative impacts are two or more individual effects which, when considered together, are considerable or which compound or increase environmental impacts. The individual effects may be changes resulting from a single project or a number of separate projects. Cumulative impacts are impacts of the project in combination with other closely related past, present, and reasonably foreseeable probable future projects (CEQA Guidelines Section 15355(a)(b)). The following factors are considered to determine the level of cumulative analysis in this EIR:

[4] The T Third loop has been approved by the SFMTA Board of Directors and is in litigation. Analysis of the baseline conditions assumes that issues are resolved and the loop tracks will be constructed prior to construction of the Proposed Project.

[5] For the purposes of understanding acreage of open space available at a local level, baseline park and recreation facility projects under construction as of the date of NOP or are approved and are reasonably likely to be completed and occupied or in operation when the Proposed Project is expected to be implemented are considered in Section 4.J, Recreation.

- **Similar Environmental Impacts** – A relevant project contributes to effects on resources that are also affected by a proposed project. A relevant future project is defined as one that is "reasonably foreseeable," such as a proposed project for which an application has been filed with the approving agency or has approved funding.
- **Geographic Scope and Location** – A relevant project is located within the geographic area within which effects could combine. The geographic scope varies on a resource-by-resource basis. For example, the geographic scope for evaluating cumulative effects to air quality consists of the affected air basin.
- **Timing and Duration of Implementation** – Effects associated with activities for a relevant project (e.g., short-term construction or demolition, or long-term operations) would likely coincide in timing with the related effects of a proposed project.

CEQA Guidelines Section 15130(b)(1) sets forth two primary approaches to the analysis of cumulative impacts. The analysis can be based on (1) a list of past, present, and probable future projects producing related impacts that could combine with those of a proposed project, or (2) a summary of projections contained in a general plan or related planning document. For the purposes of this EIR, past projects are established within existing conditions and present projects approved or under construction but not yet fully operational as of NOP publication are discussed as a part of the baseline as established above. Any additional reasonably foreseeable future projects are considered further in cumulative impact analysis. Cumulative impact analysis in San Francisco generally employs both a list-based approach and a projections approach, depending on which approach best suits the individual resource topic being analyzed.

List-Based Approach

The cumulative analyses for those topics using a list-based approach (such as Noise, and Wind and Shadow) typically consider individual projects from a list of nearby future projects anticipated in the project area. The particular projects to be considered in the cumulative analysis for each topic varies by environmental topic, and is appropriately tailored to the particular environmental topic based on the potential for combined localized environmental impacts under the topic.

Presented below is a numbered list of reasonably foreseeable future projects. Generally, these are projects for which the Planning Department had an application on file as of publication of the NOP for the Proposed Project (May 6, 2015), but for which construction had not commenced as of NOP publication and/or projects that the Planning Department has otherwise determined are reasonably feasible. The number shown for each project listed below corresponds to its numbered location on Figure 4.A.1 on p. 4.A.7. Cumulative projects are shown on the figure in yellow.

Adjacent Pier 70 Foreseeable Future Projects

16. **20th Street Historic Core Building 40 and 117, Case No. 2016-000346ENV.** The project, proposed by the Port in 2015, would add the demolition of Buildings 40 and 117, totaling approximately 40,000 gsf, to the 20th Street Historic Core project.[6] Building 40 is located north of the Pier 70 Mixed-Use District project site, on the BAE Ship Repair facility site; Building 40 is proposed for demolition because it is located in the alignment of the proposed sidewalk along the frontage of the future Crane Cove Park. Building 117 is located on the Pier 70 Mixed-Use District project site, and abuts the southern boundary of the 20th Street Historic Core site; Building 117 is proposed for demolition as part of the 20th Street Historic Core project to allow the adjacent building (Building 116) located on the 20th Street Historic Core site to be rehabilitated to meet fire code. Both Buildings 40 and 117 are contributors to the Union Iron Works Historic District, individually eligible historic resources, and historic architectural resources under CEQA.

17. **SF Port BAE Lease Renewal, Case No. 2014.0713E.** The project would include renewal of the lease for BAE Ship Repair facility, which calls for the removal of 12 polychlorinated biphenyl electrical transformers and demolition of three buildings: Building 38 (Pipe and Electric Shop), Building 119 (Yard Washroom), and Building 121 (Drydock Office). In addition, the project would demolish Cranes Nos. 2 and 6. The project would involve routine maintenance and repairs approximately for a six-week duration once every 18 months over a seven-year period.

18. **Crane Cove Park, Case No. 2015-001314ENV.** The project includes construction of a new, approximately 9.8-acre shoreline park; an extension of 19th Street for park access and circulation; creation of Georgia Street, which would connect 20th Street to the 19th Street extension; relocation of the BAE Ship Repair site entrance from 20th Street to the terminus of the 19th Street extension and rerouting BAE Ship Repair truck traffic from 20th Street to the 19th Street extension; and street improvements along the eastern side of Illinois Street. Phase 1 of construction, underway in fall 2016, is anticipated to be completed January 2018. Phase 2 is estimated to occur between 2026 and 2028.

Foreseeable Future Projects within Approximately One-Half Mile of the Project Site

19. **Seawall Lot 337/Pier 48 (Mission Rock Development), Case No. 2013.0208E.** The Mission Rock development proposed on Seawall Lot 337 and Pier 48 would include a mixed-use development, including open space, commercial, residential, retail, and parking. The project would have approximately 3,600,000 gsf of development including 1,700,000 gsf of commercial use such as office space, 650 to 1,500 residential units, 150,000 to 250,000 gsf of retail or entertainment use, 700 accessory parking spaces, and a parking structure with 2,300 parking stalls. The project would involve the rehabilitation and reuse of Pier 48.

20. **Golden State Warriors Event Center and Mixed Use Development, Case No. 2014.1441E.** The project will involve construction of a multi-purpose event center

[6] The Port filed an application to demolish Building 117 on January 7, 2016, Case No. 2016-000346ENV. Any approval of the demolition of Building 117 will undergo appropriate environmental review, as required by CEQA. San Francisco Planning Department, Notification of Project Receiving Environmental Review, Illinois and 20th Streets/Pier 70 ("20th Street Historic Core"), Case No. 2016-000346ENV, September 8, 2016.

and a variety of mixed uses, including office, retail, open space, and structured parking on an approximately 11-acre site within the Mission Bay Redevelopment Plan Area. The proposed event center would host the Golden State Warriors basketball team during the annual National Basketball Association season (generally between October and April), as well as provide a year-round venue for a variety of other uses, including concerts, family shows, other sporting and cultural events, conferences, and conventions.

21. **Mission Bay Ferry Landing.** The project would include construction of a new ferry terminal near 16th Street and Terry Francois Boulevard. The terminal would provide capacity to berth two ferries simultaneously and potentially a nearby water taxi landing to provide regional access to the new UCSF Mission Bay hospital and campus, the Golden State Warriors arena, and the surrounding neighborhoods.
22. **Mariposa Pump Station Interim Repairs, Case No. 2014-002522ENV.** The project will replace an existing 12-inch-diameter sewer pipe with new 24-inch-diameter high-density polyethylene pipe within the same alignment of existing pipe, which runs east-west in the intersection of Terry Francois Boulevard, Mariposa Street, and Illinois Street, on the southern side of a large sub-surface concrete transport/storage sewer box. The project will also replace an existing manhole associated with the Mariposa Pump Station. Proposed modifications to an existing 20-inch force main and the Mariposa Pump Station also include a new 14-inch-diameter force main that will connect the pump station to the existing 20-inch force main.
23. **2420 Third Street, Case No. 2013.0673E.** The project would involve construction of a three-story with mezzanine mixed-use building with nine residential units and one ground-level commercial unit. The project would have no off-street parking and 12 bicycle parking spaces.
24. **645 Texas Street, Case No. 2012.1218E.** The project will involve demolition of two existing one and two-story structures and construction of a new four-story, 94-dwelling unit residential project over 64 off-street parking spaces. The proposed building will be 45 feet in height.
25. **790 Pennsylvania Avenue / 1395 22nd Street, Case No. 2011.0671E.** The project will include construction of a mixed-use building with 251 dwelling units, 29,780 gsf of Production, Distribution, Repair (PDR), and 205 off-street parking spaces.
26. **Potrero Hope SF Master Plan, Case No. 2010.0515E.** The project would involve replacement of 606 units of public housing with 1,400 to 1,700 units of mixed-income, mixed-tenure housing, including 1-to-1 replacement of public housing. The project would also include neighborhood-serving retail, community facilities, parks and open space, and a new street network.
27. **Kansas and Marin Streets Sewer Improvements.** The project would construct a new 18-by-24-by-15-foot transport and storage box to improve the sewer system conveyance from the Islais Creek watershed east of Highway 101 to the Islais Creek transport and storage box. Acquisition of new right-of-way would be required.
28. **595 Mariposa Street, Case No. 2014.1579ENV.** The project would involve building upon an existing surface parking lot and constructing a five-story residential building containing 20 dwelling units with a combination of private and common open space. Net new construction will be 16,757 gsf.

29. **2051 Third Street / 650 Illinois Street, Case No. 2010.0726E.** The project will involve demolition of existing structures and construction of a new six-story, 65.4-foot-tall building with 71,225 gsf of residential (97 dwellings) and 45 off-street parking spaces.
30. **2092 Third Street / 600 18th Street, Case No. 2014.0168E.** The project would involve demolition of the existing buildings and construction of a new six-story, 68-foot-tall (84-foot-tall with mechanical penthouse), 20,540 gsf building consisting of 18 dwelling units, 3,064 gsf of ground-floor retail, 13 parking spaces, and 18 bicycle parking spaces.
31. **2177 Third Street / 590 19th Street, Case No. 2013.0784E.** The project will involve demolition of the two existing industrial/office buildings on the 29,438 gsf subject lot and construction of two seven-story, 68-foot-tall residential buildings. The proposed new buildings will have approximately 154,509 gsf of space and will include 109 dwelling units, 3,143 gsf of ground-floor retail space, and 91 parking spaces. Parking will be provided at the basement level with access from 19th Street. The project will include common open space on a podium level above the parking level and on the roof, with pedestrian bridges connecting the two buildings at each level including the roof.
32. **2146 Third Street, Case No. 2013.1109E.** The project will involve demolition of an existing building and construction of a residential building approximately 12,000 gsf in size and containing seven residential units, ranging approximately 500 to 1,200 gsf in size. The proposed building will be six stories above a basement level and would extend approximately 55 feet in height. Below grade, the project would repurpose the existing basement level as a garage with four parking spaces.
33. **777 Tennessee Street, Case No. 2013.0312E.** The project will involve the demolition of an existing two-story light industrial building and construction of a new multi-family building. The proposed new building will include 59 dwelling units over below-grade parking with 49 off-street parking spaces.
34. **815-825 Tennessee Street, Case No. 2013.0220E.** The project will involve demolition of the two-story, 815-825 Tennessee Street buildings, retaining the brick façade on the corner of Tennessee and 19th streets (listed as a known historic resource in the Central Waterfront Survey), and construction of a new six-story apartment building with subterranean parking using conventional parking and parking stackers. The new building will be 58 feet tall and will have 69 dwelling units and 48-off street parking spaces.
35. **2230 Third Street, Case No. 2013.0531E.** The project would involve demolition of an existing commercial warehouse building and construction of a new seven-story mixed-use commercial and residential building with ground-floor commercial/residential flex space with 37 dwellings units and 23 parking spaces.
36. **2290 Third Street, Case No. 2005.0408E.** The project would involve demolition of an existing one-story commercial building and construction of a six-story, mixed-use building with 80 dwelling units, 80 off-street parking spaces, and approximately 14,000 gsf of ground-floor commercial use.
37. **888 Tennessee Street / 890 Tennessee Street, Case No. 2013.0975E.** The project would involve demolition of an existing two-story building and construction of two four-story residential-over-retail building containing 110 dwelling units, 3,800 gsf of retail use, and 10,073 gsf of courtyard open space. The new building would include a 35,752-gsf below-grade parking garage with 93 off-street parking spaces.

38. **901 Tennessee Street, Case No. 2013.0321E.** The project will include demolition of an existing one-story warehouse and construction of a new four-story residential building. The building will consist of four residential levels with 39 dwelling units over a basement level with mechanical spaces and 30 off-street parking spaces.

Projections Approach

The cumulative analysis in Section 4.C, Population and Housing, relies on population forecasts presented in Association of Bay Area Government (ABAG) Citywide growth in *Projections 2013*. ABAG forecasts account for San Francisco County Priority Development Area Projects that are currently in various stages of the entitlement process, construction, and occupation.[7] Cumulative analysis in Section 4.J, Recreation also relies on ABAG's *Projections 2013* to estimate population forecasts and demand on open space and recreation facilities, but includes list-based cumulative projects of proposed future public open space relevant to the local cumulative setting.

The cumulative analysis in Section 4.E, Transportation and Circulation, relies on a Citywide growth projection model provided by the San Francisco County Transportation Authority known as the SF-CHAMP travel demand model that projects reasonably foreseeable growth in 2040 based on known and forecast development. SF-CHAMP encompasses adopted area plans and many individual projects anticipated in the project vicinity. The projections model includes many of the larger, individual projects and applies a quantitative growth factor to account for other growth that may occur. Several area plans have identified the southeastern part of the San Francisco as the location for substantial future growth in housing and employment. Examples of projects that are accounted for in the growth forecast are described in the "List-Based Approach" as well as area plans such as the *Eastern Neighborhoods Plan*, *Western SOMA Community Plan*, *Mission Bay Redevelopment Plan*, and the *Central SOMA Plan*.

The *Eastern Neighborhoods Plan* includes four area plans: the *Central Waterfront Area Plan* (which includes the project site); the *Showplace Square / Potrero Area Plan* (west of the I-280 Freeway); the *Mission Area Plan* (west of Potrero Avenue); and the *East SOMA Area Plan* (north of Mission Bay). The rezoning under the *Eastern Neighborhoods Plan* would increase the potential for residential development on infill sites in the Eastern Neighborhoods over what would have been available under the previous zoning between approximately 7,400 units to 9,900 units. The rezoning would also result in a net increase of non-residential space (excluding PDR loss) by about 3,200,000 to 6,600,000 gsf and decrease the potential sites available for PDR growth compared to previous zoning.

[7] A Priority Development Area is an infill location of at least 100 acres served by transit that is designated for compact land development, along with investments in community improvements and infrastructure.

The 303-acre *Mission Bay Redevelopment Plan* area is north of the project site. The plan was adopted in 1998. It envisioned a mixed-use, transit-oriented neighborhood that would include 6,000 housing units, 4.4 million gsf of office/research/commercial space, 500,000 gsf of retail space, public parks, a school, a library, a fire station, and a UCSF research campus, generally bounded by Mariposa, Owens, and Illinois streets and Mission Bay Boulevard South. The Mission Bay UCSF campus within Mission Bay is also the subject of a *UCSF Long Range Development Plan*. Much of the *Mission Bay Redevelopment Plan* has been built out over the last 17 years since adoption of the plan.

The *Central SOMA Plan* (*Central Corridor Plan)* is a draft plan, originally published in 2013 and revised in August 2016, that envisions substantial transit-oriented growth south of Market Street bounded by Second Street in the east, Sixth Street in the west, Townsend Street to the south, and an irregular northern border that follows south of Folsom Street, south of Clementina Street between Fourth and Fifth streets, generally south of Natoma Street between Fifth and Sixth streets, and along the eastern boundary of Sixth Street north to Stevenson Street. This area includes portions of the Downtown and Mission Bay areas, and has access to diverse transit options. The plan calls for an increase in the growth potential from 8,225 residential units and 3,827,445 gsf of commercial use under existing zoning, to 11,715 residential units and 9,391145 gsf of commercial use, respectively. The *Central SOMA Plan* may be adopted as early as fall 2017.

B. LAND USE AND LAND USE PLANNING

Section 4.B, Land Use and Land Use Planning, examines the effects of the Proposed Project related to land use and land use planning. The Environmental Setting discussion describes the existing land uses within, and in the vicinity of, the project site. The Regulatory Framework discussion identifies applicable local, regional, and State plans and policies. The Impacts and Mitigation discussion identifies the significance criteria for land use and land use planning impacts, identifies the project features pertaining to the topic of Land Use and Land Use Planning, discusses the effects on existing land use that would occur if the Proposed Project were implemented, and discusses the cumulative land use effects of the Proposed Project in combination with other proposed, planned, or reasonably foreseeable future projects.

ENVIRONMENTAL SETTING

EXISTING PROJECT SITE

The project site occupies the southern portion of the Pier 70 area, as shown on Figure 2.1: Project Location, in Chapter 2, Project Description, p. 2.6. The 69-acre Pier 70 area is owned by the Port of San Francisco and encompasses an historic shipyard property along San Francisco's Central Waterfront. Most of Pier 70 (66 of the total 69 acres) is listed on the National Register of Historic Places as the Union Iron Works Historic District.[1] Portions of Pier 70 are still used today for ship repair operations, as well as for other industrial operations. The southwest corner of the project site (the 3.6-acre Hoedown Yard) is outside of the Pier 70 area and is owned by the Pacific Gas and Electricity Company (PG&E).

As discussed in Chapter 3, Plans and Policies, several local, regional, and State plans and policies are applicable to the project site or portions of it: the *San Francisco General Plan*; the *General Plan's Central Waterfront Area Plan*; the Port of San Francisco's *Waterfront Land Use Plan* (WLUP); the Port of San Francisco's *Pier 70 Preferred Master Plan*; the Association of Bay Area Governments' *Plan Bay Area*; the San Francisco Bay Conservation and Development Commission's *Bay Plan*; and the Public Trust Doctrine, administered by the State Lands Commission.

[1] United States Department of the Interior, National Park Service, National Register of Historic Places Registration Form, *Union Iron Works Historic District*, April 17, 2014.

The project site is zoned P (Public) and M-2 (Heavy Industrial), as shown on Figure 4.B.1: Existing Use Districts in the Project Vicinity.[2] As discussed in Chapter 3, Plans and Policies, on pp. 3.3-3.4, and shown on Figure 4.B.2: Existing Height and Bulk Districts in the Project Vicinity, the westernmost portion of the project site along Illinois Street is currently within a 65-X Height and Bulk District. The remainder of the project site (encompassing the 28-Acre Site and the eastern portion of the Hoedown Yard) is currently in a 40-X Height and Bulk District.

The project site currently contains approximately 351,600 gross square feet (gsf) of deteriorating buildings and facilities. Current uses on the site, all of which are temporary, include special event venues, artists' studios, self-storage facilities, warehouses, automobile storage lots, a parking lot, a soil recycling yard, and office spaces, as further described below.

28-Acre Site

The existing buildings on the 28-Acre Site are mostly low- to mid-rise (45- to 82-foot-tall) structures. (See Figure 4.B.3: Existing Building Heights in the Project Vicinity. See also Figure 2.2: Existing Site Plan, p. 2.11.) The Port has entered into interim leases for all of the useable buildings. Current uses of these buildings are as follows:

- Building 2, formerly Warehouse No. 2, a warehouse space, is leased by Paul's Stores for storage.
- Building 11, known as the Noonan Building and previously used as administration and design offices for the World War II shipbuilding yard, is currently leased as artists' studios and office space.
- The Building 12 complex and the paved lot to the west of the complex are licensed by Forest City from the Port (authorized by the Revocable License Agreement for Special Events) for community, arts and cultural, and special events. The complex, which was once used for producing ship hull plates from templates, is made up of five buildings: Building 12 (former Plate Shop No. 2), Building 15 (former Layout Yard), Building 16 (former Stress Relieving Building), Building 25 (former washroom and lockers), and Building 32 (former Template Warehouse).
- Building 19 is currently part of the BAE Systems lease premises and is used to store sandblasting grit. Under the BAE lease, Building 19 will be removed from the BAE leasehold as part of BAE's shipyard master plan, which is still under development.
- Building 21, an electrical substation and a former Risdon Iron and Locomotive Works and Pacific Rolling Mill Company building, is leased to the SOMArts Cultural Center for storage.

[2] Planning Code Section 210.4: M-2 Districts (Heavy Industrial). These Districts are the least restricted as to use and are located at the eastern edge of the City, separated from residential and commercial areas. The heavier industries are permitted, with fewer requirements as to screening and enclosure than in M-1 Districts, but many of these uses are permitted only as conditional uses or at a considerable distance from Residential Districts. Most of the land zoned M-2 is controlled by the Port of San Francisco.

PIER 70 MIXED-USE DISTRICT PROJECT

FIGURE 4.B.3: EXISTING BUILDING HEIGHTS IN THE PROJECT VICINITY

- Building 66, the former Welding Shed, and the paved parking lots located along and to the west of Building 2 are leased to Yellow Cab for taxi cab storage.
- Building 117, formerly a shipyard training center, is leased by the Delancey Street Foundation for storage.[3]

The Port has also leased certain portions of the land within the project site, including four former slipways, Slipways 5, 6, 7, and 8, on the 28-Acre Site, which have been filled and paved. Current uses are as follows:

- East of Building 19 is an asphalt area containing a privately owned radio antenna.
- Paved land in the northeast corner of the project site, the site of a former metal recycling facility, is subleased by Affordable Self Storage.
- West of Building 11 (the Noonan Building), SOMArts and Ernest Rivera lease paved land for storage.
- North of the Building 12 complex, Yellow Cab leases paved land to park taxicabs.
- Affordable Self Storage leases the southeastern corner of the slipways, which includes rows of self-storage lockers. Immediately north of Affordable Self Storage, Boas International leases an area for new automobile storage.

Illinois Parcels

20th/Illinois Parcel

The 20th/Illinois Parcel is owned by the Port. It is a paved area with asphalt lots used for paid parking, construction lay-down, and other temporary uses. In March 2015, the Port and FC Pier 70, LLC, a Forest City affiliate, entered into a lease for approximately 1 acre of paved industrial land on the southern portion of the 20th/Illinois Parcel for retail activities such as a beer garden, food trucks, and food carts and a variety of cultural, educational, and recreational activities, including special events. A remaining section of Irish Hill is located in the southeast corner of the 20th/Illinois Parcel.

Hoedown Yard

South of the 20th/Illinois Parcel, the PG&E-owned Hoedown Yard is used for soil recycling and construction equipment storage. A remaining section of Irish Hill is located in the northeast

[3] Building 117, totaling 30,940 gsf, is located on the project site; however, the Port has proposed to demolish this building separately and prior to approval of the Proposed Project to allow the adjacent building (Building 116) located on the 20th Street Historic Core site to be rehabilitated to meet fire code. The Port filed an application to demolish Building 117 on January 7, 2016, Case No. 2016-000346ENV. Any approval of the demolition of Building 117 will undergo appropriate environmental review, as required by CEQA.

corner of the Hoedown Yard. The Hoedown Yard is outside of the 69-acre Pier 70 boundary, but it is included in the project site and proposed Special Use District (SUD).

PROJECT VICINITY

As discussed in Section 4.A, Introduction to Chapter 4, on pp. 4.A.17-4.A.18, several area plans have identified the southeastern part of San Francisco as the location for substantial future growth in housing and employment. The *Eastern Neighborhoods Rezoning and Area Plan* (*Eastern Neighborhoods Area Plan*) includes four area plans: the *Central Waterfront Area Plan* (which includes the project site); the *Showplace Square / Potrero Area Plan* (west of the Interstate 280 [I-280] Freeway); the *Mission Area Plan* (west of Potrero Avenue); and the *East SOMA Area Plan* (north of Mission Bay). The rezoning under the *Eastern Neighborhoods Plan* has increased the residential potential of infill sites in the Eastern Neighborhoods over what would have been available under the previous zoning, thereby decreasing the potential sites available for production, distribution, and repair (PDR) uses. Other plans for southeastern San Francisco include the *Mission Bay Redevelopment Projects North and South,* the *UCSF Long Range Development Plan,* and the *Central Corridor Plan* (Central SOMA Plan).

The project site is located along San Francisco's Central Waterfront, just south of Mission Bay South and east of the Potrero Hill and Dogpatch neighborhoods. The Central Waterfront is predominantly devoted to light and heavy PDR uses, including maritime-related uses, construction, transportation, warehousing/distribution, and printing and publishing.

To the North of the Project Site

Adjacent Land Uses

Consistent with the existing zoning within most of the project site, adjacent areas to the north of the project site on Pier 70 are zoned M-2 (Heavy Industrial). Consistent with the height and bulk districts within the project site, the areas immediately to the north of the project site are in a 65-X Height and Bulk District along Illinois Street, and in a 40-X Height and Bulk District eastward to the Bay.

The adjacent 7.6-acre Pier 70 20th Street Historic Core is north of the project site and contains a concentration of the most historically and architecturally significant contributors to the Union Iron Works National Register Historic District. The Historic Core contains about 270,000 square feet of largely vacant industrial and office space currently undergoing rehabilitation for adaptive reuse. The portion of the Historic Core to the south of 20th Street is surrounded by the project site to the east, south, and west and includes five buildings: Buildings 113-114, the Union Iron Works Machine Shop buildings along the south side of 20th Street; Buildings 115-116, the Foundry and Warehouse buildings; and Building 14, the Heavy Warehouse building. The portion of the

Historic Core along the north side of 20th Street includes three buildings. From west to east, they are Building 101, the Bethlehem Steel Administration building at the northeast corner of Illinois Street and 20th Street; Building 102, the Powerhouse building; and Building 104, the Union Iron Works Administration building.

20TH STREET HISTORIC CORE PROJECT

The 20th Street Historic Core Project[4] includes repair and rehabilitation of eight buildings in the Pier 70 Historic Core (Buildings 101, 102, 104, 112, 113, 115, 116, and 14) to satisfy current seismic, structural, and code requirements; reuse of the buildings as primarily light industrial and commercial uses, with one residential unit;[5] and addition of approximately 69,000 gsf of new building space. The project also includes an outdoor publicly accessible plaza and roadway, sidewalk, and parking lot improvements. In total, the project would include approximately 334,000 gsf of existing and new building space. The 20th Street Historic Core Project also includes demolition of Buildings 117 and 40.

SITE OF THE FUTURE CRANE COVE PARK

Farther north of the Historic Core is the site of the future Crane Cove Park, which is also part of Pier 70 and Port of San Francisco property.[6] Construction of the approximately 9-acre park is underway. The park would include lawn areas and shoreline access, and would incorporate the historic Slipway 4 and two historic cranes. That project would also include extension of 19th Street for park access and circulation; creation of Georgia Street, which would connect 20th Street to the 19th Street extension; relocation of the BAE Systems Ship Repair Facility entrance from 20th Street to the terminus of the 19th Street extension and rerouting of BAE Shipyard truck traffic from 20th Street to the 19th Street extension; and street improvements along the eastern side of Illinois Street.

BAE SHIP REPAIR FACILITY

To the north of the 20th Street alignment, and adjacent to the eastern portion of the project site (the 28-Acre Site), is the BAE Systems Ship Repair facility, a 17-acre site that BAE leases from the Port of San Francisco. The facility includes support buildings and lay-down areas north on

[4] San Francisco Planning Department, Certificate of Determination, Exemption from Environmental Review, 400-600 20th Street, Pier 70 ("20th Street Historic Core"), Case No. 2013.1168E, May 7, 2014.

[5] See Table 4.F.4: Sensitive Receptors in the Project Vicinity, in Section 4.F, Noise, on p. 4.F.15. Address: 628 20th Street.

[6] San Francisco Planning Department, Certificate of Determination, Exemption from Environmental Review, Crane Cove Park, Case No. 2015.001314ENV, October 5, 2015.

land and piers and floating drydocks farther north within the Bay. BAE's lease renewal,[7] approved by the Port Commission on March 24, 2015,[8] includes removal of 12 PCB electrical transformers and demolition of three buildings: Building 38 (Pipe and Electric Shop), Building 119 (Yard Washroom), and Building 121 (Drydock Office). In addition, the project would demolish Crane Nos. 2 and 6.

Mission Bay

Farther north is the 303-acre *Mission Bay Redevelopment Plan* area. The plan was adopted in 1998. It envisioned a mixed-use, transit-oriented neighborhood that would include about 6,000 housing units, 4.4 million square feet of office/research/commercial space, about 500,000 square feet of retail space, public parks, a school, a library, a fire station, and a University of San Francisco (UCSF) research campus. The Mission Bay UCSF campus within Mission Bay is also the subject of the *UCSF Long Range Development Plan*. Much of the *Mission Bay Redevelopment Plan* area has been built out over the last 17 years since adoption of the plan. UCSF Medical Center Hospital / Mission Bay Hall has been constructed and is in operation. The Golden State Warriors Event Center and Mixed Use Development Project, to be located at Third and 16th streets, was approved in December 2015.

To the West of the Project Site

As discussed in Chapter 3, Plans and Policies, on p. 3.2, the project site and neighboring Dogpatch neighborhood are within the area covered by the *Central Waterfront Area Plan*, one of the four plan areas of the *Eastern Neighborhoods Area Plan*, which was adopted in 2009. The Eastern Neighborhoods contain much of the City's industrially zoned land and have been transitioning to other uses over the past several decades. One of the goals of the Eastern Neighborhoods planning effort was to find a balance between growth of housing and office uses and preservation of PDR facilities.[9] As discussed in Section 4.A, Introduction to Chapter 4, a number of recent, primarily residential, projects have been constructed (see "Approach to Baseline Setting," on pp. 4.A.5-4.A.12) and others are proposed (see "Approach to Cumulative Impact Analysis," on pp. 4.A.12-4.A.18) in the Dogpatch neighborhood to the west in keeping with implementation of the *Central Waterfront Area Plan*.

---

[7] San Francisco Planning Department, Certificate of Determination, Exemption from Environmental Review, SF Port – Pier 70 Area – BAE Lease Renewal, Case No. 2014.0713, March 2, 2015.

[8] San Francisco Port Commission, Resolution 15-11, adopted March 24, 2015.

[9] The *Central Waterfront Area Plan* did not revise any zoning and height controls for the Pier 70 area, deferring to the Port's Pier 70 area planning process which was ongoing when the *Central Waterfront Area Plan* was in preparation.

Along the West Side of Illinois Street

To the west of the project site, across Illinois Street, is the American Industrial Center, a four-story, 84- to 92-foot-tall complex that occupies two entire blocks bounded by Illinois Street, 20th Street to the north, 23rd Street to the south, and Third Street to the east. The American Industrial Center complex is zoned PDR-1-G (Production, Distribution and Repair-1-General).[10] The blocks along the west side of Illinois Street and the east side of Third Street are in a 68-X Height and Bulk District, except for an area at 23rd Street, which is in an 85-X Height and Bulk District.

The facility comprises about 900,000 square feet of commercial, industrial, and related supporting uses. The American Industrial Center currently leases space to approximately 300 tenants engaged in various commercial and industrial activities.[11] The facility houses breweries, commercial kitchens and bakeries, garment manufacturing businesses, warehouses, and distribution centers. At the ground floor, recessed off-street loading bays line the west side of Illinois Street across from the project site.

The area north of 20th Street and west of Illinois Street is zoned UMU (Urban Mixed Use).[12] At the northwest corner of 20th and Illinois streets is a two-story commercial building at 600 20th Street. Farther west along 20th Street is a recently completed project at 616-620 20th Street, a five-story, 16-unit residential building. Farther north along the west side of Illinois Street, at 810-820 Illinois Street (a.k.a. 2235 Third Street), is a recently constructed, approximately 141-unit residential building with ground-floor retail. Farther north, at the southwest corner of the 19th and Illinois streets, is a three-story commercial building built in 1919.

---

[10] Planning Code Section 210.10: PDR-1-G Districts (Production, Distribution and Repair-1-General). The intention of this district is to retain and encourage existing production, distribution, and repair activities and promote new business formation. Thus, this district prohibits residential and office uses and limits retail and institutional uses. Additionally, this district allows for more intensive production, distribution, and repair activities than PDR-1-B and PDR-1-D but less intensive than PDR-2. Generally, all other uses are permitted. In considering any new land use not contemplated in this district, the Zoning Administrator shall take into account the intent of this district as expressed in this section and in the *General Plan*.

[11] Charles J. Higley, Farrella Braun+Martel, representing American Industrial Center, Letter Re: Pier 70 Mixed Use District – EIR Scoping Comments, June 5, 2015.

[12] Planning Code Section 853: UMU Districts (Urban Mixed Use). This district is intended to promote a vibrant mixture of uses while maintaining the characteristics of this formerly industrially zoned area. It is also intended to serve as a buffer between residential districts and PDR districts in the Eastern Neighborhoods. Within the UMU, allowed uses include production, distribution, and repair uses such as light manufacturing, home and business services, arts activities, warehouse, and wholesaling. Additional permitted uses include retail, educational facilities, and nighttime entertainment. Housing is also permitted, but is subject to higher affordability requirements. Family-sized dwelling units are encouraged. Within the UMU, office uses are restricted to the upper floors of multiple-story buildings.

West of Third Street

Farther west, the area west of Third Street includes a mixture of zoning districts reflecting its mixed-use character, including UMU (Urban Mixed Use), PDR-1-G (Production, Distribution and Repair-1-General), P (Public), NCT-2 (Neighborhood Commercial Transit-2),[13] RH-2 (Residential House, Two Family),[14] and RH-3 (Residential House, Three Family).[15] Two parks are in this area: Esprit Park, three blocks to the west of the project site along the north side of 20th Street at Minnesota Street, and Woods Yard Park, three blocks to the west of the project site along the south side of 22nd Street at Minnesota Street.

The west side of Third Street is in a 68-X Height and Bulk District except for a segment south of 20th Street, which is in a 45-X Height and Bulk District. Areas farther west, along Tennessee and Minnesota streets, are within 40-X, 45-C, 50-X, 58-X, and 68-X Height and Bulk Districts.

The area includes a wide variety of uses and a finely mixed development pattern. Parcel sizes are smaller than the American Industrial Center blocks and areas east of Illinois Street. Uses include printing and publishing, graphic design, building materials sales, light warehousing, wholesale, import/export, and auto repair. There is a small cluster of older houses on Tennessee Street. There are also several loft-style residential buildings, most of them new construction and others in converted industrial buildings. The Dogpatch neighborhood is a primarily residential enclave dating to the late 1800s. There are a number of mixed-use buildings with ground-floor commercial space on 22nd Street, which serves as the neighborhood's commercial spine. Third

[13] Planning Code Section 734: NC-2 Districts (Neighborhood Commercial Transit-2). NCT-2 Districts are transit-oriented mixed-use neighborhoods with small-scale commercial uses near transit services. The NCT-2 Districts are mixed-use districts that support neighborhood-serving commercial uses on lower floors and housing above. These districts are well-served by public transit and aim to maximize residential and commercial opportunities on or near major transit services. NCT-2 Districts are intended to provide convenience goods and services to the surrounding neighborhoods as well as limited comparison shopping goods for a wider market. The range of comparison goods and services offered is varied and often includes specialty retail stores, restaurants, and neighborhood-serving offices.

[14] Planning Code Section 209.1: RH-2 Districts (Residential House, Two Family). These districts are devoted to one-family and two-family houses, with the latter commonly consisting of two large flats, one occupied by the owner and the other available for rental. Structures are finely scaled and usually do not exceed 25 feet in width or 40 feet in height. Building styles are often more varied than in single-family areas, but certain streets and tracts are quite uniform. Considerable ground-level open space is available, and it frequently is private for each unit. The districts may have easy access to shopping facilities and transit lines. In some cases, Group Housing and institutions are found in these areas, although nonresidential uses tend to be quite limited.

[15] Planning Code Section 209.1: RH-3 Districts (Residential House, Three Family). These districts have many similarities to RH-2 Districts, but structures with three units are common in addition to one-family and two-family houses. The predominant form is large flats rather than apartments, with lots 25 feet wide, a fine or moderate scale, and separate entrances for each unit. Building styles tend to be varied but complementary to one another. Outdoor space is available at ground level, and also on decks and balconies for individual units. Nonresidential uses are more common in these areas than in RH-2 Districts.

Street between 22nd and 23rd streets also has a concentration of residential and small-scale retail/entertainment uses.

Potrero Hill

I-280, which runs north-south about 0.25 mile west of the project site, and its on- and off-ramps create a physical and visual barrier separating the mixed-use Dogpatch neighborhood from the residential Potrero Hill neighborhood farther to the west. Potrero Hill is another of the four plan areas of the *Eastern Neighborhoods Area Plan.* The blocks west of the freeway are zoned primarily RH-2 (Residential House, Two Family) District. They also include areas zoned RH-3 (Residential House, Three Family) District, NC-2 (Neighborhood Commercial-2) Districts along 18th Street and 20th Street, MUR (Mixed Use Residential) District, and P (Public) District. The area is in a 40-X Height and Bulk District.

To the South of the Project Site

Consistent with the existing zoning within most of the project site, adjacent areas to the south of the project site are zoned M-2 (Heavy Industrial) and are in a 65-X Height and Bulk District along Illinois Street, and in a 40-X Height and Bulk District eastward to the Bay.

The area adjacent to Pier 70 is occupied by PG&E's Potrero Substation (a functioning high-voltage transmission substation serving San Francisco), the decommissioned Potrero Power Plant, and the TransBay Cable converter station, which connects the Pittsburg-San Francisco 400-megawatt direct-current, underwater electric transmission cable to PG&E's electricity transmission grid by way of the Potrero Substation, and industrial lands farther south.

REGULATORY FRAMEWORK

Chapter 3, Plans and Policies, discusses the local, regional, and State land use regulatory framework applicable to the Proposed Project under the following plans and policies.

SAN FRANCISCO GENERAL PLAN

The *San Francisco General Plan* (*General Plan*) is the embodiment of the City's vision for the future of San Francisco. It provides general policies and objectives to guide land use decisions and contains some policies that relate to physical environmental issues. The *General Plan* comprises a series of ten elements, each of which pertains to a particular topic that applies Citywide: Air Quality, Arts, Commerce and Industry, Community Facilities, Community Safety, Environmental Protection, Housing, Recreation and Open Space, Transportation, and Urban Design.

The *General Plan* also includes area plans, each of which focuses on a particular area of the City, including the *Central Waterfront Plan*, in which the project site is located. Except for the western portion of the project site along the east side of Illinois Street, which was rezoned from 40-X to 65-X Height and Bulk District, the *Central Waterfront Plan* did not revise zoning and height controls for the majority of the Pier 70 area, deferring to the Port's Pier 70 area planning process which was ongoing when the *Central Waterfront Area Plan* was in preparation.

SAN FRANCISCO PLANNING CODE

Use Districts

As shown on Figure 4.B.1, p. 4.B.3, the project site is zoned P (Public) in the eastern portion of the Hoedown Yard within the Illinois Parcels, and the rest of the project site is zoned M-2 (Heavy Industrial). Most of the proposed land uses within the project site (residential, commercial, and retail/arts/light-industrial [RALI][16]) are inconsistent with the existing P (Public) and/or the M-2 (Heavy Industrial) zoning on the project site.

To implement the Proposed Project, the Zoning Maps would be amended to provide changes from the current zoning P (Public) and M-2 (Heavy Industrial) districts to the proposed SUD zoning. The proposed Pier 70 SUD would establish development controls for the project site through incorporation of the design standards and guidelines set forth in the proposed *Pier 70 SUD Design for Development* document which is included as part of the Proposed Project.

Height and Bulk Districts

As shown in Figure 4.B.2, p. 4.B.4, within the Illinois Parcels, the westernmost portion of the project site is currently within a 65-X Height and Bulk District. The remainder of the project site (encompassing the 28-Acre Site and the eastern portion of the Hoedown Yard within the Illinois Parcels) is currently within a 40-X Height and Bulk District. Bulk controls (i.e., limits on horizontal building dimensions) do not apply within an "X" Bulk District.

On June 3, 2014, San Francisco voters approved Proposition B, a ballot measure which requires Citywide voter approval for any future construction projects on Port-owned San Francisco waterfront property that exceed height limits in effect on January 1, 2014. Subsequently, on November 4, 2014, the San Francisco electorate approved Proposition F, a ballot measure that authorized a height increase at the 28-Acre Site from the existing 40 feet to 90 feet except for a 100-foot-wide portion adjacent to the shoreline that would remain at 40 feet. Proposition F conditioned the proposed height increase on completion of an EIR and approval of a development

[16] The Proposed Project would include market-rate and affordable residential uses, commercial use, retail, restaurant, and arts/light-industrial (which are collectively referred to for the purposes of this EIR as RALI uses).

plan for the 28-Acre Site by the Port Commission and Board of Supervisors. Proposition F did not address the Illinois Parcels. The area along Illinois Street had already been rezoned from 40-X to 65-X Height and Bulk District under the *Central Waterfront Plan*.

Building heights under the Proposed Project are inconsistent with the existing height limits on the project site. Upon certification of this EIR and the approval of a development plan for the 28-Acre Site by the Port Commission and Board of Supervisors, the legislative amendment to the existing Planning Code height and bulk limits within the project site adopted under Proposition F would become effective, and the existing 40-X Height and Bulk District within the inland portions of the 28-Acre Site would become 90-X (the existing height and bulk designation along a 100-foot-wide area along the shoreline would remain at 40-X). (See Figure 2.4: Existing and Proposed Height and Bulk Districts, in Chapter 2, Project Description, p. 2.16.) The existing 40-X Height and Bulk District of the eastern portion of the Hoedown Yard within the Illinois Parcels would be changed from 40-X to 65-X (the existing 65-X height and bulk designation within the rest of the Illinois Parcels would remain at 65-X).

THE ACCOUNTABLE PLANNING INITIATIVE

In November 1986, the voters of San Francisco approved Proposition M, the Accountable Planning Initiative, which added Section 101.1 to the Planning Code and established eight Priority Policies. Prior to issuing a permit for any demolition, conversion, or change of use, and prior to taking any action that requires a finding of consistency with the *General Plan*, the City is required to find that such project or action would be consistent with the following Priority Policies: (1) preservation and enhancement of neighborhood-serving retail uses and future opportunities for resident employment in and ownership of such businesses; (2) conservation and protection of existing housing and neighborhood character to preserve the cultural and economic diversity of neighborhoods; (3) preservation and enhancement of affordable housing; (4) discouragement of commuter automobiles that impede Muni transit service or that overburden streets or neighborhood parking; (5) protection of industrial and service land uses from commercial office development and enhancement of resident employment and business ownership; (6) maximization of earthquake preparedness; (7) preservation of landmarks and historic buildings; and (8) protection of parks and open space and their access to sunlight and vistas.

PORT OF SAN FRANCISCO'S *WATERFRONT LAND USE PLAN*

As discussed in Chapter 3, Plans and Policies, on pp. 3.5-3.7, most of the project site (the 28-Acre Site and the 20th/Illinois Parcel) is owned by the Port of San Francisco and therefore is subject to

the Port of San Francisco's WLUP.[17] The WLUP was initially adopted by the Port Commission in 1997, revised in 2009, defining acceptable uses, policies, and land use information applicable to all properties under the Commission's jurisdiction. To the extent that the Proposed Project could be inconsistent with certain provisions of the existing WLUP, in order to approve the Proposed Project, the San Francisco Port Commission would need to approve amendments to the WLUP as necessary to ensure consistency between the Proposed Project and the amended WLUP. In 2014-2015, Port staff completed the comprehensive WLUP *1997-2014 Review Report* and have developed a public process for targeted updates to the WLUP. Draft updates to the WLUP are anticipated in the spring of 2017.

SAN FRANCISCO BAY CONSERVATION AND DEVELOPMENT COMMISSION

As discussed in Chapter 3, Plans and Policies, on p. 3.11, the San Francisco Bay Conservation and Development Commission (BCDC) has permit jurisdiction over areas of San Francisco Bay subject to tidal action up to the mean high tide line and including all sloughs, tidelands, submerged lands, and marshlands lying between the mean high tide and 5 feet above mean sea level, and the land lying between the Bay shoreline and a line drawn parallel to, and 100 feet from, the Bay shoreline, known as the 100-foot shoreline band. Under the McAteer-Petris Act, BCDC has permit authority for the placement of fill, extraction of materials, or substantial changes in use of land, water, or structures within its jurisdiction, and to enforce policies aimed at protecting the Bay and its shoreline, as well as maximizing feasible public access to the Bay. The Proposed Project would require approval of permits for activities within BCDC's jurisdiction within the Bay and along the Bay shoreline.

STATE LANDS COMMISSION, PUBLIC TRUST EXCHANGE

As discussed Chapter 3, Plans and Policies, pp. 3.16-3.17, certain formerly tidal and submerged portions of the 28-Acre Site are subject to the Public Trust Doctrine, a Common Law legal doctrine that governs the use of tidal and submerged lands, including former tidal and submerged lands that have been filled. The proposed placement of certain non-Public Trust (non-water-oriented) uses on land within the 28-Acre Site that is subject to the Public Trust would be inconsistent, on its face, with the Public Trust Doctrine. The Public Trust Doctrine provides that filled and unfilled tide and submerged lands are to be held in trust by the State for the benefit of the people of California. Pursuant to the Burton Act (Chapter 1333 of the Statutes of 1968), the Port of San Francisco has been granted administrative control over the public trust lands in the harbor of San Francisco for purposes of commerce, navigation, and fisheries. In order to resolve the Public Trust status of portions of Pier 70, the Port has obtained State legislation (Assembly

[17] City and County of San Francisco, Port of San Francisco, *Waterfront Land Use Plan*, Map of the Southern Waterfront Subarea, Revised Version, 2009, p. 163A.

Bill [AB] 418) that authorizes the State Lands Commission to approve a Public Trust exchange that would free some land from the Public Trust to allow non-trust uses within those areas, while committing other land to the Public Trust. The Proposed Project would require State Lands Commission approval of a Public Trust Exchange Agreement pursuant to California Public Resources Code Section 6307.

The State Lands Commission may not approve the exchange of the trust lands unless it finds all of the following:[18]

1. The portions of the trust lands or interests in lands to be exchanged out of the trust have been filled and reclaimed, are cut off from access to the waters of the San Francisco Bay, and are no longer in fact tidelands or navigable waterways, are relatively useless for Public Trust purposes, and constitute a relatively small portion of the granted lands within the City.
2. The lands or interests in lands to be impressed with the trust have a monetary value equal to or greater than the monetary value of the lands or interests in lands to be exchanged out of the trust. If the lands or interests in lands to be exchanged into the trust are insufficient to meet the requirement of equal or greater monetary value, the commission may consider a deposit of funds into the Land Bank Fund established pursuant to Section 8610 of the Public Resources Code to be held solely for acquisition of property, in an amount at least equal to the difference in value, for purposes of making the finding required by this paragraph.
3. No substantial interference with trust uses and purposes, including public rights of navigation and fishing, will ensue by virtue of the exchange.
4. The lands or interests in lands impressed with the trust will provide a significant benefit to the trust and are useful for the particular trust purposes authorized by this act.
5. The configuration of trust lands within the Pier 70 area, upon completion of the exchange, consists solely of lands suitable to be impressed with the trust.
6. The appropriate State agencies have approved an environmental site investigation and risk assessment of the Pier 70 area, and agree on subsequent actions and development standards needed to ensure appropriate management of potential risks through development of a risk management plan, a remedial action plan, or comparable regulatory documents specific to the conditions at the Pier 70 area; the Port has provided adequate financial assurances to ensure performance of any affirmative remedial actions required by any such plan or comparable regulatory document; and sufficient liability measures that protect the State will be in place upon completion of the exchange.
7. The final layout of streets in the Pier 70 area shall provide access to the trust lands and be consistent with the beneficial use of the trust lands.

[18] Assembly Bill 418, An act relating to tideland and submerged lands, Section 3, Approved by the Governor, October 05, 2011. Available online at http://leginfo.legislature.ca.gov/faces/billNavClient.xhtml?bill_id=201120120AB418. Accessed April 19, 2016.

8. Streets and other transportation facilities located on trust lands shall be designed to be compatible with the trust and to serve primarily trust purposes of access to shoreline improvements and shoreline circulation rather than serving non-trust purposes.
9. The San Francisco Port Commission and the City's Board of Supervisors have approved the exchange after at least one public hearing and have found, based on supporting documentation, that the lands or interests in lands impressed with the trust will provide a significant benefit to the trust and are useful for the trust purposes authorized by this act.
10. Any surveys or legal descriptions required for the parcels in conjunction with the exchange shall be approved by the commission or its executive officer.
11. The exchange otherwise complies with the requirements of this act.
12. The exchange is consistent with and furthers the purpose of the public trust, the Burton Act trust, and this act.
13. The exchange is otherwise in the best interest of the Statewide public.

IMPACTS AND MITIGATION MEASURES

SIGNIFICANCE THRESHOLDS

The thresholds for determining the significance of impacts in this analysis are consistent with the environmental checklist in Appendix G of the State CEQA Guidelines, which has been modified by the San Francisco Planning Department. For the purpose of this analysis, the following applicable thresholds were used to determine whether implementing the Proposed Project would result in a significant impact on population and housing. Implementation of the Proposed Project would have a significant effect on population and housing if the project would:

B.1 Physically divide an established community;

B.2 Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to, the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect.

APPROACH TO ANALYSIS

A project that involves a change or intensification in land use would not be considered to have a significant impact related to the topic of Land Use and Land Use Planning unless the project would physically divide an established community.

Conflicts with existing plans and policies do not, in themselves, indicate a significant environmental effect related to the topic of Land Use and Land Use Planning within the meaning of CEQA, unless the project substantially conflicts with a land use plan/policy that was adopted for the purpose of avoiding or mitigating an environmental effect. The focus of the analysis under Impact LU-2 is on the Proposed Project's potential substantial conflicts with applicable

Land Use plans and policies. It does not present a comprehensive analysis of project conformity with applicable State, regional, and local plans and policies. Such analyses would be undertaken independent of the CEQA process, as part of the decision-makers' action to approve, modify, or disapprove the project or aspects thereof.

To the extent that physical environmental impacts may result from such conflicts, the EIR discloses and analyzes these physical impacts under the specific environmental topic sections in EIR Chapter 4, Environmental Setting and Impacts. Impacts resulting from a change or intensification of population and employment on the project site are discussed in Section 4.C, Population and Housing, and are also embodied in environmental impacts related to the capacity of existing facilities and services to adequately serve the area, such as those described in Transportation and Circulation, Recreation, Utilities and Service Systems, and Public Services. Physical impacts of construction and/or operation of the Proposed Project on the environment are embodied in physical impacts related to environmental topics such as Cultural Resources, Noise, Air Quality, Greenhouse Gas Emissions, Wind and Shadow, Hydrology and Water Quality, and Hazards and Hazardous Materials.

Project-level and cumulative land use impacts of the Proposed Project, for both the Maximum Residential Scenario and Maximum Commercial Scenario, are addressed in relation to the significance criteria.

PROJECT FEATURES

The Proposed Project would amend the *General Plan* and Planning Code, adding a new Pier 70 SUD. The Pier 70 SUD would establish land use zoning controls for the project site, and incorporate the design standards and guidelines in the proposed *Pier 70 SUD Design for Development* document. The proposed *Pier 70 SUD Design for Development* document sets forth the underlying vision and principles for development of the project site, and establishes standards and design guidelines to implement the intended vision and principles.

Mixed-Use Land Use Program

Development under the proposed SUD is intended to provide a balanced mixture of uses to support revitalization of the project site and reflect market conditions in the project site vicinity. To cover a full range of potential land uses that could be developed under the proposed SUD, this EIR analyzes both a Maximum Residential Scenario, which reflects the most-intensive residential use of the project site, and a Maximum Commercial Scenario, which reflects the most-intensive commercial use of the project site. The two scenarios bracket specific maximum ranges of uses that could be developed under the proposed SUD.

Maximum Residential Scenario

Development on the 28-Acre Site under the Maximum Residential Scenario would include a maximum of up to 3,410,830 gsf in new and renovated buildings. (See Table 2.3: Project Summary Table – Maximum Residential Scenario, and Figure 2.7: Proposed Land Use Plan – Maximum Residential Scenario, in Chapter 2, Project Description, p. 2.29 and p. 2.30, respectively.) Under this scenario, there would be up to 2,150 residential units totaling about 1,870,000 gsf, as well as approximately 1,095,650 gsf of commercial space and 445,180 gsf of RALI space (241,655 gsf of retail space; 60,415 gsf of restaurant space; and 143,110 gsf of arts/light-industrial space), in new and rehabilitated buildings. The mixed-use land use program includes two parcels, Parcels C1 and C2, that may be developed for parking, residential, or commercial use depending on future demand for parking and future travel patterns.

Development on the Illinois Parcels under the Maximum Residential Scenario would include a maximum of up to 801,400 gsf in newly constructed buildings (see Table 2.3). Under this scenario, there would be up to 875 residential units totaling about 760,000 gsf, as well as approximately 6,600 gsf of commercial area and approximately 34,800 gsf of retail/restaurant space (27,840 gsf of retail space and 6,960 gsf of restaurant space) in new buildings.

In total, there would be 3,025 total residential units, 83.9 percent more than in the Maximum Commercial Scenario. There would be 42.4 percent less of the commercial and RALI space.

Maximum Commercial Scenario

Development on the 28-Acre Site under the Maximum Commercial Scenario would include a maximum of up to about 3,422,265 gsf in new and renovated buildings. (See Table 2.4: Project Summary Table – Maximum Commercial Scenario, p. 2.31, and Figure 2.8: Proposed Land Use Plan – Maximum Commercial Scenario, p. 2.32.) Under this scenario, there would be up to 1,100 residential units totaling about 957,000 gsf, as well as approximately 2,024,050 gsf of commercial area, and 441,215 gsf of RALI space (238,485 gsf of retail space, 59,620 gsf of restaurant space, and 143,110 gsf of arts/light-industrial/PDR space), in new and rehabilitated buildings. The mixed-use land use program contemplates two parcels, Parcels C1 and C2, which may be developed for parking, residential, or commercial use depending on future demand for parking and future travel patterns.

Development on the Illinois Parcels under the Maximum Commercial Scenario would include a maximum of about 757,035 gsf in new buildings (see Table 2.4). Under this scenario, there would be up to 545 residential units totaling about 473,000 gsf, as well as approximately 238,300 gsf of commercial area and approximately 45,735 gsf of retail/restaurant space (36,590 gsf of retail space and 9,145 gsf of restaurant space) in new buildings.

In total, there would be 2,749,300 gsf of commercial and RALI space, 73.8 percent more than in the Maximum Residential Scenario. There would be 45.6 percent fewer residential units.

The use program totals of both scenarios are summarized in Table 4.B.1: Summary Totals under Maximum Residential and Maximum Commercial Scenarios, below.

Table 4.B.1: Summary Totals under Maximum Residential and Maximum Commercial Scenarios

Use	Maximum Residential Scenario Totals	Maximum Commercial Scenario Totals	Difference: Max. Res. Minus Max. Com.
Residential	2,630,000 gsf	1,430,000 gsf	1,200,000 gsf
No. of units	3,025 units	1,645 units	1,380 units
Commercial	1,102,250 gsf	2,262,350 gsf	(1,160,100) gsf
RALI	479,980 gsf	486,950 gsf	(6,970) gsf
Retail	269,495 gsf	275,075 gsf	(5,580) gsf
Restaurant	67,375 gsf	68,765 gsf	(1,390) gsf
Arts/Light-Industrial	143,110 gsf	143,110 gsf	0
Total	**4,212,230 gsf**	**4,179,300 gsf**	**(32,930) gsf**
Parking			
Off-Street	3,370 spaces	3,496 spaces	0
On-Street	285 spaces	285 spaces	0
Open Space	9 acres	9 acres	0

Sources: Forest City; Turnstone/SWCA

General Plan and Planning Code Amendments

The Proposed Project would amend the *General Plan* and Planning Code, adding a new Pier 70 SUD, which would establish land use zoning controls for the project site.

The Zoning Maps would be amended to show changes from the current zoning (M-2 [Heavy Industrial] and P [Public]) to the proposed SUD zoning.

Height limits on the 28-Acre Site would be increased to 90 feet, except for a 100-foot-wide portion adjacent to the shoreline that would remain at 40 feet, as authorized by Proposition F (November 2014). The Planning Code text and height map amendments would also modify the existing height limits on an eastern portion of the Hoedown Yard from 40 feet to 65 feet. Height

limits are further restricted through the design standards established in the proposed *Pier 70 SUD Design for Development*.

Proposed Design Standards

Design Standards for New Construction

Proposed Design Standards are included as part of the proposed *Pier 70 SUD Design for Development.* Key standards (e.g., height, use, parking) will be incorporated into the proposed SUD. Future vertical development at the project site, whether constructed by Forest City, Forest City affiliates, or third-party developers selected by the Port and Forest City, would be bound by the Design Standards to inform building designs, subject to variants to the extent permitted under the SUD. The Port and Planning Department would use the proposed Design Standards to evaluate these future development proposals within the project site for compatibility with the SUD and the Union Iron Works Historic District.

Pedestrian Passageway Option

The Proposed Project would include a pedestrian passageway option under the Maximum Commercial Scenario. A Pedestrian Passageway Option is not applicable under the Maximum Residential Scenario since mid-block pedestrian passageways are not planned under that scenario. Both the Maximum Commercial Scenario and the Pedestrian Passageway Option would include a 40-foot-wide mid-block pedestrian passage that differentiates the southern parcels' (Parcels HDY1 and HDY2, Parcels F and G, and Parcels H1 and H2) building massing. However, the Pedestrian Passageway Option would require that an above-ground building connection over the passageways retain at least 60 percent exposure to the sky, whereas the Maximum Commercial Scenario would require a minimum setback of at least 10 feet with an additional setback of another 10 feet on the upper floor.

Proposed Open Space Plan

The Proposed Project would include 9 acres of publicly owned and accessible open space. (See Figure 2.15: Proposed Open Space Plan, p. 2.46.) The proposed open space would supplement recreational amenities in the vicinity of the project site, such as the future Crane Cove Park in the northwestern part of Pier 70, and would include extension of the Blue Greenway and Bay Trail through the southern half of the Pier 70 area. Open spaces programmed as part of the Proposed Project are the Waterfront Promenade, the Waterfront Terrace, Slipway Commons, the Building 12 Market Plaza and Market Square, the Irish Hill Playground, 20th Street Plaza, and, potentially, parking structure rooftops.

Proposed Traffic and Circulation Plan

As shown on Figure 2.16: Proposed Roadway Network, p. 2.50, the proposed primary streets on the project site would be 20th and 22nd streets, built out from west to east. The proposed Maryland Street would be a secondary north-south-running street and would be designed as a shared street. New minor streets proposed as part of the Proposed Project include a new 21st Street, running west to east from Illinois Street to the Waterfront, and Louisiana Street, running north from 22nd Street. A jog on Louisiana Street from 21st Street to 20th Street to accommodate existing historic structures within the 20th Street Historic Core would be provided. All proposed streets would include sidewalks, as well as street furniture.

Bicycle and Pedestrian Improvements

The Proposed Project would include bike lanes, bike-safety-oriented street design, and bike-parking facilities to promote bicycling in and around the project site. (See Figure 2.18: Proposed Bicycle Network, p. 2.54.) Under the provisions of the SUD, bike amenities would be constructed on the project site to meet or exceed Planning Code requirements. Improvements include construction of Class 2 facilities (bicycle lanes) and Class 3 facilities (shared-lane markings and signage) on 20th Street, 22nd Street, and Maryland Street. A Class 1 separated bicycle and pedestrian facility would be provided to extend the Bay Trail and Blue Greenway the length of the project site along the shoreline.

Pedestrian travel would be encouraged throughout the project site by establishing connected pedestrian pathways running both west to east and north to south to connect open spaces and by incorporating pedestrian-safe sidewalk and street design. All streets on the project site would have 9- to 18-foot-wide sidewalks. The project site is designed to make the area east of Maryland Street a predominantly pedestrian zone.

Parking

Parking spaces would be added to meet demand created by the Proposed Project, as well as to encourage more sustainable travel modes by limiting the number of on-site parking through implementation of a site-wide maximum and a maximum ratio per use. Under the Maximum Residential Scenario, up to 3,370 off-street parking spaces and up to 285 on-street parking spaces would be allowed. Under the Maximum Commercial Scenario, up to 3,496 off-street and 285 on-street parking spaces would be allowed.

New Off-Site 20th Street Pump Station

The Proposed Project includes the replacement of the existing 20th Street Pump Station, a necessary infrastructure improvement to accommodate future sewer and stormwater demands

from anticipated development on the project site. The approximately 15- by 30-foot structure, 10-foot-tall new pump station would be located on Port lands, likely immediately northeast of the project site boundary, adjacent to existing Building 6 on the BAE Systems Ship Repair site.

IMPACT EVALUATION

Impact LU-1: The Proposed Project would not physically divide an established community. ***(Less than Significant)***

The project site is characterized by clusters of structures set within large open areas. Vehicular access is limited, and is not integrated with the street grid of the Dogpatch neighborhood to the east. There is currently no public access to the waterfront and limited visual access to the Bay through the project site.

The Proposed Project, under both the Maximum Residential Scenario and the Maximum Commercial Scenario, would extend the City street grid through the project site, along the existing alignments of 20th and 22nd streets, and a new 21st Street access from Illinois Street through the project site to the waterfront. The proposed street plan also includes the future possibility of extending the proposed Maryland Street and proposed waterfront open space southward into the adjacent Potrero Power Plant site should a development plan for that site be proposed in the future.

The Proposed Project, under both the Maximum Residential Scenario and the Maximum Commercial Scenario, would create a network of public pedestrian and bike passages and interconnected public open spaces throughout the site, and create a link for the planned Bay Trail through the project site along the Bay shoreline. The proposed network of streets, pedestrian paths, bike paths, and open spaces is intended to enhance public access through the project site and to the waterfront and to integrate the project site into Dogpatch and the Central Waterfront neighborhoods.

Similarly, the Proposed Project would enhance public access to the Bay along the existing alignments of 20th and 22nd streets, and would create new view corridors to the Bay along the proposed 21st Street as well as through the proposed Market Square/Slipways Commons public open spaces. In addition, new opportunities for the public to access the shoreline and view the Bay from the proposed Waterfront Promenade and Waterfront Terrace public open spaces would be created.

For these reasons, the Proposed Project would have a less-than-significant land use effect related to physical division of a community. No mitigation measures are necessary.

Impact LU-2: The Proposed Project would not conflict with land use plans, policies, or regulations adopted for the purpose of avoiding or mitigating an environmental effect, such that a substantial adverse physical change in the environment related to Land Use would result. *(Less than Significant)*

General Plan and Planning Code Use Districts

Maximum Residential Scenario

As discussed in Chapter 3, Plans and Policies, the proposed residential and commercial uses under the Maximum Residential Scenario are not consistent with current land use plans and policies under the *San Francisco General Plan,* and the Planning Code M-2 (Heavy Industrial) and P (Public) Use Districts. However, the *General Plan* – and in particular, the *Central Waterfront Area Plan* in which the project site is located – is a high-level planning document that supports higher-density, mixed-use, transit-oriented development such as the Proposed Project.

Maximum Commercial Scenario

Similar to the Maximum Residential Scenario, the proposed residential and commercial uses under the Maximum Commercial Scenario are not consistent with current land use plans and policies under the *San Francisco General Plan,* and the Planning Code M-2 (Heavy Industrial) and P (Public) Use Districts. However, as noted above, the *General Plan* – and in particular, the *Central Waterfront Area Plan* in which the project site is located – is a high-level planning document that supports higher-density, mixed-use, transit-oriented development such as the Proposed Project.

Conclusion

If the Board of Supervisors finds that amendments to the *General Plan* and Planning Code are warranted to allow for implementation of the Proposed Project, under both the Maximum Residential Scenario and the Maximum Commercial Scenario, the Board of Supervisors would adopt amendments to the *General Plan* and Planning Code to establish the Pier 70 SUD. Conflicts between the *General Plan* and Planning Code, and the Proposed Project would be resolved through legislative amendment of the *General Plan* and Planning Code.

Conflicts with existing plans and policies do not, in themselves, indicate a significant environmental effect related to the topic of Land Use and Land Use Planning within the meaning of CEQA, unless the project substantially conflicts with a land use plan/policy that was adopted for the purpose of avoiding or mitigating an environmental effect, such that a substantial adverse physical change in the environment related to Land Use would result. As discussed above under "Approach to Analysis," on pp. 4.B.17-4.B.18, to the extent that physical environmental impacts

may result from such conflicts, the EIR discloses and analyzes these physical impacts under the specific environmental topic sections in EIR Chapter 4, Environmental Setting and Impacts.

The Proposed Project, including both the Maximum Residential Scenario and the Maximum Commercial Scenario, would not conflict with land uses plans and policies such that a substantial adverse physical change in the environment related to Land Use would result. For this reason, the Proposed Project would have a less-than-significant land use effect related to conflict with a land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect. No mitigation measures are required. Potential conflicts with applicable *General Plan* objectives and policies will continue to be analyzed and considered as part of the review of entitlements applications required for the Proposed Project independent of environmental review under CEQA. They also will be considered by the decision-makers during their deliberations on the merits of the Proposed Project and as part of their actions to approve, modify, or disapprove the Proposed Project.

New 20th Street Pump Station

The proposed new 20th Street pump station would be located northeast of the project site boundary, adjacent to existing Building 6 on the BAE Systems Ship Repair site. The BAE Systems Ship Repair site is zoned M-2 (Heavy Industrial), and development of the new pump station, including related infrastructure improvements needed for operation of the new pump station, would be consistent with permitted uses of the existing zoning on the site. Construction of the new pump station would not conflict with land used plans and policies such that a substantial adverse physical change in the environment related to Land Use would result. The proposed pump station would have a less-than-significant land use effect related to conflict with a land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect, and no mitigation measures are required.

Port of San Francisco Waterfront Land Use Plan

Maximum Residential Scenario

As discussed in Chapter 3, Plans and Policies, the proposed residential and commercial uses under the Maximum Residential Scenario are not consistent with current land use plans and policies under the Port of San Francisco's WLUP.

Maximum Commercial Scenario

Similar to the Maximum Residential Scenario, the proposed residential and commercial uses under the Maximum Commercial Scenario are not consistent with current land use plans and policies under Port of San Francisco's WLUP.

Conclusion

If the San Francisco Port Commission finds that amendments to its WLUP are warranted to allow for implementation of the vision for the project site embodied by the Proposed Project, the Port Commission would adopt amendments to resolve the conflicts with the WLUP. Accordingly, conflicts between the WLUP and the Proposed Project would be resolved through amendment of the WLUP.

Conflicts with existing plans and policies do not, in themselves, indicate a significant environmental effect related to the topic of Land Use and Land Use Planning within the meaning of CEQA, unless the project substantially conflicts with a land use plan/policy that was adopted for the purpose of avoiding or mitigating an environmental effect. As discussed above under "Approach to Analysis," on pp. 4.B.17-4.B.18, to the extent that physical environmental impacts may result from such conflicts, the EIR discloses and analyzes these physical impacts under the specific environmental topic sections in EIR Chapter 4, Environmental Setting and Impacts.

The Proposed Project, including both the Maximum Residential Scenario and the Maximum Commercial Scenario, would not conflict with land used plans and policies such that a substantial adverse physical change in the environment related to Land Use would result. For this reason, the Proposed Project would have a less-than-significant land use effect related to conflicts with a land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect. No mitigation measures are required. Potential conflicts with applicable objectives and policies of the Port of San Francisco WLUP will be considered as part of the review of entitlements applications required for the Proposed Project independent of environmental review under CEQA. They also will be considered by the decision-makers during their deliberations on the merits of the Proposed Project and as part of their actions to approve, modify, or disapprove the Proposed Project.

<u>San Francisco Bay Conservation and Development Commission *Bay Plan*</u>

As discussed in Chapter 3, Plans and Policies, BCDC's jurisdiction includes the Bay and areas within 100 feet inland of the mean high tide line. The Proposed Project would require BCDC approval of activities within BCDC's jurisdiction along the Bay shoreline. BCDC will make the final determination of consistency with *Bay Plan* policies for the portions of the project site that are within its permit jurisdiction.

<u>Proposed Public Trust Exchange</u>

As discussed above under Regulatory Framework on pp. 4.B.15-4.B.17, the proposed placement of certain non-Public Trust (non-water-oriented) uses on land within the 28-Acre Site that is

subject to the Public Trust would be inconsistent, on its face, with the Public Trust Doctrine. To resolve the Public Trust status of portions of Pier 70, the Port has obtained State legislation (AB 418) that authorizes the State Lands Commission to approve a Public Trust exchange that would free some land from the Public Trust to allow non-trust uses within those areas, while committing other land to the Public Trust. The Proposed Project would require State Lands Commission approval of a Public Trust Exchange Agreement. Under AB 418 the State Lands Commission may not approve the exchange of the trust lands unless it finds that the proposed exchange would meet specified requirements, presented above on pp. 4.B.16-4.B.17, to ensure consistency with the purposes of the Public Trust. Conformity with the specified conditions of AB 418 would ensure that the Proposed Project would be consistent with the Public Trust Doctrine.

Conclusion

The Proposed Project would have a less-than-significant Land Use effect related to conflict with a land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect. No mitigation measures are required. Potential conflicts with applicable *General Plan*, WLUP, and *Bay Plan* objectives and policies will continue to be analyzed and considered as part of the review of entitlement applications required for the Proposed Project independent of environmental review under CEQA. They also will be considered by the decision-makers during their deliberations on the merits of the Proposed Project and as part of their actions to approve, modify, or disapprove the Proposed Project.

CUMULATIVE IMPACTS

Impact C-LU-1: The Proposed Project, in combination with past, present, or reasonably foreseeable future projects, would not contribute considerably to significant cumulative land use impacts related to (a) physical division of an established community, or (b) conflicts with applicable land use plans and policies adopted for the purpose of avoiding or mitigating an environmental effect. *(Less than Significant)*

Section 4.A, Introduction to Chapter 4, on pp. 4.A.12-4.A.17, identifies several foreseeable future projects that are located within an approximately 0.5-mile radius of the project site. In addition, as discussed on pp. 4.A.17-4.A.18, several area plans have identified the southeastern part of San Francisco as the location for substantial future growth in housing and employment. The Proposed Project would contribute to these changes in land use and extend these changes farther south and east. Residential and commercial densities under the Proposed Project would exceed those of the existing Dogpatch neighborhood but would be comparable to anticipated and planned development in the Dogpatch neighborhood area and to the existing and planned development in nearby Mission Bay.

As discussed above under Impact LU-1, the Proposed Project, under both the Maximum Residential Scenario and Maximum Commercial Scenario, would extend a network of public streets, pedestrian paths, and open spaces to facilitate public access through the project site and to the waterfront. Therefore, the Proposed Project, including both the Maximum Residential Scenario and the Maximum Commercial Scenario, would not contribute to the physical division of an established community.

The Proposed Project's conflict with existing land use plans and policies, discussed above under Impact LU-2, would not result in a cumulatively considerable contribution to an environmental impact related to Land Use. Both the Maximum Residential Scenario and Maximum Commercial Scenario would constitute a substantial increase in population and employment in the project vicinity beyond what has been previously anticipated under various area plans for the southeastern part of the City. The project site is within one of several Priority Development Areas in San Francisco that the Association of Bay Area Governments and the City have identified to accommodate anticipated population growth. Additionally, as noted above, the *General Plan* – and in particular, the *Central Waterfront Area Plan* in which the project site is located – supports higher-density, mixed-use, transit-oriented development such as the Proposed Project.

The Proposed Project, together with other projects and area plans in the vicinity, would advance several City and regional land use policy objectives such as increasing housing development areas to help the City meet its regional housing needs targets; creating a sustainable and more efficient land use pattern by concentrating and redirecting land uses into higher density, mixed-use projects near transit with access to Downtown and neighborhood retail and services; reducing the negative land use effects of automobile traffic and parking in the area and creating more livable and safe street environments for pedestrians and bicyclists; and reducing greenhouse gas emissions. Therefore, potential unanticipated population and employment growth, under both the Maximum Residential Scenario and Maximum Commercial Scenario, would not make a cumulatively considerable contribution to a significant cumulative impact related to land use resulting from a conflict with existing land use plans and policies.

For these reasons, the Proposed Project, under both the Maximum Residential Scenario and Maximum Commercial Scenario, in combination with past, present, and reasonably foreseeable future projects, would have less-than-significant cumulative land use impacts. The Proposed Project would not make a cumulatively considerable contribution to a significant cumulative land use impact, and no mitigation measures are necessary.

C. POPULATION AND HOUSING

Section 4.C, Population and Housing, examines the effects of the Proposed Project related to population, housing, and employment. The Environmental Setting discussion describes existing regional and Citywide population, housing, and employment conditions and trends, and existing population and employment characteristics on the project site. The Regulatory Framework describes regional and local plans and regulations related to population and housing. The Impacts and Mitigation Measures discussion addresses potential population, housing, and employment effects that would result from implementation of the Proposed Project, and potential mitigation measures to lessen any impacts. Both project-level and cumulative environmental impacts are evaluated. Project construction is anticipated to commence in 2018 and would be phased over an approximately 11-year period, concluding in 2029. The timeframe for existing conditions used in this analysis is 2010 and 2013 (years with the most up-to-date population and housing data as of May 6, 2015, the Notice of Preparation publication date) and 2040 for projected future project conditions.

The information in this section is based on the land use program for the Proposed Project; the 2010 U.S. Census data for the City and County of San Francisco and Census Tract 226; the 2009-2013 5-Year American Community Survey (2013 ACS); Association of Bay Area Governments (ABAG) *Projections 2013*;[1] ABAG's *Regional Housing Need Plan for the San Francisco Bay Area: 2014-2022*;[2] the 2014 Housing Element of the *San Francisco General Plan (General Plan)*; and the *2014 San Francisco Housing Inventory*.[3]

[1] ABAG is the regional agency responsible for preparing forecasts of population, housing, and employment growth in the nine Bay Area counties and their cities. ABAG's 2013 edition (*Projections 2013*) of its biennial forecast of population, housing, jobs, and income for the nine-county San Francisco Bay Region was released in July 2013.

ENVIRONMENTAL SETTING

CITY AND REGIONAL POPULATION GROWTH TRENDS

Population

As shown in Table 4.C.1: City and County of San Francisco Population Growth Trends, San Francisco's population grew over the 40-year period between 1970 and 2010, increasing by approximately 12.5 percent. Between 1970 and 1980, San Francisco experienced a period of decline in population; however, between 1980 and 2000 the City's population increased, returning to and exceeding the1970 population. Between 2000 and 2010, the rate of population growth decreased by half from the previous decade (from 7.3 percent in 2000 to 3.7 percent in 2010) as a result of the recession and subsequent sluggish economic growth. As of 2010, San Francisco is ranked as the second most populous city in the nine-county San Francisco Bay Area (Bay Area),[4] behind San Jose, and is the most urbanized county in the Bay Area, with more than 90 percent of its land developed.[5] The U.S. Census Bureau's 2013 ACS estimates that the City's total population has steadily increased since 2010, to 817,501.[6] According to ABAG *Projections 2013*, the population is expected to increase steadily through the year 2040.

Table 4.C.1: City and County of San Francisco Population Growth Trends

Year	Population	10-Year Percent Increase
1970	715,674	-
1980	678,974	-5.1%
1990	723,959	6.6%
2000	776,733	7.3%
2010	805,235	3.7%
2020	890,400	10.6%*
2030	981,800	10.3%*
2040	1,085,700	10.6%*

Note:
* = projected population growth

Sources: U.S. Census, 2015 (1970-2010); ABAG, *Projections 2013* (2020-2040)

[4] The Bay Area's nine counties are Sonoma, Napa, Solano, Marin, Contra Costa, San Francisco, Alameda, San Mateo, and Santa Clara.

[5] Bay Area Census, Ten Largest Bay Area Cities by 2010 Ranking, 1960-2010. Available online at http://www.bayareacensus.ca.gov/historical/largecity.htm. Accessed September 4, 2015.

[6] U.S. Census Bureau, 2009-2013 5-Year American Community Survey, San Francisco County, American Community Survey Demographic and Housing Estimates. Available online at http://factfinder.census.gov/rest/dnldController/deliver?_ts=461008993623. Accessed September 22, 2015.

The City's population is projected to increase by 10.6 percent between 2010 and 2020; by 10.3 percent between 2020 and 2030; and by 10.6 percent between 2030 and 2040. Overall, ABAG projects the City's population will increase by 34.8 percent over the 30-year period between 2010 and 2040.[7] Average annual growth rates under such projections would be approximately 1.2 percent.

The population of the Bay Area is expected to increase at a slightly lower rate than San Francisco's population over the same 30-year period. The Bay Area's population is estimated to increase by approximately 8.8 percent between 2010 and 2020, by 9.1 percent between 2020 and 2030, and by 9.4 percent between 2030 and 2040.[8] Overall, the Bay Area's population is expected to increase by 29.1 percent over this 30-year period. Average annual growth rates under such projections would be approximately 0.97 percent, approximately 0.23 percent lower than the San Francisco growth rate.

Housing

The following section describes the housing characteristics of San Francisco and the Bay Area. Currently, there are no housing units or residential populations on the project site.

Households

In 2010, San Francisco had 345,811 households (defined by ABAG as an occupied residential unit), comprising approximately 13.2 percent of Bay Area households (see Table 4.C.2: Population and Household Projections for San Francisco and the Bay Area, 2010-2040). By 2040, ABAG estimates the number of San Francisco households will increase by 29.4 percent to 447,350 households and represent approximately 13.5 percent of Bay Area households. In 2010, the Bay Area had 2,608,023 households, and by 2040, ABAG estimates the number of Bay Area households will increase by approximately 26.8 percent to 3,308,090 households.[9]

According to the U.S Census, the average household size in San Francisco has fluctuated between 2.30 persons per household in 2000 to 2.26 persons per household in 2010, which is smaller than the Bay Area average household size of 2.69 persons per household.[10] According to ABAG *Projections 2013,* San Francisco's average household size is projected to increase slightly to 2.27 persons per household in 2015 and to 2.35 persons per household by 2040.[11] The Bay Area

[11] ABAG, *Projections 2013,* p. 74.

average household size is expected to increase from 2.69 to 2.75 persons per household between 2015 and 2040.[12]

Table 4.C.2: Population and Household Projections for San Francisco and the Bay Area, 2010-2040

	San Francisco		Bay Area	
Year	**Population**	**Households**	**Population**	**Households**
2010	805,235	345,811	7,150,739	2,608,023
2015	847,000	362,440	7,461,400	2,720,410
2020	890,400	379,600	7,786,800	2,837,680
2025	934,800	396,000	8,134,000	2,952,910
2030	981,800	413,370	8,496,800	3,072,920
2035	1,032,500	430,070	8,889,000	3,188,330
2040	1,085,700	447,350	9,299,100	3,308,090

Source: ABAG, *Projections 2013*

Housing Density

Housing density is measured as the average number of units per acre. According to the *General Plan's* 2014 Housing Element, overall housing density in San Francisco ranges from low (14 units per acre), moderately low (36 units per acre), medium (54 units per acre), moderately high (91 units per acre), to high (283 units per acre). The project site is located in an area that has zoning parameters that permit average housing density of 54 units per acre.[13]

Existing Housing Stock

According to the 2013 ACS, San Francisco has 378,186 housing units, of which 32,842 are vacant, resulting in an approximately 8.7 percent total vacancy rate. However, the 2013 ACS estimates a much lower total vacancy rate, with a homeowner vacancy rate of approximately 1.2 percent and a rental vacancy rate of approximately 3.7 percent.[14] According to the *General Plan's* 2014 Housing Element, differences between total vacancy rate and the sum of the

[12] ABAG, *Projections 2013*, p. 19.
[13] San Francisco Planning Department, Data and Needs Analysis, Map 6, Generalized Permitted Housing Densities by Zoning Districts, San Francisco, 2013.
[14] U.S. Census Bureau, 2009-2013 5-Year American Community Survey 5-Year Estimates, San Francisco County, Selected Housing Characteristics. Available online at http://factfinder.census.gov/rest/dnldController/deliver?_ts=461008993623. Accessed September 22, 2015.

homeowner and rental vacancy rates may be attributable to sampling error and an increase in time-shares and corporate homes used for employee housing.[15]

According to the 2013 ACS, most of San Francisco's housing stock is composed of multi-unit structures (approximately 67.7 percent), with a smaller percentage of single-family homes (approximately 32.1 percent).[16] This breakdown is in accord with information in the San Francisco Planning Department's *2014 Housing Inventory*, i.e., low-density buildings (single-family homes – 33 percent), moderate density buildings (two to nine units – 31 percent), and higher density structures (10 or more units – 36 percent).[17]

In 2014, the City's housing stock was augmented by 3,514 net new units, of which approximately 21 percent were affordable units. The 2014 net new unit production represents an increase of 79 percent over 2013's net new unit production (1,960 net new housing units).[18] It also exceeded the 10-year average of 2,075 net new units and represents a continuing upward trend in net new unit production from the lowest production point, 2011 (269 units).[19] In 2014, the Department of Building Inspection authorized the construction of 3,834 new housing units, which represents a 21 percent increase over the number of units authorized in 2013.[20] The *2014 Housing Inventory* indicates that the majority of new housing units developed since 2010 have been in multi-unit developments, with a significant percentage of these (90 percent) in developments with 20 or more units.[21]

Housing Needs

Over the course of the past several decades, the construction of housing has failed to keep pace with population growth in the Bay Area. Although population growth has slowed and is predicted to continue at a relatively moderate rate through 2040, the region is still attempting to make up for housing shortages from previous growth periods. The lack of local housing options that are affordable causes many Bay Area residents to seek housing outside of the nine-county

Bay Area, resulting in long commutes and significant impacts on the regional transportation system.

This housing shortage is compounded in San Francisco by additional factors. San Francisco was historically developed as an employment center, which means that there are more jobs than housing units in the City. In addition, San Francisco is relatively built up, with limited land available for development. Policy 1.9 of the Housing Element of the *General Plan* requires that new commercial developments and higher educational institutions (also known as post-secondary educational institutions)[22] that increase the City's employment base or student population must meet the housing demand they generate, with particular emphasis on affordable housing or paying in-lieu fees into the City's Jobs-Housing Linkage Program.[23]

In 2014, the median price for a two-bedroom home in San Francisco rose to $798,910, 12 percent more than the median price in 2013 ($714,840). Median rental prices in 2014 for a two-bedroom apartment in San Francisco increased by almost 40 percent to $4,580 per month, up from $3,300 in 2013. The Bay Area remains one of the nation's most expensive housing markets.[24]

In order to respond to Statewide population and household growth, and to ensure the availability of decent affordable housing for all income groups, in 1981 the State enacted Government Code Section 65584, which requires each Council of Governments[25] to periodically distribute State-identified housing needs to all jurisdictions within its region. ABAG serves as the Council of Governments for the Bay Area. Government Code Section 65584 requires ABAG and other Council of Governments to periodically update the Regional Housing Needs Assessment. On July 18, 2013, the ABAG Executive Board adopted the *Regional Housing Need Plan for the San Francisco Bay Area: 2014-2022*, which identifies the San Francisco Bay Area's housing need determination for the 2014-2022 planning period.

The ABAG Policy Board established housing needs for all jurisdictions within its boundaries for the 2014-2022 planning period by using a "fair share" approach, based on projected household and job growth of the region as well as regional income level percentages. Each jurisdiction is required by State law to incorporate its housing need numbers into an updated version of its *General Plan* Housing Element. The City's *General Plan* Housing Element was approved by the Department of Housing and Community Development on May 29, 2015. The Bay Area's overall

[22] A higher educational institution is a public or private institution that provides educational services and can include universities, colleges, seminaries, academies, and institutes of technology.

[24] San Francisco Planning Department, *San Francisco Housing Inventory*, p. 34.
[25] A Council of Governments is a single or multi-county council created by a joint powers agreement that partakes in regional planning. ABAG is the Council of Governments for the San Francisco Bay Area.

projected housing need over the defined planning period is approximately 187,990 new residential units. San Francisco's share of this number is about 28,869 units, or an average of approximately 3,609 units per year.[26]

Government Code Section 65584 also requires that a city's share of regional housing needs include housing needs of persons at all income levels. The different income levels to be studied within the parameters of State-mandated local Housing Elements, which must be prepared by every city and county in California, are "Very Low Income," "Low Income," "Moderate Income," and "Above Moderate Income." The City's distribution of housing needs across income levels is presented in Table 4.C.3: Existing San Francisco Household Income Distribution and Housing Needs.

Table 4.C.3: Existing San Francisco Household Income Distribution and Housing Needs

Income Group	Income Level	Income Range[1]	Percentage of S.F. Households	S.F. Housing Need[2]
Very Low	≤50% of AMI	$23,300-$26,200	27.9%	6,234 units
Low	51%–80% of AMI	$55,175-$62,075	14.8%	4,639 units
Moderate	81%–120% of AMI	$81,575-$91,775	18.8%	5,460 units
Above Moderate	>120% of AMI	>$112,675	38.5%	12,536 units
Total			100.0%	28,869 units

Notes:

AMI – Area Median Income (The 2012 ACS estimated an AMI of approximately $73,802.)

[1] San Francisco Planning Department, *San Francisco General Plan*, Housing Element, Part I: Data and Needs Analysis, April 2015, Table I-39: Household Income Standards by Household Size, 2014, and Table I-40: Income Distribution, San Francisco, 2012, p. 42. The income range shown above is the average income range for two- to three-person households in the City.

[2] San Francisco Planning Department, *San Francisco General Plan*, Housing Element, Part I: Data and Needs Analysis, April 2015, Table I-38, p. 41.

Source: San Francisco Planning Department, *San Francisco General Plan*, Housing Element, Part I: Data and Needs Analysis, April 2015

Between 2004 and 2013, 19,316 net new housing units were added Citywide, with an annual average during this 10-year period of about 1,932 units per year. In comparison, a net total of 13,634 housing units were added between 1994 and 2003, or an annual rate of about 1,363 units per year. Most of the new construction in the last 10 years has occurred in larger structures, with 91 percent of the housing developed in buildings with more than 10 units.

[26] ABAG, *Regional Housing Need Plan for the San Francisco Bay Area: 2014-2022*, Appendix A, Attachment 1 and Appendix C, pdf pp. 21 and 28.

In 2014, Citywide net new housing stock increased by 3,514 units.[27] To meet current regional housing need projections, the City would need to increase housing unit production to an average of approximately 3,609 units per year. Thus, although the annual rate of housing production has steadily increased, particularly in the past few years, San Francisco remains slightly behind in meeting its share of the regional housing needs allocation forecast for the 2014-2022 planning period.

The South of Market (SOMA) Planning District, which includes the project site, absorbed most of the new housing development between 2010 and 2013, accounting for about 1,230 new units, or almost 35.3 percent of all new housing during that period. The Downtown and Western Addition Planning Districts followed with roughly 729 and 424 new units, respectively, together accounting for about 33 percent of new housing.[28] In 2014 the construction of new housing in the SOMA Planning District more than doubled compared to the previous four years, with 1,892 net new units, or 54 percent of net new additions to the City.[29] Of the new housing stock in this district, 73.8 percent was in developments with 10 or more units.[30]

Employment

San Francisco is a primary employment hub for the Bay Area and contains regional employment centers and major transportation thoroughfares. Two types of employment data are described below: total jobs within San Francisco and employed residents, i.e., the number of residents of working age who actively participate in the civilian labor force. The civilian labor force includes those who are employed (except in the armed forces) and those who are unemployed but actively seeking employment. Those who have never held a job, who have stopped looking for work, or who have been unemployed for a long period of time are not considered to be in the labor force.

Total Jobs

According to ABAG *Projections 2013*, San Francisco had about 617,420 jobs in 2015.[31] The City is projected to have a total of approximately 671,230 jobs by 2020, approximately 707,670 jobs by 2030, and approximately 759,500 jobs by 2040, resulting in an approximately 23 percent increase (142,080 total jobs) over the 25-year period.[32] Between 2015 and 2040, the total number of jobs in the nine-county Bay Area is expected to increase by almost 835,240 jobs, a 22.8 percent increase. During this period, San Francisco's share of regional employment is

[31] ABAG, *Projections 2013*, p. 22.
[32] ABAG, *Projections 2013*, p. 75.

expected to increase slightly, from 16.8 percent in 2015 to 16.9 percent in 2040.[33] As of 2010, commuters into San Francisco held 27.3 percent of the jobs in San Francisco. The share of San Francisco jobs held by residents from other Bay Area counties is expected to increase as compared to 2010 to approximately 43 percent by 2020, 40 percent by 2030, and 42 percent by 2040.[34] As a regional job center, San Francisco will continue to have a larger share of commuters than other cities in the Bay Area.

Employed Residents

According to ABAG *Projections 2013,* San Francisco had approximately 460,450 employed residents in 2015.[35] This number is expected to increase to approximately 501,470 employed residents by 2020, approximately 530,200 by 2030, and approximately 571,580 by 2040, resulting in an approximately 12 percent increase (111,130 employed residents) over the 25-year period.[36] According to 2013 ACS data, about 76 percent of San Francisco's employed residents work in San Francisco, while about 24 percent commute to jobs outside of San Francisco.[37] Assuming the same percentages, in 2040 about 137,179 (24 percent) of San Francisco's employed residents would continue to commute to jobs outside of San Francisco, and about 434,400 (76 percent) of San Francisco's employed residents would live and work in San Francisco. The City and County of San Francisco had an unemployment rate of 3.3 percent in September 2015, down 0.8 percent from September 2014.[38]

Project Area Population and Employment

The project site is located within Census Tract 226, which comprises most of the Central Waterfront Planning Area. Census Tract 226 is bounded by 16th Street to the north, I-280 to the west, 25th Street to the south, and San Francisco Bay to the east. According to the 2010 U.S. Census, Census Tract 226 had a total population of 1,534 residents.[39] Between the 2000 and

2010 U.S. Census, the population of Census Tract 226 increased by 688 residents,[40] which represents an approximately 81.3 percent increase in the population of 846 persons recorded for the census tract in the 2000 U.S. Census.[41] Currently, there are no residential units on the project site, and existing on-site employment consists of about 60 to 70 workers.[42]

REGULATORY FRAMEWORK

REGIONAL

Plan Bay Area

Plan Bay Area is a long-range (2040) integrated transportation and land use/housing strategy for the San Francisco Bay Area. *Plan Bay Area* marks the nine-county region's first long-range plan to meet the requirements of California's 2008 Senate Bill 375 (SB 375), which calls on each of the State's 18 metropolitan areas to develop a Sustainable Communities Strategy, an integrated transportation, land use, and housing plan that addresses ways to accommodate future population growth and reduce greenhouse gas emissions from cars and light trucks. *Plan Bay Area* advances initiatives to expand housing and transportation choices, create healthier communities, and build a stronger regional economy. ABAG and the Metropolitan Transportation Commission jointly approved *Plan Bay Area* on July 18, 2013.

Since 2002, the regional population, household, and job forecast has been "policy-based," meaning that the forecast promotes policy objectives which increase housing development and alternative transportation modes, specifically by increasing the proportion of growth near transit and in existing urban areas. With the adoption of SB 375 and its requirement that regional planning agencies create a plan to meet targets for greenhouse gas emissions reduction tied to land use, the Bay Area can expect to see further development directed towards existing urban areas like San Francisco to increase housing near jobs, reduce urban sprawl, and reduce greenhouse gas emissions. These areas have been identified as priority development areas (PDAs). A PDA is an infill location of at least 100 acres served by transit that is designated for compact land development, along with investments in community improvements and infrastructure. Under *Plan Bay Area*, 78 percent of new housing and 62 percent of new jobs in the Bay Area will be concentrated in PDAs. The project site is located within the Port of San

Francisco PDA, which includes approximately 678 acres of public waterfront lands and stretches 7.5 miles from Fisherman's Wharf to India Basin, adjacent to Hunters Point Shipyard in the Bayview/Hunters Point community. The Port of San Francisco PDA is one of 12 PDAs in the City where 88 percent of population growth in the City is expected to take place.[43] The Port of San Francisco PDA forecasts a population of 3,059 residents, 1,497 households, and 149,684 jobs by 2040.[44]

Regional Housing Need Plan for the San Francisco Bay Area: 2014-2022

The California Department of Housing and Community Development (HCD) is responsible for determining the overall regional housing need for the State and for initiating the process by which each Council of Governments, in this case ABAG, then distributes its share of regional housing need to all jurisdictions within its region. Government Code Section 65584 requires periodic development of a new Regional Housing Needs Assessment. In July 2013, ABAG released its *Regional Housing Need Plan for the San Francisco Bay Area: 2014-2022*, which identifies the Bay Area's housing needs determination for the 2014-2022 planning period, as described above under "Housing Needs" on pp. 4.C.5-4.C.8.

Since 1980, the State of California has required each jurisdiction to plan for its share of the State's housing need for people of all income levels (California Government Code Section 65580). The Regional Housing Need Allocation (RHNA) process is a State mandate designed to address each jurisdiction's assigned share of the Statewide housing need for an eight-year planning period. The RHNA process requires the HCD to determine the total housing need for each region in the State, and each region's Council of Governments (e.g., ABAG for the Bay Area) is then responsible for distributing this need to local governments. The total housing need for each region is based on the region's forecast for population, households, and employment. Typically, the RHNA for each region is finalized through negotiations between the HCD and each region's Council of Governments. According to State law, each jurisdiction's housing element must include a strategy to meet its share of the region's housing need for four income categories that encompass all levels of housing affordability (i.e., very low – up to 50 percent of area median income, low – between 51 and 80 percent of area median income, moderate – between 81 and 120 percent of area median income, and above moderate – above 120 percent of area median income) and must be certified by the HCD. Jurisdictions that do not have capacity to meet their RHNA at all income levels must rezone sites with appropriate development standards to accommodate the unmet capacity.

[43] ABAG, *Projections* 2013, p. 71.
[44] ABAG, Plan Bay Area Priority Development Area Showcase, February 2015. Available online at http://gis.abag.ca.gov/website/PDAShowcase/. Accessed March 7, 2016.

The RHNA process seeks to ensure that each jurisdiction recognizes its responsibility to provide housing that represents the number of additional residential units that would be required to accommodate the anticipated growth in households; to replace expected demolitions and conversions of housing units to non-housing uses; and to achieve a future vacancy rate that allows for the healthy functioning of the housing market. The RHNA process does not necessarily encourage or promote growth; rather, it requires each jurisdiction to anticipate projected growth, so that it can grow in ways that enhance quality of life; improve access to jobs, transportation, and housing; and not adversely impact the environment.

The *Regional Housing Need Plan for the San Francisco Bay Area: 2014-2022* was published in July 2013 and covers the planning period from January 31, 2015, to January 31, 2023. The HCD determined that the Bay Area must plan for 187,990 new housing units from 2014-2022. This determination is based on population projections produced by the California Department of Finance, which also took into account the uncertainty regarding the economy and regional housing markets. For this planning period, the HCD made an adjustment to account for abnormally high vacancies and unique market conditions due to prolonged recessionary conditions, high unemployment, and unprecedented foreclosures. As a result, the RHNA from the HCD for this planning period is lower than the RHNA for the 2007-2014 planning period. The housing allocation is expressed not only as an overall housing production target to alleviate tight housing market conditions and reduce long-distance commuting, but, more importantly, as separate targets for production of housing affordable to various household income categories. San Francisco's share of the regional housing need for 2014 through 2022 is 28,869 new units, with approximately 57 percent to be affordable. This represents a little over 15 percent of the regional total over the 2104-2022 time frame and amounts to a Citywide housing production goal of about 3,609 units per year. San Francisco's share of the RHNA is incorporated into the City's 2014 Housing Element (originally adopted in March 2011 and most recently re-adopted with amendments on April 27, 2015). As required by State law, the Housing Element of the *General Plan* discusses the City's fair share allocation of regional housing needs by income as projected by ABAG.

LOCAL

San Francisco General Plan

The *General Plan* includes objectives, policies, and programs related to population, housing, and employment. Several of the priority policies of the *General Plan* establish the City's interest in affordable housing, economic diversity, and a broad range of employment opportunities for residents. In addition, the Commerce and Industry Element of the *General Plan* sets forth goals for evaluating land use and other public policy directions that guide economic development. The element acknowledges that many objectives for commerce and industry are largely beyond the

realm of local control – particularly land use control – but puts forth generalized objectives as a framework for guiding public and private decisions related to economic development. In addition, the Housing Element of the *General Plan* describes housing needs and identifies the capacity for new housing in the City based on land supply and development capacity. This element focuses on the City's critical need for affordable housing. The Housing Element establishes goals for housing production, as well as policies related to mitigating the impacts of growth on the housing market that are relevant to evaluation of the Proposed Project.

Housing Element

The Housing Element is a major part of the *General Plan*. It sets forth the City's overall housing policies and seeks to ensure adequate housing for current and future San Franciscans by providing opportunities for housing development, rather than constraining opportunities. The Housing Element is comprised of two parts. Part I contains the background data and needs analysis, which form the basis for policy formulation, and Part II contains the list of objectives and policies, and descriptions of the programs to be carried out over the next five years to implement these objectives and policies. The Housing Element details objectives and policies that address growing housing demand, focus on strategies that can be accomplished within the City's limited land supply, and meet the housing goals developed during the public outreach for the Housing Element update, which include (1) prioritizing permanently affordable housing; (2) recognizing and preserving neighborhood character; (3) integrating housing, jobs, transportation, and infrastructure; and (4) continuing to be a regional model of sustainability.

On March 24, 2011, the San Francisco Planning Commission certified the Final Environmental Impact Report (EIR) for the 2004 and 2009 Housing Element. On June 21, 2011, the San Francisco Board of Supervisors adopted the 2009 Housing Element as the Housing Element of the *San Francisco General Plan*. The Planning Department recirculated for public review a revised Chapter VII, Alternatives, of the Final EIR (Revised EIR) on December 18, 2013. The Planning Commission certified the 2004 and 2009 Housing Element Final EIR, with the Revised Alternatives Analysis, on April 24, 2014. On June 17, 2014, the Board of Supervisors denied an appeal of the certification, and re-adopted the 2009 Housing Element, with minor revisions, as the 2014 Housing Element. The 2014 Housing Element was most recently re-adopted with amendments on April 27, 2015.

Housing element law (California Government Code Section 65580 et seq.) requires local jurisdictions to adequately plan for their existing and projected housing needs for all segments of its population, such that all communities contribute to the attainment of the State's housing goals. HCD is the responsible State agency tasked with allocating the region's share of the Statewide housing need to regional agencies; in the Bay Area, ABAG provides this allocation, based on the region's forecast for population, households, and employment. San Francisco's share of the

regional housing need is 28,869 new units, of which approximately 57 percent must be affordable. Under State law, all housing elements must be reviewed by the Department of Housing and Community Development; housing elements are certified if they comply with State law and meet certain planning objectives. As discussed in the Housing Element, some 47,020 new housing units could potentially be built on numerous in-fill development opportunity sites under current zoning allowances.[45] In addition, some 22,870 new housing units could be accommodated in vacant or nearly vacant lands currently or previously zoned "Public" such as Mission Bay, Treasure Island, and Hunters Point Naval Shipyard. Recent legislation has allowed the accessory dwelling units, also known as secondary dwelling units or in-law units, to be built on existing buildings in certain districts, including the Board of Supervisors' Districts 8 and 3.[46]

The following objectives and policies of the Housing Element are relevant to the Proposed Project:

Objective 1	Identify and make available for development adequate sites to meet the City's housing needs, especially permanently affordable housing.
Policy 1.1	Plan for the full range of housing needs in the City and County of San Francisco, especially affordable housing.
Policy 1.3	Work proactively to identify and secure opportunity sites for permanently affordable housing.
Policy 1.4	Ensure community based planning processes are used to generate changes to land use controls.
Policy 1.6	Consider greater flexibility in number and size of units within established building envelopes in community based planning processes, especially if it can increase the number of affordable units in multi-family structures.
Policy 1.8	Promote mixed use development, and include housing, particularly permanently affordable housing, in new commercial, institutional or other single use development projects.
Policy 1.9	Require new commercial development and higher educational institutions to meet the housing they generate, particularly the need for affordable housing for lower income workers and students.
Policy 1.10	Support new housing projects, especially affordable housing, where households can easily rely on public transportation, walking and bicycling for the majority of daily trips.
Objective 4	Foster a housing stock that meets the needs of all residents across lifecycles.
Policy 4.1	Develop new housing, and encourage the remodeling of existing housing, for families with children.

[45] San Francisco Planning Department, Data and Needs Analysis, p. I.65.

[46] San Francisco Planning Department, *sf-ADU: A Guide for Homeowners, Designers, and Contractors Considering Adding an Accessory Dwelling Unit to an Existing Residence in San Francisco*, prepared by Openscope Studio, July 2015.

Policy 4.4 Encourage sufficient and suitable rental housing opportunities, emphasizing permanently affordable rental units wherever possible.

Policy 4.5 Ensure that new permanently affordable housing is located in all of the city's neighborhoods, and encourage integrated neighborhoods, with a diversity of unit types provided at a range of income levels.

Policy 4.6 Encourage an equitable distribution of growth according to infrastructure and site capacity.

Objective 11 Support and respect the diverse and distinct character of San Francisco's neighborhoods.

Policy 11.1 Promote the construction and rehabilitation of well-designed housing that emphasizes beauty, flexibility, and innovative design, and respects existing neighborhood character.

Policy 11.3 Ensure growth is accommodated without substantially and adversely impacting existing residential neighborhood character.

Policy 11.4 Continue to utilize zoning districts which conform to a generalized residential land use and density plan and the General Plan.

Policy 11.7 Respect San Francisco's historic fabric, by preserving landmark buildings and ensuring consistency with historic districts.

Policy 11.8 Consider a neighborhood's character when integrating new uses, and minimize disruption caused by expansion of institutions into residential areas.

Policy 11.1 Use new housing development as a means to enhance neighborhood vitality and diversity.

Objective 12 Balance housing growth with adequate infrastructure that serves the City's growing population.

Policy 12.1 Encourage new housing that relies on transit use and environmentally sustainable patterns of movement.

Policy 12.2 Consider the proximity of quality of life elements, such as open space, child care, and neighborhood services, when developing new housing units.

Policy 12.3 Ensure new housing is sustainably supported by the City's public infrastructure systems.

Objective 13 Prioritize sustainable development in planning for and constructing new housing.

Policy 13.1 Support "smart" regional growth that locates new housing close to jobs and transit.

Policy 13.3 Promote sustainable land use patterns that integrate housing with transportation in order to increase transit, pedestrian, and bicycle mode share.

Central Waterfront Area Plan

The *Central Waterfront Area Plan* is part of the larger Eastern Neighborhoods Planning Area, which is composed of the Mission, Central Waterfront, East SOMA, and Showplace Square/Potrero Hill neighborhoods. The *Central Waterfront Area Plan* was adopted by the Planning Commission in 2008. It is bounded by Mariposa Street on the north, San Francisco Bay on the east, Islais Creek on the south, I-280 on the west, and includes Pier 70. The *Central Waterfront Area Plan* identifies Pier 70 as playing a substantial role in defining the Central Waterfront. However, because the Port of San Francisco was in an ongoing planning process for the waterfront at the time of the Eastern Neighborhoods community planning process, the *Central Waterfront Area Plan* does not include changes to the zoning and height controls for the majority of Pier 70, in recognition that the zoning may be modified to reflect the outcome of the Port's Pier 70 area planning process.[47] The *Central Waterfront Area Plan* strives to meet six key objectives on housing production and retention:

1. The Plan strives to construct new housing affordable to people with a wide range of incomes through the rezoning of some of the City's industrial lands. It assists households at low and very low incomes through inclusionary and land dedication strategies. It aims to help people making above the 120 percent of median income threshold for inclusionary housing but below the amount required to afford market-rate units, through "middle income" development options.
2. The Plan strives to retain and improve existing housing, in recognition of the fact that sound existing housing is one of the most valuable sources of housing the City has.
3. The Plan ensures that residential development meets not only the affordability needs, but the other needs, such as unit size, number of bedrooms, community services, and neighborhood amenities, to create a high quality of life for all individuals and families in the Eastern Neighborhoods.
4. The Plan aims to lower the costs of housing production to translate into lower-priced units, by enabling cost-effective construction and by recognizing that "time is money" in reducing unnecessary processes.
5. The Plan aims to promote health and well-being for residents, through well-designed, environmentally friendly neighborhoods and units.
6. The Plan aims to continue the City's ongoing efforts to increase affordable housing and production, through increased funding available for affordable housing through City, State, Federal and other sources.

The following objectives and policies of the *Central Waterfront Area Plan* are relevant to the Proposed Project:

Objective 2.1 Ensure that a significant percentage of new housing created in the Central Waterfront is affordable to people with a wide range of incomes.

[47] City and County of San Francisco, *Central Waterfront Area Plan*, December 2008, p. 8.

Policy 2.1.1 Require developers in some formerly industrial areas to contribute towards the City's very low, low, moderate, and middle income needs as identified in the Housing Element of the General Plan.

Policy 2.1.2 Provide land and funding for the construction of new housing affordable to very low and low-income households.

Policy 2.1.3 Provide units that are affordable to households at moderate and "middle incomes" – working households earning above traditional below-market-rate thresholds but still well below what is needed to buy a market priced home, with restrictions to ensure affordability continues.

Objective 2.3 Require that a significant number of units in new developments have two or more bedrooms except senior housing and SRO [single room occupancy] developments unless all below market rate unit are two or more bedroom units.

Policy 2.3.1 Target the provision of affordable units for families.

Policy 2.3.2 Prioritize the development of affordable family housing, both rental and ownership, particularly along transit corridors and adjacent to community amenities.

Policy 2.3.3 Require that a significant number of units in new developments have two or more bedrooms, except Senior Housing and SRO developments.

Policy 2.3.4 Encourage the creation of family supportive services, such as child care facilities, parks and recreation, or other facilities, in affordable housing or mixed-use developments.

Policy 2.3.5 Explore a range of revenue-generating tools including impact fees, public funds and grants, assessment districts, and other private funding sources, to fund community and neighborhood improvements.

Policy 2.3.6 Establish an impact fee to be allocated towards an Eastern Neighborhoods Public Benefit Fund to mitigate the impacts of new development on transit, pedestrian, bicycle, and street improvements, park and recreational facilities, and community facilities such as libraries, child care and other neighborhood services in the area.

Objective 2.4 Lower the cost of the production of housing.

Policy 2.4.1 Require developers to separate the cost of parking from the cost of housing in both for sale and rental developments.

Policy 2.4.2 Revise residential parking requirements so that structured or off-street parking is permitted up to specified maximum amounts in certain districts, but is not required.

Policy 2.4.3 Encourage construction of units that are "affordable by design."

Objective 2.6 Continue and expand the City's effort to increase permanently affordable housing production and availability.

Policy 2.6.1 Continue and strengthen innovative programs that help to make both rental and ownership housing more affordable and available.

Jobs-Housing Linkage Program

The Jobs-Housing Linkage Program was first implemented in 1985 as the Office-Affordable Housing Production Program as one means by which the impacts of Downtown office employment growth would be managed and mitigated. The original exaction was limited to Downtown (C-3 Zoning Districts) office development. The program was updated and expanded in 1997. The *Jobs Housing Nexus Analysis* prepared in 1997 for the City demonstrated the relationship between all types of new commercial development and the need for affordable housing.[48]

Policy 1.9 of the 2009 Housing Element calls for enforcement and monitoring of the Jobs-Housing Linkage Program, requiring that new commercial development (as well as institutions of higher education) in the City provide affordable housing or pay an in-lieu fee to meet the housing need attributable to employment or student population growth and new commercial development, particularly the demand for new housing affordable to low- and moderate-income households. The current Jobs-Housing Linkage Program applies to office and other types of developments. The program is incorporated into Section 413 of the Planning Code.

Residential Inclusionary Affordable Housing Program

Planning Code Section 415, or the Inclusionary Affordable Housing Program, requires that a project involving ten or more new dwelling units must (a) provide on-site below market rate units equal to 12 percent of the total number of units, (b) provide off-site below market rate units equal to 20 percent of the total number of units, or (c) pay a fee equivalent to 20 percent of the total number of units.[49]

IMPACTS AND MITIGATION MEASURES

SIGNIFICANCE THRESHOLDS

The thresholds for determining the significance of impacts in this analysis are consistent with the environmental checklist in Appendix G of the State CEQA Guidelines, which has been modified by the San Francisco Planning Department. For the purpose of this analysis, the following applicable thresholds were used to determine whether implementing the Proposed Project would

[48] Keyser Marston Associates, Inc. and Gabriel Roche, Inc., *Jobs Housing Nexus Analysis, City of San Francisco*, July 1997. Prepared for the Office of Affordable Housing Production Program, City and County of San Francisco.

[49] The Proposed Project exceeds requirements of Proposition C, which was passed by ballot in June 2016. The Proposed Project is subject to Proposition F, which was passed in November 2014 and set affordable housing rates for the 28-Acre Site at 30 percent. The remainder of the project site is subject to the Residential Inclusionary Affordable Housing Program (Planning Code Section 415).

result in a significant impact on population and housing. Implementation of the Proposed Project would have a significant effect on population and housing if the project would:

C.1 Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure);

C.2 Displace substantial numbers of existing housing units or create demand for additional housing, necessitating the construction of replacement housing; or

C.3 Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere.

APPROACH TO ANALYSIS

CEQA Guidelines Section 15064(e) notes that an economic or social change by itself would not be considered a significant effect on the environment. Population growth is considered in the context of local and regional plans and population, housing, and employment projections. Generally, a project that induces population growth is not viewed as having a significant impact on the environment unless this growth is unplanned and results in significant physical impacts on the environment. Thus, the growth and changes in employment and population, and potential demand for housing that would occur with implementation of the Proposed Project would not be adverse physical impacts in themselves. However, the physical changes needed to accommodate project-related growth may have physical impacts on the environment. Project-related growth and the increase in population would primarily result in increased demand on transportation infrastructure, public services, utilities and service systems, and recreational facilities, as well as increases in ambient noise levels and criteria air pollutant and toxic air contaminant emissions. These physical impacts are evaluated in Section 4.E, Transportation and Circulation; Section 4.F, Noise and Vibration; Section 4.G, Air Quality; Section 4.H, Greenhouse Gas Emissions; Section 4.J, Recreation; Section 4.K, Utilities and Services Systems; and Section 4.L, Public Services.

The impact analysis considers whether the Proposed Project would contribute to substantial residential population and employment growth. The Maximum Residential Scenario and the Maximum Commercial Scenario are analyzed separately. Direct population growth would result from the residents who would occupy the newly developed housing units and the people who would be employed by the proposed residential, commercial, and retail/arts/light-industrial (RALI) uses at the project site, as well as from temporary construction employment. Indirect or secondary growth is often defined as development that occurs as infrastructure is expanded to previously unserved or underserved areas. This type of development pattern typically occurs in suburban areas adjacent to or near undeveloped lands and is not applicable to the project site, which is located in a built-up urban environment that is already served by infrastructure. The

analysis also considers whether substantial numbers of residents, housing units, or employees would be displaced.

The analysis compares the population, employment, and housing characteristics that would result from development of the Proposed Project to existing conditions. The 2010 U.S. Census, 2013 ACS, 2014 Housing Element, and ABAG's *Regional Housing Need Plan for the San Francisco Bay Area: 2014-2022* were used to prepare the analysis because they are the most recent data consistently available for the project site across all population, employment, and housing indices.

PROJECT FEATURES

The Proposed Project entails the development of the 28-Acre Site and the Illinois Parcels (20th/Illinois Site and the Hoedown Yard). It would include residential, commercial, and RALI uses. Under the provisions of the proposed Special Use District, the Proposed Project would provide a flexible land use program under which certain parcels could be developed for primarily commercial or residential uses, with much of the ground floor dedicated to RALI uses.

The two scenarios, the Maximum Residential Scenario and the Maximum Commercial Scenario, would have separate effects on population and housing at the project site. Under the Maximum Residential Scenario, there would be up to 3,025 residential units, 1,102,250 gross square feet (gsf) of commercial use, and 479,980 gsf of RALI use (269,495 gsf of retail, 67,375 gsf of restaurant, and 143,110 gsf of art/light-industrial). Under the Maximum Commercial Scenario, there would be 1,645 residential units, 2,262,350 gsf of commercial use, and 486,950 gsf of RALI use (275,075 gsf of retail use, 68,765 gsf of restaurant use, and 143,110 gsf of art/light-industrial).

As stated under "Households" on pp. 4.C.3-4.C.4, ABAG *Projections 2013* estimates 2.27 persons per household for San Francisco in 2015. Because household population projections tend to fluctuate over time, for the purpose of this analysis, the 2015 household size of 2.27 is used. Therefore, the Proposed Project would have a residential on-site population of approximately 6,868 residents under the Maximum Residential Scenario (4,881 residents on the 28-Acre Site and 1,987 residents on the Illinois Parcels), and approximately 3,735 residents under the Maximum Commercial Scenario (2,497 residents on the 28-Acre Site and 1,238 residents on the Illinois Parcels). (See Table 4.C.4: Population and Employment Estimates for the Maximum Residential Scenario and the Maximum Commercial Scenario.)

Under both the Maximum Residential Scenario and Maximum Commercial Scenario, the proposed uses would displace approximately 60 to 70 existing on-site employees. As part of the Proposed Project, these employees would be offered the opportunity to lease space on the project site or to relocate to other Port properties to the extent required under California Relocation

Assistance Law (California Government Code Section 7260 et seq.), and applicable regulations. Total employment under the Maximum Residential Scenario would be 5,599 employees, with approximately 5,443 employees at the 28-Acre Site and 156 employees at the Illinois Parcels. Total employment under the Maximum Commercial Scenario would be 9,768 employees, with approximately 8,754 employees at the 28-Acre Site and 1,014 employees at the Illinois Parcels.[50,51] Potential impacts on population, housing, and employment are analyzed for both scenarios. (For a summary of employment by scenario and corresponding land use, see Table 4.C.5: Total Employment at Build-Out by Land Use under the Maximum Residential Scenario, p. 4.C.21, and Table 4.C.6: Total Employment at Build-Out by Land Use under the Maximum Commercial Scenario, p. 4.C.30.)

Table 4.C.4: Population and Employment Estimates for the Maximum Residential Scenario and the Maximum Commercial Scenario

	Maximum Residential Scenario	Maximum Commercial Scenario
Population[1]		
28-Acre Site	4,881	2,497
Illinois Parcels	1,987	1,238
Total Residents	**6,868**	**3,735**
Employment[2]		
28-Acre Site	5,443	8,754
Illinois Parcels	156	1,014
Total Employees	**5,599**	**9,768**

[51] Employment numbers for residential, open space, and parking uses were determined using Table III.C-7, p. III.C-12, from the San Francisco Planning Department, *Candlestick Point-Hunters Point Shipyard Phase II Development Plan EIR*, November 2009.

IMPACT EVALUATION

Impact PH-1: The Proposed Project would not induce substantial population growth in an area, either directly or indirectly. *(Less than Significant)*

The project site is located within the *Central Waterfront Area Plan*, part of the larger Eastern Neighborhoods Planning Area. The Eastern Neighborhoods community planning process initiated by the Planning Department encourages new housing to be located at the Central Waterfront due to this area's proximity to transit and essential services.[52] The Housing Element identifies the Central Waterfront Area for growth of 2,000 residential units; however, this does not include the Pier 70 project site.[53] The *Central Waterfront Area Plan* encourages the transformation of traditional Port activities (i.e., industrial uses) to accommodate a substantial amount of new housing. The Plan sees the Central Waterfront as "critical to supporting a much-needed increase in commercial services, enlivening open spaces, and creating a vibrant and cohesive residential neighborhood."[54] Additionally, the project site is located in the Port of San Francisco PDA, an area identified by the City and ABAG as a possible area for population and housing growth.[55]

Maximum Residential Scenario

Population

Up to 3,025 new residential units would be developed under the Maximum Residential Scenario (2,150 units on the 28-Acre Site and 875 units on the Illinois Parcels), which would result in approximately 6,868 new residents at the project site.[56] New housing associated with the Proposed Project would add to the City's contribution to the regional housing supply.

Based on the 2010 U.S. Census, the new residents would represent an approximately 448 percent increase in the total number of residents located in Census Tract 226, which comprises most of the *Central Waterfront Area Plan*. As discussed above, the project site is located within an area of the SOMA Planning District, which has an average housing density of 54 units per acre.[57] The Proposed Project would result in a maximum housing density of about 86 residential units per acre (78 residential units per acre on the 28-Acre Site and 125 residential units per acre on the Illinois Parcels), assuming maximum development of 3,025 new residential units with the Maximum Residential Scenario; thus, the average housing density of the Proposed Project would be higher than the average housing density in this portion of the SOMA Planning District.

[55] ABAG, *Projections 2013*, p. 75.
[56] ABAG *Projections 2013* estimates 2.27 persons per household in San Francisco for 2015.
[57] San Francisco Planning Department, Data and Needs Analysis, Map 6, p. 70.

Local policy emphasizes promoting mixed use development with moderate to high residential densities to meet the City's housing needs and reduce greenhouse gas emissions; this has resulted in the development of buildings with more than 10 units (91 percent of the new construction in the last 10 years). A large proportion of new housing development has occurred in areas of the City well served by transit and essential services such as the SOMA Planning District, which includes the *Central Waterfront Area Plan* and the project site. The *Central Waterfront Area Plan* identifies Pier 70 as playing a substantial role in defining the Central Waterfront; however, changes to the zoning and height controls at Pier 70 were not included in the analysis of the Eastern Neighborhoods community planning and rezoning program in recognition of the Port's Pier 70 area master planning efforts. In 2014 the construction of new housing in the SOMA Planning District more than doubled compared to that in the previous four years (approximately 54 percent of net new housing Citywide), with almost 74 percent in developments with 10 or more units.

Although the addition of approximately 6,868 new residents would be substantial for the project area, it would be not be substantial for the City as a whole, as it would represent approximately 2.4 percent of the projected increase in Citywide population growth of 280,465 persons between 2010 and 2040 (from 805,235 in 2010 to 1,085,700 in 2040), and less than 1 percent of the projected increase in the Bay Area-wide population growth of approximately 2.1 million persons over the same time period.

Although the residential density and number of units are higher than what is called for in the Housing Element, the amount of housing and residential population within the SOMA Planning District has increased more rapidly than in many other parts of the City, and the rate of growth and increased densities are consistent with the goals of the *Central Waterfront Area Plan*, the Housing Element, and *Plan Bay Area*. Further, the proposed residential density would not be considered to result in a substantial adverse impact in and of itself because the site is located in proximity to major transit corridors (e.g., T-Third Street, 22-Fillmore, and CalTrain) and employment centers (e.g., the Financial District, Mission Bay, and the SOMA area); is within an area that is currently being developed with higher residential densities; and is identified in City and regional planning documents as an area designated to accommodate a substantial proportion of the City's future residential growth, and so is appropriate for higher residential densities.

The scale of residential development from the Maximum Residential Scenario would also be above the estimated population growth within the Port of San Francisco PDA (3,059 residents

and 1,497 households by 2040).[58,59] However, the development of residential uses in this area would conform with ABAG and the City's designation of the Port of San Francisco as one of 12 PDAs that are served by existing utilities, infrastructure, and transit, and with the potential to accommodate substantial population and housing growth in the City and Bay Area.[60] The Port of San Francisco PDA remains a viable location for population growth due to its location near transit and neighborhood-serving amenities. The construction of residential units associated with the Proposed Project would assist the City in meeting its share of regional housing needs identified in the *Regional Housing Need Plan for the San Francisco Bay Area: 2014-2022* of 28,869 units by 2022.

The Proposed Project would contribute to the City's supply of affordable housing. Under the Proposed Project, 30 percent of all completed residential units on the 28-Acre Site would be required to be offered at below market rate prices, and a majority of all residential units constructed would be available as rentals. The Proposed Project's affordable housing requirement would be established through transaction documents between the Port and Forest City for the Proposed Project. The 30 percent affordable housing requirement would exceed the on-site (12 percent of all units) and off-site (20 percent of all units, within 1 mile) percentages required by Planning Code Section 415. The Illinois Parcels would also contribute to affordable housing by complying with the provisions of San Francisco Planning Code Section 415. The Proposed Project would assist San Francisco in meeting its regional housing needs allocation and affordability metrics, as outlined in the *Regional Housing Need Plan for the San Francisco Bay Area: 2014-2022.*

For the reasons discussed above, the Maximum Residential Scenario would not induce substantial[61] population growth in the Central Waterfront or Citywide, either directly, through the development of a large number of new residential units, or indirectly, through the extension or expansion of roads or other public infrastructure that could allow more growth than could be served by existing infrastructure. The increase in population from the Proposed Project would not, in itself, result in adverse physical effects, but would serve to advance key City policy

[58] ABAG, *Projections 2013,* p. 75. ABAG defines the Port of San Francisco PDA as a Mixed-Use Corridor Place Type (transit-served areas with a mix of moderate-density housing, services, retail, employment, and civic or cultural uses).

[59] ABAG, Plan Bay Area Priority Development Area Showcase, February 2015. Available online at http://gis.abag.ca.gov/website/PDAShowcase/. Accessed March 7, 2016.

[60] San Francisco County Priority Development Areas include Bayview/Hunters Point Shipyard/Candlestick Point; Balboa Park, Downtown-Van Ness-Geary; Eastern Neighborhoods; Mission Bay; Port of San Francisco; Transbay Terminal; Treasure Island; San Francisco/San Mateo Bi-County Area (with Brisbane); 19th Avenue Corridor, Market and Octavia, and Mission-San Jose Corridor.

[61] Substantial growth is defined as increases in population that are unplanned, without consideration of or planning for infrastructure, services, and housing needed to support proposed residents, employees, and visitors.

objectives, such as providing housing in appropriate locations next to Downtown and other employment-generating areas, and would further the City's Transit First policy.[62] Thus, the Proposed Project's contribution to the population and employment growth in the immediate project area would continue current development trends in the City and region and would focus development in an area that would be able to accommodate such future growth. Therefore, impacts of the Maximum Residential Scenario on population growth would be less than significant, and no mitigation measures are necessary.

Employment

Temporary Construction Employment

There would be direct, but temporary, growth in construction jobs on the project site as a result of the Proposed Project. Project construction would be phased over approximately 11 years, beginning in 2018 and concluding in 2029. Temporary construction employment would vary, depending on the construction phase. Daily average and maximum (peak) employment is estimated for the various phases of construction. However, it is assumed that an average of about 70 construction workers would be at the site per day, with a greater number during peak periods of building construction.[63] Peak periods of construction would involve having workers on the site for a combination of activities involving building construction, architectural coatings, and paving, with a maximum of 419 total daily workers.[64]

San Francisco and the five-county subregion of San Francisco, Alameda, Contra Costa, Marin, and San Mateo counties have experienced persistently high unemployment in recent years. The construction sector was particularly affected by the 2007-2008 mortgage crisis and subsequent recession. Between 2007 and 2010, construction jobs in the five-county subregion declined by nearly 38,000 jobs, or about a third, over this period. However, the trend for the five counties as a whole began to reverse in 2011, with an increase of about 520 construction jobs in the five-county subregion that year. Construction job growth has continued, and between 2010 and July 2014, more than 22,700 construction jobs were added in the five-county subregion. Therefore, as of July 2014, the loss in construction employment in the five-county subregion since 2007 stands at about 15,000 jobs.[65] Given the continuing number of unemployed construction workers, nearly

[62] The Transit First policy is a section of the San Francisco City Charter that directs City officers, boards, commissions, and departments to prioritize public transportation, bicycling, and walking, over use of a private automobile.

[63] Forest City, Pier 70 SUD Project EIR Data Request No. 2, February 6, 2015.

[64] Ibid.

[65] California Employment Development Department, *Regional Economic Analysis Profile: San Francisco Bay Area Economic Market*, February 2015. Available online at http://www.labormarketinfo.edd.ca.gov/Publications/REA-Reports/SanFranciscoBayArea-REAP2015.pdf. Accessed November 17, 2015.

all project construction labor needs would readily be met by current residents of San Francisco and the rest of the five-county subregion.

Thus, it is anticipated that construction employees not already living in the City would commute from their permanent residences elsewhere in the Bay Area rather than relocate from more distant cities or towns. Once construction phases are complete, construction workers would typically seek employment at other job sites throughout the region that require their particular construction skill. Therefore, construction of the Proposed Project under the Maximum Residential Scenario would not generate a substantial, unplanned population increase. Temporary, project-related impacts associated with construction employment would be less than significant, and no mitigation measures are necessary.

Permanent Employment

There are currently approximately 60 to 70 employees on the project site. Included as part of the Proposed Project, the Port would develop a plan for tenant relocation to the extent required under the California Relocation Assistance Law (California Government Code Section 7260 et seq.), and applicable regulations. The Port would also try to relocate larger-scale tenants to other available, suitable Port property. In accordance with the Term Sheet between the Port and Forest City, Forest City has offered the tenants of Building 11 (the Noonan Building), most of whom are on month-to-month leases, replacement space at Pier 70 after the Noonan Building is demolished, with rent based on the Port's current parameter rent schedule for the Noonan Building. Therefore, all existing employment at the project site would largely remain the same, although some jobs would relocate to a different location.

As shown in Table 4.C.5: Total Employment at Build-Out by Land Use under the Maximum Residential Scenario, the Maximum Residential Scenario would result in approximately 5,599 employees at project completion. The projected employment increase at the project site would represent approximately 0.9 percent of total jobs in the City (617,420) and 1.2 percent of employed residents in the City (460,450) in 2015. As stated under "Total Jobs" on p. 4.C.8, ABAG projects that the number of total jobs in the City will increase to 759,500 in 2040 and that the number of employed residents under the Maximum Residential Scenario would increase to 571,580 by 2040. In 2040, the employment increases would represent approximately 0.7 percent of jobs and 0.9 percent of employed residents in the City. On a Citywide basis, this incremental increase in employment due to implementation of the Maximum Residential Scenario would not be considered significant, and would not exceed the employment growth identified by ABAG. Employment growth is also within the growth projections for the Port of San Francisco PDA (149,684 jobs by 2040).[66]

Commercial (6,600 gsf)	24[2]
Retail/Arts/Light-Industrial (RALI)	
Retail (27,840 gsf)	80[3]
Restaurant (6,960 gsf)	20[4]
Open Space (2.5 acres)	1[6]
Parking (663 spaces)	3[7]
Subtotal	156
Total	**5,599**

Notes:

[1] Residential employment would include security and leasing/administration personnel. Information provided by the project sponsors on October 20, 2015 indicates there would be seven employees per residential building.

[2] Total employment for commercial land uses was calculated using the "Office – General" Land Use Type in Table C-1 of the *Transportation Impact Guidelines*, which indicates that average density is 276 gsf per employee.

[3] Total employment for retail land uses was calculated using the "General Retail" Land Use Type in Table C-1 of the *Transportation Impact Guidelines*, which indicates that average density is 350 gsf per employee.

[4] Total employment for restaurant land uses was calculated using the "Eating/Drinking" Land Use Type in Table C-1 of the *Transportation Impact Guidelines*, which indicates that average density is 350 gsf per employee.

[5] Total employment for Arts/Light-Industrial land uses was calculated using the "Office – General" Land Use Type in Table C-1 of the *Transportation Impact Guidelines*, which indicates that average density is 276 gsf per employee.

[6] Total employment for open space land uses was calculated using 0.26 employee per acre based on Table III.C-7 from the Candlestick Point-Hunters Point Shipyard Phase II Development Plan EIR.

[7] Total employment for parking land uses was calculated using 270 spaces per employee based on Table III.C-7 from the *Candlestick Point-Hunters Point Shipyard Phase II Development Plan EIR.*

Sources: City of San Francisco, *Transportation Impact Guidelines*, Table C-1, 2002; San Francisco Planning Department, *Candlestick Point-Hunters Point Shipyard Phase II Development* EIR, November 2009, Table III.C-7, p. III.C-12; e-mail communication from Forest City, October 20, 2015

Maximum Commercial Scenario

Population

Up to 1,645 new residential units would be developed under the Maximum Commercial Scenario (1,100 on the 28-Acre Site and 545 on the Illinois Parcels), which would result in approximately 3,735 new residents at the project site.[67]

Based on the 2010 U.S. Census, the new residents would represent an approximately 243 percent increase over the total number of residents located in Census Tract 226, which comprises most of the Central Waterfront Area. Although this increase would be large for the project area, it would be not be substantial for the City as a whole, as it would represent 1.3 percent of the total Citywide population growth from 805,235 in 2010 to 1,085,700 in 2040, and 0.03 percent of population growth in the nine-county Bay Area region.[68]

Similar to the Maximum Residential Scenario, the Maximum Commercial Scenario is located within an area of the *Central Waterfront Area Plan*. The project site is one of several PDAs in the City identified by ABAG and the City as an area that could accommodate anticipated housing development and population growth, an objective further supported by the City's *General Plan* Housing Element and ABAG's *Plan Bay Area*. The increase in population from the Proposed Project would not, in itself, result in an adverse physical effect, but would serve to advance key City policy objectives, such as providing housing in appropriate locations next to Downtown and other employment-generating areas, and would further the City's Transit First policies. The anticipated increase in population and density would not result in significant adverse physical effects on the environment. Therefore, the Maximum Commercial Scenario would not directly result in substantial population growth beyond that planned for in the City. Impacts from the Maximum Commercial Scenario on population growth would be less than significant, and no mitigation measures are necessary.

Employment

Temporary Construction Employment

There would be direct, but temporary, growth in construction jobs in the Central Waterfront area as a result of the Proposed Project. Project construction would be phased over approximately 11 years, beginning in 2018 and concluding in 2029. Temporary construction employment would vary, depending on the construction phase. Daily average and maximum (peak) employment is

[67] ABAG *Projections 2013* estimates 2.27 persons per household in San Francisco for 2015.
[68] ABAG projects that between 2010 and 2040, San Francisco population will increase from 805,235 in 2010 to 1,085,700 in 2040, a total increase of about 280,465 persons. ABAG *Projections 2013*, p. 75.

estimated for the various phases of construction. However, it is assumed that an average of about 70 construction workers would be at the site per day, with a greater number during peak periods of building construction.[69] Peak periods of construction would involve having workers on the site for a combination of building construction, architectural coatings, and paving, with a maximum of 419 total daily workers.[70]

Similar to the Maximum Residential Scenario, construction employees not already living in the City would commute from their permanent residences elsewhere in the Bay Area rather than relocate from more distant cities or towns. Construction jobs are still recovering from the 2007 economic downturn; thus, nearly all project construction labor needs would be readily met by current residents of San Francisco and the rest of the five-county subregion. Once construction phases are complete, construction workers would typically seek employment at other job sites throughout the region that require their particular construction skill. Thus, construction of the Proposed Project under the Maximum Commercial Scenario would not generate a substantial, unplanned population increase. Temporary, project-related impacts associated with construction employment would be less than significant, and no mitigation measures are necessary.

Permanent Employment

There are currently approximately 60 to 70 employees on the project site. Included as part of the Proposed Project, the Port would develop a plan for tenant relocation to the extent required under the California Relocation Assistance Law (California Gov. Code Section 7260 et seq.), and applicable regulations. The Port would also try to relocate larger-scale tenants to other available, suitable Port property. In accordance with the Term Sheet between the Port and Forest City, Forest City has offered the tenants of Building 11 (the Noonan Building), most of whom are on month-to-month leases, replacement space at Pier 70 after the Noonan Building is demolished, with rent based on the Port's current parameter rent schedule for the Noonan Building. Therefore, all existing employment at the project site would largely remain the same, although some jobs would relocate to a different location.

As shown in Table 4.C.6: Total Employment at Build-Out by Land Use under the Maximum Commercial Scenario, the Maximum Commercial Scenario would result in approximately 9,768 employees once the project is completed (8,754 on the 28-Acre Site and 1,014 on the Illinois Parcels). The projected employment increase at the project site would represent approximately 1.6 percent of total jobs in the City (617,420) and 2.1 percent of employed residents in the City in 2015 (460,450). As stated under "Total Jobs" on p. 4.C.8, ABAG projects that the number of total jobs in the City will increase to 759,500 in 2040 and that the

[5] Total employment for Arts/Light-Industrial land uses was calculated using the "Office – General" Land Use Type in Table C-1 of the *Transportation Impact Guidelines*, which indicates that average density is 276 gsf per employee.

[6] Total employment for open space uses was calculated using 0.26 employees per acre based on Table III.C-7 from the *Candlestick Point-Hunters Point Shipyard Phase II Development Plan EIR*.

[7] Total employment for parking uses was calculated using 270 spaces per employee based on Table III.C-7 from the *Candlestick Point-Hunters Point Shipyard Phase II Development Plan EIR*.

Sources: City of San Francisco, *Transportation Impact Guidelines*, Table C-1, 2002; San Francisco Planning Department, *Candlestick Point-Hunters Point Shipyard Phase II Development* EIR, November 2009, Table III.C-7, p. III.C-12; e-mail communication from Forest City, October 20, 2015

number of employed residents under the Maximum Commercial Scenario would increase to 571,580 by 2040. In 2040, the employment increases would represent approximately 1.3 percent of jobs in the City and 1.7 percent of employed residents in the City. On a Citywide basis, this incremental increase in employment due to implementation of the Maximum Commercial Scenario would not be considered significant, and would not exceed the employment growth identified by ABAG.

Impact PH-2: The Proposed Project would not displace substantial numbers of existing housing units or create demand for additional housing, necessitating the construction of replacement housing elsewhere. ***(Less than Significant)***

Maximum Residential Scenario

The Maximum Residential Scenario would result in new construction of 1,102,250 gsf of commercial uses, 269,495 gsf of retail uses, 67,375 gsf of restaurant uses, and 143,110 gsf of arts/light-industrial uses. As discussed under "Housing" on p. 4.C.3, no housing units are located on the project site; therefore, the Proposed Project would not displace existing housing. However, the projected increase in employment on the site would be expected to indirectly increase demand for housing.

Assuming each new employee on the project site would live alone and seek a new housing unit in the City, the Maximum Residential Scenario would induce demand for 5,599 new housing units (5,443 on the 28-Acre Site and 156 on the Illinois Parcels). This figure likely overstates the induced housing demand of the Maximum Residential Scenario, as (1) some employees may already live in the City and would not require new housing; (2) some employees may share a housing unit (rather than live alone); and (3) some employees would be expected to seek housing outside of the City.

A more realistic approach based on current commute patterns assumes 27.3 percent of jobs in San Francisco are held by commuters (and 72.7 percent of jobs are held by those who live in the City)[71] and that each household has approximately 1.27 workers. Under this assumption, the Maximum Residential Scenario would induce demand for about 3,205 housing units (3,115 on the 28-Acre Site and 90 on the Illinois Parcels).[72] However, it is probable that many employees would already live in San Francisco or other parts of the Bay Area and would not require new housing due to the Proposed Project. Therefore, this estimate of induced housing demand likely overestimates the number of employees who would move to the Bay Area as a result of the Proposed Project.

[71] San Francisco Planning Department, Data and Needs Analysis, p. I.14, indicates that 27.3 percent of the jobs in the City are held by commuters.

[72] San Francisco Planning Department, Data and Needs Analysis, p. I.14, indicates that the City of San Francisco has an average of 1.27 workers per household in 2015.

As part of the Maximum Residential Scenario, 3,025 new residential units would be constructed on the project site (2,150 on the 28-Acre Site and 875 on the Illinois Parcels), which would represent approximately 94 percent of the project's estimated induced housing demand. Depending on the number of new project employees who would share housing and who already live in the area, it is possible that the induced housing demand of the Maximum Residential Scenario could exceed the amount of housing that would be provided on the project site.

A portion of the Proposed Project's employment growth would be considered substantial if it resulted in housing demand that would exceed anticipated on-site, Citywide, and regional housing development. The housing demand for 3,205 residential units could be met with the new residential units proposed under the Maximum Residential Scenario, when considered in the context of the projected growth in the project area and Citywide. The induced housing demand would not exceed the number of projected housing units that would likely be developed under various area-wide planning efforts, including the Candlestick Point-Hunters Point Project, the Treasure Island / Yerba Buena Island Redevelopment Plan, and the Parkmerced Project. The induced demand for 3,205 residential units represents approximately 13.3 percent of the projected 24,180 housing units that could be developed. In addition, this demand would also be within the 28,869 and 187,990 new housing units that ABAG has allocated to San Francisco and other Bay Area cities, respectively, in the *Regional Housing Need Plan for the San Francisco Bay Area: 2014-2022*.[73]

The non-residential development at the project site would be subject to San Francisco's Jobs-Housing Linkage Fee (Planning Code Section 413). The fee would apply to the gross square feet of new office, retail, restaurant, and RALI uses, to mitigate the impact of employment growth on housing supply and affordability. The Jobs-Housing Linkage Fee revenue would be deposited in the Citywide Affordable Housing Fund to be used to increase the supply of affordable housing in San Francisco.

For the reasons stated above, the Maximum Residential Scenario would not displace existing housing or create a substantial demand for housing that could not be accommodated by on-site residential development and by anticipated Citywide and regional development, including affordable housing that would be developed as a result of Jobs-Housing Linkage Fee revenue. Therefore, displacement impacts of the Proposed Project would be less than significant, and no mitigation is necessary.

[73] ABAG, *Regional Housing Need Plan for the San Francisco Bay Area: 2014-2022*, p. 1.

Maximum Commercial Scenario

Assuming each new employee on the project site would live alone and seek a new housing unit in the City, the Maximum Commercial Scenario would induce demand for 9,768 new housing units. However, this figure likely overstates the induced housing demand of the Maximum Commercial Scenario because some employees would likely already live in the City, share a housing unit, or live outside of the City.

A more realistic approach based on current commute patterns assumes 27.3 percent of jobs in San Francisco are held by commuters (and 72.7 percent of jobs are held by those who live in the City) and that each household has approximately 1.27 workers. Under this assumption, the Maximum Commercial Scenario would induce demand for about 5,592 housing units (5,011 on the 28-Acre Site and 581 on the Illinois Parcels).[74,75] Similar to the Maximum Residential Scenario, it is probable that many employees would already live in the City or Bay Area and would not require new housing due to the Proposed Project. Therefore, this estimate of induced housing demand likely overestimates the number of employees who would move to the San Francisco Bay Area as a result of the Proposed Project.

As part of the Maximum Commercial Scenario, 1,645 new residential units would be constructed on the project site (1,100 on the 28-Acre Site and 545 on the Illinois Parcels), which would accommodate approximately 29.4 percent of the estimated induced housing demand. Depending on the number of new project employees who would share housing and who already live in the area, it is possible that the induced housing demand of the Maximum Commercial Scenario would exceed the amount of housing being provided on the project site.

The Proposed Project's employment growth would be considered substantial if it resulted in housing demand that would exceed anticipated on-site, Citywide, and regional housing development. A comparison of the estimated induced housing demand and the number of housing units that would be developed as part of the Maximum Commercial Scenario indicates that a substantial imbalance would not occur, as the worst-case scenario of the induced demand for 5,592 housing units would represent approximately 23.1 percent of the projected 24,180 units that could be developed under various area-wide large-scale housing projects, including the Candlestick Point-Hunters Point Project, Treasure Island / Yerba Buena Island Redevelopment Plan, and the Parkmerced Project. In addition, the *Regional Housing Need Plan for the San Francisco Bay Area: 2014-2022* has determined that 28,869 and 187,990 new housing units are

[74] San Francisco Planning Department, Data and Needs Analysis, p. 14, indicates that 27.3 percent of the jobs in the City are held by commuters.

[75] San Francisco Planning Department, Data and Needs Analysis, p. 14, indicates that the City of San Francisco has an average of 1.27 workers per household.

required for San Francisco and other Bay Area cities, respectively, between 2014 and 2022, substantially more than the 5,592 residential units that could be required under the Maximum Commercial Scenario.[76]

The non-residential development at the project site would be subject to San Francisco's Jobs-Housing Linkage Program (Planning Code Section 413). The Jobs-Housing Linkage Fee would apply to the gross square feet of new commercial, retail, restaurant, and arts/light-industrial uses, to mitigate the documented impact of employment growth on housing supply and affordability. The Jobs-Housing Linkage Fee revenue would be deposited in the Citywide Affordable Housing Fund to be used to increase the supply of affordable housing in San Francisco.

For the reasons stated above, the Maximum Commercial Scenario would not create a substantial demand for housing that could not be accommodated by on-site residential development and by anticipated Citywide and regional development, including housing that would be developed as a result of Jobs-Housing Linkage Fee revenue. Therefore, displacement impacts of the Proposed Project would be less than significant, and no mitigation is necessary.

Cumulative Impacts

Impact C-PH-1: The Proposed Project under the Maximum Residential and Maximum Commercial scenarios, in combination with past, present, and reasonably foreseeable future projects, would not result in a cumulatively considerable contribution to significant cumulative population and housing impacts. ***(Less than Significant)***

The geographic context for the analysis of cumulative impacts on population and housing is the City and the Bay Area region. The Proposed Project would potentially contribute to cumulative population and housing impacts in the context of existing, proposed, and reasonably foreseeable future development expected in San Francisco along with the region. The existing level of development in the City and region, described in the Environmental Setting on pp. 4.C.2–4.C.10, represents the baseline conditions for the evaluation of cumulative impacts. Population and employment forecasts are based on projections of future growth and take into account projects currently under review in the entitlement process.

The geographic context for an analysis of cumulative impacts to employment includes the entire Bay Area (as represented by the ABAG Planning Area[77]), since a percentage of the City population commutes to jobs outside City limits, and significant numbers of residents of other cities in the Bay Area commute to jobs within the City. The existing employment conditions,

[76] ABAG, *Regional Housing Need Plan for the San Francisco Bay Area: 2014-2022*, p. 1.
[77] The ABAG Planning Area encompasses the nine Bay Area counties: Sonoma, Napa, Solano, Marin, Contra Costa, San Francisco, Alameda, San Mateo, and Santa Clara.

representing past and present trends in this geographic area, are described in the Environmental Setting on pp. 4.C.8-4.C.10.

Population

ABAG's *Projections 2013* estimates an increase in San Francisco of 101,539 households (447,350 total households), 280,465 persons (1,085,700 total population), and 190,780 jobs (759,500 total jobs) from 2010 to 2040.[78] About 92 percent of the anticipated number of households and about 88 percent of the anticipated population growth will occur in San Francisco's PDAs.[79] At the regional level ABAG's *Projections 2013* indicates that about 78 percent of anticipated housing growth and about 69 percent of anticipated population growth would occur within PDAs.[80,81]

The population increase associated with the Proposed Project would exceed the 2040 household (1,497) and population (3,059) estimates for the Port of San Francisco PDA[82] but would be within the 2040 estimates for the adjacent PDAs (26,880 new households and 79,100 new persons) and the City (101,539 new households and 280,465 new persons). The PDAs adjacent to the project site are the Eastern Neighborhoods, Mission Bay, and Bayview/Hunters Point Shipyard/Candlestick Point. The Mission Bay PDA is to the north, the Eastern Neighborhoods PDA is to the west, and the Bayview/Hunters Point Shipyard/Candlestick Point PDA is to the south. These PDAs are Urban Neighborhood Place Types (primarily moderate- to high-density residential areas with local-serving retail services and other small business or older industrial uses). The Eastern Neighborhoods, Mission Bay, and Bayview/Hunter's Point Shipyard/Candlestick Point PDA populations are anticipated to grow by 31,060, 40,850, and 7,190 residents, respectively. When considered at the Citywide and regional level, the population increase attributable to the Proposed Project would not be considered substantial because it would not exceed population increases identified by ABAG for the adjacent PDAs (when considered together), for the City as a whole, or for the nine-county Bay Area region. The City's long-range planning efforts take into account anticipated population growth as well as demand on infrastructure, public services, and housing. Consequently, implementation of the Proposed

[78] These calculations are based on ABAG *Projections* 2013, pp. 74-75.
[79] ABAG, *Projections 2013*, p. 71.
[80] ABAG, *Projections 2013*, p. 17.
[81] San Francisco Priority Development Areas include Bayview/Hunters Point Shipyard/Candlestick Point; Balboa Park; Downtown-Van Ness-Geary; Eastern Neighborhoods; Mission Bay; Port of San Francisco; Transbay Terminal; Treasure Island; San Francisco/San Mateo Bi-County Area (with Brisbane); 19th Avenue Corridor; Market and Octavia; and Mission-San Jose Corridor.
[82] ABAG, Plan Bay Area Priority Development Area Showcase, February 2015. Available online at http://gis.abag.ca.gov/website/PDAShowcase/. Accessed March 7, 2016.

Project would not contribute substantially to significant cumulative impacts associated with population and housing growth.

The Proposed Project would directly increase the on-site population within the context of an established urban area with high levels of local and regional transit services and facilities, and would include other neighborhood amenities and services that could accommodate this increase. This direct population growth is considered planned growth, because the Proposed Project has been included in the City's population planning projections. By 2040, approximately 88 percent of San Francisco's projected population growth is expected to occur within PDAs, which includes the project site.[83] Although the scale of residential development from the Proposed Project would be greater than the estimated 2040 household and population estimates identified by ABAG for the Port of San Francisco PDA, the development of residential uses in this area would conform with ABAG and the City's designation of the Port of San Francisco as one of 12 PDAs that are served by existing utilities, infrastructure, and transit, and with the potential to accommodate future population and housing growth in the City and Bay Area region.[84]

Indirect growth (or unplanned growth) includes residential and employment growth in surrounding neighborhoods resulting from an expansion of local infrastructure and public services. The Proposed Project would improve the on-site infrastructure and transportation network, but would not build or expand infrastructure or public services that could encourage additional local growth beyond that already planned. Therefore, the Proposed Project would not result in substantial indirect population or employment growth.

For the reasons stated above, the Proposed Project would not have a cumulatively considerable contribution to any potential cumulative impact related to substantial increases in population, and its cumulative impact would be less than significant.

Housing

As identified in ABAG's *Regional Housing Need Plan for the San Francisco Bay Area: 2014-2022*, the regional housing needs allocation for the nine-county Bay Area is 187,990 residential units, with San Francisco's share at 28,869 units. The Maximum Residential Scenario would provide approximately 3,025 new residential units, or 10.4 percent of the City's regional housing needs allocation and 1.6 percent of the total regional housing need. The Maximum Commercial Scenario would provide approximately 1,645 new residential units, or 5.7 percent of the City's

[83] ABAG, *Projections 2013*, p. 71.

[84] San Francisco County Priority Development Areas include Bayview/Hunters Point Shipyard/Candlestick Point; Balboa Park; Downtown-Van Ness-Geary; Eastern Neighborhoods; Mission Bay; Port of San Francisco; Transbay Terminal; Treasure Island; San Francisco/San Mateo Bi-County Area (with Brisbane); 19th Avenue Corridor; Market and Octavia; and Mission-San Jose Corridor.

regional housing needs allocation and 0.9 percent of the total regional housing need. As noted under "Housing Needs" on pp. 4.C.5-4.C.8, over the course of the past several decades construction of housing in the region has failed to keep pace with population growth in the Bay Area. Population growth is predicted to continue to grow at a relatively moderate rate through 2040, and the region is still attempting to make up for housing shortages from previous growth periods. The Proposed Project would help reduce the housing shortage and would not contribute to significant unplanned population growth.

The demand for 3,205 to 5,592 housing units that would be generated by employment under the Maximum Residential and Maximum Commercial Scenarios, respectively, would be more than the total number of units provided by the Proposed Project. However, the housing demand could be met with units developed under various Citywide and regional planning efforts, on-site development, and housing built as a result of the Jobs-Housing Linkage Fee. As a result, the Proposed Project's contribution to the substantial cumulative housing shortage in the Bay Area would be less than significant.

Housing Demand

The demand for housing units outside of the City generated by the Proposed Project, conservatively assuming that 27.3 percent of those employed within the project site would commute from outside of San Francisco, would be dispersed throughout the nine-county Bay Area. The Proposed Project would create a demand for housing in San Francisco in excess of the on-site residential development; however, anticipated household growth in adjacent PDAs (26,880), at the citywide level (101,539), and at the regional level (700,067) estimated in ABAG's *Projections 2013* could accommodate this additional demand. Therefore, the population growth associated with increased project-related employment would not result in a housing demand that would exceed planned regional housing development, and would not be substantial. Because the employment increase associated with the Proposed Project would not be individually substantial or contribute to an exceedance of the City's employment projections, the Proposed Project would not result in a cumulatively considerable contribution to a potentially significant cumulative impact related to employment. Cumulative impacts related to physical environmental topics (like transportation, noise, and air quality) are discussed in other sections of Chapter 4 in this EIR.

Employment

Development at the project site would provide about 5,599 (under the Maximum Residential Scenario) to 9,768 (under the Maximum Commercial Scenario) new permanent jobs by 2030 (in addition to temporary construction-related jobs generated by the Proposed Project). Regional projections indicate that by 2040 the San Francisco Bay Area will have about 4,505,230 jobs

(from 3,669,990 in 2015), an increase of 835,240 jobs. Citywide projections indicate that by 2040 San Francisco will have about 759,500 jobs (from 617,420 in 2015), an increase of 142,080 jobs.[85] The Proposed Project's contribution of 5,599 to 9,768 new permanent jobs would represent about 0.6 to 1.2 percent of the anticipated increase in regional employment and about 4 to 7 percent of the anticipated employment growth in San Francisco through 2040.

San Francisco has traditionally experienced, and will continue to experience, employment opportunities that are not met by an equal supply of housing within the City, or even the Bay Area. The demand for 3,205 to 5,592 housing units that would be generated by employment under the Maximum Residential Scenario and the Maximum Commercial Scenario, respectively, would be more than the total number of units provided by the Proposed Project. However, the housing demand could be met with units that could be developed under various Citywide and regional planning efforts and housing built as a result of the Jobs-Housing Linkage Fee. Therefore, the population growth associated with increased project-related employment would not result in housing demand that would exceed planned housing development, and would not be substantial. Because the employment increase associated with the Proposed Project would not be individually substantial or contribute to an exceedance of ABAG's employment projections for the City, the Proposed Project would not result in a cumulatively considerable contribution to a potentially significant cumulative impact related to employment.

D. CULTURAL RESOURCES

Section 4.D, Cultural Resources, considers both archeological resources, tribal cultural resources, and historic architectural resources. Archeological resources are discussed first, followed by a separate discussion of historic architectural resources that begins on p. 4.D.33.

ARCHEOLOGICAL RESOURCES

This subsection assesses the potential for the presence of archeological resources within the project site, provides a context for evaluating the significance of archeological resources that may be encountered, evaluates the potential impacts (project and cumulative) of the Proposed Project on archeological resources, and provides mitigation measures that would avoid or reduce potential impacts on archeological resources.

An independent consultant has prepared an Archeological Research Design and Treatment Plan (ARDTP) for the project site.[1] The research and recommendations of the ARDTP are the basis for the information and conclusions of this EIR section with respect to archeological resources.

The information in the ARDTP used in the preparation of this subsection was obtained from regional databases, plans, and reports relevant to the Proposed Project, including the San Francisco Maritime National Historical Park photographic collection; the San Francisco History Center at the San Francisco Public Library; Sanborn Fire Insurance maps;[2] San Francisco newspapers; the California Digital Newspaper Collection, sponsored by the University of California, Riverside; the Online Archive of California; the Union Iron Works Historic District National Register Nomination Form; the Library of Congress; and the David Rumsey Map Collection, which also provided useful sources of online maps, including those from the U.S. Coast and Geodetic Survey, U.S. Geological Survey, and official City and County survey maps. Other relevant primary references include (but are not limited to) historic photographs and aerial images, City directories, U.S. Census data, and municipal reports.

[2] Sanborn Maps is an American publisher of maps of U.S. cities and towns. The maps were initially created to estimate fire insurance risks, and are now used as a record of roads and structures extant at the time.

ENVIRONMENTAL SETTING

PREHISTORIC AND HISTORIC CONTEXTS

The following discussion outlines the prehistoric context of the project site, based on relevant chronological prehistoric archeological sites on the San Francisco peninsula and in the San Francisco Bay Area.

Prehistoric Context

The oldest evidence of human occupation in San Francisco includes two isolated human skeletons discovered 45 years apart deep below City streets in marine deposits. In October 1969, fragmentary human bones were encountered during construction of the BART Civic Center Station in downtown San Francisco. Radiocarbon dating of associated organic material indicated the remains were nearly 5,000 years old. The skeleton was discovered 75 feet below ground surface within a 40-foot-thick clayey silt stratum (bay deposits), approximately 26 feet below mean sea level. More recently, an intact human skeleton was found during construction of the Transbay Transit Center in February 2014. The human remains were encountered at a depth of 58 feet below ground surface within a compressible marine clay known as Bay Mud deposits, and are estimated to be between 5,000 to 7,000 years old. The majority of known prehistoric sites in San Francisco are no more than 2,000 years old and were found buried at depths of approximately 10 to 20 feet below ground surface.

Near the southeastern shoreline of San Francisco, most of the prehistoric sites are shell midden sites, which have their greatest known concentrations in the South of Market neighborhood (north of the project site) and the Hunters Point-Bayview-Candlestick Point-Visitacion Valley area (south of the project site). A National Register-eligible district that incorporates several prehistoric sites is within sand dunes formed along the north side of historic Mission Bay, within the South of Market neighborhood approximately 1.5 miles north of the project site. These sites are considered to represent elements of a large prehistoric multi-village community. No prehistoric archeological sites have yet been encountered on the project site.

California prehistory consists of following periods: the Terminal Pleistocene period (11,500-9,600 B.C.), characterized by small and highly mobile populations of hunter-gatherers; the Early Holocene period (9600-5700 B.C.), characterized by semi-mobile hunter-gatherers who used flaked stone tools and ground stone implements; the Middle Holocene period (5700-1800 B.C.), characterized by substantial settlements, isolated burials, distinct cemeteries, milling slabs, mortars and pestles, and the fabrication and use of shell beads and other ornaments; and the late Holocene period (1800 B.C.-A.D. 1780), characterized by establishment of large shellmounds, exploitation of deer, sea otter, mussels, and clams (by the Yelamu Ohlone tribe in the San

Francisco peninsula), and brought to a close by disruption of the Mission system, disease, and displacement with European contact.

Historic Context

Spanish Period (1776-1820)

The historic period begins with the first European expedition into the San Francisco Bay Area in 1772 by Pedro Fages and his party. During the Spanish Period (1776-1820), the Spanish established Mission San Francisco de Asís (also known as Mission Dolores) in 1776 on land occupied seasonally by the Yelamu Ohlone. No permanent Ohlone or Spanish settlements were present in the vicinity of the project site during the Spanish Period. The Spanish missionaries used portions of what are now the Potrero Hill and Dogpatch neighborhoods, including the territory around the project site, as pasture for livestock known as Potrero Nuevo, or "new pasture."

Mexican Period (1821-1848)

During the Mexican Period (1821-1848), following the ceding of Spain's North American colonial outposts to the newly independent Republic of Mexico in 1822, Upper California became a province of the Republic of Mexico. In 1833–1834, the Mexican government secularized the Spanish missions, and many mission lands were also subsequently granted to wealthy and politically influential individuals who established vast cattle raising estates, or ranchos. During the Mexican period, Potrero Hill, including Potrero Point, became part of a large rancho known as Rancho Potrero de San Francisco, which was granted by the Mexican government to the sons of Francisco de Haro. Potrero Point is the geographical name for the eastern arm of the Potrero Hill natural landmass extending into San Francisco Bay. It includes those portions of the project site that are not on filled land, the Illinois Parcels and the southeastern area of the 28-Acre Site. The project site remained undeveloped throughout the 1840s. War between the United States and Mexico broke out in 1846. American attempts to seize control of California quickly ensued, and within two months California was taken by the United States. Skirmishes between the two sides continued until California was officially annexed to the United States on February 2, 1848.

Gold Rush Period (1849-1959)

The discovery of gold in the Sierra Nevada in 1848 began the Gold Rush Period (1849-1959). During this period, immigrants poured into the California territory seeking gold or associated opportunities. To accommodate the growing population, the City soon spread out in all directions. During the early Gold Rush period, the project site was located far beyond the sparsely populated southern edge of development that was concentrated to the north. The project site remained undeveloped throughout the 1850s, with the exception of a single structure in the

northern portion of the project site and a dirt track that traversed the southwestern corner. A powder magazine (a place used for artillery storage) along with several other structures and piers were present just south of the project site in 1859. In addition, the Tubbs Cordage Company's rope-making facility, which was established in the mid-1850s and included a 1,000-foot-long rope walk, was approximately 0.25 mile south of the project site. Historic maps and charts of San Francisco indicate that at the time of the Gold Rush and in the decade following, land reclamation off Potrero Point had not yet begun, and the eastern and northern portions of the project site were within San Francisco Bay.

Late Nineteenth Century (1860-1899)

In the late nineteenth century, development of the project site occurred at a steady pace. Industrial complexes were established in the northern and eastern portions of the project site, and residential and commercial neighborhoods were founded on Irish Hill in the southern and western portions, as described below.

INDUSTRIAL COMPLEXES

Little development took place around Mission Bay and San Francisco's southern waterfront before the mid-1860s, with only a limited amount of filling along the northern shores of Mission Bay. Further south, Potrero Point made an ideal manufacturing area for hazardous materials. The E. I. du Pont de Nemours Company was one of the first manufacturers to exploit this region, setting up a facility to manufacture black powder in 1854. Over the following decades, the Tubbs Cordage Company/San Francisco Cordage Manufactory, Pacific Rolling Mills, and City Gas Company Works moved to the Potrero district.

By the early 1860s, the City's early wooden shipbuilders abandoned the crowded shoreline along Steamboat Point in San Francisco's South of Market district for the deep waters and vacant lands around Potrero Point. In 1862, John North moved his shipbuilding operation from Steamboat Point to a location in Potrero Point immediately south of the Pacific Rolling Mills facility at the foot of present-day 22nd Street. This was the first shipyard established on Potrero Point. North's shipyard built a wide variety of vessels, but focused mostly on building wooden-hulled steamers for use in San Francisco Bay and inland waterways. The shipyard continued to operate at the same location until the 1890s.

Following the establishment of shipyards on Potrero Point in the early 1860s, development of the Pacific Rolling Mills Company began in 1866, and it operated at Potrero Point from 1868 until around 1900. The Pacific Rolling Mills, the first significant iron and steel mill in the West, produced machinery and specialized steel parts for the mining industry, construction, shipbuilding, and rail equipment.

By 1869, a network of roads crisscrossed the project site, with numerous structures dotting Potrero Point and several piers and a large wharf associated with Pacific Rolling Mills present on the waterfront along the eastern edge of the project site. Although some infilling along the shoreline had begun during the 1860s, the eastern and northern portions of the project site were still within San Francisco Bay at the end of the decade.

The Union Iron Works shipyard opened at Potrero Point in 1884 with a machine shop (Building 113), plate shop, pattern shop, foundry, smith shops, and slipways. The next year the yard launched the *Arago*, the first steel hull ship produced by Union Iron Works and launched on the West Coast, and one of the first steel hull ships completed in the country. In 1885, after the yard's success with the *Arago*, Union Iron Works secured naval contracts, initiating a relationship between the U.S. Navy and the yard that lasted through World War II. During the late nineteenth century, the shipyard completed some of the most famous warships of the Spanish-American War, including the USS *Oregon* and the USS *Olympia*.

The 1886 Sanborn map shows North's shipyard in the southeast corner of the project site; by that time North had sold his shipyard to new owners. The Sanborn map also shows the layout of the Pacific Rolling Mills in the northeast portion of the project site and a single "old" structure and two marine railways extending offshore from the base of the bluff. In addition, the map indicates that the former location of Henry Ewing's shipyard, near the present-day intersection of Illinois and 20th streets, had been filled between 1883 and 1886. By 1886, this location was covered with boardinghouses and other businesses that had proliferated on Irish Hill since the late 1860s.

IRISH HILL NEIGHBORHOOD, 1860-1885

When shipbuilders began to move from Steamboat Point to Potrero Point in the early 1860s, a significant residential labor force was attracted to the area. A large number of these workers were Irish immigrants, and the residential neighborhood that grew up around the industrial complex on Potrero Point became known as Irish Hill.

As industrial development of Potrero Point expanded, the number of boardinghouses and other businesses focused on serving working-class residents expanded as well. A large number of boardinghouses, cottages, and saloons were located along Illinois Street south of 20th Street as early as 1869. Although only sparse topographic information is included on the 1886 Sanborn map, it gives a detailed impression of the stark difference between the industrial complexes that occupied the level ground just above sea level and the residential and commercial neighborhood that surrounded them on the higher-elevation uplands of Irish Hill.

The 1870 census data confirms that residents of the project site included a high percentage of working-class immigrants whose jobs covered a wide range of primarily blue-collar occupations.

Although the area historically came to be known as Irish Hill, there were residents originating from countries other than Ireland as well, including the United States, England, Wales, various regions of what was to become Germany, Canada, Norway, Denmark, Sweden, and Australia. There were five Chinese residents who were young single males, aged 17-29, following that group's immigration pattern. Accounts of the North shipyard suggest that Chinese laborers may have been employed by the Potrero Point shipbuilders during the 1860s. Many of the area's residents were born in other parts of the U.S. and came west following the Gold Rush. The 1880 census did not list any Chinese residents. None of the residents from the 1869 directory still lived in the area by 1880.

Twentieth Century (1900-Present)

INDUSTRIAL COMPLEXES

The 1886 and 1900 Sanborn Maps indicate that, physically, relatively minor changes occurred in Potrero Point during that 14-year period. The 1900 Sanborn map indicates that the Pacific Rolling Mills facility expanded slightly to the west and included a machine shop, punching sheds, horseshoe storage, and offices. The Union Iron Works expanded its facility south between Michigan and Georgia streets for the extension of a spur rail line. In the southeast corner of the project site, North's shipyard, present on the 1886 Sanborn map, is no longer present on the 1900 Sanborn map; presumably, it had been removed by the expansion of the Pacific Rolling Mills facility. In 1900, the Risdon Iron & Locomotive Company acquired the Pacific Rolling Mills facility, and it operated on the same property from 1900 until 1911. Risdon produced mining equipment and developed some of the first and most successful gold dredgers.

In 1905, Charles Schwab purchased the shipyard on behalf of the Bethlehem Steel Corporation, the second largest steel manufacturer in the country. In the spring of 1908, Schwab personally oversaw upgrades to the yard's repair facilities, which allowed the yard to repair the Great White Fleet, the naval fleet that President Theodore Roosevelt ordered to sail around the world from 1907 to 1909 as a display of the country's growing military power.

By World War I, the Bethlehem Shipyard served as the headquarters of a West Coast shipbuilding complex, which included the Hunters Point Drydock, the Alameda Yard, and the U.S. Navy Destroyer Plant. New buildings designed by renowned San Francisco architects were constructed along 20th Street (outside of the project site), creating a grand entrance to the yard. The shipyard was expanded and modernized during the 1910s to include expanded infrastructure, a new plate shop (Building 109), and new foundries (Building 115/116). The 66 submarine destroyers produced by the yard made a substantial contribution to the World War I naval effort.

The yard survived the lean years after World War I on commercial ship construction and ship repair contracts. United States Maritime Commission contracts, starting in 1936, resulted in a new wave of modernization at the yard. Upgrades included a new boiler house (Building 103), a new steel warehouse (Building 117, located on the 28-Acre Site), and a yard-wide transformation from riveting to welding, which helped the yard adapt to standardized mass production that typified World War II ship production.

During the start of World War II, the shipyard was expanded to include new buildings and new and expanded slipways and wet basins along the waterfront. The shipyard was managed primarily by the U.S. Navy during the war. The most substantial development was the expansion of the southeastern slipways (Slipways 5 through 8, located on the waterfront on the 28-Acre Site) and construction of the New Yard shipbuilding facility (the Building 12 complex, also located on the 28-Acre Site), which was built by the Navy on the former destroyer plant in 1941. Building use became more specialized, with buildings designated and equipped for specific outfitting and ship repair activities. The repair yard, which contained structures and even equipment that dated back to the origins of steel shipbuilding in this country, was one of the best and the largest commercial repair yards in the country. During the war years, the yard built over 70 ships and repaired 2,500 others.

After World War II, the yard continued to build government and commercial ships into the 1970s. In the early 1980s, the Bethlehem Steel Company went bankrupt and sold the shipyard to the Port of San Francisco. Todd Shipyards purchased much of the machinery and leased portions of the yard for ship repair. Today, BAE Systems Ship Repair leases portions of the yard from the Port of San Francisco and continues to operate a ship repair facility on site, making the yard the longest operating steel hull ship repair yard in the country.

In 2014, the Potrero Point industrial complexes on Pier 70 were listed on the National Register Historic District as the Union Iron Works Historic District (see “Union Iron Works Historic District” in Chapter 2, Project Description, pp. 2.9-2.10). The Union Iron Works Historic District is a maritime industrial district that is historically significant at the national level for its association with the development of steel hull shipbuilding in the United States, including its pioneering technological developments in shipbuilding, and the production of significant wartime vessels. The Union Iron Works Historic District is also significant at the local level because it is a physical record of the trends in industrial architecture from the late nineteenth century through World War II.

IRISH HILL NEIGHBORHOOD, 1900-1914

The 1900 Federal census shows the working-class neighborhood of Irish Hill was not only in place at the turn of the century, but continued to attract new immigrants to the area. The dates of

immigration for the residents show that many of them had arrived between 1880 and 1900. San Francisco, including the Irish Hill neighborhood, which was dominated by industry as noted above, was a place of employment and possibility. Although there is a spattering of surnames, "Irish Hill" was just that, a place of work and residence for families from Ireland and other countries, as well as single boarders and servants.

Although the overall outline of Irish Hill did not change dramatically between 1900 and 1914, all residential housing between the Georgia and Maryland street alignments had been eradicated by 1914. The density of residential housing between the Illinois and Georgia street alignments had also decreased substantially. In addition, in the southwest corner of the project site, on much of the Illinois Parcels and the southwestern area of the 28-Acre Site, Irish Hill had been cut back between Illinois and Michigan streets and the boardinghouses there replaced by a large steel fuel oil tank operated by the Western Sugar Refining Company. Just a few years later, by the end of World War I, all residential housing on Irish Hill had been removed.

PRIOR GROUND DISTURBANCE WITHIN THE PROJECT SITE

Establishing industrial operations within the project site involved extensive alteration of the native Potrero Point landform, including substantial cutting and filling. The gently sloping hillside of Irish Hill depicted on the 1859 U.S. Coast Survey chart was gradually leveled and the shoreline was altered through land reclamation. This process of cutting and filling to expand the industrial facilities continued throughout the late nineteenth century and into the twentieth century up to World War II.

The northwest portion of the project site (the northern part of 20th/Illinois Parcel in the Illinois Parcel site) once straddled the Potrero Point shoreline where it transitioned from an east-west to a north-south orientation. The area became reclaimed land when the shoreline and offshore tidelands were artificially filled beginning in the late 1860s, a process that was complete by 1886. After land reclamation, this location became a vibrant and thriving part of the Irish Hill community, and it remained so through the 1910s. Bethlehem Steel established offices there in the 1920s (Buildings 39 and 54, at the southeast corner of Illinois and 20th streets).

Although no precise nineteenth century topographic data are available for Irish Hill, early topographic renderings of the project site indicate that it originally extended to a height of approximately 100 feet above sea level. Gradual expansion of the adjacent industrial complexes reduced the overall footprint of Irish Hill over the course of the late nineteenth and early twentieth centuries.

Sometime between production of the 1914 Sanborn map and the 1938 Ryker aerial image, major excavations removed the majority of the upper surface of Irish Hill, reducing it to its current

elevation of 35 feet above sea level. A more severe geographic truncation of Irish Hill occurred during construction of the New Yard/Building 12 complex in 1941. Approximately 550 linear feet of Irish Hill were removed, including the entire eastern portion of the hill, west to its current extent. This construction event brought the entire eastern portion of Irish Hill down to the same grade as the remainder of the industrial complex, approximately 12 feet above sea level. Geotechnical investigation confirms that the area immediately east of the Building 12 complex and west of the slipways is shallow (2 to 3 feet) fill over bedrock. In addition to the construction of the Building 12 complex, the construction of Slipways 5 through 8 in 1941 was also a destructive process that severely impacted the landform on the 28-Acre Site.

Today, the project site's eastern portion (comprising a majority of the 28-Acre Site) and northwestern portion (roughly, the northern portion of the 20th/Illinois Parcel) are underlain by fill, consisting of locally quarried rock, sand, and clay with wood, slag, concrete, and brick debris. The fill layer is shallower upland to the west and becomes deeper towards the Bay to the east (up to 37 feet below ground surface). The fill layer is underlain by Bay Mud (from 2 to 40 feet thick), which is underlain by stiff clay and dense sand over bedrock. The southwestern portion of the project site (roughly, the southern portion of the 20th/Illinois Parcel and the Hoedown Yard) is underlain at grade by serpentine bedrock of the Franciscan Complex with localized pockets of fill. In the northeastern portion of the Illinois Parcels (the northwestern portion of the overall project site), weak Bay Mud is located below the fill, ranging in thickness from 2 to 6 feet; the Bay Mud generally increases in thickness toward the east, and is typically underlain by stiff clay and dense sand over bedrock.

ARCHEOLOGICAL RESOURCES THAT MAY BE PRESENT WITHIN THE PROJECT SITE

No prehistoric archeological sites have been recorded within a one-half-mile radius of the project site. The project site consists of surface or shallow bedrock in the western portion of the project site and fill over Bay Mud in the eastern and northern portions of the project site. As described under "Prior Ground Disturbance within the Project Site" on pp. 4.D.8-4.D.9, the entire project site has undergone massive land transformation during the late nineteenth and early twentieth centuries that is likely to have removed any traces of prehistoric surface deposits on the project site. Artificial fill overlaying Bay Mud and bedrock has a low potential for containing significant prehistoric archeological resources. For this reason, the focus of the remainder of this subsection is on historical property types.[3]

[3] Note, however, that the presence of prehistoric archeological resources within the project site cannot be conclusively ruled out. The ARDTP includes information about prehistoric archeological property types, as well as prehistoric research themes and questions, to provide a basis for study, evaluation and treatment of prehistoric archeological resources in the event that they are encountered during project construction.

Historical archeological sites qualify as CEQA "historical resources" if they are determined to be eligible for listing on the California Register of Historic Resources (CRHR). Archeological resources associated with the Union Iron Works Historic District discovered during project-related ground disturbance may be determined to be historical resources under CEQA. In this case, archeological resources within the project area may be considered eligible for listing on the CRHR and therefore qualify as CEQA historical resources if they are related to contributing elements of the Union Iron Works Historic District even if they are not considered significant for their data potential.

To be considered eligible to the CRHR, resources must possess physical integrity as well as integrity of setting. Historical archeological resources are typically evaluated relative to their ability to meet Criterion 4 of the CRHR, which states that the site has yielded, or may be likely to yield, information important in prehistory or history (California Code of Regulations 15064.6). An archeological resource may also be CRHR-eligible under Criterion 1, association with events that have made a significant contribution to the broad patterns of history; Criterion 2, association with the lives of historically important persons; or Criterion 3, association with the distinctive characteristics of a type, period, region, or method of construction.

Listed below are archeological resources that may be present within the project site based on the known historic activities at the project site. Research themes and questions are also presented to provide the basis for evaluating the information potential of features that may be encountered during construction under CRHR Criterion 4.

Subsurface Architectural Features

Subsurface architectural features include structural remains such as foundations, wall footings, basement walls, and floor remnants. This property type encompasses a wide variety of buildings and other structures. Within the project site, there is the potential to encounter subsurface architectural features from a variety of buildings in the former Union Iron Works/Bethlehem Steel industrial complex that have been demolished or removed over time. Demolition and excavation activities in the southeast portion of the project site will likely encounter the remains of Slipways 5 through 8, which are buried under modern fill and asphalt. Locations on the former, nineteenth century shoreline that have not been severely impacted by later development may contain buried features associated with shipbuilding or other maritime activities.

In many cases, architectural remains correlate with buildings and structures depicted on maps of the City, photographs, and other documents. When that occurs, the ability of those remains to contribute to important research themes may be limited, especially for later nineteenth and early twentieth century features, because it does not reveal any new information not already available in the documentary record.

Landscape Features

Landscape features in the archeological record are often ephemeral resources, such as fence lines and ditches, but they may give evidence of historic land uses. More substantial landscape features may include elements such as stone walls and aqueducts. While historic maps are critical to an understanding of landscape evolution, the research potential for landscape features varies and often depends on what is understood about historic land use from the documentary record. There is an unknown potential for encountering landscape features in the project site.

Infrastructure Features

Infrastructure includes those features related to development and maintenance of the City of San Francisco, such as roads, cisterns, sewer lines, drain pipes, power lines, water lines, and hydrants. Infrastructure features often correlate to utility maps and the locations of architectural features such as buildings. Identification of these physical features is critical for anticipating potential project impacts on archeological resources, although the documentary record may already convey much historic information about the City's infrastructural development.

Infrastructure features most likely to be encountered within the project site would be associated with the former Union Iron Works/Bethlehem Steel industrial complex and the industrial activities that took place on the property. Utilities such as electrical lines, and hydraulic and pneumatic systems associated with steel shipbuilding, may be encountered throughout the former industrial complexes in the project site. In addition, a variety of rail spurs were installed throughout the complexes, and the location and configuration of these spurs has changed over the decades. Remnants of rail spurs from a number of different eras may be encountered during implementation of the Proposed Project. Finally, paving stones from streets within the complex may be encountered archeologically. The Union Iron Works Historic District National Register Nomination Form specifies that 20th Street paving stones are a non-contributing resource; however, additional paving stones encountered during project implementation should be evaluated separately.

Refuse Features

Refuse features that result from domestic and economic use of an area have proven to be one of the most useful sources of historical archeological investigation in urban settings. Two primary types of refuse features are recognized in archeological practice. Hollow-filled refuse features include refuse pits, privies, and wells. Discrete refuse features provide archeologists with a glimpse of the day-to-day practices of the occupants who used them. As such, these features frequently have the ability to address important research themes. Hollow-filled refuse features are commonly associated with late nineteenth century dwellings that were present in San

Francisco neighborhoods before later structures were built, and they are often the target of archeological testing programs.

Sheet refuse features (i.e., a layer or scatter of artifacts deposited on the ground's surface rather than in a hollow feature such as a pit, privy, or well) include broad artifact scatters as well as more ephemeral surface scatters that are often indicative of more extensive archeological deposits located beneath the surface. Sheet refuse often accumulates over a period of time. It may also be introduced as fill to raise low ground. The long time it may take to accumulate sheet refuse features can be problematic for archeologists, depending on the occupation history of the location under review. It may be difficult to draw conclusions from a sparse sheet refuse layer deposited over many years by several occupants.

The project site has the potential to contain refuse features associated with residences in the former areas of Irish Hill, as well as industrial refuse associated with the Union Iron Works/Bethlehem Steel complex or former shipyards. Refuse features could provide insights into the domestic and economic use of the project area and would be a useful archeological source.

Industrial Features

Industrial features are unique to industrial and manufacturing sectors such as the Pier 70 project site. Diverse industrial activities have taken place in the project site since development began there in the 1860s, including wooden shipbuilding; iron and steel manufacturing; engine, boiler, locomotive, and mining equipment construction; and steel-hull shipbuilding and repair. These industries may have left subsurface traces as each phase of expansion, modernization, and revitalization that took place on the project site. These features may be in primary or secondary contexts, and the significance of individual features would depend on integrity and potentially their relationship with contributing elements of the Union Iron Works Historic District.

HISTORICAL RESEARCH THEMES

The ARDTP identifies questions that may be addressed by the types of resources and kinds of data that the project site has the potential to contain. The research themes discussed below – consumer behavior, social status and identity, wharf and pier construction, land reclamation, and industrialization and technology – can be addressed only by using data from the archeological record (often in conjunction with the documentary record) rather than data from other sources such as archival records. The purpose of identifying the relevant research themes here is to help predict areas of special concern within the project site, given the property types that might reasonably be present. The significance of archeological remains encountered during testing or implementation of the Proposed Project would be considered in light of these themes.

Consumer Behavior

Historical material culture located within discrete hollow or sheet refuse features in former residential areas of Irish Hill may indicate the consumer behavior of residents of the project site. Objects discarded or lost in refuse deposits may illustrate the changes in both choice and utility of various nineteenth and twentieth century consumer goods. Discarded objects are an indicator of the availability of particular goods to residents of a household or neighborhood, or to business owners or employees. Consumer choice goes beyond simple availability of goods; consumer behavior can be linked to the expression of identity by both socioeconomic and ethnic groups. San Francisco's immigrant neighborhoods and the households comprising them had access to a wide array of consumer goods, and the choices individual residents or business owners or employees made in selecting goods can give insight into a variety of cultural processes that influence consumer choice.

There may be sheet refuse or hollow features associated with residential use of the project site. A variety of working class occupants lived in the boardinghouses and flats on the project site. Refuse features located in the project site would likely reflect consumption patterns of the residents and may augment current understanding of their cultural practices and daily lives. Refuse features may also represent broader consumption patterns about the community or society as a whole.

Social Status and Identity

Immigrant neighborhoods, such as San Francisco's late nineteenth century Irish Hill neighborhood, provide a unique opportunity for examining how individuals and families represent and portray their social identity and socioeconomic status. Using the historical record, including City directories and census data, researchers can identify basic information about an individual or family's identity and socioeconomic status; using the archeological record, researchers can investigate how an individual or family materially expressed their identity. Material remains on the project site would likely reflect the particular social and ethnic backgrounds of former residents of Irish Hill. Archeological deposits from households with mixed socioeconomic classes may indicate that different families experienced the neighborhood in different ways. In addition, boardinghouses, such as those on Irish Hill, can leave different signatures than family-related deposits in the archeological record.

Wharf and Pier Construction

Remnants of wharf and pier construction may be found on the project site. After the City's economic involvement with the Gold Rush faded, City residents began to explore other means of economic growth. Transportation, especially by water, became critical. Construction of wharves

and associated docks was an early competition in the rapidly growing San Francisco shoreline areas. Historic maps of the project site indicate that shipyards in the northwest and southeast portions of the project site had wharfs, which may be preserved within or beneath artificial fill.

If wharf, pier, or dock resources exist within the project site, their primary research value is likely related to the technology involved in their construction. Themes of potential research would include construction of the wharf (pilings, cribs, or other features), techniques used in the construction typical of their time and locale, and the potential for local (unique to San Francisco) innovation in wharf construction.

Land Reclamation

Local environmental, economic, and historical developments led to the creation of new land in the project site. In order to create this land, the overall landscape had to first be envisioned and then reworked to meet local needs over time. During the twentieth century, when mechanization and technology allowed for more expansive reclamation, filling events were more deliberate and covered a larger area. Within the project site, systematic removal of most of Irish Hill resulted in spoil used to create new lands to the east; beginning in 1941, the U.S. Navy used these lands to expand the shipyard. Encountering archeological features related to the land reclamation process, such as landfill retaining structures, during implementation of the Proposed Project may lead to a more comprehensive understanding of how land reclamation was accomplished and developed over time.

Industrialization and Technology

The archeological record is an important source of information on technological development that is often absent from the documentary record. Archeological remains associated with any of the various industrial facilities that operated within the project site may be encountered during implementation of the Proposed Project (including shipyards operated by John North and Henry Ewing in the early 1860's; the Pacific Rolling Mills Company, which operated from 1868, and its successors; and the Union Iron Works, which operated from around 1884, and its successors). It is likely that foundries, boiler shops, and shipbuilding activities left deposits that may give insight into industrial processes and technologies. These could include evidence of what production activities were carried out in relation to other activities, workplace conditions, what materials and products were consumed, and what waste products were produced. The potential also exists for specific features to be historically significant and therefore qualify as a CEQA historical resource based on their association with the Union Iron Works Historic District.

REGULATORY FRAMEWORK

Under CEQA, archeological resources are considered to be part of the physical environment; thus, CEQA requires that projects be analyzed for their potential to adversely affect archeological resources (CEQA Section 21083.2). For projects that may have an adverse effect on a significant archeological resource, CEQA requires preparation of an EIR (CEQA Section 21083.2 and CEQA Guidelines Section 15065). CEQA recognizes two different categories of significant archeological resources: "unique" archeological resources (CEQA Section 21083.2) and archeological resources that qualify as "historical resources" under CEQA (CEQA Section 21084.1; CEQA Guidelines Section 15064.5). Assembly Bill 52 (AB 52) (Chapter 532, Statutes of 2014), effective July 1, 2015, amends CEQA by adding Public Resources Code Section 21704, which establishes a new category of cultural resources to be considered under CEQA, called "tribal cultural resources." AB 52 also amends CEQA by adding Section 21080.3.1, which establishes a new procedure for notification and consultation with California Native American tribes that are culturally affiliated with the geographic area of the proposed project.

DEFINING ARCHEOLOGICAL RESOURCES

An archeological resource can be significant as either a "unique" archeological resource or an "historical resource" or both, but the process by which the resource is identified under CEQA as one or the other is distinct (CEQA Section 21083.2(g); CEQA Guidelines 15064.5(a)).

An archeological resource is an historical resource under CEQA if the resource is:

- Listed on or determined eligible for listing on the CRHR; this includes archeological properties listed or eligible for the NRHP;
- Listed in a "local register of historical resources";[4] or
- Listed in an "historical resource survey."

Generally, an archeological resource is determined to be an historical resource due to its eligibility for listing to the CRHR or the NRHP under Criterion 4 because of its potential scientific value; that is, it "has yielded, or may be likely to yield, information important in prehistory or history" (CEQA Guidelines Section 15064.5(a)(3)). An archeological resource may also be CRHR-eligible under other evaluation criteria, such as Criterion 1, association with events that have made a significant contribution to the broad patterns of history; Criterion 2, association with the lives of historically important persons; or Criterion 3, association with the distinctive characteristics of a type, period, region, or method of construction. Appropriate treatment for archeological properties that are CRHR-eligible under criteria other than Criterion 4 may be

[4] A local register of historical resources is a list of historical or archeological properties officially adopted by ordinance or resolution by a local government (Public Resources Code 5020.1(k)).

different than treatment for a resource that is significant exclusively for its scientific value. Appropriate treatment for archeological resources significant under Criterion 1 (Events), Criterion 2 (Persons), and Criterion 3 (Design/Construction) may include an interpretive program to preserve and enhance the ability of an archeological resource to convey its association with historic events and persons and to convey its distinctive design/construction characteristics.

Failure of an archeological resource to be listed in any of these historical inventories is not sufficient to conclude that the archeological resource is not an historical resource. When the lead agency believes there may be grounds for a determination that an archeological resource is an historical resource, then the lead agency should evaluate the resource for eligibility for listing on the CRHR (CEQA Guidelines Section 15064.5(a)(4)).

"Unique archaeological resource" is a category of archeological resources created by the CEQA statutes (CEQA Section 21083.2(g)). An archeological resource is a unique archeological resource if it meets any one of the following three criteria:

- Contains information needed to answer important scientific research questions (and there is a demonstrable public interest in that information);
- Has a special and particular quality, such as being the oldest of its type or the best available example of its type; or
- Is directly associated with a scientifically recognized important prehistoric or historic event or person.

Under CEQA, evaluation of an archeological resource as an historical resource is privileged over the evaluation of the resource as a unique archeological resource in that CEQA requires that "when a project will impact an archaeological site, a lead agency shall first determine whether the site is an historical resource" (CEQA Guidelines Section 15064.5(c)(l)).

Evaluation of an Archeological Resource as Scientifically Significant

In requiring that a potentially affected archeological resource be evaluated as an historical resource – that is, as an archeological site of sufficient scientific value to be CRHR-eligible – CEQA presupposes that the published guidance of the California Office of Historic Preservation (OHP) for CEQA providers will serve as the methodological standard by which the scientific, and thus the CRHR eligibility, of an archeological resource is to be evaluated. As guidance for the evaluation of the scientific value of an archeological resource, the OHP has issued two guidelines: *Archaeological Resource Management Reports* (1989) and the *Guidelines for Archaeological Research Designs* (1991).

Integrity of Archeological Resource

Integrity is an essential criterion in determining if a potential resource, including an archeological resource, is an historical resource. In terms of CEQA, "integrity" can, in part, be expressed in the requirement that an historical resource must retain "the physical characteristics that convey its historical significance" (CEQA Guidelines Section 15064.5(b)).

For an archeological resource that is evaluated for CRHR eligibility under Evaluation Criterion 4, "has yielded or may be likely to yield information important to prehistory or history," the word "integrity" has a different meaning from the way in which it usually applies to the built environment. For an historic building, possessing integrity means that the building retains the defining characteristics from the period of significance of the building. In archeology, an archeological deposit or feature may have undergone substantial physical change from the time of its deposition, but it may yet have sufficient integrity to qualify as a historical resource. The integrity test for an archeological resource is whether the resource can yield sufficient data (in type, quantity, quality, or diagnosticity) to address significant research questions. Thus, in archeology "integrity" is often closely associated with the development of a research design that identifies the types of physical characteristics ("data needs") that must be present in the archeological resource and its physical context to adequately address research questions appropriate to the archeological resource.

Significant Adverse Effect on an Archeological Resource

The determination of whether an effect on an archeological resource is significant depends on the effect of the project on those characteristics of the archeological resource that make the archeological resource significant. For an archeological resource that is an historical resource because of its prehistoric or historical information value, that is, its scientific data, a significant effect is impairment of the potential information value of the resource.

The depositional context of an archeological resource, especially soils stratigraphy (the characteristics of soil layers), can be contextually important to the resource in terms of dating and reconstructing its characteristics at the time of deposition and to interpreting the impacts of later deposition events on the resource. Thus, for an archeological resource eligible to the CRHR under Criterion 4, a significant adverse effect to its significance may not be limited to impacts on the artifactual material but may include effects on the soils matrix in which the artifactual material is situated.

Mitigation of Adverse Effect on Archeological Resources

Preservation in place is the preferred treatment of an archeological resource (CEQA Section 21083.2(b); CEQA Guidelines Section 15126.4(b)(3)(a)). When preservation in place of an

archeological resource is not feasible, data recovery, in accord with a data recovery plan prepared and adopted by the lead agency prior to any soils disturbance, is the appropriate mitigation (CEQA Guidelines Section 15126.4(b)(3)(C)). In addition to data recovery, under CEQA, the mitigation of effects to an archeological resource that is significant for its scientific value requires curation of the recovered scientifically significant data in an appropriate curation facility (CEQA Guidelines Section 15126.4(b)(3)(C)) that is compliant with the OHP's *Guidelines for the Curation of Archaeological Collections* (1993).

To the extent that the significance of archeological resources encountered within the project site may be premised on CRHR Criterion 1 (Events), and/or 3 (Design/Construction) (archeological resources significant under Criterion 2 (Persons) are not anticipated), a program for interpretation and display of such artifacts would preserve and enhance the ability of such resources to convey their association with the site and to their significance under these criteria.

Final studies reporting the interpretation, results, and analysis of data recovered from the archeological site are to be deposited in the California Historical Resources Regional Information Center (CEQA Guidelines Section 15126.4(b)(3)(C)).

Effects on Human Remains

Under State law, human remains and associated burial items may be significant resources in two ways. They may be significant to descendent communities for patrimonial, cultural, lineage, and religious reasons. Human remains may also be important to the scientific community, such as prehistorians, epidemiologists, and physical anthropologists. The specific stake of some descendent groups in ancestral burials is a matter of law for some groups, such as Native Americans (CEQA Guidelines Section 15064.5(d); Public Resources Code Section 5097.98). CEQA and other State regulations concerning Native American human remains provide the procedural requirements to assist in avoiding potential adverse effects to human remains within the contexts of their value to both descendent communities and the scientific community.

Effects on Tribal Cultural Resources

AB 52, effective July 1, 2105, amends the CEQA statute to identify a new category of resource to be considered under CEQA, called "tribal cultural resources." It amends the Public Resources Code to add Section 21074, which defines "tribal cultural resources," as follows:

(a) "Tribal cultural resources" are either of the following:

  (1) Sites, features, places, cultural landscapes, sacred places, and objects with cultural value to a California Native American tribe that are either of the following:

    A) Included or determined to be eligible for inclusion in the CRHR.

B) Included in a local register of historical resources as defined in subdivision (k) of Section 5020.1.

(2) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Section 5024.1. In applying the criteria set forth in subdivision (c) of Section 5024.1 for the purposes of this paragraph, the lead agency shall consider the significance of the resource to a California Native American tribe.

AB 52 adds Public Resource Code Section 21080.3.1, which establishes a new procedure for notification and consultation with a California Native American tribes that are culturally affiliated with the geographic area of the Proposed Project:

(d) Within 14 days of determining that an application for a project is complete or a decision by a public agency to undertake a project, the lead agency shall provide formal notification to the designated contact of, or a tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notice, which shall be accomplished by means of at least one written notification that includes a brief description of the proposed project and its location, the lead agency contact information, and a notification that the California Native American tribe has 30 days to request consultation pursuant to this section.

(e) The lead agency shall begin the consultation process within 30 days of receiving a California Native American tribe's request for consultation.

AB 52 adds Public Resource Code Section 21080.3.2(a), which provides,

> As a part of the consultation the parties may propose mitigation measures capable of avoiding or substantially lessening potential significant impacts to a tribal cultural resource or alternatives that would avoid significant impacts to a tribal cultural resource. If the California Native American tribe requests consultation regarding alternatives to the project, recommended mitigation measures, or significant effects, the consultation shall include those topics. The consultation may include discussion concerning the type of environmental review necessary, the significance of tribal cultural resources, the significance of the project's impacts on the tribal cultural resources, and, if necessary, project alternatives or the appropriate measures for preservation or mitigation that the California Native American tribe may recommended to the lead agency.

AB 52 Section 11(c) states, "This act shall apply only to a project that has a notice of preparation or a notice of negative declaration or mitigated negative declaration filed on or after July 1, 2015." As such, AB 52 does not apply to the Proposed Project, for which a Notice of Preparation was filed with the State Clearinghouse on May 6, 2015. Note, however, that the San Francisco Planning Department, in response to AB 52, has recently updated its CEQA Checklist to require evaluation of impacts on Tribal Cultural Resources. This updated San Francisco Planning Department CEQA Checklist has been used to evaluate impacts on Tribal Cultural Resources in this EIR.

IMPACTS AND MITIGATION MEASURES

SIGNIFICANCE THRESHOLDS

The thresholds for determining the significance of impacts in this analysis are consistent with the environmental checklist in Appendix G of the State CEQA Guidelines, which has been modified by the San Francisco Planning Department. For the purpose of this analysis, the following applicable thresholds were used to determine whether implementing the Proposed Project would result in a significant impact related to archeological resources. Implementation of the Proposed Project would have a significant effect related to archeological resources if the project would:

D.1 Cause a substantial adverse change in the significance of a historical resource as defined in Section 15064.5, including those resources listed in Article 10 or Article 11 of the San Francisco Planning Code;

D.2 Cause a substantial adverse change in the significance of an archeological resource pursuant to Section 15064.5;

D.3 Disturb any human remains, including those interred outside of formal cemeteries; or

D.4 Cause a substantial adverse change in the significance of a tribal cultural resource as defined in Public Resources Code Section 21074.

Project impacts related to the potential for substantial adverse change in the significance of historic architectural resources (Significance Threshold D.1) are discussed below, under "Historic Architectural Resources," beginning on p. 4.D.33.

APPROACH TO ANALYSIS

This Archeological Resources section is based on background information provided in the ARDTP.

Archival Research

The ARDTP compiled a list of primary (especially historic-era maps) and secondary source material to research the historical context and the land use history for the project site. The historic data compiled in the site history and general context provide information in support of possible mitigation measures.

Historic maps were used to identify the changing Pier 70 landscape over time. Nautical charts from the U.S. Coast Survey (later the U.S. Coast and Geodetic Survey) and topographic maps from the U.S. Geological Survey were used to plot the changing Potrero Point shoreline and topography over the decades. Sanborn Fire Insurance maps and the high-resolution 1938 aerial photographs by Harrison Ryker were used to trace the expansion of the Potrero Point industrial

complexes, including the Union Iron Works, Pacific Rolling Mills, and, later, Bethlehem Steel. These sources were also consulted in regard to the topographic changes to Irish Hill over time.

Secondary sources, including the Union Iron Works Historic District National Register Nomination, provided a framework for targeted research and an understanding of past historic-era land use.

Geotechnical Data

Geotechnical investigations conducted within the project site were studied to determine the presence or absence of subsurface strata with the potential to preserve buried prehistoric and historical archeological resources.[5]

Native American Consultation

On March 19, 2015, Native American Heritage Commission (NAHC) letters were sent to request information on known Native American sacred lands within the project site and a listing of individuals or groups with a cultural affiliation to the project site. A response was received from the NAHC on April 27, 2015, noting, "A record search of the sacred land file has failed to indicate the presence of Native American cultural resources in the immediate project area." The NAHC letter also provided a list of Native American individuals who may have knowledge about such cultural resources. On May 13, 2015, letters were sent to the nine individuals on the list. The letters provided a description of the project and project site maps, and solicited input and comment regarding their knowledge about sacred sites or traditional lands within the project site; no responses were received.[6]

As discussed above in "Effects on Tribal Cultural Resources" on pp. 4.D.18-4.D.19, the noticing and tribal consultation requirements of AB 52 (codified in Public Resources Code Section 21080.3) do not apply to the Proposed Project, for which a Notice of Preparation was filed with the State Clearinghouse on May 6, 2015, before enactment of AB 52.

Analysis of Scenarios

Those features of the Pier 70 Mixed-Use District Project that could have an effect on archeological resources, particularly the location, depth, and area of ground disturbance within the project site, as described below under "Project Features," are the same or substantially similar

[5] Treadwell & Rollo, *Preliminary Geotechnical Investigation, Pier 70, San Francisco, California*. Prepared for Forest City Development, 2012; and Treadwell & Rollo, *Preliminary Geotechnical Evaluation, Pier 70-Illinois/20th Street and Hoe Down Yard, San Francisco, California*, February 23, 2015.

[6] Matthew A. Russell, ESA, letter to Allison Vanderslice, San Francisco Planning Department, Re: Pier 70 Mixed-Use Project Native American Heritage Commission Contacts, November 5, 2015.

under the Maximum Commercial Scenario and the Maximum Residential Scenario, the three options for sewer/wastewater treatment, and the three options for grading around Building 12 that are analyzed in this EIR. To the extent that these features may differ somewhat from one to another, they are generally included and accounted for in an analysis of maximum ground disturbance within the project site. The same archeological regulatory requirements and mitigation measures applicable to the Proposed Project are equally applicable under the Proposed Project's scenarios and options. Therefore, this analysis of impacts on archeological resources applies to both scenarios and no separate analysis of impacts under each scenario or option is necessary.

PROJECT FEATURES

This section describes aspects of the Proposed Project that would cause ground disturbance within the project site under both scenarios.

Demolition

Buildings 11, 15, 16, 19, 25, 32, and 66, and portions of Slipways 5 through 8 would be demolished to construct the Proposed Project.[7] Demolition of the buildings would entail some ground disturbance to remove subsurface foundations. Partial demolition of Slipways 5 through 8, which are currently buried beneath approximately 6 to 7 feet of modern fill and asphalt, would involve substantial ground disturbance.

Grading and Excavation

The Proposed Project would involve excavation of soils for grading and construction of the 15- to 27-foot-deep basements planned on most of the parcels. The excavation plan indicates a total of nine separate areas of the Proposed Project (mostly in the 28-Acre Site) that would be excavated to a depth of 15 feet below ground surface, and two areas, closer to the Illinois Parcels, that would be excavated to a depth of 27 feet below ground surface. Construction of the anticipated new 20th Street pump station northeast of the project site, adjacent to Building 6 on the BAE Systems Ship Repair site, would also result in excavation to a depth of approximately 20 feet below ground surface. In addition, grading to open the new 21st Street alignment, extending east from Illinois Street, would potentially involve grading through the northernmost extent of the 35-foot-tall remnant of Irish Hill. The Proposed Project would raise the grade of the 28-Acre Site and low-lying portions of the Illinois Parcels by adding up to 5 feet of fill in order to help protect

[7] While Building 117 is located within the project site boundary, the Port has decided to demolish Building 117 prior to approval of the Proposed Project. The Port filed an application to demolish Building 117 on January 7, 2016, Case No. 2016-000346ENV. Any approval of demolition of Building 117 would undergo appropriate environmental review, as required by CEQA, and its demolition is analyzed as a cumulative project in this EIR.

against flooding and projected future sea level rise. The rehabilitation of existing Building 12 would be done under one of three grading options: raising the exterior grade, raising the exterior and interior grade, or raising the structural frame.

Geotechnical Stabilization

To address the potential hazard of liquefaction and lateral spreading that may occur during a major earthquake, the Proposed Project would include measures to reinforce the existing slope with a structural wall or ground improvements along the northeastern and southeastern portions of the project site (north and south of the Slipway structures). Structural wall solutions may include, but are not limited to, tied-back sheet pile walls (interlocking sheets of steel), rows of secant piles (interlocking piles), and king-pile walls (wider piles connected by sheeting). Ground improvements may consist of treatments such as deep soil mixing to add a cement slurry to strengthen the existing soil or vibratory methods such as vibro-compaction, vibro-replacement, and dynamic compaction to densify and strengthen the existing soil.

Utilities

Potable and Recycled Water

Potable and recycled water distribution piping would be constructed in trenches under the planned streets to carry water for drinking and firefighting needs. Connections to the existing water mains underneath 20th Street, Illinois Street, and 22nd Street would be made at the intersections of Illinois Street/22nd Street, Illinois Street/21st Street (a new street), and approximately midway along the project boundary at 20th Street.[8] If necessary, the water main underneath the western portion of 20th Street would be replaced.

Proposed Wastewater (Sewer) and Stormwater Treatment

The project sponsors anticipate retaining much of the existing combined sewer system that serves areas outside of the project site, where such continued use is acceptable to the SFPUC. The SFPUC's 20th Street pump station would be replaced as part of the Proposed Project. To handle increased sewage and wastewater flows from the Proposed Project's anticipated development, the project sponsors propose to construct new wastewater and stormwater infrastructure in trenches under the Proposed Project's roadway and open space network and connect it to an outfall structure, under one of three sewer and wastewater options.

[8] BKF, Pier 70, Proposed Utilities, Low Pressure Water System diagram, February 26, 2015.

Electricity and Natural Gas

The Proposed Project would replace overhead electrical distribution with a joint trench distribution system following the proposed roadway layout. The existing natural gas distribution system would be extended to cover the entire project site, and the piping would be realigned within the proposed roadway network to serve the project site.

IMPACT EVALUATION

Impact CR-1: Construction activities for the Proposed Project would cause a substantial adverse change in the significance of archeological resources, if such resources are present within the project site. ***(Less than Significant with Mitigation)***

Under the Proposed Project, soils would be excavated for grading and construction of the 15- to 27-foot-deep basements planned on most of the parcels. In addition, construction of the anticipated new 20th Street pump station northeast of the project site, adjacent to Building 6 on the BAE Systems Ship Repair site, would also result in excavation to a depth of approximately 20 feet below ground surface. The Proposed Project would result in a net export total of about 340,000 cubic yards of soil. Construction activities, in particular grading and excavation, could disturb archeological resources potentially located at the project site.

As described under "Prior Ground Disturbance within the Project Site" on pp. 4.D.8-4.D.9, the entire project site has undergone massive land transformation during the late nineteenth and early twentieth centuries that would likely have removed any traces of prehistoric surface deposits. Artificial fill overlaying Bay Mud and bedrock has a low potential to contain significant prehistoric archeological resources; however, the presence of prehistoric archeological resources within the project site cannot be conclusively ruled out. Historical archeological sites relating to former industrial and residential activities that could be encountered at the project site include subsurface architectural features, landscape features, infrastructure features, refuse features, and industrial features, as described above on pp. 4.D.10-4.D.12.

To the extent that archeological resources potentially present within the project site may be associated with the Union Iron Works National Register Historic District, their significance would also be premised on NRHP Criteria A (Events) and C (Architecture/Construction) and the corresponding CRHR Criterion 1 (Events) and Criterion 3 (Architecture/Construction). Data recovery or documentation alone would be inadequate to mitigate such impacts. Additional mitigation measures, such as an interpretive program, would need to be implemented. The definition of an interpretive program can be found in Mitigation Measure M-CR-1b: Interpretation, on pp. 4.D.29-4.D.30.

Unless mitigated, ground-disturbing construction activity within the project site, particularly within previously undisturbed soils, could adversely affect the significance of archeological resources under CRHR Criterion 4 (Information Potential) by impairing the ability of such resources to convey important scientific and historical information. This effect would be considered a substantial adverse change in the significance of an historical resource and would therefore be a potentially significant impact under CEQA.

Mitigation Measure M-CR-1a: Archeological Testing, Monitoring, Data Recovery and Reporting, presented below, calls for a qualified archeological consultant to prepare and submit a plan for pre-construction archeological testing, construction monitoring, and data recovery for approval by the San Francisco Environmental Review Officer (ERO).

Mitigation Measure M-CR-1b: Interpretation, pp. 4.D.29-4.D.30, calls for a qualified archeological consultant to prepare and submit a plan for post-recovery interpretation of resources. Implementation of an approved program of interpretation under Mitigation Measure M-CR-1b would preserve and enhance the ability of the resource to convey its significance under CRHR Criterion 1 (Events), Criterion 2 (People), and Criterion 3 (Architecture/Construction).

Mitigation Measure M-CR-1a: Archeological Testing, Monitoring, Data Recovery and Reporting

Based on a reasonable presumption that archeological resources may be present within the project site, the following measures shall be undertaken to avoid any potentially significant adverse effect from the Proposed Project on buried or submerged historical resources. The project sponsors shall retain the services of an archeological consultant from rotational Department Qualified Archeological Consultants List (QACL) maintained by the Planning Department archeologist. The project sponsor shall contact the Department archeologist to obtain the names and contact information for the next three archeological consultants on the QACL. The archeological consultant shall undertake an archeological testing program as specified herein. In addition, the consultant shall be available to conduct an archeological monitoring and/or data recovery program if required pursuant to this measure. The archeological consultant's work shall be conducted in accordance with this measure at the direction of the Environmental Review Officer (ERO). All plans and reports prepared by the consultant as specified herein shall be submitted first and directly to the ERO for review and comment, and shall be considered draft reports subject to revision until final approval by the ERO. Archeological monitoring and/or data recovery programs required by this measure could suspend construction of the project for up to a maximum of four weeks. At the direction of the ERO, the suspension of construction can be extended beyond four weeks only if such a suspension is the only feasible means to reduce to a less than significant level potential effects on a significant archeological resource as defined in CEQA Guidelines Sect. 15064.5 (a) and (c).

Consultation with Descendant Communities

On discovery of an archeological site[9] associated with descendant Native Americans, the Overseas Chinese, or other potentially interested descendant group, an appropriate representative[10] of the descendant group and the ERO shall be contacted. The representative of the descendant group shall be given the opportunity to monitor archeological field investigations of the site and to consult with the ERO regarding appropriate archeological treatment of the site, of recovered data from the site, and, if applicable, any interpretative treatment of the associated archeological site. A copy of the Final Archeological Resources Report shall be provided to the representative of the descendant group.

Archeological Testing Program

The archeological consultant shall prepare and submit to the ERO for review and approval an archeological testing plan (ATP). The archeological testing program shall be conducted in accordance with the approved ATP. The ATP shall identify the property types of the expected archeological resource(s) that potentially could be adversely affected by the Proposed Project, the testing method to be used, and the locations recommended for testing. The purpose of the archeological testing program will be to determine to the extent possible the presence or absence of archeological resources and to identify and to evaluate whether any archeological resource encountered on the site constitutes an historical resource under CEQA.

At the completion of the archeological testing program, the archeological consultant shall submit a written report of the findings to the ERO. If based on the archeological testing program the archeological consultant finds that significant archeological resources may be present, the ERO in consultation with the archeological consultant shall determine if additional measures are warranted. Additional measures that may be undertaken include additional archeological testing, archeological monitoring, and/or an archeological data recovery program. If the ERO determines that a significant archeological resource is present and that the resource could be adversely affected by the Proposed Project, at the discretion of the project sponsors either:

A) The Proposed Project shall be redesigned so as to avoid any adverse effect on the significant archeological resource; or

B) A data recovery program shall be implemented, unless the ERO determines that the archeological resource is of greater interpretive than research significance and that interpretive use of the resource is feasible.

Archeological Monitoring Program

If the ERO in consultation with the archeological consultant determines that an archeological monitoring program (AMP) shall be implemented, the AMP would minimally include the following provisions:

[9] The term "archeological site" is intended here to minimally include any archeological deposit, feature, burial, or evidence of burial.

[10] An "appropriate representative" of the descendant group is here defined to mean, in the case of Native Americans, any individual listed in the current Native American Contact List for the City and County of San Francisco maintained by the California Native American Heritage Commission and in the case of the Overseas Chinese, the Chinese Historical Society of America.

- The archeological consultant, project sponsors, and ERO shall meet and consult on the scope of the AMP prior to any project-related soils disturbing activities commencing. The ERO in consultation with the archeological consultant shall determine what project activities shall be archeologically monitored. A single AMP or multiple AMPs may be produced to address project phasing. In most cases, any soils-disturbing activities, such as demolition, foundation removal, excavation, grading, utilities installation, foundation work, driving of piles (foundation, shoring, etc.), site remediation, etc., shall require archeological monitoring because of the risk these activities pose to potential archeological resources and to their depositional context. The archeological consultant shall advise all project contractors to be on the alert for evidence of the presence of the expected resource(s), of how to identify the evidence of the expected resource(s), and of the appropriate protocol in the event of apparent discovery of an archeological resource;
- The archeological monitor(s) shall be present on the project site according to a schedule agreed upon by the archeological consultant and the ERO until the ERO has, in consultation with project archeological consultant, determined that project construction activities could have no effects on significant archeological deposits;
- The archeological monitor shall record and be authorized to collect soil samples and artifactual/ecofactual material as warranted for analysis;

If an intact archeological deposit is encountered, all soils-disturbing activities in the vicinity of the deposit shall cease. The archeological monitor shall be empowered to temporarily redirect demolition/excavation/pile driving/construction activities and equipment until the deposit is evaluated. If in the case of pile driving activity (foundation, shoring, etc.), the archeological monitor has cause to believe that the pile driving activity may affect an archeological resource, pile driving activity that may affect the archeological resource shall be suspended until an appropriate evaluation of the resource has been made in consultation with the ERO. The archeological consultant shall immediately notify the ERO of the encountered archeological deposit. The archeological consultant shall make a reasonable effort to assess the identity, integrity, and significance of the encountered archeological deposit, and present the findings of this assessment to the ERO. If the ERO determines that a significant archeological resource is present and that the resource could be adversely affected by the Proposed Project, at the discretion of the project sponsors either:

A) The Proposed Project shall be redesigned so as to avoid any adverse effect on the significant archeological resource; or

B) A data recovery program shall be implemented, unless the ERO determines that the archeological resource is of greater interpretive than research significance and that interpretive use of the resource is feasible.

Whether or not significant archeological resources are encountered, the archeological consultant shall submit a written report of the findings of the monitoring program to the ERO.

Archeological Data Recovery Program

If the ERO, in consultation with the archeological consultant, determines that an archeological data recovery programs shall be implemented based on the presence of a significant resource, the archeological data recovery program shall be conducted in accord with an archeological data recovery plan (ADRP). No archeological data recovery shall be undertaken without the prior approval of the ERO or the Planning Department archeologist. The archeological consultant, project sponsors, and ERO shall meet and consult on the scope of the ADRP prior to preparation of a draft ADRP. The archeological consultant shall submit a draft ADRP to the ERO. The ADRP shall identify how the proposed data recovery program will preserve the significant information the archeological resource is expected to contain. That is, the ADRP will identify what scientific/historical research questions are applicable to the expected resource, what data classes the resource is expected to possess, and how the expected data classes would address the applicable research questions. Data recovery, in general, shall be limited to the portions of the historical property that could be adversely affected by the proposed project. Destructive data recovery methods shall not be applied to portions of the archeological resources if nondestructive methods are practical.

The scope of the ADRP shall include the following elements:

- *Field Methods and Procedures.* Descriptions of proposed field strategies, procedures, and operations.
- *Cataloguing and Laboratory Analysis.* Description of selected cataloguing system and artifact analysis procedures.
- *Discard and Deaccession Policy.* Description of and rationale for field and post-field discard and deaccession policies.
- *Interpretive Program.* Consideration of an on-site/off-site public interpretive program during the course of the archeological data recovery program.
- *Security Measures.* Recommended security measures to protect the archeological resource from vandalism, looting, and non-intentionally damaging activities.
- *Final Report.* Description of proposed report format and distribution of results.
- *Curation.* Description of the procedures and recommendations for the curation of any recovered data having potential research value, identification of appropriate curation facilities, and a summary of the accession policies of the curation facilities.

Human Remains and Associated or Unassociated Funerary Objects

The treatment of human remains and of associated or unassociated funerary objects discovered during any soils disturbing activity shall comply with applicable State and Federal laws. This shall include immediate notification of the coroner of the City and County of San Francisco and in the event of the coroner's determination that the human remains are Native American remains, notification of the California State Native American Heritage Commission (NAHC) who shall appoint a Most Likely Descendant (MLD) (Pub. Res. Code Sec. 5097.98). The archeological consultant, project sponsors, ERO, and MLD shall make all reasonable efforts to develop an agreement for the treatment of, with appropriate dignity, human remains and associated or unassociated

funerary objects (CEQA Guidelines. Sec. 15064.5(d)). The agreement shall take into consideration the appropriate excavation, removal, recordation, analysis, custodianship, curation, and final disposition of the human remains and associated or unassociated funerary objects.

Final Archeological Resources Report

The archeological consultant shall submit a Final Archeological Resources Report (FARR) to the ERO that evaluates the historical significance of any discovered archeological resource and describes the archeological and historical research methods employed in the archeological testing/monitoring/data recovery program(s) undertaken. Information that may put at risk any archeological resource shall be provided in a separate removable insert within the final report. The FARR may be submitted at the conclusion of all construction activities associated with the Proposed Project or on a parcel-by-parcel basis.

Once approved by the ERO, copies of the FARR shall be distributed as follows: California Archaeological Site Survey Northwest Information Center (NWIC) shall receive one (1) copy and the ERO shall receive a copy of the transmittal of the FARR to the NWIC. The Environmental Planning division of the Planning Department shall receive one bound, one unbound and one unlocked, searchable PDF copy on CD of the FARR along with copies of any formal site recordation forms (CA DPR 523 series) and/or documentation for nomination to the National Register of Historic Places/California Register of Historical Resources. In instances of high public interest in or the high interpretive value of the resource, the ERO may require a different final report content, format, and distribution than that presented above.

Mitigation Measure M-CR-1b: Interpretation

Based on a reasonable presumption that archeological resources may be present within the project site, and to the extent that the potential significance of some such resources is premised on CRHR Criteria 1 (Events), 2 (Persons), and/or 3 (Design/Construction), the following measure shall be undertaken to avoid any potentially significant adverse effect from the Proposed Project on buried or submerged historical resources if significant archeological resources are discovered.

The project sponsors shall implement an approved program for interpretation of significant archeological resources. The interpretive program may be combined with the program required under Mitigation Measure M-CR-4b: Public Interpretation. The project sponsors shall retain the services of a qualified archeological consultant from the rotational Department Qualified Archeological Consultants List (QACL) maintained by the Planning Department archeologist having expertise in California urban historical and marine archeology. The archeological consultant shall develop a feasible, resource-specific program for post-recovery interpretation of resources. The particular program for interpretation of artifacts that are encountered within the project site will depend upon the results of the data recovery program and will be the subject of continued discussion between the ERO, consulting archeologist, and the project sponsors. Such a program may include, but is not limited to, any of the following (as outlined in the ARDTP): surface commemoration of the original location of resources; display of resources and associated artifacts (which may offer an underground view to the public); display of interpretive materials such as graphics, photographs, video, models, and public art; and

academic and popular publication of the results of the data recovery. The interpretive program shall include an on-site component.

The archeological consultant's work shall be conducted at the direction of the ERO, and in consultation with the project sponsors. All plans and recommendations for interpretation by the consultant shall be submitted first and directly to the ERO for review and comment, and shall be considered draft reports subject to revision until final approval by the ERO.

Implementation of the approved plan described in Mitigation Measure M-CR-1a would ensure that the significance of any CRHR-eligible archeological resource would be preserved and/or retained in place. If significant cultural resources are discovered, impacts would be mitigated through Mitigation Measure M-CR-1b.[11] With the implementation of Mitigation Measures M-CR-1a and M-CR-1b, the Proposed Project would not cause a substantial adverse change to the significance of an archeological resource, if present within the project site. Therefore, this impact would be less than significant with mitigation.

Impact CR-2: Construction activities for the Proposed Project would cause a substantial adverse change in the significance of human remains, if such resources are present within the project site. ***(Less than Significant with Mitigation)***

Because the project site has been substantially disturbed over the last two centuries, the possibility of discovering human remains is considered low. Although unlikely, it is possible human remains may be encountered during project implementation. Mitigation Measure M-CR-1a: Archeological Testing, Monitoring, Data Recovery and Reporting, presented on pp. 4.D.25-4.D.29, calls for compliance with applicable State and Federal laws regarding the treatment of human remains and of associated or unassociated funerary objects discovered during any soils-disturbing activity. This shall include immediate notification of the coroner of the City and County of San Francisco and the ERO and, in the event of the coroner's determination that the human remains are Native American remains, notification of the NAHC, who shall appoint an MLD (Public Resources Code Section 5097.98). The archeological consultant, project sponsors, ERO, and MLD shall make reasonable efforts to develop an agreement for the treatment of, with appropriate dignity, human remains and associated or unassociated funerary objects (CEQA Guidelines Section 15064.5(d)). The agreement should take into consideration the appropriate excavation, removal, recordation, analysis, custodianship, curation, and final disposition of the human remains and associated or unassociated funerary objects.

With implementation of Mitigation Measure M-CR-1a, the Proposed Project would not cause a substantial adverse change to the scientific significance of an archeological resource resulting

[11] ESA, *Pier 70 Mixed-Use District Project, City and County of San Francisco, Archaeological Research Design and Treatment Plan,* June 2015, p. 111 and pp. 125-126.

from the disturbance of human remains. Therefore, this impact would be less than significant with mitigation.

Impact CR-3: Construction activities for the Proposed Project would not cause a substantial adverse change in the significance of a tribal cultural resource, as defined in Public Resources Code Section 21074, if such resources are present within the project site. ***(Less than Significant)***

As discussed above in "Native American Consultation" on p. 4.D.21, the NAHC was contacted by letter on March 19, 2015, to request information on known Native American sacred lands within the project site and to request a listing of individuals or groups with a cultural affiliation to the project area. A response was received from the NAHC on April 27, 2015, noting a records search indicated that no Native American cultural resources are known to be in the immediate vicinity of the project site. The letter also provided a list of Native American individuals who may have knowledge of cultural resources in the project site. On May 13, 2015, letters were sent to the nine individuals on the list, and to date no responses have been received.[12]

As discussed above in "Effects on Tribal Cultural Resources" on pp. 4.D.18-4.D.19, the particular noticing and tribal consultation requirements of AB 52 (codified in Public Resources Code Section 21080.3) do not apply to the Proposed Project for which a Notice of Preparation was filed with the State Clearinghouse on May 6, 2015, before enactment of AB 52.

A records search with the NAHC and outreach to individuals and groups with a cultural affiliation to the project site has yielded no evidence that any tribal cultural resources are present on the project site or that implementation of the Proposed Project would cause a substantial adverse change to the significance of any tribal cultural resources. For this reason, this impact would be considered less than significant.

Cumulative Impacts

Impact C-CR-1: Disturbance of archeological resources, if encountered during construction of the Proposed Project, in combination with other past, present, and future reasonably foreseeable projects, would make a cumulatively considerable contribution to a significant cumulative impact on archeological resources. ***(Less than Significant with Mitigation)***

Ground-disturbing activities of foreseeable projects, in particular (but not limited to) those along San Francisco's Central Waterfront, have the potential to disturb previously unidentified archeological resources that could yield information pertaining to common research themes identified for the Proposed Project in the ARDTP (consumer behavior, social status and identity,

[12] Matthew Russell, ESA, letter to Allison Vanderslice, San Francisco Planning Department, Re: Pier 70 Mixed-Use Project Native American Heritage Commission Contacts, November 5, 2015.

wharf and pier construction, land reclamation, and industrialization and technology). As such, the potential disturbance of archeological resources within the project site could make a cumulatively considerable contribution to a loss of significant historic and scientific information about California, Bay Area, and San Francisco history.[13]

As discussed above, implementation of the approved plans for testing, monitoring, and data recovery would preserve and realize the information potential of archeological resources. The recovery, documentation, and interpretation of information about archeological resources that may be encountered within the project site would enhance knowledge of prehistory and history. This information would be available to future archeological studies, contributing to the collective body of scientific and historic knowledge. With implementation of Mitigation Measure M-CR-1a: Archeological Testing, Monitoring, Data Recovery and Reporting, pp. 4.D.25-4.D.29, and Mitigation Measure M-CR-1b: Interpretation, pp. 4.D.29-4.D.30, the Proposed Project's contribution to cumulative impacts would not be cumulatively considerable.

As discussed under Impact CR-3, p. 4.D.31, there is no evidence that the Proposed Project would cause a substantial adverse change in the significance of a tribal cultural resource. For this reason, the Proposed Project in combination with past, present, and future reasonably foreseeable projects would not make a cumulatively considerable contribution to a significant cumulative impact on tribal cultural resources.

[13] As discussed above on p. 4.D.9, massive land transformation within the project site during the late nineteenth and early twentieth centuries is likely to have removed any traces of prehistoric surface deposits on the project site. Artificial fill overlaying Bay Mud and bedrock has a low potential to contain significant prehistoric archeological resources.

HISTORIC ARCHITECTURAL RESOURCES

The assessment of project impacts on "historical resources," as defined by CEQA Guidelines Section 15064.5, is a two-step analysis: first, the project site is analyzed to determine if it contains a "historical resource(s)" as defined under CEQA; second, if the site is found to contain historical resources, an analysis is carried out to determine whether the project could cause a substantial adverse change to the resource. A project that may cause a substantial adverse change in the significance of a historical resource is a project that may have significant effect on the environment (CEQA Section 21084.1).

This section has two component subsections. The Environmental Setting discussion identifies the presence of historical resources in the project site. The Impacts and Mitigation Measures discussion evaluates the direct, indirect, and cumulative impacts of the Proposed Project on the historical resources identified in the Environmental Setting subsection.

ENVIRONMENTAL SETTING

The project site is located in a portion of the Pier 70 National Register Historic District, also known as the Union Iron Works (UIW) Historic District, which was listed in the National Register of Historic Places (NRHP or National Register) in 2014.[14] The UIW Historic District and project site boundaries are shown in Figure 4.D.1: Union Iron Works Historic District Boundary. The UIW Historic District is a maritime industrial district historically significant at the national level for its association with the development of steel shipbuilding in the United States, including its pioneering technological developments in shipbuilding, and the production of significant wartime vessels (NRHP Criterion A [association with important historical events]). The UIW Historic District is also significant at the local level because it is a physical record of the trends in industrial architecture from the late nineteenth century through World War II (NRHP Criterion C [architecture/design/construction]). The period of significance begins in 1884, with the construction of the shipyard, and ends in 1945 at the close of World War II.

The District contains 44 contributing buildings/structures/features that contribute to the significance of the District (collectively "contributing features") and 10 non-contributing features. Contributing features are those which were constructed during the period of significance, contribute to the historical significance of the UIW Historic District under NRHP Criteria A or C, and retain sufficient physical integrity to convey their significance. Non-contributing features of

[14] United States Department of the Interior, National Park Service, National Register of Historic Places Registration Form, *Union Iron Works Historic District*, April 17, 2014.

PIER 70 MIXED-USE DISTRICT PROJECT

FIGURE 4.D.1: UNION IRON WORKS HISTORIC DISTRICT BOUNDARY

the UIW Historic District are defined as those which have either lost integrity due to substantial alterations, or were constructed after the period of significance, or both. None of the contributing features of the UIW Historic District have been previously identified as eligible for listing in the NRHP based on individual significance in their own right, but they are collectively significant as contributing constituents of the UIW Historic District.[15]

Based upon an assessment of historic significance of each building and structure located in the project site and in the UIW Historic District that was undertaken as part of this review under CEQA, the Port of San Francisco, with Planning Department concurrence, determined that Building 21 is also individually eligible for listing in the California Register. This building is, therefore, considered to be a historical resource for the purposes of CEQA. None of the other features on the project site were determined to be individually eligible for listing in the California Register.

The project site encompasses approximately 32 acres[16] of the 66-acre District, and contains 12 contributing features within the District boundaries. Table 4.D.1: Contributing UIW Historic District Features on the Project Site, provides a list of the contributing features on the project site.

Table 4.D.1: Contributing UIW Historic District Features on the Project Site

Building Number (Name)	Date Constructed	Contributing	Individually Significant
Building 2 (Warehouse No. 2)	1941, 1944	Yes	No
Building 11 (Tool Room and Navy Office)	1941	Yes	No
Building 12 (Plate Shop No. 2)	1941	Yes	No
Building 15 (Layout Yard)	1941	Yes	No
Building 16 (Stress Relieving Building)	1941	Yes	No
Building 19 (Garage No. 1)	1941	Yes	No
Building 21 (Substation No. 5)	c. 1900	Yes	Yes
Building 25 (Washroom and Locker Room)	1941	Yes	No
Building 32 (Template Waterhouse)	1941	Yes	No
Building 66 (Welding Shed)	1945	Yes	No
Building 117 (Warehouse No. 9/Shipyard Training Center)[a]	1937-1941	Yes	No
Irish Hill (remnant) landscape feature	N/A	Yes	No

Note:

[a] Building 117 is within the project site but is part of the adjacent 20th Street Historic Core Building 40 and 117 project, as described on p. 4.A.14.

[16] Inclusive of the 3.4-acre 20th/Illinois Street parcel.

These contributing features are shown in Figure 4.D.2, Contributing and Non-Contributing Features on the Project Site, on p. 4.D.37.

There are 32 other contributing features within the UIW Historic District located immediately north and outside of the project site, primarily centered on 20th Street. Many of the buildings and structures in this area date from the District's earliest period of construction, and they are considered exceptionally rare examples of industrial Victorian-era architecture. See Table 4.D.2: Contributing UIW Historic District Features Outside of the Project Site.

As a property listed on the National Register, the UIW Historic District, including its contributing features, is automatically listed in the California Register of Historical Resources (CRHR). The Historic District is not listed in Article 10 or 11 of the San Francisco Planning Code as either individual landmarks or a local landmark site.

Under CEQA Guidelines Section 15064.5(a)(3), the UIW Historic District is defined as a "historical resource" because it is listed in the CRHR due to its listing in the NRHP.

Provided below is a historic context of the UIW Historic District, including descriptions of the contributing and non-contributing features within the project site. This historic context has been excerpted and summarized from the UIW Historic District National Register Nomination Form.[17]

HISTORIC CONTEXT

Nineteenth Century

The UIW Historic District can trace its origins to California's first iron works, opened by Peter and James Donahue at Jackson and Montgomery streets in San Francisco during the Gold Rush. In the early 1850s, the works moved to First and Mission streets, and in 1853 was renamed the UIW. The works constructed engines and boilers for iron ships, locomotive equipment for California's first trains, and most of the mining equipment used in the Comstock silver mines. Irving M. Scott managed the works starting in 1865, after Donahue retired, and was responsible for transforming it into one of the country's leading steel hull shipbuilding and repair companies.

By the early 1860s, the City's early wood shipbuilders abandoned the crowded shoreline along Steamboat Point in San Francisco's South of Market district for the deep waters and vacant lands around Potrero Point. John North was the first shipbuilder to relocate in 1862, followed by Henry Owens, William E. Colllye, and Patrick Tiernan. The 1867 completion of the Long Bridge from

South of Market over the waters of Mission Bay, and the extension of Third Street, improved access and eased transportation to this developing manufacturing center in the Potrero district. The Irish Hill and Dogpatch neighborhoods emerged as workers moved to the area. The Irish Hill neighborhood consisted of two settlements of cottages, lodging houses, and saloons clinging to the hillside north of the Pacific Rolling Mills and around the intersection of 20th and Illinois streets.

The deep waters around Potrero Point facilitated easy loading and unloading of cargo, making it an excellent location for the new UIW shipyard. Located in the outskirts of the City, Potrero Point also made an ideal manufacturing area for hazardous materials. The E. I. du Pont de Nemours Company was one of the first manufacturers to exploit this region in 1854 to manufacture black powder. Over the following decades, the Tubbs Cordage Company/San Francisco Cordage Manufactory, Pacific Rolling Mills, and City Gas Company Works moved to the area. Pacific Rolling Mills, whose property would eventually be managed by UIW under Bethlehem Steel ownership, was the first manufacturer of steel on the West Coast, starting in the 1860s.

The UIW shipyard opened at Potrero Point in 1884 with a machine shop (Building 113), plate shop, pattern shop, foundry, smith shops, and slipways. The next year the yard launched the *Arago*, the first steel hull ship produced by UIW and launched on the West Coast, and one of the first steel hull ships completed in the country. In 1885, after the yard's success with the *Arago*, Scott and UIW secured naval contracts, initiating a relationship between the U.S. Navy and the yard that lasted through World War II. During the late nineteenth century, the shipyard completed some of the most famous warships of the Spanish-American War, including the *USS Oregon* and the *USS Olympia*.

Early Twentieth Century

In 1902, the United States Shipbuilding Company (USSC) acquired UIW along with other yards and steel mills across the country. Two years later, the USSC collapsed, allowing Charles Schwab to purchase the shipyard in 1905 on behalf of the Bethlehem Steel Company, the second largest steel manufacturer in the country. In the spring of 1908, Schwab personally oversaw upgrades to the yard's repair facilities, which allowed the yard to repair the Great White Fleet, the naval fleet that President Theodore Roosevelt ordered to sail around the world from 1907 to 1909 as a display of the country's growing military power.

By World War I, the shipyard served as the headquarters of a West Coast shipbuilding complex, which included the Hunters Point Drydock, the Alameda Yard, and the U.S. Navy Destroyer Plant. Renowned San Francisco architects such as George Percy and Frederick Hamilton designed the UIW office building (Building 104) at the corner of 20th and Illinois streets, creating a grand entrance to the yard. The shipyard was expanded and modernized in the 1910s to include

infrastructure expansion, a new plate shop (Building 109), and new foundries (Building 115/116). The destroyer plant run by UIW used some of the new prefabrication methods of the period to produce three destroyers per month. The Navy prioritized submarine destroyers as the primary fleet defense against torpedo attacks from submarines, and the 66 destroyers produced by the yard made a substantial contribution to the World War I naval effort.

The yard survived the lean years after World War I on commercial ship construction and ship repair contracts. United States Maritime Commission contracts, starting in 1936, resulted in a new wave of modernization at the yard. Upgrades included a new boiler house (Building 103), a new steel warehouse (Building 117), and a yardwide transformation from riveting to welding, which helped the yard adapt to standardized mass production that typified World War II ship production. During the war, the yard was primarily under naval management. The New Yard shipbuilding facility (Building 12 complex) built by the Navy stands on the former destroyer plant. The yard also significantly contributed to World War II in the repair of 2,500 ships.

After World War II, the yard continued to build government and commercial ships into the 1970s. In the early 1980s, the Bethlehem Steel Company went bankrupt and sold the shipyard for one dollar to the Port of San Francisco. Todd Shipyards purchased much of the machinery and leased portions of the yard for ship repair. BAE Systems Ship Repair leases portions of the yard from the Port of San Francisco and continues to operate a repair facility on-site, making the yard the longest operating steel hull ship repair yard in the country.

World War II

General expansion of the shipyard occurred during the start of World War II, including new buildings and further construction and expansion of slipways and wet basins along the waterfront. Much of this work was designed, owned, and paid for by the U.S. Navy. The most substantial development was the expansion of the southeastern slipways and construction of the New Yard, also known as the Building 12 complex, comprising Buildings 12, 15, 16, 25, 32, and 66 (see discussion below). UIW also saw increased specialization of buildings during this period, specifically buildings for outfitting and ship repair.

The New Yard/Building 12 Complex

The New Yard consisted of four slipways, a plate shop, a machine shop, a warehouse, a layout yard, welding platforms, and additional smaller support buildings. The shift toward welding required welding platforms and layout areas around the slipways. The slipways for the New Yard were completed in 1941, replacing the World War I–era destroyer yard slipways and associated plate shop. Building 2 replaced a warehouse dating to the Risdon period. This portion of UIW was developed with buildings and structures ranging from 80 feet (Building 2) to 120 feet high (scaffolding for Slipways 5, 6, 7 and 8).

The New Yard optimized its layout for pre-assembly and welding following the turning flow design. Since the beginning of steel shipbuilding, the goal of shipyards was to keep parts moving forward, from the arrival of raw materials through the final assembly of vessels. By World War II, the use of a linear or straight flow of materials was considered optimal, and a straight line flow was a noted accomplishment of the new World War II yards. However, shipyards with limited space often implemented the turning flow design. Instead of the optimal strictly linear movement from the storage areas to the slipways, the turning flow design allowed for materials to enter the yard parallel to the shoreline, move through the shops in a straight line, and then turn to be assembled on the shipways.

At the New Yard, the working plans for a ship were drafted in the administration office (Building 101) or the naval office (Building 104). Plans were laid down in the mold loft, and templates were made and moved downstairs to the plate shop. Following the turning flow process, raw steel entered by rail at the top end of the yard and was held in storage yards to the west of the plate shop (Building 12) until needed. The steel was then formed in the plate shop and, as required, joined into sub-assemblies. Cranes carried the sub-assemblies to the welding platforms where the parts were joined into even larger sections, such as deck houses and bow and stern assemblies. Completed sub-assemblies were then moved by cranes to the slipways. At the New Yard, pre-assembly was also completed on welding platforms adjacent to the slipways. When the hull was completed, it was launched and moved to outfitting piers.

During World War II, specialized engineering and outfitting buildings were constructed or repurposed between the New Yard and the outfitting wharves. These buildings corresponded with specific outfitting and engineering divisions, including pipe, rigging, electrical, carpentry and joinery, sheet metal, and paint shops. Most of the engine and boiler work remained at Building 105 and Buildings 113/114. Material was moved by rail and cranes from these buildings to the outfitting wharves and installed in the hulls.

Ship repair was the main contribution of UIW to the World War II effort. During this period, the yard built over 70 ships and repaired 2,500 ships. The repair yard, which contained structures and even equipment that dated back to the origins of steel shipbuilding in this country, was one of the best and the largest commercial repair yards in the country. Provided below is a summary of the historical significance of the UIW Historic District under NRHP Criteria A and C.

NATIONAL REGISTER OF HISTORIC PLACES SIGNIFICANCE SUMMARY

The following is a summary of the historical significance of the UIW Historic District, excerpted from the National Register Nomination Form[18], with a focus on the District's historic and architectural significance associated with World War II.

Criterion A (Events)

UIW Historic District is significant under Criterion A. The District was one of the first steel hull shipyards in the country, and the first on the West Coast. It actively participated in every trend in steel shipbuilding, and the yard embodies each of those trends. UIW was an industry leader and technological pioneer during the late nineteenth century through the turn of the twentieth century, influencing shipyards in other parts of the country. It continued successfully to adopt emerging practices in prefabrication and design standardization, while retaining its original capacity to fabricate all ship components on site. The yard made significant contributions to every war effort from the Spanish-American War through World War II. It produced hundreds of ships and repaired thousands, including each of the most influential types of vessels in each war. UIW furthermore originated steel shipbuilding on the West Coast, and for most of its history, it served as the headquarters of domestic shipbuilding and ship repair for the Pacific. The yard was able to balance emerging technology with older shipbuilding and repair practices, enabling it to convey its national level of significance over each phase of development, rather than just one single period.

Criterion C (Architecture)

UIW Historic District is also historically significant under Criterion C at the local level as a District that represents a distinctive and exceptional entity. It illustrates national trends in industrial, and especially shipyard, architecture, from 1884 to 1945. Functional and aesthetic forces determined the appearance of the buildings and the layout of the yard, forces that relate to the larger national context of factory design from the early 1880s to 1945. The UIW Historic District's built environment is subdivided into four periods, each corresponding to larger national trends in industrial architecture. The World War II period is described below because it is within this context that most of the buildings on the project site were constructed.

World War II created an emergency situation requiring the construction of new ships, and, therefore, new shipbuilding facilities, as quickly as possible. Most new buildings from this period, similar to other World War II shipyards, were steel frame construction with corrugated metal cladding, relatively quick to erect. Buildings constructed in the 1930s have a brick base;

[18] United States Department of the Interior, National Park Service, National Register of Historic Places Registration Form, *Union Iron Works Historic District*, April 17, 2014.

those constructed after 1940 do not. Steel frame buildings, including pre-fabricated buildings, became especially popular during World War II for both military and civilian industrial uses because of their relative ease and speed of construction.

In 1940, UIW was contracted, along with only five other private shipyards nationwide, to perform Navy work exclusively. To promote this contractual arrangement, the Federal government made further investments in UIW. Most notable was the New Yard, now known as the Building 12 complex, located at the District's southeast quadrant where Risdon Iron Works once stood. A major upgrade to the rail system united the new facility with the rest of the shipyard.

The Building 12 complex, comprising Buildings 12, 15, 16, 25, 32, and 66, was largely built in 1941 to construct anti-aircraft cruisers. Building 12, which housed the plate shop and mold loft, comprised steel frame construction with corrugated steel cladding, which was typical of this period. The complex lacks a stylistic veneer, but displays a visual power derived from its massing and the rhythm of its openings and roof monitors.

The Building 12 complex and other developments at UIW from this period reflect the concept of functional specificity in several ways. Most important was the rationalization of the workflow process by establishing a straight or turning flow pattern. The desire for efficient work flow affected building placement and adjacencies, as well as the material handling system connecting the buildings. Other examples of functional specificity include the establishment and strategic placement of welding platforms and assembly layout areas, and proximity to slipways, where final assembly and fitting out occurred.

Buildings 12, 15, 32, and 16 connect on at least one elevation. Within, they form a single interior space. Although the compact Building 12 complex approaches the industrial ideal of containing an entire production process within one space, much of the assembly took place on open platforms or in adjacent slipways. Spatial constraints most likely dictated the compact form, as well as the turning, rather than the straight flow process.

Concrete buildings, such as Warehouse 2 (1941), continued to be built during World War II, as did many smaller wood frame buildings, most providing worker amenities. Although the buildings from this period were similar in size, design, and layout to those at other shipyards, they were not necessarily typical of other industrial buildings during this period. This is because building design was centered on the functionality of the building and not a particular aesthetic or style.

CHARACTER-DEFINING FEATURES OF UIW HISTORIC DISTRICT

Character-defining features of the UIW Historic District include those buildings, structures, and landscapes which contribute to the significance of the District and convey its importance under

NRHP Criteria A and C. For example, the buildings located along 20th Street – Buildings 113, 101, 102, 103, and 104 – and the south wall of Building 105, function to create an architectural promenade and entrance to the yard and, as a group, define the strong architectural and industrial character of this portion of the District. The fencing installed during World War I along Illinois and 20th streets is largely intact, and the entrance to the shipyard has remained at the same location since the 1890s.

The density of this urban industrial center and the variation in materials, styles, rooflines, cranes, chimneys, and waterfront features convey its historic evolution and distinguish it from other shipyard and industrial sites built or heavily remodeled during a single period. The materials used within the District are a physical record of the evolution of UIW Historic District and include unreinforced masonry, wood, concrete, and sheet metal construction. All of these features and materials are considered character-defining features of the District.

Buildings that create visual landmarks by their prominence, location, and size can be considered character-defining features of the District, as well as other contributing features. Since the 1930s, Building 103 and its large smokestack have dominated the view of the UIW Historic District from its entrance and have defined the end of 20th Street.

In addition to the 44 contributing features that comprise the UIW Historic District, the District also possesses the following character-defining features:

- Waterfront location/shoreline;
- Minimal planted vegetation;
- Open areas that are either paved with asphalt or covered with gravel;
- Streets that are improved without curbs and gutters, except for 20th Street, which has granite curbs;
- Dense urban-industrial character;
- Variation in materials, styles, rooflines, and window types;
- Variation in height and scale, with resources that range from one to six stories (80 feet) in height, some with large footprints of 60,000-100,000 square feet;
- Certain groupings of buildings, such as the entry promenade along 20th Street and the Building 12 complex;
- Features such as cranes;
- Ship repair activities; and
- Yard layout and plan.[19]

[19] United States Department of the Interior, National Park Service, National Register of Historic Places Registration Form, *Union Iron Works Historic District*, April 17, 2014.

District Integrity

The end of World War II represented the maximum build-out of the District. Since 1945, few new buildings have been added, and buildings of primary importance from all periods of growth and modernization remain. The most notable modifications to the Historic District since World War II include the following:

- Removal of above-grade features of Slipways 1 through 3 and 5 through 8;
- Removal or rebuilding of wharves and piers including Wharves 1, 3, 4, and 5 at Pier 68 and Wharf 8 at Pier 70 (includes Building 64). Wharf 8 was altered in 1941, 1942, and 1944, and completely rebuilt after 1980;
- The loss of support buildings on deteriorating wharves;
- Removal or paving over of paving stones and rail lines;
- Removal of the large gantry cranes associated with Buildings 12 and 109;
- The installation of modular buildings and construction of new buildings including the BAE Systems office and a Butler Building (Building 251) to accommodate sandblasting functions north of Building 105;
- Removal of a row of buildings between Building 6 and the New Yard. The following buildings were removed from this area after the period of significance and all but the first two date from the World War II expansion:
    - Building 4 - Sheet Metal Shop (built in 1900 with World War I and World War II additions);
    - Building 5 - Copper Shop (built in 1900 with World War I and World War II additions);
    - Building 7 - Light Warehouse;
    - Building 8 - Riggers, Carpenters, and Painters Shop;
    - Building 9 - Pipe Shop No. 2;
    - Building 10 - Pipe Rack and Locker Room;
    - Building 22 - Washroom;
    - Building 56 - Sheet Metal Shop;
    - Building 57 - Central Kitchen;
    - Building 61 - Scale House.

Despite the loss of some contributing features, the UIW Historic District forms a contiguous district with a variety of conditions. The Historic District includes examples from all periods of construction and expansion, from the opening of the yard in the early 1880s to the end of World War II. It retains sufficient historic integrity to convey its role in the birth and expansion of the U.S. steel hull shipbuilding industry and reflects the development of industrial architecture from the 1880s to 1945.

DESCRIPTION OF CONTRIBUTING AND NON-CONTRIBUTING FEATURES ON THE PROJECT SITE

Provided below are detailed descriptions of all 12 contributing features on the project site, comprising the 11 contributing buildings and 1 contributing landscape feature. Also included below are descriptions of non-contributing features within the District. These descriptions have been excerpted and summarized from the National Register Nomination Form.[20] Table 4.D.1, p. 4.D.35, identifies all of these by building number, name, and date constructed (where applicable).

Contributing Features

Building 2 (Warehouse No. 2)

Building 2 stands east of the complex formed by Buildings 113/114, 115/116, and 117. The land was formerly occupied by a portion of Irish Hill. The architect and builder of this industrial-vernacular building are unknown. It was likely designed and built by government personnel as part of the joint public-private World War II shipbuilding effort.

DESCRIPTION

Building 2 is a six-story, board-formed, concrete warehouse, rectangular in plan with a flat roof. Constructed in 1941 and 1944, it measures 256 feet long, 76 feet 9 inches wide, and 79 feet 6 inches high. Containing a total of 98,804 square feet, it is one of the tallest extant buildings in the UIW Historic District. It runs north to south, with one loading door at the north façade and three at the north end of the west façade. Also on the north façade is a personnel entrance protected by a flat awning and accessed by three stairs. The windows are steel, multi-pane, and fixed sash, and most contain operable, four-lite, central vent sashes.

The top floor, dating to 1944, has wood sash windows, which match the style of the steel sash on the lower floors. An elevator and stair tower project slightly from the west façade. Painted signage on the north end designates the building as "Warehouse 2." As on the exterior, concrete is the primary interior building material. The walls and ceiling of each floor are of board-formed concrete, and the floor is exposed concrete slab, except at the sixth floor, which has wood boards over the original concrete roof slab. Columns on a 20-foot grid divide the interior into bays; columns located on floors one through four are round with flared capitals, and those on floors five and six are square. Except for the columns, each level consists primarily of open space used for storage. The large freight elevator and stairwell stand along the west wall near the north end of the building.

[20] Ibid.

HISTORIC/CURRENT USE

Building 2, constructed during World War II, originally functioned as a warehouse to support hull construction at the Building 12 complex and outfitting. The sixth floor of the building contained a drafting room, and offices were located on the first and second floors. A bridge connects the fourth floor to the mold loft in Building 12, located south of Building 2. This building is currently used for commercial storage. Along with Building 111, Building 2 is one of two multi-story warehouses extant in the District.

INTEGRITY

Building 2 has undergone few alterations since its construction, with the exception of the sixth floor addition in 1944 that falls within the period of significance for the District. Therefore, the building retains a high degree of integrity and is a contributor to the UIW Historic District for its associations with World War II shipbuilding. It is one of the few concrete buildings from the World War II period and adds to the diversity of materials used within the District.

EVALUATION OF INDIVIDUAL SIGNIFICANCE

Because Building 2 is one of several warehouse buildings within the district that collectively played a support role in the ship building process, it is not considered to possess individual significance or to be individually eligible for listing in the California or National Registers.[21]

Building 11 (Tool Room and Navy Office/Noonan Building)

Building 11 stands just east of Building 21 and west of a paved parking lot, accessed by a road to the north. The infilled Slipways 5 through 8 are to the southeast, and the Building 12 complex (see discussion below) is to the southwest. Located on the site of the Pacific Rolling Mills former sheet and tin plate warehouse, Building 11 was built in 1941 by the Navy as part of the New Yard to aid in production related to World War II.

DESCRIPTION

This three-story, rectangular wood frame building is 156 feet long by 72 feet wide by 38 feet high and contains 32,664 square feet. It has a flat tar and gravel roof and is clad with horizontal wood siding. Two stair towers project one story above the roof. Windows are wood double-hung with simple wood surrounds, often paired. Exterior open staircases at the west and north elevations

[21] Port of San Francisco, "Union Iron Works Historic District: Profiles of Contributing and Non-Contributing Resources Proposed for Demolition by Project Area (includes contributing resources proposed for rehabilitation)," December 6, 2016.

lead to small landings and doors at the second story. Doors include single metal units at each elevation, a wood freight door centered in the east elevation, and a sliding metal door at the north.

The interior currently includes artist studios and office space. First floor spaces open directly to the exterior, without internal circulation. Exterior stairs access the second floor double-loaded corridor, whereas interior winding stairs connect the second and third floors.

HISTORIC/CURRENT USE

Building 11 provided support for hull construction at the Building 12 complex. The first floor originally contained a tool room, temporary lights department, and burner department, as well as three small offices. The two upper floors were devoted to office space. Interior signage indicates that the offices were used by the U.S. Navy. The building contained a cafeteria as well. Currently, artist studios and offices occupy the building.

INTEGRITY

Although the building has sustained minor alterations, mostly on the interior related to change of use, it maintains a high degree of integrity of location, setting, feeling, and association; and a moderate degree of integrity of design, materials, and workmanship. Therefore, it is a contributor to the UIW Historic District for its association with World War II.

EVALUATION OF INDIVIDUAL SIGNIFICANCE

Building 11 does not possess individual significance because it was a support office to the "New Yard," and the loss of the above-ground portions of related Slipways 5, 6, 7, and 8 has compromised this building's ability to convey its role in the larger ship-building process. Therefore Building 11 does not qualify for listing under the National or California Registers as an individual historical resource.[22]

Building 12 (Plate Shop No.2)

Building 12 was constructed in 1941 as the central building of the New Yard. The building was designed and built by government (Navy) personnel as part of the joint public-private World War II shipbuilding effort.

[22] Port of San Francisco, "Union Iron Works Historic District: Profiles of Contributing and Non-Contributing Resources Proposed for Demolition by Project Area (includes contributing resources proposed for rehabilitation)"; December 6, 2016.

DESCRIPTION

Building 12 measures 248 feet 2 inches by 242 feet two inches in plan by 59 feet 6 inches tall, and contains 118,890 square feet spread across two floors. Construction is steel and wood with corrugated steel cladding. The roofline is an Aiken configuration, with five raised, glazed monitors running east to west for the width of the building. Clerestory multi-lite steel sash awning windows extend the length of the monitors on the north and south sides. The central monitor measures twice the width of the others. Twelve vertical bays divide the east and west elevations into 24-foot sections. Three bands of multi-lite steel sash awning windows, with a double-height bottom band, line the north and east elevations. Below the topmost band of windows, the south elevation directly connects to Building 15. Four bands of multi-lite steel sash awning windows run the length of the east elevation, and the top band on all four sides provides light into the mold loft. A shallow ridge runs north to south along the center of the building, over the monitors, and the roof gently slopes at 4 inches per 1 foot to the east and west. The west elevation has three vehicle roll-up doors, whereas the north has two.

On the ground floor, two rows of columns running north to south divide the interior into three bays. Exposed square Howe trusses support the second floor 38 feet 4 inches above the ground. Lighting consists of standard factory lights with glass reflectors. On the north end of the building, two steel staircases with concrete treads provide access to the upper level. Asphalt paves the ground floor.

The 360 degree band of windows and the clerestory monitor windows give the second story mold loft superlative light qualities. The mold loft has a wood plank floor, and wood cladding lines the walls up to window height. The ground-floor columns penetrate through the mold loft floor to divide the space into three separate bays, with 9-foot 7-inch ceilings that rise to 17 feet 4 inches in the monitors. The mold loft has industrial light fixtures similar to those on the first floor. Two personnel doors open onto the roof of Building 15 on the south elevation, and on the north elevation, an enclosed walkway connects to Building 2. A dumbwaiter shaft opens near the walkway. In the northeast corner, partitions enclose an office, game room, and bathroom.

HISTORIC/CURRENT USE

Building 12 housed the plate shop and mold loft for the Building 12 complex and was central to hull construction at Slipways 5 through 8 to the east. The building was constructed on newly leveled ground where most of Irish Hill once stood. It was one of a number of buildings constructed for the large enterprise of shipbuilding specifically for World War II. In the process of producing a ship from blueprint to hull, the construction plans were first transferred to a life-size model in the mold loft. This pattern was then taken to the mold makers who made a template out of wood, used for the guidance of marking the steel plates. Steel plates were stored in the

adjacent yard to the west. The marked plates were then cut and shaped into the desired hull shapes. The finished plates were then transferred to the adjacent layout yard (Building 15) where the plates were checked against the molds and plans before welding. The plates were moved from the yard to Building 12 and from Building 15 to the welding platforms and slipways via U.S. Navy–owned rail lines. A rail line connecting Building 12 to the rest of the shipyard also ran next to the east elevation of Building 2. Building 12 stood adjacent to Machine Shop 2 (now demolished) and the layout yard (Building 15) as the center of this World War II–era complex. Welding platforms adjoined these buildings to the south, linking the complex with Slipways 5 through 8. The building is currently vacant and is periodically used for temporary events.

INTEGRITY

Building 12 has experienced few alterations and retains integrity of location, design, setting, materials, workmanship, feeling, and association. The main alteration to the building is the removal of machinery and equipment, including cranes, from the first floor. Building 12 contributes to the UIW Historic District because of its association with the World War II shipbuilding historic context. It is also a representative example of industrial architecture from World War II. It forms the core of the Building 12 complex, which also includes Buildings 15, 16, 25, 32, and 66 (see description of each, below).

EVALUATION OF INDIVIDUAL SIGNIFICANCE

While Building 12 is historically important as the central feature of the Building 12 complex that provides continuity with the World War II-era last phase of shipyard development known as the "New Yard" and helps convey the significance of the UIW Historic District, the building does not possess sufficient significance to qualify individually for listing in the California or National Registers.[23]

Building 15 (Layout Yard)

Building 15 stands at the south end of the District and is part of the Building 12 complex. The group, including Buildings 12, 15, 16, 25, 32, and 66, was constructed in 1941-1944 specifically for World War II. The architect/engineer and builder are unknown. The building was likely designed and built by government personnel as part of the joint World War II effort.

[23] Port of San Francisco, "Union Iron Works Historic District: Profiles of Contributing and Non-Contributing Resources Proposed for Demolition by Project Area (includes contributing resources proposed for rehabilitation)," December 6, 2016.

DESCRIPTION

This east-west oriented warehouse is immediately adjacent to Building 12 and measures approximately 242 feet 8 inches by 71 feet 7 inches, with an interior area of 17,134 square feet. A Fink truss with a king post supports the gabled roof, with the peak approximately 53 feet off the ground. Nine columns along the interior walls subdivide the space into eight distinct bays. The gabled roof covers the seven eastern bays; a flat roof of wood joists and decking covers the eighth, westernmost bay. A steel staircase on the south exterior wall leads to the flat roof, and a personnel platform on the roof rises slightly above the steel parapet.

Building 15 attaches to four other buildings, three to the south (Buildings 32, 25, and 16) and one to the north (Building 12), leaving only the eastern and western ends exposed. On the interior, no significant walls or partitions separate Building 15 from Buildings 12 or 32, creating a unified interior space between the three buildings, although at the northeast corner of Building 15, a corrugated steel wall with multi-lite steel sash windows partially divides the easternmost bay from Building 12. The southern interior wall features a cut-out through the corrugated steel that reveals the exterior north elevation of Building 25. Short wood planking serves as a roof over the approximately 1-foot gap between the two buildings. Two wood personnel doors on either side of the Building 25 cut-out provided access between the two buildings. Where Building 16 and Building 15 meet, newer corrugated steel covers the wall, and non-corrugated steel panels cover the wall at ground level. Standard industrial light fixtures, apparently original, remain.

On the exterior, the upper portion of the western façade features a corrugated steel parapet above a continuous band of multi-lite, steel sash pivot windows spanning the entire façade width. A similar band of windows glazes the ground level, interrupted by a large vehicle door in the central bay. Most of the southern elevation attaches to smaller buildings, but the western end of this elevation features a band of multi-lite windows above a vehicle door large enough for rail cars. The eastern elevation includes a band of multi-lite steel sash pivot windows at the upper level, and a roll-up steel door at the ground level. The northern façade of Building 15 attaches to Building 12.

HISTORIC/CURRENT USE

The layout yard served as an intermediate staging area for the steel plates of a vessel's hull used for hull construction in Slipways 5 through 8. As the plates left the plate shop (Building 12) adjacent and to the north, they were arranged, numbered, and checked against the molds and plans. This process assured that the welders had the correct panels lined up for welding. This occurred on either one of the welding platforms, if pre-assembled, or directly on the hull of the ship in one of the slipways to the east. U.S. Navy–owned rail lines transported the steel plates to the welding platforms and slipways of the New Yard. The personnel platform and stairs leading

up to the flat roof on the western edge of the building indicate a potential use as a viewing platform to oversee activities in the plate storage yard to the west. These former staging areas remain between Building 12 and the remnant of Irish Hill to the west. The building is currently vacant and is periodically used for temporary events.

INTEGRITY

Building 15 contributes to the UIW Historic District because of its association with the World War II steel shipbuilding effort undertaken at the New Yard. Building 15, the layout yard, has experienced few alterations and retains integrity of location, design, setting, materials, workmanship, feeling, and association.

EVALUATION OF INDIVIDUAL SIGNIFICANCE

Building 15 is a contributor to the UIW Historic District, but does not possess individual significance. Together with Buildings 16, 25, and 32, Building 15 functioned as a support building to Building 12: these other buildings are experienced as smaller additions rather than as separate resources. For these reasons, and because it lacks individual distinction, Building 15 does not qualify for listing under the National or California Registers as an individual historical resource.[24]

Building 16 (Stress Relieving Building)

Building 16, at the south end of the District, is part of the Building 12 complex, comprising Buildings 12, 15, 16, 25, 32, and 66. The actual architect and builder are unknown, but it was designed and built by government personnel in 1941 as part of the joint World War II effort.

DESCRIPTION

This two-story gabled warehouse measures 50 feet 10 inches by 152 feet 2 inches in plan and 45 feet 7 inches in height. It contains a total of 7,588 square feet, and corrugated steel panels cover the steel frame. Five prominent vents run along the gable ridge. The upper portion of all exposed façades features a band of multi-lite, steel sash awning windows with operable vents near the top of the building.

The eastern façade has five bays and two roll-up steel doors that interrupt a lower band of windows. The southern façade, divided into three bays, is almost entirely covered with steel sash windows, and has a single steel personnel door. The western façade, visible from a courtyard

[24] Port of San Francisco, "Union Iron Works Historic District: Profiles of Contributing and Non-Contributing Resources Proposed for Demolition by Project Area (includes contributing resources proposed for rehabilitation)," December 6, 2016.

formed by neighboring Buildings 15 and 32, reveals more multi-lite, steel sash windows and two metal personnel doors with windows.

The interior consists of one open bay, with a concrete foundation and a double-height ceiling approximately 33 feet 7 inches from the ground. An exposed steel compound Fink truss with a king post top forms the gable, rising an additional 12 feet. The former entrance from Building 16 into Building 15 now appears covered with metal panels. Some standard factory light fixtures remain.

Along the western façade, a large industrial furnace with a gable roof approximately 20 feet tall attaches to Building 16. The furnace features steel framed doors at the east and west elevations, with the eastern door opening directly into Building 16. The doors slide vertically into a protected compartment, and fire brick appears through holes in the doors. Four hydraulic actuators tightly seal the furnace wrap around the door's perimeter. A chimney stands along the southern side, and numerous exposed mechanical components envelop the north and south elevations of the furnace.

HISTORIC/CURRENT USE

The Stress Relieving Building was used for hull construction at the Building 12 complex. Related to quality control, pre-assembled welded components for ship hulls in Slipways 5, 6, 7, or 8 would have joints relieved of the stress inherent in the bond from imperfect welds. Stress relieving involved re-heating the bond juncture, burning the ridge and inserting a splint or "strong back" mechanically, and re-welding the joint in a controlled environment. The building is currently vacant and is periodically used for temporary events.

INTEGRITY

Building 16, the Stress Relieving Building, has experienced few alterations and retains integrity of location, design, setting, materials, workmanship, feeling, and association. Building 16 contributes to the UIW Historic District for its association to the World War II steel shipbuilding effort at the New Yard. The industrial furnace connected to this building is also a character-defining feature and is the only example of this type of furnace in the District.

EVALUATION OF INDIVIDUAL SIGNIFICANCE

Building 16 is a contributor to the UIW Historic District, but does not possess individual significance. Together with Buildings 15, 25, and 32, Building 16 functioned as a support building to Building 12 and, as in the case of Building 15, these other buildings are experienced as smaller additions rather than as separate resources. Additionally, like Building 15, Building 16

lacks individual distinction. For these reasons, Building 16 does not qualify for listing under the National or California Registers as an individual historical resource.[25]

Building 19 (Garage No. 1)

Building 19, just south of Building 108, is surrounded by open space on the east, west, and south elevations. This building stands at the end of 21st Street, which was closed during World War II. The architect and builder of this simple, industrial building, built in 1941, are unknown.

DESCRIPTION

This is a one-story, rectangular-plan gable-roofed warehouse with corrugated, galvanized steel roofing and cladding. It measures 50 feet 8 inches by 24 feet 6 inches in plan and 31 feet 6 inches tall, and contains a total of 6,152 square feet. Windows are fixed, multi-lite steel sash with central ventilators; many lites[26] are boarded or painted over. Rolling metal doors appear on the west, east, and south elevations.

The north elevation is board-formed concrete and stands higher than the adjacent east and west elevations. A small metal shed attaches to the west elevation. The interior is a single open space. Walls are corrugated metal, except for the concrete north wall. Modified Howe trusses form the roof structure and the floor is concrete slab. Freestanding machinery includes a sifter/conveyor, and the building stores sandblast grit, used to sandblast ships prior to painting.

HISTORIC/CURRENT USE

Listed as Garage No. 1 and owned by the government on the Bethlehem 1945 plan, this building was used as a garage and housed a small office during World War II. It adjoins Building 108, a planing mill and joiner shop. Building 19 is currently used by BAE Systems for storage of sandblasting grit.

INTEGRITY

Despite minor alterations, such as the attached metal shed at the west elevation, the building retains a high degree of integrity and therefore is a contributing resource. Building 19 is a contributor for its association with the World War II shipbuilding effort at the yard.

[25] Port of San Francisco, "Union Iron Works Historic District: Profiles of Contributing and Non-Contributing Resources Proposed for Demolition by Project Area (includes contributing resources proposed for rehabilitation)," December 6, 2016.

[26] "Lites" is an architectural term for individual window panes.

EVALUATION OF INDIVIDUAL SIGNIFICANCE

Building 19 is a contributor to the District, but it does not possess individual significance because it is an undistinguished utilitarian warehouse/garage building that functioned as a minor support building in the World War II-era of ship building and repair; therefore, it does not qualify for listing under the National or California Registers as an individual historical resource.[27]

Building 21 (Substation No. 5)

Building 21 stands just west of the tool room (Building 11), surrounded by two paved roads to the north and west, and a paved lot to the south and southeast, the site of infilled Slipways 5 through 8. The architect/engineer and builder of this industrial-vernacular building, constructed ca. 1900, are unknown.

DESCRIPTION

This two-story rectangular-plan building measures 101 feet 2 inches long by 75 feet 6 inches wide by 44 feet high, and contains 10,172 square feet. It has a steel frame, with corrugated metal cladding. The roof, also corrugated metal-clad, is double gable, and each gable has a wide roof monitor. The glazing consists primarily of multi-lite, double hung wood or horizontal steel sash windows, many with an operable vent sash. Many windows are covered with plywood or metal security grates; the monitor windows have been covered with corrugated metal.

The primary elevation is north; the west half features two sets of personnel doors. Two glazed metal doors at the center of the elevation lead to the Port of San Francisco's electrical storage area, and a pair of metal doors east of center leads to the radio tower control room. The east half of the north elevation features two pairs of steel freight loading doors, glazed with twelve lites per door. Two additional personnel doors open at the second level, the easternmost accessed by a metal stairway. The south elevation has two freight doors, each centered on the east and west half of the wall. A shed-roofed utility building attaches to this elevation at the southeast corner. The west elevation features a set of five hanging steel freight doors, now soldered shut. Each door is glazed with twenty-four lites.

HISTORIC/CURRENT USE

This building dates to the Risdon Iron Works period and is the only building left from that iron works. In 1911, the Risdon Yard shut down, and a subsidiary of the U.S. Steel Company purchased the yard. During World War I, the UIW Company built and operated a United States

[27] Port of San Francisco, "Union Iron Works Historic District: Profiles of Contributing and Non-Contributing Resources Proposed for Demolition by Project Area (includes contributing resources proposed for rehabilitation)," December 6, 2016.

destroyer plant on the site of the former Risdon Yard for the Emergency Fleet Corporation. The destroyer plant was commonly known as the Risdon Plant. In 1940, during the buildup to World War II, the Navy purchased the land and built an entirely new shipyard on the site of the old Risdon Yard.

Both the 1914 and 1936 Sanborn maps show Building 21 to be a machine shop and transformer house. A 1945 Bethlehem Steel Company plan describes Building 21 as Substation No. 5 and Electric Shop No. 2. In 1945, the first floor had a compressor room in the northwest corner, and a small electric parts room east of the compressor room. Adjoining the compressor room and electrical parts room to the south was an area used for housing large equipment, including transformers. Most of eastern portion of the first floor was used as an electrical shop, with a small office in the northeast part of the floor. The second floor housed a shop in the north portion and a store room in the south. Building 21 now functions as a substation for the area and for storage. The roof was replaced in kind in 2008.

INTEGRITY

The building retains its integrity. Building 21 is a District contributor because of its association with the development and expansion of power distribution at the yard, a key component in the advancement of shipbuilding processes during the late nineteenth and early twentieth centuries.

EVALUATION OF INDIVIDUAL SIGNIFICANCE

Because Building 21 is the earliest example of steel clad construction at UIW and is the only extant example of the turn-of-the-century buildings constructed by Risdon Iron Works, and because it is the only surviving resource associated with this pioneering West Coast steel fabricator, Building 21 qualifies for individual listing in the California and National Registers under Criterion 1 and A, respectively (events that have made significant contributions to local and regional history).[28]

Building 25 (Washroom and Locker Room)

DESCRIPTION

This single-story, steel frame, gable-roofed industrial building with corrugated metal-clad walls measures 51 feet 6 inches long by 29 feet wide by 19 feet tall, and contains 1,493 square feet. Built in 1941, it stands in a courtyard created by four other buildings: 15, 16, an unnumbered mechanical building addition to 16, and 32. The northern end of Building 25 attaches to

[28] Port of San Francisco, "Union Iron Works Historic District: Profiles of Contributing and Non-Contributing Resources Proposed for Demolition by Project Area (includes contributing resources proposed for rehabilitation)," December 6, 2016.

Building 15. A band of multi-lite, steel sash pivot and awning windows runs continuously on three exposed elevations, approximately 8 feet from the ground. Metal double doors with four-lite glazed upper panels open on the western façade. The steel Howe truss supports the gable roof.

No alterations to the plan or external materials are evident. The toilets, sinks, and urinals still line the walls, although all fittings have been removed. Most stall partitions have also been removed, as have the shower stalls near the center of the room.

HISTORIC/CURRENT USE

This building contains shower, bathroom, and locker facilities for the workers who labored in the adjacent buildings. Building 25 is one of the seven washroom and locker room facilities installed in 1941. It is the only example of a corrugated metal-clad washroom from that period, but is similar in style to the two washrooms, Buildings 110 and 119, constructed during the late 1930s. Washrooms, lockers, and lunch rooms were scattered throughout the yard as a means of providing needed amenities to the workers where they worked, a more efficient means of running a business with hundreds of workers.

INTEGRITY

Building 25 has experienced few alterations and retains integrity of location, design, setting, materials, workmanship, feeling, and association. Building 25 is a District contributor for its association with the improvement of worker amenities during World War II.

EVALUATION OF INDIVIDUAL SIGNIFICANCE

Building 25 is a contributor to the UIW Historic District, but does not possess individual significance. Building 25 is one of three architecturally similar World War II-era restroom facilities within the District. Together with Buildings 15, 16, and 32, Building 25 functioned as a support building to Building 12. The other buildings in the Building 12 complex are experienced as smaller additions rather than as separate resources. For these reasons, Building 25 does not qualify for listing under the National or California Registers as an individual historical resource.[29]

Building 32 (Template Warehouse)

Building 32 stands at the south end of the District and is part of the Building 12 complex (Buildings 12, 15, 16, 25, 32, and 66). The complex was constructed in 1941-1944, specifically for World War II as part of the New Yard. The architect and builder of this 1941 building are

[29] Port of San Francisco, "Union Iron Works Historic District: Profiles of Contributing and Non-Contributing Resources Proposed for Demolition by Project Area (includes contributing resources proposed for rehabilitation)," December 6, 2016.

unknown. It was likely designed and built by government personnel as part of the joint World War II effort.

DESCRIPTION

This single-story, semi-attached, rectangular warehouse with a gable roof is of steel frame construction with corrugated metal-clad walls. It measures 100 feet long by 50 feet wide by 32 feet high, and contains 4,900 square feet. Its northern end attaches to Building 15. Exposed steel compound Fink trusses with a king post form the gable and create a clear interior space with no support columns. The western façade features two rows of four, evenly spaced rectangular multi-lite steel sash awning windows with steel sills. The southern façade contains vents and a metal personnel door with four window panes. Multi-lite steel sash windows can be seen on the eastern façade from the courtyard formed by the neighboring Buildings 15 and 16. Wood planking, exposed on the interior and covered with roll roofing at the exterior, clads the roof. Two prominent vents sit on the gable ridge. The interior ground floor has been repaved with asphalt, and any mechanical and/or template storage racks have been removed. Many small standard factory light fixtures remain intact.

HISTORIC/CURRENT USE

The template warehouse, Building 32, stored wooden templates used in shaping steel hull plates at the Building 12 complex. It is one of two extant template warehouses at the yard. Used in the production of multiple hulls of the same design, the templates could be reused several times. The building is currently vacant and is periodically used for temporary events.

INTEGRITY

Building 32, the template warehouse, has experienced few alterations and retains integrity of location, design, setting, materials, workmanship, feeling, and association. It contributes to the UIW Historic District for its association with the World War II shipbuilding effort at the New Yard.

EVALUATION OF INDIVIDUAL SIGNIFICANCE

Building 32 is a contributor to the UIW Historic District, but does not possess individual significance. Together with Buildings 15, 16, and 25, they functioned as support buildings to Building 12 and are experienced as smaller additions rather than as separate resources. For these

reasons, as with the other supporting resources in the Building 12 complex, Building 32 does not qualify for listing under the National or California Registers as an individual historical resource.[30]

Building 66 (Welding Shed)

Located northeast of Building 12, Building 66 marks the northern end of the Building 12 complex, a series of six buildings constructed specifically for the World War II effort (Buildings 12, 15, 16, 25, 32, and 66). The Bethlehem Steel Company's 1945 architectural plans indicate that the Federal government erected a welding platform in 1941, but the plans do not show a shed. The shed first appears in a 1945 aerial photograph. Its architect and builder are unknown.

DESCRIPTION

This large, rectangular plan, two-story, steel frame shed with corrugated metal siding measures approximately 220 feet long by 105 feet wide and covers 23,100 square feet. It is almost completely open on the north and south ends, providing an unobstructed north-south view through the building. Columns divide the space into eleven vertical bays, and Pratt trusses support the roof gable. Along the west elevation, an attached men's locker room, measuring approximately 15 feet by 60 feet, sits outside the main bay of Building 66. At some point following the period of significance, the locker room's north end sustained significant damage, with the roof torn off and the interior exposed to the elements. Two personnel doors from the locker room opened to the west and one opened to the east, into the main Welding Shed bay. Almost all interior fixtures have disappeared. Large, angled support columns for Building 66 penetrate the locker room, dividing the space into distinct bays. The locker room roof, approximately 15 feet high along the western wall, slopes down and eastward at an approximately 15 degree angle. Translucent roof panels provided interior lighting. At the east corner of the northern elevation, a sliding vehicle door on an overhead track remains, supported by horizontal beams. No other steel panels surround the door, although a personnel door opens through the vehicle door.

HISTORIC/CURRENT USE

Building 66 was used for welding pre-assemblies and other hull components during hull construction at the Building 12 complex and Slipways 5 through 8. When Building 66 was constructed in 1945 on land that was formerly part of the Pacific Rolling Mills site, most of the yard was used for the production of war vessels. This open building sheltered outdoor activities

[30] Port of San Francisco, "Union Iron Works Historic District: Profiles of Contributing and Non-Contributing Resources Proposed for Demolition by Project Area (includes contributing resources proposed for rehabilitation)," December 6, 2016.

so that the welding work would not have to depend on good weather. Building 66 is currently used for vehicle storage.

INTEGRITY

Building 66 has experienced few major alterations and retains its original spatial qualities. Therefore, it retains integrity of location, design, setting, materials, workmanship, feeling, and association, and contributes to the UIW Historic District for its association with the World War II shipbuilding effort at the New Yard.

EVALUATION OF INDIVIDUAL SIGNIFICANCE

Building 66 is a contributor to the District and is one of the buildings that made up the "New Yard," but it does not possess individual significance because it functioned as a support facility for the former Slipways 5, 6, 7, and 8, and the loss of these related features has reduced the building's ability to convey its former historic function. Moreover, the building lacks individual distinction. Therefore, Building 66 does not qualify for listing under the National or California Registers as an individual historical resource.[31]

Irish Hill Remnant

DESCRIPTION

Irish Hill was originally a 70- to 100-foot-tall geological landform that once extended from the San Francisco Bay to Potrero Hill. The hillside of Irish Hill was gradually leveled with cutting and filling to expand the industrial facilities throughout the late nineteenth century. During the late nineteenth century, the hill towered over the shipyard, visually separating it from the adjacent Pacific Rolling Mills to the east. A small enclave that housed the unskilled labor force of UIW and other factories occupied the western slope. Around 1917, much of what remained of the hill was flattened and dumped into the Bay as landfill. All that remains today (the Irish Hill Remnant) is an approximately 35-foot-tall serpentine outcropping with a small stand of trees on its eastern slope in the undeveloped southwestern portion of the project site near the corner of Illinois and 22nd streets. The Irish Hill remnant is about 1.4 acres in size, representing approximately 4 percent of the entire 32-acre project site, or about 2 percent of the entire 66-acre UIW Historic District.

[31] Port of San Francisco, "Union Iron Works Historic District: Profiles of Contributing and Non-Contributing Resources Proposed for Demolition by Project Area (includes contributing resources proposed for rehabilitation)"; December 6, 2016.

HISTORIC/CURRENT USE

By the 1880s, Irish Hill, originally Scottish Hill, was a compact neighborhood of mostly lodging houses, restaurants, and saloons that occupied the once much larger hill. Most residents were Scottish or Irish immigrant industrial workers who, despite the noise and pollution of the factories nearby, were drawn to the area because of its proximity to their places of work. Irish Hill remained a favored residential enclave for Irish immigrants until the early twentieth century, when most of the hill was flattened and used as landfill to make way for shipyard expansion.

INTEGRITY

What was once Irish Hill is represented by the remaining peak east of Illinois and 22nd streets and south of Building 117. The topography of Irish Hill was modified during the District's period of significance and expresses the struggle between lower income, worker communities, and the shipyard's desire to expand and promote itself. Because the remaining portion of Irish Hill is the last vestige of a residential enclave that served early Irish immigrant workers who were mostly employed by waterfront industry, Irish Hill contributes to the UIW Historic District. Irish Hill, in its modified form, qualifies as a contributing landscape feature that resulted from the World War I expansion of UIW, retaining all seven aspects of integrity: location, design, materials, workmanship, setting, association, and feeling.

EVALUATION OF INDIVIDUAL SIGNIFICANCE

Although the Irish Hill Remnant is associated with the UIW Historic District, of which it is a contributing feature, the remnant no longer includes any buildings, street infrastructure, or other features that are connected to the Irish Hill neighborhood, which was home to many workers at the former Union Iron Works and Pacific Rolling Mills. Moreover, the Irish Hill Remnant, while it maintains integrity of location and setting, no longer possesses integrity of material, workmanship, or feeling, nor does it have integrity of design. Accordingly, the Irish Hill Remnant is not individually eligible for the National Register of Historic Places or the California Register of Historical Resources, and is thus not an individual historical resource under CEQA.[32]

Non-Contributing Features on the Project Site

Non-contributing features of the UIW Historic District are defined as those which have either lost integrity due to substantial alterations or were constructed after the period of significance, or both.

[32] RHAA Landscape Architects, *Irish Hill Remnant: Determination of Individual Eligibility for the National Register of Historic Places and the California Register of Historic Resources*, December 8, 2016.

Slipways 5, 6, 7, and 8 were designed and built by the U.S. Navy in 1941 as part of the New Yard (Building 12 complex). Slipways 5 and 8 were 400 feet long and Slipways 6 and 7 were 660 feet long descending from the shoreline into San Francisco Bay. All are oriented east to west, and are longer than the Pier 68 slipways, allowing for the construction of larger ships. All slipways were infilled after 1964 and the associated platforms and cranes were removed. It is assumed that the subsurface portions of the craneways remain under an asphalt parking lot. The craneways and the edge of the slipways are visible along the shoreline.

Slipways 5 through 8 were installed in 1941 when the U.S. Navy constructed the Building 12 complex. The hulls were constructed in the ways before they were launched and moved over to the adjacent wet basins for outfitting. These slipways were designed to accommodate one 6,000-ton cruiser or two 2,100-ton destroyers. Welding and prefabrication were the primary methods of steel hull construction during World War II. Welding platforms were placed on all available sides of the slipways, including a larger platform at the head of Slip 8. Two head house buildings, Buildings 34 and 35, no longer extant, sat at the head of the longer slipways, Slipways 6 and 7. Instead of the 70-foot crane track towers found at Slipways 1 through 3, single Colby cranes ran on crane tracks only slightly raised above the slip ways. Rail lines and a semi-gantry crane moved plates and materials from the Building 12 complex to the slipways. This area is currently used to store self-storage lockers and new automobiles.

Slipways 5 through 8 were integral to the World War II shipbuilding process at the New Yard and were a defining feature of the layout of the Building 12 complex. These slipways were infilled and paved over in 1964, and they have lost their integrity of design, materials, workmanship, and feeling. Because of this loss of integrity, they are non-contributing features within the UIW Historic District.

HISTORIC RESOURCES OUTSIDE OF UIW DISTRICT

Other historical resources near the project site, but outside of the UIW Historic District, are located to the west and to the south.

2301 Third Street

Opposite Illinois Street to the west of the project site is the former American Can Company Building (the American Industrial Center) at 2301 Third Street. Built originally in 1920 and occupying the two city blocks bound by Third Street on the west, Illinois Street on the east, 20th Street on the north, and 22nd Street on the south, the building was determined eligible for the NRHP for its historical and architectural significance (NRHP status code “2S2”). This building is a contributor to the Central Waterfront Historic District (see discussion below).

Central Waterfront Historic District

Located directly west of the project site, on the west side of Illinois Street and centered on Third Street from 18th Street on the north to 24th Street on the south, is the Central Waterfront Historic District, which was determined eligible for the California Register of Historical Resources. This district was identified during the Central Waterfront Survey, which found that the area contains a significant concentration of mixed-use industrial properties, associated residential and commercial properties, and civic infrastructure oriented to water, railroad, and road transportation. The Central Waterfront Survey was adopted by the Landmark Preservation Advisory Board (now Historic Preservation Commission) in 2001, and later amended in 2008. The district was the epicenter of major industrial production beginning in the late 1850s, and continuing through the end of World War II. The district contains 26 contributing resources eligible for the NRHP under Criterion 1 (Events) for association with the industrial development of San Francisco from 1872 to 1958.[33]

1201 Illinois Street

Located immediately south of and adjacent to the project site is the site containing the former PG&E Station A Potrero Power Plant at 1201 Illinois Street (the PG&E Potrero Substation). Beginning in 1899, the San Francisco Gas Light Company (predecessor to today's PG&E) expanded its physical presence in Potrero Point by constructing a large power house (Station A), pump house, meter house, compressor house, and gate house on Humboldt Street to the southeast of the UIW Shipyard. Completed between 1905 and 1930, these five brick industrial structures still stand, although they are abandoned and in greatly dilapidated condition. The structures were identified in the Central Waterfront Survey and are contributors to the Central Waterfront Historic District[34] and are considered historical resources as defined by CEQA. The cluster of brick structures is located approximately 300-500 feet south from the southern boundaries of the project site. Between the project site and the five structures associated with the former PG&E Station A Potrero Power Plant are a number of intervening buildings and structures, including three modern steel former fuel storage tanks, a modern electrical substation, and modern modular buildings and trailers, none of which would be considered historical resources under CEQA.

Dogpatch Historic District

Located two blocks to the west of the project site, opposite Third Street, is the Dogpatch Historic District. Listed in Article 10 of the Planning Code as a designated San Francisco Historic District,

[33] California Department of Parks and Recreation (DPR) District Record Form, *Central Waterfront*, prepared by Kelley & VerPlanck and Page & Turnbull, Inc., March 2008.
[34] Ibid.

the Dogpatch Historic District contains approximately 75 contributing resources centered primarily on Tennessee Street. The boundaries of the district are Mariposa Street on the north, Third Street on the east, 23rd Street on the south, and Indiana Street to the west. The western boundary of the UIW Historic District, including the western boundary of the project site, is approximately 400 feet east of the Dogpatch Historic District, with numerous intervening buildings and structures, such as the former American Can Company Building and the width of Third Street. One contributor to the Dogpatch Historic District is the Irving Murray Scott School located at 1060 Tennessee Street. This two-story, wood frame schoolhouse constructed in 1895 is individually listed in the NRHP (status code "1S"), and is located approximately 650 feet west of the project site with numerous intervening buildings and streets. Aside from the UIW Historic District, the Irving Murray Scott School is the only NRHP-listed resource in the project vicinity. Dogpatch Historic District is a historical resource as defined by CEQA.

671 Illinois Street

Located to the north of the project site and immediately adjacent to the UIW Historic District is 671 Illinois Street, the historic Kneass Boatworks Building. This building is the oldest surviving wood frame boatworks building on the waterfront and dates from the 1870's. This property was determined to be individually eligible for the National Register of Historic Places by the San Francisco Planning Department in their 2001 Central Waterfront Cultural Resources Survey.

REGULATORY FRAMEWORK

This subsection describes the pertinent Federal, State, and local laws and regulations that pertain to the identification and regulation of historic architectural resources.

FEDERAL

National Register of Historic Places

The NRHP is the nation's master inventory of cultural resources worthy of preservation. It is administered by the National Park Service, which is represented at the State level by the State Historic Preservation Officer. The NRHP includes listings of buildings, structures, sites, objects, and districts that possess historic, architectural, engineering, archaeological, or cultural significance at the Federal, State, or local level. Resources that are listed on or have been found by the State Historic Preservation Officer to be eligible for the NRHP are called historic properties. The NRHP provides four evaluative criteria to determine eligibility of a resource:

> The quality of significance in American history, architecture, archaeology and culture is present in districts, sites, buildings, structures, and objects of state and local importance that possess integrity of location, design, setting, materials, workmanship, feeling and association, and:

a. that are associated with events that have made a significant contribution to the broad patterns of history; or

b. that are associated with the lives of persons significant in our past; or

c. that embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or

d. that have yielded or may likely yield information important in prehistory or history. [35]

Although there are exceptions, certain kinds of resources are not usually considered for listing in the NRHP. These include religious properties, moved properties, birthplaces and graves, cemeteries, reconstructed properties, commemorative properties, and properties that have achieved significance within the past 50 years.

Integrity

In addition to qualifying for listing under at least one of the NRHP criteria, a property must possess sufficient integrity to be considered eligible for the NRHP. According to the *National Register Bulletin: How to Apply the National Register Criteria for Evaluation*, integrity is defined as "the authenticity of an historical resource's physical identity evidenced by the survival of characteristics that existed during the resource's period of significance." The *National Register Bulletin* defines seven characteristics of integrity as follows:

Location is the place where the historic property was constructed.

Design is the combination of elements that create the form, plans, space, structure, and style of the property.

Setting addresses the physical environment of the historic property inclusive of the landscape and spatial relationships of the buildings.

Materials refer to the physical elements that were combined or deposited during a particular period of time and in a particular pattern of configuration to form the historic property.

Workmanship is the physical evidence of the crafts of a particular culture or people during any given period in history.

Feeling is the property's expression of the aesthetic or historic sense of a particular period of time.

[35] 36 CFR Section 60.4.

Association is the direct link between an important historic event or person and an historic property.

STATE

Definition of Historical Resources under CEQA

CEQA Guidelines Section 15064.5(a), in Title 14 of the California Code of Regulations, defines a "historical resource" as:

(1) A resource listed in, or determined to be eligible by the State Historical Resources Commission, for listing in the California Register of Historical Resources.

(2) A resource included in a local register of historical resources, as defined in section 5020.1(k) of the Public Resources Code or identified as significant in an historical resource survey meeting the requirements of section 5024.1(g) of the Public Resources Code, shall be presumed to be historically or culturally significant. Public agencies must treat any such resource as significant unless the preponderance of evidence demonstrates that it is not historically or culturally significant.

(3) Any object, building, structure, site, area, place, record, or manuscript which a lead agency determines to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California may be considered to be an historical resource, provided the lead agency's determination is supported by substantial evidence in light of the whole record. Generally, a resource shall be considered by the lead agency to be "historically significant" if the resource meets the criteria for listing on the California Register of Historical Resources.

(4) The fact that a resource is not listed in, or determined to be eligible for listing in the California Register of Historical Resources, not included in a local register of historical resources (pursuant to section 5020.1(k) of the Public Resources Code), or identified in an historical resources survey (meeting the criteria in section 5024.1(g) of the Public Resources Code) does not preclude a lead agency from determining that the resource may be an historical resource as defined in Public Resources Code sections 5020.1(j) or 5024.1.

Therefore, under the CEQA Guidelines, even if a resource is not included on any local, State, or Federal register, or identified in a qualifying historical resources survey, a lead agency may still determine that any resource is a historical resource for the purposes of CEQA if there is substantial evidence supporting such a determination. A lead agency must consider a resource to be historically significant if it finds that the resource meets the criteria for listing in the CRHR.

California Register of Historical Resources Criteria

The CRHR is the authoritative guide to historical and archaeological resources that are significant within the context of California's history. Criteria for eligibility for inclusion in the CRHR are based on, and therefore correspond to, NRHP criteria for listing. A resource that meets at least

one of the eligibility criteria for inclusion in the CRHR is considered a historical resource for the purposes of CEQA. A resource is eligible for listing in the CRHR if it:

(1) Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage (Events);

(2) Is associated with the lives of persons important in our past (Persons);

(3) Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values (Design/Construction); or

(4) Has yielded, or may be likely to yield, information important in prehistory or history (Information Potential).[36]

National Park Service guidance on evaluating the integrity of resources often informs the determination of eligibility under the CRHR.

LOCAL

San Francisco Planning Code Section 101.1: Master Plan Priority Policies

Planning Code Section 101.1 is generally applicable to the Proposed Project. It requires that the City find that the Proposed Project is consistent with eight master plan priority policies. Priority Policy 7 is relevant to historical resources and establishes a priority policy "that landmarks and historic buildings be preserved."

San Francisco General Plan

The Urban Design Element of the *San Francisco General Plan* includes the following policy related to historic preservation:

Policy 2.4: Preserve notable landmarks and areas of historic, architectural or aesthetic value, and promote the preservation of other buildings and features that provide continuity with past development.

Planning Department, CEQA Review Procedures for Historical Resources

The San Francisco Planning Department prepared the *CEQA Review Procedures for Historic Resources* to provide guidance in determining whether a resource is considered a historical resource as defined by CEQA.[37] Three categories of properties are defined:

[36] Public Resources Code Section 5024.1.

[37] San Francisco Planning Department, *Preservation Bulletin No. 16, CEQA Review Procedures for Historic Resources*, Draft, March 31, 2008.

- Category A. Category A has two subcategories:
    - Category A.1. Resources listed in or formally determined to be eligible for the CRHR.
    - Category A.2. Resources listed in adopted local registers, or properties that appear eligible, or may become eligible, for the CRHR.
- Category B. Properties requiring further consultation and review.
- Category C. Properties determined not to be historical resources, or properties for which the City has no information indicating that the property is an historical resource.

To determine if a property is eligible as a historical resource for the purposes of CEQA, the San Francisco Planning Department (lead agency) requires an evaluation of a property's individual significance for listing in the California Register of Historical Resources, as well as an examination of a property's relationship to any eligible historic district.

To assess impacts within historic districts, the Planning Department examines several factors including, but not limited to, size and significance of a historic district, number and location of contributing features/non-contributing features, district integrity, district boundaries, and the proposed project. Assessments within historic districts are examined on a case-by-case basis, due to the wide variety and unique nature of historical resources.

IMPACTS AND MITIGATION MEASURES

SIGNIFICANCE THRESHOLDS

The thresholds for determining the significance of impacts in this analysis are consistent with the environmental checklist in Appendix G of the State CEQA Guidelines, which has been modified by the San Francisco Planning Department. For the purpose of this analysis, the following applicable thresholds were used to determine whether implementing the Proposed Project would result in a significant impact related to historic architectural resources. Implementation of the Proposed Project would have a significant effect related to historic architectural resources if the project would:

- Cause a substantial adverse change in the significance of a historical resource as defined in Section 15064.5, including those resources listed in Article 10 or Article 11 of the San Francisco Planning Code.

The CEQA Guidelines (Section 15064.5(b)) establish the criteria for assessing a significant environmental impact on historical resources. They state, "[a] project with an effect that may cause a substantial adverse change in the significance of an historical resource is a project that may have a significant effect on the environment." The CEQA Guidelines define "substantial adverse change" as "physical demolition, destruction, relocation, or alteration of the resource or

its immediate surroundings such that the significance of an historical resource would be materially impaired" (Section 15064.5(b)(1)).

For the purposes of this EIR, significance of a historic architectural resource is considered to be "materially impaired" and could have a potentially significant impact related to historic architectural resource if the project were to demolish or materially alter the physical characteristics that justify the inclusion of the resource in the CRHR, or that justify the inclusion of the resource in a local register, or that justify its eligibility for inclusion in the CRHR as determined by the lead agency (Section 15064.5(b)(2)).

APPROACH TO ANALYSIS

This section is based on the UIW Historic District NRHP Registration Form, an *Analysis of Proposed Demolitions Within the Union Iron Works Historic District at Pier 70*,[38] an analysis by the Port of San Francisco entitled, *Union Iron Works Historic District Profiles of Contributing and Non-Contributing Resources Proposed for Demolition by Project Area*,[39] and certificates of determination for exemptions from environmental review and associated historical resources evaluation reports for the 20th Street Historic Core Project, Crane Cove Park, and BAE Systems Lease Renewal Projects, as well as policies and procedures undertaken by the San Francisco Planning Department. As summarized in the Environmental Setting section above, these studies included extensive background research to identify historical resources, field review, and analysis by qualified architectural historians.

As described in Chapter 2, Project Description, pp. 2.25-2.33, two project scenarios are considered in the EIR: (1) a Maximum Residential Scenario and (2) a Maximum Commercial Scenario. The Proposed Project's total gsf would range between a maximum of 4,212,230 gsf, under the Maximum Residential Scenario, to 4,179,300 gsf, under the Maximum Commercial Scenario, inclusive of new construction and rehabilitated historic buildings on the 32-acre project site inclusive of the Illinois Parcels. Under both scenarios, the Proposed Project would result in the construction of new office space, residential dwelling units, retail/restaurant/arts/light-industrial uses, and open space. Associated infrastructure, grading, and vehicle and bicycle parking would also be developed to support these uses. The two scenarios would result in new buildings that are similar in massing throughout the 32-acre project site inclusive of the Illinois Parcels; would retain and renovate the historic Buildings 2, 12, and 21; and would demolish contributing features 11, 15, 16, 19, 25, 32, and 66 and the Slipways 5 through 8 non-contributing

[38] Carey & Co., Inc., *Analysis of Proposed Demolitions Within the Union Iron Works Historic District at Pier 70.* Prepared for the Port of San Francisco, May 20, 2016.
[39] Port of San Francisco, *Union Iron Works Historic District Profiles of Contributing and Non-Contributing Resources Proposed for Demolition by Project Area, May 16, 2016.*

features that are within the UIW Historic District. The overall gsf would be substantially the same between the two scenarios, with a difference of only approximately 32,000 gsf. The historical resources impacts and mitigations described below apply to both the Maximum Residential Scenario and the Maximum Commercial Scenario. The impacts to historical resources would be identical for the two scenarios because (1) the two scenarios would result in the rehabilitation and demolition of the same buildings (including historic buildings); (2) the building massing of the two scenarios would differ only slightly, and would create no substantial differences in the ways that the historic district and historic buildings on the site are seen or experienced; and (3) construction under both scenarios is expected to begin in 2018 and would involve five development phases over an approximately 11-year period, concluding in 2029. Construction vibration impacts on adjacent historic buildings are discussed in Section 4.F, Noise and Vibration, on pp. 4.F.41-4.F.45.

PROJECT FEATURES

Demolition, Retention, Rehabilitation, and Relocation of Existing Contributors to the UIW Historic District

The project site is within the southern portion of the UIW Historic District (south of the 20th Street alignment) and surrounds the southern portion of the adjacent 20th Street Historic Core (occupied by contributing Buildings 113, 114, 115, 116, and 14). Although the project site represents almost half of the UIW Historic District area (approximately 32 acres out of 66 total acres), it includes only 11 of the 44 contributing features within the District.

The Proposed Project would result in the demolition of seven contributing buildings on the project site that contribute to the UIW Historic District: Buildings 11, 15, 16, 19, 25, 32, and 66. These seven buildings (Buildings 11, 15, 16, 19, 25, 32, and 66) are not individually eligible for listing in the California Register of National Register.[40] The Proposed Project would retain and rehabilitate three buildings on the project site that are contributors to the UIW Historic District: Buildings 2, 12, and 21. Of these three buildings, one—Building 21—has been found to be individually eligible for listing in the California Register. Building 21would be raised approximately 4 feet, equivalent to the rest of the site, to address future sea level rise, and relocated about 75 feet from its current location. The Proposed Project would involve a minor alteration of the remnant of Irish Hill, which is a contributor to the UIW Historic District, but not individually eligible. See Figure 2.6: Proposed Rehabilitation, Retention, and Demolition Plan, in Chapter 2, Project Description, on p. 2.24. The disposition of existing buildings is summarized below in Table 4.D.3: Disposition of Contributing Features on the Project Site.

[40] Port of San Francisco, *Union Iron Works Historic District Profiles of Contributing and Non-Contributing Resources Proposed for Demolition by Project Area, May 16, 2016.*

Table 4.D.3: Disposition of Contributing Features on the Project Site[41]

Building Number (Name)	Retain, Rehabilitate, or Demolish?
Building 2 (Warehouse No. 2)	Retain and rehabilitate
Building 11 (Tool Room and Navy Office)	Demolish
Building 12 (Plate Shop No. 2)	Retain and rehabilitate
Building 15 (Layout Yard)	Demolish[42]
Building 16 (Stress Relieving Building)	Demolish
Building 19 (Garage No. 1)	Demolish
Building 21 (Substation No. 5)	Retain, re-locate, and rehabilitate
Building 25 (Washroom and Locker Room)	Demolish
Building 32 (Template Waterhouse)	Demolish
Building 66 (Welding Shed)	Demolish
Irish Hill (remnant)	Mostly Retain

Source: ESA 2015

Infill Construction and Design for Development

The Proposed Project calls for the establishment of new infill construction zones within the project site on large expanses of existing asphalt storage areas within the UIW Historic District to the east, west, and south of the retained contributing buildings within the project site (Buildings 2, 12, and 21) and the southern portion of 20th Street Historic Core (Buildings 113, 114, 115, 116, and 14).

New construction within allowable development zones would be restricted to the total height limits by parcel name/number, as shown in Table 4.D.4: Maximum Heights of New Construction by Parcel Name/Number. The overall heights of new construction would range from 50 feet to 90 feet, responding to the variety of building heights found in the project site, which range from 44 feet (Building 21) to 60 feet (Building 12) and 82 feet (Building 2). See Figure 2.13: Proposed Height Limits Plan, on p. 2.40, which identifies the allowable new construction zones and each developable parcel. No height increase or substantial new exterior additions would be permitted at historic Buildings 2, 12, and 21.

[41] Building 117 is within the project site but is part of the adjacent 20th Street Historic Core Building 40 and 117 project, as described on p. 4.A.14. That project includes demolition of Building 117.

[42] The structural frame of Building 15 may be retained as part of the Proposed Project. However, for purposes of this analysis, the building is assumed to be demolished.

Table 4.D.4: Maximum Heights of New Construction by Parcel Name/Number

Parcel Name/Number	Maximum Height (feet)
A, B, D, E1 (along Maryland), C1, C2, F/G, and H1/H2	90
E2 and E3	70
E1 (along 21st), PKN, PKS, and HDY	65
E4	50

Source: ESA 2014

The following pages present a viewpoint location map (see Figure 4.D.3: Viewpoint Location Map) and six simulated views illustrating the maximum potential volume of infill construction on the project site under the proposed maximum height within the context of photographic views of the project site (see Figure 4.D.4: Maximum Height of New Infill Construction (View A); Figure 4.D.5: Maximum Height of New Infill Construction (View B); Figure 4.D.6: Maximum Height of New Infill Construction (View C); Figure 4.D.7: Maximum Height of New Infill Construction (View D); Figure 4.D.8: Maximum Height of New Infill Construction (View E); and Figure 4.D.9: Maximum Height of New Infill Construction (View F)). Note that these simulations do not depict any architectural massing, features, or materials. These simulations do not represent buildings that would be constructed. Such buildings would be sculpted and articulated, as called for under the proposed Pier 70 SUD and proposed *Pier 70 SUD Design for Development.* Architectural plans for new infill buildings in the project site would be submitted to the San Francisco Planning Department and the Port of San Francisco in future implementation of the Proposed Project, if approved, and would be reviewed for conformity with the proposed height districts and the design guidance presented in the proposed *Pier 70 SUD Design for Development*.

FIGURE 4.D.9: MAXIMUM HEIGHT OF NEW INFILL CONSTRUCTION (VIEW F)

In addition to the standards and guidelines for the rehabilitation of historic buildings, as well as the establishment of maximum building heights and buildable zones for infill construction discussed above, the *Pier 70 SUD Design for Development* also contains project-wide as well as location-specific massing and architecture requirements that would influence the design of infill construction within the Pier 70 Special Use District. Project-wide standards in the proposed *Design for Development* apply to all new construction and are intended to encourage building variety and a pedestrian scale that meets the needs of a mixed-use neighborhood. Location-specific requirements in the *Design for Development* call for increased attention to the design of the building envelope at key locations. Where new construction is located adjacent to a historic building, location-specific controls ensure architectural compatibility with historic buildings within the UIW Historic District.

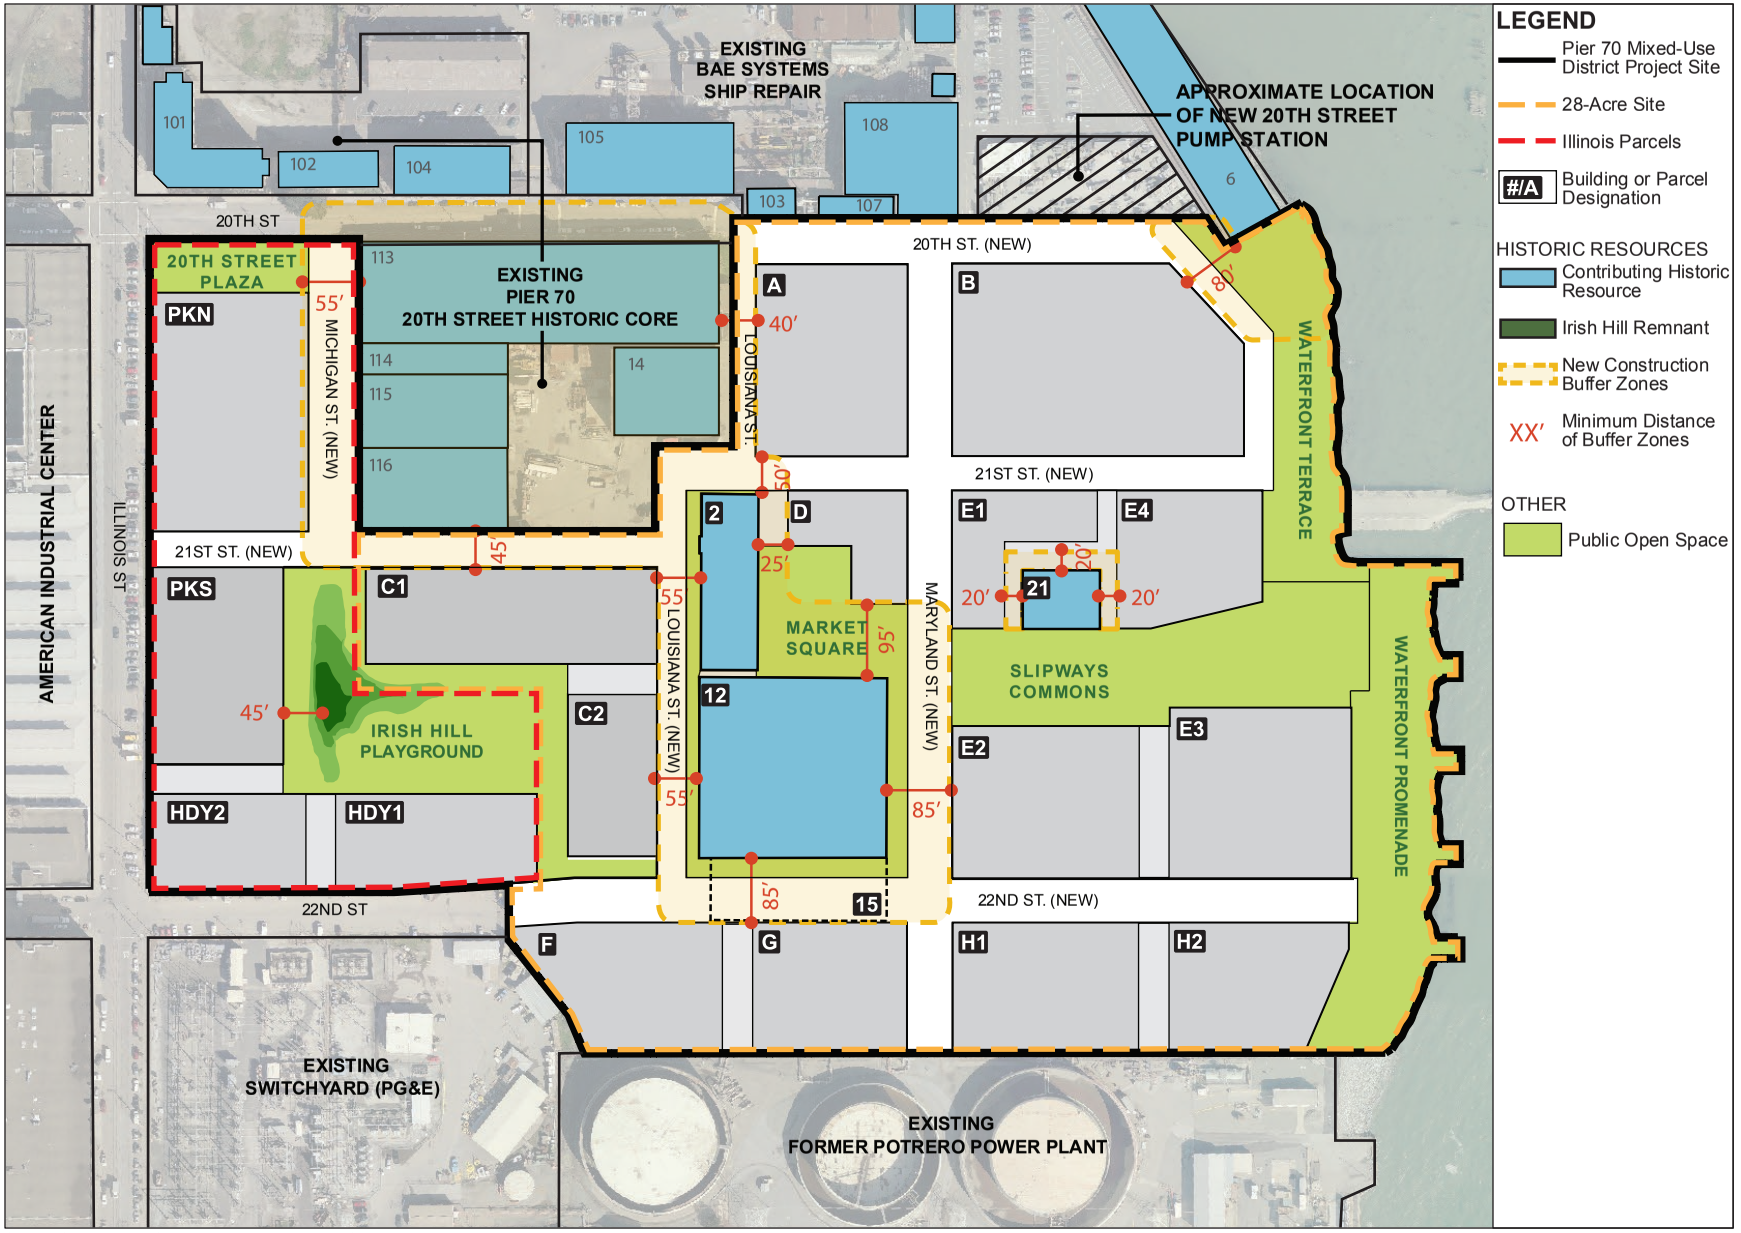
Application of the following key design features of the *Design for Development* are intended to enhance the compatibility of new infill construction with adjacent historical resources in the UIW Historic District: (1) buffer zones, (2) façades and materiality, (3) and adjacency to historical resources. Each of these project features is summarized below.

Buffer Zones

New construction would occur adjacent to historic buildings with minimum distances of separation to provide both visual and physical buffer zones, allowing the remaining historic buildings to be viewed separately from the proposed new buildings. These minimum buffer zones would range in distance from 20 to 85 feet, and would typically span the 45- to 55-foot width of existing and proposed new streets or pedestrian passageways. These buffer zones are intended to accentuate prominent views of the remaining historic Buildings 2, 12, and 21 on the project site, and historic buildings within the adjacent Historic Core site. These buffer zones also establish a minimum of 45 feet between new construction and the peak of Irish Hill. (See Figure 4.D.10: New Construction Buffer.)

Façades and Materiality

A selection of architectural strategies with regard to new building façades and materiality would draw on the District's existing forms and historic materials to enhance compatibility. Standards would prohibit false historicism, encourage building variety, and encourage façade articulation and depth. These standards would be achieved through the application of guidelines that encourage the use of historic rhythms and patterns, regional and District character, material grain, and material and color palette.



Source: Sitelab Urban Studio, Turnstone Consulting/SWCA (2016)

PIER 70 MIXED-USE DISTRICT PROJECT

FIGURE 4.D.10: NEW CONSTRUCTION BUFFER

With regard to historic rhythms and patterns, new construction would incorporate, through contemporary interpretation, one or more of the following features that draw from the District's historic character:

- Horizontal banding
- Shifted patterns/glazing
- Articulated rooflines;
- Repetitive patterns (e.g., Building 12 roofline, Building 113 windows)
- Gridded windows
- Weathered materials

(See Figure 4.D.11: Pier 70 Historic Rhythms and Patterns.)

With regard to material grain, new construction would draw on the District's use of long façades comprised of small units, such as brick and corrugated metal, as well as the District's historic use of textured and weathered materials palette (see Figure 4.D.12: Recommended Material Palette). Building façades entirely finished with smooth stucco would not be permitted. Smooth stucco would only be permitted if used in combination with other permitted building materials described in Figure 4.D.12.

Adjacency to Historic Buildings.

To enhance compatibility of new construction with adjacent historic buildings, new buildings would reference adjacent historic buildings through a range of strategies in keeping with the inherent qualities of the District, respecting its character-defining features and unique views. The design of new construction would respond to adjacent historic buildings and important views in specific locations through the use of setbacks and massing standards for view of historic Building 113; height referencing and dimensional quality; related treatment to specific historic façades; and limited or prohibited façade materials.

- *Setback and Massing Standards of Parcel A for Views of Historic Building 113*. To reflect the 60-foot height of adjacent Building 113, the massing at the northwest corner of Parcel A would be set back above 60 feet (the remainder of new construction on Parcel A would be 90 feet in height). (See Figure 4.D.13: Example Relationship of Parcel A to Historic Building 113.)

Source: Sitelab Urban Studios, Pier 70 Design for Development, Figure 6.14.3

PIER 70 MIXED-USE DISTRICT PROJECT

FIGURE 4.D.13: EXAMPLE RELATIONSHIP OF PARCEL A TO HISTORIC BUILDING 113

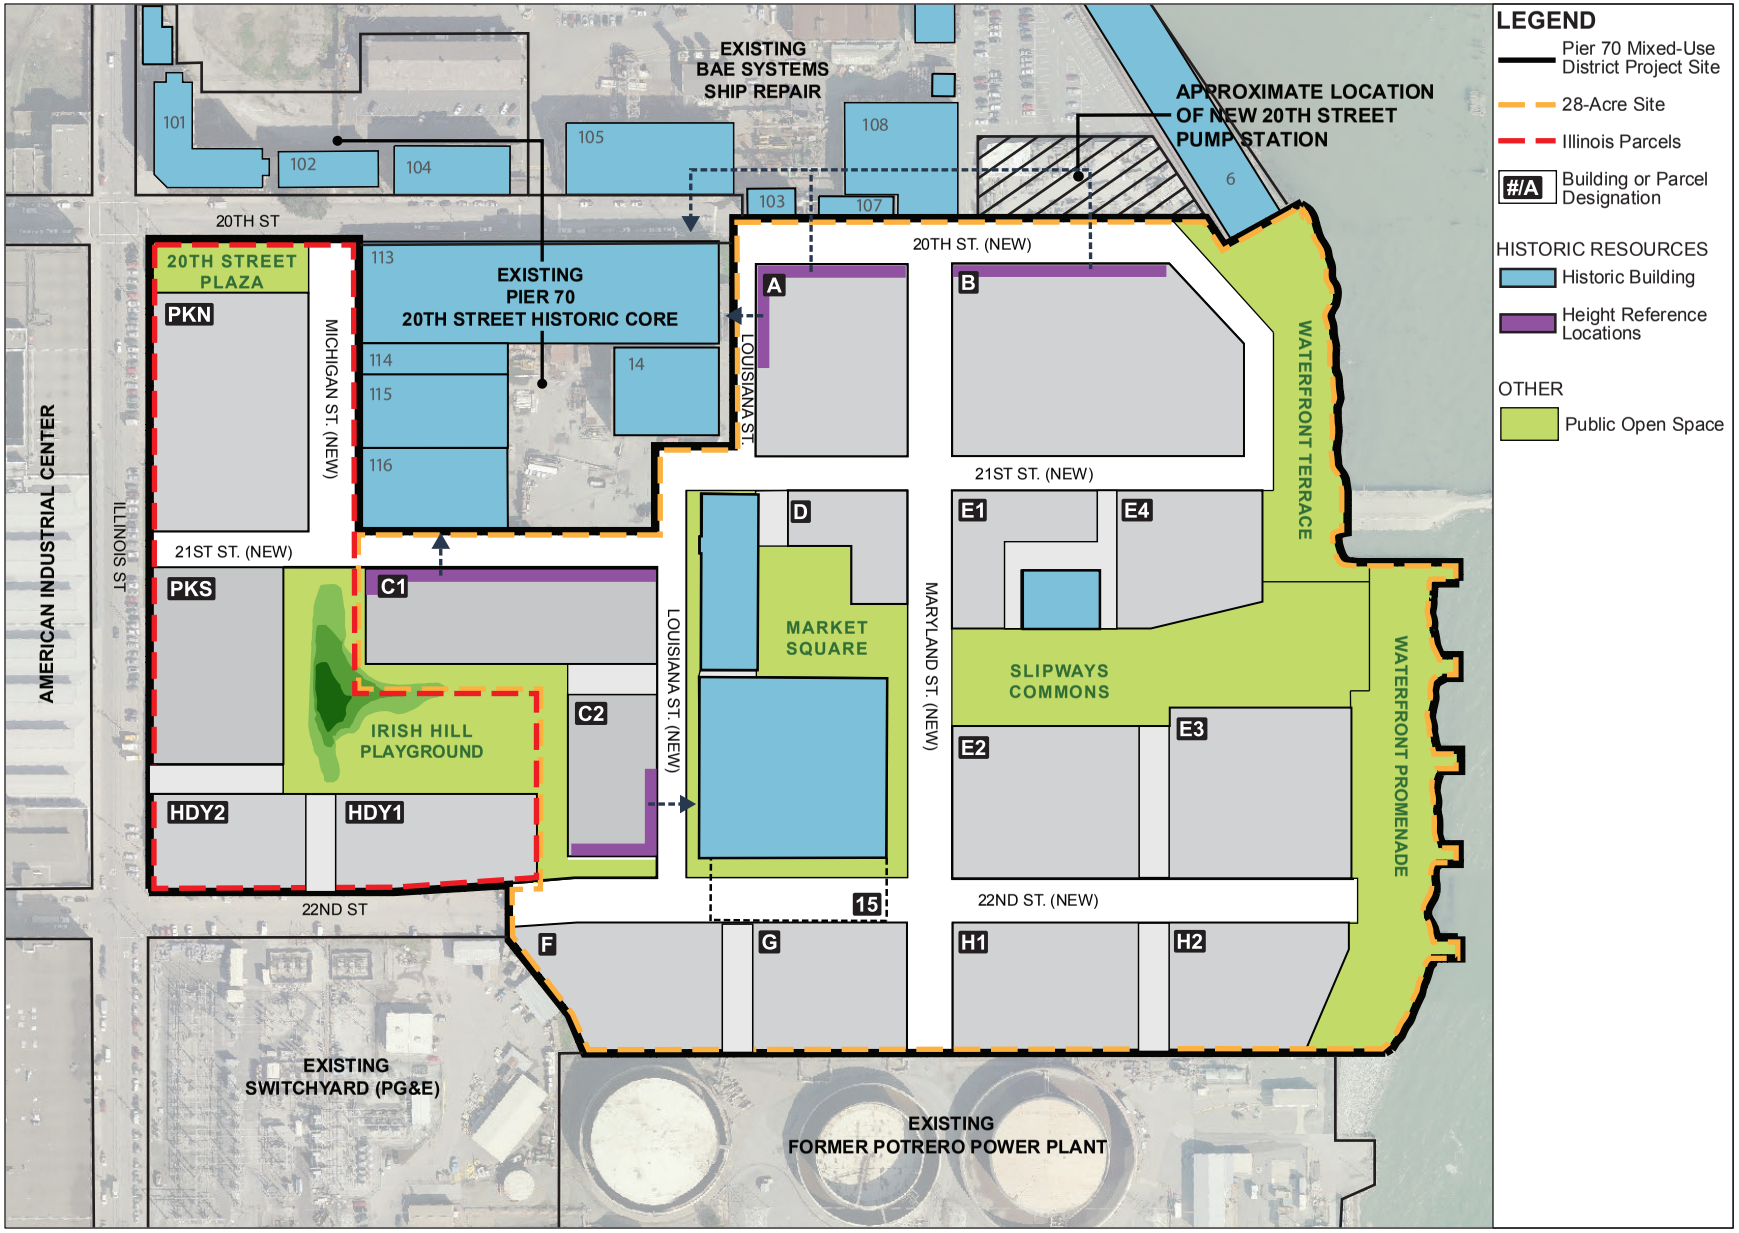
- *Height Referencing with Dimensional Quality*. To enhance compatibility of new construction with adjacent historic buildings, façades of new construction across the street from, or immediately adjacent to, historic buildings would distinctly reference the height of the adjacent building within a 5-foot height range, in order to align with the finished floors of new buildings. In order to be clearly visible, the height reference would have a dimensional quality, such that the massing would project or recess from the vertical plane through the use of distinct fenestration lines, massing, setback, or volumetric shifts, in addition to changes in the façade material or color. (See Figure 4.D.14: Height Reference Locations.)
- *Related Treatment to Adjacent Historic Buildings*. To enhance the compatibility of new construction with adjacent historic buildings, select façades of new construction would incorporate elements that relate to the adjacent historic building, in keeping with contemporary design and construction methods, including one or more of the following elements: (1) height, (2) bay rhythm/vertical modulation, (3) glazing proportions and/or pattern, (4) horizontal banding, (5) material grain, and (6) alignments with key edges or openings. This concept is visually depicted in Figure 4.D.15: Related Treatment to Adjacent Historic Resource.
- *Limited and Prohibited Façade Materials.* To enhance compatibility of new construction with adjacent historic buildings, the following materials would be limited on façades of new construction immediately adjacent to historic buildings: (1) bamboo wood, (2) smooth, flat glass curtain walls, (3) coarse-sand finished stucco, (4) highly reflective glass, and (5) wood resin panels. The following materials would be prohibited on façades of new construction immediately adjacent to historic buildings: (1) vinyl planks and siding, and (2) artificial stone or fiberglass. In addition, building façades finished entirely with solid stucco would not be permitted. Stucco could only be used in combination with other permitted building materials.

IMPACT EVALUATION

Impact CR-4: The proposed demolition of contributing buildings would not materially alter, in an adverse manner, the physical characteristics of the UIW National Register Historic District that justify its inclusion in the California Register of Historical Resources. *(Less than Significant)*

The Proposed Project would result in the demolition of seven buildings that contribute to the significance of the UIW Historic District. These are Buildings 11, 15, 16, 19, 25, 32, and 66.

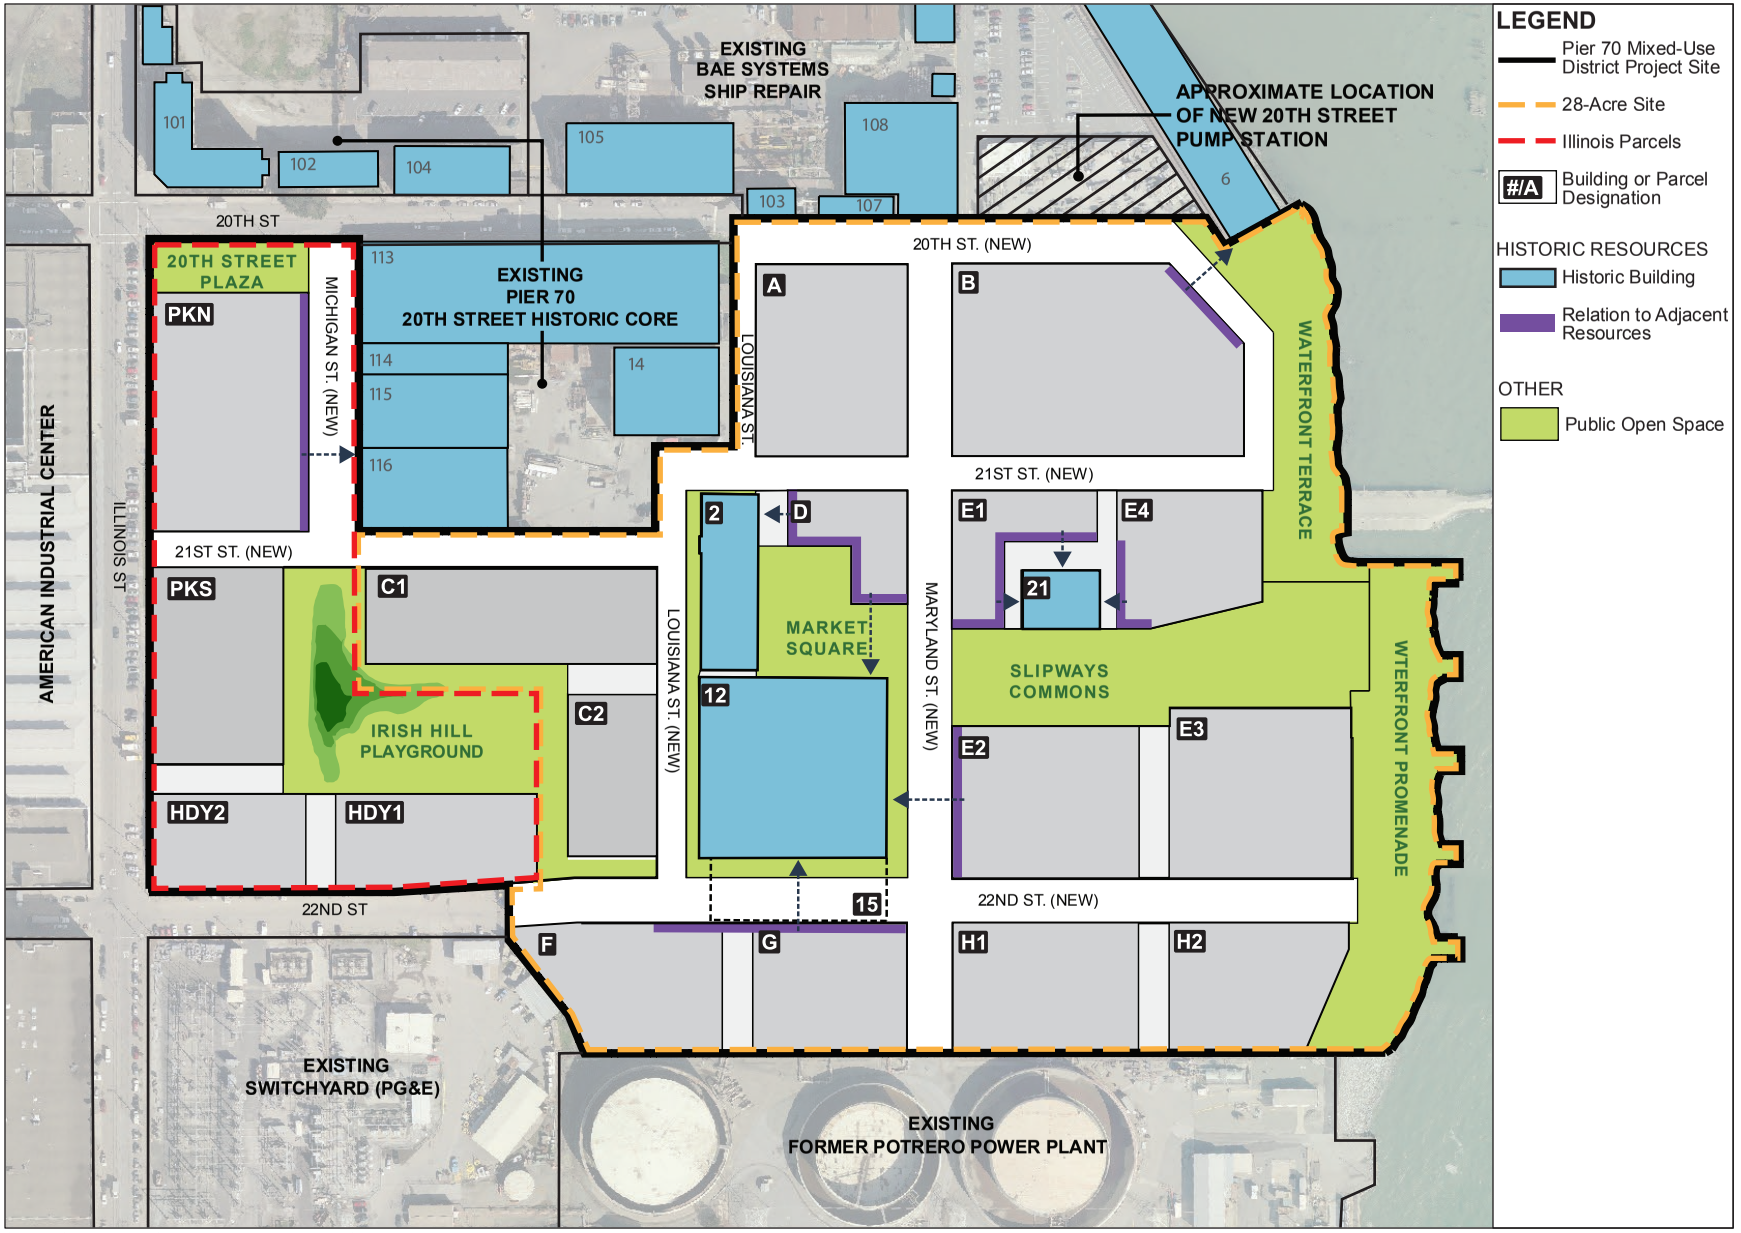
The demolition of these buildings and its effects on the integrity of the UIW Historic District were analyzed in reports prepared by Carey & Co., Inc., for the Port of San Francisco in August 2015 and by the Port of San Francisco in May 2016. The Planning Department has reviewed and concurred with the reports' findings, and the results of the analyses are presented below.



Source: Sitelab Urban Studio, Turnstone Consulting/SWCA (2016)

PIER 70 MIXED-USE DISTRICT PROJECT

FIGURE 4.D.14: HEIGHT REFERENCE LOCATIONS



Source: Sitelab Urban Studio, Turnstone Consulting/SWCA (2016)

PIER 70 MIXED-USE DISTRICT PROJECT

FIGURE 4.D.15: RELATED TREATMENT TO ADJACENT HISTORIC RESOURCES

Building 11 (Tool Room and Navy Office)

Although the loss of Building 11 would affect the District's integrity, Buildings 2, 6, 12 and 21 would remain within the UIW Historic District, and the District would maintain a solid representation of this period of historical development and use (Building 6 is outside of the project site but within the UIW Historic District boundary). For these reasons, the Planning Department and the Port of San Francisco found that the proposed demolition of Building 11 would have a less-than-significant impact on the integrity of the UIW Historic District.

Building 15 (Layout Yard), Building 16 (Stress Relieving Building), Building 25 (Washroom and Locker Room), and Building 32 (Template Warehouse)

Because Buildings 15, 16, 25, and 32 are experienced as one structure, they were examined collectively within the Building 12 complex rather than individually to determine the impact of demolition on the integrity of the UIW Historic District. The proposed demolition of these buildings is in part necessitated by the proposed rehabilitation of Building 12, the center of this building complex and its most significant and dominant structure, which was determined to be individually eligible for listing in the California Register. The Proposed Project would remove the abutting buildings so that Building 12 becomes freestanding (see the discussion of the impacts of rehabilitation efforts, below). Demolition of Buildings 15, 16, 25, and 32 is also proposed in order to extend 22nd Street eastward toward the Bay to improve vehicular and pedestrian access to this area of the Historic District and shoreline as well as to serve the needs of existing activities and proposed new infill development. A project option would retain the structural frame of Building 15; however, the removal of all other portions of this building would be treated as a *de facto* demolition.

Although the loss of these contributing buildings would diminish the integrity of the southern portion of the UIW Historic District, the loss would not be significant when considered on a District-wide basis because Buildings 6, 14, 49, and 110 (outside of the project site but within the UIW District) would be retained and would provide a significant concentration of better examples of these World War II resource types. For these reasons, the Planning Department and the Port of San Francisco found that the proposed demolition of Buildings 15, 16, 25, and 32 would have a less-than-significant impact on the integrity of the UIW Historic District.

Building 19 (Garage No. 1)

Building 19, a modest-scale steel frame corrugated metal garage/warehouse structure, would be demolished due to the proposed extension of 20th Street eastward toward the Bay. This proposed vehicular and pedestrian access would be required to serve the needs of the existing activities in the northeast portion of the project site, as well as to support future infill development. The Port's

development strategy directed new infill development to this largely open and vacant area of the UIW Historic District to minimize the loss of contributing features to maintain the District's historic character to the north and west where significant groupings of resources are located.

The integrity of the UIW Historic District would not be significantly impacted by the loss of this contributor because the UIW Historic District would continue to convey its significance and association with utilitarian steel frame and corrugated metal warehouse development from World War II. Similar modest to large warehouses would remain, including Buildings 6, 12, and 14 (Buildings 6 and 14 are outside of the project site but within the UIW Historic District boundary). For these reasons, the Planning Department and the Port of San Francisco found that the proposed demolition of Building 19 would have a less-than-significant impact on the integrity of the UIW Historic District.

Building 66 (Welding Shed)

Building 66 is a simple utilitarian facility that provided weather protection for welding pre-assemblies and other hull components associated with hull construction at the Building 12 complex. The proposed street network to serve the existing activities and proposed new infill development necessitates the removal of Building 66.

Although the building supports the UIW Historic District's ability to convey activities associated with the production of war vessels during World War II, other remaining buildings of this construction type would continue to convey the UIW Historic District's significance associated with World War II, including Buildings 6 and 14 (outside of the project site but within the UIW Historic District boundary). For these reasons, the Planning Department and the Port of San Francisco found that the proposed demolition of Building 66 would have a less-than-significant impact on the integrity of the UIW Historic District.

Conclusion

In summary, Carey & Co., Inc. found, and the Planning Department and Port of San Francisco (in its capacity as the proponent of the UIW National Register Historic District nomination) concur, that a significant concentration of World War II-era contributing features would remain in the Historic District. They would continue to provide strong visual and physical examples of the World War II era of the UIW Historic District. In many instances, the structures to be demolished are repeated elsewhere in the Historic District, as is the case with World War II warehouses, restrooms, and electrical power substations. Additionally, the proposed loss of these resources would not result in the need to adjust the boundary, because the boundary represents the historic ownership and maximum development of the District at its peak operation during World War II.

The boundary for the UIW Historic District, as with most historic districts, includes areas with non-contributing features.

The Proposed Project would result in the demolition of contributors to the UIW Historic District. For the reasons stated above, the proposed demolitions would not result in a substantial adverse change in the historic significance of the UIW Historic District, nor would they result in a deleterious effect on most of the District's character-defining features. The UIW Historic District would retain sufficient contributing features, character-defining features, and overall integrity to continue its listing in the NRHP and the CRHR. As such, the demolition of contributing Buildings 11, 15, 16, 19, 25, 32, and 66 would not materially impair the physical characteristics that justify the UIW Historic District's inclusion in the NRHP or the CRHR.

None of the seven contributing buildings proposed for demolition were found to be individually eligible for listing in the NRHP or CRHR because they either functioned as support facilities to the primary shipbuilding or repair processes, are viewed as smaller additions to the primary buildings or functions, have compromised integrity because the understanding of their role in the shipbuilding process was reduced from the loss of other related facilities, or represent utilitarian buildings that are repeated elsewhere in the District.

Although demolition of contributing Buildings 11, 15, 16, 19, 25, 32, and 66 would have a less-than-significant impact on individual historical resources identified in this EIR and the UIW Historic District as a whole, implementation of Improvement Measure I-CR-1a: Documentation and I-CR-b: Public Interpretation, which call for the documentation and interpretation of the UIW Historic District for the general public, would further reduce the less-than-significant impact resulting from the proposed demolition of contributing features.

Improvement Measure I-CR-4a: Documentation

Before any demolition, rehabilitation, or relocation activities within the UIW Historic District, the project sponsors should retain a professional who meets the Secretary of the Interior's Professional Qualifications Standards for Architectural History to prepare written and photographic documentation of all contributing buildings proposed for demolition within the UIW Historic District. The documentation for the property should be prepared based on the National Park Service's Historic American Building Survey (HABS)/Historic American Engineering Record (HAER) Historical Report Guidelines. This type of documentation is based on a combination of both HABS/HAER standards and National Park Service's policy for photographic documentation, as outlined in the NRHP and National Historic Landmarks Survey Photo Policy Expansion.

The written historical data for this documentation should follow HABS/HAER standards. The written data should be accompanied by a sketch plan of the property. Efforts should also be made to locate original construction drawings or plans of the property during the period of significance. If located, these drawings should be photographed, reproduced,

and included in the dataset. If construction drawings or plans cannot be located, as-built drawings should be produced.

Either HABS/HAER-standard large format or digital photography should be used. If digital photography is used, the ink and paper combinations for printing photographs must be in compliance with NR-NHL Photo Policy Expansion and have a permanency rating of approximately 115 years. Digital photographs should be taken as uncompressed, TIFF file format. The size of each image should be 1,600 by 1,200 pixels at 330 pixels per inch or larger, color format, and printed in black and white. The file name for each electronic image should correspond with the index of photographs and photograph label. Photograph views for the dataset should include (a) contextual views; (b) views of each side of each building and interior views, where possible; (c) oblique views of buildings; and (d) detail views of character-defining features, including features on the interiors of some buildings. All views should be referenced on a photographic key. This photographic key should be on a map of the property and should show the photograph number with an arrow to indicate the direction of the view. Historic photographs should also be collected, reproduced, and included in the dataset.

The project sponsors should transmit such documentation to the History Room of the San Francisco Public Library, and to the Northwest Information Center of the California Historical Information Resource System. The project sponsors should scope the documentation measures with Planning Department Preservation staff. Department Preservation staff should also review and approve the submitted documentation for adequacy.

Improvement Measure I-CR-4b: Public Interpretation

Following any demolition, rehabilitation, or relocation activities within the project site, the project sponsors should provide a permanent display(s) of interpretive materials concerning the history and architectural features of the District within publicly accessible areas of the project site. The content of the interpretive display(s) should be coordinated and consistent with the sitewide interpretive plan prepared for the 28-Acre Site in coordination with the Port. The specific location, media, and other characteristics of such interpretive display(s) should be presented to Planning Department preservation planning staff for review and comment and to Port preservation staff for approval prior to any demolition or removal activities.

Impact CR-5: The proposed rehabilitation of Buildings 2, 12, and 21 would materially alter, in an adverse manner, the physical characteristics of the UIW National Register Historic District that justify its inclusion in the California Register of Historical Resources and would materially alter the physical characteristics of Building 21 that justify its individual eligibility for inclusion in the California Register of Historical Resources. *(Less than Significant with Mitigation)*

Buildings 2, 12, and 21 would be rehabilitated under the Proposed Project for a range of possible reuse purposes. Prior to Port issuance of building permits, the City and the Port of San Francisco would require the project sponsors to rehabilitate Buildings 2, 12, and 21 in accordance with the Secretary of the Interior's Standards for Rehabilitation (Secretary's Standards). As noted in

CEQA Section 15064.5(a)(3), "a project that follows the Secretary of the Interior's Standards for the Rehabilitation and Guidelines for Rehabilitating Historic Buildings … shall be considered as mitigated to a level of less-than-significant impact on the historical resource."

As the rehabilitation efforts for these buildings are still in the design phase, the Planning Department conservatively finds that the impact of the proposed rehabilitation to Buildings 2, 12, and 21 to be significant. Implementation of Mitigation Measure M-CR-5: Preparation of Historic Resource Evaluation Reports, Review, and Performance Criteria, shown below, would reduce the impacts of rehabilitation on the UIW Historic District to a less-than-significant level.

Implementation of Mitigation Measure M-CR-5 would also ensure that the rehabilitation of Building 21 would not materially impair the physical characteristics of Building 21 that justify its individual eligibility for the California Register of Historical Resources.

Mitigation Measure M-CR-5: Preparation of Historic Resource Evaluation Reports, Review, and Performance Criteria.

Prior to Port issuance of building permits associated with Buildings 2, 12 and 21, Port of San Francisco Preservation staff shall review and approve future rehabilitation design proposals for Buildings 2, 12, and 21. Submitted rehabilitation design proposals for Buildings 2 and 12 shall include, in addition to proposed building design, detail on the proposed landscaping treatment within a 20-foot-wide perimeter of each building. The Port's review and analysis would be informed by Historic Resource Evaluation(s) provided by the project sponsors. The Historic Resource Evaluation(s) shall be prepared by a qualified consultant who meets or exceeds the Secretary of the Interior's Professional Qualification Standards in historic architecture or architectural history. The scope of the Historic Resource Evaluation(s) shall be reviewed and approved by Port Preservation and Planning Department Preservation staff prior to the start of work. Following review of the completed Historic Resource Evaluation(s), Planning Department preservation staff would prepare one or more Historic Resource Evaluation Response(s) that would contain the Department's determination as to the effects, if any, on historical resources of the proposed renovation. The Port shall not issue building permits associated with Buildings 2, 12, and 21 until Planning Department and Port preservation staff concur that the design (1) conforms with the Secretary of the Interior's Standards for Rehabilitation; (2) is compatible with the UIW Historic District; and (3) preserves the building's historic materials and character-defining features, and repairs instead of replaces deteriorated features, where feasible. Should alternative materials be proposed for replacement of historic materials, they shall be in keeping with the size, scale, color, texture, and general appearance. The performance criteria shall ensure retention of the following character-defining features of each historic building:

- **Building 2**: (1) board-formed concrete construction; (2) six-story height; (3) flat roof; (4) rectangular plan and north-south orientation; (5) regular pattern of window openings on east and west elevations; (6) steel, multi-pane, fixed sash windows (floors 1-5); (7) wood sash windows (floor 6); (8) elevator/stair tower that rises above roofline and projects slightly from west façade.

- **Building 12**: (1) steel and wood construction; (2) corrugated steel cladding (except the as-built south elevation, which was always open to Building 15); (3) 60-foot height; (4) Aiken roof configuration with five raised, glazed monitors; (5) clerestory multi-lite steel sash awning windows along the north and south sides of the monitors; (6) multi-lite, steel sash awning widows, arranged in three bands (with a double-height bottom band) on the north and west elevations, and in four bands on the east elevation; (7) 12-bay configuration of east and west elevations; (8) north-south roof ridge from which roof slopes gently (1/4 inch per foot) to the east and west.
- **Building 21:** (1) steel frame construction; (2) corrugated metal cladding; (3) double-gable roof clad in corrugated metal, with wide roof monitor at each gable; (4) multi-lite, double hung wood or horizontal steel sash windows[43]; and (5) two pairs of steel freight loading doors on the north elevation, glazed with 12 lites per door.

Planning Department staff and Port staff shall not approve any proposal for rehabilitation of Buildings 2, 12, and 21 unless they find that such a scheme conforms to the Secretary's Standards as specified for each building.

Impact CR-6: The proposed relocation of contributing Building 21 would not materially alter, in an adverse manner, the physical characteristics of the UIW National Register Historic District that justify its inclusion in the California Register of Historical Resources, nor the physical characteristics of Building 21 that justify its eligibility for individual inclusion in the California Register of Historical Resources. ***(Less than Significant)***

In addition to being rehabilitated, Building 21 would be relocated approximately 75 feet to the southeast to accommodate the proposed extension and rationalization of new streets, to provide sufficient room for new infill construction in the immediate vicinity, to front the new public park, and to accommodate the proposed increase in the elevation grade. Building 21 would also be raised approximately 4 feet, equivalent to the rest of the site, to accommodate the potential for sea level rise.

Relocated buildings can remain eligible for the NRHP if they satisfy NRHP Criteria Consideration B, which states that "A property removed from its original or historically significant location can be eligible if it is significant primarily for architectural value or it is the surviving property most importantly associated with a historic person or event."[44] Building 21 appears to qualify on both fronts, because it is significant for its industrial architecture and it would be considered the building "most importantly associated" with Risdon Iron Works' presence on the site. In addition to these requirements, to satisfy Criteria Consideration B, moved

[43] Many of the building's windows have been covered with plywood or metal security grates; the monitor windows have been covered with corrugated metal.

[44] U.S. Department of the Interior, National Park Service, Interagency Resources Division, How to Apply the National Register Criteria for Evaluation, Washington, D.C.: 1991, p. 29.

properties must retain an "orientation, setting, and general environment that are comparable to those of the historic location and that are compatible with the property's significance."[45]

Building 21's relocation would preserve its orientation. More generally, its context and spatial relationship to Buildings 2 and 12 would be maintained. Relocating Building 21 to the south would enable all three historic buildings to be viewed simultaneously from proposed future open space. The proposed relocation would emphasize the south wall of the building (historically the building's rear elevation), which would front the new open space, whereas the building's historic front (north) façade would be separated from proposed new Building E1 by a narrow pedestrian alley. The proximity of the north façade to other buildings, however, is in keeping with the building's historic condition. As a result, the proposed relocation of Building 21 would satisfy NRHP Criteria Consideration B and the building would remain a contributor to the UIW Historic District.

The relocation of Building 21 would not substantially affect this building's integrity of setting as a contributor to the UIW Historic District, and as a resource that is eligible for individual inclusion in the California Register of Historical Resources, because it would be within the same general location as its historic context and the spatial relationship of Buildings 2, 12 and 21 would be largely maintained. For these reasons, the proposed relocation of Building 21 would have a less-than-significant impact on historical resources. No mitigation measures are necessary.

Impact CR-7: The proposed demolition of non-contributing slipways would not materially alter, in an adverse manner, the physical characteristics of the UIW National Register Historic District that justify its inclusion in the California Register of Historical Resources. *(Less than Significant)*

The Proposed Project would demolish or substantially alter Slipways 5, 6, 7, and 8 (remnant slipways), which are non-contributors to the UIW Historic District. Because Slipways 5 through 8 do not contribute to the UIW Historic District and are not otherwise considered historical resources as defined by CEQA, their removal or substantial alteration would have a less-than-significant impact on historical resources. No mitigation measures are necessary.

Impact CR-8: The proposed site grading work associated with contributing Buildings 2 and 12 would not materially alter, in an adverse manner, the physical characteristics of the UIW National Register Historic District that justify its inclusion in the California Register of Historical Resources. *(Less than Significant)*

The grade around Buildings 2 and 12 would be raised approximately 4 feet to protect these buildings from potential sea level rise, according to the Proposed Project's site grading plan. The

[45] How to Apply the National Register Criteria for Evaluation, p. 30.

effects of the grading plan relative to historic Buildings 2 and 12, as well as the UIW Historic District as a whole, are discussed below.

Building 2

The first floor of Building 2 has a podium level approximately 5 feet above the ground to accommodate the loading docks that encircle the building. The placement of up to 4 feet of new soil surrounding this building, thereby raising the ground level to approximately 1 foot below the top of the loading docks, would not substantially change the building's character-defining features (identified in Mitigation Measure M-CR-5, pp. 4.D.93-4.D.94, above). While the new grade would result in a relatively minor change in building height relative to the overall height of this building, and would have a minor impact on the property's integrity, it would not materially impair the significance of Building 2 as a contributor to the UIW Historic District. For these reasons, the proposed grading plan would have a less-than-significant impact on this contributor to the UIW Historic District. No mitigation measures are necessary.

Building 12

Three options for the grading treatment of Building 12 relative to the proposed grading plan are included in the Proposed Project. The final grading treatment would ultimately be decided on before the Port issues building permits, subject to review and approval of the San Francisco Planning Department.[46] Each of these options is described below, including overall impacts on the significance of the building and consistency with the Secretary of the Interior's Standards.

Grading Option 1: Raise the Exterior Grade Only

Under Grading Option 1, Building 12 would remain at the current finished floor elevation. A grade differential of no more than 4 feet between the finished floor elevation of Building 12 and the surrounding street elevation would be bridged by stepped or sloped treatment of the area adjacent to the building, allowing the exterior wall to remain fully exposed. No changes to the interior floor elevation would occur under this option. While the new grade would have a minor impact on the property's integrity of setting, as all exterior, character-defining features of Building 12 would remain visible and unchanged from current conditions, this option would not materially impair the significance of Buildings 12 to the extent that it would no longer be a contributor to the UIW Historic District. Grading Option 1 would meet the Secretary of the Interior's Standards for Rehabilitation because it would retain and preserve the building's

[46] The frame of Building 15, which is included in the Building 12 complex, would remain in place as part of the Proposed Project. Because the impacts to Building 15 are analyzed separately under Impact CR-1, only the impacts of the grading plan on Building 12 are analyzed in this subsection.

character-defining features. For these reasons, Option 1 of the proposed grading plan would have a less-than-significant impact on Building 12. No mitigation measures are necessary.

Grading Option 2: Raise the Interior Slab on Grade of Building 12 Structural Frame and Raise the Exterior Grade

Under Grading Option 2, the interior slab would be raised up to a maximum of 3 feet and the adjacent exterior would be raised an additional 4 feet, while leaving the existing structure at the current elevation. The new slab on grade would be placed over compacted fill, and a thickened edge of slab would be placed around the building perimeter. Up to 4 feet of differential grading between the street elevation and the new floor slab would be bridged by stepped or sloped treatments. This option would cover some currently exposed steel column-to-foundation connections, shorten the height of pedestrian and vehicular openings, and lower the sill heights of ground-floor windows, as viewed from the interior. Although the first 4 feet of the exterior elevations of Building 12 could be obscured from view due to the raised interior grade, this would represent a relatively minor loss of historic fabric, or approximately 6 percent, of the overall 60-foot-tall elevation of Building 12, and would be minimally perceptible given the building's relatively massive (60,000-square-foot) floor plate. While the new grade would have a minor impact on the property's integrity of setting, Grading Option 2 would meet the Secretary of the Interior's Standards for Rehabilitation because it would retain and preserve the vast majority of the building's character-defining features. For these reasons, Option 2 of the proposed grading plan would have a less-than-significant impact on Building 12. No mitigation measures are necessary.

Grading Option 3: Raise Building 12 Structural Frame

Under Grading Option 3, Building 12 would be raised approximately 3 feet and placed on new slab foundations at the new grade elevation. The surrounding grade would gradually slope away from the buildings as needed for drainage purposes. This option would entail disconnecting the structural steel columns from the foundations by unbolting the existing anchor bolts, then incrementally jacking up the building columns to the desired elevation. Although the building would be higher than under current conditions, all exterior, character-defining features of Building 12 would remain visible and generally unchanged from current conditions. This option would not materially impair the significance of Building 12 as a contributor to the UIW Historic District. While the new grade would have a minor impact on the property's integrity of setting, Grading Option 3 would meet the Secretary of the Interior's Standards for Rehabilitation because it would retain and preserve the vast majority of the building's character-defining features. For these reasons, Option 3 of the proposed grading plan would have a less-than-significant impact on Building 12. No mitigation measures are necessary.

Impacts of the Grading Plan on the UIW Historic District

The grading plan indicates that portions of the project site within the UIW Historic District would be raised up to approximately 5 feet to accommodate the potential for future sea level rise, while still meeting existing grade at 20th Street and in areas adjacent to the 20th Street Historic Core. Because most of the District is currently a relatively flat, paved, and developed area, the increase in elevation of up to approximately 5 feet under the grading plan would retain its generally flat and developed appearance. The increased elevation would be a relatively minor alteration that would be nearly imperceptible from a District-wide perspective. While the new grade would have a minor impact on the District's integrity of setting, implementation of the grading plan would meet the Secretary of the Interior's Standards for Rehabilitation because it would retain and preserve the vast majority of the District's character-defining features. As such, implementation of the grading plan would result in a less-than-significant impact to the UIW Historic District as a whole. No mitigation measures are necessary.

Impact CR-9: The proposed alteration of Irish Hill, a contributing landscape feature, would not materially alter, in an adverse manner, the physical characteristics of the UIW National Register Historic District that justify its inclusion in the California Register of Historical Resources. ***(Less than Significant)***

The 35-foot-tall remnant[47] of Irish Hill is a contributing landscape feature of the UIW Historic District. All but a small portion of the remnant of Irish Hill would be retained, and the adjacent areas to the south and east would be improved as a public open space (Irish Hill Playground). It would become a central landscape feature surrounded by proposed new streets and infill construction (see Figure 2.15: Proposed Open Space Plan, in Chapter 2, Project Description, p. 2.46). A minimum buffer zone of 45 feet would be established between the peak of Irish Hill and new development to the west (Parcel PKS). New benches and plantings and a playground area would be installed south of the hill's edges, but no changes would occur to the side slopes or top of the hill. Approximately 0.04 acre, or 1,900 square feet, out of the hill's total 1.4 acres, or 60,984 square feet (representing 3 percent of the total area), would be removed to accommodate the proposed extension of 21st Street. Further, the area proposed for removal is of relatively low elevation (as compared to other areas of the hill) and therefore would not significantly alter perception of the remnant of Irish Hill's height and mass. Irish Hill appears as a lightly vegetated serpentine outcropping, with distinctive rocky exposure on the western and southern faces. The area proposed for removal is of similar aesthetic quality to the area proposed to be retained. The Proposed Project does not propose to alter the distinctive rocky exposure on the western and southern faces. The removal of 3 percent of the hill, at an area of relatively low elevation, is

[47] Only about 1.4 acres of the original 20.6 acres of the original Irish Hill remain today.

considered a relatively minor loss, and because approximately 97 percent of this important landscape feature would be retained, this portion of the Proposed Project would not materially impair the integrity of the resource as a contributing landscape feature of the UIW Historic District. The construction of new public streets and new development adjacent to Irish Hill, as well as new benches and plantings and a playground south of the hill, would alter the feeling and association of the resource, but would not reduce its overall integrity to the extent that the Irish Hill remnant would no longer remain a contributor to the UIW Historic District. Therefore, the removal of a portion of Irish Hill and the construction of adjacent new development would have a less-than-significant impact to the integrity of Irish Hill, and to the UIW Historic District as a whole. No mitigation measures are necessary.

Impact CR-10: The proposed changes and additions to the network of streets and open space would not materially alter, in an adverse manner, the physical characteristics of the UIW National Register Historic District that justify its inclusion in the California Register of Historical Resources. ***(Less than Significant)***

The proposed street network would extend the existing east-west streets (20th Street and 22nd Street), establish a new east-west street (21st Street) westward through the project site to the shoreline of the Bay, and create north-south internal streets. The Proposed Project would also provide a 9-acre interconnected network of public open spaces through the project site.

As discussed above on p. 4.D.44, the UIW Historic District designation identifies the following character-defining features within existing streets and spaces between buildings: minimal planted vegetation; open areas that are either paved with asphalt or covered with gravel; streets that are improved without curbs and gutters, except for 20th Street, which has granite curbs.[48]

The proposed network of streets and open space is intended to create visual and physical access along proposed streets and open space view corridors to the cluster of historic buildings, located both within the project site and the adjacent 20th Street Historic Core that would become the central historic core for surrounding new infill development within the project site, as well as connecting the core to a new, publicly accessible waterfront.

The proposed network of streets would establish a hierarchy of public rights-of-way to provide access and connectivity throughout the project site, building upon the existing neighborhood street grid and creating continuity through the site and to the waterfront. The proposed open space system would similarly provide enhanced access through the site and connectivity to the waterfront. For example, a continuous waterfront park ("Waterfront Terrace" and "Waterfront

[48] United States Department of the Interior, National Park Service, National Register of Historic Places Registration Form, *Union Iron Works Historic District*, April 17, 2014.

Promenade") would extend the length of the shoreline, with an extension of the park ("Slipways Commons") toward the site's interior, linking the waterfront to the historic Buildings 2, 12, and 21 and a proposed new plaza (Building 12 Market Plaza and Market Square). The waterfront park would incorporate the former slipways and craneways into the design of the Waterfront Promenade as way to reference the former industrial uses in this area of the District. For example, craneways that protrude from the shoreline into the Bay would be preserved as piers, and the craneways would be made accessible to the public. The open space framework would also retain the hilltop remnant of Irish Hill in its current state, while constructing a playground to the west of it and connecting this area to the rest of the open space system through vegetated pathways between new buildings on Parcels PKS, HDY1 and HDY2. Another component of the open space system, the proposed plaza (20th Street Plaza) at Illinois Street and 20th Street, would allow for expansive views of historic Building 113 from the corner of Illinois Street and 20th Street, and would serve as a gateway to the District, further integrating it with the existing neighborhood to the west.

Historically, Pier 70 was characterized by minimal to no vegetation, which is typical for waterfront industrial uses. This condition is a character-defining feature of the UIW District. To facilitate the transition to a new neighborhood, the *Pier 70 SUD Design for Development* calls for street trees to be planted in appropriate locations with grasses and other plantings to create the benefit of new landscape compatible with the historic character of the UIW Historic District. For example, street trees would be installed along the proposed waterfront extension of 20th Street and 22nd Street at the waterfront and southern perimeter of the district, and along some of the proposed interior north-south streets away from contributing features of the district. However, no street trees are proposed along 20th street in the project site. The installation of street trees only in some areas is intended to strike a balance between the limited vegetation currently found in the UIW Historic District and the aesthetic desires for the successful adaptive reuse of the project site. The proposed landscaping within the open space system would also consist of an "enhanced native" palette, reflective of the post-industrial organic wild grasses growing at the site today. The palette would include species native to San Francisco and the Bay Area and non-native, non-invasive, and salt- and drought-tolerant species appropriate for the urban waterfront setting.

The proposed network of streets and open space would reinforce and enhance the visual, historical, and functional connection between contributing buildings and the Bay, which is one of the District's primary character-defining features.

Other character-defining features of the District include streets without curbs and gutters, except for 20th Street, which has granite curbs, as well as open areas that are either paved with asphalt or covered with gravel. The granite curbs along 20th Street would be retained as part of the 20th Street Historic Core Project, although new and/or extended streets within the project site would

be improved with curbs and gutters as required for all new development in San Francisco. The introduction of new streets, sidewalks, and plazas within the project site would retain a sense of the open, paved areas that exist around and between contributing historic buildings. Although the introduction of new and extended streets with improved curbs and gutters would somewhat reduce the integrity of setting of the UIW Historic District, these changes would not demolish or alter in an adverse manner those physical characteristics that justify the District's inclusion in the CRHR, and the District would retain sufficient integrity to continue to convey its historical significance.

For these reasons, the proposed network of streets, street trees, and open space would not result in a material impairment of the physical characteristics of the UIW Historic District that justify its inclusion in the California Register of Historical Resources, and therefore the impact would be less than significant.

Impact CR-11: The proposed infill construction would materially alter, in an adverse manner, the physical characteristics of the UIW National Register Historic District that justify its inclusion in the California Register of Historical Resources. *(Less than Significant with Mitigation)*

The Secretary of the Interior's Rehabilitation Standard No. 9 states that "new work shall be differentiated from the old and shall be compatible with the massing, size, scale and architectural features to protect the integrity of the property and its environment." The proposed *Design for Development* contains standards and guidelines that are designed to address the required balance between differentiation and compatibility of new construction in the UIW Historic District. The *Design for Development* standards that primarily promote differentiation from historic buildings and visual variety include the following:

- *No Replication of Historic Buildings*. New construction shall not replicate or mimic historic buildings. False historicism is not permitted (S6.8.1).
- *Building Variety*. All new individual buildings within the Pier 70 SUD shall be visually distinct from each other with variations in: building massing, materials, glazing pattern and proportion, color, architectural detail, articulation, roofline modulation. Every building shall vary from its adjacent building in at least two of the above variations, of which one shall not be color (S6.8.2).
- *Façade Articulation*. Material selections shall reflect but not replicate the scale, pattern and rhythm of adjacent contributing buildings' exterior materials. Material selections shall not establish a false sense of historic development (S6.8.3).
- *Rooflines*. Duplication of the adjacent historic roofline is not permitted, unless flat (S6.10.2).

The proposed *Design for Development* also contains a number of standards and guidelines that promote compatibility and continuity with adjacent historic buildings, including the following:

- *Historic Rhythms and Patterns*. New construction buildings should incorporate, through contemporary interpretation, one or more of the following features drawn from Pier 70's historic character: horizontal banding, shifted patterns, articulated rooflines, repetitive patterns, gridded windows, and weathered materials (G6.8.1).
- *Material and Color Palette*. Material and color palette are encouraged to draw from Pier 70's historic texture and utilize the material palette provided (see Figure 4.D.12, p. 4.D.84). Materials that are intended to patina or weather are encouraged (G6.8.4).
- *Relate to Adjacent Resources*: In certain façade locations, new construction shall incorporate elements that relate to the adjacent resource in keeping with contemporary design and construction (S6.14.5).

The application of these *Design for Development* standards and guidelines, including the application of maximum heights, building articulation, material grain and palette, and building-specific responsiveness, would help maintain the integrity of the UIW Historic District by emphasizing the industrial character of the District. This would thereby reduce the impacts of new construction on the integrity of adjacent contributing buildings and the UIW Historic District.

For example, new infill construction adjacent to contributing Buildings 2, 6, 12, 21, 113, and 116 would be specifically designed to respond to the architectural character and qualities of these historic buildings through the use of setbacks, dimensional height referencing, and related treatment on select façades. New infill construction adjacent to the remnant of Irish Hill, also a contributor to the UIW Historic District, would be consistent with the dense, urban-industrial character-defining feature of the District, as well as the District's close groupings of buildings. Although the new construction would be clearly differentiated from the adjacent historic buildings through the use of modern construction materials and contemporary architectural design, the application of these building-specific treatments would also enhance their compatibility with the adjacent historic buildings, in keeping with the guidance provided in the *Design for Development* and the Secretary of the Interior's Standards, which call for a balance between the concepts of differentiation and compatibility.

The Proposed Project would also establish buffer zones surrounding the core of historic buildings and landscapes that specify the minimum distances of separation between historic buildings and landscapes and new construction. The buffer zones are intended to maximize visual and physical access to the District's historic buildings and to minimize visual intrusions into the integrity of contributing buildings. These separations would range in distance from 20 feet to 85 feet, and would typically span the width of existing and proposed new streets or pedestrian passageways The proposed buffer zones surrounding historic Buildings 2, 21, and 12 within the project site, together with the proposed buffer zones surrounding the historic buildings within the adjacent 20th Street Historic Core, are also intended to spatially unite these contributing buildings with each other as a historically and functionally related grouping of contributing buildings. The buffer

zones are also intended to prevent new infill construction from creating visual or physical barriers between the District's contributing buildings, reinforcing the historic visual and functional relationship between contributing features of the UIW Historic District. A buffer zone of 45 feet would be established between the peak of Irish Hill and adjacent new construction at Parcel PKS.

As new construction is expected to begin in 2018, would be phased over an approximately 11-year period, and could be designed and constructed by different development teams responding to varying real estate market conditions, it is possible that new infill development could change the historic significance of the UIW Historic District by introducing a wide variety of new building designs and types that may not be compatible with the historic character of adjacent historical resources. This could incrementally reduce the integrity of the UIW Historic District to the extent it may no longer qualify for the National Register, which would be considered a significant impact on historical resources. Implementation of Mitigation Measure M-CR-11: Performance Criteria and Review Process for New Construction, shown below, would ensure that future new construction would not alter, in an adverse manner, the physical characteristics of the UIW Historic District that justify its inclusion in the California Register of Historical Resources, and would thereby reduce this impact to a less-than-significant level.

Mitigation Measure M-CR-11: Performance Criteria and Review Process for New Construction

In addition to the standards and guidelines established as part of the Pier 70 SUD and *Design for Development*, new construction and site development within the Pier 70 SUD shall be compatible with the character of the UIW Historic District and shall maintain and support the District's character-defining features through the following performance criteria (terminology used has definition as provided in the *Design for Development*):

1. New construction shall comply with the Secretary of the Interior's Rehabilitation Standard No. 9: "New Addition, exterior alterations, or related new construction shall not destroy historic materials that characterize the property. The new work shall be differentiated from the old and shall be compatible with the massing, size, scale and architectural features to protect the integrity of the property and its environment."
2. New construction shall comply with the Infill Development Design Criteria in the Port of San Francisco's *Pier 70 Preferred Master Plan* (2010) as found in Chapter 8, pp. 57-69 (a policy document endorsed by the Port Commission to guide staff planning at Pier 70).
3. New construction shall be purpose-built structures of varying heights and massing located within close proximity to one another.
4. New construction shall not mimic historic features or architectural details of contributing buildings within the District. New construction may reference, but shall not replicate, historic architectural features or details.

5. New construction shall be contextually appropriate in terms of massing, size, scale, and architectural features, not only with the remaining historic buildings, but with one another.
6. New construction shall reinforce variety through the use of materials, architectural styles, rooflines, building heights, and window types and through a contemporary palette of materials as well as those found within the District.
7. Parcel development shall be limited to the new construction zones identified in *Design for Development* Figure 6.3.1: Allowable New Construction Zones.
8. The maximum height of new construction shall be consistent with the parcel heights identified in *Design for Development* Figure 6.4.1: Building Height Maximum.
9. The use of street trees and landscape materials shall be limited and used judiciously within the Pier 70 SUD. Greater use of trees and landscape materials shall be allowed in designated areas consistent with *Design for Development* Figure 4.7.1: Street Trees and Plantings Plan.
10. New construction shall be permitted adjacent to contributing buildings as identified in *Design for Development* Figure 6.3.2: New Construction Buffers.
11. No substantive exterior additions shall be permitted to contributing Buildings 2, 12, or 21. Building 12 did not historically have a south-facing façade; therefore, rehabilitation will by necessity construct a new south elevation wall. Building 21 shall be relocated approximately 75 feet east of its present placement, to maintain the general historic context of the resource in spatial relationship to other resources. Building 21's orientation shall be maintained.

Building Specific Standards

Each development parcel within the Pier 70 SUD has a different physical proximity and visual relationship to the contributing buildings within the UIW Historic District. For those façades immediately adjacent to or facing contributing buildings, building design shall be responsive to identified character-defining features in the manner described in the *Design for Development* Buildings chapter. All other façades shall have greater freedom in the expression of scale, color, use of material, and overall appearance, and shall be permitted if consistent with Secretary Standard No. 9[49] and the *Design for Development*.

Table M.CR.1: Building-Specific Responsiveness, indicates resources that are located adjacent to, and have the greatest influence on the design of, the noted development parcel façade.

[49] Standard No. 9 states that "New Addition, exterior alterations, or related new construction shall not destroy historic materials that characterize the property. The new work shall be differentiated from the old and shall be compatible with the massing, size, scale and architectural features to protect the integrity of the property and its environment."

Table M.CR.1: Building-Specific Responsiveness

Palette of Materials

In addition to the standards and guidelines pertaining to application of materials in the *Design for Development*, the following material performance standards would apply to the building design on the development parcels (terminology used has definition as provided in the *Design for Development*):

- Masonry panels that replicate traditional nineteenth or twentieth century brick masonry patterns shall not be allowed on the east façade of Parcel PKN, north and west façades of Parcel A or on the north façade of Parcel C1.
- Smooth, flat, minimally detailed glass curtain walls shall not be allowed on the façades listed above. Glass with expressed articulation and visual depth or that expresses underlying structure is an allowable material throughout the entirety of the Pier 70 SUD.
- Coarse-sand finished stucco shall not be allowed as a primary material within the entirety of the UIW Historic District.
- Bamboo wood siding shall not be allowed on façades listed above or as a primary façade material.
- Laminated timber panels shall not be allowed on façades listed above.
- When considering material selection immediately adjacent to contributing building (e.g., 20th Street Historic Core; Buildings 2, 12, and 21; and Buildings 103, 106, 107, and 108 located within or immediately adjacent to the BAE Systems site), characteristics of compatibility and differentiation shall both be taken into account. Material selection shall not duplicate adjacent building primary materials and treatments, nor shall they establish a false sense of historic development.
- Avoid conflict of new materials that appear similar or attempt to replicate historic materials. For example, Building 12 has character-defining corrugated steel cladding. As such, the eastern façade of Parcel C2, the northern façade of Parcels F and G, and the southern façade of Parcel D1 shall not use corrugated steel cladding as a primary material. As another example, Building 113 has character-defining brick-masonry

construction. As such, the northern and western façades of Parcel A and the eastern façade of Parcel K North shall not use brick masonry as a primary material.

- Use of contemporary materials shall reflect the scale and proportions of historic materials used within the UIW Historic District.
- Modern materials shall be designed and detailed in a manner to reflect but not replicate the scale, pattern, and rhythm of adjacent contributing buildings' exterior materials.

Review Process

Prior to Port issuance of building permits associated with new construction, San Francisco Planning Department Preservation staff, in consultation with the San Francisco Port Preservation staff, shall use the Final Pier 70 SUD *Design for Development* Standards, including Secretary Standard No. 9, to evaluate all future development proposals within the project site for proposed new construction within the UIW Historic District. As part of this effort, project sponsors shall also submit a written memorandum for review and approval to San Francisco Planning Department Preservation staff that confirms compliance of all proposed new construction with these guiding plans and policies.

Impact CR-12: The Proposed Project would not materially alter, in an adverse manner, the physical characteristics of other historical resources (outside of the UIW National Register Historic District) that justify inclusion of such resources in a Federal, State or local register of historical resources. *(Less than Significant)*

As discussed under "Historic Resources Outside of UIW District" on pp. 4.D.62-4.D.64, other historical resources (not within the UIW National Register Historic District) are located adjacent to the project site. The former American Can Company Building (the American Industrial Center) at 2301 Third Street, and the Central Waterfront Historic District (which includes the American Can Company Building) are located across Illinois Street west of the project site. The PG&E Station Potrero Power Plant (the PG&E Potrero Substation) at 1201 Illinois Street is located immediately south of the project site, and the historic Kneass Boatworks Building at 671 Illinois Street is located north of the project site.

Although the Proposed Project would have no direct physical impact on these historic architectural resources, the Proposed Project could have an indirect visual impact on these resources by altering their immediate visual setting. However, the integrity and historic significance of adjacent historic architectural resources is not premised on their possessing an intact and cohesive visual relationship with their surroundings. The Proposed Project would not destroy historic features and materials that characterize nearby historic architectural resources. New construction within the project site would be contemporary in design and materials and would not convey a false sense of historic development. The character-defining features and form

of nearby historic architectural resources would continue to be clearly evident from surrounding streets.

For these reasons, the indirect visual impacts of the Proposed Project are not those of a project that "demolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its eligibility for inclusion in the CRHR as determined by the lead agency for purposes of CEQA." (CEQA Guidelines Section 15064.5(b)(2)(C)). No mitigation measures are necessary.

Cumulative Impacts

Impact C-CR-2: The impacts of the Proposed Project, in consideration of other past, present, and future projects, would materially alter, in an adverse manner, the physical characteristics of the UIW National Register Historic District that justify its inclusion in the California Register of Historical Resources, and would materially alter the physical characteristics of Building 21 that justify its individual eligibility for inclusion in the California Register of Historical Resources. ***(Less than Significant with Mitigation)***

The analysis of cumulative impacts to historic architectural resources addresses all past, present, and reasonably foreseeable future projects within the boundaries of the UIW Historic District, which, in addition to the impacts of the Proposed Project, may have a significant, adverse cumulative impact to the significance of the UIW Historic District. In addition to the Proposed Project, there are three anticipated projects within the UIW Historic District that have the potential to have a significant cumulative impact on the significance of the UIW Historic District: (1) Crane Cove Park project, (2) BAE Systems Lease Renewal project, and (3) revisions to the on-going 20th Street Historic Core project, which would demolish historic Buildings 40 and 117. These projects and their potential impacts to historic architectural resources are described below, followed by an evaluation of the Proposed Project's contribution to these impacts.

Crane Cove Park Project

The Crane Cove Park project is an approximately 11-acre area located at Pier 70, bounded by Illinois Street to the west, San Francisco Bay to the east, Mariposa Street to the north, and 19th Street to the south. The project site is approximately one block north of the Pier 70 SUD project site. The site includes five historic buildings (Buildings 30, 49, 50, 109, 110), Slipways 1 through 4, and Cranes 30 and 14, and the historic iron fencing along Illinois Street all of which contribute to the UIW Historic District, a historical resource under CEQA. The Crane Cove Park project would involve the following actions: (1) construction of a new, approximately 9.8-acre shoreline park (Crane Cove Park); (2) extension of 19th Street for park access and circulation; (3) creation of Georgia Street, which would connect 20th Street to the 19th Street extension; (4)

relocation of the BAE shipyard entrance from 20th Street to the terminus of the 19th Street extension and rerouting of BAE shipyard truck traffic from 20th Street to the 19th Street extension; and (5) street improvements along the eastern side of Illinois Street. The project would involve the renovation of Buildings 49, 109, and 110, whereas Buildings 30 and 50 would be demolished. Slipway 4 would be rehabilitated as a plaza, and Crane 14 would be relocated to the end of Slipway 4. Crane 30 would remain in its current location. Slipways 1-3, a contributing feature within the District, would remain in their present condition, with some removal of fill material to expose the features to tidal action. The iron fence along Illinois Street would be retained in place.[50]

The Planning Department completed the environmental review for the Crane Cove Park project in October 2015. As part of the Crane Cove Park environmental review, Planning Department Preservation staff completed a HRER that evaluated the impacts of the project on historical resources.[51] Department staff found that the demolition of two contributing buildings (Buildings 30 and 50) within the UIW Historic District would not cause a significant adverse impact upon any qualified historical resource. The District would retain a high number of contributing features, and many of the demolished buildings are ancillary and/or repetitive relative to the District's history and significance. The department also found that the rehabilitation of the contributing features, including Buildings 49, 109, and 110; Slip No. 4; and Cranes 14 and 30, would meet the Secretary of the Interior's Standards for Rehabilitation. Further, the new construction anticipated for the project site would have a less-than-significant impact upon the District, because the new construction would be appropriately designed to preserve the District's character-defining features, while also accommodating for new design features.

BAE Systems Lease Renewal Project

The BAE shipyard is an approximately 15-acre area at Pier 70 located at the foot of 20th Street. The shipyard is currently used as a ship repair facility operating under a lease with the Port of San Francisco by BAE Systems. The project site includes piers, drydocks, and 19 buildings that support the maintenance, alteration, and repair of ships. The BAE shipyard is located within the UIW Historic District, to the north and west of the Pier 70 SUD project site. The Port executed a new lease with BAE Systems in 2015 to continue the existing ship repair use without any expansion or intensification of use. The lease includes the following specific tenant obligations within or at the perimeter of the project site: (1) demolition of three contributors (Buildings 38, 119, 121) of the 19 existing buildings to provide for additional laydown space for ship repair; (2)

[50] San Francisco Planning Department, *Certificate of Determination, Exemption from Environmental Review, Crane Cove Park,* Case No. 2015.001314ENV, October 5, 2015.
[51] San Francisco Planning Department, Historic Resource Evaluation Response (HRER), Pier 70 Crane Cove Park, September 15, 2015.

removal of 12 polychlorinated biphenyl electric transformers (PCB); (3) removal of non-historic Cranes 2 and 6; and (4) perimeter landscaping improvements. Buildings 38, 119, and 121 are contributors to the UIW Historic District, a historical resource under CEQA.[52]

The Planning Department completed the environmental review for the BAE Systems Lease Renewal Project in March 2015. As part of the BAE Systems Lease Renewal Project environmental review, Planning Department Preservation staff completed a HRER that evaluated the impacts of project on historical resources.[53] Department staff found that the demolition of Buildings 38, 119, and 121 would not impact the integrity of the UIW Historic District due to the diminished integrity of the three buildings, the size of the District, and the number of other contributing features that are similar in architectural character, history, and date of construction. Building 38, built in 1915, was one of several buildings constructed to support the shipbuilding activities during World War I. Despite its demolition, the District would retain other examples of support structures and World War I-era buildings, such as Buildings 108, 109, and 111 near the shoreline and Pier 68 high water platform, which would allow the District to continue to convey this early era of development and maritime activity. Buildings 119 and 121 are ancillary World War II-era buildings, which were constructed to support the site's shipbuilding activities. Although Building 119 would be demolished, this resource type would continue to be represented within the District by Building 110, which is very similar in size, plan, architectural treatment, and use of materials. Also, despite the demolition of Building 121, other contributing buildings such as Buildings 110, 122, and 123 would provide examples of small-scale facilities development in the shipyard during World War II. Overall, other properties within the UIW Historic District would assist in conveying the significance of these contributors. Therefore, the HRER concluded that the demolition of these three buildings would not materially impair the designation of the UIW Historic District on the NRHP. For the reasons, Planning Department staff found the BAE Systems Lease Renewal project would result in less-than-significant impacts on historical resources.

Demolition of Historic Buildings 40 and 117 as Part of Revisions to the 20th Street Historic Core Project

In 2014, the San Francisco Planning Department issued a CPE for the 20th Street Historic Core Project (Case No. 2013.1168E) to the Port of San Francisco for the rehabilitation of 10 historic buildings at Pier 70. These buildings are contributors that form the core of the UIW Historic District. The rehabilitation project is currently underway. As discussed in Section 4.A,

[52] San Francisco Planning Department, *Certificate of Determination, Exemption from Environmental Review, SF Port – Pier 70 Area – BAE Lease Renewal*, Case No. 2014.0713, March 2, 2015.

[53] San Francisco Planning Department, Historic Resource Evaluation Response (HRER), Pier 70 BAE Ship Repair, February 20, 2015.

Introduction to Chapter 4, pp. 4.A.14, in 2015 the Port added demolition of contributing Buildings 40 and 117, located within the Pier 70 project site. Buildings 40 and 117 are proposed for demolition because they are located in the alignment of the proposed sidewalk along the frontage of the future Crane Cove Park and the extension of 21st Street eastward to provide vehicular and pedestrian access into the Pier 70 site. The following is a summary from information submitted by the Port of San Francisco in connection with environmental review of the proposed demolition of Buildings 40 and 117. [54]

Building 40

Building 40 is a three story, 8,359-square-foot wood frame building that was constructed in 1941 and served as the Shipyard Employment Office Annex. Building 40 is a contributor to the District as a support building that represents the increase in facilities to accommodate the peak labor force during WWII. Although it is a contributor to the District, it has experienced significant deterioration that affects its integrity. The roof of the northern portion of the building has failed and is open to the sky, resulting in water damage that has caused the interior of the building to collapse. Removal of Building 40 as part of the 20th Street Historic Core Building 40 and 117 project would allow the Port to construct a standard width sidewalk along the frontage of the future Crane Cove Park (currently the sidewalk extends just a few hundred feet north of the corner of 20th and Illinois streets) on the east side of Illinois Street between 20th and 18th streets behind (east of) the historic iron fencing, also a contributing feature within the Historic District. Removal of Building 40 would not affect the adjacent historic iron fencing or other contributing buildings and features or the historic significance of the District because it contains other, more significant examples of WWII expansion of the shipyard, including Buildings 2, 6, 12, 14 and 49.[55]

Although Building 40 is a contributor to the District, it was not found to possess individual significance because it is one of many architecturally undistinguished support buildings from World War II and it has lost integrity due to advanced deterioration. Therefore, it would not qualify for listing under the National or California Registers as an individual historical resource.[56]

Building 117

Building 117 is a one story, 31,440-square-foot steel frame warehouse constructed in 1937/41, and is a contributor to the UIW Historic District. Building 117 is attached to the south elevation

[54] Port of San Francisco, *EE Application/Continuation Sheet for 20th Street Historic Building Rehabilitation Project*, Case No. 2013.1168E, December 4, 2015.
[55] Ibid.
[56] Port of San Francisco, *Union Iron Works Historic District Profiles of Contributing and Non-Contributing Resources Proposed for Demolition by Project Area, May 16, 2016.*

of historic Building 116. Building 117 is proposed for demolition as part of the 20th Street Historic Core Building 40 and 117 project because it is located in the alignment of the proposed extension of 21st Street eastward to provide vehicular and pedestrian access into the Pier 70 site. The extension of the street would serve existing activities and future development in the central portion of the site, becoming an extension of the city street network. The loss of Building 117 would impact the integrity of the Historic District, but it would not lose its historic significance because other examples of WWII-era steel frame corrugated metal warehouse buildings would remain throughout the District, including Buildings 6, 12, 14, 49.[57]

Although Building 117 is a contributor to the District, it was not found to possess individual significance because its simple, undistinguished, and utilitarian design lacks architectural distinction, and it had a minor support function as a parts storage warehouse in the shipbuilding and repair process. Therefore, it would not qualify for listing under the National or California Registers as an individual historical resource.[58]

For these reasons, the Planning Department and the Port of San Francisco found that the proposed demolition of Buildings 40 and 117 would have a less-than-significant impact on the integrity of the UIW Historic District. Moreover, neither building is individually eligible for the NRHP or CRHR for the reasons stated above. Therefore, their demolition would not result in a substantial adverse change to historical resources as defined by CEQA.

Evaluation of Cumulative Impacts

The Planning Department concurs that that despite the new construction under the Crane Cove Park project and the loss of two contributing buildings (Buildings 30 and 50), the loss of three contributing buildings (Buildings 38, 119, and 121) from the BAE Systems Lease Renewal project, and the loss of two contributing buildings (Buildings 40 and 117) from the revised 20th Street Historic Core project, these three projects would have a less-than-significant impact on the integrity of the UIW Historic District. As described above, the Proposed Project would result in a less-than-significant impact to historical resources (demolition of seven contributing resources), and would result in significant but mitigable impacts to historical resources resulting from rehabilitation of three contributing features and new infill construction, (with implementation of Mitigation Measures M-CR-5: Preparation of Historic Resource Evaluation Reports, Review, and Performance Criteria, and M-CR-11: Performance Criteria and Review Process for New Construction.) Accordingly, with mitigation, all Project impacts to historical resources would be less than significant.

[57] Ibid.
[58] Ibid.

In summary, all of these projects cumulatively would result in the collective loss of 14 historic buildings that contribute to the significance of the UIW Historic District, as well as the retention and rehabilitation, or no change, to the other 30 contributing features. Table 4.D.5: Cumulative Effects to All Contributing Resources in the UIW Historic District, provides a list of the effects to all contributing features resulting from past, present, and reasonably foreseeable projects within the UIW Historic District. The collective demolition of these buildings and its cumulative impact on the integrity of the UIW Historic District were analyzed in a report prepared by Carey & Co., Inc. for the Port of San Francisco in August 2015.[59] The Planning Department reviewed and concurred with the report findings, which were restated within in the BAE Ship Repair HRER. The results of this analysis include the following:

- The demolitions would enhance the ongoing ship repair activity by allowing for additional space related to ship repair activities. The authenticity of maritime use within a portion of the Historic District would allow the public to experience large-scale heavy industrial ship repair activity, the only such maritime use on San Francisco Bay.
- A significant concentration of World War II-era contributing features and buildings would remain in the Historic District. They would continue to provide strong visual and physical examples of the World War II era of the Historic District. In many instances, the structures to be demolished are repeated elsewhere in the Historic District, as is the case with World War II warehouses, restrooms, and electrical power substations.
- The proposed demolitions would allow the existing ship repair facility to continue into the future by allowing for expanded open staging areas for ship repair and would provide opportunities for new compatible infill development that would help support the adaptive use of the remaining contributors to the UIW Historic District.
- The proposed loss of these contributors would not result in the need to adjust the boundary because it represents the historic ownership and maximum development of the District at its peak operation during World War II. The boundary for the District, as with most historic districts, includes areas with non-contributing features.

Building 66 (Welding Shed)	(Proposed Project)	
Building 101 (Bethlehem Steel Administration Building)		(20th Street Historic Core)
Building 102 (Powerhouse)		No Change
Building 103 (Steam Powerhouse No. 2)		(20th Street Historic Core)
Building 104 (UIW Office Building)		(20th Street Historic Core)
Building 105 (Forge Shop)		(20th Street Historic Core)
Building 107 (Lumber Storage)		No Change
Building 108 (Planning Mill and Joinery Shop)		No Change
Building 109 (Plate Shop No. 1)		(BAE Systems)
Building 110 (Yard Washroom/Locker Room)		(BAE Systems)
Building 111 (Main Office and Substation No. 3)		No Change
Building 113 (UIW Machine Shop)		(20th Street Historic Core)

Table 4.D.5 Continued

Building Number (Name)	Demolish (Project)	Retain/Rehab (Project)
Building 114 (Blacksmith Shop)		(20th Street Historic Core)
Building 115 (Concrete Warehouse)		(20th Street Historic Core)
Building 116 (Concrete Warehouse)		(20th Street)
Building 117 (Warehouse No. 9/Shipyard Training Center)	(20th Street Historic Core)	
Building 119 (Yard Washroom)	(BAE Systems)	
Building 120 (Pipe Rack/Women's Washroom)		No Change
Building 121 (Drydock Office)	(BAE Systems)	
Building 122 (Check House No. 1)		(20th Street Historic Core)
Building 123 (Check House No. 2)		(20th Street Historic Core)
Slipways 1-3 (site of Slipways 1, 2, and 3)		(BAE Systems)
Slip 4, and Cranes 14 and 30		(BAE Systems)
Whirley Crane 27		No Change
Pier 68 (Highwater Platform)		No Change
Iron Fence (at 20th and Illinois streets)		(BAE Systems)
Irish Hill (remnant)		(Proposed Project)
Total Demolish	**14**	
Total Retain/Rehab/No Change		**30**

Overall, the Planning Department found that the proposed demolitions resulting from the Crane Cove Park project, BAE Systems Lease Renewal project, and changes to the 20th Street Historic Core project, in addition to those of the Proposed Project, would not materially impair the integrity of the UIW Historic District or its listing on the NRHP. The Planning Department also found that rehabilitation and infill construction associated with the Proposed Project would not materially impair the integrity of the UIW Historic District with implementation of the aforementioned mitigation measures. Therefore, the Proposed Project and the other projects described above would, with implementation of Mitigation Measures M-CR-5 and M-CR-11 identified herein, collectively result in a less-than-significant cumulative impact upon historical resources.

Impact C-CR-3: The impacts of the Proposed Project, in consideration of other past, present, and future projects, would not materially alter, in an adverse manner, the physical characteristics of historical resources (outside of the UIW National Register Historic District) that justify its inclusion in the California Register of Historical Resources, resulting in a cumulative impact. ***(Less than Significant)***

As discussed above under Impact CR-12, other historical resources (not within the UIW National Register Historic District) are located in the vicinity of the project site (including the former American Can Company Building, the Central Waterfront Historic District, the PG&E Station Potrero Power Plant, and the historic Kneass Boatworks Building.

The Proposed Project would not contribute to direct physical impacts on historic architectural resources. To the extent it could contribute some indirect visual impact, considered together with reasonably feasible projects in the vicinity by altering their immediate visual setting, the integrity and historic significance of adjacent historic architectural resources is not premised on their possessing an intact and cohesive visual relationship with their surroundings. The Proposed Project, together with reasonably feasible projects in the vicinity, would not destroy historic features and materials that characterize nearby historic architectural resources. The character-defining features and form of nearby historic architectural resources would continue to be clearly evident from surrounding streets.

The physical impacts of the Proposed Project on the significance of the UIW Historic District resource would not combine with that of other projects to make a considerable contribution to a significant cumulative impact on the integrity of other architectural resources in the vicinity, or more broadly in the City, State or nation. The Proposed Project, considered together with reasonably feasible projects, would not contribute to the demolition or material alteration of a historical resource outside of the UIW Historic District. No mitigation measures are necessary.

E. TRANSPORTATION AND CIRCULATION

Section 4.E, Transportation and Circulation, addresses the impacts that transportation and land use changes related to the Pier 70 Mixed-Use District Project would have on traffic, transit, pedestrian and bicycle travel and circulation, loading, and emergency access. The section describes existing transportation conditions on the project site and in the transportation study area, and presents the baseline transportation conditions against which project impacts are measured. Project-specific impacts are presented for both the maximum residential scenario and the maximum commercial scenario, and mitigation measures to reduce identified impacts and/or improvement measures to make improvements to portions of the Proposed Project where there would not be significant impacts are identified. The Proposed Project's contribution to significant cumulative impacts is identified for each transportation mode. While parking is no longer considered in determining if the Proposed Project has the potential to result in significant environmental impacts, the section presents the Proposed Project's parking demand in relation to the proposed parking supply for informational purposes only. The section summarizes the information provided in the *Pier 70 Mixed-Use District Project Transportation Impact Study* (TIS).[1] The analyses use methods consistent with the 2002 *San Francisco Transportation Impact Analysis Guidelines for Environmental Review* (hereinafter referred to as the *SF Guidelines*).

ENVIRONMENTAL SETTING

TRANSPORTATION STUDY AREA

The transportation study area is bounded roughly by San Francisco Bay, Third Street (north of Mariposa Street), Harrison Street, Fourth Street, Bryant Street, Seventh Street, Arkansas Street, Cesar Chavez Street, and Illinois Street, as shown on Figure 4.E.1: Transportation Study Area and Study Intersections. The transportation study area includes all aspects of the transportation network that may be measurably affected by trips generated by the Proposed Project. The study area is defined by travel corridors and by facilities such as transit routes and stations, bicycle routes and amenities, pedestrian sidewalks and crossings, and the overall vehicular roadway network that residents and visitors would use in traveling to and from the project site.

A total of 37 existing intersections (38 with the Proposed Project) within the transportation study area were identified as key locations that are likely to be affected by the Proposed Project, and were selected for detailed study, particularly for pedestrian conditions. These study intersections include all major intersections along Third Street, Illinois Street, 25th Street, Mariposa Street, and 16th Street, as well as numerous local intersections along access routes to and from U.S. Highway

101 (U.S. 101) and Interstate-280 (I-280) within the study area. Intersections farther away were not analyzed as part of the study, because project-generated travel remaining on local streets would be dispersed, and, consequently, the Proposed Project's effects would be relatively small.

The study intersections are identified by number on Figure 4.E.1; the intersections corresponding to numbers on Figure 4.E.1 are listed in Table 4.E.1: Study Intersections.

EXISTING CONDITIONS

Roadway Facilities

The study area is served by three freeways providing regional access and multiple local streets providing access to the project site. A section describing local roadways is followed by a description of the freeways serving the study area.

Local Roadways

Local access to the project site and the transportation study area is provided by an urban street grid network. Third Street is the main north-south street in the study area and is one of the major arterials in this eastern part of San Francisco. Mariposa and 16th streets are main east-west streets in the study area; Cesar Chavez Street is a main east-west arterial at the south end of the study area. Access to the project site is from 20th Street/Illinois Street and 22nd Street/Illinois Street, one block east of Third Street. Most of the local roadways in the study area are described in Table 4.E.2: Local Roadway Network. The table identifies the following for each of the key streets in the study area: street name; direction (east-west or north-south); typical number of lanes; the streets' designations in the *San Francisco General Plan*, if any; transit routes that use a street; and any bicycle facilities.

Table 4.E.2: Local Roadway Network

Texas Street	N-S	2	-	-	-

Notes:

E-W = east-west. N-S = north-south.

[1] The descriptions associated with each street (General Plan Designation, Transit Routes, etc.) are those that apply to some portion of that street, although not necessarily the entire length of that street.

[2] Class I bikeways are bike paths with exclusive right-of-way for use by bicyclists. Class II bikeways are bike lanes striped within the paved areas of roadways and established for the preferential use of bicycles. Class III bikeways are signed bike routes that allow bicycles to share the travel lane with vehicles. See Section 2.7 for additional discussion.

[3] Except between China Basin Street and Cesar Chavez Street where there are no bicycle facilities.

[4] Two lanes from 16th Street to Channel Street; four lanes north of Channel Street, except six lanes from King Street to Townsend Street.

[5] Four lanes from Market Street to Howard Street; five lanes (three northbound, two southbound) from Howard Street to Folsom Street during peak periods only (four lanes during other times); six lanes during peak periods only from Folsom Street to Brannan Street (four lanes during other times).

[6] Two lanes from 16th Street to King Street; three lanes from King Street to Brannan Street; four lanes north of Brannan Street.

[7] Two lanes except between Minnesota Street and Pennsylvania Avenue where there are three lanes and an additional westbound right-turn lane onto the I-280 freeway.

[8] Two lanes from The Embarcadero to Colin P Kelly Jr Street; four lanes southwest of Colin P Kelly Jr Street.

[9] Five lanes from Seventh Street to Second Street; three lanes from Second Street to I-80 ramp; two lanes from I-80 ramp to Beale Street; three lanes from Beale Street to The Embarcadero.

[10] Four lanes from Third Street to Fourth Street; two lanes elsewhere.

[11] Four lanes from Terry A Francois Boulevard to Pennsylvania Avenue; two lanes elsewhere.

[12] Six lanes at intersection with Terry A Francois Boulevard.

[13] Class II bicycle facility from 16th Street to Mariposa Street; no bicycle facilities elsewhere.

Source: Fehr & Peers, 2015; *San Francisco General Plan*

Regional Roadways

Interstate 80 (I-80) provides the primary regional access to the project site from the East Bay. I-80 runs through the northern portion of the study area and connects San Francisco to the East Bay and other points east via the San Francisco–Oakland Bay Bridge. I-80 eastbound can be accessed via the on-ramp at Fifth Street / Bryant Street, and the project site can be accessed from westbound I-80 at the off-ramp at Fifth Street / Harrison Street. Within the study area, I-80 has six lanes (three in each direction).

I-280 provides regional access to the study area from the South Bay and Peninsula. I-280 and U.S. 101 have an interchange to the south of the study area, and I-280 terminates in the study area at the King and Fifth streets intersection. I-280 is generally a six-lane freeway. The project site can be accessed from either the Mariposa Street or the Cesar Chavez Street off-ramps in the northbound direction or the 18th Street or Pennsylvania / 25th Street off-ramps in the southbound direction. The nearest on-ramps are from 25th Street or 18th Street in the northbound direction and Mariposa Street and Pennsylvania / 25th Street in the southbound direction.

U.S. 101 provides access to the north and south of the study area. U.S. 101 is to the west of the study area and provides access to the Peninsula and South Bay. U.S. 101 connects with I-80 and the San Francisco–Oakland Bay Bridge to the northwest of the project site. U.S. 101 also connects San Francisco and the North Bay via the Golden Gate Bridge via surface streets on Van Ness Avenue or Franklin Street and Lombard Street. Van Ness Avenue and Lombard Street are part of the Citywide Pedestrian Network outlined in the Transportation Element of the *San Francisco General Plan*.

Special Events

Currently, the Pier 70 site hosts approximately 50 special events per year, which include evening happy hours, music concerts, fairs, and markets. Attendance levels can vary widely, but occasionally (up to approximately four times per year) the largest events can draw up to 40,000 people. These events typically occur outside of the traditional peak periods for analysis, but at times create localized congestion around the Pier 70 site.

For all events held at the Pier 70 site, the event sponsor must obtain special permits from the Port of San Francisco, and, if required, the City. As part of the permitting process, the event sponsor must include a plan for managing travel to and from the event safely and with minimal effect on the surrounding neighborhoods. These management strategies may include special event shuttles, promotion of transit services, and parking management, such as valet parking.

Background Vehicle Miles Traveled in San Francisco and Bay Area

Many factors affect travel behavior. These factors include density, diversity of land uses, design of the transportation network, access to regional destinations, distance to high-quality transit, development scale, demographics, and transportation demand management.[2] Typically, low-density development at great distance from other land uses, located in areas with poor access to non-private vehicular modes of travel, generates more automobile travel compared to development located in urban areas, where a higher density, mix of land uses, and travel options other than private vehicles are available.

Given the travel behavior factors described above, San Francisco (in the aggregate) has a lower average VMT ratio than the nine-county San Francisco Bay Area region (hereinafter, the region). In addition, for the same reasons, different areas of the city have different VMT ratios and some areas of the City have lower VMT ratios than other areas of the city.

These geographic based differences in VMT that are associated with different parts of the city and region are identified in transportation analysis zones (TAZs). TAZs are used by planners as part of transportation planning models for transportation analysis and other planning purposes. The TAZs vary in size from single city blocks in the downtown core, multiple blocks in outer neighborhoods, to even larger zones in historically industrial areas like the Hunters Point Shipyard.

The project site is primarily located in and comprises most of the area in TAZ 559 and is generally the industrial area east of Illinois Street, south of Terry A Francois Boulevard and 16th Street, and north of 24th Street. The location of the project site is close to major transit services and facilities, bicycle and pedestrian networks and facilities, and diversity and density of land uses. A project located in TAZ 559 would have substantially reduced vehicle trips and shorter vehicle distance, and thus, reduced VMT, when compared to other areas of the region.

This is demonstrated by comparing data on average VMT for residential, office, and retail uses in the region and the specific project site TAZ, TAZ 559. Thus, the following VMT rates are identified for each by category of use:

Regional VMT: For residential development, the regional average daily VMT per capita is 17.2.[3] For office and retail development, regional average daily work-related VMT per employee is 19.1 and 14.9, respectively.

---

[2] California Smart-Growth Trip Generation Rates Study, Appendix A, University of California, Davis Institute of Transportation Studies, March 2013.

[3] Includes the VMT generated by the Proposed Project (www.sftransportationmap.org, accessed October 3, 2016).

TAZ 559 VMT: The average VMT estimates for each use category in TAZ 559 are projected to be substantially lower than the regional value. For residential development, the TAZ 559 average daily VMT per capita is 8.8. For office and retail development, the TAZ 559 average daily VMT per capita (measured in terms of employees) is 14.6 and 10.8, respectively. For retail uses, the Transportation Authority uses trip-based analysis, which counts VMT from individual trips to and from the project (as opposed to entire chain of trips). A trip-based approach, as opposed to a tour-based approach, is necessary for retail projects because a tour is likely to consist of trips stopping in multiple locations, and summarizing tour VMT to each location would over-estimate VMT.[4,5]

Table 4.E.3: Existing Daily Vehicle Miles Traveled per Capita includes a summary of the daily VMT per capita for the region and for the transportation analysis zone in which the project site is located, TAZ 559.

Table 4.E.3: Existing Daily Vehicle Miles Traveled per Capita

Land Use	Bay Area Regional Average	TAZ 559
Households (Residential)	17.2	8.8
Employment (Office)	19.1	14.6
Visitors (Retail)	14.9	10.8

Source: San Francisco Planning Department, sftransportationmap.org, Accessed October 3, 2016.

Transit Facilities

The project site is served by local transit provided by the San Francisco Municipal Railway (Muni), operated by the San Francisco Municipal Transportation Agency (SFMTA). Muni provides light rail service near the project site on Third Street and bus service on other nearby streets. Most regional transit services are generally not within walking distance of the project site but can be reached by bicycle or from various Muni lines. Regional transit provides service to the East Bay via the Bay Area Rapid Transit rail service (BART), Alameda-Contra Costa Transit buses (AC Transit), and ferries; the North Bay via Golden Gate Transit buses and ferries; and the

[4] To state another way: a tour-based assessment of VMT at a retail site would consider the VMT for all trips in the tour, for any tour with a stop at the retail site. If a single tour stops at two retail locations, for example, a coffee shop on the way to work and a restaurant on the way back home, then both retail locations would be allotted the total tour VMT. A trip-based approach allows analysts to apportion all retail-related VMT to retail sites without double-counting.

[5] San Francisco Planning Department, *Executive Summary: Resolution Modifying Transportation Impact Analysis*, Appendix F, Attachment A, March 3, 2016.

Peninsula and South Bay via Caltrain and BART rail service and San Mateo County Transit (SamTrans) buses. The project site is approximately 2.5 miles south of Market Street BART stations and the Ferry Building and approximately 2.25 miles south of the Temporary Transbay Terminal served by AC Transit. The 22nd Street Caltrain station located under the I-280 freeway structure between Indiana and Pennsylvania streets is within walking distance (approximately 0.25 mile west) of the project site. Figure 4.E.2: Existing Transit Network presents the local and regional transit routes in the transportation study area and in the Mission and South of Market (SOMA) neighborhoods.

Muni

Muni provides transit service within the City and County of San Francisco, including bus (both diesel and electric trolley), light rail (Muni Metro), cable car, and electric streetcar lines. Muni operates a number of bus and rail lines in the project vicinity. Table 4.E.4: Local Muni Operations presents the six Muni routes with stops located within approximately 1 mile of the project site and transportation study area as of March 2015. The closest Muni stops to the project site are on Third Street at 20th Street.

Muni transit operations in the transportation study area were evaluated using two methods: capacity utilization and screenlines. Capacity utilization relates the number of passengers per transit vehicle to the design capacity of the vehicle. A capacity utilization analysis was conducted for the routes providing direct access to the project site based on each route's peak capacity utilization at its maximum load point (MLP), obtained from SFMTA's automated passenger count (APC) database in September/October 2013. The MLP is the location where the route has its highest number of passengers relative to its capacity. In general, the MLP for Muni routes is not located in the transportation study area for the Proposed Project but is located closer to Downtown.

Capacity utilization during the a.m. and p.m. peak hours was determined at the MLP for each route serving the study area. The capacity per vehicle includes both seated and standing capacity, where standing capacity is between 30 and 80 percent of seated capacity (depending on the specific transit vehicle configuration). The capacity of a light rail vehicle is 119 passengers; the capacity of a historic streetcar is 70 passengers; and the capacity of a standard bus is 63 passengers.

PIER 70 MIXED-USE DISTRICT PROJECT

FIGURE 4.E.2: EXISTING TRANSIT NETWORK

Table 4.E.4: Local Muni Operations

Route	A.M. Peak Weekday Headways (7:00 a.m.-9:00 a.m.)[1]	P.M. Peak Weekday Headways (4:00 p.m.-6:00 p.m.)[1]	Hours of Operation	Neighborhoods Served by Route
KT Ingleside / Third Street Light Rail	9	9	4:00 a.m.-1:30 a.m.	Balboa Park, Market Street, Mission Bay, Visitacion Valley
10 Townsend	15	20	5:00 a.m.-12:30 a.m.	Potrero Hill, China Basin, Financial District, Pacific Heights
19 Polk	15	15	5:00 a.m.-1:30 a.m.	Hunter's Point, Mission, SOMA, Nob Hill
22 Fillmore	9	8	24 hours per day	Marina, Fillmore, Portrero Hill
48 Quintara / 24th Street	10	12	24 hours per day	SOMA, Mission, Sunset
55 16th Street[2]	15	15	6:00 a.m.-12:00 a.m.	Mission District, Mission Bay, Potrero Hill

Note:

[1] Headway is scheduled time between transit vehicles, presented in minutes.
[2] As discussed later in this section, the 55 16th Street is a relatively new, interim route designed to provide service along 16th Street until the 22 Fillmore is extended into Mission Bay. The Proposed Project's impact analysis is based on conditions after the 22 Fillmore extension is complete; therefore, no additional discussion of ridership data for the 55 16th Street is provided in this section.

Source: Muni, 2015; prepared by Fehr & Peers, 2015

Table 4.E.5: Muni Peak Hour Load and Capacity Utilization by Route presents the a.m. and p.m. peak ridership and capacities at MLPs for transit routes serving the study area for both inbound (toward Downtown) and outbound (away from Downtown) directions. (For purposes of this discussion, inbound and outbound refer to the standard SFMTA conventions, and in some cases because of the way routes are arranged, outbound may be toward Downtown relative to the Proposed Project.) For the individual routes evaluated, the MLP used is the maximum load between the project site and Market Street, since that is where the majority of project-related trips would be destined, and not necessarily inclusive of the MLP of the entire route. The 10 Townsend Inbound records passenger loads that exceed 85 percent capacity utilization, which is SFMTA's standard maximum acceptable utilization, in the a.m. and p.m. peak hour. Other routes operate within SFMTA's capacity utilization threshold (between the project site and Market Street). Immediately adjacent to the study area, capacity utilization is generally lower than the utilization at the MLP.

Table 4.E.5: Muni Peak Hour Load and Capacity Utilization by Route

Route	AM				PM			
	Maximum Load Point	Passenger Load[1]	Peak Hour Capacity[2]	Capacity Utilization	Maximum Load Point	Passenger Load[1]	Peak Hour Capacity[2]	Capacity Utilization
KT Ingleside/Third (IB)[3]	Embarcadero / Brannan Street	381	793	48%	Embarcadero / Folsom Street	314	793	40%
KT Ingleside/Third (OB)	Embarcadero / Folsom Street	310	793	39%	Embarcadero / Folsom Street	550	793	69%
10 Townsend (IB)	Second Street / Townsend Street	244	270	**90%**	Pacific Street / Stockton Street	168	189	**88%**
10 Townsend (OB)	Pacific Avenue / Mason Street	208	252	82%	Second Street / Townsend Street	153	189	80%
19 Polk (IB)	Larkin Street / O'Farrell Street	188	252	75%	Seventh Street / Howard Street	180	252	71%
19 Polk (OB)	Eighth Street / Howard Street	160	252	63%	Eighth Street / Mission Street	168	252	66%
22 Fillmore (IB)	16th Street / Guerrero Street	293	420	70%	16th Street / Folsom Street	293	473	61%
22 Fillmore (OB)	16th Street / Mission Street	267	420	63%	Fillmore Street / Grove Street	278	473	58%
48 Quintara/24th Street (IB)	24th Street / Guerrero Street	221	302	73%	24th Street / Mission Street	180	315	57%
48 Quintara/24th Street (OB)	24th Street / Folsom Street	245	315	77%	24th Street / Folsom Street	205	315	65%

Notes:
IB = inbound. OB = outbound.
Bold indicates capacity utilization of 85 percent or greater. Outbound and inbound capacities for the same route may be different due to different headways or vehicle type.
[1] Peak hour ridership.
[2] Total peak period capacity in passengers per hour.
[3] Ridership for the KT Ingleside/Third reflects MLP between project site and Market Street. Actual MLP for the entire route may occur past Market Street; however, most project-related trips on this route would be traveling to destinations along Market Street.

Sources: Fehr & Peers, 2016; San Francisco Planning Department, "Transit Data for Transportation Impact Studies," May 2015 and October 2016

The assessment of existing transit conditions in San Francisco is also performed through the analysis of screenlines. Screenlines are hypothetical lines that would be crossed by persons traveling between Downtown San Francisco and its vicinity (Superdistrict 1) to or from other parts of San Francisco and the region (Superdistricts 2, 3, and 4) (see Figure 4.E.3: San Francisco Superdistricts). The project site is located in Superdistrict 3. Four screenlines—northeast, northwest, southwest, and southeast—have been established in Downtown San Francisco to facilitate the analysis of potential impacts of projects on Muni service. Subcorridors have been established within each screenline. The bus routes and light rail lines used in this screenline analysis are considered the major commute routes from the Downtown area. Other bus routes, such as those with greater than 10-minute headways, are not included due to their generally lower ridership. Transit serving the project site crosses all four Downtown screenlines. Table 4.E.6: Muni Downtown Screenline Groupings shows the groups of Muni routes in each of the Downtown screenlines. In addition to analyzing the subcorridor groups of Muni routes, as noted above, the 22 Fillmore and 48 Quintara / 24th Street bus routes and the KT Ingleside/Third Street light rail line are also presented individually alongside the Downtown screenline information.

Table 4.E.7: Muni Downtown Screenline and Project-Specific Lines – Existing Conditions presents the existing ridership and capacity utilization at the MLP for the routes crossing the Downtown screenlines during the weekday a.m. and p.m. peak hours. The capacity utilization calculation uses a.m. data for the inbound direction and p.m. data for the outbound direction to align with the peak directions of travel and patronage loads for the Muni system to or from the Downtown area during those periods.

As shown in Table 4.E.7, all screenlines currently operate below Muni's 85 percent capacity utilization standard except the southwest screenline in the a.m. peak period (as a result of 102 percent utilization on the subway lines). The Fulton/Hayes subcorridor within the northwest screenline operates above 85 percent capacity utilization in the p.m. peak hour, at 90 percent utilization, but the overall screenline operates within 85 percent capacity utilization and the conditions are considered acceptable. Similarly, the Third Street subcorridor within the southeast screenline operates above 85 percent capacity utilization in the p.m. peak hour, at 99 percent utilization, but the overall screenline operates within 85 percent capacity utilization and conditions are also considered acceptable.

Regional Transit

The area around the project site is served by regional transit systems, which can be reached by bicycle, walking, or local Muni routes. Service is provided by Caltrain, BART, AC Transit, SamTrans, and Golden Gate Transit. Each transit system is briefly described, and information on capacity utilization at regional screenlines is provided.

CALTRAIN

Caltrain provides passenger rail service on the Peninsula between San Francisco and Downtown San Jose with several stops in San Mateo County and Santa Clara County. Some service is also available south of San Jose. Caltrain operates either local or express trains between 4:30 a.m. and midnight inbound (northbound) and 5:00 a.m. to midnight outbound (southbound). Caltrain service headways for Limited-Stop and Express ("Baby Bullet") trains during the a.m. and p.m. peak periods are 10 minutes to 40 minutes, depending on the type of train. The peak direction of service is southbound during the a.m. peak period (7:00 a.m. to 9:00 a.m.) and northbound during the p.m. peak period (4:00 p.m. to 6:00 p.m.). Local service is not provided during peak periods.

Caltrain service terminates at the San Francisco Station at King and Fourth streets. In the transportation study area, the Caltrain station on 22nd Street between Indiana Street and Pennsylvania Avenue is within walking distance of the project site. Both stations can be accessed directly by Muni transit and are served by local, limited, and express Baby Bullet trains.

BART

BART provides regional commuter rail service between San Francisco and the East Bay (Pittsburg/Bay Point, Richmond, Dublin/Pleasanton and Fremont), as well as between San Francisco and San Mateo County (Daly City, SFO Airport, and Millbrae). Weekday hours of operation are between 4 a.m. and midnight. During the weekday p.m. peak period, headways are 5 to 15 minutes along each line. Within San Francisco, BART operates underground along Market Street to Civic Center Station where it turns south through the Mission District towards Daly City, running aboveground beginning at the Balboa Park Station. The BART stations nearest to the Proposed Project study area are 16th Street Mission Station, 24th Street Mission Station, Embarcadero Station at Market Street / Main Street, Montgomery Station at Market Street / Second Street, and Powell Station at Market Street / Fifth Street.

AC TRANSIT

AC Transit operates bus service in western Alameda and Contra Costa counties and has routes to San Francisco and San Mateo County. AC Transit operates 33 "Transbay" bus routes between the East Bay and the Temporary Transbay Terminal, temporarily located at Howard and Beale streets in the SOMA area. The Temporary Transbay Terminal lies just outside of the transportation study area and is easily accessible via Muni and regional transit lines. The majority of Transbay service is provided only during commute periods in the peak direction of travel, with headways between buses of 15 to 20 minutes. The peak direction of service is into San Francisco during the a.m. peak period and out of San Francisco during the p.m. peak period. All-day service is provided on a few lines, with headways of approximately 30 minutes.

SAMTRANS

SamTrans operates bus service in San Mateo County. A few SamTrans routes also serve the Temporary Transbay Terminal in Downtown San Francisco, including Routes 292, 397, and KX. Route 292 makes San Francisco stops along Potrero Avenue and Mission Street throughout the day. Headways during the a.m. peak hours are between 15 and 30 minutes, and p.m. peak hour headways are 15 minutes. Route 397 runs along Mission Street in San Francisco and serves the Temporary Transbay Terminal. It is a late-night service route with headways of 1 hour. Route KX operates only during the peak travel periods with 60-minute headways, and travels between the Temporary Transbay Terminal and Redwood City.

GOLDEN GATE TRANSIT

The Golden Gate Bridge, Highway, and Transportation District operates Golden Gate Transit, which provides bus and ferry service between the North Bay (Marin and Sonoma counties) and San Francisco. Golden Gate Transit operates 22 commuter bus routes, nine basic bus routes, and 16 ferry feeder bus routes for ferries to San Francisco. Bus routes operate at headways of 15 to

90 minutes depending on time and day of week and bus type. Near the transportation study area, Golden Gate Transit operates commuter and basic routes on Mission Street, Howard Street, Folsom Street, Sixth Street, and Eighth Street. Golden Gate Transit also operates ferry service between the North Bay and San Francisco, connecting Larkspur and Sausalito with the Ferry Building during the morning and evening commute periods.

REGIONAL TRANSIT SCREENLINES

As is the case for Muni, transit service into and out of San Francisco on regional service providers is examined using a screenline analysis. The existing regional transit screenlines, as described in the *SF Guidelines*, were used to analyze regional transit capacity in the study area. Table 4.E.8: Regional Transit Screenlines – Existing Conditions presents the ridership and capacity utilization at the MLP for the regional screenlines during the weekday a.m. and p.m. peak hours. For regional operators, the MLP is typically at the San Francisco city limit (i.e., the East Bay MLP would occur at the Transbay Tube and on the Bay Bridge; the North Bay MLP would occur at the Golden Gate Bridge; and the South Bay MLP would occur at the southern city border). Inbound travel (into Downtown San Francisco) is analyzed during the a.m. weekday peak period, and outbound travel (out of Downtown San Francisco) is analyzed during the p.m. weekday peak period.

For regional transit providers (except for BART), the established capacity utilization threshold is equal to the number of seated passengers per vehicle. For BART, the established capacity utilization threshold is 107 passengers per car, which includes all seats and accounts for some standees. All of the regional transit operators have a 1-hour load factor standard of 100 percent, which would indicate that all seats are full. As a result, the Planning Department uses 100 percent capacity utilization as a threshold of significance for determining peak period transit demand impacts to regional transit.

As shown in Table 4.E.8, BART currently experiences over-capacity conditions in both the a.m. and p.m. peak hours to and from the East Bay. Specifically, BART's capacity utilization on the East Bay Regional Screenline is 109 percent in the a.m. peak hour and 107 percent in the p.m. peak hour. As a result, the regional screenline between San Francisco and the East Bay is over its capacity utilization threshold in the a.m. peak hour. All other regional screenlines operate within their designated capacity utilization thresholds.

Table 4.E.8: Regional Transit Screenlines – Existing Conditions

Sources: San Francisco Planning Department, "Transit Data for Transportation Impact Studies," May 2015 and October 2016

Pedestrian Facilities

A qualitative evaluation of existing pedestrian conditions was conducted during field visits to the transportation study area in May 2015. The field visits revealed a lack of pedestrian facilities at some of the 37 existing study intersections, including locations that are missing sidewalks, missing crosswalks, missing Americans with Disabilities Act (ADA) accessible curb ramps, and lacking pedestrian countdown signals. Additionally, several locations have multiple turning lanes, such as dual right-turn lanes, that make pedestrian crossing difficult. Although some signals do not provide pedestrian countdown signals, at a minimum, basic pedestrian signal heads (with or without countdown indications) are currently provided at all signalized study intersections except at 20th Street and Illinois Street (although, as noted elsewhere in this document, that signal is currently operating in flashing red mode, indicating an all-way stop). In total, 16 of the 37 existing intersections are missing at least one pedestrian curb ramp at a

crosswalk terminus. At six intersections, the crosswalks were closed due to construction during the field visits.

General pedestrian impediments observed across the study area include:

- Narrow sidewalks;
- Intersections with no crosswalks;
- Construction zones that reduce sidewalk width or close crosswalks, at times for extended periods;
- Lack of ADA accessible curb ramps or use of shared diagonal curb ramps at intersection corners;
- Freeway on- and off-ramps with short pedestrian crossing phases and/or high vehicle volumes turning into crosswalks across multiple traffic lanes; and
- Long distances between intersections, particularly in the north-south direction, limiting crossing opportunities.

In the northern part of the transportation study area, in the SOMA neighborhood just north of Mission Creek, the blocks are fairly large and some streets are relatively wide, often with four travel lanes. The City has been making improvements to some SOMA streets, such as Townsend Street west of Fourth Street, to improve the pedestrian environment; although many streets remain very automobile-oriented.

Pedestrian facilities generally are most complete in the area bounded by King Street, Bryant Street, The Embarcadero, and Seventh Street. The majority of intersections in this area have adequate curb ramps and crosswalks, and only single turning lanes. One exception within that area is the intersection of Fourth and King streets, which is challenging for pedestrians due to a number of factors. The KT Third/Ingleside light rail station is in the middle of Fourth Street, south of King Street; the N Judah light rail station is in the middle of King Street, west of Fourth Street; and the Fourth and King Caltrain Station (the system's northern terminus and busiest station) is on the northwest corner of the intersection. Additionally, there is a double right-turn lane from southbound Fourth Street to westbound King Street; King Street becomes the I-280 freeway one block west. The high volume of pedestrians crossing at all legs of this intersection, transferring between transit routes at three different transit stations, while traffic attempts to enter or exit I-280 at King Street, creates a substantial number of conflicts between modes, particularly pedestrians and automobiles. The project site is more than 1 mile from this intersection, and it is unlikely that many project-generated pedestrian trips or vehicle trips would use this intersection, except for users of the Proposed Project's shuttle system if shuttles stop near this location (see "Project Features" discussion, pp. 4.E.41-4.E.47, for more details). Improvements are planned and under construction for this intersection as part of construction of the Central Subway through signal retiming and reduction in auto travel lanes to provide right-of-way for the light rail. This

will likely reduce the number of pedestrian/vehicle conflicts at the intersection. These improvements are expected to be complete by 2019.

The central part of the study area, in Mission Bay, is largely under construction or planned for future construction. As a result, pedestrian facilities can be discontinuous in some areas; however, the overall Mission Bay Redevelopment Plan will result in a well-connected pedestrian network with more pedestrian-scale block sizes and street designs.

In the southern part of the study area, in the Dogpatch neighborhood, the north/south blocks are very long, while the east/west blocks are shorter. This portion of the study area is closest to the project site, and would be where most of the Proposed Project's pedestrian trips travel. General pedestrian impediments in this part of the study area are most prevalent along Illinois Street, Pennsylvania Avenue, Indiana Street, 16th Street, and Mariposa Street. On Mariposa Street, many intersections lack crosswalks. This causes pedestrians to have to walk a long distance before being able to cross Mariposa Street safely. Some of these issues, including new crosswalks, will be addressed by the planned improvements along Mariposa Street to widen the street, add left-turn lanes, and create a new signalized intersection at Owens Street. These improvements are being implemented separately as part of the overall Mission Bay Redevelopment Plan. Similarly, Pennsylvania Avenue also presents particularly challenging pedestrian environments, with numerous freeway on- and off-ramps, narrow or missing sidewalks, missing crosswalks, and largely industrial or auto-centric land uses. There are no pedestrian facilities at the I-280 on- and off-ramps at Pennsylvania Avenue, and the sidewalks along Pennsylvania Avenue between Cesar Chavez Street and 23rd Street are either very narrow with many obstacles such as utility poles or they are missing altogether. On 16th Street, construction on the south side of the street limits pedestrian movement at Owens Street.

Illinois Street is the other location in the southern part of the project study area lacking complete facilities. Specifically, Illinois Street between 20th and 18th streets (streets providing primary access to the project site) has gaps in the sidewalk, which is reflective of the area's industrial roots. These gaps make some areas difficult for pedestrians to traverse and make pedestrian access to the project site challenging.

The existing condition on the project site has limited pedestrian facilities with few sidewalks or crosswalks. Currently, pedestrian volumes around the project site are generally low. There is more activity along Third Street, particularly at light rail stops. There is also a fair amount of pedestrian activity along 22nd Street related to the shops and cafes between Illinois Street and Indiana Street, and west of Third Street related to the 22nd Street Caltrain Station. The project site is not on the pedestrian high injury network identified in the Vision Zero SF initiative (see "Vision Zero" under Regulatory Framework on p. 4.E.38, below).

Bicycle Circulation

Bicycle facilities in the transportation study area consist of bicycle paths, separated bicycle lanes, and bicycle routes. Bicycle paths (Class I) provide a completely separated right-of-way for the shared use of cyclists and pedestrians. These facilities are off-street and minimize cross-flow traffic, but they can be adjacent to an existing roadway. Separated bicycle lanes (Class II) provide a striped, marked, and signed bicycle lane separated from vehicle traffic. These facilities are located on roadways and reserve a minimum of 4-5 feet of space for exclusive bicycle traffic. Class II lanes can sometimes include a buffer between the auto travel lane and the bicycle lane. Bicycle routes (Class III) provide a shared travel lane marked and signed for shared use with motor vehicle traffic. These facilities may or may not be marked with "sharrows," a stencil painted on the surface of a travel lane showing a bicycle on several arrows pointing in the direction of travel, to emphasize that the roadway space is shared.

Current on-street bicycle facilities, as designated by the San Francisco Bikeway Network Map (2013),[6] are shown on a map of the project vicinity in Figure 4.E.4: Existing Bicycle Network. Bicycle volume counts were conducted during the weekday a.m. and p.m. peak periods (7:00 a.m. to 9:00 a.m. and 4:00 p.m. to 6:00 p.m., respectively) in September 2013 and January 2014. The majority of the study area is flat with limited changes in grades, facilitating bicycling within and through the area.

The following bicycle lanes and routes are found in the transportation study area:

- Route 5 runs through the study area along Terry A Francois Boulevard and Illinois Street. It is signed and striped as a Class II bicycle lane.
- Route 7 runs along Indiana Street in the study area, connecting to Mariposa Street in the north and to Third Street via Cesar Chavez Street in the south. It is designated a Class III bicycle route.
- Route 23 runs north-south in the study area along Seventh Street to Mariposa Street via Mississippi Street and terminates at Illinois Street. It is signed and striped as a Class II bicycle lane.
- Route 36 runs east-west along Townsend Street from The Embarcadero to Eighth Street and then west along 14th Street as a Class II bicycle lane.
- Route 40 runs east-west in the study area along 16th Street as a Class II bicycle lane and terminates in the east at Third Street. It continues west through the Twin Peaks neighborhood until it terminates at the Great Highway via Kirkham Street through the Sunset neighborhood.
- Route 60 runs east-west in the study area along Cesar Chavez Boulevard. It is signed and striped as a Class II bicycle lane between Third Street and Pennsylvania Avenue and is designated a Class III bicycle route west of Pennsylvania Avenue.

PIER 70 MIXED-USE DISTRICT PROJECT

FIGURE 4.E.4: EXISTING BICYCLE NETWORK

The San Francisco Bay Trail runs along Illinois Street from Cargo Way to Terry A Francois Boulevard at Mariposa Street and adjacent to the project site between 20th and 22nd streets. The Bay Trail is a planned recreational corridor that, when complete, will encircle San Francisco and San Pablo Bays with a continuous 500-mile network of bicycling and hiking trails. It will connect the shoreline of all nine Bay Area counties, link 47 cities, and cross the major toll bridges in the region. To date, approximately 340 miles of the alignment have been completed. Route 5 is part of the Bay Trail. Within San Francisco, the portion of the Bay Trail planned between Mission Creek and the southern City limits is referred to as the Blue Greenway. The Blue Greenway is generally planned to be a Class I facility that travels along the waterfront. The project site is not on the bicycle high injury network identified as part of the Vision Zero SF initiative.

Loading Facilities

The project site is currently occupied by self-storage facilities, warehouses, automobile storage lots, a parking lot, a soil recycling yard, artists' studios, and office spaces. To access the project site, trucks use Illinois Street from I-280 via 18th Street, Mariposa Street, 23rd Street, 25th Street, or Cesar Chavez Street. Currently, the roads providing immediate access to the project site tend to have low vehicle and pedestrian activity, making maneuvering to enter and exit the project site relatively easy without blocking traffic or affecting pedestrians.

Loading activity at the loading docks in the project site vicinity was observed during the morning (10:00 a.m. to 11:30 a.m.) and afternoon (4:00 p.m. to 5:30 p.m.) of a typical weekday. Trucks were observed to be on Illinois Street between 18th Street and 23rd Street throughout the day. There are currently no on-street loading spaces on the block of Illinois Street between 20th Street and 22nd Street.

There are about 25 loading docks along the frontage of the American Industrial Center (AIC) building on the west side of Illinois Street (across from the project site) between 20th Street and 22nd Street, though during observations conducted in January 2016, much of this area was used for parking private vehicles and small vans rather than for loading activities. Approximately eight loading docks near the middle of the block between 20th and 22nd streets appeared to be available for loading activities, but trucks were only observed at two or three of the docks, and trucks entering and exiting the docks were infrequent, particularly during the peak hours on the adjacent streets. Six trucks were observed during the morning (between approximately 10 – 11:30 a.m.), three of which did not pull into the loading docks, instead illegally using the sidewalk and/or the bike lane during the pick-up or delivery activity (typically about 5 minutes in duration). In the afternoon (between approximately 4 – 5:30 p.m.), four trucks were observed at the loading docks, two of which illegally used the sidewalk and/or bike lane for at least 15 minutes instead of pulling into a loading dock. In addition, two vans were observed illegally loading on the sidewalk in front of the southernmost loading docks and three mid-sized

automobiles used the loading docks for several minutes for delivery / pick-up. The informal loading activity, blocking the sidewalk and/or bike lane, creates potential conflicts with pedestrians and bicyclists, as the west side of Illinois Street is one elongated driveway apron with no raised curb and there is a Class II bicycle lane on both sides of Illinois Street, between Cargo Way and Terry A Francois Boulevard.

Emergency Access

Emergency transport vehicles typically use major streets through the transportation study area when heading to and from an emergency and/or emergency facility. Arterial roadways allow emergency vehicles to travel at higher speeds and provide enough clearance space to permit other traffic to maneuver out of the path of the emergency vehicle and yield the right-of-way. Five San Francisco Fire Department fire stations are located in or near the study area: Station 8 (Bluxome Street at Fourth Street, 1.5 miles from the project site), Station 25 (Third Street at Cargo Way, 0.9 mile from the project site), Station 29 (16th Street at Vermont Street, 1.4 miles from the project site), Station 37 (Wisconsin Street at 22nd Street, 0.8 mile from the project site), and the new Station 4 in the Public Safety Building at 1245 Third Street (0.8 mile from the project site) that opened in early 2015. The University of California, San Francisco (UCSF) Mission Bay Medical Center is located in the study area, four blocks north and two blocks west of the project site, to the north of 16th Street between Owens and Third streets. San Francisco General Hospital, with the region's main trauma center, is located approximately 1 mile west of the project site on Potrero Avenue at 23rd Street; the driving distance is more than 2 miles, as the east-west streets west of I-280 are generally discontinuous and do not connect directly to Potrero Avenue between 17th and Cesar Chavez streets.

BASELINE CONDITIONS

The analyses in CEQA documents typically present existing and existing-plus-project scenarios to isolate the impacts of the Proposed Project by comparing conditions with the Proposed Project to existing conditions. However, in the Pier 70 transportation study area, unusual aspects of the surrounding conditions warrant a different approach. Multiple land development projects and transportation infrastructure improvements are either recently completed, under construction, or approved and funded and expected to be under construction or completed by the time the Proposed Project is under construction. Because the area is changing rapidly, and there are known development and infrastructure projects underway, a baseline other than existing conditions is appropriate for the analyses presented in this section. An analysis based on existing conditions would be uninformative and misleading to the decision makers and the public. The baseline includes projects that were under construction at the time the Notice of Preparation (NOP) was published or that have been approved and funded and are reasonably likely to be completed by the time the Proposed Project is under construction. Traffic and transit trip generation and assignment for projects included in the Baseline conditions were obtained from

those projects' respective transportation impact analyses, and added to existing conditions traffic volumes and transit ridership. The local transit capacity improvements, such as the Central Subway, were added to existing conditions to provide a reasonable baseline for the analysis of transit impacts.[7]

The baseline projects are listed in Section 4.A, Introduction to Chapter 4, on pp. 4.A.5-4.A.12. They include the UCSF Hospital and Mission Bay Hall, the Public Safety Building, the Italian International School, and the 20th Street Historic Core adaptive reuse development, plus eight private residential and mixed-use development projects, two new open spaces, the Central Subway project, the new Muni route 55 16th Street, a new transit-only lane on 16th Street, and street improvements along Owens and Mariposa streets at the I-280 ramps.

No changes from Existing Conditions to Baseline Conditions have been identified for the pedestrian network, loading facilities, or emergency services access, except for those immediately adjacent to and a part of the improvements listed above (e.g., new sidewalks and crosswalks at the Mariposa Street / I-280 ramps intersections associated with the widening of Mariposa Street).

There are other known projects in the transportation study area that are under consideration, such as the proposed new Arena for the Golden State Warriors and the Mission Rock development project on Seawall Lot 337. The Arena project was approved subsequent to the completion of the transportation analysis, and the Mission Rock development project has not yet been approved; therefore, they are not included in the baseline but are considered in the cumulative impact analyses.

Transit Baseline

Transit conditions are expected to change in the transportation study area over the next several years. The Central Subway will provide a connection from the Caltrain station at Fourth Street / King Street to Chinatown. The new connection will be a subway that will serve major employment and population centers in San Francisco. As part of the Central Subway initial phase, service frequencies will be improved, substantially increasing capacity. Ground was broken on the project in 2010, and the subway extension is expected to be open to the public by 2019. Because the T Third is a major transit connection to the project site, and the Central Subway is under construction and anticipated to be operational when the first building at the Proposed Project site is occupied, the Central Subway has been included in the Baseline Conditions transit analysis. Other improvements are described below.

[7] The Muni transit analysis is based on an SF-CHAMP model run that includes ridership projections for 2020 and planned capacity assuming that the Central Subway project and other approved and funded transit improvements would be in operation by the time the Proposed Project is approved and under construction.

The new 55 16th Street bus route began operating in the Mission Bay area in January 2015, providing interim service between Mission Street and Third Street and north on Third Street to Mission Bay Boulevard North until the 22 Fillmore extension has been completed. The 22 Fillmore bus route will extend east on 16th Street to Third Street and on Third Street north to a turnaround within Mission Bay. The 33 Stanyan bus would be re-routed from Potrero Avenue to provide service on 18th Street presently provided by the 22 Fillmore. A loop at 18th Street is also planned for the T Third Muni Metro line to provide a turnaround for Central Subway trains during peak periods and special events, so that a "short line" can be operated, increasing the capacity on the T Third line between Chinatown and the 18th Street loop.[8] Although not adjacent to the Proposed Project site, the year 2020 forecasts also assume implementation of the Geary Bus Rapid Transit (BRT) project along Geary Boulevard.

Peak hour ridership and capacity utilization at the Muni Downtown screenlines and the three project-specific routes serving the project site for both the a.m. and p.m. peak hours under baseline conditions are presented in Table 4.E.9: Muni Downtown Screenlines and Project-Specific Routes – Baseline Conditions. The ridership data provided are from a 2020 model run of the San Francisco Chained Activity Model Process (SF-CHAMP) provided by the San Francisco County Transportation Authority (Transportation Authority).[9] The model run was checked to determine the land uses assumed for Pier 70 compared to an existing model (2012) and a build-out model (2040). There was substantial growth in the traffic analysis zone that includes Pier 70, and adjustments were made to the transit ridership to account for the growth in the Baseline Conditions Scenario. The capacity utilization calculation uses a.m. data in the inbound direction and p.m. data in the outbound direction, which aligns with the peak directions of travel and patronage loads for the Muni system to or from the Downtown area during those periods. As shown in the table, all screenlines operate below Muni's 85 percent capacity utilization standard except for the southwest screenline in the a.m. peak hour. The southwest screenline shows 92 percent capacity utilization overall in the a.m. peak hour, in part as a result of the 97 percent utilization on the subway lines subcorridor. Although the capacity utilization for the southwest screenline and the subway lines subcorridor exceed the 85 percent capacity utilization threshold in the a.m. peak hour under Baseline Conditions, the capacity utilization on both the subway lines subcorridor and the southwest screenline is reduced compared to Existing Conditions because of increased frequency due to Muni Forward improvements and Central Subway / T Third Short Line improvements. The Other Lines subcorridor within the southeast screenline shows 90 percent capacity utilization in the a.m. peak hour, but since the southeast screenline shows 64 percent capacity utilization overall in the a.m. peak hour, conditions on that screenline are considered acceptable.

[8] As explained in Section 4.A, Introduction to Chapter 4, pp. 4.A.11-4.A.12, the T Third short line loop has been approved by the SFMTA Board of Directors and is currently under construction.

[9] SF CHAMP Model version originally prepared for Scenario 8 of the Central Corridor Study.

Notes:

1. *Ridership and capacity for the 22 Fillmore include both the 22 Fillmore and the 33 Stanyan routes, since they will both provide complimentary service to and from the project area.*

Bold indicates capacity utilization of 85 percent or greater.

Source: Fehr & Peers, 2016. See Appendix D in the Transportation Impact Study, Appendix B to this EIR, for Transit Line Capacity Calculations.

The regional transit screenline ridership and capacity utilization with Baseline Conditions are shown in Table 4.E.10: Regional Transit Screenlines – Baseline Conditions. As under Existing Conditions, the a.m. peak hour screenline to the East Bay would continue to exceed the 100 percent capacity utilization threshold while all other screenlines would continue to operate within their capacity utilization standards. The East Bay screenline shows 109 percent capacity utilization in the a.m. peak hour for BART and 102 percent overall capacity utilization in the a.m. peak hour. The East Bay screenline shows 105 percent capacity utilization in the p.m. peak hour for BART and 96 percent overall capacity utilization in the p.m. peak hour.

Bicycle Network Baseline

The San Francisco Bicycle Plan (Bike Plan) includes several near-term improvements to the City's bicycle network within the transportation study area. The new bicycle lanes on Second Street between King Street and Market Street are included in the EIR's Baseline Conditions. These bicycle lanes are part of an initial phase of the Second Street Improvement project. The initial phase of bicycle lanes was completed in 2016, and a longer-term project to widen sidewalks and construct one-way cycle tracks is scheduled to begin construction in early 2017. Other near-term improvements in the Bike Plan on Fifth Street, Fremont Street, and 16th Street, are not funded and therefore are included in Cumulative Conditions.

Table 4.E.10: Regional Transit Screenlines – Baseline Conditions

REGULATORY FRAMEWORK

This section provides a summary of the plans and policies of the City and County of San Francisco, and regional, State, and Federal agencies that have policy and regulatory control over the project site. These plans and policies include the *San Francisco General Plan*, the *San Francisco Bicycle Plan*, and the Transit First Policy.

FEDERAL

There are no Federal transportation regulations applicable to the Proposed Project.

STATE

Senate Bill 743 and Public Resources Code Section 21099

In 2013, the California State Legislature passed Senate Bill (SB) 743, which added Section 21099 to CEQA. Section 21099(b)(1) requires that the State Office of Planning and Research (OPR) develop revisions to the CEQA Guidelines establishing criteria for determining the significance of transportation impacts of projects within transit priority areas. Specifically, SB 743 called on OPR to study the removal of automobile delay as a metric for evaluating transportation impacts and to develop alternative metrics that better match the State's policies around promoting infill development, public health through active transportation, and greenhouse gas emissions.

Additionally, SB 743 requires changes to the analysis of parking impacts for certain urban infill projects in transit priority areas.[10] Public Resources Code Section 21099(d), effective January 1, 2014, provides that "… parking impacts of a residential, mixed-use residential, or employment center project on an infill site located within a transit priority area shall not be considered significant impacts on the environment." Accordingly, parking is no longer to be considered in determining whether a project has the potential to result in significant environmental effects for projects that meet all three criteria established in the statute.

REGIONAL

San Francisco Bay Trail Plan

The Association of Bay Area Governments (ABAG) administers the San Francisco Bay Trail Plan. The Bay Trail is a multi-purpose recreational trail that, when complete, would encircle San Francisco Bay and San Pablo Bay with a continuous 500-mile network of bicycling and hiking trails; to date, about 340 miles of the alignment have been completed. The 2005 Gap Analysis Study, prepared by ABAG for the entire Bay Trail area, attempted to identify the remaining gaps in the Bay Trail system; classify the gaps by phase, county, and benefit ranking; develop cost estimates for individual gap completion; identify strategies and actions to overcome gaps; and present an overall cost and timeframe for completion of the Bay Trail system. The Bay Trail in this portion of San Francisco is along Illinois Street on the western border of the project site. Therefore, the 2005 Gap Analysis Study did not identify the project site as a gap segment of the Bay Trail. The Port's *Pier 70 Preferred Master Plan* articulates the goal of including the project site as part of the Bay Trail network.

[10] A "transit priority area" is defined as an area within 0.5 mile of an existing or planned major transit stop. A "major transit stop" is defined in California Public Resources Code Section 21064.3 as a rail transit station, a ferry terminal served by either a bus or rail transit service, or the intersection of two or more major bus routes with a frequency of service interval of 15 minutes or less during the morning and afternoon peak commute periods. A map of San Francisco's Transit Priority Areas is available online at http://sfmea.sfplanning.org/Map%20of%20San%20Francisco%20Transit%20Priority%20Areas.pdf.

LOCAL

Transit First Policy

In 1998, the San Francisco voters amended the City Charter (Charter Article 8A, Section 8A.115) to include a Transit First Policy, which was first articulated as a City priority policy by the Board of Supervisors in 1973. The Transit First Policy is a set of principles which underscore the City's commitment that travel by transit, bicycle, and foot be given priority over the private automobile. These principles are embodied in the policies and objectives of the Transportation Element of the *San Francisco General Plan*. All City boards, commissions, and departments are required, by law, to implement transit-first principles in concluding City affairs.

San Francisco General Plan

The Transportation Element of the *San Francisco General Plan* is composed of objectives and policies that relate to the eight aspects of the citywide transportation system: General Regional Transportation, Congestion Management, Vehicle Circulation, Transit, Pedestrian, Bicycles, Citywide Parking, and Goods Management. The Transportation Element references San Francisco's "Transit First" Policy in its introduction, and contains the following objectives and policies that are directly pertinent to consideration of the Proposed Project:

Objective 2: Use the transportation system as a means for guiding development and improving the environment.

- Policy 2.1: Use rapid transit and other transportation improvements in the city and region as the catalyst for desirable development, and coordinate new facilities with public and private development.
- Policy 2.4: Organize the transportation system to reinforce community identity, improve linkages among interrelated activities, and provide focus for community activities.
- Policy 2.5: Provide incentives for the use of transit, carpools, vanpools, walking, and bicycling and reduce the need for new or expanded automobile and automobile parking facilities.

Objective 8: Maintain and enhance regional pedestrian, hiking, and biking access to the coast, the Bay, and ridge trails.

- Policy 8.1: Ensure that the Coast Trail, Bay Trail, and Ridge Trail remain uninterrupted.

Objective 11: Establish public transit as the primary mode of transportation in San Francisco and as a means through which to guide future development and improve regional mobility and air quality.

Policy 11.3: Encourage development that efficiently coordinates land use with transit service, requiring that developers address transit concerns as well as mitigate traffic problems.

Objective 14: Develop and implement a plan for operational changes and land use policies that will maintain mobility and safety, despite a rise in travel demand that could otherwise result in system capacity deficiencies.

Policy 14.2: Ensure that traffic signals are timed and phased to emphasize transit, pedestrian, and bicycle traffic as part of a balanced multimodal transportation system.

Policy 14.3: Improve transit operation by implementing strategies that facilitate and prioritize transit vehicle movement and loading.

Policy 14.4: Reduce congestion by encouraging alternatives to the single-occupancy auto through the reservation of right-of-way and enhancement of other facilities dedicated to multiple modes of transportation.

Policy 14.7: Encourage the use of transit and other alternative modes of travel to the private automobile through the positioning of building entrances and the convenient location of support facilities that prioritizes access from these modes.

Objective 16: Develop and implement programs that will efficiently manage the supply of parking at employment centers throughout the city so as to discourage single-occupant ridership and encourage ridesharing, transit and other alternatives to the single-occupant automobile.

Policy 16.5: Reduce parking demand through limiting the absolute amount of spaces and prioritizing the spaces for short-term and ride-share uses.

Policy 16.6: Encourage alternatives to the private automobile by locating public transit access and ride-share vehicle and bicycle parking at more close-in and convenient locations on-site, and by locating parking facilities for single-occupant vehicles more remotely.

Objective 18: Establish a street hierarchy system in which the function and design of each street are consistent with the character and use of the adjacent land.

Policy 18.2: Design streets for a level of traffic that serves, but will not cause a detrimental impact on, adjacent land uses or eliminate the efficient and safe movement of transit vehicles and bicycles.

Policy 18.5: Mitigate and reduce impacts of automobile traffic in and around parks and along shoreline recreation area.

Objective 23: Improve the city's pedestrian circulation system to provide for efficient, pleasant, and safe movement.

Policy 23.2: Widen sidewalks where intensive commercial, recreational, or institutional activity is present and where residential densities are high.

Policy 23.3: Maintain a strong presumption against reducing sidewalk widths, eliminating crosswalks, and forcing indirect crossings to accommodate automobile traffic.

Policy 23.6: Ensure convenient and safe pedestrian crossings by minimizing the distance pedestrians must walk to cross a street.

Objective 24: Improve the ambiance of the pedestrian environment.

Objective 28: Provide secure and convenient parking facilities for bicycles.

Policy 28.1: Provide secure bicycle parking in new governmental, commercial, and residential developments.

Policy 28.3: Provide parking facilities which are safe, secure, and convenient.

Objective 30: Ensure that the provision of new or enlarged parking facilities does not adversely affect the livability and desirability of the city and its various neighborhoods.

Policy 30.1: Assure that new or enlarged parking facilities meet need, locational, and design criteria.

Policy 30.5: In any large development, allocate a portion of the provided off-street parking spaces for compact automobiles, vanpools, bicycles, and motorcycles commensurate with standards that are, at a minimum, representative of their proportion of the city's vehicle population.

Policy 30.8: Consider lowering the number of automobile parking spaces required in buildings where Class I bicycle parking is provided.

Objective 34: Relate the amount of parking in residential areas and neighborhood commercial districts to the capacity of the city’s street system and land use patterns.

Policy 34.1: Regulate off-street parking in new housing so as to guarantee needed spaces without requiring excesses and to encourage low auto ownership in neighborhoods that are well served by transit and are convenient to neighborhood shopping.

Policy 34.3: Permit minimal or reduced off-street parking for new buildings in residential and commercial areas adjacent to transit centers and along transit preferential street.

Objective 35: Meet short-term parking needs in neighborhood shopping districts consistent with preservation of a desirable environment for pedestrians and residents.

Policy 35.1: Provide convenient on-street parking specifically designed to meet the needs of shoppers dependent upon automobiles.

Policy 35.2: Assure that new neighborhood shopping district parking facilities and other auto-oriented uses meet established guidelines.

San Francisco Bicycle Plan

The *San Francisco Bicycle Plan* (*Bike Plan*) describes a City program to provide the safe and attractive environment needed to promote bicycling as a transportation mode. The *Bike Plan* identifies the citywide bicycle route network, and establishes the level of treatment (i.e., Class I, Class II, or Class III facility) on each route. The *Bike Plan* also identifies near-term improvements that could be implemented within the next 5 years, as well as policy goals, objectives, and actions to support these improvements. It includes long-term improvements, and minor improvements that would be implemented to facilitate bicycling in San Francisco.

Better Streets Plan

The *San Francisco Better Streets Plan* focuses on creating a positive pedestrian environment through measures such as careful streetscape design and traffic calming measures to increase pedestrian safety. The *Better Streets Plan* includes guidelines for the pedestrian environment, defined as the areas of the street where people walk, sit, shop, play, or interact. Generally speaking, the guidelines are for design of sidewalks and crosswalks; however, in some cases the *Better Streets Plan* includes guidelines for other areas of the roadway, particularly at intersections.

Vision Zero

Vision Zero is a policy adopted by both the San Francisco Board of Supervisors and SFMTA to eliminate all traffic deaths in San Francisco by the year 2024. The goal of Vision Zero is also to reduce severe injury inequities across neighborhoods, transportation modes, and populations. Some actions SFMTA has and will take to improve pedestrian safety include safer signal timing at intersections, adding "continental" crosswalks (crosswalks with zebra striping), "leading" pedestrian signals that allow pedestrians to get a head start at signalized intersections, red zones at intersections to improve visibility, and pedestrian bulbs to shorten pedestrian crossing distances.

Transportation Sustainability Program

The Transportation Sustainability Program is an effort to reconcile the increasing demand for transportation within San Francisco with the very limited right-of-way available. The Program aims to achieve a more efficient transportation system through a three-pronged approach. The Program calls for improved investment in transportation infrastructure, alignment of the City's environmental review processes with City policies, and adopting new practices supporting a shift in travel from single-occupant vehicles to other, more space-efficient modes of travel. Two of the three prongs of the Program have been adopted by the Board of Supervisors and or Planning Commission, an updated and expanded transportation impact fee (Transportation Sustainability Fee) and a change to the City's transportation significance thresholds. The third prong, a Transportation Demand Management (TDM) ordinance, is described further below.

Transportation Demand Management Ordinance

The San Francisco Planning Commission has recently recommended that the Board of Supervisors approve an amendment to the City's Planning Code requiring most new development projects in San Francisco to incorporate "design features, incentives, and tools" intended to reduce VMT. New development projects would be required to choose from a menu of options to develop an overall plan of TDM elements. Each development project's TDM plan will require routine monitoring and reporting to the Planning Department to demonstrate compliance. As of the preparation of this document, the ordinance has been continued at the Board of Supervisors Land Use and Transportation Committee to January 23, 2017.

Climate Action Plan

In response to overwhelming scientific evidence suggesting that human behavior is accelerating climate change, the City adopted a *Climate Action Plan* to address actions the City could take to reduce its contribution to climate change. The *Climate Action Plan* describes the effects that climate change may have on San Francisco based on scientific research and presents an inventory of San Francisco's contribution to greenhouse gas emissions – the leading human contributor toward accelerating climate change. The *Plan* also recommends a greenhouse gas reduction target and describes specific measures that the City could take to reach its target – including recommendations for reducing trips by automobile.

Waterfront Transportation Assessment

SFMTA and the Transportation Authority have been working with the other City agencies, regional transportation providers, and community members to assess future transportation system needs along the east side of the City, beginning in 2012. Phase 2 of the Waterfront Transportation Assessment (WTA) studies the SOMA Area, Mission Bay, and the Central Waterfront south to Cesar Chavez Street.[11] The Phase 2 report (WTA Phase 2) was completed in August 2015.

The purpose of the WTA is to identify future transportation facility needs to accommodate growth in the City and an expected increase in travel demand of approximately 50 percent in the SOMA and Central Waterfront area by the year 2040. The WTA Phase 2 concludes that mode shifts from car to other modes will be necessary if growth in transportation demand is to be accommodated, and that those shifts will need to be not only from car to transit but also from car to bicycle and walking. The necessary mode shifts are likely to occur only if there are

[11] SFMTA and the Transportation Authority, *Waterfront Transportation Assessment, Phase 2 SoMa, Mission Bay, Central Waterfront Transportation Analysis Final Report*, August 2015.

improvements to the transportation facilities (bicycle, pedestrian, and transit infrastructure) and their safety coupled with TDM strategies.[12]

The WTA is a planning tool with technical analysis support. The analysis supporting the conclusions accounts for the growth in jobs and population estimated to occur with implementation of the Pier 70 Mixed-Use District Project in the Central Waterfront Area.[13] The WTA does not present policies or objectives that would directly affect land use decisions. It does present recommendations for improvements that could support population and job growth in the Central Waterfront neighborhoods.

IMPACTS AND MITIGATION MEASURES

SIGNIFICANCE THRESHOLDS

The significance criteria listed below are organized by mode to facilitate the transportation impact analysis; however, the transportation significance thresholds are essentially the same as the ones in the environmental checklist (Appendix G of the State *CEQA Guidelines*) and incorporate San Francisco Planning Commission Resolution 19579 and supporting materials.[14] For the purpose of this analysis, the following applicable thresholds were used to determine whether implementing the proposed project would result in a significant impact on transportation and circulation:

- **Vehicle Miles Traveled** –
  - The project would have a significant effect on the environment if it would cause substantial additional VMT.
  - The project would have a significant effect on the environment if it would substantially induce additional automobile travel by increasing physical roadway capacity in congested areas (i.e., by adding new mixed-flow travel lanes) or by adding new roadways to the network.
- **Transit** – A project would have a significant effect on the environment if it would cause a substantial increase in transit demand that could not be accommodated by adjacent transit capacity, resulting in unacceptable levels of transit service; or cause a substantial increase in delays or operating costs such that significant adverse impacts in transit service levels could result. With the Muni and regional transit screenlines analyses, the project would have a significant effect on the transit provider if project-related transit trips would cause the capacity utilization standard to be exceeded during the peak hour. For screenlines that already operate above the utilization standard during the peak hour, a project would have a significant effect on the transit provider if project-related transit trips were more than 5 percent of total transit trips during the peak hour.

[12] SFMTA and the Transportation Authority, *Waterfront Transportation Assessment, Phase 2 SoMa, Mission Bay, Central Waterfront Transportation Analysis Final Report*, August 2015, p. 19.
[13] SFMTA, the Transportation Authority, ARUP, *Nelson/Nygaard*, *Waterfront Transportation Assessment, Phase 2 SoMa, Mission Bay, Central Waterfront Transportation Analysis, Appendix A: Technical Report*, August 2015, p. 5.
[14] San Francisco Planning Department, *Updated TIA Significance Thresholds*, September 13, 2016.

- **Pedestrians** – A project would have a significant effect on the environment if it would result in substantial overcrowding on public sidewalks, create potentially hazardous conditions for pedestrians, or otherwise interfere with pedestrian accessibility to the site and adjoining areas.
- **Bicycles** – A project would have a significant effect on the environment if it would create potentially hazardous conditions for bicyclists or otherwise substantially interfere with bicycle accessibility to the site and adjoining areas.
- **Loading** – A project would have a significant effect on the environment if it would result in a loading demand during the peak hour of loading activities that could not be accommodated within proposed on-site loading facilities or within convenient on-street loading zones, and if it would create potentially hazardous traffic conditions or significant delays affecting traffic, transit, bicycles, or pedestrians.
- **Traffic** – The project would have a significant adverse impact if it would cause major traffic hazards.
- **Emergency Vehicle Access** – A project would have a significant effect on the environment if it would result in inadequate emergency access.
- **Construction** – Construction of the project would have a significant effect on the environment if, in consideration of the project site location and other relevant project characteristics, the temporary construction activities' duration and magnitude would result in substantial interference with pedestrian, bicycle, or vehicle circulation and accessibility to adjoining areas thereby resulting in potential hazardous conditions.
- **Parking** – The project would have a significant effect on the environment if it would result in a substantial parking deficit that would create hazardous conditions or significant delays affecting traffic, transit, bicycles, or pedestrians and where particular characteristics of the project or its site demonstrably render use of other modes infeasible.

As described in the NOP/IS (provided in Appendix A in this EIR), the project site is not located within an area covered by an airport land use plan or within 2 miles of a public airport or public use airport; nor is it within the vicinity of a private airstrip. Therefore, implementation of the Proposed Project or its variants and alternatives would not result in a change in air traffic patterns, including either an increase in traffic levels, obstructions to flight, or a change in location, that results in substantial safety risks, and these issues are not addressed in this EIR.

PROJECT FEATURES

Development Program

The Proposed Project would develop the 28-Acre Site and the Illinois Parcels (the Hoedown Yard and 20th/Illinois Site). It provides for a phased and flexible land use program that would allow some of the parcels to be developed for either primarily commercial uses or residential uses. Two parcels are proposed to be designated for district structured parking, but either residential or commercial uses could be developed on one of the parcels and residential uses could be developed on the other, instead of parking. Thus, two development scenarios are analyzed

equally to provide the maximum range of transportation impacts from development of either more commercial or more residential space.

As noted in the Environmental Setting section, the project site currently hosts approximately 50 special events per year, which include evening happy hours, music concerts, fairs, and markets. Attendance levels can vary widely, but occasionally the largest events can draw up to 40,000 people.

The Proposed Project also includes open space programming elements that are anticipated to include art and cultural events, outdoor fairs, festivals and markets, outdoor film screenings, night markets, food events, street fairs or festivals, lecture series, art exhibitions, and theater performances during weekdays and weekends. Typical events at the Proposed Project, occurring up to an estimated three times per month, could have attendance of approximately 500 to 750 people, while larger-scale events, occurring approximately four times per year, could have attendance of up to 5,000 people.

As shown in Table 2.3: Project Summary - Maximum Residential Scenario, in Chapter 2, Project Description, p. 2.29, the Maximum Residential Scenario would provide up to 3,025 residential units (2,630,000 gross square feet [gsf]), 1,102,250 gsf of commercial space, 479,980 gsf of retail/arts/light-industrial (RALI) space[15], 9 acres of open space, and up to 3,370 off-street parking spaces. Existing buildings to be renovated and converted would house about 237,800 gsf of the residential, commercial, and/or RALI space. Total development would be about 4,212,230 gsf.

Table 2.4: Project Summary - Maximum Commercial Scenario, in Chapter 2, Project Description, p. 2.31, presents the land uses and square footage for the Maximum Commercial Scenario. This scenario would provide 1,645 residential units (1,430,000 gsf), 2,262,350 gsf of commercial space, almost the same amount of RALI space at 486,950 gsf, and up to 3,496 off-street parking spaces. The same buildings would be renovated and converted to residential, commercial, and/or RALI space as in the Maximum Residential Scenario. Total development would be about 4,179,300 gsf. The same 9 acres of open space is proposed as for the Maximum Residential Scenario.

For analysis purposes, it has been assumed that 33 percent of the total number of residential units under each scenario would be studio or one-bedroom units and 67 percent would be two or more bedrooms for each scenario.

[15] For transportation analysis purposes, the RALI space has been assumed to include production/distribution/repair (PDR) space, retail uses, and restaurant uses. The PDR space accounts for the light industrial uses and a portion of the arts uses that are not classed as retail. Restaurant and retail uses have trip generation and distribution rates that are different from each other and from light industrial and office uses and therefore needed to be separated from the other RALI uses.

Parcels C-1 and C-2 that could be developed with District Parking rather than residential or commercial uses have been analyzed as residential in the Maximum Residential Scenario and as residential and commercial in the Maximum Commercial Scenario to provide the highest amount of trip generation for each scenario. Rooftop open space has been assumed for these two parcels in both the Maximum Residential Scenario and Maximum Commercial Scenario

Transportation Improvements Assumed in the Analysis

Chapter 2, Project Description, summarizes the transportation and circulation improvements that are included in the Proposed Project, and presents the Transportation Plan, which includes a discussion of TDM strategies to discourage the use of automobiles and encourage transit and other modes of transportation. The roadway network improvements, transit improvements, bicycle circulation improvements, pedestrian circulation improvements, on-street loading provisions, and the TDM Plan that are assumed in the transportation and circulation analyses of the Proposed Project are reiterated and expanded on below.

Roadway Network Improvements

The project site would be accessible via Illinois Street at 20th Street, at 22nd Street, and at a new 21st Street connection. The existing 20th Street and 22nd Street rights-of-way within the project site would be improved. Three new internal north-south streets are proposed to break the site into more typical city blocks, these are, Michigan Street, Louisianan Street, and Maryland Street (see Figure 2.5: Proposed SUD Land Use Program, in Chapter 2, Project Description, p. 2.22). All streets would have sidewalks, ranging from 9 to 18 feet wide, all of which would have a minimum throughway of at least 6 feet. All streets except the portion of new Louisiana Street between 20th and 21st streets would be two-way with a single travel lane in each direction. That block of Louisiana Street would be one-way southbound with a single travel lane. Streets are proposed to be designed to the minimum width feasible to calm traffic and increase pedestrian safety while still accommodating fire trucks, transit vehicles, deliveries, and other required design vehicles – generally, between 27 and 38 feet in length. No improvements are proposed outside of the project site, other than signalization of the intersection of Illinois Street with 21st Street.

The Proposed Project would include a shared public way on Maryland Street between 21st Street and 22nd Street. This shared street would have limited vehicular traffic and would give priority to pedestrians over automobiles. This street would consist of a single shared paved surface with no curbs or gutters. The street would include raised domes, or another similar feature, to delineate the boundary between the pedestrian zone and traffic to allow for safe travel by those with visual impairment. Automobiles could access it from the adjoining streets by a curb-cut similar to a typical driveway. The proposed shared public way would allow for temporary closures of the street to vehicular traffic for markets and events. The shared public way is adjacent to the open space connecting to the Blue Greenway and the San Francisco Bay. The Blue Greenway is the

portion of the San Francisco Bay Trail that extends between Mission Creek and the southern City limits, through the Proposed Project, as discussed in "Bicycle Circulation Improvements" below.

Transit Improvements

The overall transit network serving the Proposed Project is shown in Figure 2.16: Proposed Roadway Network, in Chapter 2, Project Description, p. 2.50. No changes to the Muni system are proposed, although 22nd Street has been designed such that Muni could directly serve the project site if SFMTA chose to re-route an existing line, such as the 48 24th Street.

The Proposed Project would include a shuttle service, to be operated and maintained by a Pier 70 Transportation Management Agency (TMA), to connect the Pier 70 Mixed-Use District to regional transit hubs, like the Fourth & King Caltrain Station and 16th Street / Mission Street BART station.[16] Although the shuttle would not be operated by a transit agency, such as SFMTA, the shuttle is intended to improve connectivity for regional transit use; the shuttle service is not intended to replicate or duplicate Muni service for local trips. The shuttle service is part of the TDM Plan discussed below. It would be operated by the TMA through a third-party service provider and would have no fare associated with it. The TMA would be led by a board of directors that could include the Port, SFMTA, and representatives of various buildings constructed at the site. Exact routes and operating schemes would be determined at a later time, depending on factors such as peak period traffic congestion along specific streets and BART and Caltrain service plans, and schedules at specific stations. However, the service would be provided at a minimum of every 15 minutes during the extended weekday commute periods (7:00 a.m. to 10:00 a.m. and 3:00 p.m. to 7:00 p.m.) and would serve both trips leaving and accessing the project site during each peak period.

Bicycle Circulation Improvements

The bicycle circulation network in the vicinity of the Proposed Project, including improvements associated with the Proposed Project, is shown in Figure 2.18: Proposed Bicycle Network, in Chapter 2, Project Description, p. 2.54. The Proposed Project would include a separated bicycle and pedestrian facility along 20th Street at the water's edge to extend the Bay Trail/Blue Greenway continuously along the shore of the site. At the northern end, the Bay Trail would extend via 20th Street to Georgia Street and 19th Street. At the southern end, the trail would temporarily access Illinois Street via 22nd Street, but would be designed to connect to any future extension of the Bay Trail south of the project site. Class II bicycle lanes and Class III shared lanes are proposed throughout the Proposed Project. No improvements are proposed outside of the project site.

[16] A TMA is generally an organization of residents and/or businesses formed to promote or operate transportation programs for their members.

Pedestrian Circulation Improvements

Minimum sidewalk widths have been proposed for each street, ranging from 9 feet to 18 feet. The Bay Trail/Blue Greenway would extend through the project site and serve pedestrians as well as bicyclists, as noted above under "Bicycle Circulation Improvements." Curb extensions are planned at key locations on corners and mid-block locations wherever feasible in order to increase pedestrian visibility, shorten crossing distance, and decrease vehicle speeds. No improvements are proposed outside of the project site, except for signalization of the intersection of Illinois Street with 21st Street, which would also include construction of new curb ramps.

Loading Supply

Michigan Street, Louisiana Street, and new 21st Street are proposed to be designed as primary on-street loading corridors, with heavy loading (trucks up to 40 feet long) accommodated at Michigan Street and Louisiana Street near the Historic Core.

On- or off-street loading spaces would be required for each use based on the square footage of the buildings. All residential and arts/light industrial buildings greater than 50,000 square feet would have one to two loading spaces, which could be on- or off-street. Retail uses greater than 50,000 square feet would typically have one off-street loading space per every 25,000 square feet of gross leasable area. Commercial uses would typically have one to three off-street loading spaces. All buildings less than 50,000 square feet would use on-street loading.

Generally, the freight loading requirements for retail uses would be similar to the Planning Code requirements for retail uses in the Eastern Neighborhoods Mixed-Use District. The Proposed Project's freight loading requirements for commercial and RALI uses generally would be less than the requirements in the Planning Code for the Eastern Neighborhoods Mixed-Use District. The Proposed Project's freight loading requirements for residential uses would be similar to requirements in the Planning Code for residential development in the Downtown Residential District – the only portion of the City with residential off-street freight loading requirements in the Planning Code.

On-street loading spaces would be able to accommodate WB-40 vehicles (wheelbase of 40 feet) and would be a minimum of 75 feet long. Off-street loading spaces would be a minimum of 12 feet wide, 14 feet high, and 35 feet long, consistent with requirements in the Planning Code. The Maximum Residential Scenario would provide 28 off-street loading spaces and the Maximum Commercial Scenario would provide 25 off-street loading spaces.

There are no specific passenger loading supply requirements and no specific provisions for passenger loading have been identified. However, individual buildings would be able to apply to

SFMTA for a passenger loading zone permit in which on-street parking spaces could be converted to a white "passenger loading" zone.

Transportation Demand Management Plan

The Proposed Project includes a TDM Plan (within the Transportation Plan) that provides a comprehensive strategy to manage the transportation demands it would create. The TDM Plan incorporates transportation planning principles to address the transportation needs of the Proposed Project consistent with San Francisco's Transit First Policy, *Better Streets Plan*, *Climate Action Plan*, and Transportation Sustainability Program and associated policies; to encourage use of transit and other modes of transportation; and to discourage use of single-occupancy automobiles or automobiles in general. The improvements and TDM Plan would be the same for both the Maximum Residential Scenario and the Maximum Commercial Scenario.

While these measures are included as part of the Proposed Project, no attempt has been made to quantify the effect of specific measures at reducing automobile travel in the analysis. This discussion presents two sets of TDM measures: (1) those that are part of the Proposed Project, as described in the TDM Plan and summarized below, and (2) those that may be implemented as Mitigation Measures for Air Quality impacts as part of Mitigation Measure M-AQ-1f in Section 4.G, Air Quality, pp. 4.G.47-4.G.50. Although no specific TDM measures are required as part of Mitigation Measure M-AQ-1f, the measure does require the Proposed Project to supplement the measures in the TDM Plan with additional measures to achieve a specific reduction in overall project-generated vehicle trips compared to the forecasts in this chapter.

Key strategies in the TDM Plan include the following:

- Transportation Management Agency. The Project's TDM Plan would be administered and maintained by a TMA. The TMA for the Pier 70 Mixed-Use District Project would be funded by project-generated sources and would be responsible for working with future subtenants of the project site (e.g., employers, residents, etc.) to ensure that they are actively participating in the TDM program. Upon agreeing to lease property at the project site, subtenants would become "members" of the TMA and be able to take advantage of the TDM program services provided through the TMA. The TMA would be led by a board of directors that would be staffed by representatives from diverse stakeholders that could include the Port (as the current property owner), SFMTA (as the public agency responsible for oversight of transportation in the City), and representatives of various buildings that have been constructed at the site. The board of directors may also include representatives from commercial office tenants or homeowners' associations.
- On-site Transportation Coordinator. Day-to-day operations of the TMA would be handled by staff who would work under the high-level direction provided by the board of directors. The lead staff position would serve as the on-site Transportation Coordinator (TC), functioning as the TMA's liaison with subtenants in the implementation of the TDM program and as the TMA's representative in discussions with the City. Duties would include operation of the TMA website and ridematching services, distribution of

transportation information packets, preparation of TDM plans for large special events, development and management of a rewards program for employees who do not drive on their commute, monitoring and reporting, and management of the Proposed Project's shuttle service. The TC position would be funded by the TMA, which is funded through project-generated sources.

- Shuttle service. The TMA would be responsible for provision of shuttle service between the project site and local and regional transit hubs. The TMA is likely to provide this service through a contractual agreement with a third-party shuttle operator, similar to other existing shuttle services. The TMA would be responsible for devising the proposed service plan and ensuring that the proposed connecting shuttle service is operated in a matter that maximizes intermodal coordination with BART and Caltrain. Routes, vehicle size, and frequency would be augmented over build-out of the Proposed Project to respond to demand.
- Bikesharing stations to serve the project site. The TMA would work collaboratively with SFMTA and Bay Area Bike Share (BABS) representatives to finalize the design, location, installation timeline, and funding arrangements for both initial installation and ongoing operation and maintenance of any proposed bikesharing station, if the established BABS program expands into the surrounding area.
- Supplementary components. Supplementary components such as provision of passenger amenities, real-time occupancy data for shared parking facilities, on-street carshare spaces, unbundled parking for residents, and preferential treatment for high-occupancy vehicles would be coordinated and provided through the TMA.

In addition to the day-to-day TDM measures included as part of the Proposed Project, additional strategies may be appropriate for special events held at Pier 70. As noted earlier, events at the project site with the Proposed Project would not be as large as the larger events currently held at the site. However, events occurring approximately three times per month could have an attendance of approximately 500 to 750 people, while larger events, occurring approximately four times per year, could have attendance of up to 5,000 people.

As with how things operate under existing conditions, as explained above on p. 4.E.8 events at the Pier 70 site currently require and would continue to require City permits, and event organizers would continue to develop event-specific TDM Plans to ensure that the flow of people into and out of the site would be managed similar to current conditions.

APPROACH TO ANALYSIS

The section presents the analysis methodologies, the approach to developing the travel demand forecasts for the two project scenarios, and the cumulative 2040 conditions including reasonably foreseeable development projects and transportation improvements.

Analysis Methodology

This section presents the methodology for analyzing transportation impacts and information considered in developing travel demand for the Proposed Project. The impacts of the Proposed

Project on the surrounding roadways were analyzed using the guidelines set forth in the *SF Guidelines* and Planning Commission Resolution 19579 and supporting materials, including a Categorical Exemption Determination, incorporated herein by reference, all of which provide direction for analyzing transportation conditions and identifying the transportation impacts of a proposed project in San Francisco.

The analysis of the Proposed Project was conducted for the Baseline Conditions described above under the "Baseline Conditions" discussion, pp. 4.E.28-4.E.33, plus full build-out of each of the Proposed Project scenarios, and for future year 2040 conditions with build-out of each of the Proposed Project scenarios. The baseline plus project conditions assess the near-term effects of the two scenarios, while the 2040 cumulative plus project scenarios assess the long-term effects of these scenarios in combination with other known and forecast development. The year 2040 was selected because it is the latest year that travel demand forecasts are available from the Transportation Authority travel demand forecasting model, SF-CHAMP.

Senate Bill 743 and Public Resources Code Section 21099

As discussed in Section 4.A, Introduction to Chapter 4, pp. 4.A.3-4.A.5 and above in the Regulatory Framework subsection, p. 4.E.34, Senate Bill 743 amended CEQA by adding Public Resources Code Section 21099 regarding the analysis of parking impacts for certain urban infill projects in transit priority areas.[17] Accordingly, parking is no longer to be considered in determining if a project has the potential to result in significant environmental effects for projects that meet all three criteria established in the statute. The Proposed Project meets all of the criteria, and thus the transportation impact analysis does not consider the adequacy of parking in determining the significance of project impacts under CEQA. However, the Planning Department acknowledges that parking conditions may be of interest to the public and the decision-makers. Therefore, this EIR presents a parking demand analysis for informational purposes and considers any secondary physical impacts associated with constrained supply (e.g., queuing by drivers waiting for scarce on-site parking spaces that affects the public right-of-way) as applicable in the following transportation impact analysis.

Additionally, CEQA Section 21099(b)(1) requires that OPR develop revisions to the *CEQA Guidelines* establishing criteria for determining the significance of transportation impacts of projects within transit priority areas that promote the "reduction of greenhouse gas emissions, the development of multimodal transportation networks, and a diversity of land uses." Potential

[17] A "transit priority area" is defined as an area within one-half mile of an existing or planned major transit stop. A "major transit stop" is defined in California Public Resources Code Section 21064.3 as a rail transit station, a ferry terminal served by either a bus or rail transit service, or the intersection of two or more major bus routes with a frequency of service interval of 15 minutes or less during the morning and afternoon peak commute periods. A map of San Francisco's Transit Priority Areas is available online at http://sfmea.sfplanning.org/Map%20of%20San%20Francisco%20Transit%20Priority%20Areas.pdf.

metrics OPR may recommend to measure transportation impacts may include vehicle miles traveled, vehicle miles traveled per capita, automobile trip generation rates, or automobile trips generated. CEQA Section 21099(b)(2) states that upon certification of the revised *CEQA Guidelines* for determining transportation impacts pursuant to Section 21099(b)(1), automobile delay, as described solely by level of service (LOS) or similar measures of vehicular capacity or traffic congestion, shall not be considered a significant impact on the environment under CEQA. Section 21099(c) provides that OPR also may adopt guidelines with alternative metrics to use for traffic levels of service for transportation impacts that apply outside transit priority areas.

In January 2016, OPR published for public review and comment a *Revised Proposal on Updates to the CEQA Guidelines on Evaluating Transportation Impacts in CEQA*[18] (proposed transportation impact guidelines) recommending that transportation impacts for projects be measured using vehicle miles traveled (VMT) as the primary metric. VMT measures the amount and distance that a project might cause people to drive, accounting for the number of passengers within a vehicle.

On March 3, 2016, the San Francisco Planning Commission, by Resolution No. 19579, adopted VMT as the principal criteria for determining transportation impacts. The Planning Commission's resolution:

- Found that OPR's proposed transportation impact guidelines, as described in the OPR Technical Advisory,[19] provide substantial evidence that VMT is an appropriate standard to use in analyzing transportation impacts to protect environmental quality and a better indicator of greenhouse gas, air quality, and energy impacts than automobile delay;
- Found that automobile delay, as described solely by LOS or similar measures of vehicular capacity or traffic congestion, will no longer be considered a significant impact on the environment pursuant to CEQA, because it does not measure environmental impacts and therefore it does not protect environmental quality;
- Directed the Environmental Review Officer to remove automobile delay as a factor in determining significant impacts pursuant to CEQA for all guidelines, criteria, and list of exemptions, and to update the Transportation Impact Analysis Guidelines for Environmental Review and Categorical Exemptions from CEQA to reflect this change; and
- Directed the Environmental Planning Division and Environmental Review Officer to replace automobile delay with VMT criteria which promote the reduction of greenhouse gas emissions, the development of multimodal transportation networks, and a diversity of land uses that are consistent with proposed and forthcoming changes to the *CEQA Guidelines* by OPR.

[18] This document is available online at: https://www.opr.ca.gov/s_sb743.php.

[19] *Revised Proposal on Updates to the CEQA Guidelines on Evaluating Transportation Impacts in CEQA: Implementing Senate Bill 743*, State of California, Governor's Office of Planning and Research, January 20, 2016. Available online at https://www.opr.ca.gov/s_sb743.php.

In connection with the adoption of Planning Commission Resolution No. 19579 adopting VMT to measure transportation impacts, for localized circulation impact analysis (e.g., to analyze potential impacts to walking, bicycling, riding transit, freight and passenger loading, emergency vehicle access, construction site circulation and access, and compliance with local plans, ordinances and policies related to transportation) the Planning Department continues to use trip generation rates and trip distribution identified in the SF Guidelines.[20]

Planning Commission Resolution No. 19579 became effective immediately for all projects that have not received a CEQA determination and all projects that have previously received CEQA determinations but require additional environmental analysis.

Accordingly, this EIR contains a focused discussion of whether the addition of project vehicle trips may impact bicycle or pedestrian safety, transit operations, and emergency and private vehicle access, but does not include a discussion of potential impacts to drivers associated with automobile delay.

Automobile delay may be considered by decision-makers, independent of the environmental review process, as part of their decision to approve, modify, or disapprove the Proposed Project.

Prior to the Planning Commission's action on March 3, 2016, some projects, including the Pier 70 Mixed-Use District Project, were in the process of environmental review, and had substantively completed draft Transportation Impact Studies using methodology and the LOS CEQA significance criteria formerly used by the San Francisco Planning Department (*2002 San Francisco Transportation Impact Analysis Guidelines for Environmental Review* [*SF Guidelines*]). The *Pier 70 Mixed-Use District Project Transportation Impact Study* (TIS) included as Appendix B to this EIR, has been updated to reflect the adopted change from LOS to VMT and the associated removal of automobile delay as a significance criterion. However, Section 7 of the TIS includes a discussion of LOS conditions, including intersections that are estimated to operate at or beyond LOS E or F under project and cumulative conditions, and improvement measures that would address such effects under those conditions. Although no longer part of the CEQA transportation impacts assessment, localized volumes are described in the TIS to inform transportation improvement projects proposed/agreed to by the project sponsor, and to help inform related topics such as air quality and noise.[21]

---

[20] San Francisco Planning Department, *Executive Summary: Resolution Modifying Transportation Impact Analysis, Hearing Date: March 3, 2016*, Attachment E: *Screening Criteria for Circulation Analysis and Methodology for Travel Demand,* and Attachment F: *Methodologies, Significance Criteria, Thresholds of Significance, and Screening Criteria for Vehicle Miles Traveled and Induced Automobile Travel Impacts,* which includes an appendix from the San Francisco County Transportation Authority.

[21] See, e.g., Caltrans, *Local Development – Intergovernmental Review Program Interim Guidance: Implementing Caltrans Strategic Management Plan 2015-2020 Consistent with SB 743 (Steinberg, 2013),* approved Sept. 2, 2016, Appendix D, p. 2 ("increased traffic volumes from high-VMT

Vehicle Miles Traveled Analysis

As noted above, the Planning Commission's Resolution No. 19579 is consistent with the direction of CEQA Section 21099(b)(2), and OPR's proposed transportation impact guidelines. Moreover, it is based upon and consistent with the authority and deference CEQA provides to local agencies to identify the methodology to analyze and environmental impact.[22] Residential and office projects located in areas with low VMT, and that incorporate similar features (i.e., sufficient density, mix of uses, transit accessibility) will tend to exhibit similarly low VMT. OPR's Technical Advisory recognizes that there are various methods for assessing VMT, and specifically acknowledged the efficacy of a map-based screening approach. The City uses this approach.

San Francisco, and other lead agencies, such as Oakland and Pasadena, use maps illustrating areas that exhibit below threshold VMT to screen out projects that may not require a detailed VMT analysis. Under this approach, travel demand models or survey data provide the existing residential or office VMT, which can be modified for mixed use projects by using each use-based map as a screen for the respective use-portion of the project, to then develop maps illustrating VMT for different areas in the city. Thus, the maps demonstrate whether a proposed project is in a transportation-efficient location, (e.g., transit-oriented infill), with safe and adequate access to a multi-modal transportation system and key destinations, and that will help the city, region, and state reach their GHG reduction targets under AB 32.

This mapping approach for VMT screening has also been recently acknowledged in the Caltrans Local Development Intergovernmental Review Program, Interim Guidance, approved September 2, 2016. This Caltrans Guidance provides further support for use of a map-based screening approach. (The Interim Caltrans Guidelines replaces Caltrans' 2002 Guidelines, and is part of Caltrans' effort to support smart growth and efficient development. It is intended to help ensure that greenhouse gas emissions reduction, good community design, improved proximity to key destinations, and a safe multimodal transportation system are all integral parts of the land use decision-making process.)

The Transportation Authority uses SF-CHAMP to estimate VMT by private automobiles and taxis for different land use types within individual TAZs. Travel behavior in SF-CHAMP is calibrated by Transportation Authority staff based on observed behavior from the California Household Travel Survey 2010-2012, Census data regarding automobile ownership rates and county-to-county worker flows, and observed vehicle counts and transit boardings. SF-CHAMP

development and/or high speeds can exacerbate safety concerns . . . that may affect adjacent pedestrian facilities. Similarly, increasing traffic volumes at uncontrolled turn-movement points or in locations without adequate modal separation/refuge can increase the vulnerability for all modes, especially pedestrians and bicyclists").

[22] California Public Resources Code Section 21099(b)(1); 14 Cal. Code Regs., Section 15064(b).

uses a synthetic population, which is a set of individual actors that represents the Bay Area's actual population, who make simulated travel decisions for a complete day. The Transportation Authority uses tour-based analysis for office and residential uses, which examines the entire chain of trips over the course of a day, not just trips to and from the project. For retail uses, the Transportation Authority uses trip-based analysis, which counts VMT from individual trips to and from the project (as opposed to entire chain of trips). A trip-based approach, as opposed to a tour-based approach, is necessary for retail projects because a tour is likely to consist of trips stopping in multiple locations, and the summarizing of tour VMT to each location would over-estimate VMT.[23,24]

The following identifies thresholds of significance and screening criteria used to determine if a land use project or plan would result in significant impacts under the VMT metric.

For residential projects, a project would generate substantial additional VMT if it exceeds the regional household VMT per capita minus 15 percent. This metric is consistent with OPR's proposed transportation impact guidelines stating that a project would cause substantial additional VMT if it exceeds both the existing City household VMT per capita minus 15 percent and existing regional household VMT per capita minus 15 percent. In San Francisco, the City's average VMT per capita (8.4) is lower than the regional average (17.2). Therefore, the City average is irrelevant for the purposes of the analysis.

For office projects, a project would generate substantial additional VMT if it exceeds the regional VMT per employee minus 15 percent.

For retail projects, the Planning Department uses a VMT efficiency metric approach for retail projects: a project would generate substantial additional VMT if it exceeds the regional VMT per retail employee minus 15 percent.

For mixed-use projects, each proposed land use is evaluated independently, per the significance criteria described above.

This approach is consistent with CEQA Section 21099 and the thresholds of significance for other land uses recommended in OPR's *Revised Proposal on Updates to the CEQA Guidelines on*

[23] Retail travel is not explicitly captured in SF-CHAMP, rather, there is a generic "Other" purpose which includes retail shopping, medical appointments, visiting friends or family, and all other non-work, non-school tours. The retail efficiency metric captures all of the "Other" purpose travel generated by Bay Area households. The denominator of employment (including retail; cultural, institutional, and educational; and medical employment; school enrollment, and number of households) represents the size, or attraction, of the zone for this type of "Other" purpose travel.

[24] San Francisco Planning Department, Executive Summary: Resolution Modifying Transportation Impact Analysis, Appendix F, Attachment A, March 3, 2016.

Evaluating Transportation Impacts in CEQA[25] ("proposed transportation impact guidelines"). OPR described a 15 percent threshold below existing development as being "both reasonably ambitious and generally achievable" for the following reasons.

First, Section 21099/SB 743 states that the criteria for determining significance must "promote the reduction in greenhouse gas emissions." SB 743 also states the Legislature's intent that the analysis of transportation in CEQA better promote the State's goals of reducing greenhouse gas emissions. It cites in particular the reduction goals in the Global Warming Solutions Act and the Sustainable Communities and Climate Protection Act, both of which call for substantial reductions. The California Air Resources Board established long-term reduction targets for the largest regions in the tate that ranged from 13 to 16 percent.

Second, Caltrans has developed a statewide VMT reduction target in its Strategic Management Plan. Specifically, it calls for a 15 percent reduction in per capita VMT, compared to 2010 levels, by 2020.

Third, according to the California Air Pollution Control Officers Association (CAPCOA), 15 percent reductions in VMT are typically achievable at the project level in a variety of place types.[26]

Fourth, the *First Update to the AB 32 Scoping Plan* states, "[r]ecognizing the important role local governments play in the successful implementation of AB 32, the initial Scoping Plan called for local governments to set municipal and communitywide GHG reduction targets of 15 percent below then-current levels by 2020, to coincide with the statewide limit."[27]

The VMT significance standards, and a comparison of these standards to TAZ 559, in which the project site is located, are summarized in Table 4.E.11, Daily Vehicle Miles Traveled.

In addition to the map-based screening criterion, OPR has a Proximity to Transit Stations screening criterion that the City uses. OPR recommends that residential, retail, and office projects, as well projects that are a mix of these uses, proposed within 0.5 mile of an existing major transit stop (as defined by CEQA Section 21064.3) or an existing stop along a high quality transit corridor (as defined by CEQA Section 21155) would not result in a substantial increase in VMT. However, this presumption would not apply if the project would: have a floor area ratio of less than 0.75; (2) include more parking for use by residents, customers, or employees of the

project than required or allowed, without a conditional use; or (3) is inconsistent with the applicable Sustainable Communities Strategy.[28]

Table 4.E.11 Daily Vehicle Miles Traveled

Land Use	Bay Area VMT		TAZ 559
	Regional Average	Regional Average minus 15%	
Households (Residential)	17.2	14.6	8.8
Employment (Office)	19.1	16.2	14.6
Visitors (Retail)	14.9	12.6	10.8

Source: San Francisco Planning Department, sftransportationmap.org, Accessed October 3, 2016.

OPR's proposed transportation impact guidelines do not provide screening criteria or thresholds of significance for other types of land uses, other than those projects that meet the definition of a small project, which does not apply to the Proposed Project. Therefore, the Planning Department provides additional screening criteria and thresholds of significance to determine if land uses similar in function to residential, office, and retail would generate a substantial increase in VMT.[29]

The Planning Department applies the Map-Based Screening and Proximity to Transit Station screening criteria to the following land use types:

- Tourist Hotels, Student Housing, Single Room Occupancy Hotels, and Group Housing – Trips associated with these land uses typically function similarly to and generate a comparable number of vehicle trips as multi-family residential uses. Therefore, these land uses are treated as residential for screening and analysis.
- Childcare, K-12 Schools, Medical, Post-Secondary Institutional (non-student housing), and Production, Distribution, and Repair (PDR) – Trips associated with these land uses typically function similarly to office. While some of these uses may have some visitor/customer trips associated with them (e.g., childcare and school drop-off, patient visits, etc.), those trips are often a side trip within a larger tour. For example, the visitor/customer trips are influenced by the origin (e.g., home) and/or ultimate destination (e.g., work) of those tours. Therefore, these land uses are treated as office for screening and analysis.

[28] A project is considered to be inconsistent with the Sustainable Communities Strategy if development is located outside of areas contemplated for development in the Sustainable Communities Strategy.

[29] San Francisco Planning Department, Executive Summary: Resolution Modifying Transportation Impact Analysis, Appendix F, Attachment A, March 3, 2016.

- Grocery Stores, Local-Serving Entertainment Venues, Religious Institutions, Parks, and Athletic Clubs – Trips associated with these land uses typically function similar to retail. Therefore, these types of land uses are treated as retail for screening and analysis.

Induced Automobile Travel Analysis

The Proposed Project is a mixed-use development project that includes the creation of an internal street network, pedestrian and bicycle facilities, traffic calming measures, and intersection traffic control devices including traffic signals and stop controls.

A proposed project would not result in a substantial increase in VMT if it would include the following components and features:

- Active Transportation, Rightsizing (aka Road Diet), and Transit Projects:
  - Infrastructure projects, including safety and accessibility improvements, for people walking or bicycling
  - Installation or reconfiguration of traffic calming devices
  - Creation of new or expansion of existing transit service
  - Creation of new or addition of roadway capacity on local or collector streets provided the project also substantially improves conditions for people walking, bicycling, and, if applicable, riding transit (e.g., by improving neighborhood connectivity or improving safety)
- Other Minor Transportation Projects:
  - Rehabilitation, maintenance, replacement and repair projects designed to improve the condition of existing transportation assets (e.g., highways, roadways, bridges, culverts, tunnels, transit systems, and bicycle and pedestrian facilities) and that do not add additional motor vehicle capacity
  - Installation, removal, or reconfiguration of traffic lanes that are not for through traffic, such as left, right, and U-turn pockets, or emergency breakdown lanes that are not used as through lanes
  - Installation, removal, or reconfiguration of traffic control devices, including Transit Signal Priority (TSP) features
  - Timing of signals to optimize vehicle, bicycle or pedestrian flow on local or collector streets
  - Addition of transportation wayfinding signage
  - Removal of off- or on-street parking spaces
  - Adoption, removal, or modification of on-street parking or loading restrictions (including meters, time limits, accessible spaces, and preferential/reserved parking permit programs)

Transit Analysis

The impact of additional transit ridership generated by the Proposed Project on local and regional transit providers was assessed using screenlines. The concept of screenlines is used to describe

the magnitude of travel to or from the greater Downtown area of San Francisco and to compare estimated transit volumes to available capacities. Screenlines are hypothetical lines that would be crossed by persons traveling between Downtown San Francisco and its vicinity (Superdistrict 1) to or from other parts of San Francisco and the region (Superdistricts 2, 3, and 4). Four screenlines have been established in Downtown San Francisco to analyze potential impacts of projects on Muni service: northeast, northwest, southwest, and southeast, with sub-corridors within each screenline. The bus routes and light rail lines used in this screenline analysis are listed in Table 4.E.6, p. 4.E.6, and are considered the major commute routes to and from the Downtown area. Other bus routes, such as those with greater than 10-minute headways, are not included due to their generally lower ridership. Three regional screenlines have been established around San Francisco to analyze impacts on the regional transit agencies: North Bay, East Bay, and Peninsula and South Bay. Both sets of screenlines focus on transit trips into Downtown San Francisco in the morning (inbound) and out of Downtown in the evening (outbound), because these are the most congested directions and times.

In addition, impacts on local Muni transit service were assessed by comparing the projected ridership from each of the project scenarios to the available transit capacity at the MLP of various transit corridors, described above in the subsection on Existing Conditions under the "Transit Facilities" discussion, p. 4.E.10. Capacity utilization for a.m. and p.m. peak hours was determined at the MLP for each route serving the study area. As explained in the "Existing Conditions" section, p. 4.E.11, the MLP for Muni routes is not located in the transportation study area for the Proposed Project but is located closer to Downtown. Capacity utilization relates the number of passengers per transit vehicle to the design capacity of the vehicle.[30] Muni has established a capacity utilization standard of 85 percent, which was applied to the a.m. and p.m. weekday conditions analyzed. Because of the high amount of non-residential use proposed in both the Maximum Residential and Maximum Commercial scenarios, it is expected that many of the trips would be toward the project site in the a.m. peak and away from the project site in the p.m. peak. This directionality is counter to the direction in which the Downtown screenlines are assessed. Furthermore, based on the location of the project site outside of the Downtown screenlines, it is likely that some of the transit trips generated by the Proposed Project that do travel in the peak directions would occur after the MLP, at points where capacity is available. The analysis has not been adjusted to account for this likelihood, and therefore provides a conservative result.

The existing ridership data for the routes providing direct access to the project site were analyzed based on each route's peak capacity utilization at its MLP, obtained from SFMTA's automated

[30] The capacity per vehicle includes both seated and standing capacity, where standing capacity is between 30 and 80 percent of seated capacity (depending upon the specific transit vehicle configuration). The capacity of a light rail vehicle is 119 passengers, the capacity of a historic streetcar is 70 passengers, and the capacity of a standard bus is 63 passengers.

passenger count (APC) database in September/October 2013. The baseline was then calculated using information about the development projects expected to be completed by the time the Proposed Project is undertaken. The transit Baseline Conditions reflect Muni capacity that is expected to be available when the Central Subway project is completed and the T Third short line loop has been constructed to provide additional capacity during peak periods.

Future 2040 cumulative transit ridership projections were developed based on transit growth projections prepared for the Transit Effectiveness Project. Forecast future hourly ridership demand was then compared to expected capacity based on the likely route and headway changes identified in the Muni Forward program to estimate capacity utilization under 2040 cumulative conditions. The transit person-trips forecast to be generated by the Proposed Project were compared to the 2040 cumulative conditions at the screenlines and on specific Muni routes serving the project site.

The Proposed Project was determined to have a significant transit impact if project-generated transit trips would cause screenlines operating at less than the capacity utilization standard under Baseline Conditions to operate at more than the capacity utilization standard. The Proposed Project would also have a significant impact if project-generated transit trips would add more than 5 percent to a screenline or an individual route that already exceeds the capacity utilization standard under Baseline Conditions.

The Proposed Project would have a significant cumulative impact if the addition of Project trips to a Muni screenline or individual route would cause capacity utilization to exceed the 85 percent standard or would add more than 5 percent to a screenline or an individual route that would exceed the 85 percent capacity utilization standard under cumulative conditions without the Proposed Project.

Pedestrian Analysis

Pedestrian trips generated by the Proposed Project include walking trips to and from nearby land uses and to and from the local transit stops and the 22nd Street Caltrain station. A qualitative assessment of pedestrian conditions was conducted to determine whether pedestrian facilities would be adequate to accommodate pedestrian trips and whether any conditions hazardous to pedestrians would be created. No quantitative analysis was performed.

Bicycle Analysis

The transportation analysis includes a qualitative assessment of bicycle conditions as they relate to the project site and bicycle parking, and to bicycle circulation in the transportation study area. No quantitative analysis was performed. The analysis discusses bicycle safety and potential conflicts with traffic. The Proposed Project would result in a significant impact if it would

adversely affect bicycle facilities in the project study area or would create new hazardous conditions for bicycling.

Loading Analysis

The analysis of loading conditions includes quantification of loading demand during the peak hour of loading activities and a comparison of that demand to proposed on- and off-street loading facilities located within the project site. The Proposed Project would have a significant impact if it would result in a loading demand that could not be accommodated within proposed facilities such that potentially hazardous conditions for pedestrians or bicycles were created or substantial traffic or transit delay would occur.

Emergency Access

The qualitative discussion of emergency access addresses access to the project site and access for emergency vehicles within the planned circulation pattern.

Construction Analysis

The construction impact evaluation addresses temporary construction-related traffic from construction workers and materials delivery.

Parking Conditions

As explained in Section 4.A, Introduction to Chapter 4, p. 4.A.3-4.A.5, the EIR does not consider the adequacy of the parking supply in determining the significance of impacts of the Proposed Project. Because parking conditions are of interest to the public and decision-makers, a parking demand analysis is presented for informational purposes. The parking analysis quantifies the Proposed Project's parking demand under the Maximum Residential Scenario and the Maximum Commercial Scenario in relation to the proposed parking supply pursuant to the maximum permitted parking in the *Design for Development*, Section 5.4, Off-Street Parking, p. 152.

Travel Demand Analysis

Travel demand refers to the new vehicle, transit, bicycle, and pedestrian traffic that would be generated by the Proposed Project. Forecasts of travel demand from the Proposed Project development scenarios are presented in detail in a Travel Demand Memorandum, which is summarized here.[31] The forecasts are based on methodology in the *SF Guidelines* and supplemented with information that accounts for the large-scale and mixed-use qualities of the

[31] Adavant Consulting, *Pier 70 Special Use District Project – Estimation of Project Travel Demand*, September 4, 2015 (hereinafter "Travel Demand Memorandum").

Proposed Project. No "discount" was taken for trips associated with existing uses on the project site; therefore, the resulting travel demand for the Proposed Project scenarios is conservative.

Trip Generation

The first step in calculating travel demand is to determine the person-trip generation rate. Internal capture rates and mode splits are then applied to the person-trip generation rate.

The person-trip generation estimates for the two project scenarios include residents, employees, and visitors to the proposed development. The weekday daily and p.m. peak hour person-trip generation for the proposed uses at Pier 70 are based on the appropriate rates in Table C-1 in the *SF Guidelines*, except for person-trip generation by the Open Space, which was calculated based on trip rates contained in *Trip Generation*, published by the Institute of Transportation Engineers (ITE).[32] Trip generation has also been estimated for the weekday a.m. peak hour based on trip generation rates for the a.m. peak hour developed for this study using information obtained from ITE. The Proposed Project includes open space elements that would likely have special events ranging from a few hundred people a few times per month and up to approximately 5,000 people approximately four times per year. Because these events would be relatively infrequent and unlikely to occur during the typical weekday peak hours, they are not included in the travel demand calculations. However, the standard TDM measures that are part of the Proposed Project's TDM Plan would remain in place during events, and would serve to reduce the severity of effects on area transportation. Additionally, as noted above, events would require permits from the Port, and in some cases, the City. As part of the permitting process, the event sponsor must include a plan for managing travel to and from the event safely and with minimal effect to the surrounding neighborhoods. These management strategies may include special event shuttles, promotion of transit services, and parking management, such as valet parking.

Table 4.E.12: Person-Trip Generation (Internal and External Trips) presents the weekday daily, a.m. peak hour, and p.m. peak hour person-trip generation forecasts for the Proposed Project scenarios. The table presents trips that would occur within the project site (internal trips) and person-trips that would begin or end outside of the project site (external trips).

The Maximum Residential Scenario would generate 131,359 total daily person-trips on a typical weekday, 10,605 person-trips in the weekday a.m. peak hour, and 15,869 person-trips during the weekday p.m. peak hour (including both internal trips to the project site and external trips to or from locations outside of the project site). Of the total daily person-trips, 114,863 trips are attributable to the 28-Acre Site and 16,496 trips are attributable to the Illinois Parcels.

[32] Institute of Transportation Engineers, *Trip Generation*, 9th Edition, 2012.

Table 4.E.12: Person-Trip Generation (Internal and External Trips)

Land Use	Maximum Residential Scenario				Maximum Commercial Scenario

Total from 28-Acre Site		114,863	8,977	13,531		121,077	9,047	13,185
Total from Illinois Parcels		16,496	1,628	2,338		20,289	1,720	2,466

Note:
Numbers may not sum to total due to rounding.

Source: Fehr & Peers, 2016; Adavant Consulting, 2015

The Maximum Commercial Scenario would generate 141,366 total daily person-trips on a typical weekday, 10,767 person-trips in the weekday a.m. peak hour, and 15,651 person-trips during the weekday p.m. peak hour (including both internal and external trips). The total daily person-trips are 121,077 trips from the 28-Acre Site and 20,289 trips from the Illinois Parcels.

The *SF Guidelines* do not provide a specific methodology to assess the number of trips that could remain within a large, mixed-use project site and would, therefore, be "double counted" with a literal application of the *SF Guidelines* trip generation methodology. Using sources including the National Cooperative Highway Research Program[33] and ITE[34] as an initial point of analysis and through an iterative process, appropriate internal trip capture rates were identified.

Similarly, the *SF Guidelines* do not provide for a methodology for estimating the number of "linked" trips, which are those trips that are made as intermediate stops on the way from an origin to a primary destination. Therefore, appropriate refinements to the standard travel demand analysis approach were made to account for the size and land use mix of the two Proposed Project scenarios, with their large proposed mixes of residential, retail, and office uses.

Table 4.E.13: Trip Generation Accounting for Internal Trips presents the weekday daily, a.m. peak hour, and p.m. peak hour internal and external person-trip generation forecasts for the Proposed Project. Internalization is dependent on the quantity and mix of uses, as well as the varying levels of activity they generate at various times of the day; as a result, the internalization percentage is different for each scenario and the peak periods. The Maximum Residential Scenario is estimated to generate a larger proportion and larger numbers of internal trips than would the Maximum Commercial Scenario on a daily basis and in the a.m. and p.m. peak hours. The internalization ratios selected were within the range of published observed internalization for various land uses published by the National Cooperative Highway Research Program and ITE, and are described more fully in the Travel Demand Memorandum.[35]

In the Maximum Residential Scenario, the Proposed Project would generate 107,059 external person-trips on a typical weekday, 8,809 external person-trips in the weekday a.m. peak hour, and 12,227 external person-trips during the weekday p.m. peak hour). Approximately 18.5 percent of daily person-trips are forecast to remain within the project site in the Maximum Residential Scenario.

Table 4.E.13: Trip Generation Accounting for Internal Trips

Scenario	Number and Proportion of Person-Trips[1]					
	Daily		A.M. Peak Hour		P.M. Peak Hour	
Maximum Residential Scenario						
Internal	24,300	18.5%	1,796	16.9%	3,643	23.0%
External	107,059	81.5%	8,809	83.1%	12,227	77.0%
Total	**131,359**	**100.0%**	**10,605**	**100.0%**	**15,870**	**100.0%**
Maximum Commercial Scenario						
Internal	14,099	10.0%	1,046	9.7%	2,844	18.2%
External	127,266	90.0%	9,721	90.3%	12,808	81.8%
Total	**141,365**	**100.0%**	**10,767**	**100.0%**	**15,652**	**100.0%**

Note:

[1] Numbers may not sum to total due to rounding

Sources: Fehr & Peers, 2016; Adavant Consulting, 2015

In the Maximum Commercial Scenario, the Proposed Project would generate 127,266 external person-trips on a typical weekday, 9,721 external person-trips in the weekday a.m. peak hour, and 12,808 external person-trips during the weekday p.m. peak hour. Approximately 10 percent of daily person-trips are forecast to remain within the project site in the Maximum Commercial Scenario.

As shown in Table 4.E.13, the Maximum Commercial Scenario would generate 20,207 (19 percent) more daily external person-trips than the Maximum Residential Scenario, 912 (10 percent) more external person-trips during the a.m. peak hour, and 581 (5 percent) more external person-trips during the p.m. peak hour.

Trip Distribution

The geographic distribution of project-generated residential trips was obtained from the *2009-2013 American Community Survey 5-Year Estimate for Census Tract 226*, which corresponds to the project site area, supplemented with information from the 1990 and 2000 U.S. Census. Trip distribution for office/PDR, restaurant, and retail uses was obtained from the *SF Guidelines* for land uses within Superdistrict 3 where the project site is located. Distributions are based on the origin/destination of the trip, and are separated into the four quadrants of San Francisco (Superdistricts 1 through 4), and the East Bay, North Bay, South Bay, and outside the region.

As shown in Table 4.E.14: Trip Distribution, the majority of the project-generated trips would be within San Francisco, with the greatest proportion of residential trips related to Superdistrict 1,

the northeast quadrant, and the greatest proportion of worker trips related to Superdistrict 3, the southeast quadrant. Worker trips to/from locations outside of San Francisco are nearly evenly divided between the East Bay and the Peninsula/South Bay. Visitor trips to/from the commercial uses would also be primarily within San Francisco, with the largest proportion traveling within Superdistrict 3. A substantial number of visitor trips from outside San Francisco would be to/from outside the region (12 percent of office/PDR/restaurant trips and 22 percent of retail trips). These patterns were used as the basis for assigning project-generated transit trips to individual transit lines for both project scenarios.

Table 4.E.14: Trip Distribution

Place of Trip End	Residential Trips[1]	Office/PDR/Restaurant Trips		Retail Trips	
		Workers[2]	Visitors[3]	Workers[2]	Visitors[4]
San Francisco	76.3%	53.2%	67.0%	53.2%	59.0%
Superdistrict 1 (Northeast Quadrant)	*53.4%*	*10.6%*	*17.5%*	*10.6%*	*12.5%*
Superdistrict 2 (Northwest Quadrant)	*3.8%*	*12.5%*	*14.0%*	*12.5%*	*8.0%*
Superdistrict 3 (Southeast Quadrant)	*15.3%*	*20.5%*	*28.5%*	*20.5%*	*34.5%*
Superdistrict 4 (Southwest Quadrant)	*3.8%*	*9.6%*	*7.0%*	*9.6%*	*4.0%*

Source: Fehr & Peers, 2016; Adavant Consulting, 2015

Transit trips were assigned to specific routes based on the most direct transit route to and from the beginning and end of the trip. Trip assignments were made separately for the Maximum Residential Scenario and the Maximum Commercial Scenario.

Travel Modes

The project-generated person-trips were assigned to travel modes in order to determine the number of auto, transit, and "other" trips. The "auto" category includes those arriving at the site by private automobile and carpool, while the "transit" category includes those arriving to the site by means of public transportation. "Other" includes walking, bicycle, motorcycle, taxi, and additional modes.

Mode split information for the residential portion of each project scenario was based on data obtained from the U.S. Census, using data from Census Tract 226, in which the project site is located. Mode of travel assumptions for the office, retail, and restaurant uses were obtained from the *SF Guidelines* for employee and visitor trips using an average of Superdistrict 1 and Superdistrict 3. Adjustments were made to account for internal trips.

Table 4.E.15: Daily, A.M. Peak Hour, and P.M. Peak Hour Trip Generation by Mode for Maximum Residential Scenario, and Table 4.E.16: Daily, A.M. Peak Hour, and P.M. Peak Hour Trip Generation by Mode for Maximum Commercial Scenario, summarize the typical weekday daily, a.m. peak hour, and p.m. peak hour external trip generation by mode of travel for the Maximum Residential Scenario and the Maximum Commercial Scenario. Each table also shows the breakdown of travel between the 28-Acre Site and the Illinois Parcels for each scenario. The person-trips shown in the "Auto" columns reflect the total number of persons travelling by

automobile, not the total number of vehicle trips, as some vehicles would transport more than one person, each of whom is making a person-trip. Vehicle trip calculations are presented below.

Under the Maximum Residential Scenario during the weekday a.m. peak hour, the Proposed Project would generate 4,564 external person-trips by automobile (52 percent), 2,665 person-trips by transit (30 percent), and 1,579 person-trips by other modes, including walking (18 percent). During the weekday p.m. peak hour, the Maximum Residential Scenario would generate 6,251 external person-trips by automobile (51 percent), 2,893 person-trips by transit (24 percent), and 3,083 person-trips by other modes (25 percent). Overall, the Maximum Residential Scenario would generate 39 percent more external person-trips in the p.m. peak hour than in the a.m. peak hour, driven by the higher trip generation rate for retail and restaurant uses during the weekday p.m. peak hour.

Under the Maximum Commercial Scenario during the weekday a.m. peak hour, the Proposed Project would generate 5,087 external person-trips by automobile (52 percent), 2,818 person-trips by transit (29 percent), and 1,816 person-trips by other modes, including walking (19 percent). During the weekday p.m. peak hour, the Maximum Commercial Scenario would generate approximately 6,632 external person-trips by automobile (52 percent), 2,809 person-trips by

transit (22 percent), and 3,367 person-trips by other modes (26 percent). Overall, the Maximum Commercial Scenario would generate 32 percent more external person-trips in the p.m. peak hour than in the a.m. peak hour, driven by the higher trip generation rate for retail and restaurant uses during the weekday p.m. peak hour, as for the Maximum Residential Scenario.

As shown in Tables 4.E.15 and 4.E.16, the overall modal split for the two scenarios of the Pier 70 Mixed-Use District Project during the a.m. and p.m. peak hours would be relatively similar. As a percentage of the total, person-trips under the Maximum Residential Scenario would be approximately 1 to 2 percent more likely to travel by transit in the peak hours compared to the Maximum Commercial Scenario. Also, as shown in Tables 4.E.15 and 4.E.16, the overall daily transit use for the two scenarios would be very similar, at about 21 percent of total person-trips.

Average vehicle occupancies were applied to the auto person-trip data presented in Tables 4.E.15 and 4.E.16 to obtain vehicle trip estimates for the project scenarios. Average vehicle occupancy rates for the land uses in the project scenarios were obtained from the U.S. Census Bureau[36] for the census tract in which the project site is located, and from the *SF Guidelines* for land uses located within Superdistrict 1 and Superdistrict 3. The external vehicle trip generation results for the daily a.m. peak hour and p.m. peak hour are summarized in Table 4.E.17: Vehicle Trip Generation (External Trips).

The Maximum Residential Scenario would generate 31,016 external daily vehicle trips on a typical weekday, 3,254 external vehicle trips (60 percent inbound / 40 percent outbound) during the a.m. peak hour, and 3,930 external vehicle trips (48 percent inbound / 52 percent outbound) during the p.m. peak hour. The 28-Acre Site would generate the majority of the vehicle trips, with approximately 26,865 daily vehicle trips, 2,726 a.m. peak hour vehicle trips, and 3,309 p.m. peak hour vehicle trips. The Illinois Parcels would generate approximately 4,151 daily vehicle trips, 528 a.m. peak hour vehicle trips, and 621 p.m. peak hour vehicle trips.

The Maximum Commercial Scenario would generate 34,790 external daily vehicle trips on a weekday, 3,438 external vehicle trips (73 percent inbound / 27 percent outbound) during the a.m. peak hour, and 3,924 external vehicle trips (37 percent inbound / 63 percent outbound) during the p.m. peak hour. Similar to the Maximum Residential Scenario, the 28-Acre Site would generate the majority of the vehicle trips under the Maximum Commercial Scenario, with approximately 29,734 daily vehicle trips, 2,884 a.m. peak hour vehicle trips, and 3,317 p.m. peak hour vehicle trips. The Illinois Parcels would generate approximately 5,056 daily vehicle trips, 554 a.m. peak hour vehicle trips, and 607 p.m. peak hour vehicle trips.

[36] U.S. 2009-2013 American Community Survey 5-Year Estimates. Vehicle occupancy data were obtained from Census Tract 226, which corresponds to the area that includes the project site.

Table 4.E.17: Vehicle Trip Generation

Land Use	Vehicle Trips		
	Daily	**A.M. Peak Hour**	**P.M. Peak Hour**
Maximum Residential Scenario			
Residential (studio/1 bedroom)	2,179	382	403
Residential (2+ bedrooms)	5,883	1,031	1,087
Office	4,871	602	525
Light industrial and arts	632	78	68
General retail	8,664	285	726
Restaurant	8,664	835	1,089
Open Space	122	41	32
Total	***31,016***	***3,254***	***3,930***
Inbound	15,508 (50%)	1,951 (60%)	1,883 (48%)
Outbound	15,508 (50%)	1,303 (40%)	2,047 (52%)
28-Acre Site	26,865	2,726	3,309
Illinois Parcels	4,151	528	621
Maximum Commercial Scenario			
Residential (studio/1 bedroom)	1,139	204	177
Residential (2+ bedrooms)	3,065	548	478
Office	10,775	1,290	1,130
Light industrial and arts	682	82	71

Restaurant	9,554	938	1,221
Open Space	122	41	32
Total	***34,790***	***3,438***	***3,924***
Inbound	17,395 (50%)	2,506 (73%)	1,459 (37%)
Outbound	17,395 (50%)	933 (27%)	2,465 (63%)
28-Acre Site	29,734	2,884	3,317
Illinois Parcels	5,056	554	607

Note:
Numbers may not sum to total due to rounding.

Source: Fehr & Peers, 2016; Adavant Consulting, 2015

The Maximum Commercial Scenario would generate approximately 3,774 (13 percent) more daily external vehicle trips than would the Maximum Residential Scenario, 184 (6 percent) more external vehicle trips during the a.m. peak hour, and 6 fewer external vehicle trips during the p.m. peak hour.

Freight Delivery and Service Vehicle Demand

The delivery/service vehicle demand forecasts for the Proposed Project scenarios use the methodology and truck trip generation rates presented in the *SF Guidelines*. Delivery/service vehicle demand is based on the types and amount of land uses. As shown in Table 4.E.18: Delivery/Service Vehicle Trips and Loading Demand, the Maximum Residential Scenario would generate approximately 642 daily delivery/service vehicle trips consisting primarily of small trucks and vans. This would correspond to a demand for 30 loading spaces during an average hour of loading activities and 37 loading spaces during the peak hour of loading activities.

Table 4.E.18: Delivery/Service Vehicle Trips and Loading Demand

Land Use	Size	Daily Truck Trip Generation Rate[1]	Daily Truck Trip Generation	Average Hour Loading Space Demand	Peak Hour Loading Space Demand
Maximum Residential Scenario					
Residential	3,025 units	0.03	79	4	5
Office/PDR	1,102,250 gsf	0.21	262	12	13
Retail	269,495 gsf	0.22	59	3	3
Restaurant	67,375 gsf	3.60	243	11	14
Total	**-**	**-**	**642**	**30**	**37**
Maximum Commercial Scenario					
Residential	1,645 units	0.03	43	2	2
Office/PDR	2,262,350 gsf	0.21	505	23	29
Retail	275,075 gsf	0.22	61	3	4
Restaurant	68,765 gsf	3.60	248	11	14
Total	**-**	**-**	**856**	**40**	**50**

Notes:
Numbers may not sum to total due to rounding.
[1] *SF Guidelines*, Table H-1.

Sources: SF Guidelines, 2002; Fehr & Peers, 2016; Adavant Consulting, 2015

The Maximum Commercial Scenario would create a greater number of daily truck trips and a greater demand for loading spaces. This scenario would generate approximately 856 daily

truck/service vehicle trips, corresponding to a demand for 40 loading spaces during an average hour and 50 loading spaces during the peak hour of loading demand.

Future 2040 Cumulative Transportation Methodology

Cumulative SB 743 / VMT Methodology

OPR's proposed transportation impact guidelines do not specify a separate methodology for analyzing cumulative impacts using a VMT metric. Under CEQA, a project is considered to have "cumulatively considerable" impacts if the incremental effects of the individual project are significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects (CEQA Guidelines Section 15065(a)(3)).

VMT by its very nature is largely a cumulative impact. In general, no single project by itself would be sufficient in size to prevent the region or state from meeting its VMT (and GHG) reduction goals. Rather, an individual project's VMT contributes cumulatively to the physical secondary environmental impacts associated with the VMT resulting from the distance that existing, currently proposed and future projects would be expected to cause people to drive. VMT (and induced automobile travel) project-level significance thresholds are based on whether project VMT levels would be consistent with state and regional long-term greenhouse gas emission reduction targets and corresponding VMT per capita reduction targets.

The Planning Department has determined that a project's incremental VMT effects are not cumulatively considerable if the project site is located in an area where per capita VMT is more than 15 percent below the projected 2040 per capita regional averages for residential, office, and retail uses. This is an appropriate metric to assess cumulative VMT impacts, for the reasons set forth below.

As noted above, the Transportation Authority uses SF-CHAMP to estimate VMT for different land use types within individual TAZs. For the cumulative scenario, San Francisco 2040 cumulative VMT conditions, including cumulative VMT conditions for the TAZ in which the Project is located, were projected using a SF-CHAMP model run. This model run used the same methodology as outlined for existing conditions, but included forecasts of residential and job growth estimates and reasonably foreseeable transportation investments through 2040, based on the Association of Bay Area Governments (ABAG) most recent Projections (with projected citywide growth in population and employment allocated to individual TAZs by the Planning Department).

As stated above, OPR's proposed use of a VMT metric is intended to implement SB 743's mandate to establish criteria for determining the significance of projects' transportation impacts

that promote the "reduction of greenhouse gas emissions." Notably, San Francisco has been shown to have a significantly lower per-household carbon footprint than most other cities and counties in the San Francisco Bay Area region. Specifically, a December 2015 greenhouse gas consumption study published by the University of California, Berkeley, and funded by BAAQMD,[37] concluded that the average San Francisco household produces 38.7 metric tons of carbon dioxide equivalents (CO2e) annually, which is 12.7percent lower than the overall San Francisco Bay Area average household emissions of 44.3 metric tons of CO2e.

Maintaining per capita VMT that is 15 percent or more below the regional average is an essential component of the City's aggressive GHG reduction targets, detailed in Section H, Greenhouse Gas Emissions. Specifically, Ordinance No. 81-08, adopted in May 2008, established targets including: reduce GHG emissions by 25 percent below 1990 levels by 2017; reduce GHG emissions by 40 percent below 1990 levels by 2025; and reduce GHG emissions by 80 percent below 1990 levels by 2050 (which targets are consistent with – and in fact more ambitious than – those set forth in Governor Brown's recent EO B-30-15 by targeting a 40 percent reduction by 2025 rather than a 40 percent reduction by 2030).

Similarly, reducing per capita VMT is also a key component of the City's local GHG reduction plan, *Strategies to Address Greenhouse Gas Emissions*, recognized by BAAQMD as meeting the criteria of a qualified GHG Reduction Strategy. As further described in Section H, Greenhouse Gas Emissions), the City's Greenhouse Gas Reduction Strategy includes 30 specific regulations for new development that would reduce a project's GHG emissions. In fact, GHG reduction actions in San Francisco have resulted in a 23.3 percent reduction in GHG emissions in 2012 compared to 1990 levels, exceeding the year 2020 reduction goals in the BAAQMD's *Bay Area 2010 Clean Air Plan*, EOs S-3-05 and B-30-15, and AB 32. By complying with and exceeding Plan Bay Area targets, San Francisco is on a trajectory to meet the GHG reduction goals established by AB 32 and SB 375.

The Planning Department's cumulative significance threshold of 15 percent below 2040 per capita regional average VMT, and the proposed Project's VMT per capita, which is well below that threshold, are consistent with the adopted sustainability targets of the *Plan Bay Area*. The current *Plan Bay Area*, adopted on July 18, 2013 (Plan Bay Area 2013), is the region's Sustainable Communities Strategy for the San Francisco Bay Area 2013-2040. The current

[37] C. Jones, D. Kammen (2015). A Consumption-Based Greenhouse Gas Inventory of San Francisco Bay Area Neighborhoods, Cities and Counties: Prioritizing Climate Action for Different Locations. University of California, Berkeley, and Bay Area Air Quality Management District. Available online at http://www.baaqmd.gov/research-and-data/emission-inventory/consumption-based-ghg-emissions-inventory (last accessed 9/30/16).

update that began in Spring 2015 is called Plan Bay Area 2040, with release of the Draft Plan Bay Area 2040 and associated Draft EIR anticipated in March 2017.

Plan Bay Area 2013 is designed to reach greenhouse gas reductions established by CARB for the Bay Area region, which targets include a 7 percent per capita reduction by 2020 and a 15 percent per capita reduction by 2035.[38] Plan Bay Area 2013 identified 10 performance targets, which include both mandatory and voluntary targets. One of the mandatory performance targets requires the Bay Area to reduce its per-capita CO_2 emissions from cars and light duty trucks by 15 percent by 2040. Plan Bay Area achieves this milestone.[39] One of the voluntary targets includes decreasing automobile VMT per capita by 10 percent.[40] Plan Bay Area 2013 states that the average Bay Area resident traveled about 22 miles by car on a typical weekday in 2005; by 2040, the average resident is expected to travel 20 miles per day, a reduction of 9 percent. This near-achievement of the per-capita VMT target reflects the carefully targeted locations of envisioned housing and commercial development in Priority Development Areas with excellent transit service.[41] Even though Plan Bay Area achieves VMT reductions of 9 percent, which does not fully achieve the adopted 10 percent reduction target, Plan Bay Area nonetheless achieves the mandatory performance target to reduce per-capita CO_2 emissions from cars and light duty trucks by 15 percent by 2040[42].

Notably, the type of growth planned within the Port of San Francisco Priority Development Area (PDA), and growth within the City and County of San Francisco as a whole, will necessarily result in a population-based increased volume of VMT and GHG emissions, regardless of the City's GHG reduction targets and any new GHG reduction measures. Similarly, the population and economic activity associated with each project within the Port of San Francisco PDA, and within the City and County of San Francisco, will result in a total increase of VMT and GHG emissions. Certain projects may meet or exceed estimated population and/or employment growth identified for the Port of San Francisco PDA, while remaining within ABAG projections for the 2040 cumulative scenario. Notwithstanding such increased volume of GHG emissions and VMT, San Francisco complies with and exceeds Plan Bay Area GHG reduction targets, and is on a trajectory to meet the GHG reduction goals established by AB 32 and SB 375. Accordingly, consistency with *Plan Bay Area*, a plan designed to reach greenhouse gas reductions established by CARB for the Bay Area region, provides further support for the Planning Department's

[38] Association of Bay Area Governments and Metropolitan Transportation Commission, *Plan Bay Area*, July 18, 2013 (hereinafter "Plan Bay Area 2013," p. 4.
[39] Plan Bay Area 2013, p. 5.
[40] Ibid., p. 106.
[41] Ibid.
[42] Ibid., p. 5

adopted significance threshold for determining whether a project's incremental VMT effects are cumulatively considerable.

Future 2040 Transportation Network Improvements

There are several reasonably foreseeable improvements planned on the transportation network in the transportation study area. For the purposes of the transportation analysis for this EIR, the following transit improvements from Muni Forward were assumed to be in place as part of the 2040 cumulative conditions, in addition to those assumed to be in place for the Baseline Conditions:

- On the T Third light rail line, peak period headways would be reduced and trains would operate as two-car trains.[43]
- The 10 Townsend route would be rerouted off Townsend Street at Fourth Street. From Fourth Street, the route would extend through Mission Bay to new proposed street segments on Seventh Street between Mission Bay Boulevard and Hubble Street, on Hubble Street between Seventh and 16th streets, on 16th Street between Hubble and Connecticut streets, and on Connecticut Street between 16th and 17th streets. Peak period headways would be reduced from 20 to 6 minutes. Midday headways would be reduced from 20 to 12 minutes. The 10 Townsend would be renamed the 10 Sansome.
- The 48 Quintara/24th Street would operate all day from 48th Avenue to the Hunters Point Naval Shipyard. At 25th and Connecticut streets, this route would no longer follow the existing alignment and would change to follow the existing 19 Polk route to Hunters Point via Evans and Innes avenues. This would provide a new connection from the Mission District, Noe Valley, and the Sunset to Third Street and Hunters Point. The existing portion of the 48 Quintara/24th Street route east of Connecticut Street would be re-branded as the 58 as part of Muni Forward improvements.

Other transportation projects that were taken into consideration in the overall cumulative transportation analysis include the *San Francisco Bicycle Plan*, the Second Street Improvement Project, the Van Ness and Geary BRT Projects, and the Caltrain electrification program.

Future 2040 Development Projects

In addition to the transportation improvements listed above, the cumulative transportation impact analysis includes forecasted growth in jobs and employment in San Francisco by the year 2040. This growth includes, but is not limited to, the following reasonably foreseeable nearby development projects:

- Mission Bay Redevelopment Plans (the portions not yet built out)
- Candlestick Point-Hunters Point Shipyard Development Plan

[43] The assumptions for service increases as part of the Central Subway described herein are based on the Central Subway operating plan, which were developed and approved (including appropriate CEQA review) independent of and supersede assumptions for the T Third line outlined in Muni Forward.

- Development associated with nearby neighborhood plans, including the Eastern Neighborhoods Plans and the Western SOMA Plan
- Golden State Warriors Event Center and Mixed-Use Development
- Mission Rock Mixed-Use Project on Seawall Lot 337 and Pier 48
- Future Crane Cove Park
- India Basin
- Potrero Hope SF Master Plan

The cumulative transportation analysis is projection-based, rather than list-based; therefore, the projects listed here are simply examples of those that are accounted for in the growth forecast used in the travel demand forecasting model. The model includes a comprehensive projection of growth that is reasonably foreseeable in 2040, based on known and forecast development including growth under adopted area plans that could affect San Francisco's transportation network.

Cumulative Transportation Demand

Future year 2040 cumulative intersection traffic volumes were derived from outputs from the Transportation Authority's travel demand forecasting model (SF-CHAMP). The SF-CHAMP model is an activity-based travel demand model that has been validated to represent existing and future transportation conditions in San Francisco. The model predicts all person travels for a full day based on total and locations of population, housing units, and employment, which are then allocated to different periods throughout the day, using time of day sub-models. The model predicts person travel by mode for auto, transit, walk, and bicycle trips. The model also provides forecasts of vehicular traffic on regional freeways and major arterials and on the study area local roadway network, considering the available roadway capacity, origin-destination demand, and travel speeds when assigning the future travel demand to the roadway network.

Future year 2040 cumulative transit ridership projections were developed based on transit growth projections developed for the Transit Effectiveness Project and provided by the Planning Department. Forecast future hourly ridership demand was then compared to expected hourly capacity, as determined by the likely route and headway changes identified in Muni Forward, including those described above under the "Future 2010 Transportation Network Improvements" discussion, p. 4.E.74, to estimate capacity utilization under 2040 cumulative conditions.

IMPACT EVALUATION

CONSTRUCTION IMPACTS

Impact TR-1: Construction of the Proposed Project would not result in significant impacts on the transportation and circulation network because they would be of limited duration and temporary. (*Less than Significant*)

The discussion of construction impacts is based on currently available information from the project sponsors, summarized in Chapter 2, Project Description, and professional knowledge of typical construction practices in San Francisco. Build-out of the Proposed Project would occur in up to five phases over an approximately 11-year period, from about 2018 through about 2029. Infrastructure would be constructed in tandem with new and rehabilitated buildings and open space. Construction impacts would be the same for both the Maximum Residential Scenario and the Maximum Commercial Scenario.

Construction-related activities would generally occur Monday through Saturday, between 7:00 a.m. and 8:00 p.m., and the typical work shift for most construction workers would be from 7:00 a.m. to about 3:30 p.m. Construction is not anticipated to occur on Sundays or major legal holidays, but may occur on an as-needed basis. The hours of construction would be stipulated by the San Francisco Department of Building Inspection. Construction staging would occur within the project site.

The project sponsors and construction contractor(s) would be required to prepare traffic control plans for the various construction phases, which would be intended to reduce potential conflicts between construction activities and pedestrians, bicycles, transit, and autos at the project site and with other construction projects in the project vicinity that are expected to occur during the 11-year construction period. The exact routes that construction trucks would use would depend on the location of construction materials being transported to the project site and the location of the construction activities on the project site as well as the location of disposal sites for excavated soil and demolition debris. However, it is reasonable to assume that construction vehicles would typically use Third Street and 25th Street or Mariposa Street to access I-280 to travel south; Third Street and either Second or Fifth streets to reach the Bay Bridge and the East Bay; and Third Street, Howard Street, and Van Ness Avenue (U.S. 101) to travel to North Bay destinations. All of these streets have two or more travel lanes in each direction and are designed to handle truck traffic. The impact of construction traffic on these streets could be a slight lessening of their capacities due to slower-moving vehicles and would not substantially affect peak period conditions because construction work schedules do not typically coincide with the peak commute periods. Truck access routes would be reviewed with SFMTA as part of the traffic control plans.

If temporary traffic lane, parking lane, or sidewalk closures would be needed, the closures would be coordinated with City staff to minimize effects on local traffic and circulation. In general, lane and sidewalk closures are subject to review and approval by the City's Transportation Advisory Staff Committee (TASC) that consists of representatives of City departments, including SFMTA, Public Works, the Fire Department, the Police Department, the Health Department, the Port, and the Taxi Commission. There are no Muni bus stops adjacent to or on the project site, so none would need to be relocated.

The trip distribution and mode split of construction workers are speculative to estimate. However, it is anticipated that the addition of the worker-related vehicle or transit trips would not substantially affect transportation conditions, as impacts on local intersections or the transit network would be substantially less than those associated with the Proposed Project and would be temporary in nature. Construction workers who drive to the site and potential temporary parking restrictions along Illinois Street would cause a temporary increase in parking demand and a decrease in supply. Construction workers would need to park either on-street, in parking facilities that currently have availability during the day, or in temporary parking facilities established on vacant parcels. However, parking shortfalls would be temporary and are not considered a significant environmental impact.

Overall, construction-related transportation impacts of the Proposed Project would be less than significant and no mitigation measures would be required. However, the following Improvement Measure is identified to further reduce less-than-significant potential conflicts between construction activities and pedestrians, bicyclists, transit, and autos, and between construction activities and nearby businesses and residents:

Improvement Measure I-TR-A: Construction Management Plan

Traffic Control Plan for Construction – To reduce potential conflicts between construction activities and pedestrians, bicyclists, transit, and autos during construction activities, the project sponsors should require construction contractor(s) to prepare a traffic control plan for major phases of construction (e.g., demolition and grading, construction, or renovation of individual buildings). The project sponsors and their construction contractor(s) will meet with relevant City agencies to coordinate feasible measures to reduce traffic congestion, including temporary transit stop relocations and other measures to reduce potential traffic and transit disruption and pedestrian circulation effects during major phases of construction. For any work within the public right-of-way, the contractor would be required to comply with San Francisco's Regulations for Working in San Francisco Streets (i.e., the "Blue Book"), which establish rules and permit requirements so that construction activities can be done safely and with the least possible interference with pedestrians, bicyclists, transit, and vehicular traffic. Additionally, non-construction-related truck movements and deliveries should be restricted as feasible during peak hours (generally 7:00 a.m. to 9:00 a.m. and 4:00 p.m. to

6:00 p.m., or other times, as determined by SFMTA and the Transportation Advisory Staff Committee [TASC]).

In the event that the construction timeframes of the major phases and other development projects adjacent to the project site overlap, the project sponsors should coordinate with City Agencies through the TASC and the adjacent developers to minimize the severity of any disruption to adjacent land uses and transportation facilities from overlapping construction transportation impacts. The project sponsors, in conjunction with the adjacent developer(s), should propose a construction traffic control plan that includes measures to reduce potential construction traffic conflicts, such as coordinated material drop offs, collective worker parking, and transit to job site and other measures.

Reduce Single Occupant Vehicle Mode Share for Construction Workers – To minimize parking demand and vehicle trips associated with construction workers, the project sponsors should require the construction contractor to include in the Traffic Control Plan for Construction methods to encourage walking, bicycling, carpooling, and transit access to the project construction sites by construction workers in the coordinated plan.

Project Construction Updates for Adjacent Residents and Businesses – To minimize construction impacts on access for nearby residences, institutions, and businesses, the project sponsors should provide nearby residences and adjacent businesses with regularly-updated information regarding construction, including construction activities, peak construction vehicle activities (e.g., concrete pours), travel lane closures, and lane closures via a newsletter and/or website.

OPERATIONAL IMPACTS

VMT IMPACTS

As noted in the Analysis Methodology section, San Francisco uses maps illustrating areas that exhibit below-threshold VMT. The maps demonstrate whether a proposed project is in a transportation-efficient location, (e.g., transit-oriented infill), and will help the City, region and state reach their GHG reduction targets under AB 32. The Transportation Authority has prepared SF-CHAMP model runs to estimate the existing VMT generated per capita within each of the City's TAZs for residential, office, and retail land uses. In those TAZs where land uses are estimated to generate VMT per capita at a rate no more than 15 percent lower than the regional average for that land use type, new proposed land uses are forecasted to also generate VMT per capita at no more than 15 percent lower than the regional average for that land use type, so long as the proposed land uses are relatively similar in transportation context to the existing surrounding land uses (i.e., similar parking ratios, scale, transportation amenities, etc.).

Impact TR-2: The Proposed Project would not cause substantial additional VMT nor substantially induce automobile travel. (*Less than Significant*)

As summarized in Table 4.E.3 above, existing average daily VMT per capita is more than 15 percent below the existing regional average daily VMT per capita for residential, office, and retail uses in TAZ 559 where the Proposed Project is located. Given that the project site is located in

an area where existing VMT is more than 15 percent below the existing regional average, the Proposed Project's residential, office, and retail (and thus, PDR, open space, and restaurant) uses would not result in substantial additional VMT and impacts would be less than significant. Furthermore, the project site meets the Proximity to Transit Stations screening criterion, which also indicates that the Proposed Project's uses would not cause substantial additional VMT.[44]

For the reasons set forth below, the amount of parking included in the Proposed Project would not result in VMT beyond the significance threshold.

As stated above, many factors affect travel behavior. These factors include density, diversity of land uses, design of the transportation network, access to regional destinations, distance to high-quality transit, development scale, demographics, and transportation demand management.[45] The Transportation Authority's SF-CHAMP accounts for a variety of these factors to estimate VMT throughout San Francisco. SF-CHAMP is not sensitive to site-level characteristics like TDM measures. The amount of parking provided on a site is considered a TDM measure.

As part of the "Shift" component of the Transportation Sustainability Program, the City is pursuing the San Francisco TDM Program. The purpose of the TDM Program is to reduce the VMT that otherwise would be forecast to occur from new development (in SF-CHAMP or other transportation modeling software) based upon the new development's TAZ location. In order to achieve this VMT reduction, the San Francisco TDM Program requires that property owners select from a menu of TDM measures, defined as measures that reduce VMT by residents, tenants, employees, and visitors and are under the control of the property owner. A reduction in VMT may result from shifting vehicle trips to sustainable travel modes or reducing vehicle trips, increasing vehicle occupancy, or reducing the average vehicle trip length.

The TDM Technical Justification document[46] provides the technical basis for the creation of the applicability, targets, and assignment of points to individual measures on the TDM menu used for the San Francisco TDM Program. Each of the TDM measures on the menu is assigned a number of points, reflecting its relative effectiveness in reducing VMT. This relative effectiveness determination is grounded in literature review, local data collection, best practices research, and professional transportation expert opinion. One of the individual measures in the TDM menu that was researched was parking supply, as described below.

[45] California Smart-Growth Trip Generation Rates Study, Appendix A, University of California, Davis Institute of Transportation Studies, March 2013.

[46] San Francisco Planning Department, *Transportation Demand Management Technical Justification*, June 2016

In 2010, the California Air Pollution Control Officers Association (CAPCOA) published a report that quantifies project-level land use, transportation, energy use, and other measures effects on GHG emissions based upon a literature review of research conducted to date.[47] The CAPCOA report identifies a maximum of 12.5 percent reduction in VMT related to parking supply (PDT-1). Recent research, described further below, indicates that an area with more parking influences a higher demand for more automobile use.

A New York City study of three boroughs showed a clear relationship between guaranteed vehicular parking at home and a greater tendency to use the automobile for trips made to and from work, even when both work and home are well served by transit. The study also infers that driving to other non-work activities is also likely to be higher for households with guaranteed vehicular parking.[48] Related literature focused on the relationship between the availability of free on-street parking supply and the number of cars per household supports the findings that the availability of parking increases private car ownership by approximately nine percent.[49] A study of households within a two-mile radius of ten rail stations in New Jersey concluded that if development near transit stations is developed with a high parking supply (on- and off-street), then those developments will not reduce automobile use compared to developments located further away from transit stations, and that parking supply can undermine the incentive to use transit that proximity to transit provides.[50] A study of nine cities across the United States looked at the question of whether citywide changes in vehicular parking cause automobile use to increase, or whether minimum parking requirements an appropriate response the already rising automobile use. The study concluded that: "parking provision in cities is a likely cause of increased driving among residents and employees in those places".[51]

Research conducted in San Francisco focused on whether or not a relationship exists between the provision of off-street parking and the choice to drive among individuals traveling to or from the site (similar to the focus of one of the questions in the nine-city United States study). Following data collection and an empirical review of the data, this research found that reductions in off-street vehicular parking for office, residential, and retail developments reduce the overall automobile mode share associated with those developments, relative to projects with the same

[51] Chris McCahill, et al., "Effects of Parking Provision on Automobile Use in Cities: Inferring Causality," Transportation Research Board, November 13, 2015.

land uses in similar contexts that provide more off-street vehicular parking.[52] In other words, more off-street vehicular parking is linked to more driving and that people without dedicated parking spaces are less likely to drive.

Based upon the recent research, a reduced parking supply is one the most effective TDM measure available in the menu for the TDM Program. Eleven options (with points associated with them) are provided for this TDM measure in the TDM Program, depending upon the development project's parking supply[53] compared to the neighborhood parking rate. The neighborhood parking rate is number of existing parking spaces provided per dwelling unit or per 1,000 square feet of non-residential uses for each TAZ within San Francisco.

Using the neighborhood parking rate as a basis for assigning points accounts for the variability in geography throughout San Francisco and the effect this can have on travel behavior. Although parking supply is not an input into SF-CHAMP, based upon the recent research, the existing parking supply within a TAZ has a relationship with the VMT for that TAZ. Therefore, a new development would mostly likely not reduce VMT as it relates to parking supply if the new development is not parked at least at or below the neighborhood parking rate.

In this instance, the existing neighborhood parking rate for the project site (TAZ 559) is 0.72 spaces per residential unit and 0.04 per 1,000 square feet of non-residential space. The parking rate takes into account the amount of parking and residential units and non-residential square footage in the TAZ itself and other nearby accessible TAZs within a 0.75 mile network-based walking distance, with more distant parking and residential units and non-residential square footage within that walking distance given decreasing weight. Therefore, although the project site is relatively underutilized and only contains non-residential uses, the neighborhood parking rate accounts for residential units and non-residential square footage nearby. These rates, and in particular, the rate for non-residential space are substantially lower than elsewhere in the City, likely due to the prevalence of large industrial warehousing spaces in the neighborhood that tend to have large square footages with relatively low travel activity, and thus require low amounts of off-street parking, particularly when on-street parking exists.

In addition, even though parking is not specifically an input into SF-CHAMP, the existing parking is captured in the estimates of VMT outputs from SF-CHAMP because it is an existing condition on the ground. As mentioned above, existing average daily VMT per capita, per employee, and per retail employee in TAZ 559 is below the existing regional average daily VMT per capita, per employee, and per retail employee, respectively. Therefore, in order to exceed the

[52] Fehr and Peers, *Parking Analysis and Methodology Memo – Final*, April 2015.
[53] This refers to accessory (or off-street) parking supply, which is defined in the TDM Program Standards.

threshold of 15 percent below regional averages, the project would have to substantially increase VMT per capita, per employee, and per retail employee.

In typical conditions, a proposed project would be relatively similar in land use mix to the surrounding neighborhood's land uses. Under these circumstances, in order to account for an increase or decrease in VMT per capita from the project's parking supply, the project's parking rate is compared to the neighborhood parking rate.

The Proposed Project includes up to 3,496 parking spaces. Maximum parking supply rates per land use are 0.75 spaces per residential unit and 1.0 spaces per 1,000 square feet for non-residential uses. The residential parking rate is slightly higher than the neighborhood average rate; however, it is very close to the neighborhood average, and to the extent such a small difference may affect VMT, it is not likely to increase VMT to the point where it would exceed the threshold since the residential VMT per capita is expected to be 49 percent below the regional average.

The Proposed Project's parking supply rates for non-residential uses are higher than the neighborhood average, which could indicate that the Proposed Project's non-residential uses may be expected to generate higher VMT rates than the forecasts from SF-CHAMP (which are designed to project the "average" project) would otherwise suggest. However, the overall premise of the above discussion of parking is that for similar land uses, with all other factors held constant, an increase in parking supply would tend to increase VMT per capita and a decrease in parking supply would tend to decrease VMT per capita. In the case of the Proposed Project, the existing neighborhood non-residential parking supply, expressed as a rate per 1,000 square feet of development, is highly influenced by the prevalence of large industrial warehouses which have large square footages and relatively little transportation activity per square foot. In contrast, the Proposed Project would consist primarily of residential, retail, office, and light industrial uses, which would result in a higher population (employees and visitors) per square foot than large warehouses. Thus, the fact that the Proposed Project's non-residential parking supply rates, which are based on retail, office, and light industrial uses are higher than the existing neighborhood's non-residential parking ratio, which consists of primarily large industrial warehouses, does not necessarily suggest that the Proposed Project's land uses would generate VMT per capita for office and retail uses at a higher rate than forecasted by SF-CHAMP. In this case, because there is relatively little office and retail use in the study area comparable to the Proposed Project, a comparison to the neighborhood average is not as meaningful.

Further, as noted at the end of this Chapter, under Parking Information, pp. 4.E.124-4.E.126, for both residential and non-residential uses, the Proposed Project's parking supply is forecasted to be less than the forecasted parking demand, meaning that parking is constrained and likely contributing to decreases in VMT compared to conditions with an unconstrained parking supply.

Thus, the parking at the Proposed Project is not likely to be readily available and travelers would likely experience parking shortfalls during peak times. As a result, even though parking ratios may be higher than the neighborhood average, the effect of a parking supply that does not meet forecasted demand suggests that the VMT rates forecasted by SF-CHAMP should not be adjusted upward to account for an abundant parking supply.

Additionally, the above discussion does not fully account for the reduction in VMT likely to occur due to the Proposed Project's TDM Plan, which includes robust measures (such as shuttles, participation in the regional bikeshare program, unbundled parking supply, and the establishment of a site-wide Transportation Management Agency) to reduce VMT. The TDM Technical Justification document includes documentation regarding the estimated VMT reduction from many of the measures included in the Proposed Project's TDM Plan. Therefore, the VMT impacts of the Proposed Project would be less than significant.

Although the VMT impacts would be less than significant, implementation of the Air Quality Mitigation Measure M-AQ-1f: Transportation Demand Management, pp. 4.G.47-4.G.50, would likely further reduce the Proposed Project's less-than-significant impacts related to VMT such that it would be lower than the forecasts discussed above, if implemented. Generally, Mitigation Measure M-AQ-1f would require the reduction of single-occupant automobile trips through TDM elements that would supplement those outlined in the Proposed Project's TDM Plan. As noted earlier, the City is in the process of adopting a TDM Ordinance, requiring new development projects to implement a specific level of TDM measures. Because the Proposed Project is part of a proposed Special Use District, the Proposed Project would not be subject to the TDM Ordinance. However, the Proposed Project's TDM Plan would be required to achieve a similar policy goal to the TDM Ordinance. The Mitigation Measure described above would further enhance the level of TDM measures implemented.

Finally, the Proposed Project is not a transportation project. However, the Proposed Project would include features that would alter the transportation network. The features are new sidewalks and sidewalk widening, bicycle facilities, on-street loading zones and curb cuts, new internal roadways, on-street safety strategies, and intersection signalization described in Chapter 2, Project Description. These features fit within the general types of projects identified above that would not substantially induce automobile travel as they do not create substantial increases in roadway capacity.[54] Therefore, impacts would be less than significant.

[54] San Francisco Planning Department, Executive Summary: Resolution Modifying Transportation Impact Analysis, Appendix F, Attachment A, March 3, 2016.

TRAFFIC IMPACTS

The Proposed Project would have a significant impact on traffic if it created or contributed to a major traffic hazard in the study area. In general, the Proposed Project would add vehicle trips to the surrounding roadways; however, a general increase in traffic in and of itself would not be considered a traffic hazard.

Impact TR-3: The Proposed Project would not create major traffic hazards. (*Less than Significant*)

Existing vehicle, pedestrian, and bicycle volumes on Illinois Street, 20th Street, 22nd Street, and other streets near the project site are low (with the exception of Third Street). The Proposed Project would add vehicle trips to the surrounding roadways; however, a general increase in traffic would not be considered a traffic hazard. The Proposed Project's new internal street system is currently under development; however, the final designs would be subject to approval by the SFMTA, San Francisco Fire Department, and the Department of Public Works to ensure that the streets are designed consistent with City policies and design standards. Overall, the Proposed Project's street network has been designed to minimize street widths and provide ample sidewalk space, which serves to calm traffic, shorten pedestrian crossing distances, and encourage use of walking and bicycling.

When events are planned at the Pier 70 site, the event sponsors would be required to obtain permits from the Port of San Francisco; these permits will include strategies to enhance transportation conditions in Mission Bay and nearby neighborhoods.[55] The site's TDM coordinator should participate as a member of the Mission Bay Ballpark Transportation Coordination Committee (MBBTCC) and provide notification prior to the start of any event that would overlap with an event at the Warriors arena.

Because the Proposed Project's roadway network is designed to prioritize safe bicycle and pedestrian travel within the site, traffic speeds are likely to be relatively slow within the project site. Further, the Proposed Project would install traffic control devices within and adjacent to the project site that would further enhance safety for all users based on forecasted traffic conditions. As a result, the Proposed Project is not expected to create a major traffic hazard, and the Proposed Project's traffic impacts are considered less than significant.

[55] All new parks constructed as part of the Proposed Project would be owned by the Port of San Francisco and events would be required to go through the Port's permitting process on a case-by-case basis. For private parcels within the Proposed Project, no event venues are proposed. Generally, events with fewer than 2,000 attendees would be managed via the strategies included in the Proposed Project's TDM plan and would be expected to be operated in a manner similar to the way events on Pier 70 are currently managed. However, events with more than 2,000 attendees may require additional strategies to improve transportation conditions that would be developed through the MBBTCC.

TRANSIT IMPACTS

The Proposed Project would generate 2,665 person-trips on transit during the weekday a.m. peak hour and 2,893 person-trips on transit during the weekday p.m. peak hour in the Maximum Residential Scenario. In the Maximum Commercial Scenario, the Proposed Project would generate similar totals for transit ridership – 2,818 person-trips on transit during the weekday a.m. peak hour and 2,809 person-trips on transit during the weekday p.m. peak hour. Transit trips to and from the project site would use nearby Muni routes (T Third, 10 Townsend, 22 Fillmore, or 48 Quintara/24th Street) or the Proposed Project's shuttle system to connect to and from regional transit providers.

The Proposed Project would include a shuttle service, operated and maintained by the Pier 70 TMA, to connect the Pier 70 Mixed-Use District to regional transit hubs. The primary goal of the proposed shuttle service at Pier 70 is to provide a first-mile / last-mile connection for transit riders traveling to or from the project site, particularly for riders needing to use frequent local and regional transit. These riders would be expected to take regional transit services operated by BART, Caltrain, AC Transit, Golden Gate Transit, SamTrans, or other regional transit providers, but would need an additional connection to access these services when traveling to or from Pier 70.

The exact structure of any shuttle service provided for the Proposed Project site has not been established and would depend on factors that are not known at this time. For planning and analysis purposes, two routes have been preliminarily identified; however, final service routes and stops would be determined based on rider feedback and demand, peak period traffic congestion on local streets, and BART and Caltrain schedules and service plans at specific stations. The two preliminary routes assumed for this analysis are:

- 22nd Street, Mississippi Street, and 16th Street to access the 22nd Street Caltrain Station and the 16th Street / Mission BART station
- Third Street, 16th Street, and King Street to access the Fourth and King Caltrain Station (with some trips extending to the Transbay Transit Center)

While shuttle riders would have the option of taking local transit services operated by Muni, the shuttle system would offer complimentary service to meet the needs of these users, similar to the way in which the Mission Bay TMA shuttle system enhances existing Muni service. For the purposes of this analysis, residents and employees at the project site were forecast to use the shuttle to get to the regional transit service hubs (e.g., BART and Caltrain). All transit trips not associated with a regional service connection were assumed to be via Muni routes, rather than on the shuttle, because the shuttle is not intended to replicate Muni's local service. The proposed 15-minute headways of the shuttles would be similar to the existing 10 Townsend, 22 Fillmore, or 48

Quintara/24th Street headways. However, the shuttle service would be free to residents, employees, and other visitors.

The shuttle service would enroll in the SFMTA Commuter Shuttle Program. The Commuter Shuttle Program includes minor modifications to the existing roadways to install new commuter shuttle stops, as well as the installation of minor improvements such as signage, traffic islands, and bus bulbs. The shuttle would follow all policies set forth by the Commuter Shuttle Program. The Commuter Shuttle Program was environmentally cleared on October 22, 2015.[56]

The Baseline Conditions assume completion of the Central Subway, which is planned to open in 2019 and would supplement the existing Muni routes. After the service changes being implemented as part of the Muni Forward campaign, the 22 Fillmore and 33 Stanyan will provide service in the 16th Street corridor at 6- to 8-minute headways and 12-minute headways, respectively, during the peak periods. The 58 24th Street route (replacing portions of the 48 Quintara/24th Street) would be the least frequent Muni route serving Pier 70, but is still proposed for weekday headways of 15 minutes during the a.m. and p.m. peak periods and midday period. These service changes were also assumed in the Baseline Conditions analysis.

The additional project-generated transit trips would follow the geographic trip distribution patterns described earlier throughout San Francisco and the region. Transit trips were assigned to the individual transit routes based on the likely origins and destinations of the trips and the available capacity on each route. Table 4.E.19: Muni Downtown Screenlines – A.M. Peak Hour and Table 4.E.20: Muni Downtown Screenlines – P.M. Peak Hour present the ridership and capacity utilization at Muni screenlines and on individual Muni routes with project-generated transit trips added to the baseline ridership in the a.m. and p.m. peak periods.

As shown in the tables, with the addition of project-generated transit trips, some Muni transit corridors and individual routes would exceed Muni's capacity utilization standard of 85 percent, although no screenlines would exceed the standard.

Overall, two of the primary routes serving the study area (the T Third and the 22 Fillmore) would operate in dedicated rights-of-way and therefore are not likely to be affected by project-related traffic congestion. The 48 Quintara/24th Street will not operate on major streets in the vicinity of the Proposed Project and as such, its route is not likely to be affected by project-generated traffic congestion either. Thus, the Proposed Project's impacts on transit delay are expected to be minor and are not discussed in detail in this analysis.

Source: Fehr & Peers, 2016. See Appendix D in the Transportation Impact Study for Transit Line Capacity Calculations.

Impact TR-4: The Proposed Project would not result in any Muni screenlines exceeding 85 percent capacity utilization nor would it increase ridership by more than five percent on any Muni screenline forecast to exceed 85 percent capacity utilization under Baseline Conditions without the Proposed Project. (*Less than Significant*)

As shown on pp. 4.E.87-4.E.88, capacity utilization at the four Downtown Muni screenlines would range from 65 percent at the northwest screenline in the a.m. peak hour to 92 percent at the southwest screenline in the a.m. peak hour under Baseline Conditions. Both the Maximum Residential Scenario and Maximum Commercial Scenario would add riders to the northeast, southeast, and southwest screenlines. The addition of riders from the Proposed Project would increase capacity utilization but would not cause any of the screenlines that operate below 85 percent capacity utilization to exceed the 85 percent standard. Some sub-corridors within the screenlines would exceed 85 percent capacity utilization. Specifically, the "other lines" sub-corridor within the Southeast screenline would operate at 94 percent and 96 percent in the Maximum Residential and Maximum Commercial scenarios, respectively, in the a.m. peak hour. However, the overall screenline would operate within the 85 percent capacity utilization standard and conditions on this screenline are considered acceptable.

Capacity utilization at the southwest screenline would increase from 92 percent to 95 percent under the Maximum Residential Scenario and 96 percent under the Maximum Commercial Scenario in the a.m. peak hour. Furthermore, the "subway lines" sub-corridor within the southwest screenline would increase capacity utilization in the a.m. peak hour from 95 percent under Baseline Conditions to 101 percent and 102 percent capacity utilization under the Maximu Residential and Maximum Commercial scenarios, respectively. However, the Proposed Project would add less than 5 percent to the baseline ridership at the overall screenline. Therefore, because the Proposed Project would not cause any screenline to exceed its capacity utilization threshold and because the Proposed Project would not increase capacity utilization by more than 5 percent on any screenline forecasted to exceed its capacity utilization threshold under Baseline Conditions without the Proposed Project, the impact would be less than significant and no mitigation is required.

Impact TR-5: The Proposed Project would cause one individual Muni route to exceed 85 percent capacity utilization in the a.m. and p.m. peak hours in both the inbound and outbound directions. (*Significant and Unavoidable with Mitigation*)

The T Third light rail line (renamed from the KT Third/Ingleside route following completion of the Central Subway) as well as the 22 Fillmore and the 48 Quintara/24th Street bus routes under Baseline Conditions operate within the capacity utilization standard of 85 percent in the a.m. and p.m. peak period. With ridership generated by the Maximum Residential Scenario and Maximum

Commercial Scenario, the T Third light rail line and 22 Fillmore bus route would continue to operate below 85 percent capacity utilization. However, the 48 Quintara/24th Street routes would exceed 85 percent capacity utilization inbound and outbound with project implementation. This would occur in the a.m. and p.m. peak hours.

Maximum Residential Scenario

The Proposed Project would cause the capacity utilization of the 48 Quintara/24th Street to increase from 47 percent to 106 percent in the inbound direction and from 79 percent to 168 percent in the outbound direction in the a.m. peak hour under the Maximum Residential Scenario. Under this same scenario, in the p.m. peak hour, the Proposed Project would cause the capacity utilization of the 48 Quintara/24th Street to increase from 63 percent to 147 percent in the inbound direction and from just under 85 percent to 162 percent in the outbound direction. Project-generated ridership would be 56 percent of the inbound 48 Quintara/24th Street ridership and 53 percent of the outbound ridership on the 48 route at the MLP in the a.m. peak hour. In the p.m. peak hour, project-generated ridership would be 57 percent of the ridership on the 48 Quintara/24th Street route in the inbound direction and 48 percent in the outbound direction.

Maximum Commercial Scenario

The Proposed Project would cause the capacity utilization of the 48 Quintara/24th Street to increase from 47 percent to 94 percent in the inbound direction and from 79 percent to 206 percent in the outbound direction in the a.m. peak hour under the Maximum Commercial Scenario. Under this same scenario, in the p.m. peak hour, the Proposed Project would cause the capacity utilization of the 48 Quintara/24th Street to increase from 63 percent to 172 percent in the inbound direction and from just under 85 percent to 148 percent in the outbound direction. Project-generated ridership would be 50 percent of the inbound 48 Quintara/24th Street ridership and 62 percent of the outbound ridership on the 48 route in the a.m. peak hour. In the p.m. peak hour, project-generated ridership would be 63 percent of the ridership on the 48 Quintara/24th Street route in the inbound direction and 43 percent in the outbound direction.

This would be a significant impact on this Muni route under either scenario of the Proposed Project. In order to reduce this impact to less-than-significant levels, additional transit capacity along the 48 Quintara/24th Street bus route would be required.

Mitigation Measure M-TR-5: Monitor and increase capacity on the 48 Quintara/24th Street bus routes as needed.

Prior to approval of the Proposed Project's phase applications, project sponsors shall demonstrate that the capacity of the 48 Quintara/24th Street bus route has not exceeded 85 percent capacity utilization, and that future demand associated with build-out and occupancy of the phase will not cause the route to exceed its utilization. Forecasts of

travel behavior of future phases could be based on trip generation rates forecast in the EIR or based on subsequent surveys of occupants of the project, possibly including surveys conducted as part of ongoing TDM monitoring efforts required as part of Air Quality Mitigation Measure M-AQ-1f: Transportation Demand Management, p. 4.G.47-4.G.50.

If trip generation calculations or monitoring surveys demonstrate that a specific phase of the Proposed Project will cause capacity on the 48 Quintara/24th Street route to exceed 85 percent, the project sponsors shall provide capital costs for increased capacity on the route in a manner deemed acceptable by SFMTA through the following means:

- The project sponsors shall pay the capital costs for additional buses (up to a maximum of four in the Maximum Residential Scenario and six in the Maximum Commercial Scenario). While the project sponsors could assist with purchasing the buses, SFMTA would need to find funding to pay for the added operating cost associated with operating increased service made possible by the increased vehicle fleet. The source of that funding has not been established.

Alternatively, if SFMTA determines that other measures to increase capacity along the route would be more desirable than adding buses, the project sponsors shall pay an amount equivalent to the cost of the required number of buses toward completion of one or more of the following, as determined by SFMTA:

- Convert to using higher-capacity vehicles on the 48 Quintara/24th Street route. In this case, the project sponsors shall pay a portion of the capital costs to convert the route to articulated buses. Some bus stops along the route may not currently be configured to accommodate the longer articulated buses. Some bus zones could likely be extended by removing one or more parking spaces; in some locations, appropriate space may not be available. The project sponsors' contribution may not be adequate to facilitate the full conversion of the route to articulated buses; therefore, a source of funding would need to be established to complete the remainder, including improvements to bus stop capacity at all of the bus stops along the route that do not currently accommodate articulated buses.
- SFMTA may determine that instead of adding more buses to a congested route, it would be more desirable to increase travel speeds along the route. In this case, the project sponsors' contribution would be used to fund a study to identify appropriate and feasible improvements and/or implement a portion of the improvements that would increase travel speeds sufficiently to increase capacity along the bus route such that the project's impacts along the route would be determined to be less than significant. Increased speeds could be accomplished by funding a portion of the planned bus rapid transit system along 16th Street for the 22 Fillmore between Church and Third streets. Adding signals on Pennsylvania Street and 22nd Street may serve to provide increased travel speeds on this relatively short segment of the bus routes. The project sponsors' contribution may not be adequate to fully achieve the capacity increases needed to reduce the project's impacts and SFMTA may need to secure additional sources of funding.
- Another option to increase capacity along the corridor is to add new a Muni service route in this area. If this option is selected, project sponsors shall fund

purchase of the same number of new vehicles outlined in the first option (four for the Maximum Residential Alternative and six for the Maximum Commercial Alternative) to be operated along the new route. By providing an additional service route, a percentage of the current transit riders on the 48 Quintara/24th Street would likely shift to the new route, lowering the capacity utilization below the 85 percent utilization threshold. As for the first option, funding would need to be secured to pay for operating the new route.

Implementing any of the components of Mitigation Measure M-TR-5 would allow Muni to maintain transit headways, and would reduce the Proposed Project's impact to less-than-significant levels. Implementation of features of the mitigation measure above that would require discretionary approval actions by the SFMTA or other public agencies (including allocation of funds to operate increased frequencies) is considered uncertain because public agencies subject to CEQA cannot commit to implementing any part of a proposed project, including proposed mitigation measures, until environmental review is complete. Thus, while the SFMTA has reviewed the feasibility of the options listed above, implementation of these measures cannot be assured until after certification of this EIR. Because it is unknown whether M-TR-5 would be implemented, project-related impacts on the 48 Quintara/24th Street would be significant and unavoidable.

Impact TR-6: Two individual Muni routes would continue to operate within the 85 percent capacity utilization standard in the a.m. and p.m. peak hours in both the inbound and outbound directions with addition of the Proposed Project. (*Less than Significant*)

With implementation of the Proposed Project, both the T Third light rail and the 22 Fillmore bus route would operate within the 85 percent capacity utilization in the a.m. and p.m. peak hours in both the inbound and outbound directions under both the Maximum Residential and Maximum Commercial scenarios. As a result, the Proposed Project's impacts on those individual routes would be less than significant.

Impact TR-7: The Proposed Project would not cause significant impacts on regional transit routes. (*Less than Significant*)

As shown in Table 4.E.21: Regional Transit Screenlines – Baseline Plus Project (A.M. Peak Hour) and Table 4.E.22: Regional Transit Screenlines – Baseline Plus Project (P.M. Peak Hour), transit carriers to the North Bay and South Bay and Peninsula do not exceed their established capacity utilization standards under Baseline Conditions in the a.m. or p.m. peak hour. The East Bay screenline does exceed its established capacity utilization threshold in the a.m. peak hour (primarily due to overcrowding on BART). The East Bay screenline operates within its established capacity utilization threshold in the p.m. peak hour (although BART remains overcrowded during that peak hour between San Francisco and the East Bay).

Table 4.E.21: Regional Transit Screenlines – Baseline Plus Project (A.M. Peak Hour)

Source: Fehr & Peers, 2016. See Appendix D in the Transportation Impact Study for Transit Line Capacity Calculations.

Maximum Residential Scenario

Development under the Maximum Residential Scenario would generate 161 transit person-trips from the East Bay, 66 transit person-trips from the North Bay, and 499 transit person-trips from the South Bay in the inbound direction in the a.m. peak hour. In the outbound direction in the p.m. peak hour, the Maximum Residential Scenario would generate 140 transit person-trips to the East Bay, 57 transit person-trips to the North Bay, and 434 transit person-trips to the South Bay. The East Bay regional screenline would exceed its capacity utilization threshold in the a.m. peak hour. However, the Proposed Project would not increase the ridership by more than 5 percent during the a.m. peak hour. Although the BART line to the East Bay would exceed its capacity utilization threshold in the p.m. peak hour, the overall East Bay regional screenline would not exceed its capacity utilization threshold in the p.m. peak hour with the addition of project-related

trips. None of the other regional screenlines would exceed capacity utilization standards in either the a.m. or p.m. peak with the addition of project-generated trips.

The Maximum Residential Scenario would not result in a significant impact on regional transit service, and no mitigation would be necessary.

Maximum Commercial Scenario

Development under the Maximum Commercial Scenario would generate 208 transit person-trips from the East Bay, 80 transit person-trips from the North Bay, and 589 transit person-trips from the South Bay in the inbound direction in the a.m. peak hour. In the outbound direction in the p.m. peak hour, the Proposed Project would generate 105 transit person-trips to the East Bay, 41 transit person-trips to the North Bay, and 288 transit person-trips to the South Bay. The East Bay regional screenline would exceed its capacity utilization threshold in the a.m. peak hour. However, similar to the Maximum Residential Scenario, the Proposed Project would not increase the ridership by more than 5 percent during the a.m. peak hour under the Maximum Commercial Scenario. Also similar to the Maximum Residential Scenario, the East Bay BART line would exceed its capacity utilization threshold in the p.m. peak hour. However, the overall East Bay regional screenline would not exceed its capacity utilization threshold in the p.m. peak hour with the addition of project-related trips.

Thus, with the exception of the East Bay regional screenline in the a.m. peak hour, none of the regional screenlines would exceed capacity utilization standards in either the a.m. or p.m. peak hours with the addition of project-generated trips. Although the East Bay regional screenline would exceed its capacity utilization threshold in the a.m. peak hour, the Proposed Project would not increase ridership by more than 5 percent.

The Maximum Commercial Scenario would not result in a significant impact on regional transit service, and no mitigation would be necessary.

PEDESTRIAN IMPACTS

The Proposed Project includes sidewalks throughout the project site, with widths ranging between 9 and 18 feet, including on new internal streets and on the existing streets on the perimeter of the project site. The Proposed Project would also complete the portion of the proposed Blue Greenway, a planned multi-use path along the eastern waterfront of San Francisco, along the project site's eastern frontage. The proposed sidewalk network is intended to comply with City standards for sidewalks on residential streets pursuant to the *Better Streets Plan*.

Pedestrian trips generated by the Proposed Project would include walking trips to and from the local and regional transit stops, as well as walking trips to and from nearby complementary land

uses. As shown in Table 4.E.15, the Proposed Project would generate 1,579 non-auto, non-transit trips in the a.m. peak hour and 3,083 during the weekday p.m. peak hour with the Maximum Residential Scenario. As shown in Table 4.E.16, the Proposed Project would generate 1,816 non-auto, non-transit trips in the a.m. peak hour and 3,367 during the weekday p.m. peak hour with the Maximum Commercial Scenario. Many of these trips would be pedestrian trips. In addition, many transit trips also end or begin with a walking trip to get to or from the transit stop and many of the internal trips identified would also be by foot. Non-auto, non-transit trips include walking, bicycle, motorcycle, taxi, and trips on other transportation modes.

Impact TR-8: Pedestrian travel generated by the Proposed Project could be accommodated on the new roadway and sidewalk network proposed for the project site. (*Less than Significant*)

The Proposed Project site plan and roadway improvements would provide for sidewalks along all streets on the project site. Sidewalks would range from 9 to 18 feet and would comply with City standards for sidewalks on residential streets. New intersections would be designed to City standards, as compact as possible and with all-way stop control, to provide a pedestrian-friendly design. The Proposed Project also includes a shared street treatment on Maryland Street. This street would have no curbs and would be designed to prioritize pedestrian travel.

The Proposed Project's parking structures would be dispersed throughout the site, with access points and driveways that could create conflicts with pedestrians. These conflicts are generally expected and a necessary part of provision of off-street parking, and garage entrances would comply with appropriate design standards, which are meant to provide for the safety of all roadway users.

Thus, the pedestrian-related features of the proposed site plan would not result in hazardous pedestrian conditions or present barriers to pedestrian accessibility. The Proposed Project would accommodate the pedestrian trips it would generate. Therefore, the impact would be less than significant and no mitigation is required.

Although, as noted above, the Proposed Project's parking facility access points would comply with appropriate design standards, the less-than-significant effect of vehicle queuing across sidewalks would be minimized with implementation of Improvement Measure I-TR-B: Queue Abatement, to ensure that pedestrian travel is unimpeded.

Improvement Measure I-TR-B: Queue Abatement

It should be the responsibility of the owner/operator of any off-street parking facility with more than 20 parking spaces (excluding loading and car-share spaces) to ensure that vehicle queues do not occur regularly on the public right-of-way. A vehicle queue is defined as one or more vehicles (destined to the parking facility) blocking any portion of

any public street, alley, or sidewalk for a consecutive period of 3 minutes or longer on a daily or weekly basis.

If a recurring queue occurs, the owner/operator of the parking facility should employ abatement methods as needed to abate the queue. Appropriate abatement methods will vary depending on the characteristics and causes of the recurring queue, as well as the characteristics of the parking facility, the street(s) to which the facility connects, and the associated land uses (if applicable).

Suggested abatement methods include but are not limited to the following: redesign of facility to improve vehicle circulation and/or on-site queue capacity; employment of parking attendants; installation of LOT FULL signs with active management by parking attendants; use of valet parking or other space-efficient parking techniques; use of off-site parking facilities or shared parking with nearby uses; use of parking occupancy sensors and signage directing drivers to available spaces; TDM strategies such as additional bicycle parking, customer shuttles, delivery services; and/or parking demand management strategies such as parking time limits, paid parking, time-of-day parking surcharge, or validated parking.

If the Planning Director, or his or her designee, suspects that a recurring queue is present, the Planning Department should notify the property owner in writing. Upon request, the owner/operator should hire a qualified transportation consultant to evaluate the conditions at the site for no less than 7 days. The consultant should prepare a monitoring report to be submitted to the Planning Department for review. If the Planning Department determines that a recurring queue does exist, the facility owner/operator should have 90 days from the date of the written determination to abate the queue.

Impact TR-9: Existing pedestrian facilities in the vicinity of the project site, while incomplete, would not pose substantial hazards to pedestrian traffic generated by the Proposed Project. (*Less than Significant*)

The Proposed Project does not include improving pedestrian facilities outside the project site, except for improvements along its frontage to Illinois Street, as discussed above on pp. 4.E.45. There are sidewalks along most of the streets in the area surrounding the project site. Existing pedestrian conditions near the project site occasionally lack fully accessible facilities such as curb ramps. The Proposed Project would generate pedestrian trips to and from transit stops at 20th and Third streets for the T Third Muni light rail line, and on 22nd Street under the I-280 freeway for Caltrain. The addition of pedestrians to the sidewalks on 20th and 22nd streets is not expected to result in substantial overcrowding or otherwise create potentially hazardous conditions for pedestrians. Additionally, the 22 Fillmore terminal stop at 20th and Tennessee streets and the 48 Quintara/24th Street terminal stop at 20th and Third streets have substantial sidewalk space for waiting passengers.

In addition, as part of a separate and ongoing planning effort, the City is conducting a planning process, led by the Planning Department, to improve the public realm in the Central Waterfront and Dogpatch neighborhoods, known as the Central Waterfront/Dogpatch Public Realm Plan.

The Plan area includes the blocks between Illinois Street, Cesar Chavez Street, I-280, and Mariposa Street. This planning process is generally designed to improve sidewalks, pedestrian crossings, and lighting in the area, as well as enhance streetscape features. Upon completion, the Plan will consist of a comprehensive set of smaller projects, prioritized so that as funding becomes available, the individual components of the plan may be constructed over time. As the study area becomes more fully built out, pedestrian conditions will further improve.

Although the Central Waterfront/Dogpatch Public Realm Plan would improve conditions for pedestrians, the existing conditions provide adequate pedestrian circulation in the study area, and the Proposed Project's impact would be less than significant and no mitigation is required.

Impact TR-10: Existing pedestrian facilities at the Proposed Project's access points would present barriers to accessible pedestrian travel. (*Less than Significant with Mitigation*)

The Proposed Project's access points would use existing stop-controlled intersections on Illinois Street at 20th Street and 22nd Street and a new intersection at the new 21st Street to be added west of Illinois Street. Several barriers to accessible pedestrian travel currently exist between these intersections, including missing ADA curb ramps at the intersection of 22nd Street and Illinois Street and a narrow stretch of sidewalk with obstructions mid-block on Illinois Street between 22nd and 20th streets. This lack of an accessible path of travel to and from the project site would be a significant impact. Additionally, the Proposed Project's transit riders would cross Illinois Street at the intersections with 20th, 21st, and 22nd streets. Although the Proposed Project is proposing to construct a new signal at the new intersection at Illinois Street and 21st Street, pedestrian crossings at the all-way stop controlled intersections along Illinois Street at 20th and 22nd streets would be particularly challenging, given forecasted increases in traffic along Illinois Street. This would also be a significant impact.

In order to improve pedestrian circulation and safety adjacent to the project site, new traffic signals, ADA curb ramps and improved sidewalks would be required to be constructed along the project's Illinois Street frontage.

Mitigation Measure M-TR-10: Improve pedestrian facilities on Illinois Street adjacent to and leading to the project site.

As part of construction of the Proposed Project roadway network, the project sponsors shall fund the following improvements:

- Install ADA curb ramps on all corners at the intersection of 22nd Street and Illinois Street
- Signalize the intersections of Illinois Street with 20th and 22nd streets.
- Modify the sidewalk on the east side of Illinois Street between 22nd and 20th streets to a minimum of 10 feet. Relocate obstructions, such as fire hydrants and

power poles, as feasible, to ensure an accessible path of travel is provided to and from the Proposed Project.

With implementation of this mitigation measure, the Proposed Project would provide appropriate pedestrian access along the boundary of the project site and along corridors to nearby transit stops. The impact would be reduced to less-than-significant levels.

BICYCLE IMPACTS

Impact TR-11: The Proposed Project would not create potentially hazardous conditions for bicyclists and would not interfere with bicycle accessibility to the project site or adjoining areas. (*Less than Significant*)

The Proposed Project would provide bicycle parking in compliance with the requirements of the San Francisco Planning Code. Under either the Maximum Residential Scenario or the Maximum Commercial Scenario, residential buildings with more than 50 residential units would be required to provide 25 Class 1 bicycle parking spaces (lockers, monitored bike parking, or other restricted-access parking areas) plus one additional Class 1 space for every four residential units after the first 50 units.[57] Commercial uses would be required to provide three bicycle parking spaces for buildings with 10,000 to 20,000 square feet of professional services space or 20,000 to 50,000 square feet of restaurant or personal services space; six bicycle parking spaces for buildings with 20,000 to 50,000 square feet of professional services space or 50,000 to 100,000 square feet of restaurant or personal services space; and 12 spaces for buildings with over 50,000 square feet of professional services space or 100,000 square feet of restaurant or personal services space. The Maximum Residential Scenario proposes 1,142 Class 1 bicycle parking spaces and 514 Class 2 (unprotected bike racks) bicycle parking spaces. The Maximum Commercial Scenario proposes 995 Class 1 and 475 Class 2 bicycle parking spaces. These amounts of bicycle parking would meet or exceed Planning Code requirements.

On the project site, bicycle facilities are proposed along 20th Street, 22nd Street, and Maryland Street. The same facilities would be provided with both the Maximum Residential Scenario and the Maximum Commercial Scenario. These roadways provide direct connections to and from external roadways such as Illinois Street for travel to and from the project site. The proposal for 22nd Street between Illinois Street and the new Louisiana Street includes a Class III shared bicycle lane in the eastbound direction and a striped and signed Class II bicycle lane in the westbound direction. The bicycle facilities on other streets on the project site would be Class III shared bicycle lanes with sharrows painted on the roadway surface. The Proposed Project also includes a bi-directional bicycle path along the east side of the project site on the waterfront, separate from

[57] Thus, a 100-unit residential building would be required to provide a total of 38 Class I bicycle parking spaces (25 for the first 50 residential units plus 12.5 for the remaining 50 units).

any vehicle travel lane, to be part of the Blue Greenway and Bay Trail and connecting the eastern waterfront with The Embarcadero.

The project site is within convenient bicycling distance of office and retail uses in the Dogpatch, Mission Bay, Mission, Potrero Hill, SOMA, and Bayview neighborhoods. There are bicycle routes near the project site, including bicycle lanes on Illinois Street (Route 5), Terry A Francois Boulevard (Route 5), 16th Street (Route 40), Fourth Street (Route 40), and several blocks of Cesar Chavez Street (Route 60), and bicycle routes on Indiana Street (Route 7), a portion of Mariposa Street and Minnesota Street (Route 7), and Cesar Chavez Street (Route 60).

Bicyclists heading to or from the south would use Illinois Street, the current alignment of the Bay Trail, to connect to Route 60, which provides connections to farther destinations and designated bicycle routes. Bicyclists heading to or from the north would use Terry A Francois Boulevard or Fourth Street, both designated bicycle routes, to connect to Routes 11, 36, and 40 that provide connections to farther destinations and designated bicycle routes. Routes 40, 44, and 60 provide east-west connections that cross I-80 into the Mission District. While the existing bicycle network does not include a designated east-west route that connects to the project site between Mariposa Street and Cesar Chavez Street, bicyclists can use 20th Street, a two-lane roadway with stop-controlled intersections that travels through residential areas and small neighborhood commercial districts, to travel to and from the Potrero Hill neighborhood directly to the project site. The intersection of 20th Street and the proposed Louisiana Street on the project site would allow bicyclists to connect to the proposed Blue Greenway and Bay Trail along the shoreline.

As discussed above, the Proposed Project would comply with the Planning Code requirements for bicycle parking, would not increase bicycle traffic to a level that adversely affects bicycle facilities in the area (the bicycle mode share of the Proposed Project would be similar to the mode share in other parts of San Francisco with substantial bicycle infrastructure), and would not create a new hazard or substantial conflict for bicycling. The Proposed Project would not adversely affect bicycle accessibility to the project site or adjoining areas. Thus, the Proposed Project's impact on bicycle facilities and circulation would be less than significant.

LOADING IMPACTS

Impact TR-12: The Proposed Project's loading demand during the peak loading hour would not be adequately accommodated by proposed on-site/off-street loading supply or in proposed on-street loading zones, which may create hazardous conditions or significant delays for transit, bicycles or pedestrians. (*Significant and Unavoidable with Mitigation*)

To minimize conflicts with pedestrians and bicyclists, a maximum of one loading access point would be permitted for each building frontage where off-street loading is planned. This

requirement would minimize curb cuts and prioritize pedestrian movement where a sidewalk is present. Exterior loading docks, where loading and unloading occurs outside of a building, would not be permitted, and commercial loading entries would be required to be at least 60 feet from the corner of an intersection. Waste collection facilities would be provided separately for each building and would be visually screened from the public right-of-way, minimizing conflicts with travelways. For the residential trash/recycling pickup, trash containers would be transported by the building staff from the trash rooms to the curb at the time of trash pickup and returned following pickup, or Recology personnel would access the trash rooms to retrieve the trash containers. For the commercial/non-residential uses, trash would be carted to the curb by building management or tenants of the commercial spaces, or Recology personnel would access the trash rooms to retrieve trash containers. Building management would coordinate with the appropriate disposal and recycling company regarding the specific locations of garbage containers.

The Proposed Project includes a shared street treatment on Maryland Street that would allow limited or no vehicular access at some times, either for special events or at designated times of day. However, for all buildings fronting Maryland Street service entrances would be provided on 21st, Louisiana, and 22nd streets (although on-street loading could still occur from Maryland Street during periods when the shared street was open to vehicular access). Thus, limiting or prohibiting delivery vehicles from accessing Maryland Street from time to time would not result in a significant impact because building service access would be retained.

Despite the fact that the Proposed Project would minimize loading conflicts with bicycles and pedestrians and would not result in significant loading impacts on the shared street, there would be a loading supply shortfall that would result in significant impacts.

Overall, the Maximum Residential Scenario would generate a demand for approximately 640 daily delivery and service vehicle trips, and the Maximum Commercial Scenario would generate a demand for approximately 855 daily delivery vehicle and service vehicle trips. Deliveries would be primarily small trucks and vans, typical of deliveries throughout the City.

The residential units in the Maximum Residential Scenario would generate a demand for four loading spaces in the average loading hour and five loading spaces in the peak loading hour (generally 1 hour between the hours of 10:00 a.m. and 1:00 p.m.). The residential units in the Maximum Commercial Scenario would generate a demand for two loading spaces in both the average and peak loading hours (see Table 4.E.23: Delivery/Service Vehicle Trips and Loading Demand).

The demand for loading spaces for non-residential uses would range from 26 spaces in the Maximum Residential Scenario to 38 spaces in the Maximum Commercial Scenario in the

average loading hour. In the peak loading hour, the demand for non-residential uses would be for 32 loading spaces in the Maximum Residential Scenario and 48 loading spaces in the Maximum Commercial Scenario.

Table 4.E.23: Delivery/Service Vehicle Trips and Loading Demand

Land Use	Size	Daily Truck Trip Generation Rate	Daily Truck Trip Generation[1]	Average Hour Loading Space Demand	Peak Hour Loading Space Demand
Maximum Residential Scenario					
Residential	3,025 units	0.03	79	4	5
Office/PDR	1,102,250 gsf	0.21	262	12	13
Retail	269,495 gsf	0.22	59	3	3
Restaurant	67,375 gsf	3.60	243	11	14
Total	**-**	**-**	**642**	**30**	**37**
Maximum Commercial Scenario					
Residential	1,645 units	0.03	43	2	2
Office/PDR	2,262,350 gsf	0.21	505	23	29
Retail	275,075 gsf	0.22	61	3	4
Restaurant	68,765 gsf	3.60	248	11	14
Total	**-**	**-**	**856**	**40**	**50**

Note: The sums of individual land use loading demands may not add to the total shown due to rounding.

Sources: SF Guidelines, 2002; Fehr & Peers, 2016; Adavant Consulting, 2015

The Proposed Project would include on-street and/or off-street loading spaces based on square footage of gross leasable area.[58] Table 4.E.24: Proposed Loading Space Ratios presents the minimum loading requirements that would be applicable to new uses on the project site under both the Maximum Residential Scenario and the Maximum Commercial Scenario as described in the Proposed Project's Design for Development guidelines. Each residential building would include one or two on-street or off-street loading spaces, depending on the size of the building. Commercial/office buildings with under 50,000 square feet of gross leasable area would not be required to provide loading spaces; between 50,001 and 100,000 square feet, one on-street loading space would be required; between 100,001 and 250,000 square feet, one off-street loading space would be required; between 250,001 and 500,000 square feet, two off-street loading spaces would be required; and over 500,000 square feet, three off-street loading spaces would be

[58] Forest City, *Pier 70 Design Guidelines*, Section 9.9 Loading and Services, p. 262-263. DRAFT April 1, 2015.

required. These requirements are similar to, but not the same as, Planning Code requirements for loading.

Table 4.E.24: Proposed Loading Space Ratios

Use	Gross Leasable Area	Minimum	Loading Space Type
Commercial/Office	0-50,000 GLA	Not Required	
	50,001-100,000 GLA	1	On-street
	100,001-250,000 GLA	1	Off-street
	250,001-500,000 GLA	2	Off-street
	500,001 and above GLA	3	Off-street
Retail	0-10,000 GLA	Not Required	
	10,001-30,000 GLA	1	On-street
	30,001-50,000 GLA	2	Off-street
	50,001 GLA and above	1 per 25,000 GLA	Off-street
Residential	0-225,000 GLA	1	On-street or Off-Street
	225,001 GLA and above	2	On-street or Off-street
RALI (Retail/Arts/Light Industrial)	0-50,000 GLA	Not required	
	50,001-150,000 GLA	1	On-street
	150,001-250,000 GLA	2	Off-street

Note:
GLA = Gross Leasable Area.

Source: Forest City, *Pier 70 SUD Design Guidelines*, DRAFT April 1, 2016.

When applied to the specific buildings proposed as part of the Proposed Project, the Proposed Project's loading supply would be 28 spaces in the Maximum Residential Scenario and 25 spaces in the Maximum Commercial Scenario. This would result in a shortfall of nine loading spaces during the peak hour of loading for the Maximum Residential Scenario and a shortfall of 25 loading spaces during the peak hour of loading for the Maximum Commercial Scenario.

Most residential loading demand would be generated when tenants move in and out of a residential unit. This loading would be either from off-street loading facilities or on-street, likely near the building entrances, depending on the size of building and loading facilities provided in the building. For residential buildings with off-street facilities, new tenants would coordinate with building management to reserve space at the off-street loading facilities provided by that building. For residential buildings with no off-street facilities, new tenants would either use on-street loading facilities, if available, or they could apply for a temporary "no parking" permit with SFMTA, which prohibits on-street public parking for a temporary period to allow for moving vans and trucks to park. Residential move-ins and move-outs are typically a relatively infrequent occurrence, except when a building is first occupied, such that the off-street loading facilities and

on-street curb space would likely be adequate for move-ins and move-outs. Residential buildings would generate parcel delivery vehicles (e.g., United Parcel Service and Federal Express vans) in addition to large moving vans. These parcel deliveries are usually short and would not substantially affect circulation around the project site. The one or two on-street or off-street loading spaces that would be required for each residential building would likely satisfy the residential loading demand. Therefore, extra on-street loading spaces would not be necessary in residential areas of the project site.

Non-residential deliveries of goods to businesses such as restaurants and retail tenants would occur at on-street loading spaces at least 75 feet long or in off-street loading areas as required for buildings serving commercial/office and RALI uses with more than 100,000 gross leasable square feet. Given the forecast loading space shortfalls for both the Maximum Residential Scenario and the Maximum Commercial Scenario, service and delivery vehicles may occasionally park in regular public parking spaces or double-park and partially block local streets while loading and unloading goods. Although this is a relatively common occurrence in San Francisco and a small shortfall would not be unusual, the scale of the Proposed Project's loading shortfall combined with its relatively narrow streets would constitute a significant impact.

Other than increasing the off-street loading space requirements in the Design for Development documentation to better match demand, it may be beyond the project sponsors' control to fully mitigate the significant impact. However, there are measures the project sponsors could take to reduce the severity of the impact. Those measures are outlined in Mitigation Measure M-TR-12, below.

Mitigation Measure M-TR-12A: Coordinate Deliveries

The Project's Transportation Coordinator shall coordinate with building tenants and delivery services to minimize deliveries during a.m. and p.m. peak periods.

Although many deliveries cannot be limited to specific hours, the Transportation Coordinator shall work with tenants to find opportunities to consolidate deliveries and reduce the need for peak period deliveries, where possible.

Mitigation Measure M-TR-12B: Monitor loading activity and convert general purpose on-street parking spaces to commercial loading spaces, as needed.

After completion of the first phase of the Proposed Project, and prior to approval of each subsequent phase, the project sponsors shall conduct a study of utilization of on- and off-street commercial loading spaces. The methodology for the study shall be reviewed and approved by the Planning Department prior to completion. If the result of the study indicates that fewer than 15 percent of the commercial loading spaces are available during the peak loading period, the project sponsors shall incorporate measures to convert existing or proposed general purpose on-street parking spaces to commercial parking spaces in addition to the required off-street spaces.

Implementation of Mitigation Measures M-TR-12A and M-TR-12B may not fully resolve the loading shortfall, as the project's Transportation Coordinator may not be able to shift on-site delivery times. Additionally, there may not be an adequate supply of on-street general purpose parking spaces to convert to commercial loading spaces such that the loading shortfall can be accommodated on-street. Thus, even with implementation of Mitigation Measures M-TR-12A and M-TR-12B, the Proposed Project's loading impacts would remain significant and unavoidable.

EMERGENCY ACCESS

Impact TR-13: The Proposed Project would not result in significant impacts on emergency access to the project site or adjacent locations. (*Less than Significant*)

Emergency access to the project site would remain essentially unchanged compared to existing conditions. Emergency vehicles would continue to access the site from Third Street, Illinois Street, 20th Street, and 22nd Street. Additionally, the Proposed Project would add a new connection to the site from Illinois Street at 21st Street. Aside from the general increase in vehicle traffic described in the Proposed Project's Transportation Impact Study that would result from the additional activity at the site, the Proposed Project would not inhibit emergency access to the project site.

Internal to the project site, most roadways are proposed to have at least 22 feet curb-to-curb width to accommodate emergency vehicles (including bicycle lanes but not including parking bays). A portion of the new 21st Street between Louisiana Street and the waterfront open space would have a clear right-of-way of about 20 feet. Also, between 20th and 21st streets, Louisiana Street would have a single 15-foot travel lane and one 12-foot loading bay. The Design for Development document (*Pier 70 SUD Design Guidelines*) presents turning radii analyses completed for WB-40 (wheelbase of 40 inches), WB-50, and WB-62 design vehicles (i.e., large semi-trailer trucks) that shows all vehicle movements could be achieved with the proposed network.[59] Standard emergency vehicles in San Francisco typically have better maneuverability than these design vehicles; thus, emergency vehicle turning radii would be accommodated by the Proposed Project's street layout.

As discussed for loading, if Maryland Street is to be closed to vehicular access on some occasions, the planned service passageways would provide access to emergency services providers during those temporary closure periods.

[59] *Transportation Impact Study* Section 5.7, p. 125, citing Forest City, *Pier 70 Design Guidelines*, p. 262 DRAFT, April 1, 2015.

Development of the project site, and associated increases in vehicles, pedestrians, and bicycle travel would not substantially affect emergency vehicle access to other buildings and areas within adjacent Mission Bay, including the UCSF campus, which is just over 0.5 mile from the project site. The UCSF Medical Center Phase 1 contains an emergency room and urgent care center for the UCSF Children's Hospital at the southern end of the hospital complex, with access from Fourth Street, north of Mariposa Street. Access to the Fourth Street urgent care center is directly from Mariposa Street, or from Owens Street via the Southern Connector Road (an internal road within the Medical Center campus site that provides access between the south Medical Center entrance and the parking facilities). Owens Street can be accessed from 16th Street, the I-280 northbound off-ramp, and Mariposa Street. A number of roadway improvements are currently under construction as part of Phase 1 of the UCSF Medical Center that enhance access to UCSF and critical hospital services, including extending Owens Street between Mariposa and 16th streets, widening Mariposa Street to five lanes, installing a new signal at the Mariposa Street and Owens Street intersection, adding a lane on the I-280 northbound off-ramp at Mariposa Street, and constructing a new signal at Mariposa Street at the I-280 northbound off-ramp. On Mariposa Street, if necessary, emergency vehicles and other persons accessing the emergency room and urgent care center in their personal vehicles during an emergency would be able to travel within the center left-turn lane to access the intersection of Fourth and Mariposa streets. Therefore, circulation in the area is expected to improve with completion of these new roadway connections within Mission Bay. Further, an emergency route along Mariposa Street (the center left-turn lane) and along Third Street (the transit-only lanes) would be available along key corridors in the study area. Therefore, the Proposed Project would not result in substantial increases in vehicle delay for emergency vehicles or other persons accessing the emergency room and urgent care center in their personal vehicles.

During events at AT&T Park, approximately 1.5 miles from the project site, pre-event and post-event vehicular traffic are managed to minimize impacts on emergency vehicle circulation and access. During pre-event conditions at AT&T Park, up to 21 Parking Control Officers (PCOs) are stationed at 17 locations. During post-event conditions, up to 19 PCOs are stationed at 14 locations. This includes intersections along Third Street, Mission Rock Street, and Terry A Francois Boulevard. If necessary, emergency vehicles would be able to travel on Muni's light rail right-of-way in the median of Third Street. Persons accessing the UCSF Medical Center emergency room and urgent care center in their personal vehicles during an emergency would, if necessary, also be able to utilize the transit-only lanes to bypass congested segments on 16th Street. On Mariposa Street, emergency vehicles and other persons accessing the emergency room and urgent care center in their personal vehicles during an emergency would be able to travel within the center left-turn lane to access the intersection of Fourth and Mariposa streets. PCOs deployed for major events at AT&T Park would have the capability to respond to conflicts between event center traffic and UCSF hospital access. PCOs also have the capability to radio

ahead to other downstream PCOs to inform them of approaching vehicles requiring emergency access. Although the Proposed Project may increase traffic in the vicinity of AT&T Park on event days, the Proposed Project's increment of increase is likely small relative to the event-related traffic, and the event traffic management systems described above are designed to adapt to changes in traffic and would remain effective with implementation of the Proposed Project.

In the circumstance of simultaneous events at AT&T Park and the Proposed Project site, the event sponsors at the Proposed Project would be required to develop a TDM Plan as noted earlier that accounts for projected congestion in the area. Additionally, event traffic management systems at AT&T Park are reviewed and refined continuously to plan for such simultaneous events. Therefore, both events would likely develop refinements to their plans that ensure emergency vehicle circulation is accommodated.

Although not required to address significant impacts, implementation of Improvement Measure I-TR-C: Strategies to Enhance Transportation Conditions During Events would ensure that events at Pier 70 are coordinated with events at AT&T Park to further reduce the less-than-significant effects of congestion on emergency vehicle circulation.

> **Improvement Measure I-TR-C: Strategies to Enhance Transportation Conditions During Events.**
>
> The project's Transportation Coordinator should participate as a member of the Mission Bay Ballpark Transportation Coordination Committee (MBBTCC) and provide at least 1-month notification where feasible prior to the start of any then known event that would overlap with an event at AT&T Park. The City and the project sponsors should meet to discuss transportation and scheduling logistics for occasions with multiple events in the area.

The San Francisco Fire Department will be required to review and approve the internal circulation plan for Pier 70 prior to construction of any roadways. Because the Proposed Project would not substantially interfere with emergency access and, with clearance from the Fire Department, the Proposed Project's street system would accommodate emergency vehicle circulation on-site, the Proposed Project would have a less-than-significant impact on emergency access.

CUMULATIVE IMPACTS

The geographic context for the analysis of cumulative impacts is the transportation study area shown on Figure 4.E.1: Transportation Study Area and Study Intersections, on p. 4.E.2. As discussed in Section 4.A, Introduction to Chapter 4, on pp. 4.A.12-4.A.18, the cumulative impacts analysis takes into account reasonably foreseeable future development projects in the study area that would contribute to use of the transportation system. The 2040 future cumulative baseline is

established using the SF-CHAMP travel demand model that uses a forecast of citywide growth. The cumulative analysis for transportation is, therefore, a projections approach rather than a list-based approach. However, the model has been reviewed to ensure that it includes travel from expected growth in and near the transportation study area in addition to projects included in the Baseline Conditions, including that from build-out of Mission Bay, the Golden State Warriors Event Center and Mixed-Use Development Project in Mission Bay, the UCSF Long Range Development Plan, the Mission Rock Mixed-Use Project, and various individual development projects in the Eastern Neighborhoods Plan area.

The 2040 SF-CHAMP model run also accounts for reasonably foreseeable transportation improvements. Key improvements assumed in addition to those in the Baseline Conditions are those in the *San Francisco Bicycle Plan* and Second Street Improvement Project, further transit improvements approved in Muni Forward (formerly the Transit Effectiveness Project), and further from the project site the Van Ness BRT project and the Geary BRT project.

Included in the list of reasonably foreseeable developments is the new Warriors Arena in Mission Bay. Because the Arena will affect conditions in the study area in Cumulative conditions, a summary of the ways in which the Arena intends to manage game day conditions is provided for informational purposes.[60]

During events with more than 12,500 attendees, traffic management procedures similar to those employed at AT&T Park on game days will be implemented, including PCOs stationed at key intersections in the project vicinity to manage vehicular, transit, bicycle, and pedestrian flows. SFMTA fare inspectors will be on-hand to manage flows of passengers onto the transit vehicles. Additionally, three permanent Variable Message Signs will be installed to provide traffic alerts, messages, and alternate driving routes for drivers traveling to the event center, to destinations in the vicinity, or through the area. Overall, the Warriors Arena project was found to have significant effects on the transportation and circulation network, which were evaluated and disclosed in that project's EIR.

[60] The following text is from *Event Center and Mixed-Use Development at Mission Bay Blocks 29-32 Subsequent Environmental Impact Report*, pp. 5.2-58 and 5.2-60, Planning Department Case No. 2014.1441E, State Clearinghouse No. 2014112045, certified November 3, 2015. Available at http://sf-planning.org/environmental-impact-reports-negative-declarations. Accessed 7/11/16.

CUMULATIVE CONSTRUCTION IMPACTS

Impact C-TR-1: Construction of the Proposed Project would occur over an approximately 11-year timeframe and may overlap with construction of other projects in the vicinity. (*Less than Significant*)

Construction staging for most or all of the proposed infrastructure, structures, and landscaping would occur on the project site, based on the size of the site. Construction activities for the Proposed Project would likely overlap with construction of the 20th Street Historic Core Project on Pier 70 and Crane Cove Park, both adjacent to the project site, one or more of the remaining development projects in Mission Bay, the new Warriors Arena, and the Mission Rock Mixed-Use Project, among other construction projects expected to occur in the vicinity in the next 10+ years. The precise timing of these projects is not known at present. Construction vehicles for the Proposed Project and other nearby projects would use many of the same roads and freeway ramps. As part of the construction permitting process, the construction manager for each project would be required to meet with various City departments and the TASC to develop a detailed plan that includes coordination with other nearby construction activities. The plan would address construction vehicle routing, traffic control, transit routes, and pedestrian movements adjacent to the construction area during any overlapping construction periods. Due to the detailed planning and coordination requirements described above, the Proposed Project would not contribute considerably to a significant cumulative impact in the area.

The less-than-significant impacts would be further reduced with implementation of Improvement Measure I-TR-A: Construction Management Plan identified above under Impact TR-1.

CUMULATIVE VMT MPACTS

Impact C-TR-2: The Proposed Project's incremental effects on regional VMT would not be significant, when viewed in combination with past, present, and reasonably foreseeable future projects. (*Less than Significant*)

San Francisco 2040 cumulative conditions were projected using an SF-CHAMP model run, using the same methodology as outlined for existing conditions, but including residential and job growth estimates and reasonably foreseeable transportation investments through 2040. Projected 2040 average daily VMT per capita for residential uses is 6.4 for the transportation analysis zone where the project site is located (TAZ 559). This is 60 percent below the 2040 projected regional average daily VMT per capita of 16.1 for residential uses. Projected 2040 average daily VMT per capita for office uses is 10.1 for the project site's TAZ. This is 41 percent below the 2040 projected regional average daily VMT per capita of 17.1 for office uses. Projected 2040 average daily VMT per capita for retail uses is 11.9 for the project site's TAZ. This is 18 percent below the 2040 projected regional average daily VMT per capita of 14.6 for retail uses.

Because the project site is located in an area where VMT is greater than 15 percent below the projected 2040 regional averages for residential, office, and retail uses, the Proposed Project's incremental effects would not be significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of reasonably foreseeable future projects

The Proposed Project is not a transportation project. However, the Proposed Project would include features that would alter the transportation network. As discussed in the evaluation of project impacts, these features fit within the general types of projects identified above that would not substantially induce automobile travel.[61] Therefore, the Proposed Project would not have a considerable contribution to any substantial cumulative increase in automobile travel.

Based on the above factors and data demonstrating San Francisco's low per-household GHG consumption, GHG reductions exceeding BAAQMD and state GHG reductions goals, and consistency with *Plan Bay Area*, the Planning Department has determined that regardless of any increased volume of VMT and GHG emissions, if a project is located within an area where the percent by which per capita VMT is more than 15 percent below the projected 2040 per capita regional averages for residential, office, and retail uses, the project's incremental effects would not be significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects.

Therefore, the proposed project would not have a considerable contribution to any substantial cumulative increase in automobile travel. Cumulative VMT impacts are considered ***less than significant***.

CUMULATIVE TRAFFIC IMPACTS

The Proposed Project would have a considerable contribution to a significant cumulative impact to traffic if it, in combination with other long-term forecasted growth by year 2040, contributed to a major traffic hazard in the study area. In general, the Proposed Project and other local and regional growth would add vehicle trips to the surrounding roadways; however, a general increase in traffic in and of itself would not be considered a traffic hazard.

Impact C-TR-3: The Proposed Project would not contribute to a major traffic hazard. (*Less than Significant*)

Consistent with the City's *Better Streets Plan* and Transit First Policy, roadway improvements throughout the City – including the study area – are contemplated to improve overall safety and encourage non-automobile modes of transportation. Although growth is expected to increase

[61] Ibid.

traffic volumes somewhat in the future, that increase alone is not considered a significant hazard. As described earlier, the Proposed Project's internal roadway system would be designed to reduce traffic speeds and promote walking and bicycling and is not expected to create a major traffic hazard. Other long-term forecasted changes to the study area are also anticipated to encourage bicycling, pedestrian, and transit use, and are expected to further enhance the area safety.

The new Warriors Arena will be constructed and operational in the Cumulative Conditions. However, that project includes a detailed transportation management plan to ensure that travelers to the area are accommodated efficiently with minimal disruptions to bicycle, pedestrian, transit, and emergency vehicle access in the study area. Thus, no significant cumulative long-term traffic hazards would be expected in the study area, and the Proposed Project would not contribute to any cumulative traffic hazard impacts.

CUMULATIVE TRANSIT IMPACTS

Future year 2040 Cumulative ridership projections were developed based on transit growth projections developed for the Transit Effectiveness Project (Muni Forward) and provided by the Planning Department. Forecast future hourly ridership demand was then compared to expected hourly capacity, as determined by the likely route and headway changes identified in the Muni Forward to estimate capacity utilization under 2040 Cumulative conditions. The year 2040 Cumulative analysis assumes changes to the capacity of the lines as identified by route changes and headway changes indicated in future improvements under Muni Forward. The changes incorporated in the Cumulative conditions analysis are:

- On the T Third Muni Metro line, peak period headways would be reduced and two-car trains would be operated.
- The 10 Townsend bus route would be rerouted off Townsend Street down Fourth Street. From Fourth Street, the route would extend through Mission Bay to new proposed street segments on Seventh Street between Mission Bay Boulevard and Hubble Street, on Hubble Street between Seventh and 16th streets, on 16th Street between Hubble and Connecticut streets, and on Connecticut Street between 16th and 17th streets. Peak period headways would be reduced from 20 to 6 minutes. Midday headways would be reduced from 20 to 12 minutes. The 10 Townsend would be renamed the 10 Sansome.
- The 22 Fillmore trolley bus route would extend down 16th Street and Third Street to the UCSF Mission Bay campus and is part of a BRT proposal that would remove a general-use travel lane on 16th Street through the study area. The 33 Stanyan would be re-routed from Potrero to cover the portion of the 22 route currently serving 18th Street.
- The 48 Quintara/24th Street bus route would operate all day from 48th Avenue to the Hunters Point Naval Shipyard. At 25th and Connecticut streets, this route would no longer follow the existing alignment and would change to follow the existing 19 Polk route to Hunters Point via Evans and Innes avenues. This would provide a new connection from the Mission District, Noe Valley, and the Sunset to Third Street and

Hunters Point. This route will also be re-branded as the 58 as part of Muni Forward improvements.

The transit person-trips forecast to be generated by the Proposed Project were compared to the projections for Cumulative conditions at the four Muni screenlines as well as on an individual route basis for the routes that serve the project site. Table 4.E.25: Muni Downtown Screenlines – Cumulative Conditions A.M. Peak Hour and Table 4.E.26: Muni Downtown Screenlines – Cumulative Conditions P.M. Peak Hour summarize Cumulative 2040 transit. A cumulatively significant impact would occur if reasonably foreseeable development (i.e., cumulative conditions) would cause any of the individual routes or Downtown screenlines to exceed their capacity utilization thresholds, or would increase ridership by more than 5 percent if individual routes or Downtown screenlines are already exceeding their capacity utilization thresholds under Baseline conditions. The Proposed Project would be considered to have a considerable contribution to a significant cumulative impact if it would contribute more than 5 percent of the forecasted cumulative growth in ridership to any of the individual routes serving the project site or to any Downtown screenlines that are projected to experience a significant cumulative impact.

Impact C-TR-4: The Proposed Project would contribute considerably to significant cumulative transit impacts on the 48 Quintara/24th Street and 22 Fillmore bus routes. (*Significant and Unavoidable with Mitigation*)

In combination with reasonably foreseeable development expected to occur under Cumulative Conditions, the Proposed Project would cause the 48 Quintara/24th Street bus route to exceed 85 percent utilization in both the Maximum Residential Scenario and the Maximum Commercial Scenario during the a.m. and p.m. peak hours. The Proposed Project would contribute 48 to 61 percent of the ridership on this bus route in the a.m. peak hour and 53 to 60 percent of the ridership in the p.m. peak hour. This would be a considerable contribution to a significant cumulative impact on individual transit routes.

Mitigation Measure M-TR-5, to increase capacity on the 48 Quintara/24th Street bus route, as presented above under Impact TR-5, could reduce the Proposed Project's contribution to this significant cumulative impact. Under the Maximum Commercial Scenario, Mitigation Measure M-TR-5 would be adequate to reduce the Proposed Project's contribution to the significant cumulative impact to not considerable. Under the Maximum Residential Scenario, the Proposed Project's contribution would remain considerable even with the implementation of Mitigation Measure M-TR-5. Therefore, additional mitigation would be necessary for the Maximum Residential Scenario to reduce the considerable contribution to the significant cumulative impact on Muni service on this route.

Source: San Francisco Planning Department, "Transit Data for Transportation Impact Studies," May 2015; Fehr & Peers, 2016. See Appendix D in the Transportation Impact Study for Transit Line Capacity Calculations.

Mitigation Measure M-C-TR-4A: Increase capacity on the 48 Quintara/24th Street bus route under the Maximum Residential Scenario.

The project sponsors shall contribute funds for one additional vehicle (in addition to and separate from the four prescribed under Mitigation Measure M-TR-5 for the Maximum Residential Scenario) to reduce the Proposed Project's contribution to the significant cumulative impact to not cumulatively considerable. This shall be considered the Proposed Project's fair share toward mitigating this significant cumulative impact. If SFMTA adopts a strategy to increase capacity along this route that does not involve purchasing and operating additional vehicles, the Proposed Project's fair share contribution shall remain the same, and may be used for one of those other strategies deemed desirable by SFMTA.

The Proposed Project would also cause the 22 Fillmore bus route to exceed 85 percent utilization in the Maximum Commercial Scenario during the a.m. and p.m. peak hours. The Proposed Project would contribute 43 percent of the ridership on this bus route in the a.m. peak hour (outbound direction) and 35 percent of the ridership in the p.m. peak hour (inbound direction). This would be a considerable contribution to a significant cumulative impact on individual transit routes.

Therefore, additional mitigation would be necessary for the Maximum Commercial Scenario to reduce the considerable contribution to the significant cumulative impact on Muni service on this route.

Mitigation Measure M-C-TR-4B: Increase capacity on the 22 Fillmore bus route under the Maximum Commercial Scenario.

The project sponsors shall contribute funds for two additional vehicles to reduce the Proposed Project's contribution to the significant cumulative impact to not considerable. This shall be considered the Proposed Project's fair share toward mitigating this cumulative impact. If SFMTA adopts an alternate strategy to increase capacity along this route that does not involve purchasing and operating additional vehicles, the Proposed Project's fair share contribution shall remain the same, and may be used for one of those other strategies deemed desirable by SFMTA.

However, as with Mitigation Measure M-TR-5, because SFMTA cannot commit funding to operate additional buses on these routes, to expand bus zones, or to increase transit vehicle travel speeds until environmental review of the selected elements is complete, the implementation of Mitigation Measures M-C-TR-4A and M-C-TR-4B is uncertain, and the Proposed Project's contribution to the significant cumulative impact would remain significant and unavoidable under both project scenarios.

Impact C-TR-5: The Proposed Project would not contribute considerably to a significant cumulative impact on the T Third Muni line. (*Less than Significant*)

The T Third Muni Metro line would operate below its utilization threshold in the a.m. and p.m. peak hours under both cumulative scenarios (Maximum Residential and Maximum Commercial). Therefore, the Proposed Project would not contribute considerably to a significant cumulative impact on this transit line and its cumulative impact would be less than significant. No mitigation is necessary.

Impact C-TR-6: The Proposed Project would not contribute considerably to significant cumulative impacts at Muni Downtown screenlines. (*Less than Significant*)

The Northeast and Southeast Muni Downtown screenlines would operate below the 85 percent capacity utilization threshold under future 2040 Cumulative conditions in both the a.m. and p.m. peak hours. The Northwest Downtown screenline would operate below the 85 percent capacity utilization threshold under future 2040 Cumulative conditions in the a.m. peak hour. The Southwest Downtown screenline would operate below the 85 percent capacity utilization threshold under future 2040 Cumulative conditions in the p.m. peak hour. Cumulative impacts to these screenlines would be less than significant.

The Southwest Downtown screenline would operate above the 85 percent threshold in the a.m. peak hour both with and without the Proposed Project in year 2040. However, even with the Proposed Project (under either the Maximum Residential or Maximum Commercial scenario), the capacity utilization would be lower than the Baseline Condition, and therefore, considered a less-than-significant cumulative impact.

The Northwest Downtown screenline would operate above the 85 percent threshold in the p.m. peak hour without the Proposed Project, resulting in a significant cumulative impact. Because the Proposed Project is estimated to contribute no riders to this screenline, the Proposed Project would not contribute considerably to the significant cumulative impact. No mitigation is required.

Impact C-TR-7: The Proposed Project would not contribute considerably to significant cumulative impacts on regional transit routes. (*Less than Significant*)

As shown in Table 4.E.27: Regional Transit Screenlines – Cumulative Conditions (A.M. Peak Hour) and Table 4.E.28: Regional Transit Screenlines – Cumulative Conditions (P.M. Peak Hour), no regional providers are expected to exceed their established capacity utilization thresholds. Therefore, there would be no significant cumulative impacts on regional transit service. No mitigation is required.

Source: San Francisco Planning Department, "Transit Data for Transportation Impact Studies," May 2015; Fehr & Peers, 2016. See Appendix D in the Transportation Impact Study for Transit Line Capacity Calculations.

Maximum Residential Scenario

The Maximum Residential Scenario would contribute 161 transit riders from the East Bay, 66 riders from the North Bay, and 499 riders from the South Bay in the inbound direction in the a.m. peak hour. In the outbound direction in the p.m. peak hour, the Proposed Project would contribute 140 riders to the East Bay, 57 riders to the North Bay, and 434 riders to the South Bay. Although the BART line within the East Bay regional screenline would exceed the capacity utilization threshold in the a.m. and p.m. peak hours, the additional riders from the Proposed Project would not contribute considerably to a significant cumulative impact because the regional screenlines would operate within established capacity utilization thresholds. No mitigation is required.

Maximum Commercial Scenario

The Maximum Commercial Scenario would contribute 208 transit riders from the East Bay, 80 transit riders from the North Bay, and 589 transit riders from the South Bay in the inbound direction in the a.m. peak hour. In the outbound direction in the p.m. peak hour, the Proposed Project would contribute 105 transit riders to the East Bay, 41 transit riders to the North Bay, and 298 transit riders to the South Bay. Although the BART line within the East Bay regional screenline would exceed the capacity utilization threshold in the a.m. and p.m. peak hours, the Proposed Project's additional riders would not contribute considerably to a significant cumulative impact because the regional screenlines would operate within established capacity utilization thresholds. No mitigation is required.

CUMULATIVE PEDESTRIAN, BICYCLE AND LOADING CONDITIONS

Impact C-TR-8: The Proposed Project would not contribute considerably to significant cumulative pedestrian impacts. (*Less than Significant*)

On-site pedestrian circulation is, by its nature, site-specific, and a project generally would not contribute to cumulative impacts from other development projects. Although the Proposed Project is expected to increase both pedestrian and vehicle travel in the area, the existing local roadways are generally designed to adopted design standards, which are developed to ensure the safe circulation for all modes, including conflicts between pedestrians and other modes. Therefore, there would be no significant cumulative pedestrian impacts in the study area. As indicated in the "Pedestrian Impacts" discussion, pp. 4.E.96-4.E.100, pedestrian travel from the Proposed Project would not result in overcrowding of crosswalks or sidewalks. Therefore, the Proposed Project would not contribute to significant cumulative impacts on pedestrian travel. No mitigation is necessary.

Impact C-TR-9: The Proposed Project would not contribute considerably to a significant cumulative bicycle impact. (*Less than Significant*)

Bicycle trips are expected to increase on the project site and in the vicinity of the project site in the future as a result of the Proposed Project, as well as overall growth in the Eastern Neighborhoods and Mission Bay, and growth elsewhere in the City. The increases in traffic predicted to result from the Proposed Project could result in an increase in vehicle-bicycle conflicts at intersections in the transportation study area. The Proposed Project would not create hazardous conditions for bicycles or otherwise interfere with bicycle access to the project site or surrounding areas, and would provide new bicycle facilities on the project site. Therefore, the Proposed Project would not contribute considerably to a significant cumulative bicycle impact. No mitigation is necessary.

Impact C-TR-10: The Proposed Project would not contribute to a significant cumulative loading impact. (*Less than Significant*)

Loading impacts are by their nature localized and site-specific. The Proposed Project would result in a significant loading impact based on the shortfall in on-street and off-street loading facilities proposed compared to the demand, as explained in Impact TR-12; however, the shortfall on the project site would not be expected to contribute to any loading impacts from other development projects near the project site. Overall, because loading tends to occur as close to the delivery point as possible, particularly in cases where loading occurs via double-parking, as may be the case within the project site, it is not expected that unmet loading demand associated with the Proposed Project would be accommodated outside of the project site. Similarly, it is not likely that unmet loading demand from past, present, and reasonably foreseeable development in other parts of the study area would substantially interfere with travel on or near the project site. Therefore, cumulative loading impacts would not be significant. Although the Proposed Project itself would have a significant project-related loading impact, it would not contribute to a significant cumulative loading impact and the impact would be less than significant.

CUMULATIVE EMERGENCY VEHICLE ACCESS

Impact C-TR-11: The Proposed Project would not contribute considerably to a significant cumulative impact on emergency vehicle access. (*Less than Significant*)

The Proposed Project would not contribute considerably to cumulative emergency vehicle access conditions in the area. With implementation of the Proposed Project, emergency vehicle access to the project site would remain essentially unchanged from existing conditions, except for the addition of the 21st Street connection with Illinois Street. With implementation of transit-only lanes and changes to the number and direction of travel lanes on streets in the vicinity of the Proposed Project, emergency vehicle providers may adjust travel routes to respond to incidents;

however, emergency vehicle access in the area would not be substantially affected. Emergency vehicles would be permitted full use of transit-only lanes and would not be subject to any turn restrictions.

With the addition of the Warriors Arena, just to the north of the project site, there will be additional periods of congestion in the area, to which the Proposed Project will contribute traffic. However, the Warriors Arena operators are required to provide comprehensive event transportation management strategies to reduce the overall effect of event-related congestion on bicycles, pedestrians, transit, and emergency vehicle operations. Additionally, although not required to address a significant project-related impact, Improvement Measure I-TR-C would require the project's TDM coordinator, or other designee, to participate in the Mission Bay Ballpark Transportation Coordination Committee (MBBTCC) to ensure that events at AT&T Park, the Warriors Arena, Pier 70, and other sites in the study area are coordinated insofar as feasible, and efforts can be made to avoid overlapping events.

Therefore, for the above reasons, the Proposed Project, in combination with past, present, and reasonably foreseeable development in San Francisco, would result in less-than-significant cumulative emergency vehicle access impacts.

PARKING INFORMATION

As discussed in Section 4.A, Introduction to Chapter 4, on pp. 4.A.3-4.A.5, SB 743 amended CEQA by adding Public Resources Code Section 21099 regarding analysis of parking impacts for urban infill projects in transit priority areas. Public Resources Code Section 21099(d), effective January 1, 2014, provides, in part, that ". . .parking impacts of a residential, mixed-use residential, or employment center project on an infill site located within a transit priority area shall not be considered significant impacts on the environment." The Proposed Project meets each of the three criteria: it is in a transit priority area because it is located within 0.5 mile of a major transit stop; it is on an infill site because it is located on a developed site in an urban area; it is a mixed-use residential project; and it would be an employment center proposed to provide space for approximately 5,600 to approximately 9,770 jobs and located in a transit priority area on an already developed site zoned for commercial uses. Therefore, this EIR does not consider parking in determining the significance of project impacts.

However, the Planning Department acknowledges that parking conditions may be of interest to the public and decision-makers. Additionally, even with adoption of SB 743, secondary physical impacts of parking shortages need to be addressed. Therefore, this parking discussion is presented below to identify whether there would be any secondary physical impacts associated with a constrained parking supply, such as queuing that would affect the public rights-of-way by drivers waiting for scarce parking.

Existing Parking Conditions

Based on information from *SFPark*, an SFMTA program, and surveys conducted by Fehr & Peers in September 2013, there are approximately 2,410 on-street parking spaces in the three-block radius around the project site, bounded by Mariposa Street, Indiana Street, 25th Street, and the Bay. On-street parking is available on most block faces in this area, but not along parts of Mariposa Street, Third Street, Illinois Street, and other nearby streets. Most of the on-street parking is unmetered and unrestricted. Residential permit parking (RPP) area "X" is designated along the west side of Minnesota Street (from 20th Street to 22nd Street), the east side of Minnesota Street (from 18th Street to Tubbs Street), the west side of Tennessee Street (from 19th Street to Tubbs Street), and the east side of Tennessee Street (from 20th Street to Tubbs Street). Over 80 percent of the on-street public parking spaces were occupied during the mid-day period (1:30 p.m. to 3:00 p.m.) and nearly 70 percent was occupied in the evening (6:30 p.m. to 8:00 p.m.).

There are no public, general-use off-street parking lots in the survey area. There are some lots for permit holders or customers of adjacent businesses. The public parking lot at the corner of Illinois and 20th streets would be removed as part of the Proposed Project and therefore was not included in the data about existing parking conditions.

Proposed Project Parking Information

The Proposed Project would provide 0.75 parking spaces per residential unit, and one space per 1,000 square feet of gross floor area for office/commercial uses and for RALI uses. The maximum amount of off-street parking that would be provided is 3,370 spaces for the Maximum Residential Scenario and 3,496 spaces for the Maximum Commercial Scenario. The Proposed Project would provide for approximately 285 on-street parking spaces along most of the streets internal to the project site (a net increase of 228 on-street spaces). The Maximum Residential Scenario would generate a peak demand for approximately 7,078 parking spaces and the Maximum Commercial Scenario would generate a peak demand for approximately 7,633 parking spaces. Thus, the estimated supply would not accommodate all of the Proposed Project's parking demand.

The lack of parking may result in motorists looking for parking outside of the project site. However, there is an existing RPP area along Minnesota and Tennessee streets in the vicinity, and a new RPP area is proposed for the Dogpatch area that is closer to the project site. These features would discourage spillover parking from the Proposed Project, and would thereby eliminate project-related secondary effects of parking shortfalls. Parking management programs for events held at the project site would be developed as part of the overall event-specific TDM Plans to be completed as part of the permitting process for those events. The extent to which event-specific

parking shortfalls may affect the neighborhood is not likely to be more severe than existing conditions and, in fact, may be less due to the smaller size of events anticipated at the project site than the large events (up to 40,000 attendees) that occasionally occur under existing conditions.

Some drivers would shift to public transit or other modes of travel such as bicycling, use carshare facilities when a vehicle is needed, and/or would not own a car. It is possible that such a shift from automobile use to transit would add an unknown amount of additional demand to public transit facilities. The impacts of project-related transit ridership have been addressed earlier in this document. To the extent more riders use transit than forecasted due to parking shortfalls on the site, mitigation measures for project transit impacts are generally to be implemented based on ongoing monitoring. Thus, mitigation measures will be implemented based on actual observed conditions and not forecasted conditions.

F. NOISE AND VIBRATION

Section 4.F, Noise and Vibration, describes the existing noise environment in the project area, evaluates the potential construction-related and operational noise and vibration impacts associated with implementation of the Proposed Project, assesses the noise compatibility of proposed uses with the existing and future noise environment, and identifies mitigation measures to avoid or reduce potential adverse impacts. This section summarizes the information provided in the *Pier 70 Mixed-Use District Project, Noise Technical Memorandum.*[1]

ENVIRONMENTAL SETTING

SOUND FUNDAMENTALS

Sound is characterized by various parameters that describe the rate of oscillation (frequency) of sound waves, the distance between successive troughs or crests in the wave, the speed that it travels, and the pressure level or energy content of a given sound. The sound pressure level has become the most common descriptor used to characterize the loudness of an ambient sound, and the decibel (dB) scale is used to quantify sound intensity. Because sound can vary in intensity by over one million times within the range of human hearing, a logarithmic loudness scale is used to keep sound intensity numbers at a convenient and manageable level. Since the human ear is not equally sensitive to all sound frequencies within the entire spectrum, human response is factored into sound descriptions in a process called "A-weighting," expressed as "dBA." The dBA, or A-weighted decibel, refers to a scale of noise measurement that approximates the range of sensitivity of the human ear to sounds of different frequencies. On this scale, the normal range of human hearing extends from about 0 dBA to about 140 dBA. Except in carefully controlled laboratory experiments, a change of only 1 dBA in sound level cannot be perceived. Outside of the laboratory, a 3-dBA change is considered a perceptible difference. A 10-dBA increase in the level of a continuous noise represents a perceived doubling of loudness.[2]

Noise Descriptors

Noise is generally defined as sound that is loud, disagreeable, unexpected or unwanted. Sound is mechanical energy transmitted in the form of a wave by a disturbance or vibration that causes pressure variation in air detectable by the human ear. Variations in noise exposure over time are typically expressed in terms of a steady-state energy level (called L_{eq}) that represents the

[2] California Department of Transportation (Caltrans), *Technical Noise Supplement (TeNS) to the Traffic Noise Analysis Protocol* pp. 2-44 to 2-45, September 2013. Available online at http://www.dot.ca.gov/hq/env/noise/pub/TeNS_Sept_2013B.pdf. Accessed April 14, 2015.

acoustical energy of a given measurement, or alternatively as a statistical description of what sound level is exceeded over some fraction (10, 50 or 90 percent) of a given observation period (i.e., L_{10}, L_{50}, L_{90}). Leq (24) is the steady-state acoustical energy level measured over a 24-hour period. Lmax is the maximum, instantaneous noise level registered during a measurement period. Because residential receptors are more sensitive to unwanted noise intrusion during the evening and at night, State law requires for planning purposes that an artificial dBA increment be added to evening and nighttime noise levels to form a 24-hour noise descriptor called the Community Noise Equivalent Level (CNEL). CNEL adds a 5-dBA penalty during the evening (7:00 p.m. to 10:00 p.m.) and a 10-dBA penalty at night (10:00 p.m. to 7:00 a.m.). Another 24-hour noise descriptor, called the day-night noise level (Ldn), is similar to CNEL. Both CNEL and Ldn add a 10-dBA penalty to all nighttime noise levels between 10:00 p.m. and 7:00 a.m., but Ldn does not add the evening 5-dBA penalty between 7:00 p.m. and 10:00 p.m. In practice, Ldn and CNEL usually differ by less than 1 dBA at any given location from transportation noise sources.[3] Table 4.F.1: Representative Environmental Noise Levels, presents representative noise sources and their corresponding noise levels in dBA at varying distances from the noise sources.

Noise from Multiple Sources

Since sound pressure levels in decibels are based on a logarithmic scale, they cannot be added or subtracted in the usual arithmetical way. Adding a new noise source to an existing noise source, both producing noise at the same level, will not double the noise level. Table 4.F.2: Rules for Combining Sound Levels by "Decibel Addition," demonstrates the result of adding noise from multiple sources.

If the difference between two noise sources is 10 dBA or more, the higher noise source will dominate and the resultant noise level will be equal to the noise level of the higher noise source. In general, if the difference between two noise sources is 0 to 1 dBA, the resultant noise level will be 3 dBA higher than the higher noise source, or both sources if they are equal. If the difference between two noise sources is 2 to 3 dBA, the resultant noise level will be 2 dBA above the higher noise source. If the difference between two noise sources is 4 to 10 dBA, the resultant noise level will be 1 dBA higher than the higher noise source.

Attenuation of Noise

A receptor's distance from a noise source affects how noise levels attenuate (decrease). Transportation noise sources tend to be arranged linearly such that roadway traffic attenuates at a rate of 3.0 dBA to 4.5 dBA per doubling of distance from the source, depending on the intervening surface (paved or vegetated, respectively). Point sources of noise, such as stationary equipment or construction equipment, typically attenuate at a rate of 6.0 dBA to 7.5 dBA per doubling of distance from the source.[4] For example, a sound level of 80 dBA at 50 feet from the noise source will be reduced to 74 dBA at 100 feet, 68 dBA at 200 feet, and so on. Noise levels can also be attenuated by "shielding" or providing a barrier between the source and the receptor. With respect to interior noise levels, noise attenuation effectiveness depends on whether windows are closed or open. Based on the U.S. Environmental Protection Agency's (USEPA) national average, closed windows reduce noise levels by approximately 25 dBA, while open windows reduce noise levels by about 15 dBA.[5]

Health Effects of Environmental Noise

The World Health Organization (WHO) is perhaps the best source of current knowledge regarding health impacts of noise. According to WHO, sleep disturbance can occur when continuous indoor noise levels exceed 30 dBA (L_{eq}) or when intermittent interior noise levels reach or exceed 45 dBA (L_{max}), particularly if background noise is low. With a bedroom

[4] The 1.5-dBA variation in attenuation rate (6 dBA vs. 7.5 dBA) can result from ground-absorption effects, which occur as sound travels over soft surfaces such as soft earth or vegetation (7.5 dBA attenuation rate) versus hard ground such as pavement or very hard-packed earth (6 dBA rate) (U.S. Housing and Urban Development, *The Noise Guidebook*, 1985, p. 24. Available online at https://www.hudexchange.info/onecpd/assets/File/Noise-Guidebook-Chapter-4.pdf. Accessed April 14, 2015.

[5] U.S. EPA, *Information on Levels of Environmental Noise Requisite to Protect Public Health and Welfare with an Adequate Margin of Safety*, Appendix B, Table B-4, p. B-6, March 1974.

window slightly open (a reduction from outside to inside of 15 dB), the WHO criteria would suggest exterior continuous (ambient) nighttime noise levels should be 45 dBA (L_{eq}) or below, and short-term events should not generate noise in excess of 60 dBA (L_{max}). WHO also notes that maintaining noise levels within the recommended levels during the first part of the night is believed to be effective for the ability to fall asleep.[6]

Other potential health effects of noise identified by WHO include decreased performance on complex cognitive tasks, such as reading, attention, problem solving, and memorization; physiological effects such as hypertension and heart disease (after many years of constant exposure, often by workers, to high noise levels); and hearing impairment (again, generally after long-term occupational exposure, or shorter-term exposure to very high noise levels, for example, exposure several times a year to a concert with noise levels at 100 dBA). Noise can also disrupt speech intelligibility at relatively low levels; for example, in a classroom setting, a noise level as low as 35 dBA can disrupt clear understanding. Finally, noise can cause annoyance and can trigger emotional reactions like anger, depression, and anxiety. WHO reports that during daytime hours, few people are seriously annoyed by activities with noise levels below 55 dBA, or moderately annoyed by activities with noise levels below 50 dBA.

Vehicle traffic and continuous sources of machinery and mechanical noise contribute to ambient noise levels. Short-term noise sources, such as large vehicle audible warnings, the crashing of material being loaded or unloaded, car doors slamming, and engines revving, contribute very little to 24-hour noise levels but are capable of causing sleep disturbance and severe annoyance. The importance of noise to receptors depends on both time and context. For example, long-term high noise levels from large traffic volumes can make conversation at a normal voice level difficult or impossible, while short-term peak noise levels at night can disturb sleep.

Vibration and Groundborne Noise

Vibration is an oscillatory motion through a solid medium in which the motion's amplitude can be described in terms of displacement, velocity, or acceleration. Typically, groundborne vibration generated by man-made activities attenuates rapidly with distance from the source of the vibration. Vibration is typically measured by peak particle velocity (PPV) in inches per second (in/sec). With the exception of long-term occupational exposure, vibration levels rarely affect human health. Instead, most people consider vibration to be an annoyance that can affect concentration or disturb sleep. People may tolerate infrequent, short-duration vibration levels, but human annoyance to vibration becomes more pronounced if the vibration is continuous or occurs frequently. High levels of vibration can damage fragile buildings or interfere with

[6] World Health Organization, *Guidelines for Community Noise*, Chapter 3, p. 46, April 1999. Available online at http://www.who.int/docstore/peh/noise/guidelines2.html. Accessed November 18, 2015.

sensitive equipment. Depending on the age of the structure and type of vibration (transient, continuous, or frequent intermittent sources), vibration levels as low as 0.5 to 2.0 in/sec PPV can damage a structure.[7]

Typical sources of groundborne vibration in San Francisco are large-scale construction projects that involve pile driving or underground tunneling. Vibration is also caused by operation of transit vehicles in the subway system under Market Street, including Muni Metro light rail vehicles and heavy rail Bay Area Rapid Transit (BART) trains. In general, such vibration is only an issue when sensitive receptors are located in close proximity. Since rubber tires provide vibration isolation, rubber tire vehicles such as Muni buses, trucks, and automobiles rarely create substantial groundborne vibration effects unless there is a discontinuity or bump in the road that causes the vibration.[8]

EXISTING CONDITIONS

Noise

The Pier 70 Mixed-Use District project site is bounded by Illinois Street to the west, 20th Street to the north, San Francisco Bay to the east, and 22nd Street to the south. The project site is located in an urban area where noise from nearby industrial uses (including the BAE Systems Ship Repair facility to the north, the American Industrial Center [AIC] to the west, and PG&E Potrero Substation to the south) and vehicular traffic (automobiles, trucks, and buses on the I-280 freeway and other streets in the vicinity) dominate the existing ambient noise environment. In addition, intermittent sources of noise that contribute to ambient noise levels include distant commuter train traffic (Caltrain) approximately 0.25 mile to the west and nearby light rail trains (Third Street line) approximately 365 feet west of the Proposed Project's western boundary. More distant intermittent noise sources include activities such as concerts and sporting events at AT&T Ballpark, which is located 1.25 miles north of the site. Principal noise sources in the immediate project vicinity are described as follows:

- **BAE Systems Ship Repair Facility.** The BAE Systems Ship Repair facility is located to the north of the project site. The short-term measurements at the ship repair docks reveal that the general noise character of the ship repair work is discontinuous and episodic, but also generally broadband and without substantial tonality. The lack of strong tonality results in the noise being perceived as less annoying than a similar noise level from a tonal source, such as a transformer or chiller. The fire pump at the western end of the

[7] California Department of Transportation (Caltrans), *Transportation and Construction Vibration Guidance Manual*, September 2013, Table 9, p. 23. Available online at http://www.dot.ca.gov/hq/env/noise/publications.htm. Accessed on December 16, 2016.

[8] Federal Transit Administration (FTA), 2006, *Transit Noise and Vibration Impact Assessment,* DTA-VA-90-1003-06, p. 10-6, May 2006, U.S. Department of Transportation. Available online at http://www.fta.dot.gov/12347_2233.html. Accessed April 14, 2015.

dock runs continuously and has substantial tonality; however, the pump was not audible over the ambient conditions at any of the long-term measurement locations and, in fact, is barely detectable in the short-term measurement made nearby at the western end of the ship repair docks.

In the waterfront vicinity where there are no other buildings to block the line-of-sight from Dry Dock 2, more high-frequency energy from activities, such as water blasting or painting, is present and audible. Another mildly tonal source is the Aggreko generators located between Dry Dock 2 and Dock 4 East. These generators contribute substantial noise at the northern, central, and eastern portions of the 28-Acre Site. However, BAE has upgraded the electrical infrastructure at the shipyard, and these generators now operate only if a ship cannot connect to a line power or during a power outage.

- **American Industrial Center (AIC).** The AIC is located west of the Illinois Parcels on the west side of Illinois Street. AIC is located on Third Street between 20th and 23rd streets, and extends to Illinois Street. The facility comprises about 900,000 square feet of commercial, industrial, and related supporting uses. Currently, approximately 300 tenants engaged in various commercial and industrial activities lease space in the AIC. The facility houses breweries, commercial kitchens and bakeries, garment manufacturing businesses, warehouses, and distribution centers. On average, there are typically 2,500 to 3,000 people on the site at a given time.[9] AIC loading docks are located on Illinois Street, and noise from loading activities could cause noise disturbance along the western Illinois Parcels boundary, across Illinois Street.
- **PG&E Potrero Substation.** There is a PG&E substation located south of the Illinois Parcels (south of the project site), and it contains large transformers and related electrical equipment that are not enclosed. Transformer noise can be disturbing, because transformers generate tonal noise (i.e., noise with simple or pure tones or "hum" components). Field observations indicate that transformer noise is audible, but heavy equipment and traffic noise on local streets dominate the ambient noise environment in this area. This type of noise source could be annoying during the nighttime hours, if audible at future residences.
- **Nearby Sporting or Special Events.** Residents living along Illinois Street are and will be subject to short-term, intermittent increases in traffic noise before and after events held at the existing AT&T Park and proposed Warrior's arena. Since these increases only occur for a short time before and after a game, they do not substantially increase ambient noise levels. Even so, these short-term, intermittent increases are likely noticeable to residents living adjacent to Illinois Street.

Groundborne Noise and Vibration

Groundborne noise refers to a condition where noise is experienced inside a building or structure as a result of vibrations produced outside of the building and transmitted as ground vibration between the source and receiver. Groundborne noise can be a problem in situations where the primary

[9] Charles J. Higley, Farella Braun + Martel, LLP, *Pier 70 Mixed-Use District – EIR Scoping Comments*, June 5, 2015.

airborne noise path is blocked, such as in the case of a subway tunnel passing near homes or other noise-sensitive structures. There are no known sources of existing groundborne noise or vibration in the vicinity of the project site. Distant Caltrain traffic (approximately 0.25 mile to the west of the project site) and nearby light rail train operations (Third Street line, approximately 365 feet west of the Proposed Project's western boundary) both operate at the surface and generate airborne noise and surface vibration. Given their distance and surface location, these two sources are not considered to be substantial sources of groundborne noise or vibration for the 28-Acre Site or Illinois Parcels. There is no machinery or activities in the adjacent BAE site that would generate vibration on the 28-Acre Site or Illinois Parcels.[10]

AMBIENT NOISE MEASUREMENTS

To characterize the background noise environment in the project vicinity, a total of 14 noise measurements were collected. Four long-term (96 hours) and five short-term (15 to 30 minutes) measurements were collected north of and in the northern portion of the project area over a 5-day period[11] in May 2012 in order to determine noise characteristics of the BAE Systems Ship Repair activities and their effect on the project site's noise environment. In addition, one long-term and two short-term measurements were collected in the southeastern, southern, and western margin of the project site for a 48-hour period in April and August 2015.[12] Measurement locations are indicated on Figure 4.F.1: Noise Measurement Locations.

[10] E-mail communication dated February 2, 2016 from Dennis Deisinger, BAE Systems Ship Repair, to David Beaupre, Port of San Francisco, regarding vibration sources at the BAE site that could cause vibration in areas outside of BAE's leasehold area.

[11] Two long-term measurements (LT-1 and LT-2) were collected by Vibro-Acoustic Consultants (VACC) in the central and eastern portions of the 28-Acre Site, one long-term measurement (LT-3) was taken near the northeastern boundary of the 28-Acre Site, and one long-term measurement (LT-4) was collected by VACC along Illinois Street (north of the Mixed-Use District project site) from May 11 to May 16, 2012 (96 hours). Five short-term measurements (ST-1 through ST-5, 15 to 30 minutes) were also conducted by VACC during this same period in the vicinity of the BAE Systems Ship Repair facility, which are located north of the Mixed-Use District project site (see Appendix F for noise measurement data). The complete VACC report is included in Attachment 1 of the *Pier 70 Mixed-Use District Project, Noise Technical Memorandum,* San Francisco, CA, Case No. 2014-001272ENV, by Orion Environmental Associates (December 2016).

[12] Three long-term measurements (LT-5, LT-6, and LT-7) were collected at the waterfront on the 28-Acre Site and along Illinois Street on the Illinois Parcels by Orion Environmental Associates in the southern portion of the Mixed-Use District project site, while short-term measurements (ST-6 and ST-7, 15 minutes) were taken along the southern and western boundaries of the Mixed-Use District project site in April and August 2015. Short-term measurements were taken with a Metrosonics Model db 308 sound level meter, while the long-term measurement was taken with a 3M SoundPro SE/DL Type 2 sound meter.

PIER 70 MIXED-USE DISTRICT PROJECT

FIGURE 4.F.1: NOISE MEASUREMENT LOCATIONS

Noise measurement data are included in Appendix C. A summary of noise measurement data is presented in Table 4.F.3: Summary of Long-Term (LT) and Short-Term (ST) Noise Monitoring on the Project Site and Vicinity. Since BAE is one of the primary sources of noise in the project vicinity, the frequency and tonal characteristics of the shipyard noise were also measured as part of short-term measurements and included in Appendix C.

When noise measurements were taken in 2012, BAE was repairing a cruise ship. When this occurs, ship repair activities occur 24 hours per day, 7 days a week. Since maximum BAE operations occurred during this measurement period, these measurements are considered the worst-case, maximum background ambient noise level (including operation of generators). Subsequent to the 2012 measurements, BAE completed an electrical upgrade, which allows docking ships to connect to line power instead of Aggreko electric power generators. These generators are located between Dry Dock 2 and Dock 4 East and can also be located on docking ships near the exhaust stack. While this upgrade reduced 2012 noise levels in the northern margin of the project site most of the time, these generators still operate on a short-term basis during power outages and if a ship cannot connect to line power.[13] Therefore, the 2012 measurements conservatively represent maximum noise levels generated at the BAE site.

Sims Metals Management (SMM) was also operating in 2012 but has since closed. In 2012, it operated in the northeastern portion of the project site every day of the 2012 measurement period except Sunday. Since SMM no longer operates on-site, the noise levels measured on Sunday, May 13, 2012 (when SMM was not operating) are considered to reflect the existing ambient noise environment in the project vicinity. The 0 to 2 dBA difference in L_{dn} between Sunday and average noise levels at the three long-term measurement locations in the vicinity of SMM is not considered a substantial difference.

When noise measurements were taken in 2015, there were intermittent noise sources observed during measurements. The BAE Systems Ship Repair facility typically operates during the daytime hours only, but an undocking operation occurred, which appeared to raise nighttime noise levels for a short time by 5 to 10 decibels, resulting in a minor increase in the 24-hour L_{dn} of 2 dBA.

[13] E-mail communication with David Beaupre, Port of San Francisco, on September 8, 2015, regarding the status of the electrical upgrade project and operation of Aggreko generators at the BAE site.

Table 4.F.3: Summary of Long-Term (LT) and Short-Term (ST) Noise Monitoring on the Project Site and Vicinity (dBA)

Measurement Location	Time Period	Average L_{dn} or L_{eq}	Primary Noise Sources
LT-1: Eastern boundary of 28-Acre Site on the waterfront, south of Pier 64, between Slips 5 and 6 (minimum of 1,100 feet south of BAE Site)	Saturday, 5/12/12: Sunday, 5/13/12: Monday, 5/14/12: Tuesday, 5/15/12: **Average:**	69 dBA (L_{dn}) 66 dBA (L_{dn})[1] 64 dBA (L_{dn}) 64 dBA (L_{dn}) **66 dBA (L_{dn})**	BAE ship repair activities occurred days, nights, and weekends (24/7) during measurement period and were audible above background ambient noise levels during site visit. Large trucks and buses were observed during site visit and may have operated in parking lot near the meter.
LT-2: Center of 28-Acre Site at north façade of Building 2	Saturday, 5/12/12: Sunday, 5/13/12: Monday, 5/14/12: Tuesday, 5/15/12: **Average:**	67 dBA (L_{dn}) 65 dBA (L_{dn})[1] 65 dBA (L_{dn}) 67 dBA (L_{dn}) **66 dBA (L_{dn})**	Ambient noise dominated by traffic in the distance and local industrial activity; BAE ship repair activities audible; and the hum tone from some lighting ballasts at the roof of Building 2 were very noisy, but did not affect noise measurement results.
LT-3: Northeast boundary of 28-Acre Site southeast of Building 6 (minimum of 500 feet south of BAE Site)	Saturday, 5/12/12: Sunday, 5/13/12: Monday, 5/14/12: Tuesday, 5/15/12: **Average:**	62 dBA (L_{dn}) 60 dBA (L_{dn}) 61 dBA (L_{dn}) 63 dBA (L_{dn}) **62 dBA (L_{dn})**	Adjacent to Sims Metal Management (SMM), which was operating in 2012 but has since closed. Since SMM was closed on Sunday, 5/13/12, this level is more representative of the existing noise environment when cruise ship repair activities occur. Historic Building 6 helps block ship repair noise from this location and would continue to do so with the project.
LT-4: East of Illinois Street, north of project site, in tow yard just north of Building 103	Saturday, 5/12/12: Sunday, 5/13/12: Monday, 5/14/12: Tuesday, 5/15/12: **Average:**	61 dBA (L_{dn}) 61 dBA (L_{dn}) 63 dBA (L_{dn}) 63 dBA (L_{dn}) **62 dBA (L_{dn})**	Construction of the residential development at 820 Illinois occurred directly across Illinois Street and these activities occurred every day except Sunday. Ship repair activities were not audible at this location during the site visit.
LT-5: Southeastern boundary of 28-Acre Site on the waterfront, south of Pier 64 at Slip 8	Thursday, 4/2/15: Friday, 4/3/15: **Average:**	57 dBA (L_{dn}) 59 dBA (L_{dn}) **58 dBA (L_{dn})**	Traffic and construction activities at Affordable Storage occurred near meter. Military ship (in for repair at BAE Site) was moved from Drydock 2 to Berth 4-East around midnight.[2]

Table 4.F.3 Continued

Measurement Location	Time Period	Average L_{dn} or L_{eq}	Primary Noise Sources
LT-6: North-central portion of Illinois Parcels, east of Illinois Street, about 110 feet east of the centerline at ImPark parking lot	Tuesday, 8/18/15 Thursday, 8/19/15 **Average:**	64 dBA (L_{dn}) 64 dBA (L_{dn}) **64 dBA (L_{dn})**	Traffic on Illinois Street (including construction haul trucks); cars parking in ImPark lot; traffic/activities at AIC to the west across Illinois Street.
LT-7: Southwest portion of Illinois Parcels in Hoedown Yard, 110 feet from Illinois Street	Tuesday, 8/18/15 Daytime, 8/18/15 Wednesday, 8/19/15 Daytime, 8/19/15 **Average:**	67 dBA (L_{dn}) 63 dBA (L_{eq}) 68 dBA (L_{dn}) 66 dBA (L_{eq}) **68 dBA (L_{dn})**	Heavy equipment at Hoedown Yard; Potrero Substation hum; traffic on Illinois and 22nd streets; AIC activities to the west across Illinois Street.
ST-1: North of project site at BAE Site, at Dry Dock 2	Thursday, 5/1712, 11:00 a.m. to noon (15–30 minutes)	77 dBA (L_{eq})	Cruise ship repair activities, including nights and weekends.
ST-2: North of project site at BAE Site, West of Dry Dock 2	Thursday, 5/17/12, 11:00 a.m. to noon (15–30 minutes)	81 dBA (L_{eq})	Aggreko electric power generators operating 30 feet away.
ST-3: North of project site at BAE Site at Dock 4 East	Thursday, 5/17/12, 11:00 a.m. to noon (15–30 minutes)	76 dBA (L_{eq})	Military ship repair activities.
ST-4: North of project site at BAE Site at the western end of repair facilities	Thursday, 5/17/12, 11:00 a.m. to noon (15–30 minutes)	66 dBA (L_{eq}); 77 dBA (L_{eq})	Ship repair activities at west end of ship repair docks, fire pump (runs continuously).
ST-5: Northern boundary of 28-Acre Site adjacent to 20th Street at southern façade of BAE Site boiler building	Thursday, 5/17/12, 11:00 a.m. to noon (15–30 minutes)	76 dBA (L_{eq})[1]	BAE Site boiler facilities.
ST-6: West side of Illinois Parcels, about 50 feet east of the Illinois Street centerline	Wednesday, 4/1/15 11:30 a.m. to 11:45 a.m. (15 minutes)	64 dBA (L_{eq})	Traffic on Illinois Street, including construction haul trucks; heavy equipment operating to the south (in Hoedown Yard) was audible during measurement.

Table 4.F.3 Continued

Measurement Location	Time Period	Average L_{dn} or L_{eq}	Primary Noise Sources
ST-7: Southern boundary of project site, adjacent to 22nd Street at gate, 550 feet from Illinois Street	Wednesday, 4/1/15 noon to 12:15 p.m. (15 minutes)	58 dBA (L_{eq})	Heavy equipment at Hoedown Yard, Potrero Substation hum, and traffic on 22nd Street were audible.

Notes: Maximum BAE Site operations (24/7) occurred during measurement of LT-1 through LT-4 and therefore these measurements are considered the worst-case, maximum background ambient noise levels. No nighttime ship repair activities occurred during the LT-5 measurement period, but an undocking operation occurred around midnight on Friday, 4/3/15.

[1] During the 2012 measurement period, Sims Metals Management (SMM) operated in the northern portion of the project site every day except Sunday. Since SMM no longer operates on-site, the noise levels measured on Sunday, May 13, 2012 (when SMM was not operating) are considered to reflect the existing ambient noise environment in the project vicinity.

[2] E-mail communication from Gerry Roybal, Maritime Marketing Manager, Port of San Francisco, on April 15, 2015.

Sources: VACC, 2012 (LT-1 through LT-4 and ST-1 through ST-5); Orion Environmental Associates, 2015 (LT-5, LT-6, LT-7, ST-6, and ST-7)

A comparison of 2015 nighttime noise measurements collected along the western boundary of the Illinois Parcels (Location LT-6, which is 700 feet north of Potrero Substation and 110 feet from the centerline of Illinois Street, and Location LT-7, which is 200 feet from Potrero Substation and 110 feet from the centerline of Illinois Street) indicate that as much as 10 to 13 dBA (L_{eq}) of the nighttime ambient noise levels could be attributable to noise generated by Potrero Substation.

Both short-term and long-term noise measurements taken along Illinois Street in 2012 and 2015 were affected by construction-related truck traffic traveling on Illinois Street, current activities at the PG&E Hoedown Yard (southwest corner of the Illinois Parcel), and construction of a multi-family development (820 Illinois Street) northwest of the site.

In the project vicinity, the primary sources of noise are the BAE Systems Ship Repair facility, various industrial activities (AIC Industrial Center, PG&E Hoedown Yard, and Potrero Substation facilities), new development-related construction activities along Illinois Street, traffic on local streets in the project vicinity (Illinois Street, 20th Street, and 22nd Street), and the distant I-280 freeway. Noise measurements indicate that noise levels in the project area averaged 66 dBA (L_{dn}, ranging between 60 and 70 dBA [L_{dn}]) when nighttime ship repair activities occur, and averaged 60 dBA [L_{dn}]) or 6 dBA less when nighttime repair activities do not occur.[14]

[14] LT-1 is located approximately 1,100 feet from the BAE Systems Ship Repair facility, while LT-5 is located approximately 1,400 feet from these repair facilities. When adjusted for this difference in distance (difference of 2 dB), nighttime noise levels at approximately 1,100 feet from the dry docks (LT-1) ranged from 57-61 dBA (L_{eq}) or 66 dBA (L_{dn}) with nighttime ship repair activities and 50-55 dBA (L_{eq}) or 60 dBA (L_{dn}) without nighttime ship repair activities.

Sensitive Receptors

Some land uses (and associated users) are considered more sensitive to ambient noise levels than others due to the types of activities typically involved with the land use and the amount of noise exposure (in terms of both exposure duration and insulation from noise). In general, occupants of residences, schools, daycare centers, hospitals, places of worship, and nursing homes are considered to be sensitive receptors (i.e., persons who are sensitive to noise based on their specific activities, age, health, etc.). There are industrial, commercial, and residential uses in the project site vicinity. Existing noise-sensitive receptors in the project vicinity (within 900 feet of the project site) include residences and schools, as listed below in Table 4.F.4: Sensitive Receptors in the Project Vicinity, and their locations are indicated in Figure 4.F.2: Noise-Sensitive Receptors in the Project Vicinity, p. 4.F.16. The UCSF Mission Bay Hospital (1825 Fourth Street) is located approximately 0.3 mile to the north. Also, there are additional planned residential developments in the project vicinity, which are also listed in Table 4.F.4. There are no skilled nursing facilities, churches, or public libraries in the immediate project vicinity.

REGULATORY FRAMEWORK

FEDERAL REGULATIONS

In 1972, the Noise Control Act (42 United States Code [U.S.C.] Section 4901 et seq.) was passed by Congress to promote noise environments in support of public health and welfare. It also established the USEPA Office of Noise Abatement and Control to coordinate Federal noise control activities. USEPA established guidelines for noise levels that would be considered safe for community exposure without the risk of adverse health or welfare effects. USEPA found that to prevent hearing loss over the lifetime of a receptor, the yearly average L_{eq} should not exceed 70 dBA, and the L_{dn} should not exceed 55 dBA in outdoor activity areas or 45 dBA indoors to prevent interference and annoyance.[15] In 1982, USEPA phased out the office's funding as part of a shift in Federal noise control policy to transfer the primary responsibility of regulating noise to State and local governments.

Federal regulations establish noise limits for medium and heavy trucks (more than 4.5 tons, gross vehicle weight rating) under Title 40 of the Code of Federal Regulations, Part 205, Subpart B. The Federal truck passby noise standard is 80 dBA at 50 feet from the vehicle pathway centerline, under specified test procedures. These requirements are implemented through regulatory controls on truck manufacturers. There are no comparable standards for vibration, which tend to be specific to the roadway surface, the vehicle load, and other factors.

STATE REGULATIONS

Noise

With respect to noise insulation standards, the 2013 California Building Code (Title 24, Part 2 of the California Code of Regulations [CCR]) requires that walls and floor/ceiling assemblies separating dwelling units from each other or from public or service areas have a Sound Transmission Class (STC) of at least 50, meaning they can reduce noise by a minimum of 50 dB.[16] The Green Building Code standards (Section 1207.4, Allowable Interior Noise Levels) also specify a maximum interior noise limit of 45 dBA (L_{dn} or CNEL) in habitable rooms, and require that common interior walls and floor/ceiling assemblies meet a minimum STC rating of 50 for airborne noise.

The 2013 Green Building Standards Code (also part of the State Building Code; CCR Title 24, Part 11, and referenced below as the more commonly known "Title 24") specifies the following insulation standards for Environmental Comfort (Section 5.507) to minimize exterior noise transmission into interior spaces for non-residential buildings:

- Section 5.507.4.1, Exterior Noise Transmission, requires wall and roof-ceiling assemblies to have an STC of at least 50 and exterior windows to have a minimum STC of 30 for any of the following building locations: (1) within the 65-dBA, L_{dn}, noise contour of a freeway, expressway, railroad, or industrial source; and (2) within the 65-dBA noise contour of an airport. Exceptions include buildings with few or no occupants and where occupants are not likely to be affected by exterior noise, such as factories, stadiums, parking structures, and storage or utility buildings. Section 5.507.4.1.1 requires non-residential buildings to be designed with exterior walls and roof-ceiling assemblies with an STC rating of 45 to provide an acceptable interior noise level of 50 dBA, Leq, in occupied areas during any hour of operation.[17]
- 5.507.4.3, Interior Sound Transmission, requires wall and floor-ceiling assemblies separating tenant spaces and also separating tenant spaces and public places to have an STC of at least 40.
- 5.507.4.2, Interior Sound, requires wall and floor-ceiling assemblies separating tenant spaces and separating tenant spaces and public places to have an STC of at least 40.

San Francisco has adopted the Green Building Code; it is enforced by the Department of Building Inspection.

Vibration

To assess the damage potential to structures from ground vibration induced by construction equipment, various vibration criteria were reviewed and synthesized by Caltrans and they are presented in Table 4.F.5: Vibration Guidelines for Potential Damage to Structures. As indicated in this table, the threshold for continuous vibration sources is about half of the threshold for transient sources.

Table 4.F.5: Vibration Guidelines for Potential Damage to Structures

Structure Type and Condition	Maximum Peak Particle Velocity (in/sec, PPV)	
	Transient Sources	Continuous/Frequent Intermittent Sources
Extremely fragile historic buildings, ruins, ancient monuments	0.12	0.08
Fragile buildings	0.2	0.1
Historic and some old buildings	0.5	0.25
Older residential structures	0.5	0.3
New residential structures	1.0	0.5
Modern industrial/commercial buildings	2.0	0.5

Notes: Transient sources create a single, isolated vibration event, such as blasting or drop balls. Continuous/frequent intermittent sources include impact pile drivers, pogo-stick compactors, crack-and-seat equipment, vibratory pile drivers, and vibratory compaction equipment.

Source: Caltrans, *Transportation and Construction Vibration Guidance Manual*, September 2013, Table 19, p. 27. Available online at http://www.dot.ca.gov/hq/env/noise/publications.htm. Accessed onDecember 16, 2016.

People are more sensitive to vibration during the nighttime hours when sleeping than during daytime waking hours. Numerous studies have been conducted to characterize the human response to vibration. As shown in Table 4.F.6: Vibration Guidelines for Annoyance, for steady-state (continuous) vibration, human response is typically “strongly perceptible” at 0.1 in/sec PPV, “distinctly perceptible” at 0.035 in/sec PPV, and “barely perceptible” at 0.01 in/sec PPV.

LOCAL REGULATIONS AND GUIDELINES

San Francisco Police Code

In the City, regulation of noise is addressed in Article 29 of the Police Code (the Noise Ordinance or Police Code), which states the City’s policy is to prohibit unnecessary, excessive, and offensive noises from all sources subject to police power. Section 2900 makes the following declaration with regard to community noise levels: “It shall be the policy of San Francisco to maintain noise levels in areas with existing healthful and acceptable levels of noise and to reduce

Table 4.F.6: Vibration Guidelines for Annoyance

Human Response	Maximum Peak Particle Velocity (in/sec, PPV)	
	Transient Sources[1]	**Continuous/Frequent Intermittent Sources**[2]
Barely perceptible	0.04	0.01
Distinctly perceptible	0.25	0.04
Strongly perceptible	0.90	0.10
Severe	2.00	0.10

Notes:

in/sec = inches per second; PPV = peak particle velocity

[1] Transient sources create a single, isolated vibration event, such as blasting or drop balls.

[2] Continuous/frequent intermittent sources include impact pile drivers, pogo-stick compactors, crack-and-seat equipment, vibratory pile drivers, and vibratory compaction equipment.

Source: Caltrans, *Transportation and Construction Vibration Guidance Manual*, September 2013, Table 20, p. 38. Available online at http://www.dot.ca.gov/hq/env/noise/publications.htm. Accessed on December 16, 2016.

noise levels, through all practicable means, in those areas of San Francisco where noise levels are above acceptable levels as defined by the World Health Organization's Guidelines on Community Noise."

Sections 2907 and 2908 of Article 29 regulate construction equipment and construction work at night, while Section 2909 provides for limits on stationary-source noise from machinery and equipment. Sections 2907 and 2908 are enforced by the Department of Building Inspection, and Section 2909 is enforced by the Department of Public Health. Summaries of these and other relevant sections are presented below.

Section 2907(a) of the Police Code limits noise from construction equipment to 80 dBA when measured at a distance of 100 feet from such equipment, or an equivalent sound level at some other convenient distance. Exemptions to this requirement include impact tools with approved mufflers, pavement breakers, and jackhammers with approved acoustic shields, and construction equipment used in connection with emergency work. Section 2908 prohibits nighttime construction (between 8:00 p.m. and 7:00 a.m.) that generates noise exceeding the ambient noise level by 5 dBA at the nearest property line unless a special permit has been issued by the City.

Section 2909 generally prohibits fixed mechanical equipment noise and music in excess of 5 dBA more than ambient noise from residential sources, 8 dBA more than ambient noise from commercial sources, and 10 dBA more than ambient on public property at a distance of 25 feet or more. Section 2909(d) establishes maximum noise levels for fixed noise sources (e.g., mechanical equipment) of 55 dBA (7:00 a.m. to 10:00 p.m.) and 45 dBA (10:00 p.m. to 7:00

a.m.) inside any sleeping or living room in any dwelling unit located on residential property to prevent sleep disturbance, with windows open, except where building ventilation is achieved through mechanical systems that allow windows to remain closed.

The City's *Guidelines for Noise Control Ordinance Monitoring and Enforcement*, revised in December 2014, clarifies the definition of "ambient" as the L_{90} (the level of noise exceeded 90 percent of the time), and this noise descriptor is considered to be a conservative representation of the ambient under most conditions.[18] Ordinance compliance is determined by measuring the L_{90} for 10 minutes, with and without the noise source at issue. Use of the L_{90} descriptor is appropriate when determining code compliance of a fixed noise source (such as mechanical equipment), but is not appropriate for other aspects of a CEQA noise impact analysis, which determines noise compatibility based on L_{dn} or CNEL, a different noise descriptor (as described above under "Sound Fundamentals," p. 4.F.1).

Use of Sound Amplifying Equipment

As discussed below under Project Features, the Proposed Project includes open space that would be programmed for various special events, some of which may include amplified sound and, therefore, may require a permit from the Entertainment Commission. Article 1, Section 47.2 of the Police Code regulates the use of any sound amplifying equipment, whether truck-mounted or otherwise, within the City and County of San Francisco and consists of the following regulations:

1. The only sounds permitted are music or human speech.

2. Hours of operation permitted shall be between 9:00 a.m. and 10:00 p.m.; operation after 10:00 p.m. is permitted only at the location of a public event or affair of general public interest or as otherwise permitted by the Entertainment Commission.

3. Except as permitted by the Entertainment Commission, sound shall not be issued within 450 feet of hospitals, schools, churches, courthouses, public libraries, or mortuaries.

4. No sound truck with its amplifying device in operation shall traverse any one block in the City and County more than four times in any one calendar day.

5. Amplified human speech and music shall not be unreasonably loud, raucous, jarring, or disturbing to persons of normal sensitiveness within the area of audibility, nor louder than permitted in Subsections (6) and (7) hereof.

[18] City and County of San Francisco, San Francisco Police Code, Article 29: Regulation of Noise Guidelines for Noise Control Ordinance Monitoring and Enforcement, December 2014 Guidance (Supersedes All Previous Guidance), December 2014. Available online at https://www.sfdph.org/dph/files/EHSdocs/ehsNoise/GuidelinesNoiseEnforcement.pdf. Accessed April 22, 2015.

6. When the sound truck is in motion, the volume of sound shall be controlled so that it will not be audible for a distance in excess of 450 feet from its source; provided, however, that when the sound truck is stopped by traffic, the said sound amplifying equipment shall not be operated for longer than one minute at such a stop.

7. Except as permitted by the Entertainment Commission for public gatherings, in all cases where sound amplifying equipment remains at one location or when the sound truck is not in motion, the volume of sound shall be controlled so that it will not be audible for a distance in excess of 250 feet from the periphery of the attendant audience.

8. No sound amplifying equipment shall be operated unless the axis of the center of any sound reproducing equipment used shall be parallel to the direction of travel of the sound truck; provided, however, that any sound reproducing equipment may be so placed upon said sound truck as to not vary more than 15 degrees on either side of the axis of the center of the direction of travel and, provided further, that radial, nondirectional type of loudspeakers may be used on said sound trucks either alone or in conjunction with sound reproducing equipment placed within 15 degrees of the center line of the direction of travel.

San Francisco Entertainment Commission Permits

Section 90.1 of the San Francisco Administrative Code establishes the role of the San Francisco Entertainment Commission to regulate, promote and enhance the field of entertainment in San Francisco. The seven-member commission has powers to accept, review, and gather information to conduct hearings for entertainment-related permit applications and rule upon and issue, deny, condition, suspend, revoke or transfer entertainment-related permits in accordance with applicable laws and regulations. Additionally, the Entertainment Commission plans and coordinates the provision of City services for major events for which there is no recognized organizer, promoter, or sponsor.

Pursuant to Section 1060.1 of the Police Code, the Entertainment Commission has permit authority over a variety of different permit types including Place of Entertainment permits, Outdoor Amplified Sound/Loudspeaker permits, and Limited Live Performance permits. Permit hearings require the applicant to provide proof of neighborhood outreach to the Commission. Such outreach must consist of at least two of four types of outreach: (1) presentation to a neighborhood, community or residential group; (2) presentation to the leadership of a local not-for-profit that deals with community support such as housing, at risk youth, health, or mental services; (3) a petition including an appropriate number of neighbor signatures according to the applicants business address; and/or (4) presentation to a business association if no community organization or not-for-profit exists near the venue.

San Francisco General Plan

The Environmental Protection Element of the *San Francisco General Plan* (*General Plan*) contains Land Use Compatibility Guidelines for Community Noise for determining the compatibility of various land uses with different noise levels (see Figure 4.F.3: San Francisco Land Use Compatibility Chart for Community Noise). These guidelines, which are similar to State guidelines set forth by the Governor's Office of Planning and Research, indicate maximum acceptable noise levels for various land uses. Although this figure presents a range of noise levels that are considered compatible or incompatible with various land uses, the maximum "satisfactory" noise level is 60 dBA (L_{dn}) for residential and hotel uses; 65 dBA (L_{dn}) for school classrooms, libraries, churches, and hospitals; 70 dBA (L_{dn}) for playgrounds, parks, office uses, retail commercial uses, and noise-sensitive manufacturing/communications uses; and 77 dBA (L_{dn}) for other commercial uses such as wholesale, some retail, industrial/manufacturing, transportation, communications, and utilities. If these uses are proposed to be located in areas with noise levels that exceed these guidelines, a detailed analysis of noise reduction requirements is normally necessary for each building or group of buildings prior to final review and approval.

Objectives and policies in the Environmental Protection Element that pertain to the Proposed Project include the following:

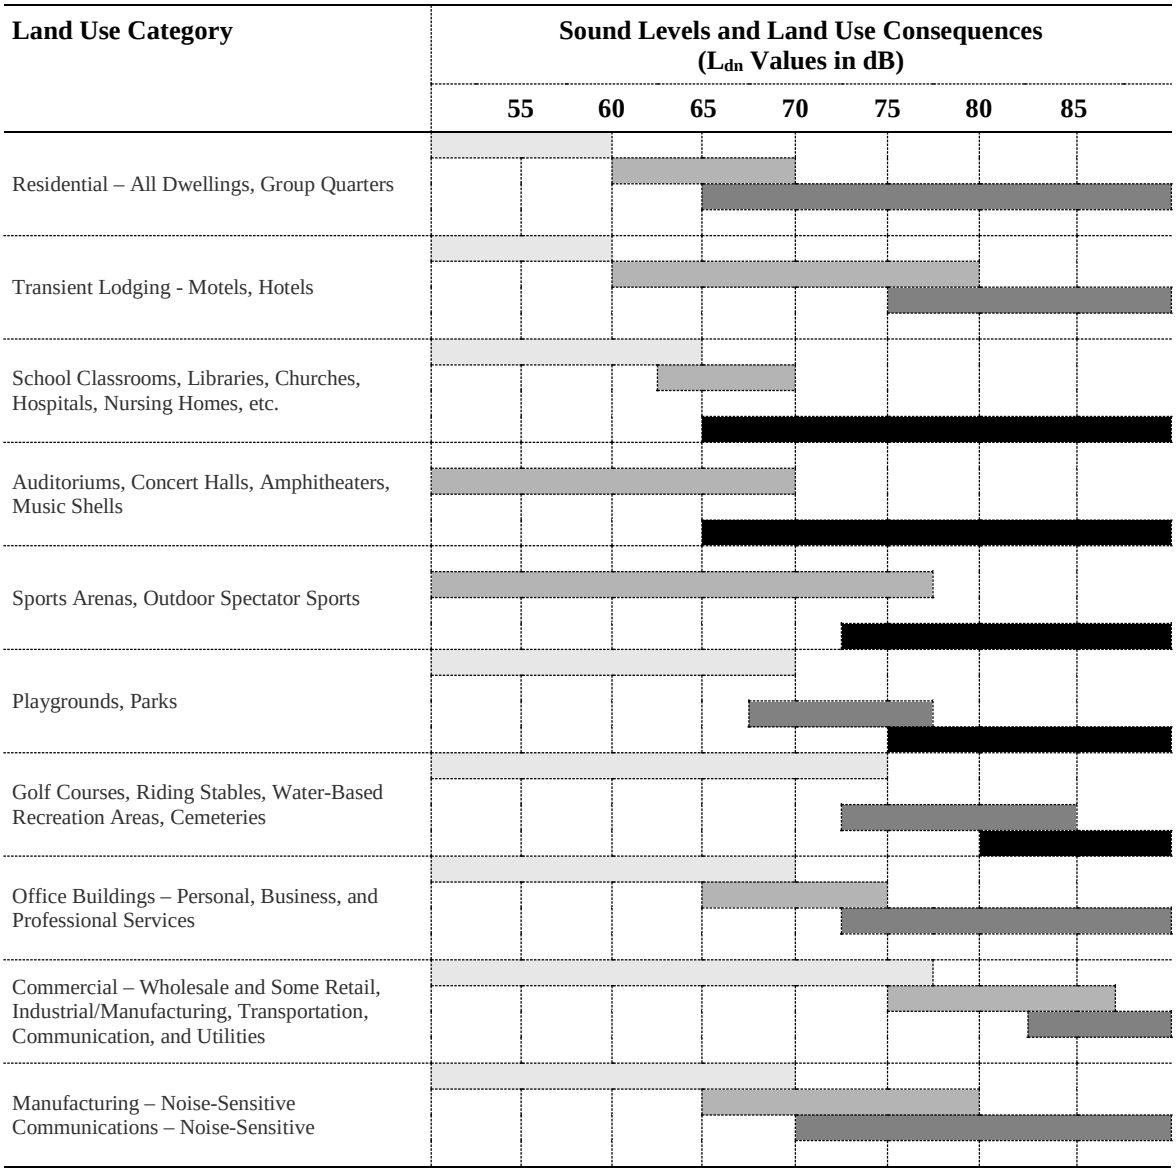
Policy 9.2: Impose traffic restrictions to reduce transportation noise. Transportation noise levels vary according to the predominance of vehicle type, traffic volume, and traffic speed. Curtailing any of these variables ordinarily produces a drop in noise level. In addition to setting the speed limit, the City has the authority to restrict traffic on city streets, and it has done so on a number of streets. In addition, certain movement restraints can be applied to slow down traffic or divert it to other streets. These measures should be employed where appropriate to reduce noise.

Policy 9.6: Discourage changes in streets which will result in greater traffic noise in noise-sensitive areas. Widening streets for additional traffic lanes or converting streets to one-way direction can induce higher traffic volume and faster speeds. Other techniques such as tow-away lanes and traffic light synchronization also facilitate heavier traffic flows. Such changes should not be undertaken on residential streets if they will produce an excessive rise in the noise level of those streets.

Objective 10: Minimize the impact of noise on affected areas. The process of blocking excessive noise from our ears could involve extensive capital investment if undertaken on a systematic, citywide scale. Selective efforts, however, especially for new construction, are both desirable and justified.

Policy 10.1: Promote site planning, building orientation and design, and interior layout that will lessen noise intrusion. Because sound levels drop as distance from the source increases, building setbacks can play an important role in reducing noise for the building occupants. (Of course,

Figure 4.F.3: San Francisco Land Use Compatibility Chart for Community Noise



Satisfactory, with no special noise insulation requirements. Noise levels in this range are considered "Acceptable."

New construction or development should be undertaken only after a detailed analysis of the noise reduction requirements is made and needed noise insulation features included in the design. Noise levels in this range are considered "Conditionally Acceptable."

New construction or development should generally be discouraged. If new construction or development does proceed, a detailed analysis of the noise reduction requirements must be made and needed noise insulation features included in the design. Noise levels in this range are considered "Conditionally Unacceptable."

New construction or development should generally not be undertaken. Noise levels in this range are considered "Unacceptable."

Source: San Francisco Planning Department, 1996. *San Francisco General Plan*, adopted on June 27, 1996. Available online at http://www.sf-planning.org/ftp/General_Plan/I6_Environmental_Protection.htm#ENV_TRA_11. Accessed March 12, 2015.

if provision of the setback eliminates livable rear yard space, the value of the setback must be weighed against the loss of the rear yard.) Buildings sited with their narrower dimensions facing the noise source and sited to shield or be shielded by other buildings also help reduce noise intrusion.

Although walls with no windows or small windows cut down on noise from exterior sources, in most cases it would not be feasible or desirable to eliminate wall openings. However, interior layout can achieve similar results by locating rooms whose use require more quiet, such as bedrooms, away from the street noise. In its role of reviewing project plans and informally offering professional advice on site development, the Department of City Planning can suggest ways to help protect the occupants from outside noise, consistent with the nature of the project and size and shape of the building site.

Policy 10.2: Promote the incorporation of noise insulation materials in new construction. State-imposed noise insulation standards apply to all new residential structures except detached single-family dwellings. Protection against exterior noise and noise within a building is also important in many nonresidential structures. Builders should be encouraged to take into account prevailing noise levels and to include noise insulation materials as needed to provide adequate insulation.

Policy 10.3: Construct physical barriers to reduce noise transmission from heavy traffic carriers. If designed properly, physical barriers such as walls and berms along transportation routes can in some instances effectively cut down on the noise that reaches the areas beyond. There are opportunities for a certain amount of barrier construction, especially along limited access thoroughfares and transit rights-of-way (such as BART), but it is unlikely that such barriers can be erected along existing arterial streets in the city. Barriers are least effective for those hillside areas above the noise source. Where feasible, appropriate noise barriers should be constructed.

Objective 11: Promote land uses that are compatible with various transportation noise levels. Because transportation noise is going to remain a problem for many years to come, attention must be given to the activities close to the noise. In general, the most noise-sensitive activities or land uses should ideally be the farthest removed from the noisy transportation facilities. Conversely, those activities that are not seriously affected by high outside noise levels can be located near these facilities.

Central Waterfront Plan

Objective 1.5: Minimize the impact of noise on affected areas and ensure general plan noise requirements are met.

Noise, or unwanted sound, is an inherent component of urban living. While environmental noise can pose a threat to mental and physical health, potential health impacts can be avoided or reduced through sound land use planning. The careful analysis and siting of new land uses can help to ensure land use compatibility, particularly in zones which allow a diverse range of land uses.

Traffic is the most important source of environmental noise in San Francisco. Commercial land uses also generate noise from mechanical ventilation and cooling systems, and through freight movement. Sound control technologies are available to both insulate sensitive uses and contain unwanted sound. The use of good urban design can help to ensure that noise does not impede access and enjoyment of public space.

Policy 1.5.1: Reduce potential land use conflicts by providing accurate background noise-level data for planning.

Policy 1.5.2: Reduce potential land use conflicts by carefully considering the location and design of both noise generating uses and sensitive uses in the Central Waterfront.

IMPACTS AND MITIGATION MEASURES

SIGNIFICANCE THRESHOLDS

The thresholds for determining the significance of impacts in this analysis are consistent with the environmental checklist in Appendix G of the State CEQA Guidelines, which has been modified by the San Francisco Planning Department. For the purpose of this analysis, the following applicable thresholds were used to determine whether implementing the project would result in a significant noise or vibration impact. The Proposed Project would have a significant impact related to noise and vibration if it were to:

F.1 Result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies;

F.2 Result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels;

F.3 Result in a substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project; or

F.4 Result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project.

F.5 Be located within an airport land use plan area, or, where such a plan has not been adopted, in an area within two miles of a public airport or public use airport, resulting in exposure to excessive noise levels for people residing or working in the area.

F.6 Be located within the vicinity of a private airstrip, resulting in the exposure to excessive noise levels for people residing or working in the project area.

F.7 Be substantially affected by existing noise levels.

The project site is not within an airport land use plan area, nor is it within 2 miles of a public airport or public use airport or in the vicinity of a private airstrip. Therefore, criteria F.5 and F.6 are not applicable, and are not discussed further in the impacts evaluation, below.

APPROACH TO ANALYSIS

Noise

Project implementation would result in operation of heavy equipment on the project site for demolition of existing structures, construction of new structures, and rehabilitation of on-site structures to be retained. Construction activities would occur intermittently on the project site over the 11-year construction duration and could expose nearby sensitive receptors to temporary increases in noise levels substantially in excess of ambient levels. Project construction would also result in temporary increases in truck traffic noise along haul routes for off-hauling excavated materials and materials deliveries. To assess potential construction noise impacts, sensitive receptors and their relative exposure were identified and described. When determining exposure to noise, consideration was given to factors such as structural barriers and distance because of their ability to attenuate noise.

Operation of on-site equipment expected to be used in project construction were estimated based on equipment noise data published by the Federal Highway Administration (FHWA) and Federal Transit Administration (FTA), as shown in Table 4.F.8: Typical Construction Noise Levels, p. 4.F.34. The sources assessed were identified by the project sponsors as likely equipment to be used during project construction. The roadway noise construction model of FHWA was then used to predict noise levels at the nearest receptors during both pile-driving activity and non-impact construction activity.

Methodology for Analysis of Construction Impacts

Construction-related noise impacts were assessed in part using FTA methodology for general quantitative noise assessment.[19] This methodology calls for estimating a combined noise level from simultaneous operation of the two noisiest pieces of equipment expected to be used in each construction phase. This method applies usage factors to each piece of equipment analyzed to account for the time that the equipment is in use over the specified time period. Given the size of the project site, the minimum distance between source and receptor was based on the distance between the closest boundary to the specified receptors.

Noise ordinances regulate noise sources under the control of local jurisdictions, such as mechanical equipment and amplified sounds, as well as prescribe hours of heavy equipment operation. Time and noise limits prescribed in Article 29 of the Police Code are used in this EIR as criteria to determine the significance of project impacts under CEQA in addition to

[19] U.S. Department of Transportation, Federal Transit Administration (FTA), *Transit Noise and Vibration Impact Assessment, Section 12.1.1 Quantitative Noise Assessment Methods*, May 2006, pp. 12-4 to 12-8. Available online at http://www.fta.dot.gov/12347_2233.html. Accessed on March 13, 2016.

consideration of other qualitative criteria such as the duration of noise and the proximity of sensitive receptors. Quantitative criteria that are used to determine the significance of construction-related noise increases under CEQA (including relevant sections of the San Francisco Noise Ordinance) are summarized as follows:

- **Construction Equipment Noise Thresholds.** Proposed construction activities would be required to comply with the San Francisco Noise Ordinance. Sections 2907 and 2908 of the San Francisco Noise Ordinance allows construction activities between 7:00 a.m. and 8:00 p.m., but limits noise from any individual piece of construction equipment, except impact tools approved by San Francisco Public Works, to 80 dBA at 100 feet, which is equivalent to 86 dBA at 50 feet. Construction noise impacts from non-impact equipment that comply with Section 2907(a) of the Noise Ordinance would be considered less than significant (Impact M-NO-1). If construction activities using non-impact equipment would exceed the Section 2907(a) standard, then the noise effects would be significant and mitigation measures would be required.
- **Construction Noise Thresholds at Sensitive Receptors.** The San Francisco Noise Ordinance does not identify quantitative noise limit standards for impact equipment or combined noise impacts from simultaneous operation of multiple pieces of equipment. Therefore, the significance of impact tool (including pile-driving noise) and combined noise increases from simultaneous operation of multiple pieces of construction equipment are evaluated at the closest sensitive receptors based on application of FTA guidelines, as described above (at residential uses, 90 dBA (L_{eq}) during the day and 80 dBA during the night because they are noise-sensitive). To determine whether the project would result in a significant impact with respect to temporary daytime increases in noise levels in the project vicinity above levels existing without the project, the Planning Department considers an increase of 10 dBA over existing noise levels ("Ambient+10 dBA" threshold) due to persistent construction, which generally represents a perceived doubling of loudness, to be a substantial temporary increase in noise levels.

Methodology for Analysis of Operational Impacts

Operation of the Proposed Project would result in permanent increases in ambient noise levels, primarily through project-related increases in traffic, addition of stationary equipment, and introduction of new uses, events, and activities on the project site. Operational noise issues evaluated in this section include: (1) noise increases resulting from the Proposed Project's stationary and mobile noise sources (Impacts NO-4 and NO-5 respectively); and (2) compatibility of the Proposed Project's noise-sensitive uses and existing uses in the project site vicinity with future noise levels at the project site, as defined by the San Francisco Land Use Compatibility Guidelines for Community Noise (Impact NO-6). Additionally, any operations or activities with the potential to cause sleep disturbance would also be considered a significant noise impact (Impacts NO-4 and NO-6). Traffic noise modeling was performed using the FHWA Traffic Noise (RD-77-108) Model. The significance of noise increases from operation of stationary equipment on the project site is assessed based on ordinance noise increase limits as specified below.

Traffic increases associated with the Proposed Project would result in traffic noise increases along local streets. In general, traffic noise increases of less than 3 dBA are barely perceptible to people, while a 5-dBA increase is readily noticeable.[20] Therefore, permanent increases in ambient noise levels of more than 5 dBA are considered to be unacceptable and a significant noise impact in any existing or resulting noise environment. However, in places where the existing or resulting noise environment is "Conditionally Acceptable," "Conditionally Unacceptable," or "Unacceptable" based on the San Francisco Land Use Compatibility Chart for Community Noise (Figure 4.F.3, p. 4.F.23), for sensitive noise receptors any noise increase greater than 3 dBA is considered a significant noise impact.

Traffic noise levels on 79 road segments in the Project vicinity were modeled using traffic volumes presented in the *Pier 70 Traffic Impact Study* (see Figure 4.E.1: Transportation Study Area and Study Intersections, in Section 4.E., Transportation and Circulation, p. 4.E.2).[21] In Table 4.F.10: Summary of Existing and Existing Plus Project Traffic Noise Levels, p. 4.F.52-4.F.56, these modeled traffic noise levels were used to determine the change in traffic noise levels resulting from changes in traffic volumes. The above thresholds (more than a 5-dBA increase, or 3-dBA increase where ambient noise levels are Conditionally Acceptable, Conditionally Unacceptable, or Unacceptable for noise-sensitive receptors) were applied to determine whether the incremental noise increases is considered significant.

Noise Limits and Performance Standards Applied in Analysis

The Police Code and Green Building Code impose noise limits and are applied in this impact analysis as significance thresholds and as performance standards in mitigation measures. These performance standards will be applied to the future design of Proposed Project residential and commercial-office buildings:

- Section 2909 of the Police Code generally prohibits noise produced by fixed noise sources (any machine or device) to result in noise levels that exceed the existing ambient (L_{90}) noise level by more than 5 dBA on residential property, 8 dBA on commercial and industrial property, and 10 dBA on public property at a distance of 25 feet. These noise limits were applied in Impact NO-4 to stationary sources as a first step or initial screening review.
- Section 2909(c) of the San Francisco Police Code generally prohibits noise produced by any machine or device in excess of 10 dBA more than ambient on public property at a distance of 25 feet. This noise limit is applied to future open space uses in Impact NO-6, and is also included as a performance standard in Mitigation Measure M-NO-6, fourth bullet.

[20] California Department of Transportation, Division of Environmental Analysis, "Technical Noise Supplement," November 2009; pp. 2-48 – 2-49. Available online at: http://www.dot.ca.gov/hq/env/noise/pub/tens_complete.pdf.

[21] Fehr & Peers, Pier 70 Mixed-Use District Project Transportation Impact Study, December 2016.

- Section 2909(d) of the Police Code establishes that no fixed noise sources (e.g., mechanical equipment) may cause the noise level inside any sleeping or living room in any dwelling unit located on residential property to exceed 55 dBA (7:00 a.m. to 10:00 p.m.) and 45 dBA (10:00 p.m. to 7:00 a.m.) in order to prevent sleep disturbance, protect public health, and prevent the acoustical environment from progressive deterioration. This noise limit is applied in Impact NO-4 to stationary sources that would be located near residential uses (as a second step or more detailed review, where initial screening review of noise limits in the above Section 2909 were exceeded) and in Impact NO-6 to residential interior noise levels. The nighttime interior noise standard is also included as a performance standard in Mitigation Measures M-NO-4a and M-NO-6, second bullet.
- Title 24 of the California Building Code specifies a maximum interior noise limit of 45 dBA (L_{dn} or CNEL) for residential uses. This standard is applied in Impact NO-6 to residential development (see Tables 4.F.11: Noise Compatibility by Parcel - Maximum Residential Scenario, pp. 4.F.61-4.F.64, and 4.F.12: Noise Compatibility by Parcel - Maximum Commercial Scenario, pp. 4.F.65-4.F.68). It was also included as a performance standard in Mitigation Measure M-NO-6.
- City noise compatibility guidelines (Figure 4.F.3, p. 4.F.23) indicate the maximum noise levels considered "Acceptable" are 60 dBA (L_{dn}) for residential uses. However, where noise levels exceed 70 dBA (L_{dn}), new residential development is generally discouraged. If new construction does proceed, a detailed analysis of noise reduction requirements must be made, and needed noise insulation features must be incorporated into the design. These guidelines are applied in Impact NO-6 to all proposed sensitive uses (see Tables 4.F.11 and 4.F.12, pp. 4.F.61-4.F.64 and pp. 4.F.65-4.F.68, respectively). Tables 4.F.11 and 4.F.12 identify noise compatibility of proposed uses by parcel or building and applicable mitigation measures for each parcel (if any).

Vibration

Vibration impacts are considered significant if they would result either in levels substantial enough to result in damage to nearby structures or buildings, or in vibration levels generally accepted as an annoyance to land uses containing sensitive receptors. Groundborne noise occurs when vibrations transmitted through the ground result in secondary radiation of noise. Construction-related groundborne noise is generally associated with underground construction activities where the airborne noise path is blocked, which is not proposed as part of this project. Therefore, this analysis is focused on groundborne vibration from construction-related activities such as the use of certain types of pile-driving and heavy equipment (Impact NO-3; Table 4.F.8, p. 4.F.34).

There are no City regulations that address vibration effects or provide numerical thresholds for determining when groundborne vibration impacts are considered significant. In the absence of City significance thresholds for vibration from construction equipment, this evaluation uses the Caltrans-identified PPV thresholds for architectural damage to buildings. For adverse human reaction, this

analysis applies the "strongly perceptible" threshold of 0.1 in/sec PPV.[22] For building damage, the threshold depends on the architectural characteristics of the potentially affected structure (see Table 4.F.5, p. 4.F.18).

PROJECT FEATURES

The Proposed Project would include amendments to the *General Plan* and Planning Code, adding a new Pier 70 SUD, which would establish land use controls for the project site and incorporate the design standards and guidelines in the proposed *Pier 70 SUD Design for Development* document.

Under the proposed Pier 70 SUD, the Proposed Project would provide a mixed-use land use program. To cover a full range of potential land uses that could be developed under the Proposed Project, the EIR analyzes a maximum residential use scenario (Maximum Residential Scenario) and a maximum commercial use scenario (Maximum Commercial Scenario) for the project site, which will bracket specific maximum ranges of uses that could be developed.

Proposed land uses on each parcel in the project site under both scenarios are presented in Figure 2.7: Proposed Land Use Plan – Maximum Residential Scenario, and Figure 2.8: Proposed Land Use Plan – Maximum Commercial Scenario, in Chapter 2, Project Description, pp. 2.30 and 2.32, respectively. Table 4.F.7: Project Summary Table by Parcel, summarizes proposed uses and height limits, and also indicates whether new construction or building rehabilitation is proposed by parcel. Under both scenarios, two parcels (C1 and C2) on the project site that are designated for district-structured parking could be developed with residential/commercial uses or residential use, depending on future market demand. Specifically, Parcel C1 could be developed with residential, commercial, or parking uses, and Parcel C2 could be developed with residential or parking uses. Active or passive public rooftop open space (sports courts, play fields, urban agriculture plots, seating, and observational terrace areas) could be developed on the roof of both of these parcels under both scenarios as well if the parcels are built as district parking structures. Accessory, surface, and below-grade parking would be allowed on all parcels on the 28-Acre Site except Buildings 2, 12, and 21 and Parcel E4. These buildings would be renovated and converted into commercial, retail/arts/light industrial (RALI), or residential uses. RALI uses would be allowed on the ground-floor levels of all future buildings on Parcels A, B, C1, C2, D, E1, E2, E3, F, G, H1, H2, PKN, PKS, HDY1, and HDY2. Building 2 would allow either commercial or residential uses, with RALI allowed on the ground floor. Buildings 12 and 21 as well as Parcel E4 would allow RALI only with commercial allowed on the upper floor. On the Illinois Parcels, retail/restaurant uses would be allowed on the ground floor, while accessory parking would be allowed on all four parcels. No residential uses would be allowed on the ground floor of PKN.

Table 4.F.7: Project Summary Table by Parcel

Project Parcel/ Building	Max Res Scenario Proposed Use	Construction Phase[1]	Max Com Scenario Proposed Use	Construction Phase[1]	Building Rehabilitation	New Construction
28-Acre Site[2]						
Parcel A	Commercial	3	Commercial	2		X
Parcel B	Commercial	4	Commercial	4		X
Parcel C1[c3]C1[c]	Residential/Parking (rooftop open space)	2	Commercial/Parking (rooftop open space)	4		X
Parcel C1[3]	Residential/Parking (rooftop open space)	2	Residential/Parking (rooftop open space)	3		X
Parcel D	Residential	2	Residential	2		X
Parcel E1	Residential	4	Residential	3		X
Parcel E2	Residential	2	Residential	2		X
Parcel E3	Residential	4	Residential	4		X
Parcel E4	RALI	4	RALI	4		X
Parcel F	Residential	3	Commercial	3		X
Parcel G	Residential	3	Commercial	3		X
Parcel H1	Residential	5	Commercial	5		X
Parcel H2	Residential	5	Commercial	5		X
Building 2	Residential	2	Commercial	2	X	
Building 12	RALI	2	RALI	2	X	
Building 21	RALI	4	RALI	4	X	
Illinois Parcels[4]						
20th/Illinois Parcel PKN	Residential	1	Residential	1		X
20th/Illinois Parcel PKS	Residential	3	Residential	2		
Hoedown Yard HDY	Residential	4	Commercial	3		X

Notes:

[1] Timing of phases is expected to be as follows: Phases 1 and 2 (2018-2020), Phase 3 (2021-2023), Phase 4 (2024-2026), and Phase 5 (2027-2029).

[2] All 28-Acre Site parcels except existing Buildings 2, 12, and 21 would be permitted to include parking as an accessory use (both above or below grade). Buildings 2, 12, and 21 would be renovated and converted into commercial, RALI, or residential uses. Also RALI uses would be on the ground-floor levels of all future buildings on Parcels A, B, C1, C2, D, E1, E2, E3, F, G, H1, H2, PKN, PKS, HDY1, HDY2, and Buildings 2 and 12. Parcel E4 and Building 21 would contain only RALI uses.

[3] Under both scenarios, Parcel C1 could be developed with residential, commercial, or parking uses and Parcel C2 could be developed with residential or parking uses. Active public rooftop open space (sports courts, play fields, urban agriculture plots, seating, and observational terrace areas) could be developed on the roof of both of these parcels under both scenarios as well, if the parcels are built as district parking structures.

[4] Retail/Restaurant uses would be allowed on the ground floor and accessory parking would be allowed on all four parcels.

Source: Forest City; Turnstone / SWCA

Open spaces programmed as part of the Proposed Project are anticipated to accommodate public outdoor events, including art exhibitions, theater performances, cultural events, outdoor fairs, festivals and markets, outdoor film screenings, evening/night markets, food events, street fairs, and lecture services. Fewer than 100 events per year are anticipated, including approximately 25 mid-size events attracting attendance between 500-750 people, and four larger-size events attracting up to 5,000 people.

Proposed Construction Phasing

For both development scenarios, the Maximum Residential Scenario and the Maximum Commercial Scenario, Proposed Project construction is expected to begin in 2018 and would be phased over an approximately 11-year period, concluding in 2029. Proposed development is expected to involve up to five phases, designated as Phases 1, 2, 3, 4, and 5 (see Figure 2.26: Proposed Phasing Plan – Maximum Residential Scenario, and Figure 2.27: Proposed Phasing Plan – Maximum Commercial Scenario, in Chapter 2, Project Description, pp. 2.82 and 2.85, respectively). Phasing may not occur exactly as laid out in the conceptual phasing plan, but this plan provides a representative approximation of project phasing.

The project applicant, Forest City, as master developer, would be responsible for completing infrastructure improvements (e.g., utilities, streets, open space) and site preparation/grading. Within each phase, such infrastructure development would occur in tandem with the development of adjacent parcels. Third-party developers would construct vertical development on individual parcels. Figures 2.26 and 2.27 show proposed phasing of open space and roadways. Proposed phasing plans are estimates and subject to change. Project build-out and design could vary from the phasing plans depending on market demand.

IMPACT EVALUATION

Project Construction

Impact NO-1: Construction of the Proposed Project would expose people to or generate noise levels in excess of standards in the Noise Ordinance (Article 29 of the San Francisco Police Code) or applicable standards of other agencies. ***(Less than Significant with Mitigation)***

On-Site Equipment Operation

Construction activity noise levels at and near any construction site would fluctuate depending on the particular type, number, and duration of use of various pieces of construction equipment. Construction-related material haul trips would increase ambient noise levels along haul routes, with the magnitude of the increase depending on the number of haul trips made and types of vehicles used. In addition, certain types of construction equipment generate impulsive noises

(such as pile driving), which can be particularly annoying to most people. Given the project's proximity to the Bay, it is assumed that at least some development in the project site area, such as construction of the secant walls proposed in the northeastern and southeastern portions (near Parcels B and H2) would entail pile-driving activities.

Table 4.F.8: Typical Construction Noise Levels, shows typical noise levels associated with a range of construction equipment. As indicated in this table, operation of jackhammers and concrete saws would have the potential to exceed the 86 dBA at 50 feet or 80 dBA at 100 feet noise limit for construction equipment (as specified by the Police Code) by 2 to 4 dBA. While jackhammers with approved acoustic shields are exempt from this ordinance limit,[23] concrete saws would not be exempt. Therefore, operation of concrete saws or any other equipment not exempt from the Police Code that exceeds 86 dBA (L_{eq}) at 50 feet would be a significant noise impact.

However, implementation of noise control measures as specified in Mitigation Measure M-NO-1: Construction Noise Control Plan, shown below, would ensure that all construction equipment noise subject to the noise ordinance be maintained at or below the 86-dBA limit, reducing potential construction-related noise impacts on off-site residents and future on-site residents affected by later construction phases to a less-than-significant level.

Mitigation Measure M-NO-1: Construction Noise Control Plan.

Over the project's approximately 11-year construction duration, project contractors for all construction projects on the Illinois Parcels and 28-Acre Site will be subject to construction-related time-of-day and noise limits specified in Section 2907(a) of the Police Code, as outlined above. Therefore, prior to construction, a Construction Noise Control Plan shall be prepared by the project sponsors and submitted to the Department of Building Inspection. The construction noise control plan shall demonstrate compliance with the Noise Ordinance limits. Noise reduction strategies that could be incorporated into this plan to ensure compliance with ordinance limits may include, but are not limited to, the following:

- Require the general contractor to ensure that equipment and trucks used for project construction utilize the best available noise control techniques (e.g., improved mufflers, equipment redesign, use of intake silencers, ducts, engine enclosures, and acoustically-attenuating shields or shrouds).
- Require the general contractor to locate stationary noise sources (such as compressors) as far from adjacent or nearby sensitive receptors as possible, to muffle such noise sources, and to construct barriers around such sources and/or the construction site, which could reduce construction noise by as much as 5 dBA. To further reduce noise, the contractor shall locate stationary equipment in pit areas or excavated areas, to the maximum extent practicable.

[23] See Section 2907(b) of the Police Code.

Table 4.F.8: Typical Construction Noise Levels

Construction Equipment	Noise Level (dBA, Leq at 50 feet)	Noise Level (dBA, Leq at 100 feet)
Jackhammer (Pavement Breaker)[1]	**88**	**82**
Concrete Saw or Mounted Impact Hammer (Hoe Ram)	**90**	**84**
Loader	79	73
Dozer	82	76
Excavator	81	75
Grader	85	79
Compactor	83	77
Dump Truck	76	70
Flatbed Truck	74	68
Concrete Truck	81	75
Forklift (gas-powered)	83	77
Street Sweeper (vacuum)	82	76
Generator	81	75
Compressor	78	72
Roller	80	74
Crane	81	75
Paver	77	71
Pile Driver[1]	**101**	**95**
San Francisco Noise Ordinance Limit	86	80

Notes: The above Leq noise levels are calculated assuming a 100 percent usage factor at full load (i.e., Lmax noise level 100 percent) for the 1-hour measurement period. Noise levels in **bold** exceed the above ordinance limit, but as indicated, two of the three exceedances are exempt from this limit.

[1] Exempt from the ordinance noise limit of 86 dBA at 50 feet or 80 dBA at 100 feet.

Sources: U.S. Department of Transportation, Federal Highway Administration, 9.0 Construction Equipment Noise Levels and Ranges, Table 9.1, RCNM Default Noise Emission Reference Levels and Usage Factors, Construction Noise Handbook, Updated July 2011. Available online at http://www.fhwa.dot.gov/environment/noise/construction_noise/handbook/handbook09.cfm Accessed January 4, 2016; U.S. Department of Transportation, Federal Transit Administration, Transit Noise and Vibration Impact Assessment, May 2006. Available online at http://www.fta.dot.gov/documents/FTA_Noise_and_Vibration_Manual.pdf. Accessed January 4, 2016.

- Require the general contractor to use impact tools (e.g., jack hammers, pavement breakers, and rock drills) that are hydraulically or electrically powered wherever possible to avoid noise associated with compressed air exhaust from pneumatically powered tools. Where use of pneumatic tools is unavoidable, an exhaust muffler on the compressed air exhaust shall be used, along with external noise jackets on the tools, which would reduce noise levels by as much as 10 dBA.
- Include noise control requirements for construction equipment and tools, including concrete saws, in specifications provided to construction contractors to the maximum extent practicable. Such requirements could include, but are not limited to, erecting temporary plywood noise barriers around a construction site, particularly where a site adjoins noise-sensitive uses; utilizing noise control blankets on a building structure as the building is erected to reduce noise levels emanating from the construction site; performing all work in a manner that minimizes noise; using equipment with effective mufflers; undertaking the most noisy activities during times of least disturbance to surrounding residents and occupants; and selecting haul routes that avoid residential uses.[24]
- Prior to the issuance of each building permit, along with the submission of construction documents, submit to the Planning Department and Department of Building Inspection or the Port, as appropriate, a plan to track and respond to complaints pertaining to construction noise. The plan shall include the following measures: (1) a procedure and phone numbers for notifying the Department of Building Inspection or the Port, the Department of Public Health, and the Police Department (during regular construction hours and off-hours); (2) a sign posted on-site describing permitted construction days and hours, noise complaint procedures, and a complaint hotline number that shall be answered at all times during construction; (3) designation of an on-site construction complaint and enforcement manager for the project; and (4) notification of neighboring residents and non-residential building managers within 300 feet of the project construction area at least 30 days in advance of extreme noise-generating activities (such as pile driving) about the estimated duration of the activity.

Implementation of Mitigation Measure M-NO-1 would reduce construction equipment noise impacts relating to the Noise Ordinance to a less-than-significant level.

[24] Based on FHWA documentation, the following reductions can be achieved: 3-dBA reduction for a noise barrier or other obstruction (like a dirt mound) that interrupts the line-of-sight between the noise source and the receptor; 8-dBA reduction if the noise source is completely enclosed or completely shielded with a solid barrier located close to the source; 5-dBA reduction if the enclosure and/or barrier have some gaps in it; 10-dBA reduction if the noise source is completely enclosed and completely shielded with a solid barrier located close to the source; 15-dBA reduction if a building stands between the noise source and receptor and completely shields the noise source; and 5-dBA reduction if noise source is enclosed or shielded with heavy vinyl noise curtain material (e.g., SoundSeal BBC-13-2 or equivalent).

Impact NO-2: Construction of the Proposed Project would cause a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project. ***(Significant and Unavoidable with Mitigation)***

On-Site Construction Activities

Project implementation would result in operation of heavy equipment on the project site for demolition of existing structures, construction of new structures, and rehabilitation of on-site structures to be retained. Construction activities would occur intermittently on the project site over the 11-year construction duration and could expose nearby sensitive receptors to temporary increases in noise levels substantially in excess of ambient levels.

Proposed redevelopment of the Pier 70 Mixed-Use District project site would result in demolition of seven existing structures, removal of a portion of Irish Hill, demolition of portions of the existing Slipways 5 through 8, construction of new buildings, and rehabilitation of three existing buildings (Figure 2.6: Proposed Rehabilitation, Retention, and Demolition Plan, in Chapter 2, Project Description, p. 2.24, shows the proposed buildings and other structures to be demolished as well as existing buildings to be rehabilitated). Construction activities associated with new building construction would include site preparation, pile driving, placement of infrastructure, placement of foundations for structures, and fabrication of structures. Demolition and construction activities would require the use of heavy trucks, material loaders, cranes, concrete saws, and other mobile and stationary construction equipment listed in Table 4.F.8, p. 4.F.34. Piles would be driven with the use of impact or vibratory pile drivers. General building construction would be less noise intrusive, involving cranes, forklifts, saws, and nail guns. Project construction would also result in temporary increases in truck traffic noise along haul routes for off-hauling excavated materials and materials deliveries.

Because the project would be constructed in phases over an 11-year period, multiple construction activities could be occurring on different parcels within the project site at any given time (i.e., demolition could occur on one parcel while pile driving occurs on another) so that some of the noisier construction activities, such as pile driving, on one project parcel could overlap with other noisier construction phases, such as demolition, on other parcels. If pile drivers operated on one parcel while a mounted impact hammer or concrete saw (for demolition) occurred on another parcel at the same time (worst-case condition), the combined noise level from these two noisiest pieces of equipment would be 89 dBA (L_{eq}) at 50 feet.[25] When compared to the FTA daytime

[25] A 20 percent usage factor was applied to both pieces of equipment. Pile drivers generate 101 dBA (L_{max}) or 88 dBA (L_{eq}) with a 20 percent usage factor. Mounted impact hammers generate 90 dBA (L_{max}) or 83 dBA (L_{eq}) with a 20 percent usage factor. If these two pieces of equipment were to operate at the same time in the same vicinity (not likely since one would be used for demolition and the other as part of foundation work), the combined noise level would be 89 dBA (L_{eq}).

thresholds of 90 dBA (L_{eq}) at residential uses, the maximum combined L_{eq} noise level would not exceed these thresholds because it is expected that both types of equipment would not operate simultaneously closer than 50 feet to any existing residential or commercial uses. It is noted that while pile driving and demolition activities could occur at any given time over the 11-year construction duration, they would not occur continuously over this time period and it is unlikely that pile drivers and either impact hammers or concrete saws would operate simultaneously at closer than 50 feet from any existing residential or commercial uses for any sustained period of time.

Noise Impacts on Off-Site Receptors

As listed in Table 4.F.5, p. 4.F.11, the closest existing off-site sensitive receptors are located 140 to 200 feet from the closest site boundary (northwest corner of Parcel PKN). When construction occurs near the northwest corner of Parcel PKN, the maximum combined L_{eq} noise level of 89 dBA (L_{eq}) at 50 feet would attenuate to 80 dBA and 77 dBA (L_{eq}) at these respective receptors. Measurement Location LT-4 (across the street from the 820 Illinois Street residential development) is the closest noise measurement location to these receptors. Ambient noise levels averaged 62 dBA (L_{dn}) or an average of 57 dBA (daytime L_{eq}) at this location and when these ambient noise levels are applied to the "Ambient+10 dBA" threshold, the thresholds would be 72 dBA (L_{dn}) or 67 dBA (daytime L_{eq}) at these receptors and the maximum combined noise levels at the three closest off-site receptors would exceed these thresholds by up to 13 dBA, a significant noise impact.

For all but these three receptor locations (residences at 820 Illinois Street and 628 20th Street (second floor), and Dogpatch Alt School at 616 20th Street), there are intervening buildings that would block and reduce Proposed Project-related construction noise at nearby existing receptors.[26] For example, the AIC building to the west of the site would interrupt the line-of-sight (at ground level and lower floors) between the project site and existing residential receptors located west of the AIC building. If phasing occurs as proposed, it would result in the construction of residential buildings on the western portion of the project site (Illinois Parcels) first. These buildings would also help block and reduce project-related construction noise (including noise from pile-driving activities to the east on the 28-Acre Site) at all existing off-site receptors (including the closest existing receptors).

With implementation of noise controls during all construction phases (specified in Mitigation Measure M-NO-1) as well as implementation of noise controls during pile driving (specified in Mitigation Measure M-NO-2: Noise Control Measures During Pile Driving, pp. 4.F.40-4.F.41), the potential for noise disturbance of existing off-site receptors (assumed to be present during the

[26] The three exceptions are the east-facing existing residential units on the upper floors of the residential building at 820 Illinois Street (located approximately 200 feet northwest of the project site boundary), second floor residence at 628 20th Street (located about 190 feet to the northwest) and the Dogpatch Alt School (Site 2) at 616 20th Street (located about 140 feet from the project site boundary).

11-year construction period) located approximately 140 to 200 feet to the northwest would be reduced. However, even with implementation of these noise controls, the feasibility of quieter, alternative pile driving methods in all areas cannot be determined at this time and also the potential would still exist that combined noise levels from simultaneous operation of the noisiest types of construction equipment could still exceed the Ambient+10 dBA threshold. Given this uncertainty and the potential 11-year duration of this activity, this impact is conservatively considered to remain significant and unavoidable with mitigation, even with implementation of Mitigation Measures M-NO-1 and M-NO-2.

Noise Impacts on On-Site Receptors

While early construction of Proposed Project residential uses on the Illinois Parcels would help reduce construction-related noise levels at existing receptors, it would also expose future residents living in these new residential buildings to construction noise generated during subsequent phases of project construction. Construction activities in this area would occur in phases over an 11-year period. Phasing may not occur exactly as laid out in the conceptual phasing plan, but this plan provides a representative approximation of project phasing.

If Proposed Project phasing occurs as proposed for the Maximum Residential Scenario, residential uses would be developed during all five phases (2018 to 2029), while commercial and RALI uses would be developed during all phases except Phase 1. If Proposed Project phasing occurs as proposed for the Maximum Commercial Scenario, more residential areas would be developed in the early phases (Phases 1, 2, and 3; 2018 to 2023) while more commercial uses would be developed in the later phases (Phases 3, 4, and 5; 2021 to 2029).

As a result of this possible phasing under either scenario, future residents in the project site area that face an adjacent or nearby construction project could be subject to demolition and construction noise for as long as 6 to 9 years. Construction-related noise generated on any given parcel would primarily affect receptors located within about 900 feet and with a direct line-of-sight (a piece of equipment generating 85 dBA would attenuate to 60 dBA over a distance of 900 feet). Depending on the order of construction within each phase and overall phasing, some Proposed Project buildings that have already been constructed could interrupt the direct line-of-sight between construction sources and noise-sensitive receptors, and reduce the number of receptors directly exposed to construction noise with no intervening buffering structure.

It is likely that pile driving would be required for construction of some buildings or structures on the 28-Acre Site and possibly on the northern portion of the Illinois Parcels. Construction of secant walls in the northeastern and southeastern portions of the 28-Acre Site could also require pile driving on upland portions of the site. In addition, other impact tools such as jackhammers, concrete saws, or mounted impact hammers (hoe rams) could be used during demolition

activities. As indicated above, simultaneous operation of such equipment would generate a maximum combined L_{eq} noise level of 89 dBA (L_{eq}) at 50 feet. Future on-site residents with a direct line-of-sight and 50 feet from demolition or construction activities could be subject to such maximum combined noise levels. As listed in Table 4.F.3, p. 4.F.11, ambient noise levels on the project site ranged between 58 dBA and 68 dBA (L_{dn}) and averaged 64 dBA (L_{dn}). Daytime noise levels ranged from 53 dBA (L_{eq}) to 73 dBA (L_{eq}) and average 61 dBA (L_{eq}). When these ambient noise levels are applied to the "Ambient+10 dBA" threshold, the average thresholds are 74 dBA (L_{dn}) and 71 dBA (daytime L_{eq}) at on-site receptors, and the maximum combined noise level of 89 dBA (L_{eq}) at 50 feet would, at times, exceed these thresholds at the closest future on-site residential receptors (those occupying residential units built in earlier phases) by up to 18 dBA. The degree of disturbance would vary with proximity of the demolition and construction activities to sensitive receptors, but is considered significant and unavoidable because the "Ambient +10 dBA" threshold could be exceeded.

Construction of proposed changes to the street network, new infrastructure (including those associated with all three sewer options), and open space improvements in the project site area would include use of similar construction equipment as would development projects, although typically for a lesser duration and generally with fewer pieces of equipment than for a major development. Accordingly, construction noise impacts associated with the street network, new infrastructure, and open space would be similar to, but somewhat less substantial than, those for development projects in the project site area, except that pile driving would not be necessary for the street network changes, utility lines (including those associated with all three sewer options), or open space improvements. Building demolition, road construction, and building construction would all occur concurrently within each phase. It is expected that infrastructure improvements (including utility lines proposed in roadways) would be done at the same time as road construction. Construction of open spaces would occur during all five phases of construction. Simultaneous operation of the noisiest pieces of equipment associated with demolition (mounted impact hammer or concrete saw) and other construction activities (excavator) would result in a combined noise level of 85 dBA (L_{eq}) at 50 feet. Such maximum combined noise levels would still exceed the average "Ambient+10 dBA" thresholds of 74 dBA (L_{dn}) or 71 dBA (daytime L_{eq}) at on-site receptors located at this proximity. Therefore, construction-related noise increases during other phases of construction, such as construction for road and infrastructure improvements, could adversely affect future on-site residents, a significant noise impact.

With implementation of noise controls during all construction phases (specified in Mitigation Measure M-NO-1) as well as implementation of noise controls during pile driving (specified in Mitigation Measure M-NO-2), the potential for noise disturbance of future on-site residents would be reduced. However, even with implementation of these noise controls, the potential would still exist that combined noise levels from simultaneous operation of the noisiest types of

construction equipment could still exceed the Ambient+10 dBA threshold, and therefore, construction-related noise impacts on future on-site residential receptors is conservatively considered to be significant and unavoidable with mitigation.

Off-Site Haul Truck Traffic

The net export total of about 340,000 cubic yards of soil and an import of about 20,000 cubic yards of clean fill would generate a total of about 45,000 truck trips, which would be phased over the duration of the planned construction activities (averaging 17 truck trips per day). This average daily increase would be minor on the principal major access streets in the project vicinity, comprising less than 0.1 percent of daily traffic on Illinois Street in the project vicinity and an even smaller percentage of daily traffic on Third Street. Construction-related truck trips generated during the estimated 11-year Proposed Project construction duration would be required by the Construction Traffic Control Plan to travel on designated truck routes (i.e., Third Street and Cesar Chavez Street for regional access to the I-280 and SR 101 freeways[27]), minimizing truck traffic in residential areas. There are residential uses on Third Street between 22nd Street and 23rd Street, but no residential uses on Third Street to the south (between 23rd Street and Cesar Chavez Street). There are no existing residential uses on Cesar Chavez Street between Third Street and the SR 101 freeway. There are also no residential uses on Illinois Street between 22nd Street and Cesar Chavez Street, although Illinois Street is not a designated truck route. Given the minimal increase in traffic on local roadways that would be attributable to project-related haul trucks, temporary increases in traffic noise resulting from haul trucks would be less than significant. Use of truck routes that avoid residential uses as required by the Construction Traffic Control Plan would further reduce less-than-significant construction-related truck noise impacts.

Mitigation Measure M-NO-2: Noise Control Measures During Pile Driving

The Construction Noise Control Plan (required under Mitigation Measure M-NO-1) shall also outline a set of site-specific noise and vibration attenuation measures for each construction phase when pile driving is proposed to occur. These attenuation measures shall be included wherever impact equipment is proposed to be used on the Illinois Parcels and/or 28-Acre Site. As many of the following control strategies shall be included in the Noise Control Plan, as feasible:

- Implement "quiet" pile-driving technology such as pre-drilling piles where feasible to reduce construction-related noise and vibration.
- Use pile-driving equipment with state-of-the-art noise shielding and muffling devices.

[27] San Francisco Municipal Transportation Agency, 2009, *San Francisco Truck Traffic Routes.* Trucks are expected to use truck routes, arterials, or freeways except for local deliveries.

- Use pre-drilled or sonic or vibratory drivers, rather than impact drivers, wherever feasible (including slipways) and where vibration-induced liquefaction would not occur.
- Schedule pile-driving activity for times of the day that minimize disturbance to residents as well as commercial uses located on-site and nearby.
- Erect temporary plywood or similar solid noise barriers along the boundaries of each Proposed Project parcel as necessary to shield affected sensitive receptors.
- Other equivalent technologies that emerge over time.

While implementation of construction-related noise control measures in Mitigation Measure M-NO-1 and pile-driving noise reduction measures in Mitigation Measure M-NO-2 would reduce the project's temporary or periodic increases in ambient noise levels, these measures would not necessarily reduce these noise increases to below the Ambient+10 dBA threshold because feasibility of quieter, alternative pile driving methods in all areas cannot be determined at this time. Given this uncertainty and the potential 11-year duration of this activity, this impact is conservatively considered to remain significant and unavoidable, even with implementation of Mitigation Measures M-NO-1 and M-NO-2.

Impact NO-3: Construction of the Proposed Project would expose people and structures to or generate excessive groundborne vibration levels. ***(Less than Significant with Mitigation)***

Groundborne Noise and Vibration

Groundborne noise refers to a condition where noise is experienced inside a building or structure as a result of vibrations produced outside of the building and transmitted as ground vibration between the source and receiver. Groundborne noise can be problematic even in situations where the primary airborne noise path is blocked, such as in the case of construction of a subway tunnel in proximity to homes or other noise-sensitive structures. While the Proposed Project would involve excavation to a maximum depth of 27 feet, noise and vibration-generating construction activities associated with construction of proposed basement levels would not involve tunneling or underground construction where the airborne noise path is blocked. Therefore, impacts related to groundborne noise from construction activities are not expected to be substantial.

The Proposed Project would include the types of construction activities that could produce excessive groundborne vibration (i.e., pile driving for foundations or secant walls). In addition, construction equipment used for demolition, site preparation, and shoring activities, such as jackhammers, pavement breakers, and drills, could generate varying degrees of temporary groundborne vibration, with the highest levels expected during demolition, excavation, and below-grade construction stages of each construction phase. Excavation for basements on the Illinois Parcels would require excavation into bedrock where use of hoe-rams or jackhammers would be

required. Project construction would also entail the use of heavy trucks for material deliveries and for off-site hauling of excavated materials and demolition debris during the daytime hours and throughout the 11-year construction period. All construction activities would be conducted primarily between 7:00 a.m. and 8:00 p.m. in compliance with Section 2908 of the City's Noise Ordinance and subject to noise controls outlined in Mitigation Measures M-NO-1 and M-NO-2.

If groundborne vibration generated by project-related demolition and construction activities were to exceed 0.5 in/sec PPV, it could cause cosmetic damage to a nearby structure. Older structures (i.e., potentially historic), such as the unreinforced monumental masonry Buildings 113 and 114 (building locations are indicated on Figure 4.D.2: Contributing and Non-contributing Features on the Project Site, in Section 4.D, Cultural Resources, p. 4.D.37), may be more fragile and cosmetic damage could occur at lower vibration levels (possibly as low as 0.2 in/sec PPV). Typical vibration levels associated with the operation of various types of construction equipment at 25, 60, and 160 feet, some of which are similar to those proposed to be used for the Proposed Project, are listed in Table 4.F.9: Vibration Levels for Construction Equipment. While vibration attenuation with distance can vary depending on subsoils, normal attenuation rates indicate that vibration generated by impact pile drivers could result in cosmetic damage to adjacent historic buildings if it occurs within 160 feet of these buildings. Parcel PKN is located approximately 80 feet from the older Buildings 113 and 114, and Parcel A is located approximately 50 feet from Building 113. Cosmetic damage to project buildings could occur if impact pile drivers are operated within 70 feet of project structures and 160 feet of Buildings 113 or 114, assuming maximum reference vibration levels. Use of sonic or vibratory pile drivers, if feasible, would generate lower levels of vibration with commensurate minimum setback distances of approximately 35 feet from project structures and 70 feet from historic buildings required to avoid cosmetic damage.

Pile driving and building locations on project parcels have not been specified for the entire site, but pile driving is proposed adjacent to and east of the 20th Street Historic Core, which adjoins the northwestern boundary of the 28-Acre Site and eastern boundary of the 20th/Illinois Parcels. While it may be possible to maintain a setback of 70 feet or more between pile drivers and adjacent structures at many locations to avoid cosmetic damage to adjacent structures, the minimum separation between some parcels such as between Parcel E1, Parcel E4, and Building 21 or between Parcels E2 and E3 would be less than 70 feet. At distances of less than 70 feet, vibration from impact or vibratory pile-driving activities could result in cosmetic damage to Proposed Project structures and historic Buildings 113 and 114, a significant vibration impact. When the more stringent threshold of 0.2 in/sec PPV is applied to historic buildings, cosmetic damage could occur at distances of up to 160 feet from historic buildings (as indicated in Table 4.F.9). However, implementation of measures such as evaluating specific potentially historic buildings,

Table 4.F.9: Vibration Levels for Construction Equipment

Equipment	Peak Particle Velocity (PPV) (in/sec)		
	At 25 Feet	At 60 Feet[1]	At 160 Feet[1]
Impact or Vibratory Pile Driver			
Range	0.170–1.518	0.065–0.579	0.022-0.197
Typical	0.65	0.248	0.084
Other Construction Equipment			
Vibratory Roller/Compactor	0.210	0.080	0.027
Large Bulldozer	0.089	0.034	0.012
Caisson Drilling	0.089	0.034	0.012
Loaded Trucks	0.076	0.029	0.010
Jackhammer	0.035	0.013	0.005
Small Bulldozer	0.003	0.001	0.000

Note:

[1] Vibration amplitudes for construction equipment assume normal propagation conditions and were calculated using the following formula: PPV equip = PPVref x $(25/D)^{1.1}$ where:

- PPV (equip) = the peak particle velocity in in/sec of the equipment adjusted for the distance
- PPV (ref) = the reference vibration level in in/sec from pages 31-33 and Table 18 of the Caltrans Vibration Guidance Manual as well as Table 12-2 of the FTA Noise and Vibration Guidance Manual
- D = the distance from the equipment to the receiver

establishing and enforcing appropriate vibration limits for the affected structures based on site-specific conditions, and monitoring vibration levels at structures of concern (as specified in Mitigation Measure M-NO-3: Vibration Control Measures During Construction) would be adequate to reduce the potential for cosmetic damage to adjacent project and historic structures to a less-than-significant level. Depending on the timing of development at Parcels E2, E3, and E4, as well as the timing of the proposed relocation of Historic Building 21 to within 25 feet of new development, construction-related vibration impacts on this building from adjacent pile driving activities could be avoided entirely if development precedes relocation. If, however, relocation of Building 21 precedes development at adjacent Parcels E2, E3, and E4, significant vibration impacts could occur. If this occurred, implementation of Mitigation Measure M-NO-3 would reduce the potential for cosmetic damage to a less-than-significant level.

While vibratory pile driving (or similar continuous vibration sources) can reduce the potential impacts to fragile structures that can occur with impact pile driving (where higher intermittent vibration levels can occur when the hammer strikes the pile), continuous vibration can also cause liquefaction (or differential settlement in sandy soils), due to the continuous nature of the

vibration. AASHTO[28] states: "Saturated, loose, uniformly or poorly graded sands and silts are sensitive to cyclic vibration such as might be produced by vibratory pile driving. These activities can produce noticeable settlement even at low vibration levels (0.1 to 0.7 in/sec), which are known to produce threshold cracking." Evaluation of this potential, enforcement of an appropriate vibration limit, and using smaller equipment or pre-drilling pile holes, as specified in Mitigation Measure M-NO-3, would reduce the potential for structural damage from vibration-induced liquefaction to a less-than-significant level.[29]

Mitigation Measure M-NO-3: Vibration Control Measures During Construction

As part of the Construction Noise Control Plan required under Mitigation Measure M-NO-1, appropriate vibration controls (including pre-drilling pile holes and using smaller vibratory equipment) shall be specified to ensure that the vibration limit of 0.5 in/sec PPV can be met at adjacent or nearby existing structures and Proposed Project buildings located on the Illinois Parcels and/or 28-Acre Site, except as noted below:

- Where pile driving and other construction activities involving the use of heavy equipment would occur in proximity to any contributing building to the Union Iron Works Historic District, the project sponsors shall undertake a monitoring program to minimize damage to adjacent historic buildings and to ensure that any such damage is documented and repaired. The monitoring program, which shall apply within 160 feet where pile driving would be used and within 25 feet of other heavy equipment operation, shall include the following components:
  - Prior to the start of any ground-disturbing activity, the project sponsors shall engage a historic architect or qualified historic preservation professional to undertake a pre-construction survey of historical resource(s) identified by the San Francisco Planning Department within 160 feet of planned construction to document and photograph the buildings' existing conditions.
  - Based on the construction and condition of the resource(s), a structural engineer or other qualified entity shall establish a maximum vibration level that shall not be exceeded at each building, based on existing conditions, character-defining features, soils conditions and anticipated construction practices in use at the time (a common standard is 0.2 inch per second, peak particle velocity).
  - To ensure that vibration levels do not exceed the established standard, a qualified acoustical/vibration consultant shall monitor vibration levels at each structure within 160 feet of planned construction and shall prohibit vibratory construction activities that generate vibration levels in excess of the standard. Should vibration levels be observed in excess of the standard, construction shall be halted and alternative construction techniques put in practice. (For example, pre-drilled piles could be substituted for driven piles, if soil conditions allow;

[28] American Association of State Highway Transportation Officials (AASHTO), *Evaluation of Transportation-Related Earthborne Vibrations,* R 8-96, 2004.

[29] As discussed in "Geotechnical Stabilization" in Chapter 2, Project Description, p. 2.69, the Proposed Project would likely include the installation of below-grade secant pile walls along the northeastern and southeastern portions of the project site on either side of the craneways to prevent lateral spread from occurring.

smaller, lighter equipment could possibly also be used in some cases.) The consultant shall conduct regular periodic inspections of each building within 160 feet of planned construction during ground-disturbing activity on the project site. Should damage to a building occur as a result of ground-disturbing activity on the site, the building(s) shall be remediated to its pre-construction condition at the conclusion of ground-disturbing activity on the site.

- In areas with a "very high" or "high" susceptibility for vibration-induced liquefaction or differential settlement risks, the project's geotechnical engineer shall specify an appropriate vibration limit based on proposed construction activities and proximity to liquefaction susceptibility zones and modify construction practices to ensure that construction-related vibration does not cause liquefaction hazards at these homes.

Implementation of Mitigation Measure M-NO-3 would reduce vibration noise impacts to a less-than-significant level.

Project Operations

Impact NO-4: Operation of the Proposed Project would result in a substantial permanent increase in ambient noise levels in the immediate project vicinity, or permanently expose persons to noise levels in excess of standards in the San Francisco General Plan and San Francisco Noise Ordinance. ***(Less than Significant with Mitigation)***

Operation of the Proposed Project would increase ambient noise levels in the immediate vicinity of the project site, primarily through the on-site use of stationary equipment, such as emergency generators, heating/ventilation/air conditioning systems, a below-grade wastewater pump station, and outdoor activities in open space areas.

Stationary Equipment

Project implementation would add new mechanical equipment, such as heating/ ventilation/ air conditioning (HVAC) systems, which could produce operational noise. Operation of HVAC equipment would be subject to the City's Noise Ordinance. Under Section 2909 of the Police Code, stationary sources are not permitted to result in noise levels that exceed the existing ambient (L_{90}) noise level by more than 5 dBA on residential property, 8 dBA on commercial and industrial property, and 10 dBA on public property. Section 2909(d) states that no fixed noise source may cause the noise level measured inside any sleeping or living room in a dwelling unit on residential property to exceed 45 dBA between 10:00 p.m. and 7:00 a.m. or 55 dBA between 7:00 a.m. and 10:00 p.m. with windows open, except where building ventilation is achieved through mechanical systems that allow windows to remain closed.

Based on noise measurements collected on the project site and its vicinity, the existing ambient (L_{90}) noise levels range between 44 and 58 dBA near the western boundary of the Illinois Parcels (LT-4 and LT-6) and between 57 and 62 dBA (LT-2) on the 28-Acre Site. Section 2909 of the

Police Code would allow mechanical equipment to generate up to 8 dB higher than the lowest ambient (or up to 52 dBA, L_{90}) near the western boundary of the Illinois Parcels and up to 8 dB higher (or up to 65 dBA, L_{90}) near the 28-Acre Site northern boundary. Depending on size, noise from HVAC equipment can generate noise levels of up to 75 dBA (L_{90}) at 30 feet. Assuming HVAC equipment operates 24 hours per day (worst-case), such noise levels would exceed ordinance noise limits if this equipment is placed near parcel boundaries, resulting in a significant impact. However, with incorporation of noise attenuation measures (e.g., provision of sound enclosures/barriers, addition of roof parapets to block noise, and increasing setback distances from sensitive receptors), as specified in Mitigation Measure M-NO-4a: Stationary Equipment Noise Controls, p. 4.F.50, HVAC-related noise would be reduced to ordinance noise limits (52 dBA) at the western boundary of the Illinois Parcels, and the mitigated noise level would attenuate to below 30 dBA at the closest existing sensitive receptors (140 to 200 feet away). With windows open, interior noise levels would be even lower and well below the 45-dBA nighttime interior noise limit (with windows open) specified in Section 2909, indicating that potential noise impacts would be reduced to less than significant. Other nearby sensitive receptors to the west, northwest, and southwest are located farther away and noise levels from project mechanical equipment would be less. Intervening buildings would also interrupt any direct lines-of-sight between these more distant receptors and rooftop noise sources.

With respect to on-site project residences, an interior noise level of 45 dBA (L_{dn} or CNEL) would be required by Title 24 of the California Building Code, and design of Proposed Project residences (under either the Maximum Residential or Maximum Commercial scenarios) would need to account for not only existing noise sources, as required by Title 24, but also future noise sources known at the time of development (including HVAC systems), as required in Mitigation Measure M-NO-4a. Therefore, incorporation of noise attenuation measures, as specified in Mitigation Measure M-NO-4a, would ensure compliance with the Section 2909 of the Police Code requirements in the interiors of Proposed Project residential units under both existing and future noise conditions, reducing potential noise impacts from stationary equipment to a less-than-significant level.

Emergency generators would be required on at least 11 of the proposed parcels where building heights would exceed 70 feet under both the Maximum Residential and Maximum Commercial scenarios, as well as at the proposed pump station. The only exception would be Parcel E1, which would not require an emergency generator under the Maximum Commercial Scenario, because the building on this parcel would be 65 feet high under this scenario. These parcels are located along the northern (A, B, D, and E1) and southern (F, G, H1, and H2) boundaries of the project site, as well as in the center of the site and just east of Irish Hill (C1 and C2). The closest existing off-site sensitive receptors would be located 700 feet or more from the closest of these buildings (C1). The emergency generators would create temporary noise from use during a power failure, could periodically result in temporary noise during testing to ensure their continued

reliability, and could operate continuously following a catastrophic emergency until electric power service is restored to the area. Emergency generators typically operate for approximately 1 hour per week (50 hours per year) and such a short noise event would not substantially alter ambient noise levels. Depending on the size, emergency generators can generate noise levels of 75 to 80 dBA (L_{eq}) at 50 feet and the L_{90} noise level would be similar to the L_{eq} level due to the continuous nature of generator noise. Although there are no existing off-site sensitive receptors within 700 feet of parcels that could contain buildings requiring generators, some of the Proposed Project buildings where emergency generators would be located would be developed with residential uses. Therefore, the Proposed Project's residential receptors could be located as close as 50 feet from these buildings/parcels. At this distance, noise levels generated by operation of emergency generators would exceed noise limits specified in Section 2909(d) of the Police Code (55 dBA from 7:00 a.m. to 10:00 p.m. and 45 dBA from 10:00 p.m. to 7:00 a.m. inside any sleeping or living room in any dwelling unit located on residential property), a significant impact. However, with incorporation of noise attenuation measures specified in Mitigation Measure M-NO-4a, this impact would be reduced to a less-than-significant level.

A wastewater pump station (the 20th Street Pump Station) and electrical transformers are proposed to be located to the north of the 28-Acre Site between Building 108 and Building 6. Pumps associated with the pump station would be located below grade, while other pump station facilities and transformers would be above grade. Noise increases resulting from these new facilities would ultimately depend on the number and size of pumps, the size and type of transformers, extent of noise attenuation features incorporated into the facility design, ambient noise levels in the vicinity, and proximity to sensitive receptors. Although pump noise can be highly variable, below-grade pumps are estimated to generate approximately 52 dBA (L_{eq} or L_{90}) (due to the continuous nature of pump noise when operating) at 25 feet from any vent openings to the below-grade pump station structure.[30] In the same vicinity, transformers (up to 1,000 kilovolt amps [kVA]) could generate noise levels of up to 38-44 dBA (L_{eq} or L_{90} due to the continuous nature of transformer noise) at 25 feet, depending on the type of transformer (liquid immersed vs. dry-type).[31] As indicated in Table 4.F.3, p. 4.F.11, daytime L_{90} noise levels in this vicinity (LT-3) were measured to range from 52 to 58 dBA (L_{90}), and therefore, combined noise generated by these facilities (53 dBA, L_{eq} or L_{90}) would have a slight potential to increase ambient noise levels in this vicinity. Existing industrial uses (BAE Systems Ship Repair) and proposed commercial uses (under both the Maximum Residential and Maximum Commercial scenarios) would be located adjacent to this

[30] This level assumes that the interior level will not exceed 85 dBA (to avoid the need for OSHA worker hearing protection) and the building/enclosure reduces interior noise levels by 20 dBA at vent openings (conservative since most enclosures can provide at least 25 dB reductions).

[31] Transformer noise levels were estimated based on National Electrical Manufacturers Association standards (NEMA, *NEMA TR 1-2013, Transformers, Step Voltage Regulators and Reactors,* p. 4, 2014; NEMA *Transformers, Regulators and Reactors, No. TR 1,* p. 4, 1994. Since distance is not specified in NEMA standards, for the purpose of this analysis, levels were assumed to be a near-field noise level at 5 feet and then converted to a far-field noise level at 50 feet by applying a 20-dB reduction.

facility, and Section 2909(b) would limit noise increases adjacent to such uses to 8 dBA above ambient (L_{90}). Whether or not future noise levels exceed ordinance noise limits will ultimately depend on the size and design of the proposed wastewater pump station facilities as well as ambient noise levels at the closest property plane for the pump station. Given the range of existing ambient noise levels in the pump station vicinity, addition of the proposed pump station is conservatively considered to have the potential to slightly exceed ordinance noise limits, a significant impact. However, with implementation of Mitigation Measure M-NO-4a, the design of the wastewater pump station will be required to comply with applicable noise limits specified in Section 2909 of the Police Code and this would ensure this impact is reduced to less than significant. Compliance with this ordinance limit would ensure that project-related noise increases from this pump station would be maintained at acceptable levels at existing industrial uses, proposed commercial uses, and more distant proposed residential uses.

Other Noise-Generating Uses

Development of commercial-office uses in proximity to existing residential uses would increase the potential for noise disturbance or conflicts. Sources of noise typically associated with such non-residential uses that can cause sleep disturbance include mechanical equipment, delivery trucks and associated loading areas, parking cars, and use of refuse bins. Mechanical equipment (stationary noise sources) can include emergency generators as well as refrigeration and HVAC units, and associated noise impacts from these sources are discussed above.

With respect to delivery trucks, if deliveries and associated unloading/loading activities occur in proximity to future residential buildings and during the nighttime hours, future residents could be subject to sleep disturbance by noise from these activities. Noise typically associated with delivery trucks includes trucks maneuvering in and out of designated loading areas, audible warnings when trucks reverse into loading areas, idling during deliveries, opening and closing of truck doors and rollup doors, use of rolling hand carts and dollies, and engines starting. There would be a potential for sleep disturbance from these types of noise under both scenarios, because all future commercial-office or RALI buildings would be located adjacent to one or more residential buildings (as close as 23 to 38 feet in some instances), a potentially significant noise impact. The California Air Resources Board limits the idling of diesel trucks (over 10,000 pounds) to no more than 5 minutes, and this rule would help minimize truck idling noise in loading areas. Audible warnings are required by Cal-OSHA to be at least 5 dBA above ambient noise levels. These devices are highly directional in nature, and when in reverse, the trucks and the warning alarm would be directed towards the loading area and adjacent commercial-office structures. Audible warnings are, of course, intended to warn persons who are behind the vehicle when it is backing up, and could cause sleep disturbance if they occur during the nighttime (including early morning) hours near residential uses, a potentially significant noise impact. However, locating loading areas on the sides of commercial-office buildings that face away from

residential buildings to the extent feasible or designing loading areas with noise shielding (preferably enclosures) or restricting these activities to the daytime hours (7:00 a.m. to 8:00 p.m.), as specified in Mitigation Measure M-NO-4b: Design of Future Noise-Generating Uses, first bullet, would reduce the significant impact related to the potential for sleep disturbance of future residents from this noise source to a less-than-significant level.

Noise associated with parking cars includes engines starting and car doors slamming. Such noise can cause annoyance at adjacent residential uses if it is concentrated in one area (i.e., a surface parking lot is located adjacent to residences), and if it occurs during the evening or nighttime hours, it could cause sleep disturbance, a potentially significant impact. Parking for each project building is proposed to be located under the building (below-grade parking) or in a parking garage. These types of parking facilities could be designed to avoid or minimize the potential for such noise disturbance or annoyance at future residences with incorporation of appropriate noise-shielding measures into any future parking structures, as specified in Mitigation Measure M-NO-4b, second bullet. This would reduce significant noise conflicts from this future use to a less-than-significant level.

Noise associated with trash or refuse facilities for both future residential and commercial-office uses could disturb or annoy any future nearby residents, a significant impact. Such noise is typically associated with trash-dumping activities, operation of trash compactors and garbage truck collection activities (including truck noise, operation of motors that lift trash containers, banging of containers during trash collection activities, and audible warnings when trucks reverse).

As indicated in Impact NO-4 under "Stationary Equipment," p. 4.F.45, Section 2909 limits noise increases from fixed (stationary) mechanical equipment associated with each Proposed Project building (residential or commercial-office) to 5 dBA from residential sources and 8 dBA for commercial-office sources, and this requirement would limit the potential for noise compatibility problems. However, there are no similar code restrictions or noise limits that restrict activities such as these (i.e., parking structures, loading docks, and trash bins) that are related to commercial-office uses. Implementation of noise avoidance or minimization practices through the design of both future commercial-office and residential buildings, as specified in Mitigation Measures M-NO-6: Design of Future Noise-Sensitive Uses, pp. 4.F.70-4.F.71, and Mitigation Measure M-NO-4b would help reduce to a less-than-significant level the potential conflicts between future noise-generating uses and residential receptors and the potential for sleep disturbance. Mitigation Measure M-NO-6 would require a site-specific noise evaluation for each residential parcel or building to be developed to ensure that applicable interior noise standards are met, and the evaluation is required to account for planned commercial-office and open space uses in adjacent areas, future variations in Proposed Project build-out (building heights, location, and phasing), any changes in activities adjacent to or

near the Illinois Parcels or 28-Acre Site (given the Proposed Project's long build-out period), and any shielding provided by surrounding buildings that exist at the time of development. In addition, implementation of noise control measures in the design of noise-generating uses such as loading docks, trash enclosures, surface parking lots, and mechanical equipment evaluation, as specified in Mitigation Measure M-NO-4b, would ensure that new sources of noise associated with development of new non-residential uses are properly evaluated and potential sleep disturbance effects ameliorated, so that potential conflicts between new noise-generating uses and existing noise-sensitive uses would be avoided or reduced to a less-than-significant level.

Mitigation Measure M-NO-4a: Stationary Equipment Noise Controls

Noise attenuation measures shall be incorporated into all stationary equipment (including HVAC equipment and emergency generators) installed on buildings constructed on the Illinois Parcels and 28-Acre Site as well as into the below-grade or enclosed wastewater pump station as necessary to meet noise limits specified in Section 2909 of the Police Code.[32] Interior noise limits shall be met under both existing and future noise conditions, accounting for foreseeable changes in noise conditions in the future (i.e., changes in on-site building configurations). Noise attenuation measures could include provision of sound enclosures/barriers, addition of roof parapets to block noise, increasing setback distances from sensitive receptors, provision of louvered vent openings, location of vent openings away from adjacent commercial uses, and restriction of generator testing to the daytime hours.

Mitigation Measure M-NO-4b: Design of Future Noise-Generating Uses near Residential Uses

Future commercial/office and RALI uses shall be designed to minimize the potential for sleep disturbance at any future adjacent residential uses. Design approaches such as the following could be incorporated into future development plans to minimize the potential for noise conflicts of future uses on the project site:

- Design of Future Noise-Generating Commercial/Office and RALI Uses. To reduce potential conflicts between sensitive receptors and new noise-generating commercial or RALI uses located adjacent to these receptors, exterior facilities such as loading areas/docks, trash enclosures, and surface parking lots shall be located on the sides of buildings facing away from existing or planned sensitive receptors (residences or passive open space). If this is not feasible, these types of facilities shall be enclosed or equipped with appropriate noise shielding.
- Design of Future Above-Ground Parking Structure. If parking structures are constructed on Parcels C1 or C2, the sides of the parking structures facing adjacent or

[32] Under Section 2909 of the Police Code, stationary sources are not permitted to result in noise levels that exceed the existing ambient (L_{90}) noise level by more than 5 dBA on residential property, 8 dBA on commercial and industrial property, and 10 dBA on public property. Section 2909(d) states that no fixed noise source may cause the noise level measured inside any sleeping or living room in a dwelling unit on residential property to exceed 45 dBA between 10:00 p.m. and 7:00 a.m. or 55 dBA between 7:00 a.m. and 10:00 p.m. with windows open, except where building ventilation is achieved through mechanical systems that allow windows to remain closed.

nearby existing or planned residential uses shall be designed to shield residential receptors from noise associated with parking cars.

Implementation of Mitigation Measures M-NO-4a and M-NO-4b would reduce noise compatibility impacts on noise-sensitive receptors from stationary sources to a less-than-significant level.

Impact NO-5: Operation of the Proposed Project would cause substantial permanent increases in ambient noise levels along some roadway segments in the project site vicinity. ***(Significant and Unavoidable with Mitigation)***

Operational Traffic Noise

Operation of the Proposed Project would result in permanent increases in ambient noise levels, primarily through project-related increases in traffic. As explained above under "Methodology for Analysis of Operational Impacts," pp. 4.F.27-4.F.28, for operational noise impacts, the following thresholds are applied to determine the significance of project-related traffic noise increases: (1) an increase of more than 5 dBA is considered a significant traffic noise increase; and (2) in places where the existing or resulting noise environment is "Conditionally Acceptable," "Conditionally Unacceptable," or "Unacceptable" for noise-sensitive uses based the San Francisco Land Use Compatibility Chart for Community Noise (Figure 4.F.3), any noise increase greater than 3 dBA is considered a significant traffic noise increase.

Noise modeling was completed to estimate existing (baseline) and future traffic noise levels along 79 road segments in the Pier 70 Mixed-Use District project area based on traffic volumes presented in the project's Traffic Impact Study.[33] Noise modeling results are presented in Table 4.F.10: Summary of Existing and Existing Plus Project Traffic Noise Levels. Traffic noise levels presented in this table have been modeled for the purpose of identifying the future incremental noise level increases attributable to project and cumulative development.

Table 4.F.10 indicates that Proposed Project implementation (under both the Maximum Residential and Maximum Commercial scenarios) would result in traffic noise increases ranging from 0 to 14.3 dBA on local roadways providing access to the site. Of the 79 road segments examined, traffic noise increases on all analyzed street segments would not exceed the above

Notes: Noise levels may vary by up to one-tenth of a decibel due to rounding. Noise levels in **bold** exceed either of the following threshold increases when compared to baseline noise levels: (1) an increase of 5 dBA or more, or (2) an increase of 3 dBA or more in areas where the existing or resulting noise increase exceeds acceptable (or satisfactory) levels for the affected use (see Figure 4.F.3: San Francisco Land Use Compatibility Chart for Community Noise, p. 4.F.23).

Res: Residential; Com: Commercial; Off: Office; Ind: Industrial; Inst: Institutional; UCSF: University of California, San Francisco

Traffic noise modeling was completed using the Federal Highway Administration RD-77-108 model. Assumptions include: Travel speeds on all streets, 25 mph, except on 16th, Third, and Cesar Chavez, where the posted speed limit is 30 mph; Vehicle Mix: 98% Autos/1.5% Medium Trucks/0.5% Heavy Trucks; Day-Night Split: 76% Day (7:00 a.m. to 7:00 p.m.), 12% Evening (7:00 p.m. to 10:00 p.m.), and 12% Night (10:00 p.m. to 7:00 a.m.). Background noise levels due to traffic on other roadways (such as cross-streets or nearby freeways) and non-traffic-related activities are not reflected in these noise levels. Noise levels in this table are intended to indicate incremental noise changes due to project implementation and future growth. Since they do not include background noise levels, they may not necessarily reflect actual noise levels along these roadway segments if there are other nearby sources of noise. Changes between scenarios analyzed may not show change due to rounding in the noise modeling results.

Source: Orion Environmental Associates, 2016

thresholds except for the following, which would exceed traffic noise thresholds, resulting in significant impacts:

- 20th Street (east of Third Street to east of Illinois Street)
- 22nd Street (east of Tennessee Street to east of Illinois Street)
- Illinois Street (20th Street to south of 22nd Street)

These street segments either directly adjoin the project site or are within two blocks of the project site and provide direct access to the site. Based on the significance thresholds for traffic noise increases, these increases would be significant. As shown in Table 4.F.10, existing land uses located adjacent to all but one of the above-listed street segments are currently industrial, and such uses are not considered sensitive to traffic noise increases (i.e., not noise-sensitive receptors). There is one street segment, 22nd Street between Tennessee Street and Third Street where there are residential uses and the resulting noise level is estimated to slightly exceed 60 dBA (L_{dn} or CNEL) and the incremental increase attributable to the project would be 3.2 dB, 0.2 dB above the threshold.

The Proposed Project would include a shuttle service, operated and maintained by the Pier 70 TMA, to connect the Pier 70 Mixed-Use District to regional transit hubs. The primary goal of the proposed shuttle service at Pier 70 is to provide a first-mile / last-mile connection for transit riders traveling to or from the project site, particularly for riders needing to use frequent local and regional transit. These riders would be expected to take regional transit services operated by BART, Caltrain, Alameda-Contra Costa Transit (AC Transit), Golden Gate Transit, San Mateo County Transit (SamTrans), or other regional transit providers, but would need an additional connection to access these services when traveling to or from Pier 70. The exact structure of any shuttle service provided for the Proposed Project site has not been established and would depend on factors that are not known at this time. For planning and analysis purposes, two routes have been preliminarily identified; however, final service routes and stops would be determined based on rider feedback and demand, peak period traffic congestion on local streets, and BART and Caltrain schedules and service plans at specific stations. The two preliminary routes assumed for this analysis are:

- 22nd Street, Mississippi Street, and 16th Street to access the 22nd Street Caltrain Station and the 16th Street / Mission BART station; and
- Third Street, 16th Street, and King Street to access the Fourth and King Caltrain Station (with some trips extending to the Transbay Transit Center)).)

An increase in shuttle bus volumes along these routes would incrementally increase traffic noise levels along these streets. However, the degree of impact would depend on bus sizes, frequency of buses on an hourly basis, and hours of operation. The future shuttle bus schedule is not known

at this time, but it is anticipated that any shuttle trips would be relatively minor and adequately accounted for in the modeled traffic noise analysis above.

Reduction of project-related one-way traffic by 20 percent through transportation demand management measures required in Air Quality Mitigation Measure M-AQ-1f: Transportation Demand Management (see Section 4.G, Air Quality, pp. 4.G.47-4.G.50), could reduce noise levels by up to 1.0 dB. Therefore, implementation of M-AQ-1f would reduce the above significant impacts related to noise increases to less than significant with mitigation at all of the above street segments except for three road segments:

- 22nd Street from Third Street to Illinois Street;
- 22nd Street east of Illinois Street (on the project site); and
- Illinois Street from the future 21st Street and 22nd Street (adjacent to the project site).

The one-block section of 22nd Street located off-site is developed with industrial uses and therefore, does not have noise-sensitive receptors. Project residences located adjacent to the section of 22nd Street east of Illinois Street (where the highest increase [14 dBA] is projected to occur) and the section of Illinois Street between the proposed 21st and 22nd streets (where the next highest increase [7 dBA] is projected to occur) would not be adversely affected by future noise levels because noise attenuation measures would be incorporated into these units as necessary to ensure that interior noise levels are maintained at acceptable levels even with future traffic noise level increases (see Mitigation Measure M-NO-6: Design of Future Noise-Sensitive Uses. pp. 4.F.70-4.F.71). While this mitigation measure would reduce the effects of project-related traffic noise increases on the interior environment of future uses, the Proposed Project's traffic would still result in noise levels that would cause a substantial permanent increase in ambient noise levels. Therefore, this impact would remain significant and unavoidable with mitigation.

Reduction of project-related one-way traffic by 20 percent through transportation demand management measures required in Air Quality Mitigation Measure M-AQ-1f: Transportation Demand Management, would reduce project-related noise increases on local streets in the project area to less-than-significant levels except on three road segments. Therefore, significant impacts related to traffic noise increases on these three road segments would remain significant and unavoidable, even with implementation of Mitigation Measure M-AQ-1f.

Impact NO-6: The Proposed Project's occupants would be substantially affected by future noise levels on the site. ***(Less than Significant with Mitigation)***

As indicated above in Impacts NO-1 through NO-5, construction and operation of the Proposed Project would result in significant short- and long-term noise increases at the project site and its immediate vicinity. Therefore, the impact of these increases on future residents or users of the

project site is evaluated below.[34] Besides residential uses, future users of the site include open space/park/playground, commercial, and RALI uses. Open space/park/playground users in urban areas, commercial uses, and RALI uses are not considered to be sensitive to noise, and therefore, noise compatibility of these uses is not considered a CEQA impact. Noise compatibility of all proposed uses is evaluated in Table 4.F.11: Noise Compatibility by Parcel - Maximum Residential Scenario, and Table 4.F.12: Noise Compatibility by Parcel - Maximum Commercial Scenario, but where noise levels are considered Conditionally Acceptable for a proposed use, it is not considered a significant CEQA impact unless the use is residential; this is because residential uses are the only proposed land use that are noise-sensitive.

Compatibility with Future Noise Levels

As indicated above, the primary sources of future noise on the project site and its vicinity are from BAE Systems Ship Repair facility activities, earthmoving activities in the southwestern corner of the Illinois Parcel (PG&E Hoedown Yard), Existing Plus Project traffic noise on Illinois Street and other local streets, tonal noise from transformers at PG&E Potrero Substation, and loading dock activities along Illinois Street at the AIC Building. In addition to shipyard-related noise, there is continuous, distant background traffic noise from the I-280 freeway and other roadways. Passing Muni light rail and Caltrain rail operations also contribute to background noise. Long-term noise measurements collected in the project site and vicinity indicate that noise levels on the Illinois Parcels from these existing and future noise sources range from 64 to 68 dBA (L_{dn}), while noise levels in the southeastern portion of the 28-Acre Site range from 57 to 59 dBA (L_{dn}), which are somewhat quieter than those typical of light industrial/urban mixed-use locations. When measurement locations LT-3 and LT-4 are compared with measurement locations LT-1 and LT-2, existing intervening buildings (located both off- and on-site) appear to effectively shield some portions of the Mixed-Use District project site from noise generated by ship repair activities.

In general, the Maximum Residential Scenario would result in development of the greatest number of new residences, while the Maximum Commercial Scenario would result in development of the least number of residences. Both scenarios would result in development of the same amount of open space. Under both scenarios, multi-family residential units would be developed generally along the western and central portions of the project site (east side of Illinois Street, across from the AIC on Parcels PKN and PKS, and in the center of the site, Parcels D and E1, and in the central and eastern portions of the site (Parcels E2 and E3). Under both scenarios, Parcel C1 could be developed with residential, commercial, or parking uses and Parcel C2 could

[34] In *California Building Industry Association v. Bay Area Air Quality Management District*, the California Supreme Court concluded that CEQA generally does not require an analysis of how existing environmental conditions will impact a project's future users or residents unless a proposed project risks exacerbating an existing environmental hazard or condition. In that case, the potential impact of such hazards on future residents or users should be evaluated.

be developed with residential or parking uses. Active rooftop open space (sports courts, play fields, urban agriculture plots, seating, and observational terrace areas) could be developed on both of these parcels under both scenarios as well, if the parcels are developed with parking uses. However, under the Maximum Residential Scenario, residential uses would be developed along the southern boundary instead of commercial uses (Parcels HDY 1/HDY2, F/G, H1/H2) as well as in the center of the project site (Building 2). Noise levels are lowest in the southeast portion of the Mixed-Use District project site and the residential units in the center of the site would be shielded from BAE operational noise by commercial-office buildings to the north. Under both scenarios, residential uses on the western boundary of the project site would be subject to the highest noise levels from traffic on Illinois Street as well as activities at the AIC building and from operation of Potrero Substation.

The degree to which noise causes disturbance to people depends on noise frequencies, bandwidths, levels, and time patterns. In addition, higher frequencies, pure tones, and fluctuating noise levels tend to be more disturbing than lower frequencies, broadband, and constant-level noise. Although there are no standards or guidelines in the State Code or City noise guidelines that pertain to noise frequency or bandwidth, it is important to consider the noise character when considering the suitability of the project site for residential uses and potential for future noise conflicts.

Based on the data presented in Table 4.F.3, p. 4.F.11, the existing L_{dn} over most of the Mixed-Use District project site ranged from 60 to 69 dBA (L_{dn}) on the Illinois Parcels (LT-6 and LT-7), with slightly lower noise levels (57 to 59 dBA, L_{dn}) occurring in the southeastern corner of the 28-Acre Site (LT-5). A breakdown of noise compatibility by parcel and use for the Maximum Residential Scenario is presented in Table 4.F.11: Noise Compatibility by Parcel - Maximum Residential Scenario, while the same breakdown is provided for the Maximum Commercial Scenario in Table 4.F.12: Noise Compatibility by Parcel - Maximum Commercial Scenario.

PROPOSED RESIDENTIAL USES

The San Francisco Land Use Compatibility Chart for Community Noise (Figure 4.F.3, p. 4.F.23) indicates that noise levels up to 60 dBA (L_{dn}) are considered satisfactory (Acceptable) for residential uses, and no special noise insulation measures are required; between 60 dBA and 70 dBA (L_{dn}), noise levels are considered Conditionally Acceptable, where a detailed noise analysis is required and needed noise insulation features must be included in the design; above 65 dBA (L_{dn}), new residential construction is generally discouraged, but if it does proceed, a detailed noise analysis is required and needed noise insulation features must be included in the design.

As indicated in Tables 4.F.11 and 4.F.12, future noise levels at all Proposed Project parcels designated for residential use have existing noise levels that are considered Conditionally Acceptable, ranging between 60 dBA and 70 dBA (L_{dn}), with one exception: Illinois Parcels PKN

Table 4.F.11: Noise Compatibility by Parcel - Maximum Residential Scenario

Project Parcel/ Building	Max Res Scenario Proposed Use	Existing Noise Level (Ldn)	With Future Traffic Noise Increases (Ldn)[1]	Noise Compatibility with Proposed Use (Comparison to City Noise Guidelines in Figure 4.F.3)	Noise Mitigation Needed
28-Acre Site[2]					
Parcel A	Com-Office	60-66 dBA	60-70 dBA	Acceptable for commercial-office uses (≤70 dBA, Ldn).	N/A
Parcel B	Com-Office	60-66 dBA	65-69 dBA	Acceptable for commercial-office uses (≤70 dBA, Ldn).	N/A
Parcel C1	Com-Office or Residential	58-66 dBA	58-71 dBA	Acceptable for commercial-office uses (≤70 dBA, Ldn) except Conditionally Acceptable on north façade (71-75 dBA, Ldn) or Conditionally Acceptable for residential uses (>60 dBA, Ldn).	N/A or Yes (M-NO-6)
	or Parking		58-71 dBA	Parking use is not subject to City noise guidelines, but potential for disturbance of adjacent residents from noise associated with parking activities.	N/A
Parcel C2	Residential	58-66 dBA	58-70 dBA	Conditionally Acceptable for residential uses (>60 dBA, Ldn).	Yes (M-NO-6)
	or Parking	58-66 dBA	58-70 dBA	Parking use is not subject to City noise guidelines, but potential for disturbance of adjacent residents from noise associated with parking activities.	N/A
Parcel D	Residential	66 dBA	66-70 dBA	Conditionally Acceptable for residential uses (>60 dBA, Ldn). Project residences would be subject to shipyard noise with measured nighttime levels of 58-64 dBA (Leq) and 60-69 dBA (Lmax). Proposed building demolition could increase shipyard-related noise at this parcel during the early phases by creating a more direct line of sight between residential uses and BAE ship repair activities, but new construction in the northern portion of the 28-Acre Site could ultimately result in offsetting decreases (by blocking direct lines of sight) from shipyard-related noise levels on this parcel, depending on phasing.	Yes (M-NO-6)
Parcel E1	Residential	66 dBA	66-69 dBA	Conditionally Acceptable for residential uses (>60 dBA, Ldn). Project residences would be subject to shipyard noise with measured nighttime levels of 58-64 dBA (Leq) and 60-69 dBA (Lmax). Proposed building demolition could increase shipyard noise at this parcel during early phases by creating a more direct line of sight between residential uses and BAE ship repair activities, but new construction in the northern portion of the 28-Acre Site could ultimately result in offsetting decreases (by blocking direct lines of sight) from shipyard noise, depending on phasing.	Yes (M-NO-6)
Parcel E2	Residential	58-66 dBA	66-69 dBA	Conditionally Acceptable for residential uses (>60 dBA, Ldn).	Yes (M-NO-6)

Building 12 Market Plaza/Square	Open Space / Parks	66 dBA	66-68 dBA	Acceptable for playgrounds/parks (≤70 dBA, Ldn), but potential noise conflicts with adjacent residential uses.	N/A
Illinois Parcels[3]					
Parcel PKN	Residential	62-64 dBA	65-72 dBA	Conditionally Acceptable for residential uses (>60 dBA, Ldn), and new residential construction generally discouraged on south façade	Yes (M-NO-6)

Table 4.F.11 Continued

Project Parcel/ Building	Max Res Scenario Proposed Use	Existing Noise Level (Ldn)	With Future Traffic Noise Increases (Ldn)[1]	Noise Compatibility with Proposed Use (Comparison to City Noise Guidelines in Figure 4.F.3)	Noise Mitigation Needed
Parcel PKS	Residential	62-64 dBA	65-72 dBA	Conditionally Acceptable for residential uses (>60 dBA, Ldn), and new residential construction generally discouraged on north façade (>70 dBA, Ldn), but acceptable interior levels can still be achieved with supplemental noise-reduction measures. Project residences on west side would be subject to noise generated by AIC with measured nighttime Lmax up to 77 dBA, but averaging 70 dBA.	Yes (M-NO-6)
Hoedown Yard (HDY1/2)	Residential	62-64 dBA[4]	62-70 dBA	Conditionally Acceptable for residential uses (>60 dBA, Ldn). Project residences on west side would be subject to noise generated by AIC (up to 77 dBA, Lmax, averaging 70 dBA, Lmax) to the west and Potrero Substationto the south (increased ambient of 10 to 13 dBA, Leq, at 200 feet).[5]	Yes (M-NO-6)
20th Street Plaza	Open Space / Parks	62-64 dBA	62-71 dBA	Acceptable for playgrounds/parks (≤70 dBA, Ldn), but Conditionally Acceptable at the northern margin of the plaza adjacent to 20th Street.	N/A
Irish Hill Playground	Open Space / Parks	62-64 dBA	62-72 dBA	Acceptable for playgrounds/parks (≤70 dBA, Ldn), but Conditionally Acceptable on north side adjacent to 21st Street (71-77.5 dBA, Ldn)	N/A

Notes: N/A = Not applicable and no mitigation required because it is not a noise-sensitive use. As indicated under "Attenuation of Noise," p. 4.F.4, closed windows reduce noise levels by approximately 25 dBA, while open windows reduce noise levels by about 15 dBA.

[1] Traffic noise levels were first estimated for each project roadway based on future estimated traffic volumes, and then adjusted for distance to the edge of the road rights-of-way to represent the maximum noise level at closest possible location of a building façade. Noise levels by façade are listed for each parcel and building on the project site in Appendix F, Project On-Site Noise Exposure by Parcel. The above table summarizes these estimates by presenting the lowest and highest combined noise levels for each parcel at the edge of the adjacent or closest road rights-of-way.

[2] All 28-Acre Site parcels except existing Buildings 2, 12, and 21 would be permitted to include accessory parking. Also RALI uses would be allowed on the ground floor of Parcels A, B, C1, C2, D, E1, E2, E3, F, G, H1, and H2.

[3] Retail/Restaurant uses would be allowed on the ground floor and accessory parking on all four parcels.

[4] Ambient noise levels for Parcel HDY are estimated based on measurements collected along Illinois Street to the north because measurements at Parcel HDY included noise from heavy equipment operations associated with the existing PG&E corporation yard activities in the Hoedown Yard. These operations would cease on this parcel when this parcel is redeveloped as part of project implementation, but transformer noise from Potrero Substation would continue.

[5] When measured L90 levels between midnight and 4:00 a.m. are compared between LT-6 and LT-7 (same distance to Illinois Street except LT-7 is located 200 feet from Potrero Substation to the south), the difference in nighttime ambient was 10 to 13 dBA, which could be attributable to Potrero Substation.

Illinois Parcels[3]					
Parcel PKN	Residential	62-64 dBA	65-72 dBA	Conditionally Acceptable for residential uses (>60 dBA, Ldn), and new residential construction generally discouraged on south façade (>70 dBA, Ldn), but acceptable interior levels can still be achieved with supplemental noise-reduction measures. Project residences on the west side would be subject to noise generated by AIC with maximum exterior noise levels up to 77 dBA (Lmax), averaging 70 dBA (Lmax) during the nighttime hours.	Yes (M-NO-6)
Parcel PKS	Residential	62-64 dBA	65-72 dBA	Conditionally Acceptable for residential uses (>60 dBA, Ldn), and new construction generally discouraged on north façade (>70 dBA, Ldn), but acceptable interior levels can still be achieved with supplemental noise-reduction measures. Project residences on west side would be subject to noise generated by AIC with maximum exterior noise levels up to 77 dBA (Lmax), averaging 70 dBA (Lmax) during the nighttime hours.	Yes (M-NO-6)
Hoedown Yard (HDY1/2)	Com-Office	62-64 dBA[4]	62-70 dBA	Acceptable for commercial-office uses (≤70 dBA, Ldn). Project commercial uses on west side would be subject to noise generated by AIC (up to 77 dBA (Lmax), averaging 70 dBA (Lmax) during the nighttime hours) to the west and PG&E transformers to the south (increased ambient of 10 to 13 dBA (Leq) at 200 feet during the night[5]), no noise compatibility problems since commercial uses are not considered noise-sensitive.	N/A

Table 4.F.12 Continued

Project Parcel/ Building	Max Com Scenario Proposed Use	Existing Noise Level (Ldn)	With Future Traffic Noise Increases (Ldn)[1]	Noise Compatibility with Proposed Use (Comparison to City Noise Guidelines in Figure 4.F.3)	Noise Mitigation Needed
20th Street Plaza	Open Space / Parks	62-64 dBA	62-71 dBA	Acceptable for playgrounds/parks (≤70 dBA, Ldn) except Conditionally Acceptable adjacent to 20th Street (70-77.5 dBA, Ldn).	N/A
Irish Hill Playground	Open Space / Parks	62-64 dBA	62-72 dBA	Acceptable for playgrounds/parks (≤70 dBA, Ldn) but Conditionally Acceptable adjacent to 21st Street and Illinois Street (70-77.5 dBA, Ldn).	N/A

Notes: N/A = Not applicable and no mitigation required because it is not a noise-sensitive use. As indicated under "Attenuation of Noise," p. 4.F.4, closed windows reduce noise levels by approximately 25 dBA, while open windows reduce noise levels by about 15 dBA.

[1] Traffic noise levels were first estimated for each project roadway based on future estimated traffic volumes, and then adjusted for distance to the edge of the road rights-of-way to represent the maximum noise level at closest possible location of a building façade. Noise levels by façade are listed for each parcel and building on the project site in Appendix F, Project On-Site Noise Exposure by Parcel. The above table summarizes these estimates by presenting the lowest and highest combined noise levels for each parcel at the edge of the adjacent or closest road rights-of-way.

[2] All 28-Acre Site parcels except existing Buildings 2, 12, and 21 would be permitted to include accessory parking. Also RALI uses would be allowed on the ground floor of Parcels A, B, C1, C2, D, E1, E2, E3, F, G, H1, and H2.

[3] Retail/Restaurant uses would be allowed on the ground floor and accessory parking on all four parcels.

[4] Ambient noise levels for Parcel HDY are estimated based on measurements collected along Illinois to the north because measurements at Parcel HDY included noise from heavy equipment operations associated with the existing PG&E corporation yard activities. These operations would cease on this parcel when this parcel is redeveloped as part of project implementation, but transformer noise from Potrero Substation would continue.

[5] When measured L90 levels between midnight and 4:00 a.m. are compared between LT-6 and LT-7 (same distance to Illinois except LT-7 is located 200 feet from Potrero Substation to the south), the difference in nighttime ambient was 10 to 13 dBA, which could be attributable to Potrero Substation.

Source: Orion Environmental Associates, 2016

and PKS, where future noise levels are estimated to be slightly higher (72 dBA, L_{dn}) at 19 feet from the centerline of the future 21st Street. Except for the residential units that would face 21st Street on these two parcels, it is expected that proposed residential uses on the project site could be designed to meet the 45-dBA (L_{dn} or CNEL) interior noise standard specified by Title 24 with incorporation of common noise attenuation measures. Examples of common noise attenuation measures include selecting glazing with higher noise reduction, improving exterior wall construction, and adapting the layout of interior spaces and/or location of windows. Therefore, compliance with Title 24's interior standard would reduce noise compatibility impacts to less-than-significant levels at all residential units except those subject to noise levels above 70 dBA (L_{dn}). Within the project site, residential units facing the future 21st Street on Parcels PKN and PKS would be subject to noise levels of up to 72 dBA (L_{dn}), resulting in a significant impact. With incorporation of noise attenuation measures into the project design as necessary in order to meet the 45-dBA interior noise standard, as specified in Mitigation Measure M-NO-6, this impact would be reduced to a less-than-significant level.

Historic Building 2 is proposed to be rehabilitated in compliance with the Secretary of the Interior's Standards for the Treatment of Historic Properties. Noise levels measured just north of this building (LT-2) were 66 dBA (L_{dn}). When future traffic noise levels are added to existing ambient noise levels, future noise levels at the edges of road rights-of way are estimated to range between 66 and 70 dBA (L_{dn}). This building is proposed for residential uses under the Maximum Residential Scenario. When compared to the City's compatibility guidelines for residential uses (Figure 4.F.3, p. 4.F.23), future noise levels in the vicinity of this building are considered to be Conditionally Acceptable, a significant impact. With incorporation of noise attenuation approaches into the project design as necessary in order to meet the 45-dBA interior noise standard of Title 24, as specified in Mitigation Measure M-NO-6, this impact would be reduced to a less-than-significant level.

The applicant would be required to demonstrate that the 45-dBA (L_{dn} or CNEL) interior noise standard specified by Title 24 would be met at all project residences, and additional noise attenuation measures are required to be incorporated into the project design as necessary to meet this interior standard, but also address potential sleep disturbance effects on affected parcels (as indicated in Tables 4.F.11 and 4.F.12) from adjacent or nearby industrial activities. It is noted that on-site noise levels could increase with proposed building demolition (as noted in Tables 4.F.11 and 4.F.12), but also decrease in the future with project implementation if existing heavy equipment operations at the Hoedown Yard cease and Proposed Project buildings are up to 90 feet tall in the northern portion of the 28-Acre Site. Such building heights could help partially shield the rest of the site from noise generated by the BAE Systems Ship Repair facility (i.e., BAE boilers and generators). Such future noise reductions, however, would ultimately depend on

the final locations and heights of proposed buildings but could reduce the extent of noise attenuation required at some residential units.

PROPOSED OPEN SPACE/PARK/PLAYGROUND USES

In urban environments, playgrounds and parks (active recreation areas) as well as open space areas in urban areas are not considered noise-sensitive uses, and therefore, the following analysis of noise compatibility is provided for informational purposes only. Under the City's compatibility guidelines for playgrounds and parks (Figure 4.F.3), noise levels up to 70 dBA (L_{dn}) are considered to be Acceptable, and no noise attenuation approaches need to be implemented. As indicated in Tables 4.F.11 and 4.F.12, future noise levels at all but three Proposed Project parcels designated for open space/park/playground uses are estimated to range between 60 dBA and 70 dBA (L_{dn}). Such levels are considered Acceptable for these outdoor uses. Future noise levels under both scenarios could reach 71 or 72 dBA along the edges of the Parcel C1 Rooftop, 20th Street Plaza, and Irish Hill Playground (located adjacent to 20th and 21st streets), and such levels are considered Conditionally Acceptable. While noise levels exceeding 70 dBA (L_{dn}) are attributable to traffic noise on these streets, they would only occur along the margins of the open spaces/parks located adjacent to these streets, not the main park or playground areas. Park users could access quieter areas within these parks (away from adjacent streets), and noise levels would be considered generally acceptable at proposed open space/park/playground areas.

Mitigation Measure M-NO-6: Design of Future Noise-Sensitive Uses

Prior to issuance of a building permit for vertical construction of specific residential building design on each parcel, a noise study shall be conducted by a qualified acoustician, who shall determine the need to incorporate noise attenuation measures into the building design in order to meet Title 24's interior noise limit for residential uses as well as the City's (Article 29, Section 2909(d)) 45-dBA (L_{dn}) interior noise limit for residential uses. This evaluation shall account for noise shielding by buildings existing at the time of the proposal, potential increases in ambient noise levels resulting from the removal of buildings that are planned to be demolished, all planned commercial or open space uses in adjacent areas, any known variations in project build-out that have or will occur (building heights, location, and phasing), any changes in activities adjacent to or near the Illinois Parcels or 28-Acre Site (given the Proposed Project's long build-out period), any new shielding benefits provided by surrounding buildings that exist at the time of development, future cumulative traffic noise increases on adjacent roadways, existing and planned stationary sources (i.e., emergency generators, HVAC, etc.), and future noise increases from all known cumulative projects located with direct line-of-sight to the project building.

To minimize the potential for sleep disturbance effects from tonal noise or nighttime noise events associated with nearby industrial uses, predicted noise levels at each project building shall account for 24/7 operation of the BAE Systems Ship Repair facility, 24/7 transformer noise at Potrero Substation (if it remains an open air facility), and industrial

activities at the AIC, to the extent such use(s) are in operation at the time the analysis is conducted.

Noise reduction strategies such as the following could be incorporated into the project design as necessary to meet Title 24 interior limit and minimize the potential for sleep disturbance from adjacent industrial uses:

- Orient bedrooms away from major noise sources (i.e., major streets, open space/recreation areas where special events would occur, and existing adjacent industrial uses, including AIC, Potrero Substation, and the BAE site) and/or provide additional enhanced noise insulation features (higher STC ratings) or mechanical ventilation to minimize the effects of maximum instantaneous noise levels generated by these uses even though there is no code requirement to reduce L_{max} noise levels. Such measures shall be implemented on Parcels D and E1 (both scenarios), Building 2 (Maximum Residential Scenario only), Parcels PKN (both scenarios), PKS (both scenarios), and HDY (Maximum Residential Scenario only);
- Utilize enhanced exterior wall and roof-ceiling assemblies (with higher STC ratings), including increased insulation;
- Utilize windows with higher STC / Outdoor/Indoor Transmission Class (OITC) ratings;
- Employ architectural sound barriers as part of courtyards or building open space to maximize building shielding effects, and locate living spaces/bedrooms toward courtyards wherever possible; and
- Locate interior hallways (accessing residential units) adjacent to noisy streets or existing/planned industrial or commercial development.

Implementation of Mitigation Measure M-NO-6 would reduce noise compatibility impacts on project residences to a less-than-significant level.

Impact NO-7: The Proposed Project's special events would result in substantial periodic, temporary noise increases. ***(Less than Significant with Mitigation)***

The Proposed Project would include development of a number of public open spaces. The open space planning chapter in the *Pier 70 SUD Design for Development* provides concepts and approximate hypothetical site plans, but these concepts and site plans would be further developed. Under the conceptual ideas, the Market Square open space area is proposed to have open-air markets, market stalls, small performances, and gatherings (between Buildings 2, 12, and Parcel D). Community gatherings (i.e., festivals, performances, and nighttime cultural events) are proposed in the Slipways Common open space area (between Parcels E1, E2, E3, E4, and Building 21). A café terrace, social lawn, beer garden, food/beverage operations, and picnic area are proposed in the Waterfront Terrace open space area. Viewing pavilions proposed in the Waterfront Promenade would accommodate a variety of public program uses such as cultural events and gatherings. Typical events, occurring up to an estimated three times a month, could have attendance of approximately 500 to 750 people, while larger-scale events, occurring

approximately four times per year, could have attendance up to 5,000 people. The Waterfront Promenade would also include pedestrian and bike trails, café terrace, and passive recreation. The Irish Hill Playground (between Parcels PKS, HDY, C1, and C2) would have playground facilities. If Parcels C1 and C2 are built as district parking, there would be public open space on the rooftops. While final plans for this open space area have not been developed, potential uses for this open space include sport courts and play fields, urban agriculture plots, seating, and observational terrace areas.

Residential uses are proposed to be developed adjacent to the Irish Hill Playground (Parcel PKS under both scenarios and Parcel HDY under the Maximum Residential Scenario). Residential uses would also be developed adjacent to the Market Square open space area (Building 2 and Parcel D under the Maximum Residential Scenario, but only Parcel D under the Maximum Commercial Scenario). Residential uses would also be proposed adjacent to Slipway Commons, where events would be held during the day and evening (Parcels E1, E2, and E3 under both scenarios), as well as adjacent to the Waterfront Promenade, where cultural events would be held during the day and evening (Parcel H2 under Maximum Residential Scenario). RALI or commercial-office uses are proposed adjacent to the Waterfront Terrace open space area (Parcels B2 and E4 under both scenarios), where there would be more intensive outdoor uses (a beer garden and food/beverage operations).

The proximity of future residential uses to these types of open space uses would pose the potential for Proposed Project residents to be disturbed or annoyed by noise from outdoor active recreation/open space activities. Noise levels associated with the proposed café terrace, social lawn, beer garden, food/beverage operations, picnic areas and the playground would be typical of an urban, mixed-use residential area and would be less than significant in regards to compatibility with nearby sensitive receptors. The potential noise conflicts would be greatest where amplified sound systems would be used and/or events occur during the more noise-sensitive late evening/nighttime hours when sleep disturbance could occur.

As discussed above under Local Regulations and Guidelines, promoters of any proposed outdoor events on the site's outdoor plaza that would use amplified sound or music would be required to obtain a permit from the City prior to the event. Section 1060.1 of the Police Code requires a permit to conduct, operate, or maintain a place of entertainment, limited live performance locale or one-time event within the City and County of San Francisco. Concerts in the proposed open spaces would require the promoter to obtain a Limited Live Performance Permit from the San Francisco Entertainment Commission. This permit process requires a public hearing and includes a requirement for neighborhood outreach. Article 1, Section 47.2 of the Police Code, while generally focused on truck-mounted amplification equipment, regulates the use of any sound amplifying equipment, whether truck-mounted or otherwise. Hours of operation are restricted to

between 9:00 a.m. and 10:00 p.m., unless permitted by the San Francisco Entertainment Commission.

Due to uncertainties as to the nature and extent of future outdoor events at the project site, the use of amplified sound equipment could still have the potential for significant noise impacts to nearby sensitive receptors in excess of standards established in the San Francisco General Plan or San Francisco Noise Ordinance. Implementation of Mitigation Measure M-NO-7: Noise Control Plan for Outdoor Amplified Sound, shown below, would ensure that sound levels generated by amplified equipment would be consistent with Section 2909 of the City's Police Code, which establishes a not-to-exceed (except through a variance) noise standard for fixed sources of noise and from events subject to regulation by the Entertainment Commission. Event noise generated from a public property would be limited to 10 dBA above the local ambient at a distance of 25 feet or more; event noise generated from a commercial property would be limited to 8 dBA above the local ambient at any point outside the property plane. In addition, compliance with Section 2909(d) would limit noise from outdoor activities in residential interiors to 45 dBA between 10:00 p.m. and 7:00 a.m. or 55 dBA between 7:00 a.m. and 10:00 p.m. with windows open. Any variance to these limits granted pursuant to Section 2910 of the Police Code could only be approved through the Entertainment Commission hearing process required by Section 1060.1 of the Police Code.

Therefore, with implementation of Mitigation Measure M-NO-7: Noise Control Plan for Outdoor Amplified Sound, and with compliance with Sections 47.2, 1060.1 and 2909 of the Police Code, periodic and temporary noise increases associated with special events would be less than significant.

Mitigation Measure M-NO-7: Noise Control Plan for Special Outdoor Amplified Sound

The project sponsor shall develop and implement a Noise Control Plan for operations at the proposed entertainment venues to reduce the potential for noise impacts from public address and/or amplified music. This Noise Control Plan shall contain the following elements:

- The project sponsor shall comply with noise controls and restrictions in applicable entertainment permit requirements for outdoor concerts.
- Speaker systems shall be directed away from the nearest sensitive receptors to the degree feasible.
- Outdoor speaker systems shall be operated consistent with the restrictions of Section 2909 of the San Francisco Police Code, and conform to a performance standard of 8 dBA and dBC over existing ambient L_{90} noise levels at the nearest residential use.

Impact NO-8: Operation of the Proposed Project would not expose people and structures to or generate excessive groundborne vibration or noise levels. *(Less than Significant)*

Operational-related groundborne vibration is not a common environmental problem and even large vehicles (e.g., trucks and buses) do not generally result in perceptible vibration. Therefore, no significant long-term vibration effects are expected to be associated with proposed residential, commercial, and RALI uses under both the Maximum Residential and Maximum Commercial scenarios, and no mitigation is necessary.

Operation of pumps at the below-ground or enclosed wastewater pump station would have the potential to generate groundborne vibration that could cause sleep disturbance during the more sensitive nighttime hours if residential receptors are located nearby. However, vibration generated by pump station equipment can affect other equipment within the pump station if vibration levels are not controlled adequately. Therefore, controls that are already incorporated into the design to prevent damage to pump station equipment from excessive vibration would also be sufficient to avoid operational vibration levels from causing sleep disturbance at the closest residential receptors (located a minimum of 375 feet away) and cosmetic damage of adjacent project structures (located at least 75 feet away). Therefore, potential operational vibration effects associated with the proposed wastewater pump station would be less than significant and no mitigation is necessary.

CUMULATIVE IMPACTS

Cumulative construction noise impacts are assessed based on a review of the foreseeable future projects that are located adjacent or in close enough proximity to the project site so as to affect the same noise-sensitive receptors (those located adjacent to or near the project site or along shared construction haul routes), and under construction at the same time as the Proposed Project (see Section 4.A, Introduction to Chapter 4, pp. 4.A.12-4.A.17).

Cumulative operational noise impacts are assessed by modeling cumulative plus project traffic noise levels and comparing the results with existing modeled traffic noise levels to the criteria discussed above.

The geographic scope of potential cumulative noise impacts encompasses the project site and its immediate vicinity for cumulative construction-related noise impacts as well as road segments adjacent to intersections analyzed in the Transportation Impact Study (see Figure 4.E.1: Transportation Study Area and Study Intersections, in Section 4.E, Transportation and Circulation, p. 4.E.2, for study intersection locations). As noted in Section 4.E, p. 4.E.112, the cumulative traffic analysis utilizes a projections approach and the cumulative traffic noise analysis likewise uses a projections approach because it uses these traffic volumes to estimate

operational traffic noise increases. A list-based approach is also used to evaluate cumulative construction-related noise increases because cumulative impacts can occur if construction projects in proximity to each other occur simultaneously and affect the same noise-sensitive receptors that are located adjacent to or near the project sites or shared construction haul routes.

Construction

Impact C-NO-1: Construction of the Proposed Project combined with cumulative construction noise in the project area would not cause a substantial temporary or periodic increase in ambient noise levels in the project vicinity during construction. ***(Less than Significant)***

In general, the potential for cumulative noise increases associated with Proposed Project construction would result if there are any other projects located nearby that could be constructed at the same time or substantially extend the duration of construction noise at any nearby sensitive receptors. The closest sensitive receptor is located approximately 140 feet northwest of the site (616 20th Street). The closest cumulative projects where concurrent construction could cumulatively increase noise levels in the vicinity of the project site would be the BAE Lease Renewal project, located immediately north of the 28-Acre Site, approximately 200 feet north of the Illinois Parcels, and Crane Cove Park, located north of the 20th Street Historic Core project and BAE Lease Renewal project. BAE improvements would involve mostly routine maintenance and repair work and are not expected to generate noise levels higher than normal operations. These activities are expected to occur every 18 months for 6 weeks at a time over the next 7 years. Crane Cove Park would involve primarily park improvements. Phase 1 of Crane Cove Park would be completed in January 2018, which is approximately when construction of the Proposed Project would start, minimizing the potential for overlapping construction activities. Phase 2 of Crane Cove Park has not been determined, but could occur between August 2026 to December 2028, which could overlap with Phase 5 of the Proposed Project (2027 to 2029). However, Phase 5 construction would occur in the southern margin of the 28-Acre Site, which is the most distant portion of the site from Crane Cove Park, and such separation would minimize the potential for cumulative construction noise increases. Given the limited duration and scope of potential concurrent construction activities associated with these two cumulative projects (i.e., neither would involve the extended duration of construction and pile driving activities like those associated with Project construction), cumulative noise impacts associated with any overlapping construction would be less than significant.

Construction activities associated with the Proposed Project in combination with construction of these and other cumulative projects in the vicinity (such as the Golden State Warriors Event Center and Mixed Use Development, Seawall Lot 337/Pier 48, and various smaller projects located in the neighborhoods to the west of the site) could result in cumulative increases in construction-related traffic on construction routes such as Illinois Street, 25th Street, or Cesar

Chavez Street. These are the streets that provide access to/from the I-280 and SR 101 freeways. As these streets already serve as truck routes, they have higher ambient noise levels than local residential streets. Given that these truck routes have limited residential or other sensitive receptor land uses located adjacent to these routes, cumulative traffic increases on these routes are not expected to substantially increase ambient noise levels in the vicinity of these routes for sensitive receptors and this cumulative impact would be less than significant. Therefore, the Proposed Project's contribution would not be cumulatively considerable.

Prior to Proposed Project implementation, Building 117 is expected to be demolished as part of the 20th Street Historic Core project. Demolition of this building could temporarily increase baseline noise levels on the project site from traffic on Illinois Street because it currently serves as a barrier and interrupts the line-of-sight between the project site and Illinois Street.[35] However, proposed construction of structures on Parcels C1 and C2 would restore this barrier effect for parcels and buildings to the east. In addition, retention of Buildings 2 and 12 would help to further block shipyard noise from parcels to the west and south (Parcels PSK, HDY, C1, C2, F, and G). Therefore, changes in the noise environment on the project site as a result of cumulative building demolition would not adversely affect future on-site residents.

Operation

Impact C-NO-2: Operation of the Proposed Project, in combination with other cumulative development would cause a substantial permanent increase in ambient noise levels in the project vicinity. ***(Significant and Unavoidable with Mitigation)***

As indicated in Table 4.F.13: Summary of Cumulative Traffic Noise Levels, when traffic noise increases related to the Proposed Project (under both the Maximum Residential and Maximum Commercial scenarios) are added to future traffic noise increases resulting from cumulative development, the Proposed Project would add 0 to 8.0 dBA (L_{dn}) to estimated cumulative noise increases under both scenarios. Of the 79 road segments examined, the Proposed Project would contribute considerably to cumulative traffic noise increases along the following street segments because cumulative noise increases would exceed significance thresholds for traffic noise increases):

- 22nd Street (east of Third Street to east of Illinois Street)
- Illinois Street (Mariposa Street to 22nd Street)

[35] Increased baseline would result in lower impacts; therefore, not accounting for this increased baseline is a conservative approach.

Notes: Noise levels may vary by up to one-tenth of a decibel due to rounding. Noise levels in **bold** exceed either of the following threshold increases when compared to baseline noise levels: (1) an increase of 5 dBA or more, or (2) an increase of 3 dBA or more in areas where the existing or resulting noise increase exceeds acceptable (or satisfactory) levels for the affected use (see Figure 4.F.3: San Francisco Land Use Compatibility Chart for Community Noise, p. 4.F.23).

Res: Residential; Com: Commercial; Off: Office; Ind: Industrial; Inst: Institutional; UCSF: University of California, San Francisco Traffic noise modeling was completed using the Federal Highway Administration RD-77-108 model. Assumptions include: Travel speeds on all streets, 25 mph, except on 16th, Third, and Cesar Chavez, where the posted speed limit is 30 mph; Vehicle Mix: 98% Autos/1.5% Medium Trucks/0.5% Heavy Trucks; Day-Night Split: 76% Day (7:00 a.m. to 7:00 p.m.), 12% Evening (7:00 p.m. to 10:00 p.m.), and 12% Night (10:00 p.m. to 7:00 a.m.). Background noise levels due to traffic on other roadways (such as cross-streets or nearby freeways) and non-traffic-related activities are not reflected in these noise levels. Noise levels in this table are intended to indicate incremental noise changes due to Proposed Project implementation and future growth. Since they do not include background noise levels, they may not necessarily reflect actual noise levels along these roadway segments if there are other nearby sources of noise. Changes between scenarios analyzed may not show change due to rounding in the noise modeling.

Source: Orion Environmental Associates, 2016

These street segments either directly adjoin the project site or are within two blocks of the project site and provide direct access to the site. It is noted that existing land uses located adjacent to all but one of the above-listed street segments are commercial or industrial, and such uses are not considered sensitive to traffic noise increases (i.e., not noise-sensitive receptors). Residential development is located adjacent to the segment of Illinois Street between Mariposa Street and 20th Street. Based on the significance thresholds for traffic noise increases, these cumulative traffic noise increases would be a cumulatively significant impact because traffic noise would result in a substantial permanent increase in ambient noise levels, and the project's contribution to these cumulative increases would be cumulatively considerable.

Additionally, when 2040 cumulative (with Proposed Project) noise levels are compared to 2020 baseline noise levels, 2020 noise levels would increase by 0 to 15 dBA under both scenarios with increases exceeding the significance thresholds for traffic noise increases on the following roadway segments:

- Third Street (Channel to south of Mission Rock and 20th to 23rd Streets)
- 20th Street (east of Third Street to east of Illinois Street)
- 22nd Street (west of Third Street to east of Illinois Street)
- 23rd Street (Third Street to Illinois Street)
- 25th Street (west of Third Street to Illinois Street)
- Cesar Chavez (East of Third Street)
- Illinois Street (Mariposa Street to south of 22nd Street)
- Indiana Street (north of 25th Street)

These street segments either directly adjoin the project site or are within approximately eight blocks of the project site and several provide direct access to the site. It is noted that existing land uses located adjacent to many of the above-listed street segments are commercial or industrial, and such uses are not considered sensitive to traffic noise increases (i.e., not noise-sensitive receptors). There is a school and residential development located adjacent to 20th Street between Third Street and Illinois Street. Residential development is also located adjacent to Third Street (Channel to 25th), Illinois Street (Mariposa Street to 20th Street), and on 22nd Street (west of Third Street). Based on the significance thresholds for traffic noise increases, these cumulative traffic noise increases would also be a cumulatively significant impact because traffic noise would result in a substantial permanent increase in baseline noise levels. The project's contribution to these increases would range from 22 to 95 percent of these increases and therefore, the Proposed Project contribution to these cumulative traffic noise increases would be cumulatively considerable.

Implementation of Transportation Demand Management measures required in Air Quality Mitigation Measure M-AQ-1f: Transportation Demand Management, could result in reductions of one-way traffic by up to 20 percent, and such reductions could provide noise level reductions of up to 1.0 dB. Such reductions would reduce the above significant noise increases to less than significant along Illinois Street (between Mariposa Street and the proposed 23rd Street) and 22nd Street (west of Third Street) but would not be sufficient to reduce cumulative noise increases on any of the other above-listed street segments to less-than-significant levels (i.e., below threshold levels). Cumulative traffic noise increases would still exceed the significance thresholds for traffic noise increases on some of the above-listed street segments by up to 2.0 dBA when compared to future baseline noise levels (2040) and by up to 14.2 dBA when compared to existing baseline noise levels (2020). Therefore, the proposed project would result in a considerable contribution to this cumulative impact, which is significant and unavoidable with mitigation.

G. AIR QUALITY

INTRODUCTION

This section discusses the existing air quality conditions in the project area, presents the regulatory framework for air quality management, and analyzes the potential for the Proposed Project to affect existing air quality conditions, both regionally and locally, from activities that emit criteria and non-criteria air pollutants. It also analyzes the types and quantities of emissions that would be generated on a temporary basis from proposed construction activities as well as those generated over the long term from operation of the Proposed Project. The analysis determines whether those emissions are significant in relation to applicable air quality standards and identifies feasible mitigation measures for significant adverse impacts. This section also includes an assessment of the potential for odor impacts and an analysis of cumulative air quality impacts. Emissions of greenhouse gases (GHGs) resulting from the Proposed Project's potential impacts on climate change and the City's and State's goals for GHG emissions are presented and discussed in Section 4.H, Greenhouse Gas Emissions.

The analysis in this section is based on a review of existing air quality conditions in the Bay Area region and air quality regulations administered by the U.S. Environmental Protection Agency (EPA), the California Air Resources Board (CARB), and the Bay Area Air Quality Management District (BAAQMD). This analysis includes methodologies identified in the updated BAAQMD *CEQA Air Quality Guidelines*[1] and its companion documentation. Additionally, an Air Quality Technical Report (AQTR)[2] was prepared for the Proposed Project; this report quantitatively assesses the air quality contributions of the Proposed Project and forms the basis of much of the assessment of air quality impacts herein.

ENVIRONMENTAL SETTING

CLIMATE AND METEOROLOGY

The project site is in the San Francisco Bay Area Air Basin (SFBAAB or air basin). The air basin's moderate climate steers storm tracks away from the region for much of the year, although storms generally affect the region from November through April. San Francisco's proximity to

[1] BAAQMD *CEQA Air Quality Guidelines*, Updated May 2012. Available online at http://www.baaqmd.gov/~/media/files/planning-and-research/ceqa/baaqmd-ceqa-guidelines_final_may-2012.pdf?la=en. Accessed July 19, 2016.

[2] Environmental Science Associates, Pier 70 Mixed Use District Project Air Quality Technical Report, December 2016.

the onshore breezes stimulated by the Pacific Ocean provides for generally very good air quality in the City and at the project site.

Annual temperatures in the project area average in the mid-50s (degrees Fahrenheit), generally ranging from the low 40s on winter mornings to the mid-70s during summer afternoons. Daily and seasonal oscillations of temperature are small because of the moderating effects of nearby San Francisco Bay. In contrast to the steady temperature regime, rainfall is highly variable and confined almost exclusively to the "rainy" period from November through April. Precipitation may vary widely from year to year as a shift in the annual storm track of a few hundred miles can mean the difference between a very wet year and drought conditions.

Atmospheric conditions such as wind speed, wind direction, and air temperature gradients interact with the physical features of the landscape to determine the movement and dispersal of air pollutants regionally. The project area is within the Peninsula climatological subregion. Marine air traveling through the Golden Gate is a dominant weather factor affecting dispersal of air pollutants within the region. Wind measurements recorded on the San Francisco mainland indicate a prevailing wind direction from the west and an average annual wind speed of 10.3 miles per hour (mph).[3] Increased temperatures create the conditions in which ozone formation can increase.

AMBIENT AIR QUALITY – CRITERIA AIR POLLUTANTS

As required by the 1970 Federal Clean Air Act, the EPA initially identified six criteria air pollutants that are pervasive in urban environments and for which State and Federal health-based ambient air quality standards have been established. The EPA calls these pollutants "criteria air pollutants," because the agency has regulated them by developing specific public health-based and welfare-based criteria as the basis for setting permissible levels. Ozone, carbon monoxide (CO), particulate matter (PM), nitrogen dioxide (NO_2), sulfur dioxide (SO_2), and lead are the six criteria air pollutants originally identified by the EPA. Since adoption of 1970 Act, subsets of PM have been identified for which permissible levels have been established. These include PM of 10 microns in diameter or less (PM_{10}) and PM of 2.5 microns in diameter or less ($PM_{2.5}$).

The BAAQMD is the regional agency with jurisdiction for regulating air quality within the nine-county SFBAAB. The region's air quality monitoring network provides information on ambient concentrations of criteria air pollutants at various locations in the San Francisco Bay Area. Table 4.G.1: Summary of San Francisco Air Quality Monitoring Data (2011-2015), presents a

Table 4.G.1: Summary of San Francisco Air Quality Monitoring Data (2011-2015)

Pollutant	Most Stringent Applicable Standard	Number of Days Standards Were Exceeded and Maximum Concentrations Measured[a]				
		2011	2012	2013	2014	2015
Ozone						
Maximum 1-Hour Concentration (ppm)	>0.09[b]	0.070	0.069	0.069	0.079	0.085
Days 1-Hour Standard Exceeded		0	0	0	0	0
Maximum 8-Hour Concentration (ppm)	>0.070[c]	0.054	0.048	0.059	0.069	0.067
Days 8-Hour Standard Exceeded		0	0	0	0	0
Carbon Monoxide (CO)						
Maximum 1-Hour Concentration (ppm)	>20[b]	1.8	2.0	1.8	1.6	1.8
Days 1-Hour Standard Exceeded		0	0	0	0	0
Maximum 8-Hour Concentration (ppm)	>9.0[b]	1.2	1.2	1.4	1.2	1.3
Days 8-Hour Standard Exceeded		0	0	0	0	0
Suspended Particulates (PM_{10})						
Maximum 24-Hour Concentration ($\mu g/m^3$)	>50 [b]	46	**51**	44	36	47
Days 24-Hour Standard Exceeded[d]		0	1	0	0	0
Suspended Particulates ($PM_{2.5}$)						
Maximum 24-Hour Concentration ($\mu g/m^3$)	>35 [c]	**48**	**36**	**49**	**33**	**35**
Days 24-Hour Standard Exceeded[d]		2	1	2	0	0
Annual Average ($\mu g/m^3$)	>12 [b, c]	9.5	8.2	10.1	7.7	9.6
Nitrogen Dioxide (NO_2)						
Maximum 1-Hour Concentration (ppm)	>0.100 [c]	0.09	**0.12**	0.07	0.08	0.07
Days 1-Hour Standard Exceeded		0	1	0	0	0

Notes:

Bold values are in excess of applicable standard.

ppm = parts per million.

$\mu g/m^3$ = micrograms per cubic meter.

a Number of days exceeded is for all days in a given year, except for PM. PM_{10} was monitored every 6 days prior to 2013 and has been monitored every 12 days effective January 2013.

b State standard, not to be exceeded.

c Federal standard, not to be exceeded.

d Based on a sampling schedule of 1 out of every 6 days or every 12 days, for a total of approximately 60 samples per year for 2011 and 2012, and 30 samples per year for 2013, 2014, and 2015.

Source: BAAQMD, Bay Area Air Pollution Summary, 2011 – 2015. Available online at http://www.baaqmd.gov/about-air-quality/air-quality-summaries. Accessed April 21, 2016.

5-year summary for 2011 to 2015 of the highest annual criteria air pollutant concentrations, recorded at the air quality monitoring station operated and maintained by the BAAQMD at 16th and Arkansas streets (Potrero Hill), approximately 1 mile northwest of the project site. Table 4.G.1 also compares measured pollutant concentrations with the most stringent applicable ambient air quality standards (State or Federal). These concentrations are health-based standards established with an ample margin of safety. For determining attainment with air quality standards, exceedances are assessed on a region-wide basis. Concentrations shown in bold indicate only a localized exceedance of the standard.

Ozone

Ozone is a secondary air pollutant produced in the atmosphere through a complex series of photochemical reactions involving reactive organic gases (ROG, also sometimes referred to as volatile organic compounds or VOCs by some regulatory agencies) and oxides of nitrogen (NOx) in the presence of sunlight. The main sources of ROG and NOx, often referred to as ozone precursors, are combustion processes (including motor vehicle engines) and the evaporation of solvents, paints, and fuels. In the Bay Area, automobiles are the single largest source of ozone precursors. Ozone is referred to as a regional air pollutant because its precursors are transported and diffused by wind concurrently with ozone production through the photochemical reaction process. Ozone causes eye irritation, airway constriction, and shortness of breath and can aggravate existing respiratory diseases, such as asthma, bronchitis, and emphysema.

According to published data, and as shown in Table 4.G.1, p. 4.G.3, above, the most stringent applicable standards for ozone (State 1-hour standard of 0.09 parts per million [ppm] and the Federal 8-hour standard of 0.075 ppm) were not exceeded in San Francisco between 2011 and 2015. In 2015, the EPA strengthened the 8-hour ozone standard to 0.070 ppm, and the new standard became effective December 28, 2015.

Carbon Monoxide

CO is an odorless, colorless gas usually formed as the result of the incomplete combustion of fuels. The single largest source of CO is motor vehicles; the highest emissions occur during low travel speeds, stop-and-go driving, cold starts, and hard acceleration. Exposure to high concentrations of CO reduces the oxygen-carrying capacity of the blood and can cause headaches, nausea, dizziness, and fatigue; impair central nervous system function; and induce angina (chest pain) in persons with serious heart disease. Very high levels of CO can be fatal. As shown in Table 4.G.1, the more stringent State CO standards were not exceeded between 2011 and 2015. Measurements of CO indicate hourly maximums ranging between 8 and 10 percent of the more stringent State standard, and maximum 8-hour CO levels that are approximately 13 to 16 percent of the allowable 8-hour standard.

Particulate Matter

Particulate matter is a class of air pollutants that consists of heterogeneous solid and liquid airborne particles from human-made and natural sources. Particulate matter is measured in two size ranges: PM_{10} and $PM_{2.5}$. In the Bay Area, motor vehicles generate about one-half of the SFBAAB's particulates, through tailpipe emissions as well as brake pad and tire wear. Wood burning in fireplaces and stoves, industrial facilities, and ground-disturbing activities such as construction are other sources of such fine particulates. These fine particulates are small enough to be inhaled into the deepest parts of the human lung and can cause adverse health effects. According to the CARB, studies in the United States and elsewhere "have demonstrated a strong link between elevated particulate levels and premature deaths, hospital admissions, emergency room visits, and asthma attacks," and studies of children's health in California have demonstrated that particle pollution "may significantly reduce lung function growth in children."[4] The CARB also reports that statewide attainment of PM standards could prevent thousands of premature deaths, lower hospital admissions for cardiovascular and respiratory disease and asthma-related emergency room visits, and avoid hundreds of thousands of episodes of respiratory illness in California.[5] Among the criteria pollutants that are regulated, particulates appear to represent a serious ongoing health hazard. As long ago as 1999, the BAAQMD was reporting, in its *CEQA Air Quality Guidelines*, that studies had shown that elevated particulate levels contribute to the death of approximately 200 to 500 people per year in the Bay Area. $PM_{2.5}$ is of particular concern because epidemiologic studies have demonstrated that people who live near freeways, especially people who live within 500 feet of freeways or high-traffic roadways, have poorer health outcomes, including increased asthma symptoms and respiratory infections and decreased pulmonary function and lung development in children.[6]

As presented above in Table 4.G.1, the State 24-hour PM_{10} standard was exceeded on one monitored occasion between 2011 and 2015 in San Francisco. It is estimated that the State 24-hour PM_{10} standard of 50 micrograms per cubic meter ($\mu g/m^3$) was exceeded on up to 6 days per year between 2011 and 2015.[7] The State 24-hour $PM_{2.5}$ standard was exceeded on five monitored occasions between 2011 and 2015.[6] The Federal and State annual average standards were not exceeded between 2011 and 2015.

[5] Ibid.

[6] San Francisco Department of Public Health, *Assessment and Mitigation of Air Pollutant Health Effect from Intra-urban Roadways: Guidance for Land Use Planning and Environmental Review*, May 2008, p. 7.

[7] PM_{10} was sampled every sixth day prior to 2013; therefore, actual days over the standard can be estimated to be six times the numbers listed in the table. $PM_{2.5}$ is continuously monitored.

Nitrogen Dioxide

NO_2 is a reddish brown gas that is a byproduct of combustion processes. Automobiles and industrial operations are the main sources of NO_2. Aside from its contribution to ozone formation, NO_2 can increase the risk of acute and chronic respiratory disease and reduce visibility. NO_2 may be visible as a coloring component of the air on high pollution days, especially in conjunction with high ozone levels. The current State 1-hour standard for NO_2 (0.18 ppm) is being met in San Francisco. In 2010, the EPA implemented a new 1-hour NO_2 standard (0.10 ppm), which is presented in Table 4.G.2: State and Federal Ambient Air Quality Standards and Attainment Status for the San Francisco Bay Area Air Basin, below. Currently, the CARB is recommending that the SFBAAB be designated as an attainment area for the new standard.[8] As shown in Table 4.G.1, p. 4.G.3, this new Federal standard was exceeded on 1 day at the San Francisco station between 2011 and 2015.

The EPA has also established requirements for a new monitoring network to measure NO_2 concentrations near major roadways in urban areas with a population of 500,000 or more. Sixteen new near-roadway monitoring sites are required in California, three of which will be in the Bay Area. These monitors are planned for Berkeley, Oakland, and San Jose. The Oakland station commenced operation in February 2014, and the San Jose station commenced operation in March 2015; the Berkeley station is not yet operational. The new monitoring data may result in a need to change area designations in the future. The CARB will revise the area designation recommendations, as appropriate, once the new monitoring data become available.

Sulfur Dioxide

SO_2 is a colorless, acidic gas with a strong odor. It is produced by the combustion of sulfur-containing fuels such as oil, coal, and diesel. SO_2 has the potential to damage materials and can cause health effects at high concentrations. It can irritate lung tissue and increase the risk of acute and chronic respiratory disease.[9] Pollutant trends suggest that the SFBAAB currently meets and will continue to meet the State standard for SO_2 for the foreseeable future.

In 2010, the EPA implemented a new 1-hour SO_2 standard, which is presented in Table 4.G.2. The EPA initially designated the SFBAAB as an attainment area for SO_2. Similar to the new Federal standard for NO_2, the EPA established requirements for a new monitoring network to

---

[9] BAAQMD, *CEQA Air Quality Guidelines*, May 2011. Available online at http://www.baaqmd.gov/~/media/Files/Planning%20and%20Research/CEQA/BAAQMD%20CEQA%20Guidelines%20May%202011.ashx; p. C-16. Accessed January 19, 2016.

measure SO_2 concentrations beginning in January 2013.[10] No additional SO_2 monitors are required for the Bay Area, because the BAAQMD jurisdiction has never been designated as non-attainment for SO_2 and no State implementation plans or maintenance plans have been prepared for SO_2.[11]

Lead

Leaded gasoline (phased out in the United States beginning in 1973), paint (on older houses, cars), smelters (metal refineries), and manufacture of lead storage batteries have been the primary sources of lead released into the atmosphere. Lead has a range of adverse neurotoxic health effects, which put children at special risk. Some lead-containing chemicals cause cancer in animals. Lead levels in the air have decreased substantially since leaded gasoline was eliminated.

Ambient lead concentrations are only monitored on an as-warranted, site-specific basis in California. On October 15, 2008, the EPA strengthened the national ambient air quality standard for lead by lowering it from 1.50 $\mu g/m^3$ to 0.15 $\mu g/m^3$ on a rolling 3-month average. The EPA revised the monitoring requirements for lead in December 2010.[12] These requirements focus on airports and large urban areas resulting in an increase in 76 monitors nationally. Lead monitoring stations in the Bay Area are located at Palo Alto Airport, Reid-Hillview Airport (San Jose), and San Carlos Airport. Non-airport locations for lead monitoring are in Redwood City and San Jose.

Air Quality Index

The EPA developed the Air Quality Index (AQI) scale to make the public health impacts of air pollution concentrations easily understandable. The AQI, much like an air quality "thermometer," translates daily air pollution concentrations into a number on a scale between 0 and 500. The numbers in the scale are divided into six color-coded ranges, with numbers 0 through 300 as outlined below.

Table 4.G.2: State and Federal Ambient Air Quality Standards and Attainment Status for the San Francisco Bay Area Air Basin

Pollutant	Averaging Time	State (SAAQS[a])		Federal (NAAQS[b])	
		Standard	Attainment Status	Standard	Attainment Status
Ozone	1-hour	0.09 ppm	**N**	NA	See Note c
	8-hour	0.070 ppm	**N**	0.070 ppm[d]	**N**/Marginal
Carbon Monoxide (CO)	1-hour	20 ppm	A	35 ppm	A
	8-hour	9 ppm	A	9 ppm	A
Nitrogen Dioxide (NO_2)	1-hour	0.18 ppm	A	0.100 ppm	U
	Annual	0.030 ppm	NA	0.053 ppm	A
Sulfur Dioxide (SO_2)	1-hour	0.25 ppm	A	0.075 ppm	A
	24-hour	0.04 ppm	A	0.14 ppm	A
	Annual	NA	NA	0.03 ppm	A
Particulate Matter (PM_{10})	24-hour	50 µg/m^3	**N**	150 µg/m^3	U
	Annual[e]	20 µg/m^3 [f]	**N**	NA	NA
Fine Particulate Matter ($PM_{2.5}$)	24-hour	NA	NA	35 µg/m^3	**N**
	Annual	12 µg/m^3	**N**	12 µg/m^3	U/A
Sulfates	24-hour	25 µg/m^3	A	NA	NA
Lead	30-day	1.5 µg/m^3	A	NA	NA
	Cal. Quarter	NA	NA	1.5 µg/m^3	A
	Rolling 3-month average	NA	NA	0.15	U
Hydrogen Sulfide	1-hour	0.03 ppm	U	NA	NA
Visibility-Reducing Particles	8-hour	See Note g	U	NA	NA

Notes:

A = Attainment; **N** = Non-attainment; U = Unclassified; NA = Not Applicable, no applicable standard; ppm = parts per million; µg/m^3 = micrograms per cubic meter.

a SAAQS = state ambient air quality standards (California). SAAQS for ozone, CO (except Lake Tahoe), SO_2 (1-hour and 24-hour), NO_2, PM, and visibility-reducing particles are values that are not to be exceeded. All other state standards shown are values not to be equaled or exceeded.

b NAAQS = national ambient air quality standards. NAAQS, other than ozone and particulates, and those based on annual averages or annual arithmetic means, are not to be exceeded more than once a year. The 8-hour ozone standard is attained when the 3-year average of the fourth highest daily concentration is 0.08 ppm or less. The 24-hour PM_{10} standard is attained when the 3-year average of the 99th percentile of monitored concentrations is less than the standard. The 24-hour $PM_{2.5}$ standard is attained when the 3-year average of the 98th percentile is less than the standard.

c The U.S. Environmental Protection Agency (EPA) revoked the national 1-hour ozone standard on June 15, 2005.

d This Federal 8-hour ozone standard was approved by EPA in October 2015 and became effective on December 28, 2015.

e State standard = annual geometric mean; national standard = annual arithmetic mean.

f In June 2002, the CARB established new annual standards for $PM_{2.5}$ and PM_{10}.

g Statewide visibility-reducing particle standard (except Lake Tahoe Air Basin): Particles in sufficient amount to produce an extinction coefficient of 0.23 per kilometer when the relative humidity is less than 70 percent. This standard is intended to limit the frequency and severity of visibility impairment due to regional haze and is equivalent to a 10-mile nominal visual range.

Sources: BAAQMD, Standards and Attainment Status, 2015. Available online at http://www.baaqmd.gov/research-and-data/air-quality-standards-and-attainment-status. Accessed January 19, 2016.

U.S. EPA National Ambient Air Quality Standards, 2012. Available online at http://www3.epa.gov/ttn/naaqs/criteria.html. Accessed January 19, 2016.

- Green (0-50) indicates "good" air quality. No health impacts are expected when air quality is in the green range.
- Yellow (51-100) indicates air quality is "moderate." Unusually sensitive people should consider limited prolonged outdoor exertion.
- Orange (101-150) indicates air quality is "unhealthy for sensitive groups." Active children and adults, and people with respiratory disease, such as asthma, should limit outdoor exertion.
- Red (151-200) indicates air quality is "unhealthy." Active children and adults, and people with respiratory disease, such as asthma, should avoid prolonged outdoor exertion; everyone else, especially children, should limit prolonged outdoor exertion.
- Purple (201-300) indicates air quality is "very unhealthy." Active children and adults, and people with respiratory disease, such as asthma, should avoid prolonged outdoor exertion; everyone else, especially children, should limit outdoor exertion.

The AQI numbers refer to specific amounts of pollution in the air. They are based on the Federal air quality standards for ozone, CO, NO_2, SO_2, PM_{10}, and $PM_{2.5}$. In most cases, the Federal standard for these air pollutants corresponds to the number 100 on the AQI chart. If the concentration of any of these pollutants rises above its respective standard, the air quality can be unhealthy for the public. In determining the air quality forecast, local air districts, including the BAAQMD, use the anticipated concentration measurements for each of the major pollutants, convert them into AQI numbers, and determine the highest AQI for each zone in a district.

Readings below 100 on the AQI scale would not typically affect the health of the general public (although readings in the moderate range of 50 to 100 may affect unusually sensitive people). Levels above 300 rarely occur in the United States, and readings above 200 have not occurred in the Bay Area in decades.[13] AQI statistics over recent years indicate that air quality in the Bay Area is predominantly in the "Good" or Moderate" categories and healthy on most days for most people. Historical BAAQMD data indicate that the SFBAAB experienced air quality in the Red level (unhealthy) on 3 days between the years 2010 and 2014. As shown in Table 4.G.3: Air Quality Index Statistics for the San Francisco Bay Area Air Basin, the SFBAAB had a total of 14 Orange-level (unhealthy for sensitive groups) days in 2010, 12 days in 2011, 8 days in 2012, 15 days in 2013, and 11 days in 2014.

TOXIC AIR CONTAMINANTS AND LOCAL HEALTH RISKS AND HAZARDS

In addition to criteria air pollutants, individual projects may emit toxic air contaminants (TACs). TACs collectively refer to a diverse group of air pollutants that are capable of causing chronic (i.e., of long duration) and acute (i.e., severe but short-term) adverse effects to human health, including carcinogenic effects. Human health effects of TACs include birth defects, neurological damage, cancer, and death. There are hundreds of different types of TACs with varying degrees of toxicity. Individual TACs vary greatly in the health risk they present; at a given level of exposure, one TAC may pose a hazard that is many times greater than another.

Unlike criteria air pollutants, TACs are not subject to ambient air quality standards but are regulated by the BAAQMD using a risk-based approach to determine which sources and pollutants to control as well as the degree of control. A health risk assessment (HRA) is an analysis which estimates human health exposure to toxic substances, and when considered together with information regarding the toxic potency of the substances, provides quantitative estimates of health risks.[14]

Exposures to fine PM ($PM_{2.5}$) are strongly associated with mortality, respiratory diseases, and lung development in children, and other end results, such as hospitalization for cardiopulmonary disease.[15] In addition to $PM_{2.5}$, diesel PM (DPM), a byproduct of diesel fuel combustion, is also of concern. The CARB identified DPM as a TAC in 1998, primarily based on evidence demonstrating cancer effects in humans.[16] The estimated cancer risk from exposure to diesel exhaust is much higher than the risk associated with any other TAC routinely measured in the region.

[14] In general, a health risk assessment is required if the BAAQMD concludes that projected emissions of a specific air toxic compound from a proposed new or modified source suggest a potential public health risk. The applicant is then subject to a health risk assessment for the source in question. Such an assessment generally evaluates chronic, long-term effects, estimating the increased risk of cancer as a result of exposure to one or more TACs.

[16] CARB, Fact Sheet, "The Toxic Air Contaminant Identification Process: Toxic Air Contaminant Emissions from Diesel-fueled Engines," October 1998.

San Francisco Modeling of Air Pollution Exposure Zones

In an effort to identify areas of San Francisco most adversely affected by sources of TACs, San Francisco partnered with the BAAQMD to inventory and assess air pollution and exposures from vehicles, stationary sources, and area sources within San Francisco. Citywide dispersion modeling was conducted using AERMOD[17] to assess the emissions from the following primary sources: vehicles on local roadways, permitted stationary sources, port and maritime sources, and Caltrain. Emissions of PM_{10} (DPM is assumed equivalent to PM_{10}), $PM_{2.5}$, and total organic gases (TOG) were modeled on a 20 × 20–meter receptor grid covering the entire City. The citywide modeling results represent a comprehensive assessment of existing cumulative exposures to air pollution throughout the City. The methodology and technical documentation for modeling citywide air pollution is available in the document entitled, *The San Francisco Community Risk Reduction Plan: Technical Support Documentation*.[18]

Model results were used to identify areas in the City with poor air quality, termed Air Pollutant Exposure Zones (APEZ), based on the following health-protective criteria: (1) cumulative $PM_{2.5}$ concentrations greater than 10 $\mu g/m^3$; and/or (2) excess cancer risk from the contribution of emissions from all modeled sources greater than 100 per one million persons exposed.

An additional health vulnerability layer was incorporated in the APEZ for those San Francisco ZIP codes in the worst quintile of Bay Area Health Vulnerability scores (ZIP Codes 94102, 94103, 94105, 94124, and 94130). In these areas, the standard for identifying areas as being within the zone were lowered to: (1) excess cancer risk from the contribution of emissions from all modeled sources greater than 90 per one million persons exposed; and/or (2) cumulative $PM_{2.5}$ concentrations greater than 9 $\mu g/m^3$.

Lastly, all parcels within 500 feet of a major freeway were also included in the APEZ, consistent with findings in CARB's *Air Quality and Land Use Handbook: A Community Health Perspective*, which suggests air pollutant levels decrease substantially at approximately 500 feet from a freeway.[19]

Citywide modeling results identified the project site as within an APEZ. However, this designation reflects an incorrect assumption that BAE Systems (a permitted stationary source

[17] AERMOD is the EPA's preferred or recommended steady state air dispersion plume model. For more information on AERMOD and to download the AERMOD Implementation Guide see www.epa.gov/ttn/scram/dispersion_prefrec.htm#aermod (accessed November 20, 2015).

[19] CARB, *Air Quality and Land Use Handbook: A Community Health Perspective*, April 2005. Available online at http://www.arb.ca.gov/ch/handbook.pdf. Accessed November 20, 2015.

operator) is within the project site, rather than north of the project site where it is currently located. Revised modeling was conducted in consultation with BAAQMD to reassess cancer risk and $PM_{2.5}$ concentrations within the project area and its environs. This updated modeling demonstrated that the Proposed Project site is not located in an areas that meet the APEZ criteria.

Fine Particulate Matter

In April 2011, the EPA published *Policy Assessment for the Particulate Matter Review of the National Ambient Air Quality Standards*. In this document, EPA staff concludes that the then-current Federal annual $PM_{2.5}$ standard of 15 $\mu g/m^3$ should be revised to a level within the range of 13 to 11 $\mu g/m^3$, with evidence strongly supporting a standard within the range of 12 to 11 $\mu g/m^3$. APEZs for San Francisco are based on the health protective $PM_{2.5}$ standard of 11 $\mu g/m^3$, as supported by the EPA's Particulate Matter Policy Assessment, although lowered to 10 $\mu g/m^3$ to account for uncertainty in accurately predicting air pollutant concentrations using emissions modeling programs.

Excess Cancer Risk

The 100 per one million persons exposed (100 excess cancer risk) criterion discussed above in the "San Francisco Modeling of Air Pollution Exposure Zones" section, pp. 4.G.11-4.G.12, is based on EPA guidance for conducting air toxic analyses and making risk management decisions at the facility and community-scale level.[20] As described by the BAAQMD, the EPA considers a cancer risk of 100 per one million or less to be within the "acceptable" range of cancer risk. Furthermore, in the 1989 preamble to the benzene National Emissions Standards for Hazardous Air Pollutants (NESHAP) rulemaking,[21] the EPA states that it "…strives to provide maximum feasible protection against risks to health from hazardous air pollutants by (1) protecting the greatest number of persons possible to an individual lifetime risk level no higher than approximately one in one million and (2) limiting to no higher than approximately one in ten thousand [100 in one million] the estimated risk that a person living near a plant would have if he or she were exposed to the maximum pollutant concentrations for 70 years." The 100 per one million excess cancer cases is also consistent with the ambient cancer risk in the most pristine portions of the Bay Area based on BAAQMD regional modeling.[22]

[21] 54 *Federal Register* 38044, September 14, 1989.

[22] BAAQMD, *Revised Draft Options and Justification Report, California Environmental Quality Act Thresholds of Significance*, October 2009, p. 67.

In addition to monitoring criteria pollutants, both the BAAQMD and CARB operate TAC monitoring networks in the SFBAAB. These stations measure 10 to 15 TACs, depending on the specific station. The TACs selected for monitoring are those that traditionally have been found in the highest concentrations in ambient air and therefore tend to produce the most significant risk. The nearest BAAQMD ambient TAC monitoring station to the project area is the station at 10 Arkansas Street in San Francisco. The ambient concentrations of carcinogenic TACs measured at the Arkansas Street station, approximately 0.5 mile west of the project site, are presented in Table 4.G.4: 2015 Annual Average Ambient Concentrations of Carcinogenic Toxic Air Contaminants Measured at BAAQMD Monitoring Station, 10 Arkansas Street, San Francisco. The estimated cancer risk from a lifetime exposure (70 years) to these substances is also reported in the table. When TAC measurements at this station are compared to ambient concentrations of various TACs for the Bay Area as a whole, the cancer risks associated with mean TAC concentrations in San Francisco are similar to those for the Bay Area as a whole. Therefore, the estimated average lifetime cancer risk resulting from exposure to TAC concentrations monitored at the San Francisco station do not appear to be any greater than for the Bay Area as a region.

Roadway-Related Pollutants

Motor vehicles are responsible for a large share of air pollution, especially in California. Vehicle tailpipe emissions contain diverse forms of particles and gases, and vehicles also contribute to particulates by generating road dust through tire wear. Epidemiologic studies have demonstrated that people living close to freeways or busy roadways have poorer health outcomes, including increased asthma symptoms and respiratory infections, and decreased pulmonary function and lung development in children. Air pollution monitoring conducted in conjunction with epidemiologic studies has confirmed that roadway-related health effects vary with modeled exposure to PM and NO_2. In traffic-related studies, the additional non-cancer health risk attributable to roadway proximity was seen within 1,000 feet of the roadway and was strongest within 300 feet.[23] As a result, the CARB recommends that new sensitive land uses not be located within 500 feet of a freeway or urban roads carrying 100,000 vehicles per day.

Diesel Particulate Matter

The CARB identified DPM as a TAC in 1998, primarily based on evidence demonstrating cancer effects in humans. The exhaust from diesel engines includes hundreds of different gaseous and particulate components, many of which are toxic. Mobile sources such as trucks and buses are among the primary sources of diesel emissions, and concentrations of DPM are higher near

Table 4.G.4: 2015 Annual Average Ambient Concentrations of Carcinogenic Toxic Air Contaminants Measured at BAAQMD Monitoring Station, 10 Arkansas Street, San Francisco

Substance	Concentration	Cancer Risk per Million[a]
Gaseous TACs (ppb)		
Acetaldehyde	0.50[b]	2[b]
Benzene	0.20	18
1,3-Butadiene	0.038	14
Carbon Tetrachloride	0.094	25
Formaldehyde	1.28[b]	9[b]
Perchloroethylene	0.015	0.6
Methylene Chloride	0.127	0.4
Chloroform	0.030	0.8
Trichloroethylene	0.012	0.1
Particulate TACs (ng/m^3)		
Chromium (Hexavalent)	0.078	12
Total Risk for All TACs		**81.9**

Notes:

TACs = toxic air contaminants; BAAQMD = Bay Area Air Quality Management District; ppb = part per billion; ng/m^3 = nanograms per cubic meter.

[a] Cancer risks were estimated by applying published unit risk values to the measured concentrations.

[b] Year 2014 data, as 2015 data not available for these TACs.

Source: CARB, Ambient Air Toxics Summary-2013. Available online at: http://www.arb.ca.gov/adam/toxics/sitesubstance.html. Accessed October 22, 2015.

heavily traveled highways. The CARB estimated that the average Bay Area cancer risk from exposure to DPM, based on a population-weighted average ambient DPM concentration, is approximately 480 in one million, as of 2000, which is much higher than the risk associated with any other toxic air pollutant routinely measured in the region. The statewide risk from DPM as determined by the CARB declined from 750 in one million in 1990 to 570 in one million in 1995; by 2000, CARB estimated the average statewide cancer risk from DPM at 540 in one million.[24,25]

[24] CARB, *California Almanac of Emissions and Air Quality - 2009 Edition*, Table 5-44 and Figure 5-12. Available online at http://www.arb.ca.gov/aqd/almanac/almanac09/chap509.htm. Accessed October 22, 2015.

In 2000, the CARB approved a comprehensive Diesel Risk Reduction Plan to reduce diesel emissions from both new and existing diesel-fueled vehicles and engines. Subsequent CARB regulations apply to new trucks and diesel fuel. With new controls and fuel requirements, 60 trucks built in 2007 would have the same particulate exhaust emissions as one truck built in 1988.[26] The regulation is anticipated to result in an 80 percent decrease in statewide diesel health risk in 2020 as compared with the diesel risk in 2000. Despite notable emission reductions, the CARB recommends that proximity to sources of DPM emissions be considered in the siting of new sensitive land uses. The CARB notes that these recommendations are advisory and should not be interpreted as defined "buffer zones," and that local agencies must balance other considerations, including transportation needs, the benefits of urban infill, community economic development priorities, and other quality of life issues. With careful evaluation of exposure, health risks, and affirmative steps to reduce risk where necessary, the CARB's position is that infill development, mixed use, higher density, transit-oriented development, and other concepts that benefit regional air quality can be compatible with protecting the health of individuals at the neighborhood level.[27]

SENSITIVE RECEPTORS

Air quality does not affect every individual in the population in the same way, and some groups are more sensitive to adverse health effects than others. Population subgroups sensitive to the health effects of air pollutants include the elderly and the young; population subgroups with higher rates of respiratory disease, such as asthma and chronic obstructive pulmonary disease; and populations with other environmental or occupational health exposures (e.g., indoor air quality) that affect cardiovascular or respiratory diseases. The BAAQMD defines sensitive receptors as children, adults, and seniors occupying or residing in residential dwellings, schools, day care centers, hospitals, and senior-care facilities. Workers are not considered sensitive receptors because all employers must follow regulations set forth by the Occupation Safety and Health Administration (OSHA) to ensure the health and well-being of their employees.[28]

---

[25] This calculated cancer risk value from ambient air exposure in the Bay Area can be compared against the lifetime probability of being diagnosed with cancer in the United States, from all causes, which for men is more than 40 percent (based on a sampling of 17 regions nationwide), or greater than 400,000 in one million, according to the American Cancer Society. (American Cancer Society, last revised October. 1, 2014, available online at http://www.cancer.org/cancer/cancerbasics/lifetime-probability-of-developing-or-dying-from-cancer.)

[27] CARB, *Air Quality and Land Use Handbook: A Community Health Perspective*, April 2005. Available online at http://www.arb.ca.gov/ch/handbook.pdf. Accessed October 22, 2015.

[28] BAAQMD, *Recommended Methods for Screening and Modeling Local Risks and Hazards*, May 2011, p. 12.

The proximity of sensitive receptors to motor vehicles is an air pollution concern, especially in San Francisco where building setbacks are limited and roadway volumes are hig5her than most other parts of the Bay Area. Vehicles also contribute to particulates by generating road dust and through tire wear.

Existing receptors evaluated in this analysis include a representative sample of known residents (child and adult) in the surrounding neighborhood, and other sensitive receptors (school children, hospital/nursing home patients, etc.) located in the surrounding community and along the expected travel routes of the on-road delivery and haul trucks. For a list of sensitive receptors within 900 feet of the project site, refer to Table 4.F.4: Sensitive Receptors in the Project Vicinity, in Section 4.F, Noise, p. 4.F.15. The health risk impact analysis also includes receptor locations out to a distance of 1,000 meters from the project site, consistent with citywide modeling. In addition to the residential receptors, there are four schools and a daycare within 900 feet of the project site were identified: Dogpatch Alterntaive School (site 2), Potrero Kids Daycare, Dogpatch Alternative School (Site 1), La Picola Scuola Italiana, and Friends of Potrero Hill Nursery School.

The project site in not located within an area that meets the APEZ criteria. Background cancer risk values on the project site are between 21 and 44 in one million, with background values ranging from 0 to 265 in one million within 1,000 meters of the site.[29] Background $PM_{2.5}$ concentrations range from 8.3 to 8.8 $\mu g/m^3$ on the project site, with background values varying between 0 and 11 $\mu g/m^3$ within 1,000 meters of the site. The nearest off-site receptors within an APEZ are located approximately 900 feet to the west and are thus designated due to the proximity of Interstate 280.

EXISTING STATIONARY SOURCES OF AIR POLLUTION

The BAAQMD's inventory of permitted stationary sources of emissions shows eight permitted stationary emission facilities present within or near the 1,000-foot zone of influence[30] of the project site. The sources at these permitted facilities include printers, stationary diesel engines for power generators, a gas station, and the now decommissioned Potrero Power Plant (which was removed from the City's baseline model as part of this analysis). The BAE Systems ship repair facility north of the project site operates diesel-fired electric generators to maintain power for ships while at dry dock and also conducts sandblasting activities. The diesel generators generate

[29] Environmental Science Associates, Pier 70 Mixed Use District Project Air Quality Technical Report, December 2016.

[30] For assessing community risks and hazards, an area of influence of 1,000-foot radius is recommended around the project property boundary. BAAQMD recommends that any proposed project that includes the siting of a new source or receptor assess associated impacts within 1,000 feet, taking into account both individual and nearby cumulative sources. As explained above, the HRA evaluated sources within a larger area of 1,000 meters.

DPM emissions. The sandblasting generates $PM_{2.5}$ emissions. As a consequence, citywide modeling indicates background $PM_{2.5}$ concentrations of up to 9.5 $\mu g/m^3$ in the project vicinity.

MAJOR ROADWAYS CONTRIBUTING TO AIR POLLUTION

Third Street, 16th Street, Mariposa Street, 25th Street, and Cesar Chavez Street are arterial roadways in the existing local roadway system within 1,000 meters of the project site that carry at least 10,000 vehicles in annual average daily traffic based on the City's SF CHAMP roadway model.[31] This traffic contributes to concentrations of $PM_{2.5}$, DPM, and other air contaminants emitted from motor vehicles near the street level. Both Interstate 280 and the Caltrain rail line are also located within 1,000 meters from the project site. Aside from the surrounding major roadways, the only other areas of mobile-source activity or otherwise "non-permitted" sources (e.g., railyards, trucking distribution facilities, and high-volume fueling stations) located within 1,000 meters of the project site would be SF MUNI Woods Division storage and maintenance yards located at 22nd and Indiana streets and the Islais Creek Motor Coach Maintenance and Operations Facility at Cesar Chavez and Illinois streets.

REGULATORY FRAMEWORK

FEDERAL REGULATIONS

The 1970 Clean Air Act (last amended in 1990) requires that regional planning and air pollution control agencies prepare a regional air quality plan to outline the measures by which both stationary and mobile sources of pollutants are planned to be controlled in order to achieve all standards by the deadlines specified in the act. These ambient air quality standards are intended to protect the public health and welfare, and they specify the concentration of pollutants (with an ample margin of safety) to which the public can be exposed without adverse health effects. They are designed in consideration of those segments of the public most susceptible to respiratory distress, including asthmatics, the very young, the elderly, people weak from other illness or disease, or persons engaged in strenuous work or exercise. Healthy adults can tolerate occasional exposure to air pollution levels that are somewhat above ambient air quality standards without observing adverse health effects.

The current attainment status for the SFBAAB, with respect to Federal standards, is summarized above in Table 4.G.2, p. 4.G.9. In general, the SFBAAB experiences low concentrations of most pollutants when compared to Federal standards, except for ozone and PM (PM_{10} and $PM_{2.5}$), for which standards are exceeded periodically (see Table 4.G.1, p. 4.G.3).

[31] San Francisco Metropolitan Transportation Agency, Chained Activity Modeling Process version 4.3.0, Average Daily Traffic Volumes, provided to ESA, August 2, 2012.

STATE REGULATIONS

California Clean Air Act

Although the Federal Clean Air Act established national ambient air quality standards, individual states retained the option to adopt more stringent standards and to include other pollution sources. California had already established its own air quality standards when Federal standards were established, and because of the unique meteorological problems in California, there is considerable diversity between the State and national ambient air quality standards, as shown in Table 4.G.2, p. 4.G.8. California ambient standards are at least as protective as national ambient standards and are often more stringent.

In 1988, California passed the California Clean Air Act (California Health and Safety Code Sections 39600 et seq.), which, like its Federal counterpart, required the designation of areas as attainment or non-attainment, but based these designations on State ambient air quality standards rather than the Federal standards. As indicated in Table 4.G.2, the SFBAAB is designated as "non-attainment" for State ozone, PM_{10}, and $PM_{2.5}$ standards, and is designated as "attainment" for other pollutants.

Toxic Air Contaminants

In 2005, the CARB approved a regulatory measure to reduce emissions of toxic and criteria pollutants by limiting the idling of new heavy-duty diesel vehicles. The regulations generally limit idling of commercial motor vehicles (including buses and trucks) within 100 feet of a school or residential area for more than 5 consecutive minutes or periods aggregating more than 5 minutes in any 1 hour. Buses or vehicles also must turn off their engines upon stopping at a school and must not turn their engines on more than 30 seconds before beginning to depart from a school. Also, State law Senate Bill 352 (SB 352) was adopted in 2003 and limits locating public schools within 500 feet of a freeway or busy traffic corridor (Section 17213 of the Education Code; Section 21151.8 of the Public Resources Code).

The Carl Moyer Memorial Air Quality Standards Attainment Program

The Carl Moyer Memorial Air Quality Standards Attainment Program (Carl Moyer Program) is a grant program that reduces air pollution from vehicles and equipment by providing funds to replace or retrofit older equipment or engines with engines, equipment, and other sources of air pollution, such as ground support equipment at airports, that are cleaner than what the EPA would require. Money collected through the Carl Moyer Program complements California's regulatory program by providing incentives to affect early or extra emission reductions, especially from emission sources in environmental justice communities and areas disproportionately impacted by

air pollution. The Carl Moyer Program funds clean air projects involving a variety of vehicles and equipment, including the following.

- Repower: The replacement of an in-use engine with another, cleaner engine.
- Retrofit: An emission control system used exclusively with an in-use engine, vehicle, or piece of equipment.
- New purchases: Vehicles or equipment certified to optional, lower emission standards.
- Fleet modernization or equipment replacement: The replacement of an older vehicle or piece of equipment that still has a remaining useful life with a newer, cleaner vehicle or piece of equipment. The old vehicle/equipment is scrapped. Equipment may include on-road heavy-duty vehicles and off-road equipment replacement as well as emergency vehicles (fire apparatus) and lawn and garden equipment replacement.
- Vehicle retirement (or car scrap): Paying owners of older, more polluting vehicles that still have remaining useful life to voluntarily retire those vehicles earlier than they would have otherwise.

The Carl Moyer Program establishes a cost effectiveness standard that a proposed clean air project must meet to receive funding under the program. On March 27, 2015, the cost effectiveness limit was updated to $18,030 per weighted ton of ROG, NOx, and PM in resulting emissions reductions.[32] The program has established guidelines and criteria for the funding of emissions reduction projects. The BAAQMD administers the Carl Moyer Program within the SFBAAB.

REGIONAL AND LOCAL REGULATIONS AND PLANS

Bay Area Air Quality Management District

The BAAQMD is the regional agency with jurisdiction over the nine-county region located in the SFBAAB. The Association of Bay Area Governments, Metropolitan Transportation Commission, county transportation agencies, cities and counties, and various non-governmental organizations also participate in the efforts to improve air quality through a variety of programs. These programs include the adoption of regulations and policies, as well as implementation of extensive education and public outreach programs. BAAQMD is responsible for attaining and maintaining air quality in the region within Federal and State air quality standards. Specifically, BAAQMD has the responsibility to monitor ambient air pollutant levels throughout the region and to develop and implement strategies to attain the applicable Federal and State standards.

[32] CARB. Memorandum Re: Carl Moyer Program: Review and Update of the Cost-Effectiveness Limit and Capital Recovery Factors for 2015. March 27, 2015. Available online at http://www.arb.ca.gov/msprog/mailouts/msc1509/msc1509.pdf. Accessed April 24, 2015.

BAAQMD does not have authority to regulate emissions from motor vehicles. Specific rules and regulations adopted by the BAAQMD limit the emissions that can be generated by various stationary sources, and identify specific pollution reduction measures that must be implemented in association with various activities. These rules regulate not only emissions of the six criteria air pollutants, but TAC emissions sources are also subject to these rules and are regulated through the BAAQMD's permitting process and standards of operation. Through this permitting process, including an annual permit review, the BAAQMD monitors the generation of stationary emissions and uses this information in developing its air quality plans. Any sources of stationary emissions constructed as part of the Proposed Project would be subject to the BAAQMD Rules and Regulations. Both Federal and State ozone plans rely heavily on stationary source control measures set forth in BAAQMD's Rules and Regulations.

Per its Engineering Policy and Procedure Manual,[33] the BAAQMD requires implementation of best available control technology for toxics and would deny an authority to construct or a permit to operate for any new or modified source of TACs that exceeds a cancer risk of 10 in one million or a chronic or acute hazard index of 1.0. The permitting process under BAAQMD Regulation 2, Rule 5 requires a Health Risk Screening Analysis, the results of which are posted on the BAAQMD's website.

Bay Area Air Quality Planning Relative to State and Federal Standards

Federal Air Quality Plan

Air quality plans developed to meet Federal requirements are referred to as State Implementation Plans. The Federal and State Clean Air Acts require plans to be developed for areas designated as non-attainment (with the exception of areas designated as non-attainment for the State PM_{10} standard). The most recent Bay Area ozone plan prepared in response to Federal air quality planning requirements is the 2001 Ozone Attainment Plan.

California Air Quality Plan

The *Bay Area 2010 Clean Air Plan* (hereafter the Clean Air Plan) was adopted on September 15, 2010, by the BAAQMD, in cooperation with the Bay Area Metropolitan Transportation Commission, the Bay Conservation and Development Commission, and Association of Bay Area Governments. The Clean Air Plan defines a control strategy that the BAAQMD and its partners implement to "(1) reduce emissions and decrease ambient concentrations of harmful pollutants; (2) safeguard public health by reducing exposure to air pollutants that pose the greatest health

[33] BAAQMD, Engineering Policy and Procedure Manual, 2013. Available online at http://www.baaqmd.gov/~/media/files/engineering/policy_and_procedures/engineering-policy-and-procedure-manual.pdf?la=en. Accessed February 6, 2016.

risk, with an emphasis on protecting the communities most heavily impacted by air pollution; and (3) reduce greenhouse gas (GHG) emissions to protect the climate. The legal impetus for the CAP is to update the previous ozone plan, the Bay Area 2005 Ozone Strategy, to comply with State air quality planning requirements as codified in the California Health & Safety Code."[34]

The 2010 Clean Air Plan updates and replaces the *2005 Ozone Strategy* in accordance with the requirements of the California Clean Air Act to implement "all feasible measures" to reduce ozone; provide a control strategy to reduce ozone, PM, TACs, and GHGs in a single, integrated plan; review progress in improving air quality in recent years; and establish emission control measures to be adopted or implemented in the 2010–2012 time frame. The control strategy includes stationary-source control measures to be implemented through BAAQMD regulations; mobile-source control measures to be implemented through incentive programs and other activities; and transportation control measures to be implemented through transportation programs in cooperation with the Metropolitan Transportation Commission, local governments, transit agencies, and others. The Clean Air Plan also represents the Bay Area's most recent triennial assessment of the region's strategy to attain the State 1-hour ozone standard.[35] The 2010 Clean Air Plan is currently in the process of being updated with a Final Draft expected to be circulated in mid to late December 2016 and will be considered for approval by the BAAQMD Board in Spring of 2017.

San Francisco General Plan Air Quality Element

The *San Francisco General Plan* (*General Plan*) includes the 1997 Air Quality Element.[36] The objectives specified by the City include the following.

Objective 1:	Adhere to State and Federal air quality standards and regional programs.
Objective 2:	Reduce mobile sources of air pollution through implementation of the Transportation Element of the General Plan.
Objective 3:	Decrease the air quality impacts of development by coordination of land use and transportation decisions.
Objective 4:	Improve air quality by increasing public awareness regarding the negative health effects of pollutants generated by stationary and mobile sources.
Objective 5:	Minimize particulate matter emissions from road and construction sites.

[34] BAAQMD, *Bay Area 2010 Clean Air Plan, Final Clean Air Plan Volume 1*, p. ES-1, Adopted September 15, 2010.

[35] BAAQMD, *2010 Clean Air Plan*. Available online at http://www.baaqmd.gov/Divisions/Planning-and-Research/Plans/Clean-Air-Plans.aspx. Accessed November 20, 2015.

[36] San Francisco Planning Department, Air Quality Element of the *San Francisco General Plan*, July 1997, updated in 2000.

Objective 6: Link the positive effects of energy conservation and waste management to emission reductions.

San Francisco Construction Dust Ordinance

The City has adopted San Francisco Health Code Article 22B and San Francisco Building Code Section 106.A.3.2.6, which collectively constitute the Construction Dust Control Ordinance. The ordinance requires that all site preparation work, demolition, or other construction activities within San Francisco that have the potential to create dust or to expose or disturb more than 10 cubic yards or 500 square feet of soil comply with specified dust control measures whether or not the activity requires a permit from the Department of Building Inspection (DBI). For projects over 0.5 acre, the Dust Control Ordinance requires that the project sponsor submit a dust control plan for approval by the San Francisco Department of Public Health prior to issuance of a building permit by DBI or Port of San Francisco.

Building permits will not be issued without written notification from the Director of Public Health that the applicant has a site-specific dust control plan, unless the Director waives the requirement. The Construction Dust Control Ordinance requires project sponsors and contractors responsible for construction activities to control construction dust on the site or implement other practices that result in equivalent dust control that are acceptable to the Director of Public Health.

Dust suppression activities may include watering of all active construction areas sufficiently to prevent dust from becoming airborne; increased watering frequency may be necessary whenever wind speeds exceed 15 mph. Reclaimed water must be used if required by Article 21, Section 1100 et seq. of the San Francisco Public Works Code.

The project site is over 35 acres in size, and therefore the project sponsor would be required to prepare a dust control plan.

San Francisco Health Code Provisions for Urban Infill Development (Article 38)

San Francisco adopted Article 38 of the San Francisco Health Code in 2008, with revisions that took effect in December 2014. The revised code requires that sensitive land use developments within the mapped Air Pollutant Exposure Zones (APEZ) incorporate Minimum Efficiency Reporting Value 13 (MERV-13)-equivalent ventilation systems to remove particulates from outdoor air. This regulation also applies to conversion of uses to a sensitive use (residential, senior care facilities, day care centers, etc.). Article 38 may be applicable to the eastern portion of the Proposed Project because it is currently identified as within an APEZ in the Article 38 map

prepared by the San Francisco Department of Public Health[37] and would include sensitive (residential) land uses. Under Article 38, updates to the mapping are conducted every 5 years and those portions of the project site identified on the current map at the time of permitting would be subject to the filtration requirements. This designation is primarily the result of emissions from the BAE Systems ship repair facility north of the project site, which operates diesel generators to maintain power for ships while at dry dock and also conducts sandblasting activities, the former of which generates DPM emissions and the latter of which generates $PM_{2.5}$ emissions. The location of emissions from the BAE Systems facility was updated as part of this project's air quality analysis and based on that modeling, the project site would no longer meet the criteria for being within the APEZ. See Impact AQ-3 below for more information.

IMPACTS AND MITIGATION MEASURES

SIGNIFICANCE THRESHOLDS

For the impacts analyzed in this section, the project would have a significant impact related to air quality if it were to:

- conflict with or obstruct implementation of the applicable air quality plan;
- violate any air quality standard or contribute substantially to an existing or projected air quality violation;
- result in a cumulatively considerable net increase of any criteria pollutant for which the project region is in non-attainment under an applicable Federal or State ambient air quality standard (including releasing emissions that exceed quantitative thresholds for ozone precursors);
- expose sensitive receptors to substantial pollutant concentrations; or
- create objectionable odors affecting a substantial number of people.

APPROACH TO ANALYSIS

In general, the Proposed Project would result in two types of potential air quality impacts. First, the project would result in air pollution through construction activity. Second, the project would generate air pollutants during project operations, due to increased vehicle travel and new stationary sources (i.e., up to 11 new emergency standby diesel generators). During the approximately 11-year construction phase, operation of earlier phases of the project would overlap with construction of later phases.

[37] San Francisco Department of Public Health, Air Pollution Exposure Zone Map, Inset 2. Available online at https://www.sfdph.org/dph/files/EHSdocs/AirQuality/AirPollutantExposureZoneMap.pdf. Accessed February 6, 2016.

Each of these types of direct impacts is in turn separated into impacts from criteria air pollutant emissions, which are generally regional in nature, and into impacts associated with exposure to TACs and $PM_{2.5}$, which is a localized health impact expressed in terms of exposure to $PM_{2.5}$ concentrations and the probability of contracting cancer per 100 in one million persons exposed to TAC concentrations. The assessment of criteria air pollutant impacts addresses the second and third bulleted significance thresholds identified above. The assessment of localized health risk and exposure to $PM_{2.5}$ concentrations addresses the fourth bulleted significance threshold identified above.

Air quality analysis conducted for this impact assessment uses the emission factors, models, and tools distributed by a variety of agencies including CARB, the California Air Pollution Officers Association, the California Office of Environmental Health Hazard Assessment (March 2015), and the EPA. Additionally, the analysis includes methodologies identified in the BAAQMD *CEQA Air Quality Guidelines* (May 2012).

In the *California Building Industry Association v. Bay Area Air Quality Management District* case decided in 2015,[38] the California Supreme Court held that CEQA does not generally require lead agencies to consider how existing environmental conditions might impact a project's users or residents, except where the project would significantly exacerbate an existing environmental condition. Accordingly, the significance criteria above related to exposure of new sensitive receptors to substantial pollutant concentrations are valid only to the extent that the project significantly exacerbates the air quality conditions. An impact is considered significant if the project would significantly exacerbate existing or future air quality conditions.

PROJECT FEATURES

The Proposed Project would include amendments to the *General Plan* and Planning Code, adding a new Pier 70 Special Use District (SUD), which would establish land use controls for the project site and incorporate the design standards and guidelines in the proposed *Pier 70 SUD Design for Development* document.

Under the provisions of the proposed Pier 70 SUD, the Proposed Project would provide a flexible land use program. To cover a full range of potential land uses that could be developed under the Proposed Project, the EIR analyzes a maximum residential use scenario (Maximum Residential Scenario) and a maximum commercial use scenario (Maximum Commercial Scenario) for the project site, which bracket specific maximum ranges of uses that could be developed.

[38] *California Building Industry Association v. Bay Area Air Quality Management District*, 62 Cal.4th 369. Opinion Filed December 17, 2015.

Proposed land uses on each parcel in the project site under both scenarios are presented in Figure 2.7: Proposed Land Use Plan – Maximum Residential Scenario, and Figure 2.8: Proposed Land Use Plan – Maximum Commercial Scenario, in Chapter 2, Project Description, pp. 2.30 and 2.32, respectively. Figure 2.10: Proposed Height Limits Plan, p. 2.36, shows that 10 parcels could have up to 11 structures exceeding 70 feet in height. Because of building code requirements, buildings of this height may require emergency standby generators that are a source of air pollutant emissions.

Under both scenarios, two parcels (C1 and C2) on the project site that are designated for district-structured parking could be developed with a mixture of residential/commercial uses or only residential use, depending on future market demand. Specifically, Parcel C1 could be developed with residential, commercial, or parking uses, and Parcel C2 could be developed with residential or parking uses. Active public rooftop open space (sports courts, play fields, urban agriculture plots, seating, and observational terrace areas) could be developed on the roof of both of these parcels under both scenarios as well if the parcels are built as district parking structures. As a conservative measure, the air quality analysis assumes that these parcels will be developed with residential/commercial uses instead of parking structures, because for transportation and air quality purposes parking structures are not considered to be vehicle trip generators. Additionally, construction of residential/commercial uses would generate more emissions than a parking structure due to more extensive interior finishing and use of natural gas for heating purposes.

AIR QUALITY PLAN

The applicable air quality plan is the BAAQMD's 2010 Clean Air Plan. Consistency with the Clean Air Plan can be determined if the project supports the goals of the plan, includes applicable control measures from the plan, and if the project would not disrupt or hinder implementation of any control measures from the plan. Consistency with the Clean Air Plan is the basis for determining whether the Proposed Project would conflict with or obstruct implementation of an applicable air quality plan, the first bulleted significance criterion identified above.

CRITERIA AIR POLLUTANTS

As described above under Regulatory Framework, the SFBAAB experiences low concentrations of most pollutants when compared to Federal or State standards and is designated as either in attainment or unclassified for most criteria pollutants, with the exception of ozone, $PM_{2.5}$, and PM_{10}, for which these pollutants are designated as non-attainment for either the State or Federal standards.

By definition, regional air pollution is largely a cumulative impact in that no single project is sufficient in size to, by itself, result in non-attainment of air quality standards. Instead, a project's

individual emissions are considered to contribute to the existing, cumulative air quality conditions. If a project's contribution to cumulative air quality conditions is considerable, then the project's impact on air quality would be considered significant.[39]

Table 4.G.5: Criteria Air Pollutant Thresholds, identifies quantitative criteria air pollutant significance thresholds followed by a discussion of each threshold. Projects that would result in criteria pollutant emissions below these significance thresholds would not violate an air quality standard, contribute substantially to an air quality violation, or result in a cumulatively considerable net increase in criteria air pollutants within the SFBAAB. Both of these threholds (average daily and maximum annual) apply to operational emissions from a given project. Construction emissions are assessed solely with respect to the average daily threholds, pursuant to BAAQMD guidance, because of the temporary nature of construction-related emissions.[40]

Table 4.G.5: Criteria Air Pollutant Thresholds

Pollutant	Average Daily Emissions (pounds per day)	Maximum Annual Emissions (tons per year)
ROG	54	10
NOx	54	10
PM_{10}	82	15
$PM_{2.5}$	54	10
Fugitive Dust	Construction dust ordinance or other best management practices to control fugitive dust emissions	

Source: BAAQMD, CEQA Air Quality Guidelines, June 2011, p. 2-2. Available online at http://www.baaqmd.gov/~/media/Files/Planning%20and%20Research/CEQA/BAAQMD%20CEQA%20Guidelines%20May%202011.ashx?la=en. Accessed February 6, 2016.

The thresholds of significance for criteria air pollutants are based on substantial evidence presented in Appendix D of the 2011 BAAQMD CEQA Air Quality Guidelines and BAAQMD's 2009 *Revised Draft Options and Justification Report* concerning CEQA thresholds.[41]

The potential for a project to result in a cumulatively considerable net increase in criteria air pollutants that may contribute to an existing or projected air quality violation is based on the State and Federal Clean Air Acts' emissions limits for stationary sources. To ensure that new

[39] BAAQMD, *CEQA Air Quality Guidelines*, p. 2-1, May 2011. Available online at http://www.baaqmd.gov/~/media/Files/Planning%20and%20Research/CEQA/BAAQMD%20CEQA%20Guidelines%20May%202011.ashx?la=en. Accessed February 6, 2016.

[40] Ibid.

[41] BAAQMD, CEQA Air Quality Guidelines, May 2011, p. 2-2; BAAQMD, *Revised Draft Options and Justification Report, California Environmental Quality Act Thresholds of Significance*, p. 17, October 2009.

stationary sources do not cause or contribute to a violation of an air quality standard, BAAQMD Regulation 2, Rule 2 requires that any new source that emits criteria air pollutants above a specified emissions limit must offset those emissions. For ozone precursors ROG and NOx, the offset emissions level is an annual average of 10 tons per year (or 54 pounds per day).[42] These levels represent emissions below which new sources are not anticipated to contribute to an air quality violation or result in a considerable net increase in criteria air pollutants that could result in increased health effects.

The Federal New Source Review program was created under the Federal Clean Air Act to ensure that stationary sources of air pollution are constructed in a manner that is consistent with attainment of Federal health-based ambient air quality standards. For PM_{10} and $PM_{2.5}$, the emissions limit under the New Source Review program is 15 tons per year (82 pounds per day) and 10 tons per year (54 pounds per day), respectively. These emissions limits represent levels at which a source is not expected to have a significant impact on air quality.[43]

Although the regulations specified above apply to new or modified stationary sources, land use development projects generate ROG, NOx, PM_{10}, and $PM_{2.5}$ emissions as a result of increases in vehicle trips, energy use, architectural coating, and construction activities. Therefore, the identified thresholds can be applied to the construction and operational phases of land use projects. Those projects that would result in emissions below these thresholds would not be considered to contribute to an existing or projected air quality violation or result in a considerable net increase in ozone precursors or PM.

Fugitive dust emissions are typically generated during construction phases. Studies have shown that the application of best management practices (BMPs) at construction sites significantly controls fugitive dust,[44] and individual measures have been shown to reduce fugitive dust by anywhere from 30 to 90 percent.[45] The BAAQMD has identified eight BMPs to control fugitive dust emissions from construction activities.[46] San Francisco's Construction Dust Control Ordinance requires a number of fugitive dust control measures to ensure that construction projects do not result in visible dust. The project would be subject to the requirements of the

Construction Dust Control Ordinance, which is the basis for determining the significance of air quality impacts from fugitive dust emissions.

Total construction emissions by phase were calculated using the latest version of CalEEMod (version 2013.2.2), and total emissions were divided by the number of construction days by phase to derive average daily emissions for comparison against applicable significance thresholds.

Construction emissions would be generated by many different construction sources, including off-road construction equipment such as excavators, loaders, backhoes, drill rigs, and cranes; and on-road trucks. The predominant source of emissions of NOx, PM_{10}, and $PM_{2.5}$ would be off-road equipment, which would generate more than three times the emissions of on-road vehicles and trucks.

Because operation of earlier phases would occur during construction of later phases, the construction analysis accounts for operational emissions that would occur simulataneously with construction of later phases. Therefore, operational emissions are evaluated after each of the five phases of construction and upon buildout of each scenario using the CalEEMod model. This allows for an analysis of the total emissions that would occur from construction activities and simultaneous operations during the 11-year construction period.

OTHER CRITERIA POLLUTANTS

Regional concentrations of CO in the Bay Area have not exceeded the State standards in the past 11 years, and SO_2 concentrations have never exceeded the standards. The primary source of CO emissions from development projects is vehicle traffic. Construction-related SO_2 emissions represent a negligible portion of the total basin-wide emissions, and construction-related CO emissions represent less than 5 percent of the Bay Area total basin-wide CO emissions. As discussed previously, the Bay Area is in attainment for both CO and SO_2. Furthermore, the BAAQMD has demonstrated, based on modeling, that to exceed the California ambient air quality standard of 9.0 ppm (8-hour average) or 20.0 ppm (1-hour average) for CO, project traffic in addition to existing traffic would need to exceed 44,000 vehicles per hour at affected intersections (or 24,000 vehicles per hour where vertical and/or horizontal mixing is limited). The transportation analysis indicates that the intersection in the project area with the greatest vehicle volumes would be Fifth and Harrison streets with hourly volumes of 5,432 in year 2040 with the project and convention traffic, which is less than 24,000. Therefore, given the Bay Area's attainment status and the limited CO and SO_2 emissions that could result from the project, the project would not result in a cumulatively considerable net increase in CO or SO_2, and a quantitative analysis is not required.

LOCAL HEALTH RISKS AND HAZARDS

In addition to criteria air pollutants, individual projects may emit TACs. Analysis of toxic substances that may become airborne such as naturally occurring asbestos is assessed in Section 4.P, Hazards and Hazardous Materials.

As part of this project, Ramboll/ENVIRON conducted an HRA for the Proposed Project to provide quantitative estimates of health risks from exposures to TACs. The results have been included in an AQTR.[47] The HRA examined all sensitive receptors within 1,000 meters of the project boundary. The HRA effort updated the Citywide CRRP model to reflect refined locations of existing stationary sources as well as to update cancer risk values based on the latest (2015) guidance by the State OEHHA which will be considered for adoption by BAAQMD near the end of 2016[48]. The Proposed Project would locate new sensitive receptors (residential land uses) under both of the analyzed scenarios. The entirety of the project site was assessed as a potential sensitive receptor area using a 20-meter receptor grid. Refer to Figures 2.7 and 2.8, p. 2.30 and p. 2.32 of Chapter 2, Project Description. respectively, for specific locations of on-site residential uses under each of the scenarios analyzed. Exposure assessment guidance[49] establishes the assumption that people in residences would be exposed to air pollution 24 hours per day, 350 days per year, for 30 years as the basis for calculating cancer risk in all HRAs. Therefore, the assessment of air pollutant exposure to residents typically result in the greatest adverse health outcomes of all population groups.

As discussed previously, neither the proposed receptors nor the nearest off-site receptors are located within an area that currently meets the APEZ criteria. For receptors not located in areas that meet the APEZ criteria, an HRA is conducted to determine whether the Proposed Project would, in combination with other exiting sources in the area, result in a given off-site or on-site receptor meeting the APEZ criteria. If a receptor point meets the APEZ criteria, that otherwise would not without the project, a project would result in a significant health risk impact if the project would contribute to $PM_{2.5}$ concentrations above 0.3 $\mu g/m^3$ or result in an excess cancer risk greater than 10.0 per million persons exposed. The 0.3 $\mu g/m^3$ $PM_{2.5}$ concentration and the excess cancer risk of 10.0 per one million persons exposed are the levels below which the

[49] California Environmental Protection Agency, *The Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessment*, February 2015. Available online at http://oehha.ca.gov/air/hot_spots/2015/2015GuidanceManual.pdf. Accessed January 18, 2016.

BAAQMD considers new sources not to make a considerable contribution to cumulative health risks.[50]

CUMULATIVE IMPACTS

As discussed above, the contribution of a project's individual air emissions to regional air quality impacts is, by its nature, a cumulative effect. Emissions from past, present, and future projects in the vicinity also have or will contribute to adverse regional air quality impacts on a cumulative basis. No single project by itself would be sufficient in size to result in non-attainment of ambient air quality standards. Instead, a project's individual emissions contribute to existing cumulative air quality conditions.[51] As described above, the project-level thresholds for criteria air pollutants are based on levels by which new sources are not anticipated to contribute to an air quality violation or result in a considerable net increase in criteria air pollutants. Therefore, if a project's emissions are below the project-level thresholds, the project would not be considered to result in a considerable contribution to cumulative regional air quality impacts.

Similarly, the HRA takes into account the cumulative contribution of localized health risks to sensitive receptors from sources included in the Citywide modeling plus the Proposed Project's sources. Other future projects, whose emissions have not been incorporated into the existing citywide health risk modeling are also taken into consideration. However, unlike criteria air pollutants, health risks are localized impacts in that that beyond 1,000 feet from an emission source, pollutant levels tend to return to background levels. Thus, cumulative health risks are typically assessed based on cumulative emissions sources within 1,000 feet of a project site.

IMPACT EVALUATION

Impact AQ-1: During construction, the Proposed Project would generate fugitive dust and criteria air pollutants, which would violate an air quality standard, contribute substantially to an existing or projected air quality violation, and result in a cumulatively considerable net increase in criteria air pollutants. ***(Significant and Unavoidable with Mitigation)***

Construction activities would result in emissions of ozone precursors and PM in the form of dust (fugitive dust) and exhaust (e.g., vehicle tailpipe emissions). Emissions of ozone precursors and PM are primarily a result of the combustion of fuel from on-road and off-road vehicles. However, ROGs are also emitted from activities that involve painting, other types of architectural

[51] BAAQMD, *CEQA Air Quality Guidelines*, May 2011, p. 2-1.

coatings, or asphalt paving. For both development scenarios, the Maximum Residential Scenario and the Maximum Commercial Scenario, Proposed Project construction is conceptual; however it is expected to begin in 2018 and would be phased over an approximately 11-year period, concluding in 2029. Proposed development is expected to involve up to five phases, designated as Phases 1, 2, 3, 4, and 5; phasing estimates are shown in Table 2.5: Project Construction Phasing – Maximum Residential Scenario, in Chapter 2, Project Descripton, pp. 2.80-2.81, Figure 2.21: Proposed Phasing Plan – Maximum Residential Scenario, p. 2.60, Table 2.6: Project Construction Phasing – Maximum Commercial Scenario, pp. 2.83-2.84, and Figure 2.22: Proposed Phasing Plan – Maximum Commercial Scenario, p. 2.63.

Construction phases would include demolition, excavation, and site preparation; pile installation; placement of infrastructure; placement of foundations for structures; and fabrication of structures. Demolition and construction activities would require the use of drill rigs, heavy trucks, excavators, material loaders, cranes, and other mobile and stationary construction equipment. During the project's approximately 11-year construction period, construction activities would result in emissions of ozone precursors and PM, as discussed below.

Fugitive Dust

Project-related demolition, excavation, grading, and other construction activities may cause wind-blown dust that could contribute PM into the local atmosphere. Despite the established Federal standards for air pollutants and ongoing implementation of State and regional air quality control plans, air pollutants continue to have impacts on human health throughout the country.

Dust can be an irritant causing watering eyes or irritation to the lungs, nose, and throat. Demolition, excavation, grading, and other construction activities can cause wind-blown dust that adds PM to the local atmosphere. Depending on exposure, adverse health effects can occur due to this PM in general as well as due to specific contaminants, such as lead or asbestos that may be constituents of dust.

In response to these concerns, the San Francisco Board of Supervisors approved a series of amendments to the San Francisco Building and Health Codes, generally referred hereto as the Construction Dust Control Ordinance (Ordinance 176-08, effective July 30, 2008), with the intent of reducing the quantity of dust generated during site preparation, demolition, and overall construction work in order to protect the health of the general public and onsite workers, to minimize public nuisance complaints, and to avoid orders to stop work by DBI. The Dust Control Ordinance would be applicable for the portion of the project site that is outside Port jurisdiction (Hoe Down Yard). For portions of the project site under the jurisdiction of the Port (20th/Illinois Parcel and 28-Acre Site), Section 1247 of Article 22B of the Public Health Code requires that all city agencies that authorize construction or other improvements on City property

adopt rules and regulations to ensure that the dust control requirements of Article 22B are followed. The DBI will not issue a building permit without written notification from the Director of Public Health that the applicant has a site-specific dust control plan, unless the Director waives the requirement. The site-specific dust control plan would require the project sponsor to submit a map to the Director of Public Health showing all sensitive receptors within 1,000 feet of the site. If the project is determined to be within 1,000 feet of sensitive receptors, a site-specific dust control plan shall be submitted to the Director of Health. This plan shall contain the following measures specified in Section 106.3.2.6.3 of the Building Code: designate an individual who will be responsible for monitoring compliance with dust control requirements; water all active construction areas sufficiently to prevent dust from becoming airborne, using reclaimed water whenever possible; during excavation and dirt-moving activities, wet sweep or vacuum streets and sidewalks where work is in process; cover any inactive stockpiles; and use dust enclosures, curtains, and dust collectors as necessary.

In addition, the site-specific dust control plan may require the project sponsor to wet down areas of soil at least three times per day; provide an analysis of wind direction and install upwind and downwind particulate dust monitors; record particulate monitoring results; hire an independent, third-party to conduct inspections and keep a record of those inspections; establish shut-down conditions based on wind, soil migration, etc.; establish a hotline for surrounding community members who may be potentially affected by project-related dust; limit the area subject to construction activities at any one time; install dust curtains and windbreaks on the property lines, as necessary; limit the amount of soil in hauling trucks to the size of the truck bed and securing with a tarpaulin; enforce a 15 mph speed limit for vehicles entering and exiting construction areas; sweep affected streets with water sweepers at the end of the day; install and use wheel washers to clean truck tires; terminate construction activities when winds exceed 25 mph; and sweep off adjacent streets to reduce particulate emissions. Inactive stockpiles (where no disturbance occurs for more than 7 days) greater than 10 cubic yards or 500 square feet of excavated material, backfill material, import material, gravel, sand, road base, and soil shall be covered with a 10 mil (0.01 inch) polyethylene plastic (or equivalent) tarp, braced down, or other equivalent soil stabilization techniques should be used. Reclaimed water must be used for dust suppression watering, when required by Article 21, Section 1100 et seq. of the San Francisco Public Works Code. Even if not required, reclaimed water should be used whenever possible. Contractors shall provide as much water as necessary to control dust (without creating run-off in any area of land clearing, and/or earth movement).

Implementation of dust control measures in compliance with the regulations and procedures set forth by the San Francisco Dust Control Ordinance would ensure that potential dust-related construction air quality impacts of the Proposed Project would be less than significant.

Criteria Air Pollutants

Methodology – Construction Emissions

Construction-related emissions of criteria air pollutants were calculated using the CalEEMod emissions calculator model (version 2013.2.2) developed for the California Air Pollution Control Officers Association. Although the project sponsors provided illustrative information on estimated sequences of phase construction, project-specific off-road equipment types are not known at this stage of project development. Consequently, the air quality analysis used default off-road equipment types represented in the CalEEMod model[52] as assumptions for each phase.

On-road haul truck traffic would primarily consist of material delivery to the site and removal of demolition and excavation materials. Approximately 325,000 cubic yards of soil would be hauled away from the entire site for all five phases of construction, resulting in a maximum of 80 round trips per day (160 one-way trips), including both soil off-haul and demolition spoils. These soil haul trips were allocated to the site preparation and grading phases of construction. Additional trucks would be required for concrete delivery, plus vendor trips allocated to the building construction phases of the construction periods.

Construction of the Proposed Project would occur in five phases over an up to 11-year period and buildings constructed in a given phase would be occupied after completion of that phase. Phases 1 and 2 are assumed to commence construction in 2018, Phase 3 in 2021, Phase 4 in 2024, and Phase 5 in 2027. During construction of Phase 3, Phases 1 and 2 are assumed to be operational. Therefore, the analysis adds together the construction emissions of Phase 3 and the operational emissions of Phases 1 and 2. The phases may not be undertaken exactly as laid out in the phasing diagram, so these emissions estimates are designed to provide a representative approximation. The CalEEMod model output reports as well as summary sheets detailing input values are provided in the AQTR in Appendix D.

Methodology – Operational Emissions

The Proposed Project would generate operational emissions from a variety of sources, including stationary sources (diesel emergency generators); area sources (natural gas combustion in boilers/heaters, and stoves, consumer products, architectural coatings, and landscape equipment); and from mobile sources (daily automobile and truck trips). Potential emissions from 11 emergency diesel generators (stationary sources) were estimated based on CARB/EPA Tier 2

[52] On August 5, 2013, BAAQMD notified the public via its website that all future CEQA analysis of criteria pollutant emissions should be conducted using CalEEMod. However, this notification is no longer posted.

emission standards, conservatively assuming that each parcel with designated building height limits in excess of 70 feet would require such equipment. Currently, the project applicant does not have specifications for potential generators. It was assumed that proposed generators would be 400 horsepower units and would meet the Federal Tier 2 diesel engine standards for PM for diesel engines with a rating between 75 and 750 horsepower and operate 50 hours per year (consistent with BAAQMD permitting limits). Project operational emissions of criteria pollutants from vehicle, stationary (backup generators), and area sources are summed to determine total operational emissions. Ultimately, the vast majority (98 percent) of operational emissions are from mobile emissions (54 percent) and area sources (43 percent). The area source emission component is primarily attributable to the use of consumer products by building occupants (77 percent) and the application of paints and other architectural coatings for maintenance purposes (18 percent).

Area-source and energy emissions were calculated using CalEEMod model based on the type and size of land uses associated with the Proposed Project, including the number of estimated residents. Area sources include natural gas combustion in stoves, hearths, consumer products, area architectural coatings, and landscaping equipment. San Francisco County-specific consumer product emission rate data were used in the CalEEMod model to estimate daily VOC emissions.

Mobile-source emissions would result from vehicle trips (auto and truck) associated with the Proposed Project and were also calculated using the CalEEMod model based on the number of vehicle trips identified in the transportation impact study prepared for the project.[53] Operational emission calculations for entrained road dust are based on San Francisco-specific silt loadings.[54]

The detailed quantification of operational-related criteria air pollutant emissions was conducted for the Proposed Project for both the Maximum Residential Scenario and the Maximum Commercial Scenario at project build out, year 2030, as well as at the completion of each incremental phase of construction, in 2020 (after completion of Phase 1), 2022 (completion of Phase 2), 2025 (completion of Phase 3), and 2028 (completion of Phase 4). The criteria air pollutant significance thresholds are based on levels by which a project would contribute considerably to significant air quality impacts (the project being the sum of the emissions at any one time, whether the emissions are from operation or construction is inconsequential to the effect on the air basin). Consequently, operational emissions are added to construction emissions when they would occur simultaneously, to disclose and analyze the air quality impacts of the whole project.

[53] Fehr & Peers, Transportation Impact Study, Pier 70 Waterfront Site Special Use District (SUD) Project, Screencheck Draft, December 2016.

[54] CARB, Miscellaneous Process Methodology 7.9, Entrained Road Travel, Paved Road Dust, Revised April 2014.

Maximum Residential Scenario

Table 4.G.6: Unmitigated Average Daily and Maximum Annual Emissions for the Maximum Residential Scenario During Construction, presents construction-period emissions for the Maximum Residential Scenario, which, due to the concurrent construction and operation of the project, are calculated in terms of average daily emissions and worse case maximum annual emissions.

Construction of the Maximum Residential Scenario would result in emissions of ROG, NOx, PM_{10}, and $PM_{2.5}$ that would be below the thresholds of significance when considered alone. However, future construction phases (Phases 3, 4, and 5) would occur when operational emissions would also be generated by the earlier phases.

As shown in Table 4.G.6, construction-related emissions during concurrent construction of Phases 1 and 2 which includes development of the entirety of the Illinois Parcels would be less than significant. Additionally, after completion and occupancy of Phase 1 and the continuation of Phase 2 construction, the combined construction-related and operational emissions would be less than significant. However, construction of Phase 3, when considered with occupancy and operation of Phases 1 and 2, would result in emissions of ROG and NOx that would exceed significance thresholds, while emissions of PM_{10} and $PM_{2.5}$ would be below their respective thresholds.

Construction of Phase 4 and Phase 5 when considered with occupancy and operation of earlier phases would also result in emissions of ROG and NOx that would exceed significance thresholds, while emissions of PM_{10} would be meet the threhold with Phase 5 construction and $PM_{2.5}$ emissions would be below thresholds.

Therefore, unmitigated criteria pollutant emissions from the Maximum Residential Scenario during simultaneous construction and operation would be a significant air quality impact.

MAXIMUM COMMERCIAL SCENARIO

Table 4.G.7: Unmitigated Average Daily and Maximum Annual Emissions for the Maximum Commercial Scenario During Construction, presents construction-period emissions for the Maximum Construction Scenario. As shown in Table 4.G.7, construction-related emissions during concurrent construction of Phases 1 and 2 which include development of the entirety of the Illinois Parcels would be less than significant, as would the continued construction of Phase 2 with completion and occupancy of Phase 1. However, construction of Phase 3 when considered with occupancy and operation of Phases 1 and 2 would result in emissions of ROG and NOx that would exceed significance thresholds, while emissions of PM_{10} and $PM_{2.5}$ would be below their respective thresholds.

Table 4.G.6: Unmitigated Average Daily and Maximum Annual Emissions for the Maximum Residential Scenario During Construction

Phase 5 Total	**32**	**20**	**15**	**4.8**
Significance Threshold	10	10	15	10
Above Threshold?	**Yes**	**Yes**	Yes	No

Notes: Bolded numerical values are totals during construction of a given phase with the addition of operational emissions from previous phases. If the total exceeds a threshold, then the exceedance is identified by a bolded "Yes" response.

For each construction phase, annual emissions are divided over the number of construction days for the given phase, to determine the average daily emissions. Phases 1 and 2 would be constructed concurrently. Phase durations as estimated by the applicant were 780 days for all phases except Phase 1 which would be less intensive. Phase 1 duration estimatd using CalEEMod default values as this data was not available.

Source: ESA, 2016

Construction of Phase 4 when considered with occupancy and operation of earlier phases would result in emissions of ROG and NOx that would exceed significance thresholds, while emissions of PM_{10} and $PM_{2.5}$ would be below the applicable thresholds. Construction of Phase 5 when considered with occupancy and operation of earlier phases would result in emissions of ROG, NOx, and PM_{10} that would exceed significance thresholds, while emissions of $PM_{2.5}$ would be below the applicable threshold.

Therefore, criteria pollutant emissions during simultaneous construction and operation of the Maximum Commercial Scenario would be significant.

Generally the Maximum Commercial Scenario results in a marginal 1 to 6 percent greater emissions than the Maximum Residential Scenario, depending on the year analyzed and whether average pounds per day or maximum tons per year are considered. Regardless, under the Maximum Commercial Scenario emissions of ROG, NOx, and PM_{10} would exceed significance thresholds, while emissions of $PM_{2.5}$ would be below the applicable threshold

Health Implications of Significant Impacts Related to Emissions of Ozone Precursors and PM_{10}

ROG and NOx are ozone precursors, and the main health concern of exposure to ground-level ozone is effects on the respiratory system, especially on lung function. Several factors influence these health impacts, including the concentrations of ground-level ozone in the atmosphere, the duration of exposure, average volume of air breathed per minute, the length of intervals between short-term exposures, and the sensitivity of the person to the exposure.[55,56] The concentration of ground-level ozone in the atmosphere is influenced by the volume of air available for dilution, the temperature, and the intensity of ultraviolet light. In the Bay Area, the worst case conditions for ozone formation occur in the summer and early fall on warm, windless, sunny days.[57]

PM_{10} consists of particulates that are small enough to be inhaled into the deepest parts of the human lung and can cause adverse health effects. According to the CARB, studies in the United States and elsewhere "have demonstrated a strong link between elevated particulate levels and premature deaths, hospital admissions, emergency room visits, and asthma attacks," and studies

[57] BAAQMD, *Air Pollutants Regulated by the Air District*. Available online at http://hank.baaqmd.gov/dst/pollutants.htm. Accessed January 19, 2016.

of children's health in California have demonstrated that particle pollution "may significantly reduce lung function growth in children." The CARB also reports that statewide attainment of PM standards could prevent thousands of premature deaths, lower hospital admissions for cardiovascular and respiratory disease and asthma-related emergency room visits, and avoid hundreds of thousands of episodes of respiratory illness in California.[58] High levels of PM can exacerbate chronic respiratory ailments, such as bronchitis and asthma, and have been associated with increased emergency room visits and hospital admissions. $PM_{2.5}$ is of particular concern because epidemiologic studies have demonstrated that people who live near freeways and high-traffic roadways have poorer health outcomes, including increased asthma symptoms and respiratory infections and decreased pulmonary function and lung development in children.[59]

Given these various factors, it is difficult to predict the magnitude of health effects from the project's exceedance of significance criteria for regional ROG, NOx, and PM_{10} emissions. The increase in emissions associated with the Proposed Project represents a fraction of total SFBAAB regional ROG emissions (up to 186 pounds per day compared to 265 tons per day in the SFBAAB region in 2012),[60] NOx emissions (up to 111 pounds per day compared to 318 tons per day in the SFBAAB region in 2012), and PM_{10} emissions (up to 165 pounds per day compared to 119 tons per day in the SFBAAB region in 2012). Although Table 4.G.1, p. 4.G.3, indicates that the most stringent applicable ozone standards were not exceeded at the Potrero Hill monitoring station between 2011 and 2015, the SFBAAB region experienced an average of 8.4 days of exceedance per year between 2011 and 2015.[61] The PM_{10} standard was exceeded on one day at the Potrero Hill monitoring station between 2011 and 2015. The Proposed Project's ROG, NOx, and PM_{10} increases could contribute to new or exacerbated air quality violations in the SFBAAB region by contributing to more days of ozone or PM_{10} exceedance or result in AQI values that are unhealthy for sensitive groups and other populations. As shown in Table 4.G.3, p. 4.G.10, the SFBAAB has averaged between 8 and 15 days per year that are considered unhealthy for sensitive groups and had 3 unhealthy (red) days in the last 5 years for which data are available.

On unhealthy days, persons are recommended to avoid both prolonged and heavy-exertion outdoor activities.[62]

Mitigation of Construction-Related and Operational Air Quality Impacts

To address ROG, NOx, and PM_{10} emissions that would occur during construction of the Proposed Project under both the Maximum Residential and Maximum Commercial Scenarios, Mitigation Measure M-AQ-1a: Construction Emissions Minimization, shown below, has been identified and would apply during construction of Phases 3, 4, and 5, or after build-out of 1.3 million gross square feet of development, whichever comes first.

Mitigation Measure M-AQ-1a: Construction Emissions Minimization

A. *Construction Emissions Minimization Plan.* Prior to issuance of a site permit, the project sponsors shall submit a Construction Emissions Minimization Plan (Plan) to the Environmental Review Officer (ERO) for review and approval by an Environmental Planning Air Quality Specialist. The Plan shall detail project compliance with the following requirements:

1. Where access to alternative sources of power is available, portable diesel generators used during construction shall be prohibited. Where portable diesel engines are required because alternative sources of power are not available, the diesel engine shall meet the EPA or CARB Tier 4 off-road emission standards and be fueled with renewable diesel (at least 99 percent renewable diesel or R99), if commercially available, as defined below.

2. All off-road equipment greater than 25 horsepower that operates for more than 20 total hours over the entire duration of construction activities shall have engines that meet the EPA or CARB Tier 4 off-road emission standards and be fueled with renewable diesel (at least 99 percent renewable diesel or R99), if commercially available. If engines that comply with Tier 4 off-road emission standards are not commercially available, then the project sponsors shall provide the next cleanest piece of off-road equipment as provided by the step-down schedules in Table M-AQ-1.

[62] U.S. Environmental Protection Agency, *Air Quality Index, A Guide to Air Quality and Your Health*, February 2014. Available online at www.epa.gov/airnow/aqi_brochure_02_14.pdf. Accessed January 19, 2016.

Table M.AQ.1: Off-Road Equipment Compliance Step-Down Schedule

Compliance Alternative	Engine Emission Standard	Emissions Control
1	Tier 3	CARB PM VDECS (85%)[1]
2	Tier 2	CARB PM VDECS (85%)

How to use the table: If the requirements of (A)(2) cannot be met, then the project sponsors would need to meet Compliance Alternative 1. Should the project sponsors not be able to supply off-road equipment meeting Compliance Alternative 1, then Compliance Alternative 2 would need to be met.

[1] CARB, Currently Verified Diesel Emission Control Strategies (VDECS). Available online at http://www.arb.ca.gov/diesel/verdev/vt/cvt.htm. Accessed January 14, 2016.

i. With respect to Tier 4 equipment, "commercially available" shall mean the availability taking into consideration factors such as: (i) critical path timing of construction; and (ii) geographic proximity of equipment to the project site.

ii. With respect to renewable diesel, "commercially available" shall mean the availability taking into consideration factors such as: (i) critical path timing of construction; (ii) geographic proximity of fuel source to the project site; and (iii) cost of renewable diesel is within 10 percent of Ultra Low Sulfur Diesel #2 market price.

iii. The project sponsors shall maintain records concerning its efforts to comply with this requirement. Should the project sponsor determine either that an off-road vehicle that meets Tier 4 emissions standards or that renewable diesel are not commercially available, the project sponsor shall submit documentation to the satisfaction of the ERO and, for the former condition, shall identify the next cleanest piece of equipment that would be use, in compliance with Table M-AQ-1-1.

3. The project sponsors shall ensure that future developers or their contractors require the idling time for off-road and on-road equipment be limited to no more than 2 minutes, except as provided in exceptions to the applicable State regulations regarding idling for off-road and on-road equipment. Legible and visible signs shall be posted in multiple languages (English, Spanish, and Chinese) in designated queuing areas and at the construction site to remind operators of the 2-minute idling limit.

4. The project sponsors shall require that each construction contractor mandate that construction operators properly maintain and tune equipment in accordance with manufacturer specifications.

5. The Plan shall include best available estimates of the construction timeline by phase with a description of each piece of off-road equipment required for every construction phase and shall be updated pursuant to the reporting requirements in Section B below. Reporting requirements for off-road equipment descriptions

and information shall include as much detail as is available, but are not limited to: equipment type, equipment manufacturer, equipment identification number, engine model year, engine certification (Tier rating), horsepower, engine serial number, and expected fuel usage and hours of operation. For Verified Diesel Emission Control Strategies (VDECS) installed, descriptions and information shall include technology type, serial number, make, model, manufacturer, CARB verification number level, and installation date and hour meter reading on installation date. The Plan shall also indicate whether renewable diesel will be used to power the equipment. The Plan shall also include anticipated fuel usage and hours of operation so that emissions can be estimated.

6. The project sponsors and their construction contractors shall keep the Plan available for public review on site during working hours. Each construction contractor shall post at the perimeter of the project site a legible and visible sign summarizing the requirements of the Plan. The sign shall also state that the public may ask to inspect the Plan at any time during working hours, and shall explain how to request inspection of the Plan. Signs shall be posted on all sides of the construction site that face a public right-of-way. The project sponsors shall provide copies of the Plan to members of the public as requested.

B. *Reporting.* Quarterly reports shall be submitted to the ERO indicating the construction activities undertaken and information about the off-road equipment used, including the information required in Section A(5). In addition, reporting shall include the approximate amount of renewable diesel fuel used.

Within 6 months of the completion of all project construction activities, the project sponsors shall submit to the ERO a final report summarizing construction activities. The final report shall indicate the start and end dates and duration of each construction phase. The final report shall include detailed information required in Section A(5). In addition, reporting shall include the actual amount of renewable diesel fuel used.

C. *Certification Statement and On-site Requirements.* Prior to the commencement of construction activities, the project sponsors shall certify through submission of city-standardized forms (1) compliance with the Plan, and (2) all applicable requirements of the Plan have been incorporated into contract specifications.

Residual Impact with Implementation of Mitigation Measure M-AQ-1a

Mitigation Measure M-AQ-1a would result in a reduction of construction-related ROG emissions ranging from 8 to 10 percent, depending on the construction phase. Emissions of construction-related NOx would be reduced by 54 to 64 percent and emissions of construction-related PM_{10} would be reduced between 72 and 83 percent. Construction emissions alone would be less than significance thresholds. Emissions of simultaneous operational and construction emissions would still exceed thresholds but would be substantially reduced by this measure. Additionally, as discussed later in Impact AQ-3, particulate emission reductions from this measure are necessary to reduce potential health risk impacts to on-site receptors to less than significant levels. Implementation of this mitigation measure would not result in any adverse environmental effects.

To address emissions that would occur during operation of the Proposed Project, the following mitigation measures, have been identified: M-AQ-1b: Diesel Backup Generator Specifications; M-AQ-1c: Use Low- and Super-Compliant VOC Architectural Coatings in Maintaining Buildings through Covenants Conditions and Restrictions (CC&Rs) and Ground Lease; M-AQ-1d: Promote Use of Green Consumer Products; M-AQ-1e: Electrification of Loading Docks; M-AQ-1f: Transportation Demand Management; M-AQ-1g: Additional Mobile Source Control Measures; and M-AQ-1h: Offset Operational Emissions.

M-AQ-1b: Diesel Backup Generator Specifications

To reduce NOx associated with operation of the Maximum Commercial or Maximum Residential Scenarios, the project sponsors shall implement the following measures.

A. All new diesel backup generators shall:

   1. have engines that meet or exceed CARB Tier 4 off-road emission standards which have the lowest NOx emissions of commercially available generators; and

   2. be fueled with renewable diesel, if commercially available, which has been demonstrated to reduce NOx emissions by approximately 10 percent.

B. All new diesel backup generators shall have an annual maintenance testing limit of 50 hours, subject to any further restrictions as may be imposed by the BAAQMD in its permitting process.

C. For each new diesel backup generator permit submitted to BAAQMD for the project, anticipated location, and engine specifications shall be submitted to the San Francisco Planning Department for review and approval prior to issuance of a permit for the generator from the San Francisco DBI or the Port. Once operational, all diesel backup generators shall be maintained in good working order for the life of the equipment and any future replacement of the diesel backup generators shall be required to be consistent with these emissions specifications. The operator of the facility at which the generator is located shall maintain records of the testing schedule for each diesel backup generator for the life of that diesel backup generator and provide this information for review to the Planning Department within 3 months of requesting such information.

Residual Impact with Implementation of Mitigation Measure M-AQ-1b

Mitigation Measure M-AQ-1b would result in an 86 percent reduction of ROG emissions from generators. Emissions of NOx emissions from generators would be reduced by 89 percent and emissions of PM_{10} would be reduced by 98 percent. Operational emissions would still exceed thresholds as the overall contribution of generator emissions to total project emissions is very small. However, as discussed later in Impact AQ-3, particulate emission reductions from this measure are necessary to reduce potential health risk impacts to on-site receptors to less than significant levels. Implementation of this mitigation measure would not result in any adverse environmental effects.

M-AQ-1c: Use Low- and Super-Compliant VOC Architectural Coatings in Maintaining Buildings through Covenants Conditions and Restrictions (CC&Rs) and Ground Lease

The project sponsors shall require all developed parcels to include within their CC&Rs and/or ground leases requirements for all future interior spaces to be repainted only with "Super-Compliant" Architectural Coatings (http://www.aqmd.gov/home/regulations/compliance/architectural-coatings/super-compliant-coatings). "Low-VOC" refers to paints that meet the more stringent regulatory limits in South Coast AQMD Rule 1113; however, many manufacturers have reformulated to levels well below these limits. These are referred to as "Super-Compliant" Architectural Coatings.

Residual Impact with Implementation of Mitigation Measure M-AQ-1c

Regulation 8 Rule 3 of the BAAQMD places limits on the VOC content of paint and other architectural coatings, and use of lower VOC coatings available to consumers can further reduce operational ROG emissions. Low- and Super-Compliant VOC paints are manufactured and sold by numerous companies. ROG emissions associated with maintenance application of paint and other architectural coatings represent a relatively small percentage (8 percent) of total project ROG emissions. Mitigation Measure M-AQ-1c would reduce ROG emissions associated with maintenance application of paint and other architectural coatings by 31 percent. Operational emissions would still exceed thresholds as the overall contribution of architectural coating emissions to total project emissions is comparatively small. Should the applicant commit to requiring use of no-VOC interior paints, ROG emissions from maintenance application of paint and other architectural coatings could be further reduced by up to 90 percent. Implementation of this mitigation measure would not result in any adverse environmental effects.

M-AQ-1d: Promote Use of Green Consumer Products

The project sponsors shall provide education for residential and commercial tenants concerning green consumer products. Prior to receipt of any certificate of final occupancy and every 5 years thereafter, the project sponsors shall work with the San Francisco Department of Environment (SF Environment) to develop electronic correspondence to be distributed by email annually to residential and/or commercial tenants of each building on the project site that encourages the purchase of consumer products that generate lower than typical VOC emissions. The correspondence shall encourage environmentally preferable purchasing and shall include contact information and website links to SF Approved. This website also may be used as an informational resource by businesses and residents.

Residual Impact with Implementation of Mitigation Measure M-AQ-1d

SF Approved (sfapproved.org) is administrated by SF Environment, and identifies products and services that are required and recommended for use by City departments in connection with the City's Precautionary Purchasing Ordinance (Section 203 of the San Francisco Environment

Code). Mitigation Measure M-AQ-1d would reduce ROG emissions associated with use of consumer products. Given that the project applicant does not have authority to require use of certain products, no reduction in ROG emissions can be estimated from this measure. Implementation of this mitigation measure would not result in any adverse environmental effects.

M-AQ-1e: Electrification of Loading Docks

The project sponsors shall ensure that loading docks for retail, light industrial, or warehouse uses that will receive deliveries from refrigerated transport trucks incorporate electrification hook-ups for transportation refrigeration units to avoid emissions generated by idling refrigerated transport trucks.

Residual Impact with Implementation of Mitigation Measure M-AQ-1e

Mitigation Measure M-AQ-1e would reduce emissions of ROG, NOx, and PM_{10}. Given that the specific land uses are not determined, no reduction in emissions can be reliably estimated from this measure at this time. Implementation of this mitigation measure would not result in any adverse environmental effects.

M-AQ-1f: Transportation Demand Management

The project sponsors shall prepare and implement a Transportation Demand Management (TDM) Plan with a goal of reducing estimated one-way vehicle trips by 20 percent compared to the total number of one-way vehicle trips identified in the project's Transportation Impact Study at project build-out. To ensure that this reduction goal could be reasonably achieved, the TDM Plan will have a monitoring goal of reducing by 20 percent the one-way vehicle trips calculated for each building that has received a Certificate of Occupancy and is at least 75% occupied compared to the one-way vehicle trips anticipated for that building based on anticipated development on that parcel, using the trip generation rates contained within the project's Transportation Impact Study. There shall be a Transportation Management Association that would be responsible for the administration, monitoring, and adjustment of the TDM Plan. The project sponsor is responsible for identifying the components of the TDM Plan that could reasonably be expected to achieve the reduction goal for each new building associated with the project, and for making good faith efforts to implement them. The TDM Plan may include, but is not limited to, the types of measures summarized below for explanatory example purposes. Actual TDM measures selected should include those from the TDM Program Standards, which describe the scope and applicability of candidate measures in detail and include:

- Active Transportation: Provision of streetscape improvements to encourage walking, secure bicycle parking, shower and locker facilities for cyclists, subsidized bike share memberships for project occupants, bicycle repair and maintenance services, and other bicycle-related services;
- Car-Share: Provision of car-share parking spaces and subsidized memberships for project occupants;

- Delivery: Provision of amenities and services to support delivery of goods to project occupants;
- Family-Oriented Measures: Provision of on-site childcare and other amenities to support the use of sustainable transportation modes by families;
- High-Occupancy Vehicles: Provision of carpooling/vanpooling incentives and shuttle bus service;
- Information and Communications: Provision of multimodal wayfinding signage, transportation information displays, and tailored transportation marketing services;
- Land Use: Provision of on-site affordable housing and healthy food retail services in underserved areas;
- Parking: Provision of unbundled parking, short term daily parking provision, parking cash out offers, and reduced off-street parking supply.

The TDM Plan shall include specific descriptions of each measure, including the degree of implementation (e.g., for how long will it be in place, how many tenants or visitors will it benefit, on which locations within the site will it be placed, etc.), and the population that each measure is intended to serve (e.g. residential tenants, retail visitors, employees of tenants, visitors, etc.). It shall also include a commitment to monitoring of person and vehicle trips traveling to and from the project site to determine the TDM Plan's effectiveness, as outlined below.

The TDM Plan shall be submitted to the City to ensure that components of the TDM Plan intended to meet the reduction target are shown on the plans and/or ready to be implemented upon the issuance of each certificate of occupancy.

TDM Plan Monitoring and Reporting: The Transportation Management Association, through an on-site Transportation Coordinator, shall collect data and make monitoring reports available for review and approval by the Planning Department staff.

- Timing: Monitoring data shall be collected and reports shall be submitted to Planning Department staff every year (referred to as "reporting periods"), until five consecutive reporting periods display the project has met the reduction goal, at which point monitoring data shall be submitted to Planning Department staff once every three years. The first monitoring report is required 18 months after issuance of the First Certificate of Occupancy for buildings that include off-street parking or the establishment of surface parking lots or garages that bring the project's total number of off-street parking spaces to greater than or equal to 500. Each trip count and survey (see below for description) shall be completed within 30 days following the end of the applicable reporting period. Each monitoring report shall be completed within 90 days following the applicable reporting period. The timing shall be modified such that a new monitoring report shall be required 12 months after adjustments are made to the TDM Plan in order to meet the reduction goal, as may be required in the "TDM Plan Adjustments" heading below. In addition, the timing may be modified by the Planning Department as needed to consolidate this requirement with other monitoring and/or reporting requirements for the project.

- Components: The monitoring report, including trip counts and surveys, shall include the following components OR comparable alternative methodology and components as approved or provided by Planning Department staff:
    - Trip Count and Intercept Survey: Trip count and intercept survey of persons and vehicles arriving and leaving the project site for no less than two days of the reporting period between 6:00 a.m. and 8:00 p.m. One day shall be a Tuesday, Wednesday, or Thursday during one week without federally recognized holidays, and another day shall be a Tuesday, Wednesday, or Thursday during another week without federally recognized holidays. The trip count and intercept survey shall be prepared by a qualified transportation or qualified survey consultant and the methodology shall be approved by the Planning Department prior to conducting the components of the trip count and intercept survey. It is anticipated that the Planning Department will have a standard trip count and intercept survey methodology developed and available to project sponsors at the time of data collection.
    - Travel Demand Information: The above trip count and survey information shall be able to provide travel demand analysis characteristics (work and non-work trip counts, origins and destinations of trips to/from the project site, and modal split information) as outlined in the Planning Department's *Transportation Impact Analysis Guidelines for Environmental Review*, October 2002, or subsequent updates in effect at the time of the survey.
    - Documentation of Plan Implementation: The TDM Coordinator shall work in conjunction with the Planning Department to develop a survey (online or paper) that can be reasonably completed by the TDM Coordinator and/or TMA staff to document the implementation of TDM program elements and other basic information during the reporting period. This survey shall be included in the monitoring report submitted to Planning Department staff.
    - Assistance and Confidentiality: Planning Department staff will assist the TDM Coordinator on questions regarding the components of the monitoring report and shall ensure that the identity of individual survey responders is protected.

TDM Plan Adjustments. The TDM Plan shall be adjusted based on the monitoring results if three consecutive reporting periods demonstrate that measures within the TDM Plan are not achieving the reduction goal. The TDM Plan adjustments shall be made in consultation with Planning Department staff and may require refinements to existing measures (e.g., change to subsidies, increased bicycle parking), inclusion of new measures (e.g., a new technology), or removal of existing measures (e.g., measures shown to be ineffective or induce vehicle trips). If three consecutive reporting periods' monitoring results demonstrate that measures within the TDM Plan are not achieving the reduction goal, the TDM Plan adjustments shall occur within 270 days following the last consecutive reporting period. The TDM Plan adjustments shall occur until three consecutive reporting periods' monitoring results demonstrate that the reduction goal is achieved. If the TDM Plan does not achieve the reduction goal then the City shall impose additional measures to reduce vehicle trips as prescribed under the development agreement, which may include restriction of additional off-street parking spaces beyond those previously established on the site, capital or operational improvements intended to reduce vehicle trips from the project, or other measures that support sustainable trip

making, until three consecutive reporting periods' monitoring results demonstrate that the reduction goal is achieved.

Residual Impact with Implementation of Mitigation Measure M-AQ-1f

Mitigation Measure M-AQ-1f would reduce mobile source emissions of ROG, NOx, and PM_{10}. Quantification of emission reduction from this measure is based on a 20 percent reduction target for vehicle trips. Because most measures are expected to be employer-based, the 20 percent reduction in vehicle trips was calculated for weekday trips only. Although emission reductions would be substantial, operational emissions would still exceed thresholds. Implementation of this mitigation measure would encourage sustainable modes of transportation and the use of single-occupant vehicles would be discouraged, which would increase the use of taxi/rideshare, transit, bicycle and pedestrian modes. The impacts resulting from such a shift of vehicle trips to other modes are difficult to predict. If many vehicle trips were to shift to transit and pedestrian trips, it is possible that this mitigation measure could contribute to significant and unavoidable transit impacts (as discussed in Section 4.E, Transportation and Circulation), but not likely to a substantial degree. The potential for contributions to these other transportation modes as a result of this mitigation measure is speculative because it is unknown which specific TDM meausres would ultimately be selected. Moreover, current literature does not document which travel modes people would choose in respose to implementation of several TDM meaures. The proposed project would be required to pay the Transportation Sustainability Fee and fees to SFMTA as part of Mitigation Measure M-TR-5, to increase capacity on the 48 Quintara/24th Street bus route, pp. 4.E.91-4.E.93. Therefore, implementation of this mitigation measure would not cause any significant effects in addition to those that would result from implementation of the Proposed Project.

Mitigation Measure M-AQ-1g: Additional Mobile Source Control Measures

The following Mobile Source Control Measures from the BAAQMD's 2010 Clean Air Plan shall be implemented:

- Promote use of clean fuel-efficient vehicles through preferential (designated and proximate to entry) parking and/or installation of charging stations beyond the level required by the City's Green Building code, from 8 to 20 percent.
- Promote zero-emission vehicles by requesting that any car share program operator include electric vehicles within its car share program to reduce the need to have a vehicle or second vehicle as a part of the TDM program that would be required of all new developments.

Residual Impact with Implementation of Mitigation Measure M-AQ-1g

Mitigation Measure M-AQ-1g would marginally reduce mobile source emissions of ROG, NOx, and PM_{10}. No additional emissions reductions were quantified from implementation of this

mitigation measure. Implementation of this mitigation measure would not result in any adverse environmental effects.

Mitigation Measure M-AQ-1h: Offset Operational Emissions

Prior to issuance of the final certificate of occupancy for the final building associated with Phase 3 or after build out of 1.3 million square feet of development, whichever comes first, the project sponsors, with the oversight of the ERO, shall either:

(1) Directly fund or implement a specific offset project within San Francisco to achieve reductions the one-time reduction of 25 tons per year of ozone precursors and 1 ton of PM_{10}. This offset is intended to offset the estimated annual tonnage of operational ozone precursor and PM_{10} emissions under the buildout scenario realized at the time of completion of Phase 3. To qualify under this mitigation measure, the specific emissions offset project must result in emission reductions within the SFBAAB that would not otherwise be achieved through compliance with existing regulatory requirements. A preferred offset project would be one implemented locally within the City and County of San Francisco. Prior to implementation of the offset project, the project sponsors must obtain the ERO's approval of the proposed offset project by providing documentation of the estimated amount of emissions of ROG, NOx, and PM_{10} to be reduced (tons per year) within the SFBAAB from the emissions reduction project(s). The project sponsors shall notify the ERO within 6 months of completion of the offset project for verification; or

(2) Pay a one-time mitigation offset fee to the BAAQMD's Strategic Incentives Division in an amount no less than $18,030 per weighted ton of ozone precursors and PM_{10} per year above the significance threshold, calculated as the difference between total annual emissions at build out under mitigated conditions and the significance threshold in the EIR air quality analysis, which is 25 tons per year of ozone precursors and 1 ton of PM_{10}, plus a 5 percent administrative fee, to fund one or more emissions reduction projects within the SFBAAB. This one-time fee is intended to fund emissions reduction projects to offset the estimated annual tonnage of operational ozone precursor and PM_{10} emissions under the buildout scenario realized at the time of completion of Phase 3, or after completion of 1.3 million sf of development, whichever comes first. Documentation of payment shall be provided to the ERO.

Acceptance of this fee by the BAAQMD shall serve as an acknowledgment and commitment by the BAAQMD to implement one or more emissions reduction project(s) within 1 year of receipt of the mitigation fee to achieve the emission reduction objectives specified above, and provide documentation to the ERO and to the project sponsors describing the project(s) funded by the mitigation fee, including the amount of emissions of ROG, NOx, and PM_{10} reduced (tons per year) within the SFBAAB from the emissions reduction project(s). If there is any remaining unspent portion of the mitigation offset fee following implementation of the emission reduction project(s), the project sponsors shall be entitled to a refund in that amount from the BAAQMD. To qualify under this mitigation measure, the specific emissions retrofit project must result in emission reductions within the SFBAAB that would not otherwise be achieved through compliance with existing regulatory requirements.

Residual Impact with Implementation of Mitigation Measure M-AQ-1h

Mitigation Measure M-AQ-1h would offset emissions of ROG, NOx, and PM_{10} that would exceed the respective thresholds of significance for these pollutants. Implementation of the emissions reduction project could be conducted by the BAAQMD and is outside the jurisdiction and control of the City and not fully within the control of the project sponsor. M-AQ-1h also allows the project sponsor to directly fund or implement an offset project; however, no such project has yet been identified. Therefore, the residual impact of project emissions during construction is conservatively considered *significant and unavoidable with mitigation*, acknowledging the assumption that the project sponsor would implement Mitigation Measures M-AQ-a though M-AQ-1h (Emission Offsets). Although the specific offset projects are not known, it is anticipated that implementation of this mitigation measure would not result in any adverse environmental effects.

Residual Impact with Implementation of All Identified Mitigation Measures

Implementation of Mitigation Measure M-AQ-1a (Construction Emissions Minimization)**,** above, would substantially reduce construction-related emissions of ROG, NOx, and PM_{10}. The measure would require use of off-road equipment to meet the most tringent emission standards available and would reduce construction-related emissions of ROG, NOx, and PM_{10}. Mitigated daily engine exhaust emissions from construction activities associated with the Proposed Project with compliance with Tier 4 requirements are compared with emission significance thresholds in Table 4.G.8 for the Maximum Residential Scenario during Construction and in Table 4.G.9 for the Maximum Commercial Scenario during Construction. Both these tables assume mitigation reductions as previously described for each measure. As can be seen in these tables, criteria air pollutant emissions would remain significant during construction of Phases 3, 4, and 5 when operational emissions are also considered.

Mitigation Measures M-AQ-1b through M-AQ-1g above would reduce operational emissions associated with both the Maximum Residential Scenario and the Maximum Commercial Scenario. Quantifiable emission reductions from implementation of these measures are reflected in Tables 4.G.8 and 4.G.9 below for the Maximum Residential Scenario and the Maximum Commercial Scenario, respectively. Specifically, the following emissions reductions were quantified as a result of implementation of Mitigation Measures M-AQ-1b through M-AQ-1h:

- **M-AQ-1b: Diesel Backup Generator Specifications** – Quantification of the emission reduction from this measure is based on Tier 4 emission factors for emergency backup generators.
- **M-AQ-1c: Use Low- and Super-Compliant VOC Architectural Coatings in Maintaining Buildings through CC&Rs** – Quantification of the emission reduction from this measure for residential and commercial uses are conservatively based on 50

grams of ROG per liter for interior finsishes and 100 grams ROG per liter for exterior finishes rate for SCAQMD.

- **M-AQ-1d: Promote Use of Green Consumer Products** – Given that the project applicant does not have authority to require use of certain products, no reduction in ROG emissions are estimated from this measure.
- **M-AQ-1e: Electrification of Loading Docks** – Given that the specific land uses are not determined, no reduction in emissions can be reliably estimated from this measure at this time.
- **M-AQ-1f: Transportation Demand Management** – Quantification of the emission reduction from this measure is based on a 20 percent reduction target for vehicle trips. Because most measures are expected to be employer-based, the 20 percent reduction in vehicle trips were only taken for weekday employee trips.
- **Mitigation Measure M-AQ-1g: Additional Mobile Source Control Measures**- No additional emissions reductions were estimated from implementation of these mitigation measures.

Emissions of ROG and NOx during construction of Phases 3, 4, and 5 with consideration of concurrent operational emissions would remain significant even with implementation of Mitigation Measures M-AQ-1a through M-AQ-1g. Consequently, Mitigation Measure M-AQ-1h (Emissions Offsets) is identified to further reduce the residual pollutant emissions. Mitigation Measure M-AQ-1h would require the project sponsor to offset remaining emissions to below significance thresholds by funding the implementation of an offsite emissions reduction project in an amount sufficient to mitigate residual criteria pollutant emissions shown in Tables 4.G.8 and 4.G.9.

As specified in Mitigation Measure M-AQ-1h, offsetting of the project's emissions would follow completion of construction activities for Phases 1 and 2. If construction emissions were considered alone, without operational emissions, construction emissions would be less than significant. Consequently, emissions offsets would represent the necessary amount of offset required to also address operational emissions. Therefore, emissions reduction projects funded through Mitigation Measure M-AQ-1h would offset the regional criteria pollutant emissions generated by operation of the Proposed Project that would remain in excess of the applicable thresholds after implementation of the project-specific emission reductions required under Mitigation Measures M-AQ-1a through M-AQ-1g. If Mitigation Measure M-AQ-1h is implemented via a directly funded or implemented offset project, it could have the potential to reduce the impact to a less than significant level but only if the timing of the offsets could be documented prior to the occupancy of Phase 3 and ensured for the life of the project. Therefore, the residual impact of project emissions during construction is conservatively considered significant and unavoidable with mitigation, acknowledging the assumption that the project sponsor would implement Mitigation Measures M-AQ-1a though M-AQ-1h (Emission Offsets).

Phase 5 Total	**29**	**16**	**13**	**4.0**
Significance Threshold	10	10	15	10
Above Threshold?	**Yes**	**Yes**	No	No

Notes: Bolded numerical values are totals during construction of a given phase with the addition of operational emissions from previous phases. If the total exceeds a threshold, then the exceedance is identified by a bolded "Yes" response.

For each construction phase, annual emissions are divided over the number of construction days for the given phase, to determine the average daily emissions. Phases 1 and 2 would be constructed concurrently. Phase durations as estimated by the applicant were 780 days for all phases except Phase 1 which would be less intensive. Phase 1 duration estimated using CalEEMod default values as these data were not available.

No mitigation is required until Phase 3 of construction. Consequently construction emissions for Phase 1 and Phase 2 are unmitigated.

Impact AQ-2: At project build-out, the Proposed Project would result in emissions of criteria air pollutants at levels that would violate an air quality standard, contribute to an existing or projected air quality violation, and result in a cumulatively considerable net increase in criteria air pollutants. (*Significant and Unavoidable with Mitigation*)

Operational emissions at project build-out were quantified consistent with the methodology identified above for Impact AQ-1 for build-out year 2030. The operational emissions at project build-out for the Maximum Residential and Maximum Commercial Scenarios are discussed below.

Maximum Residential Scenario

The daily and annual increase in emissions associated with operation of the Maximum Residential Scenario in the assumed build-out year of 2030 is summarized in Table 4.G.10: Unmitigated Average Daily and Maximum Annual Operational Emissions at Project Build-out for the Maximum Residential Scenario, for ROG (precursor of ozone), NOx (precursor of ozone), PM_{10}, and $PM_{2.5}$. Project-related emissions under the Maximum Residential Scenario would exceed BAAQMD thresholds of significance for ROG, NOx, and PM_{10}. ROG emissions would be primarily from mobile emissions (54 percent) and area sources (43 percent). The area source emission component is primarily attributable to consumer product use of building occupants (77 percent) and maintenance application of paints and other architectural coatings (18 percent). NOx emissions would be primarily from mobile sources and energy demand, while PM_{10} emissions are almost entirely mobile source related.

Therefore, the Proposed Project would have a significant impact on regional emissions related to operational emissions of ozone precursors and PM_{10}. Significant emissions of ozone precursors (ROG and NOx) and PM_{10} from operation would have the same potential health effects as discussed in Impact AQ-1 above.

Maximum Commercial Scenario

The daily and annual increase in emissions associated with operation of the Maximum Commercial Scenario is shown in Table 4.G.11: Unmitigated Average Daily and Maximum Annual Operational Emissions at Project Build-out for the Maximum Commercial Scenario, for ROG, NOx, PM_{10}, and $PM_{2.5}$. Project-related emissions under the Maximum Commercial Scenario would exceed BAAQMD thresholds of significance for ROG, NOx, and PM_{10}. Therefore, the Proposed Project would also have a significant impact on regional emissions related to ozone precursors and PM_{10} under this scenario. Significant emissions of ozone precursors (ROG and NOx) and PM_{10} from operation would have the same potential health effects as discussed in Impact AQ-1 above.

Mitigation Measures M-AQ-1b though M-AQ1g would reduce operational emissions associated with both the Maximum Residential and Maximum Commercial Scenarios. As indicated in Table 4.G.12: Mitigated Average Daily and Maximum Annual Operational Emissions at Project Build-out for the Maximum Residential Scenario, and Table 4.G.13: Mitigated Average Daily and Maximum Annual Operational Emissions at Project Build-out for the Maximum Commercial Scenario, even with implementation of Mitigation Measures M-AQ-1b through M-AQ-1g, criteria pollutant emissions from operation of the Maximum Residential Scenario or the Maximum Commercial Scenario would remain significant. Consequently, implementation of Mitigation Measure M-AQ-1h: Offsets of Operational Emissions would be required to reduce emission to the extent feasible.

As discussed in Impact AQ-1, if Mitigation Measure M-AQ-1h is implemented via a directly funded or implemented offset project, it could have the potential to reduce the impact to a less than significant level but only if the timing of the offsets could be documented prior to the occupancy of Phase 3 and ensured for the life of the project. Therefore, the residual impact of project emissions during operation at build out is conservatively considered significant and unavoidable with mitigation, acknowledging the assumption that the project sponsor would implement Mitigation Measures M-AQ-1a though M-AQ-1h (Emission Offsets).

Impact AQ-3: Construction and operation of the Proposed Project would generate toxic air contaminants, including DPM, which would expose sensitive receptors to substantial pollutant concentrations. (*Less than Significant with Mitigation*)

Site preparation activities, such as demolition, excavation, grading, foundation construction, and other ground-disturbing construction activity, would affect localized air quality during the construction phases of the Proposed Project. Short-term emissions from construction equipment during these site preparation activities would include directly emitted PM ($PM_{2.5}$ and PM_{10}) and TACs such as DPM. Additionally, the long-term emissions from the project's mobile and

stationary sources, as described in Impact AQ-1, would include PM ($PM_{2.5}$) and TACs such as DPM and some compounds or variations of ROGs. The generation of these short- and long-term emissions could expose sensitive receptors to substantial pollutant concentrations of TACs, resulting in a localized health risk. Therefore, an HRA was conducted for the Proposed Project.

Neither the proposed receptors nor the nearest off-site receptors are located within an area that currently meets the APEZ criteria (100 in one million excess cancer risk or a $PM_{2.5}$ concentration of 10 $\mu g/m^3$). For receptors not located in areas that meet the APEZ criteria, an HRA is conducted to determine whether the Proposed Project would, in combination with other exiting sources in the area, result in a given off-site or on-site receptor meeting the APEZ criteria. If a receptor point meets the APEZ criteria, that otherwise would not without the project, a project would result in a significant health risk impact if the project would contribute to $PM_{2.5}$ concentrations above 0.3 $\mu g/m^3$ or result in an excess cancer risk greater than 10.0 per one million persons exposed.

Methodology

An HRA is used to determine if a particular chemical poses a significant risk to human health and, if so, under what circumstances. The HRA prepared for this project focuses on $PM_{2.5}$ and TACs because these, more so than other types of air pollutants, pose significant health impacts at the local level[63]. The methodologies for the TAC analysis were based on the most recent BAAQMD Recommended Methods for Screening and Modeling Local Risks and Hazards,[64] which recommends the use of the EPA's AERMOD model.

The health risk estimated DPM, speciated[65] total organic gas (TOG), and $PM_{2.5}$ concentrations based on data generated by the CalEEMod model for construction and operational project vehicle traffic. Operational contributions from emergency standby generators were based on calculations using emission rates published by EPA25F.[66] DPM, TOG, and $PM_{2.5}$ emissions rates were used as inputs into AERMOD to predict worst case DPM, TOG, and $PM_{2.5}$ concentrations, respectively. AERMOD is also the model that was used by BAAQMD in the citywide modeling discussed in the Setting section. DPM and speciated TOG concentrations were then used to determine excess lifetime cancer risk based on the health risk assessment methodology published

by the OEHHA in 2015. Construction activities were modeled as area sources, haul trips and operational trips as adjacent volume sources, and operational generators as point sources[67].

The DPM and $PM_{2.5}$ concentrations for each phase of construction due to construction activities and haul trips were modeled separately by year of construction, to account for emissions specific to construction activities occurring in specific time periods. Operational on-road traffic and emergency generator emissions were also modeled to determine pollutant concentrations at on- and off-site receptors. The excess cancer risk and $PM_{2.5}$ concentrations from all sources (ambient [for $PM_{2.5}$ only] plus project construction, operation, and traffic sources) as well as the excess cancer risk from the sum of all existing emissions sources for each receptor point was then determined.

Near-field air dispersion modeling of DPM from project sources was conducted using the EPA's AERMOD model (version 15181).[68] This model requires inputs such as source parameters, meteorological parameters, topography information, and receptor parameters. The exposure parameters were obtained using risk assessment guidelines from the California Environmental Protection Agency[69] and BAAQMD[70]. Exposure parameters include daily breathing rate, exposure time, exposure frequency, exposure duration, average time, and inhalation intake factors. Details of the AERMOD modeling inputs, toxics analysis, and exposure parameters are included in the AQTR.

Off-site child residents (living adjacent to the project site and not within any of the project's phases) were assumed to be present at one location during the entire construction period and were evaluated for both project scenarios. Off-site and on-site residents were assumed to be present at one location for 30 years, consistent with OEHHA guidance.

---

[67] In dispersion modeling, a point source is a source emanated from a discrete point on the modeling grid. An area source is a two-dimensional emissions source that is represented by polygon vertices. A volume source is a three-dimensional emissions source that is represented by a location, release height, and initial lateral and vertical plume sizes.

[68] On November 9, 2005, the EPA promulgated final revisions to the Federal Guideline on Air Quality Models, in which it recommended that AERMOD be used for dispersion modeling evaluations of criteria air pollutant and toxic air pollutant emissions from typical industrial facilities. EPA Preferred/Recommended Models, *AERMOD Modeling System*, http://www.epa.gov/ttn/scram/dispersion_prefrec.htm#aermod.

[70] BAAQMD, *Air Toxics NSR Program Health Risk Screening Analysis (HRSA) Guidelines*, January 2010. Available online at http://www.baaqmd.gov/~/media/Files/Engineering/Air%20Toxics%20Programs/hrsa_guidelines.ashx. Accessed January 18, 2016.

$PM_{2.5}$ concentrations are evaluated on an annual average basis. However, excess cancer risk is evaluated based on lifetime exposure to pollutant concentrations; therefore, the AQTR evaluated excess cancer risk as a result of exposure to both construction and operational emission together. Both the Maximum Commercial and Maximum Residential Scenarios were evaluated and the higher result for each receptor type was determined.

Excess Cancer Risk from Construction and Operation Emissions at Off-Site Receptors. The maximum estimated excess lifetime cancer risk from all project sources (assuming a receptor was born during construction and exposed to project-related emissions for 30 years) at off-site locations is presented in Table 4.G.14 for the Maximum Residential Scenario and Table 4.G.15 for the Maximum Commercial Scenario. As shown in the tables, unmitigated emissions plus existing background emissions would not result in a total excess cancer risk of 100 in one million at the most impacted receptor. This would be below the level for causing a new location to meet the APEZ excess cancer risk criteria, and thus would be a less-than-significant impact. The majority of project-generated excess cancer risk at the Maximum Exposed Individual Sensitive Receptor (MEISR) would be attributable to construction emissions.

Excess Cancer Risk from Construction and Operational Emissions at On-Site Receptors. Both the Maximum Residential Scenario and the Maximum Commercial Scenario would include development of residential units, which is considered a sensitive land use for purposes of air quality evaluation. The Proposed Project would result in construction-related TAC emissions that would affect the occupants of the first phases of the Proposed Project and diesel backup generators may also impact these future residents. The estimated excess cancer risk from the emissions of both scenarios at the on-site MEISR are presented in Table 4.G.16: Lifetime Cancer Risk and $PM_{2.5}$ Concentration Contributions at the Maximally Impacted On-Site Receptors. The project's emissions would combine with existing background concentrations and would exceed the APEZ excess cancer risk criteria of an excess cancer risk of 100 per one million persons exposed. Therefore, the impact with regard to increased cancer risk would be *significant* for on-site receptors for the Maximum Residential and Maximum Commercial Scenarios.

The mitigated condition assumed in the HRA included emission reductions quantified for Mitigation Measures M-AQ-1a: Construction Emissions Minimization, M-AQ-1b: Diesel Backup Generator Specifications, M-AQ-1c: Use Low- and Super-Compliant VOC Architectural Coatings in Maintaining Buildings through CC&Rs, and M-AQ-1f: Transportation Demand Management. As indicated in Tables 4.G.15 and 4.G.16, construction emissions contribute over 90 percent of the unmitigated project's health risk. Consequently, implementation of Mitigation Measure M-AQ-1a alone would be sufficient to reduce this impact to a less than significant level.

Note:

[a] In some instances the mitigated value may be greater than the non-mitigated value. This can occur when application of mitigation changes the location of the maximally impacted receptor, thereby potentially resulting in a reported value for a given receptor that is different and potentially greater than that of the previous maximally impacted receptor under the non-mitigated condition.

Source: Ramboll ENVIRON, 2016

$PM_{2.5}$ Concentrations from Construction and Operation Emissions at Off-Site Receptors. The maximum estimated $PM_{2.5}$ concentrations from all project sources at off-site locations are presented in Table 4.G.14 for the Maximum Residential Scenario and in Table 4.G.15 for the Maximum Commercial Scenario. As shown in the tables, unmitigated emissions in combination with background concentrations would result in $PM_{2.5}$ concentrations of 8.5 $\mu g/m^3$ for both scenarios, which would be below the levels for causing a new location to meet the APEZ criteria of 10 $\mu g/m^3$. Therefore, this would be a less than significant impact.

$PM_{2.5}$ Concentrations from Construction and Operation Emissions at On-Site Receptors. The maximum estimated $PM_{2.5}$ concentrations from all project sources at on-site locations are presented in Table 4.G.16. As shown in the table, unmitigated emissions in combination with background concentrations would result in $PM_{2.5}$ concentrations of 8.6 $\mu g/m^3$ for both scenarios, which would be below the levels for causing a new location to meet the APEZ criteria of 10 $\mu g/m^3$. Therefore, this would be a less than significant impact.

In summary, the Proposed Project would result in significant health risk impact to on-site sensitive receptors under both the Maximum Residential and Maximum Commercial Scenarios. This impact would be reduced to less than significant with incorporation of Mitigation Measure M-AQ-1a.

Impact AQ-4: The Maximum Residential or Maximum Commercial Scenarios would conflict with implementation of the Bay Area 2010 Clean Air Plan. (*Less than Significant with Mitigation*)

The most recently adopted air quality plan for the SFBAAB is the 2010 Clean Air Plan. Although an updated Clean Air Plan is currently being prepared, it is still not finalized and subject to change based on pending public comments. The Clean Air Plan is a road map that demonstrates how the Bay Area will, in accordance with the requirements of the California Clean Air Act, implement all feasible measures to reduce ozone. It also provides a control strategy to reduce ozone, PM, air toxics, and GHGs. In determining consistency with the Clean Air Plan, this analysis considers whether the project would (1) support the primary goals of the Clean Air Plan, (2) include applicable control measures from the Clean Air Plan, and (3) avoid disrupting or hindering implementation of control measures identified in the Clean Air Plan.

The primary goals of the Clean Air Plan are to (1) reduce emissions and decrease concentrations of harmful pollutants, (2) safeguard the public health by reducing exposure to air pollutants that pose the greatest health risk, and (3) reduce GHG emissions. To meet the primary goals, the Clean Air Plan recommends specific control measures and actions. These control measures are grouped into various categories and include stationary- and area-source measures, mobile-source measures, transportation control measures, land-use measures, and energy and climate measures.

The Clean Air Plan recognizes that, to a great extent, community design[71] dictates individual travel modes and that a key long-term control strategy to reduce emissions of criteria pollutants, air toxics, and GHGs from motor vehicles is to channel future Bay Area growth into communities where goods and services are located nearby and people have a range of viable transportation options. To this end, the Clean Air Plan includes 55 control measures aimed at reducing air pollutants in the SFBAAB. Many of these measures address stationary sources and will be implemented by BAAQMD using its permit authority and therefore are not suited to implementation through local planning efforts or project approval actions. The applicable 25 CAP measures are identified in Table 4.G.17: Control Strategies of the 2010 Clean Air Plan. This table identifies each control strategy and correlates it to specific elements of each of the two project scenarios or explains why the strategy does or does not apply to the project site development. As shown in Table 4.G.17, without certain mitigation measures incorporated into the project, the project would not include applicable control measures from the 2010 Clean Air Plan and this impact would be *significant*. However, with incorporation of mitigation measures identified in Table 4.G.17, the Proposed Project would include applicable control strategies contained in the 2010 Clean Air Plan for the SFBAAB.

The Proposed Project's impact with respect to GHGs is discussed in Section 4.H, Greenhouse Gas Emissions. As stated there, the Proposed Project would be substantially compliant with the City's Greenhouse Gas Reduction Strategy and thus would not result in any significant impacts associated with an increase in GHGs or conflict with measures adopted for the purpose of reducing such emissions.

In addition to the above measures, transportation control measures that are identified in the Clean Air Plan are implemented by the *San Francisco General Plan* and the Planning Code, for example, through the City's Transit First Policy, the bicycle parking requirements, and transit impact development fees. Additionally, the project would incorporate a TDM program identified as Mitigation Measure M-AQ-1f. As indicated in Table 4.G.17, implementation of the TDM Program under Mitigation Measure M-AQ-1f and the additional Mitigation Measure M-AQ-1g (Additional Mobile Source Control Measures [preferential parking and/or charging stations for

[71] For people who live (and/or work) in low-density, car-oriented developments, the motor vehicle is often the only viable transportation option. In such situations, even the most robust strategy to promote alternative modes of travel can have, at best, only a very modest effect. In contrast, compact communities with a mixture of land uses make it much easier to walk, cycle, or take transit for at least some daily trips.

Table 4.G.17: Control Strategies of the 2010 Clean Air Plan

2010 Clean Air Plan Control Strategy	Elements of Proposed Project Site Development Consistent with the Strategy or Explanation of Non-Applicability
Transportation Control Measures	
TCM A: Improve Transit Services	As stated in Mitigation Measure M-TR-4: Monitor and increase capacity on the 48 Quintara/24th Street bus routes as needed, the project sponsors would be required by the Planning Department to perform and submit trip generation calculations or monitoring surveys to demonstrate if and when the Proposed Project will cause capacity on the 48 Quintara/24th Street Muni route to exceed 85 percent and if so shall provide capital costs for increased capacity on the route. Although the San Francisco Municipal Transportation Agency has not formally agreed to operate increased service on this route, this measure provides for transit improvement should the San Franciso Municipal Transportation Agency acknowledge that it is warranted.
TCM B: Improve System Efficiency	Not Applicable: This measure addresses infrastructure improvements to increase operational efficiencies on freeways and transit service (such as common fare payment systems) that are geared toward regional transit agencies and Caltrans, and not by local government or through land use development projects.
TCM C: Encourage Sustainable Travel Behavior (i.e., voluntary employer-based trip reduction program)	Mitigation Measure M-AQ-1f would require the project sponsors to establish a TDM program. Developers may choose from a menu of TDM strategies including subsidies for site users who use transit or other alternative modes of transportation.
TCM D: Support Focused Growth (Bicycle and Pedestrian friendliness)	The Proposed Project includes bike lanes and bike-parking facilities to promote bicycling in and around the project site. Under the provisions of the SUD, bike amenities would be constructed on the project site to meet or exceed Planning Code requirements. Improvements proposed by the Proposed Project include construction of Class 2 bicycle facilities and Class 3 bicycle facilities (shared-lane markings and signage) on 20th Street, 22nd Street, and Maryland Street, and a Class 1 separated bicycle and pedestrian facility would be provided to extend the Bay Trail and Blue Greenway the length of the project site along the shoreline.
TCM E: Implement Pricing Strategies	As discussed in the project description, all residential parking would be unbundled, which means parking would be an optional, additional cost to the price of renting or purchasing a dwelling unit. Additionally, parking strategies would be included as part of the Proposed Project's TDM program.
Mobile Source Control Measures	
MSM A-1: Promote Clean Fuel Efficient Vehicles	Not part of Proposed Project site development. Mitigation Measure M-AQ-1g would increase the requirement for the project sponsors to provide preferential parking for alternative-fueled vehicles above that required by the Planning Code.

Table 4.G.17 Continued

2010 Clean Air Plan Control Strategy	Elements of Proposed Project Site Development Consistent with the Strategy or Explanation of Non-Applicability
MSM A-2: Zero Emission Vehicles	Not part of Proposed Project site development. Mitigation Measure M-AQ-1g requires the project sponsor to provide neighborhood electric vehicle programs to reduce the need to have a car or second car.
MSM A-3: Green Fleets	Development of the project site generally would be retail, commercial, or residential in nature and unlikely to accommodate a land use requiring a fleet of vehicles. However, it is possible that the project could implement replacement or repair of high-emitting vehicle fleet as part of Mitigation Measure M-AQ-1h (Emissions Offsets).
MSM A-4: Replacement or Repair of High-Emitting Vehicles	The project is a development project whose vehicle emissions would be generated by residents and commercial tenants who own their own vehicles. However, it is possible that the project could implement replacement or repair of high-emitting vehicles as part of Mitigation Measure M-AQ-1h (Emissions Offsets).
MSM B-1: Fleet Modernization for Medium and Heavy-Duty Trucks	The project is a development project whose vehicle emissions would be generated by residents and commercial tenants who own their own vehicles. However, it is possible that the project could implement replacement or repair of high-emitting vehicles as part of Mitigation Measure M-AQ-1h (Emissions Offsets).
MSM B-2: Low NOx Retrofits in Heavy-Duty Trucks	Construction of the Proposed Project would be subject to Mitigation Measure M-AQ-1a, which would require low NOx-emitting construction vehicles. Regarding operational emissions, the project is a development project whose vehicle emissions would be generated by residents and commercial tenants who own their own vehicles. However, it is possible that the project could implement replacement or repair of high-emitting vehicles as part of Mitigation Measure M-AQ-1h (Emissions Offsets).
MSM B-3: Efficient Drive Trains	Not Applicable: This strategy addresses development and demonstration programs in partnership with the CARB and the California Energy Commission.
MSM C-1: Construction and Farming Equipment	Construction of the Proposed Project would be subject to Mitigation Measure M-AQ-1a, which would require Tier 4, low-emissions construction vehicles. With regards to operational emissions, the project is a development project whose vehicle emissions would be generated by residents and commercial tenants who own their own vehicles. However, it is possible that the project could implement replacement or repair of high-emitting vehicles as part of Mitigation Measure M-AQ-1h (Emissions Offsets).
MSM C-2: Lawn & Garden Equipment	This strategy addresses voluntary exchange programs implemented by BAAQMD. This measure could be one of the measures implemented by previously identified Mitigation Measure M-AQ-1h (Emissions Offsets).

Table 4.G.17 Continued

2010 Clean Air Plan Control Strategy	Elements of Proposed Project Site Development Consistent with the Strategy or Explanation of Non-Applicability
MSM C-3: Recreational Vessels	This strategy addresses voluntary exchange programs implemented by BAAQMD. This measure could be one of the measures implemented by previously identified Mitigation Measure M-AQ-1h (Emissions Offsets).
Land Use and Local Impact Measures	
LUM 1: Goods Movement	Development of the project site generally would be retail, commercial or residential in nature and would not include warehousing and industrial uses that would involve substantial goods transport.
LUM 2: Indirect Source Review Rule	Not Applicable: This strategy addresses implementation of an indirect source rule by BAAQMD.
LUM 3: Updated CEQA Guidelines	Not Applicable: This strategy addresses updating of the *CEQA Guidelines* by BAAQMD. These guidelines were most recently updated in May 2012, and were one of many tools used in the assessment of air quality impacts.
LUM 4: Land Use Guidance	Not Applicable: This strategy addresses updating land use planning documents such as the proposed development scenarios and demonstrating consistency with air quality protection guidance such as the BAAQMD *CEQA Guidelines* that are applied in this analysis.
LUM 5: Reduce Health Risk in Impacted Communities	The Proposed Project site is identified in Figure 3-2 of the CAP as an "impacted community." This EIR evaluates the health risk effects of the project in combination with existing background health risks in Impact AQ-3 and determines that with incorporation of Mitigation Measure M-AQ1a, the Proposed Project would not result in a significant health risk impact.
LUM 6: Enhanced Air Quality Monitoring	Not Applicable: This strategy addresses air quality monitoring that is under the purview of BAAQMD and/or the CARB.
Energy and Climate Measures	
ECM 1: Energy Efficiency	The Proposed Project would comply with San Francisco Green Building Requirements for energy efficiency in new buildings. Energy-efficient appliances and energy-efficient lighting would also be installed in the three rehabilitated historic buildings.
ECM 2: Renewable Energy	The Proposed Project is required to meet San Francisco Green Building Requirements for renewable energy. As discussed in Section 4.H Greenhous Gas Emissions, at least 15 percent of the roof area of all proposed buildings (excluding existing Buildings 2, 12, and 21) would include roof-mounted or building-integrated solar photovoltaic (PV) systems and/or roof-mounted solar thermal hot water systems.

Table 4.G.17 Continued

2010 Clean Air Plan Control Strategy	Elements of Proposed Project Site Development Consistent with the Strategy or Explanation of Non-Applicability
ECM 3: Urban Heat Island Mitigation	The Proposed Project development includes provision of a substantial amount of open space. This open space, as currently proposed, along with the landscaping requirements that would be imposed for site-specific development projects within the project site would implement measure ECM-3.
ECM 4: Shade Tree Planting	No street trees would be removed, and new street trees would be planted along designated street segments, for a total of approximately 152 street trees. Street trees would be planted in accordance with Public Works Code Section 806(d), except for areas around the Historic Core, where Federal historic standards would be applied.

Source: ESA, 2016

fuel-efficient vehicles and a neighborhood electric vehicle program]) would ensure the project includes relevant transportation control measures specified in the Clean Air Plan. Therefore, the Proposed Project would include applicable control measures identified in the Clean Air Plan and would support the primary goals of the Clean Air Plan.

Examples of a project that could cause the disruption or delay of Clean Air Plan control measures are projects that would preclude the extension of a transit line or bike path, or projects that propose excessive parking beyond City parking requirements. The Proposed Project site is a dense, walkable urban area near a concentration of regional and local transit service which include a Muni light rail stop at Third and 20th streets, 500 feet from the project site, and a Caltrain stop at 22nd Street, less than 0.5 mile from the project site. The Proposed Project site is designated as a Priority Development Area pursuant to the *Plan Pay Area.* This designation applies to new development areas that would support the day-to-day needs of residents and workers in a pedestrian-friendly environment served by transit. The Proposed Project includes bike lanes, bike-safety-oriented street design, and bike-parking facilities to promote bicycling in and around the project site.

The Proposed Project would not preclude the extension of a transit line or a bike path or any other transit improvement and, thus, would not disrupt or hinder implementation of control measures identified in the Clean Air Plan.

The City's Planning Code does not have parking minimum or maximum requirements for the existing Heavy Industrial zoning designation. However, the Pier 70 SUD would establish parking maximums of no more than 0.75 parking space per residential dwelling unit and no more than one parking space per 1,000 square feet of gross floor area for the office, commercial, retail, arts, or light industrial uses resulting in a maximum of over 4,000 spaces for both scenarios. Under the

Maximum Residential Scenario, about 3,370 off-street parking spaces and 285 on-street parking spaces would be allowed. Under the Maximum Commercial Scenario, about 3,496 off-street and 285 on-street parking spaces would be allowed. Consequently, the Proposed Project does not propose excessive parking beyond City parking requirements.

For the reasons described above, the Proposed Project would not interfere with implementation of the Clean Air Plan, and because the Proposed Project would be consistent with the applicable air quality plan that demonstrates how the region will improve ambient air quality and achieve the State and Federal ambient air quality standards, this impact would be less than significant.

Impact AQ-5: The Maximum Residential or Maximum Commercial Scenarios would not create objectionable odors that would affect a substantial number of people. (*Less than Significant*)

During construction, the various diesel-powered vehicles and equipment in use on site would create localized odors. These odors would be temporary and depend on specific construction activities occurring at certain times and are not likely to be noticeable for extended periods of time beyond the project site. Therefore, the potential for diesel odor impacts is considered less than significant. Existing uses on the project site are entirely for storage and auto space and are not an existing odor source.

Although there may be some potential for small-scale, localized odor issues to emerge around project sources such as solid waste collection, food preparation, etc., substantial odor sources and consequent effects on on-site and off-site sensitive receptors would be unlikely. BAAQMD Regulation 7 places general limitations on odorous substances and specific emission limitations on certain odorous compounds and applies to restaurants that employ more than five persons. Therefore, odor impacts would be less than significant.

CUMULATIVE IMPACTS

This section discusses the cumulative impacts to air quality that could result from the Proposed Project in conjunction with past, present, and reasonably foreseeable future projects.

Impact C-AQ-1: The Maximum Residential or Maximum Commercial Scenarios, in combination with past, present, and reasonably foreseeable future development in the project area, would contribute to cumulative regional air quality impacts. (*Significant and Unavoidable with Mitigation*)

The contribution of a project's individual air emissions to regional air quality impacts is, by its nature, a cumulative effect. Emissions from past, present, and future projects in the region also have or will contribute to adverse regional air quality impacts on a cumulative basis. No single project by itself would be sufficient in size to result in non-attainment of ambient air quality

standards. Instead, a project's individual emissions contribute to existing cumulative air quality conditions.[72] As described above, the project-level thresholds for criteria air pollutants are based on levels by which new sources are not anticipated to contribute to an air quality violation or result in a considerable net increase in criteria air pollutants. Therefore, because the Proposed Project's emissions exceed the project-level thresholds, the project would result in a considerable contribution to cumulative regional air quality impacts. As discussed above, implementation of Mitigation Measures M-AQ-1a through M-AQ-1h would reduce this impact, however, not to a less-than-significant level. Therefore, this impact would be significant and unavoidable with mitigation.

Impact C-AQ-2: The Maximum Residential or Maximum Commercial Scenarios, in combination with past, present, and reasonably foreseeable future development in the project area, would contribute to cumulative health risk impacts on sensitive receptors. (*Less than Significant with Mitigation*)

The HRA takes into account the cumulative contribution of existing localized health risks to sensitive receptors from sources included in the Citywide modeling plus the Proposed Project's sources. There are, however, other future projects, whose emissions have not been incorporated into the existing citywide health risk modeling because analysis with respect to CEQA for these future project either has not yet been prepared or is pending.

The BAAQMD has identified a distance of 1,000 feet as an appropriate zone of influence for assessing health risk impacts[73] and specifies that cumulative sources represent the combined total risk values of each individual source within the 1,000-foot evaluation zone.

Cumulative projects that are within 1,000 feet of the project site are identified in Figure 4.A.1: Location of Baseline and Foreseeable Future Projects, in Section 4.A, Introduction to Chapter 4, p. 4.A.7. There are 16 cumulative projects within this zone of influence, two of which are already completed and/or occupied. Another one of these cumulative projects is for the renewal of the lease for BAE Systems whose operations were already considered in the HRA analysis. The remaining projects are either residential, most of which have a ground floor retail or commercial component, or the proposed development of Crane Cove Park.

Citywide modeling of future health risks under 2040 conditions has been conducted by the City. This modeling includes transportation emissions for year 2040 and was based on growth projections that would have reasonably accounted for the traffic emissions from projects listed in Section 4.A Cumulative. Background (without project) cancer risk and $PM_{2.5}$ concentrations in

[72] BAAQMD, *CEQA Air Quality Guidelines*, May 2011, p. 2-1.
[73] BAAQMD, *CEQA Air Quality Guidelines*, May 2011, p. 5-2.

2040 are expected to decrease due to improved vehicle fleets and the electrification of Caltrain. Additionally, any backup diesel generators or other stationary sources that may be proposed by cumulative projects would need to meet BAAQMD permit requirements; therefore, emissions from these sources would be limited.

Citywide modeling for year 2040 does not include construction emissions because these are variable and difficult to predict. Cumulative year 2040 conditions without the project show lower background risks than the existing baseline cancer risks and consequently, addition of the project's risks cancer risk to 2040 conditions would similarly not result in new locations meeting the APEZ criteria that otherwise would not without the project with mitigation. Therefore, the project plus cumulative development projects and background risks in 2040 would not result in significant health risk impacts and the analysis in Impact AQ-3 presents a worst-case cumulative health risk analysis.

The Proposed Project would be required to implement Mitigation Measure M-AQ-1a, Construction Emission Minimization, which could reduce construction-period emissions. Additionally, Mitigation Measure M-AQ-1b, Diesel Backup Generator Specifications, would limit diesel generator emissions. Implementation of these mitigation measures would reduce the project's contribution to cumulative air quality impacts to a less-than-significant level.

This page intentionally blank.

H. GREENHOUSE GAS EMISSIONS

Section 4.H, Greenhouse Gas Emissions, describes global climate change, greenhouse gas (GHG) emissions, and the existing regulatory framework governing GHG emissions, and analyzes the impacts related to GHGs associated with development of the Proposed Project. The GHG emissions analysis is based on the Proposed Project's compliance with plans and policies adopted for the purpose of reducing GHG emissions as set forth in the City's aggressive local GHG reduction plan, *Strategies to Address Greenhouse Gas Emissions*, recognized by the Bay Area Air Quality Management District (BAAQMD) as meeting the criteria of a qualified GHG Reduction Strategy.

ENVIRONMENTAL SETTING

GREENHOUSE GAS EMISSIONS AND CLIMATE CHANGE

Gases that trap heat in the atmosphere are referred to as GHGs because they capture heat radiated from the sun as it is reflected back into the atmosphere, much as a greenhouse does. The accumulation of GHGs contributes to global climate change. The primary GHGs, or climate pollutants, are carbon dioxide (CO_2), black carbon, methane (CH_4), nitrous oxide (N_2O), ozone, and water vapor.

Individual development projects contribute to the cumulative effects of climate change by emitting GHGs during demolition, construction, and operational phases. While the presence of some of the primary GHGs in the atmosphere is naturally occurring, CO_2, CH_4, and N_2O are also emitted from human activities, accelerating the rate at which these compounds occur within the earth's atmosphere. Emissions of CO_2 are largely by-products of fossil fuel combustion, whereas emissions of CH_4 result from off-gassing associated with agricultural practices and landfills. Black carbon has emerged as a major contributor to global climate change, possibly second only to CO_2. Black carbon is produced naturally and by human activities as a result of the incomplete combustion of fossil fuels, biofuels, and biomass.[1] N_2O is a by-product of various industrial processes. Other GHGs include hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride, and are generated in certain industrial processes. GHGs are typically reported in "carbon dioxide-equivalent" measures (CO_2E).[2]

[1] Center for Climate and Energy Solution, What is Black Carbon?, April 2010. Available online at http://www.c2es.org/docUploads/what-is-black-carbon.pdf. Accessed March 3, 2016.

[2] Because of the differential heat absorption potential of various GHGs, GHG emissions are frequently measured in terms of "carbon dioxide-equivalents," which presents a weighted average based on each gas's heat absorption (or "global warming") potential.

There is international scientific consensus that human-caused increases in GHGs contribute to global warming and, thus, climate change. Many impacts resulting from climate change, including sea level rise, increased fires, floods, severe storms, and heat waves, already occur and will only become more severe and costly.[3] Secondary effects of climate change likely include impacts to agriculture, the State's electricity system, and native freshwater fish ecosystems; an increase in the vulnerability of levees such as in the Sacramento-San Joaquin Delta; changes in disease vectors; and changes in habitat and biodiversity.[4,5]

GREENHOUSE GAS EMISSION ESTIMATES AND ENERGY PROVIDERS IN CALIFORNIA

The California Air Resources Board (CARB) estimated that in 2013 California produced about 459.3 million gross metric tons of CO_2E ($MMTCO_2E$).[6,7] The CARB found that transportation is the source of 37 percent of the State's GHG emissions, followed by electricity generation (both in-State generation and imported electricity) at 20 percent, and industrial sources at 23 percent. Commercial and residential fuel use (primarily for heating) accounted for 12 percent of GHG emissions.[8] In San Francisco, motorized transportation and natural gas sectors were the two largest sources of GHG emissions, accounting for approximately 35 percent (2.0 million $MTCO_2E$) and 27 percent (1.5 million $MTCO_2E$), respectively, of San Francisco's 4.75 million $MTCO_2E$ emitted in 2012.[9] Electricity consumption (building operations and transit) accounts for approximately 21 percent (1.1 million $MTCO_2E$) of San Francisco's GHG emissions.[10]

Electricity in San Francisco is primarily provided by the Pacific Gas and Electricity Company (PG&E) and the San Francisco Public Utilities Commission (SFPUC). In 2012, electricity consumption in San Francisco was approximately 6.0 million megawatt-hours (MWh). Of this total, PG&E produced approximately 71 percent of electricity distributed (4.2 million MWh; about 81 percent of San Francisco's electricity-driven GHG emissions), and the SFPUC produced approximately 16 percent of the electricity distributed (0.9 million MWh, about 0 percent of San Francisco's electricity-driven GHG emissions).[11]

PG&E's 2015 power mix was as follows: 25 percent natural gas, 23 percent nuclear, 30 percent eligible renewables (described below), 6 percent large hydroelectric, and 17 percent unspecified power.[12]

The SFPUC operates three hydroelectric power plants in association with San Francisco's Hetch Hetchy water supply system, and provides electrical power to Muni, City buildings, and a limited number of other commercial accounts in San Francisco. Electricity generated by the Hetch Hetchy system achieved net zero GHG emissions for year 2012.[13]

REGULATORY FRAMEWORK

STATE

Executive Orders S-3-05 and B-30-15

Executive Order (EO) S-3-05 sets forth a series of target dates by which Statewide emissions of GHGs need to be progressively reduced, as follows: by 2010, reduce GHG emissions to 2000 levels (approximately 457 million $MTCO_2E$); by 2020, reduce emissions to 1990 levels (approximately 427 million $MTCO_2E$); and by 2050, reduce emissions to 80 percent below 1990 levels (approximately 85 million $MTCO_2E$). California produced about 452 million $MTCO_2E$ in 2010, thereby meeting the 2010 target date to reduce GHG emissions to 2000 levels.

EO B-30-15 set an additional, interim Statewide GHG reduction target of 40 percent below 1990 levels to be achieved by 2030. The purpose of this interim target is to ensure California meets its target of reducing GHG emissions to 80 percent below 1990 levels by 2050.[14] EO B-30-15 also

requires all State agencies with jurisdiction over sources of GHG emissions to implement measures within their statutory authority to achieve reductions of GHG emissions to meet the 2030 and 2050 GHG emissions reductions targets.

Assembly Bill 32 and California Climate Change Scoping Plan

In 2006, the California legislature passed Assembly Bill 32 (California Health and Safety Code Division 25.5, Sections 38500, et seq., or AB 32), also known as the California Global Warming Solutions Act. AB 32 requires CARB to design and implement emission limits, regulations, and other measures, such that feasible and cost-effective Statewide GHG emissions are reduced to 1990 levels by 2020.

Pursuant to AB 32, CARB adopted the *Climate Change Scoping Plan* (*Scoping Plan*) in December 2008, outlining measures to meet the 2020 GHG reduction limits. In order to meet the goals of AB 32, California must reduce its GHG emissions by 30 percent below projected 2020 business-as-usual emissions levels (approximately 15 percent below 2008 levels).[15] The *Scoping Plan* estimates a reduction of 174 million $MTCO_2E$ from transportation, energy, agriculture, forestry, and other high global warming sectors (see Table 4.H.1: GHG Reductions from the AB 32 Scoping Plan Categories).[16]

The AB 32 *Scoping Plan* also anticipates that actions by local governments will result in reduced GHG emissions because local governments have the primary authority to plan, zone, approve, and permit development to accommodate population growth and the changing needs of their jurisdictions.[17] The *Scoping Plan* also relies on the requirements of Senate Bill (SB) 375 (discussed below) to align local land use and transportation planning for achieving GHG reductions.

The *Scoping Plan* must be updated every five years to evaluate AB 32 policies and ensure that California is on track to achieve the 2020 GHG reduction goal. In 2014, CARB released the *First Update to the Climate Change Scoping Plan (First Update)*, which builds upon the initial scoping plan with new strategies and recommendations. The *First Update* identifies opportunities to leverage existing and new funds to further drive GHG emission reductions through strategic planning and targeted low carbon investments. This update defines CARB's climate change priorities for the next five years and sets the groundwork to reach long-term goals set forth in EO S-3-05. The *First Update* highlights California's progress toward meeting the near-term 2020

Table 4.H.1: GHG Reductions from the AB 32 Scoping Plan Categories[18,19]

GHG Reduction Measures by Sector	GHG Reductions ($MMTCO_2E$)
Transportation Sector	62.3
Electricity and Natural Gas	49.7
Industry	1.4
Landfill Methane Control Measure	1
Forestry	5
High Global Warming Potential GHGs	20.2
Additional Reductions Needed to Achieve the GHG Cap	34.4
Other Recommended Measures	
Government Operations	1-2
Agriculture – Methane Capture at Large Dairies	1
Water	4.8
Green Buildings	26
High Recycling/Zero Waste	9
Total Reductions Counted Towards 2020 Target	**216.8-217.8**

Note: $MMTCO_2E$ = million metric tonnes of CO_2E (carbon dioxide equivalent)

GHG emission reduction goals in the initial scoping plan. It also evaluates how to align the State's longer-term GHG reduction strategies with other State policy priorities for water, waste, natural resources, clean energy, transportation, and land use.[20]

Senate Bill 375

The *Scoping Plan* also relies on the requirements of SB 375 (Chapter 728, Statutes of 2008), also known as the Sustainable Communities and Climate Protection Act of 2008, to reduce carbon emissions from land use decisions. SB 375 requires regional transportation plans developed by each of the State's 18 Metropolitan Planning Organizations to incorporate a "sustainable communities strategy" in each regional transportation plan that will then achieve GHG emission reduction targets set by CARB. For the Bay Area, the per-capita GHG emission reduction target

[18] Ibid.

[20] CARB, *First Update to the Climate Change Scoping Plan*, May 2014. Available online at http://www.arb.ca.gov/cc/scopingplan/2013_update/first_update_climate_change_scoping_plan.pdf. Accessed March 3, 2016.

is a 7 percent reduction by 2020 and a 15 percent reduction by 2035 from 2005 levels.[21] *Plan Bay Area*, the Metropolitan Transportation Commission's regional transportation plan, adopted in July 2013, is the region's first plan subject to SB 375 requirements.[22]

Senate Bills 1078, 107, X1-2, and 350 / Executive Orders S-14-08 and S-21-09

California established aggressive renewable portfolio standards under SB 1078 (Chapter 516, Statutes of 2002) and SB 107 (Chapter 464, Statutes of 2006), which require retail sellers of electricity to provide at least 20 percent of their electricity supply from renewable sources by 2010. EO S-14-08 (November 2008) expanded the State's renewable portfolio standard from 20 percent to 33 percent of electricity from renewable sources by 2020. In September 2009, Governor Schwarzenegger continued California's commitment to the renewable portfolio standard by signing EO S-21-09, which directed CARB to enact regulations to help California meet the renewable portfolio standard goal of 33 percent renewable energy by 2020.[23]

In April 2011, Governor Brown signed SB X1-2 (Chapter 1, Statutes of 2011) codifying the GHG reduction goal of 33 percent by 2020 for energy suppliers. This renewable portfolio standard preempts CARB's 33 percent renewable sources electricity standard and applies to all electricity suppliers (not just retail sellers) in the State, including publicly owned utilities, investor-owned utilities, electricity service providers, and community choice aggregators. Under SB X1-2, all of these entities must adopt the new renewable portfolio standard goals of 20 percent of retail sales from renewable sources by the end of 2013, 25 percent by the end of 2016, and 33 percent by the end of 2020.[24] Eligible renewable sources include geothermal, ocean wave, solar photovoltaic, and wind, but exclude large hydroelectric (30 MW or more). Therefore, because the SFPUC receives more than 67 percent of its electricity from large hydroelectric facilities, the remaining electricity provided by the SFPUC is required to be 100 percent renewable.[25] SB 350 (Chapter 547, Statutes of 2015), signed by Governor Brown in October 2015, dramatically increased the stringency of the renewable portfolio standard. SB 350 establishes a renewable

portfolio standard target of 50 percent by 2030, along with interim targets of 40 percent by 2024 and 45 percent by 2027.

REGIONAL

The BAAQMD is responsible for attaining and maintaining Federal and State air quality standards in the San Francisco Bay Area Air Basin, as established by the Federal Clean Air Act and the California Clean Air Act, respectively. The Clean Air Act and the California Clean Air Act require plans to be developed for areas that do not meet air quality standards, generally. The most recent air quality plan, the *Bay Area 2010 Clean Air Plan* (*Clean Air Plan*), includes a goal of reducing GHG emissions to 1990 levels by 2020, 40 percent below 1990 levels by 2035, and 80 percent below 1990 levels by 2050.[26]

In addition, the BAAQMD established a climate protection program to reduce pollutants that contribute to global climate change and affect air quality in the San Francisco Bay Area Air Basin; the program includes GHG-reduction measures that promote energy efficiency, reduce vehicle miles traveled, and develop alternative energy sources.[27]

The BAAQMD CEQA Air Quality Guidelines also assists lead agencies in complying with the requirements of CEQA regarding potentially adverse impacts to air quality. The BAAQMD advises lead agencies to consider adopting a greenhouse gas reduction strategy capable of meeting AB 32 goals and then reviewing projects for compliance with the greenhouse gas reduction strategy.[28] This is consistent with the approach to analyzing GHG emissions in the CEQA Guidelines Section 15183.5.

LOCAL

San Francisco Greenhouse Gas Reduction Ordinance

In May 2008, the City adopted Ordinance No. 81-08, which amended the San Francisco Environment Code to establish GHG emissions targets and require departmental action plans and to authorize the San Francisco Department of the Environment to coordinate efforts to meet these targets. The City ordinance establishes the following GHG emissions reduction limits and target

[26] Bay Area Air Quality Management District (BAAQMD), *Clean Air Plan*, September 2010. Available online at http://www.baaqmd.gov/plans-and-climate/air-quality-plans/current-plans. Accessed March 3, 2016.

[27] BAAQMD, *Climate Protection Program*. Available online at http://www.baaqmd.gov/plans-and-climate/climate-protection/climate-protection-program. Accessed May 26, 2016.

[28] BAAQMD, *California Environmental Quality Act Air Quality Guidelines*, p. 4-7, May 2012. Available online http://www.baaqmd.gov/~/media/Files/Planning%20and%20Research/CEQA/BAAQMD%20CEQA%20Guidelines_Final_May%202012.ashx?la=en. Accessed March 3, 2016.

dates by which to achieve them: determine 1990 Citywide GHG emissions by 2008, the baseline level, with reference to which target reductions are set; reduce GHG emissions by 25 percent below 1990 levels by 2017; reduce GHG emissions by 40 percent below 1990 levels by 2025; and reduce GHG emissions by 80 percent below 1990 levels by 2050.[29] The City's GHG reduction targets are consistent with—in fact, more ambitious than—those set forth in Governor Brown's recent EO B-30-15 by targeting a 40 percent reduction by 2025 rather than a 40 percent reduction by 2030.

San Francisco Greenhouse Gas Reduction Strategy

San Francisco has developed a number of plans and programs to reduce the City's contribution to global climate change and to meet the goals of the City's Greenhouse Gas Reduction Ordinance. San Francisco's *Strategies to Address Greenhouse Gas Emissions*[30] documents the City's actions to pursue cleaner energy, energy conservation, alternative transportation and solid waste policies. For instance, the City has implemented mandatory requirements and incentives that have measurably reduced GHG emissions including, but not limited to, increasing the energy efficiency of new and existing buildings, installing solar panels on building roofs, implementing a green building strategy, adopting a zero waste strategy, adopting a construction and demolition debris recovery ordinance, creating a solar energy generation subsidy, incorporating alternative fuel vehicles in the City's transportation fleet (including buses), and adopting a mandatory recycling and composting ordinance. The strategy also includes 30 specific regulations for new development that would reduce a project's GHG emissions. These GHG reduction actions have resulted in a 23.3 percent reduction in GHG emissions in 2012 compared to 1990 levels,[31] exceeding the year 2020 reduction goals in the BAAQMD's Clean Air Plan, EOs S-3-05 and B-30-15, and AB 32.

IMPACTS AND MITIGATION MEASURES

SIGNIFICANCE THRESHOLDS

The thresholds for determining the significance of impacts in this analysis are consistent with the environmental checklist in Appendix G of the State CEQA Guidelines, which has been modified

[29] City and County of San Francisco, *Greenhouse Gas Emissions Targets and Departmental Action Plans*, May 2008. Available online at http://environment.sanfranciscocode.org/9/. Accessed May 26, 2016.

[30] San Francisco Planning Department, *Strategies to Address Greenhouse Gas Emissions in San Francisco*, November 2010. Available online at http://sfmea.sfplanning.org/GHG_Reduction_Strategy.pdf. Accessed March 3, 2016.

[31] ICF International, *Technical Review of the 2012 Community-wide Inventory for the City and County of San Francisco*, January 21, 2015. Available online at http://sfenvironment.org/download/2012-community-greenhouse-gas-inventory-3rd-party-verification-memo-january-2015. Accessed May 26, 2016.

by the San Francisco Planning Department. The Proposed Project would have a potentially significant impact related to GHG emissions if the project were to:

H.1 Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment; or,

H.2 Conflict with any applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases.

APPROACH TO ANALYSIS

GHG emissions and global climate change represent cumulative impacts. GHG emissions cumulatively contribute to the significant adverse environmental impacts of global climate change. No single project could generate enough GHG emissions to noticeably change the global average temperature; instead, the combination of GHG emissions from past, present, and future projects and activities has contributed and will contribute to global climate change and its associated environmental impacts.

The BAAQMD has prepared guidelines and methodologies for analyzing GHGs. These guidelines are consistent with CEQA Guidelines Sections 15064.4 and 15183.5, which address the analysis and determination of significant impacts from a proposed project's GHG emissions. CEQA Guidelines Section 15064.4 allows lead agencies to rely on a qualitative analysis to describe GHG emissions resulting from a project. CEQA Guidelines Section 15183.5 allows for public agencies to analyze and mitigate GHG emissions as part of a larger plan for the reduction of greenhouse gases and describes the required contents of such a plan. Accordingly, San Francisco has prepared its own greenhouse gas reduction strategy (described above), which the BAAQMD has reviewed and concluded that "aggressive GHG reduction targets and comprehensive strategies like San Francisco's help the Bay Area move toward reaching the State's AB 32 goals, and also serve as a model from which other communities can learn."[32]

The following analysis of the Proposed Project's impact on climate change focuses on the project's contribution to cumulatively significant GHG emissions. Because no individual project could emit GHGs at a level that could result in a significant impact on the global climate, this analysis is in a cumulative context, and this section does not include an individual project-specific impact statement.

[32] BAAQMD, letter from J. Roggenkamp to B. Wycko, San Francisco Planning Department, October 28, 2010. Available online at http://www.sf-planning.org/ftp/files/MEA/GHG-Reduction_Letter.pdf. Accessed November 2, 2015.

PROJECT FEATURES

The Proposed Project entails the development of the 28-Acre Site and the Illinois Parcels and would include residential, commercial-office, and retail/arts/light-industrial (RALI) uses. Under the provisions of the proposed SUD, the Proposed Project would provide a flexible land use program, under which certain parcels could be developed for primarily commercial-office or residential uses. In addition, two parcels on the project site that would be designated for district structured parking, Parcels C1 and C2, could be developed with either residential or commercial-office uses depending on future market demand and future transportation network changes. Project construction is anticipated to commence in 2018 and would be phased over an approximately 11-year period, concluding in 2029.

The Proposed Project would be a high-density, mixed-use infill development in a transit-oriented area of the City. Under the Maximum Residential Scenario, 1,142 Class I and 514 Class II bicycle parking spaces would be provided. Class II bicycle parking would also be provided at key entrance areas of the major open spaces. Under the Maximum Commercial Scenario, 995 Class I and 475 Class II bicycle parking spaces would be provided. Both scenarios would include construction of Class 2 facilities (bicycle lanes) and Class 3 facilities (shared-lane markings and signage) on 20th, 22nd, and Maryland streets. A Class 1 separated bicycle and pedestrian facility would be provided along the Bay Trail and Blue Greenway the length of the project site along the shoreline.

The Proposed Project would include a Transportation Plan, which would include the establishment of a Transportation Management Association (TMA) to manage implementation of Transportation Demand Management (TDM) measures at the site. Through the TMA, the Proposed Project would implement a number of amenities and education strategies regarding transportation choices, including real-time occupancy data for shared parking facilities, on-street carshare spaces, unbundled parking for residents, preferential treatment for high-occupancy vehicles, a website, brochures and a newsletter, as well as a dedicated Transportation Coordinator staff person.

The Proposed Project would comply with San Francisco Green Building Requirements for energy efficiency in new buildings. Energy-efficient appliances and energy-efficient lighting would be installed in the three rehabilitated historic buildings. At least 15 percent of the roof area of all proposed buildings (excluding existing Buildings 2, 12, and 21) would include roof-mounted or building-integrated solar photovoltaic (PV) systems and/or roof-mounted solar thermal hot water systems. However, the project sponsor estimates that up to 6.5 MW of solar PV panel arrays

could be located on the 600,000 sq. ft. of available unshaded roof area.[33] Over 6 MW of solar panels could offset the equivalent of 25 percent of the Proposed Project's total energy cost, assuming that 70 percent of available unshaded roof area is devoted to PV due to maintenance and other rooftop space requirements.[34]

The Proposed Project includes the installation of a recycled water system, and buildings would use recycled water for all uses authorized by the State. The Proposed Project would include the diversion and reuse of graywater and rainwater for toilet and urinal flushing and irrigation for buildings larger than 250,000 square feet. Although the City does not currently have an available source of recycled water, the project sponsors would install temporary recycled water systems to provide non-potable water for activities such as irrigation, cooling, and/or toilet and urinal flushing.

The Proposed Project would use Low Impact Design features to decrease storm water flow in accordance with San Francisco Green Building Requirements, Stormwater Management Ordinance, and the Stormwater Design Guidelines. No street trees would be removed, and new street trees would be planted along designated street segments, for a total of approximately 108 street trees. Street trees would be planted in accordance with Public Works Code Section 806(d), except for areas around the historic core, where Secretary of the Interior Standards for the Treatment of Historic Properties would be applied.

Other GHG-reducing measures include water-conserving interior features, convenient recycling and composting, and other features consistent with San Francisco's requirements. The project sponsor has prepared a Sustainability Plan that summarizes how the Pier 70 Mixed-Use District Project would attain social, economic, and environmental sustainability over the course of the Proposed Project's design, implementation, and operation.[35] Many of these features would serve to reduce energy and water consumption, which, in turn, would reduce GHG emissions. (Reductions in water use save energy that would otherwise be used to transport and treat the water.)

[33] See Memorandum to Kelly Pretzer, Forest City, from Melissa Higbee, AECOM, re: Assumptions for Pier 70 Energy Calculations, November 25, 2015, pp. 5-7.
[34] Forest City, *Pier 70 Sustainability Plan*, Draft, January 2016, p. 60.
[35] Forest City, *Pier 70 Sustainability Plan*, Draft, January 2016.

IMPACT EVALUATION

Impact C-GG-1: The Proposed Project would generate GHG emissions, but not at levels that would result in a significant impact on the environment or conflict with any policy, plan, or regulation adopted for the purpose of reducing GHG emissions. (*Less than Significant*)

Individual projects contribute to the cumulative effects of climate change by directly or indirectly emitting GHGs during construction and operational phases. Direct operational emissions include GHG emissions from new vehicle trips and area sources (natural gas combustion). Indirect emissions include emissions from electricity providers; energy required to pump, treat, and convey water; and emissions associated with waste removal, disposal, and landfill operations.

The Proposed Project would increase the intensity of use of the site through development of new residential, commercial, and RALI uses. Therefore, the Proposed Project would contribute to annual long-term increases in GHGs as a result of approximately 31,016 daily vehicle trips under the Maximum Residential Scenario and 34,790 daily vehicle trips under the Maximum Commercial Scenario (refer to Section 4.E, Transportation and Circulation, for further information regarding vehicle trip generation). Additional long-term increases in GHGs from residential and commercial operations associated with energy use, water use and wastewater treatment, and solid waste disposal would also occur. Construction activities would also result in increases in GHG emissions over the approximately 11-year construction period.

The Proposed Project would be subject to regulations adopted to reduce GHG emissions as identified in the GHG reduction strategy. All new buildings and additions to existing buildings under the Proposed Project (including those on Port property) would comply with the San Francisco Green Building Ordinance requirements of the San Francisco Green Building Code. As discussed below, compliance with the applicable regulations would reduce the project's GHG emissions related to transportation, energy use, waste disposal, wood burning, and use of refrigerants.

The Proposed Project would be subject to and would comply with GHG reduction measures as shown in Table 4.H.2: Regulations Applicable to the Proposed Project. Applicable regulations in Table 4.H.2 are organized by GHG sectors (e.g., transportation, energy efficiency, renewable energy, etc.) to provide direct correlation between the Proposed Project's sources of GHG emissions and regulations that would reduce those emissions. Both the Maximum Residential Scenario and the Maximum Commercial Scenario and each of the sewer and grading options would comply with San Francisco's Greenhouse Gas Reduction Strategy, and there is no substantive difference between the Maximum Residential Scenario and the Maximum Commercial Scenario with regard to GHG emissions; however, scenario-specific alterations in design, if applicable to GHG-related regulations, are shown in Table 4.H.2, pp. 4.H.13-4.H.28.

Table 4.H.2: Regulations Applicable to the Proposed Project

Regulation	Requirements	Remarks
Transportation Sector		
Commuter Benefits Ordinance (San Francisco Environment Code Section 427)	All employers of 20 or more employees nationwide must provide at least one of the following benefit programs: (1) A Pre-Tax Election consistent with 26 U.S.C. § 132(f), allowing employees to elect to exclude from taxable wages and compensation, employee commuting costs incurred for transit passes or vanpool charges, or (2) Employer Paid Benefit whereby the employer supplies a transit or vanpool subsidy for each Covered Employee. The subsidy must be at least equal in value to the current cost of the Muni Fast Pass including BART travel, or (3) Employer Provided Transportation furnished by the employer at no cost to the employee in a vanpool or bus, or similar multi-passenger vehicle operated by or for the employer.	All employers of the proposed commercial uses with 20 or more employees nationwide are required to provide at least one of the benefit programs set forth in the Commuter Benefits Ordinance.
Emergency Ride Home Program	All San Francisco companies are eligible to register for the Emergency Ride Home program. Employers must register annually. Once registered, all San Francisco employees of the company are eligible to request reimbursement.	Participation in the Emergency Ride Home Program would be part of the Transportation Demand Management (TDM) Program, and all San Francisco employees of those companies would be eligible for the benefits and services provided by the program.

Table 4.H-2 Continued

Regulation	Requirements	Remarks
Transportation Management Programs (San Francisco Planning Code Section 163)	Requires new buildings or additions over a specified size (buildings >25,000 square feet or 100,000 square feet depending on the use and zoning district) within certain zoning districts (including downtown and mixed-use districts in the City's eastern neighborhoods and south of market) to implement a Transportation Management Program and provide on-site transportation management brokerage services for the life of the building.	Prior to issuance of a temporary permit of occupancy, the project sponsors shall execute an agreement with the Director of Planning to implement an on-site transportation brokerage service and transportation management program. The Proposed Project would include a Transportation Plan intended to manage transportation demands and to encourage sustainable transportation choices, consistent with the City of San Francisco's Transit First, Better Streets, Climate Action, and Transportation Sustainability Plans and Policies. The Transportation Plan would include the establishment of a Transportation Management Association (TMA) to manage implementation of Transportation Demand Management (TDM) measures at the site. Through the TMA, the Proposed Project would implement a number of amenities and education strategies regarding transportation choices, including real-time occupancy data for shared parking facilities, on-street carshare spaces, unbundled parking for residents, preferential treatment for high-occupancy vehicles, a website, production of brochures and newsletter, as well as a dedicated Transportation Coordinator staff person.
Transportation Sustainability Fee (San Francisco Planning Code Section 411A)	Establishes Citywide fees for all new development. Fees based on a proportion of the gross area of the project based on the type of use. Fees are paid to the Department of Building Inspection and provided to the San Francisco Municipal Transportation Agency and regional providers to improve transit services.	Developers of future buildings at the project site would comply with this requirement by paying the Transportation Sustainability Fee for all applicable economic activity categories or subcategories.

Table 4.H-2 Continued

Regulation	Requirements	Remarks
Jobs-Housing Linkage Program (San Francisco Planning Code Section 413)	The Jobs-Housing Program found that new large scale developments attract new employees to the City who require housing. The program is designed to provide housing for those new uses within San Francisco, thereby allowing employees to live close to their place of employment. The program requires a developer to pay a fee or contribute land suitable for housing to a housing developer or pay an in-lieu fee.	The Proposed Project would be mixed-use and would include residential units on-site. Under the Maximum Residential Scenario, up to 3,025 residential units, 1,102,250 gsf of commercial space, and 479,980 gsf of RALI space. Under the Maximum Commercial Scenario, up to 1,645 residential units, 2,262,350 gsf of commercial space, and 486,950 gsf of RALI space. The Proposed Project would meet, or exceed, all below-market rate housing requirements or pay an in-lieu fee. For the 28-Acre Site, 30 percent of all completed residential units would be required to be offered at below market rate prices; and residential units on the Illinois Parcels would be subject to the affordable housing requirements of the City's Affordable Inclusionary Housing Ordinance. Further, under Board of Supervisors Resolution No. 54-14, if the City exercises its option to purchase the Hoedown Yard from PG&E, proceeds from the sale of the Hoedown Yard would be directed to the City's HOPE SF housing program, which includes the Potrero Terrace and Annex HOPE SF project. Additionally, developers of future buildings at the project site would comply with this requirement by paying the Jobs Housing Linkage Fee for all applicable economic activity categories or subcategories.

Table 4.H-2 Continued

Regulation	Requirements	Remarks
Bicycle Parking, Showers, and Lockers in New and Expanded Buildings (San Francisco Planning Code Sections 155.1-155.4)	Requires bicycle facilities for new and expanded buildings, new dwelling units, change of occupancy, increase of use intensity, and added parking capacity/area. Refer to Section 155.2 and 155.3 for requirements by use. Non-residential projects that add 10 or more parking spaces must: meet Planning Code Section 155 and CalGreen 5.106.4 (provide short and long-term (secure) bicycle parking for at least 5 percent of motorized vehicle capacity), whichever is stricter.	The Maximum Residential Scenario would provide up to approximately 1,142 Class 1 and 514 Class 2 bicycle parking spaces in compliance with San Francisco Planning Code, Section 155.1-155.4. The Maximum Commercial Scenario would provide up to approximately 995 Class 1 and 475 Class 2 bicycle parking spaces in compliance with San Francisco Planning Code, Section 155.1-155.4. Bicycle amenities (showers and lockers) would be provided in accordance with Planning Code requirements for both scenarios. In addition, the *Pier 70 SUD Design for Development* may require bike-share stations at Maryland Street between 21st and 22nd streets and if no other bike-share locations are in the Dogpatch neighborhood, at the intersection of Illinois Street and 20th Street. Existing commercial buildings would have up to approximately 12 Class I and 3 Class II bicycle parking spaces in the Maximum Residential Scenario. In the Maximum Commercial Scenario, existing commercial buildings would have up to approximately 33 Class I and 7 Class II bicycle parking spaces. These bicycle parking figures are included in the totals in the above paragraph.
Bicycle parking in parking garages (San Francisco Planning Code Section 155.2)	(C) Garages with more than 500 automobile spaces shall provide 25 spaces plus one additional space for every 40 automobile spaces over 500 spaces, up to a maximum of 50 bicycle parking spaces. Where parking capacity is increased by 10 or more spaces, CalGreen 5.106.4 applies.	Up to two parking structures and several parking facilities may be constructed at the project site with automobile parking spaces. If the garage(s) or underground facilities contain more than 500 automobile spaces, the required amount of bicycle parking spaces would be included. For the Maximum Residential Scenario, this is estimated at up to approximately 169 Class 2 spaces. In the Maximum Commercial Scenario, this is estimated at approximately 175 Class 2 spaces. Note that the Class 2 bicycle parking spaces are included in the overall bicycle parking figures provided in the Planning Code Sections 155.1-155.4 description, above.

Table 4.H-2 Continued

Regulation	Requirements	Remarks
Bicycle parking in Residential Buildings (San Francisco Planning Code Section 155.2)	Class 1 Bicycle Parking Spaces: (A) For projects up to 100 dwelling units, one Class 1 space for every 2 dwelling units, or (B) For projects over 100 dwelling units, one Class 1 space for every dwelling unit plus one Class 1 space for every 4 dwelling units over 100. Class 2 Bicycle Parking Spaces: One Class 2 space for every 20 dwelling units.	The Maximum Residential Scenario would provide up to approximately 906 Class 1 and 151 Class 2 bicycle parking spaces in compliance with, or in excess of, the San Francisco Planning Code, Section 115.1-155.4. The Maximum Commercial Scenario would provide up to approximately 561 Class 1 and 82 Class 2 bicycle parking spaces in compliance with, or in excess of, the San Francisco Planning Code, Section 115.1-155.4. Note that the Class 1 and Class 2 bicycle parking spaces are included in the overall bicycle parking figures provided in the Planning Code Sections 155.1-155.4 description, above.
San Francisco Green Building Requirements for Fuel Efficient Vehicle and Carpool Parking (San Francisco Green Building Code Section 5.106.5, CalGreen Sections 5.106.5 and 5.710.6.3)	Requires New Large Commercial projects, New High-rise Residential projects and Commercial Interior projects to provide designated parking for low-emitting, fuel efficient, and carpool/van pool vehicles. Mark 8 percent of parking stalls for such vehicles. For non-residential additions and interior alterations to existing buildings, the regulation applies for projects that would add 10 or more parking spaces to the project site.	The Proposed Project would comply with the San Francisco Green Building Requirements for designated parking as applicable and required. For the Maximum Residential Scenario, up to approximately 88 parking spaces for low-emitting, fuel efficient and carpool/vanpool vehicles would be designated. For the Maximum Commercial Scenario, up to approximately 181 spaces would be designated.
Car Sharing Requirements (San Francisco Planning Code Section 166)	New residential projects or renovation of buildings being converted to residential uses within most of the City's mixed-use and transit-oriented residential districts are required to provide car share parking spaces.	The Proposed Project would comply with San Francisco Planning Code Section 166, requirements for car-share parking spaces. Car share pods would be located throughout the project site, in compliance with Section 166, to reduce the need amongst on-site residents, visitors, and employees for privately owned automobiles and parking. In total, approximately 45 car share parking spaces would be provided in both the Maximum Residential and Maximum Commercial Scenarios.

Table 4.H-2 Continued

Regulation	Requirements	Remarks
Energy Efficiency Sector (includes water use reduction regulations)		
San Francisco Health Code Article 12C: Alternate Water Sources for Non-Potable Applications	Requires new buildings of 250,000 sf or more of gross floor area be constructed, operated, and maintained using available alternate water sources for toilet and urinal flushing and irrigation; that new buildings of 40,000 sf or more of gross floor area prepare water budget calculations; and that subdivision approval requirements include compliance with Article 12C.	The Proposed Project would comply with San Francisco Health Code Article 12C. Although the City does not currently have an available source of recycled water, the project sponsors would install recycled water systems to provide the project site with non-potable water needs, such as irrigation, cooling, and/or toilet and urinal flushing. Accordingly, the Proposed Project include the installation of recycled water pipelines beneath existing and proposed streets within the project area as shown on Figure 2.20: Proposed Recycled Water Distribution System. These lines would temporarily connect to the in-City, low-pressure water system at the intersection of 22nd Street with Illinois Street and the intersection of 20th Street with the proposed Louisiana Street. Backflow prevention devices would be installed at each connection to prevent backflow from the recycled water system to the potable low-pressure water system. Once the City's recycled water system is constructed, the Proposed Project's recycled water pipelines would connect to the City's recycled water system. The Eastside Recycle Water Project system is currently in the planning phase and is anticipated to be completed in 2029. Upon completion, the system is planned to connect to the project site.

Table 4.H-2 Continued

Regulation	Requirements	Remarks
San Francisco Green Building Requirements for Energy Efficiency (San Francisco Green Building Code Sections 4.101, 4.103, 5.103)	Demonstrate compliance with Title 24 Part 6 (2013) Energy Standards, and additionally meet energy efficiency prerequisites of the applicable green building rating system: • GreenPoint Rated: demonstrate a 10 percent compliance margin • LEED for Homes (including midrise): demonstrate a 10 percent compliance margin • LEED BD+C 2009: No compliance margin requirement.	The Proposed Project would comply with the San Francisco Green Building Requirements related to energy efficiency. The project sponsors or developers of future buildings on the project site shall provide documentation demonstrating that the Title 24 Part 6 (2013) Energy Standards would be met, including the compliance margin required for the certification system chosen by the project sponsors (GreenPoint Rated or LEED Gold). The proposed buildings would exceed by 5 percent the energy efficiency requirements of Title 24 Part 6 (2013) Energy Standards, or, if Title 24 is updated in the future, the project sponsors would comply with the then-current requirements.
San Francisco Green Building Requirements: Commissioning of Building Energy and Water Systems (LEED EA3, San Francisco Green Building Code Section 5.103.1.4, CalGreen Sections 5.410.2 and 5.410.4.)	New non-residential buildings and alterations to non-residential buildings must conduct design and construction commissioning to verify energy and water using components meet the owner's or owner representative's project requirements. Commissioning requirements apply to all building operating systems covered by Title 24 Part 6, as well as process equipment and controls, and renewable energy systems. • New non-residential projects ≥25,000 sq ft: complete Enhanced Commissioning of Building Energy Systems (meeting LEED EAc3 – SFGBC 5.103.1.4 and CalGreen 5.410.) • Non-residential new buildings and alterations <25,000 square feet and ≥10,000 square feet: commission all energy systems (CalGreen 5.410) • Non-residential new buildings and alterations less than 10,000 square feet, must complete testing and adjusting of energy systems. (CalGreen 5.410.4) • New residential high rise, new commercial interior, and Major Alterations to Residential buildings must each commission building energy systems, meeting the LEED prerequisite EAp1.	All new non-residential buildings and additions to non-residential buildings under the Proposed Project would comply with the San Francisco Green Building Requirements related to the commissioning of building energy and water systems as well as commissioning requirements of Title 24 Part 6.

Table 4.H-2 Continued

Regulation	Requirements	Remarks
San Francisco Stormwater Management Ordinance (Public Works Code, Article 4.2)	All projects disturbing more than 5,000 square feet of ground surface must manage stormwater on-site using low impact design. Comply with the Stormwater Management Ordinance, including SFPUC Stormwater Design Guidelines.	The Proposed Project is subject to these requirements because it would involve disturbance of more than 5,000 square feet of ground surface. The Proposed Project would use Low Impact Design features to decrease storm water flow. The Proposed Project would comply with all City requirements related to stormwater management, including the San Francisco Green Building Requirements, the San Francisco Stormwater Management Ordinance, and the SFPUC's Stormwater Design Guidelines.
San Francisco Green Building Requirements for water use reduction (San Francisco Green Building Code Sections 4.103.2.2 and 5.103.1.2, CalGreen Sections 4.303.1 and 5.303.2-5.303.6)	All new buildings must comply with current CA water fixture and fitting efficiency requirements. All fixtures and fittings within areas of alteration, or serving areas of alteration, must be upgraded to current CA and San Francisco fixture and fitting water efficiency requirements. (For local requirements applicable to alterations, see Commercial Water Conservation Ordinance and Residential Water Conservation Ordinance below.) Additionally: • New large commercial and high-rise residential projects need to: incorporate fixtures and fittings cutting water consumption by a total of 30 percent (LEED WEc3)	The Proposed Project would comply with the San Francisco Green Building Requirements related to water use reduction. For example, to reduce potable water demand, high-efficiency fixtures and appliances would be installed in new buildings, and fixtures in existing buildings would be retrofitted. Further, although the City does not currently have an available source of recycled water, the project sponsors would install recycled water systems to provide non-potable water for activities such as irrigation, cooling, and/or toilet and urinal flushing. Once the City's recycled water system is constructed, the Proposed Project's recycled water pipelines would connect to the City's recycled water system.

Table 4.H-2 Continued

Regulation	Requirements	Remarks
Commercial Water Conservation Ordinance (San Francisco Building Code, Chapter 13A)	Requires all alterations to existing commercial properties to achieve the following: 1. If showerheads have a maximum flow >2.5 gallons per minute (gpm), replace with ≤2.0 gpm. 2. All showers have no more than one showerhead per valve. 3. If faucets and faucet aerators have a maximum flow rate >2.2 gpm, replace with unit meeting current code: • Non-residential lavatory: ≤0,4 gpm • Kitchen faucet: ≤0.8 gpm • Metering faucet: ≤0.2 gal/cycle 4. If toilets have a maximum rated water consumption >1.6 gallons per flush (gpf), replace with ≤1.28 gpf toilet. 5. If urinals have a maximum flow rate >1.0 gpf, replace with ≤0.5 gpf unit. 6. Repair all water leaks.	Existing operable structures on the project site would be required to comply with this subject ordinance by January 1, 2017. To reduce potable water demand, high-efficiency fixtures and appliances would be installed in new buildings, and fixtures in existing buildings would be retrofitted.

Table 4.H-2 Continued

Regulation	Requirements	Remarks
Residential Water Conservation Ordinance (San Francisco Building Code, Housing Code, Chapter 12A)	Requires all residential properties (existing and new), prior to sale, to upgrade to the following minimum standards: 1. If showerheads have a maximum flow >2.5 gpm, replace with ≤2.0 gpm. 2. All showers have no more than one showerhead per valve. 3. If faucets and faucet aerators have a maximum flow rate >2.2 gpm, replace with unit meeting current code: • Non-residential lavatory: ≤0.4 gpm • Residential lavatory: ≤1.5 gpm • Kitchen faucet: ≤0.8 gpm • Metering faucet: ≤0.2 gal/cycle 4. If toilets have a maximum rated water consumption >1.6 gpf, replace with ≤1.28 gpf toilet 5. If urinals have a maximum flow rate >1.0 gpf, replace with ≤0.5 gpf unit. 6. Repair all water leaks. Although these requirements apply to existing buildings, compliance must be completed through the Department of Building Inspection, for which a discretionary permit (subject to CEQA) would be issued.	The Proposed Project would comply with this requirement by meeting the standards set forth in the Residential Water Conservation Ordinance. To reduce potable water demand, high-efficiency fixtures and appliances would be installed in new buildings, and fixtures in existing buildings would be retrofitted.

Table 4.H-2 Continued

Regulation	Requirements	Remarks
San Francisco Water Efficient Irrigation Ordinance (San Francisco Administrative Code Chapter 63)	Projects that include 500 square feet (sf) or more of new or modified landscape are subject to this ordinance, which requires that landscape projects be installed, constructed, operated, and maintained in accordance with rules adopted by the SFPUC that establish a water budget for outdoor water consumption. Tier 1: 1,000 square feet <= project's modified landscape <2,500 sf Tier 2: (A) New project landscape area is greater than or equal to 500 sf or; (B) the project's modified landscape area is greater than or equal to 2,500 sf. Note: Tier 2 compliance requires the services of landscape professionals. See the SFPUC Web site for information regarding exemptions to this requirement. www.sfwater.org/landscape	The Proposed Project would be subject to Tier 2 requirements because it includes a new landscape area greater than or equal to 500 sf. The Proposed Project would be in compliance with rules adopted by the SFPUC for Tier 2 project landscaping. Although the City does not currently have an available source of recycled water, the project sponsors would install temporary recycled water systems to provide the project site with non-potable water needs, such as irrigation, cooling, and/or toilet and urinal flushing. Once the City's recycled water system is constructed, the recycled water pipelines would connect to the City's recycled water system.
San Francisco Existing Commercial Buildings Energy Performance Ordinance (San Francisco Environment Code Chapter 20)	Owners of nonresidential buildings in San Francisco with ≥10,000 square feet that are heated or cooled must conduct energy efficiency audits, as well as to annually measure and disclose energy performance. Certain exceptions apply for new construction or if specified performance criteria are met.	All of the three existing buildings to remain would comply with San Francisco Environment Code Chapter 20 by benchmarking energy use every year and receiving an energy audit every five years unless performance criteria are met through renovation.
Light Pollution Reduction (CalGreen Section 5.106.8)	For nonresidential projects, comply with lighting power requirements in CA Energy Code, CCR Part 6. Meet California Energy Code minimum for Lighting Zones 1-4 with Backlight/Uplight/Glare ratings meeting CalGreen Table 5.106.8.	The Proposed Project would comply with San Francisco Green Building Requirements for light pollution reduction as applicable and required.

Table 4.H-2 Continued

Regulation	Requirements	Remarks
Renewable Energy		
San Francisco Green Building Requirements for Renewable Energy (San Francisco Green Building Code Section 4.201.2)	Newly constructed residential and non-residential buildings of 10 occupied floors or less shall install solar photovoltaic systems and/or solar thermal systems in the solar zone required by California Code of Regulations, Title 24, Part 6 Section 110.10.	The Proposed Project would include for roof-mounted or building-integrated solar photovoltaic (PV) systems and/or roof-mounted solar thermal hot water systems for all proposed buildings, excluding existing Buildings 2, 12, and 21. At least 15 percent of the roof area would include roof-mounted or building-integrated solar PV systems and/or roof-mounted solar thermal hot water systems in residential and commercial buildings. These systems would partially offset the energy demands of the associated buildings.
Waste Reduction Sector		
Mandatory Recycling and Composting Ordinance (San Francisco Environment Code, Chapter 19 and CalGreen Section 5.410.1)	All persons in San Francisco are required to separate their refuse into recyclables, compostables and trash, and place each type of refuse in a separate container designated for disposal of that type of refuse. (San Francisco Environment Code Chapter 19) All new construction, renovation and alterations must provide for the storage, collection, and loading of recyclables, compost and solid waste in a manner that is convenient for all users of the building. (San Francisco Environment Code Chapter 19 and CalGreen 5.410.1)	Under the Proposed Project, typical trash collection trucks would drive around the project site to pick up solid waste from each individual building separated by residents and businesses into recyclables, compostables, and trash for the landfill. The Proposed Project would comply with San Francisco's Green Building Requirements by providing for recycling, compost, and solid waste collection and loading that is convenient for all users.
San Francisco Construction and Demolition Debris Recovery Ordinance (San Francisco Environment Code, Chapter 14, San Francisco Building Code Chapter 13B, and San Francisco Health Code Section 288)	Applies to all projects: No construction and demolition material may be taken to landfill or placed in the garbage. All (100 percent of) mixed debris must be transported by a registered hauler to a registered facility to be processed for recycling. Source separated material must be taken to a facility that recycles or reuses those materials. Additionally, projects that include full demolition of an existing structure must submit a waste diversion plan to the Director of the Department Environment and the plan must provide for a minimum of 65 percent diversion from landfill of construction and demolition debris, including materials source separated for reuse or recycling.	The Proposed Project would comply with San Francisco Green Building Requirements for construction and demolition debris recovery in connection with the proposed demolition by submitting a waste diversion plan to the Director of the Environment. The Proposed Project would not take construction and demolition material directly to a landfill or place it directly in the garbage.

Table 4.H-2 Continued

Regulation	Requirements	Remarks
San Francisco construction and demolition debris recycling requirements (San Francisco Green Building Code Sections 5.103.1.3 and 4.103.2.3)	In addition to complying with the Construction and Demolition Debris Recovery Ordinance, new commercial buildings of ≥25,000 square feet and new residential buildings of 4 or more occupied floors must develop a plan to divert a minimum of 75 percent of construction and demolition debris from landfill, and meet LEED Materials & Resources Credit 2.	The ordinance applies to the Proposed Project because it would include new commercial buildings of ≥25,000 square feet and new residential buildings of 4 or more occupied floors. The Proposed Project would comply with San Francisco Green Building Requirements for construction and demolition debris recycling by submitting a plan to divert a minimum of 75% of construction and demolition debris from landfill and meeting LEED Materials & Resources Credit 2.
Environment/Conservation Sector		
Street Tree Planting Requirements (San Francisco Public Works Code Section 806(d))	Public Works Code Section 806(d) requires projects that include new construction, significant alterations, new curb cuts, a new garage, or new dwelling units to plant a 24-inch box tree for every 20 feet along the property street frontage.	The Proposed Project would plant street trees in accordance with Public Works Code Section 806(d) including along 22nd Street and Maryland Street. Street trees would be permitted, but not required, along Illinois Street, 20th Street, 21st Street, and Louisiana Street. Secretary of the Interior Standards for the Treatment of Historic Properties would be applied to retain the historic industrial character for areas around the historic core. The *Pier 70 SUD Design for Development* would outline street tree planting requirements that are responsive to features of the Union Iron Works Historic District, and therefore restrict street trees along certain street segments. The Proposed Project would plant street trees along designated street segments, for a total of approximately 108 required street trees.

Table 4.H-2 Continued

Regulation	Requirements	Remarks
Construction Site Runoff Pollution Prevention for New Construction (San Francisco Public Works Code, Article 4.2)	Construction Site Runoff Pollution Prevention requirements depend upon project size, occupancy, and the location in areas served by combined or separate sewer systems. Any project disturbing ≥5,000 square feet of ground surface is required to submit and receive approval of an Erosion and Sediment Control Plan prior to commencing any construction-related activities. The plan must be site-specific, and details the use, location, and emplacement of the sediment and erosion control devices at the project site. All construction sites, regardless of size, must implement BMPs to prevent illicit discharge into the sewer system. For more information on San Francisco's requirements, see www.sfwater.org.	The Proposed Project would comply with all applicable City requirements related to the prevention of construction site runoff pollution, which would include the preparation of an erosion and sediment control plan, a stormwater soil loss prevention plan, or a Stormwater Pollution Prevention Plan.
Enhanced Refrigerant Management (CalGreen Sections 5.508.1.2 and 5.508.2)	Commercial buildings must not install equipment that contains chlorofluorocarbons or halons. Applies to new construction and all alterations. New commercial refrigeration systems containing refrigerants with Global Warming Potential (GWP) of 150 or greater, installed in food stores with 8,000 square feet or more of refrigerated display cases, walk-in coolers or freezers connected to remote compressor units or condensing units: Piping shall meet all requirements of 5.508.2 (all sections), and shall undergo pressure testing during installation prior to evacuation and charging. System shall stand unaltered for 24 hours with no more than a one pound pressure change from 300 psig.	The Proposed Project would comply with applicable requirements for enhanced refrigerant management as applicable and required.
Low-emitting Adhesives, Sealants, Caulks, Paints, Coatings, Composite wood, and Flooring (CalGreen Section 4.504)[36]	Adhesives, sealants, and caulks - Comply with volatile organic compound (VOC) limits in South Coast Air Quality Management District Rule 1168 VOC limits and California Code of Regulations Title 17 for aerosol adhesives. Paints and coatings - Comply with VOC limits in the Air Resources Board Architectural Coatings	The Proposed Project would comply with applicable requirements for low-emitting materials (adhesives, sealants, caulks, paints, coatings, composite wood, and flooring) as applicable and required.

[36] While not a GHG, VOCs are precursor pollutants that form ground level ozone. Increased ground-level ozone is an anticipated effect of future global warming that would result in added health effects locally. Reducing VOC emissions would reduce the anticipated local effects of global warming.

Table 4.H-2 Continued

Regulation	Requirements	Remarks
	Suggested Control Measure and California Code of Regulations Title 17 for aerosol paints. Carpet - All carpet must meet one of the following: 1. Carpet and Rug Institute Green Label Plus Program, 2. California Department of Public Health Standard Practice for the testing of VOCs (Specification 01350), 3. NSF/ANSI 140 at the Gold level, 4. Scientific Certifications Systems Sustainable Choice, OR 5. California Collaborative for High Performance Schools (CHPS) EQ 2.2 and listed in the CHPS High Performance Product Database and carpet cushion must meet Carpet and Rug Institute Green Label, and indoor carpet adhesive & carpet pad adhesive must not exceed 50 gallons per VOC content. Composite wood - Meet CARB Air Toxics Control Measure for Composite Wood, including meeting the emission limits in CalGreen Table 5.504.4.5. Resilient flooring systems - For 80 percent of floor area receiving resilient flooring, install resilient flooring complying with: 1. Certified under the Resilient Floor Covering Institute FloorScore program, 2. Compliant with the VOC-emission limits and testing requirements of California Department of Public Health 2010 Standard Method for the Testing and Evaluation Chambers v.1.1, 3. Compliant with the CHPS EQ2.2 and listed in the CHPS High Performance Product Database, OR 4. Certified under the Greenguard Children & Schools Program to comply with California Department of Public Health criteria.	

Table 4.H-2 Continued

Regulation	Requirements	Remarks
Low-emitting Adhesives, Sealants, Caulks, Paints, Coatings, Composite wood, and Flooring (CalGreen Sections 4.504.2 - all sections)	Interior paints and coatings: Comply with VOC limits in the Air Resources Board Architectural Coatings Suggested Control Measure and California Code of Regulations Title 17 for aerosol paints. See CalGreen Table 4.504.3 for details. Aerosol paints and coatings - Meet BAAQMD VOC limits (Regulation 8, Rule 49) and Product-Weighted Maximum Incremental Reactivity Limits for Reactive Organic Compound. (California Code of Regulations Title 17, Section 94520) Caulks, Construction adhesives, and Sealants - Meet South Coast Air Quality Management District Rule 1168. See CalGreen Tables 4.504.1 and 4.504.2. Composite Wood - Meet CARB Airborne Toxic Control Measure formaldehyde limits for composite wood. See CalGreen Table 4.504.5.	The Proposed Project would comply with applicable requirements for low-emitting materials (adhesives, sealants, caulks, paints, coatings, composite wood, and flooring) as applicable and required.
Wood Burning Fireplace Ordinance (San Francisco Building Code, Chapter 31, Section 3111.3; CalGreen Sections 4.503.1 and 5.503.1)	Bans the installation of wood burning fire places (except those that are designed for food preparation in new or existing restaurants or bakeries) except for direct-vent or sealed combustion units compliant with EPA Phase II limits (CalGreen 4.503.1 and 5.503.1) and at least one of the following: • Pellet-fueled wood heater • EPA approved wood heater • Wood heater approved by the Northern Sonoma Air Pollution Control District	This Proposed Project would not include the installation of wood burning fireplaces. To the extent wood burning fireplaces designed for food preparation in new restaurants and bakeries are included, they would comply with applicable requirements.

Note: The GHG Analysis Compliance Checklist for the Pier 70 Mixed-Use District Project has been prepared for the Proposed Project and variants. However, the GHG Checklist provided in the EIR (Table 4.H.2: Regulations Applicable to the Proposed Project) analyzes only the Proposed Project. A GHG emissions analysis for the project variants is provided separately in Chapter 6, Project Variants.

Source: San Francisco Planning Department, GHG Analysis Compliance Checklist for the Pier 70 Mixed-Use District Project, dated November 18. 2015

Compliance with the City's Commuter Benefits Program, transportation management programs, Transportation Sustainability Fee, Jobs-Housing Linkage Program, bicycle parking requirements, low-emission car parking requirements, and car sharing requirements would reduce the Proposed Project's transportation-related emissions.[37] The regulations reduce GHG emissions from single-occupancy vehicles by promoting the use of alternative transportation modes with zero or lower GHG emissions on a per capita basis.

The Proposed Project would be required to comply with the energy efficiency requirements of the City's Green Building Code, Stormwater Management Ordinance, Water Conservation and Irrigation ordinances, and Energy Conservation Ordinance, which would promote energy and water efficiency, thereby reducing the Proposed Project's energy-related GHG emissions.[38] Additionally, the project would be required to meet the renewable energy criteria of the Green Building Code, further reducing the project's energy-related GHG emissions.

The Proposed Project's waste-related emissions would be reduced through compliance with the City's Recycling and Compositing Ordinance, Construction and Demolition Debris Recovery Ordinance, and Green Building Code requirements. These regulations reduce the amount of materials sent to a landfill, reducing GHGs emitted by landfill operations. These regulations also promote reuse of materials, conserving their embodied energy[39] and reducing the energy required to produce new materials.

Compliance with the City's Street Tree Planting requirements would serve to increase carbon sequestration. Other regulations, including those limiting refrigerant emissions and the Wood Burning Fireplace Ordinance would reduce emissions of GHGs and black carbon, respectively. Regulations requiring low-emitting finishes would reduce volatile organic compounds (VOCs).[40] Thus, the Proposed Project was determined to be consistent with San Francisco's GHG reduction strategy.[41]

The project sponsors are required to comply with these regulations, which have proven effective as San Francisco's GHG emissions have measurably decreased when compared to 1990

[37] The Proposed Project would be required to meet the objectives of the Transportation Demand Management (TDM) Ordinance. The TDM Ordinance requires development projects to incorporate design features, incentives, and tools that support alternative forms of transportation.

[38] Compliance with water conservation measures reduce the energy (and GHG emissions) required to convey, pump and treat water required for the project.

[39] Embodied energy is the total energy required for the extraction, processing, manufacture and delivery of building materials to the building site.

[40] While not a GHG, VOCs are precursor pollutants that form ground level ozone. Increased ground level ozone is an anticipated effect of future global warming that would result in added health effects locally. Reducing VOC emissions would reduce the anticipated local effects of global warming.

[41] San Francisco Planning Department, *Greenhouse Gas Analysis: Compliance Checklist for Pier 70 Mixed-Use District Project*, November 18, 2015.

emissions levels, demonstrating that the City has met and exceeded EO S-3-05, AB 32, Clean Air Plan GHG reduction goals for the year 2020. Other existing regulations, such as those implemented through AB 32, will continue to reduce a proposed project's contribution to climate change. In addition, San Francisco's local GHG reduction targets are consistent with the long-term GHG reduction goals of EO S-3-05, EO B-30-15, AB 32, and the Clean Air Plan.

Furthermore, as discussed in the Regulatory Setting section above, the land use strategy in *Plan Bay Area* is intended to meet the per-capita GHG reduction targets of 7 percent by 2020 and 15 percent by 2035 from 2005 levels. *Plan Bay Area's* land use strategy is to promote future development around existing and planned transit nodes. New development areas that would support the day-to-day needs of residents and workers in a pedestrian-friendly environment served by transit are identified as Priority Development Areas (PDAs) in *Plan Bay Area*. As stated in the *Plan Bay Area Environmental Impact Report*, implementation of the land use and transportation strategies in *Plan Bay Area* would reduce GHG emissions by 15 percent between 2010 and 2040.[42] *Plan Bay Area* meets the requirements of SB 375 by developing an integrated transportation and land use plan that would attain per-capita GHG emissions reduction targets of 7 percent by 2020 and 15 percent by 2035 from 2005 levels.[43]

Because the Proposed Project would be located within a PDA, consistent with *Plan Bay Area's* land use strategy, it would assist in reducing projected levels of regional GHG land use emissions. Furthermore, because it is located within a PDA and would provide housing and commercial uses within the PDA, the Proposed Project would be consistent with *Plan Bay Area* and would further the State and regional goals of accommodating growth in ways that would reduce GHG emissions.

Therefore, because the Proposed Project is consistent with the City's GHG reduction strategy, it is also consistent with the GHG reduction goals of EO S-3-05, EO B-30-15, AB 32, and the Clean Air Plan, would not conflict with these plans, and would therefore not exceed San Francisco's applicable GHG threshold of significance. As such, the Proposed Project would result in a less-than-significant impact with respect to GHG emissions. No mitigation measures are necessary.

While the Proposed Project would result in a less-than-significant impact from GHG emissions, it is worth noting that a number of mitigation measures identified in this EIR would also have the added co-benefit of even further reducing GHG emissions from the Proposed Project. These mitigation measures and an explanation of how they would reduce the project's GHG emissions are described below.

[43] ABAG and Metropolitan Transportation Commission, *Environmental Impact Report for Plan Bay Area*, Draft, April 2013. p. ES-5.

Mitigation Measure M-AQ-1g: Transportation Demand Management, shown in Section 4.G, Air Quality, on pp. 4.G.47-4.G.50, would require the reduction of the project's one-way vehicle trips by 20 percent through the implementation of Transportation Demand Management (TDM) strategies. Components of the TDM Plan would encourage use of transit and non-motorized modes of transportation which would help reduce emissions of GHGs. In addition, Mitigation Measures MM-AQ-1a through MM-AQ-1g, pp. 4.G.42 -4.G.51, would help reduce emissions of GHGs through the reduction in construction emissions; limitations on diesel generators; use of low VOC architectural coatings and green consumer products; electrification of loading docks; and emission offsets.

I. WIND AND SHADOW

Section 4.I, Wind and Shadow, discusses both wind and shadow impacts. Wind is discussed first, followed by a separate discussion of shadow that begins on p. 4.I.69.

WIND

The Wind subsection describes the Proposed Project's impacts on ground-level wind currents at various locations on the project site and in the vicinity. The Environmental Setting discussion includes a general description of the wind environment in San Francisco and a discussion of regulations related to the review of wind impacts from proposed development projects. The Impacts discussion describes significance criteria for determining if wind impacts are significant under CEQA; existing wind conditions on the project site; the wind impacts of the Proposed Project and cumulative development projects; and mitigation and improvement measures. The discussion of wind impacts in this subsection is supported by a pedestrian wind study prepared by an independent consultant.[1]

Because the project site area is changing rapidly, and there are known development and infrastructure projects currently underway, a baseline other than existing conditions is appropriate for the analyses presented in this subsection. The baseline includes projects that were under construction at the time the Notice of Preparation (NOP) was published or that have been approved and funded and would be either under construction or completed by the time the Proposed Project is under construction. See "Approach to Baseline Setting" in Section 4.A, Introduction to Chapter 4, pp. 4.A.5-4.A.13, and "Approach to Analysis" in this Wind subsection, pp. 4.I.7-4.I.9.

ENVIRONMENTAL SETTING

EXISTING CLIMATE AND WIND CONDITIONS

The difference in atmospheric pressure between two points on the earth causes air masses to move from the area of higher pressure to the area of lower pressure. This movement of air masses results in wind currents. In San Francisco, wind direction is most variable during the winter, when strong southerly winds, which are frequent during the approach of a winter storm, occur. Average wind speeds are highest during the summer and lowest during the winter.

[1] Rowan Williams Davies & Irwin, Inc. (RWDI), Pier 70 Mixed Use District Project EIR; Final Report: Pedestrian Wind Study, Wind Tunnel Tests, dated July 18, 2016 (hereinafter referred to as "Pedestrian Wind Study").

Typically, regardless of season, the highest wind speeds occur around the mid-afternoon through early evening hours, and the lowest wind speeds occur around the early morning hours.

As winds move over the land, they encounter surface roughness and take on differing characteristics due to differing topography, vegetation, and structures that all act to slow the wind at ground level and to create turbulence. However, when winds reach large areas of smooth, flat surfaces, such as open land or the waters of San Francisco Bay, the speed of the wind near that smooth surface will increase, and the level of turbulence in the wind will decrease.

The following descriptions of San Francisco Bay Area (Bay Area) climate and wind, topography and winds, and wind flows, which both paraphrase and directly quote from the Bay Area Air Quality Management District's (BAAQMD's) *Climate, Physiography, and Air Pollution Potential – Bay Area and Its Subregions*,[2] explain why and how those winds at the project site differ from those winds that occur in downtown San Francisco.

Bay Area Climate and Wind

During the summer, the California coastal climate is dominated by the Pacific High, a semi-permanent high-pressure cell over the northeastern Pacific Ocean. This high, together with a thermal low over the Sonoran-Mojave Desert, causes northwest airflow along the coast and onshore winds over the Bay Area during much of the summer. Marine air approaching the coast, already cool from travelling over the ocean, is further cooled as it crosses the very cold ocean waters that lie near the coast. This cold, dense marine layer of air is the major source of the stronger local summer winds in the Bay Area. During the winter, the Pacific High weakens and shifts southward, and winter storms become frequent, with occasional strong winds as storm fronts pass through the region. During winter rainy periods, winds are often moderate. When the Pacific High becomes dominant during the winter, temperature inversions[3] become strong and often are surface-based; winds are light.

The Bay Area experiences stable atmospheric conditions. The inversion layer is typically about 1,500 feet above sea level and is usually created by subsidence, the heating of downward-moving air in the Pacific High. The marine inversion often moves lower in the afternoon during the summer. In July and August, it is frequently at 500 to 1,000 feet in the afternoon, but at 1,000 to 1,500 feet in the morning.

---

[2] BAAQMD, *Climate, Physiography, and Air Pollution Potential - Bay Area and Its Subregions.* Available at http://hank.baaqmd.gov/dst/papers/bay_area_climate.pdf. Accessed November 21, 2015.

[3] A temperature inversion occurs in the atmosphere when a layer of air is warmer than the layer of air that lies below it. Under normal atmospheric conditions, the air is heated from the ground up and the temperature of air decreases regularly as altitude increases.

Bay Area Topography and Wind

Bay Area terrain is complex. In the Bay Area, the northwest-southeast trending Coast Range (hills) is divided into western and eastern ranges, with San Francisco Bay between them. The Bay Area contains sea-level passes, or gaps, through the Coast Range. The Golden Gate is the sea-level gap in the western range and the Carquinez Strait is the sea-level gap in the eastern range. These two sea-level gaps allow air to flow relatively freely between the coast and the Central Valley, generally following a path over the intervening San Francisco Bay and low lands that lie between the two gaps.

Ridges at elevations of 1,500 feet and higher in the eastern and western ranges of the Coast Range are high enough to distort surface wind flows through the Bay Area. The distortion is greatest when low-level inversions are present and the surface air flows independently from the air above the inversion. This is very common during the summer, when the surface air mass of the marine layer turns into the sea breeze.

San Francisco is located at a low-lying gap within the Coast Range, with the Marin peninsula northward from the Golden Gate, and the Santa Cruz range southward from around Pacifica. The marine layer can easily pass over much of low-lying San Francisco, as well as through the Golden Gate, resulting in high winds on the San Francisco Bay and in San Francisco.

Project Site Wind Conditions

The eastern portion of San Francisco experiences the predominant wind pattern effects described above. United States Weather Bureau meteorological data that are representative of downtown and eastern San Francisco were gathered at the old San Francisco Federal Building at 50 United Nations Plaza (at a height of 132 feet) during the six-year period of 1945 to 1950. These data describe the speed, direction, and frequency of occurrence of winds, and were used in the Pedestrian Wind Study. These meteorological data, along with data from the BAAQMD, show that winds from the northwest, west-northwest, west, and west-southwest (NW, WNW, W, WSW, respectively) are the most prevalent.

Sites adjacent to San Francisco Bay, such as the 28-Acre Site, are susceptible to strong winds throughout both the day and year. Over San Francisco Bay, there is no intervening topography to slow down the wind.

BUILDINGS AND WIND SPEED

The direction and speed of wind currents can be altered by natural features of the land or by buildings and structures. Flat, open ground without buildings or trees allows wind to proceed

unobstructed. The existing project area has large expanses of asphalt that create this unobstructed condition.

Groups of buildings clustered together tend to act as obstacles that reduce wind speeds; the heights, massing, and orientations or profiles of the buildings are some of the factors that can affect wind speeds.

When a building is in the open or much taller than those around it, rather than a similar height, it can intercept and redirect winds downward that might otherwise flow overhead. The winds can be directed down the vertical face of the building to ground level, and these redirected winds can be relatively strong and relatively turbulent.

The massing of a building can affect wind speeds. In general, slab-shaped buildings have the greatest potential to accelerate ground-level winds, while buildings that have setbacks, unusual shapes or are more geometrically complex often result in lower ground-level wind speeds. However, irregular shapes may also increase wind speeds in particular areas, depending on the circumstance.

The orientation or profile of a building is another factor that can affect wind speeds. When the wide face of a building, as opposed to its narrow face, is oriented perpendicular to the prevailing wind direction, the building has more surface area to intercept and redirect winds down to ground level, increasing the probability of strong and turbulent winds at ground level.

Another aspect is whether buildings of similar heights are together or a few buildings stand much taller than the rest. Clustered buildings in a downtown area can improve wind conditions at street level, while taller buildings can cause wind problems for pedestrians. The condition that will prevail depends upon the details of the situation. The existing project site is characterized by large open areas interspersed with relatively low-rise buildings. These characteristics do not provide shelter from wind.

WIND SPEED AND PEDESTRIAN COMFORT

The comfort of pedestrians varies under different conditions of sun exposure, temperature, clothing, and wind speed. Winds up to 4 miles per hour (mph) have no noticeable effect on pedestrian comfort. With winds from 4 to 8 mph, wind is felt on the face. Winds from 8 to 13 mph will disturb hair, cause clothing to flap, and extend a light flag mounted on a pole. Winds from 13 to 19 mph will raise loose paper, dust, and dry soil, and will disarrange hair. With winds from 19 to 26 mph, the force of the wind will be felt on the body. With 26- to 34-mph winds, umbrellas are used with difficulty, hair is blown straight, walking steadily is difficult, and wind

noise is unpleasant. Winds over 34 mph increase difficulty with balance, and gusts can be hazardous and can blow people over.

REGULATORY FRAMEWORK

In order to provide a safe and comfortable wind environment for people in San Francisco, the City has established comfort and hazard criteria for use in evaluating the wind effects of proposed buildings. Section 148 of the Planning Code, "Reduction of Ground-level Wind Currents in C-3 Districts," specifically outlines these criteria for the Downtown Commercial (C-3) Districts. Additional Planning Code sections apply the same criteria to the Rincon Hill, Van Ness Avenue, and South of Market areas. As explained below, under Section 148, new buildings and additions within specific areas of San Francisco may not cause wind speeds that meet or exceed this hazard criterion, i.e., such projects will not be approved.

Although the requirements and criteria of Section 148 do not apply to the project site, the wind hazard criterion that is defined in Section 148 is used by the Planning Department as a significance threshold in the CEQA environmental review process to assess the environmental impact of projects throughout San Francisco and is therefore the basis of the analysis in this Environmental Impact Report (EIR). Planning Code Section 148 criteria are based on pedestrian-level wind speeds that include the effects of wind turbulence; these are referred to as "equivalent wind speeds," defined in the Planning Code as "an hourly mean wind speed adjusted to incorporate the effects of gustiness or turbulence on pedestrians."

Section 148 establishes equivalent wind speeds of 7 mph as the comfort criterion for public seating areas and 11 mph as the comfort criterion for areas of substantial pedestrian use, and states that new buildings and additions to buildings may not cause ground-level winds to exceed these levels more than 10 percent of the time year round between 7:00 a.m. and 6:00 p.m. Section 148 also establishes a hazard criterion, a 26 mph equivalent wind speed for a single full hour of the year.

Although Section 148 does not apply to the project site or to the Proposed Project, this EIR's impact analysis significance threshold is based on the hazard criterion defined in Section 148. The measured equivalent wind speeds that were exceeded 10 percent of the time year round between 7:00 a.m. and 6:00 p.m. are provided here for informational purposes;[4] this information relates to the Section 148 pedestrian comfort criteria and is commonly reported in San Francisco

[4] The typical procedure for wind tunnel testing of locations subject to Section 148 relies on wind data collected from the United States Weather Bureau weather station atop the Federal Building at 50 United Nations Plaza during the six-year period of 1945 to 1950. Wind data from 7:00 a.m. to 6:00 p.m. are used, because this time period represents peak pedestrian activity in a downtown setting.

EIRs; however, the Section 148 comfort criteria are not used to evaluate the significance of wind impacts in this EIR.

The pedestrian comfort criteria and comparisons of wind speeds to those criteria provide information about the usability of the project site. This helps inform planners and designers about open spaces, sidewalks, and bike paths.

The Section 148 comfort criteria are based on wind speeds measured and averaged over 1 minute, the same averaging time as the weather bureau wind data. In contrast, the hazard criterion is defined by a wind speed that is measured and averaged over 1 hour; when stated on the same time-basis as the comfort criteria wind speeds, the hazard criterion wind speed (26 mph for a full hour) is a 1-minute average wind speed of 36 mph.[5,6]

According to Section 148, if wind testing of proposed buildings is necessary, it shall be performed according to test protocols agreed to by the Planning Department.[7] The protocols include, among other things, defining the extent and content of the wind test model, the elements to be included in each wind test scenario, the test point locations, and the use of the wind speed profiles that apply to the test site, so that the scaling of the wind tunnel test results will be correct.

IMPACTS AND MITIGATION MEASURES

SIGNIFICANCE THRESHOLDS

The proposed project would have a significant impact related to wind, if it would:

- Alter wind in a manner that substantially affects public areas.

To assess whether a project would result in a significant impact under this criterion, the City uses the Planning Code's hazard criterion; that is, it determines whether a project would cause equivalent wind speeds to reach or exceed the wind hazard level of 26 mph for a single hour of

---

[5] Arens, E; Ballanti, D; Bennett, C.; Guldman, S.; White, B., "Developing the San Francisco Wind Ordinance and its Guidelines for Compliance" (hereinafter referred to as "Developing the San Francisco Wind Ordinance"), Building and Environment, Vol. 24, No. 4, pp. 297-303, 1989. Available at http://escholarship.org/uc/item/2pd6f6kb. Accessed November 15, 2015.

[6] The wind hazard criterion is derived from the 26 mph hourly average wind speed that would generate a 3-second gust of wind at 20 meters per second, a commonly used guideline for wind safety. Because the original Federal Building wind data were collected at 1-minute averages (i.e., a measurement of sustained wind speed for 1 minute, collected once per hour), the 26 mph hourly average is converted to a 1-minute average of 36 mph, which is used to determine compliance with the 26 mph 1-hour hazard criterion in the Planning Code. (Arens, E. et al., "Developing the San Francisco Wind Ordinance," Building and Environment, Vol. 24, No. 4, pp. 297-303, 1989.)

[7] Section 148(c). Procedures and Methodologies for implementing this section shall be specified by the Office of Environmental Review of the Department of City Planning. (Added by Ord. 414-85, App. 9/17/85; amended by Ord. 188-15, File No. 150871, App. 11/4/2015, Eff. 12/4/2015.) 9/17/85)

the year. (As explained above under Regulatory Framework, pp. 4.I.5-4.I.6, the 26 mph on an hourly averaged basis is equivalent to 36 mph on a minute-averaged basis. The tables on pp. 4.I.17-4.I.36 provide wind speeds compared to 36 mph.) If a project would cause a wind hazard or add to an existing wind hazard in a public area, it may result in a significant impact under CEQA, because the project would result in hazardous wind conditions for pedestrians. However, a new wind hazard location is not necessarily a significant impact, depending on whether it is offset by eliminating an existing hazard elsewhere. The City requires mitigation measures to avoid the new wind hazard or the increase in wind hazards.

The Section 148 comfort criteria are not CEQA significance criteria. The comfort criteria are discussed for informational purposes only. The Section 148 comfort criteria are used in this EIR to help inform decision-makers and the public about the comfort, usability and suitability of the proposed open spaces for various uses from a wind perspective.

Note that, in addition to being applicable to specific areas, as identified above, Section 148 criteria normally apply to public areas that are open and accessible to the public, such as sidewalks, streets, as well as public parks and open spaces. Section 148 criteria are not applied to private open spaces, service areas, and non-public areas on project sites.

APPROACH TO ANALYSIS

The wind impact analysis relies upon wind tunnel testing using the Planning Department's standard methodology. The wind tunnel test of the Proposed Project was conducted using a 1:400 (1 inch = 33 feet) scale model of the Proposed Project and surrounding buildings within a 1,600-foot radius from a point approximately 400 feet to the west of the center of the project site.[8] The wind study area extends a little past 19th Street, to the north. To the west, the wind study area includes Illinois, Third, and farther, past Tennessee streets. To the south, it extends almost to Humboldt Street, which is perpendicular to Illinois Street, and which goes east into the former Potrero Power Plant.

The scale model, which was equipped with permanently mounted wind speed sensors, was placed inside an atmospheric boundary layer wind tunnel. Proposed changes in grade were not modeled because the changes were deemed insufficient to affect pedestrian-level wind speeds.[9] Building

[8] "This study area is typical of a wind study, as it includes all buildings that would impact the proposed site." Pedestrian Wind Study, p. 2. In other words, the dimensions of the physical model are sufficiently wide (diameter of the turntable) to include all buildings that would affect winds at the project site.

[9] The area around Building 12 was modeled as flat; therefore, effectively Grading Option 3, where the grade matches surrounding grades. If Grading Option 1 were implemented, the abrupt change in elevation of approximately 4 feet could cause small localized zones of lower wind speeds; this would not be a substantial effect.

massing extending upward to the proposed Height Limits Plan was modeled (further details below); actual architectural designs might give different results in the wind tunnel.

Using four wind directions (NW, WNW, W, WSW), wind tunnel tests were then conducted for the project site and vicinity using the following six different configurations:[10]

- Baseline Conditions Configuration: All existing buildings on the project site,[11] and existing and baseline buildings in the surroundings within a 1,600-foot radius of a point approximately 400 feet to the west of the center of project site;[12]
- Maximum Residential Scenario Configuration: All existing and baseline buildings in the surroundings, on-site rehabilitated buildings to be retained, the maximum heights under the proposed Maximum Heights Plan, and massing of a representative residential building typology on each parcel in the Maximum Residential Scenario;
- Maximum Commercial Scenario Configuration: All existing and baseline buildings in the surroundings, on-site rehabilitated buildings to be retained, the maximum heights under the proposed Maximum Heights Plan,[13] and maximum massing on each parcel in the Maximum Commercial Scenario;
- Maximum Commercial Scenario: Pedestrian Passageway Option Configuration: The same as the Maximum Commercial Scenario Configuration, but with the passageways in the southern portion of the project site configured per the Pedestrian Passageway Option.[14]
- Maximum Residential Scenario plus Cumulative Configuration:[15] The same as the Maximum Residential Scenario Configuration, plus anticipated cumulative development near the project site; and

[10] Pedestrian Wind Study, p. 1 (portions quoted).

[11] "Existing buildings" excludes temporary structures, such as: (a) the storage facility's trailer at the southeast corner of the site and the storage lockers or containers, and (b) the small and large sheds at the Hoedown Yard (some are open-ended). None of these temporary structures are taller than one story.

[12] The following baseline projects are within the wind tunnel study area: 2235 Third Street, 20th Street Historic Core, 851 Tennessee Street, 616 20th Street, and 1201-1225 Tennessee Street. As discussed in the "Approach to Baseline Setting" discussion in Section 4.A, Introduction to Chapter 4, pp. 4.A.5-4.A.12, baseline buildings include projects that were under construction as of the date of the NOP or approved and reasonably likely to be completed and occupied when the Proposed Project is expected to be implemented.

[13] Other wind tunnel modeling details are as follows: The wind tunnel model appropriately used maximum heights under the Pier 70 Maximum Heights Plan; this did not include potential rooftop mechanical equipment (allowed up to 16 feet above the building height). The grade around Building 12 was modeled as the same as surrounding new construction (Option 3). The proposed, new, off-site 20th Street pump station west of Building 6 was not included in the model because at approximately 10 feet in height, it would not have a material effect on pedestrian-level wind speeds.

[14] See "Mid-Block Passages," in Chapter 2, Project Description, pp. 2.42-2.44.

[15] Figure 1a through Figure 1f in the Pedestrian Wind Study show photographs of the physical model used in the wind tunnel test for the configurations studied. See Pedestrian Wind Study, PDF pp. 40 through 45. Image 1 and the table on p. 4 of the Pedestrian Wind Study show the cumulative projects analyzed.

- Maximum Commercial Scenario plus Cumulative Configuration: The same as the Maximum Commercial Scenario Configuration, plus anticipated cumulative development near the project site.

The eight cumulative projects near enough to the site to affect pedestrian-level winds and therefore within the diameter of the physical model evaluated in the wind tunnel are 2177 Third Street, 777 Tennessee Street, 815 – 825 Tennessee Street, 2230 Third Street, 888 Tennessee Street, 2290 Third Street, 901 Tennessee Street, and 2420 Third Street.[16]

The physical model had 248 wind speed sensors (also known as wind sensor test points) to measure mean and gust wind speeds at an equivalent full-scale height of approximately 5 feet above ground. Six of these measurement locations were on the roofs of proposed parking structures, and consequently are not applicable to the Baseline Configuration (test point locations 141, 142, 143, 165, 166, and 167). Twelve of the measurement locations were covered by existing buildings that are planned for demolition (test point locations 121-123, 182, 192, 193, 205-207, 217-219). Therefore, the Baseline Conditions Configuration has 18 fewer wind sensor test points than the other configurations.

The wind tunnel analysis relies on wind data collected from the United States Weather Bureau weather station atop the Federal Building at 50 United Nations Plaza during the six-year period of 1945 to 1950. Wind data from 7:00 a.m. to 6:00 p.m. are used, because this time period represents peak pedestrian activity in a downtown setting.

Section 148 establishes equivalent wind speeds of 7 mph as the comfort criterion for public seating areas. While public open space areas have been designated, the exact locations of public seating and other features within those open spaces are not known. The proposed *Pier 70 SUD Design for Development* provides concepts and approximate hypothetical site plans, but these concepts and site plans are to be further developed. The Pedestrian Wind Study uses the 11-mph comfort criterion, because the public seating locations are subject to change. Table 4.I.1: Wind Comfort Analysis (Criteria Speed = 11 mph) and Table 4.I.2: Wind Hazard Analysis (Criteria Speed = 36 mph), pp. 4.I.17-4.I.26 and pp. 4.I.27-4.I.36, respectively, present the Pedestrian Wind Study results.

[16] See Pedestrian Wind Study, pp. 40-45. Figure 1a through Figure 1f in the Pedestrian Wind Study show photographs of the physical model used in the wind tunnel analysis as modified for the above scenarios. Image 1 and the table on p. 4 of the Pedestrian Wind Study show the cumulative projects analyzed.

PROJECT FEATURES

Building Locations and Maximum Building Heights

The proposed Pier 70 SUD would include amendments to the *General Plan* and Planning Code that would establish the height and bulk district on the project site. The existing height and bulk district on the 28-Acre Site is 40-X; the proposed amendments to the *General Plan* and Planning Code would include an amendment to change the existing 40-X Height and Bulk District to 90-X, except for a 100-foot-wide portion adjacent to the shoreline, which would remain at 40-X. (See Figure 2.13: Proposed Height Limits Plan, in Chapter 2, Project Description, p. 2.40.) Maximum building heights would be generally 50, 65, 70, and 90 feet, depending on location. Buildings up to 90 feet in height could generally be constructed along the southern and northern perimeters. At the center and eastern portions of the site, new buildings would be limited to heights between 50 to 70 feet.

The existing height and bulk districts on the Illinois Parcels are 65-X along the western end of the project site, and 40-X within the eastern portion of the Hoedown Yard. The proposed amendments to the *General Plan* and Planning Code would include an amendment to change the existing 40-X Height and Bulk District to 65-X. Proposed building locations on the 20th/Illinois portion of the site would front Illinois Street and the new 21st Street. Proposed development on the Hoedown Yard would front Illinois Street and the southern property line adjacent to 22nd Street.

Buildings 2 and 12, in the central portion of the 28-Acre Site, would be retained at their existing heights of approximately 80 feet and 60 feet, respectively. Existing Building 21, which is about 45 feet tall, would be moved about 75 feet southeast from its current location to a new site just north of the proposed Slipways Commons open space. Relocated Building 21 would be framed by new 90-foot-tall, 65-foot-tall, and 50-foot-tall buildings to the west, north, and east, respectively.

Proposed Open Space Plan

The Proposed Project would construct 9 acres of publicly owned open space. (See Figure 2.15: Proposed Open Space Plan, in Chapter 2, Project Description, p. 2.15.) Open spaces included as part of the Proposed Project under both the Maximum Residential and Maximum Commercial scenarios would be the Waterfront Terrace, Waterfront Promenade, Slipways Commons, Building 12 Market Plaza and Market Square, Irish Hill Playground, and 20th Street Plaza. If parking is developed on Parcels C1 and/or C2, public open space would be built on the building rooftops.

These open spaces are described below; they are not yet fully programmed. The conceptual ideas for activities and improvements at these locations are summarized below, under "Public Open Spaces within the Project Site," p. 4.I.47, and further elaborated under "Project Features," p. 4.I.75, and "Proposed Open Space Plan" in the Shadows subsection of this EIR section, p. 4.I.76.

Pedestrian Passageway Option

A Maximum Residential Scenario and a Maximum Commercial Scenario are evaluated in this EIR. The approximate location of pedestrian and service passageways is shown in Figure 2.14: Mid-Block Passageway Locations, in Chapter 2, Project Description, p. 2.43. Since design details for these pedestrian building connectors between Parcels HDY1 and HDY2, Parcels F and G, and Parcels H1 and H2 these passageways are not decided, the wind tunnel study evaluates three different pedestrian passageways options in order to fully analyze wind conditions along the southern parcels. Under the Maximum Residential Scenario, the building connectors would be 40 feet wide and fully open to the sky. Under the Maximum Commercial Scenario, building connectors would also be 40 feet wide and allow for exposure to the sky in accordance with the *Pier 70 SUD Design for Development* setback requirements. Under the Pedestrian Passageway Option, the mid-block passageway remains 40 feet wide. An above-ground building connection would be allowed and would be required to have at least 60 percent of the overhead area exposed directly to the sky. A comparison of the pedestrian passageway options is shown in Figure 4.I.1: Pedestrian Passageway Connector Options along Southern Parcels.

WIND TUNNEL TEST RESULTS

Wind tunnel testing was conducted for the Proposed Project. Tests were performed for the baseline condition and for the Proposed Project at full build-out. Figure 4.I.2: Pedestrian Wind Comfort and Hazard Conditions – Baseline Conditions, p. 4.I.15, shows the wind tunnel test points for the baseline conditions. Table 4.I.1: Wind Comfort Analysis (Criteria Speed = 11 mph) presents the analysis results for the measured equivalent wind speeds that were exceeded 10 percent of the time for each test location and test scenario and the percentage of time that the wind speed would exceed the pedestrian comfort criterion.[17] Table 4.I.2: Wind Hazard Analysis (Criteria Speed = 36 mph) presents the wind hazard analysis results, the equivalent wind speed, and the number of hours per year that the hazard criterion would be exceeded for each test location and test scenario. This analysis compares baseline wind conditions and conditions with the Proposed Project at full build-out, based on the measured winds at the test point locations. For the wind tunnel test, the physical model was based on maximum heights under the Pier 70

[17] Although neither the Section 148 pedestrian comfort criterion nor the seating comfort criterion is used as a CEQA significance threshold, the analysis and discussion of the comfort criterion provides a basis for evaluating the comfort and usability of pedestrian areas and open spaces.

Height Limits Plan and a representative residential building typology for the Maximum Residential Scenario. The physical model for the Maximum Commercial Scenario and Pedestrian Passageway Option were based on maximum heights under the Pier 70 Heights Plan and maximum commercial massing. For the 28-Acre Site, maximum building heights would be generally 50, 65, 70, and 90 feet, depending on location. Buildings up to 90 feet in height could generally be constructed along the southern and northern perimeters. At the center and eastern portions of the site, new buildings would be limited to heights between 50 to 70 feet. The maximum building heights on the Illinois Parcels would be 65 feet. See Figure 2.13: Proposed Height Limits Plan on p. 2.40.

Overview by Test Scenario

Baseline Conditions - Pedestrian-Level Wind Speeds

COMFORT CRITERION

Wind speeds were measured at 230 ground-level test locations for baseline conditions. Figure 4.I.2, p. 4.I.15, shows the pedestrian wind comfort conditions for this configuration.[18] The wind tunnel test results are shown in Tables 4.I.1 and 4.I.2, pp. 4.I.17-4.I.26 and pp. 4.I.27-4.I.36, respectively.

Under baseline conditions, the average equivalent wind speed for the wind comfort analysis at the 230 test locations is approximately 13 mph. The range of measured wind speeds is from 4 to 20 mph.[19] Under baseline conditions, 68 of the 230 test locations meet the comfort criteria, and 162 do not. In other words, a majority of test points exceed the 11-mph comfort criterion under baseline conditions as shown in Figure 4.I.2.

The highest baseline wind speeds include locations adjacent to the western sides or corners of buildings, such as adjacent to Building 103 beyond the northern edge of the project site (20 mph at test point 54), corner of Building 105 on 20th Street (19 mph at test point 52), and the southwestern corner of Building 66 (18 mph at test point 199). The shoreline and slipway areas also experience 18-mph winds, e.g., shoreline at southeastern corner of project site (test point 238), near the shoreline (test point 243), and along the shoreline at the slipways (test points 226, 239, 246, and 248).

There are wind conditions between 8 and 11 mph, shown in yellow on Figure 4.I.2, to the east of certain buildings, such as east of Buildings 114, 115, 14, 12, 15, and 16 (e.g., test points 210, 195, and 196). These locations are on the leeward side of buildings (the side sheltered from the wind). The calmest winds, shown in blue (less than 7 mph) are on the eastern edges of Buildings 12 and 15 (test points 194, 195, 197) and the southwestern corner of Building 117 (test point 140).

[18] As discussed under "Approach to Analysis" above, the Pier 70 Design for Development provides concepts and approximate hypothetical site plans that are subject to change. Therefore, whether a particular open space location would have public seating (7-mph comfort criterion) or not (11-mph pedestrian comfort criterion) is subject to change. The Pedestrian Wind Study's assignment of 7 mph and 11 mph as the comfort criterion for a particular test points is based on the draft Pier 70 Design for Development's seating arrangement. Those assignments are shown in Tables 4.I.1 and 4.I.2. As mentioned above, because the public seating locations are subject to change, this EIR focuses on the 11-mph wind speed.

[19] Unless otherwise specified, wind speeds discussed are the 90th percentile wind speeds, i.e., the wind speed exceeded only 10 percent of the time. Thus, the highest wind speeds cited above are not the peak instantaneous wind speed that may be experienced at pedestrian level.

HAZARD CRITERION

The wind hazard criterion of Planning Code Section 148 is exceeded at two locations under Baseline conditions: adjacent to, and west of, Building 103 beyond the northern edge of the project site (test point 54), and near the southwest corner of Building 66, between Buildings 66 and 12 (test point 199). The Building 103 location exceeds the hazard criterion for 2 hours per year with wind speeds of 38 mph. Building 103 is outside the project site.[20] The Building 66 location exceeds the hazard criterion for 7 hours per year with wind speeds of 40 mph. This is due at least in part to air being accelerated by going through the "pinch point" between the two buildings (i.e., "wind funneling" whereby the opening through which wind flows is narrowed, thereby increasing wind speeds through the opening).

Maximum Residential Scenario Wind Speeds

COMFORT CRITERION

Under the Proposed Project's Maximum Residential Scenario at full build-out, the average of wind speeds at the 248 test points is 12 mph. The range of wind speeds is from 6 to 20 mph. Figure 4.I.3: Pedestrian Wind Comfort and Hazard Conditions - Maximum Residential Scenario shows the pedestrian wind comfort conditions for the Maximum Residential Scenario. Under the Maximum Residential Scenario, 129 of the 248 test locations comply with the 11-mph comfort criterion, and 119 do not.[21]

As shown in Figure 4.I.3, many of the areas where wind speeds exceed the 11-mph criterion under baseline conditions would be reduced to 8 to11 mph under the Maximum Residential Scenario. Proposed buildings would serve to block wind in the following situations:

- The northeastern portion of the 28-Acre Site, which is in an open area under baseline conditions, but between Parcels B, E1, and E4 under the Maximum Residential Scenario (test points 79, 80, 81, and 82);
- An area between Parcels B, E1, and E4 (test points 79 through 82);
- Within the proposed Irish Hill Playground area (test points 161 and 162); and
- An area in the south-central part of the 28-Acre Site, which would be adjacent to development on Parcel F (test points 175 and 181).

[20] For test point 54 at Building 103, the Pedestrian Wind Study (p. 7) states, "The off-site location to the north is inherently gusty, and the hazard is not caused by the proposed development. Gust speeds in such gusty areas can vary between similar wind tunnel tests. The average wind speed exceeded 1 hour/year is 22 mph."

[21] When comparing the comfort criteria exceedances, it is important to remember that there are 18 additional test points for the Maximum Residential Configuration as compared to the Baseline Conditions Configuration. This makes the net decrease of 21 points more meaningful.

PIER 70 MIXED-USE DISTRICT PROJECT

FIGURE 4.I.3: PEDESTRIAN WIND COMFORT AND HAZARD CONDITIONS – MAXIMUM RESIDENTIAL SCENARIO

This page intentionally blank

However, wind speeds would increase under the Maximum Residential Scenario, as compared to baseline conditions, at locations such as adjacent to Building 12 (test points 194, 197, and 198, increasing 2 to 5 mph), likely due to the introduction of taller buildings across the street to the east.

Under the Maximum Residential Scenario, Parcels C1 and C2 could be developed with residential uses or with structured parking that includes rooftop open space. If residential uses are built on Parcels C1 and C2, there would be no rooftop open space, and the wind speeds measured at test points 141 through 143 and 166 would not be relevant to the analysis of the project's wind impacts. If structured parking with rooftop open space is built on Parcels C1 and C2, then wind speeds on those rooftops would be of concern. Some of the highest wind speeds under the Maximum Residential Scenario would be on the rooftops of Parcels C1 and C2, e.g., 19 to 20 mph at test points 141 through 143 (rooftop of Building C1), and 19 mph at test point 166 (rooftop of Building C2).

HAZARD CRITERION

If structured parking is not built on Parcels C1 and C2, the wind hazard criterion of Planning Code Section 148 would not be exceeded at any of the 248 test locations under the Maximum Residential Configuration.

However, if district structured parking is built on Parcel C1 with rooftop public open space, then there would be a hazard criterion exceedance at test point 143.

Maximum Commercial Scenario Wind Speeds

COMFORT CRITERION

Under the Proposed Project's Maximum Commercial Configuration at full build-out, the average of the existing wind speeds at the 247 test points[22] is 12 mph. The range of measured wind speeds is from 6 to 21 mph. Figure 4.I.4: Pedestrian Wind Comfort and Hazard Conditions - Maximum Commercial Scenario, p. 4.I.43, shows the pedestrian wind conditions for this configuration. Under the Maximum Commercial Scenario, 133 of the 247 test locations meet the comfort criterion, and 115 do not.

Similar to the Maximum Residential Scenario, the Maximum Commercial Scenario alters the overall pattern of wind speeds, compared to baseline conditions. The highest wind speeds occur at the western faces or southwestern corners of buildings, including: adjacent to Building 103 at

[22] Under the Maximum Commercial Configuration, test point 183 between Parcels F and G does not exist. Test point 183 is used in the Maximum Commercial - Pedestrian Passageway Option Configuration.

the northern edge of the project site (21 mph at test point 54); southwestern corner of Building 6 (19 mph at test point 71); southwestern corner of Building 105, north of the project site (18 mph at test point 52 and 18 mph at test point 56).

Also similar to the Maximum Residential Scenario, if structured parking with rooftop open space is built on Parcels C1 and C2 under the Maximum Commercial Scenario, then wind speeds on those rooftops would be of concern. Some of the highest wind speeds under the Maximum Commercial Scenario would be on the rooftops of Parcels C1 and C2, e.g., 19 to 20 mph at test points 141 through 143 (rooftop of Building C1), and 19 mph at 166 (rooftop of Building C2).

HAZARD CRITERION

The wind hazard criterion of Planning Code Section 148 would be exceeded at one of the 247 test locations under the Maximum Commercial Configuration. Adjacent to Building 103, test point 54 would exceed the hazard criterion (39 mph) for 5 hours per year, which is 3 more hours than under baseline conditions. This point is adjacent to, and west of, Building 103 beyond the northern edge of the project site.

Additionally, if structured parking is built on Parcel C1 with rooftop public open space, then there would be a hazard criterion exceedance at test point 143.

Maximum Commercial - Pedestrian Passageway Option - Wind Speeds

COMFORT CRITERION

The Maximum Commercial Scenario - Pedestrian Passageway Option provides for north-south pedestrian passageways for three pairs of parcels on the southern part of the project site. Compared to the Maximum Commercial Scenario, this option also has less building mass between Parcels H1 and H2 along the north-south pedestrian passageway. Figure 4.I.5: Pedestrian Wind Comfort and Hazard Conditions - Maximum Commercial Scenario - Pedestrian Passageway Option, p. 4.I.45, shows the pedestrian wind comfort conditions for this configuration.

Wind tunnel testing of this option shows the following results: between Parcels H1 and H2 (at test point 235 at ground level), the wind speed drops from 12 mph under the Maximum Commercial Scenario to 11 mph with the Passageway Option. (Both results are less than the 17 mph at test point 235 under baseline conditions.) Under the Passageway Option, the passageway between Parcels F and G (test point 183) has a wind speed of 10 mph.[23] This does not exceed the pedestrian comfort criterion of 11 mph.

[23] There is no test point 183 under the Maximum Commercial Scenario configuration, because the location is within the building mass.

Source: RWDI, Pedestrian Wind Study.

PIER 70 MIXED-USE DISTRICT PROJECT

FIGURE 4.1.5: PEDESTRIAN WIND COMFORT AND HAZARD CONDITIONS – MAXIMUM COMMERCIAL SCENARIO – PEDESTRIAN PASSAGEWAY OPTION

This page intentionally blank

Between Parcels HDY1 and HDY2, the Passageway Option (test points 156, 157, and 158), extending from 22nd Street to the Irish Hill Playground, has 8- to 11-mph winds under the option, versus 8- to 10-mph winds under the Maximum Commercial Scenario. Under the Passageway Option, none of the test points exceed the comfort criterion.

HAZARD CRITERION

Under the Pedestrian Passageway Option, at the area adjacent to Building 103 (test point 54), beyond the northern edge of the 28-Acre Site, the wind hazard exceedance under the Maximum Commercial Scenario (39 mph) is reduced to 35 mph, i.e., below the wind hazard criterion. The basis for this change is unclear, as Building 103 is distant from the pedestrian passageways, but "[g]ust speeds in such gusty areas can vary between similar wind tunnel tests."[24]

Additionally, if structured parking is built on Parcel C1 with rooftop public open space, then there would be a hazard criterion exceedance (37 mph) at test point 143.

Public Open Spaces within the Project Site

The wind conditions that would exist at each proposed public open space within the project site are summarized below. Although the comfort criteria are not used as thresholds of significance in this EIR under CEQA, wind speeds over 11 mph and their locations are noted, as these will provide the reader with information about the usability and suitability of the proposed open spaces for various uses from a wind perspective.

Improvement measures for the public open spaces are described below under "Project Impacts." The conceptual locations for public seating, which are subject to change, are discussed and improvement measures suggested. As discussed above under "Significance Thresholds" on pp. 4.I.6-4.I.7, the City uses the Planning Code's hazard criterion for determining whether a project would result in a significant impact. The comfort criteria-related effects are not significant environmental impacts and are discussed in this section for informational purposes.

Waterfront Terrace

The Waterfront Terrace extends from the northeastern corner of the project site along the waterfront to nearly the southern end of Parcel E4, where it meets Slipways Commons (at the northernmost slipway), as shown in Figure 2.15: Proposed Open Space Plan, in Chapter 2, Project Description, p. 2.46. The concept design includes three primary spaces running north to south: the Building 6 viewing pavilion, the social lawn, and eating and drinking space.

[24] Pedestrian Wind Study, p. 7.

COMFORT CRITERION

Test points in the interior of the proposed Waterfront Terrace include 75, 76, 77, and 78. Under baseline conditions, winds at these test points range from 15 to 18 mph, which exceeds the 11-mph criterion. Under the Maximum Residential Scenario, winds at these test points range from 9 to 14 mph, with one point (test point 78) below 11 mph and the other three points (test points 75, 76, and 77) exceeding 11 mph. Wind speed results for the Maximum Commercial Scenario are nearly identical, except that test point 76 is windier (13 mph rather than 12 mph). (See Table 4.I.1, pp. 4.I.17-26.)

Based on the reduction of wind speeds, the proposed buildings may serve as partial obstacles to the winds from westerly directions, particularly shielding the southern part of the Waterfront Terrace (test point 78). However, the Waterfront Terrace would still be subject to winds from the northwesterly and easterly directions. Northwest winds are likely to accelerate around the northeastern corner of Parcel B.[25] Westerly winds would likely channel between Buildings E3 and E4.

Around the edges of the proposed Waterfront Terrace and/or next to buildings adjacent to the open space are test points 70, 71, 74, 79, 80, 223, and 224. Wind speeds decrease from the Existing Scenario under the Maximum Residential Scenario at test points 74, 79, 80, 223, and 224. For the northern part of the open space, the pedestrian comfort results for test points 70 and 71 are not much different than those under the baseline conditions, Maximum Residential Scenario, and Maximum Commercial Scenario. It is likely that the blocking of westerly winds by the Proposed Project is not as effective at their exposed location and/or the blocking effect is offset by the distance of these test points to buildings.

HAZARD CRITERION

No wind hazard criterion exceedances would occur at any of the test points in the Waterfront Terrace area under baseline conditions, the Maximum Residential Scenario, and the Maximum Commercial Scenario.

Waterfront Promenade

The proposed Waterfront Promenade extends from the southeastern corner of the project site along the waterfront to just north of Parcel E3, where it meets Slipways Commons. It would include pedestrian and bike paths and possibly outdoor eating areas.

[25] Pedestrian Wind Study, p. 9.

COMFORT CRITERION

Under baseline conditions, winds within the proposed Waterfront Promenade (at test points 238, 239, 245, 246, and 248) range from 15 to 18 mph, exceeding the 11-mph criterion. Under the Maximum Residential Scenario, winds at these five test points range from 9 to 13 mph, with winds at two test points below the 11-mph criterion and winds at three test points (238, 246, and 248) above 11 mph. Similar to the Waterfront Terrace, the proposed buildings serve as obstacles to the winds from westerly directions.

Results shown in Table 4.I.1 for the Maximum Commercial Scenario are similar, except that test point 245 is windier (12 mph rather than 9 mph). The winds also range from 9 to 13 mph, constituting a mix of areas exceeding and not exceeding the 11-mph criterion.

HAZARD CRITERION

No wind hazard criterion exceedances would occur at any of the test points in the Waterfront Promenade area under baseline conditions, the Maximum Residential Scenario, and the Maximum Commercial Scenario.

Slipways Commons

The proposed Slipways Commons would extend from the proposed Maryland Street to the shoreline. It is envisioned as a place for passive recreation, daytime community gatherings, and cultural events and nighttime activities such as art, light shows, evening festivals, and performances.[26]

COMFORT CRITERION

Under baseline conditions, winds within and around the edges of the proposed Slipways Commons (test points 208, 209, 211 through 216, 220 through 222, and 225 through 230) range from 12 to 18 mph. Under the Maximum Residential Scenario, winds at these test points range from 8 to 15 mph, with seven points below the 11-mph criterion and ten points at or above 11 mph (test points 215, 220, 221, 222, 225, 226, 227, 228, 229, and 230). Wind speed results for the Maximum Commercial Scenario are very similar to those for the Maximum Residential Scenario, except that the Maximum Commercial Scenario would result in an additional exceedance at test point 214 (11 mph rather than 10 mph).

[26] *Pier 70 SUD Design for Development*, p. xii.

HAZARD CRITERION

No wind hazard criterion exceedances would occur at any of the test points in the proposed Slipways Commons area under baseline conditions, the Maximum Residential Scenario, and the Maximum Commercial Scenario.

Building 12 Market Plaza and Market Square

Building 12 Market Plaza and Market Square would be open spaces north, east, and south of Building 12 that may be used for temporary events, such as market stalls, as well as for artworks and community gatherings.[27]

COMFORT CRITERION

Test points in the Building 12 Market Plaza and Market Square open areas include 193, 194, 197 through 199, and 202 through 205. Under baseline conditions, winds at these locations range from 5 to 18 mph. Under the Maximum Residential Scenario, winds at these test points range from 9 to 14 mph, with seven test points below the 11-mph criterion and two test points (202 and 203) above 11 mph. Wind speed results for the Maximum Commercial Scenario are identical to those for the Maximum Residential Scenario. The public courtyard in the area between Buildings 2 and 12 would experience high wind speeds due to west and west-southwest flow over the shorter Building 2 and downwash from the courtyard-facing façades of Building D-1.

HAZARD CRITERION

No wind hazard criterion exceedances would occur at the Building 12 Market Plaza and Market Square under baseline conditions, the Maximum Residential Scenario, and the Maximum Commercial Scenario. Because Building 66 would be demolished, there would no longer be a narrow space between Buildings 66 and 12, which resulted in the baseline conditions hazard exceedance at test point 199.

Irish Hill Playground

The Irish Hill Playground would be adjacent to, and south of, the remnant of Irish Hill. Conceptual ideas for its use include a children's play area, community gardens, and public seating for all ages.[28]

[27] *Pier 70 SUD Design for Development*, p. 45.
[28] *Pier 70 SUD Design for Development*, p. 61.

COMFORT CRITERION

Under baseline conditions, the area designated for the proposed Irish Hill Playground has winds between 11 to 15 mph. (Test points in this open area include 159 through 163, along with east side of Parcel PKS, and test points 144 through 146.) Under the Maximum Residential Scenario, winds at these test points range from 9 to 13 mph, with seven points below the 11-mph criterion and one point (test point 163) at or above 11 mph. Wind speed results for the Maximum Commercial Scenario are very similar to the Maximum Residential Scenario, except that the Maximum Commercial Scenario results in an additional comfort exceedance at test point 145 (11 mph rather than 10 mph). In sum, the Proposed Project would reduce winds at a majority of test points at the Irish Hill Playground below the 11-mph comfort criterion.

HAZARD CRITERION

No wind hazard criterion exceedances would occur at any of the test points in the Irish Hill Playground under baseline conditions, the Maximum Residential Scenario, and the Maximum Commercial Scenario.

20th Street Plaza

The 20th Street Plaza, at the northwestern corner of the project site, would be a gateway plaza. Potential open space features include a seating terrace and stormwater garden terraces.[29]

COMFORT CRITERION

Under baseline conditions, winds at the proposed 20th Street Plaza (test points 110 through 115, at the corner of 20th and Illinois streets) range from 9 to 16 mph, with three points below the 11-mph criterion and three points (test points 111,112, and 115) at or above 11 mph. Under the Maximum Residential Scenario, winds at these test points range from 9 to 14 mph, with two points below the 11-mph criterion and four points (test points 110, 112, 114, and 115) at or above 11 mph. Wind speed results for the Maximum Commercial Scenario are very similar to those for the Maximum Residential Scenario, but with three points below the 11-mph criterion and three points at or above 11 mph. Generally, the Proposed Project has only a small effect in reducing winds in the 20th Street Plaza. The Proposed Project would not provide much shielding from the predominant winds.

HAZARD CRITERION

No wind hazard criterion exceedances would occur at the 20th Street Plaza under baseline conditions, the Maximum Residential Scenario, and the Maximum Commercial Scenario.

[29] *Pier 70 Design for Development*, p. 71.

Rooftop Open Space

If Parcels C1 and C2 are built as structured parking, there would be public open space on the rooftops. Conceptual uses include sports courts, play terraces, viewing, and food cultivation. There are no existing conditions wind results applicable to rooftops.

COMFORT CRITERION

Under the Maximum Residential Scenario, winds from Parcel C1 rooftop[30] (test points 141, 142, and 143) range from 19 to 20 mph, exceeding the 11-mph criterion. Wind speed results for the Maximum Commercial Scenario are identical to those for the Maximum Residential Scenario.

Under the Maximum Residential Scenario, winds from the Parcel C2 rooftop[31] (test points 165, 166, and 167) range from 14 to 19 mph, with each of these test points exceeding the 11-mph criterion. If built as a parking structure, the roof heights may be less than 90 feet, thereby reducing the wind speeds. Wind speed results for the Maximum Commercial Scenario are very similar to those for the Maximum Residential Scenario, except that the Maximum Commercial Scenario would be windier at test point 161 (17 mph compared to 16 mph).

HAZARD CRITERION

Under the Maximum Residential Scenario and Maximum Commercial Scenario, the wind hazard criterion of Planning Code Section 148 would be exceeded on the rooftop of Building C1 at test point 143 (37 mph) for 1 hour per year. Under the Maximum Commercial Scenario - Pedestrian Passageway Option, the wind hazard criterion would be exceeded on the rooftop of Building C1 at test point 143 (37 mph) for 2 hours per year.[32]

Public Open Spaces Outside the Project Site

Future Historic Core Plaza

The planned Historic Core Plaza is part of the baseline. It is an approximately 45,000-square-foot plaza south of Building 113 and east of Buildings 114, 115, and 116. It would be constructed as part of the adjacent 20th Street Historic Core Project.

[30] Building C1 modeled at a maximum height of 90 feet.
[31] Building C2 was modeled at a maximum height of 90 feet.
[32] These wind tunnel test results assume a height of 90 feet for the roof. If built as a parking structure, the roof heights may be less, reducing the wind speed. However, the wind speeds may still exceed the hazard criterion.

COMFORT CRITERION

Under baseline conditions, winds at the Historic Core Plaza (test points 125 through 130) range from 9 to 15 mph, with one point (test point 125) below the 11-mph criterion and five points above 11 mph. Under the Maximum Residential Scenario, winds at these same test points decrease about 1 to 2 mph, ranging from 8 to 14 mph, with one point (test point 125) below the 11-mph criterion and five points at or above 11 mph. Wind speed results for the Maximum Commercial Scenario are very similar to those for the Maximum Residential Scenario, except that the Maximum Commercial Scenario would be less windy at test points 126 (11 mph compared to 12 mph), 129 (11 mph compared to 12 mph), and 130 (13 mph compared to 14 mph).

HAZARD CRITERION

No wind hazard criterion exceedances in the future Historic Core Plaza would occur under baseline conditions, the Maximum Residential Scenario, and the Maximum Commercial Scenario.

Future Crane Cove Park

Crane Cove Park is under development as a maritime and viewing area, and would include features such as an amphitheater, picnic sites, a promenade, overlooks, playgrounds, a senior fitness park, and walking areas.

COMFORT CRITERION

Under baseline conditions, winds at Crane Cove Park (test point 38) are 18 mph, exceeding the 11-mph pedestrian comfort criterion. Under the Maximum Residential Scenario, the wind speed is 19 mph. Under the Maximum Commercial Scenario, the wind speed is 15 mph.

HAZARD CRITERION

No wind hazards would occur in the proposed Crane Cove Park under baseline conditions, the Maximum Residential Scenario, and the Maximum Commercial Scenario.

Sidewalks within the Project Site

The Proposed Project includes construction of sidewalks within the project site.

COMFORT CRITERION

Sidewalks along a number of streets within the project site would experience winds exceeding the 11-mph comfort criterion under the Maximum Residential and Maximum Commercial scenarios. Pedestrians and bicyclists at these locations would be affected. As shown in Figures 4.I.3 and

4.I.4, p. 4.I.39 and p. 4.I.43, respectively, the sidewalks with wind speeds exceeding the 11-mph comfort criterion include the following:

- 20th Street, particularly next to Parcels A and B;
- 21st Street, particularly adjacent to Parcel C1;
- 22nd Street, between Parcels H1 and E2, and between Parcels H2 and E3;
- Michigan Street;
- Louisiana Street; and
- Maryland Street, between Parcels A and B.

HAZARD CRITERION

No wind hazard criterion exceedances would occur under baseline conditions, the Maximum Residential Scenario, and the Maximum Commercial Scenario on sidewalks within the project site.

IMPACT EVALUATION

Discussion of the effects of the Proposed Project under the City's pedestrian comfort criterion is provided here for informational purposes only, as the threshold used to identify significant impacts is the hazard criterion.

Impact WS-1: The phased development of the Proposed Project would temporarily alter wind in a manner that substantially affects public areas. ***(Less than Significant with Mitigation)***

Construction of the Proposed Project is expected to occur in phases and take approximately 11 years to reach full build-out. Although the Proposed Project at full build-out would generally slightly improve wind conditions on the project site, potentially significant interim wind impacts may occur prior to the completion of construction. Due to phased build-out, a particular building configuration resulting from partial completion of the Proposed Project could last for one or more years, creating the potential for interim wind impacts. Furthermore, if the Proposed Project were not completed, a partial build-out situation would occur, resulting in different wind characteristics than those tested in the wind tunnel.

The wind tunnel testing performed for this EIR provides information about the wind conditions on sidewalks, streets, parks, and open spaces within and in the vicinity of the Proposed Project only at full build-out for the massings in the configurations tested. Wind testing for the EIR assumes full build-out, with massing models for future proposed buildings in the project site providing shelter from prevailing winds for buildings downwind. Prior to full build-out, stronger pedestrian-level winds than those presented for the Pier 70 Pedestrian Wind Study are likely to

occur on open spaces and at individual building sites. Thus, wind hazard criterion exceedances could occur at locations not identified in the wind tunnel test scenarios. The potential for exceedances of the wind hazard criterion during the phased construction period would occur under the Maximum Residential Scenario and the Maximum Commercial Scenario. Additionally, the ultimate build-out of the Proposed Project might not maximize the development potential under either of these two scenarios.

The Pedestrian Wind Study does not provide numerical results about wind conditions during interim stages of development and, as a practical matter, cannot provide such information, due to the number of possible permutations of development. For commercial parcels, maximum envelope massings were used in the Pedestrian Wind Study for this EIR. For residential parcels, representative residential building typologies were used in the Pedestrian Wind Study for this EIR, not architectural designs, which might give different results. Once surrounding buildings have been completed and provide effective wind shelter, it is possible that these temporary impacts would cease; however, they may not, depending on the architectural designs of those buildings. Depending upon the circumstances of the construction, these temporary impacts could continue until the full build-out. Because such impacts are anticipated to occur, they are considered to be potentially significant impacts.

Because potential wind hazards could result from a very large number of possible combinations of different building designs, and permutations of construction sequences during the build-out of the Proposed Project, predicting the occurrence of all such hazards is not possible.

Based on the Pedestrian Wind Study and knowledge of the prevailing wind directions, development of buildings on the project site generally from the west to the east would provide the best protection from potential wind hazards. The amount of sheltering provided by then-existing buildings on adjacent parcels or areas located upwind (to the southwest, west, northwest, and north) of a subsequent development site should be considered.

The existing buildings across Illinois Street, to the west of the project site, provide sufficient shelter from prevailing winds for buildings proposed on Parcels PKN and PKS. However, there is insufficient provision of shelter from across the BAE shipyard for Parcels A and B, and from across the PG&E Potrero Substation for Parcel F.

The existing historic buildings to the west and north of Parcel A would not sufficiently protect Parcel A, because the heights of the historic buildings are significantly lower than the proposed maximum 90-foot height for Parcel A. Where there is a taller building downwind of lower buildings, there is a potential for wind hot spots, in this case, a classic wind trap effect where winds are funneled into an area.

Depending on circumstances, such as the heights and proximity of surrounding buildings, buildings under 80 feet in height, would be less likely to create wind hazards.

As described above, in addition to the impacts identified in this EIR for the Proposed Project, at full build-out there may be potential temporary wind hazard impacts associated with certain new structures within the project site where insufficient protection from strong winds exists at the time of construction and occupancy. This applies to all proposed buildings over 80 feet in height.

During the period before full build-out of the Proposed Project, wind hazards could occur at public locations that were not identified in the Pedestrian Wind Study and/or identified wind hazards could be increased in severity or extent. Such wind hazards would likely exist until buildings on adjacent parcels are completed and provide shelter from the unabated force of the wind. This would be a significant impact. Since the duration of construction is expected to be 11 years, mitigation measures, such as architectural canopies or screens, fences, shrubs, trees (limited by the need to preserve the integrity of the Historic District), and/or street furniture to offer wind protection and/or to limit access to the hazardous area(s), would be necessary to prevent exposure of pedestrians, cyclists, residents, or occupants to hazardous winds in pedestrian areas during that temporary interval.

Implementation of Mitigation Measure M-WS-1: Identification and Mitigation of Interim Hazardous Wind Impacts, shown below, would reduce the project's significant wind impact to a less-than-significant level.

> **Mitigation Measure M-WS-1: Identification and Mitigation of Interim Hazardous Wind Impacts**
>
> When the circumstances or conditions listed in Table M.WS.1 are present at the time a building Schematic Design is submitted, the requirements described below apply:

Table M.WS.1: Circumstances or Conditions during which Mitigation Measure M-WS-1 Applies

Subject Parcel Proposed for Construction	Circumstance or Condition	Related Upwind Parcels
Parcel A	Construction of any new buildings on Parcel A.	NA
Parcel B	Construction of any new buildings on Parcel B.	NA
Parcel E2	Construction of any new buildings on Parcel E2 over 80 feet in height, prior to any construction of new buildings on approximately 80% of the combined total parcel area of Parcels H1 and G that would be completed by the estimated time of occupancy of the subject building, as estimated on or about the date of the building Schematic Design submittal.	Parcels H1 and G
Parcel E3	Construction of any new buildings on Parcel E3 over 80 feet in height, prior to any construction of new buildings on approximately 80% of the combined total parcel area of Parcels E2 and G that would be completed by the estimated time of occupancy of the subject building, as estimated on or about the date of the building Schematic Design submittal.	Parcels E2 and G
Parcel F	Construction of any new buildings on Parcel F.	NA
Parcel G	Construction of any new buildings on Parcel G.	NA
Parcel H1	Construction of any new buildings on Parcel H1 over 80 feet in height, prior to any construction of new buildings on approximately 80% of the combined total parcel area of Parcels E2 and G that would be completed by the estimated time of occupancy of the subject building, as estimated on or about the date of the building Schematic Design submittal.	Parcels E2 and G
Parcel H2	Construction of any new buildings on Parcel H2 over 80 feet in height, prior to any construction of new buildings on approximately 80% of the combined total parcel area of Parcels H1, E2, and E3 that would be completed by the estimated time of occupancy of the subject building, as estimated on or about the date of the building Schematic Design submittal.	Parcels H1, E2, and E3

Source: SWCA.

Requirements

A wind impact analysis shall be required prior to building permit issuance for any proposed new building that is located within the project site and meets the conditions described above. All feasible means (e.g., changes in design, relocating or reorienting certain building(s), sculpting to include podiums and roof terraces, adding architectural canopies or screens, or street furniture) to eliminate hazardous winds, if predicted, shall be implemented. After such design changes and features have been considered, the additional effectiveness of landscaping may also be considered.

1. Screening-level analysis. A qualified wind consultant approved by the Planning Department's Environmental Review Officer (ERO) shall review the proposed building design and conduct a "desktop review" in order to provide a qualitative result determining whether there could be a wind hazard. The screening-level analysis shall have the following steps: For each new building proposed that meets the criteria above, a qualified wind consultant shall review and compare the exposure, massing, and orientation of the proposed building(s) on the subject parcel to the building(s) on the same parcel in the representative massing models of the Proposed Project tested in the wind tunnel as part of this EIR and in any subsequent wind analysis testing required by this mitigation measure. The wind consultant shall identify and compare the potential impacts of the proposed building(s) to those identified in this EIR, subsequent wind testing that may have occurred under this mitigation measure, and to the City's wind hazard criterion. The wind consultant's analysis and evaluation shall consider the proposed building(s) in the context of the "Current Project Baseline," which, at any given time during construction of the Proposed Project, shall be defined as any existing buildings at the site, the as-built designs of all previously-completed structures and the then-current designs of approved but yet unbuilt structures that would be completed by the time of occupancy of the subject building.

   (a) If the qualified wind consultant concludes that the building design(s) could not create a new wind hazard and could not contribute to a wind hazard identified by prior wind tunnel testing for the EIR and in subsequent wind analysis required by this mitigation measure, no further review would be required. If there could be a new wind hazard, then a quantitative assessment shall be conducted using wind tunnel testing or an equivalent quantitative analysis that produces comparable results to the analysis methodology used in this EIR.

   (b) If the qualified wind consultant concludes that the building design(s) could create a new wind hazard or could contribute to a wind hazard identified by prior wind tunnel testing conducted for this EIR and in subsequent wind analysis required by this mitigation measure, but in the consultant's professional judgment the building(s) can be modified to reduce such impact to a less-than-significant level, the consultant shall notify the ERO and the building applicant. The consultant's professional judgment may be informed by the use of "desktop" analytical tools, such as computer tools relying on results of prior wind tunnel testing for the Proposed Project and other projects (i.e., "desktop" analysis does not include new wind tunnel testing). The analysis shall include consideration of wind location, duration, and speed of wind. The building applicant may then propose changes or supplements to the design of the proposed building(s) to achieve this result.

These changes or supplements may include, but are not limited to, changes in design, building orientation, sculpting to include podiums and roof terraces, and/or the addition of architectural canopies or screens, or street furniture. The effectiveness of landscaping may also be considered. The wind consultant shall then reevaluate the building design(s) with specified changes or supplements. If the wind consultant demonstrates to the satisfaction of the ERO that the modified design and landscaping for the building(s) could not create a new wind hazard or contribute to a wind hazard identified in prior wind tunnel testing conducted for this EIR and in subsequent wind analysis required by this mitigation measure, no further review would be required.

(c) If the consultant is unable to demonstrate to the satisfaction of the ERO that no increase in wind hazards would occur, wind tunnel testing or an equivalent method of quantitative evaluation producing results that can be compared to those used in the EIR and in any subsequent wind analysis testing required by this mitigation measure is required. The building(s) shall be wind tunnel tested in the context of a model that represents the Current Project Baseline, as described in Item 1, above. The testing shall include all the test points in the vicinity of a proposed building or group of buildings that were tested in this EIR, as well as all additional points deemed appropriate by the consultant to determine the wind performance for the building(s). Testing shall occur in places identified as important, e.g., building entrances, sidewalks, etc., and there may need to be additional test point locations considered. At the direction and approval of the Planning Department, the "vicinity" shall be determined by the wind consultant, as appropriate for the circumstances, e.g., a starting concept for "vicinity" could be approximately 350 feet around the perimeter of the subject parcel(s), subject to the wind consultant's reducing or increasing this radial distance. The wind tunnel testing shall test the proposed building design(s), as well as the Current Project Baseline, in order to clearly identify those differences that would be due to the proposed new building(s). In the event the wind tunnel testing determines that design of the building(s) would increase the hours of wind hazard or extent of area subject to hazardous winds beyond those identified in prior wind testing conducted for this EIR and in subsequent wind tunnel analysis required by this mitigation measure, the wind consultant shall notify the ERO and the building applicant. The building applicant may then propose changes or supplements to the design of the proposed building(s) to eliminate wind hazards. These changes or supplements may include, but are not limited to, changes in design, building orientation, sculpting building(s) to include podiums and roof terraces, adding architectural canopies or screens, or street furniture. All feasible means (changes in design, relocating or reorienting certain building(s), sculpting to include podiums and roof terraces, the addition of architectural canopies or screens, or street furniture) to eliminate wind hazards, if predicted, shall be implemented to the extent necessary to mitigate the impact. After such design changes and features have been considered, the additional effectiveness of landscaping at the size it is proposed to be installed may also be considered. The wind consultant shall then reevaluate the building design(s) with specified changes or supplements. If the wind consultant demonstrates to the satisfaction of the ERO that the modified design would not create a new wind hazard or contribute to a wind hazard identified in prior wind tunnel testing conducted for this EIR and in

subsequent wind analysis required by this mitigation measure, no further review would be required.

If the proposed building(s) would result in a wind hazard exceedance, and the only way to eliminate the hazard is to redesign a proposed building, then the building shall be redesigned.

Implementation of the steps required by Mitigation Measure M-WS-1 would reduce the exposure of pedestrians and cyclists to the effects of hazardous winds during phased build-out.[33] With implementation of Mitigation Measure M-WS-1, the potential impact would be reduced to a less-than-significant level.

Impact WS-2: For public open space built on rooftops, the Proposed Project would alter wind in a manner that affects those public open spaces. ***(Less than Significant with Mitigation)***

If Parcels C1 and C2 are developed with structured parking, public open space would be provided on the rooftops. Under the Maximum Residential Scenario and Maximum Commercial Scenario, the wind hazard criterion of Planning Code Section 148 would be exceeded on the rooftop of Building C1 at test point 143 for 1 hour per year. Under the Maximum Commercial Scenario - Pedestrian Passageway Option, test point 143 would have 2 hours of exceedance of the hazard criterion. In all three modeled instances, Building C1 was modeled at a maximum height of 90 feet. This impact would be reduced to a less-than-significant level with implementation of Mitigation Measure M-WS-2: Wind Reduction for Rooftop Winds.

Mitigation Measure M-WS-2: Wind Reduction for Rooftop Winds

If the rooftop of building(s) is proposed as public open space and/or a passive or active public recreational area prior to issuance of a building permit for the subject building(s), a qualified wind consultant shall prepare a wind impact and mitigation analysis in the context of the Current Project Baseline regarding the proposed architectural design. All feasible means (such as changing the proposed building mass or design; raising the height of the parapets to at least 8 feet, using a porous material where such material would be effective in reducing wind speeds; using localized wind screens, canopies, trellises, and/or landscaping around seating areas) to eliminate wind hazards shall be implemented as necessary. A significant wind impact would be an increase in the number of hours that the wind hazard criterion is exceeded or an increase in the area subjected to winds exceeding the hazard criterion as compared to existing conditions at the height of the proposed rooftop. The wind consultant shall demonstrate to the satisfaction of the ERO that the building design would not create a new wind hazard or contribute to a wind hazard identified in prior wind testing conducted for this EIR.

[33] "Desktop" analytical tools and approaches are discussed in H. Wu, C.J. Williams, H.A. Baker and W.F. Waechter, "Knowledge-based Desk-top Analysis of Pedestrian Wind Conditions," *Structures*, 2004, pp. 1-10.

Impact WS-3: At full build-out, the Proposed Project would not alter wind in a manner that substantially affects ground-level public areas. ***(Less than Significant)***

Maximum Residential Scenario

Under the Maximum Residential Scenario, no new hazardous wind locations would be created.

The wind hazards at the southwest corner of Building 66 (test point 199) under baseline conditions would be eliminated by the Maximum Residential Scenario, because Building 66 would be demolished as part of the Proposed Project. The baseline conditions wind hazard exceedance at Building 103, just north of the project site (test point 54), would also be eliminated.

The pedestrian comfort criterion is not considered within the CEQA significance threshold; however, improvement measures are suggested below to improve the suitability and usability of public open spaces and further reduce this less-than-significant impact. City decision-makers may choose to impose these improvement measures on the Proposed Project as conditions of approval.

Maximum Commercial Scenario

Under the Maximum Commercial Scenario and the Maximum Commercial Scenario - Pedestrian Passageway Option, no new hazardous wind locations would be created that would affect public areas. The exception would be the parking structure option, as described under Impact WS-2.

The hazardous wind condition at the southwest corner of Building 66 (test point 199) under baseline conditions would be eliminated by the Maximum Commercial Configuration, because Building 66 would be demolished as part of the Proposed Project.

The baseline conditions wind hazards at Building 103 (test point 54), beyond the northern edge of the 28-Acre Parcel, would continue under the Maximum Commercial Scenario, which would represent a continuation of baseline conditions. The Maximum Commercial Scenario would increase the number of hours per year of exceedance from 2 hours to 5 hours at test point 54. It would not create any new wind hazard exceedance.

The pedestrian comfort criterion is not considered within the CEQA significance threshold; however, Improvement Measures I-WS-3a: Wind Reduction for Public Open Spaces and Pedestrian and Bicycle Areas; I-WS-3b: Wind Reduction for Waterfront Promenade and Waterfront Terrace; I-WS-3c: Wind Reduction for Slipways Commons; I-WS-3d: Wind Reduction for Building 12 Market Plaza and Market Square; I-WS-3e: Wind Reduction for Irish Hill Playground; and I-WS-3f: Wind Reduction for 20th Street Plaza are suggested below to improve the comfort, suitability, and usability of public open spaces and further reduce this less

than significant impact. City decision makers may choose to impose these improvement measures on the Proposed Project as conditions of approval.

Improvement Measure I-WS-3a: Wind Reduction for Public Open Spaces and Pedestrian and Bicycle Areas

For each development phase, a qualified wind consultant should prepare a wind impact and mitigation analysis regarding the proposed design of public open spaces and the surrounding proposed buildings. Feasible means should be considered to improve wind comfort conditions for each public open space, particularly for any public seating areas. These feasible means include horizontal and vertical, partially-porous wind screens (including canopies, trellises, umbrellas, and walls), street furniture, landscaping, and trees. Specifics for particular public open spaces are set forth in Improvement Measures I-WS-3b to I-WS-3f.

Any proposed wind-related improvement measure should be consistent with the design standards and guidelines outlined in the *Pier 70 SUD Design for Development*.

Improvement Measure I-WS-3b: Wind Reduction for Waterfront Promenade and Waterfront Terrace

The Waterfront Promenade and Waterfront Terrace would be subject to winds exceeding the pedestrian wind comfort criteria. A qualified wind consultant should prepare written recommendations of feasible means to improve wind comfort conditions in this open space, emphasizing vertical elements, such as wind screens and landscaping. Where necessary and appropriate, wind screens should be strategically placed directly around seating areas. For maximum benefit, wind screens should be at least 6 feet high and made of approximately 20 to 30 percent porous material. Design of any wind screen or landscaping shall be compatible with the Historic District.

Improvement Measure I-WS-3c: Wind Reduction for Slipways Commons

The central and western portions of Slipways Commons would be subject to winds exceeding the pedestrian wind comfort criteria. Street trees should be considered along Maryland Street, particularly on the east side of Maryland Street between Buildings E1 and E2. Vertical elements such as wind screens would help for areas where street trees are not feasible. Where necessary and appropriate, wind screens should be strategically placed to the west of any seating areas. For maximum benefit, wind screens should be at least 6 feet high and made of approximately 20 to 30 percent porous material. Design of any wind screen or landscaping shall be compatible with the Historic District.

Improvement Measure I-WS-3d: Wind Reduction for Building 12 Market Plaza and Market Square

Building 12 Market Plaza and Market Square would be subject to winds exceeding the pedestrian wind comfort criteria. For reducing wind speeds in the public courtyard between Buildings 2 and 12, the inner south and west façades of Building D-1 could be stepped by at least 12 feet to direct downwashing winds above pedestrian level. Alternatively, overhead protection should be used, such as a 12-foot-deep canopy along the inside south and west façades of Building D-1, or localized trellises or umbrellas over seating areas. For reducing wind speeds on the eastern and southern sides of Building 12,

street trees should be considered, along Maryland and 22nd streets. Smaller underplantings should be combined with street trees to reduce winds at pedestrian level. Design of any wind screen or landscaping shall be compatible with the Historic District.

Improvement Measure I-WS-3e: Wind Reduction for Irish Hill Playground

The Irish Hill Playground would be subject to winds exceeding the pedestrian wind comfort criteria. For maximum benefit, wind screens should be at least 6 feet high and made of approximately 20 to 30 percent porous material. Design of any wind screen or landscaping shall be compatible with the Historic District.

Improvement Measure I-WS-3f: Wind Reduction for 20th Street Plaza

The 20th Street Plaza would be subject to winds exceeding the pedestrian wind comfort criteria. A qualified wind consultant should prepare written recommendations of feasible means to improve wind comfort conditions in this open space, emphasizing hardscape elements, such as wind screens, canopies, and umbrellas. Where necessary and appropriate, wind screens should be strategically placed to the northwest of any seating area. For maximum benefit, wind screens should be at least 6 feet high and made of approximately 20 to 30 percent porous material. If there would be seating areas directly adjacent to the north façade of the PKN Building, localized canopies or umbrellas should be used. Design of any wind screen or landscaping shall be compatible with the Historic District.

Cumulative Impacts

Impact C-WS-1: The Proposed Project at full build-out, when combined with other cumulative projects, would not alter wind in a manner that substantially affects public areas within the vicinity of the project site. ***(Less than Significant)***

For the analysis of cumulative wind impacts, the development projects within 1,600 feet from a point approximately 400 feet to the west of the center of the project site were analyzed.[34] In theory, cumulative project winds can increase or reduce impacts, depending on the specifics (e.g., height and proximity of buildings, location in context of predominant wind directions, etc.), especially the proximity of the cumulative projects to the Proposed Project. However, cumulative projects along with the Proposed Project could result in an increased number of buildings that would collectively act as obstacles that would reduce wind speeds in the project site vicinity. The results of the wind tunnel analysis are summarized below.

Maximum Residential Scenario Plus Cumulative Projects

Under the Maximum Residential Scenario plus cumulative projects, the wind tunnel test results are very similar to those for the Maximum Residential Scenario. Figure 4.I.6: Pedestrian Wind

[34] Image 1 and the table on p. 4 of the Pedestrian Wind Study show the cumulative projects analyzed.

Comfort and Hazard Conditions - Maximum Residential Scenario Plus Cumulative, p. 4.I.65, shows the pedestrian wind comfort conditions for this configuration.

Under the Maximum Residential Scenario plus cumulative projects, the average wind speed is 11 mph. (This is 1 mph less than the average under the Maximum Residential Scenario.) The range of wind speeds is from 7 to 19 mph. Under Maximum Residential Scenario plus cumulative projects, 133 of the 248 test locations comply with the comfort criterion, and 115 do not.

The wind hazard criterion of Planning Code Section 148 would not be exceeded at any test locations under the Maximum Residential Scenario plus cumulative projects. No mitigation measures are necessary.

Maximum Commercial Scenario Plus Cumulative Projects

Under the Maximum Commercial Scenario plus cumulative projects, the wind tunnel test results are very similar to the Maximum Commercial Scenario. Figure 4.I.7: Pedestrian Wind Comfort and Hazard Conditions - Maximum Commercial Scenario Plus Cumulative, p. 4.I.67, shows the pedestrian wind comfort conditions for this configuration.

Under the Maximum Commercial Scenario plus cumulative projects, the average wind speed is 11 mph. (This is the same as the average under the Maximum Commercial Scenario.) The range of wind speeds is from 7 to 19 mph. Under the Maximum Commercial Scenario plus cumulative projects, 134 of the 247 test locations comply with the comfort criterion, and 113 do not.

The Pedestrian Passageway Option did not need to be tested in the wind tunnel with cumulative projects because there are not any cumulative projects to the south of the project site close enough to affect the wind test results.

The wind hazard criterion of Planning Code Section 148 would not be exceeded at any test locations under the Maximum Commercial Scenario plus cumulative projects. No mitigation measures are necessary.

SHADOW

The Shadow subsection discusses the shadow impacts of the Proposed Project on open spaces and recreation facilities in the vicinity of the project site. The Environmental Setting discussion identifies the existing and planned publicly accessible open spaces and recreation facilities in the vicinity of the project site that could potentially be affected by the Proposed Project; identifies applicable regulations related to shadow impacts; and summarizes the regulatory framework related to the topic of Shadow.

The Impacts discussion, pp. 4.I.72-4.I.112, describes whether the Proposed Project would cast shadow on parks and open spaces in the vicinity of the project site in such a manner as to reduce the use and enjoyment of those spaces. For informational purposes, this discussion also describes shadow impacts of new buildings under the Proposed Project on proposed public open space that is included as part of the Proposed Project. The Impacts discussion also describes the cumulative effects of the Proposed Project, combined with past, present, and reasonably foreseeable future projects.

The potential extent of shadow impacts of the Proposed Project is based on a shadow fan diagram prepared by the Planning Department that projects the maximum reach of project shadow throughout an entire year one hour after sunrise and one hour before sunset.[35] The analysis is based on a digital shadow analysis prepared by an independent consultant that shows the location of project shadow on existing and planned public open spaces on and in the vicinity of the Proposed Project at representative times of the year throughout the day between one hour after sunrise to one hour before sunset (see "Approach to Analysis," pp. 4.I.73-4.I.75).[36]

ENVIRONMENTAL SETTING

PUBLICLY ACCESSIBLE OPEN SPACES IN THE VICINITY OF THE PROPOSED PROJECT

There are no existing publicly accessible open space areas within the project site.

There are three existing publicly accessible open spaces within a 0.25-mile vicinity of the project site boundary, listed below. (These open spaces are shown on Figure 4.J.1: Existing, Baseline, and Future Parks and Recreational Facilities, in Section 4.J, Recreation, p. 4.J.8.)

- Esprit Park is three blocks to the west of the project site along the northern side of 20th Street at Minnesota Street. It is an approximately 1.8-acre field bordered with picnic

[35] The Planning Department's shadow fan for the Proposed Project, dated January 30, 2015.
[36] PreVision Design, Pier 70 Project Shading Analysis, May 31, 2016.

tables, benches, and redwood trees. It is owned and managed by the San Francisco Parks and Recreation Department.

- Warm Water Cove Park is south of the project site along the waterfront at the eastern terminus of 24th Street. It is an approximately 1.85-acre open space. It is owned by the Port of San Francisco.
- Woods Yard Park is three blocks to the west of the project site along the southern side of 22nd Street at Minnesota Street. It is an approximately 0.25-acre site located with two grassy areas, shade trees, and a sand pit. It is owned by the San Francisco Municipal Transit Authority.

There is one planned publicly accessible Port of San Francisco-owned open space on Pier 70 adjacent to the project site.

- The planned Historic Core Plaza would be an approximately 45,000-sq.-ft. plaza south of Building 113 and east of Buildings 114, 115, and 116. It would be constructed as part of the adjacent 20th Street Historic Core Project. The primary pedestrian access to the plaza would be from 20th Street through an atrium within Building 113. It would also be accessible from the project site from the south and east.

The following publicly accessible Port of San Francisco-owned open space is under construction on Pier 70 north of the project site.

- The future Crane Cove Park is an approximately 9-acre site north of the project site within Pier 70. It is bounded by Illinois Street to the east, Mariposa Street to the north, San Francisco Bay to the east, and the future continuation of 19th Street to the south. The planned park would include a variety of landscape and plaza areas; 1,000 feet of San Francisco Bay shoreline open to the public; adaptive reuse of historic resources, including Slipway 4 and two cranes; and views of the dry dock, City skyline, and San Francisco Bay.[37] The site is owned by the Port of San Francisco, which will own and operate the park. Phase I (which consists of most of the western portion of the site and the extension of 19th Street) is anticipated to be completed in late 2017.[38] Later phases within the eastern portion are anticipated to be completed 5 to 10 years later.

REGULATORY FRAMEWORK

SAN FRANCISCO GENERAL PLAN

The *General Plan* contains objectives and policies that are related to preserving sunlight on open spaces and other public areas. These objectives and policies are found in the Recreation and Open Space Element and the Urban Design Element.

[37] Port of San Francisco, Crane Cove Park, December 2015. Available online at http://www.sfport.com/index.aspx?page=2025. Accessed December 15, 2015.

Recreation and Open Space Element

The Recreation and Open Space Element states that solar access to public open space should be protected.[39] In San Francisco, the presence of the sun's warming rays is essential to enjoying open space. This is because climatic factors, including ambient temperature, humidity, and wind, usually combine to create a comfortable climate only when direct sunlight is present. Therefore, the shadows created by new development nearby can critically diminish the utility of the open space.

Urban Design Element

The Urban Design Element states that buildings to the south, east, and west of parks and plazas should be limited in height or effectively oriented so as not to prevent the penetration of sunlight to such parks and plazas. Large buildings and developments should, where feasible, provide ground-level open space on their sites, well situated for public access and for sunlight penetration.[40]

SAN FRANCISCO PLANNING CODE

Planning Code Section 101.1 / Proposition M

In November 1986, the voters of San Francisco approved Proposition M (the Accountable Planning Initiative), which added Section 101.1 to the Planning Code and established eight Priority Policies. These Priority Policies are the basis upon which inconsistencies with the *General Plan* are resolved. Priority Policy No. 8 calls for the protection of parks and open space and their access to sunlight and vistas.

Prior to issuing a permit for any project which requires an Initial Study under CEQA; prior to issuing a permit for any demolition, conversion, or change of use; and prior to taking any action which requires a finding of consistency with the *General Plan*, the City is required to find that the Proposed Project or legislation would be consistent with the Priority Policies.

Planning Code Section 295 / Proposition K

In 1984, San Francisco voters approved an initiative known as "Proposition K, The Sunlight Ordinance," which was codified in 1985 as Planning Code Section 295. Section 295 prohibits the

[39] City and County of San Francisco, *General Plan*, Recreation and Open Space Element, April 2014, p. 18. Available online at http://www.sf-planning.org/ftp/General_Plan/Recreation_OpenSpace_Element_ADOPTED.pdf. Accessed January 4, 2016.

approval of "any structure that would cast any shade or shadow upon any property under the jurisdiction of, or designated for acquisition by, the Recreation and Park Commission" unless the Planning Commission, upon the recommendation of the General Manger of the Recreation and Park Department and after review and comment by the Recreation and Park Commission, has found that the shadows cast by a proposed project would not have an adverse impact on the use of the property. Section 295 does not apply to structures that do not exceed 40 feet in height. The period analyzed is from the first hour after sunrise until the last hour before sunset.

On February 7, 1989, pursuant to Proposition K, the Planning Commission and the Recreation and Park Commission adopted a joint resolution adopting criteria for determination of significant shadows in 14 Downtown parks, as described in a February 3, 1989, memorandum to the Planning Commission and the Recreation and Park Commission regarding "Proposition K, The Sunlight Ordinance."[41] These criteria establish an "absolute cumulative limit" (ACL) for new shadow allowed on these parks, as well as qualitative criteria for allocating the ACL among individual development projects. As discussed below, no properties under the jurisdiction of the Recreation and Park Commission are on the project site nor within the potential reach of Proposed Project shadow. As such, Planning Code Section 295 does not apply to the Proposed Project.

Planning Code Sections 146 and 147

Other Planning Code sections related to shadow, such as Sections 146 and 147, apply to certain zoning districts, with the intent to maintain direct sunlight on public sidewalks in certain downtown areas during critical periods of use and to minimize shadow on public plazas or other publicly accessible open spaces other than those protected by Section 295. The Pier 70 project site is not in zoning districts that are subject to the provisions of Planning Code Sections 146 and 147.

IMPACTS AND MITIGATION MEASURES

SIGNIFICANCE THRESHOLDS

The threshold for determining the significance of impacts in this analysis is consistent with the environmental checklist in Appendix G of the State CEQA Guidelines, which has been modified by the San Francisco Planning Department. For the purpose of this analysis, the following applicable threshold was used to determine whether implementing the Proposed Project would result in a significant shadow impact. Implementation of the Proposed Project would have a significant shadow effect if the project would:

[41] City and County of San Francisco Planning Department, Memorandum to the Planning Commission and Recreation and Park Commission, "Proposition K, The Sunlight Ordinance," February 3, 1989.

- Create new shadow in a manner that substantially affects outdoor recreation facilities or other public areas.

"Outdoor recreation facilities or other public areas" studied in this section include planned baseline and future Port of San Francisco open spaces within the potential reach of project shadow and nearby public sidewalks. Shadow impacts on open spaces proposed as part of the Proposed Project are evaluated for informational purposes.

APPROACH TO ANALYSIS

Shadow Fan

In order to determine whether any outdoor recreation facilities or other public open spaces could be potentially affected by project shadow, the Planning Department prepared a "shadow fan" diagram. The shadow fan plots the maximum potential reach of project shadow over the course of a year (from one hour after sunrise until one hour before sunset on each day of the year) and plots the locations of nearby open spaces, recreation facilities, and parks. The shadow fan accounts for topographical changes but it does not account for existing shadows cast by existing buildings. The shadow fan is used by the Planning Department as the basis for initially identifying which open spaces, recreation facilities, and parks merit further study. Those that are outside the maximum potential reach of project shadow do not require further study.

Based on the shadow fan for the Proposed Project, the adjacent future Historic Core Plaza that is part of baseline conditions and the southernmost portion of the future Crane Cove Park, to the north of the project site, could be potentially within the reach of project shadow. No other off-site publicly accessible open spaces in the vicinity of the project site are within the potential reach of project shadow.

Based on the shadow fan for the Proposed Project, shadow from the Proposed Project could not reach any property under the jurisdiction of, or designated for acquisition by, the Recreation and Park Commission from one hour after sunrise to one hour before sunset at any time during the year. For this reason, quantification of new project shadow, a method for analyzing shadow impacts on Recreation and Park properties, is not necessary for the Proposed Project.

Shadow Model and Assumptions

An independent consultant prepared a digital shadow model of the Proposed Project at full build-out. Specific architectural designs for buildings within the project site are not available at this time. The Proposed Maximum Height Plan does not specify the exact massing and location of the future proposed buildings, but shows the proposed maximum distribution of building heights across the project site (ranging from 50 to 90 feet high). The height plan would be the same for every parcel under both the Maximum Residential Scenario and the Maximum Commercial

Scenario and therefore serves to cover maximum building volume on each parcel under both scenarios. To understand the worst-case scenario, this analysis of shadow impacts assumes full build-out under the height plan shown in Figure 2.13: Proposed Height Limits Plan, in Chapter 2, Project Description, p. 2.40, and assumes building volumes that are built to the maximum height and cover the entire footprint of each parcel. The model adds an additional 16 feet of height above the maximum height for each parcel to account for rooftop mechanical features which would be exempt (under Planning Code Section 260(b)) from the proposed maximum heights limits. The model accounts for the proposed grading of the project site to address sea level rise. It addresses Grading Option 3 for Building 12, which involves raising the grade of the rehabilitated building to the proposed new grade and therefore would have the greatest potential reach of shadow of the three grading options.

Shadows from existing buildings to be retained and rehabilitated are shown as existing shadow on the diagrams; shadows of existing buildings on the project site that are to be demolished to construct the Proposed Project are not shown in the diagrams. For these reasons, this analysis represents a conservative disclosure of shadow impacts (i.e., one that may overstate, rather than understate, new project shadow). Project phasing of development of open space is not separately discussed. The proposed new 20th Street Pump Station that would be built at an off-site location (west of Building 6 in the BAE Systems parking lot) is not modeled; it would not cast new shadow on any open space.
